The Lombards' Arianism helped to maintain their separateness from the king's Roman subjects. Theodelinda's Catholicism had little permanent influence except for her support of the influential monastery of Bobbio. Arian bishops continued in parts of northern Italy, and Rothari was actively anti-orthodox; it was only in King Perctarit's reign (671–688) and after the intervention of Roman missionaries that the Lombards abandoned Arianism.

Theodelinda's line died out with the brutal Aripert II (reigned 700–712), and a new dynasty was raised to the throne. Its second representative, Liudprand, who reigned from 712 to 744, was probably the greatest of the Lombard kings. Until 726 he seems to have been concerned exclusively with the internal condition of his kingdom. Subsequently, helped by the internal dissensions resulting from imperial policies, he steadily reduced the area still under Byzantine rule; and he also made his authority effective in Spoleto and Benevento. The laws which he issued in 15 of the 31 years of his reign reveal an increase in royal power, a growing opposition to violent revenge, and the greater importance of property transactions. Coins and documents from his court confirm the impression of a strong and effective monarch.

In 751 Ravenna and the remaining central Italian Byzantine territories were occupied by Aistulf (king 749–756), who then invaded the territory around Rome. On the appeal of Pope Stephen II (III), the Frankish king Pepin led two expeditions into Italy in 754/755 and 756, and compelled Aistulf to surrender to the papacy most of his conquests since 751. When in 772 Aistulf's successor Desiderius invaded these papal territories, Pope Adrian I sought the help of the Frankish king Charles (Charlemagne). The latter entered Italy in 773 and after a year's siege Pavia finally fell to his armies. Desiderius was captured, the great men of the kingdom made their submission, and Charles became king of the Lombards as well as king of the Franks. The region was later ruled by Spain (1535–1713), Austria (1713–96), and France (1796–1814). In 1859 Lombardy came under Italian rule.

The traditions and achievements of the Lombards were not forgotten with the disappearance of an independent kingdom. In the 780s Paulus Diaconus, himself of an old Lombard family, wrote their history from the beginning to the death of Liudprand; and in the 9th century the princes of Benevento, whom the Franks failed to subject, regarded themselves as maintaining the ancient traditions of the Lombard people. The Italian language includes a number of words of Lombard origin; and for at least two centuries the judicial institutions of northern Italy showed traces of Lombard influence. The Lombards also played a part in the development of later Germanic ornament (in the 7th century), though their contribution to the art of Italy was negligible. Finally many features of later Italian life which have Roman origins, such as the notariate, were transmitted via the Lombards. (A.C./G.Kh.)

Piedmont

PHYSICAL AND HUMAN GEOGRAPHY

The northwestern region of Piedmont (Piemonte) is composed of the provinces of Alessandria, Asti, Cuneo, Novara, Turin (Torino), and Vercelli. It has an area of 9,807 square miles (25,400 square kilometres). To the south, west, and north it is surrounded by the vast arc of the Ligurian Apennines and the Maritime, Cottian, Graian, and Pennine Alps. The core of the region is the Po Valley, open to the east and consisting, especially in its eastern portion, of some of the best farmlands in Italy. South of the Po are the low and intensively cultivated hills of Monferrato and of the Langhe. In the foothills of the Alps are Lakes Maggiore and Orta. The Po and its tributaries, the Dora Baltea, Dora Riparia, Sesia, Tanaro, Ticino, and Scrivia, provide ample water for agriculture.

The alpine arc of Piedmont plays a vital part in the power production of the region and of north Italy as a whole; its hydroelectric plants provide energy for industry, transportation, and domestic use. The forests provide lumber; the alpine and sub-alpine meadows afford excellent pasture for cattle as the base of a prosperous dairy industry. The lowlands produce wheat and rice, vegetables and fruit, milk and cheese; the hills south of the Po are noted for some of Italy's highest quality wines, both of the sparkling (Asti) and still (Barbera) variety. Piedmont is part of the great industrial triangle of north Italy (Turin–Genoa–Milan), and its industries are characterized by their variety as well as by their important output. Turin, the largest city and the leading industrial centre, is the location of one of Europe's largest automobile plants, as well as of printing, textile, and machine industries. Ivrea, northeast of Turin, is the headquarters of one of the leading makers of office machinery in Europe. Textiles, chemicals, paper, rubber, nonmetallic minerals, and glass are among the other important Piedmontese industries.

Through Piedmont passes the principal rail connection between France and Italy, the Turin–Mt. Cenis Tunnel–Paris line, while to the north the Simplon Tunnel leads to Switzerland. A network of roads and expressways ties all parts of the region closely together; Genoa, easily reached from Piedmont, serves as its port. An all-weather road between France and Italy, passing through a long tunnel under Mont Blanc, thence through the Valle d'Aosta region to Turin and Milan, and a tunnel under the St. Bernard Pass between Switzerland and Italy were opened in the 1960s.

HISTORY

In Roman times Piedmont played a role of importance because its passes served as connections between Italy and the transalpine provinces of the empire. After periods of Lombard and Frankish rule, the House of Savoy emerged as the most important feudatory of northwest Italy. This dynasty first became powerful as successor to the marquesses of Ivrea and of Turin, but after 1400 its control of both slopes of the Alps, ruling over what is now French Savoy (Savoie) and over Piedmont, gave it undisputed sovereignty over much of the region. After 1700 practically all of Piedmont passed under Savoyard domination, while the addition of Sardinia to its territories provided it with still wider interests. During the Italian Risorgimento it was Piedmont that led the attempts of 1848, 1859, and 1866 to unite all Italy, and Victor Emmanuel II, originally king of Piedmont, became modern Italy's first king in 1861. (G.Kh.)

Sardinia

Character and location

The second largest island in the Mediterranean Sea, second in size only to Sicily, Sardinia (Italian Sardegna) was for centuries ravaged by invaders, malaria ridden, backward, and poverty stricken. Almost ignored by the modern world until the 1950s, this autonomous region within the Italian republic was later included in an ambitious industrial development scheme. It also became a major tourist centre.

Ichnusa or Sandaliotis, the names given to the island by the Greeks, derived from its shape, which resembles a sandal or foot, the later name, Sardinia, stemming from Latin.

Divided into the provinces of Sassari (in the north), Nuoro and Oristano (in the centre), and Cagliari (in the south), Sardinia measures some 150 miles (240 kilometres) from north to south and about 75 miles at its widest point, with a surface area of 9,194 square miles (23,813 square kilometres). It lies 112 sea miles from the Italian mainland and 120 from Africa, which is just visible on a clear winter's day from Sardinia's most southerly point, Capo Teulada. Its island neighbour, Corsica, lies 7½ miles to the north, across the Strait of Bonifacio.

PHYSICAL AND HUMAN GEOGRAPHY

The land. Among the natural features of the island, the mountains are outstanding, particularly the Gennargentu in Nuoro, the Limbara heights in Gallura, and the famous *macchia,* the grasslands mingled with scrub of cistus, lentisk, myrtle, prickly pear, and dwarf oaks, which covers most of the uncultivated countryside. Yet man, too, has left an impressive imprint: among a notable range of architectural monuments, generally Romanesque or Pisan in style, the Paleo-Christian Church of San Gavino at Porto Torres is exemplary. Rising, like many of its kind, among solitary, rolling hills, the beautiful Pisan Saccargia di Santa Trinità (located near Sassari), of alternate limestone and basalt, lends its own character to the landscape, as do the ancient citadel walls rising high above the modern city of Cagliari.

Topographically, a pattern of rolling uplands predominates. It leads in the eastern centre to the Gennargentu, with La Marmora (6,017 feet [1,834 metres]), the highest point in Sardinia, just above Bruncu Spina (6,001 feet). The Punta Balestieri (4,468 feet) tops the granite range of the Limbara, surrounded by ancient cork forests. Only in the extreme northwest and in the west coast near Oristano are there large areas of low-lying land. The plain of the Campidano, 60 miles long, running diagonally from Cagliari to Oristano, the granary of imperial Rome, is an exception. Today, its fertile soil produces much of the island's corn, as well as fruit and vegetables.

Climatic patterns

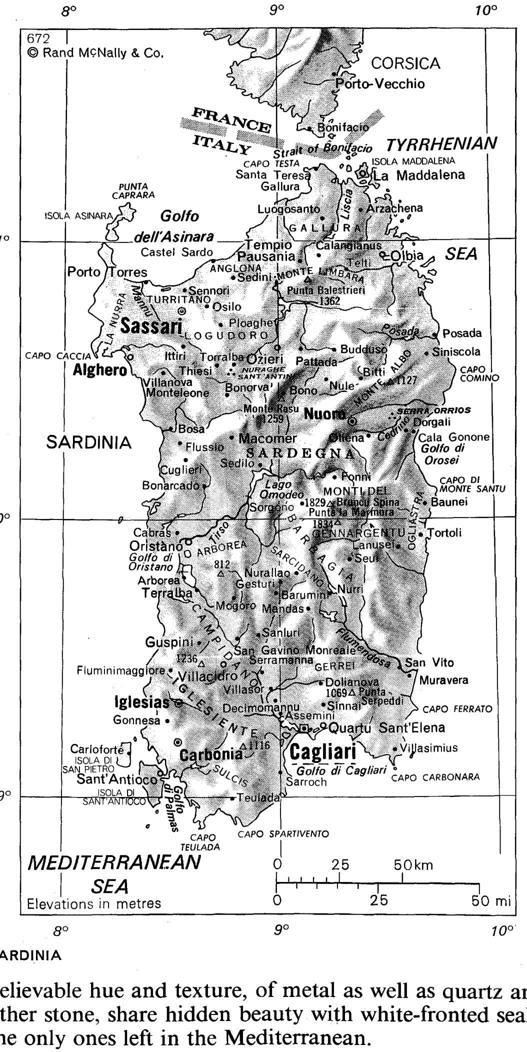
With some nine months each year of sunshine, Sardinia has a predominantly mild climate; there are only slight variations of temperature—between 43° and 55° F (6° and 13° C) in winter and from 61° to 79° F (16° to 26° C) in summer, except in the mountains, where snow may lie on the topmost peaks for as long as six months. The name Gennargentu—"the silver gate"—refers to the spectacular effect of the sun on the gleaming snow crystals. There is generally a breeze, the prevailing wind being the *maestrale,* from the northwest; the *greco* is from the east, and only when the *sirocco* blows from the southeast is the air damp and oppressive.

Rainfall is low, the mean in Cagliari being only 18.9 inches (480 millimetres), in Sassari, 23.1 inches, though this increases in the higher lands. The longest rivers, the Tirso (93 miles) and the Flumendosa (79 miles), both rise in Nuoro, fed by innumerable mountain streams that dry up in summer. There are more than 26,000 springs on the island, and some 200 lakes have been formed, with major reservoirs on the Tirso and its tributaries. For months from the end of January onward the island is a paradise of fruit blossoms and of wild flowers that yield their fragrance and colour to the thyme and other herbs mingling in the *macchia.* Oleander blooms abound in every shade from white to vivid reds. In addition to cork oaks, ilex, chestnuts, and pines throng the forests.

Cattle, goats, and pigs are allowed to wander freely in the uplands, with only sheep being herded as protection against foxes and other predators. In early summer the shepherds lead their flocks to the highlands, the men taking only a little wine and their *carta da musica* (wafer-thin bread), finding meat and water as they need it, milking their ewes and making *peccorino* cheese.

Donkeys abound; the only albinos in the world are found in Asinara, and at Castel Sardo there is a diminutive breed hardly larger than a big dog. The Sard's horse is prized above all, and its well-being was protected by laws in medieval times. In the heart of the island, in the plain of Gesturi, there is still a breed of wild horse, swift and beautiful, of unknown origin, also protected by law. Conservation measures also apply to the mufflon (horned sheep), the rare red and fallow deer, and, in the marshes of Cagliari, a species of heron and also the fleeting spring flocks of flamingos. Other wild birds include eagles, quail, and woodcock. Wild-boar hunting is allowed only at certain seasons, and there are no poisonous snakes.

The 500 miles of coastline, fringed with small bays and endless white sands, are riddled with deep caves, many unexplored. The two most famous are the Grotta di Nettuno (Cave of Neptune), among the coral beds of Alghero, and the Grotta del Bue Marino (the Grotto of the Sea Ox), stretching more than two miles long at Cala Gonone on the east coast. Here, stalactites and stalagmites of unbelievable hue and texture, of metal as well as quartz and other stone, share hidden beauty with white-fronted seals, the only ones left in the Mediterranean.



SARDINIA

Sardinia has also three first-class natural harbours: at Cagliari; at Asinara on the northwest; and, on the extreme northeast, among an archipelago of seven small islands, the harbour of La Maddalena, where Lord Nelson held his fleet for nine months before setting out on the voyage that led to Trafalgar. He declared it to be the finest harbour in the Mediterranean and—unavailingly—besought his country to take it.

The people. A people whose origin has remained unknown, the Sards (and their similarly mysterious language) have inevitably been influenced by the successive nations that occupied the island. Some of the linguistic results are not without humour: at Alghero, half the people speak Catalan but the others Sardo, so communication has to be in Italian. Similarly, the islanders of San Pietro still speak Genoese, inherited from refugees from Tabarca who settled there in the 18th century; on the adjacent San'Antioco, Sardo is the language, so once more Italian must be used. In general, Tuscan has a definite sphere of influence north of a line from Olbia, through Tempio, to Castel Sardo; Genoese predominates around Sassari, with the exception of Alghero, Spanish, and Arabic in the south; and the purest native strains, both of people and of language, are found in the isolated mountains of the Gennargentu. The strongest foreign associations are Spanish, contacts with the Iberian Peninsula having been dated from as early as the 2nd millennium BC. The legendary foundation of Nora by an Iberian chief, Norax, from Tartessus, before the Phoenician arrival, is perhaps associated with this link. Certainly, modern Sardo includes many Spanish words.

Linguistic complexities

The Sardinians are a devout Catholic people. The population has increased in recent years, in spite of considerable migration. Distribution is uneven, the only considerable concentrations being in Cagliari and Sassari, and then, much further down the scale, at Nuoro, Iglesias, and Oristano.

Profound material and psychological changes are besetting contemporary Sard life. All serious observers agree that the Sards are a dignified, brave, and loyal people, whose backward, almost tribal way of life, especially in isolated villages and mountain areas, is suddenly being catapulted, as it were, from the flint to the jet age, without the centuries of gradual transformation experienced on the mainland of Europe.

In the past, robbery or violence among the Sards arose generally from either hunger or vendetta; the former is often tempered by generosity from others hardly better off, and from it stems, in part, the fiercely held tradition of hospitality to the stranger. Loyalty to friend or family has, for centuries, facilitated survival in the face of savage butchery. It is a natural habit as ingrained as sleeping and eating, the results of failure to observe it in the past often being so dire that only blood could wash away the stain. It is said, with pride, that if a Sard is your friend he is your friend for life and that no Sard will ever betray another to a "foreigner." That includes Italians, who, after all, were invaders, too.

The economy. The two most important developments in the economy in recent decades have been the inclusion of Sardinia in the Italian government-sponsored scheme of aid for the developing areas of southern Italy, Sardinia, and Sicily and the extermination of the malaria mosquito. Known as the Cassa per il Mezzogiorno (Fund for the South), the former project gave financial help and technical advice toward the establishment of new businesses, assistance in the training of workers, temporary remission of taxes, and other incentives. The plan was based on the idea that in the scheduled areas lies a potentially enormous supply of untapped labour that could help to give Italy an important lead in export markets and increase its value within the EEC. Petrochemical plants in Sardinia at Porto Torres and at Sarroch near Cagliari were extended, and other far-reaching plans involved foreign as well as Italian investors.

The campaign against the mosquito

The extermination of the malaria mosquito, begun in 1943 by the United Nations Relief and Rehabilitation Administration, UNRRA, with a pilot scheme at Oristano, was followed in 1947 by a campaign that covered the whole island and that was financed by the Rockefeller Foundation of the U.S. For centuries the ubiquitous disease, known as *intemperie,* was thought to be caused by the climate, and its elimination, apart from the obvious improvement in health of the people, helped to treble the number of foreign tourists over the next decades. An outstanding example of tourist development was the construction of a luxury resort, the Costa Smeralda, at Arzachena, by an international consortium headed by the Aga Khan IV.

Sardinian mining for gold, silver, lead, copper, and other ores has been known since ancient times, and the island is the most important source of fluorspar in Europe. Poor-quality coal is mined at Carbonia and is mainland Italy's only source of natural supply, as is the sea salt from the lagoons of Carloforte and Cagliari. Hard wheat is the important crop; olives, citrus fruits, and grapes are also grown. The centuries-old cork forests of Gallura produce most of Italy's total output. Other industries include the making of *peccorino* cheese and the processing of such wines as the *vernaccia* and *Malvasia,* from the Ogliastra, and the celebrated red wine of Olbia.

At Stintino, on the Golfo dell'Asinara (Gulf of Asinara), and also at Carloforte, fishing for *tonno* (tunny) is skilled, well organized, and profitable for all. It is financed by Genoese. The only difficulty with this industry is that the course of these great fish, storming their way through to spawning grounds in the Black Sea, remains uncertain until the last moment.

The building of good motor roads linking the main centres of Sardinia and improvements of lesser routes, in conjunction with considerable government concessions to tourists bringing cars to the island, greatly increased motor traffic. Rail communications between the main centres are now fairly good, but other services are slow and limited. The two international airports at Cagliari and Alghero were joined in the early 1970s by a third, at Olbia. A private airline connects the Costa Smeralda with the mainland. Maritime services are good and include car ferries. Connections are frequent between the Sardinian towns of Cagliari, Olbia, Golfo degli Aranci, and Porto Torres and the mainland towns of Civitavecchia, Genoa, Naples, Palermo, Toulon, and Tunis.

Administrative and social conditions. Article 1 of the special statute for Sardinia, dated February 26, 1948, states: "Sardinia and its islands shall be considered an autonomous region with its own legal status, within a united Republic of Italy." Government is administered by a small executive body, the *giunta,* appointed from among members of the Regional Council, themselves elected on the basis of proportional representation in the ratio of one councillor for every 20,000 inhabitants. Members of the Council elect a president from among themselves; he has the right to be present at Cabinet meetings in Rome when matters concerning Sardinia are involved. Only in rare cases—usually where expert knowledge is required—are other than regional councillors appointed to administrative posts within the *giunta.*

The constitutional background

Elections are held every four years. Every citizen reaching the age of 21 has the right to vote but cannot become a councillor until the age of 25. There are no postal votes; although, in theory, absentee voters abroad can claim free second-class transport "to the border," this privilege is not much exercised.

The wide legislative powers held by the *giunta* affect nearly all spheres of life: social services, labour, industrial conditions, hotel and tourist trade, and public works, including building and urban planning. The region retains the bulk of the income collected from the many tax sources, as well as from a state tobacco monopoly. The central government nevertheless retains control of customs and excise, the armed forces, the *carabinieri* and the finance police (who watch the entry of goods and may examine corporate records in tax matters), the urban and rural police having only limited functions. The railways are also state property, but other means of transport within the island, as well as local sea and air traffic, are the responsibility of the *giunta.* Two years of military service are compulsory, as on the mainland.

Under Italian law every citizen has the right to free education, and in Sardinia "subscription" is available to assist talented children from poor families to attend universities. Taxes include contributions toward medical care and pensions, the latter being payable at the age of 55 for women and 65 for men.

Within the framework of the Regional Council the four provinces have considerable administrative powers over their domestic affairs, all of which are jealously guarded. Isolation of small villages is one of the problems but is, to a growing extent, being overcome by the organization of communes, whereby two or more communities join for mutual benefit and protection. Each commune has at least one policeman, while in other, solitary villages, the local mayor has authority to enlist up to 15 volunteers, known as *baracelli,* whose powers are limited but who perform a useful function. The origin of this force goes back to the days of the Spanish vigilantes.

Cultural life. As might be expected in an island with so long and varied a history, folklore and craftwork abound in Sardinia, in many cases the origins and inspiration for both going back to forgotten centuries and pagan beginnings. Witchcraft and both black and white magic are still part of life. No one realized this better than the Nuorese authoress Grazia Deledda, who was given the Nobel Prize for literature in 1926 for her understanding portrayal of the power and passions of life in the primitive communities around her.

Magical survivals

Every town and village has its own festival, but the most important is the Sagra di Sant'Efisio at Cagliari in early May, which commemorates the martyrdom of a Roman general who was converted to Christianity. All Sardinia flocks to the capital for this spectacle, which affords an opportunity to witness the exquisitely embroidered (and often valuable) costumes of the women. The men's national costume includes, together with the stocking cap seen on the nuraghic bronzes, a tunic said to be similar to that worn under their armour by Roman soldiers.

Most of the festivals involve feats of horsemanship, as at the Sartiglia of Oristano, the dangerous Ardia at Sedilo, and the Cavalcata at Sassari, where there is also a Feast of the Candles. At Mamoiada, in Nuoro, a remarkable feature is the Feast of the Mamuthones, where men, wearing masks and sheepskins on their backs loaded with bells, perform a ritual dance, ending with a symbolic "killing" of the scapegoat. The variety of songs and dances is endless; they are often performed to the accompaniment of the *launeddas,* ancient triple pipes.

Much of the craftwork, still unspoiled by the intrusion of modernity, is skilled and beautifully made, some being decorated with designs based on Punic and even earlier symbolic patterns. Gold filigree, often allied to coral, is always worn on special occasions. Wood carving exhibits a great variety and includes the making and decorating of the cassapanca, the bridal chest. Other examples include leatherwork from Dorgali, basket making of palm or asphodel from Castel Sardo or Flussio, as well as finely woven carpets from Nule and Ploaghe, filet lace from Bosa, ceramics and terra-cotta from, among other places, Tortoli, Assemini, and Oristano, and the finely woven *arazzi,* or wall hangings, made in Mogoro, some of which show Arab influence.

HISTORY

Ancient origins and the classical period. The dominating feature of the island (7,000 examples are said to exist) is the nuraghi: strange, truncated cone structures of huge blocks of basalt taken from extinct volcanoes, built without any bonding. Most are quite small, a few obviously fortresses, with wells and other defensive measures; two of these latter, Sant'Antine at Torralba and Su Nuraxi at Barumini, are three stories, and about 50 feet, high. One nuraghe is always within sight of another, the greatest concentrations being in the northwest and south centre. There is also an important nuraghic village at Serra Orrios, near Dorgali, with traces of nearly 80 buildings identified, including temples, wells, and a theatre. The rock-cut tombs of Anghelu Ruju, the Dolmen, Tombe dei Giganti (Tombs of the Giants, for mass burial), and Domus de Janas (Witches' Homes) are also yielding much interesting information to archaeologists.

But though modern science has helped to identify and approximately date weapons, jewelry, utensils, and votive objects of metal, pottery, obsidian, and other stones, almost nothing is known of the nuraghic people themselves. The expression of *il vero Sardo* "the true Sard," referring to a certain type of man or woman, rarely met with, obviously different, may hint at an ethnic survival, and there are a few place-names that have no origin in Greek, Punic, or Latin tongues. Expert opinion now gives the dates of the nuraghi from about 1500 to 400 BC, but the mystery remains how such a people, well organized, with remarkable engineering skill and an equal talent in the creation of the beautiful and often witty bronzes to be seen in the Cagliari and Sassari museums, apparently left no trace of a written word.

Phoenicians were the island's first recorded settlers, at about 800 BC. They traded in metals and founded colonies in the south at Nora, Sulcis, Bithia, Tharros, and Karalis (or Cagliari). The Greeks soon raided the north and sacked the town of Olbia, to be followed in turn by the Carthaginians, against whom the Sards revolted repeatedly. In 238 BC the long and brutal Roman occupation began. It was to last nearly 700 years, with Sardinia becoming the first Roman province and Cagliari a port for the Roman fleet in AD 46.

Phoenician, Roman, and Vandal imprint

The medieval and modern period. After the Romans there were the Vandals, about AD 477, followed briefly by the Romans again, then Byzantines, and later still the Saracens, who in 711 sacked and occupied Cagliari, forcing the luckless Sards to pay heavy ransom.

Ninth-century records mention the *giúdice* (governing judge) for the first time, and at the beginning of the 11th century the four divisions of the island are described: that of Cagliari (for the south), Arborea (the centre), Logudoro (Torres), and Gallura (northeast), each with its own *giúdice.* By this time the Italian cities of Pisa and Genoa, with papal support, were struggling against each other and the Sards for domination of the islands. Vatican influence shifted, however, to Alfonso IV of Aragon, who in 1326 defeated the Pisans, taking Cagliari by force. Later in the same century, the famous warrior queen Eleanor of Arborea unsuccessfully rallied the island against the invaders. Her outstanding work, the codifying of the laws begun by her father, was nevertheless completed, and in 1421, after her death, her Carta de Logu was accepted by the Sard Parliament as valid for the whole island and remained so until the Treaty of Utrecht in 1713. In the 15th century, meanwhile, under Spanish occupation, Sardinia was raised to the status of a dominion, with its own viceroy. In 1720 Victor Amadeus II of Savoy was proclaimed first king of all Sardinia, and in 1861 the accession of Victor Emmanuel II finally united Sardinia with Italy, although it was not until 1948 that Sardinia was given a degree of autonomous government. (M.De.)

Venetia

PHYSICAL AND HUMAN GEOGRAPHY

The name Venetia is used in English to denote that part of northern Italy that lies east of Lombardy, with various senses according to the historical period in question. In classical Latin, Venetia meant the territory of the Veneti. In modern Italian, however, Venezia by itself is simply the name of Venice; but if some qualifying term is added, a larger area can be designated.

The Republic of Venice extended its power over the Italian mainland northward, westward, and eastward in the Middle Ages. The name Venetia may thus be applied in a general sense to cover these old Venetian possessions, which finally included all the modern region of Veneto, sometimes also called Venezia Euganea, and a large part of the modern region of Friuli-Venezia Giulia.

The republic's territory west of Lake Garda and the Mincio River (Brescia, Bergamo, and Crema, held from the late 15th century) was, however, regarded as part of Lombardy rather than of Venetia; nor did the latter name include Dalmatia, likewise a possession of the republic.

The modern region of Veneto (also called Venezia Euganea) comprises the provinces of Venice, Padua, Rovigo, Verona, Vicenza, Treviso, and Belluno. Its area is 7,095 square miles (18,377 square kilometres). It is surrounded by Lombardy on the west, Trentino-Alto Adige to the north, Emilia-Romagna to the south, and the Adriatic Sea, Friuli-Venezia Giulia, and Austria to the east and northeast. The northern limit of Veneto is marked by a mountainous area, including the Dolomites, between Lake Garda at the southwestern extremity and the Carnic Alps

(Alpi Carniche) at the northeastern end. The southern portion consists of a fertile plain extending to the Gulf of Venice and watered chiefly by the Po, Adige, Brenta, Piave, and Livenza rivers. The mouths of these rivers, especially the several mouths of the Po, form an extensive delta area with shore lagoons. The climate is maritime in the south and turns Alpine toward the north.

Agriculture

Veneto is a chief producer of wheat, sugar beet, and hemp; while corn, dairy cattle fodder, and fruit (apples, pears, peaches, cherries), as well as vines on the sunny slopes of the mountains, are also grown. Cattle are extensively raised on the plain and fishing is practiced in the Venetian Lagoon. Much use is made of irrigation, and there has been a good deal of land reclamation, especially in the Po delta. After World War II large estates were expropriated for distribution to smallholders. Sources of energy for the region are methane gas from the Miocene rocks of the Po plain and hydroelectric power from the Alpine area. The larger towns of the plain have textile, silk, lace, hemp, paper, founding, and shipbuilding industries. Marghera, the port of Venice, has zinc and aluminum smelting plants and oil refineries, and it also produces sulfuric acid and synthetic ammonia for the chemical industry. Venice, besides being a tourist centre, carries on its traditional glass-, lace-, and tapestry-making crafts. The adjacent island of Murano specializes in glassware and that of Burano in lace. The only other notable port is Chioggia, south of Venice, a centre of fisheries and lace making. Verona is a chief communications centre between Italy and central Europe and an agricultural market, with engineering, chemical, and wine industries besides artistic handicrafts; Padua is an agricultural centre and has engineering, silk, textile, and chemical industries; Vicenza is also an agricultural market and manufactures textiles, fertilizers, and luxury goods. Treviso has textile mills and food-processing and other industrial plants; Rovigo is the agricultural centre for the Po delta and has a sugar-refining industry; Valdagno is a model industrial city and textile centre.

The region is well served by a dense road network, notably the Venice–Milan–Turin motorway (*autostrada*). Venice is connected to the mainland by a road and rail bridge. The chief local traffic route in Venice is the Grand Canal. (G.Kh./Ed.)

HISTORY

Origins. A people called the Veneti arrived in this territory about 1000 BC. They became allies of the Romans, who founded in 181 BC the colony of Aquileia, later famous as a Christian patriarchate. The region suffered severely from the barbarian invasions. Venice came into existence after the fall of the Roman Empire in the West. The Lombard invasion of northern Italy in AD 568 caused inhabitants of Altino and Aquileia, to take refuge in the lagoons, where only a few fishermen and salt workers lived without fixed abodes. The first islands to be occupied were Torcello, in the Venetian lagoon north of Burano, and Grado near Aquileia in the Marano lagoon. When the Exarchate of Ravenna was created *c.* 584, the region formed part of it. In 607 the patriarchate of Aquileia was transferred to Grado. When Oderzo, the last remaining mainland city of the Byzantines, fell to the Lombards in 641, political authority was transferred to an unnamed island later called Cittanova Eracliana in the Venetian lagoon. The Veneto-Byzantine area was then restricted to the lagoons and isolated politically, though not for trading purposes, from the other Byzantine possessions in Italy. The refugees formed new communities on islands of the lagoon and set up administration units.

The first elected duke was Orso, chosen in an anti-Byzantine military declaration in 727, but he was succeeded by Byzantine officials until *c.* 751, when the Exarchate of Ravenna came to an end. At the same time there was internal crisis between Cittanova and Malamocco, a settlement on the Lido in command of the main communication routes that had been developed by exiles from Cittanova. In the second half of the 8th century, Malamocco wrested from Cittanova the prerogatives of government but was not strong enough to unite the local administrations in a centralized regime.

Internal political strife

This internal political strife was complicated by the attempts of the patriarchs of Grado, who had extended their temporal influence along the coast as far as Equilo, to support the defeated inhabitants of Cittanova and Torcello against Malamocco. The doge Maurizio set up the bishopric of Olivolo in the Rialto island group, in order to check the southward advance of Grado, having already allied himself with the surviving Lombards and the Byzantines of Istria to oppose the Frankish expansion under the Carolingians. The new doge Obelerio and his brother Beato formed an alliance with the Franks of Italy and brought Venice under the subjection of the young king Pepin (died 810) in order to free themselves from Byzantine overlordship.

Rialto. Pro-Byzantine reaction to this event under the doges of the Partecipazi family led to the transfer of the seat of government from Malamocco to the Rialto group of islands, by then the natural centre for the exiles of the factional fighting. The move both centralized political activity and assured territorial and political independence. These were accompanied by a parallel development of the social and economic life of the lagoon islands, particularly the Rialto itself. Though a Franco-Byzantine treaty of 814 guaranteed to Venice political and juridical independence from the rule of the Western Empire, it did not confirm any effective dependence on the Byzantine Empire, and by 840–841 the doge was negotiating international agreements in his own name with Western governments without involving the Byzantine authorities. This freedom of Venice from Byzantine control was never sanctioned by any diplomatic or juridical document, but it became hallowed by custom and by centuries of uncontested power. The unusual legal and political position of a small duchy situated in territorial isolation between two great empires, in friendly relations with the West, and in theoretical dependence on but effective independence of the Byzantines, contributed greatly to its function as a trading middleman.

A succession of serious internal crises concerning the office of doge, from the time of the Partecipazi to that of the Badoer, Condiano, and Orseolo families, did not halt the rapid development of trade, which increased the national wealth and extended Venice's political influence from the Adriatic to the Mediterranean. The increase in private wealth led to the gradual achievement of internal stability by creating a broader ruling class that was capable of putting a limit to the power of the doge. Gradually a national consciousness developed, of which the first signs reflected in the daily life of the citizens were the reforms of Doge Orso Partecipazio I in the late 9th century. The national church, ruled by the patriarch of Grado, was reorganized by the institution of five new bishoprics. From the time of Giovanni Partecipazio's successor (887), the doge was chosen by popular election, though without destroying the monarchic system or the custom of co-regency, which assured the continuity of power. Finally the group of Rialto islands was solemnly transformed into the city of Venice (*civitas Venetiarum*).

The new order. The final collapse of family faction rule under the Orseolo regime led to a change in the system of government, inaugurated by Doge Domenico Flabanico (1032–42). He restored to the people the sovereign right (obscured during civil strife) to elect the doge, but the term *populus* was in practice restricted to the residents of the Rialto and, more narrowly, to the group of nobles who regularly frequented the doge's palace. The executive organ was the ducal curia (*dux* and *judices*), and the legislative assembly was summoned to approve the doge's acts. The temporal authority was preserved from ecclesiastical intervention, while the national church, centred on the patriarchate of Grado, was strengthened by the abandonment of metropolitan jurisdiction (Istria) outside the boundaries of the duchy. A new church was built for St. Mark, symbol of the Venetian spirit, under Doge Domenico Contarini (1043–70), an energetic defender of Grado's metropolitan rights and of the religious independence of the duchy.

Expansion of trade. In external affairs Contarini and his successors remained neutral (despite the complaints of Pope Gregory VII) in the conflict between papacy and empire, while safeguarding Venetian economic interests in the Adriatic when the conflict began to be reflected on the Dalmatian coast. But the greatest danger to Venetian economic interests was the 11th-century Norman expansion under Robert Guiscard, which threatened to cut Venetian communications to the south. The successful action taken against the Normans by Doge Domenico Selvo and his successor Vitale Falier was intended more to assure Venetian freedom on the sea than to aid the Byzantine Empire, and it made clear that Venice's control of trade routes in the Mediterranean must rest on a firmer basis than mere usage. In gratitude for Venetian aid against the Normans, the Byzantine emperor Alexius I Comnenus granted Venice unrestricted trade throughout the Byzantine Empire, with no customs dues, a privilege that marked the beginning of Venetian activity in the East (1082). The Adriatic, however, was not yet under control, as the Dalmatian ports were threatened by the Hungarians and Slavs, with whom it was difficult to come to agreement. Zadar (Zara), the most important of these ports because it controlled the northern Adriatic, changed hands frequently until it finally became Venetian in 1409.

Norman expansion under Robert Guiscard

Toward the end of the 11th century the Crusades centred the newly awakened trading interests of the West on the Mediterranean. At first, however, Venice was concerned chiefly to gain control only of the European trading ports of the Byzantine Empire, leaving to private interests the trading opportunities with Syria and Asia Minor, although being prepared to intervene later if it should prove to be profitable to do so. As the 12th century progressed, the two other Italian merchant republics, Genoa and Pisa, came into conflict in the new trading area that had been opened up. The Venetians also, who were the first to win trade concessions from the Byzantine Empire, aroused the hatred of the Byzantines by their arrogance and highhandedness and by the conflict of interests continually rekindled by day-to-day contacts in the same market. Thus when the Byzantines and the Venetians should have been cooperating at sea against a revival of Norman expansion in Corfu (1143–44), they let slip the fruits of victory and vented on each other the fury of mutual hatred. In 1169 the Byzantine emperor Manuel I Comnenus made a trade agreement with the Genoese and in 1170 with the Pisans. In 1171 he tried to free himself from Venetian competition by arresting every Venetian in the empire and confiscating his goods.

The commune. All this time the expansion of Venice abroad and along the borders of the lagoon in the communes of Padua, Treviso, and Ferrara, as well as in the patriarchate of Aquileia, not only enriched its patrimony but also created an awareness of its own political power. Between 1140 and 1160 the most revolutionary change in Venice's political structure took place: the doge lost his monarchic character, becoming a mere official (though he still assumed resounding titles), and the commune took over the powers, functions, and prerogatives of the state. All political and administrative matters were placed in the hands of the *Maius consilium* (Great Council) of 45 members, which had evolved from a lesser body called the *Consilium sapientium.* A Minor Council of six members exercised executive powers alongside the doge, and magistrates were granted administrative and judicial functions. The financial system was elaborated and the market of the commune was controlled by executive organs.

Reorganization of the state

This systematic reorganization of the state was necessitated by the social development, the economic expansion corresponding to the scale of political needs, and the national communities formed on the Dalmatian coast. The reorganization was achieved in hard times under pressure of rivals in the Mediterranean; of an advancing policy by Manuel I Comnenus and by Frederick I Barbarossa, simultaneously converging on the Adriatic; of a spirit of revolt in the Dalmatian cities from Capodistria to Pola (now Pula, Yugoslavia) and Zadar; of disorders to be quelled in the mainland communes; of wary collaboration with the Lombard League, which governed the trade routes to the hinterland; of controlling the trading posts on the Italian coast from Ferrara to Ancona; and of guaranteeing free access to Apulian ports.

The hatred between the Byzantines and the Venetians reached its culminating point when the doge Enrico Dandolo diverted the Fourth Crusade to sack Constantinople in 1204. This reaction of the Western world in defense of its own interests brought great territorial gains on the continent to those who took part in it, but Venice preferred to assure for itself the dominion of the seas by acquiring the title of "lord of the fourth part and a half" (*Dominus quartae partis et dimidiae*) of the Byzantine Empire. The republic thus took possession of an extensive island patrimony from the Aegean to Crete and the lookout posts of Modon and Coron (modern Methoni and Koroni, Greece), and dominated the whole eastern Mediterranean, reaffirming an economic supremacy that quickly aroused the covetousness of the Genoese and the Pisans. The tremendous conflict between Venice and Genoa (the Pisans played a minor role) lasted for the better part of two centuries. Early attempts at cooperation were wrecked by the pressure of events, especially in Syria, where the Genoese had prior rights. Defeated at Acre (1258), the Genoese by the Treaty of Nymphaeum (1261) with the Byzantine Empire (then based at Nicaea) engineered the downfall of the Latin Empire of Constantinople set up by the Venetians in 1204. The Venetians, however, not only retained their island possessions but also recovered their trading privileges in Constantinople after a Genoese-Byzantine conflict had broken out. Syria had by then fallen to the Muslims, and the rivalry between Venice and Genoa was played out in Constantinople, dragging on in a long war of privateering on the seas.

The patriciate. Meanwhile at home the Venetian state was being built up. In 1242 the civil statutes of Jacopo Tiepolo regulated civil and economic relations, and maritime statutes had been established in 1239. From the Popular Assembly to the Great Council the scope of the commune was progressively enlarged. The elective members of the Great Council were raised from 45 to 60 and then to 100 by an increase in the ex officio members (the total of magisterial office holders). The Council of 40 (first mentioned in 1223) received powers of jurisdiction, and the *Consiglio dei Rogati* (60 members; founded mid-13th century), invested with the control of economic affairs, in time assumed all legislative functions and the honorific title of Senate. National, political, and economic interests abroad were protected wherever Venetian influence existed by obtaining trade concessions and reorganizing the national organs of jurisdiction in the colonial centres (from Constantinople to Tyre and Acre) or abroad (from Zadar to Ragusa, Crete, and Euboea).

In the 11th–12th century the Michiel and Falier families had tried to perpetuate ducal power, and restrictive electoral systems had been introduced to prevent the formation of family factions. In the 13th century similar attempts by the Ziani and Tiepolo families also failed, and the governing class strengthened its organization by translating into law the order already hallowed by custom. In 1268 an interlocking process of choice by lot and voting alternately among the members of the Great Council was introduced in order to select 41 persons who then, by a majority of not less than 25 votes, agreed on the next doge to take office.

Between 1290 and 1300 new laws restricted the right to take part in the government to families traditionally performing magistrate's duties. The patrician class was not created by the "closing of the Great Council" (*serrata del Maggior Consiglio*) achieved by these laws, but it received its legal status from them. Henceforward anyone claiming personal power had to act outside the patrician order and rely on the people; and the people were linked so closely to the patricians by economic needs that he would never find sufficient support. Thus the conspiracy of Marin Bocconio failed (1299), as did those of Bajamonte Tiepolo and the Querini brothers (1310), and later of Marin Falier (1354).

The special conditions of Venetian society created a governing class very different from that of the other Italian communes or of the continental states. To counter any attempts at sole personal rule, the Council of Ten was established (1310) to police the patrician order and defend the existing regime.

Struggle for naval supremacy. This consolidated internal regime aroused the jealousy of those who felt offended by the arrogance of Venice. The republic now had to fight at sea, to defend its maritime interests, and on the mainland as well. It had taken a cautious part in the negotiations leading to the Lombard League's truce of 1177 and had intervened more openly in the crusade against Ezzelino da Romano. By the beginning of the 14th century it was swept into struggles on the mainland of Italy and became involved in Adriatic and Mediterranean problems. Thus Venice took an active part in a war with Ferrara to safeguard the vital trade route of the Po, disputed by the Holy See, and when the Scaligers came to power in Verona the republic made alliance with the Carraresi of Padua, with the Florentines, and with the Visconti of Milan who feared the rise of a strong territorial lordship in the heart of northern Italy. Deviating from its strictly maritime policy, Venice established sovereignty over Treviso, thereby assuring itself of its own food supply but also providing itself with a land frontier to be defended.

Rivalry with Genoa

Meanwhile, the antagonism and rivalry with Genoa were rekindled. On Genoa's side was the King of Hungary, the Patriarch of Aquileia, and the Visconti of Milan, while Venice had the support of the Carraresi and the distant king of Aragon. The conflict, chiefly carried on in Dalmatia, was made more difficult for all by the spread of the Black Death (1348), by the economic and financial crisis caused by the prolongation of the war itself, and by the inanity of operations, which quickly disillusioned and dismantled the ill-assorted coalitions. The alternation of victories and defeats brought no conclusion to either side, but both exhausted their energies and resources. At last a second anti-Venetian coalition brought the war almost into Venice itself: at Pola and at Chioggia, Venice was first defeated and then won the victory (1380–81), triumphing under Vettor Pisani. The Peace of Turin (1381) eliminated Genoese political influence from the Mediterranean and the East, leaving the Venetian government as arbiter of the sea routes.

Conquest of the mainland. The Venetian victory over Genoa took place under the threat of Turkish advance in the East. The Venetians had to negotiate a state of neutrality with the Turks and find another base to compensate for the smaller yield now to be expected from the East. So they turned to the Italian mainland to rid themselves of the nuisance of neighbouring lordships and later to defend and exploit the rich land they had acquired, whose yield was no less important than overseas trade for the national economy. The restlessness of the Carraresi, Scaligers, Aquileiesi, and Visconti encouraged intervention, at first through subsidies to support one party against another, and later by the dissolution of the realm of Gian Galeazzo Visconti (1402). For a time Venetian territorial rule went no further than the rivers Mincio and Livenza, thus including the Treviso area and the Carraresi and Scaliger lands of Padua and Verona together with a lien on the Polesine (Rovigo) up to the Po, which belonged to the Este family. But beyond the Livenza lay the politically and economically important principality of the patriarch of Aquileia through which passed the main routes to Germany and to Istria. As the patriarch could not guarantee peace and order, Venice incorporated the principality in the Venetian domains (1420).

Venetian territory now covered roughly the areas of the modern regions of Veneto and Friuli-Venezia Giulia together with the Istrian Peninsula, and the doge Tommaso Mocenigo claimed that his city had reached its political and economic zenith. It had a solid base in Italy that could largely compensate for its losses in the East, and it should not expect indefinite progress—in fact, efforts to enlarge its conquests might be dangerous, and it was better to preserve, not to risk, its accumulated wealth. This warning was not heeded, however, by Mocenigo's successors, who feared that standing fast on the positions so far conquered would mean the beginning of a decline.

The doge Francesco Foscari risked a further policy of conquest in mainland Italy, dismembering the realm of Filippo Maria Visconti while the Turks encroached upon the Byzantine Empire in the East. Foscari carried out his first Lombard conquests in the territory of Brescia in 1426 just as Thessalonica fell to the Turks, and held the Adda River (1432–54) while the Turks took Constantinople (1453). Greed for territorial conquest made Venice forget the greater profit to be won in the East and involved Venetian policy, not only in the tangled web of Italian balance of power but in the conflicts between the great powers of Europe on a scale out of proportion to Venetian forces and aims. The Peace of Lodi (1454) did not ease the situation in Italy, which was threatened by foreign intervention. It was followed by the formation of the Italian League for the restoration of political balance among the Italian states, which produced a merely ephemeral accord.

The Peace of Lodi (1454)

Turkish expansion in the eastern Mediterranean after the fall of Constantinople involved Venice in war: Euboea (Negroponte) fell in 1470 to the Turks, with whom the Venetians finally made peace in 1479. But Venice was soon involved in another war, this time with Ferrara (1481), in which it conquered the Polesine (1484). This merely increased the opposition of the other Italian states to Venetian territorial expansion.

Europe against Venice. This internal discord made Italy a prey to invading foreigners, Spanish, French, and German. By 1508 these powers, together with the pope, the Hungarians, the Savoyards, and the Ferrarese, united to form the League of Cambrai against the Venetians, who were defeated at the Battle of Agnadello. Venice was saved from the worst results of this event by internal discords within the League of Cambrai, but Venetian territories on the mainland were diminished, and at the same time the consequences of the economic crisis could no longer be avoided. Not only was the Eastern market lost, but the discovery of new lands to the West and new trade routes to the East released Europe from dependence on the Venetian market. Venice ceased to be a Mediterranean power; it became a European power but without the advantages of the Atlantic states, now open to the New World.

Venetian policy in the 16th century was dictated by the need to keep intact its political, economic, and territorial heritage against the advance of the Turks on the one side and the pressure of the great western European powers on the other. This need supplied the reason for Venice's intervention in the Italian crisis of Charles V and in its struggle against the Turks, from the defeat of Preveza in 1538 to the victory of Lepanto and the loss of Cyprus in 1571; and for its tenacious resistance to ecclesiastical pressure from the pope. So Venice declined into economic stagnation, embittered by a constitutional conflict beween the *Consiglio dei Rogati* and the Council of Ten for control of the public finances. As the great Venetian statesman and historian Paolo Paruta (1540–98) pointed out, Venetian peace and neutrality meant defending the immediate interests of the nation but ceasing to take part in problems in which it was not directly concerned. Thus the spirit of political and religious conservatism grew increasingly tenacious in Venice.

Life and politics in the 17th century. Some scholars have detected symptoms of political and spiritual regeneration in the period between the end of the 16th and the beginning of the 18th centuries, but this is to overlook the slow and progressive withdrawal to prepared positions on which Venetian life was then based. The political crisis caused by the papal interdict of Venice in 1606 was not concerned with heresy or reform but with the temporal prerogatives of the papacy. Paolo Sarpi, the energetic defender of Doge Leonardo Donà's policy that had provoked the Roman Curia, never contested the legitimacy of papal power, but in the temporal sphere he denied that it carried any prerogatives superior to the sovereign rights of the state.

The only perspective open to Venetian policy was the defense of Crete, its surviving possession in the eastern Mediterranean, against the Turks and of its Adriatic possessions threatened not only by the Turks but also by the Spaniards and Austrians. After a long campaign (1645–69) Crete fell to the Turks, the Venetians being allowed to retain merely a few strongholds. This blow to Venetian morale was mitigated, however, by the preservation of Dalmatia, and the government, after allying itself with Austria, attempted to reestablish itself in the eastern Mediterranean by liberating the Morea (Peloponnese) from the Turks. There the brilliant campaign of Francesco Morosini in 1684–88 assured Venice of this new Greek territory, which was finally handed over by the Peace of Karlowitz (Karlovci; 1699). The conquest, however, proved a burden of great and unprofitable expense, and by the Peace of Passarowitz (Pozarevac; 1718) the Morea returned to the Turks. Thus ended Venetian activity in the eastern and southern Mediterranean, save for an unsuccessful attempt on Algerian and Tunisian pirates under Angelo Emo (1769).

The end of the Venetian republic. The last period of the Venetian republic was spent in neutrality, a policy inherited from its 16th-century theoreticians. It was neutral not merely politically but spiritually also, being estranged from the fervour of new ideas germinating in other nations. There was no lack of talent, no unwillingness to work or to understand, but Venetian life had crystallized into a system from which escape was not possible. Thus one cannot speak of Venetian society in the 18th century without referring back perpetually to that 16th-century crystallization that prevented any reform, whether agrarian, commercial, or political. The plans of Angelo Querini, Giorgio Pisani, and Carlo Contarini, the supposed reformers of the 18th century, did not go beyond the mentality of the noble class which for three centuries had controlled the government and which existed to uphold ancestral tradition or to satisfy personal ambition. In all the reformist literature of the century there is a chill dialectic.

Effects of the French Revolution on Venice

The end of the republic came after the outbreak of the French Revolution. Napoleon, determined to destroy the Venetian oligarchy, claimed as a pretext that Venice was hostile to him and a menace to his line of retreat during his Austrian campaign of 1797. The Peace of Leoben left Venice without an ally. The government offered no resistance, and Ludovico Manin, the last doge, was deposed on May 12, 1797. A provisional democratic municipality was set up in place of the republican government.

On the fall of the republic in 1797, during the French Revolutionary Wars, all Venetia east of the Adige River, together with the Polesine plain between the Adige and lower Po, passed to Austria under the Treaty of Campo Formio. Under the Treaty of Lunéville (1801) Austria lost the Polesine; and under the Treaty of Pressburg (1805) all western Venetia was added to Napoleon's kingdom of Italy, while western Istria was annexed to France. The rest of Istria, with the formerly Austrian Carniola, was likewise annexed to France by the Treaty of Vienna (1809). On Napoleon's downfall (1814) all Venetia was restored to Austria; and in 1815 the kingdom of Lombardy-Venetia was constituted for the Austrian emperor. Lake Garda, the Mincio, and a line drawn north–south from the Mincio west of Mantua (Mantova) to the Po formed the frontier between the Lombard and the Venetian halves of this kingdom: Venetia (German Venetien, as opposed to Venedig, Venice) was then bounded on the northwest by the county of Tirol including Trento and Bolzano; on the northeast by Carinthia; and on the east by the Austrian Küstenland (Gorizia, with Istria). In the revolution of 1848 a provisional republican government was set up by Daniele Manin, but it fell the following year.

The composite kingdom lasted until 1859, when Lombardy passed to Sardinia-Piedmont after the Peace of Zürich. After the Seven Weeks' War of 1866, in which Prussia defeated Austria, the Austrian kingdom of Venetia, but not the Küstenland, was ceded to Italy.

The Treaty of Saint-Germain (1919), after World War I, gave the Küstenland to the Italians, who then renamed it Venezia Giulia. The same treaty, however, also gave to Italy the southern Tirol. Though this area had never been Venetian, the Italians then named it Venezia Tridentina (Tridentum being the Latin for Trento) and spoke of *le tre Venezie* ("the three Venetias," namely Euganea, Giulia, and Tridentina). After World War II the Italian peace treaty of 1947 gave most of Venezia Giulia to the Yugoslavs, who received Plezzo (Bovec), Caporetto (Kobarid), and Tolmino (Tolmin) on the Isonzo (Soca) River in the north and also all Istria except the free zone of Trieste. The northern part of the free zone of Trieste was assigned to Italy in 1954, whereupon it was merged into the region of Friuli-Venezia Giulia; *i.e.,* the Italian rump of Venezia Giulia and the district of Friuli, transferred from the Veneto region.

In World War I the Austrians were defeated by the Italian forces at Vittorio Veneto in the northeast of the region. Considerable damage was sustained during World War II, notably at Verona and Treviso. The province of Udine was transferred from Veneto to Friuli-Venezia Giulia in 1947.

The region was subjected severely to storm and flood in November 1966; rivers overflowed the plain, and around Belluno in the southern Dolomites landslides caused by rains destroyed communications and engulfed houses and people. A similar landslide in 1963 had plunged into the Vaiont reservoir, drowning the village of Longarone and about 2,000 persons with the overspill.

Tuscany

PHYSICAL AND HUMAN GEOGRAPHY

The central region of Tuscany (Italian Toscana) consists of the provinces of Arezzo, Grosseto, Florence (Firenze), Leghorn (Livorno), Lucca, Massa-Carrara, Pisa, Pistoia, and Siena, with a total area of 8,877 square miles (22,991 square kilometres). In the north and northeast the region is bounded by the Tuscan-Emilian Apennine (Appennino Tosco-Emiliano), these being separated by a series of long valleys (Mugello, Casentino) from the sub-Apennine uplands of Monte Albano, Pratomagno, and others. Quite separate from the Apennine and sub-Apennine systems are the so-called anti-Apennines of Tuscany, consisting of low mountains (*e.g.,* the Apuane Alps and the Colline Metallifera) and plateaus extending as far south as the volcanic uplands of the Lazio region. Farthest west are several isolated massifs along or near the coast (Monte Argentario, Monte Amiata). The lowlands of Tuscany are either interior valleys (*e.g.,* Val di Chiana and Valdarno) or littoral plains, the most important coastal plain being the Maremma. Watered chiefly by the Arno and the Ombrone, Tuscany has few rivers capable of supporting major hydroelectric projects, but the borax deposits at Larderello produce enough underground steam to power a major generating station. Among the mineral resources, easily worked iron ore from Elba is nearing exhaustion, but lead, zinc, antimony, mercury, copper, and iron pyrites are still produced in the region. Lignite is mined around San Giovanni Valdarno, and the marble of Carrara is world famous. Steel and iron are manufactured at Piombino, chemicals at Leghorn and near Pisa, ships at Leghorn, and textiles and ceramics in many cities. Besides larger manufacturing firms, Tuscany is famous for its artisan industries, especially in Florence (leather, lace, silver).

Agriculture

Agriculture in Tuscany is among the most prosperous in Italy, characterized by specific forms of land ownership and a variety of crops. The classic form of land ownership and utilization is share growing, the *mezzadria* system, with the landlord (who provides capital and current expenses) sharing the harvest with the tenant, who supplies the labour. Shares are fixed by law, and many tenancy contracts have been carried on for generations between landowner and tenants. Besides cereals, Tuscan agriculture is noted for wines (the wines of the Chianti district, near Siena, are the best known and most widely exported of all Italian wines), olives and olive oil (around Lucca), vegetables, and fruit. Cattle, horses, pigs, and poultry are raised in large numbers. The railway system is characterized by two trunk lines, the coast line, running from Rome through Grosseto, Leghorn, and Pisa to Genoa; and the interior line, from Rome through Arezzo to Florence, Bologna, and Milan. Construction began on a high-speed direct railway between Florence and Rome. There are numerous secondary railways and a good network of highways and of bus services. Florence is the largest city and Leghorn the leading port; Florence, Pisa, and Siena are important tourist resorts.

(G.Kh.)

HISTORY

The name Tuscany is derived from that of the Tusci, Tuscans or Etruscans. Their country, Etruria, which was finally annexed by the Romans in 351 BC, comprised not only Tuscany but also the northern part of what is now Lazio. In the 8th century AD, however, after Charlemagne occupied the Lombard kingdom in northern Italy, the name of Tuscia or Toscana became restricted to the area north of Viterbo and Bolsena. Tuscany then became a march, or frontier district, of the Frankish dominions, the principal authority in the march being, from 774, in the hands of the counts of Lucca. Boniface I, the first known count of Lucca, died in 823 and was succeeded by his son Boniface II, whose victories over the Arabs in the Mediterranean served to bring both Corsica and Sardinia into the Tuscan sphere of influence. With the decline of the Carolingian power in Italy the counts began to assume occasionally the style of duke or margrave of Tuscany. The 10th century, however, saw the rise of the House of the Attoni of Canossa, and a member of this house, Boniface, *c.* 1027 was invested with the margraviate of Tuscany by the emperor Conrad II. On the assassination of Boniface (1052), his widow, Beatrice, governed until 1076, when her daughter, the great Matilda of Tuscany, took her place.

The rise of communes

The quarrel about investiture between the empire and the papacy coincided with the rise of the communes in northern Italy, whereby a number of the more prosperous towns asserted their independence of their overlords. In Tuscany the first communes to emerge were Pisa, Lucca, and Pistoia, which, having obtained concessions from the emperor Henry IV, joined the Ghibelline faction. Subsequently Siena, Florence, and Arezzo also established communes. Florence, influenced to some extent by Matilda's benevolent attitude toward its commune, inclined, as she did, to the Guelph, or papal, side. As Matilda bequeathed all her extensive possessions to the church, her death (1115) was followed by a struggle over her inheritance between the popes and the emperors. This enabled the Tuscan cities gradually to confirm their independence until the old unity of the march was lost altogether. Widespread inundations in the Arno valley and in the Lucca area led to destitution that helped to bring about the politico-economic upheaval.

Pisan supremacy in the 12th and 13th centuries was contested by Florence and by Lucca (which eventually left the Ghibelline camp), and Pisa, though supported by Siena and Pistoia, had also Genoa for an enemy. After the defeat of the Pisan navy by the Genoese in the Battle of Meloria (1284), Florence grew to be the leading city of Tuscany. The Tuscan dialect as spoken in Florence and written by Dante came to be a standard form for Italian.

The Medici grand duchy. The later medieval history of Tuscany is chiefly that of the consolidation of Florentine supremacy and of the establishment in Florence of the dynasty of the Medici. Twice (1495–1512 and 1527–30) the Medici were expelled, but after the surrender of Florence to the emperor Charles V's forces in August 1530, they were restored, and Alessandro de' Medici became gonfaloniere for life, a dignity that was made hereditary in the family. As he held the title of duke of Città di Penna, he is generally called duke of Florence. Under his successor Cosimo de' Medici, Siena, the one remaining outpost of republicanism in Tuscany, was annexed (1559), and Cosimo was created grand duke of Tuscany (Cosimo I) by Pope Pius V in 1569. His son Francesco I was recognized as grand duke by the emperor Maximilian II in 1576. Under his descendants, Ferdinand I, Cosimo II, Ferdinand II, Cosimo III, and Gian (Giovanni) Gastone, Tuscany played but a small part in European history.

The House of Habsburg-Lorraine. Gian Gastone being childless, it was agreed in the preliminaries (1735) of the Treaty of Vienna during the War of the Polish Succession that Francis of Lorraine, future husband of the Austrian archduchess Maria Theresa of Habsburg, should succeed eventually to Tuscany in compensation for Lorraine, of which he was dispossessed. In 1737 Gian Gastone died, and Tuscany was governed for Francis, who resided in Austria, by a series of foreign regents.

Francis, who had been elected emperor in 1745, died in 1765 and was succeeded on the throne of the grand duchy by his younger son, Leopold I. Leopold resided in Tuscany and proved one of the most capable and remarkable of the reforming princes of the 18th century. He substituted Tuscans for foreigners in government offices, introduced a system of free trade in foodstuffs (at the suggestion of the Sienese Sallustio Bandini), and promoted agriculture. He reorganized taxation on a basis of equality for all citizens, reformed the administration of justice and local government, and suppressed torture and capital punishment. He also curbed the power of the clergy, suppressed some religious houses, reduced the mortmain, and rejected papal interference. With the aid of Scipione de' Ricci, bishop of Pistoia, he even attempted to reform church discipline, but Ricci's action was condemned by Rome and he was forced to resign. At the death of his brother Joseph II in 1790, Leopold became emperor and moved to Vienna. After a brief regency he appointed his second son, Ferdinand III, grand duke.

The French occupation. During the French Revolutionary Wars a French force entered Florence in 1799 and was welcomed by a small number of republicans. The Grand Duke was forced to flee, and a provisional government on French lines was established. But the mass of the people were horrified at the irreligious character of the new regime, and a counterrevolution broke out at Arezzo. Bands of armed peasants expelled the French from the countryside, with many atrocities. With Austrian help Florence was occupied and a government established in Ferdinand's name, but after Bonaparte's victory at Marengo the French returned in force, dispersed the bands, and reentered Florence (October 1800). They too committed atrocities, but they were more warmly welcomed than before by the people, after the experience of Austro-Aretine rule. Joachim Murat set up a provisional government.

Treaty of Lunéville (1801)

By the Treaty of Lunéville (1801), Tuscany was renounced by the Austrians. It was then erected into the kingdom of Etruria for the Bourbon prince Louis, son of Ferdinand, duke of Parma. When Louis died (1803), his widow, the Spanish infanta Maria Luisa, ruled as regent for her son Charles Louis until 1807. Then the emperor Napoleon obliged her father, Charles IV of Spain, to agree to the cession of Tuscany-Etruria to France, compensating Charles Louis with a Portuguese principality.

Annexed to the French Empire in 1808, Tuscany was divided into three *départements,* to be governed from 1809 by Napoleon's sister Elisa as titular grand duchess. French progressive ideas gained some adherents, but to most Tuscans the new institutions were distasteful as subversive of cherished traditions. The heavy taxes and conscription were especially resented.

The Habsburg restoration. After Napoleon's defeats in 1814, Ferdinand III returned to Tuscany, where he was received with some enthusiasm. The Congress of Vienna added some further territory to the grand duchy and guaranteed, moreover, that Lucca should in due course revert to it (as it did in 1847). The restoration in Tuscany was unaccompanied by the excesses that characterized it elsewhere, and much of the French legislation was retained. Ferdinand was succeeded in 1824 by his son Leopold II, who continued his father's policy of benevolent but enervating despotism. When the political excitement consequent on the election of Pius IX spread to Tuscany, Leopold, in February 1848, granted a constitution. For some months Gino Capponi was prime minister. A Tuscan contingent took part in the Sardinian (Piedmontese) campaign against Austria, but the increase of revolutionary agitation in Tuscany, culminating in the proclamation of the republic (February 8, 1849), led to Leopold's departure for Gaeta. Under the republican triumvirate of F.D. Guerrazzi, Giuseppe Mazzini, and G. Montanelli disorders continued, and Leopold was invited to return and did so, but forfeited his popularity by according the protection of an Austrian army (July 1849). In 1852 he formally abrogated the constitution, and three years later the Austrians departed. When in 1859 a second war between Sardinia and Austria became imminent, revolutionary agitation broke out once more. There was a division of opinion between the moderates, who favoured a constitutional Tuscany under Leopold as part of an Italian federation, and the popular party, led by Ferdinando Bartolommei, who aimed at the unity of Italy under Victor Emmanuel. At last a compromise was reached, and the Grand Duke was requested to grant a constitution and to take part in the war against Austria. Leopold having rejected these demands, the Florentines rose and expelled him (April 27, 1859).

Union with the Italian kingdom. A provisional government, led by Ubaldino Peruzzi and afterward by Bettino Ricasoli, was established. It declared war against Austria and then handed over its authority to a Sardinian royal commissioner (May 9). A few weeks later a French force under Prince Napoleon ("Plon-Plon") landed in Tuscany to threaten Austria's flank, but meanwhile the emperor Napoleon III made peace with Austria and agreed to the restoration of Leopold and other Italian princes. Victor Emmanuel was obliged to recall the royal commissioners, but together with Cavour he secretly encouraged the provisional governments, and the constituent assembly of Tuscany voted for annexation to Sardinia. The King accepted the annexation (March 22, 1860). On February 18, 1861, the kingdom of Italy, comprising Tuscany, was proclaimed.

Storms and floods, chiefly of the Arno and Ombrone rivers, dealt a severe blow to Tuscan agriculture and inundated Florence and Grosseto in 1966. (L.Vi./Ed.)

Emilia-Romagna

PHYSICAL AND HUMAN GEOGRAPHY

The north-central region of Emilia-Romagna is bounded by Venetia and Lombardy on the north, Liguria on the west, Tuscany on the south, the Marches on the southeast, and the Adriatic Sea on the east. With an area of 8,542 square miles (22,124 square kilometres), the region embraces the provinces of Bologna, Ferrara, Forlì, Modena, Parma, Piacenza, Ravenna, and Reggio nell'Emilia.

The northern plain

The northern portion is a great plain from the Via Aemilia to the Po. Its highest point is not more than 200 feet (60 metres) above sea level, while along the east coast are lagoons near the mouths of the Po and those called the Valli di Comacchio to the south of them. Farther south is the plain around Ravenna (10 feet), which continues as far as Rimini where the mountains come down to the coast. The region was badly hit by the great floods of 1966.

Immediately to the southeast of the Via Aemilia the mountains begin to rise, culminating in the central chain of the Ligurian and Tuscan Apennines. The boundary follows the summits of the chain in the provinces of Parma, Reggio, and Modena, passing over the Monte Bue (5,840 feet) and the Monte Cimone (7,103 feet), while in the provinces of Bologna and Forlì it stays along the northeastern slopes of the chain.

With the exception of the Po the main rivers of Emilia-Romagna descend from this portion of the Apennines, the majority of them being tributaries of the Po. The Trebbia (which rises in the province of Genoa), Taro, Secchia, and Panaro are the most important. Even the Reno, Ronco, and Montone, which now flow directly into the Adriatic, were, in Roman times, tributaries of the Po, and the Savio and Rubicon (Uso) seem to be the only streams of any importance from these slopes of the Tuscan Apennines that ran directly into the sea in Roman times. A considerable amount of electric power is derived from these rivers, and the stations are connected with the Alpine plants so that interchange at different seasons is possible. Emilia-Romagna is one of the leading regions of Italian agriculture. A large part of it is lowland, with water available both in the form of precipitation and from irrigation systems. Wheat and corn are the chief cereals, and sugar beets, tobacco, and potatoes the industrial crops. Vegetables are grown in the lowlands, while the best wines come from the Apennine slopes. There are large numbers of beef and dairy cattle. Cheese, meat, and smoked meats of various kinds support a large food-packing industry, and there are flour and sugar milling and the preserving of vegetables and fruit. Among the industries the manufacture of cars and trucks, farm machinery, chemicals and pharmaceuticals, and clothing are particularly important. The extraction of large deposits of natural gas (at Cortemaggiore north of Piacenza and near Ravenna) and of oil (at Cortemaggiore) gives the region a vital role in the energy economy of Italy. The main rail artery is the Milan–Bologna–Rimini–Bari line. Bologna also has trunk railway lines connecting it with Verona and Venice to the north and Florence and Rome to the south. The region is well served by secondary railway lines and highways. Express highways connect Bologna with Milan and with Florence.

HISTORY

The name Emilia comes from the Via Aemilia, the Roman road from Ariminum (Rimini) to Placentia (Piacenza) that traversed the entire district from southeast to northwest, its line being closely followed by the modern railway. In popular usage the name was transferred to the district (which formed the eighth Augustan region of Italy) as early as the time of Martial, and in the 2nd and 3rd centuries AD Aemilia was frequently named as a district under imperial judges, generally in combination with Liguria or Tuscia. From the 3rd to the 5th century the district of Ravenna was, as a rule, not treated as part of Aemilia, the chief town of the latter being Placentia. In the 4th century Aemilia and Liguria were joined to form a consular province; after that Aemilia stood alone, Ravenna being sometimes temporarily added to it. The boundaries of the ancient district correspond approximately with those of the modern.

The chief cities of Emilia

In the 6th century AD Ravenna became the seat of a Byzantine exarch. After the Lombards had for two centuries attempted to subdue the Pentapolis (Rimini, Ancona, Fano, Pesaro, and Senigallia), Pepin took these cities from Aistulf and in 754 gave them, with the March of Ancona, to the papacy to which, under the name of Romagna, they continued to belong. The other chief cities of Emilia—Ferrara, Modena, Reggio nell'Emilia, Parma, Piacenza—were independent. Whether belonging to the Romagna or not, each had a history of its own and, notwithstanding the feuds of Guelphs and Ghibellines, they prospered considerably. Pope Nicholas III obtained control of the Romagna in 1278, but the papal dominion during the Avignon period was only maintained by the efforts of Cardinal Albornoz, a Spaniard sent to Italy by Innocent VI in 1353. Even so, the papal supremacy was little more than nominal, and this state of things only ceased when Cesare Borgia, the natural son of Alexander VI, crushed most of the petty princes of Romagna, intending to found there a dynasty of his own. On the death of Alexander VI, however, it was his successors in the papacy who profited by what Cesare Borgia had begun. The majority of the towns were thenceforth subject to the church and administered by cardinal legates. In 1796–1814 Emilia was first incorporated in the Italian republic and then in the Napoleonic Italian kingdom. After 1815 Romagna returned to the papacy and its ecclesiastical government. The duchy of Parma was given to Marie-Louise, wife of the deposed Napoleon, and Modena to the archduke Francis of Austria, the heir to the last Este. In Romagna and Modena the government was oppressive, arbitrary, corrupt, and unprogressive, but in Parma conditions were better. In 1821 and 1831 there were unsuccessful attempts at revolt in Emilia, which were sternly and cruelly repressed. Chronic discontent continued, and the people joined again in the movement of 1848–49, which was crushed by Austrian troops. In 1860 the struggle for independence was finally successful, Emilia passing to the Italian kingdom almost without resistance. The region's name was changed to Emilia-Romagna in 1948. (G.Kh.)

Papal States

PHYSICAL AND HUMAN GEOGRAPHY

The Papal States (States of the Church) were the lands over which the popes, as heads of the Roman Catholic Church, had sovereignty from 756 to 1870; in particular they were those in Italy, with which this section is concerned. Included were the modern regions of Lazio, Umbria, the Marches, and part of Emilia-Romagna, with boundaries that shifted over the years.

The land. The west-central region of Lazio (ancient Latium) is composed of the provinces of Roma (Rome), Frosinone, Latina, Rieti, and Viterbo. Its area is 6,642 square miles (17,203 square kilometres).

In the east Lazio is dominated by the central Apennines. In its northeasternmost section, near Rieti, the region includes part of the Abruzzi. Monte Terminillo (7,260 feet [2,213 metres]), the highest peak, is in the Reatini range; other Apennine ranges within Lazio are the Sabini, Simbruini, and Ernici. Limestone is the main component of the Apennines, and karst phenomena are found in a number of places. The lower foothills of the pre-Apennines are fertile; some of the valleys, such as those near Rieti and Subiaco, are among the best farming areas of the entire Apennine chain.

Regions

The western part of Lazio centres around the Campagna di Roma. To the northwest and southeast of it are four groups of ancient volcanoes, the Cimini, Volsini, Sabatini, and Alban mountains, each containing one or more crater lakes, those of Bracciano, Albano, Nemi, Bolsena, and Vico. The Campagna di Roma continues northwestward into the Maremma and southeastward with the Pontine marshes, while beyond Terracina lie the plains of Fondi and Formia. Southeast of the volcanic Alban hills, the Lepini, Ausoni, and Aurunci, stark, denuded mountains, extend to the Garigliano River, the southern limit of Lazio.

The central region of Umbria comprises the provinces of Perugia and Terni. Its area is 3,265 square miles. Umbria's core is the upper and middle valley of the Tiber, flanked on the west and east by low hills that, in the east, gradually rise to the Umbrian-Marchigian Apennines (Roman Apennines). The characteristic feature of the region's physiography is the prevalence of wide basins, some of lacustrine origin (Lago Trasimeno); others form sections of river valleys, such as the Umbrian Valley between Perugia and Spoleto and the Tiber Valley from Sansepolcro to Umbertide, or small depressions, such as the plains of Gubbio and Terni.

The central region of the Marches is composed of the provinces of Ancona, Ascoli Piceno, Macerata, and Pesaro-Urbino. Its area is 3,742 square miles. The Marches is a region of mountains and hills, the only pieces of level land being scattered along river valleys and on the Adriatic shore. Its mountain backbone is the Umbrian-Marchigian section of the Apennines; the administrative boundary between the Marches and neighbouring Umbria is the watershed between the Tyrrhenian and Adriatic slopes. The highest peak of the region is Monte Vettore (8,130 feet). Except for the northernmost part, the hills of Montefeltro, the Marches is characterized by rivers running at right angles to the main Apennine crests out to the Adriatic, separated by low parallel ridges. The most important of these rivers are the Metauro, the Foglia, the Esino, the Potenza, the Chienti, and the Tronto, the last named forming the boundary between the Marches and the Abruzzi. The upper valleys of these streams are narrow, often passing through deep gorges, while the lower sections are wider. The valley bottoms are thoroughly cultivated, and most of the lower slopes are either in meadows or in well-tended fields.

The economy. *Lazio.* Until the latter part of the 19th century, much of the lowland area of Lazio was marshy and malarial, and its agriculture was characterized by migratory grazing and growing of wheat in the lowlands and grapes on the hills. Major reclamation works in the Maremma, the Campagna di Roma, and the Pontine marshes during the first half of the 20th century transformed farming in Lazio completely. Migratory grazing was greatly reduced in importance. Wheat and corn, vegetables and fruit, meat and dairy products are dominant in the lowlands, while olive groves, orchards, and vineyards cover the slopes. Commercial vineyards are especially important around Montefiascone, on the Alban Hills, and around Terracina and Formia. Civitavecchia and Gaeta are the main fishing ports.

Industry plays a subordinate role in the economy of Lazio. Rome, the capital of the region and of Italy, is the major urban and industrial centre and the region's banking and commerical core. However, Rome's industries, with a few exceptions, are either of the artisan type (fashion) or highly specialized (motion pictures). Rome, including the Vatican city-state, is Italy's largest tourist centre, and tourism is one of the city's largest employers. Large numbers of persons are also employed by the government. In the remainder of the region chemical and pharmaceutical plants, food industries, and a few small machine industries are the only ones of importance.

The transportation pattern of Lazio is dominated by Rome. The city is connected by trunk railroads with Genoa, Florence, Ancona, Pescara, and Naples, and it is the centre of the highway system of central Italy. Construction began on a high-speed direct Florence–Rome railway. After World War II Rome also became one of Europe's busiest airports, through which many trunk lines pass to the Far and Middle East and to Africa. Civitavecchia, the only port of importance, is noted chiefly for its trade with Sardinia.

Umbria. Farming in the hills and valleys is prosperous, characterized by intensive land use, especially intercropping. The principal cereals are wheat and corn, the latter supporting a sizable number of pigs. Potatoes, sugar beets, grapes, and olives are grown, and the wine of Orvieto is well known throughout Italy. The major power centre of Umbria is the hydroelectric complex of Terni, which supports the steel, chemical, and electrochemical industries at Terni, Narni, and Foligno. Textiles and food industries at Perugia are important. The main Rome–Florence railway passes through the southernmost part of the region, with a branch through Terni to Foligno and Perugia, joining the main line south of Cortona. The other main line (Rome–Ancona) passes through Terni and Foligno to Fabriano and Ancona. There is an excellent system of highways and bus communications.

The Marches. The economy of the Marches is predominantly agricultural. Wheat and corn are the main cereals, and there are vineyards on all the sunny slopes, a white wine produced in the area being especially popular. The local type of cattle, beasts of burden rather than meat or milk producers, are known throughout Italy, and there are large numbers of horses, pigs, sheep, and poultry. Fishing is important in several of the Adriatic ports, especially in Ancona and San Benedetto del Tronto. Industries are mostly small or medium sized and include shipbuilding in Ancona, paper in Fabriano, textiles in Iesi, musical instruments in Castelfidardo, and pottery in Pesaro and Recanati. Ancona is the largest city and the only one with a natural harbour; Pesaro is the only other urban centre of any size on the seacoast. The other cities are hilltop settlements, like Urbino, Macerata, and Ascoli Piceno, or valley centres, like Iesi and Fabriano. The main artery of northwest–southeast travel is the coast railroad, from Bologna through Rimini to Pesaro and Ancona and on to Foggia and Bari. Ancona also has a direct rail line to Rome.

For Romagna, see the section *Emilia-Romagna* in this article.

HISTORY

From the 4th century AD onward the Roman Catholic Church was the recognized proprietor of extensive estates throughout and even beyond Italy, but it held these *patrimonia* in the manner of a landowning corporation, under the Roman Empire, not in that of a sovereign ruler. By the middle of the 8th century, however, the Lombards had overrun most of Italy. The duchy of Rome was then still theoretically dependent on the Byzantine, or East Roman, Empire; but the Byzantines could not protect the duchy, within which the bishops of Rome, supported by their clergy, exercised an authority counterbalancing that of the local barons and their army. When Pope Stephen II (III) appealed for help against the Lombards to the Frankish ruler Pepin III the Short, Pepin in 754 made the famous and controversial Donation, whereby he undertook to "restore" to the Roman Church and the "Republic of the Romans" numerous lands of which they had been despoiled, regardless of the fact that these lands ought juridically to have been restored to the Exarchate of Ravenna.

Pepin's "restoration" of lands

The Lombard king Aistulf, by the Treaty of Pavia in 756, ceded (1) Comacchio and Ravenna; (2) the country from Forlì to Senigallia and Jesi between the Apennines and the Adriatic; and (3) Gubbio in the Apennines, linking the northeastern territories with the duchy of Rome by way of Perugia. This cession, which comprised less than what the Donation of Pepin had adumbrated, was the beginning of the temporal power of the papacy. Bologna, Ferrara, Imola, Faenza, and Ancona were added to the dominion soon afterward; but Charlemagne, whose Donation of 774 had promised far more, *c.* 781 limited the further acquisitions of the Holy See to the Sabina (Rieti and its vicinity, on the frontier of the duchy of Spoleto), to some Campanian cities (soon lost), and to some parts of the formerly Lombard Tuscia, including Orvieto and Viterbo.

With the breakup of the Carolingian Empire an era of vicissitudes began. The history of the Papal States is thereafter for centuries practically inextricable from that of Italy and of the papacy, or from that of Rome and of the other cities of the dominion. The extent over which papal authority was effective shrank or grew with the Holy See's prestige. The temporal power suffered from the growth of feudalism, from disorders in Rome itself, and from the domination of the Saxon dynasty after the revival of the Holy Roman Empire for Otto I in the 10th century; but it reasserted itself in the second half of the 12th century thanks chiefly to the alliance with the Norman conquerors of southern Italy and to the genius of Pope Gregory VII. The duchy of Benevento was recognized as papal in 1052 and definitely acquired in 1077; and the countess Matilda of Tuscany bequeathed her great inheritance to the Holy See. Pope Innocent III took great advantage of the dispute between the Hohenstaufen and their rival Otto IV for the imperial crown to promote his claims, notably in the March of Ancona; and Otto in 1201 acknowledged the church's right to the duchy of Spoleto.

The rise of the communes and the subsequent emergence of the *signorie* weakened papal authority, especially in the Romagna. The translation of the papacy to Avignon (1309) left the dominion in Italy to chaos; and the brilliant work of reconquest and rehabilitation carried out by Cardinal Albornoz in the 1350s and '60s was undone in the '70s by the War of the Eight Saints and by the beginning of the Great Schism.

At the end of the Great Schism in 1449 the Romagna, the Marches, and Umbria were still mostly in the lands of signorial houses exercising "vicariates" granted to them by the Holy See but in fact ruling as they saw fit. It was to subdue these places that Pope Alexander VI launched his son Cesare Borgia on his expeditions. Much of Borgia's conquests, however, fell away on Alexander's death (1503), and the restoration of the Papal State had to be undertaken again by popes Julius II and Leo X in the period 1510–21: they also won Modena and Parma and Piacenza for the church. Modena, however, was recovered in 1527 by the House of Este; and Parma and Piacenza were granted in 1545 to the House of Farnese, to which moreover the ancient papal territory of Castro had been given as a duchy in 1537. Efforts to recover Ferrara from the Estensi were finally successful in 1598, and Urbino returned to direct papal rule in 1626. The attempt of the Barberini pope, Urban VIII, to take Castro back by force (1641–44) was frustrated, but the duchy was reannexed to the papal state in 1649.

In the 18th century, though they were traversed by foreign armies in the course of dynastic wars, the Papal States enjoyed a period of prosperity under paternalistic government. The French Revolutionary Wars and the Napoleonic Wars changed everything: Bologna, Ferrara, and the Romagna were ceded by the Treaty of Tolentino (1797), under which the French also occupied the Marches and Umbria; Rome was a republic from February to November 1799; and after an interval in which the lands south of the Romagna returned to papal rule, the Marches were annexed to the Napoleonic Kingdom of Italy in 1808 and the remnant of the Papal State to the French Empire in 1809.

Restoration of the Papal States

The Congress of Vienna in 1815 restored the Papal States; but the liberalizing influence of Cardinal Consalvi, which had culminated in the Statute of 1816, was largely counteracted in Pope Leo XII's pontificate. Administratively, the state was divided between (1) Rome and its Comarca, or district, under a special regime; (2) the Legations, or *Legazioni,* under a cardinal legate or a vice-legate; and (3) the Delegations, under prelates.

The Italian Risorgimento gradually destroyed the temporal power. Austrian intervention against a revolt in the northern Legations (1831–32) was followed by the French occupation of Ancona until 1838. The conduct of Pope Pius IX in 1848 led to the proclamation of the short-lived Roman Republic in 1849. Thenceforward the temporal power depended on Austrian or French protection. Through the defeat of Austria in 1859 and the Battle of Castelfidardo in 1860 the Romagna and the Marches, with Perugia, Spoleto, Orvieto, and Rieti, were annexed to the Kingdom of Sardinia-Piedmont, which in 1861 became the Kingdom of Italy. Garibaldi's attack on the remnant of the Papal States in 1867 was defeated at Mentana; but in 1870 the final annexation to Italy was achieved. The Lateran Treaty of 1929 recreated a temporal power in the Vatican City State.

(Ed.)

Mezzogiorno

The Mezzogiorno, or southern, region of Italy consists roughly of the area south of the Garigliano River, plus the islands of Sicily and Sardinia, and corresponds approximately to the former Kingdom of Naples. Because of its economic backwardness, particularly in the 19th and 20th centuries, the Mezzogiorno grew into a major social and political problem for Italy. Thus the Cassa per il Mezzogiorno, or the Italy Development Fund, was initiated in order to alleviate some of the strains experienced by the south.

PHYSICAL AND HUMAN GEOGRAPHY

The Mezzogiorno includes the regions of Campania, Puglia, Basilicata, Lucania, and Calabria, as well as Sicily and Sardinia.

The land. *Campania.* The region of Campania comprises the provinces of Avellino, Benevento, Caserta, Naples, and Salerno. Campania extends from the Garigliano (the lower Liri River, ancient Liris) in the north to the Gulf of Policastro in the south, facing the Tyrrhenian Sea; on the inland side it is bordered by Latium (Lazio), Abruzzi, Molise, Puglia, and Basilicata. Its physiography is dominated by volcanic and seismic phenomena that characterize the area surrounding the Gulf of Naples (Campi Flegrei, or Phlegraean Fields; Vesuvius). Around these areas of volcanic activity extend the principal lowlands of Campania; the Volturno lowland; the plains called Terra di Lavoro from the middle Volturno (ancient Volturnus) River to the eastern flanks of Mt. Vesuvius; while the only other lowland of any size, the plain of the lower Sele River (ancient Silarus), is separated from the others by the Lattari Mountains between Pompeii and Salerno. To the east are the complex uplands of the region, part of the Apennine system, the Matese, the Picentini, and the Cilento mountains, and beyond these, the Neapolitan Apennines (Appennino Napoletano). The only rivers of any size are the Volturno in the northern and the Sele in the southern part of the region. Among the intermontane basins that of Benevento is the most important. While communications between the coastal areas of Campania are relatively easy, the highly dissected character of the interior makes rail and road travel "across the grain," in the west–east direction, very difficult.

Puglia. The region of Puglia (Apulia) extends from the Fortore River in the northwest to Cape Santa Maria di Leuca, the "heel" of the peninsula, in the southeast. It is composed of the provinces of Bari, Brindisi, Foggia, Lecce, and Taranto. The northern third of the region is centred on the Foggia Plain, or Tavoliere, flanked by the Gargano massif in the north and the Neapolitan Apennines in the west. The central third is occupied by the low plateau of the Murge, limited in the west by a depression, the "fossa premurgiana," while in the east it slopes gradually to the narrow coastal plains of the Adriatic. The southern third, southeast of the Taranto-Ostuni line, is the Salentine Peninsula, consisting of the lowland of Lecce and the low plateaus east of Taranto and south of Lecce. The predominant rock material of Puglia is limestone, and karst phenomena of underground drainage and large cave formations are present in many areas.

The coastline for the most part is low and sandy, except in the Gargano Peninsula and in the southeasternmost tip of Puglia. The only rivers of significance are the Fortore and the Ofanto, but there are numerous springs, some under the sea near the coastline. Absence of surface water over large areas led to construction of the Apulian Aqueduct, largest of its kind in Italy, which traverses the region as far as Cape Leuca.

Basilicata. The region of Basilicata roughly corresponds to the ancient region of Lucania (see below) and comprises the provinces of Potenza and Matera. It falls into a western mountainous section, dominated by the Lucanian Apennines, and an eastern section of low hills and wide valleys, while along the Ionian sea the sand and clay hills overlook narrow coastal plains. The extinct volcano of Mt. Vulture stands isolated from the Apennines in the north.

Lucania. Lucania is an ancient territorial division of southern Italy, corresponding to most of the modern region of Basilicata with much of the province of Salerno and part of that of Cosenza. Its boundaries were, approximately, the Silarus (Sele) River on the northwest, the Bradanus (Bradano) on the northeast, and the Crathis (Crati) and Laus (Lao) rivers on the south; Eburum (Eboli) and Volceii (Buccino) beyond the Silarus and Bantia (Banzi) beyond the Bradanus were, however, also included in Lucania. Apart from the east coast and the Silarus Valley, the whole of Lucania was occupied by the Lucanian Apennines.

Calabria. The region of Calabria comprises the provinces of Catanzaro, Cosenza, and Reggio di Calabria. Sometimes referred to as "the toe of the Italian boot," Calabria is a peninsula of irregular shape, jutting out in a northeast–southwest direction from the main body of Italy and separating the Tyrrhenian and Ionian seas. Most of the region is mountainous or hilly, the only extensive lowlands being those of the lower Crati Valley near Sibari (which derived its name from ancient Sybaris), of the Marchesato near Crotone, of Sant'Eufemia, and of Gioia Tauro. In the north Calabria is linked to the Lucanian Apennines (Appennino Lucano) by the massif of Monte Pollino; the Pollino is continued southward along the west coast by the coast range, which in turn is separated by the Crati River from the extensive La Sila massif. A narrow isthmus between the Gulf of Sant'Eufemia in the west and the Gulf of Squillace in the east separates the northern from the southern part of the region; the uplands continue as the Calabrian Apennines (Appennino Calabrese) and culminate in the southernmost part as the massif of the Aspromonte.

Agriculture

The economy. The economy of the Mezzogiorno is based largely on agriculture, although many areas produce low yields due to poor soil and lack of labour-saving machinery. Principle crops include cereals, fruit, olives, grapes, and tobacco; wine production and fishing are also important.

Campania. The most important farming areas of Campania are the lowlands of the Terra di Lavoro and of the circum-vesuvian plain. The land is fertile, and utilization is extremely intensive, characterized by interculture, with plots of land producing cereals on the ground, fruit on trees along the edges of the plots, and grapes from vines trailing between trees. Farms are usually small, and human labour is used for most farming operations. The most important crops are fruit (apricots, apples, peaches, nuts, citrus, and grapes), early vegetables and flowers, and such industrial crops as tobacco and hemp. Wines of Campania, especially those from Vesuvius (Lacrima Christi), from Ischia (Epomeo), and from the Sorrento peninsula, are famous throughout Italy. Fishing is important in the Bay of Naples, Procida and Torre del Greco being the leading ports. Metallurgy, chemicals, machinery and tools, textiles, agricultural industries (canning, flour milling, tobacco), and shipbuilding are the most important industries. In Naples and its suburbs there is a flourishing artisan industry working coral, pearls, tortoise shell, leather, and lace. The tourist trade in Naples, on the Sorrento peninsula, and on the islands of Capri and Ischia, is an important source of income. Naples is a leading Italian port. The transportation system is also centred on Naples. Main lines connect the city with Rome (via Formia and via Cassino), with Benevento, Foggia, and the Adriatic coast, with Potenza and Taranto, and with Reggio di Calabria and Sicily.

Puglia. Wheat and oats are the principal cereals, raised in the Foggia Plain and in the more fertile parts of the plateaus; olives, grapes, almonds, and figs are grown intensively in the coastal and some inland areas; tobacco is a specialty of the Lecce Plain. The wines of Puglia are among the strongest of Italy and are used to fortify other, lighter varieties. Fishing is carried out in many ports; those of the Gargano, of Barletta, of Monopoli, and of Taranto are the most important. Salt is produced from seawater at Margherita di Savoia, near Foggia. Bari is the largest city and the leading port, as well as the biggest industrial centre (especially chemicals and petrochemicals). The largest railroad centre is Foggia, with lines connecting it to Naples–Rome, Bologna–Milan, and Bari–Taranto–Brindisi–Lecce. The so-called "Ionian" railroad follows the Ionian coast from Taranto to Reggio di Calabria. After World War II Puglia became one of the principal areas of Italian land reform.

Basilicata. The mainstay of the economy is agriculture; most of it, however, is characterized by low yields. Wheat and rye are the principal cereals; sheep, goats, and pigs the farm animals. New crops introduced in the eastern and coastal areas include tobacco, vegetables, sugar beets, and flowers. Dairy and beef cattle are also raised. Except for olive presses and flour mills, industry in Basilicata was very late in developing. Potenza, the administrative centre, and Matera are the principal cities. The main railroad line of the Basilicata links Naples and Battipaglia in the northwest through Potenza with Taranto to the east, connecting also with the Ionian railroad (Taranto–Reggio di Calabria). Local lines radiate from Potenza and from Matera in several directions, and bus services reach all of the villages of the region.

Calabria. The mainstay of Calabria's economy is farming, once characterized by large landed estates and tiny peasant holdings. Under the Italian land reform the majority of the former latifundia were broken up and new, small peasant holdings created, with rural service centres, new houses, and new roads. Formerly the agriculture of Calabria concentrated almost entirely on cereals and the raising of sheep and goats, with occasional work in the forests of the Sila uplands. New commercial crops, citrus fruit (mostly on the west coast), figs, and chestnuts, were introduced. Hydroelectric power was developed during the 1920s and 1930s in La Sila and is an important feature of the Calabrian economy, supplying electric railways and the industrial centre of Crotone on the Ionian coast, which has chemical industries. The highways are well developed, with extensive bus services. A railway and car ferry links the ports of Reggio di Calabria and Villa San Giovanni with Messina in Sicily.

Calabria is one of the few areas of southern Italy with a non-Italian minority: the Albanians who settled in the region during the 15th and 16th centuries under Turkish pressure, and who have retained their speech, the Greek Catholic rite in their churches, and, on festival occasions, their colourful national costumes.

HISTORY

Ancient history. *Campania.* Ancient Campania was smaller than the modern region and roughly extended over the area now comprising the provinces of Naples, western Caserta, and northern Salerno. It was bounded on the northwest by the territory of the Aurunci, on the northeast by Samnium, on the south by the Sorrento peninsula, and on the west by the Tyrrhenian Sea. By the 1st century AD the northwestern boundary extended as far as Sinuessa (near Mondragone) and the Volturnus (Volturno) River, and the northern boundary came between Venafrum (modern Venafro) and Casinum (Cassino); the Volturnus valley and foothills of the Apennines as far as Abellinum (Avellino) formed the boundary on the northeast. The southern boundary remained unchanged.

Campani was the Roman name for inhabitants first of the town of Capua (modern Santa Maria Capua Vetere) and its district and then for inhabitants of the Campanian plain. The name is pre-Roman and appears with Oscan terminations on coins of the early 4th or late 5th century BC struck for or by the Samnites, the conquerors of the Etruscans in Campania at the end of the 5th century. Cumae was taken in 428 or 421, Nola about the same time, and the local dialect, henceforth known as Oscan, spread over all Campania except for the Greek cities, although Etruscans remained for at least another century. Latin became general soon after the Social War (90–89 BC) except in Neapolis (Naples), where Greek was the official language during the Roman Empire. The Samnites took over many Etruscan customs; the haughtiness and luxury of the men of Capua were proverbial at Rome. This town became the ally of Rome in 338 BC. By the end of the 4th century Campania was completely Romanized and was granted a limited form of Roman citizenship (*civitas sine suffragio*). Certain towns with their territories (Neapolis, Nola, Abella [Avella], Nuceria Alfaterna [Nocera Inferiore]) were nominally independent in alliance with Rome. These towns were faithful to Rome throughout the war against Hannibal (218–202 BC), but Capua and its satellite towns revolted. After its capture by the Romans in 211 the people of Capua were severely punished and their land confiscated. During the Roman Empire, however, it flourished as a *colonia*. In the division of Italy into *regiones* by the emperor Augustus, Campania with Latium formed the first region. From *c.* AD 285 the name Campania was extended northward to include the whole of Latium. This district was governed by a *corrector* who received the title of *consularis c.* AD 333.

Spread of the Latin language

Puteoli (modern Pozzuoli), the chief ancient harbour, was most important in the 2nd–1st century BC. The road system of Campania was extremely well developed, the most important road centre being Capua. The Appian Way met the via Latina at Casilinum, three miles to the northwest.

After the fall of Rome the region was occupied successively by the Goths and Byzantines. The Normans conquered it in the 11th century, and it was incorporated in the kingdom of Sicily in the 12th century.

Puglia. The southeastern extremity of Puglia was Roman (not to be confused with modern) Calabria, referring from the 3rd century BC to the district in the southeastern extremity of the peninsula between the Adriatic and the Gulf of Tarentum ending in the Iapygian promontory (Salentina). Calabria occupied the southern part of modern Puglia (Apulia), consisting of the provinces of Lecce, Brindisi, and Taranto, though the latter extends farther westward than the ancient district (modern Calabria comprises the ancient territory of the Bruttii, the southwestern extremity of Italy).

Between 272 and 266 BC six triumphs were recorded in the Roman *fasti* (calendar) over the Tarentini, Sallentini, and Mesapii, while the name Calabria does not occur; but after the foundation of a colony at Brundisium about 246 and the final subjection of Tarentum in 209, Calabria became the general name for the peninsula. According to Strabo (1st century AD) earlier Calabria had been extremely prosperous and had had 13 cities, but all except Tarentum and Brundisium had dwindled to villages. The Appian Way, extended to Brundisium probably by 244 BC, passed through Tarentum; the shorter route by Canusium (Canosa di Puglia), Barium (Bari), and Egnatia (near Fasano) was only made a main route by the emperor Trajan. When the emperor Augustus divided Italy into *regiones* he joined Calabria to Apulia and the territory of the Hirpini to form the second region. From the end of the 2nd century Calabria was associated for juridical purposes either with Apulia or with Lucania and the district of the Bruttii, while the emperor Diocletian placed it under one *corrector* (governor) with Apulia. When the Lombards seized Calabria about AD 668 its name became transferred to the southwestern peninsula of Italy. After the tumultuous times following the disintegration of the Roman Empire, Puglia was ruled by the Byzantines for more than two centuries and came to know its greatest glory under Hohenstaufen emperors.

Basilicata. During medieval times Basilicata was first under Lombard rule, controlled by the duke of Benevento and, later, of Salerno; after an interval of Byzantine control, the Normans took over and made Melfi the capital of one of their important dominions. Until the fall of the Hohenstaufen, Basilicata played a significant part in the affairs of southern Italy.

Lucania. Lucania was so called from the Lucanians (Lucani) who conquered it about the middle of the 5th century BC. Before that it was included under the general name of Oenotria, applied by the Greeks to southernmost Italy. The mountainous interior was occupied by Oenotrians and Chones, while on the coasts on both sides were powerful Greek colonies that doubtless exercised a protectorate over the interior. The Lucanians were a southern branch of the Samnite group, who spoke Oscan. After much intertribal conflict they began to attack the Greek cities, especially Tarentum, which appealed first to Archidamus III of Sparta (killed 338), then to Alexander, king of Epirus (killed 330). In 298 BC the Lucanians made alliance with Rome, and Roman influence was extended by the colonies at Venusia (Venosa; 291 BC), Paestum (273), and above all Tarentum (272). On the landing of Pyrrhus in Italy (281 BC) they were among the first to declare in his favour and found themselves exposed to the resentment of Rome when the departure of Pyrrhus left his allies at the mercy of the Romans. After several campaigns they were reduced to subjection (272 BC). They sided with Hannibal during the Second Punic War (216 BC), and their territory during several campaigns was ravaged by both armies. The country never recovered from these disasters and under the Roman government fell into decay, to which the Social War, in which the Lucanians took part with the Samnites against Rome (90 BC onward), gave the finishing stroke. For administrative purposes under the Roman Empire, Lucania was always united with the district of the Bruttii to the south. The two together constituted the third region of Augustus' reorganized Italy.

Calabria. In classical times the region was a centre of Greek colonization; Crotona, Sybaris, and Rhegion (now Reggio di Calabria) were Greek cities of wide fame. After the Roman conquest the splendour of the Greek cities slowly gave way to a remote provincial existence, and eventually *Ager Bruttius* as it was then called passed to the Byzantines, who applied the name Calabria (which was also the Roman name for the southeast extremity of the Italian peninsula). The Lombards controlled the region from Benevento and, later, from Salerno. After another period of Byzantine rule Calabria shared with the rest of southern Italy its Hohenstaufen, Angevin, and Aragonian rulers.

Kingdom of Naples. The term Kingdom of Naples has been conventionally given, since the end of the 14th century, to the kingdom of Sicily *citra Pharum* (*i.e.*, "on the hither side of the Strait of Messina"); in other words, to the mainland part of the greater medieval kingdom of Sicily, from which the island had been detached to form the separate kingdom of Sicily *ultra Pharum* ("beyond the Strait"). The mainland territory was bounded in the north by the Papal States, with a roughly S-shaped frontier running from the mouth of the Tronto River on the Adriatic coast to a point just east of Terracina on the Tyrrhenian coast, so that Abruzzi, Molise, and the Terra di Lavoro were its northernmost provinces.

The Normans and the Hohenstaufens. The Byzantines, Lombards, Arabs, and indigenous lords who had long been rivals for control over southern Italy and Sicily were displaced in the 11th century by bands of Normans from France. Among these, two brothers were preeminent: Robert Guiscard and Roger I. The papacy, which in 1059 had accepted Robert Guiscard as its vassal for his past and future conquests, looked to the Norman power in the south to prevent the German kings or Holy Roman emperors from extending their dominion over the whole

Roger II, king of Sicily

of Italy. In 1130 Roger I's son Roger II, having united all the Norman acquisitions, assumed the title king of Sicily. An energetic ruler with a splendid capital at Palermo, he welded his heterogeneous subjects—Catholic Italians and Normans, Orthodox Greeks, and Muslim Arabs—into a strong state.

Roger II died in 1154, his son and successor William I in 1166, and the latter's son William II in 1189. The heiress of the Sicilian kingdom was then Roger's daughter Constance, who had in 1186 been married to the German king Henry VI, son of Frederick I Barbarossa, of the Hohenstaufen dynasty. The consequent accession of Henry to Sicily was resisted by a national party, which set up first Tancred of Lecce as king, then Tancred's son Roger as joint king with him; but they were defeated by the Germans in 1194. Installed as king at Palermo, Henry now linked the Sicilian crown to the imperial (his since 1191).

The union of the crowns, dissolved by Henry's death (1197), was reconstituted by his son. Acknowledged in Sicily as king in 1198 (when Constance died), Frederick received the Sicilian crown from Pope Innocent III in 1209 and became German king in 1212 and emperor in 1220. His subsequent disregard of Sicily's feudal dependence on the Holy See and his attempt to override the autonomy of the Italian communes and of the feudatories provoked a formidable conflict. For the Kingdom of Sicily itself, his Constitutions of Melfi (1231) and his changes of the Norman dispositions there reflected his absolutist attitude. Though he patronized the arts and developed the economy, the kingdom had to contribute disproportionately to the expenses of his wars. When he died (1250), the Hohenstaufen succession had already been called in question by his second excommunication (1245).

Frederick's heir, the German king Conrad IV, died in 1254. Then Manfred, a bastard son of Frederick II, assumed the regency for Conrad's son Conradin. In 1258, on a false report of Conradin's death, Manfred had himself crowned king of Sicily, which he then tried to make independent of pope and emperor alike. The papacy, meanwhile, had been offering the Sicilian crown to others: Henry III of England accepted it in 1254 for his son Edmund, but this scheme came to nothing. At last, in 1265, Charles of Anjou, count of Provence and brother of Louis IX of France, accepted the crown as a vassal of the papacy. At the Battle of Benevento (1266) Manfred was defeated and killed.

The Angevins. So as to be nearer to his Guelph allies of northern and central Italy and to Rome, Charles made Naples his capital instead of Palermo. A revolt linked with Conradin's attempt to assert his claims (1268) was savagely put down. Charles, however, had further ambitions—in Italy, in the Balkans, and in the Arab Mediterranean—and subjected his kingdom to oppressive taxation. Discontent was exploited by exiles abroad, in particular the physician Giovanni di Procida and Ruggiero de Lauria, at the court of Peter III of Aragon, who had married Manfred's daughter Constance. When the revolt known as the Sicilian Vespers broke out at Palermo in 1282, Charles was taken by surprise. Rebellion spread over all Sicily and into Calabria.

Peter III's landing in Sicily began a war in which the Ghibelline states of Italy took the Aragonese side while the papacy and France took the Angevin. The Aragonese navy had several successes; *e.g.,* in the battle of Naples in 1284, in which Charles I's son, the future Charles II, was taken prisoner. Charles I died in 1285, and Charles II had to accept humiliating terms before being restored to Naples. Yet he finally expelled the Aragonese from the mainland; and at the Peace of Caltabellotta (1302) it was agreed that the island should revert to Angevin rule on the death of Peter III's son, who took the misleading style of Frederick III. Hostilities, however, were resumed, and warfare punctuated by truces went on until Joan I of Naples in the 1370s waived her rights to Sicily and accepted Frederick's grandson, the rightly numbered Frederick III, as her vassal.

Peace of Caltabellotta (1302)

When the Sicilian crisis arose, Charles I issued the *capitoli,* or Articles of San Martino (1283), which extended the jurisdiction and immunities of barons and clergy and strengthened feudalism. The capital city, moreover, with its administration monopolized by an urban aristocracy and with its swollen population largely destitute and often workless, became another privileged entity whose particular interests were allowed to overshadow those of the nation as a whole. While the parliament remained under the control of the feudatories, municipal life stagnated, since there was no way for an active middle class to make its influence felt. Poor in natural resources, the country based its economy on agriculture and livestock. Foreigners—mostly Florentines, Venetians, Genoese, Catalans, and Marseillais—competed between themselves for what trade there was and dominated the markets.

Conditions improved under Charles II's son Robert, who succeeded to the crown in 1309. Against the emperor Henry VII he took the Guelph side. Successfully defended by his troops, the Guelph communes in Tuscany finally put themselves under his protection; and the Avignon pope, John XXII, later made Robert his vicar for the Papal States. A capable ruler, Robert enhanced the prestige of his capital at home and abroad.

Robert died in 1343, leaving the crown to his granddaughter Joan I. Two years later dynastic strife broke loose. The Angevin princes of the branch of Taranto (sons of Robert's brother Philip) procured the murder of Joan's husband Andrew, an Angevin of the Hungarian branch (grandson of Robert's brother Charles Martel). Suspected of complicity in the murder, Joan fled to Avignon. Louis I of Hungary, Andrew's brother, twice tried to win the kingdom for himself (1348 and 1350–52), but the brutality of the Hungarians provoked a reaction in Joan's favour. She and her second husband, Louis of Taranto, were recognized as sovereigns of the kingdom in 1352.

Avid for power, Louis of Taranto quarrelled with his queen. The tranquillity that the grand seneschal Niccolò Acciaiuoli had worked to promote was shattered. When the schism of the papacy began (1378), Joan supported the antipope Clement VII. Pope Urban VI therefore declared the crown forfeit and offered it to another Neapolitan Angevin, Charles of Durazzo. Joan turned for help to Louis of Anjou-Provence (a brother of the French king Charles V), but Charles of Durazzo took Naples, imprisoned Joan, and had her put to death (1382).

Anarchy followed Charles's death (1386), the kingdom being alternately ravaged by the mercenaries of rival kings and embroiled in the conflicts of other Italian states. There was an interval of resurgence while Charles III's son Ladislas was king, from 1400 to 1414. An able soldier with no political scruples, Ladislas subdued the great feudatories, expelled his rival Louis II, and, by exploiting the Italian situation, made himself master of the Papal States, from which he invaded Tuscany. Premature death cut short his plans. His sister and successor Joan II, who reigned until 1435, was dominated by condottieri, favourites, and barons one after another. She first adopted Alfonso V of Aragon as her heir (Alfonso I of Naples), then put up Louis III of Anjou-Provence against him. The court could get no obedience from the provinces, over which the Angevin and Aragonese factions fought ruinously. Finally the Aragonese took Naples in 1442, driving René I, Louis III's brother and titular successor, into exile.

The Aragonese. Alfonso, whose predecessors had from 1409 united the crowns of Aragon and Sicily, fulfilled an ancient Aragonese aspiration when he conquered Naples; but in 1443 he decided that, whereas Aragon and Sicily would pass to his brother John, the Neapolitan succession should go to his bastard son Don Ferrante, or Ferdinand I. The Neapolitan barons helped him to win the approbation of Pope Eugenius IV, who had hitherto been against him. Alfonso's policy of war and expenditure in Italy was designed to strengthen his son's position and to open up new vistas for Aragonese diplomacy and commerce. The result, however, was to aggravate the disequilibrium in the kingdom.

Succeeding Alfonso in 1458, Ferdinand I was soon faced with a baronial revolt in favour of René or the latter's son John of Calabria. Centralization and modernization antagonized the barons; and they revolted again in 1485–87, with the intention, this time, of putting his younger son Frederick (born in 1451) on the throne. Ferdinand prevailed by trickery and ruthlessness.

Invasion of Italy by Charles VIII

Meanwhile Charles VIII of France had inherited the Angevin claims to Naples. In 1494 he invaded Italy to conquer the kingdom. Alfonso II of Naples, Ferdinand I's elder son and successor, abdicated in favour of his son Ferdinand II, or Ferrandino, in 1495; but the kingdom, torn by faction, could not withstand the French, and Charles was crowned king. The formation of the League of Venice obliged Charles to withdraw from Naples, and Ferdinand II was restored to his throne a few months before his death (1496). The crown then passed to Frederick (Alfonso II's brother), under whom the kingdom enjoyed a few years of security. Finally, however, Louis XII of France and Ferdinand II of Aragon, by the Treaty of Granada (1500), agreed to divide the kingdom between themselves, on the pretext of forestalling a Turkish occupation. Frederick gave himself up to Louis XII in 1501 and was pensioned off in France, where he died in 1504. The French and the Spaniards soon came to blows over the partition. Gonzalo de Córdoba's victories at Cerignola and on the Garigliano River (1503) decided the issue in Spain's favour.

The Spanish viceroyalty. The Spanish kings ruled Naples through viceroys. After the failure of the last French effort to recover the Angevin inheritance (1528, when the siege of Naples had to be abandoned), the major defensive concern of the viceroys was against the Turks and the Barbary pirates. Internally, they applied themselves to breaking the political power of disloyal feudatories. Pedro de Toledo, viceroy from 1532 to 1553 for the emperor Charles V, was especially successful, but his attempt to reinforce absolutism by introducing the Spanish Inquisition was foiled by a vigorous opposition.

Pedro de Toledo and his successors enhanced the importance of the capital, whose population grew to excess. While the aristocracy was still predominant in the *seggi*, or municipal administration of Naples, a popular element was brought in, so that the system became rather more democratic. The parliament of the kingdom, whose sole function was to vote supplies of money, was last convened in 1642; thereafter the viceroys treated the *seggi,* on whose loyalty they relied, as representatives of the kingdom.

The rising of Masaniello in July 1647 was provoked by taxation and by the high cost of living but was really organized and directed by Giulio Genoino, a lawyer who wanted the people's voice in the administration to be made equal to the nobility's. It failed, but insurrection broke out again: while the provinces rose against baronial oppression, the city of Naples, turning at last against Spanish rule, proclaimed itself a republic. As neither the papacy, nor Savoy, nor France could undertake its effective protection, the republic had to offer sovereignty to the Duc de Guise (Henry de Lorraine), but the Spaniards took prompt countermeasures, supported by those who wanted to see order restored. By spring 1648 the rebellion was crushed.

The second half of the 17th century was a period of stagnation for the kingdom. The last lights of Renaissance culture in southern Italy had gone out with Tommaso Campanella and with the economist Antonio Serra (*Breve trattato. . . ,* 1613). Society was paralyzed by the rivalries of pressure groups and by corruption; and the Spanish monarchy, which drained the country of money and soldiers to prop its power in Europe, made matters worse by its administrative experiments. There was, however, a slow reawakening of intellectual life as the currents of European thought touched Naples, Cartesianism being the most vital factor.

The Spanish succession and the Austrian interlude. When the War of the Spanish Succession was breaking out, a group of nobles, led by Gaetano Gambacorta, principe di Macchia, in reaction against the absolutism of Spain and its middle-class supporters, plotted to offer the crown to an Austrian Habsburg (1701). This conspiracy came to nothing; but the Austrians overran the kingdom in 1707, and by the peace treaties of Utrecht and Rastatt (1713–14) it was ceded to the emperor Charles VI. Sicily was at the same time ceded to Victor Amadeus II of Savoy; but a few years later, in accordance with the Quadruple Alliance of 1718, it was transferred to Austria likewise, in exchange for Sardinia. The Austrians undertook some measures of rehabilitation and were to some extent open to the influence of the Neapolitan intelligentsia, whose great spokesmen now were Giambattista Vico and Pietro Giannone.

Don Carlos de Borbón

The first Bourbon period. On the outbreak of the War of the Polish Succession in 1733, France, Spain, and Sardinia-Savoy agreed that the Spanish infante Don Carlos de Borbón should have Naples and Sicily if they could be conquered. Don Carlos defeated the Austrians in the Battle of Bitonto (1734) and was finally recognized in his possession of the two kingdoms by the Peace of Vienna (1738). He had also the Presidi, that is, the former Habsburg possessions on the Tuscan coast. Welcome to the Neapolitans because it brought independence to the kingdom, he made his reign glorious by careful reform of the political and administrative system and by splendid building. His most able minister was the great Bernardo Tanucci.

In 1759, on succeeding unexpectedly to the Spanish throne, Charles abdicated his Italian possessions to his third son, who became king as Ferdinand IV of Naples (III of Sicily). There was a council of regency, on which Tanucci sat, until the new king came of age in 1767. The next year Ferdinand married the Austrian archduchess Maria Carolina, an ambitious woman who easily took control of her pleasure-loving husband's government. By ousting Tanucci and putting the Englishman John Acton at the head of affairs, she opened the way for British and Austrian influence to replace Spanish.

The backwardness of the kingdom, where the aristocracy and the clergy were still highly privileged and the lower class lived in degrading poverty, was meanwhile being denounced by progressive thinkers such as Antonio Genovesi; and the Neapolitan government, in the paternalistic spirit of "enlightened despotism," sponsored a vigorous program of legislation to rectify these injustices and to modernize the state. The expulsion of the Jesuits (1767) was another symptom of the current tendency.

The monarchy was halted in its course of reform by the example of the French Revolution, which released a flood of republican and democratic ideas. These ideas appealed strongly to those—middle-class intellectuals, nobles, and churchmen alike—who had seen the Bourbon reforms as designed rather to increase the king's power than to benefit the nation. "Patriots" began to conspire and were countered by persecution. Having entered the War of the First Coalition against France in 1793, Ferdinand had to withdraw from it in 1796, after the Franco-Sardinian Treaty of Paris; but the French intervention in Rome alarmed him, and the British admiral Nelson's victory in the Battle of the Nile encouraged him to take part in the War of the Second Coalition in 1798. His army, under the Austrian Karl von Mack, advanced against the Roman republic but was defeated at Civita Castellana by the French under J.E. Championnet, who then pursued it toward Naples. In Naples, while the local Jacobins were preparing to revolt on the arrival of the French, the populace rose to defend its king; but Ferdinand took panic and fled with his entourage and his treasure to Palermo, having ordered the burning of the fleet built up in the past decade.

The Republic and the first Bourbon restoration. The French entered Naples, and on January 24, 1799, the Parthenopean republic was proclaimed. The republicans, however, who had ingenuously welcomed the French as liberators, were idealists out of touch with the actual life of the people. With no army of their own, they were caught between the royalist-popular counterrevolution and the exorbitant demands of the French. Appointed vicar of the kingdom by Ferdinand, the cardinal Fabrizio Ruffo landed in Calabria and mustered an army of all sorts, including brigands and convicts. The city of Naples, abandoned by the French, fell to Ruffo on June 13, 1799, after desperate resistance by the "patriots." The castles that still held out were won over by a capitulation whereby their defenders were promised freedom to remain at home unmolested or to embark for Toulon. On June 24, however, Nelson's fleet arrived, and Nelson, in agreement with Palermo, repudiated the capitulation, despite Ruffo's protests. The patriots' ships were attacked, many prisoners were taken, and Francesco Caracciolo was hanged. After Ferdinand's return to Naples (July 1799), special tribunals sentenced the leading republicans to death. The jurist Mario Pagano, the physician Domenico Cirillo, the priest Francesco Conforti, the writer Luigia Sanfelice, and the noble Ettore Carafa, conte di Ruvo, were among the victims of a reaction that estranged open-minded intellectuals from the Bourbon dynasty.

Napoleon's terms in the Treaty of Florence (March 1801)

After the Franco-Austrian Peace of Lunéville, Ferdinand had to accept Napoleon's harsh terms in the Treaty of Florence (March 1801), whereby he surrendered the Presidi to France, agreed to grant a general amnesty, and consented to a French occupation of parts of his territory. When the War of the Third Coalition broke out (1805) he entered into secret dealings with Austria and Great Britain. The exasperated Napoleon, having defeated the Austrians at Austerlitz, sent his brother Joseph to conquer Ferdinand's kingdom. Ferdinand fled to Sicily again, and the French overran the mainland. The capital was taken easily, as the bourgeoisie, remembering the troubles of 1799, formed its own militia to hold the populace down (January 1806).

The Decennio. Napoleon first annexed the kingdom to his empire, then declared it independent, with Joseph as king (March 30, 1806). When Joseph was transferred to Spain (1808), Napoleon gave Naples to his brother-in-law Joachim Murat.

The Decennio, as the decade of French rule is called by Neapolitan historians, brought great reforms. Feudalism was abolished; seignorial domains were broken up and ecclesiastical property was confiscated and sold (thus promoting the growth of the agrarian middle class); the laws were unified, with the introduction of the Code Napoléon; army and navy were brought into being on modern lines; brigandage was suppressed; and the administration was reorganized. Neapolitans brought up on the principles of the 18th century but conscious of traditional values collaborated with French officials in the public service.

Murat was deservedly popular as king; but discontent was fomented by clandestine propaganda spread from Sicily by Lord William Bentinck, the British envoy there, who had saddled Ferdinand with a constitution and so could represent him as standing for liberalism. Moreover, Napoleon's tutelage was oppressive and suspicious. To win genuine independence, Murat negotiated secretly with Great Britain and with Austria, concluding a treaty with the latter in January 1814, after Napoleon's defeat at Leipzig. During the Hundred Days, however, he rallied to Napoleon's cause, took up arms against Austria and, on March 30, 1815, from Rimini, appealed to the Italians to join him in a fight for the national independence of the peninsula. Defeated by the Austrians at Tolentino (May 2), he abandoned his kingdom and retired to France.

The second Bourbon restoration. By his Treaty of Casalanza with the Austrians (May 20, 1815), Ferdinand IV recovered the Kingdom of Naples. On the recommendation of the Congress of Vienna, he unified Naples and Sicily to form the Kingdom of the Two Sicilies, of which he was styled Ferdinand I (1816). Though he had assured conservative Austria that he would not allow any institutions incompatible with the absolutism about to be reimposed on the Austrian north of Italy, he took no measures to undo the reforms of the Decennio when he returned to Naples in June 1815. On the contrary, he sought to integrate and to develop its achievement and retained much of its personnel in his service.

Sicily proved obstinately hostile to the centralizing policy of unification with Naples: the Sicilian barons, who had resented the viceroy Domenico Caracciolo's antifeudal program in the 1780s, had in 1812, with Bentinck's connivance, transformed their own parliament and forced the King to accept a constitution on the English model, so that autonomists and liberals were now combined in opposition to the Bourbons. On the mainland, the pathetic failure of Murat's audacious landing in Calabria (October 1815) and his subsequent execution, far from discouraging his partisans, increased their numbers and created a Murat cult which looked backward to the Decennio and forward to the united Italy envisaged by him at Rimini. Even stronger in opposition to the Bourbons were the Carbonari, who were in existence in the kingdom in 1810 and whose ranks, reinforced by men returning from Germany and Switzerland, now included nobles, priests, bourgeois, and, particularly, army officers. The Bourbon government antagonized them by its measures against secret societies, by its favouritism toward its own trusty friends, and by its wide concessions to the church in the Concordat of 1818 with the papacy.

Revolution

Revolution began on July 1, 1820, with a demonstration by a cavalry regiment at Nola. It spread quickly, under the leadership of Gen. Guglielmo Pepe. The rebels demanded the democratic and unicameral Spanish constitution of 1812; Ferdinand granted it on July 7 and swore to it on July 13. The Sicilians, on the other hand, rose for their own constitution of 1812, which was aristocratic and bicameral; and the Neapolitan parliament, consisting entirely of mainland deputies, resorted to armed force against Sicilian separatism. At the Congress of Troppau Austria's call for intervention by the powers against revolutionary threats to the European order was agreed to despite British and French objections, but a decision on Naples was postponed for the Congress of Laibach in 1821.

Granted leave by his parliament to go abroad, Ferdinand attended the Congress of Laibach and promptly broke his oath to the constitution. With his consent and the mandate of the Holy Alliance, Austria undertook to restore his absolute monarchy. Pepe's forces were defeated at Rieti, and on March 23, 1821, the Austrians entered Naples. They were to stay there, as the watchdogs of the Bourbons, until 1827, when King Francis I obtained their recall and engaged a Swiss bodyguard instead.

Reprisals were taken against the liberals; and the kingdom was dominated by the police for the rest of Ferdinand's reign and throughout Francis I's (1825–30). Resentment bred an outcrop of malcontents, a reemergence, under various names, of the Carbonari. A new revolt, in the Cilento, was put down by force (1828).

Francis I's son and successor Ferdinand II began his reign with measures expressly intended to amend things. Trade and industry increased; agricultural production was encouraged; the lot of the workers was improved; better budgets allowed a reduction of taxes; laws were brought up to date; and public works were undertaken. Ferdinand, however, allowed no political reflection of this economic progress, though he issued an amnesty on his accession and was ready to employ, as administrative experts, men who had previously been exiled or imprisoned. In foreign affairs he was inclined to neutrality, as he saw that alliances might compromise his precious independence.

Ferdinand II's attitude was thus quite irreconcilable with the spirit of the Italian Risorgimento, which was affecting his kingdom through various channels. Periodicals and intellectual groups sprang up to satisfy the revived taste for literature, history, philosophy, and the arts; and liberalism and nationalism thrived in the new atmosphere. Vincenzo Gioberti, who had a Neapolitan precursor in Vincenzo Cuoco (1770–1823), captivated the majority of would-be reformers with his book *Del primato,* which appealed to tradition and called for an Italian federation of the existing states under papal presidency. Others held less moderate views: Giuseppe Mazzini, who wanted a unitary republic of Italy, had converts in the kingdom; and the backward areas were sprinkled with revolutionary cells plotting to subvert the economic and social order, as for instance Benedetto Musolino's Calabrian association Giovane Italia (not to be confused with Mazzini's Giovine Italia). Gradually the old political world of Naples was undermined by a more or less clandestine and heterogeneous opposition: liberal constitutionalists (mainly former Carbonari), led by Carlo Poerio; Giobertians, led by the historian Carlo Troya; and democrats of all sorts, including extremists. Successive revolts proved that repression was not enough to stifle the revolutionary ferment. A violent rising at Cosenza in 1844 was put down rigorously, but its example prompted Mazzini to encourage the ill-fated expedition of the brothers Attilio and Emilio Bandiera to Calabria in 1845.

Rejoicings at Pope Pius IX's early marks of sympathy for the Italian cause (1846–47) were paralleled by overt attacks on Bourbon tyranny: Luigi Settembrini published his *Protesta del popolo delle due Sicilie* in July 1847. There followed the great year of European revolutions. Sicily, still obstinately separatist, was in revolt from January 12, 1848; and alarm for the mainland induced Ferdinand II to grant a constitution on January 29. Modelled on the French constitution of 1830, this was promulgated on February 11. A constitutional guard was formed; the kingdom joined the Italian customs union; and finally, under pressure from the people, war was declared against Austria on April 7. Pepe was sent with an expedition to Lombardy while the fleet sailed for Venice.

Constitution of 1848

Elections took place in April 1848. The democrats were agitating in the press for a parliamentary revision of the constitution and for other controversial measures. There were riots in Naples, and the peasants' seizure of national, communal, and private lands exposed the activity of socialist and communist cells. Parliament was to have met on May 15; but on May 13 the radicals demanded that the king's oath should acknowledge the parliament's right to revise the constitution. The King refused, and barricades were put up (May 14). Ferdinand would not open parliament unless the barricades were dismantled, but the rebels stood firm until troops had mastered them by force (evening of May 15). When Troya resigned from the ministry, Ferdinand replaced him with the reactionary principe di Cariati (Gennaro Spinelli). Eventually the King dissolved parliament, announced fresh elections, recalled his troops from Lombardy, and broke off relations with Sardinia-Piedmont (July). The democrats were now openly opposing the liberals and working for a republic. The provinces were still in commotion. When the elections returned as many radicals as before, Ferdinand postponed the opening of parliament from July 1848 to November and then to February 1849.

After both Pius IX and Leopold II of Tuscany had been driven by revolution to take refuge at Gaeta, Ferdinand dissolved the parliament and shelved the constitution (March 1849); and the Austrian victory at Novara gave a free hand to reaction in Italy. Sicily, which in summer 1848 had declared the Bourbon dynasty deposed, was subdued by Carlo Filangieri in April–May 1849. Sentences of death (commuted by Ferdinand to penal servitude), imprisonment, banishments, and dismissals, were widespread: Carlo Poerio, Silvio Spaventa, Francesco de Sanctis, and Luigi Settembrini were victims of the reprisals. The liberals, having identified themselves with the cause of Italian national unity, were wholly discredited, and vigorous absolutism was brought back. Believing that he had thus won tranquillity for his subjects, Ferdinand devoted himself again to public works and to economic improvement. Foreign liberals, such as Gladstone in the British press (1851) and Cavour at the Paris conference (1856), inveighed against the kingdom as morally bankrupt and politically anachronistic. Carlo Pisacane, a former officer of the Bourbon army who had fought for the Roman republic and had absorbed Mazzinian and socialist ideas, landed at Sapri with a small force in 1857 but was defeated and killed by the local police and townspeople. Next year, yielding to French and British pressure, Ferdinand released into exile some of his political prisoners. In May 1859, on his deathbed, while the French and the Sardinians were beginning their campaign in Lombardy, Ferdinand adjured his heir, Francis II, to stay neutral and to eschew innovations.

On his accession to the throne, Francis II appointed as prime minister the moderate Carlo Filangieri, who advised him to reinstate the constitution and to accept the alliance offered to him by Victor Emmanuel II of Sardinia. Francis hesitated, while his kingdom was shaken with the reverberation of Sardinian successes in Lombardy and central Italy. The Swiss regiments, hitherto the mainstay of royal absolutism, mutinied in July 1859 and were disbanded; Filangieri resigned in March 1860; and Palermo rose in revolt on April 4.

Sicily, the hotbed of antidynastic feeling, had already been infiltrated by emissaries of the Comitato d'Azione, an organization under Mazzinian influence whose aim was to unify Italy by means of revolution, instead of waiting for Cavour to do so by internationally acceptable means. These emissaries, notably Francesco Crispi and Rossolini Pilo, prepared the ground for Giuseppe Garibaldi, who landed with his Thousand at Marsala on May 11, 1860, declared himself for "Italy and Victor Emmanuel" (to the chagrin of the Mazzinians), defeated the Bourbon troops at Calatafimi on May 15, and was in Palermo (which the Bourbons had recovered since its revolt) by the end of the month.

Garibaldi

Francis on June 25, 1860, signed a proclamation promising a general amnesty for political offenders and a liberal ministry; and on July 1 he restored the constitution; but the amnesty only exposed Naples to the return of exiles who were either converts to Cavour's plan for a unitary Italian monarchy under the House of Savoy or partisans of Lucien Murat, Joachim's heir. Garibaldi's victory at Milazzo (July 20) put an end to Bourbon resistance throughout Sicily, except in the citadel of Messina; and Great Britain, France, Russia, and Sardinia ignored Francis II's plea that the invasion should be halted at the straits. Cavour, who, unlike Victor Emmanuel II, had at first objected to the expedition both because its democratic sponsors had opposed his cession of Nice and Savoy to France and because its revolutionary aspect might have compromised his plans, now began to abet it. On August 18, Garibaldi crossed the straits and took Reggio di Calabria. As his forces advanced northward, Bourbon rule collapsed, province by province. Francis fled to Gaeta on September 6; and Garibaldi, having entered Naples in triumph on September 7, assumed the dictatorship on September 8. The Neapolitan fleet refused to follow the King.

The revolutionaries with Garibaldi's forces might now have proclaimed a republic; and if they had marched on Rome, France and Austria would have intervened. To forestall this and at the same time to seize a role for Sardinia in the liberation of southern Italy, Cavour exploited the pretext furnished by the disorderly conduct of the foreign volunteers who were rallying to defend the Papal States. The Sardinian army began to overrun the Papal States on September 11, 1860; and on October 12 it crossed the frontier into Neapolitan territory. A Bourbon counteroffensive against the Garibaldians was defeated in a desperate and hard-fought battle on the Volturno River (October 1–2).

In Naples, meanwhile, Cavour's followers, in favour of annexation by Sardinia, were disputing with anti-annexationists, whom Mazzini and Carlo Cattaneo arrived to reinforce. Plebiscites, held on October 21, 1860, one for the mainland and one for Sicily, came out in favour of annexation. On October 26, at Caianello near Teano, Garibaldi saluted Victor Emmanuel as "king of Italy," a title confirmed by the Italian parliament at Turin in February 1861.

The French naval squadron that had been protecting the heroic defenders of Gaeta was withdrawn, at British insistence, in January 1861; and on February 13 Francis and his family sailed for Rome, whereupon Gaeta surrendered. The citadel of Messina capitulated on March 12, that of Civitella del Tronto on March 20. The 700-year-old kingdom was no more.

The 20th century. The Mezzogiorno in the recent past has suffered economically and socially compared to the prosperous north. Not only was there a great chasm between large landholders and peasants, but the government structure, by inadequately providing for the welfare of the people, encouraged criminal organizations, such as the Mafia, to flourish. Feudal traditions remained very strong in the south; few resources, as well as preferential treatment by the government toward the north, kept the Mezzogiorno underdeveloped. In addition, southern politicians placated the wealthy with special advantages.

The spread of organized crime

In the late 19th century, awareness of the south's situation spawned a style of literature known as Letturatura Meridionalista. Writings portrayed the exploitation of the landless peasants and the detrimental effects of government policy there.

The central government undertook some public projects in the early 20th century, but these were insufficient and many residents decided to emigrate. Fascist policy in the 1920s and 1930s concentrated primarily on controlling the Mafia's power. After World War II some large estates were dismantled and redistributed. The Cassa per il Mezzogiorno (Fund for the South) represented the government's efforts to encourage economic development. Some of the programs have included providing capital for investment and for industrial projects.

Sicily

PHYSICAL AND HUMAN GEOGRAPHY

Location and general character of the island

The largest and one of the most densely populated islands in the Mediterranean Sea, Sicily (with several small adjacent islands) is an autonomous region of Italy. Its northern shore, site of the capital, Palermo, is lapped by the Tyrrhenian Sea; to the east it looks across the narrow Strait of Messina to the toe of the Italian peninsula; and it lies about 100 miles (160 kilometres) northeast of Tunisia, in North Africa. Sicily occupies 9,830 square miles (25,460 square kilometres), and with its adjacent islands it covers 9,927 square miles.

Sicily's strategic location at the centre of the Mediterranean has made the island a turbulent crossroads of history, a pawn of conquest and empire, and a melting pot for a dozen or more ethnic groups whose warriors or merchants sought its shores virtually since the dawn of recorded history. The island and its people have lived much by the sea, flourishing when the Mediterranean traffic was intense and stagnating when it waned. Only a few days' sailing time from the ancient civilizations of Greece and the Aegean, Sicily was at times the major western outpost of the high culture of those regions. Its land also lies open to climatic influences from all directions. In spite of these many forces that so often have reshaped its political and social life and of the economic depression that continues to plague it, Sicily has been able to establish one of the most distinct identities among the Italian regions, a distinctiveness that is guarded jealously by its inhabitants.

The land. *Relief.* The landscape of Sicily is mainly one of mountains, sometimes reaching almost to the coasts, and of irregular coastal plains on which all the main cities are located. The present topography is the result of the fact that the rocks erode easily in a climate marked by intense exposure to the sun, persistent drought during the long summers, and the sea winds.

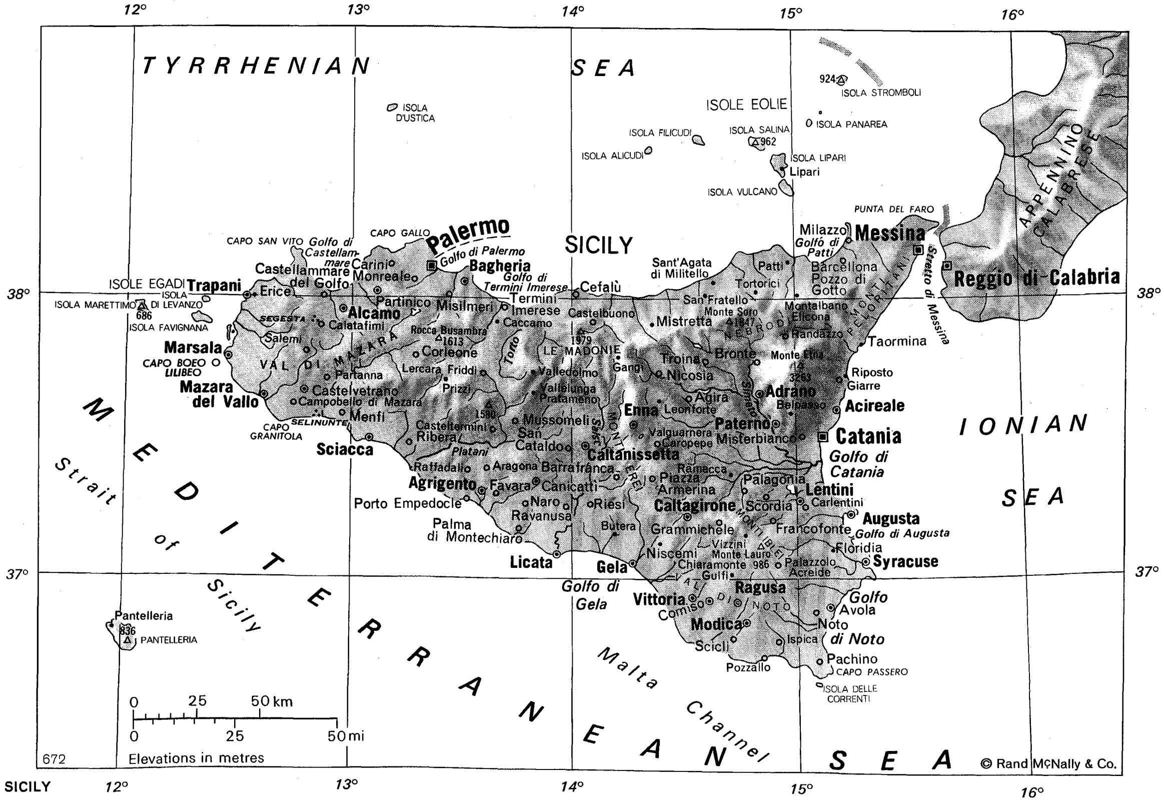
The mountain chains

The mountains are continuations of the Apennines of the Italian peninsula and the Atlas Mountains of northwestern Africa, which are parts of the discontinuous Alpine–Himalayan mountain belt circling much of the Earth from Asia to southern Europe and northern Africa. In northeastern Sicily the Peloritani chain rises suddenly from the Strait of Messina and continues the landscape of the Calabrian Apennines of the mainland, though without the typical high plateaus. The higher reaches have little or no vegetation and are deeply scarred by currents that, at lower altitudes, produce frequent flash floods and sweep away both rubble and fertile sediments. Forests of chestnut, beech, or Mediterranean scrub climb above the cultivated lower slopes. Maximum altitudes are about 4,300 feet (1,300 metres).

The Nebrodi and Le Madonie chains to the west are higher, reaching 5,900 and 6,600 feet, respectively. The forms are similar, though in Le Madonie they tend to be stark, standing out like great limestone massifs or peninsulas. Le Madonie is known for its underground drainage, which provides water to Palermo. Inland, the mountains gradually diminish in height toward the south, with great expanses of virtual tableland known for its sulfurous, desolate conditions; grasses and twisted olive trees dominate the landscape. The Iblei chain in the southeast is of volcanic origin and presents a refreshing scene of brightly coloured vegetation.

Mt. Etna

To the northeast of this chain, the great mass of Mt. Etna rises to 10,703 feet (3,263 metres), the highest point in Sicily, which is a region of strong seismic activity. One of the world's most active volcanoes and the biggest in all of Europe, Mt. Etna covers half the province of Catania and rises above the provincial capital of that name. It is thought that this massive mountain was gradually built by extruded volcanic debris from beneath the sea to its present height. Luxuriant wild and cultivated trees and shrubs cover its sides wherever a cover of decomposed debris occurs. Underground water and springs are plentiful for the many vineyards and citrus orchards that grow in the region.



SICILY

Climate. Sicily's most notable climatic factors are its southern latitude, its insularity, its elevations decreasing from north to south, and the moderate atmospheric pressure characteristic of the Mediterranean. Latitude and the pattern of winds make it a sun-drenched island, and desert winds from Africa often scourge the southern and central regions during the May-to-October summers.

Summer temperatures often climb over 85° F (29° C), but the climate is even more influenced by the rainfall, which is irregular in quantity from year to year but regular in its uneven annual distribution, virtually all of it falling in late autumn and winter. The south receives the least amount of rain and the northeast the most. Much of the fall is lost through deforestation (less than 4 percent of the island is woodland) and the soil's resultant inability to hold the torrents from the mountains; and, though the amounts are similar to those on the Italian mainland at equivalent latitudes, the irregularity of the fall and its concentration in short downpours contributes significantly to the island's agricultural depression and rural poverty. Neither irrigation facilities nor discoveries of underground water have begun to counteract this natural blight.

Plant and animal life. Only on the higher slopes does the chestnut replace the laurel, perhaps the most characteristic Sicilian tree. Pines grow on Mt. Etna, on whose upper reaches grow the low, isolated shrubs and grasses of the Alpine zone. Of the cultivated plants, only the flowering ash is native; the olive, grape, almond, pomegranate, hazel, and other fruit and nut trees, however, date from antiquity. Arabs introduced the date palm and citrus trees, though the common orange is of 16th-century Chinese origin, and other species came a century later from the Americas. Of the few animal species, the invertebrates, birds, and fish outnumber mammals, though remains of vanished large mammals occasionally are encountered in caves. Overall, the animal population represents a transitional zone between Italy and Africa.

The people. *Ethnic composition.* Sicily was already inhabited toward the end of the Pleistocene Epoch (more than 10,000 years ago), and throughout its history has received peoples of every coast on the Mediterranean. According to archaeologists, anthropologists, philologists, and historians, the peoples living there in the remotest times, the Sicani, were of Mediterranean origin. Some of the physical features of the present-day population may be traced to them: elongated heads, small stature, and dark pigmentation of the eyes and hair. Interbred with them were the Elymi, who left their mark mainly on the towns of Segesta, Erice, and Entella; they may have come in small numbers from neighbouring Africa.

Diversity of ethnic stocks and physical types

Then the Siculi, a short-headed Eurasian people who spoke an Italic language akin to Latin, came down the peninsula from the central and eastern Alps; they seem to have infiltrated slowly and in small waves among these ancient Mediterranean peoples. The Siculi and Sicani seem to have formed the most homogeneous group of the island's population. But as early as the transition from the Bronze to the Iron Age, they appear to have been molested by Greek pirates, coinciding and in a sense competing with Etruscan pirates in the lower Tyrrhenian. Some pirate groups appear to have established themselves on the island, forcing the inhabitants to withdraw inland and fortify their new settlements. Later, between the 8th and 6th centuries BC, migrations from Greece seem to have been more frequent and of larger size. The new peoples—among them Ionians from Euboea and Samos, Aeolians and Achaeans from Boeotia, and Dorians from Corinth and other locations—had apparently left their homelands to settle on the island.

At more or less the same time, the Carthaginians, Semites from the North African coast, set up some of their trading posts along the western coast of Sicily. Some of the tyrants then welcomed exiles from the neighbouring continent and recruited labourers to cultivate the land and mercenaries to fight their battles from the Italian peninsula, Greece, Asia, and Africa. These new immigrants remained and merged with their predecessors, an example that was later followed by Romans, Vandals, Goths, and Byzantines, who came for reasons of war or conquest.

From Arabia, Egypt, Syria, and Mesopotamia came the Muslims, who took only 80 years to conquer Sicily, settling mainly in the northern regions, while the Berbers were more predominant in the south. Many Sicilian Christians converted to Islām. Around the year 1000 the Normans arrived and held the island for more than a century; then came the Swabians, who held it for three-quarters of a century. The tall stature, blond hair, blue eyes, and pink colouring of some present-day Sicilians may be traceable to them. The Aragonese also governed Sicily for more than a century.

Demography. The Sicilian population is the most urbanized of the provinces in southern Italy; yet it displays many characteristics of a rural population, a fact attributable primarily to a generally low standard of living. The greatest proportion live in the provinces of Palermo and Catania, and only a small fraction live outside the narrow coastal strip around the island. Migrants long have been driven from the interior not only by the barrenness but also by malaria and by the land-tenure system, *latifundium,* characterized by large estates ruling over great wheat-growing acreages.

The economy. *Incomes.* The per capita income of Sicilians is substantially less than the national average. The tertiary sector of the economy—retailing and services—plus the civil service account for about one-half the island's income. Industry has gradually outstripped agriculture to contribute the greater proportion of the other one-half, especially in Palermo. Much of this industry, moreover, is based on the processing of the products of farm, forest, fishery, and mine.

Agriculture, industry, and energy resources

Components. Agriculture employs about one-quarter of the labour force, and a very high percentage of Sicily's land area is given over to it and to forestry. Much of this is sown in wheat, which does not require great fertility. In ancient Rome, Sicily was known as one of the breadbaskets of the republic and empire. Citrus fruits (including nine-tenths of Italy's entire lemon production) and vegetables, however, provide the largest part of agricultural exports to the peninsula and abroad. Dams, flood- and erosion-control measures, and irrigation canals are among the major projects undertaken in recent years to assist the farmer.

Among the more promising aspects of industry, which employs about one-third of all workers, have been the discoveries of petroleum and the building of refineries to complement the plants producing chemicals, pharmaceuticals, cement, fertilizers, and synthetics. These are in addition to the small-scale food- and sulfur-processing plants and apparel manufacturing. Mineral production also includes limestone, asphalt, potash, and salt.

Virtually all of Sicily's energy is generated in thermal plants; hydro potentiality is nil. The three main ports—Palermo, Catania, and Messina—have extensive shipping facilities and are interconnected by single-track railways. Main highways between cities are adequate, but secondary roads are poor. Many interior communities are reachable only by track.

Governmental involvement. Since World War II, the national government has given Sicily and other areas of southern Italy special funds to improve transportation facilities and other public works and to prepare them for industrial development. In its turn, the regional government took numerous steps to ease the location and capitalization of industry. Years of political instability and shortage of resources, however, have tended to impede even the legislated goals.

Administrative and social conditions. *Government.* An Italian constitutional statute of 1948 made Sicily an autonomous region, divided into nine provinces. Government is parliamentary, with the president elected from among the members of the regional assembly. With the assembly's executive committee, he promulgates laws and may attend meetings of the Italian council of ministers and speak on Sicilian matters. He represents the federal government and is charged with maintaining order with the help of the national police force. A Sicilian separatist movement won minority support after World War II but faded in the 1950s.

The social milieu. Life in much of the interior has remained in the late 20th century at a primitive level, with inadequate water supplies and sanitation, and rampant disease. Unemployment has been chronic, except around the developing petroleum-producing and petroleum-processing centres.

The regional government exercises complete control of primary education, but the illiteracy rate remains high. The universities in Palermo, Messina, and Catania are required to maintain national standards. The well-stocked civil service provides a well-organized system of social services that are generally of low calibre. Good housing and medical services, even in the cities, tend to be in short supply as well.

A peculiar feature of the separateness of Sicilian life from that of mainland Italy is the persistence of the Mafia, an organization dating from the Middle Ages that gradually evolved into a paralegal criminal brotherhood. It gives certain parts of the island virtually a dual government, standard of conduct, and system of enforcement—one is the legitimate regime and the other a shadow but a pervasive social, economic, and political network maintaining its powers through violence. In recent years it has tended to move away from the rural areas, in which it was spawned, to urban Sicily, in which through its traditional code of silence and frequently violent settlement of disputes it directs its activities at legitimate businesses through extortion and terror.

Cultural life. Sicily has made its contribution to Italian literature and art. The poets of the Sicilian school at the court of the emperor Frederick II were important in the development of Italian lyrical poetry in the vernacular early in the 13th century. The Byzantine and Norman architecture of the island with its splendid mosaic murals is celebrated. In the 15th century the great painter Antonella da Messina introduced the Flemish technique of oil painting to Italy.

In more recent times, in the realm of the "fine" arts, Palermo has its opera house and Catania its Bellini Theatre, named in honour of the island's major musical celebrity, the opera composer Vincenzo Bellini. In literature the influences of two Sicilians, the novelist Giovanni Verga and the playwright Luigi Pirandello, have profoundly affected the shape of modern Italian literature and have had great influence far beyond the shores of the Mediterranean. In 1959 the Sicilian poet Salvatore Quasimodo was awarded the Nobel Prize for Literature.

Italian song

Sicily has been called the cradle of the Italian popular song. Various kinds of song exist locally: love songs are the most numerous, followed by the work songs of such occupations as fishing (the *mattanza,* or tuna fishing song) and by the sung accompaniments to the many children's games. The songs of the beggars and the musical cries of the street vendors are still heard, though they, like much traditional culture, are disappearing under the homogenizing influence of radio and television and of modern life in general.

Sicily has strong traditions of folk art. The elaborately painted carts of the peasants, which are features of the provinces of Catania and Palermo, depict on their sideboards scenes of combat between the Christian knights and the Saracens. Though no extant carts predate the 19th century, their art may commemorate the era of Sicilian prosperity under the Norman kings and the themes of chivalric quest popular in the epic poetry of that time. Similar themes run through many of the puppet dramas, which remain popular on the island. Silversmiths' and goldsmiths' work, to be seen especially in Palermo, and peasant filigree settings for gems are of the most intricate refinement, and Sicilian embroidery has an uninterrupted tradition many centuries old.

Popular religious festivals make up colourful occasions for the sun-bleached land. The processions of triumphal cars of the feasts celebrating St. Rosalia in Palermo, the Annunciation in Trapani, and St. Lucia in Syracuse, as well as the historical pageants featuring symbolic figures of Christians and Saracens and of Normans and Turks in combat to the accompaniment of fireworks and dancing, represent the gayer sides of Sicilian life.

(Ed.)

HISTORY

Greek Sicily. At the coming of the Greeks three peoples occupied the island of Sicily: in the east the Sicels, or Siculi, who gave their name to the island but were reputed to be latecomers from Italy; to the west of the Gelas River, the Sicani; and in the extreme west the Elymians, a people to whom a Trojan origin was assigned, with their chief centres at Segesta and at Eryx (Erice) with its temple of Aphrodite. The Sicels spoke an Indo-European language; there are no remains of the languages of the other peoples. There were also Phoenician settlements on the island. The Greeks settled Sicilian towns between the 8th and 6th centuries BC. The mountainous centre remained in the hands of Sicels and Sicani, who were increasingly Hellenized in ideas and material culture.

After the foundation of the colonies, little is known of them until the 5th century BC. They prospered materially, building temples whose remains, at Syracuse, Akragas, and Selinus, are among the finest monuments of archaic and classical architecture. Their sculpture and other arts were vigorous, though provincial and largely dependent on impulses from mainland Greece. There is some reason to believe that they had a colonial economy, producing food (corn, sheep and cattle, fish) and importing manufactured objects (of which clay vases are the chief survivors) from Greece—in the period before 550 BC mainly from Corinth, afterward from Athens. The broad acres of the colonies and the use of Sicel serfs at Syracuse and probably also elsewhere gave rise to a life of easy circumstances and, in the 5th century, contributed to the great wealth of the tyrants. The fine series of Sicilian coins began toward the middle of the 6th century. The poet Stesichorus of Himera, who retold many of the stories of epic with a new spirit reflected in archaic vase paintings, belonged to this period.

Sicily's tyrants

There were many tyrants—unconstitutional monarchs—in the 6th century, especially in those towns that were pressed by the growing hostility of the Carthaginians; the most famous was Phalaris of Akragas. In general, however, this was a period of aristocratic or oligarchical constitutions. The early 5th century saw tyrants in most cities. The tyrannies were short-lived, however, and were succeeded by uneasy democracies in most cities, Syracuse still taking the lead. The Sicels then for the first time formed a united power, under Ducetius, who founded a new city at Palici in the plain of Catania and became a serious threat to Syracuse and to Akragas. He was defeated and his political work largely undone, except for the foundation of Cale Acte (Caronia) on the north coast. The Sicels did not again attempt to combine as a force, but their Hellenization continued; many Sicel cities began to coin on the Greek model.

The Athenians looked for allies in Sicily at least as early as 458/457. The ultimate object of this expedition was the subjection of the whole of Sicily. The Athenians were received with suspicion, even by some of their allies, and Naxos and Catania were the only Greek cities to support them; they also had help from some of the Sicels. The utter defeat of the Athenian force under the walls of Syracuse in 413 was achieved in part by the arrival of the Spartan leader Gylippus and was followed by the dispatch of small forces from Syracuse and other Sicilian cities to help the Spartans against Athens.

Carthaginian wars. The failure of Athens left the field open for Carthage, with whom the Athenians had sought an alliance. Dionysius the Elder, leader of Syracuse, fought a series of inconclusive wars against the Carthaginians, finally winning a victory *c.* 396 BC. He had to fight other Carthaginian wars, however, in 392–391, 383–378, and 368–367, the year of his death. In the peace made in 378 the boundary between Greek and Carthaginian Sicily was fixed at the River Halycus (Platani).

Dionysius of Syracuse

Dionysius used his position as defender of Greek Sicily to build up a personal power that anticipated the Hellenistic monarchies in many ways. The transplantations of population and refoundations of cities that had been a feature of the rule of Gelon and Hieron continued.

The rule of Dionysius at Syracuse depended on foreign mercenaries and on secret police, and many of the typical features of Plato's and Aristotle's accounts of Greek tyrants are no doubt derived from him. But he was well served by efficient ministers, such as Philistus the historian (who, however, went into exile). He was himself a poet and, like earlier tyrants, kept a court, which was visited by Plato and other philosophers and poets. He made Syracuse the greatest power in the Greek world, and it became the largest and, probably, the most populous of Greek cities, with its extensive fortifications. His power, however, did not long survive him. Most of his conquests in Italy fell to the Lucanians and Bruttii, and at Syracuse his son Dionysius the Younger, after ruling from 367 to 356, was expelled by his uncle Dion. Dion was killed in 354, and there followed 10 years' confusion: fighting in Syracuse between Dionysius the Younger and the citizens; tyrannies in other cities; and renewed danger from Carthage, allied with Hicetas, tyrant of Leontini and rival of Dionysius. The Syracusans appealed to their mother city Corinth, and Timoleon came as a deliverer. He freed the cities from tyrants and defeated the Carthaginians at the Battle of the Crimisus (probably 341), but the boundary remained at the River Halycus. Timoleon's reputation was high because he restored the democracy at Syracuse and retired after his work of liberation was done, but his settlement did not last long after his death (*c.* 336). The Carthaginians, who had already played off one city against another, continued this policy, while the Greeks consumed their energies in struggles between would-be tyrants. They found another leader in Agathocles, one of the ablest soldiers of the time, who made himself tyrant of Syracuse in 317. Akragas, strengthened by Syracusan exiles, stood out again as the rival of Syracuse; and Hamilcar, son of Gisgo, won many Greek cities to the Carthaginian alliance and blockaded Agathocles in Syracuse. Agathocles broke through and carried the war into Africa, where he won many successes (310–307) but was finally completely defeated and had to flee back to Sicily. In spite of this defeat he maintained his position at Syracuse and made peace on the old terms with Carthage. He formed marriage alliances with Ptolemy I of Egypt and with Pyrrhus of Epirus, who married his daughter. He was the first of the Sicilian tyrants to take the title of king. He died in 289. In spite of his reputation for treachery and massacre, his rule was remembered as a period of prosperity.

The Mamertini

In the troubles which followed Agathocles' death, his disbanded Campanian mercenaries seized Messana and called themselves the Mamertini, children of Mamers, or Mars. The fortunes of Sicily were thus linked with Rome. The attack on the Mamertini by Hieron II, king of Syracuse, led in 264 to the intervention of Rome and the First Punic War (264–241). The war began as a three-cornered event between Rome, the Carthaginians, and Hieron; but in 263 Hieron turned from the Carthaginians to Rome and formed an alliance to which he remained loyal for the rest of his long life. The Romans were thus free to use Greek Sicily as a base for war with Carthage. The western part of the island, both Greek and Phoenician, suffered greatly in this long war. By the treaty which ended it Carthage ceded to Rome all its possessions in Sicily, which thus became the first Roman province (241). Hieron retained possession of eastern Sicily, south of Messana. His rule was able and enlightened, and his financial enactments, particularly his corn laws, were taken over when Rome incorporated his kingdom. This period of peace was the last golden age of free Sicily.

Roman Sicily. At the outbreak of the Second Punic War Hieron held firm to the Roman alliance, but after his death in 216 his grandson Hieronymus repudiated it. Hieronymus was overthrown by revolution at Syracuse (215), but the city had to stand a siege from the Romans. The great fortress of Euryelus perhaps took its final form then, under the inspiration of Archimedes, though there is no reason to doubt that its construction began in the time of Dionysius I. Syracuse was taken and sacked in 212, Akragas after a further campaign in 210. The whole of Sicily then became Roman.

Little is known of the early organization of the Roman province. It was governed by a praetor sent out yearly from Rome, who after the annexation of Syracuse had his capital there. Two quaestors were appointed, one with his office at Syracuse, the other at Lilybaeum. The province included a number of free cities: Messana, Tauromenium, and Netum (Noto) were allied cities (the two latter had probably taken the Roman side in the Second Punic War); a number of others, including allies from the First Punic War, were also free—Segesta, Halicyae, Panormos, Halaesa, and Centuripe. The rest paid tithes to the Roman people according to the law of Hieron, which was extended to the whole island. Sicily had long had a surplus of corn for export, and Livy records occasional dispatch to Rome as early as the 5th century BC; the island now became the granary of the Roman people. The rolling country of the central part of the island was suitable for pasture and cultivation on a large scale in latifundia (landed estates), and slave gangs were introduced on the estates both of rich Sicilians and of Roman citizens. Hence arose the two great slave revolts of the second half of the 2nd century BC, the first, led by Eunus, from 135 to 132, with Enna and Tauromenium as its centres, the second from 104 to 100, both periods of internal and external stress at Rome. The settlements after these two wars by Publius Rupilius (131) and Manius Aquilius (99) modified the organization of the province.

In spite of slave wars and the burden of Roman provincial governors and tax farmers, Sicily was not unprosperous under the Roman republic. It was free from external dangers; and even the unprivileged cities kept their own laws, magistrates, and assemblies, and provision was made for lawsuits between Romans and Sicilians and between Sicilians of different cities. There seems not to have been much commercial exploitation; tax collecting was normally in the hands of the Greeks themselves, not of Roman *publicani;* and smallholdings continued to be the rule in many cities. The wealth of the cities, both free and tributary, may be seen from the speeches of Cicero in prosecution of Gaius Veres, who in three years' governorship (73–71) had plundered widely, with especial attention to works of art. He also failed to defend the province against pirates.

Sicily was again a battlefield between 43 and 36 BC, when Sextus Pompeius held Messana and cut off the corn supply of Rome. In the division of provinces between Augustus and the Senate, Sicily fell to the latter. It had perhaps received Latin rights from Julius Caesar. Augustus planted colonies at Panormos, Syracuse, Tauromenium, Thermae, Tyndaris, and Catania. But the island remained Greek; not only the old Greek cities but also the old Sicel towns, which had long been completely assimilated to the Greek, used Greek as their everyday language, though Latin was the official language. Christianity was early introduced to Syracuse, where the catacombs and early churches (belonging mainly to the Byzantine period) are second only to those of Rome.

Byzantine rule. The Byzantine general Belisarius occupied Sicily in 535, when his emperor began hostilities against the Ostrogoths in Italy, and after a short time Sicily came under Byzantine rule. When the emperor Heraclius and his successors divided the empire into themes (provinces), Sicily became one of them, placed between the exarchate of Ravenna in the north and that of Carthage in the south; it was administered by a *patricius* responsible to the government at Constantinople. Probably after the Italian revolt of 726 and certainly after the fall of the exarchate in the middle of the 8th century, the Byzantine dominions in southern Italy were incorporated in the theme of Sicily, an arrangement that lasted until the time of the Arab conquest, when the mainland dominions were formed into the themes of Calabria and Longobardia.

Ecclesiastically, Sicily remained at first under the papacy, which in addition to rights of jurisdiction had considerable interests in the island, arising from its vast Sicilian estates. Gregory I's letters admirably illustrate the importance attached to them by the pope. The Iconoclastic Controversy and the ensuing revolt against Byzantine rule under papal leadership (726) led to the confiscation by the emperor of the papal estates in Sicily and southern Italy; soon after, the ecclesiastical jurisdiction of these regions passed to the patriarch of Constantinople.

These political and ecclesiastical changes corresponded to demographic and cultural developments of longer standing. In Sicily and southern Italy, the Greek element had been greatly strengthened since the end of the 6th century as a result of emigration from other Byzantine provinces after the Avar and Slav invasions of Greece and, later, of the Persian and Arab conquests. The Hellenization of Sicily, which appears to have been all but complete in the 8th century, is revealed in the history of the Sicilian Church. The Greek rite, already used at the time of Gregory I, spread during the 7th century from the eastern coast over the whole of the island. By the time of its separation from Rome, the Sicilian Church was virtually Greek. Sicily was thus well on the way to becoming a fully integrated part of the Byzantine Empire when the Arab conquest began in 827.

Spread of the Greek rite

Arab conquest. Ever since the 7th century, Arab expansion in North Africa had constituted an immediate threat to Sicily and to southern Italy, the occupation of which would moreover expose Greece, the exarchate of Ravenna, and Dalmatia to Saracen attack. Sicily consequently became a vital link in the imperial defense against Islām.

Rebellions within Sicily significantly weakened Byzantine rule, leading finally to the Arab conquest. The last Byzantine stronghold, Rameta, was not lost until 965. The Byzantines, however, did not abandon hope of reconquering Sicily. Basil II was planning a Sicilian expedition at the time of his death (1025); it was actually dispatched in 1038 under the great Byzantine general George Maniaces. The campaign was highly successful, and a large part of eastern Sicily, including Messina and Syracuse, was recaptured; but after Maniaces was suddenly recalled, the Byzantine position on the island collapsed.

The Arab conquest separated Sicily not only from Constantinople but also from the Italian mainland, where the Arabs did not succeed in establishing themselves permanently. The history of Arab Sicily, on the other hand, was marked by growing independence from Africa. Until 909 it was under the Aghlabids; after their fall, it passed under the Fāṭimids, who moved their capital to Cairo in 972. But from the middle of the 10th century the office of the governor (amir) became hereditary in the dynasty of the Kalbids, until the anarchy after Maniaces' conquests led to the fall of that dynasty and to the division of Sicily into a number of principalities, while Palermo acquired self-government.

During and after the conquest, large Arab immigration from Africa took place; this, together with the conversions of Christians, contributed to make Sicily not only politically but also culturally part of the Arab world. However, the Greek Christian element remained predominant in the Val Demone; and even after the Arabs gained a majority in the rest of Sicily, Christian groups remained scattered over the island.

As in other Arab countries, the Christians, although placed in a position of legal inferiority, enjoyed religious toleration and a measure of self-government in return for paying taxes, which may have been often less burdensome than those levied by the Byzantines. Relics of the Greek episcopate seem to have survived to the end of the Arab period; so did a number of Basilian monasteries; both provided the principal link with the Byzantine world outside (particularly with Calabria, where the Greek population had been strengthened by emigrants from Sicily). As far as the Sicilian clergy, secular and regular, was concerned, this emigration seems to have been less the result of persecutions than of the gradual spread of Islām over Sicily.

The Norman conquest: Roger I. When the Normans began to conquer Sicily in 1060, they were welcomed as liberators, and their progress was doubtless assisted by the Christian population. They were no newcomers to the island. Norman mercenaries from the mainland, among them two sons of Tancred of Hauteville, had fought in Maniaces' army and taken part in the capture of Messina. In 1059 Pope Nicholas II invested another son of Tancred, Robert Guiscard, with his past and future conquests not only in Apulia and Calabria but also in Sicily. In his oath of allegiance Robert styled himself "by the grace of God and St. Peter duke of Apulia and Calabria and, with their help, hereafter of Sicily."

The conditions under which the Norman expedition took place were to leave a profound mark on the history of Sicily. The papal enfeoffment of Robert with Sicily may have been legally contestable—it was naturally not recognized by Constantinople—but it forged a link between the papacy and Sicily that long outlasted Norman rule.

It was Robert's brother, Count Roger I, who as the former's vassal and with his assistance became the real conqueror of Sicily. Internal conflicts among the Arabs served him well. The amir of Syracuse and Catania, at war with his brother-in-law, the amir of Girgenti (Agrigento) and Castrogiovanni (as Enna came to be called), went so far as to offer Roger his help to conquer the island. The first landing (1060), near Messina, was followed by an equally inconclusive attack on that town in 1061; the third, made in greater strength and with the participation of Robert, succeeded (summer, 1061). The possession of Messina gave the Normans control of the straits and a military base for further advance; the capture of Palermo (1072) concluded the first phase of the conquest; and the capture of Noto (1091) completed it. Although Robert's assistance was at first all-important, Roger soon assumed the leading role. After the conquest Robert probably retained only Palermo—apart from the suzerainty over the whole island, which suzerainty became entirely nominal under Roger Borsa, Robert's weak successor as duke of Apulia (1085–1111), who in 1091 surrendered half of Palermo to his uncle.

The Norman capture of Messina

If Roger was the real conqueror of Sicily, he was also the founder of the Norman Sicilian state. By distributing fiefs sparingly, he gave feudalism a less important place in Sicily than it had acquired on the mainland, where Robert Guiscard had established his ducal power by making the Normans accept him as their ruler. At the same time he accepted much of the existing law and institutions. In his treatment of the Arab majority, his policy of religious toleration resembles that previously practiced by the Arabs. Their legal conditions varied considerably, ranging from the liberties that they enjoyed at Palermo, where they had their own quarter and mosques, to the serfdom of the mass of the country population. Roger made use of their military and administrative services; many leading Arabs, however, seem to have left the country after the conquest.

Roger showed much favour to the Greeks, as appears from his lavish patronage of Basilian monasticism. He founded or restored at least 14 Greek monasteries as against four Benedictine ones. The Norman conquest was followed by an increase of the Greek population, Basilian monks from Calabria forming only one element of the new immigration. The Sicilian Church, however, became Latin, according to the promise made by Robert Guiscard to Pope Nicholas II in 1059. But the papacy was left only little influence in it; the concession of the apostolic legation to Roger (1098) made the Sicilian Church practically independent of Rome by sanctioning an already existing state of monarchical control.

Roger II and the foundation of the kingdom. The survival of Roger I's work during the difficult period after his death (1101) was a measure of his success. Roger's son and heir Simon died in 1105 and was succeeded by his brother Roger II; but their mother, Adelaide, ruled as regent from 1101 until Roger attained his majority in 1112. Roger continued his father's efforts to take advantage of the difficulties of the Duke of Apulia (Roger Borsa had been succeeded by his son William in 1111), not only eliminating the last relic of ducal authority on the island by obtaining the second half of Palermo in 1122 but also extending his lands and influence in the duchy of Apulia and in Calabria. After Duke William's death in 1127, Roger II crossed over to the mainland to assert his claims as his heir.

Roger's expedition opened a period of struggles that lasted until 1139. His claims were opposed not only by many lords and towns but also, until 1128, by Pope Honorius II. By supporting the antipope Anacletus II against Innocent II, Roger obtained the royal title for Sicily, Apulia, and Calabria (1130). But this led to an alliance of Innocent II and the emperor Lothair against the ruler who by his support of the antipope was primarily responsible for the prolongation of the schism. Lothair's invasion of the kingdom in 1136 in alliance with Pisa and Venice and, perhaps, Byzantium brought Roger's fortunes to their lowest point. But after Lothair's withdrawal, Roger soon recovered lost ground; and after the death of Anacletus (1138), Innocent II confirmed him in the royal title. The Treaty of Mignano (1139) meant the final acknowledgement by the papacy of the Norman kingdom, which included the mainland provinces of Apulia, Calabria, and Capua as well as Sicily.

The political problems of the kingdom were, to no small extent, a legacy of the different territories of which it was formed. Thus the conflicts with the German and Byzantine emperors belong largely to the history of the southern Italian provinces, while Roger's and his successors' African policy is rooted in the earlier history of Sicily. The first expeditions against the Zirid prince of Mahdia in North Africa (1118, 1123) were failures; but in 1134–35 internal discords in the Zirid state provided Roger with fresh opportunities for intervention, which was facilitated by the growth of the Sicilian navy; the expedition led to the occupation of the island of Djerba. The capture of Tripoli in 1146 initiated a series of conquests that culminated in that of Mahdia in 1148; by that year, Roger's African empire extended from Tripoli to Tunis, from the desert of Barca to Kairouan. That it was short-lived was primarily due to the failure to check the growing power of the Almohads; and the death of the grand admiral George of Antioch, the conqueror of Africa, in 1151–52 and that of Roger II in 1154 jeopardized its survival. The crisis was to begin in 1156 with an Arab rising in Africa; by 1160, the African empire was lost. The Norman kings, however, did not abandon their African ambitions: William II was to send a fleet to lay siege to Alexandria in 1174, and further expeditions were to be undertaken against the North African coast in the following years.

Extension of Roger's African Empire

Expansion in Africa had sharpened the antagonism between Norman Sicily and Constantinople. At first, when the Byzantines had received support from the Western emperors, the alliance of the two empires constituted a formidable threat to the Sicilian kingdom; but the clash between Byzantine and Western imperial claims led, after Frederick I Barbarossa's Roman coronation (1155), to the end of the alliance, Frederick continuing an anti-Norman policy of his own. Roger took the initiative against the Byzantines in 1147 and 1149, seized Corfu, and invaded Greece. The Byzantines, on the other hand, reconquered part of Apulia in 1155, after Roger's death; but they lost the conquered territories again after their crushing defeat at Brindisi (1156). Peace was concluded in 1158 and was not broken until 1185, when King William II invaded the Byzantine Empire, took Durazzo (Durres) and Thessalonica, and advanced toward Constantinople, with the ultimate aim of seizing the Eastern imperial crown. But the counteroffensive under the new emperor Isaac II Angelus put an end to this expedition. It was the last great enterprise of the Norman kings.

Internal development of Norman Sicily. Roger II's internal policy was based on that of his father and was continued by his son William I (1154–66) and by the latter's son William II (1166–89); but his own contribution to the building of the Sicilian state was very great. The combination of Norman, Arabic, and Byzantine elements is perhaps the most striking but at the same time a very natural characteristic of the government and civilization of the kingdom. Roger's Assizes of Ariano (1140) derive largely from Justinian and later Byzantine law; very strong Byzantine influence can be found in the judicial and fiscal administration and in the central financial department, the *duana* (diwan), the personnel of which was originally Arabic. The Norman chancery issued documents in Latin, Greek, and Arabic. On the other hand, the curia was primarily modelled on that of the northern European states; and not only were feudal institutions accepted but feudal barons also played an important part in the provincial and local administration. At the same time, some of the most influential ministers of the Norman period, the grand admirals such as George of Antioch, were Greeks. Roger's capital was cosmopolitan Palermo.

But despite the role played by Greeks and Arabs in the bureaucracy, Sicily became progressively Latinized. While the Muslim population was decreased by conversions, the Latin element was strengthened by the settlement of colonies of "Lombards" (*i.e.,* mainlanders), Greeks and Arabs being gradually reduced to small minorities. This process is also reflected in the large number of Latin monasteries founded by the kings, after the initial favour shown to the Basilian monks. But Sicilian civilization retained the composite character that it had possessed from the beginning; Sicilian scholars translated Greek classical texts into Latin; Idrisi, on the orders of Roger II, composed one of the outstanding works of Arab geography; and Sicilian architecture was the product of Roman, Byzantine, Arabic, and Norman influences.

The Hohenstaufen accession. William II's death (1189) was followed by a struggle for the succession. William I and William II had long supported Pope Alexander III in his conflict with Frederick Barbarossa; but a truce had been concluded in 1177 and the subsequent rapprochement between the King and the Emperor had resulted in William II's sanctioning the betrothal of Frederick's son Henry to Constance, daughter of Roger II and heiress apparent to the kingdom (1184; marriage 1186). This created a situation of great potential danger for the papacy, as it strengthened imperial claims on the kingdom of Sicily by the addition to them of Constance's rights. On William's death, however, there was strong Norman opposition to the prospect of German rule, and Tancred, an illegitimate grandson of Roger II, was crowned king. Frederick's son, who had succeeded his father as Henry VI, failed to make good his claims in 1191, when he was forced to raise the siege of Naples; but the sudden death of Tancred early in 1194 proved a turning point. The reign of his young son, William III, under the regency of Queen Sibylla lasted only 10 months; Henry VI finally occupied the kingdom and was crowned king at Palermo in 1194. A new period in the history of Sicily had begun.

Struggle for succession

Henry aimed at including Sicily permanently in the empire, which he unsuccessfully tried to make hereditary in his family, the House of Hohenstaufen; and the distribution of high offices and lands among his followers was to strengthen his control of the kingdom. His death in 1197 temporarily put an end to imperial domination. Constance, as ruler with her young son, the future emperor Frederick II, returned to a strictly Norman policy. But she died in 1198, leaving Frederick under the guardianship of Pope Innocent III. The following years were marked by growing anarchy, due to the weakness of the monarchy, to the attempts of German lords to seize hold of the kingdom, to the Arabs' endeavours to improve their position, and to the commercial expansion of Pisa and Genoa. After Frederick had reached his majority (1208), Innocent handed the government over to him.

The emperor Frederick II (Frederick I of Sicily). In 1211 Pope Innocent saw himself forced to support Frederick's renewed election as king of the Romans or as German king. Frederick promised Innocent, just before the latter's death in 1216, to renounce the Sicilian kingdom in favour of his son Henry after his imperial coronation; but the papacy's hope to prevent in this way the reunion of Sicily and the empire was not fulfilled, for in 1220 Frederick succeeded in having Henry elected German king. The eventual union of the German and Sicilian crowns, foreshadowed by this election, made papal insistence on Frederick's renunciation obsolete; and when Frederick was crowned emperor in the same year, Honorius III tacitly recognized him also as Sicilian king.

Frederick devoted the following years to the restoration of royal power in the kingdom; and in this formidable task he revealed himself the true successor of Roger II. In Sicily Frederick acted as Norman rather than German ruler: symptomatically, his edict on the resignation of privileges (1220) put the deadline at the death of William II, not of Henry VI. His preoccupation with the affairs of the kingdom was largely responsible for the postponements of his crusade, which led in 1227 to his excommunication. Papal troops invaded the kingdom during his absence in Palestine (1228–29); but Frederick's return meant his im-

The Constitutions of Melfi (1231)

mediate victory, and the Peace of San Germano (1230) was followed by further internal reforms. The Constitutions of Melfi (1231), a legal code inspired by Roger II's Assizes, give a remarkable insight into the organization of the kingdom and also into the political ideas of its ruler. Frederick carried the evolution of the Sicilian administration considerably beyond what had been achieved by the Normans; on the other hand, the use that he made of assemblies of estates, including municipal representatives (from 1232), was a landmark in the history of the Sicilian parliament. In his highly centralized government Frederick was the heir to his Norman predecessors, whose work he continued. The same continuity can also be seen in Sicilian culture, but at Frederick's brilliant cosmopolitan court Italian poetry provided a new formative element.

The end of Hohenstaufen rule. Frederick's work was jeopardized and his dynasty ruined by the union of Sicily with the empire. The conflicts with the papacy and with its allies, the Lombard communes, meant a serious strain on the Sicilian economy and started a chain of events that was finally to lead to the establishment of the House of Anjou in the kingdom. Innocent IV, having declared Frederick deposed from the imperial throne (1245), wanted to deprive him and his descendants of the Sicilian crown as well. Frederick's death in 1250 and that of his son Conrad IV in 1254 provided the papacy with new opportunities, but the success of Manfred, one of Frederick's illegitimate sons, in establishing control over the kingdom even before Conrad's death complicated the situation and gave rise to lengthy and tortuous negotiations in which papal offers of the Sicilian crown to foreign princes alternated with rapprochements to Conrad and to Manfred. Manfred was crowned king at Palermo in 1258—a usurpation of the rights of Conradin, Conrad IV's young son and heir. In 1263, after negotiations with Manfred had broken down for the last time, Pope Urban IV announced the choice of Charles of Anjou, brother of Saint Louis, as king of Sicily (Edmund Lancaster, son of Henry III of England, who had been invested by the papacy with the kingdom in 1255, had failed to substantiate his claims). In 1265 Charles was invested with the kingdom by Pope Clement IV in Rome; near Benevento, in 1266, he defeated Manfred, who was killed.

Charles of Anjou. After Benevento there was no serious resistance to Charles in the kingdom. But his rule had still to stand its test when Conradin came to Italy in 1267 to seize his inheritance. A rising in his favour swept the kingdom and showed the fragility of Charles's position. In 1268, however, Conradin was defeated at Tagliacozzo and executed at Naples. There followed severe suppression of the revolt, especially in Sicily, where it had been more widespread than on the mainland. Charles tried to put his power on a firm foundation by a large-scale distribution of fiefs among his French nobility. At the same time he preserved, in its main outlines, Frederick's system of government. The "French colonization," however, and the sense of grievance that it caused among the Sicilians was partly responsible for the great revolt of 1282, known as the Sicilian Vespers, which severed Sicily once more from the mainland.

The Aragonese. The revolt of the Vespers precipitated the arrival in Sicily of Peter III of Aragon, who had a claim to the crown through his marriage (1262) to the Hohenstaufen heiress Constance, Manfred's daughter. The Sicilians, however, were jealous of their independence: it had been only after the papacy had rebuffed their appeal for recognition of a communal regime of their own that they had addressed themselves to Peter. While Peter was accepted as king (Peter I), Constance governed the island for him until his death in 1285; but then, whereas their eldest son succeeded to Aragon as Alfonso III, the Sicilian crown was transmitted to their second son, who became James I of Sicily. The termination of the personal union between Aragon and Sicily was gratifying to Sicilian separatist feeling, but its effect was prejudiced when Alfonso, having already deserted the Sicilian side in the continuing War of the Sicilian Vespers, died without issue in 1291. In his will he had stipulated that if his brother James were to succeed him in Aragon as James II, he should renounce Sicily to their youngest brother Frederick, in repetition of the previous arrangement; but James, heir to Aragon in his own right, would not at first be bound by this condition and simply nominated Frederick as his lieutenant in Sicily. Subsequently, however, he found that from Aragon's point of view it was indeed expedient to renounce the Sicilian connection; and by the Treaty of Anagni (1295) he agreed to surrender Sicily to the papacy.

The War of the Sicilian Vespers

The Sicilians reacted against this new betrayal by taking Frederick as their king. Though in fact he was Frederick II of Sicily, he took the style of Frederick III.

James II of Aragon allied himself with Charles II of Naples to execute the Treaty of Anagni against the Sicilians, but the allies' efforts came to nothing; and the Treaty of Caltabellotta (1302) brought the 20 years' War of the Vespers to an end: Frederick was to have the kingdom for his lifetime, after which it should revert to the Neapolitan Angevins. Pope Boniface VIII, whose predecessors had steadfastly opposed the Aragonese over Sicily, could only insist that Frederick should style himself "king of Trinacria" (*i.e.,* "of the Three-cornered Isle") instead of "king of the Island of Sicily."

The Angevin-Aragonese peace did not last long. Having taken the emperor Henry VII's side against Robert of Naples and the Guelphs, Frederick resumed the title "king of Sicily" and, in 1314, induced the Sicilian parliament to declare that on his death the crown should pass to his son Peter. Successive Neapolitan attacks on the island failed to reduce him, and on his death his son succeeded him as Peter II (1337).

Frederick's position had obliged him to rely on the support of the Sicilian parliament. He organized it as an assembly of three *bracci*, or houses, representing the feudatories, the clergy, and the towns of the royal domain, on the model of the three estates of the kingdom of Aragon; and he associated it with himself in the exercise of sovereignty. Himself a strong ruler, he was able to keep his barons in order. Under his successors, however, the barons began to assert themselves both in encroachment on the royal authority and in internal warfare of their own; *e.g.,* between the "Latin" faction (the older Sicilian nobility) and the "Catalan" (the Aragonese newcomers) during the reign of King Louis, who was only four years old when he succeeded his father, Peter II, in 1342.

The next king, Frederick III (properly numbered), who succeeded his brother Louis in 1355, managed to withstand renewed attacks by the Neapolitan Angevins (who occupied Messina for a short time in 1356) and finally came to terms with Joan I of Naples in 1373: she agreed that Sicily, officially called Trinacria again, should be a separate kingdom in vassalage both to the Holy See and to her own kingdom of Naples-Sicily.

Frederick III died in 1377, leaving a daughter, Mary, as his heiress. There ensued a long period of disorder. Peter IV of Aragon, on the grounds that the testament of Frederick III (II) precluded female succession to the Sicilian crown, claimed it for himself as the nearest male heir (he was also the father of Mary's mother and the husband of her aunt); and Mary underwent a series of abductions. Peter, however, in the face of objections from the papacy and the Angevins, in 1380 ceded his pretensions to his second son, Martin, duque de Montblanch, whose son Martin was to marry Mary. Peter IV died in 1387, leaving Aragon to his elder son John I; the Queen of Sicily was brought to Spain in 1388; and her marriage to the younger Martin took place in 1390. In 1392 the couple landed in Sicily with Martin of Montblanch and began to reign as queen and king-consort, despite strong local opposition. Mary died in 1401, leaving her widower to reign alone as Martin I of Sicily; but meanwhile the Duque de Montblanch had become king of Aragon as Martin I in 1395 through the death of John I. When Martin I of Sicily died without legitimate issue in 1409, he left his kingdom, with his second wife, Blanche of Navarre, as regent, to his father, who thus became Martin II of Sicily.

Martin II, who had no surviving children of his own, intended that Sicily at least, if not Aragon too, should go to his grandson Fadrique (Frederick) de Luna, a bastard of Martin I of Sicily. On Martin II's death, however, in

1410, this succession was contested; and Ferdinand of Antequera, son of Peter IV's daughter Leonor, having been chosen king of Aragon as Ferdinand I in 1412, defeated Fadrique's partisans and reestablished Blanche's authority as his regent in Sicily. Thenceforward the Aragonese (later the Spanish) and the Sicilian crowns were to remain united for nearly 300 years (until the War of the Spanish Succession).

Alfonso V of Aragon (I of Sicily), having succeeded his father, Ferdinand I, in 1416, used Sicily as his base for his expeditions to Naples during Joan II's precarious tenure of that kingdom; and the Aragonese conquest of Naples after Joan's death temporarily restored the personal union of the Neapolitan and Sicilian crowns. Alfonso, however, kept the two kingdoms theoretically separate, arranging as early as 1443 that his bastard son Ferdinand (Don Ferrante) was to inherit Naples, whereas Sicily passed at his death in 1458 to his brother John II of Aragon (John I of Sicily). John's son Ferdinand II finally recovered Naples for the legitimate line of Aragon (1503).

The dynastic troubles of the period 1337–1412 had further helped the Sicilian feudatories and the towns to extort privileges from the kings as the price of support. The royal lieutenants or viceroys who ruled for the Aragonese kings from 1415 had extensive powers but still had always to reckon with the Sicilian parliament. By the middle of the 15th century it had become an accepted principle of the constitution of the kingdom that no new taxes should be levied without the parliament's consent; and this power of veto over subsidies to the king made the *bracci* a formidable obstacle to royal or viceregal absolutism, as well as to any attempt to reduce feudal, ecclesiastical, or municipal privileges.

The Spanish Habsburgs. Ferdinand II, dying in 1516, left Sicily, with Naples and all his Spanish inheritance, to his grandson, the Austrian Habsburg Charles I of Spain, who three years later became Holy Roman emperor as Charles V. The reign began with a rising (1516) of the privileged orders against the viceroy, Hugo de Moncada, whom Charles recalled without cancelling the edicts that had provoked the trouble. A rising against the new viceroy, Ettore Pignatelli, duque de Monteleone, developed however into widespread outrages against the nobility, which reacted by co-operating with the viceroy. Thereafter the privileged orders in general professed themselves loyal to the distant monarchy, which stood as the guarantor of their privileges, while the viceroys had to bear the burden and the odium of actual government, raising the necessary taxes and trying to keep order in an island still prone to baronial vendetta and to jealous rivalries between towns. The arrival of the Ottoman Turks in the western Mediterranean exposed Sicily to danger from a new quarter, and it became a base for the Emperor's counterattacks on the North African coast.

Rising against the viceroy

In 1555 Charles V abdicated Naples to his son, the future Philip II of Spain. Pope Paul IV then promoted a scheme whereby the French should conquer Naples for a prince of their own house and seize Sicily for the Venetians; but Philip, to whom Charles V had abdicated Spain and Sicily in 1556, forced the Pope to recognize him in 1557 and secured peace from the French in 1559. The Battle of Lepanto (1571) checked the gravest menace from Turkey.

Contributions from Sicily were required for Philip II's enterprises in western Europe and for the defense of Spanish interests in the west and in Italy during Philip III's reign (1598–1621). With the growth of the French challenge to Spain during Philip IV's reign (1621–65) the viceroys had constantly to raise more troops and more money, and the measures to which they turned were resented as oppressive or contrary to the traditional privileges of Sicily. In May 1647, when the viceroy Pedro Fajardo, marquês de Los Vêlez, had put a tax on grain and at the same time tried to keep the old price of loaves by reducing their weight, the people of Palermo rose in revolt and forced him to repeal the tax. Then, in July, the Palermitans, led by Giuseppe Alessio, rose again to demand the repeal of all taxes imposed since Charles V's death and the reservation of the viceroyalty and other public offices to Sicilians; the viceroy withdrew from Palermo and, fearing lest the Sicilian barons and the other towns might join the rebellion, began negotiations with Alessio. The latter, however, lost control over his riotous followers and was assassinated; Messina, always the envious rival of Palermo, remained loyal; the French took no advantage of the situation; and in September the viceroy and his Spaniards returned to the capital, where he died a few weeks later. His successor, faced with another revolt, had to concede a general amnesty. The events of the early summer had largely inspired the parallel revolt of Masaniello in Naples.

The revolt of Messina (1674)

The revolt of Messina in 1674, during the reign of Charles II of Spain, was no less characteristic of Sicily under foreign rule than that of Palermo and was more serious because the French, at war with Spain again, were able to exploit it. The governor of Messina, Luis del Hoyo, wishing to break the stranglehold of the municipal oligarchy over the senate of Messina, tried to exploit popular discontent during a food shortage in order to introduce a popular element into the Senate. The oligarchy stirred up its own popular reaction; Del Hoyo was replaced by Diego de Soria as governor; but conflict between the Senate's and the governor's factions went on until, in August 1674, Soria was besieged in his palace and force to capitulate. The Messinese then appealed to Louis XIV of France, a French fleet arrived in September with supplies of food, and in April 1675 the Duc de Vivonne (Louis Victor de Rochechouart) was sworn in as Louis XIV's viceroy of Sicily. Though Palermo declared itself for Spain against its traditional rival, the whole island might have fallen to the French if the Dutch had not sent a fleet, under the great M.A. de Ruyter, to support their Spanish ally. The naval war around the island was indecisive, and Messina itself held out against the Spaniards until the French, making the Peace of Nijmegen (1678), deserted the Sicilian cause. A viceregal amnesty to the rebels was revoked, and Messina's Senate and privileges were abolished.

The Savoyard and Austrian Habsburg interval. Charles II's death (1700) was followed by the War of the Spanish Succession, during which Sicily's eventual fate was continually in discussion between the belligerent powers. The Austrians overran the Kingdom of Naples (1707); and the Bourbon Philip V of Spain, under pressure from the English, ceded Sicily to Victor Amadeus II of Savoy at the Peace of Utrecht (1713). The Franco-Austrian Peace of Rastatt (1714) left the Austrians in possession of Naples and also gave Sardinia to them, but Spain was not a party to this peace.

The Spaniards, having seized Sardinia in 1717, invaded Sicily in July 1718. Victor Amadeus was unable to defend his kingdom without Austrian help. Austria, however, wanted to exchange Sardinia with him for Sicily; and this exchange had been included in the plan on which the Quadruple Alliance of Great Britain, France, the United Provinces of the Netherlands, and Austria (August 1718) was formed for the settlement of the Austro-Spanish dispute.

The British admiral George Byng (later Viscount Torrington) destroyed the Spanish fleet off Cape Passero; the Austrians crossed the straits into Sicily; Victor Amadeus agreed to the plan for the exchange; and declarations of war against Spain were issued from Great Britain in December 1718 and from France in January 1719. By the Treaty of The Hague (February 1720) Spain accepted the terms of the alliance, and Sicily passed to Austria.

The Bourbons. Extremely disliked in Sicily, Austrian rule there came to an end during the War of the Polish Succession, when the Spanish Bourbon infante Don Carlos, having first conquered Naples and the mainland for himself, was crowned king at Palermo in July 1735. Having initiated his great program of enlightened reform for his two Italian kingdoms, he abdicated Naples and Sicily to his third son, Ferdinand (III of Sicily), when he himself became king of Spain as Charles III in 1759. The antifeudal policy of the viceroy Domenico Caracciolo in the 1780s was resented by the Sicilian baronage, but Ferdinand was able to take refuge in Sicily when he was expelled from Naples by the French Revolutionary army in 1799. On his second expulsion from Naples, during the Napoleonic period, Ferdinand established himself in Sicily again (1806), to remain there, under British protection, for a far longer time. The British occupation, with Lord William Bentinck as ambassador in practical control of affairs from 1811, was chiefly important to Sicily for the constitution of 1812. The old parliament, ever jealous of its right to bargain with the crown, had been obstructing the war effort and so was superseded by a bicameral organ on British lines. Though this "English" constitution went some way to satisfying Sicilian particularism, it offended not only the King but also the more reactionary elements in Sicily insofar as it curtailed their privileges, notwithstanding its aristocratic bias.

The restoration of the Bourbons to Naples (1815) put an end to the constitution; and in 1816 the unitary Kingdom of the Two Sicilies was proclaimed, subjecting Sicily to centralized government from Naples, with the King now styled Ferdinand I. The Sicilians hated this, and, in 1820, Palermo rose in revolt for their constitution of 1812. The contemporary Neapolitan revolution, on the other hand, was for the democratic Spanish constitution of 1812, and troops from Naples suppressed the Sicilian autonomist movement before Naples in turn was put down for Ferdinand by the Austrians.

Ferdinand I was succeeded by Francis I (1825–30), the latter by Ferdinand II (1830–59). When revolution broke out in Sicily in January 1848, the latter promised a constitution, but the Sicilians, acting again in disunion with the mainland, soon declared the deposition of the Bourbon dynasty and offered the crown to a prince of the House of Savoy. After the defeat of the Neapolitan revolution in 1849, Carlo Filangieri reduced Sicily to obedience again in April–May.

The last Bourbon king of Sicily

Francis II was the last Bourbon king of Sicily. Within a year of his accession, Giuseppe Garibaldi landed at Marsala with his "Thousand" on May 11, 1860. A provisional government was formed at Palermo in June, a constitution was proclaimed in August; but after Garibaldi's conquest of Naples and his junction with the Sardinian-Piedmontese army, a Sicilian plebiscite in October decided by an overwhelming majority under universal suffrage for annexation to Sardinia. Messina, which held out for Francis, fell to the Piedmontese in March 1861. Sicily thus became part of the new kingdom of Italy.

The Italian Regione. Despite the plebiscite, the House of Savoy found Sicily no more docile than earlier foreign dynasties had found it. Garibaldi's abortive *pronunciamiento* of 1862 was launched from Sicily and supported by the Sicilians, whom the royal government had to reduce by force. Brigandage and conspiracy continued into the 20th century, feeding on separatist tradition, on Catholic resentment at the government's treatment of the papacy before the Lateran Treaty, and on general discontent at the north's neglect of the backward south. Symptomatic of this state of affairs was the persistence of the Mafia.

After World War II, during which Sicily had become a battleground, the Italian government gave more sympathetic attention to the island's problem. (N.Ru./Ed.)

BIBLIOGRAPHY

General works. *Enciclopedia Italiana,* 36 vol. (1929–37), a basic, if somewhat dated, source; EDITORS OF HOLIDAY, *Italy* (1960), a good, general book mostly for the tourist; TOURING CLUB ITALIANO, *Conosci l'Italia* (1957–), a basic guidebook; see also DENIS MACK SMITH, *Italy: A Modern History* (1959); NINETTA JUCKER, *Italy* (1970); and LUIGI BARZINI, *The Italians* (1964).

Physical and human geography. *The land and people:* DONALD S. WALKER, *A Geography of Italy,* 2nd ed. (1967), a comprehensive text covering regional, economic, physical, and historical aspects; ROBERT E. DICKINSON, *The Population Problem of Southern Italy* (1955), a pioneer study of settlement patterns; CARLO BATTISTI, "La lingua nazionale e le minoranze linguistiche in Italia," in *Archivio per l'Alto Adige,* 54:155–208 (1960).

The economy: G. BARBERO, *Land Reform in Italy* (1961), is a study of economic achievements and future prospects. Italian statistical publications include: *Annuario statistico italiano, Annuario di statistica agraria,* and *Annuario di statistiche industriali*—all issued by the ISTITUTO CENTRALE DI STATISTICA. SHEPARD B. CLOUGH, *The Economic History of Modern Italy* (1964); and VERA C. LUTZ, *Italy: A Study in Economic Development* (1962), provide good background information. DONALD C. TEMPLEMAN, *The Italian Economy* (1981), a study of the 1970s economy in nontechnical language.

Administration and social conditions: Basic works include EMILIO CROSA (ed.), *La Constitution italienne de 1948* (1950); NORMAN KOGAN, *A Political History of Postwar Italy* (1981); ROBERT CHARLES FRIED, *The Italian Prefects: A Study in Administrative Politics* (1963); and ROBERTO ALMAGIA, *L'Italia,* 2 vol. (1959). See also JOSEPH LA PALOMBARA, *Interest Groups in Italian Politics* (1964); and SIDNEY G. TARROW, *Peasant Communism in Southern Italy* (1967).

Cultural life and institutions: CESARE CARAVAGLIOS, *Il folklore musicale in Italia* (1936); and PAOLO TOSCHI, *Arte popolare italiana* (1960), are two excellent Italian sources. Basic references are RENZO FRATTAROLO, *Introduzione bibliografica alla letteratura italiana* (1963); and MARIO PUPPO, *Manuale critico-bibliografico per lo studio della letteratura italiana* (revised annually).

History. *Italy in the early Middle Ages: The Cambridge Medieval History,* 8 vol. (1911–36; 2nd ed., 1966–), contains good coverage of medieval Italy. Primary documentary sources are published in the *Rerum Italicarum Scriptores* by L.A. MURATORI and in the *Monumenta Germaniae Historica.* Also important are the series of the *Historiae Patriae Monumenta,* the *Fonti della storia d'Italia* of the Italian Historical Institute for the Middle Ages, the *Regesta Chartarum Italiae,* and the *Biblioteca della Società storica subalpina.* Still of great use are THOMAS HODGKIN, *Italy and Her Invaders,* 2nd ed., 8 vol. (1892–1916, reprinted 1967); LUDO M. HARTMANN, *Geschichte Italiens im Mittelalter,* 4 vol. (1897–1915, successive editions); and PASQUALE VILLARI, *Le invasioni barbariche in Italia,* 2nd ed. (1905; Eng. trans. of 1st ed., *The Barbarian Invasions of Italy,* 2 vol., 1902). More recent works are ROMOLO CAGGESE, *L'alto Medioevo* (1937); *Il Medioevo,* by various authors, vol. 1 of the *Storia d'Italia,* ed. by the UTET of Turin, 2nd ed. (1965); and GABRIELE PEPE, *Il medio evo barbarico. d'Italia* (1963). Medieval Italy has been put into its European framework in the excellent works of GIOACCHINO VOLPE, *Il Medioevo,* 2nd ed. (1933); GIORGIO FALCO, *La Santa Romana Repubblica,* 5th ed. (1965; Eng. trans., *The Holy Roman Republic,* 2nd ed., 1964); and ROBERTO S. LOPEZ, *Naissance de l'Europe* (1962; Eng. trans., *The Birth of Europe,* 1967). For the social classes and daily life, see ANTONIO VISCARDI and GIANLUIGI BARNI, *L'Italia nell'età comunale* (1966); GIANLUIGI BARNI and GINA FASOLI, *L'Italia nell'alto Medioevo* (1971). For economic history, see WILHELM VON HEYD, ALOYS SCHULTE, and ADOLF SCHAUBE, see ALFRED J. DOREN, *Italienische Wirtschaftsgeschichte,* vol. 1 (1934); FILIPPO CARLI, *Storia del commercio italiano,* 2 vol. (1934–36); GINO LUZZATTO, *Storia economica d'Italia. Il Medioevo,* 2nd ed. (1963); ROBERT S. LOPEZ, "The Trade of Medieval Europe: The South," in *The Cambridge Economic History of Europe,* 2nd ed., vol. 2 (1965). For demography, see JULIUS BELOCH, *Bevölkerungsgeschichte Italiens,* 3 vol. (1937–61). (*Ostrogothic and Byzantine–Lombard periods*): ERNESTO SESTAN, *Stato e nazione nell'Alto Medioevo: Ricerche sulle origini nazionali in Francia, Italia, Germania* (1952); CHARLES H. DIEHL, *Études sur l'administration byzantine dans l'Exarchat de Ravenne, 568–751* (1888); GIAN PIETRO BOGNETTI, *L'età longobarda,* 4 vol. (1966–68); JULES GAY, *L'Italie méridionale et l'empire byzantin . . . , 867–1071,* 2 vol. (1904, reprinted 1960); ARCHIBALD R. LEWIS, *Naval Power and Trade in the Mediterranean, A.D. 500–1100* (1951, reprinted 1970); and NICOLA CILENTO, *Italia meridionale longobarda* (1966). (*Carolingian and post-Carolingian periods*): See the chapters on Italy in LOUIS HALPHEN, *Charlemagne et l'empire carolingien* (1947); and HEINRICH FICHTENAU, *Das Karolingische Imperium* (1949; Eng. trans., *The Carolingian Empire,* 1957); also LOUIS DUCHESNE, *Les Premiers temps de l'État pontifical* (1898; Eng. trans., *The Beginnings of the Temporal Sovereignty of the Popes, A.D. 754–1073,* 1908), a classic, now outdated; and PAOLO BREZZI, *Roma e l'impero medioevale, 774–1252* (1947); ROBERTO CESSI, *Venezia ducale,* vol. 1 (1963); MICHELANGELO SCHIPA, *Il Mezzogiorno d'Italia anteriormente alla monarchia. Ducato di Napoli e Principato di Salerno* (1923); and MICHELE AMARI, *Storia dei Musulmani di Sicilia,* 2nd ed., 3 vol. (1933–39). See also the section on Italy in ROBERT HOLTZMANN, *Geschichte der sächsischen Kaiserzeit, 900–1024,* 3rd ed. (1955); and CHRIS WICKHAM, *Early Medieval Italy: Central Power and Local Society, 400–1000* (1981), a political history.

The High Middle Ages: (*The 11th century*): AUGUSTIN FLICHE, *La Réforme grégorienne,* 3 vol. (1924–37); ERNST WERNER, *Die gesellschaftlichen Grundlagen der Klosterreform im 11. Jahrhundert* (1953). (*Norman Sicily*): JOHN JULIUS NORWICH, *The Normans in the South, 1016–1130* (1967); and *The Kingdom in the Sun, 1130–1194* (1970); FERDINAND CHALANDON, *Histoire de la domination normande en Italie et en Sicile,* 2 vol. (1907); M. CARAVALE, *Il regno normanno di Sicilia* (1966); S. TRAMON-

TANA, *I Normanni in Italia,* vol. 1 (1970). (*The 12th and 13th centuries*): EDOUARD JORDAN, *L'Allemagne et l'Italie aux XII^e^ et XIII^e^ siècles* (1939); PETER RASSOW, *Honor imperii* (1940). The principal contribution to the history of the formation of the autonomous communes is that given by GIOACCHINO VOLPE in *Medio Evo italiano,* 2nd ed. (1928, reprinted 1961) and a whole series of monographs on the Tuscan cities. On the rural communes, and in general on the evolution of society in the countryside, see FEDOR SCHNEIDER, *Die Entstehung von Burg und Landgemeinde in Italien* (1924); and GIAN PIETRO BOGNETTI, *Sulle origini dei comuni rurali del Medio Evo* (1927). Among important works on a single city or region are: VITO VITALE, *Breviario della storia di Genova,* 2 vol. (1955); FRANCESCO COGNASSO, *Storia di Torino* (1934); PIETRO VACCARI, *Pavia nell'alti Medioevo e nell'età comunale* (1956); vol. 3–5 of the *Storia di Milano* of the Fondazione Treccani, Milan (1954–55); PIETRO TORELLI, *Un Comune cittadino in territorio ad economia agricola . . . ,* 2 vol. (1930–52); L. SIMEONI, "Le origini del Comune di Verona," *Nuova Arch.,* vol. 21 (1913); J.K. HYDE, *Padua in the Age of Dante* (1966); GIORGIO CRACCO, *Società e Stato nel Medioevo Veneziano* (1967); DAVID HERLIHY, *Medieval and Renaissance Pistoia* (1967); GAETANO SALVEMINI, *Magnati e popolani in Firenze dal 1280 al 1295* (1899; new ed. 1960 and 1966); and NICOLA OTTOKAR, *Il Comune di Firenze alla fine del dugento* (1926), both on Florence; FERDINAND SCHEVILL, *Siena: The History of a Medieval Commune* (1909, reprinted 1964); ENRICO FIUMI, *Storia economica e sociale di San Gimignano* (1961); GIOACCHINO VOLPE, *Toscana medievale* (1964), including articles on Massa Marittima, Volterra, and Sarzana; and *Studi sulle istituzioni comunali a Pisa,* new ed. (1970); EMILIO CHRISTIANI, *Nobilità e popolo nel comune di Pisa . . .* (1962); DANIEL WALEY, *Mediaeval Orvieto* (1952); PAOLO BREZZI, *Roma e l'impero medioevale, 774–1252* (1947); EUGENIO DUPRE THESEIDER, *Roma dal comune di popolo alla signoria pontificia, 1252–1377* (1952); and ENRICO BESTA, *La Sardegna medievale,* 2 vol. (1908–09). An excellent discussion of the institutions and in general of the communal life is included in DANIEL WALEY, *The Italian City-Republics* (1969). (*The Papal State and Southern Italy*): JOACHIM SEEGER, *Die Reorganisation des Kirchenstaates unter Innocenz III* (1937); DANIEL WALEY, *The Papal State in the Thirteenth Century* (1961); ERNESTO PONTIERI, *Ricerche sulla crisi della monarchia siciliana nel secolo XIII,* 3rd ed. (1958); EDOUARD JORDAN, *Les Origines de la domination angevine en Italie* (1909); EMILE G. LEONARD, *Les Angevins de Naples* (1954); STEVEN RUNCIMAN, *The Sicilian Vespers* (1958); FRANCESCO GIUNTA, *Aragonesi e Catalani nel Mediterraneo,* 2 vol. (1953–59); and J.K. HYDE, *Society and Politics in Medieval Italy: The Evolution of Civil Life, 1000–1350* (1973).

Italy in the late Middle Ages and the Renaissance: Some of the best general accounts of the history of Italy in the 14th and 15th centuries are embedded in treatments of Renaissance culture as a whole. Among such works are DENYS HAY, *The Italian Renaissance in Its Historical Background* (1961); MYRON P. GILMORE, *The World of Humanism, 1453–1517* (1952); and PETER BURKE, *Culture and Society in Renaissance Italy, 1420–1540* (1972). The classic book of JACOB BURCKHARDT (Eng. trans., *The Civilization of the Renaissance in Italy . . . ,* many editions), also continues to be richly suggestive. The structure and the problems of the Italian communes are usefully described in DANIEL WALEY, *The Italian City-Republics* (1969); their revolutionary significance in the medieval political world is discussed in the last section of WALTER ULLMANN, *Principles of Government and Politics in the Middle Ages* (1961). GARRETT MATTINGLY, *Renaissance Diplomacy* (1955), studies both the diplomatic history of Italy in this period and the development of diplomatic institutions and practice. Stimulating on the confrontation between republicanism and despotism in Renaissance Italy and above all on its significance for cultural history and the emergence of the modern political consciousness is HANS BARON, *The Crisis of the Early Italian Renaissance,* rev. ed. (1966). For the crisis of 14th-century society and its effect on the religious life and the mood of Italy, see MILLARD MEISS, *Painting in Florence and Siena After the Black Death* (1951). On Milanese despotism there is a good biography by D.M. BUENO DE MESQUITA, *Giangaleazzo Visconti, Duke of Milan (1351–1402)* (1941). For Florence, FERDINAND SCHEVILL, *History of Florence from the Founding of the City Through the Renaissance* (1936, reprinted 1961), is solid and informative, but the best general introduction to all aspects of Florentine history and society in this period is GENE A. BRUCKER, *Renaissance Florence* (1969); the same author's *Florentine Politics and Society, 1343–1378* (1962) and *The Civic World of Early Renaissance Florence* (1977) are excellent examples of the best specialized studies of Florence in recent scholarship. For Florence under the Medici, see KURT S. GUTKIND, *Cosimo de' Medici, pater patriae, 1389–1464* (1938); and NICOLAI RUBINSTEIN, *The Government of Florence Under the Medici (1434–1494)* (1966). On Venice a good introduction is D.S. CHAMBERS, *The Imperial Age of Venice, 1380–1580* (1970); for the Venetian political tradition, see WILLIAM J. BOUWSMA, *Venice and the Defense of Republican Liberty* (1968); for Venetian society see ANGELO VENTURA, *Nobilità e popolo nella società veneta del '400 e '500* (1964). For Lucca see MARINO BERENGO, *Nobili e mercanti nella Lucca del Cinquecento* (1965); and for Naples see ALAN RYDER, *The Kingdom of Naples Under Alfonso the Magnanimous: The Making of a Modern State* (1976). Some sense of the problems of the Papal State may be derived from PETER PARTNER, *The Papal State Under Martin V* (1958); these problems are vividly illustrated in the memoirs of PIUS II, available in English under the title *Memoirs of a Renaissance Pope* (1959). For Sicily see DENIS MACK SMITH, *A History of Sicily,* 2 vol. (1968). On the events at the end of the 15th century and their impact on Machiavelli and Guicciardini, see FEDERICO CHABOD, *Machiavelli and the Renaissance* (1958), which also contains a useful bibliography for Italy in the age of the Renaissance; and FELIX GILBERT, *Machiavelli and Guicciardini: Politics and History in Sixteenth-Century Florence* (1965). ERIC W. COCHRANE, *Historians and Historiography in the Italian Renaissance* (1981), an excellent overview of historical writing.

Italy in the 16th–18th centuries: An exhaustive bibliography may be found in the appendix to ERNESTO PONTIERI, *Le lotte per il predominio in Europe tra la Spagna e la Potenza ispanoasburgica,* included in vol. 5, pt. 2, of the *Storia Universale* (1971). See also LUIGI SIMEONI, *La Signorie,* vol. 2 (1950); ROMOLO QUASSA, *Preponderanza Spagnuola, 1559–1700,* 2nd ed. (1950); *Storia d'Italia* (*op. cit.*), vol. 2, with an updated bibliography and listing of specific monographs; and LUIGI BULFERETTI, "La decadenza italiana nel seicento," *Cultura e scuola,* 1:98–104 (1962), a review of recent studies. See also the relevant volumes of *The Cambridge Modern History* and *The New Cambridge Modern History.* For a general view of Italy in the 18th century, beyond what may be found in various histories of Italy, see GIORGIO CANDELORO, *Storia dell'Italia moderna,* vol. 1 (1956); GUIDO QUAZZA, *Il problema italiano e l'equilibrio europeo, 1720–1738* (1965); FRANCO VENTURI, *Settecento riformatore* (1969); and GIUSEPPE GALASSO, *Potere e istituzioni in Italia: Dalla caduta dell'Impero romano a oggi* (1974). For Lombardy in particular, see FRANCO VALSECCHI, *L'assolutismo illuminato in Austria e in Lombardia,* 2 vol. (1931–34); S. PUGLIESE, *Condizioni economiche e finanziarie della Lombardia nella prima metà del secolo XVIII* (1924); and FEDERICO CHABOD, *Lo stato e la vita religiosa a Milano nell'epoca di Carlo V* (1971). A basic text is vol. 12 of the *Storia di Milano,* of the FONDAZIONE TRECCANI, Milan, *L'età delle reforme, 1706–1796* (1959). For Tuscany, see NICCOLO RODOLICO, "La Toscana alla vigilia delle riforme," "Emanuele di Richecourt iniziatore delle riforme lorenesi in Toscana" and "I primi provvedimenti contro la manumorta ecclesiastica in Toscana," all included in the collection *Saggi di storia medievale e moderna* (1963), with numerous bibliographical references and references to works by the same author on the Lorraine period. An excellent biography of Peter Leopold is ADAM WANDRUSZKA, *Leopold II* (1963, in German; Italian trans., 1968). For Naples, see HEINRICH BENEDIKT, *Das Königreich Neapel unter Kaiser Karl VI* (1927); RAFFAELE COLAPIETRA, *Vita pubblica e classi politiche del viceregno napoletano, 1656–1734* (1961); RAFFAELE AJELLO, "Il banco di San Carlo: Organi di governo e opinione pubblica nel Regno di Napoli di fronte al problema della ricompra dei diritti fiscali," in *Rivista Storica Italiana,* vol. 81, fascicle 4, pp. 812–881 (1969); LINO MARINI, *Il mezzogiorno d'Italia di fronte a Vienna e a Roma e altri studi di storia meridionale* (1970); GIUSEPPE RECUPERATI, "Napoli e i viceréo austrici, 1707–1784," in *Storia di Napoli,* vol. 7 (n.d.); and HAROLD M. ACTON, *The Bourbons of Naples, 1734–1825* (1956). For Sicily, see RAFF MARTINI, *La Sicilia sotto gli Austriaci (1719–1734)* (1907); FRANCESCO DE STEFANO, *Storia della Sicilia dal secolo XI al XIX,* pp. 231–235 (1948), with extensive bibliography; DENIS MACK SMITH, *Storia della Sicilia medioevale e moderna,* pp. 316–332 (1970); VIRGILIO TITONE, *La Sicilia dalla dominazione spagnola all'unità d'Italia* (1955); GIUSEPPE GALASSO, *Mezzogiorno medievale e moderno* (1965) and *Dal comune medievale all'unità: Linee di storia meridionale* (1969); and the relevant volumes of *The Cambridge Modern History* and *The New Cambridge Modern History.*

Italy from 1789 to 1871: The two most important comprehensive studies are those by CESARE SPELLANZON, *Storia del Risorgimento e dell'Unità d'Italia,* vol. 1–4 (1933–50), which covers the period from the 18th century to 1849 and continues down to the Crimean War with vol. 6–8 by E. DI NOLFO (1959–65); and by GIORGIO CANDELORO, *Storia dell'Italia moderna,* 6 vol. (1956–1970). Spellanzon and Di Nolfo pay particular attention to the political currents and diplomatic history, Candeloro to socio-economic structures. On the Jacobin movement, reference should be made to the interpretations by DELIO CANTIMORI, in *Studi di storia,* pp. 629–638 (1959); and by ARMANDO SAITTA, "La questione del giacobinismo italiano," in *Critica storica,* vol. 4, pp. 204–249 (1965). For the Republic and the Kingdom of Italy, see CARLO ZAGHI, *Napoleone e l'Europa* (1969); and, on the South, PASQUALE VILLANI, "Il Regno di Napoli nel decennio francese (1806–1815)," in *Studi storici in onore di Gabriele Pepe,* pp. 689–702 (1969), which sets forth the plan of a future work. On the various Italian states during the Restoration, the best studies are AUGUSTO SANDONA, *Il Regno Lombardo-Veneto, 1814–1859. La costituzione e l'amministrazione* (1912); KENT R. GREENFIELD, *Economics and Liberalism in the Risorgimento: A Study of Nationalism in Lombardy, 1814–1848,* rev. ed. (1965); REUBEN J. RATH, *The Provisional Austrian Regime in Lombardy-Venetia, 1814–1815* (1969); GAETANO CINGARI, *Mezzogiorno e Risorgimento: La Restaurazione a Napoli dal 1821 al 1830* (1970); and ROSARIO ROMEO, *Il Risorgimento in Sicilia* (1950). On Cavour and his milieu, see ADOLFO OMODEO, *L'opera politica del conte di Cavour (1848–1857)* (1968); ROSARIO ROMEO, *Cavour e il suo tempo, 1810–1842* (1969); and, related to Pius IX, ROGER AUBERT, *Le Pontificat de Pie IX* (1952). On the unification movement, see RAYMOND GREW, *A Sterner Plan for Italian Unity: The Italian National Society in the Risorgimento* (1963); and DENIS MACK SMITH, *Cavour and Garibaldi, 1860: A Study in Political Conflict* (1954). Studies of the formation of the Italian state and the policy of the Right are: CLAUDIO PAVONE, *Amministrazione centrale e amministrazione periferica da Rattazzi a Ricasoli* (1964); ERNESTO RAGIONIERI, *Politica e amministrazione nella storia dell'Italia unita* (1967); ALDO BERSELLI, *La destra storica dopo l'unità,* 2 vol. (1963–65); and ARNALDO SALVESTRINI, *I moderati toscani e la classe dirigente italiana (1859–1876)* (1965).

Italy from 1871 to the present: Comprehensive works or works on individual periods include BENEDETTO CROCE, *Storia d'Italia dal 1871 al 1915,* 2nd ed. (1928; Eng. trans., *A History of Italy, 1871–1915,* 1929, reprinted 1963), a classic of liberal ethico-political historiography; GIOACCHINO VOLPE, *Italia moderna 1815–1915,* 3 vol. (1946–52); DENIS MACK SMITH, *Italy: A Modern History* (1959), on the years 1861–1958; CHRISTOPHER SETON-WATSON, *Italy from Liberalism to Fascism, 1870–1925* (1967), an accurate and concise reconstruction; GIORGIO CANDELORO, *Storia dell'Italia moderna,* vol. 6 (1970), which follows economic and social developments closely for the years 1871–96; FEDERICO CHABOD, *L'Italie contemporaine* (1950); LUIGI SALVATORELLI and GIOVANNI MIRA, *Storia d'Italia nel periodo fascista* (1956); FRANCO CATALANO, *L'Italia dalla dittatura alla democrazia, 1919–1948,* 2nd ed. (1965); NORMAN KOGAN, *A Political History of Postwar Italy* (1966); and GIUSEPPE MAMMARELLA, *L'Italia dopo il fascismo, 1943–1968* (1970). For special topics, see RICHARD A. WEBSTER, *The Cross and the Fasces: Christian Democracy and Fascism in Italy* (1960); RICHARD HOSTETTER, *The Italian Socialist Movement,* vol. 1, *Origins (1860–1882)* (1958); and GAETANO ARFE, *Storia del socialismo italiano, 1892–1926,* 2nd ed. (1965). On the Communist Party, see PAOLO SPRIANO, *Storia del Partito Comunista Italiano,* 3 vol. (1967–70), up to 1939. Traditional regions. *Liguria:* M. ALMAGRO, "Ligures en España," in *Rivista de studi liguri,* XV, pp. 195–208 (1949), and XVI, pp. 37–56 (1950); A. BERTHELOT, "Les Ligures," in *Revue archéologique,* pp. 72 ff., 245 ff. (1933); and J. JANNORAY, *Ensérune* (1955). There is no good modern general history of Genoa, since N. LAMBOGLIA *et al., Storia di Genova,* 3 vol. (1941–42), reached only to *c.* 1200. V. VITALE, *Breviario della storia di Genova,* 2 vol. (1955–56), provides an indispensable outline and a guide to the voluminous specialist literature for the period to 1815; for the subsequent period, see his "Genova," in *Enciclopedia italiana,* vol. 16 (1932). Many useful articles and monographs appear in the *Atti della Società Ligure di Storia Patria,* vol. 1 (1861–). See also R.S. LOPEZ, "Market Expansion: The Case of Genoa," *Journal of Economic History,* 24:445–464 (1964); E. BACH, *La Cité de Gênes au XII^e^ siècle* (1955); and J. HEERS, *Gênes au XV^e^ siècle: activité économique et problèmes sociaux* (1961).

Sardinia: MARGARET GUIDO, *Sardinia* (1963), is a scholarly book on Sardinian prehistory, with important illustrations. The section on Sardinia by the ECONOMIST INTELLIGENCE UNIT in *The Mezzogiorno: Investment Prospects for the Seventies* (1971) deals with economics but is rather technical. T. and B. HOLME and B. GHIRADELLI, *Travellers' Guide to Sardinia* (1967), is a short guide for the interested tourist, covering a wide range of subjects; MARY DELANE, *Sardinia: The Undefeated Island* (1968), an account of a journey, includes descriptions of terrain, as well as history and folklore. JOHN WARRE TYNDALE, *The Island of Sardinia,* 3 vol. (1849), is a survey by a barrister dealing in great detail with the history and customs of Sardinians at that time, as does ALBERT DE LA MARMORA, *Voyage en Sardaigne,* 3 pt. (1839–60). D.H. LAWRENCE, *Sea and Sardinia* (1921), is a highly personalized report of people encountered on a brief visit. MARCELLO SERRA, *Mal di Sardegna* (1955), is considered as something of a classic in its analysis of the effects of history and the conditions of life on the island. G.M. TREVELYAN, *Garibaldi and the Thousand* (1909), is of special note for the description of the island of Caprera, where Garibaldi lived and is buried, his tomb guarded always by a sailor. GRAZIA DELEDDA, *Canne al vento* (1958), is a novel demonstrating the continuing belief in witchcraft, as well as a remarkable understanding of the attitudes of the Sards to each other; the author received the Nobel Prize for Literature in 1926 for her descriptions of Sardinian life.

Venetia: The fullest guide-history is G. LORENZETTI, *Venezia e il suo estuario,* 2nd ed. (1956). See also M. MURARO and A. GRABAR, *Treasures of Venice* (1963). Complete accounts covering the whole of the history of Venice include S. ROMANIN, *Storia documentata della Repubblica di Venezia* (1853); H. KRETSCHMAYR, *Geschichte von Venedig* (1905–34); P.G. MOLMENTI, *La storia de Venezia nella vita privata* (1925); and R. CESSI, *Storia della Repubblica di Venezia* (1944); see also the series of lectures relating to the various centuries of the history of Venice in the series *La civiltà veneziana,* ed. by FONDAZIONE "GIORGIO CINI," vol. 1–7 (1955–62).

For studies of individual periods or aspects, see R. CESSI, *Venezia ducale,* 2nd ed. (1940), *Le origini del ducato veneziano* (1952), *La Repubblica di Venezia e il problema adriatico* (1953); C. The periodical *Archivo storico per le provincie napoletane,* 80 vol. (1876–1961), sponsored by the Società Napoletana di Storia Patria, provides bibliographies in its volumes for 1910–14, 1930, 1932, 1938, 1950, and 1960. For medieval sources see B. CAPASSO, *Le fonti della storia delle provincie napoletane dal 568 al 1500,* ed. by E.O. MASTROJANNI (1902). Useful works in English are S. RUNCIMAN, *The Sicilian Vespers* (1958); H. ACTON, *The Bourbons of Naples* (1956) and *The Last Bourbons of Naples* (1961); R.M. JOHNSTON, *The Napoleonic Empire in Southern Italy* . . . , 2 vol. (1904).

Sicily: ALDO PECORA, *Sicilia* (1968), is an informative, general work. Geography and physical description may be found in OLINTO MARINELLI, *Sicilia* (1968); GUSTAVO CUMIN, *La Sicilia* (1944); and FRANCIS M. GUERCIO, *Sicily: The Garden of the Mediterranean, the Country and Its People,* 2nd ed. (1954). Land use and economics are covered in FERDINANDO MILONE, *Sicilia* (1960), on the interaction of nature and man; JOHN P. COLE, *Italy* (1964); VERA C. LUTZ, *Italy: A Study in Economic Development* (1962), with an acute understanding of the south; MARGARET CARLYLE, *The Awakening of Southern Italy* (1962); and NUNZIO PRESTIANNI, *L'economia agraria della Sicilia* (1946), which is technical but interesting. On archaeology, see MARGARET GUIDO, *Sicily: An Archaeological Guide* (1967); L. BERNABO BREA, *La Sicilia prima dei Greci,* 4th ed. (1966; Eng. trans., *Sicily Before the Greeks,* rev. ed., 1966); and the various writings of PAOLO ORSI. See also periodicals and other publications of the Instituto Centrale di Statistica, the Banco di Sicilia, and organs of the Sicilian regional government and of the University of Sicily.

Jainism

Jainism—along with Hinduism and Buddhism—is one of the three most ancient of India's religious traditions still in existence. Its name derives from the Sanskrit verb root *ji,* "to conquer." The name refers to the ascetic battle that the Jaina monks must fight against the passions and bodily senses in order to gain omniscience and the complete purity of soul that represents the highest religious goal in the Jaina system. The monk-ascetic who achieves this omniscience and purity is called a Jina (literally, "Conqueror," or "Victor"), and adherents to the tradition are called Jainas, or Jains. Although Jainism has a much smaller number of adherents than do Hinduism and Sikhism, its influence on India's culture has been considerable, including significant contributions in philosophy and logic, art and architecture, grammar, mathematics, astronomy and astrology, and literature.

Jainism has largely been confined to India, although the migration of Indians to other, predominantly English-speaking countries has spread its practice to many Commonwealth nations and to the United States. Its continuous existence in India for some 2,500 years is in sharp contrast to Buddhism, which is widespread in Asia but no longer widely practiced in the land of its origin. This gives Jainism a unique status as the only Sanskritic non-Hindu religious tradition to have survived in India to the present.

For coverage of related topics in the *Macropædia* and *Micropædia,* see the *Propædia,* section 823.

This article is divided into the following sections:

HISTORY

Mahāvīra

Early history (6th century BC–c. 5th century AD). Jaina history began in the 6th century BC with Vardhamāna, who is known as Mahāvīra ("Great Hero"). Mahāvīra was the 24th and last Tirthankara (literally, "Ford-maker") of the current age (*kalpa*) of the world. (Tirthankaras, also called Jinas, are revealers of the Jaina religious path [*dharma*] who have crossed over life's stream of rebirths and have set the example that all Jainas must follow.) Mahāvīra was a contemporary of Siddhārtha Gautama (the Buddha) and was born in the same area, the lower Gangetic Plain. Although Mahāvīra was a historical figure, all of the accounts of his life are legendary and serve the ritual life of the Jaina community better than they do the historian. However, a little of the historical circumstances of Mahāvīra and the early Jaina community can be pieced together from a variety of sources.

The 6th century BC was a period of intense religious activity in the lower Gangetic Plain. In addition to Buddhism, the Ājīvika sect, founded by Gośāla Maskarīputra, appeared; and at about this time, probably in the same region, the two great "forest" Upanishad texts of early Hinduism, the *Brihadāranyaka* and the *Chāndogya,* came into existence. The prevailing ethos common to all these religious perspectives was asceticism, which stood in contrast to the ritualistic Brahmanic schools associated with the earliest period of classical Hinduism.

Mahāvīra, like the Buddha, was the son of a chieftain of the Kshatriya (military or ruling) class. At age 30 he renounced his princely status to take up the ascetic life. It is likely that he pursued the discipline of a preestablished ascetic tradition and had a reforming influence on it. His acknowledged status as the 24th Tirthankara (or Jina) means that Jainas perceive him as the last revealer in this cosmic age of the Jaina *dharma.* Mahāvīra had 11 disciples (called *gaṇadharas*), all of whom were Brahman converts to Jainism; all founded monastic lineages, but only two—Indrabhūti Gautama and Sudharman, the disciples who survived Mahāvīra—served as the points of origin for the historical Jaina monastic community.

The community appears to have grown quickly—Jaina tradition states that it numbered 14,000 monks and 36,000 nuns at the time of Mahāvīra's death. From the beginning the community was subject to a number of schismatic movements. Jamāli, Mahāvīra's son-in-law, led the first of seven schisms that occurred during the Jina's lifetime. None of these had a significant effect on the Jaina community. The only schism to have a lasting effect was that between the Svetambaras (literally, "White-robed") and the Digambaras ("Sky-clad"; *i.e.,* naked); this division still exists. The major points of difference between the two concern the question of proper monastic attire and whether or not a soul can attain liberation from a female body (a possibility the Digambaras deny).

Each sect has its own account of how the schism arose. The separation appears to have begun as a physical split of the community during the 3rd century BC. According to Digambara tradition, Bhadrabāhu I (whom the Digambaras regard as their founder) foresaw a 12-year famine in the Mauryan kingdom of Candra Gupta and took half of the monastic community south with him to Śravaṇa Beḷgoḷa (near modern Hassan, in Karnātaka state). Digambara tradition also states that Candra Gupta accompanied Bhadrabāhu as his disciple. Svetambara tradition, however, states that Bhadrabāhu went to Nepal and that the Svetambara–Digambara split was led by a monk named Śivabhuti in the last half of the 1st century AD. All differences of doctrine and praxis that developed between the two sects appear to have arisen from this geographical separation.

The four councils

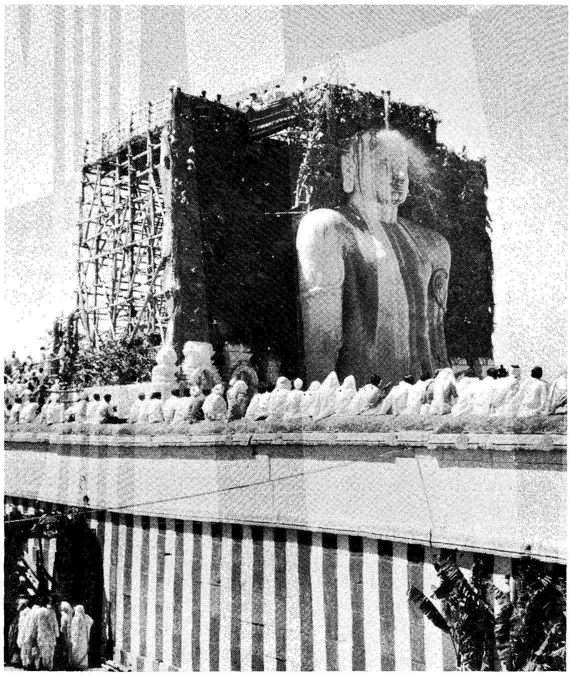
These differences were formalized through a series of councils that met to preserve and codify the teachings of Mahāvīra in written form. It was felt that the teachings, preserved orally since his death, were in danger of being lost. Four councils were held between the 4th century BC and the 5th century AD. The last one, held at Valabhī in Saurāṣṭra (modern Gujarāt state) in either AD 453 or 456, codified the Svetambara canon that is still in use. The Digambara monastic community considered this redaction too corrupt to be normative, and the schism between the two communities became irrevocable.

During this period, Jainism spread from its place of origin westward to Ujjain, where it gained the patronage of Candra Gupta, the grandfather of Aśoka (the last great Mauryan emperor), and later Samprati, the grandson of Aśoka. Later, in the 1st century BC, a monk named Kālakācārya seems to have caused the overthrow of King Gardabhilla of Ujjain and his replacement with the Śāhi kings, who were probably of Scythian or Persian origin. By the time of the Gupta dynasty (AD 320–*c.* 600), Jainas were retaining the patronage of the Gupta emperors of Magadha, but they had become stronger in central and western India than in their homeland.

Early medieval developments (500–1100). The early medieval period was the time of Jainism's greatest flowering, particularly for the Digambara community in the south. The Digambaras gained the patronage of three major dynasties during these centuries—the Gaṅgas in Karnātaka (3rd–11th century); the Rāṣṭrakūṭas, whose kingdom was just north of the Gaṅga realm (8th–12th century); and the Hoysaḷas in Karnātaka (11th–14th century). Digambara monks are reputed to have engineered the succession of the Gaṅga and the Hoysaḷa dynasties, thus stabilizing uncertain political situations and guaranteeing Jaina political protection and support.

Digambara political activity

This involvement in politics on the part of the Digambaras allowed Jainism to prosper in Karnātaka and the Deccan. An abundance of epigraphical evidence details an elaborate patronage system through which kings, queens, state ministers, and military generals endowed the Jaina community with tax revenues and with direct grants for the construction and upkeep of temples. In addition, many of these political figures had Jaina monks as spiritual teachers and advisers. Two notable examples are Śāntala Devī, the queen of the Hoysaḷa king Viṣṇuvardhana, and the Gaṅga general Chāmuṇḍarāya, who in the 10th century oversaw the creation of a colossal statue of Bāhubali (locally called Gomateśvara; son of Ṛṣabha, the first Tirthankara) at Śravaṇa Beḷgoḷa.



Ceremony of anointing the colossal image of the Jaina saint Bāhubali (called locally Gommateśvara) at Śravaṇa Beḷgoḷa, Karnātaka state, India.

James Burke—LIFE Magazine © 1972 Time Inc.

During this period Digambara writers produced a large amount of philosophical treatises, commentaries, and poetry, which was written in Prakrit, Kannada, and Sanskrit. Much of this literary activity had royal patronage and participation. Noteworthy was the monk Jinasena, whose Sanskrit philosophical and poetic writing had the support of the Rāṣṭrakūṭa king, Amoghavarṣa I. Himself an author in Kannada and Sanskrit, Amoghavarṣa seems to have renounced his throne and become a disciple of Jinasena in the early 9th century. This privileged position allowed the Digambara Jainas to engage in sectarian debate from a position of strength. Inscriptions and epigraphs describe many of the most important monks of this period as victors over the Buddhists, Brahmans, Vaiṣṇavites, and Śaivites in philosophical and religious debate.

The Svetambaras seem to have been less flamboyantly embroiled in dynastic politics than their southern counterparts, though there is evidence of such activity in Gujarāt and Rājasthān that helped establish sympathetic kings in the 8th century (Vānarāja, 716–806) and the 12th century (Kumārapāla, whose reign ended with the Muslim invasions). Kumārapāla's accession was masterminded by the great Svetambara scholar and minister of state Hemacandra. The Svetambaras were no less productive in literary output than their Digambara counterparts at this period.

Beginning in the early centuries AD, the role of the Jaina layman was articulated with a detail and precision not seen up to that point. The process began for the Digambaras as early as the 2nd to 3rd century; with the Svetambaras it seems to have begun in the 5th to 6th century. The early medieval period was a time of particularly intense reflection for both groups on the role of the laity. A large Āvaśyaka literature, discussing the layman's religious behaviour and vows, poured forth from these beginnings and lasted until the 17th century. A formalized caste system appeared among the Jaina laity. This was depicted and given authority by Jinasena in his *Ādipurāṇa,* a hagiography of Ṛṣabha and his two sons Bāhubali and Bharata. It differed from the Hindu system in that the Kshatriyas were given a place of prominence over the Brahmans; in addition, the Jainas did not see the caste system as an inherent part of the structure of a created universe. There also were differences in the organization of the caste system between the Digambaras and the Svetambaras.

Late medieval–early modern developments (1100–1800). In the period of their greatest influence (6th–

late 12th century), Jaina monks ceased being wandering ascetics and tended to become dwellers at temples or monastic residences, surrounded by the comforts that their calling demanded they forego. In addition, the Digambara monks' active involvement in dynastic politics undoubtedly earned them enemies. These two factors led to a decline of Jaina influence in ensuing centuries.

Effect of the Muslim invasion

The Svetambara community's eclipse was greatly accelerated by the successful invasion of Muslim forces into western and northern India in the 12th century. With this sudden shift of political control from indigenous to foreign hands, the Svetambara community concentrated on stabilizing itself in the new circumstances. At about this time, the monastic libraries were put underground in Rājasthān to keep the manuscripts from being destroyed and to preserve them better from the elements. There is evidence of Jaina laymen serving as ministers to Muslim rulers, which surely benefited the community.

Reform movements appeared within the community at various times, often stressing the inappropriateness of image worship, especially for monks. This was likely a response to strong Muslim religious values. The most successful of these reform movements was that of the mid-15th-century layman Lonkā Sāha, which led ultimately to the founding of the Sthānakavāsī sect in the 18th century.

By the advent of the Vijayanagar Empire in the 14th century, Digambara Jainism had lost all significant royal support and survived largely by keeping to itself. At this time elaborate temple rituals with Tantric overtones developed within the Digambara community. This, plus the lax attitudes of the administrators of Digambara temple complexes, helped fuel resentment both within and outside the community. This situation made the Digambaras susceptible to attacks by renascent Hindu devotional movements. These movements began in Tamil Nādu as early as the 6th century and in Karnātaka in the 12th century. One of the most vigorous of these Hindu movements was that of the Lingayats, or Vīraśaivas, which arose in full force in the 12th century in northern Karnātaka, a stronghold of Digambara Jainism. The Lingayats gained royal support, and many Jainas themselves converted to the Lingayat religion in ensuing centuries.

Digambara laity were among the foremost critics of their community's deteriorating situation. The most significant Digambara reform movement occurred in the late 16th century, led by a layman and poet named Bānārasīdās. This movement attacked the elaborateness of Digambara ritualism and the cavalier behaviour of its religious leaders.

Recent Jaina history. In modern times, Svetambara Jainism has maintained a more effective organization and has a larger monastic community than its Digambara counterpart. Both communities devote much energy to maintaining temples and publishing critical editions of their religious texts.

In addition, the Jainas stress publicly their deep and longstanding commitment to *ahiṃsā* ("nonviolence"). Notable in this connection is the friendship and exchange of letters between Mohandas Gandhi and the Svetambara layman Raychandrabhai Mehta. Gandhi considered his interactions with Mehta to be important in formulating his own ideas on the use of nonviolence as a political tactic.

Jainas have traditionally been professional and mercantile people. These trades have made them adaptable to other environments and societies besides those of India. Many Jainas have emigrated overseas, and this has had the result of increasing international awareness of Jainism. (G.R.S.)

IMPORTANT FIGURES OF JAINA LEGEND

Sixty-three significant figures form the focus of Jaina legend and story. The most important of these are the 24 Tirthankaras, perfected human beings who appear from time to time to preach and embody the Jaina religious path; they represent the highest religious attainment for the Jaina. The Tirthankaras, along with 12 *cakravartin*s ("world conquerors"), nine *vāsudeva*s (counterparts of Vāsudeva, the patronymic of Krishna), and nine *baladeva*s (counterparts of Balarāma, the elder half-brother of Krishna), constitute a list of 54 *mahāpuruṣa*s ("great souls"), to which were later added nine *prativāsudeva*s (enemies of the *vāsudeva*s). Other, more minor, figures include nine *nārada*s (counterparts of the deity Nārada, the messenger between gods and humans), 11 *rudra*s (counterparts of the Vedic god Rudra, from whom Śiva is said to have evolved), and 24 *kāmadeva*s (gods of love), all of which show Hindu influences. Bāhubali is said to be the first *kāmadeva.* (See also HINDUISM: *Hindu mythology.*)

Subordinated to these figures are the gods, classified into four groups: *bhavanavāsī*s (gods of the house), *vyantara*s (intermediaries), *jyotiṣka*s (luminaries), and *vaimānika*s (astral gods). These, in turn, are divided into several subgroups. Other gods and goddesses also occur in various Jaina texts, such as the 64 *dikkumārī*s (maidens of the directions), who act as nurses to a new-born Tirthankara. Such deities played an important role in ancient Indian folk religion, and the Jainas, Buddhists, and Hindus all assimilated them into their pantheons and rituals.

DOCTRINES OF JAINISM

The Jaina's religious goal is the complete perfection and purification of the soul. This can occur only when the soul is in a state of eternal liberation from and nonattachment to corporeal bodies. Liberation is impeded by the accumulation of *karman*s (see below *Karman*), bits of material, generated by a person's actions, that bind themselves to the soul and consequently bind the soul to material bodies through many births; this has the effect of thwarting the full self-realization and freedom of the soul. To understand how the Jainas perceive and address this problem, however, it is first necessary to explain the Jaina conception of reality.

The notion of the wheel of time

Time and the universe. Time, according to the Jainas, is eternal and formless. It is conceived as a wheel with 12 spokes called *ārā*s ("ages"), six making an ascending arc and six a descending one. In the ascending arc (*utsarpiṇī*), man progresses in knowledge, age, stature, and happiness, while in the descending arc (*avasarpiṇī*) he deteriorates. The two cycles joined together make one rotation of the wheel of time, which is called a *kalpa.*

The world is eternal and uncreated. Its constituent elements, the six substances (*dravya*s), are soul, matter, time, space, and the principles of motion and the arrest of motion. These are eternal and indestructible, but their conditions change constantly.

Jainas divide the inhabited universe into five parts. The lower world (*adholoka*) is subdivided into seven tiers, each one darker and more tortuous than the one above it. The middle world (*madhyaloka*) consists of numberless concentric continents separated by seas, the centre continent of which is called Jambudvīpa. Human beings occupy Jambudvīpa, the second continent, and half of the third; the focus of Jaina activity, however, is Jambudvīpa, the only continent on which it is possible for the soul to achieve liberation. The celestial world (*ūrdhvaloka*) consists of two categories of heaven: one for the souls of those who may or may not have entered the Jaina path, and one for the souls of those who are far along on the path and are close to the time of their emancipation. At the apex of the occupied universe is the *siddhaśīlā,* the crescent-shaped abode of liberated souls (*siddha*s). Finally, there are some areas inhabited solely by *ekendriya*s, organisms that have only a single sense. Although *ekendriya*s permeate all parts of the occupied universe, there are places where they are the only living beings.

Jīva and ajīva. Jaina reality is constituted by *jīva* ("soul," or "living substance") and *ajīva* ("non-soul," or "inanimate substance"). *Ajīva* is divided into two categories: non-sentient and material, and non-sentient and nonmaterial. All but *jīva* are without life.

Characteristics of *jīva*

The essential characteristics of *jīva* are consciousness (*cetanā*), bliss (*sukha*), and energy (*vīrya*). In its pure state, *jīva* possesses these qualities in infinite measure. The souls, infinite in number, are divisible in their embodied state into two main classes, immobile and mobile, according to the number of sense organs possessed by the body they inhabit. The first group consists of souls inhabiting immeasurably small particles of earth, water, fire, and air, plus the vegetable kingdom, which possess only the sense of touch. The second group comprises souls that inhabit bodies that have between two and five sense organs. The Jainas believe that the four elements (earth, water, fire, and air) also are animated by souls. Moreover, the universe is full of an infinite number of minute beings, *nigoda*s, which are slowly evolving.

A *jīva* is formless and genderless and cannot be perceived by the senses. A soul is not all-pervasive, but can, by contraction or expansion, occupy various amounts of space. Like the light of a lamp in a small or a large room, it can fill both the smaller and larger bodies it occupies. While the soul assumes the exact dimensions of the body it occupies, it is not identical with that body.

Matter (*pudgala*) has the characteristics of touch, taste, smell, and colour. Its essential characteristic is lack of consciousness. The smallest unit of matter is the atom (*paramāṇu*). Heat, light, and shade are forms of fine matter.

The non-sentient, nonmaterial substances are the principles of motion and its arrest, space, and time. They are always pure and are not subject to defilement. The principles of motion and its arrest permeate the universe; they do not exist independently but, rather, form a necessary precondition for any object's movement or coming to rest. Space is infinite, all-pervasive, and formless and provides accommodation for the entire universe. It is divided into occupied (*i.e.,* the universe) and unoccupied portions. Time is said to consist of innumerable eternal and indivisible particles of "non-corporeal substance" that never mix with one another but that fill the entire universe. Thus, the non-sentient, nonmaterial substances form the context within which the drama of a *jīva*'s struggle to extricate itself from involvement with matter occurs.

Karman. The fundamental tenet of Jaina doctrine is that all phenomena are linked together in a universal chain of cause and effect. Every event has a definite cause behind it. By nature each soul is pure, possessing infinite knowledge, bliss, and power; however, these faculties are restricted from beginning-less time by foreign matter coming in contact with the soul. Fine foreign matter producing the chain of cause and effect, of birth and death, is *karman,* a fine atomic substance and not a process as in Hinduism. To be free from the shackles of *karman,* a person must stop the influx of new *karman*s and eliminate the acquired ones.

Karmic particles are acquired as the result of intentional action tinged with passionate expression. Acquired *karman*s can be annihilated through a process called *nirjarā,* which consists of fasting, not eating certain kinds of food, control over taste, resorting to lonely places, mortifications of the body, atonement and expiation for sins, modesty, service, study, meditation, and renunciation of the ego. *Nirjarā* is, thus, the calculated cessation of passionate action.

Stages of the soul's growth

A soul passes through various stages of spiritual development before becoming free from all karmic bondages. These stages of development (*guṇasthāna*s) involve progressive manifestations of the innate faculties of knowledge and power and are accompanied by decreasing sinfulness and increasing purity.

*Jīva*s become imprisoned in a succession of bodies due to their connection with karmic matter. These embodied souls bear different colours or tints (*leśyā*), varying according to the merits or demerits of the particular being. This doctrine of *leśyā,* peculiar to Jainism, seems to have been borrowed from the Ājīvika doctrine of six classes of bodies, expounded by Gośāla Maskarīputra. The six *leśyā*s in Jainism are, in the ascending order of man's spiritual progress, black, blue, gray, fiery red, lotus-pink (or yellow), and white.

Theories of knowledge as applied to liberation. In Jaina thought, four stages of perception—observation, will to recognize, determination, and impression—lead to a subjective cognition (*matijñāna*), the first of five kinds of knowledge (*jñāna*). The second kind of knowledge is *śrutajñāna,* derived from the scriptures and general information. Both of these are mediated cognition, based on external conditions perceived by the senses. There are three kinds of immediate knowledge—*avadhi* (supersensory perception), *manaḥparyāya* (reading the thoughts of others), and *kevala,* which is the stage of omniscience. *Kevala* is necessarily accompanied by freedom from karmic obstruction and by direct experience of the soul's pure form unblemished by its attachment to matter. Omniscience is the foremost attribute of a liberated *jīva,* the emblem of its purity; thus, a liberated soul, such as a Tirthankara, is called a *kevalin* ("possessor of omniscience").

According to Jainism, *yoga,* the ascetic physical and meditative discipline of the monk, is the means to the attainment of omniscience, and thus to *mokṣa,* or liberation. *Yoga* is the cultivation of true knowledge of reality, faith in the teachings of the Tirthankaras, and pure conduct; it is, thus, intimately connected to the three jewels (*ratnatraya*) of right knowledge, right belief, and right conduct (respectively, *samyagjñāna, samyagdarśaṇa,* and *samyakcāritra*). (See INDIAN PHILOSOPHY; LOGIC, THE HISTORY AND KINDS OF.)

Jaina ethics. The *ratnatraya* constitute the basis of Jaina ethics. Right knowledge, faith, and conduct must be cultivated together; none of them can be achieved in the absence of the others. Right faith leads to calmness or tranquillity, detachment, kindness, and the renunciation of pride of birth, beauty of form, wealth, scholarship, prowess, and fame. Right faith leads to perfection only when followed by right conduct. Yet, there can be no virtuous conduct without right knowledge, which consists of clear distinction between the self and the nonself. Knowledge of scriptures is distinguished from inner knowledge. Knowledge without faith and conduct is futile. Without purification of mind, all austerities are mere bodily torture. Right conduct is thus spontaneous, not a forced mechanical quality. Attainment of right conduct is a gradual process, and a householder can observe only partial self-control; when he becomes a monk, he is further able to observe more comprehensive rules of conduct.

Concept of *ahiṃsā*

Two separate courses of conduct are laid down for the ascetics and the laity. In both cases, the code of morals is based on the doctrine of *ahiṃsā,* or nonviolence. Since thought gives rise to action, violence in thought merely precedes violent behaviour. Violence in thought, then, is the greater and subtler form of violence, because it arises from ideas of attachment and aversion, grounded in passionate states, which result from negligence or lack of care in behaviour. Jainism enjoins avoidance of all forms of injury, whether committed by body, mind, or speech.

RITUAL PRACTICES AND RELIGIOUS AND SOCIAL INSTITUTIONS

The monks and their practices. Svetambaras acknowledge two classes of monks: *jinakalpin*s, who wander naked and use the hollows of their palms as alms bowls; and *sthavirakalpin*s, who retain minimal possessions such as a robe, an alms bowl, a whisk broom, and a *mukhavastrikā* (a piece of cloth held over the mouth to protect against the ingestion of small insects). A monk must obey the "great vows" (*mahāvrata*s) to avoid injuring any life form, lying, stealing, having sexual intercourse, or accepting personal possessions. To help him live out his vows, a monk's life is carefully regulated in all details by specific ordinances and by the oversight of his superiors. For example, to help him observe the vow of noninjury, a monk may not take meals after dark, since to do so would increase the possibility that he would harm any insects that might be attracted to the food. Monks are expected to suffer with equanimity such hardships as those imposed by the weather, geographical terrain, travel, or physical abuse. Exceptions are allowed in emergencies, since a monk who survives a calamity can purify himself by confession and by practicing even more rigorous austerities.

Among the Digambaras, a full-fledged monk remains naked, though there are lower-grade monks who wear a loincloth and keep with them one piece of cloth not more than one and one-half yards long. Digambara monks use a peacock-feather duster and water gourd, live apart from human habitations, and beg and eat only once a day, using the palm of one hand as an alms bowl.

Eight essentials noted for the conduct of monks include the three *gupti*s (care in thought, speech, and action) and the five *samiti*s (kinds of vigilance over conduct). The six *āvaśyakas*, or obligations, are equanimity; praise of the Tirthankaras (Jinas); obeisance to the Jinas, teachers, and scriptures; atonement; resolution to avoid sinful activities; and meditation.

The act of *sallekhanā*

The type of austerities in which a monk engages, the length of time he engages in them, and their severity are carefully regulated by his preceptor, who takes into account the monk's spiritual development, his capacity to withstand the austerities, and his ability to understand how they help further his spiritual progress at a given time. The culmination of a monk's ascetic rigours is the act of *sallekhanā,* in which a monk lies on one side on a bed of thorny grass and ceases to move or take food. This act of ritual starvation is the monk's ultimate act of nonattachment, in which he lets go of the body for the sake of his soul. The ascetic's preparatory rigours, which point to and culminate in this act, generally take 30 years or more. While it is a tenet of Jaina doctrine that no one can achieve liberation in this corrupt time, it is thought that the act of *sallekhanā* still has value since it can improve a soul's spiritual situation in the next birth.

Religious disciplines of the laity. The life of a lay votary is a preparatory stage to the rigours of ascetic life. The lay votary is enjoined to observe eight primary behavioral qualities (which vary but usually include the avoidance of meat, wine, honey, fruits, roots, and night eating) and 12 vows: five *aṇuvratas* ("little vows"), three *guṇavratas*, and four *śikṣāvratas*. The *aṇuvratas* are vows to abstain from gross violence, falsehood, and stealing; to be content with one's own wife; and to limit one's possessions. The other sets of vows are supplementary in nature, meant to strengthen and protect the *aṇuvratas*. They involve avoidance of unnecessary travel, harmful activities, and the pursuit of pleasure; fasting and control of diet; offering of gifts and service to monks, the poor, and fellow believers; and voluntary death if the observance of vows proves impossible.

The *sāmāyika,* a lay meditative and renunciatory ritual of limited duration, aims at strengthening equanimity of mind and resolve to pursue the spiritual discipline of the Jaina *dharma.* This ritual brings the lay votary close to the demands required of an ascetic for a limited time. It may be performed in a person's own house, in a temple, in a fasting hall, or before a monk.

Eleven *pratimās*, or stages of a householder's spiritual progress, are listed. Medieval writers conceived *pratimā* (literally, "statue") as a regular progressing series, a ladder leading to higher stages of spiritual development. The last two stages lead logically to renunciation of the world and assumption of the ascetic life.

The disciplines to which Jaina laity must adhere have influenced significantly the types of vocations that they pursue. Since all of their actions should minimize acts of violence to other living creatures, Jainas tend to pursue commercial and professional enterprises and to avoid such careers as military service. This has created an ironic situation in which many adherents to a highly austere and ascetic religion are wealthy.

Sacred times and places. *Festivals and fairs.* The principal Jaina festivals are connected with the five major events in the life of each Tirthankara. These mark the occasions of the Tirthankara's descent into his mother's womb, birth, renunciation, attainment of omniscience, and final emancipation.

The festival of Paryuṣaṇa

The most popular Jaina festival is Paryuṣaṇa, or Paijusaṇa, which occurs in the month of Bhādrapada (August–September). Paryuṣaṇa literally means (1) pacification by forgiving and service with wholehearted effort and devotion and (2) staying at one place for the monsoon season. On the last day of the festival, Jainas distribute alms to the poor and take a Jina image in procession through the streets. Confession is performed during the festival to remove all ill feelings about conscious or unconscious misdeeds during the past year.

Twice a year, for nine days (March–April and September–October), a fasting ceremony known as *olī* is observed. These are also the eight-day festivals corresponding to the mythical celestial worship of images of the Jinas.

On the full-moon day of the month of Kārttika (October–November), at the same time that Hindus celebrate Dewali (festival of lights), Jainas commemorate the Nirvana of Mahāvīra by lighting lamps. Five days later is Jñānapañcamī (literally, "The Fifth Level of Knowledge," *i.e., kevala*), which the Jainas celebrate with temple worship and with worship of the scriptures. Mahāvīra Jayanti, the birth date of Mahāvīra, is celebrated in early April.

The Jainas also celebrate a number of festivals in common with Hindus, such as Holi (spring festival), Navaratra (nine nights festival), and Poṅgal (a South Indian spring festival).

Pilgrimages and shrines. The erection of shrines and the donation of religious manuscripts are regarded as pious acts. Most villages or towns inhabited by Jainas have at least one Jaina shrine; some have become pilgrimage sites. Lists of these shrines have been composed, and the most noteworthy shrines are offered adoration in daily worship.

Places of pilgrimage were created at sites marking the principal events in the lives of Tirthankaras. Parasnāth Hill and Rājgīr in Bihār and Śatruñjaya and Girnār hills on the Kāthiāwār Peninsula are among such important ancient pilgrimage sites. Other shrines that have become pilgrimage destinations are Śravaṇa Beḷgoḷa in Karnātaka, Mounts Abu and Kesariajī in Rājasthān, and Antarikśa Pārśvanātha in Akola district, Mahārāshtra.

Cave temples

Several Jaina cave temples, dating from as early as the 2nd century BC, have been discovered and excavated. Cave temples are found at Udayagiri and Khandagiri, in Orissa; Rājgīr, in Bihār; Aihole, in Karnātaka; Ellora, in Mahārāshtra; and Sittānnavāsal in Tamil Nādu.

Temple worship and observance. Temple worship is mentioned in early texts that describe gods worshiping Jina images and relics in heavenly eternal shrines. Worship, closely associated with the obligatory rites of the laity, is offered to all liberated souls, to monks, and to the scriptures. Though Tirthankaras remain unaffected by offerings and worship, such actions serve as a form of meditative discipline for the votary offering them. Daily worship includes recitation of the names of the Jinas and idol worship by bathing the image and making offerings to it. Svetambaras decorate images with clothing and ornaments. The worshiper also chants hymns of praise and prayers and mutters sacred formulas. Such Jaina rituals show considerable similarity in form to Hindu rituals. A long-standing debate within both Jaina communities over the centuries has concerned the relative value of external acts of worship and internalized acts of mental discipline and meditation.

Domestic rites and rites of passage. Early Jaina literature is silent about domestic rites and rites of passage marking the main events in a person's life. These rituals are modeled mainly on the 16 Hindu samskaras, which include conception, birth, naming, first meal, tonsure, investiture with the sacred thread, beginning of study, marriage, and death. They are first discussed in Jinasena's 9th-century work, *Ādipurāṇa.*

Welfare institutions. Jainas are renowned for various types of munificence, such as sponsoring pilgrimages, famine relief, relief to Jaina widows and the poor, and maintaining shelters for old animals to save them from slaughter (an act of *ahiṃsā*). In addition, Jainas have encouraged research in and publication of editions of Jaina canonical and commentarial texts. Noteworthy in this connection are the Bhāratīya Jñānapīṭha publishing house in Vārānasi, Uttar Pradesh, and Lalbhai Dalpatbhai Institute for Indological Research at Ahmadābād, Gujarāt.

JAINA LITERATURE

Canonical and commentarial literature. Jaina canonical scriptures do not belong to a single period, nor is any text free from later revision or additions. The sacred literature, preserved orally from the time of Mahāvīra, was first systematized in a council at Patna about the end of the 4th century BC, and again in two later councils at Mathura and Valabhī in the early 3rd century AD. The fourth and last council, at Valabhī in the mid-4th century, is considered the source of the existing Svetambara canon, though some commentators insist that the present reading is in accordance with the Mathura council.

The original, unadulterated teachings of the Jinas are said to be contained in 14 texts, called the Pūrvas ("Foundation"), which are now lost. Svetambaras and Digambaras agree that a time will come when the teachings of the Jinas will be completely lost; Jainism will then disappear from the earth and reappear at an appropriate point in the next time cycle (*kalpa*). The two sects disagree, however, about the extent to which the corruption and loss of the Jinas' teachings has already occurred. Consequently, the texts for each sect differ.

Svetambara canon

The Svetambaras follow an extensive canon (*āgama*) as the repository of their tradition, which they believe is based upon compilations of Mahāvīra's discourses by his disciples. This canon preserves the teachings of Mahāvīra in an imperfect way, as it is thought to be mixed with much that was not said by the Jina. The number of texts considered to make up the Svetambara canon has varied over time and by monastic group. Largely through the influence of the 19th-century German scholar Johann Georg Bühler, however, Western scholars have fixed the number of texts in this canon at 45, divided into six groups: the 11 Aṅgas ("Parts"; originally there were 12, but one, the Dṛṣṭivāda, has been lost), 12 Upāṅgas (subsidiary texts), four Mūla-sutras (basic texts), six Cheda-sutras (concerned with discipline), two Cūlikā-sutras (appendix texts), and 10 Prakīrṇakas (mixed, assorted texts). The Aṅgas contain several dialogues, mainly between Mahāvīra and his disciple Indrabhūti Gautama, presumably recorded by the disciple Sudharman, who transmitted the teachings to his own disciples.

According to modern scholars, the Ācārāṅga and the Sūtrakṛtaṅga, among the Aṅgas, and the Uttarādhyayana, among the Mūla-sutras, are among the oldest parts of the canon. The Cheda-sutra text, Daśāśrutaskandha, concludes with the Kalpa-sutra, which recounts the lives of the Jinas and includes an appendix of rules for monastic life and a list of eminent monks.

Bhadrabāhu, whom tradition credits with being the last Jaina sage to know the contents of the Pūrvas, is asserted to be the author of the Niryuktis, the earliest commentaries on the Jaina canonical texts. These concise, metrical commentaries, written in Prakrit, gave rise to an expanded corpus comprising texts called Bhāṣyas and Cūrṇis. These were composed between the 4th and 7th centuries and contain many ancient Jaina historical and legendary traditions, along with a large number of popular stories brought into the service of Jaina doctrine. The Bhāṣyas and Cūrṇis, in turn, gave rise in the medieval period to a large collection of Sanskrit commentaries. Haribhadra, Sīlāṅka, Abhayadeva, and Malayagiri are the best-known authors of such commentaries.

Digambara canon

Digambaras give canonical status to two works in Prakrit: the Karmaprābhṛta ("Chapters on Karman," also called Ṣhaṭkhaṇḍāgama) and the Kaṣāyaprābhṛta ("Chapters on the Kaṣāyas"). The Karmaprābhṛta, based on the now-lost Dṛṣṭivāda text, deals with the doctrine of *karman* and was committed to writing by Pushpadanta and Bhūtabalin in the mid-2nd century; the Kaṣāyaprābhṛta, compiled by Guṇadhara from the same source at about the same time, deals with the passions that defile and bind the soul. Later commentaries by Vīrasena (8th century) and his disciple Jinasena (9th century) on the Kaṣāyaprābhṛta are also highly respected by Digambaras.

Philosophical and other literature. In addition to the canons and commentaries, the Svetambara and Digambara traditions have produced a voluminous corpus of literature, written in several languages, in the areas of philosophy, poetry, drama, grammar, music, mathematics, medicine, astronomy, astrology, and architecture. In Tamil, the epics *Cilappatikāram* and *Jīvikaciṇṭāmaṇi*, which are written from a Jaina perspective, are important works of early postclassical Tamil literature. Jaina authors were also an important formative influence on Kannada literature. The *Ādipurāṇa* of the Jaina lay poet Pampa (another text dealing with the lives of Ṛṣabha, Bāhubali, and Bharata) is the earliest extant piece of *mahākāvya* ("high poetic") Kannada literature. Jainas were similarly influential in the Prakrit languages, Apabhramsa, Old Gujarati, and, later, Sanskrit. A particularly important literary figure in Prakrit and Sanskrit was the Svetambara monk Hemacandra (12th century), who composed an important Prakrit grammar, as well as poetry, philosophical treatises, and a mammoth epic poem on the lives of the 63 Jaina *mahāpuruṣa*s, entitled *Triṣaṣṭiśalākāpuruṣacaritra.*

Other noncanonical Jaina writers on philosophy include Mallavādin I (4th century), Siddhasena Divākara (*c.* 5th century), Haribhadra Sūri (*c.* 8th century), Samantabhadra (before the 5th century), Akalaṅka (*c.* 8th century), Siddharṣi Gaṇin (10th century), Śāntisūri (11th century), Vidyānandin (*c.* 8th–9th century), Anantakīrti (10th century), Māṇikyanandin (11th century), Prabhācandra (11th century), and Vādi Deva Sūri (12th century). Among later authors, Upādhyāya Yaśovijaya (*c.* 17th century), a versatile scholar, is especially noteworthy.

Digambaras also value the Prakrit works of Kuṇḍakuṇḍa (*c.* 2nd century), including the *Pravacanasāra* (on ethics), the *Samayasāra* (on fine entities), the *Niyamasāra* (on Jaina monastic discipline), and the six *Prābhṛta*s ("Chapters") on various religious topics. Of similar importance is the *Tattvārthādhigama-sutra* of Umāsvāmin (or Umāsvāti), whose work is claimed by both communities. Composed early in the Christian Era, the *Tattvārthādhigama-sutra* was the first work in Sanskrit on Jaina philosophy dealing with such subjects as logic, epistemology, ontology, ethics, cosmography, and cosmogony; it generated numerous commentaries, including one by Umāsvāti himself.

RELIGIOUS SYMBOLISM AND ICONOGRAPHY

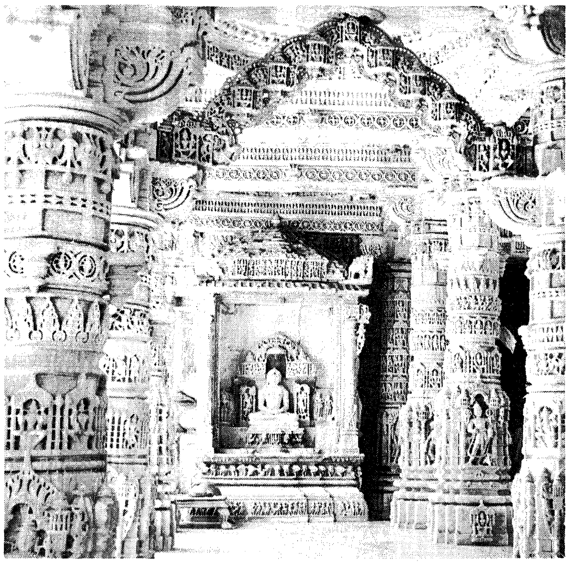
Image worship was introduced at an early stage, perhaps even during the century immediately following the death of Mahāvīra. The Jina himself appears to have made no statement regarding the worship of images. Descriptions of *stūpa*s (reliquaries for the bones and ashes of saints), commemorative pillars, and tree shrines appear in early Jaina texts, which also refer to the worship in the heavens by gods of images of the four legendary Śāśvata Jinas ("Eternal Victors") and of costly relic boxes. Mention is made of *śilāpaṭa*s, which apparently were stone plaques or reliefs placed on lion thrones underneath trees, such as those associated with the worship of Yakshas (mythical nature spirits), and also depicted on Buddhist reliefs from Bharhut (2nd century BC). The *śilāpaṭa*s appear to be the prototypes of the later Jaina *āyāgapaṭa*s (tablets of homage) from Mathura (Uttar Pradesh state), which show representations of *stūpa*s, *caitya* pillars surmounted by elephants, *dharmacakra*s (wheels of the law), and the *aṣṭamaṅgala*s (eight auspicious symbols). Later *āyāgapaṭa*s show a Jina attended by two nude disciples and the figure of the monk Kaṇha Samaṇa with his disciples, or they depict the figure of a noblewoman with attendants.

*Āyāgapaṭa*s

The earliest extant Tirthankara image is possibly the highly-polished Mauryan period torso from Lohanipur, near Patna. Numerous Tirthankara images in the sitting and standing postures dating from the early Christian Era have been uncovered in excavations of a Jaina *stūpa* at Mathura. The earliest images of Tirthankaras are all nude. The various Jinas are distinguished by inscriptions giving their names carved on the pedestals, but later iconographic devices such as symbols specific to each Jina did not evolve until about the 5th century.

Worship of the 16 principal Jaina Tantric goddesses, the Mahāvidyās, was probably introduced in the Gupta age. From the 6th to the 11th century a common pair of attendants was employed in sculpture for all the Tirthankaras, but from about the 9th century 24 *śāsanadevatā*s were evolved, each one to attend a different Tirthankara. The names of many of the attendants suggest Hindu or Buddhist influence.

The religious merit that accrues from hearing and reading Jaina texts encouraged the careful and loving preservation of illustrated manuscripts. The miniature paintings on palm-leaf and paper manuscripts preserved in the Jaina monastic libraries provide a continuous history of the art of painting in western India from the 11th century to the present. The lives of the Jinas and legends of Jaina saints provide a framework for the artists to depict gods and goddesses, throne rooms and village interiors, gardens, and temples. Religious symbols such as the *ashṭamaṅgala*s



Interior of a Jaina temple, showing the Tirthankara image enshrined. Dilwāra Temple, Mount Abu, India, 13th century AD.

By courtesy of the Government of India Tourist Office, London

and the 14 dreams of the mothers of the Tirthankaras frequently appear in paintings.

In addition to the miniatures and to painted wooden book covers that often show mythological scenes, paintings on cloth are also known. Wall paintings are found on cave shrines at Sittānavāsal (Tamil Nādu state) and at Ellora.

Jaina temples generally contain a number of metal images of various types and metal plaques showing auspicious symbols. Metal images of the Jinas are also kept by pious Jainas for home devotion. Among the earliest known bronzes are one of Pārśvanātha in the Prince of Wales Museum of Western India in Bombay, which may date from the 1st century BC, and a group of bronzes (1st–3rd century AD) from Chausa in Bihār in the Patna Museum.

JAINISM AND OTHER RELIGIONS

Shared key concepts

Jainism, Hinduism, and Buddhism. Jainism, Hinduism, and Buddhism share a discourse made available through the Sanskrit language and the dialects (Prakrits) derived from it. Having a set of key concepts in common has enabled these traditions to finely hone their religious debates. For example, all three traditions share a notion of *karman* as the actions of individuals that determine their future births; yet, each has attached connotations to the concept that are uniquely its own. This is also true with terms such as *dharma* (often translated "duty," "righteousness," or "religious path"), *yoga* ("ascetic discipline"), and *yajña* ("sacrifice," or "worship"). This Sanskritic discourse has been brought into the service of the religious and philosophical speculations, as well as the polemics, of each of these traditions.

The same circumstance occurs in the ritual life and literature of each religion. In the ritual sphere, for example, the *abhiṣeka,* or head-anointing ritual, has had great significance among all three, especially in royal contexts. The best-known example of this ritual is the one performed every 12 to 14 years on the statue of Bāhubali at the Jaina pilgrimage site at Śravaṇa Beḷgoḷa. The structure of this ritual is similar in each religious context; in each case, however, it has specific meanings peculiar to that context.

In the literary sphere, each tradition developed an extensive corpus of canonical and commentarial literature, and each has developed a body of narrative literature. For example, so great was the influence of the story of Rāma in the classical Hindu *Rāmāyaṇa,* that the Buddhists and Jainas felt obliged to retell the story in their own terms. Jaina literature includes 16 different tellings of this story in Sanskrit and Prakrit.

Finally, each tradition shares a similar understanding of the ascetic life, though each understands it as functioning properly only within the context of its own religious system. Many of the terms applied to figures in each monastic organization are the same (though not necessarily the same in meaning), and several of the monastic ritual and meditative activities are similar in structure.

Jainism and Islām. In reference to Muslim influence on Jainism, it has been suggested that the concept of *āśātanās*—activities that are unfitting or indecent in a temple—reveals a notion of the sanctity of the temple that is more evocative of Muslim *barakah* ("holiness") than of any traditional Jaina attitude. The most obvious influence of Islām is seen, however, in the repudiation by the Svetambara Loṅkāsāha sect of image worship as something without canonical support. A parallel sect, the Terāpanthin, also arose among the Digambaras.

Jaina influence at the Mughal court of Akbar is a bright chapter in Jaina history. Akbar honoured Hīravijaya Sūri, then the leader of the Svetambara Tapā *gaccha* (subgroup). His disciples and other monks gained the respect of the Mughal emperors Jahāngīr, Shāh Jahān, and even the Muslim chauvinist Aurangzeb. Akbar issued a decree prohibiting animal slaughter near important Jaina sites during the Paryuṣaṇa festival. Jahāngīr also issued decrees for the protection of Śatruñjaya, and Aurangzeb issued a decree favouring the Jainas with respect to proprietary rights over Mount Śatruñjaya. Mughal painting, influential in different schools of Indian painting, also influenced Jaina miniature painting.

BIBLIOGRAPHY

General sources: Good introductions are HERMANN JACOBI, "Jainism," in *Encyclopædia of Religion and Ethics,* vol. 7, pp. 465–474 (1928); and COLETTE CAILLAT, "Jainism," in *The Encyclopedia of Religion,* ed. by MIRCEA ELIADE, vol. 7, pp. 507–514 (1987). Standard works include HERMANN JACOBI (trans.), *Gaina Sūtras,* 2 vol. (1884–95, reissued as *Jaina Sutras,* 1968), with noteworthy introductions by Jacobi to each volume; JOHANN GEORGE BUHLER, *On the Indian Sect of the Jainas,* trans. from German, 2nd ed. (1963); HELMUTH VON GLASENAPP, *Der Jainismus* (1925, reprinted 1964), the most comprehensive text on Jainism, and *The Doctrine of Karman in Jain Philosophy,* trans. from German (1942); and WALTHER SCHUBRING, *The Doctrine of the Jainas* (1962; originally published in German, 1935), a scholarly work, and *The Religion of the Jainas,* trans. from German (1966). JAIN, *Jaina Law* (1926); COLETTE CAILLAT, *Attonements in the Ancient Ritual of the Jaina Monks* (1975; originally published in French, 1965); COLETTE CAILLAT and RAVI KUMAR, *The Jain Cosmology* (1981); and A.N. UPADHYE, *Upadhye Papers* (1983), a collection of essays on Jaina history and literature by an eminent Jaina scholar.

Literature and art: M. WINTERNITZ, *History of Indian Literature,* vol. 2 (1933, reprinted 1971; originally published in German, 1920); H.R. KAPADIA, *A History of the Canonical Literature of the Jainas* (1941), a good description of the Jaina canon; A.

CHAKRAVARTY, *Jaina Literature in Tamil* (1974), a survey of Jaina works in this South Indian language and Jaina influence on Tamil literature; JAGDISHCHANDRA JAIN, *Prakrit Narrative Literature: Origin and Growth* (1981); B.C. BHATTACHARYA, *The Jaina Iconography,* 2nd rev. ed. (1974), a brief outline of the subject; JYOTINDRA JAIN and EBERHARD FISCHER, *Jaina Iconography,* 2 vol. (1978), a later work; UMAKANT P. SHAH, *Studies in Jaina Art* (1955), a review of Jaina art in North India, with a discussion of various symbols in Jaina worship and a good bibliography, and *Akota Bronzes* (1959), a description of rare Jaina bronzes from a site in Gujarāt; A. GHOSH (ed.), *Jaina Art and Architecture,* 3 vol. (1974–75); KLAUS FISCHER, *Caves and Temples of the Jains* (1956); MOTI CHANDRA, *Jain Miniature Paintings from Western India* (1949), a standard textbook; W. NORMAN BROWN, *The Story of Kālaka* (1933), a well-known work on Kālakācārya and miniature Jaina paintings; UMAKANT P. SHAH (ed.), *Treasures of Jaina Bhaṇḍāras* (1978); and P.B. DESAI, *Jainism in South India and Some Jaina Epigraphs* (1957), a useful compilation.

(U.P.S./G.R.S.)

Jakarta

Jakarta is the capital of the Republic of Indonesia and one of the largest and most consistently growing cities in that country. Until 1949 the city was called Batavia; its present name was adopted in that year but was spelled Djakarta until 1972. Coextensive with the metropolitan district of Jakarta Raya, it has an area of 228 square miles (590 square kilometres) and lies at the mouth of the Ciliwung (Liwung River) on the northwest coast of Java.

In 1966 the city was declared to be a special metropolitan district (*daerah khusus ibukota*), thus gaining a status approximately equivalent to that of a state or province. The city has long been a major trade and financial centre; it has also become an important industrial city and an important centre for education.

This article is divided into the following sections:

Physical and human geography

THE LANDSCAPE

The city site. Jakarta lies on a low, flat alluvial plain, with extensive swampy areas; it is easily flooded during the rainy seasons. The parts of the city farther inland are slightly higher. The draining of swamps for building purposes and the continuous decrease of upland forest vegetation have increased the danger of floods. With an excess of water in the soil, Jakarta still has a shortage of clean drinking water, for which there is an increasing demand. The area is quite fertile for fruit and other horticulture, as most of the soil is of old volcanic origin.

Climate. Jakarta is a tropical, humid city, with temperatures ranging between the extremes of 75° and 93° F (24° and 34° C) and a relative humidity between 75 and 85 percent. The average mean temperatures are 79° F (26° C) in January and 82° F (28° C) in October. The annual rainfall is more than 67 inches (1,700 millimetres). Temperatures are often modified by sea winds. Jakarta, like any other large city, now also has its share of air and noise pollution.

The city layout. Although the Dutch were the first to attempt to plan the city, the city layout is probably more British than Dutch in character, as can be seen from such large squares as the Medan Merdeka (Freedom Field) and Lapangan Banteng (Place of the Gaur [large wild ox]). The Oriental style, or "indische" style, as the Dutch call it, is, however, not only apparent in the city's way of life but also in the types of houses, the wide, tree-lined streets, and the original spacious gardens and house lots. In Kebayoran, a satellite town built since World War II on the southwestern side of the city, and in other modern developments, the houses and garden lots are much smaller than in the older colonial districts.

Traditional neighbourhoods

Jakarta has always been a city of new settlers who assimilated local ways and became Jakartans themselves. Some traditional neighbourhoods can, however, be identified. The Kota (Fort), or Old City, for example, sometimes also called the downtown section, is the central business district and also the financial capital of Indonesia. It houses a significant part of the Chinese population. The area of Kemayoran (Progress) and Senen, originally on the eastern fringe of the city, is now almost central in its location and increasingly has become the major retail area of the city.

The Jatinegara (Real Country) section, originally a Sundanese settlement but later incorporated as a separate town, then a Dutch army camp (Meester Cornelis), has now merged with the rest of Jakarta and includes many new settlers. The Menteng and Gondangdia sections were formerly fashionable residential areas near the central Medan Merdeka (then called Weltevreden). To the west, Tanahabang (Red Earth) and Jati Petamburan, are, like Kemayoran, densely developed. Tanjungpriok is the harbour, with its own community attached to it.

The most common type of house in the city is the kampong, or village house. Most are built of materials such as wood or bamboo mats, but this does not necessarily mean that this is substandard. Another common type of housing, often used to house government workers, is the colonial

Jakarta and (inset) its metropolitan area.

urban house, or *rumah gedongan;* these are mostly single-family detached or semidetached houses, each standing on a separate lot. Apartment buildings constitute a more modern category; although they are more economical in the use of land than single-family types, their architectural and construction costs often make them fairly expensive. Housing is generally overcrowded.

Some of Jakarta's buildings, such as the Portuguese Church (1695) in the Old City, are of architectural or historical interest. Some of the buildings around the city square in the Kota also date from colonial times, including the old city hall (1710), which has been restored and now serves as the municipal museum. The National Archives building was originally the palace of a Dutch governor general, Abraham van Riebeeck. The Ministry of Finance building, facing Banteng Square, also was designed as

Buildings from colonial times

a governor's palace (Herman Willem Daendels, one of Napoleon's marshals). The Presidential Palace, north of Medan Merdeka, faces the Monas, or Monumen Nasional (National Monument), at 360 feet (110 metres) the highest building in Jakarta. The Istiqlal Mosque, in the northeast corner of Medan Merdeka opposite Banteng Square, is one of the largest mosques in Southeast Asia. The National Museum (formerly the Central Museum), on the west side of the Medan Merdeka, houses a collection of historical, cultural, and artistic artifacts.

After World War II Jakarta underwent a building boom. The Hotel Indonesia (the city's first high-rise building) and the Senayan Sports Complex were built for the Asian Games in 1962. Most high-rise buildings are located along Husni Thamrin and Jendral Sudirman roads, connecting Jakarta with Kebayoran.

THE PEOPLE

The population of Jakarta has increased more than 100 percent since 1940. Much of this increase is attributed to immigration. Although government regulations close the city to unemployed new settlers, better economic conditions inevitably attract new people. In addition, much of the population is young and fertile, resulting in a very high natural increase potential. Analysis of the immigrant stream shows that after the West Javanese, the largest groups represented are the Central and East Javanese; a sizable number also are from Sumatra. Other population groups—Arabs, Indians, Europeans, and Americans—are present in small numbers.

THE ECONOMY

Economically, Jakarta plays several roles. It can be identified first as the national capital and a central place of control for the national economy, then as an administrative centre in its own right, and, finally, as a significant industrial hub. In addition, its location as a port makes it an important centre for trade.

Industry. Jakarta has some manufacturing industries, including several iron foundries and repair shops, margarine and soap factories, breweries, and printing works. Machinery, cigarettes, paper, glassware, wire cable, and aluminum and asbestos, and more recently also automotive, products are manufactured. There are also tanneries, sawmills, textile mills, food-processing plants, and a film industry.

Commerce and trade. The cost of living in the city continues to rise. Land is expensive, and rents are high, so that industrial development and the construction of new housing usually are undertaken on the outskirts, while commerce and banking remain concentrated in the city centre. The Indonesian Chamber of Commerce is active in promoting trade with other countries; the annual Jakarta Fair (usually held from July to August) also serves to promote trade.

City-operated markets

To meet the needs of the local city population, the municipality operates several markets. The central city markets (Pasar Kota), like the markets of Pasar Senen to the east of the central city and Pasar Glodok in the Kota area, are major retail centres. The Pasar Jatinegara is primarily a food supply centre. The district markets are fairly large, with each one catering to a whole section of the city. There are also small neighbourhood markets, each serving only a limited area. Special markets include one selling fish, one selling used and new automobile parts, the Pasar Rumput flea market, and the Jalan Surabaya souvenir and antique market. Jakarta also has several general neighbourhood markets.

Transportation. Major road arteries lead west from the centre of the Kota Old City and east and south from the administrative centre in Gambir. To the east, a major railroad connects the city with all of the island of Java. There is also a highway, primarily a regional supply road, running between Jakarta and the agriculturally productive areas of East and Central Java. To the south, a road and railroad connect Jakarta with Bogor, Sukabumi, and Bandung. To the west, a railroad and road run to Banten and to the harbour in Merak, which is connected by ferry to Lampung in Sumatra.

The port of Tanjungpriok in Jakarta is the largest in Indonesia, handling exports from West Java and a large proportion of Indonesia's import trade; many goods are transshipped to other islands or harbours.

Jakarta is served by several international airlines, by Garuda Indonesian Airways (the national airline, with international and domestic service), and by other domestic airlines. The city has airports at Kemayoran (relatively close to the city centres) and Halim Perdanakusuma and the new international airport in Cengkareng.

The *becak,* or tricycle taxi

The central bus terminal, located on Lapangan Banteng, serves all the city, intercity, and regional bus lines; there are also suburban bus terminals in Jatinegara, Kebayoran, Grogol, Kota, and Tanjungpriok. The major railroad stations are at Kota in the old city, Gambir on Medan Merdeka, Pasar Senen on the east, and Manggarai and Jatinegara on the south. Tanahabang serves the west and traffic to Merak. Traffic jams occur particularly during the morning and afternoon rush hours. Public transportation in the city is by bus or minibus. The *becak*, or tricycle taxi, is used only for local neighbourhood transportation, and regular taxis now operate throughout the metropolitan area.

ADMINISTRATIVE AND SOCIAL CONDITIONS

Government. The mayor of the city has the same status as the governor of a province. The city government is composed of two branches, the executive and the electorate. The executive consists of a governor assisted by four vice governors, an executive staff, and a regional secretary; there are also a number of city directorates, bureaus, and agencies attached to the executive. The electorate consists of 35 to 40 members, including representatives of eight political parties, four representatives of the armed forces, and nine representatives of the so-called functional groups. It is headed by a council of five members, one chairman, and four vice chairmen.

Public utilities. Public utilities are usually operated or owned by the Indonesian government. The State Electricity Company and the subsidiary State Gas Company both supply Jakarta. Postal and cable services and telephone services are supplied by state companies working under the aegis of the Department of Communications. Jakarta's electricity comes from several sources; these include the thermal plant in Ancol, close to the port of Tanjungpriok, smaller diesel plants in various parts of the city, and the Jatiluhur hydroelectricity project located close to Purwakarta, about 70 miles (110 kilometres) southeast of Jakarta. A new thermal power plant is under construction in Surabaya.

The city government is responsible for the water supply. The city water is obtained in part from freshwater springs in the Bogor area, but most of the supply comes from the Pejompongan water treatment plant. Water is required mainly for domestic purposes but is also needed for industry and to supply ships. The removal of garbage and the provision of other sanitation services are also the responsibility of the municipality.

Hospitals and clinics

Health. There are three major hospitals—one operated directly by the Department of Health, one by the Roman Catholic Church, and one by a Protestant mission. Three municipal hospitals each serve a separate area of the city—the Sumber Waras Hospital in western Jakarta, the Fatmawati Hospital in Kebayoran (southern Jakarta), and the Persahabatan (Friends) Hospital in eastern Jakarta. Altogether Jakarta has about 40 general or special hospitals. In addition, there are several hundred general clinics or polyclinics located throughout the city. A quarantine hospital is in operation in Tanjungpriok. The city also operates a hospital and rehabilitation centre for the mentally ill and destitute, and there are many family-planning and child care clinics.

Education. To meet the needs for primary education, many new elementary schools and secondary schools have been built, and a number of old school buildings have been renovated. There is a well-developed system of kindergartens, elementary schools, *madrasah*s (religious schools), secondary schools, and high schools. There are also many vocational and special schools and more than 100 universities, academies, and institutes for higher learning. The largest and best known university is the Universitas Indonesia (founded 1950).

CULTURAL LIFE

Among other cultural activities, the Taman Ismail Marzuki centre has facilities for traditional or classical art performances as well as theatres for presenting modern plays and concerts; the centre also has a planetarium. Traditional performances include *wayang* dance and drama, gamelan music, and *wayang* puppet shows. Traditional performances representing the culture of other parts of Indonesia are included in the programs presented at the annual Jakarta Fair.

Extensive public recreation areas in and around Jakarta include the Bina Ria seaside recreation area at Ancol and the Ragunan zoo, near Pasarminggu. Playgrounds include, among others, the Taman Ria complex at the Jakarta Fair grounds, located just south of the Monas. The 250-acre (100-hectare) Taman Mini Indonesia Indah (Beautiful Indonesia in Miniature) park, just southeast of the city, contains exhibits of traditional houses representing each of Indonesia's 27 provinces. The city also provides public recreation facilities.

History

The first settlements on the site of Jakarta were established at the mouth of the Ciliwung, perhaps as early as the 5th century AD. The city's official history, however, starts in 1527, when the Sultan of Bantam defeated the Portuguese there and called the place Jayakerta (Sundanese: Glorious Fortress).

The Dutch, under the leadership of Jan Pieterszoon Coen, captured and razed the city in 1619, after which the capital of the Dutch East Indies—a walled township named Batavia—was established on the site.

The colonial history of the city can be divided into three major periods. First was that of the Dutch East India Company, when most of the activities of the city centred around the fortress and the company warehouses. At that time the city somewhat resembled a typical Dutch town, complete with canals. The second period began in the early 1800s, when the city was extended to include higher and more healthful areas to the south, which would later become the seat of the new colonial government. A brief interval of British control during the Napoleonic Wars, ending in 1815, interrupted the second period. During the third period, which lasted from about the 1920s to 1941, the city became modernized.

The colonial era

The colonial era ended with the entry of Japan into World War II, when Indonesia was occupied by Japanese forces. After the war the city was briefly occupied by the Allies and then was returned to the Dutch. During the Japanese occupation and again after Indonesian nationalists declared independence on August 17, 1945, the city was renamed Djakarta. The Dutch name Batavia remained the internationally recognized name until full Indonesian independence was achieved and Djakarta was officially proclaimed the national capital (and its present name recognized) on December 27, 1949.

Jakarta has undergone tremendous growth and development since Indonesia's independence. Despite its problems, the city has become one of the largest metropolises of tropical Asia.

BIBLIOGRAPHY. On the history of Jakarta, see F. DE HAAN, *Uit Oud-Batavia* (1898); and DJAKARTA, KOTAPRADJA, *Sedjarah pemerintahan kota Djakarta* (1958). A contemporary description is given in the guidebook, *Djakarta,* issued by the PETUNDJUK DCI (1969). Census and population information may be found in the Jakarta volumes issued by the BIRO PUSAT STATISTIK in its *Sensus penduduk* (Census of Population) reports for the censuses of 1961, 1971, and 1980; and in H.J. HEEREN (ed.), *The Urbanisation of Djakarta* (1955). See also *Djakarta: Its Rehabilitation and Development* (n.d.), issued by the Badan Perentjana Pembangunan (Development Planning Body) of the City Government; and PAULINE D. MILONE, *Urban Areas in Indonesia* (1966).

(W.J.W.)

Japan

The island country of Japan (Japanese: Nihon or Nippon) lies off the east coast of Asia. It consists of four main islands—Hokkaido (Hokkaidō), Honshu (Honshū), Shikoku, and Kyushu (Kyūshū)—that, along with numerous smaller islands, trend in a great northeast-southwest arc for some 1,500 miles (2,400 kilometres); the average width of the chain is about 130 miles, and Japan has a total land area of 145,870 square miles (377,801 square kilometres). Honshu is the largest of the four main islands, followed in size by Hokkaido, Kyushu, and Shikoku. The national capital, Tokyo (Tōkyō), is one of the most populous cities in the world.

Japan is bounded to the west by the Sea of Japan, which separates it from the eastern shores of the Soviet Union and North and South Korea; to the north by La Perouse (Sōya) Strait (separating it from the Soviet island of Sakhalin) and the Sea of Okhotsk; to the northeast by the southern Kuril Islands (since World War II under Soviet administration); to the east and south by the Pacific Ocean; and to the southwest by the East China Sea, which separates it from the People's Republic of China.

The Japanese landscape is rugged, with more than four-fifths of the land surface consisting of mountains. The abundant rainfall and generally mild temperatures throughout most of the country have produced a lush vegetation and, despite the mountainous terrain and generally poor soils, have made it possible to raise a variety of crops. Japan has a large population, which is heavily concentrated in the low-lying areas along the Pacific coast of Honshu.

Complexity and contrast are the keynotes of life in Japan—a nation possessing an intricate and ancient cultural tradition, yet one that, especially since World War II, has emerged as a modern industrial giant. Tension between old and new is apparent in all phases of Japanese life. A characteristic sensitivity to natural beauty and a concern with form and balance are evident in such cities as Kyōto and Nara, as well as in Japan's ubiquitous gardens. Even in the countryside, however, the impact of rapid westernization is evident upon many aspects of Japanese life. The agricultural regions are characterized by low population densities and well-ordered rice fields and fruit orchards, whereas the industrial and urbanized belt along the Pacific coast of Honshu is noted for its highly concentrated population and for the despoilment of the environment by airborne pollutants and other wastes. Heavy emphasis is placed on education.

Japan's spectacular economic growth—the greatest of any nation since the 1940s—has brought the country to the forefront of the world economy. It is one of the world's principal shipbuilders and is a major producer and exporter of manufactured goods, including automobiles, electrical products, chemicals, and steel. An important feature of the burgeoning economy is the prevalence of large, quasi-monopolistic industrial companies. (Ak.W./Ed.)

This article is divided into the following sections:

Physical and human geography

THE LAND

Mountainous character of Japan

Relief. The mountainous character of the country is the outcome of geologically recent orogenic (mountain-building) forces, as evidenced by the frequent occurrence of violent earthquakes, volcanic activity, and signs of change in levels along the coast. There are no sizable structural plains and peneplains (large land areas levelled by erosion), which usually occur in more stable regions of the Earth. The mountains are for the most part in a youthful stage of dissection in which steep slopes are incised by dense river-valley networks. Rivers are mostly torrential, and their valleys are accompanied by series of river terraces that are the result of movements in the Earth's crust. Recent volcanoes are juxtaposed with old and highly dissected ones. The shores are characterized by elevated and depressed features such as headlands and bays, which display an incipient stage of development.

The mountains are divided into many small land blocks that are separated by lowlands or deep saddles; there is no long or continuous mountain range. These land blocks are the result of intense faulting (movement of adjacent rock masses along a fracture) and warping (bending of the Earth's crust), the former process being regarded as dominant. One consequence is that mountain blocks are often bounded by fault scarps and flexure slopes that descend in step formation to the adjacent lowlands.

Coalescing alluvial fans—cone-shaped deposits of alluvium that run together—are formed where rivers emerge from the mountains. When the rivers are large enough to extend their courses to the sea, low deltaic plains develop in front of the fans; this occurs most frequently where the rivers empty into shallow and sheltered bays, as in the deltas of Kantō (Kwanto), Nōbi, and Ōsaka. In most places, however, fan surfaces plunge directly into the sea and are separated by low, sandy beach ridges.

Dissected plains are common. Intense disturbances have caused many former alluvial fans, deltas, and sea bottoms to be substantially uplifted to form flat-topped uplands such as those found in the Kantō Plain (Kantō-heiya). Frequently the uplands have been overlain with volcanic ash, as in the Kantō and Tokachi plains.

In addition, Japan is truly a land of volcanoes. Violent eruptions are frequently experienced, and at least 60 volcanoes have been active within historical time. New volcanoes born during the 20th century include Shōwa-shinzan (Shōwa Volcano) on Hokkaido and Myōjin-shō off the Beyoneisu (or Bayonnaise) Rocks in the Pacific. The abundant hot springs are mostly of volcanic origin. Many of the gigantic volcanoes are conical in shape (*e.g.,* Fuji-san [Mount Fuji]), while others form steep lava domes (*e.g.,* Dai-sen and Unzen). Conspicuous shield volcanoes (broad, gently sloping volcanic cones such as Mauna Loa on Hawaii Island) are rare, and extensive lava plateaus are lacking. One of the characteristics of the volcanic areas is the prevalence of calderas (large, circular, basin-shaped volcanic depressions), especially in the northeast and southwest, many of which are occupied by lakes, such as Kutcharo, Towada, and Ashi.

Japan's mountains have been influenced by the orogenic formation of six mountain arcs off the Pacific coast of Asia. They are, from northeast to southwest, the Chishima Range of the Kuril Islands; the Karafuto (Sakhalin) Mountain system of Hokkaido; the Northeast, Southwest, and Shichito-Mariana ranges of Japan; and the Ryukyu (Nansei) Island formations. The four major landform areas of Japan—the Hokkaido, Northeastern, Central, and Southwestern regions—have developed as a result of the formation of these arcs.

Four major landform regions

The Hokkaido region was formed by the coalescence of the Chishima and Karafuto arcs. The backbone of the region runs from north to south. The Chishima arc enters Hokkaido as three volcanic chains with elevations of more than 6,000 feet (1,800 metres); these are arranged in ladder formation and terminate in the heart of the region.

Chief components of the mountain system are the Kitami-sanchi (Kitami Mountains) in the north and the Hidaka-sammyaku (Hidaka Range) in the south.

The Northeastern Region nearly coincides with the northeastern mountain arc and stretches from southwest Hokkaido to central Honshu. Several rows of mountains, lowlands, and volcanic zones are well oriented to the general trend of the insular arc of this region, which is convex toward the Pacific Ocean. The Kitakami and Abukuma ranges on the east coast are somewhat oblique to the general trend; they are chiefly composed of older rocks, and plateau-like landforms survive in the centre. In the western zone, the formations conform to the general trend and are composed of a basement complex overlain by thick accumulations of young rocks that have been subjected to mild folding. The Ōu-sammyaku, capped with towering volcanoes that form the Nasu-kazantai (Nasu Volcanic Zone), is separated from the coastal ranges by the Kitakami-Abukuma lowlands to the east and by a row of basins in the west.

The Central Region of Honshu is dominated by the overlapping of the Northeast, Southwest, and Shichito-Mariana mountain arcs. It contains Japan's highest mountain, Fuji-san, which rises to 12,388 feet (3,776 metres), and its broadest width of 168 miles (270 kilometres). The trend of the mountains, lowlands, and volcanic zones intersects the island almost at right angles. The most notable physical feature is the Fossa Magna, a great rift lowland that traverses the widest portion of Honshu from the Sea of Japan to the Pacific. It is partially occupied by mountains and volcanoes of the Fuji-kazantai. Intermontane basins are sandwiched between the lofty, partially glaciated central mountain knots of the Akaishi, Kiso, and Hida ranges (which together form the Japanese Alps) to the west and the Kantō-sanchi to the east. The shallow structural basin of the Kantō Plain, which stretches to the east of the Kantō-sanchi, is the most extensive lowland of Japan; the immense metropolis of Tokyo spreads out from its centre, covering a vast area of the plain.

The Southwestern Region of southern Honshu, Shikoku, and northern Kyushu generally coincides with the southwest mountain arc, and the general trend of highlands and lowlands is roughly convex toward the Sea of Japan. The region is divided into the Inner Zone, formed by complex faulting, and the Outer Zone, formed by warping. The Inner Zone is chiefly composed of granite, Paleozoic (225,000,000–570,000,000 years old), and volcanic rocks, which are arranged in complicated juxtaposition. The Outer Zone, consisting of the Akaishi, Kii, Shikoku, and Kyushu mountain groups, in contrast, is characterized by a regular zonal arrangement from north to south of crystalline schists, Paleozoic, Mesozoic (65,000,000–225,-000,000 years old), and Tertiary (2,500,000–65,000,000 years old) formations. The outstanding surface features of the Inner Zone present a highly complex mosaic of numerous fault blocks, while those of the Outer Zone are continuous except where the sea straits separate them into the four independent groups. The Inland Sea (Seto-naikai) is the region where the greater amount of depression has resulted in the invasion of sea waters. The northern edge of the Inner Zone is studded with the gigantic lava domes of the Daisen-kazantai, which, together with volcanic Aso-san, bury a considerable part of the western extension of the Inland Sea in central Kyushu.

T. Okuda—Aspect Picture Library, London

Taishō Pond in Kamikōchi Valley, Chūbu Region. Beyond are the peaks of Hotaka-dake, highest mountain in the Hida Range, which is the northernmost range in the Japanese Alps.

The Ryukyu Islands Region constitutes the main portion of the Ryukyu arc, which penetrates into Kyushu as the Kirishima-kazantai and terminates at Aso-san (Mount Aso). The influence of the arc is also seen in the trend of the many elongated islands off western Kyushu, including the Koshiki, Gotō, and Tsushima islands. The islands of the Shichito-Ogasawara region, to the east of the Ryukyu arc, consist of a number of volcanoes on the submarine ridge of the Shichito-Marina arc and the Bonin Islands (in Japanese Ogasawara-guntō), which include Peel Island and Iwo Jima (Iō-jima).

Drainage and soils. The increasing demand for fresh water because of the rice culture, industrialization, and urbanization is a serious problem. Difficulties of supply lie in the paucity of natural water reservoirs, the swift runoff of the rivers, and the engineering difficulties of constructing large-scale dams in the rugged mountains.

Japan's rivers are generally short and swift-running and are supplied by small drainage basins. The most significant rivers are the Teshio and Ishikari rivers of Hokkaido; the Kitakami, Tone, Shinano, Kiso, and Tenryū rivers of Honshu; and the Chikugo of Kyushu. Some of the rivers from the volcanic areas of northeastern Honshu are acidic and are useless for irrigation and other purposes.

Major rivers

Biwa-ko (Lake Biwa), the largest in Japan, covers 260 square miles of central Honshu. All other major lakes are in the northeast. Most of the coastal lakes, such as Kasumiga-ura (Lake Kasumi) and Hamana-ko of Honshu, are drowned former valleys, the bay mouths of which have been dammed by sandbars. Inland lakes such as Biwa, Suwa, and Inawashiro of Honshu occupy tectonic depressions of recent fault origin. Lakes of volcanic origin (*e.g.,* Kutcharo of Hokkaido and Towada and Ashi of Honshu) outnumber all other types.

The soils of Japan are customarily divided from northeast to southwest into a weak podzolic (soils with a thin organic mineral layer over a gray leached layer) zone, a brown-earth zone, and a red-earth zone. There are some local variations. The northern half of the Tōhoku area of northern Honshu is included in the brown forest soil area. The northern tip of Hokkaido is classed as a subzone of the podzolic soils; the remainder of the island is included in the subzone of the acidic brown forest soils; and most of western Honshu is a transitional zone. Yellow-brown forest soils extend along the Pacific coast from southern Tōhoku to southern Kyushu, while red and yellow soils are confined to the Ryukyu Islands.

Kuroboku soils (black soils rich in humus content) are found on terraces, hills, and gentle slopes throughout Japan, while gley (sticky, blue-gray compact) soils are found in the poorly drained lowlands. Peat soils occupy the moors in Hokkaido and Tōhoku. Muck (dark soil, containing a high percentage of organic matter) and gley paddy soils are the products of years of rice culture. Polder soils (those reclaimed from the sea) are widely distributed, and immature volcanic ash soils are found on the uplands. The widespread reddish soils are generally regarded as the products of a former warm, humid climate.

Climate. Japan's present climate is influenced by the country's latitudinal extent, the surrounding oceans, and the neighbouring Asian landmass, whereas local climatic variations are the result of relief features. In winter, the high pressure zone over eastern Siberia and the low pressure zone over the western Pacific result in an eastward flow of cold air (the winter monsoon) from late September to late March that picks up moisture over the Sea of Japan. The winter monsoon deposits its moisture as rain or snow on the side of Japan facing the Sea of Japan and brings dry, windy weather to the Pacific side. The pressure systems are reversed during the summer, and air movements from the east and south (the summer monsoon) from mid-April to early September bring warmer temperatures and rain. Cyclonic storms and frequent and destructive typhoons occur during the summer and early fall, especially in the southwest.

The effects of ocean currents

The warm waters of the Kuroshio (Japan) Current, which corresponds to the Gulf Stream of the Atlantic, flow northward along Japan's Pacific coast as far as latitude 35° N. The Tsushima Current branches westward from the Kuroshio Current off southern Kyushu and washes the coasts of Honshu and Hokkaido along the Sea of Japan; it is this current that lends moisture to the winter monsoon. The counterpart of the Labrador Current, the cold Oyashio (Chishima) Current, flows southeastward from the Bering Sea along the east coast of Hokkaido and northeastern Honshu. Its waters meet those of the Kuroshio Current, causing dense sea fogs in summer, especially off Hokkaido.

The chief physical feature to affect climate is the mountainous backbone of the islands. The ranges interrupt air flow from the northwest and southeast and cause the gloomy weather and heavy snows of winter along the Sea of Japan coast and the bright and windy winter weather along the Pacific. Temperatures and annual precipitation are about the same on both coasts, but they drop noticeably in the mountainous interior.

Temperatures are generally warmer in the south than in the north, and the transitional seasons of spring and fall are shorter in the north. At Asahikawa, in central Hokkaido, the mean temperature in January, the coldest month, is 16° F (−9° C), and the mean temperature in August, the hottest month, is 70° F (21° C), with an annual average temperature of 43° F (6° C). At Tokyo, the mean temperature for January is 39° F (4° C), the mean for August 81° F (27° C), and the annual average 59° F (15° C). Inland from Tokyo, Matsumoto is cooler, with an annual average temperature of 52° F (11° C); whereas an annual average of 57° F (14° C) occurs on the Sea of Japan coast at Kanazawa. The warmest temperatures occur on Kyushu and the southern islands; at Kagoshima, the mean temperature for January is 45° F (7° C), the mean for August is 81° F (27° C), and the average is 63° F (17° C).

Precipitation in the form of rain and snow is plentiful throughout the islands. Maximum precipitation falls in the early summer, and the minimum occurs in winter except on the Sea of Japan coast, which receives the country's highest snowfall. The summer rainy season occurs through June and July; it is known as the *baiu* ("plum rain") because it begins when the plums ripen. Torrential rains accompany the typhoons.

Rainfall patterns vary with topography, but most of the country receives more than 40 inches (1,020 millimetres) of precipitation annually. The smallest amount of precipitation occurs on eastern Hokkaido, where only 37 inches fall annually at Obihiro, whereas the mountainous interior of the Kii-hantō (Kii Peninsula) of central Honshu receives more than 160 inches annually. Varying amounts of snow fall on Japan. From November to April snow blankets Hokkaido, northern and interior Honshu, and the northwest coast.

Plant and animal life. Much of the original vegetation has been replaced by agriculture or by the introduction of foreign species to the islands. Semitropical rain forest prevails in the Ryukyu and Bonin islands and contains various kinds of mulberries, camphor, oaks, and ferns (including tree ferns); madder and lianas are found as undergrowth. In the Amami-shotō (Amami Islands) this type of plant life occurs only on lowlands, but it grows at higher altitudes southward. There are a few mangrove swamps along the southern coast of Kyushu.

Vegetational regions

The laurel forest zone of evergreen, broad-leaved trees extends from the southwestern islands northward to the lowlands of northern Honshu. Camphor, pasania, Japanese evergreen oak, camellia, and holly are typical trees, and various kinds of ferns grow as undergrowth. In Kyushu, the evergreen zone reaches to more than 3,300 feet, but its altitudinal limit decreases northeastward across Honshu. In general, camphor dominates in the littoral lowlands; pasania, in sunny and well-drained sites; and Japanese evergreen oak, in the foggy and cloudy inlands. In the southwestern Hondo region (Honshu, Shikoku, and Kyushu) are ficus and fan palm. The coastal dunes are dominated by pine trees. Natural stands of Japanese cedar, some containing trees that are more than 2,000 years old, occur above 2,300 feet on Yaku-shima, south of Kyushu.

Deciduous broad-leaved forests develop in the higher and northward portions of the laurel forest zone. In Kyushu, this type of forest occurs above 3,300 feet, but it gradually descends northward to meet the shoreline in northern Honshu. Its upper limit reaches 6,000 feet in Shikoku and 5,000 feet in central Honshu. The representative trees are beech, katsura tree, maple, oak, and birch; while various kinds of bamboo grasses grow as undergrowth. All of these trees, but especially the maples, are admired for their beautiful fall colours. The trees have been occasionally replaced by larch, false cypress, false arborvitae, Japanese cedar, Japanese red pine, Japanese black pine, and other coniferous species. The deciduous zone extends into western Hokkaido, where beeches terminate at the southwestern peninsula, and further northeastward is replaced by basswood and maple. Some stands of conifers are mixed with the representative forests of this zone.

Coniferous trees are numerous in the north and eastern periphery of Hokkaido up to 2,300 feet above sea level. Sakhalin spruce, Sakhalin fir, blue fir, and Yezo spruce are mixed with such deciduous trees as birch, oak, and maple and dense undergrowth of mosses and lichens. Coniferous trees are mixed with deciduous vegetation in southwestern Hokkaido and occur in the higher portion of central Honshu and Shikoku.

High-altitude small shrubs, the creeping pine, and alpine plants grow in the high mountain knots of central Honshu above 8,000 feet. This zone gradually descends northward to Hakkōda-san, in northern Honshu, at 4,600 feet and to Daisetsu-zan, in central Hokkaido, at about 3,600 feet.

The cherry tree, celebrated for its spring blossoms, is planted all about the country. Many varieties have been cultivated, and natural stands are also found in the mountains.

Animal life

Despite the country's large human population, the land mammals of Japan are relatively numerous in the remote, heavily forested mountain regions. These animals include bears, wild boars, raccoon dogs (*tanuki*), foxes, deer, antelope, hares, and weasels; some species are distinct from those of the neighbouring Asian continent. Wild monkeys (the Japanese macaque) inhabit many places; those found at the northern tip of Honshu represent the northern limit of monkey habitation in the world.

Japanese waters are inhabited by whales, dolphins, porpoises, and fish such as salmon, sardines, sea bream, mackerel, tuna, trout, herring, grey mullets, smelts, and cod. Crustaceans include crabs, shrimp, prawns, clams, and oysters and are important as food; clams and oysters are raised commercially. The rivers and lakes abound in trout, salmon, and crayfish. In addition, several varieties of seaweed are collected for food.

Reptiles include sea turtles, freshwater tortoises, sea snakes, and lizards. There are two species of poisonous snakes, but most of the snakes, including the five-foot-long Japanese rat snake, are harmless. Toads, frogs, and newts are common; and the Japanese giant salamander of Kyushu and Honshu attains a length of four feet.

Water birds include gulls, auks, grebes, albatrosses, shearwaters, herons, ducks, geese, swans, and cranes. The cormorant is sometimes trained to catch fish. There are about 150 species of songbirds, as well as eagles, hawks, falcons, pheasant, ptarmigan, quail, owls, and woodpeckers. Storks

and the Japanese crested ibis (*toki*), once abundant, have nearly become extinct.

Administrative regions. The concept of regions in Japan is inseparable from the historic development of administrative units. Care was always taken to include various physical features in the larger administrative units so as to create a well-balanced geographic whole. Many of the ancient terms for administrative units have survived in the form of place-names.

The origin of Japan's regions

The Taika reforms of 646 established the *ri* (roughly corresponding to the later village community) as the basic social and economic unit and the *gun* (district) as the smallest political unit to be governed by the central government. The *gun* were grouped to form more than 60 *kuni* (provinces), the largest political units, which were ruled by governors appointed by the central government. Each *kuni* was composed of maritime plains, interior basins, and mountains to constitute a more or less independent geographic entity. Several adjacent *kuni* that were linked by a trunk road or a convenient sea route were grouped into a *dō;* the term signified both the route and the region. The core region of the country was called the Kinai, or the land adjacent to the shifting Imperial capitals.

During the Nara (710–784) and Heian (794–1185) periods, the region of Honshu to the east of the three great mountain barriers of Arachi, Fuwa, and Suzuka north, east, and southeast of Biwa-ko was called Kantō (*kan,* "barrier"; *tō,* "east"); and that to the west Kansai (*kan,* "barrier"; *sai,* "west"). As the empire's frontier shifted to the northeast, Kantō came to indicate the region to the east of Hakone barrier, and Kansai gradually came to include limited areas near the capital of Kyōto as far as Ōsaka and present Kōbe. Northern areas that had not come under direct control of the central government were called *Yezochi,* "the land of non-subjugated people."

A third regional system was applied after the 10th century, in which *kuni* were amalgamated according to their distance from Kyōto. The larger units were *kingoku,* or proximate *kuni; chūgoku,* or intermediate *kuni;* and *engoku,* or remote *kuni.* Mutsu and Dewa in northeastern Honshu and islands such as Sado, Oki, Tsushima, and Iki were termed *henkyō,* or peripheral, lands.

In 1871 the feudal system was dissolved and the *ken,* or prefectural, system was established. At first the more than 300 prefectures were mostly the former fiefs of feudal lords, who were appointed as governors. Through amalgamation and partition there were frequent changes in the *ken* pattern, until by 1888 the present configuration of 43 *ken* (including Okinawa), three *fu* (urban prefectures) of Tokyo, Ōsaka, and Kōbe, and one *dō* (Hokkaido) was established; in 1943 Tokyo was given the status of *to,* or metropolis.

Modern regional units

Early in the 20th century it was recognized that larger geographical divisions were needed. By 1905 a system of eight *chihō* (regions) had been set up that divided the country from northeast to southwest. The *chihō* are Hokkaido; Tōhoku (northern Honshu); Kantō (eastern Honshu); Chūbu (central Honshu); Kinki (west central Honshu); Chūgoku (western Honshu); Shikoku; and Kyushu (including the Ryukyus). Another system used by some governmental agencies is a modification of the *chihō* system. Chūbu-chihō, for example, is subdivided into Hokuriku, Tōsan, and Tōkai. This system is devised so as to group prefectures of similar geographic character into one *chihō* and is more effective for illustrating regional contrasts and comparing statistics. In addition, planners have come to refer to the string of industrialized and urbanized areas along the Pacific seaboard between Kantō-chihō and northern Kyushu as the Pacific Belt Zone (Taihei-yō Beruto Chitai). This zone includes most of the Japanese cities with populations of more than 1,000,000, as well as more than half of the country's total population.

Settlement patterns. Since the late 19th century, economic and social changes have affected even the most remote rural villages, but many things Japanese have survived. In the villages, many features that are in common with those of other Asian villages are well preserved. Autonomous and cooperative systems of agricultural practices and rituals, as well as mutual assistance among the villagers, have been handed down to the present. An autonomous rural unit, generally known as a *mura,* consists of some 30 to 50 or more households. Now called an *aza,* this unit should not be confused with the administrative terms *mura* or *son* in use after 1888.

Rural settlement patterns

Most of the rural settlements are of age-old origin, and their histories are lost in time. Historically traceable settlements owe their origins largely to land reclamation after the 16th century. They are commonly called *shinden,* or "new paddy fields," but in terms of social structure they do not radically differ from the older settlements.

Considerable local difference is evident in the settlement pattern. Some villages are agglomerated, as are those of Kinki-chihō; some are dispersed, as in northeastern Shikoku; some are elongated, such as those on the rows of sand dunes in the Niigata-heiya (Niigata Plain) and on the natural levees of deltas; while others are scattered on the steeper mountain slopes. These differences are only superficial; without exception, the inhabitants are bound together to form a firm village community.

No village is regarded as purely rural. Those that are near industrialized urban centres include commuters and industrial workers. The more remote settlements send out seasonal labourers during the winter months. The villages of Hokkaido are based on commercial agriculture, and each household has direct contact with a nearby town.

Fishing villages were absent in Tōhoku-chihō until the beginning of the 17th century, when northward movement began. They were originally dependent upon nearby rice-producing villages; although some dried, salted, or smoked fish found more distant markets. The fishing villages are most numerous in the southwest, where an exchange economy has long been in practice. Mountain villages that depend solely on mountain products other than rice are exceedingly rare. Many of them were founded after the 17th century, when lumber, charcoal, and other such products found markets in the growing towns on the plains. There were also some villages in the mountainous interior of western Tōhoku that relied purely upon hunting, but these have all but disappeared.

Urban centres

Urban settlement is generally of recent origin. Except for the former capital cities of Nara, Kyōto, and Kamakura, no sizable town of any significance appeared before the 16th century. Most of the provincial capitals, or *kokufu,* of ancient Japan were only administrative centres that contained official residences and were not developed towns. After the latter part of the 16th century, influential temples and feudal lords began to build towns by gathering merchants and craftsmen close to their headquarters. The power of the feudal lords stabilized when they built *jōka-machi* (castle towns), which were located so as to command and control the main transportation routes and surrounding areas; the majority of Japan's important cities, including Tokyo, have developed from them.

Next in importance were the port towns, such as Hakata and Sakai, which have experienced more vicissitudes than the castle towns. In addition, some of the religious towns have grown to a considerable size, as in the case of Ise, Kompira, and Zenkōji. Under the regime of the Tokugawa shogunate (1603–1867), peaceful conditions fostered nationwide pilgrimages on a scale unknown in the preceding period, and temple and shrine towns such as Kyōto and Nara flourished.

Widespread urban growth began in the late 19th century with the development of the international ports of Kōbe, Yokohama, Niigata, Hakodate, and Nagasaki and the naval bases of Yokosuka, Kure, and Sasebo. Industrialization ushered in the rapid growth of Japanese cities, and some of the industrial towns (*e.g.,* Yawata, Niihama, Kawasaki, and Amagasaki) were founded in response to economic development. Most of the former castle towns, and especially those along the Pacific belt, have been expanded directly or indirectly by industrialization. In Hokkaido and in southern Kyushu raw materials and power resources have attracted a limited number of industrial plants, which alone are responsible for the existence of cities such as Tomakomai, Muroran, Nobeoka, and Minamata.

Japanese cities are bewildering mixtures of old and new, East and West. Oriental congestion exists side by side with the most modernized business centres and industrial establishments; and the fragmented, patchwork pattern of land ownership is a formidable obstacle in ever-expanding cities of skyscrapers, subways, and underground plazas. Other serious problems are the shortage of better housing, the increasing use of the automobile, overcrowded public transportation systems, the shortage of open space, environmental pollution, and the constant menace of earthquakes and floods. (Ak.W./Y.M.)

THE PEOPLE

Ethnic and linguistic groups. The Japanese people are classified as a branch of the Mongoloid race and are closely akin to the peoples of eastern Asia; they constitute the overwhelming majority of the population. The indigenous Ainu largely have been assimilated into the general population, although small groups survive in Hokkaido. There are two minority groups in the country who generally have not been assimilated into Japanese society and who are subject to varying degrees of discrimination. The larger of these, the *burakumin,* are the descendants of a formerly outcast class of ethnic Japanese. Koreans constitute the second group. Most are descended from Koreans who migrated to Japan in the first half of the 20th century, when Korea was a Japanese colony; despite having been born and raised in Japan, they are classified as resident aliens. The Okinawans form another group, who though they are Japanese citizens are often relegated to a second-class status.

Japanese is the national language, and Ainu is almost extinct. The Japanese language is generally included in the Altaic linguistic group and is especially akin to Korean, although the vocabularies differ. Some linguists also contend that Japanese contains elements of Southeast Asian languages. The introduction of the Chinese writing system and of Chinese literature in about the 4th century AD enriched the Japanese vocabulary. Until that time Japanese had no written form, and at first Chinese characters (called *kanji* in Japanese) were used to write Japanese; but by the 9th century two syllabaries, known collectively as *kana* (*katakana* and *hiragana*), were developed from them. Since then, a combination of *kanji* and *kana* has been used for written Japanese. Although some 3,000 to 5,000 *kanji* are in general use, after World War II the number of characters necessary for a basic vocabulary was reduced to about 2,000, and the writing of these characters was simplified. Several thousand Western loanwords, principally from English, have also been adopted.

The distribution of Japanese nearly coincides with the territory of Japan. Standard Japanese, based on the dialect spoken in Tokyo, was established in the late 19th century through the creation of a national educational system and through more widespread communication. There are many local dialects, which are often mutually unintelligible, but standard Japanese is understood nationwide.

The dialects of the Japanese language

Japanese is broadly divided linguistically into the two major dialects of Hondo and Nantō. The Hondo dialect is used throughout Japan and may be divided into three major subdialects of the east, west, and Kyushu. The Eastern subdialects were established in the 7th and 8th centuries and became known as the *azuma* ("Eastern") language. After the 17th century there was a vigorous influx of the Kamigata (Kinai) dialect, which was the foundation of standard Japanese. Among the Western dialects, Kinki dialect was long the standard language of Japan, although the present Kamigata dialect of the Kyōto–Ōsaka region is of recent origin.

The Kyushu dialects have been placed outside the mainstream of linguistic change of the Western dialects and retain some of the 16th-century forms of the latter. They extend as far south as Tanega and Yaku islands. The Nantō dialects are used by Okinawa islanders from Amami-Ōshima in Kagoshima Prefecture as far west as Yonaguni-jima. Long placed outside the mainstream of linguistic change, they strongly retain their ancient forms.

Religions. In Japan, the indigenous religion, Shintō, various sects of Buddhism, and Christianity exist together with a number of "new religions" (*shinkō shukyō*) that have emerged since the 19th century; not one of the religions is dominant, and each is affected by the others.

Population density of Japan.

For example, one person or family may believe in several Shintō gods and at the same time belong to a Buddhist sect. Intense religious feelings are generally lacking except among the adherents of some of the new religions.

Shintō and Buddhism

Shintō is a polytheistic religion. People, commonly major historical figures, as well as natural objects have been enshrined as gods. Some of the Hindu gods and Chinese spirits were also introduced and Japanized. Each rural settlement has at least one shrine of its own; and there are several shrines of national significance, the most important of which is the Grand Shrine of Ise in Mie Prefecture. After the Meiji Restoration, Shintō became a state-supported religion, but this institution was abolished after World War II.

Buddhism was officially introduced into the Imperial court from Korea in the mid-6th century AD. Direct contact with central China was maintained, and several sects were introduced. In the 8th century Buddhism was adopted as the national religion, and national and provincial temples, nunneries, and monasteries were built throughout the country. In the early 9th century, the Tendai and Shingon sects were introduced by Japanese monks who had studied in China. These sects have continued to exert profound influence in some parts of Japan. Zen Buddhism, introduced at the beginning of the Kamakura period, has maintained a large following. Most of the major Buddhist sects of modern Japan, however, have descended from those that were modified in the 13th century by monks such as Shinran, who established an offshoot of Pure Land (Jōdo) Buddhism called the True Pure Land sect (Jōdo Shinshū), and Nichiren, who founded Nichiren Buddhism.

Christianity was introduced into Japan in the 16th century by Roman Catholic missionaries and was well received both as a religion and as a symbol of European culture. After the establishment of the Tokugawa shogunate, Christians were persecuted, and Christianity was totally banned in 1637. Inaccessible and isolated islands and the peninsula of western Kyushu continued to harbour "hiding Christian" villages until the ban was lifted by the Meiji government in 1873. Christianity was reintroduced by Western missionaries, who established many Russian Orthodox, Roman Catholic, and Protestant congregations.

The great majority of what are now called the "new religions" were founded after the mid-19th century. Most have their roots in Shintō, but they have also been influenced by Buddhism, Neo-Confucianism, and Christianity. One of the largest, the Sōka Gakkai ("Value Creation Society"), is based on a sect of Nichiren Buddhism and has powerful political organization. Another new Nichiren sect to attract a large following is the Risshō Kōsei-kai. New Shintō cults include Tenri-kyō and Konkō-kyō.

Demographic trends. The increase in Japan's population since the 19th century has kept pace with economic development, and the standard of living has risen steadily. Japan's overall population density is exceeded by only a few countries, although population distribution is highly variable. Some 80 percent of the country consists of mountainous areas, which has caused the congested concentration of population within the limited plains and lowlands. The increased population has been absorbed into the ever-expanding urban areas, while the population of rural districts has declined considerably.

Population growth trends

Japan has experienced spectacular growth since 1868, when the population numbered about 33,000,000. This increase is directly related to slow but steady urban growth; the development of Hokkaido, Tōhoku, and southern Kyushu; and the introduction of commercial agriculture. In 1897, when industrialization first began, the population numbered more than 42,000,000. From 1898 to 1918 growing industrial cities and mining towns absorbed a large population, as did Hokkaido and the sericultural (silkworm-raising) rural districts.

In 1920, when the first precise census was conducted, the population was nearly 57,000,000. Between 1919 and 1945 Tokyo, Ōsaka, Nagoya, and northern Kyushu developed as the nation's four major industrial districts. At the same time, some of the smaller cities lost their ability to sustain a growing population, and some of them declined. By 1940 the population had grown to more than double that of 1868. During World War II, there was a marked migration to the rural areas to avoid aerial bombing, and some cities such as Ōsaka were reduced to one-third their previous size. After 1945, the repatriated population of nearly 9,000,000 and the temporarily explosive increase in the birth rate caused abnormally high growth.

The rapid rehabilitation of industry after 1950 has resulted in the continuing concentration of population in the Pacific coastal areas. The expansion of the Keihin area is not confined to Tokyo, Yokohama, and their adjacent suburbs but extends to a much wider circle. The same is true of the Keihanshin (Kyōto–Ōsaka–Kōbe) and Chūkyō (Nagoya) areas. Rural areas outside the direct influence of urbanization have been subjected to a marked decline. Adult males migrate to the Pacific coast, and many of those who remain at home periodically leave as temporary labourers, creating a constant outflow of population from the mountainous areas and isolated islands. In many places, emigration is so marked that the remaining population cannot maintain a balanced community, and whole settlements are abandoned. A striking demographic feature since World War II is the decline of birth and death rates in response to improved birth control measures and health conditions. Thus, Japan's rate of population increase is one of the world's lowest, and its life expectancy is among the highest. (Ak.W./Y.M./Ed.)

THE ECONOMY

Japan's regional and world standing

Japan is remarkable for its extraordinarily rapid rate of economic growth in the 20th century, especially after World War II. This growth has been based on unprecedented expansion of industrial production and on an aggressive export trade policy. As a result, Japan has become the second largest free-market economic power, ranking only behind the United States. It is one of the world's largest producers of motor vehicles, steel, and high-technology manufactured goods. Although Japan's standard of living did not increase as rapidly as did the overall economy in the early postwar decades—due in large part to the high percentage of capital reinvestment in those years—it gradually has caught up and become comparable with that found in other developed countries.

Administration of the economy. *Private enterprise, the role of the government, and taxation.* Japan's system of economic management is probably without parallel in the world. Although the extent of direct state participation in economic activities is limited, the government's control and influence over business is stronger and more pervasive than in most other free-enterprise countries. This control is not exercised through legislation or administrative action but through constant—and to an outsider almost obsessive—consultation with business and through the authorities' deep indirect involvement in banking. Consultation is mainly by means of joint committees and groups that keep under review, monitor performance of, and set targets for nearly every branch and sector of the economy. In addition, there are several agencies and government departments that concern themselves with such aspects of the economy as exports, imports, investment, and prices, as well as with overall economic growth. These are staffed by experts, who are not only in constant touch with business but are also close to the minister concerned; they form an integral part of a system that is quick to collate and interpret the latest economic indicators and to respond to changes in the situation. The most important of these agencies is the Economic Planning Agency. Like the Bureau of Statistics, it forms part of the Prime Minister's Office and, apart from monitoring the daily running of the economy, it is also responsible for long-term planning.

The system works well, without any major crises in government–business relations, because of the unusual self-discipline of Japanese businessmen in their dealings with the authorities and the government's deep understanding of the role, needs, and problems of business. The need for large-scale government participation in economic activities is thereby obviated, and, unlike many governments in the free-enterprise world, the state appears to be reluctant to extend its direct role. In 1985, for example, the government relinquished to the private sector its monopolies over the tobacco and salt industries and domestic telephone and telegraph services; and in 1987 the publicly owned Japanese National Railways was privatized, its operations divided into several constituent companies that operate together under the name Japan Railways (JR) Group. The government retains an interest in international telecommunications services and radio and television broadcasting. It plays no part in gas production or—except for providing electricity in economically underdeveloped areas—in electricity generation.

The government's role in banking

The government's economic influence is supplemented by its substantial role in banking. The state owns a number of financial institutions, such as the Japan Development Bank, the Export-Import Bank, the Small Business Finance Corporation, and the Housing Loan Corporation, whose principal objectives are to finance private enterprise in areas that are considered particularly desirable. The Ministry of Finance and the Bank of Japan have considerable influence over business investment decisions because of the close interdependence of business, the commercial banks, and the central bank.

Tax revenues account for a great majority of the government's total income. Japanese taxes can be divided into three main categories: taxes on individuals, taxes on business, and miscellaneous levies. Individuals are subject to progressive income, prefectural, and municipal inhabitant taxes. Income tax is divided into withholding tax, which is deducted at the source of income, and assessment tax, which is payable annually. The local taxes consist of a per capita levy and an income levy. An enterprise tax is sometimes levied on individuals who carry on specified business activities. Businesses are subject to local inhabitant taxes, which consist of a per capita and a corporation levy, enterprise tax, and corporation tax. Other taxes include gift and inheritance taxes, excise taxes levied on a number of consumer goods, and liquor, gasoline, travel, entertainment, securities-exchange, and automobile-acquisition taxes.

Trade unions and employers' associations. Japanese trade unions have had a relatively short history. Although there were several labour organizations before World War II, trade unions became important only after the U.S. occupation forces introduced legislation that gave workers the right to organize, to bargain with employers, and to strike. Because Japanese trade unions are generally organized on a plant or enterprise basis, their number is relatively large, and in many cases there are different organizations for different plants of the same company. The great majority of the enterprise unions are affiliated to federations that are loosely organized on craft lines, such as the Federation of Iron and Steel Workers Unions and Federation of Textile Workers Unions, and to one of the national labour organizations. They retain much of their independence, however, in dealing with employers. While the craft and national federations formulate general policy, discuss and advise on strategy, and coordinate wage offensives, serious negotiations are usually conducted by individual unions and the employees. One result of Japan's industrial, as opposed to craft, unionism is that demarcation disputes and interunion rivalry for members are relatively rare. Furthermore, if judged in terms of working days lost, Japanese labour relations have been noticeably more amicable than those in other developed countries, such as the United Kingdom, Italy, and the United States.

Labour organizations

The national labour organizations are the left-wing and highly political General Council of Trade Unions of Japan (Sōhyō), the more moderate and less political Japan Confederation of Labour (Dōmei), the National Federation of Industrial Labour Organizations (Shinsambetsu), and the Federation of Independent Unions (Chūritsu Rōren). Sōhyō is the largest of the four, and Dōmei is its principal rival; Chūritsu Rōren often associates itself with Sōhyō, especially during the annual "spring labour offensive."

Apart from the political demands of the left-wing unions, labour organizations have been mainly concerned with such questions as wages, prices, and working conditions. Problems of the evolution of a comprehensive industrial policy, of greater centralization, and of the union of the rival national organizations became important during the late 20th century mainly because of the trend toward growing concentration in industry and greater cooperation among the various employers' organizations. There is also a growing feeling that in this age of rapid technological progress and change, the ideology-ridden policies of Sōhyō are no longer adequate. Although all of the interested parties pay lip service to unification, the pressure for greater cooperation, pragmatism, and professionalism comes mainly from the independent unions in private industries. Moves to unify these private-industry unions have been undertaken in the hope that unification would create a large politically moderate union capable of restraining the influence of the highly ideological government and public sector unions led by Sōhyō.

Resources. *Minerals.* Although Japan's mineral deposits are fairly diverse, with a few exceptions the reserves are small and production is inadequate to meet more than a small part of domestic requirements. The quality of the minerals mined is often poor, and since deposits are widely scattered the extractive industry is characterized by a large number of small and relatively inefficient mines that do not lend themselves to the application of modern, large-scale mining methods. Coal, iron ore, zinc, lead, copper, chromite, and manganese are among the most important minerals, and although a large number of others are mined on a minor scale, there is an almost complete lack of nickel, cobalt, bauxite, nitrates, rock salt, potash, phosphates, and oil.

Coal is the country's most important mineral. Japanese coal is of relatively poor quality and is difficult to mine, and production costs are therefore high. Production is concentrated in Hokkaido and Kyushu. Despite the Kyushu field's proximity to the sea, it has lost much of its importance because of the gradual exhaustion of the richer seams and the poor quality of the coal mined. The seams of the Hokkaido field are thicker than those of Kyushu, and the use of mechanized, large-scale mining methods has resulted in a relatively high output per miner.

Oil deposits are meagre, domestic oil production accounting for a negligible fraction of Japan's oil consumption. The oil-bearing belt extends from northern Honshu on the Sea of Japan to the Ishikari-Yūfutsu lowlands in Hokkaido; virtually the whole of the country's output comes from Niigata and Akita prefectures. Natural gas is produced in Honshu; two major fields are in the south Kantō region and in Niigata Prefecture.

Although Japan ranks as one of the world's major steelmakers, domestic resources and production of iron ore are small; Japan imports almost all of its iron ore. Japanese ore is of poor quality and is obtained mostly from small mines in Hokkaido and northern Honshu.

Copper, once Japan's most important metallic ore, is produced in mines situated in Hokkaido and the prefectures of Akita and Iwate. Domestic production is far from enough to meet demand, and the majority of copper ore is imported. Lead and zinc are often found in conjunction with copper; zinc production is concentrated in Gifu Prefecture. Other metallic ores mined include silver, gold, tungsten, tin, antimony, molybdenum, and titanium. Japan also has large sulfur and limestone deposits.

Agricultural and forest resources. Because of the country's mountainous terrain, the supply of agricultural land is limited. The soil, largely infertile and immature, requires careful husbandry and fertilization. Timber resources are extensive, consisting of broad-leaved and coniferous forests, but a sizable proportion of the forestland is located in inaccessible mountain areas. Most of the forest area is privately owned, and much of it is distributed among a large number of relatively small holders. The rest is publicly owned; it is in these areas that large-scale reafforestation has taken place.

Timber resources

Hydroelectric resources. As a result of its climate, Japan has considerable water resources. It also has an extensive network of rivers that can be used for irrigation, although flooding is a serious problem in many parts of the country. As a result of the mountainous terrain, the ample hydroelectric potential is distributed in an uneven fashion. Hydroelectric development is largely concentrated in central Honshu along the Shinano, Tenryū, Tone, and Kiso rivers; in Tōhoku; and in some parts of Kyushu. This pattern of distribution ensures that Japan's hydroelectric capabilities are well located in relation to the important industrial areas. Although there is significant undeveloped potential, the best sites are already utilized, and further additions to capacity are increasingly expensive. Most hydroelectric power plants cannot operate at full capacity for more than a few months of the year because of seasonal variations of rainfall and the difficulty of constructing adequate storage facilities.

Agriculture and fishing. Agricultural production, including forestry and fishing, has grown less rapidly than national output or has actually declined, and it accounts for only a small proportion of the national income. Despite rapid increases in yields, agricultural output per person is considerably less than in other sectors of the economy. The agricultural sector employs a relatively large percentage of the working population in comparison to its contribution to the national economy, although increasing numbers of farm workers are leaving agriculture for other industries. Japanese agriculture is characterized by a large number of small and often inefficient farms, and many farmers have to rely on outside occupations for a substantial part of their income. Larger farms are generally found in Hokkaido, where units of 25 to 50 acres (10 to 20 hectares) are not uncommon. The country's principal crop is rice. Other important farm products include wheat, barley, potatoes, fruits, vegetables, and tea.

The main objectives of the government's agricultural policy have been to encourage self-sufficiency in the more important commodities, to enlarge the size of the average

The government's agricultural policy

holding, which is small by advanced agricultural standards, and to close the gap between rural and urban incomes. The central feature of this policy has been an artificially high producer rice price. This has succeeded in raising farm incomes and has led to increases in the production of rice; a growing surplus of rice, however, has prompted the government to encourage farmers to raise livestock and to grow vegetables, wheat, and other crops instead of rice. Livestock-raising has become one of the most important farming activities, although most feeds must be imported.

Japan has one of the largest catches of fish of any nation in the world. In spite of its dominant international position, the Japanese fishing industry faces a number of serious problems, partly the result of structural weaknesses within the industry and partly a result of the restrictions placed upon it by nations that have claimed a 200-mile economic zone in their coastal waters. Despite the efforts of the government to create larger and more efficient units, small and medium-sized enterprises and individual fishermen still account for the bulk of the total income. Imports of fishery products exceed exports.

Industry. *Mining and quarrying.* Mining is a relatively unimportant branch of the economy. Most of the value of mining production is accounted for by coal, with copper, limestone, oil and natural gas, lead and zinc, sulfur, silver, and gold also significant contributors. The coal industry has suffered from the competition of cheaper foreign coal and from the rapid shift to oil after World War II. Despite the closure of a large number of uneconomic pits and a growth in productivity, foreign competition has had an unfavourable effect on the financial results of most coal-mining companies, which repeatedly has forced the government to aid the industry.

Manufacturing. The most notable feature of Japan's economic growth since World War II has been the rapid development of manufacturing. Progress has been made in terms of quantitative growth, quality, variety, and efficiency. Japan has become a greatly feared competitor whose products are in increasing demand. It is one of the world's principal shipbuilders and automakers and is a major producer of crude steel, synthetic rubber, aluminum, sulfuric acid, plastics, cement, pulp and paper, refined copper, and cotton yarn. It has some of the world's largest and most advanced industrial plants.

The most spectacular growth has been in the production of motor vehicles, iron and steel, machinery (including robots), petrochemicals, precision equipment (notably cameras), and advanced electronic products (including computers, telecommunications equipment, and consumer goods). Some of the older industries, however, have advanced relatively slowly. The lumber and wood industry, textiles, and foodstuffs have failed to match the expansion in manufacturing as a whole.

Reasons for industrial growth

A principal reason for Japan's industrial performance has been the high level and rapid growth of capital investment. A boom in equipment investment provided the iron-and-steel and machine-building industries with a rapidly growing home market, allowed for a spectacular increase in productive capacity and in the scale of operations, and led to a rapid replacement of old machinery. This, in turn, resulted in a considerable improvement in productivity throughout the economy and enabled industry to grow, despite the acute shortage of skilled labour that developed. Despite rising wages, many sectors of Japanese manufacturing have a formidable advantage over their rivals, a fact that is well illustrated by the country's growing exports. Also important to Japan's strong industrial position in the world are the high rate of labour productivity, relative to other major industrial countries, and the extensive use of technological innovations.

During the late 20th century, industry has also been characterized by a growing tendency toward tie-ups, mergers, and takeovers among the larger manufacturing and industrial concerns. These actions have been made possible by the gradual relaxation and the increasingly flexible interpretation of the country's antimonopoly laws enacted after World War II. The authorities have accepted the argument that greater concentration at the top is essential in order to improve efficiency, to make better use of the existing resources, and to increase or maintain international competitiveness. This argument has been given additional force by the need to strengthen Japanese enterprises in the face of growing direct foreign investment, made possible under the government's capital decontrol program. The merger of the Yawata and Fuji Steel companies into the Nippon Steel Corporation, for example, created one of the world's largest producers of steel.

There are also a large number of small and relatively inefficient manufacturing enterprises that use a substantial amount of the scarce labour. By and large, small firms tend to be more prominent in the less dynamic industries.

Despite Japan's rapidly increasing consumption of energy, per capita consumption remains low when compared to that of other industrialized countries. The largest single source of energy is oil; almost the entire demand is satisfied through imports, an important share of which comes from fields developed by Japanese companies. In addition, the difficulty and expense of mining coal has steadily reduced its importance. Because of the difficulties involved in hydroelectric development, the majority of the total electric power is generated by thermal plants. Oil is important, but there has been an increase in the importance of coal-fired electricity plants. There are also a number of nuclear and geothermal plants. The growth in gas production has been greatest for natural gas and liquefied natural gas, which account for the largest share of total production.

Finance. Japan's complex financial system is different from that of other developed countries in a number of important aspects. The Bank of Japan, established in 1882, is the sole bank of issue; it also plays an important role in determining and enforcing the government's economic and financial policies. The bulk of the domestic banking business is transacted through commercial banks, of which the city banks (such as Dai-Ichi Kangyo, Fuji, Mitsubishi, and Sanwa) are the most important. There are also a number of long-term credit banks, some government financial institutions—including the Japan Development Bank and the Export-Import Bank—and many mutual savings and loan banks and credit associations.

Relationship between banks and industry

One of the more unusual features of the Japanese financial system is the high degree of interdependence between the central bank, the commercial banks, and industry. Traditionally, industry has relied on banks for a large part of its borrowing requirements, and, although the importance of its own capital has increased, private and government financial institutions still account for a substantial part of the total. Since the commercial banks are responsible for most credit extended to industry, their influence on their client companies is considerable. Their active lending policy also means that their liquidity ratios tend to be low by Western standards and that they are forced to rely on call money (money that is readily available to banks as loans) and on large-scale borrowing from the Bank of Japan. The central bank is thereby in a strong position to influence bank operations and to bring about a quick adjustment in the volume of credit through credit ceilings, moral pressure, and other methods. Other sources of finance that are less susceptible to central bank influence include mutual savings and loan banks, credit associations, life insurance companies, and other nonbank financial institutions.

The bond market is relatively undeveloped because the government's low, long-term interest rate policy has made bonds relatively unattractive as compared with the comparatively high level of short-term rates. Individuals and institutional investors tend to buy discount debentures only. Bond buying, therefore, is confined chiefly to banks and other financial institutions, which are expected to purchase government and government-guaranteed bonds according to an unofficial allocation quota. The secondary bond market has been in operation since the mid-1960s, and, although over-the-counter transactions have risen rapidly, a significant proportion of the total business is accounted for by trading in financial debentures. It is generally accepted that improvement of the efficiency of the bond market is important, but significant progress cannot be made without rectifying the imbalance between short- and long-term interest rates.

There are several stock exchanges in Japan; the two most important, Tokyo and Ōsaka, account for almost all of the total business. Foreign investors have taken an interest in Japanese stocks, and the Tokyo exchange has become one of the world's largest.

Trade. An outstanding feature of Japan's economic development has been the rapid advance in its overseas sales, even though the share of exports in the country's gross national product has not changed significantly. From the point of view of individual industries and as a generator of growth, however, exports are much more important than their contribution to the national income would suggest.

Reasons for this spectacular export performance are the growing variety of Japan's industrial output, the shift to products with a relatively high value added, more advanced sales-promotion techniques, and the country's export competitiveness. The rise in labour productivity enabled industry to absorb much of the rapid rise in wage costs, with the result that for many years Japan's export prices tended to be lower than those of its principal competitors. Increasingly, however, Japanese exports have faced strong competition from such developing industrial nations as South Korea and Taiwan.

A significant change in the composition of exports occurred in the late 20th century. The share of total exports of textiles and food products decreased considerably, while exports of machinery and transport equipment grew dramatically, accounting for the largest component of exports. Other important exports include metal and metal manufactures and chemicals. The United States is Japan's largest single customer; East and Southeast Asia, western Europe, and the Middle East are other important customers.

Growth of imports

Imports have also grown steadily. Because of Japan's meagre natural resources, the bulk of its imports are raw materials, foodstuffs, and fuels. The major components of manufactured goods are machinery and allied products and chemicals. Japan's largest suppliers include East and Southeast Asia, the United States, the Middle East, western Europe, and Australia. (E.I.U./Y.M.)

Transportation. Until the latter part of the 19th century, the majority of Japanese people traveled on foot. There were no vehicular means of transportation except for small wagons, carts, or palanquins (*kago*) carried by men or animals. The first railway was built between Tokyo and Yokohama in 1872, and others soon followed, though the rugged terrain required the construction of many tunnels and bridges. Iron ships were built at about the same time, and modern ports were constructed. Road construction, however, tended to lag behind the development of other means of transport, resulting in the present congestion of most urban areas.

Japan's great cities attract large numbers of passengers and vast quantities of goods. Tokyo, especially, is an incomparably large focus for transportation; it is followed by the Ōsaka metropolitan area, including the three cities of Ōsaka, Kōbe, and Kyōto. The third largest focus of transportation is Nagoya. All of these large urban agglomerations are served by large and internationally known ports. Other cities, such as Kita-Kyūshū, Fukuoka, Sapporo, Sendai, and Hiroshima, also function as hubs of the transportation network.

Transport networks

The largest volume of intercity or interregional transport, in both passengers and goods, moves between the two largest metropolitan regions—by rail, road, coastal waterway, and air. Kyushu is connected with Honshu by the world's first undersea railway tunnel (built in 1941), by an undersea double-decked road tunnel (built in 1958), and by a huge suspension bridge linking the two (opened in 1973). With the opening in 1988 of a railway tunnel between Hokkaido and Honshu and of a multiple-span railway–road bridge between Honshu and Shikoku, all four of Japan's main islands were linked by surface transport.

The Japanese network of telecommunications and of postal services is among the best in the world. Its hundreds of islands, as well as its remotest villages deep in the mountains, are effectively linked by these services. During the 1980s Japan became a world leader in the use of advanced telecommunications, including fibre-optics networks and electronic-mail systems.

Road networks. The development of the road network is retarded in comparison with Japan's general economic progress and in view of its large number of cars. Some expressways have been built between major cities and to some scenic areas. In addition, the metropolitan regions of Tokyo and Ōsaka have a limited-access highway network within their respective built-up areas. The construction of a nationwide network of expressways, however, is expected to require many years. The fact that many roads, both in built-up and in rural areas, are narrow and winding causes additional planning problems. Until the 1920s most Japanese roads were used almost exclusively by pedestrians; even horse-drawn vehicles rarely used them. This fact, as well as the limited area of land in proportion to population, affected the pattern of road development considerably. Even in the late 20th century a great number of narrow roads were still being constructed, although subject to a minimum width. In rural areas footpaths are still in use, despite the existence of many newly built or widened motorable roads. Extremely dense networks of footpaths in many mountain areas are used for recreation.

Japanese city street patterns are manifold. Cities such as Kyōto and Nara still preserve the gridiron street pattern of the ancient Chinese city plan, though with modifications in built-up inner parts of the cities. In many rural areas as well, the ancient pattern of land division and the resultant road pattern take the rectangular gridiron form, which is similar to the U.S. township layout in concept and pattern, although it evolved much earlier and is smaller in size. Feudal towns, especially fortified (castle) towns, have somewhat similar street patterns, though with many modifications for defense purposes.

The number of four-wheeled motor vehicles and three-

Orion Press, Tokyo

Multiple-span bridge over the Inland Sea, linking Kojima, Honshu, with Sakaide, Shikoku.

Increases in vehicular traffic

wheeled trucks has increased at a phenomenal rate. Japan has an extremely high density of motor vehicles per unit area in the plains and in other inhabited areas. Trucks represent a much higher proportion of vehicular traffic than in other major motorized countries, and not until the late 20th century did passenger cars outnumber trucks. The quantities of freight transported by trucks have surpassed those carried by rail. Many families now have two or more automobiles, and commuting to work by car has become an increasingly common practice, resulting in road congestion in the big cities and in industrial areas. Although railways still play the major role in carrying commuters, there appears to be no practical solution to the problem of how to reduce the number of cars on the roads. The increases in poisonous exhaust gases and in the noise of the traffic have become serious problems. Steps taken to alleviate them include the development of pollution-control devices for automobiles and the installation of noise barriers on highways in densely populated areas. In addition, the desire to preserve natural or historical sites or to keep areas free from traffic noise often has proved an obstacle to road construction.

Railways. Despite the competition from road transport, railways play an extremely important role in transporting passengers. Railroads continue to give way, however, to competition from road and air transport.

The first Japanese rail line was financed by the British and built by British engineers. There was strong opposition to its construction, because many feared the expansion of foreign economic and political influence. This opposition was silenced somewhat after the line was completed. Other early railroad construction faced strong local opposition, but Japanese engineers began to build railroads at a rapid rate. The first streetcar line was constructed in Kyōto in 1891, using the electricity from the nation's first power station. In subsequent years Japan, unlike most other Asian countries, developed quite extensive intraurban and suburban railroad systems; the period between the two world wars, in particular, was characterized by the construction of many railroad lines to the suburbs to serve the needs of growing numbers of middle-income people. In 1927 the first subway was built in Tokyo's downtown district. Construction of new railroads continued until the outbreak of World War II, but the Japanese defeat and its aftermath prevented further construction for some time. From about 1955 onward, however, railroad construction was resumed. Subway construction, in particular, progressed, and systems have been built in Tokyo, Ōsaka, Nagoya, Sapporo, Yokohama, Fukuoka, Kyōto, and Kōbe.

The New Tōkaidō Line of the Shinkansen

In 1964 the New Tōkaidō Line of the Shinkansen—then a part of the government-owned Japanese National Railways and now one of the companies of the JR Group—began operations. Named for the Tōkaidō, the ancient highway between Kyōto and Tokyo, the line provides high-speed passenger service on an electrified, double-track route between Tokyo and Ōsaka. It is part of an eventual nationwide network of high-speed trains linking all major cities. Following completion of the New Tōkaidō Line, Shinkansen service was extended westward to Okayama in 1972 and then to Hakata (Fukuoka) on Kyushu in 1975. Two lines radiating outward from Tokyo—north to Niigata and northeast to Morioka—were opened in 1982.

The most serious traffic problem is caused by congestion on railroad transport within the large cities. Most commuter trains are very crowded during rush hours, with some trains carrying twice—and (rarely) three times—the number of passengers for which they were designed. Services have been expanded to cope with the growing demand. In Tokyo, a monorail (completed in 1964) operates over a distance of about eight miles between downtown Tokyo and the airport at Haneda. Monorails are numerous in Japan and are used primarily for commuting and recreational purposes. Many cable cars also operate in the mountains. The length of daily commuting time has become a serious problem; in some instances it consumes two hours each way.

Port facilities. Japan is one of the world's principal seagoing nations and has one of the world's largest merchant fleets. It has engaged in seafaring since early times. In about 1600 the port of Sakai, just south of present-day Ōsaka, prospered from its trade with China and Southeast Asia. Soon afterward the feudal regime greatly restricted foreign trade by imposing a policy of isolation from the rest of the world—a policy that was to last for about 250 years. As a consequence, few ports engaged in foreign trade, the notable exceptions being Nagasaki and Kagoshima in southern Kyushu and the Tsushima archipelago between Japan and Korea. After Japan reopened its doors to foreign trade in 1859, it was some time before large modern trading ports were developed; Yokohama and Kōbe became and have remained the leading trade ports of Japan, the former being the outport of Tokyo and the latter the outport for Ōsaka and Kyōto. Many other modern ports subsequently came into existence, including Nagoya, Kawasaki, Chiba, Kita-Kyūshū, Mizushima, and Sakai.

Air transport. Both domestic and international air transportation play important roles in Japan. Before World War II, air transportation was considerably restricted, but, since the foundation in 1953 of Japan Air Lines (JAL), international flights have proved profitable. Despite competition by railways, especially the Shinkansen, the volume of domestic air transport has grown considerably. Tokyo is the nation's largest single focus of air transport, followed by Ōsaka. Other major airports are in Nagoya, Sapporo, and Fukuoka. All other metropolitan areas in Japan are also connected by air routes. Generally speaking, southwestern Japan is covered by a denser network of air transport than other regions, primarily because of the presence of many islands.

GOVERNMENT AND SOCIAL CONDITIONS

Government. *Constitution and structure of government.* Japan's constitution was promulgated in 1946 and came into force in 1947, superseding the Meiji Constitution of 1889. It differs from the earlier document in the following points: first, the emperor, rather than being the embodiment of all sovereign authority (as he was previously), is the symbol of the state and of the unity of the people, while sovereign power rests with the people; second, Japan renounces war as a sovereign right; and third, fundamental human rights are guaranteed as eternal and inviolable. Furthermore, the government is now based on a constitution that aims at maintaining Japan as a peaceful and democratic country in perpetuity.

The role of the emperor

The emperor has no powers related to government. His major role as emperor consists in such formalities as appointing the prime minister—who is first designated by the Diet (Kokkai)—and appointing the chief justice of the Supreme Court (Saikō Saibansho), convoking sessions of the Diet, promulgating laws and treaties, and awarding state honours—all with the advice and approval of the Cabinet (Naikaku).

Legislative powers are vested in the Diet, which is popularly elected and consists of two houses. The House of Representatives, or lower house (Shūgiin), ultimately takes precedence over the House of Councillors, or upper house (Sangiin). Membership in the House of Representatives is based on proportional representation from prefectural districts, while that in the House of Councillors is divided between proportional representation and at-large representation. The House of Representatives controls the budget and approves treaties with foreign powers. Executive power is vested in the Cabinet, which is organized by the prime minister. If the House of Representatives passes a resolution of no-confidence or refuses to pass a vote of confidence in the government, the Cabinet must resign, unless the House of Representatives is dissolved within 10 days. There are governmental ministries and agencies in addition to the Prime Minister's Office. All offices of the central government are located in and around the Kasumigaseki district in central Tokyo. An independent constitutional body called the Board of Audit is responsible for the annual auditing of the accounts of the state.

Local government. Japan is divided into 47 prefectures, 43 of which are *ken* (prefectures proper), one of which (Tokyo) is a *to* (metropolitan prefecture), one (Hokkaido) is a *dō* (district), and two (Ōsaka and Kyōto) are *fu* (urban prefectures). Prefectures, which are administered by governors and assemblies, vary considerably both in area and in population. The largest prefecture is Hokkaido, with an area of 32,246 square miles, while the smallest is Ōsaka, with 720 square miles. The most populous prefecture is Tokyo, and the least populous is Tottori. A prefecture is further subdivided into minor civil divisions; these include the city (*shi*), town (*machi* or *chō*), and village (*mura* or *son*). All these local government units have their own mayors, or chiefs, and assemblies. Before World War II, there were also counties (*gun*), consisting of towns and villages but excluding cities within a prefecture. This county system only survives in the form of statistical units.

An intermediate level of governmental services is formed between the central and prefecture levels; the branch offices of the government are located in certain cities, which—as regional centres—generally administer several prefectures together. Designated cities (*shitei toshi*), which must have populations of at least 500,000 each, are divided into wards (*ku*). These cities include Yokohama, Ōsaka, Nagoya, Kyōto, Kōbe, Kita-Kyūshū, Sapporo, Kawasaki, Fukuoka, and Hiroshima. A ward has a chief and an assembly, the former being nominated by the mayor and the latter elected by the residents. Tokyo has 23 special wards (*tokubetsu ku*), the chiefs of which are elected by the residents. These special wards, created after the metropolitan prefecture was established in 1943, demarcate the city of Tokyo from the other cities and towns that make up the metropolitan prefecture; the city proper, however, no longer exists as an administrative unit.

Terms of office; constituencies

The political process. Members of both the House of Representatives and the House of Councillors are chosen by general elections. Members of the House of Representatives serve for a four-year term, but this may be terminated earlier if the house is dissolved. Members of the House of Councillors are elected for a six-year term, with half of the members being elected every three years. The electoral procedure for the House of Councillors differs from that for the House of Representatives in that about two-fifths of the total are elected from a national constituency, in which each voter casts a vote for a national candidate; the remaining members are elected from the prefectural constituencies. The number of seats for each constituency was determined largely by the population density in each area in 1947, with some modifications resulting from the population increase in urban constituencies. Heads of local governmental units, such as prefectures, cities, special wards, towns, and villages, are elected by local residents. Universal adult suffrage is available to all men and women who are 20 years or older.

Freedom to organize political parties is guaranteed by the constitution; any organization that supports a candidate for political office is required by law to be registered as a political party. Since the enactment of the 1947 constitution, many political parties have been organized, have merged, or have been dissolved. There are now more than 10,000 parties, most of them of local or regional significance. The Liberal-Democratic Party (LDP; Jiyū-Minshutō) represents somewhat conservative elements. Such conservative parties have been the dominant force in government since the mid-20th century.

The Japan Socialist Party (JSP; Nihon Shakaitō), long a major opposition party, draws much of its support from labour unions and inhabitants of the large cities. It has a neutralist policy, urging the establishment of a peaceful security system covering Japan and East Asia by means of a treaty between Japan, the United States, the Soviet Union, and China.

The Clean Government Party (Kōmeitō), also a major opposition party, draws its main support from the Sōka Gakkai. Although the party was formed in 1964 under the influence of the Sōka Gakkai, it has renounced any formal ties with it. The Clean Government Party's major policy aim is the establishment of a welfare system and the promotion of "human Socialism." The Democratic Socialist Party (DSP; Minshatō) was formed in 1960 by a right-wing splinter group of the JSP. It advocates an independent foreign policy and aims at creating a Socialist society through democratic processes, and it draws most of its support from the same sources as the JSP itself. The Japan Communist Party (JCP; Nihon Kyōsantō) is a small but important party that exerts a strong influence on political and intellectual developments in society. The New Liberal Club (NLC; Shin Jiyū Kurabu), founded in 1976 by several of the more progressive members of the LDP, plays a small but important role in Diet politics.

The role of the citizen in politics is often discussed both in journalism and in daily conversation, especially at election time. Many citizens wish to participate in solving such problems as traffic congestion, waste disposal, air and water pollution, the shortage of parks and playgrounds, and noise control. In many cities there are numbers of commercial and residential streets that have been closed to automobile traffic.

Justice. The judiciary is completely independent of the executive and legislative branches of the government. The judiciary system consists of the Supreme Court, eight high courts, a district court in each prefecture, with the exception of Hokkaido, which has four, and many summary (informal) courts. Family courts also abound.

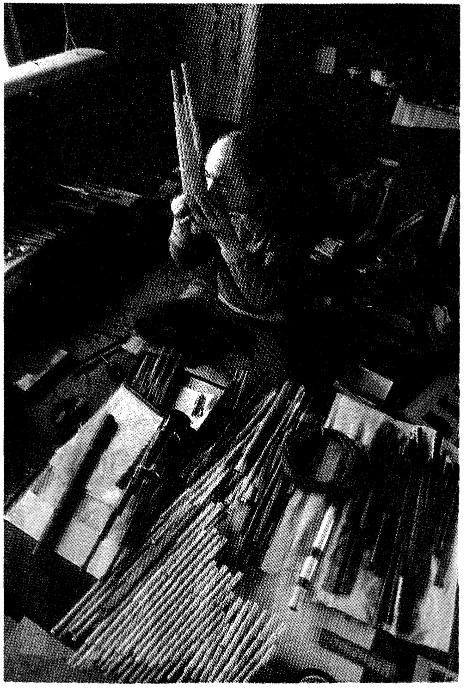
The Supreme Court consists of one chief justice and 14 other justices. The chief justice is appointed by the emperor upon designation by the Cabinet, while the other justices are appointed by the Cabinet. The appointment of the justices of the Supreme Court is subject to review in a national referendum, first at the time of the general election following their appointment and then at the general election every 10 years thereafter. An impeachment system also exists; the court of impeachment consists of members of the House of Representatives and of the House of Councillors. The Supreme Court determines questions of the constitutionality of any law, order, regulation, or official act. Lower court judges are appointed by the Cabinet from a list of persons nominated by the Supreme Court. The appointment term is for 10 years, and reappointment is allowed. All judges of lower courts must retire at the age of 70, according to law.

The Self-Defense Forces

Armed forces. Under its present constitution, Japan cannot maintain armed forces for purposes of aggression; in consequence, national security is maintained by the Self-Defense Forces (Jieitai), as well as by the collective security system in which the United States participates. The Self-Defense Forces play a role that is entirely limited to defense and internal security.

Between 1945 and 1950, Japan had no armed forces

Jim Brandenburg—TSW-CLICK/Chicago



Craftsman testing a *shō*, a type of mouth organ made from wood and bamboo that is used in *bugaku* (court music).

except for police; after the outbreak of the Korean War, however, the government, at the suggestion of the Allied occupation forces, established a National Police Reserve, which later became the Self-Defense Forces, and increased the strength of the Maritime Safety Agency. The Self-Defense Forces consist of ground, maritime, and air forces, under the civilian-controlled National Defense Council.

The constitutionality of the Self-Defense Forces has often been disputed. The Supreme Court ruled in 1959 that it did not violate the constitution, because its purpose was defensive. United States military bases operate in many parts of Japan under the Treaty of Mutual Cooperation and Security, concluded between Japan and the United States in 1960 and reaffirmed in 1970. The treaty may be terminated one year after either signatory indicates such an intention.

Japan's police services are under the supervision and control of the National Police Agency. Police services operate relatively smoothly; many problems that plague other countries are absent because of Japan's insularity and its nearly uniform ethnic composition. The relatively low ratio of extremely violent crimes to total crimes stands in contrast to that of most advanced countries.

Education. A great many educational institutions existed even in the feudal period preceding the Meiji Restoration of 1868, a number of which had been subjected to Chinese cultural influences since ancient times. Numerous private temple schools (*terakoya*), mostly in towns, functioned as elementary schools; reading, writing, and arithmetic were taught by monks, unemployed warriors, or others. Provincial lords (daimyo) also established special schools for children of the warrior class. Yet another type of school instructed primarily the children of wealthier merchants and farmers.

The modern educational system was introduced immediately after the Meiji Restoration. The government set up elementary and secondary schools throughout Japan in 1872, and in 1886 a system providing three to four years of education was inaugurated. The introduction of modern education did not encounter many problems, primarily because it was possible to utilize the educational system already functioning. Free compulsory education was introduced in 1900, and in 1908 it was extended to a period of six years. Since 1947, compulsory education has been for a nine-year period, beginning at the age of six.

The educational system of Japan is organized as follows: kindergarten lasts from one to three years but is not compulsory. Compulsory elementary school lasts six years, compulsory middle school three years, and high school (not compulsory) another three years. Higher education institutions consist of junior colleges, lasting for two to three years, and ordinary colleges and universities, lasting for four years. A master's degree can be obtained in two years after earning a bachelor's degree, and a doctor's degree in three years after earning a master's degree. In addition, there are five-year technological colleges that combine high school and junior college education. Public elementary and middle schools are free.

Higher education

Japan is one of the few countries in the world that provides a complete and thorough education for almost all the people. Although neither kindergartens nor high schools are compulsory, attendance at both has become virtually universal; higher education has also become popular. There are more than 1,000 institutions of higher education in the country. A large number of preparatory schools (*juku*) have been established to help students prepare for the difficult and highly competitive university entrance examinations.

The Tokyo metropolitan area, including Yokohama and many other satellite cities, has a high concentration of students, which has led to congestion as well as to an active intellectual life. The Tsukuba Science City, located about 40 miles northeast of Tokyo, consists of government research facilities and two universities.

Educational administration is decentralized, with the Ministry of Education playing a coordinating role. Responsibilities for the budget, curriculum, teacher appointments, and the supervision of elementary and middle schools are in the hands of local educational boards.

Health and welfare. Higher living standards, including better nutrition and better living conditions, as well as progress in medical care, have contributed much to an increase in the life span. Numerous hospitals, clinics, and health centres throughout the nation, as well as health education in schools and among the public at large, have virtually eliminated such diseases as typhus, diphtheria, and scarlet fever. Tuberculosis and dysentery are much less prevalent than they once were. Cholera, leprosy, and rabies have long been practically nonexistent. Increases in the so-called diseases of civilization have, however, become a serious problem. Stroke, high blood pressure, heart ailments, mental disorders, and similar diseases have become principal causes of death, as have traffic accidents. Cancer has also become a major cause of death. Japanese medical practice is usually of the Western type, but classical Chinese techniques are also used.

Changing dietary conditions

The Japanese people are obtaining increasingly better food. Although calorie consumption is generally lower than that of Europeans or Americans, overnutrition causing excess weight has nevertheless become a serious problem. The traditional Japanese food has been replaced partly by Western types of food and partly by Chinese food—to such a degree that the average Japanese no longer regards Western or Chinese food as alien.

During the feudal period, there was a social division of commoners into four classes (warrior, farmer, craftsman, and merchant), with a peer class above and an outcast class below. With the exception of the *burakumin,* the former outcast class, this social-class system has almost disappeared. In 1959, for example, Crown Prince Akihito married a commoner. Insofar as a social-class system does persist it does not have the ethnic basis that can exist in multiracial societies since the Japanese regard themselves as belonging to the same ethnic group. The few exceptions include resident aliens (non-Japanese citizens)—particularly Koreans who came to Japan as labourers before and during World War II and their descendants—and Japanese citizens of Ainu origin, who are scattered over the island of Hokkaido. Before World War II there was a tendency to distinguish the people of Okinawa from other Japanese because many of them exhibited minor differences in physiognomy and cultural life; this tendency has diminished but not disappeared. Okinawan culture, including its dialect and religion, is now recognized as sharing many traits with Japanese culture and, in some respects, represents a prototype. The ethnic unity of the Japanese is reflected in the fact that, of all the peoples of the world, the Japanese have been among the least inclined to intermarry with foreigners. A vernacular word for foreigner, *gaijin* (literally, "outside person"), is often used in daily conversation; the term implies that *gaijin* are fundamentally different from Japanese and, as such, cannot understand Japanese culture.

Vast discrepancies between the conditions of the rich and poor have been reduced since World War II largely as a result of the agricultural reforms of 1946 to 1950 and of the application of a graduated income tax. Although differences exist in income and property, the great majority of the Japanese regard themselves as in the middle-income group. Most of those in the upper middle-income group own their own homes, usually houses with several rooms surrounded by a garden; those in the lower middle-income group usually live in a two- to five-room house or (in urban areas) in an apartment house. The social attitudes of the Japanese and the absence of strict zoning in urban areas have contributed to the mixed land uses characteristic of Japan's cities; thus, functionally different establishments, such as shops, factories, or houses, are found adjoining one another, so that mixed rather than exclusive social patterns result.

Social-welfare services have expanded considerably since the end of World War II. Social welfare programs include social insurance, services for the aged and the physically and mentally handicapped, and care for disadvantaged children. Social insurance itself consists of health insurance, pension insurance, unemployment insurance, and workmen's accident compensation insurance. After 1961 the health-insurance system covered all Japanese people.

The scale of payments varies and in some cases no payments are required. The government has established hundreds of health centres throughout Japan, aiming primarily at improving environmental sanitation and at preventing communicable diseases in their early stages. Most of the hospitals are operated by unions, associations, or individuals, and the remainder by local governments and the national government. Aged people receive many services, including medical examinations, home-help services, recreational services, and institutional care, as well as varying amounts of financial aid. Local governments are obliged to provide welfare services for the physically handicapped and mentally retarded. Various children's welfare programs also exist—for example, medical-care services are free to expectant mothers and to young children from low-income families. Many voluntary and private associations also provide supplementary services.

Wartime destruction of houses

Housing. The housing shortage has posed major political and social problems. It is due to the following: the destruction of 70 percent of the houses in 70 percent of the major cities in Japan during World War II; constantly rising land prices, especially in and around major cities; the general use of lumber as a building material, requiring earlier replacement than brick or stone; the frequent occurrence of earthquakes, typhoons, and heavy rains bringing floods; the government's inclination to encourage economic growth rather than house construction; a rapidly rising standard of living, creating a demand for larger and better houses; and an increase in the number of families, resulting from the breaking up of extended families into smaller units.

The penchant for living in single-family homes may be attributed to the Japanese love of nature, to the influence of the garden-city movement, and to the fashion for imitating the tree-shaded residences of the feudal warrior class. The government and some private construction companies have encouraged construction of multistory apartment houses.

To cope with the housing shortage, a semigovernmental agency, the Housing Loan Corporation, was established in 1950 to finance house construction at low interest rates. In 1955, another semigovernmental agency was organized: the Japan Housing Corporation (since 1981 called the Housing and Urban Development Corporation), which has contributed significantly to housing construction. In addition, local governments have built a number of units, mostly of the apartment-house type and primarily for low-income families, and many large corporations maintain low-cost housing for their employees. A major proportion of the houses built are subsidized by governmental or semigovernmental funds. Generally, the size of housing units is increasing as per capita national income rises.

CULTURAL LIFE

The cultural milieu. Japan's long history has produced a cultural milieu that differs significantly from that of other countries. In general, this milieu is characterized by an inseparable mixture of traditional Japanese culture with introduced Chinese and Western cultural forms.

Ancient Chinese influences

Prehistoric Japanese culture was subjected to ancient Chinese cultural influences that were introduced some 1,500 years ago. One consequence was the imposition of the gridiron system of land division, which long endured; it is still possible to trace the ancient place-names and field division lines of this system. Chinese writing and many other Chinese developments were also introduced. The Buddhist religion, which originated in India and underwent modification in Central Asia, China, and Korea, also exerted a profound influence on the Japanese cultural life, but in the course of history, the process of Japanization continued. The Japanization of the introduced Chinese culture was greatly accelerated during the 250-year period of isolation that ended in 1868. The climate of Japan, for example, which was much more humid than that of China, led to such cultural adaptations as the use of lumber for building in place of the mud and brick used in China. Similarly, the Chinese characters had only a limited use because they did not fit the Japanese language.

After the Meiji Restoration of 1868, Japan began to modernize and to industrialize on the European and U.S. pattern. In the period since then, the United States generally has exerted a more conspicuous influence on Japanese cultural and social life than has Europe. Western cultural traits have been introduced on a large scale through the schools and the mass-communication media. Western scientific and technical terms have been widely diffused in translation and have even been re-exported to China and Korea. U.S., English, French, German, or Soviet influences on Japanese culture are in evidence in literature, the visual arts, music, education, science, recreation, and ideology.

Effects of Western influences

Modernization has often been accompanied by cultural changes. Rationalism and Socialism based on Christianity, as well as Marxism, have become inseparably related to everyday Japanese life. Western or Westernized music seems to be preferred to traditional Japanese music at most social levels. Although Japanese Christians form a fractional percentage of the population, Christmas is enjoyed, if not celebrated, quite widely, almost as a folk event. The use of Western dress among the Japanese, in place of the kimono, is widespread, although the kimono tends to be used by women at celebrations and by a considerable number of male adults and older women for home wear. House construction has also been changed considerably by the introduction of Western architectural forms and functions. In shape, in colour, and in building materials, many contemporary Japanese houses are significantly different from the traditional ones; they now have more modernistic shapes, use more colours, and are more often made of concrete and stucco.

Everyday use of modern transport and of modern communication media has brought Japanese urban life close to that of the West. Japanese forms of recreation are similar to those in other developed countries, although there are some notable differences. Outdoor recreational activities include hiking, mountaineering, skiing, skating, golf, swimming, boating, fishing, baseball, tennis, and football (soccer). Indoor recreations include Shōgi (a kind of Chess), Go (a strategy game also similar to Chess), Mah-Jongg, Japanese and Western card games, basketball, volleyball, table tennis, bowling, wrestling, gymnastics, and such martial arts as judo, kendo, karate, and aikido. Sumo wrestling is also practiced, or watched, both indoors and out.

Arts, folk traditions, and popular culture. The Japanese cultural tradition includes many forms of the fine arts and folk arts. Local variations are found throughout Japan's mountainous archipelago, where most river basins, valleys, or islands have their own specific folklores.

The highly refined traditional arts of Japan include flower arranging (*ikebana*), the tea ceremony (*cha-no-yu*), painting, calligraphy, dance, music, theatrical plays (including such forms of drama as Kabuki, a highly stylized form of drama characterized by singing and dancing; *bunraku,* the puppet theatre; Nō, the classic form of dance-drama), and *gagaku* (court music), gardening, and architecture. Delicacy and exquisiteness of form, together with simplicity, characterize traditional Japanese artistic taste. The Japanese tend to view the traditional Chinese arts generally as being too grandiose or showy. The newly introduced Western arts are also felt to suffer from the same flaws, though in a different fashion.

With the advance of modernization, many folk traditions and forms of folklore are rapidly disappearing. The widespread use of standard Japanese has accelerated this trend, since local cultures are directly related to dialects. Folk songs, for example, are generally no longer commonly sung except in some remote areas in northern and southwestern Japan. Folk music and dance are related to local life and are often significantly concerned with the local religion (whether animistic, Shintō, or Buddhist), agriculture, or human relations (including the theme of love). Some, however, still enjoy a great popularity, which has been increased through the mass media. On informal social occasions, even in the large cities, folk and popular songs are often sung. Such traditional arts as *ikebana, cha-no-yu,* and calligraphy are studied and practiced by a great many Japanese; *ikebana* and *cha-no-yu,* in particular, are popular among young unmarried women, since these are regarded as cultural or aesthetic attributes for future housewives. Traditional Japanese painting, dance, and music have, however, lost much of their traditional popularity, though the poetic forms of haiku and waka continue to flourish.

Changes in social customs

In social life, the arranged marriage (*miai-kekkon*) is being replaced by the love match, though a significant proportion of marriages are still arranged or initiated by parents or other older persons or, sometimes, by friends. Modern (usually Western) popular culture has gained a strong foothold in Japan. Jazz, rock, and the blues are enjoyed by the younger generation, along with half-Westernized or half-Japanized folk and popular songs. Many more or less Japanese songs are sung to the accompaniment of Western musical instruments; at the same time, many more or less Western subjects are treated in Japanese-style drama or song.

Japan has 12 national holidays. New Year's Day is traditionally regarded as the most important of these holidays, with millions of people engaging in a kind of pilgrimage that leads to shrines and temples starting at midnight of December 31. For three days thereafter, people visit shrines and temples, their families, and the homes of friends. In addition to the 12 national holidays, there are also such nationwide festivities as the Doll Festival, or Girls' Day (March 3), which is comparable to Boys' Day (May 5), now celebrated as Children's Day (a national holiday). May Day (May 1) is celebrated by many workers. Many temples and shrines celebrate their own specific festivals, attracting large numbers of people. City, town, and village authorities, as well as local communal bodies, often organize local festivals.

Cultural institutions. In addition to its cultural institutions such as libraries, museums, art galleries, theatres, parks, gardens, and schools of various kinds, Japanese department stores also play a role in the dissemination of culture by offering free or low-cost exhibitions.

The National Diet Library in Tokyo (which also includes branch libraries) is the single largest library in Japan. Higher educational institutions, including universities, colleges, junior colleges, and technical colleges, have hundreds of libraries. Secondary and elementary schools are also equipped with libraries as a matter of course. In addition, there are city, town, and village libraries, some equipped with mobile facilities. The overwhelming majority of library books are in the Japanese language.

Museums

There are museums of all kinds; these include general, science, historical, art, and outdoor museums, as well as zoos, botanical gardens, and aquariums. Museums of all kinds have been increasing in number, as well as in the quantity of their exhibits and in their attendance.

Local governments provide youth educational services, offering classes on various topics. Adult education is also conducted by local governments, as well as by private institutions, offering classes in general education, vocational training, technology, homemaking, home economics, arts, physical education, and recreation. Many institutions also help to promote nature studies and recreation through public and private youth hostels, national lodging houses, national vacation villages, national parks, quasi-national parks, and a great many prefectural natural parks.

Special and miscellaneous schools also function as agencies of cultural dissemination. These schools, which are recognized by the local authorities, offer courses in such subjects as dressmaking, handicrafts, cooking, abacus calculation, foreign languages, driving, and nursing.

Press and broadcasting. The print and broadcast media have long been influential in Japan, although their activities were somewhat circumscribed by the government until the end of World War II.

The press. Japan ranks as one of the major book publishing countries in the world, and Tokyo is the centre of the Japanese publishing industry. Several thousand magazines are also published, with more than half of these being weeklies.

The role of newspapers is of great importance. Major newspapers print both morning and evening daily editions, and daily circulation is relatively high. Several newspapers have nationwide circulation, and some local papers also have large circulations. Japan's largest dailies rank among the highest in the world in circulation, and all of the large papers are generally considered to maintain high editorial standards.

Radio and television. Radio and television are used in Japan far more extensively than in any other Asian country and, indeed, than in most other countries in the world. Radio broadcasting began in 1925 with the establishment of Nippon (Nihon) Hōsō Kyōkai, or NHK (the Japan Broadcasting Corporation)—a public corporation financed by license fees that according to law must be paid by television-set owners. NHK broadcasts many quality programs, both on radio and on television; no commercial advertisements are permitted.

The first television broadcast was made by NHK in 1952. Television stations now broadcast to all parts of Japan, including all of the isolated islands. NHK has been broadcasting overseas programs such as "Radio Japan" since 1953 and now broadcasts in more than 20 languages. Private commercial broadcasting began in 1951 and has gained widespread popularity. In addition, satellite and cable television reception has become common.

Commercial advertising has become an immense industry in Japan. Television and newspapers are the most important media of advertising; magazine and radio advertising are less significant.

For statistical data on the land and people of Japan, see the *Britannica World Data* section in the BRITANNICA WORLD DATA ANNUAL. (Y.M.)

History

ANCIENT AND MEDIEVAL JAPAN TO C. 1550

Prehistoric Japan. *Pre-Ceramic culture.* It is not known when man first settled on the Japanese archipelago. It was long believed that there was no Paleolithic occupation in Japan, but since World War II a number of Paleolithic tools have been uncovered. These include both core tools, made by chipping away the surface of a stone, and flake tools, made by working with a stone flake broken off from a larger piece of stone. It seems likely that the people who used these implements moved to Japan from the Asian continent. At one stage, land connections via what are now the straits of Korea and Tsushima made possible immigration from the Korean peninsula, while another connection, via what are now the Sōya and Tsugaru straits, allowed people to come in from northern Asia.

The Paleolithic Age in Japan is variously dated from 30,000 to 10,000 years ago. Nothing certain is known of the culture of the period, though it seems likely that people lived by hunting and gathering, used fire, and made their homes either in pit-type dwellings or in caves. No bone or horn artifacts of the kind associated with this period in other areas of the world have yet been found in Japan. There was no knowledge whatsoever of pottery; hence, the period is referred to in Japan as the Pre-Ceramic or Pre-Pottery era.

The Japanese Neolithic cultures

Jōmon culture (5th or 4th millennium to c. 250 BC). The Pre-Ceramic period is followed by two Neolithic cultures, the Jōmon and the Yayoi. The former takes its name from the *jōmon* ("cord marks") pottery found throughout the archipelago. A convincing theory dates the period during which Jōmon pottery was used from about 10,000 years ago until the 2nd or 3rd century BC. Of the features common to Neolithic cultures all over the world—progress from chipped tools to polished tools, the manufacture of pottery, the beginnings of agriculture and pasturage, the development of weaving, and the erection of monuments using massive stones—the first two are prominent features of the Jōmon period, but the remaining three do not appear until the succeeding Yayoi period. The manufacture of pottery, however, was highly developed, and the work of Jōmon culture has a diversity and complexity of form and an exuberance of artistic decoration. It is customary to take changes in the type of pottery used as a basis for subdividing the age and to distinguish very early, early, middle, late, and very late periods. It must be remembered, however, that since Jōmon culture spread over the whole of the archipelago, it also developed regional differences, and this combination of both chronological and regional variations gives the evolution of Jōmon pottery a high degree of complexity.

The pottery of the very early period includes many deep, urnlike vessels with tapered bases. In the early period, the vessels of eastern Japan become roughly cylindrical in shape, with flat bases, and the walls contain an admixture of vegetable fibre. In the middle period there were rapid strides in pottery techniques; the pots produced during this time in the central mountain areas are generally considered to be the finest of the whole Jōmon era. The surface of these generally cylindrical vessels is covered with complex patterns of raised lines, and powerfully decorative projections rise from the rim to form handles. From the middle period onward there is increasing variety in the types of vessels, and a clear distinction developed between high-quality ware using elaborate techniques and simpler pots made for purely practical use. The amount of the latter increases steadily, preparing the way for the transition to Yayoi pottery.

Jōmon dwelling sites have been found in various parts of the country. They can be classified into two types: one, the pit-type dwelling, consisted of a shallow pit with a floor of trodden earth and a roof; the other was made by laying a circular or oval floor of clay or stones on the surface of the ground and covering it with a roof. Remains of such dwellings have been found in groups ranging from five or six to several dozen, apparently representing the size of human settlements at the time. Most of these settlements form a horseshoe shape, with a space in the centre that seems to have been used for communal purposes. Nothing certain is known, however, concerning social or political organization at this period. It can be deduced that each household was made up of several family members and that the settlement made up of such households was led by a headman or magician.

The people of the Jōmon period lived mainly by hunting and fishing and by gathering edible nuts and roots. The appearance of large settlements from the middle period onward has been interpreted by some scholars as implying the cultivation of certain types of crop—a hypothesis supported by the fact that the chipped stone axes of this period are not sharp but seem to have been used for digging soil. Weaving was still unknown, and clothes were probably made of skins or bark. Jewelry included bracelets made of seashells, earrings of stone or clay, and necklaces and hair ornaments of stone or bone and horn. From the latter part of the period, the custom also spread over the whole country of extracting or pointing certain teeth, probably performed as a rite marking the attainment of adulthood.

No especially elaborate rites of burial were evolved, and the dead were buried in a small pit dug near the dwelling. Sometimes the body was buried with its knees drawn up or with a stone clasped to its chest, a procedure that probably had some religious or magical significance. A large number of clay figurines have been found, many representing female forms that were probably magical objects associated with primitive fertility cults.

The Ainu

For years certain scholars have claimed that the people responsible for the Jōmon culture were not of Japanese stock but were ancestors of the Ainu, an aboriginal Caucasian people now found in northern Japan. Scientific investigation of the bones of Jōmon people carried out since the beginning of the 20th century has disproved this theory. The Jōmon people were a particular people who might be called proto-Japanese, and they were spread all over the country. Despite certain variations in character arising from differences in period or place, they seem to have constituted a single stock with more or less consistent characteristics. The present Japanese people were produced by an admixture of certain strains from the Asian continent and from the South Pacific, together with adaptations made in accordance with environmental changes. Linguistic evidence suggests that a people speaking a language belonging to the primitive Ural-Altaic family moved eastward across Siberia and entered Japan via Sakhalin and Hokkaido. Nothing can yet be proved concerning their relationship with the people of the Pre-Ceramic period, but it cannot be asserted that they were entirely unrelated.

Yayoi culture (c. 250 BC to c. AD 250). The new Yayoi culture that arose in Kyushu (the southernmost of the four main Japanese islands), while the Jōmon culture was still undergoing development elsewhere, spread gradually eastward, overwhelming the Jōmon culture as it went, until it reached the northern districts of Honshu, the largest island of Japan. The name Yayoi derives from the name of the district in Tokyo where, in 1884, the unearthing of pottery of this type first drew the attention of scholars. Yayoi pottery was fired at higher temperatures than Jōmon pottery and was turned on wheels. It is distinguished partly by this marked advance in technique and partly by an absence of the proliferating decoration that characterized Jōmon pottery. It developed, in short, as pottery for practical use. It is accompanied by metal objects and is associated with the wet cultivation of rice. Culturally, it represents a notable advance over the Jōmon period and is believed to have lasted for some five or six centuries, from the 3rd or 2nd century BC to the 2nd or 3rd century AD.

In China, the 3rd and 2nd centuries BC corresponded with the period of the unified empire under the Ch'in (221–206 BC) and Han (206 BC–AD 220) dynasties, which had already entered the Iron Age. In 108 BC, the emperor Wu Ti occupied the Korean peninsula and established Lo-lang and three other colonies. They provided a base for a strong influx of Chinese culture into Korea, which, in turn, spread to Japan. The fact that Yayoi culture had iron implements from the outset, and bronze implements somewhat later, probably indicates borrowings from Han culture. Iron objects rust easily, and comparatively few have been found, but they seem to have been widespread at the time. These include axes, knives, sickles and hoes, arrowheads, and swords. The bronze objects are also varied, including halberds, swords, spears, *taku* (small bell-shaped devotional objects from China), and mirrors. The halberds, swords, and spears seem not to have been used in Japan for the practical purposes for which they were evolved in China but to have been prized as precious objects.

Wet cultivation of rice

The wet cultivation of rice, possibly borrowed from southern China, was one of the most important features of Yayoi culture. The earliest Yayoi pottery and sites, discovered in northern Kyushu, have yielded marks of rice husks as well as carbonized grains of rice; this suggests that rice growing was carried on in Japan from the earliest days of the culture. Traces of paddy fields, their divisions marked with wooden piles, have been found close to sites of settlements in various districts, along with irrigation channels equipped with dams and underdrains, showing that techniques of making and maintaining paddy fields were quite advanced.

Generally speaking, the settlements of this period were built on low-lying alluvial land to facilitate the irrigation of the paddies, but at one stage they were built in the hills or on high ground instead. It is not clear whether this was dictated by the needs of defense or whether dry cultivation was being practiced. Much as in the Jōmon period, there were two types of dwelling, the pit type and the type built on the surface; but in addition to these, raised-floor structures appeared and were used for storing grain.

With the acquisition of a knowledge of textiles, clothing made great strides compared with the Jōmon period. The cloth was woven on primitive looms using vegetable fibres.

The dead were buried in either large clay urns or heavy stone coffins. Both were common in northern Kyushu and neighbouring areas, and similar urns and coffins are also found in Korea, where they probably originated. The graves were usually marked by mounds of earth or circles of stones, but a special type employed a dolmen (a large slab of stone supported over the grave by a number of smaller stones). Since the erection of dolmens was widely practiced in Manchuria and Korea, these, too, are believed to be a sign of an influx of continental culture. Normally, graves occur in clusters, but occasionally one is found apart, surrounded by a ditch and with swords, beads, and mirrors buried along with the dead. Such special graves suggest that society was already divided into classes.

It is natural to suppose that these new cultural elements represent a migration to Japan from Korea or China. Yet it is also certain that the migration was not of an order to change the character of the men who had inhabited the islands from Jōmon times. Although Yayoi culture undoubtedly represents an admixture of new sanguineous elements, it seems likely that the chief strain of proto-Japanese found all over the country during the Jōmon period was not disrupted but was carried over into later ages. This point of view is supported by the accounts of the "men of Wo," found in the Chinese history *Wei chih.*

Chinese chronicles. Japan first appears in Chinese chronicles under the name of Wo (in Japanese, Wa). The Han histories relate that "in the seas off Lo-lang lie the men of Wo, who are divided into more than 100 states, and who bring tribute at fixed intervals." Lo-lang was one of two Han colonies established in the Korean peninsula in 108 BC, and it is beyond doubt that the country of Wo was Japan. A Later Han (23–220) history records that in AD 57 the "state of Nu in Wo" sent emissaries to the Later Han court and that the Emperor gave them a gold seal. The "state of Nu," located around what is now Hakata Bay, in Kyushu, was one of more than 100 states into which Wo was divided. This account was confirmed by a gold seal, apparently the identical seal awarded by the Chinese emperor, unearthed on the island of Shikano, at the mouth of Hakata Bay, in 1748. Later, in the latter half of the 2nd century, there was civil war in the state of Wo; a woman called Pimiko (Himiko in Japanese) used her religious authority to pacify the land, and there came into being a union of more than 30 states, which opened communications with the Wei dynasty (AD 220–264) in China. Wei, too, sent emissaries to Wo, and friendly relations between the two sides continued during the first half of the 3rd century. The *Wei chih* contains a detailed account of the route from Lo-lang to the court of the Wo queen in "Yamatai." Scholars are divided as to whether Yamatai was located in northern Kyushu or in the Kinai district. If it was in northern Kyushu, then the union of states was a purely local government, unrelated to the Yamato court of later times, but if it was in the Kinai district, then it would be natural to see it as the ancestor of that court. This would suggest, in turn, that Japan had already achieved a considerable degree of political unification. But it seems most likely Yamatai was a local centre of power in Kyushu and that unification did not take place until a century later.

The "state of Nu in Wo"

According to the *Wei chih,* the people of Wo had already reached a fairly high degree of civilization. Society had clear-cut divisions of rank, and the people paid taxes. There were impressive raised-floor buildings. The various provinces held fairs where goods were bartered. Since there were exchanges of letters with Wo, it seems, too, that there were already some who could read and write.

The ancient period (c. AD 250–710). *The Yamato court and the unification of the nation.* The question of how the unification of Japan was first achieved and of how the Yamato court, with the *tennō* ("emperor of heaven") at its centre, came into being has inspired many hypotheses, none of which has so far proved entirely convincing. Thanks to Chinese and Korean records, however, it is possible to get at least an approximate idea of the date when unification occurred. The relations that Yamatai had begun with Wei were continued with Chin (AD 265–317), the dynasty that replaced Wei; but following the dispatch of a mission in 266, all records of exchanges cease, and it is not until 147 years later, in 413 during the Eastern Chin dynasty (AD 317–419) in China, that the name of Wo again appears in Chinese documents. It is most likely that the blank period resulted from conditions within Japan that made exchanges with other countries impossible. The collapse of Yamatai and the birth pangs of the united nation that took its place probably occurred during this period.

Date of unification

It is possible to push the date of unification of the nation back a few decades earlier than 413: a memorial erected in 414 commemorating the achievements of King Kwanggaet'o (Japanese Hotae) of Koguryŏ (a Korean state, 37 BC–AD 668), describing the fighting between Wo and Koguryŏ that took place on the Korean peninsula from the end of the 4th century into the beginning of the 5th century, makes special mention of a great army sent to the peninsula in 391 by Wo that succeeded in subjugating the kingdoms of Paekche, Kaya, and Silla. Such military success presupposes a long period of preparation and the prior establishment of a Wo foothold on the peninsula. The 8th-century *Nihon shoki* ("Chronicles of Japan"), one of Japan's two oldest histories, mentions the dispatch of troops by Japan in 369. Displays of strength of this kind would hardly have been possible unless Japan were already unified, and the date of the unification of the country may therefore be set at the middle of the 4th century at the latest.

The rise and decline of the Yamato court. At the time of unification, Japan already seems to have been an extremely powerful nation, as attested by the fact that it took on Koguryŏ, which dominated Korea, and established a base for its own power in southern Korea. Paekche, in the west of southern Korea, was a friendly state that paid tribute to Japan, while Kaya (Japanese, Mimana), at the southern extremity of the peninsula, was under direct Japanese jurisdiction. Tributes from these states lined the coffers of the Yamato court and encouraged a marked rise in standards of living. Weavers, smiths, and irrigation experts migrated to Japan from these areas, and the Chinese ideographic script came into Japan at this time, together with Confucian works written in that script.

The Yamato court reached its peak in the early 5th century and thereafter went into a rapid decline. The main reason was that the states of the Korean peninsula, as a result of shifts in international relationships, broke away from Japan, so that the latter was no longer able to rely on tribute from them. Japan therefore conceived the idea of borrowing the authority of the Chinese court in achieving the subjugation of the Korean kingdoms. Beginning in 421, it sent envoys to the Liu-Sung dynasty (420–479) to ask that the Japanese emperor be granted the title of generalissimo, with military control over the states of Korea. Such envoys were sent on a number of occasions during the Liu-Sung dynasty and continued until 502, during the Liang dynasty (502–557). These attempts proved futile and are themselves evidence of the decline of Japan's military power.

The Korean rebellion

Japan's difficulties abroad were paralleled by an impasse in domestic affairs. The Yamato court was headed by a hereditary emperor, while its members were drawn from the group of powerful *muraji* (clan leader) families, which had been vassals of the emperor from the start, and another group of powerful families, the *omi* (chieftain), which had sworn allegiance during the process of national unification. The highest officers of government were the *ō-muraji* and the *ō-omi*, the heads and representatives of those two groups. In time, however, some members of these families began to cool in their allegiance to the emperor or even to plot with the states of Korea. In addition, there were ceaseless struggles involving succession to the throne within the Imperial family itself. As a result, Mimana, Japan's domain in Korea, was captured in 562 by the kingdom of Silla, depriving Japan of a powerful foothold on the peninsula. By the end of the 6th century, Japan had reached a low point in both foreign and domestic affairs.

During the declining years of the Yamato court, however, there was one event of the utmost cultural importance: the introduction of Buddhism from the Korean kingdom of Paekche. The date of its introduction is traditionally set at either 538 or 552, but it seems likely that Buddhist beliefs had begun spreading among ordinary Japanese at a much earlier date. Buddhism at first was an object of wonder and admiration, a rare item of foreign culture symbolized by its beautiful statuary, its imposing religious paraphernalia, and its majestic temples. The Buddhism that first spread among the Japanese was almost certainly a simple reliance on the magical powers of the religion in seeking various benefits in the present world. True understanding of its doctrines did not come until the time of Shōtoku Taishi (Prince Shōtoku).

Introduction of Buddhism

The period from the latter half of the 3rd century until the beginning of the 7th century is known to archaeologists as the age of the Tumulus, or Kofun, culture, for burial mounds were then erected over a wide area, and their shapes and contents (the objects buried with the dead) give a good idea of the material aspects of the everyday life of the time. These include the well-known *haniwa* tomb sculptures.

The idealized government of Shōtoku Taishi. The Yamato court that fell into such desperate straits toward the end of the 6th century was to be resuscitated by efforts made within the Imperial family itself, efforts that in the course of a century reformed the government of the country and set it moving toward formation of a centralized state more suited to the new age. The movement was touched off by the theories of ideal government expounded by Prince Shōtoku, who, as regent for his aunt, the empress Suiko, took charge of the nation in these difficult times. Prince Shōtoku took the Buddhist spirit of peace and salvation for all beings as the ideal underlying his government. He made no move, even, to charge the known murderer of the previous emperor but worked to convince him gradually, through the ideas of Buddhism, of the wrong he had done.

The Prince's most striking achievement in the field of domestic government was his establishment of a system of 12 court ranks in 603 and the "Seventeen Article Constitution" in 604. The former, which made clear the relative stations of persons working at the court by giving them caps of different colours, aimed to encourage efficient use of persons of ability and give the court a proper organization and etiquette of its own. The constitution consists of 17 simple articles setting forth the ideals of the state and rules for human conduct. It distinguishes the ruler, his ministers, and the people as the three human elements making up the state and clearly lays down the duties and rights of each; it thus set the pattern of a centralized state presided over by a single ruler, and it provided a kind of basic law of the nation.

The constitution of 604

Shōtoku's chief achievement in foreign relations was the opening of relations with Sui dynasty (581–618) China. The exchanges between Japan and China in the 5th century had placed Japan in the position of a tributary state. Prince Shōtoku opened relations with Sui on an equal basis, and envoys were exchanged by the two countries. He also sent Japanese students to China to learn directly from Chinese culture, which had hitherto reached Japan via the states of Korea. Shōtoku was a profound student of Buddhism who gave lectures on the scriptures and himself wrote commentaries. His commentary on the Lotus Sūtra, four volumes of which survive in the original draft written by the Prince himself, may be called the oldest written work of known authorship in Japan.

As Buddhism gained ground, imposing temples were built in the Chinese style. The astonishment aroused by these great buildings—often with more than one story and with massive tiled roofs—that were built where there had been only low, thatched houses may well be imagined. A new civilization descended on Japan almost overnight. Of the temples built at the time, all that has survived of most of them are the foundation stones, but the Hōryū-ji, founded in 607 at Ikaruga in present Nara Prefecture, still preserves its ancient wooden structures; indeed, it is the oldest wooden building in the world.

The Taika reforms. The death of Prince Shōtoku, in 622, prevented his ideals of government from bearing full fruit. The Soga family, regaining its former powers, exterminated Prince Shōtoku's son Yamashiro Ōe in 643 and all his family. At the same time, however, the students whom Shōtoku had sent to China were returning to Japan with accounts of the power and efficiency of the T'ang dynasty (618–907), which had overthrown the Sui dynasty and unified China. These accounts impressed on educated men the need to reform the government, strengthen the power of the state, and take every step to prepare against possible pressure from outside.

In 645 Prince Nakano Ōe and Nakatomi Kamatari engineered a coup d'état within the palace, killing the Soga family and wiping out all forces opposed to the Imperial family. They then set about establishing a system of centralized government with the emperor as absolute monarch at its head. An edict issued in 646 abolished private ownership of land and men by the wealthy families. The land thus taken over by the state was to be parcelled out among all who had attained a certain age, with the right to cultivate, in exchange for which the tenants were to pay a fixed tax. Provisions were also made for a governmental system embracing a capital city and local administration and for defense and communications facilities. A system was also established whereby a kind of "complaints box" was installed at court to give people a chance to appeal directly to the emperor. The main outlines of the reforms were drawn up in about five years. They are given the name Taika reforms after the *nengō* ("year name")—the first such in Japanese history—that was given to the era at that time. In the countries of East Asia, era names are a symbol of an independent nation, a sign that the sovereign's authority is effective.

Abolition of private land-ownership

Not long after the Taika reforms, Japan became involved in a dispute that led it to send troops to Korea. Paekche, whose royal castle had been captured in 660 by the combined forces of T'ang (China) and Silla (another Korean kingdom), called on Japan for help. Japan, which had traditionally been friendly with Paekche, sent a large army; it was crushed, however, in 663, by a combined T'ang and Silla army at the mouth of the Pak River. Japan withdrew entirely and gave up any further intervention on the peninsula. The Japanese ruler of the time, the empress Saimei, went to northern Kyushu and directed operations personally, even though she was already 67 at the time. The Empress was succeeded by Prince Nakano Ōe, who, as the emperor Tenji, directed his attention to domestic affairs. He built fortifications in Kyushu to prepare for an expected T'ang and Silla invasion and amended the system established by the Taika reforms so as to make it more suitable to the practical needs of the state. His younger brother, the emperor Temmu, similarly devoted his energies to domestic government; he had the Taika reforms set forth in written codes, which comprised *ritsu-ryō* political structure.

The ritsu-ryō system. The *ritsu-ryō* can be divided between *ritsu,* the criminal code, and *ryō,* the administrative and civil codes. A similar system had long been in force in China, and the Japanese *ritsu-ryō* was an imitation of the *lü-ling* of T'ang China and incorporated some of its articles just as they stood. Where different local conditions called for amendment, however, amendments were made without hesitation; it is a good early example of the skill of the Japanese in importing foreign culture.

The Japanese emperor, for example, was in some respects an absolute monarch who ruled over the whole country as the head of a bureaucracy in the same manner as the emperor of China. Yet at the same time he was also the traditional high priest who maintained peace for the land and people by paying tribute to the gods and sounding out their will. Thus the central government was headed by twin agencies—the Council of State (Dajōkan), which combined within its functions the various practical aspects of administration, and the Office of Deities (Jingikan), which was in charge of the worship of the gods. Prospective bureaucrats were required to study at a central college and to pass prescribed examinations; during their term of office their achievement was subjected to scrutiny once a year, and their rank and position were adjusted in accordance with the results. This was based on the highly developed bureaucratic system of China, yet the *ritsu-ryō* system was not too bound by its provisions to provide special favours for men of high rank and good family. This, too, was a compromise between the new principles of the *ritsu-ryō* system and the old spirit of respect for birth. The provinces were divided into three types of administrative division: the *kuni,* or *koku* (province), the *kōri,* or *gun* (county), and the *sato,* or *ri* (village), to be administered by officials known as *kokushi, gunji,* and *richō,* respectively. The posts of *kokushi* were filled by members of the central bureaucracy in turn, but the posts of *gunji* and *richō* were filled by members of prominent local families.

The Imperial government

The people were divided into two main classes, freemen and slaves. The slaves were the possession of the government, the aristocracy, and the shrines and temples; as such they were obliged to provide unlimited labour, but their total number accounted for less than one-tenth of the population. The majority of the free population were farmers. At the age of six, each male child was apportioned paddy fields that remained his to cultivate for life. A tax was levied on the produce of the paddies, and a head tax was levied on adult males. The paddy field tax was low (about 3 percent of the crop), but the head tax, payable in handicrafts such as silk and hemp, imposed a heavy burden. Moreover, the transport of the goods from the provinces to the capital was the responsibility of the taxed, which involved an enormous labour for those living in distant parts. Adult males were also obliged to give military service and to provide labour for public works at the command of the local *kokushi,* amounting to not more than 60 days per year. Since the government's finances depended on such tribute from the common people, whenever the latter found the burden too much and fled from their registered homes to avoid paying taxes the government felt the pinch immediately.

The lowest ranking freemen were the groups of smiths, tanners, and others engaged in manufacturing. They were mostly the descendants of immigrants who inherited their trades and paid their taxes in the form of manufactured goods or by working for fixed periods in the government workshops.

Shrine and temple aristocracy

All land was in principle the property of the state. Most of the land was distributed equally among the people, but, apart from this, land of a certain annual yield was given to bureaucrats and other high-ranking persons as stipends and to Shintō shrines and Buddhist temples as sources of revenue. Land other than paddy fields was left to the individual to use as he pleased. There was a need to open up new paddy fields as a means of providing for a growing population, but the *ritsu-ryō* system made inadequate provision for this process. In time, the government began to encourage the opening up of new land, and in 743 the system was changed to give permanent private possession of such land to the person who had first put it under cultivation. As a result, the aristocrats and the shrines and temples frantically set about putting land under cultivation in order to increase their own privately owned territories. The principle of public ownership of land provided for in the *ritsu-ryō* system began to crumble, and as it did so the whole system of government grew increasingly shaky.

Nara period (710–784). *Beginning of the Imperial state.* In 710 the Imperial capital was shifted a short distance from Asuka to Nara. For the next 75 years, with minor gaps, Nara was the seat of government, and the old custom of changing the capital with each successive emperor was finally discarded. During this period, the centralized government provided for under the *ritsu-ryō* structure worked well, but a still conspicuous feature is the brilliant flowering of culture, especially Buddhist culture. The leaders in its promotion were the emperor Shōmu and his consort, Kōmyō. Immediately on his accession, Shōmu, who from childhood had been given a thorough schooling as future emperor, showed an eager concern to promote the stable livelihood of the people. Convinced that the Buddhist faith was a means to ensuring both the happiness of the individual and peace for the country as a whole, he introduced strong doses of Buddhism into his government.

Official encouragement of Buddhism

One of the measures he took was the founding of the temples known as *kokubun-ji.* Each province was to build a monastery known as *kokubun-ji* and a nunnery known as *kokubun-niji,* each with a seven-story pagoda and each housing a statue of the Śakyamuni Buddha. Each monastery was to have 20 monks, each nunnery 10 nuns, whose constant task would be to recite the scriptures and offer up prayers for the welfare of the nation. Just as the temporal world had its *kokushi* (governors) in each province to attend to its administrative and juridical matters, so the spiritual world would have officially appointed monks and nuns, distributed evenly among the provinces, to attend to the spiritual needs of the people.

The second measure taken by Shōmu was the construction of the Tōdai-ji as *kokubun-ji* of the capital and the installation within it of a huge bronze figure of the Vairocana Buddha as supreme guardian deity of the nation. The casting of the Daibutsu (Great Buddha) was a tremendously difficult task. The Emperor, however, called on the people at large to contribute to the project, in however humble a way, and thereby partake of the grace of the Buddha. The great image that was produced as a result, though damaged in later ages, still stands in the Tōdai-ji and is famous the world over as the Great Buddha of Nara.

The marriage of Buddhism and politics that was Shōmu's ideal was to cause trouble in the following era. The temples gradually amassed vast wealth, and the monks acquired high political positions and began to interfere in secular affairs. A movement to counter such abuses arose among the aristocracy, the leaders of the movement being the Fujiwara family, descendants of Nakatomi Kamatari, who had played such an important role in the Taika reforms. Kamatari and his son Fuhito (later given the surname Fujiwara) had supervised compilation of the codes that comprised the *ritsu-ryō* system and had become prominent figures at court as a new type of bureaucrat-noble. The subsequent progress of the family's fortunes was not always smooth. In particular, the emphasis on Buddhism in government had obliged them to lie low. At the end of the 8th century, however, when it seemed to them that the evils of Buddhistic government were threatening the future of the nation, they set on the throne a new emperor, Kōnin, who had no leanings toward Buddhism. Kōnin's son, the emperor Kammu, who was of a similar mind, shifted the capital to Heian-kyō (present Kyōto) to sever connections with the temples of Nara and reestablished government in accordance with the *ritsu-ryō* system.

Culture in the Nara period. The cultural flowering centring on Buddhism was an outcome of lively exchanges with other nations. Four times within 70 years the government sent official missions to the court of T'ang, and each time they were accompanied by a large number of students who went to study in China. By this time T'ang had formed a great empire that controlled not only the central plains of China but parts of Mongolia and Siberia to the north and of Central Asia to the west.

The *Man'yō-shū* anthology

Japanese culture, borrowing from the T'ang, whose capital, Ch'ang-an, was a great international city, thus showed in the Nara period marked international flavour. The ceremony of consecration of the Great Buddha of the Tōdai-ji, for example, was conducted by a Brahmin high priest born in India, while the music was played by musicians from all over the Far East. But despite this strongly international flavour, respect was also shown for traditional Japanese ways and outlooks. An outstanding example of this respect is the collection of Japanese verse known as *Man'yō-shū* (*c.* 8th century AD), an anthology of 4,500 poems both ancient and contemporary. The poets range over all classes of society, from the emperor and members of the Imperial family through the aristocracy and the priesthood to farmers, soldiers, and prostitutes, and the scenery celebrated in the verse represents districts all over the country. The poems deal directly and powerfully with basic human themes, such as love between men and women or between parents and children, and are deeply imbued with the traditional spirit of Japan, scarcely influenced at all by Buddhist or Confucian ideas. The anthology had immense influence on all subsequent Japanese culture.

The compilation of Japan's two most ancient histories, the *Koji-ki* and *Nihon shoki,* also took place at the beginning of the 8th century. Both works are extremely important, for they draw on oral or written traditions handed down from much earlier times.

The Heian period (794–1185). *Changes in ritsu-ryō government.* In 794, as noted above, the emperor Kammu shifted his capital to Heian-kyō, cut the ties between government and Buddhism, and revived government in accordance with the *ritsu-ryō.* Commanding that the provisions of the *ritsu-ryō* system be enforced, he also amended those articles that were no longer relevant to the age. Since it was difficult in practice to carry out the allocation of rice fields once every six years, this was amended to once in 12 years. A tighter watch was imposed on corruption among local officials. The original system of raising conscript troops was abolished, and troops were thenceforth selected from among the sons of local government officers and persons of rank. An alien tribe known as the Emishi in the northern districts of Honshu was brought under government control. Those Emishi who submitted to government forces were resettled throughout the empire and quickly assimilated to the existing population.

Buddhism was forbidden to interfere in affairs of state, but as a religion it was encouraged to fulfill its proper functions. Two brilliant monks, Saichō and Kūkai, were sent to China to study. Each of them, on his return to Japan, established a new sect of Japanese Buddhism: the Tendai sect, founded by Saichō, and the Shingon sect, founded by Kūkai. In the Nara period, Buddhism had been no more than a transplantation of the Buddhism of T'ang China, but the two new sects, though basically derived from China, were reworked in a characteristically Japanese fashion. As headquarters of their new sects, Saichō and Kūkai founded, respectively, the Enryaku-ji (also known as the Hieizan-ji) on Mt. Hiei (Hiei-zan) and the Kongōbu-ji (*ji*, "temple") on Mt. Kōya (Kōya-san). The two sects were thenceforth to form the twin mainstreams of Japanese Buddhism.

After Kammu, successive emperors carried on his policies, and society enjoyed some 150 years of peace. The formal aspects of government, at least, were carefully observed, and the supplementing of the legal codes, the compilation of histories, and the minting of coins all took place frequently in accordance with precedent. The social reality, however, became increasingly chaotic, so that form and actuality were soon travelling along quite different courses. The very foundations of *ritsu-ryō* government had begun to crumble because of the difficulty of finding enough rice fields to distribute to the people and the decline in government revenue resulting from the impoverishment of the masses.

Decline of *ritsu-ryō* government

A good example of the split between form and reality is the fact that while, on the surface, appointments to official posts at court were made just as they had always been, real power shifted to other posts that were newly created as the occasion demanded. Typical of such new posts were those of *kurōdo,* a kind of secretary and archivist to the emperor, and the *kebiishi,* who had total control over the police and the judicature. The two supreme examples of such posts were those of *sesshō* (regent) and *kampaku* (chief councillor). The original role of the *sesshō* was to attend to affairs of state during the minority of the emperor, while the *kampaku*'s role was to attend to state matters for the emperor even after he had come of age. Neither post had been foreseen by the *ritsu-ryō* system, which was rooted in the principle of direct rule by the emperor.

The rule of Imperial succession

In the middle of the 9th century, however, when the emperor Seiwa ascended to the throne at the age of nine, his maternal grandfather, Fujiwara Yoshifusa, became *sesshō.* Yoshifusa's son Mototsune became *sesshō* during the minority of the emperor Yōzei, then in the reign of the emperor Uda he created the post of *kampaku.* It thus became the established custom that a member of the Fujiwara family should serve as *sesshō* and *kampaku.* In order to become *sesshō* or *kampaku,* it was necessary that the person concerned should marry his daughter into the Imperial family, then establish the resulting offspring as emperor. In other words, an important qualification was that one should be the emperor's maternal grandfather or father-in-law. As a result of this complex system, there were constant struggles at court involving the expulsion of members of other families by the Fujiwara family or wrangling among the Fujiwara themselves.

One of the most celebrated affairs involving the expulsion of a member of another family by the Fujiwara was the removal of Sugawara Michizane from his post as minister and his exile to Kyushu. Born into a family of scholars, Michizane was himself an outstanding scholar whose ability in writing Chinese verse and prose was said to rival that of the Chinese themselves. Recognizing his talent, the emperor Uda singled him out for an attempt to break the authority of the Fujiwara family. As part of his plan, Uda appointed Michizane and Fujiwara Tokihira to a succession of government posts. In 899 Uda's successor, the emperor Daigo, simultaneously appointed Tokihira as his minister of the left and Michizane as minister of the right. The Fujiwara objected strenuously. In 901 Tokihira falsely reported to Daigo, who was sympathetic to the Fujiwara, that Michizane was plotting treason. The matter was taken up officially and Michizane was demoted to a ministerial post in Kyushu, effectively sending him and his family into exile.

The culture of the 9th century was a continuation of that of the 8th, insofar as its foundations were predominantly Chinese. The writing of Chinese prose and verse was popular among scholars, and great respect for Chinese customs was shown in the daily lives of the aristocracy. Many Buddhist monks went to China to bring back as yet unknown scriptures and iconographic pictures. Buddhist sculpture and paintings produced in Japan were done in the T'ang style. At the end of the 9th century, however, Japan cut off formal relations with T'ang China, perhaps because of the expense involved in sending regular envoys and perhaps because of the political unrest accompanying the breakup of the T'ang empire. The practical result was the stimulation of a more purely Japanese cultural tradition. Japanese touches were gradually added to the basically T'ang styles, and a new culture slowly came into being; but it was not until the 10th century and later that this tendency became a strong current.

Aristocratic government at its peak. From the 10th century and through the 11th, successive generations of the Fujiwara family continued to control the nation's government by monopolizing the posts of *sesshō* and *kampaku,* and the wealth that poured into their coffers enabled them to lead lives of the greatest brilliance. The high-water mark was reached in the time of Fujiwara Michinaga. Four of his daughters became consorts of four successive emperors, and three of their sons became, respectively, the emperors Go-Ichijō, Go-Suzaku, and Go-Reizei. Government during this period was based mostly on precedent, and the court had become no more than a centre for ceremonies. Court ministers were content to perform prescribed rites on prescribed days and were utterly unfitted to deal with any sudden social crisis that might confront them.

The growth of private estates

The *ritsu-ryō* system of public ownership of land and men survived in name alone; land passed into private hands, and men became private citizens. Typical of the new privately owned lands were the *shōen* ("manors"), which developed on the basis of rice fields under cultivation since the adoption of the *ritsu-ryō* system. Since the government encouraged the opening up of new land during the Nara period, the temples and aristocrats with resources at their disposal hastened to develop new areas, and vast private lands accrued to them. The owners of the new lands used one pretext or another to obtain special exemption from taxes, so that the *shōen* gradually became nontaxpaying estates. The increase in such *shōen* thus came to pose a serious threat to the government, which accordingly issued frequent edicts intended to check the formation of new estates. This merely served, however, to establish more firmly the position of those already existing and failed to halt the tendency for such land to increase. Since the owners of the *shōen* were the same aristocracy and high officials that made up the government, it was extremely difficult to change the situation.

Although the aristocracy and temples around the capital enjoyed exemption from taxes on their *shōen,* the same privileges were not available to powerful families in the provinces. These, accordingly, presented their *shōen* to members of the Imperial family or the aristocracy, concluding agreements with them that the latter should become owners in name while the former themselves retained rights as actual administrators of the property. Thanks to such agreements the estates of the aristocracy went on increasing steadily and their incomes swelled proportionately. The *shōen* of the Fujiwara family in particular reached such vast proportions that it was said that among them they owned the whole country.

While the aristocracy was leading a life of luxury on the proceeds from its estates, the first stirrings of a new power in the land—the warrior, or samurai, class—were taking place in the provinces. Younger members of the Imperial family and lower ranking aristocrats who were dissatisfied with the Fujiwara monopoly of high posts would take up posts as local officials in the provinces, where they settled permanently, acquired lands of their own, and established their own power. In order to protect their territories, they began to press the local inhabitants into service and to give them arms, thus building up armed forces of their own. As a consequence, when men of true martial ability and sufficient autonomy emerged, the slightest incident involving any one of them was liable to provoke armed conflict. The risings of Taira Masakado (died 940) in the Kantō district and of Fujiwara Sumitomo (died 941) in western Japan had an enormous effect in lowering the government's prestige and encouraging the desolation of the provinces.

The development of the *kana* syllabaries

During the 10th century a truly Japanese culture developed, one of the most important contributing factors being the emergence of indigenous scripts, the *kana* syllabaries. Until then, Japan had no writing of its own; Chinese ideographs were used partly for their sense and partly for their pronunciation in order to represent the Japanese language, which was entirely different from Chinese. The educated men and women of the day, however, gradually evolved a system of writing that used a purely phonetic, syllabic script formed by simplifying a certain number of the Chinese characters; another script was created by abbreviating Chinese characters. These scripts, called *hiragana* and *katakana*, respectively, made it possible to write the national language with complete freedom, and their invention was an epoch-making event in the history of the expression of ideas in Japan. Thanks to the *kana,* a great amount of verse and prose in Japanese was to be produced.

Particularly noteworthy in this respect were the daughters of the Fujiwara, who, under the aristocratic government of the day, became the consorts of successive emperors and surrounded themselves with talented women who vied with each other in learning and the ability to produce fine writing. The *hiragana* script provided such women with an opportunity to create works of literature. Among such works, the *Genji monogatari* (*The Tale of Genji*), a novel by Murasaki Shikibu; and the *Makura no sōshi* (*The Pillow Book of Sei Shōnagon*), a collection of vivid scenes and incidents of court life by Sei Shōnagon, who was a lady-in-waiting to the empress Sadako, are masterpieces that hold a place in world, and not merely Japanese, literature. The waka, the native Japanese verse form, was an indispensable part of the daily lives of the aristocracy, and proficiency in verse-making was counted an essential accomplishment for an intellectual. Such circumstances led to the compilation in 905 of the *Kokinshū* (or *Kokin wakashū*), the first of a series of anthologies of verse made at Imperial command.

The same trend toward the development of purely Japanese qualities became strongly marked in Buddhism also. Both the Tendai and Shingon sects produced a succession of gifted monks and continued, as sects, to flourish. But, being closely connected with the court and aristocracy, they tended to pursue worldly wealth and riches at the expense of purely religious goals, and it was left to the Jōdo (Pure Land) sect of Buddhism to preach a religion that sought to arouse a desire for salvation in ordinary men. Pure Land Buddhism, which became a distinct sect in the 12th and 13th centuries, expounded the glories of the paradise of Amida (Amitābha, or Buddha of Infinite Light)—the world after death—and urged all to renounce the defilements of the present world for the sake of rebirth in that paradise; it seemed to offer an ideal hope of salvation in the midst of the collapse of the old order. It was a very approachable religion in that it eschewed difficult theories and ascetic practices, teaching that in order to achieve rebirth it was only necessary to invoke the name of Amida and dwell on the marks of his divinity. This same teaching also inspired artists to produce an astonishing number of representations of Amida in both sculpture and painting. The mildness of his countenance and the softly curving folds of his robe contrasted strongly with the grotesque Buddhist sculpture in the preceding age and represented a much more truly Japanese taste.

The signs of the growing independence of Japanese culture, apparent in every field, were an indication that by now, two centuries after the first busy ingestion of continental culture, the process of absorption was nearing completion.

Government by cloistered emperors (insei) and the rise of the samurai. The powerful authority wielded by members of the Fujiwara family as *sesshō* and *kampaku* was maintained by their blood relationship on the maternal side to successive emperors; once such a relationship disappeared, their power was bound to weaken. This, in fact, is what happened; the emperor Go-Sanjō ascended the throne even though he was not born of a daughter of the Fujiwara, while Michinaga's sons Yorimichi and Norimichi both gave their daughters to be Imperial consorts without obtaining the desired birth of an Imperial prince. As a result of these and other circumstances, real political power passed from the *sesshō* and *kampaku* to the "cloistered emperors" during the latter half of the 11th century; in other words, it passed to emperors who had already abdicated and taken Buddhist vows—thus nominally renouncing the world—yet who wielded a very real power behind the scenes. This system, known as *insei* ("cloistered government"), was perhaps a more natural arrangement insofar as it represented a shift from government by matrilinear relatives of the emperor to government by patrilinear relatives. In continuing to treat the actually reigning emperor as a pure figurehead, however, it was no whit better than the old *sesshō-kampaku* system. The cloistered-emperor system continued for a long period, although the emperors Shirakawa, Toba, and Go-Shirakawa—who retired for periods of 43, 27, and 34 years, respectively—were the only ones to wield absolute, behind-the-scenes power.

The power of retired emperors

The *insei* system was inspired by no particular ideal and conformed to no particular rules. The one common feature of each reign was that the emperor became a Buddhist priest and governed in a way that theoretically respected the teachings of Buddhism. In practice, this "Buddhism" was more preoccupied with construction of ostentatious temples than with true belief. Other signs of the same trend were the frequent journeys of retired emperors to worship at distant temples and their edicts strictly prohibiting the killing of living creatures; it did not concern them that such edicts deprived a large number of their subjects of their occupations.

The nominal respect for Buddhism spurred on the secularization of the religion. Properly speaking, the world of Buddhism should have been one in which factionalism could have no part, a world in which nothing counted but wisdom, virtue, and experience. But at this time large numbers of aristocrats were taking holy vows and going to live in the temples, which thus became centres of factionalism and intrigue. Most of the higher positions in the religious world were occupied by members of the Imperial family and former aristocrats. This effectively closed advancement to commoners, and the lower ranking monks in the temples harboured a grudge against their superiors on this account. Whenever some particularly serious grievance arose, they would march in a body on the capital and try to force acceptance of their demands by a direct appeal to the court. Some idea of the nuisance they constituted can be gained from the fact that even the retired emperor Shirakawa—the most powerful of the cloistered emperors—ranked them with the waters of the Kamo River and the dice in games of chance as one of three superhuman forces that he was powerless to control. Nor did the monks hesitate to resort to armed force; it was an age in which a priesthood ostensibly committed to compassion and respect for life in all its forms could openly bear arms and engage in slaughter.

The rise of the warrior class

Another feature of the age was the rise of the warrior class. With the development of government by the cloistered emperors, the more powerful of the samurai, who, as noted above, first established their power in the provinces, gradually gathered in or near the capital, where they acted as military police. Associating with the Fujiwara court nobles and aristocracy, they gradually established a foothold at court. Outstanding among these samurai were the Minamoto (or Genji) family, descendants of the emperor Seiwa, and the Taira (or Heike) family, descendants of the emperor Kammu. The Taira had at first settled in the Kantō district, where they extended their influence over a wide area; but they had suffered a setback in the uprising of Taira Masakado and had finally lost their hold on the Kantō district as the result of another, later rising by Masakado's descendant Tadatsune. The Minamoto clan, favourites of the Fujiwara, had been a prominent family in the capital from the start, but their fame as a warrior clan was greatly heightened in the mid-11th century when after 12 years of hard fighting they quelled a rising by the Abe family in the Tōhoku district. Minamoto Yoshiie, who played an important part in the fighting, became the nation's most celebrated warrior, and many powerful clans made voluntary vows of allegiance to him and presented him with land in return for his protection. Yoshiie, however, had no son to match him in military prowess, and the Taira took advantage of this relative decline to advance their own fortunes again. Taking advantage of the *insei* system as a means to their own political advancement, they curried favour with the retired emperors. Taira Masamori and his son Tadamori served as governors in provinces in western Japan, building up their own power in the area, and aided the retired emperors' programs of temple building by erecting a large number of new temples and pagodas. Tadamori also tried his hand at trade with Sung dynasty China as a means of amassing wealth. In such ways, the social position of the Taira rose steadily, so that Tadamori's son Kiyomori could take his place alongside the aristocracy.

Discord between retired emperors and reigning emperors combined with internal differences within the Fujiwara family to split the Imperial family and nobility into two parties, which enlisted the Minamoto family and the Taira family, respectively, on their own sides. The two sides eventually clashed openly in Kyōto in what is known as the Hōgen Disturbance (July 1156). The conflict was on a small scale, the outcome determined by a single night's fighting, yet it was highly significant as showing that the power of the samurai was sufficient to sway the nation's government. In the Heiji Disturbance (1159) that followed, the Minamoto were thoroughly defeated, and Taira Kiyomori emerged as the chief power in the land. Although he was a samurai by birth, Kiyomori shared certain aristocratic tendencies of the Fujiwara, and the 20-odd years of Taira rule that followed had a special character of their own. He himself became grand minister of state (*dajō-daijin*) at the court, and more than 50 other official posts were filled by members of his family. His daughter became the consort of the emperor Takakura, and the prince born of the union ascended to the throne in his infancy—a return to government by matrilinear relatives of the emperor. Kiyomori's rule also had its more drastic, soldierlike aspects; thus in a single move he swept 42 court officials from their posts and into exile, and he razed to the ground troublesome temples such as the Tōdai-ji and Kōfuku-ji. His repairing of the Inland Sea route and his encouragement of trade with Sung China were measures that would never have occurred to a Fujiwara government.

The Heiji Disturbance

While the Taira family thrived in the capital, the descendants of the original Minamoto were quietly building up their strength in the provinces. Finally Yoritomo, a descendant in the direct line of the Minamoto family, who grew up in exile at Izu, rallied the Minamoto and sent his younger brothers Yoshitsune and Noriyori to attack Kyōto. The final rout of the fleeing Taira forces on the sea off the island of Shikoku put a more or less decisive end to the swing of fortune between Minamoto and Taira.

It also marked an important turning point in Japanese history, since Yoritomo's establishment of a military government, or shogunate, in Kamakura may be seen as the beginning of rule by a samurai class backed up by a feudal system and the end of the ancient monarchical system of court and aristocracy. The shogunate, or *bakufu* (literally, "tent government," the name for the field headquarters of a campaigning warrior), was to hold effective political control in Japan until the restoration of Imperial power in 1868. (T.Sa.)

The Kamakura bakufu (1192–1333). *The establishment of military government.* The establishment of the shogunate by Minamoto Yoritomo at the end of the 12th century marks the beginning of a new era, one in which independent government by the warrior class successfully opposed the political authority of the civil aristocracy. Yoritomo established his headquarters in Kamakura and entrusted the suppression of the powerful Taira family to his younger brothers Noriyori and Yoshitsune. Meanwhile, he gathered a following in eastern Japan as a foundation for a new military government. As a first step he set up in 1180 the Samurai-dokoro (Board of Retainers), a disciplinary board to control his military vassals. General administration was handled by a secretariat, which was opened four years later and known as the Kumonjo (later renamed the Mandokoro). In addition, a judicial board, the Monchūjo, was set up to handle lawsuits and appeals. Under these institutions, the organization of the *bakufu* gradually took shape.

Bakufu institutions

In 1185, after the destruction of the Taira family, Yoritomo appointed military governors (*shugo*) in all the provinces and military stewards (*jitō*) in both public and private landed estates. It was the job of the *shugo* to recruit metropolitan guards and keep strict control over subversives and criminals. The *jitō* collected taxes, supervised the management of landed estates, and maintained public order.

In 1189 Yoritomo finally destroyed the great Fujiwara family of Mutsu Province, which had sheltered his rebellious brother Yoshitsune. Three years later Yoritomo went to Kyōto and was appointed shogun (an abbreviation of *seii taishōgun*; "barbarian-quelling generalissimo"), the highest honour that could be accorded a warrior. At first the chief base of the *bakufu* lay in the landed estates seized from the Taira family and in the limited administrative revenues from public estates in provinces granted to Yoritomo by the Imperial court. But later the *bakufu* was able to expand its influence over those public estates that were still controlled by the civil provincial governors, as well as the private estates of the civil aristocracy and the temples and shrines.

The regency government. After the death of Yoritomo in 1199, real power in the *bakufu* passed into the hands of the Hōjō family, from which Yoritomo's wife, Masako, had come. In 1203 Hōjō Tokimasa, Masako's father, assumed the position of regent (*shikken*) for the shogun, an office that was held until 1333 by nine successive members of the Hōjō family. Taking advantage of disputes among Yoritomo's generals, the Hōjō overthrew their rivals, and after three generations the direct line of descent from Yoritomo had become extinct. Though wielding actual power, the Hōjō family was of low social rank, and its leaders did not aspire to become shoguns themselves. Kujō Yoritsune, a distant relative of Yoritomo, was appointed shogun, while Tokimasa's son Hōjō Yoshitoki (*shikken* 1205–24) handled most government business. Thereafter, the appointment and dismissal of the shogun followed the wishes of the Hōjō family.

This increasing political power of the military led to a conflict with the aristocracy. Hence, the emperor Go-Toba, seeing in the demise of the Minamoto family a good opportunity to restore his political power, in 1221 issued a mandate to the country for the overthrow of Yoshitoki, but few warriors responded to his call. A *bakufu* army occupied Kyōto, and Go-Toba was arrested and banished to the island of Oki in an incident known as the Jōkyū Disturbance, after the era name Jōkyū (1219–22). The *bakufu* now set up its headquarters in Kyōto to supervise the Imperial court and to control the legal and administrative business of the western provinces. The estates of the civil aristocrats and warriors who had joined Go-Toba were confiscated and distributed as rewards among the shogun's vassals. The political power of the *bakufu* now extended over the whole country.

The Jōkyū Disturbance

Meanwhile, the regent Hōjō Yasutoki, to strengthen the base of his political power, reorganized the council of leading retainers into an advisory council known as the Hyōjō-shū. In 1232 the council drew up a legal code known as the Jōei Shikimoku (Jōei Formulary). Its 51

articles set down in writing for the first time the legal precedents of the *bakufu.* Its purpose was simpler than that of the *ritsu-ryō,* the old legal and political system of the Nara and Heian civil aristocracy. In essence it was a body of pragmatic law laid down for the proper conduct of the warrior way of life. Distinctive features of the formulary included a strong emphasis upon the lord-vassal relationship and paternal power and a recognition of female inheritance of land; its sway was gradually extended over the whole country. In 1249 the regent Hōjō Tokiyori also set up a supreme court, the Hikitsuke-shū, to secure greater impartiality and promptness in legal decisions.

The Mongol invasions. The establishment of the regency government coincided with the rise of the Mongols under Genghis Khan in Central Asia. In the space of barely half a century they had established an empire extending from the Korean peninsula in the east and as far west as Russia and Poland. In 1260 Genghis Khan's successor, Kublai, became Great Khan in China and fixed his capital at present-day Peking. In 1271 Kublai adopted the dynastic title of Yüan; shortly thereafter the Mongols began preparations for an invasion of Japan. In the autumn of 1274 a Mongol and Korean army of some 40,000 men set out from present-day South Korea. On landing in Kyushu it occupied the Matsura district of Hizen Province (part of present-day Saga Prefecture) and advanced to Chikuzen. The *bakufu* appointed Shōni Sukeyoshi as military commander, and the Kyushu military vassals were mobilized for defense. A Mongol army landed in Hakata Bay, forcing the Japanese defenders to retreat to Dazaifu; but a typhoon suddenly arose, destroying over 200 ships of the invaders, and the survivors returned to southern Korea.

The *bakufu* took measures against a renewed invasion. Coastal defenses were strengthened, and a stone wall was constructed extending for several miles around Hakata Bay to thwart the powerful Mongol cavalry. Apportioned among the Kyushu military vassals, these public works took five years to complete and required considerable expenditure. Meanwhile, the Mongols made plans for a second expedition. In 1281 two separate armies were arrayed: an eastern army consisting of about 40,000 Mongol, North Chinese, and Korean troops set out from South Korea; and a second army of about 100,000 South China troops under the command of the Mongol general Hung Ch'a-ch'iu. The two armies met at Hirado and in a combined assault breached the defenses at Hakata Bay. But again a fierce typhoon destroyed nearly all of the invading fleet, forcing Hung Ch'a-ch'iu to retreat precipitately. The remnants of the invading army were captured by the Japanese; it is said that of 140,000 invaders, fewer than one in five made good their escape. The defeat of the Mongol invasions was of crucial importance in Japanese history. The military expenditure undermined the economic stability of the Kamakura government and led to the insolvency of many of the military vassals. It led to another prolonged period of isolation from China that was to last until the 14th century. Moreover the victory gave a great impetus to a feeling of national pride, and the Kamikaze (Divine Wind) that destroyed the invading hosts gave the Japanese the belief that they were a divinely protected people.

Samurai groups and farming villages. The Japanese feudal system began to take shape under the Kamakura *bakufu.* At its inception in the Kamakura (1192–1333) and Muromachi (1338–1573) periods, Japanese feudalism presents a different appearance from that of later eras. In the earlier periods feudal warrior-landlords lived in farming villages and carried on agriculture themselves, while the central civil aristocracy and the temples and shrines held huge public and private estates in various provinces and wielded power comparable to that of the *bakufu.* These estates were, in reality, managed by influential resident landlords who had become warriors. They were often the original developers of their districts, becoming officials of the provincial government, agents of the private estates, and military stewards appointed by the *bakufu.* As leaders of a large number of villagers, they laboured to develop the rice fields and irrigation works in the areas under their jurisdiction, and they and other influential landlords constructed spacious homes for themselves in the villages and hamlets where they lived.

Among these were some who were military vassals of the shogun and others who were connected to the aristocracy or the temples and shrines. The military vassals owed their loyalty to the shogun, for whom they performed public services such as guard duty in Kyōto, where the emperor lived with his court. In return, the shogun not only guaranteed these men the traditional landholdings but rewarded them with new lands. This connection between lord and vassal, on which grants of landownership or management were based, gave Japanese society a distinctly feudal character.

The samurai served on the battlefield and in times of peace engaged in hunting and training in the military arts, nourishing a rugged and practical character. The *kyūba no michi* ("the way of the bow and horse"), the samurai ideal of chivalry, grew out of this daily training and the experience of actual warfare. Pride of family name was especially valued, and loyal service to one's overlord became the fundamental morality. This was the origin of the more highly developed code of Bushidō, or Way of the Warrior, of later ages.

The status of women in the samurai families was comparatively high; they were allowed to inherit a portion of the estates, a practice that gradually came to be restricted.

Economic changes in the Kamakura period

After the middle of the Kamakura period, the farming villages in which the warriors resided underwent changes as agricultural practices advanced, and other aspects of society were changing as well. Artisans were usually attached to the proprietors of the private estates and progressively became more specialized along with the growth of consumer demand. Centres for metal casting and metalworking, paper manufacture, and other skills appeared in the localities. The exchange of agricultural products, manufactured goods, and other products thrived; local markets, held on three fixed days a month, became common. Copper coins from Sung (960–1279) China circulated in these markets, while itinerant merchants increased their activity. Bills of exchange were also used for payments to distant localities. In the large ports, specialized wholesale merchants appeared who were called *toimaru.* They served as contractors who stored, transported, and sold goods. Further, it was common for many merchants and artisans to form guilds, known as *za,* organized under the temples, shrines, or civil aristocrats. Such guilds, which resembled European trade guilds in the Middle Ages, gained special monopoly privileges and exemptions from customs duties.

Kamakura culture: the new Buddhism and its influence. During the Kamakura period the newly arisen samurai class came to dominate the ancient civil aristocracy, which continued to maintain the classical culture. Vigorous overseas trade fostered the transmission of Zen Buddhism (in Chinese, Ch'an) and Neo-Confucianism from Sung China. Chinese influences were seen in monochrome painting style (*suiboku-ga*), forms of architecture, certain skills in pottery manufacture, and the custom of tea drinking—all of which assisted the formation of the samurai culture and exerted an enormous influence on everyday life.

Introduction of Zen sects

In matters of religion, the great social changes that took place between the end of the Heian period and the early Kamakura period caused the people to demand a simple standard of faith, in place of the complicated teachings and ceremonies of the ancient Buddhism. The warriors of the farming villages, in particular, demanded a religion that would suit their personal experience. Several new Buddhist sects sprang up which eschewed difficult ascetic practices and recondite scholarship. Among these may be included the Jōdo, or Pure Land, sect and its offshoot, the Shin (True) school. The Zen school sought to open the way to insight by self-effort; hence, it met with a ready response, satisfying the demands of the samurai. At the same time, scholarship and the arts were still deeply linked with esoteric Buddhism, which was a vigorous influence even in Shintō circles (see BUDDHISM).

In scholarly and literary circles, the civil aristocrats of Kyōto confined themselves to the annotation and interpretation of the ancient classics and to the study of precedents and ceremonies. But at the beginning of the Kamakura period, a brilliant circle of waka (poems of 31 syllables) poets gathered around the retired emperor Go-Toba, and an Imperial selection of poems entitled the *Shin kokin wakashū* was compiled. The waka of this period is characterized by the term *yūgen,* which may be described as a mood both peaceful and profound.

Just before the Jōkyū Disturbance the monk Jien (posthumous name Jichin) completed his *Gukanshō* ("Jottings of a Fool"). This is the first work of historical philosophy in Japan, and it provides a comprehensive picture of the rise and fall of political powers from the Buddhist viewpoint. Meanwhile, with the rise of the samurai style of life, warriors with a love of scholarship and a delight in waka poetry appeared. One was Hōjō Sanetoki, who collected Japanese and Chinese books and founded a famous library, the Kanazawa Bunko, in the Shōmyō-ji (at what is now Kanazawa). Military epics became popular. The most famous that has come down to us is the anonymously written *Heike monogatari* (*The Tale of the Heike*). They were recited throughout the country by Buddhist troubadours called *biwa hōshi.* After the middle Kamakura period, as Buddhist pessimism grew fainter, various kinds of instruction manuals and family injunctions were composed, while collections of essays such as Yoshida Kenkō's *Tsurezure-gusa* (*Essays in Idleness*) also made their appearance. The new nationalistic fervour found expression in Kokan Shiren's *Genkō shakusho* (1332), a 30-volume history of Buddhism in Japan.

Impact of military on the arts

In the visual arts the carving of wooden images of famous monks flourished, and, after the middle of the Kamakura period, Chinese styles of the Sung dynasty also began to enter Kamakura wood carving. In painting, in addition to Buddhist themes, picture scrolls (*emaki-mono*) became popular, taking as their themes the history of temples and shrines, the biographies of founders of the sects, and military epics.

Decline of Kamakura society. In the later Kamakura period occurred the breakdown of family solidarity among the samurai (see below).

During the troubled state of society at the end of the period, feudal landlords, out of the necessity of defending their own lands, seem to have devoted themselves chiefly to the military arts and to have entrusted the running of agriculture to their household dependents. Moreover, lands were no longer divided among younger sons but were now kept entirely in the hands of the eldest son. Power thus became concentrated in the head of the household, to whom other family members were subordinated in a lord–vassal relationship.

At the same time, major economic changes began to undermine the position of the *bakufu* vassals. Yet, despite the social crises among the landholders, trade was flourishing. Coins came into increasing circulation, and city styles of living began to be imitated in the country. But the landowners were often unable to meet their expenditures from the income of their limited holdings. Therefore, they borrowed money at high rates of interest from rich moneylenders, and many were forced to surrender their holdings when unable to repay their loans. Thus the gap between rich and poor became marked among the shogun's vassals. In particular, the local military governors, who had the right to raise troops, progressively gained control over the resident landlords, establishing a lord–vassal relationship with them. Moreover, deputies sent out by the heads of families to oversee their distant landholdings often broke with the main family and became vassals of the military governors. This powerful new class of local magnates was called daimyo (domain lords) and soon began to challenge the authority of the Hōjō regents in the *bakufu.*

The Ashikaga, Sasaki, Shōni, and Shimazu families were among the most powerful of the new class. The *bakufu* began to totter, shaken by the disputes between the Hōjō family and the rival military governors. When the Andō family raised a revolt in Mutsu Province at the end of the Kamakura period, the government found it difficult to suppress, partly because of the remoteness of the site of the uprising. In addition, regional unions of small landlords developed in the Kinai (the five home provinces centred around Kyōto).

Taking advantage of the accumulating weaknesses of the *bakufu,* a movement arose among the civil aristocracy to regain political power from the military. The occasion was provided by the question of the Imperial succession. In the mid-13th century there emerged two competing lines for the succession—the senior line centred on the Jimyō-in in Kyōto and the junior line centred on the Daikaku-ji on the western edge of the city. In the last half of the century, each side sought to win the support of the *bakufu.* In 1317 the *bakufu* proposed that the two lines serve by turns as emperor, but the dispute did not cease. Finally, in 1318 Prince Takaharu of the junior line acceded to the throne as the emperor Go-Daigo.

Dispute over the succession

The Muromachi (or Ashikaga) shogunate (1338–1573). *The Kemmu Restoration and the dual dynasties.* On the accession of Go-Daigo, the retired emperor Go-Uda broke the long-established custom and dissolved the "cloistered" Imperial government. As a result, the entire authority of the Imperial government was concentrated in the hands of a single emperor, Go-Daigo. A party of young reforming court nobles gathered around the Emperor, who revived the Kirokusho (Records Office) and strove to renovate the government. But to realize his ideal of a true Imperial restoration, it was necessary for Go-Daigo to rid himself of the interference of the *bakufu.* His plans for its overthrow were discovered, however, and he was arrested and exiled to Oki Island. But in the Kinai area, local leaders, supported by militant Buddhist monks, raised an army to overthrow the *bakufu.* The Imperial forces were led by Prince Morinaga and Kusunoki Masashige, but the decisive victory was brought about by the powerful Kantō families of Ashikaga Takauji and Nitta Yoshisada, discontented vassals of the Hōjō family. In 1333 Takauji successfully attacked the Hōjō headquarters and forced the *bakufu* leaders to commit suicide. Yoshisada meanwhile conquered the *bakufu* in Kamakura. Thus, after 140 years' rule, the *bakufu* government was brought to an end.

Overthrow of the Kamakura *bakufu*

The return of Go-Daigo to Kyōto in 1333 is known as the Kemmu Restoration (Kemmu no Chūkō). The Emperor immediately set about to restore direct Imperial rule. He abolished the powerful office of *kampaku* and set up a central bureaucracy. He established the Kirokusho to settle lawsuits in the provinces; the Zassho Ketsudansho (Court of Miscellaneous Claims) to handle minor suits; and a *musha-dokoro* (guard station) to keep order among the warriors in Kyōto. He placed Prince Morinaga in charge of his military forces and set up members of the Imperial family as provincial leaders in the north and east.

Those local warriors, however, who had joined the Imperial forces in the overthrow of the *bakufu* were disappointed in the division of the spoils. A rebel army formed under the leadership of Ashikaga Takauji, and in 1336 it drove the Emperor from Kyōto. Takauji set up an emperor from the senior Imperial line (the Jimyō-in), while Go-Daigo and his followers set up a rival court in the Yoshino Mountains near Nara. For the next 60 years political power was divided between the Southern Court in Yoshino and the Northern Court in Kyōto. It remained for Takauji's grandson Yoshimitsu to establish peace (1392) between the two courts; thereafter, the Imperial succession remained with the descendants of the Northern Court. Throughout the long dispute, however, local warriors attached themselves to the military governors, who increasingly asserted their independence from the declining central authority.

Division of Northern and Southern courts

The establishment of the Muromachi bakufu. After the withdrawal of Go-Daigo to Yoshino, Ashikaga Takauji set up a *bakufu* at Nijō Takakura in Kyōto. But in 1378 Takauji's grandson, the shogun Yoshimitsu, moved the *bakufu* to the Muromachi district in Kyōto, where it remained and took final shape. Yoshimitsu, assisted by the successive *kanrei* (deputy shogun) Hosokawa Yoriyuki and Shiba Yoshimasa, gradually overcame the great military governors. He destroyed the Yamana family in 1391, and in 1399, with his power further enhanced by his success in uniting the Northern and Southern courts, he attacked and destroyed the great military governor Ōuchi Yoshihiro, thus gaining control of the Inland Sea. Yoshimitsu was now raised to the highest office of grand minister of state, or *dajō-daijin.* He constructed the famed Golden Pavilion (Kinkaku-ji; see below *The establishment of military culture*) at his country seat in Kitayama, taking great pride in its luxurious display; he also carried on trade and diplomacy with Ming dynasty China under the title of king of Japan.

The Muromachi *bakufu* inherited almost unchanged the structure of its Kamakura predecessor (see above), setting up a Mandokoro, Monchūjo, and Samurai-dokoro. But after the appointment of Hosokawa Yoriyuki as *kanrei* (deputy shogun), this post became the most important in the *bakufu* government. The official business of the Mandokoro was to control the finances of the *bakufu;* and later the Ise family, who were hereditary retainers of the Ashikaga, came to inherit this office. The Samurai-dokoro, besides handling legal judgments, was entrusted with the control of the capital. Leading officials called *shoshi* who held the additional post of military governor of Yamashiro Province (Kyōto Prefecture) were next in importance to the *kanrei.* In local administration, a special administrator was set up in Kamakura to control the 10 provinces of the Kantō area. This office came to be held by heads of the Ashikaga Motouji family. The 11 provinces of Kyushu were controlled by an office known as the Kyushu *tandai.*

Structure of the Muromachi *bakufu*

The finances of the Muromachi *bakufu* could not be met simply from its receipts from the lands under its direct control. So, according to their needs, the military governors and stewards of each province were ordered to levy a money tax, on either every unit of land or every household, but this was not fully effective. As a result, taxes were levied from such dealers as pawnbrokers, and sake brewers, who were among the wealthiest merchants of the time. Financial deficiencies were also supplemented by engaging in trade with China. But the foundations of this *bakufu* began to be shaken by the increasing power of the military governors and by the frequent uprisings of local samurai and farmers.

In the Kamakura period, the authority of the military governors was limited to security matters. In the latter half of the Northern and Southern courts period, their executive power over the areas under their control was increased. As disturbances increased, they gained wide powers of military command. Sometimes the private estates were made depots for military supplies on the pretext of protecting them from the depredations of the samurai, and half their yearly taxes were given to the warriors. This was called the equal tax division, or *hanzei.* Many military governors succeeded to their domains by inheritance, and in cases such as that of the Yamana family a single military governor sometimes held a number of provinces. Thus arose a new class of official known as the *shugo* daimyo.

From the outset, the controlling power of the Ashikaga *bakufu* was weak, and, especially after the death of Yoshimitsu, the tendency for powerful military governors to defect became marked. Hence, as time passed the office of shogun became increasingly impotent.

The rise of commerce and manufacturing

In the villages around Kyōto, the status of farmers rose markedly as agriculture became more highly developed, and commerce and small-scale manufacturing prospered. Also, confederations of the middle and small landlords, or *myōshu,* proceeded apace and often resulted in uprisings. Such confederations appeared where farming by the greater *myōshu* had dissolved and middle and small *myōshu* had established themselves on a wide scale. These smaller landlords endeavoured to defend themselves against the ravages of local warfare, and they formed unions to manage the forests in common and to maintain irrigation works. In such confederations, a leader called the elder, or *otona,* would be selected to carry on village government. Assemblies were held regularly among its members at the village shrine or temple, and regulations were drawn up for the maintenance of the community life.

As self-government became strong in the communities, the resistance of farmers became fierce. After the northern and southern courts dispute, armed uprisings arose among the farming villages, demanding reductions in yearly taxes against the old proprietors and a moratorium on debts owed to the moneylenders. A large-scale uprising of this kind took place in 1428 in the last years of Yoshimitsu's reign. In 1429 an uprising broke out in Harima Province (present Hyōgō Prefecture) aimed at the expulsion of the warriors from the province. In 1441 farmers living around Kyōto attacked the pawnbrokers and demanded a moratorium on debts from the *bakufu.* Thereafter, uprisings occurred on a greater or lesser scale almost yearly—testimony to the fading power of the *bakufu.*

The *kangō* trade

Trade between China and Japan. Trade with Ming dynasty China began after the suppression of Japanese piracy. Ashikaga Takauji had sent ships of the Tenryū-ji to trade with the Yüan dynasty. But trade then ceased on account of the internal disturbances, and pirates from the maritime districts of west Japan raided the Korean peninsula and the continental mainland. When Korea came under the control of the Yi dynasty and when the Ming dynasty emerged in China, it requested the *bakufu* to open formal trade relations with the aim of suppressing piracy. Yoshimitsu, both in response to the desires of the merchants and in order to supplement the finances of the *bakufu,* began formal trade relations with Ming China and Korea, repatriating a large number of Chinese who had been taken captive by the pirates. In response, the Ming also began to trade, but under the form of tribute from Yoshimitsu, "King of Japan," to the Emperor of China. In this trade, in order to distinguish between pirate ships and trading ships, seals received from the Ming called *kangōfu* were used. Hence the use of the term *kangō* trade.

The profits of this trade were important to the *bakufu,* but later the control of this trade came into the hands of the Hosokawa and Ōuchi families, under whose protection trading merchants became active in Hakata, Hyōgo, and Sakai. After the Ōnin War (see below), the Ōuchi controlled this trade, but on their destruction the *kangō* trade ceased and piracy again became rife. Trade with Yi dynasty Korea was carried on through the agency of the Sō family of Tsushima, and various domain lords and the merchants of Hakata were actively involved in it, importing cotton and other goods. Japanese traders resided in Pusan and elsewhere in Korea. Also included in the trade with China and Korea were goods imported by Japanese merchants from the Ryukyu Islands, lying between Japan and Taiwan, and dye materials, pepper, and other special products from the South Seas.

Edicts for cancellation of debts

The Ōnin War (1467–77). In the reign of the shogun Ashikaga Yoshimasa a general civil war broke out in the area around Kyōto, caused by economic distress and by a dispute over the Imperial succession. Indeed, severe famines engendered rebellion nearly every autumn, and it is said that during his term as shogun Yoshimasa issued 13 edicts for the cancellation of debts known as *tokuseirei,* or "acts of grace." Lacking children of his own, Yoshimasa at first proposed that his younger brother should succeed him. But when he later fathered a child a quarrel arose over the succession for control of the family. The two chief administrators, Shiba and Hatakeyama, and the great military governors also took sides in the power dispute, with Kosokawa Katsumoto and Yamana Sōzen (also known as Yamana Mochitoyo) at the head. In 1467, the first year of the Ōnin era, fighting broke out between the eastern army of the Hosokawa party and the western army of the Yamana party. The eastern army had the advantage of the support of both the Emperor and the shogun, but the western army, assisted by the Ōuchi family, recovered its power, and fighting continued for 11 years, centred on Kyōto. Destruction around Kyōto was severe, and many large temples and residences were burned. After 11 years of warfare, the fighting spread to the provinces. As a result, the farming villages held conferences and quite frequently mounted armed uprisings in self-defense. The leaders of these armed uprisings were local samurai with roots in the farming villages. Such men frequently established themselves as domain lords (daimyo) during the war disturbances. They formed associations and often mounted uprisings that extended over a whole province and challenged the great military governors. In the autumn of 1485, 36 representatives of the local warriors of southern Yamashiro Province met in the Byōdō-in (Byōdō Temple) at Uji and successfully demanded the withdrawal of the two Hatakeyama armies. As a result, the southern Yamashiro area became self-governing for more than eight years.

In these wars, the civil aristocracy and priests lost the income from their private estates. Many of them left the capital, moving to Sakai or Nara or even taking up residence in the castle towns under the protection of local domain lords. This migration assisted in the diffusion of the central culture to the localities. Old traditions were destroyed, but from the ashes a new culture was born.

The shogun Ashikaga Yoshimasa, for example, finally turned his back on a troubled world and set up a country residence in the Higashiyama ward of Kyōto, where he lived in elegance and refinement, paying no attention to matters of government. The political power of the *bakufu* thus became virtually extinct, and real power came into the hands of the chief administrators of the Hosokawa (1490–1558) family. In the 16th century this power then came into the hands of their retainers, the Miyoshi (1558–65) family, until it was finally usurped by their own retainers, the Matsunaga (1565–68) family.

The period of the "Warring Country." *The emergence of new forces.* After the Ōnin War, the power of local leaders became increasingly strong, and there were many instances in which the deputies of military governors usurped the domains of their superiors, retainers overthrew their overlords, and branch families seized power from main families. Because of this tendency for "inferiors to overcome superiors" (*gekokujō*), the previous military governors almost completely disappeared from Kyōto and the surrounding provinces; a new type of domain lord, called *sengoku* ("warring country") daimyo, took their place.

Until the first half of the 16th century, domain lords in the various localities were thus building up strong military bases. During this period, the provinces held by the domain lords were almost completely free of *bakufu* control. The domain lords included the local leaders among their retainers, taking away their independence by enforcing land surveys and directly controlling the farming villages. Domain lords such as the Imagawa, Date, and Ōuchi issued their own laws called *bunkoku-hō.* These provincial laws, while drawing on the samurai laws of the Jōei Formulary and thereafter, also included regulations for farmers, and they applied strict controls over retainers. It was made a principle that inheritance by retainers should be restricted to the main heir alone, and the overlord's permission was necessary for his vassals to inherit property or to marry. In the farming villages the domain lords, in addition to carrying out land surveys, built irrigation dikes and opened new rice fields. In order to concentrate their power they also readjusted the disposition of local fortified strongholds, gathered their retainers into castles, and reorganized roads and post stations to centre on their castle towns.

Growth of cities and trade

Commerce and towns made marked development at this time in Japan's history. Markets also came to be held six times a month and were set up all over the country. Despite the obstructions of the customs barriers, the products of all the districts were available in these markets. In large cities such as Kyōto, commodity exchange markets were set up to handle huge quantities of rice, salt, fish, and other goods; wholesalers, or *toiya,* specialized in dealings with distant areas. The circulation of coined money also became vigorous, but in addition to the various kinds of copper coin imported from China of the Sung, Yüan, and Ming dynasties, privately minted coins also circulated within the country, giving rise to confusion of exchange rates. The *bakufu* and domain lords issued laws to prohibit people from hoarding good coins but without effective results. The guilds now showed a strong monopolistic tendency in order to protect themselves against new-style merchants who emerged while new guilds were set up in the castle towns (*jōka-machi*) under the direct control of the domain lords. Among the cities of the time, next to Kyōto and Nara, Uji and Yamada outside the gates of Ise-jingū (Ise Shrines) flourished. Besides these, towns grew up around the castles of the domain lords, such as Naoetsu of the Uesugi family, Yamaguchi of the Ōuchi family, Ichijōdani of the Asakura family, and Odawara of the later Hōjō. As the castles of the domain lords were moved from mountain fortresses to strongholds in the plains, markets were opened outside the castle walls, and merchants and artisans gathered there to live. Harbour towns (*minato machi*) such as Sakai, Hyōgo, and Onomichi on the Inland Sea, Suruga and Obama on the Japan Sea, and Kuwana and Ōminato on Ise Bay also flourished as exchange centres. Sake brewers, brokers, and wholesale merchants were leading townsmen (*machi shu*), and town elders, called *otona,* were chosen to carry on local government through assemblies. In the trading port of Sakai, for example, an assembly of 36 men drawn from the wholesale guilds carried on the city government. They maintained soldiers and constructed moats and other defenses, and while profiting from the confrontation of the domain lords, they resisted their domination. The Jesuit missionaries (see below) compared Sakai to the free cities of Europe in the Middle Ages and described its flourishing condition in their reports.

The arrival of the Europeans. As the warring domain lords carved out their territories, the central authority ceased to maintain control over overseas trade. Further, Japanese marauders in association with Chinese pirates again became active. At this time, the Spanish and Portuguese made their appearance in the archipelago. In 1543 (according to Japanese sources), the first Portuguese were shipwrecked on the island of Tanega, off southern Kyushu. These were the first Europeans to arrive in Japan, and the art of musket construction they passed on at this time immediately spread to Sakai and other places.

The Jesuit missionaries

In 1549 the Jesuit missionary Francis Xavier arrived in Kagoshima. After missionary work for two years and three months, he left Japan, and thereafter Jesuit missionaries arrived continuously. The missionaries made use of the trade from the Portuguese ships to propagate Christianity, and there were cases in which merchant ships would not enter the ports of domain lords who did not show good will toward missionary activity. Thus, domain lords, seeking the profits of foreign trade and the acquisition of military equipment and supplies, progressively protected Christianity, until finally some domain lords even became Christian converts. Three Kyushu Christian lords—Ōtomo Sōrin, Arima Harunobu, and Ōmura Sumitada—sent an embassy to Rome. Farmers also increasingly became converts under the influence of the social relief work and medical aid that accompanied missionary activity.

The establishment of military culture. While absorbing the traditional culture of the civil aristocracy, the military families that established themselves in Kyōto also introduced the continental culture of the Sung, Yüan, and Ming dynasties, especially the culture associated with Zen Buddhism, thus fashioning a new military family culture. This began with the golden age of the shogun Ashikaga Yoshimitsu at the end of the 14th century. In this period, scholarship and the arts flourished in the five Zen monasteries of Kyōto under the patronage of the shogun. Renga (linked verse) and Nō drama became vigorous. The essence of this culture finds concentrated expression in the Golden Pavilion in Yoshimitsu's country estate at Kitayama. Destroyed by an arsonist in 1950 and rebuilt in 1955, it is now officially the Rokuon-ji (Rokuon Temple) in northwestern Kyōto. Facing a garden of refined elegance, the Golden Pavilion is built in the Japanese *shinden* style (an ecclesiastical style with Zen influence) in its first and second stories, while its upper story is in the *kara* ("Chinese") style of the Zen school. Thus Kitayama culture, while absorbing Zen influences from China, shows many influences of the native aristocratic culture. In the time of the shogun Yoshimasa, the samurai culture, in addition to even deeper Zen taste, shows a refined appreciation of simplicity and quiet profundity. The Silver Pavilion (Ginkaku-ji) and its garden built by Yoshimasa on his country estate at Higashiyama (now part of the Jishō-ji) displays the essence of this polished Higashiyama culture. While adopted by the local domain lords, Higashiyama culture also gave rise to a new culture centred on the townsmen of Kyōto and Sakai, and it is the forerunner of the Azuchi-Momoyama and Edo cultures.

Increasing temporal role of the monasteries

In Buddhism, the ancient great temples like the Enryaku-ji became mere shadows of their former greatness with the diminution of their landed estates. Since the Kamakura period, the Rinzai sect had been linked to the upper military families. The Muromachi shogunal family (the Ashikaga) gave special protection to the group of the priest Musō Soseki of this sect, which flourished in the Gozan monasteries (the five most important Zen monasteries) in Kyōto. The monks of the Gozan became advisers to the *bakufu* in government, diplomacy, and culture; they studied the Neo-Confucian philosophy of Chu Hsi that came from China along with Zen, published books, and wrote poetry and prose in the Chinese style. But the five monasteries became vulgarized because of their excessive links with the political world, and they ceased to prosper as the *bakufu* declined. In contrast, the Myōshin-ji and Daitoku-ji groups arose, and the latter is famous for the monk Ikkyū, who propagated his own teaching. At this time Rennyo (1415–99) of the Shin (True) sect of Jōdo (Pure Land) Buddhism came forth from the Hongan-ji in Kyōto, teaching his principles in simple phrases and spreading the faith by organizing groups called *kō.* He came under persecution from the Enryaku-ji, however, and he fled to Echizen Province, establishing a school of instruction at Yoshizaki. He then moved to Settsu Province, where at Ishiyama (now a part of Ōsaka) the Hongan-ji achieved its golden age. While also persecuted, the Hokke (Lotus) sect progressively gained adherents among the warriors and merchants. At this time, the custom of pilgrimages to the holy places of the Buddhist deity Kannon, to the Shintō shrines at Ise, and to the summit of Mt. Fuji also became popular. Within this trend, a worldly Shintō belief arose, and in the 15th century the scholar Yoshida Kanetomo, while proclaiming Shintō principles, also took the occasion to free Shintō shrines from Buddhist control; he believed that only a deep religious faith could cure the people of their despondency. In the arts the Nō drama developed in the Kamakura period under the influence of agricultural festival dances, and guilds (*za*) were formed to serve at the ceremonies of temples and shrines and at funeral services. From among the four guilds attached to the Kōfuku-ji and the Kasuga Shrine of Yamato Province (present Nara Prefecture), the father and son Kan'ami and Zeami Motokiyo appeared; under the patronage of the shogun Yoshimitsu, they laid the foundations for a flourishing Nō drama, establishing the guidelines for performance and bequeathing many texts. *Kyōgen* (dialogue plays with dance), which developed from the comic elements of an older form of entertainment called *sarugaku,* were performed in the intervals of Nō drama; taking their topics from the everyday life of the common people, *kyōgen* were widely appreciated by them. Traditional Japanese waka verse was also composed, but renga (linked verse) became ever more popular and was enjoyed by the warriors and the common people. After a time, however, renga became overly formal, as the waka did, and lost its freshness; hence, the free-style verse called haikai was born.

Developments in architecture and the visual arts

Along with the prosperity of Zen, the *shoin* style of building closely connected with this school was widely adopted by the military families and civil aristocrats in the construction of their residences, becoming the foundation of present-day domestic architecture. The *shoin* was originally a room in which monks read the Buddhist scriptures. In constructing the *shoin,* an entrance called a *genkan* is built, while within the room straw mats called *tatami* are laid out, paper-covered sliding partitions are used, and an alcove and shelves at different levels are set up. The custom of hanging a monochrome painting in the alcove and placing flowers or an incense bowl before it also arose at this time. In gardens, a delight was first taken in adding the Zen mood of retreat from the world to the *shinden* style, making symbolic use of streams, flowers, and bushes. Later, even more symbolic gardens were constructed using arrangements only of stones, raked sand, and gravel. The carving of images of the Buddha and the Buddhist paintings that had flourished in the Kamakura period now declined, as did the ancient sects themselves, and new ones arose. *Yamato-e* painting also declined, and the picture-scrolls lost their freshness. On the other hand, with the increase of interest in Zen, monochrome painting in the Sung and Yüan style was begun by the monks of the Gozan. In the time of Yoshimasa, the great painter Sesshū broke away from imitation of Chinese models and opened new frontiers in monochrome paintings. The father and son Kanō Masanobu and Kanō Motonobu introduced the gentle models of *Yamato-e* to monochrome painting and became the founders of the succeeding Kanō school. Tea drinking, introduced from Sung China by the Buddhist priest Eisai in the Kamakura period, spread to the warriors and the common people in the northern and southern courts period. In particular, in the time of the shogun Yoshimasa, Jukō came from Nara and began the *wabi-cha* form of tea ceremony by bringing together the *cha-no-yu* of the civil aristocracy and the *cha yoriai* of the common people. This new form spread among the warriors and great merchants and was further purified by the Sakai merchant Jōō. Together with the development of the tea ceremony, new forms were brought about in the construction of tearooms, flower arrangement, pottery, and Japanese cakes. Higashiyama culture became further diffused among the common people, and as the livelihood and education of the merchants and artisans of the cities reached higher levels they enjoyed Nō and *kyōgen* dramas, the tea ceremony, and renga. Fairy stories were also widely enjoyed, being easy to read, and included stories that had been related among the people since ancient times. These became popular not only among the children of the civil aristocracy and warriors but also among those of the townsmen who were educated in temples and shrines. The local domain lords also promoted culture within their domains, enhancing their dignity as lords by building temples and shrines in their castle towns and actively introducing the culture of Kyōto.

Thus, while warfare was rife in the Kamakura and Muromachi periods, these were, nevertheless, eras that gave Japan some of its most distinctive cultural institutions.

(T.T.)

THE EARLY MODERN HISTORY OF JAPAN (1550–1850)

Unification. *The Oda regime.* In the 1550–60 period the *sengoku* daimyo, who had survived the wars of the previous 100 years, moved into an even fiercer stage of mutual conflict. These powerful daimyo were harassed not only by their mutual conflicts but also by the social development of the common people within their domains. The lords sought to resolve these contradictions by acquiring land and people to widen their domains and, finally, by trying to grasp the leadership of the whole country. To accomplish this purpose, they considered it necessary to control Kyōto, the political centre since ancient times. In the midst of these struggles, one such *sengoku* daimyo, Oda Nobunaga of Owari Province in modern Aichi Prefecture, succeeded in entering the capital as the first feudal unifier.

The first feudal unifier

On the emergence of Oda's regime, the feudal disintegration of the previous century began to show a clear tendency toward unification. Oda's bold wars of suppression, which entitled him to be called a military genius, led to a great redrawing of the political map, previously split up among the domain lords of the whole country. In the Kinai district, on which Oda's conquered territory was centred, however, he established control by dividing his new domain among his commanders. Rather than completely abrogating the long-established privileges of the temples, shrines, and local landlords (*kokujin*), he at first recognized these, regarding them as an important adjunct to the strengthening of his military power and using them as followers in the unification wars. The land surveys aimed at strengthening feudal landownership were at this stage carried out not so much to gain control over the complicated landholding and taxation system of the farmers as to define the size of fiefs (*chigyō*) of his retainers in order to confirm the extent of their military services and obligations.

The unification policy of the Oda regime was upheld by the separation of the warriors from the farmers, but it could not be fully achieved because of resistance from old political forces. Unification became more clearly established later, during Toyotomi Hideyoshi's regime.

The Hideyoshi regime. Oda was the son of an Owari domain lord, whereas Hideyoshi was the son of a farmer from the same province. Entering Oda's service, Hideyoshi was greatly esteemed for his brilliant talents, and before Oda's death Hideyoshi had become one of his most powerful commanders. After Oda's death during the Honnō-ji (a monastery in Kyōto) Incident of 1582—when his retainer and commander, Akechi Mitsuhide, rebelled against him—Hideyoshi eliminated many rivals by his superb political judgment and shrewd actions, thus firmly establishing himself as successor. In the footsteps of Oda, Hideyoshi proceeded to unify the whole country at a rapid pace, and, in 1590, all Japan—from Kyushu in the southwest to Tōhoku in the northeast—had come under his control. On the pretext of giving rewards for distinguished service, Hideyoshi gave the Kantō domain, formerly of the Hōjō family, to Tokugawa Ieyasu, causing Ieyasu to move to Edo; this was, in fact, a stratagem to remove the Tokugawa family from the Chūbu district, where its power had been nourished.

The keynote of the Hideyoshi unification policy was its firm establishment in principle of the separation of the warriors and farmers. Thus, the clear-cut contrast between feudal landowners and feudal small farmers (or serfs) became the basic model of the system.

The Taikō land survey

The Taikō land survey played an important part in this process. *Taikō* was a traditional title for former *kampaku* (chancellors), and it was assumed by Hideyoshi in 1591. The Taikō land survey was carried out over the whole country from 1583 to 1598, just before Hideyoshi's death. As a result of this survey, the complicated connections of rights to landownership that had developed since the Kamakura period were set in order. Landowning relations were now based on *kokudaka—i.e.,* on the actual product of the land. Moreover, this actual product now came within the landlord's grasp in every village, and land taxes were now levied on the village as a unit. This is called the *mura-uke,* or village responsibility, system. In addition to this definition of the rights held by the farming population, the *kokudaka* system also applied to the landholdings of domain lords (the *chigyō*) to be distributed among their retainers. In place of previous land taxes (*nengu*) assessed in money as so many hundred or ten thousand *kan* of silver, an assessment of *kokudaka* was made as so many hundred or ten thousand *koku* of rice, a *koku* representing the amount of rice consumed by one person in one year; the amount was also used as a standard on which military services were levied in proportion.

During the Taikō land survey, a land-survey register was drawn up in every village, and farmers so registered were recognized in their rights as cultivators to the extent of the land thus registered; in return they were bound to pay land taxes in rice and forbidden to neglect the cultivation of their fields or to move elsewhere. Farmers were thus reduced to rural serfs, tied to the land, and exploited. The promulgation of an order of social-status control in 1591 prohibited people who neither cultivated the land nor performed military service (*i.e.,* the artisans and merchants) from residing in the villages, showing a further advance from the separation of the warriors and farmers to a feudal social class system of warriors, farmers, artisans, and merchants. The order of "sword hunt" (*katanagari*), which took away arms from the farmers, was also an important prerequisite for this policy. By establishing the *kokudaka* system, the Taikō land survey delivered the final blow to the *shōen* system, a system of manors in medieval times, which had already greatly declined. The feudal *chigyō* system, based on the *kokudaka* system, was established throughout the country, the domain lords all submitted to the despotic control of the Hideyoshi regime, and the alliance-like relationship between Oda and the former *sengoku* daimyo changed to a clear lord-vassal relationship.

The political structure of the Hideyoshi regime was not yet fully equipped, however, to be the unified governing authority controlling the whole country. For example, the *kurairechi,* or lands under its direct control, which were the immediate financial base of the regime, amounted to about 2,000,000 *koku.* But setting aside those of the metropolitan and surrounding provinces, these lands were in many cases divided among the distant, independent domain lords (*tozama* daimyo), and the management of these lands was entrusted to them. Such lands were thus not firmly in the grasp of the regime. By contrast, the lands that later came under the direct control of the Tokugawa shogunate amounted to more than 4,000,000 *koku,* or better than double those of the Hideyoshi regime, and 80 percent of them were managed by officials known as *gundai* and *daikan,* who were direct retainers of the shogunate, with only 20 percent deposited with domain lords. This inner contradiction in the political structure of the Hideyoshi regime gave rise to internal power struggles and finally drove Hideyoshi to such reckless actions as the Korean expeditions (aggressions against Korea in 1592 and in 1597). The Hideyoshi regime collapsed on the failure of that expedition and as the direct result of Hideyoshi's subsequent death. Tokugawa Ieyasu was the strongest candidate to form the next regime.

The Matsudaira family

The bakuhan system. *The establishment of the system.* The ancestors of Tokugawa Ieyasu, the founder of the Edo *bakufu,* were the Matsudaira, a *sengoku* daimyo family from the mountainous region of Mikawa Province (in present Aichi Prefecture). The Matsudaira family had built up their base as domain lords by advancing into the plains of Mikawa. But when they were attacked by the powerful domain lords of the Oda family from the west, they were defeated, and Ieyasu's father, Hirotada, was killed. Ieyasu had earlier been sent to the Imagawa family as a hostage to cement an alliance but had been captured enroute by the Oda family. After his father's death he finally was sent to the Imagawa family and spent 12 years under detention. In 1560 Imagawa Yoshimoto was killed by Oda Nobunaga in the Battle of Okehazama, in which Nobunaga destroyed the Imagawa family and confirmed his course of unification, and Ieyasu was finally released. He returned to Okazaki in Mikawa and brought this province under his control. As Oda's ally, he guarded the rear for the advance on Kyōto, and he thereafter fought his own military campaigns, advancing eastward. By 1582 he was a powerful daimyo, possessing, in addition to his home province of Mikawa, the four provinces of Suruga and Tōtōmi (modern Shizuoka Prefecture), Kai (Yamanashi Prefecture), and southern Shinano (Nagano Prefecture).

When Hideyoshi seized the ruling power, Ieyasu at first opposed him. But he then submitted, and, rising to be the most powerful domain lord among Hideyoshi's vassals, he became chief of the five *tairō,* the highest officers of the Hideyoshi regime. After Hideyoshi's death Ieyasu won the Battle of Sekigahara in 1600, in which all daimyo in the country took part, establishing his national supremacy. In 1603 Ieyasu set up the Edo *bakufu* (more commonly known as the Tokugawa shogunate [1603–1867]) to legalize this position. Control over the domain lords was firmly exercised at this time. On the pretext of allotting rewards after Sekigahara, he dispossessed, reduced, or transferred a large number of opposing daimyo and gave the confiscated lands either to relatives and retainers of the Tokugawa family to establish them as domain lords and to increase their holdings or reserved the lands as the family's domains. In addition, Hideyoshi's son Hideyori was reduced to the position of a domain lord of the Kinki district. Two years after the establishment of the *bakufu,* Ieyasu relinquished the office of shogun to his son Hidetada, retiring to Sumpu (modern city of Shizuoka) to devote himself to strengthening the foundations of the *bakufu.* In 1615 Ieyasu stormed and captured Ōsaka Castle, destroying the Toyotomi family. Immediately afterward, the Buke Shohatto (Laws for the Military Houses) and the Kinchū Narabi ni Kuge Shohatto (Laws for the Imperial and Court Officials) were promulgated as the legal basis for *bakufu* control of the domain lords and the Imperial court. In 1616 Ieyasu died.

Completion of the *bakuhan* system

Under the second and third shoguns, Hidetada and his successor, Iemitsu, the *bakufu* control policy advanced further until the *bakuhan* system—the government system of the Tokugawa shogunate; literally a combination of *bakufu* and *han* (the domain of a daimyo)—reached its completion. By reorganizations in 1633–42 the executive of the *bakufu* government was almost completed, as represented by the offices of senior councillors (*rōjū*), junior councillors (*waka doshiyori*), and three commissioners (*bugyō*) for the temples and shrines of the country, the shogun's capital, and the treasury of the *bakufu.* Confiscations and reductions were continuously made against the domains, and wide-scale transfers also took place, distributing the strategic districts of Kantō, Kinki, and Tōkaidō among the relatives and retainers of the *bakufu,* thus keeping the "outside" (*tozama*) domain lords in check. Along with the rearrangement of the daimyo, the lands under the direct control of the *bakufu* were also increased at key points throughout the country. The most important cities and mines were also placed under direct *bakufu* control and used to control commerce, industry, and trade.

The *bakufu* also revised the Laws for the Military Houses and systematized the *sankin kōtai* (alternative attendance), by which the domain lords were required to pay ceremonial visits to Edo every other year, while their wives and children resided permanently in Edo as hostages. The *sankin kōtai* system was unique to Japanese feudalism and never appeared in European feudalism. In addition, the daimyo were forced to assist in such public works as the construction of castles in the *bakufu* domains, thus being driven into financial difficulties. The *bakufu* domains now amounted to more than 7,000,000 *koku*—about one-fourth of the whole country. Of these lands, more than 4,000,000 *koku* were under its direct control, and 3,000,000 *koku* were distributed among the *hatamoto* and *gokenin,* the liege vassals to the *bakufu.* In addition, because the *bakufu* had a monopoly of foreign trade and alone had the right to issue currency, it had considerably greater financial resources than did the domain lords. In military strength, it was also far more powerful than any individual daimyo.

In step with the structural organization of the *bakufu* as the supreme power, the domain governments of the daimyo also progressively took firm shape. The relationship between the shogun and the daimyo was linked with the lord-vassal relationship, based on the feudal *chigyō* system. The land of the whole country belonged to the shogun, who divided this among the domain lords as a special favour, or *go-on.* In return, the domain lords had a duty to provide military and other services to the shogun. This same connection existed between the domain lords and their retainers, and in order to concentrate and strengthen the ruling power of the domain lords, it was necessary for them to tighten this connection. Applying restrictions to the traditional right of the domain warriors to *chigyō,* or subdomains, retainers were supplied with rice stipends (*kuramai*) in place of *chigyō,* thus increasing their dependence on the domain lord. At the same time, this increased the lands under the direct control of the daimyo, strengthening the economic base of the domain. These were the same methods employed by the *bakufu.* In this way, a hierarchical, feudal *chigyō* system was established by means of the *koku* system, which extended from the shogun and the domain lords to their retainers. This was the fundamental condition that made possible the concentration of ruling power in the hands of superiors, the principal distinguishing feature of the Japanese feudal system.

Having been inherited from the Oda–Hideyoshi regimes, the control of the farmers, which was the main object of feudal rule, was now further strengthened. The Taikō land survey had recognized the rights of the lower-class farmers as the actual cultivators of the land and made them bear the responsibility for the payment of land taxes. While also carried out on this basis, the land surveys of the *bakufu* and the daimyo domains were much more detailed and precise in standards of survey, adopting the policy of extracting the greatest possible tax yield, limited only by the necessity for the farmers to continue to produce. The Tokugawa villages thus differed from those of the preceding ages, which had been controlled by patriarchal landlords, or *myōshu.* The Tokugawa villages were composed of a main core of feudalistic petty farmers, who went under the general title of *hombyakushō* ("farmers proper"). At the same time, the village became an administrative unit of the new feudal regime; and to carry out its functions, a system of village officers was organized in three grades—*nanushi* (or *shōya*), *kumigashira,* and *hyakushōdai.* The inhabitants of the towns and villages of the whole country were required to form *gonin-gumi* ("five-household groups"), or neighbourhood associations, to foster joint responsibility for tax payment, to prevent offenses against the laws of their overlords, to provide one another with mutual assistance, and to keep a general watch on one another. The so-called outer economic controls over farmers were further strengthened: farmers were strictly prohibited from buying and selling land, from abandoning their land, or from changing their occupation; minute restrictions were also applied to keep their clothes, food, and houses as simple as possible. The Keian no Ofuregaki ("Proclamations of the Keian era") was promulgated by the *bakufu* in 1649, a compendium of *bakufu* policies toward rural administration.

Control of the villages

The enforcement of national seclusion. The 1630s also marked an important dividing line in foreign relations with the enforcement of *sakoku,* or national seclusion. The path toward seclusion had been prepared during the formation process of the *bakuhan* system. The seeds of this policy had been sown in trade control and in measures against Christianity by the Oda-Hideyoshi regimes. Driven on by his consciousness of Japan as a "divine country" in his position as feudal overlord, Hideyoshi, though strongly attracted to trade as a source of national wealth and military strength, had issued an order for the exclusion of the missionaries. Ieyasu, even more strongly attracted by profits, made efforts to trade not only with the Portuguese Catholics but also with Protestant Holland and England, protecting trade with the southern regions by granting special licenses, or *shuin-jō* ("red-seal license"), to oceangoing merchant ships. But Ieyasu's encouragement of trade was above all aimed at establishing a *bakufu* trade monopoly. In 1604 a special system for the purchase of silk was established, and the Chinese silk imported to Japan by Portuguese ships was sold at fixed prices to the powerful merchants of Kyōto, Sakai, and Nagasaki, who formed a guild and then distributed this silk to the domestic retail merchants. Moreover, under the name of "emperor's silk" (*go-yō ito*), Ieyasu enjoyed a preferential purchase of a part of the imported silk prior to the said guild's treatment and reaped a huge profit on releasing this to the domestic markets.

As a result of his eagerness for trade, it was natural for Ieyasu to be generous to the propagation of Christianity. But Ieyasu feared that the Christians would link up with the Toyotomi family to resist the *bakufu,* and he took steps to prohibit Christianity before his destruction of the Toyotomi family. Decrees prohibiting Christianity were promulgated in 1612 and 1614, and the persecution of its adherents began immediately thereafter. This persecution became much more severe during the reigns of Hidetada and Iemitsu, until finally it became official policy to stamp out Christianity even at the sacrifice of trade. This policy became manifest with the seclusion orders of the 1630s. Thus, in 1635 Japanese were forbidden to make overseas voyages or to return to Japan from overseas, which was a severe blow to traders.

In 1637, in resistance to heavy taxes and the prohibition of Christianity, an uprising took place in the Shimabara Peninsula of Kyushu, consisting of farmers led by masterless Christian samurai. For five months they put up a fierce fight against the *bakufu* army. Having suffered this bitter experience, known as the Shimabara Rebellion, the *bakufu* thereafter stepped up its strict controls on Christians and attempted to root them out by such means as *fumi-e,* in which one was required to trample on an image of Christ or the Virgin Mary. The system of registration at Buddhist temples, or *teraukeseido,* was begun, and all the inhabitants of the country had to belong as parishioners to a parent Buddhist temple, called a *danna-dera* ("family temple"), which every year had to guarantee that the parishioner was not a Christian. In 1639, when Portuguese ships were forbidden to visit Japan, the seclusion orders were fully effective both in name and reality. The Dutch and the Chinese were allowed to trade as before, but this trade was restricted and was confined to the island of Dejima at Nagasaki. Iemitsu also allowed a certain amount of trade with Korea and the Ryukyu Islands.

The Shimabara Rebellion

Various views exist as to the influence of national seclusion on the Japanese, but the depth of its impact was probably without parallel in Japanese history. It is an undeniable fact that the vigorous desire of the Japanese to expand overseas prior to the seclusion policy was thenceforth diverted into a negative national character known as *shimaguni konjō,* or insularity. While the seclusion policy was useful in enabling the Tokugawa shogunate to exercise an enduring and stable political dominance for nearly 300 years, this simply resulted in the long continuation of a rigid feudal system to an extent unknown elsewhere in the world. Industry developed and gave rise to a unique popular culture, but it was a limited Japanese feudal culture with no international characteristics.

Status distinction system. Thus, the *bakuhan* system was firmly established in the second half of the 17th century, as determined by domestic and foreign conditions. This establishment of a feudal class structure of warriors, farmers, artisans, and merchants (*shi-nō-kō-shō*) was truly the final consummation of the *bakuhan* system. Distinctions between the statuses of warriors, farmers, artisans, and merchants were strictly enforced, but the distinction between the warriors and the other three statuses was especially strict. Forming barely 7 percent of a total population estimated at 30,000,000, the warriors levied taxes on the farmers, who formed more than 80 percent of the population and who thus provided the economic foundation of the system. To symbolize this society, the warriors wore swords in everyday life, because the system was maintained by their great military power. While peace lasted for some 250 years, it was in fact no more than an armed peace. Another special feature of this society was that, even in family relationships, absolute obedience was demanded from members of the family toward the house head (*kachō*). Among the family members, the status of women was especially low, and the idea of *danson-johi* (respect for the male, contempt for the female) was prevalent.

Relations between superiors and inferiors

The establishment of the *bakuhan* system created a need for a new world view and a system of ethics to support it. In these circumstances, the Shintō and Buddhist ideologies of early medieval society were useless. Only the morals of Confucianism, especially the Chu Hsi studies, could provide an intellectual rationalization for the status-oriented social structure of the *bakuhan* system, with its stratified feudal landowning structure headed by the shogun and its attribution of superior status to warriors over the other social classes. The feudal rulers, in particular, demanded Shushigaku ("Chu Hsi school") because, among the various schools of Confucianism, it was the most systematic as a doctrinal system. The Chu Hsi scholar Hayashi Razan was employed by the *bakufu* and was well suited to the *bakufu* foundation period. He is said to have had a hand in the drafting of all *bakufu* official documents and in the formulation of *bakufu* laws. His political ideas, as seen in his *Honchō hennen-roku* ("Chronological History of Japan") and in the *Honchō tsugan* ("Survey History of Japan"), compiled by his son Gahō, provided a historical justification for the establishment of the Tokugawa shogunate. The role of Chu Hsi studies was to repudiate the revolutionary idea of *gekokujō,* or the overthrow of superiors by inferiors, and to emphasize the idea of *kenshin,* linking this to Confucian moral conceptions. The central moral conceptions of Confucianism were *chū,* or "loyalty," and *kō,* or "filial piety." But in contrast to China, more emphasis was placed on *chū* as a support for feudal lord-vassal relations than on *kō,* which was a family ethic. Chu Hsi studies opposed the world view and logic of Christianity, which gave more importance to God than to the ruler-subject relationship and which also bitterly criticized Buddhism, which had been the ideology of the Middle Ages.

Wang Yang-ming studies (Oyōmeigaku) also held a special place in Confucian circles in the early Edo period. These studies were characterized by a strong subjective idealism, but in other aspects they had practical elements. Nakae Tōju, said to be the father of Japanese Wang Yang-ming studies, was so earnest in performing virtuous acts that he was called the sage of Ōmi. One of his followers, Kumazawa Banzan, transformed Wang Yang-ming studies from a means for individual spiritual training to a method for providing the energy for political reformation.

Commercial economy

Industries, cities, and culture. With the establishment of the *bakuhan* system, the anarchy of the earlier period ended, bringing in its wake a tendency to domestic peace. As a result, industry was promoted and cities developed. This trend took place in the latter half of the 17th century, centred in the Kinki district, where productive power was the most advanced in the whole country. Feudal petty farmers, who went under the general name of *hombyakusho,* now became widespread, and, while paying heavy taxes and performing various kinds of labour services, they sought to enjoy a better standard of living, however slight. In addition to their efforts as cultivators, they reclaimed new lands and produced various commercial crops and handicraft goods for sale in the city markets. Representative of such commercial crops were cotton and rapeseed oil in the Kinki district and silk in east Japan. Communications and transportation also developed for the circulation of such goods. But this circulation of commercial goods among the people was centred on the side roads and waterways rather than on the five great highways constructed by the *bakufu.* As a result of the development of industry and communications, such new-style merchants as wholesalers and brokers came to the fore, and powerful financiers also appeared.

As for the cities, the castle towns of the domain lords were the most numerous, but these gradually came to acquire the character of commercial cities. Purely commercial cities and post towns (towns along highways) also arose throughout the country. The cities of Edo, Ōsaka, and Kyōto, under the direct control of the *bakufu,* were especially developed. When its warrior inhabitants are included, Edo in the early years of the 18th century had a population of more than 1,000,000 and thus became the largest city in the world.

Cultural activities

In this period remarkable artists and masterpieces appeared in the fine arts and crafts. Great artists representative of the culture include Ihara Saikaku in *ukiyo-zōshi* ("tales of the floating world") genre novels, Chikamatsu Monzaemon in *jōruri* ("puppet play") drama, and Matsuo Bashō in haiku. Saikaku was a townsman who spent all his life in Ōsaka. He first aspired to write haikai—humorous renga (linked-verse) poetry from which the more serious haiku was derived—and for more than 30 years he was active as a haikai composer. One of his fortes was in *yakazu-haikai,* which was a competition to compose as many haikai as possible within a fixed period of time. Saikaku set a new record by composing 23,500 haikai in a single day and night—one verse every four seconds. In 1685 Saikaku gave up haikai and next set out to write *ukiyo-zōshi,* producing about 20 masterpieces in succession, beginning with *Kōshoku ichidai otoko* (1682; *The Life of an Amorous Man,* 1964). Between 1624 and 1643 the *ukiyo-zōshi* novel had transformed the *kana-zōshi* (storybooks written in *kana*) into an even more thoroughly townsman form of literature after the latter had replaced the previous *otogi-zōshi* ("fairy-tale books") in popularity. The unique spirit of the age can be seen in the word *ukiyo,* which had meant "sad world" in medieval times. Written with a different calligraphic character in *bakuhan* times, it now meant "floating world" and implied pleasure. The consistent aim of Saikaku's works was to depict, as accurately as possible, human desire for love and gain, taking the realistic viewpoint that "human beings are bundles of desire equipped with arms and legs." His viewpoint also contained a keen criticism of the warriors as men so bound by social status and moral principles that they could not live a free life.

Matsuo Bashō became closely attached to haiku (although the word itself was not commonly used until the 19th century) and fashioned it into up-to-date popular poetry. Bashō came from a warrior family; but after becoming a masterless samurai, or *rōnin,* he devoted himself to the development of haiku as an artistic literary form, while suffering various hardships in his means of livelihood. Bashō found the existing haikai style unsatisfying. He began writing hokku (17-syllable opening verses for renga) as separate poems, developing a new style called *shōfū* or "Bashō style." Bashō proclaimed what he called *makotono* ("true") haiku, seeking the spirit of this poetic form in sincerity and truthfulness. He also brought a new beauty to haiku by the use of small and simple words. He brought about an artistic flowering of the highbrow conceptions of medieval poetry by grafting onto them the commonplace feelings of the Tokugawa people. Rather than repudiating tradition, Bashō's haiku brought it to completion.

During the period 1592–1614 the *Jōrurihime monogatari* (a romantic ballad), drawing on the traditions of the medieval narrative story, was for the first time arranged in the form of dramatic literature accompanied by puppetry and the samisen (a lutelike musical instrument). It continued to develop until the three masters—Takemoto Gidayū as narrator, Chikamatsu Monzaemon as composer, and Tatsumatsu Hachirobei as puppeteer—made *jōruri* the representative form of Tokugawa performing arts.

The idea of *giri*

Gidayū was the son of a farmer, while Chikamatsu, like Bashō, came from a warrior family. Chikamatsu wrote more than 80 *jidaimono,* or historical dramas, and 20 *sewamono,* or domestic dramas of contemporary townsman society, both for *jōruri.* He also wrote more than 30 Kabuki plays. The chief theme running through Chikamatsu's works is the idea of *giri* (or "duty"), which is to be understood not so much as feudal morality enforced from above but rather as the traditional consciousness of honour and dignity in one's motives and position and of social consciousness in human relations. The compositions of Chikamatsu's later years seek the motif of tragedy in the fact that this *giri,* while proof of men's humanity, cannot be thoroughly achieved because of their immorality and lack of principle. Beginning with his *Shinjū ten no Amijima* (1720; *The Love Suicide of Amijima,* 1953), the leading male and female characters in his *sewamono* dramas are unable to keep the postulates of *giri* in this world and so die by *shinjū* (a suicide pact between lovers) in order to realize their love in a future life. Buddhist elements can be seen in this conclusion, as well as the unresolvable contradictions that faced the townsman in Genroku period society (1688–1703).

Kabuki also established its foundations as Tokugawa drama in this period. The *okuni* Kabuki, named for the female dancer Izumo Okuni, which had been popular at the turn of the 17th century, afterward developed from the *yūjo* Kabuki, or courtesan style, to the *wakashū* Kabuki, or young-man style. The *wakashū* Kabuki was prohibited by the *bakufu* moral censors, however, because of widespread homosexuality among its performers, and it developed into the *yarō* Kabuki style, played by adult males distinguished from the *wakashū* by shaven forelocks. At the same time, Kabuki now developed from its previous dancing-act form into a regular drama centred on a dramatic plot with realistic acting. The Kabuki was centred in the cities of Kyōto, Ōsaka, and Edo. In Kyōto and

Ōsaka Kabuki, the speciality was the *wagoto,* a drama with a pronounced comical element, centred on love, whereas the popular form of Edo Kabuki was the *aragoto,* which had developed from the *kinpira jōruri,* based on the theme of the heroic tale of Kinpira—son of Sakata Kintoki and one of the leading followers of Minamoto Yorimitsu—and adopted the manners of the *kabukimono*—the rowdy bucks of the age.

The traditional arts of Nō drama, the tea ceremony, and flower arrangement also reached new stages of development in the period. The tea ceremony (*cha-no-yu*) in particular became popular and was practiced not only by the shogun and domain lords but also by the newly risen merchants, who used their wealth to become eager collectors of tea-ceremony utensils with historical associations. As the tea ceremony became popular, many schools came into existence, including that of Sen-ke (Sen house), the school of Sen Rikyū, fostering the tendency for the art of the tea ceremony to be monopolized by the house heads of the various schools and for the profession of tea master to develop. This "house head" (*iemoto*) system gradually also spread to flower arrangement and to other arts. One result of this was to inhibit further development of these artistic forms.

Distinctive tendencies also arose in the fine arts and crafts. One representative of this is Ogata Kōrin, who brought decorative painting to completion and bequeathed to posterity many splendid masterpieces in gold lacquer (*maki-e*) and other work. The technique of dyeing and weaving was also improved, and, in Kyōto, Miyazaki Yūzen brought the splendid *yūzen-zome* (rice-paste batik method of dyeing) to completion, while the kimono became even more colourful. In Edo, Ukiyo-e drawing in traditional styles was further developed by Hishikawa Moronobu, who depicted not only the usual courtesans and actors but also vividly portrayed various aspects of the lives of ordinary people. Besides his original drawings, he used the Chinese technique of wood-block printing to satisfy popular demand. Famous centres of pottery production also arose at various places throughout the country.

Changes in ceremonies and daily customs

The old ceremonies of the Imperial court and the various forms of deportment developed in the *bakufu* were extended to the common people and shaped the manners of the cities and farming regions. Japanese customs in dress, food, and housing became established at this time. The custom changed from eating twice a day to three times a day; in the cities rice became the normal food, and a rich variety of cakes and sweets was consumed.

The weakening of the bakuhan system. On entering the 18th century, the inner contradictions of the *bakuhan* system came to the surface and began to show signs of weakness. The finance of the *bakufu* and domain lords was based on a rice-using economy, in which executives endeavoured to levy taxes—to be paid in kind, mostly in rice, centred on the yearly crop. Rice and other crops were then transported to the great central cities like Edo and Ōsaka and exchanged into money. This forced the farmer-producers to subsist at a low standard of living and to be as self-sufficient as possible, being able to purchase only iron tools, salt, medicines, and other such goods that they could not produce for themselves. Taxes, however, came to be paid in money to a fair extent, and, because farmers also wanted to widen the scale of their activities and to enjoy a more comfortable life, it was unavoidable that they would show a strong interest in commercial-goods production. But whereas rich farmers profited from commercial-goods production, the vast majority of poor farmers and peasants became more deeply impoverished as a result of their involvement in such production. Squeezed by the merchant intermediaries, who forced them to sell their products cheaply, many were forced to part with their lands.

Thus, as the commercial economy extended into the farming villages, social divisions arose among the farmers. Tax-paying connections became unstable, and the financial difficulties of the warriors, who existed on the taxes paid by the farmers, were naturally aggravated. Because the level of agricultural technology in the feudal period was generally backward, hundreds of thousands of people starved or left their villages during periodic crop failures and famines, and the abandonment of cultivated land also became conspicuous. The samurai class had long since taken up normal residence in the cities. With the development of the urban way of life, they now suffered from increased expenditures. The *bakufu* and the domains tried to suppress commercial-goods production, which destroyed the self-sufficient economy of the farmers. But when all such attempts failed, they encouraged such production, seeking to supplement their finances by monopolizing the farmers' commercial goods and selling them themselves. This policy was the monopoly system, a phenomenon that may be termed the merchantization of the feudal lords. Thus, on top of increased taxes, the farmers were deprived of the profits of their commercial goods. Unable to restrain themselves, they violated the strict legal prohibitions with repeated farmer uprisings (*hyakushō ikki*). Meanwhile, the city poor, who were driven to the border line of starvation by the rising price of rice and other commodities, often rioted, plundering and destroying rice shops and pawnshops; these urban riots were called *uchikowashi* ("destruction").

Rural and urban unrest

Political reform in the bakufu and the domains. Continual political reforms made by the overlords in response to this crisis in the feudal system characterize the latter half of the Tokugawa period. Such reforms began with the eighth shogun, Tokugawa Yoshimune (ruled 1716–45). Yoshimune appointed civilians to official posts in finance and rural administration in order to increase government efficiency. As an emergency policy, he ordered the domain lords to make rice contributions (*agemai*), which he allotted to the *hatamoto* to supplement their stipends. More characteristic was his effort to increase tax yields by opening new lands to cultivation and revising the method of taxation. He also sought to bring fresh air into a stuffy, despotic government by such means as setting up complaint boxes, or *meyasu-bako,* to hear the views of the people and drawing up a part of a legal code, the Kujikata Osadamegaki, which mitigated criminal punishments. He made efforts to control the falling price of rice, earning him the name of "the rice shogun." But when the price of rice rose sharply in a great famine in the 1730s, the common people of Edo attacked the wholesale rice dealers who had cornered the market. This was the first such riot in Edo. Yoshimune's reforms took many twists and turns; but in 1744, the year before his retirement, the receipts of the *bakufu* both in total land taxes and in tax receipts reached their highest level for the entire Edo period. For this reason Yoshimune was called the "great ruler who restored the *bakufu.*" His success, however, was possibly due to the fact that the disturbances had not yet become very grave, whereas the political power of the *bakufu* was still quite strong.

The "rice shogun"

When Yoshimune's son Ieshige became the ninth shogun, government by the personal attendants of the shogun, which Yoshimune's personal rule had prevented, was revived. Chamberlains, or *soba-yōnin,* who handled communications with the senior councillors, gained strong powers of authority as his spokesmen when they won the Shogun's confidence. One such man was Tanuma Okitsugu, who rose from chamberlain to be senior councillor. Okitsugu delighted in bribery, and he was criticized by an opposition group for corrupting the *bakufu* government. But he was an active reformer who further developed some of Yoshimune's programs. Instead of suppressing the activities of the big-city merchants, Okitsugu used them to promote production; and while advancing the development of the commercial-goods economy, he sought to control it. His ready recognition of the commercial and industrial guilds, or *kabu nakama,* seems to have been aimed not so much at gaining contributions (*myōga-kin*) for the treasury as for establishing a controlled commercial-goods circulation, linking the city guilds with the village producers. Okitsugu was criticized by the people for issuing large amounts of debased coinage that caused a rise in prices, but he may have been trying to increase the amount of currency to match the developing circulation of commercial goods.

Okitsugu's progressive political attitude is best revealed in his development of Ezo (present-day Hokkaido) as a

Natural disasters

precaution against the southward advance of the Russians; he even considered trading with Russia. Various natural disasters occurred in his time, however: a great eruption of Mt. Asama (Asama-yama) in 1783 was followed by a great famine in 1783–87, in which large numbers of people starved to death. In addition, derelict land deserted by its cultivators increased, and the custom of *mabiki,* or infanticide, became common among parents unable to rear their children. Some people became landlords by collecting together the lands of poor farmers; others became powerful merchants. The anti-feudal struggle of the farmers also rose to an unprecedented pitch, until, in 1787, a large-scale riot lasted for three days and threatened to reduce Edo to anarchy. Okitsugu had already been dismissed as senior councillor in the previous year, and Matsudaira Sadanobu, grandson of Yoshimune and the lord of Shirakawa domain (in modern Fukushima Prefecture), was indicated as his successor. But Okitsugu's supporters in the *bakufu* made every effort to prevent Sadanobu's appointment, and for more than six months the political situation remained a complete vacuum. The farmers' riot suddenly changed the situation, however, and Sadanobu was appointed senior councillor.

Sadanobu is renowned as the director of the Kansei reforms (1789–1801). He rejected Okitsugu's free and easy administration and instituted a policy of retrenchment. He set out to reduce the high prices in the great cities and had a fund established in Edo under the name of *shichibu tsumikin* (70 percent reserve fund); knowing that land and house rents were high in the shogun's capital because of the heavy *machinyūyō* tax levied on its landlords, he reduced this tax and set aside 70 percent of it as a fund for the relief of the poor. To relieve the hardships of the *bakufu* retainers, he took emergency measures to cancel the debts of the *hatamoto* to the *fudasashi,* the Edo merchants who handled the exchange of their stipends. The farming villages, which were the foundation of the *bakuhan* system, had been devastated in the great famine of the 1780s, so while encouraging the *daikan* (a head official managing the *kuraireichi*) to bring land back into cultivation and to increase the population of the villages, Sadanobu also issued orders that annual rice taxes were to be increased as much as possible.

Sadanobu was a firm admirer of Chu Hsi studies, and he believed that government must be conducted on the basis of Confucian benevolent rule. He established an examination system for promotions among *bakufu* officials and also prohibited all teachings except those of the Chu Hsi school at the Shōheikō, the *bakufu* official college.

Sadanobu's reforms give the impression of an overly severe reaction to Okitsugu's administration; and whereas people at first welcomed them, antipathy gradually increased. Within the *bakufu* also, the O-Ōku, or shogunate domestic quarters, composed of ladies, disliked Sadanobu's reforms and forced him to resign by covert stratagems (the Shogun's favourite mistresses tempted the Shogun to expel him). While Sadanobu was senior councillor, a Russian envoy, Adam Laxman, landed at Nemuro in 1792 and requested trade relations, but the *bakufu* did not give its assent. Sadanobu ordered that plans be drawn up immediately for a coastal defense system centred on Edo Bay (now called Tokyo Bay), while he himself inspected the coastline of Izu, Sagami, and Bōsō. Because of Sadanobu's resignation (1793), these plans were not carried out; but the *bakufu* councillors of this time were the first to react to the footsteps of the foreign nations advancing on Asia, which now came to be heard through the wall of national seclusion.

In conjunction with the *bakufu* programs, reforms were carried out within the various daimyo domains. A distinctive feature of domain reforms at this time, however, was that they tried to apply stronger regulations and control over the commercial-goods economy of the farmers.

Sadanobu was senior councillor during the reign of Tokugawa Ienari, the 11th shogun. Ienari was restrained by Sadanobu's strict political reforms, but when the latter left the *bakufu* council, the Shogun was able to relax. Even so, Ienari was not completely free while the councillors who had supported Sadanobu's reforms were still alive. During the period 1804–31 these men died one after another, and the *bakufu* government became even more lax than in the time of Okitsugu. Mizuno Tadaakira, a senior councillor in this period, had risen as a personal attendant to Ienari and had business ability. But he welcomed bribery, and the other officials followed his lead, greatly increasing the corruption of the *bakufu.* On the surface, things seemed peaceful, but, underneath, the stagnation of the feudal system became even more grave. Especially in the farming villages of Kantō, right in the lap of the *bakufu,* homeless ruffians and gamblers continually caused disturbances. The *bakufu* therefore set up an office called the Kantō Torishimari-deyaku (Supervisors of the Kantō District) to strengthen police control of the area, and it ordered the villages of Kantō to form associations to assist this office.

The Russian attack on Etorofu

The growth of the northern problem. In the early 1800s foreign relations became a fairly pressing problem, and the situation in Ezo fell into confusion. In 1804 another Russian envoy, N.P. Rezanov, came to Nagasaki to request commercial relations. When the *bakufu* refused this request, his men attacked Etorofu Island. Prior to this, the *bakufu* had relieved the Matsumae domain of eastern Ezo and placed it under its direct control; and in 1807 the *bakufu* also took direct control of both eastern and western Ezo for defensive purposes. In 1808 the English warship "Phaeton" made an incursion on Nagasaki, and three years later the Russian naval lieutenant V.M. Golovnin landed on Kunashiri Island and was arrested by the Japanese. When these incidents were resolved, peace continued for a time in the northern regions, and the *bakufu* relaxed its precautions, returning all Ezo to the Matsumae domain in 1821. In the south, English ships often appeared in Japanese waters after the "Phaeton" incident, and the *bakufu,* in 1825, cancelled the Order for the Provision of Firewood and Water (*Shinsui Kyūyo Rei*) and promulgated the Order for the Driving Away of Foreign Ships (*Ikokusen Uchiharai Rei*). While attempting to preserve the iron law of seclusion to the bitter end, *bakufu* policy had no consistency (to foreign ships it was at times offensive and at times not), and it was utterly powerless when it received the full weight of foreign pressure in about the 1840s.

New learning and thought. As this weakening of the *bakuhan* system grew more serious, new movements took place in scholarship and culture. In the latter half of the 17th century the Kogaku (Study of Antiquity) school arose; scholars criticized Chu Hsi studies and advocated a return to the original ideals of Confucianism. This view was developed by Itō Jinsai and Ogyū Sorai. Especially in his work *Seidan,* Sorai insisted that the main reason for the financial distress of the warrior class in both the *bakufu* and the domains was that there was no "system" in things, and that when the warriors left the villages and moved to the cities, they had to buy everything, whereas before they had been able to live self-sufficiently. Various other schools of Confucianism arose, such as Setchūgaku (Eclectic Studies) and Kōshōgaku (Positivistic Studies). Conflict between the various schools became fierce, and the academic world grew confused. The authority of Chu Hsi studies grew weak, and, at the time of the Kansei reforms the *bakufu* attempted to reinvigorate them. It issued an order prohibiting all other schools of Confucianism in the college of the *bakufu,* but it had no marked results. At the same time, studies like Confucianism spread remarkably in the provinces, as can be seen from the establishment of domain schools (*hankō*), principally in the later Edo period, for the education of the domain samurai. Thus, learning and culture arose in the domains, accompanied by a growth of scholarship with local colouring. Among such schools, the Kaitoku-dō in Ōsaka was famous as the "townsmen's university." This school was founded by cooperation between Confucian scholars and rich merchants, and both samurai and merchants sat together to hear lectures. It is not surprising that the unique thinker and scholar Yamagata Bantō should have been produced from this rationalized way of study.

New movements also appeared in Shintō, which, with Confucianism and Buddhism, acted as the ideology of popular education. The Confucian scholar Yamazaki Ansai formulated Shintō from the standpoint of Confucianism and proclaimed the Suika form of Shintō. But in the later Tokugawa period popular interest in Shintō grew progressively stronger, centred on the Ise faith. This tendency was spurred on by lectures that explained Shintō in terms easily understood by the common people. Thereafter, Shingaku (Heart Learning) arose, which explained Confucian, Shintō, and Buddhist teachings to the townsmen and farmers. Its founder was Ishida Baigan. Kokugaku (National Learning) was also established against the same social background. Kamo Mabuchi studied the *Man'yōshū,* the most ancient collection of poetry in Japan, and other ancient writings, urging a return to old ways that had not been defiled by foreign ideas, such as Confucianism and Buddhism. By studying the ancient language of Japan's oldest classic, the *Kojiki* ("Records of Ancient Matters"), his pupil Motoori Norinaga clarified Japan's ancient system of morality, called *kannagara no michi* ("way of the gods"). Inheriting Norinaga's explanation of Shintō, called Fukko (Restoration) Shintō, Hirata Atsutane regarded Japan as the centre of the world; and fiercely upholding the conception of Japan as a divine country (*shinkoku*), he strongly advocated reverence for the Imperial house. Hirata's thought, along with Mitogaku (Mito school), provided the ideological foundation for the "*Sonnō jōi*" ("Revere the Emperor! Drive out the barbarians!") movement of the late Tokugawa period.

Western studies

Studies of European modern science also arose, termed *yōgaku* ("Western learning") or *rangaku* ("Dutch learning"). A great stimulus to the concrete development of Western studies was provided by the publication, in 1774, of the *Kaitai shinsho,* a translation by Sugita Gempaku and others of an anatomical book imported from the Low Countries. Thus, Western studies became progressively more vigorous, centred on medicine. But as the crisis in the feudal system grew more serious, many scholars of Western studies criticized the seclusion policy, making the *bakufu* nervous. The persecution of Watanabe Kazan, Takano Chōei, and other representative scholars of Western studies in the *bansha no goku* incident (1839), which resulted from a conservative plot within the *bakufu,* seriously undermined Western studies in Japan. Thereafter, as consciousness of the foreign threat grew stronger, Western studies came to place heavy emphasis on the field of military technology.

Other philosophers also appeared who repudiated feudal society. Andō Shōeki, in his *Shizen shin'eidō,* portrayed an ideal society in which all people equally engaged in farming, without social distinctions or exploitations. This shows the extent to which the common people were troubled by the contradiction of feudalism. Even if Shōeki is considered exceptional, other men successively appeared with an anti-feudal worldview directly or indirectly influenced by empirical science and Western studies. Miura Baien of Kyushu called his learning Rational Studies (Jōrigaku); it contained a dialectical method of thought. Hiraga Gennai, the son of a foot soldier of the Takamatsu domain, disliked the restricted life of the warrior; he became a masterless samurai (*rōnin*) and thought and acted freely. He advocated that Japan prevent the outflow of gold and silver by promoting domestic production and exchanging these products for foreign goods. Because this view agreed with Tanuma Okitsugu's desire for a production development policy, Hiraga was employed by Okitsugu and sent to Nagasaki. While experimenting with such things as functional dynamos and thermometers, Gennai gave full play to his genius by cultivating sugarcane and carrots, producing Dutch-style pottery, and surveying and developing mines in various provinces of the country. He also produced masterpieces as a dramatist. An attitude of naive materialism grew in his thought.

The work of Shiba Kōkan and Yamagata Bantō also appeared at this time. Kōkan is known as the pioneer of etching in Japan; but he also displayed an evolutionistic attitude, repudiating the feudal status system on the ground that both the emperor and the beggar were similar human beings, thus insisting on human equality. Bantō was chief manager to a rich Ōsaka merchant and had financial ability. In his work *Yume no shiro* ("Instead of Dreams"), he reconstructed the Japanese history in the age of gods from the worldview of natural science. He, too, had a strong feeling for human equality, saying "both in ancient times and at the present, there is no upper or lower among human beings."

Growth of popular knowledge

The common people of the Tokugawa period, by their production and labour, were progressively reared in empirical knowledge, and their self-awareness as human beings became stronger. At the outset of the period only a handful of upper-class farmers, such as the *shōya* or *nanushi,* were literate; by the end of this period, with the exception of the very lowest class, farmers were all at least partly literate. This is also connected with the diffusion of the *terakoya* (temple schools), the educational organs of the common people. But in any case, it reflected the growth in popular knowledge extending more than 300 years. This is also shown by the fact that "village conflicts" (*murakata sōdō*) became more fierce in the later part of this period, as the farmers sought to censure the improper acts of village officials and to make the village more democratic. The fact that the leadership in these conflicts was taken by the middle- and lower-class farmers was a natural phenomenon. In comparison with the present, however, it is undeniable that, in the Tokugawa cities and villages, backward social tendencies were still firmly rooted. The cause of this backwardness may be attributed to the collective abuses brought about by the feudal system, but the role played by such religions as Shintō and Buddhism cannot be overlooked.

Buddhism especially had strong powers of regulation over the lives of the common people. Among the various Buddhist sects in this period, the Jōdo, Jōdo Shin, Zen, and Nichiren made striking advances because their temples were guaranteed in their privileged status by the implementation of the *terauke* ("temple certificate") system of the *bakufu.* Besides their previous role in conducting funeral rites and masses, they now had charge of registration and census; thus grafted onto the livelihood of the people, their operation was generally stabilized. The tendency also became strong for the people to seek *genze riyaku—i.e.,* to pray for happiness during their lifetime, such as for commercial prosperity or restoration of health—and not to wait for happiness after their death. In response to this, various ceremonies were conducted and efforts made to swell the financial income of the temples. Among such ceremonies, the most important were *kaichō* and *tomitsuki. Kaichō* consisted of allowing the people to worship a Buddhist image that was normally kept concealed and not generally displayed. Gradually this came to be performed by moving the image out to other cities and villages. *Tomitsuki* was an officially authorized lottery, and in Edo the raffles at such temples as the Yanaka Tennō-ji, the Yushima Tenjin, and the Meguro Fudō (better known as the Ryūsen-ji) were famous. Among the Buddhist priests who profited from the trend of the times, there were some who led loose private lives, providing the Confucian scholars with examples for demanding that Buddhism be stamped out.

Various sorts of popular faiths flourished in the cities and villages. Shugen-dō had, as its special characteristic, prayers by itinerant monks (*yamabushi*) for curing illness or bringing happiness, but in its teachings, while centred on Buddhism, it also contained beliefs drawn from Shintō and elsewhere to meet the religious feelings of the people. A new faith in healing spirits arose from the view that human suffering could be cured only by men who had suffered the same hardships themselves, and in the late Tokugawa period a development took place toward faith in living gods (*ikigami*) who could respond to the various requests of the common people and who became revered as sect founders (*kyōso*). These sects included the Kurozumi-kyō, founded by Kurozumi Munetada, the Konkō-kyō of Kawate Bunjirō, and the Tenri-kyō of Nakayama Miki. People like Nakayama Miki reflected the confused social conditions of the late Tokugawa period, and their advocacy of *yo-naoshi,* or relief of the world by social reform, had political undertones. Influenced by the popularity of the cult of Shintō shrines, periodic pilgrimages to Ise, called *okage-mairi* or *nuke-mairi,* became popular. Pilgrimages were also made to Ise by groups of several hundreds of thousands of common people. Among such pilgrims, there were those who had political hopes for *yo-naoshi* in common with the faiths of the sect founders.

The maturity of Edo culture. In the early 19th century the city culture that had arisen in Edo was brought to full maturity in learning and craftsmanship. This Edo culture was supported by rich townsmen and warriors, and it was also widespread among the townsmen generally. Literary styles took various forms; representative authors are Santō Kyōden in the *sharebon,* or genre novel, Jippensha Ikku in the *kokkeibon,* or comic novel, and Takizawa Bakin in the *yomihon,* or regular novel. They examined in detail such things as the townsman's way of life, customs, conceptions of beauty, and ways of thinking. In the world of art, Ukiyo-e came to completion in both form and content and established its position as popular art. *Nishiki-e,* wood-block printing in many colours, was invented by Suzuki Harunobu and entered its golden age with the prints of Kabuki actors by Tōshūsai Sharaku and of courtesans by Kitagawa Utamaro. In the last years of the Edo period, the masters of wood-block landscape prints, Andō Hiroshige and Katsushika Hokusai, created new boundaries and even influenced foreign art. As a result of links with the city culture, scholarship arose even in local towns and villages, where crafts and products with distinctive local colouring were supported by landlords and merchants. A national culture emerged from these city and local cultures and became the foundation of a modern culture that developed during and after the Meiji period.

Literary styles of the Edo period

But signs of stagnation and corruption also appeared in some aspects of Edo culture—a reflection of the crisis in the *bakuhan* system. The crisis had reached new levels by the third decade of the 19th century. A great famine, lasting several years, dealt a savage blow to the impoverished villages, and farmer uprisings and city riots reached unprecedented peaks. In 1836 an uprising took place in the Gunnai district of Kai Province (Yamanashi Prefecture), then under direct *bakufu* control, and spread westward to the Kuninaka plain across the Sasago Pass, by this time numbering more than 50,000 adherents. Dividing into two groups, insurgents attacked the residences of nearly 500 prominent men and for a time reduced the centre of Kai to anarchy. How deeply the *bakufu* was shocked by this can be seen in the sentencing of 562 persons to crucifixion for their part in the uprising. A year later in the city of Ōsaka, also under direct *bakufu* control, Ōshio Heihachirō, a former city official, raised a revolt to overthrow the officials and rich merchants and to relieve the poor; although the uprising was speedily suppressed, the *bakufu* was greatly astonished that a former faithful official would lead a revolt. In addition to these domestic disturbances, the European powers began to press more heavily upon Japan. The Opium War (1839–42) arose between the Ch'ing dynasty of neighbouring China and the British, and foreign gains following this war filled the *bakufu* authorities with a sense of crisis. Tokugawa Nariaki, the lord of the Mito domain, urged the *bakufu* to make definite political reforms; he called the domestic resistance of the common people the domestic anxiety and the pressure of the foreign nations the foreign anxiety.

Internal and external threats

The Tempō reform and the collapse of the bakuhan system. Faced by this threatening situation in both domestic and foreign affairs, the chief senior councillor, Mizuno Tadakuni, instituted a reform program; this Tempō (the name of the year period from 1830 to 1844) reform lasted only from 1841 to 1843, however. Tadakuni set in order the regulations for the government officials and encouraged them to practice frugality and the literary and military arts. He also aimed to restore the farming villages devastated by the great famine. Tadakuni was stricter than earlier reformers in that he planned to force temporary residents in Edo to return to their home villages and to restrict the commercial-goods production of the farmers to make them produce rice. In order to lower the price of commodities in the cities, he applied detailed regulations to the townsmen. He further ordered that the *kabu nakama,* or merchant and artisan guilds, be dissolved because he regarded them as the cause of rising commodity prices. Tadakuni planned to reclaim by military means the Imba Swamp (Imba-nuema; in modern Chiba Prefecture) so that food supplies could be conveyed to Edo from the provinces of Hitachi and Kazusa (Ibaraki and Chiba prefectures) if Edo Bay were blockaded by foreign ships. Plans for the defense of Edo Bay took concrete form and included the seven islands of Izu. Tadakuni also promulgated a land-requisition (*agechi*) order to bring daimyo and *hatamoto* domains surrounding Edo and Ōsaka under direct *bakufu* control; the main object of this was the defense of Edo, but it was also a plan to supplement the finances of the *bakufu.* The *agechi* order was finally withdrawn, however, in the face of fierce opposition from the daimyo, *hatamoto,* and people of the domains concerned, and, as a direct result of this failure, Tadakuni was driven from his seat among the senior councillors in 1845. Tadakuni predicted that because of his reforms the Tokugawa shogunate would keep its government for another 30 years, and it was in fact almost 30 years after his reforms that the *bakufu*'s downfall took place (1867). In the same Tempō period, administrative reforms were carried out in many of the domains, and the reforms of the powerful domains in southwestern Japan, especially Chōshū and Satsuma, are noteworthy. In these domains middle- and lower-class samurai came forward as reformers, replacing the previous conservative officials. Adopting the slogan "Enrich the country, strengthen the military" ("*Fukoku kyōhei*"), these new officials were able to institute policies that improved domain finances; the resulting surpluses were used to modernize the military armaments of the domains. The way was thus gradually being prepared for the emergence of the leaders of the Meiji Restoration (1868) and of modern Japan.

In 1845, when Abe Masahiro replaced Mizuno Tadakuni as head of the *rōjū* (senior councillors), various movements appeared that can be called reactions to the Tempō reform. One of these involved the commissioners for the shogun's capital, with close connections with the Edo merchants, and tried to restore the *kabu nakama* guilds. In 1851 an order was finally issued for the revival of the *nakama.* But the guilds included those (sometimes called *kumiai*) that had arisen since the dissolution of the Tempō era *kabu nakama,* and their controlling power over city markets was thus extremely restricted. The confrontation of the city merchants with the village producers and local merchants over monopoly of commercial-goods circulation routes had grown fiercer, and the former had been forced to yield further.

Thus, the domestic reaction to the Tempō reform was comparatively calm, and the major stumbling block facing the *bakufu* was the foreign problem. The Netherlands, the only European power trading with Japan, saw that, if Britain succeeded in forcing Japan to open the country, it would lose its monopoly; so the Dutch now planned to seize the initiative in opening Japan and to thus turn the situation to their own advantage. In 1844 the king of The Netherlands, William II, sent a diplomatic mission urging the *bakufu* to open the country, but Abe and the *bakufu* rulers refused this suggestion. Visits by foreign ships, however, increased progressively. In 1844, 1845, and 1846, British and French warships visited the Ryukyu Islands and Nagasaki to request commercial relations. In response, the *bakufu* in 1845 established the new office of Kaibo-gakari for coastal defense and various diplomatic posts. The defense system of Edo Bay was also revived, the number of domains on guard duty was increased, and new gun emplacements were built. In 1848 it was decided not to revive the order to drive away foreign ships, which had been rescinded during the Tempō reform, but that extensive military preparations should be made.

Foreign rivalries in the opening of Japan

Rumours had long circulated among the various foreign countries that the United States government would send an expeditionary fleet to Japan. In 1846 Comdr. James Biddle of the American East Indian fleet appeared with two warships in Uraga Harbour (Uraga-kō) and held consultations on the question of commercial relations. When refused by the *bakufu,* he left empty-handed. The United States, however, eagerly desired ports for fuel and provisions for its Pacific merchant and whaling ships and would not give up trying to open Japan. But the *bakufu* had for so many years kept its place as overlord of the political regime by strictly maintaining the ancestral law of seclusion that it could not muster up the resolution to step forward and open the country. The opening of Japan was thus postponed until the last possible moment and had to be effected unilaterally by foreign pressure, backed by massive naval strength; this pressure was initiated by the squadron of U.S. warships commanded by Matthew C. Perry that entered Uraga-kō in July 1853. (K.Ma.)

JAPAN SINCE 1850

The Meiji Restoration. The term restoration is commonly applied to the political changes that returned power to the throne during the reign of Mutsuhito, who took the reign name Meiji ("enlightened rule," 1868–1912). The term *ōsei-fukkō* ("restoration of Imperial rule") made it possible to interpret sweeping changes as being traditional in motivation. Actually, the Meiji changes constituted a social and political revolution that began before 1868, and political innovations ended only with the promulgation of a constitution in 1889.

Fall of the Tokugawa. The arrival of the foreigners in the 1850s provided a new issue for domestic politics and a new measure for the effectiveness of the feudal administration. When it became clear that the Shogun was unable to protect Japan from the barbarians and that his concessions to them were made in spite of their known repugnance to the Imperial court in Kyōto, the two shogunal boasts of loyalty to and protection for the court proved spurious. The slogan "*Sonnō jōi*" ("Revere the Emperor! Drive out the barbarians!") was first raised by men who sought to influence shogunal policy and then taken up by others who wanted to embarrass the Tokugawa. The Shogun's ratification of the Harris Treaty (1858) and of others that followed was carried out in the face of strong opposition from the Kyōto court, and it brought to the surface antagonisms that had developed during the long years of peace and study. They centred in the Tokugawa house of Mito, which had done much to sponsor Confucian scholarship. The Mito daimyo made vigorous attempts to involve the Kyōto court in affairs of the shogunate with a view to establishing a nationwide program of preparedness. For this he was punished by the head of the Edo council of elders, Ii Naosuke. In 1860 Ii was assassinated by men from Mito and Satsuma, an act that inaugurated years of violence. Many of those who took part were young samurai from Edo; their swords availed little against the foreigners' guns, but they took a heavy toll of political enemies.

Reaction against foreign intervention

Years of extremism followed. The Tokugawa shogunate, anxious to rally support among its feudatories and to help them to prepare their defenses, relaxed its controls and regulations. In many fiefs young enthusiasts tried to push their feudal superiors into a less cautious and more strongly antiforeign position. It soon became obvious to most that expelling the foreigners by force was impossible. Antiforeign acts provoked stern countermeasures and diplomatic indemnities, which tightened the foreign hold on the country. After the bombardments of Kagoshima in 1863 and Shimonoseki a year later, there could be no doubt of the foreigners' military superiority. Thereafter, the slogans of antiforeignism and exclusion were used chiefly as a means of obstructing and embarrassing the shogunate. The Edo policymakers were forced to make surface concessions to the antiforeign elements, which aroused the hostility and distrust of the treaty powers. After the arrival of the British minister Sir Harry Parkes in 1865, Great Britain, in particular, began to tire of negotiating with a shogunate that stood between it and the Kyōto court and began to consider ways of dealing directly with the latter. It gradually became clear that ultimate authority lay in Kyōto.

In some fiefs the young extremists found themselves unable to budge their superiors from their conservative positions. From Chōshū (now part of Yamaguchi Prefecture), foreign shipping in Shimonoseki Strait was shelled in 1863. This drew the bombardment of Shimonoseki the following year. Samurai opinion grew so vehement that after the fief authorities submitted to Tokugawa discipline in 1864, a swift military coup brought to power, as the daimyo's counsellors, a group of men who had led the radical antiforeign movement. But they were no longer blindly antiforeign; several had secretly travelled to England. Their aims were national—to overthrow the shogunate and create a new government headed by the emperor. The same men developed militia units based on Western training methods and arms. Chōshū became the centre for discontented young samurai from other fiefs who were impatient with their leaders' caution. In 1866 Chōshū allied itself with Satsuma in expectation of a Tokugawa attempt to crush all *tozama* daimyo opponents and erect a centralized despotism with French help.

Anti-Tokugawa alliance

The Tokugawa armies were successfully repulsed at Chōshū in 1866, causing the shogunate to lose more power and prestige. The death of the shogun Iemochi in 1866 brought to power, as the last shogun, Yoshinobu, who was aware of the pressing need for national unity. He spurned suggestions that he seek French help to put down his enemies. When he was urged by a lord of Tosa to resign his powers, he did so rather than risk a full-scale assault by Satsuma and Chōshū, confident that as lord of eastern Japan he would emerge as an important figure in whatever new political organization should develop. But the young Meiji emperor, who had succeeded to the throne in 1867, was guided by several nobles in close touch with leaders of Satsuma and Chōshū, and the last shogun was manoeuvred into a choice between giving up his land, which would risk revolt from his vassals, or appearing disobedient, which would justify punitive measures. Yoshinobu's armies advanced on Kyōto, only to be defeated. Satsuma, Chōshū, and Tosa units, now the Imperial army, advanced on Edo, which was surrendered without a battle; fighting continued to the north until the summer of 1869, but the Tokugawa cause was doomed. In January 1868 the principal lords were summoned to Kyōto to learn of the restoration of Imperial rule. During the next year the capital was moved to Edo (renamed Tokyo), and the building of the modern state began.

From feudal to modern state. The Meiji government was dominated by the Satsuma, Chōshū, and court figures who had outmanoeuvred the Shogun. They were convinced that Japan would need a unified national government in order to achieve military and material equality with the Western powers. Most of them, like Kido Kōin and Itō Hirobumi of Chōshū and Saigō Takamori and Ōkubo Toshimichi of Satsuma, were young samurai of modest rank, but they did not represent in any sense a class interest. Indeed, their measures destroyed that class. In order to gain backing for their policies, they enlisted leaders of fiefs with which they had worked—from Tosa, Saga, Echizen—and maintained their cooperation with such court nobles as Iwakura Tomomi and Sanjō Sanetomi.

The cooperation of the impressionable young emperor was essential. It was taken for granted that Western strength depended on constitutionalism, which produced national unity; on industrialization, which produced material strength; and on a well-trained military. The new slogan of the day became "*Fukoku Kyōhei*" ("Enrich the country, strengthen the military"). Knowledge was to be sought in the West, the goodwill of which was essential if the unequal treaties were to be revised. Therefore, a number of missions to the West were organized. In 1871 Iwakura Tomomi led a large number of his fellow government leaders to visit Europe and the United States. The experience gained abroad strengthened convictions already formed as to measures of modernization that would be required.

Missions to the West

Abolition of feudalism. The Meiji leaders began with measures to lessen the feudal decentralization on which they blamed much of Japan's weakness. In 1869 the leaders of the Satsuma, Chōshū, Tosa, and Saga domains persuaded their daimyo to return their lands to the throne; other lords hastened to follow suit. The court took steps to regularize and make uniform administration in the fiefs, but it appointed the former lords as new governors. In 1871 the governor daimyo were summoned to Tokyo, and feudalism was declared abolished. The approximately 300 fiefs became 72 prefectures and three metropolitan districts; this number was later reduced by one-third. For the most part, the daimyo lost contact with administration, and, although they were rewarded with titles in a new European-style peerage, set up in 1884, their political importance was slight.

It was necessary to end the complex system of social stratification that had existed under feudalism; yet, it was difficult to make arrangements for the samurai, who numbered, with dependents, almost 2,000,000. In 1869 the old hierarchy was replaced with a new and simpler division whereby court nobility and feudal lords were termed aristocracy (*kazoku*); upper and middle samurai, *shizoku;* other samurai, *sotsuzoku* (a rank soon abolished); and all others, commoners (*heimin*), including the previously unlisted pariah groups. The samurai were given pensions equal to a part of their old income. When the regime found these pensions too heavy for its treasury to carry, the pensions were changed to interest-bearing but nonconvertible bonds. During the same years the distinctive hairstyle of the samurai (and those of farmers and merchants) was discouraged; the wearing of swords, the former badge of class, was later banned.

Samurai revolts

Many of the bonds were soon squandered, because few warriors had had occasion to develop commercial aptitude, and the inflation that accompanied government expenditures lessened their value greatly. In 1873, moreover, a nationwide conscription was instituted, depriving the samurai of their traditional monopoly of military service. There were a number of samurai revolts, the most serious in the southwest, which had led in the restoration movement and where warriors previously had reason to expect the greatest rewards. Some revolts, as in Chōshū, expressed discontent against administrative measures that deprived samurai of their importance, while in Saga the dissidents championed a foreign war to employ samurai.

The last and greatest revolt came in Satsuma (1877), led by the restoration hero Saigō Takamori. The new conscript levies were hard pressed to defeat Saigō, and the government had to enlist former samurai and empty its military academies in order to put down the revolt. But the revolts merely expressed regional discontents and were never coordinated. Even in the case of the Satsuma war, the loyalties of most of the Satsuma men in the central government remained with the Imperial cause.

In 1873 land surveys were begun to determine the amount and value of land on the basis of average yield in recent years, and a tax in money of 3 percent of the value was then set as the land tax. Out of the same surveys came certificates of ownership of land for farmers, who were also released from feudal controls. The land measures involved basic changes, and there was widespread confusion and uncertainty among the farmers, frequently expressed by short-lived revolts and demonstrations. The establishment of private ownership, along with measures to promote new technology, fertilizers, and seeds, soon produced a rise in recorded agricultural output. The land tax, supplemented by printed money, was the principal source of the government's income for several decades.

Although hard pressed for money, the government also began a program of industrialization, seen as essential for national strength. Aside from military industries and strategic communications, it was carried out in private hands, although the government set up pilot plants to provide encouragement. Trade and manufacturing benefitted from the new national market and legal security, although unequal treaties made it impossible to protect industries with tariffs until 1911.

Rise of the *zaibatsu*

In the 1880s fear of excessive inflation resulted in a decision to sell most of the new plants to private investors—usually people who had close relations with government officials. A small number of individuals came to dominate many enterprises; they were known as the *zaibatsu,* or financial cliques. With tremendous opportunities and few competitors, the same firms appeared in enterprise after enterprise. Their aims were close to those of the government leaders, and there were often close friendships between them. The House of Mitsui, for instance, had close relations with Meiji leaders, while that of Mitsubishi was founded by a colleague of the restoration leaders.

Equally important for building a modern state was the development of national loyalties. True national unity required the propagation of new loyalties among the masses, previously inarticulate and powerless. The early restoration government, influenced by a Shintō revival, elevated a bureau of Shintō, the state cult, to the highest position in the new political hierarchy and strove to replace Buddhism with a strong cult of the national deities. Christianity was legalized in 1873, with great reluctance, at the urging of the Iwakura mission, and thereafter it seemed important to bolster traditional outlooks without risking foreign condemnation by forcing a state religion upon the Japanese. The education system proved an ideal vehicle for ideological orientation. A system of universal education was announced in 1872. For a time its organization and philosophy were Western inspired; but during the 1880s, as the government leaders saw their countrymen turning to Western ideas and learned of a new nationalist orientation of schooling in Europe, the Japanese system was altered to include emphasis on "ethics," and in 1890 the Imperial Rescript on Education laid out the lines of Confucian and Shintō ideology, which constituted the moral content of later Japanese education. Thus, loyalty to the emperor, who was hedged about with Confucian teaching and Shintō reverence, became the centre of a citizen's ideology. Meanwhile, to avoid charges of indoctrination, the state distinguished between this secular cult and actual religion; in this way, the leaders could permit "religious freedom" while requiring a form of worship as the patriotic duty of all Japanese subjects. This uniform system of mass education was also utilized to project into the nation at large the ideal of samurai loyalty that had been the heritage of the ruling class.

Charter oath of 1868

Constitutional movement. It was widely believed that constitutions provided much of the unity that gave Western countries their strength, and Japanese leaders were eager to bring themselves abreast of the world in this respect. A government plan (1868) experimented with a two-chamber house, but it proved unworkable because the government leaders preferred to have their own way. The Emperor's charter oath (April 1868), however, committed the government to seek knowledge and wisdom throughout the world, to abandon customs of the past, to allow all subjects to fulfill their proper aspirations, and to allow popular opinion to influence their decisions.

To these statements of intent were added protests from below. A democratic movement grew out of a split in the leadership group over government policy. Itagaki Taisuke and other leaders of the Tosa faction combined with members of the Saga fief in 1873. Their demands for a punitive expedition against Korea, the obscurantist government of which had insulted Japanese envoys, had been refused because domestic reforms were to come first, and they resigned their positions. Instead of championing the old order, however, Itagaki and his friends called for a popular assembly so that future decisions would reflect the will of the people (by which they initially meant their fellow samurai) and thus preserve unity. Itagaki and his Tosa followers developed discussion and mutual-help groups and, gradually growing in political confidence and ability, organized themselves on a national basis as the Liberal Party (Jiyūtō) in 1881. It should be noted that the movement had only a narrow social and regional base at this time and that its purposes were to promote effective national unity rather than tolerance of diversity and dissent.

When the remaining Meiji leaders were asked to submit their opinions on constitutional problems in 1881, Ōkuma Shigenobu, a Saga leader, revealed a relatively liberal draft instead of first submitting it for the scrutiny of his colleagues. He also revealed sensational evidence of corruption in the disposal of government assets on the island of Hokkaido. Ōkuma was forced out of the government and he organized the Progressive Party (Kaishintō) in 1882. Itagaki's Liberal Party had a predominantly rural backing of former samurai and village leaders, many of whom objected to government taxation policies; Ōkuma's party had an urban base and attracted support in the business and journalistic worlds.

The Emperor promised that a constitution would be insti-

Economic distress of the late 19th century

tuted in 1889; the parties were urged to await the Imperial decisions quietly. The constitution was prepared behind the scenes by a commission headed by Itō Hirobumi. The period of constitution writing coincided with one of intense economic distress as the government sought to stem the inflation caused by the spending of the 1870s. But deflationary measures caused hardship in the countryside and provided a situation in which party agitation could easily kindle direct action. Several instances of this and severe government repression in the form of police and press controls forced the parties to dissolve temporarily in 1884. Itagaki travelled to Europe and returned more than ever convinced of the need for national unity in the face of Western condescension.

Itō Hirobumi also travelled to Europe for help in preparation of the new constitution. In Germany he found what seemed an appropriate balance of imperial power and constitutional forms that seemed to offer modernity without sacrificing effective control. As a balance to a popularly elected house, Itō first organized a new European-style peerage in 1884. The government leaders, military commanders, and former daimyo were given titles and readied for future seats in a house of peers. A Cabinet system was installed in 1885, and a privy council, designed to judge and safeguard the constitution, was set up in 1888. Itō resigned as premier to head the council.

The constitution was completed by 1889, and elections for the lower house were held to prepare for the initial diet, which met in 1890. The constitution took the form of a gracious grant by the Emperor, and it could be amended only upon Imperial initiative. Its provisions were couched in general terms. Rights and liberties were granted "except as regulated by law." If the diet refused to approve a budget, the previous year's could be followed. The emperor was "sacred and inviolable"; he commanded the armies, made war and peace, and dissolved the lower house at will. Effective power thus lay with the executive, which could claim to represent the Imperial will. The education rescript of 1890 was to guarantee that future generations accept the Imperial will and authority without question. In spite of its antidemocratic features, the constitution provided a much greater area for dissent than had previously existed. The lower house could initiate legislation. Private property was inviolate, and freedoms, even when subject to legislation, were greater than none at all. The budgetary arrangements meant that increased support for the military could be had only with Diet approval. Initially, a tax qualification of 15 yen limited the electorate to about 500,000; this was lowered in 1900 and 1920, and in 1925 universal manhood suffrage came into effect. The government leaders had difficulty controlling and manipulating the lower house, despite their power of dissolution and their resources for intimidation and bribery, thus illustrating that the constitution had altered the political picture. And the party leaders' cooperation with their erstwhile enemies when given a reasonable amount of prestige and patronage showed their large areas of agreement with the Meiji oligarchs.

End of the Restoration

The constitution ended the Meiji Restoration and revolution. The government leaders soon retired behind the scenes to influence the political world as elder statesmen (*genrō*) and acted to maintain and conserve the balance of ideological and political institutions they had worked out.

Imperial Japan. *Foreign affairs.* Achieving equality with the Western powers had been one of the major goals since the beginning of the Meiji period. Treaty reform, designed to end the foreigners' judicial and economic privileges provided by extraterritoriality and fixed customs rates, had been attempted as early as the Iwakura mission of 1871; but the Western powers refused to consider it until Japanese legal institutions had been brought into line with those of the West. Japanese attempts at compromise arrangements in the 1880s were denounced by the press and opposition groups in Japan. The treaty provisions for extraterritoriality were formally changed in 1894, after the completion of the Meiji institutional reforms; tariff autonomy came into effect in 1911.

Asian matters took second place to internal problems during most of the Meiji period. In 1874 a punitive expedition was launched against Formosa to chastise the aborigines for murdering Ryukyuan fishermen. This lent support to the Japanese claim to the Ryukyus, which had been under Satsuma influence in Tokugawa times; the islands were incorporated into Japan in 1879 despite Chinese protests. Adventures in Korea, however, although espoused by nationalists and, on occasion, by liberals, were avoided by the government, which was conscious of its need for internal reform and foreign approval. The matter was complicated by a growing Chinese readiness to resist Japanese interference in the affairs of Korea, China's most important tributary state. The Chinese were alert to the danger of Japanese gains. Incidents in 1882 and 1884 that might have led to war with China and Korea were instead settled by compromise. In 1885 China and Japan agreed that neither would send troops to Korea without first informing the other.

Sino-Japanese War (1894–95)

By the early 1890s Chinese influence in Korea was clearly becoming predominant. In 1894 Korea requested Chinese assistance in putting down a rebellion. When the Chinese informed Tokyo of this, Japan quickly rushed troops to Korea and, after the rebellion was crushed, showed no inclination to withdraw. Hostilities between Chinese and Japanese forces broke out first at sea and then in Korea in July–August 1894. The Japanese navy sank or captured much of the northern Chinese fleet, and a peace treaty was negotiated at Shimonoseki between Japan and China on April 17, 1895. Both powers recognized the independence of Korea; China ceded Formosa, the Pescadores Islands, and the Liaotung Peninsula, granted Japan all rights enjoyed by European powers, and made significant new economic concessions; new treaty ports were opened, and Japan received an indemnity of 200,000,000 taels in gold in two installments. A subsidiary treaty of commerce (1896) gave Japan freedom to engage in trade, manufacture, and industry in China's treaty ports and provided for tax exemption within China for all goods so manufactured. Japan thus marked its own emancipation from unequal treaties by imposing even harsher terms on its neighbour. But the European powers were not yet prepared to welcome Japan as a full equal in the imperialist scramble in China. Germany, France, and Russia forced Japan to return the Liaotung Peninsula to China. In 1898 Russia forced China to grant it the lease of that peninsula with its important naval base at Port Arthur. The war thus demonstrated that the Japanese could not maintain Asian military victories without Western sufferance. Nevertheless, the war proved a tremendous source of prestige for Japan and brought the Tokyo government much internal support; it also strengthened the hand of the army in national affairs.

Russo-Japanese War (1904–05)

Instead of accepting Japanese leadership, Korea sought the help of the Russians as a counterweight. During the Boxer Rebellion in China (1900), Japanese troops took a major part in the allied expedition that rescued foreign nationals in Peking, but Russia occupied south Manchuria, thereby strengthening communications with Korea. Realizing the need of protection against a possible combination of European enemies, the Japanese government began talks that led to an Anglo-Japanese Alliance (1902). Each signatory agreed to aid the other in the event of an attack by two or more powers, while remaining neutral if the other was at war with a single power. The Tokyo government was thus prepared to take a firmer line with respect to Russian advances in Manchuria and Korea. In 1904 Japanese ships attacked the Russian fleet at Port Arthur without the formality of a declaration of war. Japanese arms were everywhere successful; the most spectacular victory was in Tsushima Strait, where the ships of Adm. Togō Heihachirō destroyed the Russian Baltic fleet. But Japanese armies were strained to their utmost, and it was with relief that Japan accepted the U.S. Pres. Theodore Roosevelt's offer of good offices for the negotiations that led to peace, signed at Portsmouth, New Hampshire, September 5, 1905. Japanese primacy in Korea was recognized, and Russia surrendered to Japan its economic and political interests in south Manchuria (including the Liaotung Peninsula) as well as the southern half of the island of Sakhalin. The victory over Russia altered the balance of power in Asia, and Japan's ability to cope with a great European power accelerated the development of nationalist movements in Asia. Within Japan, however, the failure to secure a Russian indemnity to cover the costs of the war made the treaty unpopular.

After the conclusion of the war, Japanese leaders now had a free hand to guide the course of reform in Korea, and Korean resistance was met with force. Itō Hirobumi, sent to Korea as resident general, forced through treaties that gave Korea little more than protectorate status and forced the abdication of the Korean king. In 1909 Itō was assassinated, and the following year Korea was formally annexed to Japan. Korean liberties and resistance were crushed under military rule. By the end of the Meiji period, Japan had thus achieved equality with the West and had, in fact, become the strongest military and imperialist power in Asia.

Japan had abundant opportunity to use its new power in the years that followed. During World War I the Western powers were fully occupied in Europe. Japan took part in the war in compliance with the Anglo-Japanese Alliance, but generally it limited its participation to the seizure of the German Pacific Islands and the German holdings on the Shantung Peninsula. When China pressed for return of these, the Japanese government presented the so-called Twenty-one Demands in January 1915. China reluctantly agreed to extend the duration of the Manchurian leases and to joint control of steelworks and ironworks in central China. The German Shantung holdings were to be settled by agreement between Japan and Germany at the time of the peace treaty; subsequently, Japan agreed to hand back the territory in return for further commercial privileges. China promised not to alienate harbours in Fukien province to any other power without Japanese approval. But the Chinese resisted group V of the Twenty-one Demands, which would have reduced China to the status of a Japanese ward. Japan had gained abundant opportunity for the exploitation of Manchuria, but the ill feeling aroused by the negotiations, together with Chinese chagrin at failure to recover its losses in the Treaty of Versailles, cost Japan any hope of Chinese friendship. Subsequent Japanese sponsorship of corrupt warlord regimes in Manchuria and North China helped to confirm the anti-Japanese nature of modern Chinese nationalism.

The Twenty-one Demands

Japanese behaviour when the Allies intervened in Siberia in 1918 after the Bolshevik Revolution furthered the impression of Japanese rapacity. One of the principal reasons for a disarmament conference in Washington, D.C. (1922), was an attempt to lessen Japanese influence. A network of treaties was worked out that placed restraints on Japanese ambitions while guaranteeing Japanese security. Japan, Great Britain, the United States, and France concluded a four-power pact that replaced the Anglo-Japanese alliance; a five-power pact (with Italy) for disarmament set limitations for capital ship construction on a ratio of five for Great Britain and the United States to three for Japan. Parallel guarantees against fortifying advanced bases assured Japan of safety in Pacific waters. A nine-power pact would, it was hoped, protect China from further unilateral demands. Japan subsequently agreed to retire from Shantung, and, shortly afterward, Japanese armies withdrew from Siberia and northern Sakhalin. In 1925 a treaty with the Soviet Union extended recognition and ended active hostilities.

Thus, by the mid-1920s Japan's great surge forward in the Pacific had ended; this brought hope that a new quality of moderation and reasonableness, based on the absence of irritating reminders of inferiority and weakness, might characterize Japanese policy.

Lower-house opposition

Constitutional government. The inauguration of constitutional government in 1890 saw a vigorous and often obstreperous opposition in the lower house of the Diet, and it was probably general determination to prove that parliamentary institutions could work in Japan that forced the party and government leaders to cooperate sufficiently to make the system work. The first Cabinets, led by Yamagata Aritomo, Matsukata Masayoshi, and Itō, attempted to maintain the principle that the government, which in their view represented the emperor, should be aloof from parties and that it was the duty of the lower house to approve government requests. This policy failed because the parties desired to increase their power and patronage and therefore sought Cabinets responsible to the lower house. It was only the Sino-Japanese War that produced the kind of unity the constitution makers had envisaged. In the years that followed, the oligarchs formed alliances with the two parties, usually exchanging a Cabinet seat or two for support in the lower house. These arrangements proved unsatisfactory as party leaders soon raised their sights. In 1898 Itagaki and Ōkuma combined forces to form a single party, the Kenseitō, and, because this ruled out successful administration by a nonparty Cabinet, they were allowed to form a government. But their alliance was of short duration, as long-standing animosities and jealousies enabled antiparty forces among the bureaucracy and oligarchy to force their resignation within a few months.

A discernible division now developed among the dwindling group of Meiji leaders. Yamagata Aritomo dominated the army and much of the bureaucracy. During the two years he held power after the fall of the Kenseitō Cabinet, he strengthened legal and institutional safeguards against rule by political parties and secured an Imperial ordinance that service ministers should be career officers on the active list; this gave the army or navy power to break a Cabinet. Partly in reaction, Itō Hirobumi, also of Chōshū, formed his own political party in 1900, the Rikken Seiyūkai, enlisting most of the former followers of Itagaki. Thereafter, practical political goals of power and patronage softened the hostility between oligarchs and politicians.

After 1901 both Itō and Yamagata retired from active participation in politics; until 1913 Cabinets were led by their protégês Saionji Kimmochi and Katsura Tarō. Basic decisions of politics and policy, however, continued to be made by the core group of elder statesmen, who advised the Emperor on all important decisions and selected prime ministers by rotating power between the two principal factions. Saionji was the last to be recruited into this extraconstitutional body.

Changing political patterns

With the death or enfeeblement of the first generation of leaders, the pattern of political manipulation changed. No subsequent group could match the prestige the Meiji leaders had enjoyed. The Meiji emperor died in 1912 and was succeeded by a son who took the reign name Taishō ("great righteousness," reigned 1912–26); but mental illness prevented him from approximating his father's fame. The growth in prestige and power of businessmen found expression in their control of the political parties and resulted in an increasing role for professional party politicians. The *genrō*'s last attempt to seat Katsura in 1912 ended in failure, while his successor, Adm. Yamamoto Gonnohyōe, was discredited by scandals in naval procurement. Ōkuma Shigenobu emerged from retirement to head a Cabinet during World War I and was succeeded by a military Cabinet under Gen. Terauchi Masatake. In 1918, however, discontent with Terauchi's reactionary posture and administrative incompetence combined with the rising power of the party professionals to bring about the appointment of Hara Takashi (Hara Kei) as prime minister. Hara was the first nontitled person to hold that office, and his appointment marked the first party Cabinet. His assassination in 1921 cut short his cautious efforts to reduce the power of the military and the bureaucracy and to extend the franchise. After several short-lived Cabinets, a successful party Cabinet was organized in 1924 by Katō Takaaki. The army was reduced in size; moderate social legislation was enacted; and universal manhood suffrage extended the franchise to 14,000,000 voters. Meanwhile, Japan avoided stronger steps in China's civil war and pursued a conciliatory course with Russia, despite demands from nationalists, who utilized alleged outrages in China and the discriminatory U.S. Immigration Act of 1924 to warn of the futility of appeasing or cooperating with other powers.

But, as the parties grew in power, they tended to look to bureaucrats for leadership. The businessmen who supported the parties and the bureaucrats who led them shared a fear of the social movements that followed in-

Reaction to social movements

dustrialization and the importation of foreign ideas. A growing labour movement had already been checked by a special police law introduced in 1900. This was strengthened under Katō in 1925, as conservatives generally began to fear subversion in labour and tenant movements. A small Communist party was organized by a group of intellectuals in 1922, and a general interest in Marxist thought contributed to more fears of subversion. Under the Meiji constitution, party governments had to make their peace with the military, with the House of Peers, and with the conservatives close to the throne; whatever ideas for reform they had therefore had to be worked out with the utmost caution. Frequently, the Diet found itself virtually powerless, and this encouraged corruption and disorders in the chamber, which did little to win popular respect for the machinery of representative government. There were no institutional changes that enabled a government to be firmly based on popular support. The Meiji Constitution was so ambiguous in its provisions for the executive that the party prime ministers could achieve little unless they secured, through compromise, the cooperation of forces antagonistic to democratic government.

Social change. Changes in the social and intellectual scene outstripped those in the political. Many of them were related to the development of industry. After the Treaty of Shimonoseki the government utilized the Chinese indemnity to subsidize the Yawata Iron and Steel Works, which were established in 1897 and began production in 1901. Yawata depended on China for its ores. After 1900 Japan's population exceeded the capabilities of domestic food production so that there was need to import food as well. Growing textile and other consumer-goods industries expanded to meet Japanese needs and to earn credits required for the import of raw materials. Heavy industry was encouraged by government-controlled banks, which provided needed capital. Strategic industries, notably steel and the principal rail trunk lines, were in government hands, but most new growth was in the private sector, albeit somewhat concentrated in the *zaibatsu* financial and industrial giants.

Social protest

The enlarged urban population produced movements of social inquiry and protest. In 1895 the industrial labour force numbered about 400,000. Several efforts to organize socialist movements speedily met with police repression. Peace preservation laws were passed in 1900 and 1925, and in 1928 it became a capital crime to agitate against private property or Japanese state policy (*kokutai*). In 1903 a small group organized the *Heimin shimbun* ("Commoner's Newspaper"); it published *The Communist Manifesto* and opposed the Russo-Japanese War in the name of the workers of Russia and Japan before being forced to cease publication. The labour and Socialist movements gained strength after World War I, but leadership was usually theoretical and doctrinaire, with little real contact with the workers. Police repression and the difficulties of organizing a labour force of diverse industrial empires such as those of Mitsui and Mitsubishi also retarded the labour movement. Meanwhile, the increasing confidence and power of management came to influence and at times control the political parties. The Katō Cabinet of 1924–26 was sometimes referred to as a Mitsubishi Cabinet.

In the countryside the principal reflection of the new trade patterns was an additional impetus to silkworm production to augment the farmers' income. Farm villages also provided the bulk of the labourers for the new industries, and farm daughters were found in many textile plants. The early 20th century was not a time of agricultural prosperity. Farmers were handicapped by growing fragmentation of holdings and increasing tenantry. The rising number of tenants resulted in the growth of tenant organizations, especially during and after World War I. Government efforts to encourage voluntary reform brought only a law for mediation of disputes in 1924. But a financial panic in 1927 aggravated rural conditions and indebtedness even before the collapse of the U.S. silk market in 1929 spelled disaster for the farmers and workers alike.

The most lasting social changes were found in the great metropolitan centres, where a growing labour force and new middle-income groups were concentrated. The Tokyo–Yokohama area was devastated by the great Kantō earthquake in 1923, and its reconstruction as a modern metropolis symbolized the growth and orientation of the urban society. The currents of enthusiasm during and after World War I were uniformly international and largely U.S. in inspiration. Western music, dancing, and sports became popular, and rising standards of living and expectation produced the need for more and better higher education. The participation of women in office work in the new enterprises and the rise of a feminist movement, however unsuccessful, marked the beginning of changes in the family system.

The educated class grew in numbers and in vigour. Currents of thought included Western-style democracy and the new radicalism of the Soviet Union; the Marxist influence went far beyond the ranks of the struggling Communist Party—which was, in any event, soon crushed by the police. Political liberalism was championed by the University of Tokyo figure Yoshino Sakuzō, who formed a group of students and intellectuals the title of which—Shinjinkai (New Peoples Association)—symbolized the self-conscious break with tradition. Minobe Tatsukichi, a distinguished constitutional theorist, introduced the idea that the emperor was an organ of the state and not the sole source of sovereignty. Such men faced sharp criticism and had, in time, to resign their positions, but they had great influence and symbolized and stimulated advanced currents of thinking.

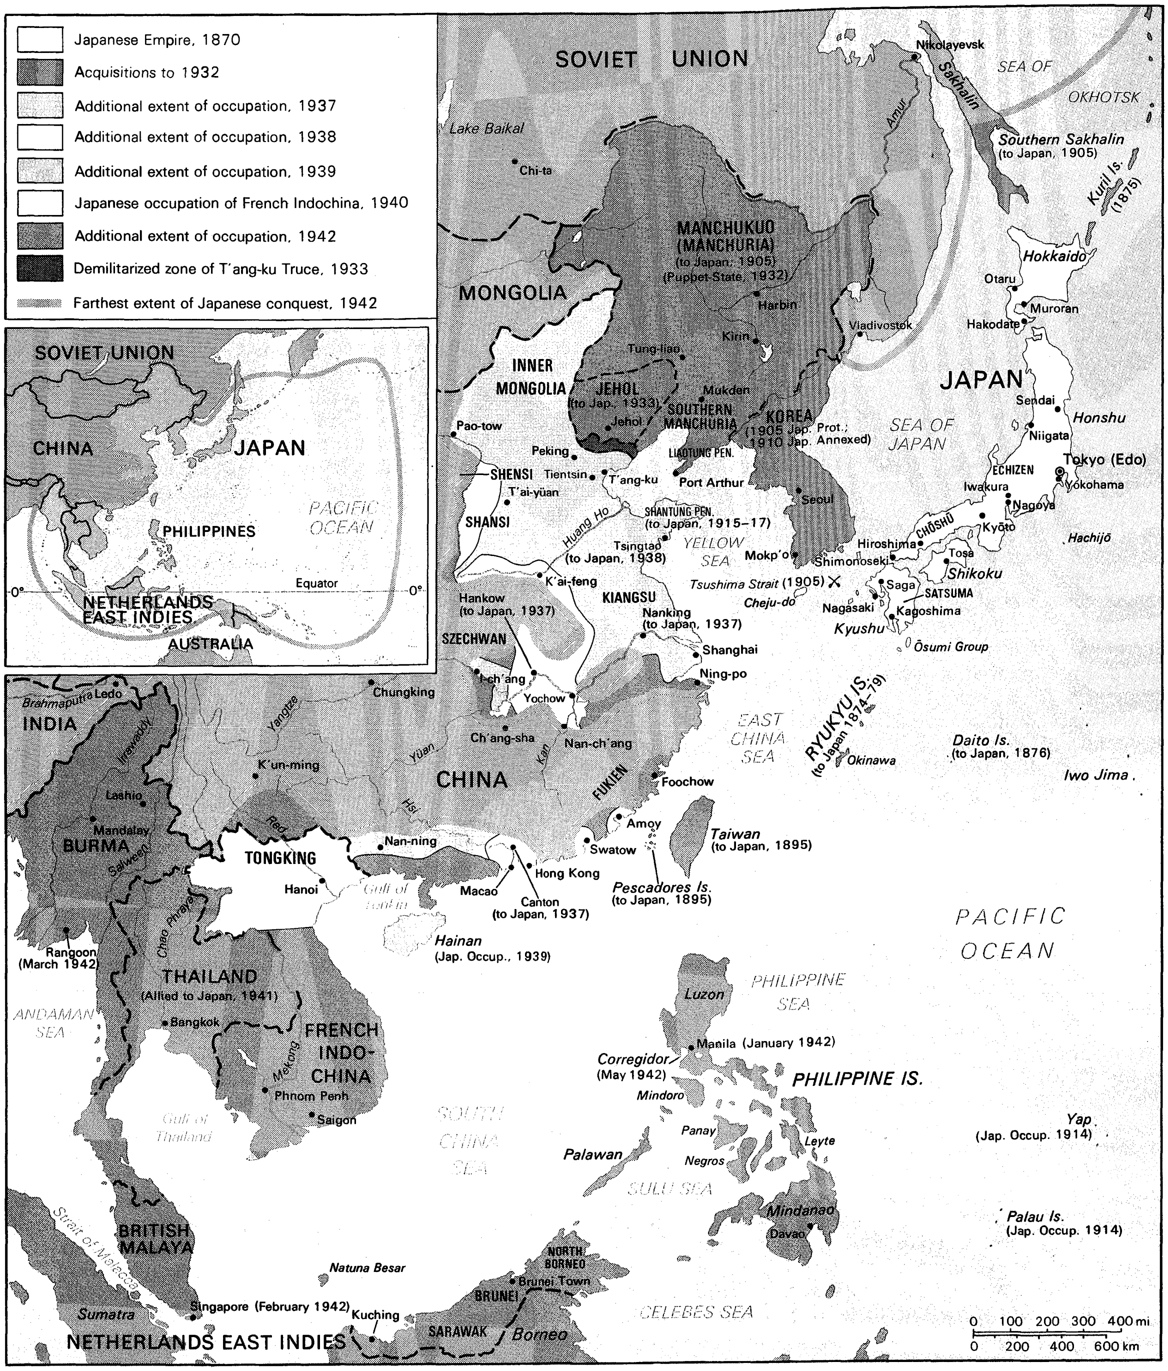
Attempts to break with tradition

The base for these new currents was precarious. Politically and institutionally, no advances—beyond the universal manhood suffrage of 1925—were scored, while, under the peace-preservation laws of 1928, a special police corps was established to seek out "dangerous thoughts." Economically, the urban classes were dependent upon the continuance of the favourable trade patterns of the 1920s. When the Great Depression at the end of the decade wrecked Japan's foreign markets and removed the possibility of the villagers' augmenting rice income with that of silk and when the irresponsibility and occasional corruption of Diet representatives contrasted with poverty elsewhere in Japanese society, many were prepared to listen to charges that the political-party government, dominated by selfish *zaibatsu* interests, had neglected Japan's markets in China, imperilled morality and decency at home, and allowed subversive trends to flourish, while the politicians reaped personal gains.

The rise of the militarists. The notion that expansion through military conquest would solve Japan's economic problems gained currency during the Great Depression of 1929. A key argument advanced to support it was that Japan's population had grown from 30,000,000 at the time of the Meiji Restoration to almost 65,000,000 in 1930; each year the problem grew worse, and the imports of needed foodstuffs increased. It was also argued that emigration to many areas was cut off because of discrimination against Oriental peoples. Efforts made by Japan and China to secure a racial-equality clause in the League of Nations covenant had been frustrated by Western statesmen who feared the anger of their constituents. So the argument ran that no recourse could be expected without resort to force.

Military distrust of party government

To these economic and racial arguments was added the military's distrust of party government. The Washington conference had allowed a smaller ratio of naval strength than the navy had desired, and the government of Prime Minister Hamaguchi Osachi in 1930 accepted and gained approval of the London Naval Conference limitations of cruiser strength over military objections. The Katō government had cut the army strength. Many service leaders had also bridled under Japan's moderation during the Chinese Kuomintang northern expedition in 1926 and 1927, and they would have preferred a much stronger stand. The Seiyūkai Cabinet under Prime Minister Tanaka Giichi reversed that policy by intervening in Shantung in 1927 and 1928. Tanaka was forced out in 1929 and replaced by Hamaguchi, under whom the policy of moderation returned. It seemed to many that such vacillation earned Japan ill will and expensive boycotts in China without gaining any advantage.



Japanese expansion in the late 19th and 20th centuries.

Many military leaders resented the restrictions that civilian governments had placed upon them, and their power was considerable. It would be wrong to attribute such views to all or even most of the high command, but enough army officers in particular held this position to furnish a possible focus for dissatisfaction among other groups in Japanese society. The idea of the frugal, selfless samurai was peculiarly useful as a contrast to the stock characterization of the selfish party politician.

These economic pressures and political misgivings were exploited by civilian ultranationalists who opposed parliamentary government as "un-Japanese." Since Meiji times a number of rightist organizations had formed, dedicated to the theme of internal "purity" and external expansion. They sought to preserve what they thought was unique in the Japanese spirit and fought against excessive Western influences. Some originated in the Meiji period, when nationalists had felt obliged to work for a "fundamental settlement" of differences with Russia; the Kokuryūkai (Black Dragon Society, popularly the Amur River Society) was one such, while others, such as the Seisantō (Productivity Society), were keyed to labour and social problems. The Kokusūikai (National Purity Society) worked to preserve national purity, while the Ketsumeidan (League of Blood) was terrorist. They opposed political parties, big business, acculturation, and Westernization. By allying with other rightists, they alternately terrorized and intimidated their presumed opponents. A number of business leaders and political figures lost their lives, and the assassins' success in publicizing and dramatizing the virtues they claimed to embody had a considerable importance in the ethos of the troubled 1930s. It is clear, however, that the terrorists never had as much influence as they claimed or as the West believed.

The principal force against parliamentary government was provided by junior military officers. Largely from rural backgrounds, distrustful of their senior leaders, ignorant of political economy, and contemptuous of the urban luxuries of politicians, the officers were ready marks for rightist theorists. Many of them were animated by goals that were national-socialist in character. Kita Ikki, a former Socialist and former member of the Kokuryūkai, wrote in his outline for the reconstruction of Japan that the Meiji Constitution should be set aside in favour of a revolutionary regime advised by "national patriots" and headed initially by a military government, which should nationalize major forms of property, limit wealth, end party-government and peerage systems, and prepare to grasp the leadership of a revolutionary Asia. Kita helped persuade a number of young officers to take part in the violence of the 1930s, in large measure designed to create disorder so great that military government would follow.

Aggression in Manchuria

The Kwantung Army, which invested the Kwantung (Liaotung) Peninsula and patrolled the South Manchurian Railway zone, provided a rich harvest of officers keenly aware of Japan's continental interests and prepared to take steps to further them. They hoped to place the civilian government in an untenable position and to force its hand. The Tokyo terrorists similarly sought to change foreign as well as domestic policies. The pattern of direct action in Manchuria began with the murder in 1928 of Marshal Chang Tso-lin, the warlord ruler of Manchuria. The action, though not authorized by the Tanaka government, helped bring about its fall. Tanaka's Cabinet, however, dared not investigate and punish those responsible, and this convinced extremist officers that their lofty motives would make retribution impossible. The succeeding government of Prime Minister Hamaguchi showed intentions of restraining military activists and powers, however, and the next plots centred around plans for replacing civilian government altogether; Hamaguchi was mortally wounded by an assassin in 1930. In March 1931 a coup involving highly placed army generals, planned to terrorize civilian politicians into a grant of martial law, was abandoned because of disagreement among the principals.

Terrorism and revolts

On September 18, 1931, came the Manchurian Incident, which launched aggression in East Asia. A Kwantung Army charge that Chinese soldiers had tried to bomb a South Manchurian Railway train (which arrived at its destination safely) resulted in a speedy and unauthorized capture of Mukden, followed by the occupation of all Manchuria. The civilian government in Tokyo could not stop the army, and even army headquarters was not always in full control of the field commanders. Prime Minister Wakatsuki Reijirō gave way, in December 1931, to Inukai Tsuyoshi. Inukai's plans to stop the armies by Imperial intervention were frustrated. In 1932 naval officers took the lead in extremism; a terrorist attack in Tokyo in May took the life of Inukai but failed to secure a proclamation of martial law. The army now announced that it would accept no party Cabinet. To forestall its desires for power, the last *genrō,* Saionji, suggested retired Adm. Saitō Makoto as prime minister. Plotting continued, culminating in a revolt of a regiment about to leave for Manchuria. On February 26, 1936, several outstanding statesmen (including Saitō) were murdered; Prime Minister Okada Keisuke escaped when the assassins mistakenly shot his brother-in-law. For more than three days the rebel unit held much of downtown Tokyo. When the revolt was put down on February 29, the ringleaders were quickly arrested and executed. The influence of the young extremists, the Imperial Way faction (Kōdō-ha), now gave way before that of the more cautious Control faction (Tōsei-ha), which had less sweeping plans for internal reform but shared many of the foreign-policy goals of the young fanatics.

The only possible source of prestige sufficient to thwart the military lay with the throne. The senior statesmen, however, were cautious lest they imperil the Imperial institution itself. The young emperor Hirohito had succeeded to the rule in 1926, taking as his reign title Shōwa. His outlook was more progressive than that of his predecessors; he had travelled in the West, and his interests lay in marine biology (of which the ultranationalists disapproved in one whose role it was to embody the Japanese mystique). The palace advisers feared that a strong stand by the Emperor would only widen the search for victims and might lead to dethronement of the monarch. As international criticism of Japan's aggression grew, many Japanese rallied to the support of their soldiers.

Creation of Manchukuo

The road to World War II. Each advance by the military extremists gained them a new compromise concession by more moderate elements in the government and brought greater foreign hostility and distrust. Rather than attempt to thwart the military, the government agreed to reconstitute Manchuria as the "independent" state of Manchukuo. The last Manchu emperor of China, P'u-i was first declared regent and then enthroned as emperor in 1934. Actual control lay with the Kwantung Army, however; all key positions were held by Japanese, with surface authority for cooperative Chinese and Manchu. A League of Nations committee recommended in October 1932 that Japanese troops be withdrawn, Chinese sovereignty in Manchuria recognized, and a large measure of autonomy granted to Manchuria. The League called upon member states to withhold recognition from the new puppet state. In March 1933 Japan formally withdrew from the world body. Thereafter, Japan poured technicians and capital into Manchukuo, exploiting its rich resources to establish the base for the heavy-industry complex that was to undergird the new order in East Asia.

In northern China, boundary areas were consolidated in order to enlarge Japan's economic sphere. In early 1932 the Japanese Navy precipitated an incident at Shanghai in order to end a boycott of Japanese goods there; but Japan was not yet prepared to challenge other powers for control of central China, and a League of Nations commission arranged terms for a withdrawal in May 1932. Frustrated naval officers returned to Tokyo to carry out the violence that killed Inukai on May 15. A move southward from Manchuria into Jehol in January 1933 led to the T'ang-ku Truce in May, whereby a demilitarized zone was set up between Peking and the Great Wall. This brought the fighting to a temporary close. In 1934, Japan made it clear that it would brook no interference in its China policy and that Chinese attempts to procure technical or military assistance elsewhere would bring Japanese opposition.

Further external ambitions, however, had to wait for the resolution of domestic crises. The military revolt in Tokyo in February 1936 marked the high point of the extremist faction and the consolidation of power by the Control faction within the army. Finance minister Takahashi Korekiyo, whose policies had brought Japan out of its economic depression, was killed, and his opposition to further inflationary spending was thus stilled. When further efforts by the palace advisers to defer full power for the military failed, the leadership went to the popular but ineffective Konoe Fumimaro, scion of an ancient court family (June 1937). In this same period Chiang Kai-shek was kidnapped by Chinese border armies at Sian in December 1936, and he formulated an agreement to consolidate Nationalist and Communist efforts into an anti-Japanese front. To this was added evidence that the Japanese people were not yet prepared to renounce their parliamentary system. In the spring of 1937, general elections showed a startling strength for a new Social Mass Party, which received 36 seats out of 466, and a heavy majority for the two parties (the Seiyūkai and its rival the Minseitō), which had combined forces against the government and its policies. The time seemed ready for new efforts by civilian leaders, but the field armies anticipated them.

The Marco Polo Bridge Incident

On July 7, 1937, Japanese troops engaged Chinese units near Peking. Soon dubbed the Marco Polo Bridge Incident, it rekindled warfare between China and Japan. Japanese armies took Nanking, Hankow, and Canton despite vigorous Chinese resistance; to the north, Inner Mongolia and the provinces of Shansi and Shensi were invaded but not fully invested. On discovering that the Nationalist government, which had retired to Chungking in Szechwan, refused to compromise, the Japanese installed a more cooperative regime at Nanking in 1940.

Japan had signed the Anti-Comintern Pact with Germany in November 1936 and later with Italy. This was replaced by the Tripartite Pact in September 1940, by which Japan was recognized as the leader of a new order for Asia, and the three signatories agreed to assist each other if any one was attacked by a power not then at war. This was directed against the United States, since the Soviets and Nazis were then allied; the Soviet Union was invited to join in the pact later in 1940.

Japanese relations with the Soviet Union were considerably less cordial than those with Germany. The Soviets consented, however, to sell their Chinese Eastern Railway holdings to the South Manchurian Railway in 1935, thereby strengthening Manchukuo. In 1937 the Soviet Union signed a nonaggression pact with China, and in 1938 and 1939 Russian and Japanese armies tested each other in two full-scale battles along the border of Manchukuo. The Soviet-Nazi pact of August 1939, however, was followed by a neutrality pact between the Soviet Union and Japan in April 1941.

The German–Japanese tie was never a close or effective one. Both parties were limited in their cooperation by distance, distrust, and claims of racial superiority. The Japanese were uninformed about Nazi plans for attacking the Soviet Union, and the Germans were not told of Japan's plans to attack Pearl Harbor. Nor, despite formal statements of rapport, did Japan's state structure approach the totalitarianism of the Nazis. A national-mobilization law (1938) gave the Konoe government sweeping economic and political powers, and in 1940, under the second Konoe Cabinet, the Imperial Rule Assistance Association was established to merge the political parties into one central organization; yet, the institutional structure of the Meiji Constitution was never altered, and the wartime governments never achieved full control over interservice competition. The Imperial Rule Assistance Association never succeeded in mobilizing all segments of national life around a leader. The emperor remained but a symbol, albeit an increasingly military one, and no *Führer* could compete without endangering the national polity. Wartime social and economic thought retained important vestiges of an agrarianism and familism that were in essence premodern rather than totalitarian.

Relations with the democratic powers

Japan's relations with the democratic powers deteriorated steadily. The United States and Great Britain did what they could to assist the Chinese Nationalist cause. The Burma Road permitted the transport of minimal supplies to Nationalist forces. Constant Japanese efforts to close this route were successful briefly in 1940, when the British felt they could not risk a second war. But anti-Japanese feeling had strengthened in the United States, especially after the sinking of a U.S. gunboat, the "Panay," in the Yangtze River in 1937. In 1939 U.S. Secretary of State Cordell Hull denounced the 1911 treaty of commerce with Japan, and thus embargoes became possible in 1940. Pres. Franklin D. Roosevelt's efforts to rally public opinion against aggressors included efforts to stop Japan, but, even after the outbreak of war in Europe in 1939, public opinion in the United States was averse to courting war by stronger measures.

The European war presented the Japanese with tempting opportunities. After the Nazi attack on Russia (1941), the Japanese were torn between German urgings to join the war against the Soviets and their natural inclination to seek richer prizes from the colonial powers to the south. In 1940 Japan had occupied northern Indochina in an attempt to block access to supplies of the Chinese Nationalists, and in July 1941 it announced a joint protectorate with Vichy France over the whole colony. The way was prepared for further moves in Southeast Asia.

The United States reacted to the occupation of Indochina by freezing Japanese assets and declaring an embargo on oil to Japan. The government was faced with the alternatives of withdrawing from at least Indochina and possibly China or seizing the sources of oil production in the Netherlands East Indies. Negotiations with Washington were carried on under the second Konoe Cabinet. Konoe was willing to withdraw from Indochina, and he sought a personal meeting with Roosevelt, hopeful of some U.S. concessions or favour with which he might convince his military leaders. But the U.S. State Department refused to agree to a meeting without prior Japanese concessions. Pressed by his war minister, Gen. Tōjō Hideki, Konoe resigned in October 1941 to be succeeded by Tōjō. Secretary of State Hull refused to agree to Japan's "final offer": Japan would withdraw from Indochina after China had come to terms in return for U.S. promises to resume oil shipments, cease aid to China, and unfreeze Japanese assets. With Japan's decision for war made, the negotiators received instructions to continue to negotiate. Preparations for the opening strike against the U.S. fleet at Pearl Harbor were already in motion. The Japanese military elected to try to establish, through a "new order in East Asia," a co-prosperity sphere in which Japan, as the centre of an industrial bloc comprising Manchuria, Korea, and North China, would draw from the rich colonies of Southeast Asia the raw materials it needed, while inspiring them to friendship and alliance by destruction of their previous masters. But, in practice, "East Asia for the Asiatics," Japan's slogan, turned out to mean "East Asia for Japan."

Preparations for war

World War II and defeat. The attack on Pearl Harbor (December 7, 1941) achieved complete surprise and success. It also unified U.S. opinion and determination to see the war through to a successful finish. The Japanese had expected that, once they fortified their new holdings, a reconquest would be so expensive in lives and treasure that it would discourage the "soft" democracies. Instead, the U.S. fleet was rebuilt with astonishing speed, and the chain of defenses was breached before these riches could be effectively tapped by Japan.

Early successes

The first years of the war brought Japan great success. Japanese troops occupied Manila in January 1942, although Corregidor held out until May; Singapore fell in February, the Netherlands Indies and Rangoon in early March. The Allies had difficulty maintaining communication lines to Australia, and the loss of the British battleships "Repulse" and "Prince of Wales," added to the U.S. Pacific fleet disaster, seemed to promise the Japanese Navy freedom of action. Tōjō grew in confidence and popularity and began to style himself somewhat in the manner of a Fascist leader. But the U.S. Navy had not been permanently driven from the South Pacific. The Battle of Midway in June 1942 cost the Japanese fleet aircraft carrier strength it could ill afford to lose, and the battle for Guadalcanal in the Solomons ended with Japanese withdrawal in February 1943.

After Midway, Japanese naval leaders came secretly to the conclusion that Japan's outlook for victory was poor. When the fall of Saipan in July 1944 brought U.S. bombers within range of Tokyo, the Tōjō Cabinet was replaced by that of Koiso Kuniaki. Koiso formed a supreme war direction council designed as a link between the Cabinet and the high command. It was becoming evident that Japan was losing the war, but no group had a program acceptable to the military leaders. There were also grave problems about breaking the news to the Japanese people, who had been told only of victories. Great fire-bombing raids in 1945 brought destruction to every major city except the old capital of Kyōto; but the generals were still determined to continue the war, confident that a major victory or a protracted battle would be the best way of gaining honourable terms. The Allied talk of unconditional surrender provided a good excuse for continuing the fight.

In February 1945 the Emperor met with a group of senior statesmen to discuss steps that might be taken. When U.S. landings were made on Okinawa in April, the Koiso government fell. The problem of the new premier, Adm. Suzuki Kantarō, was not whether to end the war but how best to do so. The first plan advanced was to ask the Soviet Union, with which Japan was still at peace, to intercede with the Allies. The Soviet government, however, was planning to enter the Pacific war, and reply was delayed while Soviet leaders took part in the Potsdam Conference in July. The Potsdam Declaration of July 26 offered the first ray of light with its statement that Japan would not be "enslaved as a race nor destroyed as a nation."

The atomic bombs

On August 6 and 9 the atomic bombs took their toll of life in Hiroshima and Nagasaki. On August 8 the Soviet Union declared war and on the 9th marched into Manchuria, where the Kwangtung Army could offer only slight resistance. The Japanese government attempted to gain as its sole condition for surrender a qualification concerning the maintenance of the Imperial institution; after the Allies agreed to respect the will of the Japanese people, the Emperor insisted on surrender. The Pacific war came to an end on August 14. The formal surrender was signed on September 2 in Tokyo Bay aboard the USS "Missouri."

Military extremists made an unsuccessful attempt to prevent the radio broadcast of the Emperor's announcement to the nation. There were a number of suicides among the military officers and nationalists who felt themselves dishonoured, but the Emperor's prestige and personal will, once expressed, sufficed to bring an orderly transition. To increase the appearance of direct rule, the Suzuki Cabinet was replaced by that of Prince Higashikuni Naruhiko.

Investigators concluded that neither atomic bomb nor Soviet entry was central to the decision to surrender, although they probably helped to advance the date. It was decided that submarine blockade of the Japanese islands had brought economic defeat by preventing exploitation of Japan's new colonies, sinking merchant tonnage, and convincing Japanese leaders of the hopelessness of the war. Bombing brought the consciousness of defeat to the people. Destruction of the Japanese Navy and Air Force jeopardized the home islands. Japan's largest armies, however, were never defeated, and this was responsible for the army's eagerness to fight on. Occupation found Japan's cities destroyed, its stockpiles exhausted, and its plants gutted. The government stood without prestige or respect. An alarming shortage of food and rising inflation threatened what remained of national strength. The time was ripe for changes.

After World War II. *SCAP and its objectives.* Gen. Douglas MacArthur, Supreme Commander, Allied Powers (SCAP), received his orders for the occupation of Japan through U.S. military channels; a Far Eastern Commission made up of Pacific war Allies was to make policy in Washington and provide consultation through an Allied Council for Japan, which sat in Tokyo. In fact the occupation became an American affair, and SCAP grew into a large headquarters. SCAP worked through the Japanese government. In the early years it provided direct instructions frequently, but with time suggestions were made more discreetly.

Purposes of the occupation

Occupation purposes had been held out in general terms in the Potsdam Declaration, with its promises of freedoms and statements of intent to remove undemocratic tendencies; those purposes were defined more precisely in a document that was worked out by the U.S. departments of state, war, and navy. Its emphases were on demilitarization, so that Japan would not again become a danger to peace; on democracy, so that (although the U.S. was not to impose any particular form of government) a responsible Japanese government would guard individual rights; and on encouragement of the Japanese to develop an economy that would be adequate for peacetime needs.

MacArthur responded enthusiastically to the idea of a demilitarized and democratic Japan and utilized the complex pattern of authority under which he functioned to ward off interference from Washington or from the Allies. He rushed constitutional reform to anticipate outside suggestions and first ignored and then delayed moves for partial Japanese rearmament after the Cold War changed U.S. priorities. The occupation measures created an open historical situation in which new forces could and did rise; SCAP measures proved lasting in cases where they coincided with trends already present within Japanese society, and those measures were vital to Japan's recovery as a free society and economy.

The early months of the occupation saw SCAP move swiftly to remove the principal supports of the militarist state. The armed forces were demobilized; State Shintō was disestablished; nationalist organizations were abolished and their members removed from important posts. Also removed from active roles were all persons prominent in wartime organizations and politics, including commissioned officers of the armed services and all high executives of the principal industrial firms. In Tokyo an international tribunal tried General Tōjō and other war leaders, sentencing seven to death, 16 to life imprisonment, and two to shorter terms. Millions of Japanese were repatriated from the former colonies and from Southeast Asia. The Home Ministry, which had controlled wartime Japan through its appointive governors and national police, was abolished, and the Education Ministry was deprived of its sweeping powers to control compulsory education. Because central control and military influence were being attacked by a military government that needed centralized powers in order to be effective, the occupation's role was often contradictory. Geography and economic rationality reinforced the logic of centralization, and many of the moves toward decentralization were modified or reversed a half decade later.

New constitution

Political reform. SCAP informed leading Japanese citizens that constitutional reform should receive first attention. Between October 1945 and February 1946 a Cabinet committee headed by Matsumoto Jōji prepared revisions of the Meiji Constitution, but the changes were few and superficial. MacArthur's government section rushed a new draft and submitted it to the Japanese government as a basis for further deliberations. Despite the misgivings of conservative statesmen, it was approved by the Emperor and submitted for amendment to the first postwar Diet, which had been elected in April 1946 (in these elections women had voted for the first time). The constitution, slightly modified, was promulgated on November 3, 1946, and went into effect on May 3, 1947. Its preface stated the intention of the Japanese people to ensure peaceful cooperation with all nations and the blessings of liberty for themselves and their descendants. The constitution included a 31-article bill of rights, and Article 9 renounced war as a "sovereign right of the nation" and pledged that "land, sea, and air forces, as well as other war potential, will never be maintained." The Emperor was described as the "symbol of the state and of the unity of the people, deriving his position from the will of the people with whom resides sovereign power." Earlier, on January 1, 1946, the Emperor had renounced claim to divinity. The constitution provided for a bicameral Diet, with the greatest power for a House of Representatives, the members serving four-year terms. The old peerage was dissolved and the House of Peers replaced by a House of Councillors, the members serving six-year terms. The prime minister was to be chosen by the Diet from its members, and an independent judiciary had the right of judicial review.

The new constitution thus reversed the Meiji pattern and contributed to responsible government by specifying the locus of executive authority. Despite its hasty preparation and foreign inspiration, it gained wide public support. Although the ruling conservatives desired to revise it after Japan regained its sovereignty in 1952, and an official commission favoured changes in 1964, the decreasing likelihood of mobilizing the two-thirds majority of the Diet necessary to secure approval for changes gradually made the possibility seem moot. In 1982, however, the election as prime minister of Nakasone Yasuhiro, who had long called for revision of Article 9 and preparation of a more "Japanese" constitution, once again revived discussions of revision.

By the time a peace treaty went into effect in 1952, elements of the political pattern had already changed, and subsequent governments showed their ability to modify by administrative actions a constitution that remained unchanged. Decentralization in some fields had proved expensive and inefficient. The police, for instance, while less centralized than in the days of the Home Ministry, had returned to a substantially national organization. Despite the announced goals of local decentralization, changing patterns of communications and administration had shown the logic of incorporating many small units of administration into larger units, a trend particularly marked in the countryside, where villages and towns merged to form a more rational tax structure. Article 9 had been compromised by a decision taken by SCAP to form the National Police Reserve of 75,000 men in 1950, during the Korean War. The force, later (1954) renamed the Self-Defense Forces, came to number about 240,000 by 1980.

Nevertheless, the basic principles of the constitution of 1947 enjoyed support among all factions in Japanese politics. Executive leadership was a chief asset of the new institutions. With the abolition of the competing forces that beset the premiers of the 1930s, the postwar prime ministers found themselves in charge of the administration and, with rearmament, of the armed forces as well. Thus, responsible leadership gradually replaced the ambiguous claims of Imperial rule of earlier days.

Economic and social changes. SCAP's political democratization was reinforced by economic and social changes designed to create interest groups that would use their new rights to protect the new political and economic structure. Changes in the countryside, in industry, and in social legislation all had the same purpose of breaking or weakening the old pattern of hierarchic control that had distinguished the "family-state" ideal of the Meiji leaders.

In agriculture the occupation established a program of land reform to convert tenants into owners. Tenancy had risen after World War I, and only ineffectual measures had been taken against it by the prewar government. Japan's wartime governments made important changes in land relationships. In their attempts to achieve national unity and equal sacrifice, they created agricultural associations to collect all rice. Absentee landlords received a lower rate of payment, and the tenant's relations with his landlord became much less important. Moreover, peasant sons in the armed services were able to send home part of their pay, while the shortage of labour made it possible for many members of farm families to secure gainful employment in factories. Thus, important preliminaries in rural well-being, not least among them the opportunities of the black market, took place prior to SCAP's instructions to the Japanese government to prepare a land-reform plan.

SCAP land reform

The government plan seemed inadequate to occupation authorities, and in the spring of 1946 a SCAP plan was drawn up; it became law in October. By its terms village and prefectural land commissions were elected with tenant, owner-farmer, and landlord representation to select land for purchase and eligible purchasers from among tenants. The government then bought the land at pre-inflation prices and sold it to the tenant. Four years later the reform had changed the ownership of more than two-thirds of Japan's cultivated acreage, and advantageous tax and price arrangements enabled the majority of new owners to pay for their land. The average family holding remained about 2½ acres (one hectare). In view of the larger population and the change in laws covering primogeniture, there was increased fragmentation of land, but the reform helped produce a striking rise in rural prosperity.

Initial Allied plans contemplated exacting heavy reparations from Japan, but the unsettled state of other Asian countries that were to have been recipients brought reconsideration. Except for Japanese assets overseas and a small number of war plants, reparations were very nearly limited to those worked out between Japan and its Asian victims after the peace treaty signed in San Francisco in 1951.

SCAP and the *zaibatsu*

Similar moderation marked the course of planning for deconcentration of the great *zaibatsu* firms. They at first were considered Japan's chief potential war makers but later came to be seen as essential elements in economic recovery. Of 1,200 concerns marked for investigation and possible dissolution in 1948, only 28 were broken up by SCAP, though the major units of the *zaibatsu* empires—holding companies—were dissolved and their securities made available for public purchase. New legislation sought to enforce fair trading and to guard against return to monopolies. Taxes on the profits of war wiped out many large fortunes and affected all large concentrations, while capital levy, inheritance, and graduated income taxes were designed to equalize the tax burden. The removal of wartime leaders from the business world prevented any action by the senior executives of 250 concerns during most of the occupation years. By 1950, extensive changes, although far short of those initially proposed, had taken place in the industrial world. The large banks, however, were not broken up and proved to be the centres for a measure of reconsolidation in the years after the occupation ended.

The balance of economic power was also affected by measures that produced a strong labour movement, which contested with management for political and economic primacy. After the Home and Welfare ministries were dissolved, a new Labour Ministry was established in 1947. All political prisoners, including the core of the Japan Communist Party, were released in the early months of the occupation. Most of those released turned their attention to organizing the labour movement, hoping to use it as a path to power. Laws on trade unions and labour relations, modelled on New Deal legislation in the United States, were passed, and soon a strong union movement appeared, led by men with political ambitions. When a general strike was announced for February 1947, with the avowed purpose of overthrowing the government, SCAP issued an injunction against it. Thereafter, occupation policy was concerned with reconstruction and no longer exclusively with liberation, and steps against inflation, political radicalism, and Communist control of labour unions followed. Under the Socialist Cabinet of Prime Minister Katayama Tetsu, labour education was emphasized, and in July 1948 SCAP ordered the government to take steps to deprive government workers—including those in communications unions—of the right to strike. A new labour organization, the General Council of Trade Unions of Japan (Sōhyō), was sponsored as a counterweight and gradual replacement for the Congress of Industrial Labour Unions of Japan (Sambetsu Kaigi), which had become dominated by the left. After 1951 Sōhyō too became increasingly anti-government and anti-American. Although some occupation measures deprived labour of useful weapons for fighting its way to power, the political strength of organized labour, expressed through the Japan Socialist Party (JSP), remained significantly different from what it had been before the war. The government's failure to carry through a police law designed to curb labour radicalism and sabotage in 1958 demonstrated the powerful support labour held in the Diet, the press, and public opinion.

Labour unions

The postwar social legislation saw energies and hopes long repressed by the Japanese government spring to full flower. The civil code, which reinforced the power of the male head of the family with numerous legal supports, was rewritten to allow for equality between the sexes and joint inheritance rights. Women were given the right to vote and to sit in the Diet. The abolition of the peerage, created in Meiji days, symbolized the modernization of society.

In the years after the peace treaty, which became effective on April 28, 1952, there were a number of changes in the pattern of occupation reforms. The Japanese government continued the emphasis on economic reconstruction that the occupation had inaugurated in 1948. The great labour offensives of the late 1940s had failed in their political objectives, but strikes throughout the 1950s continued to hamper industry. A new pattern of enterprise unions gradually brought peace to industry, while national federations became dominated by government workers. Many of the great firms united around banks whose credit was essential to their operation, and the government's power to allocate foreign currency, inherited from SCAP, gave it power to set and influence industrial policy. Although the land-reform system remained unaltered, rapid industrialization relieved pressure on the countryside as more and more Japanese moved to the cities. Electoral representation remained substantially unchanged, giving agricultural constituencies disproportionate influence in the politics of trade liberalization. Social legislation, however, had created such strong interest groups throughout Japanese society that substantial reversal of postwar changes did not take place. Japan soon entered a period of sustained prosperity and growth, and most Japanese credited this to the egalitarian reforms of the postsurrender years. For many, the new order was symbolized by the marriage of Crown Prince Akihito and a commoner, Shōda Michiko, in 1959.

International relations. Japan's return to international relations at the end of the occupation found it stripped of its conquests and deprived of some of its own territory. The Republic of China on Taiwan, the People's Republic of China on the mainland, the Republic of Korea (South Korea), and the Democratic People's Republic of Korea (North Korea) possessed military establishments far larger than Japan's Self-Defense Forces. International relations were not destined to be conducted on the pacifist lines envisioned by Article 9 of the constitution of 1947. The United States maintained its occupancy of Okinawa and the Ryukyus, while the Soviet Union occupied the entire

Kuril chain and reclaimed southern Sakhalin. The Korean War, which broke out in June 1950, increased the urgency of a peace treaty. Arrangements were worked out between the principal non-Communist allies before and during the command of Gen. Matthew B. Ridgway, who succeeded MacArthur as supreme commander in April 1951.

The San Francisco Conference that convened in September 1951 to sign the Japanese peace treaty ratified arrangements that had been worked out earlier by John Foster Dulles under the direction of Secretary of State Dean Acheson. Japan recognized the independence of Korea and renounced all rights to Taiwan and the Pescadores, the Kurils, and southern Sakhalin and gave up its rights in the Pacific islands to which it had held mandate under the League of Nations. The Soviet Union attended the San Francisco Conference, but it failed to make its objections to the treaty heard and consequently did not become a signatory. This enabled Japan to retain the hope of regaining at least the Kuril islands closest to Hokkaido—territory that it had not seized in war—through diplomatic efforts.

The San Francisco peace treaty recognized Japan's "right of individual and collective self-defense," which was exercised through a U.S.–Japan security pact whereby U.S. forces would remain until Japan could "assume responsibility for its own defense." Japan agreed not to grant similar rights to a third power without U.S. approval. U.S. assistance was extended to the Japanese defense forces, while U.S. units, except for air detachments and naval bases, were gradually removed to Okinawa.

Reparation treaties

The peace treaty made no arrangement for reparations for Japan's Pacific war victims but provided that Japan should negotiate with the countries concerned. Consequently, effective resumption of relations with the nations of Asia came only after treaties covering reparations had been worked out. These were signed with Burma in 1954, the Philippines in 1956, and Indonesia in 1958. In 1956 Japan restored diplomatic relations with the Soviet Union but without working out a formal peace treaty. In December 1956, with the Soviet Union no longer invoking a veto, Japan was admitted to the United Nations and subsequently became active in UN meetings and specialized agencies. It also became a contributing member of the Colombo Plan group of nations for economic development in South and Southeast Asia, of the General Agreement on Tariffs and Trade (GATT), and of the Organization for Economic Cooperation and Development (OECD). For many Japanese, their country's return to international status and eminence was symbolized by its holding the Olympic Games in 1964 and an international fair (Expo 70) at Ōsaka in 1970. Japan played a leading role in the creation of the Asian Development Bank in 1965–66.

At the time of the San Francisco treaty, Prime Minister Yoshida Shigeru had intended to delay committing Japan to either of the two Chinas, and the absence of both governments from San Francisco made this seem possible. But John Foster Dulles convinced Yoshida that the treaty would meet opposition in the U.S. Senate unless some assurance was given that Japan would recognize the Republic of China on Taiwan; thus, Tokyo soon negotiated a peace treaty with that regime but a treaty that did not prejudice possible subsequent negotiations with Peking. A lively trade developed between Japan and Taiwan, and Japanese contributions to the economy of Taiwan were considerable. The treaty also encouraged the development within Japan's Liberal-Democratic Party (LDP) of a so-called Taiwan lobby. Because Japan's relations with Peking remained tenuous, Chiang Kai-shek was for a time able to hold the Japanese government to its commitments by threatening to cut off Taiwan trade if Tokyo considered developmental loans to the mainland.

Chinese–Japanese trade

Mainland trade relationships developed slowly in the absence of political ties. In 1953 an unofficial trade pact was signed between private Japanese groups and authorities of the People's Republic, and the list of goods under embargo for mainland trade was gradually shortened. As late as 1972, however, 167 items remained on that list. In addition to unofficial agreements with Japanese firms designated as friendly by Peking, there developed in the 1960s an informal, semiofficial "memorandum" trade that became increasingly important. The Peking government made skillful use of trade for political purposes, in the hope of embarrassing or weakening Japan's conservative governments, and intervals of ideological tension on the mainland were usually reflected in declining trade with Japan. In 1958 China's Great Leap Forward campaign resulted in a temporary closure of all trade with Japan, and in the mid-1960s the Great Proletarian Cultural Revolution resulted in a severe decline. Nevertheless, Japan gradually became China's most important trading partner.

In 1971 Pres. Richard M. Nixon's announcement of a forthcoming visit to Peking produced a rapid growth in Japanese willingness to compromise ties with Taiwan in favour of closer relations with Peking. Peking also indicated new interest in formal relations with Japan, subject to the revocation of Japan's treaty with Taiwan. The People's Republic was admitted to the United Nations in 1971; in September 1972 Prime Minister Tanaka Kakuei reached agreement with Peking on steps to normalize relations, and simultaneously Japan severed its ties with Taiwan, replacing its embassy with a nonofficial office. Japan then vigorously pursued trade opportunities with the People's Republic, and in August 1978 the two countries concluded a Treaty of Peace and Friendship that bound both to "perpetual peace and friendship" and pledged them to oppose "hegemony" from whatever source and to foster economic and cultural relations. That same year, an eight-year agreement for a total of $20,000,000,000 in industrial contracts was signed. As Peking's program of modernization seemed to falter, however, Japanese investors moderated their expectations and showed renewed interest in Taiwan. Moderation in Peking and Taiwan made it possible to pursue both objectives. Japan also developed massive interests in South Korea, with which it had signed a treaty in 1965 that provided for reparations and opened the way to trade and investment.

Japanese–Chinese Treaty of Peace and Friendship

Postwar politics. After the surrender in 1945, Japanese politics at first returned to the pattern that had been interrupted by the militarist domination of national life. Extremists of the right were discredited by their identification with the lost war. Their major figures were removed from office or arrested, and until 1952, when all but those convicted by the international tribunal were permitted to resume their careers, little rightist organization was possible. Thereafter, some figures of the 1930s reemerged, but the rightists lacked unity and could offer no program of leadership in Asia. They were handicapped by a decline of support in the military and business sectors. Most important, rightist ideology found few listeners among the postwar generation accustomed to new freedoms. Except for a few spectacular incidents, such as the murder of the Socialist leader Asanuma Inajirō in 1960, rightist activities were limited to efforts to revive national holidays, such as February 11 (Foundation Day, for Emperor Jimmu, a campaign that succeeded in 1966), and demonstrations against the Soviet Union and China.

The left fared better for a time. With the release of political prisoners after the war, and with the repeal of the peace-preservation laws that had hampered political organization in prewar days, prominent Communist Party leaders returned to action. Land reform deprived them of an issue they had used elsewhere in Asia, but the postwar years, with their confusion and economic hardship, provided a favourable climate for Communists. Their high point at the polls came in the general election of 1949, when Communists placed 35 candidates in the House of Representatives and received nearly 10 percent of the vote.

On the outbreak of the Korean War in 1950, SCAP ordered Communist leaders removed from politics. Most chose to go underground, reappearing after the occupation ended. By that time popular sympathy with the Communist cause had declined markedly. The steady rise of living standards, the uncooperative attitude of the Soviet Union in negotiations over the Kuril Islands and in fishing-treaty discussions, a popular distaste for Communist opposition to the Imperial institution, and widespread dislike of the extremist tactics shown by leftist labour unions combined to create an unpromising climate for the Communists.

While not reversed, these trends were modified in the late

1960s. The spectacular economic growth of that decade produced great urban migrations that provided promising settings for mass organization and politics, and both conservative-religious (*e.g.,* Kōmeitō, or Clean Government Party, the political arm of the Sōka-gakkai movement) and radical political movements grew in strength. The conservative government's policy of giving priority to export development over social-welfare measures, though partly justified by a rising standard of living in which all groups shared, did little to alleviate the difficult conditions for many of the new recruits to the urban labour force. Communist leaders exploited their possibilities skillfully. In the mid-1960s they broke publicly with Peking to establish an autonomous and somewhat nationalist image, and their student organizations followed a relatively moderate line during anarchic disruptions at the universities in the late 1960s. These policies helped produce large pluralities in many urban elections, as in contests for the House of Councillors, where voter constituencies were large, but the Japan Communist Party remained far from power and found it difficult to establish satisfactory coalition arrangements with the more strongly pro-Peking Japan Socialist Party and other "reformist" elements.

The vicissitudes of right and left made it natural for the prewar moderates to dominate postwar politics. Career diplomats and bureaucrats possessed the command of English that enabled them to work with SCAP authorities, and, because they had been out of action since the 1930s, they had not become liable to the purge that removed militarists from office. Thus, figures of the 1920s and '30s reemerged, as did also the remnants of the party organizations of those years. The liaison agency, staffed largely by former diplomats, assumed immediate importance. The Cabinet that emerged shortly after the arrival of U.S. forces was headed by Shidehara Kijūrō, who was replaced in May 1946 by Yoshida Shigeru; both were diplomats. In 1947 and 1948 there was an interval of rule under Katayama Tetsu, a Socialist who headed a coalition Cabinet but who was unable to carry out a Socialist program. In 1948 Ashida Hitoshi held office for five months, after which Yoshida returned as prime minister and remained until December 1954, setting a record for modern Japanese prime ministers. Yoshida negotiated the peace treaty and the security pact in 1951 and set Japan's postsurrender course of close cooperation with the United States.

Formation of the Liberal-Democratic Party

Hatoyama Ichirō became a candidate for Yoshida's position, and the Liberal Party was split between their respective followers as a result. The San Francisco treaty and security pact split the Socialist Party into two factions also: the left opposing both the treaty (because it did not include the Communist countries) and the security pact with the United States, the right wing favouring the treaty while opposing the security pact. In October 1955 the Socialists reunited, and a month later the Liberals and Democrats reunited to form the Liberal-Democratic Party, which thereafter was the dominant party.

After independence. The Korean War marked the turn from depression to recovery for Japan. As the staging area for the UN effort in South Korea, the country profited from the many services it provided.

The return of independence in 1952 found the Japanese economy in the process of growth and change. Sustained prosperity and high growth rates changed all sectors of life. The countryside, where farmers had benefitted from land reform, began to feel the effects of small-scale mechanization and a consistent migration to industrial centres. Agricultural yields rose as improved strains of crops and modern technology were introduced, as household appliances appeared in remote villages, and as the cities' changing, more diversified patterns of food consumption provided a market for more cash crops, truck (market) garden fruits and vegetables, and meat products. Population control slowed the birth rate, and steady industrial growth brought full employment and even a labour shortage.

Structural changes in the economy

Particularly in the 1960s, the structure of the Japanese economy changed in order to concentrate on products of highly advanced technology, emphasizing Japan's need for stable, advanced trading partners instead of its earlier developed Asian markets for inexpensive textiles. Improvements in transportation—*e.g.,* cargo-handling methods and bulk transport by large ore carriers—were removing the disadvantage of the greater distances over which Japan's new materials were moving. Most important, a large and growing domestic market was rendering invalid earlier generalizations about Japan's need for cheap labour and captive Asian markets for inexpensive exports. Japan's economy grew rapidly from the 1960s to the "oil shock" of 1973 and thereafter continued to grow, though at a slower rate. Its output shifted with world currents, and its industrial development made it a world leader in shipbuilding, electronics, steel, automobiles, and high technology.

Japanese leaders attempting to raise the national income felt their options in international affairs severely restricted by the alliance with the United States, Taiwan, and South Korea, which prevented closer ties with the Soviet Union, China, and North Korea. Prosperity was a universal goal, but international politics proved sharply divisive. Public-opinion polls showed firm agreement against military power and continued horror of atomic or nuclear developments; and it was agreed that the Self-Defense Forces could not be utilized for international or UN causes.

U.S.–Japanese treaty revision

Restoration of relations with the Soviet Union and membership in the United Nations, both in 1956, were the principal efforts and achievements of Hatoyama Ichirō, who succeeded Yoshida in 1954. Hatoyama was followed by Ishibashi Tanzan in December 1956 and by Kishi Nobusuke in 1957. Kishi, who had been named, though not tried, as a war criminal because of his membership in the Tōjō Cabinet, was much criticized for his war record, but he continued the policies of cooperation with the United States that Yoshida had initiated. In 1958 the Peking government, occupied with its Great Leap Forward, closed all trade contacts with Japan. At the same time, revisions in the U.S.–Japan Treaty of Mutual Cooperation and Security were being discussed. A proposed treaty revision, to be in force for 10 years, alarmed many Japanese who had felt only slightly involved in the original agreement negotiated at the time of independence. Issues were further complicated by plans for a state visit by Pres. Dwight D. Eisenhower. Originally planned as a follow-up to a visit to Moscow, the visit changed drastically after the Soviet Union shot down a U.S. U-2 reconnaissance plane on May 1, 1960. Eisenhower's trip abroad had begun as a symbol of peace and coexistence but became a strategic tour of U.S. Pacific allies and bases. Its critics charged that it was designed to sustain the falling popularity of the Kishi government. After the Kishi Cabinet used its majority to force the treaty revisions through the Diet, opposition to the Prime Minister, the treaty, and the Eisenhower visit increased steadily. Gigantic student demonstrations shook Tokyo day after day. The treaty survived, but Eisenhower's visit was cancelled, and Kishi resigned in July 1960. In 1970, when the treaty had run its course, both governments were reluctant to see a repetition of the events of 1960 and agreed to invoke its provisions indefinitely, subject to one year's revocation by either party.

Ikeda, Satō, and their successors. Kishi was followed by Ikeda Hayato in 1960. A specialist in economic policy, Ikeda's goal of doubling national income in 10 years was more than met, as Japan's economy grew at rates of over 10 percent annually, the highest in the industrialized world. The U.S. administration of Pres. John F. Kennedy caught the imagination of many Japanese, and Kennedy's designation of the popular scholar Edwin O. Reischauer as ambassador further improved Japanese–American relations. By the late 1960s the unpopularity of the war in Vietnam threatened to disturb U.S. relations again.

The era of Satō

Satō Eisaku, who succeeded Ikeda in 1964, continued Ikeda's policies and proved an able and resourceful figure; he remained in office until 1972, thus eclipsing Yoshida's record. In 1965 Japan entered treaty relations with South Korea. At home, Satō worked for continued economic growth and tried to free Japan from reminders of defeat—the Bonin and Ryukyu islands, which had been left under U.S. occupation by the San Francisco treaty of peace, and U.S. military bases on Okinawa, essential to U.S. commitments to South Korea and an important link to U.S. forces in Vietnam. In the late 1960s, Japanese opposition to the Vietnam war made these bases highly objectionable. Satō's government secured the return of the Bonin Islands in 1967, and the retrocession of the Ryukyus became effective in 1972. U.S. bases on Okinawa were retained but were subject to the restrictions that affected other U.S. bases in Japan. Satō resigned in 1972 and in 1974 was awarded the Nobel Prize for Peace for his role in maintaining Japan's policy against nuclear weapons.

Tanaka scandals

Tanaka Kakuei, Satō's successor, seemed to promise a new stage of Japanese strength. One of his first acts was to travel to Peking, on the heels of U.S. Pres. Richard M. Nixon, to officially recognize the People's Republic. Tanaka reacted to increasing public concern with problems of pollution and overcrowding by calling for the redistribution of industry throughout the Japanese islands. Soon he was being charged with worsening inflation as land prices soared. More serious was the effect of the petroleum crisis of 1973 on a country completely dependent on imported oil. Outbreaks of panic buying by consumers brought reminders of the essential fragility of Japan's economic position; the rapid rise in the price of oil marked the end of an era of relatively cheap and abundant resources. Japan experienced the world recession of the 1970s, and its recovery seemed slower because of the previous years of exuberant growth. The Tanaka era ended in 1974 with a scandal based on irregularities in the accumulation of his private fortune. Shortly afterward Tanaka was implicated in improper use of official influence to bring about the selection by a Japanese airline of airplanes manufactured by Lockheed Aircraft Corp. (M.B.J.)

Tanaka was succeeded by Miki Takeo, the leader of a small faction in the governing Liberal-Democratic Party who won favour while larger factions were in disarray. Miki was determined to pursue the Lockheed affair, and a lengthy investigation and prosecution of Tanaka and his associates was begun. Tanaka was arrested in July 1976 and indicted on a charge of bribery; throughout the protracted court proceedings and even after his conviction in October 1983, Tanaka was a political power and remained so until 1987. Elections to the Diet in December 1976 brought a temporary end to the Liberal-Democrats' absolute majority, and Miki resigned. The new prime minister, Fukuda Takeo, had rich experience in many branches of government and was considered a specialist in economic policy. The problems of the Japanese economic turndown proved difficult, however, and combined with party factional differences to bring about Fukuda's defeat in 1978. He was succeeded by Ōhira Masayoshi, who announced his intention to continue Fukuda's foreign policies.

Ōhira died in office in 1980 and was succeeded by Suzuki Zenko, who in 1982 gave way to Nakasone Yasuhiro. Like their predecessors, each was a faction leader in the ruling party, but, unlike the others, Nakasone was a much more visible and outspoken leader, particularly on the matter of increasing Japan's defensive capability. In characteristic fashion, he took the unprecedented action of having his term extended by one year, and he became only the second postwar prime minister to name his successor, Takeshita Noboru, who took office in 1987.

In 1988 scandal again rocked the government when it was disclosed that the Recruit Cosmos Co., a data and real-estate conglomerate, had given money and sold stock not yet available to the public at prices well below expected market value to many bureaucrats and politicians—including Nakasone, Takeshita, and other prominent Liberal-Democrats—in order to gain influence. Largely as a result of the scandal and of a new and unpopular consumption (value-added) tax, the party's public approval plummeted, and in June 1989 Takeshita resigned. He was replaced by foreign minister Uno Sōsuke, who proclaimed as his main goal the restoration of public confidence in the party but was himself implicated in a sex scandal. In July the opposition parties outpolled the Liberal-Democrats in elections to the upper house and for the first time ever gained a majority in that body; in August, after Uno had resigned, the upper house selected Doi Takako, leader of the JSP, to be prime minister. Although Doi's nomination was overruled by the lower house—which chose Liberal-Democrat Kaifu Toshiki—it was the first time that a woman had been considered for prime minister and reflected a growing influence by women in Japanese politics.

The Shōwa era of Hirohito came to an end with his death in January 1989 and was followed by the Heisei ("Achieving Peace") era of his son Akihito. Hirohito's 62-year reign was the longest in recorded Japanese history.

After the 1970s Japan produced large surpluses in Japanese-American trade and became the largest or second largest trading partner of virtually every country with which it traded. It invested heavily in other countries, and its manufacturers built plants throughout the world.

Relations with China

Within Japanese politics and opinion, the long-standing polarization over Japan's treaty with the United States was made obsolete by the developments in Japanese relations with China—*i.e.,* vigorous trading and the signing of the Treaty of Peace and Friendship referred to above. Although opponents of the treaty had long argued that the American tie and the Japanese Self-Defense Forces threatened to cut Japan off from China, Peking saw both the treaty and forces as constraints against its Soviet rival and no longer criticized them. In fact, friendship with China had become compatible with alliance with the United States. The ideology of class warfare had lost relevance in the atmosphere of general affluence and middle-class consciousness. Decades of resistance to further rearmament were weakening because of resentment of the Soviet stance on the northern islands and because of increased U.S. pressure for Japan to have a greater share of the region's defense. At the same time, the new mood of national confidence made it difficult for leaders to secure agreement for further liberalization of imports into Japan, and charges of protectionism produced resentment of U.S. pressures. Japan's prosperity depended upon world trade, but protectionist sentiments grew against Japanese goods.

Thus, the Japanese became aware that the shibboleths of the postsurrender decades were obsolete. Japan was not poor but wealthy, not weak but a power in the international economy, and not isolated but the largest trading partner of almost every country in the world. This awareness was reflected in a surge of introspection in which writers discussed the role for their country and the nature of their society. What remained was a growing consensus around general principles, summed up by Prime Minister Fukuda in 1978: Japan should adhere to its decision not to become a major military power and should promote friendly cooperation with all nations and work to accept growing responsibility within the international community. Japan remained unusually dependent upon the stability of the world economy, but that stability in turn was more dependent upon the quality of Japanese participation than it had ever been before. (M.B.J./Ed.)

BIBLIOGRAPHY

Physical and human geography: Two good gazetteers of Japan are *Nihon chimei jiten,* compiled by AKIRA WATANABE, 4 vol. (1954–56); and *Nihon chimei daijiten,* compiled by AKIRA WATANABE *et al.,* 7 vol. (1967–68). The *Nippon: A Charted Survey of Japan,* an industrial digest issued annually since 1936, contains physical and economic statistical data with explanations. Representative geographical works in English include *Regional Geography of Japan,* trans. from the Japanese, 6 vol. (1957), the proceedings of a conference of the International Geographical Union; and ROBERT B. HALL, JR., *Japan: Industrial Power of Asia,* 2nd ed. (1976), which contains a brief analysis of postwar industrial development. Geomorphology is covered by AKIRA WATANABE, "Landform Divisions of Japan," *Bull. Geogr. Surv. Inst., Tokyo,* 2:81–94 (1950–51); and by TORAO YOSHIKAWA, SOHEI KAIZUKA, and YOKO OTA, *The Landforms of Japan* (1981); climatology is dealt with by EIICHIRŌ FUKUI (ed.), *The Climate of Japan* (1977). TAKESHI MATSUI, "General Characteristics of the Soil Geography of Japan," *Pedorojisto/Pedologist,* 12:25–36 (1968), is useful; and *Japanese Cities: A Geographical Approach* (1970), published by the ASSOCIATION OF JAPANESE GEOGRAPHERS, discusses many pertinent subjects. BUREAU OF STATISTICS, *Statistical Handbook of Japan* (annual), contains official information, and *Japan Statistical*

Yearbook (annual) provides the best readily available information source on Japan as a whole. The MINISTRY OF FOREIGN AFFAIRS OF JAPAN, *Japan in Transition: One Hundred Years of Modernization* (1968, reissued 1975), gives general descriptions and is illustrated. HISAO AONO and SHŌHEI BIRUKAWA (eds.), *Nihon chishi* (1967–80), is a comprehensive series dealing with Japan's regional geography by prefectures. EDWARD A. ACKERMAN, *Japan's Natural Resources and Their Relation to Japan's Economic Future* (1953), is a basic source for understanding the economic development. For general background on the economy, see also GEORGE C. ALLEN, *Japan's Economic Recovery* (1958), and *Japan's Economic Expansion* (1965, reprinted 1969); ROBERT J. BALLON (ed.), *Doing Business in Japan,* 2nd ed., rev. (1968); RICHARD K. BEARDSLEY (ed.), *Studies on Economic Life in Japan* (1964); ALICE H. COOK, *An Introduction to Japanese Trade Unionism* (1966); WILLIAM W. LOCKWOOD (ed.), *The State and Economic Enterprise in Japan* (1965, reprinted 1969); YUTAKA MATSUMURA, *Japan's Economic Growth, 1945–1960* (1961); and TAKAFUSA NAKAMURA, *The Postwar Japanese Economy* (1981; originally published in Japanese, 1980). Detailed current information on various aspects of the economy may be found in publications of the Japanese government, such as the BANK OF JAPAN, *Economic Statistics of Japan* (annual); and the MINISTRY OF AGRICULTURE AND FORESTRY, *Abstract of Statistics on Agriculture, Forestry, and Fisheries* (annual). *Kodansha Encyclopedia of Japan,* 9 vol. (1983), provides a comprehensive compilation of information on Japan's history and its modern physical, social, political, and cultural environment. RYUZIRO ISIDA, *Geography of Japan* (1961, reprinted 1969), is concerned with major aspects of the physical, economic, and cultural environment. GLENN T. TREWARTHA, *Japan: A Geography* (1965), also deals with geographical aspects in detail; as does THE ASSOCIATION OF JAPANESE GEOGRAPHERS, *Geography of Japan* (1980). A detailed field survey of village life from geographical, historical, and social viewpoints is made in RICHARD K. BEARDSLEY, JOHN W. HALL, and ROBERT E. WARD, *Village Japan* (1959, reprinted 1969). Japan's cities are treated in detail in RONALD P. DORE, *City Life in Japan: A Study of a Tokyo Ward* (1958, reprinted 1965). J.D. BISIGNANI, *Japan Handbook* (1983), is a comprehensive travel guide. FREDERICA M. BUNGE (ed.), *Japan: A Country Study,* 4th ed. (1983), is a comprehensive work covering geographical, economic, social, and cultural aspects. See also *Grand Atlas of Japan* (1985), published by Heibonsha; and *The National Atlas of Japan* (1977), published by the GEOGRAPHICAL SURVEY INSTITUTE.

History: Among various critical guides in Western languages, JOHN W. HALL, *Japanese History: New Dimensions of Approach and Understanding,* 2nd ed. (1966), is a convenient and skilled presentation of scholarly work, and *Japanese History: A Guide to Japanese Reference and Research Materials* (1954, reprinted 1973); and HERSCHEL WEBB, *Research in Japanese Sources: A Guide* (1965), survey the extent of works on Japanese history by Japanese scholars. Additions to published materials will be found, though not annotated, in the annual bibliographical issue of the *Journal of Asian Studies.*

In addition to general surveys and monographs, the following three compendiums by groups of recognized scholars are suggested for advanced students who are accustomed to reading Japanese: KŌTA KODAMA (ed.), *Zusetsu Nihon bunka shi taikei* ("Illustrated Compendium of Japanese Cultural History"), 2nd ed., 14 vol. (1965–68), a collection of essays arranged in chronological order and with numerous illustrations for the general reading public, the last volume devoted to bibliography and related materials; SABURŌ IENAGA (ed.), *Iwanami Kōza: Nihon rekishi* ("Iwanami Lectures on Japanese History"), 23 vol. (1962–64), a collection of articles contributed by many authors and arranged in chronological order by periods, well-documented and directed to somewhat advanced readers; and KAWADE SHOBO (ed.), *Nihon no rekishi* ("A History of Japan"; 1965–67), composed of 27 volumes written by different authors with 4 volumes devoted to illustrations, in chronological order.

Authoritative accounts in English include JOHN K. FAIRBANK, EDWIN O. REISCHAUER, and ALBERT M. CRAIG, *East Asia: Tradition and Transformation,* rev. ed. (1973); and H. PAUL VARLEY, *Japanese Culture,* 3rd ed. (1984). Though dated, JAMES MURDOCH, *A History of Japan,* 3 vol. (1903–26, reprinted in 6 vol., 1964), is a pioneer work that gives a detailed political history. A later survey is GEORGE B. SANSOM, *A History of Japan,* 3 vol. (1958–63, reissued 1978). Shorter excellent interpretive works include SANSOM's *Japan: A Short Cultural History,* rev. ed. (1976), and *The Western World and Japan* (1950, reissued 1977); EDWIN O. REISCHAUER, *Japan: The Story of a Nation,* 3rd ed. (1981), and *The Japanese* (1977, reprinted 1981); SABURŌ IENAGA, *History of Japan,* 7th ed. (1963, reissued 1969); MIKISO HANE, *Japan: A Historical Survey* (1972); BRADLEY SMITH, *Japan: A History in Art* (1964); MITSUSADA INOUE, *Introduction to Japanese History: Before the Meiji Restoration,* rev. ed. (1968); WILLIAM G. BEASLEY, *The Modern History of Japan,* 3rd ed. (1981); and JOHN W. HALL, *Japan from Prehistory to Modern Times* (1970). The JAPAN. NATIONAL COMMISSION FOR UNESCO, *Japan: Its Land, People and Culture,* 3rd ed. (1973), is a comprehensive reference work.

For further reading, selected monographic works on Japan (in English) are listed below, grouped according to their historical approach. (*Ancient*): GERARD J. GROOT, *The Prehistory of Japan* (1951, reprinted 1972); C. MELVIN AIKENS and TAKAYASU HIGUCHI, *Prehistory of Japan* (1982), an inventory of archaeological sites and finds; J. EDWARD KIDDER, JR., *Japan Before Buddhism,* rev. ed. (1966); ROBERT KARL REISCHAUER, *Early Japanese History: c. 40 B.C.–A.D. 1167,* 2 vol. (1937, reissued 1967); IVAN I. MORRIS, *The World of the Shining Prince: Court Life in Ancient Japan* (1964, reissued 1979). (*Medieval and early modern*): G. CAMERON HURST III, *Insei: Abdicated Sovereigns in the Politics of Late Heian Japan, 1086–1185* (1976); JOHN W. HALL, *Government and Local Power in Japan, 500–1700* (1966, reissued 1980); KAN'ICHI ASAKAWA (ed.), *The Documents of Iriki, Illustrative of the Development of the Feudal Institutions of Japan,* rev. ed. (1955, reissued 1974); MINORU SHINODA, *The Founding of the Kamakura Shogunate, 1180–1185* (1960); JEFFREY P. MASS, *Warrior Government in Early Medieval Japan* (1974), and, with JOHN W. HALL (eds.), *Medieval Japan: Essays in Institutional History* (1974); JOHN W. HALL and TOYODA TAKESHI (eds.), *Japan in the Muromachi Age* (1977), the outcome of a binational conference held in 1973; DELMER M. BROWN, *Money Economy in Medieval Japan* (1951); YI-T'UNG WANG, *Official Relations Between China and Japan, 1368–1549* (1953); HELEN CRAIG MCCULLOUGH, *The Taiheiki: A Chronicle of Medieval Japan* (1959, reprinted 1976); CHARLES R. BOXER, *The Christian Century in Japan, 1549–1650* (1951, reprinted 1974), *Fidalgos in the Far East, 1550–1770,* 2nd ed. (1968), and *Jan Compagnie in Japan, 1600–1817,* 2nd ed. (1950, reprinted 1968); GEORGE ELISON, *Deus Destroyed: The Image of Christianity in Early Modern Japan* (1973); H. PAUL VARLEY, *The Ōnin War* (1967); JOHN W. HALL, NAGAHARA KEIJI, and KOZO YĀMAMURA (eds.), *Japan Before Tokugawa* (1981), the outcome of a 1977 conference; CONRAD TOTMAN, *Politics in the Tokugawa Bakufu, 1600–1843* (1967); JOHN W. HALL and MARIUS B. JANSEN (eds.), *Studies in the Institutional History of Early Modern Japan* (1968); SUSAN B. HANLEY and KOZO YAMAMURA, *Economic and Demographic Change in Preindustrial Japan, 1600–1868* (1978); HAROLD BOLITHO, *Treasures Among Men: The Fudai Daimyo in Tokugawa Japan* (1974); RONALD P. DORE, *Education in Tokugawa Japan* (1965); CHARLES D. SHELDON, *The Rise of the Merchant Class in Tokugawa Japan, 1600–1868* (1958, reprinted 1973); THOMAS C. SMITH, *The Agrarian Origins of Modern Japan* (1959, reissued 1966); JOHN W. HALL, *Tanuma Okitsugu, 1719–1788: Forerunner of Modern Japan* (1955, reprinted 1982); DONALD KEENE, *The Japanese Discovery of Europe, 1720–1830,* rev. ed. (1969); JOHN A. HARRISON, *Japan's Northern Frontier* (1953); GEORGE A. LENSEN, *The Russian Push Toward Japan* (1959, reissued 1971); WILLIAM G. BEASLEY (ed. and trans.), *Select Documents on Japanese Foreign Policy, 1853–1868* (1955, reprinted 1967); GRACE E. FOX, *Britain and Japan, 1858–1883* (1969); MARIUS B. JANSEN, *Sakamoto Ryōma and the Meiji Restoration* (1961, reprinted 1971); ALBERT M. CRAIG, *Chōshū in the Meiji Restoration* (1961, reissued 1967). (*Modern*): CHITOSHI YANAGA, *Japan Since Perry* (1949, reprinted 1975); E. HERBERT NORMAN, *Japan's Emergence as a Modern State* (1940, reprinted 1973); WILLIAM W. LOCKWOOD, *The Economic Development of Japan: Growth and Structural Change,* exp. ed. (1968, reprinted 1974); THOMAS C. SMITH, *Political Change and Industrial Development in Japan: Government Enterprise, 1868–1880* (1955, reissued 1974); WILLIAM CHAMBLISS, *Chiaraijima Village: Land Tenure, Taxation and Local Trade, 1818–1884* (1965); JOHANNES HIRSCHMEIER, *The Origins of Entrepreneurship in Meiji Japan* (1964); MARIUS B. Japanese Literature

Both in quantity and quality, Japanese literature ranks as one of the major literatures of the world, comparable in age, richness, and volume to English literature, though its course of development has been quite dissimilar. The surviving works comprise a literary tradition extending from the 7th century AD to the present; during all of this time there was never a "dark age" devoid of literary production. Not only do poetry, the novel, and the drama have long histories in Japan, but some literary genres not so highly esteemed in other countries—including diaries, travel accounts, and books of random thoughts—are also prominent. A considerable body of writing by Japanese in the Chinese classical language, of much greater bulk and importance than comparable Latin writings by Englishmen, testifies to the Japanese literary indebtedness to China. Even the writings entirely in Japanese present an extraordinary variety of styles, which cannot be explained merely in terms of the natural evolution of the language. Some styles were patently influenced by the importance of Chinese vocabulary and syntax; but others developed in response to the internal requirements of the various genres, whether the terseness of haiku (a poem in 17 syllables) or the bombast of the dramatic recitation.

This article is divided into the following sections:

GENERAL CONSIDERATIONS

Problems in reading Japanese literature

The difficulties of reading Japanese literature can hardly be exaggerated; even a specialist in one period is likely to have trouble deciphering a work from another period or genre. Japanese style has always favoured ambiguity, and the particles of speech necessary for easy comprehension of a statement are often omitted as unnecessary or as fussily precise. Sometimes the only clue to the subject or object of a sentence is the level of politeness in which the words are couched; for example, the verb *mesu* (meaning "to eat," "to wear," "to ride in a carriage," etc.) designates merely an action performed by a person of quality. In many cases, ready comprehension of a simple sentence depends on a familiarity with the background of a particular period of history. The verb *miru,* "to see," had overtones of "to have an affair with" or even "to marry" during the Heian period in the 10th and 11th centuries, when men were generally able to see women only after they had become intimate. The long period of Japanese isolation in the 17th and 18th centuries also tended to make the literature provincial, or intelligible only to persons sharing a common background; the phrase "some smoke rose noisily" (*kemuri tachisawagite*), for example, was all readers of the late 17th century needed to realize that an author was referring to the Great Fire of 1682 that ravaged the shogunal capital of Edo (the modern city of Tokyo).

Despite the great difficulties arising from such idiosyncrasies of style, Japanese literature of all periods is exceptionally appealing to modern readers, whether read in the original or in translation. Because it is prevailingly subjective and coloured by an emotional rather than an intellectual or moralistic tone, its themes have a universal quality almost unaffected by time. To read a diary by a court lady of the 10th century is still a moving experience, because she described with such honesty and intensity her deepest feelings that the modern reader forgets the chasm of history and changed social customs separating her world from his own.

The "pure" Japanese language, untainted and unfertilized by Chinese influence, contained remarkably few words of an abstract nature. Just as English borrowed such words as morality, honesty, justice, and the like from the Continent, the Japanese borrowed these terms from China; but if the Japanese language was lacking in the vocabulary appropriate to a Confucian essay, it could express almost infinite shadings of emotional content. A Japanese poet who was dissatisfied with the limitations imposed by his native language or who wished to describe unemotional subjects—whether the quiet outing of aged gentlemen to a riverside or the poet's awareness of his insignificance as compared to the grandeur of the universe—naturally turned to writing poetry in Chinese. From the 16th century on, many words that had been excluded from poetry because of their foreign origins or their humble meanings, following the dictates of the codes of poetic diction established in the 10th century, were adopted by the practitioners of the haiku, originally an iconoclastic, popular verse form. For the most part, however, the Japanese writers, far from feeling dissatisfied with the limitations on expression imposed by their language, were convinced that virtuoso perfection in phrasing and an acute refinement of sentiment were more important to poetry than the voicing of intellectually satisfying concepts.

Effect of the language on literary forms

The Japanese language itself also shaped poetic devices and forms. Because it lacks a stress accent, meaningful rhymes (all words end in one of five simple vowels), or quantity, poetry was distinguished from prose mainly in that it consisted of alternating lines of five and seven syllables; however, if the intensity of emotional expression was low, this distinction alone could not save a poem from dropping into prose. The difficulty of maintaining a high level of poetic intensity may account for the preference for short verse forms that could be polished with perfectionist care. But however moving a tanka (verse in 31 syllables) is, it clearly cannot fulfill some of the functions of longer poetic forms; and there are no Japanese equivalents of *Paradise Lost, The Rape of the Lock,* or *Tintern Abbey.* Instead, the poets devoted their efforts to perfecting each syllable of their compositions, expanding the content of a tanka by suggestion and allusion and prizing shadings of tone and diction more than originality or boldness of expression.

The fluid syntax of the prose affected not only style but content as well. Japanese sentences are sometimes of inordinate length, responding to the subjective turnings and twistings of the author's thought; and the writers considered smooth transitions from one statement to the next, rather than structural unity, the mark of excellent prose. The longer works accordingly betray at times a lack of overall structure of the kind associated in the West with Greek concepts of literary form but consist instead of episodes linked chronologically or by other associations. The difficulty experienced by Japanese writers in organizing their impressions and perceptions into sustained works may explain the development of the diary and travel account, genres in which successive days or the successive stages of a journey provide a structure for otherwise unrelated descriptions. Japanese literature contains some of the world's longest novels and plays; but its genius is most strikingly displayed in the shorter works, whether the tanka, the haiku, the Nō plays, or the poetic diaries.

An acute literary sensibility, fostered especially by the traditions of the court, encouraged the creation of "codes" of poetic practice and of a considerable body of criticism, extending back to the 10th century, that was usually composed by the leading poets or dramatists themselves. These codes exerted an inhibiting effect on new forms of literary composition, but they also helped to preserve a distinctively aristocratic tone.

Relation to Chinese and Korean literature

Japanese literature absorbed much direct influence from China, but the characteristic literary works are strikingly dissimilar. The tradition of feminine writing, especially of such introspective works as diaries, gave a colouring to Japanese prose quite unlike the more objective, masculine Chinese writings. Although the Japanese have been criticized for their imitations of Chinese examples (even by some Japanese), the Japanese novel in fact antedates any Chinese novels by centuries; and the theatre developed quite independently. Because the Chinese and Japanese languages are unrelated, the poetry naturally took different forms, although Chinese poetic examples and literary theories were often in the minds of the Japanese poets. Japanese and Korean are probably related languages, but Korean literary influence was negligible, though Koreans served an important function in transmitting Chinese literary and philosophical works to Japan. Poetry and prose written in the Korean language were unknown to the Japanese until relatively modern times.

From the 8th to the 19th century Chinese literature enjoyed greater prestige among educated Japanese than their own; but a love for the Japanese classics, especially those composed at the court in the 10th and 11th centuries, gradually spread among the entire people and influenced literary expression in every form, even the songs and tales composed by humble people totally removed from the aristocratic world portrayed in classical literature.

HISTORY

Origins. The first writing of literature in Japanese was occasioned by influence from China. The Japanese were still comparatively primitive and without writing when, in the first four centuries AD, knowledge of Chinese civilization gradually reached them. They rapidly assimilated much of this civilization, and the Japanese scribes adopted Chinese characters as a system of writing, although an alphabet (if one had been available to them) would have been infinitely better suited to the Japanese language. The characters, first devised to represent Chinese monosyllables, could be used only with great ingenuity to represent the agglutinative forms of the Japanese language. The ultimate results were chaotic, giving rise to one of the most complicated systems of writing ever invented. The use of Chinese characters enormously influenced modes of expression and led to an association between literary composition and calligraphy lasting many centuries.

Early writings. The earliest Japanese texts were written in Chinese because no system of transcribing the sounds and grammatical forms of Japanese had been invented. The oldest known inscription, on a sword that dates from about AD 440, already showed some modification of normal Chinese usage in order to transcribe Japanese names and expressions. The most accurate way of writing Japanese words was by using Chinese characters not for their meanings but for their phonetic values, giving each character a pronunciation approximating that used by the Chinese themselves. In the oldest extant works, the *Kojiki* (712; "Records of Ancient Matters") and *Nihon shoki*, or *Nihon-gi* (720; "Chronicles of Japan"), more than 120 songs, some perhaps dating back to the 5th century AD, are given in phonetic transcription, doubtless because the Japanese attached great importance to the sounds themselves. In these two works, both officially commissioned "histories" of Japan, many sections are written entirely in Chinese; but parts of the *Kojiki* were composed in a complicated mixture of language that made use of the Chinese characters sometimes for their meaning and sometimes for their sound. (D.Ke.)

The Kojiki and Nihon shoki as collections of myths. Most of the surviving Japanese myths are recorded in these two works. They tell of the origin of the ruling class and were apparently aimed at strengthening its authority. Therefore, they are not pure myths but have much political colouring. They are based on two main traditions: the Yamato Cycle, centred around the sun goddess Amaterasu Ōmikami, and the Izumo Cycle, in which the principal character is Susanoo (or Susanowo) no Mikoto, the brother of Amaterasu.

Myths and genealogies

Genealogies and mythological records were kept in Japan, at least from the 6th century AD and probably long before that. By the time of the emperor Temmu (7th century), it became necessary to know the genealogy of all important families in order to establish the position of each in the eight levels of rank and title modelled after the Chinese court system. For this reason, Temmu ordered the compilation of myths and genealogies that finally resulted in the *Kojiki* and *Nihon shoki.* The compilers of these and other early documents had at their disposal not only oral tradition but also documentary sources. A greater variety of sources was available to the compiler of the *Nihon shoki.* While the *Kojiki* is richer in genealogy and myth, the *Nihon shoki* adds a great deal to scholarly understanding of both the history and the myth of early Japan. Its purpose was to give the newly Sinicized court a history that could be compared with the annals of the Chinese.

Cosmology

The purpose of the cosmologies of the *Kojiki* and *Nihon shoki* is to trace the Imperial genealogy back to the foundation of the world. The myths of the Yamato Cycle figure prominently in these cosmologies. In the beginning, the world was a chaotic mass, an ill-defined egg, full of seeds. Gradually, the finer parts became heaven (Yang), the heavier parts earth (Yin). Deities were produced between the two: first, three single deities, and then a series of divine couples. According to the *Nihon shoki,* one of the first three "pure male" gods appeared in the form of a reed that connected heaven and earth. A central foundation was now laid down for the drifting cosmos, and mud and sand accumulated upon it. A stake was driven in, and an inhabitable place was created. Finally, the god Izanagi (He Who Invites) and the goddess Izanami (She Who Invites) appeared. Ordered by their heavenly superiors, they stood on a floating bridge in heaven and stirred the ocean with a spear. When the spear was pulled up, the brine dripping from the tip formed Onogoro, an island that became solid spontaneously. Izanagi and Izanami then descended to this island, met each other by circling around the celestial pillar, discovered each other's sexuality, and began to procreate. After initial failures, they produced the eight islands that now make up Japan. Izanami finally gave birth to the god of fire and died of burns. Raging with anger, Izanagi attacked his son, from whose blood such deities as the god of thunder were born. Other gods were born of Izanami on her deathbed. They presided over metal, earth, and agriculture. In grief, Izanagi pursued Izanami to Yomi (analogous to Hades) and asked her to come back to the land of the living. The goddess replied that she had already eaten food cooked on a stove in Yomi and could not return. In spite of her warning, Izanagi looked at his wife and discovered that her body was infested with maggots. The angry and humiliated goddess then chased Izanagi from the underworld. When he finally reached the upper world, Izanagi blocked the entrance to the underworld with an enormous stone. The goddess then threatened Izanagi, saying that she would kill a thousand people every day. He replied that he would father one thousand and five hundred children for every thousand she killed. After this, Izanagi pronounced the formula of divorce.

Izanagi then returned to this world and purified himself from the miasma of Yomi no Kuni. From the lustral water falling from his left eye was born the sun goddess Amaterasu Ōmikami, ancestress of the Imperial family. From his right eye was born the moon god Tsukiyomi no Mikoto and from his nose, the trickster god Susanoo. Izanagi gave the sun goddess a jewel from a necklace and told her to govern heaven. He entrusted the dominion of night to the moon god. Susanoo was told to govern the sea. According to the *Kojiki,* Susanoo became dissatisfied with his share and ascended to heaven to see his older sister. Amaterasu, fearing his wild behaviour, met him and suggested that they prove their faithfulness to each other by bringing forth children. They agreed to receive a seed from each other, chew it, and spit it away. If gods rather than goddesses were born, it would be taken as a sign of the good faith of the one toward the other. When Susanoo brought forth gods, his faithfulness was recognized, and he was permitted to live in heaven.

Susanoo trickster myth

Susanoo, becoming conceited over his success, began to play the role of a trickster. He scattered excrement over the dining room of Amaterasu, where she was celebrating the ceremony of the first fruits. His worst offense was to fling into Amaterasu's chamber a piebald horse he had "flayed with a backward flaying" (a ritual offense).

Enraged at the pranks of her brother, the sun goddess hid herself in a celestial cave, and darkness filled the heavens and the earth. The gods were at a loss. Finally, they gathered in front of the cave, built a fire, and made cocks crow. They erected a sacred evergreen tree, and from its branches they hung curved beads, mirrors, and cloth offerings. A goddess named Amenouzume no Mikoto then danced half-nude. Amaterasu, hearing the multitudes of gods laughing and applauding, became curious and opened the door of the cave. Seizing the opportunity, a strong-armed god dragged her out of the cave.

The Izumo Cycle

The myths of the Izumo Cycle then begin to appear in the narration. Having angered the heavenly gods and having been banished from heaven, Susanoo descended to Izumo, where he rescued Princess Marvellous Rice Field (Kushiinada Hime) from an eight-headed serpent. He then married the Princess and became the progenitor of the ruling family of Izumo. The most important member of the family of Susanoo was the god Ōkuninushi no Mikoto, the great earth chief, who assumed control of this region before the descent to earth of the descendants of the sun goddess.

Before long, Amaterasu, the leader of the celestial gods—the gods of Izumo were known as earthly gods—asked Ōkuninushi to turn over the land of Izumo, saying that "the land of the plentiful reed-covered plains and fresh rice ears" was to be governed by the descendants of the heavenly gods. After the submission of Izumo, Amaterasu made her grandson Ninigi no Mikoto (*ninigi* is said to represent rice in its maturity) descend to earth. According to the *Nihon shoki,* Amaterasu handed Ninigi some ears of rice from a sacred rice field and told him to raise rice on earth and to worship the celestial gods. The grandson of the sun goddess then descended to the peak of Takachiho (meaning high thousand ears) in Miyazaki, Kyushu. There he married a daughter of the god of the mountain, named Konohana-sakuya Hime (Princess Blossoms of the Trees).

When Ninigi's wife became pregnant and was about to give birth, all in a single night, he demanded proof that the child was his. She accordingly set fire to her room, then safely produced three sons. One of them, in turn, became the father of the legendary first emperor, Jimmu, who is considered to mark the watershed between the "age of the gods" and the historical age; but Jimmu's eastern expedition and conquest of the Japanese heartland was also a myth. (N.M./D.Ke.)

Origin of the tanka in the Kojiki. The myths in the *Kojiki* are occasionally beguiling, but the only truly literary parts of the work are the songs. The early songs lack a fixed metrical form; the lines, consisting of an indeterminate number of syllables, were strung out to irregular lengths, showing no conception of poetic form. Some songs, however, seem to have been reworked—perhaps when the manuscript was transcribed in the 8th century—into what became the classic Japanese verse form, the tanka (short poem), consisting of five lines of five, seven, five, seven, and seven syllables. Various poetic devices employed in these songs, such as the *makura kotoba* ("pillow word"), a kind of fixed epithet, remained a feature of later poetry.

Altogether, some 500 primitive songs have been preserved in various collections. Many describe travel, and a fascination with place-names, evident in the loving enumeration of mountains, rivers, and towns with their mantic epithets, was developed to great lengths in the gazetteers (*fudoki*) compiled at the beginning of the 8th century. These works, of only intermittent literary interest, devote considerable attention to the folk origins of different place-names, as well as to other local legends.

The significance of the Man'yōshū. A magnificent anthology of poetry, the *Man'yōshū* (compiled after 759; "Collection of Ten Thousand Leaves"), is the single great literary monument of the Nara period (710–784), although it includes poetry written in the preceding century, if not earlier. Most of the 4,500 or so poems are tankas; but the masterpieces of the *Man'yōshū* are the 260 *chōka* ("long poems"), ranging up to 150 lines in length and cast in the form of alternating lines in five and seven syllables followed by a concluding line in seven syllables. The amplitude of the *chōka* permitted the poets to treat themes impossible within the compass of the tanka—whether the death of a wife or child, the glory of the Imperial family, the discovery of a gold mine in a remote province, or the hardships of military service.

Kakinomoto Hitomaro

The greatest of the *Man'yōshū* poets, Kakinomoto Hitomaro, served as a kind of poet laureate in the late 7th and early 8th centuries, accompanying the sovereigns on their excursions and composing odes of lamentation for deceased members of the Imperial family. Modern scholars have suggested that the *chōka* may have originated as exorcisms of the dead, quieting the ghosts of recently deceased persons by reciting their deeds and promising that they will never be forgotten. Some of Hitomaro's masterpieces describe the glories of princes or princesses he may never have met so convincingly as to transcend any difference between "public" expressions of grief and his private feelings. Hitomaro's *chōka* are unique in Japanese poetry thanks to their superb combination of imagery, syntax, and emotional strength; they are works of truly masculine expression. He showed in his tanka, however, that he was also capable of the evocative, feminine qualities typical of later Japanese poetry.

The *chōka* often concluded with one or more *hanka* ("envoys") that resumed central points of the preceding poem. The *hanka* written by the 8th-century poet Yamabe Akahito are so perfectly conceived as to make the *chōka* they follow at times seem unnecessary; the concision and evocativeness of these poems, identical in form with the tanka, are close to the ideals of later Japanese poetry. Nevertheless, the supreme works of the *Man'yōshū* are the *chōka* of Hitomaro, Ōtomo Tabito, Ōtomo Yakamochi (probably the chief compiler of the anthology), and Yamanoue Okura. The most striking quality of the *Man'yōshū* is its powerful sincerity of expression. The poets were certainly not artless songsmiths exclaiming in wonder over the beauties of nature, a picture that is often painted of them by sentimental critics; but their emotions were stronger and more directly expressed than in later poetry. The corpse of an unknown traveller, rather than the falling of the cherry blossoms, stirred in Hitomaro an awareness of the uncertainty of human life.

The *Man'yōshū* is exceptional in the number of poems composed outside the court, whether by frontier guards or persons of humble occupation. Perhaps some of these poems were actually written by courtiers in the guise of commoners, but the use of dialect and familiar imagery contrasts with the strict poetic diction imposed in the 10th century. The diversity of themes and poetic forms also distinguishes the *Man'yōshū* from the more polished but narrower verse of later times. In Okura's famous "Dialogue on Poverty," for example, two men—one poor and the other destitute—describe their miserable lots, revealing a concern over social conditions that would be absent from the classical tanka. Okura's visit to China early in the 8th century, as the member of a Japanese embassy, may account for Chinese influence in his poetry. His poems are also prefaced in many instances by passages in Chinese stating the circumstances of the poems or citing Buddhist parallels.

The *Man'yōshū* was transcribed in an almost perversely complicated system that used Chinese characters arbitrarily, sometimes for meaning and sometimes for sound. The lack of a suitable script probably inhibited literary production in Japanese during the Nara period. The growing importance, however, of Chinese poetry as the mark of literary accomplishment in a courtier may also have interrupted the development of Japanese literature after its first flowering in the *Man'yōshū.*

Eighteen *Man'yōshū* poets are represented in the collection *Kaifūsō* (751), an anthology of poetry in Chinese composed by members of the court. These poems are little more than pastiches of ideas and images borrowed directly from China; the composition of such poetry reflects the enormous prestige of Chinese civilization at this time.

Classical literature: Heian period (794–1185). The foundation of the city of Heian-kyō (later known as Kyōto) as the capital of Japan marked the beginning of a period of great literary brilliance. The earliest writings of the period, however, were almost all in Chinese because of the continued desire to emulate the culture of the continent. Three Imperially sponsored anthologies of Chinese poetry appeared between 814 and 827, and it seemed for a time that writing in Japanese would be relegated to an extremely minor position. The most distinguished writer of Chinese verse, the 9th-century poet Sugawara Michizane, gave a final lustre to this period of Chinese learning by his erudition and poetic gifts; but his refusal to go to China when offered the post of ambassador, on the grounds that China no longer had anything to teach Japan, marked a turning point in the response to Chinese influence.

The first major work in *kana*

Poetry. The invention of the *kana* phonetic syllabary, traditionally attributed to the 9th-century Shingon priest and Sanskrit scholar Kūkai, enormously facilitated writing in Japanese. Private collections of poetry in *kana* began to be compiled about 880; and in 905 the *Kokinshū* ("Collection from Ancient and Modern Times"), the first major work of *kana* literature, was compiled by the poet Ki Tsurayuki and others. This anthology contains 1,111 poems divided into 20 books arranged by topics, including six books of seasonal poems, five books of love poems, and single books devoted to such subjects as travel, mourning, and congratulations. The two prefaces are clearly indebted to the theories of poetry described by the compilers of such Chinese anthologies as the *Shih Ching* and *Wen hsüan,* but the preferences they express would be shared by most tanka poets for the next 1,000 years. The preface by Tsurayuki, the oldest work of sustained prose in *kana,* enumerated the circumstances that move men to write poetry; he believed that melancholy, whether aroused by a change in the seasons or by a glimpse of white hairs reflected in a mirror, provided a more congenial mood for writing poetry than the harsher emotions treated in the *Man'yōshū.* The best tanka in the *Kokinshū* captivate the reader by their perceptivity and tonal beauty, but these flawlessly turned miniatures obviously lack the variety of the *Man'yōshū.*

Skill in composing tanka became an asset in gaining preference at court; it was also essential to a lover, whose messages to his mistress (who presumably could not read Chinese, still the language employed by men in official documents) often consisted of poems describing his own emotions or begging her favours. In this period the tanka almost completely ousted the *chōka* because the shorter poems were more suited to the lover's billet-doux or to competitions on prescribed themes.

For the poets of the *Kokinshū* and the later court anthologies, originality was less desirable than perfection of language and tone. The critics, far from praising novelty of effects, condemned deviations from the standard poetic diction (established by the *Kokinshū*) of some 2,000 words and insisted on absolute adherence to the poetic conventions. Although these restrictions saved Japanese poetry from lapses into bad taste or vulgarity, they froze it for centuries in prescribed modes of expression. Only a skilled critic can distinguish a tanka of the 10th century from one of the 18th century. The *Kokinshū* set the precedent for later court anthologies, and a knowledge of its contents was indispensable to all poets as a guide and source of literary allusions.

Love poetry occupies a prominent place in the *Kokinshū,* but the joys of love are seldom celebrated; instead, the poets wrote in the melancholy vein prescribed in the preface, describing the uncertainties before a meeting with the beloved, the pain of parting, or the sad realization that an affair had ended. The invariable perfection of diction, unmarred by any indecorous cry from the heart, may sometimes make one doubt the poet's sincerity. This is not true of the great *Kokinshū* poets of the 9th century—Ono Komachi, Lady Ise, Ariwara Narihira, and Tsurayuki himself—but even Buddhist priests, who presumably had renounced carnal love, wrote love poetry at the court competitions; and it is hard to detect any difference between such poems and those of sincere lovers.

The preface of the *Kokinshū* lists judgments on the principal poets of the collection. This criticism is unsatisfying to a modern reader because it is so terse and unanalytical; but it nevertheless marks a beginning of Japanese poetic criticism, an art that developed impressively during the course of the Heian period.

The literary diary

Prose. Ki Tsurayuki is celebrated also for his *Tosa nikki* (935; *The Tosa Diary*), the account of his homeward journey to Kyōto from the province of Tosa, where he had served as governor. Tsurayuki wrote this diary in Japanese, though men at the time normally kept their diaries in Chinese (perhaps it was in order to escape reproach for adopting this unmanly style that he pretended a woman in the governor's entourage was the author). Events of the journey are interspersed with the poems composed on various occasions. The work is affecting especially because of the repeated, though muted, references to the death of Tsurayuki's daughter in Tosa.

Tosa nikki is the earliest example of a literary diary. Although Tsurayuki pretended that it was written by a woman, the later Heian diarists who wrote in the Japanese language were, in fact, court ladies; their writings include some of the supreme masterpieces of the literature. *Kagerō nikki* (*The Gossamer Years*) describes the life between 954 and 974 of the second wife of Fujiwara Kaneie, a prominent court official. The first volume, related long after the events, is in the manner of an autobiographical novel; even the author confesses that her remembrances are probably tinged with fiction. The second two volumes approach a true diary, with some entries apparently made on the days indicated. The writer (known only as "the mother of Michitsuna") describes, with many touches of self-pity, her unhappy life with her husband. She evidently assumed that readers would sympathize, and often this is the case, though her self-centred complaints are not endearing. In one passage, in which she gloats over the death of a rival's child, her obsession with her own griefs shows to worst advantage; yet her journal is extraordinarily moving precisely because the author dwells exclusively on universally recognizable emotions and omits the details of court life that must have absorbed the men.

Other diaries of the period include the anecdotal *Murasaki Shikibu nikki* ("The Diary of Murasaki Shikibu"; Eng. trans., *Murasaki Shikibu: Her Diary and Poetic Memoirs*), at once an absorbing literary work and a source of information on the court life the author (Murasaki Shikibu) described more romantically in her masterpiece *Genji monogatari* (*c.* 1010; *The Tale of Genji*), and *Izumi Shikibu nikki* (*The Diary of Izumi Shikibu*), which is less a diary than a short story liberally ornamented with poetry.

These "diaries" are closely related in content and form to the *uta monogatari* ("poem tales") that emerged as a literary genre later in the 10th century. *Ise monogatari* (*c.* 980; *Tales of Ise*) consists of 143 episodes, each containing one or more poems and an explanation in prose of the circumstances of composition. The brevity and often the ambiguity of the tanka gave rise to a need for such explanations, and when these explanations became extended or (as in the case of *Ise monogatari*) were interpreted as biographical information about one poet (Ariwara Narihira), they approached the realm of fiction.

Along with the poem tales, there were works of religious or fanciful inspiration going back to *Nihon ryōiki* (822; *Miraculous Stories from the Japanese Buddhist Tradition*), an account of Buddhist miracles in Japan compiled by the priest Kyōkai. These stories, written in Chinese, were probably used as a source of sermons by the priests with the intent of persuading ordinary Japanese, incapable of reading difficult works of theology, that they must lead virtuous lives if they were not to suffer in hell for present misdeeds. No such didactic intent is noticeable in *Taketori monogatari* (10th century; *Tale of the Bamboo Cutter*), a fairy tale about a princess who comes from the moon to dwell on earth in the house of a humble bamboo cutter; the various tests she imposes on her suitors, fantastic though they are, are described with humour and realism.

Early development of the novel

The first lengthy "novel," *Utsubo monogatari* ("The Tale of the Hollow Tree"), was apparently written between 956 and 983 by Minamoto Shitagō, a distinguished courtier and scholar. This uneven, ill-digested work is of interest chiefly as an amalgam of elements in the poem tales and fairy tales; it contains 986 tanka, and its episodes range from early realism to pure fantasy.

The contrast between this crude work and the sublime *Genji monogatari* is overwhelming. Perhaps the difference is best explained in terms of the feminine traditions of writing, exemplified especially by the diaries, which enabled Murasaki Shikibu to discover depths in her characters unsuspected by the male author of *Utsubo monogatari.* The *Genji monogatari* is the finest work not only of the Heian period but of all Japanese literature and merits being called the first important novel written anywhere in the world. *Genji monogatari* was called a work of *mono no aware* ("a sensitivity to things") by the great 18th-century literary scholar Motoori Norinaga; the hero, Prince Genji, is not remarkable for his martial prowess or his talents as a statesman but as an incomparable lover, sensitive to each of the many women he wins. The story is related in terms of the successive women Genji loves; each of them evokes a different response from this marvellously complex man. The last third of the novel, describing the world after Genji's death, is much darker in tone; and the principal figures, though still impressive, seem no more than fragmentations of the peerless Genji.

The success of *Genji monogatari* was immediate. The author of the touching *Sarashina nikki* (mid-11th century; "Sarashina Diary"; Eng. trans., *As I Crossed a Bridge of Dreams*) described how as a girl she longed to visit the capital so that she might read the entire work (which had been completed some 10 years earlier). Imitations and derivative works based on *Genji monogatari,* especially on the last third of it, continued to be written for centuries, inhibiting the fiction composed by the court society.

Makura no sōshi (*c.* 1000; *The Pillow Book of Sei Shōnagon*) is another masterpiece of the Heian period that should be mentioned with *Genji monogatari.* Japanese critics have often distinguished the *aware* of *Genji monogatari* and the *okashi* of *Makura no sōshi. Aware* meant sensitivity to the tragic implications of a moment or gesture, *okashi,* the comic overtones of perhaps the same moment or gesture. The lover's departure at dawn evoked many wistful passages in *Genji monogatari,* but in *Makura no sōshi* the author noted with unsparing exactness the lover's fumbling, ineffectual leavetaking, and his lady's irritation. Murasaki Shikibu's *aware* can be traced through later literature—sensitivity always marked the writings of any author in the aristocratic tradition—but Sei Shōnagon's wit belonged to the Heian court alone.

The Heian court society passed its prime by the middle of the 11th century, but it did not collapse for another 100 years. Long after its political power had been usurped by military men, the court retained its prestige as the fountainhead of culture. But in the 12th century, literary works belonging to a quite different tradition began to appear. *Konjaku monogatari* (early 12th century; "Tales of Now and Then"), a massive collection of religious and folktales, drawn not only from the Japanese countryside but also from Indian and Chinese sources, described elements of society that had never been treated in the court novels. These stories, though crudely written, provide glimpses of how the common people spoke and behaved in an age marked by warfare and new religious movements. The collection of folk songs *Ryōjin hishō,* compiled in 1179 by the emperor Go-Shirakawa, suggests the vitality of this burgeoning popular culture even as the aristocratic society was being threatened with destruction.

Medieval literature: Kamakura, Muromachi, and Azuchi-Momoyama periods (1192–1600). *Kamakura period (1192–1333).* The warfare of the 12th century brought to undisputed power military men (samurai) whose new regime was based on martial discipline. Though the samurai expressed respect for the old culture, some of them even studying tanka composition with the Kyōto masters, the capital of the country moved to Kamakura. The lowered position of women under this feudalistic government perhaps explains the noticeable diminution in the importance of writings by court ladies; indeed, there was hardly a woman writer of distinction between the 13th and 19th centuries.

Poetry

The court poets, however, remained prolific: 15 Imperially sponsored anthologies were completed between 1188 and 1439; and most of the tanka followed the stereotypes established in earlier literary periods.

The finest of the later anthologies, the *Shin kokinshū* (*c.* 1205), was compiled by Fujiwara Sadaie, or Teika, among others, and is considered by many as the supreme accomplishment in tanka composition. The title of the anthology—"the new *Kokinshū*"—indicates the confidence of the compilers that the poets represented were worthy successors of those in the 905 collection; they included (besides the great Teika himself) Teika's father, Fujiwara Toshinari (Shunzei), the priest Saigyō, and the former emperor Go-Toba. These poets looked beyond the visible world for symbolic meanings. The brilliant colours of landscapes filled with blossoms or reddening leaves gave way to monochrome paintings; the poet, instead of dwelling on the pleasure or grief of an experience, sought in it some deeper meaning he could sense if not fully express. The tastes of Teika especially dominated Japanese poetic sensibility, thanks not only to his poetry and essays on poetry but to his choices of the works of the past most worthy of preservation.

Prose

Teika is credited also with a novel, *Matsura no miya monogatari* ("Tale of Matsura Shrine"). Though it is unfinished and awkwardly constructed, its dreamlike atmosphere lingers in the mind with the overtones of Teika's poetry; dreams of the past were indeed the refuge of the medieval romancers, who modelled their language on the *Genji monogatari,* though it was now archaic, and borrowed their themes and characters from the Heian masterpieces. Stories about wicked stepmothers are fairly common; perhaps the writers, contrasting their neglect with the fabled lives of the Heian courtiers, identified themselves with the maltreated stepdaughters; and the typical happy ending of such stories—the stepdaughter in *Sumiyoshi monogatari* is married to a powerful statesman and her wicked stepmother humiliated—may have been the dream fulfillment of their own hopes.

Various diaries describe travels between Kyōto and the shogun's capital in Kamakura. Courtiers often made this long journey in order to press claims in lawsuits, and they recorded their impressions along the way in the typical mixture of prose and poetry. *Izayoi nikki* ("Diary of the Waning Moon"; Eng. trans. in *Translations from Early Japanese Literature*) tells of a journey made in 1277 by the nun Abutsu. A later autobiographical work that also contains extensive descriptions of travel is the superb *Towazu-gatari* (*c.* 1307; "Uninvited Remarks"; Eng.

trans., *The Confessions of Lady Nijō*) by Lady Nijō, a work (discovered only in 1940) that provides a final moment of glory to the long tradition of introspective writing by women at court.

Although these writings in the aristocratic manner preserved much of the manner of Heian literature, works of quite different character were even more prominent in the medieval period. There are many collections of Buddhist and popular tales, of which the most enjoyable undoubtedly is the *Uji shūi monogatari* (*A Collection of Tales from Uji*)—a compilation over a period of years of some 197 brief stories. Although the incidents described in these tales are often similar to those found in *Konjaku monogatari,* they are told with considerably greater literary skill.

Gunki monogatari established as a literary genre

An even more distinctive literary genre of the period is the *gunki monogatari,* or war tale. The most famous, *Heike monogatari* (*The Tale of the Heike*), was apparently first written at the court about 1220, probably by a nobleman who drew his materials from the accounts recited by priests of the warfare between the Taira (Heike) and the Minamoto (Genji) families in the preceding century. The celebrated opening lines of the work, a declaration of the impermanence of all things, also states the main subject, the rise and fall of the Taira family. The text, apparently at first in three books, was expanded to 12 in the course of time, as the result of being recited with improvisations by priest-entertainers. This oral transmission may account not only for the unusually large number of textual variants but also for the exceptionally musical and dramatic style of the work. Unlike the Heian novelists, who rarely admitted words of Chinese origin into their works, the reciters of the *Heike monogatari* employed the contrasting sounds of the imported words to produce what has been acclaimed as the great classic of Japanese style. Although the work is curiously uneven, effective scenes being followed by dull passages in which the narrator seems to be stressing the factual accuracy of his materials, it is at least intermittently superb; and it provided many later novelists and dramatists with characters and incidents for their works.

Heike monogatari was by no means the earliest literary work describing warfare; and other writings, mainly historical in content, were graced by literary flourishes uncommon in similar Western works. *Ōkagami* (*c.* 1120?; "The Great Mirror"; Eng. trans., *Ōkagami*), the most famous of the "mirrors" of Japanese history, undoubtedly influenced the composition of *Heike monogatari,* especially in its moralistic tone. *Hōgen monogatari* (Eng. trans., *Hōgen monogatari*) and *Heiji monogatari* (partial Eng. trans. in *Translations from Early Japanese Literature*) chronicle warfare that antedates the events described in *Heike monogatari* but were probably written somewhat later.

War tales continued to be composed throughout the medieval period. The *Taiheiki* ("Chronicle of the Great Peace"; Eng. trans., *Taiheiki*), for example, covers about 50 years, beginning in 1318, when the emperor Go-Daigo ascended the throne. Though revered as a classic by generations of Japanese, it possesses comparatively little appeal for Western readers, no doubt because so few of the figures come alive.

Characters are more vividly described in two historical romances of the mid- to late 14th century, *Soga monogatari,* an account of the vendetta carried out by the Soga brothers, and *Gikeiki* ("Chronicle of Gikei"; Eng. trans., *Yoshitsune*), describing the life of Minamoto Yoshitsune. Though inartistically composed, these portraits of resourceful and daring heroes caught the imaginations of the Japanese; and their exploits are still prominent on the Kabuki stage.

Another important variety of medieval literature was the reflective essays of Buddhist priests. *Hōjō-ki* (1212; *The Ten Foot Square Hut*) by Kamo Chōmei is a hermit's description of his disenchantment with the world and his discovery of peace in a lonely retreat. The elegiac beauty of its language gives this work, brief though it is, the dignity of a classic. Chōmei was also a distinguished poet, and his essay *Mumyōshō* (*c.* 1210–12; "Nameless Notes") is perhaps the finest example of traditional Japanese poetic criticism.

A later priest, Yoshida Kenkō, writing during the days of warfare and unrest that brought an end to the Kamakura shogunate in 1333, the brief restoration of Imperial authority under the emperor Go-Daigo from 1333 to 1335, and the institution of the Ashikaga shogunate in 1338, barely hints at the turmoil of the times in his masterpiece *Tsurezure-gusa* (*c.* 1330; *Essays in Idleness*); instead, he looks back nostalgically to the past, seeking out the survivals of happier days. Kenkō's aesthetic judgments, often based on a this-worldly awareness rather surprising in a Buddhist priest, gained wide currency, especially after the 17th century, when *Tsurezure-gusa* was widely read.

The Muromachi (1338–1573) and Azuchi-Momoyama (1574–1600) periods. In the 15th century a poetic form of plebeian origins displaced the tanka as the preferred medium of the leading poets. Renga (linked verse) had begun as the composition of a single tanka by two people and was a popular pastime even in remote rural areas. One person would compose the first three lines of a tanka, often giving obscure or even contradictory details in order to make it harder for the second person to complete the poem intelligibly. Gradually, renga spread to the court poets, who saw the artistic possibilities of this diversion and drew up "codes" intended to establish renga as an art. These codes made possible the masterpieces of the 15th century, but their insistence on formalities (*e.g.,* how often a "link" on the moon might appear in 100 links, and which links must end with a noun and which with a verb) inevitably diluted the vigour and freshness of the early renga, itself a reaction against the excessively formal tanka. Nevertheless, the renga of the great 15th-century master Iio Sōgi and his associates are unique in their shifting lyrical impulses, moving from link to link like successive moments of a landscape seen from a boat, avoiding any illusion that the whole was conceived in one person's mind.

Poetry

Prose

The short stories of the 15th and 16th centuries cannot be said to have high literary value. Many still look back to the world of the Heian court, but others introduce folk materials or else elements of the miraculous in the attempt to interest readers who lacked the education to appreciate the conventional literary manner. Even though many promising stories are ruined by absurdities before their course is run, for a few moments they often give unforgettable glimpses of a society torn by disorder. The stories are anonymous, but the authors seem to have been both courtiers and Buddhist priests.

Drama

Unquestionably the finest literary works of the 15th century are the Nō dramas, especially those by Zeami Motokiyo (see EAST ASIAN ARTS). They were written in magnificent poetry (often compared to "brocade" because of the many allusions to the poetry of the past) and were provided with a structure that is at once extremely economical and free. Many are concerned with the Buddhist sin of attachment: an inability to forget his life in this world prevents a dead man from gaining release but forces him to return again and again as a ghost to relive the violence or passion of his former existence. Only prayer and renunciation can bring about deliverance. Zeami's treatises on the art of Nō display extraordinary perceptivity. His stated aims were dramatic conviction and reality, but these ideals meant ultimates to him and not superficial realism. Some Nō plays, it is true, have little symbolic or supernatural content, but the central elements of a typical program of five Nō plays were found in the highly poetic and elusive masterpieces that suggest a world invisible to the eye but evokable by the actors through the beauty of movements and speech. Unhappiness over a world torn by disorder may have led writers to suggest in their works truths that lie too deep for words. This seems to have been the meaning of *yūgen* ("mystery and depth"), the ideal of the Nō plays. Parallel developments occurred in the tea ceremony, the landscape garden, and monochrome painting, all arts that suggest or symbolize rather than state.

Literature during the Tokugawa period (1603–1867). The restoration of peace and the unification of Japan were achieved in the early 17th century, and for approximately 250 years the Japanese enjoyed almost uninterrupted peace. During the first half of the Tokugawa period, the cities of Kyōto and Ōsaka dominated cultural activity; but from about 1770 Edo (the modern Tokyo) became paramount. From the mid-1630s to the early 1850s Japan was closed, by government decree, to contact with the outside world. Initially, this isolation encouraged the development of indigenous forms of literature; but, eventually, in the virtual absence of fertilizing influence from abroad, it resulted in provincial writing. The adoption of printing in the early 17th century made a popular literature possible. The Japanese had known the art of printing since at least the 8th century, but they had reserved it exclusively for reproducing Buddhist writings. The Japanese classics existed only in manuscript form. It is possible that the demand for copies of literary works was so small that it could be satisfied with manuscripts, costly though they were; or perhaps aesthetic considerations made the Japanese prefer manuscripts in beautiful calligraphy, sometimes embellished with illustrations. Whatever the case, not until 1591 was a nonreligious work printed. About the same time, Portuguese missionaries in Nagasaki were printing books in the Roman alphabet. In 1593, in the wake of the Japanese invasion of Korea, a printing press with movable type was sent as a present to the emperor Go-Yōzei. Printing soon developed into the hobby or extravagance of the rich, and many examples of Japanese literature began to appear in small editions. Commercial publication began in 1609; by the 1620s even works of slight literary value were being printed for a public eager for new books.

Role of printing in creating a popular literature

Poetry

Early Tokugawa period (1603–c. 1770). Poetry underwent many changes during the early part of the Tokugawa period. At first the court poets jealously maintained their monopoly over the tanka, but gradually other men, many of them *kokugakusha* ("scholars of national learning"), changed the course of tanka composition by attempting to restore to the form the simple strength of *Man'yōshū* poetry. The early 18th-century poet Kamo Mabuchi was the best of the neo-*Man'yōshū* school, but his tanka rarely rise above mere competence in the ancient language.

The chief development in poetry during the Tokugawa shogunate was the emergence of the haiku as an important genre. This exceedingly brief form (17 syllables arranged in lines of five, seven, and five syllables) had originated in the hokku, or opening verse of a renga sequence, which had to contain in its three lines mention of the season, the time of day, the dominant features of the landscape, etc., making it almost an independent poem. The hokku became known as the haiku late in the 19th century, when it was entirely divested of its original function of opening a sequence of verse; but today even the 17th-century hokku are usually called haiku.

As early as the 16th century haikai renga, or comic renga, had been composed by way of diversion after an evening of serious renga composition, reverting to the original social, rather than literary, purpose of making linked verse. As so often happened in Japan, however, a new art, born as a reaction to the stultifying practices of an older art, was "discovered," codified, and made respectable by practitioners of the older art, generally at the cost of its freshness and vitality. Matsunaga Teitoku, a conventional 17th-century poet of tanka and renga who revered the old traditions, became almost in spite of himself the mentor of the new movement in comic verse, largely as the result of pressure from his eager disciples. Teitoku brought dignity to the comic renga and made it a demanding medium, rather than the quip of a moment. His haikai were distinguishable from serious renga not by their comic conception but by the presence of a *haigon*—a word of Chinese or recent origins that was normally not tolerated in classical verse.

Inevitably, a reaction arose against Teitoku's formalism. The poets of the Danrin school, headed by Nishiyama Sōin and Ihara Saikaku, insisted that it was pointless to waste months if not years perfecting a sequence of 100 verses. Their ideal was rapid and impromptu composition; and their verses, generally colloquial in diction, were intended to amuse for a moment rather than to last for all time. Saikaku especially excelled at one-man composition of extended sequences; in 1684 he composed the incredible total of 23,500 verses in a single day and night, too fast for the scribes to do more than tally.

The haiku was perfected into a form capable of conveying poetry of the highest quality by Matsuo Bashō. After passing through an apprenticeship in both Teitoku and Danrin schools, Bashō founded a school of his own, insisting that a haiku must contain both a perception of some eternal truth and an element of contemporaneity, combining the characteristic features of the two earlier schools. Despite their brief compass, Bashō's haiku often suggest, by means of the few essential elements he presents, the whole world from which they have been extracted; the reader must participate in the creation of the poem. Bashō's best known works are travel accounts interspersed with his verses; of these, *Oku no hosomichi* (1694; *The Narrow Road Through the Deep North*) is perhaps the most popular and revered work of Tokugawa literature.

Prose

The general name for the prose composed between 1600 and 1682 is *kana-zōshi,* or "*kana* books," the name originally having been used to distinguish popular writings in the Japanese syllabary from more learned works in Chinese. The genre embraced not only fiction but also works of a near historical nature, pious tracts, books of practical information, guidebooks, evaluations of courtesans and actors, and miscellaneous essays. Only one writer of any distinction is associated with the *kana-zōshi*—Asai Ryōi, a samurai who became the first popular and professional writer in Japanese history. Thanks to the development of relatively cheap methods of printing and a marked increase in the reading public, Ryōi was able to make a living as a writer. Although some of his works are Buddhist, he wrote in a simple style, mainly in *kana.* His most famous novel, *Ukiyo monogatari* (*c.* 1661; "Tales of the Floating World"), is primitive both in technique and in plot; but under his mask of frivolity Ryōi attempted to treat the hardships of a society where the officially proclaimed Confucian philosophy concealed the gross inequalities in the lots of different men.

The first important novelist of the new era was Ihara Saikaku. Some Japanese critics rank him second only to Murasaki Shikibu in all Japanese literature, and his works have been edited with the care accorded only to great classics. Such attention would surely have surprised Saikaku, whose fiction was dashed off almost as rapidly as his legendary performances of comic renga, with little concern for the judgments of posterity.

Saikaku's first novel, *Kōshoku ichidai otoko* (1682; *The Life of an Amorous Man*), changed the course of Japanese fiction. The title itself had strong erotic overtones, and the plot describes the adventures of one man, from his precocious essays at lovemaking as a child of seven to his decision at the age of 60 to sail to an island populated only by women. The licensed quarters of prostitution established in various Japanese cities by the Tokugawa government (despite its professions of Confucian morality), in order to help control unruly samurai by dissipating their energies, became a centre of the new culture. Expertise in the customs of the brothels was judged the mark of the man of the world. The old term *ukiyo,* which had formerly meant the "sad world" of Buddhist stories, now came to designate its homonym, the "floating world" of pleasure; this was the chosen world of Saikaku's hero, Yonosuke, who became the emblematic figure of the era.

Saikaku's masterpiece, *Kōshoku gonin onna* (1686; *Five Women Who Loved Love*), described the loves of women of the merchant class, rather than prostitutes; this was the first time that women of this class were given such attention. In other works he described, sometimes with humour but sometimes with bitterness, the struggles of merchants to make fortunes. His combination of a glittering style and warm sympathy for the characters lifted his tales from the borders of pornography to high art.

Saikaku was a central figure in the renaissance of literature of the late 17th century. The name Genroku (an era name designating the period 1688–1703) is often used of the characteristic artistic products: the Ukiyo-e ("pictures of the floating world"); the *ukiyo-zōshi* ("tales of the floating world"); the Kabuki and *jōruri,* or puppet theatres; and haiku poetry. Unlike its antecedents, this culture prized modernity above conformity to the ancient traditions; to be abreast of the floating world was to be up-to-date, sharing in the latest fashions and slang, delighting in the moment rather than in the eternal truths of Nō plays of medieval poetry.

Another, darker side to Genroku culture is depicted in Saikaku's late works, with their descriptions of the desperate expedients to which men turned in order to pay their bills. Saikaku seldom showed much sympathy for the prostitutes he described; but the chief dramatist of the time, Chikamatsu Monzaemon, wrote his best plays about unhappy women, driven by poverty into their lives as prostitutes, whose only release from the sordid world in which they were condemned to dwell came when they joined their lovers in double suicides. In the world of merchants treated by Chikamatsu, a lack of money, rather than the cosmic griefs of the Nō plays, drove men to death with the prostitutes they loved but could not afford to buy.

Drama

Chikamatsu wrote most of his plays for the puppet theatre, which, in the 18th century, enjoyed even greater popularity than Kabuki. His plays fell into two main categories: those based, however loosely, on historical facts or legends, and those dealing with contemporary life. The domestic plays are rated much higher critically because they avoid the bombast and fantastic displays of heroism that mark the historical dramas; but the latter, adapted for the Kabuki theatre, are superb acting vehicles.

The mainstays of the puppet theatre were written not by Chikamatsu but by his successors; his plays, despite their literary superiority, failed to satisfy the audiences' craving for displays of puppet techniques and for extreme representations of loyalty, self-sacrifice, and other virtues of the society. The most popular puppet play (later adapted also for the Kabuki actors) was *Chūshingura* (1748; "The Treasury of Loyal Retainers"; Eng. trans., *Chūshingura*) by Takeda Izumo and his collaborators; the same men were responsible for half a dozen other perennial favourites of the Japanese stage. The last great 18th-century writer of puppet plays, Chikamatsu Hanji, was a master of highly dramatic, if implausible, plots.

Poetry

Late Tokugawa period (c. 1770–1867). The literature of the late Tokugawa period is generally inferior to earlier achievements, especially those of the Genroku masters. Authentic new voices, however, were heard in traditional poetic forms. Later neo-*Man'yōshū* poets such as Ryōkan, Ōkuma Kotomichi, and Tachibana Akemi proved that the tanka was not limited to descriptions of the sights of nature or disappointed love but could express joy over fish for dinner or wrath at political events. Some poets who felt that tanka did not provide ample scope for the display of such emotions turned, as in the past, to writing poetry in Chinese. The early 19th-century poet Rai Sanyō probably wrote verse in Chinese more skillfully than any previous Japanese.

Later Tokugawa poets also added distinctive notes of their own to the haiku. Yosa Buson, for example, introduced a romantic and narrative element, and Kobayashi Issa employed the accents of the common people.

Prose

A great variety of fiction was produced during the last century of the Tokugawa shogunate, but it is commonly lumped together under the somewhat derogatory heading of *gesaku* ("playful composition"). The word "playful" did not necessarily refer to the subject matter but to the professed attitude of the authors, educated men who disclaimed responsibility for their compositions. Ueda Akinari, the last master of fiction of the 18th century, won a high place in literary history mainly through his brilliant style, displayed to best advantage in *Ugetsu monogatari* (1776; *Tales of Moonlight and Rain*), a collection of supernatural tales. The *gesaku* writers, however, did not follow Akinari in his perfectionist attention to style and construction; instead, they produced books of almost formless gossip, substituting the raciness of daily speech for the elegance of the classical language, and relying heavily on the copious illustrations for success with the public.

The *gesaku* writers were professionals who made their living by sale of their books. They aimed at as wide a public as possible, and when a book was successful it was usually followed by as many sequels as the public would accept. The most popular of the comic variety of *gesaku* fiction was *Tōkai dōchū hizakurige* (1802–22; "Travels on Foot on the Tōkaidō"; Eng. trans., *Shank's Mare*), by Jippensha Ikku, an account of the travels and comic misfortunes of two irrepressible men from Edo along the Tōkaidō, the great highway between Kyōto and Edo. *Shunshoku umegoyomi* (1832–33; "Spring Colours: The Plum Calendar"), by Tamenaga Shunsui, is the story of Tanjirō, a peerlessly handsome but ineffectual young man for whose affections various women fight. The author at one point defended himself against charges of immorality: "Even though the women I portray may seem immoral, they are all imbued with deep sentiments of chastity and fidelity." It was the standard practice of *gesaku* writers, no matter how frivolous their compositions might be, to pretend that their intent was didactic.

The *yomihon* ("books for reading"—so called to distinguish them from works enjoyed mainly for their illustrations) were much more openly moralistic. Although they were considered to be *gesaku,* no less than the most trivial books of gossip, their plots were burdened with historical materials culled from Chinese and Japanese sources, and the authors frequently underlined their didactic purpose. But despite the serious intent of the *yomihon,* they were romances, rather than novels; and their characters, highly schematized, tended to be witches, fairy princesses, and impeccably noble gentlemen. Where they succeeded, as in a few works by Takizawa Bakin, they are absorbing as examples of storytelling rather than as embodiments of the principle of *kanzen chōaku* ("the encouragement of virtue and the chastisement of vice"), Bakin's professed aim in writing fiction.

Japanese literature in general was at one of its lowest levels at the end of the Tokugawa period. A few tanka poets and the Kabuki dramatist Kawatake Mokuami are the only writers of the period whose works are still read today. It was an exhausted literature that could be revived only by the introduction of fresh influences from abroad.

Modern literature. Even after the arrival of Commodore Perry's fleet in 1853 and the gradual opening of the country to the West and its influence, there was little noticeable effect on Japanese literature. The long closure of the country and the general sameness of Tokugawa society for decades at a time seems to have atrophied the imaginations of the *gesaku* writers. Even the presence of curiously garbed foreigners, which should have provoked some sort of reaction from authors searching for new materials, at first produced little effect. The *gesaku* writers were oblivious to the changes in Japanese society, and they continued to grind out minor variants on the same hackneyed themes of the preceding 200 years.

It was only after the removal in 1868 of the capital to Edo (renamed Tokyo) and the declaration of the emperor Meiji that he would seek knowledge from the entire world that the *gesaku* writers realized their days of influence were numbered. They soon fell under attack from their old enemies, the Confucian denouncers of immoral books, and also from advocates of the new Western learning. Although the *gesaku* writers responded with satirical pieces and traditional Japanese fiction deriding the new learning, they were helpless to resist the changes transforming the entire society.

Early translations and their influence

Introduction of Western literature. Translations from European languages of nonliterary works began to appear soon after the Meiji Restoration. The most famous example was the translation (1870) of Samuel Smiles's *Self-Help;* it became a kind of bible for ambitious young Japanese eager to emulate Western examples of success. The first important translation of a European novel was *Ernest Maltravers,* by the British novelist Lord Bulwer-Lytton, which appeared in 1879 under the title *Karyū shunwa* ("A Spring Tale of Blossoms and Willows"). The early translations were inaccurate, and the translators unceremoniously deleted any passages they could not understand readily or which they feared might be unintelligible to Japanese readers. They also felt obliged to reassure readers that, despite the foreign names of the characters, the emotions they felt were exactly the same as those of a Japanese.

It did not take long, however, for the translators to discover that European literature possessed qualities unknown in the Japanese writings of the past. The literary scholar Tsubouchi Shōyō was led by his readings in European fiction and criticism to reject didacticism as a legitimate purpose of fiction; he insisted instead on its artistic values. His critical essay *Shōsetsu shinzui* (1885; "The Essence of the Novel") greatly influenced the writing of subsequent fiction not only because of its emphasis on realism as opposed to didacticism but because Tsubouchi, a member of the samurai class, expressed the conviction that novels, hitherto despised by the intellectuals as mere entertainments for women and children, were worthy of even a scholar's attention.

Ukigumo (1887–89; "Floating Cloud"; Eng. trans., *Japan's First Modern Novel*), by Futabatei Shimei, was the first modern Japanese novel. The author was familiar with Russian literature and contemporary Western literary criticism. Futabatei wrote *Ukigumo* in the colloquial, apparently because his readings in Russian literature had convinced him that only the colloquial could suitably be used when describing the writer's own society. Despite Futabatei's success with this experiment, most Japanese writers continued to employ the literary language until the end of the century. This was due, no doubt, to their reluctance to give up the rich heritage of traditional expression in favour of the unadorned modern tongue.

Western influences on poetry. Translations of Western poetry led to the creation of new Japanese literary forms. The pioneer collection, *Shintaishi-shō* (1882; "Selection of Poems in the New Style"), contained not only translations from English but also five original poems by the translators in the poetic genres of the foreign examples. The translators declared that although European poetry had greater variety than Japanese poetry—some poems are rhymed, others unrhymed, some are extremely long, others abrupt—it was invariably written in the language of ordinary speech. The insistence on modern language and the discovery of the many forms available to the poet were not the only lessons learned from European poetry. The translators also made the Japanese public aware of how much of human experience had never been treated in the tanka or haiku forms.

Innumerable Western critics have sarcastically commented on the Japanese proclivity for imitating foreign literary models and on their alleged indifference to their own traditions. It is true that without Russian examples Futabatei could not have written *Ukigumo,* and without English examples such poets as Shimazaki Tōson could not have created modern Japanese poetry; but far from recklessly abandoning their literary heritage, most writers were at great pains to acquaint themselves with their traditional literature. The outstanding novelists of the 1890s—Ozaki Kōyō, Kōda Rohan, Higuchi Ichiyō, and Izumi Kyōka—all read Saikaku and were noticeably influenced by him. Ichiyō's short novel *Takekurabe* (1895; *Growing Up*) described the children of the Yoshiwara quarter of Edo in a realistic manner quite unlike that of the usual stories about prostitutes and their customers, but she used the language of Saikaku for her narration. Izumi Kyōka, though educated partly at a Western mission school, wrote superbly in the vein of late Tokugawa fiction; something of the distant Japanese literary past pervaded even his writings of the 1930s, the final years of his life.

Influence of Saikaku

In poetry, too, the first products of Western influence were comically inept experiments with rhyme and with such unpromising subjects as the principles of sociology. Shimazaki Tōson's "Akikaze no uta" (1896; "Song of the Autumn Wind"), however, is not merely a skillful echo of Shelley but a true picture of a Japanese landscape; and the irregular lines of his poem tend to fall into the traditional pattern of five and seven syllables.

A decade after the works of such English Romantic poets as Shelley and Wordsworth had influenced Japanese poetry, the translations made by Ueda Bin of the French Parnassian and Symbolist poets made an even more powerful impression. Ueda wrote, "The function of symbols is to help create in the reader an emotional state similar to that in the poet's mind; symbols do not necessarily communicate the same conception to everyone." This view was borrowed from the West, but it accorded perfectly with the qualities of tanka.

Because of the ambiguities of traditional Japanese poetic expression, it was natural for a given poem to produce different effects on different readers; the important thing, as in Symbolist poetry, was to communicate the poet's mood. If the Japanese poets of the early 1900s had been urged to avoid contamination by foreign ideas, they would have declared that this was contrary to the spirit of an enlightened age. But when informed that eminent foreign poets preferred ambiguity to clarity, the Japanese responded with double enthusiasm.

Revitalization of tanka and haiku. Even the traditional forms, tanka and haiku, though moribund in 1868, took on new life, thanks largely to the efforts of Masaoka Shiki, a distinguished late 19th-century poet in both forms but of even greater importance as a critic. Yosano Akiko, Ishikawa Takuboku, and Saitō Mokichi were probably the most successful practitioners of the new tanka. Yosano Akiko's collection *Midaregami* (1901; *Tangled Hair*) stirred female readers especially, not only because of its lyrical beauty but because Akiko herself seemed to be proclaiming a new age of romantic love. Takuboku emerged in the course of his short life (he died in 1912 at the age of 26) as perhaps the most popular tanka poet of all time. His verses are filled with strikingly individual expressions of his intransigent personality. Saitō Mokichi combined an absorption with *Man'yōshū* stylistics and a professional competence in psychiatry. Despite the austere nature of his poetry, he was recognized for many years as the leading tanka poet. In haiku, Takahama Kyoshi built up a following of poets strong enough to withstand the attacks of critics who declared that the form was inadequate to deal with the problems of modern life. Kyoshi himself eventually decided that the function of haiku was the traditional one of an intuitive apprehension of the beauties of nature; but other haiku poets employed the medium to express entirely unconventional themes.

Most tanka and haiku poets continued to use the classical language, probably because its relative concision permitted them to impart greater content to their verses than modern Japanese permits. Poets of the "new style," therefore, were readier to employ the colloquial. Hagiwara Sakutarō, generally considered the finest Japanese poet of the 20th century, brilliantly exploited the musical and expressive possibilities of the modern tongue. Other poets, such as Horiguchi Daigaku, devoted themselves mainly to translations of European poetry, achieving results so compelling in Japanese that these translations are considered to form an important part of the modern poetry of Japan.

"New-style" poetry

The novel between 1905 and 1941. The dominant stream in Japanese fiction since the publication of *Hakai* (1906; *The Broken Commandment*), by Shimazaki Tōson, and *Futon* (1907; *The Quilt*), by Tayama Katai, has been naturalism. Although the movement was originally inspired by the works of the 19th-century French novelist Émile Zola and other European naturalists, it quickly took on a distinctively Japanese colouring, rejecting (as a Confucian scholar might have rejected *gesaku* fiction) carefully developed plots or stylistic beauty in favour of absolute verisimilitude in the author's confessions or in his minute descriptions of the lives of unimportant people hemmed in by circumstances beyond their control.

By general consent, however, the two outstanding novelists of the early 20th century were men who stood outside the naturalist movement, Mori Ōgai and Natsume Sōseki. Ōgai began as a writer of autobiographical fiction with strong overtones of German Romantic writings. Midway in his career he shifted to historical novels that are virtually devoid of fictional elements but are given literary distinction by their concise and masculine style. Sōseki gained fame with humorous novels such as *Botchan* (1906; "The Young Master"; Eng. trans., *Botchan*), a fictionalized account of his experiences as a teacher in a provincial town. *Botchan* has enjoyed phenomenal popularity ever since it first appeared. It is the most approachable of Sōseki's novels, and the Japanese have found pleasure in identifying themselves with the impetuous, reckless, yet basically decent hero. The coloration of Sōseki's subsequent novels became progressively darker, but even the most gloomy have maintained their reputation among Japanese readers, who take it for granted that Sōseki is the greatest of the modern Japanese novelists and who find echoes in their own lives of the mental suffering he described. Sōseki wrote mainly about intellectuals living in a Japan that had been brutally thrust into the 20th century. His best known novel, *Kokoro* (1914; "The Heart"; Eng. trans., *Kokoro*), revolves around another familiar situation in his novels, two men in love with the same woman. His last novel, *Meian* (1916; *Light and Darkness*), though unfinished, has been acclaimed by some as his masterpiece.

An amazing burst of creative activity occurred in the decade following the end of the Russo-Japanese War in 1905. Probably never before in the history of Japanese literature were so many important writers working at once. Three novelists who first emerged into prominence at this time were Nagai Kafū, Tanizaki Jun'ichirō, and Akutagawa Ryūnosuke. Nagai Kafū was infatuated with French culture and described with contempt the meretricious surface of modern Japan. In later years, however, though still alienated from the Japanese present, he showed nostalgia for the Japan of his youth, and his most appealing works contain evocations of the traces of an old and genuine Japan that survived in the parody of Western culture that was Tokyo.

Tanizaki Jun'ichirō

Tanizaki's novels, notably *Tade kuu mushi* (1928–29; "Insects That Eat Knotweed"; Eng. trans., *Some Prefer Nettles*), often presented a conflict between traditional Japanese and Western-inspired ways. In his early works he also proclaimed a preference for the West. Tanizaki's views changed after he moved to the Kansai region in the wake of the Great Kantō Earthquake of 1923, and his subsequent writings traced his gradual accommodation with the old culture of Japan that he had previously rejected. Between 1939 and 1941 Tanizaki published the first of his three modern-language versions of *Genji monogatari.* He willingly sacrificed years of his career to this task because of his unbounded admiration for the supreme work of Japanese literature.

Tanizaki's longest novel, *Sasameyuki* (1943–48; "A Light Snowfall"; Eng. trans., *The Makioka Sisters*), evoked with evident nostalgia the Japan of the 1930s, when people were preoccupied not with the prosecution of a war but with marriage arrangements, visits to sites famous for their cherry blossoms, or the cultural differences between Tokyo and Ōsaka. Two postwar novels by Tanizaki enjoyed great popularity, *Kagi* (1956; *The Key*), the account of a professor's determination to have his fill of sex with his wife before impotence overtakes him; and *Fūten rōjin nikki* (1961–62; *Diary of a Mad Old Man*), a work in a comic vein that describes a very old man's infatuation with his daughter-in-law. No reader would turn to Tanizaki for wisdom as to how to lead his life, nor for a penetrating analysis of society, but his works not only provide the pleasures of well-told stories but also convey the special phenomenon of adulation and rejection of the West that is so prominent a part of the Japanese culture of the 20th century.

Akutagawa established his reputation as a brilliant storyteller who transformed materials found in old Japanese collections by infusing them with modern psychology. No writer enjoyed a greater following in his time, but Akutagawa found less and less satisfaction in his reworkings of existing tales and turned eventually to writing about himself in a sometimes harrowing manner. His suicide in 1927 shocked the entire Japanese literary world. The exact cause is unknown—he wrote of a "vague malaise"—but perhaps Akutagawa felt incapable either of sublimating his personal experiences into pure literature or else of giving them the accents of the proletarian literature movement, then at its height.

The proletarian literature movement in Japan, as in various other countries, attempted to use literature as a weapon to effect reform and even revolution in response to social injustices. Although the movement gained virtual control of the Japanese literary world in the late 1920s, governmental repression beginning in 1928 eventually destroyed it. The chief proletarian writer, Kobayashi Takiji, was tortured to death by the police in 1933. Few of the writings produced by the movement are of literary worth, but the concern for classes of people who had formerly been neglected by Japanese writers gave these works their special significance.

Other writers of the period, convinced that the essential function of literature was artistic and not propagandistic, formed schools such as the "Neo-sensualists" led by Yokomitsu Riichi and Kawabata Yasunari. Yokomitsu's politics eventually moved far to the right, and the promulgation of these views, rather than his efforts to achieve modernism, coloured his later writings; but Kawabata's works (for which he won the Nobel Prize for Literature in 1968) are still admired for their lyricism and intuitive construction. Though Kawabata began as a modernist and experimented with modernist techniques to the end of his career, he is better known for his portraits of women, whether the geisha of *Yukiguni* (1948; *Snow Country*) or the different women whose lives are concerned with the tea ceremony in *Sembazuru* (1952; *Thousand Cranes*).

The "I novel"

Japanese critics have divided the fiction of the prewar period into schools, each usually consisting of one leading writer and his disciples. Probably the most influential author was Shiga Naoya. His characteristic literary form was the "I novel" (*watakushi shōsetsu*), a work that treats autobiographical materials with stylistic beauty and great intelligence but is not remarkable for invention. Shiga's commanding presence caused the I novel to be more respected by most critics than outright works of fiction; but the writings of his disciples are sometimes hardly more than pages torn from a diary, of interest only if the reader is already devoted to the author.

The postwar novel. The aggressive wars waged by the Japanese militarists in the 1930s inhibited literary production. Censorship became increasingly stringent, and writers were expected to promote the war effort. During the Pacific War of 1941–45 little worthwhile literature appeared. Tanizaki began serial publication of *The Makioka Sisters* in 1943, but publication was halted by official order, and the completed work appeared only after the war. The immediate postwar years signalled an extraordinary period of activity, both by the older generation and by new writers. The period is vividly described in the writings of Dazai Osamu, notably *Shayō* (1947; *The Setting Sun*). Other writers described the horrors of the war years; perhaps the most powerful was *Nobi* (1951; *Fires on the Plain*) by Ōoka Shōhei, which described defeated Japanese soldiers in the Philippine jungles. The atomic bombs also inspired much poetry and prose, though it was often too close to the events to achieve artistic integrity. A few works, especially *Kuroi ame* (1965; *Black Rain*) by Ibuse Masuji, succeeded in suggesting the ultimately indescribable horror of the disaster.

Mishima Yukio

The Japan of the immediate postwar period and the prosperous Japan of the 1950s and 1960s provided the background for most of the works of Mishima Yukio, an exceptionally brilliant and versatile novelist and playwright who became the first Japanese writer generally known abroad. Mishima's best known works include *Kinkaku-ji* (1956; *The Temple of the Golden Pavilion*), a psychological study, based on an actual incident, of a young monk who burned a famous architectural masterpiece; and *Hōjō no Umi* (1965–70; *The Sea of Fertility*), the tetralogy he completed on the day of his death. Abe Kōbō was notable among modern writers in that he managed, sometimes by resorting to avant-garde techniques, to transcend the particular condition of being a Japanese and to create myths of suffering humanity in such a work as *Suna no onna* (1962; *The Woman in the Dunes*). The special nature of traditional Japanese culture, which made it infertile ground for Christianity in the 16th century, was treated in several moving novels by Endō Shūsaku, notably *Chimmoku* (1966; *Silence*). The novels of Kita Morio were characterized by an attractive streak of humour that provided a welcome contrast to the prevailingly dark tonality of other contemporary Japanese novels. *Nire-ke no hitobito* (1963–64; *The House of Nire*), though based on the careers of his grandfather and father (the poet Saitō Mokichi) was saved by its humour from becoming no more than an I novel. For almost 20 years Ōe Kenzaburō, a novelist of exceptional power, was treated as the youngest writer of importance, but in the 1970s a new generation at last began to appear with a promise of a renewal of the modern Japanese novel.

The modern drama. The modern Japanese theatre also began with translations and adaptations of Western plays. This new theatre originated at the end of the 19th century, when the public was still too much under the influence of Kabuki to appreciate plays without music or dance. Even in the 20th century, a distinguished dramatist such as Kishida Kunio rarely had the opportunity to see his works performed. The development of modern drama no doubt was hampered by the introduction, at about the same time, of motion pictures, which had a much greater appeal for the public. The most successful playwrights of the 1920s and 1930s, such as Mayama Seika, wrote works that, although the products of modern minds, exploited the special talents of Kabuki actors by treating historical themes and by preserving the traditional stage language. Various distinguished writers were attracted from time to time to the theatre, but they were forced to devote their major efforts to writing fiction, if only because they were so badly remunerated for their plays. It was not until after World War II that modern dramas worthy of an international audience were written and staged.

BIBLIOGRAPHY

General works: SHUICHI KATO, *A History of Japanese Literature*, 3 vol. (1979–83; originally published in Japanese, 2 vol., 1975–80), considers Japanese literature as a key to Japanese intellectual history. JIN'ICHI KONISHI, *A History of Japanese Literature*, trans. from the Japanese, ed. by EARL MINER (1984–), gives special attention to relations among the literatures of other countries of Asia. DONALD KEENE (ed.), *Anthology of Japanese Literature to the Nineteenth Century*, rev. ed. (1978), offers selections from earliest times, with introductions. A good but brief discussion of Japanese myths is E. DALE SAUNDERS, "Japanese Mythology," in SAMUEL N. KRAMER (ed.), *Mythologies of the Ancient World* (1961). GEOFFREY BOWNAS and ANTHONY THWAITE (trans.), *The Penguin Book of Japanese Verse* (1964), gives examples in every form. ROBERT H. BROWER and EARL MINER, *Japanese Court Poetry* (1961), is an excellent study extending from the earliest period to the 14th century. BURTON WATSON (trans.), *Japanese Literature in Chinese*, 2 vol. (1975–76), provides an excellent selection of poetry and some examples in prose, and his work with HIROAKI SATO (eds. and trans.), *From the Country of Eight Islands: An Anthology of Japanese Poetry* (1981), contains poetry of every period. EARL MINER (ed.), *Japanese Poetic Diaries* (1969, reprinted 1976), contains examples from the Heian period to the 19th century.

Early and Nara periods: Kojiki (1968), and *This Wine of Peace, This Wine of Laughter: A Complete Anthology of Japan's Earliest Songs* (1968), are both translations by DONALD L. PHILIPPI. *The Manyōshū: One Thousand Poems Selected and Translated from the Japanese* (1940, reissued 1965), contains an excellent selection from this great anthology; and IAN HIDEO LEVY, *The Ten Thousand Leaves* (1981–), is the first volume of a complete translation.

Heian period: IVAN MORRIS, *The World of the Shining Prince* (1964, reissued 1979), provides the social and historical background for the Heian literary masterpieces. KYOKO MOTOMOCHI NAKAMURA (trans.), *Miraculous Stories from the Japanese Buddhist Tradition: The Nihon Ryōiki of the Monk Kyōkai* (1973), also contains Buddhist tales from Indian and Chinese sources. *Kokinshū* is a complete translation by LAUREL RASPLICA RODD and MARY CATHERINE HENKENIUS (1984). *The Gossamer Years,* trans. by EDWARD SEIDENSTICKER (1964, reprinted 1973); MURASAKI SHIKIBU, *The Tale of Genji,* trans. by EDWARD SEIDENSTICKER (1976, reprinted 1981), and another translation by ARTHUR WALEY (1926–33); and *The Pillow Book of Sei Shōnagon,* 2 vol. (1967), and *As I Crossed a Bridge of Dreams* (1971), both trans. by IVAN MORRIS, are all poetic renderings of these classics. *The Izumi Shikibu Diary,* trans. by EDWIN A. CRANSTON (1969); *Murasaki Shikibu, Her Diary and Poetic Memoirs,* trans. by RICHARD BOWRING (1982); *Tales of Ise,* trans. by HELEN C. MCCULLOUGH (1968); and *Tales of Yamato,* trans. by MILDRED M. TAHARA (1980), are more literal versions with scholarly introductions. HELEN C. MCCULLOUGH (trans.), *Ōkagami, the Great Mirror* (1980), and, with WILLIAM H. MCCULLOUGH (trans.), *A Tale of Flowering Fortunes: Annals of Japanese Aristocratic Life in the Heian Period* (1980), are histories written with an admixture of poetry and fiction. THOMAS H. ROHLICH (trans.), *A Tale of Eleventh Century Japan: Hamamatsu Chūnagon Monogatari,* is an example of later Heian fiction. MARIAN URY (trans.), *Tales of Times Now Past* (1979), includes 62 stories from the *Konjaku monogatari.* WILLIAM R. LAFLEUR (trans.), *Mirror for the Moon* (1978), is a collection of free but poetic translations of waka by Saigyō.

Middle Ages: WILLIAM R. LAFLEUR, *The Karma of Words: Buddhism and the Literary Arts in Medieval Japan* (1983), provides a general background for the literature of the period. *The Tale of the Heike,* trans. by HIROSHI KITAGAWA and BRUCE T. TSUCHIDA (1975), is a rendering of the classic account of the warfare between the Taira and Minamoto clans. *The Taiheiki* (1959, reprinted 1976), and *Yoshitsune* (1966), both trans. by HELEN C. MCCULLOUGH, are accurate versions of war tales in rather old-fashioned language. DONALD KEENE (trans. and ed.), *Essays in Idleness* (1967), and *Twenty Plays of the Nō Theatre* (1970), are readable though fairly literal; ARTHUR WALEY (trans.), *The Nō Plays of Japan* (1922, reissued 1979), gives freer versions of the plays. D.E. MILLS (trans.), *A Collection of Tales from Uji* (1970), is a readable and scholarly study. KAREN BRAZELL (trans.), *The Confessions of Lady Nijō* (1973), is a diary of exceptional interest. EARL MINER, *Japanese Linked Poetry* (1979), is a study of renga and haikai poetry with translations.

Tokugawa period: DONALD KEENE, *World Within Walls* (1976, reprinted 1978), is a history of the literature of the period. The several excellent translations of works by Ihara Saikaku include *Five Women Who Loved Love,* trans. by W. THEODORE DE BARY (1956, reprinted 1973); *The Japanese Family Storehouse,* trans. by G.W. SARGENT (1959, reprinted 1969); *The Life of an Amorous Woman, and Other Writings,* trans. by IVAN MORRIS (1963, reissued 1969); and *Worldly Mental Calculations,* trans. by BEN BEFU (1976). HOWARD HIBBETT, *The Floating World in Japanese Fiction* (1959, reissued 1975), is a critical study with translations. MAKOTO UEDA, *Matsuo Bashō* (1970, reissued 1982), contains biographical and critical material on the great haiku poet. NOBUYUKI YUASA (trans.), *The Narrow Road to the Deep North, and Other Travel Sketches* (1966), contains all of Bashō's travel accounts. EARL MINER and HIROKO ODAGIRI (trans.), *The Monkey's Straw Raincoat and Other Poetry of the Bashō School* (1981), gives examples of the linked verse. CHIKAMATSU MONZAEMON, *Major Plays* (1961); and TAKEDA IZUMO, MIYOSHI SHŌRAKU, and NAMIKI SENRYŪ, *Chūshingura: The Treasury of Loyal Retainers* (1971), both trans. by DONALD KEENE; TAKEDA IZUMO *et al., Sugawara and the Secrets of Calligraphy,* trans. by STANLEIGH H. JONES, JR. (1985); and MOKUAMI KAWATAKE, *Love of Izayoi and Seishin,* trans. by FRANK T. MOTOFUJI (1966), are representative plays of the Tokugawa period. UEDA AKINARI, *Ugetsu Monogatari: Tales of Moonlight and Rain,* trans. by LEON ZOLBROD (1974), is a collection of stories of the supernatural. *Ryōkan* (1977), and *Grass Hill* (1983), both trans. by BURTON WATSON, contain poems by monks.

Modern period: DONALD KEENE, *Dawn to the West: Japanese Literature of the Modern Era,* 2 vol. (1984), is a history since 1868. MAKOTO UEDA, *Modern Japanese Writers and the Nature of Literature* (1976), and *Modern Japanese Poets and the Nature of Literature* (1983), are valuable studies. MASAO MIYOSHI, *Accomplices of Silence: The Modern Japanese Novel* (1974, reprinted 1982), is an absorbing study. J. THOMAS RIMER, *Modern Japanese Fiction and Its Tradition: An Introduction* (1978), traces the native elements in modern literature. DONALD KEENE (ed.), *Modern Japanese Literature* (1956); IVAN MORRIS (ed.), *Modern Japanese Stories* (1961, reissued 1970); YUKIO MISHIMA and GEOFFREY BOWNAS (eds.), *New Writing in Japan* (1972); and HOWARD HIBBETT (ed.), *Contemporary Japanese Literature* (1977), are anthologies of modern writing in different genres. TAKAMICHI NINOMIYA and D.J. ENRIGHT (eds.), *The Poetry of Living Japan* (1957, reprinted 1979); ICHIRA KŌNO and RIKUTARO FUKUDA (eds. and trans.), *An Anthology of Modern Japanese Poetry* (1957, reprinted 1971); KENNETH REXROTH and IKUKO ATSUMI (eds. and trans.), *The Burning Heart: Women Poets of Japan* (1977); and *Modern Japanese Poetry,* trans. by JAMES KIRKUP, ed. by A.R. DAVIS (1978), are representative collections. JANINE BEICHMAN, *Masoka Shiki* (1982); and MASAOKA SHIKI, *Peonies Kana: Haiku by the Upasaka Shiki,* trans. and ed. by HAROLD J. ISAACSON (1972), are devoted to the Meiji poet. AMY VLADECK HEINRICH, *Fragments of Rainbows* (1983), is a study of life and poetry of Saitō Mokichi. RICHARD BOWRING, *Mori Ōgai and the Modernization of Japanese Culture* (1979); and J. THOMAS RIMER, *Mori Ōgai* (1975), are studies of this important writer. EDWIN MCCLELLAN, *Two Japanese Novelists* (1969, reissued 1971), discusses major works by Natsume Sōseki and Shimazaki Tōson. EDWARD SEIDENSTICKER, *Kafū the Scribbler* (1965), is a biography of Nagai Kafū with translations from his writings. DENNIS KEENE, *Yokomitsu Riichi, Modernist* (1980), is a study of the chief figure in the Shinkankaku movement. *Modern Japanese Drama,* ed. and trans. by TED T. TAKAYA (1979), contains plays by five outstanding modern dramatists.

(D.Ke.)

Jefferson

Third president of the United States, principal author of the Declaration of Independence, and influential political philosopher, Thomas Jefferson was born on April 13, 1743, at Shadwell, in Albemarle County, Virginia, the son of Peter Jefferson, an early settler and leader in the county, and Jane Randolph Jefferson. Peter Jefferson was a surveyor and cartographer and was largely self-educated. Upon his death in 1757 he left his son considerable property, but the inheritance for which Thomas Jefferson expressed particular gratitude was his father's determination that he should have a sound classical education. After several years of study at local grammar and classical schools, Jefferson entered the College of William and Mary in 1760. In spite of his youth, he became a close friend of three leading residents of Williamsburg—William Small of the college faculty, George Wythe of the Virginia bar, and Francis Fauquier, lieutenant governor of the colony. These three older men gave Jefferson a taste for the pleasures of a society more urbane and sophisticated than that of rural Virginia, and Small and Wythe gave direction to his intellectual drive. Small introduced him to the natural sciences and to rational methods of inquiry; Wythe led him to see the study of law not as a narrow vocational preparation but as a means of understanding the history, culture, institutions, and morals of a people. After two years at the college, Jefferson studied law for five years under Wythe's direction and was admitted to the bar in 1767. In 1769 he entered the lower house of the colonial legislature, thus beginning a long career in politics that ended 40 years later with his retirement as president of the United States.

Author of the Declaration. When Jefferson entered the House of Burgesses, Virginia and the other colonies were already engaged in the long decade of opposition to British colonial policies that led eventually to revolution and independence. Jefferson joined with Patrick Henry and others who favoured strong resistance to George III and the British Parliament and soon became one of the leaders of this group. His political style was very different from that of Henry. He was assiduous in committee work, a skilled legal craftsman, a scholar who drew on his comprehensive knowledge of law and history to support the colonial case against Great Britain. He rarely made speeches, disliked oral dispute, whether in formal debate or informal conversation, and he recognized the necessity of consensus for effective political action; the pen was his natural means of expression, and he was a virtuoso in its use. His first major essay, "A Summary View of the Rights of British America" (1774), displayed an impressive array of learning and logic, demonstrated his capacity for intense passion and the ability to express it eloquently, and revealed an inclination to intellectual radicalism. The majority of his colleagues were not then prepared for his conclusion that the British Parliament had no authority at all to legislate for the colonies, but, as relations with Great Britain grew steadily worse, his arguments became increasingly acceptable and his language both persuasive and provocative. "The God who gave us life gave us liberty at the same time: the hand of force may destroy, but cannot disjoin them."

Delegate to the Second Continental Congress

In the spring of 1775 the Virginia legislature, sitting as a revolutionary convention in defiance of the royal governor, appointed Jefferson as a member of its delegation to the Second Continental Congress meeting in Philadelphia. There he joined with the more radical group in the Congress, and again his skills as a committeeman and stylist were recognized and used. In June of 1776, when the decision to break irrevocably with Great Britain seemed near, Jefferson was appointed to the committee assigned to draft a formal statement of the reasons for such a decision. Benjamin Franklin and John Adams were also on the committee, but they recognized the superior talent of the Virginian and gracefully bowed to it. Jefferson thus became the principal author of the Declaration of Independence. It was an official state paper, and in later life he stated that it was intended to be an expression of the American mind. That was no doubt true, but it is also true that his personal commitment to its principles was profound and intense. It was this commitment, not the mere fact of literal authorship, that rendered Jefferson uniquely symbolic of the ideals expressed in the Declaration.

Role in Virginia politics. Jefferson meant his revolutionary manifesto to be more than an eloquent justification of revolt against Great Britain. He intended to translate its principles into practice and to create in America a society in which the gap between aspiration and achievement would be narrowed. He had wanted to begin by taking part in framing the new constitution of Virginia, which was adopted in June of 1776, but his duties in Philadelphia made that impossible, and he did not enter the Virginia legislature until October. He then set in motion a plan for comprehensive reform of the laws and institutions of Virginia. Two parts of the plan show the thoroughness with which he had considered the nature of representative government and the conditions necessary to its successful operation. A third embodied his passionate commitment to intellectual freedom.

Jefferson sought and secured abolition of the laws of primogeniture and entail in Virginia in order to discourage concentration of property in the hands of a few great landowners. He believed that property was among the natural rights to which man was born and that it meant the right to a decent means of subsistence. After observing the economic conditions in France a few years later, he wrote:

> Whenever there is in any country, uncultivated lands and unemployed poor, it is clear that the laws of property have been so far extended as to violate natural right. The earth is given as a common stock for man to labour and live on. If for the encouragement of industry we allow it to be appropriated, we must take care that other employment be provided to those excluded from the appropriation. If we do not the fundamental right to labour the earth returns to the unemployed.

No society that denied this right could be just, nor was it likely to enjoy for long a republican government. Jefferson believed that the virtues required for that form of government could not flourish in conditions of extreme poverty or complete economic dependence.

The educational system proposed for Virginia was also a part of Jefferson's comprehensive plan for republican government. The lower schools would provide literacy for the entire population, which, combined with a free press, was necessary for an informed public opinion. The upper schools would develop a natural aristocracy to supply the leadership so essential to representative government, while scholarships awarded on the basis of merit would prevent identification of educational opportunity with economic privileges. Jefferson did not believe that an ignorant people could make rational and responsible decisions about public affairs, nor did he believe that men were equal in intelligence or that the operation of a government was a simple job easily mastered by the common man. He assumed that men of superior capabilities were those naturally suited for public office, and his scheme of education was intended to insure that such men, regardless of their economic circumstances, be given an opportunity to develop their talents. Jefferson's fellow Virginians were not prepared for so comprehensive a system of free public education, however, and the only part of it that he secured was the University of Virginia.

The statute of Virginia

The third and most famous reform, the statute of Virginia for religious freedom, met with bitter and persistent opposition and was not enacted until 1786, while Jefferson was in France. Although Americans had largely abandoned the gross forms of persecution common a few generations earlier, the toleration they practiced was limited and erratic. In some states, as in Virginia, a single church was established; others restricted public office to Protestants; some required belief in specific doctrines of the Christian religion, such as the divinity of Jesus, the Trinity, and immortality. The Virginia statute constituted a complete break with the traditional relationship between church and state. It prohibited support of any religion by public taxation and forbade all civil disabilities imposed on citizens because of religious belief or the lack of it. Jefferson regarded the statute as partial fulfillment of his celebrated vow: "I have sworn upon the altar of God eternal hostility against every form of tyranny over the mind of man."

After three years in the legislature, Jefferson was elected governor in 1779 and served for two years in a position characterized by much responsibility and very little power. When Virginia was invaded by British forces in the winter of 1780–81, Jefferson was unable to organize effective opposition and barely escaped capture when a detachment of troops raided Charlottesville and Monticello. His conduct during the emergency was criticized, and, although the legislature gave him a unanimous vote of confidence, he could not forget the slur cast upon his character as a public official. He refused to serve again either as governor or legislator and retired to Monticello determined to live out his life as a private citizen.

There was a reason other than wounded pride for this decision. He was worried about the health of his wife, Martha Wayles Skelton Jefferson. Since their marriage in 1772, she had borne him five children of whom only two survived, and in the fall of 1781 she was again pregnant. Jefferson's fears were justified, for she did not recover strength after the birth of the sixth child and died September 6, 1782. Jefferson's grief was incalculable.

"Notes on Virginia." After his retirement as governor and before he returned to public service in December of 1782, Jefferson wrote and revised the major portion of *Notes on Virginia,* his only book. It originated in a comprehensive but routine series of questions put to him by the secretary of the French legation in order to compile information about the new country. Jefferson's response was as revealing of himself as it was informative about the state of Virginia. In later years he learned to guard his pen carefully, especially after letters he considered to be purely private were printed in newspapers or elsewhere without his permission. The language of this book was frequently unrestrained. It was as if the *Notes,* written for the most part after his abrupt and unhappy withdrawal from Virginia politics and during the months of desperate fear for the life of his wife, provided a means for the release of otherwise restrained emotions.

Discussion of race and slavery in the *Notes*

The *Notes* include a discussion of slavery, its effects on both whites and blacks, and an attempt to delineate the racial characteristics of the latter. Although he was unalterably opposed to slavery and reiterated his reasons in this essay, he both expressed and reflected one of the principal obstacles to abolition—the belief that, because of inherent racial differences, blacks and whites could not live together in peace and harmony. Jefferson's summary of the supposed differences may now be seen as a classic example of the failure of an individual mind—and in this case one of exceptional independence and critical rigour—to transcend the cultural boundaries of its age. It is a curious blend of attempted objectivity flawed by the intrusion of unconscious prejudices and unexamined assumptions. He argued, among other points, that the blacks were inferior in physical beauty, that they might be lacking in foresight, that they were equal in memory but inferior in reason and imagination to the white race. He was aware of the influence of environment on behaviour and belief, accepted it as a general principle, and even cited it to explain the slave's alleged disposition to theft. Yet, he could not or did not apply it consistently and rigorously throughout his examination of the subject. It would appear that he clearly recognized the difficulties involved in applying the methods of scientific analysis to problems of racial characteristics, but they were difficulties beyond his power to resolve.

> The opinion that they are inferior in the faculties of reason and imagination, must be hazarded with great diffidence. To justify a general conclusion, requires many observations, even where the subject may be submitted to the anatomical knife, to optical glasses, to analysis by fire or by solvents. How much more then where it is a faculty, not a substance, we are examining; where it eludes the research of all the senses; where the conditions of its existence are various and variously combined; where the effects of those which are present or absent bid defiance to calculation; let me add too, as a circumstance of great tenderness, where our conclusion would degrade a whole race of men from the rank in the scale of beings which their Creator may perhaps have given them. To our reproach it must be said, that though for a century and half we have had under our eyes the races of black and of red men, they have never yet been viewed by us as subjects of natural history. I advance it, therefore, as a suspicion only, that the blacks, whether originally a distinct race, or made distinct by time and circumstances, are inferior to the whites in the endowments both of body and mind.

The *Notes* are otherwise interesting because they reveal the mind of a revolutionist in the midst of a revolution he regarded as unfinished. With some equanimity, he attributed the "very capital errors" in the Virginia constitution of 1776 to inexperience; it was with passionate outrage that he criticized proposals made twice in the Virginia legislature to follow Roman precedent and establish a temporary dictator in time of emergency:

> The very thought alone was treason against the people; was treason against mankind in general; as riveting forever the chains which bow down their necks, by giving to their oppressors a proof which they would have trumpeted through the universe, of the imbecility of republican government, in times of pressing danger, to shield them from harm.

He urged revision of the constitution and enactment of his plans for universal education and full freedom of religion because he believed that the public virtue then prevalent among both the people and their leaders was impermanent, in part a function of the revolutionary situation, and destined to diminish. Rulers would become corrupt and abuse their power, and the people "will forget themselves, but in the sole faculty of making money, and will never think of uniting to effect a due respect for their rights." Jefferson's belief in republican government did not rest on naïve and unqualified faith in the people. Republican government would operate successfully only under certain conditions: a wide distribution of property or the availability of a substitute that provided men with a decent subsistence honestly earned; an educated and informed population; laws and institutions designed to compensate for the diminution of public virtue that Jefferson thought was sure to come when the crises of the revolutions were over.

Return to politics. In December 1782 he returned to public service and was for several months a member of the Virginia delegation to the Continental Congress. During this time Virginia ceded to the national government the area northwest of the Ohio River, which it claimed under grants made during the colonial period. In an ordinance drafted for the governance of this land, Jefferson set forth the principle that it should not be held by the original 13 states as colonial territory but should be divided into areas that, upon reaching a designated condition of population and organization, should enter the Union as states equal to the original 13. He also included a prohibition that would have forbidden slavery after 1800 in this territory and any others of which the United States might become possessed. The provision was defeated by one vote; a similar one had been incorporated in the Northwest Ordinance of 1787, but it applied only to that territory. Had Jefferson's original proposal been adopted, and had it remained in force, then slavery would have been outlawed in the whole area of the Louisiana Purchase. As he himself later commented,

> Thus we see the fate of millions of unborn hanging on the tongue of one man, and heaven was silent in that awful moment.

Visit to France

In 1784 Jefferson went to France to join Benjamin Franklin and John Adams in negotiating treaties with European powers. After a few months he succeeded Franklin as resident U.S. minister to the French government. His diplomatic duties were not onerous, and Paris offered him the intellectual and artistic society he had first glimpsed as a student at the College of William and Mary. There he could attend the theatre and opera, visit museums, keep up with science and inventions, associate freely with European scientists and intellectuals, share the *politesse* of French society, and indulge his passion for books. He loved France and the French, but not uncritically. His observations of economic and social conditions strengthened his aversion to absolute monarchy, and the contrast he saw between French and U.S. domestic morality led to a series of letters condemning the former and warning against the dangers of corruption should young men of his own country be sent to France for their education. (He did not want his daughters to marry abroad and so took them back to Virginia when the older was 17.) As author of the Declaration of Independence and of the Statute for Religious Freedom of Virginia, he had considerable influence with such moderate political leaders as the Marquis de Lafayette, and during the early stages of the French Revolution he was optimistic about the future of their efforts to effect gradual changes in the monarchy and its attendant laws and institutions. It was the greatest intellectual error of his life: France had almost none of the ingredients that had contributed to the success of the United States War of Independence, a fact Jefferson would surely have realized had he not allowed himself to indulge in wishful thinking. Jefferson observed only the opening stages of the Revolution, for he returned to the United States at the end of 1789.

Controversy with Hamilton. In the meantime, the Articles of Confederation had been replaced by the Constitution drafted in Philadelphia in 1787 and ratified the following year. Jefferson approved of most of that document but was critical of its lack of a bill of rights and its failure to impose limitations on the length of tenure for the presidency. Upon his return to Virginia in the fall of 1789, he was requested by George Washington to become secretary of state in the new government. With considerable reluctance, he accepted. Soon after he assumed the new office he became involved in controversy with Alexander Hamilton, who was secretary of the treasury. He opposed Hamilton's financial policies on the grounds that they exceeded the powers delegated to the central government by the Constitution, that they were contrary to the interests of the majority of the people, and that they represented a threat to republican institutions. Jefferson and Hamilton also disagreed on questions of foreign policy, with Jefferson at first leaning toward France and Hamilton toward Great Britain.

The issues between the two men were not purely personal; they extended to the country at large and led to the formation of national political parties based on policy and principle as well as personality. Thus was established the precedent and pattern of a national two-party system. Both Jefferson and Hamilton retired from the Cabinet near the end of Washington's first term, but each continued to be the symbol of the new parties, Jefferson of the Democratic-Republican, Hamilton of the Federalist. Both sides developed organizational skills among the electorate, the Congress, and the state legislatures, and both made effective use of the press. James Madison was, as usual, Jefferson's able collaborator and supplied active leadership of the party until the latter returned to the centre of national politics as vice president under John Adams in 1797. In 1798, when the United States was close to war with France, the Federalist-controlled Congress enacted the Alien and Sedition Acts. The latter, particularly as applied by Federalist judges, was used to stifle Democratic-Republican criticism of the government. Jefferson and Madison believed it to be contrary to the first amendment and therefore unconstitutional, a position they argued in the Virginia and Kentucky Resolutions of 1798–99.

Role in the development of the two-party system

The decade ended with the defeat of the Federalists in the election of 1800. It was a critical period in the development of the new nation; politics were sharply divisive, conducted with extreme animosity, and permeated with fundamental cleavages over political principles. Jefferson regarded Hamilton as an enemy of republican government; Hamilton regarded Jefferson as a demagogic radical. Hamilton had a dream of national grandeur to which he was prepared to subordinate the immediate interests of the individual. Jefferson saw the purpose of government as the protection of the individual's right to life, liberty, and the pursuit of happiness. Jefferson's attitudes and behaviour during this period were revealing. He did not exercise an Olympian calm; his letters sometimes displayed anger and passion toward the policies of his opponents and toward some of them personally. At the same time, he sensed and feared the divisive and destructive effects of unrestrained ideological conflict. Not only could the latter disrupt the social harmony that Jefferson valued so highly, but it could also conceivably rip the fabric of republican government altogether. A desire to forestall in America what had so frequently been the fate of such governments in the past seemed to influence Jefferson's conduct of the presidency during his first term.

Presidency. The Federalist candidates clearly lost the presidential election of 1800, but under the electoral system then prevailing neither of the Republican candidates, Jefferson and Aaron Burr, could claim victory. The Constitution had provided no means for electors to distinguish between their choices for president and vice president, and both candidates had received the same number of votes. The choice between them was therefore made in the House of Representatives. Partly because of the influence of Hamilton, who distrusted Burr even more than he disliked Jefferson, the latter was chosen president and inaugurated March 4, 1801.

The spirit and content of Jefferson's inaugural address were conciliatory, and so, to a considerable extent, were the policies of his first administration. There was no attempt at wholesale reversal of Federalist policies of the preceding 12 years, and in at least two instances—the Louisiana Purchase and the Embargo Act—he was said to be even more Federalist than the Federalists themselves. There was, however, an effort to nullify the Federalist attempt to fill the federal judiciary with partisan appointees holding office for life, and there was sufficient turnover in other federal offices to give some substance to the accusation that Jefferson introduced the spoils system. But, in spite of the very bitter controversy of the preceding years, Jefferson's inauguration ushered in no drastic or radical changes. Had Jefferson been more doctrinaire or less aware of the danger of unrestrained political passion and of the delicate situation created by the first party change of administration in the new government's history, the future of U.S. politics might have been characterized by less stability than has been the case. The precedent he deliberately set must rank with the Louisiana Purchase as one of the major achievements of his presidency.

The Louisiana Purchase

The acquisition of the Louisiana Territory in 1803 was of incalculable importance, nearly doubling the size of the United States. Jefferson's original plan was to purchase merely a small area at the mouth of the Mississippi River. When Napoleon offered to sell the entire territory, Jefferson saw his chance and took it, even though, as he frankly admitted, he had no constitutional authority to do so. He believed that the purchase would contribute to the security of the United States by removing from the continent a major foreign power and that it would ensure the stability of republican government for generations to come by providing a vast reservoir of land for settlers.

Jefferson was re-elected in 1804; George Clinton replaced Burr as vice president. Jefferson's second administration was notable for his unsuccessful efforts to convict his former vice president, Burr, of treasonable acts in the southwestern territories, and for his efforts to pursue a policy of neutrality during the Napoleonic Wars and maintain the rights of neutrals on the high seas. His overwhelming desire to avoid war with either side led to charges of timidity and vacillation, and his Embargo Act (1807) was criticized as inconsistent with the principles of individual freedom and his former opposition to a strong national government. The act was securely based on the power given to the Congress to regulate commerce with foreign nations—a power of which Jefferson approved long before he became president—but the enforcement provisions of the act and its amendments can rightly be questioned as contravening the Fourth Amendment's prohibition of unreasonable search and seizure.

During Jefferson's presidency the power and prestige of the Supreme Court grew under the leadership of Chief Justice John Marshall. In the case *Marbury* v. *Madison* (1803), the court explicitly asserted the right and power of judicial review. Jefferson opposed the power of the court as the ultimate and exclusive interpreter of the Constitution and argued that such a power lodged in one department of the government whose members held office for life was irresponsible and therefore contrary to the principles of republican government.

Establishment of the University of Virginia

Jefferson might have been elected president for a third term but chose to follow Washington's example of withdrawing after two terms. On March 4, 1809, he turned the office over to his successor, James Madison, and went home to Monticello. There was one more official act he sought to accomplish, the establishment of the University of Virginia, to which he referred as "the last of my mortal cares, and the last service I can render my country." He designed the buildings and supervised their construction to the most minute detail; he gathered the faculty, planned the curriculum, and even selected the reading for some of the courses. He had never been able to persuade his fellow Virginians to support public education for elementary and secondary pupils, but the university was an appropriate conclusion to a political career remarkable for its creativity as well as for its duration and success.

Jefferson's political career was undoubtedly impressive, but it was far from absorbing all of the energy, time, and talent of the man himself. He probably enjoyed politics more than he was willing to admit; it is also true that his often-expressed longing to retire to private life and pursue his other interests was very real. These interests were numerous and varied.

Personal and intellectual interests. He was an extraordinarily learned man, and the range of his knowledge and inquiry is scarcely credible in the modern age of specialization. He knew Latin, Greek, French, Spanish, Italian, and Anglo-Saxon and concerned himself with such questions as the difference between the ancient and modern pronunciation of Greek. At the age of 71 he tackled Plato's *Republic* in the original and found its author greatly overrated. He attempted an analysis of the New Testament in order to discover what Jesus really said as distinguished from what he was reported to have said. He enjoyed the study of mathematics and found its precision and certitude a welcome relief from the untidiness of politics and government. He was an ardent student of the natural sciences, carried on an extensive correspondence with such men as Joseph Priestley, and sometimes contributed time and money to progress in these fields. The discovery of fossil remains in various parts of the country fascinated him, and he tried to collect and classify as many as he could. He was much interested in the experiments with balloons and submarines then being made, and, while he was abroad, he sent back to his friends at home various mechanical and scientific gadgets produced in Europe, including a polygraph and phosphorus matches. His travel notes record impressions ranging from nearly ecstatic admiration of architectural monuments to sober economic analysis of the reasons for the differences in prosperity between regions producing white and red wine.

Interest in the natural sciences

He was an enthusiastic practitioner of scientific farming, conducted numerous experiments at Monticello, was always on the lookout for some new plant or seed that might contribute to the prosperity of the United States (once going so far as to smuggle a particular variety of rice across the Italian border); kept meticulous meteorological records; and, as a keen linguist, instigated the first systematic collection of American Indian dialect. His interest in architecture was intense and enduring, and his influence on the Neoclassical style in the United States was great.

The pursuit of these various interests concurrently with his political activities and the management of his estates (which included several thousand acres and at one time about 150 slaves) is remarkable. To this record of industry must be added the voluminous correspondence Jefferson maintained with extraordinary conscientiousness until very near his death. He could have accomplished so much only through rigorous self-discipline and an efficient organization of his time and activities. Yet, he was one of the most generous and approachable of men. Friends and strangers alike wrote to him for advice or came to Monticello when he was in residence. Relatives and guests filled Monticello to capacity—sometimes beds were made for as many as 50 people—and devoured his food as well as his time. For privacy he retreated several times a year to Poplar Forest, a second home built as a refuge in Bedford County.

Personal appearance and personality

Jefferson was 6 feet 2 inches in height, large boned, slim, erect, and sinewy. He had angular features, a ruddy complexion, sandy hair, and hazel-flecked gray eyes. His carriage was relaxed and somewhat awkward, and by 18th-century standards he seems to have been regarded as pleasant rather than handsome in appearance. He was sensitive and perceptive in personal relations, gracious and charming in manner (though sometimes cold upon first meeting strangers), and almost invariably even tempered. As a matter of both principle and inclination, he attempted to prevent political differences from creating personal ill will, and though he was subjected to malicious abuse during the political controversies in which he was involved, he endured it with relative equanimity and felt genuine animosity toward only a very few of his opponents and critics.

Because he was so central a figure, so widely known, so articulate, and so meticulous in preserving his letters and papers, it is possible to reconstruct a remarkably complete account of his career and his work. Yet, the man himself—the private man—remains elusive. There was a reserve of privacy that he kept inviolate. For example, no letters exchanged between him and his wife exist. Their marriage was, by contemporary accounts, an extraordinarily happy one, and it would therefore appear that Jefferson destroyed whatever letters once existed in order to keep their relationship forever private. Jefferson was, as his modern editor has suggested, ultimately a lonely man.

Ten days before his death, Jefferson replied to an invitation to join the residents of Washington, D.C., in celebrating the 50th anniversary of the proclamation of the Declaration of Independence. He could not attend because of illness, but he sent his best wishes, and, of the Declaration that was to be celebrated, he wrote:

> May it be to the world, what I believe it will be, (to some parts sooner, to others later, but finally to all,) the signal of arousing men to burst the chains under which monkish ignorance and superstition had persuaded them to bind themselves, and to assume the blessings and security of self government.

While Jefferson grew steadily weaker at Monticello, his

Deaths of Jefferson and Adams

old friend John Adams was nearing death in Massachusetts. It seems certain from the accounts of friends and relatives of both that each man wanted badly to live until the 50th anniversary of the day that symbolized the central endeavour and achievement of their lives. They succeeded. Jefferson died shortly before one o'clock on the afternoon of July 4, 1826; Adams died a few hours later, his last words said to have been, "Jefferson still survives." Jefferson was buried at Monticello. The epitaph that he had chosen was inscribed on his tombstone: "Here was buried Thomas Jefferson, author of the Declaration of American Independence, of the statute of Virginia for religious freedom, and father of the University of Virginia." (C.M.K.)

BIBLIOGRAPHY. JULIAN P. BOYD (ed.), *The Papers of Thomas Jefferson*, 19 vol. (1950–74), covering the period up to March 10, 1791, is the definitive edition of Jefferson's papers. It includes extensive notes on the background, context, and significance of the documents printed, among which are papers written to Jefferson as well as those written by him. This edition, when completed, will comprise 60 volumes. Two other collections of Jefferson's writings can be used for the period not yet reached by the Boyd edition: ANDREW A. LIPSCOMB and ALBERT ELLERY BERGH (eds.), *The Writings of Thomas Jefferson*, 20 vol. in 10 (1905); and PAUL LEICESTER FORD (ed.), *The Works of Thomas Jefferson*, 12 vol. (1904–05). A selection is presented in MERRILL D. PETERSON (ed.), *The Portable Thomas Jefferson* (1975, reissued 1977). The correspondence between Jefferson and John and Abigail Adams is reproduced in LESTER J. CAPPON (ed.), *The Adams–Jefferson Letters*, 2 vol. (1959, reprinted 1971). The letters are notable for their warmth and, especially those between the two men after 1812, for their discussions of the intellectual and political developments of the times. Examinations of their friendship are offered in JOHN M. ALLISON, *Adams and Jefferson: The Story of a Friendship* (1966); and MERRILL D. PETERSON, *Adams and Jefferson: A Revolutionary Dialogue* (1976, reprinted 1978). Information about Jefferson's intellectual life may be found in E. MILLICENT SOWERBY (comp.), *Catalogue of the Library of Thomas Jefferson*, 5 vol. (1952–59, reprinted 1983), which contains a list of the books sold by Jefferson to the Congress in 1815, replacing the library burned by the British and forming the nucleus of the present Library of Congress. A convenient single-volume anthology of Jefferson's letters and papers is ADRIENNE KOCH and WILLIAM PEDEN (eds.), *The Life and Selected Writings of Jefferson* (1944, reissued 1982). EDWIN M. BETTS and JAMES A. DEAR (eds.), *The Family Letters of Thomas Jefferson* (1966), includes some 570 letters to and from his children and grandchildren. The variety of Jefferson's interests is revealed in VIRGINIA. UNIVERSITY. LIBRARY, *The Jefferson Papers of the University of Virginia* (1973), comprising more than 3,000 items; EUGENE L. HUDDLESTON, *Thomas Jefferson: A Reference Guide* (1982), is an annotated bibliography.

The definitive biography is that by DUMAS MALONE, *Jefferson and His Time*, 6 vol. (1948–81). A good popular biography is NATHAN SCHACHNER, *Thomas Jefferson: A Biography*, 2 vol. (1951, reissued in 1 vol., 1960). A comprehensive single-volume biography, unfortunately published without footnotes, is MERRILL D. PETERSON, *Thomas Jefferson and the New Nation* (1970). The 19th-century biography by HENRY S. RANDALL, *The Life of Thomas Jefferson*, 3 vol. (1858, reprinted 1972), is valuable because of Randall's extensive consultation with people then living who had known Jefferson personally. The influence of Jefferson in America is treated in MERRILL D. PETERSON, *The Jefferson Image in the American Mind* (1960). Other biographical works include JOSEPH C. FARBER and WENDELL D. GARRETT, *Thomas Jefferson Redivivus* (1971), a book of photographs of places Jefferson knew; THOMAS FLEMING, *The Man from Monticello: An Intimate Life of Thomas Jefferson* (1969); GENE GURNEY and CLARE GURNEY, *Monticello* (1966), an illustrated history of Jefferson's home; and THOMAS JEFFERSON, *Thomas Jefferson: A Biography in His Own Words*, by the eds. of *Newsweek Books* (1974).

Jefferson as an artist emerges in several works: HELEN CRIPE, *Thomas Jefferson and Music* (1974); DESMOND GUINNESS and JULIUS T. SADLER, *Mr. Jefferson, Architect* (1973); WILLIAM H. ADAMS (ed.), *Jefferson and the Arts: An Extended View* (1976); PAGE SMITH, *Jefferson: A Revealing Biography* (1976); LALLY WEYMOUTH (ed.), *Thomas Jefferson: The Man, His World, His Influence* (1973); and HOWARD C. RICE, *Thomas Jefferson's Paris* (1976).

For analyses of Jefferson's attitudes toward race and slavery, see DAVID B. DAVIS, *The Problem of Slavery in the Age of Revolution, 1770–1823* (1975); FAWN M. BRODIE, *Thomas Jefferson: An Intimate History* (1974), a biography developing the thesis that Jefferson's slave Sally Hemings was his mistress; BARBARA CHASE-RIBOUD, *Sally Hemings* (1979), a historical novel; VIRGINIUS DABNEY, *The Jefferson Scandals: A Rebuttal* (1981), which argues against Brodie and Chase-Riboud; JOHN C. MILLER, *The Wolf by the Ears: Thomas Jefferson and Slavery* (1977, reprinted 1980), an examination of contradictions in Jefferson's approach to slavery that disputes Brodie's biography; and ERIK H. ERIKSON, *Dimensions of a New Identity* (1974), an exploration of Jefferson's opposition to slavery as a characteristic of American identity. Jefferson's views on American Indians are covered in FREDERICK M. BINDER, *The Color Problem in Early National America as Viewed by John Adams, Jefferson and Jackson* (1968); and BERNARD W. SHEEHAN, *Seeds of Extinction: Jeffersonian Philanthropy and the American Indian* (1973, reprinted 1974).

Interpretive studies include GARRY WILLS, *Inventing America: Jefferson's Declaration of Independence* (1978); EDMUND S. MORGAN, *The Meaning of Independence: John Adams, George Washington, Thomas Jefferson* (1976, reprinted 1978); JONATHAN DANIELS, *Ordeal of Ambition: Jefferson, Hamilton, Burr* (1970); LANCE BANNING, *The Jeffersonian Persuasion: Evolution of a Party Ideology* (1978, reprinted 1980), an exploration of the roots of American opposition. Several monographs examine Jefferson's administration: FORREST MCDONALD, *The Presidency of Thomas Jefferson* (1976); ROBERT M. JOHNSTONE, *Jefferson and the Presidency: Leadership in the Young Republic* (1978); RICHARD E. ELLIS, *The Jeffersonian Crisis: Courts and Politics in the Young Republic* (1971, reprinted 1974); NOBLE E. CUNNINGHAM, *The Process of Government Under Jefferson* (1978); HENRY STEELE COMMAGER, *Jefferson, Nationalism, and the Enlightenment* (1975). Foreign policy and American expansion are discussed in BURTON SPIVAK, *Jefferson's English Crisis: Commerce, Embargo, and the Republican Revolution* (1979); LAWRENCE S. KAPLAN, *Jefferson and France: An Essay on Politics and Political Ideas* (1967, reprinted 1980); GEORGE DARGO, *Jefferson's Louisiana: Politics and the Clash of Legal Traditions* (1975); and DONALD JACKSON, *Thomas Jefferson & the Stony Mountains: Exploring the West from Monticello* (1981).

Jerusalem

Jerusalem (Hebrew Yerushalayim; Arabic Bayt al-Muqaddas, or al-Quds), one of the world's oldest and holiest cities, was in December 1949 proclaimed by the State of Israel to be its capital. The city plays a central role in the spiritual and emotional perspective of the three major monotheistic religions. For Jews throughout the world, Jerusalem is the focus of age-old yearnings, a living proof of ancient grandeur and independence and a centre of national renaissance; for Christians, it is the scene of their Saviour's agony and triumph; for Muslims, it is the goal of the Prophet Muḥammad's mystic night journey and the site of one of Islām's most sacred shrines. For all three faiths it is a centre of pilgrimage—the Holy City, the earthly prototype of the heavenly Jerusalem.

From 1948 until 1967, Jerusalem was divided into Israeli (West Jerusalem) and Jordanian (East Jerusalem) sectors, with the Israeli sector of the city becoming the capital of Israel. During the Six-Day War of June 1967, however, Israel occupied the former Jordanian sector, over which it proclaimed jurisdiction as an integral part of the unified city. Its standing as capital of the nation was reaffirmed by a special Israeli law passed in 1980. Since 1975 the unified Jerusalem has been Israel's largest city.

An outstanding characteristic of Jerusalem, which covers an area of 42 square miles (109 square kilometres), is the variety of its people and culture. The Old City has Jewish, Christian, Armenian, and Muslim quarters. The Jewish quarter suffered during the 1947–48 fighting but since has been completely rebuilt. Its historical synagogues have been restored, and the new residential quarters, though modern, preserve some of their old Oriental atmosphere. The old Jewish neighbourhoods outside the Old City, on the other hand, reflect much of the atmosphere brought from Jewish habitats elsewhere in the Orient, as well as in eastern Europe. Similarly, many of the Christian institutions made direct copies of the architecture common to their native lands.

Arabs in traditional and modern dress; Christians, Western and Oriental, in their infinite variety of secular and monastic vestments; Jews in fashionable and Orthodox dress; and hosts of tourists combine in colourful, kaleidoscopic patterns. Synagogues, churches, mosques, and dwellings in various styles make up the city's unique architectural mosaic. The scent of Oriental cooking and spices, the peal of church bells, the calls of muezzins from minarets, and the chanting of Jewish prayers at the Western (Wailing) Wall all add a particular tinge to the life of the city. These impressions, however, are in a large measure limited to the Old City. Outside the walls Jerusalem is in every sense a modern city with its network of streets and transportation, high-rise buildings, supermarkets, businesses, schools, and restaurants and coffeehouses. It is the persistent mingling of Hebrew, Arabic, and English in the streets that brings to mind the multicultural and political complexities of life in this revered city.

This article is divided into the following sections:

Physical and human geography

THE LANDSCAPE

The city site. On the east, Jerusalem looks down on the Dead Sea and across the Jordan River to the arid mountains of Moab; on the west, it faces the coastal plain and the Mediterranean Sea, about 35 miles (58 kilometres) away. The main north–south road bisects the city in its course along the watershed between the coastal plain and the Great Rift Valley of the Jordan River and links Nābulus (ancient Shechem) to the north with Bethlehem, Hebron, and Beersheba to the south. A major road links Jerusalem with Jericho, about 36 road miles to the east, and hence along the Jordan to the Sea of Galilee in the north. The (Yigal) Allon Road cuts across the Judaean Desert, linking with the new Israeli settlements in Samaria. The west–east road from Tel Aviv–Yafo, 58 miles to the west, crosses the Jordan north of the Dead Sea and runs to Amman, Jordan (biblical Rabbah), about 60 miles to the east; the Tel Aviv–Jerusalem sector has been developed into a modern four-lane highway. A newer transversal road leads westward from Jerusalem, eventually converging on the Ben-Gurion Airport at Lod.

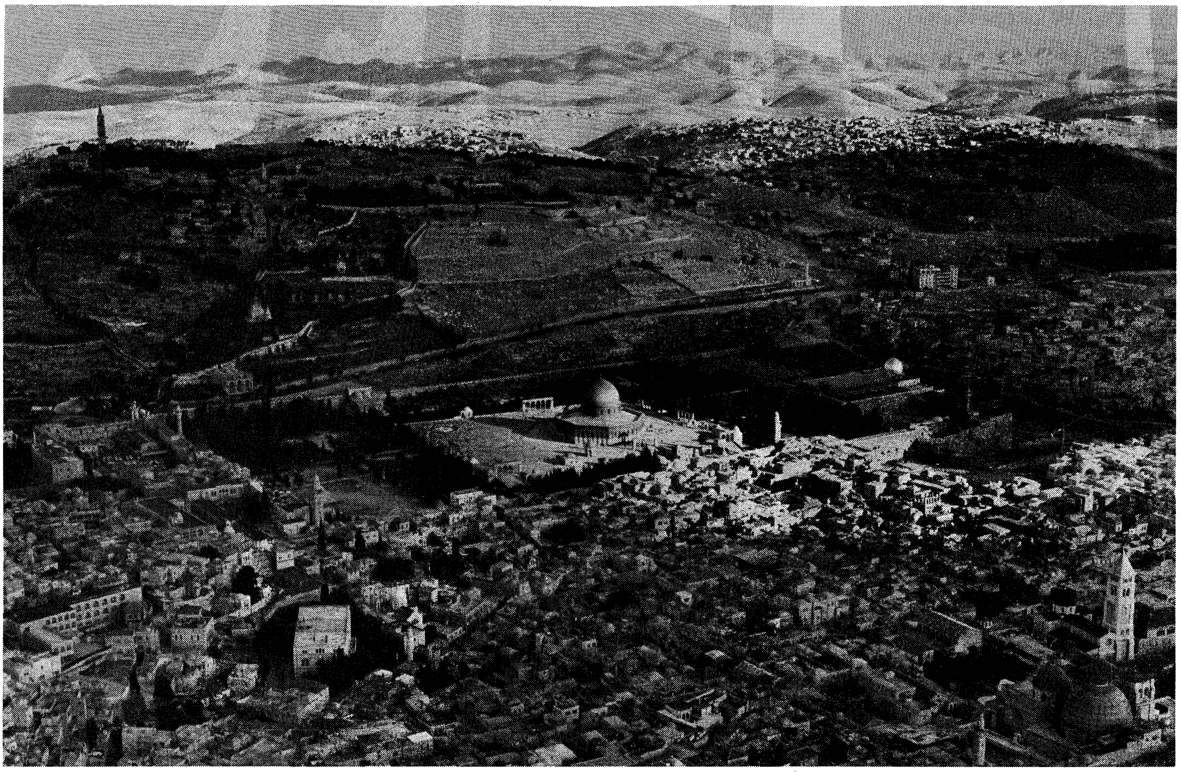
Climate. Jerusalem has a mixed subtropical, semiarid climate with warm, dry summers and cool, rainy winters. The average annual rainfall is about 20 inches (500 millimetres), and snow falls every two or three years. Average temperatures range from about 75° F (24° C) in August to about 50° F (10° C) in January. The hot desert wind, called *sharav* (*khamsīn*), is fairly common in autumn and spring. Average daily humidity is about 62 percent in the daytime but may drop 30–40 percent under *sharav* conditions. Summer exposure to the Sun's rays in Jerusalem is among the most intense on the globe, attributable partly to the lack of clouds or humidity and partly to the angle of the Sun (80°) over the horizon at that season.

Jerusalem has no serious air pollution. Its altitude ensures the free mixing of surface air, and pollutant sources are few, for there is little heavy industry.

Plant and animal life. Lying on the watershed between the relatively rainy Har Yehuda ("Hills of Judaea") and the dry Judaean Desert, Jerusalem has both Mediterranean and Irano-Turanian vegetation. The various red and brown Mediterranean soils, formed by the different types of limestone chalk covering the hills, support as many as 1,000 plant species.

There is a great variety of birds, including 70 resident species and about 150 winter visitors. Those most commonly seen are the hooded crow, jay, swift (which nests in old walls and buildings), and bulbul. The only venomous snake is the Palestine viper; the smooth lizard and common chameleon frequent gardens.

The city layout. The municipal boundaries, defined in 1967, stretch from the Jerusalem Airport in the north to



The Old City of Jerusalem. In the centre is the Dome of the Rock; the Dead Sea is in the background.
Werner Braun

a point almost reaching Bethlehem in the south and from the ridge of Mt. Scopus and the Mount of Olives in the east to Mt. Herzl, ʿEn Kerem, and the Hadassah Medical Centre of Hebrew University in the west.

The Old City

The Old City, which is believed to have been continuously inhabited for almost 5,000 years, forms a walled quadrilateral about 3,000 feet (900 metres) long on each side. It is dominated by the raised platform of the Temple Mount (Hebrew Har ha-Bayt), the site of the First and Second Temples, known to Islām as al-Ḥarām ash-Sharīf ("The Noble Holy Place"). The rest of the area within the walls—divided by the ancient street layout into Muslim, Christian, Jewish, and Armenian quarters—is a typical Oriental city, with its mosques and its medieval vaulted triple bazaar in the centre and a labyrinth of smaller suqs, or bazaars, along David Street, which leads from Jaffa Gate and the Citadel toward the Temple Mount. The Old City is distinguished by its many churches and by the ancient synagogues and study houses of the Jewish Quarter.

Neighbourhoods outside the walls

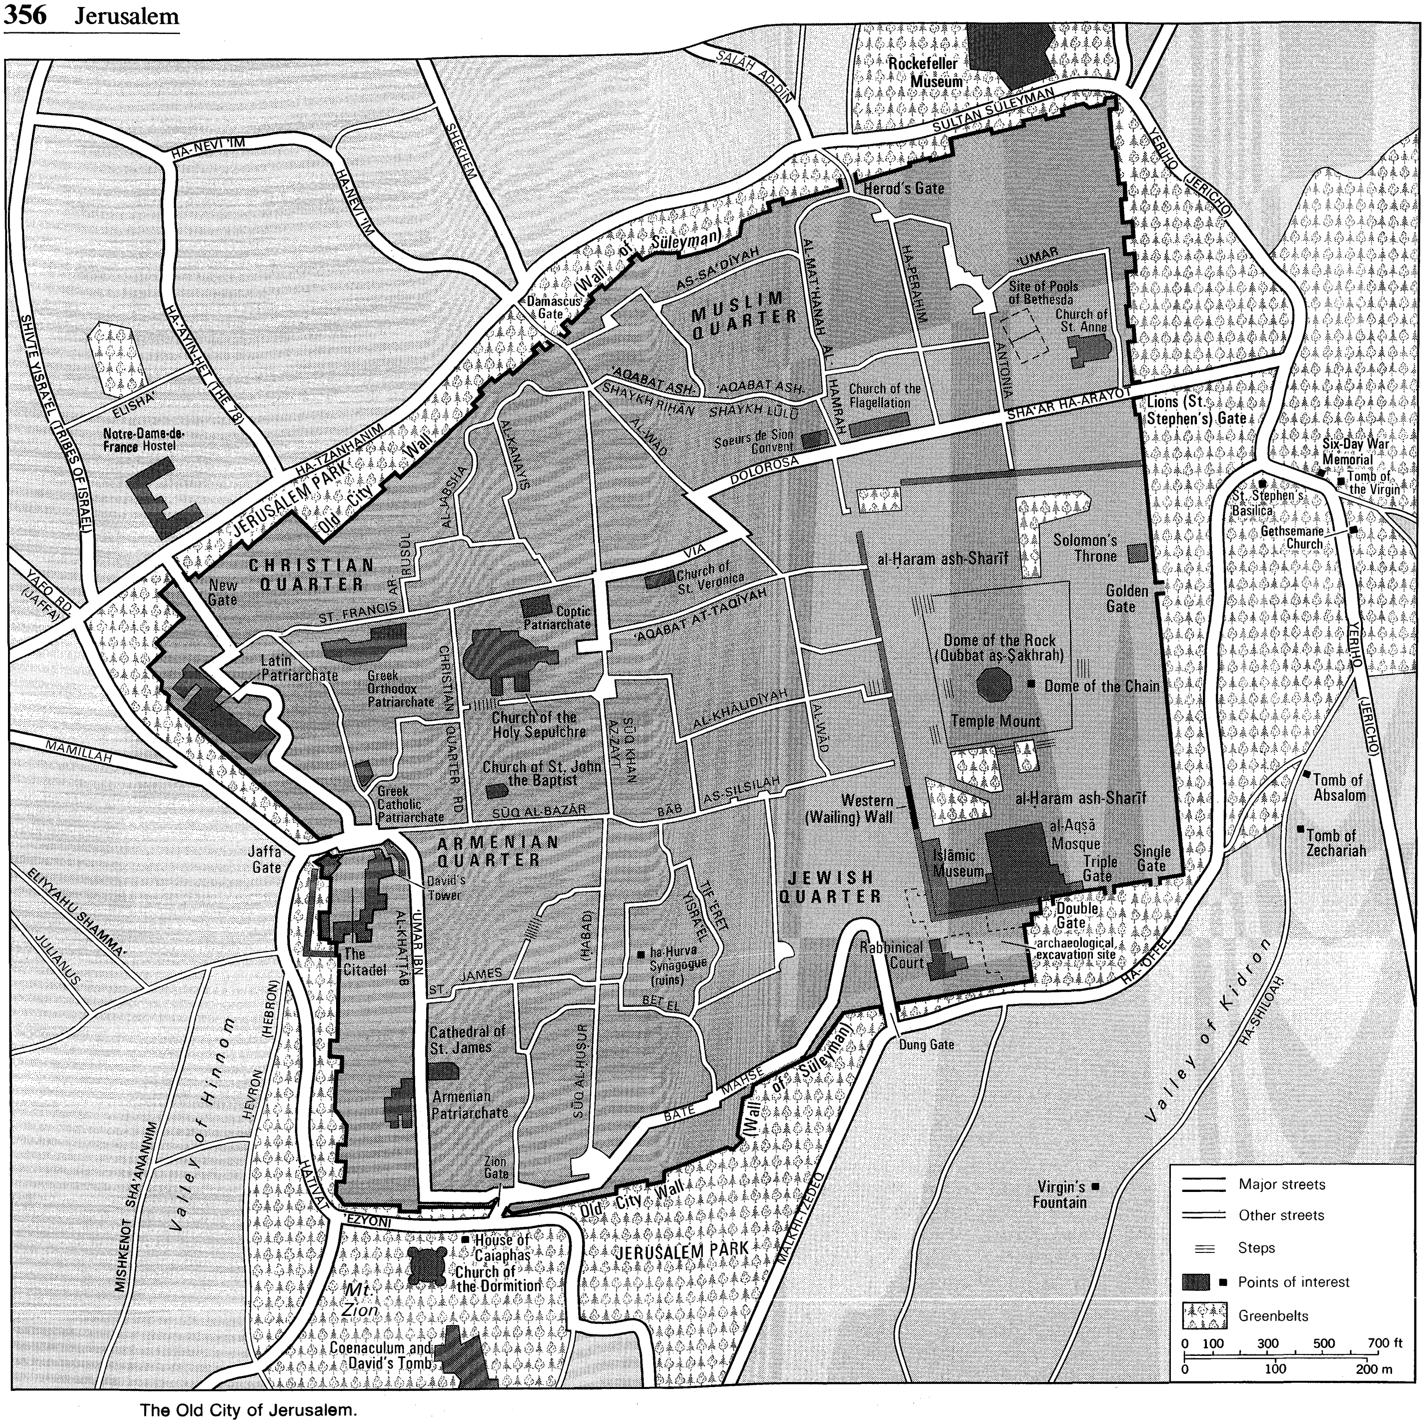
The first neighbourhoods outside the Old City walls, built from the 1860s onward, were scattered chiefly along the main roads leading into the city. The earliest of the Jewish communities were paralleled by non-Jewish expansion prompted by Christian religious or nationalistic motivation and included establishment of the Russian Compound, the German Colony, and the American Colony. Some early communities, such as Mishkenot Sha'anannim and Yemin Moshe, with its famous windmill landmark, have been reconstructed and partially settled or turned into cultural centres. Others include the Bukharan Quarter; Me'a Sheʿarim, founded by Orthodox Jews from eastern and central Europe, with its scores of small synagogues and Talmudic study houses; and Maḥane Yehuda, with its fruit and vegetable market, inhabited mainly by Jews of Oriental origin. Residential quarters established between World Wars I and II include Reḥavya in the centre, Talpiyyot in the south, and Qiryat Moshe and Bet ha-Kerem in the west. The old campus of the Hebrew University at Mt. Scopus, which formed for 20 years (1948–67) an Israeli enclave in the Jordanian-dominated sector, was entirely rebuilt after the Six-Day War. Some Arab districts, such as Talbieh (modern Qomemiyyut) and Katamon (Gonen), abandoned during the fighting of 1947–48, became Jewish neighbourhoods; and thousands of houses were built for new immigrants in districts to the west, newly incorporated into the city. Arab neighbourhoods outside the Old City include the American Colony, ash-Shaykh Jarrāḥ, Wādī al-Jōz, and Bayt Ḥanīnā in the north and villages such as Silwān and Bayt Ṣafāfā in the south. Other important communities include Gillo, Newe Yaʿaqov, and Ramot Allon.

Housing. There is a great variety of housing in the city. In the Old City are antiquated buildings constructed of ancient stones; 19th-century Jewish neighbourhoods, some of which have declined into slums; modern quarters with tree-lined streets; and government-built housing projects, mainly for new immigrants. The most common basic dwelling unit in the Old City consists of a complex of structures, often on different levels, built around an inner court that is entered through a narrow corridor. Steps have been taken to facilitate slum clearance.

Architecture. The outstanding characteristic of the architecture of Jerusalem is the coexistence of old and new, sacred and secular, in a variety of styles. The most conspicuous feature is the Old City Wall, erected 1538–40 by the Ottoman sultan Süleyman the Magnificent, largely on the foundations of earlier walls going back chiefly to the period of the Crusades but in some places dating to Byzantine, Herodian, and even Hasmonean times. On three sides of the Temple Mount, parts of the original supporting walls still stand. During the centuries when Jews were excluded from the Temple Mount, its Western Wall became Jewry's holiest shrine. Since 1967 the wall has been further exposed, and plans have been made to landscape the area once excavations are completed. The main buildings on the platform are the gold-capped Dome of the Rock, completed in 691, and the silver-domed al-Aqṣā Mosque, built in the early 8th century.

The Wall of Süleyman

The Citadel (with David's Tower) beside the Jaffa Gate, which acquired its present form in the 16th century, was created over ruins from the Hasmonean and Herodian periods, integrating large parts of crusader structures and some Mamlūk additions. The large number of churches mainly represent two great periods of Christian architecture, the Byzantine and crusader periods. The predominant characteristic of the former are monumental, two-

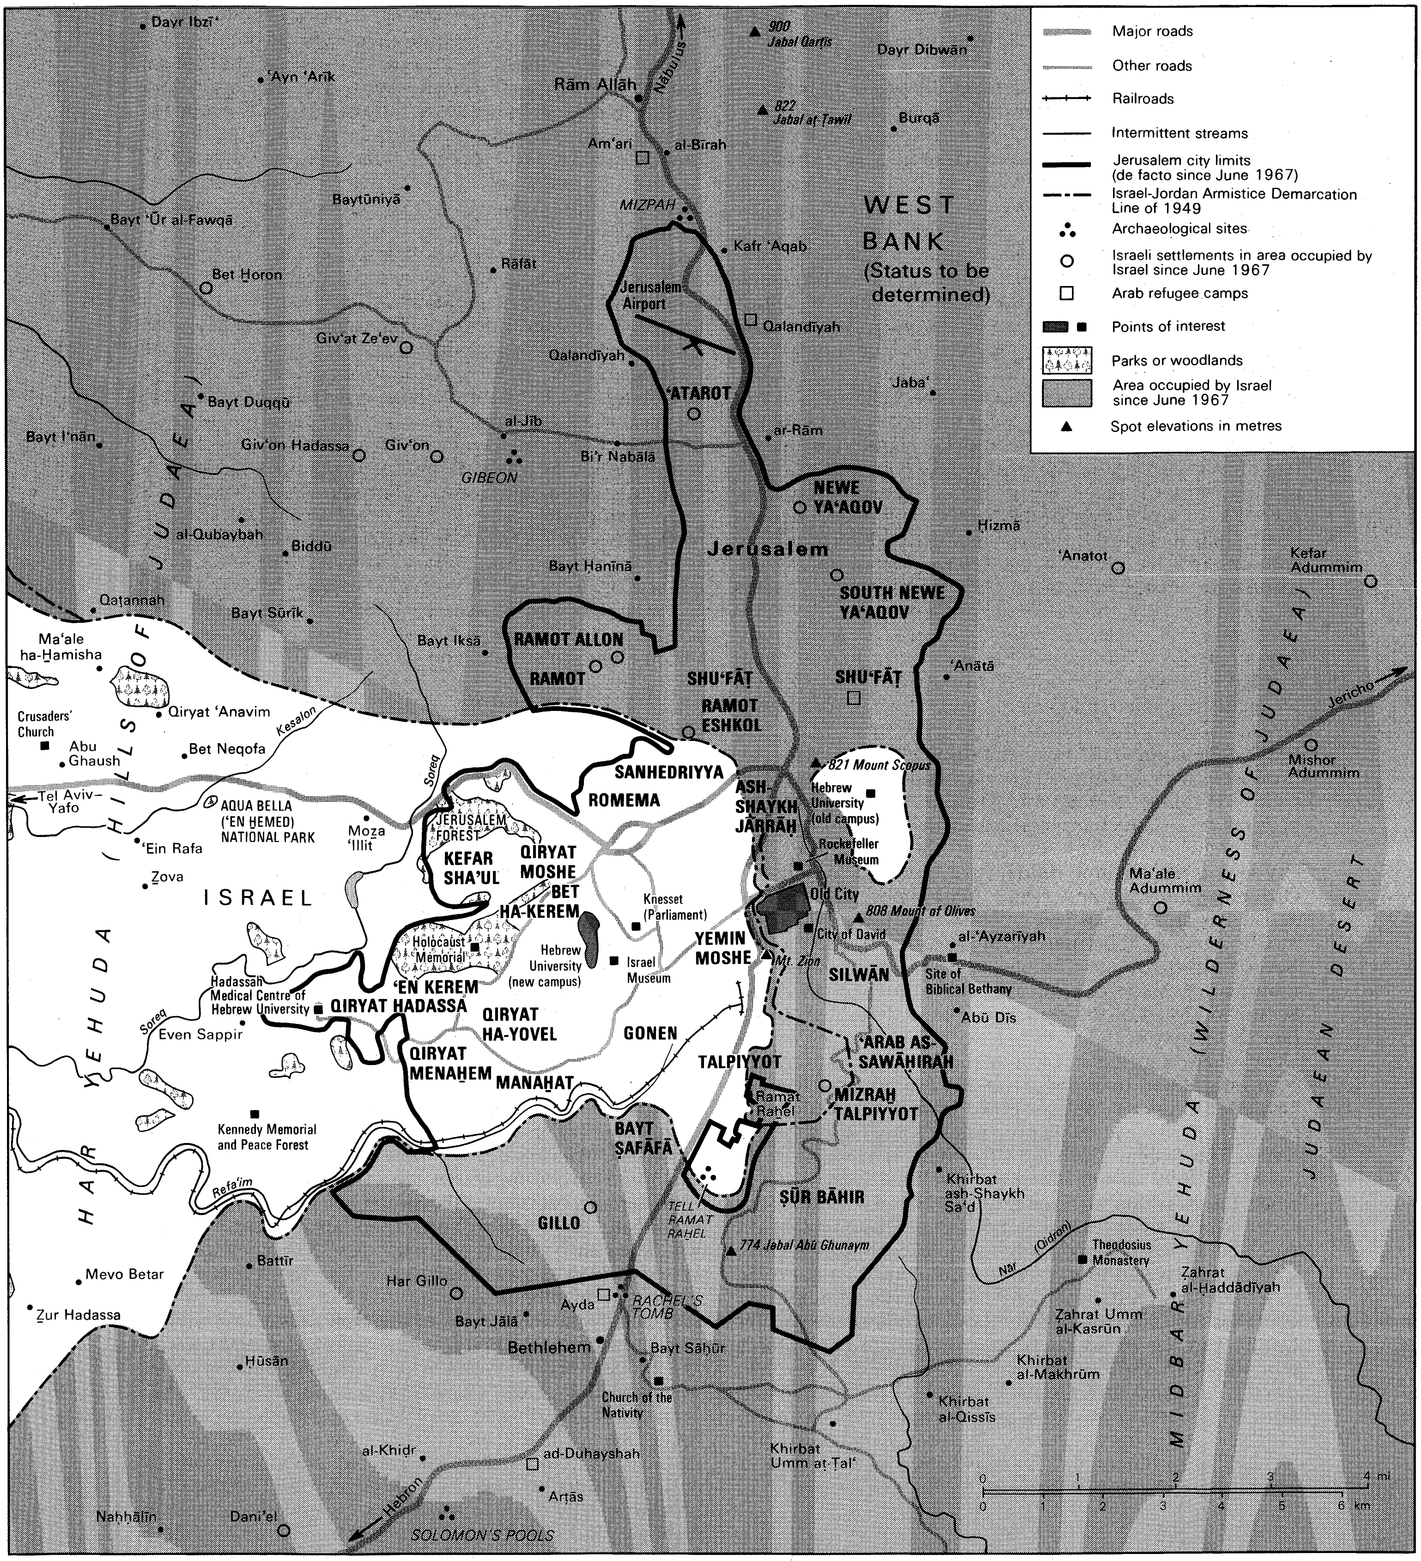


The Old City of Jerusalem.

or three-tiered ornamental or carved basketlike capitals, the latter reflecting Romanesque styling, which features pointed arches and ribbed vaults. The Church of the Holy Sepulchre incorporates elements of both styles, but its facade and layout are architecturally Romanesque. The best example of the mixed style is the Church of St. Anne (its substructure is Byzantine); others are the Armenian Cathedral of St. James, which combines Romanesque with Oriental elements, and the Tomb of the Virgin, which is Romanesque in its upper part but Byzantine in its lower. The central part of the triple bazaar, as well as its link with the Cardo (a restored Roman-Byzantine mall), is of crusader origin. Mamlūk constructions of the 13th to the 15th century, as well as coats of arms of Mamlūk rulers, are found along David Street and near the Gate of the Chain at the Western Wall. The constructions are characterized by "stalactite" or "honeycomb" ornamentation and the use of multicoloured slabs of stone. Ottoman architecture of the beginning of the 16th century continued the Mamlūk style and is represented in some structures of the Temple Mount. The rock-cut tombs east and north of the Old City exemplify architecture of the first half of the 1st millennium BC (Tomb of Pharaoh's Daughter) and the Second Temple period (Tombs of the Kings, Tomb of Absalom, and Tomb of Zechariah). The restored Monastery of the Cross, in the heart of modern Jerusalem, dates from the 5th century.

Modern architecture

As Jerusalem spread outside the walls, the architecture came to be characterized chiefly by iron beams and red-tiled roofs. From 1930 there was a radical change, and flat roofs and reinforced concrete faced with naturally dressed stone predominated. Whereas residential buildings are seldom taller than four stories and office buildings seldom taller than eight, there is a growing tendency, despite opposition, for high-rise construction. This is the case with a number of modern hotels at the western entrance to the city, and the construction of office buildings in the city centre is following the trend. All building, however,



Jerusalem.

must follow a city ordinance requiring construction of stone. Outstanding modern architecture is reflected by the buildings on the university campuses on Mt. Scopus and Givʻat Ram, the Knesset (Parliament), the Israel Museum, the Jerusalem Theatre, and the Hebrew Union College. More modern trends are represented by the Bank of Israel, the Jerusalem Great Synagogue, and the President's Home. An earlier generation is represented by the Government House (UN Headquarters), the King David Hotel, the Rockefeller (Archaeological) Museum, and the Young Men's Christian Association.

THE PEOPLE

Composition of the population

Because Jerusalem is a holy city, uniquely revered by three major religions, its people can, perhaps, be best described according to religious affiliation. Most of the city's residents are Jews. The Muslims are the most homogeneous of the communities, the Christians the most diversified.

Responsibility for the city's holy places and religious communities is vested in the Ministry of Religious Affairs, which has special desks for the individual denominations. The administration, protection, and care of holy places are in the hands of the respective religious authorities. Penalties of up to seven years' imprisonment may be inflicted for desecration of these places. The rites and observances of all the faiths are publicly celebrated.

Jews. Among the Jews, the main divisions are between Ashkenazim and Sephardim, names denoting, not very accurately, places of origin. Of more importance is the division between the orthodox and the more secular-minded segments of the population, whose attitudes over religious as well as political matters often conflict. Jerusalem is the centre of Jewish religious reverence and aspiration. The most sacred spot is the Temple Mount, on which Orthodox Jews refrain from setting foot for fear of profaning its sanctity. In addition to the Western Wall—the most important centre of prayer and pilgrimage—other holy places are Mt. Zion, with the reputed tomb of King David, the Mount of Olives, with its ancient Jewish cemetery, and the tombs of priestly families in the Valley of Kidron. Ancient synagogues and study houses in the Old City are being restored; particularly worthy of mention is the interconnected group of four synagogues begun in the 16th century by Jews exiled from Spain. There are scores of Jewish houses of prayer in the New City. Notable modern institutions include the synagogue at Hekhal Shelomo, the seat of the Chief Rabbinate of Israel. Jerusalem is the world's foremost centre of rabbinic learning and contains scores of yeshivas, the Talmudic academies.

Muslims. Jerusalem is revered by Muslims as the third holiest place on earth, and the pilgrimage to Jerusalem (*taqdīs*) completes the main pilgrimage (*ḥajj*). A Council of Waqf (religious endowment) and Muslim Affairs was created in 1967, with jurisdiction over Sharīʿah courts and waqfs. The council assumed the responsibility for the administration of Muslim affairs that had previously rested with the Council of Waqf and Muslim Affairs in Amman.

Christians. Christians constitute the smallest but the most highly diversified section of the population. The city is the seat of three resident patriarchs of the Eastern Orthodox churches and many archbishops and bishops, and it has an ecclesiastical embassy for almost every sect in Christendom. The main groups are Eastern Orthodox, Monophysite, Roman Catholic, and Protestant. Major denominations share control over the Church of the Holy Sepulchre. Most of the church bodies in Jerusalem maintain scholarly research institutes with fine libraries.

The Greek Orthodox Church maintains a patriarchate with jurisdiction over the entire Holy Land. The Russian Orthodox churches (one governed from Moscow and one in exile) have considerable properties dating back to tsarist times. The Roman Catholic Church in Jerusalem, established in 1099 during the First Crusade, was dissolved when the Muslims won the city in 1244. The Franciscan order, which since 1334 has been the "Custodian of the Holy Land," is charged with the safekeeping of Roman Catholic rights and properties in Jerusalem. The Latin Patriarchate was reestablished in 1847. Of the Monophysite churches, the Armenian is the largest (others include the Coptic and the Abyssinian), its patriarchate having been established in the 6th century. Most of the Armenians dwell in a compound around the seat of the patriarchate at the Cathedral of St. James, which constitutes the largest monastic centre in the country. The Protestant community is small but influential. The jurisdiction of the Anglican archbishop extends over the entire Middle East.

Armenian Church

THE ECONOMY

The main source of livelihood in Jerusalem is government and public service employment (including the academic and clerical professions). Since 1967, business activity and investment in the city have been stimulated by the housing boom and the ever-increasing influx of pilgrims and tourists. Personal income has risen steadily, and unemployment is marginal, although the city still deals with a large number of social welfare cases.

Industry and trade. The establishment of heavy industries has not been encouraged, in the interest of preserving the traditional character of the city. Combined with transport and marketing difficulties, this has limited the city to a number of small industries. They include diamond cutting and polishing and the manufacture of home appliances, furniture, shoes, pencils, plastics, textiles, clothing, and pharmaceuticals and chemicals. There are also printing and publishing houses, as well as workshops producing jewelry, giftware, religious articles, curios, and printed fabrics. More recent additions include the modern science-based industries and the development of industrial quarters in the outskirts of the city and in some of its easily accessible satellite settlements. Nevertheless, the percentage of the work force engaged in industry remains quite small, whereas about two-thirds is engaged in services. The tourist boom has stimulated the construction of first-rate hotels in the city, which receives the highest number of tourists in the country. The heaviest influx is linked with the Jewish high holidays, Christmas, Passover, Easter, and the Muslim pilgrimage.

Transportation. Despite a considerable increase in roads and streets since the mid-1970s, the traffic problem remains one of the most acute in city planning because of the ever-increasing number of private vehicles. Public transportation is provided by bus companies, which operate in eastern and western Jerusalem and also make interurban connections. The latter are also offered by taxi services (*sherut*), which connect Jerusalem with all major Israeli towns, including Elat and Tiberias. The old railway connecting Jerusalem with Tel Aviv–Yafo and Haifa on the coast and with Beersheeba inland is of secondary importance; the Jerusalem Airport at the northern edge of the city serves mainly inland tourist traffic.

ADMINISTRATION AND SOCIAL CONDITIONS

Government. Jerusalem is the seat of the president and the Knesset (Parliament) of Israel. In 1947 the United Nations recommended that it be made an international city, but the proposal was opposed by both Israel and Jordan. Although a large number of countries do not recognize Jerusalem as the capital of Israel, a large proportion of the resident foreign embassies and legations in Israel were located in Jerusalem until the 1980 law officially proclaimed the unified city the nation's capital. Most of the foreign delegations then moved to Tel Aviv–Yafo to reaffirm nonrecognition of Jerusalem as the Israeli capital. France and the United States each maintain consulates in the eastern and western parts of the city. Diplomats living in the Tel Aviv area go to Jerusalem to present their credentials to the president and transact business at the Foreign Ministry. The ministries are concentrated in the Qiryat Ben-Gurion, the government complex, which is flanked by the Knesset on one side and the Bank of Israel on the other. The Ministry of Defense is still located in Tel Aviv–Yafo, and several ministries are in temporary housing in Jerusalem. In addition to the Supreme Court and the Chief Rabbinate, the city also houses the head offices of many world Jewish bodies, such as the Jewish Agency and the World Zionist Organization, as well as the Martyrs' and Heroes' Remembrance Authority (Yad va-Shem), which commemorates the victims of the Holocaust.

The Municipal Council is composed of 31 members who are elected every four years by proportional representation. The council is headed by the mayor, who, since 1975, has been elected by direct vote. Permanent residents, even if not Israeli nationals, are entitled to vote. Of the administrative staff, more than 20 percent are Arabs. Official correspondence is issued in both Hebrew and Arabic.

Voting

Services. Jerusalem has always depended on human ingenuity to bring its water from afar. The underground aqueduct built by King Hezekiah in the 8th century BC is still extant, and many reservoirs and rainwater cisterns date from ancient times. Since the 1950s the New City has enjoyed an unlimited supply from the Israeli national water grid; East Jerusalem was reconnected to the West Jerusalem system in 1967.

The city has a modern sewerage system. The six miles of ancient piping that run through the Old City still present serious engineering problems. Drainage repairs in the Christian Quarter have uncovered Byzantine pavements, which have now been restored. Additionally, parts of the Via Dolorosa, said to follow the path along which Jesus carried the cross to Golgotha, have been repaved to facilitate the Christian pilgrimage.

Electricity is supplied by the national grid of an Israeli government corporation, as well as by a small diesel plant in East Jerusalem.

Health. The Hadassah Medical Centre at ʿEn Kerem is one of the most advanced institutions of its kind in the world. It treats patients from throughout the country, as well as from the West Bank, the Gaza Strip, and Jordan. Other hospitals are the Hadassah Hospital on Mt. Scopus; Shaʿare Tzedeq, which pays special attention to the requirements of Orthodox Jews; Biqur Ḥolim; St. John's Ophthalmic Hospital; Ezrat Nashim for mental patients; Alyn for crippled children; an Arab-Muslim hospital, al-Maqāṣid al-Khayrīyah, at et-Tur; and an Arab-Christian hospital, al-Muṭallaʿ (Augusta Victoria), on the Mount of Olives, which is run by Lutheran organizations that mainly care for the Arab population. A modern medical centre that also serves the Arab population was opened in 1982 at ash-Shaykh Jarrāḥ in northeast Jerusalem. Also important are the Austrian Hospice inside the old town, the French Hospital, St. Louis (accepting terminal cases), and the Sisters of Charity (for the crippled and handicapped). After unification of East and West Jerusalem the Kupat Ḥolim, the medical insurance arm of the General Federation of Labour, established several clinics in the eastern part of the city. Supplementing the regular medical facilities are the Magen David Adom and the Red Crescent (counterparts of the Red Cross), which provide additional emergency services.

Most families belong to one of the medical insurance funds run by the labour federations and other nongovernmental bodies. Medical insurance is by law obligatory for all citizens. The municipal social welfare department takes care of social cases that are not covered by medical insurance. Municipal clinics have been established for mothers and children. Health supervision, including dental inspection and treatment, is provided in all of the city's schools. All health services are subsidized by the government. Rapidly developing and expanding social services provide adult education, senior citizen clubs, and youth clubs among a variety of programs in both parts of the city. Community centres are the focal points of educational and recreation programs in the neighbourhoods.

Religious and secular education

Education. Because of the high birth rate and the strong religious convictions of many among the population, education has always involved complex problems. The language of instruction is Hebrew in Jewish schools and Arabic in Arab schools. Hebrew and Arabic are alternately first or second languages in all schools. In structure and curriculum, as a rule, the Arab schools follow the Jordanian system. While the majority of school-age children attend government schools, there are numerous private institutions maintained by Jewish, Muslim, and Christian religious organizations. In the latter, the language of instruction is sometimes French or English. State kindergartens were introduced in East Jerusalem in 1967. Education is the single most important item in the city's budget, and the municipality is responsible for the maintenance of classrooms from kindergarten through high school.

The Hebrew University of Jerusalem (opened 1925) is the country's foremost institution of higher learning. It has two main campuses—at Mt. Scopus in the east and at Givʿat Ram in the west, in addition to the medical school at ʿEn Kerem and the Faculty of Agriculture in Reḥovot. The old buildings on Mt. Scopus have been renovated and supplemented by a new complex of buildings. Other institutes of higher learning are the Bezalel Academy of Arts and Design, the Rubin Academy of Music, the Hebrew Union College, several teachers'-training colleges, and an Armenian seminary.

Libraries

The Jewish National and University Library, with about 2,500,000 volumes is the largest in the country. It has the foremost collection of books, incunabula, and periodicals of Judaica in the world, in addition to an excellent library on archaeology and Oriental studies, including the history of Palestine. In addition there are the Library of the Knesset and the State Archives (each of which receives a copy of every book printed in Israel) and the Municipal Library and its branches. Numerous other libraries serve a variety of needs.

CULTURAL LIFE

An important cultural institution is the Israel Museum, which, in addition to its general art collection, houses a comprehensive Middle Eastern archaeological collection, several important Dead Sea Scrolls and other relics, a notable collection of Jewish ritual art, Middle Eastern ethnological exhibits, a sculpture garden, and a youth wing. The Rockefeller Museum concentrates on the archaeology of the Holy Land, and there is an Islāmic Museum near the al-Aqṣā Mosque, as well as the L.A. Mayer Memorial Institute for Islāmic Art in West Jerusalem.

Special mention should be made of the École Biblique et Archéologique Française, the Studium Biblicum Franciscanum, the Pontifical Biblical Institute, the British School of Archaeology, the William Foxwell Albright Institute of Archaeological Research, the Swedish Theological Institute, and the Ben Zvi Institute. All of these have libraries dealing with theology and the ancient and modern history of Israel and the Middle East; some have collections of antiquities and valuable manuscripts.

Art exhibitions are held in the Israel Museum, the Artists' House, Hutzot ha-Yotzer (the craftsmen's centre), the International Cultural Centre for Youth, and private galleries. Concerts and theatre performances are given at Binyane ha-ʾUma (the Convention Centre), the Khan (housed in a restored 18th-century building), and the Wise Auditorium of the Hebrew University. The beginnings of an Arab theatre have been established.

The only English-language daily in Israel, the *Jerusalem Post,* is printed in Jerusalem, as are all of the Arabic-language dailies. Most Hebrew scholarly periodicals are also printed in the city. The Government Press Office is located at Beit Agron, the headquarters of the Jerusalem Journalists' Association. The headquarters of the Israel Broadcasting Authority (television and radio) are also in Jerusalem. Radio broadcasts are mainly in Hebrew and Arabic, though some programs are also broadcast in a number of languages, including English, French, Ladino, Romanian, Russian, and Yiddish.

The Jerusalem Foundation, established in 1966, recruits funds for the preservation of the city's multi-religious heritage and the embellishment of its barren areas. This foundation is responsible for Jerusalem's many parks, gardens, woodlands, and forests. The largest is Jerusalem Park, designed as a greenbelt to encircle the Old City walls. There are also small gardens, playgrounds, and recreational areas dotting the city. The Biblical Zoo houses specimens of all the animals that are mentioned in the Bible, and the Natural History Museum focuses on the country's fauna.

The municipality, the Young Men's Christian Association (YMCA), and local clubs run comprehensive sports programs. The YMCA soccer field can accommodate 10,000 spectators, and the ha-Poʿel (Workers' Sports Club) field 7,500. There are a number of open-air swimming pools. Community centres in the suburbs also provide sports facilities.

Archaeological excavations

Since 1968 extensive excavations have been carried out in the Old City on behalf of the Hebrew University Institute of Archaeology, the Israel Department of Antiquities and Museums, and the Israel Exploration Society. The digs around the southern and western walls of the Temple Mount, going down to the Herodian pavements, have revealed the steps leading to the Temple, the priests' underground entrance to the Temple, and many religious objects. There are also impressive remains of public buildings alongside a main street. Remains found within the precincts of the First Wall in the Jewish Quarter bore the imprint of burning and destruction during the sack of the city by the Romans in AD 70. For the first time were found walls of structures dating to the 8th and 7th centuries BC. One of these has been identified as the "Broad Wall" described by Nehemiah. A crucified body, from Roman times, with a nail still lodged in the ankle, was discovered in a Jewish tomb at Givʿat ha-Mivtar. Extensive excavations in the Citadel uncovered structures of the Hasmonean, Herodian, crusader, and Mamlūk periods.

Below the Temple Mount outside the walls, impressive remains of an Umayyad palace have been found. The excavations since 1978 in the Mt. Ophel and City of David area have revealed Canaanite and early Hebrew settlements, the latter with a wealth of seals, bulls, epigraphical material, and everyday utensils. A most significant discovery was that of the Roman and Byzantine Cardo, running from the vicinity of the Zion Gate through the restored Jewish Quarter to its crusader part and crossing with the Old City bazaars. The street was reconstructed using the ancient pavement, columns, and capitals. The discovery of the Crusaders' Church, hospice, and hospital of the crusader Teutonic Order (12th century AD) in the Jewish quarter and the huge expanse of wall and towers (from the crusader and Ayyūbid periods of the 12th and 13th centuries AD) between the Dung Gate and the Zion Gate is a major contribution to the history of the city. (Jo.Pr./Ed.)

History

THE EARLY PERIOD

Ancient origins. The earliest traces of human settlement in the city area, found on a hill to the southeast, are from the late Chalcolithic Period and Early Bronze Age (*c.* 3000 BC). Excavations have shown that a settlement existed on the site south of the Temple Mount, and a massive town wall was found just above the Gihon Spring, which determined the location of the ancient settlement. The name, known in its earliest form as Urusalim, is probably of western Semitic origin and apparently means "Foundation of Shalem" ("Foundation of God"). The city and its earliest rulers, the Egyptians, are mentioned in the Egyptian Execration Texts (*c.* 1900–1800 BC) and again in the 14th-century Tell el-Amarna correspondence, which contains a message from the city's ruler, Abdi-Kheba (Abdu-Ḥeba), requiring his sovereign's help against the invading Hapiru (Habiru, ʿApiru). A biblical narrative mentions the meeting of Canaanite Melchizedek, said to be king of Salem (Jerusalem), with the Hebrew patriarch Abraham, and in a later episode it mentions another king, Adonizedek, who headed an Amorite coalition and was vanquished by Joshua.

Kings of Judah

About the year 1000 BC Jerusalem, on the frontier of Benjamin and Judah, inhabited by a mixed population described as Jebusites, was captured by David, founder of the joint kingdom of Israel and Judah, and the city became the Jewish kingdom's capital. His successor, King Solomon, extended the city and built his Temple on the threshing floor of Araunah (Ornan) the Jebusite. Thus Jerusalem became the place of the royal palace and the sacred site of a monotheistic religion.

On Solomon's death the northern tribes seceded. In 922 BC the Egyptian pharaoh Sheshonk I sacked the city, to be followed by the Philistines and Arabians in 850 and Joash of Israel in 786. After Hezekiah became king of Judah, he built new fortifications and an underground tunnel, which brought water from Gihon Spring to the Pool of Siloam inside the city, but he succumbed to the might of Sennacherib of Assyria, who in 701 forced payment of a heavy tribute. In 612 Assyria yielded its primacy to Babylon. Eight years later Jerusalem was despoiled, and its king was deported to Babylon. In 586 BC the city and Temple were completely destroyed by Nebuchadrezzar, and the captivity began. It ended in 538 BC when Cyrus II the Great of Persia, who had overcome Babylon, permitted the Jews, led by Zerubbabel, of the Davidic house, to return to Jerusalem. The Temple was restored (515 BC) despite Samaritan opposition, and the city became the centre of the new statehood and its position strengthened when Nehemiah (*c.* 444) restored its fortifications.

Hellenistic and Hasmonean periods. With the coming of Alexander the Great and his victory at Issus in 333 BC, Jerusalem was drawn for the first time into the orbit of Western power politics.

The growth of Greek influence

After Alexander's death, Palestine fell to the share of his marshal, Ptolemy I Soter, son of Lagus, who had occupied Egypt and had made Alexandria his capital. In the year 198 BC Jerusalem was acquired by the northern dynasty, descended from Seleucus I Nicator, another of Alexander's marshals, which ruled from Antioch (contemporary Antakya, Tur.). The growth of Greek, or pagan, influence affronted the orthodox, whose hostility burst into armed rebellion in 167 BC after the Seleucid Antiochus IV Epiphanes had deliberately desecrated the Temple. The revolt was led by a pious countryman called Mattathias, son of Hasmoneus (Hasmon), and was carried on by his son Judas, known as the Maccabee. The Hasmoneans succeeded in expelling the Seleucids, and Jerusalem regained its position as the capital of an independent state ruled by the priestly Hasmonean dynasty.

The kingdom of Herod

Roman rule. Rome had for some time been expanding its authority in Asia, and in 63 BC Pompey captured Jerusalem. A clash with Jewish nationalism was averted for some time by the political skill of a remarkable family, whose most illustrious member was Herod the Great. Herod was of Edomite descent, though of Jewish faith, and was allied through his mother with the nobility of Nabataean Petra, the rich Arab state that lay to the east of the Jordan. In 40 BC Herod, who had distinguished himself as governor of Galilee, was appointed "client" king of Judaea by the Roman Senate. He was the friend of Mark Antony and, after the defeat of Antony by Octavian at Actium in 31 BC, of Octavian himself.

Herod was king for the next 36 years, during which period Jerusalem reached its peak of greatness, growing in richness and expanding even beyond the new double line of walls. The Temple Mount esplanade was artificially enlarged with supporting walls (including the Western Wall) to house Herod's greatest creation, the splendid new Temple, which took more than a generation to build. The new royal palace was strengthened by immense towers that were integrated in the older Hasmonean walls, whereas the Temple was defended by a new citadel. An amphitheatre added to the Hellenistic character of the city. Centre of religion, goal of obligatory pilgrimage, and the seat of the ruler and of the autonomous court of the Sanhedrin (Jewish Council of Elders), Jerusalem became a great metropolis of the Hellenistic world. Herod died in 4 BC and was succeeded by his son Archelaus, who was subsequently deposed by the Romans in AD 6 and replaced by the first of a series of Roman procurators. It was under the fifth procurator, Pontius Pilate, that Jesus of Nazareth was put to death.

From AD 41 to 44 the kingdom of Herod was reconstituted for his grandson Herod Agrippa I, upon whose premature death the procurators returned. In 66 the Jews rebelled against Rome, and in 70 the city was besieged and almost wholly destroyed by the Roman forces under Titus. The Temple, Herod's greatest creation, was reduced to ashes. By 130 the city had been partially repopulated, and the Jews again revolted unsuccessfully against Rome from 132 to 135. Hadrian decided to plant a Roman city, Aelia Capitolina, on the site. The general layout of Hadrian's town has lasted into the 20th century.

Christian pilgrims early found their way to Jerusalem. It was, however, the conversion to Christianity of Constantine the Great and the famous pilgrimage (326) of his mother, Empress Helena, who found "the True Cross," that made possible the building of the famous shrines in Jerusalem, including the Church of the Holy Sepulchre, and inaugurated one of the city's most splendid and prosperous epochs. The Christian glorification was carried on into the 6th century when, under the emperor Justinian, the Church of Resurrection was rebuilt and many other churches, as well as monasteries and hospices, were established. In 614 this golden age was brought to an end by the Persian invasion, in which the inhabitants of Jerusalem were massacred and the churches destroyed.

The Islāmic and crusader periods. In 638 the Muslim caliph ʿUmar I entered Jerusalem, and in 688–691 the 10th caliph, ʿAbd al-Malik ibn Marwān, built the Dome of the Rock. The city, however, lost some of its earlier importance, despite being proclaimed a goal of Muslim pilgrimage, when the caliphate was moved from Damascus to Baghdad. It shrank in size, and the new line of walls (11th century) did not include the City of David and Mt. Zion. Both the Umayyads and their successors, the ʿAbbāsids, pursued a liberal policy toward Christians and Jews. In 969 control of Jerusalem passed to the Shīʿite Fāṭimid caliphs of Egypt, and in 1010 the caliph al-Ḥākim ordered the destruction of Christian shrines. In

1071 the Seljuq Turks defeated the Byzantines, displaced the Egyptians as masters of the Holy Land, and cut the pilgrim routes, thus stimulating the Crusades.

The city was recaptured by the Egyptians (1098) a year before the hosts of the First Crusade besieged the city. The crusader state took its name from the city, as the Kingdom of Jerusalem. The city regained its position as capital of the kingdom, which (with its northern principalities) stretched from the confines of modern Turkey to the Red Sea. The great Muslim sanctuaries became Christian churches, and in 1149 the Church of the Holy Sepulchre as it exists today was consecrated. Muslims and Jews were barred from living in the city. The kingdom in Jerusalem lasted from 1099 to 1187, when it was overthrown by Saladin, whose Ayūbbid successors ruled from Damascus and Cairo. Jerusalem was again in Christian hands from 1229 to 1239 and from 1240 to 1244, when it was sacked by the Khwārezmian Turks. In 1247 the Holy City fell once more to Egypt and remained subject to the Mamlūks. The great sanctuaries became Muslim again, and the only Christians who remained were the Greek Orthodox and other Oriental groups. In the 14th century the Franciscans began to represent the Roman Catholic interests. The Jews, who had been barred by the crusaders, returned and from the mid-13th century inhabited their own quarter. The layout of the quarters was fixed in that period. The Mamlūks dotted the Temple Mount and the city with mosques, madrasahs, and ornamental tombs.

In 1517 the Ottoman sultan Selim I took the city and inaugurated a Turkish regime that lasted 400 years. The 16th century was a period of great urban development. In addition to the new walls, which still encompass the Old City, and the repaired water supply, new madrasahs, waqfs, and charity institutions multiplied. But by the end of the century the city began to decline, a process that lasted for the next 300 years.

MODERN JERUSALEM

Several factors determined the fate of the city in the 19th century. In 1831 Ibrāhīm Pasha, son of the Egyptian ruler Muḥammad ʿAlī, captured Jerusalem and introduced a series of far-reaching reforms, which were retained when the Turks regained the city (1840). A municipality was established in 1887, and by the middle of the century all of the great European powers had established consulates in the city, which had a salutary influence on the position of the non-Muslim population. Finally, Jewish immigration, mainly from eastern Europe, changed the city's demographic structure and the relative importance of the Old City and the new quarters outside the walls. Christian and Muslim quarters followed suit. By the mid-19th century half of the city's population was Jewish, and it was expanding beyond the walls.

In 1917 British troops under Sir Edmund Allenby entered Jerusalem after the retreat of the Turks. This opened a new era lasting until 1948, during which Jerusalem again became a capital, now ruled under the British Mandate and headed by a high commissioner. About half of its population of some 80,000 was Jewish, with the rest divided between Muslims and Christians. The city developed quickly, expanding its economy and population despite bloody confrontations between Arabs and Jews in 1920, 1929, and 1936 and with skirmishes continuing to the eve of World War II. In 1947 the hostilities renewed; the British pulled out in 1948, and in the ensuing fighting Transjordan captured the Old City, and Jerusalem was divided between Transjordan and the Israelis, the latter proclaiming it the capital of the State of Israel. During the Six-Day War of June 1967 the Israelis stormed the Old City and claimed Jerusalem to be unified once again. Despite a UN resolution that disapproved of the action, the city continued to develop as a unified entity under Israeli administration. The declaration by the Knesset in 1980 that officially made unified Jerusalem the capital of Israel stirred considerable international controversy, and recognition of the capital was withheld by numerous countries. In the following years the city's status remained a point of international contention as restoration work and new construction progressed throughout the old and new sections.

BIBLIOGRAPHY. A good general account of the city is given by TEDDY KOLLEK and MOSHE PEARLMAN in *Jerusalem, Sacred City of Mankind* (1968; U.S. title, *Jerusalem: A History of Forty Centuries*). The best guides to Christian monuments and holy places are EUGENE HOADE, *Guide to the Holy Land,* 11th ed. (1981), and *Jerusalem and Its Environs,* 5th ed. (1964). Noteworthy archaeological works include KATHLEEN M. KENYON, *Jerusalem: Excavating 3000 Years of History* (1967), and *Digging Up Jerusalem* (1974); and the *Encyclopedia of Archaeological Excavations in the Holy Land,* rev. trans. from the Hebrew, vol. 2 (1976), Eng. ed. by MICHAEL AVI-YONAH. For recent excavations and discoveries, see NAHMAN AVIGAD, *Discovering Jerusalem* (1983; originally published in Hebrew, 1980); YIGAEL YADIN (ed.), *Jerusalem Revealed: Archaeology in the Holy City, 1968–1974,* trans. by R. GRAFMAN (1975, reissued 1976); BENJAMIN MAZAR, *The Mountain of the Lord,* trans. from the Hebrew (1975); and MEIR BEN-DOV, *In the Shadow of the Temple* (1985).

For ancient history the Bible is the basic source, best consulted in the modern edition known as *The Jerusalem Bible* (1966), prepared in Jerusalem itself by scholars long conversant with the Holy City and its monuments. It may be supplemented by a good commentary such as JAMES HASTINGS, *Dictionary of the Bible,* rev. ed. by FREDERICK C. GRANT and H.H. ROWLEY (1963). Next to the Bible, the main original source for ancient Jerusalem is FLAVIUS JOSEPHUS, the Jewish historian who wrote under Roman patronage at the end of the 1st century AD; the *Loeb Classical Library* edition, *Josephus,* 9 vol. (1926–65, reprinted 1966–69), is recommended. Of modern works, see EMIL SCHURER, *The History of the Jewish People in the Age of Jesus Christ (175 B.C.–A.D. 135),* 2 vol. rev. ed. by GEZA VERMES, FERGUS MILLAR, and MATTHEW BLACK (1973–79; originally published in German, 2nd ed., 1886–90). GEORGE ADAM SMITH, *Jerusalem: The Topography, Economics and History from the Earliest Times to A.D. 70,* 2 vol. (1907–08, reprinted 1974 in 1 vol.), is a comprehensive survey by a great scholar. The works of the great Dominican scholars HUGHES VINCENT and F.M. ABEL, especially *Jérusalem: recherches de topographie, d'archéologie et d'histoire,* 2 vol. in 4 (1912–26), should also be read. For medieval history, STEVEN RUNCIMAN, *A History of the Crusades,* 3 vol. (1951–54, reprinted 1975), provides essential background, and each volume contains an exhaustive bibliography. See also JOSHUA PRAWER, *The Crusaders' Kingdom: European Colonialism in the Middle Ages* (1972; U.K. title, *The Latin Kingdom of Jerusalem,* 1973), and *Crusader Institutions* (1980). GUY LE STRANGE (trans.), *Palestine Under the Moslems: A Description of Syria and the Holy Land from A.D. 650 to 1500* (1890, reprinted 1975), is an exhaustive collection of medieval Arabic sources. T.S.R. BOASE, *Castles and Churches of the Crusading Kingdom* (1967), is a finely illustrated work by an outstanding scholar. AMNON COHEN and BERNARD LEWIS, *Population and Revenue in Towns of Palestine in the Sixteenth Century* (1978); and YEHOSHUA BEN-ARIEH, *Jerusalem in the 19th Century: The Old City* (1984; originally published in Hebrew, 1977), treat the Ottoman period. The beginning of modern scholarship was heralded by three books: EDWARD ROBINSON and ELI SMITH, *Biblical Researches in Palestine, Mount Sinai and Arabia Petraea,* 3 vol. (1841, reprinted 1977), by the founder of scientific biblical geography; JAMES FINN, *Stirring Times; or, Records from Jerusalem Consular Chronicles of 1853 to 1856,* compiled by his widow (1878); and CHARLES W. WILSON *et al., The Recovery of Jerusalem: A Narrative of Exploration and Discovery in the City and the Holy Land* (1871, reprinted 1872), the record of the first underground survey of the ancient city. Since then, the output of books on every aspect of Jerusalem has been unceasing. Current publications in all aspects and languages can be followed in the quarterly *Kiryat Sefer.* For the period of the British mandate, ALBERT M. HYAMSON, *Palestine Under the Mandate, 1920–1948* (1950, reprinted 1976), is the standard work. STEWART PEROWNE, *The One Remains* (1954, reissued 1955), is an eyewitness account of the succeeding period. Of particular importance to understanding modern history are MERON BENVENISTI, *Jerusalem, the Torn City* (1976; originally published in Hebrew, 1973); DAVID H.K. AMIRAN, ARIE SHACHAR, and ISRAEL KIMHI (eds.), *Atlas to Jerusalem* (1973), and *Urban Geography of Jerusalem* (1973), a companion volume; and JOEL L. KRAEMER (ed.), *Jerusalem: Problems and Prospects* (1980). Two general histories are JOHN GRAY, *A History of Jerusalem* (1969), an authoritative survey by a biblical scholar; and A.L. TIBAWI, *Jerusalem: Its Place in Islam and Arab History* (1969). The latest archaeological excavations are reported in the *Israel Exploration Journal* (quarterly). Studies of current problems are published by the Jerusalem Institute for Israel Studies, including ORA AHIMEIR (ed.), *Jerusalem: Aspects of Law,* 2nd rev. ed. (1983); and DAVID KROYANKER, *Jerusalem Planning and Development, 1979–1982,* trans. from the Hebrew (1982).

(S.H.P./Jo.Pr.)

Jesus: The Christ and Christology

Jesus of Nazareth, the founder of Christianity, a religion that claims more than a third of the world's population in the 20th century, was born in Judaea about 6 BC and died by crucifixion about AD 30. Because of the theological motifs and presuppositions in the faith of the early church in respect to Jesus, it is difficult to write with certainty an authentic life of Jesus.

This article is divided into the following sections:

The gospel tradition

SOURCES

The history of the life, work, and death of Jesus of Nazareth reveals nothing of the worldwide movement to which he gave rise. He lived and taught in a remote area on the periphery of the Roman Empire. His life was of short duration, and knowledge of it remained hidden from most of his contemporary world. None of the sources of his life and work can be traced to Jesus himself; he did not leave a single known written word. Also, there are no contemporary accounts written of his life and death. What can be established about the historical Jesus depends almost without exception on Christian traditions, especially on the material used in the composition of the Gospels of Mark, Matthew, and Luke, which reflect the outlook of the later church and its faith in Jesus.

References in Roman historical and administrative accounts

Non-Christian sources. Non-Christian sources are meagre and contribute nothing to the history of Jesus that is not already known from the Christian tradition. The mention of Jesus' execution in the *Annals* of the Roman historian Tacitus (XV, 44), written about AD 110, is, nevertheless, worthy of note. In his account of the persecution of Christians under the emperor Nero, which was occasioned by the burning of Rome (AD 64), the Emperor, in order to rid himself of suspicion, blamed the fire on the so-called Christians, who were already hated among the people. Tacitus writes in explanation: "The name is derived from Christ, whom the procurator Pontius Pilate had executed in the reign of Tiberius." The "temporarily suppressed pernicious superstition" to which Jesus had given rise in Judaea soon afterward had spread as far as Rome. Tacitus does not speak of Jesus but, rather, of Christ (originally the religious title "Messiah," but used very early among Christians outside Palestine as a proper name for Jesus). The passage only affords proof of the ignominious end (crucifixion) of Jesus as the founder of a religious movement and illustrates the common opinion of that movement in Rome. An enquiry of the governor of Asia Minor, Pliny the Younger, in his letter to the emperor Trajan (*c.* AD 111) about how he should act in regard to the Christians (*Epistle* 10, 96ff.) comes from the same period. Christians are again described as adherents of a crude superstition, who sang hymns to Christ "as to a god." Nothing is said of his earthly life, and the factual information in the letter undoubtedly stems from Christians.

Another Roman historian, Suetonius, remarked in his life of the emperor Claudius (*Vita Claudii* 25:4; after AD 100): "He [Claudius] expelled the Jews, who had on the instigation of Chrestus continually been causing disturbances, from Rome." This may refer to turmoils occasioned among the Jews of Rome by the intrusion of Christianity into their midst. But the information must have reached the author in a completely garbled form or was understood by him quite wrongly to mean that this "Chrestus" had at that time appeared in Rome as a Jewish agitator. Claudius' edict of expulsion (AD 49) is also mentioned in Acts 18:2.

References in Jewish sources

Josephus, the Jewish historian at the court of Domitian who has depicted the history of his people and the events of the Jewish–Roman war (66–70), only incidentally remarks about the stoning in AD 62 of "James, the brother of Jesus, who was called Christ . . ." (*Antiquities* XX, 200). He understandably uses the proper name "Jesus" first (for as a Jew he knows that "Christ" is a translation of "Messiah"), but he adds, though qualified by a derogatory "so-called," the second name that was familiar in Rome. (Some scholars have suggested, however, that this reference was a later Christian insertion.) Scholars also have questioned the authenticity of a second passage in the same work, known as the "Testimony of Flavius" (XVIII, 63ff.), which is generally thought to contain at least some statements, apparently later insertions, that summarize Christian teaching about Jesus.

In the Talmud, a compendium of Jewish law, lore, and commentary, only a few statements of the rabbis (Jewish religious teachers) of the 1st and 2nd centuries come into consideration. Containing mostly polemics or Jewish apologetics, they reveal an acquaintance with the Christian tradition but include several divergent legendary motifs as well. The picture of Jesus offered in these writings may be summarized as follows: born the (according to some interpretations, illegitimate) son of a man called Panther, Jesus (Hebrew: Yeshu) worked magic, ridiculed the wise, seduced and stirred up the people, gathered five disciples about him, and was hanged (crucified) on the eve of the Passover. The *Toledot Yeshu* ("Life of Jesus"), an embellished collection of such assertions, circulated among Jews during the Middle Ages in several versions.

These independent accounts prove that in ancient times even the opponents of Christianity never doubted the historicity of Jesus, which was disputed for the first time and on inadequate grounds at the end of the 18th, during the 19th, and at the beginning of the 20th centuries.

Christian sources. Christian testimonies about Jesus were collected in the New Testament. Though they certainly represent only a selection from a much broader stream of tradition (Luke 1:1–4), these testimonies are a very valuable and representative selection. They are, however, of very different kinds. From many of them next to nothing can be learned about the historical Jesus.

The Pauline Letters. The oldest New Testament writings, the genuine letters of Paul (written in the 50s of the 1st century), contain little information about the life of Jesus. Paul, the Apostle, who had not known Jesus personally (II Cor. 5:16), shows no interest in Jesus' biography. At the centre of Paul's thought and proclamation there stands only the theologically important significance of the death, Resurrection, exaltation, and Second Coming of Jesus Christ, contained in numerous short doctrinal and creedal formulas. These formulas the Apostle himself occasionally characterizes as being the tradition that he has received and handed on (I Cor. 11:23ff.; 15:3ff.) or they are in other ways indicated as a given tradition (Rom. 1:3ff.; Phil. 2:6–11).

The importance of the Synoptic Gospels

The Gospels. The most important sources for the life of Jesus are the Synoptic (parallel view of sources) Gospels: Mark, Matthew, and Luke. The Gospel According to John, the Fourth Gospel, assumes a special position. Though it offers some parallels to the other three, and though the independent traditions in it may in individual cases have historical kernels, the tradition in John shows that the gospel has reached an advanced theological state. Because a theological conception has been incorporated in the account to such an extent, this Gospel cannot be directly used as a historical source. It is also the latest of the Gospels, written about AD 100.

That the gospel literature was capable of developing in very different directions is also shown by the extracanonical tradition about Jesus, which is preserved in fragmentary form in quotations by the early Church Fathers and in other sources and which is marked by legendary features and tendencies. The Coptic *Gospel of Thomas* (written in the 2nd century by Gnostic Christians; *i.e.,* heretical believers in esoteric, dualistic doctrines), which was found in 1945 in Naj' Ḥammādī (Egypt), is an example of such extracanonical literature. It contains 114 sayings of Jesus loosely strung together, which have some points of contact with the sayings of Jesus in the canonical Gospels. But this Gospel has no earthly, historical contours in its account of Jesus (*e.g.,* no accounts of the Passion and Easter). As a bearer of heavenly revelation in this Gospel, Jesus instructs the esoteric circle of his disciples about the foreign world of matter that they must renounce in order to participate in the imperishable, transcendent world of light from which they originate. The *Gospel of Thomas,* thus, is of no use as a source for the historical Jesus.

The Synoptic Gospels were originally anonymous. According to questionable 2nd-century tradition, they were written by the immediate disciples of Jesus or companions of the oldest Apostles. Most probably the Gospels were composed between AD 70 and 100. That they were written at such a relatively late time does not detract from their historical significance, however, because an older, oral tradition is collected in them and has left its traces everywhere. The character and structure of the individual traditions are incorporated into the Gospels, which definitely do not have a historical or biographical interest in facts, circumstances, and the course of events. They do not reproduce the story of Jesus as such but, instead, recount history interpreted from the viewpoint of the Christian faith. What Jesus says, does, and suffers is interpreted as the fulfillment of the Old Testament promises, and his story is slanted toward his end (the Passion and the Resurrection), his significance as the divine Saviour, and his Second Coming. In other words, the Gospel texts do not intend to describe the Jesus of the past but rather to proclaim who he is for all ages of time. These perspectives of the post-Easter church to which the writers belong and for which their reports are intended must continually be taken into consideration.

A comparison of the first three canonical Gospels reveals a strange blending of agreements and differences. Mark, Matthew, and Luke contain, by and large, the same traditional material. Some parts, however, are to be found only in Matthew and Luke, and a considerable amount of material is peculiar only to Matthew or only to Luke (and a small amount to Mark, as well). According to almost all critical biblical scholars, Mark, the shortest Gospel, is viewed as the oldest—not Matthew, as was earlier assumed—and served as the main literary source for the other two. They also believe that the material common to Matthew and Luke comes from a second source (called Q, from the German *Quelle,* "source"). This second source (Q) consisted almost exclusively of sayings (logia) of Jesus and contained no Passion or Easter tradition and is therefore known among scholars as the logia, or sayings, source.

Investigation of the Gospels by German biblical scholars such as Karl Ludwig Schmidt, Martin Dibelius, and Rudolf Bultmann—who developed what is known as form criticism, the study of the origin and development of the traditions in the Gospels—has shown that the basic stock of the tradition consisted of numerous small, self-contained units (single sayings, parables, debates, anecdotes, and miracle stories), originally without any relation to each other, and mostly without any interest in dates, places, or historical circumstances. It was the Gospel writers (or some earlier collectors) who first joined these individual pieces together editorially, forming a kind of "discourse" out of sayings and groups of sayings and, through linking individual scenes, creating the impression of a connected chain of events. They used a very modest set of tools for this; *e.g.,* short introductory and connecting phrases, stereotyped, generalizing indications of time ("next," "a few days later"), and frequently repeated, indefinite indications of place (mountain, field, road, house, lake). These editorial turns of phrase are, as a rule, easy to sever from their context and are employed very differently by the separate Gospel writers.

In methodically distinguishing and separating traditional and editorial features, form criticism of the Gospels has apparently dissolved the presuppositions for a historically sound, connected life of Jesus, which scholars have again and again attempted to write in the course of the last 200 years. But such an analysis was only a first step of research into the older material itself. Popular oral tradition, to which the Synoptic material belongs, makes use of fixed forms appropriate in each case to the contents, so as to be easily fixed in the memory. The tradition about Jesus offers many examples of this: prophetic sayings, the Beatitudes, pronouncements of woe, wisdom sayings similar to proverbs, legal sayings, church rules, dialogues, and others. In a corresponding way, many miracles of Jesus are narrated by means of motifs and other features also known from reports of other miracle workers. From this one perceives that this tradition is interested not so much in what was historically unique as in what was typical. Thus, with regard to the Gospels, it has to be considered that their tradition was formed and collected from the point of view of the faith of the post-Easter church, under the influence of its ideas and ways of thought and in close connection with its vital interests and the ways in which its life found expression. When interpreting the texts, scholars must therefore be concerned with the question of their setting in life (*Sitz im Leben*) in the church as well.

This critical survey of the sources shows that there are limits set on a portrayal of the historical Jesus. Many questions are still under debate or have to remain open.

TIMES AND ENVIRONMENT

Political conditions. Politically, the small Jewish nation in Jesus' time was rent and impotent. Always situated in an area of tension between the great empires of the ancient world (*e.g.,* Egypt, Assyria, Babylonia, Persia, and Syria) as they struggled with each other and succeeded one another, it had already lost its political independence since the time of the Babylonian Exile (586–538 BC) and had come under changing foreign domination: in the Hellenistic period, first under the Egyptian Ptolemaic dynasty (3rd century BC) and then under the Syrian Seleucid dynasty (2nd century BC), and, finally, until its ultimate overthrow (AD 70), under the Romans, who continued to rule the area. Only for a short interim was there a Jewish kingdom. The Maccabees, a priestly family, reigned after their revolt (168–165 BC) against Antiochus IV (Epiphanes), the Syrian king. Their rule, however, came to an end as a result of internal disintegration and violent struggles for the throne.

Judaea under Roman domination

Initially courted by the rival parties, the Roman general Pompey marched into Palestine, capturing Jerusalem in 63 BC, and reduced the Jewish territory to Judaea, without the coastal cities and the confederacy of towns of the Decapolis (central Transjordan). Several other smaller regions—*e.g.,* inland Galilee of the northern province around Lake Gennesaret and Peraea, east of the Dead Sea—were left to the Jews. By exploiting the threat to the Roman Empire from the Parthians and by adapting himself skillfully to the changing power situations after the murder of Julius Caesar (44 BC), the clever and adroit Herod I (reigned 37–4 BC) managed with the help of the Romans to become "king of the Jews" and to extend the Jewish state over almost all of Palestine again. His regime was decidedly progressive. He promoted Hellenization (*i.e.,* emphasizing Greek culture) by modern building projects, the founding of towns, and in other ways. But he also attempted to win the favour of the Jews, above all by rebuilding Solomon's Temple in ostentatious form and on an enormous scale. It was begun in 20 BC but was not finally completed until AD 64, a few years before its destruction in AD 70 by Titus, who became emperor of Rome nine years later.

Though the Jews demanded of the Romans the abolition of Herodian rule after his death, the Romans divided the land up among the sons of Herod the Great. The most important and largest part, Judaea, with Jerusalem, Samaria, southern Judaea, and Idumaea, was granted to Archelaus, who was deposed by AD 6. His area was integrated into the Roman administration under a governor (procurator), who controlled military, taxation, and judicial affairs. As was their custom, the Romans allowed the Jews to practice their religion and to exercise restricted powers of administration and jurisdiction. Some of the procurators, however, did not hold themselves strictly to these principles. Pontius Pilate, who is designated in an inscription found in 1961 as *praefectus Judaeae,* ruled (AD 26–36) ruthlessly and with bursts of cruelty. He was dismissed for this reason. The reigns of Herod's other two sons were of rather longer duration: Philip (4 BC–AD 34) ruled as tetrarch of the non-Jewish region northeast of Lake Gennesaret, and Herod Antipas (4 BC–AD 39) served as ruler of Galilee and the remote Peraea.

As far as Jesus' story is concerned, the conditions in Galilee, the land of his origin and his ministry, are of paramount importance. Thoroughly changed in character by the settlement of foreign colonists, although again in the process of being re-Judaized, Galilee was held in contempt by the Judaeans. Though the land's culture and civilization were in large measure Hellenistic, especially at the court of Herod Antipas, in individual towns and among the owners of large estates, the Jewish population, which spoke Aramaic, lived with its own, largely unaffected religious traditions. At the time of Jesus, Galilee was known as a seat of Jewish resistance to Rome.

According to Josephus (*Antiquities* XVIII, 18 ff.), Herod Antipas—whom Jesus called a "fox" (Luke 13:32)—held John the Baptist, the prophet who preached repentance, to be politically dangerous, had him put in prison, and had him executed for this reason. The Synoptic tradition, however, gives the Baptist's harsh criticism of Herod's unlawful second marriage as the reason (Mark 6:17–29).

Various sectarian Jewish groups at the time of Jesus

Information about political conditions in Palestine at the time of Jesus is found mainly in non-biblical sources, especially in Josephus. Only a few details are mentioned in the Gospels. Such information is nevertheless significant as background for the story of Jesus, even if it does not contribute much to an understanding of his teaching. The attitude of the Jewish people to the foreign rule of the Romans was not uniform. There were conformists, especially among the priestly aristocracy in Jerusalem, and there were those who exhibited concealed and open resistance.

Religious conditions. Judaism in the time of Jesus presents a disunited, fragmented picture, composed of widely different groups.

Significance of form criticism

The Pharisees. In the reports of the Synoptic Gospels, the Pharisees serve almost entirely to exemplify his opponents. They are incensed by his preaching and behaviour, spy on him, press from the very beginning to have him done away with, and are, conversely, themselves attacked by him most fiercely as being self-righteous hypocrites. Debates with the Pharisees without doubt played an important role in Jesus' life. From the Gospels there has developed a crude popular view that "Pharisee" is synonymous with "self-righteous hypocrite." The New Testament sources, however, are to be used with discretion in this respect for the following reasons: (1) the later narrators were in large measure no longer conversant with the historical circumstances, especially because they were themselves outside the region of Palestine. As a rule, the Pharisees are introduced as a collective quantity in the Gospels but, in reality, were not a unified group. There are also sporadic references in the Synoptic tradition to the fact that Jesus maintained table fellowship with Pharisees (Luke 7:36; 11:37; 14:1). It is also worthy of note that they play no part in the Passion tradition (with the exception of the later legend in Matt. 27:62ff. about the Pharisees' requesting a guard at Jesus' tomb). (2) A Synoptic comparison reveals the tendency to give Jesus' opponents more concrete form, but in a schematic way. In the later texts, the Pharisees are frequently introduced as the constant foil for Jesus, whereas the older tradition speaks of Jesus' opponents in an indefinite way. (3) Matthew, especially, reflects the sharpened conflicts between Jews and Christians in the period after the destruction of Jerusalem (AD 70), when a theologically narrower brand of Pharisaism was finally asserting itself in the course of the religious reconstitution of Judaism. This later picture dominates the Talmudic tradition, but it may not be projected back into the time of Jesus.

Originating in the time of the Maccabees (or earlier, according to some scholars), the movement of the Pharisees (*i.e.,* the "separated ones") formed itself into a religious association composed chiefly of laymen from varied classes and callings. Its aim was strict adherence to the Torah (Law) in even the most remote areas of daily life, in order to realize the true Israel of God. This especially included the scrupulous observance of the individual ritual commandments for the practice of prayer and fasting, cultic purity, and the avoidance of all contact with the cultically unclean, whether that be lawless persons, sinners, corpses, animals, or unclean utensils. In the Pharisees' piety there was also to be found an eager longing for the future world of God, a doctrine of the resurrection of the dead, and a hope in the promised Davidic Messiah, who would establish his rule in Jerusalem and destroy the power of the heathen.

Jesus' relation to the Pharisees

In view of this religious situation, it is difficult to arrive at a uniform judgment on Jesus' relation to the Pharisees. Points of contact in matters of teaching definitely are present; *e.g.,* in the expectation of the resurrection of the dead, which they hold in common (Mark 12:25–27). Again, there are critical statements about formalized and hypocritical piety in Jewish Talmudic tradition, and not just in sayings of Jesus. It would therefore be unjust to judge all Pharisees to be alike. Obviously, many sayings of Jesus have parallels in Rabbinic tradition. Nevertheless, there is no question that Jesus rejected their claim to righteousness and their ideal of representing the true Israel, that he characterized their "tradition of the elders" as human tradition in contrast to the commandment of God, and that, through his attitude to tax collectors and sinners, he must have given them offense. Because of such opinions of Jesus, they probably would have influenced the people against Jesus. That certainly need not mean, however, that the Pharisees, who were politically anything but dominant, aimed at Jesus' crucifixion from the start (contrary to what is said; Mark 3:6).

The Sadducees. A party of quite another kind was that of the Sadducees, who belonged to the Jerusalem priestly caste. They carried much less authority among the people than the Pharisees. As a theologically conservative school, they differed from the latter also in their rejection of the additional "traditions" and the new doctrine of the resurrection of the dead. Because of the Sadducees' hierarchical tradition and their readiness to adapt themselves to the current political conditions, their influence in Jesus' time, before the destruction of the Temple, is not to be underestimated. Besides the Pharisees and the elders of the people, they had a decisive voice in the supreme religious and judicial authority, the Sanhedrin. A close relation probably existed between them and the Roman rulers. They did not, however, survive the catastrophic outcome of the war and the end of the Temple (AD 70).

The scribes. The scribes are frequently mentioned in the Gospels. In later Judaism, which, since the time of Ezra (5th century BC), was committed to the Mosaic Law, they formed a most respected class of the teachers. Corresponding to the normative significance of the Law for all religious, moral, social, and legal questions of Jewish life, the scribe was a combination of theologian and lawyer. Social origin and membership of a particular party played no role in this group. In Jesus' time, there were, apart from Pharisees and priests, also Sadducees and Zealots among the scribes. They were not paid as a professional class but, instead, had to find their own living. As scribes, they had to expound the Torah and give directives for daily life. Those who had undergone the long and careful training in their schools were accorded the status of scribe, wore the long robe of the scholar (Mark 12:38), were respectfully addressed as "rabbi" (Matt. 23:7), and were allowed to sit in a place of honour in the synagogue. Jesus, like the scribes, sat to teach (Matt. 5:1; Luke 4:20), engaged in debate, gave his opinion on the diverging doctrinal propositions of particular schools (Matt. 19:3ff.), and gathered disciples about him. The stereotyped way in which, particularly in Matthew, Pharisees and scribes are grouped together reflects the conditions obtaining at the time of the Gospel-writers, in which it was the Pharisees who controlled the instruction in the synagogues exclusively. But earlier, in the time of Jesus, the scribes were a more motley group. Also, it is not allowable to conclude from the fact that Jesus is frequently addressed as "rabbi" and "teacher" that he himself was a member of this profession.

Theocratic ideals and zeal for the Law among the Zealots

The Zealots. The involvement of the religiopolitical movement of the Zealots, a revolutionary group, in the historical development of Palestine was disastrous to the nation. No longer contented with the passive resistance of the Pharisees, out of whose ranks they certainly gained many adherents, the Zealots took the ideal of a theocracy and zeal for the Law extremely seriously. The first outbreak of their activities occurred in AD 6, when the Syrian legate Quirinius ordered the population in Judaea to register. This aroused indignation and was the signal for an insurrectionist movement, which confined itself initially to scattered individual acts of revolt but soon expanded, took military form, and finally instigated the First Jewish Revolt (AD 66–70). Biblical and nonbiblical sources name Judas, a Galilean scribe from Gamala, as founder of the Zealots. Like him, other fanatical messianic prophets also found significant followings. In Jesus' time, the conflict had not yet reached its zenith. The Zealots carried out sudden raids on the Roman occupation forces and conducted a guerrilla war from their hiding places in the wilderness. The Romans correspondingly held the land under strict control, reinforced their troops in Jerusalem at the times of the Jewish festivals, when great crowds of pilgrims gathered in the city, and took drastic and ruthless action if they anticipated sedition. This situation illuminates the events leading to Jesus' death. The Zealots' goals were political and, primarily, religious: the realization of a Jewish theocracy, the rule of the promised Messiah, and the destruction of the heathen regime.

The thesis that Jesus belonged to the Zealots or founded a related movement was first advanced in the 18th century and has repeatedly been supported in recent times. The most important point in its favour is Jesus' execution on the cross, a punishment that only the Roman authorities could inflict and did frequently against rebels. There were two others executed in the same manner with Jesus, and they, like Barabbas, who was granted amnesty in Jesus' place (Mark 15:15), are referred to as "robbers" (Mark 15:27), a customary term for rebels at this time. This could indicate that, at that Passover time, when many Jews were in the city, a Zealot revolt had been planned and was bloodily suppressed but also that Jesus had actually been willing to play a leading part in it.

Jesus' messianic entry into Jerusalem and the cleansing of the Temple (Mark 11) are also interpreted along these lines, the latter being understood as an attack on the dominant priestly class that sympathized with the Romans. Some also see a connection with the fact that one of the disciples was carrying a weapon when Jesus was arrested in Gethsemane (Mark 14:47). The later Christian tradition has, it is claimed, for apologetic and theological reasons, altered the true historical state of affairs until it has become unrecognizable. But isolated hints have nonetheless been preserved in it; *e.g.,* Jesus' critical sayings about that "fox" Herod (Luke 13:32) and the violent earthly rulers (Luke 22:25); similarly, the way he attracted Zealots, documented by the fact that among his disciples at least one, called Simon (Luke 6:15; Acts 1:13), was a Zealot.

There are, however, no sufficient reasons to support the hypothesis of Jesus belonging to the Zealots. The undeniable fact that he was crucified by the Romans as a political messianic pretender only proves that he was held to be a Zealot and was probably denounced as an enemy of the state, but not that he really was. The most important and decisive argument against the Zealotism assumption is found in Jesus' message of the dawning of the Kingdom of God, which belongs to the best established items in the tradition. It lacks any politico-nationalistic features and expressly says that God alone, and not any human activity, establishes his Kingdom (Mark 4:26–29) and offers his salvation to all without exception. If Jesus were directly or indirectly to be counted among the Zealots, this would mean at the same time that he must have fought to have the Law rigorously carried into effect and must have strictly avoided associating with sinners, especially with the tax collectors, who stood in the service of Rome. In the dialogue on paying tribute to Caesar (Mark 12:13–17), Jesus even expressly rejected rebellion against the Roman emperor, without thereby glorifying his regime.

The Essenes. Far removed from the above-mentioned religious groups were the sectarian, separatist Essenes, most probably identical with the sect of Qumrān (near the northwest bank of the Dead Sea). The sensational discovery in 1947 of many of their original writings (the Dead Sea Scrolls) and the later excavations of their settlement have extended knowledge of the Jewry of those times to an extraordinary degree and have occasioned the suggestion that both John the Baptist and Jesus came from this sect or were, at the least, heavily dependent on their teaching. Important arguments, however, speak against this assumption. This sect had arisen, like the Pharisees, in the 2nd century BC out of a conflict with the official priesthood in Jerusalem but had nevertheless preserved the priestly traditions and, at the same time, developed a strongly ritualistic practice of the Law. Characteristics of the Qumrān community are: its monastic seclusion from the outside world, including the rest of the Jews; the way it termed itself the "children of light" in contrast to the "children of darkness"; its rigid organization and discipline; and its apocalyptic expectations—centring on the intervention of God in history, along with dramatic and cataclysmic events—and other special features of its theology. Although the new texts found at the Dead Sea show numerous individual parallels to the Jesus tradition of the Gospels, there are already fundamental differences between the Qumrān sect and John the Baptist. His eschatological (last times) message of repentance addressed to the nation as a whole fits in with the sect as little as does his unique kind of Baptism—which one underwent once and for all—with the Essenes' regular ritual washings. Nor does John's temporal and geographic proximity to the strictly esoteric Qumrān sect justify asserting close relations between them. There also are diametrical differences between the views of the sect and the range of Jesus' ministry, his message of salvation, his understanding of God's will in a way free of all casuistry, and, especially, the radical character of his commandment of love and his fellowship with sinners and social outcasts.

Characteristics of the Qumrān community

THE LIFE AND MINISTRY OF JESUS

The birth and family. *The birth of Jesus.* The course of Jesus' life and the geographical setting of his ministry can only be given in rough outline. The details are surrounded by many uncertainties. The period within which his ministry and death occurred may, however, be narrowed down with considerable accuracy on the basis of a synchronistic dating of the appearance of John the Baptist in the 15th year of Tiberius (Luke 3:1)—*i.e.,* AD 28/29—which is confirmed by nonbiblical sources. But the year and place of Jesus' birth are uncertain. Mark and John say nothing about them. The only sources for them are the widely divergent birth and childhood legends in Matthew 1 and 2, where Jesus' birth and early lot are set in the time of Herod I and the change of regime (4 BC), and the narrative of Luke 2, which links Jesus' birth with the first registration in Judaea under the emperor Augustus (AD 6). There is also historical evidence of a census carried out around 8 BC. With all of this in mind, many sources estimate the year of birth as 7–6 BC. (The use of BC [before Christ] and AD [Anno Domini, or "in the year of the Lord"] was not common until the Middle Ages.)

Davidic descent of Jesus

The tradition of Bethlehem as the place of Jesus' birth has its source in all probability in the Old Testament conception of the Messiah as a descendant of David. Early Christianity took this view from the beginning. "Son of David" is found in many texts (*e.g.,* Mark 10:48) alongside other titles of Jesus. Its original political and national sense was abandoned, even though it is still recognizable in the acclamation of the people (Mark 11:10). The theological motif of Jesus' Davidic descent, however, did not necessarily involve the idea that he was born in Bethlehem, David's hometown. That is the case only in Matthew 2 and Luke 2. The accounts differ in that, in Matthew, Bethlehem is thought of as the parents' original place of residence, which they soon change to Nazareth because of the dangers threatening their child (*e.g.,* the flight to Egypt), whereas, in the Lucan story, Jesus' parents really live in Nazareth but stay in Bethlehem temporarily because they are obliged to register at the Davidic family's place of origin. Both traditions are to be judged as legendary variations of the theological theme of Jesus' messiahship, even though each in its own way assigns to his birth a place in history. The extent to which these texts are marked by theological motifs, above all by the thought that Jesus as Messiah fulfills the promises of the Old Testament and the hope of Israel and the world, is shown by the numerous quotations woven into the stories. (G.Bor./Ed.)

The widely differing genealogies in Matthew 1 and Luke 3 also belong in the context of the doctrine of the Davidic descent of the Messiah (Christ). They are the only New Testament evidences for genealogical reflection about Jesus' messiahship. The two texts, however, cannot be harmonized. They show that originally a unified tradition about Jesus' ancestors did not exist and that attempts to portray his messiahship genealogically were first undertaken in Jewish Christian circles with use of the Septuagint (Greek translation) text of the Old Testament. Both texts have to be eliminated as historical sources. They are nevertheless important for the development of Christology (doctrines on the nature of Christ), because they reveal the difficulty of reconciling the genealogical proof of Jesus' Davidic descent with the relatively late idea of his virgin birth.

This last tradition, too, is recorded in only two stories—in Luke 1 and Matthew 1—and was originally quite unconnected with the frequently found motif of Jesus' divine Sonship. Paul, John, and the rest of the New Testament writers are not acquainted with the idea. Also, it has left no traces in the rest of the Synoptic tradition, not even in the story of Jesus' birth (Luke 2:1–10), where Joseph and Mary appear as his natural parents. In Matthew 1, Jesus' miraculous birth is presupposed, and, in Luke 1, it is explained more closely. This tradition is not to be traced back directly to the idea, widely held in classical antiquity, of heroes and great men who derived from the union of a deity with a human woman. In other words, Jesus is not characterized as a demigod here. What underlies this tradition is, rather, the concept of the creative power of God and his Spirit, which is known from Hellenistic Judaism. This theological, not biological, motif has been applied to Jesus and, with the greatest probability, only secondarily combined with the Greek version of the messianic promise of Isa. 7:14 (in the Septuagint, the Hebrew word *'alma—i.e.,* "young woman"—is translated as "virgin"), and in this way the Christian story came about. According to a very old, reliable tradition, the village of Nazareth, which lay in the Galilean hill country, had a Jewish population, and was untouched by the influence of the Hellenistic cities, was the hometown, and then certainly also the birthplace, of the "Nazarene" (Mark 1:24; 10:47; 14:67; 16:6).

The Jewish character of Jesus' parents, brothers, and sisters

The family of Jesus. Four of Jesus' brothers and several sisters are mentioned in Mark 6. (There is no basis in the text for making them into half brothers and half sisters or cousins, and to do so betrays a dogmatic motive.) All his relatives' names testify to the purely Jewish character of the family: his mother's name was Mary (Miriam), his father's, Joseph, and his brothers', James (Jacob), Joseph, Judas, and Simon (names of Old Testament patriarchs). The same is true of the name Jesus. In the Septuagint it is the customary Greek form for the common Hebrew name Joshua; *i.e.,* "Yahweh helps." It is also mentioned in Mark 6 that Jesus or his father (there are variant textual versions) was a carpenter. There are several not unimportant pieces of information preserved about the later history of the family. Of his father, who probably died early, little is mentioned. His mother, brothers, and sisters did not join his movement at first but, rather, disapproved of his behaviour (Mark 3:31–35). Mary is, however, mentioned as a member of the Christian Church after his death (Acts 1:14). The same is true of his brother James, whom Paul names among the witnesses of the Resurrection (I Cor. 15:7) and who was the leader of the Jerusalem Church after Peter (Galatians, Acts). The author of the Letter of James has taken a brother's name for himself, as did the author of the Letter of Jude in respect to another brother. According to a later nonbiblical account (in the *Ecclesiastical History* of Eusebius, a 4th-century historian of the church), grandchildren of Jude (who otherwise remains unknown), who were living in Galilee, were summoned by the emperor Domitian as "descendants of David," but then released as representing no political danger.

Jesus most likely grew up in the piety that was cultivated in the home and in the synagogue (including Bible study, obedience to the Law, prayer, and expectation of the final coming of the Messiah) and also took part in pilgrimages to Jerusalem. From these scattered reports it is possible to gain some information about Jesus' background and theological education. The latter also comes to light in his teaching and in the frequently attested honorific form of address "rabbi" (teacher), which, in the language of the time, was not yet confined to members of the trained and ordained profession of the scribes. Nothing is precisely known, however, about Jesus' youth and inner development. What is known is contained in the sole narrative in Luke 2:40–52 (the boy Jesus in the Temple) and the legendary apocryphal gospels, which, after the manner of legend, sought to illumine the obscurity of Jesus' childhood.

The Christian significance of John the Baptist

The ministry. *The role of John the Baptist.* The Gospel accounts of the appearance and activity of John the Baptist and of Jesus' Baptism at his hands first establish a historically safe basis for knowledge of Jesus' life and work. Significantly, the oldest Gospel writer calls these events "the beginning of the gospel of Jesus Christ" (Mark 1:1), indicating that his would be a message about Christ, not a description of the contemporary background for Jesus' life. The Baptist is, therefore, represented exclusively from the Christian point of view. His place in the Christian history of salvation is that of a forerunner or pioneer; or he is a witness to Jesus, as in the Gospel According to John. But the tradition has nevertheless preserved unchallengeable information about John, especially in Q. Josephus characterizes him as a mere moral teacher and his Baptism as merely ritual washing. In reality, however, he made his appearance in the desert as a prophet of the imminent Last Judgment, calling all without exception to repentance in the eleventh hour, and baptized those who were ready to repent, in order to prepare them for the baptism of fire of the mightier one coming from heaven and to preserve them from his annihilating wrath (Matt. 3:7ff. and Luke 3:7ff.). His dress and diet as an ascetic nomad and, above all, the location of his ministry (the Judaean desert and the Jordan steppes), far away from the institutions and places of traditional religion and secularity, illustrate the earnestness of his eschatological preaching and his attack on all conventional piety; but they also correspond to the old prophetic promise that God would encounter his people in the Last Days, as he did once before, in the desert. Historically, all these features may not be understood immediately in Christian perspective; *i.e.,* as pointing to Jesus as the Messiah. The tradition of the Gospels visibly and increasingly interpreted the history of the Baptist in retrospect, and not least for the reason that there still existed for a considerable time alongside the disciples of Jesus a rival body of disciples of the Baptist.

The significance of Jesus' Baptism

That Jesus was baptized by John, as all the Gospels record, indicates that in all probability Jesus initially belonged to John's movement. The account of Jesus' Baptism is styled in the Gospels as an "epiphany (or manifestation) story" and deals with Jesus' installation at this time as Messiah (Mark 1:9–11). The announcement of the Kingdom of God by John and his call to repentance retained decisive significance for Jesus. His high estimate of the Baptist emerges unambiguously from the fact that he placed John above the prophets and called him the greatest among men (Matt. 11:7–11). He saw the signs of the approaching Kingdom of God in the work of the Baptist as in his own work, and he recognized the authority given John as being from heaven (Mark 11:27–33). These words carry all the more weight historically, because the tendency of the context here is to proclaim Jesus as the Messiah and to place the Baptist, as the lesser, in Jesus' service. It is significant that John himself is nowhere attacked in the Synoptic texts, nor is he designated as a follower of Jesus. Wherever polemic can be recognized in the Gospels (especially in John), it is always directed against the false belief, doubtlessly held by the (later) Baptist disciples, that John was the promised Messiah. The extent to which the close connection between Jesus and John occupied the theological reflection, apologetics, and imagination of the Christian Church is shown by several passages and, above all, by the cycle of legends in the introduction to Luke (chapter 1). Regardless of the close relationship between Jesus and John the Baptist, especially in their prophetic announcement of the approaching Kingdom of God and their call to repentance (*cf.* Matt. 3:2; 4:17), there are also radical differences.

The beginning of the ministry. At the latest, after the Baptist's imprisonment (as the Synoptics state), possibly even earlier (according to John), Jesus began as a grown man (Luke 3:23) an independent public ministry, but in the villages of his Galilean homeland and—sporadically—in the neighbouring countryside, rather than in the wilderness, as did John. The real area of his ministry was the district on the northwest bank of the Lake of Gennesaret (or Sea of Galilee; the towns of Beth-saida, Chorazin, and Capernaum). The change of scene is significant in itself. Jesus did not call the people into the desert. He sought men in their settlements and took part in their ordinary life, and not as an ascetic, like John the Baptist (Matt. 11:18). He worked among them as a wandering preacher (Matt. 8:20) and charismatic miracle worker, without, however, baptizing like John. But the image he presents is nonetheless highly peculiar. He taught not only in the synagogues but likewise in the open air, on the shore of the lake, and on the road. There also were strange people in the group surrounding him: women, children, and many who were viewed as godless or unclean. Further, the manner of his teaching is surprising. He did not derive it from the Holy Scriptures, although he was familiar with them, esteemed them, and appealed to them here and there. Instead, he constantly presented the reality of God and the validity of his will in an immediate way and made them comprehensible to his hearers without using the established structure of sacred texts and traditions and without presupposing a conventional, religious point of view. His metaphors, parables, and proverb-like utterances were not used to explain traditional teachings of biblical theology but, instead, appealed directly to the everyday experience and the understanding of his hearers, and they are therefore characterized by a unique self-evidence and a disarming simplicity.

Jesus' relationships to various people

This corresponds to the manner of his behaviour in his meetings with other people. The Gospels portray this in a large number of separate scenes. These persons vary considerably: pious and impious, rich and poor, respected and outcast, healthy and ill. In every encounter, Jesus' amazing sovereignty with which—free of all prejudices—he mastered the situation is made visible. He saw through his opponents' attempts to corner him in debate, disarmed their objections, saw the needs of the possessed and the sick who crowded around him, and associated with those who were avoided by others. Some of the scenes may only have been added or filled out in later popular tradition, but they clearly demonstrate the power with which Jesus helped people by word and deed, whether he grew passionately angry over the power of disease or over the pride and lovelessness of the "righteous" or whether he commanded the demons or blessed children and laid hands on the sick.

The calling of the disciples. According to the unanimous witness of the Synoptic Gospels, Jesus gave rise to a movement in Galilee and found numerous followers, although not without provoking rejection as well. This movement cannot yet be called a "church." (This concept first appears in the later tradition.) To spread his message and movement, he called on his disciples, for the sake of the approaching Kingdom of God, to resolutely surrender all ties of family and work (Mark 8:34ff.; Matt. 10:37ff.; Luke 14:26ff.) and to follow him and to become "fishers of men" (Mark 1:17; Luke 5:10). Many of his words are of extreme sharpness and do not conceal how difficult the disciples' road will be (Luke 14:25–33). But, at the same time, the patent immediacy of Jesus' sovereign power comes to light in these texts. In the scenes mentioned, it is Jesus who makes the decision. He calls, appoints, and selects particular men, without regard to their origin and previous training. There are fishermen (Andrew, Peter, James, and John), a tax collector (Matthew), and Zealots (Simon and, perhaps, Judas Iscariot) among them, perhaps also a few craftsmen and peasants. Whether it was a circle of 12 disciples from the start is questionable and under debate. It is clear, however, that he commissioned and authorized his disciples to preach and to drive out demons (Mark 3:14). Some of these disciples are well noted in the Synoptic tradition (*e.g.,* Peter and Judas Iscariot). In the Gospel According to John, others come into the foreground, including some from among the followers of the Baptist. Of others, only their names are known (*e.g.,* Thaddaeus). A characteristic of these companions of Jesus is that their discipleship is not, as with the rabbis, a transitional stage that ends with their "training." None of them moves up after sufficient study to the status of "master" (Matt. 23:8). Even if accounts of the calling of disciples have, in general, been styled in the later tradition as examples of what it means to be a Christian and individual scenes have been added to the original stock of stories, the recollection of incidents that occurred during Jesus' ministry in Galilee is doubtlessly preserved in the texts.

Origins of the disciples

The Galilean period. The loose and often differing order of the individual scenes only entitles scholars to speak of a rather ambiguous Galilean period of Jesus' activity: they cannot say with certainty how long it lasted. Because the Synoptic Gospels mention only one trip of Jesus to Judaea and Jerusalem, with the Passion following it, the impression is created that the period lasted no longer than one year. Editorial and theological considerations have, without question, also played a part in this presentation (*e.g.,* Jesus' activity in Galilee and his sufferings in Jerusalem). Scholars offer several good reasons, however, to support the assumption that the Synoptic outline still deserves to be preferred to the widely differing one in John. In the latter, Jesus is in Jerusalem for three celebrations of the Passover (John 2:13–23; 6:4; 11:55), as well as for one Sukkot (Feast of Tabernacles; John 7:2) and one Ḥanukka (Feast of Dedication; John 10:22). This involves a period of more than two full years. It is doubtful, however, that

John is based on an independent tradition, because the indications of time referred to serve the Evangelist as a means of changing the scene of Jesus' ministry between Jerusalem and Galilee. (The centre here is Jerusalem.)

THE MESSAGE OF JESUS

The central and dominant theme of Jesus' teaching

The Kingdom of God. Jesus announced the approaching Kingdom of God and therefore called people to repentance. The first two Gospels have set this at the beginning in a programmatic saying as a summary of his preaching and have thus characterized the central and dominant theme of his mission as a whole (Mark 1:15; Matt. 4:17). Thus, the Kingdom of God, or Kingdom of Heaven (a Jewish circumlocution for God preferred by Matthew), does not just denote a final chapter of his "system of doctrine" (a concept that cannot be applied to Jesus, in any case). The underlying Jewish word (*malkhuta*) means God's kingship, and not primarily his domain. This meaning prevails in the New Testament texts. But Kingdom of God or Heaven is also used in a spatial sense ("Enter . . ."). The burning expectation of the Kingdom of God was widely spread in contemporary Judaism in manifold form, based on the Old Testament faith in the God of the fathers, the Creator and Lord of the world, who had chosen Israel to be his people. But with this faith there had united itself the contradictory experience that the present condition of the world was ungodly, that Satanic powers reigned in it, and that God's kingship would only manifest itself in the future. In wide circles, this expectation had the form of a national, political hope in the Davidic Messiah, though it had expanded this hope in apocalyptic speculation to a universal expectation. In each case it was directed toward the Last Days. Likewise, in Jesus' message, the expression Kingdom of God has a purely eschatological—*i.e.,* future—sense and means an event suddenly breaking into this world from the outside, through which the time of this present world is ended and overcome.

Eschatological motifs

These traditional motifs of the end of the world, the Last Judgment, and the new world of God are not lacking in the sayings of Jesus preserved in the Gospel tradition. Thus, Jesus has not by any means changed the Kingdom of Heaven into a purely religious experience of the individual human soul or given the Jewish eschatological expectation the sense of an evolutionary process immanent in the world or of a goal attainable by human effort. Some of his parables have given rise to such misunderstanding (*e.g.,* the stories of the seed and harvest, the leaven, and the mustard seed). In such cases, the modern thought of an organic process has been wrongly introduced into the texts. People of classical and biblical times, however, heard in them connotations of the surprising and the miraculous. The Kingdom of God, thus, is not yet here. Hence the prayer, "Thy kingdom come!" (Matt. 6:10; Luke 11:2), and the tenses, for example, in Jesus' Beatitudes and predictions of woe (Luke 6:21–26). The poor, the hungry, and the weeping are not yet in heaven. The petitions of the Lord's Prayer presuppose the deeply distressing circumstance that God's name and will are abused, that his Kingdom is not yet come, and that men are threatened by the temptation to fall away.

In regard to Jesus' preaching, one cannot, therefore, speak of a realized eschatology—*i.e.,* the Last Times are now here (according to the view of C.H. Dodd, a British biblical scholar)—but of an eschatology "in process of realizing itself" (according to the view of Joachim Jeremias, a German biblical scholar); for God's Kingdom is very close. It is on the threshold, already casts its light into the present world, and is seen in Jesus' own ministry through word and deed. In this, his message differs from the eschatology of his time and breaks through all of its conceptions. He neither shared nor encouraged the hope in a national messiah from the family of David, let alone proclaimed himself as such a messiah, nor did he support the efforts of the Zealots to accelerate the coming of the Kingdom of God. He also did not tolerate turning the Kingdom of God into the preserve of the pious adherents of the Law (Pharisees; Qumrān sect), and he did not participate in the fantastic attempts of the apocalyptic visionaries of his time to calculate and thus depict in detail the end of the present world and the dawn of the new "aeon," or age (Luke 12:56). Nor did he undertake a direct continuation of the Baptist's preaching.

All the ideas and images in Jesus' preaching converge with united force in the one thought, namely, that God himself as Lord is at hand and already making his appearance, in order to establish his rule. Jesus did not want to introduce a new idea of God and develop a new theory about the end of the world. It would therefore be incorrect to understand his preaching in the Jewish apocalyptic sense of immediate expectancy, coming, as it were, to a boiling point. The proximity of the Kingdom of God actually means that God himself is at hand in a liberating attack upon the world and in a saving approach to those in bondage in the world; he is coming and yet is already present in the midst of the still-existing world. In Jesus' message, God is no longer the prisoner of his own majesty in a sacral sphere into which pious tradition had exiled him. He breaks forth in sovereign power as Father, Helper, and Liberator and is already now at work, as is indicated by Jesus' proclaiming of his nearness and by Jesus' actions in entering the field of battle himself, to erect the signs of God's victory over Satan: "But if it is by the finger of God that I cast out demons, then the kingdom of God has come upon you" (Luke 11:20). For this reason, Jesus called out: the shift in the aeons is here; now is the hour of which the prophets' promises told (Matt. 11:5; Isa. 35:5). This "here and now" carries all the weight in Jesus' message: "Blessed are the eyes which see what you see! For I tell you that many prophets and kings desired to see what you see, and did not see it, and to hear what you hear, and did not hear it" (Luke 10:23–24). In answer to the Pharisees' question about when the Kingdom of God is coming, Jesus therefore said, "The Kingdom of God does not come in an observable way, nor will they say, 'Look, here it is!' or 'There!' For look, the Kingdom of God is within your reach" (Luke 17:20–21; another translation: "in the midst of you").

The dominant feature of Jesus' preaching is the Heavenly Father's turning in mercy and love to the suffering, guilty, outcast, and to those who, according to the prejudices of the "pious," have no right to receive a share in the final salvation. Numerous parables described how God behaves toward them and shows himself as Lord and King (*e.g.,* Luke 15; Matt. 18:23ff.; 20:1ff.). They all speak of God's action in images drawn from daily life, so that everyone can understand. They belong to the uncontestedly oldest stock of the Jesus tradition. But Jesus did not only teach this, he practiced and illustrated it himself by his own behaviour and thereby offended the pious, who claimed the Kingdom of Heaven for themselves.

The message of repentance

In this message of the approaching Kingdom of God, Jesus' call to repentance is grounded. He called on all not to miss the hour of salvation (Luke 14:16ff.; 13:6ff.), to sacrifice everything for the Kingdom of God (Matt. 13:44ff.), and to receive it like a child (Mark 10:15), without the presumptuous and desperate conceit that one might win it and realize it by one's own works (Mark 4:26ff.; Matt. 13:24ff.). Jesus' summons to be wise, to be on the watch (Luke 16:1ff.; 12:35ff.; Mark 13:33ff.; Matt. 24:45ff.), and to surrender the fiction of one's own righteousness (Luke 18:10ff.) belongs here, too. In Jesus' preaching, repentance does not mean a prerequisite or precondition or even a penitent contemplation of oneself but, rather, a consequence of the proximity of the Kingdom of God (Matt. 4:17) and an opening of oneself for his future, a movement not backward, but forward. Jesus in this way binds future and present insolubly together. The apocalyptic's question about how much time still has to elapse before the new world of God is here is thus rendered meaningless. He who asks this only proves that he understands neither the future nor the present properly; namely, God's future as the salvation that is already dawning and one's own present in the light of the coming Kingdom of God.

Jesus therefore rejected the demand that he produce "signs" as proof of the dawning of the time of salvation (Matt. 12:38ff.; Mark 8:11). He himself is to be viewed as the "sign," just as once Jonah, the prophet of repentance, was the only sign given to the people in Nineveh (Luke 11:29ff.). The sign is not identical with the thing signified, but it is a valid indication of it.

According to the Synoptics, Jesus never made his "messiahship" the subject of his teaching or used it as legitimation for his message. It is significant that the "I am" sayings of John, which bear the stamp of Christology throughout, are not found in the Synoptic tradition. That does not in any way affect the fact that Jesus in a decisive way included his own person as eschatological prophet and charismatic miracle worker in the event of the Kingdom of God: "And blessed is he who takes no offense at me" (Matt. 11:6).

The will of God. In Jesus' teaching, the nearness of God is itself viewed as a moving force. It creates, as it were, a field of force and challenges the whole person to obey the will of God unconditionally ("Let your loins be girded and your lamps burning"; Luke 12:35). As little as Jesus tolerated attempts at calculating the time when the Kingdom of God should come, so much the more did he demand that men reckon with its coming. The relation between eschatology and ethics in Jesus' teaching, however, needs to be further clarified. His commandments nowhere have the character of prophetic sayings, and their content is not given an eschatological basis even where Jesus linked them with the promise of heavenly reward and, correspondingly, with the threat of damnation in the Last Judgment (*e.g.,* Matt. 24:24ff.; Luke 19:11ff.). God's will is valid in itself, always and everywhere. For this reason, it is incorrect to characterize Jesus' demands as "interim ethics"; *i.e.,* as exceptional emergency laws in the situation of the world that lies in the blaze of the cosmic catastrophes accompanying the shift of the aeons and the speedy dawn of the Kingdom of God (as did Albert Schweitzer, a great Alsatian theologian, medical missionary, and Nobel laureate). Jesus did not draw arguments for his ethical demands from the perishing order but, rather, from the existing world, the Old Testament commandments, the creation, and experiences known to everyone. Thus, he did not aim at forming a "holy remnant," which would escape the rejection awaiting others in the Last Judgment, on the basis of some kind of select monastic rule.

Eschatology and ethics

The certainty of God's nearness is, nevertheless, the open or concealed point of reference for Jesus' exposition of the will of God and explains his attitude to the Old Testament Law. Corresponding to the character of the Old Testament legal tradition, he refers to the will of God in single sayings and in comments in relation to individual commandments, and, it should be noted, he did not develop these into coherent "moral teaching." Rather, he took up quite different kinds of commandments as concrete examples, above all from the Decalogue and related texts, concerning one's behaviour toward one's fellow human beings (on murder and anger, adultery and divorce, oaths, retaliation, love for others; see Matt. 5:21ff.) and also ceremonial commandments (concerning the Sabbath, prayer, fasting, and defilement) and other cultic duties. Jesus always went to the root of these commandments, and he did not content himself with the mere letter of the Law but disclosed within the Law—sometimes even against the letter of the Law (Mark 10:1ff.)—the genuine will of God. Though Jesus respected the Law, it was no longer for him the only source of the knowledge of God's will and no longer the absolute intermediate authority that exclusively mediates people's relation to God. From this basis are to be understood both Jesus' exposition of the Law and also his criticism of all formalistic casuistry, which is for him only "human tradition."

Jesus thus brings about a confrontation between the reality of God, which is no longer disguised by holy letter and tradition, and the similarly undisguised reality of man. People also can no longer delude themselves into believing that their pious works would represent them before God and thus keep on piling them up, as it were, like the Pharisee (Luke 18:11ff.). What God wants from humanity is not something but humanity itself, unconditionally and undividedly. The classic passages for these thoughts are the antitheses of the Sermon on the Mount (Matt. 5:21–48). They sharpen God's demands to the utmost extreme and leave no room for merely legalistic behaviour. Their leitmotiv is: "Not only, but even. . . ." Even anger, the lustful look, the "legal" divorce, retaliation that keeps within the limits prescribed, and love that excludes the enemy are against God's will.

These extreme demands are meant not so much to be paradoxically overdemanding as, rather, liberating. Firstly, they are formulated in a way that everyone can understand. They include numerous references to the natural, unperverted practices of people in their daily lives. Secondly, the demands do not describe an unattainable distant goal, which all human action must of necessity fail to meet. Rather, Jesus pointed again and again to what the heavenly Father has done, does, and will do with his children and to God's possibilities, which are unlimited, whereas a person might despair of his or her own limited possibilities and impotence (Mark 10:27). Jesus' sayings about faith (Mark 9:23ff.), prayer (Luke 11:1ff.; Matt. 6:1ff.), or worry (Matt. 6:25ff.) are examples of this. Wherever Jesus calls on people to decide for themselves for God, he bases the argument on the fact that God has already decided for humanity. The unlimited readiness to forgive that he calls for also has its motivation in the limitless mercy of God, which he demonstrates toward the guilty in unfathomable measure (Matt. 18:23ff.). Jesus draws his hearers into this relation to God and, therefore, does not engage in abstract reflections about whether his demands are capable of fulfillment. In this way, what a person loses is the characteristic of being able to attain meritorious achievements (Matt. 20:1ff.). On the other hand, Jesus certainly did not give up the thought of "reward." The reward, however, is not a material prize, although images of this kind are not lacking, but the confirmation and perfection of the relation to God (Matt. 25:14ff.). The idea that human beings could claim and charge payment from God is for Jesus completely excluded (Luke 17:10).

The nearness of God, the real God, also brings humanity, no longer graded and classified in traditional categories, into urgent and imperious proximity. How much Jesus was concerned with human beings is shown especially by his commandment of love, which he not only taught but also practiced to the point of offensiveness. In it is concentrated the "better righteousness" that he demands of his disciples (Matt. 5:20). Jesus has taken over the Old Testament dual commandment of love of God and one's neighbour (Deut. 6:5; Lev. 19:18), which is also in Judaism a summary of the whole Law. But it is characteristic of Jesus' preaching (1) that he consistently subordinated all other laws—*e.g.,* the Sabbath commandment—to this highest critical standard (*e.g.,* Mark 2:27; 3:4), and (2) that he extended and heightened love of one's neighbour to love of one's enemies (Luke 6:27ff.), and (3) that his commandment does not have the abstract ideal of a general philanthropy at its root. Rather, he directed his hearers into the situations—always eventful and concrete—where they encounter their enemy (Matt. 5:38ff.) and their fellows in need (Luke 10:25ff.). Behaviour toward one's fellow is so important for Jesus that it is all that is spoken of in many of his utterances, without any mention of the first commandments of the Decalogue concerning behaviour toward God (*e.g.,* Matt. 5:25ff.; 7:12; 19:16ff.).

Individual and social ethics

The distinction that modern moral philosophy makes between individual and social ethics has, in respect to Jesus' teaching, only limited application. To be sure, Jesus did not draw up a program for a new order for the world and the nations, he did not demand a more just distribution of property, did not fight against the differences existing between masters, slaves, and hired workers, and did not give any directives for a better administration of justice. The world he had before his eyes was the world as it was, within the horizon of Palestinian Jewish rural conditions, and not the world as it ought to be. His sayings, parables, and illustrations show how keenly he assessed everyday life and how clearly he described it in his graphic, vigorous way—not glorifying this world as an eternally valid, divinely willed order, and also not getting morally indignant about it. Rather, he calls on people to behave in this given world in conformity to the original will of God and his dawning Kingdom; *e.g.,* to renounce the reign of mam-mon (Matt. 6:24; Luke 16:9ff.). Jesus did not, however, require a complete surrender of property from everyone. His followers were not to avail themselves of the legally regulated facilities for asserting one's own rights and were not to conform to the ways of customary behaviour in the world. The assertion that the world cannot be governed with the Sermon on the Mount is thus not to be denied. Jesus' sayings about retaliation and his commandment of love are not juristically practicable as they stand, because they can only serve as a guide for the one who has been wronged by someone else or who is required to divide his possessions with another person. Legislators and judges have to decide exclusively about the rights of others and must restrain evil for the sake of the general social order. But the truism about the impracticability of the Sermon on the Mount conceals the fact that Jesus' teaching contains strong impulses toward social criticism.

Jesus unmasks as hollow conventions many ostensibly valid standards, explaining the Law according to the norm of the commandment of love and applying it to concrete situations. For this reason he also resists egocentricity, not only of individuals but of entire religiously and socially privileged groups, and joins with discriminated-against people (*e.g.,* heathens, Samaritans, tax collectors, and harlots). Thus, Jesus calls on people to live a life that corresponds to the proximity of God's Kingdom, although the validity and urgency of his commandments require no apocalyptic basis. The act of their proclamation, however, stands nonetheless close to Jesus' own mission (Luke 11:32ff.). Whether, and in what way, he expressed the fact of his mission by the use of Christological titles is not thereby decided. Jesus knew that he had been sent to the "lost sheep of the house of Israel" (Matt. 15:24; 9:36). His ministry, seen as a whole, was confined to the sphere of his own people. Only a few significant words and scenes point forward to the inclusion of non-Jews, in a new, eschatological people of God (Matt. 8:11ff.). Jesus, however, did not organize a mission to the heathen (Matt. 10:5ff.) nor a worldwide "church." The only saying of this kind, spoken to Peter (Matt. 16:17ff.), has been placed in the mouth of the earthly Jesus by the later church and clearly reflects its situation, doctrine, and discipline. But Jesus certainly did call into existence a movement in Galilee and allowed at least the narrower circle of his disciples, if not all of his followers, to share in his wanderings and ministry. Later tradition first identified the latter group alone with the Apostles (authorized emissaries), the circle of whom was, however, not originally restricted to that group (*cf.* I Cor. 15:5ff.). The number 12 symbolizes the 12 tribes of Israel. If Jesus appointed these disciples himself, he thereby demonstrated his eschatological claim on the whole of Israel. According to the saying in Matt. 19:28 and Luke 22:30, which was probably not formulated until later, he conferred on them the office of ruling and judging the perfected Israel of the new aeon.

THE SUFFERINGS AND DEATH OF JESUS IN JERUSALEM

Jesus' decision to go to Jerusalem

Jesus' decision to go to Jerusalem is the turning point in his story. The events it set in motion soon came to have decisive significance for the faith of his followers. It is not coincidental that the Gospels narrate this period of his life in disproportionate breadth. Despite the many points of agreement among the Gospels, there also are considerable discrepancies within the tradition of the Passion. Thus, one cannot expect the tradition of the Passion to provide historically accurate reports, for it has been formed from the viewpoint of the church and its faith in Christ. The most important theological motifs in the narratives include the intention of presenting Jesus' sufferings and death as the fulfillment of God's will, the decision, in conformity with the words of the Old Testament Prophets and Psalms, to proclaim him as Messiah and Son of God, despite his brutal end. Nevertheless, important historical facts may be inferred from the texts.

Jesus probably went to Jerusalem with his disciples for the Passover in order to call the people of Israel gathered there to a final decision in view of the dawning Kingdom of God. He must have been aware of the heavy conflicts with the Jewish rulers that lay ahead of him. The story of the cleansing of the Temple, in particular, shows that Jesus did not avoid these conflicts. The later tradition, stylizing the story, gives as Jesus' sole motive for going to Jerusalem his desire to die there and to rise again in accordance with the will of God (Mark 8:31; 9:31; 10:32ff.). The best clue for a reconstruction of the outward course of Jesus' Passion is given by his Crucifixion. It proves that he was condemned and executed under Roman law as a political rebel. All reports agree that he died on Friday (Mark 15:42; Matt. 27:62; Luke 23:54; John 19:31). They differ, however, in that, according to the Synoptics, this was the 15th of Nisan (March/April); *i.e.,* the first day of the Passover. But, according to John, it was the previous day; *i.e.,* the one on which the Passover lambs were slaughtered and on which the festival was begun in the evening (in accordance with the Jewish division of days) with a common meal. Thus, according to John, Jesus' last meal with the disciples was not itself a Passover meal but took place earlier. Each of these datings may be theologically motivated, whether it be that the Eucharist is to be represented as the Passover meal (Synoptics) or whether Jesus himself is to be shown as the true Passover lamb, who died at the hour when the lambs were slaughtered (John). Historically, the Johannine dating is to be preferred, and the 14th Nisan (April 7) is to be regarded as the day of Jesus' death. The question of the occasion for Jesus' execution and the role that the Jews played is thereby more difficult and more important.

The date of Jesus' death

The way the Gospels present the facts of the case, Jesus was actually condemned to death by the supreme Jewish tribunal (Mark 14:55ff.). Pilate, on the other hand, was convinced of Jesus' innocence and made vain attempts to release him but finally yielded to the Jews' pressure against his better judgment (Mark 15:22ff.). The historical reliability of this account has rightly been questioned. First, the Synoptic reports differ among themselves. According to Mark and Matthew, the Jewish supreme court had already gathered in the home of the High Priest after Jesus' arrest in the night of Holy Thursday to Friday and condemned him to death as a blasphemer at that point (Mark 14:64). Thereafter, they resolved to hand Jesus over to Pilate in a new session in the early morning (Mark 15:1). Luke knows of only one session and has the interrogation take place in the morning (Luke 22:66), but he says nothing about Jesus' condemnation (Luke 22:71). John deviates even more; here, only the high priests Annas and Caiaphas are involved in the interrogation of Jesus (John 18:13ff.). Secondly, with regard to all the Gospel accounts, the question arises, what earwitness can be supposed later to have given the disciples an exact report? Thirdly, the jurisdictional competency of the Jewish Sanhedrin is disputed. In the opinion of some scholars, the Jewish authorities were permitted to pronounce sentence of death and to carry it out by stoning in the case of serious religious offenses (blasphemy). In the opinion of others, though, this required the confirmation of the Roman procurator. Also, trials of this kind were not to be conducted during the period of the festival.

The strongest argument against the Synoptic presentation is, however, that it is styled throughout in a Christian, and not in a Jewish, way; *i.e.,* on the basis of scriptural proof and the Christian confession to the messiahship and divine Sonship of Jesus. The High Priest's question, "Are you the Christ, the Son of the Blessed?" (Mark 14:61), is unthinkable from the viewpoint of Jewish premises, because Son of God was not a Jewish title for the Messiah. Thus, the account reflects the controversies of the later church with the Judaism of its day.

There also is in the Gospels a tendency to exonerate Pilate at the Jews' expense. His behaviour, however, does not match the picture that nonbiblical sources have handed down about him. But everything speaks for Jesus' having been arrested as a troublemaker, informally interrogated, and handed over to Pilate as the leader of a political revolt by the pro-Roman priestly and Sadducean members of the Sanhedrin, who were dominant in Jerusalem society in those days. The cleansing of the Temple and a prophetic, apocalyptic saying of Jesus (John 2:19; *cf.* Mark 14:58; Acts 6:14) about the destruction of the Temple may thereby have played a role. It can hardly be assumed that each and all of the Pharisees, who were without political influence at that time, were involved in the plot. Nor are they mentioned as a separate group in the Passion narratives alongside the priests, elders, and scribes.

The other scenes in the Passion story do not need to be listed here separately. They relate more to the theological meaning of Jesus' Passion and are, to a large measure, formed in an edifying cultic manner, even though they refer to events that are certainly historical; *e.g.,* Judas' betrayal, Jesus' last meal with his disciples, and Peter's denial of Jesus. The traces of an eyewitness account are perhaps still recognizable at certain points (Mark 14:52; 15:21).

The last words of Jesus

The accounts differ in their presentation of Jesus' death, especially in their rendering of his last words. It is only in Mark and Matthew that Jesus dies crying out the prayer from Psalm 22: "My God, my God, why hast thou forsaken me?" The distinction between the repentant and the defiant thief is only found in Luke. Jesus' last words are given differently in Luke ("Father, into thy hands I commit my spirit!") and John ("It is finished"). Each of these accounts, as also the testimony of the Roman centurion ("Truly this man was the Son of God!"; Mark 15:39), gives expression to the significance of Jesus and his story.

THE STORY OF JESUS AND FAITH IN JESUS

Did Jesus' violent death render his mission and story meaningless? In other words, did he enter definitively into the past as a failure and thus in this sense become the "historical" Jesus? For Pilate and the Romans, as for Jesus' Jewish opponents, there was no longer any problem. The decision had been taken. But Jesus' disciples were faced with this pressing question all the more. Their hopes were bitterly disappointed (Luke 24:13ff.). According to the unanimous witness of the New Testament texts, they did not find the answer themselves but were given it soon after Jesus' death through the Easter (Resurrection) appearances of Jesus (I Cor. 15:3ff.; etc.) and the experience of his Presence in the Spirit. The faith of early Christianity, with all of its practical and theological manifestations, grew out of this. This faith was not the preserve of a few enthusiasts or the personal opinion of individual Apostles. Wherever there were early Christian witnesses and communities, they were all united in believing and acknowledging the risen Lord (I Cor. 15:11).

The forms and ideas in which this faith found expression were various. According to the oldest view, Jesus' Resurrection meant his exaltation to divine lordship and was not necessarily connected with the tradition of the finding of the empty tomb, as the Gospels variously relate it. The theory of the resurrected one's having walked on earth for 40 days and only subsequently ascending into heaven is found only in Acts (1:3). Thus, there exists an undeniable tension between the unequivocal nature of the Easter *message,* on the one hand, and the equivocal nature of the Easter *accounts* and the historical problems connected with them, on the other. But the phenomenon of the whole Gospel tradition, rightly understood, is an expression of the faith in the living Christ without which neither a single word or deed of Jesus nor his Passion would have been handed down at all. The New Testament tradition does not aim at preserving the memory of Jesus as a figure of the past and telling only who Jesus *was,* but it wants to proclaim who Jesus *is.*

It may seem surprising that the question of Jesus' awareness of being the Messiah has been scarcely discussed in this article, let alone been given a precise answer. Usually, decisive significance is assigned to this question. Many scholars believe that access to the historical Jesus is only to be gained through the fact that Jesus had such an awareness in association with particular titles, such as Son of God, Son of man, and Messiah. In just the same way, they believe that the rise of the early Christian faith can only be understood by the same means. In light of the fact that the Gospels portray Jesus as the Christ (Greek term for the Messiah) and that numerous other titles of a similar kind are also found in them, the importance of this question is not to be underestimated. But it must nevertheless be noted that the Gospels are interested in the fact that Jesus was and is the Messiah, but not in his "consciousness" and inner development in a modern sense. The stories of Jesus' Baptism, temptation, and Transfiguration, for example, are not reports of experiences. But the question of whether Jesus applied one or several of those titles to himself still needs to be examined carefully, for each of them implies thoughts and concepts that must be of considerable relevance for his preaching and ministry. On this question, the opinions of scholars diverge widely, but it is uncontested that Jesus related his mission and activity in a unique way to the dawn of the Kingdom of God. It is another—and doubtful—question, however, that he expressed this understanding of himself through any traditional title.

Jesus' use of messianic titles

Three observations are important for the discussion of these problems. First, in the incontestably authentic texts in the Synoptics, Jesus never makes his own status a special topic of his teaching or the recognition of his rank a condition of salvation. Second, it is not only presumed but—by means of a comparison of the parallel texts and their modification from one Gospel to the next—often capable of proof and, in other cases, requiring to be assumed that the faith of the later church has had a major influence on the formation of the Christological texts. A third observation is also not without its importance. Wherever in such texts Jesus talks about the Messiah and the Son of David, the Son of man, the Son of God, and the Lord, there is never any indication that he is using these titles in a completely new sense. The meaning they have, however, is no longer congruent with the ideas that Jesus' contemporary hearers must have connected with the titles, to the extent that they were not completely unknown to them. Because the historical Jesus indubitably wanted to be understood, the critical question necessarily arises about texts of this kind reflecting the views of the later church and its environment.

Views about traditional messianic titles

Some of the traditional titles could not possibly have been used by Jesus with reference to himself. In those days his hearers could only have understood "Messiah" or "Son of David" in the political or national sense, which conflicted with Jesus' intentions. Also, the exclusive title "Son of God" must have been incomprehensible to the Jews of Palestine, although not to the later hearers of the Christian missionary preaching in the non-Jewish, Hellenistic world. The same applies to the expression "the (divine) Lord," which for Jews was reserved for God alone. Some scholars believe that Jesus understood himself to be the suffering servant of God, of whom Isaiah 53 speaks. But in the Gospels reference is hardly made to this important chapter. The sole passage (Mark 10:45) does not, at least in the form handed down, reproduce an authentic saying of the Lord but contains an interpretation of Jesus' death that goes back to the Greek-speaking Jewish Christian Church.

Thus, the problem is narrowed down to the question about Jesus' calling himself the "Son of man." This concept, which is frequently found in his statements about himself, is a title of sovereignty. It stems from Jewish apocalypticism and means not a normal human being but, rather, the mythical figure of the Judge of all the world, who will come on the clouds of heaven at the end of the days (Dan. 7:13ff.; etc.). An early group of Jesus' sayings (Mark 13:26; 14:62; Matt. 24:27) speaks of the Son of man in this eschatological, future sense and always in the third person, yet in some texts in such a way that Jesus does not explicitly identify himself with this Son of man (Mark 8:38; Luke 9:26; 12:8ff.). Two other groups of sayings speak of him quite differently. One speaks exclusively of his suffering, dying, and rising again in accordance with the will of God (Mark 8:31; 9:31; 10:33ff.); the other, of his authoritative work and wanderings on earth (Mark 2:10–28; Matt. 8:20; 11:19), both without a view of the Last Judgment. No Jewish hearer of Jesus could have recognized the apocalyptic Son of man in these sayings. Loosed from the ideas traditionally linked with it, the concept has here been given completely new contents in a retrospective view of Jesus' ministry and end. Thus, both of these groups of sayings are only to be understood from the point of view of the later church. Therefore, only some sayings of Jesus of the first group probably come into question as authentic ones. If Jesus spoke of the coming Son of man, those sayings prove he was speaking in the apocalyptic language and concepts of his day in order to express the promise that his disciples' loyalty to him will be recognized and confirmed in the Last Judgment. The relation of his earthly person to the figure of the coming Judge is not thereby made the subject of reflection. The Jesus tradition has gone through a process of modification, and the faith of the later church has made a major contribution to the formation of the tradition, whatever its precise extent may be.

The post-Easter message of salvation

In the post-Easter message of salvation, the eschatological here and now belongs inseparably to Jesus' message of the Kingdom of God and was being realized in him. In the face of unbelief and doubt, the Gospels do not just offer an account of the history of Jesus as it transpired, but they interpret it as God's history with the world, as the decisive, redemptive, and ultimate act and word of God for the world. All titles of sovereignty that faith has assigned to Jesus express the fact that in him the turning point of the ages, the inauguration of salvation, and the nearness and presence of God have arrived. The special character of the Gospel tradition should therefore be understood in this sense. This tradition has not replaced the historical Jesus with a mythical Christ but has made explicit the Christology that was secretly implicit in Jesus' words, works, and way, although without titles of sovereignty and supernatural traits. The question appropriate to the Gospel tradition would, therefore, not be about what has happened to Jesus of Nazareth in the course of the development but, rather, why the first Christians held fast to him. To ask in this way and to accept the answer of the Gospels are matters for faith. It goes beyond the limits of historical research.

(G.Bor.)

The picture of Christ in the early church: The Apostles' Creed

Even before the Gospels were written, Christians were reflecting upon the meaning of what Jesus had been and what he had said and done. It is a mistake, therefore, to suppose that such reflection is a later accretion upon the simple message of the Gospels. On the contrary, the early Christian communities were engaged in witness and worship from the very beginning. The forms of that witness and worship were also the forms of the narratives in the Gospel accounts. From this fact it follows that to understand the Gospel accounts regarding Jesus we must consider the faith of the early church regarding Christ. In this sense it is valid to maintain that there is no distinction between "the Jesus of history" and "the Christ of faith," and that the only way to get at the former is by the latter. Christology, the doctrine about Christ, is then as old as Christianity itself.

To comprehend the faith of the early church regarding Christ, we must turn to the writings of the New Testament, where that faith found embodiment. It was also embodied in brief confessions or creeds, but these have not been preserved for us complete in their original form. What we have are fragments of those confessions or creeds in various books of the New Testament, snatches from them in other early Christian documents, and later forms of them in Christian theology and liturgy. The so-called Apostles' Creed is one such later form. It did not achieve its present form until quite late; just how late is a matter of controversy. But in its earliest ancestry it is very early indeed, perhaps dating back to the 1st century. And its confession regarding Christ is probably the earliest core, around which later elaborations of it were composed. Allowing for such later elaboration, we may say that in the Apostles' Creed we have a convenient summary of what the early church believed about Christ amid all the variety of its expression and formulation. The creeds were a way for Christians to explain what they meant by their acts of worship. When they put "I believe" or "We believe" at the head of what they confessed about God and Christ, they meant that their declarations rested upon faith, not merely upon observation.

PREEXISTENCE

The stages of Christ's career

The statement "I believe" also indicated that Christ was deserving of worship and faith, and that he was therefore on a level with God. At an early date, possibly as early as the words of Paul in Phil. 2:6–11, Christian theology began to distinguish three stages in the career of Jesus Christ: his preexistence with the Father before all things; his Incarnation and humiliation in "the days of His flesh" (Heb. 5:7), and his glorification, beginning with the Resurrection and continuing forever.

Probably the most celebrated statement of the preexistence of Christ is the opening verses of the Gospel of St. John. Here Christ is identified as the incarnation of the Word (Logos) through which God made all things in the beginning, a Word existing in relation to God before the creation. The sources of this doctrine have been sought in Greek philosophy, both early and late, as well as in the Jewish thought of Philo and of the Palestinian rabbis. Whatever its source, the doctrine of the Logos in John is distinctive by virtue of the fact that it identifies the Logos with a specific historical person. Other writings of the New Testament also illustrate the faith of the early Christians regarding the preexistence of Christ. The opening chapters of both Colossians and Hebrews speak of Christ as the preexistent one through whom all things were created, therefore as distinct from the created order of things in both time and preeminence; the preposition "before" in Col. 1:17 apparently refers both to his temporal priority and to his superior dignity. Yet before any theological reflection about the nature of this preexistence had been able to find terms and concepts, the early Christians were worshipping Christ as divine. Phil. 2:6-11 may be a quotation from a hymn used in such worship. Theological reflection told them that if this worship was legitimate, he must have existed with the Father "before all ages."

Jesus Christ. By the time the text of the creed was established, this was the usual designation for the Saviour. Originally, of course, "Jesus" had been his given name, meaning "Yahweh saves," or "Yahweh will save" (see Matt. 1:21), while "Christ" was the Greek translation of the title "Messiah." Some passages of the New Testament still used "Christ" as a title (*e.g.,* Luke 24:26; II John 7), but it is evident from Paul's usage that the title became simply a proper name very early. Most of the Gentiles took it to be a proper name, and it was as "Christians" that the early believers were labelled (Acts 11:26). In the most precise language, the term "Jesus" was reserved for the earthly career of the Lord; but it seems from liturgical sources that it may actually have been endowed with greater solemnity than the name "Christ." Within a few years after the beginnings of the Christian movement, Jesus, Christ, Jesus Christ, and Christ Jesus could be used almost interchangeably, as the textual variants in the New Testament indicate. Only in modern times has it become customary to distinguish sharply among them for the sake of drawing a line between the Jesus of history and the Christ of faith, and this only in certain circles. The theologians and people of many churches still use phrases like "the life of Christ," because "Christ" is primarily a name. It is difficult to imagine how it could be otherwise when the Old Testament implications of the title have become a secondary consideration in its use—a process already evident within the New Testament.

God's only son. The declaration that Jesus Christ is the son of God is one of the most universal in the New Testament, most of whose books refer to him that way. The Gospels do not quote him as using the title for himself in so many words, although sayings like Matt. 11:27 come close to it. There are some instances where the usage of the Gospels appears to echo the more general implications of divine sonship in the Old Testament as a prerogative of Israel or of the true believer. Usually, however, it is evident that the evangelists, like Paul, meant some special honour by the name. The evangelists associated the honour with the story of Jesus' baptism (Matt. 3:17) and transfiguration (Matt. 17:5), Paul with the faith in the Resurrection (Rom. 1:4). From this association some have argued that "Son of God" in the New Testament never referred to the preexistence of Christ. But it is clear in John and in

Paul that this implication was not absent, even though it was not as prominent as it became soon thereafter. What made the implication of preexistence more prominent in later Christian use of the term "Son of God" was the clarification of the doctrine of the Trinity, where "Son" was the name for the eternal Second Person (Matt. 28:19). As the Gospels show, the application of the name "Son of God" to Jesus was offensive to the Jews, probably because it seemed to smack of gentile polytheism. This also made it all too intelligible to the pagans, as early heresies indicate. Facing both the Jews and the Greeks, the apostolic church confessed that Jesus Christ was "God's only Son": the Son of God, in antithesis to Jewish claims that the eternal could have no sons; the only Son, in antithesis to Greek myths of divine procreation.

Kyrios

The Lord. As passages like Rom. 1:4, show, the phrase "Jesus Christ our Lord" was one of the ways the apostolic church expressed its understanding of what he had been and done. Luke even put the title into the mouth of the Christmas angel (Luke 2:11). From the way the name "Lord" (*Kyrios*) was employed during the 1st century it is possible to see several implications in the Christian use of it for Christ. The Christians meant that there were not many divine and lordly beings in the universe, but only one *Kyrios* (I Cor. 8:5–6). They meant that the Roman Caesar was not the lord of all, as he was styled by his worshippers, but that only Christ was Lord (Rev. 17:14). And they meant that Yahweh, the covenant God of the Old Testament, whose name they pronounced as "Lord," had come in Jesus Christ to establish the new covenant (see Rom. 10:12–13). Like "Son of God," therefore, the name *Kyrios* was directed against both parts of the audience to which the primitive church addressed its proclamation. At times it stood particularly for the risen and glorified Christ, as in Acts 2:36; but in passages that echoed the Old Testament it was sometimes the preexistence that was being primarily emphasized (Matt. 22:44). Gradually "our Lord," like "Christ," became a common way of speaking about Jesus Christ, even when the speaker did not intend to stress his lordship over the world.

INCARNATION AND HUMILIATION

Conceived by the Holy Spirit, born of the Virgin Mary. Earlier forms of the creed seem to have read: "Born of the Holy Spirit and of the Virgin Mary." The primary affirmation of this article is that the Son of God, the Word, had become man or, as John's Gospel put it, "flesh" (John 1:14). Preexistence and Incarnation presuppose each other in the Christian view of Jesus Christ. Hence the New Testament assumed his preexistence when it talked about his becoming man; and when it spoke of him as preexistent, it was ascribing this preexistence to him whom it was describing in the flesh. It may be that the reference in the creed to the Virgin Mary was intended to stress primarily her function as the guarantee of Christ's true humanity, but the creed also intended to teach the supernatural origin of that humanity. Although it is true that neither Paul nor John makes reference to it, the teaching about the virginal conception of Jesus, apparently based upon Isa. 7:14, was sufficiently widespread in the 1st century to warrant inclusion in both Matthew and Luke, as well as in creeds that date back to the 1st century. As it stands, the creedal statement is a paraphrase of Luke 1:35. In the New Testament the Holy Spirit was also involved in the baptism and the Resurrection of Jesus.

Suffered under Pontius Pilate, was crucified, dead, and buried. To a reader of the Gospels, the most striking feature of the creed is probably its omission of that which occupied a major part of the Gospels, the story of Jesus' life and teachings. In this respect there is a direct parallel between the creed and the Epistles of the New Testament, especially those of Paul. Judging by the amount of space they devoted to the Passion story, even the writers of the Gospels were apparently more interested in these few days of Jesus' life than they were in anything else he had said or done. The reason for this was the faith underlying both the New Testament and the creed, that the events of Jesus' Passion, death, and Resurrection were the events by which God had accomplished the salvation of human beings. The Gospels found their climax in those events, and the other material in them led up to those events. The Epistles applied those events to concrete situations in the early church. From the way Paul could speak of the Cross (Phil. 2:6–11) and of "the night when he [Jesus] was betrayed" (I Cor. 11:23), it seems that before our Gospels came into existence the church commemorated the happenings associated with what came to be called Holy Week. Some of the earliest Christian art was a portrayal of these happenings, another indication of their importance in the cultic and devotional life of early Christianity. How did the Cross effect the salvation of human beings? The answers of the New Testament and the early church to this question involved a variety of metaphors: Christ offered himself as a sacrifice to God; his life was a ransom for many; his death made mankind alive; his suffering was an example to people when they must suffer; he was the Second Adam, creating a new humanity; his death shows people how much God loves them; and others. Every major atonement theory of Christian theological history discussed below was anticipated by one or another of these metaphors. The New Testament employed them all to symbolize something that could be described only symbolically, that "God was in Christ reconciling the world to himself, not counting their trespasses against them" (II Cor. 5:19).

The happenings of Holy Week

He descended into hell. This phrase was probably the last to be added to the creed. Its principal source in the New Testament was the description in I Pet. 3:18–20 of Christ's preaching to the spirits in prison. Originally the descent into hell may have been identified with the death of Christ, when he entered the abode of the dead in the underworld. But in the time before it entered the creed, the descent was frequently taken to mean that Christ had gone to rescue the souls of the Old Testament faithful from the underworld, from what western Catholic theology eventually called the *limbo patrum.* Among some of the Church Fathers the descent into hell had come to mean Christ's declaration of his triumph over the powers of hell. Despite its subsequent growth in importance, however, the doctrine of the descent into hell apparently did not form an integral part of the apostolic preaching about Christ.

GLORIFICATION

The third day he rose again from the dead. The writers of the New Testament nowhere made the Resurrection of Christ a matter for argument, but everywhere asserted it and assumed it. With it began that state in the history of Jesus Christ that was still continuing, his elevation to glory. They used it as a basis for three kinds of affirmations. The Resurrection of Christ was the way God bore witness to his son, "designated Son of God in power according to the Spirit of holiness by his resurrection from the dead" (Rom. 1:4); this theme was prominent also in the Book of Acts. The Resurrection was also the basis for the Christian hope of life after death (I Thess. 4:14), and without it that hope was said to be baseless (I Cor. 15:12–20). The Resurrection of Christ was also the ground for admonitions to manifest a "newness of life" (Rom. 6:4) and to "seek the things that are above" (Col. 3:1). The writers of the New Testament themselves expressed no doubt that the Resurrection had really happened. But Paul's discussion in I Cor. 15 shows that among those who heard the Christian message there was such doubt, as well as efforts to rationalize the Resurrection. The differences among the Gospels, and between the Gospels and Paul, suggest that from the outset a variety of traditions existed regarding the details of the Resurrection. But such differences only serve to emphasize how universal the faith in the Resurrection was amid this variety of traditions.

The Resurrection

He ascended into heaven, and sitteth on the right hand of God the father almighty. As indicated earlier, the narrative of the Ascension is peculiar to Luke-Acts, but other parts of the New Testament may refer to it. Eph. 4:8–10 may be such a reference, but many interpreters hold that for Paul Resurrection was identical with Ascension. That, they maintain, is why he could speak of the appearance of the risen Christ to him in continuity with the appearances to others (I Cor. 15:5–8) despite the fact that, in the chronology of the creed, the Ascension intervened between them. Session at the right hand of the Father was apparently a Christian interpretation of Ps. 110:1. It implied the elevation—or, as the doctrine of preexistence became clearer, the restoration—of Christ to a position of honour with God. Taken together, the Ascension and the session were a way of speaking about the presence of Christ with the Father during the interim between the Resurrection and the Second Advent. From Eph. 4:8–16, it is evident that this way of speaking was by no means inconsistent with another Christian tenet, the belief that Christ was still present in and with his church. It was, in fact, the only way to state that tenet in harmony with the doctrine of the Resurrection.

The Second Advent

From thence he shall come to judge the quick and the dead. The creed concludes its Christological section with the doctrine of the Second Advent: the First Advent was a coming into the flesh, the Second Advent a coming in glory. Much controversy among modern scholars has been occasioned by the role of this doctrine in the early church. Those who maintain that Jesus erroneously expected the early end of the world have often interpreted Paul as the first of those who began the adjustment to a delay in the end, with John's Gospel as a more advanced stage of that adjustment. Those who hold that the imminence of the end was a continuing aspect of human history as Jesus saw it also maintain that this phrase of the creed was a statement of that imminence, without any timetable necessarily implied. From the New Testament it seems that both the hope of the Second Coming and a faith in the continuing presence of Christ belonged to the outlook of the apostolic church, and that seems to be what the creed meant. The phrase "the quick and the dead" is a summary of passages like I Cor. 15:51–52 and I Thess. 4:15–17.

In order to complete the confession of the creed regarding the glorification of Christ, the Nicene Creed added the phrase: "Of His kingdom there shall be no end." This was a declaration that Christ's return as judge would usher in the full exercise of his reign over the world. Such was the expectation of the apostolic church, based upon what it knew and believed about Jesus Christ.

The dogma of Christ in the ancient councils

The main lines of orthodox Christian teaching about the person of Christ were set by the New Testament and the ancient creeds. But what was present there in a germinal form became a clear statement of Christian doctrine when it was formulated as dogma. In one way or another, the first four ecumenical councils were all concerned with the formulation of the dogma regarding the person of Christ—his relation to the Father, and the relation of the divine and the human in him.

Such a formulation became necessary because teachings arose within the Christian community that seemed to threaten what the church believed and confessed about Christ. Both the dogma and the heretical teachings against which the dogma was directed are therefore part of the history of Jesus Christ.

THE COUNCILS OF NICAEA AND CONSTANTINOPLE

Early heresies. From the outset, Christianity has had to contend with those who misinterpreted the person and mission of Jesus. Both the New Testament and the early confessions of the church referred and replied to such misinterpretations. As the Christian movement gained adherents from the non-Jewish world, it had to explain Christ in the face of new challenges.

These misinterpretations touched both the question of his humanity and the matter of his deity. A concern to safeguard the true humanity of Jesus led some early Christians to teach that Jesus of Nazareth, an ordinary man, was adopted as the Son of God in the moment of his baptism or after his Resurrection; this heresy was called adoptionism. Gnostics and others wanted to protect him against involvement in the world of matter, which they regarded as essentially evil, and therefore taught that he had only an apparent, not a real body; they were called docetists. Most of the struggle over the person of Christ, however, dealt with the question of his relation to the Father. Some early views were so intent upon asserting his identity with the Father that the distinction of his person was lost and he became merely a manifestation of the one God. Because of this idea of Christ as a "mode" of divine self-manifestation, proponents of this view were dubbed "modalists"; from an early supporter of the view it was called "Sabellianism." Other interpretations of the person of Christ in relation to God went to the opposite extreme. They insisted so strenuously upon the distinctness of his person from that of the Father that they subordinated him to the Father. Many early exponents of the doctrine of the Logos were also subordinationists, so that the Logos idea itself became suspect in some quarters. What was needed was a framework of concepts with which to articulate the doctrine of Christ's oneness with the Father and yet distinctness from the Father, and thus to answer the question (Adolf von Harnack): "Is the Divinity which has appeared on earth and reunited men with god identical with that supreme Divinity which governs heaven and earth, or is it a demigod?"

Nicaea. That question forced itself upon the church through the teachings of Arius. He maintained that the Logos was the first of the creatures, called into being by God as the agent or instrument through which he was to make all things. Christ was thus less than God, but more than man; he was divine, but he was not God. To meet the challenge of Arianism, which threatened to split the church, the newly converted emperor Constantine convoked in 325 the first ecumenical council of the Christian church at Nicaea. The private opinions of the attending bishops were anything but unanimous, but the opinion that carried the day was that espoused by the young presbyter Athanasius, who later became bishop of Alexandria. The Council of Nicaea determined that Christ was "begotten, not made," that he was therefore not creature but creator. It also asserted that he was "of the same essence as the Father" (*homoousios to patri*). In this way it made clear its basic opposition to subordinationism, even though there could be, and were, quarrels about details. It was not equally clear how the position of Nicaea and of Athanasius differed from modalism. Athanasius asserted that it was not the Father nor the Holy Spirit, but only the Son that became incarnate as Jesus Christ. But in order to assert this, he needed a more adequate terminology concerning the persons in the Holy Trinity. So the settlement at Nicaea regarding the person of Christ made necessary a fuller clarification of the doctrine of the Trinity, and that clarification in turn made possible a fuller statement of the doctrine of the person of Christ.

The first ecumenical council

Constantinople. Nicaea did not put an end to the controversies but only gave the parties a new rallying point. Doctrinal debate was complicated by the rivalry among bishops and theologians as well as by the intrusion of imperial politics that had begun at Nicaea. Out of the post-Nicene controversies came that fuller statement of the doctrine of the Trinity which was needed to protect the Nicene formula against the charge of failing to distinguish adequately between the Father and the Son. Ratified at the Council of Constantinople in 381, but since lost, that statement apparently made official the terminology developed by the supporters of Nicene orthodoxy in the middle of the 4th century: one divine essence, three divine persons (*mia ousia, treis hypostaseis*). The three persons, Father, Son, and Holy Spirit, were distinct from one another but were equal in their eternity and power. Now it was possible to teach, as Nicaea had, that Christ was "of the same essence as the Father" without arousing the suspicion of modalism. Although this doctrine seemed to make problematical the unity of God, it did provide an answer to the first of the two issues confronted by the church in its doctrine of the person of Christ—the issue of Christ's relation to the Father. It now became necessary to clarify the second issue—the relation of the divine and the human within Christ.

THE COUNCILS OF EPHESUS AND CHALCEDON

The Trinity

By excluding several extreme positions from the circle of orthodoxy, the formulation of the doctrine of the Trinity in the 4th century determined the course of subsequent discussion about the person of Christ. It also provided the terminology for that discussion, since 5th-century theologians were able to describe the relation between the divine and the human Christ by analogy to the relation between the Father and the Son in the Trinity. The term that was found to express this relation in Christ was "nature," *physis.* There were three divine persons in one divine essence; such was the outcome of the controversies in the 4th century. But there were also two natures, one of them divine and the other human, in the one person Jesus Christ. Over the relation between these two natures the theologians of the 5th century carried on their controversy.

The abstract questions with which they sometimes dealt in that controversy, some of them almost unintelligible to a modern mind, must not be permitted to obscure the fact that a basic issue of the Christian faith was at stake: how can Jesus Christ be said to partake of both identity with God and brotherhood with humanity?

The parties. During the half century after the Council of Constantinople several major points of emphasis developed in the doctrine of the person of Christ; characteristically, these are usually defined by the episcopal see that espoused them. There was a way of talking about Christ that was characteristic of the see at Alexandria. It stressed the divine character of all that Jesus Christ had been and done, but its enemies accused it of absorbing the humanity of Christ in his divinity. The mode of thought and language employed at Antioch, on the other hand, emphasized the true humanity of Christ; but its opponents maintained that in so doing it had split Christ into two persons, each of whom maintained his individual selfhood while they acted in concert with each other. Western theology was not as abstract as either of these alternatives. Its central emphasis was a practical concern for human salvation and for as irenic a settlement of the conflict as was possible without sacrificing that concern. Even more than in the 4th century, considerations of imperial politics were always involved in conciliar actions, together with the fear in countries like Egypt that Constantinople might come to dominate them. Thus a decision regarding the relation between the divine and the human in Christ could be simultaneously a decision regarding the political situation. Nevertheless, the settlements at which the councils of the 5th century arrived may be and are regarded as normative in the church long after their political setting has disappeared.

The conflict between Alexandria and Antioch came to a head when Nestorius, taking exception to the use of the title "Mother of God" or, more literally, "God-Bearer" (*Theotokos*) for the Virgin Mary, insisted that she was only "Christ-Bearer." In this insistence the Antiochian emphasis upon the distinction between the two natures in Christ made itself heard throughout the church. The Alexandrian theologians responded by charging that Nestorius was dividing the person of Christ, which they represented as so completely united that, in the famous phrase of Cyril, there was "one nature of the Logos which became incarnate." By this he meant that there was only one nature, the divine, before the Incarnation, but that after the Incarnation there were two natures indissolubly joined in one person; Christ's human nature had never had an independent existence. There were times when Cyril appeared to be saying that there was "one nature of the incarnate Logos" even after the Incarnation, but his most precise formulations avoided this language.

The Council of Ephesus in 431 was one in a series of gatherings called to settle this conflict, some by one party and some by the other. The actual settlement was not accomplished, however, until the calling of the Council of Chalcedon in 451.

The settlement at Chalcedon. The basis of the settlement was the Western understanding of the two natures in Christ, as formulated in the *Tome* of Pope Leo I of Rome. Chalcedon declared: "We all unanimously teach . . . one and the same Son, our Lord Jesus Christ, perfect in deity and perfect in humanity . . . in two natures, without being mixed, transmuted, divided, or separated. The distinction between the natures is by no means done away with through the union, but rather the identity of each nature is preserved and concurs into one person and being." In this formula the valid emphases of both Alexandria and Antioch came to expression; both the unity of the person and the distinctness of the natures were affirmed. Therefore the decision of the Council of Chalcedon has been the basic statement of the doctrine of the person of Christ for most of the church ever since. The western part of the church went on to give further attention to the doctrine of the work of Christ. In the eastern part of the church the Alexandrians and the Antiochians continued the controversies that had preceded Chalcedon, but they clashed now over the question of how to interpret Chalcedon. The controversy over the Monophysite and the Monothelite heresies was an effort to clarify the interpretation of Chalcedon, with the result that the extremes of the Alexandrian position were condemned just as the Nestorian extreme of the Antiochian had been.

The two natures in Christ

Emerging from all this theological discussion was an interpretation of the person of Christ that affirmed both his oneness with God and his oneness with humanity while still maintaining the oneness of his person. Interestingly, the liturgies of the church had maintained this interpretation at a time when the theologians of the church were still struggling for clarity; and the final solution was a scientifically precise restatement of what had been present germinally in the liturgical piety of the church. In the formula of Chalcedon that solution finally found the framework of concepts and of vocabulary that it needed to become intellectually consistent. In one sense, therefore, what Chalcedon formulated was what Christians had been believing from the beginning; but in another sense it represented a development from the earlier stages of Christian thought.

The interpretation of Christ in Western faith and thought

With the determination of the orthodox teaching of the church regarding the person of Christ, it still remained necessary to clarify the doctrine of the work of Christ. While it had been principally in the East that the discussion of the former question was carried on—though with important additions from the West, as we have seen—it was the Western Church that provided the most detailed answers to the question: granted that this is what Jesus Christ was, how are we to describe what it is that he did?

DOCTRINES OF THE PERSON AND WORK OF CHRIST

The medieval development. The most representative spokesman of the Western Church on this question, as on most others, was St. Augustine. His deep understanding of the meaning of human sin was matched by his detailed attention to the meaning of divine grace. Central to that attention was his emphasis upon the humanity of Jesus Christ as man's assurance of his salvation, an emphasis to which he gave voice in a variety of ways. The humanity of Christ showed how God elevated the humble; it was the link between the physical nature of human beings and the spiritual nature of God; it was the sacrifice which the human race offered to God; it was the foundation of a new humanity, recreated in Christ as the old humanity had been created in Adam—in these and other ways Augustine sought to describe the importance of the Incarnation for the redemption of man. By combining this stress upon the humanity of Christ as the Saviour with a doctrine of the Trinity that was orthodox but nevertheless highly creative and original, St. Augustine put his mark indelibly upon Western piety and theology, which, in Anselm and in the reformers, sought further for adequate language in which to describe God's deed of reconciliation in Jesus Christ.

St. Augustine

During the formative centuries of Christian dogma, there had been many ways of describing that reconciliation, most of them having some precedent in biblical speech. One of the most prominent pictures of the reconciliation was that connected with the biblical metaphor of ransom: Satan held the human race captive in its sin and corruptibility, and the death of Christ was the ransom paid to the Devil as the price for setting mankind free. A related metaphor was that of the victory of Christ: Christ entered into mortal combat with Satan for the human race, and the winner was to be lord; although the Crucifixion appeared to be Christ's capitulation to the enemy, his Resurrection broke the power of the Devil and gave the victory to Christ, granting to mankind gift of immortality. From the Old Testament and the Epistle to the Hebrews came the image of Christ as the sacrificial victim who was offered up to God as a means of stilling the divine anger. From the sacrament of penance came the idea, most fully developed by St. Anselm, that the death of Christ was a vicarious satisfaction rendered for mankind. Like the New Testament, the Church Fathers could admonish their hearers to learn from the death of Christ how to suffer patiently. They could also point to the suffering and death of Christ as the supreme illustration of how much God loves mankind. As in the New Testament, therefore, so in the tradition of the church there were many figures of speech to represent the miracle of the reunion between man and God effected in the God-man Christ Jesus.

Common to all these figures of speech was the desire to do two things simultaneously: to emphasize that the reunion was an act of God, and to safeguard the participation of man in that act. Some theories were so "objective" in their emphasis upon the divine initiative that man seemed to be almost a pawn in the transaction between God in Christ and the Devil. Other theories so "subjectively" concentrated their attention upon man's involvement and man's response that the full scope of the redemption could vanish from sight. It was in Anselm of Canterbury that Western Christendom found a theologian who could bring together elements from many theories into one doctrine of the Atonement, summarized in his book, *Cur Deus homo?* According to this doctrine, sin was a violation of the honour of God. God offered man life if he rendered satisfaction for that violation; but the longer man lived, the worse the situation became. Only a life that was truly human and yet had infinite worth would have been enough to give such a satisfaction to the violated honour of God on behalf of the entire human race. Such a life was that of Jesus Christ, whom the mercy of God sent as a means of satisfying the justice of God. Because he was true man, his life and death could be valid for men; because he was true God, his life and death could be valid for *all* men. By accepting the fruits of his life and death, mankind could receive the benefits of his satisfaction. With some relatively minor alterations, Anselm's doctrine of Atonement passed over into the theology of the Latin church, forming the basis of both Roman Catholic and orthodox Protestant ideas of the work of Christ. It owed its acceptance to many factors, not the least of them being the way it squared with the liturgy and art of the West. The crucifix has become the traditional symbol of Christ in the Western Church, reinforcing and being reinforced by the satisfaction theory of the Atonement.

Scholastic theology

Scholastic theology, therefore, did not modify traditional ways of speaking about either the person or the work of Christ as sharply as it did, for example, some of the ways the Church Fathers had spoken about the presence of the body and blood of Christ in the Eucharist. The major contribution of the scholastic period to the Christian conception of Jesus Christ appears to lie in the way it managed to combine theological and mystical elements. Alongside the growth of Christological dogma and sometimes in apparent competition with it was the development of a view of Christ that sought personal union with him rather than accurate concepts about him. Such a view of Christ appeared occasionally in the writings of Augustine, but it was in men like Bernard of Clairvaux that it attained both its fullest expression and its most adequate harmonization with the dogmatic view. The relation between the divine and the human natures in Christ, as formulated in ancient dogma, provided the mystic with the ladder he needed to ascend through the man Jesus to the eternal Son of God, and through him to a mystical union with the Holy Trinity; this had been anticipated in the mystical theology of some of the Greek fathers. At the same time the dogma saved mysticism from the pantheistic excesses to which it might otherwise have gone; for the doctrine of the two natures meant that the humanity of the Lord was not an expendable element in Christian piety, mystical or not, but its indispensable presupposition and the continuing object of its adoration, in union with his deity. As a matter of fact, another contribution of the medieval development was the increased emphasis of St. Francis of Assisi and his followers upon the human life of Jesus. These brotherhoods cultivated a more practical and ethical version of mystical devotion, to be distinguished from speculative and contemplative mysticism. Their theme became the imitation of Christ in a life of humility and obedience. With it came a new appreciation of that true humanity of Christ which the dogma had indeed affirmed, but which theologians had been in danger of reducing to a mere dogmatic concept. As Henry Thode and others have suggested, this new appreciation is reflected in the way painters like Giotto began to portray Jesus, in contrast with their Western predecessors and especially with the stylized picture of Christ in Byzantine icon painting.

Luther, Calvin, and Zwingli

The Reformation and classical Protestantism. The attitude of the reformers toward traditional conceptions of the person and work of Christ was conservative. Insisting for both religious and political reasons that they were orthodox, they altered little in the Christological dogma. Martin Luther and John Calvin gave the dogma a new meaning when they related it to their doctrine of justification by grace through faith. Because of his interpretation of sin as the captivity of the will, Luther also revived the patristic metaphor of the Atonement as the victory of Christ; it is characteristic of him that he wrote hymns for both Christmas and Easter but not for Lent. The new attention to the Bible that came with the Reformation created interest in the earthly life of Jesus, while the Reformation idea of "grace alone" and of the sovereignty of God even in his grace made the deity of Christ a matter of continuing importance.

In the ideas about the Lord's Supper set forth by Huldrych Zwingli, Luther thought he saw a threat to the orthodox doctrine of Christ, and he denounced those doctrines vehemently. As this controversy progressed, Luther interpreted the ancient dogma of the two natures to mean that the omnipresence of the divine nature was communicated to the human nature of Christ, and that therefore Christ as both God and man was present everywhere and at all times. Although he repudiated both Luther's and Zwingli's theories, Calvin was persuaded that the ancient Christological dogma was true to the biblical witness and he permitted no deviation from it. All this is evidence for the significance that "Jesus Christ, true God begotten of the Father from eternity, and also true man, born of the Virgin Mary," to use Luther's formula, had in the faith and theology of all the reformers.

At one point the theology of the reformers did serve to bring together several facets of the biblical and the patristic descriptions of Jesus Christ. That was the doctrine of the threefold office of Christ, systematized by Calvin and developed more fully in Protestant orthodoxy: Christ as prophet, priest, and king. Each of these symbolized the fulfillment of the Old Testament and represented one aspect of the church's continuing life. Christ as prophet fulfilled and elevated the prophetic tradition of the Old Testament, while continuing to fulfill his prophetic office in the ministry of the Word. Christ as priest brought to an end the sacrificial system of the Old Testament by being both the priest and the victim, while he continues to function as intercessor with and for the church. Christ as king was the royal figure to whom the Old Testament had pointed, while exercising his rule among men now through those whom he has appointed. In each of the three, Protestants differed from one another according to their theological, ethical, or liturgical positions. But the threefold office enabled Protestant theology to take into account the complexity of the biblical and patristic pictures of Christ as no oversimplified theory was able to do, and it is probably the chief contribution of the reformers to the theological formulation of the doctrine of the person and work of Christ.

THE DEBATE OVER CHRISTOLOGY IN MODERN CHRISTIAN THOUGHT

Few Protestant theologians in the middle of the 20th century were willing to endorse the ancient dogma of the two natures in Christ as unconditionally as the reformers had done, for between the Reformation and modern theology there intervened a debate over Christology that altered the perspective of most Protestant denominations and theologians. By the 20th century there was a wider gap between the theology of the reformers and that of many modern Protestants than there had been between the theology of the reformers and that of their Roman Catholic opponents.

The Socinian criticism

Origins of the debate. The earliest criticism of orthodox dogma came in the age of the Reformation, not from the reformers but from the "left wing of the Reformation," from Michael Servetus (1511?–53) and the Socinians. This criticism was directed against the presence of nonbiblical concepts and terms in the dogma, and it was intent upon safeguarding the true humanity of Jesus as a moral example. There were many inconsistencies in this criticism, such as the willingness of Servetus to call Jesus "Son of God" and the Socinian custom of addressing prayer and worship to him. But it illustrates the tendency, which became more evident in the Enlightenment, to use the Reformation protest against Catholicism as a basis for a protest against orthodox dogma as well. While that tendency did not gain much support in the 16th century because of the orthodoxy of the reformers, later criticism of orthodox Christology was able to wield the "Protestant principle" against the dogma of the two natures on the grounds that this was a consistent application of what the reformers had done. Among the ranks of the Protestant laity, the hymnody and the catechetical instruction of the Protestant churches assured continuing support for the orthodox dogma. Indeed, the doctrine of Atonement by the vicarious satisfaction of Christ's death has seldom been expressed as amply as it was in the hymns and catechisms of both the Lutheran and the Reformed churches. During the period of Pietism in the Protestant churches, this loyalty to orthodox teaching was combined with a growing emphasis upon the humanity of Jesus, also expressed in the hymnody of the time.

When theologians began to criticize orthodox ideas of the person and work of Christ, therefore, they met with opposition from the common people. Albert Schweitzer dates the development of a critical attitude from the work of H.S. Reimarus (1694–1768), but Reimarus was representative of the way the Enlightenment treated the traditional view of Jesus. The books of the Bible were to be studied just as other books are, and the life of Jesus was to be drawn from them by critically sifting and weighing the evidence of the Gospels. The Enlightenment thus initiated the modern interest in the life of Jesus, with its detailed attention to the problem of the relative credibility of the Gospel records. It has been suggested by some historians that the principal target of Enlightenment criticism was not the dogma of the two natures but the doctrine of the vicarious Atonement. The leaders of Enlightenment thought did not make a sudden break with traditional ideas, but gave up belief in miracles, the Virgin Birth, the Resurrection, and the Second Advent only gradually. Their principal importance for the history of the doctrine of Christ consists in the fact that they made the historical study of the sources for the life of Jesus an indispensable element of any Christology.

Strauss and Renan

The 19th century. Although the Enlightenment of the 18th century was the beginning of the break with orthodox teachings about Jesus Christ, it was only in the 19th century that this break attracted wide support among theologians and scholars in many parts of Christendom—even, for a while, among the Modernists of the Roman Catholic Church. Two works of the 19th century were especially influential in their rejection of orthodox Christology. One was the *Life of Jesus,* first published in 1835 by David Friedrich Strauss; the other, bearing the same title, was first published by Ernest Renan in 1863. Strauss's work paid more attention to the growth of Christian ideas—he called them "myths"—about Jesus as the basis for the picture we have in the Gospels, while Renan attempted to account for Jesus' career by a study of his inner psychological life in relation to his environment. Both works achieved wide circulation and were translated into other languages, including English. They took up the Enlightenment contention that the sources for the life of Jesus were to be studied as other sources are, and what they constructed on the basis of the sources was a type of biography in the modern sense of the word. In addition to Strauss and Renan, the 19th century saw the publication of a plethora of books about the life and teachings of Jesus. Each new hypothesis regarding the problem of the Synoptic Gospels implied a reconstruction of the life and message of Jesus.

The fundamental assumption for most of this work on the life and teachings of Jesus was a distinction between the "Jesus of history" and the "Christ of faith." Another favourite way of putting the distinction was to speak of the religion *of* Jesus in antithesis to the religion *about* Jesus. This implied that Jesus was a man like other men, but with a heightened awareness of the presence and power of God. Then the dogma of the church had mistaken this awareness for a metaphysical statement that Jesus was the Son of God and had thus distorted the original simplicity of his message. Some critics went so far as to question the very historicity of Jesus, but even those who did not go that far questioned the historicity of some of the sayings and deeds attributed to Jesus in the Gospels.

In part this effort grew out of the general concern of 19th-century scholarsip with the problem of history, but it also reflected the religious and ethical assumptions of the theologians. Many of them were influenced by the moral theories of Kant in their estimate of what was permanent about the teachings of Jesus, and by the historical theories of Hegel in the way they related the original message of Jesus to the Christian interpretations of that message by later generations of Christians. The ideas of evolution and of natural causality associated with the science of the 19th century also played a part through the naturalistic explanations of the biblical miracles. And the historians of dogma, climaxing in Adolf von Harnack (1851–1931), used their demonstration of the dependence of ancient Christology upon non-Christian sources for its concepts and terminology to reinforce their claim that Christianity had to get back from the Christ of dogma to the "essence of Christianity" in the teachings of Jesus about the fatherhood of God and the brotherhood of man.

The 20th century. At the beginning of the 20th century the most influential authorities on the New Testament were engaged in this quest for the essence of Christianity and for the Jesus of history. But that quest led in the early decades of the 20th century to a revolutionary conclusion regarding the teachings of Jesus, namely, that he had expected the end of the age to come shortly after his death and that his teachings as laid down in the Gospels were an "interim ethic," intended for the messianic community in the brief span of time still remaining before the end. The effort to apply those teachings in modern life was criticized as a dangerous modernization. This thesis of the "consistent eschatology" in Jesus' message was espoused by Johannes von Weiss (1863–1914) and gained wide circulation through the writings of Albert Schweitzer.

Form criticism

The years surrounding World War I also saw the development of a new theory regarding the composition of the Gospels. Because of its origin, this theory is usually called form criticism (German *Formgeschichte*). It stressed the forms of the Gospel narratives—parables, sayings, miracle stories, Passion accounts, etc.—as an indication of the oral tradition in the Christian community out of which the narratives came. While the attention of earlier scholars had been concentrated on the authenticity of Jesus' teachings as transmitted in the Gospels, this new theory was less confident of being able to separate the authentic from the later elements in the Gospel records, though various proponents of it did suggest criteria by which such a separation might be guided. The studies of form criticism made a life of Jesus in the old biographical sense impossible, just as consistent eschatology had declared impossible the codification of a universal ethic from the teachings of Jesus. Some adherents of form criticism espoused an extreme skepticism regarding any historical knowledge of Jesus' life at all, but the work of men like Martin Dibelius and even Rudolf Bultmann showed that such skepticism was not warranted by the conclusions of this study.

Influenced by these trends in New Testament study, Protestant theology by the middle of the 20th century was engaged in a reinterpretation of the Christology of the early church. Some Protestant churches continued to repeat the formulas of ancient dogma, but even there the critical study of the New Testament documents was beginning to call those formulas into question. The struggles of the evangelical churches in Germany under Adolf Hitler caused some theologians to realize anew the power of the ancient dogma of the person of Christ to sustain faith, and some of them were inclined to treat the dogma with less severity. But even they acknowledged that the formulation of that dogma in static categories of person, essence, and nature was inadequate to the biblical emphasis upon actions and events rather than upon states of being. Karl Barth for the Reformed tradition, Lionel Thornton for the Anglican tradition, and Karl Heim for the Lutheran tradition were instances of theologians trying to reinterpret classical Christology. While yielding nothing of their loyalty to the dogma of the church, Roman Catholic theologians like Karl Adam were also endeavouring to state that dogma in a form that was meaningful to modern men. The doctrine of the work of Christ was receiving less attention than the doctrine of Christ's person. In much of Protestantism, the concentration of the 19th century upon the teachings of Jesus had made it difficult to speak of more than the prophetic office. The priestly office received least attention of all; and, therefore, despite the support accorded to efforts like that of Gustaf Aulén to reinterpret the metaphor of the Atonement as Christ's victory over his enemies, Protestant theology in the middle of the 20th century was still searching for a doctrine of the Atonement to match its newly won insights into the doctrine of the person of Christ.

In a curious way, therefore, the figure of Jesus Christ has become both a unitive and a divisive element in Christendom. All Christians are united in their loyalty to him, even though they express their loyalty in a variety of doctrinal and liturgical ways. But doctrine and liturgy also divide Christian communions from one another. It has not been the official statements about Christ that have differed widely among most communions. What has become a sharp point of division is the amount of historical and critical inquiry that is permitted where the person of Christ is involved. Despite their official statements and confessions, most Protestant denominations had indicated by the second half of the 20th century that they would tolerate such inquiry, differ though they did in prescribing how far it would be permitted to go. On the other hand, the exclusion of Modernism by the Roman Catholic Church in 1907–10 drew definite limits beyond which the theological use of the methods of critical inquiry was heretical. Within those limits, however, Roman Catholic biblical scholars were engaging in considerable critical literary study, at the same time that critical Protestant theologians were becoming more sympathetic to traditional Christological formulas. BIBLIOGRAPHY

Times and environment: BO REICKE, *The New Testament Era* (1968, reissued 1978; originally published in German, 1964); ANTHONY E. HARVEY, *Jesus and the Constraints of History* (1982), a study of the constraints imposed on Jesus by contemporary conditions.

The life and ministry of Jesus: Valuable surveys of premodern material are provided by ROBERT M. GRANT, *The Earliest Lives of Jesus* (1961), for the early patristic period; and HARVEY K. MCARTHUR, *The Quest Through the Centuries* (1966), especially for the 14th and 16th centuries. Modern historical study of the Gospels dates from the 18th century and was characterized in the 19th and early 20th centuries by the Life-of-Jesus movement. The literature is authoritatively surveyed in ALBERT SCHWEITZER, *The Quest of the Historical Jesus* (1910, reissued 1968; originally published in German, 1906); and C.C. MCCOWN, *The Search for the Real Jesus* (1940). JOHN F. O'GRADY, *Models of Jesus* (1981); and JOHN FERGUSON, *Jesus in the Tide of Time: A Historical Study* (1980), are studies of interpretations of Jesus in different ages and cultures. MAURICE GOGUEL, *The Life of Jesus* (1933, reissued 1976; originally published in French, 1932), is a biography especially valuable for the inclusion of detailed evidence frequently assumed in subsequent works. JOSEPH KLAUSNER, *Jesus of Nazareth* (1925, reissued 1979; originally published in Hebrew, 1922), remains important for its collection of relevant rabbinic materials. SHIRLEY J. CASE, *Jesus: A New Biography* (1927, reprinted 1968), in spite of its title, is a socio-historical treatment of the subject. Other lives include VINCENT TAYLOR, *The Life and Ministry of Jesus* (1954); ETHELBERT STAUFFER, *Jesus and His Story* (1960, originally published in German, 1957); and DAVID FLUSSER, *Jesus* (1969; originally published in German, 1968). The first half of the 20th century witnessed a marked decline in the appearance of biographies and studies of the historical Jesus. Several factors contributed to the decline, of which the most important was the rise of form criticism in the first quarter of the century as exemplified in MARTIN DIBELIUS, *From Tradition to Gospel* (1934, reissued 1971; trans. of the rev. 2nd German ed., 1933); and RUDOLF BULTMANN, *The History of the Synoptic Tradition*, rev. ed. (1968, reissued 1972; originally published in German, 1921). Bultmann's *Jesus and the Word* (1934, reissued 1958; originally published in German, 1926) presents a so-called encounter with the message of Jesus but without sharp differentiation of that message from the church's "earliest tradition." The period 1950–70 produced a resurgence of interest in the historical Jesus. Stimulus for the resurgence is often credited to a paper by ERNST KASEMANN, "The Problem of the Historical Jesus," in W.J. MONTAGUE (trans.), *Essays on New Testament Themes* (1964). The "new quest," as it came to be called after JAMES M. ROBINSON, *A New Quest of the Historical Jesus* (1959, reissued 1983), arose as a question concerning continuity between Jesus and his message, on the one hand, and the early church's proclamation of Christ, on the other. Some of the alternative positions concerning the possibility of a biography of Jesus may be seen in CARL E. BRAATEN and ROY A. HARRISVILLE (eds.), *The Historical Jesus and the Kerygmatic Christ* (1964), a collection of essays by major figures. Distinctive positions are to be found in ERNST FUCHS, *Studies of the Historical Jesus* (1964; originally published in German, 1964); JOHN KNOX, *The Church and the Reality of Christ* (1962); HUGH ANDERSON, *Jesus and Christian Origins* (1964); LEANDER E. KECK, *A Future for the Historical Jesus* (1971, reissued 1981); FREDERICK F. BRUCE, *Jesus and Christian Origins Outside the New Testament* (1974), an annotated list of sources; JAMES P. MACKEY, *Jesus, the Man and the Myth: A Contemporary Christology* (1979); GEORGE VERMES, *Jesus the Jew: a Historian's Reading of the Gospels* (1974), the thesis that Jesus was a Galilean Ḥasid; and EDWARD SCHILLEBEECKX, *Jesus: An Experiment in Christology* (1979; originally published in Dutch, 1975), a review and interpretation of modern scholarship. Accurate popular presentations are in HEINZ ZAHRNT, *The Historical Jesus* (1963; originally published in German, 1960); and in the moderately conservative JOACHIM JEREMIAS, *The Problem of the Historical Jesus* (1964, reissued 1972; originally published in German, 1960). The entire trend of Gospel study since the rise of form criticism is challenged by BIRGER GERHARDSSON in *Memory and Manuscript* (1961), who argues that Jesus himself taught his disciples, in the manner of a Jewish rabbi, to memorize and transmit traditions in a fixed form. J. ARTHUR BAIRD, *Audience Criticism and the Historical Jesus* (1969), explores the use of the computer in literary analysis but is somewhat ambiguous with respect to total historical methodology. A standard study is GÜNTHER BORNKAMM, *Jesus of Nazareth* (1960, reissued 1975; originally published in German, 1956). ROLAND H. BAINTON, *Behold the Christ* (1974), discusses works of art representative of various interpretations of Christ.

The message of Jesus: Many of the titles listed in the preceding section include discussions of the teachings of Jesus. NORMAN PERRIN, *Rediscovering the Teaching of Jesus* (1967, reissued 1976), is an important technical introduction. THOMAS W. MANSON, *The Sayings of Jesus* (1949, reissued 1979), is a valuable commentary on the so-called Q material. Since JOHANNES WEISS, *Jesus' Proclamation of the Kingdom of God* (1971; originally published in German, 1892), it has been recognized that the eschatological Kingdom of God was the centre of Jesus' message. Whether the message implied a wholly futuristic expectation, a "realized" eschatology, or a future kingdom with present manifestations is still discussed. Convenient summaries of alternative interpretations are presented in NORMAN PERRIN, *The Kingdom of God in the Teaching of Jesus* (1963; reissued 1975); and GÖSTA LUNDSTRÖM, *The Kingdom of God in the Teaching of Jesus* (1963; originally published in Swedish, 1947). Perrin's work also includes a survey of interpretations of the phrase "Son of man" and other titles related to Jesus' vocation. Representative modern studies include WERNER G. KÜMMEL, *Promise and Fulfillment* (1957; originally published in German, 1945); RUDOLF SCHNACKENBURG, *God's Rule and Kingdom* (1963; originally published in German, 1959); GEORGE ELDON LADD, *Jesus and the Kingdom* (1964), written from a conservative perspective; and H.E. TÖDT, *The Son of Man in the Synoptic Tradition* (1965; originally published in German, 1959). Modern investigation of the parables derives from C.H. DODD, *The Parables of the Kingdom*, rev. ed. (1961). A definitive work is JOACHIM JEREMIAS, *The Parables of Jesus*, 3rd rev. ed. (1972; originally published in German, 1947). DAN O. VIA, *The Parables* (1967, reissued 1977), is one of several books in which literary critical insights are employed to advance interpretation beyond strictly historical critical study. ETA LINNEMANN, *Jesus of the Parables* (1967; originally published in German, 1961), advances views along the lines proposed by Ernst Fuchs. MARTIN DIBELIUS, *The Sermon on the Mount* (1940); HANS WINDISCH, *The Meaning of the Sermon on the Mount* (1951; originally published in German, 1929); and WILLIAM D. DAVIES, *The Setting of the Sermon on the Mount* (1964, reissued 1976), offer varying interpretations of the most familiar body of Jesus' teaching. See also MILAN MACHOVEČ, *A Marxist Looks at Jesus* (1976; originally published in German, 1972), a sympathetic study; JON SOBRINO, *Christology at the Crossroads: A Latin American Approach* (1978; originally published in Spanish, 1976), representative of "liberation theology"; ROSEMARY R. RUETHER, *To Change the World: Christology and Cultural Criticism* (1981), a feminist Christology; CHARLES B. KETCHAM, *A Theology of Encounter: The Ontological Ground for a New Christology* (1978), an existentialist's Christology; and RUSSEL PREGEANT, *Christology Beyond Dogma* (1978), a hermeneutical study of Matthew.

The sufferings and death of Jesus: EDUARD LOHSE, *History of the Suffering and Death of Jesus Christ* (1967; originally published in German, 1964), provides a convenient overview of the problems. Of the massive literature on the trial and Crucifixion, JOSEPH BLINZLER, *The Trial of Jesus* (1959; trans. from 2nd rev. German ed., 1955); and PAUL WINTER, *On the Trial of Jesus*, 2nd ed. (1974), have been very influential. The range of scholarly opinion about the trial is well represented by eight responsible essays in *Judaism*, 20:6–74 (1971).

The story of Jesus and faith in Jesus: REGINALD H. FULLER, *The Mission and Achievement of Jesus* (1954, reissued 1967), and *The Foundations of New Testament Christology* (1965), partly because of the author's shift in viewpoint, exhibit a range of opinion on the relation of Jesus' sense of vocation to the church's Christology. A more difficult study is that of FERDINAND HAHN, *The Titles of Jesus in Christology* (1969; originally published in German, 1963).

Joan of Arc

Joan of Arc (French Jeanne d'Arc) was a peasant girl who, believing that she was acting under divine guidance, led the French army in a momentous victory at Orléans that repulsed an English attempt to conquer France during the Hundred Years' War. Captured a year afterward, Joan was burned by the English and their French collaborators as a heretic. She became the greatest national heroine of her compatriots. Her achievement was a decisive factor in the awakening of French national consciousness. She was canonized in 1920.

Giraudon—Art Resource/EB Inc.

St. Joan, equestrian miniature from the manuscript *La Vie des femmes célèbres* by Antoine Dufour, c. 1505. In the Musée Archéologique Thomas Dobrée, Nantes, Fr.

Joan was born *c.* 1412, the daughter of a tenant farmer, at Domrémy, on the borders of the duchies of Bar and Lorraine. In her mission of expelling the English and their Burgundian allies from the Valois kingdom of France, she felt herself to be guided by the "voices" of St. Michael, St. Catherine, and St. Margaret. She possessed many attributes characteristic of the female visionaries who were a noted feature of her time. These qualities included extreme personal piety, a claim to direct communication with the saints, and a consequent reliance upon individual experience of God's presence beyond the ministrations of the priesthood and the confines of the institutional church. But to these were added remarkable mental and physical courage, as well as a robust common sense. Known as La Pucelle, or the Maid of Orléans, Joan became in the following centuries a focus of unity for the French people, especially at times of crisis.

JOAN'S MISSION

The crown of France at the time was in dispute between the dauphin Charles, son and heir of the Valois king Charles VI, and the Lancastrian English king Henry VI. Henry's armies were in alliance with those of Philip the Good, duke of Burgundy (whose father, John the Fearless, had been assassinated in 1419 by partisans of the Dauphin), and were occupying much of the northern part of the kingdom. The apparent hopelessness of the Dauphin's cause at the end of 1427 was increased by the fact that, five years after his father's death, he still had not been crowned. Reims, the traditional place for the investiture of French kings, was well within the territory held by his enemies. As long as the Dauphin remained unconsecrated, the rightfulness of his claim to be king of France was open to challenge.

Joan's village of Domrémy was on the frontier between the France of the Anglo-Burgundians and that of the Dauphin. The villagers had already had to abandon their homes before Burgundian threats. Led by her voices, Joan traveled in May 1428 from Domrémy to Vaucouleurs, the nearest stronghold still loyal to the Dauphin, where she asked the captain of the garrison, Robert de Baudricourt, for permission to join the Dauphin. He did not take the 16-year-old girl and her visions seriously, and she returned home. Joan went to Vaucouleurs again in January 1429. This time her quiet firmness and piety gained her the respect of the people; and the captain, persuaded that she was neither a witch nor feebleminded, allowed her to go to the Dauphin at Chinon. She left Vaucouleurs about February 13, dressed in men's clothes and accompanied by six men-at-arms. Crossing territory held by the enemy, and traveling for 11 days, she reached Chinon.

Meeting with the Dauphin

Joan went at once to the castle occupied by the dauphin Charles. He was uncertain whether to receive her, and his counselors gave him conflicting advice; but two days later he granted her an audience. Charles had hidden himself among his courtiers, but Joan made straight for him and told him that she wished to go to battle against the English and that she would have him crowned at Reims. On the Dauphin's orders she was immediately interrogated by ecclesiastical authorities in the presence of Jean, duc d'Alençon, a relative of Charles, who showed himself well-disposed toward her. For three weeks she was further questioned at Poitiers by eminent theologians who were allied to the Dauphin's cause. These examinations, the record of which has not survived, were occasioned by the ever-present fear of heresy following the end of the Great Schism in 1417. Joan told the ecclesiastics that it was not at Poitiers but at Orléans that she would give proof of her mission; and forthwith, on March 22, she dictated letters of defiance to the English. In their report the churchmen suggested that in view of the desperate situation of Orléans, which had been under English siege for months, the Dauphin would be well-advised to make use of her.

Joan returned to Chinon. At Tours, during April, the Dauphin provided her with a military household of several men; Jean d'Aulon became her squire, and she was joined by her brothers Jean and Pierre. She had her standard painted with an image of Christ in Judgment and a banner made bearing the name of Jesus. When the question of a sword was brought up, she declared that it would be found in the church of Sainte-Catherine-de-Fierbois, and one was in fact discovered there.

Troops numbering several hundred men were mustered at Blois, and on April 27 they set out for Orléans. The city, besieged since Oct. 12, 1428, was almost totally surrounded by a ring of English strongholds. When Joan and one of the French commanders, La Hire, entered with supplies on April 29, she was told that action must be deferred until further reinforcements could be brought in.

Relief of Orléans

On the evening of May 4, when Joan was resting, she suddenly sprang up, apparently inspired, and announced that she must go and attack the English. Having herself armed, she hurried out to the east of the city toward an English fort where, indeed, an engagement of which she had not been told was taking place. Her arrival roused the French, and they took the fort. The next day Joan addressed another of her letters of defiance to the English. On the morning of May 6 she crossed to the south bank of the river and advanced toward another fort; the English immediately evacuated it in order to defend a stronger position nearby, but Joan and La Hire attacked them there and took it by storm. Very early on May 7 the French advanced against the fort of Les Tourelles. Joan was wounded but quickly returned to the fight, and it was thanks in part to her example that the French commanders maintained the attack until the English capitulated. Next day the English were seen to be retreating, but, because it was a Sunday, Joan refused to allow any pursuit.

Joan left Orléans on May 9 and met Charles at Tours. She urged him to make haste to Reims to be crowned. Though he hesitated because some of his more prudent counselors were advising him to undertake the conquest of Normandy, Joan's importunity ultimately carried the day. It was decided, however, first to clear the English out of the other towns along the Loire River. Joan met her friend the Duc d'Alençon, who had been made lieutenant general of the French armies, and they moved off together, taking a town and an important bridge. They next attacked Beaugency, whereupon the English retreated into the castle. Then, notwithstanding the opposition of the Dauphin and Georges de La Trémoille, one of his favourites, and despite the reserve of Alençon, Joan received the Constable de Richemont, who was under suspicion at the French court. After making him swear fidelity, she accepted his help. Shortly thereafter the castle of Beaugency was surrendered.

The French and English armies came face to face at Patay on June 18, 1429. Joan promised success to the French, saying that Charles would win a greater victory that day than any he had won so far. The victory was indeed complete; the English army was routed and with it, finally, its reputation for invincibility.

Battle of Patay

Instead of pressing home their advantage by a bold attack upon Paris, Joan and the French commanders turned back to rejoin the Dauphin, who was staying with La Trémoille at Sully-sur-Loire. Again Joan urged upon Charles the need to go on swiftly to Reims. He vacillated, however; and as he meandered through the towns along the Loire, Joan accompanied him, arguing all the while in an attempt to vanquish his hesitancy and prevail over the counselors who advised delay. She was not unaware of the dangers and difficulties involved but declared them of no account. Finally she won Charles to her view.

From Gien, where the army began to assemble, the Dauphin sent out the customary letters of summons to the coronation. Joan wrote two letters: one of exhortation to the people of Tournai, always loyal to Charles, the other a challenge to Philip the Good, duke of Burgundy. She and the Dauphin set out on the march to Reims on June 29. Before arriving at Troyes, Joan wrote to the inhabitants, promising them pardon if they would submit. They countered by sending a friar, the popular preacher Brother Richard, to take stock of her; but though he returned full of enthusiasm for the Maid and her mission, the townsfolk decided after all to remain loyal to the Anglo-Burgundian regime. The Dauphin held a council, and Joan proposed that the town be attacked. The next morning she began the assault, and the citizens at once asked for terms. The royal army then marched on to Châlons. Despite an earlier decision to resist, the Count-Bishop handed the keys of the town to Charles. On July 16 the royal army reached Reims, which opened its gates. The coronation took place on July 17, 1429. Joan was present at the consecration, standing with her banner not far from the altar. After the ceremony she knelt before Charles, calling him her king for the first time. That same day she wrote to the Duke of Burgundy, adjuring him to make peace with the King and to withdraw his garrisons from the royal fortresses.

Coronation of the Dauphin

Charles VII left Reims on July 20, and for a month the army paraded through Champagne and the Île-de-France. On August 2 the King decided on a retreat from Provins to the Loire, a move that implied abandoning any plan to attack Paris. The loyal towns that would thus have been left to the enemy's mercy expressed some alarm. Joan, who was opposed to Charles's decision, wrote to reassure the citizens of Reims on August 5, saying that the Duke of Burgundy, then in possession of Paris, had made a fortnight's truce, after which it was hoped that he would yield Paris to the King. In fact, on August 6, English troops prevented the royal army from crossing the Seine at Bray, much to the delight of Joan and the commanders, who hoped that Charles would attack Paris. Everywhere acclaimed, Joan was now, according to a 15th-century chronicler, the idol of the French. She herself felt that the purpose of her mission had been achieved.

Near Senlis, on August 14, the French and English armies again confronted each other. This time only skirmishes took place, neither side daring to start a battle, though Joan carried her standard up to the enemy's earthworks and openly challenged them. Meanwhile Compiègne, Beauvais, Senlis, and other towns north of Paris surrendered to the King. Soon afterward, on August 28, a four months' truce for all the territory north of the Seine was concluded with the Burgundians.

Joan, however, was becoming more and more impatient; she thought it essential to take Paris. She and Alençon were at Saint-Denis on the northern outskirts of Paris on August 26, and the Parisians began to organize their defenses. Charles arrived on September 7, and an attack was launched on September 8, directed between the gates of Saint-Honoré and Saint-Denis. The Parisians could be in no doubt of Joan's presence among the besiegers; she stood forward on the earthworks, calling on them to surrender their city to the King of France. Wounded, she continued to encourage the soldiers until she had to abandon the attack. Though the next day she and Alençon sought to renew the assault, they were ordered by Charles's council to retreat.

Attack on Paris

Charles VII retired to the Loire, Joan following him. At Gien, which they reached on September 22, the army was disbanded. Alençon and the other captains went home; only Joan remained with the King. Later, when Alençon was planning a campaign in Normandy, he asked the King to let Joan rejoin him, but La Trémoille and other courtiers dissuaded him. Joan went with the King to Bourges, where many years later she was to be remembered for her goodness and her generosity to the poor. In October she was sent against Saint-Pierre-le-Moûtier; through her courageous assault, with only a few men, the town was taken. Joan's army then laid siege to La Charité-sur-Loire; short of munitions, they appealed to neighbouring towns for help. The supplies arrived too late, and after a month they had to withdraw.

Compiègne

Joan then rejoined the King, who was spending the winter in towns along the Loire. Late in December 1429 Charles issued letters patent ennobling Joan, her parents, and her brothers. Early in 1430 the Duke of Burgundy began to threaten Brie and Champagne. The inhabitants of Reims became alarmed, and Joan wrote in March to assure them of the King's concern and to promise that she would come to their defense. When the Duke moved up to attack Compiègne, the townsfolk determined to resist, and in late March or early April Joan left the King and set out to their aid, accompanied only by her brother Pierre, her squire Jean d'Aulon, and a small troop of men-at-arms. She arrived at Melun in the middle of April, and it was no doubt her presence that prompted the citizens there to declare themselves for Charles VII.

Joan was at Compiègne by May 14, 1430. There she found Renaud de Chartres, archbishop of Reims, and Louis I de Bourbon, comte de Vendôme, a relative of the King. With them she went on to Soissons, where the townspeople refused them entry. Renaud and Vendôme therefore decided to return south of the Marne and Seine rivers; but Joan refused to accompany them, preferring to return to her "good friends" in Compiègne.

CAPTURE, TRIAL, AND EXECUTION

On her way back Joan heard that John of Luxembourg, the captain of a Burgundian company, had laid siege to Compiègne. Hurrying on, she entered Compiègne under cover of darkness. The next afternoon, May 23, she led a sortie and twice repelled the Burgundians but was eventually outflanked by English reinforcements and compelled to retreat. Remaining until the last to protect the rear guard while they crossed the Oise River, she was unhorsed and could not remount. She gave herself up and, with her brother Pierre and Jean d'Aulon, was taken to Margny, where the Duke of Burgundy came to see her. In telling the people of Reims of Joan's capture, Renaud de Chartres accused her of rejecting all counsel and acting willfully. Charles, who was working toward a truce with the Duke of Burgundy, made no attempts to save her.

Imprisonment

John of Luxembourg sent Joan and Jean d'Aulon to his castle in Vermandois. When she tried to escape in order to return to Compiègne, he sent her to one of his more distant castles. There, though she was treated kindly, she became more and more distressed at the predicament of Compiègne. Her desire to escape became so great that she jumped from the top of a tower, falling unconscious into the moat. She was not seriously hurt, and when she had recovered, she was taken to Arras, a town adhering to the Duke of Burgundy.

News of her capture had reached Paris on May 25. Next day the University of Paris, which had taken the English side, requested the Duke of Burgundy to turn her over for judgment either to the chief inquisitor or to the bishop of Beauvais, Pierre Cauchon, in whose diocese she had been seized. The university wrote also, to the same effect, to John of Luxembourg; and on July 14 the Bishop of Beauvais presented himself before the Duke of Burgundy asking, on his own behalf and in the name of the English king, that the Maid be handed over in return for a payment of 10,000 francs. The Duke passed on the demand to John of Luxembourg, and by Jan. 3, 1431, she was in the Bishop's hands. The trial was fixed to take place at Rouen. Joan was moved to a tower in the castle of Bouvreuil, which was occupied by the Earl of Warwick, the English commander at Rouen. Though her offenses against the Lancastrian monarchy were common knowledge, Joan was brought to trial before a church court because the University of Paris, as arbiter in matters concerning the faith, insisted that she be tried as a heretic. Her beliefs were not strictly orthodox, according to the criteria for orthodoxy laid down by many theologians of the period. She was no friend of the church militant on Earth (which perceived itself as in spiritual combat with the forces of evil), and she threatened its hierarchy through her claim that she communicated directly with God by means of visions or voices. Further, her trial might serve to discredit Charles VII by demonstrating that he owed his coronation to a witch, or at least a heretic. Her two judges were to be Cauchon, bishop of Beauvais, and Jean Lemaître, the vice-inquisitor of France.

Interrogation

The trial. Beginning Jan. 13, 1431, statements taken in Lorraine and elsewhere were read before the Bishop and his assessors; they were to provide the framework for Joan's interrogation. Summoned to appear before her judges on February 21, Joan asked for permission to attend mass beforehand, but it was refused on account of the gravity of the crimes with which she was charged, including attempted suicide in having jumped into the moat. She was ordered to swear to tell the truth and did so swear, but she always refused to reveal the things she had said to Charles. Cauchon forbade her to leave her prison, but Joan insisted that she was morally free to attempt escape. Guards were then assigned to remain always inside the cell with her, and she was chained to a wooden block and sometimes put in irons. Between February 21 and March 24 she was interrogated nearly a dozen times. On every occasion she was required to swear anew to tell the truth, but she always made it clear that she would not necessarily divulge everything to her judges since, although nearly all of them were Frenchmen, they were enemies of King Charles. The report of this preliminary questioning was read to her on March 24, and apart from two points she admitted its accuracy.

When the trial proper began a day or so later, it took two days for Joan to answer the 70 charges that had been drawn up against her. These were based mainly on the contention that her whole attitude and behaviour showed blasphemous presumption: in particular, that she claimed for her pronouncements the authority of divine revelation; prophesied the future; endorsed her letters with the names of Jesus and Mary, thereby identifying herself with the novel and suspect cult of the Name of Jesus; professed to be assured of salvation; and wore men's clothing. Perhaps the most serious charge was of preferring what she believed to be the direct commands of God to those of the church.

On March 31 she was questioned again on several points about which she had been evasive, notably on the question of her submission to the church. In her position, obedience to the court that was trying her was inevitably made a test of such submission. She did her best to avoid this trap, saying she knew well that the church militant could not err, but it was to God and to her saints that she held herself answerable for her words and actions. The trial continued, and the 70 charges were reduced to 12, which were sent for consideration to many eminent theologians in both Rouen and Paris.

Meanwhile, Joan fell sick in prison and was attended by two doctors. She received a visit on April 18 from Cauchon and his assistants, who exhorted her to submit to the church. Joan, who was seriously ill and obviously thought she was dying, begged to be allowed to go to confession and receive Holy Communion and to be buried in consecrated ground. But they continued to badger her, receiving only her constant response "I am relying on our Lord," "I hold to what I have already said." They became more insistent on May 9, threatening her with torture if she did not clarify certain points. She answered that even if they tortured her to death she would not reply differently, adding that in any case she would afterward maintain that any statement she might make had been extorted from her by force. In face of this commonsense fortitude her interrogators, by a majority of 10 to three, decided on May 12 that torture would be useless. Joan was informed on May 23 of the decision of the University of Paris that if she persisted in her errors she would be turned over to the secular authorities; only they, and not the church, could carry out the death sentence of a condemned heretic.

Abjuration, relapse, and execution. Apparently nothing further could be done. Joan was taken out of prison for the first time in four months on May 24 and conducted to the cemetery of the church of Saint-Ouen, where her sentence was to be read out. First she was made to listen to a sermon by one of the theologians in which he violently attacked Charles VII, provoking Joan to interrupt him because she thought he had no right to attack the King, a "good Christian," and should confine his strictures to her. After the sermon was ended, she asked that all the evidence on her words and deeds be sent to Rome. But her judges ignored her appeal to the Pope, to whom, under God, she would be answerable, and began to read out the sentence abandoning her to the secular power. Hearing this dreadful pronouncement, Joan quailed and declared she would do all that the church required of her. She was presented with a form of abjuration, which must already have been prepared. She hesitated in signing it, eventually doing so on condition that it was "pleasing to our Lord." She was then condemned to perpetual imprisonment or, as some maintain, to incarceration in a place habitually used as a prison. In any case, the judges required her to return to her former prison.

Revocation of abjuration

The vice-inquisitor had ordered Joan to put on women's clothes, and she obeyed. But two or three days later, when the judges and others visited her and found her again in male attire, she said she had made the change of her own free will, preferring men's clothes. They then pressed other questions, to which she answered that the voices of St. Catherine and St. Margaret had censured her "treason" in making an abjuration. These admissions were taken to signify relapse, and on May 29 the judges and 39 assessors agreed unanimously that she must be handed over to the secular officials.

The next morning, May 30, 1431, Joan received from Cauchon permission, unprecedented for a relapsed heretic, to make her confession and receive Communion. Accompanied by two Dominicans, she was then led to the Place du Vieux-Marché. There she endured one more sermon, and the sentence abandoning her to the secular arm—that is, to the English and their French collaborators—was read out in the presence of her judges and a great crowd. The executioner seized her, led her to the stake, and lit the pyre. A Dominican consoled Joan, who asked him to hold high a crucifix for her to see and to shout out the assurances of salvation so loudly that she should hear him above the roar of the flames. To the last she maintained that her voices were sent of God and had not deceived her. According to the rehabilitation proceedings of 1456, few witnesses of her death seem to have doubted her salvation, and they agreed that she died a faithful Christian. A few days later the English king and the University of Paris formally published the news of Joan's execution.

Rehabilitation

Almost 20 years afterward, on his entry into Rouen in 1450, Charles VII ordered an inquiry into the trial. Two years later the cardinal legate Guillaume d'Estouteville made a much more thorough investigation. Finally, on the order of Pope Calixtus III following a petition from the d'Arc family, proceedings were instituted in 1455–56 that revoked and annulled the sentence of 1431. Joan was canonized by Pope Benedict XV on May 16, 1920; her feast day is May 30. The French parliament, on June 24, 1920, decreed a yearly national festival in her honour; this is held the second Sunday in May.

CHARACTER AND IMPORTANCE

Joan of Arc's place in history is assured. Perhaps her contribution to the history of human courage is greater than her significance in the political and military history of France. She was victimized as much by a French civil conflict as by a war with a foreign power. The relief of Orléans was undoubtedly a notable victory, which secured the loyalty of certain regions of northern France to the régime of Charles VII. But the Hundred Years' War continued for a further 22 years after her death, and it was the defection of Philip the Good of Burgundy from his alliance with the Lancastrians in 1435 that provided the foundation upon which the recovery of Valois France was to be based. The nature of Joan's mission, moreover, is a source of controversy among historians, theologians, and psychologists. Innumerable points about her campaigns and about the motives and actions of her supporters and enemies are subject to dispute: for instance, the number and dates of her visits to Vaucouleurs, Chinon, and Poitiers; how she was able to win the confidence of the Dauphin at their first meeting at Chinon; whether Charles's perambulations after his coronation at Reims represented triumphant progress or scandalous indecision; what her judges meant by "perpetual imprisonment"; whether, after her recantation, Joan resumed men's clothes of her own free will and at the bidding of her voices or, as one later story has it, because they were forced upon her by her English jailers.

Assessment

Later generations have tended to distort the significance of Joan's mission according to their own political and religious viewpoints rather than seeking to set it in the troubled context of her time. The effects of the Great Schism within the Western Church (1378–1417) and the decline of papal authority during the Conciliar Movement (1409–49) made it difficult for persons to seek independent arbitration and judgment in cases relating to the faith. The verdicts of the Inquisition were liable to be coloured by political and other influences; and Joan was not the only victim of an essentially unjust procedure, which allowed the accused no counsel for the defense and which sanctioned interrogation under duress. Her place among the saints is secured, not perhaps by the somewhat dubious miracles attributed to her, but by the heroic fortitude with which she endured the ordeal of her trial and, except for one lapse toward its end, by her profound conviction of the justice of her cause, sustained by faith in the divine origin of her voices. In many ways a victim of internal strife within France, condemned by judges and assessors who were almost entirely northern French in origin, she has become a symbol of national consciousness with whom all French people, of whatever creed or party, can identify.

BIBLIOGRAPHY. Thereis an extremely large literature on Joan of Arc but no truly definitive biography. Important works include: JULES QUICHERAT (ed.), *Procès de condamnation et de réhabilitation de Jeanne d'Arc,* 5 vol. (1841–49, reprinted 1965); *Le Procès de condamnation de Jeanne d'Arc,* 2 vol., trans. and annotated by PIERRE TISSET (1960–70); PAUL DONCOEUR (ed.), *La Minute française des interrogatoires de Jeanne la Pucelle* (1952); *La Réhabilitation de Jeanne la Pucelle,* 3 vol., trans. and annotated by PAUL DONCOEUR and YVONNE LANHERS (1956–61), containing the recorded testimony from the trial of more than 100 witnesses who had known Joan of Arc; and PIERRE LANÉRY D'ARC, *Les Mémoires et consultations en faveur de Jeanne d'Arc* (1889), dealing with the memoirs of jurists and theologians, intended to facilitate her rehabilitation. In English, DANIEL S. RANKIN and CLAIRE QUINTAL (eds. and trans.), *The First Biography of Joan of Arc with the Chronicle Record of a Contemporary Account* (1964); and RÉGINE PERNOUD, *Joan of Arc by Herself and Her Witnesses* (1964, reissued 1982; originally published in French, 1962), and *The Retrial of Joan of Arc: The Evidence at the Trial for Her Rehabilitation* (1955; originally published in French, 1953), are particularly recommended. Other works include GEORGES DUBY and ANDRÉE DUBY (eds.), *Les Procès de Jeanne d'Arc* (1973); JOHN H. SMITH, *Joan of Arc* (1973), which explores her military activities; HENRI GUILLEMIN, *Joan, Maid of Orléans* (1973; originally published in French, 1970); PHILIPPE WOLFF, "Le Théologien Pierre Cauchon, de sinistre mémoire," in *Économies et sociétés au Moyen Âge: Mélanges offerts à Edouard Perroy,* pp. 553–570 (1973); EDWARD LUCIE-SMITH, *Joan of Arc* (1976); WALTER S. SCOTT, *Jeanne d'Arc* (1974); MARINA WARNER, *Joan of Arc: The Image of Female Heroism* (1981, reprinted 1982), a psychohistorical approach with an important survey of the posthumous history of Joan's legend; FRANCES GIES, *Joan of Arc: The Legend and the Reality* (1981), an examination of her life and the literature about her; and COLLOQUE D'HISTOIRE MÉDIÉVALE. ORLÉANS, FRANCE, 1979, *Jeanne d'Arc: une époque, un rayonnement* (1982), an informative collection of scholarly papers. For the political background to Joan's career see M.G.A. VALE, *Charles VII* (1974); C.T. ALLMAND, *Lancastrian Normandy, 1415-1450* (1983); and ROGER G. LITTLE, *The Parlement of Poitiers: War, Government and Politics in France, 1418-1436* (1984).

(Y.L./M.G.A.V.)

Johannesburg

Johannesburg, the largest city of the Republic of South Africa and one of the largest cities on the African continent, is South Africa's economic metropolis. It stands on the southern slopes of the Witwatersrand—commonly called the Rand—a rocky watershed of east–west ridges surrounded by the Transvaal highveld. The greater metropolitan area, also known as Greater Johannesburg, consists of a municipal and a magisterial area.

Johannesburg grew at a remarkable speed after the discovery of gold on the Rand in 1886. It now lies at the centre of the country's gold-mining industry. Johannesburg is the only city of its size that is not situated on a coast, a lakeshore, or on a river.

The article is divided into the following sections:

Physical and human geography

THE LANDSCAPE

The city site. Johannesburg is situated in the most thickly populated part of southern Africa. The mines, many of which were almost worked out in the early 1970s, lie to the south and southwest of the city. The city's height at 5,709 feet (1,740 metres) above sea level is measured at Joubert Park near the centre of the city; the highest point, however, is the site of the Republic Observatory, which stands at an altitude of 5,932 feet.

Climate. Johannesburg has an attractive climate; in July the mean temperature is about 50° F (10° C); in December it is 68° F (20° C). Rainfall averages about 33 inches (850 millimetres) a year. The sun shines for an average of nine hours a day in summer and more than seven hours in winter. The city's air and water are relatively pure in most parts; water shortages occur periodically, especially during the winter months.

The city centre

The city layout. The streets of the centre of the city, laid out on a grid plan established in 1886, are narrow, and city blocks are short. More imaginative street planning is in evidence in the suburbs, where many of the streets are tree lined.

There are about 400 suburbs altogether; most of the city's workers live either in the suburbs or in the surrounding dormitory towns. The population is segregated by colour, in accordance with South Africa's official policy of apartheid (literally "apartness"), so that the nonwhite groups—black Africans, Coloureds, Asians—are each restricted to residence in certain areas, which are located particularly in the west and southwest. The major buildings in the city are grouped around Eloff Street, the main shopping area that leads south from the railway station, with Von Brandis, Joubert, and Rissik streets parallel to it. Other streets in the vicinity include Commissioner, Market, Fox, and Main streets (which constitute the commercial area) and Jeppe and Bree streets. Joubert Park, Sturrock Park, George Harrison Park (named for the Australian who first discovered gold-bearing quartz in the area in 1886), Turffontein Race Course, sports grounds, and mine dumps are all in the area. Johannesburg is the meeting place of roads from major towns in South Africa, such as Pretoria, Bloemfontein, Cape Town, and Durban. Not included in the municipal area, though formerly administered by the municipality, is Soweto (South-Western Townships), an independent city originally constituted as a group of towns inhabited by black Africans. Soweto has an area of 26 square miles (67 square kilometres) and is linked with Johannesburg by road and rail. Housing, water, sanitation, and lighting are supplied, and sports fields, schools, and other facilities are provided by the city council. All shopkeepers in the area are black Africans. Nearby townships include Coronationville and Westbury, reserved for Coloured people, and—about 20 miles (32 kilometres) away—Lenasia, a township for Asians.

Architectural styles

It is customary in Johannesburg to demolish and rebuild houses, rather than to follow the European practice of renovating or altering existing buildings. There are numerous blocks of flats or apartments for all types of income groups, and many South Africans have been able to maintain houses with gardens. Architectural styles of all kinds are in evidence. Buildings of the style developed from 18th-century Cape architecture are noticeable in residential areas, whereas business buildings and many houses are derived from modern European or United States models. Public buildings are modern adaptations of older European styles, particularly English, Dutch, and Renaissance Italian. By the early 1970s it had become the practice to construct apartment buildings (called flats in Johannesburg) so that residential density can be increased; it was still the custom, however, to build single-story homes for married nonwhites. Subsidized housing is available for eligible (*i.e.,* low-income) groups of the population, and large building projects are features of Soweto and other areas to the south of the city.

THE PEOPLE

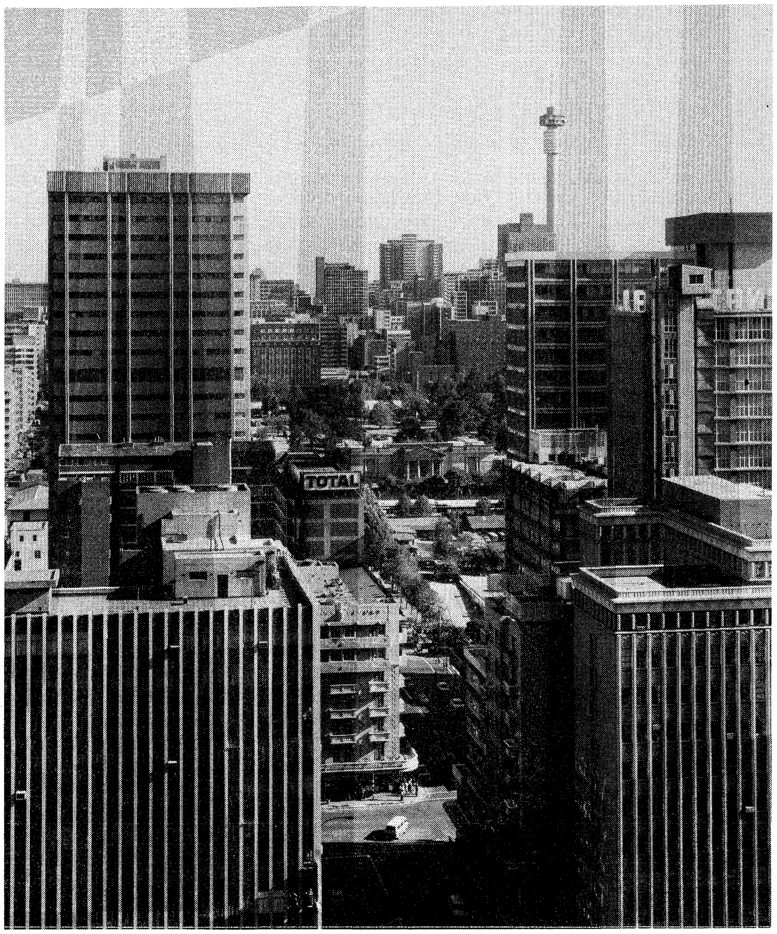
About 60 percent of the city's population is black. Whites comprise approximately one-third of the residents, and the remainder are Coloureds and Asians.

The city is cosmopolitan. Although English- and Afrikaans-speaking groups dominate the white section of the population, minority groups of Germans, Dutch, Hungarians, Italians, French, Scandinavians, Swiss, Poles, and others are also to be found, while Jews from all of these groups have also made Johannesburg their home. Africans speaking Zulu, Xhosa, Pedi, Venda, and Tswana also inhabit the city, while Asian groups include Japanese, Chinese, and Indians, speaking various languages and adhering to various faiths. The Coloured people of the city represent an intermixture of many groups, both white and nonwhite; they speak English or Afrikaans or both, and belong to Christian churches.

THE ECONOMY

South Africa's business centre

Commerce and industry. Because Johannesburg is the centre of the South African business world, more affluent people are to be found in this city than elsewhere in the country. Gold mining is now conducted elsewhere, but most of the business and administrative headquarters of the gold-mining companies are located there. Many secondary industries, particularly of the heavier type, are to be found in the city, and opportunities for employment of many kinds are available. There are many banking, industrial, and commercial concerns, both South African and foreign; the city is also the home of the Johannesburg



Downtown Johannesburg. Joubert Park is in the middle distance, and the J.G. Strijdom (or Hillbrow) Tower for telecommunications is in the right background.

Colour Library International

Stock Exchange, which was founded in 1887. Because of the city's importance, it has a number of branch offices of governmental institutions, as well as consular offices and other institutions (such as banks, building societies, and insurance companies) usually located only in capital cities.

Transportation. Highways have been built in many parts of the city to accommodate the large amount of traffic that enters and leaves the city each day. In the suburbs local public transport is provided by bus services, whereas the railroad serves commuters living outside municipal boundaries to the east, west, and south. Jan Smuts (international) Airport, from which scheduled domestic flights also leave, is situated 14 miles northeast of the city. Charter planes fly from Rand Airport, nine miles to the east; and Baragwanath Aerodrome, seven miles to the southeast, has facilities for gliding and other aerial sports.

ADMINISTRATIVE AND SOCIAL CONDITIONS

Government. Johannesburg is a municipally controlled city. It has a city council with 47 councillors, elected by popular vote every five years; a mayor is chosen by the councillors from among themselves each year. The city council is the local government unit and is responsible to the Transvaal provincial council, which is in turn responsible to the central government. City councillors represent the same political parties that are represented in the national Parliament.

Public services. The local transport, electricity and gas utilities, fire-fighting services, and sanitation are run by the municipality. Water is provided by the municipality through the agency of the Rand Water Board. The railways are government owned, with the city's large railway station constituting the heart of the nation's rail system. Electricity for the mines and railways is provided by a public utility with headquarters in the city.

Police services are provided by the nationally administered South African Police service, but traffic is regulated by the municipality's traffic officers. The city operates produce and livestock markets and the abattoir. The Witwatersrand Agricultural Society organizes a major show every year. It attracts agricultural and industrial exhibitors from throughout the country as well as from overseas. Trade is promoted by the Johannesburg Chamber of Commerce; the Commercial Exchange, a unique institution, owes its existence to commerce generated by the mining industry. Mining operations themselves are regulated by the South African Chamber of Mines, which also has its headquarters in the city.

Health. In addition to Johannesburg General Hospital, medical facilities for whites include many private nursing homes and institutions for sick children, maternity cases, and mine workers. Medical facilities for nonwhites are also extensive, and include clinical, curative, midwifery, and dental services; most mines also provide hospitalization for employees. Medical research is pursued at the South African Institute for Medical Research (founded 1912) as well as at the medical school of the University of the Witwatersrand (founded 1922).

Education. The University of the Witwatersrand itself is mainly intended for English-speaking students; higher education in Afrikaans is provided at the Rand Afrikaans University (founded 1966). The Witwatersrand Technikon (founded 1925) specializes in technological training related to mining and other subjects. In addition, there are throughout the city a large number of schools, both private and governmental, for pupils of all ages, from kindergarten to school-leaving age. Teacher-training courses are given at the Johannesburg College of Education (for English-speaking students), at the Goudstadse Onderwyskollege (for Afrikaans-speakers), at the Transvaal College of Education (for Asians), and at the Rand College of Education (for Coloured students).

CULTURAL LIFE

Cultural institutions include the Johannesburg Public Library and a number of museums with collections relating to South African history, military history, medicine, archaeology, geology, costumes, transport, railroads, and Judaica. The Johannesburg Art Gallery exhibits modern European paintings as well as the work of South African artists. Commercial art galleries and antique shops are scattered throughout the city centre and in the northern districts. Branch library services are available in the suburbs and townships.

There are a great number of sporting facilities, including golf courses, tennis courts, rugby and soccer grounds, swimming baths, and cricket grounds, as well as privately owned sports clubs of various kinds and commercial establishments providing facilities for ice hockey, horse racing, and ice skating. The Zoological Gardens have a large collection of wild animals, some fine gardens, and a lake. The larger parks constitute popular picnic areas, and there are numerous open areas in the suburbs. South African wild flowers are to be seen in the Wilds Botanic Gardens, which consists of 45 acres (about 17 hectares) in the northern suburbs; wild birds may be seen at the Melrose Bird Sanctuary. The open space known as the Civic Centre has some fine examples of sculpture; the Civic Theatre is the home of opera, ballet, music, and drama. Throughout the city, many cinemas, halls, and theatres are to be found, as well as a number of recreation centres. There are also a planetarium and some observatories, including the Republic Observatory, which is of international importance. Kelvin House is the headquarters of many of South Africa's scientific and technical societies, including the South African Chemical Institute. A number of societies cater to the interests of photographers, philatelists, chess players, horticulturists, students of Jewish affairs, archaeologists, and other specialized groups.

History

EARLY SETTLEMENT

The discovery of gold

Johannesburg was founded as a result of the discovery of gold in the Witwatersrand area of the Transvaal in 1886. The farms from Driefontein in the east to Roodepoort in the west were proclaimed as public diggings, and gold-mining operations began. The centre of contemporary Johannesburg now stands on land that was then government ground and was known as Randjeslaagte or Rantjeslaagte. There has been much controversy about the origin of the name Johannesburg; the earliest known official statement about the Johannes, for whom the city was named, dated from 1896, when it was recorded that it was called after Johann Rissik, acting surveyor general, and Christian Johannes Joubert, head of the mines department of the Zuid-Afrikaansche Republiek (South African Republic), in whose territory the goldfields were located. The two men had been appointed as commissioners to investigate the mining situation. By November 1886, according to the provisions of the act known as the Gold Law, the first members of a Goldfield's Diggers Committee were elected and became the city's first local government authority. This body was later called the Sanitary Committee but by 1897 had become a Stadsraad, or Town Council. In 1887, the year after the discovery of gold, the mining syndicates—forerunners of the mining companies of today—had begun to operate in Johannesburg; and houses, offices, churches, and shops had begun to spring up.

In 1889 the new city's expansion was halted when the miners reached a zone of pyrite (an ore of sulfur, associated with gold and sometimes called fool's gold) from which it was not known how to extract the gold. As a result, a number of mines closed down before three Scotsmen from Glasgow, the brothers R.W. Forrest and W. Forrest and J.S. MacArthur, discovered the cyanide method of gold extraction. This process saved the Rand, and Johannesburg's growth was resumed.

Although postal facilities of a sort were available from the outset and a telegraph office was opened in 1887, the first telephone service was not installed until 1894. Goods had to be carried in by ox wagon, and passengers were transported by coach and horses; the only railroad in the locality, from Johannesburg to nearby Boksburg, was primarily used for the transport of coal to the mines. In 1892, however, the city was linked by rail to the port of Cape Town, some 800 miles to the southwest. By 1896 the inhabitants of Johannesburg, most of whom were English-speaking and did not have the franchise, came to wish for representation in the government of the country. As a result, differences between the rulers of the country in Pretoria and the mining men in Johannesburg became acute. When the South African War between the United Kingdom and the Zuid-Afrikaansche Republiek broke out in 1899, many residents left Johannesburg. By agreement, the mines were handed over undamaged when the British took the city in 1900. At the conclusion of the war in 1902, by which time the city's population numbered 100,000, labour for the mines was so scarce that Chinese workers were imported. Due to political pressures, however, the Chinese were all repatriated by 1910, the year in which Johannesburg, together with the remainder of the Transvaal, became a part of the Union of South Africa.

THE MODERN CITY

After World War I, labour unrest occasioned various strikes in the mines. In a strike of 1922, white miners opposed the use of Africans for semiskilled work. The strike was suppressed but at a cost of more than 200 lives. In 1928 Johannesburg was declared to be a city; it celebrated its 50th anniversary in 1936. World War II checked further development from 1939 to 1945, after which a building boom occurred, with urban expansion taking place to the north and northwest. By 1970 the city's municipal boundaries were extended to include an area of 104 square miles.

Expansion of the city after World War II

Samuel Johnson

The English poet, critic, essayist, and lexicographer Samuel Johnson became famous not only for his writings but also for his forceful, witty conversation. After Shakespeare, Johnson is possibly the best known figure and the most frequently quoted in the whole range of English literature.

EARLY LIFE AND INFLUENCES

He was born at Lichfield, Staffordshire, on September 18 (new style; September 7, old style), 1709. His father, Michael Johnson, was a prominent citizen of Lichfield and was sheriff of the city at the time of Samuel's birth. As a bookseller, he conducted a substantial but not very profitable business. Samuel was not a healthy child. His eyes were weak and he was the victim of a tubercular infection in the glands of the neck, commonly known then as "the King's Evil." In the hope that the cure for this disease lay in the royal touch, Mrs. Johnson travelled to London with Samuel in March 1712, and the boy was duly touched by Queen Anne. His memories of the ceremony were naturally slight, but he retained "a sort of solemn recollection of a lady in diamonds and a long black hood." It is not recorded that he derived any physical benefit from the royal touch, but the gold amulet that the Queen hung round his neck remained there until his death.

Michael Johnson was a high churchman with Jacobite sympathies, favouring the Stuart rather than the Hanoverian succession. His wife, Sarah Ford, was a devout woman with leanings toward Calvinism. She taught her son to learn the collect for the day by heart and expounded to him the contrast between heaven and hell. In 1717 Johnson entered Lichfield grammar school and began the study of Latin. One of his schoolfellows, Edmund Hector, who was to become his lifelong friend, recalling in later years Johnson's "uncommon abilities for learning," wrote: "His ambition to excel was great, though his application to books . . . was very trifling . . . his dislike to business was so great that he would procrastinate his exercises to the last hour." It was a disposition that remained with Johnson throughout his long literary career.

When he was promoted to the upper school, Johnson came under the discipline of the headmaster, a scholar but a tyrant who beat his boys indiscriminately—"to save them from the gallows." As Johnson later said, "My master whipt me very well. Without that, Sir, I should have done nothing." After a brief period at the grammar school at Stourbridge, where he was a student and also took some part in the teaching of the younger boys, Johnson helped his father in the bookshop. Rambling along his father's shelves, he read widely and with the instinct of an incipient scholar—"not voyages and travels, but all literature, Sir, all ancient writers, all manly . . ." Thus, by the time that he entered Pembroke College, Oxford, in 1728, he was familiar with many works unknown at the universities; and when he was first introduced to William Jorden, tutor of the college, his own contribution to the conversation was a quotation from the Latin grammarian and philosopher Macrobius. Johnson thought little of Jorden's scholarship but praised his goodness of heart. William Adams, fellow and later master of Pembroke, meant more to Johnson and remained his friend through many years. He had some good friends, too, among the undergraduates of his own generation. He was near to his old schoolfellow, John Taylor of Ashbourne, at Christ Church, and among Pembroke men he had the reputation of being gay and frolicsome. But it was a forced gaiety. Frustrated and embittered by poverty, he defied authority and "thought to fight his way by his literature and his wit." One example of his scholastic facility survives from his undergraduate days—a Latin translation of Alexander Pope's "Messiah," which was included in a *Miscellany* published at Oxford in 1731.

Friends and influences at Oxford

How the impecunious Michael Johnson was enabled to send his son to college is not wholly clear. Possibly a small legacy received by Mrs. Johnson may have helped. But, in any event, Johnson was compelled to leave Oxford in December 1729 after a residence of 13 months. His prospects were poor. He had no degree or other qualification; his father's business was declining; an application for an ushership (assistant teacher) at Stourbridge was unsuccessful. His father died at the end of 1731, and in the following year Samuel accepted a post as undermaster in the grammar school at Market Bosworth. The work brought him neither health nor happiness, and he resented the arrogance with which he was treated by Sir Wolstan Dixie, in whose house he lived. Through the influence of his old friend Edmund Hector, who had become a surgeon in Birmingham, Johnson secured the task of translating into English the French version of *A Voyage to Abyssinia* by Father Jerome Lobo. Johnson's preface gives an early indication of his instinctive sympathy with the natives of an invaded country. The invaders of Abyssinia were missionaries who preached the gospel with swords in their hands. The preface also gives an authentic foretaste of Johnson's prose style:

> The Reader . . . will discover, what will always be discover'd by a diligent and impartial Enquirer, that wherever Human Nature is to be found, there is a mixture of Vice and Virtue, a contest of Passion and Reason, and that the Creator doth not appear Partial in his Distributions, but has balanced in most Countries their particular Inconveniences by particular Favours.

Marriage and early literary endeavours

Johnson's sojourn in Birmingham brought him something more than a fee of five guineas for his first book—it brought him a wife in the person of Elizabeth, widow of Harry Porter, a mercer. She was 20 years older than Johnson, and it is not easy to determine the grounds of mutual attachment. Johnson, in later years, used to speak of his wife's beautiful blonde hair; and whatever the lady thought of Johnson's looks ("lean and lank . . . the scars of the scrofula deeply visible") or of his "convulsive starts and odd gesticulations," she at least appreciated the vigour and good sense of his conversation. The marriage took place at Derby in 1735, and the bride brought with her a reputed dowry of £700. On the strength of this and with the encouragement of a friend who was registrar of the ecclesiastical court of Lichfield, Johnson decided to set up at Edial, near Lichfield, a school on his own at which young gentlemen could be boarded and taught the Latin and Greek languages. He prepared an elaborate curriculum, but only a few young gentlemen, among whom was David Garrick, came as pupils, and at the end of two years Johnson had to admit failure.

But in spite of ill health, of melancholia, of his lack of a degree, and of the collapse of his school, the desire to be known as a scholar and a writer remained clear in his mind. While still a schoolboy he had written of

> . . . the young Authour, panting after fame,
> And the long honours of a lasting name

and in the year before his marriage he had written to the founder of the *Gentleman's Magazine,* offering to fill a column, on reasonable terms, with poetry, dissertations, critical remarks on ancient and modern authors, and other material. Furthermore, with plenty of time on his hands at Edial, he embarked, again with the encouragement of friends, on the writing of a tragedy, based on the story of Sultan Mahomet (Mehmed) II and the beautiful Greek maiden Irene, as told by Richard Knolles in his *General History of the Turks.* But the work was not finished, and Johnson, facing the fact that he must write something for which an editor or a bookseller would pay, decided to seek his fortune in London. So, in company with David Garrick, he rode to London in March 1737. Arthur Murphy, in "An Essay on the Life and Genius of Samuel Johnson LL.D." (1792), wrote:

> Two such candidates for fame perhaps never, before that day, entered the metropolis together. . . . They brought with them genius, and powers of mind, peculiarly formed by nature for the different vocations to which each of them felt himself inclined. . . . In three or four years afterwards Garrick came forth with talents that astonished the publick. . . . Johnson was left to toil in the humble walks of literature.

Contributions to the *Gentleman's Magazine*

The *Gentleman's Magazine* offered him the first opportunity of humble toil. Edward Cave, the publisher, quickly recognized his journalistic ability, and Johnson contributed a number of pieces in prose and verse—odes, epigrams, reviews, as well as a series of concise biographies. In the later part of 1737 he returned to Lichfield, finished his tragedy *Irene,* and brought his wife to London. Meanwhile, his ambition to be a writer of something more than ephemeral pieces for periodicals remained, and in 1738 his first substantial poem, *London,* was published. It was written in imitation of the third *Satire* of Juvenal, and in it Johnson embodied his protest against political corruption:

> Here let those reign, whom pensions can incite
> To vote a patriot black, a courtier white;

against the dangers of the London streets:

> Their ambush here relentless ruffians lay,
> And here the fell attorney prowls for prey;
> Here falling houses thunder on your head,
> And here a female Atheist talks you dead.

and, with more acutely personal feeling, against the miseries of the unknown and impecunious author:

> This mournful truth is ev'ry where confess'd,
> SLOW RISES WORTH, BY POVERTY DEPRESS'D.

London, published anonymously, had an immediate success. It went quickly into three editions and won high praise from Alexander Pope. But Johnson's fee was only 10 guineas, and again he thought of schoolmastering as an alternative to being "starved to death in translating for booksellers." The headmastership of Appleby School in Leicestershire was offered to him, subject to his obtaining the degree of M.A., but negotiations for its conferment broke down both at Oxford and at Dublin; similarly, his lack of a degree in law frustrated his application for permission to practice as an advocate. To this period of embittered disappointment belong his two most violent and satirical strictures upon the government of Walpole: the first was *Marmor Norfolciense* (1739), an essay upon a Latin rhyme supposed to have been discovered in Walpole's county, Norfolk; and the second, *A Compleat Vindication of the Licensers of the Stage* (1739), an ironical defense of the suppression of Henry Brooke's play *Gustavus Vasa.* Both satires are the protests of an angry young man rebelling against authority and striving, as he had striven at Oxford, to fight his way out by his wit. Johnson was no sentimental Jacobite, but his scorn of the Hanoverian government was never more bitterly explicit than in *Marmor Norfolciense:*

Satires against the Walpole ministry

> Then o'er the World shall Discord stretch her wings;
> Kings change their Laws, and Kingdoms change their
> Kings.

The story that a warrant was issued for Johnson's arrest has never been verified, but, meanwhile, as a member of Cave's staff, he was required to treat contemporary politics in more sober style. Reports of parliamentary debates had been a feature of the *Gentleman's Magazine* since 1732, but shortly after Johnson's arrival in London the House of Commons forbade publication of its proceedings. Cave, however, contrived to continue the publication as "Debates in the Senate of Magna Lilliputia"; and in the first instance Johnson was employed to assist in editing and expanding the reports, but from 1740 to 1743 the "Debates" were entirely Johnson's own work. He was not a reporter in the modern sense and was only once inside the House of Commons. Sometimes he had a few notes supplied by other reporters, sometimes nothing more than the subject of debate and the names of the speakers; sometimes, he confessed, the "Debates" were the mere coinage of his own imagination, and in later years he had some prickings of conscience about his freedom of invention. As a journalistic feat, they were a remarkable tour de force. He would shut himself up in a room at Cave's headquarters in St. John's Gate and deliver three columns for the *Magazine* in an hour. His often-quoted remark that he took care that the Whig dogs—members of the political party opposed to the Tories—should not have the best of it gives a false impression of what he was doing. His reports have been well described as leading articles on both sides of the question, rather than records of the cut and thrust of debate. The short speech put into the mouth of Walpole at the end of the debate on the motion for his removal from office is a remarkably objective record of a minister speaking with dignity and restraint in his own defense.

Friendship with Richard Savage

One of Johnson's closest companions in his early years in London was Richard Savage. Savage had in his time been actor, playwright, and poet. He claimed to have been nobly born and had had many friends among the great whose hospitality he persistently abused. Two qualities at least he shared with Johnson—poverty and patriotic indignation against the Walpole administration. When their fortunes were at their lowest, they would spend whole nights in "a perambulation round the squares of Westminster . . . when all the money they could both raise was less than sufficient to purchase for them the shelter and sordid comforts of a night cellar." When Savage died, Johnson lost no time in commemorating his friend. Written con amore and at a white heat, the *Account of the Life of Mr Richard Savage,* published anonymously in 1744, was the first of Johnson's prose works to captivate the public. The novelist Henry Fielding, who would publish *Tom Jones* five years later, called it the best treatise in the language on the excellencies and defects of human nature; Joshua Reynolds, then only 21 but destined to become one of England's greatest painters, could not put the book down until he had finished it.

RECOGNITION AND MATURE CAREER

The theatre. In addition to a great variety of hack work, Johnson was now turning his attention to Shakespeare. In 1745 he published his *Miscellaneous Observations on the Tragedy of Macbeth,* coupled with preliminary proposals for his own edition of the plays, but he was deflected from further Shakespearean work by the suggestion that he should compile a dictionary of the English language. That a syndicate of booksellers should have chosen Johnson for so gigantic a task is a tribute to the position he had made for himself during his nine years in London.

In those same years David Garrick had made more rapid and more brilliant progress. Deserting the law for the theatre, he had made his mark as an actor in 1741 and by 1747 had become the manager of Drury Lane Theatre. For the first performances under Garrick's management Johnson wrote a prologue, and, although he commonly spoke with contempt of actors and their profession, he was willing, for friendship's sake, to plead their cause:

> Ah let not Censure term our Fate our Choice,
> The Stage but echoes back the publick Voice,
> The Drama's Laws the Drama's Patrons give,
> For we that live to please, must please to live.

At this time, moreover, Johnson had a personal interest in dramatic production. His tragedy *Irene* had long lacked a publisher or a producer. Garrick, when he came into power, agreed to do his best for his old master, and *Irene* was produced "with a display of Eastern magnificence" in 1749. It ran for nine nights. It was essentially a moralist's play, and although it was said to be universally admired, it has never been revived.

The Vanity of Human Wishes

More permanent was Johnson's second didactic poem, *The Vanity of Human Wishes* (1749), in which the careers of Galileo, Wolsey, Charles XII of Sweden, and others are shown to illustrate the hazards of political ambition, the futility of military conquest, and the miseries of authorship:

> There mark what ills the scholar's life assail,
> Toil, envy, want, the patron, and the jail.
> See nations, slowly wise and meanly just,
> To buried merit raise the tardy bust.
> If dreams yet flatter, once again attend,
> Hear Lydiat's life, and Galileo's end.

Though at the time of its publication *The Vanity of Human Wishes* had a much less rapid sale than *London,* it is Johnson's greatest poem. Its manner is that of its period. But Johnson's panorama of the rise and fall of scholars and philosophers, of statesmen and kings, in the modern as well as the ancient world, is inspired by that "high seriousness" that endows the poem with universality. But the record of disillusionment is not the end.

> Must helpless man, in ignorance sedate,
> Roll darkling down the torrent of his fate?

No, says Johnson, he must pray for the love and patience and faith of the Christian.

The "Rambler." The contract for *A Dictionary of the English Language* had been signed in 1746, and Johnson published his *Plan of a Dictionary of the English Language* the following year. He made no complaint of what the booksellers offered him, but it was not enough to keep the wolf from the door. So, in 1750, he embarked upon the *Rambler,* a twopenny sheet published twice a week and containing a single anonymous essay. The *Rambler* is of fundamental importance in any estimate of Johnson's approach to literature. Before he embarked on the work he prayed that he might promote the glory of God and the salvation of himself and others. The Rambler, in short, was not an entertainer but an instructor, and 19th-century critics tended to dismiss his essays as lay sermons.

Johnson had recently founded his first club (the Ivy Lane Club) and from his tavern chair would take a prominent part in contributing to what he called "colloquial entertainment." But a printed essay demanded "more accurate thought and more laboured beauties." Talking for victory was legitimate; with the printed word came the moralist's responsibility, and in Johnson's literary creed the basic article of belief was that it was always a writer's duty to make the world better. This sense of responsibility determined the style of the essays. He created no character comparable to that of Addison and Steele's Sir Roger de Coverley in the *Spectator,* and the essays bear little relation to current events or current literature. On the other hand, they frequently reflect the social and literary conditions of the time: there is scorn for the virtuoso and the overdomesticated hostess; an objective picture of the prostitute's life; a vigorous protest against the death sentence for robbery; and, inevitably, a grimly humorous presentation of the journalist's lot. Moreover, they show a remarkable understanding of human frustration and blocked wills. As has recently been pointed out, in the writings of Johnson there is the closest anticipation of the theories of Freud, if not his language, before the 20th century.

The *Rambler* appeared twice a week for two years (1750–52). A few days after the issue of the last number, Johnson's constitutional melancholy was deepened by the death of his wife. The full story of his married life must necessarily be conjectural. None of Johnson's friends in his early London period appears to have met Mrs. Johnson, and there are but few contemporary references to her. That the marriage was based on mutual admiration and affection is reasonably clear. From the beginning Mrs. Johnson had relished the quality of her husband's conversation, and she had a special admiration for the *Rambler;* Johnson, on his part, appreciated her intelligent reading of comedy. But, domestically, they were not well suited. Johnson was as insistent about the quality of his food as he was careless and untidy about the house. What was more serious was that in her later years Mrs. Johnson became addicted to strong liquor and to drugs and was unwilling to satisfy her husband's physical desires. Something of this may be read between the lines of Johnson's prayers and meditations about her death. Nevertheless, Johnson's affection, tinged with some remorse, remained sincere; and its sincerity is not impaired by the discovery that on April 22, 1753, he purposed "to try . . . to seek a new wife without any derogation from dear Tetty's memory." The precise direction of his search is not known, but it is interesting that he contemplated an adventure that he was later to describe as the triumph of hope over experience. "Formosae, cultae, ingeniosae, piae" ("a woman of beauty, elegance, ingenuity, and piety")—so Johnson described his Tetty on the gravestone that he placed in Bromley Parish Church more than 30 years later. In lapidary inscriptions, as he said, a man is not upon oath.

Mrs. Johnson's death

In 1752 Johnson was a lonely man, but he had made some good friends. At the Ivy Lane Club he was delighted "to pass those hours in a free and unrestricted interchange of sentiments, which otherwise had been spent at home in painful reflection." There were 10 members, including Sir John Hawkins, who lived to be Johnson's executor and biographer; John Hawkesworth, editor of the *Adventurer,* to which Johnson himself contributed a number of essays; John Ryland, one of the few of Johnson's early friends who lived to attend his funeral; John Payne, publisher of the *Rambler;* and Richard Bathurst, the physician whom Johnson loved better than any other creature. It was at the Ivy Lane Club that Johnson celebrated the publication of the first book of his friend Mrs. Charlotte Lennox by "a whole night spent in festivity." About five in the morning, according to Hawkins, "Johnson's face shone with meridian splendour, though his drink had been only lemonade."

The dictionary. In 1747 Johnson published his *Plan of a Dictionary of the English Language.* At the suggestion of Robert Dodsley, the author and bookseller, it was dedicated to Lord Chesterfield. At first Chesterfield showed some interest and made some suggestions for revision, but when he paid no further attention to the work, Johnson would not be obsequious—and Johnson did not forget. In April 1753 he was beginning work upon the second volume of the *Dictionary,* and he had still to write the preface, the grammar, and the history.

Two years later the work was finished. It had occupied Johnson and his amanuenses for eight and one-half years, and its accomplishment was described by Sir James Murray, editor in chief of the *Oxford English Dictionary,* as a marvellous one. It surpassed earlier dictionaries not in bulk but in precision of definition and in literary illustration. Its 40,000 words were, in fact, rather less than those in the work of his predecessor, Nathaniel Bailey; but what distinguished Johnson's work was the range of reading by which he exemplified the different shades of the meaning of a particular word. "I applied myself," he wrote in his preface, "to the perusal of our writers . . . noting whatever might be of use to ascertain or illustrate any word or phrase." Certain books (Bacon's *Essays,* South's *Sermons,* and others) have survived with Johnson's underlinings and indications of the passages chosen for quotation. His assistants copied the quotations on separate slips, and these were pasted below Johnson's own definitions. At the beginning Johnson had looked forward to hours that he would revel away in feasts of literature and ransack the obscure recesses of northern learning. But he soon realized that these were "the dreams of a poet doomed at last to wake a lexicographer." To the weariness of copying was

Character and reputation of the *Dictionary* added the vexation of expunging, and Johnson, having set practical limits to his work, was acutely conscious of its imperfections. His orthography was admittedly controvertible and his etymology uncertain; and, even while the dictionary was hastening to publication, some words, as he said, were budding and some were falling away. Nevertheless, the claim made in the final paragraph of his preface—one of the finest examples of his prose style—was abundantly justified:

> In this work, when it shall be found that much is omitted, let it not be forgotten that much likewise is performed; and though no book was ever spared out of tenderness to the author, and the world is little solicitous to know whence proceeded the faults of that which it condemns; yet it may gratify curiosity to inform it, that the *English Dictionary* was written with little assistance of the learned, and without any patronage of the great; not in the soft obscurities of retirement, or under the shelter of academick bowers, but amidst inconvenience and distraction, in sickness and in sorrow.

Today the ordinary reader may tend to remember the few "wild blunders"; the "risible absurdities"; and the frankly personal prejudices shown in the definitions of "oats" ("A grain, which in England is generally given to horses, but in Scotland supports the people"), "excise," "pension," and other well-known examples. But Johnson's enrichment of the wordbooks of his predecessors by judicious definition and by linguistic illustration from English literature was an enduring monument in the history of lexicography.

On the title page of the *Dictionary,* Johnson had the satisfaction of describing himself as a Master of Arts of the University of Oxford, and it is significant that the award was made in consideration of the religious and moral value of his essays. The degree, in short, was conferred upon the Rambler.

The *Dictionary* was well received, and opposition came only from "the Criticks of the coffeehouse whose outcries are soon dispersed in the air and are thought on no more." But there had been one outcry of enthusiastic praise that Johnson did not allow to be dispersed. Shortly before the work appeared, in two papers in the *World,* Lord Chesterfield, seeking to make amends for his previous neglect, hailed Johnson as the supreme dictator of the English language and so provoked the most famous of all Johnson's letters:

> The notice which you have been pleased to take of my labours, had it been early, had been kind; but it has been delayed till I am indifferent, and cannot enjoy it; till I am solitary, and cannot impart it; till I am known, and do not want it. . . .

Journalism. Johnson was soon at work upon an abridged edition of the *Dictionary,* but fame as a lexicographer had not relieved him of pecuniary distress. In March 1756 he was under arrest for the sum of £5 18*s.* Normally he would have appealed to one of the printers for whom he worked, but they were not available, and it was the printer-novelist Samuel Richardson who sent him six guineas. So, of necessity, his activity as a journalist continued. He edited Sir Thomas Browne's *Christian Morals* (1756), wrote prefaces to William Payne's *Introduction to the Game of Draughts* (1756) and Richard Rolt's *New Dictionary of Trade and Commerce* (1756), and contributed many articles to journals. In the *Literary Magazine,* Jonas Hanway's "Essay on Tea" provoked Johnson's description of himself as a "hardened and shameless tea-drinker" who had drunk of it for 20 years without hurt and therefore believed it not to be poison.

A more important review was that of Soame Jenyns' *Free Inquiry into the Nature and Origin of Evil* (1757), in which, with massive irony, Johnson demolished the conjecture of a superior race of beings deceiving and tormenting men for their own pleasure:

> The only end of writing is to enable the readers better to enjoy life, or better to endure it: and how will either of those be put more in our power by him who tells us, that we are puppets, of which some creature not much wiser than ourselves manages the wires.

Nor could Johnson swallow the bland assertion that poverty was generally compensated by better health and a more exquisite relish of the smallest enjoyments. "Life," he retorted, "must be seen before it can be known." These were topics on which he wrote with peculiar depth of feeling, and, as always when he felt deeply, his style became more simple.

Political writings

Neither Johnson's interests nor his writings were confined to the problems of literature and ethics. To the *Literary Magazine* of 1756 he contributed two articles on the political situation—"An Introduction to the Political State of Great Britain" and "Observations on the present State of Affairs." In both he writes with scorn of the power politics inherent in both English and French colonialism. The dispute between the two countries in America was "the quarrel of two robbers for the spoil of a passenger," and even those who had settled in the New World on the fairest terms had no other merit than that of "a scrivener who ruins in silence over a plunderer that seizes by force." Nor was he afraid of asserting that the French sent out better governors and that they treated the natives better than did the English. It was ridiculous, he wrote, to imagine that the friendship of nations, whether civil or barbarous, could be gained or kept but by kind treatment; and it was this basic mistrust of the motives and methods of colonizers that provoked his later and better known outburst against colonial claims. Meanwhile, he had projects of his own in hand or in view. He issued his proposals for his edition of Shakespeare in 1756, emphasizing, not for the first time, that his motive was not desire of fame but want of money. In April 1757 he wrote to his old friend Edmund Hector, in Birmingham, that the subscriptions, if slightly disappointing, were satisfactory, but early in 1758 he was obliged to borrow £40 from a bookseller.

"The Idler" essays

About the same time he undertook to contribute a weekly essay, to be entitled "The Idler," to the *Universal Chronicle.* Of these essays it may be said that the reader who has been nurtured in the tradition that while Johnson's talk is magnificent, his writings (other than the *Lives of the English Poets*) are unreadable, would be well advised to turn his attention to "The Idler." Though the moralist and the social reformer (especially on such topics as debtors' prisons and vivisection) are still evident, he is willing to turn aside to the human comedy: for instance, to the female bargain hunter ("whatever she thinks cheap, she holds it the duty of an economist to buy") or to the publisher ("Some never dealt with authors; others had their hands full; some had never known such a dead time; others had lost by all that they had published for the last twelvemonth"). There are also some character sketches, of which the most memorable is that of "Mr. Sober":

> Mr. Sober's chief pleasure is conversation; there is no end of his talk or his attention; to speak or to hear is equally pleasing; for he still fancies that he is teaching or learning something, and is free for the time from his own reproaches.
>
> But there is one time at night when he must go home, that his friends may sleep; and another time in the morning, when all the world agrees to shut out interruption. These are the moments of which poor Sober trembles at the thought.

It is a rare and convincing piece of self-portraiture. Every week for two years, with a few exceptions, Johnson delivered his "Idler" essay to the printer.

Rasselas. In the midst of his work and worry came news of his mother's illness. On January 13, 1759, he contrived to send her 12 guineas. But he knew that he would need more, and on the same day that he wrote his last tender tribute to his mother (January 20), he implored Strahan, the printer, to let him have £30 on account of "a thing he was preparing for the press." The thing was to be entitled *The Prince of Abissinia,* better known as *Rasselas.* Written in the evenings of a week with the impending expenses of his mother's funeral in mind, it explores and exposes the vanity of the human search for happiness. The setting was no doubt prompted by Johnson's recollection of Jerome Lobo's *Voyage to Abyssinia,* and the work is addressed to those who "listen with credulity to the whispers of fancy and pursue with eagerness the phantoms of hope." Impelled by such eagerness, Rasselas, with his sister, leaves his happy valley because its pleasure has ceased to please and because he is fired with a desire to do something. He meets with men of varied occupations and interests and earnestly explores their manner of life—scholars, astronomers, shepherds, hermits, poets. With Imlac, the poet, he ranges over many of the basic problems of art and life but gains little satisfaction from the answers he receives. At his first entry into city life, Rasselas meets everywhere with gaiety and happiness, but closer association reveals a picture of levity and intemperance. From the extravagance of youth he turns to an inspiring lecture on morality, only to find that the lecturer's philosophy collapses at the first stroke of personal misfortune. When he passes hopefully to scenes of pastoral simplicity, he finds the shepherds cankered with discontent, since they are condemned to labour for the luxury of the rich; when he seeks advice from a hermit, he is disappointed to be told that "the life of a solitary man will be certainly miserable, but not certainly devout." So the journey of disillusionment continues, until Imlac protests: "While you are making the choice of life, you neglect to live"—which is, perhaps, the most important moral to be drawn from the tale.

The moral of *Rasselas*

Of all Johnson's writings, none is more intensely characteristic than *Rasselas.* It is a remarkable example of his fluent productivity when he had a definite object and a definite date before him, but speed did not debase either the solemnity of his subject or the dignity of its treatment. Johnson allowed his imagination to wander into Ethiopia and Egypt, but fundamentally *Rasselas* is a spiritual autobiography. Furthermore, it was the one prose work of Johnson's that obtained an immediate and wide popularity in his lifetime. It satisfied the taste of the 18th-century reader for "impressive truth in splendid fiction drest"—and not only of the English reader. In a variety of translations its fame spread over Europe and beyond.

Johnson's circle. In spite of his struggles and sorrows, Johnson was, by this time, no longer a lonely hack writer. His writings, though they did not make his fortune, had brought him many friends. Joshua Reynolds had been enthralled by Johnson's *Life of Savage* and was no less enthusiastic about his conversation and his counsel; Charles Burney, a leading English music historian of his time, warmly commended the *Dictionary* and encouraged the edition of Shakespeare; Bennet Langton, a Lincolnshire gentleman and scholar, came to London at an early age for the express purpose of meeting the author of the *Rambler.* Johnson also cherished his Oxford friendships. He spent some time there in 1754 and again in 1755 and 1759 and, after the conferment of his degree, took a keen pleasure in wearing his gown. It was at Trinity in 1759 that Bennet Langton introduced him to Topham Beauclerk, who was descended from Charles II and Nell Gwyn.

Introductions, reviews, and dedications

Even so, Johnson was still at the beck and call of authors, editors, and friends for the writing of introductions, reviews, and, especially, dedications. Of James Bennet's edition of Roger Ascham's works he was virtually the editor and contributed a life of Ascham, a famous scholar and Latin secretary to Elizabeth I; he wrote the loyal address presented to George III on his accession by the painters, sculptors, and architects; he revised a pamphlet on the proper route for the coronation procession; he reviewed a work on Mary, queen of Scots, and wrote a dedication for Giuseppe Baretti's *Italian Dictionary.* Meanwhile his edition of Shakespeare tarried. In 1762 the unexpected happened. He was informed of the gracious intention of his majesty the King to confer on him a pension of £300 a year. Could he in decency take it, after defining "pension" in his *Dictionary* as "pay given to a state hireling for treason to his country"? At least, he felt, he must consult his friends. But Reynolds reassured him, and Lord Bute, the prime minister, told him that the award was made not for anything he might do but for what he had already done. So, from a full heart, Johnson thanked his lordship for sparing him "the shame of solicitation, and the anxiety of suspense."

Meeting with James Boswell. The following year was to provide yet another landmark in Johnson's life, for on May 16, 1763, his accidental meeting with James Boswell in the back parlour of Thomas Davies' bookshop in Covent Garden inaugurated one of the most famous companionships in history. Boswell, the eldest son of Lord Auchinleck, a Scottish judge, had studied law at Edinburgh and Glasgow and had a passionate desire to taste the felicities of London life. His mind was dominated by two ambitions—to meet famous men and to be a famous author himself. Staying in a country house in the previous year, he had read aloud, with enthusiastic comment, some of the *Rambler* essays; and, in the list of celebrities whom he wished to meet, the author of the *Rambler* stood high. A little daunted by Johnson's brusque rejoinders at their first meeting, Boswell was nevertheless encouraged by Davies to persevere; and a week later he waited, with some apologies, upon Johnson. Johnson cut him short. "I am obliged," he said, "to any man who visits me." So Boswell stayed and listened in rapture. "His conversation," he wrote in his diary, "is as great as his writing." He could give no higher praise. To Johnson new friendships were always welcome, and especially with young people (Johnson was then 53 and Boswell only 22), for such friendships lasted longest. To the charm of Boswell's enthusiasm he quickly succumbed. Together they enjoyed suppers at the Mitre Tavern and excursions on the Thames, but the signal mark of Johnson's favour was his offer to accompany Boswell in the coach to Harwich, whence Boswell was to embark on his continental tour. Johnson gave him much sound advice. In particular, he urged him to keep a diary, and it is to Boswell's diary that the world owes its intimate knowledge of Johnson. Many others left valuable records of his life and character, but it was Boswell who Johnsonized the land.

Foundation of The Club

In 1764 Johnson was happy to concur with Joshua Reynolds' suggestion for the foundation of what is still the most famous of London dining clubs—The Club. Among the original members, besides Reynolds and Johnson, were Edmund Burke, Topham Beauclerk, Bennet Langton, and Oliver Goldsmith, and nine years later it was one of the proudest moments of Boswell's life when he was admitted to membership.

Edition of Shakespeare. Meanwhile, Johnson had been working on his edition of Shakespeare. Adumbrated in 1745 and formally announced in 1756, it had occupied him for much more than the two years in which he had hoped to complete it, and the long delay had provoked some typical satire from the pen of the scurrilous poet Charles Churchill:

> He for subscribers baits his hook,
> And takes their cash—but where's the book?

The book, in eight volumes, appeared at length in 1765. Johnson had been a student of Shakespeare all his life. He was no idolater, and his basic criticism is that of the moralist:

> He is so much more careful to please than to instruct, that he seems to write without any moral purpose . . . . He carries his persons indifferently through right and wrong, and at the close dismisses them without further care, and leaves their examples to operate by chance. This fault the barbarity of his age cannot extenuate; for it is always a writer's duty to make the world better.

As an editor Johnson set out, first, to correct textual corruptions; second, to elucidate obscurities of language; and, last, in treating of Shakespeare's sources, to examine the very books that Shakespeare consulted. Of the critics' complaint of Shakespeare's neglect of the unities of time and place he made short work. The demand for these unities arose from "the supposed necessity of making the drama credible," but in Johnson's view no drama was either credible or credited. "The truth is that the spectators are always in their senses, and know, from the first act to the last, that the stage is only a stage, and that the players are only players." Johnson recognized that Shakespeare wrote his plays not for the reader at his desk but for an audience in the theatre. But Johnson himself could never appreciate the contribution made by the actor to dramatic interpretation. For him the actor was a reciter who said his piece "with just gesture and elegant modulation," and it was not in the theatre but in his study that he was most deeply moved by "the perpetual tumult of indignation, pity and hope." "He that peruses Shakespeare," he wrote about *Macbeth,* "looks round alarmed and starts to find himself alone," and he was so deeply shocked by his first reading of Cordelia's death in *King Lear* that he could not bear to read it again until he revised the play as an editor. The romantic critics of the 19th century belittled Johnson's work on Shakespeare, but the prophecy by the English critic Sir Walter Raleigh (1861–1922) that Johnson would receive more respect in the 20th century has been abundantly fulfilled by modern editors. It was in the year of the publication of his Shakespeare that Johnson received the degree of LL.D. from Trinity College, Dublin; his own university did him a similar honour 10 years later.

The house in Gough Square

Johnson's household. In whatever literary work Johnson was engaged his greatest terror was solitude, and the composition of his household reflects his efforts to avoid it. He had many habitations in London of which the most famous is the house in Gough Square, just north of Fleet Street, in which he lived from 1749 to 1759. When Boswell first called upon him in 1763 he was at 1, Inner Temple Lane. From there he moved back to Johnson's Court (7, Fleet Street) in 1765 and in 1776 to Bolt Court, which was his home until his death. The house in Gough Square has been well preserved and is now a Johnson museum. There the *Dictionary* was compiled; there the *Rambler,* the *Idler,* possibly *Rasselas,* and much else was written; there his wife died in 1752. Even before her death and long before the grant of his pension, he had begun to make his house a refuge for the poor and unfortunate.

Anna Williams, daughter of Zachariah Williams, who had received Johnson's help in writing his *Longitude at Sea,* came to London in the hope of being cured of a cataract but later became totally blind. She was a constant visitor in Mrs. Johnson's lifetime and, after her death, came to live in the house. For the rest of her life she had either a room in Johnson's house or lodgings near at hand. Blindness made her peevish in manner, but Johnson's regard and affection for her remained constant. When she died in 1783, he mourned a companion to whom he had had recourse for domestic amusement for 30 years. Shortly after Mrs. Johnson's death, Johnson's beloved friend Richard Bathurst presented to him Francis Barber, a Negro slave who had been freed by Bathurst's father. Johnson made Francis his friend as well as his servant, sent him to school at Bishop's Stortford, and provided for him handsomely in his will. Another humble friend was Robert Levett, "an obscure practiser in physick amongst the lower people," who was given a room at the top of the house in Johnson's Court. Johnson insisted that Levett was indebted to him for nothing more than houseroom, a share of a penny loaf at breakfast, and an occasional Sunday dinner. His death provoked one of Johnson's most moving poems:

> Well try'd through many a varying year,
> See Levett to the grave descend;
> Officious, innocent, sincere,
> Of every friendless name the friend.

Yet another beneficiary was Mrs. Desmoulins, daughter of Dr. Swynfen, Johnson's godfather, who joined the household in the early London years. After Mrs. Johnson's death she appears to have been in charge of the cooking. But she quarrelled constantly with Anna Williams, and anarchy reigned in the kitchen.

Friendship with the Thrales

It was from this domestic background that in 1765 Johnson was introduced to a family that was to provide one of the most comforting friendships of his life. Henry Thrale, owner of a Southwark brewery, had been married to Hester Lynch Salusbury in 1763. Two years later he was elected member of Parliament for Southwark, and his wife became a famous hostess and, in particular, "the provider and conductress of Dr. Johnson." For the first time in his life Johnson, who was invited not only to dine but to spend weeks, or even months, at the Thrales's country house at Streatham, was free to enjoy the luxury of solid comfort. No man, as he said, is a hypocrite in his pleasures, and at Streatham he could enjoy them all—a good library, intelligent conversation, pretty women, late hours, tasteful cookery. Furthermore, he became the confidant and counsellor of both parents and children; a room was set apart for him at the Southwark house as well as at Streatham; he was one of the family.

Political pamphlets. Already Johnson's pension had made two important differences in his way of life: he was no longer obliged to write for a living, and he could afford the time and money for holidays. Not that he was entirely idle as a writer: Shakespeare and the *Dictionary* called for revision; friends called for dedications and prologues (he wrote one for Goldsmith's *Good-Natur'd Man*); and he was also moved to write a series of political pamphlets. Of these tracts, the general view was, for long, that they exhibited the sad spectacle of a great man giving vent, unworthily, to the abusive expression of his conservative prejudice against the rights of the people. Today, more trouble is taken to understand Johnson's point of view. The pamphlets of the 1770s are seen not as a sudden whim of his later years but as part of the expression of a lifelong concern with political morality, which in the 1730s and 1740s had produced pamphlets vigorously denouncing the alleged tyranny and corruption of the Walpole government and, in the 1750s, a large amount of acute journalistic analysis (and condemnation) of the commercial and imperialist motives underlying the Seven Years' War.

The False Alarm (1770) was written not so much to defend the right of the House of Commons to refuse readmittance to a member already expelled as to protest against the absurdity of raising the controversy to the level of a constitutional crisis. What the country was arguing about, he said, was whether Middlesex should be represented, or not, by a criminal from jail. To raise the cry that liberty was in danger was to raise a false alarm.

Thoughts on the Late Transactions respecting Falkland's Islands (1771) was a reply to the anonymous political controversialist Junius and others, who had been urging the British government to resist the Spanish claim to those islands by aggressive action, and who now reproached it for having avoided war by a diplomatic compromise that left Britain in possession of the islands, though without fully establishing its title to them as against Spain's. Johnson gives a thorough history of the rival claims and of the diplomatic manoeuvring and then, in vigorous rhetoric, denounces the jingoism of his opponents, charging them with warmongering for commercial gain.

> These are the men who, without virtue, labour, or hazard . . . rejoice when obstinacy or ambition adds another year to slaughter and devastation; and laugh from their desks at bravery and science, while they are adding figure to figure, and cipher to cipher, hoping for a new contract from a new armament, and computing the profits of a siege or tempest.

The Patriot (1774), a short piece written just before the election of that year, defines the qualities of the true patriot and contrasts them with the behaviour of those who had unjustifiably arrogated the title to themselves. As for the supposed defenders of liberty of conscience, had they not opposed the act of Parliament that gave the Catholics of Quebec the right to practice their own religion?

Taxation No Tyranny (1775) is a reply to the resolutions passed by the American Continental Congress of 1774, which assert a position similar to that contained in the Declaration of Independence in the year 1776. Here it is important to remember that throughout his life Johnson had shown little sympathy toward European colonization and colonists in general and had published bitter denunciations of the exploitation (and worse) of native populations by the Portuguese in Africa, the Spanish in Central and South America, and the "English barbarians that cultivate the southern islands of America"—the West Indies. In an "Idler" essay (81; 1759) Johnson puts into the mouth of an Indian chief a fierce tirade against the American colonists' oppression of the Indians and Negroes. By comparison, the colonists' complaints of "oppression" by the British government (in the form of taxation) seem to Johnson trivial. For mercenary reasons, they had settled on the other side of the Atlantic under English protection and with the authority of English charters. That they had no representation at Westminster was their own fault. They had the protection of English arms. Why should they not pay for it? And, if there were 3,000,000 Whigs in America "fierce for liberty," why were the loudest yelps for liberty heard among the drivers of Negroes?

For Johnson, these tracts were an opportunity to expound his essentially pragmatic philosophy of politics. He ascribed divine right neither to kings nor to people. Talk

Johnson's pragmatic philosophy of politics

about liberty in the abstract or about "natural" rights he dismissed as cant. What was essential for a civilized community was a stable government and respect for its laws. But he clearly recognized that there was an ultimate safeguard. If government abused its power, mankind would not bear it; against a tyrant the people would rise and cut off his head.

The politics of the 1770s did not deter Johnson from the enjoyment of his newfound liberties. With the Thrales he spent weeks at Brighton as well as at Streatham, and his "annual midland ramble" included long visits to Oxford, to Lichfield, and to his old friend John Taylor at Ashbourne.

Journey to the western islands of Scotland. In 1773 Boswell persuaded Johnson to accompany him on a more exciting expedition. Johnson had wanted to visit the Hebrides, the western islands of Scotland, for longer than he could remember and now felt that Boswell's "gaiety of conversation and civility of manners were sufficient to counteract the inconveniences of travel." The travellers left Edinburgh on August 18 and followed the coast road. At St. Andrews Johnson's sadness at the sight of archiepiscopal ruins was mitigated by the kindness of the professors; at Aberdeen he was made a freeman of the city; dining with the governor of Ft. George, he talked learnedly about gunpowder. After Inverness, horses were substituted for the post chaise, and by the shore of Loch Ness Johnson encountered an old woman, who could speak very little English, boiling goat's flesh in a kettle. They crossed to Skye from Glenelg. There they had rain for the first time and were warned that a succession of three dry days was not to be expected for many months. In the island of Raasay they found "nothing but civility, elegance and plenty," and Johnson was delighted with the patriarchal life that he had come to see. Similarly, at Dunvegan he "tasted lotus." On the voyage to the island of Mull in the Inner Hebrides they were driven by a stormy sea into Coll, where, to Boswell's delight, Johnson strutted about one night with a broadsword and target (shield). But they were weather-bound for a week, and Johnson began to long for the mainland—"to go on with existence." It was Boswell, not Johnson, who insisted on visiting Iona, a small island southwest of Mull, but Johnson's comment is one of the most famous paragraphs in all his writings: "That man is little to be envied, whose patriotism would not gain force upon the plain of Marathon, or whose piety would not grow warmer among the ruins on Iona." On the way back to Edinburgh a visit was paid to Boswell's father at Auchinleck, where, to Boswell's distress, Johnson did not succeed in avoiding controversial topics. After a fortnight's stay in Edinburgh, Johnson returned to London and declared that his tour was the most pleasant journey he had ever made.

Boswell's diary

From many points of view the tour was a triumph. Johnson had his 64th birthday at Dunvegan, and his endurance of the physical strain of riding his pony up the rough tracks of Mam Rattachan, of sleeping in Highland huts, and of being tossed in small boats on stormy seas was in itself remarkable. Socially, with rare exceptions, the tour was a complete success, both from Johnson's point of view and from that of his hosts. For Boswell, of course, it was a glorious opportunity for him to write what was, in effect, the first installment of his *Life* of Johnson. Johnson himself was moved, for once, to write a book for its own sake. It was at Anoch in Glenmoriston, on August 31, 1773, that the travellers "entered a narrow valley not very flowery, but sufficiently verdant." While the horses grazed, Johnson sat down on a bank "such as a writer of Romance might have delighted to feign" and conceived the thought not of a romance but of an account of his journey. Of course, he did not attempt to compete with Boswell, whose diary he read, and approved, at intervals. For an intimate personal record of the "minute particulars" of Johnson's behaviour and conversation, the reader naturally turns to Boswell's *Journal of a Tour to the Hebrides,* published after Johnson's death. Johnson, in his own *Journey to the Western Islands of Scotland* (1775), was concerned to describe the customs, religion, education, trade, and agriculture of a society that was new to him. His narrative is far from being impersonal, but it contains no gossip. It was in his many letters to Mrs. Thrale that he wrote more freely. In one letter he offered her a definition of travel highly characteristic of his general approach to life: "The use of travelling is to regulate imagination by reality, and instead of thinking how things may be, to see them as they are."

Not long after his return, Johnson was saddened by the death of Oliver Goldsmith. They had met perhaps as early as 1760, and Johnson had been one of the first to recognize the quality of Goldsmith's writings. He had contributed a famous couplet to *The Traveller,* and *She Stoops to Conquer* had been dedicated to him. He frequently crushed Goldsmith in argument at The Club and elsewhere, but his final judgment was sincere: "Let not his frailties be remembered," he wrote, "he was a very great man."

Tours of Wales and France with the Thrales

Johnson's intimacy with the Thrales at this time is clearly illustrated by his joining them in two long tours—to North Wales in 1774 and to France in the following year. On the way to Wales he was able to introduce them to his Lichfield friends, and some time was spent in the Vale of Clwyd, where Mrs. Thrale's ancestors had lived. On the return journey Johnson was interested to see Matthew Boulton's "enginery" at Birmingham, where Boulton built steam engines in partnership with James Watt, and at Oxford the party was entertained in the hall of University College. In France he was interested more in people than in places. He admired some of the cathedrals, but his most significant comments were on social conditions, particularly on the gulf between rich and poor. There was no provision for the maintenance of the poor, and there was no comfortable middle class.

"The Lives of the English Poets." In 1777 three booksellers waited upon Johnson and asked him to write a series of *Lives* for an "elegant and accurate" edition of the English poets that they and others had in preparation. Johnson agreed. The choice of the poets had already been made, and he strongly objected to the volume being described as "Johnson's Poets." Only five names (and some of them rather odd names) were added at his suggestion. Though he said that he wrote his pieces "dilatorily and hastily, unwilling to work, and working with vigour and haste," it was in this work that he came nearest to actual enjoyment of writing.

The *Lives* are not a series but a miscellany. They follow no plan; they have no uniformity of design. On certain major poets (Milton, Dryden, Pope, and others) Johnson wrote long essays that remain as part of the stock-in-trade of English criticism. He was led on, he said, by "the honest desire of giving useful pleasure." Thus, in writing of Abraham Cowley, he seized the opportunity of a lengthy examination of the characteristics of the Metaphysical Poets, those poets who were "more desirous of being admired than understood." On the other hand, in a laconic piece of 300 words on Richard Duke, he concluded that his poems "were not below mediocrity." When he came to James Thomson (one of his own additions) he praised his *Seasons* highly, but of the poem *Liberty* he wrote: "When it first appeared, I tried to read and soon desisted. I have never tried again . . . ."

Criticism of Milton and Gray

The biographical part of literature was what Johnson loved best, and he made no attempt to separate the poetry from the man who had written it. If he disapproved of the man, he found it difficult to be a detached critic of his work. The *Lives* of Milton and Gray might be cited as two instances. Milton's religion and politics are scornfully exposed—he was not a member of any church and politically he was an acrimonious and surly republican. And some of this prejudice comes through in the discussion of Milton's poetry. To be sure, Johnson had high praise for *Comus* and "L'Allegro" and "Il Penseroso," and thought *Paradise Lost* one of the great "productions of the human mind." But he did not wish it longer, and insisted on pointing out major faults. In his criticism of "Lycidas" (a judgment that was to irritate the Romantics, though even this has been persuasively defended by modern critics), Johnson made a firm break with the older pastoral tradition, which he found stale and appropriate only to descriptions of country life.

Personal dislike is also evident in the *Life* of Gray. To the *Elegy* Johnson paid a famous tribute of genuine admiration, but he approached his other poems with "the neutrality of a stranger and the coldness of a critick." In fact, he was far from neutral in his harsh unfavourable criticisms of Gray's linguistic inversions and antiquarian epithets. It was Gray's attitude to life and literature that irritated Johnson. One who had spent 30 years in Grub Street could have little patience with a fastidious scholar who asked for leisure to be good and wrote only when he was in the humour.

LAST YEARS

Death of Henry Thrale

Publication of the *Lives* was completed in 1781, and a storm of criticism broke out. But Johnson was too old a campaigner to be disturbed by criticism, and, in fact, the *Lives* remains the best loved, or the least neglected, of Johnson's works. What distressed him far more that year than unfavourable reviews was the death of Henry Thrale. No loss since that of his wife had so much oppressed him; he felt like a man beginning a new course of life. To some extent he was saved from brooding over his loss by his attention to his duties as executor. Always interested in trade and commerce, he had enjoyed discussing brewery policy with Thrale in his lifetime, and now he was dealing not with parcels of boilers and vats but with "the potentiality of growing rich beyond the dreams of avarice."

To his disappointment, but to Mrs. Thrale's delight, the brewery was sold to "a knot of rich Quakers" for £135,000. For a time Johnson continued to regard Streatham as his home, but in August 1782 Mrs. Thrale told him of her decision to sell the house. On his last visit in October he humbly thanked God for the comforts he had enjoyed there. A room was allotted to him in the house that Mrs. Thrale took in Argyll Street, but the intimacy of the Streatham days was weakening. For long a victim of asthma and dropsy, Johnson had a paralytic stroke in June 1783, from which he did not properly recover until the spring of the following year. Mrs. Thrale wrote to him with "the attention and tenderness of ancient time," but she dared not tell him that she had for long been trying to decide whether or not to marry Gabriel Piozzi, an Italian musician. When, at the end of June 1784, Johnson heard of her decision to marry, he wrote a letter of angry condemnation; but a week later he recognized that Mrs. Thrale's marriage (which was, in fact, a happy one) was her own affair and thanked her for the kindness that had soothed 20 years of a life radically wretched.

Johnson was now bereft of many old friends. He was a sick man, but to the end he fought untiringly against his worst enemy—solitude—and the melancholy that it induced. In December 1783 he had formed yet another club in Essex Street, which was conveniently near his house in Bolt Court, and in the following July he set out upon his last Midland ramble. At Lichfield everyone was pleased to see him; he stayed for two months at Ashbourne, where he was comfortable but "hungry for conversation," for John Taylor, his friend from school days, went to bed at nine; at Birmingham he talked over old times with Edmund Hector; at Oxford he was welcomed to his old college by the master. On November 16 he returned to London. Though his mind remained alert, his bodily state grew worse, and he died on December 13, 1784. A week later he was buried in Westminster Abbey. One journalist noted that there was only one man of hereditary title among the mourners; but he added, rightly, that he who was followed by Reynolds and Burke did not go unhonoured to the grave.

REPUTATION AND CHARACTER

The history of Johnson's fame is curious. In his own day he was acknowledged as an outstanding writer and thinker, and his fame still persists. Yet today his reputation rests on a dual tradition. There is the "folk image," based largely on Boswell's accounts, and perpetuated by Macaulay, which stresses Johnson the witty talker, who often takes the wrong side of an argument. This is the colourful eccentric, the bear with the heart of gold, whom everybody quotes but nobody reads, remembered chiefly as a character in a great book. Then there is Johnson the man of letters, so admired in his own day and now, after a long eclipse, once again dominating the scene. This second tradition does not rule out Johnson the talker, so admirably described by Boswell, but it concentrates on the Great Cham's own writings.

Johnson the moralist

In scores of recent books the emphasis is not on Johnson's amusing foibles and forceful remarks but rather on his vigorous reasoning intelligence, his keen understanding of human frailty, his detestation of hypocrisy, and his practice of applying ethical standards to nations as well as to individuals. Many of Johnson's so-called obtuse prejudices, when properly understood, derive from his insistence on making strict moral judgments. Johnson was not a sentimental Tory reactionary. He violently opposed war and pleaded for more humane treatment of prisoners of war. He attacked censorship in the 1737 licensing act; he argued for mitigation of laws against prostitutes and debtors and the death penalty for forgery. He was the consistent champion of the poor and oppressed and argued for the rights of blacks and other indigenous peoples. Yet at the same time he saw the necessity of a strong central government in order to withstand the pressures of wealthy mercantile interests.

Moreover, it is now evident that Johnson was not, as was formerly assumed, a strictly neoclassical literary critic; rather, his approach tended to be empirical. He rejected any slavish following of rules and insisted on judging each work separately, making his own decision as to its merits and defects. Johnson is now seen to be the father of 20th-century New Criticism.

Although he scorned those optimists who had a naïve faith in the perfectibility of human institutions, Johnson himself was not a complete pessimist. Along with his skeptical doubts, he had an enormous zest for living. Participation and struggle were always necessary, and while there were some areas where improvement might be possible, everything had to have a strong ethical base. Johnson was not only a moralist but a Christian moralist. The sinfulness of man and his need of redemption by the Passion of Jesus Christ were the basis of his personal faith. His constitutional melancholy deprived him of a feeling of joy in his religion, and the sin of which he was most deeply conscious was idleness. In his *Prayers and Meditations* (1785), published after his death, his repentance and his good resolutions, constantly repeated but seldom kept, show the sincerity of his heart-searching and his humility. But his faith prevailed, and in his last days he refused to take opiates because he had prayed that he might render his soul to God unclouded.

Born in a bookshop, Johnson had the qualities, and the conscience, of a scholar. By the writing of books he strove to earn his daily bread; by the reading of books he sought to enlarge the range of his ideas and of his scholarship. And what, he asked in later years, should books teach but the art of living? Few men have left finer examples of the art of living than Samuel Johnson. (S.R.S./J.L.Cl.)

MAJOR WORKS

VERSE: *London: A Poem* (1738); *The Vanity of Human Wishes* (1749); *Irene: a Tragedy* (1749).

PROSE: *Marmor Norfolciense* (1739), satirical essay; *A Compleat Vindication of the Licensers of the Stage* (1739), ironical defense of the suppression of Henry Brooke's play *Gustavus Vasa; An Account of the Life of Mr Richard Savage* (1744); *Miscellaneous Observations on the Tragedy of Macbeth* (1745); *The Plan of a Dictionary of the English Language* (1747); *The Rambler* (1750–52); *A Dictionary of the English Language,* 2 vol. (1755); *The Prince of Abissinia,* 2 vol. (1759), better known as *Rasselas; The Idler* (1758–60); *The Plays of William Shakespeare,* 8 vol. (1765); *The False Alarm* (1770); *Thoughts on the Late Transactions respecting Falkland's Islands* (1771); *The Patriot* (1774); and *Taxation No Tyranny* (1775), four political tracts; *A Journey to the Western Islands of Scotland* (1775); *Prefaces, Biographical and Critical, to the Works of the English Poets,* 10 vol. (1779–81, rev. as *The Lives of the most eminent English Poets,* 4 vol., 1781); *Prayers and Meditations, composed by Samuel Johnson, LL.D.* (1785), published posthumously by George Strahan.

BIBLIOGRAPHY. The standard bibliography is WILLIAM P. COURTNEY and DAVID NICHOL SMITH, *A Bibliography of Samuel*

Johnson (1915, reprinted 1967), supplemented by ROBERT W. CHAPMAN and ALLEN T. HAZEN, "Johnsonian Bibliography: A Supplement to Courtney," in OXFORD BIBLIOGRAPHICAL SOCIETY, *Proceedings and Papers,* vol. 5, pt. 3, p. 116 (1938). ROBERT B. ADAM, *The R.B. Adam Library Relating to Dr. Samuel Johnson and His Era,* 4 vol. (1929–30), contains facsimilies of many manuscripts and letters. The most extensive Johnson collection is now in the Hyde Library, near Somerville, New Jersey, described in GABRIEL AUSTIN (ed.), *Four Oaks Library,* 2 vol. (1967). JAMES L. CLIFFORD and DONALD J. GREENE, in *Samuel Johnson: A Survey and Bibliography of Critical Studies* (1970), with about 4,000 entries, list the most important works on Johnson from his day through 1968.

Collected editions: The Oxford edition, *The Works of Samuel Johnson,* 9 vol. (1825), with two supplementary volumes of *Debates,* has long been the most cited, but its text is deficient by modern standards. The collection was reprinted under the title *Dr. Johnson's Works,* 11 vol. (1970). The new Yale edition under the general editorship of ALLEN T. HAZEN and JOHN H. MIDDENDORF undertakes to supply a more satisfactory text. To this edition belong *Diaries, Prayers, and Annals,* ed. by EDWARD L. MCADAM, JR., with DONALD and MARY HYDE (1958); *The Idler and The Adventurer,* ed. by WALTER J. BATE, JOHN M. BULLITT, and LAWRENCE F. POWELL (1963); *Poems,* ed. by EDWARD L. MCADAM, JR., with GEORGE MILNE (1964); *Johnson on Shakespeare,* ed. by ARTHUR SHERBO, 2 vol. (1968); *The Rambler,* ed. by WALTER J. BATE and ALBRECHT B. STRAUSS, 3 vol. (1969); *A Journey to the Western Islands of Scotland,* ed. by MARY LASCELLES (1971); *Political Writings,* ed. by DONALD J. GREENE (1977); and *Sermons,* ed. by JEAN H. HAGSTRUM and JAMES GRAY (1978). HELEN H. NAUGLE and PETER B. SHERRY (eds.), *A Concordance to the Poems of Samuel Johnson* (1973), is based on *The Poems of Samuel Johnson,* ed. by DAVID NICHOL SMITH and EDWARD L. MCADAM (1941), and on the Yale edition of the *Poems.* Until superseded, the standard edition of *The Lives of the English Poets* is that by GEORGE B. HILL, 3 vol. (1905, reprinted 1967); and of the correspondence, *The Letters of Samuel Johnson with Mrs. Thrale's Genuine Letters to Him,* ed. by R.W. CHAPMAN, 3 vol. (1952). The most extensive anthology is *Johnson, Prose and Poetry,* selected by MONA WILSON (1950, reprinted 1967).

Biography and criticism: The number of biographical and critical studies of Johnson is enormous. Apart from Boswell's *Journal of a Tour to the Hebrides* (1785) and *Life of Johnson* (1791), both of which are available in many editions, there are a number of contemporary authorities, including the official *Life of Samuel Johnson, LL.D.* by SIR JOHN HAWKINS (1787, reprinted 1974); HESTER LYNCH PIOZZI, *Anecdotes of the Late Samuel Johnson, LL.D., During the Last Twenty Years of His Life* (1786; ed. by S.C. ROBERTS, 1925); ARTHUR MURPHY, *An Essay on the Life and Genius of Samuel Johnson, LL.D.* (1792, reprinted 1970); ROBERT ANDERSON, *The Life of Samuel Johnson, LL.D., with Critical Observations on His Works* (3rd expanded ed., 1815, reprinted 1974). Portions of these and many other anecdotes are included in GEORGE B. HILL (ed.), *Johnsonian Miscellanies,* 2 vol. (1897, reprinted 1966). Two of the most famous essays on Johnson are those of THOMAS MACAULAY: one a review of J.W. Croker's edition of Boswell (*Edinburgh Review,* 1831), in which the depreciation of Johnson as a writer set the fashion for many years; the other, a more balanced account, in the *Encyclopædia Britannica,* 8th ed. (1856). Among shorter Victorian studies are those by LESLIE STEPHEN, *Samuel Johnson* (1878, reprinted 1968); and FRANCIS R. GRANT, *Life of Samuel Johnson* (1887, reprinted 1972). See also JAMES T. BOULTON (ed.), *Johnson: The Critical Heritage* (1971); and MARY HYDE, *The Impossible Friendship: Boswell and Mrs. Thrale* (1972).

In the 20th century much new biographical evidence has been assembled by ALEYN L. READE in *Johnsonian Gleanings,* 11 vol. (1909–52, reprinted 1968): ALLEN T. HAZEN, *Samuel Johnson's Prefaces and Dedications* (1937, reprinted 1973); EDWARD L. MCADAM, JR., *Dr. Johnson and the English Law* (1951); BENJAMIN B. HOOVER, *Samuel Johnson's Parliamentary Reporting* (1953); and in the various volumes of the *Yale Edition of the Private Papers of James Boswell* (ed. by FREDERICK A. POTTLE *et al.*), particularly *The Correspondence and Other Papers of James Boswell Relating to the Making of the Life of Johnson,* ed. by MARSHALL WAINGROW (1969). Much of this new evidence is used in JOSEPH W. KRUTCH, *Samuel Johnson* (1944, reprinted 1963); JAMES L. CLIFFORD, *Young Sam Johnson* (1955, reprinted 1981), and *Dictionary Johnson: Samuel Johnson's Middle Years* (1979); PAUL FUSSELL, *Samuel Johnson and the Life of Writing* (1971); CHRISTOPHER HIBBERT, *The Personal History of Samuel Johnson* (1971); and GEORGE IRWIN, *Samuel Johnson: A Personality in Conflict* (1971).

Special studies include WALTER RALEIGH, *Six Essays on Johnson* (1910, reprinted 1965), an early revaluation correcting Macaulay's view; BERTRAND H. BRONSON, *Johnson Agonistes, and Other Essays* (1946, reissued 1965); WILLIAM K. WIMSATT, JR., *The Prose Style of Samuel Johnson* (1941, reprinted 1972); JEAN H. HAGSTRUM, *Samuel Johnson's Literary Criticism* (1952, reprinted 1967); JEAN H. SLEDD and GWIN J. KOLB, *Dr. Johnson's Dictionary: Essays in the Biography of a Book* (1955, reprinted 1974); ARTHUR SHERBO, *Samuel Johnson, Editor of Shakespeare* (1956, reprinted 1978); EDWARD A. BLOOM, *Samuel Johnson in Grub Street* (1957); DONALD J. GREENE, *The Politics of Samuel Johnson* (1960, reprinted 1973); MAURICE J. QUINLAN, *Samuel Johnson: A Layman's Religion* (1964); CHESTER F. CHAPIN, *The Religious Thought of Samuel Johnson* (1968); and RICHARD B. SCHWARTZ, *Samuel Johnson and the New Science* (1971), and *Samuel Johnson and the Problem of Evil* (1975). A study of one aspect of Johnson's critical thought is presented in LEOPOLD DAMROSCH, *Samuel Johnson and the Tragic Sense* (1972); and a discussion of the fusion of religion and morality is found in JAMES GRAY, *Johnson's Sermons: A Study* (1972). There have also been various collections of shorter articles: FREDERICK W. HILLES (ed.), *New Light on Dr. Johnson: Essays on the Occasion of His 250th Birthday* (1959, reprinted 1967); *Johnson, Boswell and Their Circle: Essays Presented to Lawrence Fitzroy Powell* (1965); DONALD J. GREENE (ed.), *Samuel Johnson: A Collection of Critical Essays* (1965); and JAMES L. CLIFFORD (ed.), *Twentieth Century Interpretations of Boswell's Life of Johnson* (1970). Other studies include CAREY MCINTOSH, *The Choice of Life: Samuel Johnson and the World of Fiction* (1973); ROBERT D. STOCK, *Samuel Johnson and Neoclassical Dramatic Theory: The Intellectual Context of the "Preface to Shakespeare"* (1973), and (ed.), *Samuel Johnson's Literary Criticism* (1974); PETER QUENNELL, *Samuel Johnson: His Friends and Enemies* (1973); and DOROTHY MARSHALL, *Dr. Johnson's London* (1968).

General evaluations that stress Johnson the moralist, thinker, and critic are: WALTER J. BATE, *The Achievement of Samuel Johnson* (1955, reprinted 1978), and *Samuel Johnson* (1977, reprinted 1979), a psychological study; ROBERT B. VOITLE, JR., *Samuel Johnson the Moralist* (1961); PAUL K. ALKON, *Samuel Johnson and Moral Discipline* (1967); ARIEH SACHS, *Passionate Intelligence: Imagination and Reason in the Works of Samuel Johnson* (1967). DONALD J. GREENE, *Samuel Johnson* (1970), is an excellent introduction and analysis. Later studies include THOMAS M. CURLEY, *Samuel Johnson and the Age of Travel* (1976); WILLIAM EDINGER, *Samuel Johnson and Poetic Style* (1977); JOHN P. HARDY, *Samuel Johnson: A Critical Study* (1979); JOHN WAIN, *Samuel Johnson,* 2nd ed. (1980), a comprehensive biographical and literary account; and ISRAEL SHENKER, *In the Footsteps of Johnson and Boswell* (1982), an imaginative, humorous account of places visited by Johnson and Boswell.

Jordan

The Hashemite Kingdom of Jordan (al-Mamlakah al-Urdunnīyah al-Hāshimīyah), an Arab state of Southwest Asia, is a young nation that occupies an ancient land associated with the civilizations of antiquity. It is bounded to the north by Syria, to the east by Iraq, to the southeast and south by Saudi Arabia, and to the west by Israel and the West Bank. Jordan has 12 miles (19 kilometres) of coastline on the Gulf of Aqaba in the southwest, where al-ʿAqabah, its only port, is located. The total area of undisputed territory is 34,443 square miles (89,206 square kilometres). Jordan's capital and largest city is Amman.

As an international entity, Jordan came into being after World War I, gaining its independence from the United Kingdom as a hereditary constitutional monarchy in 1946. King Hussein ibn Talal ascended the throne in 1953; he attempted to maintain Jordan's traditional policy of friendship with the West despite strong local and international pressures. Although Jordan has meagre natural resources, its most pressing problems are political. The intellectual and ideological divisions and frustrations that pervade the Arab world are reflected within Jordan—all the more so because the country has provided a haven for thousands of Arab refugees who fled from their homes as a result of the Arab-Israeli wars.

An economically developing country, Jordan throughout its existence has had to depend upon outside aid. This came first from the United Kingdom, later from the United States, and then—since 1967—from other Western and Arab countries, including Saudi Arabia, Kuwait, and the United Arab Emirates. Despite population pressures, a paucity of natural resources, and an influx of refugees, Jordan was able to achieve strong economic growth prior to the 1967 war. To sustain this progress, Jordan initiated state planning in 1964, with a seven-year plan envisaging a self-sufficient economy. The 1967 Six-Day War with Israel, however, and the resulting influx of still more refugees, temporarily halted some of the measures included in the plan, overstrained the economy, which was already in difficulty, and increased Jordan's dependence on outside aid. Since then Jordan has successfully implemented a series of government plans. The object of these plans has been the revitalization of Jordan's economy, the reduction of its need for outside aid, and the promotion of general economic and social development.

This article is divided into the following sections:

Physical and human geography

THE LAND

Relief and drainage. There are three major physiographic regions in Jordan: the Jordan desert, the East Bank uplands, and the Jordan rift valley (a branch of the great African rift-valley system).

The desert is located in the eastern and southern parts of the country, occupying more than four-fifths of its territory. The desert's northern part is composed of volcanic lava and basalt, and its southern part of outcrops of sandstone and granite. It is much eroded, primarily by wind. The East Bank uplands, an escarpment overlooking the rift valley, has an average altitude of between 2,000 and 3,000 feet (600 and 900 metres); the elevation increases to about 5,750 feet in the south. There are outcrops of sandstone, chalk, limestone, and flint extending to the extreme south, where igneous rocks solidified from the molten state predominate. In the northern uplands several valleys and perennial streams run west; around al-Karak they run west, east, and north; south of al-Karak nonperennial valley streams run east toward al-Jafr Depression.

Jordan Valley

The Jordan Valley, some 1,312 feet below sea level at the Dead Sea, contains the lowest point on the Earth's surface. Meandering south, the Jordan River drains the waters of the Sea of Galilee (Lake Tiberias), the Yarmūk, and the valley streams of both plateaus into the Dead Sea. The soil of its lower reaches is very saline, and the shores of the Dead Sea consist of salt marshes that do not support vegetation. The Dead Sea occupies the central area of the valley. To its south, Wadi al-ʿArabah, a completely desolate region, is thought to contain mineral resources.

Climate. The climate varies from the Mediterranean type in the west to the desert type in the east and south, but the land is generally arid. The proximity of the Mediterranean Sea is the major climatic influence, although this influence is modified by continental air masses and by altitude. Average monthly temperatures at the capital in the north range between 46° and 78° F (8° and 26° C), while at al-ʿAqabah in the far south they range between 60° and 91° F (16° and 33° C). The prevailing winds throughout the country are westerly to southwesterly, but spells of hot, dry, dusty winds blowing from the southeast off the Arabian Peninsula frequently occur. Known locally as the khamsin, these winds bring the country its most uncomfortable weather. They blow most often in the early and late summer and can last for several days at a time before terminating abruptly as the wind direction changes and much cooler air follows. Rainfall occurs in the short, cool winters, decreasing from 16 inches (400 millimetres) annually in the northwest near the Jordan River to less than four inches in the south. The average rainfall in the East Bank uplands totals about 14 inches annually. The valley itself has a yearly average of eight inches, and the desert regions receive less than two inches. Occasional snow and frost occur in the uplands but are rare in the rift valley.

Plant and animal life. The plant and animal life of Jordan falls into three distinct types: that associated with

the Mediterranean, with the steppe (treeless plains), and with the desert. In the uplands the Mediterranean type predominates, while in the drier steppe region sagebrush predominates. Grassland is the most prevalent vegetation on the steppe, however, but some isolated trees and shrubs, such as lotus fruit and the Mount Atlas pistachio, also occur. In the desert scant vegetation grows in depressions and on the sides and floors of the valleys.

There is a great variety of animal life, including wild boars, as well as the ibex, a species of wild goat found in the gorges and in the 'Ayn al-Azraq oasis. Hares, jackals, foxes, wildcats, hyenas, wolves, gazelles, mole rats, mongooses, and a few panthers also occur. Among the domesticated animals, horses, mules, donkeys, camels, cattle, sheep, and goats are most common. Centipedes, scorpions, and various types of lizards are also found. Birds include the golden eagle and the vulture, while wild fowl include the pigeon and the partridge.

Nomads

Settlement patterns. The landscape falls into two regions—the desert zone and the cultivated zone—each of which is associated with its own mode of living. The nomads (Bedouin, or Badu) generally inhabit the desert and some areas of the steppe and the uplands. The number of nomads has decreased dramatically because of successful government efforts at resettlement. The eastern Bedouin are principally camel breeders and herders, while the western Bedouin are sheep and goat herders. There are some seminomads, in whose existence the modes of life of the desert and the cultivated zones merge. These people adopt a nomadic existence, living in tents only in the winter months after they have planted their lands, upon which some have also built modest homes; they return to their homes again in the spring or at harvest time. The two largest nomadic tribes of Jordan are Banū Sakhr and al-Ḥuwayṭāt. The grazing grounds of both are entirely within Jordan, as is the case with the smaller tribe of as-Sirhān. Other, lesser tribes include Banū Hasan, al-Banū Khalid, al-Ajarmeh, al-Adwan, Banū Attiyeh, al-Hajayah, and as-Sleet, as well as the smaller tribes of al-Hawazim, as-Sulaylat, and ash-Sherarat, which traditionally were obliged to pay protection money to larger tribes. The Rwalah tribe, which is not indigenous, passes through Jordan in its yearly wandering from Syria to Saudi Arabia.

Including nomads, rural residents represent about a third of the population. The average village is a cluster of houses and other buildings, including an elementary school and a mosque, with pasturage on the outskirts. A medical dispensary and a post office may be found in the larger villages, together with a general store and a small café, whose owners are usually part-time farmers. Kinship relationships are patriarchal, while extended-family ties govern social relationships and tribal organization. Increases in the literacy rate and the influence of the mass media, in addition to extensive migration from rural to urban areas, have had a marked influence.

Of the total population, more than half live in the dozen or so major cities and towns. Amman has a population of more than three-quarters of a million, but the smaller towns have only a few thousand inhabitants. Most towns have hospitals, banks, government and private schools, mosques, churches, libraries, and entertainment facilities, and some have institutions of higher learning and newspapers. Amman and az-Zarqā', and to some extent Irbid, have urban characteristics, while smaller towns are more reluctant to accept modernizing influences.

THE PEOPLE

Languages and dialects

Ethnic and religious groups. The majority of the people are Arabic-speaking. In addition to the difference between the written, or classic, Arabic and the colloquial form, there are various dialects with local inflections and accents. The Qaysī-Yemeni dichotomy—a pre-Islāmic split that was introduced to the area with the Arab conquests and that cut across religious and ecological lines—was at one time an important broad social division. The Arabs, whether Muslim or Christian, used to trace their ancestry from the north Arabian Qaysī (Ma'dī, Nizārī, Adnanī, or Ismā'īlī) tribes or from the south Arabian Yemeni (Banū Kalb or Qahtani) tribes. Only a few tribes and towns have continued to be aware of the split.

The vast majority of the people are Sunnite Muslim, and a small percentage are Christian. Among Christians adherents of the Rūm, or Greek Orthodox church, form a majority. Other Christian groups include the Rūm, or Greek, Catholics, also called the Melchites, or Eastern Catholics, who recognize the supremacy of the pope; the Roman Catholic community, headed by a patriarch appointed by the pope; and the small Syrian Orthodox, or Jacobite, church, whose members use Syriac in their liturgy. Most non-Arab Christians are Armenians; the majority belong to the Gregorian, or Armenian, Orthodox church, the rest to the Armenian Catholic church. There are several Protestant denominations representing relatively recently formed communities whose converts came almost entirely from other Christian sects.

The Druze, an offshoot of the Ismā'īlī Shī'ite sect, number a few hundred and reside in and around Amman. The Bahā'ī—who in the 19th century also split off from Shī'ite Islām and who number around 1,000—live in al-'Adasīyah in the Jordan Valley. The Armenians, Druze, and Bahā'ī are at once religious and ethnic communities. The Shishan (Chechen) are a Circassian Shī'ite Muslim group, numbering around 1,000, who are descended from 19th-century immigrants. With the Cherkess, who are Sunnite, they make up the most important non-Arab minority. Another small non-Arab group consists of some Turkmen.

Demography. The population structure is predominantly young; persons under the age of 15 constitute the largest component of the population. The birth rate is high relative to the death rate, producing a natural rate of increase of about 3 percent annually. Internal migration from rural to urban centres has added an additional burden to the economy, while the number of Jordanians living abroad has increased significantly.

Refugees

The influx of Palestinian refugees has not only altered Jordan's demographic map but also affected its political, social, and economic life. After the 1948–49 Arab-Israeli War and the annexation of the West Bank, Jordanian citizenship was granted to some 400,000 Palestinians who were residents of and remained on the West Bank and to about half a million refugees from the new Israeli state. Many of these refugees settled on the East Bank. From 1949 to 1967 Palestinians continued to move to the East Bank in large numbers. After the 1967 war an estimated 310,000 Palestinians, mostly from the West Bank, sought refuge in Jordan; thereafter immigration from the West Bank continued at a reduced rate.

More than 60 percent of Jordan's population are ethnic Palestinians. Most are employed and hold full Jordanian citizenship; fewer than half are registered with the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA). Only a small percentage live in refugee camps or receive aid from the UNRWA.

THE ECONOMY

Despite its basic problems, the Jordanian economy before 1967 showed resilience and growth. Economic growth, which was halted by war in the second half of 1967, continued thereafter at a slower pace but was revitalized by the implementation of a series of state economic plans. The West Bank's contribution to domestic income prior to the war was around one-third of the total, but its occupation by Israel in 1967 required that the government apply its social and economic plans to the East Bank only.

The major sources of revenue are community, social, and

Sources of revenue

personal services; mining and industry, trade, communications and transportation, agriculture, and construction. Income from tourism, which has grown dramatically, is mostly in foreign reserves, and tourism has become a major factor in Jordan's efforts to reduce its balance of payments deficit.

There has been a great outflow of skilled labour from Jordan to neighbouring countries, although the problem has eased somewhat. This change is a result both of better employment opportunities within Jordan itself and of a curb on foreign labour by the neighbouring Persian Gulf states.

Resources. There are only some 90,000 acres (36,000 hectares) of forest in Jordan, most of which are on the rocky highlands. Although unprotected, these forests have survived the depredations of villagers and nomads alike, as well as constant overgrazing. The Jordanian government embarked on a reforestation program in 1948. In the higher regions of the uplands, the predominant types of trees are the Aleppo oak, the Kermes oak, the Palestinian pistachio, the Aleppo pine, and the Oriental strawberry tree. Wild olives are also found there, and the Phoenician juniper occurs in the regions with lower rainfall.

Pastureland is so degraded that it can barely support Jordan's livestock; it has, moreover, been reduced by the extension of land devoted to olive and fruit trees. Artesian wells have been dug to increase the pasturage area. Sheep and goats are by far the most important livestock, but there are some cattle, camels, horses, donkeys, and mules. Livestock decreases when droughts occur. There is fishing in the Gulf of Aqaba.

Mineral resources include large deposits of phosphates, potash, limestone, and marble, as well as dolomite, kaolin, and salt. In addition, newly discovered minerals include barite (the principal ore of the metallic element barium), quartzite, gypsum (used as a fertilizer), and feldspar, and there are unexploited deposits of copper and uranium. Cement production is a major mineral-based industry.

Power in Jordan is generated by fossil fuel, mostly oil. There are several generating plants; the two major power stations, at Amman and az-Zarqā', are linked by a transmission system. By the late 20th century the government had nearly completed a program to link the major cities by a countrywide grid, which later is to include rural areas.

Trade. Exports, though growing, do not cover the value of imports; the deficit is financed by foreign grants, loans, and other forms of capital transfers. Although Jordan's trade deficit has been large, it is offset somewhat by earnings from tourism, remittances sent by Jordanians working abroad, earnings from foreign investments made by the Jordan Central Bank, and subsidies from Arab and other governments.

Administration of the economy. The economy is primarily based on private enterprise. To reduce its dependence on outside assistance, raise the standard of living, and reduce the imbalance between imports and exports, the government, in 1964, began the process of planning the economy. All of the government plans have given a high priority to agriculture, mining and industry, tourism, and the service industries, in addition to the strengthening and widening of the social, health, welfare, and education infrastructure. Unemployment among the male population has been reduced while income per capita has increased dramatically.

Aside from a licensing system, a moderate taxation on luxury items, and the establishment of standards and health measures, both internal and international trade are virtually free of restraint. Governmental support takes the form of ensuring the basic framework of internal security, guaranteeing a stable currency, and maintaining the transport and communication routes and other facilities required for economic progress. The government also has participated with private enterprise in establishing the largest mining, industrial, and tourist firms in the country. The government also owns a significant share of the largest companies.

Taxation

Fiscal policy has aimed at increasing revenue by raising various tax rates and by reforming the tax system. Measures applied since 1964 include increases in customs and excise duties and an increase in income taxes. Although the government has placed great effort on reforming the income tax, both to increase revenue and to redistribute income, revenue from indirect taxes continues to exceed that from direct taxes. Tax measures have been adopted to increase the rate of savings necessary for financing investments. Exemptions on foreign investments and transfers of foreign profits and capital have been continued.

The existence of labour unions and employer organizations is recognized by law. The weakness of the trade-union movement is partly compensated for by the government, which has special procedures for settling labour disputes; if governmental efforts fail, the union or employers may resort to the judicial process.

The small size of the Jordanian market, the fluctuations in agricultural production because of irregular rainfall, lack of capital, political instability, and the presence of refugees all combine to make the continuation of outside help a necessity. The economy is thus highly sensitive both to domestic and to international policy.

The road system

Transportation. Jordan has a main, secondary, and rural road network, most of which is hard-surfaced. This roadway system, maintained by the Ministry of Public Works, links the major cities and towns and also links the kingdom with neighbouring countries. Within cities, towns, and villages, however, the local authorities are responsible for road upkeep. One of the main traffic arteries is the Amman–Jarash–ar-Ramthā highway, which links Jordan with Syria. The route from Amman via Maʿān to the port of al-ʿAqabah is the principal route to the sea. From Maʿān the Desert Highway passes through al-Mudawwarah, linking Jordan with Saudi Arabia. The Amman–Jerusalem highway, passing through Nāʿūr, is a major tourist artery. The Hejaz Jordan Railway is government-operated and extends from Darʿā in the north via Amman to Maʿān in the south. A new line operated by the Aqaba Railway Corporation runs to the port of al-ʿAqabah, and another line between Maʿān and Medina in Saudi Arabia is being constructed. Rail connections also run from Darʿā north to Damascus in Syria. The Royal Jordanian Airline links Jordan to Arab, African, Asian, American, and European countries. Queen Alia international airport near al-Jīzah, south of Amman, was opened in 1983. Amman and al-ʿAqabah have smaller airports.

Before 1948 Jordan's Mediterranean Sea trade was through Haifa. The Arab-Israeli conflicts severed that link, and Jordan's outlet was then, for a time, through Beirut, in Lebanon. The expansion of the Jordanian economy, especially the export of phosphate, led to the development of the port of al-ʿAqabah.

ADMINISTRATION AND SOCIAL CONDITIONS

Government. The 1952 constitution is the most recent of a series of legislative instruments that, both before and after independence, moved toward increased executive responsibility. The constitution declares Jordan to be a constitutional hereditary monarchy with a parliamentary form of government. Islām is the official religion of the state, and Jordan is declared to be part of the Arab *ummah* ("nation"). The king wields wide powers over the executive, legislative, and judicial branches. Jordan's central government is headed by a prime minister appointed by the king; the prime minister then chooses his Cabinet. According to the constitution, the appointments of both prime minister and Cabinet are subject to parliamentary approval. The Cabinet coordinates the work of the different departments and establishes general policy.

Under the constitution the membership of the upper house of the bicameral legislature, composed of *al-aʿyān* ("notables"), is appointed by the king for four years. Elections for *nuwwāb* ("deputies") of the lower house are to be held at least every four years, although elections have been frequently suspended. The ninth parliament, elected in 1965, was prorogued several times before being replaced in 1978 by the National Consultative Council, an appointed body with reduced power that debates government programs and activities. The parliament was reconvened, however, in a special session called in January 1984.

Persons 18 years of age and over may vote provided they meet the legal requirements and are not members of the royal family. Voting participation has varied and has run as high as 70 percent. Political parties were banned in 1957, however. Before that date several parties—Communist, Arạb Baʿath Socialist, National Socialist, Muslim Brotherhood, Liberation Movement, Arab Constitutional, Nahda (Renaissance), and Ummah (Community)—ran candidates, but none had a mass following. The Muslim Brotherhood was the only party exempted from the 1957 ban, but the group has been kept under close surveillance.

Jordan is divided into administrative *muḥāfaẓāt* (governorates), which in turn are divided into districts and subdistricts, each of which is headed by an official appointed by the minister of the interior. Cities and towns have mayors and elected councils.

Three categories of courts

Justice. The judiciary is constitutionally independent, though judges are appointed and dismissed by royal *irādah* ("decree") following a decision of the Justices Council. There are three categories of courts. The first category consists of regular courts, including magistrates' courts, courts of first instance, and courts of appeals and cassation in Amman, which hear appeals passed on from lower appeals courts. The constitution also provides for the Diwān Khāṣṣ (Special Council), which interprets the laws and passes on their constitutionality. The second category consists of Sharīʿah Muslim courts and other religious courts for non-Muslims; these exercise jurisdiction over matters of personal status. The third category consists of special courts, such as land, government, property, municipal, tax, and customs courts.

The armed forces. The Jordanian armed forces, which include an air force equipped with modern jet aircraft, developed from the Arab Legion, which was originally commanded by British officers. There also is a small navy. The king is commander in chief of the armed forces.

Education. There are three types of schools in Jordan—government schools, private schools, and the UNRWA schools for refugee children. Schooling consists of six years of elementary, three years of preparatory, and three years of secondary education. The Ministry of Education supervises all schools and establishes the curricula, teachers' qualifications, and state examinations; it also distributes free books to students in government schools and enforces compulsory education to the age of 14. The majority of the students attend government schools. In addition to Khadduri Agricultural Training Institute, there are agricultural secondary schools, as well as a number of vocational, labour, and social affairs institutes, a Sharīʿah (Qur'ānic) seminary, and nursing, military, and teachers' colleges. The State University of Jordan was established in Amman in 1962; Yarmūk University was established in 1976. A third university, Mu'tah, opened in 1981.

Health and welfare. Infectious diseases, except for dysentery and eye infections, have been brought under control. The number of physicians has grown rapidly. Comprehensive health facilities are operated by the government. A national health insurance program covers medical, dental, and eye care at a modest cost; service is provided free to the indigent.

Welfare services were private until the Ministry of Social Affairs was established in 1951. Besides supervising and coordinating social and charitable organizations, the ministry administers welfare programs.

Wages are higher in industry than in agriculture and in the cities than elsewhere. There are minimum wages for both skilled and unskilled labourers. The development of local services and resources, the availability of hard currencies from foreign aid, and a competitive import policy have given Jordan a degree of price stability not often encountered among developing nations.

Housing. The housing situation has remained critical despite continuing housing construction. Housing surveys conducted in Amman and the East Jordan Valley showed that the major proportion of households consist of one-room dwellings. The Housing Corporation and the Jordan Valley Authority build units for low-income families. Urban renewal projects in Amman and az-Zarqā' have provided new units and renovated others. The Housing Bank issues home building loans.

CULTURAL LIFE

Culturally, Jordan is an integral part of the Arab world and thus cannot be said to have a separate and distinct culture of its own. As in the rest of the Arab world, the highest form of artistic expression remains oral. Jordan's most famous poet was Muṣṭafā Wahbah aṭ-Ṭāl, whose style and content rank him among the major Arab poets of the 20th century. After World War II a number of important poets and prose writers emerged, though few have achieved an international reputation.

Both private and governmental efforts have been made to foster the arts, and an art gallery has been opened. Modernity has lessened the influence of the traditional Islāmic injunction against the portrayal of animate objects. Thus, in addition to the traditional decorative design, architecture, and the various handicrafts, it is possible to find sophisticated forms of painting and sculpture.

Folk and popular arts

Folk art survives in tapestry work and in the making of leather, pottery, and ceramics, as well as in the manufacturing of wool and goat-hair rugs with varicoloured stripes. Popular culture is manifested in such oral arts as songs, ballads, and storytelling. The villagers have special songs for births, circumcisions, weddings, funerals, planting, plowing, and harvesting. Several types of *debkah* (dances characterized by the pounding of feet on the floor to mark the rhythm) are danced on festive occasions, while the *sahjeh* is a well-known Bedouin dance. The Circassian minority has a sword dance, as well as several other Cossack dances. Government interest in preserving folk arts has resulted in the formation of a national troupe that is regularly featured on state radio and television programs.

Newspapers are privately owned and extensively regulated. There are several literary magazines and scientific and topical periodicals. Most professional groups and government departments issue their own periodicals. Radio and television stations, which are government-owned, feature programs from both Arab and foreign, mostly Western, countries. Most major towns have movie theatres that offer both Arab and foreign films. There is no legitimate theatre in Jordan, but amateur groups perform in institutions of learning, on radio and television, and in the various foreign cultural centres in Amman, Irbid, and Jerusalem.

For statistical data on the land and people of Jordan, see the *Britannica World Data* section in the BRITANNICA WORLD DATA ANNUAL.

History

Modern Jordan occupies an area rich in archaeological and religious associations. The Jordanian desert appears to have been the home of hunters from Lower Paleolithic times, as their flint tools are found widely distributed. In the southeast of the country, at Jabal aṭ-Ṭubayq, there are rock carvings of all periods, the earliest of which have been attributed to the Paleolithic-Mesolithic. As the lowest of deposits show, mesolithic hunters appear to have visited Jericho (Tall as-Sulṭān). A series of later levels reveal, first, round houses and then plastered rectangular houses built by people who did not know the use of pottery. Following these were two pottery levels and a series of deposits on the site and in the neighbouring tombs, extending to the Late Bronze Age. This site, excavated first by John Garstang and later by K.M. Kenyon, is important also for its massive pre-pottery defensive works, dated by radiocarbon tests to about 7000 BC. In the Chalcolithic period the neighbouring site of Tulaylāt al-Ghassūl (also in the Jordan Valley) shows a well-built village of *c.* 4500–3000 BC with painted plaster walls.

Early Bronze Age deposits

The Early Bronze Age (*c.* 3000–2100 BC) is marked by deposits at the base of Dhībān; but although many sites have been found in the north of the country few have been excavated, and little evidence of settlement in this period is found south of ash-Shawbak. The Early Bronze Age was terminated by a nomadic invasion that destroyed the principal towns and villages and marked the end of a period of apparently peaceful development. Security was not again reestablished until the advent of the Egyptians after 1580 BC. It was once thought that the area was unoccupied between 1900 and 1300 BC, but a systematic archaeological survey has shown that the country had a settled population throughout the period. At Amman a small temple with Egyptian, Mycenaean, and Cypriot imported objects has been found confirming this.

BIBLICAL ASSOCIATIONS

From the Middle Bronze Age onward there are biblical accounts of the area, mentioning kingdoms such as Gilead in the north and those of Moab, in central Jordan, and Midian. At the time of the Exodus the Israelites tried to pass through Edom in southern Jordan but were refused permission. They were at first repulsed by the Amorites, whom they later defeated. The Israelite tribes of Gad and Reuben and half of the tribe of Manasseh settled in the conquered territory of the Ammonites, Amorites, and Bashan and rebuilt many of the towns they had partially destroyed. A nearly contemporary record of this period is the Mesha or Moabite stone found at Dhībān in 1868 and now in the Louvre, Paris. It is inscribed in an eastern form of Canaanite, closely akin to Hebrew.

The next few centuries (1300–1000 BC) were marked by constant raiding from both sides of the Jordan. David attacked Moab and Edom, killing two-thirds of the population of Moab and all the males of Edom. Although Ammon with its capital, Rabbath Ammon (modern Amman), was held for a time, it regained its independence on the death of David (*c.* 960 BC). Solomon had a port on the Gulf of Aqaba at Ezion-geber, later Elat in Israel, where copper ore was smelted from mines in the Wadi al-ʿArabah and trade carried on with the southern Arabian states.

Hostilities remained constant between Judah and Edom. A Hebrew king, Amaziah, even captured Sela (Petra), the capital, and slew 10,000 prisoners. The next invaders were the Assyrians, who under Adadnirari III (811 or 810–782 BC) overran the eastern part of the country as far as Edom. Revolts led to the retaking of the country by Tiglath-pileser III (reigned 745–727 BC) in the first year of his reign and to the division of the country into provinces under Assyrian governors. This policy of direct rule continued until the fall of the Assyrian empire in 612 BC. The Assyrian texts are the first to refer to the Nabataeans, who at this time occupied the land south and east of Edom (ancient Midian). After the fall of Assyria the Moabites and Ammonites continued to raid Judah until the latter was conquered by the Neo-Babylonians under Nebuchadrezzar II. Little is known of the history of Jordan under the Neo-Babylonians and Persians, but during this period the Nabataeans infiltrated into Edom and forced the Edomites out into southern Palestine.

It was not until the Hellenistic rule of the Seleucids and the Ptolemies that the country prospered, trade increased, and new towns were built. Rabbath Ammon was renamed Philadelphia, and Jarash became Antioch-on-the-Chrysorrhoas, or Gerasa. Hostilities between the Seleucids and Ptolemies enabled the Nabataeans to extend their kingdom northward and to increase their prosperity based on the caravan trade with Arabia and Syria. The northern part of Jordan was for a time in Jewish hands, and there were constant struggles between the Jewish Maccabees and the Seleucids. It is to this period that the majority of the Dead Sea Scrolls may be attributed.

During 64–63 BC the kingdom of Nabataea was conquered by the Romans under Pompey, who restored the Hellenistic cities destroyed by the Jews and set up the Decapolis. The country remained independent but paid imperial taxes.

Jordan under Roman rule

Roman policy seems to have been to maintain Nabataea as a buffer state against the desert tribes. In 25–24 BC it served as a starting point for Aelius Gallus' ill-starred expedition in search of Arabia Felix. Nabataea was finally absorbed into the Roman Empire by Trajan in AD 106 as the province of Palaestina Tertia. Under Roman rule Jordan prospered, and many new towns and villages were established. The whole country, except the Decapolis, was made part of the new province called Arabia Petraea, with its capital first at Petra and later at Buṣrá as-Shām in Syria. After AD 313 Christianity became a recognized religion, and a large number of churches were built.

THE LATIN KINGDOM AND MUSLIM DOMINATION

The whole area was devastated in the 6th and 7th centuries AD by the intermittent warfare between Byzantium and Sāsānian Persia. In AD 627 the emperor Heraclius finally defeated the Persians and reestablished order in the area, but Byzantium had been gravely weakened by the long struggle and was left in a state of exhaustion to face the totally unexpected menace of a new power that had arisen in Arabia. In AD 636 the Muslims, led by the famous "Sword of Islām," Khālid ibn al-Walīd, destroyed a Byzantine army at the Battle of the Yarmūk River and brought the greater part of Syria and Palestine under Muslim rule.

The caliphs of the Umayyad dynasty (AD 660–750) established their capital at Damascus and built splendid hunting lodges and palaces in the Jordanian desert. These can still be seen at sites such as Qaṣr ʿAmrah, al-Kharānah, aṭ-Ṭūbah, and Qaṣr al-Mshattā. Many Roman forts were rebuilt. After the seizure of power by the ʿAbbāsids in AD 750, the capital was transferred to Baghdad, and Syria, which had been the Umayyad metropolitan province and from which they had drawn most of their support, was severely repressed. Jordan, now distant from the centre of power, became a backwater and slowly reverted to the old Bedouin way of life. With the capture of Jerusalem by the crusaders in AD 1099, the Latin kingdom of Jerusalem was extended east of the Jordan, and a principality known as Oultre Jourdain was set up. A capital was established at al-Karak. After the crusaders retreated, the history of Jordan remained uneventful. In the 16th century it submitted to Ottoman rule and became part of the *vilayet* of Damascus.

In the 19th century the Turks settled Circassian, Caucasian, and other refugees in Transjordan to protect their communications with Arabia; in 1908 they completed the Hejaz railway linking Damascus and Medina. As a territorial state Jordan is a creation of the 20th century.

TRANSJORDAN, THE HASHEMITE KINGDOM, AND THE PALESTINE WAR

The Conference of San Remo

World War I led in 1916 to the Arab revolt against the Turks and to the cutting of the Hejaz railway, in which T.E. Lawrence played an important role. Al-ʿAqabah was taken in July 1917, and by October 1918 Damascus had fallen into Allied hands with the assistance of the Arab forces in pinning down the Turkish Army in Jordan. In 1920 the Conference of San Remo allotted the Palestine mandate to Great Britain and the Syrian mandate to France, thus effectively separating the areas now covered by Israel and Jordan from Syria, with which they had previously been linked. In November 1920 Abdullah of the Hashemite house arrived in Maʿān, then part of the Hejaz, accompanied by a group of armed supporters and intent on raising the tribes to attack the French, who had forced his brother Fayṣal to relinquish his newly founded kingdom in Syria. Abdullah was persuaded by the British government to refrain and, instead, to take over the government of what became known as Transjordan (1921).

Transjordan, although part of the Palestinian mandate, was expressly excluded from the clauses regarding the establishment of a "Jewish national home." In May 1927, Transjordan was formally recognized as an independent constitutional state, although it remained under British tutelage. In 1939 an elected Cabinet took the place of an Executive Council, and the emir was authorized to raise military forces and to open independent Transjordanian consulates. After World War II, in 1946, a new treaty was signed with Britain, and in May of that year Abdullah became the first king of the Hashemite Kingdom of Transjordan (later Jordan). Two years later the Palestinian mandate ended, and the Transjordanian Arab Legion, commanded by Glubb Pasha (John [later Sir John] Bagot Glubb), joined Egyptian, Syrian, Lebanese, and Iraqi troops in an attempt to prevent the creation of a Jewish state. A considerable enclave of Palestinian territory—including Hebron (al-Khalīl), Bethlehem (Bayt Laḥm), Ram Allah, and Nābulus, as well as part of Jerusalem (the Old City)—totaling about 2,000 square miles remained in Jordanian hands at the time of the signing of the Jordanian-Israeli armistice pact on April 3, 1949. This territory was formally annexed in 1950, but it brought with it the problem of a large refugee population that, on the whole, was hostile to the Hashemite regime.

Assassination of King Abdullah

King Abdullah was assassinated by a follower of Haj Amīn al-Ḥusaynī, the former mufti of Jerusalem, on July 20, 1951. Abdullah's elder son, Talal, succeeded him, but mental illness caused his deposition by the parliament in August 1952. Talal's son Hussein was crowned in Amman at his coming of age (by the Muslim calendar) on May 2, 1953.

KING HUSSEIN

The early years of Hussein's reign were beset by problems and difficulties. In 1955 Jordan refused to join the Baghdad Pact. In 1956 Hussein dismissed his British advisers, including Glubb, and later that year the Jordanian treaty with Great Britain was abrogated. In 1957 Hussein survived the first of several military plots to overthrow his regime; political parties were also dissolved by royal decree. (K.S.A.J./Ed.)

After Egypt's union with Syria in the establishment of the United Arab Republic (U.A.R.) in 1958, fear of the consequences for his regime led Hussein to conclude a federal union with Iraq. The overthrow of the Iraqi monarchy in the same year brought a quick end to this federation; subsequently, British paratroops were flown to Jordan to prevent the overthrow of the monarchy by a Nasserist army and by Palestinians.

Syria's secession from the U.A.R. in 1961 brought temporary relief to the regime in Jordan. During the years that followed, U.S. aid made it possible for Hussein to promote considerable economic development in his country. There was also a boom in tourism, centred on the Old City of Jerusalem. The political climate, however, was less positive for Hussein. His Palestinian subjects, who included some of the best educated and most talented elements in the Arab world, objected to the king's suspension of the constitution, outlawing of political parties, and establishment of a royal dictatorship based largely on tribal and foreign support.

Formation of the Palestine Liberation Organization

Until 1964 the Palestinians had been leaderless and unorganized. They had received United Nations aid supplemented by the provision of cheap labour in the "host" countries. Their cause had been argued for them by others, and such political activity as they evinced had come about in relationship with one or other of the Arab states or leaders. In 1964, however, an Arab summit meeting led to the formation of the Palestine Liberation Organization (PLO). About the same time, Palestinians formed a secret organization called the Palestine National Liberation Movement, known from a reversal of its Arabic initials as al-Fatah. Both the PLO and al-Fatah undertook the training of guerrilla units for raids on Israel. (W.L.O.)

By the end of 1966, relations with Israel had undergone a marked deterioration, and Arab raids emanating mainly from Jordan provoked sharp reprisals. In December there were armed clashes on the border with Syria, as Jordan attempted to prevent Syrian-based Palestinian infiltration through Jordan into Israel. Jordan finally broke off diplomatic relations with Syria in May 1967, but this did not prevent it from proclaiming its solidarity with Syria in the face of the alleged Israeli military buildup near the Syrian frontier and from signing a defense pact with Egypt. When war broke out between Israel and the Arab states on June 5, 1967, Jordan was fully committed, and its forces were engaged almost immediately. Within 48 hours Israeli forces had overrun the whole of the territory west of the river, involving the capture of Bethlehem, Hebron, Jericho, Nābulus, Rām Allāh, and Janīn, as well as the entire city of Jerusalem. Jordan suffered heavy casualties, lost one-third of its most fertile land, and was faced with some 200,000 new refugees for an already overburdened economy to support.

Jordan's losses were in part made good by foreign aid, notably from Saudi Arabia, Kuwait, and Libya, but the progress that had been made in Jordan's economy prior to June 1967 was reversed. Another legacy of the June war was a considerable increase in guerrilla activities aimed at the overthrow of the Hashemite dynasty as a prelude to resuming war with Israel.

CIVIL WAR

Relations between the guerrillas and the government steadily deteriorated. In February 1970 the government published a ban on the carrying of arms in public in towns, the storage of arms and explosives, and activity by political parties. There were clashes with the army, and the government was forced to suspend the decrees. Life in Amman came to a standstill. Eventually a compromise was reached, and tension was reduced. The government agreed to give full support for the war against Israel, while the guerrillas undertook to discipline their members and to respect Jordan's internal security.

Under the terms of a peace plan drafted by U.S. Secretary of State William Rogers, Israel would give up all occupied Arab territory in exchange for a binding peace treaty and other concessions. Following Jordan's adherence to the Rogers peace plan, which was rejected by all the guerrilla organizations, there were demonstrations in Amman, and the guerrillas declared their intention to escalate the struggle. The Rogers plan was abandoned in 1971.

Popular Front for the Liberation of Palestine

In September 1970 a Marxist guerrilla group, the Popular Front for the Liberation of Palestine (PFLP), hijacked three airliners to Dawson's Field, a desert airstrip near Amman, holding the crews and passengers hostage against the release of guerrillas detained in Great Britain, West Germany, Switzerland, and Israel. Meanwhile, the situation in Jordan became chaotic, and outbreaks of fighting in Amman developed rapidly into full-scale civil war. On September 16 a curfew was imposed, and Jordan was virtually cut off from the outside world. A Syrian attempt at invasion on behalf of the guerrillas was repelled, and, after nine days of bitter fighting, a peace agreement was reached. Intensive efforts at mediation by the other Arab states were concluded at a Cairo summit meeting on September 27. An agreement involving substantial concessions to the guerrillas was signed by King Hussein and the guerrilla leader Yasir Arafat, but tension persisted.

During the early months of 1971 there were outbreaks of serious fighting during which the guerrillas were forced out of Amman and back toward the Syrian frontier. Despite their protests, the other Arab governments failed to intervene, and by April Hussein was strong enough to demand the guerrillas' withdrawal from Amman. In July their remaining strongholds in the north were destroyed by the Jordanian Army.

The suppression of the Palestinian resistance movements by the Jordanian government was bitterly resented, and reprisals were threatened. Members of the "Black September" organization shot and fatally wounded Prime Minister Wasfi at-Tal outside a hotel in Cairo on November 28, and an unsuccessful attempt was made on the life of the Jordanian ambassador in London.

JORDAN AFTER CIVIL WAR

On March 15, 1972, in Amman, King Hussein proposed a plan for a federated "United Arab Kingdom," to consist of the Gaza Strip linked to the West and East banks of the Jordan River, each bank to have its own elected parliament under a federal parliament, with Hussein as supreme head of state. The plan met with mixed reactions from Israel and hostility from the rest of the Arab world, excepting Morocco and Saudi Arabia. Egypt severed diplomatic relations with Jordan over the plan in April. (K.S.A.J.)

In February 1973 a group of Palestinian guerrillas, arrested after entering Jordan from Syria, was sentenced to death by a military court for aiming to overthrow the government. The sentences were commuted by King Hussein after mediation efforts by other Arab leaders. In September 1973 Jordan restored diplomatic relations with Egypt and in October with Syria.

In the Arab-Israeli War of October 1973, Jordan sent troops to the Syrian front but did not open a third front along the Jordan River. The war brought into the open the conflicting claims of Hussein and Yasir Arafat, leader of the PLO, to represent the Palestinian Arabs. In November King Hussein suggested to Egypt and Syria that they accept Jordan's claim to sovereignty over the West Bank and East Jerusalem; once this was accepted the West Bank population could determine its government through a plebiscite. After rejection of the proposal, in May 1974 King Hussein said that he would recognize the PLO as the sole legitimate representative of all the Palestinian people if all the other Arab states would also recognize the PLO. Jordan would, however, abandon its responsibility for recovery of lost Palestinian territory. At an Arab summit meeting in Rabat, Mor., on October 26–28, King Hussein, under pressure from the Arab states, signed a resolution naming the PLO as the sole legitimate representative of the Palestinian people and affirming their right to an independent state in their homeland. In return Jordan reportedly was to receive $300,000,000 in aid from Saudi Arabia.

In 1975 and 1976 Jordan made progress in reestablishing closer relations with other Arab states. Jordan's relations with the United States, however, were strained over a major arms deal opposed by the U.S. Congress. Jordan eventually decided to purchase Hawk missiles, despite the conditions set on the sale.

The reluctance of the United States to supply arms and the Egyptian-Israeli Sinai agreement of 1975 led Jordan to pursue closer relations with Syria. A Jordanian-Syrian joint high commission was formed in 1976 to coordinate the countries' foreign policies and armed forces, and a major economic and trade agreement was made. In December 1976 King Hussein and Syrian president Ḥafiz al-Assad announced their intention to unite the countries.

In 1977 steps were taken toward a reconciliation with the PLO. Several meetings were held in early 1977 with PLO representatives. King Hussein rejected Egyptian president Anwar el-Sādāt's proposal of the establishment of a Jordanian-Palestinian link before the Geneva peace conference.

In April 1978 King Hussein formed a 60-member National Consultative Council to replace the parliament, which had been dissolved in 1974 and briefly reconvened in 1976. The power of the council was reduced to debating proposed legislation. In January 1984, however, King Hussein reconvened the National Assembly, which appointed new West Bank representatives. Elections were held in March to fill the empty East Bank seats, with women being included in the electorate for the first time.

Relations with other nations

Relations with the other Arab nations fluctuated during the 1980s in response to the Egyptian-Israeli peace talks, the Iran–Iraq War, and attempts at negotiation between Jordan and the PLO. Jordan had broken off diplomatic relations with Egypt following the Camp David accords of 1979 between Egypt and Israel, but in September 1984 full diplomatic relations were again established. Differences between Jordan and Syria led to a confrontation in November 1980; both countries mobilized troops along their border, but no fighting occurred. When the Iran–Iraq War broke out in 1980, Jordan supported Iraq and became its major supplier of arms. Relations with the United States became strained when the U.S. Congress moved to restrict sales of arms to Jordan in 1986, and Jordan then looked to the Soviet Union and France for additional military and economic aid.

On July 31, 1988, King Hussein announced that Jordan would surrender to the PLO all claim to the Israeli-occupied West Bank and sever all legal and administrative ties to the territory. Earlier Hussein had dissolved the lower house of Jordan's parliament, half of whose members represented West Bank districts, and canceled a West Bank development plan. Jordan stopped paying salaries to Palestinian civil servants, teachers, and health workers on the West Bank, and West Bank residents lost their legal status as Jordanian citizens.

Judaism

Judaism, the religion of the Jews, is the complex expression of a religious and ethnic community, a way of life as well as a set of basic beliefs and values, which is discerned in patterns of action, social order, and culture as well as in religious statements and concepts. The first section of this article treats the history of Judaism in the broadest and most complete sense, from the early ancestral beginnings of the Jewish people down to contemporary times. In the second section the beliefs, practices, and culture of Judaism are discussed. Dates are listed throughout as BCE (Before the Common Era = BC) and CE (Common Era = AD).

The article is organized as follows:

THE HISTORY OF JUDAISM

It is history that provides the clue to an understanding of Judaism, for its primal affirmations appear in early historical narratives. Many contemporary scholars agree that although the biblical (Old Testament) tales report contemporary events and activities, they do so for essentially theological reasons. Such a distinction, however, would have been unacceptable to the authors, for their understanding of events was not superadded to but was contemporaneous with their experience or report of them. For them, it was primarily within history that the divine presence was encountered. God's presence was also experienced within the natural realm, but the more immediate or intimate disclosure occurred in human actions. Although other ancient communities saw a divine presence in history, this was taken up in its most consequent fashion within the ancient Israelite community and has remained, through many developments, the focus of its descendants' religious affirmations. It is this particular claim—to have experienced God's presence in human events—and its subsequent development that is the differentiating factor in Jewish thought. As ancient Israel believed itself through its history to be standing in a unique relationship to the divine, this basic belief affected and fashioned its lifestyle and mode of existence in a way markedly different from groups starting with a somewhat similar insight. The response of the people Israel to the divine presence in history was seen as crucial not only for itself but for all mankind. Further, God had—as person—in a particular encounter revealed the pattern and structure of communal and individual life to this people. Claiming sovereignty over the people because of his continuing action in history on its behalf, he had established a *berit* ("covenant") with it and had required from it obedience to his Torah (teaching). This obedience was a further means by which the divine presence was made manifest—expressed in concrete human existence. The corporate life of the chosen community was thus a summons to the rest of mankind to recognize God's presence, sovereignty, and purpose—the establishment of peace and well-being in the universe and in mankind.

God's presence in history

History, moreover, disclosed not only God's purpose but also manifested man's inability to live in accord with it. Even the chosen community failed in its obligation and had, time and again, to be summoned back to its responsibility by divinely called spokesmen—the prophets—who warned of retribution within history and argued and reargued the case of affirmative human response. Israel's role in the divine economy and thus Israel's particular culpability were dominant themes sounded against the motif of fulfillment, the ultimate triumph of the divine purpose, and the establishment of divine sovereignty over all mankind.

General observations

NATURE AND CHARACTERISTICS

In nearly 4,000 years of historical development, the Jewish people and their religion have displayed both a remarkable adaptability and continuity. In their encounter with the great civilizations, from ancient Babylonia and Egypt down to Western Christendom and modern secular culture, they have assimilated foreign elements and integrated them into their own socioreligious system, thus maintaining an unbroken line of ethnic and religious tradition. Furthermore, each period of Jewish history has left behind it a specific element of a Judaic heritage that continued to influence subsequent developments, so that the total Jewish heritage at any time is a combination of all these successive elements along with whatever adjustments and accretions are imperative in each new age.

The fundamental teachings of Judaism have often been grouped around the concept of an ethical (or ethical-historical) monotheism. Belief in the one and only God of Israel has been adhered to by professing Jews of all ages and all shades of sectarian opinion. By its very nature monotheism ultimately postulated religious universalism, although it could be combined with a measure of particularism. In the case of ancient Israel (see below *Biblical Judaism*), particularism took the shape of the doctrine of election; that is, of a people chosen by God as "a kingdom of priests and a holy nation" to set an example for all mankind. Such an arrangement presupposed a covenant between God and the people, the terms of which the chosen people had to live up to or be severely punished. As the 8th-century-BCE prophet Amos expressed it: "You only have I known of all the families of the earth; therefore I will punish you for all your iniquities." Further, it was a concept that combined with the messianic idea, according to which, at the advent of the Redeemer, all nations would see the light, give up war and strife, and follow the guidance of the Torah (divine guidance, teaching, or law) emanating from Zion (a hill in Jerusalem that has a special spiritual significance). With all its variations in detail, messianism has, in one form or another, permeated Jewish thinking throughout the ages and, under various guises, has coloured the outlook of many secular-minded Jews (see also DOCTRINES AND DOGMAS: *Eschatology*).

Law became the major instrumentality by which Judaism was to bring about the reign of God on earth. In this case law meant not only what the Romans called *jus* (human law) but also *fas,* the divine or moral law that embraces practically all domains of life. The ideal, therefore, as expressed in the Ten Commandments, was a religioethical conduct that involved ritualistic observance as well as individual and social ethics, a liturgical–ethical way constantly expatiated on by the prophets and priests, rabbinic sages, and philosophers. Such conduct was to be placed in the service of God, as the transcendent and immanent Ruler of the universe, and as such the Creator and propelling force of the natural world, and also as the One giving guidance to history and thus helping man to overcome the potentially destructive and amoral forces of nature. According to Judaic belief, it is through the historical evolution of man, and particularly of the Jewish people, that the divine guidance of history constantly manifests itself and will ultimately culminate in the messianic age. Judaism, whether in its "normative" form or its sectarian deviations, never completely departed from this basic ethical–historical monotheism.

(S.W.B./L.H.S.)

PERIODIZATION

The division of the millennia of Jewish history into periods—a procedure frequently dependent on individual preferences—has not been devoid of theological or scholarly presuppositions. The Christian world long believed that until the rise of Christianity the history of Judaism was but a "preparation for the Gospel" (*preparatio evangelica*) followed by the "manifestation of the Gospel" (*demonstratio evangelica*) as revealed by Christ and the Apostles. This formulation could be theologically reconciled with the assumption that Christianity had been preordained even before the creation of the world.

On the other hand, 19th-century biblical scholars moved the decisive division back into the period of the Babylonian Exile and restoration of the Jews to Judah (6th–5th centuries BCE). They asserted that after the first fall of Jerusalem (586 BCE) the ancient "Israelitic" religion gave way to a new form of the "Jewish" faith, or Judaism, as formulated by Ezra the Scribe and his school (5th century BCE). A German historian, Eduard Meyer, in 1896 published *Die Entstehung des Judentums* ("The Origin of Judaism"), in which he placed the origins of Judaism in the Persian period (see below *Biblical Judaism*) or the days of Ezra and Nehemiah (5th century BCE) and actually attributed to Persian imperialism an important role in shaping the new emergent Judaism.

These theories have been discarded by most scholars, however, in the light of a more comprehensive knowledge of the ancient Middle East and the abandonment of a theory of gradual evolutionary development that was dominant at the beginning of the 20th century. Most Jews share a long-accepted notion that there never was a real break in continuity and that Mosaic-prophetic-priestly Judaism was continued, with but few modifications, in the work of the Pharisaic and rabbinic sages (see below *Rabbinic Judaism*) well into the modern period. Even today the various Jewish groups, whether Orthodox, Conservative, or Reform, all claim direct spiritual descent from the Pharisees and the rabbinic sages. In actual historical development, however, many deviations have occurred from so-called normative or rabbinic Judaism.

In any case, the history of Judaism here is viewed as falling into the following major periods of development: biblical Judaism (*c.* 20th–4th century BCE), Hellenistic Judaism (4th century BCE–2nd century CE), rabbinic Judaism (2nd–18th century CE), and modern Judaism (*c.* 1750 to the present). (S.W.B.)

Biblical Judaism (20th–4th century BCE)

THE ANCIENT MIDDLE EASTERN SETTING

The family of the Hebrew patriarchs (Abraham, Isaac, and Jacob) is depicted in the Bible as having had its chief seat in the northern Mesopotamian town of Harran—then (mid-2nd millennium BCE) belonging to the Hurrian kingdom of Mitanni. From there Abraham, the founder of the Hebrew people, is said to have migrated to Canaan (comprising roughly the region of modern Israel and Lebanon)—throughout the biblical period and later ages a vortex of west Asian, Egyptian, and east Mediterranean ethnoculture. Thence the Hebrew ancestors of the people of Israel (named after the patriarch Jacob, also called Israel) migrated to Egypt, where they lived in servitude, and a few generations later returned to occupy part of Canaan. The Hebrews were seminomadic herdsmen and occasionally farmers, ranging close to towns and living in houses as well as tents.

Early Israelite culture

The initial level of Israelite culture resembled that of its surroundings; it was neither wholly original nor primitive. The tribal structure resembled that of West Semitic steppe dwellers known from the 18th-century-BCE tablets excavated at the north central Mesopotamian city of Mari; their family customs and law have parallels in Old Babylonian and Hurro-Semite law of the early and middle 2nd millennium. The conception of a messenger of God that underlies biblical prophecy was Amorite (West Semitic) and found in the tablets at Mari. Mesopotamian religious and cultural conceptions are reflected in biblical cosmogony, primeval history (including the Flood story in Gen. 6:9–8:22), and law collections. The Canaanite component of Israelite culture consisted of the Hebrew language and a rich literary heritage—whose Ugaritic form (which flourished in the northern Syrian city of Ugarit from the mid-

15th century to about 1200 BCE) illuminates the Bible's poetry, style, mythological allusions, and religiocultic terms. Egypt provides many analogues for Hebrew hymnody and wisdom literature. All the cultures among which the patriarchs lived had cosmic gods who fashioned the world and preserved its order, including justice; all had a developed ethic expressed in law and moral admonitions; and all had sophisticated religious rites and myths.

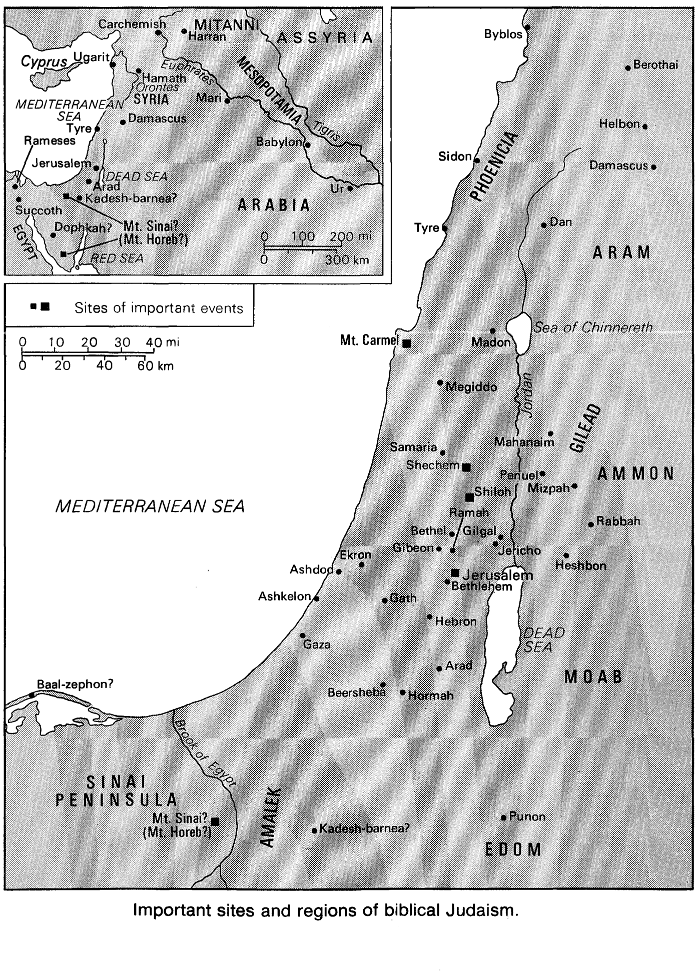
Though plainer when compared with some of the learned literary creations of Mesopotamia, Canaan, and Egypt, the earliest biblical writings are so imbued with contemporary ancient Middle Eastern elements that the once-held assumption that Israelite religion began on a primitive level must be rejected. Late-born amid high civilizations, the Israelite religion had from the start that admixture of high and low features characteristic of all the known religions of the area. Implanted on the land bridge between Africa and Asia, it was exposed to crosscurrents of foreign thought throughout its history.

THE PRE-MOSAIC PERIOD: THE RELIGION OF THE PATRIARCHS

The God of the patriarchs

Israelite tradition identified YHWH (by scholarly convention pronounced Yahweh), the God of Israel, with the Creator of the world, who had been known to and worshipped by men from the beginning of time. Abraham (perhaps 19th or 18th–17th centuries BCE) did not discover this God, but entered into a new covenant relation with him, in which he was promised the land of Canaan and a numerous progeny. God fulfilled that promise through the actions of the 13th-century-BCE Hebrew leader Moses: he liberated the people of Israel from Egypt, imposed Covenant obligations on them at Mt. Sinai, and brought them to the promised land.

Historical and anthropological studies present formidable objections to the continuity of YHWH worship from Adam (the biblical first man) to Moses, and the Hebrew tradition itself, moreover, does not unanimously support even the more modest claim of the continuity of YHWH worship from Abraham to Moses. Against it is a statement in chapter 6, verse 3, of Exodus that God revealed himself to the patriarchs not as YHWH but as El Shaddai—an epithet (of unknown meaning) the distribution of which in patriarchal narratives and Job and other poetical works confirms its archaic and unspecifically Israelite character. Comparable is the distribution of the epithet El Elyon (God Most High). Neither of these epithets appears in postpatriarchal narratives (excepting the Book of Ruth). Other compounds with El are unique to Genesis: El Olam (God the Everlasting One), El Bethel (God Bethel), and El Roʾi (God of Vision). An additional peculiarity of the patriarchal stories is their use of the phrase "God of my [your, his] father." All of these epithets have been taken as evidence that patriarchal religion differed from the worship of YHWH that began with Moses. A relation to a patron god was defined by revelations starting with Abraham (who never refers to the God of his father) and continuing with a succession of "founders" of his worship. Attached to the founder and his family, as befits the patron of wanderers, this unnamed deity (if indeed he was one only) acquired various Canaanite epithets (El, Elyon, Olam, Bethel, *qone eretz* [possessor of the Land]) only after their immigration into Canaan. Whether the name of YHWH was known to the patriarchs is doubtful. It is significant that while the epithets Shaddai and El occur frequently in pre-Mosaic and Mosaic-age names, YHWH appears as an element only in the names of Yehoshuaʿ (Joshua) and perhaps of Jochebed—persons who were closely associated with Moses.



Important sites and regions of biblical Judaism.

The patriarchs are depicted as objects of God's blessing, protection, and providential care. Their response is loyalty and obedience and observance of a cult whose ordinary expression is sacrifice, vow, and prayer at an altar, stone pillar, or sacred tree. Circumcision was a distinctive mark of the cult community. The eschatology (doctrine of ultimate destiny) of their faith was God's promise of land and a great progeny. Any flagrant contradictions between patriarchal and later mores have presumably been censored; yet distinctive features of the post-Mosaic religion are absent. The God of the patriarchs shows nothing of YHWH's "jealousy"; no religious tension or contrast with their neighbours appears, and idolatry is scarcely an issue. The patriarchal covenant differed from the Mosaic Sinaitic Covenant in that it was modelled upon a royal grant to favourites and contained no obligations, the fulfillment of which was to be the condition of their happiness. Evidently not the same as the later religion of Israel, patriarchal religion prepared the way for it in its familial basis, its personal call by the deity, and its response of loyalty and obedience to him.

Little can be said of the relation of the religion of the patriarchs to the religions of Canaan. Known points of contact between the two are the divine epithets mentioned above. Like the God of the fathers, El, the head of the Ugaritic pantheon was depicted both as a judgmental and a compassionate deity. Baal (Lord), the aggressive young agricultural deity of Ugarit, is remarkably absent from Genesis. Yet the socioeconomic situation of the patriarchs was so different from the urban, mercantile, and monarchical background of the Ugaritic myths as to render any comparisons highly questionable.

THE MOSAIC PERIOD: FOUNDATIONS OF THE ISRAELITE RELIGION

The Egyptian sojourn. According to Hebrew tradition, a famine caused the migration to Egypt of the band of 12 Hebrew families that later made up a tribal league in the land of Israel. The schematic character of this tradition does not impair the historicity of a migration to Egypt, an enslavement by Egyptians, and an escape from Egypt under an inspired leader by some component of the later league of Israelite tribes. To disallow these events would make their centrality as articles of faith in the later religious beliefs of Israel inexplicable.

The importance of Moses, the Exodus, and the Sinai Covenant

Tradition gives the following account of the birth of the nation. At the Exodus from Egypt (13th century BCE), YHWH showed his faithfulness and power by liberating Israel from bondage and punishing their oppressors with plagues and drowning at the sea. At Sinai, he made Israel his people and gave them the terms of his Covenant, regulating their conduct toward him and each other so as to make them a holy nation. After sustaining them miraculously during their 40-year wilderness trek, he enabled them to take the land that he had promised to their fathers, the patriarchs. Central to these events is God's apostle, Moses, who was commissioned to lead Israel out of Egypt, mediate God's Covenant to them, and bring them to Canaan.

Behind the legends and the multiform law collections, a historical figure must be posited to whom the legends and the legislative activity could be attached. And it is precisely Moses' unusual combination of roles that makes him credible as a historical figure. Like Muḥammad at the birth of Islām, Moses fills oracular, legislative, executive, and military functions. The main institutions of Israel are his creation: the priesthood and the sacred shrine, the Covenant and its rules, the administrative apparatus of the tribal league. Significantly, though Moses is compared to a prophet in various texts in the Pentateuch (the first five books of the Bible), he is never designated as one—the term being evidently unsuited for so comprehensive and unique a figure.

Mosaic religion. The distinctive features of Israelite religion appear with Moses. The proper name of Israel's God, YHWH, was revealed and interpreted to Moses as meaning *ehye asher ehye*—an enigmatic phrase (literally meaning "I am/shall be what I am/shall be") of infinite suggestiveness. The Covenant, defining Israel's obligations, is ascribed to Moses' mediation. Although it is impossible to determine what rulings go back to Moses, the Decalogue, or Ten Commandments, presented in chapter 20 of Exodus and chapter 5 of Deuteronomy, and the larger and smaller Covenant codes in Ex. 20:22–23:33; 34:11–26) are held by critics to contain early covenant law. From them, the following features may be noted: (1) The rules are formulated as God's utterances—*i.e.,* expressions of his sovereign will. (2) They are directed toward, and often explicitly addressed to, the people at large; Moses merely conveys the sovereign's message to his subjects. (3) Publication being of the essence of the rules, the people as a whole are held responsible for their observance (see also DOCTRINES AND DOGMAS: *Covenant*).

The liberation from Egypt laid upon Israel the obligation of exclusive loyalty to YHWH. This meant eschewing all other gods—including idols venerated as such—and the elimination of all magical recourses. The worship of YHWH was aniconic (without images); even such figures as might serve in his worship were banned—apparently owing to the theurgic overtones (the implication that through them men may influence or control the god by fixing his presence in a particular place and making him accessible). Though a mythological background lies behind some cultic terminology (*e.g.,* "a pleasing odor to YHWH," "my bread"), sacrifice is rationalized as tribute or (in priestly writings) is regarded purely as a sacrament; *i.e.,* as a material means of relating to God. Hebrew festivals also have no mythological basis; they either celebrate God's bounty (*e.g.,* at the ingathering of the harvest) or his saving acts (*e.g.,* the festival of unleavened bread, which is a memorial of the Exodus).

Moses breaking the tablets of the Law on Mt. Sinai in anger over the Israelites' worship of the golden calf. Etching by Marc Chagall.

Social values and concerns

The values of life and limb, labour, and social solidarity are protected in the rules on relations between man and man. The involuntary perpetual slavery of Hebrews is abolished, and a seven-year limit is set on bondage. The humanity of slaves is defended: one who beats his slave to death is liable to death; if he maims a slave he must set the slave free. A murderer is denied asylum and may not ransom himself from death, while for deliberate and severe bodily injuries the lex talionis ("an eye for an eye" principle) is ordained. Harm to property or theft is punished monetarily, never by death.

Moral exhortations call for solidarity with the poor and the helpless, for brotherly assistance to fellows in need. Institutions are created (*e.g.,* the sabbatical, or seventh, fallow year, in which land is not cultivated) to embody them in practice.

Since the goal of the people was the conquest of a land, their religion had warlike features. Organized as an army (called "the hosts of YHWH" in Ex. 12:41), they encamped in a protective square around their palladium—the tent housing the ark in which the stone "tablets of the Covenant" rested. When journeying, the sacred objects were carried and guarded by the Levites (a tribe serving religious functions), whose rivals, the Aaronites, had a monopoly on the priesthood. God, sometimes called "the warrior," marched with the army; in war, part of the booty was delivered to his ministers.

THE PERIOD OF THE CONQUEST AND SETTLEMENT OF CANAAN

The conquest of Canaan was remembered as a continuation of God's marvels at the Exodus. The Jordan River was split asunder, Jericho's walls fell at Israel's shout; the enemy was seized with divinely inspired terror; the sun stood still in order to enable Israel to exploit its victory. Such stories are not necessarily the work of a later age; they reflect rather the impact of these victories on the actors in the drama, who felt themselves successful by the grace of God.

A complex process of occupation, involving both battles of annihilation and treaty arrangements with the natives, has been simplified in the biblical account of Joshua's wars. Gradually, the unity of the invaders dissolved (most scholars believe that the invading element was only part of the Hebrew settlement in Canaan; other Hebrews, long since settled in Canaan from patriarchal times, then joined the invaders' covenant league). Individual tribes made their way with more or less success against the residue of Canaanite resistance. New enemies, Israel's neighbours to the east and west, appeared, and the period of the judges (leaders, or champions) began.

The religious situation during the time of the Book of Judges

The Book of Judges, the main witness for the period, does not speak with one voice on the religious situation. Its editorial framework describes repeated cycles of apostasy, oppression, appeal to God, and relief through a Godsent champion. The premonarchic troubles (before the kingship of Saul; see below) caused by the weakness of the disunited tribes were thus accounted for by the covenantal sin of apostasy. The individual stories, however, present a different picture. Apostasy does not figure in the exploits of the judges Ehud, Deborah, Jephthah, and Samson; YHWH has no rival, and faith in him is periodically confirmed by the saviours he sends to rescue Israel from their neighbours.

This faith is shared by all the tribes; and it is owing to their common cult that a Levite from Bethlehem could serve first at an Ephraimite and later also at a Danite sanctuary. The religious bond, preserved by the common cult, was enough to enable the tribes to act more or less in concert under the leadership of elders or an inspired champion in time of danger or religious scandal.

To be sure, both written and archaeological testimonies point to the Hebrews' adoption of Canaanite cults—the Baal worship of Gideon's family and neighbours in Ophrah in Judges, chapter 6, is an example. The many cultic figurines (usually female) found in Israelite levels of Palestinian archaeological sites also give colour to the sweeping indictments of the framework of the Book of Judges. But these phenomena belonged to the private, popular religion; the national God, YHWH, remained one—Baal sent no prophets to Israel—though YHWH's claim to exclusive worship was obviously not effectual. Nor did his cult conform with later orthodoxy; Micah's idol in Judges, chapter 17, and Gideon's ephod (priestly or religious garment) were considered apostasies by the editor, in accord with the dogma that other than orthodoxy there is only apostasy—heterodoxy (nonconformity) being unrecognized and simply equated with apostasy.

To the earliest sanctuaries and altars honoured as patriarchal foundations—at Shechem, Bethel, Beersheba, and Hebron in Cisjordan (west of the Jordan); at Mahanaim, Penuel, and Mizpah in Transjordan (east of the Jordan)—were now added new ones at Dan, Shiloh, Ramah, Gibeon, and Gilgal, among others. A single priestly family could not operate all these establishments, and Levites rose to the priesthood; at private sanctuaries even non-Levites might be consecrated as priests. The ark of the Covenant was housed in the Shiloh sanctuary, staffed by priests of the house of Eli, who traced their consecration back to Egypt. But the ark remained a portable palladium in wartime; Shiloh was not regarded as its final resting place. The law in Exodus, chapter 20, verses 24–26, authorizing a plurality of altar sites and the simplest forms of construction (earth and rough stone) suited the plain conditions of this period.

THE PERIOD OF THE UNITED MONARCHY

Conflicting views regarding the monarchy

The religiopolitical problem. The loose, decentralized tribal league could not cope with the constant pressure of external enemies—camel-riding desert marauders who pillaged harvests annually or iron-weaponed Philistines (an Aegean people settling coastal Palestine *c.* 12th century BCE) who controlled key points in the hill country occupied by Israelites. In the face of such threats to the Israelites, local, sporadic, God-inspired saviours had to be replaced by a continuous central leadership that could mobilize the forces of the entire league and create a standing army. Two attitudes were distilled in the crisis, one conservative and antimonarchic, the other progressive and promonarchic. The conservative appears first in Gideon's refusal, in Judges, chapter 8, verse 23, to found a dynasty: "I will not rule you," he tells the people, "my son will not rule over you; YHWH will . . . !" This theocratic view pervades one of the two contrasting accounts of the founding of the monarchy fused in chapters 8–12 of the First Book of Samuel: the popular demand for a king was viewed as a rejection of the kingship of God, which was embodied in a series of inspired saviours from Moses and Aaron, through Jerubbaal, Bedan, and Jephthah, to Samuel. The other account depicts the monarchy as a gift of God, designed to rescue his people from the Philistines (I Sam. 9:16). Both accounts represent the seer-judge Samuel as the key figure in the founding of Israel's monarchy, and it is not unlikely that the two attitudes struggled in his breast.

The triumph of the ark of the Covenant over paganism, a representation of the antagonism between Judaism and Hellenistic paganism. It was inspired by the biblical story (I Sam. 5:1–5) of the ark, which was captured in battle by the Philistines and which toppled the cult images of Dagon. Mural painting from the synagogue at Doura-Europus, Syria, 3rd century CE.

The Benjaminite Saul was made king (*c.* 1020 BCE) by divine election and by popular acclamation after his victory over the Ammonites (a Transjordanian Semitic people), but his career was clouded by conflict with Samuel, the major representative of the old order. Saul's kingship was bestowed by Samuel and had to be accommodated to the ongoing authority of that man of God. The two accounts of Saul's rejection by God (through Samuel) involve his usurpation of the prophet's authority. King David, whose forcefulness and religiopolitical genius established the monarchy (*c.* 1000 BCE) on an independent spiritual footing, resolved the conflict.

The Davidic monarchy. The essence of the Davidic innovation was the idea that, in addition to divine election through Samuel and public acclamation, David had God's promise of an eternal dynasty (a conditional, perhaps earlier, and an unconditional, perhaps later, form of this promise exist in Psalms, 132 and II Samuel, chapter 7, respectively). In its developed form, the promise was conceived of as a covenant with David, parallelling the Covenant with Israel and instrumental in the latter's fulfillment; *i.e.,* that God would channel his benefactions to Israel through the chosen dynasty of David. With this new status came the inviolability of the person of God's anointed (a characteristically Davidic idea) and a court rhetoric—adapted from pagan models—in which the king was styled "the [firstborn] son of God." An index of the king's sanctity was his occasional performance of priestly duties. Yet the king's mortality was never forgotten—he was never deified; prayers and hymns might be said on his behalf, but they were never addressed to him as a god.

The chosen dynasty and the chosen city

David captured the Jebusite stronghold of Jerusalem and made it the seat of a national monarchy (Saul had never moved the seat of his government from his home town, the Benjaminite town of Gibeah, about three miles north of Jerusalem). Then, fetching the ark from an obscure retreat, David installed it in his capital, asserting his royal prerogative (and obligation) to build a shrine for the national God—at the same time joining the symbols of the dynastic and the national covenants. This move of political genius linked the God of Israel, the chosen dynasty of David, and the chosen city of Jerusalem in a henceforth indissoluble union.

David planned to erect a temple to house the ark, but the tenacious tradition of the ark's portability in a tent shrine forced postponement of the project to his son Solomon's reign. As part of his extensive building operations, Solomon built the Temple on a Jebusite threshing floor, located on a hill north of the royal city, which David had purchased to mark the spot where a plague had been halted. The ground plan of the Temple—a porch with two free-standing pillars before it, a sanctuary, and an inner sanctum—followed Syrian and Phoenician sanctuary models. A bronze "sea" resting on bulls and placed in the Temple court has a Babylonian analogue. Exteriorly, the Jerusalem Temple resembled Canaanite and other Middle Eastern religious structures, but there were differences; *e.g.,* no god image stood in the inner sanctum, but rather only the ancient ark and the new large cherubim (hybrid creatures with animal bodies, human or animal faces, and wings) whose wings covered it, symbolizing the presence of YHWH who was enthroned upon celestial cherubim.

Alongside a brief, ancient inaugural poem in I Kings, chapter 8, verses 12–13, an extensive (and, in its present form, later) prayer expresses the distinctively biblical view of the temple as a vehicle of God's providing for his people's needs. Since, strangely, no reference to sacrifice is made, not a trace appears of the standard pagan conception of the temple as a vehicle of man's providing for the gods.

That literature flourished under the aegis of the court is to be gathered from the quality of the preserved narrative of the reign of David, which gives every indication of having come from the hand of a contemporary eyewitness. The royally sponsored Temple must have had a library and a school attached to it (in accord with the universally attested practice of the ancient Middle East), among whose products were not only royal psalms but also such liturgical pieces intended for the common man as eventually found their way into the book of Psalms.

The emergence of Torah and wisdom literature

The latest historical allusions in the Torah literature (the Pentateuch) are to the period of the united monarchy; *e.g.,* the defeat and subjugation of the peoples of Amalek, Moab, and Edom by Saul and David, in Numbers, chapter 24, verses 17–20. On the other hand, the polity reflected in the laws is tribal and decentralized, with no bureaucracy. Its economy is agricultural and pastoral, class distinctions apart from slave and free are lacking, and commerce and urban life are rudimentary. A premonarchic background is evident, with only rare explicit reflections of the later monarchy; *e.g.,* in Deuteronomy, chapter 17, verses 14–20. The groundwork of the Torah literature may thus be supposed to have crystallized under the united monarchy.

It was in this period that the traditional wisdom cultivated among the learned in neighbouring cultures came to be prized in Israel. Solomon is represented as the author of an extensive literature comparable to that of other Eastern sages. His wisdom is expressly attributed to YHWH in the account of his night oracle at Gibeon (in which he asked not for power or riches but for wisdom), thus marking the adaptation to biblical thought of this common Middle Eastern genre. As set forth in Proverbs, chapter 2, verse 5, "It is YHWH who grants wisdom; knowledge and understanding are by his command." Patronage of wisdom literature is ascribed to the later Judahite king, Hezekiah, and the connection of wisdom with kings is common in extrabiblical cultures as well.

Domination of all of Palestine entailed the absorption of "the rest of the Amorites"—the pre-Israelite population that lived chiefly in the valleys and on the coast. Their impact on Israelite religion is unknown, though some scholars contend that a "royally sponsored syncretism" arose with the aim of fusing the two populations. That popular religion did not meet the standards of the biblical writers and that it incorporated pagan elements—and that such elements may have increased as a result of intercourse with the newly absorbed "Amorites"—is likely and required no royal sponsorship. On the other hand, the court itself welcomed foreigners—Philistines, Cretans, Hittites, and Ishmaelites are named, among others—and made use of their service. Their effect on the court religion may be surmised from what is recorded concerning Solomon's many diplomatic marriages: foreign princesses whom Solomon married brought along with them the apparatus of their native cults, and the King had shrines to their gods built and maintained on the Mount of Olives. Such private cults, while indeed royally sponsored, did not make the religion of the people syncretistic.

Such compromise with the pagan world, entailed by the widening horizons of the monarchy, violated the sanctity of the holy land of YHWH and turned the king into an idolator in the eyes of zealots. Religious opposition, combined with grievances against the organization of forced labour for state projects, led to the secession of the northern tribes (headed by the Joseph tribes) after Solomon's death.

THE PERIOD OF THE DIVIDED KINGDOM

Religion in the northern kingdom (Israel)

Jeroboam I (10th century BCE), the first king of the north (now called Israel, in contradistinction to Judah, the southern Davidic kingdom), appreciated the inextricable link of Jerusalem and its sanctuary with the Davidic claim to divine election to kingship over all Israel (the whole people, north and south). He therefore founded rival sanctuaries at Dan and at Bethel—ancient cult sites—and manned them with non-Levite priests whose symbol of YHWH's presence was a golden calf—a pedestal of divine images in ancient iconography and the equivalent of the cherubim of Jerusalem's Temple. He also moved the autumn ingathering festival one month ahead so as to foreclose celebration of this most popular of all festivals in common with Judah.

For the evaluation of Jeroboam's innovations and the subsequent official religion of the north down to the mid-8th century, one must rely almost exclusively on the Book of Kings (later divided into two books). This work has severe limitations as a source for religious history. The material of this book, in good part contemporary, is subjugated to a dogmatic historiography that regards the whole enterprise of the north as one long apostasy ending in a deserved disaster. The culmination of Kings' history with the exile of Judah shows its provenience to have been Judahite. Yet the evaluation of Judah's official religion is subject to an equally dogmatic standard, namely, the royal adherence to the Deuteronomic rule of a single cult site. The author considered the Solomonic Temple to be the cult site chosen by God, according to Deuteronomy, chapter 12, the existence of which rendered all other sites illegitimate. Every king of Judah is judged according to whether or not he did away with all extra-Jerusalemite places of worship. (The date of this criterion may be inferred from the indifference toward it of all persons [*e.g.,* the 9th-century-BCE prophets Elijah and Elisha and the Jerusalemite priest Jehoiada] prior to the late-8th-century-BCE Judahite king Hezekiah.) Another serious limitation is the restriction of Kings' purview: excepting the Elijah–Elisha stories, it notices only the royally sponsored cult; notices of the popular religion are very few. From the mid-8th century the writings of the classical prophets, starting with Amos, set in. These take in the people as a whole, in contrast to Kings; on the other hand their interest in theodicy (justification of God) and their polemical tendency to exaggerate and generalize what they deem evil must be taken into consideration before approving their statements as sober history.

Religion in the southern kingdom (Judah)

For a half-century after the north's secession (*c.* 922 BCE), the religious situation in Jerusalem was unchanged. The distaff side of the royal household perpetuated, and even augmented, the pagan cults. King Asa (reigned *c.* 908–867 BCE) is credited with a general purge, including the destruction of an image made for the goddess Asherah by the queen mother, granddaughter of an Aramaean princess. He also purged the *qedeshim* ("consecrated men"—conventionally rendered as "sodomites," or "male sacred prostitutes").

Foreign cults entered the north with the marriage of the 9th-century-BCE king Ahab to the Tyrian princess Jezebel. Jezebel brought with her a large entourage of sacred personnel to staff the temple of Baal and Asherah that Ahab built for her in Samaria, the capital of the northern kingdom of Israel. In all else, Ahab's orthodoxy was irreproachable, though others of his court may have joined the worship of the foreign princess. That fierce opposition to the non-YWHW cults sprang up must be supposed in order to account for Jezebel's persecution of the prophets of YHWH, conduct untypical of a polytheist except in self-defense. Elijah's assertion that the whole country apostatized is a hyperbole based on the view that whoever did not actively fight Jezebel was implicated in her polluted cult. Such must have been the view of the prophets, whose fallen were the first martyrs to die for the glory of God. The quality of their opposition may be gauged by Elijah's summary execution of the foreign Baal cultists after they failed the test at Mt. Carmel, where they vied against him in a contest over whose god was truly God. A three-year drought (attested also in Phoenician sources), declared by Elijah to be punishment for the sin, must have done much to kindle the prophets' zeal.

To judge from the Elisha stories, the Baal worship in the capital city, Samaria, was not felt in the countryside.

There the religious tone was set by the popular prophets and the prophetic companies ("the sons of the prophets") who attached themselves to them. In popular consciousness these men were wonder-workers—healing the sick and reviving the dead, foretelling the future, and helping to find lost objects. To the biblical narrator they witness the working of God in Israel. Elijah's rage at the Israelite king Ahaziah's recourse to the pagan god Baalzebub, Elisha's cure of the Syrian military leader Naaman's leprosy, and anonymous prophets' directives and predictions in matters of peace and war all serve to glorify God. Indeed, the equation of Israel's prosperity with God's interest generated the issue of "true" and "false" prophecy that made its first appearance at this time. That prophecy of success could turn out to be a snare is exemplified in a story of conflict between Micaiah, the lone 9th-century-BCE prophet of doom, and 400 unanimous prophets of victory who lured Ahab to his death. The poignancy of the issue is highlighted by Micaiah's acknowledgment that the 400 were also prophets of YHWH—but inspired by him deliberately with a "lying spirit."

The issue of "true" and "false" prophecy

THE PERIOD OF CLASSICAL PROPHECY AND CULT REFORM

The emergence of the literary prophets. By the mid-8th century a hundred years of chronic warfare between Israel and Aram had finally ended—the Aramaeans having suffered heavy blows from the Assyrians. King Jeroboam II (8th century BCE) was able to undertake to restore the imperial sway of the north over its neighbour, and a prophecy of Jonah that he would extend Israel's borders from the Dead Sea to the entrance to Hamath (Syria) was borne out. The well-to-do expressed their relief in lavish attentions to the institutions of worship and their private mansions. But the strain of the prolonged warfare showed in the polarization of society between the wealthy few who had profited from the war and the masses whom it had ravaged and impoverished. Dismay at the dissolution of Israelite society animated a new breed of prophets who now appeared—the literary or classical prophets, first of whom was Amos, an 8th-century-BCE Judahite who went north to Bethel.

Prophetic denouncements of social injustices

That apostasy would set God against the community was an old conception of early prophecy; that violation of the sociomoral injunctions of the Covenant would have the same result was first proclaimed by Amos. Amos almost ignored idolatry, denouncing instead the corruption and callousness of the oligarchy and rulers. The religious exercises of such villains he proclaimed were loathsome to God; on their account Israel would be oppressed from the entrance to Hamath to the Dead Sea and exiled from its land.

The westward push of the Neo-Assyrian Empire in the mid-8th century BCE soon brought Aram and Israel to their knees. In 733–732 Assyria took Gilead and Galilee from Israel and captured Aramaean Damascus; in 721 Samaria, the Israelite capital, fell. The northern kingdom sought to survive through alliances with Assyria and Egypt; its kings came and went in rapid succession. The troubled society's malaise was interpreted by Hosea, a prophet of the northern kingdom (Israel), as a forgetting of God. As a result, in his view, all authority had evaporated: the king was scoffed at, priests became hypocrites, and pleasure seeking became the order of the day. The monarchy was godless; it put its trust in arms, fortifications, and alliances with the great powers. Salvation, however, lay in none of these, but in repentance and reliance upon God.

Prophecy in the southern kingdom. Judah was subjected to such intense pressure to join an Israelite–Aramaean coalition against Assyria that its 8th-century-BCE king Ahaz chose to submit himself to Assyria in return for relief. Ahaz introduced a new Aramaean-style altar in the Jerusalem Temple and adopted other foreign customs that are counted against him in the book of Kings. It was at this time that Isaiah prophesied in Jerusalem. At first (under Uzziah, Ahaz' prosperous grandfather), his message focussed on the corruption of Judah's society and religion, stressing the new prophetic themes of indifference to God (which went hand in hand with a thriving cult) and the fateful importance of social morality. Under Ahaz, the political crisis evoked Isaiah's appeals for trust in God, with the warning that the "hired razor from across the Euphrates" would shave Judah clean as well. Isaiah interpreted the inexorable advance of Assyria as God's chastisement; Assyria was "the rod of God's wrath." But since Assyria ignored its mere instrumentality and exceeded in an insolent manner its proper function, God, when he finished his purgative work, would break Assyria on Judah's mountains. Then the nations of the world, who had been subjugated by Assyria, would recognize the God of Israel as the lord of history. A renewed Israel would prosper under the reign of an ideal Davidic king, all men would flock to Zion (the hill symbolizing Jerusalem) to learn the ways of YHWH and submit to his adjudication, and universal peace would prevail (see also DOCTRINES AND DOGMAS: *Eschatology*)

The prophecy of Micah (8th century BCE), also a Judahite, was contemporary with that of Isaiah, and touched on similar themes (*e.g.,* the vision of universal peace is found in both their books). Unlike Isaiah however, who believed in the inviolability of Jerusalem, Micah shocked his audience with the announcement that the wickedness of its rulers would cause Zion to become a plowed field, Jerusalem a heap of ruins, and the Temple mount a wooded height. Moreover, from the precedence of social morality over the cult, Micah drew the extreme conclusion that the cult had no ultimate value and that God's requirement of men can be summed up as "to do justice, and to love kindness, and to walk humbly with your God."

Reforms in the southern kingdom. According to Jeremiah (about 100 years later), Micah's prophetic threat to Jerusalem had caused King Hezekiah (reigned *c.* 715–*c.* 686 BCE) to placate God—possibly an allusion to the cult reform instituted by the King in order to cleanse Judah from various pagan practices. A heightened concern over assimilatory trends resulted in his also outlawing certain practices considered legitimate up to his time. Thus, in addition to removing the bronze serpent that had been ascribed to Moses (and that had become a fetish), the reform did away with the local altars and stone pillars, the venerable (patriarchal) antiquity of which did not save them from the taint of imitation of Canaanite practice. Hezekiah's reform, part of a restorational policy that had political, as well as religious, implications, appears as the most significant effect of the fall of the northern kingdom on official religion. The outlook of the reformers is suggested by the catalog in II Kings, chapter 17, of religious offenses that had caused the fall, which the objects of Hezekiah's purge closely resemble. Hezekiah's reform is the first historical evidence for Deuteronomy's doctrine of cult centralization. Similarities between Deuteronomy and the Book of Hosea lend colour to the supposition that the reform movement in Judah, which culminated a century later under King Josiah, was sparked by attitudes inherited from the north.

The reform of King Hezekiah

Hezekiah was the leading figure in a western coalition of states that coordinated a rebellion against the Assyrian king Sennacherib with the Babylonian rebel Merodach-Baladan, shortly after the Assyrian's accession in 705 BCE. When Sennacherib appeared in the west in 701 the rebellion collapsed; Egypt sent a force to aid the rebels, but it was defeated. Hezekiah saw his kingdom overwhelmed and offered tribute to Sennacherib; the Assyrian, however, pressed for the surrender of Jerusalem. In despair, Hezekiah turned to the prophet Isaiah for an oracle. Though the prophet condemned the King's reliance upon Egyptian help, he stood firm in his faith that Jerusalem's destiny precluded its fall into heathen hands. The King held fast, and Sennacherib, for reasons still obscure, suddenly retired from Judah and returned home. This unlooked-for deliverance of the city may have been regarded as a vindication of the prophet's faith and was doubtless an inspiration to the rebels against Babylonia a century later. For the present, while Jerusalem was intact, the country had been devastated and its kingdom turned into a vassal state of Assyria.

During Manasseh's peaceful reign of 55 years in the 7th century BCE, Judah was a submissive ally of Assyria. Manasseh's forces served in the building and military

Foreign influences and the Deuteronomic reform

operations of the Assyrian kings Esarhaddon and Ashurbanipal. Judah benefitted from the upsurge of commerce that resulted from the political unification of the whole Near East. The prophet Zephaniah attests to heavy foreign influence on the mores of Jerusalem—merchants who adopted foreign dress, cynics who lost faith in the efficacy of YHWH to do anything, people who worshipped the pagan host of heaven on their roofs. Manasseh's court was the centre of such influences. The royal sanctuary became the home of a congeries of foreign gods—the sun, astral deities, and Asherah (the female fertility deity) all had their cults there alongside YHWH. The countryside also was provided with pagan altars and priests, alongside the local YHWH altars that were revived. Presumably, at least some of the blood that Manasseh is said to have spilled freely in Jerusalem must have belonged to YHWH's devotees. No prophecy is dated to his long reign.

With Ashurbanipal's death in 627, Assyria's power faded quickly; the young Judahite king Josiah (reigned *c.* 640–609 BCE) had already set in motion a vigorous movement of independence and restoration, a cardinal aspect of which was religious. First came the purge of foreign cults in Jerusalem, under the aegis of the high priest Hilkiah; then the countryside was cleansed. In the course of renovating the Temple, a scroll of Moses' Torah (by scholarly consensus an edition of Deuteronomy) was found. Anxious to abide by its injunctions, Josiah had the local YHWH altars polluted to render them unusable and collected their priests in Jerusalem. The celebration of the Passover that year was concentrated in the Temple, as it had not been "since the days of the judges who judged Israel," according to II Kings 23:22, or since the days of Samuel, according to II Chron. 35:18; both references reflect the unhistorical theory of the Deuteronomic (Josianic) reformers that the Shiloh sanctuary was the precursor of the Jerusalem Temple as the sole legitimate site of worship in Israel (as demanded by Deuteronomy, chapter 12). To seal the reform, the King convoked a representative assembly and had them enter into a covenant with God over the newfound Torah. For the first time, the power of the state was enlisted on behalf of the ancient covenant and in obedience to a covenant document. It was a major step toward the fixation of a sacred canon.

Josiah envisaged the restoration of Davidic authority over the entire domain of ancient Israel, and the retreat of Assyria facilitated his program—until he became fatally embroiled in the struggle of the powers over the dying empire. His death in 609 was doubtless a setback for his religious policy as well as his political aspirations. To be sure, the royally sponsored syncretism of Manasseh's time was not revived, but there is evidence of recrudescence of unofficial local altars. Whether references in Jeremiah and Ezekiel to child sacrifice to YHWH reflect post-Josianic practices is uncertain. There is stronger indication of private recourse to pagan cults in the worsening political situation.

That Assyria's fall should have been followed by the yoke of a harsh new heathen power dismayed the devotees of YHWH who had not been prepared for it by prophecy. Their mood finds expression in the oracles of the prophet Habakkuk in the last years of the 7th century BCE. Confessing perplexity at God's toleration of the success of the wicked in subjugating the righteous, the prophet affirms his faith in the coming salvation of YHWH, tarry though it might. And in the meantime, "the righteous must live in his faith."

Prophecies of Jeremiah and Ezekiel

But the situation in fact grew worse as Judah was caught in the Babylonian–Egyptian rivalry. Some attributed the deterioration to the burden of Manasseh's sin that still rested on the people. For the prophet Jeremiah (active *c.* 626–*c.* 580 BCE), the Josianic era was only an interlude in Israel's career of guilt that went back to its origins. His pre-reform prophecies denounced Israel as a faithless wife and warned of imminent retribution at the hands of a nameless northerner. After Nebuchadrezzar's decisive defeat of Egypt at Carchemish (605 BCE), Jeremiah identified the scourge as Babylon. King Jehoiakim's attempt to be free of Babylonia ended with the exile of his successor, Jehoiachin, along with Judah's elite (597); yet the court of the new king, Zedekiah, persisted in plotting new revolts, relying—against all experience—on Egyptian support. Jeremiah now proclaimed a scandalous doctrine of the duty of all nations, Judah included, to submit to the divinely appointed world ruler, the Babylonian monarch Nebuchadrezzar. In submission lay the only hope of avoiding destruction; a term of 70 years had been set to humiliate all men beneath Babylon. Imprisoned for demoralizing the populace, Jeremiah persisted in what was viewed as his traitorous message; the leaders, on their part, persisted in their policy, confident of Egypt and the saving power of Jerusalem's Temple, to the bitter end.

Jeremiah also had a message of comfort for his hearers. He foresaw the restoration of the entire people—north and south—in the land, under a new David. And since events had shown that man was incapable of achieving a lasting reconciliation with God on his own, he envisioned the penitent of the future being met halfway by God, who would remake their nature so that to do his will would come naturally to them. God's new covenant with Israel would be written on their hearts, so that they should no longer need to teach each other obedience, for young and old would know YHWH.

Among the exiles in Babylonia, the prophet Ezekiel, Jeremiah's contemporary, was haunted by the burden of Israel's sin. He saw the defiled Temple of Manasseh's time as present before his eyes, and described God as abandoning it and Jerusalem to their fates. Though Jeremiah offered hope through submission, Ezekiel prophesied an inexorable, total destruction as the condition of reconciliation with God. The majesty of God was too grossly offended for any lesser satisfaction. The glory of God demanded Israel's ruin, but the same cause required its restoration also. For Israel's fall disgraced YHWH among the nations; to save his reputation he must therefore restore Israel to its land and make it prosper as never before. The dried bones of Israel must revive, that they and all the nations should know that he was YHWH (Ezek. 37). Ezekiel, too, foresaw the remaking of human nature, but as a necessity of God's glorification; the concatenation of Israel's sin, exile, and consequent defamation of God's name must never be repeated. In 586 BCE the doom prophecies of Jeremiah and Ezekiel came true. Rebellious Jerusalem was reduced by Nebuchadrezzar, the Temple was burnt, and much of Judah's population dispersed or deported to Babylonia.

THE EXILIC PERIOD

Postexilic religious forms

The survival of the religious community of exiles in Babylonia demonstrates how rooted and widespread the religion of YHWH was. Abandonment of the national religion as an outcome of the disaster is recorded of a minority only. There were some cries of despair, but the persistence of prophecy among the exiles shows that their religious vitality had not flagged. The Babylonian Jewish community, in which the cream of Judah lived, had no sanctuary or altar (in contrast to the Jewish garrison of Elephantine in Egypt); what developed in their place can be surmised from new postexilic religious forms: fixed prayer; public fasts and confessions; and assembly for the study of the Torah, which may have developed from visits to the prophets for oracular edification. The absence of a local or territorial focus must also have spurred the formation of a literary–ideational centre of communal life—the sacred canon of Covenant documents that came to be the core of the present Pentateuch. Observance of the Sabbath—a peculiarly public feature of communal life—achieved a significance among the exiles virtually equivalent to all the rest of the Covenant rules together. Notwithstanding its political impotence, the spirit of the exiles was so high that foreigners were attracted to their ranks, hopeful of sharing their future glory.

Assurance of that future glory was given not only in the consolations promised by Jeremiah and Ezekiel (the fulfillment of whose prophecies of doom lent credit to their consolations); the great comforter of the exile was the writer or writers of what is known as Deutero-Isaiah (Isa. 40–66), who perceived in the rise and progress (from *c.* 550) of the Persian king Cyrus II the Great the instrument of God's salvation. Going beyond the national hopes of

Ezekiel, animated by the universal spirit of the pre-exilic Isaiah, Deutero-Isaiah saw in the miraculous restoration of Israel a means of converting the whole world to faith in Israel's God. Israel would thus serve as "a light for the nations, that YHWH's salvation may reach to the end of the earth." In his conception of the vicarious suffering of God's servant—through which atonement is made for the ignorant heathen—Deutero-Isaiah found a handle by which to grasp the enigma of faithful Israel's lowly state among the Gentiles. The idea was destined to play a decisive role in the self-understanding of the Jewish martyrs of the Syrian king Antiochus IV Epiphanes' persecution in the 2nd century BCE (in, for example, Daniel) and later again in the Christian appreciation of the death of Jesus.

THE PERIOD OF THE RESTORATION

After conquering Babylon, Cyrus so far justified the hopes put in him that he allowed those Jews who wished to do so to return and rebuild their Temple. Though, in time, some 40,000 made their way back, they were soon disillusioned by the failure of the glories of the restoration to materialize and by the controversy with the Samaritans, and left off building the Temple. (The Samaritans were a judaized mixture of native north Israelites and Gentile deportees settled by the Assyrians in the erstwhile northern kingdom.) A new religious inspiration came under the governorship of Zerubbabel, a member of the Davidic line, who became the centre of messianic expectations during the anarchy attendant upon the accession to the Persian throne of Darius I (522). The prophets Haggai and Zechariah perceived the disturbances as heralds of an imminent overthrow of the heathen Persian Empire and a worldwide manifestation of God and glorification of Zerubbabel. Against that day they urged the people quickly to complete the building of the Temple. The labour was resumed and completed in 516; but the prophecies remained unfulfilled. Zerubbabel disappears from the biblical narrative, and the spirit of the community flagged again.

Role of repentance and the Torah

The one religious constant in the vicissitudes of the restored community was the mood of repentance and the desire to win back God's favour by adherence to his Covenant rules. The anxiety that underlay this mood produced a hostility to strangers, which encouraged a lasting conflict with the Samaritans, who asked permission to take part in rebuilding the Temple of the God they too worshipped. The Jews, however, rejected them on ill-specified grounds—apparently ethnoreligious; *i.e.,* they felt the Samaritans to be alien to their historical community of faith, especially to its messianic hopes. Nonetheless, intermarriage occurred and precipitated a new crisis when, in 458, the priest Ezra arrived from Babylon, intent on enforcing the regimen of the Torah. By construing ancient and obsolete laws excluding Canaanites and others so as to make them apply to their own times and neighbours, the leaders of the Jews brought about the divorce and expulsion of several dozen non-Jewish wives and their children. Tension between the xenophobic (fear of strangers) and xenophilic (love of strangers) in postexilic Judaism was finally resolved some two centuries later with the development of a formality of religious conversion, whereby Gentiles who so wished could be taken into the Jewish community by a single, simple procedure.

The decisive constitutional event of the new community was the covenant subscribed to by its leaders in 444, making the Torah the law of the land: a charter granted by the Persian king Artaxerxes I to Ezra—scholar and priest of the Babylonian Exile—empowered him to enforce the Torah as the imperial law for the Jews of the province Avar-nahra (Beyond the River), in which the district of Judah (now reduced to a small area) was located. The charter required the publication of the Torah and the publication, in turn, entailed its final editing—now plausibly ascribed to Ezra and his circle. Survival in the Torah of patent inconsistencies and disaccords with the postexilic situation indicate that its materials were by then sacrosanct, to be compiled but no longer created. But these survivals made necessary the immediate invention of a harmonizing and creative method of text interpretation to adjust the Torah to the needs of the times. The Levites were trained in the art of interpreting the text to the people; the first product of the creative exegesis later known as Midrash is to be found in the covenant document of Nehemiah, chapter 9—every item of which shows development, not reproduction, of a ruling of the Torah. Thus, with the publication of the Torah as the law of the Jews the basis of the vast edifice of the Oral Law characteristic of Judaism was laid.

Origins of the Oral Law

Concern over observance of the Torah was fed by the gap between messianic expectations and the gray reality of the restoration. The gap signified God's continued displeasure, and the only way to regain his favour was to do his will. Thus it is that Malachi, the last of the prophets, concludes with an admonition to be mindful of the Torah of Moses. God's displeasure, however, had always been signalized by a break in communication with him. As time passed and messianic hopes remained unfulfilled, the sense of a permanent suspension of normal relations with God took hold, and prophecy died out. God, it was believed, would some day be reconciled with his people, and a glorious revival of prophecy would then occur. For the present, however, religious vitality expressed itself in dedication to the development of institutions that would make the Torah effective in life. The course of this development is hidden from view by the dearth of sources from the Persian period. But the community that emerged into the light of history in Hellenistic times is one made over radically by this momentous, quiet process. (Mo.Gr.)

Hellenistic Judaism (4th century BCE–2nd century CE)

THE GREEK PERIOD (332–63 BCE)

Hellenism and Judaism. Actual contact between Greeks and Semites goes back to Minoan and Mycenaean times and is reflected in certain terms in Homer and in other early Greek authors. It is not until the end of the 4th century, however, that Jews are first mentioned by Greek writers, who praise the Jews as brave, self-disciplined, and philosophical.

After being conquered by Alexander the Great (332 BCE), Palestine became part of the Hellenistic kingdom of Ptolemaic Egypt, the policy of which was to permit the Jews considerable cultural and religious freedom.

Hellenizing under Seleucid rule

When in 198 BCE Palestine was conquered by King Antiochus III (247–187 BCE), of the Syrian Seleucid dynasty, the Jews were treated even more liberally, being granted a charter to govern themselves by their own constitution, namely, the Torah. Greek influence, however, was already becoming manifest. Some of the 29 Greek cities of Palestine attained a high level of culture. The mid-3rd century-BCE Zenon papyri—containing the correspondence of a business manager of a high Ptolemaic official—present the picture of a wealthy Jew, Tobiah, who through commercial contact with the Ptolemies acquired a veneer of Hellenism, to judge at least from the pagan and religious expressions in his Greek letters. His son and especially his grandsons became ardent Hellenists. It has been argued that the Hellenic influence was so strong among the Jews of Judaea by the beginning of the 2nd century that if the process had continued without the forcible intervention of the Seleucids in Jewish affairs (see below) Judaean Judaism would have become even more syncretistic than that of Philo, the Hellenistic Jewish philosopher of Alexandria (*c.* 15 BCE–*c.* 40 CE). The apocryphal writer Jesus ben Sirach so bitterly denounced the Hellenizers in Jerusalem (*c.* 180 BCE) that he was forced by the authorities to temper his words.

In the early part of the 2nd century BCE, Hellenizing Jews came into control of the high priesthood itself. Jason as high priest (175–172 BCE) established Jerusalem as a Greek city, Antioch-at-Jerusalem, with Greek educational institutions. His ouster by an even more extreme Hellenizing faction, which established Menelaus (died 162 BCE) as high priest, occasioned a civil war, with the wealthy aristocrats supporting Menelaus and the masses Jason. The Syrian king Antiochus IV Epiphanes, who had initially bestowed exemptions and privileges upon the Jews, intervened upon the request of Menelaus' party. Antiochus' promulgation of decrees against the practice of Judaism and the offensive

The Maccabean revolt

and cruel measures to enforce them led to the revolt of an old priest, Mattathias, and his five sons—the so-called Maccabees or Hasmoneans. It has been conjectured that one of the Dead Sea Scrolls, the *War of the Sons of Light Against the Sons of Darkness,* mirrors the fierceness of this struggle. In any case, the figure of the martyr, as known in Judaism and Christianity—the person who bears witness to the faith through his suffering and death—dates from this event.

The tactics employed both in the countryside and in Jerusalem by the Hasmoneans in their counterattack against Hellenizing Jews, whose children they forcibly circumcised, indicate the inroads that Hellenism had already made. On the whole, however, the chief strength of the Hellenizers lay among the wealthy urban population, while the Maccabees derived their strength from the peasants and urban masses. Yet, there is evidence that the ruthlessness exhibited by the Hasmoneans toward the Greek cities of Palestine had political rather than cultural origins, and that, in fact, they were fighting for personal power no less than for the Torah. In any case, some of those who fought on the side of the Maccabees were idol-worshipping Jews. The Maccabees soon found a modus vivendi with Hellenism: Jonathan (160–142), according to the Jewish historian Josephus (*c.* 38–*c.* 100 CE), negotiated a treaty of friendship with Sparta; Aristobulus (104–103 BCE) actually called himself Philhellene (a lover of Hellenism); Alexander Jannaeus (103–76) hired Greek mercenaries and inscribed his coins with Greek as well as with Hebrew. The Greek influence reached its height under King Herod I of Judaea (37–4 BCE), who built a Greek theatre, amphitheatre, and hippodrome in or near Jerusalem.

Social, political, and religious divisions. During the Hellenistic period the priests were both the wealthiest class and the strongest political group among the Jews of Jerusalem. The wealthiest of all were the Oniad family, who held the hereditary office of high priest until they were replaced by the Hasmoneans; the Temple that they supervised was, in effect, a bank, where the Temple wealth was kept and where private individuals also deposited their money. Hence, from a social and economic point of view, Josephus is justified in calling the government of Judaea a theocracy (rule by those having religious authority). Opposition to the priests' oppression arose among an urban middle class group known as scribes (*soferim*), who were interpreters and instructors of the Torah on the basis of an oral tradition probably going back to the time of the return from the Babylonian Exile (538 BCE and after). A special group of the scribes known as Ḥasidim (Greek, Hasideans), or "Pietists," became the forerunners of the Pharisees (middle-class liberal Jews who reinterpreted the Torah and the prophetic writings to meet the needs of their times) and joined the Hasmoneans in the struggle against the Hellenists, though on religious rather than on political grounds.

Josephus held that the Pharisees and the other Jewish parties were philosophical schools, and some modern scholars have argued that the groupings were primarily along economic and social lines; but the chief distinctions among them were religious and go back well before the Maccabean revolt. The equation of Pharisaic with "normative" Judaism can no longer be supported, at any rate not before the destruction of the Temple in 70 CE. The fact that in 70 CE, according to the Palestinian Talmud (see below *Rabbinic Judaism*), there were 24 types of "heretics" in Palestine indicates that there was, in fact, much divergence among Jews; and this picture is confirmed by Josephus, who notes numerous instances of religious leaders who claimed to be prophets and who obtained considerable followings.

The Pharisees and the Sadducees

Some other modern scholars have sought to interpret the Pharisees' opposition to the Sadducees—wealthy, conservative Jews who accepted the Torah alone as authoritative—as based on an urban–rural dichotomy; but a very large share of Pharisaic concern was with agricultural matters. To associate the rabbis with urbanization seems a distortion. The chief support for the Pharisees came from the lower classes, whether in the country or in the city.

The chief doctrine of the Pharisees (literally "Separatists") was that the Oral Law had been revealed to Moses at the same time as the Written Law. In their exegesis and interpretation of this oral tradition, particularly under the rabbi Hillel at the end of the 1st century BCE, the Pharisees were liberal, and their regard for the public won them considerable support. That the Maccabean ruler John Hyrcanus I broke with them and that Josephus set their number at merely "more than 6,000" at the time of King Herod indicates that they were less numerous and influential than Josephus would have his readers believe. The Pharisees stressed the importance of performing all the commandments, including those that appeared to be of only minor significance; those who were particularly strict in their observance of the Levitical rules were known as *ḥaverim* ("companions"). They believed in the providential guidance of the universe, in angels, in reward and punishment in the world to come, and in resurrection of the dead, in all of which beliefs they were opposed by the Sadducees. In finding a modus vivendi with Hellenism, at least in form and in terminology, however, the Pharisees did not differ greatly from the Sadducees. Indeed, the supreme council of the Great Synagogue (or Great Assembly) of the Pharisees was modelled in its organization on Hellenistic religious and social associations. Because they did not take an active role in fostering the rebellion against Rome in 66–70 CE, they were able, through their leader Johanan ben Zakkai, to obtain Roman permission to establish an academy at Jabneh (Jamnia), where, in effect, they replaced the cult of the Temple with study and prayer.

The Sadducees and their subsidiary group, the Boethusians (Boethosaeans), who were identified with the great landowners and priestly families, were more deeply influenced by Hellenization. The rise of the Pharisees may thus be seen, in a sense, as a reaction against the more profound Hellenization favoured by the Sadducees, who were allied with the philhellenic Hasmoneans. From the time of John Hyrcanus (135–104 BCE) the Sadducees generally held a higher position in comparison with the Pharisees and were in favour with the Jewish rulers. Religiously more conservative than the Pharisees, they rejected the idea of a revealed oral interpretation of the Torah, though, to be sure, they had their own tradition, the *sefer gezerot* ("book of decrees" or "decisions"). They similarly rejected the inspiration of the prophetic books of the Bible, as well as the Pharisaic beliefs in angels, rewards, and punishments in the world to come, providential governance of human events, and resurrection of the dead. For them Judaism centred on the Temple; but about 10 years before the destruction of the Temple in 70 CE, the Sadducees in effect disappeared from Jewish life when the Pharisees excluded them from entering the Temple.

The "people of the land" and converts

Not constituting any particular party were the unlearned rural masses known as *ʿamme ha-aretz* ("people of the land"), who were to be found among both the Pharisees and Sadducees and even among the Samaritans, descendants of the northern Israelites who had their own Torah and their own sanctuary. The *ʿamme ha-aretz* did not give the prescribed tithes, did not observe the laws of purity, and were neglectful of the laws of prayer; and so great was the antagonism between them and the learned Pharisees that to their daughters was applied the biblical verse, "Cursed be he who lies with any kind of beast." The antipathy was reciprocated, for in the same passage in the Babylonian Talmud (*Pesaḥim*) are added the words, "Greater is the hatred wherewith the *ʿamme ha-aretz* hate the scholar than the hatred wherewith the heathens hate Israel." That there was, however, social mobility is clear from the Talmudic dictum, "Heed the sons of the *ʿam ha-aretz,* for they will be the living source of the Torah." That there is little evidence that the early Christian church was particularly successful in converting *ʿamme ha-aretz* suggests that their position was not unbearable.

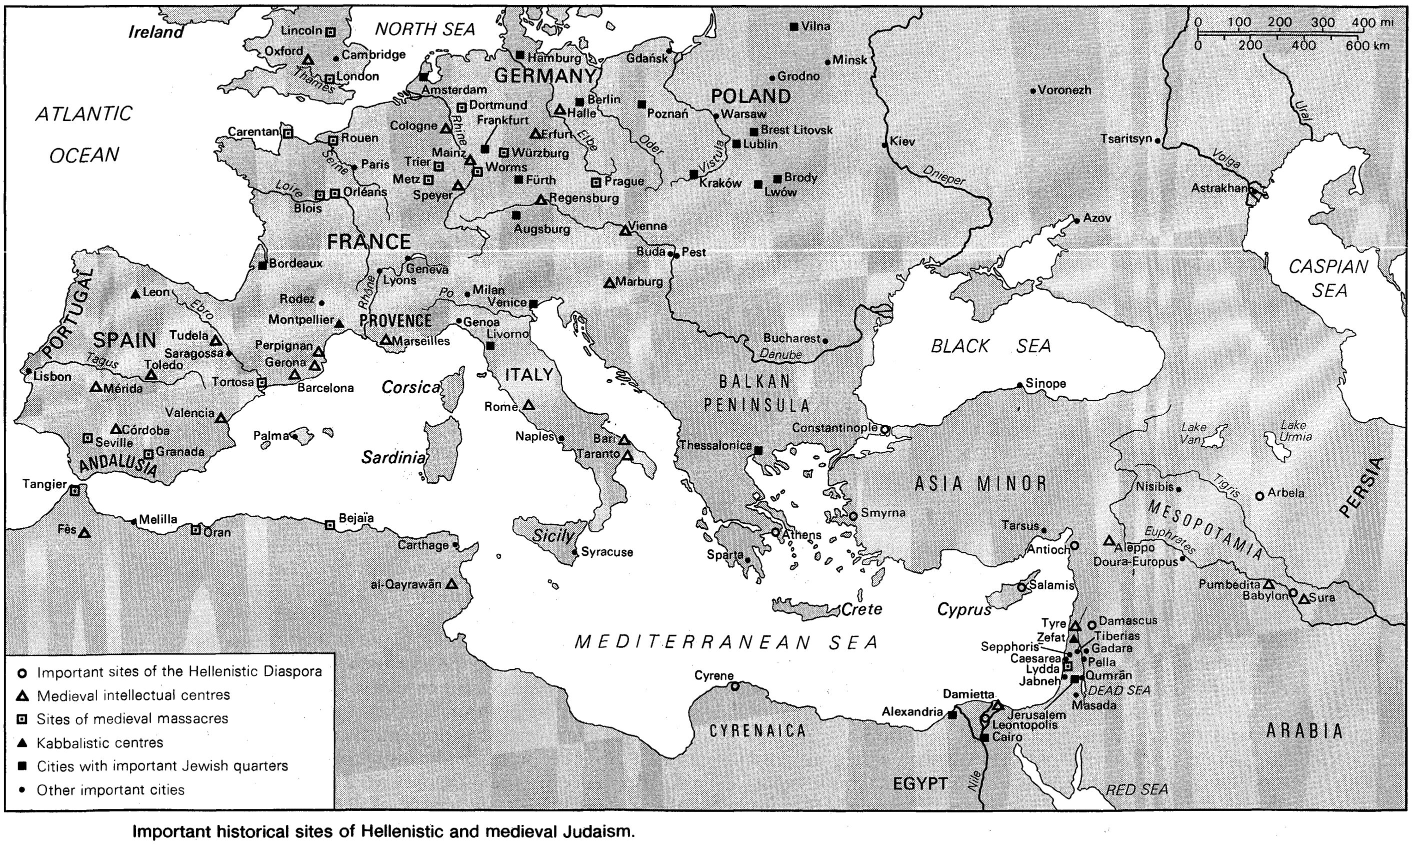
Proselytes (converts) to Judaism, though not constituting a class, became increasingly numerous both in Palestine and especially in the Diaspora (the Jews living beyond Palestine). Scholarly estimates of the Jewish population of this era range from 700,000 to 5,000,000 in Palestine and from 2,000,000 to 5,000,000 in the Diaspora, with the prevailing opinion being that about one-tenth of the population of the Mediterranean world at the beginning of the Christian Era was Jewish. Such numbers represent a considerable increase from previous eras and must have included large numbers of proselytes. Already in 139 BCE the Jews of Rome were charged by the praetor (civil administrator) with attempting to contaminate Roman morals with their religion, presumably an allusion to proselytism. The first large-scale conversions were by John Hyrcanus and Aristobulus, who, in 130 and 103 BCE, respectively, forced the people of Idumaea in southern Palestine and of Ituraea in northern Palestine to become Jews. The eagerness of the Pharisees to win converts is seen in a statement in Matthew that the Pharisees would "traverse sea and land to make a single proselyte." To be sure, some of the proselytes, according to Josephus, did return to their pagan ways, but the majority apparently remained true to their new religion. In addition, there were many "sympathizers" with Judaism who observed one or more Jewish practices without being fully converted.

Outside the pale of Judaism in most, though not all, respects were the Samaritans, who, like the Sadducees, refused to recognize the validity of the Oral Law; and, in fact, the break between the Sadducees and the Samaritans did not occur until the conquest of Shechem by John Hyrcanus (128 BCE). Like the later so-called Qumrān covenanters (the monastic group with whom are associated the Dead Sea Scrolls), they were opposed to the Jewish priesthood and the cult of the Temple, regarded Moses as a messianic figure, and forbade the revelation of esoteric doctrines to outsiders.

Scholars have recently revised an older conception of a "normative" Pharisaic Judaism dominant in Palestine and a deviant Judaism dominant in the Diaspora. On the one hand, the picture of "normative" Judaism is broader than at first believed, and it is clear that there were many differences of emphasis within the Pharisaic party; and, on the other hand, supposed differences between Alexandrian and Palestinian Judaism were not as great as had been formerly thought. In Palestine, no less than in the Diaspora, there were then deviations from Pharisaic standards.

Hellenistic influences on Pharisaic Judaism

Despite the attempts of the Pharisaic leaders to restrain the wave of Greek influence, they themselves showed at least a surface Hellenization. In the first place, as many as 2,500–3,000 words of Greek origin are to be found in the Talmudic corpus, and they supply important terms in the fields of law, government, science, religion, technology, and everyday life, especially in the popular sermons preached by the rabbis. When preaching, the Talmudic rabbis often gave the Greek translation of biblical verses for the benefit of those who understood Greek only. The prevalence of Greek in ossuary (burial) inscriptions and the discovery of Greek papyri in the Dead Sea caves confirm the widespread use of the language, though few Jews, it seems, really mastered Greek. Again, there was a surface Hellenization in the frequent adoption of Greek names, even by the rabbis; and there is evidence (Talmud, *Soṭa*) of a school at the beginning of the 2nd century that had 500 students of "Greek wisdom." Even after 117 CE, when it was prohibited by the rabbis to teach one's son Greek, Rabbi Judah the Prince, the editor of the Mishna (authoritative compilation of the Oral Law) at the end of the 2nd century, remarked, "Why talk Syriac in Palestine? Talk either Hebrew or Greek." Even the synagogues of the period have the form of Hellenistic-Roman basilicas, have frequent inscriptions in Greek, and often have pagan motifs. Many of the anecdotes told about the rabbis have Socratic and Cynic parallels. There is evidence of discussions of rabbis with Athenians, Alexandrians, and Roman philosophers, and even with the emperor Antoninus; but in all of these discussions there is evidence of only one rabbi, Elisha ben Abuyah, who became a Gnostic heretic, accepting certain esoteric religious dualistic views. The rabbis never mention the Greek philosophers Plato or Aristotle or the Hellenistic Jewish philosopher Philo, and they never use any Greek philosophical terms; the only Greek author whom they name is Homer. Again, the parallels between Hellenistic rhetoric and rabbinic hermeneutics are in the realm of terminology rather than of substance, and those between Roman and Talmudic law are inconclusive. Part of the explanation of this may be that, although there were 29 Greek cities in Palestine, none was in Judaea, the real stronghold of the Jews.



Important historical sites of Hellenistic and medieval Judaism.

Religious rites and customs in Palestine: Temple and synagogues. The most important religious institution of the Jews until its destruction in 70 was the Temple in Jerusalem—the Second Temple, erected 538–516 BCE. Though services were interrupted for three years by Antiochus Epiphanes (167–165 BCE) and though the Roman general Pompey desecrated the Temple (63 BCE), Herod lavished great expense in rebuilding it. The high priesthood itself became degraded by the extreme Hellenism of such high priests as Jason and Menelaus; and the institution declined when Herod began the custom of appointing the high priests for political and financial considerations. That not only the multitude of Jews but the priesthood itself suffered from sharp divisions is clear from the bitter class warfare that ultimately erupted in 59 CE between the high priests on the one hand and the ordinary priests and the leaders of the populace of Jerusalem on the other.

Though the Temple remained central in Jewish worship, synagogues may already have emerged during the Babylonian Exile in the 6th century BCE. In any case, in the following century, Ezra stood upon a pulpit of wood and read from the Torah to the people (Nehemiah). According to the interpretation of some scholars, a synagogue existed even within the precincts of the Temple; and certainly by the time of Jesus, to judge from the references to Galilean synagogues in the New Testament, synagogues were common in Palestine. Hence, when the Temple was destroyed in 70, the spiritual vacuum was hardly as great as it had been after the destruction of the First Temple (586 BCE).

The Sanhedrin

The chief legislative, judicial, and educational body of the Palestinian Jews during the period of the Second Temple was the Great Sanhedrin (council court), consisting of 71 members, among whom the Sadducees were an important party. The members shared the government with the king during the early years of the Hasmonean dynasty, but beginning with Herod's reign their authority was restricted to religious matters. In addition, there was another Sanhedrin, set up by the high priest, which served as a court of political council, as well as a kind of grand jury.

Religious and cultural life in the Diaspora. During the Hellenistic–Roman period the chief centres of Jewish population outside Palestine were in Syria, Asia Minor, Babylonia, and Egypt, each of which is estimated to have had at least 1,000,000 Jews. The large Jewish community of Antioch—which, according to Josephus, had been given all the rights of citizenship by the Seleucid founder-king, Seleucus Nicator (died 280 BCE)—attracted a particularly large number of converts to Judaism. It was in Antioch that the apocryphal book of Tobit was probably composed in the 2nd century BCE to encourage wayward Diaspora Jews to return to their Judaism. As for the Jews of Asia Minor, whose large numbers were mentioned by Cicero (1st century BCE), their not joining in the Jewish revolts against the Roman emperors Nero, Trajan, and Hadrian would indicate that they had sunk deep roots into their environment. In Babylonia, in the early part of the 1st century CE, two Jewish brothers, Asinaeus and Anilaeus, were able to establish an independent minor state; their followers were so meticulous in observing the Sabbath that they assumed that it would not be possible to violate the Sabbath even in order to save themselves from a Parthian attack. In the early part of the 1st century CE, according to Josephus, the royal house and many of their entourage in the district of Adiabene in northern Mesopotamia were converted to Judaism; some of the Adiabenian Jews distinguished themselves in the revolt against Rome in 66 (see below).

The Egyptian Diaspora

The largest and most important Jewish settlement in the Diaspora was in Egypt. There is evidence (papyri) of a Jewish military colony at Elephantine (Yeb), Upper Egypt, as early as the 6th century BCE. These papyri reveal the existence of a Jewish temple—which most certainly would be considered heterodox—and some syncretism (mixture) with pagan cults. Alexandria, the most populous and most influential Hellenistic Jewish community in the Diaspora, had its origin when Alexander the Great assigned a quarter of the city to the Jews. Until about the 3rd century BCE the papyri of the Egyptian Jewish community were written in Aramaic; after that, with the exception of the Nash papyrus in Hebrew, all papyri until 400 CE were in Greek. Similarly, of the 116 Jewish inscriptions from Egypt, all but five are written in Greek. The process of Hellenistic acculturation is, thus, obvious.

The most important work of the early Hellenistic period, dating, according to tradition, from the 3rd century BCE, is the Septuagint, a translation of the Pentateuch into Greek. (The translation of the whole Hebrew Bible was completed during the next two centuries.) The fact that, in the *Letter of Aristeas* (see below) and the works of Philo and Josephus, this translation was itself regarded as divinely inspired led to the neglect of the Hebrew original. The translation shows some knowledge of Palestinian exegesis and the tradition of Halakha (the Oral Law); but the rabbis themselves, noting that the translation diverged from the Hebrew text, apparently had ambivalent feelings about it, as is evidenced in their alternate praise and condemnation of it. The fact that such a concept as Torah was translated as *nomos* ("law") and *tzedaqa* as *dikaiosynē* ("justice") opened the way to antilegalism in early Christianity and to Platonic interpretations; and the introduction of such Greek mythological terms as "Titans" and "Sirens" helped to pave the way for the syncretism of Judaism and paganism.

The establishment of a temple at Leontopolis in Egypt (*c.* 145 BCE) by a deposed high priest, Onias IV, indicates that the temple was clearly heterodox; but this temple never really offered a challenge to the one in Jerusalem and was merely the temple of the military colony of Leontopolis. It is significant that the Palestinian rabbis ruled that a sacrifice intended for the temple of Onias might be offered in Jerusalem. That the temple of Onias made little impact upon Egyptian Jewry can be seen from the silence about it on the part of Philo, who often mentions the Temple in Jerusalem. The temple of Onias, however, continued until it was closed by the Roman emperor Vespasian in 73 CE.

The chief religious institutions of the Egyptian Diaspora were synagogues. As early as the 3rd century BCE there were inscriptions mentioning two *proseuchai,* Jewish prayerhouses. In Alexandria there were numerous synagogues throughout the city, of which the largest was so famous that it is said in the Talmud (see below *Rabbinic Judaism*) that he who has not seen it has never seen the glory of Israel.

Egyptian Jewish literature. In Egypt the Jews produced a considerable literature (most of it now lost), intended to inculcate in Greek-speaking Jews a pride in their past and to counteract an inferiority complex that some of them felt about Jewish cultural achievements. In the field of history, Demetrius, near the end of the 3rd century BCE, wrote a work *On the Kings in Judaea*—perhaps intended to refute an anti-Semitic Egyptian priest and author—showing considerable concern for chronology. In the 2nd century BCE a Jew who used the name of Hecataeus wrote *On the Jews.* Another, Eupolemus (*c.* 150 BCE), like Demetrius, wrote *On the Kings in Judaea;* an indication of its apologetic nature may be seen from the fragment asserting that Moses taught the alphabet not only to the Jews but also to the Phoenicians and to the Greeks. Artapanus (*c.* 100 BCE), in his book *On the Jews,* went even further in romanticizing Moses by identifying him with the Greek Musaeus and the Egyptian Hermes-Thoth (god of Egyptian writing and culture) and by asserting that Moses was the real originator of Egyptian civilization and that he even taught the Egyptians the worship of the deity Apis (the sacred bull) and the ibis (sacred bird). In his history, Cleodemus (or Malchus), in an obvious attempt to win for the Jews the regard of the Greeks, asserted that two sons of Abraham had joined Heracles in his expedition in Africa and that the Greek hero had married the daughter of one of them. On the other hand, Jason of Cyrene (*c.* 100 BCE) wrote a history, of which II Maccabees is a summary, glorifying the Temple and violently attacking the Jewish Hellenizers; but his manner of writing history is typically Hellenistic, with emphasis on pathos. III Maccabees (1st century BCE) is a work of propaganda intended to counteract those Jews who sought to win citizenship in Alexandria. The *Letter of Aristeas,* though ascribed to a pagan courtier, Ptolemy II Philadelphus, was probably composed by an Alexandrian

Jew about 100 BCE to defend Judaism and its practices against detractors.

Egyptian Jews also composed poems and plays, now extant only in fragments, to glorify their history. Philo the Elder (*c.* 100 BCE) wrote an epic *On Jerusalem* in Homeric hexameters. Theodotus (*c.* 100 BCE) wrote an epic *On Shechem,* quite clearly apologetic, to judge from the fragment connecting the name of Shechem with Sikimios, the son of the Greek god Hermes. At about the same time, a Jewish poet wrote a didactic poem, ascribing it to the pagan Phocylides, though closely following the Bible in some details; the author disguised his Jewish origin by omitting any attack against idolatry from his moralizing. A collection known as *The Sibylline Oracles,* containing Jewish and Christian prophecies in pagan disguise, includes some material composed by a 2nd-century-BCE Alexandrian Jew who intended to glorify the pious Jews and perhaps to win converts; it is possible that the *Oracles* were known to the Roman poet Virgil when he wrote his fourth *Eclogue.*

A Jewish dramatist of the period, Ezekiel (*c.* 100 BCE), composed tragedies in Greek. Fragments of one of them, *The Exodus,* show how deeply he was influenced by the Greek dramatist Euripides. Whether such plays were actually presented on the stage or not, they edified Jews and showed the pagans that the Jews had as much material for drama as they did.

Alexandrian Jewish philosophical achievements

The greatest achievement of Alexandrian Judaism was in the realm of wisdom literature and philosophy. In a work on the analogical interpretation of the Law of Moses, Aristobulus in the 2nd century BCE anticipated Philo in attempting to harmonize Greek philosophy and the Torah, in using the method of allegory to explain anthropomorphisms in the Bible, and in asserting that the Greek philosophers were indebted to Moses. The Wisdom of Solomon, dating from the 1st century BCE, shows an acquaintance with the Platonic doctrine of the preexistence of the soul and with a method of argument known as *sorites* that was favoured by the Stoics (Greek philosophers). During the same period the author of IV Maccabees showed an intimate knowledge of Greek philosophy, particularly of Stoicism.

By far the greatest figure in Alexandrian Jewish literature is Philo, who has come to be recognized as a major philosopher. His synthesis of Greek philosophy, particularly that of Plato, and of the Torah, and his formulation of the Logos (Word, or Divine Reason) as an intermediary between God and the world, helped lay the groundwork for Neoplatonism (a philosophy dealing with levels of being), Gnosticism (a dualistic religious movement teaching that matter is evil and that spirit is good), and the philosophical framework of the early Church Fathers. Philo was a devotee of Judaism neither as a mystic cult nor as a collateral branch of Pharisaic Judaism; he was a Diaspora Jew with a profound knowledge of Greek literature who, though almost totally ignorant of Hebrew, tried to find a modus vivendi between Judaism and secular culture.

Mention may be made of the Jewish community of Rome. Numbering perhaps 50,000, it was, to judge from the inscriptions in the Jewish catacombs, predominantly Greek-speaking and almost totally ignorant of Hebrew. References in Roman writers, particularly Tacitus and the satirists, have led scholars to conclude that the community—which was influential, to judge from the pagan jibes—observed the Sabbath and the dietary laws and was active in seeking converts.

Modifications of Jewish traditions by Diaspora Jews

The Hellenization of the Diaspora Jews is, however, to be seen not merely in their literature but even more in the papyri and art objects that have recently been studied at great length. As early as 290 BCE, Hecataeus of Abdera, a Greek non-Jew living in Egypt, had remarked that under the Persians and Macedonians the Jews had greatly modified the traditions of their fathers. The fact that—to judge from other papyri—at least three-fourths of the Egyptian Jews had personal names of Greek, rather than Hebrew, origin is significant. That the only schools of which mention is made are Sabbath schools intended for adults and that, on the contrary, Jews were extremely eager to gain admittance for their children to Greek *gymnasia*—where quite obviously they would have to make compromises with their Judaism—indicates their scale of values. Again, there are a number of violations from the norms of Halakha (which precluded the charging of interest for a loan), most notably in the fact that of 11 known extant loan documents only two are without interest. There are often striking similarities between the documents of sale, marriage, and divorce of the Jews and of the Greeks in Egypt, though some of this, as with the documents of the Elephantine Jewish community, may be due to a common origin in the cuneiform law of ancient Mesopotamia. The charms and apotropaic (designed to avert evil) amulets are often syncretistic, and the Jews can hardly have been unaware of the religious significance of symbols that were still very much filled with meaning in pagan cults. The fact that the Jewish community of Alexandria was preoccupied in the 1st century BCE and the 1st century CE with obtaining rights as citizens—which certainly involved compromises with Judaism, including participation in pagan festivals and sacrifices—shows how far they were ready to deviate. Philo mentions Jews who scoffed at the Bible, which they insisted on interpreting literally, and of others who failed to adhere to the biblical laws that they regarded as mere allegory; he writes too of Jews who observed nothing of Judaism except the holiday of Yom Kippur. But despite such deviations, the pagan writers constantly accuse the Diaspora Jews of being "haters of mankind" and of being absurdly superstitious; and Christian writers later similarly attack the Jews for refusing to give up the Torah. At least they were loyal Jews in their contributions of the Temple tax and in pilgrimages to Jerusalem on the three festivals. Actual apostasy and intermarriage were apparently not common, but the virulent anti-Semitism and the pogroms perpetrated by the Egyptian non-Jews must have served as a deterrent.

Palestinian literature. During this period literature was composed in Palestine in Hebrew, Aramaic, and Greek, with the exact language still a subject of dispute among scholars in many cases and with the works often apparently composed by more than one author over a considerable period of time. Most of the works composed in Hebrew, many of them existing only in Greek—Ecclesiasticus, I Maccabees, Judith, *Testaments of the Twelve Patriarchs,* Baruch, *Psalms of Solomon,* Prayer of Manasseh—and many of the Dead Sea Scrolls are generally conscious imitations of biblical books, often reflecting the dramatic events of the Maccabean struggle and often with an apocalyptic tinge (involving the dramatic intervention of God in history). The literature in Aramaic consists of the following: (1) biblical or Bible-like legends or midrashic (interpretive) additions—*Testament of Job, The Martyrdom of Isaiah, Paralipomena of Jeremiah, Life of Adam and Eve,* the Dead Sea *Genesis Apocryphon,* Tobit, Susanna, Bel and the Dragon; and (2) apocalypses—*Enoch* (perhaps originally written in Hebrew), *Assumption of Moses,* the Syriac Baruch, II (IV) Esdras, and *Apocalypse of Abraham.* In Greek the chief works by Palestinians are histories of the Jewish War against Rome and of the Jewish kings by Justus of Tiberias (both are lost) and the history of the Jewish War, originally in Aramaic, and the *Jewish Antiquities* by Josephus (both written in Rome).

Apocalyptic and wisdom literature

Of the wisdom literature composed in Hebrew, the book of the Wisdom of Jesus the Son of Sirach, or Ecclesiasticus (*c.* 180–175 BCE), modelled on the book of Proverbs, identified Wisdom with the observance of the Torah. The *Testaments of the Twelve Patriarchs,* probably written in the latter half of the 2nd century BCE, patterned on Jacob's blessings to his sons, are now thought to belong to eschatological literature related to the Dead Sea Scrolls. The identification of Wisdom and Torah is stressed in the Mishnaic tract *Pirqe Avot* ("Sayings of the Fathers"), which, though edited 200 CE, contains the aphorisms of rabbis dating back to 300 BCE.

Books such as the *Testament of Job,* the Dead Sea Scroll *Genesis Apocryphon,* the *Book of Jubilees* (now known to have been composed in Hebrew, as seen by its appearance among the Dead Sea Scrolls), and *Biblical Antiquities,* falsely attributed to Philo (originally written in Hebrew, then translated into Greek, but now extant only in Latin), as well as the first half of Josephus' *Jewish Antiquities,* often show affinities with rabbinic Midrashim (interpretive works) in their legendary accretions of biblical details. Sometimes, as in *Jubilees* and in the Pseudo-Philo work, these accretions are intended to answer the questions of heretics, but often, particularly in the case of Josephus, they are apologetic in presenting biblical heroes in a guise that would appeal to a Hellenized audience.

Apocalyptic trends, given considerable impetus by the victory of the Maccabees over the Syrian Greeks, were not—as was formerly thought—restricted to Pharisaic circles. They were (as is clear from the Dead Sea Scrolls) found in other groups as well, and are of particular importance for their influence on both Jewish mysticism and early Christianity. These books, which have a close connection with the biblical Book of Daniel, stress the impossibility of a rational solution to the problem of theodicy—how to reconcile the righteousness of God with observable evil. They also stress the imminence of the day of salvation, which is to be preceded by terrible hardships, and presumably reflected the current historical setting. In the book of *Enoch* there is stress on the terrible punishment inflicted upon sinners in the Last Judgment, the imminent coming of the Messiah and of his kingdom, and the role of angels.

The sole Palestinian Jewish author writing in Greek whose works are preserved is Josephus. His account of the war against the Romans in his *Life* and, to a lesser degree, in the *Jewish War* are largely a defense of his own questionable behaviour as the commander of the Jewish forces in Galilee. But these works and more especially *Against Apion* and the *Jewish Antiquities* are largely defenses of Judaism against anti-Semitic attacks. Josephus' *Jewish War* is often quite deliberately parallel to Thucydides' *History of the Peloponnesian War;* and his *Jewish Antiquities* is quite deliberately parallel to Dionysius of Halicarnassus' *Roman Antiquities,* dating from earlier in the same century.

THE ROMAN PERIOD (63 BCE–135 CE)

New parties and sects. Under Roman rule a number of new groups, largely political, emerged in Palestine. Their common aim was to seek an independent Jewish state. All were zealous for, and strict in their observance of, the Torah.

The Herodians and the Zealots

The Herodians were a political group that after the death of Herod—whom they apparently regarded as the Messiah—sought the reestablishment of the rule of Herod's descendants over an independent Palestine as a prerequisite for Jewish preservation. Unlike the Zealots, however (see below), they did not refuse to pay taxes to the Romans.

The Zealots' party, founded *c.* 6–9 CE, refused to pay tribute to the Romans and advocated overthrowing them on the ground that they should acknowledge God alone as their master. A priestly, eschatologically oriented resistance movement, the Zealots were particularly dedicated to keeping the Temple and its cult pure and used guerrilla tactics toward that end. The Sicarii (Assassins), so-called because of the dagger (*sica*) they carried, arose *c.* 54, according to Josephus, as a group of bandits who kidnapped or murdered those who had found a modus vivendi with the Romans. It was they who made a stand at the fortress of Masada near the Dead Sea, committing suicide rather than be captured by the Romans (73).

The Essenes, New Covenanters, and Dead Sea groups

A number of other parties—various types of Essenes, Damascus Covenanters, and the Qumrān Dead Sea groups—were distinguished by their pursuit of an ascetic monastic life, disdain for material goods and sensual gratification, sharing of material possessions, concern for eschatology, strong apocalyptic views in anticipation of the coming of the Messiah, practice of ablutions to attain greater sexual and ritual purity, prayer, contemplation, and study. The Essenes were like the Therapeutae, a Jewish religious group that had flourished in Egypt two centuries earlier, but the latter actively sought "wisdom" whereas the former were anti-intellectual. Only some of the Essenes were celibate. The Essenes have been termed Gnosticizing Pharisees because of their belief, shared with the Gnostics, that the world of matter was evil; some have seen in them the influence of a quasi-monasticism.

The Damascus sect (New Covenanters) were a group of Pharisees who went beyond the letter of the Pharisaic Halakha. Like the Essenes and the Dead Sea sect, they had a monastic type of organization and opposed the way in which sacrifices were offered in the Temple.

The continuing recent discoveries of scrolls in caves of the Dead Sea area have focussed attention on the groups that lived there. On the basis of paleography, carbon-14 testing, and the coins discovered there, most scholars accept a 1st-century date for them. A theoretical relationship of the communities with John the Baptist and the nascent Christian groups remains in dispute, however. The sectaries have been identified variously as Zealots, an unnamed anti-Roman group, and especially Essenes; but a major difference between the Qumrān groups and the Essenes is that the former were militarily activist (the discovery of hymns and a calendar at Masada—a stronghold of the Sicarii—that had previously been found at Qumrān, may indicate a connection between the groups), while the latter were, for the most part, pacifist. That the groups had secret, presumably apocalyptic, teachings is clear from the fact that among the scrolls are some in cryptographic script and reversed writing; and yet, despite their extreme piety and legalistic conservatism, they apparently were not unaware of Hellenism, to judge from the presence of Greek books at Qumrān.

It has long been debated whether the Gnostic systems of the 1st and 2nd centuries go back to the collapse of the apocalyptic strains in Judaism—which expected a final transforming catastrophic event—when the Temple was destroyed in 70. It is doubtful that there is any direct Jewish source for this Gnosticism, though some characteristic Gnostic doctrines are found in certain groups of particularly apocalyptic 1st-century Jews—the dichotomy of body and soul and a disdain for the material world, a notion of esoteric knowledge, and an intense interest in angels and in problems of creation.

Origin of Christianity: the early Christians and the Jewish community. Though it attracted little attention among pagans and Jews at the beginning, the rise of Christianity was by far the most important "sectarian" development of the Roman period. With the revision, largely due to the discoveries at Qumrān, of the view that Pharisaic Judaism was to be considered normative, primitive Christianity, with its apocalyptic and eschatological interests, has come to be viewed by many scholars as no longer "sectarian" or peripheral to Jewish development but, at least initially, as part of a broad spectrum of attitudes within Judaism. Jesus himself, despite his criticisms of Pharisaic legalism, may now be classified as a Pharisee with strong apocalyptic inclinations; he proclaimed that he had no intention of abrogating the Torah, but of fulfilling it. It is possible to envision a direct line between Jewish currents, both in Palestine and the Diaspora in the Hellenistic Age, and Christianity, particularly in the traditions of martyrdom, proselytism, monasticism, mysticism, liturgy, and religious philosophy, especially the doctrine of the Logos (Word) as an intermediary between God and the world and the synthesis of faith and reason. The Septuagint, in particular, played an important role both theoretically, in the transformation of Greek philosophy into the theology of the Church Fathers, and practically, in converting Jews and Jewish "sympathizers" to Christianity. The connection of nascent Christianity with the Qumrān groups may be seen in their dualism and apocalypticism; but there are differences, notably in the conception of the Incarnation, in the relationship of the Son and the Father, and in Jesus' vicarious suffering for sinners as against the direct suffering of the Qumrān Teacher of Righteousness. Again, the Qumrān group constituted an esoteric movement, militant, with enforced community of goods, concerned with strict observance of the Torah, especially with its calendar, whereas Christianity was pacifist, was open to all, and represented a New Covenant, with stress away from the Torah ritual and with voluntary community of possessions. In general, moreover, Christianity was more positively disposed toward Hellenism than was Pharisaism, particularly under the leadership of Paul, a thoroughly Hellenized Jew.

Primitive Christianity a part of the 1st-century Jewish religious spectrum

When Paul proclaimed his antinomianism (against Torah observance as a means of salvation) many Jewish followers of Jesus became Jewish Christians and continued to observe the Torah. Their two main groupings were the Ebionites—probably to be identified with those called *minim,* or "sectaries," in the Talmud—who accepted Jesus as the Messiah but denied his divinity, and the Nazarenes, who regarded Jesus as both Messiah and God, but regarded the Torah as binding upon Jews alone.

The break between Judaism and Christianity

The percentage of Jews converted to any form of Christianity was extremely small, as can be seen from the frequent criticisms of Jews for their stubbornness by Christian writers. In the Diaspora, despite the strong influence of Hellenism, there were relatively few Jewish converts, though the Christian movement had some success in winning Alexandrian Jews.

There were four major stages in the final break between Christianity and Judaism: (1) the flight of the Jewish Christians from Jerusalem to Pella across the Jordan in 70 and their refusal to continue the struggle against the Romans; (2) the institution by the patriarch Gamaliel II of a prayer in the Eighteen Benedictions against such heretics (*c.* 100), and (3 and 4) the failure of the Christians to join the messianic leaders Lukuas-Andreas and Bar Kokhba in the revolts against Trajan (115–117) and Hadrian (132–135), respectively.

Judaism under Roman rule. When Pompey entered the Temple in 63 BCE as an arbiter both in the civil war between Hyrcanus and Aristobulus and in the struggle of the Pharisees against both Jewish rulers, Judaea in effect became a puppet state of the Romans. During the civil war between Pompey and Julius Caesar, the Idumaean Antipater had ingratiated himself with Caesar by aiding him and was rewarded by being made governor of Judaea; the Jews were rewarded through the promulgation of a number of decrees favourable to them, which were reaffirmed by Augustus and later emperors. His son Herod, king of Judaea, an admirer of Greek culture, supported a cult worshipping the Emperor and built temples to Augustus in non-Jewish cities. Since he was by origin an Idumaean, he was regarded by many Jews as a foreigner. (The Idumaeans, or Edomites, were forcibly converted to Judaism by John Hyrcanus; see above.) On several occasions during and after his reign, Pharisaic delegations sought to convince the Romans to end the quasi-independent Jewish government. After the death of Herod's son and successor Archelaus in 6 CE, his realms were ruled by Roman procurators, the most famous or infamous of whom, Pontius Pilate (26–36), attempted to introduce busts of the Roman emperor into Jerusalem and discovered the intense religious zeal of the Jews in opposing this measure. When Caligula ordered the governor of Syria, Petronius, to install a statue of himself in the Temple, a large number of Jews proclaimed they would suffer death rather than to permit such a desecration. Petronius in response succeeded in getting the Emperor to delay. The procurators of Judaea, being of equestrian (knightly) rank and often of Oriental Greek stock, were more anti-Semitic than the governors of Syria, who were of the higher senatorial order. The last procurators in particular were indifferent to Jewish religious sensibilities; and various patriotic groups, to whom nationalism was an integral part of their religion, succeeded in polarizing the Jewish population and bringing on an extremely bloody war with Rome in 66–70. The climax of the war was the destruction of the Temple in 70, though, according to Josephus, the Roman general (and later emperor) Titus sought to spare it. The war was not ended, however, until 73, when the Sicarii at Masada committed suicide rather than submit to the Romans.

Jewish wars against the Romans

The papyri indicate that the war against Trajan (115–117), involving the Jews of Egypt, Cyrenaica, Cyprus, and Mesopotamia (though only to a minor degree those of Palestine), was a widespread revolt under a Cyrenian king-messiah, Lukuas-Andreas, aimed at freeing Palestine from Roman rule. The same spirit of freedom impelled another messiah, Bar Kokhba, who had the support of the greatest rabbi of the time, Akiba, in his spontaneous uprising (132–135). The result was Hadrian's decrees prohibiting circumcision and public instruction in the Torah, though these were soon revoked by Antoninus Pius. Having suffered such tremendous losses on the field of battle, Judaism turned its dynamism to the continued development of the Talmud (see below *Rabbinic Judaism*). (L.H.F.)

Rabbinic Judaism (2nd–18th centuries)

THE AGE OF THE TANNAIM (135–C. 200)

The role of the rabbis. With the defeat of Bar Kokhba and the ensuing collapse of active Jewish resistance to Roman rule (135–136), politically moderate and quietist rabbinic elements remained the only cohesive group within Jewish society. With Jerusalem off limits to the Jews, rabbinic ideology and practice, which were not dependent on Temple, priesthood, or political independence for their vitality, provided a viable program for autonomous community life and thus filled the vacuum created by the suppression of all other Jewish leadership. The Romans, confident that the will for insurrection had been shattered, soon relaxed the Hadrianic prohibitions of Jewish ordination, public assembly, and regulation of the calendar and permitted rabbis who had fled the country to return and reestablish an academy in the town of Usha in Galilee.

The strength of the rabbinate lay in its ability to represent simultaneously the interests of the Jews and the Romans, whose religious and political needs, respectively, now chanced to coincide. The rabbis were regarded favourably by the Romans, as a politically submissive class, which, with its wide influence over the Jewish masses, could translate the Pax Romana (the peace imposed by Roman rule) into Jewish religious precepts. To the Jews, on the other hand, the rabbinic ideology gave the appearance of continuity to Jewish self-rule and freedom from alien interference. The rabbinic program fashioned by Johanan ben Zakkai's circle (see above *Hellenistic Judaism*) had replaced sacrifice and pilgrimage to the Temple with study of Scripture, prayer, and works of piety, thus eliminating the need for a central sanctuary (in Jerusalem) and making of Judaism a religious association capable of fulfillment anywhere. Judaism was now, for all intents and purposes, a Diaspora religion even on its home soil. Any sense of real break with the past was mitigated by continued adherence to purity laws (dietary and bodily) and by assiduous study of Scripture, including those legal sections that historical developments had now made obsolete. The reward held out for scrupulous study and fulfillment was the promise of messianic deliverance; *i.e.,* divine restoration of all those institutions that had become central in Jewish notions of national independence—the Davidic monarchy, Temple service, the ingathering of Diaspora Jewry—and, above all, the assurance of personal reward to the righteous through resurrection and participation in the national rebirth.

The rabbinic way

Apart from the right to teach Scripture publicly, the most pressing need felt by the surviving rabbis was for the reorganization of a recognized body that would reactivate the functions of the former Sanhedrin and pass on disputed questions of law and dogma. A high court was, accordingly, organized under the leadership of Simeon ben Gamaliel (reigned *c.* 135–*c.* 175), the son of the previous patriarch (the Roman term for the head of the Palestinian Jewish community) of the house of Hillel, in association with rabbis representing other schools and interests. In the ensuing struggle for power, the patriarch managed to concentrate all communal authority in his office. The dominating role of the patriarchate reached its zenith in the days of his son and successor, Judah the Prince, whose reign (*c.* 175–*c.* 220) marked the climax of this period of rabbinic activity, otherwise known as the "age of the *tannaim*" (teachers). Armed with wealth, Roman backing, and dynastic legitimacy (which the patriarch now traced to the house of David), Judah sought to standardize Jewish practice through a corpus of legal norms that would reflect recognized views of the rabbinate on every aspect of life. The Mishna (collection of rabbinic law) that soon emerged became the primary source of reference in all rabbinic schools and constituted the core around which the Talmud (commentary on Mishna, literally "teaching") was later compiled. It thus remains the best single introduction to the complex of rabbinic values and practices as they evolved in Roman Palestine.

The Mishna

The making of the Mishna. Although the promulgation of an official corpus represented a break with rabbinic precedent, Judah's Mishna did have antecedents. During the 1st and 2nd centuries CE, rabbinic schools had compiled for their own reference collections in which the results of their exegesis and application of Scripture to problematic situations (Midrash, "investigation" or "interpretation"; plural Midrashim) had been recorded in terse legal form. By 200 CE several such compilations were circulating in Jewish schools and were being utilized by judges. While adhering to the structural form of these earlier collections, Judah compiled a new one in which universally accepted views were recorded alongside those still in dispute, thereby largely reducing the margin for individual discretion in the interpretation of the law. Although his action aroused opposition, and some rabbis continued to invoke their own collections, the authority of his office and the obvious advantages of a unified system of law soon outweighed centrifugal tendencies, and his Mishna attained quasi-canonical status, becoming known as "The Mishna" or "Our Mishna." For all its clarity and comprehensiveness, its phraseology was often obscure or too terse to satisfy all needs, and a companion known as the Tosefta ("Additions") was compiled shortly thereafter in which omitted traditions and explanatory notes were recorded. Since, however, neither compilation elucidated the processes by which their decisions had been elicited, various authorities set about collecting the midrashic discussions of their schools and recording them in the order of the verses of Scripture. During the 3rd and 4th centuries the tannatic Midrashim on the Pentateuch were compiled and introduced as school texts.

Fundamentally legal in character, this literature was designed to regulate every aspect of life—the six divisions of the Mishna on agriculture, festivals, family life, civil law, sacrificial and dietary laws, and purity encompass virtually every area of Jewish experience—and, accordingly, also recorded the principal Pharisaic and rabbinic definitions and goals of the religious life. One tract of the Mishna, *Avot* ("Sayings of the Fathers"), treated the meaning and posture of a life according to Torah, while other passages made reference to the mystical studies into which only the most advanced and religiously worthy were initiated; *e.g.,* the activities of the *Merkava,* or divine "Chariot," and the doctrines of creation (see below, *Jewish mysticism*). The rabbinic program of a life dedicated to study and fulfillment of the will of God was thus a graded structure in which the canons of morality and piety were attainable on various levels, from the popular and practical to the esoteric and metaphysical. Innumerable sermons and homilies preserved in the midrashic collections, liturgical compositions for daily and festival services, and mystical tracts circulated among initiates all testify to the deep spirituality that informed rabbinic Judaism.

THE AGE OF THE AMORAIM: THE MAKING OF THE TALMUDS (3RD–6TH CENTURIES)

Palestine (c. 220–c. 400). The promulgation of the Mishna initiated the period of the *amoraim* (lecturers or interpreters), those teachers who made the Mishna the basic text of legal exegesis. The curriculum now centred on the elucidation of the text of the standard compilation, harmonization of its decisions with extra-Mishnaic traditions recorded in other collections, and the application of its principles to new situations. The records of these amoraic studies have been preserved in the form of two running commentaries on the Mishna known as the Palestinian (or Jerusalem) Talmud ("Teaching") and the Babylonian Talmud, reflecting the study and legislation of the academies of the two principal centres of Jewish concentration in the Roman and Persian empires of that time. (Talmud is also the comprehensive term for the whole collections, Palestinian and Babylonian, containing Mishna, commentaries, and other matter. See below, *The literature of Judaism*)

The rabbinic educational system

The principal agencies mediating the rabbinic way of life and literature to the masses were the schools, ranging from the primary school to the advanced "house of study" and more formal academy (yeshiva), the synagogue, and the Jewish courts, which not only adjudicated litigations but also decided on ritual problems. Primary schools had long been available in the villages and cities of Palestine, and tannaitic law made education of male children a religious duty. Introduced at the age of five or six to Scripture, the student advanced at the age of 10 to Mishna and finally in mid-adolescence to Talmud or the processes of legal reasoning. Regular reading of Scripture in the synagogue on Mondays, Thursdays, the Sabbaths, and festivals, coupled with concurrent translations into the Aramaic vernacular and frequent sermons, provided for lifelong instruction in the literature and the values elicited from it. The amoraic emphasis on the moral and spiritual aims of Scripture and its ritual is reflected in their midrashic collections, which are predominantly homiletical (sermonic) rather than legal in content.

An amoraic sermon conceded that of every thousand beginners in primary school only one would be expected to continue as far as Talmud. In the 4th century, however, there were enough advanced students to warrant academies in Lydda, Caesarea, Sepphoris, and Tiberias (in Palestine), where leading scholars trained disciples for communal service as teachers and judges. In Caesarea, the principal port and seat of the Roman administration of Palestine, where pagans, Christians, and Samaritans maintained renowned cultural institutions, the Jews, too, established an academy that was singularly free of patriarchal control. The outstanding rabbinic scholar there, Abbahu (*c.* 279–320), wielded great influence with the Roman authorities and, because he combined learning with personal wealth and political power, attracted some of the most gifted students of the day to the city. In *c.* 350 the studies and decisions of the authorities in Caesarea were compiled as a tract on the civil law of the Mishna. Half a century later, the academy of Tiberias issued a similar collection on other tracts of the Mishna, and this compilation, in conjunction with the Caesarean material, constituted the Palestinian Talmud.

The role of the patriarchs

Despite increasing tensions between some rabbinic circles and the patriarch, his office was the agency providing a basic unity to the Jews of the Roman Empire. Officially recognized as a Roman prefect, a government official, the patriarch at the same time delegated apostles to Jewish communities to inform them of the Jewish calendar and of other decisions of general concern and to collect an annual tax of a half shekel paid by male Jews for his treasury. As titular head of the Jewish community of the mother country and as a vestigial heir of the Davidic monarchy, the patriarch was a reminder of a glorious past and of a hope for a brighter future. How enduring these hopes were may be seen from the efforts to gain permission to rebuild the Temple in Jerusalem. Although the emperor Julian (reigned 361–363) actually authorized the reconstruction, the project came to naught as a consequence of a disastrous fire on the sacred site and the subsequent death of the Emperor.

The adoption of Christianity as the religion of the empire had no direct effect on the religious freedom of the Jews; *i.e.,* on their freedom to worship and observe their life rules. The ever-mounting hostility between the two religions, however, resulted in severe curtailment of Jewish disciplinary rights over their coreligionists, interference in the collection of patriarchal taxes, restriction of the right to build synagogues, and, finally, upon the death of the patriarch Gamaliel VI in *c.* 425, the abolition of the patriarchate and the diversion of the Jewish tax to the imperial treasury. Though Mediterranean Jewry was now fragmented into disjointed communities and synagogues, the principles of the regulation of the Jewish calendar had been committed to writing *c.* 359 by the patriarch Hillel II, and this, coupled with the widespread presence of rabbis, ensured continuity of Jewish adherence. Even the emperor Justinian's (reigned 527–565) restrictions on synagogal worship and preaching apparently had no devastating effect. A new genre of liturgical poetry, combining ecstatic prayer with didactic motifs, developed in this period of political decline and won acceptance in synagogues in Asia Minor as well as beyond the Euphrates.

Babylonia (200–650). In the increasingly unfriendly climate of Christendom, Jews drew consolation in the knowledge that in nearby Babylonia (then under Persian rule) a vast population of Jews continued to live under a network of effective and autonomous Jewish institutions and officialdom. Steadily worsening conditions in Palestine had drawn many Jews to Persian domains, where economic opportunities and the Jewish communal structure enabled them to gain a better livelihood while living in accordance with their ancestral traditions. To regulate internal Jewish affairs and ensure the steady flow of taxes, the Parthian, or Arsacid, rulers (247 BCE–224 CE) had appointed *c.* 100 CE an exilarch, or "head of the [Jews in] exile"—who claimed more direct Davidic descent than the Palestinian patriarch—to rule over the Jews as a quasi-prince. In *c.* 220 two Babylonian disciples of Judah the Prince, Abba Arika and Samuel bar Abba, began to propagate the Mishna and related tannaitic literature as the yardsticks of normative practice. As heads of the academies at Sura and Nehardea, respectively, Abba and Samuel cultivated a native Babylonian rabbinate, which increasingly provided the manpower for local Jewish courts and other communal services. While the usual tensions between temporal and religious arms frequently erupted in Babylonia, too, the symbiosis of exilarchate and rabbinate endured uninterruptedly until the middle of the 11th century.

The model for Diaspora Judaism

Paradoxically, Babylonian rabbinism derived its ideological strength from its fundamentally unoriginal character. As a transplant of Palestinian Judaism it claimed historic legitimacy to the Sāsānid rulers (224–651), who protected Jewish practices against interference from fanatical Magian priests, and to native Jewish officials, who argued for the validity of indigenous Babylonian deviations from Palestinian norms. But ultimately the historic importance of this transplantation lay in Babylonia's serving as the proving ground for the adaptability of Palestinian Judaism to a Diaspora situation. Legal and theological adaptations generated by needs of the new locale and times inevitably effected changes in the religious tradition. The laws of agriculture, purity, and sacrifices all of necessity fell into disuse. The values embodied in these laws, however, and the core of the legal-theological system—ranging from doctrinal faith in the revelation and election of Israel, to the requirement that the individual live by the canons of Jewish civil and family law, and the establishment of a network of communal institutions modelled on those of the mother country—remained intact, thereby ensuring a basic continuity and uniformity to rabbinically oriented communities everywhere. The real contribution of the Babylonian rabbinate to Jewish religion lay, accordingly, in its demonstration of how Palestinian Judaism was to be implemented on Gentile soil. Since historic circumstances made Babylonia the mediator of this tradition to all Jewish communities in the High Middle Ages (9th–12th centuries), the Babylonian version of Jewish religion became synonymous with normative Judaism and the measure of Judaic authenticity everywhere.

"The law of the [Gentile] government is binding," the principle formulated by Samuel, head of the academy at Nehardea (died 254), summarizes the essential novelty in rabbinic reorientation to life on foreign soil. Whereas Palestinian rabbis had perforce to comply with imperial decrees of taxation de facto—and this was all that Samuel had in mind—Babylonian teachers now rationalized the legitimacy of governmental authority in this respect de jure and thus enjoined upon the Jews political quietism and submissiveness as part of their religious theory. In all other areas of civil law, the Jews were instructed by their rabbis to bring their litigations to Jewish courts and thus to conduct their businesses as well as their family lives by rabbinic law.

While the rabbis could obviously more effectively impose their discipline in matters of public law than in private religious practice, the density of the Jewish population in many areas of Parthia (northeastern Iran) and Babylonia facilitated the application of moral and disciplinary pressures. The most effective vehicle for the dissemination of their teachings was the academies, of which those of Sura and Pumbedita remained preeminent, where judges and communal teachers were trained. Frequent public lectures in the synagogues of the academies on Sabbaths and festivals were capped by public *kalla* (study-course) assemblies for alumni of the schools during the two months, Adar (February–March) and Elul (August–September), when the lull in agricultural work freed many to attend semiannual refresher instruction. These meetings were followed by regular popular lectures during the festival seasons that soon followed. Thus, while rabbis constituted a distinct class within the community, their efforts were oriented toward making as much of the community as possible members of an elite of learning and religious scrupulosity. The harmonious relations that obtained with but few interruptions over the centuries between the Sāsānian rulers and their Jewish subjects gave the Jewish population the air of a quasi-state, which the Jewish leadership frequently extolled as superior to the Jewish community of Palestine.

Redaction of the Babylonian Talmud, *c.* 500–650

The dissemination of the Palestinian Talmud probably stimulated the Babylonians to follow suit by collecting and arranging in similar fashion the records of study and decisions of their own academies and courts. The Babylonian Talmud, which apparently underwent several stages of redaction (*c.* 500–650) on the basis of the proto-Talmuds—the early collections of commentaries on the Mishna—used in the academies, accordingly became the standard of reference for judicial precedent and theological doctrine for all of Babylonian Jewry and all those communities under its influence. As had been the case with the Mishna, the redaction of the Babylonian Talmud was later designated by authorities as marking the end of a period in Jewish history, and the scholars who put the finishing stylistic touches, known as *savoraʾim* ("explicators"), were classified as a transitional stage between the *amoraim* and *geonim* (see below).

The enduring vigour of Jewish faith throughout these centuries is graphically demonstrated by the missionary activity of Jews throughout the ancient Middle East, especially in the Arabian Peninsula. Proud Jewish tribes living in close proximity to each other in the vicinity of Yathrib (later Medina, Muḥammad's home city), engaged in agriculture and commerce and also in proclaiming the superiority of their monotheistic ethos and eschatology (doctrine of last things). In Yemen (southwestern Arabia) the last of the Ḥimyarite rulers (reigned from *c.* 2nd century CE), Dhu Nuwas, proclaimed himself a Jew and finally suffered defeat (*c.* 525) as a consequence of Christian influence on the Abyssinian armies. Jewish missionaries, however, continued to compete with Christian missionaries and thus helped lay the groundwork for the birth of an indigenous Arabic monotheism—Islām—that was to alter the course of world history.

THE AGE OF THE GEONIM (C. 640–1038)

Triumph of the Babylonian rabbinate. The lightning conquests in the Middle East, North Africa, and the Iberian Peninsula by the armies of Islām (7th–8th centuries) provided the environmental framework for the basically uniform (*i.e.,* Babylonian) character of medieval Judaism. As a "people of the Book" (*i.e.,* of the Bible), the Jews were permitted by the Muslims to live under the same autonomous structure that had developed under Arsacid and Sāsānian rule. The heads of the two principal academies were now formally recognized by the exilarch, and through him by the Muslim caliphate (religiopolitical rulers), as the official arbiters of all questions of religious law and as the religious heads of all Jewish communities that came under Muslim sway. Known as *geonim* (plural of *gaon,* "excellency"), and conducting high courts manned by scholars assigned graded ranks, they drew their financial support from Jewish communities assigned to them by the exilarch. Religious questions and contributions were solicited from all Jewish communities, and these along with formal gaonic replies (*responsa*) were regularly publicized at the semiannual *kalla* convocations. Under the strong leadership of Yehudai, *gaon* of Sura (presided 760–763), the Babylonian rabbinate exerted vigorous efforts to replace Palestinian usage wherever it was still in vogue, including the study of Palestinian amoraic legal literature, by Babylonian practice and texts, thus making the Babylonia Talmud the unrivalled standard of Jewish norms everywhere. The success of this campaign is evidenced by the fact that the term Talmud, when unqualified, has ever since meant the Babylonian Talmud. Indeed, even in Palestine the Babylonian corpus displaced its older rival and caused the study of Palestinian Talmudic literature to be confined to circles of legal specialists.

The Karaite movement

Antirabbinic reactions. The firm, and on occasion oppressive, tactics of exilarchs and *geonim* generated antirabbinic reactions, especially in outlying areas where enforcement was difficult, in the form of sectarian and messianic revolts. Inspired in part by ancient Palestinian sectarian doctrines and in part by Muslim usage, the sects were by and large quickly and forcefully suppressed. In the 9th century, however, a moderate group under the leadership of Anan ben David, a disaffected member of the exilarchic family, successfully organized a dissident movement that soon developed into a formidable challenger of Rabbinite (a term first used for the Talmudic adherents by the dissidents) supremacy. Known as Karaites (Scripturalists), the new sect advocated a threefold program of (1) rejection of rabbinic law as a human fabrication and therefore an unwarranted, unauthoritative addition to Scripture, (2) a return to Palestine to hasten the messianic redemption, and (3) a re-examination of Scripture to retrieve authentic law and doctrine. Under the leadership of Daniel al-Qumisi (*c.* 850?), a Karaite settlement prospered in the Holy Land, from which it spread as far as northwestern Africa and Christian Spain. A barrage of Karaite treatises arguing new views of scriptural exegesis stimulated renewed study of the Bible and Hebrew language in Rabbinite circles as well. The most momentous consequence of these new studies was the invention of several systems of vocalization for the text of the Hebrew Bible (Christian Old Testament) in Babylonia and Tiberias in the 9th and 10th centuries. The annotation of the Masoretic (traditional, or authorized) text of the Bible with vocalic, musical, and grammatical accents in the Tiberian schools of the 10th-century scholars Ben Naftali and Ben Asher fixed the Masoretic text permanently and through it the morphology (basic form and structure) of the Hebrew language for Karaites as well as Rabbinites.

In the face of sectarian challenges, the *geonim* intensified their efforts against any deviation from Rabbinite norms and began to issue handbooks of Jewish law that set forth in concise and unequivocal terms the standards for correct practice. A number of these codes, notably the *Halakhot gedolot* ("Great Laws"), *Siddur Rav Amram Gaon* (on liturgical practice), and *She*ʾ*eltot* ("Disquisitions") by Aḥa of Shabḥa (*c.* 680–*c.* 752), attained authoritative status in local schools and further helped give a unitary stamp to medieval Judaism.

Secular culture and philosophy

The *geonim,* however, were powerless to halt several social developments in the 9th century that progressively undermined their hold even over Rabbinite communities. A renascence of Greek philosophy and sciences in Arabic translation, coupled with the progressive urbanization of the upper classes of all religioethnic groups in the centres of political, commercial, and cultural activity, generated a new intelligentsia that cut across religioethnic lines. Widespread skepticism in basic doctrines of faith such as creation, revelation, and retribution was most poignantly represented by latitudinarianism (the tendency to be flexible and tolerant about deviations from orthodox beliefs and doctrines) and by antinomian (anti-Mosaic-law) Gnostic groups that negated divine providence and omniscience. Ḥiwi al-Balkhī, a 9th-century skeptical Jewish pamphleteer, scandalized the faithful by an open attack on the morality of Scripture and by an expurgated edition of the Bible for schools that omitted "offensive" materials (*e.g.,* alleged stories of God acting dishonestly). A mystifying Hebrew tract entitled *Sefer yetzira* ("Book of Creation") posited in terse and enigmatic epigrams a novel theory of creation that betrayed unmistakable Neoplatonic influence. Karaites joined philosophically oriented intellectuals in heaping scorn on popular Rabbinite customs that smacked of superstition and, above all, on Talmudic homilies that referred to God in anthropomorphic terms.

Gaonic difficulties were compounded by the rise in North Africa and Spain of populous and wealthy Jewish communities that, thanks to the development of their own local schools and native talent, ignored the Babylonian academies or favoured one over the other with religious queries and, in consequence, with financial contributions. To the delight of dissidents and the chagrin of the faithful, competition between the Babylonian academies turned to internecine hostility. Occasional revolts against exilarchic taxation and administration in outlying areas of Persia had to be quelled with armed force. The Palestinian Rabbinites had revived their own academies, and their presidents now not only appealed for support in other Diaspora lands but challenged the authority of the Babylonians to serve as final arbiters on such matters of public import as the regulation of the calendar. By 900 the Rabbinite community of Babylonia was in a state of chaos and dissolution.

The gaonate of Saʿadia ben Joseph. In a bold effort to restore discipline and respect for the gaonate, an able exilarch, David ben Zakkai (916/917–940), bypassed the families from whom the *geonim* had traditionally been selected and in 928 appointed Saʿadia ben Joseph al-Fayyumi to head the academy of Sura. Of Egyptian birth, Saʿadia had gained wide acclaim for his scholarly retorts to Karaites, heretics, and Palestinian Rabbinites. Politically, Saʿadia's brief presidency was a fiasco and aggravated the chaos by a communal civil war. His gaonate, however, gave an official stamp to his many works, which responded to the ideological challenges to Rabbinism by restating traditional Judaism in intellectually cogent terms. Saʿadia thus became the pioneer of a Judeo-Arabic culture that was to come to full flower in Andalusian Spain a century later (see below *Sefardic developments*). His translation of the Bible into Arabic and his Arabic commentaries on Scripture made the rabbinic understanding of the Bible accessible to masses of Jews. His poetic compositions for liturgical use provided the stimulus for the revival of Hebrew poetry. Above all, his rationalist commentary on the puzzling "Book of Creation" and his brilliant philosophic treatise on Jewish faith, *Beliefs and Opinions,* synthesized Torah (the divine law in the Five Books of Moses and the rabbinic understanding of this revelation) and "Greek wisdom" in accordance with the dominant Muslim philosophical school of Kalām and thus made Judaism philosophically respectable and the study of philosophy a religiously acceptable pursuit.

Gaonates of Sherira and Hai

Far from tightening the gaonic hold over the Jewish communities of the Arabic world, Saʿadia's works actually provided the wherewithal for ever-greater intellectual and religious self-sufficiency. While economic, political, and military upheavals progressively weakened all institutional fabrics in the Middle East, concurrent prosperity and consolidation in the West stimulated the maturation of indigenous leadership in Egypt, al-Qayrawān (Kairouan; in present-day Tunisia), and Muslim Spain. To be sure, able *geonim* such as Sherira and his son Hai exercised enormous influence over the Judeo-Arabic world through hundreds of legal *responsa* issued in the course of their successive terms (968–1038) at Pumbedita. Circumstances beyond anyone's control, however, were bringing the curtain down on the effectiveness of exilarchate and gaonate. But by 1038, the year of Hai's death, the consequences of four centuries of gaonic activity had become indelible: the Babylonian Talmud had become the agent of basic Jewish uniformity; the synthesis of philosophy and tradition had become the hallmark of the Jewish intelligentsia; and the Hebrew classics of the past had become the texts of study in Jewish schools everywhere.

MEDIEVAL EUROPEAN JUDAISM (950–1750)

The two major branches. Despite the fundamental uniformity of medieval Jewish culture, the cultural–political divisions within the Mediterranean basin, in which Arabic-Muslim and Latin-Christian civilizations coexisted as discrete and self-contained societies, shaped the character of the Jewish subculture of the area. Two major branches of rabbinic civilization developed in Europe, the Ashkenazic, or Franco-German, and the Sefardic, or Andalusian-Spanish. Distinguished most conspicuously by their varying pronunciation of Hebrew, the numerous differences between them in religious orientation and practice derived, in the first instance, from the geographical fountainheads of their culture—the Ashkenazim (plural of Ashkenazi) tracing their cultural filiation to Italy and Palestine and the Sefardim (plural of Sefardi) to Babylonia—and from the influences of their respective immediate milieus. While the Jews of Christian Europe wrote for internal use almost exclusively in Hebrew, those of Muslim areas regularly employed Arabic for prose works and Hebrew for poetic composition. Whereas the literature of Jews in Latin areas was overwhelmingly religious in content, that of the other branch was well endowed with secular poetry and scientific works inspired by the cultural tastes of the Arabic literati. Most significantly, the two forms of European Judaism differed in their approaches to the identical rabbinic base that both had inherited from the East and in their radically different attitudes to Gentile culture and politics.

The Golden Age of Jewish Arabic and Hebrew culture

Sefardic developments. In Muslim Spain, Jews frequently served the government in official capacities and, therefore, not only took an active interest in political affairs but also engaged in considerable social and intellectual intercourse with influential circles of the Muslim population. Since the support of letters and scholarship was part of state policy in Muslim Spain, and since Muslim savants traced the source of Muslim power to the vitality of the Arabic language, scripture, and poetry, Jews looked at Arabic culture with undisguised admiration and unabashedly attempted to adapt themselves to its canons of scholarship and good taste. The hallmark of the cultured Jew accordingly became a polished command of Arabic style and the ability to display the beauty of his own heritage through a philological mastery of the text of the Hebrew Bible and through the composition of new Hebrew verse, now set to an alien Arabic metre. Since Arabic philosophers and scientists promulgated syntheses of Greek philosophy with the revelation to Muḥammad, rationalist study of the Jewish classics and defense of rabbinic faith in philosophic terms became dominant motifs in the Andalusian Jewish schools (in southern Spain).

The atmosphere generated a fever of literary creativity in classical Jewish disciplines as well as in the sciences cultivated by the Arabs that has gained for the period the title of "the Golden Age of Hebrew literature" (*c.* 1000–1148). What distinguished the Jewish culture of this age was not only the supreme literary merit of its Hebrew poetry, the new spirit of relatively free and rationalist examination of hallowed texts and doctrines, and the extension of Jewish cultural perspectives to totally new horizons—mathematics, astronomy, medicine, philosophy, political theory, aesthetics, belles-lettres—but also the frequent overlapping of the Sefardic religious leadership with the new Jewish courtier class. The unprecedented heights which the latter attained—Ḥisdai ibn Shaprut as counsellor to the caliphs of Córdoba, the Ibn Nagrelas as viziers of Granada, the Ibn Ezras, Ibn Megashs, and Ibn Albalias as high officials in Granada and Seville—and the distinctions of these men and of their protégês in Jewish and worldly letters restored the ancient integration of culture and practical life and generated a neoclassicism ("classicism" here meaning biblicism) that expressed the identification of the Jewish elite with the biblical age of Jewish power and artistic creativity. The effort to recapture the vitality and beauty of biblical poetry stimulated comparative philological and fresh exegetical research that yielded new insights into the morphology of the Hebrew language and into the historical soil of biblical prophecy. Judah ibn Ḥayyuj and Abū al-Walīd Marwān ibn Janāḥ produced manuals on biblical grammar that applied the results of Arabic philology to their own tongue and that have, accordingly, provided the principles of Hebrew grammatical study down to modern times. The anticipations of modern higher biblical criticism by Judah ibn Balaʿam and Moses ibn Gikatilla (flourished 11th century) were popularized in Hebrew a few generations later by Abraham ibn Ezra. In the revival of Hebrew poetry, liturgical as well as secular, that translated the new preoccupation with language and beauty into art, Andalusian Jewry saw its greatest achievements. Solomon ibn Gabirol, Moses ibn Ezra, and Judah ha-Levi were but the acknowledged supreme geniuses of a form of expression that became a passion with thousands the length and breadth of Spain. But by far the most enduring consequence of the new temper was their redefinition of religious faith in the light of Greco-Arabic philosophical theories. Solomon ibn Gabirol's exposition of faith in Neoplatonic terms, Abraham ibn Daud's defense of Rabbinism by Aristotelian categories, Judah ha-Levi's attack on philosophy as religiously bankrupt, and Moses Maimonides' epoch-making synthesis of Judaism and medieval Aristotelianism fixed philosophic inquiry as an enduring subject on the agenda of rabbinic concerns. A new class of philosophers that emerged in the 13th century and sponsored the translation of Arabic literature into Hebrew and of Hebrew and Arabic literature into Latin brought Jews and their thought into the mainstream of Western philosophy and gained for them the position of middlemen of culture between East and West.

Influence of Greco-Arabic philosophy

The salient trends of Sefardic Judaism did not imply relegation of the rabbinic class to a second place. Rather they shaped a fresh approach to rabbinic texts that paralleled in many respects those adopted in biblical exegesis. Strict adherence to consistency, systematization, and philological exactitude yielded new codes that often diverged from gaonic judgments. A digest of Talmudic law by Isaac Alfasi placed the Sefardic rabbinate on a self-reliant footing and epitomized its ideal of getting at the essentials of Talmudic law by sidestepping contingent discussions. In this area, too, it was Moses Maimonides who through his code of Jewish law, *Mishne Torah,* brought the Sefardic principles of comprehensiveness, lucidity, and logical arrangement to their apex. Written in Mishnaic Hebrew, the work remains to this day the only comprehensive treatment of all of Jewish law, including those fields that are not applicable in the Diaspora (agriculture, purity, sacrifices, Temple procedure).

With Maimonides, however, the pure Sefardic tradition came to an end, for the Almohad (Berber Muslim reformers) invasion of Spain in 1147–48 wiped out the Jewish communities of Andalusia and drove thousands either to northern Spain and Provence or, as in the case of Maimonides' family, to North Africa and Egypt. Sefardic Jewry suddenly encountered a discrete, mature, Jewish culture that for centuries had been developing independently and along quite different lines.

Ashkenazic developments. The spokesmen of Ashkenazic Jewry, into whose communities the Sefardim had been thrust by political events, regarded their own heritage and the Christian world in which they lived from a perspective shaped exclusively by rabbinic categories. From the world of the Talmud and Midrash they drew their school texts and the values that determined their judgments. Sensing no intellectual challenge in Christian faith, which they regarded with thinly concealed contempt, they constituted for the most part a merchant class that lived in urban centres under the protection of ecclesiastical and temporal rulers but under their own complex of laws and institutions. Except for mercantile relations, Christian society was closed to them, thanks largely to age-old ecclesiastical prohibitions forbidding all social intercourse with them. With the Arab conquest and the rise of the Carolingians (the 8th–10th-century dynasty that ruled France and Germany), the 12-decade interlude of suppression by the Visigoths (589–711) came to an end, and the Roman precedent of toleration and autonomy again became the rule. Merchants and rabbis moved from Italy to France and the Rhineland and infused new energies into the Jewish communities there. A native religious leadership began to emerge at the very time that Andalusian Jewry was entering its Golden Age. The bloody upheavals of the First Crusade (1096–99) in the communities of the Rhineland, although unleashing a tide of hatred, periodic violence, and progressive restrictions on Jewish activities, struck Jewish communities that had attained sufficient resilience to reestablish their communal institutions shortly afterward and continue the cultivation of their deeply ingrained traditions.

Ashkenazic cultural and religious patterns

By 1150 Ashkenazic Jewry had generated a culture pattern of its own with an indigenous literature that ranged from the popular homily to the esoteric tract on the nature of the divine glory. Study of the Bible and Talmud was oriented toward a mystical pietism in which prayer and contemplation of the secrets embedded in the liturgy were to lead to religious experience. Significantly, the fathers of the Ashkenazic tradition were remembered as liturgical poets and initiates into divine mysteries, and the early codes of the Franco-German schools were heavily weighted with discussions of liturgical usage. After the Second Crusade (1147–49), the German Jewish mystics (also called Ḥasidim, or pietists) placed heavy emphasis on the merits of asceticism, martyrdom and lifelong disciplines of penitence, thus adapting to Jewish idiom the features of saintliness celebrated in the universe of discourse of which they were a part. For the masses of Jews the cultural fare consisted principally of biblical tales and instruction, as interpreted by rabbinic Midrash, the lives of scholars and saints, and liturgical poetry reaffirming the election of Israel and faith in messianic redemption. The chief vehicle of popular instruction consisted of anthologies from the Rabbinic writings and commentaries on Scripture, of which the most popular was that of Rabbi Solomon ben Issac of Troyes, known as Rashi, the acronym formed from the initials of his name in Hebrew. For the more advanced student, Rashi composed a succinct commentary on the Talmud that, unmatched for compact thoroughness and lucidity, achieved an authority approaching that of the text itself.

As living sources of law and values, the Bible and Talmud had an impact that was apparent in communal decision and in the bearing of the leadership at home, in the marketplace, and in the synagogue. Taking their cue from Talmudic precedent and from Christian ecclesiastical procedures of their own times, the Ashkenazic rabbis occasionally gathered in regional synods to enact legislation on problems of a general nature for which there was no adequate precedent in the literature. Among the most enduring of these measures were the prohibition of bigamy and arbitrary divorce and severe economic penalties for abandonment of wives. Of far more immediate concern to the average Jew were the circumvention of Talmudic prohibitions against usury, relaxation of prohibitions regarding traffic with Gentiles in wines, and adoption of severe disciplinary measures, such as excommunication, against informers or those appealing, in cases involving Jews, to the Gentile authorities.

The rise and spread of Kabbala

A new religious trend began in Provence (a province of southeastern France) in the 13th century with the introduction into the Talmudic academies of a novel form of mystical study known as Kabbala (literally, "tradition"), which soon spread to northern Spain. Expressing Gnostic-type doctrines in rabbinic guise, the devotees of Kabbala devised an esoteric vocabulary that reinterpreted the Bible and rabbinic law as allegories of the various modes in which God is manifested in a spiritual universe, access to which was reserved for initiates. The most renowned literary product of this new circle was the *Zohar* ("The Book of Splendour"), a vast mystical commentary on the Pentateuch by Moses de León (*c.* 1275), which with later additions became the Bible of Jewish mystics everywhere. Although some of the theological notions of the Kabbalists deviated from basic postulates of Jewish monotheism, the insistence of the mystics on unflagging ritual orthodoxy and on a nominal acceptance of the biblical text as divine revelation helped them avert the suspicions aroused by Jewish Aristotelians and Averroists (followers of the 12th-century Arabic Aristotelian philosopher Averroës) and, in time, even won for them the status of a rabbinic elite. Indeed, some of the mystics lent their support to the antiphilosophic campaign that began in Montpellier, in southern France, *c.* 1200 and condemned the study of philosophy as generating skepticism, latitudinarianism, and disrespect for traditional literature. (For a fuller discussion of Kabbala see below, *Jewish mysticism.*)

Conflicts, disasters, and new movements. Basically, the conflict between "fundamentalist" and philosopher in Provence and northern Spain represented a clash between two mature Jewish subcultures of diverse geographic origins, the Sefardic and Ashkenazic, each of which had in the course of centuries developed different esoteric doctrines to transcend the legalistic formalism and confining dogmas of normative Judaism. Both forms of speculation sought salvation for exceptional individuals through knowledge and thus provided an immediate substitute for messianic deliverance from exile and servitude. Each group charged the other with distortion of tradition, and each issued apologias (defenses or justifications) and excommunications characteristic of medieval doctrinal controversy. While the rifts within communities attained bitter proportions, the common threat posed by ecclesiastical attacks on the Talmud in public disputations and by the expulsion of the Jews from France in 1306 prevented open rupture or resolution of the conflict. Ever since that time, two strands of orthodoxy representing the two forms of medieval metaphysical speculation have lived side by side in an uneasy truce.

Jews, longing for a return to the Holy Land, point to a visionary Jerusalem, which is depicted in the Gothic style of Christian church architecture. The Jews are shown with the pointed hats they were required to wear to distinguish them from Christians, and are represented with birds' heads, since they felt it was sacrilegious to depict the human form in sacred objects. Illustration from the Birds' Head Haggada, an illuminated manuscript from southern Germany, *c.* 1300.

Most rabbinic circles of the 14th and 15th centuries displayed a progressive dogmatism and insistence on uniformity of practice. The great legal code of Jacob ben Asher of Toledo, *Arbaʿa ṭurim* (*c.* 1335; "Four Rows"), which sought to level differences in usage between Ashkenazim and Sefardim, bespoke the dominant trend of the rabbinate. The increasing hardening of ideological lines, however, did not eliminate independent thinking. Gersonides (Levi ben Gershom) gave Jewish Aristotelianism a new and comprehensive formulation, while Isaac Albalag propounded an Averroist (rationalistic) interpretation of the Bible predicated on a theory of double truth (of reason and revelation). In Muslim areas, the Maimonidean regimen of philosophic contemplation was extended by Maimonides' son Abraham to a quest for pietist ecstasy that betrayed many features of Ṣūfism (Islāmic mysticism).

Anti-Jewish riots and massacres of 1391 and a wave of apostasy in the wake of the disputation of Tortosa (1411–14)—which ended with a papal bull forbidding Talmud study, compelling attendance at Christian sermons, and other onerous measures—struck catastrophic blows in the Spanish communities and fed the anti-intellectualism of

Adversity and response: mysticism, messianism, rationalism

the rabbinate. Hasdai Crescas, while conceding the philosophic untenability of traditional belief in freedom of the will, launched a scathing attack on Aristotelian approaches to religion, and his disciple Joseph Albo issued a compendium on dogma that reaffirmed the traditional postulates of divine creation, revelation, and retribution as axioms of Judaism. But these reassertions of traditional faith could not overcome the ideological and social fragmentation that had split the Spanish communities into congealed strata that were often in open conflict with each other. Widespread marranism (ostensible conversion to Christianity) polarized the community and left deposits of bitterness that extended to those returning to the fold. The expulsions from Spain (1492) and Portugal (1497 and 1506) dealt the final blow and drove the escaping leadership into intensified pursuits of mystical escape from, and rationalization of, the endless calamities that befell their flocks. In Italy and the Ottoman Empire (Asia Minor, northeastern Africa, and southeastern Europe), the two principal centres of refuge for the exiles of the Iberian Peninsula, legalistic Kabbalism, which insisted on strict observance of the law as precondition of mystical practice and study, became the dominant spirit of a rabbinic leadership that in the face of terribly adverse circumstances continued to produce works of encyclopaedic proportions and staggering erudition in every field of Jewish learning.

Inspired by the Jewish tradition that the messianic era—when the messiah would come to bring in the rule of God—would be preceded by horrendous catastrophes, a group of single-minded rabbis established a community in Ẕefat (Safed), Palestine, where in anticipation of the new dawn all of life was to be conducted on principles of saintliness and mystical contemplation. Under the leadership of one Jacob Berab, the ancient practice of ordination was reinstituted in 1538 to form the nucleus of a revived Sanhedrin so as to administer ritual procedures requiring ordained authorities. While the effort failed because of rabbinic opposition, it reflected a widespread temper and further fanned messianic hopes sparked shortly before by the campaigns of tragic consequences by David Reubeni and Solomon Molkho in Italy, which ended in their being burned at the stake by the Christian authorities. In Ẕefat itself Kabbalism soon entered a new phase under the inspiration of Isaac Luria and Ḥayyim Vital, who confided to their disciples that the calamities of Israel were but a mirror of the captivity into which many sparks of the Godhead itself had fallen. Liturgical innovations and a novel mystical theology were formulated to redeem the imprisoned elements of divinity and thus restore creation to the harmony intended for it (see also below, *Jewish mysticism*).

That the Almighty himself was not quite omnipotent, at least with respect to the fate of his chosen people, was cautiously hinted in a Hebrew work of history (1550) by Solomon ibn Verga, who saw the Jewish problem as a sociopolitical one to which theological answers were futile. Such guarded rationalism was entertained by a number of courageous thinkers in 16th-century Italy, where, despite the policy of ghettoization (the segregation of the Jewish community in a restricted quarter) begun by Venice in 1516 and soon extended to all major Italian cities, the spirit of the Renaissance and the passion for historical criticism had captivated many Jews. Catholic scholars and prelates occasionally employed rabbis to instruct them in the Hebrew language and in the secrets of the Kabbala, which some Christians believed actually verified the postulates of their own faith. Contacts with Christian scholars in turn introduced Jews like Azariah dei Rossi, whose *Meor ʿenayim* ("Enlightenment of the Eyes") inaugurated critical textual study of rabbinical texts, to new bodies of literature that had been lost to the Jewish community, such as the works of Philo and Josephus (see above *Hellenistic Judaism*).

The Shabbetaian debacle

Such phenomena, however, were decidedly in the minority and contrary to the dominant trend. Dogmatic Kabbalism spread progressively and finally came to social expression in 1666 with the widespread acceptance of the views of the pseudo-messiah Shabbetai Tzevi (Sabbatai Zevi). Most of European and Ottoman Jewry was swept into a hysterical pitch in the belief that the end was now finally at hand. When the pseudo-messiah converted to Islām after being apprehended by the Ottoman government, mass despondency took the form of crypto-Shabbetaianism in which the apostasy of the messiah was explained as a form of voluntary crucifixion for the sake of the Jews. A witch-hunt on the part of traditionalists to uncover the cells of heresy unsettled Jewish communities everywhere by an emphasis on greater rigidity than before.

The following century (to *c.* 1750) was the darkest in the history of rabbinic Judaism. Scholarship reached an ebb of quality and popular religion a mechanical state such as Jews had never before experienced. The massacres and impoverishment of Polish Jewry after 1648 brought a pall over the growing eastern European centres of Jewish life. Antinomian eruptions of extreme Shabbetaians under the leadership of the self-proclaimed messiah and later Catholic convert Jacob Frank (1726–91) alarmed Gentile authorities almost as much as they did Jews. But the fossilization referred to above was only apparent. Beneath the surface many were restlessly searching for new avenues of faith, and the 18th century saw fresh responses that set the history of the Jews and of Judaism on new directions and spelled the beginnings of a new era. (G.D.C.)

Modern Judaism (c. 1750 to the present)

THE NEW SITUATION

The various criteria used to mark off dividing points in the history of the Jews and Judaism (see above *General observations*) are especially notable when it comes to setting a starting date for the modern period. Historians of thought put it in the late 17th century with the appearance of men, such as the philosopher Benedict de Spinoza, who ceased, in part or in toto, to believe in the inherited faith without at the same time ceasing to be Jews (*i.e.,* to consider themselves and be considered as Jews). Some Israeli scholars set it at about 1700 with the first stirrings of that new and continuing emigration from the Diaspora to the Holy Land that culminated in the mid-20th century in the creation of the State of Israel. Political and social historians set it in the mid- and late-18th-century processes that led to the American and French revolutions and to the results that flowed from these two epochal events, among them the emancipation of Jews from discriminatory and segregative laws and customs, the attainment of legal status as citizens, and the freedom of individual Jews to pursue careers appropriate to their talents. These varying approaches appear to have one thing in common—the view that these postmedieval forms of Jewish experience assume the end of the doctrine of the Exile, whereby Jews saw themselves as a people waiting out centuries of woe in alien lands until the moment of divine redemption. Jewish modernity for most scholars, then, is marked by the end of a passive waiting on the Messiah and the beginning of an active pursuit of personal or national fulfillment on this earth and preferably in one's lifetime.

Although the 18th century Haskala (Enlightenment) among the Ashkenazim of central and eastern Europe is often taken as the starting point of Jewish modernity, the process of Westernization had begun a good deal earlier among the Sefardim in western Europe and Italy. The Marranos who went to such communities as Amsterdam and Venice in the 17th century to declare themselves as Jews carried with them the Western education that they had acquired while living as Christians in the Iberian Peninsula, and the habits of criticism that had kept them from assimilating into the majority during their Marrano years and that some, such as Spinoza, a son of Marranos, used in analyzing all of the biblical tradition, including especially their own religion. In Italy there was an older Jewish community that had never been sealed off culturally from the influence of its environment; some of its figures were influenced by, and participated in, the main currents of the Renaissance (see above *Rabbinic Judaism*).

Increased contact with Western languages, manners, and modes of living came to the Ashkenazim only in the 18th century when new economic opportunities created such possibilities and needs. Jewish bankers and factors in various German principalities, army provisioners in most of the European countries, capitalists who were permitted to live in such places as Berlin because they opened new factories or were otherwise helpful to the expansion of the economy—all were in increasing contact with Gentile society, and most of them began to look upon the goal of their lives as the winning of full acceptance. Around this wealthy element there arose a number of intellectuals who agitated for the end of ghetto ways as the necessary preamble to the emancipation of the Jews.

THE HASKALA, OR ENLIGHTENMENT

The role of Moses Mendelssohn

In central Europe. By far the most outstanding figure of the 18th-century Jewish Enlightenment was the philosopher Moses Mendelssohn, who, while remaining a devoted adherent of Orthodox Judaism, turned away from the traditional Jewish preoccupation with the Talmud and its literature to the intellectual world of the European Enlightenment, of which he became the foremost Jewish representative. Mendelssohn did not attempt a philosophical defense of Judaism until pressed to do so by Christians who questioned how he could remain faithful to what they saw as an unenlightened religion. In his response, *Jerusalem,* published in 1783, Mendelssohn defended the validity of Judaism as the inherited faith of the Jews by defining it as revealed divine legislation and declared himself at the same time to be a believer in the universal religion of reason, of which Judaism was but one historical manifestation. Aware that he was accepted by Gentile society as an "exceptional Jew" who had embraced Western culture, Mendelssohn's message to his own community was to become Westerners, to seek out the culture of the Enlightenment. To that end he joined with a poet, Naphtali Herz (Hartwig) Wessely, in translating the Torah into German, combining Hebrew characters with modern German phonetics in an effort to displace Yiddish, and wrote a modern biblical commentary in Hebrew, the *Beʾur* ("Commentary"). Within a generation, Mendelssohn's Bible was to be found in almost every literate Jewish home in central Europe and had served to introduce its readers to German culture. Through his personal example and his life's work Mendelssohn made it possible for his fellow Jews to join the Western world without sacrificing their Judaism; he had convinced them that their intellectual processes were those of universal reason, with which Judaism accorded.

Educational reform

Mendelssohn's work was carried on by a group of Jewish intellectuals who had gathered around him in his lifetime, forming the nucleus of the Berlin Haskala, which was most active in the 20 years following their mentor's death. In the pages of their Hebrew-language periodical, *ha-meʾassef* ("The Collector"), they preached the virtues of secular culture and used Hebrew as a vehicle by which to introduce that culture. To achieve their goal of an enlightened Judaism, the leaders of the Berlin Haskala publicized the need for secular education. In response to the Holy Roman emperor Joseph of Austria's Edict of Toleration of 1781, Naphtali Wessely welcomed the efforts and issued an urgent call for the reform of Jewish education as a prelude to full emancipation. Purely secular subjects—mathematics, German, and world history and literature—were to take precedence over the traditional Jewish studies. The study of the Bible, since it was generally acknowledged to be a fundamental part of Western culture, was to be emphasized at the expense of the more traditional learning in the Talmud. Following this model, modern Jewish schools were established by Jewish intellectuals and businessmen in several German cities, among them Frankfurt and Hamburg. As its educational activities began to bear fruit in the wide dissemination of secular culture, the Berlin Haskala abandoned the use of Hebrew for German and gradually disintegrated. Unlike Mendelssohn himself, the immediate descendants of his circle and his own children were unable to strike a balance between Jewish and secular culture; their Western education undermined their religious faith and they perceived their identity as Europeans rather than as Jews.

One of Mendelssohn's disciples, David Friedlaender, offered to convert to Christianity without accepting Christian dogma or Christian rites; he felt that both Judaism and Christianity shared the same religious truth but that there was no relation at all between Judaism's ceremonial law and that truth. The offer was refused unless Friedlaender would acknowledge the superiority of Christianity and make an unconditional commitment to it, which he was not prepared to do. Unlike Friedlaender, many others who began by following Mendelssohn chose to leave the Jewish faith as the only way to win full acceptance in the European community of which they felt themselves a part.

The modern Hebrew Renaissance

In eastern Europe. The Haskala, thus, was quickly played out in central Europe; as an idea its further career was to continue in eastern Europe, particularly in the Russian Empire, where it flourished in the middle third of the 19th century until, as a result of the pogroms of 1881, Jews lost faith in the goodwill of Russians to accept "enlightened" Jews. It was a tenet of the Russian Haskala that the tsar was a benevolent leader who would bestow emancipation upon his Jewish subjects as soon as they proved themselves worthy of it; and that it was the task of the Jews, then, to transform themselves into model citizens, enlightened, unsuperstitious, devoted to secular learning and productive occupations. Following the example of the Berlin Haskala, a Russian Hebrew-language writer, Isaac Baer Levinsohn, published a pamphlet, *Teʿuda be-Yisrael* ("Testimony in Israel") citing the benefits of secular education. At the same time, such writers as Joseph Perl and Isaac Erter, though Orthodox Jews themselves, in virulent satire attacked the superstitious folk customs of the masses and opened the way to the anticlericalism which was to become characteristic of the Russian Haskala. In the 1840s and 1850s the emphasis shifted from satire and attack on the cultural parochialism of the Pale of Settlement (the regions to which the Jews were restricted) to romanticization of life outside the Pale, including periods of the Jewish past. Thus, Hebrew poets and novelists, such as Michal Levensohn and Abraham Mapu, arose on Russian soil to contribute their talents to the creation of a modern Hebrew literature. With the climate of government reforms in the 1860s, the Russian Haskala entered a "positivist" phase, calling for practical social and economic reforms. Hebrew-language journals were established and the Hebrew essay and didactic poetry, calling for religious and cultural reforms, came into their own, particularly at the hands of such stylists as the poet Y.L. Gordon and the essayist Moses Leib Lilienblum. Abandoning the original Hebrew and German orientation of the Russian Haskala, a number of Jewish intellectuals, the most prominent of whom were Yoachim Tarnopol, Osip Rabinovich, and Lev Levanda, became Russifiers, founding Russian-language Jewish weeklies devoted to "patriotism, emancipation, modernism." Like their contemporary fellow Jews in western Europe, they declared themselves to be Russians by nationality and Jews by religious belief alone. In 1863 a group of wealthy Jews in St. Petersburg and Odessa created the Society for the Promotion of Culture among the Jews of Russia for the purpose of educating Jewry into "readiness for citizenship." The goal of all segments of the Russian Haskala in the 1860s and 1870s was to turn Jews into good Russians and to make their Jewishness a matter of personal idiosyncrasy alone. The period of reaction that set in with the pogroms (massacres) of 1881 was to prove how deluded the hopes of the Haskala had been.

RELIGIOUS REFORM MOVEMENTS

One element of Westernization that the Haskala had championed was the reform of religion. It began in western Europe during the Napoleonic period (1800–15) when certain aspects of Jewish belief and observance were seen as incompatible with the new position of the Jew in Western society. Napoleon convoked a Sanhedrin (Jewish legislative council) in 1807 to create a new, modern definition of Judaism in its renunciation of Jewish nationhood and national aspirations, its protestations that rabbinic authority was purely spiritual, and its recognition of the priority of civil over religious authorities even in the matters of intermarriage. In areas other than France, the rationale for reform, at least in its early years, was more aesthetic than doctrinal. The external aspects of worship—

German Reform Judaism

i.e., the form of the service—appeared unacceptable to the newly Westernized members of the Jewish bourgeoisie in both Germany and the United States, whose standards of cultural acceptability had been shaped by the surrounding society, and who desired above all to resemble their Gentile peers. Thus, the short-lived Reform temple established in Seesen, by the pioneer German reformer Israel Jacobson, in 1810 enshrined order and dignity of a Protestant type in the service and introduced an organ, sermon, and prayers in German, in place of Hebrew, to create an uplifting spiritual experience. The more radical temple in Hamburg (established 1818) adopted all of Jacobson's reforms and published its own much-abridged prayer book, which deleted almost all the references to the long-awaited restoration of Zion. Reformers in Charleston, South Carolina, introduced similar changes in the synagogue ritual in 1824, for they sought a non-national Judaism similar in form to Protestantism and adapted to the surrounding culture. It was apparent to the reformers that in Western society Judaism would have to divest itself of its alien customs and conform to the cultural and intellectual standards of the new "age of reason."

German Reform in the 1840s became institutionalized, a matter of organized, formal belief and practice, and, at a series of synods held at Brunswick (1844), Frankfurt (1845), and Breslau (1846), it created the first theological rationalization for changes introduced in the previous generation. Judaism, it was declared, had always been a developmental religion that conformed to the demands of the times, and, since the Jews were not now a nation, they were no longer bound by their entire religious–political code of law, but only by the dictates of moral law. Thus, those rituals which stood in the way of full Jewish participation in German social and political life were no longer considered valid expressions of Jewish religious truth. The use of Hebrew in religious services was limited; practices such as the dietary laws and circumcision and all national messianic hopes were discarded upon the altar of the "spirit of the times." Messianism in Reform Judaism was transmuted into active concern for social welfare in the present, and the Jewish role in history became Diaspora-centred, a mission to the Gentiles.

Reform Judaism in the United States

Although Reform was initiated in Europe, it did not enjoy a successful career there, for many central European governments that regulated the existence of religious communities would not recognize more than one form of Judaism in any one locale. Reform did not achieve its greatest success until it was imported into the United States along with the massive German-Jewish immigration of the 1840s and coalesced with earlier American trends toward reform. By 1880 almost all of the 200 synagogues in the United States had become Reform, amalgamating in the Union of American Hebrew Congregations (formed 1873). In 1885 the Reform philosophy was given its most comprehensive formulation in the so-called Pittsburgh Platform, drawn up by a conference of Reform rabbis. This manifesto declared that Judaism was an evolutionary faith, and no longer a national faith, and that it was now to be de-orientalized. While the preservation of historical identity was considered to be beneficial, the maintenance of continuity of tradition was not; the Talmud was to be considered merely as religious literature, and not as legislation. The rationalist principles of the Pittsburgh Platform remained the official philosophy of the American Reform movement until a later generation, seeking to meet different emotional and intellectual needs, reintroduced the concept of Jewish peoplehood into the Columbus Platform of 1937, which also reemphasized Hebrew and traditional liturgy and practices. Classical (19th-century) Reform was very much a late child of the Enlightenment, and by mid-20th century its Enlightenment philosophy appeared antiquated to many Jewish thinkers.

Conservative Judaism

If Reform was a child of Enlightenment rationalism, Conservative Judaism was a child of historical romanticism. It began in 1845 when Zacharias Frankel and a group of followers seceded from a second Reform synod at Frankfurt over the issue of the limitation of the use of Hebrew to a small core of prayers. For Frankel, Hebrew represented the spirit of Judaism and the Jewish people, and Judaism itself was not merely a theology of ethics but the historical expression of the Jewish experience; this definition he called "positive-historical Judaism." Although Conservative Judaism conceived of Judaism as a developmental religion, it charted its course through close study of the tradition and the will of the people, and thus came to largely traditional conclusions about religious observance.

ORTHODOX DEVELOPMENTS

In western and central Europe. The bulk of the official Jewish establishment in western and central Europe, though affected by the efforts at religious reform, remained Orthodox (a term first used by Reform leaders to designate their traditionalist opponents). Under the leadership of Samson Raphael Hirsch, a more modern and militant form of Neo-Orthodoxy arose, based in Frankfurt am Main, which asserted its right to break with any Jewish community that contained Reform elements and to form an independent community. The thinking of this group was profoundly influential, for it indicated the possibility of living a ritually and religiously full life while being totally integrated into Western society. It accomplished this by positing a theoretical division between religion and culture; the Jews were to remain Orthodox in religion (although deferring their messianic aspirations to the unforeseeable future) while becoming Western in manners and culture. This form of Orthodoxy, which became the intellectual model for Western Orthodoxy, continued into the late 20th century in the United States in a variety of religious and academic institutions (such as the Yeshiva University and the bulk of English-speaking Orthodox synagogues), coexisting in substantial tension with a number of Orthodox groups, most notably the Lubavitcher and Satmar Ḥasidim (for Ḥasidism, see below), and some Talmudic academies that saw the Western world itself as the enemy and chose to recreate the ghetto.

Ḥasidism

In eastern Europe. By the mid-18th century Orthodoxy in eastern Europe, having been convulsed by frantic messianism and stifled by the sterility of purely legalistic scholarship, was ripe for revival. The experience of Shabbetaianism (the first messianic movement to excite virtually all of world Jewry) had revealed in the mid-17th century the pervasiveness of Jewish exhaustion with the Exile and fervent longing for messianic redemption, while the nihilistic sect of Frankists (the followers of Jacob Frank, see above *Rabbinic Judaism*) in the 18th century had transmuted that messianism into a this-worldly hysteria. Talmudic piety and study, sunk in excessive *pilpul* (acute logical distinctions that often became mere hairsplitting), was refreshed by the new critical methods of Elijah ben Solomon, the *gaon* of Vilna. Although essentially a legal rigorist, he was open to Western scientific learning insofar as it helped him to elucidate Talmudic texts. Orthodox religious expression also was raised to a new level with the development of Ḥasidism (Pietism) by Israel Baal Shem Tov in the mid-18th century. Although Ḥasidism contained elements of social protest, being at least in part a movement of the poor against the wealthy communal leadership and of the unlearned against the learned—though many of its leaders, among them Rabbi Baer, the *maggid* ("preacher") of Mezhirich and Rabbi Levi Isaac of Berdichev, were well-versed in Talmudic learning—it was essentially a non-messianic outcry in the name of religious emotion, emphasizing prayer and personal religious devotion here and now. Contemporary scholarship is investigating the linkage between Ḥasidism and eastern European Christian pietistic movements. The major innovation that Ḥasidism introduced into Jewish religious life was the charismatic leader, the *rebbe* who served as teacher, confessor, wonder-worker, God's vicar on earth, and occasionally as atoning sacrifice. Although the earliest *rebbes* were democratically chosen, the position of leadership passed to their descendants on the presumption that they had inherited their fathers' charisma and thus created spiritual dynasties. Ḥasidism spread throughout eastern Europe and enjoyed its greatest success in Poland.

Ḥasidism was notably unsuccessful, however, in Lithuania, where the traditional rabbinic class, under the leadership of Elijah, the Vilna *gaon,* was able to stave off its influence by issuing a ban of excommunication (*ḥerem,* "anathema") against the new movement. The tactic (a complete boycott and cutting off of communication) was widely embraced by non-Ḥasidic rabbis, who earned for themselves among the Ḥasidim the title of Mitnaggedim (Opponents), but it proved largely ineffective in areas where the rabbis had lost the respect of the masses, and it called forth a round of counter-excommunications by the Ḥasidic *rebbes.* With the passage of time, Ḥasidim and Mitnaggedim abandoned their conflict and came to see each other as allies against the threat to all Orthodox Jewish religion of Haskala and secularization. The impact of Ḥasidism on eastern European Jewry cannot be overemphasized; even in Lithuania, where it did not take firm hold, it stimulated the growth of a home-grown pietism in the Musar (ethicist) movement of the mid-19th century, and it renewed the Talmudic energies of its opponents.

DEVELOPMENTS IN SCHOLARSHIP

The Science of Judaism

As Jews moved into Western society in central Europe, there arose a group of young Jewish intellectuals who devoted themselves to Jewish scholarship of a far different type from traditional Talmudic learning or medieval philosophy. In 1819 Leopold Zunz and Moses Moser founded the Society for Jewish Culture and Learning for the study of Jewish history and literature. Although the original group quickly dissolved, Zunz became the unofficial leader of a generation of scholars dedicated to the Wissenschaft des Judentums (Science of Judaism). Under its carefully objective and scholarly facade, the Wissenschaft movement embraced a variety of nonacademic motives and goals. All of its members sought to prove that the Jewish past was intellectually respectable and worthy of study, and hence that the Jews deserved an equal place within European societies. Jewish scholarship was enlisted as a weapon in the battles for change. Thus, Isaac M. Jost wrote a general history of the Jews to promote Reform; Zunz's *Gottesdienstliche Vorträge der Juden, historisch entwickelt* (1832; "The Worship Sermons of the Jews, Historically Developed") served to legitimize the modern innovation of the sermon in the vernacular; and Abraham Geiger, the outstanding leader of German Reform in the 1840s and 1850s, interpreted the Pharisees as the forerunners of the reformers of his own day. In their work these intellectuals presented archetypes of what modern Jews should become. To support their claims of academic respectability, the Wissenschaft figures highlighted those aspects of the Jewish past that were closely integrated with general fields of study. In particular, Moritz Steinschneider, who owes his fame to towering achievements in bibliography, was concerned above all with the contribution of Jews to science, medicine, and mathematics. Nineteenth-century Jewish scholarship set out to praise Judaism as one of the cofounders of the Western tradition, and thus to argue that whenever the Jews were not excluded from European society they have produced great culture, and that they would repeat such accomplishments under conditions of social and political equality.

The Wissenschaft movement stimulated the critical study of the Jewish past, and great works of synthesis, written from a variety of perspectives, began to appear: Heinrich Graetz's multivolumed *Geschichte der Juden von den ältesten Zeiten bis auf die Gegenwart* (1853–75; *History of the Jews*), written from a romantic-national point of view; Isaac Halevy's *Dorot ha-rishonim* (1897–1932; "The First Generations") and Ze'ev Jawitz's *Toldot Yisrael* (1894; "History of Israel"), from an orthodox standpoint; and Simon Dubnow's *Weltgeschichte des jüdischen Volkes* (1925–29; "World History of the Jewish People"), reflecting his belief in secular, nationalistic communal autonomy. Since the 1920s this tradition of great synthesis has been carried on in the United States by Salo W. Baron, who by the early 1970s had produced 14 volumes of his *Social and Religious History of the Jews* (1952), and in Israel by Benzion Dinur, whose chief work was *Yisrael ba-gola* (3rd ed., 5 vol., 1961–66; "Israel in the Exile"). Many other first-rank scholars in Europe, Israel, and the United States have made notable contributions to the study of Jewish history, rabbinics, and mysticism. This great emphasis on historical research and knowledge from a wide variety of perspectives tended to propose veneration for the Jewish past as a substitute for waning religious faith.

JEWISH–CHRISTIAN RELATIONS

Christianity and Russian anti-Semitism

Jewish–Christian relations in the 19th century, strained at best, often erupted into open conflict. Established Christianity, and Roman Catholicism in particular, staunch upholders of the old order, identified the Jews as the major beneficiaries of the French Revolution and as the bearers of a liberal, secular, anticlerical, and often revolutionary threat. Clerical anti-Semitism was thus in France allied with the anti-Semitism of the traditional right, and these movements contended with those who affirmed the results of the French Revolution in the great convulsion of the "Dreyfus affair" in the last years of the 19th century. In Russia the conflict of the Jews and the Orthodox Church released the most open and virulent manifestation of religious anti-Semitism. To the church, the Jews were the enemy seeking to undermine Russian Orthodoxy and the tsar, the very foundations of Russian tradition. The church and the tsarist authorities went so far as to condone, and even encourage, the violent pogroms that were perpetrated against the Jews in 1881–82 and again in 1905. Russian Orthodoxy was active as well in spreading the so-called blood libel, a superstitious belief in Jewish ritual murder which had reemerged even in the 19th century, in Damascus in 1840 (in which instance the French Consul in Syria initiated the accusation) and in Hungary in the Tiszaeszlár affair in 1882. In both cases torture was used to obtain false confessions but the accused were ultimately cleared. The most infamous recurrence of the blood libel in modern times, however, was the Beilis case of 1911–13, in which the tsarist government, with church complicity, sought unsuccessfully to convict a Jewish bookkeeper in Odessa of ritual murder. From Russian Orthodox circles, too, arose the *Protocols of the Learned Elders of Zion,* a fraudulent documentation of an alleged international Jewish conspiracy to conquer the world by subverting the social order through Liberalism, Freemasonry, and other modern movements; the concoction appeared around the turn of the century and enjoyed a phenomenal success in anti-Semitic propaganda. In spite of the fact that much of modern anti-Semitism was not Christian but racial, pagan, and often left-wing, Jews have attributed even secular anti-Semitism to older Christian teachings, which they assert persisted as a case of time lag. In the 20th century Jews and Christians have moved toward mutual understanding. In the early decades of the century, some liberal Christian voices were raised against anti-Semitism; in the United States the National Conference of Christians and Jews was founded (1928) as a response to anti-Semitism propagated in Henry Ford's *Dearborn Independent.* Elements of the Church spoke out during the 1930s against the Nazi persecution of the Jews, but the majority of Christian religious figures in Europe remained silent, even during the Holocaust (near extermination of European Jews). In response to the Holocaust, however, the World Council of Churches denounced anti-Semitism in 1946, and in 1965 the Roman Catholic Church's Schema on the Jews and other non-Christian religions, adopted by the Second Vatican Council, revised its traditional attitude toward the Jews as the killers of Christ. A growing sense of ecumenism (of fellowship and common concerns) has been shared by Jews and Christians alike. Although there remain many difficulties related to the question of the place that Zionism and the State of Israel hold within Judaism, the older forms of official church anti-Semitism have radically lessened.

Christianity and the Nazi persecution

ZIONISM

The most striking of the new phenomena in Jewish life is Zionism, which, insofar as it has focussed on the return to Zion (the poetic term for the Holy Land), is a re-echo of older religious themes. Insofar as it has stressed the national concentration of the Jews in a secular state, however, it is yet another example of the secularization of Jewish life and of Jewish messianism. In its secular aspects Zionism attempted to complete the emancipation of the

Jews by transforming them into a nation like all other nations. Although it drew upon the general currents of 19th-century European nationalism, its major impetus came from the revival of a virulent form of racist anti-Semitism in the last decades of the 19th century, as noted above. Zionism reacted to anti-Semitic contentions that the Jews were aliens in European society and could never hope to be integrated into it in any numbers, and transformed this charge into a basic premise of a program of national regeneration and resettlement. Zionism has come to occupy roughly the same place in Jewish life as the "social gospel"—according to which the Kingdom of God is to be achieved in economic and social life—for Christians; the involvement in Israel as the new centre of Jewish energies, creativity, and renewal serves as the secular religion of many Diaspora Jews.

AMERICAN JUDAISM

The central and eastern European immigrant styles of Judaism

The story of Judaism in the United States is the story of several fresh beginnings. In the colonial period the style of the tiny American Jewish community was shaped by the earliest Sefardic immigrants; the community was officially Orthodox but, unlike European Jewish communities, was voluntaristic, and by the early 19th century there was a significant drift of the younger generation from Judaism. By the mid-19th century a new wave of central European immigrants revived the declining American Jewish community and remade it to serve its own needs. Primarily petty shopkeepers and traders, the new immigrants migrated westward, founding new Jewish centres which were almost entirely controlled by laymen. The exigencies of life on the frontier within an open society created a predisposition for religious reform, and it is significant that the greatest American Reform Jewish leader of the 19th century, Isaac Mayer Wise, was based in Cincinnati, Ohio. Wise sought to unite all of American Jewry in the new nontraditional institutions that he founded, Hebrew Union College (1875), the Union of American Hebrew Congregations (1873), and the Central Conference of American Rabbis (1889); but his ever more radical reforming spirit ultimately drove the traditionalist elements within the American Jewish community into opposition. The head of the traditionalist circles had been Isaac Leeser, a native of Germany, who had attempted to create an indigenous American community on the lines of a modernized traditionalism. Conservative forces, after his death, became disorganized, but in reaction to Reform they defined themselves by their attachment to the sabbath, the dietary laws, and especially to Hebrew as the language of prayer. Under the leadership of Sabato Morais, an Orthodox Jew of Italian birth, Conservative circles in 1886 founded a rabbinic seminary of their own, the Jewish Theological Seminary of America.

American Orthodoxy

The eastern European immigrants who moved in large numbers to the American shores in the years from 1881 to 1914 were profoundly different in culture and manners from the older elements of the American Jewish community, and it is they and their descendants who made American Judaism as it is today. The bridge between the existing Jewish community led by German Jews of Reform persuasion and the new immigrant masses was the traditionalist element among the older settlers. Cyrus Adler, traditionalist himself, cooperated with a German Reform circle of Jacob Schiff in reorganizing the Jewish Theological Seminary (1902) and other institutions for the purpose of Americanizing the eastern European immigrants. Enough eastern European rabbis and scholars had immigrated, however, to create their own synagogues, which reproduced the customs of the old world. Whereas in 1880 almost all of the 200 Jewish congregations in the United States were Reform, by 1890 there were 533 synagogues, and most of the new ones founded by immigrant groups were Orthodox. The Union of Orthodox Jewish Congregations, which was established in 1898 by elements associated with the Jewish Theological Seminary, was soon taken over by Yiddish-speaking recent immigrants for whom the seminary was much too liberal. In 1902 immigrant rabbis also formed their own body, the Union of Orthodox Rabbis of the United States and Canada (the Agudath ha-Rabbanim), which fostered the creation of yeshivas (rabbinic academies) of the old type. In 1915 two small yeshivas, Etz Chaim and Rabbi Isaac Elhanan Theological Seminary, added Yeshiva College of secular studies in 1928, and became Yeshiva University in 1945. The eastern European Orthodox elements concentrated primarily on Jewish education and it was they who introduced the movement for Jewish day schools, analogous to Christian parochial schools. Gradually an American version of Orthodoxy developed on the Neo-Orthodox model of Samson Raphael Hirsch, which combined institutional separatism and cooperation with other Jewish groups in umbrella organizations.

The immigrants and their children had three desires; to upgrade themselves socially by joining older congregations or forming their own in an Americanized image; to affirm an unideological commitment to Jewish life; and to maintain their ties to the overseas Jewish communities of their origin. With their strong sense of Jewish peoplehood, they introduced Zionism into American Jewish life, and accepted the basic ideas of Mordecai Kaplan's Reconstructionism, which was committed to Zionism. A small group of anti-Zionists remained a significant force in the 1930s and 1940s, but their central organization, the American Council for Judaism, represented the descendants of earlier German-Jewish immigrants. The later immigrants took over all the earlier institutions of the Jewish community and imbued them with their own spirit.

The religious continuum

American Jewish religious life is a continuum—from the most traditional Orthodoxy to the most radical Reconstructionism. In theory, all of the Orthodox groups agree on the revealed nature of all of Jewish law; for the Reform groups, the moral doctrine of Judaism is divine and its ritual law is man made; the Conservatives see Judaism as the working out in both areas of a divine revelation that is incarnate in a slowly changing human history; and the Reconstructionists (who include both Conservative and Reform Jews) view Judaism as the evolving civilization created by the Jewish people in the light of its highest conscience. What really marks the various bodies in the mind of the Jewish community is their difference in ritual practices, but the ritual variations shade from one group into the other. The role of the rabbi is substantially the same in all three groups; he is no longer a Talmudic scholar but a preacher, pastor, and administrator, a cross between a parish priest and the leader of an ethnic group. Although there was some cooperation among the three major Jewish denominations—Orthodoxy, Reform, and Conservatism—the real effort of organized Jewish religion in America in the late 20th century revolved around the individual synagogue and the denomination to which it belonged. As religious identification became increasingly respectable in American life, the Jews followed the American norm, affiliating in greater numbers with synagogues, though often for ethnic or social, rather than religious reasons.

JUDAISM IN OTHER LANDS

Modernity came first to the Jewish people in Europe and it was, therefore, within the European context that representatives of important non-Ashkenazi communities such as the proto-Zionist Sefardi Judah ben Solomon Ḥai Alkalai of Sarajevo, the Luzzatto family in Italy, and Elijah ben Abraham Benamozegh in France, participated in variations of Jewish modernity. In England and France, more than in Germany or Russia, Wissenschaft des Judentums (see above *Developments in scholarship*), with its enlightenment ideology, was the central focus of Jewish experience; there the "republic of scholarship" became the synagogue of the Jewish intelligentsia. In neither country did Reform Judaism gain a major foothold, for the Orthodox establishment, which remained the official synagogue, liberalized its synagogue practice while retaining its essentially conservative outlook. In Anglo-Jewish life in the last decades of the 19th century the two most pronounced modernist tendencies were Solomon Schechter's moderate romantic traditionalism and the "renewed Karaism" of Claude Joseph Goldsmid Montefiore, whose version of religious reform was "back to the Bible."

Outside of Europe, in such places as South America and Canada, Jewish modernity appeared late, for European Jewry arrived in those places even later than in the United States, attaining a significant number only in the 20th century. These communities have been dependent on immigrant scholars and intellectuals for serious Jewish thought. Jews in the Arab lands, in North Africa and the Middle East, living within traditional societies, entered modernity even later than those on the peripheries of Europe. Many of them received their first introduction to the Western world in widespread schools set up by the Alliance Israélite Universelle (a Jewish defense organization centred in Paris), which combined Jewish education with the language and values of French civilization. Yet most of these communities remained traditionalist almost to the moment when they were expelled or felt compelled to relocate, since 1948, when the state of Israel was created. The ferment of modernity in all its forms is now being felt in their ranks. In Israel, which has received a large segment of Sefardic Jewry, the attention of these communities has turned to attaining equality with the more advanced Ashkenazim rather than developing some forms of modern Jewish thought.

Other groups that may be described as regional or ethnic include the Bene-Israel, descendants of Jewish settlers in the Bombay region of India, whose deviation in some Halakhic matters from the present Orthodox consensus has raised problems for those among them who have migrated to Israel; the Falashas, the Jewish community of Ethiopia whose development has been almost entirely outside the mainstream described in this article; and the Black Jews of the United States whose place in, and relation to, the rest of the community remains unclear.

CONTEMPORARY JUDAISM

As a result of the Holocaust, Judaism has become a non-European religion; its three major centres, which together include more than three-fourths of world Jewry, are Israel, the Soviet Union, and the United States. Although Jews constitute only a small fraction of the population of the United States, Judaism occupies a role far surpassing its numerical importance and is regarded with Roman Catholicism and Protestantism as one of the major American faiths. Similarly, in the international realm of Western religion, Judaism has been welcomed as a partner able to deal with other major religions as an equal on such issues as anti-Semitism, human rights, and world peace.

The rights and needs of the world Jewish community, including Israel, have triggered deep conflicts with which Judaism has been involved with the Arab and Communist worlds. Friction between Israel and the Arab states has created tension with Islām, while the political stand of Israel and the treatment of the Jewish minority within the Soviet Union have led to open clashes with the Communist leadership. Some of the diatribes and charges that have issued from the Arabs and Communists in this struggle have at times re-evoked older forms of anti-Semitism. In the long-range view, the problems of Judaism and Islām seem more soluble than those of Judaism and such secular ideologies as Communism, for the major religions of the world are increasingly seeking accommodation with each other, as all are confronted by hostile secularist ideologies which have retained their conversionary élan.

Secularization and Jewish identity

Within its own community Jewry is faced with the increasing secularization of Jewish identity in its three major centres, each in its own way. In the United States the open society and the melting pot ideologies of past generations have fostered among many Jews a sense of Jewish identity increasingly devoid of concrete religious, national, or historical content; in the Soviet Union government policy since the 1930s has banned the teaching of Judaism and Jewish culture to the young and has severely discouraged any manifestation of Jewish identity as a sign of the disloyalty of "rootless cosmopolitans" to the Russian state; and in Israel a secular nationalism has taken root, raising questions as to the role that Judaism plays in the identity of the average Israeli. Nonetheless, underneath the external secularization there are signs of a persisting deep Jewish religious fervour, in which the sense of history, community, and personal authenticity figure as the intertwined strands of Jewish religious life, especially as it has been affected by the State of Israel. Some of the rituals of the Jewish tradition, especially the rites of passage at the crucial stages of individual existence, are almost universally observed, except in the Soviet Union; in the United States, for example, more than 80 percent of Jewish children receive some formal religious training. Among Jewish youth there is, in some circles, a quest for tradition. In the United States, Jewish communes have been established that seek new forms of Jewish expression; in Israel, groups such as Mevaqshe Derekh (Seekers of the Way) have tried to bridge secular Israeli culture and Jewish tradition and to maintain traditional Jewish ethical standards even in wartime; in the Soviet Union thousands of young people gather on several occasions of the year to dance and sing and express solidarity in front of the synagogues in Leningrad and Moscow. Still, signs of major weaknesses persist. The rate of intermarriage among Jews in the Diaspora increased, while regular synagogue attendance, at the very highest 20 percent in the United States, remained far below church attendance. Despite their lack of traditional piety, there is a general sense among Jews that they remain Jews not because of the force of anti-Semitism but because of the attractiveness of their tradition and their sense of a common history and destiny.

The enduring existence of the Jews and Judaism

If in 1945, the world Jewish community, decimated and horrified by the Holocaust, felt in danger of disappearing, there appeared to be no such despair in the last quarter of the century when there was an expectation that Jewish communal feeling would remain strong, especially, for many or most Jews, in the light of the existence of Israel. Judaism enjoyed a heightened dignity in the eyes of the world as well, not only as a result of the creation of the State of Israel, but also because of its close relations with other world religions. Although the recurring phenomenon of the alienation of young Jews from their tradition was a troubling prospect, it is no more so than in recent past generations. Along with other major religions, Judaism's most disturbing problem yet to be solved was how to deal with secular ideologies and with the growth of secularism within its own ranks. Thus, looking forward to the last decades of the 20th century, it appeared that Judaism would have to contend with as many problems as other major religions, but that it faced them with no less confidence than these, and with more confidence than it had felt earlier in the century. (Ar.H.)

THE JUDAIC TRADITION

The literature of Judaism

A paradigmatic statement is made in the narrative that begins with Genesis and concludes with Joshua. In the early chapters of Genesis the divine is described as Creator of the natural order, including mankind. In the Eden, Flood, and Tower of Babel stories, man is recognized as rebellious and disobedient. In the patriarchal stories (about Abraham, Isaac, Jacob, and Joseph) a particular family is called out of humankind to restore the thwarted relationship through personal and communal responsiveness. The subsequent history of the community thus formed is recounted so that the divinely sought restoration may be recognized and the nature of the obedient community may be observed: the Egyptian servitude, the going out from Egypt, the revelation of the "teaching," the wandering years, and finally fulfillment through entrance into the "land" (Canaan). The prophetic books (in the Hebrew Bible these include the historical narratives up to the Babylonian Exile—*i.e.,* Joshua, Judges, Samuel, and Kings) continue to deal with the rebellion-obedience tension, interpreting it within the changing historical context and adding new levels of meaning to the fulfillment-redemption motif. (The literature of the Old Testament is treated in the article BIBLICAL LITERATURE.)

Philosophical, mystical, and exegetical additions

It is from this "narrative theology," as it has been recited throughout the centuries, that new formulations of the primal affirmations have been drawn. These have been clothed in a number of vocabularies: philosophical, mystical, ethnic, political, and others. The emphases have been various, the disagreements often profound. No single exposition has exhausted the possibilities of the affirmations or of the relationship between them. Philosophers have expounded them on the highest level of abstraction, using the language of the available philosophic systems. Mystics have enveloped them in the extravagant prose of speculative systems and in simple folktales. Attempts have been made to encompass them in theoretical ethical statements and express them through practical ethical behaviour. Yet, in each instance, the proposed interpretations have had to come to terms with the biblical affirmations and with the particular mode of understanding them required by the spiritual and intellectual demands arising out of the community's experience. The biblical texts, themselves the products of a long period of transmission and embodying more than a single outlook, were subjected to extensive study and interpretation over many centuries and, when required, were translated into other languages. The whole literature continued to provide the basis of further developments, so that any attempt to formulate a statement of the affirmations of Judaism must, however contemporary it seeks to be, give heed to the scope and variety of speculation and formulation in the past.

SOURCES AND SCOPE OF THE TORAH

The concept "Giver of Torah" played a central role in the understanding of God, for it is Torah, or "teaching," that confirms the events recognized by the community as the act of God. In its written form, Torah was considered to be especially present in the first five books of the Bible (the Pentateuch), which therefore came to be called Torah. In addition to this written Torah, or "Law," there were also unwritten laws or customs and interpretations of them, carried down in an oral tradition over many generations, which acquired the status of oral Torah.

The Talmud ("study" or "learning") is the literary culmination of this oral tradition, which, according to the rabbis who created the Talmud, originated at Mt. Sinai as part of the divine revelation vouchsafed to Moses, along with the material recorded in the Pentateuch. In its broadest sense, the Talmud is a set of books consisting of the Mishna ("repeated study"), the Gemara ("completion"), and certain auxiliary materials. The Mishna is a collection of originally oral laws supplementing scriptural laws. The Gemara is a collection of commentaries on and elaborations of the Mishna, which in "the Talmud" is reproduced in juxtaposition to the Gemara. For present-day scholarship, however, Talmud in the precise sense refers only to the materials customarily called Gemara—an Aramaic term prevalent in medieval rabbinic literature that was used by the church censor to replace the term Talmud within the Talmudic discourse in the Basel edition of the Talmud, published 1578–81. This practice continued in all later editions.

Mishna and Gemara

The term Midrash ("exposition" or "investigation"; plural, Midrashim) is also used in two senses. On the one hand, it refers to a mode of biblical interpretation prominent in the Talmudic literature; on the other, it refers to a separate body of commentaries on Scripture using this interpretative mode.

The oral tradition interpreted the written Torah, adapted its precepts to ever-changing political and social circumstances, and supplemented it with new legislation. Thus the oral tradition added a dynamic dimension to the written code, making it a self-regenerating, endless source of guidance, a perpetual process rather than a closed system. The vitality of this tradition is fully demonstrated in the way the ancient laws were adapted after the destruction of the Temple in 70 CE and by the role the Talmud played in the survival of the Jewish people in exile. By the 11th century, Diaspora Jews lived within a Talmudic culture that unified them and that superseded geographical boundaries and language differences. Jewish communities governed themselves according to Talmudic law, and individuals regulated the smallest details of their lives by it.

Central to this vast structure was, of course, the Jewish community's concern to live in accordance with the divine will embodied and expressed in Torah in the widest sense. Scripture, Halakhic and Haggadic Midrash, Mishna, and Gemara were the sources from which the leaders of the communities drew in order to provide both stability and flexibility. The dispersion of the Jews outside Palestine confronted communities and individuals with novel and unexpected situations that had to be dealt with in such a way as to provide continuity while at the same time making it possible to exist with the unprecedented.

Prophecy and religious experience. Torah in the broad sense includes the whole Hebrew Bible, including the prophetic books. In biblical prophecy, God is seen as continuing to be disclosed in the nexus of historical events and as making ethical demands upon the community. According to rabbinic Judaism, this source of Torah—the charismatic person—dried up in the period of Ezra (*i.e.,* about the time of the return from the Babylonian Exile in the 5th century BCE). This opinion may have been a defensive reaction to the luxuriant growth of apocalyptic speculation about the end of the world and the kingdoms of this world, a development that was considered dangerous and unsettling in the period after the Bar Kokhba revolt (132–135 CE). Indeed, there appears to have developed an ongoing suspicion that unrestrained individual experience as the source of Torah was inimical to the welfare of the community. Such an attitude was by no means new. Deuteronomy (13:2–19) had already warned against such "misleaders." The culmination of this attitude is to be found in a Talmudic narrative in which even the *bat qol,* the divine "echo" that announces God's will, is ignored on a particular occasion. Related to this is the reluctance on the part of teachers in the early Christian centuries to point to wonders and miracles in their own time. Far from expressing an ossification of religious experience—the development of the *Siddur* and the Talmudic reports on the devotional life of the rabbis contradict such an interpretation—the attitude seems to be a response to the development of such religious enthusiasm as was exhibited, for example, in the behaviour of the Christian Church in Corinth (I Cor.) and among Gnostic sects and sectarians. Thus, even among the speculative mystics of the Middle Ages, where allegorization of Scripture abounds, the structure of the community and the obligations of the individual are not displaced by the deepening of personal religious life through mystical experience. The decisive instance of this is Joseph Karo (16th century), who was thought to be in touch with a supernal guide, but who was, at the same time, the author of an important codification of Jewish law, the *Shulḥan ʿarukh.*

Anticharismatic trends in post-biblical Judaism

Admittedly, there have been occasions when Torah, even in the wide sense, has been rigidly viewed and applied. In certain historical situations, the dynamic process of rabbinic Judaism has been treated as a static structure. What is of greater significance, however, is the way in which this tendency toward inflexibility has been checked and reversed by the inherent dynamism of the rabbinic tradition.

Modern views of Torah. In modern times—since the end of the 18th century—the traditional position has been challenged both in detail and in principle. The rise of biblical criticism has raised a host of questions about the origins and development of Scripture and thus about the very concept of Torah, in the senses in which it has functioned in Judaism. Naturalistic views of God have required a reinterpretation of Torah in sociological terms as the ideals and sancta (holy things) of the Jewish people. Other and varying positions of many sorts have been and undoubtedly will be forthcoming. What is crucial, however, is the concern of all these positions to retain—with whatever modifications are required—the concept of Torah as one of the central and continuing affirmations of Judaism.

Opposition to the Talmud. Despite the central place of the Talmud in traditional Jewish life and thought, sig-

Anti-Talmudic positions

nificant Jewish groups and individuals have opposed it vigorously. The Karaite sect in Babylonia, beginning in the 8th century, refuted the oral tradition and denounced the Talmud as a rabbinic fabrication. Medieval Jewish mystics declared the Talmud a mere shell covering the concealed meaning of the written Torah, and heretical messianic sects in the 17th and 18th centuries totally rejected it. The decisive blow to Talmudic authority came in the 18th and 19th centuries when the Haskala (the Jewish Enlightenment movement) and its aftermath, Reform Judaism, secularized Jewish life and, in doing so, shattered the Talmudic wall that had surrounded the Jews. Thereafter, modernized Jews usually rejected the Talmud as a medieval anachronism, denouncing it as legalistic, casuistic, devitalized, and unspiritual.

There is also a long-standing anti-Talmudic tradition among Christians. The Talmud was frequently attacked by the church, particularly during the Middle Ages, and accused of falsifying biblical meaning, thus preventing Jews from becoming Christians. The church held that the Talmud contained blasphemous remarks against Jesus and Christianity and that it preached moral and social bias toward non-Jews. On numerous occasions the Talmud was publicly burned, and permanent Talmudic censorship was established.

On the other hand, since the Renaissance there has been a positive response and great interest in rabbinic literature by eminent non-Jewish scholars, writers, and thinkers in the West. As a result, rabbinic ideas, images, and lore, embodied in the Talmud, have permeated Western thought and culture.

Content, style, and form. The Talmud is first and foremost a legal compilation. At the same time it contains materials that encompass virtually the entire scope of subject matter explored in antiquity. Included are topics as diverse as agriculture, architecture, astrology, astronomy, dream interpretation, ethics, fables, folklore, geography, history, legend, magic, mathematics, medicine, metaphysics, natural sciences, proverbs, theology, and theosophy.

This encyclopaedic array is presented in a unique dialectic style that faithfully reflects the spirit of free give-and-take prevalent in the Talmudic academies, where study was focussed upon a Talmudic text. All present participated in an effort to exhaust the meaning and ramifications of the text, debating and arguing together. The mention of a name, situation, or idea often led to the introduction of a story or legend that lightened the mood of a complex argument and carried discussion further.

This text-centred approach profoundly affected the thinking and literary style of the rabbis. Study became synonymous with active interpretation rather than with passive absorption. Thinking was stimulated by textual examination. Even original ideas were expressed in the form of textual interpretations.

Halakha and Haggada; Midrash and Mishna

The subject matter of the oral Torah is classified according to its content into Halakha and Haggada and according to its literary form into Midrash and Mishna. Halakha ("law") deals with the legal, ritual, and doctrinal parts of Scripture, showing how the laws of the written Torah should be applied in life. Haggada ("narrative") expounds on the nonlegal parts of Scripture, illustrating biblical narrative, supplementing its stories, and exploring its ideas. The term Midrash denotes the exegetical method by which the oral tradition interprets and elaborates scriptural text. It refers also to the large collections of Halakhic and Haggadic materials that take the form of a running commentary on the Bible and that were deduced from Scripture by this exegetical method. In short, it also refers to a body of writings. Mishna is the comprehensive compendium that presents the legal content of the oral tradition independently of scriptural text.

Modes of interpretation and thought. Midrash was initially a philogical method of interpreting the literal meaning of biblical texts. In time it developed into a sophisticated interpretive system that reconciled apparent biblical contradictions, established the scriptural basis of new laws, and enriched biblical content with new meaning. Midrashic creativity reached its peak in the schools of Rabbi Ishmael and Akiba, where two different hermeneutic methods were applied. The first was primarily logically oriented, making inferences based upon similarity of content and analogy. The second rested largely upon textual scrutiny, assuming that words and letters that seem superfluous teach something not openly stated in the text.

The Talmud (*i.e.,* the Gemara) quotes abundantly from all Midrashic collections and concurrently uses all rules employed by both the logical and textual schools; moreover, the Talmud's interpretation of Mishna is itself an adaptation of the Midrashic method. The Talmud treats the Mishna in the same way that Midrash treats Scripture. Contradictions are explained through reinterpretation. New problems are solved logically by analogy or textually by careful scrutiny of verbal superfluity.

Midrashic-Talmudic thinking

The strong involvement with hermeneutic exegesis—interpretation according to systematic rules or principles—helped develop the analytic skill and inductive reasoning of the rabbis but inhibited the growth of independent abstract thinking. Bound to a text, they never attempted to formulate their ideas into the type of unified system characteristic of Greek philosophy. Unlike the philosophers, they approached the abstract only by way of the concrete. Events or texts stimulated them to form concepts. These concepts were not defined but, once brought to life, continued to grow and change meaning with usage and in different contexts. This process of conceptual development has been described by some as "organic thinking." Others use this term in a wider sense, pointing out that, although rabbinic concepts are not hierarchically ordered, they have a pattern-like organic coherence. The meaning of each concept is dependent upon the total pattern of concepts, for the idea content of each grows richer as it interweaves with the others.

EARLY COMPILATIONS

Ezra the scribe who, according to the Book of Ezra, reestablished and reformed the Jewish religion in the 5th century BCE, began the "search in the Law . . . to teach in Israel statutes and ordinances."

His work was continued by *soferim* (scribes), who preserved, taught, and interpreted the Bible. They linked the oral tradition to Scripture, transmitting it as a running commentary on the Bible. For almost 300 years they applied the Torah to changing circumstances, making it a living law. They also introduced numerous laws that were designated "words of the *soferim*" by Talmudic sources. By the end of this period, rabbinic Judaism—the religious system constructed by the scribes and rabbis—was strong enough to withstand pressure from without and mature enough to permit internal diversity of opinion.

At the beginning of the 2nd century BCE, a judicial body headed by the *zugot*—pairs of scholars—assumed Halakhic authority. There were five pairs in all, between *c.* 150 and 30 BCE. The first of the *zugot* also introduced the Mishnaic style of transmitting the oral tradition.

The *tannaim*

The making of the Mishna: 2nd–3rd centuries. Hillel and Shammai, the last of the *zugot,* ushered in the period of the *tannaim*—"teachers" of the Mishna—at the end of the 1st century BCE. This era, distinguished by a continuous attempt to consolidate the fragmentary Midrashic and Mishnaic material, culminated in the compilation of the Mishna at the beginning of the 3rd century CE. The work was carried out in the academies of Hillel and Shammai and in others founded later. Most scholars believe that Halakhic collections existed prior to the fall of Jerusalem, in 70 CE. Other compilations were made at Yavne, a Palestinian town near the Mediterranean, as part of the effort to revitalize Judaism after the disaster of 70 CE. By the beginning of the 2nd century there were many such collections. Tradition has it that Rabbi Akiba organized much of this material into separate collections of Midrash, Mishna, and Haggada and introduced the formal divisions in tannaitic literature. His students and other scholars organized new compilations that were studied in the different academies.

After the rebellion of the Jews against Roman rule led by Simeon bar Kokhba in 132–135, when the Sanhedrin (the Jewish supreme court and highest academy) was revived, the Mishnaic compilation adopted by the Sanhedrin president became the official Mishna. The Sanhedrin reached its highest stature under the leadership of Judah ha-Nasi (Judah the Prince, or President); he was also called Rabbi, as the preeminent teacher.

It seems certain that the official Mishna studied during his presidency was the Mishna we know and that he was its editor. Judah aimed to include the entire content of the oral tradition. He drew heavily from the collections of Akiba's pupils but also incorporated material from other compilations, including early ones. Nevertheless, the accumulation was such that selection was necessary. Thus almost no Midrash or Haggada was included. Colleagues and pupils of Judah not only made minor additions to the Mishna but tried to preserve the excluded material, the Baraitot ("Exclusions"), in separate collections. One of these was the Tosefta ("Addition"). Midrashic material was gathered in separate compilations, and later revisions of some of these are still extant. The language of all of the tannaitic literature is the new Hebrew developed during the period of the Second Temple (*c.* 6th century BCE–1st century CE).

The *amoraim*

The making of the Talmuds: 3rd–6th century. The expounders of the Mishna were the *amoraim* ("interpreter"), and the two Talmuds—the Palestinian (or Jerusalem) and the Babylonian—consist of their explanations, discussions, and decisions. Both take the form of a running commentary on the Mishna.

The foundations for these two monumental works were begun by three disciples of Judah ha-Nasi: Joḥanan bar Nappaḥa, Rav (Abba Arika), and Samuel bar Abba, in their academies at Tiberias, in Palestine, and at Sura and Nehardea in Babylonia, respectively. Centres of learning where the Mishna was expounded existed also at Sepphoris, Caesarea, and Lydda in Palestine. In time new academies were established in Babylonia, the best known being those at Pumbedita, Mahoza and Naresh, founded by Judah bar Ezekiel, Rava, and Rav Pappa, respectively. The enrollment of these centres often numbered in the thousands, and students spent many years there. Those who no longer lived on the academy grounds returned twice annually for the *kalla,* a month of study in the spring and fall.

Academies differed in their methods of study. Pumbedita, for example, stressed casuistry, while Sura emphasized breadth of knowledge. Students often moved from one academy to another and even from Palestine to Babylonia or from Babylonia to Palestine. This kept open the channels of communication between the various academies and resulted in the inclusion of much Babylonian material in the Palestinian Talmud, and vice versa.

Despite the overwhelming similarity of the two Talmuds, however, they do differ in some ways. The Palestinian Talmud is written in the Western Aramaic dialect, the Babylonian in the Eastern. The former is invariably shorter, and, not having been subject to final redaction, its discussions are often incomplete. Its explanations tend to remain closer to the literal meaning of the Mishna, preferring textual emendation to casuistic interpretation. Finally, some of the legal concepts in the Babylonian Talmud reflect the influence of Persian law, for Babylonia was under Persian rule at the time.

The main endeavour of the *amoraim* was to thoroughly explain and exhaust the meaning of the Mishna and the Baraitot. Apparent contradictions were reconciled by such means as explaining that conflicting statements referred to different situations or by asserting that they stemmed from the Mishnayot (Mishnas) of different *tannaim.* The same techniques were used when amoraic statements contradicted the Mishna. These discussions took place for hundreds of years, and their content was passed on from generation to generation, until the compilation of the Talmud.

The compilation of the Palestinian and Babylonian Talmuds

The portion of the Palestinian Talmud dealing with the three Bavot ("gates")—*i.e.,* the first three tractates of the fourth order of the Mishna (for orders and tractates, see *Talmudic and Midrashic literature,* below)—was compiled in Caesarea in the middle of the 4th century and is distinguished from the rest by its brevity and terminology. The remainder was completed in Tiberias some 50 years later. It seems likely that its compilation was a rescue operation designed to preserve as much of the Halakhic material collected in Palestinian academies as possible, for by that time the deterioration of the political situation had forced most Palestinian scholars to emigrate to Babylonia.

The Babylonian Talmud was compiled up to the 6th century. Some scholars suggest that the organization of the Talmud began early and that successive generations of *amoraim* added layer upon layer to previously arranged material. Others suggest that at the beginning a stratum called Gemara, consisting only of Halakhic decisions or short comments, was set forth. Still others theorize that no overall arrangement of Talmudic material was made until the end of the 4th century.

The statement in the tractate *Bava metzia* that "Rabina and Rav Ashi were the end of instruction" is most often understood as referring to the final redaction of the Talmud. Since at least two generations of scholars following Rav Ashi (died 427) are mentioned in the Talmud, most scholars suggest that "Rabina" refers to Rabina bar Huna (died 499) and that the redaction was a slow process lasting about 75 years to the end of the 5th century.

According to the tradition of the *geonim*—the heads of the academies at Sura and Pumbedita from the 6th to the 11th centuries—the Babylonian Talmud was completed by the 6th-century *savoraim* ("expositors"). But the extent of their contribution is not precisely known. Some attribute to them only short additions. Others credit them with creating the terminology linking the phases of Talmudic discussions. According to another view, they added comments and often decided between conflicting opinions. The proponents of the so-called Gemara theory noted above ascribe to them the entire dialectic portion of Talmudic discourse.

TALMUDIC AND MIDRASHIC LITERATURE

Mishna. The Mishna is divided into six orders (*sedarim*), each order into tractates (*massekhtot*), and each tractate into chapters (*peraqim*). The six orders are *Zeraʿim, Moʿed, Nashim, Neziqin, Qodashim,* and *Ṭohorot.*

Zeraʿim, Moʿed, and *Nashim*

1. *Zeraʿim* ("Seeds") consists of 11 tractates: *Berakhot, Pea, Demai, Kilayim, Sheviʿit, Terumot, Maʿaserot, Maʿaser sheni, Ḥalla, ʿOrla,* and *Bikkurim.* Except for *Berakhot* ("Blessings"), which treats of daily prayers and grace, this order deals with laws related to agriculture in Palestine. It includes prohibitions against mixtures in plants (hybridization), legislation relating to the sabbatical year (when land lies fallow and debts are remitted), and regulations concerning the portions of harvest given to the poor, the Levites, and the priests.

2. *Moʿed* ("Season" or "Festival") consists of 12 tractates: *Shabbat, ʿEruvin, Pesaḥim, Sheqalim, Yoma, Sukka, Betza, Rosh Hashana, Taʿanit, Megilla, Moʿed qaṭan,* and *Ḥagiga.* This order deals with ceremonies, rituals, observances, and prohibitions relating to special days of the year, including the Sabbath, holidays, and fast days. Since the half-shekel Temple contribution was collected on specified days, tractate *Sheqalim,* regarding this practice, is included.

3. *Nashim* ("Women") consists of seven tractates: *Yevamot, Ketubbot, Nedarim, Nazir, Soṭa, Giṭṭin,* and *Qiddushin.* This order deals with laws concerning betrothal, marriage, sexual and financial relations between husband and wife, adultery, and divorce. Since Nazirite (ascetic) and other vows may affect marital relations, *Nedarim* ("Vows") and *Nazir* ("Nazirite") are included here.

Neziqin, Qodashim, and *Ṭohorot*

4. *Neziqin* ("Damages") consists of 10 tractates, the first three of which were originally considered one (the *Bavot*): *Bava qamma, Bava metzia, Bava batra, Sanhedrin, Makkot, Shevuʿot, ʿEduyyot, ʿAvoda zara, Avot,* and *Horayot.* This order deals with civil and criminal law concerning damages, theft, labour relations, usury, real estate, partnerships, tenant relations, inheritance, court composition, jurisdiction and testimony, erroneous decisions of the Sanhedrin, and capital and other physical punishments. Since idolatry, in the literal sense of worship or veneration of material images, is punishable by death, *ʿAvoda zara* ("Idolatry") is included. *Avot* ("Fathers"), commonly called "Ethics of the Fathers" in English, seems to have

been included to teach a moral way of life that precludes the transgression of law.

5. *Qodashim* ("Sacred Things") consists of 11 tractates: *Zevaḥim, Menaḥot, Ḥullin, Bekhorot, ʿArakhin, Temura, Keretot, Meʿila, Tamid, Middot,* and *Qinnim.* This order incorporates some of the oldest Mishnaic portions. It treats of the Temple and includes regulations concerning sacrifices, offerings, and donations. It also contains a detailed description of the Temple complex.

6. *Ṭohorot* ("Purifications") consists of 12 tractates: *Kelim, Ohalot, Negaʿim, Para, Ṭohorot, Miqwaʾot, Nidda, Makhshirin, Zavim, Ṭevul yom, Yadayim,* and *ʿUqtzin.* This order deals with laws governing the ritual impurity of vessels, dwellings, foods, and persons, and with purification processes.

Tosefta. The Tosefta ("Addition") closely resembles the Mishna in content and order. In its present form it at times supplements the Mishna, at other times comments on it, and often also opposes it. There is no Tosefta on the tractates *Avot, Tamid, Middot,* and *Qinnim.* The Talmud quotes from many other collections of Mishnaiot and Baraitot: some are attributed to *tannaim,* and predate the established Mishna; and others, to *amoraim.* The original material is lost.

Incompleteness of the Talmuds

Talmud (Gemara). Although the entire Mishna was studied at the Palestinian and Babylonian academies, the Palestinian Talmud (Gemara) covers only the first four orders (except chapters 21–24 of *Shabbat* and chapter 3 of *Makkot*) and the first three chapters of *Nidda* in the sixth order. Most scholars agree that the Palestinian Talmud was never completed to the fifth and sixth orders of the Mishna and that the missing parts of the other orders were lost. A manuscript of chapter 3 of *Makkot* was, in fact, found and was published in 1946.

The Babylonian Talmud does not cover orders *Zeraʿim* (except *Berakhot*) and *Ṭohorot* (except *Nidda*) and tractates *Tamid* (except chapters 1,2,4), *Sheqalim, Middot, Qinnim, Avot,* and *ʿEduyyot.* Scholars concur that the Talmud for these parts was never completed, possibly because their content was not relevant in Babylonia.

Midrashim. *Halakhic.* Halakhic Midrashim are exegetic commentaries on the legal content of Exodus, Leviticus, Numbers, and Deuteronomy. The five extant collections are *Mekhilta,* on Exodus; *Mekhilta deRabbi Shimʿon ben Yoḥai,* on Exodus; *Sifra,* on Leviticus; *Sifre,* on Numbers and Deuteronomy; *Sifre zuṭa,* on Numbers. (*Mekhilta* means "measure," a norm or rule; *Sifra,* plural *Sifre,* means "writing" or "book.") Critical analysis reveals that *Mekhilta* and *Sifre* on Numbers differ from the others in terminology and method. Most scholars agree that these two originated in the school of Ishmael and the others in that of Akiba. In their present form they also include later additions. Mention should also be made of *Midrash tannaim* on Deuteronomy, consisting of fragments recovered from the Yemenite anthology *Midrash ha-gadol.*

Haggadic. Haggadic Midrashim originated with the weekly synagogue readings and their accompanying explanations. Although Haggadic collections existed in tannaitic times, extant collections date from the 4th–11th centuries. Midrashic compilations were not authoritatively edited and tend to be coincidental and fragmentary.

Biblical and nonbiblical Haggadot

Most notable among biblical collections is *Midrash rabba* ("Great Midrash"), a composite of commentaries on the Pentateuch and five Megillot (Song of Songs, Ruth, Ecclesiastes, Esther, Lamentations) differing in nature and age. Its oldest portion, the 5th-century *Genesis rabba,* is largely a verse-by-verse commentary, while the 6th-century *Leviticus rabba* consists of homilies and *Lamentations rabba* (end of 6th century) is mainly narrative. The remaining portions of *Midrash rabba* were compiled at later dates.

The *Tanḥuma* (after the late-4th-century Palestinian *amora* Tanḥuma bar Abba), of which two versions are extant, is another important Pentateuchal Midrash. Additional Midrashic compilations include those to the books of Samuel, Psalms, and Proverbs. Mention should also be made of *Pesiqta* ("Section" or "Cycles") *deRab Kahana* (after a Babylonian *amora*) and *Pesiqta rabbati* ("The Great Cycle"), consisting of homilies on the Torah (Pentateuch) readings that occur on festivals and special Sabbaths.

Haggadic compilations independent of biblical text include *Avot deRabbi Natan, Tanna deve Eliyyahu, Pirqe* ("Chapters") *deRabbi Eliezer,* and tractates *Derekh eretz* ("Correct Conduct"). These primarily deal with ethics, moral teachings, and biblical narrative.

Among the medieval anthologies are the *Yalquṭ* ("Compilation") *Shimoni* (13th century), *Yalquṭ ha-makhiri* (14th century), and *ʿEn Yaʿaqov* ("Eye of Jacob," 16th century). The two most important modern Haggadic anthologies are those of Wilhelm Bacher and Louis Ginzberg.

Codes. The Talmud's dialectic style and organization are not those of a code of laws. Accordingly, codification efforts began shortly after the Talmud's completion. The first known attempt was *Halakhot pesuqot* ("Decided Laws"), ascribed to Yehudai Gaon (8th century). *Halakhot gedolot* ("Great Laws"), by Simeon Kiyyara, followed 100 years later. Both summarize Talmudic Halakhic material, omitting dialectics but preserving Talmudic order and language. The later *geonim* concentrated on particular subjects, such as divorce or vows, introducing the monographic style of codification.

Codification literature gained impetus by the beginning of the 11th century. During the next centuries many compilations appeared in Europe and North Africa. The most notable, following Talmudic order, were the *Hilkhot Harif,* by Isaac Alfasi (11th century), and *Hilkhot Harosh,* by Asher ben Jehiel (13th–14th centuries). Though modelled after *Halakhot gedolot,* the *Hilkhot Harif* encompasses only laws applicable after the destruction of the Temple but includes more particulars. The *Hilkhot Harosh* closely follows Alfasi's code but often also includes the reasoning underlying decisions.

The *Mishne Torah, Sefer ha-ṭurim,* and *Shulḥan ʿarukh*

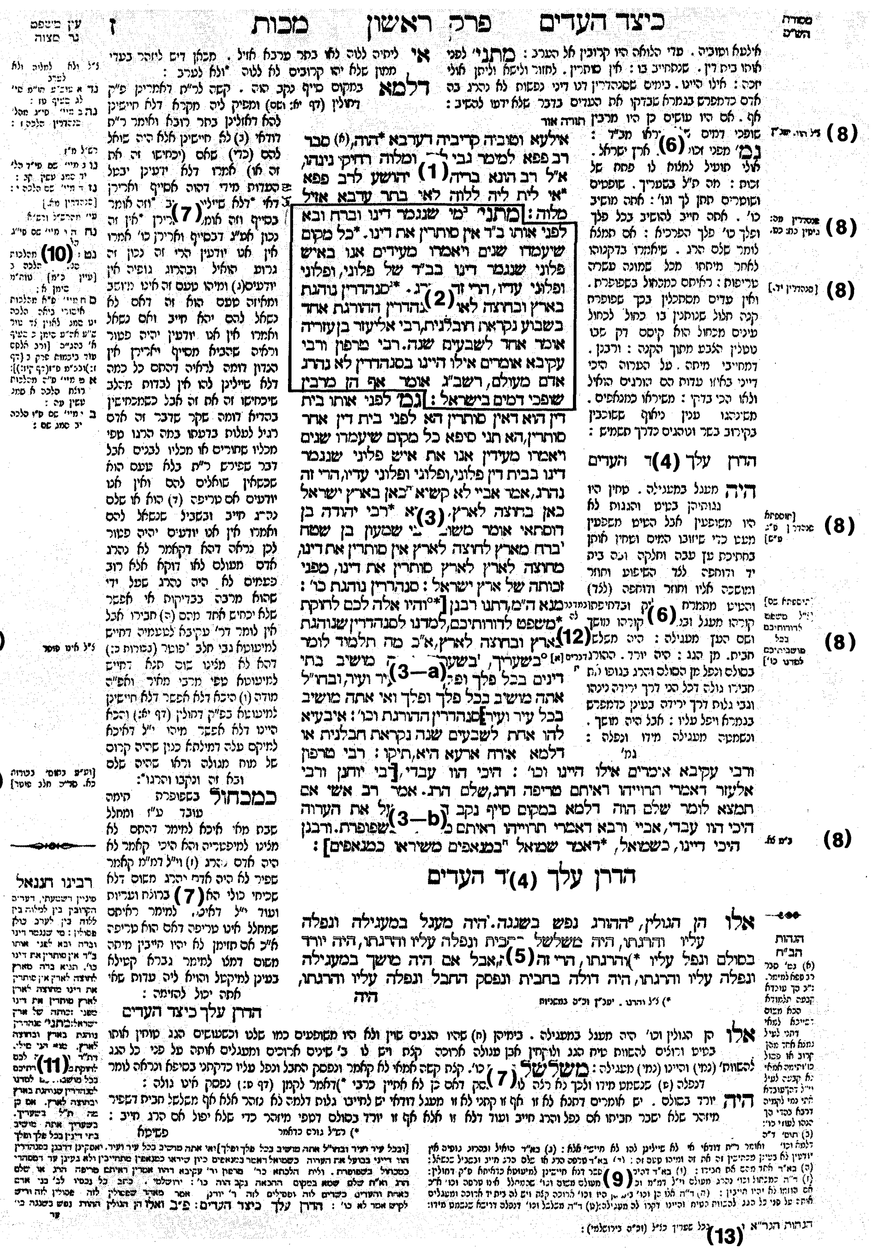
The most important of the topically arranged codifications were: the *Mishne Torah, Sefer ha-ṭurim,* and *Shulḥan ʿarukh.* (1) The *Mishne Torah* ("The Torah Reviewed") by Maimonides (12th century), is a monumental work, original in plan, language, and order; it encompasses all religious subject matter under 14 headings and includes theosophy, theology, and religion. (2) The *Sefer ha-ṭurim* ("Book of Rows," or " Parts"), by Jacob ben Asher (14th century), the son of Asher ben Jehiel, introduced new groupings, dividing subject matter into four major categories (*ṭurim*) reminiscent of the Mishnaic orders; it includes only laws applicable after the destruction of the Temple. (3) The *Shulḥan ʿarukh* ("The Prepared Table") by Joseph Karo (16th century), the last of the great codifiers, is structured after the *Sefer ha-ṭurim,* but presents the Sefardic (Middle Eastern and North African) rather than the Ashkenazic (Franco-German and eastern European) tradition, with decisions largely following those of Alfasi, Maimonides, and Rabbi Asher. When the 16th-century Ashkenazic codifier Moses Isserles added his notes, this became the standard Halakhic code for all Jewry.

Commentaries. The interpretive literature on the Talmud began with the rise of academies in Europe and North Africa. The earliest known European commentary, though ascribed to Gershom ben Judah (10th–11th centuries), is actually an eclectic compilation of notes recorded by students of the Mayence (Mainz) Academy. Compilations of this kind, known as *quntresim* ("notebooks"), also developed in other academies. Their content was masterfully reshaped and reformulated in the renowned 11th-century commentary of Rashi (acronym of *Ra*bbi *Sh*lomo *Yitzḥaqi*), in which difficulties likely to be encountered by students are anticipated and detail after detail is clarified until a synthesized, comprehensible whole emerges.

The commentaries of Ḥananel ben Ḥushiel and Nissim ben Jacob ben Nissim, the first to appear in North Africa (11th century), are introductory in nature. They summarize the content of Talmudic discussions, assuming that details will be understood once the general idea becomes comprehensible. This style was later followed by the Spanish school, including Joseph ibn Migash and Maimonides. However, as Rashi's work became known, it displaced all other commentaries. (Note its predominant role in the sample page of Talmud.)

Tosafot, novellae, and *responsa*

A new phase in Talmudic literature was initiated by Rashi's grandchildren, Rabbis Isaac, Samuel, and Jacob, the sons of Meir, who established the school of *tosafot.*



Sample page (7a) of the tractate *Makkot* (of the fourth order, *Neziqin*) of the Vilna edition of the Babylonian Talmud, first printed in 1880–86. It discusses the fate of a man who was convicted and escaped and how he is to be judged. Code numbers, a box surrounding the Mishna, and brackets indicating the extent of comments (3-a) and (3-b) have been superimposed onto the original page. (1) End of the Gemara to the previous Mishna. (2) Mishna. (3) Gemara. (3-a) Halakhic Midrash supporting the Mishna. (3-b) Three short comments from Palestine, Sura, and Pumbedita. (4) Mark indicating the end of the chapter. (5) Mishna of the next chapter. (6) Commentary of Rashi (1040–1105). (7) *Tosafot,* discussing special points in the Gemara and Rashi. (8) Cross-reference notes to other Talmudic and Rabbinic sources and textual variants. (9) Notes by Joel Sirkes (1561–1640). (10) References to the codes of Maimonides, Moses of Concy, the *Tur,* and the Shulḥan ʿarukh. (11) Commentary of Hananel of North Africa, early 11th century. (12) References to scripture. (13) Notes by Elijah Gaon of Vilna (1720–97).

(These medieval "additions" are not to be confused with the tannaitic Tosefta discussed above.) Reviving Talmudic dialectic, they treated the Talmud in the same way that it had treated the Mishna. They linked apparently unrelated statements from different Talmudic discourses and pointed out the fine distinctions between seemingly interdependent statements. This dialectic style was soon adopted in all European academies. Even the writings of Ravad (Abraham ben David), Zerahiah ha-Levi, and Yeshaya deTrani, three of the most original Talmudists (12th century), reflect the impact of Tosafist dialectic.

The works of Meir Abulafia and Menaḥem Meiri, although of the North African genre, include a strong dialectic element. In Spain such dialectic works were known as *ḥiddushim* or *novellae* (since they sought "new insights"), the most famous being those written by four generations (13th–14th centuries) of teacher and pupil: Ramban (Naḥmanides, or Moses ben Naḥman), Rashba (Solomon ben Adret), Ritba (Yomtov ben Abraham), and Ran (Nissim ben Reuben Gerondi).

A major role in establishing Talmudic authority was also played by the *responsa* literature, replies (*responsa*) to legal and religious questions. Beginning in the 7th century, when the Babylonian *geonim* responded in writing to questions concerning the Talmud, it developed into a branch of Talmudic literature that continued to the present. Then, as now, Talmudic authorities were approached for explanations and decisions. Among the *geonim* the best known were Sherira (10th century) and his son Hai. In the Middle Ages the most important were Alfasi, Ibn Migash (Joseph ibn Migash), Maimonides, Ravad (Abraham ben David of Posquières), Ramban, Rashba, Rosh (Asher ben Jehiel), Ran, and Ribash (Isaac ben Sheshet Perfet).

Writing and printing of the Talmuds. Study in the academies was always oral; hence the question of when the Mishna and Talmud were first committed to writing has been the subject of much discussion. According to some scholars, the process of writing began with Judah ha-Nasi. Others attribute it to the *savoraim.*

The Palestinian Talmud was first printed in Venice (1523–24). All later editions followed this one. Printing of the Babylonian Talmud was begun in Spain about 1482, and there have been more than 100 different editions since. The oldest extant full edition appeared in Venice (1520–23). This became the prototype for later printings, setting the type of page and pagination (a total of close to 5,500 folios). The standard edition was printed in Vilna beginning in 1886. It carries many commentaries and commentaries upon commentaries. In the sample page reproduced here, the Mishna and the Gemara are placed in the centre column of the page and are printed in the heavy type. The commentary of Rashi is always located in the inner column of the page and the *tosafot* in the outer column. Other commentaries and references to legal codes and to scriptural verses surround the major commentaries, in smaller type. Talmudic citations are made by tractate name, folio number, and side of the folio (a or b).

NONLEGAL SUBJECT MATTER

God, Torah, and Israel

Main religious doctrines. While the Talmudic rabbis never formally systematized their beliefs, their underlying religious concepts are clearly reflected in their decisions, ideas, and attitudes. Preeminent in rabbinic thinking were the concepts of God, Torah, and Israel.

God. The rabbinic God was primarily the biblical God who acted in history, the creator and source of life who was experienced through the senses rather than intellect. In reaction to sectarian teachings (*i.e.,* Gnosticism and early Christianity), however, the rabbis stressed God's universality, absolute unity, and direct involvement with the world. His immanence and transcendence (being present in and beyond the universe) were emphasized, and biblical anthropomorphisms (ascribing human attributes to God) were explained metaphorically. The rabbis also stressed an intimacy into the relationship between God and man. God became the father to whom each individual could turn in direct prayer for his needs. To the names YHWH and Elohim, which traditionally were identified with God's mercy and judgment, respectively, the rabbis added new terms reflecting his other attributes—*e.g.,* Shekhina ("Presence"), representing his omnipresence, or immanence; and Maqom ("Place"), his transcendence.

Torah. Torah, in the Talmudic sense, refers to all religious and ethical teachings handed down by tradition. According to the rabbis, God created the Torah long before the world. It contained the eternal divine formula for the world's future workings and thus the answers to all problems for all times and all people. God himself is depicted as studying the Torah, for even he cannot make decisions concerning the world that contradict it.

Israel. The people Israel, according to the rabbis, were chosen by God to be the guardian of his Torah, and, just as God chose Israel, Israel chose God. Thus, the concept of Israel as a nation bound together by an irrevocable commitment to bring the Torah to the world, and bearing corporate responsibility for this mission, was formed. No Jew can free himself from this commitment, but anyone accepting it, regardless of race, becomes a full-fledged Jew with obligations binding him and his descendants.

With this in mind, the rabbis repeatedly emphasized the importance of studying Torah. They pointed out that the Torah is not a declaration of religious beliefs. Rather it is a statement of a discipline regulating each detail of life. Any transgression of this discipline hampers the divine plan of establishing God's way of life in this world.

Sanctification of everyday life

Worship. The intensive rabbinic religious involvement led to the growth of a new concept of worship. While in the Bible worship was usually centred in the sanctuary of the Temple in Jerusalem, the rabbis, particularly after the destruction of the Second Temple (70 CE), attempted to sanctify all of life. Thus, they said that one must bless God upon arising in the morning, before dressing, before and after meals, and in all ordinary daily actions or routines. Each move in life should be an act of worship glorifying God's name.

Messianic kingdom. In rabbinic thinking the establishment of God's kingdom was tied to the Messiah, who was to be a descendant of King David, wise, just, a great scholar, a moral leader, and courageous king. He would redeem the Jews from exile and reestablish their independence in the land of Israel. With this the world would be ushered into a new era of righteousness and universal peace. The rabbis referred to this era as "the world to come," portraying it as an immense academy in which the righteous would study Torah without interruption. They refrained from describing it further, saying that human language and fantasy are inadequate to its wonders.

The nature of the Messiah and the time of his arrival raised much speculation. Following the defeat of Bar Kokhba, leader of the revolt against Roman rule (135 CE), the Messiah's coming, in rabbinic thought, faded into the mysterious and distant future, and descriptions concerning his personality assumed supernatural overtones.

For a fuller discussion of major religious doctrines, see below, *Basic beliefs and doctrines.*

Doctrine of man. The fate of man, his achievements and failures, his being and nothingness, occupy an important place in Talmudic literature. The rabbis' concept of man was a universal one. While they assumed that Jews are bound by greater religious duties than others, they considered all men equal, all created in the image of God. "Therefore, but a single man was created . . . That none should say to his fellow, 'My father was greater than thy father'" (tractate *Sanhedrin*).

The world, according to the Talmud, was created for the sake of man, and it is incumbent upon him to keep it in order. His responsibility begins at home. Man must care for his health, marry, build a family, provide for and educate children, honour parents, friends, and elders. He also carries social responsibilities and has to be part of the community. He must learn a trade and work so that he does not become a burden to the community.

The *yetzer ha-ṭov* and *yetzer ha-ra*

The uniqueness of man in this world, likened by the Talmud to the uniqueness of God in the universe, lies in his freedom of choice. Nature follows its laws and angels their missions, but man is his own master. In contrast to St. Paul's doctrine that the original sin of Adam made sin an integral part of human nature, the rabbis considered man a wondrous and harmonious being. The duality of his nature was explained by the existence of a good and bad impulse, personified by two angels, *yetzer ha-ṭov* (the good inclination) and *yetzer ha-raʿ* (the evil inclination), which enter each man after birth. It is the duty of man to overcome his evil inclination, and it is for this that he is rewarded. Moreover, since there is corporate responsibility, not only is the sinner punished but the community at large also suffers. Here again, however, man is his own master. He can reverse the course of sin and punishment by repentance. Although repentance may be accompanied by formal and ceremonial acts, such as fasting, its basic principle is the renunciation of the sin and the wholehearted decision not to repeat it. When a man transgresses against God, his sin is forgiven by repentance alone, but, when he transgresses against his fellow man, he must make good his wrongdoing as well as repent.

Medicine and science. The Talmud devoted considerable attention to the maintenance of good health, regarding it a religious duty. A keen understanding of the importance of hygiene in preventing illness was reflected in an emphasis upon bodily cleanliness. The rabbis also stressed the necessity for moderation in eating and drinking and the importance of a proper diet. The Talmud prescribed remedies for illnesses and mentioned surgical techniques, such as cesarean section.

Religious concerns surrounding the calendar, prohibitions against planting seeds of different kinds together, dietary laws, and Sabbath-walking limits resulted in an intense rabbinical interest in astronomy, zoology, mathematics, and geometry.

The challenge of pagan myths, legend, and folklore

Legend and folklore. Side by side with the Midrashic Haggada, which was the outgrowth of Bible exegesis and developed in the academies, the Talmuds and Midrashic collections contain a large quantity of Haggadic material with mythological rudiments, allusions to pagan beliefs and customs, and folkloristic elements of a world strange to the rabbis. Folktales and legends, animal lore, and adventure narratives, containing pagan ideas and beliefs, that were told by their Gentile neighbours were no doubt a major attraction to the common Jews, especially those in the countryside (the *ʿam ha-aretz,* or "people of the land"). The rabbis realized the great danger involved in this situation and developed their own folk material. They adopted the dramatic and artistic parts of these stories but rejected the unwanted elements, replacing them with their own ideas. Thus the animals and birds in fables quote the Bible and discuss it in the same manner that the rabbis do.

Ancient mythology seems to have been well known and liked by the Jewish masses. Again, in order to fight its influence, the rabbis reworked its content in their own spirit. They retained the mythological suspense—the sea tries to drown the earth—but there is no mythological struggle between equal powers; angels try to prevent the creation of man, but they do not possess titanic power. All are subdued by the command of God. Thus, the rabbis transformed the ancient myths into dramatic evidence against polytheism. (See also below, *Jewish myth and legend.*)

Astrology, magic, and divination. Astrology was a recognized science in the ancient world. The rabbis could not reject it entirely, and some concluded that the power of the stars is confined to Gentiles. Others made it part of God's order, saying that stars influence this world in the same way that climate influences plants. The rabbis strenuously objected to omens and other forms of divination because they considered them magic. Dreams were considered by some rabbis as meaningless, while others saw in them an element of prophecy.

The rabbis believed in the efficacy of magic but strenuously objected to its practice. They permitted only magic that had been proved effective in healing. They also permitted the use of incantations for the purpose of counteracting the hold of magic. Because of their supposedly protective nature, the use of amulets was also countenanced.

Demons (evil spirits) and the evil eye

The existence of a demonic kingdom was accepted by the rabbis without question. Evil spirits are invisible and fill the nether world. They avoid sunlight and concentrate in waters and deserted places. They also mingle with people, trouble them, and help them. They have passions and are born and die like people. However, they also have some of the traits and powers of angels. The evil eye was considered as dangerous as evil spirits. It was thought that for mysterious reasons some people have the power to injure others by looking at them and that it is generally jealousy that triggers this effect. The rabbis, however, repeatedly emphasized that all of these strange powers are under the divine government and, moreover, that they cannot hurt the pious.

TALMUDIC LAW AND JURISPRUDENCE

Sacral basis of Talmudic law

Unlike the Romans, who considered ritual law (*fas*) God-given and social law (*lex*) man-made, the rabbis believed all Jewish law to be of divine origin. Thus, for example, unfairness in labour relations was considered a religious sin and caring for the sick a religious obligation. Though familiar with the concept of natural law (ethical principles inherent in the nature of things and apprehensible through human reason), the rabbis objected to making nature the basis of law. Even rabbinic ordinances were regarded as having validity only because the authority of the rabbis is sanctioned by the Torah.

Methods of arriving at legal principle and decisions. Ancient Halakha knew no controversy. The earliest controversy dates to the pre-tannaitic *zugot.* Hillel and Shammai differed on significant issues, and, with the rise of their schools, Halakhic uniformity began to crumble. Halakha became a scholastic discipline that developed in academic rather than judicial settings, more and more issues remaining unresolved. Over 300 controversies between the schools of Hillel and Shammai (called the House of Hillel and the House of Shammai, respectively) are reported in Talmudic sources. As time passed, disputes proliferated even more and were considered legitimate provided they conformed to the rule of Halakhic discipline.

No attempt was made to restore Halakhic uniformity until the beginning of the 2nd century CE. Controversies were sometimes resolved by citing old traditions, by establishing precedents, or, when the sages could convene, by vote taking.

At Yavne, Gamaliel II, the president of the revived Sanhedrin (*c.* 80–*c.* 115 CE), attempted to suppress diversity of opinion, but failed. The right to differ was already established. Moreover, in the Halakhic collection compiled at Yavne (tractate *ʿEduyyot*), the views of individual scholars were preserved. The sages at Yavne, however, did take a major step toward restoring Halakhic consistency by upholding the generally more lenient views of the House of Hillel over those of the House of Shammai, thus establishing the Hillelite tradition as the main trend of rabbinic Judaism.

Guidelines for settling Halakhic controversies

The principle that differing opinions should be recorded was followed by Judah ha-Nasi in his Mishna. Modern scholars differ as to whether he meant to compile a code of law or merely a Halakhic collection. The *amoraim,* however, accepted his Mishna as the definitive code and introduced a set of guidelines according to which disputes were decided. Thus, for example, collective (". . . the sages said") and individual opinions stated anonymously were taken as law; Akiba's decisions were upheld over those of his colleagues. Similar guidelines developed also with regard to amoraic controversies.

With the completion of the Talmud, a new phase in Halakhic development began. Not only were there two different Talmuds and a large Haggadic literature but even within each of the Talmuds diversified opinions were reported. The *geonim* laid down rules governing the use of this enormous literature for lawmaking. They designated the Babylonian Talmud the highest authority, taking the Palestinian Talmud into consideration only when it did not disagree with the Babylonian or when the latter expressed no opinion on a subject. They also deprived the Haggadic literature of Halakhic authority and set guidelines for the precedence of opinion among *amoraim.* These geonic rules served as the basis of all future codifications.

After the geonic period two methods of decision making were applied. The first of these relied primarily upon the authoritative codes. The Mediterranean rabbis, for example, made the code of Maimonides the source of all of their lawmaking. The second method relied on the original Talmudic sources for decision making. This method was applied by the Tosafists and their followers, who, though they consulted the older codes, did not accept them as the final authorities. The *responsa* literature represents a synthesis of these two methods. Although it makes use of codes as the main source of law, its decisions are always accompanied by a discussion and analysis of earlier relevant literature. This approach has been used by rabbis to the present day.

In addition to the above, in particular instances throughout the ages rabbinic authorities promulgated ordinances (*taqqanot*) and edicts (*gezerot*). These were made in response to pressing needs of time and circumstance, and this form of lawmaking was most frequently used by rabbinic synods in the Middle Ages.

The Great and Lesser Sanhedrins

Administration of justice. *Courts.* A comprehensive judicial system is described in Talmudic sources. The highest court was the Great Sanhedrin. It consisted of 71 members and convened daily in one of the Temple halls. It was the highest legal and religious authority in the country and had exclusive jurisdiction over matters of a national and public nature. It also functioned as the court of appeals, dealing with cases that were not resolved by the lower courts.

Next in line of judicial authority was the Lesser Sanhedrin. Each town with a population of 120 or more had a court of this kind. These courts each consisted of 23 members and dealt with cases involving capital punishment.

The members of the Sanhedrins had to be ordained, pious, mature in age, sound in mind and body, of wide knowledge, and of pure Jewish descent. Persons who were too old or who had never had children were ineligible, for it was thought that they might not be merciful.

The lower courts dealt with all remaining cases. Each consisted of three members and convened on Mondays and Thursdays. In cases involving a penalty the three judges had to be ordained, but in those involving ordinary monetary litigation ordination was not required. In the latter type of case, concerned parties were allowed the alternative of setting up ad hoc arbitration bodies.

Rules of evidence. Jewish law was extremely strict regarding evidence acceptable in court. In cases entailing physical punishment, no circumstantial evidence, confession, or self-incrimination was recognized. The testimony of two eyewitnesses who confronted the defendant was required. In monetary cases documentary evidence and, at times, oaths were acceptable. Any mental or moral defects or self-interest in the case disqualified witnesses. Relatives could not serve as judges or witnesses.

Trial procedure. Jewish law knows of no lawyers. After the facts were presented, the court investigated, deliberated, and made its decision by voting. Both sides had to be treated equally, even to the point of seeing to it that neither should be dressed more richly than the other. Each side could be heard only in the presence of the other.

In the trial procedure of capital cases, there was a clear tendency toward bias in favour of the defendant. Thus, only the judges could argue for conviction, but all present could argue for acquittal. The most junior judges voted first so that they would not be unduly influenced by their seniors. A majority of one was sufficient for acquittal, but a majority of two was necessary for conviction. A verdict of acquittal could be reached on the same day but one of conviction only on the following day. When the court erred, only its convictions, and not its acquittals, were reversed.

Death penalties

Criminal law. In Jewish law, ritual and nonritual transgressions were crimes punishable by court. Each of the 36 most severe transgressions (*e.g.,* adultery, sodomy, idolatry, sorcery, or murder) carried one of four types of death penalty (stoning, burning, beheading, and strangling). Rabbinic law, however, tended to minimize the practice of capital punishment. The rigorous cross-examination of witnesses and the warning of impending punishment that the transgressor had to receive immediately before committing his crime made it almost impossible to reach a death verdict.

If despite all of this a death verdict was reached, every legal effort was made to allow for a last-minute reversal. Execution was expedited and carried out in the most humane manner possible, the accused being given an opiate before dying. To show their compassion the judges fasted on the day of execution. According to tradition the death penalty was abolished 40 years before the destruction of the Temple, when the Great Sanhedrin was exiled from the Temple complex.

The punishment for 207 other transgressions (*e.g.,* perjury, some forms of incest, the eating of forbidden foods) was flagellation. Here, too, the rabbis tended to be lenient. As in capital cases, a rigorous cross-examination and a warning were required. The maximum number of stripes administered was 39. Prior to flagellation the transgressor was examined medically to determine the number of stripes he could withstand.

Side by side with the above penalties, the courts also inflicted *makkat mardut* (disciplinary stripes) and excommunication in cases where regular flagellation could not legally be applied. These two punishments were generally used in Babylonia, where ordained courts did not exist. It should be mentioned also that the Mishna includes a few obscure references to a form of imprisonment used instead of capital punishment.

Civil and social law. Although the rabbis considered both ritual and nonritual law sacred, they demonstrated great independence in supplementing the relatively brief relevant scriptural comments and regulations with a comprehensive system of civil and social law. In response to variations in social and economic circumstances, certain differences in Palestinian and Babylonian Talmudic law emerged. The Babylonian rabbis, for example, recognized the law of the state as binding in monetary matters, while the Palestinian rabbis did not. In general, however, Jewish civil law developed relatively autonomously. In instances where the rabbis did adopt alien legal concepts, they elaborated upon them until they could be fully integrated into the spirit and structure of Jewish law.

Social welfare, torts, family law, financial law

The following are some of the areas covered: (1) Social welfare: a comprehensive social welfare system was worked out, including obligations to provide for children, educate them, and train them for a profession. Regulations of charity, medical assistance, and burial of the dead were established. (2) Torts: included were all damages caused by a person directly or indirectly via his property. The main aim was to compensate for damages. Consequently, no torts were classified as criminal. Even "an eye for an eye" was interpreted to mean financial compensation. (3) Family law: included were regulations concerning marriage and divorce procedures and the innovation of the *ketubba* (marriage contract), which spells out the mutual obligations of husband and wife in the areas of finance, medical care, clothing, housework, sexual relations, and child care. According to biblical law, the right to inherit belongs to sons first. To protect the rights of wives and daughters, rabbinic law obligated the sons to maintain the widows and unmarried daughters. (4) Financial law: except for Gen. 23:9 ff., Jer. 32:10, and Ruth 4:8, Scripture makes no reference to transaction procedures. The growth of finances, industry, and land estates led the rabbis to develop laws concerning contracts, partnerships, and legal arrangements to circumvent the biblical prohibition against usury. A series of modes of transaction effecting the transfer and acquisition of property evolved. Labour relations, rents, and leases were also carefully regulated.

THE TALMUD TODAY

Role in the Jewish community. With the rebirth of a Jewish national state (since 1948) and the concomitant revival of Jewish culture, the Talmud has achieved renewed importance. Orthodox Jewry has always focussed upon its study and has believed it to be the absolute Halakhic authority. This belief has now become even further intensified. While rabbinic courts in Israel have jurisdiction only in the area of family life, it has become one of the aims of religious (Orthodox) Jewry there to establish Talmudic law as the general law of the state.

It should also be noted that, aside from the special case of Israel, the legal system described above has continued to function down to the present day in Jewish communities all over the world. The jurisdiction of rabbinic courts is voluntarily accepted by Orthodox Jews. These courts continue to exert authority, especially in the areas of family and dietary law, the synagogue, and the organization of charity and social activity.

Conservative Jewry, too, has always been committed to rabbinic tradition. It has, however, conceptualized this tradition as an evolutionary process in which Halakha changes to meet the challenge of new conditions. Professional scholarship was considered crucial for understanding the furthering of this process. More recently, however, as a result of revived nationalism, new emphasis has been put upon lay education. Thus, a network of day schools and higher institutions of learning in which rabbinic tradition occupies a major role in the curriculum has been established. Scores of young Conservative Jews now search in the Talmud for answers to crucial problems, such as abortion and civil violence.

Classical (19th-century) Reform Judaism not only dissassociated itself from the Talmud but negated it. More recently, however, Reform leaders have been inclined to reestablish some measure of ritual practice and rabbinic climate. Thus, it is now not unusual to find them stating their decisions in the form of *responsa* and using the rabbinic style of argument and even the casuistic type of Talmudic dialectic (*pilpul*) to justify their religious practices.

Talmudic scholarship. Although Talmudic scholarship continues to be advanced by individuals in a number of countries, its two main centres are in Israel and the United States. The Israeli centre has tended to focus upon research of a critical nature. Like Bible criticism, this work is divided between source criticism (*i.e.,* discovering the different sources, their dates, and the methods by which Talmudic literature was formed) and textual criticism (*i.e.,* establishing the correct text and reading). Research is also being done on Haggadic concepts and thinking, Talmudic law, and Halakhic development.

Talmudic scholarship in the United States has tended to be more philosophically and historically oriented. There has been great interest in the development of Halakha and in folklore and custom. Essential work has been done and continues to be done in the areas of source criticism. A work unique in scope and method is S. Lieberman's commentary on the Tosefta. (H.Z.D./L.H.S./Ed.)

Basic beliefs and doctrines

The Judaic and the human

Judaism is not and cannot be viewed as an abstract intellectual system, although some of its affirmations may be couched in such terms. It affirms divine sovereignty disclosed in creation (nature) and in history, without necessarily insisting upon—but at the same time not rejecting—metaphysical speculation about the divine (see below *Jewish philosophy*). It insists that the community has been confronted by the divine not as abstraction but as person, with whom the community and its members enter into relationship. It is—as the concept Torah indicates—a program of human action, rooted in this personal confrontation. Further, the response of this particular people to its encounter with God is viewed as significant for all mankind. The community is called upon to express its loyalty to God and the Covenant by exhibiting solidarity within its corporate life on every level—including every aspect of human behaviour, from the most public to the most private. Thus, even Jewish worship is communal celebration of the meetings with God in history and in nature. Yet the particular existence of the Covenant people is not thought of as contradicting but rather as enhancing human solidarity. This people, together with all men, is called upon to create political, economic, and social forms that will affirm divine sovereignty—embody it in communal existence. This task is carried out in the belief not that man will succeed solely by his own efforts in these endeavours but that these sought-after human relationships have both their source and their goal in God—who assures their actualization. Within the sphere of his existence in the community, each Jew is called upon to realize the Covenant in his personal intention and behaviour.

In considering the basic affirmations of Judaism from this point of view it is best to allow indigenous formulations rather than systematic statements borrowed from other traditions to govern the presentation.

GOD

An early statement of basic beliefs and doctrines emerged in the liturgy of the synagogue some time during the last pre-Christian and first Christian centuries, although there is evidence that such formulations were not absent from the Temple cult that came to an end in the year 70 CE. A section of the *Siddur* (order of worship, or prayerbook) that has as its focus the recitation of a series of biblical passages (Deut. 6:4–9; Deut. 11:13–21; Num. 15:37–41) takes its name from the first of these, Shema ("Hear"): "Hear, O Israel! the Lord is our God, the Lord alone" (or ". . . the Lord our God, the Lord is one"). In the Shema—often regarded as the Jewish confession of faith, or creed—the biblical material and accompanying benedictions are arranged to provide a unified statement about God and his relationship to the world and Israel, as well as Israel's obligations toward and response to God. In this statement, God, who is the Creator of the universe and who has chosen Israel in love ("Blessed art thou, O Lord, who has chosen thy people Israel in love"), expressed by the giving of Torah, is declared to be "one"; his love is to be reciprocated by men who lovingly obey Torah and whose obedience is rewarded and rebellion punished. The goal of this obedience is God's "redemption" of Israel, a role foreshadowed by his action in bringing Israel out of Egypt.

Divine love and justice

Unity and uniqueness. At the centre of this liturgical formulation of belief is the concept of the divine unity. In its original setting, it may have served as the theological statement of the reform under Josiah, king of Judah, in the 7th century BCE when worship was centred exclusively in Jerusalem, and all other cultic centres were rejected, so that the existence of one shrine only was understood as affirming one deity. The idea, however, acquired further meaning. It was understood toward the end of the pre-Christian era to proclaim—over against dualistic religious formulations in the Greco-Roman world—the unity of divine love and divine justice, as expressed in the divine names YHWH and Elohim, respectively. A further expansion of this affirmation is found in the first two benedictions of this liturgical section, which together proclaim that the God who is the Creator of the universe and the God who is Israel's ruler and lawgiver are one and the same—as over against religious positions that insisted that the Creator God and the lawgiver God were separate and even inimical. Subsequently, this affirmation was developed in philosophical and mystical terms by both medieval and modern thinkers.

Creativity. As has been noted, this "creed," or "confession of faith," underscores in the first benediction the relation of God to the world as that of Creator to creation. "Blessed art thou, O Lord our God, King of the Universe, who forms light and creates darkness, who makes peace and creates all things." It adds the assertion that his activity is not in the past but is ongoing and continuous, for "he makes new continually, each day, the work of creation"; thus, unlike the deity of the Stoic world view, he remains actively present in nature. This "creed" is concerned as well to come to terms with the ever-present problem of evil. Paraphrasing Isa. 45:7, "I form the light and create darkness; I make peace, and create evil," it changes the last word to "all" (or "all things") rather than "evil." The change was clearly made to avoid the implication that God is the source of moral evil. Judaism, however, did not flinch from confronting the problem of pain and suffering in the world and affirming the paradox of suffering and divine sovereignty, of pain and divine providence, refusing to accept the concept of a partial God—a God that is Lord over only the harmonious and pleasant aspects of reality.

Divine Providence

Activity in the world. The second and the third benedictions deal with divine activity within the realm of history and human life. God is teacher of men through the giving of instruction (Torah; see above); he acts in the life of mankind in historical events; he has chosen a particular people—Israel—in love to witness to his presence and his desire for a perfected society; he will, as redeemer, enable man to experience that perfection. These activities, together with creation itself, are understood to express divine compassion and kindness as well as justice (judgment), recognizing the sometimes paradoxical relation between them. Taken together, they disclose Divine Providence—God's continual activity in the world. The constant renewal of creation (nature) is itself an act of compassion overriding strict justice and affording mankind further opportunity to fulfill the divinely appointed obligation. Yet the basically moral nature of God is asserted in the second of the biblical passages that form the core of this liturgical statement (Deut. 11:13–21). Here, in the language of its agricultural setting, the community is promised reward for obedience and punishment for disobedience. The intention of the passage is clear: obedience is rewarded by the preservation of order, so that the community and its members find wholeness in life; while disobedience—rebellion against divine sovereignty—shatters order, so that the community is overwhelmed by adversity. The passage of time has made the original language unsatisfactory (promising rain, crops, and fat cattle), but the basic principle remains, affirming that, however difficult it is to recognize the fact, there is a divine law and judge. Support for this affirmation is drawn from the third biblical passage (Num. 15:37–41), which explains that the fringes the

Israelites are commanded to wear on the corners of their garments are reminders to observe the commandments of God, who brought forth Israel from Egyptian bondage. The theme of divine redemption is elaborated in the concluding benediction to point toward a future in which the as yet fragmentary rule of God will be brought to completion: "Blessed is his name whose glorious kingdom is for ever and ever."

Otherness and nearness. Within this complex of ideas, other themes are interwoven. In the concept of the divine Creator there is a somewhat impersonal or remote quality—of a power above and apart from the world—which is underscored by such expressions as the trifold declaration of God's holiness, or divine otherness, in Isaiah 6:3: "Holy, holy, holy is the Lord of hosts . . ." The development of surrogate divine names for biblical usage, as well as the substitution of Adonai ("my Lord") for the tetragrammaton (YHWH) in the reading of the Bible itself, suggests an acute awareness of the otherness of God. Yet this has as its countertheme the affirmation of divine nearness. In the biblical narrative it is God himself who is the directly active participant in events, an idea that is emphasized in the liturgical narrative (Haggada) recited during the Passover meal (seder): "and the Lord brought us forth out of Egypt—not by an angel, and not by a seraph, and not by a messenger . . . ." The surrogate divine name *Shekhina,* the Present One, is derived from a Hebrew root meaning "to dwell," again calling attention to divine nearness ("presence"). The relationship between these two affirmations, otherness and nearness, is expressed in a Midrashic statement, "in every place that divine awesome majesty is mentioned in Scripture, divine abasement is spoken of, too."

The divine "thou"

Closely connected with these ideas is that of divine personhood, most particularly disclosed in the use of the pronoun "thou" in direct address to God. The community and the individual, confronted by the Creator, teacher, redeemer, addresses the divine as living person, not as theological abstraction. The basic liturgical form, the *berakha* ("blessing"), is usually couched in the second person singular: "Blessed art thou . . . ." This relationship, through which remoteness is overcome and presentness is established, illuminates creation, Torah, and redemption, for it reveals the meaning of love. From it flow the various possibilities of expressing the divine–human relationship in personal, intimate language. Sometimes, especially in mystical thought, such language becomes extravagant, foreshadowed by such vivid biblical metaphors as the husband–wife relation in Hosea; the "adoption" motif in Ezek. 16; and the firstborn-son relation (Ex. 4:22). Nonetheless, although terms of personal intimacy are used widely to express Israel's and man's relationship with God, such usage is restrained by the accompanying sense of divine otherness. This is to be seen in the liturgical "blessings," where, following the direct address to God, in which the second person singular pronoun is used, the verbs, with great regularity, are in the third person singular, thus providing the requisite tension between nearness and otherness, between the impersonal and the personal.

Modern views of God. The Judaic affirmations about God have not always been given the same emphasis nor have they been understood in the same way. This was true in the Middle Ages, among both philosophers and mystics, as well as in modern times. In the 19th century, western European Jewish thinkers attempted to express and transform these affirmations in terms of German Idealist philosophy: more recently, philosophical Naturalism was offered as the suitable content of Judaism, while still retaining the traditional God language. The meaningfulness of the whole body of such affirmations, moreover, has been called into question by the philosophical schools of Logical Positivism and Linguistic Analysis. Most recently, the destruction of 6,000,000 Jews during the Nazi period has raised the issue of the validity of such concepts as God's presence in history, divine redemption, the covenant, and the chosen people. In every case, however, it is with the structure of ideas here noted that these challenges must deal.

ISRAEL (THE JEWISH PEOPLE)

Choice and covenant. The concluding phrase of the second benediction of the liturgical section referred to above reads: "who has chosen thy people Israel in love." Here the basis of the relationship between God and Israel set forth in the biblical narrative is clearly and succinctly stated: the choice of this people was determined by no other factor than divine love. The patriarchal narratives, beginning with the 12th chapter of Genesis, presuppose the choice, which is set forth explicitly in Deut. 7:6–8 in the New Jewish Version:

> For you are a people consecrated to the Lord your God: of all the peoples on earth the Lord your God chose you to be His treasured people. It is not because you are the most numerous of peoples that the Lord set His heart on you and chose you—indeed you are the smallest of peoples; but it was because the Lord loved you and kept the oath He made with your fathers that the Lord freed you with a mighty hand and rescued you from the house of bondage, from the power of Pharaoh king of Egypt.

Later rabbinic traditions on occasion sought to base the choice upon some special merit of Israel, and the medieval poet and theologian Judah ha-Levi suggested that the openness to divine influence originally present in Adam continued only within the people of Israel.

The binding agreement between God and Israel

However understood, the background of this choice is the recurring disobedience of mankind narrated in Genesis 2–11. Abraham and his descendants are singled out not merely as the object of the divine blessing but also as its channel to all mankind. The choice, however, demands a reciprocal response from Abraham and his lineage. That response is obedience, as exemplified in the first instance by Abraham's readiness to leave his "native land" and "father's house" (Gen. 12:1). This twofold relationship was formalized in a mutually binding agreement, a covenant between the two parties. The covenant, thought by some modern biblical scholars to reflect the form of ancient suzerainty treaties, indicates (as in the Ten Utterances) the source of Israel's obligation—the acts of God in history—and the specific requirements those acts impose. The formalization of this relationship was accomplished by certain cultic acts that may, according to some contemporary scholars, have been reenacted on a regular basis at various sacred sites in the land, eventually being centralized in Jerusalem. The content of the covenantal obligations thus formalized was Torah. Israel was bound in obedience, and Israel's failure to obey provided the occasions for the prophetic messages. The prophets, as spokesmen for God, called the community to renewed obedience, threatened and promised disaster if such was not forthcoming, and—recalling the source of the choice in divine love—sought to explain its persistence even when, strictly understood, the covenant should have been repudiated by God.

The choice of Israel has its concrete expression in the requirements of the precepts (*mitzwot,* singular *mitzwa*) that are part of Torah. The blessing recited before the public reading of the pentateuchal portions on Sabbath, festivals, holy days, fasts, and certain weekdays refers to God as "He who chose us from among all the peoples and gave us His Torah," thus emphasizing the intimate relationship between the elective and revelatory aspects of God.

Priest and witness to the nations

Israel's role was not defined solely in terms of its own obedience to the commandments. As noted, Abraham and his descendants were seen as the means by which the estrangement of disobedient mankind from God was to be overcome. Torah was the formative principle underlying the community's fulfillment of this obligation. Israel was to be "a kingdom of priests and a holy nation" (Ex. 19:6) functioning within mankind and for its sake. This task is enunciated with particular earnestness in the writings of the prophets. In Isa. 43–44, Israel is declared to be God's witness and servant who is to bring the knowledge of God to the nations. In chapter 42 of the same book Israel is declared to be a "covenant of the people, a light to the nations, to open the blind eyes, to bring out the prisoners from the prisons, and them that sit in darkness out of the prison house" (42:6–7). This double motif of a chosen people and witness to the nations, joined to that of the righteous king, developed in the biblical and postbiblical periods into messianism in its several varieties (see below *Eschatology*).

The intimate relation between choice, covenant, and Torah determined the modality of Israel's existence. Religious faith, far from being restricted to or encapsulated in the cult, found its expression in the totality of communal and individual life. The obligation of the people was to be the true community, in which the relationship between its members was open, in which social distance was repudiated, and in which response to the divine will expressed in Torah was called for equally from all. One of the important recurring themes of the prophetic movement was the adamant rejection of any tendency to limit divine sovereignty to the partial area of "religion," understood as the realm of the priesthood and cult. Subsequent developments continued this theme, although it appeared in a number of other forms. Pharisaic Judaism and its continuation, rabbinic Judaism, down to modern times has resolutely held to the idea of the all-pervasive functioning of Torah, so that however the various Jewish communities over the centuries may have failed to fulfill the ideal, the self-image of the people was that of "holy community."

Israel and the nations. The double motif of "treasured people" and "witness" was not without its tensions as it functioned in ongoing history. Tensions are especially visible in the period following the return from the Babylonian Exile at the end of the 6th and beginning of the 5th centuries BCE. It is, however, doubtful whether the use of such terms as nationalism, particularism, or exclusivism (as opposed to universalism) are of any great help in understanding the situation. Emphasis has, for example, been laid upon Ezra 9:2 and 10:2, in which the reestablished community is commanded to give up wives taken from "the peoples of the land." This is taken as indication of the narrow, exclusivistic, nationalistic nature of Judaism, without reference to the situation in which a harassed contingent of returned exiles sought to maintain itself in a territory surrounded by politically unfriendly if not hostile neighbours. Nor does this represent racialism, since foreigners were admitted to the Jewish community, and in the following centuries some groups engaged in extensive missionary activities, appealing to the individuals of the nations surrounding them to join themselves to the God of Israel, who was the one true God, the Creator of the heavens and earth.

The welding of exclusivism and universalism

A more balanced view recognizes that within the Jewish community religious universalism was affirmed at the same time and by the same people who understood the nature of Jewish existence in politically particularistic (*i.e.*, nationalistic) terms. To neglect either side is to distort the picture. In no case was the universalism disengaged from the reality of the existing community, even when it was expressed in terms of the ultimate fulfillment of the divine purpose, the restoration of the true covenantal relationship between God and all mankind. Nor was political particularism, even under circumstances of great provocation and resentment, misanthropic. The most satisfactory figure in describing the situation of the restored community, and one that continues to be useful in dealing with later episodes, is that of the human heartbeat, made up of two functions, the systole, or contraction, and the diastole, or expansion. There have been several periods of contraction and of expansion throughout the history of Judaism. The emphasis within the abiding tension has been determined by the historical situation in which the community has found itself. To generalize in one direction or the other is fatal to an understanding of the history and faith of the "holy community."

The people and the land. Closely related to the concept of Israel as the chosen, or Covenant, people is the role of the land of Israel. In the patriarchal stories, settlement in Canaan is an integral part of the fulfillment, from the divine side, of the Covenant. The goal of the Israelites escaping from Egypt is the same land, and entry into it is understood in the same fashion. The return from the Babylonian Exile, too, is seen in the same light. As there was the choice of a people, so was there the choice of a land—and for much the same reason. It was to provide the setting in which the community could come into being as it carried out the divine commandments. This choice of the land contrasts significantly with the predominant ideas of other peoples in the ancient world, in which the deity or divinities were usually bound to a particular parcel of ground outside of which they lost their effectiveness or reality. Though some such concepts may very well have crept into Israelite thought during the period of the kings (from Saul to Jehoiachin), the crisis of the Babylonian Exile was met by a renewal of the affirmation that the God of Israel was, as Lord of all the earth, free from territorial restraint, although He had chosen a particular territory for this chosen people. Here again the twofold nature of Jewish thought becomes apparent, and both sides are to be affirmed or the view is distorted. Following the two revolts against Rome (66–73 CE and 132–135 CE), the Jews of the ever-widening dispersion continued, as they had before these disasters, to cherish the land. Once again it became the symbol of fulfillment, so that return to it was looked upon as an integral part of messianic restoration.

The land as ideal and reality

The liturgical patterns of the community, insofar as they were concerned with natural phenomena (*e.g.*, planting, rainfall, harvest, and the annual cycle) rather than historical events, were based on geography, topography, and agricultural practices of the land, viewed as paradigmatic. Although Jews continued to live in the land, yet for most in the distant dispersion it was idealized and viewed primarily in eschatological terms—at the end of days, in the world to come. The 11th-century poet Judah ha-Levi not only longed for it in verse but also gave it a significant role in his theological interpretation of Judaism and eventually sought to return to it from his native Spain. It was not, however, until the 19th century that the land began to play a role other than the goal of pilgrimage or of occasional settlement by pietists and mystics. At the end of that century the power of the utopian concept was released in eastern Europe in a cultural renaissance that focussed, in part, on a return to the land and, in western and central Europe, in a political movement coloured by nationalist motifs in European thought. The coming together of these two gave rise to Zionism. The political movement reflected a dissatisfaction with the view of the Jews as merely a body or organization of religious believers—like the Christian churches—an interpretation that had become dominant following the political emancipation of the Jews in the period after Napoleon. The political emphasis of Zionism aroused considerable opposition from those Jews who were convinced of the necessity of a churchly definition of Judaism parallel to the Roman Catholic and Protestant communions. While this conflict erupted in bitter debate during the first half of the 20th century, the events of the Nazi period in Europe brought it to a close, except for some sporadic renewals on the part of numerically insignificant groups. For the most part, although there are few satisfactory formulations—theological or secular—there is a working consensus that acknowledges a significant role to the land and recognizes that a churchly definition of the Jewish community, while strategically acceptable in some situations, does not do justice to history and is not theologically sound if it suggests that Judaism merely consists of abstract doctrines and dogmas. Some Jews, however, argue that whatever the past has been, the future of the Jewish community is with those movements in the modern world that cut across or transcend the particularity Zionism represents.

Modern views of the people Israel. The nature of the people Israel and of the land of Israel has been variously interpreted in the history of Jewish thought. In modern times, some interpretations have been deeply influenced by contemporary political and social discussions in the general community. Thus, for example, Zionist theoreticians were influenced by concepts of political nationalism on the one hand and by socialist ideas on the other. Further, the challenge to traditional theological concepts in the 19th century raised issues about the meaning of the choice of Israel, and Jewish thinkers borrowed from romantic nationalism such ideas as the "genius" of the people.

Modern reinterpretations or rejections of chosenness

Most recently, attempts have been made to approach the question sociologically, dismissing the theological mode as unhelpful. The concept of the chosen people is then understood to indicate a specific role deliberately undertaken by the Jewish people and similar to that espoused by other groups (*e.g.,* "Manifest Destiny" by the American people). The establishment of the State of Israel has motivated some thinkers to call for a repudiation of the idea, in keeping with the position that normal existence for the Jews requires the dismissal of such concepts. Although only a small minority of Jewish thinkers espouse this position, the doctrine of the choice is not without its theological difficulties even for those who continue to affirm it.

MAN

The image of God. In Gen. 1:26, 27; 5:1; and 9:6 two terms occur, "image" and "likeness," that seem to indicate clearly the biblical understanding of man's essential nature: he is created in the image and likeness of God. Yet the texts in which they are used are not entirely unambiguous; the idea they point to does not appear elsewhere in Scriptures; and the concept is skirted cautiously in the rabbinic interpretations. What the image and likeness of God or the divine image refer to in the biblical text is not made explicit, and, in the light of the psychosomatic unity of man that dominates the biblical concepts, it is not possible to escape entirely from the implication of "bodily" similarity. What the terms meant in their context at the time and whether they reflect mythological usages taken over from other Middle Eastern thought is a question that is by no means answered. Evidence of the problematic nature of the concept is found in rabbinic Judaism. Akiba (2nd century CE) ignored the usages in Gen. 1 and 5 and emphasized 9:6, understanding it to mean, contrary to the usual interpretation, "after an image, God made man," that is, in the Platonic sense of a heavenly archetype. He did not wish to allow any resemblance between God and any created being. Other interpretations sought to avoid the difficulty by rendering *elohim* (a plural form) not as "God" but as "divine beings" (*i.e.,* angels: "God created man after the image of divine beings [*elohim*]").

The earthly–spiritual creature. In those parts of the Jewish community of antiquity that were deeply influenced by Greek philosophical ideas, a dualistic interpretation of man was offered. Here the divine likeness suggested is that of the immortal, intellectual soul as contrasted to the body. Still other thinkers, both ancient and modern, have understood that likeness to be ethical, with particular emphasis placed on freedom of the will. What is evident is that no doctrine of man can be erected on the basis of these several verses alone, but that a broader view must be taken, in which they are assimilated. A careful examination of the biblical material, particularly the words *nefesh, neshama,* and *ruaḥ,* which are often too broadly translated as "soul" and "spirit," indicates that these must not be understood as referring to the psychical side of a psychophysical pair. A man did not possess a *nefesh* but rather was a *nefesh,* as Gen. 2:7 says: "*wayehi ha-adam le-nefesh ḥayya*" (". . . and the man became a living being"). Man was, for most of the biblical writers, what has been called "a unit of vital power," not a dual creature separable into two distinct parts of unequal importance and value. While this understanding of the nature of man dominated biblical thought, in apocalyptic literature (2nd century BCE–2nd century CE) the term *nefesh* began to be viewed as a separable psychical entity with existence apart from body. Although this was not entirely divorced from the unitary biblical view, nonetheless a functional body–soul dualism was present in such literature. In the Alexandrian version of Hellenistic Judaism the orientation toward Greek philosophy, particularly the Platonic view of the soul imprisoned in the flesh, led to a clear-cut dualism with a negative attitude toward the body. Rabbinic thought remained closer to the biblical position, at least in its understanding of man as a psychosomatic unit, although the temporary separation of the components after death was an accepted position.

"Soul," "spirit," or "life"

The biblical view of man as an inseparable psychosomatic unit meant that death was understood to be his dissolution. Yet, although man ceased to be, this dissolution was not utter extinction. Some of the power that functioned in the unit may have continued to exist, but it was not to be understood any longer as life. The existence of the dead in *sheol,* the netherworld, was not living but the shadow or echo of living. For most of the biblical writers this existence was without experience, either of God or of anything else; it was unrelated to events. To call it immortality is to empty that term of any vital significance. However, this concept of *sheol,* along with belief in the possibility of occasional miraculous restorations of dead individuals to life, and perhaps even the idea of the revival of the people of Israel from the "death" of exile, provided a foothold for the development of belief in the resurrection of the dead body at some time in the future. The stimulus for this may have come from ancient Iranian religion, in which the dualistic cosmic struggle is eventually won by life through the resurrection of the dead. This idea began to appear in sketchy form in postexilic writings (Isa. 26:19; Dan. 12:2). In this view there is life only in the psychosomatic unit now restored. This restoration was bound up with the eschatological hope of Israel (see *Eschatology,* below) and was limited to the righteous. In subsequent apocalyptic literature a sharper distinction between body and soul was entertained, and the latter was conceived of as existing separately in a disembodied state after death. Although at this point the doctrine of the resurrection of the body was not put aside, nonetheless, the direction of thinking changed. The shades of *sheol* were now thought of as souls, and real personal survival—with continuity between life on earth and in *sheol*—was posited. Now Greek ideas, with their individualistic bent, began to have influence, so that the idea of resurrection that was in some way related to a final historical consummation, began to recede. True life after death was now seen as release from the bondage of the body, so that in place of, or alongside of, the afterlife of physical resurrection was set the afterlife of the immortal soul.

Sheol, resurrection, and immortality

It was not the status of the soul, however, that concerned either the biblical or the rabbinic thinkers. What emerged from the latter's discussions of the biblical themes was an emphasis on the ethical import of man's composite makeup. Man is in a state of tension or equilibrium between the two foci of creation, the "heavenly" and the "earthly." He necessarily participates in both, and, as such, is the one responsible creature who can truly serve his Creator, for he alone, having both sides of creation in him, may choose between them. It is the ability to make an ethical choice that is the distinguishing mark of man. This ability is not derived from the "heavenly" side but resides in the double basis of man's existence. It is important to recognize this as something other than a body–soul dualism in which the soul is the source of good and the body the basis of evil. Such an attitude, however, did appear in some rabbinic material and was often affirmed in medieval philosophical and mystical speculations and by some of the later moralists. These are genuine variations and developments of the biblical-rabbinic ideas and may not be dismissed as aberrations. They represent authentic attempts to come to terms with other currents of thought and with the problems and uncertainties inherent within the earlier materials themselves.

The ethically bound creature. Mankind is then viewed, however this position is arrived at, as ethically involved. The first 11 chapters of Genesis are posited upon this responsibility, for the implicit assumption of the prepatriarchal stories is man's ability to choose between obedience and disobedience. Rabbinic Judaism, taking up the covenant-making episode between God and Noah (Gen. 9:8–17), developed it as the basis of mankind's ethical obligation. All men, not merely Israel, were engaged in a covenant relationship with God, which was spelled out in explicit precepts—variously enumerated as six, seven, or even 10 and occasionally as many as 30—that reflect general humanitarian behaviour and are intended to assure the maintenance of the natural order by the establishment of a proper human society. The Covenant with Israel was meant to bring into being a community that would advance the development of this society through its own obedience and witness.

The good and evil impulses

Man's nature, viewed ethically, was explained in rabbinic Judaism not only as a tension between the "heavenly" and "earthly" components but also as a tension between two "impulses." Here again, fragmentary and allusive biblical materials were developed into more comprehensive statements. The biblical word *yetzer* means "plan," that which is formed in man's mind. In the two occurrences of the word in Genesis (6:5; 8:21), the plan or formation of man's mind is described as *raʿ*, perhaps "evil" in the moral sense or maybe no more than "disorderly," "confused," "undisciplined." The other biblical occurrences do not have this modifier. Nonetheless, the Aramaic translations (Targumim) invariably denominated it as *bisha* ("wicked") wherever it occurred. Rabbinic literature created a technical term *yetzer ha-raʿ* ("the evil impulse") to denote the source within man of his disobedience, and, subsequently, the counterterm *yetzer ha-ṭov* ("the good impulse") to indicate man's obedience. These more clearly suggest the ethical quality of man's duality, while their opposition and conflict point to man's freedom and the ethical choices he makes. Indeed, it is primarily within the realm of the ethical that Judaism posits freedom, recognizing the bound, or determined, quality of much of his existence (*e.g.,* his natural environment or physiological makeup).

It is this ethically free creature who stands within the covenant relationship and who may choose to be obedient or disobedient. Sin, then, is ultimately deliberate disobedience or rebellion against the divine sovereign. This is more easily observed in relation to Israel, for it is here that the central concern of Judaism is most evident and the subject discussed in greatest detail. It should be noted, however, that since, according to Judaic tradition, all mankind stands within a covenant relation to God and is commanded to be moral and just, essentially the same choice is made universally. In technical language, the acceptance of divine sovereignty by the people of Israel and by the individual within that community is called "receiving the yoke of the kingship." This involves intellectual commitment to a basic belief, as expressed by the Deuteronomic proclamation: "Hear, O Israel, the Lord, our God, the Lord is one!" At the same time it imposes obligations in terms of communal and individual behaviour. These two responses are understood to be inextricably bound together, so that rejection of the divine sovereign is manifest as denial of God both intellectually and practically. It amounts to "breaking the yoke of the kingship." In more specific terms, sin is sometimes summed up under three major, interrelated headings: idolatry, murder, and illicit sexual behaviour, each and all of which explicitly and implicitly involve rebellion, for they involve activities that deny—if not God's existence—his commanding relationship and the requirement of man's response. Such behaviour destroys the community and sets individual against individual, thus thwarting the ultimate purpose of God, the perfected human society.

Teshuva ("turning")

If, however, man is free to choose rebellion and to suffer its consequences, he is also able to turn back to God and to become reconciled with him. The Bible—most particularly the prophetic writings—is filled with this idea, although the term *teshuva* ("turning") came into use only in rabbinic sources. Basically it grows out of the covenant and God's unwillingness—despite man's failures—to break off his relationship. In rabbinic thought it is apparently assumed that even the direst warnings of utter disaster and rejection imply the possibility of turning back to God, motivated by remorse and the desire for restoration. Divine readiness and human openness are the two sides of the process of reconciliation. What was expressed in prophetic literature in the immediate historicopolitical situation was stated in the synagogal liturgy in connection with pentateuchal and prophetic lessons and the homilies developed from them. Thus, the divine invitation was constantly being offered. Man was called upon to atone for his rebellion by positive action that repudiated his failure. He was summoned to reconstitute wholeness in his individual life and community in society.

Historically viewed, Jewish existence, as it developed under rabbinic leadership, following after the two disastrous rebellions against Rome, was an attempt to reconstitute a community of faith expressed in worship and in an ordered society that would enable the individual to live a hallowed life of response to the divine will. Although this plan was not spelled out in detail, it was probably understood to be the paradigm for the eventual reconstruction of humanity.

Medieval and modern views of man. The Jewish view of man is certainly less clearly articulated than its affirmations concerning God. Nonetheless, it is evident that its central concern was ethical. The question of how man as individual and community was to behave was the focus of interest. Yet it is also clear that metaphysical concerns, however rudimentary in the beginning, were included in the developing discussion. Medieval philosophers sought an accommodation between the doctrine of the resurrection of the body and the concept of the immortality of the soul. The greatest of them, Moses Maimonides (1135–1204), propounded an extremely subtle position that equated immortality with the cleaving of the human intellect to the active intellect of the universe, thus limiting it to philosophic adepts. In the modern period, the impact of various philosophical and psychological schools has further fragmented the situation so that little or no consensus is evident, although resurrection or immortality language is still used even when its content is uncertain. But alongside this lack of agreement, the view that man is to be understood, however else, as a creature who makes free ethical choices for which he is responsible remains—although variously articulated—the basic affirmation of Judaism about man.

ETHICS AND SOCIETY

The imitation of God

The ethical emphasis of Judaism. Jewish affirmations about God and man intersect in the concept of Torah as the ordering of human existence in the direction of the divine. Man, however else understood, is an ethically responsible creature responsive to the presence of God in nature and in history. Although that responsiveness is expressed on many levels, it is within the horizontal relationship of man to man that it is most explicitly called for. The pentateuchal legislation sets down, albeit within the limitations of the structures of the ancient Middle East, the patterns of interpersonal relations. The prophetic messages are deeply concerned with these demands and see the disregard of them as the source of social and individual disorder. No segment of society, even the most exalted, is free of ethical obligation. Indeed, the transformation of prophetism from its earlier form as ecstaticism and soothsaying is seen in the ethical confrontation of David by Nathan ("Thou art the man") for seducing Bathsheba and arranging to have her husband killed (II Sam. 12). What is particularly striking is the affirmation that God is not only the source of ethical obligation but is himself the paradigm of it. In the so-called Code of Holiness (Lev. 19), it is imitation of divine holiness that is offered as the basis of human behaviour in the ethical sphere as well as the cultic-ceremonial. Concern for the economically vulnerable members of the community; obligations toward neighbours, hired labourers, and the physically handicapped; interfamilial relationships; and attitudes toward strangers (*i.e.,* non-Israelites) were all motivated by the basic injunction, "You shall be holy, for I, the Lord your God, am Holy." Acceptable human behaviour is, therefore, "walking in all His ways" (Deut. 11:22). The dialectic relation between God and man in the literary prophets also exhibits divine righteousness and divine compassion as patterns to be emulated in the life of the community.

This theme, *imitatio Dei* ("imitation of God"), as developed in rabbinic Judaism, is expressed succinctly in a comment on the verse from Deuteronomy quoted above. In response to the question of how it is possible to walk "in all His ways," the reply is made (*Sifre* Deut. 85a): "As He is merciful and gracious, so be you merciful and gracious. As He is righteous so be you righteous. As He is holy, strive to be holy." Indeed even more daringly, God is described as clothing the naked, nursing the sick, comforting the mourners, burying the dead, so that man may recognize his own obligations.

Interpenetration of communal and individual ethics. What stands out in the entire development of Jewish ethical formulations is the constant interpenetration of communal and individual obligations and concerns. Although in the Book of Ezekiel (see especially chapter 18) emphasis is laid on individual responsibility, "the person who sins shall die," in contrast to the more widespread statement of communal involvement, "visiting the sins of the fathers upon the children" (*e.g.,* Ex. 20:5), these two aspects of ethical conduct are never entirely distinguished in Judaism. The just society requires the just man, and the just man functions within the just society. The concrete expression of ethical requirements in legal precepts took place with both ends in view, so that the process of beginning the holy community and the formation of the *ḥasid* ("pious"), the man of steadfast devotion to God, were concomitant processes. The relationship between the two is, of course, often mediated by the historical situation, so that in some periods one or the other moves to the centre of practical interest. In particular, the end of the Judaean state (70–135 CE) truncated the communal aspect of ethical obligations, often limiting discussion to apolitical responsibilities rather than to the full range of social involvements. The reestablishment of the State of Israel in the 20th century has, therefore, reopened for discussion areas that have for millennia been either ignored or relegated to the realm of abstraction. What this implies is that the full ethical responsibility of the Jew cannot be carried out solely within the realm of individual relationships but must include involvement in the life of a fully articulated community.

The just man in a just society

This double involvement is most vividly apparent in the biblical period, when both were equally present as divine command and demand. In the rabbinic period, because of the new political context, the communal aspect receded, so that discussion was mainly oriented toward the relationships between the members of the Jewish community or between individuals as such, and away from political responsibilities in the larger society. Nonetheless, the virtues that were understood to govern these relationships were, in their biblical setting, communal as well. Righteousness and compassion had been obligations of the state, governing the relationship between political units, as the first two chapters of Amos make evident. At the same time, as Micah 6:8 shows, doing justly, loving mercy, and walking humbly with God made up the pattern of the individual's obligations as well. Given the situation of the dispersion of the Jews following the revolts against Rome in the 1st and 2nd centuries CE, the individual pattern became the object of primary considerations. It is important to recognize that while theoretical ethical systems were not developed until the Middle Ages under the influence of philosophical concerns, nonetheless, even in the early period it was understood that behind the practical system of Halakha, the enumeration of legal precepts, there stood the dynamic of ethical theory. An attempt was made to reduce the hundreds of precepts to a small number expressing the ethical essence of Torah.

The key moral virtues. In keeping with the rabbinic understanding of Torah, study also was viewed as an ethical virtue. A passage in the traditional Prayer Book enumerates a series of virtuous acts—honouring parents, deeds of steadfast love, attendance twice daily at worship, hospitality to wayfarers, visiting the sick, dowering brides, accompanying the dead to the grave, devotion in prayer, peacemaking in the community and in family-life—and concludes by setting study of Torah as the premier virtue. Here is exhibited the complex variety of ethical behaviour called for within the Jewish tradition. To parental respect and family tranquillity are added, in other contexts, the responsibility of parents for children, the duties of husband and wife in the establishment and maintenance of a family, and ethical obligations that extend from the conjugal rights of each to the protection of the wife if the marriage is dissolved. The biblical description of God as upholding the cause of the fatherless and the widow and befriending the stranger, providing him with food and clothing (Deut. 10:18), remained a motivating factor in the structure of the community. Ethical requirements in economic life are expressed concretely in such a passage as Lev. 19:35–36: "You shall do no wrong in judgment, in measures of length or weight or quantity. You shall have just balances, just weights, a just *ephah,* and a just *hin*"; and in Amos' bitter condemnation of those who "sell the righteous for silver, and the needy for a pair of shoes" (Amos 2:6). Such injunctions, together with many other specific precepts and expressions of moral requirements, established the basis for a wide-ranging program that sought to govern, both in detail and in general, the economic life of the individual and the community. Not only are relations within the human sphere the object of ethical concern but nature also is so regarded. The animal world, in the biblical view, requires merciful consideration, so that not only man is commanded to rest on the Sabbath but his domestic animals are to share the rest with him (Ex. 20:10; 23:12). Mistreatment of beasts of burden is prohibited (Deut. 22:4); and wanton destruction of animal life falls under the ban (*ibidem:* 6–7). In the rabbinic attitude toward brute creation, even inanimate nature is the object of human solicitude. Thus, for example, the food-yielding trees of a city under siege may not be destroyed, according to Deuteronomic legislation (Deut. 20:14–20). The enlargement of this and other biblical precepts resulted in the generalized rabbinic prohibition "You shall not destroy" that governs man's use of his environment.

Protection of the weak

The relation to non-Jewish communities and cultures. As noted above, the end of the Jewish state reduced the scope of ethical judgments in the political sphere; nonetheless, relations between the Jewish community and other societies—particularly political units: the Roman and Christian empires, the Islāmic states, and other regimes—provided opportunities for the exploration of the ethical implications of such encounters. Since most of these were victor-victim, superior-inferior, power-powerless situations, with the Jews the weaker party, prudential considerations were dominant. Despite this, Jewish authorities sought to bring to bear upon these external arrangements the ethical standards that governed the internal structures.

The whole problem of the relationship between the Jewish community, in whatever form it has existed and does exist, and other social units has been vastly complicated. Ideally, the relation is that of witness to the divine intent in the world. Practically, it has swung between the extremes of isolation and assimilation, in which the ideal has, on occasion, been lost sight of. Culturally, from its earliest beginnings, the people Israel has met and engaged the ideas, forms, behaviour and attitudes of its neighbours in constructive development. It borrowed as it contributed and reformulated what it received in terms of its own commitments and affirmations. On more than a few occasions, as in the period of settlement in Canaan, it rejected the religiocultural ideas and forms of the native population. On others, it actively sought out—as in the Islāmic period in Spain (8th to 15th centuries)—ideas and cultural patterns of its neighbours, viewing them from its own perspective and embracing them when they were found to be of value. Indeed, the whole history of Israel's relationship with the world may be comprehended in the metaphor, used previously, of the heartbeat with its systole and diastole. No period of its existence discloses either total rejection of or abject surrender to other cultural and political structures but rather a tension, with the focal point always in motion at varying rates. Being more than a "confession" in the Christian sense, Judaism's adjustment to and relation with other sociopolitical units involved larger aspects of communal and individual life than merely the religious. Whether or not, under such circumstances, it is helpful to describe Judaism as a civilization, it is important to recognize that, viewed functionally, much more must be included than is usually subsumed under the common usage of "religion."

Isolation and assimilation

The formulation of Jewish ethical doctrines. The ethical concerns of Judaism have found frequent literary expression. Not only were rabbinic writings constantly directed toward the establishment of legal patterns that embody such concerns but in the medieval period the issues were dealt with in treatises on morals; in ethical wills, in which a father instructed his children about their obligations and behaviour; in sermons; and in other forms. In the 19th century the traditionalist Musar ("moral instructor") movement in eastern Europe and the philosophical discussions of the nascent Reform movement in the West focussed upon ethics. Indeed, since the political and social emancipation of the Jews, ethical and social rather than theological questions have tended to be given priority. Often the positions espoused have turned out to be, nonetheless, "judaized" versions of philosophic ethics or of political programs. In some instances, as in the case of the distinguished German-Jewish philosopher Hermann Cohen, the result has been a Jewishly compelling restatement of a secular philosophic ethics. In others, it has resulted in no more than a pastiche. More crucial, however, is the question of a unique Jewish ethics and of its authority. The reestablishment of a Jewish state renews the possibility that the full range of ethical decisions, including communal as well as individual responsibility, may be confronted. In such a situation, the ideal task of the people moves out of the realm of speculation to become actual again.

The Musar movement

THE UNIVERSE

Creation and Providence: God's world. Although the first chapter of Genesis affirms divine creation, it does not offer an entirely unambiguous view of the origin of the universe, as the debate over the correct understanding of Gen. 1:1 in former as in modern times discloses. (Was there or was there not a preexisting matter, void, or chaos?) Yet, basically, the interest of the author was not in the mode of creation, a later concern perhaps reflected in the various translations of the verse: "In the beginning God created," which could signify what medieval philosophers designated *creatio ex nihilo* ("creation out of nothing"); and "when God began to create," which could indicate some concept of prime matter. He was concerned rather to affirm that the totality of existence, inanimate (Gen. 1:3–19), living (20–25), and human (26–31), derived immediately from the same divine source; and, thus, that it is a universe. As divine creation, it is transparent to the presence of God, so that the Psalmist said: "The heavens declare the glory of God, and the expanse proclaims [that it is] the work of his hands" (19:1). Indeed, the repeated phrase: "And God saw how good it was" (Gen. 1:4, 10, 12, 18, 25, 31) may be understood as the ground of this affirmation, for the workmanship discloses the workman. The observed order of the universe is further understood by the biblical author to be the direct result of a covenantal relationship established between the world and God: "So long as the earth endures, seedtime and harvest. Cold and heat, summer and winter, day and night, shall not cease." (Gen. 8:22). This doctrine of the providential ordering of the universe, reaffirmed in rabbinic Judaism, is not without its difficulties, as in the liturgical change made in Isa. 45:7 to avoid ascribing evil to God. Nonetheless, despite the problem of theodicy (the problem of evil in a world made and ordered by God), Judaism has not acquiesced to the mood reported in the Palestinian Targum to Gen. 4:8: "He did not create the world in mercy nor does he rule in mercy." Rather, it has affirmed a benevolent and compassionate God.

Creation and history

It is the physical world—divine creation—that provides the stage for history, which is the place of the divine human encounter. An early Midrash, in response to the question as to why Scripture begins with the story of creation, points out that it was necessary in order to establish the identity of the Creator with the Giver of Torah, an argument basic to the liturgical structure of the Shema. This relationship is further emphasized in the Qiddush, the prayer of sanctification recited at the beginning of the Sabbath. That day is designated "a remembrance of creation" and "a recollection of the going-forth from Egypt." Thus, creation (nature) and history are understood to be inextricably bound up, for both derive from the same divine source. This being so, redemption—the reconciliation of God and man through and in history—does not ignore or exclude the natural world. Using the imagery of an extravagantly fecund world of nature, rabbinic thought expressed its view of the all-inclusive effects of the restored relationship.

Man's place in the universe. Man as creature is, of course, subject to the natural order. It is, indeed, in the world and through the world that man carries out his relationship to God. The commandments of Torah are obeyed not solely as observances between man and God but as actions between man and man, between man and the world. Although the creation story designates man as ruler over the earth and its inhabitants (Gen. 1:26–28; see also Ps. 8:5–9), nonetheless, far from being an arbitrary master, man's dominion is limited by Torah, for its regulations are concerned not only with transactions between man and man but also lay out his responsibilities to the land he cultivates, the produce of the soil, the animals he domesticates. Bound in the network of existence he, as the moral creature, is responsible for it in all of its parts.

Man's responsibility to nature

Even the destruction of the Jewish commonwealth in the 1st and 2nd centuries CE did not alienate the Jew from these responsibilities, as the elaborate system of Mishna and Gemara gives evidence. The gradual but consistent exclusion of the Jewish community from immediate connection with large segments of the natural world, through legislation in Christendom and Islām, tended to dull the Jew's awareness of it; the recurring references to it in the religious calendar, however, and the observation of harvest festivals even by citydwellers continued to remind the community of its ties. Thus, at the end of the 19th century, the nascent Zionist movement recognized that the regeneration of the Jewish people involved, among other requirements, a responsible relation to the natural order expressed in its attitude toward and treatment of the land.

As indicated in other contexts, the particular emphasis placed on one or the other side of the frequent twofoldness of the Jewish view has depended upon the situation in which the community has found itself. If nature as the place of divine disclosure has, during long periods of Jewish existence, assumed a somewhat subordinate role, it has never been rejected or been seen to be irrelevant to the divine purpose. Indeed, in Jewish eschatology, its restoration is part of the goal of history.

Intermediary beings: angels and demons. The exact nature of the nonhuman beings mentioned in Scripture—angels or messengers—is not altogether clear and their roles seem ephemeral. In the postexilic period, perhaps under Iranian influence, and in the late biblical and postbiblical literature, these beings emerge as more complete and often as clearly identifiable individuals with their own personal names. The unfocussed biblical view gave way to an elaborate hierarchy of functionaries who acted, in some apocalyptic visions, as a veritable heavenly bureaucracy. Nevertheless, despite a consensus concerning their existence, there was little agreement as to their role or importance. In some Midrashim God takes counsel with them; in other sources the rabbis urge men not to involve them but to approach God directly. Actually, they belong to that marginal area between religion and folklore. Like their counterfigures, the demons, they have a residual existence rooted in various layers of the Jewish experience and interpretation of the universe. At some times they are highly individualized and sharply realized; at others, they flit in and out of the imagination like bats in the evening. The medieval philosophers Aristotelized or Platonized them; the early mystics Neoplatonized them; the Kabbalists continually invented new ones and fitted them into their complicated network of cosmic existence. Nonetheless, their role, even in periods of considerable emphasis, was peripheral. They were outside the great movements and meanings of Jewish thought.

Contemporary philosophical speculation about the nature of the universe has, of course, required a response from Jewish thinkers. But, given the particular temper of a period in which metaphysics has not been central to much of theological discussion, no major statement has yet developed that has taken hold of the dominant positions and attempted to view them from the Jewish creationist perspective. The attempt within Reconstructionism to provide a naturalistic framework for Judaism, while courageous, lacks the breadth and depth of the great philosophical approaches.

ESCHATOLOGY

The future age of mankind and the world. The choice of Israel, according to the biblical writings, had occurred because of mankind's continual failure, by rebellion against its Creator, to fulfill its divine potential. The subsequent failure of Israel to become the holy community and thereby a witness to the nations gave rise to the prophetic movement that summoned the people to obedience. An integral part of prophetic summoning, side by side with threats of punishment and warnings of disaster, was the envisioning of a truly holy community, a society fully responding to the divine imperative. This kingdom of the future was conceived of as entirely natural, functioning as any normal sociopolitical unit and under the leadership of a human ruler, who would, however, carry out his tasks within the sphere of divine sovereignty, serving primarily to exhibit his own obedience and thus to stimulate the obedience of the entire people. This human monarch of the future was often, although not always, portrayed in terms of an idealized David, using such features of his life and reign as would underscore submission to God and emphasized social stability, economic satisfaction, and peace. During the period of the monarchy, the prophetic demand was directed toward each succeeding king, with the hope or even the expectation that he would be or become the new David, or the ideal ruler.

The Davidic model

The Babylonian Exile added a new measure of urgency to this expectation, although it was not expressed in any uniform fashion. The later chapters of the Book of Ezekiel provide in largely impersonal fashion the constitution for the new commonwealth but do not describe the peculiar characteristics of the ruler, while the later chapters of the Book of Isaiah focus on several figures—including Cyrus the Mede—who are seen as the divine instruments ushering in a new era. It is important to recognize that while such figures have extraordinary virtues ascribed to them, these virtues are neither superhuman nor suprahuman but such as are ultimately required of all Israel and of all men. The frustrations of the postexilic period, when the several attempts to bring into being the holy community had no more than partial success and were thwarted by the imperial designs of the great powers—as they had been in the preexilic period as well—led to an emphasis upon the futuristic quality of the messianic hope. This was abetted undoubtedly by external influences, such as Iranian thought, in which the cosmic rather than the historic aspect of a future era dominated. Since ancient cosmic myths—in good measure demythologized—had been part of the Israelite intellectual inheritance, evidenced at least in literary usages throughout Scriptures, the impact of such neighbouring ideas was to reinvigorate the mythic elements. Thus, hopes for the future at the end of the Persian period and on through the Hellenistic developments after *c.* 330 BCE comprised both historical expectations focussed upon a sociopolitical community and cosmic-mythic visions that moved on a broader stage. The latter were, of course, never entirely absent from the historical expectations and situations, for a renewal of nature was viewed as integral to the functioning of true society. The obedient community required, and was to be granted, a natural world in which true human relations could exist. In its most vivid forms, apocalypses (*i.e.,* visionary disclosures of the future), the literature of the period affords a remarkable insight into the agonies and urgencies of the people. After the failures, saving events, and disappointments of the past are recounted, the present, in transparent disguise, is portrayed and the immediately hoped-for intervention of God is described in awesome detail as a means of affirming and confirming the faith of those who saw themselves as the remnant, or perhaps the promise, of the holy community.

The socio-political and cosmic-mythic aspects

The king-messiah and his reign. Put schematically, Israel's hope was for the restoration of divine sovereignty over all of creation. Concretely, that hope found a considerable variety of expressions. Of all such expressions, that which centred around the idealized king began to assume an ever more important (but never exclusive) role. Many of the writings that report the ideas and attitudes of the Jewish community in the period immediately preceding and following the rise of Christianity are either ignorant of or more probably indifferent to the personal element. God is envisioned as the protagonist of the end, actively intervening or sending his messengers (*i.e.,* angels), to perform specific acts in ending the old and inaugurating the new era. On the other hand, in some writings of the period the anointed king-messiah (Hebrew, *mashiaḥ,* "anointed")—the title reflects the episode in I Sam. 16 in which David is thus singled out as the divinely chosen ruler—becomes more sharply defined as the central figure in the culminating events and, given the cosmic-mythic components, assumes suprahuman and in some instances, even quasi-divine, aspects. It is clear, then, that the doctrine of last things in Judaism is not necessarily messianic, if that term is properly limited to an inauguration of a future era through the action of a human, suprahuman, or quasi-divine person. Nonetheless, it must be recognized that the messianic version of eschatology played a more compelling role in rabbinic Judaism than other modes. The same is true with regard to the locus of the "world (or age) to come." Given the ingredients noted above, it was possible to construct various eschatological landscapes ranging from the mundane to the celestial, from Jerusalem in the hills of Judah to a heavenly city. Indeed, confronted with an embarrassment of riches, the medieval theologians sought to combine them into an inclusive system that intricately involved as large a variety of the possibilities as could be brought together. In such patterns the messianic this-worldly emphasis was understood as a preliminary movement toward an ultimate resolution. The ideal ruler, the new David, would reestablish the kingdom in its own land (in "Zion," or Palestine) and would reign in righteousness, equity, justice, and truth, thus bringing into being the holy nation and summoning all mankind to dwell under divine sovereignty. As a component of this reestablished kingdom, the righteous dead of Israel would be resurrected to enjoy life in the true community that did not exist in their days. This kingdom, however long it was destined to endure, was not permanent. It would come to an end either at a predetermined time or as victim of the unrepentant nations and cosmic foes, at which point the ultimate intervention by God would take place. All the wicked throughout history would be recalled to life, judged, and doomed; all the righteous would be transformed and transported into a new world; *i.e.,* creation would be totally restored. Particular emphases that one or the other of these ideas received, the ways in which they were interpreted—philosophically, mystically, or ethically—were determined most frequently by the situations and conditions in which the Jewish community found itself. With such a considerable body of ideas at its disposal and with the details of none of them ever receiving the kind of affirmation that statements about God, Torah, and Israel had, freedom of speculation in the realm of eschatology was little restricted. Thus, Joseph Albo (15th century) in his work on Jewish "dogmas," the *Sefer ha-ʿiqqarim,* was not inhibited from denying that belief in the messiah was fundamental. The mystical movements of the Middle Ages found in eschatological hopes a crucial centre. The early Kabbala was little interested in messianism, for it interiorized the expectations in the direction of personal redemption. Following the disasters of the late 15th to 17th centuries (*e.g.,* the expulsion of the Jews from Spain and the Cossack massacre of the Jews in Poland) however, messianic speculation in all of its varieties underwent a luxuriant growth, finally running wild in the movements surrounding Shabbetai Tzevi of Smyrna and later Jacob Frank of Offenbach. These tragedies for the Jewish communities once again resulted in a futurizing of the hopes or at least a limiting of their application (see also below, *Jewish mysticism*).

Resurrection of the dead and Last Judgment

Secularization of messianism. In the 19th century, with the political emancipation of the Jews in western Europe and the development of an optimistic evolutionism, messianism was transformed by many liberal thinkers into a version of the idea of progress whose goal was often thought of as immediately attainable through enlightened social and political action. When disillusionment with the emancipation set in, messianism was even more completely secularized in some segments of the community who saw its meaning and fulfillment in some form of socialism—again, rather close at hand. In others, it was absorbed into the emerging political nationalism—Zionism. Similar developments took place in eastern Europe, with parallel transformations. In more recent times, particularly since the events symbolized by the name Auschwitz (a Nazi death camp in Poland, where millions of Jews were exterminated), the earlier modern interpretations, particularly of messianism, but also of eschatology as a whole, have been considered inadequate. Although no compelling statement has been forthcoming, Jewish thinkers in the second half of the 20th century have been attempting once again to come to grips with eschatological concepts in all of their varieties and forms.

Basic practices and institutions

THE HALLOWING OF EVERYDAY EXISTENCE

The centrality of Halakha

Systematic presentations of the affirmations of the Jewish community never served as the sole mode of expressing beliefs of the people. Side by side with speculation—Haggadic, philosophic, mystical, or ethical—there stood, not in a secondary role but as the other of the double focuses, Halakha ("practice," "rules of conduct"), the paradigmatic statement of the behaviour, individual and communal, that embodied concretely the beliefs conceptualized in speculation. Life in the holy community was understood to embrace every level of human existence. The prophets vigorously resisted attempts to limit the sovereignty of the God of Israel to organized worship and ritual. The Pharisees, even while the Jerusalem Temple cult was still in existence, sought to reduce priestly exclusiveness by enlarging the scope of sacral rules to include, as far as possible, all of the people. Rabbinic Judaism, Pharisaism's surviving descendant, continued the process of democratization and sought, through its system of interpretation, to find in every occasion of life a means of affirming divine concern and presence. Viewed negatively by some Protestant theologians, this development has been judged to stifle spontaneity. Yet spontaneity is not necessarily lacking in a world governed by Halakha, although the danger of the stylized routine in religious and ethical life is apparent. Nonetheless, the intention of the Halakhic attitude is to remind the Jew constantly that each and every occasion of life is a locus of divine disclosure. This is most clearly seen in the *berakhot,* the "blessings," that are prescribed to accompany the performance of a broad spectrum of human actions, from the commonplace routines of daily life to the restricted gestures of the cultic-liturgical year In these, God is addressed directly in the second person singular, his sovereignty is affirmed, and his activity as Creator, Giver of Torah, or redeemer, expressed in a wide variety of eulogies, is proclaimed. There are no areas of human behaviour in which man cannot be met by God, and in terms of its intention, the Halakhic pattern is designed to make such possibilities experienced realities. Yet, again, it must be noted that the situation of the Jewish community determines in a very large way how the intention is actualized. On more than one occasion the Halakhic pattern has served as a defense against a hostile environment and has thus tended to become scrupulosity (an obsessive concern with minute details), but the dynamic of the intention itself has as often broken through to re-establish its integrity and hallow life in its wholeness.

THE TRADITIONAL PATTERN OF INDIVIDUAL AND FAMILIAL PRACTICES

Perspective on the traditional pattern of an individual's life is obtained by examining a passage from the Babylonian Talmud (tractate *Berakhot* 60b) that was subsequently reworked into a liturgical structure but which in its original form exhibits the intention discussed above. In this passage, the blessings accompanying a man's waking and returning to the routines of life are prescribed. There is a brief thanksgiving on awakening for being restored to conscious life; then the impingement of the external world is responded to in a benediction over the cock's crowing; following this, each ordinary act, opening one's eyes, stretching and sitting up, dressing, standing up, walking, tying one's shoes, fastening one's belt, covering the head, washing the hands and face, has its accompanying blessing, reminding a man that the world and the life to which he has returned exist in the presence of God. These are followed by a supplication in which the petitioner asks that his life during the day may be worthy in all of its relationships. Then, as the first order of daily business, Torah, both written (Bible) and oral (Mishna), is briefly studied, introduced by eulogies of God as Giver of Torah. Finally, there is a prayer for the establishment of the Kingdom of God, for each day contains within itself the possibility of ultimate fulfillment. As indicated, this was originally not a part of public worship (even today it is, strictly speaking, not part of the synagogue service, although it is most frequently recited there) but was personal preparation for a life to be lived in the presence of God.

The liturgy of daily life

Such individual responsibility marks much of Jewish observance, so that the synagogue—far from being the focus of observance—shares with the home and the workaday world the opportunities for the divine-human encounter. The table blessings, Qiddush (the "sanctification" of the Sabbath and festivals), the erection of the booth (*sukka*) for Sukkot (the Feast of Tabernacles), the seder (the festive Passover meal) with its symbols and narration of the Exodus, the lighting of the lamps during the eight days of Ḥanukka (the Feast of Dedication), are all the obligation of the individual and the family and have their place in the home. It is here, too, that woman's role is defined and here, as contrasted with the synagogue, that she functions centrally. Given the traditional dietary regimen of the Jewish community—the exclusion of swine, carrion eaters, shellfish, and other creatures, the separation of meat and dairy products, the ritual slaughtering of animals, the required separation and burning of a small portion of dough (*ḥalla*) when baking, the supervision of the Passover food requirements, and many other stipulations—there exists a large and meticulously governed

The central role of women in family religion area within the home that is indeed the sphere of woman's religion. There seems not to have been a hierarchy of values in which the home-centred, as contrasted with the synagogue-oriented, practices were given an inferior status. In modern times, however, particularly in Western civilization where the pervasiveness of religious obligation has been replaced by ecclesiastical institutionalism, on the prevailing Christian model, this whole crucial area has lost much of its meaning as a place of divine-human meeting. Thus, for many it is only the synagogue that provides such an opportunity, and the individual act has been reduced on the scale of values. With this downgrading, woman's religion has lost its significance so that her status—when parallels are drawn to her role in the larger society—has been reduced to one of inferiority. However attenuated personal religious responsibility may have become in some environments or transformed into stylized cultural forms, the intention that informs the Halakhic structure, the hallowing of the individual's total existence, remains a potent force within the Jewish community.

THE TRADITIONAL PATTERN OF SYNAGOGUE PRACTICES

The other focus of observance is the synagogue. The origins of this institution are obscure and a number of hypotheses have been proposed to account for the appearance of this essentially lay-oriented form of worship. What seems certain is that during the period of the Second Temple—following the return from Babylon and continuing until the Temple destruction in 70 CE—there were, side by side with the official cult, other modes of worship more or less independent of the priesthood and nonsacrificial in form. The reports by the philosopher Philo and the historian Josephus in the 1st century, buttressed by the Qumrān document (Dead Sea Scrolls), provide some knowledge of the practices of the contemporary Essenes; rabbinic sources, including the earliest layers of the traditional order of worship, enable us to understand another, apparently Pharisaic, mode; the brief allusions to the practices of James and his Jewish Christian companions in the book of Acts suggest yet other varieties. In any case, the grouping that formed the cadre of what eventually became rabbinic Judaism observed some form of worship that, with the destruction of the Temple cult, was able to provide a new centre and even to absorb enough from the defunct priestly institution to suggest continuity and legitimacy. This was probably the basic pattern for synagogal liturgy in the millennia that followed.

Readings from the Torah and prophets

At the heart of synagogal worship is the public reading of Scriptures. This takes place at the morning service on Sabbaths, holy days, and festivals, on Monday and Thursday mornings, and on Sabbath afternoons. The readings from the Pentateuch are presently arranged in an annual cycle so that, beginning on the Sabbath following the autumnal festivals with Gen. 1:1, the entire five books are read through the rest of the year. The texts for festivals, holy days, and fasts reflect the particular significance of those occasions. In addition, a second portion from the prophetic writings (in the Jewish tradition these include Joshua, Judges, Samuel, and Kings, as well as the three major and 12 minor prophets, but not Daniel) is read on many of these occasions. All of this takes place within the structure of public worship and is provided with ceremonies during which the Sefer Torah ("Book of the Torah"), the pentateuchal scroll, is removed from the ark (cabinet) at the front of the synagogue, and carried in procession to the reading desk; from it, the pertinent text is chanted by the reader. The text for the service is divided into subsections varying from seven on the Sabbath to three at the weekday morning service, and individuals are called forward to recite the blessings eulogizing God as Giver of Torah before and after each of these. The order of worship is composed of the preparatory blessings and prayers noted above, to which are added passages recalling the Temple sacrificial cult (thus relating the present form of worship to the past); the recitation of a number of Psalms and biblical prayers; the Shema and its accompanying benedictions, introduced by a call to worship that marks the beginning of formal public worship; the prayer (*tefilla*) in the strict sense of petition; confession and supplication (*taḥanun*) on weekdays; the reading of Scripture; and concluding acts of worship. This general structure of the morning service varies somewhat, with additions and subtractions for the afternoon and evening services and for Sabbath, holy days, and festivals.

The "Eighteen Benedictions"

The prayer (*tefilla*), just mentioned, is often called the *shemone ʿesre,* the "Eighteen Benedictions"—although it actually has 19—or the *ʿamida,* "standing," because it is recited in that position. It is made up of three introductory benedictions: praise of the God of the Fathers, of God the Redeemer who resurrects the dead, and of God the holy one who fills the earth with his glory, and of three concluding acts; a prayer for the acceptance of the service, a thanksgiving, and a prayer for peace—with a series of intermediate petitions for knowledge, well-being, acceptance of repentance, forgiveness of sin, and others. On the Sabbath and festivals these are replaced by benedictions that mention the specific occasion but are not petitionary, it being considered inappropriate to attend to workday concerns at these times.

While the general outline of this order of service is found throughout the entire Jewish world, the details have varied, both in different periods and in geographic and cultural areas. The public service, requiring the presence of at least 10 males, the *minyan* ("quorum"), is generally led by a synagogal official, the *ḥazzan,* or cantor, but any Jewish male with the requisite knowledge may act in this capacity since there is, quite strictly, no clerical class in the community to whom such leadership is limited (see *The rabbi,* below).

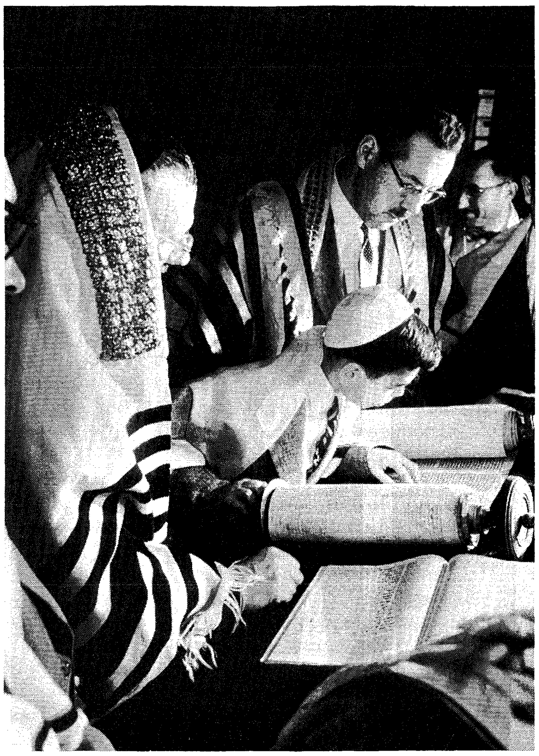
The synagogue room itself has a very simple basic form although, of course, it may be embellished considerably. The only requirements are a container for the Torah scroll(s), the *aron ha-qodesh* ("the holy ark")—a chest against the east wall, or a recessed closet with doors and a curtain; a prayer desk (*ʿamud*) facing the ark at which the reader stands when reciting the service; and the pulpit (*bima*)—according to some requirements in or close to the centre of the room—from which the Torah is read. In the Spanish-Portuguese tradition, only one desk (called *teva*) is used. The ark contains one or more scrolls, on which are written the five books of Moses. These are variously ornamented, depending upon the cultural region: European communities decking them in coverings of cloth; Oriental (North African and Near Eastern) placing them in wooden or metal containers. In addition, silver ornaments, in the form of towers or crowns, are often set on the tops of two rods on which the scroll is wound, and a breastplate and a pointer are suspended from them.

Accommodations for the worshippers vary according to the cultural milieu, from rugs and cushions in Oriental synagogues to pews and standing desks in European ones. Given this essential simplicity, the synagogue room itself may be used for other purposes than worship, *e.g.,* study and community assembly. Again, this varies with the cultural pattern.

CEREMONIES MARKING THE INDIVIDUAL LIFE CYCLES

Circumcision and naming

There are within Jewish life two cycles corresponding to the individual and the synagogal focuses, although they necessarily intermingle. The life of the individual is marked by observances that single out the notable events of personal existence. A male child is circumcised on the eighth day following birth, as a covenantal sign (Gen. 17); the rite of circumcision (*berit mila*) is accompanied by appropriate benedictions and ceremonies, including naming. Females are named in the synagogue, generally on the Sabbath following birth, when the father is called to recite the benedictions over the reading of Torah. A firstborn son, if he does not belong to a priestly or a levitical family, is rcdeemed at one month (in accordance with Ex. 13:12–13 and Num. 18:14–16) by the payment of a stipulated sum to a cohen (a putative member of the priestly family). On arrival at the age of 13, a boy is called publicly to recite the Torah benedictions, thus signifying his religious coming-of-age; he is thenceforth obligated to observe the commandments as his own responsibility—he is now a Bar Mitzwa ("Son of the Commandment"). Marriage (*ḥatuna,* also *Qiddushin,* "sanctifications") involves



Boy reading the Torah at synagogue services, an important part of the Bar Mitzwa ceremony.

Cornell Capa—Magnum

a double ceremony, performed together in modern times but separated in ancient times by a year. First is the betrothal (*erusin*), which includes the reading of the marriage contract (*ketubba*) and the giving of the ring with a declaration, "Behold you are consecrated to me by this ring according to the law of Moses and Israel," accompanied by certain benedictions. This is followed by the marriage proper (*nissuʾin*), consisting of the reciting of the seven marriage benedictions. The ceremony is performed under a *ḥuppa*, a canopy, that symbolizes the bridal bower.

The burial service is marked by simplicity. The body is prepared for the grave by the *ḥevraʾ qaddishaʾ* (the holy society), clad only in a simple shroud, and the interment takes place as soon after death as possible. In Israel no coffin is used. There are observances connected with death, many of which belong to the realm of folklore rather than Halakhic tradition. A mourning period of 30 days is observed, of which the first seven (*Shivʿa*) are the most rigorous. During the 11 months following a death, the bereaved recite a particular form of a synagogal doxology (Qaddish) during the public service as an act of memorial. The doxology itself, entirely devoid of any mention of death, is a praise of God and a prayer for the establishment of the coming Kingdom. It is also recited annually on the anniversary of the death (*yahrzeit*). (L.H.S.)

THE CYCLE OF THE RELIGIOUS YEAR

The term Jewish religious year as used in this section encompasses the cycle of Sabbaths and holidays that are commonly observed by the Jewish religious community—and officially in Israel by the Jewish secular community as well. The Sabbath and festivals are bound to the Jewish calendar, reoccur at fixed intervals, and are celebrated at home and in the synagogue according to ritual set forth in Jewish law and hallowed by Jewish custom. According to Jewish teaching, the Sabbath and festivals are, in the first instance, commemorative. The Sabbath, for example, commemorates the Creation, and Passover commemorates the Exodus from Egypt over 3,000 years ago. The past is not merely recalled; it is also relived through the Sabbath and festival observances. Creative physical activity ceases on the Sabbath as it did, according to Genesis, when the Creation was completed; Jews leave their homes and reside in booths during the Sukkot festival as did their biblical ancestors. Moreover, Sabbath and festival themes are considered to be perpetually significant, recurring and renewed in every generation. Thus the revelation of the Torah (the divine teaching or law) at Sinai, commemorated on Shavuot, is considered an ongoing process which recurs whenever a commitment is made to Torah study.

An important aspect of Sabbath and festival observance is sanctification. The Sabbath and festivals sanctified the Jews more than the Jews sanctified the Sabbath and festivals. Mundane meals became sacred meals; joy and relaxation became sacred obligations (*mitzwot*). No less significant is the contribution of the Sabbath and festivals toward communal awareness. Thus, neither Sabbath nor festival can be properly observed in the synagogue according to the ancient tradition if fewer than 10 male Jews are present. Again, a Jew prays on Rosh Hashana and mourns on Tisha be-Av not only for his own fate but for the fate of all Jews. The sense of social cohesiveness fostered by the Sabbath and festival observances has stood the Jews well throughout their long, often tortuous history.

The seven-day week, the notion of a weekly day of rest, and many Christian and Islāmic holiday observances owe their origins to the Jewish calendar, Sabbath, and festivals.

The Jewish calendar. *Lunisolar structure.* The Jewish calendar is lunisolar—*i.e.,* regulated by the positions of both the moon and the sun. It consists usually of 12 alternating lunar months of 29 and 30 days each (except for Ḥeshvan and Kislev, which sometimes have either 29 or 30 days), and totals 353, 354, or 355 days per year. The average lunar year (354 days) is adjusted to the solar year (365¼ days) by the periodic introduction of leap years in order to assure that the major festivals fall in their proper season. The leap year consists of an additional 30-day month called First Adar, which always precedes the month of (Second) Adar. A leap year consists of either 383, 384, or 385 days and occurs seven times during every 19-year period (the so-called Metonic cycle). Among the consequences of the lunisolar structure are these: (1) The number of days in a year may vary considerably, from 353 to 385 days. (2) The first day of a month can fall on any day of the week, that day varying from year to year. Consequently, the days of the week upon which an annual Jewish festival falls vary from year to year despite the festival's fixed position in the Jewish month.

Leap year: Second Adar

Months and notable days. The months of the Jewish religious year, their approximate equivalent in the Western Gregorian calendar, and their notable days, are as follows:

Tishri (September–October)
1, 2 Rosh Hashana (New Year)
3 Tzom Gedaliahu (Fast of Gedaliah)
10 Yom Kippur (Day of Atonement)
15–21 Sukkot (Tabernacles)
22 Shemini Atzeret (Eighth Day of the Solemn Assembly)
23 Simḥat Torah (Rejoicing of the Law)

Ḥeshvan, or Marḥeshvan (October–November)

Kislev (November–December)
25 Ḥanukka (Feast of Dedication) begins

Ṭevet (December–January)
2–3 Ḥanukka ends
10 ʿAsara be-Tevet (Fast of Tevet 10)

Shevaṭ (January–February)
15 Tu bi-Shevaṭ (15th of Shevaṭ: New Year for Trees)

Adar (February–March)
13 Taʿanit Esther (Fast of Esther)
14, 15 Purim (Feast of Lots)

Nisan (March–April)
15–22 Pesaḥ (Passover)

Iyyar (April–May)
18 Lag ba-Omer (33rd Day of the Omer Counting)

Sivan (May–June)
6, 7 Shavuot (Feast of Weeks, or Pentecost)

Tammuz (June–July)
17 Shivaʿ ʿAsar be-Tammuz (Fast of Tammuz 17)

Av (July–August)
9 Tisha be-Av (Fast of Av 9)

Elul (August–September)

During leap year, the Adar holidays are postponed to Second Adar.

Since 1948 many Jewish calendars list Iyyar 5—Israel Independence Day—among the Jewish holidays.

Regulation by the Sanhedrin and patriarchate

Origin and development. The origin of the Jewish calendar can no longer be accurately traced. Some scholars suggest that a solar year prevailed in ancient Israel, but no convincing proofs have been offered, and it is more likely that a lunisolar calendar similar to that of ancient Babylonia prevailed in ancient Israel. In late Second Temple times (*i.e.,* 1st century BCE to 70 CE), calendrical matters were regulated by the Sanhedrin, or council of elders, at Jerusalem. The testimony of two witnesses who had observed the New Moon was ordinarily required to proclaim a new month. Leap years were proclaimed by a council of three or more rabbis with the approval of the *nasi,* or president, of the Sanhedrin. With the decline of the Sanhedrin, calendrical matters were decided by the Palestinian patriarchate (the official heads of the Jewish community under Roman rule). Jewish persecution under Constantius II (reigned 337–361) and advances in astronomical science led to the gradual replacement of observation by calculation. According to Hai ben Sherira (died 1038)—the head of a leading Talmudic academy in Babylonia—Hillel II, a Palestinian patriarch, introduced a fixed and continuous calendar in 359 CE. A summary of the regulations governing the present calendar is provided by Maimonides, the great medieval philosopher and legist, in his *Code: Sanctification of the New Moon,* chapters 6–10.

Fragments of writings discovered in a geniza (depository for sacred writings withdrawn from circulation) have brought to light a calendrical dispute between Aaron ben Meir, a 10th-century Palestinian descendant of the patriarchal (Hillel) family, and the Babylonian Jewish authorities, including Saʿadia ben Joseph—an eminent 10th-century philosopher and *gaon* (head of a talmudic academy). Ben Meir's calculations provided that Passover in 922 be celebrated two days earlier than the date fixed by the normative calendar. After a bitter exchange of letters, the controversy subsided in favour of the Babylonian authorities, whose hegemony in calendrical matters was never again challenged.

Calendars of various sectarian Jewish communities deviated considerably from the normative calendar described above. The Dead Sea (or Qumrān) community (made famous by the Dead Sea Scrolls discoveries) adopted the calendrical system of the noncanonical books of *Jubilees* and *Enoch,* which was essentially a solar calendar. Elements of this same calendar reappear among the Mishawites, a sect founded in the 9th century.

The Karaites, a sect founded in the 8th century, refused, with some exceptions, to recognize the normative fixed calendar and reintroduced observation of the New Moon. Leap years were determined by observing the maturation of the barley crop in Palestine. Consequently, Karaites often celebrated the festivals on dates different from those fixed by the rabbis. Later, in medieval times, the Karaites adopted some of the normative calendrical practices, while rejecting others.

The Sabbath. The Jewish Sabbath (from Hebrew *shavat,* "to rest") is observed throughout the year on the seventh day of the week—Saturday. According to biblical tradition, it commemorates the original seventh day on which God rested after completing the creation.

Scholars have not succeeded in tracing the origin of the seven-day week, nor can they account for the origin of the Sabbath. A seven-day week does not accord well with either a solar or lunar calendar. Some scholars, pointing to the Akkadian term *shapattu,* suggest a Babylonian origin for the seven-day week and the Sabbath. But *shapattu,* which refers to the day of the Full Moon and is nowhere described as a day of rest, has little in common with the Jewish Sabbath. It appears that the notion of the Sabbath as a holy day of rest, linking God to his people and recurring every seventh day, was unique to ancient Israel.

Importance. The central significance of the Sabbath for Judaism is reflected in the traditional commentative and interpretative literature called Talmud and Midrash (*e.g.,* "if you wish to destroy the Jewish people, abolish their Sabbath first") and in numerous legends and adages from more recent literature (*e.g.,* "more than Israel kept the Sabbath, the Sabbath kept Israel"). Some of the basic teachings of Judaism affirmed by the Sabbath are God's acts of creation, God's role in history, and God's covenant with Israel. Moreover, the Sabbath is the only Jewish holiday the observance of which is enjoined by the Ten Commandments. Jews are obligated to sanctify the Sabbath at home and in the synagogue by observing the Sabbath laws and engaging in worship and study. The leisure hours afforded by the ban against work on the Sabbath were put to good use by the rabbis, who used them to promote intellectual activity and spiritual regeneration among Jews. Other days of rest, such as the Christian Sunday and the Islāmic Friday, owe their origins to the Jewish Sabbath.

Worship, study, and abstinence from work

Observances. The biblical ban against work on the Sabbath, while never clearly defined, includes such activities as baking and cooking, travelling, kindling fire, gathering wood, buying and selling, and bearing burdens from one domain into another. The Talmudic rabbis listed 39 major categories of prohibited work, including agricultural activity (*e.g.,* plowing and reaping), work entailed in the manufacture of cloth (*e.g.,* spinning and weaving), work entailed in preparing documents (*e.g.,* writing), and other forms of constructive work.

At home, the Sabbath begins Friday evening some 20 minutes before sunset, with the kindling of the Sabbath candles by the wife, or in her absence by the husband. In the synagogue, the Sabbath is ushered in at sunset with the recital of selected psalms and the *Lekha Dodi,* a 16th-century Kabbalistic (mystical) poem. The refrain of the latter goes: "Come, my beloved, to meet the bride," the "bride" being the Sabbath. After the evening service, each Jewish household begins the first of three festive Sabbath meals by reciting the *Qiddush* ("sanctification" of the Sabbath) over a cup of wine. This is followed by a ritual washing of the hands and the breaking of bread; two loaves of bread (commemorating the double portions of manna described in Exodus) being placed before the breaker of bread at each Sabbath meal. After the festive meal, the remainder of the evening is devoted to study or relaxation. The distinctive features of the Sabbath morning synagogue service include the public reading of the Torah, or Five Books of Moses (the portion read varies from week to week) and, generally, the sermon, both of which serve to educate the listeners. Following the service, the second Sabbath meal begins, again preceded by *Qiddush* (of lesser significance), and conforming for the most part to the first Sabbath meal. The afternoon synagogue service is followed by the third festive meal (without *Qiddush*). After the evening service, the Sabbath comes to a close with the Havdala ("Distinction") ceremony, which consists of a benediction noting the distinction between Sabbath and weekday, usually recited over a cup of wine accompanied by a spice box and candle.

The Havdala ceremony

The Jewish holidays. The major Jewish holidays are the Pilgrim Festivals: Pesaḥ (Passover), Shavuot (Feast of Weeks, or Pentecost), and Sukkot (Tabernacles); and the High Holidays: Rosh Hashana (New Year) and Yom Kippur (Day of Atonement). In common, their observance is required by the Torah and work is prohibited for the duration of the holiday (except on the intermediary days of the Pesaḥ and Sukkot festivals, when work the neglect of which entails monetary loss is permitted). Purim (Feast of Lots) and Ḥanukka (Feast of Dedication), while not mentioned in the Torah (and therefore of lesser solemnity), were instituted by Jewish authorities in the Persian and Greco-Roman periods. Lacking the work restrictions characteristic of the major festivals, they are sometimes regarded as minor festivals. In addition, there are the five fasts: ʿAsara be-Ṭevet (Fast of 10 Ṭevet), Shivaʿ ʿAsar be-Tammuz (Fast of Tammuz 17), Tisha be-Av (Fast of Av 9), Tzom Gedaliahu (Fast of Gedaliah), and Taʿanit Esther (Fast of Esther); and the lesser holidays—*i.e.,* holidays the observances of which are few and not always clearly defined—such as Rosh Ḥodesh (First Day of the Month), Ṭu bi-Shevaṭ (New Year for Trees), and Lag ba-ʿOmer (33rd Day of Omer Counting). The fasts and the lesser holidays also lack the work restrictions characteristic of the major festivals. Some of the fasts and Rosh Ḥodesh are mentioned in Scripture, but most of the details concerning their proper observance, as well as those concerning the other lesser holidays, were provided by the Talmudic and medieval rabbis.

Pilgrim festivals. In Temple times, all males were required to appear at the Temple three times annually and actively participate in the festal offerings and celebrations. These were the joyous pilgrim festivals of Pesaḥ, Shavuot, and Sukkot. Originally, they marked the major agricultural seasons in ancient Israel and commemorated Israel's early history; but after the destruction of the Second Temple in 70 CE, emphasis was almost exclusively placed on the commemorative aspect.

In modern Israel, Pesaḥ, Shavuot, and Sukkot are celebrated for the number of days prescribed by Scripture, namely, seven days, one day, and eight days, respectively (with Shemini Atzeret added to Sukkot). Due to calendrical uncertainties which arose in Second Temple times (6th century BCE to 1st century CE), each festival is celebrated for an additional day in the Diaspora.

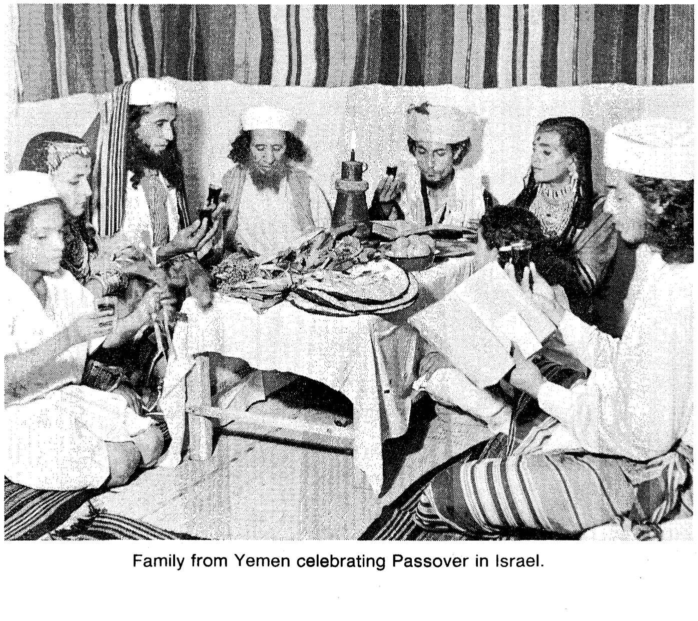
Pesaḥ
(Passover)

Pesaḥ commemorates the Exodus from Egypt and the servitude that preceded it. As such, it is the most significant of the commemorative holidays, for it celebrates the very inception of the Jewish people—*i.e.,* the event which provided the basis for the covenant between God and Israel. The term *pesaḥ* refers originally to the paschal (Passover) lamb sacrificed on the eve of the Exodus, the blood of which marked the Jewish homes to be spared from God's plague; its etymological significance, however, remains uncertain. The Hebrew root is usually rendered "passed over"—*i.e.,* God passed over the homes of the Israelites when inflicting the last plague on the Egyptians—hence the term Passover. The festival is also called Ḥag, Matzot ("Festival of Unleav- ened Bread"), for unleavened bread is the only kind of bread consumed during Passover.

Leaven (*seʾor*) and foods containing leaven (*ḥametz*) are neither to be owned nor consumed during Pesaḥ. Aside from meats, fresh fruits, and vegetables, it is customary to consume only those foods prepared under rabbinic supervision and labelled "kosher for Passover," warranting that they are completely free of contact with leaven. In many homes, special sets of crockery, cutlery, and cooking utensils are acquired for Passover use. On the evening preceding the 14th day of Nisan, the home is thoroughly searched for any trace of leaven (*bediqat ḥametz*). The following morning the remaining particles of leaven are destroyed by fire (*biʿur ḥametz*). From then until after Pesaḥ, no leaven is consumed. Many Jews sell their more valuable leaven products to non-Jews before Passover (*mekhirat ḥametz*), repurchasing the foodstuffs immediately after the holiday.

The unleavened bread (*matza*) consists entirely of flour and water, great care being taken to prevent any fermentation before baking. Hand-baked *matza* is flat, rounded, and perforated. Since the 19th century, many Jews have preferred the square-shaped, machine-made *matza.*

Popperfoto



Family from Yemen celebrating Passover in Israel.

Passover eve is ushered in at the synagogue service on the evening before Passover, after which each family partakes of the seder ("order of service); *i.e.,* an elaborate festival meal in which every ritual is regulated by the rabbis. (In the Diaspora, the seder is also celebrated on the second evening of Passover.) The table is bedecked with an assortment of foods symbolizing the passage from slavery (*e.g.,* bitter herbs) into freedom (*e.g.,* wine). The Haggada (literally "narration"), a printed manual comprised of appropriate passages culled from Scripture, Talmud, and Midrash, accompanied by medieval hymns, serves as a guide for the ensuing ceremonies and is recited as the evening proceeds. The seder opens with the cup of sanctification (Qiddush), the first of four cups of wine drunk by the celebrants. An invitation is extended to the needy to join the seder ceremonies, after which the youngest son asks four prescribed questions expressing his surprise at the many departures from usual mealtime procedure. ("How different this night is from all other nights!") The father then explains that the Jews were once slaves in Egypt, were then liberated by God, and now commemorate the servitude and freedom by means of the seder ceremonies. Special blessings are recited over the unleavened bread and the bitter herbs (*maror*), after which the main courses are served. The meal closes with a serving of *matza* recalling the paschal lamb, consumption of which concluded the meal in Temple times. The seder concludes with the joyous recital of hymns praising God's glorious acts in history and anticipating a messianic redemption to come.

The Passover liturgy is considerably expanded and includes the daily recitation of Psalms 113–118 (Hallel, "praise"), public readings from the Torah, and an additional service (*musaf*). On the first day of Pesaḥ, a prayer for dew in the Holy Land is recited; on the last day, the memorial service for the departed (*yizkor*) is added.

Shavuot
(Feast of
Weeks, or
Pentecost)

Originally an agricultural festival marking the wheat harvest, Shavuot commemorates the revelation of the Torah at Sinai. Shavuot ("weeks") takes its name from the seven weeks of grain harvest separating Passover and Shavuot. The festival is also called Ḥag ha-Qazir (Harvest Festival) and Yom ha-Bikkurim (Day of First Fruits). Greek-speaking Jews called it *pentēkostē,* meaning "the fiftieth" day after the sheaf offering. In rabbinic literature, Shavuot is called *atzeret* ("cessation, conclusion"), perhaps because the cessation of work is one of its distinctive features, or possibly because it was viewed as concluding the Passover season. In liturgical texts it is described as the "season of the giving of our Torah." The association of Shavuot with the revelation at Sinai, while not attested to in Scripture, is alluded to in the Pseudepigrapha (a collection of noncanonical writings). In rabbinic literature the association first appears in 2nd-century materials. The association, probably an ancient one, was derived in part from the book of Exodus, which dates the revelation at Sinai to the third month (counting from Nisan), *i.e.,* Sivan.

Scripture does not provide an absolute date for Shavuot. Instead, 50 days (or seven weeks) are reckoned from the day the sheaf offering (ʿOmer) of the harvest was brought to the Temple, the 50th day being Shavuot. According to the Talmudic rabbis, the sheaf offering was brought on the 16th of Nisan; hence Shavuot always fell on or about the 6th of Sivan. Jewish sectarians, such as the Sadducees, rejected the rabbinic tradition concerning the date of the sheaf ceremony, preferring a later date, and celebrated Shavuot accordingly.

In Temple times, aside from the daily offerings, festival offerings, and first-fruit gifts, a special cereal offering consisting of two breads prepared from the new wheat crop was offered at the Temple. Since the destruction of the Second Temple, Shavuot observances have been dominated by its commemorative aspect. Many Jews spend the entire Shavuot night studying Torah, a custom first mentioned in the *Zohar* ("Book of Splendour"), a Kabbalistic work edited and published in the 13th–14th centuries. Some prefer to recite the *tiqqun lel Shavuʿot* ("Shavuot night service"), an anthology of passages from Scripture and the Oral Law (Mishna) compiled in the late medieval period. An expanded liturgy includes Hallel, public readings from the Torah, *yizkor* (in many congregations), and *musaf.* The Book of Ruth is read at the synagogue service, possibly because of its harvest-season setting.

Sukkot (Tabernacles)

Sukkot ("booths"), an ancient harvest festival that commemorates the booths the Israelites resided in after the Exodus, was the most prominent of the three pilgrim festivals in ancient Israel. Also called Ḥag ha-Asif (Festival of Ingathering), it has retained its joyous, festive character through the ages. It begins on Tishri 15 and is celebrated for seven days. The concluding eighth day (plus a ninth day in the Diaspora), Shemini Atzeret, is a separate holiday. In Temple times, each day of Sukkot had its own prescribed number of sacrificial offerings. Other observances, recorded in the Mishna tractate *Sukka,* include the daily recitation of Hallel, daily circumambulation of the Temple altar, a daily water libation ceremony, and the nightly *bet ha-shoʿeva* or *bet ha-sheʾuvah* ("place of water drawing") festivities starting on the evening preceding the second day. The last mentioned featured torch dancing, flute playing, and other forms of musical and choral entertainment.

Ideally, Jews are to reside in booths—walled structures covered with thatched roofs—for the duration of the festival; in practice, most observant Jews take their meals in the *sukka* ("booth") but reside at home. A palm-tree branch (*lulav*), bound up together with myrtle (*hadas*) and willow (*ʿarava*) branches, is held together with a citron (*etrog*) and waved. Medieval exegetes provided ample (if not always persuasive) justification for the Bible's choice of these particular branches and fruit as symbols of rejoicing. The numerous regulations governing the *sukka, lulav,* and *etrog* comprise the major portion of the treatment of Sukkot in the codes of Jewish law. The daily Sukkot liturgy includes the recitation of Hallel, public readings from the Torah, the *musaf* service, and the circumambulation of the synagogue dais. On the last day of Sukkot, called Hoshana Rabba (Great Hoshana) after the first words of a prayer (hoshana, "save us") recited then, seven such circumambulations take place. Kabbalistic (mystical) teaching has virtually transformed Hoshana Rabba into a solemn day of judgment.

Hoshana Rabba is followed by Shemini Atzeret (Eighth Day of Solemn Assembly), which is celebrated on Tishri 22 (in the Diaspora also Tishri 23). None of the more distinctive Sukkot observances apply to Shemini Atzeret; but Hallel, public reading from the Torah, *yizkor* (in many congregations), *musaf,* and a prayer for rain in the Holy Land are included in its liturgy. Simḥat Torah (Rejoicing of the Law) marks the annual completion of the cycle of public readings from the Torah. The festival originated shortly before the gaonic period (*c.* 600–1050 CE) in Babylon, where it was customary to conclude the public readings annually. In Palestine, where the public readings were concluded approximately every three years, Simḥat Torah was not celebrated annually until after the gaonic period. Israeli Jews celebrate Simḥat Torah and Shemini Atzeret on the same day; in the Diaspora, Simḥat Torah is celebrated on the second day of Shemini Atzeret. Its joyous celebrations bring the Sukkot season to an appropriate close.

Ten Days of Penitence. The Ten Days of Penitence begin on Rosh Hashana and close with Yom Kippur. Already in Talmudic times they were viewed as forming an especially appropriate period of introspection and repentance. Penitential prayers (*seliḥot*) are recited prior to the daily morning service and, in general, during the period scrupulous observance of the Law is expected.

Rosh Hashana (New Year)

According to Mishnaic teaching, the New Year festival ushers in the Days of Judgment for all of mankind. Despite its solemnity, the festive character of Rosh Hashana is in no way diminished. In Scripture it is called "a day when the horn is sounded"; in the liturgy "a day of remembrance." In the land of Israel and in the Diaspora, Rosh Hashana is celebrated on the first two days of Tishri. Originally celebrated by all Jews on Tishri 1, calendrical uncertainty led to its being celebrated an additional day in the Diaspora and, depending upon the circumstances, one or two days in Palestine. After the calendar was fixed in 359, it was regularly celebrated in Palestine on Tishri 1 until the 12th century, when Provençal scholars introduced the two-day observance. Considerable speculation in recent literature concerning the origin of the Jewish New Year festival proves mostly that its early history can only be conjectured, not reconstructed.

Scroll of the Law being shown to the congregation on Simḥat Torah in a synagogue on the Tunisian island of Jazīrat Jarbah.

BBC Hulton Picture Library

The most distinctive Rosh Hashana observance is the sounding of the ram's horn (*shofar*) at the synagogue service. Medieval commentators suggest that the blasts acclaim God as Ruler of the universe, recall the divine revelation at Sinai, and are a call for spiritual reawakening and repentance. An expanded New Year liturgy stresses God's sovereignty, his concern for man, and his readiness to forgive those who repent. On the first day of Rosh Hashana (except when it falls on the Sabbath) it is customary for many to recite penitential prayers at a river, symbolically casting their sins into the river; this ceremony is called *tashlikh* ("thou wilt cast"). Other symbolic ceremonies, such as eating bread and apples dipped in honey, accompanied with prayers for a "sweet" and propitious year, are performed at the festive meals.

Yom Kippur (Day of Atonement)

The most solemn of the Jewish festivals, Yom Kippur is a day when sins are confessed and expiated and man and God are reconciled. It is also the last of the Days of Judgment and the holiest day of the Jewish year. Celebrated on Tishri 10, it is marked by fasting, penitence, and prayer. Work, eating, drinking, washing, anointing one's body, sexual intercourse, and donning leather shoes are all forbidden.

In Temple times, Yom Kippur provided the only occasion for the entry of the high priest into the Holy of Holies; details of the expiatory rites performed by the high priest and others are recorded in the Mishna and recounted in the liturgy. Present-day observances begin with a festive meal shortly before Yom Kippur eve. The Kol Nidre prayer (recited before the evening service) is a legal formula which absolves Jews from fulfilling solemn vows, thus safeguarding them from accidentally violating a vow's stipulations. The formula first appears in gaonic sources (derived from the Babylonian Talmudic academies, 6th–11th centuries) but may be older; the haunting melody that accompanies it is of medieval origin. Virtually the entire day is spent in prayer at the synagogue, the closing service (*neʿila*) concluding with the sounding of the ram's horn.

Minor festivals: Ḥanukka and Purim. Ḥanukka and Purim are joyous festivals lacking the work restrictions characteristic of the major festivals.

Ḥanukka (Feast of Dedication)

Ḥanukka commemorates the Maccabean (or Hasmonean) victories over the forces of the Seleucid king Antiochus IV Epiphanes (reigned 175–164 BCE), and the rededication of the Temple Kislev 25, 164 BCE. Led by Mattathias and his son Judah Maccabee, the Maccabees were the first Jews who fought to defend their religious beliefs rather than their lives. Ḥanukka is celebrated for eight days beginning on Kislev 25. The Ḥanukka lamp or candelabrum (*menora*), which recalls the Temple lampstand, is kindled each evening. One candle is lit the first evening; an additional candle is lit each subsequent evening until eight candles are lit on the last evening. According to the Talmud (Shabbat 21b), the ritually pure oil available at the rededication of the Temple was sufficient for only one day's light but miraculously lasted for eight days, hence the eight-day celebration of Ḥanukka. Evidence from the Apocrypha (writings excluded from the Jewish canon but included in the Roman Catholic and Eastern Orthodox canons) and rabbinic literature shows an association between Sukkot and Ḥanukka, possibly accounting for the latter's eight-day duration. Ḥanukka joy is expressed in festive meals, song, games, and gifts to children. The liturgy includes Hallel, public readings from the Torah, and the *ʿal ha-nissim* ("for the miracles") prayer. The Scroll of Antiochus, an early medieval account of Ḥanukka, is read in some synagogues and homes.

Purim (Feast of Lots)

As recorded in the biblical Book of Esther, Purim commemorates the delivery of the Persian Jewish community from the plottings of Haman, Ahasuerus' (perhaps Xerxes, king of Persia, 486–465 BCE) prime minister. Mordecai and his cousin Esther, the King's Jewish wife, interceded on behalf of the Jewish community, rescinded the royal edict authorizing a pogrom against the Jews, and instituted the Purim festival. The historicity of the biblical account is questioned by many modern scholars. It is now generally conceded that the Book of Esther was written in the Persian period (it contains Persian but not Greek words) and reflects Persian custom. Except for the Book of Esther, the earliest mention of the Purim festival is from the 2nd–1st centuries BCE. The name of the festival was derived from the Akkadian *pûru,* meaning "lot."

In most Jewish communities, Purim is celebrated on Adar 14 (some also celebrate it on the 15th, others only on the 15th). On the evening preceding Purim, men, women, and children gather in the synagogue to hear the Book of Esther read from a scroll (*megilla*). The reading is repeated Purim morning. A festive meal during the day is accompanied by much song, wine, and merriment. Masquerades, Purim plays, and other forms of parody are common. Friends exchange gifts of foodstuffs and also present gifts to the poor. Aside from the Esther readings, the liturgy includes public reading from the Torah and recital of the Purim version of the *ʿal hanissim* prayer.

The five fasts. The commemorative aspects of the fasts are bound up with their penitential aspects, all of which find expression in the liturgy. Thus the Jew not only relives the tragic history of his people with each fast, but is also afforded an opportunity to search within himself and focus on his own (and his people's) present and future. Penitential prayers (*seliḥot*) are recited on all fasts, and the Torah is read at the morning and afternoon services.

ʿAsara be-Ṭevet (Fast of Ṭevet 10) commemorates the beginning of the siege of Jerusalem by Nebuchadnezzar, king of Babylonia, in 588 BCE.

Shivaʿ ʿAsar be-Tammuz (Fast of Tammuz 17) commemorates the first breach in the wall of Jerusalem by the Romans in 70 CE. It initiates three weeks of semi-mourning that culminate with Tisha be-Av.

Tisha be-Av (Fast of Av 9) commemorates the destruction of the First and Second Temples in 586 BCE and 70 CE. The most solemn of the five fasts, its self-denials are more rigorous than those prescribed for the others, and, like Yom Kippur, the fast begins at sunset. The book of Lamentations is read at the evening service, followed by poetic laments that are also recited Tisha be-Av morning.

Tzom Gedaliahu (Fast of Gedaliah) commemorates the slaying of Gedaliah, governor of Judah after the destruction of the First Temple.

Taʿanit Esther (Fast of Esther), which commemorates Esther's fast (*cf.* Esther 4:16), is first mentioned in gaonic literature.

The lesser holidays. A major festival in the biblical period, Rosh Ḥodesh (First Day of the Month) gradually lost most of its festive character. Since Talmudic times, it has been customary to recite Hallel on Rosh Ḥodesh. In the medieval period, aside from the liturgical practices carried over from the Talmudic period, it was celebrated with a festive meal. Always more diligently observed in Palestine than in the Diaspora, attempts to revive its full festive character are being made in modern Israel.

First mentioned in the Mishna, where it marks the New Year for tithing purposes, Tu bi-Shevat (New Year for Trees) assumed a festive character in the gaonic period, and later in the medieval period it became customary to eat assorted fruits on the holiday. In modern times it is associated with the planting of trees in Israel.

Lag ba-ʿOmer (33rd Day of the ʿOmer Counting) is a joyous interlude in the otherwise somber period of ʿOmer counting (*i.e.,* of the 49 days to Shavuot), which is traditionally observed as a time of semi-mourning. Usually celebrated as a school holiday with outings, it is first mentioned in medieval sources, which attribute its origin to the cessation of a plague that was decimating the students of Akiba, an influential rabbinic sage in the 2nd century, and to the anniversary of the death of another great rabbi, Simeon ben Yoḥai (died *c.* 170 CE).

The situation today. Modern attitudes toward the Sabbath and festivals vary considerably. Acculturated Jews under the sway of Western secularism often are ignorant of, or choose to neglect, traditional observances. Attitudes of committed Jews in the Western world are patterned mostly along the lines of accepted Orthodox, Conservative, and Reform practice. Thus for example, driving to synagogue services on the Sabbath is unthinkable in Orthodox circles, a matter of dispute among Conservative rabbis, and normative practice for Reform Jews. Among Orthodox Jews, who best preserve the traditional observances, contemporary discussion centres mostly on technological advances and their effect on Halakhic practice (the behaviour laid down in the written and oral Torah). Whether or not hearing aids may be worn on the Sabbath, and how crossing the international dateline affects observance of Sabbaths and festivals typify the sort of problem raised in Orthodox *responsa* ("replies" to questions on law and observance). Recent (and often heated) discussion in Conservative literature raises the possibility of abolishing the obligatory character of the additional festival days in the Diaspora (except for the second day of Rosh Hashana), thus unifying Jewish practice throughout the world. Reform Jews, the most innovative of the three groups, observe neither the additional festival days (including the second day of Rosh Hashana) nor the fasts and have introduced numerous modifications in the liturgy as well as in the observances. In recent years more radical Reform congregations have experimented freely with "psychedelic" sound and light effects and other novel forms of synagogue service.

In Israel Sabbath is the national day of rest, and Jewish holidays are vacation periods. Municipal ordinances govern public observance of the Sabbath and festivals; their enactment and enforcement vary with the political influence of the local Orthodox Jewish community. Attempts to interpret festivals along nationalistic lines are common; some kibbutzim (communal farms) stress the agricultural significance of the festivals. Independence Day is a national holiday; the preceding day, Remembrance Day, commemorates Israel's war dead. Yom Hashoa (Holocaust Day)—marking the systematic destruction of European Jewry between 1933 and 1945 and recalling the short-lived Ghetto uprisings—is commemorated officially on Nisan

27; many religious Israelis prefer to commemorate it on Ṭebet 10 (a fast day) now called *yom ha-qaddish* (day upon which the mourner's prayer is recited). Since the June 1967 war, Iyyar 28—Liberation of Jerusalem Day—is celebrated unofficially by many Israelis. Appropriate services are conducted on all the aforementioned holidays by most segments of Israel's religious community.

In Israel and the Diaspora, Jewish theologians often stress the timelessness and contemporaneity of holiday observances. Nevertheless, "revised" Passover Haggadot (plural of Haggada) in which contemporary issues are accorded a central position, appear regularly.

Scholarly research into the origin of the festivals, if unabated, has not advanced significantly in recent years, nor is it likely to unless new evidence is forthcoming. Attempts to trace the development and spread of festival observances have fared better, and studies such as A. Yaari's *History of the Simḥat Torah Festival* (in Hebrew) bode well for the future. (S.Z.L.)

HOLY PLACES: THE LAND OF ISRAEL AND JERUSALEM

The Jerusalem Temple

The land of Israel, as is evident from the biblical narratives, played a significant role in the life and thought of the Israelites. It was the promised home, for the sake of which Abraham left his birthplace; the haven toward which moved the tribes who escaped from Egyptian servitude; the hope of the exiles in Babylon. In the long centuries following the destruction of the Judean state by the Romans, it remained inextricably bound up with messianic and eschatological expectations. During the early period of settlement, there seem to have been many sacred localities, with one or another functioning for a time as a central shrine for all of the tribes, without displacing the others. Even the establishment of Jerusalem as the political capital by David and the building of a royal chapel there by Solomon did not bring to an end local cult centres. It was not until the reign of Josiah of Judah (640–609) that a reform centralized the cult in Jerusalem and attempted—although not entirely successfully—to end worship at local shrines. However irregular was the effectiveness of this reform, the Babylonian Exile and the subsequent return saw Jerusalem and its Temple win out over its rivals and become—in law, in fact, and in sentiment—the centre of Jewish cultic life. As noted above, this did not inhibit the rise and development of other forms of worship and even—on a few occasions—other cult centres. Nonetheless, no matter how unpopular the priesthood of the Jerusalem Temple became with some segments of the population—the Qumrān community seems to have denied its legality, and the Pharisees complained bitterly about its arrogance and exactions, attempting when politically feasible to impose and enforce Pharisaic regulations upon it—reverence for the Temple itself seems to have remained a widespread sentiment. With the destruction of the Temple by the Romans in 70 CE, such reverence was transformed both by messianic expectations and eschatological hopes into fervent devotion, which, over the following centuries, became idealized and even supernaturalized. The most ardently articulated statement of the crucial role of the land of Israel and the Jerusalem Temple is found in the *Sefer ha-Kuzari* of Judah ha-Levi in which the two are seen as absolutely indispensable for the proper relation between the people Israel and God. Symbolizing the significance of the land and of the city is the practice of facing in their direction during worship. The earliest architectural evidence derived from synagogue remains in Galilee indicates that the attempt was made to arrange the building in such a way that the worshippers faced directly toward Jerusalem. This practice may have continued even in the Diaspora, but at a later date the present practice of setting the holy ark in or before the east wall was established, so that "facing Jerusalem" is now more symbolic than actual.

THE SACRED LANGUAGE: HEBREW AND THE VERNACULAR TONGUES

Use of the vernacular in worship

The transformation of Hebrew into a sacred language is, of course, bound up with the political fate of the people. In the period following the return from the Babylonian Exile, Aramaic, a cognate of Hebrew, functioned as the international or imperial language in official life and certainly gained a foothold as a vernacular. It did not, despite claims made by some scholars, displace the everyday Hebrew of the people. The language of the Mishna, far from being a scholar's dialect, seems to reflect—in the same way as the Koine (common) Greek of the New Testament—popular speech. Displacement of Hebrew—both in its literary form in Scriptures and in its popular usage—did take place in the Diaspora, however, as evidenced by the need to translate Scriptures into Greek in some communities and into Aramaic in others. As far as the emerging order of worship is concerned, there seems also to have been an inclination on the part of some authorities to permit even the recitation of the Shema complex in the vernacular. Struggles over these issues within the communities continued for a number of centuries in various places, but the development of formal literary Hebrew—a sacred tongue, to be used side by side with the Hebrew Scriptures in worship—brought them to an end. Although the communities of the Diaspora used the vernaculars of their environment in day-to-day living and even—as in the case of the communities of the Islāmic world—for philosophical, theological, and other scholarly writings, in worship, Hebrew remained the standard until modern times when some of the reform movements in western Europe sought partially—and a very small fraction even totally—to displace it.

THE RABBINATE

Legal, judicial, and congregational roles. The rabbinate, with its peculiar nature and functions, is the result of a series of developments going back to the period that followed the disastrous second revolt against Rome (132–135 CE). The term rabbi ("my teacher") was originally an honorific title for the graduates of the academy directed by the *nasi* or patriarch, the head of the Jewish community in Palestine in that era, who was also a Roman imperial official. The curriculum of the school was Torah, written and oral, according to the Pharisaic tradition and formulation. The *nasi* appointed rabbis to the law court (the Bet Din) and as legal officers of local communities: acting with the local elders, they supervised and controlled the life of the community and its members in all of its aspects. A similar situation obtained in Babylon under the Parthian and Sāsānian empires, where the *resh galuta* or exilarch ("head of the exile") appointed rabbinical officials to legal and administrative posts. In time the patriarchate and exilarchate disappeared, but the rabbinate, nourished by independent rabbinical academies, survived. An authorized scholar, when called to become the judicial officer of a community, would at the same time become the head of the local academy and would, after adequate preparation and examination, grant authorization to his pupils, who were then eligible to be called to rabbinical posts. There was, thus, a diffusion of authority, the communities calling, rather than a superior official appointing, their rabbis. What must be kept in mind is that these rabbis were not ecclesiastical personages but communal officials, responsible for the governance of the entire range of life of what was understood to be the *qehilla qedosha,* the "holy community."

The modern rabbi

In modern times and particularly in the Western world, the total change in Jewish communal existence required a transformation of this ancient structure. The rabbinate became, for the most part, an ecclesiastical rather than a communal agency, reflecting the requirements of civic life in modern national states. The education of rabbis who now function within this new situation is carried on in seminaries whose structure and curriculum have been influenced by European and American academic institutions. The majority of their graduates serve as congregational rabbis, in roles similar to those of ministers and priests in the Christian denominations, but with some other functions deriving from the particular situation and nature of the Jewish community.

Even in the State of Israel, where certain larger areas, such as that of family law, are still reserved to the rabbinate, it nonetheless functions more as a counterpart to other ecclesiastical organizations, Christian and Muslim, than as an overarching and all-inclusive communal agency that embodies, as in the past, involvement in every aspect of community and personal life.

Chief rabbinates. The existence of the offices of chief rabbi in the State of Israel derives from the situation in the Turkish Empire when the various religious communities functioned as quasi-political entities in that multiethnic conglomerate. Israel has two chief rabbis, one for the Ashkenazic (European) and one for the Sefardic (Oriental) communities—they no longer function, however, as the heads of whole communities but only of ecclesiastical organizations. The same is true in those countries outside Israel that have the office of chief rabbi; *e.g.,* Great Britain and France. Here they function vis à vis the governments like their ecclesiastic counterparts in the Christian churches. While they have certain kinds of limited authority because of their official position, their jurisdiction extends only over those members of the total Jewish community who are ready to accept it; others form their own ecclesiastical units and act without reference to the chief rabbinate. In some situations, particularly in the United States where there is no similar structure, the title chief or grand rabbi has been assumed occasionally by individuals as the means of asserting superior dignity or even (fruitlessly) authority.

GENERAL COUNCILS OR CONFERENCES

The precise nature of the Sanhedrin (Council Court) in the last years of the Jewish commonwealth is a much disputed matter. The several councils mentioned in Talmudic literature are equally difficult to define with exactitude. There are references scattered throughout medieval literature that suggest the existence of councils and synods but their composition and authority are also uncertain. Around 1000 a synod was held in the Rhineland in which French and German communities participated under the guidance of Rabbenu Gershom, the leading rabbinic authority of the region. The late Middle Ages saw the rise in eastern Europe of the Waʿad Arbaʿ Aratzot (Council of the Four Lands) composed of communal representatives from Great Poland, Little Poland, Russian Poland (Volhynia), and Lithuania. At the beginning of the modern era Napoleon (1806) summoned an Assembly of Notables—representatives of communities under French dominion—to deal with questions arising from the dissolution of the older status of the Jews and their naturalization as individuals into the new national states. Those decisions of the Assembly that involved questions of Jewish law were subsequently submitted to a Grand Sanhedrin called into being by Napoleon to provide some sort of Halakhic justification for the acts the French imperial government had required of the Jewish communities. During the 19th century the demand for the reform of Jewish life—principally the liturgy of the synagogue, but many other aspects as well—evoked a series of rabbinical conferences and synods that debated the questions and sought to guide the changes thought to be necessary. A similar procedure was followed on the American scene. In both instances, after an initial period in which radicals, moderates, and conservatives argued their respective cases in the same forum, polarization set in and intellectual differences were transformed into competing organizations. In the 1970s the several tendencies within the Jewish communities in North America were institutionalized in rabbinical conferences and congregational unions—Orthodox, Conservative, and Reform—whose influence was in large measure limited to their adherents. In the United States the Synagogue Council of America claims to be the "united voice" of American Jewry in common concerns. There is also a worldwide body in Reform or Liberal Judaism—the World Union for Progressive Judaism.

MODERN VARIATIONS

Reinterpretations of the Halakhic system

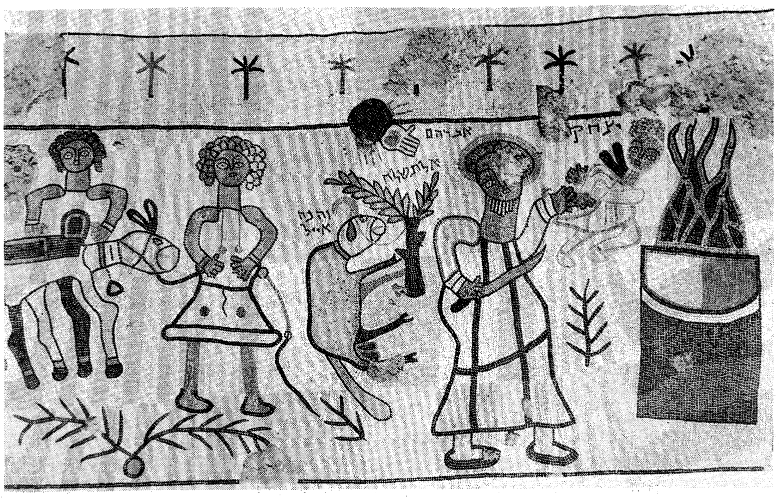
The above sketch of basic practices and institutions has attempted to describe the so-called traditional situation, although it has been indicated that even here there are variations—actually more than have been noted. In addition, reference has been made to some shifts and changes that represent a giving up of traditional practices on the basis of intellectual decisions about the nature of Judaism, its beliefs, practices, and institutions. Such changes are far too numerous to describe in detail. What is more important is to indicate their motivation. Basically, it is the view that the Halakhic system is not, as a whole and in all of its parts, divinely revealed but is rather a human process that seeks to expose in mutable forms the meaning of the divine-human encounter. Thus viewed, the practices and institutions are understood to be historically determined, reflecting the multifaceted experience of the people Israel as it has sought to live in the presence of God. Historical scholarship has, from this point of view, disclosed the origins, rise, development, and decline of these structures in the past and thus authorizes such changes in the present and future as appear to fulfill the needs of the community and its members. An examination of the specific deviations from the traditional forms makes clear that the application of this position, or attitude, has been subject to wide variation during the 19th and 20th centuries, in which it has operated. Some have seen it as a call for the disengagement from much if not all of the traditional pattern, and a recognition that only the spiritual essence is of importance or consequence for Judaism. Others have argued that an indiscriminate use of historicism (the explanation of values and forms in terms of their historical conditions) is unjustified and that the burden of proof is always upon those who would introduce changes. In the post-World War II period, the question has been whether a reconstituted Halakhic system might not be a requirement of the day.

Art and iconography

The synagogue at Doura-Europus

The anti-iconic principle and its modifications. Although the Second Commandment (Ex. 20:4; Deut. 5:8), "You shall not make yourself a graven image, or any likeness of anything that is in heaven above, or that is in the earth beneath, or that is in the water under the earth," has indeed been understood as absolutely prohibiting any and all artistic representation, this is not the only way in which these words may be interpreted. What is intended is a prohibition against the construction of such likenesses as were the object of worship in the cultural area in which the Israelites dwelt. Even in the Bible there are reports of artistic productivity in the construction of the tent sanctuary and its ritual vessels (Ex. 25–31) and of the Temple in Jerusalem (I Kings 6–7). The literalness and rigour with which the commandment was interpreted depended upon the larger situation of the community, so that during periods of external pressures toward religious conformity, such as the reign of Antiochus IV Epiphanes in Antioch (175–164 BCE), the anti-iconic attitude sharpened. Similarly, during the Roman occupation, the presence of the battle standards of the legions with their animal representations was looked upon as an affront, while extreme Pietists would not even handle Roman coinage because of the images stamped on it. On the other hand, the walls of a 3rd-century-CE synagogue in Doura-Europus in Syria are covered from floor to ceiling with biblical scenes with human representations, and a number of synagogues in Palestine had elaborate mosaic floors with the signs of the zodiac, representations of the seasons, and the like. Further, illuminated manuscripts from the medieval period in Europe were frequently decorated with biblical figures, some quite clearly copied from Christian prototypes. A fascinating mediating position is to be seen in a Haggada, in which the human figures have bird heads. Synagogues from a later, although preemancipation, period (before the 18th century) were often decorated with animal figures. In the modern period the avoidance of human figures has not been entirely accomplished, although nothing like the decorations of Doura-Europus has appeared.

Ceremonial objects and symbols. Nonetheless, given this general anti-iconic attitude, much of Jewish artistic endeavour has been directed toward the creation of ceremonial objects: Qiddush goblets, candlesticks and candelabra, spice boxes for the Havdala ceremony at the end of the Sabbath, ornamented containers for the *mezuza* (a



Sacrifice of Isaac, detail of a mosaic from the synagogue of Bet Alfa, Jezreel, Israel, 6th century AD.

parchment on which is written Deut 6:4–9 and 11:13–21, fastened to the doorpost on the right side as one enters), the silver crowns placed on the Torah scrolls, together with the mantles and breastplates for the same, and many other objects designed to embellish the performance of the large number of ritual acts of the individual and the community. All of these vary in artistic quality, from the work of simple artisans to exquisitely produced works of master craftsmen.

Architecture. The building of synagogues, too, is an expression of artistic interest and concern, as well as of religious and social function. Nothing is known of these edifices, if indeed there were any, until the Greco-Roman period. Then the Roman basilica often provided the appropriate model. What was required was a spacious hall for assembly, and galleries for the women, and this form served that purpose very well. However synagogues were furnished before the destruction of the Second Temple, after that event some attempt seems to have been made to transfer some of the latter's appurtenances to the former, a move that was successfully resisted. When possible, the synagogue stood on a hill. Before it stood a walled entrance court with a fountain for ablutions. Before the Temple destruction, the building may have been oriented with its doors facing eastward, but afterward they faced Jerusalem; still later, when the holy ark containing the Torah scrolls was placed in a fixed position, the orientation was reversed so that the central gate would not be blocked; ultimately, the ark was placed in or against the east wall, without reference to the actual direction of Jerusalem. As the Diaspora grew larger, the new communities adapted the architectural forms of the enveloping culture. The surviving buildings of the Muslim period in Spain are often built with the horseshoe arches and decorated with the exquisite stucco arabesques that mark the era. The medieval period in Christian Europe saw a revival of a very strict anti-iconic attitude and a gradual rejection of the church edifice in favour of secular buildings as a model for the synagogue. The increasingly limited role of the Jew in that society and the enlargement of restrictions by church and state made it necessary to modify the synagogal structure. The doors no longer were in the wall facing the ark; the courtyard grew smaller; galleries were discontinued (side rooms now serving as the women's section); and a double- rather than a triple-aisled construction was largely favoured. Similar developments took place in eastern Europe with the building of fortress-synagogues and the remarkable wooden synagogues of Poland. In the early postemancipation period, Baroque style had its day, followed by Greek temples, Romanesque, Gothic, and pseudo-Byzantine churches, and pseudo-Moorish mosques. In the most recent period, the various schools of functionalism and their commercial descendants have come to the fore. The best of these have brought together fine architectural design and beautifully conceived and executed decoration. The interior arrangement, even in some traditional synagogues, has been influenced by the Protestant sermon-centred form of worship, so that some of the unique forms that marked older structures are absent. The holy ark is, however, still a centre of attention and has often been treated in interesting and striking ways.

Synagogal sites and structures

Paintings and illustrations. As noted above, the use of paintings in the decoration of synagogues goes back to at least the 3rd century CE and is found in the late pre-emancipation and modern synagogues as well. Manuscripts, too, were illuminated with miniatures and the Renaissance period saw the appearance of beautifully decorated Scrolls of Esther and *ketubbot* (marriage contracts). Nonetheless, the appearance of Jewish artists in painting and sculpture is a modern phenomenon. Beginning in the 19th century, interest grew apace and more and more Jews are to be found, often in the avant-garde of these fields. Some, such as Marc Chagall and Jacques Lipchitz, have done specifically religious art.

Liturgical cantillation

Music. The description of the synagogue service above noted the role of the *ḥazzan,* or cantor. It is he who reads the service and declaims the scriptural lessons to certain set musical modes that vary with the season and occasion. Many of these call for melodic responses on the part of the congregation. The origins and varying developments

of these chants are ancient, often obscure, and equally complicated. Whatever the basic materials, these were enlarged, varied, corrupted, and reworked over the centuries in the various environments in which the Jewish communities have lived. In modern times musicologists have begun to examine with great care the history of synagogal music, analyzing its basic structures and its relationship to the music of Christian liturgical traditions. In the 19th century in Western Europe much of the traditional music was either discarded or re-worked under the influence of western forms and styles. In addition the pipe-organ was introduced and was the centre of stormy controversy.

Literature. Literature has been throughout the ages the home of Jewish artistic activity. The Hebrew Bible is a work of monumental artistry, exhibiting grandeur of form and language in historical narrative, poetry, rhetoric, and aphorism. The extrascriptural writings of the period, although their originals have often vanished, still disclose literary genius of a high order in translation. The documents of the rabbinic tradition are not often looked at with an eye to their literary worth but much of the material, particularly the Haggadic portions of the Midrashim, reveals a noteworthy sensitivity to the uses of language. In the medieval period much attention was given to the production of *piyyuṭim,* liturgical poetry with which to embellish the *Siddur* (prayer book), itself a collection containing much imaginative, as well as pedestrian, writing. In the Islāmic world, under the influence of Arabic poetry, Hebrew poetry rose to a high peak in both liturgical and secular forms. The Middle Ages in the Rhineland also saw the beginnings of the Jewish form of Middle High German that was, over the centuries, to develop into an autonomous Jewish language, Yiddish, which, in the 19th century, became a literary vehicle of very high order. The same period saw the beginnings of the recreation of Hebrew into a literary language that has become the basis of the spoken vernacular of the State of Israel and of a flourishing literature encompassing every branch of the field. Since the emancipation at the end of the 18th century, Jews in western Europe and later in the United States have turned to literature in the vernaculars of their countries, and have produced writers of note dealing with both Jewish and general themes. (L.H.S.)

Jewish philosophy

The term Jewish philosophy refers to various kinds of reflective thought engaged in by persons identified as being Jews, in one sense or another. At times, as in the Middle Ages, this meant any methodical and disciplined thought, whether on general philosophical subjects or on specifically Judaic themes, pursued by Jews. In other eras, as in modern times, concentration on the latter has been considered a decisive criterion, so that philosophers who are Jewish but unconcerned with Judaism or the Jewish heritage and destiny in their thought are not ordinarily classified as Jewish philosophers.

PRE-HELLENISTIC AND HELLENISTIC THOUGHT

Bible and Apocrypha. Philosophy arose in Judaism under Greek influence; however, a kind of philosophical approach may be discerned in early Jewish religious works apparently subject to little or no Greek influence. The books of Job and Qohelet (Ecclesiastes) were favourite works of medieval philosophers, who took them as philosophical discussions untinged by theological preconceptions. The book of Proverbs introduces, in an apparently theological context, the concept of Wisdom (Ḥokhma), which was to have a primordial significance for Jewish philosophical and theological thought, and presents it as the first and favourite of God's creations. It is also praised in the book of the Wisdom of Jesus the Son of Sirach (Ecclesiasticus) as instilled by God into all his works and granted in abundance to those he loves. It is sometimes equated with fearing God and keeping the Law; however, in other passages piety seems to be regarded as superior to Wisdom. The Wisdom of Solomon, probably originally written in Greek, praises Wisdom, which is held to be an image of God's goodness and a reflection of the eternal light. God is said to have given the author knowledge of the composition of the world, of the powers, the elements, the nature of animals, the divisions of time, and the positions of the stars. In its vocabulary and perhaps in some of its doctrines, the work shows the influence of Greek philosophical conceptions. It has had considerable influence on Christian theology.

The concept of Wisdom

Philo Judaeus. The first systematic attempt to apply Greek philosophical concepts to Jewish doctrines was made by Philo Judaeus (Philo of Alexandria) in the 1st century CE. Philo, a scholar who combined Greek and Jewish learning, was influenced by Platonic and Stoic writings, and probably also by certain postbiblical Jewish beliefs and speculations. He apparently had some knowledge of the Oral Law, which was being evolved in his time, and he also knew of the Essenes, a contemporary rigorous sect, whom he praised highly.

Philo's main contribution was interpretative. He provided Jewish conceptions with the hallmark of intellectual and cultural respectability by stating them in Greek philosophical terms; he also showed that many Greek notions were consonant with Jewish doctrine, as he conceived it, and with the allegorical sense of biblical texts, as he read them. He had two schemes of reference—Jewish religious tradition and Greek philosophy—and the fact that he took care to stress the primacy of the former may have been more than mere lip service. It may be argued with some plausibility that in central points of his thought, such as his conception of the Logos (the divine Reason or Word), Philo used philosophical notions as trappings for an originally religious belief. A main function of the Logos in his thought is to serve as an intermediary between the transcendent, unknowable God and the world, a view that probably has a close connection with the view of his Jewish contemporaries concerning the world of God, by means of which he accomplishes his designs. On basic philosophical or theological problems, such as the creation of the world or the freedom of will, Philo's writings provide either vague or contradictory answers. He placed mystic ecstasy, of which he may have had personal experience, above philosophical and theological speculations.

The concept of Logos

Philo's approach, his method of interpretation, and his way of thinking, as well as some of his conceptions—primarily that of the Logos—exerted a considerable influence on early Christian thought but not, to any comparable extent, upon Jewish thought in that period. Later, in the Middle Ages, knowledge of Philo among Jews was either very slight or nonexistent. Not until modern times was his role in Jewish religious thought recognized.

Other ancient sources. Some traces of a knowledge of popular, mainly Stoic philosophy may be found in the Mishna, a codification of the Oral Law composed in Palestine in the 2nd century CE, and in the subsequent Talmudic literature set down in writing in Palestine and Babylonia. On the whole these traces are rather slight. Some scholars believe that the influence of Greek philosophy on Palestinian Jewry was far-reaching, but the case, to say the least, is not proven. Jewish theological and cosmological speculations occur in the Midrashim (plural of Midrash,), which, under the guise of interpreting biblical verses, propound allegorical interpretations, legends, and myths, and in the *Sefer Yetzira* ("Book of Creation"), a work that is a combination of a cosmogony and a grammar and that was fictitiously attributed to Abraham. There is no clear evidence of the period in which it was written; both the 3rd century and the 6th or 7th century have been suggested. The book became a key work in later Jewish mysticism.

MEDIEVAL PHILOSOPHY

Islāmic background

In the 9th and 10th centuries, after a long hiatus, systematic philosophy and ideology reappeared among Jews, a phenomenon indicative of their accession to Islāmic civilization. The evolution of Islām in the 9th and 10th centuries showed that Greek scientific and philosophic lore could be separated, at least to some extent, from its pagan associations and could be transformed into another language and another culture; it also tended to show that a culture in which the sciences and philosophy or the sciences and theology or both of these combinations were an indispensable part could be based upon a monotheistic prophetic religion that in all relevant essentials, including adherence to a basic religious law, was closely akin to Judaism. The question of whether philosophy is compatible with religious law (the answer being sometimes negative) constituted the main theme of the foremost medieval Jewish thinkers. From approximately the 9th to the 13th centuries Jewish philosophical and theological thought participated in the evolution of Islāmic philosophy and theology and manifested only in a limited sense a specifically Jewish character. Jewish philosophers showed no particular preference for philosophic texts written by Jewish authors over those composed by Muslims, and in many cases the significant works of Jewish thinkers constitute a reply or a reaction to the ideas of Islāmic philosophic and scientific writings.

Jewish kalām. Although several Jewish intellectuals in 9th–10th-century Babylonia were steeped in Greek philosophy, the most productive and influential Jewish thinkers of this period represented a very different tendency, that of the Muʿtazilite *kalām. Kalām* (literally, "speech") is an Arabic term used both in Islāmic and in Jewish vocabulary to designate several theological schools that were ostensibly opposed to Greek, particularly Aristotelian, philosophy. The Aristotelians, both Islāmic and Jewish, regarded *kalām* theologians (called the *mutakallimūn*) with a certain contempt, holding them to be mere apologists, watchdogs of religion, and indifferent to truth. Herein they did not do justice to their adversaries, for many representatives of the Muʿtazilite school of *kalām,* formed in the 8th century, displayed a genuine speculative impulse. Its theology, forged in disputes with Zoroastrians, Manichaeans, and Christians, claimed to be based on reason.

Saʿadia ben Joseph. This belief in reason, as well as some of the tenets of Muʿtazilite theology, were taken over by Saʿadia ben Joseph, who was also influenced, either directly or through the intermediary of an Arabic philosopher, by the arguments of a Christian 6th-century philosopher, John Philoponus, against certain Aristotelian and Neoplatonic positions. Saʿadia's main theological work, *Kitāb al-amānāt wa al-iʿtiqādāt (Beliefs and Opinions),* is modelled on similar Muʿtazilite treatises and on a Muʿtazilite classification of theological subject matter known as the Five Principles. Like many Muʿtazilite authors, Saʿadia starts out by setting forth in his introduction a list and theory of the various sources of knowledge.

Saʿadia's four sources of knowledge

Saʿadia distinguished four sources: (1) the five senses, (2) the intellect, or reason, (3) necessary inferences, and (4) reliable information given by trustworthy persons. In Saʿadia's sense of the word, intellect, or reason (*al-ʿaql*), means first and foremost an immediate, a priori cognition, independent of sense experience. In *Beliefs and Opinions* the intellect is characterized as having immediate ethical cognitions—that is, as discerning what is good and what is evil—in opposition to the medieval Aristotelians, who did not regard even the most general ethical rules as a priori cognitions. The third source of knowledge comprises inferences of the type "if there is smoke, there is fire," which are based on data furnished by the first two sources of knowledge. The fourth source of knowledge is meant to validate the teachings of Scripture and of the religious tradition. Teachings of Scripture must be held true because of the trustworthiness of the men who propounded them. One of the main purposes of the work is to show that the knowledge deriving from the fourth source concords with that discovered by means of the other three, or, in other words, that religion and human reason agree.

Saʿadia opposed Aristotle's view that the natural order was eternal. He held, with other partisans of the Muʿtazilite *kalām,* that the demonstration of the temporal creation of the world must precede and pave the way for the proof of the existence of God the Creator. Given the demonstrated truth that the world has a beginning in time, it can be proved that it could have been produced only through the action of a creator. It can further be proved that there can have been only one Creator.

Divine justice and human ethical judgment

The theology of Saʿadia, like that of the Muʿtazilites, hinges on two principles: the unity of God and the principle of justice. The latter principle takes issue with the view (widespread in Islām and present also in Judaism) that the definition of what is just and what is good depends solely on God's will, to which none of the moral criteria found among men is applicable; according to this view, a revelation from God can convert an action now generally recognized as evil into a good action. Against this way of thinking, Saʿadia and the Muʿtazilites believed that being good and just or evil and unjust are intrinsic characteristics of human actions and cannot be changed by divine decree. The notions of justice and of good, as conceived by man, are binding on God himself. Since, according to Saʿadia, man has a priori knowledge of good and evil, just and unjust, the fact that human ethical judgments are valid for God means that man's ethical cognitions are also those of the Deity.

The function of religious law—of central importance in traditional Judaism and Islām—is to impose on man the accomplishment of good actions and to prohibit bad ones. Because Saʿadia believed that man has a priori knowledge of good and evil and that this knowledge coincides with the principles underlying the most important portions of the revealed law, he was forced to ask the question whether this law is not superfluous. He could, however, point out that, whereas the human intellect recognizes that certain actions—for instance, murder or theft—are evil, it cannot by itself discover the best possible definition of what constitutes a particular transgression, nor can it, on its own, determine the punishment appropriate for a transgression. On both points, Saʿadia asserted, the commandments of religious law give the best possible answers.

The commandments that accord with the behests of the human intellect were designated by Saʿadia as the intellectual, or rational, commandments. According to him, they include the duty of manifesting gratitude to the Creator for the benefits he has bestowed upon man. Saʿadia recognized that a considerable number of commandments—for instance, those dealing with the prohibition of work on the Sabbath—do not belong to this category. He held, however, that the obligation to obey them may be derived from the rational commandment that makes it incumbent upon man to be grateful to God, for such gratitude entails obedience to his orders.

Karaite rationalism and atomism

The Karaites. Saʿadia's adoption of the rational Muʿtazilite theology was a part of his overall activity, directed toward the consolidation of rabbinical Judaism (based on the Mishna and Talmud), which was being attacked by the Karaites. This Jewish sect, founded by Anan ben David in the 8th century, rejected the authority of the Oral Law—that is, of the Mishna and the Talmud. In the 10th century and afterward, the Karaites accepted as their guides the Bible (Old Testament) and human reason, in the Muʿtazilite sense of the word. Their professed freedom from any involvement with postbiblical Jewish religious tradition facilitated a rational approach to theological doctrine. This approach led the Karaite authors to criticize their opponents, the adherents of rabbinical Judaism, for holding anthropomorphic beliefs based, in part, on texts of the Talmudic period. Karaite authors propounded, in conceptual terms, a theology of Jewish history in exile (*galut*). Life in exile is a diminished existence; nevertheless, the good or bad actions of the Jewish people (rather than their material strength or weakness) affect the course of history. Redemption may come when all Jews are converted to Karaism.

The Karaites adopted, wholesale, Muʿtazilite *kalām,* including its atomism. The Muʿtazilite atomists held that everything that exists consists of minute, discrete parts. This applies not only to bodies but also to space, to time, to motion, and to the "accidents"—that is, qualities, such as colour—which the Islāmic and Jewish atomists regarded as being joined to the corporeal atoms (but not determined by them, as had been believed by the Greek Atomists). An instant of time or a unit of motion does not continue the preceding instant or unit. All apparent processes are discontinuous, and there is causal connection between their successive units of change. The fact that cotton put into fire generally burns does not mean that fire is a cause of burning; rather, it may be explained as a "habit," signifying that this sequence of what is often wrongly held to be cause and effect has no character of necessity. God's free will is the only agent of everything that occurs, with the exception of one category—human actions. These are causes that produce effects; for instance, a man who throws a stone at another man, who is then killed, directly brings about the latter's death. This inconsistency on the part of the theologians was necessitated by the principle of justice, for it would be unjust to punish a man for a murder that was a result not of his action but of God's. This grudging admission that causality exists in certain strictly defined and circumscribed cases was occasioned by moral, not physical, considerations.

Jewish Neoplatonism. *Isaac Israeli.* Outside Babylonia, philosophical studies were pursued by Jews in the 9th and 10th centuries in Egypt and in the Maghrib (northwest Africa). The outstanding figure was Isaac ben Solomon Israeli, an Egyptian-born North African who has been called "the first Jewish Neoplationist." In his philosophical works, such as the "Book of Elements" and the "Book of Five Substances," he drew largely upon a 9th-century Muslim popularizer of Greek philosophy, Abū Yūsuf Yaʿqūb al-Kindī, and also, in all probability, upon a lost pseudo-Aristotelian text. The peculiar form of Neoplatonic doctrine that seems to have been set forth in this text had, directly and indirectly, a considerable influence on medieval Jewish philosophy.

According to Israeli, God creates through his will and power. The two things that were created first were form, identified with wisdom, and matter, which is designated as the genus of genera (the classes of things) and which is the substratum of everything, not only of bodies, but also of incorporeal substances. This conception of matter seems to derive from the Greek Neoplatonists Plotinus and Proclus, particularly from the latter. In Proclus' opinion generality was one of the main criteria for determining the ontological priority of an entity (relative place in the levels of reality). Matter, because of its indeterminacy, obviously has a high degree of generality; consequently, it figures among the entities having ontological priority. According to the Neoplatonic view, which Israeli seems to have adopted, the conjunction of matter and form gives rise to the intellect. A light sent forth from the intellect produces the rational soul, and in its turn it gives rise to the vegetative soul.

Israeli's doctrine of prophecy seems to be the earliest Jewish philosophical theory attributing prophecy to the influence of the intellect on the imaginative faculty. According to Israeli, this faculty receives from the intellect spiritual forms that are intermediate between corporeality and spirituality. This explanation implies that these forms, "with which the prophets armed themselves," are inferior to purely intellectual cognitions.

Solomon ibn Gabirol. In essentials the schema of creation and emanation propounded by Isaac Israeli and his Neoplatonic source or sources was taken over by Solomon ibn Gabirol, a celebrated 11th-century Hebrew liturgical poet, who seems to have been the earliest Jewish philosopher of Spain. His chief philosophical work, "Fountain of Life," written in Arabic, has been preserved in full only in a 12th-century Latin translation entitled *Fons vitae.* This work, which makes no reference to Judaism or to specifically Jewish doctrines, is a didactic dialogue between a disciple and a master who teaches him true philosophical knowledge. Despite its prolixity and many contradictions, it is an impressive work. Few medieval texts so effectively communicate the Neoplatonic conception of the existence of a number of planes of being that differ according to their ontological priority, the derivative and inferior ones constituting a reflection in a grosser mode of existence of those that are prior and superior.

Ibn Gabirol's doctrine of divine will

A central conception in Ibn Gabirol's philosophy is concerned with the divine will, which appears to be both part of and separate from the divine essence. Infinite according to its essence, the will is finite in its action. It is described as pervading everything that exists and as being the intermediary between the divine essence and matter and form. Will was one of a number of traditional appellations applied in various medieval theologies to the entity intermediate between the transcendent Deity and the world or to the aspect of the Deity involved in creation. According to a statement in *Fons vitae,* matter derives from the divine essence, whereas form derives from the divine will. This suggests that the difference between matter and form has some counterpart in the Godhead and also that universal matter is superior to universal form. Some of Ibn Gabirol's statements seem to bear out the impression of superiority of universal matter; other passages, however, appear to imply a superiority of universal form.

Form and matter, whether they be universal or particular, exist only in conjunction. All things, with the sole exception of God, are constituted through the union of the two, the intellect no less than the corporeal substance. In fact, the intellect is the first being in which universal matter and form are conjoined. The intellect contains and encompasses all things. It is through the grasp of the various planes of being, through ascending in knowledge to the world of the intellect and apprehending what is above it—the divine will and the world of the Deity—that man may "escape death" and reach "the source of life."

Judah ha-Levi. Judah ben Samuel ha-Levi (*c.* 1075–*c.* 1141), also from Spain and a celebrated Hebrew poet, was the first medieval Jewish thinker who consciously and consistently based his thought upon arguments drawn from Jewish history. His views are set forth in an Arabic dialogue, *al-Hazari* (Hebrew *Sefer ha-Kuzari*), the full title of which is translated as "The Book of Proof and Argument in Defense of the Despised Faith." This work is usually called *Kuzari*; *i.e.,* "the Khazar."

The *Kuzari*

Basing his narrative on the historical fact that the Khazars (a Turkic-speaking people in Central Eurasia) were converted to Judaism (*c.* 740), ha-Levi relates that their King, a pious man who did not belong to any of the great monotheistic religions, dreamed of an angel, who said to him, "Your intentions are pleasing to the Creator, but your works are not." To find the correct way of pleasing God, the King seeks the guidance of a philosopher, a Christian, a Muslim, then, finally, after hesitating to have recourse to a representative of a people degraded by its historical misfortune, of a Jewish scholar who converts him to Judaism. The words of the angel heard in a dream may, in accordance with both religious and philosophical doctrine, be regarded as a kind of revelation. The use of this element of the story enabled ha-Levi to suggest that it is not the spontaneous activity of human reason that impels man to undertake the quest for the true religion; for this, one needs the gift of prophecy, or, at least, a touch of the prophetic faculty (or a knowledge of the revelations of the past).

The argument of the philosopher whose advice is sought by the King brings this point home. This disquisition is a brilliant piece of writing, for it lays bare the essential differences between the Aristotelian God, who is totally ignorant of and consequently wholly indifferent to human individuals, and the God of religion. Within the framework of philosophical doctrine, the angel's words are quite meaningless. Not only is the God of the philosophers, who is a pure intellect, not concerned with man's works, but the (cultural) activities, involving both mind and body, to which the angel clearly referred, cannot, from the philosophical point of view, either help or hinder man in the pursuance of the philosophers' supreme goal—the attainment of union with the active intellect, a "light" of the divine nature. This union was supposed to confer knowledge of all intelligible things. Thus, man's supreme goal was here held to be of a purely intellectual nature.

In opposition to the philosopher's faith, the religion of ha-Levi's Jewish scholar is based upon the fact that God may have a close, direct relationship with man, who is not conceived primarily as a being endowed with intellect. The postulate that God can have intercourse with a creature made of the disgusting materials that go into the composition of the human body is scandalous to the King and prevents his acceptance of the doctrine concerning prophecy, expounded by the Muslim sage (just as the extraordinary nature of the Christological dogmas deters him from adopting Christianity).

The Jewish scholar's position is that it is contemplation

Knowledge of God through the contemplation of Jewish history

not of the cosmos but of Jewish history that procures knowledge of God. Ha-Levi was aware of the odium attaching to the doctrine of the superiority of one particular nation; he held, however, that only this doctrine explains God's dealing with mankind, which, like many other things, reason is unable to grasp. The controversies of the philosophers serve as proof of the failure of human intelligence to find valid solutions to the most important problems.

Ha-Levi's dialogue was also directed against the Karaites. He shows the necessity and celebrates the efficacy of a blind, unquestioning adhesion to tradition, which the Karaites rejected. Yet, he expounds a theology of Jewish exile that seems to have been influenced by Karaite doctrine. According to ha-Levi, even in exile the course of Jewish history is not determined like that of other nations by natural causes, such as material strength or weakness; the decisive factors are the religious observance or disobedience of the Jews. The advent of Christianity and of Islām prepares the other nations for conversion to Judaism, an event that will occur in the eschatological period (at the end of history).

Other Jewish thinkers c. 1050–c. 1150. During the period comprising the second half of the 11th century and the first half of the 12th century, many other Jewish thinkers appeared in Spain. Bahya ben Joseph ibn Pakuda wrote one of the most popular books of Jewish spiritual literature, *Kitāb al-hidāyah ilā farāʾiḍ alqulūb* ("Guidance to the Duties of the Heart"), which combines a theology influenced by Saʿadia with a moderate mysticism inspired by the teachings of the Muslim Ṣūfīs (mystics). The commandments of the heart—that is, those relating to men's thoughts and sentiments—are contrasted with the commandments of the limbs—that is, the Mosaic commandments enjoining or prohibiting certain actions. Bahya maintained that both sets of commandments should be observed (thus rejecting the antinomian position), but made clear that first and foremost he was interested in the commandments of the heart.

Abraham bar Hiyya Savasorda, a mathematician, astrologer, and philosopher, outlined in *Megillat ha-megalle* ("Scroll of the Revealer") a view of Jewish history that is reminiscent of ha-Levi but does not emphasize to the same degree the uniqueness of that history; it is also set forth in much less impressive fashion. Living in Barcelona under Christian rule, Bar Hiyya wrote his scientific and philosophical treatises not in Arabic but in Hebrew. Hebrew was also used by Abraham ibn Ezra (died *c.* 1167), a native of Spain who travelled extensively in Christian Europe. His commentaries on the Bible contributed to the diffusion among the Jews of Greek philosophical thought, to which Ibn Ezra made many, although as a rule disjointed, references. His astrological doctrine had a strong influence on some philosophers.

A borderline case: Abū al-Barakāt

The last outstanding Jewish philosopher of the Islāmic East, Abū al-Barakāt al-Baghdādī (who died as a very old man sometime after 1164), also belongs to this period. As a borderline case he illustrates a certain indeterminacy in the definition of a Jewish thinker. An inhabitant of Iraq, he was converted to Islām in his old age (for reasons of expediency, according to his biographers). His philosophy appears to have had a strong impact on Islāmic thought, whereas its influence upon Jewish philosophy and theology is very hard to pin down and may be practically nonexistent. His chief philosophical work, *Kitāb al-muʿtabar* ("The Book of That Which Has Been Established by Personal Reflection"), has very few references to Jewish texts or topics. Abū al-Barakāt rejects Aristotelian physics completely; according to him, time is the measure of being, and not, as Aristotle taught, the measure of motion, and he replaces Aristotle's bidimensional concept of place with the tridimensional notion of space, the existence of which is independent of the existence of bodies.

Jewish Aristotelianism. With regard to the adoption of Aristotelianism, including systems that in many essentials stem from but also profoundly modify the pure Aristotelian doctrine, there is a considerable time lag between the Islāmic East, on the one hand, and Muslim Spain and the Maghrib, on the other.

Abraham ibn Daud. Abraham ibn Daud (12th century), who is regarded as the first Jewish Aristotelian of Spain, was primarily a disciple of Avicenna, the great 11th-century Islāmic philosopher. According to a not unlikely hypothesis, he may have translated or helped to translate some of Avicenna's works into Latin, for Ibn Daud lived under Christian rule in Toledo, a town that in the 12th century was a centre for translators. His historical treatises, written in Hebrew, manifest his desire to familiarize his coreligionists with the historical tradition of the Latin world, which at that time was alien to most of them. But his philosophical work, *Sefer ha-emuna ha-rama* ("Book of Sublime Faith"), written in 1161 in Arabic, shows few, if any, signs of Christian influence.

The doctrine of emanation, set forth in the "Book of Sublime Religion," describes in the manner of Avicenna the procession of the ten incorporeal intellects, the first of which derives from God. This intellect produces the second intellect, and so on. Ibn Daud questioned in a fairly explicit manner Avicenna's views on the way the second intellect is produced; his discipleship did not by any means spell total adherence. Ibn Daud's psychology was also, and more distinctively, derived from Avicenna. The argumentation leading to a proof that the rational faculty is not corporeal attempts to derive the nature of the soul from the fact of immediate self-awareness. Like Avicenna, Ibn Daud tended to found psychology on a theory of consciousness.

Ibn Daud often referred to the accord that, in his view, existed between philosophy and religious tradition. As he remarked, the "Book of Sublime Faith" was not meant to be read either by readers who, in their simplicity, are satisfied with what they know of religious tradition or by those who have a thorough knowledge of philosophy. It was intended for readers of one type only, those who, being, on the one hand, acquainted with the religious tradition and having, on the other, some rudiments of philosophy, are "perplexed." It was for the same kind of people that Maimonides wrote his *Guide of the Perplexed.*

The greatest medieval Jewish philosopher

Maimonides. Maimonides (Moses ben Maimon, 1135–1204), a native of Spain, is incontestably the greatest name in Jewish medieval philosophy, but his reputation is not derived from any outstanding originality in philosophical thought. Rather, the distinction of Maimonides, who is also the most eminent codifier of Jewish religious law, is to be found in the vast scope of his attempt, in the *Dalālat al-hāʾirīn* (*Guide of the Perplexed*), to safeguard both religious law and philosophy (the public communication of which would be destructive of the law) without suppressing the issues between them and without trying to impose, on the theoretical plane, a final, universally binding solution of the conflict.

As Maimonides made clear in his introduction to the *Guide,* he regarded his self-imposed task as perilous, and he therefore had recourse to a whole system of precautions destined to conceal his true meaning from the people who, lacking the necessary qualifications, might misread the book and abandon observance of the law. According to Maimonides' explicit statement, these precautions include deliberately contradictory statements meant to mislead the undiscerning reader. The apparent or real contradictions that may be encountered in the *Guide* are perhaps most flagrant in Maimonides' doctrine concerning God. There seems to be no plausible hypothesis capable of explaining away the differences between the following three views:

1. God has an eternal will that is not bound by natural laws. Through an act of his will, he created the world in time and imposed on it the order of nature. This creation is the greatest of miracles; only if it is admitted can other miracles, which interfere with the causally determined concatenations of events, be regarded as possible. The philosophers' God, who is not free to cut the wings of a fly, is to be rejected. This conception is in keeping with the traditional religious view of God and is avowedly adopted by Maimonides because failure to do so would undermine religion.

2. Man is incapable of having any positive knowledge concerning God. No positive attributes—*e.g.,* wisdom or life—can be ascribed to God. Contrary to the attributes

predicated of created beings, the divine attributes are strictly negative; they state what God is not: for instance, he is not not-wise, and such a statement is not a positive assertion. Hence, only a negative theology is possible—saying what God is not. The way God acts can, however, be known. This knowledge is to be found in natural science.

3. God is an intellect. The formula current among medieval philosophers that maintains that in God the knowing subject, the object known, and the act of intellectual knowledge are identical derives from Aristotle's thesis that God knows only himself. Maimonides, however, in adopting the formula, interpreted it in the light of human psychology and epistemology (theory of knowledge), pointing out that, according to a theory of Aristotle, the act of human (not only of divine) cognition brings about an identity of the cognizing subject and cognized object. The parallel drawn by Maimonides between the human and the divine intellect quite evidently implies a certain similarity between the two; in other words, it is incompatible with the negative theology of other passages of the *Guide.* Nor can it be reconciled with his theological doctrine that the structure of the world—created in time—came into being through the action of God's will.

Maimonides' doctrine of prophecy

The enigma of the *Guide* would be nonexistent if Maimonides could be held to have believed that truth can be discovered in a suprarational way, through revelations vouchsafed to the prophets. This, however, is not the case. Maimonides held that the prophets (with the exception of Moses) combine great intellectual abilities, which qualify them to be philosophers, with a powerful imagination. The intellectual faculty of the philosophers and the prophets receives an overflow from the active intellect. In the case of the prophets, this overflow not only brings about intellectual activity but also passes over into the imaginative faculty, giving rise to visions and dreams. The fact that prophets have a strong imagination gives them no superiority in knowledge over philosophers, who do not have it. Moses, who belonged to a higher category than did the other prophets, did not have recourse to imagination.

The laws and religion as instituted by Moses are intended not only to ensure the bodily welfare and safety of the members of the community but also to facilitate the attainment of intellectual truths by individuals gifted enough to uncover the various hints embodied in religious laws and practices. This does not mean that all the beliefs inculcated by Judaism are true. Some indeed express philosophical truths, although in an inaccurate way, in a language suited to the intellectual capacity of the common people, who in general cannot grasp the import of the dogmas they are required to profess. Other beliefs, however, are false but necessary for the preservation of a public order upholding justice—*e.g.,* the belief that God is angry with wrongdoers.

As far as the Law—that is, the religious commandments—is concerned, two aspects of Maimonides' position may be distinguished. First, he maintained that it is unique in its excellence and valid for all time. This profession of faith, at least with regard to its assumptions about the future, lacked philosophical justification; however, it could be regarded as necessary for the survival of Judaism. Second, he asserted that certain precepts of the Mosaic Law were related to specific historical situations and the need to avoid too sharp a break with popular customs and practices, for instance, the commandments concerning sacrifice.

Influence of the *Guide of the Perplexed*

For at least four or five centuries the *Guide of the Perplexed* exercised a very strong influence in the European centres of Jewish thought; in the 13th century, when the *Guide* was twice translated into Hebrew, these centres were Spain, the south of France, and Italy. Rather paradoxically, in view of the unsystematic character of Maimonides' exposition, it was used as a standard textbook of philosophy and condemned as such when the teaching of philosophy came under attack. The performance of this function by the *Guide* was rendered possible, or at least facilitated by, the fact that from the 13th century onward the history of Jewish philosophy in European countries acquired a continuity it had never had before. This development seems to have resulted from the substitution of Hebrew for Arabic as the language of philosophical exposition. Because of the existence of a common and relatively homogeneous philosophical background—the Hebrew texts were much less numerous and less diverse than Arabic philosophical works—and the fact that Jewish philosophers reading and writing in Hebrew read the works of their contemporaries and immediate predecessors, something like a dialogue can be discerned. In striking contrast to the immediately preceding period, European Jewish philosophers in the 13th century and after frequently devoted a very considerable part of their treatises to discussions of the opinions of other Jewish philosophers. That many of the Jewish philosophers in question wrote commentaries on the *Guide* undoubtedly furthered this tendency.

Influence of Averroës and Christian Scholastics on medieval Jewish philosophy

Averroists. The influence of Maimonides' great Islāmic contemporary Averroës, many of whose commentaries and treatises were translated into Hebrew, was second only to that of Maimonides on Jewish intellectual development. Indeed, it may be argued that for philosophers, as distinct from the general reading public, it often came first. In certain cases commentators on the *Guide* tend, in spite of the frequent divergences between the two philosophers, to quote Averroës' opinions in order to clarify those of Maimonides.

The apparently significant influence of Christian Scholastic thought on Jewish philosophy was often not openly acknowledged by Jewish thinkers in the period beginning with the 13th century. Samuel ibn Tibbon, one of the translators of the *Guide* into Hebrew and a philosopher in his own right, remarked on the fact that the philosophical sciences were more widely known among Christians than among Muslims. Somewhat later, at the end of the 13th century and after, Jewish scholars in Italy translated into Hebrew varied texts of Thomas Aquinas and other Christian Scholastics; not infrequently, some of them acknowledged the debt they owed their Christian masters. In Spain and in the south of France, a different convention seems to have prevailed up to the second half of the 15th century. Whereas Jewish philosophers of these countries felt no reluctance about referring to Greek, Arabic, and other Jewish philosophers, as a rule they refrained from citing Christian thinkers whose views had, in all probability, influenced them. In the case of certain Jewish thinkers, this absence of reference to the Christian Scholastics served to disguise the fact that in many essentials they were representative of the philosophical trends, such as Latin Averroism, that were current among the Christian Scholastics of their time.

Quite evident is the resemblance between certain views professed by the Latin Averroists and the parallel opinions of Isaac Albalag, a Jewish philosopher who lived in the second half of the 13th century, probably in Catalonia, Spain, and who wrote a commentary in Hebrew on the *Tahāfut al-falāsifah* ("The Inconsistencies of the Philosophers"), an exposition of Avicenna's doctrine written by the Muslim philosopher al-Ghazālī. Albalag's assertion that both the teachings of the Bible and the truths demonstrated by reason must be believed even if they are contradictory clearly poses the question whether some historical connections exist between this view and the Latin Averroist doctrine that there are two sets of truths—the religious and the philosophical—and that these are not necessarily in accord. In most other points Albalag was a follower of the system of Averroës himself. This philosophical position may be exemplified by his rejection of the view that the world was created in time. He professed, it is true, to believe in what he called "absolute creation in time." This expression, however, merely signifies that at any given moment the continued existence of the world depends on God's existence, an opinion that is essentially in harmony with Averroës.

Joseph Caspi, a prolific 14th-century philosopher and exegetical commentator, maintained a somewhat unsystematic philosophical position that seems to have been influenced by Averroës. He expressed the opinion that knowledge of the future, including that possessed by God himself, is of a probabilistic nature. The prescience of the prophets is of the same nature. It is more than likely that Caspi's interest in this problem had some connection with the debate about future contingencies in which Christian Scholastics were engaged at that time.

Moses Narboni

Moses of Narbonne, or Moses Narboni, who lived in the south of France in the 14th century, was, like many other Jewish writers of this period, mainly a writer of commentaries. He wrote commentaries on biblical books, on treatises of Averroës, and on Maimonides' *Guide.* In his commentary on the *Guide,* Narboni often interprets the earlier Jewish philosopher's opinions by recourse to Averroës' views. Narboni also expounded and gave radical interpretations to certain conceptions that he understood as implied in the *Guide.* According to Narboni, God participates in all things, because he is the measure of all substances. God's existence appears to be bound up with that of the world, to which he has a relation analogous to that existing between a soul and its body (a comparison already made in the *Guide*).

Gersonides. Gersonides (Levi ben Gershom), another 14th-century Jewish philosopher born in the south of France, wrote the systematic philosophical work *Sefer milḥamot Adonai* ("The Book of the Wars of the Lord") as well as many philosophical commentaries. Gersonides apparently never explicitly mentioned Christian Scholastic philosophers; he cited Greek, Arabic, and Jewish thinkers only, and in many ways his system appears to have stemmed from the doctrines of Maimonides or Averroës, regardless of whether he agreed with them or not. For example, he explicitly rejected Maimonides' doctrine of negative theology. A comparison of his opinions and of the particular problems that engaged his attention, with the views and debates found in Scholastic writings of his period, however, suggests that he was also influenced by the Latins on certain points.

Gersonides disagreed both with the Aristotelian philosophers who maintained the eternity of the world and with the religious partisans who believed in the creation of the world in time out of nothing. He maintained that God created the world in time out of a preexistent body lacking all form. As conceived by Gersonides, this body seems to be similar to primal matter.

The problem of human freedom of action and a particular version of the problem of God's knowledge of future contingencies form an important part of Gersonides' doctrine. Gersonides, who, unlike the great Jewish and Muslim Aristotelians, believed in astrology, held that all happenings in the world except human actions are governed by a strict determinism. God's knowledge does not extend to individual human acts but embraces the general order of things; it grasps the laws of universal determinism but is incapable of apprehending events resulting from man's freedom. Thus, the object of God's knowledge is an ideal world order, which differs from the real world insofar as the latter is in some measure formed according to man's free will.

In political and social doctrine there is a fundamental difference between Maimonides and Gersonides. Gersonides does not appear to have assigned to the prophets any political function; according to him, their role consists in the prediction of future events. The providence exercised by the heavenly bodies ensures the existence in a given political society of men having an aptitude for and exercising the handicrafts and professions necessary for the survival of the community. He remarked that in this way the various human activities are distributed in a manner superior to that outlined in Plato's *Republic.* Thus, he rejected explicitly Plato's political philosophy, which, having been adapted to a society ruled through the laws promulgated by a prophet (Muḥammad), had been an important element of Jewish philosophy in the Arabic period.

Ḥasdai Crescas. Ḥasdai ben Abraham Crescas (1340–1410), a Spanish-Jewish thinker, like Gersonides had thorough knowledge of Jewish philosophy and partial knowledge of Islāmic philosophy, and both seem to have been influenced by Christian Scholastic thought; moreover, in certain important respects Crescas was influenced by Gersonides himself. In Crescas' main work, *Or Adonai* ("The Light of the Lord"), however, one of his objectives, quite contrary to Gersonides, was to expose the weakness and insufficiency of Aristotelian philosophy. This attitude may be placed in the wider context of the return to religion itself, as opposed to the Aristotelian rationalization of religion, and the vogue of Kabbala (Jewish theosophical mysticism), both of which were characteristic features of Spanish Jewry in Crescas' time. This change in attitude has been regarded as a reaction to the increasing precariousness of the position of the Jewish community in Spain.

Anti-Aristotelianism

The low estimation of the certainties and the rationalistic arrogance of the medieval Aristotelians coincided chronologically with a certain disintegration of and disaffection toward classical Aristotelian Scholasticism. Relevant to this decline were the so-called voluntarism of Duns Scotus, the Nominalism of William of Ockham and other 13th–14th-century Christian Scholastics, and the development, in the 14th century and after, of anti-Aristotelian physics at the University of Paris and elsewhere. Significantly there is a pronounced resemblance between Crescas' views and two of these trends, Scotism and the "new" physics.

Crescas accepted Gersonides' view that divine attributes cannot be negative, but unlike his predecessor he centred his explanation of the difference between the attributes of God and those of created existents on the antithesis between an infinite being and finite beings. It is through infinitude that God's essential attributes—wisdom, for instance—differ from the corresponding and otherwise similar attributes found in created beings. In Crescas', as in Spinoza's, doctrine (see below), God's attributes are also infinite in number. The central place assigned to the thesis of God's infinity in Crescas' system suggests the influence of Duns Scotus' theology, which is similarly founded upon the concept of divine infinity.

The problem of the infinite approached from an altogether different angle was one of the main themes of Crescas' critique of Maimonides' 25 propositions; these propositions, concerned mainly with Aristotelian physical doctrines, had been set forth in the *Guide* as the basis of Maimonides' proof for the existence of God. Crescas' declared purpose in criticizing and rejecting several of these propositions was to show that the traditional Aristotelian proofs (founded in the first place on physical doctrines) were not valid. In the course of his critique, Crescas attempted to disprove the Aristotelian thesis that the existence of an actual infinite is impossible. He held that space is not a limit but a tridimensional extension, that it is infinite, and that, contrary to Aristotle, the existence of a vacuum and of more worlds than one is possible. He also criticized as being impossible the thesis of the Aristotelian philosophers that there exists an infinite number of causes and effects, which have order and gradation. This thesis refers not to a temporal succession of causes and effects that have a similar ontological status but to a vertical series, descending from God to the lowest rung in creation. His attacks were likewise directed against the Aristotelians' conceptions of time and of matter.

Crescas' fundamental opposition to Aristotelianism is perhaps most evident in his rejection of the conception of intellectual activity as the supreme state of being for man and for God. Crescas' God is not first and foremost an intellect, and the supreme goal to which man can aspire is to love God with a love corresponding as far as possible to the infinite greatness of its object and to rejoice in the observance of his commandments. God, too, loves man, and his love, in spite of the lowliness of its object, is proportionate to his infinity.

Crescas attacked the separation of the intellect from the soul as conceived by the Aristotelians and attempted, perhaps in part under the influence of Judah ha-Levi, to refute the Aristotelian doctrine that the actualized intellect, in contradistinction to the soul, survives the death of the body. According to Crescas, the soul is a substance in its own right and can be separated from the body; it continues to subsist after the body's death.

Joseph Albo. Whereas Crescas unmistakably regarded the Aristotelian philosophers as adversaries to be criticized or combatted, the attitude of Joseph Albo (*c.* 1380–*c.* 1444), who regarded Crescas as his teacher, is much less clearly defined. Albo did not eschew self-contradiction, apparently considering it a legitimate precaution on the part of a philosophical or theological author; indeed, he

Albo's mixture of religious tradition and rational philosophy

indulged in it in a much more obvious way than did Maimonides. But, whereas the latter's fundamental philosophical position is fairly clear, the problem being how far he was prepared to deviate from Aristotelian doctrine in the interests of religion, there may be valid doubt whether Crescas and the Jewish religious tradition or Maimonides and Averroës were Albo's true masters. Mainly because of this perhaps deliberate failure to explain to the reader where he really stood, Albo has often been dismissed as an eclectic. He was strongly influenced not only by the authors just mentioned but also by Saʿadia. He seems to have had a considerable knowledge of Christian theology, even adopting for his own purposes certain Scholastic doctrines. He differs from Crescas and to some extent resembles Maimonides in having a marked interest in political theory.

The proclaimed theme of Albo's magnum opus, *Sefer ha-ʿiqqarim* ("Book of Principles"), is the investigation of the theory of Jewish religious dogmas, the number of which Maimonides, in a nonphilosophical work, had set at 13, whereas Albo, following a doctrine that in the last analysis seems to go back to Averroës, would limit the number to three: the existence of God, divine providence in reward and punishment, and the Torah as divine revelation. One section, usually including the philosophical and the traditional religious interpretations side by side, is devoted to each of these dogmas. Albo's principal and relatively novel contribution to Jewish doctrinal evolution is the classification, in his introduction, of natural, conventional, and divine law.

Natural law (the universal moral law inherent in human nature) is necessary, because man, being political by nature, must belong to a community, which may be restricted in size to one town or may extend over the whole earth. Natural law preserves society by promoting right and repressing injustice; thus, it restrains men from stealing, robbing, and murdering. The positive laws instituted by wise men take into account the particular nature of the people for whose benefit they are instituted, as well as other circumstances. This means that they differ from the natural law in not being universally applicable. Neither natural law nor the more elaborate conventional laws, however, lead men toward true spiritual happiness; this is the function of divine laws instituted by a prophet, which teach men true theoretical opinions. Whereas Maimonides maintained that Judaism was the only divine law promulgated by a true prophet, Albo considered that the commandments given to Noah for all mankind also constitute divine law, which ensures, although to a lesser degree than does Judaism, the happiness of its adherents. This position justifies a certain universalism; in accordance with a Talmudic saying, Albo believed that the pious among the non-Jews—that is, those who observe Noah's laws—have a share in the world to come. But he rejected the pretensions of Christianity and Islām to be divine laws.

MODERN PHILOSOPHY

The Iberian-Dutch philosophers. The expulsion of the Jews from Spain and Portugal produced a new centre of Jewish thought, Holland, where many of the exiled Jews found a new and safer domicile; the tolerance of the regime seemed to provide guarantees against external persecution. This did not prevent, and indeed may have furthered, the establishment of an oppressive internal orthodoxy that was prepared to chastise rebellious members of the community. This was evident in the cases of Uriel Acosta, or da Costa, and Benedict de Spinoza, two 17th-century philosophers who rebelled against Jewish orthodoxy and who were excommunicated for their views (Acosta twice).

The two excommunicados: Acosta and Spinoza

Uriel Acosta. Acosta came to Amsterdam from Portugal, where, belonging to a family of Marranos (Jews who had converted to escape religious persecution), he had been brought up in the Catholic faith; his philosophical position was to a great extent determined by his antagonism to the orthodox Judaism that he encountered in Amsterdam. His growing estrangement from generally accepted Jewish doctrine is attested by his Portuguese treatise *Sobre a Mortalidade da Alma* ("On the Mortality of the Soul"). He considered that the belief in the immortality of the soul has had many evil effects, for it impels men to choose an ascetic way of life and even to seek death. According to him, nothing has tormented men more than the belief in an inner, spiritual good and evil. At this stage Acosta affirmed the authority of the Bible from which, according to him, the mortality of the soul can be proved.

In his autobiography, written in Latin and entitled *Exemplar Humanae Vitae* ("Example of a Human Life"), he takes a more radical position. He proclaims the supreme excellency of the natural moral law (which, when arguing before Jews, he seems to identify with the divine commandments to Noah, thus suggesting a correspondence with the view of Albo). Accordingly, he denies the validity of the argument that natural law is inferior to Judaism and Christianity, because he believes that both these religions teach the love of one's enemies, a precept that is not a part of natural law and is a manifest impossibility.

Benedict de Spinoza. Although modern philosophers of Jewish origin are not considered as belonging to the history of Jewish philosophy unless they deal with Judaic themes, this restriction may not apply to Spinoza for the following reasons. (1) It was through the study of Jewish philosophical texts that Spinoza was first initiated into philosophy. (2) Spinoza's system is in part a radicalization of, or perhaps a logical corollary to, medieval Jewish doctrines; and the impact of Maimonides and of Crescas is evident. (3) A considerable portion of Spinoza's *Tractatus Theologico-Politicus* deals with problems related to Judaism.

Spinoza's view of prophecy

The first chapters of the *Tractatus* show that the doctrine of prophecy is of central importance to Spinoza's explanation of Judaism and that, in dealing with this subject, he used Maimonides' categories, although he applied them to different people or groups of people. Maimonides held that the prophets combined intellectual perfection, which made them philosophers, with perfection of the imaginative faculty. He also referred to a category of persons endowed with a strong imagination but possessing no extraordinary intellectual gifts; this category includes, for example, lawgivers and statesmen. Spinoza took over this last category but applied it to the prophets, whom he described as possessing vivid imaginations but as not necessarily having outstanding intellectual capacities. He denied that the biblical prophets were philosophers and used a philosophical and historical approach to the Scriptures to show that the contrary assertion is not borne out by the texts.

Spinoza also denied Maimonides' assertion that the prophecy of Moses was essentially different from that of the other prophets and that this was largely because Moses, in prophesying, had no recourse to the imaginative faculty. According to Spinoza, the distinctive fact about Moses' prophecy was that he heard the voice of God in a prophetic vision—that is, in a state in which his imagination was active. In this assertion Spinoza employed one of Maimonides' categories of prophecy, differentiated in the *Guide* according to certain characteristics of prophetic dreams and visions; however, Maimonides thought it improbable that the voice of God was ever heard in prophetic vision, and he held that this category is purely hypothetical. It seems evident that in his classification of Moses, Spinoza was concerned not with what really happened in history but with pigeonholing the biblical evidence into Maimonides' theoretical framework so that it fit in with his own theologico-political purpose: to show that there could be a religion superior to Judaism.

This purpose made it imperative to propound in the *Tractatus Theologico-Politicus* a theory concerning Jesus, whom Spinoza designates as Christus. The category and the status assigned to Jesus are by and large similar to those that Maimonides attributed to Moses. Thus, Jesus is referred to in the *Tractatus* as a religious teacher who makes recourse not to the imaginative faculty but solely to the intellect. His authority may be used to institute and strengthen the religion Spinoza called *religio catholica* ("universal religion"), which has little or nothing in common with any of the major manifestations of historic Christianity.

The difference between Judaism and Spinoza's *religio* *catholica* corresponds to the difference between Moses and Jesus. After leaving Egypt the Jews found themselves, in Spinoza's view, in the position of people who had no allegiance to any positive law; they had, as it were, reverted to a state of nature and were faced with the need to enter into a social pact. They were also an ignorant people and very prone to superstition. Moses, a man of outstanding ability, made use of the situation and the characteristics of the people in order to make them accept a social pact and a state founded upon it that, contrary to Spinoza's scheme for his ideal communities, were not based first and foremost upon utilitarian—that is, reasonable—consideration of the advantages of life in society over the state of nature.

The social pact concluded by the children of Israel in the desert was based upon a superstitious view of God as "King" and "Judge," to whom the children of Israel owed whatever political and military successes they obtained. It was to God rather than to the representatives of the popular will that the children of Israel transferred political sovereignty. In due course political sovereignty was vested in Moses, God's representative, and in his successors. It should be added that, in spite of Spinoza's insistence on the superstitious foundations of the ancient Israelite state, his account of its regime was not wholly unsympathetic. He believed, however, that it contained the seeds of its own destruction and that, with the extinction of this state, the social pact devised by Moses had lapsed and all the political and religious obligations incumbent upon the Jews had become null and void.

The rational state and its religion

It could be argued that, because the state conceived by Spinoza is based not on superstitious faith but on a social contract originating in rational, utilitarian considerations, it does not necessarily need to have its authority safeguarded and stabilized by means of religion. Nevertheless, Spinoza appears to have held the view—perhaps derived from a purely empirical knowledge of the behaviour of the common run of men—that there is a need for religion. In order to fulfill the need for some religion and to obviate the danger of harmful religions, he devised his *religio catholica,* the universal religion, which has the following distinctive traits: (1) Its main purpose, a practical one (which is furthered by recourse to the authority of Jesus), is to impel men to act in accordance with justice and charity. Such conduct is tantamount to obedience to the laws of the state and to the orders of the magistrates, in whom sovereignty is vested; for disobedience—even if it springs from compassionate motives—weakens the social pact, which safeguards the welfare of all the members of the community; in consequence, its evil effects outweigh whatever good it may produce. (2) Although religion, according to Spinoza, is not concerned with theoretical truth, in order to be effective the *religio catholica* requires dogmas, which he set forth in the *Tractatus.* These dogmas are formulated there in terms that can be interpreted in accordance both with the philosophical conception of God that Spinoza regarded as true and also with the superstitious ideas of ordinary people. It follows that if they are accepted as constituting by themselves the only creed that everybody is obliged to profess, people cannot be persecuted on account of their beliefs; Spinoza held that such a persecution may lead to civil war and may thus destroy the state. Philosophers are free to engage in the pursuit of truth and to attain, if they can, the supreme goal of man, freedom grounded in knowledge. There can be little doubt that the furtherance of the cause of tolerance for philosophical opinions was one of Spinoza's main objects in writing the *Tractatus.*

The relation between Spinoza's *Ethics,* his major philosophical work, and Jewish medieval philosophy is much more ambiguous than in the case of Spinoza's *Tractatus Theologico-Philosophicus.* In a way, Spinoza's metaphysical system, contained in the *Ethics,* can be regarded as being, in part, a spelling out of some extreme consequences, which could perhaps be legitimately drawn from medieval Aristotelianism; but the facts of the case are no doubt much more complicated than this.

German philosophers. *Moses Mendelssohn.* Moses Mendelssohn opened what may be called the German period of Jewish philosophy (*c.* 1750–*c.* 1830). This period, in which a considerable number of works on Jewish philosophy were written in German and often under the influence of German philosophy, is also marked by the emancipation of the Jews—that is, by the abrogation of discriminatory laws directed against them—and by their partial or complete assimilation. In this period in particular, the term Jewish philosophy applies especially to works the main purpose of which, or one of the main purposes of which, consists in proposing a definition of Judaism and a justification of its existence. The second task is often conceived as necessitating a confrontation of Judaism with Christianity rather than with philosophy, which served as a critical point of comparison for many medieval philosophers. This change seems to have been a result of the demarcation of the sphere of religion in such a way that, at least in the opinion of the philosophers, possible points of collision no longer existed between it and philosophy. This demarcation was largely furthered by the doctrine of Spinoza, from whom Mendelssohn and others took over and adopted for their own purposes certain fundamental ideas concerning Judaism. Like Spinoza, Mendelssohn held that it is not the task of Judaism to teach rational truths, although they may be referred to in the Bible. Contrary to what he called Athanasian Christianity—that is, the doctrine set forth in the Athanasian Creed—Judaism has no binding dogmas; it is centred on inculcating belief in certain historical events and on action—that is, observance of religious law (including the ceremonial commandments). Such observance is supposed to lead to happiness in this world and in the afterlife. Mendelssohn did not reject this view offhand, as Spinoza would have done; indeed, he seems to have been prepared to accept it, God's mysteries being inscrutable, and the radicalism and what may be called the consistency of Spinoza being the complete antithesis of Mendelssohn's apologetics. Non-Jews were supposed by Mendelssohn to owe allegiance to the natural moral law.

Solomon Formstecher. Whereas Mendelssohn continued the medieval tradition, at least to some extent, or adopted Spinoza's doctrine for his purposes, the Jewish philosophers of the first half of the 19th century may generally be regarded as disciples of the philosophers of their own time. In *Die Religion des Geistes* ("The Religion of the Spirit"), Solomon Formstecher (1808–89) may have been influenced by F.W.J. Schelling, an eminent German philosopher, in his conception of nature and spirit as manifestations of the divine. There are, in Formstecher's view, two types of religions that correspond to these manifestations: (1) the religion of nature, in which God is conceived as the principle of nature or as the world soul, and (2) the religion of the spirit, which conceives of God as an ethical being. According to the religion of the spirit, God has produced the world as his manifestation in full freedom and not, as the religion of nature tends to profess, because the world was necessary for his own existence.

The religions of nature and of spirit

The religion of the spirit, which corresponds to absolute religious truth, was first manifested in the Jewish people. The religious history of the world may be understood as a process of universalization of the Jewish religion. Thus, Christianity propagated Jewish conceptions among the nations; however, it combined them with pagan ideas. The pagan element is gradually being eliminated—Protestantism, for instance, in this respect, marks considerable progress. When at long last the Jewish element in Christianity is victorious, the Jews will be right to give up their isolation. The progress that will bring about this final religious union is already under way.

Samuel Hirsch. The main philosophical work of Samuel Hirsch, entitled *Die Religionsphilosophie der Juden* ("The Philosophy of Religion of the Jews"), was decisively influenced by G.W.F. Hegel. This influence is most evident in Hirsch's method and in the task that he assigned to the philosophy of religion—the transformation of religious consciousness into conceptual truth. Contrary to Hegel, however, he did not consider religious truth to be inadequate as compared to philosophical truth.

God revealed himself in the first stages of Jewish history by means of miracles and of prophecy. At present, he manifests himself in the miracle that is constituted by the existence of the Jewish people. At its beginning in the time of Jesus, Christianity was identical with Judaism. The decisive break between the two religions was caused by Paul. When the Pauline elements are eliminated from Christianity, it will be in all essentials in agreement with Judaism, which, however, will preserve its separate existence.

Nachman Krochmal. Nachman Krochmal, a native of Galicia (at that time, part of Austria), was the author of *More nevukhe ha-zman* ("Guide for the Perplexed for Our Time"), a treatise in Hebrew on the philosophy of history and on Jewish history that had a considerable influence. Krochmal's philosophical thought was centred on the notion of "spirit," Krochmal being mainly concerned with the "national spirit," the particular spirit that is proper to each people and that accounts for the peculiar characteristics differentiating one people from another in every domain of human activity. The national spirits of all peoples except the Jewish are, according to Krochmal, essentially particular. Hence, the national spirit either becomes extinct with the extinction of the nation or, if it is a powerful spirit, is assimilated by some other nation. The Jewish people have a special relation to the Universal Spirit, who is the God of Israel. This relation accounts for the perpetuity of the Jewish people.

Solomon Steinheim. Solomon Ludwig Steinheim, the author of *Die Offenbarung nach dem Lehrbegriff der Synagoge* ("The Revelation According to the Doctrine of the Synagogue"), was apparently influenced by the antirationalism of Friedrich Heinrich Jacobi, a German philosopher. His criticism of science is based on Jacobi's criticism, but he did not agree with Jacobi in opposing discursive reason to the intuitive knowledge of God—Steinheim contrasted human reason to divine revelation. The main point on which the revelation, vouchsafed to the prophets of Israel, is opposed to reason is to be found in the fact that the God posited by reason is subject to necessity, that he can act only in accordance with laws. Moreover, reason affirms that nothing can come from nothing. Accordingly, God is free to create not a good world, but only the best possible world. Revealed religion, on the other hand, affirms the freedom of God and the creation of the world out of nothing.

The Neo-Kantian philosopher of Judaism

Hermann Cohen. There seems to be little connection between the Jewish philosophers of the first half or two-thirds of the 19th century and Hermann Cohen (1842–1918), the head of the Neo-Kantian school centred at the University of Marburg. In a certain sense Cohen may be regarded as a rather unusual case among the philosophers of Judaism of his and the preceding generations because of the two aspects of his philosophical thought—the general and the Jewish—and the uneasy equilibrium between them. Judaism was by no means the only important theme of his philosophical system; it was one of several and not even his point of departure. There is no doubt that, for most of his life, Cohen was wholly committed to his brand of Kantianism, in the elaboration of which he displayed considerable originality—it has been maintained with some justification that his doctrine manifests a certain (unintentional) kinship with Hegel's. Cohen's idea of God, however, derives from an analysis and a development of certain conceptions of Immanuel Kant. In Cohen's view reason requires that nature be conceived of as conforming to one rational plan and that harmony exist between the domains of natural and of moral teleology (ultimate purposes or ends). These two requirements, in turn, necessitate the adoption of the idea of God—the word idea being used in the Kantian sense, which means that no assertion is made about the metaphysical reality of God.

Cohen seems to have changed his attitude in the last years of his life; although he did not explicitly renounce his previous positions, a considerable shift of emphasis can be discerned in his doctrines. The notion of the human individual—an individual who is weak and full of sin—comes to the fore, as well as the conception of a correlation, a relationship, between God and the individual. This relationship is one of love, the love of God for man and the love of man for God. It is difficult to reconcile the conception of God expounded in Cohen's work of his last period with his Kantian or Neo-Kantian attitude toward metaphysics.

Franz Rosenzweig. Franz Rosenzweig published his main philosophical work, *Der Stern der Erlösung* (*The Star of Redemption,* 1971), in 1921. This work begins with a rejection of the traditional philosophical attitude that denies the fear of death, maintaining, instead, that this fear is the beginning of the cognition of the All. Man should continue to fear death, despite the indifference of philosophy and its predilection for accepting death. Traditional philosophy is interested exclusively in the universal, and it is monistic—its aim is to discover one principle from which everything can be derived. This tendency of philosophy, however, denatures human experience, which knows not one but three separate domains (which Kant had referred to in a different context), namely, God, the world, and man.

According to Rosenzweig, God (like the world and like man) is known through experience (the experience of revelation). In Greek paganism, the most perfect manifestation of paganism, every one of these domains subsists by itself: the gods, the cosmos, and man as the tragic, solitary, silent hero. Biblical religion is concerned with the relation between the three: the relation between God and the world, which is creation; the relation between God and man, which is revelation; and the relation between man and the world, which leads to salvation. The philosophy that renounces the ambition to find one principle for everything that exists and that follows biblical religion in centring on the connections between the three domains and between the words and acts that bring about and develop these connections, Rosenzweig termed the narrative philosophy; the term and the concept were taken over from Schelling, whose influence Rosenzweig repeatedly emphasized.

The biblical faith brought forth two valid religions—Christianity and Judaism. The first is described by Rosenzweig as the eternal way; the Christian peoples seek in the vicissitudes of time and history the way to salvation. In contradistinction to them, the existence of the stateless Jewish people is not concerned with time and history; it is—notwithstanding the hope for final salvation—already an eternal life, renewed again and again according to the rhythm of the liturgical Jewish year.

Martin Buber. Since the early years of the 20th century, Martin Buber has exercised a powerful influence on both Jews and non-Jews. In his early period Buber was led, partly through empathy with Jewish and non-Jewish mysticism, to stress unitive experience and knowledge, in which the difference between one man and another and between man and God tend to disappear. But in his final period he taught, following, as he claimed, a suggestion of Ludwig Feuerbach, a 19th-century German philosopher, that man can only realize himself as a human being in a relation with another, who may be another man or God. This conception of the "I and Thou" relationship leads to the formulation of Buber's view of the dialogical life—the mutual, responsive relation between man and others—and accounts for the importance that he attaches to the category of "encounter." (S.Pi.)

"I and Thou"

Jewish mysticism

This section deals with the special nature and characteristics of Jewish mysticism, the main lines of its development, and its role in present-day religion and culture.

NATURE AND CHARACTERISTICS

The Judaic context. The term mysticism applies whenever a person is convinced that it is possible to establish *direct contact,* apart from sense perception and intellectual apprehension, with the divine—a reality undefinable by pure logic and believed to be the ultimate ground of being. Since mysticism springs from an aspiration to join and grasp that which falls outside ordinary experience, it is not easily restricted within precise limits. The boundary line that separates mysticism from metaphysics and cosmology (doctrines on the basic nature or structure of being and the world), from theosophies (systems of thought claiming special insights or revelation into the divine nature), and various forms of occultism (the study and control of supernatural powers), and from theurgy (the art of compelling or persuading divine powers) and even magic, often of the lowest kind, is not clear.

If mysticism is defined as the search for *direct* contact with the divine, however, it seems to be incompatible with Judaism. In its classical and normative form, Judaism appears as faith in a sole God who created the universe and who chose to reveal himself to a selected group by means of a rule of life he imposed on it—Torah ("Guidance" or "Teachings," incorrectly rendered as "Law"). The earthly destiny of the chosen nation, as well as the eternal salvation of the individual, in traditional Judaic beliefs, depends upon the observance of this rule of life, through which any relationship to God must take place. The fact is, however, that in the religious history of Judaism the quest for God goes beyond this relationship mediated by Torah, without ever dispensing with it (since that would take the seeker outside of Judaism) or pretending to reach the depths of the mystery of the divine, or still less to end in an ontological identification with it (where God and man are the same in nature and being).

Three types of Jewish mysticism. Three types of mysticism may be discerned in the history of Judaism: the ecstatic, the contemplative, and the esoteric. Though they are distinct types, in practice there are frequent overlappings and mixtures between them.

The first type is characterized by the quest for God—or, more precisely, for access to a supernatural realm, which is itself still infinitely remote from the inaccessible deity—by means of ecstatic experiences; this method is sometimes tainted by theurgy. The second follows the way of metaphysical meditation pushed to the limit, always bearing in its formulations the imprint of the cultural surroundings of the respective thinkers, who are exposed to influences from outside Judaism; this was the case with Philo of Alexandria (*c.* 15 BCE–after 40 CE) and a few of the Jewish thinkers of the Middle Ages, who drew their inspiration from Greco-Arabic Neoplatonism and sometimes also from Muslim mysticism.

Esoterism

The third type of mysticism claims an esoteric knowledge (hereafter called esoterism) that explores the divine life itself and its relationship to the extradivine level (the natural, finite realm) of being, a relationship that is subject to the "law of correspondences." From this perspective, the extradivine is a symbol of the divine; that is, a reality that reveals another, superior reality, whence reciprocal action of the one on the other (which corresponds to it) exists. This form of mysticism, akin to gnosis—the secret knowledge claimed by Gnosticism, a Hellenistic religio-philosophical movement—but purged, or almost purged, of the dualism that characterizes the latter, is what is commonly known as Kabbala (literally "tradition"). By extension, this term is also used to designate technical methods, used for highly diverse ends, ranging from the conditioning of the aspirant to ecstatic experiences to magical manipulations of a frankly superstitious character. If the concept of spiritual energy acting on matter and at a distance originally underlay these practices, it finally became unrecognizable and all that remained was a collection of "tricks of the trade."

The favour with which the doctrine of correspondences was regarded by ancient and medieval science, as well as the tendency in the three monotheistic religions (Judaism, Christianity, and Islām) to reconcile the results of rational reflection with the data of revelation, had the result of turning speculation on the origin and order of the universe toward mysticism.

Perennial human questions

It must also be noted that the quest for God implies the search for solutions to problems that go beyond those of religion in the narrow sense and that arise even when there is no interest in the relationship between man and supernatural powers. Man ponders the problems of his origins, his destiny, his happiness, his suffering—questions that arise outside of religion, as well as within nonmystical forms of religious life; the presence or absence of religious institutions or dogmas is of little importance when it comes to these questions. They were all formulated within nonmystical Judaism and served as the basis and framework for the setting and solution of problems in the various forms of Jewish mysticism. This mysticism, especially in its "Kabbalistic" form, brought about profound transformations in the concepts of the world, God and "last things" (resurrection, last judgment, messianic kingdom, etc.) set forth in biblical and rabbinical Judaism. Nevertheless, Jewish mysticism's own set of problems about the origins of the universe and of man, of evil and sin, of the meaning of history, of the afterlife and the end of time is rooted in the very ground of Judaism and cannot be conceived outside of an exegesis of revealed Scripture and rabbinical tradition.

MAIN LINES OF DEVELOPMENT

A study of the main lines of Jewish mysticism, following its actual historical development, reveals that during a very long period, from its origins in the 1st century CE to the middle of the 12th century, only the first two of the three types outlined above existed. It was not until the second half of the 12th century that esoterism became clearly discernible; from then on it continued to develop in various forms up to very recent times.

Early stages to the 6th century CE. The centuries that followed the return from the Babylonian Exile in the 6th century BCE witnessed the growth and intensification of reflection on the intermediary beings between man and God, of meditation on the divine appearances whose special place of occurrence had formerly been the most sacred part of the Jerusalem Temple, of speculation on the coming into being and organization of the universe and on the creation of man. None of these themes was absent from the Bible, which was held to be divinely revealed, but each had become the object of a constant ideological readjustment that also involved the infiltration of concepts from outside and reaction against them. The speculative taste of Jewish thinkers between the 2nd century BCE and the 1st century CE took them in many different directions: angelology (doctrine about angels) and its counterpart demonology (doctrine about devils); mythical geography and uranography, description of the heavens; speculation on the divine manifestations—which had as background the Jerusalem Temple worship and the visions of the moving "Throne" (the "Chariot," *Merkava*) in the prophecy of Ezekiel; on the double origin of man, a being formed of the earth but also the "image of God"; on the end of time; on resurrection (a concept that appeared only toward the end of the biblical period); and on rewards and punishments in the afterlife.

The literary crystallization of all this ferment was accomplished in writings, such as the book of Enoch, of which Pharisaic (rabbinical) Judaism—which became the normative Jewish tradition after the Roman conquest of Jerusalem and the destruction of the Second Temple (70 CE)—retained almost nothing and even the vestiges of which it tended to obliterate in its own writings; the Talmud and the Midrash (rabbinical legal and interpretative literature) touched these themes only with great reserve, often unwillingly and more often in a spirit of negative polemic.

As early as the 1st century CE, and probably even before the national calamity of 70, there were certainly sages or teachers recognized by the religious community for whom meditation on the Scriptures—especially the creation narrative, the public revelation of the Torah on Mount Sinai, the *Merkava* vision of Ezekiel, the Song of Solomon—and reflection on the end of time, resurrection, and the afterlife were not only a matter of exegesis and of attaching new ideas to texts recognized to be of divine origin but also a matter of inner experience. It was, however, probably in other circles that speculation on the invisible world was engaged in and where the search for the means of penetrating it was carried out. It is undeniable that there exists a certain continuity between the apocalyptic visions (*i.e.*, of the cataclysmic advent of God's Kingdom) and documents of certain sects (Dead Sea Scrolls) and the writings, preserved in Hebrew, of the "explorers of the supernatural world" (*Yorde Merkava*). The latter comprise ecstatic hymns, descriptions of the "dwellings" (*hekhalot*) located between the visible world and the ever-inaccessible divinity, whose transcendence is paradoxically expressed by anthropomorphic descriptions consisting of inordinate hyperboles (*Shiʿur qoma,* "Divine Dimensions"). In addition, a few documents have been preserved that attest to the existence of methods and practices having to do with the initiation of carefully chosen persons who were made to undergo tests and ordeals in accordance with psychosomatic criteria borrowed from physiognomy (art of determining character from physical, especially facial, traits). Some theurgic efficacy was attributed to these practices, and there was some contamination from Egyptian, Hellenistic, or Mesopotamian magic. (A curious document in this respect, rich in pagan material, is the *Sefer ha-razim,* the "Treatise on Mysteries," which was discovered in 1963.)

Two early sources of mystic writings

In this extrarational domain, there are many similarities between concepts reflected in unquestionably Jewish texts and the documents of contemporary non-Jewish esoterism, to the point that it becomes difficult, sometimes impossible, to distinguish the giver from the receiver. Two facts are certain however. On the one hand Gnosticism never ceases to exploit in its own way biblical themes (such as the tale of creation and speculation on angels and demons) that have passed through Judaism, whatever their original source may have been; on the other hand, though Jewish esoterism may borrow this or that motif from ancient gnosis or syncretism (fusion of various faiths) and may even raise to a very high rank in the hierarchy of being a supernatural entity such as the angel Metatron, also known as "little Adonai" (*i.e.,* little Lord or God), it still remains inflexibly monotheistic and rejects the Gnostic concept of a bad or simply inferior demiurge who is responsible for the creation and governing of the visible world. Finally, it is noteworthy that during the centuries that separate the Talmudic period (2nd to 5th centuries AD) from the full resurgence of Jewish esoterism in the middle of the 12th century, the texts that have been preserved progressively lose their density and affective authenticity and become reduced to the level of literary exercises that are more grandiloquent than substantial.

Sefer Yetzira. In the ancient esoteric literature of Judaism, a special place must be given to the *Sefer Yetzira* ("Book of Creation"), which deals with cosmogony and cosmology (the origin and order of the universe). Creation, it affirms with a clearly anti-Gnostic insistence, is the work of the God of Israel and took place on two different levels: the ideal, immaterial level and the concrete level. This was done according to a complex process that brings in the 10 numbers (*sefirot,* singular *sefira*) of decimal notation and the 22 letters of the Hebrew alphabet. The 10 numbers are not to be taken merely as arithmetical symbols: they are cosmological factors, the first of which is the spirit of God—with all the ambiguities that this term *ruaḥ* has in Hebrew—while the nine others seem to be the archetypes of the three elements (air, water, fire) and the spatial dimensions (up, down, and the four cardinal points). After having been manipulated either in their graphic representation or in combination, the letters of the alphabet, which are considered to be adequate transcriptions of the sounds of the language, are in turn instruments of creation.

The ontological value of speech

The basic idea of all this speculation is that speech (that is, language composed of words, which are in turn composed of letters/sounds) is not only a means of communication but also an operational agent destined to produce being—it has an ontological value. This value, however, does not extend to every form of language; it belongs to the Hebrew language alone.

The universe that is produced by means of the *sefirot* and the letters is constituted according to the law of correspondences between the astral world, the seasons that mark the rhythm of time, and man in his psychosomatic structure.

The "Book of Creation" certainly does not proceed entirely from biblical data and rabbinical reflection upon them; certain Greek influences are discernible, even in the vocabulary. What is important, however, is its influence on later Jewish thought, down to the present time: philosophers and esoterists have vied with one another in commentating it, pulling it in their own direction, and adjusting it to their respective ideologies. Even more important is the fact that Kabbala (see below *The making of the Kabbala*) borrowed a great part of its terminology from it (*sefira,* among others), naturally making semantic adaptations as required.

The speculation traced above developed during the first six centuries of the Common Era, both in Palestine and in Babylonia (later called Iraq); Babylonian Judaism had its own social and ideological characteristics, which put it in opposition to Palestinian Judaism in various aspects, including esoterism as well as other manifestations of the life of the spirit. The joint doctrinal influence of the two centres was to spread during the period from the mid-8th to 11th century among the Jews established in North Africa and Europe; mystical doctrines also filtered in, but very little is known about the circumstances and means of their penetration.

The Arabic-Islāmic influence (7th–13th century). Arabic-Islāmic culture provided another important influence in Jewish mystical development. A considerable part of Jewry, which had fallen under Muslim domination in the 7th and 8th centuries, participated in the new Arabic-Islāmic civilization; the Jews of Asia, Africa, and Spain soon adopted Arabic, the prevailing language of culture and communication. By way of Arabic-language culture, elements of Greek philosophy and Islāmic mysticism penetrated Judaism and contributed to the deepening of certain theological concepts that were Jewish in origin but had become the common property of the three religions of the Book: affirming the divine unity, purging all anthropomorphism from the idea of God, and approaching the divine by progressing on a spiritual path that leads through an ascetic discipline (both physical and intellectual) to a detachment from this world and a freeing of the soul from all that distracts it from God. Greek philosophy and Islāmic mysticism, moreover, raised very serious questions that threatened many traditional beliefs, such as the creation of the world, the providential action of God, miracles, eschatology (doctrines about the resurrection of the body, rewards, and especially material punishments in the hereafter). Even in the Christian West, where cultural contacts between the majority society and the Jewish minority were far from reaching the breadth and intensity of the Judeo-Arab relations, Jewish intellectuals were unable to remain totally impervious to the incursions of the surrounding civilization. Moreover, at the beginning of the 12th century, if not earlier, European Judaism received part of the intellectual Arabic and Judeo-Arabic heritage through translations or adaptations into Hebrew, its only cultural language.

Greek philosophy and Islāmic mysticism

The making of the Kabbala (c. 1150–1250). It was in these circumstances that, starting around 1150, manifestations of markedly theosophic ideologies appeared in the south of present-day France (in the regions of Provence–Languedoc–Roussillon). Two types can be distinguished at the outset, which are very different as to their manner of appearance, their form, and their content.

Sefer ha-bahir. The first type is represented in fragmentary, poorly written, and badly assembled texts that began to circulate in Provence–Languedoc during the third quarter of the 12th century. Their inspiration, however, leaves no doubt as to the community of their origin. They were in the form of a Midrash; that is, an interpretation of Scripture with the help of a particular interpretative method, full of sayings attributed to ancient rabbinical authorities. This whole body of texts, probably imported from the Near East (Syria–Palestine–Iraq), is known as the "Midrash of Rabbi Nehunya ben Haqana" (from the name of a 2nd-century rabbi) or *Sefer ha-bahir,* "Book of Brightness" (from a characteristic word of the first verse of Scripture to be elucidated in the work). The authorities cited are all inauthentic (as was often the case in late works), and the content of this Midrash, even its nonmystical content, is entirely Gnostic; a Gnosticism that tries nevertheless to escape any ontological dualism (and, as a matter of fact, succeeds).

Its object is to present the origin of things and the course of history centred naturally on that of the chosen people, with the vicissitudes caused in turn by obedience to God and by sin, as bound and conditioned by the

Role of the divine powers

manifestation of divine powers. These "powers" are not "attributes" derived and defined by philosophical abstraction, although that is one of the terms used to designate it: they are hypostases (essences or substances). They are inseparable from God, but each one is clothed in its own personality, each operates in its own manner, in the leaning toward severity or mercy, in dynamic correspondence with the behaviour of man, especially of the Jew, in the visible world. They are ranked in a hierarchical order, which is not yet as fixed as it became starting with the second generation of Kabbalists in Languedoc and Catalonia (see below *The school of Gerona* [*Catalonia*]). The rich nomenclature used to designate the "powers" exploits the resources of both the Bible and rabbinical tradition, of the "Book of Creation," of some ritual observances, and also of the letters of the Hebrew alphabet and the signs that can be added to them to indicate the vowels. All of this combines to give a symbolical rendering of the myth, cosmology, sacred history, and eschatology through which an anonymous group of theosophists attempt to formulate their doctrine: a Gnostic myth, except for the adjustments that eliminate the radical depreciation of the visible world.

Thus, according to the *Sefer ha-bahir,* the universe is the manifestation of the hierarchically organized divine powers, and the one that is at the bottom of the hierarchical ladder has special charge of the visible world. This entity is highly complex. Undoubtedly there are survivals of Gnostic speculation on Sophia ("Wisdom"), who is involved, sometimes to her misfortune, in the material world. This power is also the divine "Presence" (*Shekhina*) of rabbinical theology but profoundly transformed: it has become a hypostasis; by a bold innovation, moreover, it is characterized as a feminine being and thus finds itself, while remaining an aspect of the divinity, in the position of a daughter or a wife, who owns nothing herself and receives all from the father or the husband. It is also identified with the "Community of Israel," another radical innovation, but facilitated by ancient speculation based on the allegorical interpretation of the Song of Solomon, which represents the relationship of God to the chosen nation in terms of the marriage bond. Thus a theosophical equality is established between the whole of the people chosen by God, constituted into a kind of mystical body, and an aspect of the divinity, whence the solidarity and linked destiny of the latter and the human group in question. As a matter of fact, a comparable relationship between the "Presence" and Israel was not totally foreign to ancient rabbinical theology. In this light, the obedience or disobedience of Israel to its particular vocation is a determining factor of cosmic harmony or disruption and extends to the inner life of the divinity. This is the essential and definitive contribution of the *Sefer ha-bahir* to Jewish theosophy. In the same document may be seen the resurgence of a notion fought against by the older theologians—that of *metensōmatōsis,* the reincarnation into several successive bodies of a soul that has not attained the required perfection in a previous existence.

School of Isaac the Blind. Parallel to the appearance of the *Sefer ha-bahir* but independent of it, another theosophic tendency unfolded in Languedoc, the second type referred to above. The two movements would take only about thirty years to converge, to constitute what may conveniently, though not quite precisely, be called classical Kabbala. The second school flourished in Languedoc during the last quarter of the 12th century and crossed the Pyrenees into Spain in the first years of the 13th century.

Return to the undifferentiated One

The most eminent spokesman of this school was Isaac ben Abraham, known as Isaac the Blind. For this theosophist, among whose extant works there is in particular a very obscure commentary of the "Book of Creation," the general vision of the universe proceeds, to use the words of Gershom G. Scholem (the eminent 20th-century Kabbala scholar), from the link he discovers between the hierarchical orders of the created world and the roots of all beings implanted in the world of the *sefirot.* One can already see a Neoplatonic influence in the reflections of Isaac; *e.g.,* the proceeding of things from the One and the corresponding return to the heart of the primordial undifferentiatedness, which is the fullness of being and at the same time every conceivable being. This return is not merely eschatological and cosmic but is in some way realized in the life of prayer of the contemplative mystic privileged to have supernatural inspirations, "appearances" of the prophet Elijah, by means of concentration, of orientation of action and thought (*kawwana*), and of "adhesion" (*devequt*), being-with-God, though not, indeed, a transforming union by which the human personality blends completely into the deity or becomes one with it.

The synthesis of the themes of the *Bahir* and the cosmology of the "Book of Creation," accomplished by Isaac or by others in the doctrinal environment inspired by his teachings, is and remains the foundation of Kabbala whatever enrichment, adjustments, even changes of orientation and sometimes radical modifications the composite may have undergone subsequently.

The 10 sefirot. It is also in this environment that the nomenclature of the 10 *sefirot* became more or less fixed; it is important to remember this, whatever variant terminologies and even divergent concepts as to the nature of these entities may exist elsewhere—*e.g.,* as internal powers of the divine organism (Gnostic point of view), as hierarchically ordered intermediaries between the infinite and the finite (Neoplatonic concept), or simply as instruments of the divine activity, neither partaking of the divine substance nor being outside it.

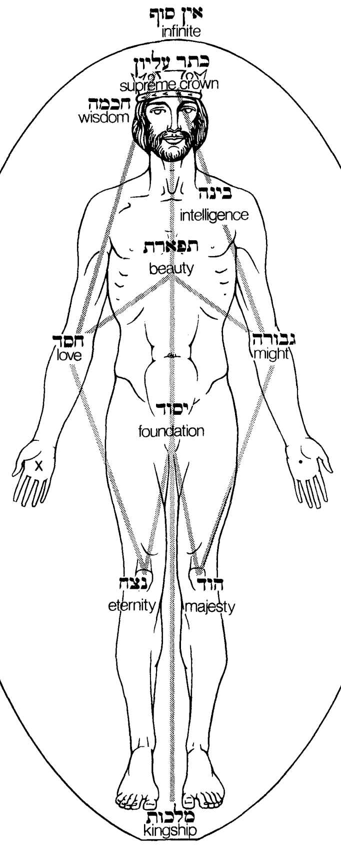
The classical list of the *sefirot* is:

1. *keter ʿElyon*	The Supreme Crown (its identity or nonidentity with the Infinite, *En Sof,* the unknowable deity, remains problematical)
2. *ḥokhma*	Wisdom, the location of primordial ideas in God
3. *bina*	Intelligence, the organizing principle of the universe
4. *ḥesed*	Love, the attribute of goodness
5. *gevura*	Might, the attribute of severity
6. *tif'eret*	Beauty, the mediating principle between the preceding two
7. *netzaḥ*	Eternity
8. *hod*	Majesty
9. *yesod*	Foundation of all the powers active in God
10. *malkhut*	Kingship, identified with the *Shekhina* ("Presence")

The School of Gerona (Catalonia). The double current of the gnosticizing theosophy of the *Sefer ha-bahir* and the contemplative mysticism of the masters of Languedoc became one in the elaborations it was subject to at the hands of the Kabbalists in Catalonia, where the Jewish community of Gerona was, during the first half of the 13th century, a veritable seat of esoterism. These elaborations followed the same overall lines, though they were at the same time highly diversified, depending on the personal inclinations of each writer. To the school of Gerona belong, among others, masters such as Ezra ben Solomon, Azriel of Gerona, Jacob ben Sheshet, Moses ben Naḥman (or Naḥmanides, *c.* 1195–1270, the famous Talmudist, biblical commentator, and mystical philosopher); their influence on the subsequent course of Jewish mysticism is of fundamental importance. None of them has left a complete synthesis of his theosophy; they expressed themselves, with more or less reserve, by means of commentaries, sermons, polemic or apologetic treatises or, at the most, brief summaries for the noninitiated. It is not impossible, however, to discover through these texts their vision of the world and compare it with the views of the Jewish thinkers who attempted to harmonize the biblical-rabbinical tradition with Greco-Arab philosophy, whether of Neoplatonic or Aristotelian inspiration.

The divine "nothing"

At the base of the Kabbalistic view of the world there is an option of faith: it is by a voluntary decision that the unknowable deity—who is "nothing" or "nothingness" (nonfinite) because he is a fullness of being totally inaccessible to any human cogitation—set into motion the process that leads to the visible world. This concept radically separates Kabbala from the determinism from which the philosophy of the period could not, without internal



Sefirot superimposed on the human body (see text).

From C.D. Ginsburg, *Kabbalah: The Essenes;* Samuel Weiser Inc.

contradictions, free the principle of being. In addition it offers a solution consistent with faith to the problem, highly embarrassing for the philosophers, of creation *ex nihilo* (out of nothing): the paradoxical reinterpretation of the concept of the "nothing" eliminates the original matter coeternal with God and solves the opposition between divine transcendence (remoteness from the world) and immanence (presence in the world); issuing from the unfathomable depth of the deity and called to return to it, the world, visible as well as invisible, is radically separated from God, who is at the same time constantly present. The correspondence between the *sefirot,* which are modes of the divine manifestation, and all the degrees of being gives meaning to the structure of the world and to the history of humanity centred on the revelation especially given to the chosen people, a revelation that is a rule of life for this people and, consequently, the criterion of merit and sin, or good and evil. Thus, from the top to the bottom of the ladder, there are but corresponding realities that control one another; contrary to the opinion of the philosophers, evil is also a reality since it is the rupture of the universal harmony. It is also the consequence of this rupture, in the form of punishment, but it is repairable. From this perspective, scrupulous observance of the Torah, the revealed Law (both in the written text and the oral tradition), is the essential factor for the very maintenance of the universe. From that point on, the "rational" motivation of the commandments, which raises insurmountable difficulties for the theologians of philosophical orientation, is in the eyes of the Kabbalists but a false problem; the real problem is the fundamental nature of the Torah. Kabbala brings more than one solution to it, whereas philosophy is not even able to raise the question.

It follows from this general concept that the Jewish faith, with its implications—the conviction of holding the undiluted truth, the faithful preservation of ritual practices, and the eschatological expectation—is safeguarded from all the doubts that either philosophical speculation or the rival religious doctrines of Christianity and Islām could evoke in the minds of Jewish believers. Considered from this point of view, Kabbala, already at the stage it had reached at Gerona, turns out to have been a significant factor in the survival of Judaism, which was exposed everywhere in medieval society to the perils that the history of the period reveals.

Besides the Gerona school and the doctrinal descendants of Isaac the Blind in Languedoc, there was another school of Jewish esoterism in southern Europe during the first half of the 13th century. This school—whose followers preferred to remain anonymous and therefore published their writings, such as the *Sefer ha-ʿiyyun* ("Book of Speculation"), either without giving any author's name or by attributing them to fictitious authorities—directed its speculation both to the highest levels of the divine world, where it discerned further aspects beyond the 10 *sefirot* and attempted to give an idea of them by resorting to the symbolism of light, and to the primordial causes and the archetypes contained in the deity or directly issued from it. The sometimes striking similarity between these speculations and those of John Scotus Erigena, a notable 9th-century Christian philosopher, seems to indicate not only a typological kinship of themes between this Kabbalistic current and Latin-language Christian Neoplatonism but also a concrete influence of the latter upon the former. The same may be true about Isaac the Blind and the school of Gerona, but certain knowledge is lacking.

Sefer ha-temuna. Still another current manifested itself at the same period; it found its literary expression in the *Sefer ha-temuna* ("Book of the Image") of unknown authorship. This very obscure document claims to explain the figures of the letters of the Hebrew alphabet. In fact, the speculation of this treatise bears on two themes that were not foreign to the school of Gerona, but it develops them in a personal manner that decisively influenced the future of Jewish theosophy. On the one hand, it deals with a theory of different cycles through which the world must travel from the time of its emergence to its reabsorption into the primordial unity and, on the other hand, with various readings that correspond to these cycles in the divine manifestation that is constituted by the revealed Scriptures. In other words, the reading, thus the interpretation, and consequently the message of the Torah vary according to the cycles of existence; the passage to a cycle other than that under whose governance humanity is presently living could thus entail the modification, even the abrogation, of the rule of life to which the chosen people are presently subject, an explosive notion that opened the way to an overthrow of the traditional values of Judaism.

The cycles of existence

Medieval German (Ashkenazic) Ḥasidism. The period from *c.* 1150 to 1250, which witnessed the establishment of Kabbala in the south of France and in Spain, is no less important for the shaping of Jewish mysticism in the other branch of European Judaism, in northern France (and England) and in the Rhine and Danube regions of Germany. Unlike medieval Kabbala, which was to experience a broad and varied development starting in the second half of the 13th century, the movement designated somewhat summarily as German (or Ashkenazic, from a biblical place-name conventionally used to designate Germany) Ḥasidism (Pietism), would hardly survive as a living and independent current beyond the second quarter of the 13th century. There was undoubtedly within Franco-German Judaism a certain continuity of mystical tradition, based on the *Sefer Yetzira* and the *Hekhalot* (see above *Sefer Yetzira*); certain elements of theurgy and magic of Babylonian origin had perhaps also reached it through Italy; and it would seem that the gnosticizing current crystallized in the *Sefer ha-bahir* did not pass without leaving traces in Germany. The intellectual atmosphere of Franco-German Judaism, however, differed greatly from that reigning in Spain or even Provence–Languedoc; it was characterized by an almost exclusively Talmudic culture, less intellectual contact with the non-Jewish environment than in the countries of Muslim civilization, and a very limited knowledge of the Jewish theology in Arabic of the Middle East, North Africa, and Spain. This situation would change only in the last third of the 12th century; until then, the "philosophical" equipment of the Franco-German Jewish scholar consisted essentially of a Hebrew paraphrase, dating perhaps from the 11th century, of the treatise *Beliefs and Opinions* by Saʿadia ben Joseph (the great 9th–10th-century Babylonian Jewish scholar and philosopher), and the commentary on the "Book of Creation," written directly in Hebrew (in 946) by the Italian Jew Shabbetai Donnolo. Even when the cultural influence of Spanish Judaism came to be felt more strongly in France–England and Germany, the speculative Kabbala noted above hardly penetrated there. Thinkers within Franco-German Judaism who inclined toward theological speculation had their own problems, which resulted in a mysticism strongly imbued with asceticism, a type of mysticism toward which the general situation of the Jews in those regions contributed, as, especially after the First Crusade, they were severely afflicted by bloody persecutions.

Ashkenazic speculation and asceticism

The main speculative problem was that of the relationship between God in his pure transcendence and total unity and his manifestations in creation, as well as in revelation and communication with inspired men. Reflection on this problem led to the elaboration of various supernatural hierarchies between the inaccessible God and the created universe or the recipient of divine communication; data on angels taken from the Bible and rabbinical and mystical tradition, as well as speculation on the *Shekhina,* were used as material for these hierarchies and also gave a peculiar coloration to liturgical practice. The latter was marked, moreover, by a concern for spiritual concentration by means of fixing the attention on the words and even the letters of the synagogue prayers. Whatever the historical interest of these speculations, they had no great repercussions on the subsequent course of Jewish esoterism; the only exceptions are the mysticism of prayer and demonology, which was sometimes influenced by the beliefs of the Christian environment and fully developed in Ḥasidic circles. On the other hand, the ascetic morality of the movement, which found its literary expression in the work of Eleazar ben Judah of Worms (*c.* 1160–1238) and in the two recensions of the "Book of the Pious" (*Sefer ḥasidim*), was to mark Jewish spirituality, esoteric or not, from then on.

The making of the Zohar (c. 1260–1492). Once the actually marginal episode of German Ḥasidism was finished, almost all of the creative activity in Jewish mysticism was to be situated or would originate in Spain, up to the expulsion of the Jews in 1492.

After the flowering of the schools described above came to an end, around the year 1260, two other currents appeared. The first, in its own manner, resumed relations with Gnosticism in that it placed the problem of evil at the centre of its reflection. The texts that reflect this tendency do not maintain evil in a state of dependence on the "attribute of judgment" within the structure of the *sefirot* set up by the previous Kabbalists but locate it outside the divinity, constructing a parallel system of "left-hand *sefirot,*" with a corresponding development of an exuberant demonology. The second movement, whose main representative was the 13th-century visionary-adventurer Abraham ben Samuel Abulafia, found its justification in inner experiences considered "prophetic" and encouraged by training methods akin to those of Yoga, the Byzantine Hesychasts (mystical, quietist monks), and the Muslim Ṣūfīs (mystics); moreover, an important place was given to speculations on the letters and vocalic signs of the Hebrew script. Unlike the protagonists of other mystical schools of Spain that until then had not sought to spread their ideas outside the circle of initiates, Abulafia applied himself in various places to propaganda and exhibitions that disaffected and worried the leaders of Judaism and caused their initiator to be pursued even by the non-Jewish authorities. The numerous writings that he left were later to stimulate a few minds among the Kabbalists.

The world of Moses de León

The work of Moses ben Shem Tov de León, in the last quarter of the 13th century, marked one of the most important turning points in the development of Jewish mysticism. Moses de León was born in the middle of the 13th century and died in 1305; he was the author of several esoteric works, which he signed with his own name. But at the same time, in order to better spread his ideas and to more effectively combat philosophy, which he considered a mortal danger to the Jewish faith, he turned to the composition of pseudepigrapha (writings ascribed to other authors, usually in past ages) in the form of Midrashim (plural of Midrash) on the Pentateuch, the Song of Solomon, Book of Ruth, and Lamentations, in which Talmudic authorities appeared, of whom only the names were even partially authentic, a procedure already used by the *Sefer ha-bahir* (see above *Sefer ha-bahir*); in its most finished version (for there were several of them), the plot of the tales centred around Rabbi Simeon ben Yoḥai, a doctor of the 2nd century, about whom the Talmud already related some curious anecdotes, most of them semilegendary. Moses de León thus produced, over a period of about 30 years, first a work entitled *Midrash ha-neʿelam* ("The Mystical Midrash") whose method was largely allegorical and whose tongue was mainly Hebrew, and then a larger work, the *Sefer ha-zohar* ("Book of Splendour"), or more briefly the *Zohar,* whose content is theosophic and which was written in artificial Aramaic. The book culminates in a long speech in which Simeon ben Yoḥai, on the day of his death, supposedly exposes the quintessence of his mystical doctrine. The literary hoax of Moses de León was not immediately accepted as authentic by all the esoterists and still less by scholars outside the theosophic movement; it took half a century or more for the *Zohar* and imitations of it to be recognized as authoritative ancient works, and even then it was not without some reluctance. The nearly contemporary imitations of the *Zohar* that were incorporated into it or appended to it were sometimes of a markedly different ideological orientation: the *Raʿya Mehemana* ("Faithful Shepherd"—that is to say, Moses, who is the central figure of this composition, the particular subject of which is the interpretation and theosophic justification of the precepts of the Torah); and the *Tiqqune Zohar,* elaborations in the same vein bearing upon the first word of the book of Genesis (*Bereshit,* "In the beginning"). Although critics were never fully silenced and the authenticity of the *Zohar* was already questioned in the 15th century, the myth created by Moses de León and his imitators became a spiritual reality for the majority of believing Jews; it still retains this character among "Orthodox" Jews. The *Zohar,* believed to be based on supernatural revelations and reinterpreted in diverse ways, would serve as support and reference for all the Jewish theosophies in the centuries ahead.

Doctrine and symbolism of the *Zohar*

As to doctrine, the *Zohar* and its appendixes develop, amplify, and exaggerate speculation and tendencies that already existed, rather than offering any radical innovation. All of the ideas had already been accepted for a long time in Jewish theosophy: the springing forth of being from the depth of the divine "nothing"; the solidarity of the world of the *sefirot* (complicated by the introduction of four ontological levels at each one of which the schema of the 10 *sefirot* is reproduced) with the visible world; the indispensable contribution of man (that is, of the Jew) who observes the biblical and rabbinical precepts in their slightest details, to universal harmony—these emphases remain the main lines of the *Zohar.* But all these themes (the speculations of the *Sefer ha-Temuna,* mentioned above, on the cosmic cycles and the "Prophetic Kabbala" of Abulafia being tacitly set aside) were largely organized and enhanced by the use, or rather the unscrupulous appropriation, of materials taken from rabbinical tradition and ancient esoterism as well as from more recent theological and philosophical currents of thought, despite the lack of esteem that the writers of the Zoharic corpus felt and sought to make others feel toward works created by gentiles.

The method of symbolic representation used by the writings of the Zoharic corpus was supported by a system of interpretation that made use of the originally Christian concept of the fourfold meaning of Scripture: literal, moral, allegorical (philosophical), and mystical. The symbolism thus set up boldly made use of an exuberant anthropomorphic and even erotic imagery whose function was to convey the manifestation of the levels of the *sefirot* to each other and to the extradivine world. The myth of the primordial man (Adam Qadmon), a virtually divine being, reappeared here under a new form, and it was to remain in the subsequent development of Kabbala.

The *Zohar* thus claims to provide a complete explanation of the world, man, history, and the situation of the Jew; on a higher level, to justify the biblical revelation and rabbinical tradition, down to the slightest detail, including the messianic expectation; and thereby to neutralize philosophy. But, while setting itself up as the defender of the traditional religion regulated by the Talmud and its commentaries, in a sense it places itself above tradition, by proclaiming boisterously the incomparable value of the theosophic teaching of "Rabbi Simeon ben Yoḥai" and the superiority of the esoteric doctrine over the Talmudic studies, which were open to all and which, along with the observance of the precepts, were, according to common opinion, supposed to constitute the basic justification of the life of the Jew. There is in this attitude—more accentuated in the *Raʿya Mehemana* (see above) than in the *Zohar* proper—a revolutionary potentiality, a possible threat to the primacy of practice and study of Torah; the future would show that this danger was not completely unreal.

The Lurianic Kabbala. After the establishment of the Zoharic corpus, no major changes took place in Jewish esoterism until the middle of the 16th century, when in Safed (in Upper Galilee, Palestine; present-day Ẓefat, Israel) a religious centre of extreme importance for Judaism was established, which was mainly inspired by teachers coming from families expelled from Spain. Until the expulsion of the Jews from Spain (1492) and during the two generations that followed it, the Kabbalistic literary output had certainly been abundant, in Spain till the expulsion as well as in Italy and the Middle East; but it was primarily a matter of systematizing or even popularizing the *Zohar* or of extending the speculation already developed in the 13th century; there were also some attempts at reconciling philosophy and Kabbala. It should be noted that even the traditionalist theologians adopted a careful and rather reserved attitude toward Kabbala.

The tragedy for Judaism of the expulsion from Spain and of the forced conversions to Christianity that preceded it by a century, and which would become even more extensive in Portugal shortly afterward, deeply marked the victims. These events, accentuating the already existing pessimism in response to the situation of the Jewish people dispersed among the nations, intensified the messianic expectation. This expectation does not seem to have been unrelated to the beginnings of the printed transmission of Kabbala—the first two printed editions of the *Zohar* date from 1558. All these factors, joined with certain internal developments of speculative Kabbala in the 15th century, prepared the ground for the new theosophy inaugurated by the teaching of Isaac ben Solomon Luria, who was born in Jerusalem in 1534, educated in Egypt, and died in Safed in 1572; although his teaching is traditionally associated with Safed, he spent only the last three years of his life there. Luria wrote very little; his doctrine has been transmitted, amplified, and probably somewhat distorted through the works of his disciples, of which the main one was Ḥayyim Vital (1543–1620), who wrote *ʿEtz Ḥayyim* ("Tree of Life"), the standard presentation of Lurianic Kabbala.

The teaching of Isaac Luria

The theosophy of Luria, whose novelty was proclaimed by its creator and perfectly realized by the esoterists who held to the Zoharistic Kabbala (organized and codified precisely in Safed, during the lifetime of Luria, by Moses ben Jacob Cordovero, 1522–70), is of extreme complexity in its details, although basically it is but one more attempt to reconcile divine transcendence with immanence and to bring a solution to the problem of evil, which the believer in the divine unity can recognize neither as a power existing independently of God nor as an integral part of him.

The theosophic vision of Luria is expressed in a vast mythical construct, which is typologically akin to certain Gnostic and Manichaean (3rd-century dualistic) systems but which strives at all costs to avoid dualism. The essential elements of this myth are as follows: the withdrawal (*tzimtzum*) executed by the divine light, which originally filled all things, in order to make room for the extradivine; the sinking, as a result of a catastrophic event that occurred during this process, of luminous particles into matter (*qelippot,* "shells," a term already used in Kabbala to designate the evil powers); whence the necessity of saving these particles and returning them to their origin, by means of "repair" or "restoration" (*tiqqun*). This must be the work of the Jew who not only lives in complete conformity to the religious duties imposed on him by tradition but who also dedicates himself, in the framework of a strict asceticism, to a contemplative life founded on mystical prayer and the directed meditation (*kawwana*) of the liturgy, which is supposed to further the harmony (*yiḥud,* "unification") of the innumerable attributes within the divine life. The successive reincarnations of the soul, a constant theme of Kabbala that Lurianism developed and made more complex, are also invested with an important function in the work of "repair." In short, Lurianism proclaims the absolute requirement of an intense mystical life with, as its negative side, an unceasing struggle against the powers of evil. Thus it presents a myth that symbolizes the origin of the world, its fall, and its redemption; it gives meaning to the existence and to the hopes of the Jew, not merely exhorting him to a patient surrender to God but moving him to a redeeming activism, which is the measure of his sanctity. Obviously, such requirements make the ideal of Lurianism possible only for a small elite; ultimately, it is realizable only through the exceptional personage of the "just"—the ideal holy Jew described above.

Shabbetaianism. During the 60 years that followed the death of the founder, the Kabbala linked to the name of Luria and overlaid with accretions from the other mysticisms of Safed spread through the Jewish Diaspora and deeply permeated its spiritual life, liturgy, and devotional practices. It emphasized the necessity of "repair" of a world in which the uneasiness of the Jew kept growing, for in spite of certain favourable factors—the relative tolerance of the Ottoman Empire and the peaceable establishment of an important Marrano (Iberian Jewish, or Sefardic) community in Amsterdam—there was no overall solution to the problem of the "conversos" (converts) who had remained in the Iberian Peninsula. The other half of the Jewish people, the Ashkenazim, also experienced a serious crisis: its most prosperous and dynamic section, the Jewish population of Poland, was sorely tried, almost totally ruined, and in large part forced to move back toward the west because of the massacres and the destruction that took place during the Cossack uprising of 1648. These ideological and historical data may provide the necessary context for understanding the astonishing though short-lived success of Rabbi Shabbetai Tzevi of Smyrna (1626–76), who proclaimed himself messiah in 1665. The "Messiah" was forcibly converted to Islām in 1666 and ended his life in exile 10 years later, but despite his failure he had faithful followers. A sect was thus born and survived largely thanks to the activity of Nathan of Gaza (*c.* 1644–90), an unwearying propagandist for the "Messiah," who justified the actions of Shabbetai Tzevi, which were contrary to the Law, and his final apostasy by theories that were based on the Lurian theory of "repair": it had to be understood as the descent of the just into the abyss of the "shells" in order to liberate from it the captive particles of divine light. The Shabbetaian crisis lasted nearly a century, some of its aftereffects even longer. It led to the formation of sects whose members were externally converted to Islām—*e.g.,* the Dönme (Turkish, "apostates") of Salonika, whose descendants still live in Turkey—or to Roman Catholicism—*e.g.,* the Polish supporters of Jacob Frank (1726–91), the self-proclaimed Messiah and Catholic convert. In Bohemia–Moravia, however, the Frankists outwardly remained Jews. This crisis did not discredit Kabbala, but it led the spiritual authorities of Judaism to watch over and severely curtail its spread and to exercise rigorous ideological control, by concrete acts of censorship and repression, over anyone, even a person of tested piety and recognized knowledge, who was suspected of Shabbetaian sympathies or of messianic pretensions.

Shabbetai Tzevi, a 17th-century "Messiah"

Modern Ḥasidism. Though it is true that the messianic movement centred around Shabbetai Tzevi could only produce disillusionment and that if it had not been contained it could have led Judaism to its ruin, yet it answered not only the theosophic aspirations of a small number of visionary scholars but also an affective need of the Jewish masses that was left unsatisfied by the dry intellectualism of the Talmudists and the economic and social oppression of the ruling classes (both Jewish and non-Jewish). This was the case especially in Poland, which before the partition of the Polish kingdom (1772–95) included Lithuanian, Belorussian, and Ukrainian territories. It was there that the so-called Ḥasidic movement, in no way connected with medieval German Ḥasidism, originated around the middle of the 18th century—a movement in which the Lurian Kabbala, theoretically maintained as the basis of speculation, underwent adjustments and transformations that continue to the present day.

The Ba'al Shem Ṭov

If modern Ḥasidism may be regarded as a mass movement, having a minimum of organization, using the methods of propaganda and preaching, and forming groups of acknowledged members, then the legend is credible that traces it back to a single founder, Israel ben Eliezer, known as Ba'al Shem Ṭov (Master of the Good Name; that is, a possessor—he was not the only one of his kind—of the secret of the ineffable name of God, which bestows an infallible power to heal and perform other miraculous operations). This man was born about 1700 and died in 1760 in southern Poland. Though relatively untrained according to the norms of the rabbinical Judaism of his time, he was a spiritual personage of exceptional quality and was able to win to his ideas not only the common people but also many representatives of the intellectual elite. The mist of legend that surrounds him is too dense for it to be possible to reconstruct entirely his personal doctrine, which he probably never systematized. Drawing his inspiration from the methods of the itinerant preachers whose activity was becoming more intense in 18th-century eastern European Judaism, he delivered his teaching in the form of homiletic interpretations of sacred texts, having recourse to fables and parables borrowed from daily life and from folklore; this method remained constant in Ḥasidism, but it is undeniably an exaggeration and even an error in perspective to consider, as did Martin Buber (see below *Modern Jewish mysticism*), that the tale and the anecdote are the most authentic expression of the doctrine and the spirituality of Ḥasidism. It is indeed in the doctrinal works, most of them expressed in the form of sermons on the weekly sections of the Pentateuch and other liturgical lessons, that the thought of the Ḥasidic "rabbis" is expressed. It is very diversified thought, for there are as many bodies of doctrine in Ḥasidism as there were creative spirits during the first three generations of the movement. It is, nevertheless, possible to point to a few traits that are fundamental and common to Ḥasidism as a whole.

In theory, it remains rooted in the Lurianic Kabbala—and nothing essential separates it at this point from its most implacable adversaries in the traditional Judaism of eastern Europe. What is unique to it is to have made of *devequt,* "being-with-God," an object of aspiration and even a constant duty for all Jews and in all circumstances of life, even those seemingly most profane; in other words, it demands a total spiritualization of Jewish existence. This requirement entails a reevaluation, less new in its principle than in its concrete application, of the speculative concepts of Kabbala: the emphasis is placed on the inner life of the believer, and it is at this level that the supercosmic drama is played (a drama whose stage was, according to bookish theosophy, in the universe of the *sefirot*); according to several teachers, the same emphasis on inwardness holds for messianic redemption. At the same time, Ḥasidism transforms into social reality a requirement that was also part of the Lurian doctrine of "repair," though it was unfortunately distorted by Shabbetaianism: Ḥasidism puts at the centre of the religious life and organization of the group, as an indispensable guide and unquestioned authority, the inspired leader, endowed with supernatural powers—the "just" (*tzaddiq*), the "miracle-working rabbi" (*Wunder-rebbe*). Ḥasidism thus produced, wherever it triumphed, an undeniable spiritual renewal; the reverse of the medal was the cult of personality, competition between "dynasties" of "rabbis," obstinacy in maintaining the Ḥasidic community apart from the surrounding society, with all the social and economic consequences that this will to isolation entailed and for which it would be false to lay all the blame on the environment, despite its definite hostility toward the Jews.

The *tzaddiq*

From its very beginnings, Ḥasidism was to encounter strong resistance on the part of the official Judaism of the period, which had been sensitized to the anarchism of the Shabbetaians and was at the same time solicitous for the prerogatives of the established community leaders and rabbis, the vigilant guardians over the traditional laws and their application, who were confined to the formal study of the Talmud and its commentaries. The behaviour of the followers of Ḥasidism, though irreproachable in its strict, even rigorous observance of ritual rules, displayed several traits that were distasteful to its adversaries (besides the unconditional submission to the *tzaddiq,* who often doubled as the rabbi of the official congregation): desertion of the general communal synagogues, meetings in small conventicles, modifications of the liturgy, casual dress during prayer, and preference given to mystical meditation rather than to the dialectical study of the Talmud, which requires instead serious intellectual concentration. Nevertheless, the conflict between the Ḥasidim and the "Opponents" (Mitnaggedim) did not finally degenerate into a schism; after three generations, a kind of tacit compromise was established between the two tendencies—Ḥasidic and Talmudic—without the consciousness of differences ever being erased. The compromise was rather to the advantage of Ḥasidism, but not without a few concessions on its part, notably on the question of education.

The strong organization of the Ḥasidic groups allowed them to survive the dislocation of eastern European Judaism as a result of the events of World War II, but its vital centres are today in the United States rather than in Palestine, in part because of economic reasons, in part because of the more or less reserved, and at sometimes frankly hostile, attitude of the Ḥasidic "rabbis" toward political Zionism and the State of Israel. The best known of the U.S.-based groups is the very active Lubavitchers (after Lyubavichi, Russia, seat of a famous school of Ḥasidism), whose headquarters are in the Crown Heights district of Brooklyn, New York.

MODERN JEWISH MYSTICISM

The role played by Kabbala and Ḥasidism in the thought and spirituality of contemporary Judaism is far from being insignificant, though its importance is not as great as in former times. Of course, there is hardly any really living Kabbalistic and Ḥasidic literature, but the personal thought of religious writers such as Abraham Isaac Kook (*c.* 1865–1935), spiritual leader, mystic, and chief rabbi of Palestine, continues to exercise a marked influence. Furthermore, the renewal of religious thought in "westernized" Jewish circles between the two wars received a powerful impulse from the philosopher Martin Buber (1878–1965), whose work is in part devoted to the propagation of Ḥasidic ideology as he understood it. "Neo-Orthodoxy," founded in Germany by Samson Raphael Hirsch (1808–88), was quite indifferent to mysticism at the outset, but it too came to be influenced by it, especially after the rediscovery of living Judaism in Poland during World War I by Western Jewish thinkers. Also significant is the work of Abraham Joshua Heschel (1907–72), a Polish Jewish writer of distinguished Ḥasidic background and double culture—traditional and Western—who emigrated to the United States.

Christian and secular Kabbala

Jewish mysticism also has exercised some influence on thought outside the Jewish community. Kabbala, distorted and deflected from its own intentions, transcended the frontiers of Judaism and helped nourish and stimulate certain currents of thought in Christian society, from the Renaissance to the present: "Christian Kabbala," born in the 15th century under the impetus of Jewish converts from Spain and Italy, claimed to find in the Kabbalistic documents, touched up if necessary or even forged, arguments for the truths of the Christian faith. Thus a certain number of Christian Humanist scholars became interested in Jewish mysticism and several of them acquired a fairly extensive knowledge of it on the basis of authentic texts. Among them were Giovanni Pico della Mirandola (1463–

94) and Gilles of Viterbo (Egidio da Viterbo; *c.* 1465–1532) in Italy, and Johannes Reuchlin (1455–1522), who was responsible for writing one of the principal expositions of Kabbala in a language accessible to the learned non-Jewish public (*De arte Cabbalistica,* 1517), in Germany, while the visionary Guillaume Postel (1510–81) was attracting disciples in France. The occult philosophy of the 16th century, the "natural philosophy" of the 17th and 18th centuries, and the occult and theosophic theories that are cultivated even today and that have coloured the ideology of Freemasonry—all of these focus and continue to make borrowings from Kabbala, though they rarely grasp its spirit and meaning. The same is true of most of the books on Kabbala put out by publishers of occult and theosophic literature today.

The rigorous scholarly study of Jewish mysticism is a very recent phenomenon. The state of mind and the tendencies of the founders of the "science of Judaism" (the scholarly study of Jewish religion, literature, history, etc.) in Germany during the first half of the 19th century were too permeated with rationalism to be favourable to scholarly investigation of a movement judged to be obscurantist and retrograde. Granting some valuable earlier works, research on a large scale and application of the proved methods of philology and history of religions began only with the work of Gershom G. Scholem, who was professor of Kabbala at the Hebrew University, Jerusalem from 1923 to 1965, and has been continued by his disciples, both direct and indirect. This research touched all of the areas of Jewish mysticism that are briefly described in this article; however, the gaps in knowledge remain serious in every area. Critical editions of mystical texts are few in number; unpublished documents are cataloged in a very incomplete manner; and only a few monographs on writers and particular themes exist, though these are indispensable preliminaries to a detailed and thorough synthesis. It is to be hoped that the one outlined by Scholem in 1941, in his *Major Trends in Jewish Mysticism,* though of exceptional value in its time, will be taken up again and completed. (G.V.)

Jewish myth and legend

Jewish myth and legend comprises a vast body of stories transmitted over the past 3,000 years in Hebrew and in vernacular dialects, such as Yiddish (Judeo-German) and Ladino (Judeo-Spanish), spoken by Jews in various parts of the world. These stories have played an important role in the history of Jewish religion and culture.

SIGNIFICANCE AND CHARACTERISTICS

Apart from their intrinsic appeal, Jewish myths and legends claim attention for three special reasons: (1) Those incorporated in the Old Testament now form part and parcel of the cultural heritage of the Western world and have exerted a profound influence on its literature and art. (2) During the Middle Ages Jews were among the principal transmitters of Oriental tales to the West, so that many familiar Eastern stories can be traced to Jewish compilations. (3) Since these stories have been accumulated through centuries of constant migration, they provide an unrivalled body of "clinical" material for studying the process by which popular tales in fact travel and are transformed.

Basic character and role

Not all of the stories are of Jewish origin; many can be readily paralleled elsewhere and are derived from tales the Jews picked up from their non-Jewish neighbours in the lands of their dispersion. Even what is borrowed, however, is usually impressed with a distinctive Jewish stamp, being adapted to point up some precept of the Jewish religion, to illustrate some facet of Jewish life, or to exemplify some trait of Jewish character and temperament. The dominant overall feature of the stories is, indeed, their religious and moral tone; most of them are, in fact, told specifically as part of the homiletic exposition of Scripture. Such stories are taught to Jews from early childhood as a regular part of their religious education. To the tradition-minded Jew, therefore, they are more than mere literary fancies and assume a kind of doctrinal complexion. Biblical characters and events present themselves to him more in the lineaments of later legend than in their original biblical form; while popular notions about heaven and hell, rewards and punishments, the coming of the Messiah, and the resurrection of the dead derive mainly from this source rather than from Scripture itself.

Virtually all the standard types of folktale are represented. Conspicuously absent, however, are pure fairy tales because fairies, elves, and the like are foreign to the Jewish imagination, which prefers to people the otherworld with angels and demons subservient to God.

A distinction must be made, of course, between myth and legend. In common parlance, a myth is a story about gods or otherworldly beings. Judaism, however, is a rigorously monotheistic religion; hence, in this narrower sense, there can be no original Jewish myths. Nevertheless, from the earliest times, Jews have not disdained to borrow those of their pagan neighbours and then adapt them to their own religious outlook. If, however, the term is interpreted in a larger sense, to mean the portrayal of continuous, transtemporal concerns in the context of particular and punctual events, myth is indeed one of the essential vehicles by which Judaism conveys its message; for it is only when historical happenings are translated into this wider dimension that they cease to be mere antiquarian data and acquire continuing relevance. In Judaism, for example, the Exodus from Egypt is projected mythically from something that happened at a particular time into something that is continually happening, and it thus comes to exemplify the situation and experience of all men everywhere—their emergence from the bondage of obscurantism, their individual revelations at their individual Sinais, their trek through a figurative wilderness, even their death in it so that their children or children's children may eventually reach the figurative "promised land." By the same token, the historical destruction of the Temple of Jerusalem is transformed by myth into a paradigm of the continuing mutual estrangement of God and man, their exile from one another.

Legend, on the other hand, implies no more than a fanciful embroidering of purportedly historical fact. Unlike myth, it does not transcend the punctual and local.

SOURCES AND DEVELOPMENT

Myth and legend in the Old Testament. The vast repertoire of Jewish myths and legends begins with the Old Testament. Their overall purpose in Scripture is to illustrate the ways of God with man, as exemplified both in historical events and in personal experience. The stories themselves are often derived from current popular lore and possess abundant parallels in other cultures, both ancient and modern. In each case, however, they are given a peculiar and distinctive twist.

Myths in Genesis

Myths. Old Testament myths are found mainly in the first 11 chapters of Genesis, the first book of the Bible. They are concerned with the creation of the world and of man, the origin of the continuing human condition, the primeval Deluge, the distribution of peoples, and the variation of languages.

The basic stories are derived from the popular lore of the ancient Middle East and can be paralleled in the extant literature of the peoples of the area. The Mesopotamians, for instance, also knew of an earthly paradise such as Eden, and the figure of the cherubim—properly griffins rather than nightgowned angels—was known to the Canaanites. In the Bible, however, this mythical garden of the gods becomes the scene of man's fall and the background of a story designed to account for the natural limitations of human life. Similarly, the Babylonians, too, told of the formation of man from clay, but in the scriptural version his function is to bear rule over all other creatures, whereas in the pagan tale it is to serve as an earthly menial of the gods. Again, the story of the Deluge, including the elements of the ark and the dispatch of the raven and dove, appears already in the Babylonian myths of Gilgamesh and Atrahasis. There, however, the hero is eventually made immortal, whereas in the Bible this detail is omitted because to the Israelite mind no child of woman could receive that status. Lastly, while the story of the Tower of Babel was told originally to account for the stepped temples (ziggurats) of Babylonia, to the Hebrew writer its purpose is simply to inculcate the moral lesson that man should not build beyond his assigned station.

Myths in the Prophets and Holy Writings

Scattered through the Prophets and Holy Writings (the two latter portions of the Hebrew Bible) are allusions to other ancient myths—*e.g.,* to that of a primordial combat between Yahweh and a monster variously named Leviathan (Wriggly), Rahab (Braggart), or simply Sir Sea or Dragon. The Babylonians told likewise of a fight between their god Marduk and the monster Tiamat; the Hittites told of a battle between the weather god and the dragon Illuyankas; while from Ras Shamra (ancient Ugarit), in north Syria, has come a Canaanite poem relating the discomfiture of Sir Sea by the deity Baal and the rout of an opponent named Leviathan. (Originally, this myth probably referred to the annual subjugation of the floods.)

Ancient myths are utilized also in the form of passing allusions or poetic "conceits," much as modern Westerners may speak of Cupid or the Muses. Thus, there are references in the prophetic books to a celestial upstart hurled to Earth on account of his brashness and to the imprisonment of certain rebellious constellations.

The prophets used such myths paradigmatically to illustrate the hand of God in contemporary events or to reinforce their forecasts. Thus, to Isaiah the primeval dragon becomes the symbol of that continuous force of chaos and evil that will again have to be vanquished before the Kingdom of God can be established on Earth. Similarly, for Ezekiel the celestial upstart serves as the prototype of the prince of Tyre, destined for an imminent fall; and Habakkuk sees in the impending rout of certain invaders a repetition on the stage of history of Yahweh's mythical sortie against the monster of the sea.

Legends and other tales. Old Testament legends often embellish the accounts of national heroes with standard motifs drawn from popular lore. Thus, the story (in Genesis) of Joseph and Potiphar's wife recurs substantially (with other characters) in an Egyptian papyrus of the 13th century BCE. The depositing of the infant Moses in the bulrushes (in Exodus) has an earlier counterpart in a Babylonian tale about Sargon, king of Akkad (*c.* 2334–*c.* 2279 BCE), and is paralleled later in legends associated with the Persian Cyrus and with Tu-Küeh, the fabled founder of the Turkish nation. Jephthah's rash vow (in Judges) whereby he is committed to sacrifice his daughter recalls the classical legend of Idomeneus of Crete, who had similarly to slay his own son. The motif of the letter whereby David engineers the death in battle of Bathsheba's husband recurs in Homer's story of Bellerophon and again in the episode of Rosencrantz and Guildenstern in *Hamlet.* The celebrated judgment of Solomon concerning the child claimed by two contending women is told, albeit with variations of detail, about Buddha, Confucius, and other Oriental sages; while the story of how Jonah was swallowed by a "great fish" but subsequently disgorged intact finds a parallel in the Indian tale of the hero Śaktideva, who experienced the same thing during his quest for the Golden City. On the other hand, it should be observed that many of the parallels commonly cited from the folklore of primitive peoples may be, in fact, mere playbacks of biblical material picked up from Christian missionaries.

Etiologic tales

Sometimes, worldwide folktales serve in the Old Testament to account for the names of places in Palestine or for the origins of traditional customs and institutions. Thus, the familiar story of the man who has to struggle with the personified current of a river before he can cross it is localized (in Genesis) at the ford of Jabbok simply because that name suggests the Hebrew word *abḳ* ("struggle"); and Samson's felling of 1,000 Philistines with the jawbone of an ass is placed at Ramath-leḥi because *leḥi* is Hebrew for "jawbone." Similarly, a taboo against eating the sciatic nerve of an animal is validated (in Genesis) by the legend that Jacob was struck in the hip when he tussled with an otherworldly being at Penuel (Face of God); and the custom of annually bewailing the vanished spirit of fertility is rationalized (in Judges) as a lamentation for the hapless daughter of Jephthah.

Besides myths and legends the Old Testament also contains a few examples of fables (didactic tales in which animals or plants play human roles). Thus, the serpent in Eden talks to Eve, and Balaam's ass not only speaks but also "flairs" spirits; while in the celebrated parable of Jotham (in Judges) trees compete for kingship.

Finally, in the Book of Job (38:31) there are allusions to star myths concerning the binding of Orion (called the Fool) and the "chaining" of the Pleiades.

Contemporary interpretations. The tendency to interpret biblical tales and legends as authentic historical records or as allegories, or as the relics of solar, lunar, and astral myths, is now a thing of the past. For the modern folklorist, their primary interest lies in the fact that they push back to remote antiquity several tales and motifs long known from later literature. For the theologian, however, they pose the deeper problem of distinguishing clearly between the permanent message of Scripture and the particular form in which it is conveyed. Such a process of "demythologization" is today one of the central concerns of religious thought. It involves recognition of the fact that the natural language of religious truth is myth so that the continuing relevance of ancient scriptures depends not on a total rejection of that vehicle but rather on a constant expansion and remodelling of it—*i.e.,* on remythologization rather than demythologization. In the final analysis, the traditional portrayal of God himself is simply a mythical representation of ultimate reality, but that reality transcends the particular images in which it happens to be expressed. At the same time, it must be clearly understood that expressions that can be reconciled with modern Western patterns of thought only if taken as metaphors were literal statements of fact to ancient and primitive peoples. Gods, for example, were not merely "personifications" of natural phenomena but rather the effective potencies of the phenomena themselves conceived from the start as personal beings, much as a modern child might conceive of a railroad engine as "Mr. Choochoo."

Angelology, demonology, and eschatology

Myth and legend in the Persian period. When, in 539 BCE, the Jews came under Persian domination, they absorbed a good deal of Iranian folklore about spirits and demons, the eventual dissolution of the world in a fiery ordeal, and its eventual renewal. This introduced a new element into Jewish myth and legend. Hierarchies of angels, archangels such as Michael, Gabriel, and Uriel (modelled loosely upon the six Iranian spiritual entities, the *amesha spentas*), and the demonic figures of Satan, Belial, and Asmodeus (corresponding to the Iranian Angra Mainyu [Ahriman], Druj, and Aēshma daeva) now entered their popular mythology, and there was a preoccupation with apocalyptic visions of heaven and hell and of the Last Days. Unfortunately, no Jewish texts of this genre from the Persian period itself are extant so that these new elements can be recognized only inferentially from their survival in later times, notably in such products of the ensuing Hellenistic age as the Dead Sea Scrolls.

The principal monument of Jewish story in the Persian period is the biblical Book of Esther, and this is basically the Judaized version of a Persian novella about the shrewdness of harem queens. The story was adapted to account for a popular festival named Purim, but this is probably a transmogrification of the Persian New Year. Such leading elements of the tale as the parade of Mordecai through the streets dressed in royal robes, the fight between the Jews and their adversaries, and the hanging of Haman and his sons seem, indeed, to reflect customs associated with that occasion, viz., the ceremonial ride of a common citizen through the capital, the mock combat between two teams representing Old Year and New Year, and the execution of the Old Year in effigy.

Myth and legend in the Hellenistic period. *Historiated Bibles and legendary histories.* When, in 330 BCE, Alexander the Great completed his conquest of the Middle East, Judaism entered a new phase. The dominant features of the ensuing Hellenistic age were an increasing cosmopolitanism and a fusion of Oriental and Greek cultures. These found expression in Jewish myth and legend in the composition (in Greek) of stories designed to link the Bible with general history, to correlate biblical and Greek leg-

ends, and to claim for the Hebrew patriarchs a major role in the development of the arts and sciences. It was asserted, for instance, that Abraham had taught astrology to the king of Egypt; that his and Keturah's sons had aided Heracles against the giant Antaeus; and that Moses, blithely identified both with the semi-mythical Greek poet Musaeus and with the Egyptian Thoth, had been the teacher of Orpheus (putative founder of one of the then current "mystery cults") and the inventor of navigation, architecture, and the hieroglyphic script. Leading writers in this vein were Artapanus, Eupolemus, and Cleodemus (all *c.* 100 BCE), but their works are known to us only from stray quotations by Eusebius and Clement of Alexandria, early Church Fathers.

Novelistic versions of biblical figures

Furthermore, the Jews followed a current Greek literary fashion of retelling Homeric and other ancient legends in "modernized," novelistic versions, well seasoned with romantic elaborations. Among the Dead Sea Scrolls has been found a paraphrase of Genesis in which the biblical narrative is tricked out with several familiar folklore motifs. Thus, when Noah is born, the house is filled with light, just as it is said elsewhere to have been at the birth of the Roman king Servius Tullius, of Buddha, and (later) of several Christian saints. When Abraham's life is threatened he dreams of a cedar about to be felled—the same omen said to have presaged the deaths of Domitian and Severus Alexander. (True, the parallels are of later date, but they illustrate the persistence of age-old popular traditions.) The same trend toward fanciful elaboration of scriptural tales is manifested also in the *Testaments of the Twelve Patriarchs* ("testaments" meaning last wills), in which the virtues and weaknesses of the sons of Jacob are illustrated by moralistic legends. There is also a lengthy paraphrase of early biblical narratives, mistakenly attributed to Philo, the famous Alexandrian Jewish philosopher of the first century CE.

Apocrypha and Pseudepigrapha. The principal monuments of Jewish literature during the Hellenistic period are the works known collectively as the Apocrypha and Pseudepigrapha. The former are certain later writings excluded by Jews from the canon of the Old Testament but found in the Greek Septuagint version. The latter are other late writings not included in any authorized version of the Scriptures and spuriously attributed to biblical personalities.

Judaized versions of foreign tales

The Apocrypha include several Judaized versions of tales well represented in other cultures. The book of Tobit, for instance, turns largely on the widespread motifs of "The Grateful Dead" and the "Demon in the Bridal Chamber." The former relates how a traveller who gives burial to a dishonoured corpse is subsequently aided by a chance companion who turns out to be the spirit of the deceased. The latter tells how a succession of bridegrooms die on the nuptial night through the presence of a demon beside the bridal bed. Similarly, in Bel and the Dragon (2nd century BCE) occurs the equally familiar motif that fraud (in this case perpetrated in a temple) is detected by the imprint of the culprit's foot on strewn ashes—a motif that reappears later in the French and Celtic romance of Tristan and Iseult. Again, *Susanna and the Elders* (also 2nd century BCE) revolves around the well-worn theme that a charge of unchastity levelled against a beautiful woman is refuted when a clever youngster ("Daniel come to judgment") points out discrepancies in the testimony of her accusers. The story has a close parallel in a Samaritan tale about the daughter of a high priest in the 1st century CE; while the motif of the clever youngster who surpasses seasoned judges recurs later in infancy gospels and in the tale of ʿAlī Khamājah in *The Thousand and One Nights.*

The most interesting folktale in the Pseudepigrapha is that contained in *The Martyrdom of Isaiah* (1st century CE?), which tells how the prophet, fleeing from King Manasseh, hid in a tree that opened miraculously and how he eventually perished when it was sawn asunder. A similar tale is related in the Talmud about a certain Isaac ben Joseph and (later) in the Persian epic *Shāh-nāmeh* (*c.* 1000 CE) about the hero Jamshīd.

Myth and legend in Talmud and Midrash. *Midrash and Haggada.* Toward the end of the 1st century CE, through a process known as "canonization," certain traditional Hebrew writings came to be recognized as an authoritative corpus of divine revelation, later called the Hebrew Bible or Old Testament. The study of them became, henceforth, an essential element of the Jewish religion. This meant that the sacred text had to be subjected to a form of interpretation that would bring out its universal significance and permanent relevance. The process was known as Midrash (literally "searching the Scriptures"), and a leading constituent of it was the spicing of homiletic discourses with elaborative legends—a pedagogic device called Haggada ("storytelling"). Originally transmitted orally, the legends were eventually committed to writing in that vast sea of literature known as the Talmud (the authoritative compendium of early rabbinic law and lore), as well as in later compilations geared to particular books or sections of the Old Testament, to scriptural lessons read in the services of the synagogue, or to specific biblical characters or moral themes (see also above *Torah*).

The range of Haggada is virtually inexhaustible; a few representative examples must suffice. In regard to biblical characters, both Moses and David were born circumcised; Cain had a twin sister; Abraham will sit at the gate of hell to reproach the damned on Judgment Day; Aaron once locked the angel of death in the tabernacle; Solomon understood the language of animals; King Hiram, who supplied materials for the Temple, entered paradise alive; the flesh of Leviathan will feed the righteous in the world to come.

Indebtedness of Haggada to non-Jewish sources

In such fanciful elaborations of Scriptures, Haggada does not disdain to draw on classical tales. The men of Sodom, it is said, subjected itinerant strangers to the ordeal of Procrustes' bed; the Earth opened to rescue newborn Hebrew males from the Pharaoh, as it did for Amphiaraus, the prophet of Argos, when he fled from Periclymenus after the attack on Thebes; Moses spoke at birth, as did Apollo; Solomon's ring, cast into the river, was retrieved from a fish that had swallowed it, as was that of Polycrates, the tyrant of Samos, in the story told by Herodotus; the Queen of Sheba had the feet of an ass, like the child-stealing witch (Onoskelis) of Greek folklore; no rain ever fell on the altar at Jerusalem, just as none was said to have fallen on Mt. Olympus.

Other familiar motifs also appear. Moses qualifies as a husband for Zipporah by alone being able to pluck a rod from Jethro's garden—a variant of the tale told later about the sword Excalibur in the Arthurian legend; David's harp is played at night by the wind, like that of Aeolus; Isaiah, like Achilles and Siegfried, has only one vulnerable spot in his body—his mouth; Job has a magic belt, which relieves his pains.

Legends are developed also from fanciful interpretations of scriptural verses. Thus, Adam is said to have fallen only a few hours after his creation because the Hebrew text of Ps. 49:12 can be literally rendered "Adam does not last the night in glory." Lamech slays the wandering Cain—a fanciful interpretation of his boast in Gen. 4:23–24. Melchizedek is immortal in view of Ps. 110:4: "You are a priest for ever after the order of Melchizedek." The first man is a hermaphrodite (this notion has analogues elsewhere) because Gen. 1:27 says of God's creation, "Male and female he created them."

Fables and animal stories. Midrash also uses fables paralleled in non-Jewish sources. Aesop's fable of the "Lion and the Crane" is quoted by a rabbi of the 1st century CE, and the tales of the "Fox in the Vineyard" and of the "Camel Who Got Slit Ears for Wanting Horns" likewise make their appearance.

Sometimes, too, material is drawn from medieval bestiaries (manuals on animals, real or imaginary, with symbolic or moralistic interpretations). Bears, we are told, lack mother's milk; hares and hyenas can change sex; only one pair of unicorns exists at a time; there is a gigantic bird (*ziz*) that reaches from Earth to sky.

Contribution of Haggada to Christian and Islāmic legends. Several of the stories related in Haggadic literature were later adopted and adapted by Christian writers. Thus, the legend that Adam was created out of virgin soil was taken to prefigure the fact that the second Adam (*i.e.,* Jesus) was likewise born of a virgin; while the story that the soil in question was taken from the site of the future Temple was transformed into the claim that Adam had been molded out of the dust of Calvary. Similarly, the legend that, at the dedication of the Temple, the doors had swung open automatically to admit the ark of the Covenant was transferred to the consecration of a church by St. Basil; and the Talmudic tale that the bronze Nicanor gates of the Temple had floated to Jerusalem when cast overboard for ballast during their shipment from Alexandria was applied to the doors of a sacred edifice erected in honour of St. Giles.

Nor was it only the Christians who absorbed Haggadic legends. The Qurʾān, the sacred book of Islām, likewise incorporates a good deal of such material in its treatment of such biblical characters as Joseph, Moses, David, and Solomon.

Myth and legend in the medieval period. *Jewish contribution to diffusion of folktales.* The Middle Ages was a singularly productive period in the history of Jewish myth and legend. Jews now began to play a prominent role in the transmission of Oriental tales to the West and thereby enhanced their own repertoire with a goodly amount of secular material. Especially in Spain and Italy, Arabic versions of standard collections were translated into Hebrew and thence into Latin, thus spreading the stories to the Christian world. The Indic fables of Bidpai, for example, were rendered into Hebrew from the 8th-century Arabic version of ʿAbd Allāh ibn al-Muqaffaʿ, and from this Hebrew rendering there subsequently developed, in the 12th century, John of Capua's *Directorium humanae vitae* ("Guide for Human Life"), one of the most celebrated repertoires of moralistic tales (*exempla*) used by Christian preachers. So, too, the famous *Senbād-nāmeh* ("Fables of Sinbad"; one of the sources, incidentally, of Boccaccio's *Decameron*) was rendered from Arabic into Hebrew and thence into Latin; while the renowned romance of *Barlaam and Josaphat*—itself a Christian adaptation of tales about the Buddha—found its Jewish counterpart in a compilation entitled *The Prince and the Dervish,* adapted, from an Arabic text, by Abraham ben Samuel ibn Ḥisdai, a leader of Spanish Jewry in the 13th century.

The *Alexander Romance,* Arthurian legend, and Aesop's fables

Hebrew versions of medieval romances. Here, too, however, the traffic moved in both directions: Hebrew translations were also made from Latin and other European languages. There are, for instance, several Hebrew adaptations of the *Alexander Romance,* based mainly (though not exclusively) on Leo of Naples' Latin rendering of the Greek original by Callisthenes. The central theme is, of course, the exploits of the great Macedonian conqueror, and the narrative is spiced with fanciful accounts of his adventures in foreign lands and of the outlandish peoples he encounters. There is likewise a Hebrew reworking of the Arthurian legend, in the form of a secular sermon in which Arthurian and biblical scenes are blithely mixed together. Finally, there is a Hebrew *Ysopet* (the common title for a medieval version of Aesop) that shares several of its fables with the famous collection made by Marie de France in the late 12th century.

Jewish contributions to Christian and Islāmic tales. Moreover, apart from these Hebrew translations of Oriental and European works, a good deal of earlier haggadic material is embodied in the *Disciplina clericalis* of Peter Alfonsi, a baptized Jew of Aragon originally known as Moses Sephardi. This book, composed in the 12th century, is the oldest European collection of novellas and served as a primary source for the celebrated *Gesta Romanorum* ("Deeds of the Romans") of the same period—a major quarry for European storytellers, poets, and dramatists for many centuries.

Haggadic material percolated also to Arabic writers during this period. Not only does the Qurʾān incorporate such material but also the Egyptian recension of *The Thousand and One Nights* seems to have drawn extensively on Jewish sources, as, for instance, in its tales of "The Sultan and His Three Sons," "The Angel of Death," "Alexander and the Pious Man," and the legend of Baliqiyah.

Major medieval Hebrew collections. Between the 11th and 13th century the tendency developed in Europe to compile, both for entertainment and edification, comprehensive collections of tales and fables; standard examples are the British *Gesta Romanorum,* the Spanish *El novellino,* and the aforementioned *Disciplina clericalis.* Among Jews similar collections were made, especially in Morocco as well as in Moorish Spain. Two of the most important are *The Book of Comfort* by Nissim ben Jacob ben Nissim of al-Qayrawān (11th century) and *The Book of Delight* by Joseph ben Meir ibn Zabara of Spain (end of the 12th century). The former, composed in Judeo-Arabic, is a collection of some 60 moralizing tales designed to comfort the author's father-in-law on the loss of a son. It belongs to a well-known genre of Arabic literature, derives mainly from Arabic sources, and is permeated by a preoccupation with divine justice, typical of the Muʿtazilite school of Islāmic theology. It was later translated into Hebrew. *The Book of Delight* consists of 15 tales, largely about the wiles of women, exchanged between two travelling companions—a form of cadre, or "enclosing tale," adopted on a more extensive scale by Chaucer in his *Canterbury Tales,* which dates from the same period. Typical is the tale of the "Silversmith and His Wife," which relates how a craftsman, persuaded by his greedy wife to make a statue of a princess, gets his hands cut off by the king for violating the Islāmic law against making images, while his wife reaps rich rewards from the flattered princess. Although most of the stories are taken from Arabic sources, some indeed find parallels in rabbinic literature To the latter category belongs, for instance, the famous tale of the matron of Ephesus, who, while keeping vigil over her husband's tomb, at the same time engages in an intrigue with a guard posted nearby to watch over the corpses of certain crucified robbers. When, during one of their trysts, one of the corpses is stolen and her lover therefore faces punishment, the shrewd woman exhumes the body of her husband and substitutes it. This tale is found already in the *Satyricon* of Petronius and was later used by Voltaire in his *Zadig* and by the 20th-century English playwright Christopher Fry in his *A Phoenix Too Frequent.*

The story of the matron of Ephesus

Of the same genre but deriving mainly from west European rather than Arabic sources are the *Mishle shuʿalim* ("Fox Fables") of Berechiah ha-Nakdan (the Punctuator), who may have lived in England toward the end of the 12th century. About half of these tales recur in Marie de France's *Ysopet,* and only one of them is of specifically Jewish origin. Berechiah's work was translated into Latin and thence became a favourite repertoire of European storytellers.

Among anonymous compendiums of this type is *The*

Alphabet of Ben Sira, extant in two recensions, probably of the 11th century. This is basically a collection of proverbs attributed to the famous sage of the apocryphal book Ecclesiasticus (Wisdom of Jesus the Son of Sirach). In one of the recensions they are illustrated by appropriate tales. The author is represented as an infant prodigy who performs much the same feats of sapience as are attributed to Jesus in some of the Infancy Gospels.

The *Josippon, Jashar,* and *Jerahmeel* collections

Medieval historiated Bibles and legendary histories. Two other developments mark the history of Jewish myth and legend during the Middle Ages. The first was a revival of the Hellenistic vogue of compiling large-scale compendiums in which the history of the Jews was "integrated," in legendary fashion, with that of the world in general and especially with classical traditions. Two major works of this kind, both composed (apparently) in Italy during the 9th century, are (1) *Josippon,* composed by a certain Ben Gorion, which presents a fanciful record from the creation onward and contains numerous references to foreign nations; and (2) the *Book of Jashar,* a colourful account from Adam to Joshua, named for the ancient book of heroic songs and sagas mentioned in the Bible (Josh. 10:13; II Sam. 1:18). There is also a voluminous *Chronicles of Jerahmeel,* written in the Rhineland in the 14th century. This draws largely on Pseudo-Philo's earlier compilation, mentioned above, and is of special interest because it includes Hebrew and Aramaic versions of certain books of the Apocrypha.

Medieval Haggadic compendiums. The other development was the gathering of Haggadic legends and tales into comprehensive, systematic compendiums. Works of this kind are (1) *Yalquṭ Shimeʿoni* ("The Collection of Simeon"), attributed to a certain Rabbi Simeon of Frankfurt am Main; (2) *Midrash ha-gadol* ("The Great Midrash"), composed after the death of Moses Maimonides (1204), whom it quotes; and (3) the *Midrash of David ha-Nagid,* grandson of Maimonides. About 100 years later appeared a similar work, *Yalquṭ ha-Makiri* ("The Collection of Makhir"), on the Prophets and Holy Writings, compiled by one Makhir ben Abba Mari in Spain (see above *Torah*). It has been suggested that the compilation of such works was spurred by the necessity of providing "ammunition" for the public disputations with Christian ecclesiastics that the church forced upon Jewish scholars in this period.

Myth and legend in the modern period. *Kabbalistic tales.* In the 16th century, Jewish myth and legend took several new directions. The disappointment of messianic expectations through the dismal eclipse of the pretender Shabbetai Tzevi produced, by way of compensation, an increased interest in occult speculation and in the mystical lore of the Kabbala (esoteric Jewish mysticism). Important schools of Kabbala arose in Italy and at Safed, in Palestine, and tales of the miraculous Faust-like powers of such masters as Isaac Luria and Ḥayyim Vital Calabrese began to circulate freely after their deaths.

The legend of Joseph della Reyna

Another reaction to the dashing of messianic hopes is represented by the beautiful story of the Kabbalist Joseph della Reyna and his five disciples, who go journeying through the world to oust Satan and prepare the way for the Deliverer. Warned by the spirits of such worthies as Rabbi Simeon ben Yoḥai and the prophet Elijah, they nevertheless succeed eventually in procuring their blessing and help and are sent on to the angel Metatron. The latter furnishes them with protective spells and spices and advises Joseph to inscribe the ineffable name of God on a metal plate. When, however, they reach the end of their journey Satan and his wife, Lilith, attack them in the form of huge dogs. When the dogs are subdued they beg for food. Moved to pity, Joseph gives them spices to revive them. At once they summon a host of devils. Two of the disciples die of terror; two go mad, and only Joseph and one disciple are left. The Messiah weeps in heaven, and Elijah hides the great horn of salvation. A voice rings out telling Joseph that it is vain to attempt to hasten the footsteps of the Redeemer.

The repertory of Jewish tales and legends was seasoned, however, by other elements. During the 16th century—the age of the great navigators—stories began to circulate about the discovery of the Ten Lost Tribes in remote parts of the world.

Judeo-German (Yiddish) tales. It was at the same period that Judeo-German (Yiddish) came increasingly to replace Hebrew as the language of Jewish tales and legends in Europe, a major factor in this development being the desire to render them accessible to women unschooled in the sacred tongue. Not only were the synagogal lessons from Scripture legendarily embellished in a so-called *Taitsh Humesh* ("Yiddish Pentateuch"), in the more fancifully titled *Tzeʾena u-reʾena* ("Go Forth and See"; *cf.* S. of Sol. 3:11) by Jacob ben Isaac Ashkenazi, and in adaptations of the story of Esther designed for dramatic presentation on the feast of Purim, but the Hebrew *Chronicles of Josippon* also assumed Yiddish dress. More secular productions were a verse rendition of the Arthurian legend, entitled *Artus Hof* ("The Court of King Arthur"), based largely on Gravenberg's medieval *Wigalois,* and the *Bove Buch* by Elijah Levita, which retold the romance of Sir Bevis of Southampton.

These "frivolous" productions were in time offset by collections of moral and ethical tales. The principal of these are (1) the *Brantspiegel,* attributed to a certain Moses Henoch (Prague 1572), and (2) the *Maʿaseh Buch* ("Story Book"), a compendium of 254 tales compiled by Jacob ben Abraham of Meseritz and first published at Basel in 1602. The latter was drawn mainly from the Talmud but was supplemented by later legends about medieval rabbis. Jewish legends also circulated in the form of ephemeral chapbooks, a large selection of which is preserved in the library of the Yiddish Scientific Institute in New York City.

Judeo-Persian and Judeo-Spanish (*Ladino*) *tales.* A similar development, though on a lesser scale, took place among Jews who spoke other vernacular dialects. Major monuments of Judeo-Persian literature are poetic embellishments of biblical narratives composed by a certain Shāhīn of Shīrāz in the 14th century and by Joseph ben Isaac Yahudi (*i.e.,* the Jew) some 300 years later. These, however, are exercises in virtuosity rather than in creative storytelling. In Judeo-Spanish (Ladino) there are versified elaborations of the story of Joseph, entitled *Coplas de Yoçef* ("Song of Joseph"), composed, in 1732, by Abraham de Toledo and embodying a certain amount of traditional haggadic material. From a revival of literary activity in the 18th century comes a comprehensive "legendary Bible" called Me-ʿam Loʿez ("From a People of Strange Tongue"; *cf.* Ps. 114:1), begun by one Jacob Culi and continued by later writers, as well as several renderings of standard Hebrew collections and a number of Purim plays. Until the Nazi holocaust in the 1940s, Judeo-Spanish folktales were still current in Macedonia and Yugoslavia, but these leaned more on Balkan than on Jewish sources.

Ḥasidic tales. The rise of the Ḥasidic sect (a popular pietistic-mystical movement) in eastern Europe at the end of the 18th century begat a host of legends (circulated mainly through chapbooks) concerning the lives, wise sayings, and miracles of such *tzaddiqim,* or masters, as Israel ben Eliezer, "the Besht" (1700–60), and Dov Baer of Meseritz (died 1772). (See also above *Jewish mysticism.*) These, however, are anecdotes rather than formally structured stories and often borrow from non-Jewish sources.

Droll stories. To the popular creativity of the ghetto belong also the droll tales of the Wise Men of Chełm (in Poland)—Jewish counterparts of the German noodles (stupid people; hence "noodle stories") of Schildburg and of the more familiar English Wise Men of Gotham. These, too, were circulated mainly in Yiddish popular prints. Typical of them is the tale of the two "sages" who went for a walk, one carrying an umbrella and the other without one. Suddenly it began to rain. "Open your umbrella," said the one without one. "It won't help," answered the other, "it's full of holes." "Then why did you bring it?" rejoined his friend. "I didn't think it would rain," was the reply.

Modern Israeli folktales. The gathering of Jews from many lands into the modern state of Israel has made that country a happy hunting ground for the student of Jewish folktales. Assiduous work has been undertaken by Dov Noy of Hebrew University in Jerusalem, aided by enthusiastic amateurs throughout the country. Mainly, however, the stories are retellings of traditional material. (T.H.G.)

Judaism in world perspective

RELATION WITH NON-JUDAIC RELIGIONS

Exclusivist and universalist emphases. The biblical tradition out of which Judaism emerged was predominantly exclusivist ("no other gods"). The gods of the nations were regarded as "no gods" and their worshippers as deluded, while the God of Israel was acclaimed as the sole lord of history, and the Creator of heaven and earth. The unexpected universalist implications of this exclusivism are most forcibly expressed in an oft-quoted verse from Amos (9:7):

God's rule over all the nations

> "Are you not like the Ethiopians to me, O people of Israel?" says the Lord. "Did I not bring up Israel from the land of Egypt, and the Philistines from Caphtor and the Syrians from Kir?"

Here the universal rule of the God of Israel is unmistakably proclaimed. Yet in the same book (3:1–2), after referring to the deliverance from Egypt—an act recognized as similar to that occurring in the affairs of other peoples—the prophet, speaking for God, says: "You only have I known of all the families of the earth." Thus the exclusivism has two focuses, one universal, the other particularistic. The ultimate claim of the universalistic position is found in Malachi 1:11: "For from the rising of the sun to its setting my name is great among the nations." This, however, in no way negates the special covenantal relationship between God and his people; indeed, it is this universalistic theme that underscores that special relation. To interpret Judaism's stance toward other religious systems in any other way is to fail to do justice to its inner dialectic. It is neither a bland latitudinarianism that admits any or all viewpoints and practices, nor a fanatical intolerance but rather a subtle interplay of affirmation and rejection. The latter is directed primarily against the worship of finite things or aspects—idolatry—the basic failure of the peoples who are the objects of the same divine solicitude as is Israel. If the religions of the nations are rejected because of their failure fully and truly to know God, the peoples themselves are not. Living under the covenant with Noah (see above), their fulfillment of such responsibilities provides for their acceptance, for they are not expected to live within the realm of Torah (see also *Relations with other religions* below).

Relation to Christianity. Judaism's relation to Christianity is a complicated one because of the close historical interconnections between them. From a Judaic standpoint, Christianity is or was a Jewish "heresy" and as such may be judged somewhat differently than other religions. Its claims over against Judaism as the true fulfillment of the covenant and, thus, as the true Israel have given rise throughout the centuries to polemics of varying intensity. The rise to power of the church and the embodiment of its anti-Judaic sentiments and attitudes in the political structures and processes of Christian nations made sharply negative Jewish responses inevitable. Nevertheless, during the Middle Ages Jewish thinkers attempted to avoid designating Christianity as idolatry and even to argue that, in a special way, being derived from Judaism, it was fulfilling—at least on the moral plane—the divine purpose.

Christian and Jewish polemic and counter-polemic

In modern times the relation has undergone changes necessitated by the newer situations into which the Jewish community has moved. This does not mean that the polemical-apologetic stance has come entirely to an end. The rejection of Judaism as a living religion by Christians continued and continues, argued not so much on dogmatic as on scholarly grounds. The Jewish response to this has often been countercriticism. Beyond this, however, there has been a growing inclination within the Jewish community to respond to the development of an affirmative theology of Judaism in both the Roman Catholic and Protestant churches by providing a theology of Christianity within Jewish thought. Occasional formulations in this direction have appeared, but it is far too early to know exactly what will emerge. At the same time, it must be noted, there are those who see no need for such a movement, arguing that the failure of the Christian churches in recent years to respond adequately to the tragedies of Jewish existence precludes any real engagement of one with the other.

Relation to Islām. The emergence of Islām in Arabia in the 7th century CE brought Judaism face to face with a second religious movement that derived some of its ideas and structures from the older tradition. In this case, as in that of Christianity, the new religion claimed a special relation with Judaism. Muḥammad held that the faith he proclaimed was none other than the pristine religion of Abraham, the father of Ishmael—progenitor of the Arabs—as well as of Isaac, from whom the people of Israel descended. That religion had been distorted both by Judaism and Christianity; and Muḥammad, the "seal" of the prophets, had been called by God to restore it to its purity. The confrontation between Judaism and Islām, as that with Christianity, was coloured by political and social considerations both before and after Islām moved out of Arabia to build a world empire (including the conquest and settlement of Palestine). During the subsequent period, the intellectual development of the Islāmic world and the emergence of theologians and philosophers of the highest order challenged Judaism and had considerable influence on the rise of similar thinkers within that community. Given the strong monotheism and the anti-iconic attitude of Islām, many of the questions that arose between Judaism and trinitarian and iconic Christianity were not an issue between Judaism and Islām. The crucial point of dispute here was the nature of prophecy, given Muḥammad's claim concerning his culminating role in the prophetic tradition. The medieval period thus saw polemics directed against that claim and, as in the case of the theological work of Moses Maimonides, *More nevukhim* (*The Guide of the Perplexed*), an exposition of the nature of prophecy that, without directly dealing with Muḥammad's claim, may be understood to undercut it. Nonetheless, Islām, too, was understood to contribute to the fulfillment of the divine purpose. From the late medieval period onward, the intellectual engagement between the two religions diminished with the general decline in the Turkish Empire that then embraced the Muslim world. In modern times it has not yet been renewed for many reasons. Once the political problems in the eastern Mediterranean between the State of Israel and the Arab world have been meliorated, the contiguity of the two communities suggests an inevitable renewal of conversations on the religious as on many other levels.

Relations with other religions. Judaism's encounters with religions other than Christianity and Islām have been in large measure limited to the past. In the Hellenistic world, it confronted and rejected the varieties of syncretistic cults that grew up. Within the Sāsānian Empire it was forced to deal with Zoroastrianism, but the outlines of its response have not yet been entirely disentangled from the literature of the period. In the modern world, particularly in the most recent period, it has come face to face with the religions of the Middle and Far East, but beyond a few tentative explorations nothing tangible has appeared. What seems certain is that, considering the growing interest in and exchange between East and West, Jewish thinkers will not be able to rest with older formulations concerning the nature of other religious systems. Without compromising its own faith or falling into an uncritical relativism, Judaism may indeed in the future seek a new way of understanding and relating to the varieties of religious systems facing it on the world scene.

Judaism confronts the religions of mankind

THE ROLE OF JUDAISM IN WESTERN CULTURE AND CIVILIZATION

Its historic role. Given the relationship between Judaism and Christianity—the dominant religious force in the development of Western culture—the role of Judaism in that development was significant. Although the church drew from other sources as well, its retention of the sacred Scriptures of the synagogue (the "Old Testament") as an integral part of its Bible—a decision sharply debated in the 2nd century CE—was crucial. Not only was the development of its ideas and doctrines deeply influenced, but it received as well an ethical dynamism that constantly overcame an inclination to withdraw into world-denying isolation. It was, however, not only Judaism's heritage but its persistence that touched Western civilization. The continuing existence of the Jews, even as a pariah people, was both a challenge and a warning; and ultimately, at the beginning of the modern era, their liberation from the shackles of discrimination, segregation, and rejection was understood by many to be the touchstone of all human liberty. Until the final ghettoization of the Jew—it is well to remember that the term "ghetto" belongs in the first instance to Jewish history—at the end of the Middle Ages and the beginning of the Renaissance, intellectual contact between Judaism and Christianity, and thus with Western culture, did not cease. Jerome translated the Hebrew Bible into Latin with the aid of Jewish scholars; Luther, into German with the aid of commentaries beholden to Jewish authors. Jewish thinkers mediated the remarkable intellectual achievements of the Islāmic world to Christian Europe and added their own contributions as well. Even heresies within the church found, on occasion, their inspiration or prototype in Judaism.

Its present role. In the modern world, while the influence of Jews has increased in almost every realm of cultural life, the impact of Judaism has diminished. The reason for this is not difficult to find. The Gentile leaders who extended emancipation to the Jews at the end of the 18th and beginning of the 19th centuries, while eager to grant political equality to the individual Jew, did so with the implicit and explicit requirement that conformity through reforms of Judaism be agreed to. With the transformation of Judaism into an ecclesiastical institution, largely on the model of German Protestant churches, its ideas and structures took on the cast of its environment in a way quite unlike what had ensued in its earlier confrontations with various philosophical systems. Indeed, for some, Judaism and 19th-century European thought were held to be not merely congruent but identical. Thus, while numerous contributors to diverse aspects of Western culture and civilization are to be found among Jews of the 20th century—scientists, politicians, statesmen, scholars, musicians, artists—their activities cannot, except in specific instances, be considered as deriving from Judaism as it has been sketched above.

The two key events: Auschwitz and the establishment of Israel

Future prospects. Two events of the 20th century have, however, confronted Judaism in such ways as to suggest that its wrestling with them and their profound challenge to it may presage a new role and a new influence for Judaism: "Auschwitz" and the establishment of the State of Israel. The premeditated murder of some 6,000,000 European Jews by the Nazis for no other reason than that they were Jews, has shaken Jewish thinkers to their very core. Indeed, so traumatic was this event, that for almost two decades following it, no substantial attempt was made to plumb its meaning. At the same time, the reappearance of the State of Israel, viewed for the most part from outside the Jewish community as nothing more than a political event, has set in motion an entirely different chain of theological inquiry. These two happenings have clearly, but in as yet unpredictable ways, begun to work and to move within the thought of contemporary Judaism. Out of this working and moving there may emerge an inescapable spiritual impact upon Western culture and civilization, which have, as yet, resolutely refused to face the realities these fateful occurrences represent. If contemporary Judaism is able to say what they mean, however haltingly, it will have renewed its potent relationship to the Western world, and, given the nature of contemporary society, established a similar bond with the Eastern world as well. (L.H.S.)

Hellenistic Judaism: (*Bibliographies*): GERHARD DELLING (ed.), *Bibliographie zur jüdisch-hellenistischen und intertestamentarischen Literatur 1900–1970,* 2nd ed. (1975), extremely comprehensive bibliography on religion and literature of Diaspora Judaism, arranged according to topics, with separate bibliographies on every major Hellenistic Jewish author and on each book of the Apocrypha and Pseudepigrapha; RALPH MARCUS, "A Selected Bibliography (1920–1945) of the Jews in the Hellenistic-Roman Period," *Proceedings of the American Academy for Jewish Research,* 16:97–181 (1946–47), covers both Palestine and the Diaspora, helpful for noting works that are useful introductions and works that are indispensable to the specialist; LOUIS H. FELDMAN, *Scholarship on Philo and Josephus, 1937–1962* (1963), critical bibliography, arranged topically, with comments on both Diaspora and Palestinian Judaism generally. (*Papyrological and archaeological sourcebooks*): VICTOR A. TCHERIKOVER, ALEXANDER FUKS, and MENAHEM STERN (eds.), *Corpus Papyrorum Judaicarum,* 3 vol. (1957–64), contains text, translation, bibliography, and commentary on all papyri and inscriptions pertaining to Jews from 323 BCE to 641 CE—thoroughly reliable; ERWIN R. GOODENOUGH, *Jewish Symbols in the Greco-Roman Period,* 13 vol. (1953–68), a magnificent, exhaustive collection of the archaeological findings, with highly insightful, if controversial, commentary. (*Standard scholarly treatments of Hellenistic Judaism*): VICTOR A. TCHERIKOVER, *Hellenistic Civilization and the Jews* (1959; orig. pub. in Hebrew, 1930), extremely meticulous and generally balanced (though with an anti-theological bias), particularly in dealing with the political and social factors in both Palestinian and Diaspora Jewry; ROBERT H. PFEIFFER, *History of New Testament Times, with an Introduction to the Apocrypha* (1949), a sane and useful, if unoriginal, survey of the political, religious, and literary history of Palestinian and especially Diaspora Judaism, from 200 BCE to 200 CE; MOSES HADAS, *Hellenistic Culture: Fusion and Diffusion* (1959), highly suggestive, though often extravagant, treatment of the interaction of Hellenism and other cultures, especially Judaism. (*Introductory popular treatments of Hellenistic Judaism*): RALPH MARCUS, "The Hellenistic Age," in LEO W. SCHWARZ (ed.), *Great Ages and Ideas of the Jewish People,* pp. 93–139 (1956), extremely judicious and readable account by an eminent authority; for a readable guide to the literature, together with representative samples, see his "Hellenistic Jewish Literature," in LOUIS FINKELSTEIN (ed.), *The Jews: Their History, Culture and Religion,* 3rd. ed., vol. 2, pp. 1077–1115 (1960). (*Works on Palestinian Judaism*): GEORGE FOOT

MOORE, *Judaism in the First Centuries of the Christian Era,* 3 vol. (1927–30, reprinted 1966–67), classic treatment based primarily on the Talmudic corpus, though the view of a Pharisaic "normative" Judaism has since been strongly challenged; SOLOMON ZEITLIN, *The Rise and Fall of the Judaean State: A Political, Social and Religious History of the Second Commonwealth,* 2 vol. (1962–67), stimulating and often highly original survey of the period from 332 BCE to 66 CE, though the scholarly dogmatism is occasionally jarring; SAUL LIEBERMAN, *Greek in Jewish Palestine,* 2nd ed. (1965) and *Hellenism in Jewish Palestine,* 2nd ed. (1962), highly significant, ingenious, and learned illustrations of the influence of Greek culture on the language and exegetical format of the Palestinian rabbis. (*Works on Diaspora Judaism*): HARRY A. WOLFSON, *Philo: Foundations of Religious Philosophy in Judaism, Christianity, and Islam,* rev. ed., 2 vol. (1962), a great and seminal, though controversial, work that makes Alexandrian Judaism a collateral branch of Palestinian Pharisaic Judaism; LOUIS H. FELDMAN, "The Orthodoxy of the Jews in Hellenistic Egypt," *Jewish Social Studies,* 22:215–237 (1960), a survey using literature, papyri, and art objects to examine the synthesis of Greek culture and Judaism in the upper and lower classes, respectively, of Hellenistic Egypt. See also JOHN J. COLLINS, *Between Athens and Jerusalem: Jewish Identity in the Hellenistic Diaspora* (1983); and MENAHEM MOR and URIEL RAPPAPORT, *Bibliography of Works on Jewish History in the Hellenistic and Roman Periods* (1982).

Rabbinic Judaism: (*Palestinian Judaism*): SOLOMON SCHECHTER, *Aspects of Rabbinic Theology* (1961), a concise, authoritative, and engaging treatment of classical (*i.e.,* rabbinic) Judaism. (*Babylonian Judaism*): JACOB NEUSNER, *A History of the Jews in Babylonia,* 5 vol. (1965–70; vol. 1, rev. 1969), the most comprehensive treatment of Babylonian Jewry during the Tannaitic and Amoraic periods. (*Judeo-Arabic culture*): S.D. GOITEIN, *Jews and Arabs: Their Contacts Through the Ages,* 3rd rev. ed. (1974), a popular work by the ranking authority on all aspects of Jewish–Arabic symbiosis, particularly valuable for the medieval period; ABRAHAM IBN DAUD, *Sefer ha-Qabbalah* (*The Book of Tradition*), ed. and trans. by GERSON D. COHEN (1967), the classic medieval Hebrew chronicle with analytic essays on Spanish Jewry's "golden age." (*Jews of medieval Europe*): ISRAEL ABRAHAMS, *Jewish Life in the Middle Ages,* new ed. rev. by CECIL ROTH (1932), delightful and erudite studies of social life and institutions in medieval Europe; MORITZ GÜDEMANN, *Geschichte des Erziehungswesens und der Cultur der Juden,* 3 vol. (1880–88), a social and intellectual history of medieval Ashkenazic Jewry (France, Germany, Italy); CECIL ROTH, *The Jews in the Renaissance* (1959), lucid and informative, but with little critical analysis, valuable on Jewish contact with Christian men of letters; GERSHOM SCHOLEM, *Shabbethai Zevi,* 2 vol. (1957), a penetrating and comprehensive study (in Hebrew) of the great false Messiah as well as of his religious antecedents and legacy; STEPHEN SHAROT, *Messianism, Mysticism, and Magic: A Sociological Analysis of Jewish Religious Movements* (1982), an informative scholarly study.

Contemporary Judaism: The most convenient summary for the study of modern Jewish history is HOWARD MORLEY SACHAR, *The Course of Modern Jewish History,* updated and expanded ed. (1977). Modern Jewish thought and movements are covered in a useful manual by JOSEPH BLAU, *Modern Varieties of Judaism* (1966). NATHAN ROTENSTREICH, *Jewish Philosophy in Modern Times* (1968); and the last (modern) section of JULIUS GUTTMAN, *Philosophies of Judaism* (1964), are more advanced. The very best book on Jewish religion in the modern age is unfortunately still untranslated: MAX WIENER, *Jüdische Religion im Zeitalter der Emanzipation* (1933). For Zionism, see the only attempt at a comprehensive reader in English, ARTHUR HERTZBERG (ed.), *The Zionist Idea* (1959). There are two excellent expositions of Judaism from a Reform–Liberal point of view: LEON ROTH, *Judaism: A Portrait* (1960); and LEO BAECK, *The Essence of Judaism* (1961). Conservative Judaism is well described in a book about its early history, MOSHE DAVIS, *The Emergence of Conservative Judaism* (1963); and by JACOB AGUS, *Dialogue and Tradition* (1969), the essays of a distinguished Conservative thinker. Reconstructionism is best understood in the words of its founder, MORDECAI M. KAPLAN, *Judaism As a Civilization,* 2nd ed. (1957). The standard modern single volume about Orthodox Judaism is ISIDORE EPSTEIN, *Judaism* (1935). Neo-Ḥasidism was best described by its greatest exponent, MARTIN BUBER, *The Origin and Meaning of Hasidism* (1960). Later studies include EUGENE B. BOROWITZ, *Choices in Modern Jewish Thought: A Partisan Guide* (1983); PAUL R. MENDES-FLOHR and JEHUDA REINHARZ (eds.), *The Jew in the Modern World* (1980); DAN ROSS, *Acts of Faith: A Journey to the Fringes of Jewish Identity* (1982).

Judaic literature: B. GERHARDSSON, *Memory and Manuscript* (1961), contains a description of the methods and techniques by which the oral tradition was transmitted. H.L. STRACK, *Introduction to the Talmud and Midrash* (1931); and M. MIELZINER, *Introduction to the Talmud,* 4th ed. (1968), are still the best introductions for the general reader. The latter is particularly helpful in explaining Talmudic dialectic terminology and debate. J. BOWKER, *The Targums and Rabbinic Literature* (1969); and E. DEUTSCH, *The Talmud* (1895), are both descriptions of the Talmud, the former concentrating upon Talmudic literary compilations and the latter upon Talmudic content. The introduction of J. GOLDIN, *The Living Talmud* (1957), contains a vivid description of Talmudic debate. C. ALBECK, *Introduction to the Talmud,* in Hebrew (1969); and Z.H. CHAJES, *The Student's Guide Through the Talmud* (Eng. trans. 1952), are more advanced introductions, the former analytical and scientific and the latter representing the traditional view. J. NEUSNER (ed.), *The Formation of the Babylonian Talmud* (1970), contains summaries of some research by modern scholars on the question of how the Talmud was formed. L. GINZBERG, "Introduction to the Talmud," in *A Commentary on the Palestinian Talmud,* vol. 1 (1941), is the only introduction to the Palestinian Talmud available in the English language. L. FINKELSTEIN, *Akiba* (1962), is a historical and sociological approach to the development of Halakha. See SAUL LIEBERMAN, *op. cit.,* for the interrelationship between the ancient rabbinic world and its Gentile environment. B. COHEN, *Jewish and Roman Law,* 2 vol. (1966); and I. HERZOG, *The Main Institutions of Jewish Law,* 2 vol. (1966–67), are the best English descriptions of Jewish law. J. Z. LAUTERBACH, *Rabbinic Essays* (1951); and E.E. URBACH, *The Sages: Their Concepts and Beliefs,* in Hebrew (1969), cover the major aspects of rabbinic theology. I. HEINEMANN, *Paths of the Aggadah,* in Hebrew (1970); M. KADUSHIN, *The Rabbinic Mind,* 3rd ed. (1972); and D. BEN AMOS, *Narrative Forms of the Haggadah: Structural Analysis* (1969), discuss Haggadic methods, forms, concepts, and thinking. L. ZUNZ, *Die Gottesdienstlichen Vorträge der Juden* (1892; updated Hebrew translation, 1950), is a thorough historical survey of Haggadic literature. D. NOY, *Motif-Index of the Talmudic-Midrashic literature* (1954); J.J. SLOTKI, *Index Volume to the Soncino Talmud* (1952); M. GASTER, *The Exempla of the Rabbis* (1924, rev. ed. 1968); and C.G. MONTEFIORE and H. LOEWE, *A Rabbinic Anthology* (1938), are very helpful as reference guides; while W.O.E. OESTERLEY, H. LOEWE, and E.I.J. ROSENTHAL, *Judaism and Christianity,* rev. ed. (1969); and C. MERCHAVIA, *The Church Versus Talmudic and Midrashic Literature,* in Hebrew (1970), describe the relationship between the church and rabbinic Judaism. E.R. BEVAN and C. SINGER (eds.), *The Legacy of Israel* (1927), deals with the influence of Judaism on world culture. Extensive bibliographies may be found in the works of Gerhardsson, Mielziner, Bowker, and Ben Amos. JACOB NEUSNER, *Judaism: The Evidence of the Mishnah* (1981), introduces new methods of textual criticism.

Basic beliefs and doctrines: KAUFMANN KOHLER, *Jewish Theology: Systematically and Historically Considered* (1918, reprinted 1928); YEHEZKEL KAUFMANN, *The Religion of Israel from Its Beginnings to the Babylonian Exile* (1960; orig. pub. in Hebrew, 1937–56), an abridgement and translation of the work of one of the most influential Jewish biblical scholars of modern times; GEORGE FOOT MOORE, *Judaism in the First Centuries of the Christian Era,* 3 vol. (1927–30), a masterful work by a distinguished Christian student of Judaism; SOLOMON SCHECHTER, *Some Aspects of Rabbinic Theology* (1909, reprinted 1936 and 1961), an insightful presentation of the basic doctrines; CLAUDE G. MONTEFIORE and HERBERT LOEWE, *A Rabbinic Anthology* (1960), a collection of materials from rabbinic sources, arranged under theologic headings, with ample notes and discussions; JULIUS GUTTMANN, *Philosophies of Judaism: The History of Jewish Philosophy from Biblical Times to Franz Rosenzweig* (1964), a philosophy of Judaism in the form of a history of philosophy in Judaism; ARTHUR HERTZBERG (ed.), *Judaism* (1961); JACOB NEUSNER, *The Way of Torah: An Introduction to Judaism,* 3rd ed. (1979), a very helpful statement using a history-of-religions approach; LEO BAECK, *Dieses Volk; jüdische Existenz,* 2 vol. (1955–57; Eng. trans., *This People Israel: The Meaning of Jewish Existence,* 1964), a masterful interpretation of Jewish affirmations set within an historical context; ABRAHAM E. MILLGRAM (ed.), *Great Jewish Ideas* (1964), a collection of essays by various scholars setting forth classic positions, covering a wide range of theological ideas; JACOB B. AGUS, *The Jewish Quest* (1983), a collection of essays on basic concepts of Jewish theology.

Ethics and society: SIMON BERNFELD (comp.), *The Foundations of Jewish Ethics,* 2nd rev. ed. (1968), source materials covering Jewish history, with brief introductions by several notable scholars; MORITZ LAZARUS, *Die Ethik des Judenthums,* 2 vol. (1898–1911; Eng. trans., *The Ethics of Judaism,* 1900), a classic presentation from a 19th-century perspective; SAMUEL S. COHON, *Judaism: A Way of Life* (1948), written from the Reform point of view but deeply sympathetic to a wide range of ideas. Jewish ethics is also explored in ANNE ROIPHE, *Generation Without Memory: A Jewish Journey in Christian Amer-*

ica (1981); and illustrated with literary examples in FRANCINE KLAGSBRUN (comp.), *Voices of Wisdom: Jewish Ideals and Ethics for Everyday Living* (1980).

Basic practices and institutions: LEWIS N. DEMBITZ, *Jewish Services in Synagogue and Home* (1898); HAYYIM SCHAUSS, *The Jewish Festivals* (1938; orig. pub. in Hebrew, 1933), and *The Lifetime of a Jew Throughout the Ages of Jewish History* (1950); ABRAHAM Z. IDELSOHN, *Jewish Liturgy and Its Development* (1932, reprinted 1967); MARK L. RAPHAEL (ed.), *Jews and Judaism in the United States: A Documentary History* (1983); SHALOM LILKER, *Kibbutz Judaism: A New Tradition in the Making* (1982).

Art and iconography: FRANZ LANDSBERGER, *A History of Jewish Art* (1946); ABRAHAM Z. IDELSOHN, *Jewish Music in Its Historical Development* (1929, reprinted 1967); CECIL ROTH (ed.), *Jewish Art: An Illustrated History* (1961).

Relation with non-Judaic religions: LEO BAECK, *Judaism and Christianity* (1958); SAMUEL SANDMEL, *We Jews and You Christians: An Inquiry into Attitudes* (1967); JACOB KATZ, *From Prejudice to Destruction: Anti-Semitism* (1980); FRANCIS E. PETERS, *Children of Abraham: Judaism, Christianity, Islam* (1982).

The role of Judaism in Western culture and civilization: CECIL ROTH, *The Jewish Contribution to Civilization* 3rd ed. (1956); DENNIS B. KLEIN, *Jewish Origins of the Psychoanalytic Movement* (1981).

The present-day forms of Judaism: LEON D. STITSKIN (ed.), *Studies in Torah Judaism* (1969); ALFRED JOSPE (ed.), *Tradition and Contemporary Experience: Essays on Jewish Thought and Life* (1970); ARNOLD JACOB WOLF (ed.), *Rediscovering Judaism: Reflections on a New Theology* (1965); *The Condition of Jewish Belief: A Symposium, Compiled by the Editors of Commentary Magazine* (1966); MORDECAI M. KAPLAN, *Judaism as a Civilization,* 2nd ed. (1957); SOLOMON POLL, *The Hasidic Community of Williamsburg: A Study in the Sociology of Religion* (1969); BERNARD MARTIN (ed.), *Contemporary Reform Jewish Thought* (1968); CHARLES LIEBMAN, "Orthodoxy in American Jewish Life," *American Jewish Yearbook* (1965); MORDECAI WAXMAN (ed.), *Tradition and Change: The Development of Conservative Judaism* (1958); JOSHUA ROTHENBERG, *The Jewish Religion in the Soviet Union* (1972).

The religious year: ROLAND DE VAUX, *op. cit.,* summarizes the contemporary state of biblical scholarship regarding the origin and development of the Jewish calendar, sabbath, and festivals. Other relevant works include: THEODOR H. GASTER, *Festivals of the Jewish Year* (1953), an anthropological, comparative, and often speculative approach to the sabbath and festivals; SHLOMO YOSEF ZEVIN, *ha-Moʿadim ba-halakhah* (1944), a modern classic (in Hebrew) treating talmudic and post-talmudic developments in the festival observances; and MENAHEM M. KASHER, *Torah Shelemah,* vol. 13 (1949), a comprehensive history of the Jewish calendar, also in Hebrew.

General introductions to Jewish philosophy: JULIUS GUTTMANN, *Die Philosophie des Judentums* (1933; Eng. trans., *Philosophies of Judaism,* 1964), the best general treatment of Jewish philosophy from the ancient to the modern period, ending with Franz Rosenzweig; NATHAN ROTENSTREICH, *Jewish Philosophy in Modern Times: From Mendelssohn to Rosenzweig* (1968), a good philosophical discussion of the major thinkers in modern Jewish philosophy, especially perceptive on Hermann Cohen. ALEXANDER ALTMANN, *Essays in Jewish Intellectual History* (1981), a collection of insightful scholarly essays on many aspects of Jewish philosophy.

Hellenistic philosophy: NAHUM GLATZER (ed.), *The Essential Philo* (1971), lengthy selections from the major works of Philo, with notes; HARRY A. WOLFSON, *Philo,* rev. ed., 2 vol. (1962), the most comprehensive study of Philo in any language, with special emphasis upon Philo's influence upon later philosophy.

Medieval philosophy: ISAAC HUSIK, *A History of Medieval Jewish Philosophy* (1940, reprinted 1969), a thorough examination of each of the major medieval Jewish philosophers from Isaac Israeli through Joseph Albo, with good bibliography; *Three Jewish Philosophers: Philo, Saadya Gaon, Jehuda Halevi,* trans. and ed. by HANS LEWY, ALEXANDER ALTMANN, and ISAAK HEINEMANN (1965), a good introductory anthology containing representative selections from these classical figures with perceptive introductions and explanatory notes; GEORGES VAJDA, *Introduction à la pensée juive du moyen âge* (1947), a good general survey organized around the major philosophical traditions in medieval Jewish philosophy, with extensive bibliography.

Jewish Kalām: SAʿADIA BEN JOSEPH, *The Book of Beliefs and Opinions,* trans. by SAMUEL ROSENBLATT (1948), Saʿadia's important philosophical work dealing with the major topics in Jewish theology such as faith and reason, creation, God, and reward and punishment; *A Karaite Anthology,* trans. and ed. by LEON NEMOY (1952), an excellent collection of the more accessible Karaite materials, covering a wide range of themes, writers, and periods; ISRAEL EFROS, "Medieval Jewish Philosophy" (1967), a collection of essays (in Hebrew) containing a full-length study of Saʿadia's philosophy, in addition to short essays on Judah ha-Levi and Maimonides.

Jewish Neo-Platonism: ISAAC ISRAELI, *Works,* ed. and trans. by ALEXANDER ALTMANN and S.M. STERN (1958), contains complete translations of three of Israeli's works and excerpts from another, together with a comprehensive essay on his philosophy; SOLOMON IBN GABIROL, "Fountain of Life," trans. from the Latin into Hebrew by J. BLUWSTEIN (1950), in addition to a complete vocalized translation of the text this edition contains the Hebrew summary made by Shem Tov ibn Falaquera in the 13th century.

Judah ha-Levi: The Kuzari, trans. by HARTWIG HIRSCHFELD (1964), a complete English translation of the text and notes, with an introductory essay by HENRY SLONIMSKY; LEO STRAUSS, "The Law of Reason in the Kuzari," in *Persecution and the Art of Writing* (1952), in addition to this perceptive and provocative essay on ha-Levi's attitude towards philosophy and rationalistic ethics, the book contains important essays on Maimonides and Spinoza; BAHYA IBN PAQUDA, *The Duties of the Heart* (Hebrew ed. by A. ZIFRONI, 1928; Eng. trans. by EDWIN COLLINS, 1904), one of the more widely read medieval classics of Jewish philosophy, concentrating upon ethics and personal piety; ABRAHAM BAR HIYYA, *The Meditation of the Sad Soul,* trans. with introduction by G. WIGODER (1971), one of the more accessible philosophical works of this important medieval astronomer and mathematician, devoted primarily to ethical and religious themes.

Jewish Aristotelianism: ABRAHAM IBN DAUD, *Das Buch Emunah Ramah,* ed. and trans. into German by S. WEIL (1852), one of the first manifestations of the Jewish assimilation of Aristotelian philosophy, containing a critique of Gabirol's neo-Platonism.

Maimonides: The Guide of the Perplexed, trans. with introductory essay by SHLOMO PINES (1963), an accurate and clear translation, with an excellent essay by Pines and a valuable prefatory essay by LEO STRAUSS; *A Maimonides Reader,* ed. with introduction and notes by I. TWERSKY (1972), a fine anthology containing important material from Maimonides' *Mishne Torah* and other legal writings, as well as from his shorter philosophical-theological essays and the *Guide;* HARRY A. WOLFSON, "Maimonides on Negative Attributes," in the *Louis Ginzberg Jubilee Volume,* pp. 411–446 (1945), the best historical and analytical study of Maimonides' doctrine of divine attributes; and "Halevi and Maimonides on Prophecy," *Jewish Quarterly Review,* n.s., 32:345–370, 33:49–82 (1942), an excellent historical analysis of the sources of doctrines of both philosophers on prophecy and a clear analysis of the differences between them. ISADORE TWERSKY, *Studies in Jewish Law and Philosophy* (1982), is a collection of previously published articles, some of them in Hebrew.

Averroists: (*Isaac Albalag*): GEORGES VAJDA, *Isaac Albalag, Averroïste juif, traducteur et annotateur d'Al-Ghazâlî* (1960), a translation of and commentary on Albalag's main philosophical work, al-Ghazālī's "Inconsistencies of the Philosophers," containing valuable citations from the classical Arabic philosophical texts. (*Levi ben Gerson*): "The Wars of the Lord" (1866), Gersonides' major philosophical work (in Hebrew) dealing with the most difficult and controversial topics in medieval philosophy and science; SEYMOUR FELDMAN, "Gersonides' Proofs for the Creation of the Universe," *Proceedings of the American Academy for Jewish Research,* 35:113–137 (1967), an analytical study of Gersonides' theory of creation and of his criticism of Aristotle's theory of eternity of the universe. (*Hasdai Crescas*): "The Light of the Lord" (1861), Crescas' most original critique (in Hebrew) of Aristotelian philosophy and his vigorous defense of traditional Judaism; HARRY A. WOLFSON, *Crescas' Critique of Aristotle* (1929), the most important study of medieval Jewish and Arabic philosophy so far written, containing a translation and critical Hebrew text of part 1 of the treatise with comprehensive, detailed, and most valuable notes and introductory essay; JOSEPH ALBO, *Book of Principles,* trans. with critical text by ISAAC HUSIK, 4 vol. (1946), a fine translation with helpful notes of Albo's treatise in Jewish dogmatics.

Modern Jewish philosophy: (*Iberian-Dutch philosophers*): I.S. RÉVAH, *Spinoza et le dr. Juan de Prado* (1959), a study of the cultural background of Spinoza's Amsterdam, especially of the heterodox elements in Sefardic Judaism, containing valuable material pertaining to the excommunication of Spinoza and the ideas of Uriel da Costa; BARUCH SPINOZA, *Theologico-Political Treatise,* trans. by R.H.M. ELWES (1883, reprinted 1951), Spinoza's critique of the Bible and the Jewish religion; LEO STRAUSS, *Spinoza's Critique of Religion* (1965), an excellent philosophical study of Spinoza's *Treatise,* its relation to Maimonides, Uriel da Costa, and other Sefardic heterodox thinkers; HARRY A. WOLFSON, *The*

Philosophy of Spinoza, 2 vol. (1934, reprinted 1969), a most detailed commentary on Spinoza's *Ethics,* containing valuable references to Spinoza's medieval sources such as Maimonides, Gersonides, and Crescas.

German philosophers: (*Moses Mendelssohn*): *Jerusalem and Other Jewish Writings,* trans. and ed. by ALFRED JOSPE (1969), a complete translation of *Jerusalem* and other miscellaneous writings, pertaining to questions on the Jewish religion, with a brief, informative, acute introduction by the editor; JULIUS GUTTMANN, "Mendelssohn's Jerusalem and Spinoza's *Theologico-Politico Treatise*" (in Hebrew) in his *Religion and Knowledge* (1956), a collection of Guttmann's essays that also includes important essays on ha-Levi, Maimonides, Gersonides, and Crescas, as well as on themes in modern philosophy of Judaism; NACHMAN KROCHMAL, "Collected Works" (1961, in Hebrew), containing his "Guide for the Perplexed of Our Times," ed. by S. RAWIDOWICZ and Rawidowicz' comprehensive analytical study of Krochmal's philosophy of Jewish history and its relationship to Hegelian philosophy. (*Hermann Cohen*): *Die Religion der Vernunft aus den Quellen des Judentums* (1919, reprinted 1966), Cohen's major work dealing with his philosophy of Judaism, organized according to the main themes of the Jewish religion; *Reason and Hope: Selections from the Jewish Writings of Hermann Cohen,* trans. and ed. by EVA JOSPE (1971), a useful collection from Cohen's miscellaneous writings on Jewish themes. (*Franz Rosenzweig*): *The Star of Redemption,* trans. by WILLIAM HALLO (1971), Rosenzweig's early but impressive statement of his "re-conversion" to Judaism, which has been influential in contemporary Jewish and non-Jewish theology; NAHUM GLATZER, *Franz Rosenzweig: His Life and Thought,* 2nd ed. (1961), an excellent anthology of Rosenzweig's various writings, containing many letters that reveal the more important and intimate episodes in Rosenzweig's career. (*Martin Buber*): See bibliography to article BUBER, MARTIN in the *Micropædia.* Interpretive studies include EMIL L. FACKENHEIM, *To Mend the World: Foundations of Future Jewish Thought* (1982); ARTHUR A. COHEN, *The Tremendum: A Theological Interpretation of the Holocaust* (1981); ALFRED JOSPE (ed.), *Studies in Jewish Thought: An Anthology of German Jewish Scholarship* (1981).

Jewish mysticism: G.G. SCHOLEM, *Major Trends in Jewish Mysticism,* rev. ed. (1961), the standard survey of the subject, with a chapter-by-chapter bibliography, *On the Kabbalah and its Symbolism* (Eng. trans. 1965), several studies on some of the great themes of Jewish mysticism; A.E. WAITE, *The Holy Kabbalah: A Study of Secret Tradition in Israel* (1929), a theosophical view of Jewish mysticism. HUGO ODEBERG, *3 Enoch; or the Hebrew Book of Enoch* (1928); ISIDOR KALISCH, *A Book on Creation* (1877); J. ABELSON, *The Immanence of God in Rabbinical Literature* (1912); G.G. SCHOLEM, *Jewish Gnosticism, Merkabah Mysticism, and Talmudic Tradition* (1960); JOSHUA TRACHTENBERG, *Jewish Magic and Superstition* (1939, paperback 1961). G.G. SCHOLEM, *Ursprung and Anfänge der Kabbala* (1962; French trans., *Les Origines de la Kabbale,* 1966); *Le commentaire d'Ezra de Gérone sur le Cantique des Cantiques,* trans. by G. VAJDA (1969); *The Zohar,* trans. by H. SPERLING and M. SIMON, 5 vol. (1931–34; paperback, sel. and ed. by G.G. SCHOLEM, 1963). MOSES CORDOVERO, *The Palm Tree of Deborah,* trans. from the Hebrew by L. JACOBS, 3rd ed. (1981); RAPHAEL J. ZWI WERBLOWSKY, *Joseph Karo: Lawyer and Mystic* (1962). L.I. NEWMAN, *The Hasidic Anthology* (Eng. trans. 1963); DOB BAER OF LUBAVITCH, *Tract on Ecstasy,* trans. from the Hebrew by L. JACOBS (1963). MARTIN BUBER, *The Origin and Meaning of Hasidism* (Eng. trans. 1960); S.H. DRESNER, *The Zaddik: The Doctrine of the Zaddik According to the Writings of Rabbi Yaakov Yosef of Polnoy* (1960); S. POLL, *The Hasidic Community of Williamsburg* (1962). J.L. BLAU, *The Christian Interpretation of the Cabala in the Renaissance* (1944); F. SECRET, *Les Kabbalistes chrétiens de la Renaissance* (1964); BEN ZION BOKSER, *The Jewish Mystical Tradition* (1981).

Jewish myth and legend: T.H. GASTER, *Myth, Legend, and Custom in the Old Testament* (1969); R.H. CHARLES (ed.), *The Apocrypha and Pseudepigrapha of the Old Testament in English,* 2 vol. (1913, reprinted 1964); M.R. JAMES, *The Lost Apocrypha of the Old Testament, Their Titles and Fragments* (1920). Myth and legend of the Hellenistic period is treated in W.N. STEARNS (ed.), *Fragments from Graeco-Jewish Writers* (1908); C.C. TORREY (ed. and trans.), *Lives of the Prophets* (1946); T.H. GASTER (trans.), *The Dead Sea Scriptures in English Translation,* pp. 256–267, 2nd ed., (1964). The Legends of the Talmud and Midrash are digested and annotated in LOUIS GINZBERG'S classic, *Legends of the Jews,* 7 vol. (1909–39), also available in a one-volume abridgment (1961). The *Midrash Rabbah* has been translated and edited by HARRY FREEDMAN and MAURICE SIMON, 13 vol. in 5, 3rd ed. (1983); and the *Midrash on Psalms,* by W.G. BRAUDE, 2 vol. (1959). Principal editions and translators are listed in H.L. STRACK, *Einleitung in Talmud und Midraš,* 5th ed. (1921; Eng. trans., *Introduction to the Talmud and Midrash,* 1931). Compilations and studies of medieval myth and legend include *The Book of Jashar,* trans. by M.M. NOAH (1840); M.R. JAMES (trans.), *The Biblical Antiquities of Philo* (1917); MOSES GASTER (trans.), *The Chronicles of Jerahmeel* (1899); I.J. KAZIS (ed. and trans.), *The Book of the Gests of Alexander of Macedon* (in Hebrew; 1962); CURT LEVIANT (ed. and trans.), *King Artus* (1969); MOSES HADAS (trans.), *The Book of Delight* (1932). On the diffusion of medieval Jewish tales, see J. JACOBS, *Jewish Ideals, and Other Essays,* pp. 135–161 (1896); LOUIS GINZBERG, "Jewish Folklore: East and West," *Independence, Convergence, and Borrowing in Institutions, Thought, and Art,* Harvard Tercentenary Conference of Arts and Sciences, pp. 89–108 (1937). Judeo-German (Yiddish) works on the subject include MOSES GASTER, *Ma'aseh Book,* 2 vol. (1934); N.C. GORE (ed. and trans.), *Tzeenah u-Reenah: A Jewish Commentary on the Book of Exodus* (1965). Judeo-Spanish (Ladino) works include IGNACIO GONZALEZ LLUBERA (ed.), *Coplas de Yocef* (1935); C. CREWS, "Judaeo-Spanish Folktales in Macedonia," *Folk-Lore,* 43:193–225 (1932). For a treatment of Hasidic legend, see MARTIN BUBER (ed.), *Tales of the Hasidim,* 2 vol. (1947–48). Myths and legends of the Holy Land are treated in DOV NOY (ed.), *Folktales of Israel* (1963); ZEV VILNAY, *Legends of Palestine* (1932; orig. pub. in Hebrew, 1929), and his *The Sacred Land,* 3 vol. (1973–78).

Judicial and Arbitrational Systems

This article deals primarily with the operations of the judicial branch of government. It explores some of the fundamental relationships of this branch with legislative and executive branches and analyzes the functions, the structure and organization, and, finally, the key personnel of courts, such as judges and juries. This article also treats arbitration, another legal means of resolving disputes.

The approach is comparative, contrasting and comparing the systems of the two predominant legal traditions of the contemporary world: first, that of the common law, represented by England, the United States, Canada, Australia, and other nations deriving their legal systems from the English model; and, second, that of the civil law, as represented by nations of western Europe and Latin America and certain Asian and African nations that have modelled their legal systems on western European patterns. Reference is made to the legal institutions in the Soviet Union and other Communist nations that display distinctive characteristics different from those of the civil-law tradition, from which, basically, they developed. A separate section deals more specifically with systems in Communist countries.

The article is divided into the following sections:

Functions of courts

KEEPING PEACE

The primary function of any court system in any nation—to help keep domestic peace—is so obvious that it is rarely considered or mentioned. If there were no agency to decide impartially and authoritatively whether a person had committed a crime and, if so, what should be done with him, other persons offended by his conduct would take the law into their own hands and proceed to punish him according to their uncontrolled discretion. If there were no agency empowered to decide private disputes impartially and authoritatively, self-help, quickly degenerating into physical violence, would prevail and anarchy would result. Not even a primitive society could survive under such conditions. All social order would be destroyed. In this most basic sense, courts constitute an essential element in society's machinery for keeping peace.

DECIDING CONTROVERSIES

In the course of helping to keep the peace, courts are called upon to decide controversies. If, in a criminal case, the defendant denies committing the acts charged against him, the court must choose between his version of the facts and the prosecution's; and if he asserts that his conduct did not constitute a crime, the court must decide whether his view of the law or the prosecution's is correct. In a civil case, if the defendant disputes the plaintiff's account of what happened between them—for example, whether they entered into a certain agreement—or if he disputes the plaintiff's view of the legal significance of whatever occurred—for example, whether the agreement was legally binding—the court again must choose between the contentions of the parties. The issues presented to, and decided by, the court may be either factual, legal, or both.

It would be a mistake, however, to assume that courts spend all of their time deciding controversies. Many cases brought before them are not contested. They represent potential, rather than actual, controversies in which the court's role is more administrative than adjudicatory. The mere existence of a court renders unnecessary any very frequent exercise of its powers. The fact that it operates by known rules and with reasonably predictable results leads those who might otherwise engage in controversy to compose their differences.

The court's administrative role

Most people arrested and charged with crime in the common-law world plead guilty. If they do so understandingly and without coercion of any sort, there is no need to determine guilt, for the sole question is whether the defendant should go to jail, pay a fine, or be subjected to other corrective treatment. In civil-law countries some judicial inquiry into the question of guilt or innocence is required even after a confession. But the inquiry is brief and tends to be perfunctory. The main problem to be resolved, usually without contest, is what sentence should be imposed.

The vast majority of civil cases are also uncontested or, at least, are settled before trial. The court keeps the calendar moving, sometimes encouraging settlement, and decides such questions of law or fact as are presented by the parties; but the number of cases actually tried is small compared to the number settled.

Most divorce cases are uncontested, both parties usually being anxious to terminate the marriage and often agreeing on related questions concerning support and the custody of children. All the court does in such cases is to review what the parties have agreed upon and give its official approval.

Many other uncontested matters come before courts, such as the adoption of children, the distribution of assets in trusts and estates, and the setting up of corporations. Occasionally questions of law or fact arise that have to be decided by the court, but normally all that is required is judicial supervision and approval.

JUDICIAL LAWMAKING

As courts decide controversies they create an important by-product beyond the peaceful settlement of disputes, that is, the development of rules for future cases. Law is thus made not only by legislatures but also by the courts.

To an extent that varies greatly between common-law and civil-law nations, all courts apply preexisting rules formulated by legislative bodies. In the course of doing so, they interpret those rules, sometimes distorting them, sometimes transforming them from generalities to specifics, sometimes filling gaps to cover situations never considered by the original lawmakers. The judicial decisions embodying these interpretations then become controlling for future cases, sometimes to the extent of virtually supplanting the legislative enactments themselves.

The uses of experience in the law: stare decisis

This is one aspect of the doctrine of precedent, or, as it is sometimes called, stare decisis (literally, "to stand by decided matters"). Judges follow earlier decisions, not only to save themselves the effort of working out fresh solutions for the same problems each time they recur but also, and primarily, because their goal is to render uniform and stable justice. If one individual is dealt with in a certain way today, the theory is that another individual engaging in substantially identical conduct under substantially identical conditions tomorrow or a month or year hence should be dealt with in the same way. This, reduced to its essentials, is all that precedent means.

In civil-law nations all judicial decisions are, in theory, based upon legislative enactments, and the doctrine of judicial precedent does not apply. Practice, however, departs from theory. While there are comprehensive legislative codes in these countries, supposedly covering almost every aspect of human conduct and supplying ready-made answers for all problems that can arise, in fact many of the provisions are exceedingly vague and are sometimes almost meaningless until applied to concrete situations, when judicial interpretation gives them specific meaning. Furthermore, the legislative codes cannot anticipate all situations that may arise and come before the courts. The gaps in legislative schemes must be and are filled by judicial decisions, for no court in any nation is likely to refuse to decide a case on the ground that it has not been told in advance the answers to the questions presented to it. Decisions dealing with circumstances unforeseen by the codes and giving specific meaning to vague legislative provisions are published in most civil-law countries and are frequently referred to by lawyers and relied upon by judges. They are not considered "binding," but neither are they forgotten or disregarded. In actual practice, they have almost as much influence as statutory interpretations in nations that formally adhere to the doctrine of stare decisis.

Precedent and common law

It remains true that in common-law countries judicial lawmaking is more pervasive and more frankly acknowledged than in civil-law countries. In addition to rendering decisions that authoritatively interpret statutes, the courts of these nations have created a vast body of law without any statutory foundation whatever. Centuries ago, when there was no legislation to guide them, judges began to decide cases in accordance with their own conceptions of justice. Later judges followed them, deciding like cases in the same manner but distinguishing earlier cases when dissimilar factors were discovered in the cases before them. The later cases also became precedents to be followed in still later cases presenting substantially similar fact patterns. So the process has continued over centuries and is still continuing. The total accumulation of all these judicial decisions is what constitutes "the common law"—the by-product of judges deciding cases and setting forth their reasons. In the common-law nations, legislation is, as a result, more limited in scope than in the civil-law countries. It does not purport to provide for all possibilities but leaves large areas of conduct to be governed solely by judge-made law.

To speak of precedent as "binding" even in common-law systems is misleading. As already noted, earlier decisions can be and are distinguished when judges conclude that they are based upon situations different from those before the court in later cases. Even more significant, earlier decisions can be overruled by the courts that rendered them (not by courts lower in the judicial hierarchy) when the judges conclude that they have proved to be so erroneous or unwise as to be unsuited for current or future application. The Supreme Court of the United States has overruled many of its own earlier decisions, to the consternation of those who yearn for a rigid separation of powers and who are unable to accept the inevitability of judicial lawmaking. Many of these overrulings are in the field of constitutional law, in which legislative correction of an erroneous judicial interpretation of the Constitution is impossible and in which the only alternative is the exceedingly slow, cumbersome, costly, and difficult process of constitutional amendment. Nevertheless, the power to overrule decisions is not restricted to constitutional interpretations. It extends to areas of purely statutory and purely judge-made law as well, areas in which legislative action would be equally capable of accomplishing needed changes. Even in England, which has no written constitution and which has traditionally followed a far more rigid doctrine of stare decisis than the United States, the House of Lords, in its role as the highest court, has announced its intention of departing from precedent "in appropriate cases."

Conflicting views of the court's role

The desirability of judicial lawmaking has long been the subject of lively debate in both civil- and common-law countries. That courts should not arrogate to themselves unrestricted legislative power is universally accepted. But when existing statutes and precedents are outmoded or barbarous as applied to specific cases before the courts, should not judges be able to change the law in order to achieve what they conceive to be just results or, stated differently, to avoid what they consider unjust results?

The extent to which the judges should be bound by statutes and case precedents as against their own ethical ideas and concepts of social, political, and economic policy is an important question, as is the matter of which should prevail when justice and law appear to the judges to be out of alignment with each other. These are questions upon which reasonable persons disagree vigorously even when they are in basic agreement on the proposition that some degree of judicial lawmaking is inevitable. What is mainly at issue is the proper tempo and scope of judicial change. How quickly should judges act to remedy injustice and when should they consider an existing rule to be so established that its alteration calls for constitutional amendment or legislative enactment rather than judicial decision? As many dissenting opinions attest, judges themselves disagree on the answers to these questions, even when they are sitting on the same bench hearing the same case.

CONSTITUTIONAL DECISIONS

Marbury v. *Madison*

In some nations courts not only interpret legislation but determine its validity and in so doing sometimes render statutes inoperative. This happens only in nations that have written constitutions and have developed a doctrine of "judicial supremacy." The prime example is the United States, and the classic statement of the doctrine is the Supreme Court's decision in *Marbury* v. *Madison* (1803), in which Chief Justice Marshall said:

> The powers of the legislature are defined and limited; and that those limits may not be mistaken, or forgotten, the Constitution is written. To what purpose are powers limited, and to what purpose is that limitation committed to writing, if these limits may, at any time, be passed by those intended to be restrained? The distinction between a government with limited and unlimited powers, is abolished, if those limits do not confine the persons on whom they are imposed, and if acts prohibited and acts allowed, are of equal obligation. It is a proposition too plain to be contested, that the Constitution controls any legislative act repugnant to it. . . . It is emphatically the province and duty of the judicial department to say what the law is. Those who apply the rule to particular cases, must of necessity expound and interpret that rule. If two laws conflict with each other, the courts must decide on the operation of each.

Armed with the authority asserted at this early date, the Supreme Court of the United States has held many statutes, federal as well as state, unconstitutional and has also invalidated executive actions that violated the Constitution. Even more surprising is the fact that lower courts also possess and exercise the same powers. Whenever a question arises in any U.S. court at any level as to the constitutionality of a statute or executive action, that court is obligated to determine its validity in the course of deciding the case before it. The case may have been brought for the sole and express purpose of testing the constitutionality of the statute or it may be an ordinary civil or criminal case, in which a constitutional question incidental to the main purpose of the proceeding is raised. Of course, when a lower court decides a constitutional question, its decision is subject to appellate review, sometimes at more than one level. When a state statute is challenged as violating the state constitution, the final authority is the supreme court of that state; when a federal or state statute or a state constitutional provision is challenged as violating the Constitution of the United States, the ultimate arbiter is the Supreme Court of the United States.

In a few American states, questions as to the constitutional validity of a statute may be referred in abstract form to the state's highest court by the chief executive or the legislature for an advisory opinion. This, however, is unusual and, in any event, supplementary to the normal procedure of raising and deciding constitutional questions. The normal pattern is for a constitutional question to be raised at the trial-court level in the context of a genuine controversy and to be decided finally on appellate review of the trial-court decision.

Other methods of constitutional adjudication

The U.S. pattern of constitutional adjudication is not followed in all nations that have written constitutions. In some, such as Germany, there is a special court at the highest level of government that handles only constitutional questions and to which all such questions are referred as soon as they arise. A constitutional question may be referred to the special court in abstract form for a declaratory opinion by a procedure similar to that prevailing in the minority of U.S. states that allow advisory opinions.

In other nations, written constitutions may be in effect but not accompanied by any conception that their authoritative interpretation is a judicial function. Legislative bodies, rather than courts, act as the guardians and interpreters of the constitution, being guided by their provisions but not bound by them in any realistic sense.

Finally, there are some nations, such as England, that have no written constitutions. Here parliamentary supremacy clearly prevails. The courts have no power to invalidate statutes, although they can and do interpret them.

PROCEDURAL RULE MAKING

Distinct from the type of lawmaking just described is a more conscious and explicit type of judicial legislation and one that is less controversial. It is directed toward the rules of procedure by which the courts operate. This is a technical area in which expert knowledge of the type possessed by judges and lawyers is needed; in which constant attention to detail is required; and in which major problems of social, economic, or political policy are seldom encountered. Some legislative bodies, able or willing to devote only sporadic attention to the day-to-day problems of the management of litigation, have delegated the power to regulate procedure to the courts themselves. This is not ad hoc judicial lawmaking as a by-product of deciding cases but openly acknowledged promulgation of general rules for the future, in legislative form, by courts rather than legislatures.

An outstanding example of judicial rule making is found in the United States, where Congress has delegated to the Supreme Court broad power to formulate rules of civil, criminal, and appellate procedure for the federal courts. The Supreme Court also has and exercises the power to amend the rules from time to time as experience indicates that changes are desirable. Congress reserves the power to veto the rules so promulgated but has felt no need to exercise it.

Other legislative bodies, including those of some American states and most of the nations of continental Europe, have been unwilling to repose equal trust in the courts and have retained for themselves the power to regulate procedure. The results have been varied. Courts sometimes become so immersed in day-to-day decision making that they fail to pay adequate attention to the proper functioning of the judicial machinery and so perpetuate rules that are unduly rigid, unrealistic, and unsuited to the needs of litigants, which was the case in England and the American colonies during the 18th and first part of the 19th century. When such a condition occurs, reform through legislative action is indicated. Apart from the occasional necessity of major sweeping changes, however, experience in the common-law countries, at least, indicates that procedural rule making is better vested in the courts than in legislative bodies.

REVIEW OF ADMINISTRATIVE DECISIONS

Existing alongside the courts in any nation are administrative agencies of various kinds. Some do substantially the same kind of work as is done by courts and in substantially the same manner; some have quite different functions such as the issuing of licenses and the payment of welfare benefits.

The relationship between such agencies and regular courts differs markedly between common-law countries and civil-law countries. In common-law countries the actions of administrative agencies are subject to review in the ordinary courts. If the agency is one that decides controversies in substantially the same manner as a court, but in a different and more limited area, judicial control takes much the same form of appellate review as is provided for the decisions of lower courts. The objective of reviewing the record of proceedings is to determine whether the administrative agency acted within the scope of its jurisdiction, whether there was any evidence to support its conclusion, and whether the governing law was correctly interpreted and applied. Administrative decisions are seldom upset by the courts because of a belief on the part of most judges that administrative agencies have special expertise in the area of their specialty. However, they can be and occasionally are upset, thus underscoring the large degree of judicial control over other agencies of government that characterizes common-law systems. If the administrative agency does not engage in formal adjudication, it produces no record of proceedings for judicial review. Nevertheless, its action can be challenged in court by way of trial rather than appeal. The same problems are presented for judicial determination: did the agency act within its jurisdiction, did it correctly follow the law, and was there any rational or factual basis for its action?

In many civil-law countries, the ordinary courts have no control over administrative agencies. Their decisions are reviewed by a special tribunal that is engaged exclusively in that work and that has nothing to do with cases of the type that come into the courts. Its function is solely appellate and solely within the specialized areas entrusted to the administrative agencies. The prototype of this type of tribunal is the Conseil d'État of France.

ENFORCEMENT OF JUDICIAL DECISIONS

The method of enforcing a judicial decision depends upon its nature. If it does nothing more than declare legal rights, as is true of a simple divorce decree (merely severing marital ties, not awarding alimony or the custody of children), or a declaratory judgment (for example, interpreting a contract or a statute), no enforcement is needed. If a judgment orders a party to do or refrain from doing a certain act, as happens when an injunction is issued, the court itself takes the first step in enforcing the judgment by holding in contempt anyone who refuses to obey its order and sentencing him to pay a fine or go to jail. Thereafter, enforcement is in the hands of the executive branch of government, acting through its correctional authorities.

In routine criminal cases and in civil cases that result in the award of money damages, courts have little to do with the enforcement of their judgments. That is the function of the executive branch of government, acting through sheriffs, marshals, jailers, and similar officials. The courts themselves have no machinery for enforcement.

The limits of judicial power

Some judgments are extremely controversial, as was the case with the decision of the Supreme Court of the United States ordering racial desegregation of the schools. When voluntary compliance with such a judgment is refused, forcible methods of enforcement are necessary, sometimes extending to the deployment of armed forces under the control of the executive branch of the government. The withdrawal of executive support seldom occurs, even when decisions are directed against the executive branch itself; but when such executive support is withheld, the courts are rendered impotent. Judges, being aware of their limited power, seldom render decisions that they know to be so lacking in support that they will not be enforced.

Court structure and organization

TYPES OF COURTS

There are many different types of courts and many ways to classify and describe them. Basic distinctions must be made between civil and criminal courts, between courts of general jurisdiction and those of limited jurisdiction, and between trial and appellate courts.

Criminal courts. Criminal courts deal with persons accused of crime, deciding whether they are guilty and, if so, determining the consequences they shall suffer. Prosecution is on behalf of the public, represented by some official such as a district attorney, procurator, or a police officer. Courts are also public agencies, but in this instance they stand neutral between the prosecution and the defense, their objective being to decide between the two in accordance with law.

In civil-law countries a more active role is assigned to the judge and a more passive role to counsel than in common-law countries. In the common-law courts, in which the "adversary" procedure prevails, the lawyers for both sides bear responsibility for producing evidence and they do most of the questioning of witnesses. In civil-law countries, "inquisitorial" procedure prevails, with judges doing most of the questioning of witnesses and having an independent responsibility to discover the facts. This difference pertains more to procedure rather than function.

If a person has been found guilty, he is sentenced, again according to law and within limits fixed by legislation. The objective is not so much to wreak vengeance upon the offender as to rehabilitate him and deter others from following his example. Hence the most common sentences are fines, short terms of imprisonment, and probation (which allows the offender to remain at large but under supervision). In extremely serious cases, the goal may be to prevent the offender from committing further crimes, which may call for a long term of imprisonment or even capital punishment. The death penalty, however, is gradually disappearing from the criminal codes of civilized nations.

Criminal proceedings in any nation inevitably have some educational impact on defendants and upon members of the general public. In Communist nations education is a conscious and primary goal. A basic provision of Soviet law declares:

> By all its activities the court shall educate the citizens of the U.S.S.R. in the spirit of devotion to the Motherland and the cause of communism in the spirit of strict and undeviating observance of Soviet laws, of care for socialist property, of labor discipline, of honesty toward public and social duty, of respect for the rights, honor and dignity of citizens, for the rules of socialist common-life.

Civil courts. Civil courts deal with "private" controversies, as where two individuals (or corporations) are in dispute over the terms of a contract or over who shall bear responsibility for an auto accident. Ordinarily the public is not a party as in criminal proceedings, for it has no interest beyond providing just rules for decision and a forum where the dispute can be impartially and peacefully resolved.

It is possible, however, for the government to be involved in civil litigation if it stands in the same relation to a private party as another individual might stand. Thus, if a postal truck should run down a pedestrian, the government might be sued civilly by the injured person; or if the government contracted to purchase supplies that turned out to be defective, it might sue the dealer for damages in a civil court.

Distinction between civil and criminal actions

The objective of a civil action is not punishment or correction of the defendant or the setting of an example to others but rather to restore the parties so far as possible to the positions they would have occupied had no legal wrong been committed. The most common civil remedy is a judgment for money damages, but there are others, such as an injunction ordering the defendant to do or refrain from doing a certain act or a judgment restoring property to its rightful owner.

Civil claims do not ordinarily arise out of criminal acts. A person who breaks his contract with another or who causes him a physical injury through negligence may have committed no crime but only a civil wrong for which he may not be prosecuted criminally by the public.

There are, however, areas of overlap, for a single incident may give rise to both civil liability and criminal prosecution. In some nations, such as France, both types of responsibility can be determined in a single proceeding under a concept known as adhesion by which the injured party is allowed to assert his civil claim in the criminal prosecution, agreeing to abide by its outcome. This removes the necessity of two separate trials. In common-law countries there is no such procedure, even though civil and criminal jurisdiction may be merged in a single court. Two separate actions must be brought, independent of each other.

Courts of general jurisdiction. Although there are some courts that handle only criminal cases and others that handle only civil cases, a more common pattern is for a single court to be vested with both civil and criminal jurisdiction. Such is the High Court of England and such are many of the trial courts found in U.S. states. Often these tribunals are called courts of general jurisdiction, signifying that they can deal with almost any type of controversy, although in fact they may not have jurisdiction over certain types of cases assigned to specialized tribunals. Often such courts are also described as superior courts, because they are empowered to handle serious criminal cases and important civil cases involving large amounts of money.

Even if a court possesses general or very broad jurisdiction, it may nevertheless be organized into specialized branches, one handling criminal cases, another handling civil cases, another handling juvenile cases, and so forth. The advantage of such an arrangement is that judges can be transferred from one type of work to another, and cases do not fail to be heard for having been instituted in the wrong branch since they can be transferred administratively with relatively little effort.

Courts of limited jurisdiction. Specialized tribunals of many kinds exist, varying from nation to nation. Some deal only with the administration of the estates of deceased persons (probate courts), some only with disputes between merchants (commercial courts), some only with disputes between employers and employees (labour courts). All are courts of limited jurisdiction. Deserving of special mention because of their importance are juvenile courts, empowered to deal with misconduct by children and sometimes also with the neglect or maltreatment of children. Their procedure is much more informal than that of adult criminal courts, and the facilities available to them for the pretrial detention of children and for their incarceration, if necessary after trial, are different. The emphasis is on salvaging children, not punishing them.

Traffic courts also deserve mention because they are so common. They process motor vehicle offenses such as speeding and improper parking. Their procedure is summary and their volume of cases heavy. Contested trials are relatively infrequent.

Finally, in most jurisdictions there are what are called, unfortunately and for want of a better term, "inferior" courts. These are often manned by part-time judges who are not trained in the law. They handle minor civil cases involving small sums of money, such as bill collections, and minor criminal cases carrying light penalties, such as simple assaults. In addition to finally disposing of minor criminal cases, such courts may handle the early phases of more serious criminal cases—fixing bail, advising defendants of their rights, appointing counsel, and conducting preliminary hearings to determine whether the evidence is sufficient to justify holding defendants for trial in higher "superior" courts.

Appellate courts. The tribunals described thus far are trial courts or "courts of first instance." They see the parties, hear the witnesses, receive the evidence, find the facts, apply the law, and determine the outcome.

Above them, to review their work and correct their errors, are appellate courts. These are usually collegiate bodies, consisting of several judges instead of the single judge who usually presides over a trial court. The jurisdiction of the appellate courts is usually general; specialized appellate tribunals handling, for example, only criminal appeals or only civil appeals are rare, although not unknown. The Conseil d'État of France and the Federal Constitutional Court of Germany have already been mentioned as examples of specialization.

Appellate review is not automatic. It must be sought by some party aggrieved by the judgment in the court below. For that reason, and because an appeal may be both expensive and useless, there are far fewer appeals than trials and, if successive appeals are available, as is often the case, far fewer second appeals than original appeals. Judicial systems are organized on a hierarchical basis: at the bottom are numerous trial courts scattered throughout the nation; above them are a smaller number of first level appellate courts, usually organized on a regional basis; and at the apex is a single court of last resort.

Varieties of appellate review

There are three basic types of appellate review. The first consists of a retrial of the case, with the appellate court hearing the evidence for the second time, making fresh findings of fact, and in general proceeding in much the same manner as the court that originally rendered the judgment under attack. This "trial de novo" is used in common-law countries for the first stage of review but only when the trial in the first instance was conducted by an "inferior" court—one typically manned by a part-time judge or two or more such judges, empowered to try only minor cases and keeping no adequate record of its proceedings.

The second type of review is based in part on a "dossier," which is a record compiled in the court below of the evidence received and the findings made there. The reviewing court has the power to rehear the same witnesses again or to supplement their testimony by taking additional evidence, but it need not and frequently does not do so, being content to rely on the record already made in reaching its own findings of fact and conclusions of law. This type of proceeding prevails generally in civil-law countries for the first stage of appellate review, even when the original trial was conducted in a superior court, staffed by professional judges, and empowered to try important or serious cases.

The third type of review is based solely on a written record of proceedings in the court or courts below. The reviewing court does not itself receive evidence directly but concentrates its effort on discovering from the record whether any errors were committed of such a serious nature as to require reversal or modification of the judgment under attack or a new trial in the court below. The emphasis is on questions of law (both procedural and substantive) rather than on questions of fact. This type of review prevails both in civil-law nations and common-law nations at the highest appellate level. It is also used in common-law nations at lower levels when the judgment of a superior court is under attack. The purpose of this type of review is not merely to assure that correct results are reached in individual cases but also to clarify and expound the law in the manner described earlier. Lower courts have little to do with the development of the law, for they ordinarily do not write or publish opinions. The highest appellate courts do, and it is their opinions that become the guidelines for future cases.

Courts in federal systems. Many nations, such as England, France, and Japan, have unitary judicial systems with all courts (that is, regular courts as distinguished from administrative bodies) fitting into a single national hierarchy of tribunals along the lines just described. Other nations, organized on a federal basis, tend to have more complicated court structures, reflecting the fragmentation of governmental powers between the central authority and the local authorities. In the United States, for example, there are 51 separate judicial systems, one for each state and another for the federal government. To a limited extent, the jurisdiction of the federal courts is exclusive of that exercised by the state courts, but there are large areas of overlap and duplication. At the top level is the Supreme Court of the United States, hearing appeals not only from the lower federal courts but also from state courts insofar as they present federal questions arising under the Constitution of the United States or under federal statutes or treaties. If a case in a state court involves only a question of state law—for example, the interpretation of a state statute—the ultimate authority is the state supreme court, and no appeal is possible to the Supreme Court of the United States.

Court structure in a federal form of government need not be as complicated as that in the United States. It is possible to have only one set of courts for the nation, operated by the central government and handling all cases that arise under state law as well as federal law.

Another possibility is for each state or province to have its own system of courts, handling all questions of federal as well as state law, and for the central government to maintain only a single supreme court to decide questions as to the relationship of the central authority and the local authorities or as to the relationship among the local authorities themselves. This is the pattern in Canada and Australia.

Conflict of laws problems

Another complication resulting from a federal form of government is that questions involving conflict of laws arise with great frequency. Such questions concern the choice to be made between the law of one jurisdiction and another as the rule for decision in a particular case. Even in a unitary system, such problems cannot be avoided, for an English court may be called upon to try a case arising from a transaction that took place in France and to decide whether English or French law should govern. Such problems arise much more often, however, in federal systems, where laws differ from state to state and people move about very freely. Their activities in one state sometimes become the subject of a lawsuit in another, requiring the court to decide which law should apply.

JUDGES

A court is a complex institution whose functioning depends upon many people: not only the judge but also the parties, their lawyers, witnesses, clerks, bailiffs, probation officers, administrators, and many others, including, in certain types of cases, jurors. Nevertheless, the central figure in any court is the judge.

Judges vary enormously, not only from nation to nation but often within a single nation. For example, a rural justice of the peace in the United States—untrained in the law, serving part-time, sitting alone in work clothes in a makeshift courtroom, collecting small fees or receiving a pittance for salary, trying a succession of routine traffic cases and little else—obviously bears little resemblance to a justice of the Supreme Court of the United States—a full-time, well-paid, black-robed professional, assisted by law clerks and secretaries, sitting in a marble palace with eight colleagues and deciding at the highest appellate level only questions of profound national importance. Yet both persons are judges.

The levels of legal training

Lay judges. In some civil-law countries, judges at all levels are professionally trained in the law, but in many other nations they are not. In England, part-time lay judges outnumber full-time professional judges by about 60 to 1. Called magistrates or justices of the peace, they dispose of about 97 percent of all criminal cases in that nation and do so with general public satisfaction and the approbation of most lawyers. Professional judges deal only with the most serious crimes, which are relatively few in number; most of their time is devoted to civil cases. England places unusually heavy reliance on lay judges, but they are far from unknown in the courts of many other nations, particularly at the lowest trial level. This is as true in the U.S.S.R. as it is in the United States. There is considerable diversity in the way laymen are chosen and used in judicial work. In the U.S.S.R. and the United States, for example, lay judges are popularly elected for limited terms, whereas in England they are appointed by the lord chancellor to serve until retirement or removal. In the U.S.S.R. and England the lay judges serve intermittently in panels on a rotating basis for short periods, whereas in the United States they sit alone and continuously. In the U.S.S.R. lay judges (who are called assessors) always sit with professional judges; in England, they sometimes do; and in the United States, they never do. In some underdeveloped nations, few judges at any level are legally trained. They are more likely to be priests, for the law they administer is mainly derived from religious teaching, and religion and secular government are often not sharply differentiated. The vast majority of nations that use lay judges at the lowest trial level, however, insist upon professionally trained judges at higher levels: in trial courts of general jurisdiction and in appellate courts.

Professional judges in the civil-law tradition. Professional judges in civil-law countries are markedly different in background and outlook from professional judges in common-law countries. Both are law trained and both perform substantially the same functions, but there the similarities cease. In a typical civil-law country, a person graduating from law school makes a choice between a judicial career and a career as a private lawyer. If he chooses the former and is able to pass an examination, he is appointed to the judiciary by the minister of justice (a political officer) and enters service in his early 20s. His first assignment is to a low-level court; thereafter, he works his way up the judicial ladder as far as he can until his retirement on a pension. His promotions and assignments depend upon the way his performance is regarded by a council of senior judges, or sometimes upon the judgment of the minister of justice, who may or may not exercise his powers disinterestedly and on the basis of merit. The civil-law judge, in short, is a civil servant.

Professional judges in the common-law tradition. In common-law nations, the path to judicial office is quite different. Upon completion of his formal education, a person typically spends 15, 20, or 25 years in the private practice of law or, less commonly, in law teaching or governmental legal service; then, at about age 50, becomes a judge. He takes no competitive examination but is appointed or elected to office. In England the appointive system prevails for all levels of judges, including even lay magistrates. Appointments are primarily under the control of the lord chancellor, who, although a cabinet officer, is also the highest judge of the realm. They are kept surprisingly free from party politics. In the United States, the appointive method is used in federal courts and some state courts, but it tends to be highly political. Appointments are made by the chief executive of the nation or state and are frequently subject to legislative approval. In many states, judges are popularly elected, sometimes on nonpartisan ballots, sometimes on partisan ballots with all the trappings of traditional political contests. In an attempt to de-emphasize political considerations and yet maintain some measure of popular control over the selection of judges, a third method of judicial selection has been devised and is slowly growing in popularity. Called the Missouri Plan, it involves the creation of a nominating commission that screens judicial candidates and submits to the appointing authority a limited number of names of persons considered qualified. The appointing authority must make his choice from the list submitted. The person chosen as judge then assumes office for a limited time, and, after the conclusion of this probationary period, he stands for "election" for a much longer term. He does not run against any other candidate but only "against his own record."

Political status of the judiciary

In common-law countries, a person does not necessarily enter the judiciary at a low level; he may be appointed or elected to his nation's highest court or to one of its intermediate courts. He does not look forward to any regular pattern of promotion, nor is he necessarily assured of long tenure with ultimate retirement on a pension. In some courts, life tenure is provided, usually subject to mandatory retirement at a fixed age. In others, tenure is limited to a stated term of years. At the conclusion of his term, if not mandatorily retired earlier, the judge must be reelected or reappointed if he is to continue.

While in office, the common-law judge enjoys greater power and prestige and more independence than his civil-law counterpart. He occupies a position to which most members of his profession aspire. He is not subject to outside supervision and inspection by any council of judges or by a minister of justice; nor is he liable to be transferred by action of such an official from court to court or place to place. The only administrative control over him is that exercised by judicial colleagues, whose powers of management are generally slight, being limited to such matters as requiring periodical reports of pending cases and arranging for temporary (and usually consensual) transfers of judges between courts when factors such as illness or congested calendars require them. Only if a judge misbehaves very badly is he in danger of disciplinary sanctions and then usually only by way of criminal prosecution for his misdeeds or legislative impeachment and trial, resulting in removal from office—a very cumbersome, slow, ill-defined, inflexible, ineffective, and seldom used procedure. In parts of the United States, newer and more expeditious methods of judicial discipline are developing in which senior judges are vested with power to impose sanctions ranging from reprimand to removal from office of erring colleagues. They are also vested with power to retire judges who have become physically or mentally unfit to discharge their duties.

Discipline of judges

Except at the very highest appellate level, common-law judges are no less subject than their civil-law counterparts to appellate reversals of their judgments. But appellate review cannot fairly be regarded as discipline. It is designed to protect the rights of litigants; to clarify, expound, and develop the law; and to help and guide rather than reprimand lower court judges. (D.K.)

JURIES

The jury is a historic legal institution in which a group of laymen participate in a major way in deciding cases brought to trial. Its exact characteristics and powers depend on the laws and practices of the countries, provinces, or states in which it is found, and there is considerable variation. Basically, however, it recruits laymen at random from the widest population for the trial of a particular case and allows them to deliberate in secrecy, to reach a decision by other than majority vote, and to make it public without giving reasons.

History and use. The jury's origin is lost in the past. It may have been indigenous to England or have been brought there by the Norman invaders in 1066. Originally, the jurors were neighbourhood witnesses who passed judgment based on what they themselves knew. But the breakdown of medieval society and the growth of the towns changed this; the jury was called upon to determine the facts of the case, based upon the evidence presented in court. The availability of the jury in the king's courts may have been a key factor in centralizing the nation's courts under the king and in creating the common law. By the 15th century, nonrational modes of trial such as ordeal, in which the defendant was subjected to various tortures that, if successfully endured, proved his innocence, were replaced by the jury trial, which became the established form of trial for both criminal and civil cases at common law.

Two forces moved the jury abroad. One was the expansion of the British Empire, which brought the jury to Asia, Africa, and the American continent. The other was the French Revolution and its aftermath, which brought it, as a symbol of popular government, to the European continent: first to France itself, then, through Napoleon, to the Rhineland, later to Belgium, most of the remaining German states, Austria-Hungary, Russia, Italy, Switzerland, Holland, and Luxembourg, although the last two abolished it immediately after Napoleon's defeat. In each of these countries, use of the jury was from the outset limited to trials of major crimes and of political crimes against the state.

Beginning in the mid-19th century, the jury was weakened in a variety of ways: in 1850, Prussia, for example, removed treason from its jurisdiction; in 1851, the duchy of Nassau removed all political crimes; in 1923, Czechoslovakia removed treason and, one year later, libel; in 1919, Hungary suspended jury trial entirely and never restored it. Germany abandoned the jury in 1924. Both the Soviet bloc and the fascist states abolished it outright; France never restored the jury abolished during the German occupation in the 1940s, and Japan did away with its short-lived jury courts in 1943. After World War II, Austria reintroduced the jury in a weakened form.

United States as major user of jury system

Thus, there are three important points about the history and development of the jury as a legal institution: first, the effort to introduce it outside the Anglo-American legal orbit has failed; further, in England itself, its use was limited by statute to a small category of cases; and thus, the United States has emerged today as the home of the jury system for both criminal and civil cases. Some 120,000 jury trials are conducted there annually, more than 90 percent of all jury trials in the world.

Use of the jury in the United States depends on two factors: the degree to which it is available as a matter of right, and the degree to which the parties themselves choose to use it. The laws as to its availability have varied from state to state, but in 1968, in *Duncan* v. *Louisiana,* the United States Supreme Court declared that a jury trial is a constitutional right in all criminal cases in which the penalty may exceed six months' imprisonment. In civil cases its constitutional status is less clear, but in general jury trial is available. The practice of allowing the parties to waive a jury trial also varies widely from region to region, and, as a result, the number of jury trials per year also varies widely. The annual number of criminal jury trials per 100,000 population ranges between 3 for Connecticut to 144 for Georgia.

Jury procedures. *Selection.* Historically, there were some minimum requirements of property and competence for jury service. More recently, the idea of genuine random selection from the population, to achieve a cross section of the community, has been gaining ground. Since 1969, it has been the principle of selection in the federal courts. Most jurisdictions exempt some groups from jury service: policemen, lawyers, doctors, and so on. Some jurisdictions exempt women entirely. All jurisdictions excuse jurors if the service imposes undue hardship.

The voir dire

The commitment of important decisions to a random group of laymen has been moderated, particularly in the United States, by an elaborate screening, voir dire, conducted by trial counsel at the inception of a trial. The law permits counsel to challenge prospective jurors either for cause (if there is specific likelihood of bias) or, for a limited number, "peremptorily"—that is, without having to give a reason. American trial tradition attaches a great deal of significance to the strategies of juror selection, and, in celebrated cases, the lawyers' voir dire examination has extended for several weeks.

Size and unanimity. Traditionally, the jury had 12 members and was required to reach its decisions with unanimity, a striking arrangement in Anglo-American countries that make all other decisions by majority vote. Over the years some modifications have been made. Some jurisdictions prescribe or allow in minor cases a jury of six. Oregon allows 10:2 verdicts—that is, a majority of 10—in all criminal cases, except capital ones; and in 1968 Great Britain followed the Oregon example. A few Southern states in the United States allow majority verdicts in misdemeanour trials. In civil cases, many states now allow 10:2 verdicts. When the required number (12 or 10) of jurors cannot agree on a verdict (termed a hung jury in the United States), the judge declares a mistrial, which means the case, unless it is withdrawn, must be tried anew. It is somewhat remarkable that "hung" juries occur with relative infrequency even when unanimity is required. In Europe juries operate under a different principle. Unless at least two-thirds of all the jurors vote guilty, the defendant must be acquitted. The U.S. Army court-martial jury also operates under this principle.

Sentencing. Although in civil cases the jury decides both issues of liability and amount of damages, in criminal cases it has been restricted generally to the issues of guilt, with punishment left to the judge. In some Southern U.S. states, however, the jury also decides the sentence within a range that the law provides. And in all jurisdictions that have retained the death penalty, if the jury finds the defendant guilty of the capital crime, it decides, or at least expresses an opinion, as to whether the death penalty is to be imposed. In most jurisdictions decisions on guilt and sentence are rendered simultaneously, but California has introduced the so-called second trial in capital cases, which occurs after a guilty verdict. At such a "second trial" pleas and evidence are presented for and against the imposition of the death penalty in the specific case, and only then is the jury asked to determine the sentence.

Relation of judge and jury

Control. Trial by jury is, of course, trial by jury under the supervision of a judge. The formula for sharing power between judge and jury is complex. First, the judge decides what the jury may or may not hear under the rules of evidence. Second, if the judge finds that the evidence presented leaves no factual issue to be resolved, he may withdraw the issue from the jury and direct the jury to acquit a defendant or, in a civil trial, find for either plaintiff or defendant; he cannot, however, direct a guilty verdict in a criminal trial. Third, in some jurisdictions the judge may, and often will, summarize the evidence or even discuss its weight. Fourth, the judge instructs the jury as to the law it should apply in reaching the verdict. Finally, if the judge finds the jury's verdict to be manifestly against the weight of the evidence, he may with one exception set it aside and order a new trial. The only exception is in a criminal case in which the jury renders an acquittal; under Anglo-American law (though not under European continental law) the jury's acquittal is always final.

The jury normally renders a general verdict, that is, a yes or no answer to liability or guilt, and does not give reasons for its decision. At times, however, courts employ "special verdicts" or "special interrogatories" in which the jurors are asked to decide a series of specific factual issues that bear on the overall verdict.

The controversy over the jury. The jury has been enmeshed in a perennial debate as to its merits, a debate that has recruited some of the great names in law and political philosophy, from Montesquieu, William Blackstone, and Thomas Jefferson to present-day theorists and practitioners, and has centred on three issues. First, there is the debate about collateral aspects: there are favourable contentions that the jury provides an important civic experience, that it makes tolerable the stringency of certain decisions, that it acts as a sort of lightning rod for animosity that otherwise might centre on the more permanent judge, and that the jury is a guarantor of integrity since it is said to be more difficult to bribe 12 people than one. Against this it has been urged that jury duty disenchants the citizen, that it imposes an unfair burden, that the jury is expensive, and that it makes it difficult to do away with the often interminable delays that exist in civil litigation.

The jury's competence

Second, there is the issue of the jury's competence. It is argued that the judge, by training, discipline, experience, and superior intelligence, is better able to understand law and facts than laymen drawn from a broad range of levels of intelligence, without experience and without durable official responsibility. But it is also argued that 12 heads are better than one, that the jury as a group has wisdom and strength beyond that of its individual members, that it makes up in common sense and experience what it lacks in training, and that its very inexperience is an asset because it secures a fresh perception of each trial, avoiding the stereotypes that may infect the judicial eye.

Finally, there is the question of the jury's interpretation of the law. The critics complain that the jury will not follow the law, either because it does not understand it or because it does not like it, and hence will administer justice unevenly and that the jury produces a government by men and not by rule of law, against which Anglo-American political tradition is so steadfastly set. The jury's champions offer this very flexibility as its most endearing characteristic. They see the jury as a remarkable device for ensuring that the rigidity of the general rule can be shaped to justice in a particular case, with government by the spirit of the law and not by its letter.

Performance. In a recent survey of some 7,000 jury trials, the presiding judges were requested to reveal how they would have decided without a jury; the results of the survey provided some major insights into the actual performance of the contemporary American jury. In both civil and criminal trials, judge and jury agreed in 78 percent of all verdicts. In civil cases the disagreement in the remaining cases was symmetrically split; in 19 percent of the criminal cases, however, the judge would have convicted, whereas the jury acquitted. The letter of the law confines the jury to "finding the facts," but the deviations from the judge are mostly due to the jury's subtle, and not always conscious, injecting its sense of justice into a case that might go either way. This sense of justice may be concerned with the person of the accused, with the threat of too harsh a punishment, or with the content of the criminal law rules. Thus, close study of the jury has revealed it as a highly sensitive institution, subtle and discerning, moved by factors far beyond gross sympathy for the defendant. On the whole, the system tolerates and even appreciates these deviations of the jury from the judge, even if in rare cases they reflect what the national community experiences as intolerable local prejudice.

OTHER JUDICIAL OFFICIALS

In most countries there are other officials who serve the court. Court clerks, who are responsible for case records and documents, and bailiffs, who are in charge of keeping order, are found in most judicial systems. Also prevalent are officers who prosecute cases in the government's name: states attorneys and district attorneys in the United States, procurators-general in the U.S.S.R., and *procureurs généraux* in France.

Probation officers are found in many countries including the U.S. and Japan. Notaries in France, Italy, and the U.S.S.R. have greater powers than their counterparts in the U.S. In fact, they perform many services carried out by lawyers in the common-law system, such as drafting and verifying wills and contracts and preparing petitions for presentation in court.

Certain countries have officials that are particularly indigenous to their country or legal system. France, for example, has a *juge d'instruction,* who is responsible for the preliminary investigative proceedings prior to a criminal trial.

THE STRUCTURE AND STATUS OF THE JUDICIARY UNDER COMMUNISM

Although the essential legal institutions of the Soviet Union and other Communist countries are based on the civil-law system, certain features are unique. These characteristics are partly the result of the Soviet Union's attitudes toward law that antedate the Soviet system, but mostly they result from the attempt to reconcile Marxist theory with the institutional needs of a modern society.

According to Marx and his followers, the legal system, like all other governmental structures and instruments of class oppression, would "wither away" in a Communist society; thus the courts that existed after the Revolution were considered temporary institutions, required only during the transition to Communism. The ordinary and traditional business of the courts was carried on by the so-called people's courts, while "revolutionary tribunals" dealt with individuals the government considered to be political opponents. A nonjudicial body in the hands of the secret police (at first called Cheka, later OGPU and NKVD), operating in the style of an administrative agency, also heard cases and handed out sentences—usually of the severest kind.

The Soviet three-level court system

In 1921 some capitalist measures were temporarily introduced to revive the economy, and this necessitated some stabilization of the legal system and its institutions. A three-level system of courts with civil and criminal jurisdiction was established in 1922 for the Russian Republic, which in the same year formed a federation with the other soviet republics under its jurisdiction, making up the Union of Soviet Socialist Republics. A new constitution created a federal court—the U.S.S.R. Supreme Court—and a federal judiciary act of 1924 established uniform principles for the judiciary throughout the republics, patterned largely after the system adopted by the Russian Republic. The basic structure of the courts laid down at that time has remained essentially the same to the present, with some minor changes and reforms.

The "People's Courts" on the local level are courts of original jurisdiction for minor criminal cases and a large number of civil cases. The next level, the provincial courts, receive appeals from the people's courts and have original jurisdiction over political and serious civil and criminal cases. The highest level in each republic is its supreme court, which hears appeals from the provincial courts, disciplines lower courts, and has some original jurisdiction over extremely serious cases.

On all three levels, appellate cases are tried by a court consisting of three full-time judges, whereas one judge and two lay judges, or assessors, preside over cases on first hearing. Judges of the people's courts are popularly elected every five years, and judges on the provincial and supreme court levels are "elected" by soviets (bodies combining legislative and executive functions) of the corresponding levels of government. All judges may be recalled before the expiration of their terms by those who elected them.

The federal court system is twofold. There are courts called military tribunals that deal with charges against men in the armed forces and with charges of espionage brought against civilians. The other federal body is the U.S.S.R. Supreme Court—the highest judicial body—which has original jurisdiction in a few special cases relating to the survival of the regime, appellate power over the decisions of the supreme courts of the republics or decisions of the military tribunals, and the right to issue directives to all inferior courts in matters of administration of justice on the basis of a series of its decisions. Although Soviet legal theory is patterned after that of civil-law countries in that it does not recognize judicial lawmaking, these Supreme Court directives function as a source of law and are binding on all courts. The status of the judiciary in the Soviet Union has undergone some changes that parallel the institutional changes since the early days of the Revolution. The system organized in 1922 had the stated purpose of safeguarding the conquests of the Revolution and establishing the dictatorship of the proletariat. Judges were called upon to use their "revolutionary conscience" in deciding cases, and the doctrine of impartiality and independence of the judiciary was repudiated. With the passage of time, however, the Soviet rulers found the need for legal institutions of a stable nature increasing rather than decreasing, and the goal of the legal system was changed from protection of a particular class to protection of the socialist order and the rights of all citizens. Although the role of the judiciary is still conceived of as a political task, there is some acceptance of the idea that judges should be independent and impartial. Marxist philosophy notwithstanding, the Soviet Union and other Socialist countries are confronted with a growing need for legal institutions to fulfill many of the same functions as those in the West. One attempt to fill this need in recent years has been the appearance of "social organizations," such as the "comrades' courts," which are described as voluntary organizations using persuasion and social influence to deal with matters that would otherwise come before a court. But these organizations are party controlled, have only limited power to impose sanctions, and do not appear at present to offer an effective alternative to the type of legal institutions that have been developing within Soviet society.

The status of judges

The other Communist countries, both in eastern Europe and Asia, adopted legal institutions patterned largely after the Soviet model. Since Stalin's death, however, there have been some modifications in the eastern European countries, coinciding with the reforms in the civil and criminal codes adopted by the Soviet Union in the late 1950s and early 1960s. Chinese leaders, however, have resisted efforts to codify their laws, preferring flexibility in their courts, and they have abandoned the policy of copying Soviet legal patterns.

(Ed.)

Arbitration

Arbitration is a nonjudicial, legal technique for resolving disputes by referring them to a third party for a binding decision, or "award," as an arbitrator's findings are usually described. The arbitrator may be a single person or an arbitration board, usually of three members. Arbitration is most commonly resorted to for the resolution of commercial disputes and must be distinguished from mediation and conciliation, which are common in the settlement of labour disputes between management and labour unions. In such cases, the parties resort to a third person to offer a recommendation for a settlement or to help them to reach a compromise. Such intervention by a third party, which also occurs in international disputes between states in the form of diplomatic intervention and good offices, has no binding force upon the disputants, as has the arbitrator's decision, the award.

COMMERCIAL ARBITRATION

Commercial arbitration is a means of settling disputes by referring them to a third person, an arbitrator, selected by the parties for a decision based on the evidence and arguments presented to the arbitration tribunal. The parties agree in advance that the decision will be accepted as final and binding upon them.

Historically, commercial arbitration was used in resolving controversies between medieval merchants, in fairs and marketplaces in England and on the European continent, and in the Mediterranean and Baltic sea trade. The increased use of commercial arbitration became possible after courts were empowered to enforce the parties' agreement to arbitrate. The first such statute was the English Arbitration Act of 1889, now consolidated into an act of 1950 and adopted by arbitration statutes in most countries of the Commonwealth. It was followed in the United States by an arbitration statute of the state of New York in 1920 and a Federal Arbitration Act of 1925. Codified in 1940, the latter deals with the enforcement in federal courts of arbitration agreements and awards in maritime transactions and those involving interstate and foreign commerce. Most states of the United States adopted, sometimes with minor changes, the Uniform Arbitration Act of 1955, as amended in 1956, which had been promoted by the Commissioners on Uniform State Laws and recommended by the American Bar Association. This act provides for the judicial enforcement of an agreement to arbitrate existing and future disputes, thereby making the arbitration agreement no longer revocable, as it had been under common law. It also provides for the substitution of arbitrators in the event of a party failing to select an arbitrator and for a suspension of any court action instituted in contravention of a voluntary arbitration agreement. The courts thereby play an important role in implementing arbitration agreements, making judicial assistance available against a recalcitrant party. This concept of modern arbitration law, which recognizes the irrevocability of arbitration agreements and the enforceability of awards prevails also in the arbitration statutes of nearly all countries of Europe and Asia. Latin American procedural laws generally provide only for court enforcement of agreements to arbitrate existing disputes and do not provide for the enforcement of subsequent disputes that may arise under the arbitration agreement.

Statutory development of arbitration

Function and scope. Arbitration has been used customarily for the settlement of disputes between members of trade associations and between different exchanges in the securities and commodities trade. Form contracts contain a standard arbitration clause referring to the arbitration rules of the respective organization. Numerous arrangements between parties in industry and commerce also provide for arbitration of controversies arising out of contracts for the sale of manufactured goods, for terms of service of employment, for construction and engineering projects, for financial operations, for agency and distribution arrangements, and for many other undertakings.

The usefulness and significance of arbitration is demonstrated by its increasing use by the business community and the legal profession in many countries of the world. The primary advantage is the speed with which controversies can be resolved by arbitration, compared with the long delays of ordinary court procedure. The expert knowledge of arbitrators of the customs and usages of a specific trade makes testimony by others and much documentation unnecessary, thereby eliminating expenses connected with court procedures. The privacy of the arbitration procedure is also much valued by parties to the controversy; situations unfavourable to the party's credit or deficiencies in manufactured goods revealed in arbitration proceedings do not become known to outsiders. There are, however, also disadvantages in the arbitration process. The fact that in Anglo-American practice no reasons are given by the arbitrator to accompany his award prevents the development of a guideline for the further conduct of business relations. This uncertainty resulting from lack of reasoned precedents, moreover, makes the arbitral decision less predictable. Further obstacles to the wider use of commercial arbitration are the divergencies in municipal laws and court decisions that result in different interpretations of similar arbitration questions and the fact that awards are not published: publication of awards, even without identification of the parties, might assist in the establishment of precedents useful in discouraging future disputes on similar issues in a specific branch of industry or commerce.

Advantages of arbitration over court procedure

Procedure. The method of selecting arbitrators is an important aspect of the arbitration process, for the arbitrator's ability and fairness is the decisive element in any arbitration. The general practice is for both parties to select an arbitrator at the time a conflict arises or at the time the arbitration agreement is concluded. The two arbitrators then select a chairman, forming a tribunal. Selection of arbitrators is also often made by agencies administering commercial arbitration under preestablished rules of procedure. These organizations—various trade associations, produce exchanges, and chambers of commerce in many countries—maintain panels of expert arbitrators. The parties may either make their own selection or entrust the appointment of the arbitrators to the organization.

Challenges to the arbitration process are not uncommon. A party may claim, for example, that no valid arbitration agreement came into existence because the person signing the agreement had no authority to do so or that a condition precedent to arbitration had not been fulfilled. More often, arbitration is contested on the ground that the specific controversy is not covered by the agreement. In such cases, the issue of whether the arbitrator has authority to deal with the conflict is usually determined by a court. Further challenges to the arbitration process may be directed against an arbitrator, on grounds, for example, of alleged lack of impartiality. Any such challenge can generally be maintained only after the arbitration has been concluded, as courts are reluctant to interfere with the arbitration process before an award has been rendered.

The arbitration process is governed by the rules to which the parties referred in their agreement; otherwise, the procedure will be determined by the arbitrators. The arbitration proceedings must be conducted so as to afford the parties a fair hearing on the basis of equality. The arbitrator generally has the authority to request the parties and third persons to produce documents and books and to enforce such a request by issuing subpoenas. If a party fails to appear at a properly convened hearing, without showing a legitimate cause, the arbitrator in most instances will proceed in the absence of that party and render an award after investigation of the matter in dispute.

Under the law and arbitration practice of most countries, the award is valid and binding upon the parties when rendered by a majority of the arbitrators, unless the parties expressly request a unanimous decision of the arbitrators, which they seldom do. The statutory law of various countries and the rules of agencies administering commercial arbitration contain provisions on the form, certification, notification, and delivery of the award, with which requirements the arbitrator has to comply.

A much-disputed question in commercial arbitration concerns the law to be applied by the arbitrators. Generally, the award must be based upon the law as determined by the parties in their agreement. This failing, the arbitrator must apply the law he considers proper in accordance with the rules of conflict of laws. In both cases, the arbitrator will have to take account of the terms of the contract and the usage of the specific trade. If, during any arbitration proceeding, a compromise is reached by the parties, that compromise may be recorded as an award by the arbitrator.

Appeal of arbitration decisions to the courts

Appeals to the courts from the award cannot be excluded by agreement of the parties, since the fairness of the arbitration process as a quasi-judicial procedure has to be maintained. Any court control is, however, confined to specific matters, usually enumerated in the arbitration statutes, such as misconduct of the arbitrator in denying a party the full presentation of its claim or not granting a postponement of the hearing for good cause. A review of the award by a court generally will not deal with the arbitrator's decisions as to facts or with his application of the law. The competence of the courts is restricted in order not to make the arbitration process the beginning of litigation instead of its end. Recognition of an award and its enforcement will be denied when it appears to be contrary to public policy, as might be the case, for example, in cases involving trusts (monopolies), industrial property rights, or violation of foreign-currency restrictions. An arbitration award has the authority of a court decision and may be enforced by summary court action according to the procedural law of the country in which execution is being sought.

International commercial arbitration. International commercial arbitration between traders of different countries has long been recognized by the business community and the legal profession as a suitable means of settling trade controversies out of court. The procedure in international commercial arbitration is basically the same as in domestic arbitration. In order to establish more uniformity in procedure and to make access to arbitration facilities more easily available, the United Nations economic commissions in 1966 published new rules applying to international arbitration. Those for Europe are contained in the "Arbitration Rules of the United Nations Economic Commission for Europe" and for Asia and the Far East in the "Economic Commission for Asia and the Far East Rules for International Commercial Arbitration."

The development of international commercial arbitration has been furthered by uniform arbitration legislation prepared by the United Nations Conference on International Commercial Arbitration in 1958 and by the Council of Europe and the Inter-American Juridical Committee of the Organization of American States. One particularly difficult problem of international commercial arbitration is the enforcement of awards in a country other than the one in which they were rendered. Statutory municipal laws do not usually contain provisions for the enforcement of foreign awards, and parties are faced with uncertainty about the law and practice of enforcement procedure in a country other than their own.

The aforementioned international agreements, to which most of the trading nations of the world adhere, facilitate the enforcement of foreign awards to the extent that no further action is necessary in the country in which the award was rendered: the opposing debtor must establish that the award has been set aside or that its effects have been suspended by a competent authority, thus shifting the burden of proof of the nonbinding character of the award to the losing party.

Further development of international commercial arbitration is encouraged by the United Nations Commission on International Trade Law, which aims at promoting the harmonization and unification of laws in the field of international commercial arbitration.

LABOUR ARBITRATION

Labour arbitration—the reference of disputes between management and labour unions to an impartial third party for a final resolution—is usually the last step under a collective-bargaining agreement after all other measures to achieve a settlement have been exhausted. Labour arbitration is not, as is commercial arbitration, an auxiliary avenue of justice and thereby a substitute for ordinary court procedure but a technique also for settling or avoiding strikes.

Two major aspects of labour arbitration

Two major aspects of labour arbitration are usually distinguished: arbitration of rights and arbitration of interests. Arbitration of rights refers to the arbitration of an existing labour contract when a dispute over the application of that contract arises between labour and management. Arbitration of interests refers to arbitration between labour and management during the negotiation of a new labour contract.

Arbitration of rights. Arbitration of rights under the terms of a collective-bargaining agreement is employed in the United States far more than in most other countries. Outside the United States, labour courts, industrial courts, or conciliation and arbitration commissions perform the function of arbitrating rights. These bodies are usually appointed by the government, and recourse to them is frequently compulsory.

More than 90 percent of the collective-bargaining agreements in the United States provide for arbitration as a last step in the grievance procedure. Employees, for example, through their union, may present for arbitration complaints concerning such matters as discipline, discharge, and violations of working conditions. Other issues frequently submitted to arbitration customarily concern premium payments and incentive rates, overtime and vacations, Christmas bonuses, seniority rights, and fringe benefits, such as pension and welfare plans.

The arbitrator's decision must be based on the collective-bargaining agreement, which provides for the application of an existing contract to the grievance presented. The question of whether the various steps in the grievance procedure have been complied with before the initiation of the arbitration is usually left to the determination of the arbitrator and not of a court. The question, however, of whether the disputed issue is covered by the collective-bargaining agreement has to be determined by a court and not by the arbitrator. This authority of the courts was upheld by the Supreme Court of the United States in 1960.

Selection of labour arbitrators

The choice of arbitrator is made either by naming him in the agreement or, more often, by leaving the choice open until a dispute has arisen. Frequently, only a single arbitrator is appointed—usually an expert in the field of industrial relations. Alternatively, tripartite arbitration boards are established, both parties appointing their own arbitrator, who acts somewhat as advocate. A neutral chairman is selected either by the parties or by the two party-appointed arbitrators.

A further technique of arbitration of rights is the appointment of a single permanent arbitrator, or "umpire," to resolve disputes for the duration of the collective-bargaining agreement. The umpire will be intimately acquainted with the various economic, financial, and other aspects of the particular industry and will be familiar with the relationship between management and union developed in the past. He sometimes follows precedents, especially those established by his predecessor. This permanent umpire system originated in the United States in the anthracite-coal industry at the beginning of the 20th century and has been employed in such other important industries as newspaper printing and clothing.

Labour arbitrators render binding decisions on the disputes submitted to them. They are not bound by strict rules of court procedure, especially as regards burden of proof and the presentation of evidence. As arbitrators, they have the power to subpoena persons and written evidence. Labour arbitrators tend to evaluate factual evidence rather freely and often reduce penalties imposed upon employees by the management for breach of the labour contract. Even minor questions, such as the use of company time by employees for washups or coffee breaks, are submitted to arbitration, in order to establish precedents in the operation of the plant. Generally, however, arbitrators are not bound to follow previous decisions.

Decisions of labour arbitrators are seldom reviewed by the courts, as awards are usually fully complied with by both parties.
