CONTENTS

Muḥammad and the Religion of Islām

Islām is a major world religion belonging to the Semitic family; it was promulgated by the Prophet Muḥammad in Arabia in the 7th century AD. The Arabic term islām, literally "surrender," illuminates the fundamental religious idea of Islām—that the believer (called a Muslim, from the active particle of *islām*) accepts "surrender to the will of Allāh (Arabic: God)." Allāh is viewed as the sole God—creator, sustainer, and restorer of the world. The will of Allāh, to which man must submit, is made known through the sacred scriptures, the Qur'ān (Koran), which Allāh revealed to his messenger, Muḥammad. In Islām Muḥammad is considered the last of a series of prophets (including Adam, Noah, Jesus, and others), and his message simultaneously consummates and abrogates the "revelations" attributed to earlier prophets.

Retaining its emphasis on an uncompromisng monotheism and a strict adherence to certain essential religious practices, the religion taught by Muḥammad to a small group of followers spread rapidly through the Middle East to Africa, Europe, the Indian subcontinent, the Malay Peninsula, and China. Although many sectarian movements have arisen within Islām, all Muslims are bound by a common faith and a sense of belonging to a single community.

This article deals with the founding of Islām by Muḥammad, the fundamental beliefs and practices of the religion, and the connection of religion and society in the Islāmic world. The history of the various peoples who embraced Islām is covered in the article ISLĀMIC WORLD.

This article is divided into the following major sections:

THE FOUNDATIONS OF ISLĀM

Muḥammad: the Prophet and his message

LIFE AND WORKS

Muḥammad (in full, Abū al-Qāsim Muḥammad ibn 'Abd Allāh ibn 'Abd al-Muṭṭalib ibn Hāshim) was born in Mecca *c.* 570 after the death of his father, 'Abd Allāh. Muḥammad was at first under the care of his paternal grandfather, 'Abd al-Muṭṭalib. Because the climate of Mecca was considered to be unhealthful, he was given as an infant to a wet nurse from a nomadic tribe and spent some time in the desert. At six he lost his mother, Āminah of the clan of Zuhra, and at eight his grandfather. Though his grandfather had been head of the prestigious Hāshem (Hāshim) clan and was prominent in Mecca politics, he was probably not the leading man in Mecca, as some sources suggest. Muḥammad came under the care of the new head of the clan, his uncle Abū Ṭālib, and is reputed to have accompanied him on trading journeys to Syria. About 595, on such a journey, he was in charge of the merchandise of a rich woman, Khadījah of the clan of Asad, and so impressed her that she offered marriage. She is said to have been about 40, but she bore Muḥammad at least two sons, who died young, and four daughters, of whom the best known was Fāṭimah, the wife of Muḥammad's cousin 'Alī, who is regarded as Muḥammad's divinely ordained successor by the Shī'ah branch of Islām. Until Khadījah's death in 619, Muḥammad took no other wife. The marriage was a turning point in Muḥammad's life. By Arab custom, minors did not inherit, and therefore Muḥammad had no share in the property of his father or grandfather; but by his marriage he obtained sufficient capital to engage in mercantile activity on a scale commensurate with his abilities.

Prophetic call and early religious activity. Muḥammad appears to have been of a reflective turn of mind and is said to have adopted the habit of occasionally spending nights in a hill cave near Mecca. The poverty and misfortunes of his early life doubtless made him aware of tensions in Meccan society. Mecca, inhabited by the tribe of Quraysh (Koreish), to which the Hāshim clan belonged, was a mercantile centre formed around a sanctuary, the Kaʿbah (Kaaba), which assured the safety of those who came to trade at the fairs. In the later 6th century there was extensive trade by camel caravan between the Yemen and the Mediterranean region (Gaza and Damascus), bringing goods from India and Ethiopia to the Mediterranean; and the great merchants of Mecca had obtained monopoly control of this trade. Mecca was thus prosperous, but most of the wealth was in a few hands. Tribal solidarity was breaking up; merchants pursued individual interests and disregarded their traditional duties to the unfortunate. About 610, as he reflected on such matters, Muḥammad had a vision of a majestic being (later identified with the angel Gabriel) and heard a voice saying to him, "You are the Messenger of God." This marked the beginning of his career as messenger (or apostle) of God (*rasūl Allāh*), or Prophet (*nabī*). From this time, at frequent intervals until his death, he received "revelations"—that is, verbal messages that he believed came directly from God. Sometimes these were kept in memory by Muḥammad and his followers, and sometimes they were written down. About 650 they were collected and written in the Qurʾān (or Koran, the sacred scriptures of Islām), in the form that has endured. Muslims believe the Qurʾān is divine revelation, written in the words of God himself.

Muḥammad's vision

Muḥammad is said to have been perturbed after the vision and first revelation but to have been reassured by his wife, Khadījah. In his later experiences of receiving messages there was normally no vision. (Occasionally there were physical concomitants, such as perspiring on a cold day, and these gave rise to the suggestion, now agreed to be unwarranted, that he was an epileptic.) Sometimes he heard a noise like a bell but apparently never a voice. The essence of such an experience was that he found a verbal message in his heart—that is, in his conscious mind. With the help of Khadījah's Christian cousin Waraqah, he came to interpret these messages as in general identical with those sent by God through other prophets or messengers to Jews, Christians, and others and to believe that by the first great vision and by the receipt of the messages he was commissioned to communicate them to his fellow citizens and other Arabs. In addition to proclaiming the messages he received, Muḥammad must have offered explanations and expositions of them in his own words, as is evident in the large body of prophetic traditions that the community has preserved.

Soon he gathered some sympathetic friends who accepted his claim to be a prophet and joined him in common worship and prayers. These culminated in an act of prostration in which they touched the ground with their foreheads in acknowledgment of God's majesty—still a cardinal act in Islāmic worship. In about 613 Muḥammad began preaching publicly, and he and his followers spent their days together in the house of a young man named al-Arqam. It is probable that they sometimes worshipped together in the Kaʿbah, a sanctuary of the Arab pagans.

Pagan religious milieu

The people of Mecca at the time nominally worshipped many gods, but few believed that man was dependent on supernatural powers. The merchants thought most things could be accomplished by wealth and by human planning. Some men regarded Allāh as a "high god" who stood above lesser deities. (Allāh, the Arabic word for God, is used by Christian Arabs as well as by Muslims.) The earliest passages of the Qurʾān revealed to Muḥammad emphasize the goodness and power of God as seen in nature and in the prosperity of the Meccans and call on the latter to be grateful and to worship "the Lord of the Kaʿbah," who is thus identified with God. Gratitude is to be expressed in generosity with one's wealth and avoidance of niggardliness. As a sanction, men are warned that they will appear before God on the Last Day to be judged according to their deeds and assigned to heaven or hell. (The doctrines of the Qurʾān are examined later in this article.)

By proclaiming this message publicly, Muḥammad gained followers—39, it is said—before he entered the house of al-Arqam. The names of 70 followers are known prior to the appearance of opposition to the new religion, and there were probably more. Most were young men under 30 when they joined Muḥammad. They included sons and brothers of the richest men in Mecca, though they might be described as persons excluded from the most lucrative forms of commerce. A handful of Muḥammad's early followers are spoken of as "weak," which merely means that they were not of the tribe of Quraysh and so not effectively protected by any clan. The new religion was eventually called Islām—*i.e.,* "surrender [to the will of God]"—and its adherents were called Muslims—*i.e.,* "those who have surrendered"—though the Qurʾān speaks of them primarily as "the believers."

Opposition at Mecca. Although Muḥammad's preaching was basically religious, there was implicit in it a critique of the conduct and attitudes of the rich merchants of Mecca. Attempts were made to get him to soften his criticism by offering him a fuller share in trade and a marriage alliance with one of the wealthiest families, but he decisively rejected such offers. About 615 more active opposition appeared. Points in the message of the Qurʾān were questioned, such as the assertion that men would be resurrected before the Judgment. Commercial pressure was brought to bear on Muḥammad's supporters, and in some families there was mild persecution of junior members who followed him. It is sometimes suggested that the main reason for opposition was the merchants' fear that the new religion would destroy the recognition of the Kaʿbah as a sanctuary, but this is unlikely. Certainly attacks on idols appeared in the Qurʾān, and Islām began to be characterized by the insistence that "there is no god but God" (Allāh), but no attack was made on the Kaʿbah, and the idols mentioned had their chief shrines elsewhere.

Commercial pressure, boycott, and persecution

A leader of the opposition arose in the person of Abū Jahl, a contemporary of Muḥammad, who probably felt that the latter, despite his claim to be "only a warner" (of Judgment to come), was building a position of authority that might one day make him politically supreme in Mecca, because Arabs deeply respected the kind of wisdom or knowledge that Muḥammad clearly had. In about 616 Abū Jahl organized a boycott of the clan of Hāshim by the chief clans of Mecca, allegedly because the clan continued to protect Muḥammad and did not curb his preaching; but, since few of the clan were Muslims, other questions may have been involved. After three years the boycott lost momentum, perhaps because some of the participants found they were harming their own economic interests.

Both Muḥammad's wife, Khadījah, and his uncle Abū Ṭālib died in about 619, and another uncle, Abū Lahab, succeeded as head of the clan of Hāshim. He was closer to the richest merchants, and at their instigation he withdrew the protection of the clan from Muḥammad. This meant that Muḥammad could easily be attacked and therefore could no longer propagate his religion in Mecca. He left for the neighbouring town of aṭ-Ṭāʾif, but the inhabitants were insufficiently prepared to receive his message, and he failed to find support. Having secured the protection of the head of another clan, he returned to Mecca. In 620 Muḥammad began negotiations with clans in Medina, leading to his emigration, or *hijrah,* there in 622.

It is difficult to assess the nature and extent of the persecution of the Muslims in Mecca. There was little physical violence, and that almost always within the family. Muḥammad suffered from minor annoyances, such as having filth deposited outside his door. The persecution is said to have led to the emigration of some of the Muslims to Ethiopia about 615, but they may have been seeking opportunities for trade or military support for Muḥammad. Some remained until 628, long after Muḥammad was established in Medina. Whatever the nature of the persecution, the Muslims were very bitter about it.

The emigration from Mecca to Medina. In the summer of 621, 12 men from Medina, visiting Mecca for the annual pilgrimage to the Kaʿbah (still a pagan shrine), secretly professed themselves Muslims to Muḥammad and went back to make propaganda for him at Medina. At the pilgrimage in June 622 a representative party of 75 persons from Medina, including two women, not merely professed Islām but also took an oath to defend Muḥammad as they would their own kin. These are known as the two Pledges of al-ʿAqaba. Muḥammad now encouraged his faithful Meccan followers to make their way to Medina in small groups, and about 70 emigrated thus. The Meccans are said to have plotted to kill Muḥammad before he could leave. With his chief lieutenant he slipped away unperceived, used unfrequented paths, and reached Medina safely on September 24, 622. This is the celebrated *hijrah* (Latin Hegira), which may be rendered "emigration," though the basic meaning is the severing of kinship ties. It is the traditional starting point of Islāmic history. The Islāmic Era (AH or Anno Hegirae) begins on the first day of the Arabic year in which the *hijrah* took place—July 16, 622, in the Western calendar.

Medina was different from Mecca. It was an oasis in which date palms flourished and cereals could be grown. Agriculture had been developed by several Jewish clans, who had settled among the original Arabs, and they still had the best lands. Later Arab immigrants belonging to the tribes of al-Aws and al-Khazraj, however, were in a stronger position. The effective units among the Arabs were eight or more clans, but nearly all of these had become involved in serious feuds. Much blood had been shed in a battle in about 618, and peace was not fully restored. In inviting Muḥammad to Medina, many of the Arabs there probably hoped that he would act as an arbiter among the opposing parties. Their contact with the Jews may have prepared them for a messianic religious leader, who would deliver them from oppression and establish a kingdom in which justice prevailed.

The Constitution of Medina

A document has been preserved known as the Constitution of Medina. In its present form it is a combination of at least two earlier documents and is probably later than 627, but its main provisions are almost certainly those originally agreed upon between Muḥammad and the Muslims of Medina. In form the document creates a confederation on traditional Arab lines among nine groups—eight Arab clans and the emigrants from Mecca. Muḥammad is given no special position of authority, except that the preamble speaks of the agreement as made between "Muḥammad the prophet" and the Muslims now resident in Medina, and it is stated that serious disputes are to be referred to him. The Jewish groups had refused to acknowledge Muḥammad as prophet and in the document appear in a secondary character as attached to various Arab clans. For at least five years, Muḥammad had no direct authority over members of other clans, but, in the closing years of his life, the prestige of his military successes gave him almost autocratic power. The revelations he received at Medina frequently contained legal rules for the community of Muslims, but they dealt with political questions only rarely.

The first five years at Medina. The first 18 months at Medina were spent in settling down. Muḥammad was given a piece of land and had a house built, which eventually held apartments grouped around a central courtyard for each of his wives. The Muslims often joined Muḥammad at prayers in his home, which, after his death, became the mosque of Medina. The emigrants (*muhājirūn,* the men from Mecca) were at first guests of brother Muslims in Medina, but Muḥammad cannot have contemplated this situation continuing indefinitely. A few emigrants carried on trade in the local market run by a Jewish clan. Others, with the approval of Muḥammad, set out in normal Arab fashion on razzias (*ghazawāt,* "raids") in the hope of intercepting Meccan caravans passing near Medina on their way to Syria. Muḥammad himself led three such razzias in 623. They all failed, probably because traitors betrayed the Muslim movements to the enemy. At last, in January 624, a small band of men was sent eastward with sealed orders telling them to proceed to Nakhlah, near Mecca, and attack a caravan from Yemen. This they did successfully, and in doing so they violated pagan ideas of sanctity—thereby making the Meccans aware of the seriousness of the threat from Muḥammad.

The Battle of Badr and its consequences

About the same time there was a change in Muḥammad's general policy in important respects. One aspect was the "break with Jews"; instead of making concessions to the Jews in the hope of gaining recognition of his prophethood, he asserted the specifically Arabian character of the Islāmic religion. Hitherto the Muslims had faced Jerusalem in prayer, but a revelation now bade them face Mecca. Perhaps because of this change some Muslims of Medina were readier to support Muḥammad. In March 624 he was able to lead about 315 men on a razzia to attack a wealthy Meccan caravan returning from Syria. The caravan, led by Abū Sufyān, the head of the Umayyah clan, eluded the Muslims by devious routes and forced marches. Abū Jahl, the head of the Makhzūm clan, however, leading a supporting force of perhaps 800 men, wanted to teach Muḥammad a lesson and did not withdraw. On March 15, 624, near a place called Badr, the two forces found themselves in a situation, perhaps contrived by Muḥammad, from which neither could withdraw without disgrace. In the ensuing battle at least 45 Meccans were killed, including Abū Jahl and other leading men, and nearly 70 taken prisoner, while only 14 Muslims died. To Muḥammad this appeared to be a divine vindication of his prophethood, and he and all the Muslims were greatly elated.

In the flush of victory some persons in Medina who had satirized Muḥammad in verse were assassinated, perhaps with his connivance. He also made a minor disturbance an excuse for expelling the Jewish clan, which ran the market. This weakened his most serious opponent there, the "hypocrite" (*munāfiq*), or nominal Muslim, ʿAbd Allāh ibn Ubayy, who was allied with the local Jews. The remaining waverers among the Arabs probably became Muslims about this time. Thus the victory of Badr greatly strengthened Muḥammad. At the same time he was using marriage relationships to bring greater cohesion to the emigrants. Of his daughters, Fāṭimah was married to ʿAlī (later fourth caliph, or leader of the Islāmic community) and Umm Kulthūm to ʿUthmān (third caliph). He himself was already married to ʿĀʾishah, daughter of Abū Bakr (first caliph), and was now espoused also to Ḥafṣah, daughter of ʿUmar (second caliph), whose previous husband was one of the Muslims killed at Badr.

The Battle of Uḥud

In the same year Muḥammad led larger Muslim forces on razzias against hostile nomadic tribes and had some success. Presumably, he realized that the Meccans were bound to try to avenge their defeat. Indeed, Abū Sufyān was energetically mobilizing Meccan power. On March 21, 625, he entered the oasis of Medina with 3,000 men. One of the features of Medina was a large number of small forts that were impregnable to Arab weapons and tactics. Muḥammad would have preferred the Muslims to retire to these; but those whose cereal crops were being laid waste persuaded him to go out to fight. By a night march with 1,000 men, he reached the hill of Uḥud on the further side of the Meccan camp. On the morning of March 23 the Meccan infantry attacked and was repulsed with considerable loss. As the Muslims pursued, the Meccan cavalry launched a flank attack after the archers guarding the Muslim left had abandoned their position. The Muslims were thrown into confusion. Some made for a fort and were cut down, but Muḥammad and the bulk of his force managed to gain the lower slopes of Uḥud, where they were safe from the cavalry. The Meccans, because of their losses, were unable to press home their advantages and without delay set out for home, while Muḥammad the next day made a show of pursuing. The battle produced neither a clear victor nor loser. In Badr and Uḥud together, the Meccans had killed about as many men as they had lost; but they had boasted that they would make the Muslims pay several times over, and they had not shown the degree of superiority appropriate to their leading position in Arabia. Muḥammad, though he had lost above 70 men, realized that this was a military reverse, not a defeat; but the confidence of the Muslims and perhaps his own had been struck a serious blow. If the victory of Badr was a sign of God's support, did Uḥud indicate that he had abandoned the Muslims? Muḥammad's faith soon overcame any momentary doubts, and he was gradually able to restore the confidence of his followers.

The siege of Medina

For two years after Uḥud, both sides prepared for a decisive encounter. In the razzias Muḥammad led or sanctioned, he seems to have aimed at extending his own alliances and at preventing others from joining the Meccans. In at least two cases a small party of Muslims was tricked or ambushed, and most of their lives were lost. And another Jewish clan was expelled from Medina. At length, in April 627 Abū Sufyān led a great confederacy of 10,000 men against Medina. On this occasion Muḥammad had ordered the crops to be harvested and a trench to be dug to defend the main part of the oasis from the Meccan cavalry. For a fortnight the confederates besieged the Muslims. Attempts to cross the trench failed, and fodder for the horses was scarce, while Muḥammad's agents among the attackers fomented potential dissensions. Then, after a night of wind and rain the great army melted away. The Meccans had exerted their utmost might and had failed to dislodge Muḥammad, whose position was now greatly strengthened.

For more than two years now there had been opposition to Muḥammad in Medina, chiefly from ʿAbd Allāh ibn Ubayy and other so-called hypocrites (*munāfiquin*) who had abandoned Muḥammad at Uḥud and who together had fostered disaffection. Shortly before the siege Muḥammad had a showdown with ʿAbd Allāh ibn Ubayy, who had joined in spreading slanders about Muḥammad's wife ʿĀ'ishah. This confrontation revealed that ʿAbd Allāh had little support in Medina, and he became reconciled to Muḥammad. After the siege of Medina, Muḥammad attacked the Jewish clan of Qurayẓah, which had probably been intriguing against him. When they surrendered, the men were all executed and the women and children sold as slaves.

The winning of the Meccans. Muḥammad's farsightedness as a statesman is manifest in the policies he next adopted. He might have proceeded to crush the Meccans, and he indeed put economic pressure on them; but his main aim was to gain their willing adherence to Islām. He had already realized that, insofar as the Arabs became Muslims, it would be necessary to direct outward the energies expended on razzias against one another. There could be no question of Muslims raiding Muslims. It is noteworthy that his largest razzias, apart from the expeditions against the Meccans, were along the route to Syria followed by the Arab armies after his death (see ISLAMIC WORLD). He doubtless realized that the administrative skill of the Meccan merchants would be required for any expansion of his embryonic state.

The Treaty of al-Ḥudaybiyah

In a dream Muḥammad saw himself performing the annual pilgrimage to Mecca, and in March 628 he set out to do so, driving sacrificial animals; but he was disappointed because no more than 1,600 men would accompany him. The Meccans were determined to prevent the Muslims from entering their town, so Muḥammad halted at al-Ḥudaybiyah, on the edge of the sacred territory of Mecca. After some critical days the Meccans made a treaty with Muḥammad. Hostilities were to cease, and the Muslims were to be allowed to make the pilgrimage to Mecca in 629. The orderly withdrawal showed how completely Muḥammad controlled his followers. Partly to reward this orderly conduct, Muḥammad two months later led the same force against the Jewish oasis of Khaybar, north of Medina. After a siege it submitted, but the Jews were allowed to remain on condition of sending half of the date harvest to Medina. Thus throughout 628 and 629 Muḥammad's power was growing, since success led more men to become Muslims, for the religious attraction of Islām was apparently supplemented by material motives.

Meanwhile Mecca was in decline. Several leading men had emigrated to Medina and become Muslims. New leaders had taken over from Abū Sufyān but had accomplished little, although the treaty with Muḥammad had removed his pressure on their caravans. Shortly after the treaty, Muḥammad had married Umm Ḥabībah, a daughter of Abū Sufyān and a widow whose Muslim husband had died in Ethiopia. This led to an understanding with Abū Sufyān, who began to work for the peaceful surrender of Mecca. It was probably when he was in Mecca for the pilgrimage in March 629 that Muḥammad became reconciled with another uncle, al-ʿAbbās, and married his uncle's sister-in-law Maymūnah.

The victorious entrance into Mecca

An attack by Meccan allies in about November 629 upon allies of Muḥammad led to the latter's denunciation of the treaty of al-Ḥudaybiyah. After secret preparations he marched on Mecca in January 630 with 10,000 men. Abū Sufyān and other leading Meccans went out to meet him and formally submitted, and Muḥammad promised a general amnesty. When he entered Mecca there was virtually no resistance. Two Muslims and 28 of the enemy were killed. A score of persons were specifically excluded from the amnesty, but some were later pardoned. Thus Muḥammad, who had left Mecca as a persecuted prophet, not merely entered it again in triumph but also gained the allegiance of most of the Meccans. Though he did not insist on their becoming Muslims, many soon did so.

Muḥammad spent 15 to 20 days in Mecca settling various matters of administration. Idols were destroyed in the Kaʿbah and in some small shrines in the neighbourhood. To relieve the poorest among his followers, he demanded loans from some of the wealthy Meccans. When he marched east to meet a new threat, 2,000 Meccans went with him.

The closing years: the unification of Arabia. Ever since the *hijrah,* Muḥammad had been forming alliances with nomadic tribes. At first these were probably nonaggression pacts, but, when he was strong enough to offer protection, he made it a condition of alliance that the tribe should become Muslim. While in Mecca Muḥammad had word of a large concentration of hostile nomads, and he set out to confront them. A battle took place at Ḥunayn in which part of Muḥammad's army was put to flight, but he himself and some older Muslims stood firm. The enemy was finally routed, and their dependents and possessions were all captured. They were allowed to ransom wives and children, but their livestock was divided as booty.

Muḥammad was now militarily the strongest man in Arabia. Most tribes sent deputations to Medina seeking alliance. It is difficult to say how much of Arabia joined his alliance, for the inner politics of each tribe were complex, and in some cases the deputation might represent only a small section. Muḥammad benefitted from the defeat of the Persian Empire by the Byzantine (Christian) Empire (627–628), for, in the Yemen and in places on the Persian Gulf, minorities that had relied on Persian support against Byzantium now turned to Muḥammad instead.

March to the Syrian border. The greatest of all of Muḥammad's razzias occurred at the end of 630, when he took 30,000 men on a month's journey to the Syrian border. In this campaign he pioneered the invasion of Syria and made agreements that became models for treaty arrangements with captured peoples. Some of the tribes near Syria were Christian and adhered to the Byzantines; chiefly as a result of this, Muḥammad's earlier friendship for the Christians, notably those of Ethiopia, changed to hostility. Before his death, armed opposition to him appeared in one or two parts of Arabia, but the Islāmic state was strong enough to deal with this. Thus he left most of Arabia united and poised for expansion into Syria and Iraq.

Muḥammad personally led the pilgrimage to Mecca, in March 632, in a form according with Islāmic belief. Although he had been in poor health for some time, no arrangement had been made for the succession. Thus his death at Medina in June 632 provoked a major crisis among his followers. The dispute over the leadership of the Muslim community eventually resulted in the most important schism in the history of Islām. (This development is discussed later in this article; see below *Theology and sectarianism.*)

CHARACTER AND ACHIEVEMENTS

Although greatly maligned by medieval European scholars—whose opinions still retain some influence—Muḥammad came to be viewed more objectively in the 19th century. Some of the evidence against him, such as his connivance at assassinations and his approval of the execution of the men of a Jewish clan, are historical matters that cannot be denied.

By his contemporaries, however, Muḥammad was admired for his courage, resoluteness, and impartiality, and for a firmness that was tempered by generosity. He won men's hearts by his personal charm. He was gentle, especially with children. Though he was sometimes silent in thought, for the most part he was engaged in purposeful activity. He walked vigorously and spoke rapidly. He became for later Muslims an exemplar of virtuous character, and stories presented him as realizing the Islāmic ideal of human life.

Muḥammad's chief significance is as founder of a state and of a religion. In his lifetime he created a federation of Arab tribes, which, in less than 20 years after his death, defeated the Byzantine and Persian empires, occupied a vast territory from Libya to Persia, and then developed into the Arab, or Islāmic, Empire. He made the religion of Islām the basis of Arab unity. Islāmic doctrine maintains that God is the founder of the religion, not Muḥammad, but the latter played an obviously important part in fostering the nascent religion. His concern with ultimate questions, his mystical outlook, and his moral seriousness were important adjuncts to the preaching of the Qurʾānic message. (W.M.W./Ed.)

THE LEGACY OF MUḤAMMAD

From the very beginning of Islām, Muḥammad had inculcated a sense of brotherhood and a bond of faith among his followers, both of which helped to develop among them a feeling of close relationship that was accentuated by their experiences of persecution as a nascent community in Mecca. The conspicuous socioeconomic content of Islāmic religious practices cemented this bond of faith. In AD 622, when the Prophet fled to Medina, his preaching was soon accepted, and the community-state of Islām emerged. During this early period, Islām acquired its characteristic ethos as a religion uniting in itself both the spiritual and temporal aspects of life and seeking to regulate not only the individual's relationship to God (through his conscience) but human relationships in a social setting as well. Thus, there is not only an Islāmic religious institution but also an Islāmic law, state, and other institutions governing society. Not until the 20th century were the religious (private) and the secular (public) distinguished by some Muslim thinkers and separated formally, as in Turkey.

This dual religious and social character of Islām, expressing itself in one way as a religious community commissioned by God to bring its own value system to the world through the *jihād* ("holy war" or "holy struggle"), explains the astonishing success of the early generations of Muslims. Within a century after the Prophet's death in AD 632, they had brought a large part of the globe—from Spain across Central Asia to India—under a new Arab Muslim empire.

Relationship to other religions

The period of Islāmic conquests and empire building marks the first phase of the expansion of Islām as a religion. Islām's essential egalitarianism within the community of the faithful and its official discrimination against the followers of other religions won rapid converts. Jews and Christians were assigned a special status as communities possessing scriptures and called the "people of the Book" (*ahl al-kitāb*) and, therefore, were allowed religious autonomy. They were, however, required to pay a per capita tax called *jizyah*, as opposed to pagans, who were required to either accept Islām or die. The same status of the "people of the Book" was later extended to Zoroastrians and Hindus, but many "people of the Book" joined Islām in order to escape the disability of the *jizyah*. A much more massive expansion of Islām after the 12th century was inaugurated by the Ṣūfīs (Muslim mystics), who were mainly responsible for the spread of Islām in India, Central Asia, Turkey, and sub-Saharan Africa (see below).

Besides the *jihād* and Ṣūfī missionary activity, another factor in the spread of Islām was the far-ranging influence of Muslim traders, who not only introduced Islām quite early to the Indian east coast and South India but who proved as well to be the main catalytic agents (besides the Ṣūfīs) in converting people to Islām in Indonesia, Malaya, and China. Islām was introduced to Indonesia in the 14th century, hardly having time to consolidate itself there politically before coming under Dutch colonial domination.

The vast variety of races and cultures embraced by Islām (estimated to total from 600,000,000 to 700,000,000 persons worldwide) has produced important internal differences. All segments of Muslim society, however, are bound by a common faith and a sense of belonging to a single community. With the loss of political power during the period of Western colonialism in the 19th and 20th centuries, the concept of the Islāmic community (*ummah*), instead of weakening, became stronger. The faith of Islām helped various Muslim peoples in their struggle to gain political freedom in the mid-20th century and the unity of Islām contributed to later political solidarity.

Sources of Islāmic doctrinal and social views

Islāmic doctrine, law, and thinking in general are based upon four sources, or fundamental principles (*uṣūl*): (1) the Qurʾān, (2) the *sunnah* ("traditions"), (3) *ijmāʿ* ("consensus"), and (4) *ijtihād* ("individual thought").

The Qurʾān (literally, Reading, or Recitation) is regarded as the Word, or Speech, of God delivered to Muḥammad by the angel Gabriel. Divided into 114 *sūrah*s (chapters) of unequal length, it is the fundamental source of Islāmic teaching. The *sūrah*s revealed at Mecca during the earliest part of Muḥammad's career are concerned with ethical and spiritual teachings and the Day of Judgment. The *sūrah*s revealed at Medina at a later period in the career of the Prophet are concerned with social legislation and the politico-moral principles for constituting and ordering the community. *Sunnah* ("a well-trodden path") was used by pre-Islāmic Arabs to denote their tribal or common law; in Islām it came to mean the example of the Prophet; *i.e.,* his words and deeds as recorded in compilations known as Ḥadīth.

Ḥadīth, or collection of the Prophet's sayings

Ḥadīth (a Report, or collection of sayings attributed to the Prophet) provide the written documentation of the Prophet's word and deeds. Six of these collections, compiled in the 3rd century AH (9th century AD) came to be regarded as especially authoritative by the largest group in Islām, the Sunnah. Another large group, the Shīʿah, has its own Ḥadīth.

The doctrine of *ijmāʿ*, or consensus, was introduced in the 2nd century AH (8th century AD) in order to standardize legal theory and practice and to overcome individual and regional differences of opinion. Though conceived as a "consensus of scholars," in actual practice *ijmāʿ* was a more fundamental operative factor. From the 3rd century AH *ijmāʿ* has amounted to a principle of rigidity in thinking; points on which consensus was reached in practice were considered closed and further substantial questioning of them prohibited. Accepted interpretations of the Qurʾān and the actual content of the *sunnah* (*i.e.,* Ḥadīth and theology) all rest finally on the *ijmāʿ*.

Ijtihād, meaning "to endeavour" or "to exert effort," was required to find the legal or doctrinal solution to a new problem. In the early period of Islām, because *ijtihād* took the form of individual opinion (*raʾy*), there was a wealth of conflicting and chaotic opinions. In the 2nd century AH *ijtihād* was replaced by *qiyās* (reasoning by strict analogy), a formal procedure of deduction based on the texts of the Qurʾān and the Ḥadīth. The transformation of *ijmāʿ* into a conservative mechanism and the acceptance of a definitive body of Ḥadīth virtually closed the "gate of *ijtihād*." Nevertheless, certain outstanding Muslim thinkers (*e.g.,* al-Ghazālī, died AD 1111) continued to claim the right of new *ijtihād* for themselves, and reformers of the 18th and 19th centuries, because of modern influences, have caused this principle to once more receive wider acceptance.

The Qurʾān and Ḥadīth are treated in the following sections. The significance of *ijmāʿ* and *ijtihād* are discussed below in the contexts of Islāmic theology, philosophy, and law. (F.R./Ed.)

Islāmic scripture: the Qurʾān

The Qurʾān (Arabic: Reading or Recitation; often spelled Koran), the holy book of Islām, is regarded by believers as the true word of God as revealed to the Prophet Muḥammad. In its written form it is accepted as the earthly reproduction of an uncreated and eternal heavenly original, according to the general view referred to in the Qur’ān itself as "the well-preserved tablet" (*al-lawḥ al-maḥfūẓ*; Qur’ān 75:22). The word *qur’ān* is derived from the verb *qara’a* "to read," "to recite," but there is probably also some connection with Syriac *qeryānā,* "reading," used for the scriptural lessons in the Syrian Church. In the Qur’ān itself the word is not used with reference to the book as a whole but only as a term for separate revelations or for the divine revelation in general. The Qur’ān is held in high esteem as the ultimate authority in all matters legal and religious and is generally regarded as infallible in all respects. Its Arabic language is thought to be unsurpassed in purity and beauty and to represent the highest ideal of style. To imitate the style of the Qur’ān is a sacrilege.

FORM

Division into chapters and verses

In length the Qur’ān is approximately comparable with the New Testament. For purposes of recitation during the holy month of Ramaḍān it is divided into 30 "portions" (*juz’,* plural *ajzā’*), one for each day of the month. Its main division, however, is into 114 chapters, called *sūrah*s, of very unequal length. With the exception of the first *sūrah,* the so-called *fātiḥah* ("opening" of the book), which is a short prayer, the *sūrah*s are arranged roughly according to length, *sūrah* 2 being the longest and the last two or three the shortest. Because the longest *sūrah*s generally derive from the latter part of Muḥammad's activity, the consequence of this arrangement is that the oldest *sūrah*s are generally to be found toward the end of the book and the youngest generally appear at its beginning.

In the accepted version of the Qur’ān now in use, each *sūrah* has a heading containing the following elements: (1) a title, which is usually derived from some conspicuous word in the *sūrah,* such as "The Cow," "The Bee," "The Poets," but is usually not an indication of the contents of the whole chapter; (2) the *basmalah; i.e.,* the formula-prayer "In the name of God, the Merciful, the Compassionate"; (3) an indication of whether the *sūrah* was revealed at Mecca or at Medina and of the number of its verses; and finally (4) in some cases one or more *fawātiḥ,* or detached letters (*e.g., ṭā’ sīn, ṭā’ sīn mīm*), or *alif lām mīm,* the meaning of which has not been satisfactorily explained, though it is thought that they might stand for abbreviated words, indicate certain collections of *sūrah*s, or have an esoteric significance.

The verses in the Qur’ān are called *āyah* (plural *āyāt,* literally "signs") and vary considerably in length. The shortest verses generally occur in the earliest *sūrah*s, in which the style of Muḥammad's revelation comes very close to the rhymed prose (*saj‘*) used by the *kāhin*s, or soothsayers, of his time. As the verses get progressively longer and more circumstantial, the rhymes come farther and farther apart. There is also a change of linguistic style: the earlier *sūrah*s are characterized by short sentences, vivid expressions, and poetic force; and the later ones become more and more detailed, complicated and, at times, rather prosaic in outlook and language. As a result, it is sometimes difficult to decide whether or not a rhyme is intended to indicate the end of a verse; and consequently, there are variations in the numbering of verses (*e.g.,* between the European editions long used by Western scholars and the official Egyptian edition that has now replaced them in most scholarly works).

The Qur’ān generally appears as the speech of God, who mostly speaks in the first person plural ("we"). When the prophet Muḥammad is speaking to his compatriots, his words are introduced by the command, "Say," thus emphasizing that he is also speaking on divine injunction only. At times the form is also dramatic, bringing in objections by Muḥammad's opponents and answering them by counter-arguments. Narrative passages are mostly brief. Stories of prophets and biblical persons are often alluded to as though they are known to the audience. The stress is not on the narrative but on its didactic uses.

On closer analysis very few of the *sūrah*s turn out to be uniform in style or content. The longest text dealing with one subject is *sūrah* 12, which tells the story of Joseph, differing from the biblical account in a great many details, most of which seem to outside historians to have been drawn from Jewish sources. Otherwise the longer *sūrah*s are composed of several brief sections dealing with a variety of topics. Thus the Qur’ān does not give the appearance of a planned, organized, or systematic treatise, an impression that is further heightened by the fact that certain favourite phrases such as "but God is forgiving, compassionate," "God is knowing, wise," "most of them know nothing" often have little or no apparent connection with the immediate context. In fact, some skeptics claim that these additions served only to produce a needed rhyme.

Heterogeneous style

It is often emphasized that Muḥammad brought to his people "an Arabic Qur’ān"; *i.e.,* a book or set of recitations in the Arabs' own language comparable to those of Judaism and Christianity. Also the vocabulary of the Qur’ān is overwhelmingly of Arabic origin, but there are, nevertheless, borrowed words, mostly from Hebrew and Syriac, bearing witness to Muḥammad's debt to Judaism and Christianity. These loan words are primarily technical terms such as *injīl,* "gospel" (Greek *evangelion*); *taurāt,* "the law, or Torah" of Judaism; *Iblīs,* "the Devil" (Greek *diabolos*); or translations or adaptations of theological terms such as *āmana,* "to believe" (Hebrew or Aramaic); *ṣalāt,* "prayer" (probably Syriac). Such explanations are usually regarded with suspicion by Muslims, since orthodox doctrine holds that the language of the Qur’ān is the purest Arabic. (H.R./Ed.)

DOCTRINES OF THE QUR’ĀN

God. The doctrine about God in the Qur’ān is rigorously monotheistic: God is one and unique; he has no partner and no equal. Trinitarianism, the Christian belief that God is three persons in one substance, is vigorously repudiated. Muslims believe that there are no intermediaries between God and the creation that he brought into being by his sheer command: "Be." Although his presence is believed to be everywhere, he does not inhere in anything. He is the sole Creator and sustainer of the universe, wherein every creature bears witness to his unity and lordship. But he is also just and merciful: his justice ensures order in his creation, in which nothing is believed to be out of place, and his mercy is unbounded and encompasses everything. His creating and ordering the universe is viewed as the act of prime mercy for which all things sing his glories. The God of the Qur’ān, described as majestic and sovereign, is also a personal God; he is viewed as being nearer to man than man's jugular vein, and, whenever a person in need or distress calls him, he responds. Above all, he is the God of guidance and shows everything, particularly man, the right way, "the straight path."

The God of the Qur’ān

This picture of God—wherein the attributes of power, justice, and mercy interpenetrate—is related to the Judeo-Christian tradition, whence it is derived with certain modifications, and also to the concepts of pagan Arabia, to which it provided an effective answer. The pagan Arabs believed in a blind and inexorable fate over which man had no control. For this powerful but insensible fate the Qur’ān substituted a powerful but provident and merciful God. The Qur’ān carried through its uncompromising monotheism by rejecting all forms of idolatry and eliminating all gods and divinities that the Arabs worshipped in their sanctuaries (ḥarams), the most prominent of which was Ka‘bah sanctuary in Mecca itself.

The universe. In order to prove the unity of God, the Qur’ān lays frequent stress on the design and order in the universe. There are no gaps or dislocations in nature. Order is explained by the fact that every created thing is endowed with a definite and defined nature whereby it falls into a pattern. This nature, though it allows every created thing to function in a whole, sets limits; and this idea of the limitedness of everything is one of the most fixed points in both the cosmology and theology of the Qur’ān. The universe is viewed, therefore, as autonomous, in the sense that everything has its own inherent laws of behaviour, but not as autocratic, because the patterns of behaviour have been endowed by God and are strictly limited. "Everything has been created by us according to a measure." Though every creature is thus limited and "measured out" and hence depends upon God, God alone, who reigns unchallenged in the heavens and the earth, is unlimited, independent, and self-sufficient.

Man. According to the Qurʾān, God created two apparently parallel species of creatures, man and *jinn,* the one from clay and the other from fire. About the *jinn,* however, the Qurʾān says little, although it is implied that the *jinn* are endowed with reason and responsibility but are more prone to evil than man. It is with man that the Qurʾān, which describes itself as a guide for the human race, is centrally concerned. The Judeo-Christian story of the Fall of Adam (the first man) is accepted, but the Qurʾān states that God forgave Adam his act of disobedience, which is not viewed in the Qurʾān (in contradistinction to its understanding in the Christian doctrine) as original sin.

In the story of man's creation, angels, who protested to God against the creation of man, who "would sow mischief on earth," lost in a competition of knowledge against Adam. The Qurʾān, therefore, declares man to be the noblest of all creation, the created being who bore the trust (of responsibility) that the rest of the creation refused to accept. The Qurʾān thus reiterates that all nature has been made subservient to man: nothing in all creation has been made without a purpose, and man himself has not been created "in sport," his purpose being service and obedience to God's will.

Despite this lofty station, however, the Qurʾān describes human nature as frail and faltering. Whereas everything in the universe has a limited nature, and every creature recognizes its limitation and insufficiency, man is viewed as rebellious and full of pride, arrogating to himself the attributes of self-sufficiency. Pride, thus, is viewed as the cardinal sin of man, because by not recognizing in himself his essential creaturely limitations he becomes guilty of ascribing to himself partnership with God (*shirk:* associating a creature with the Creator) and of violating the unity of God. True faith (*īmān*), thus, consists of belief in the immaculate Divine Unity and Islām in one's submission to the Divine Will.

Pride, the cardinal sin

Satan, sin, and repentance. In order to communicate the truth of the Divine Unity, God has sent messengers or prophets to men, whose weakness of nature makes them ever prone to forget or even willfully reject the Divine Unity under the promptings of Satan. According to the Qurʾānic teaching, the being who became Satan (Shayṭān or Iblīs) had previously occupied a high station but fell from divine grace by his act of disobedience in refusing to honour Adam when he, along with other angels, was ordered to do so. Since then, his work has been to beguile man into error and sin. Satan is, therefore, the contemporary of man, and Satan's own act of disobedience is construed by the Qurʾān as the sin of pride. Satan's machinations will cease only on the Last Day.

Judging from the accounts of the Qurʾān, the record of man's accepting the prophets' messages has been rather dismal. The whole universe is replete with signs of God; the human soul itself is viewed as a witness of the unity and grace of God. The messengers of God have, throughout history, been calling man back to God. Yet very few men have accepted the truth; most of them have rejected it and become disbelievers (*kāfir,* plural *kuffār:* literally "ungrateful"—*i.e.,* to God), and when man becomes so obdurate, his heart is sealed by God. Nevertheless, it is always possible for a sinner to repent (*tawbah*) and redeem himself by a genuine conversion to the truth. There is no point of no return, and God is always willing and ready to pardon. Genuine repentance has the effect of removing all sins and restoring a person to the state of sinlessness with which he started his life.

Prophecy. Prophets are men specially elected by God to be his messengers. Prophethood is indivisible, and the Qurʾān requires recognition of all prophets as such without discrimination. Yet they are not all equal, some of them being particularly outstanding in qualities of steadfastness and patience under trial. Abraham, Noah, Moses, and Jesus were such great prophets. As vindication of the truth of their mission, God often vests them with miracles: Abraham was saved from fire, Noah from the deluge, and Moses from the Pharaoh. Not only was Jesus born from the Virgin Mary, but God also saved him from crucifixion at the hands of the Jews. The conviction that God's messengers are ultimately vindicated and saved is an integral part of the Qurʾānic doctrine.

All prophets are human and never part of divinity: they are simply recipients of revelation from God. God never speaks directly to a human: he either sends an angel messenger to him or makes him hear a voice or inspires him. Muḥammad is accepted as the last prophet in this series and its greatest member, for in him all the messages of earlier prophets were consummated. He had no miracles except the Qurʾān, the like of which no human can produce. (Soon after the Prophet's death, however, a plethora of miracles was attributed to him by Muslims.) The angel Gabriel brought the Qurʾān down to the Prophet's "heart." Gabriel is represented by the Qurʾān as a spirit, but the Prophet could sometimes see and hear him. According to early traditions, the Prophet's revelations occurred in a state of trance when his normal consciousness was in abeyance. This state was accompanied by heavy sweating. The Qurʾān itself makes it clear that the revelations brought with them a sense of extraordinary weight: "If we were to send this Qurʾān down on a mountain, you would see it split asunder out of fear of God."

Muḥammad as the last prophet

This phenomenon at the same time was accompanied by an unshakable conviction that the message was from God, and the Qurʾān describes itself as the transcript of a heavenly "Mother Book" written on a "Preserved Tablet." The conviction was of such an intensity that the Qurʾān categorically denies that it is from any earthly source, for in that case it would be liable to "manifold doubts and oscillations."

Eschatology. In Islāmic doctrine, on the Last Day, when the world will come to an end, the dead will be resurrected and a judgment will be pronounced on every person in accordance with his deeds. Although the Qurʾān in the main speaks of a personal judgment, there are several verses that speak of the resurrection of distinct communities that will be judged according to "their own book." In conformity with this, the Qurʾān also speaks in several passages of the "death of communities," each one of which has a definite term of life. The actual evaluation, however, will be for every individual, whatever the terms of reference of his performance. In order to prove that the resurrection will occur, the Qurʾān uses a moral and a physical argument. Because not all requital is meted out in this life, a final judgment is necessary to bring it to completion. Physically, God, who is all-powerful, has the ability to destroy and bring back to life all creatures, who are limited and are, therefore, subject to God's limitless power.

According to strict Qurʾānic doctrine, there is no intercession, although God himself, in his mercy, may forgive certain sinners. Those condemned will burn in hellfire, and those who are saved will enjoy the abiding pleasures of paradise. Hell and heaven are both spiritual and physical. Besides suffering in physical fire, the damned will also experience fire "in their hearts"; similarly, the blessed, besides physical enjoyment, will experience the greatest happiness of divine pleasure. Quite early, however, Islāmic tradition developed the notion of intercession, probably in answer to the Christian doctrine of redemption.

Social service. Because the purpose of the existence of man, as of every other creature, is submission to the Divine Will, God's role in relation to man is that of the commander. Whereas the rest of nature obeys God automatically, man alone possesses the choice to obey or disobey. With the deep-seated belief in Satan's existence, man's fundamental role becomes one of moral struggle, which constitutes the essence of human endeavour. Recognition of the unity of God does not simply rest in the intellect but entails consequences in terms of the moral struggle, which consists primarily in freeing oneself of narrowness of mind and smallness of heart. One must go out of oneself and expend one's best possessions for the sake of others.

God in the role of commander

The doctrine of social service, in terms of alleviating suffering and helping the needy, constitutes an integral part of the Islāmic teaching. Praying to God and other religious acts are deemed to be a pure facade in the absence of active welfare service to the needy. In regard to this matter, the Qurʾānic criticisms of human nature become very sharp: "Man is by nature timid; when evil befalls him, he panics, but when good things come to him he prevents them from reaching others." It is Satan who whispers into man's ears that by spending for others he will become poor. God, on the contrary, promises prosperity in exchange for such expenditure, which constitutes a credit with God and grows much more than the money people invest in usury. Hoarding of wealth without recognizing the rights of the poor is threatened with the direst punishment in the hereafter and is declared to be one of the main causes of the decay of societies in this world. The practice of usury is forbidden.

The concept of a community of the faithful

With this socioeconomic doctrine cementing the bond of faith, the idea of a closely knit community of the faithful who are declared to be "brothers unto each other" emerges. Muslims are described as "the middle community bearing witness on mankind," "the best community produced for mankind," whose function it is "to enjoin good and forbid evil" (Qurʾān). Cooperation and "good advice" within the community are emphasized, and a person who deliberately tries to harm the interests of the community is to be given exemplary punishment. Opponents from within the community are to be fought and reduced with armed force, if issues cannot be settled by persuasion and arbitration.

Because the mission of the community is to "enjoin good and forbid evil" so that "there is no mischief and corruption" on earth, the doctrine of *jihād,* in view of the constitution of the community as the power base, is the logical outcome. For the early community it was a basic religious concept. *Jihād,* or holy war, means an active struggle using armed force whenever necessary. The object of *jihād* is not the conversion of individuals to Islām but rather the gaining of political control over the collective affairs of societies to run them in accordance with the principles of Islām. Individual conversions occur as a by-product of this process when the power structure passes into the hands of the Muslim community. In fact, according to strict Muslim doctrine, conversions "by force" are forbidden, because after the revelation of the Qurʾān "good and evil have become distinct," so that one may follow whichever one may prefer (Qurʾān), and it is also strictly prohibited to wage wars for the sake of acquiring worldly glory, power, and rule. With the establishment of the Muslim empire, however, the doctrine of the *jihād* was modified by the leaders of the community. Their main concern had become the consolidation of the empire and its administration, and thus they interpreted the teaching in a defensive rather than in an expansive sense. The Khārijite sect (see below *Theology and sectarianism*) which held that "decision belongs to God alone," insisted on continuous and relentless *jihād,* but its followers were virtually destroyed during the internecine wars in the 8th century.

Qurʾān and *jihād*

Besides a measure of economic justice and the creation of a strong community ideal, the Prophet Muḥammad effected a general reform of the Arab society, in particular protecting its weaker segments—the poor, the orphans, women, and slaves. Slavery was not legally abolished, but emancipation of slaves was religiously encouraged as an act of merit. Slaves were given legal rights, including the right of acquiring their freedom against payment, in installments, of a sum agreed upon by the slave and his master out of his earnings. A slave woman who bore a child by her master became automatically free after her master's death. The infanticide of girls that was practiced among certain tribes—out of fear of poverty or a sense of shame—was forbidden.

Distinction and privileges based on tribal rank or race were repudiated in the Qurʾān and in the celebrated "Farewell Pilgrimage Address" of the Prophet shortly before his death. All men are therein declared to be "equal children of Adam," and the only distinction recognized in the sight of God is to be based on piety and good acts. The age-old Arab institution of intertribal revenge (called *thaʾr*)—whereby it was not necessarily the killer who was executed but a person equal in rank to the slain person—was abolished. The pre-Islāmic ethical ideal of manliness was modified and replaced by a more humane ideal of moral virtue and piety.

(F.R./Ed.)

ORIGINS AND COMPILATION OF THE QURʾĀN

Revelation of the Qurʾān to the Prophet

Muslim tradition. According to Muslim tradition the Qurʾān was revealed to Muḥammad in separate pieces over some 20 years. On such occasions, Muḥammad, it is said, was in a kind of trance or ecstasy, during which the revelations were brought to him by the angel Gabriel. On his return to normal consciousness he recited the words of revelation to those present. There are many traditions about the occasions on which a certain *sūrah* or part of a *sūrah* was revealed. Thus the revelation of the Qurʾān is connected with events in the life of the Prophet. Even the traditional recension (version) of the Qurʾān itself classifies the *sūrah*s as Meccan or Medinan.

Obviously, many people learned the words of the revelation by heart, but there are also traditions that, at the time of their revelation, Muḥammad had them written down on "pieces of paper, stones, palm-leaves, shoulder-blades, ribs, and bits of leather," *i.e.,* whatever writing-material there was at hand. It is believed that the Prophet indicated to the scribes the context in which a certain passage should be placed.

Establishment of an authoritative text

After the Prophet's death, and especially after the battle of Yamāmah (633), in which a great number of those who knew the Qurʾān by heart had fallen, fear arose that the knowledge of the Qurʾān might disappear. So it was decided to collect the revelations from all available written sources and, as Muslim tradition has it, "from the hearts [*i.e.,* memories] of people." A companion of the Prophet, Zayd ibn Thābit, is said to have copied on sheets whatever he could find and to have handed it over to the caliph ʿUmar. After ʿUmar's death the collection was left in the care of his daughter Ḥafṣah. Other copies of the Qurʾān appear to have been written later, and different versions were used in different parts of the Muslim empire. So that there would be no doubt about the correct reading of the Qurʾān, the caliph ʿUthmān (644–656) is reported to have commissioned Zayd ibn Thābit and some other learned men to revise the Qurʾān using the "sheets" of Ḥafṣah, comparing them with whatever material was at hand, and consulting those who knew the Qurʾān by heart. It was decided that in case of doubt about the pronunciation, the dialect of Quraysh, the Prophet's tribe, was to be given preference. Thus an authoritative text of the Qurʾān (now known as the ʿuthmānic recension) was established.

These traditions may have been reworked and changed to some extent to suit certain dogmatic theories concerning the Qurʾān, but in the main they reflect historical truth. It is obvious that the description of the method of revelation has been somewhat simplified. The Qurʾān itself states (42:50–52) that God spoke to Muḥammad "by suggestion, or from behind a veil, or by sending a messenger to suggest what he pleases." The first term (Arabic *waḥy*) denotes a "suggestion" or "inspiration" of the kind that is well known by many poets; the Qurʾān also uses a term meaning "it was sent down." The second term seems to suggest some kind of imaginative locution without any accompanying vision. Only the third expression alludes to an angel but without mentioning the name of Gabriel.

Views of those outside Islām. The chronology of the *sūrah*s is a much debated problem. The existing traditions concerning the occasions for the revelation of certain passages cannot always be controlled and may or may not be reliable. European scholars have applied the criteria of style and contents to establish the relative order of the *sūrah*s or parts of *sūrah*s. From the time when Theodor Nöldeke published his *History of the Qurʾān* (1860), it has been common to arrange the *sūrah*s in four groups, deriving from three subsequent periods at Mecca and from Medina. The above exposition of the content of the Qurʾān roughly follows this arrangement.

In the Muslim view, Muḥammad received every word of the Qurʾān directly from God. The Qurʾān describes, and indignantly rejects, accusations that the Prophet had reproduced things that he had drawn from other sources. Western scholars who have analyzed the contents of the various revelations have shown that much of the narrative material concerning biblical persons and events differs from the biblical account and seems to have come from later Christian and, above all, from Jewish sources (*e.g.,* Midrash). Other motifs, such as the idea of the impending judgment and the descriptions of paradise agree with standard topics in the missionary preaching of the contemporary Syriac church fathers. The dependence need not, however, be of a literary kind, but might be due to influence from oral traditions.

Question of influence of oral traditions on text

It would appear that learning the words of the revelation by heart was the normal way of preserving them, and that only on special occasions were the words written down immediately. The existence of various early collections of Qurʾānic material seems to be a warranted fact, although their nature and contents cannot be determined. Some of the *sūrah*s beginning with separate letters (*al-fawātiḥ*)—certain consonant combinations detached from the main text (mentioned above under the heading *Form*)—occur together in the present Qurʾān and in the order of decreasing length in such a way as to suggest that they once formed separate collections. The establishment of a vulgate recension (a standard version) was not sufficient to secure the uniform and correct reading of the Qurʾān in all details. The Arabic script was incomplete; several consonants were easy to confuse, and there was no way of indicating the vowels to differentiate the variety of possible meanings inherent in a particular combination of consonants. To assure the correct recitation, therefore, it was necessary to know the text more or less by heart. In this way, differing variant readings arose, warranted by this or that "reader" of the Qurʾān.

The recorded variations, however, turned out to be remarkably few, and though no complete listing of the textual variants exists, it can safely be said that the textual tradition of the Qurʾān is much firmer and more uniform than that of the New Testament. The Arabic script was gradually improved. Diacritical signs were introduced to distinguish the letters that were similar in form, and long vowels were indicated by the letters *alif* (for *ā*), *wāw* (for *ū*), and *yā* (for *ī*). It is known that this vowel system was still disputed at the beginning of the 9th century. The special vowel signs placed above or beneath the letters were added in a different colour and did not count as part of the text itself.

INTERPRETATIONS

The "readers" (*qurrāʾ,* singular *qāriʾ*) were the specialists of the text of the Qurʾān. They were at the same time philologians, and it was to a great extent from their dealings with the language of the Qurʾān that the science of Arabic grammar grew. Two schools developed, one at Baṣra (in present-day Iraq), which was especially interested in systematizing and ordering the material to set up the rules governing the language, and a rival one at Kūfa (also in Iraq), which took more interest in the exceptional. It was theorized that several variant readings could be accepted only if they were based on the ʿUthmānic recension (version). It was also important that a reading be based on the authority of some renowned reader.

There was also theological speculation as to the true nature of the Qurʾān. In the discussions initiated by the Muʿtazilites (Seceders; literally, "those who stand apart"; a group that sought to introduce philosophical principles from Greek rationalism into Islāmic thought) the question of the eternity of the Qurʾān (*i.e.,* of its heavenly prototype) was one of the main points. The Muʿtazilites, who wanted to avoid everything that might compromise or encroach upon the oneness of God, denied the doctrine that the Qurʾan was uncreated and eternal, because this would mean that something else besides the God of eternity would exist eternally and thus create an eternal and irreconcilable "dualism." Consequently they asserted that the Qurʾān was created by God. This doctrine, however, was rejected by orthodox adherents of Islām. In popular belief, the reverence for the Qurʾān is often directed toward the visible, physical book or parts of it. Oaths are taken on it, and passages are sometimes copied out of it to be used for magical or superstitious purposes.

In these and other doctrinal disputes the parties sought support for their opinions in the sayings of the Qurʾān, since it was considered as the ultimate authority in all legal and religious questions. The correct interpretation of the Qurʾān became the object of a special branch of learning, the so-called *tafsīr,* or Qurʾānic exegesis. All kinds of resources were utilized in order to elucidate the meaning of a Qurʾānic passage. Traditions concerning the circumstances surrounding the revelation of certain passages or containing interpretative utterances of the Prophet that had been transmitted orally were recorded and collected, together with other traditions deriving from and concerning the Prophet (Ḥadīth). At times, in order to provide authority for a certain theory, traditions were simply invented. Any interpretation of a Qurʾānic passage that could not be supported by Ḥadīth was originally rejected. The results of the study of grammar and lexicography were also utilized; examples from contemporary poetry were often quoted in order to elucidate the grammatical structure or the lexical meaning of a passage. Thus, work on the Qurʾān, whose ultimate goal was the correct understanding and application of its teachings, went hand in hand with the development of Arabic grammar and lexicography.

Qurʾānic exegesis

Two works are especially renowned in the field of *tafsīr,* namely the commentary of aṭ-Ṭabarī (839–923), a huge encyclopaedic collection that sums up everything that had been done so far in the field, and the *Kashshāf* of Zamakhsharī (1075–1143), which has gained almost canonical reputation, though its author was a Muʿtazilite and began his work with the words, "Praise be to God who created the Qurʾān." A handy commentary of Bayḍāwī (d. *c.* 1280), which is often quoted as authoritative, is merely an abridged revision of the latter work.

The theological schools of medieval Islām all sought to support their doctrines with the aid of Qurʾānic exegesis, and each of them produced their own commentaries. There are also examples of allegorical interpretation (*taʾwīl*) especially in Ṣūfī (Islāmic mystical) literature, in which the doctrines of mysticism are found to be hidden behind the literal sense of the Qurʾānic word.

Qurʾānic exegesis gained new significance with the appearance of modernism toward the end of the 19th century. The modernists, who sought to revive Islām from its degradation and to reconcile it with what they found valuable in Western scientific traditions, set up the principle of returning to the pure and uncorrupted Islām of the "ancestors." As a consequence, the interpretation of the oldest and original source of Islām was regarded as imperative, and attempts were made to establish the principles necessary for a correct understanding of the Qurʾān. Traditional exegesis was accused of having introduced Israelite legends and false traditions that had nothing to do with the original teachings of the Prophet. On the other hand, the authority of the Qurʾān was never called in question.

Modern commentaries

Muḥammad ʿAbduh, the founder of modernism in Egypt, for several years published exegetical lectures in the journal *al-Manār;* and they were later published in book form by his Syrian disciple Rashīd Riḍā. In them he accepts the Qurʾān as the literally inspired word of God, in which there can be nothing false or antiquated, and tries to show that the results of modern science and many modern views are already present in the Qurʾān. This is often achieved by twisted interpretations, reading modern ideas into the words of the Qurʾān. For instance, the *jinn* (genii) of *sūrah* 2:176 that cause disease are interpreted as "microbes," and the words in 2:250, "How often a little company has overcome a numerous company; and God is with those who endure," is taken to refer to ideas reminiscent of Darwin's theory of the struggle for life and the survival of the fittest. Allegorical interpretation is also used when it can serve the purpose of the author. Other modernistic interpreters of the Qurʾān have continued along the same lines. The Qurʾān is, however, left untouched by criticism; as the infallible word of God it cannot have been influenced by the circumstances under which it was revealed, it can contain no mistake, and it cannot be superseded by any new discovery.

Later developments, however, have brought some new ideas to the fore. In an Urdu commentary on the Qur'ān, which has in part been made available in English, Maulana Abul Kalam Azad (1888–1958), an Indian Muslim scholar (minister of education of the Republic of India at the time of his death), developed some new principles for the interpretation of the Qur'ān. He argues that it is necessary to interpret the Qur'ān against the background of its environment; therefore it is necessary to study the cultures and the languages of ancient Arabia and other Semitic peoples. Study of the historical circumstances in which the Qur'ān came into being is said to facilitate the understanding of what it meant to those who received the revelation.

Scholars have no doubt, however, that there are new developments in the field of Qur'ānic exegesis. D. Rahbar, in his study *The God of Justice* (1960), argues that in order to elucidate a passage in the Qur'ān one should quote traditional exegesis and medieval dogmatics and, above all, use other Qur'ānic passages for comparison, letting one passage throw light on another. Though such ideas are looked upon with suspicion by orthodox Muslims and are fervently rejected by most Muslim leaders, they may indicate the inception of a more historical view of the Qur'ān, one that tries to distinguish between central religious ideas and those outward things that are dependent on the historical environment.

TRANSLATIONS

The Qur'ān was revealed to Muḥammad as "an Arabic book" or an Arabic reading (*qur'ān*), to provide the Arabs with a holy book in their own language, comparable with the Scriptures of Judaism and Christianity. As has been noted, the language of the Qur'ān is regarded as surpassing everything that can be written in Arabic. The Qur'ān itself is a miracle and cannot be imitated by man.

As a consequence of this, it is regarded as unfitting to translate the Qur'ān. In countries in which other languages are spoken, the Qur'ān is still recited in Arabic. There exist Muslim translations of the Qur'ān; *e.g.*, into Turkish, Urdu, and English (the latter during the Aḥmadiyah movement founded in 1889 by Mirza Ghulam Aḥmad in the Punjab region of India), but on principle these are regarded as paraphrases, not as translations that can be used for ritual purposes.

The Qur'ān was first printed in Arabic at Rome by Pagninus Brixiensis (1530), but the edition was never circulated. A. Hinckelmann published an Arabic text at Hamburg in 1694. Since then several European editions have appeared; one of the best was that of G. Flügel (1834), the first critical edition, often reprinted. It is from this edition that Western scholars have usually quoted the Qur'ān. Several editions are today printed in Muslim countries, and an official Egyptian edition is gaining more and more ground among Western scholars.

First critical edition

The first Latin translation was made in 1143 at the request of an abbot of the monastery of Cluny and was published at Basle in 1543 by Theodor Bibliander and afterward rendered into Italian, German, and Dutch. The first French translation was by A. du Ryer (1647); it was translated into English by Alexander Ross (1649–88). G. Sale's English translation first appeared in 1734 and has passed through many new editions. It has become something of a classic and can still be useful in many respects. A translation by J.M. Rodwell, with the *sūrah*s arranged in chronological order, appeared in 1861. E.H. Palmer's translation was published in Sacred Books of the East in 1880. Bell's translation "with a critical rearrangement of the sūrahs" (1937–39) tries to analyze the *sūrah*s into their smallest units and show how these were joined together to form the present Qur'ān. (See *Bibliography* for contemporary English translations.)

The Qur'ān has also been translated into most other European languages. Special mention should be made of R. Blachère's French translation (1949–50) because of its rather detailed notes, and of R. Paret's German rendering (1962), which is very accurate and makes extensive use of parallel passages within the Qur'ān itself, but is rather dry in its style. (H.R./Ed.)

Ḥadīth, traditions of the Prophet

Ḥadīth is the record of the traditions or sayings of the Prophet Muḥammad, revered and received as a major source of religious law and moral guidance, second only to the authority of the Qur'ān, or scripture of Islām. It might be defined as the biography of Muḥammad perpetuated by the long memory of his community for their exemplification and obedience. The development of Ḥadīth is a vital element during the first three centuries of Islāmic history, and its study provides a broad index to the mind and ethos of Islām.

NATURE AND ORIGINS

The term Ḥadīth derives from the Arabic root *ḥdth*, meaning "to happen," and so, "to tell a happening," "to report," "to have, or give, as news," or "to speak of." It means tradition seen as narrative and record. From it comes *sunnah* (literally, a "well-trodden path," *i.e.*, taken as precedent and authority or directive), to which the faithful conform in submission to the sanction that Ḥadīth possesses and that legalists, on that ground, can enjoin. Tradition in Islām is thus both content and constraint, Ḥadīth as the biographical ground of law and *sunnah* as the system of obligation derived from it. In and through Ḥadīth, Muḥammad may be said to have shaped and determined from the grave the behaviour patterns of the household of Islām by the posthumous leadership his personality exercised. There were, broadly, two factors operating to this end. One was the unique status of Muḥammad in the genesis of Islām; the other was the rapid geographical expansion of the new faith in the first two centuries of its history into various areas of cultural confrontation. Ḥadīth cannot be rightly assessed unless the measure of these two elements and their interaction is properly taken.

Sunnah

The experience of Muslims in the conquered territories of west and middle Asia and of North Africa was related to their earlier tradition. Islāmic tradition was firmly grounded in the sense of Muḥammad's personal destiny as the Prophet—the instrument of the Qur'ān and the apostle of God. The clue to tradition as an institution in Islām may be seen in the recital of the *Shahādah* or "witness" ("There is no god but God; Muḥammad is the prophet of God"), with its twin items as inseparable convictions—God and the messenger. Islāmic tradition follows from the primary phenomenon of the Qur'ān, received personally by Muḥammad and thus inextricably bound up with his person and the agency of his vocation. Acknowledgment of the Qur'ān as scripture by the Islāmic community was inseparable from acknowledgment of Muḥammad as its appointed recipient. In that calling, he had neither fellow nor partner, for God, according to the Qur'ān, spoke only to Muḥammad. When Muḥammad died, therefore, in AD 632, the gap thus created in the emotions and the mental universe of Muslims was shatteringly wide. It was also permanent. Death had also terminated the revelation embodied in the Qur'ān. By the same stroke scriptural mediation had ended, as well as prophetic presence.

The Prophet's death was said to have coincided with the perfection of revelation. But the perfective closure of both the book and the Prophet's life, though in that sense triumphant, was also onerous, particularly in view of the new changing circumstances, both of space and time, in the geographical expansion of Islām. In all the new pressures of historical circumstance, where was direction to be sought? Where, if not from the same source as the scriptural mouthpiece, who by virtue of that consummated status had become the revelatory instrument of the divine word and could therefore be taken as an everlasting index to the divine counsel? The instinct for and the growth of tradition are thus integral elements in the very nature of Islām, Muḥammad, and the Qur'ān. Ongoing history and the extending dispersion of Muslim believers provided the occasion and spur for the compilation of Ḥadīth.

HISTORICAL DEVELOPMENT

The appeal of the ordered recollection of Muḥammad to the Islāmic mind did not become immediately formalized and sophisticated. On the contrary, there is evidence that the full development of Ḥadīth was slow and uneven. Time and distance had to play their role before memory became stylized and official.

Relation to early Arabic poetry

Literary tradition in pre-Islāmic Arabia. The first generation had its own immediacy of Islāmic experience, both within the life span of the Prophet and in the first quarter century afterward. It had also the familiar patterns of tribal chronicle in song and saga. Pre-Islāmic poetry celebrated the glory of each tribe and their warriors. Such poetry was recited in honour of each tribe's ancestors. The vigour and élan of original Islām took up these postures and baptized them into Muslim lore. The proud history of which Muḥammad was the crux was, naturally, the ardent theme, first of chronicle, and then of history writing. Both needed and stimulated the cherishing of tradition. The lawyers, in turn, took their clues from the same source. While the Qurʾān was being received, there had been reluctance and misgiving about recording the words and acts of the Prophet, lest they be confused with the uniquely constituted contents of the scripture. Knowledge of Muḥammad's disapproval of the practice of recording his words is evidence enough that the practice existed. With the Qurʾān complete and canonized, those considerations no longer obtained; and time and necessity turned the instinct for Ḥadīth into a process of gathering momentum.

Developments of the 1st and 2nd centuries AH. Within the first century of the Prophet's death, tradition had come to be a central factor in the development of law and the shape of society. Association by Ḥadīth with Muḥammad's name and example became increasingly the ground of authority. The 2nd century brought the further elaboration of this relationship by increasing formalism in its processes. Traditions had to be sustained by an expert "science" of attestation able to satisfy rigorous formal criteria of their connection with the person of Muḥammad through his "companions," by an unbroken sequence of "reportage" (see below). This science became so meticulous that it is fair (even if also paradoxical) to suspect that the more complete and formally satisfactory the attestation claimed to be, the more likely it was that the tradition was of late and deliberate origin. The developed requirements of acceptability that the tradition boasted simply did not exist in the early, more haphazard and spontaneous days.

It is clear that many customs and usages native to non-Arab societies prior to their Islāmization found their way into Islām in the form of reputed or alleged traditions of Muḥammad, though always on the condition of their general compatibility with the Islāmic religion. Implicit in this sense in Muḥammad's personal example and genius, tradition inferred an elasticity and an embrace large enough to comprehend and anticipate all that Islām in its wide geographical experience was to become.

Qurʾānic commentary

Qurʾānic commentary, as it developed in the wake of these other factors of law and custom, also leaned heavily on traditional material, for the incidents of the Qurʾānic narrative and the occasions of revelation could best be understood by what tradition had to say in its reporting of them. Further, since the patterns of Qurʾānic commentary were largely hortatory, Ḥadīth was a ready mine of word and story calculated to exemplify and reinforce what exhortation commended. Except in rare and controversial cases (the so-called Ḥadīth Qudsī, or Holy Tradition), these traditional factors in Qurʾānic interpretation were only elucidatory, and the substance of tradition could in no way dispute or displace the essential, primary, authority of the Qurʾānic text. For the *obiter dicta* (incidental observations) of Muḥammad, though sacrosanct, lacked the hallmark of revelation, which belonged solely to the Qurʾān. Among earliest developed examples of Ḥadīth are the narratives of the biographer Ibn Isḥāq (died AH 150 [AD 767]) and the compilation of laws by Mālik ibn Anas, known as al-Muwaṭṭaʾ (died AH 179 [AD 795]). But they preceded by less than half a century the success of the theory that made tradition indispensable to the valid development of Islāmic law.

3rd century AH and subsequent developments. The chief protagonist of the view correlating tradition and law was Muḥammad ash-Shāfiʿī (died AH 204 [AD 820]) who claimed for tradition a divine imprint as an extension of the revelation of the Qurʾān. It was in line with this conviction that the phrase "the Qurʾān and the *sunnah*" became current to describe the fount of authority in Sunnī Islām (the major traditionalist sect). By this mandate and out of the needs and inventiveness of lawyers, the mass of tradition grew apace. When virtually no issues could be argued, still less settled, except by connection with cited acts and opinions of Muḥammad, the temptation to require or to imagine or to allege such traditions became irresistible. Supply approximated to demand, and the growth of both made more ingenious and pretentious the science of supporting attribution. The increasing volume and complexity of the material contained in Ḥadīth necessitated larger compilations and more detailed classification. These factors worked together to inspire a critical editorial activity that in the course of the 3rd century generated what have come to be regarded as the six canonical collections of Ḥadīth by Sunnī Muslims. The first two of them have acquired a status of great sanctity. Before noting these it is convenient to describe the editorial task and the editorial procedures that constitute the developed science of Ḥadīth criticism.

THE SCIENCE OF ḤADĪTH

Matn and *isnād*

The study of tradition distinguishes between the substance, or content, known as the "gist" (*matn*) of the matter, and the "leaning" (*isnād*) or chain of corroboration on which it hangs.

Form of Ḥadīth and criteria of authentication. That Muḥammad observed, "Seek knowledge, though it be in China" or "Beware of suspicion, for it is the falsest of falsehoods" reveals the *matn* or "the meat of the matter." The formula introducing such a Ḥadīth would speak in the first person: "It was related to me by A, on the authority of B, on the authority of C, on the authority of D, from E (here a companion of Muḥammad) that the Prophet said . . . ." This chain of names constituted the *isnād* on which the saying or event depended for its authenticity. The major emphases in editing and arguing from tradition always fell on the *isnād,* rather than on a critical attitude to the *matn* itself. The question was not, "Is this the sort of thing Muḥammad might credibly be imagined to have said or done?" but "Is the report that he said or did it well supported in respect of witnesses and transmitters?" The first question would have introduced too great a danger of subjective judgment or independence of mind, though it may be suspected that issues were in fact often decided by such critical appraisal in the form of decisions ostensibly relating only to *isnād.* The second question certainly allowed a theoretically objective and reasonably precise pattern of criteria.

If the adjacent names in the chain of transmission overlapped in life, there was certainty that they could have listened to one another. Their travels were also investigated to see if their paths could have really crossed. Biographies could be built up to show that they were honest men and spoke truly. Comparative study could be made of their reputations for veracity as acknowledged by their contemporaries or indicated by their traditions when compared. The frequency of currency through several sources was yet another element in the testing of traditions. Most important of all was the final link with the "companion," who in the first instance had the tradition from his or her contact with the Prophet.

Weight of traditions

Classifications. In all these ways, and others involving more minutiae, it was possible to establish categories of Ḥadīth quality. Traditions might be sound (*ṣaḥīḥ*), good (*ḥasan*), or weak (*ḍaʿīf*). Other terms, such as healthy (*ṣāliḥ*) and infirm (*saqīm*), were also current. Each of the three classifications was liable to subdivisions, depending on refinements of assessment and, later, on their standing with the classic compilers. Distinctions were less rigorously seen if the traditions were cited not for legal definitions but merely for moral purposes. A *ḍaʿīf* tradition, for example, might well be salutary for exhortation, even if lawyers were required to exclude or ignore it. Traditions also varied in strength according to whether one or more "companions" could be adduced, whether the *isnād* had parallels, whether they were continuous back to Muḥammad (*muttaṣil*), or intermitted (*mawqūf*). The subtleties in these and other questions were part of the active competence that attended the whole science.

The repute and authority of the canonical collections did much to stabilize the situation, but only because their emergence demonstrated that the zest for tradition had overreached itself. By the end of the 3rd century AH it was sorely necessary to solidify Ḥadīth into a stable corpus of material to which no new element could credibly be added and from which extravagances had been purged. The Ḥadīth tradition within the various traditions had by then become a permanent and disciplined element in the authority structure of Islām—the second great source of law and practice, complementary to the Qur'ān and available for analogical handling (*qiyās*) and for consensus (*ijtihād*) as further sources of legislation, arguing from the Qur'ān and the Sunnah as primary. Shī'ah tradition (see below) stands apart from this structure of authority.

THE COMPILATIONS

The most revered of all traditionalists was Muḥammad ibn Ismā'īl al-Bukhārī (AH 194–56 [AD 810–870]), whose *Kitāb al-Jāmi' aṣ-Ṣaḥīḥ* (*The Book of the Authentic Collection*) has a unique place in the awe and esteem of Muslims as a work of great historical import and deep piety. While a boy he made the pilgrimage to Mecca and gathered traditions in wide travels. According to tradition, he was inspired to his task by a vision of Muḥammad pestered by flies while asleep—flies that he (al-Bukhārī) fanned from the Prophet's face. The flies represented the cloud of spurious traditions darkening the true image, and the fan was its tireless rescuer. Whatever the truth of this narrative, it captures the temper of al-Bukhārī's vocation. His *Ṣaḥīḥ* occupied 16 years of editorial pains and scrutiny. He included 7,397 traditions with full *isnād.* Allowing for repetitions, the net total was 2,762, gathered, it is said, from over 600,000 memorized items. He arranged the whole into 97 books and 3,450 chapters or topics, repeating the traditions that bore on several themes.

Of comparable stature was the *Ṣaḥīḥ* of Muslim ibn al-Ḥajjāj (AH 202–261 [AD 817–875]), to which the compiler prefaced a discussion of the criteria of Ḥadīth. The material largely confirms his contemporaries, and all such traditions common to these two authorities are known as agreed (*muttafaq*). It became characteristic to give freer rein to prevailing or communal assent in matters of *isnād.*

There are four other classical collections of tradition, all belonging within the 3rd century AH, and interdependent in part. Abū Dā'ūd al-Sijistānī (AH 202–275 [AD 817–889]) produced his *Kitāb as-Sunan* ("Book of traditions"), containing 4,800 traditions relating to matters of jurisprudence (as the term *Sunan* indicates, in contradistinction to a *Jāmi',* or collection embracing all fields). Abū 'Isā Muḥammad at-Tirmidhī (died AH 279 [AD 892]) edited the *Jāmi'aṣ-Ṣaḥīḥ,* adding notes on the distinctive interpretations of the schools of law (*madhāhib*). Abū' Abd ar-Raḥmān an-Nasā'ī (AH 216–303 [AD 830–915]) produced another *Kitāb as-Sunan* with special concern for the religious law relating to ritual acts. Abū 'Abdallāh ibn Mājā (AH 210–273 [AD 824–886]), a pupil of Abū Dā'ūd, compiled another with the same title but tended to a readier tolerance of less than satisfactory traditions. Preferences shifted between these four, and some were slower of recognition than others. Nor did they oust the earlier collection of Mālik ibn Anas, which maintained, if intermittently, its wide appeal. But they formed the increasing reliance of generations of Muslims, within the unique eminence of the master "pair," and formed the sources of later popular editions, intended to conflate material for didactic purposes. One such was the work of Abū Muḥammad al-Baghawī (died AH 516 [AD 1122]) called *Maṣābīḥ as-Sunnah* ("The Lamps of the Sunnah"). Commentaries on all these classical *musannafāt,* or compilations, were many, and important in education and piety.

SECTARIAN VARIATIONS

The tradition of the Shī'ah, a minority branch of Islām, (distinguished from the tradition of the Sunnah majority by belief in the special role of the Prophet's cousin 'Alī and his descendants) diverges sharply from a very early date, though the emphasis on the personality of Muḥammad was identical. The Shī'ah broke away from the (to be) dominant Sunnī stream of Islām for deep reasons of politics, emotion, and theology. There was the dispute about caliphal succession and the role of 'Alī, cousin and son-in-law of Muḥammad and fourth caliph, and bitter cleavage because of the tragic fate of his two sons and especially of Ḥusayn in the massacre of Karbalā', from which there ultimately evolved the theology of vicarious suffering epitomized in Shī'ī devotion and ritual. (Sectarian disputes are treated in detail; see below *Theology and sectarianism.*) All these factors inevitably involved the business of tradition. The schism read the origins according to the divided loyalties, and there was little that was not potentially contentious, apart from obvious matters; *e.g.,* Muḥammad's intentions for 'Alī and the caliphate. The issues were fought out in rivalry for the mind of the Prophet, the authority of which was the sole agreement in the very disputing of it. The Shī'ah thus rejected the tradition of the Sunnīs and developed their own corpus of tradition (though there is evidence that an-Nasā'ī, at least, among the classical compilers, had sympathy with aspects of their cause). They also questioned the Sunnī notions of *isnād* and of the community as a locus of authority and evolved their own system of submission to their *imāms* (Shī'ah leaders). This altered the whole role that tradition might play. The major Shī'ī compilations date from the 4th and 5th centuries and allow only traditions emanating from the house of 'Alī. The first of them is that of Abū Ja'far Muḥammad al-Qulīnī (died AH 328 [AD 939]), *Kāfī fī 'Ilm ad-Dīn,* which might be translated: "All You Need About the Science of Religious Practice."

Shī'ah and Sunnah

SIGNIFICANCE OF ḤADĪTH

Canonical collections of Ḥadīth are, for the non-Muslim, an introduction to a world of faith, of behaviour and authority, a world of almost encyclopaedic inclusiveness. Provisions of law are the primary element, enlarging Qur'ānic legislation. They contain a whole array of moral, social, commercial, and personal matters, as well as the themes of eschatology. All reaches of public and private conduct may be found there, from the disposal of a date stone to the crisis of the deathbed, from the manner of ablution to the duties of forgiveness, from the physical routines of digestion to the description of the day of judgment. There is a Talmudic capacity for detail and scrupulousness in legal and ethical prescriptions and precepts. There are stories of integrity and right action, for example, that of the purchaser of a plot of ground who subsequently unearthed in it a pot of gold, which he brought back to the former owner, protesting that it was not within his bargain. The vendor, likewise, refused to claim it since he had not known the gold was there when he sold his field. An arbitrator solved their dilemma of honesty by proposing the marriage of the son of one with the daughter of the other so that, after alms, the gold might be settled on the couple. Through and in tradition, Islām aligned itself authoritatively with all it found compatible in local usages and brought hospitably and masterfully within its purview the continuity of many cultures. There is wide evidence of the impact of Jewish and Christian elements, notably in the realm of eschatology, in the elaboration of the stark and urgent Qur'ānic doctrine of the last judgment. But always the imprint of Islām is clear. Tradition is at once a mine and a kind of currency, the source and the circulation of the values it makes and preserves. (A.K.C./Ed.)

Fundamental practices and institutions of Islām

THE FIVE PILLARS

During the earliest decades after the death of the Prophet, certain basic features of the religio-social organization of Islām were singled out to serve as anchoring points of the community's life and formulated as the "Pillars of Islām." To these five, the Khawārij sect added a sixth pillar, the *jihād,* which, however, was not accepted by the general community.

The shahādah or profession of faith. The first pillar is the profession of faith: "There is no god but God; Muḥammad is the prophet of God," upon which depends the membership in the community. The profession must be recited at least once in one's lifetime, aloud, correctly, and purposively, with an understanding of its meaning and with an assent from the heart. From this fundamental belief are derived beliefs in (1) angels (particularly Gabriel, the Angel of Revelation), (2) the revealed Books (the Qurʾān and the sacred books of Judeo-Christian revelation described in the Qurʾān), (3) a series of prophets (among whom Judeo-Christian figures are particularly eminent—although it is believed that God has sent messengers to every nation), and (4) the Last Day (Day of Judgment).

Basic beliefs deriving from the *shahādah*

Prayer. The second pillar consists of five daily congregational prayers, which may, however, be offered individually if one is unable to go to the mosque. The first prayer is performed in the morning before sunrise, the second just after noon, the third in the later afternoon, the fourth immediately after sunset, and the fifth before retiring to bed (only three prayers are mentioned in the Qurʾān: morning, evening, and the middle prayer in the afternoon).

Before a prayer, ablutions are performed by washing the hands, face, and feet. The muezzin (one who gives the call for prayer) chants aloud from a raised place (such as a tower) in the mosque. When prayer starts, the *imām,* or leader (of the prayer), stands in the front facing Mecca, and the congregation stands behind him in rows, following him in various postures. Each prayer consists of two to four genuflection units (*rakʿah*); each unit consists of a standing posture (during which verses from the Qurʾān are recited, in certain prayers aloud, in others silently), as well as a genuflection and two prostrations. At every change in posture, "God is great" is recited. Tradition has fixed the materials to be recited in each posture.

Special congregational prayers are offered on Friday instead of the prayer just after noon. The Friday service consists of a sermon (*khuṭbah*), part of which consists of preaching in the local language and part of recitation of certain formulas in Arabic. In the sermon, the preacher usually recites a verse of the Qurʾān and builds his address on it, which can be of a moral, social, or political content. Friday sermons have usually considerable impact on public opinion regarding sociopolitical questions.

Nature of sermons

Although not ordained as an obligatory duty, nocturnal prayers (called *tahajjud*) are encouraged, particularly during the latter half of the night. During the month of Ramaḍān (see below *Fasting*) lengthy prayers are offered congregationally before retiring and are called *tarāwīḥ.*

In strict doctrine, the five daily prayers cannot be waived even for the sick, who may pray in bed and, if necessary, lying down. When on a journey, it is recommended that the two afternoon prayers be combined into one and the sunset and late evening prayers into one prayer as well. In practice, however, much laxity has occurred, particularly in modern times, although Friday prayers are still attended by large numbers.

Lehnert & Landrock

The zakāt. The third pillar is the obligatory tax called *zakāt* ("purification," indicating that such a payment makes the rest of one's wealth religiously and legally pure). This is the only permanent tax levied by the Qurʾān and is payable annually on food grains, cattle, and cash after one year's possession. The amount varies for different categories. Thus, on grains and fruits it is 10 percent if land is watered by rain, 5 percent if land is watered artificially. On cash and precious metals it is 2½ percent. *Zakāt* is collectable by the state and is to be used primarily for the poor, but the Qurʾān mentions other purposes: ransoming Muslim war captives, redeeming chronic debts of people, tax collectors' fees, *jihād* (and by extension, according to Qurʾān commentators, education and health), and creating facilities for travellers.

After the breakup of Muslim religio-political power, payment of *zakāt* has become a matter of voluntary charity dependent on individual conscience. Some Muslim countries are seeking to reintroduce it, and in several Middle Eastern countries *zakāt* is officially collected, but on a voluntary basis.

The fast of Ramaḍān

Fasting. Fasting during the month of Ramaḍān (ninth month of the Muslim lunar calendar), laid down in the Qurʾān (2:183–185), is the fourth pillar of the faith. Fasting begins at daybreak,and ends at sunset, and during the day eating, drinking, and smoking are forbidden. The Qurʾān (2:185) states that it was in the month of Ramaḍān that the Qurʾān was revealed. Another verse of the Qurʾān (97:1) states that it was revealed "on the night of determination," which Muslims generally observe on the night of 26–27 Ramaḍān. For a person who is sick or on a journey, fasting may be postponed until "another equal number of days." Daily feeding of one poor person is also prescribed "for those who can afford it."

The ḥajj. The fifth pillar is the annual pilgrimage (*ḥajj*) to Mecca prescribed for every Muslim once in a lifetime—"provided one can afford it" and provided a person has enough provisions to leave for his family in his absence. The pilgrimage rite begins every year on the 7th and ends on the 10th of the month of Dhū al-Ḥijjah (last month of the Muslim year). When the pilgrim is about six miles (ten kilometres) from the Holy City, he enters upon the state of *iḥrām:* he wears two seamless garments and neither shaves nor cuts his hair or nails until the ceremony ends. The principal activities consist of walking seven times around the Kaʿbah, a shrine within the Sacred Mosque; the kissing and touching of the Black Stone (Ḥajar al-Aswad); and the ascent of and running between Mt. Ṣafā and Mt. Marwah (which are now, however, mere elevations) seven times.

At the second stage of the ritual, the pilgrim proceeds from Mecca to Minā, a few miles away; from there he goes to ʿArafāt, where it is essential to hear a sermon and to spend one afternoon. The last rites consist of spending the night at Muzdalifah (between ʿArafāt and Minā) and offering sacrifice on the last day of *iḥrām,* which is the *ʿīd* ("festival") of sacrifice.

Many countries have imposed restrictions on the number of outgoing pilgrims because of foreign-exchange difficulties. Because of the improvement of communications, however, the total number of visitors has greatly increased in recent years. In 1965 the number of visitors was estimated to be about 1,500,000, approximately 600,000 of them from outside Arabia. All Muslim countries send official delegations on the occasion, which is being increasingly used for religio-political congresses. At other times in the year, it is considered meritorious to perform the lesser pilgrimage (*ʿumrah*), which is not, however, a substitute for the *ḥajj* pilgrimage.

SACRED PLACES AND DAYS

The most sacred place for Muslims is the Kaʿbah sanctuary at Mecca, the object of the annual pilgrimage. It is much more than a mosque; it is believed to be the place where the heavenly bliss and power touches the earth directly. According to Muslim tradition, the Kaʿbah was built by Abraham. The Prophet's mosque in Medina is the next in sanctity. Jerusalem follows in third place in sanctity as the first *qiblah* (*i.e.,* direction in which the Muslims offered prayers at first, before the *qiblah* was changed to the Kaʿbah) and as the place from where Muḥammad, according to tradition, made his ascent (*miʿrāj*) to heaven. For the Shīʿah, Karbalāʾ in Iraq (the place of martyrdom of ʿAlī's son, Ḥusayn) and Meshed in Iran (where Imām ʿAlī ar-Riḍā is buried) constitute places of special veneration where the Shīʿah make pilgrimages.

Shrines of Ṣūfī saints. For the Muslim masses in general, shrines of Ṣūfī saints are particular objects of reverence and even veneration. In Baghdad, the tomb of the greatest saint of all, ʿAbd al-Qādir al-Jīlānī, is visited every year by large numbers of pilgrims from all over the Muslim world.

The Ṣūfī shrines, which were managed privately in earlier periods, are almost entirely owned by governments in the 20th century and are managed by departments of *awqāf* (plural of *waqf,* a religious endowment). The official appointed to care for a shrine is usually called a *mutawallī.* In Turkey, where such endowments formerly constituted a very considerable portion of the national wealth, all were confiscated by the regime of Mustafa Kemal Atatürk (president, 1928–38).

The mosque. The general religious life of the Muslims is centred around the mosque, and in the days of the Prophet and early caliphs the mosque was, indeed, the centre of all community life. Small mosques are usually supervised by the *imām* (one who administers the prayer service) himself, although sometimes also a muezzin is appointed. In larger mosques, where Friday prayers are offered, a *khaṭīb* (one who gives the *khuṭbah,* or sermon) is appointed for Friday service. Many large mosques also function as religious schools and colleges. Mosque officials are appointed by the government in most countries. In some countries, *e.g.,* Pakistan, most mosques are private and are run by the local community, although some of the larger ones are being increasingly taken over by the government departments of *awqāf.*

Holy days. The Muslim calendar (based on the lunar year) dates from the emigration (*hijrah*) of the Prophet from Mecca to Medina in AD 622. The two festive days in the year are the *ʿīds,* ʿĪd al-Fiṭr celebrating the end of the month of Ramaḍān and the other, ʿĪd al-Aḍḥā (the feast of sacrifice), marking the end of the pilgrimage. Because of the crowds, *ʿīd* prayers are offered either in very large mosques or on specially consecrated grounds. Other sacred times include the "night of determination" (believed to be the night in which God makes decisions about the destiny of individuals and the world as a whole) and the night of the ascension of the Prophet to heaven. The Shīʿah celebrate the 10th of Muḥarram (the first month of the Muslim year) to mark the day of the martyrdom of Ḥusayn. The Muslim masses also celebrate the death anniversaries of various saints in a ceremony called *ʿurs* (literally, "nuptial ceremony"). The saints, far from dying, are believed to reach the zenith of their spiritual life on this occasion. (F.R./Ed.)

ISLĀMIC THOUGHT

Islāmic theology (*kalām*) and philosophy (*falsafah*) are two traditions of learning developed by Muslim thinkers who were engaged, on the one hand, in the rational clarification and defense of the principles of the Islāmic religion (*mutakallimūn*) and, on the other, in the pursuit of the ancient (Greek and Hellenistic, or Greco-Roman) sciences (*falāsifah*). These thinkers took a position that was intermediate between the traditionalists, who remained attached to the literal expressions of the primary sources of Islāmic doctrines (the Qurʾān, or the Islāmic scripture, and the Ḥadīth, or the sayings and traditions of Muḥammad) and who abhorred reasoning, and those whose reasoning led them to abandon the Islāmic community (the *ummah*) altogether. The status of the believer in Islām remained in practice a juridical question, not a matter for theologians or philosophers to decide. Except in regard to the fundamental questions of the existence of God, Islāmic revelation, and future reward and punishment, the juridical conditions for declaring someone an unbeliever or beyond the pale of Islām were so demanding as to make it almost impossible to make a valid declaration of this sort about a professing Muslim. In the course of events in Islāmic history, representatives of certain theological movements, who happened to be jurists and who succeeded in converting rulers to their cause, made those rulers declare in favour of their movements and even encouraged them to persecute their opponents. Thus there arose in some localities and periods a semblance of an official, or orthodox, doctrine.

Origins, nature, and significance of Islāmic theology

EARLY DEVELOPMENTS

Beginnings of Islāmic theology

The beginnings of theology in the Islāmic tradition in the second half of the 7th century are not easily distinguishable from the beginnings of a number of other disciplines—Arabic philology, Qurʾānic interpretation, the collection of the sayings and deeds of the prophet Muḥammad (Ḥadīth), jurisprudence, and historiography. Together with these other disciplines, Islāmic theology is concerned with ascertaining the facts and context of the Islāmic revelation and with understanding its meaning and implications as to what Muslims should believe and do after the revelation had ceased and the Islāmic community had to chart its own way. During the first half of the 8th century, a number of questions—which centred on God's unity, justice, and other attributes and which were relevant to man's freedom, actions, and fate in the hereafter—formed the core of a more specialized discipline, which was called *kalām* ("speech"). This term (*kalām*) was used to designate the more specialized discipline because of the rhetorical and dialectical "speech" used in formulating the principal matters of Islāmic belief, debating them, and defending them against Muslim and non-Muslim opponents. Gradually, *kalām* came to include all matters directly or indirectly relevant to the establishment and definition of religious beliefs, and it developed its own necessary or useful systematic rational arguments about human knowledge and the makeup of the world. Despite various efforts by later thinkers to fuse the problems of *kalām* with those of philosophy (and mysticism), theology preserved its relative independence from philosophy and other nonreligious sciences. It remained true to its original traditional and religious point of view, confined itself within the limits of the Islāmic revelation, and assumed that these limits as it understood them were identical with the limits of truth.

THE HELLENISTIC LEGACY

Relationships to other religious communities

The pre-Islāmic and non-Islāmic legacy with which early Islāmic theology came into contact included almost all the religious thought that had survived and was being defended or disputed in Egypt, Syria, Iran, and India. It was transmitted by learned representatives of various Christian, Jewish, Manichaean (members of a dualistic religion founded by Mani, an Iranian prophet, in the 3rd century), Zoroastrian (members of a monotheistic, but later dualistic, religion founded by Zoroaster, a 7th-century-BC Iranian prophet), Indian (Hindu and Buddhist, primarily), and Ṣābian (star worshippers of Harran often confused with the Mandaeans) communities and by early converts to Islām conversant with the teachings, sacred writings, and doctrinal history of the religions of these areas. At first, access to this legacy was primarily through conversations and disputations with such men, rather than through full and accurate translations of sacred texts or theological and philosophic writings, although some translations from Pahlavi (a Middle Persian dialect), Syriac, and Greek must also have been available.

The characteristic approach of early Islāmic theology to non-Muslim literature was through oral disputations, the starting points of which were the statements presented or defended (orally) by the opponents. Oral disputation continued to be used in theology for centuries, and most theological writings reproduce or imitate that form. From such oral and written disputations, writers on religions and sects collected much of their information about non-Muslim sects. Much of Hellenistic (post-3rd century BC Greek cultural), Iranian, and Indian religious thought was thus encountered in an informal and indirect manner.

From the 9th century onward, theologians had access to an increasingly larger body of translated texts, but by then they had taken most of their basic positions. They made a selective use of the translation literature, ignoring most of what was not useful to them until the mystical theologian al-Ghazālī (flourished 11th–12th centuries) showed them the way to study it, distinguish between the harmless and harmful doctrines contained in it, and refute the latter. By this time Islāmic theology had coined a vast number of technical terms, and theologians (*e.g.*, al-Jāḥiẓ) had forged Arabic into a versatile language of science; Arabic philology had matured; and the religious sciences (jurisprudence, the study of the Qur'ān, Ḥadīth, criticism, and history) had developed complex techniques of textual study and interpretation. The 9th-century translators availed themselves of these advances to meet the needs of patrons. Apart from demands for medical and mathematical works, the translation of Greek learning was fostered by the early ʿAbbāsid caliphs (8th–9th centuries) and their viziers as additional weapons (the primary weapon was theology itself) against the threat of Manichaeanism and other subversive ideas that went under the name *zandaqah* ("heresy" or "atheism"). (M.S.M./Ed.)

Theology and sectarianism

Despite the notion of a unified and consolidated community, as taught by the Prophet, serious differences arose within the Muslim community immediately after his death. According to the Sunnah, or traditionalist faction—who now constitute the majority of Islām—the Prophet had designated no successor. Thus the Muslims at Medina decided to elect a separate chief. Because he would not have been accepted by the Quraysh, the *ummah,* or Muslim community, would have disintegrated. Therefore, two of Muḥammad's fathers-in-law, who were highly respected early converts as well as trusted lieutenants, prevailed upon the Medinans to elect a single leader, and the choice fell upon Abū Bakr, father of the Prophet's favoured wife, ʿĀʾ ishah. All of this occurred before the Prophet's burial (under the floor of ʿĀʾishah's hut, alongside the courtyard of the mosque).

According to the Shīʿah, or "Partisans" of ʿAlī, the Prophet had designated as his successor his son-in-law ʿAlī ibn Abī Ṭālib, husband of his daughter Fāṭimah and father of his only surviving grandsons, Ḥasan and Ḥusayn. His preference was general knowledge; yet, while ʿAlī and the Prophet's closest kinsmen were preparing the body for burial, Abū Bakr, ʿUmar, and Abū ʿUbaydah from Muḥammad's Companions in the Quraysh tribe, met with the leaders of the Medinans and agreed to elect the aging Abū Bakr as the successor (*khalīfah,* hence "caliph") of the Prophet. ʿAlī and his kinsmen were dismayed but agreed for the sake of unity to accept the *fait accompli* because ʿAlī was still young

After the murder of ʿUthmān, the third caliph, ʿAlī was invited by the Muslims at Medina to accept the caliphate. Thus ʿAli became the fourth caliph (656–661), but the disagreement over his right of succession brought about a major schism in Islām, between the Shīʿah, or "legitimists"—those loyal to ʿAlī—and the Sunnah, or "traditionalists." Athough their differences were in the first instance political, arising out of the question of leadership, theological differences developed over time.

THE KHAWĀRIJ

During the reign of the third caliph, ʿUthmān, certain rebellious groups accused the Caliph of nepotism and misrule, and the resulting discontent led to his assassination. The rebels then recognized the Prophet's cousin and son-in-law, ʿAlī, as ruler but later deserted him and fought against him, accusing him of having committed a grave sin in submitting his claim to the caliphate to arbitration. The word *khāraju,* from which *khārijī* is derived, means "to withdraw" and Khawārij were, therefore, seceders who believed in active dissent or rebellion against a state of affairs they considered to be gravely impious.

The basic doctrine of the Khawārij was that a person or a group who committed a grave error or sin and did not sincerely repent ceased to be Muslim. Mere profession of the faith—"there is no god but God; Muḥammad is the prophet of God"—did not make a person a Muslim unless this faith was accompanied by righteous deeds. In other words, good works were an integral part of faith and not extraneous to it. The second principle that flowed from their aggressive idealism was militancy, or *jihād,* which the Khawārij considered to be among the cardinal principles, or pillars, of Islām. Contrary to the orthodox view, they interpreted the Qurʾānic command about "enjoining good and forbidding evil" to mean the vindication of truth through the sword. The placing of these two principles together made the Khawārij highly inflammable fanatics, intolerant of almost any established political authority. They incessantly resorted to rebellion and as a result were virtually wiped out during the first two centuries of Islām.

Because the Khawārij believed that the basis of rule was righteous character and piety alone, any Muslim, irrespective of race, colour, and sex, could, in their view, become ruler—provided he or she satisfied the conditions of piety. This was in contrast to the claims of the Shīʿah (the party of Muḥammad's son-in-law, ʿAlī) that the ruler must belong to the family of the Prophet and to the doctrine of the Sunnah (followers of the Prophet's way) that the head of state must belong to the Prophet's tribe, *i.e.,* the Quraysh.

A moderate group of the Khawārij, the Ibāḏīs, avoided extinction, and its members are to be found today in North Africa and in Oman and other parts of East Africa, including Zanzibar Island. The Ibāḏīs do not believe in aggressive methods and, throughout medieval Islām, remained dormant. Because of the interest of 20th-century Western scholars in this sect, the Ibāḏīs have become active and have begun to publish their classical writings and their own journals.

The permanent influence of the Khawārij

Although Khārijism is now essentially a story of the past, it has left a permanent influence on Islām, because of reaction against it. It forced the religious leadership of the community to formulate a bulwark against religious intolerance and fanaticism. Positively, it has influenced the reform movements that have sprung up in Islām from time to time and that have treated spiritual and moral placidity and status quo with a quasi-Khawārij zeal and militancy.

THE MUʿTAZILAH

The question of whether works are an integral part of faith or independent of it, as raised by the Khawārij, led to another important theological question: are human acts the result of a free human choice, or are they predetermined by God? This question brought with it a whole series of questions about the nature of God and of man. Although the initial impetus to theological thought, in the case of the Khawārij, had come from within Islām, full-scale religious speculation resulted from the contact and confrontation of Muslims with other cultures and systems of thought.

As a consequence of translations of Greek philosophical and scientific works into Arabic during the 8th and 9th centuries and the controversies of Muslims with Dualists (*e.g.,* Gnostics and Manichaeans), Buddhists, and Christians, a more powerful movement of rational theology emerged; its representatives are called the Muʿtazilah (literally "those who stand apart," a reference to the fact that they dissociated themselves from extreme views of faith and infidelity). On the question of the relationship of faith to works, the Muʿtazilah—who called themselves "champions of God's unity and justice"—taught, like the Khawārij, that works were an essential part of faith but that a person guilty of a grave sin, unless he repented, was neither a Muslim nor yet a non-Muslim but occupied a "middle ground." They further defended the position, as a central part of their doctrine, that man was free to choose and act and was, therefore, responsible for his actions. Divine predestination of human acts, they held, was incompatible with God's justice and human responsibility. The Muʿtazilah, therefore, recognized two powers, or actors, in the universe—God in the realm of nature and man in the domain of moral human action. The Muʿtazilah explained away the apparently predeterministic verses of the Qurʾān as being metaphors and exhortations.

Emphasis on reason

They claimed that human reason, independent of revelation, was capable of discovering what is good and what is evil, although revelation corroborated the findings of reason. Man is, therefore, under moral obligation to do the right even if there were no prophets and no divine revelation. Revelation has to be interpreted, therefore, in conformity with the dictates of rational ethics. Yet revelation is neither redundant nor passive. Its function is twofold. First, its aim is to aid man in choosing the right, because in the conflict between good and evil man often falters and makes the wrong choice against his rational judgment. God, therefore, must send prophets, for he must do the best for man; otherwise, the demands of divine grace and mercy cannot be fulfilled. Secondly, revelation is also necessary to communicate the positive obligations of religion—*e.g.,* prayers and fasting—which cannot be known without revelation.

God is viewed by the Muʿtazilah as pure Essence, without eternal attributes, because they hold that the assumption of eternal attributes in conjunction with Essence will result in a belief in multiple coeternals and violate the pure, unadulterated unity of God. God knows, wills, and acts by virtue of his Essence and not through attributes of knowledge, will, and power. Nor does he have an eternal attribute of speech, of which the Qurʾān and other earlier revelations were effects; the Qurʾān was, therefore, created in time and was not eternal.

The promises of reward that God has made in the Qurʾān to righteous people and the threats of punishment he has issued to evildoers must be carried out by him on the Day of Judgment. For promises and threats are viewed as reports about the future, and if not fulfilled exactly those reports will turn into lies, which are inconceivable of God. Also, if God were to withhold punishment for evil and forgive it, this would be as unjust as withholding reward for righteousness. There can be neither undeserved punishment nor undeserved reward; otherwise, good may just as well turn into evil and evil into good. From this position it follows that there can be no intercession on behalf of sinners.

When, in the early 9th century, the ʿAbbāsid caliph al-Maʾmūn raised Muʿtazilism to the status of the state creed, the Muʿtazilite rationalists showed themselves to be illiberal and persecuted their opponents. Aḥmad ibn Ḥanbal (died 855), an eminent orthodox figure and founder of one of the four orthodox schools of Islāmic law, was subjected to flogging and imprisonment for his refusal to subscribe to the doctrine that the Qurʾān, the word of God, was created in time.

THE SUNNAH

In the 10th century a reaction began against the Muʿtazilah that culminated in the formulation and subsequent general acceptance of another set of theological propositions, which became Sunnī, or "orthodox" theology.

The issues raised by these early schisms and the positions adopted by them enabled the Sunnī orthodoxy to define its own doctrinal positions in turn. Much of the content of Sunnī theology was, therefore, supplied by its reactions to those schisms. The term *sunnah,* which means a "well-trodden path" and in the religious terminology of Islām normally signifies "the example set by the Prophet," in the present context simply means the traditional and well-defined way. In this context, the term *sunnah* usually is accompanied by the appendage "the consolidated majority" (*al-jamāʿah*). The term clearly indicates that the traditional way is the way of the consolidated majority of the community as against peripheral or "wayward" positions of sectarians, who by definition must be erroneous.

The way of the majority. With the rise of the orthodoxy, then, the foremost and elemental factor that came to be emphasized was the notion of the majority of the community. The concept of the community so vigorously pronounced by the earliest doctrine of the Qurʾān gained both a new emphasis and a fresh context with the rise of Sunnism. Whereas the Qurʾān had marked out the Muslim community from other communities, Sunnism now emphasized the views and customs of the majority of the community in contradistinction to peripheral groups. An abundance of tradition (Ḥadīth) came to be attributed to the Prophet to the effect that Muslims must follow the majority's way, that minority groups are all doomed to hell, and that God's protective hand is always on (the majority of) the community, which can never be in error. Under the impact of the new Ḥadīth, the community, which had been charged by the Qurʾān with a mission and commanded to accept a challenge, now became transformed into a privileged one that was endowed with infallibility.

Tolerance of diversity. At the same time, while condemning schisms and branding dissent as heretical, Sunnism developed the opposite trend of accommodation, catholicity, and synthesis. A putative tradition of the Prophet that says "differences of opinion among my community are a blessing" was given wide currency. This principle of toleration ultimately made it possible for diverse sects and schools of thought—notwithstanding a wide range of difference in belief and practice—to recognize and coexist with each other. No group may be excluded from the community unless it itself formally renounces Islām. As for individuals, tests of heresy may be applied to their beliefs, but, unless a person is found to flagrantly violate or deny the unity of God or expressly negate the prophethood of Muḥammad, such tests usually have no serious consequences. Catholicity was orthodoxy's answer to the intolerance and secessionism of the Khawārij and the severity of the Muʿtazilah. As a consequence, a formula was adopted in which good works were recognized as enhancing the quality of faith but not as entering into the definition and essential nature of faith. This broad formula saved the integrity of the community at the expense of moral strictness and doctrinal uniformity.

On the question of free will, Sunnī orthodoxy attempted a synthesis between man's responsibility and God's omnipotence. The champions of orthodoxy accused the Muʿtazilah of quasi-Magian Dualism (Zoroastrianism) insofar as the Muʿtazilah admitted two independent and original actors in the universe: God and man. To the orthodox it seemed blasphemous to hold that man could act wholly outside the sphere of divine omnipotence, which had been so vividly portrayed by the Qurʾān but which the Muʿtazilah had endeavoured to explain away in order to make room for man's free and independent action.

Formulators of Sunnī doctrine

Influence of Al-Ashʿarī and al-Māturīdī. The Sunnī formulation, however, as presented by al-Ashʿarī and al-Māturīdī, Sunnī's two main representatives in the 10th century, shows palpable differences despite basic uniformity. Al-Ashʿarī taught that human acts were created by God and acquired by man and that human responsibility depended on this acquisition. He denied, however, that man could be described as an actor in a real sense. Al-Māturīdī, on the other hand, held that although God is the sole Creator of everything, including human acts, nevertheless, man is an actor in the real sense, for acting and creating were two different types of activity involving different aspects of the same human act.

In conformity with their positions, al-Ashʿarī believed that man did not have the power to act before he actually acted and that God created this power in him at the time of action; and al-Māturīdī taught that before the action man has a certain general power for action but that this power becomes specific to a particular action only when the action is performed, because, after full and specific power comes into existence, action cannot be delayed.

Al-Ashʿarī and his school also held that human reason was incapable of discovering good and evil and that acts became endowed with good or evil qualities through God's declaring them to be such. Because man in his natural state regards his own self-interest as good and that which thwarts his interests as bad, natural human reason is unreliable. Independently of revelation, therefore, murder would not be bad nor the saving of life good. Furthermore, because God's Will makes acts good or bad, one cannot ask for reasons behind the divine law, which must be simply accepted. Al-Māturīdī takes an opposite position, not materially different from that of the Muʿtazilah: human reason is capable of finding out good and evil, and revelation aids human reason against the sway of human passions.

Despite these important initial differences between the two main Sunnī schools of thought, the doctrines of al-Māturīdī became submerged in course of time under the expanding popularity of the Ashʿarite school, which gained wide currency particularly after the 11th century because of the influential activity of the Ṣūfī theologian al-Ghazālī. Because these later theologians placed increasing emphasis on divine omnipotence at the expense of the freedom and efficacy of the human will, a deterministic outlook on life became characteristic of Sunnī Islām—reinvigorated by the Ṣūfī world view, which taught that nothing exists except God, whose being is the only real being. This general deterministic outlook produced, in turn, a severe reformist reaction in the teachings of Ibn Taymīyah, a 14th-century theologian who sought to rehabilitate human freedom and responsibility and whose influence has been strongly felt through the reform movements in the Muslim world since the 18th century.

THE SHĪʿAH

The Shīʿah are the only important surviving sect in Islām. As noted above, they owe their origin to the hostility between ʿAlī (the fourth caliph and son-in-law of the Prophet) and the Umayyad dynasty (661–750). After ʿAlī's death, the Shīʿah (Party; *i.e.,* of ʿAlī) demanded the restoration of rule to ʿAlī's family, and from that demand developed the Shīʿite legitimism, or the divine right of the holy family to rule. In the early stages, the Shīʿah used this legitimism to cover the protest against the Arab hegemony under the Umayyads and to agitate for social reform.

Emphasis on the *imām*

Gradually, however, Shīʿism developed a theological content for its political stand. Probably under Gnostic (esoteric, dualistic, and speculative) and old Iranian (dualistic) influences, the figure of the political ruler, the *imām* (exemplary "leader"), was transformed into a metaphysical being, a manifestation of God and the primordial light that sustains the universe and bestows true knowledge on man. Through the *imām* alone the hidden and true meaning of the Qurʾānic revelation can be known, because the *imām* alone is infallible. The Shīʿah thus developed a doctrine of esoteric knowledge that was adopted also, in a modified form, by the Ṣūfīs, or Islāmic mystics (see below *Islāmic mysticism, Ṣūfism*). The orthodox Shīʿah recognize 12 such *imāms*, the last (Muḥammad) having disappeared in the 9th century. Since that time, the *mujtahids* (*i.e.,* the Shīʿī divines) have been able to interpret law and doctrine under the putative guidance of the *imām,* who will return toward the end of time to fill the world with truth and justice.

On the basis of their doctrine of imamology, the Shīʿah emphasize their idealism and transcendentalism in conscious contrast with Sunnī pragmatism. Thus, whereas the Sunnīs believe in the *ijmāʿ* ("consensus") of the community as the source of decision making and workable knowledge, the Shīʿah believe that knowledge derived from fallible sources is useless and that sure and true knowledge can come only through a contact with the infallible *imām.* Again, in marked contrast to Sunnism, Shīʿism adopted the Muʿtazilite doctrine of the freedom of the human will and the capacity of human reason to know good and evil, although its position on the question of the relationship of faith to works is the same as that of the Sunnīs.

Parallel to the doctrine of an esoteric knowledge, Shīʿism, because of its early defeats and persecutions, also adopted the principle of *taqīyah,* or dissimulation of faith in a hostile environment. Introduced first as a practical principle, *taqīyah,* which is also attributed to ʿAlī and other *imāms,* became an important part of the Shīʿah religious teaching and practice. In the sphere of law, Shīʿism differs from Sunnī law mainly in allowing a temporary marriage, called *mutʿah,* which can be legally contracted for a fixed period of time on the stipulation of a fixed dower.

Introduction of the passion motive

From a spiritual point of view, perhaps the greatest difference between Shīʿism and Sunnism is the former's introduction into Islām of the passion motive, which is conspicuously absent from Sunnī Islām. The violent death (in 680) of ʿAlī's son, Ḥusayn, at the hands of the Umayyad troops is celebrated with moving orations, passion plays, and processions in which the participants, in a state of emotional frenzy, beat their breasts with heavy chains and sharp instruments, inflicting wounds on their bodies. This passion motive has also influenced the Sunnī masses in Afghanistan and the Indian subcontinent, who participate in passion plays called *taʿziyahs.* Such celebrations are, however, absent from Egypt and North Africa.

Although the Shīʿah number only about 40,000,000 (Shīʿism has been the official religion in Iran since the 16th century), Shīʿism has exerted a great influence on Sunnī Islām in several ways. The veneration in which all Muslims hold ʿAlī and his family and the respect shown to ʿAlī's descendants (who are called *sayyids* in the East and *sharīfs* in North Africa) are obvious evidence of this influence.

Ismāʿīlīs. Besides the main body of Twelver (Ithnā ʿAsharīyah) Shīʿah, Shīʿism has produced a variety of more or less extremist sects, the most important of them being the Ismāʿīlī. Instead of recognizing Mūsā as the seventh *imām,* as did the main body of the Shīʿah, the Ismāʿīlīs upheld the

Muslims carrying the *taʿzīyah* to their cremation during a procession commemorating the martyrdom of Ḥusayn, in Jaipur, India.

claims of his elder brother Ismāʿīl. One group of Ismāʿīlīs, called Seveners (Sabʿīyah), considered Ismāʿīl the seventh and last of the *imām*s. The majority of Ismāʿīlīs, however, believed that the imamate continued in the line of Ismāʿīl's descendants. The Ismāʿīlī teaching spread during the 9th century from North Africa to Sind, in India, and the Ismāʿīlī Fāṭimid dynasty succeeded in establishing a prosperous empire in Egypt. Ismāʿīlīs are subdivided into two groups—the Nizārīs, headed by the Aga Khan, and the Mustaʿlīs in Bombay, with their own spiritual head. The Ismāʿīlīs are to be found mainly in East Africa, Pakistan, India, and Yemen.

In their theology, the Ismāʿīlīs have absorbed the most extreme elements and heterodox ideas. The universe is viewed as a cyclic process, and the unfolding of each cycle is marked by the advent of seven "speakers"—messengers of God with Scriptures—each of whom is succeeded by seven "silents"—messengers without revealed scriptures; the last speaker (the Prophet Muḥammad) is followed by seven *imām*s who interpret the Will of God to man and are, in a sense, higher than the Prophet because they draw their knowledge directly from God and not from the Angel of Revelation. During the 10th century, certain Ismāʿīlī intellectuals formed a secret society called the Brethren of Purity, which issued a philosophical encyclopaedia, *The Epistles of the Brethren of Purity,* aiming at the liquidation of positive religions in favour of a universalist spirituality.

The late Aga Khan III (1887–1957) had taken several measures to bring his followers closer to the main body of the Muslims. The Ismāʿīlīs, however, still do not have mosques but *jamāʿat khānah*s ("gathering houses"), and their mode of worship bears little resemblance to that of the Muslims generally.

Other Shīʿī sects. Several other sects arose out of the general Shīʿite movement—*e.g.,* the Nuṣayrīs, the Yazīdīs, and the Druzes—out of which only the Druzes have any considerable following. The Druze sect, sometimes considered as independent from Islām, arose in the 11th century out of a cult of deification of the Fāṭimid caliph al-Ḥākim. Some authorities believe that the growth of the Freemasonry movement was influenced by Druze rituals.

Druzes and Bahāʾīs

During a 19th-century anticlerical movement in Iran, a certain ʿAlī Moḥammad of Shīrāz appeared, declaring himself to be the Bāb ("Gate"; *i.e.,* to God). At that time the climate in Iran was generally favourable to Messianic ideas. He was, however, bitterly opposed by the Shīʿah *ʿulamāʾ* (council of learned men) and was executed in 1850. After his death, his two disciples, Ṣobḥ-e Azal and Bahāʾ Ullāh, broke and went in different directions. Bahāʾ Ullāh eventually declared his religion—stressing a humanitarian pacificism and universalism—to be an independent religion outside Islām. The Bahāʾī faith won a considerable number of converts in North America during the early 20th century (see also in the *Micropædia:* DRUZE; BAHĀʾĪ FAITH).

Islāmic mysticism, or Ṣūfism, emerged out of early ascetic reactions on the part of certain religiously sensitive personalities against the general worldliness that had overtaken the Muslim community and the purely "externalist" expressions of Islām in law and theology. These persons stressed the Muslim qualities of moral motivation, contrition against overworldliness, and "the state of the heart" as opposed to the legalist formulations of Islām. For a complete exposition of Ṣūfī history, beliefs, and practices, see below *Islāmic mysticism, Ṣūfism.*

OTHER GROUPS

The Aḥmadīyah. In the latter half of the 19th century in Punjab, India, Mirza Ghulam Ahmad claimed to be an inspired prophet. At first a defender of Islām against Christian missionaries, he adopted certain doctrines of the Indian Muslim modernist Sayyid Ahmad Khan—namely, that Jesus died a natural death and was not assumed into heaven as the Islāmic orthodoxy believed and that *jihād* "by the sword" had been abrogated and replaced with *jihād* "of the pen." His aim appears to have been to synthesize all religions under Islām, for he declared himself to be not only the manifestation of the Prophet Muḥammad but also the Second Advent of Jesus, as well as Ḳrishna for the Hindus, among other claims. He did not announce, however, any new revelation or new law.

In 1914 a schism over succession occurred among the Aḥmadīyah. One group that seceded from the main body, which was headed by a son of the founder, disowned the prophetic claims of Ghulam Ahmad and established their centre in Lahore (in modern Pakistan). The main body of the Aḥamadīyah evolved a separatist organization and, after the partition of India in 1947, moved their headquarters to Rabwah in what was then West Pakistan.

Both groups are noted for their missionary work, particularly in the West and in Africa. Within the Muslim countries, however, there is fierce opposition to the main group because of its claim that Ghulam Ahmad was a prophet (the Muslim community believes in the finality of prophethood with Muḥammad) and because of its separatist organization. Outside the Muslim countries, however, the Qadiani group (as the main body is called, Qadian being the birthplace of the founder and first centre of the sect) acts more like a movement than a sect, with a relatively loose connection with its centre in Pakistan.

The "Black Muslims." After World War II an Islāmic movement arose among blacks in the U.S.; members called themselves the Nation of Islam, but they were popularly known as Black Muslims. Although they adopted some Islāmic social practices, the group was in large part a black separatist and social-protest movement. Their leader, Elijah Muhammad, who claimed to be an inspired prophet, interpreted the doctrine of Resurrection in an unorthodox sense as the revival of oppressed ("dead") peoples. The popular leader and spokesman Malcolm X (el-Hajj Malik el-Shabazz) broke with Elijah Muhammad and adopted more orthodox Islāmic views. He was assassinated in 1965. After the death of Elijah Muhammad in 1975, the group was renamed World Community of Islam in the West and officially abandoned its separatist aims. The name was again changed in the late 1970s, to American Muslim Mission. (F.R./Ed.)

Islāmic mysticism, Ṣūfism

Mysticism is that aspect of Islāmic belief and practice in which Muslims seek to find the truth of divine love and knowledge through direct personal experience of God. It consists of a variety of mystical paths that are designed to ascertain the nature of man and God and to facilitate the experience of the presence of divine love and wisdom in the world.

Islāmic mysticism is called *taṣawwuf* (literally, "to dress in wool") in Arabic, but it has been called Ṣūfism in Western languages since the early 19th century. An abstract word, Ṣūfism derives from the Arabic term for a mystic, *ṣūfī,* which is in turn derived from *ṣūf,* "wool," plausibly a reference to the woollen garment of early Islāmic ascetics. The Ṣūfīs are also generally known as "the poor," *fuqarāʾ*, plural of the Arabic *faqīr*, in Persian *darvīsh*, whence the English words fakir and dervish.

Origins and influence

Though the roots of Islāmic mysticism formerly were supposed to have stemmed from various non-Islāmic sources in ancient Europe and even India, it now seems established that the movement grew out of early Islāmic asceticism that developed as a counterweight to the increasing worldliness of the expanding Muslim community; only later were foreign elements that were compatible with mystical theology and practices adopted and made to conform to Islām.

By educating the masses and deepening the spiritual concerns of the Muslims, Ṣūfism has played an important role in the formation of Muslim society. Opposed to the dry casuistry of the lawyer-divines, the mystics nevertheless scrupulously observed the commands of the divine law. The Ṣūfīs have been further responsible for a large-scale missionary activity all over the world, which still continues. Ṣūfīs have elaborated the image of the prophet Muḥammad—the founder of Islām—and have thus largely influenced Muslim piety by their Muḥammad-mysticism. Without the Ṣūfī vocabulary, Persian and other literatures related to it, such as Turkish, Urdu, Sindhi, Pashto, and Panjabi, would lack their special charms. Through the poetry of these literatures mystical ideas spread widely among the Muslims. In some countries Ṣūfī leaders were also active politically.

HISTORY

Islāmic mysticism had several stages of growth, including (1) the appearance of early asceticism, (2) the development of a classical mysticism of divine love, and (3) the rise and proliferation of fraternal orders of mystics. Despite these general stages, however, the history of Islāmic mysticism is largely a history of individual mystic experience.

The first stage of Ṣūfism appeared in pious circles as a reaction against the worldliness of the early Umayyad period (AD 661–749). From their practice of constantly meditating on the Qurʾānic words about Doomsday, the ascetics became known as "those who always weep" and those who considered this world "a hut of sorrows." They were distinguished by their scrupulous fulfillment of the injunctions of the Qurʾān and tradition, by many acts of piety, and especially by a predilection for night prayers.

Classical mysticism. The introduction of the element of love, which changed asceticism into mysticism, is ascribed to Rābiʿah al-ʿAdawīyah (died 801), a woman from Basra who first formulated the Ṣūfī ideal of a love of God that was disinterested, without hope for paradise and without fear of hell. In the decades after Rābiʿah, mystical trends grew everywhere in the Islāmic world, partly through an exchange of ideas with Christian hermits. A number of mystics in the early generations had concentrated their efforts upon *tawakkul*, absolute trust in God, which became a central concept of Ṣūfism. An Iraqi school of mysticism became noted for its strict self-control and psychological insight. The Iraqi school was initiated by al-Muḥāsibī (died 857)—who believed that purging the soul in preparation for companionship with God was the only value of asceticism. Its teachings of classical sobriety and wisdom were perfected by Junayd of Baghdad (died 910), to whom all later chains of the transmission of doctrine and legitimacy go back. In an Egyptian school of Ṣūfism, the Nubian Dhū an-Nūn (died 859) reputedly introduced the technical term *maʿ rifah* ("interior knowledge"), as contrasted to learnedness; in his hymnical prayers he joined all nature in the praise of God—an idea based on the Qurʾān and later elaborated in Persian and Turkish poetry. In the Iranian school, Abū Yazīd al-Bisṭāmī (died 874) is usually considered to have been representative of the important doctrine of annihilation of the self, *fanāʾ* (see below); the strange symbolism of his sayings prefigures part of the terminology of later mystical poets. At the same time the concept of divine love became more central, especially among the Iraqi Ṣūfīs. Its main representatives are Nūrī, who offered his life for his brethren, and Sumnūn "the Lover."

Mystical love

The first of the theosophical speculations based on mystical insights about the nature of man and the essence of the Prophet were produced by such Ṣūfīs as Sahl at-Tustarī (died *c.* 896). Some Hellenistic ideas were later adopted by al-Ḥakīm at-Tirmidhī (died 898). Sahl was the master of al-Ḥusayn ibn Manṣūr al-Ḥallāj, who has become famous for his phrase *anā al-ḥaqq*, "I am the Creative Truth" (often rendered "I am God"), which was later interpreted in a pantheistic sense but is, in fact, only a condensation of his theory of *huwa huwa* ("He he"): God loved himself in his essence, and created Adam "in his image." Ḥallāj was executed in 922 in Baghdad as a result of his teachings; he is, for later mystics and poets, the "martyr of Love" par excellence, the enthusiast killed by the theologians. His few poems are of exquisite beauty; his prose, which contains an outspoken Muḥammad-mysticism—*i.e.*, mysticism centred on the prophet Muḥammad—is as beautiful as it is difficult.

Ṣūfī thought was in these early centuries transmitted in small circles. Some of the *shaykhs*, Ṣūfī mystical leaders or guides of such circles, were also artisans. In the 10th century, it was deemed necessary to write handbooks about the tenets of Ṣūfism in order to soothe the growing suspicions of the orthodox; the compendiums composed in Arabic by Abū Ṭālib Makkī, Sarrāj, and Kalābādhī in the late 10th century, and by Qushayrī and, in Persian, by Hujvīrī in the 11th century reveal how these authors tried to defend Ṣūfism and to prove its orthodox character. It should be noted that the mystics belonged to all schools of Islāmic law and theology of the times.

The last great figure in the line of classical Ṣūfism is Abū Ḥāmid al-Ghazālī (died 1111), who wrote, among numerous other works, the *Iḥyāʾ ʿulūm ad-dīn* ("The Revival of the Religious Sciences"), a comprehensive work that established moderate mysticism against the growing theosophical trends—which tended to equate God and the world—and thus shaped the thought of millions of Muslims. His younger brother, Aḥmad al-Ghazālī, wrote one of the subtlest treatises (*Sawāniḥ*; "Occurrences" [*i.e.*, stray thoughts]) on mystical love, a subject that then became the main subject of Persian poetry.

Rise of fraternal orders. Slightly later, mystical orders (fraternal groups centring around the teachings of a leader-founder) began to crystallize. The 13th century, though politically overshadowed by the invasion of the Mongols into the Eastern lands of Islām and the end of the ʿAbbāsid caliphate, was also the golden age of Ṣūfism: the Spanish-born Ibn alʿArabī created a comprehensive theosophical system (concerning the relation of God and the world) that was to become the cornerstone for a theory of "Unity of Being." According to this theory all existence is one, a manifestation of the underlying divine reality. His Egyptian contemporary Ibn al-Fāriḍ wrote the finest mystical poems in Arabic. Two other important mystics, who died *c.* AD 1220, were a Persian poet, Farīd od-Dīn ʿAṭṭār, one of the most fertile writers on mystical topics, and a Central Asian master, Najmuddīn Kubrā, who presented elaborate discussions of the psychological experiences through which the mystic adept has to pass.

The mystical poetry of Jalāl ad-Dīn ar-Rūmī

The greatest mystical poet in the Persian language, Jalāl ad-Dīn ar-Rūmī (1207–73), was moved by mystical love to compose his lyrical poetry that he attributed to his mystical beloved, Shams ad-Dīn of Tabriz, as a symbol of their union. Rūmī's didactic poem *Mas̄navī* in about 26,000 couplets—a work that is for the Persian-reading mystics second in importance only to the Qurʾān—is an encyclopaedia of mystical thought in which everyone can find his own religious ideas. Rūmī inspired the organization of the whirling dervishes—who sought ecstasy through an elaborate dancing ritual, accompanied by superb music. His younger contemporary Yunus Emre inaugurated Turkish mystical poetry with his charming verses that were transmitted by the Bektāshīyah (Bektaşi) order of dervishes and are still admired in modern Turkey. In Egypt, among many other mystical trends, an order—known as Shādhilīyah—was founded by ash-Shādhilī (died 1258); its main literary representative, Ibn ʿAṭāʾ Allāh of Alexandria, wrote sober aphorisms (*ḥikam*).

At that time, the basic ideals of Ṣūfism permeated the whole world of Islām; and at its borders as, for example, in

India, Ṣūfīs largely contributed to shaping Islāmic society. Later some of the Ṣūfīs in India were brought closer to Hindu mysticism by an overemphasis on the idea of divine unity which became almost monism—a religiophilosophic perspective according to which there is only one basic reality, and the distinction between God and the world (and man) tends to disappear. The syncretistic attempts of the Mughal emperor Akbar (died 1605) to combine different forms of belief and practice, and the religious discussions of the crown prince Dārā Shukōh (executed for heresy, 1659) were objectionable to the orthodox. Typically, the countermovement was again undertaken by a mystical order, the Naqshbandīyah, a Central Asian fraternity founded in the 14th century. Contrary to the monistic trends of the school of *waḥdat al-wujūd* ("existential unity of being"), the later Naqshbandīyah defended the *waḥdat ash-shuhūd* ("unity of vision"), a subjective experience of unity, occurring only in the mind of the believer, and not as an objective experience. Aḥmad Sirhindī (died 1624) was the major protagonist of this movement in India. His claims of sanctity were surprisingly daring: he considered himself the divinely invested master of the universe. His refusal to concede the possibility of union between man and God (characterized as "servant" and "Lord") and his sober law-bound attitude gained him and his followers many disciples, even at the Mughal court and as far away as Turkey. In the 18th century, Shāh Walī Allāh of Delhi was connected with an attempt to reach a compromise between the two inimical schools of mysticism; he was also politically active and translated the Qur'ān into Persian, the official language of Mughal India. Other Indian mystics of the 18th century, such as Mīr Dard, played a decisive role in forming the newly developing Urdu poetry.

Trends in modern Ṣūfism

In the Arabic parts of the Islāmic world, only a few interesting mystical authors are found after 1500. They include ash-Shaʿrānī in Egypt (died 1565) and the prolific writer ʿAbd al-Ghanī an-Nābulusī in Syria (died 1731). Turkey produced some fine mystical poets in the 17th and 18th centuries. The influence of the mystical orders did not recede; rather new orders came into existence, and most literature was still tinged with mystical ideas and expressions. Political and social reformers in the Islāmic countries have often objected to Ṣūfism because they have generally considered it as backward, hampering the free development of society. Thus, the orders and dervish lodges in Turkey were closed by Kemal Atatürk in 1925. Yet, their political influence is still palpable, though under the surface. Such modern Islāmic thinkers as the Indian philosopher Muḥammad Iqbāl have attacked traditional monist mysticism and have gone back to the classical ideals or divine love as expressed by Ḥallāj and his contemporaries. The activities of modern Muslim mystics in the cities are mostly restricted to spiritual education.

SUFI LITERATURE

Though a prophetic saying (Ḥadīth) claims that "he who knows God becomes silent," the Ṣūfīs have produced a literature of impressive extent and could defend their writing activities with another Ḥadīth: "He who knows God talks much." The first systematic books explaining the tenets of Ṣūfism date from the 10th century; but earlier, Muḥāsibī had already written about spiritual education, Ḥallāj had composed meditations in highly concentrated language, and many Ṣūfīs had used poetry for conveying their experiences of the ineffable mystery or had instructed their disciples in letters of cryptographic density. The accounts of Ṣūfism by Sarrāj and his followers, as well as the *ṭabaqāt* (biographical works) by Sulamī, Abū Nuʿaym al-Iṣfahānī, and others, together with some biographies of individual masters, are the sources for knowledge of early Ṣūfism.

Early mystical commentaries on the Qur'ān are only partly extant, often preserved in fragmentary quotations in later sources. With the formation of mystical orders, books about the behaviour of the Ṣūfī in various situations became important, although this topic had already been touched on in such classical works as *Adāb al-murīdīn* ("The Adepts' Etiquette") by Abū Najīb as-Suhrawardī (died 1168), the founder of the Suhrawardīyah order and uncle of the author of the oft translated *ʿAwārif al-maʿārif* ("The Well-known Sorts of Knowledge"). The theosophists had to condense their systems in readable form; Ibn al-ʿArabī's *al-Futūḥāt al-Makkīyah* ("The Meccan Revelations") is the textbook of *waḥdat al-wujūd* (God and creation as two aspects of one reality); his smaller work on the peculiar character of the prophets—*Fuṣūṣ al-ḥikam* ("The Bezels—or cutting edges—of Wisdom")—became even more popular.

Later mystics commented extensively upon the classical sources and, sometimes, translated them into their mother tongues. A literary type that has flourished especially in India since the 13th century is the *malfūẓāt,* a collection of sayings of the mystical leader, which are psychologically interesting and allow glimpses into the political and social situation of the Muslim community. Collections of letters of the *shaykh*s are similarly revealing. Ṣūfī literature abounds in hagiography, either biographies of all known saints from the Prophet to the day of the author, or of saints of a specific order, or of those who lived in a certain town or province, so that much information on the development of Ṣūfī thought and practice is available if sources are critically sifted.

Poetical, national, and regional literature

The greatest contribution of Ṣūfism to Islāmic literature, however, is poetry—beginning with charming, short Arabic love poems (sometimes sung for a mystical concert, *samāʿ*) that express the yearning of the soul for union with the beloved. The love-relation prevailing in most Persian poetry is that between a man and a beautiful youth; less often, as in the writings of Ibn al-ʿArabī and Ibn al-Fāriḍ, eternal beauty is symbolized through female beauty; in Indo-Muslim popular mystical songs the soul is the loving wife, God the longed-for husband. Long mystic–didactic poems (*mas̄navīs*) were written to introduce the reader to the problems of unity and love by means of allegories and parables. After Sanāʾī's (died 1131?) *Ḥadīqat al-ḥaqīqah wa sharīʿat aṭ-ṭariqah* ("The Garden of Truth and the Law of Practice"),came ʿAṭṭar's *Manṭeq oṭ-ṭeyr* ("The Birds' Conversation") and Rūmī's *Mas̄navī-ye maʿnavī* ("Spiritual Couplets"). These three works are the sources that have furnished poets for centuries with mystical ideas and images. Typical of Ṣūfī poetry is the hymn in praise of God, expressed in chains of repetitions.

The mystics also contributed largely to the development of national and regional literatures, for they had to convey their message to the masses in their own languages: in Turkey as well as in the Panjabi-, the Sindhi-, and the Urdu-speaking areas of South Asia, the first true religious poetry was written by Ṣūfīs, who blended classical Islāmic motifs with inherited popular legends and used popular rather than Persian metres. Ṣūfī poetry expressing divine love and mystical union through the metaphors of profane love and union often resembled ordinary worldly love poetry; and nonmystical poetry made use of the Ṣūfī vocabulary, thus producing an ambiguity that is felt to be one of the most attractive and characteristic features of Persian, Turkish, and Urdu literatures. Ṣūfī ideas thus permeated the hearts of all those who hearkened to poetry. An example is al-Ḥusayn ibn Manṣūr al-Ḥallāj, the 10th-century martyr–mystic, who is as popular in modern progressive Urdu poetry as he was with the "God-intoxicated" Ṣūfīs; he has been converted into a symbol of suffering for one's ideals.

SUFI THOUGHT AND PRACTICE

Important aspects. The mystics drew their vocabulary largely from the Qur'ān, which for Muslims contains all divine wisdom and has to be interpreted with ever-increasing insight. In the Qur'ān, mystics found the threat of the Last Judgment, but they also found the statement that God "loves them and they love him," which became the basis for love-mysticism. Strict obedience to the religious law and imitation of the Prophet were basic for the mystics. By rigid introspection and mental struggle the mystic tried to purify his baser self from even the smallest signs of selfishness, thus attaining *ikhlāṣ,* absolute purity of intention and act. *Tawakkul* (trust in God) was sometimes practiced to such an extent that every thought of tomorrow was considered irreligious. "Little sleep, little talk, little food" were fundamental; fasting became one of the most important preparations for the spiritual life.

Central concern of Ṣūfism

The central concern of the Ṣūfīs, as of every Muslim, was *tawḥīd,* the witness that "There is no deity but God." This truth had to be realized in the existence of each individual, and so the expressions differ: early Ṣūfism postulated the approach to God through love and voluntary suffering until a unity of will was reached; Junayd spoke of "recognizing God as He was before creation"; God is seen as the One and only actor; He alone "has the right to say 'I'." Later, *tawḥīd* came to mean the knowledge that there is nothing existent but God, or the ability to see God and creation as two aspects of one reality, reflecting each other and depending upon each other (*waḥdat al-wujūd*).

The mystics realized that beyond the knowledge of outward sciences intuitive knowledge was required in order to receive that illumination to which reason has no access. *Dhawq,* direct "tasting" of experience, was essential for them. But the inspirations and "unveilings" that God grants such mystics by special grace must never contradict the Qurʾān and tradition and are valid only for the person concerned. Even the Malāmatīs, who attracted public contempt upon themselves by outwardly acting against the law, in private life strictly followed the divine commands. Mystics who expressed in their poetry their disinterest in, and even contempt of, the traditional formal religions never forgot that Islām is the highest manifestation of divine wisdom.

The idea of the manifestation of divine wisdom was also connected with the person of the prophet Muḥammad. Though early Ṣūfism had concentrated upon the relation between God and the soul, from AD 900 onward a strong Muḥammad-mysticism developed. In the very early years, the alleged divine address to the Prophet—"If thou hadst not been I had not created the worlds"—was common among Ṣūfīs. Muḥammad was said to be "Prophet when Adam was still between water and clay." Muḥammad is also described as light from light, and from his light all the prophets are created, constituting the different aspects of this light. In its fullness such light radiated from the historical Muḥammad and is partaken of by his posterity and by the saints; for Muḥammad has the aspect of sanctity in addition to that of prophecy. An apocryphal tradition makes even God attest: "I am Aḥmad (= Muḥammad) without 'm' (*i.e.,* Aḥad, 'One')."

The *walī,* or saint

A mystic may also be known as *walī.* By derivation the word *walī* ("saint") means "one in close relation; friend." The *awlīyāʾ* (plural of *walī*) are "friends of God who have no fear nor are they sad." Later the term *walī* came to denote the Muslim mystics who had reached a certain stage of proximity to God, or those who had reached the highest mystical stages. They have their "seal" (*i.e.,* the last and most perfect personality in the historical process; with this person, the evolution has found its end—as in Muḥammad's case), just as the prophets have. Woman saints are found all over the Islāmic world.

The invisible hierarchy of saints consists of the 40 *abdāl* ("substitutes"; for when any of them dies another is elected by God from the rank and file of the saints), seven *awtād* ("stakes," or "props," of faith), three *nuqabāʾ* ("leader"; "one who introduces people to his master"), headed by the *quṭb* ("axis, pole"), or *ghawth* ("help")—titles claimed by many Ṣūfī leaders. Saint worship is contrary to Islām, which does not admit of any mediating role for human beings between man and God; but the cult of living and even more of dead saints—visiting their tombs to take vows there—responded to the feeling of the masses, and thus a number of pre-Islāmic customs were absorbed into Islām under the cover of mysticism. The advanced mystic was often granted the capacity of working miracles called *karāmāt* (*charismata* or "graces"); not *muʿjizāt* ("that which men are unable to imitate"), like the miracles of the prophets. Among them are "cardiognosia" (knowledge of the heart), providing food from the unseen, presence in two places at the same time, and help for the disciples, be they near or far. In short, a saint is one "whose prayers are heard" and who has *taṣarruf,* the power of materializing in this world possibilities that still rest in the spiritual world. Many great saints, however, considered miracle working as a dangerous trap on the path that might distract the Ṣūfī from his real goal.

The path. The path (*ṭarīqah*) begins with repentance. A mystical guide (*shaykh, pīr*) accepts the seeker as disciple (*murīd*), orders him to follow strict ascetic practices, and suggests certain formulas for meditation. It is said that the disciple should be in the hands of the master "like a corpse in the hand of the washer." The master teaches him constant struggle (the real "Holy War") against the lower soul, often represented as a black dog, which should, however, not be killed but merely tamed and used in the way of God. The mystic dwells in a number of spiritual stations (*maqām*), which are described in varying sequence, and, after the initial repentance, comprise abstinence, renunciation, and poverty—according to Muḥammad's saying, "Poverty is my pride"; poverty was sometimes interpreted as having no interest in anything apart from God, the Rich One, but the concrete meaning of poverty prevailed, which is why the mystic is often denoted as "poor," fakir or dervish. Patience and gratitude belong to higher stations of the path, and consent is the loving acceptance of every affliction.

On his way to illumination the mystic will undergo such changing spiritual states (*ḥāl*) as *qabḍ* and *basṭ,* constraint and happy spiritual expansion, fear and hope, and longing and intimacy, which are granted by God and last for longer or shorter periods of time, changing in intensity according to the station in which the mystic is abiding at the moment. The way culminates in *maʿrifah* ("interior knowledge," "gnosis") or in *maḥabbah* ("love"), the central subject of Ṣūfism since the 9th century, which implies a union of lover and beloved, and was therefore violently rejected by the orthodox, for whom "love of God" meant simply obedience. The final goal is *fanāʾ* ("annihilation"), primarily an ethical concept of annihilating one's own qualities, according to the prophetic saying "Take over the qualities of God," but slowly developing into a complete extinction of the personality. Some mystics taught that behind this negative unity where the self is completely effaced, the *baqāʾ,* ("duration, life in God") is found: the ecstatic experience, called intoxication, is followed by the "second sobriety"; *i.e.,* the return of the completely transformed mystic into this world where he acts as a living witness of God or continues the "journey in God." The mystic has reached *ḥaqīqah* ("realty"), after finishing the *ṭarīqah* ("path"), which is built upon the *sharīʿah* ("law"). Later, the disciple is led through *fanāʾ fī ashshaykh* ("annihilation in the master") to *fanāʾ fiar-Rasūl* ("annihilation in the Prophet") before reaching, if at all, *fanāʾ fī-Allāh* ("annihilation in God").

The practice of *dhikr*

One of the means used on the path is the ritual prayer, or *dhikr* ("remembrance"), derived from the Qurʾānic injunction "And remember God often" (*sūrah* 62:10). It consists in a repetition of either one or all of the most beautiful names of God, of the name "Allāh," or of a certain religious formula, such as the profession of faith: "There is no God but Allāh and Muḥammad is his prophet." The rosary with 99 or 33 beads was in use as early as the 8th century for counting the thousands of repetitions. Man's whole being should eventually be transformed into remembrance of God.

In the mid-9th century some mystics introduced sessions with music and poetry recitals (*samāʿ*) in Baghdad in order to reach the ecstatic experience—and since then debates about the permissibility of *samāʿ,* filling many books, have been written. Narcotics were used in periods of degeneration, coffee by the "sober" mystics (first by the Shādhilīyah after 1300).

Besides the wayfarers (*sālik*) on the path, Ṣūfīs who have no master but are attracted solely by divine grace are also found; they are called Uwaysī, after Uways al-Qaranī, the Yemenite contemporary of the Prophet who never saw him but firmly believed in him. There are also the so-called *majdhūb* ("attracted") who are often persons generally agreed to be more or less mentally deranged.

Symbolism in Ṣūfism. The divine truth was at times revealed to the mystic in visions, auditions, and dreams, in colours and sounds, but to convey these nonrational and ineffable experiences to others the mystic had to rely upon such terminology of worldly experience as that of love and intoxication—often objectionable from the orthodox viewpoint. The symbolism of wine, cup, and cupbearer, first expressed by Abū Yazīd al-Bisṭāmī in the 9th century, became popular everywhere, whether in the verses of the Arab Ibn al-Fāriḍ, or the Persian ʿIrāqī, or the Turk Yunus Emre, and their followers. The hope for the union of the soul with the divine had to be expressed through images of human yearning and love. The love for lovely boys in which the divine beauty manifests itself—according to the alleged Ḥadīth "I saw my Lord in the shape of a youth with a cap awry"—was commonplace in Persian poetry. Union was described as the submersion of the drop in the ocean, the state of the iron in the fire, the vision of penetrating light, or the burning of the moth in the candle (first used by Ḥallāj). Worldly phenomena were seen as black tresses veiling the radiant beauty of the divine countenance. The mystery of unity and diversity was symbolized, for example, under the image of mirrors that reflect the different aspects of the divine, or as prisms colouring the pure light. Every aspect of nature was seen in relation to God. The symbol of the soulbird—in which the human soul is likened to a flying bird—known everywhere, was the centre of ʿAṭṭār's *Manṭeq oṭ-ṭeyr* ("The Birds' Conversation"). The predilection of the mystical poets for the symbolism of the nightingale and rose (the red rose = God's perfect beauty; nightingale = soul; first used by Baqli [died 1206]) stems from the soulbird symbolism. For spiritual education, symbols taken from medicine (healing of the sick soul) and alchemy (changing of base matter into gold) were also used. Many descriptions that were originally applied to God as the goal of love were, in later times, used also for the Prophet, who is said to be like the "dawn between the darkness of the material world and the sun of Reality."

Symbolism of union with the divine

Allusions to the Qurʾān were frequent, especially so to verses that seem to imply divine immanence (God's presence in the world), such as "Whithersoever ye turn, there is the Face of God" (*sūrah* 2:109), or that God is "Closer than your neck-vein" (*sūrah* 50:8). *Sūrah* 7:172—*i.e.,* God's address to the uncreated children of Adam ("Am I not your Lord" [*alastu birabbikum*])—came to denote the pre-eternal love relation between God and man. As for the prophets before Muḥammad, the vision of Moses was considered still imperfect, for the mystic wants the actual vision of God, not His manifestation through a burning bush. Abraham, for whom fire turned into a rose garden, resembles the mystic in his afflictions; Joseph, in his perfect beauty, the mystical beloved after whom the mystic searches. The apocryphal traditions used by the mystics are numerous; such as "Heaven and earth do not contain me, but the heart of my faithful servant contains Me"; and the possibility of a relation between man and God is also explained by the traditional idea: "He (God) created Adam in His image."

THEOSOPHICAL SUFISM

Ṣūfism, in its beginnings a practical method of spiritual education and self-realization, grew slowly into a theosophical system by adopting traditions of Neoplatonism, the Hellenistic world, Gnosticism (an ancient esoteric religiophilosophical movement that viewed matter as evil and spirit as good), and spiritual currents from Iran and various countries in the ancient agricultural lands from the eastern Mediterranean to Iraq. One master who contributed to this development was the Persian as-Suhrawardī, called al-Maqtūl ("killed"), executed in 1191 in Aleppo. To him is attributed the philosophy of *ishrāq* ("illumination"), and he claimed to unite the Persian (Zoroastrian) and Egyptian (Hermetic) traditions. His didactic and doctrinal works in Arabic among other things taught a complicated angelology (theory of angels); some of his smaller Persian treatises depict the journey of the soul across the cosmos; the "Orient" (East) is the world of pure lights and archangels, the "Occident" (West) that of darkness and matter; and man lives in the "Western exile."

At the time of Suhrawardī's death the greatest representative of theosophic Ṣūfism was in his 20s: Ibn al-ʿArabī, born at Murcia, Spain, where speculative tendencies had been visible since Ibn Masarrah's philosophy (died 931). Ibn al-ʿArabī was instructed in mysticism by two Spanish woman saints. Performing the traditional pilgrimage to Mecca, he met there an accomplished young Persian lady who represented for him the divine wisdom. This experience resulted in the charming poems of the *Tarjumān al-ashwāq* ("Interpreter of Yearning"), which the author later explained mystically. Ibn al-ʿArabī composed at least 150 volumes. His magnum opus is *al-Futūḥāt al-Makkīyah* ("The Meccan Revelations") in 560 chapters, in which he expounds his theory of unity of being.

Contributions of Ibn al-ʿArabī

The substance of theosophic Ṣūfism is as follows. According to the Ḥadīth *qudsī*, or "holy tradition"—"I was a hidden treasure and wanted to be known"—the absolute, or God, yearned in his loneliness for manifestation and created the world by effusing being upon the heavenly archetypes, a "theophany (a physical manifestation of deity) through God's imaginative power." The universe is annihilated and created every moment. Every divine name is reflected in a named one. The world and God are said to be like ice and water, or like two mirrors contemplating themselves in each other, joined by a sympathetic union. The Prophet Muḥammad is the universal man, the perfect man, the total theophany of the divine names, the prototype of creation. Muḥammad is the "word," each particular dimension of which is identified with a prophet, and he is also the model for the spiritual realization of the possibilities of man. The mystic has to pass the stages of the Qurʾānic prophets as they are explained in the *Fuṣūṣ al-ḥikam* ("Bezels of Wisdom") until he becomes united with the *ḥaqīqa Muḥammadīya* (the first individualization of the divine in the "Muḥammadan Reality"). Man can have vision only of the form of the faith he professes, and Ibn al-ʿArabī's oft-quoted verse, "I follow the religion of love wherever its camels turn," with its seeming religious tolerance means, as S.H. Nasr puts it: "the form of God is for him no longer the form of this or that faith exclusive of all others but his own eternal form which he encounters." The theories of the perfect man were elaborated by Jīlī (died *c.* 1424) in his compendium *Al-insān al-kāmil* ("The Perfect Man") and became common throughout the Muslim world.

Ibn al-ʿArabī's theosophy has been attacked by orthodox Muslims and mystics of the "sober" school as incongruent with Islām because "a thoroughly monistic system cannot take seriously the objective validity of moral standards." Even the adversaries of the "greatest master" could not, however, help using part of his terminology. Innumerable mystics and poets propagated his ideas, though they only partly understood them, and this circumstance led also to a misinterpretation of the data of early Ṣūfism in the light of existential monism. Later Persian poetry is permeated by the pantheistic feeling of *hama ost* ("everything is He").

Ibn al-ʿArabī's contemporary in Egypt, the poet Ibn al-Fāriḍ, is usually mentioned together with him; Ibn al-Fāriḍ, however, is not a systematic thinker but a full-fledged poet who used the imagery of classical Arabic poetry to describe the state of the lover in extremely artistic verses and has given, in his *Tāʾiyat al-kubrā* ("Poem of the Journey"), glimpses of the way of the mystic, using, as many poets before and after him did, for example, the image of the shadow play for the actions of the creatures who are dependent upon the divine playmaster. His unifying experience is personal and is not the expression of a theosophical system.

SUFI ORDERS

Organization. Mystical life was first restricted to the relation between a master and a few disciples; the foundations of a monastic system were laid by the Persian Abū Saʿīd ebn Abī ol-Kheyr (died 1049), but real orders or fraternities came into existence only from the 12th century onward: ʿAbd al-Qādir al-Jīlānī (died 1166) gathered the first and still most important order around himself; then followed the Suhrawardīyah, and the 13th century saw the formation of large numbers of different orders in the East (for example, Kubrawīya in Khvārezm) and West (Shādhilīyah). Thus, Ṣūfism ceased to be the way of the chosen few and influenced the masses. A strict ritual was

Initiation and investiture

elaborated: when the adept had found a master for whom he had to feel a preformed affinity, there was an initiation ceremony in which he swore allegiance (*bayʿat*) into the master's hand; similarities to the initiation in Ismāʿīlism, the 9th-century sect, and in the guilds suggest a possible interaction. The disciple (*murīd*) had to undergo a stern training; he was often ordered to perform the lowest work in the community, to serve the brethren, to go out to beg (many of the old monasteries subsisted upon alms). A seclusion period of 40 days under hard conditions was common for the adepts in most orders.

Investiture with the *khirqah,* the frock of the master, originally made from shreds and patches, was the decisive act by which the disciple became part of the *silsilah,* the chain of mystical succession and transmission, which leads back—via Junayd—to the Prophet himself and differs in every order. Some mystical leaders claimed to have received their *khirqah* directly from al-Khiḍr, a mysterious immortal saint.

In the earliest times, allegiance was sworn exclusively to one master who had complete power over the disciple, controlling each of his movements, thoughts, visions, and dreams; but later many Ṣūfīs got the *khirqah* from two or more *shaykh*s. There is consequently a differentiation between the *shaykh at-tarbiyah,* who introduces the disciple into the ritual, forms, and literature of the order, and the *shaykh aṣ-ṣuḥbah,* who steadily watches him and with whom the disciple lives. Only a few members of the fraternity remained in the centre (*dargāh, khānqāh, tekke*), close to the *shaykh,* but even those were not bound to celibacy. Most of the initiated returned to their daily life and partook in mystic services only during certain periods. The most mature disciple was invested as *khalīfah* ("successor") to the *shaykh* and was often sent abroad to extend the activities of the order. The *dargāh*s were organized differently in the various orders; some relied completely upon alms, keeping their members in utmost poverty; others were rich, and their *shaykh* was not very different from a feudal lord. Relations with rulers varied—some masters refused contacts with the representatives of political power; others did not mind friendly relations with the grandees.

Discipline and ritual. Each order has peculiarities in its ritual. Most start the instruction with breaking the lower soul; others, such as the later Naqshbandīyah, stress the purification of the heart by constant *dhikr* ("remembrance") and by discourse with the master (*ṣuḥbah*). The forms of *dhikr* vary in the orders. Many of them use the word Allāh, or the profession of faith with its rhythmical wording, sometimes accompanied by movements of the body, or by breath control up to complete holding of the breath. The Mawlawīs, the whirling dervishes, are famous for their dancing ritual, an organized variation of the earlier *samāʿ* practices, which were confined to music and poetry. The Rifāʿīs, the so-called Howling Dervishes, have become known for their practice of hurting themselves while in an ecstatic state that they reach in performing their loud *dhikr.* (Such practices that might well degenerate into mere jugglery are not approved by most orders.) Some orders also teach the *dhikr khafī,* silent repetition of the formulas, and meditation, concentrating upon certain fixed points of the body; thus the Naqshbandīs do not allow any emotional practices and prefer contemplation to ecstasy, perhaps as a result of Buddhist influence from Central Asia. Other orders have special prayers given to the disciples, such as the protective *ḥizb al-baḥr* ("The protective armour of the sea"; *i.e.,* for seafaring people—then extended to all travellers) in the Shādhilīyah order. Most of them prescribe for their disciples additional prayers and meditation at the end of each ritual prayer.

Adaptation to levels of society

Function and role in Islāmic society. The orders formed an excellent means of bringing together the spiritually interested members of the community. They acted as a counterweight against the influence of hairsplitting lawyer-divines and gave the masses an emotional outlet in enthusiastic celebrations (*ʿurs,* "marriage") of the anniversaries of the deaths of founders of mystic orders or similar festivals in which they indulged in music and joy. The orders were adaptable to every social level; thus, some of them were responsible for adapting a number of un-Islāmic folkloristic practices such as veneration of saints. Their way of life often differed so much from Islāmic ideals that one distinguishes in Iran and India between orders *bā sharʿ* (law-bound) and *bī sharʿ* (not following the injunctions of the Qurʾān). Some orders were more fitting for the rural population, such as the Aḥmadīyah (after Aḥmad al-Badawī; died 1286) in Egypt. The Aḥmadīyah, however, even attracted some Mamlūk rulers. The Turkish Bektāshīyah (Haci Bektaş, early 14th century), together with strange syncretistic cults, showed a prevalence of the ideals of the Shīʿites (from Shīʿah—the followers of ʿAlī, son-in-law of the prophet Muḥammad, whose descendants claimed to be rightful successors to the religious leadership of Islām). The figure of ʿAlī played a role also in other fraternities, and the relations between Ṣūfism in the 14th and 15th centuries and the Shīʿah still have to be explored, as is also true of the general influence of Shīʿite ideas on Ṣūfism. Other orders, such as the Shādhilīyah, an offshoot of which still plays an important role among Egyptian officials and employees, are typically middle class. This order demands not a life in solitude but strict adherence to one's profession and fulfillment of one's duty. Still other orders were connected with the ruling classes, such as, for a time, the Chishtīyah in Mughal India, and the Mawlawīyah, whose leader had to invest the Ottoman sultan with the sword. The Mawlawīyah is also largely responsible for the development of classical Turkish poetry, music, and fine arts, just as the Chishtīyah contributed much to the formation of classical Indo-Muslim music.

Missionary activity

The main contribution of the orders, however, is their missionary activity. The members of different orders who settled in India from the early 13th century attracted thousands of Hindus by their example of love of both God and their own brethren and by preaching the equality of men. Missionary activity was often joined with political activity, as in 17th- and 18th-century Central Asia, where the Naqshbandīyah exerted strong political influence. In North Africa the Tijānīyah, founded in 1781, and the Sanūsīyah, active since the early 19th century, both heralded Islām and engaged in politics; the Sanūsīyah fought against Italy, and the former king of Libya was the head of the order. The Tijānīyah extended the borders of Islām toward Senegal and Nigeria, and their representatives founded large kingdoms in West Africa. Their influence, as well as that of the Qādirīyah (see below), is still an important sociopolitical factor in those areas.

Geographical extent of Ṣūfī orders. It would be impossible to number the members of mystical orders in the Islāmic world. Even in such countries as Turkey, where the orders have been banned since 1925, many people still cling to the mystical tradition and feel themselves to be links in the spiritual chains of the orders and try to implement their ideals in modern society. The most widely spread group is, no doubt, the Qādirīyah, whose adherents are found from West Africa to India—the tomb of ʿAbd al-Qādir al-Jīlānī in Baghdad still being a place of pilgrimage. The areas where the Sanūsīyah live are restricted to the Maghrib, the Atlas Massif, and the coastal plain from Morocco to Tunisia, whereas the Tijānīyah has some offshoots in Turkey. Such rural orders as the Egyptian Aḥmadīyah and Dasūqīyah (named after Ibrāhīm ad-Dasūqī; died 1277) are bound to their respective countries, as are the Mawlawīs and Bektāshīyah to the realms of the former Ottoman Empire. The Bektāshīyah had gained political importance in the empire because of its relations with the Janissaries, the standing army. Albania, since 1929, has had a strong and officially recognized group of Bektāshīyah who were even granted independent status after World War II. The Shaṭṭārīyah (derived from ʿAbd ash-Shaṭṭār; died 1415) extends from India to Java, whereas the Chishtīyah (derived from Khwājah Muʿīnud-Dīn Chishtīp; died 1236 in Ajmer) and Suhrawardīyah remain mainly inside the Indo-Pakistan subcontinent. The Kubrāwīyah reached Kashmir through ʿAlī Hama-dhānī (died 1385), a versatile author, but the order later lost its influence.

The great variety of possible forms may be seen by comparing the Haddāwah, vagabonds in Morocco, who "do not spoil God's day by work" and the Shādhilīyah with a sober attitude toward professional life and careful introspection. Out of the Shādhilīyah developed the austere Darqāwīyah, who, in turn, produced the ʿAlāwīyah, whose master has attracted even a number of Europeans. The splitting up and formation of suborders is a normal process, but most of the subgroups have only local importance. The High Ṣūfī Convent in Egypt counts 60 registered orders.

SIGNIFICANCE

Ṣūfism has helped to shape large parts of Muslim society. The orthodox disagree with such aspects of Ṣūfism as saint worship, visiting of tombs, musical performances, miracle mongering, degeneration into jugglery, and the adaptation of pre-Islāmic and un-Islāmic customs; and the reformers object to the influences of the monistic interpretation of Islām upon moral life and human activities. The importance given to the figure of the master is accused of yielding negative results; the *shaykh* as the almost infallible leader of his disciples and admirers could gain dangerous authority and political influence, for the illiterate villagers in backward areas used to rely completely upon the "saint." Yet, other masters have raised their voices against social inequality and have tried, even at the cost of their lives, to change social and political conditions for the better and to spiritually revive the masses. The missionary activities of the Ṣūfīs have enlarged the fold of the faithful. The importance of Ṣūfism for spiritual education, and inculcation in the faithful of the virtues of trust in God, piety, faith in God's love, and veneration of the Prophet, cannot be overrated. The *dhikr* formulas still preserve their consoling and quieting power even for the illiterate. Mysticism permeates Persian literature and other literatures influenced by it. Such poetry has always been a source of happiness for millions, although some modernists have disdained its "narcotic" influence on Muslim thinking.

Industrialization and modern life have led to a constant decrease in the influence of Ṣūfī orders in many countries. The spiritual heritage is preserved by individuals who sometimes try to show that mystical experience conforms to modern science. Today in the West, Ṣūfism is popularized, but the genuinely and authentically devout are aware that it requires strict discipline, and that its goal can be reached—if at all—as they say, only by throwing oneself into the consuming fire of divine love. (An.Sc.)

Islāmic philosophy

Origin and inspiration of Islāmic philosophy

The origin and inspiration of philosophy in Islām are quite different from those of Islāmic theology. Philosophy developed out of and around the nonreligious practical and theoretical sciences; it recognized no theoretical limits other than those of human reason itself; and it assumed that the truth found by unaided reason does not disagree with the truth of Islām when both are properly understood. Islāmic philosophy was not a handmaid of theology. The two disciplines were related, because both followed the path of rational inquiry and distinguished themselves from traditional religious disciplines and from mysticism, which sought knowledge through practical, spiritual purification. Islāmic theology was Islāmic in the strict sense: it confined itself within the Islāmic religious community, and it remained separate from the Christian and Jewish theologies that developed in the same cultural context and used Arabic as a linguistic medium. No such separation is observable in the philosophy developed in the Islāmic cultural context and written in Arabic: Muslims, Christians, and Jews participated in it and separated themselves according to the philosophic rather than the religious doctrines they held.

THE EASTERN PHILOSOPHERS

Background and scope of philosophical interest in Islām. The background of philosophic interest in Islām is found in the earlier phases of theology. But its origin is found in the translation of Greek philosophic works. By the middle of the 9th century, there were enough translations of scientific and philosophic works from Greek, Pahlavi, and Sanskrit to show those who read them with care that scientific and philosophic inquiry was something more than a series of disputations based on what the theologians had called sound reason. Moreover, it became evident that there existed a tradition of observation, calculation, and theoretical reflection that had been pursued systematically, refined, and modified for over a millennium.

The basis of Islāmic philosophy in Greek philosophical and scientific works

The scope of this tradition was broad: it included the study of logic, the sciences of nature (including psychology and biology), the mathematical sciences (including music and astronomy), metaphysics, ethics, and politics. Each of these disciplines had a body of literature in which its principles and problems had been investigated by classical authors, whose positions had been, in turn, stated, discussed, criticized, or developed by various commentators. Islāmic philosophy emerged from its theological background when Muslim thinkers began to study this foreign tradition, became competent students of the ancient philosophers and scientists, criticized and developed their doctrines, clarified their relevance for the questions raised by the theologians, and showed what light they threw on the fundamental issues of revelation, prophecy, and the divine law.

Relation to the Muʿtazilah and interpretation of theological issues. *The teachings of al-Kindī.* Although the first Muslim philosopher, al-Kindī, who flourished in the first half of the 9th century, lived during the triumph of the Muʿtazilah of Baghdad and was connected with the ʿAbbāsid caliphs who championed the Muʿtazilah and patronized the Hellenistic sciences, there is no clear evidence that he belonged to a theological school. His writings show him to have been a diligent student of Greek and Hellenistic authors in philosophy and point to his familiarity with Indian arithmetic. His conscious, open, and unashamed acknowledgment of earlier contributions to scientific inquiry was foreign to the spirit, method, and purpose of the theologians of the time. His acquaintance with the writings of Plato and Aristotle was still incomplete and technically inadequate. He improved the Arabic translation of the "Theology of Aristotle" but made only a selective and circumspect use of it.

Al-Kindī's interest in scientific inquiry

Devoting most of his writings to questions of natural philosophy and mathematics, al-Kindī was particularly concerned with the relation between corporeal things, which are changeable, in constant flux, infinite, and as such unknowable, on the one hand, and the permanent world of forms (spiritual or secondary substances), which are not subject to flux yet to which man has no access except through things of the senses. He insisted that a purely human knowledge of all things is possible, through the use of various scientific devices, learning such things as mathematics and logic, and assimilating the contributions of earlier thinkers. The existence of a "supernatural" way to this knowledge in which all these requirements can be dispensed with was acknowledged by al-Kindī: God may choose to impart it to his prophets by cleansing and illuminating their souls and by giving them his aid, right guidance, and inspiration; and they, in turn, communicate it to ordinary men in an admirably clear, concise, and comprehensible style. This is the prophets' "divine" knowledge, characterized by a special mode of access and style of exposition. In principle, however, this very same knowledge is accessible to man without divine aid, even though "human" knowledge may lack the completeness and consummate logic of the prophets' divine message.

Reflection on the two kinds of knowledge—the human knowledge bequeathed by the ancients and the revealed knowledge expressed in the Qurʾān—led al-Kindī to pose a number of themes that became central in Islāmic philosophy: the rational–metaphorical exegesis of the Qurʾān and the Ḥadīth; the identification of God with the first being and the first cause; creation as the giving of being and as a kind of causation distinct from natural causation and Neoplatonic emanation; and the immortality of the individual soul.

The teachings of Abū Bakr ar-Rāzī. The philosopher whose principal concerns, method, and opposition to authority were inspired by the extreme Muʿtazilah was the physician Abū Bakr ar-Rāzī (flourished 9th–10th centuries). He adopted the Muʿtazilah's atomism and was intent

The concept of the five eternal principles

on developing a rationally defensible theory of creation that would not require any change in God or attribute to him responsibility for the imperfection and evil prevalent in the created world. To this end, he expounded the view that there are five eternal principles—God, Soul, prime matter, infinite, or absolute, space, and unlimited, or absolute, time—and explained creation as the result of the unexpected and sudden turn of events (*faltah*). *Faltah* occurred when Soul, in her ignorance, desired matter and the good God eased her misery by allowing her to satisfy her desire and to experience the suffering of the material world, and then gave her reason to make her realize her mistake and deliver her from her union with matter, the cause of her suffering and of all evil. Ar-Rāzī claimed that he was a Platonist, that he disagreed with Aristotle, and that his views were those of the Ṣābians of Harran and the Brahmins (Hindu teachers).

Ismāʿīlī theologians became aware of the kinship between certain elements of his cosmology and their own. They disputed with him during his lifetime and continued afterward to refute his doctrines in their writings. According to their account of his doctrines, he was totally opposed to authority in matters of knowledge, believed in the progress of the arts and sciences, and held that all reasonable men are equally able to look after their own affairs, equally inspired and able to know the truth of what earlier men had taught, and equally able to improve upon it. Ismāʿīlī theologians were incensed, in particular, by his wholesale rejection of prophecy, particular revelation, and divine laws. They were likewise opposed to his criticisms of religion in general as a device employed by evil men and a kind of tyranny over men that exploits their innocence and credulity, perpetuates ignorance, and leads to conflicts and wars.

Although the fragmentary character of al-Kindī's and ar-Rāzī's surviving philosophic writings does not permit passing firm and independent judgment on their accomplishments, they tend to bear out the view of later Muslim students of philosophy that both lacked competence in the logical foundation of philosophy, were knowledgeable in some of the natural sciences but not in metaphysics, and were unable to narrow the gap that separated philosophy from the new religion, Islām.

The relationship of law and theology to the community

The teachings of al-Fārābī. *Political philosophy and the study of religion.* The first philosopher to meet this challenge was al-Fārābī (flourished 9th–10th centuries). He saw that theology and the juridical study of the law were derivative phenomena that function within a framework set by the prophet as lawgiver and founder of a human community. In this community, revelation defines the opinions the members of the community must hold and the actions they must perform if they are to attain the earthly happiness of this world and the supreme happiness of the other world. Philosophy could not understand this framework of religion as long as it concerned itself almost exclusively with its truth content and confined the study of practical science to individualistic ethics and personal salvation.

In contrast to al-Kindī and ar-Rāzī, al-Fārābī recast philosophy in a new framework analogous to that of the Islāmic religion. The sciences were organized within this philosophic framework so that logic, physics, mathematics, and metaphysics culminated in a political science whose subject matter is the investigation of happiness and how it can be realized in cities and nations. The central theme of this political science is the founder of a virtuous or excellent community. Included in this theme are views concerning the supreme rulers who follow the founder, their qualifications, and how the community must be ordered so that its members attain happiness as citizens rather than isolated human beings. Once this new philosophical framework was established, it became possible to conduct a philosophical investigation of all the elements that constituted the Islāmic community: the prophet-lawgiver, the aims of the divine laws, the legislation of beliefs as well as actions, the role of the successors to the founding legislator, the grounds of the interpretation or reform of the law, the classification of human communities according to their doctrines in addition to their size, and the critique of "ignorant" (pagan), "transgressing," "falsifying," and "erring" communities. Philosophical cosmology, psychology, and politics were blended by al-Fārābī into a political theology whose aim was to clarify the foundations of the Islāmic community and defend its reform in a direction that would promote scientific inquiry and encourage philosophers to play an active role in practical affairs.

Significance of al-Fārābī in the dissemination of Greek philosophical thought

Interpretation of Plato and Aristotle. Behind this public, or exoteric, aspect of al-Fārābī's work stood a massive body of more properly philosophic or scientific inquiries, which established his reputation among Muslims as the greatest philosophical authority after Aristotle, a great interpreter of the thought of Plato and Aristotle and their commentators, and a master to whom almost all major Muslim as well as a number of Jewish and Christian philosophers turned for a fuller understanding of the controversial, troublesome, and intricate questions of philosophy. Continuing the tradition of the Hellenistic masters of the Athenian and Alexandrian philosophical schools, al-Fārābī broadened the range of philosophical inquiry and fixed its form. He paid special attention to the study of language and its relation to logic. In his numerous commentaries on Aristotle's logical works, he expounded for the first time in Arabic the entire range of the scientific and nonscientific forms of argument and established the place of logic as an indispensable prerequisite for philosophic inquiry. His writings on natural science exposed the foundation and assumptions of Aristotle's physics and dealt with the arguments of Aristotle's opponents, both philosophers and scientists, pagan, Christian, and Muslim.

The analogy of religion and philosophy. Al-Fārābī's theological and political writings showed later Muslim philosophers the way to deal with the question of the relation between philosophy and religion and presented them with a complex set of problems that they continued to elaborate, modify, and develop in different directions. Starting with the view that religion is analogous or similar to philosophy, al-Fārābī argued that the idea of the true prophet-lawgiver ought to be the same as that of the true philosopher-king. Thus, he challenged both al-Kindī's view that prophets and philosophers have different and independent ways to the highest truth available to man and ar-Rāzī's view that philosophy is the only way to that knowledge. That a man could combine the functions of prophecy, lawgiving, philosophy, and kingship did not necessarily mean that these functions were identical; it did mean, however, that they all are legitimate subjects of philosophic inquiry. Philosophy must account for the powers, knowledge, and activities of the prophet, lawgiver, and king, which it must distinguish from and relate to those of the philosopher. The public, or political, function of philosophy was emphasized. Unlike Neoplatonism, which had for long limited itself to the Platonic teaching that the function of philosophy is to liberate the soul from the shadowy existence of the cave—in which knowledge can only be imperfectly comprehended as shadows reflecting the light of the truth beyond the cave (the world of senses)—al-Fārābī insisted with Plato that the philosopher must be forced to return to the cave, learn to talk to its inhabitants in a manner they can comprehend, and engage in actions that may improve their lot.

The use of al-Fārābī's theological–political writings to reform Ismāʿīlī thought

Impact on Ismāʿīlī theology. Although it is not always easy to know the immediate practical intentions of a philosopher, it must be remembered that in al-Fārābī's lifetime the fate of the Islāmic world was in the balance. The Sunnī caliphate's power hardly extended beyond Baghdad, and it appeared quite likely that the various Shīʿī sects, especially the Ismāʿīlīs, would finally overpower it and establish a new political order. Of all the movements in Islāmic theology, Ismāʿīlī theology was the one that was most clearly and massively penetrated by philosophy. Yet, its Neoplatonic cosmology, revolutionary background, antinomianism (antilegalism), and general expectation that divine laws were about to become superfluous with the appearance of the *qāʾim* (the imam of the "resurrection") all militated against the development of a coherent political theory to meet the practical demands of political life and present a viable practical alternative to the Sunnī caliphate. Al-Fārābī's theologico-political writings helped point out this basic defect of Ismāʿīlī theology. Under the Fāṭimids in Egypt (969–1171), Ismāʿīlī theology modified its cosmology in the direction suggested by al-Fārābī, returned to the view that the community must continue to live under the divine law, and postponed the prospect of the abolition of divine laws and the appearance of the *qāʾim* to an indefinite point in the future.

The teachings of Avicenna. *The "Oriental Philosophy."* Even more indicative of al-Fārābī's success is the fact that his writings helped produce a philosopher of the stature of Avicenna (flourished 10th–11th centuries), whose versatility, imagination, inventiveness, and prudence shaped philosophy into a powerful force that gradually penetrated Islāmic theology and mysticism and Persian poetry in eastern Islām and gave them universality and theoretical depth. His own personal philosophic views, he said, were those of the ancient sages of Greece (including the genuine views of Plato and Aristotle), which he had set forth in the "Oriental Philosophy," a book that has not survived and probably was not written or meant to be written. They were not identical with the common Peripatetic (Aristotelian) doctrines and were to be distinguished from the learning of his contemporaries, the Christian "Aristotelians" of Baghdad, which he attacked as vulgar, distorted, and falsified. His most voluminous writing, *Kitāb ash-shifāʾ* ("The Book of Healing"), was meant to accommodate the doctrines of other philosophers as well as hint at his own personal views, which are elaborated elsewhere in more imaginative and allegorical forms.

Distinction between essence and existence and the doctrine of creation. Avicenna had learned from certain hints in al-Fārābī that the exoteric teachings of Plato regarding "forms," "creation," and the immortality of individual souls were closer to revealed doctrines than the genuine views of Aristotle, that the doctrines of Plotinus and later Neoplatonic commentators were useful in harmonizing Aristotle's views with revealed doctrines, and that philosophy must accommodate itself to the divine law on the issue of creation and of reward and punishment in the hereafter, which presupposes some form of individual immortality. Following al-Fārābī's lead, Avicenna initiated a full-fledged inquiry into the question of being, in which he distinguished between essence and existence. He argued that the fact of existence cannot be inferred from or accounted for by the essence of existing things and that form and matter by themselves cannot interact and originate the movement of the universe or the progressive actualization of existing things. Existence must, therefore, be due to an agent-cause that necessitates, imparts, gives, or adds existence to an essence. To do so, the cause must be an existing thing and coexist with its effect. The universe consists of a chain of actual beings, each giving existence to the one below it and responsible for the existence of the rest of the chain below. Because an actual infinite is deemed impossible by Avicenna, this chain as a whole must terminate in a being that is wholly simple and one, whose essence is its very existence, and therefore is self-sufficient and not in need of something else to give it existence. Because its existence is not contingent on or necessitated by something else but is necessary and eternal in itself, it satisfies the condition of being the necessitating cause of the entire chain that constitutes the eternal world of contingent existing things.

Avicenna's investigation of being

All creation is necessarily and eternally dependent upon God. It consists of the intelligences, souls, and bodies of the heavenly spheres, each of which is eternal, and the sublunary sphere, which is also eternal, undergoing a perpetual process of generation and corruption, of the succession of form over matter, very much in the manner described by Aristotle.

The immortality of individual souls. There is, however, a significant exception to this general rule: the human rational soul. Man can affirm the existence of his soul from direct consciousness of his self (what he means when he says "I"); and he can imagine this happening even in the absence of external objects and bodily organs. This proves, according to Avicenna, that the soul is indivisible, immaterial, and incorruptible substance, not imprinted in matter, but created with the body, which it uses as an instrument. Unlike other immaterial substances (the intelligences and souls of the spheres), it is not pre-eternal but is generated, or made to exist, at the same time as the individual body, which can receive it, is formed. The composition, shape, and disposition of its body and the soul's success or failure in managing and controlling it, the formation of moral habits, and the acquisition of knowledge all contribute to its individuality and difference from other souls. Though the body is not resurrected after its corruption, the soul survives and retains all the individual characteristics, perfections or imperfections, that it achieved in its earthly existence and in this sense is rewarded or punished for its past deeds. Avicenna's claim that he has presented a philosophic proof for the immortality of generated ("created") individual souls no doubt constitutes the high point of his effort to harmonize philosophy and religious beliefs.

The doctrine of individual souls

Philosophy, religion, and mysticism. Having accounted for the more difficult issues of creation and the immortality of individual souls, Avicenna proceeded to explain the faculty of prophetic knowledge (the "sacred" intellect), revelation (imaginative representation meant to convince the multitude and improve their earthly life), miracles, and the legal and institutional arrangements (acts of worship and the regulation of personal and public life) through which the divine law achieves its end. Avicenna's explanation of almost every aspect of Islām is pursued on the basis of extensive exegesis of the Qurʾān and the Ḥadīth. The primary function of religion is to assure the happiness of the many. This practical aim of religion (which Avicenna saw in the perspective of Aristotle's practical science) enabled him to appreciate the political and moral functions of divine revelation and account for its form and content. Revealed religion, however, has a subsidiary function also—that of indicating to the few the need to pursue the kind of life and knowledge appropriate to rare individuals endowed with special gifts. These men must be dominated by the love of God to facilitate the achievement of the highest knowledge. In many places Avicenna appears to identify these men with the mystics. The identification of the philopher as a kind of mystic conveyed a new image of the philosopher as a member of the religious community who is distinguished from his coreligionists by his otherworldliness, dedicated to the inner truth of religion, and consumed by the love of God.

Prophetic, revelatory, and social knowledge

Avicenna's allegorical and mystical writings are usually called "esoteric" in the sense that they contain his personal views cast in an imaginative, symbolic form. The esoteric works must, then, be interpreted. Their interpretation must move away from the explicit doctrines contained in "exoteric" works such as the *Shifāʾ* and recover "the unmixed and uncorrupted truth" set forth in the "Oriental Philosophy." The "Oriental Philosophy," however, has never been available to anyone, and it is doubtful that it was written at all. This dilemma has made interpretation both difficult and rewarding for Muslim philosophers and modern scholars alike.

THE WESTERN PHILOSOPHERS

Background and characteristics of the western Muslim philosophical tradition. Andalusia (in Spain) and western North Africa contributed little of substance to Islāmic theology and philosophy until the 12th century. Legal strictures against the study of philosophy were more effective than in the east. Scientific interest was channelled into medicine, pharmacology, mathematics, astronomy, and logic. More general questions of physics and metaphysics were treated sparingly and in symbols, hints, and allegories. By the 12th century, however, the writings of al-Fārābī, Avicenna, and al-Ghazālī had found their way to the west. A philosophical tradition emerged, based primarily on the study of al-Fārābī. It was critical of Avicenna's philosophic innovations and not convinced that al-Ghazālī's critique of Avicenna touched philosophy as such, and it refused to acknowledge the position assigned by both to mysticism. The survival of philosophy in the west required extreme prudence, emphasis on its scientific character, abstention from meddling in political or religious matters, and abandonment of the hope of effecting extensive doctrinal or institutional reform.

Significance of Islāmic philosophers in the West

The duty of the philosopher

The teachings of Ibn Bājjah. *Theoretical science and intuitive knowledge.* Ibn Bājjah (died 1138) initiated this tradition with a radical interpretation of al-Fārābī's political philosophy that emphasized the virtues of the perfect but nonexistent city and the vices prevalent in all existing cities. He concluded that the philosopher must order his own life as a solitary individual, shun the company of nonphilosophers, reject their opinions and ways of life, and concentrate on reaching his own final goal by pursuing the theoretical sciences and achieving intuitive knowledge through contact with the Active Intelligence. The multitude live in a dark cave and see only dim shadows. Their ways of life and their imaginings and beliefs consist of layers of darkness that cannot be known through reason alone. Therefore, the divine law has been revealed to enable man to know this dark region. The philosopher's duty is to seek the light of the sun (the intellect). To do so, he must leave the cave, see all colours as they truly are and see light itself, and finally become transformed into that light. The end, then, is contact with Intelligence, not with something that transcends Intelligence (as in Plotinus, Ismāʿīlism, and mysticism), a doctrine criticized by Ibn Bājjah as the way of imagination, motivated by desire, and aiming at pleasure. Philosophy, he claimed, is the only way to the truly blessed state, which can be achieved only by going through theoretical science, even though it is higher than theoretical science.

Unconcern of philosophy with reform. Ibn Bājjah's cryptic style and the unfinished form in which he left most of his writings tend to highlight his departures from al-Fārābī and Avicenna. Unlike al-Fārābī, he is silent about the philosopher's duty to return to the cave and partake of the life of the city. He appears to argue that the aim of philosophy is attainable independently from the philosopher's concern with the best city and is to be achieved in solitude or, at most, in comradeship with philosophic souls. Unlike Avicenna, who prepared the way for him by clearly distinguishing between theoretical and practical science, Ibn Bājjah is concerned with practical science only insofar as it is relevant to the life of the philosopher. He is contemptuous of allegories and imaginative representations of philosophic knowledge, silent about theology, and shows no concern with improving the multitude's opinions and way of life.

Explanation of Avicenna's "Oriental Philosophy"

The teachings of Ibn Ṭufayl. *The philosopher as a solitary individual.* In his philosophic story *Ḥayy ibn Yaqẓān* ("*Alive Son of Awake*"), the philosopher Ibn Ṭufayl (died 1185) fills gaps in the work of his predecessor Ibn Bājjah. The story communicates the secrets of Avicenna's "Oriental Philosophy" as experienced by a solitary hero, who grows up on a deserted island, learns about the things around him, acquires knowledge of the natural universe (including the heavenly bodies), and achieves the state of "annihilation" (*fanāʾ*) of the self in the divine reality. This is the apparent and traditional secret of the "Oriental Philosophy." But the hero's wisdom is still incomplete, for he knows nothing about other human beings, their way of life, or their laws. When he chances to meet one of them—a member of a religious community inhabiting a neighbouring island, who is inclined to reflect on the divine law and seek its inner, spiritual meanings and who has abandoned the society of his fellow men to devote himself to solitary meditation and worship—he does not at first recognize that he is a human being like himself, cannot communicate with him, and frightens him by his wild aspect. After learning about the doctrines and acts of worship of the religious community, he understands them as alluding to and agreeing with the truth that he had learned by his own unaided effort, and he goes as far as admitting the validity of the religion and the truthfulness of the prophet who gave it. He cannot understand, however, why the prophet communicated the truth by way of allusions, examples, and corporeal representations or why religion permits men to devote much time and effort to practical, worldly things.

Concern for reform. His ignorance of the nature of most men and his compassion for them make the solitary hero insist on becoming their saviour. He persuades his companion to take him to his coreligionists and help him convert them to the naked truth by propagating among them "the secrets of wisdom." His education is completed when he fails in his endeavour. He learns the limits beyond which the multitude cannot ascend without becoming confused and unhappy. He also learns the wisdom of the divine lawgiver in addressing them in the way they can understand, enabling them to achieve limited ends through doctrines and actions suited to their abilities. The story ends with the hero taking leave of these people after apologizing to them for what he did and confessing that he is now fully convinced that they should not change their ways but remain attached to the literal sense of the divine law and obey its demands. He returns to his own island to continue his former solitary existence.

The hidden secret of Avicenna's "Oriental Philosophy." The hidden secret of Avicenna's "Oriental Philosophy" appears, then, to be that the philosopher must return to the cave, educate himself in the ways of nonphilosophers, and understand the incompatibility between philosophical life and the life of the multitude, which must be governed by religion and divine laws. Otherwise, his ignorance will lead him to actions dangerous to the well-being of both the community and philosophy. Because Ibn Ṭufayl's hero had grown up as a solitary human being, he lacks the kind of wisdom that could have enabled him to pursue philosophy in a religious community and be useful to such a community. Neither the conversion of the community to philosophy nor the philosopher's solitary life is a viable alternative.

Solution to the problem of the relation of philosophy to the community

The teachings of Averroës. *Philosophy.* To Ibn Ṭufayl's younger friend Averroës (Ibn Rushd, flourished 12th century) belongs the distinction of presenting a solution to the problem of the relation between philosophy and the Islāmic community in the west, a solution meant to be legally valid, theologically sound, and philosophically satisfactory. Here was a philosopher fully at home in what Ibn Bājjah had called the many layers of darkness. His legal training (he was a judge by profession) and his extensive knowledge of the history of the religious sciences (including theology) enabled him to speak with authority about the principles of Islāmic law and their application to theological and philosophic issues and to question the authority of al-Ghazālī and the Ashʿarīs to determine correct beliefs and right practices. He was able to examine in detail from the point of view of the divine law the respective claims of theology and philosophy to possess the best and surest way to human knowledge, to be competent to interpret the ambiguous expressions of the divine law, and to have presented convincing arguments that are theoretically tenable and practically salutary.

The intention of the divine law

The divine law. The intention of the divine law, he argued, is to assure the happiness of all members of the community. This requires everyone to profess belief in the basic principles of religion as enunciated in the Qurʾān, the Ḥādith, and the *ijmāʿ* (consensus) of the learned and to perform all obligatory acts of worship. Beyond this, the only just requirement is to demand that each pursue knowledge as far as his natural capacity and makeup permit. The few who are endowed with the capacity for the highest, demonstrative knowledge are under a divine legal obligation to pursue the highest wisdom, which is philosophy, and they need not constantly adjust its certain conclusions to what theologians claim to be the correct interpretation of the divine law. Being dialecticians and rhetoricians, theologians are not in a position to determine what is and is not correct interpretation of the divine law so far as philosophers are concerned. The divine law directly authorizes philosophers to pursue its interpretation according to the best—*i.e.,* demonstrative or scientific—method, and theologians have no authority to interfere with the conduct of this activity or judge its conclusions.

Theology. On the basis of this legal doctrine, Averroës judged the theologian al-Ghazālī's refutation of the philosophers ineffective and inappropriate because al-Ghazālī did not understand and even misrepresented the philosophers' positions and used arguments that only demonstrate his incompetence in the art of demonstration. He criticized al-Fārābī and Avicenna also for accommodating the theologians of their time and for departing from the path of the ancient philosophers merely to please the theologians. At the other extreme are the multitude for whom there are no more convincing arguments than those found in the divine law itself. Neither philosophers nor theologians are permitted to disclose to the multitude interpretations of the ambiguous verses of the Qur'ān or to confuse them with their own doubts or arguments. Finally, there are those who belong to neither the philosophers nor the multitude, either because they are naturally superior to the multitude but not endowed with the gift for philosophy or else are students in initial stages of philosophic training. For this intermediate group theology is necessary. It is an intermediate discipline that is neither strictly legal nor philosophic. It lacks their certain principles and sure methods. Therefore, theology must remain under the constant control of philosophy and the supervision of the divine law so as not to drift into taking positions that cannot be demonstrated philosophically or that are contrary to the intention of the divine law. Averroës himself composed a work on theology to show how these requirements can be met: *Kitāb al-kashf ʿan manāhij al-adillah* ("Exposition of the Methods of Proofs"). In the Latin West he was best known for his philosophical answer to al-Ghazālī, *Tahāfut at-tahāfut* ("Incoherence of the Incoherence"), and for his extensive commentaries on Aristotle, works that left their impact on medieval and renaissance European thought.

The new wisdom: synthesis of philosophy and mysticism

PHILOSOPHY, TRADITIONALISM, AND THE NEW WISDOM

The role of Arabic philosophical literature in the West

Philosophy. The western tradition in Islāmic philosophy formed part of the Arabic philosophic literature that was translated into Hebrew and Latin and that played a significant role in the development of medieval philosophy in the Latin West and the emergence of modern European philosophy. Its impact on the development of philosophy in eastern Islām was not as dramatic, but was important nevertheless. Students of this tradition—*e.g.,* the prominent Jewish philosopher Maimonides (flourished 12th century) and the historian Ibn Khaldūn (flourished 14th century)—moved to Egypt, where they taught and had numerous disciples. Most of the writings of Ibn Bājjah, Ibn Ṭufayl, and Averroës found their way to the east also, where they were studied alongside the writings of their eastern predecessors. In both regions thinkers who held to the idea of philosophy as formulated by the eastern and western philosophers thus far discussed continued to teach. They became isolated and overwhelmed, however, by the resurgence of traditionalism and the emergence of a new kind of philosophy whose champions looked on the earlier masters as men who had made significant contributions to the progress of knowledge but whose overall view was defective and had now become outdated.

The emergence of philosophy under a new garb

Traditionalism and the new wisdom. Resurgent traditionalism found effective defenders in men such as Ibn Taymīyah (13th–14th centuries) who employed a massive battery of philosophic, theological, and legal arguments against every shade of innovation and called for a return to the beliefs and practices of the pious ancestors. These attacks, however, did not deal a decisive blow to philosophy as such. It rather drove philosophy underground for a period, only to re-emerge in a new garb. A more important reason for the decline of the earlier philosophic tradition, however, was the renewed vitality and success of the program formulated by al-Ghazālī for the integration of theology, philosophy, and mysticism into a new kind of philosophy called wisdom (*ḥikmah*). It consisted of a critical review of the philosophy of Avicenna, preserving its main external features (its logical, physical, and, in part, metaphysical structure, and its terminology) and introducing principles of explanation for the universe and its relation to God based on personal experience and direct vision.

Characteristic features of the new wisdom. If the popular theology preached by the philosophers from al-Fārābī to Averroës is disregarded, it is evident that philosophy proper meant to them what al-Fārābī called a state of mind dedicated to the quest and the love for the highest wisdom. None of them claimed, however, that he had achieved this highest wisdom. In contrast, every leading exponent of the new wisdom stated that he had achieved or received it through a private illumination, dream (at times inspired by the Prophet), or vision and on this basis proceeded to give an explanation of the inner structure of natural and divine things. In every case, this explanation incorporated Platonic or Aristotelian elements but was more akin to some version of a later Hellenistic philosophy, which had found its way earlier into one or another of the schools of Islāmic theology, though, because of the absence of an adequate philosophic education on the part of earlier theologians, it had not been either elaborated or integrated into a comprehensive view. Like their late-Hellenistic counterparts, exponents of the new wisdom proceeded through an examination of the positions of Plato, Aristotle, and Plotinus. They also gave special attention to the insights of the pre-Socratic philosophers of ancient Greece and the myths and revelations of the ancient Near East, and they offered to resolve the fundamental questions that had puzzled earlier philosophers. In its basic movement and general direction, therefore, Islāmic philosophy between the 9th and the 19th centuries followed a course parallel to that of Greek philosophy from the 5th century BC to the 6th century AD.

Use of Greek philosophers by exponents of the new wisdom

Critiques of Aristotle in Islāmic theology. The critique of Aristotle that had begun in Muʿtazilī circles and had found a prominent champion in Abū Bakr ar-Rāzī was provided with a more solid foundation in the 10th and 11th centuries by the Christian theologians and philosophers of Baghdad, who translated the writings of the Hellenistic critics of Aristotle (*e.g.,* John Philoponus) and made use of their arguments in commenting on Aristotle and in independent theological and philosophic works. Avicenna's attack on these so-called Aristotelians and their Hellenistic predecessors (an attack that had been initiated by al-Fārābī and was to be continued by Averroës) did not prevent the spread of their theologically based anti-Aristotelianism among Jewish and Muslim students of philosophy in the 12th century, such as Abū al-Barakāt al-Baghdādī (died *c.* 1175) and Fakhr ad-Dīn ar-Rāzī. These theologians continued and intensified al-Ghazālī's attacks on Avicenna and Aristotle (especially their views on time, movement, matter, and form, the nature of the heavenly bodies, and the relation between the intelligible and sensible worlds). They suggested that a thorough examination of Aristotle had revealed to them, on philosophic grounds, that the fundamental disagreements between him and the theologies based on the revealed religions represented open options and that Aristotle's view of the universe was in need of explanatory principles that could very well be supplied by theology. This critique provided the framework for the integration of philosophy into theology from the 13th century onward.

Synthesis of philosophy and mysticism. Although it made use of such theological criticisms of philosophy, the new wisdom took the position that theology did not offer a positive substitute for and was incapable of solving the difficulties of "Aristotelian" philosophy. It did not question the need to have recourse to the Qur'ān and the Ḥadīth to find the right answers. It insisted (on the authority of a long-standing mystical tradition), however, that theology concerns itself only with the external expressions of this divine source of knowledge. The inner core was reserved for the adepts of the mystic path whose journey leads to the experience of the highest reality in dreams and visions. Only the mystical adepts are in possession of the one true wisdom, the ground of both the external expressions of the divine law and the phenomenal world of human experience and thought.

The inner core of divine knowledge as reserved for the adepts

PRIMARY TEACHERS OF THE NEW WISDOM

The teachings of as-Suhrawardī. The first master of the new wisdom, as-Suhrawardī (12th century), called it the "Wisdom of Illumination." He rejected Avicenna's distinction between essence and existence and Aristotle's distinction between substance and accidents, possibility and actuality, and matter and form, on the ground that they are mere distinctions of reason. Instead, he concentrated on the notion of being and its negation, which he called "light" and "darkness," and explained the gradation of beings as gradation of their mixture according to the degree of "strength," or "perfection," of their light. This gradation forms a single continuum that culminates in pure light, self-luminosity, self-awareness, self-manifestation, or self-knowledge, which is God, the light of lights, the true One. The stability and eternity of this single continuum result from every higher light overpowering and subjugating the lower, and movement and change in it result from each of the lower lights desiring and loving the higher.

As-Suhrawardī's "pan-lightism" is not particularly close to traditional Islāmic views concerning the creation of the world and God's knowledge of particulars. The structure of his universe remains largely that of the Platonists and the Aristotelians. And his account of the emanation process avoids the many difficulties that had puzzled Neoplatonists as they tried to understand how the second hypostasis (reality) proceeds from the One. He asserted that it proceeds without in any way affecting the One and that the One's self-sufficiency is enough to explain the giving out that seems to be both spontaneous and necessary. His doctrine is presented in a way that suggests that it is the inner truth behind the exoteric (external) teachings of Islām as well as Zoroastrianism, indeed the wisdom of all ancient sages, especially Iranians and Greeks, and the revealed religions as well. This neutral yet positive attitude toward the diversity of religions, which was not absent among Muslim philosophers and mystics, was to become one of the hallmarks of the new wisdom. Different religions were seen as different manifestations of the same truth, their essential agreement was emphasized, and various attempts were made to combine them into a single harmonious religion meant for all of mankind.

The positive attitude to the diversity of religions

As-Suhrawardī takes an important step in this direction through his doctrine of imaginative-bodily "resurrection." After their departure from the prison of the body, souls that are fully purified ascend directly to the world of separate lights. The ones that are only partially purified or are evil souls escape to a "world of images" suspended below the higher lights and above the corporeal world. In this world of images, or forms (not to be confused with the Platonic forms, which as-Suhrawardī identifies with higher and permanent intelligible lights), partially purified souls remain suspended and are able to create for themselves and by their own power of imagination pleasing figures and desirable objects in forms more excellent than their earthly counterparts and are able to enjoy them forever. Evil souls become dark shadows, suffer (presumably because their corrupt and inefficient power of imagination can create only ugly and frightening forms), and wander about as ghosts, demons, and devils. The creative power of the imagination, which as a human psychological phenomenon was already used by the philosophers to explain prophetic powers, was seized upon by the new wisdom as "divine magic." It was used to construct an eschatology, to explain miracles, dreams, and other saintly theurgic (healing) practices, to facilitate the movement between various orders of being, and for literary purposes.

The teachings of Ibn al-ʿArabī. The account of the doctrines of Ibn al-ʿArabī (12th–13th centuries) belongs properly to the history of Islāmic mysticism. Yet his impact on the subsequent development of the new wisdom was in many ways far greater than was that of as-Suhrawardī. This is true especially of his central doctrine of the "unity of being" and his sharp distinction between the absolute One, which is undefinable Truth (*ḥaqq*), and his self-manifestation (*ẓuhūr*), or creation (*khalq*), which is ever new (*jadīd*) and in perpetual movement, a movement that unites the whole of creation in a process of constant renewal. At the very core of this dynamic edifice stands nature, the "dark cloud" (*ʿamā*) or "mist" (*bukhār*), as the ultimate principle of things and forms: intelligence, heavenly bodies, and elements and their mixtures that culminate in the "perfect man." This primordial nature is the "breath" of the Merciful God in his aspect as Lord. It "flows" throughout the universe and manifests Truth in all its parts. It is the first mother through which Truth manifests itself to itself and generates the universe. And it is the universal natural body that gives birth to the translucent bodies of the spheres, to the elements, and to their mixtures, all of which are related to that primary source as daughters to their mother.

Doctrine of the "unity of being"

Ibn al-ʿArabī attempted to explain how Intelligence proceeds from the absolute One by inserting between them a primordial feminine principle, which is all things in potentiality but which also possesses the capacity, readiness, and desire to manifest or generate them, first, as archetypes in Intelligence, and then as actually existing things in the universe below. Ibn al-ʿArabī gave this principle numerous names, including prime "matter" (*ʿunṣur*), and characterized it as the principle "whose existence makes manifest the essences of the potential worlds." The doctrine that the first simple originated thing is not Intelligence but "indefinite matter" and that Intelligence was originated through the mediation of this matter was attributed to Empedocles, 5th-century-BC Greek philosopher, in doxographies (compilations of extracts from the Greek philosophers) translated into Arabic. It represented an attempt to bridge the gulf between the absolute One and the multiplicity of forms in Intelligence. The Andalusian mystic Ibn Masarrah (9th–10th centuries) is reported to have championed pseudo-Empedoclean doctrines, and Ibn al-ʿArabī (who studied under some of his followers) quotes Ibn Masarrah on a number of occasions. This philosophic tradition is distinct from the one followed by the Ismāʿīlī theologians, who explained the origination of Intelligence by the mediation of God's will.

The teachings of Twelver Shīʿism and the school of Isfahan. After Ibn al-ʿArabī, the new wisdom developed rapidly in intellectual circles in eastern Islām. Commentators on the works of Avicenna, as-Suhrawardī, and Ibn al-ʿArabī began the process of harmonizing and integrating the views of the masters. Great poets made them part of every educated man's literary culture. Mystical fraternities became the custodians of such works, spreading them into Central Asia and the Indian subcontinent and transmitting them from one generation to another. Following the Mongol khan Hülagü's entry into Baghdad (1258), the Twelver Shīʿah were encouraged by the Il Khanid Tatars and Naṣīr ad-Dīn aṭ-Ṭūsī (the philosopher and theologian who accompanied Hülagü as his vizier) to abandon their hostility to mysticism. Muʿtazilī doctrines were retained in their theology. Theology, however, was downgraded to "formal" learning that must be supplemented by higher things, the latter including philosophy and mysticism, both of earlier Shīʿī (including Ismāʿīlī) origin and of later Sunnī provenance. Al-Ghazālī, as-Suhrawardī, Ibn al-ʿArabī, and Avicenna were then eagerly studied and (except for their doctrine of the imamate) embraced with little or no reservation. This movement in Shīʿī thought gathered momentum when the leaders of a mystical fraternity established themselves as the Ṣafavid dynasty (1501–1732) in Iran, where they championed Twelver Shīʿism as the official doctrine of the new monarchy. During the 17th century, Iran experienced a cultural and scientific renaissance that included a revival of philosophic studies. There, Islāmic philosophy found its last creative exponents. The new wisdom as expounded by the masters of the school of Isfahan radiated throughout eastern Islām and continued as a vital tradition until modern times.

The role of mystical fraternities in the east

The major figures of the school of Isfahan were Mīr Dāmād (Muḥammad Bāqir ibn ad-Dāmād, died 1631/32) and his great disciple Mullā Ṣadrā (Ṣadr ad-Dīn ash-Shīrāzī, *c.* 1571–1640). Both were men of wide culture and prolific writers with a sharp sense for the history and development of philosophic ideas.

The teachings of Mīr Dāmād. Mīr Dāmād was the first to expound the notion of "eternal origination" (*ḥudūth dahrī*) as an explanation for the creation of the world. Muslim philosophers and their critics had recognized the crucial role played by the question of time in the discussion of the eternity of the world. The proposition that time is the measure of movement was criticized by Abū al-Barakāt al-Baghdādī, who argued that time is prior to movement and rest, indeed to everything except being. Time is the measure or concomitant of being, lasting and transient, enduring and in movement or rest. It character-

The concept of "eternal origination"

izes or qualifies all being, including God. God works in time, incessantly willing and directly creating everything in the world: his persistent will creates the eternal beings of the world, and his ever-renewed will creates the transient beings. The notion of a God who works in time was of course objectionable to theology, and Fakhr ad-Dīn ar-Rāzī refused to accept this solution despite its attractions. Ar-Rāzī also saw that it leads to the notion (attributed to Plato) that time is a self-subsistent substance, whose relation to God would further compromise his unity. Finally, ar-Rāzī explained that this self-subsistent substance will have to be related to different beings in different ways. It is called "everlastingness" (*sarmad*) when related to God and the Intelligences (angels) that are permanent and do not move or change in any way, "eternity" (*dahr*) when related to the totality of the world of movement and change, and "time" (*zamān*) when related to corporeal beings that make up the world of movement and change.

The problems of essence and existence

Mīr Dāmād returned to Avicenna and sought to harmonize his views with those of as-Suhrawardī on the assumption that what Avicenna meant by his "Oriental" (*mashriqīyah*) philosophy was identical with as-Suhrawardī's wisdom of "illumination" (*ishrāq*), which he interpreted as a Platonic doctrine that asserted the priority of essence (form) over being (existence). Time, for Mīr Dāmād, was neither a mere being of reason nor an accident of existing things. It belongs to the essence of things and describes their mode and rank of being. It is a "relation" that beings have to each other because of their essential nature. There must, therefore, be three ranks of order of time corresponding to the three ranks of order of being. Considered as the relation of God to the divine names and attributes (Intelligences or archetypes), the relation is "everlastingness." Considered as the relation between the Intelligences, or archetypes, and their reflections in the mutable things of the world below, the relation is "eternity." And considered as the relation between these mutable things, the relation is "time." Creation, or origination, is this very relation. Thus, the origination of the immutable Intelligences, or archetypes, is called "everlasting creation," the origination of the world of mutable beings as a whole is called "eternal creation," and the generation of mutable things within the world is called "temporal creation."

The teachings of Mullā Ṣadrā. Mullā Ṣadrā superimposed Ibn al-ʿArabī's mystical thought (whose philosophic implications had already been exposed by a number of commentators) on the "Aristotelian"-Illuminationist synthesis developed by Mīr Dāmād. Against his master, he argued with the Aristotelians for the priority of being (existence) over essence (form), which he called an abstraction; and, with Ibn al-ʿArabī, he argued for the "unity of being" within which beings differ only according to "priority and posteriority," "perfection and imperfection," and "strength and weakness." All being is thus viewed as a graded manifestation, or determination, of absolute, or pure, Being, and every level of being possesses all the attributes of pure Being, but with varying degrees of intensity or perfection.

Mullā Ṣadrā's doctrine of nature

Mullā Ṣadrā considered his unique contribution to Islāmic philosophy to be his doctrine of nature, which enabled him to assert that everything other than God and his knowledge—*i.e.,* the entire corporeal world, including the heavenly bodies—is originated "eternally" as well as "temporally." This doctrine of nature is an elaboration of the last manifestation of Ibn al-ʿArabī's "nature" or prime "matter," articulated on philosophic grounds and within the general framework of Aristotelian natural science and defended against every possible philosophic and theological objection.

Nature for Mullā Ṣadrā is the "substance" and "power" of all corporeal beings and the direct cause of their movement. Movement (and time, which measures it) is therefore not an accident of substance or an accompaniment of some of its accidents. It signifies the very change, renewal, and passing of being—itself being in constant "flow," or flux. The entire corporeal world, both the celestial spheres and the world of the elements, constantly renews itself. The "matter" of corporeal things has the power to become a new form at every instant; and the resulting matter–form complex is at every instant a new matter ready for, desiring, and moving toward another form. Men fail to observe this constant flux and movement in simple bodies not because of the endurance of the same form in them but because of the close similarity between their ever-new forms. What the philosophers call "movement" and "time" are not, as they believed, anchored in anything permanent—*e.g.,* in what they call "nature," "substance," or "essence"; essence is permanent only in the mind, and nature and substance are permanent activity. Nature as permanent activity is the very being of natural things and identical with their substance. Because nature is "permanent" in this sense, it is connected to a permanent principle that manifests activity in it permanently. Because nature constantly renews itself, all renewed and emergent things are connected to it. Thus, nature is the link between what is eternal and what is originated, and the world of nature is originated both eternally and temporarily.

The problem of movement, change, or renewal

Mullā Ṣadrā distinguishes this primary "movement-in-substance" (*al-ḥarakah fī al-jawhar*) from haphazard, compulsory, and other accidental movements that lack proper direction, impede the natural movement of substance, or reverse it. Movement-in-substance is not universal change or flux without direction, the product of conflict between two equally powerful principles, or a reflection of the nonbeing of the world of nature when measured against the world of permanent forms. It is, rather, the natural beings' innate desire to become more perfect, which directs this ceaseless self-renewal, self-origination, or self-emergence into a perpetual and irreversible flow upward in the scale of being—from the simplest elements to the human body–soul complex and the heavenly body–soul complex (both of which participate in the general instability, origination, and passing of being that characterizes the entire corporeal world). This flow upward, however, is by no means the end. For the indefinite "matter" (Ibn al-ʿArabī's "cloud" and the mystics' "created Truth") is the "substratum" of everything other than its Creator, the mysterious pure Truth. It "extends" beyond the body–soul complex to the Intelligences (divine names) that are Being's first, highest, and purest actualization or activity. This "extension" unites everything other than the Creator into a single continuum. The human body–soul complex and the heavenly body–soul complex are not moved externally by the Intelligences. Their movement is an extension of the process of self-perfection. Having reached the highest rank of order of substance in the corporeal world, they are now prepared, and still moved by their innate desire, to flow upward and transform themselves into pure intelligence.

IMPACT OF MODERNISM

The new wisdom lived on during the 18th and 19th centuries, conserving much of its vitality and strength but not cultivating new ground. It attracted able thinkers such as Shāh Walī Allāh of Delhi and Hādī Sabzevārī and became a regular part of the program of higher education in the cultural centres of the Ottoman Empire, Iran, and the Indian subcontinent, a status never achieved by the earlier tradition of Islāmic philosophy. In collaboration with its close ally Persian mystical poetry, the new wisdom determined the intellectual outlook and spiritual mood of educated Muslims in the regions where Persian had become the dominant literary language.

The problem of reform in modern Islāmic thought

The wholesale rejection of the new wisdom in the name of simple, robust, and more practical piety (which had been initiated by Ibn Taymīyah and which continued to find exponents among jurists) made little impression on its devotees. To be taken seriously, reform had to come from their own ranks and be espoused by such thinkers as the eminent theologian and mystic of Muslim India Aḥmad Sirhindī (flourished 16th–17th centuries)—a reformer who spoke their language and attacked Ibn al-ʿArabī's "unity of being" only to defend an older, presumably more orthodox form of mysticism. Despite some impact, however, attempts of this kind remained isolated and were either ignored or reintegrated into the mainstream, until the coming of the modern reformers. The 19th- and 20th-century reformers Jamāl ad-Dīn al-Afghānī, Muḥammad

Abduh, and Muḥammad Iqbāl were initially educated in this tradition, but they rebelled against it and advocated radical reforms.

The modernists attacked the new wisdom at its weakest point; that is, its social and political norms, its individualistic ethics, and its inability to speak intelligently about social, cultural, and political problems generated by a long period of intellectual isolation that was further complicated by the domination of the European powers. Unlike the earlier tradition of Islāmic philosophy from al-Fārābī to Averroës, which had consciously cultivated political science and investigated the political dimension of philosophy and religion and the relation between philosophy and the community at large, the new wisdom from its inception lacked genuine interest in these questions, had no appreciation for political philosophy, and had only a benign toleration for the affairs of the world.

None of the reformers was a great political philosopher. They were concerned with reviving their nations' latent energies, urging them to free themselves from foreign domination, and impressing on them the need to reform their social and educational institutions. They also saw that all this required a total reorientation, which could not take place so long as the new wisdom remained not only the highest aim of a few solitary individuals but also a social and popular ideal as well. Yet, as late as 1917, Iqbāl found that "the present-day Muslim prefers to roam about aimlessly in the valley of Hellenic-Persian mysticism, which teaches us to shut our eyes to the hard reality around, and to fix our gaze on what is described as 'illumination.' " His reaction was harsh: "To me this self-mystification, this nihilism, *i.e.,* seeking reality where it does not exist, is a physiological symptom, giving me a clue to the decadence of the Muslim world."

The call to return to the early masters of Islāmic theology and philosophy

To arrest the decadence and infuse new vitality in a society in which they were convinced religion must remain the focal point, the modern reformers advocated a return to the movements and masters of Islāmic theology and philosophy antedating the new wisdom. They argued that these, rather than the "Persian incrustation of Islām," represented Islām's original and creative impulse. The modernists were attracted, in particular, to the views of the Muʿtazilah: affirmation of God's unity and denial of all similarity between him and created things; reliance on human reason; emphasis on man's freedom; faith in man's ability to distinguish between good and bad; and insistence on man's responsibility to do good and fight against evil in private and public places. They were also impressed by the traditionalists' devotion to the original, uncomplicated forms of Islām and by their fighting spirit, and by the Ashʿarīs' view of faith as an affair of the heart and their spirited defense of the Muslim community. In viewing the scientific and philosophic tradition of eastern and western Islām prior to the Tatar and Mongol invasions, they saw an irrefutable proof that true Islām stands for the liberation of man's spirit, promotes critical thought, and provides both the impetus to grapple with the temporal and the demonstration of how to set it in order. These ideas initiated what was to become a vast effort to recover, edit, and translate into the Muslim national languages works of earlier theologians and philosophers, which had been long neglected or known only indirectly through later accounts.

The role of universities in the reform of Islāmic theology and philosophy

The modern reformers insisted, finally, that Muslims must be taught to understand the real meaning of what has happened in Europe, which in effect means the understanding of modern science and philosophy, including modern social and political philosophies. Initially, this challenge became the task of the new universities in the Muslim world. In the latter part of the 20th century, however, the originally wide gap between the various programs of theological and philosophic studies in religious colleges and in modern universities narrowed considerably.

(M.S.M./Ed.)

THE CULTURE OF ISLĀM

Islāmic Law, Sharīʿah

Total and unqualified submission to the will of Allāh (God) is the fundamental tenet of Islām: Islāmic law is therefore the expression of Allāh's command for Muslim society and, in application, constitutes a system of duties that are incumbent upon a Muslim by virtue of his religious belief. Known as the Sharīʿah (literally, "the path leading to the watering place"), the law constitutes a divinely ordained path of conduct that guides the Muslim toward a practical expression of his religious conviction in this world and the goal of divine favour in the world to come.

NATURE AND SIGNIFICANCE OF ISLĀMIC LAW

Muslim jurisprudence, the science of ascertaining the precise terms of the Sharīʿah, is known as *fiqh* (literally "understanding"). The historical process of the discovery of Allāh's law (see below) was regarded as completed by the end of the 9th century when the law had achieved a definitive formulation in a number of legal manuals written by different jurists. Throughout the medieval period this basic doctrine was elaborated and systematized in a large number of commentaries, and the voluminous literature thus produced constitutes the traditional textual authority of Sharīʿah law.

Scope of Sharīʿah

In classical form the Sharīʿah differs from Western systems of law in two principal respects. In the first place the scope of the Sharīʿah is much wider, since it regulates man's relationship not only with his neighbours and with the state, which is the limit of most other legal systems, but also with his God and his own conscience. Ritual practices, such as the daily prayers, almsgiving, fasting, and pilgrimage, are an integral part of Sharīʿah law and usually occupy the first chapters in the legal manuals. The Sharīʿah is also concerned as much with ethical standards as with legal rules, indicating not only what man is entitled or bound to do in law, but also what he ought, in conscience, to do or refrain from doing. Accordingly, certain acts are classified as praiseworthy (*mandūb*), which means that their performance brings divine favour and their omission divine disfavour, and others as blameworthy (*makrūh*), which means that omission brings divine favour and commission divine disfavour; but in neither case is there any legal sanction of punishment or reward, nullity or validity. The Sharīʿah is not merely a system of law, but a comprehensive code of behaviour that embraces both private and public activities.

The second major distinction between the Sharīʿah and Western legal systems is the result of the Islāmic concept of law as the expression of the divine will. With the death of the Prophet Muḥammad in 632, communication of the divine will to man ceased so that the terms of the divine revelation were henceforth fixed and immutable. When, therefore, the process of interpretation and expansion of this source material was held to be complete with the crystallization of the doctrine in the medieval legal manuals, Sharīʿah law became a rigid and static system. Unlike secular legal systems that grow out of society and change with the changing circumstances of society, Sharīʿah law was imposed upon society from above. In Islāmic jurisprudence it is not society that moulds and fashions the law, but the law that precedes and controls society.

Such a philosophy of law clearly poses fundamental problems of principle for social advancement in contemporary Islām. How can the traditional Sharīʿah law be adapted to meet the changing circumstances of modern Muslim society? This is now the central issue in Islāmic law. (See below *Reform of Sharīʿah law*).

HISTORICAL DEVELOPMENT OF SHARĪʿAH LAW

For the first Muslim community established under the leadership of the Prophet at Medina in 622, the Qurʾānic revelations laid down basic standards of conduct. But the Qurʾān is in no sense a comprehensive legal code. No more than 80 verses deal with strictly legal matters; while these verses cover a wide variety of topics and introduce many novel rules, their general effect is simply to modify the existing Arabian customary law in certain important particulars.

During his lifetime Muḥammad, as the supreme judge of the community, resolved legal problems as they arose by interpreting and expanding the general provisions of the Qurʾān, and the same *ad hoc* activity was carried on after his death by the caliphs (temporal and spiritual rulers) of Medina. But the foundation of the Umayyad dynasty in 661, governing from its centre of Damascus a vast military empire, produced a legal development of much broader dimensions. With the appointment of judges, or *qāḍīs,* to the various provinces and districts, an organized judiciary came into being. The *qāḍīs* were responsible for giving effect to a growing corpus of Umayyad administrative and fiscal law; and since they regarded themselves essentially as the spokesmen of the local law, elements and institutions of Roman-Byzantine and Persian-Sāsānian law were absorbed into Islāmic legal practice in the conquered territories. Depending upon the discretion of the individual *qāḍī,* decisions would be based upon the rules of the Qurʾān where these were relevant; but the sharp focus in which the Qurʾānic laws were held in the Medinian period had become lost with the expanding horizons of activity.

Development of a judiciary

Development of different schools of law. A reaction to this situation arose in the early 8th century when pious scholars, grouped together in loose, studious fraternities, began to debate whether or not Umayyad legal practice was properly implementing the religious ethic of Islām. Actively sponsored by the ʿAbbāsid rulers, who came to power in the mid-8th century pledged to build a truly Islāmic state and society, the activities of the jurists (*faqīh,* plural *fuqahāʾ*) in these early schools of law marked the real beginning of Islāmic jurisprudence. Their aim was to Islāmize the law by reviewing the current legal practice in the light of the Qurʾānic principles and then on this basis adopting, modifying, or rejecting the practice as part of their ideal scheme of law.

Of the many early schools of law the two most important were those of the Mālikīs in Medina and the Ḥanafīs in al-Kūfah, named after two outstanding scholars in the respective localities, Mālik ibn Anas and Abū Ḥanīfah. Inevitably the Mālikī and Ḥanafī doctrines, as they were then being recorded in the first compendiums of law, differed considerably from each other, not only because free juristic speculation was bound to produce varying results but also because the thought of the scholars was conditioned by their different social environments. A deep conflict of juristic principle emerged within the schools between those who maintained that outside the terms of the Qurʾān scholars were free to use their reason (*raʾy*) to ascertain the law and those who insisted that the only valid source of law outside the Qurʾān lay in the precedents set by the Prophet himself.

The jurist ash-Shāfiʿī (died 820) aimed to eliminate these schisms and produce greater uniformity in the law by expounding a firm theory of the sources from which the law must be derived. Ash-Shāfiʿī's fundamental teaching was that knowledge of the Sharīʿah could be attained only through divine revelation found either in the Qurʾān or in the divinely inspired traditions (*sunnah*) of the Prophet as ascertained through authentic reports (Ḥadīth). Human reason in law should be strictly confined to the process of analogical deduction, or *qiyās*—problems not specifically answered by the divine revelation were to be solved by applying the principles upon which closely parallel cases had been regulated by the Qurʾān or *sunnah.*

The role of divinely inspired traditions

Shāfiʿī's insistence upon the importance of the *sunnah* as a source of law produced a great activity in the collection and classification of Ḥadīths, particularly among his own supporters, who formed the Shāfiʿī school, and the followers of Aḥmad ibn Ḥanbal (died 855) who formed the Ḥanbalī school. Muslim scholarship maintained that the classical compilations of Ḥadīths—especially those of Bukhārī (died 870) and Muslim (died 875)—constituted an authentic record of the Prophet's precedents. The general view of Western orientalists, however, is that a considerable part of the *sunnah* represents the views of later jurists fictitiously ascribed to the Prophet to give the doctrine a greater authority.

Later developments. Shāfiʿī's thesis formed the basis of the classical theory of the roots of jurisprudence (*uṣūl al-fiqh*), which crystallized in the early 10th century. Juristic "effort" to comprehend the terms of the Sharīʿah is known as *ijtihād,* and legal theory first defines the course that *ijtihād* must follow. In seeking the answer to a legal problem the jurist must first consult the Qurʾān and the *sunnah.* Failing any specific solution in this divine revelation he must employ analogy (*qiyās*) or certain subsidiary principles of reasoning—*istiḥsān* (equitable preference) and *istiṣlāḥ* (the public interest). The legal theory then evaluates the results of *ijtihād* on the basis of the criterion of *ijmāʿ* (consensus). As an attempt to define Allāh's law, the *ijtihād* of individual scholars could result only in a tentative conclusion termed *ẓann* ("conjecture"). But where a conclusion became the subject of unanimous agreement by the qualified scholars, it became a certain (*yaqīn*) and infallible expression of Allāh's law.

Two major effects flowed from this classical doctrine of *ijmāʿ*. It served first as a permissive principle to admit the validity of variant opinions as equally probable attempts to define the Sharīʿah. Second, it operated as a restrictive principle to ratify the status quo; for once the *ijmāʿ* had cast an umbrella authority not only over those points that were the subject of a consensus but also over existing variant opinions, to propound any further variant was to contradict the infallible *ijmāʿ* and therefore tantamount to heresy.

Ijmāʿ set the final seal of rigidity upon the doctrine, and from the 10th century onward independent juristic speculation ceased. In the Arabic expression, "the door of *ijtihād* was closed." Henceforth jurists were *muqallids*, or imitators, bound by the doctrine of *taqlīd* ("clothing with authority" *i.e.,* unquestioned acceptance) to follow the doctrine as it was recorded in the authoritative legal manuals.

Sharīʿah law is a candidly pluralistic system, the philosophy of the equal authority of the different schools being expressed in the alleged dictum of the Prophet: "Difference of opinion among my community is a sign of the bounty of Allāh." But outside the four schools of Sunnī, or orthodox, Islām stand the minority sects of the Shīʿah and the Ibāḍīs whose own versions of the Sharīʿah differ considerably from those of the Sunnīs. Shīʿī law in particular grew out of a fundamentally different politico-religious system in which the rulers, or *imāms*, were held to be divinely inspired and therefore the spokesmen of the Lawgiver himself. Geographically, the division between the various schools and sects became fairly well defined as the *qāḍīs*' courts in different areas became wedded to the doctrine of one particular school. Thus Ḥanafī law came to predominate in the Middle East and the Indian subcontinent; Mālikī law in North, West, and Central Africa; Shāfiʿī law in East Africa, the southern parts of the Arabian peninsula, Malaysia, and Indonesia; Ḥanbalī law in Saudi Arabia, Shīʿī law in Iran and the Shīʿī communities of India and East Africa; Ibāḍī law in Zanzibar, ʿUman, and parts of Algeria.

Distribution of various schools of Islāmic law

Although Sharīʿah doctrine was all-embracing, Islāmic legal practice has always recognized jurisdictions other than that of the *qāḍīs*. Because the *qāḍis*' courts were hidebound by a cumbersome system of procedure and evidence, they did not prove a satisfactory organ for the administration of justice in all respects, particularly as regards criminal, land, and commercial law. Hence, under the broad head of the sovereign's administrative power (*siyāsah*), competence in these spheres was granted to other courts, known collectively as *maẓālim* courts, and the jurisdiction of the *qāḍīs* was generally confined to private family and civil law. As the expression of a religious ideal, Sharīʿah doctrine was always the focal point of legal activity, but it never formed a complete or exclusively authoritative expression of the laws that in practice governed the lives of Muslims.

THE SUBSTANCE OF TRADITIONAL SHARĪʿAH LAW

Sharīʿah duties are broadly divided into those that an individual owes to Allāh (the ritual practices or *ʿibādāt*) and those that he owes to his fellow men (*muʿāmalāt*). It is the latter category of duties alone, constituting law in the Western sense, that is described here.

Penal law. Offenses against the person, from homicide to assault, are punishable by retaliation (*qiṣāṣ*), the offender being subject to precisely the same treatment as his victim. But this type of offense is regarded as a civil injury rather than a crime in the technical sense, since it is not the state but only the victim or his family who have the right to prosecute and to opt for compensation or blood money (*diyah*) in place of retaliation.

Fixed punishment

For six specific crimes the punishment is fixed (*ḥadd*): death for apostasy and for highway robbery; amputation of the hand for theft; death by stoning for extramarital sex relations (*zinā*) where the offender is a married person and 100 lashes for unmarried offenders; 80 lashes for an unproved accusation of unchastity (*qadhf*) and for the drinking of any intoxicant.

Outside the *ḥadd* crimes, both the determination of offenses and the punishment therefore lies with the discretion of the executive or the courts.

Law of transactions. A legal capacity to transact belongs to any person "of prudent judgment" (*rāshid*), a quality that is normally deemed to arrive with physical maturity or puberty. There is an irrebuttable presumption of law (1) that boys below the age of 12 and girls below the age of 9 have not attained puberty, and (2) that puberty has been attained by the age of 15 for both sexes. Persons who are not *rāshid,* on account of minority, mental deficiency, simplicity, or prodigality, are placed under interdiction: their affairs are managed by a guardian and they cannot transact effectively without the guardian's consent.

The basic principles of the law are laid down in the four root transactions of (1) sale (*bayʿ*), transfer of the ownership or corpus of property for a consideration; (2) hire (*ijārah*), transfer of the usufruct (right to use) of property for a consideration; (3) gift (*hibah*), gratuitous transfer of the corpus of property, and (4) loan (*ʿāriyah*), gratuitous transfer of the usufruct of property. These basic principles are then applied to the various specific transactions of, for example, pledge, deposit, guarantee, agency, assignment, land tenancy, partnership, and *waqf* foundations. *Waqf* is a peculiarly Islāmic institution whereby the founder relinquishes his ownership of real property, which belongs henceforth to Allāh, and dedicates the income or usufruct of the property in perpetuity to some pious or charitable purpose, which may include settlements in favour of the founder's own family.

The Islāmic law of transactions as a whole is dominated by the doctrine of *ribā.* Basically, this is the prohibition of usury, but the notion of *ribā* was rigorously extended to cover, and therefore preclude, any form of interest on a capital loan or investment. And since this doctrine was coupled with the general prohibition on gambling transactions, Islāmic law does not, in general, permit any kind of speculative transaction the results of which, in terms of the material benefits accruing to the parties, cannot be precisely forecast.

Family law. A patriarchal outlook is the basis of the traditional Islāmic law of family relationships. Fathers have the right to contract their daughters, whether minor or adult, in compulsory marriage. Only when a woman has been married before is her consent to her marriage necessary; but even then the father, or other marriage guardian, must conclude the contract on her behalf. In Ḥanafī and Shīʿī law, however, only minor girls may be contracted in compulsory marriage, and adult women may conclude their own marriage contracts, except that the guardian may have the marriage annulled if his ward has married beneath her social status.

Husbands have the right of polygamy and may be validly married at the same time to a maximum of four wives. Upon marriage a husband is obliged to pay to his wife her dower, the amount of which may be fixed by agreement or by custom; and during the marriage he is bound to maintain and support her provided she is obedient to him, not only in domestic matters but also in her general social activities and conduct. A wife who rejects her husband's dominion by leaving the family home without just cause forfeits her right to maintenance.

Law of divorce

But it is in the traditional law of divorce that the scales are most heavily weighted against the wife. A divorce may be effected simply by the mutual agreement of the spouses, which is known as *khulʿ* when the wife pays some financial consideration to the husband for her release; and according to all schools except the Ḥanafīs a wife may obtain a judicial decree of divorce on the ground of some matrimonial offense—*e.g.,* cruelty, desertion, failure to maintain—committed by the husband. But the husband alone has the power unilaterally to terminate the marriage by repudiation (*ṭalāq*) of his wife. *Ṭalāq* is an extrajudicial process: a husband may repudiate his wife at will and his motive in doing so is not subject to scrutiny by the court or any other official body. A repudiation repeated three times constitutes a final and irrevocable dissolution of the marriage; but a single pronouncement may be revoked at will by the husband during the period known as the wife's *ʿiddah,* which lasts for three months following the repudiation (or any other type of divorce) or, where the wife is pregnant, until the birth of the child.

The legal position of children within the family group, as regards their guardianship, maintenance, and rights of succession, depends upon their legitimacy, and a child is legitimate only if it is conceived during the lawful wedlock of its parents. In Sunnī law no legal relationship exists between a father and his illegitimate child; but there is a legal tie, for all purposes, between a mother and her illegitimate child. Guardianship of the person (*e.g.,* control of education and marriage) and of the property of minor children belongs to the father or other close male, agnate relative, but the bare right of custody (*ḥaḍānah*) of young children, whose parents are divorced or separated, belongs to the mother or the female, maternal relatives.

Succession law. An individual's power of testamentary disposition is basically limited to one-third of his net estate (*i.e.,* the assets remaining after the payment of funeral expenses and debts) and two-thirds of the estate passes to the legal heirs of the deceased under the compulsory rules of inheritance.

Sunnī inheritance laws

There is a fundamental divergence between the Sunnī and the Shīʿī schemes of inheritance. Sunnī law is essentially a system of inheritance by male agnate relatives or *ʿaṣabah—i.e.,* relatives who, if they are more than one degree removed from the deceased, trace their connection with him through male links. Among the *ʿaṣabah,* priority is determined by: (1) class, descendants excluding ascendants, who in turn exclude brothers and their issue, who in turn exclude uncles and their issue; (2) degree, within each class the relative nearer in degree to the deceased excluding the more remote; (3) strength of blood tie, the germane, or full blood, connection excluding the half blood, or consanguine, connection among collateral relatives. This agnatic system is mitigated by allowing the surviving spouse and a limited number of females and nonagnates—the daughter; son's daughter; mother; grandmother; germane, consanguine, and uterine sisters; and uterine brother—to inherit a fixed fractional portion of the estate in suitable circumstances. But the females among these relatives only take half the share of the male relative of the same class, degree, and blood tie, and none of them excludes from inheritance any male agnate, however remote. No other female or non-agnatic relative has any right of inheritance in the presence of a male agnate. Where, for example, the deceased is survived by his wife, his daughter's son, and a distant agnatic cousin, the wife will be restricted to one-fourth of the inheritance, the grandson will be excluded altogether, and the cousin will inherit three-fourths of the estate.

Shīʿī law rejects the criterion of the agnatic tie and regards both the maternal and paternal connections as equally strong grounds of inheritance. In the Shīʿī system the surviving spouse always inherits a fixed portion, as in Sunnī law, but all other relatives, including females and nonagnates, are divided into three classes: (1) parents and lineal descendants; (2) grandparents, brothers and sisters, and their issue; (3) uncles and aunts and their issue. Any relative of class one excludes any relative of class two, who in turn excludes any relative of class three. Within each class the nearer in degree excludes the more remote, and the full blood excludes the half blood. While, therefore, a male relative normally takes double the share of the corresponding female relative, females and nonagnates are much more favourably treated than they are in Sunnī law. In the case mentioned above, for example, the wife would take one-fourth, but the remaining three-fourths would go to the daughter's son, or indeed to a daughter's daughter, and not to the agnatic cousin.

Under Shīʿī law the only restriction upon testamentary power is the one-third rule, but Sunnī law goes further and does not allow any bequest in favour of a legal heir. Under both systems, however, bequests that infringe these rules are not necessarily void and ineffective; the testator has acted beyond his powers, but the bequest may be ratified by his legal heirs.

Further protection is afforded to the rights of the legal heirs by the doctrine of death sickness. Any gifts made by a dying person in contemplation of his death are subject to precisely the same limitations as bequests, and, if they exceed these limits, will be effective only with the consent of the legal heirs.

Procedure and evidence. Traditionally, Sharīʿah law was administered by the court of a single *qāḍī*, who was the judge of the facts as well as the law, although on difficult legal issues he might seek the advice of a professional jurist, or *muftī*. There was no hierarchy of courts and no organized system of appeals. Through his clerk (*kātib*) the *qāḍī* controlled his court procedure, which was normally characterized by a lack of ceremony or sophistication. Legal representation was not unknown, but the parties would usually appear in person and address their pleas orally to the *qāḍī*.

Burden of proof

The first task of the *qāḍī* was to decide which party bore the burden of proof. This was not necessarily the party who brought the suit, but was the party whose contention was contrary to the initial legal presumption attaching to the case. In the case of an alleged criminal offense, for example, the presumption is the innocence of the accused, and in a suit for debt the presumption is that the alleged debtor is free from debt. Hence the burden of proof would rest upon the prosecution in the first case and upon the claiming creditor in the second. This burden of proof might, of course, shift between the parties several times in the course of the same suit, as, for example, where an alleged debtor pleads a counterclaim against the creditor.

The standard of proof required, whether on an initial, intermediate or final issue, was a rigid one and basically the same in both criminal and civil cases. Failing a confession or admission by the defendant, the plaintiff or prosecutor was required to produce two witnesses to testify orally to their direct knowledge of the truth of his contention. Written evidence and circumstantial evidence, even of the most compelling kind, were normally inadmissible. Moreover, the oral testimony (*shahādah*) had usually to be given by two male, adult Muslims of established integrity or character. In certain cases, however, the testimony of women was acceptable (two women being required in place of one man), and in most claims of property the plaintiff could satisfy the burden of proof by one witness and his own solemn oath as to the truth of his claim.

If the plaintiff or prosecutor produced the required degree of proof, judgment would be given in his favour. If he failed to produce any substantial evidence at all, judgment would be given for the defendant. If he produced some evidence, but the evidence did not fulfill the strict requirements of *shahādah*, the defendant would be offered the oath of denial. Properly sworn this oath would secure judgment in his favour; but if he refused it, judgment would be given for the plaintiff, provided, in some cases, that the latter himself would swear an oath.

In sum, the traditional system of procedure was largely self-operating. After his initial decision as to the incidence of the burden of proof, the *qāḍī* merely presided over the predetermined process of the law: witnesses were or were not produced, the oath was or was not administered and sworn, and the verdict followed automatically.

LAW IN CONTEMPORARY ISLĀM

The scope of Sharīʿah law and the mode of its administration. During the 19th century the impact of Western civilization upon Muslim society brought about radical changes in the fields of civil and commercial transactions and criminal law. In these matters the Sharīʿah courts were felt to be wholly out of touch with the needs of the time, not only because of their system of procedure and evidence but also because of the substance of the Sharīʿah doctrine, which they were bound to apply.

As a result, the criminal and general civil law of the Sharīʿah was abandoned in most Muslim countries and replaced by new codes based upon European models with a new system of secular tribunals to apply them. Thus, with the notable exception of the Arabian peninsula, where the Sharīʿah is still formally applied in its entirety, the application of Sharīʿah law in Islām has been broadly confined, from the beginning of the 20th century, to family law, including the law of succession at death and the particular institution of *waqf* endowments.

The decline of Sharīʿah

Nor, even within this circumscribed sphere, is Sharīʿah law today applied in the traditional manner. Throughout the Middle East generally Sharīʿah family law is now expressed in the form of modern codes, and it is only in the absence of a specific relevant provision of the code that recourse is had to the traditionally authoritative legal manuals. In India and Pakistan much of the family law is now embodied in statutory legislation, and since the law is there administered as a case-law system, the authority of judicial decisions has superseded that of the legal manuals.

In most countries, too, the court system has been, or is being, reorganized to include, for instance, the provision of appellate jurisdictions. In Egypt and Tunisia the Sharīʿah courts, as a separate entity, have been abolished, and Sharīʿah law is now administered through a unified system of national courts. In India, and, since partition, in Pakistan it has always been the case that Sharīʿah law has been applied by the same courts that apply the general civil and criminal law.

Finally, in many countries, special codes have been enacted to regulate the procedure and evidence of the courts that today apply Sharīʿah law. In the Middle East documentary and circumstantial evidence are now generally admissible; witnesses are put on oath and may be cross-examined, and the traditional rule that evidence is only brought by one side and that the other side, in suitable circumstances, takes the oath of denial has largely broken down. In sum, the court has a much wider discretion in assessing the weight of the evidence than it had under the traditional system of evidence. In India and Pakistan the courts apply the same rules of evidence to cases of Islāmic law as they do to civil cases generally. The system is basically English law, codified in the Indian Evidence Act, 1872.

Reform of Sharīʿah law. Traditional Islāmic family law reflected to a large extent the patriarchal scheme of Arabian tribal society in the early centuries of Islām. Not unnaturally certain institutions and standards of that law were felt to be out of line with the circumstances of Muslim society in the 20th century, particularly in urban areas where tribal ties had disintegrated and movements for the emancipation of women had arisen. At first this situation seemed to create the same apparent impasse between the changing circumstances of modern life and an allegedly immutable law that had caused the adoption of Western codes in civil and criminal matters. Hence, the only solution that seemed possible to Turkey in 1926 was the total abandonment of the Sharīʿah and the adoption of Swiss family law in its place. No other Muslim country, however, has as yet followed this example. Instead, traditional Sharīʿah law has been adapted in a variety of ways to meet present social needs.

From the outset the dominating issue in the Middle East has been the question of the juristic basis of reforms—*i.e.*, granted their social desirability, their justification in terms of Islāmic jurisprudential theory, so that the reforms appear as a new, but legitimate, version of the Sharīʿah.

In the early stages of the reform movement, the doctrine of *taqlīd* (unquestioning acceptance) was still formally observed and the juristic basis of reform lay in the doctrine of *siyāsah,* or "government," which allows the political authority (who, of course, has no legislative power in the real sense of the term) to make administrative regulations of two principal types.

Egyptian reforms

The first type concerns procedure and evidence and restricts the jurisdiction of the Sharīʿah courts in the sense that they are instructed not to entertain cases that do not fulfill defined evidential requirements. Thus, an Egyptian law was enacted in 1931 that no disputed claim of marriage was to be entertained where the marriage could not be proved by an official certificate of registration, and no such certificate could be issued if the bride was less than 16 or the bridegroom less than 18 years of age at the time of the contract. Accordingly the marriage of a minor contracted by the guardian was still perfectly valid but would not, if disputed, be the subject of judicial relief from the courts. In theory the doctrine of the traditional authorities was not contradicted, but in practice an attempt had been made to abolish the institution of child marriage. The second type of administrative regulation was a directive to the courts as to which particular rule among existing variants they were to apply. This directive allowed the political authority to choose from the views of the different schools and jurists the opinion that was deemed best suited to present social circumstances. For example, the traditional Ḥanafī law in force in Egypt did not allow a wife to petition for divorce on the ground of any matrimonial offense committed by the husband, a situation that caused great hardship to abandoned or ill-treated wives. Mālikī law, however, recognizes the wife's right to judicial dissolution of her marriage on grounds such as the husband's cruelty, failure to provide maintenance and support, and desertion. Accordingly, an Egyptian law of 1920 codified the Mālikī law as the law henceforth to be applied by the Sharīʿah courts.

By way of comparison, reform in the matters of child marriage and divorce was effected in the Indian subcontinent by statutory enactments that directly superseded the traditional Ḥanafī law. The Child Marriage Restraint Act, 1929, prohibited the marriage of girls below the age of 14 and boys below the age of 16 under pain of penalties; while the Dissolution of Muslim Marriages Act, 1939, modelled on the English Matrimonial Causes Acts, allowed a Ḥanafī wife to obtain judicial divorce on the standard grounds of cruelty, desertion, failure to maintain, etc.

In the Middle East, by the 1950s, the potential for legal reform under the principle of *siyāsah* had been exhausted. Since that time the basic doctrine of *taqlīd* has been challenged to an ever-increasing degree. On many points the law recorded in the medieval manuals, insofar as it represents the interpretations placed by the early jurists upon the Qurʾān and the *sunnah,* has been held no longer to have a paramount and exclusive authority. Contemporary jurisprudence has claimed the right to renounce those interpretations and to interpret for itself, independently and afresh in the light of modern social circumstances, the original texts of divine revelation: in short to reopen the door of *ijtihād* that had been in theory closed since the 10th century.

Syrian and Tunisian reforms

The developing use of *ijtihād* as a means of legal reform may be seen through a comparison of the terms of the Syrian law of Personal Status (1953) with those of the Tunisian Law of Personal Status (1957) in relation to the two subjects of polygamy and divorce by repudiation (*ṭalāq*).

As regards polygamy the Syrian reformers argued that the Qurʾān itself urges husbands not to take additional wives unless they are financially able to make proper provision for their maintenance and support. Classical jurists had construed this verse as a moral exhortation binding only on the husband's conscience. But the Syrian reformers maintained that it should be regarded as a positive legal condition precedent to the exercise of polygamy and enforced as such by the courts. This novel interpretation was then coupled with a normal administrative regulation that required the due registration of marriages after the permission of the court to marry had been obtained. The Syrian Law accordingly enacts: "The *qāḍī* may withhold permission for a man who is already married to marry a second wife, where it is established that he is not in a position to support them both." Far more extreme, however, is the approach of the Tunisian reformers. They argued that, in addition to a husband's financial ability to support a plurality of wives, the Qurʾān also required that co-wives should be treated with complete impartiality. This Qurʾānic injunction should also be construed, not simply as a moral exhortation, but as a legal condition precedent to polygamy, in the sense that no second marriage should be permissible unless and until adequate evidence was forthcoming that the wives would in fact be treated impartially. But under modern social and economic conditions such impartial treatment was a practical impossibility. And since the essential condition for polygamy could not be fulfilled the Tunisian Law briefly declares: "Polygamy is prohibited."

With regard to *ṭalāq* the Syrian law provided that a wife who had been repudiated without just cause might be awarded compensation by the court from her former husband to the maximum extent of one year's maintenance. The reform was once again represented as giving practical effect to certain Qurʾānic verses that had been generally regarded by traditional jurisprudence as moral rather than legally enforceable injunctions—namely, those verses that enjoin husbands to "make a fair provision" for repudiated wives and to "retain wives with kindness or release them with consideration." The effect of the Syrian law, then, is to subject the husband's motive for repudiation to the scrutiny of the court and to penalize him, albeit to a limited extent, for abuse of his power. Once again, however, the Tunisian *ijtihād* concerning repudiation is far more radical. Here the reformers argued that the Qurʾān orders the appointment of arbitrators in the event of discord between husband and wife. Clearly a pronouncement of repudiation by a husband indicated a state of discord between the spouses. Equally clearly the official courts were best suited to undertake the function of arbitration that then becomes necessary according to the Qurʾān. It is on this broad ground that the Tunisian law abolishes the right of a husband to repudiate his wife extrajudicially and enacts that: "Divorce outside a court of law is without legal effect." Although the court must dissolve the marriage if the husband persists in his repudiation, it has an unlimited power to grant the wife compensation for any damage she has sustained from the divorce—although in practice this power has so far been used most sparingly. In regard to polygamy and *ṭalāq* therefore, Tunisia has achieved by reinterpretation of the Qurʾān reforms hardly less radical than those effected in Turkey some 30 years previously by the adoption of the Swiss Civil Code.

Pakistani reforms

In Pakistan a new interpretation of the Qurʾān and *sunnah* was the declared basis of the reforms introduced by the Muslim Family Laws Ordinance of 1961, although the provisions of the Ordinance in relation to polygamy and *ṭalāq* are much less radical than the corresponding Middle Eastern reforms, since a second marriage is simply made dependent upon the consent of an Arbitration Council and the effect of a husband's repudiation is merely suspended for a period of three months to afford opportunity for reconciliation.

Judicial decisions in Pakistan have also unequivocally endorsed the right of independent interpretation of the Qurʾān. For example, in *Khurshīd Bībī* v. *Muḥammad Amīn* (1967) the Supreme Court held that a Muslim wife could as a right obtain a divorce simply by payment of suitable compensation to her husband. This decision was based on the Court's interpretation of a relevant Qurʾānic verse. But under traditional Sharīʿah law this form of divorce, known as *khul*, whereby a wife pays for her release, is a contract between the spouses and as such entirely dependent upon the husband's free consent.

These are but a few examples of the many far-reaching changes that have been effected in the Islāmic family law. But the whole process of legal reform as it has so far developed still involves great problems of principle and practice. A hard core of traditionalist opinion still adamantly rejects the validity of the process of reinterpretation of the basic texts of divine revelation. The traditionalists argue that the texts are merely being manipulated to yield the meaning that suits the preconceived purposes of the reformers, and that therefore, contrary to fundamental Islāmic ideology, it is social desirability and not the will of Allāh that is the ultimate determinant of the law.

As regards the practical effect of legal reform, there exists in many Muslim countries a deep social gulf between a Westernized and modernist minority and the conservative mass of the population. Reforms that aim at satisfying the standards of progressive urban society have little significance for the traditionalist communities of rural areas or for the Mulsim fundamentalists, whose geographical and social distribution crosses all apparent boundaries. It is also often the case that the *qāḍīs*, through their background and training, are not wholly sympathetic with the purposes of the modernist legislators—an attitude often reflected in their interpretations of the new codes.

Such problems are, of course, inevitable in the transitional stage of social evolution in which Islām finds itself. But the one supreme achievement of jurisprudence over the past few decades has been the emergence of a functional approach to the question of the role of law in society. Jurisprudence has discarded the introspective and idealistic attitude that the doctrine of *taqlīd* had imposed upon it since early medieval times and now sees its task to be the solution of the problems of contemporary society. It has emerged from a protracted period of stagnation to adopt again the attitude of the earliest Muslim jurists, whose aim was to relate the dictates of the divine will to their own social environment. It is this attitude alone that has ensured the survival of the Sharīʿah in modern times as a practical system of law and that alone provides its inspiration for the future. (N.J.C.)

Social and ethical principles

FAMILY LIFE

A basic social teaching of Islām is the encouragement of marriage, and the Qurʾān regards celibacy definitely as something exceptional—to be resorted to only under economic stringency. Thus, monasticism as a way of life was severely criticized by the Qurʾān. With the appearance of Ṣūfism, however, many Ṣūfīs preferred celibacy, and some even regarded women as an evil distraction from piety, although marriage remained the normal practice also with Ṣūfīs.

Pre-Islāmic practice of polygamy and the Qurʾān

Polygamy, which was practiced in pre-Islāmic Arabia, was permitted by the Qurʾān, which, however, limited the number of simultaneous wives to four, and this permission was made dependent upon the condition that justice be done among co-wives. The Qurʾān even suggests that "You shall never be able to do justice among women, no matter how much you desire." Medieval law and society, however, regarded this "justice" to be primarily a private matter between a husband and his wives, although the law did provide redress in cases of gross neglect of a wife. Right of divorce was also vested basically in the husband, who could unilaterally repudiate his wife, although the woman could also sue her husband for divorce before a court on certain grounds.

The virtue of chastity is regarded as of prime importance by Islām. The Qurʾān advanced its universal recommendation of marriage as a means to ensure a state of chastity (*iḥṣān*), which is held to be induced by a single free wife. The Qurʾān states that those guilty of adultery are to be severely punished with 100 lashes. Tradition has intensified this injunction and has prescribed this punishment for unmarried persons, but married adulterers are to be stoned to death. A false accusation of adultery is punishable by 80 lashes.

The general ethic of the Qurʾān considers the marital bond to rest on "mutual love and mercy," and the spouses are said to be "each other's garments." The detailed laws of inheritance prescribed by the Qurʾān also tend to confirm the idea of a central family—husband, wife, and children, along with the husband's parents. Easy access to polygamy (although the normal practice in Islāmic society has always been that of monogamy) and easy divorce on the part of the husband led, however, to frequent abuses in the family. In recent times, most Muslim countries have enacted legislation to tighten up marital relationships.

Rights of parents in terms of good treatment are stressed in Islām, and the Qurʾān extols filial piety, particularly tenderness to the mother, as an important virtue. A murderer of his father is automatically disinherited. The tendency of the Islāmic ethic to strengthen the immediate family on the one hand and the community on the other at the expense of the extended family or tribe did not succeed, however. Muslim society, until the encroachments upon it of modernizing influences, has remained basically one composed of tribes or quasi-tribes. Despite urbanization, tribal affiliations offer the greatest resistance to change and development of a modern polity. So strong, indeed, has been the tribal ethos that, in most Muslim societies, daughters are not given their inheritance share prescribed by the sacred law in order to prevent disintegration of the joint family's patrimony.

THE STATE

Because Islām draws no distinction between the religious and the temporal spheres of life, the Muslim state is by definition religious. The main differences between the Sunnī, Khawārij, and Shīʿī concepts of rulership have already been pointed out above. It should be noted that, although the office of the Sunnī caliph (*khalīfah,* one who is successor to the Prophet in rulership) is religious, this does not imply any functions comparable to those of the pope. The caliph has no authority either to define dogma or, indeed, even to legislate. He is the chief executive of a religious community, and his primary function is to implement the sacred law and work in the general interests of the community. He himself is not above the law and if necessary can even be deposed, at least in theory.

Sunnī political theory is essentially a product of circumstance—an after-the-fact rationalization of historical developments. Thus, between the Shīʿah legitimism that restricts rule to ʿAlī's family and the Khawārij democratism that allowed rulership to anyone, even to "an Ethiopian slave," Sunnism held the position that "rule belonged to the Quraysh" (the Prophet's tribe)—the condition that actually existed. Again, in view of the extremes represented by the Khawārij, who demanded rebellion against what they considered to be unjust or impious rule, and Shīʿites, who raised the *imām* to a metaphysical plane of infallibility, Sunnites took the position that a ruler has to satisfy certain qualifications but that rule cannot be upset on small issues. Indeed, under the impact of civil wars started by the Khawārij, Sunnism drifted to more and more conformism and actual toleration of injustice.

Political conformism of Sunnism

The first step taken in this direction by the Sunnites was the enunciation that "one day of lawlessness is worse than 30 years of tyranny." This was followed by the principle that "Muslims must obey even a tyrannical ruler." Soon, however, the sultan (ruler) was declared to be "shadow of God on earth." No doubt, the principle was also adopted—and insisted upon—that "there can be no obedience to the ruler in disobedience of God"; but there is no denying the fact that the Sunnī doctrine came more and more to be heavily weighted on the side of political conformism. This change is also reflected in the principles of legitimacy. Whereas early Islām had confirmed the pre-Islāmic democratic Arab principle of rule by consultation (*shūrā*) and some form of democratic election of the leader, those practices soon gave way to dynastic rule with the advent of the Umayyads. The *shūrā* was not developed into any institutionalized form and was, indeed, soon discarded. Soon the principle of "might is right" came into being, and later theorists frankly acknowledged that actual possession of effective power is one method of the legitimization of power.

In spite of this development, the ruler could not become absolute because a basic restraint was placed upon him by the Sharīʿah law under which he held his authority and which he dutifully was bound to execute and defend. When, in the latter half of the 16th century, the Mughal emperor Akbar in India wanted to arrogate to himself the right of administrative–legal absolutism, the strong reaction of the orthodox thwarted his attempt. In general, the *'ulamā'* (religious scholars) jealously upheld the sovereign position of the Sharī'ah against the political authority.

The effective shift of power from the caliph to the sultan was, again, reflected in the redefinition of the functions of the caliph. It was conceded that, if the caliph administered through *wazīrs* (viziers or ministers) or subordinate rulers (*amīrs*), it was not necessary for him to embody all the physical, moral, and intellectual virtues theoretically insisted upon earlier. In practice, however, the caliph was no more than a titular head from the middle of the 10th century onward, when real power passed to self-made and adventurous *amīrs* and sultans, who merely used the caliph's name for legitimacy.

EDUCATION

Muslim educational activity began in the 8th century, primarily in order to disseminate the teaching of the Qur'ān and the *sunnah* of the Prophet. The first task was to collect and systematize the knowledge that was handed down by the previous generations concerning the meaning of the Qur'ān and the activity and precepts of the Prophet. Thus, in the early period, the character of learning was traditional. that tradition was committed to writing in the 2nd century AH and systematized and developed in the 3rd century AH. This vast activity of "seeking knowledge" (*ṭalab al-'ilm*) resulted in the creation of specifically Arab sciences of tradition, history, and literature.

When the introduction of the Greek sciences—philosophy, medicine, and mathematics—created a formidable body of lay knowledge, a creative reaction on the traditional religious base resulted in the rationalist theological movement of the Mu'tazilah. Based on that Greek legacy, from the 9th to the 12th century AD a brilliant philosophical movement flowered and presented a challenge to orthodoxy on the issues of the eternity of the world, the doctrine of revelation, and the status of the Sharī'ah.

Distinction between religious and secular sciences

The orthodox met the challenges positively by formulating the religious dogma. At the same time, however, for fear of heresies, they began to draw a sharp distinction between religious and secular sciences. The custodians of the Sharī'ah developed an unsympathetic attitude toward the secular disciplines and excluded them from the curriculum of the *madrasah* (college) system. Their exclusion from the Sunnī system of education proved fatal, not only for those disciplines but, in the long run, for religious thought in general because of the lack of intellectual challenge and stimulation. A typical *madrasah* curriculum included logic (which was considered necessary as an "instrumental" science for the formal correctness of thinking procedure), Arabic literature, law, Ḥadīth, Qur'ān commentary, and theology. Despite sporadic criticism from certain quarters, the *madrasah* system remained impervious to change.

One important feature of Muslim education was that primary education (which consisted of Qur'ān reading, writing, and rudimentary arithmetic) did not feed candidates to institutions of higher education, and the two remained separate. In higher education, emphasis was on books rather than on subjects and on commentaries rather than on original works. This, coupled with the habit of learning by rote (which was developed from the basically traditional character of knowledge that encouraged learning more than thinking), impoverished intellectual creativity still further.

Despite these grave shortcomings, however, the *madrasah* produced one important advantage. Through the uniformity of its religio-legal content, it gave the *'ulamā'* the opportunity to effect that overall cohesiveness and unity of thought and purpose that, despite great variations in local Muslim cultures, has become a palpable feature of the world Muslim community. This uniformity has withstood even the serious tension created against the seats of formal learning by Ṣūfism through its peculiar discipline and its own centres.

In contrast to the Sunnī attitude toward it, philosophy continued to be seriously cultivated among the Shī'ah, even though it developed a strong religious character. Indeed, philosophy has enjoyed an unbroken tradition in Persia down to the present and has produced some highly original thinkers. Both the Sunnī and the Shī'ah medieval systems of learning, however, have come face to face with the greatest challenge of all—the impact of modern education and thought.

Organization of education developed naturally in the course of time. Evidence exists of small schools already established in the first century of Islām that were devoted to reading, writing, and instruction in the Qur'ān. These schools of "primary" education were called *kuttābs.* The well-known governor of Iraq at the beginning of the 8th century, the ruthless al-Ḥajjāj, had been a schoolteacher in his early career. When higher learning in the form of tradition grew in the 8th and 9th centuries, it was centred around learned men to whom students travelled from far and near and from whom they obtained a certificate (*ijāzah*) to teach what they had learned. Through the munificence of rulers and princes, large private and public libraries were built, and schools and colleges arose. In the early 9th century, a significant incentive to learning came from the translations made of scientific and philosophical works from the Greek (and partly Sanskrit) at the famous *bayt al-ḥikmah* ("house of wisdom") at Baghdad, which was officially sponsored by the caliph al-Ma'mūn. The Fāṭimid caliph al-Ḥākim set up a *dār alḥikmah* ("hall of wisdom") in Cairo in the 10–11th centuries. With the advent of the Seljuq Turks, the famous vizier Niẓām al-Mulk created an important college at Baghdad, devoted to Sunnī learning, in the latter half of the 11th century. The oldest surviving university, al-Azhar at Cairo, was established by the Fāṭimids, but Saladin (Ṣalāḥ ad-Dīn al-Ayyūbī), after ousting the Fāṭimids, consecrated it to Sunnī learning in the 12th century. Throughout subsequent centuries, colleges and quasi-universities (called *madrasah* or *dār al-'ulūm*) arose throughout the Muslim world from Spain (whence philosophy and science were transmitted to the Latin West) across Central Asia to India. In Turkey, a new style of *madrasah* came into existence; it had four wings, for the teaching of the four schools of Sunnī law. Professorial chairs were endowed in large colleges by princes and governments, and residential students were supported by college endowment funds. Myriads of smaller centres of learning were endowed by private donations.

CULTURAL DIVERSITY

Underneath the legal and creedal unity, the world of Islām harbours a tremendous diversity of cultures, particularly in the outlying regions. The expansion of Islām can be divided into two broad periods. In the first period of the Arab conquests, the assimilative activity of the conquering religion was far-reaching. Although Persia resurrected its own language and a measure of its national culture after the first three centuries of Islām, its culture and language had come under heavy Arab influence. Only after Ṣafavid rule installed Shī'ism as a distinctive creed in the 16th century did Persia regain a kind of religious autonomy. The language of religion and thought, however, continued to be Arabic.

Ṣūfī compromises with local customs

In the second period, the spread of Islām was not conducted by the state with *'ulamā'* influence but was largely the work of Ṣūfī missionaries. The Ṣūfīs, because of their latitudinarianism, compromised with local customs and beliefs and left a great deal of the pre-Islāmic legacy in every region intact. Thus, among the Central Asian Turks, shamanistic practices were absorbed, while in Africa the holy man and his *barakah* (an influence supposedly causing material and spiritual well-being) are survivors from the older cults. In India there are large areas geographically distant from the Muslim religio-political centre of power in which customs are still Hindu and even pre-Hindu and in which people worship a motley of saints and deities in common with the Hindus. The custom of *satī,* under which a widow burned herself alive along with her dead husband, persisted in India even among some Muslims until late into the Mughal period. The 18th- and 19th-century reform movements exerted themselves to "purify" Islām of these accretions and superstitions.

Indonesia affords a striking example of this phenomenon. Because Islām reached there late and soon thereafter came under European colonialism, the Indonesian society has retained its pre-Islāmic world view beneath an overlay of Islāmic practices. It keeps its customary law (called *adat*) at the expense of the Sharīʿah; many of its tribes are still matriarchal; and culturally the Hindu epics *Rāmāyaṇa* and *Mahābhārata* hold a high position in national life. Since the 19th century, however, orthodox Islām has gained steadily in strength because of fresh contacts with the Middle East.

Apart from regional diversity, the main internal division within Islāmic society is brought about by urban and village life. Islām originally grew up in the two cities of Mecca and Medina, and as it expanded, its peculiar ethos appears to have developed in urban areas. Culturally, it came under a heavy Persian influence in Iraq, where the Arabs learned the ways and style of life of their conquered people, who were culturally superior to them. The custom of veiling women (which originally arose as a sign of aristocracy but later served the purpose of segregating women from men—the *pardah*), for example, was acquired in Iraq.

Another social trait derived from outside cultures was the disdain for agriculture and manual labour in general. Because the people of the town of Medina were mainly agriculturists, this disdain could not have been initially present. In general, Islām came to appropriate a strong feudal ethic from the peoples it conquered. Also, because the Muslims generally represented the administrative and military aristocracy and because the learned class (the *ʿulamāʾ*) was an essential arm of the state, the higher culture of Islām became urban based.

This city orientation explains and also underlines the traditional cleavage between the orthodox Islām of the *ʿulamāʾ* and the folk Islām espoused by the Ṣūfī orders of the countryside. In the modern period, the advent of education and rapid industrialization threatened to make this cleavage still wider. With the rise of a strong and widespread fundamentalist movement in the second half of the 20th century, this dichotomy has decreased.

Religion and the arts

THE VISUAL ARTS

Aniconism as a governing principle of art

The Arabs before Islām had hardly any art except poetry, which had been developed to full maturity and in which they took great pride. As with other forms of culture, the Muslim Arabs borrowed their art from Persia and Byzantium. Whatever elements the Arabs borrowed, however, they Islāmized in a manner that fused them into a homogeneous spiritual-aesthetic complex. The most important principle governing art was aniconism; *i.e.,* the religious prohibition of figurization and representation of living creatures. Underlying this prohibition is the assumption that God is the sole author of life and that a person who produces a likeness of a living being seeks to rival God. The tradition ascribed to the Prophet that a person who makes a picture of a living thing will be asked on the Day of Judgment to infuse life into it, whether historically genuine or not, doubtless represents the original attitude of Islām. In the Qurʾān (3:49, 5:113), reflecting an account in a New Testament apocryphal work, it is counted among the miracles of Jesus that he made likenesses of birds from clay "by God's order," and, when he breathed into them, they became real birds, again, "by God's order."

Hence, in Islāmic aniconism two considerations are fused together: (1) rejection of such images that might become idols (these may be images of anything) and (2) rejection of figures of living things. Plato and Plotinus, Greek philosophers, had also dismissed representative art as an "imitation of nature"; *i.e.,* as something removed from reality. The Islāmic attitude is more or less the same, with the added element of attributing to the artist a violation of the sanctity of the principle of life. The same explanation holds for the Qurʾānic criticism of a certain kind of poetry, namely, free indulgence in extravagant image mongering: "They [poets] recklessly wander in every valley" (26:225).

This basic principle has, however, undergone modifications. First, pictures were tolerated if they were confined to private apartments and harems of palaces. This was the case with some members of the Umayyad and ʿAbbāsid dynasties, Turks, and Persians—in particular with the Shīʿah, who have produced an abundance of pictorial representations of the holy family and of the Prophet himself. Second, in the field of pictorial representation, animal and human figures are combined with other ornamental designs such as fillets and arabesques—stressing their ornamental nature rather than representative function. Third, for the same reason, in plastic art they appear in low relief. In other regions of the Muslim world—in North Africa, Egypt, and India (except for Mughal palaces)—representational art was strictly forbidden. Even in paintings, the figures have little representational value and are mostly decorative and sometimes symbolic. This explains why plastic art is one of the most limited areas of Islāmic art. The only fullfledged plastic figures are those of animals and a few human figures that the Seljuqs brought from eastern Turkistan.

Miniature painting

Much more important than plastic art were paintings, particularly frescoes and later Persian and Perso-Indian miniatures. Frescoes are found in the Umayyad and ʿAbbāsid palaces and in Spain, Iran, and in the harem quarters of the Mughal palaces in India. Miniature paintings, introduced in Persia, assumed much greater importance in the later period in Mughal India and Turkey. Miniature painting was closely associated with the art of book illumination, and this technique of decorating the pages of the books was patronized by princes and other patrons from the upper classes. (Miniature painting is also discussed below; see *Illustration of myth and legend.*)

MUSIC

Instrumental music was forbidden by the orthodox in the formative stages of Islām. As for vocal music, its place was largely taken by a sophisticated and artistic form of the recitation of the Qurʾān known as *tajwīd.* Nevertheless, the Muslim princely courts generously patronized and cultivated music. Arab music was influenced by Persian and Greek music. Al-Fārābī, a 10th-century philosopher, is credited with having constructed a musical instrument called the *arghanūn* (organ). In India, Amīr Khosrow, a 14th-century poet and mystic, produced a synthesis of Indian and Persian music and influenced the development of later Indian music.

Among the religious circles, the Ṣūfīs introduced both vocal and instrumental music as part of their spiritual practices. The *samāʿ,* as this music was called, was opposed by the orthodox at the beginning, but the Ṣūfīs persisted in this practice, which slowly won general recognition. The great Ṣūfī poet Jalāl ad-Dīn ar-Rūmī (died 1273)—revered equally by the orthodox and the Ṣūfīs—heard the divine voice in his stringed musical instrument when he said "Its head, its veins (strings) and its skin are all dry and dead; whence comes to me the voice of the Friend?"

LITERATURE

In literature, drama and pure fiction were not allowed—drama because it was a representational art and fiction because it was akin to lying. Similar constraints operated against the elaboration of mythology (see below *Islāmic myth and legend*). Story literature was tolerated, and the great story works of Indian origin—*The Thousand and One Nights* and *Kalīlah wa Dimnah*—were translated from the Persian, introducing secular prose into Arabic. Didactic and pious stories were used and even invented by popular preachers. Much of this folklore found its way back into enlarged editions of *The Thousand and One Nights* and, through it, has even influenced later history writing. Because of the ban on fictional literature, there grew a strong tendency in later literary compositions—in both poetry and prose—toward hyperbole (*mubālaghah*), a literary device to satisfy the need of getting away from what is starkly real without committing literal falsehood, thus often resulting in the caricature and the grotesque. Poetry lent itself particularly well to this device, which was freely used in panegyrics, satires, and lyrics. As a form of effective expression, poetry is eminently characteristic of the East. The Arab genius is almost natively poetical with its strong and vivid imagination not easily amenable to the rigorous order that reason imposes upon the mind.

Poetry as a characteristic of the East

This borderline attitude between the real and the unreal was particularly favourable to the development, in all medieval Islāmic literatures of the Middle East, of the lyric and panegyric forms of poetry wherein every line is a self-contained unit. Much more importantly, it afforded a specially suitable vehicle for a type of mystic poetry in which it is sometimes impossible to determine whether the poet is talking of earthly love or spiritual love. For the same reason, poetry proved an effective haven for thinly veiled deviations from and even attacks on the literalist religion of the orthodox.

ARCHITECTURE

Architecture is by far the most important expression of Islāmic art, particularly the architecture of mosques. It illustrates both the diversity of cultures that participated in the Islāmic civilization and the unifying force of Islāmic monotheism represented by the spacious expanse of the mosque—a veritable externalization of the all-enveloping divine unity, heightened by the sense of infinity of the arabesque design. The arabesque, though ornately decorative, spiritually represents the infinite vastness of God.

Among the earliest monuments are the mosque of ʿAmr built in Egypt in 641–642 and the famous Dome of the Rock of Jerusalem (finished in 691), which, however, is not a mosque but a monument, a concentric-circular structure consisting of a wooden dome set on a high drum and resting on four tiers and 12 columns. The Umayyad ruler al-Walīd (died 715) built the great mosque at Damascus and al-Aqṣā Mosque at Jerusalem with two tiers of arcades in order to heighten the ceiling. The early Syro-Egyptian mosque is a heavily columned structure with a prayer niche (*miḥrāb*) oriented toward the Kaʿbah sanctuary at Mecca.

In Spanish and North African architecture these features are combined with Roman-Byzantine characteristics, the masterpieces of Spanish architecture being the famous Alhambra Palace at Granada and the Great Mosque of Córdoba. In the famous Persian mosques, the characteristic Persian elements are the tapered brick pillars, the arches (each supported by several pillars), the huge arcades, and the four sides called *eyvān*s. With the advent of the Seljuqs in the 11th century, faience decoration (glazed earthenware) of an exquisite beauty was introduced, and it gained further prominence under the Timurids (14th–16th centuries).

In the number and greatness of mosques, Turkey has the pride of first place in the Muslim world. Turkey began with a Persian influence and then later Syrian in the 13th and 14th centuries, but Turkey developed its own cupola domes and monumental entrances. The Turkish architects accomplished symmetry by means of one large dome, four semidomes, and four small domes among them. In the Indo-Pakistan subcontinent, Muslim architecture first employed Hindu architectural features (*e.g.,* horizontal rather than arcuate, or bowlike, arches and Hindu ornamentation), but later the Persian style predominated.

(F.R./Ed.)

Islāmic myth and legend

The strict monotheism of Islām does not allow for much mythological embellishment, and only reluctantly were the scriptural revelations of the Qurʾan elaborated and enlarged by commentators and popular preachers. Thus, in the first three centuries, a number of ideas from the ancient Near East, from Hellenistic and especially from Judeo-Christian traditions were absorbed into Islām and given at least partial sanction by the theologians. At the same time, legends were woven around the Prophet Muḥammad and the members of his family. Though inconsistent with historical reality, these legends formed for the masses the main sources of inspiration about the famous figures of the past.

Role of storytellers

Since early times Islāmic theologians have sought to disregard the Qurʾānic interpretation of both storytellers and mystics. The *quṣṣāṣ,* or storytellers, made the Qurʾānic revelation more understandable to the masses by filling in the short texts with detailed descriptions that were not found in scripture. Though the mystics tried to maintain the purity of the divine word, they also attempted a spiritualization of both the Qurʾān and the popular legends that developed around it. Their way of giving to the Qurʾānic words a deeper meaning, however, and discovering layer after layer of meaning in them, sometimes led to new quasi-mythological forms. Later Islāmic mystical thinkers built up closed systems that can be called almost mythological (*e.g.,* the angelology—theory of angels—of Suhrawardī al-Maqtūl, executed 1191). An interesting development is visible in poetry, especially in the Persian-speaking areas, where mythological figures and pious legend often were turned into secular images that might awaken in the reader a reminiscence of their religious origin. Such images contribute to the iridescent and ambiguous character of Persian poetry.

SOURCES AND VARIATIONS

The Qurʾān and non-Islāmic influences. The sources of Islāmic mythology are first of all the Qurʾānic revelations. Since, for the Muslims, the Qurʾān is the uncreated word of God (the text revealed to Muḥammad considered an earthly manifestation of the eternal and uncreated original in heaven), it contains every truth, and whatever is said in it has been the object of meditation and explanation through the centuries. Thus, since the 9th century, commentators on the Qurʾān have been by far the most important witnesses for Islāmic "mythology." They wove into their explanations various strands of Persian and ancient oriental lore and relied heavily on Jewish tradition. For example, the Jewish convert, Kaʿb al-Aḥbār brought much of the *Isrāʾīliyāt* (things Jewish) into Islāmic tradition. Later on, the mystics' commentaries expressed some gnostic (a dualistic viewpoint in which spirit is viewed as good and matter as evil) and Hellenistic concepts, of which the Hellenistic idea of the Perfect Man—personified in Muḥammad—was to gain greatest prominence. Commentaries written in the border areas of Islāmic countries now and then accepted a few popular traditions from their respective areas; however, the formative period was finished quite early. Traditions about the life and sayings of the Prophet grew larger and larger and are interesting for the study of the adoption of foreign mythological material. A valuable source for Islāmic legends are the *qiṣaṣ al-anbiyāʾ*—stories of the prophets, such as those by Thaʿālibī (born 1035) and Kisāʾī (11th century)—traditions concerning the prophets of yore in which a large number of pre-Islāmic and non-Islāmic ideas were incorporated.

While the classical mythology of Islām, as far as it can be properly called so, is spread over the whole area of Islām, the miracles and legends around a particular Muslim saint are found chiefly in the area of his special influence (especially where his order is most popular). Even if the names of the saints differ, the legends woven around them are very similar to each other and almost interchangeable. In the area where Persian was read—from Ottoman Turkey to India—the mythological concepts of Ferdowsī's *Shāh-nāmeh* are found side by side with the legends taken from ʿAṭṭār's and Rūmī's works.

Trans-cultural proliferation

The mystics. From the 11th century onward, the biographies of the mystics often show interesting migrations of legendary motifs from one culture to another. For the Persian-speaking countries the *Tazkerat ol-Owlīyāʾ* ("Memoirs of the Saints") of Farīd od-Dīn ʿAṭṭār (died *c.* 1220) has become the storehouse of legendary material about the early Ṣūfī mystics. ʿAṭṭār's Persian epics (especially his *Manṭeq ot-ṭeyr,* the "Birds' Conversation") also contain much material that was used by almost every writer after him. *The Masnavī* (a sort of poetic encyclopaedia of mystical thought in 26,000 couplets) of Jalāl od-Dīn Rūmī (died 1273) is another important source for legends of saints and prophets. For the Iranian world view, Ferdowsī's (died *c.* 1020) *Shāh-nāmeh* ("Book of Kings") gave a poetical account of the mythology of old Iran, and its heroes became models for many poets and writers. The whole mythological and legendary heritage is condensed in allusions found in lyrical and panegyrical poetry. The Persian poet Ebrāhim ebn ʿAlī Khāqānī's (*c.* 1121–*c.* 1199) works, *qaṣīdahs* ("Odes"), are typical. The close connection of the Ṣūfī orders with the artisans' lodges and guilds was instrumental in the dissemination of legendary material, especially about the alleged founder, or patron, of the guild (such as Ḥallāj as patron of cottoncarders and Idrīs as patron of the tailors).

Muslim historians interested in world history often began their works with mythological tales; central Asian traditions were added in Iran during the Il-Khanid period (AD 1256–1335). Folk poetry, in the different languages spoken by Muslims, provides a popular representation of traditional material, be it in Arabic, Persian, Turkish, the Indian and Pakistani languages (Urdu, Bengali, Sindhi, Panjabi, Baluchi, etc.), or the African languages; in all of them allusions to myth and legend are found down to the level of riddles and lullabies. Typical of the legendary tradition of the Shī'ah are the *ta'ziyas* ("passion-plays") in Iran, commemorating the death of Husayn ibn 'Alī in Karbalā' (680) and the *marsīyehs* (threnodies or elegies for the dead), which form an important branch of the Urdu poetry of India and Pakistan. A proper study of the distribution of most aspects of mythology in the various Muslim areas has not been undertaken, since much of the popular material is rarely available in print or is written in less-known languages—a good example is the extremely rich collections of legends and popular pious works in the Pakistani language, Sindhi.

TYPES OF MYTH AND LEGEND

Cosmogony and eschatology. The world was created by God's word *kun* ("Be") out of nothing; after the creation of the angelic beings from light, Adam was formed from clay and destined to be God's vicegerent, *khalīfah.* All of the angels obeyed God's order to prostrate themselves before Adam, except Iblīs (Satan), who refused and was cursed; due to Iblīs' instigation Adam ate the forbidden fruit (or grain) and was driven out of paradise. Questions of original sin or of Eve's role do not arise in the Muslim version of creation. Satan's disobedience has been explained by the mystics as actually an expression of his obedience to the divine will that does not allow worship of any but the Lord and that conflicted with the order that Satan prostrate himself before Adam.

Satan's refusal to worship Adam, depicting the rebellious angel Iblīs, or Satan, as the human figure on a prayer rug (right). From a 17th-century manuscript of Majāles ol-'Oshshāq. In the Bibliothèque Nationale, Paris (supplément Persan 1559).

Before the creation, God addressed the posterity of Adam: "Am I not your Lord," *alastu birabbikum,* and they answered "Yes" (Qur'ān, *sūrah* 7:172). This pre-eternal covenant is the favourite topic of mystical poetry, especially in the Persian-speaking areas for expressing pre-eternal love between God and man, or the unchangeable fate that was accepted that very day, the Yesterday as contrasted to the Tomorrow of resurrection. Angels and jinns (genies) are living powers that become visible in human life; they are accepted as fully real.

Every destiny is written on the "well-preserved tablet," and now "the pen has dried up"—a change in destiny is not possible. Later mystics have relied on an extra-Qur'ānic revelation in which God attests: "I was a hidden treasure" and have seen the reason for creation in God's yearning to be known and loved. For them, creation is the projection of divine names and qualities onto the world of matter.

Centrality of death and resurrection

The central event of Islām is death and resurrection. The dead will be questioned by two terrible angels (that is why the profession of faith is recited to the dying); only the souls of martyrs go straight to heaven where they remain in the crops of green birds around the divine throne (green is always connected with heavenly bliss). The end of the world will be announced by the coming of the mahdī (literally, "the directed or guided one")—a messianic figure who will appear in the last days and is not found in the Qur'ān but developed out of Shī'ah speculations and sometimes identified with Jesus. The mahdī will slay the Dajjāl, the one-eyed evil spirit, and combat the dangerous enemies, Yājūj and Mājūj, who will come from the north of the earth. The trumpet of Isrāfīl, one of the four archangels, will awaken the dead for the day of resurrection, which is many thousands of years long and the name of which has come to designate a state of complete confusion and turmoil.

The eschatological inventory as described in the Qur'ān was elaborated by the commentators: the scales on which the books or deeds are weighed (an old Egyptian idea), the book in which the two recording angels have noted down man's deeds, and the narrow bridge that is said to be sharper than a sword and thinner than a hair and leads over hell (an Iranian idea). The dreadful angels of hell and the horrors of that place are as thoroughly described by theologians as the pleasures of paradise, with its waters and gardens and the houris who are permanent virgins. Pious tradition promises space in heavenly mansions, filled with everything beautiful, to those who repeat certain prayer formulas a certain number of times, or for similar rewarding deeds, whereas the mystic longs not "for houris some thousand years old" but for the vision of God, who will be visible like the full moon. In the concept of the *sidrah* tree as the noblest place in paradise a remnant may be found of the old tree of life. God's throne is on the waters (Qur'ān, *sūrah* 11:9) in the highest world, surrounded by worshipping angels. The created world, the earth, is surrounded by the mountain Qāf and enclosed by two oceans that are separated by a barrier. Mecca is the navel of the earth, created 2,000 years before everything else, and the deluge did not reach to proto-*Ka'bah.* Often the world is conceived as a succession of seven heavens and seven earths, and a popular tradition says that the earth is on water, on a rock, on the back of a bull, on a *kamkam* (meaning unknown), on a fish, on water, on wind, on the veil of darkness—hence the Persian expression *az māh tā māhī,* from the moon to the fish; *i.e.,* throughout the whole world.

Tales and legends concerning religious figures. The majority of popular legends concern the leading personalities of Islām.

Muhammad. Muḥammad, whose only miracle, according to his own words, was the bringing of the Qur'ān, is credited with innumerable miracles and associated with a variety of miraculous occurrences: his finger split the moon, the cooked poisoned meat warned him not to touch it, the palm trunk sighed, the gazelle spoke for him; he cast no shadow; from his perspiration the rose was created, etc. His ascension to heaven (*mi'rāj*) is still celebrated: he rode the winged horse Burāq in the company of the angel Gabriel through the seven spheres, meeting the other prophets there, until he reached the divine presence, alone, even without the angel of inspiration. Muḥammad-mysticism proper was developed in the late 9th century; he is shown as the one who precedes creation, his light is pre-eternal, and he is the reason for and goal of creation. He becomes the perfect man, uniting the divine and the human sphere as dawn is between night and day. His birth was surrounded by miracles, and his birthday (12. Rabīʿ I) became a popular holiday on which numerous poems were written to praise his achievements. The hope for him who has been sent as "mercy for the worlds" and will intercede for his community on Doomsday is extremely strong, especially among the masses, where these legends have completely overshadowed his historical figure.

Muḥammad-mysticism

Other Qurʾānic figures. In addition to Muḥammad himself, his cousin and son-in-law ʿAlī, the Shīʿah hero, has been surrounded by legends concerning his bravery, his miraculous sword, Dhūa'l-fiqār, and his wisdom. ʿAlī's son, Ḥusayn, is the subject of innumerable poems that concern the day of his final fight in Karbalāʾ.

Almost every figure mentioned in the Qurʾān has become the centre of a circle of legends, be it Yūsuf, the symbol of overwhelming beauty, or Jesus with the lifegiving breath, the model of poverty and asceticism. Of special interest is Khiḍr, identified with the unnamed companion of Moses (Qurʾān, *sūrah* 20). He is the patron saint of the wayfarers, connected with green, the colour of heavenly bliss, appearing whenever a pious person is in need, and immortal since he drank from the fountain of life, which is hidden in the darkness. In many respects, he is the Islāmic counterpart of Elijah. Strong influences of the Alexander romances (a widely distributed literary genre dealing with the adventures of Alexander the Great) are visible in his figure.

The mystics as miracle workers

Mystics and other later figures. The great religious personalities have become legendary, especially the martyr-mystic Ḥallāj (executed in Bagdad, 922). His word *anā al-Ḥaqq,* "I am the Creative Truth," became the motto of many later mystics. His death on the gallows is the model for the suffering of lovers, and allusions to his fate are frequent in Islāmic literature. An earlier mystic, Abū Yazīd al-Bisṭāmī (died 874), was the first to speak about the ascension of the mystic to heaven, which is a metaphor for higher unitive, mystical experience. A variation of the Buddha legend has been transferred onto the person of the first Ṣūfī (mystic) who practiced absolute poverty and trust in God, the Central Asian Ibrāhīm ibn Adham (died *c.* 780). The founders of mystical orders were credited by their followers with a variety of miracles, such as riding on lions, healing the sick, walking on water, being present at two places at the same time, and cardiognosia (which is the knowledge of what is in another's heart, or thought reading). ʿAbd al-Qādir al-Jīlānī (died 1166), the founder of the widespread Qādirīyah order of mystics, and many others have attracted upon themselves a large number of popular stories that formerly had been told about pre-Islāmic saints or about some divinities, and these motifs can easily be transferred from one person to the other. In this sphere the survival of pre-Islāmic customs and legends is most visible. The idea of the hierarchy of saints, culminating in the *quṭb*, the pole or axis, thanks to whose activities the world keeps going, belongs to the mythology of Ṣūfism (Islāmic mysticism).

Mythologization of secular tales. A feature of Islāmic mythology is the transformation of unreligious stories into vehicles of religious experience. The old hero of romantic love in Arabic literature, Majnūn, "the demented one," became a symbol of the soul longing for identification with God, and in the Indus Valley the tales of Sassui or Sohnī, the girls who perish for their love, and other romantic figures, have been understood as symbols of the soul longing for union with God through suffering and death.

Tales and beliefs about numbers and letters. Many Muslim tales, legends, and traditional sayings are built upon the mystical value of numbers, such as the threefold or sevenfold repetition of a certain rite. This is largely explained by examples from the life of a saintly or pious person, often the Prophet himself, who used to repeat this or that formula so and so many times. The number 40, found in the Qurʾān (as also in the Bible) as the length of a period of repentance, suffering, preparation, and steadfastness, plays the same role in Islām where it is connected, for example, with the 40 days' preparation and meditation, or fasting, of the novice in the mystical brotherhood. To each number, as well as to each day of the week, special qualities are attributed through the authority of both actual and alleged statements of the Prophet. Many pre-Islāmic customs were thus justified. The importance given to the letters of the Arabic alphabet is peculiar to Muslim pious thought. Letters of the alphabet were assigned numerical values: the straight *alif* (numerical value one), the first letter of the alphabet, becomes a symbol of the uniqueness and unity of Allāh; the *b* (numerical value two), the first letter of the Qurʾān, represents to many mystics the creative power by which everything came into existence; the *h* (numerical value five) is the symbol of *huwa,* He, the formula for God's absolute transcendence; the *m* (numerical value 40) is the "shawl of humanity" by which God, the One (al-Aḥad), is separated from *Aḥmad* (*Muḥammad*). M is the letter of human nature and hints at the 40 degrees between man and God. The sect of the Ḥurūfīs developed these cabalistic interpretations of letters, but they are quite common in the whole Islāmic world and form almost a substitute for mythology.

Number symbolism

ILLUSTRATION OF MYTH AND LEGEND

Persian, Turkish, and Indian Mughal miniature painting

Since the art of representation is opposed in Islām, illustrations of mythological and legendary subjects are rarely found. Miniature painting developed only in the Persian and, later on, in the Turkish and Indo-Muslim areas. Books such as Zakarīyāʾ ebn Moḥammad al-Qazvīnī's *Cosmography* contain in some manuscripts a few pictures of angels, like Isrāfīl with the trumpet, and histories of the world or histories of the prophets, written in Iran or Turkey, also contain in rare manuscripts representations of angels or of scenes as told in the Qurʾān, especially the story of Yūsuf and Zalīkhā, which inspired many poems. The *Shāh-nāmeh* has been fairly frequently illustrated. When the Prophet of Islām is shown at all, his face is usually covered and in several cases his companions or his family members are also shown with veiled faces.

The only subject from the legends surrounding Muḥammad that has been treated by miniaturists several times is his ascension to heaven. There are a number of splendid Persian miniatures depicting this. In poetical manuscripts that contain allusions to legends of the saints, these topics were also sometimes illustrated (*e.g.,* Jonah and the great fish or scenes from the wanderings of Khiḍr). Several miniatures deal with the execution of the mystic al-Ḥallāj. Mythological themes proper are found almost exclusively in the paintings of Mughal India; especially in the period of Jahāngīr, in which the eschatological peace of lion and lamb lying together is illustrated as well as the myth of the earth resting on the bull, on the fish, etc. But by that time European influence was also already visible in Mughal art.

SIGNIFICANCE AND MODERN INTERPRETATIONS

Mythology proper has only a very small place in official Islām and is mostly an expression of popular traditions through which pre-Islāmic influences seeped into Islām. Reformers tried to purge Islām of all non-Qurʾānic ideas and picturesque elaborations of the texts, whereas the mystics tried to spiritualize them as far as possible. Modern Muslim exegesis attempts to interpret many of the mythological strands of the Qurʾān in the light of modern science, as psychological factors, like Muḥammad's ascension to heaven, and especially deprives the eschatological parts of the Qurʾān of their religious significance. Cosmic events are interpreted as predictions of modern scientific research. To some interpreters, jinns and angels are spiritual forces; to others, jinns are microbes or the like. Thus the religious text is confused with a textbook of science. Popular legends surrounding the Prophet and the saints are still found among the masses but are tending to disappear under the influence of historical research, though many of them have formed models for the behaviour and spiritual life of the Muslim believer. (An.Sc.)

(1979), a historical and systematic interpretation of Islām, and *Islamic Methodology in History* (1965), a critical appraisal of the development of *sunnah, ijmāʿ,* and *ijtihād;* REUBIN LEVY, *An Introduction to the Sociology of Islam* (1930–), useful account of the development of Islāmic society and institutions. JOHN W. BAGNOLE, *Cultures of the Islamic Middle East* (1978), an annotated guide to 402 English-language readings for the nonspecialist.

Education: ARTHUR S. TRITTON, *Materials on Muslim Education in the Middle Ages* (1957), an informative, useful compilation; BAYARD DODGE, *Muslim Education in Medieval Times* (1962), a useful sketch.

Political theory and institutions: ERWIN I.J. ROSENTHAL, *Political Thought in Medieval Islam* (1958), a good general survey of the subject.

Islāmic arts: In view of the wealth of descriptive treatments, rather than theory, it is difficult to point to a single source. K.A.C. CRESWELL, *A Bibliography of the Architecture, Arts and Crafts of Islam to 1st Jan. 1960* (1961), and *Supplement, Jan. 1960 to Jan. 1972* (1973), contain all the necessary references. See also his *Early Muslim Architecture,* 2nd ed. (1969), and AMERICAN UNIVERSITY AT CAIRO, CENTER FOR ARABIC STUDIES, *Studies in Islamic Art and Architecture in Honor of Professor K.A.C. Creswell* (1965); HAMILTON A.R. GIBB, *Arabic Literature: An Introduction,* 2nd ed. (1974), a probing survey of 1,500 years of literature; SALIH J. ALTOMA, *Modern Arabic Literature* (1975), a bibliography of 850 general and scholarly works covering 1800–1970.

Muḥammad. *Biographical works:* W. MONTGOMERY WATT, *Muhammad at Mecca* (1953) and *Muhammad at Medina* (1956, reprinted 1977), a full-scale treatment, summarized in *Muhammad: Prophet and Statesman* (1961, reissued 1974), by the same author; FRANTS BUHL, . . . *Das Leben Muhammeds,* 3rd ed. (1961), a German translation of a work published in Danish in 1903 that is still considered reliable; TOR ANDRAE, *Mohammed: The Man and His Faith,* trans. by THEOPHIL MENZEL (1936, reprinted 1971), chiefly concerned with religious aspects; IBN HISHĀM, *The Life of Muhammad: A Translation of Isḥāq's Sīrat rasūl Allāh* (1955, reissued 1967), the primary Arabic biography; NABIA ABBOTT, *Aishah: The Beloved of Mohammed* (1942, reprinted 1973), a scholarly work; JOHN BAGOT GLUBB, *The Life and Times of Muhammad* (1970), a popular account based on the author's familiarity with Arab life.

Primary sources: The Qurʾān, of course, contains basic contemporary materials on Muḥammad, but it is difficult to assess them without broader historical knowledge. The vast collections of Traditions (Ḥadīth), or anecdotes about Muḥammad's words and deeds, are historically disputable and, besides, seldom tell us anything significant about Muḥammad's career. The main sources of historical value are the early biographies (8th–9th century), especially the *Sīrah* of IBN ISḤĀQ, as adapted by IBN HISHĀM, and the *Maghāzi* ("Expeditions") of AL-WAQIDI, together with the supplementary materials recorded by his associate IBN SAʿD. The last item contains much material about the Companions (persons in contact with Muḥammad) and thus about the Prophet's relation to and work with them. Some contemporary documents are preserved in the early biographical works, the most important being the so-called "Constitution of Medina." The latter is in Guillaume's translation of Ibn Isḥāq cited above; other documents are in Watt's *Muhammad at Medina.*

The Qurʾān. The basic work is T. NÖLDEKE, *Geschichte des Qorāns* (1860, 2nd ed. by FRIEDRICH SCHWALLY 1909–38, reprinted 1970). Less comprehensive but more modern are RICHARD BELL, *Introduction to the Qurʾān,* new ed., rev. and enl. by W. MONTGOMERY WATT (1970); and RÉGIS BLACHÈRE, *Introduction au Coran,* 2nd ed. (1977). The history of Qurʾānic interpretation is set forth in IGNÁC GOLDZIHER, *Die Richtungen der islamischen Koranauslegung* (1920, reprinted 1970). It should be supplemented by JOHANNES M.S. BALJON, *Modern Muslim Koran Interpretation, 1880–1960* (1961, reprinted 1968). ARTHUR JEFFERY, *The Qurʾān as Scripture* (1952, reprinted 1980), deals with the Qurʾān's view of its own function. KENNETH CRAGG, *The Event of the Qurʾān* (1971), deals with the meaning of the Qurʾān in Islāmic life. English translations include *The Meaning of the Glorious Qurʾan: Text and Explanatory Translation,* by MUHAMMAD M. PICKTHALL (1938, reissued 1977); *The Koran Interpreted* by ARTHUR J. ARBERRY (1964), which is well known for its literary qualities; and HELMUT GÄTJE, *The Qurʾān and Its Exegesis: Selected Texts with Classical and Modern Muslim Interpretations,* trans. and ed. by ALFORD T. WELCH (1977).

Ḥadīth. J. ROBSON, "Hadīth," in *The Encyclopaedia of Islam,* new ed., vol. 3, pp. 23–28 (1971), and TH.W. JUYNBOLL, "Hadīth," in *The Encyclopaedia of Islam,* vol. 2, pp. 189–194 (1927), two important summaries with extensive bibliographies; ALFRED GUILLAUME, *The Traditions of Islam* (1924, reprinted 1980), a general introduction serviceable for a first study; IGNÁC GOLDZIHER, *Études sur la tradition islamique,* ed. by LÉON BERCHER (1952), a French trans. of the major part of vol. 2 of *Muhammedanische Studien,* 2 vol. (1888–90, Eng. trans. by C.R. BARBER and S.M. STERN, *Muslim Studies,* ed. by S.M. STERN, 1967–71), a classic work on the early development of Ḥadīth, reflecting the early history of religious ideas in Islām; MAULANA MUHAMMAD ALI, *A Manual of Hadith* (1944), a general selection, mainly from al-Bukhārī, in Arabic and English; A.J. WENSINCK, *A Handbook of Early Muhammadan Tradition* (1927, reprinted 1971), an alphabetical arrangement by a great Dutch scholar; MUHAMMAD Z. SIDDIQI, *Ḥādīth Literature: Its Origin, Development, Special Features and Criticism* (1961), an Asian Muslim's presentation.

Theology and philosophy. FRANZ ROSENTHAL (ed.), *The Classical Heritage in Islam,* trans. from the German by EMILE MARMORSTEIN and JENNY MARMORSTEIN (1975), and RICHARD WALZER, *Greek into Arabic: Essays on Islamic Philosophy* (1962, reissued 1970), deal with the Greek and Hellenistic background and its appropriation. PARVIZ MOREWEDGE (ed.), *Islamic Philosophical Theology* (1979), is a major contribution by nine internationally known authorities written for advanced students; W. MONTGOMERY WATT, *The Formative Period of Islamic Thought* (1973), is a study of the evolution of theological thought in the 300 years after Muḥammad's death, and his *Free Will and Predestination in Early Islam* (1948, reissued 1972), is an excellent treatment of the formative period of Islāmic theology; ASAF A.A. FYZEE (ed. and trans.), . . . *a Shīʿite Creed* (1942), is an annotated translation of a standard Shīʿite creed by Ibn Bābawayh; LOUIS GARDET and M.-M. ANAWATI, *Introduction à la théologie musulmane,* 2nd ed. (1970), is a comprehensive handbook on Sunnī theology; and A.J. WENSINCK, *The Muslim Creed* (1932, reprinted 1965), discusses the background and development of Sunnī doctrines. The theology of the Shīʿah is given a prominent place in HENRY CORBIN, *Histoire de la philosophie islamique* (1964–); and its early development is discussed by WILFERD MADELUNG in both *Der Imam al-Qāsim ibn Ibrāhīm und die Glaubenslehre der Zaiditen* (1965), and "Imamism and Muʿtazilite Theology," in *Le Shīʿisme imâmite,* pp. 13–30 (1970). M.M. SHARIF (ed.), *A History of Muslim Philosophy,* 2 vol. (1963–66), is a comprehensive collective work on the history of Islāmic philosophy and related subjects; it is especially useful for the later medieval and modern periods. MAJID FAKHRY, *A History of Islamic Philosophy* (1970), is a general history. FAZLUR RAHMAN discusses the development of the later synthesis between mysticism and philosophy in "Dream, Imagination and ʿĀlam al-Mithāl," *Islamic Studies,* vol. 3, no. 2, pp. 167–180 (June 1964) in the introduction to *Selected Letters of Shaikh Aḥmad Sirhindī* (1968), and in "The Eternity of the World and the Heavenly Bodies in Post-Avicennan Philosophy," in GEORGE F. HOURANI (ed.), *Essays on Islamic Philosophy and Science* (1975), a collection representing recent trends in interpreting Islāmic philosophy.

Islāmic mysticism. *Introductory works:* ARTHUR H. PALMER (comp.), *Oriental Mysticism: A Treatise on Sufiistic and Unitarian Theosophy of the Persians,* 2nd ed. by ARTHUR J. ARBERRY (1938, reprinted 1974), an exposition of later mystical ideas; ANNEMARIE SCHIMMEL, *Mystical Dimensions of Islam* (1975), a multifaceted, introductory study of Ṣūfism; REYNOLD A. NICHOLSON, *The Mystics of Islam* (1914, reprinted 1975), a very readable introduction to classical Ṣūfism and Ṣūfī poetry; ARTHUR J. ARBERRY, *Sufism: An Account of the Mystics of Islam* (1950), a historical survey of classical Ṣūfism; G.-C. ANAWATI and LOUIS GARDET, *Mystique musulmane,* 3rd ed. (1976), an excellent study of the major trends and leading personalities in classical Ṣūfism; ROBERT C. ZAEHNER, *Hindu and Muslim Mysticism* (1960, reissued 1969), a thought-provoking study of the possible relations between Indian and early Muslim mysticism.

History: MARGARET SMITH, *Rābi'a the Mystic & Her Fellow-Saints in Islam: Being the Life and Teachings of Rābi'a al-'Adawiyya al-Qaysiyya of Basra, Together with Some Account of the Place of the Women Saints in Islam* (1928, reprinted 1977), the first study of the herald of mystical love in Islām; JOSEPH VAN ESS, *Die Gedankenwelt des Ḥārit al-Muḥāsibī anhand von übersetzungen aus seinen Schriften dargestellt und erläutert* (1961), an excellent introduction to the theology and psychology of early mystical thought in Islām; LOUIS MASSIGNON, *La Passion de Husayn ibn Mansûr Hallâj: martyr mystique de l'Islam,* new ed. 4 vol. (1975), an indispensable source book for the history of Ṣūfism in the classical period; ANNEMARIE SCHIMMEL, *Al-Halladsch, Märtyrer der Gottesliebe* (1968), a German translation of parts of Ḥallāj's poetry and prose, and a study of his influence on the literatures of the different Islāmic peoples; SERGE DE LAUGIER DE BEAURECUEIL, *Khwādja 'Abdullāh Anṣārī (396–481 H./1006–1089): Mystique Hanbalite* (1965), a biography of the author of the beautiful Persian *munājāt* (prayers) and other mystical books; A.J. WENSINCK, *La Pensée de Ghazzālī* (1940), a short and reliable introduction to Ghazālī's thought; JOHN A. SUBHAN, *Sufism: Its Saints and Shrines* (1938, reissued 1978), a useful survey of the later development of Islāmic mysticism.

Ṣūfī literature: HELMUT RITTER, *Das Meer der Seele* (1955, reissued 1978), an exhaustive work on Farīd ud-Dīn 'Aṭṭār's thought as reflected in his mystical poetry; JALĀLU'DDIN RŪMĪ, *The Mathnawí,* ed. with critical notes, translation, and commentary by REYNOLD A. NICHOLSON, 8 vol. (1925–40), the encyclopaedia of mystical thought in the 13th century in masterly translation; H.T. SORLEY, *Shah Abdul Latīf of Bhit* (1940; reprinted 1966), a study of the greatest mystical poet of Sind.

Ṣūfī thought and practice: BENEDIKT REINERT, *Die Lehre vom Tawakkul in der klassischen Sufik* (1968), the first fundamental study of a single concept central to early Islāmic mysticism, built upon a critical analysis of all available sources; ARTHUR J. ARBERRY, *The Doctrine of the Ṣūfīs* (1935, reprinted 1977), a useful translation of Kalābādhi's *Kitāb at-ta'arruf,* one of the early treatises on Ṣūfī thought; *The Kashf al-Maḥjub: The Oldest Persian Treatise on Sufism* by ALI BIN UTHMAN al-HUJWIRI, trans. by REYNOLD A. NICHOLSON (1911, reprinted 1976), a masterly translation of the voluminous 11th-century account of Ṣūfī thought; G.-H. BOUSQUET (ed.), *Ih'yâ 'ouloûm ed-dîn; ou Vivification des sciences de la foi* (1955), an analytical index of the most widely read work on moderate mystical thought, prepared with the assistance of numerous scholars; CONSTANCE E. PADWICK, *Muslim Devotions* (1961), the only account of the popular mystically tinged piety of the Muslims as reflected in their prayer books; LALEH BAKHTIAR, *Sufi: Expressions of the Mystic Quest* (1976), discusses and shows through illustrations the Ṣūfī experience and its expression in the arts.

Theosophical Ṣūfism: A.E. AFFIFI, *The Mystical Philosophy of Muhyid Dín-Ibnul 'Arabí* (1939, reissued 1974), the first attempt, in a Western language, to systematize the pantheistic system of the 13th-century theosophist; HENRY CORBIN, *Creative Imagination in the Sūfism of Ibn 'Arabī,* trans. by RALPH MANHEIM (1970); REYNOLD A. NICHOLSON, *Studies in Islamic Mysticism* (1921, reissued 1978), a study of Abū Sa'īd and a discussion of Jīlī's Perfect Man and of Ibn al-Fāriḍ, with a superb translation of most of his odes.

Ṣūfī orders: OCTAVE DEPONT and XAVIER CAPPOLANI, *Les Confréries religieuses musulmanes* (1897), a comprehensive account of Ṣūfī brotherhoods; HANS J. KISSLING, "Die Wunder der Derwische," ZDMG (*Zeitschrift der deutschen morgenländischen Gesellschaft),* vol. 107, no. 2, pp. 348–361 (August 1957), a fully documented account of the kinds of miracles performed by dervishes; KHALIQ A. NIZAMI, *The Life and Times of Shaikh Faridud-din Ganj-i-Shakar* (1955, reprinted 1973), a good survey of the life of one of the leading Chishtī saints in India; RENÉ BRUNEL, *Le Monachisme errant dans l'Islam: Sīdi Heddi et les Heddāwa* (1955), a penetrating study of a little known fraternity of dervishes in North Africa; JAMIL M. ABUN-NASR, *The Tijaniyya: A Sufi Order in the Modern World* (1965), a study of the development of political activities of this 19th-century order in the northern and western parts of Africa; J. SPENCER TRIMINGHAM, *The Sufi Orders in Islam* (1971), the first attempt to give a survey of all orders in Islām, and, as such, quite useful.

Islāmic law. A general survey of the Islāmic legal system, covering its historical development, jurisprudential theory, and the most important spheres of the substantive law, is contained in JOSEPH SCHACHT, *An Introduction to Islamic Law* (1964); JAMES N.D. ANDERSON, *Islamic Law in the Modern World* (1959, reprinted 1975); and NOEL J. COULSON, *History of Islamic Law* (1964, reprinted 1971). The reader is referred to the bibliographies of these books, particularly for the numerous articles written by James N.D. Anderson on developments in the law. JOSEPH SCHACHT, *Origins of Muhammadan Jurisprudence* (1950, reissued with corrections and additions, 1967), is a fundamental work of modern research on the early development of legal theory written by the pioneer scholar of this subject. A sound analysis of traditional legal theory is presented in ABDUR RAHIM, *Muhammadan Jurisprudence* (1911, reprinted 1981); and in *The Philosophy of Jurisprudence in Islam,* (1961), an Eng. trans. by FARMAT J. ZIADEH of the Arabic text of an outstanding Muslim jurist, Subhi Mahmassani. MAJID KHADDURI and HERBERT J. LIEBESNY (eds.), *Law in the Middle East* (1955), includes chapters by Muslim scholars and Western Orientalists on the various spheres of substantive Islāmic law, traditional and modern. ASAF A.A. FYZEE, *Outlines of Muhammadan Law,* 4th ed. (1974), is a standard text dealing with Islāmic law as it is applied in India and Pakistan. NORMAN ANDERSON, *Law Reform in the Muslim World* (1976), is a comparative study of the history, philosophy, and achievements of legal reform. *The Encyclopaedia of Islam* (1913–42; new ed., 1960–), contains numerous articles on individual legal topics.

Islāmic myth and legend. TOR ANDRAE, *Die Person Muhammeds in Lehre und Glauben seiner Gemeinde* (1917), on the development of Muḥammad-mysticism; ISRAEL FRIEDLÄNDER, *Die Chadhirlegende und der Alexander-Roman* (1913), on the relation between the Alexander romance and the figure of Khiḍr; MAX J.H. HORTEN, *Die religiöse Gedankenwelt der gebildeten Muslime in heutigen Islam* (1916), an account of popular Islām, and *Die religiöse Gedankenwelt des Volkes im heutigen Islam,* 2 pt. (1917–18), an account of the ideas of educated people in Islām; A.J. WENSINCK, "The Ocean in the Literature of the Western Semites," *Verhandelingen der Koninklijke Akademie van Wetenschappen,* vol. 19, no. 2 (1918), and "The Ideas of the Western Semites Concerning the Navel of the Earth," *ibid.,* vol. 17, no. 1 (1916); SEYYED H. NASR, *Three Muslim Sages* (1964, reissued 1976), an account of the theories of Suhrawardī al-Maqtūl and Ibn 'Arabī; JOSEPH HOROWITZ, "The Growth of the Mohammed Legend," *Moslem World,* vol. 10, no. 1, pp. 49–58 (January 1920), stresses the haggadic influences; WALTHER EICKMANN, *Angelologie und Dämonologie des Korans . . .* (1908), a study of the Qur'ānic concepts of angels and demons; ERNST A. ZBINDEN, *Die Djinn des Islam und der altorientalische Geisterglaube* (1953), a study of the different types of spirits in Islāmic folklore and tradition; RUDOLF KRISS and HUBERT KRISS-HEINRICH, *Volksglaube im Bereich des Islam,* 2 vol. (1960–62), useful studies in Islāmic folklore, with extensive bibliographies; TAUFIC CANAAN, *Mohammedan Saints and Sanctuaries in Palestine* (1927), on Palestinian folklore; articles in the *Shorter Encyclopaedia of Islam* (1953), an authoritative collection of information, each article furnished with an extensive bibliography.

Islāmic Arts

The vast populations of the Middle East and elsewhere that adopted the Islāmic faith from the 7th century onward have created such an immense variety of literatures, performing arts, visual arts, and music that it virtually defies any comprehensive definition. In the narrowest sense, the arts of the Islāmic peoples might be said to include only those arising directly from the practice of Islām; more commonly, however, the term is extended to include all of the arts produced by Muslim peoples, whether connected with their religion or not. In this article, the subject includes the arts created in pre-Islāmic times by Arabs and other peoples in Asia Minor and North Africa who eventually adopted the Islāmic faith. On the other hand, arts produced in cultural areas that were only partially Muslim, such as South Asia, Southeast Asia, and Central Asia, are discussed primarily in articles on arts of those regions.

This article is divided into the following sections:

General considerations

It is difficult to establish a common denominator for all of the artistic expressions of the Islāmic peoples. Such a common denominator would have to be meaningful for miniature painting and historiography, for a musical mode and the form of a poem. The relationship between the art of the Islāmic peoples and its religious basis is anything but direct.

The prohibition on representation

Like most prophetic religions, Islām is not conducive to fine arts. Representation of living beings is prohibited—not in the Qurʾān but in the prophetic tradition. Thus, the centre of the Islāmic artistic tradition lies in calligraphy, a distinguishing feature of this culture, in which the word as the medium of divine revelation plays such an important role. Representational art was found, however, in some early palaces and "at the doors of the bathhouses," according to later Persian poetry. After the 13th century a highly refined art of miniature developed, primarily in the non-Arab countries; it dwells, however, only rarely upon religious subjects. The typical expression of Muslim art is the arabesque, both in its geometric and in its vegetabilic form—one leaf, one flower growing out of the other, without beginning and end and capable of almost innumerable variations—only gradually detected by the eye—which never lose their charm. An aversion to empty spaces distinguishes that art; neither the tile-covered walls of a mosque nor the rich imagery of a poem allows an unembellished area; and the decoration of a carpet can be extended almost without limit.

The centre of Islāmic religion is the clean place for prayer, enlarged into the mosque, which comprises the community and all its needs. The essential structure is similar throughout the Muslim world. There are, of course, period and regional differences—large, wide court mosques of early times; court mosques, with big halls, of Iran and adjacent countries; central buildings with the wonderfully shaped domes of the Ottoman Empire. The implements, however, are the same: a niche (*miḥrāb*)—pointing to Mecca—made of wood, marble, mosaic, stone, tiles; a small pulpit for the Friday sermon; minarets, locally differently shaped but always rising like the call to prayer that is uttered from their tops; the wooden carved stands for the Qur'ān, which is to be written in the most perfect form; sometimes highly artistic lamps (made in Syria and proverbially mentioned all over the Muslim world); perhaps bronze candlesticks, with inlaid ornaments; and rich variations of the prayer mats. If any decoration was needed, it was the words of God, beautifully written or carved in the walls or around the domes. At first connected with the mosques and later independent of them are schools, mausoleums, rooms for the students, and cells for the religious masters.

The poetry of the Arabs consisted in the beginning of praise and satirical poems thought to be full of magic qualities. The strict rules of the outward form of the poems (monorhyme, complicated metre) even in pre-Islāmic times led to a certain formalism and encouraged imitation. Goethe's statement that the stories of *The Thousand and One Nights* have no goal in themselves shows his understanding of the character of Arabic belles lettres, contrasting them with the Islāmic religion, which aims at "collecting and uniting people in order to achieve one high goal." Poets, on the other hand, rove around without any ethical purpose, according to the Qur'ān. For many pious Muslims, poetry was something suspect, opposed to the divine law, especially since it sang mostly of forbidden wine and of free love. The combination of music and poetry, as practiced in court circles and among the mystics, has always aroused the wrath of the lawyer divines who wielded so much authority in Islāmic communities. This opposition may partly explain why Islāmic poetry and fine arts took refuge in a kind of unreal world, using fixed images that could be correctly interpreted only by those who were knowledgeable in the art.

The ambiguity of Persian poetry, which oscillates between the worldly, the divine, and often the political level, is typical of Islāmic writings. Especially in Iran and the countries under its cultural influence, this kind of poetry formed the most important part of literature. Epic poetry of all kinds developed exclusively outside the Arabic-speaking countries; Western readers look in vain for an epical structure in such long poems (as in the case of the prose-romances of the Arabs) and find, instead, a rather aimless representation of facts and fictions. A similar characteristic even conditions innumerable historical works in Arabic, Persian, and Turkish, which, especially in classical times, contain much valuable information, put together without being shaped into a real work of art; only rarely does the historian or philosopher reach a comprehensive view. The first attempt at a philosophy of history, Ibn Khaldūn's *Muqaddimah,* in the 14th century, was rarely studied by his Arab compatriots.

The accumulation of large amounts of material, which is carefully organized up to the present, seems typical of all branches of Islāmic scholarship, from theology to natural sciences. There are many minute observations and descriptions but rarely a full view of the whole process. Later, especially in the Persian, Turkish, and Indo-Muslim areas, a tendency to overstress the decorative elements of prose is evident; and the contents even of official chronicles are hidden behind a network of rhymed prose, which is difficult to disentangle.

The characteristic lack of structure

This tendency is illustrated in all branches of Islāmic art: the lack of "architectural" formation. Instead, there is a kind of carpet-like pattern; the Arabic and Persian poem is, in general, judged not as a closed unity but rather according to the perfection of its individual verses. Its main object is not to convey a deep personal feeling but to perfect to the utmost the traditional rules and inherited metaphors, to which a new image may sometimes be added; thus the personality of the poet becomes visible only through the minimal changes of expression and rhythm and the application of certain preferred metaphors, just as the personality of the miniature painter can be detected by a careful observation of details, of his way of colouring a rock or deepening the shade of a turban. The same holds true for the arabesques, which were developed according to a strict ritual to a mathematical pattern and were refined until they reached a perfection of geometrical complicated figures, as in the dome of the Karatay Medrese in Konya (1251); it corresponds both to the most intricate lacelike Kūfic inscriptions around this dome and to the poetical style of Jalāl ad-Dīn ar-Rūmī, who wrote in that very place and during those years. His immortal mystical poems comprise thousands of variations on the central theme of love. Although such a perfect congruency of poetry and fine arts is not frequently found, the precept about Persian art that "its wings are too heavy with beauty" can also be applied to Persian poetry. Thus, the tile work of a Persian mosque, which combines different levels of arabesque work with different styles of writing, is reminiscent of the way Persian poetry combines at least two levels of reality. And a perfect harmony is reached in some of the miniature manuscripts of Iran, Muslim India, or Ottoman Turkey, which, in their lucid colours and fine details of execution, recall both the perfection of the calligraphy that surrounds them on delicate paper and the subtlety of the stories or poems that they accompany or illustrate.

Those accustomed to the Western ideals of plasticity or form in the fine arts and literature or to the polyphonic interweaving of melodic lines in music have some difficulties in appreciating this art. The palaces seem to be without a fixed architectural plan; rooms and gardens are simply laid out according to daily needs. The historian offers an astounding amount of detailed reports and facts but with no unifying concept. The Muslim writer prefers this carpet-like form; he adds colour to colour, motif to motif, so that the reader only understands the meaning and end of the whole web from a certain distance. Music, differentiated as it may be in the countries between Morocco and India, follows the same model: variations of highest subtlety on a comparatively simple given subject or theme.

Man, a puppet; God, the only actor

Drama and opera in the Western sense did not develop in the Islāmic countries until the 19th century; and the art of the novel is a very recent development. There was no reason for drama: in the Muslim perception God is the only actor who can do whatever he pleases, whose will is inscrutable. Man is, at best, a puppet on a string, behind whose movement those with insight detect the hand of the play master; neither is the problem of personal guilt and absolution posed as it is in the West, nor is a catharsis, or purging of emotion, needed through drama. The atomist theory, widely accepted in Islām since the 10th century, leaves no room for a "dramatic" movement; it teaches that God creates everything anew in every moment, and what is called a "law of nature" is nothing but God's custom, which he can interrupt whenever he pleases.

It is true that certain other forms are found in the more folkloristic arts of Islām. Every region has produced poetry, in regional languages, that is more lively and more realistic than the classical court poetry; but such poetry tends to become restricted to certain fixed forms that can be easily imitated. Attempts at drama in Islām come from these more popular spheres in Iran (and, rarely, in Lebanon and Iraq), where the tragic events of the murder of Ḥusayn (680) at Karbalā' were dramatized in strange forms, using the vocabulary of traditional Persian poetry and theology. Thus, strangely hybrid forms emerge in the Islāmic arts, highly interesting for the historian of religion and the student of literature but not typical of the classical Islāmic ideals. Popular illustrations of tales and legends and those of some of the Shī'ah heroes are similarly interesting but atypical. In modern times, of course, there have been imitations of all forms of Western literary and visual arts: paintings in the Impressionist or Cubist style, the use of free verse instead of the stern classical forms; and novels, dramas, motion pictures, and music combining Western and Eastern modes. Belief in the Qur'ānic dictum "Whatever is on earth will perish save His face" discouraged artistic endeavour on a large scale; but the Prophetic tradition "Verily God is beautiful and loves beauty" has inspired numberless artists and artisans, writers and poets, musicians, and mystics to develop their arts and crafts as a reflection of that divine beauty. A theory of aesthetics comprising the various artistic expressions of the Muslim peoples has yet to be written. Although there have been a number of studies in literary criticism, the formal indebtedness of some of the best modern poets and painters to the Islāmic heritage has never been studied in full.

It is notable that the arts of the Islāmic peoples have had relatively little impact on other cultures, certainly far less than their artistic merit would appear to warrant.

Islāmic art in the West

Europe has known art objects of Islāmic origin since the early Middle Ages, when they were brought home by the crusaders or manufactured by the Arabs in Sicily and Spain. Much admired and even imitated, they formed part of the material culture in those times, so much so that even the coronation robes of the German emperor were decorated with an Arabic inscription. At the same time, Islāmic motives wandered into the belles lettres of Europe, and Islāmic scientific books formed a basis for the development of Western science. Islāmic culture as such, however, was rather an object of hatred than of admiration; a more objective appreciation of both the works of art and of literature did not start until the mid-17th century, when travelers told of the magnificent buildings in Iran and Mughal India, and the first works from Persian literature were translated, influencing German classical literature. Indian miniatures inspired Rembrandt, just as European paintings were imitated by Islāmic, especially Mughal, artists. Persian carpets were among the most coveted gifts for princes and princesses.

A bias against the cultures of the East persisted, however, until after the 18th-century Age of Enlightenment; the indefatigable work of the British scholars at Fort William at Calcutta brought new literary treasures to Europe, where they were studied carefully by specialists in the emerging field of Islāmic studies. Poets such as Goethe in Germany in the early 19th century paved the way for a deeper understanding of Islāmic poetry. Islāmic literatures, however, continue to be known to the larger Western public almost exclusively by *The Thousand and One Nights,* or *The Arabian Nights' Entertainment* (translated first in the early 18th century), Omar Khayyam's *robāʿīyāt,* and the lyrics of Ḥāfeẓ. Even experts who are aware of the immense wealth of the literatures in the different Islāmic languages (such as Arabic, Persian, Turkish, and Urdu) until now have rarely appreciated the literatures from an aesthetic viewpoint; rather, they have used them as a source for lexicography and for philological and historical research. The situation in Islāmic fine arts and architecture is similar. Although the beauty of the Alhambra, for example, had already inspired European scholars and artists in the early 19th century, a thorough study of Islāmic art as an independent field began only in the 20th century. There was even less interest in the music of Islāmic peoples, the arabesque-like uniformity of which seems strange to Western ideals of harmony.

Islāmic literatures

NATURE AND SCOPE

It would be almost impossible to make an exhaustive survey of Islāmic literatures. There are so many works, of which hundreds of thousands are available only in manuscript, that even a very large team of scholars could scarcely master a single branch of the subject. Islāmic literatures, moreover, exist over a vast geographical and linguistic area, for they were produced wherever the Muslims went, pushing out from their heartland in Arabia through the countries of the Near and Middle East as far as Spain, North Africa, and, eventually, West Africa. Iran (Persia) is a major centre of Islām, along with the neighbouring areas that came under Persian influence, including Turkey and the Turkic-speaking peoples of Central Asia. Many Indian vernaculars contain almost exclusively Islāmic literary subjects; there is an Islāmic content in the literature of Malaysia and in that of some East African languages, including Swahili. In many cases, however, the Islāmic content proper is restricted to religious works—mystical treatises, books on Islāmic law and its implementation, historical works praising the heroic deeds and miraculous adventures of earlier Muslim rulers and saints, or devotional works in honour of the prophet Muḥammad.

The vast majority of Arabic writings are scholarly—the same, indeed, is true of the other languages under discussion. There are superb, historically important translations made by medieval scholars from Greek into Arabic; historical works, both general and particular; a range of religiously inspired works; books on grammar and on stylistics, on ethics and on philosophy. All have helped to shape the spirit of Islāmic literature in general, and it is often difficult to draw a line between such works of "scholarship" and works of "literature" in the narrower sense of that term. Even a strictly theological commentary can bring about a deeper understanding of some problem of aesthetics. A work of history composed in florid and "artistic" language would certainly be regarded by its author as a work of art as well as of scholarship, whereas the grammarian would be equally sure that his keen insights into the structure of Arabic grammar were of the utmost importance in preserving that literary beauty in which Arabs and non-Arabs alike took pride.

Pride in literary beauty

In this treatment of Islāmic literatures, however, the definition of "literature" is restricted to poetry and belles lettres, whether popular or courtly in inspiration. Other categories of writing will be dealt with briefly if these shed light on some peculiar problem of literature.

The range of Islāmic literatures. Although Islāmic literatures appear in such a wide range of languages and in so many different cultural environments, their unity

> is safeguarded by the identity of the basic existential experience, by the identity of the fundamental intellectual interests, by the authoritativeness of certain principles of form and presentation, not to mention the kindred political and social organization within which those peoples aspire to live.

Arabic: language of the Qurʾān. The area of Islāmic culture extends from western Africa to Malaysia, Indonesia, and the Philippines; but its heartland is Arabia, and the prime importance and special authority of the Arabic language was to remain largely unquestioned after the spread of Islām. The Arabic poetry of pre-Islāmic Arabia was regarded for centuries afterward as the standard model for all Islāmic poetic achievement, and it directly influenced literary forms in many non-Arab literatures. The Qurʾān, Islām's sacred scripture, was accepted by pious Muslims as God's uncreated word and was considered to be the highest manifestation of literary beauty. A whole literature defended its inimitability (*iʿjāz*) and unsurpassable beauty. Because it was God's own word, the Qurʾān could not legitimately be translated into any other language; the study of at least some Arabic was therefore required of every Muslim. Arabic script was used by all those peoples who followed Islām, however much their own languages might differ in structure from Arabic. The Qurʾān became the textbook of the Muslims' entire philosophy of life; theology, lexicography, geography, historiography, and mysticism all grew out of a deep study of its form and content; and even in the most secular works there can be found allusions to the holy book. Its imagery not unexpectedly permeates all Islāmic poetry and prose.

Allusions to the Qurʾān in all literary genres

Between the coming of Islām in the 7th century and the 11th, a great deal of poetry and prose in Arabic was produced. One branch of literature in Spain and North Africa matured in perfect harmony with the classical ideals of the Muslim East although its masters, during the 11th and 12th centuries, invented a few strophic forms unknown to classical Arabic poetry. In modern times, North African Muslim literature—mainly from Algeria and Morocco—often uses French as a means of expression, since the tradition of Arabic writing was interrupted by the French occupation in the 19th century and has had to be built up afresh.

Persian. In 641 the Muslims entered Iran, and Persian influence on literary taste becomes apparent in Arabic literature from the mid-8th century onward. Many stories and tales were transmitted from, or through, Iran to the Arab world and often from there to western Europe. Soon Iran could boast a large literature in its own tongue. Persian literature was more varied in its forms and content than that written in classical Arabic. Although Persian adopted many of the formal rules of the Arabic language (including prosody and rhyme patterns), new genres, including epic poetry, were introduced from Iran. The lyric, elegant and supple, also reached its finest expression in the Persian language.

South Asian. Persian culture was by no means restricted to Iran itself. Northwestern India and what is now Pakistan became a centre of Islāmic literature as early as the 11th century, with Delhi and Agra being of special importance. It was to remain a stronghold of Muslim cultural life, which soon also extended to the east (Bengal) and south (Deccan). Persian remained the official language of Muslim India until 1835, and not only its poetry but even its historiography was written in the high-flown manner that exemplified the Persian concept of fine style. Muslim India can further boast a fine heritage of Arabic poetry and prose (theological, philosophical, and mystical works).

At various times in its history the Indian subcontinent was ruled by princes of Turkish origin (indeed, the words *Turk* and *Muslim* became synonymous in some Indian languages). The princes surrounded themselves with a military aristocracy of mainly Turkish extraction, and thus a few poetical and prose works in Turkish were written at some Indian courts. In various regions of the subcontinent an extremely pleasing folk literature has flourished throughout the ages: Sindhi in the lower Indus Valley, for example, and Punjabi in the Punjab are languages rich in an emotional poetry that uses popular metres and forms. At the Indo-Iranian border the oldest fragments of the powerful Pashto poetry date from the Middle Ages. The neighbouring Baluchi poetry consists largely of ballads and religious folksongs. All the peoples in this area have interpreted Islāmic mysticism in their own simple, touching imagery. In the east of the subcontinent, Bengali Muslims possess a large Islāmic literary heritage, including religious epics from the 14th and 15th centuries and some lovely religious folksongs. The achievements of modern novelists and lyric poets from Bangladesh are impressive. To the north, where Islām came in the 14th century, a number of classical themes in Islāmic lore were elaborated in Kashmiri lyric and epic poetry. To the south, an occasional piece of Islāmic religious poetry can be found even in Tamil and Malayalam. Some fine Muslim short stories have been produced in modern Malayalam.

Islāmic mystical thought in folk literature

Urdu, now the chief literary language of Muslim India and Pakistan, borrowed heavily from Persian literature during its classical period in the 18th century. In many writings only the verbs are in Urdu, the rest consisting of Persian constructions and vocabulary; and the themes of traditional Urdu literature were often adapted from Persian. Modern Urdu prose, however, has freed itself almost completely from the past, whereas in poetry promising steps have been taken toward modernization of both forms and content (see SOUTH ASIAN ARTS).

Turkish. An elaborate "classical" style developed in Turkish after the 14th century, reaching its peak in the 17th. Like classical Urdu, it was heavily influenced by Persian in metrics and vocabulary. Many exponents of this "high" style came from the Balkan provinces of the Ottoman Empire. On the other hand, a rich and moving folk poetry in popular syllable-counting metres has always flourished among the Turkish population of Anatolia and Rumelia. The mystical songs of their poet Yunus Emre (died *c.* 1321) contributed greatly toward shaping this body of literature, which was preserved in the religious centres of the Ṣūfī orders of Islām. From this folk tradition, as well as from Western literature, modern Turkish literature has derived a great deal of its inspiration.

Turkic languages. A great deal of the Muslim literature of Central Asia is written in Turkic languages, which include Uzbek, Tatar, and Kirgiz. Its main cultural centres (Samarkand, Bukhara, Fergana) became part of the Muslim empire after 711. Central Asia was an important centre of Islāmic learning until the Tsarist invasions in the 1870s, and the peoples of this region have produced a classical literature in Arabic. Many of the most famous Arabic and Persian scholars and poets writing in the heyday of Muslim influence were Central Asians by birth. Central Asians also possess a considerable literature of their own, consisting in large part of epics, folktales, and mystical "words of wisdom." The rules of prosody which hold for Arabic and Persian languages have been deliberately imposed on the Turkic languages on several occasions, notably by ʿAlī Shīr Navāʾī (died 1501), a master of Chagatai poetry and prose in Herāt, and by Bābur (died 1530), the first Mughal emperor in India. Tadzhik literature is basically Persian, both as it is written today in the Tadzhik Soviet Socialist Republic and as it existed in earlier forms, when it was indistinguishable from classical Persian. After the Russification of the country, and especially after the 1917 Revolution, a new literature emerged that is part and parcel of the Soviet Union's literature. The same can be said, by and large, about the literatures of other Muslim Turkic peoples of Central Asia.

Other languages. Smaller fragments of Islāmic literature, in Chinese, are found in China (which has quite a large Muslim population) and in the Philippines. The literary traditions of Indonesia and of Malaysia, where the religion of Islām arrived long ago, are also worth noting. Historical and semimythical tales about Islāmic heroes are a feature of the literature in these areas, a fact of immense interest to folklorists.

Contact with Islām and its "written" culture also helped to preserve national idioms in many regions. Often such idioms were enriched by Arabic vocabulary and Islāmic concepts. The leaders of the Muslims in such areas in northern Nigeria, for example, preferred to write poetry and chronicles in Arabic, while using their mother tongue for more popular forms of literature (see AFRICAN ARTS). Of particular interest in this connection is Kurdish literature, which has preserved in an Iranian language several important, popular heterodox texts and epics.

Islāmic literatures and the West. Small fragments of Arabic literature have long been known in the West. There were cultural interrelations between Muslim Spain (which, like the Indus Valley, became part of the Muslim empire after 711) and its Christian neighbours, and this meant that many philosophical and scientific works filtered through to western Europe. It is also likely that the poetry of Muslim Spain influenced the growth of certain forms of Spanish and French troubadour poetry and provided an element, however distorted, for medieval Western romances and heroic tales.

First Western studies

Investigation of Oriental literatures by Western scholars did not begin until the 16th century in the Netherlands and England. First attempts toward an aesthetic understanding of Arabic and Persian poetry came even later: they were made by the British Orientalists of Fort William, Calcutta, and by German pre-Romantics of the late 18th century. In the first half of the 19th century the publication of numerous translations of Oriental poetry, especially into German, began to interest some Europeans. The poetical translations from Arabic, Persian, and Sanskrit made by the German Orientalist and poet Friedrich Rückert can scarcely be surpassed, either in accuracy or in poetical mastery. The Persian poet Ḥāfeẓ became well known in German-speaking countries, thanks to Johann Wolfgang von Goethe's enchanting poems, *West-östlicher Divan* (1819), a collection which was the first response to Persian poetry and the first aesthetic appreciation of the character of Oriental poetry by an acknowledged giant of European literature. An "Orientalizing style," which employed Arabo-Persian literary forms such as the *ghazal* (a short, graceful poem with monorhyme), became fashionable at times in Germany. Later, Edward FitzGerald aroused new interest in Persian poetry with his free adaptations of Omar Khayyam's *robāʿīyāt* (*The Rubáiyát of Omar Khayyám,* 1859). The fairy tales known as *The Thousand and One Nights,* first translated in 1704, provided abundant raw material for many a Western writer's play, novel, story, or poem about the Islāmic East.

EXTERNAL CHARACTERISTICS

In order to understand and enjoy Oriental literature, the external characteristics of it have to be studied most carefully. The literatures of the Islāmic peoples are "intellectual"; in neither poetry nor prose are there many examples of subjective lyricism, as it is understood in the West. The principal genres, forms, and rules were inherited from pre-Islāmic Arabic poetry but were substantially elaborated afterward, especially by the Persians.

Rhyme and metre. Arabic poetry is built upon the principle of monorhyme, and the single rhyme, usually consisting in one letter, is employed throughout every poem, long or short. The structure of Arabic permits such monorhymes to be achieved with comparative ease. The Persians and their imitators often extended the rhyming part over two or more syllables (*radīf*) or groups of words, which are repeated after the dominant rhyming consonant. The metres are quantitative, counting long and short syllables (*ʿarūḍ*). Classical Arabic has 16 basic metres in five groupings; they can undergo certain variations, but the poet is not allowed to change the metre in the course of his poem. Syllable-counting metres, as well as strophic forms, are used in popular, or "low," poetry; only in post-classical Arabic were some strophic forms introduced into "high" poetry. Many modern Islāmic poets, from Pakistan to Turkey and North Africa, have discarded the classical system of prosody altogether. In part they have substituted verse forms imitating Western models such as strophic poems with or without rhyme; since about 1950 free verse has almost become the rule, although a certain tendency toward rhyming or to the use of alliterative quasi-rhymes can be observed.

Genres. The chief poetic genres, as they emerged according to traditional rules, are the *qaṣīdah,* the *ghazal,* and the *qiṭʿah;* in Iran and its adjacent countries there are, further, the *robāʿī* and the *mas̄navī.*

Qaṣīdah. The *qaṣīdah* (literally "purpose poem"), a genre whose form was invented by pre-Islāmic Arabs, has from 20 to more than 100 verses and usually contains an account of the poet's journey. In the classic pattern, the parts followed a fixed sequence, beginning with a love-poem prologue (*nasīb*), followed by a description of the journey itself, and finally reaching its real goal by flattering the poet's patron, sharply attacking some adversaries of his tribe, or else indulging in measureless self-praise. Everywhere in the Muslim world the *qaṣīdah* became the characteristic form for panegyric. It could serve for religious purposes as well: solemn praise of God, eulogies of the Prophet, and songs of praise and lament for the martyr heroes of Shīʿah Islām were all expressed in this form. Later, the introductory part of the *qaṣīdah* often was taken up by a description of nature or given over to some words of wisdom; or the poet took the opportunity to demonstrate his skill in handling extravagant language and to show off his learning. Such exhibitions were made all the more difficult because, though it varied according to the rank of the person to whom it was addressed, the vocabulary of each type of *qaṣīdah* was controlled by rigid conventions. This type of poetry, however, could obviously lend itself easily to empty verbosity or to pedantry.

The love poem

Ghazal. The *ghazal* possibly originated as an independent elaboration of the *qaṣīdah*'s introductory section, and it usually embodies a love poem. Ideally, its length varies between five and 12 verses. It can be used either for religious or secular expression, the two often being blended indistinguishably. Its diction is light and graceful, its effect comparable to that of chamber music, whereas the *qaṣīdah*-writer employs, so to speak, the full orchestral resources.

Qiṭʿah. Monorhyme is used in both the *qaṣīdah* and *ghazal.* But while these two forms begin with two rhyming hemistiches (half-lines of a verse), in the *qiṭʿah* ("section") the first hemistich does not rhyme, and the effect is as though the poem had been "cut out" of a longer one (hence its name). The *qiṭʿah* is a less serious literary form that was used to deal with aspects of everyday life; it served mainly for occasional poems, satire, jokes, word games, and chronograms.

Robāʿī. The form of the *robāʿī,* which is a quatrain in fixed metre with a rhyme scheme of *a a b a,* seems to go back to pre-Islāmic Persian poetical tradition. It has supplied the Persian poets with a flexible vehicle for ingenious aphorisms and similarly concise expressions of thought for religious, erotic, or skeptical purposes. The peoples who came under Persian cultural influence happily adopted this form.

Mas̄navī. Epic poetry was unknown to the Arabs, who were averse to fiction, whether it was expressed in poetry or in prose. The development of epic poetry was thus hindered, just as was the creation of novels or short stories. Nevertheless, *mas̄navī*—which means literally "the doubled one," or rhyming couplet, and by extension a poem consisting of a series of such couplets—became a favourite poetical form of the Persians and those cultures they influenced. The *mas̄navī* enabled the poet to develop the thread of a tale through thousands of verses. Yet even in such poetry, only a restricted number of metres was employed, and no metre allowed more than 11 syllables in a hemistich. Metre and diction were prescribed in accordance with the topic; a didactic *mas̄navī* required a style and metre different from a heroic or romantic one. The *mas̄navī* usually begins with a praise of God, and this strikes the keynote of the poem.

Other poetic forms. There is a variety of other forms that are more or less restricted to folk poetry, such as the *sīḥarfī* ("golden alphabet"), in which each line or each stanza begins with succeeding letters of the Arabic alphabet. In Muslim India the *bārāmāsa* ("12 months") is a sort of lovers' calendar in which the poet, assuming the role of a young woman of longing, expresses the lover's feelings in accord with the seasons of the year. Apart from these, later writers tried to develop strophic forms. Sometimes *ghazal*s with the same metre were bound together as "stanzas" to form a longer unit through the use of a linking verse. When the linking verse was recurrent, the poem was called a *tarjīʿ-band* (literally "return-tie"); when the linking verse was varied, the poem was called a *tarkīb-band* (literally "composite-tie"). True stanzas of varying lengths were also invented. Among these, mainly in Urdu and Turkish, a six-line stanza known as *musaddas* became the form used for the *mars̄īyeh* (dirge for the martyrs of Karbalāʾ). Because it had come to be associated with lofty feeling and serious thought, *musaddas* later was used for the first reformist modern poems.

Rhyming prose

The Arabs inherited a love for rhymed prose from pre-Islāmic Arabia. Although the extent of prose literature, even in the field of belles lettres, is very large, the novel and novella were introduced only after contact with European literatures.

Maqāmah. The most typical expression of the Arabic—and Islāmic—spirit in prose is the *maqāmah* (gathering, assembly), which tells basically simple stories in an extremely and marvelously complicated style (abounding in word plays, logographs, double entendre, and the like) and which comes closest to the Western concept of the short story.

The versatility and erudition of the classical *maqāmah* authors is dazzling, but the fables and parables that, during the first centuries of Islām, had been told in a comparatively easy flowing style, later became subject to a growing trend toward artificiality, as did almost every other literary genre, including expository prose. Persian historiographers and Turkish biographers, Indo-Muslim writers on mysticism and even on science all indulged in a style in which rhyme and rhetoric often completely obscured the meaning. It is only since the late 19th century that a matter-of-fact style has slowly become acceptable in literary circles; the influence of translations from European languages, the role of journalism, and the growing pride in a pure language freed from the cobwebs of the past worked together to make Islāmic languages more pliable and less artificial.

Imagery. In all forms of poetry and in most types of prose, writers shared a common fund of imagery that was gradually refined and enlarged in the course of time. The main source of imagery was the Qurʾān, its figures and utterances often divested of their sacred significance. Thus, the beautiful Joseph (*sūrah* 12) is a fitting symbol for the handsome beloved; the nightingale may sing the psalms of David (*sūrah* 21:79 *a.o*); the rose sits on Solomon's wind-borne throne (*sūrah* 21:81 *a.o*), and its opening petals can be compared to Joseph's shirt rent by Potiphar's wife (*sūrah* 12:25 ff.), its scent to that of Joseph's shirt, which cured blind Jacob (*sūrah* 12:94). The tulip reminds the poet of the burning bush before which Moses stood (*sūrah* 20:9 ff.), and the coy beloved refuses the lover's demands by answering, like God to Moses, "Thou shalt not see me" (*sūrah* 7:143); but her (or his) kiss gives the dying lover new life, like the breath of Jesus (*sūrah* 3:49). Classical Persian poetry often mentions knights and kings from Iran's history alongside those from Arabic heroic tales. The cup of wine offered by the "old man of the Magians" is comparable to the miraculous cup owned by the Iranian mythical king Jamshīd or to Alexander's mirror, which showed the marvels of the world; the nightingale may sing "Zoroastrian tunes" when it contemplates the "fire temple of the rose." Central scenes from the great Persian *mas̄navīs* contributed to the imagery of later writers in Persian-, Turkish-, and Urdu-speaking areas. Social and political conditions are reflected in a favourite literary equation between the "beautiful and cruel beloved" and "the Turk": since in Iran and India the military caste was usually of Turkish origin, and since the Turk was always considered "white" and handsome, in literary imagery he stood as the "ruler of hearts." Minute arabesque-like descriptions of nature, particularly of garden scenes, are frequent: the rose and the nightingale have almost become substitutes for mythological figures. The versatile writer was expected to introduce elegant allusions to classical Arabic and Persian literature and to folklore and to know enough about astrology, alchemy, and medicine to use the relevant technical terms accurately. Images inspired by the pastimes of the grandees—chess, polo, hunting, and the like—were as necessary for a good poem as were those referring to music, painting, and calligraphy. Similarly, allusions in poetic imagery to the Arabic letters—often thought to be endowed with mystical significance or magical properties—were very common in all Islāmic literatures. The poet had to follow strict rules laid down by the masters of rhetoric, rigidly observing the harmonious selection of similes thought proper to any one given sphere (four allusions to Qur'ānic figures, for example; or three garden images all given in a single verse). The poet was expected to invent new fantastic etiologies (*ḥosn-e ta‘līl*): he had to describe natural phenomena in some elegant and surprising metaphor. Thus, "The narcissus has strewn silver in the way of the bride rose . . ." means simply "The narcissus has withered"—for when the rose (dressed in red, like an Oriental bride) appears in late spring it is time for the narcissus to shed its white petals, just as people would shed silver coins in the way of a bridal procession.

Qualities expected of the versatile writer

Skills required of the writer. The writer was also expected to use puns and to play with words of two or more meanings. He might write verses that could provide an intelligible meaning even when read backward. He had to be able to handle chronograms, codes based on the numerical values of a phrase or verse, which, when understood, gave the date of some relevant event. Later writers sometimes supplied the date of a book's compilation by hiding a chronogram in its title. A favourite device in poetry was the "question and answer" form, employed in the whole poem, or only in chosen sections.

One was expected to show his talent at both improvisation and elaboration on any theme if he wished to attract the interest of a generous patron. His poetry was judged according to the perfection of its individual verses. Only in rare cases was the poem appreciated as a whole: the lack of coherent argument, which often puzzles the Western reader in *ghazal* poetry, is in fact deliberate.

It would be idle to look for the sincere expression of personal emotion in Arabic, Turkish, or Persian poetry. The conventions are so rigid that the reader is allowed only a rare glimpse into the poet's feelings. Indeed, such feelings were put through the sieve of intellect, and personal experiences were thereby transformed into arabesque-like work of artistry, if not art. In the hands of mediocre versifiers and prose writers, however, literature became mannered and completely artificial. The reader soon tires of the constantly recurring moon faces, hyacinth curls, ruby lips, and cypress statures (that is, tall and slender). Yet the great masters of poetry and rhetoric (who all have their favourite imagery, rhymes, and rhythmical patterns) will sometimes allow the patient reader a glimpse into their hearts by a slight rhythmical change or by a new way of expressing a conventional thought.

These are, of course, quite crude generalizations. Folk poetry, for instance, has to be judged by different standards, though even here conventional forms and inherited imagery make it, on the whole, more standardized than might be wished. Only in the 20th century has a complete break with classical ideals been made—sincerity instead of monotonous imitation, political and social commitment instead of empty panegyric, realism instead of escapism: these are the characteristic features of modern literatures of the Muslim countries.

HISTORICAL DEVELOPMENTS: PRE-ISLĀMIC LITERATURE

The first known poetic compositions of the Arabs are of such perfect beauty and, at the same time, are so conventionalized, that they raise the question as to how far back an actual poetic tradition does stretch. A great number of pre-Islāmic poems, dating from the mid-6th century, were preserved by oral tradition. The seven most famous pieces are *al-Mu‘allaqāt* ("The Suspended Ones," known as *The Seven Odes*), and these are discussed more fully below. The term *mu‘allaqāt* is not fully understood: later legend asserts that the seven poems had been hung in the most important Arab religious sanctuary, the Ka‘bah in Mecca, because of their eloquence and beauty and had brought victory to their authors in the poetical contests traditionally held during the season of pilgrimage. Apart from these seven, quite a number of shorter poems were preserved by later scholars. An independent genre in pre-Islāmic poetry was the elegy, often composed by a woman, usually a deceased hero's sister. Some of these poems, especially those by the poetess al-Khansā' (died after 630) are notable for their compact expressiveness.

The first poetry

Poetry. The poet (called a *shā‘ir,* a wizard endowed with magic powers) was thought to be inspired by a spirit (*jinn, shayṭān*). The poet defended the honour of his tribe and perpetuated their deeds. Religious expression was rare in pre-Islāmic poetry. In the main it reflects the sense of fatalism that was probably needed if the harsh circumstances of Bedouin life in the desert were to be endured.

The most striking feature of pre-Islāmic poetry is the uniformity and refinement of its language. Although the various tribes, constantly feuding with one another, all spoke their own dialects, they shared a common language for poetry whether they were Bedouins or inhabitants of the small capitals of al-Ḥīrah and Ghassān (where the influence of Aramaic culture was also in evidence).

Arabic was even then a virile and expressive language, with dozens of synonyms for the horse, the camel, the lion, and so forth; and it possessed a rich stock of descriptive adjectives. Because of these features, it is difficult for foreigners and modern Arabs alike to appreciate fully the artistic qualities of early Arabic poetry. Imagery is precise, and descriptions of natural phenomena are detailed. The sense of universal applicability is lacking, however, and the comparatively simple literary techniques of simile and metaphor predominate. The imaginative power that was later to be the hallmark of Arabic poetry under Persian influence had not yet become evident.

The virility of Arabic

The strikingly rich vocabulary of classical Arabic, as well as its sophisticated structure, is matched by highly elaborate metrical schemes, based on quantity. The rhythmical structures were analyzed by the grammarian Khalīl of Basra (died *c.* 791), who distinguished 16 metres. Each was capable of variation by shortening the foot or part of it; but the basic structure was rigidly preserved. One and the same rhyme letter had to be maintained throughout the poem. (The rules of rhyming are detailed and very complicated but were followed quite strictly from the 6th to the early 20th century.)

As well as rules governing the outward form of poetry, a system of poetic imagery already existed by this early period. The sequence of a poem, moreover, followed a fixed pattern (such as that for the *qaṣīdah*). Pre-Islāmic poetry was not written down but recited; and therefore sound and rhythm played an important part in its formation, and the *rāwīs* (reciters) were equally vital to its preservation. A *rāwī* was associated with some famous bard and, having learned his master's techniques, might afterward become a poet himself. This kind of apprenticeship to a master whose poetic style was thus continued became a common practice in the Muslim world (especially in Muslim India) right up to the 19th century.

The seven authors of *The Seven Odes*

From pre-Islāmic times the seven authors of *The Seven Odes,* already described, are usually singled out for special praise. Their poems and miscellaneous verses were collected during the 8th century and ever since have been the subject of numerous commentaries in the East. They have been studied in Europe since the early 19th century.

The poet Imru' al-Qays (died *c.* AD 550), of the tribe of Kindah, was foremost both in time and in poetic merit. He was a master of love poetry; his frank descriptions of dalliance with his mistresses are considered so seductive that (as orthodox Puritanism claims) the Prophet Muḥammad called him "the leader of poets on the way to Hell." His style is supple and picturesque. It grips the attention whether his poems sing of his love adventures or describe a seemingly endless rainy night. Of all classical Arabic poets he is probably the one who appeals most to modern taste. At the other extreme stands Zuhayr, praising the chiefs of the rival tribes of ʿAbs and Dhubyān for ending a long feud. He is chiefly remembered for his serious *qaṣīdah* in which, old, wise, and experienced, he meditates upon the terrible escalation of war. Various aspects of Bedouin life, as well as the attitude of the Arabs to the rulers of the small kingdom of al-Ḥīrah on the Euphrates, are reflected in the poems of an-Nābighah adh-Dhubyānī, ʿAmr, and Ṭarafah. The boastful pride of the self-centred Arab warrior can be observed best in the poems of al-Ḥārith, who became proverbial for his arrogance. ʿAntarah, son of a black slave girl, won such fame on the battlefield and for his poetry that he later became the hero of an Arabic folk romance.

Two other masters can stand beside these seven. Exciting for their savagery and beauty are some poems by Ta'abbaṭa Sharran and Shanfarā, both outlaw warriors. Their verses reveal the wildness of Bedouin life, with its ideals of bravery, revenge, and hospitality. Ta'abbaṭa Sharran is the author of a widely translated "Song of Revenge" (for his uncle), composed in a short, sharp metre. Shanfarā's *lāmīyah* (literally "poem rhyming in l") vividly, succinctly, and with a wealth of detail tells of the experiences to be had from life in the desert. This latter poem has sometimes been considered a forgery, created by a learned grammarian. The suggestion highlights the question, often posed, of how much pre-Islāmic poetry is genuine and how much is the product of later scholars. Some modern critics—without proper justification—would dismiss the entire *corpus* as counterfeit.

Prose. While poetry forms the most important part of early Arabic literature and is an effective historical preservation of the Arabs' past glory, there is also a quantity of prose. Of special interest is the rhymed prose (*sajʿ*) peculiar to soothsayers, which developed into an important form of ornate prose writing in every Islāmic country. Tales about the adventures and battle days of the various tribes (*ayyām al-ʿArab,* or "The Days of the Arabs") were told and handed down from generation to generation, usually interspersed with pieces of poetry. Proverbs and proverbial sayings were as common as in most cultures at a comparable level of development. The "literary" genre most typical of Bedouin life is the *musāmarah,* or "nighttime conversation," in which the central subject is elaborated not by plot but by carrying the listener's mind from topic to topic through verbal associations. Thus, the language as language played a most important role. The *musāmarah* form inspired the later *maqāmah* literature.

The *musāmarah:* "nighttime conversation"

It has been said—and this certainly holds true for the *musāmarah*—that Arabic literature demands attention from its listeners only in short bursts; for listeners are carried from verse to verse, from anecdote to anecdote, from pun to pun, along a theme whose broad outline is entirely familiar. Western Orientalists have for this reason spoken of the "molecular," or "atomic," structure both of classical Arabic literature and of traditional Islāmic thought. An audience listening to one of the ancient bards—or to a modern poet or orator in the Muslim world—would be able to listen without tiring. The sheer emotive power of the Arabic language to enrapture and bewitch its listeners by sound alone should be kept in mind when considering any piece of Arabic literature. Only a people endowed with peculiar sensibility to the word could properly appreciate the refinement of pre-Islāmic poetry and be ready to accept the concept of divine revelation appearing through the word in the Qur'ān.

EARLY ISLĀMIC LITERATURE

With the coming of Islām the attitude of the Arabs toward poetry seems to have changed. The new Muslims, despite their long-standing admiration for powerful language, often shunned poetry as reminiscent of pagan ideals now overthrown. For the Qur'ān, in *sūrah* 26:225 ff., condemned the poets "who err in every valley, and say what they do not do. Only the perverse follow them!" The Qur'ān, as the uncreated word of God, was now considered the supreme manifestation of literary beauty. It became the basis and touchstone of almost every cultural and literary activity and attained a unique position in Arabic literature.

Age of the caliphs. It might be expected that a new and vigorous religion would stimulate a new religious literature to sing of its greatness and glory. This, however, was not the case. Maybe the once boastful poets felt, at least for a while, that they were nothing but humble servants of Allāh. At any rate, no major poet was inspired by the birth and astonishingly rapid expansion of Islām. Only much later did poets claim that their work was the "heritage of prophecy" or draw upon a tradition that calls the tongues of the poets "the keys of the treasures beneath the Divine Throne." The old, traditional literary models were still faithfully followed: a famous ode by Kaʿb, the son of Zuhayr, is different from pre-Islāmic poetry only insofar as it ends in praise of the Prophet, imploring his forgiveness, instead of eulogizing some Bedouin leader. Muḥammad's rather mediocre eulogist, Ḥassān ibn Thābit (died *c.* 659), also slavishly repeated the traditional patterns (even including the praise of wine that had been such a common feature of pre-Islāmic poetry at the court of al-Ḥīrah, despite the fact that wine had been by then religiously prohibited).

Influence of pre-Islāmic poetry

Religious themes are to be found in the *khuṭbah*s, or Friday sermons, which were delivered by governors of the provinces. In these *khuṭbah*s, however, political considerations frequently overshadow the religious and literary aspects. The *quṣṣāṣ* (storytellers), who interpreted verses from the Qur'ān, attracted large audiences and may be regarded as the inventors of a popular religious prose. Their interpretations were highly fanciful, however, and hardly squared with the theologian's orthodoxy.

The desire to preserve words of wisdom is best reflected in the sayings attributed to ʿAlī, the fourth caliph (died 661). These, however, were written down, in superbly concise diction, only in the 10th century under the title *Nahj al-balāghah* ("The Road of Eloquence"), a work that is a masterpiece of the finest Arabic prose and that has inspired numerous commentaries and poetical variations in the various Islāmic languages.

Umayyad dynasty. The time of the "Four Righteous Caliphs," as it is called, ended with ʿAlī's assassination in 661. The Umayyad dynasty then gained the throne, and a new impetus in poetry soon became perceptible. The Umayyads were by no means a pious dynasty, much enjoying the pleasures of life in their residence in Damascus and in their luxurious castles in the Syrian desert. One of their last rulers, the profligate al-Walīd ibn Yazīd (died 744), has become famous not so much as a conqueror (although in 711 the Muslims reached the lower Indus basin, Transoxania, and Spain) but as a poet who excelled in frivolous love verses and poetry in praise of wine. He was fond of short, light metres to match his subjects and rejected the heavier metres preferred by *qaṣīdah* writers. His verses convey a sense of ease and gracious living. Al-Walīd was not, however, the first to attempt this kind of poetry: a remarkable poet from Mecca, ʿUmar ibn Abī Rabīʿah (died *c.* 712 or 720), had contributed in large measure to the separate development of the love poem (*ghazal*) from its subordinate place as the opening section of the *qaṣīdah.* Gentle and charming, in attractive and lively rhythms, his poems sing of amorous adventures with the ladies who came to Mecca on pilgrimage. His gay, melodious poems still appeal to modern readers.

The love poets of Medina

In Medina, on the other hand, idealized love poetry was the vogue; its invention is attributed to Jamīl (died 701), of the tribe ʿUdhrah, "whose members die when they love." The names of some of these "martyrs of love," together with the names of their beloved, were preserved and eventually became proverbial expressions of the tremendous force of true love. Such was Qays, who went mad because of his passion for Laylā and was afterward known as Majnūn (the "Demented One"). His story is cherished by later Persian, Turkish, and Urdu poets; as a symbol of complete surrender to the force of love, he is dear both to religious mystics and to secular poets.

Notwithstanding such new developments, the traditional *qaṣīdah* form of poetry was by no means neglected during the Umayyad period. Moreover, as the satirists of Iraq rose to fame, the *naqāʾiḍ* ("polemic poetry matches") between Jarīr (died *c.* 729) and al-Farazdaq (died *c.* 728 or 730) excited and delighted tribesmen of the rival settlements of Basra and Kūfah (places that later also became rival centres of philological and theological schools). The work of these two poets has furnished critics and historians with rich material for a study of the political and social situation in the early 9th century. The wealth of al-Farazdaq's vocabulary led one of the old Arabic critics to declare: "If Farazdaq's poetry did not exist, one-third of the Arabic language would be lost." Philologists, eager to preserve as much of the classical linguistic heritage as possible, have also paid a great deal of attention to the largely satirical poetry of al-Ḥuṭayʾah (died 674). The fact that Christians as well as Muslims were involved in composing classical Arabic poetry is proved by the case of al-Akhṭal (died *c.* 710), whose work preserves the pre-Islāmic tradition of al-Ḥīrah in authentic form. He is particularly noted for his wine songs. Christians and Jews had been included among the pre-Islāmic poets.

Prose literature was still restricted to religious writing. The traditions of the Prophet began to be compiled, and, after careful sifting, those regarded as trustworthy were preserved in six great collections during the late 9th century. Two of these—that of al-Bukhārī and that of Muslim ibn al-Ḥajjāj—were considered second only to the Qurʾan in religious importance. The first studies of religious law and legal problems, closely connected with the study of the Qurʾān, also belong to that period.

The ʿAbbāsids. It was not until the ʿAbbāsids assumed power in 750, settling in Baghdad, that the golden age of Arabic literature began. The influx of foreign elements added new colour to cultural and literary life. Hellenistic thought and the influence of the ancient cultures of the Near East, for example, contributed to the rapid intellectual growth of the Muslim community. Its members, seized with insatiable intellectual curiosity, began to adapt elements from all the earlier high cultures and to incorporate them into their own. They thus created the wonderful fabric of Islāmic culture that was so much admired in the Middle Ages by western Europe. Indian and Iranian threads were also woven into this fabric, and a new sensitivity to beauty in the field of poetry and the fine arts was cultivated.

The classical Bedouin style was still predominant in literature and was the major preoccupation of grammarians. These men were, as the modern critic Sir Hamilton Gibb has emphasized, the true humanists of Islām. Their efforts helped to standardize "High Arabic," giving it an unchangeable structure once and for all. By now the inhabitants of the growing towns in Iraq and Syria were beginning to express their love, hatred, religious fervour, and frivolity in a style more appealing to their fellow townsmen. Poets no longer belonged exclusively to what had been the Bedouin aristocracy. Artisans and freed slaves, of non-Arab origin, were included among their number. Bashshār ibn Burd (died *c.* 784), the son of a Persian slave, was the first representative of the new style. This ugly, blind workman excelled as a seductive love poet and also as a biting satirist—"Nobody could be secure from the itch of his tongue," it was later said—and he added a new degree of expressiveness to the old forms. The category of *zuhdīyāt* (didactic-ascetic poems) was invented by the poet Abū al-ʿAtāhīyah (died 825 or 826) from Basra, the centre of early ascetic movements. His pessimistic thoughts on the transitory nature of this world were uttered in an unpretentious kind of verse that rejected all current notions of style and technical finesse. He had turned to ascetic poetry after efforts at composing love songs.

The works of Abū Nuwās

The same is said of Abū Nuwās (died *c.* 813), the most outstanding of the ʿAbbāsid poets. His witty and cynical verses are addressed mainly to handsome boys; best known are his scintillating drinking songs. His line "Accumulate as many sins as you can" seems to have been his motto; and compared with some of his more lascivious lines, even the most daring passages of pre-Islāmic poetry sound chaste. Abū Nuwās had such an incomparable command over the language, however, that he came to be regarded as one of the greatest Arabic poets of all time. Nevertheless, orthodox Muslims would quote of him and of his imitators the Prophet's alleged saying that "poetry is what Satan has spit out," since he not only described subjects prohibited by religious law but praised them with carefree lightheartedness.

Tendency toward mannered writing

The "new" style. The new approach to poetry that developed during the 9th century was first accorded scholarly discussion in the *Kitāb al-badīʿ* ("Book of the Novel and Strange") by Ibn al-Muʿtazz (died 908), caliph for one day, who laid down rules for the use of metaphors, similes, and verbal puns. The ideal of these "modern" poets was the richest possible embellishment of verses by the use of tropes, brilliant figures of speech, and farfetched poetic conceits. Many later handbooks of poetics discussed these rules in minute detail, and eventually the increasing use of rhetorical devices no longer produced art but artificiality. (Ibn al-Muʿtazz was himself a fine poet whose descriptions of courtly life and nature are lovely; he even tried to compose a tiny epic poem, a genre otherwise unknown to the Arabs.) The "modern" poets, sensitive to colours, sounds, and shapes, also were fond of writing short poems on unlikely subjects: a well-bred hunting dog or an inkpot; delicious sweetmeats or jaundice; the ascetic who constantly weeps when he remembers his sins; the luxurious garden parties of the rich; an elegy for a cat; or a description of a green ewer. Their amusing approach, however, was sooner or later bound to lead to mannered compositions. The growing use of colour images may be credited to the increasing Persian influence upon ʿAbbāsid poetry; for the Persian poets were, as has been often observed, on the whole more disposed to visual than to acoustic imagery.

New attitudes toward love, too, were being gradually developed in poetry. Eventually, what was to become a classic theme, that of *ḥubb ʿudhrī* ("ʿUdhrah love")—the lover would rather die than achieve union with his beloved—was expounded by the Ẓāhirī theologian Ibn Dāʾūd (died 910) in his poetic anthology *Kitāb az-zahrah* ("Book of the Flower"). This theme was central to the *ghazal* poetry of the following centuries. Although at first completely secular, it was later taken over as a major concept in mystical love poetry. (The first examples of this adoption, in Iraq and Egypt, took place in Ibn Dāʾūd's lifetime.) The wish to die on the path that leads to the beloved became commonplace in Persian, Turkish, and Urdu poetry; and most romances in these languages end tragically. Ibn Dāʾūd's influence also spread to the western Islāmic world. A century after his death, the theologian Ibn Ḥazm (died 1064), drawing upon personal experiences, composed in Spain his famous work on "pure love" called *Ṭawq al-ḥamāmah* (*The Ring of the Dove*). Its lucid prose, interspersed with poetry, has many times been translated into Western languages.

The conflict between the traditional ideals of poetry and the "modern" school of the early ʿAbbāsid period also led to the growth of a literary criticism, the criteria of which were largely derived from the study of Greek philosophy.

Traditional poetry, meanwhile, was not neglected. But its style was somewhat modified in accordance with the new ideas. Two famous anthologies of Bedouin poetry, both called *Ḥamāsah* ("Poems of Bravery"), were collected by the Syrian Abū Tammām (died 845 or 846) and his disciple al-Buḥturī (died 897), both good classical poets in their own right. They provide an excellent survey of those poems from the stock of early Arabic poetry that were considered worth preserving. A century later Abū al-Faraj al-Iṣbahānī (died 967), in a multivolume work entitled *Kitāb al-aghānī* ("Book of Songs"), collected a great number of poems and biographical notes on poets and musicians. This material gives a colourful and valuable panorama of literary life in the first four centuries of Islām.

Mutanabbī's poetry

In the mid-10th century a new cultural centre emerged at the small court of the Ḥamdānids in Aleppo. Here the Central Asian scholar al-Fārābī (died 950) wrote his fundamental works on philosophy and musical theory. Here, too, for a while, lived Abū aṭ-Ṭayyib al-Mutanabbī (died 965), who is in the mainstream of classical *qaṣīdah* writers but who surpasses them all in the extravagance of what has been called his "reckless audacity of imagination." He combined some elements of Iraqi and Syrian stylistics with classical ingredients. His compositions—panegyrics of rulers and succinct verses (which are still quoted)—have never ceased to intoxicate the Arabs by their daring hyperbole, their marvelous sound effects, and their formal perfection. The Western reader is unlikely to derive as much aesthetic pleasure from Mutanabbī's poetry as does one whose mother tongue is Arabic. He will probably prefer the delicate verses about gardens and flowers by Mutanabbī's colleague in Aleppo, aṣ-Ṣanawbarī (died 945), a classic exponent of the descriptive style. This style in time reached Spain, where the superb garden and landscape poetry of Ibn Khafājah (died 1139) displayed an even higher degree of elegance and sensitivity than that of his Eastern predecessors.

Before turning to the development of prose, it is necessary to mention a figure unique among those writing in Arabic. This was Abū al-ʿAlāʾ al-Maʿarrī (died 1057), a blind poet of Syria, whose verses have appealed greatly to young Arabs of the present because of the poems' sincerity and humanity. But al-Maʿarrī's vocabulary is so difficult, his verses, with their double rhymes, are so compressed in meaning, that even his contemporaries, flocking to his lectures, had to ask him to interpret their significance. His outlook is deeply pessimistic and skeptical. Although his poems display a mastery of the Arabic traditional stylistic devices, they run counter to the conventional ideals of Arab heroism by speaking of bitter disappointment and emphasizing asceticism, compassion, and avoidance of procreation.

> Taking reason for his guide he judges men and things with a freedom which must have seemed scandalous to the rulers and privileged classes of the day. Among his meditations on the human tragedy a fierce hatred of injustice, hypocrisy, and superstition blazes out. Vice and folly are laid bare in order that virtue and wisdom may be sought . . .

says Reynold A. Nicholson, al-Maʿarrī's foremost interpreter in the West, who has also translated his *Risālat al-ghufrān* ("Epistle of Pardon"), which describes a visit to the Otherworld. Maʿarrī's extremely erudite book also contains sarcastic criticism of Arabic literature. His *Al-Fuṣūl wa al-ghāyāt* ("Paragraphs and Periods") is an ironic commentary on man and nature but is presented as a sequence of pious exhortations in rhymed prose. It has scandalized the pious, some of whom see it as a parody of the Qurʾān. Maʿarrī's true intention in this book, which came to light only recently, is unknown.

Development of literary prose. During the ʿAbbāsid period, literary prose also began to develop. Ibn al-Muqaffaʿ (died *c.* 756), of Persian origin, translated the fables of Bidpai into Arabic under the title *Kalīlah wa Dimnah.* These fables provided Islāmic culture with a seemingly inexhaustible treasure of tales and parables, which are to be found in different guises throughout the whole of Muslim literature. He also introduced into Arabic the fictitious chronicles of the Persian *Khwatāy-nāmak* ("Book of Kings"). This was the source of a kind of pre-Islāmic mythology that the literati preferred above the somewhat meagre historical accounts of the Arab pagan past otherwise available to them. These activities demanded a smooth prose style, and Ibn al-Muqaffaʿ has therefore rightly been regarded as the inaugurator of what is called "secretarial literature" (that produced by secretaries in the official chancelleries). He also translated writings on ethics and the conduct of government, which helped to determine the rules of etiquette (*adab*). His works are the prototype of the "Mirror for Princes" literature, which flourished during the late Middle Ages both in Iran and in the West. In this literature, a legendary Persian counselor, Bozorgmehr, was presented as a paragon of wise conduct. Later, stories were invented that combined Qurʾānic heroes with historical characters from the Iranian past.

The work of al-Jāḥiẓ

A growing interest in things outside the limits of Bedouin life was reflected in a quantity of didactic yet entertaining prose by such masters as the broadminded and immensely learned al-Jāḥiẓ (died 869). In response to the wide-ranging curiosity of urban society, the list of his subjects includes treatises on theology, on misers, on donkeys, and on thieves. His masterpiece is *Kitāb al-Ḥayawān* ("Book of Animals"), which has little to do with zoology but is a mine of information about Arab proverbs, traditions, superstitions, and the like. Al-Jāḥiẓ's style is vigorous, loquacious, and uninhibited. His work, however, is not well constructed, and it lacks the clear sobriety of the "secretarial style." Yet the glimpses it affords into the life of various strata of society during the 9th century have rightly attracted the special interest of Western scholars. Less impressive, but almost as multifaceted, are the treatises of Ibn Abī ad-Dunyā (died 894).

The concept of *adab* was soon enlarged to include not only educational prose dealing with etiquette for all classes of people but belles lettres in general. The classic example of Arabic style for prose writers in this field, accepted as such for almost a millennium, is the writing of the Persian Ibn Qutaybah (died 889). His *ʿUyūn al-akhbār* ("Fountains of Stories"), in 10 books, each dealing with a given subject, provided a model to which numberless essayists in the Muslim world conformed. In his book on poetry and poets, Ibn Qutaybah dared, for the first time, to doubt openly that pre-Islāmic poetry was incomparable. The most vigorous prose style was achieved by Abū Ḥayyān at-Tawḥīdī (died 1023), who portrayed the weaknesses of the two leading viziers, both notorious for their literary ambitions, ". . . with such bitterness," as Gibb remarks, "that the book was reputed to bring misfortune upon all who possessed a copy." This work, like others by Tawḥīdī that have quite recently been discovered, reveals the author's sagacity and striking eloquence. His correspondence on problems of philosophy with Miskawayh (died 1030), the author of a widely circulated book on ethics and of a general history, helps to complete the picture of this extraordinary writer.

Some time about 800 the Arabs had learned the art of papermaking from the Chinese. Henceforth, cheap writing material was available, and literary output was prodigious. The *Fihrist* ("Index"), compiled by the bookseller Ibn an-Nadīm in 988, gave a full account of the Arabic literature extant in the 10th century. This Index covered all kinds of literature, from philology to alchemy; but most of these works unfortunately have been lost. In those years manuals of composition (*inshāʾ*) were written elaborating the technique of secretarial correspondence, and they grew into an accepted genre in Arabic as well as in Persian and Turkish literature. The devices thought indispensable for elegance in modern poetry were applied to prose. The products were mannered, full of puns, verbal tricks, riddles, and the like. The new style, which was also to affect the historian's art in later times, makes a good deal of this post-classical Arabic prose look very different from the terse and direct expression characteristic of the early specimens. Rhymed prose, which at one time had been reserved for such religious occasions as the Friday sermons, was now regarded as an essential part of elegant style.

Rhetorical artistry in the *maqāmah*

This rhetorical artistry found its most superb expression in the *maqāmah,* a form invented by Badīʿ az-Zamān al-Hamadhānī (died 1008). Its master, however, was al-Ḥarīrī (died 1122), postmaster (head of the intelligence service) at Basra and an accomplished writer on grammatical subjects. His 50 *maqāmah*s, which tell the adventures of Abū Zayd as-Sarūjī, with a wealth of language and learning, come closer to the Western concept of short story than anything else in classical Arabic literature. They abound in verbal conceits, ambivalence, assonance, alliteration, palindromes; they change abruptly from earnest to jest, from the crude to the most sublime, as the modern scholar G.E. von Grunebaum has pointed out in his evaluation of this form, which he regards as the most typical literary reflection of the Islāmic spirit. The work of al-Ḥarīrī has certainly been widely admired in the East; it has been imitated in Syriac and in Hebrew and has formed part of the syllabus in Muslim high schools of India. The pleasure to be derived from the brilliant artifice and ingenuity behind such compositions has led to their being imitated in other literary fields: quite often, in later Persian literature, one finds poems—sometimes whole books—composed of letters without diacritical marks (which distinguish otherwise similar-looking letters) or even made up entirely of unconnected letters. Even a commentary on the Qurʾān, in undotted letters, has been written in India (by Fayẓī, died 1595).

Writers on music and philology

Achievements in the western Muslim world. The Arabic literature of Moorish Spain and of the whole Maghrib developed parallel with that of the eastern countries but came to full flower somewhat later. Córdoba, the seat of the Umayyad rulers, was the centre of cultural life. Its wonderful mosque has inspired Muslim poets right up to the 20th century (such as Sir Muḥammad Iqbāl, whose Urdu ode, "The Mosque of Córdoba," was written in 1935). Moorish Spain was a favourite topic for reformist novelists of 19th-century Muslim India, who contrasted their own country's troubled state with the glory of classical Islāmic civilization. Moorish Spain reached its cultural, political, and literary heyday under ʿAbd ar-Raḥmān III (912–961). Literary stylistic changes, as noted in Iraq and Syria, spread to the west: there the old Bedouin style had always been rare and soon gave way to descriptive and love poetry. Ibn Hāniʾ (died 973) of Seville has been praised as the Western counterpart of al-Mutanabbī, largely because of his eulogies of the Fāṭimid caliph al-Muʿizz, who at that time still resided in North Africa. The entertaining prose style of Ibn ʿAbd Rabbihi (died 940) in his *al-ʿIqd al-farīd* ("The Unique Necklace") is similar to that of his elder contemporary Ibn Qutaybah, and his book in fact became more famous than that of his predecessor. Writers on music and philology also flourished in Spain; literary criticism was practiced by Ibn Rashīq (died 1064) and, later, by al-Qarṭājannī (died 1285) in Tunis. Ibn Ḥazm (died 1064), theologian and accomplished writer on pure love, has already been mentioned.

Philosophy: Averroës and Avicenna. Philosophy, medicine, and theology, all of which flourished in the ʿAbbāsid East, were also of importance in the Maghrib; and from there strong influences reached medieval Europe. The influences often came through the mediation of the Jews, who, along with numerous Christians, were largely Arabized in their cultural and literary outlook. The eastern Muslim countries could boast of the first systematic writers in the field of philosophy, including al-Kindī (died *c.* 870), al-Fārābī (died 950), and especially Avicenna (Ibn Sīnā, died 1037). Avicenna's work in philosophy, science, and medicine was outstanding and was appreciated as such in Europe. He also composed religious treatises and tales with a mystical slant. One of his romances was reworked by the Maghribi philosopher Ibn Ṭufayl (died 1185) in his book *Ḥayy ibn Yaqẓān* ("Alive Son of Awake"), or *Philosophus Autodidactus* (the title of its first Latin translation, made in 1671). It is the story of a self-taught man who lived on a lonely island and who, in his maturity, attained the full knowledge taught by philosophers and prophets. This theme was elaborated often in later European literature.

The dominating figure in the kingdom of the Almohads, however, was the philosopher Averroës (Ibn Rushd, died 1198), court physician of the Berber kings in Marrākush (Marrakech) and famous as the great Arab commentator on Aristotle. The importance of his frequently misinterpreted philosophy in the formation of medieval Christian thought is well known. Among his many other writings, especially notable is his merciless reply to an attack on philosophy made by Ghazālī (died 1111). Ghazālī had called his attack *Tahāfut al-falāsifah* (*The Incoherence of the Philosophers*), while Averroës' equally famous reply was entitled *Tahāfut at-tahāfut* (*The Incoherence of the Incoherence*). The Persian-born Ghazālī had, after giving up a splendid scholarly career, become the most influential representative of moderate Ṣūfism. His chief work, *Iḥyāʾ ʿulūm ad-dīn* ("The Revival of the Religious Sciences"), was based on personal religious experiences and is a perfect introduction to the pious Muslim's way to God. It inspired much later religious poetry and prose. The numerous writings by mystics, who often expressed their wisdom in rather cryptic language (thereby contributing to the profundity of Arabic vocabulary), and the handbooks of religious teaching produced in eastern Arab and Persian areas (Sarrāj, Kalābādhī, Qushayrī, and, in Muslim India, al-Hujwīrī) are generally superior to those produced in western Muslim countries. Yet the greatest Islāmic theosophist of all, Ibn al-ʿArabī (died 1240), was Spanish in origin and was educated in the Spanish tradition. His writings, in both poetry and prose, shaped large parts of Islāmic thought during the following centuries. Much of the later literature of eastern Islām, particularly Persian and Indo-Persian mystical writings, indeed, can be understood only in the light of his teachings. Ibn al-ʿArabī's lyrics are typical *ghazal*s, sweet and flowing. From the late 9th century, Arabic-speaking mystics had been composing verses often meant to be sung in their meetings. At first a purely religious vocabulary was employed, but soon the expressions began to oscillate between worldly and heavenly love. The ambiguity thus achieved eventually became a characteristic feature of Persian and Turkish lyrics.

The pious Muslim's way to God

Among the Arabs, religious poetry mainly followed the classical *qaṣīdah* models, and the poets lavishly decorated their panegyrics to the Prophet Muḥammad with every conceivable rhetorical embellishment. Examples of this trend include *al-Burdah* ("The Mantle") of al-Buṣīrī (died 1298), upon which dozens of commentaries have been written (and which has been translated into most of the languages of Muslims because of the power to bless attributed to it). More sophisticated but less well known is an ode on the Prophet by the Iraqi poet Ṣafī ad-Dīn al-Ḥilli (died 1350), which contains 151 rhetorical figures. The "letters of spiritual guidance" developed by the mystics are worth mentioning as a literary genre. They have been popular everywhere; from the western Islāmic world the letters of Ibn ʿAbbād (died 1390) of Ronda (in Spain) are outstanding examples of this category, being written clearly and lucidly.

Geographical literature. The Maghrib also made a substantial contribution to geographical literature, a field eagerly cultivated by Arab scholars since the 9th century. The Sicilian geographer ash-Sharīf al-Idrīsī produced a famous map of the world and accompanied it with a detailed description in his *Kitāb nuzhat al-mushtāq fī ikhtirāq al-āfāq* ("The Delight of Him Who Wishes to Traverse the Regions of the World," 1154), which he dedicated to his patron, Roger II. The Spanish traveler Ibn Jubayr (died 1217), while on pilgrimage to Mecca, kept notes of his experiences and adventures. The resulting book became a model for the later pilgrims' manuals that are found everywhere in the Muslim world. The Maghribi explorer Ibn Baṭṭūṭah (died 1368/69 or 1377) described his extensive travels to the Far East, India, and the region of the Niger in a book filled with information about the cultural state of the Muslim world at that time. The value of his narrative is enhanced by the simple and pleasing style in which it is written.

Spanish mastery of poetical forms

Poetry. In the field of poetry, Spain, which produced a considerable number of masters in the established poetical forms, also began to popularize strophic poetry, possibly deriving from indigenous models. The *muwashshaḥ* ("girdled") poem, written in the classical short metres and arranged in four- to six-line stanzas, was elaborated, enriched by internal rhymes, and, embodying some popular expressions in the poem's final section, soon achieved a standardized form. The theme is almost always love. Among the greatest lyric poets of Spain was Ibn Zaydūn of Córdoba (died 1071), who was of noble birth. After composing some charming love songs dedicated to the Umayyad princess Wallādah, he turned his hand to poetic epistles. He is the author of a beautiful *muwashshaḥ* about his hometown, which many later poets imitated. When the *muwashshaḥ* was transplanted to the eastern Arabic countries, however, it lost its original spontaneity and became as stereotyped as every other lyric form of expression during the later Middle Ages. Another strophic form developed in Spain is the songlike *zajal* (melody), interesting for its embodiment of dialect phrases and the use of occasional words from Romance languages. Its master was Ibn Quzmān of Córdoba (died 1160), whose life-style was similar to that of Western troubadours. His approach to life as expressed in these melodious poems, together with their mixed idiom, suggests an interrelationship with the vernacular troubadour poetry of Spain and France.

Historiography: Ibn Khaldūn. Any survey of western Muslim literary achievements would be incomplete if it did not mention the most profound historiographer of the Islāmic world, the Tunisian Ibn Khaldūn (died 1406). History has been called the characteristic science of the Muslims because of the Qurʾānic admonition to discover signs of the divine in the fate of past peoples. Islāmic historiography has produced histories of the Muslim conquests, world histories, histories of dynasties, court annals, and biographical works classified by occupation—scholars, poets, and theologians. Yet, notwithstanding their learning, none of the earlier writers had attempted to produce a comprehensive view of history. Ibn Khaldūn, in the famous *Muqaddimah* or introduction to a projected general history, *Kitāb al-ʿibar,* sought to explain the basic factors in the historical development of the Islāmic countries. His own experiences, gained on a variety of political missions in North Africa, proved useful in establishing general principles that he could apply to the manifestations of Islāmic civilization. He created, in fact, the first "sociological" study of history, free from bias. Yet his book was little appreciated by his fellow historians, who still clung to the method of accumulating facts without shaping them properly into a well-structured whole. Ibn Khaldūn's work eventually attracted the interest of Western Orientalists, historians, and sociologists alike; and some of his analyses are still held in great esteem.

Significance of Ibn Khaldūn

Decline of the Arabic language. Ibn Khaldūn, who had served in his youth as ambassador to Pedro I the Cruel, of Castile, and in his old age as emissary to Timur, died in Cairo. After the fall of Baghdad in 1258, this city had become the centre of Muslim learning. Historians there recorded every detail of the daily life and the policies of the Mamlūk sultans; theologians and philologists worked under the patronage of Turkish and Circassian rulers who often did not speak a word of Arabic. The amusing, semicolloquial style of the historian Ibn Iyās (died after 1521) is an interesting example of the deterioration of the Arabic language. While classical Arabic was still the ideal of every literate man, it had become exclusively a "learned" language. Even some copyists who transcribed classical works showed a deplorable lack of grammatical knowledge. It is hardly surprising that poetry composed under such circumstances should be restricted to insipid versification and the repetition of well-worn clichés.

MIDDLE PERIOD: THE RISE OF PERSIAN AND TURKISH POETRY

The new Persian style. During the ʿAbbāsid period, the Persian influence upon the Arabic had grown considerably: at the same time, a distinct Modern Persian literature came into existence in northeastern Iran, where the house of the Sāmānids of Bukhara and Samarkand had revived the memory of Sāsānian glories.

The first famous representative of this new literature was the poet Rūdakī (died 940/941), of whose *qaṣīdah*s only a few have survived. He also worked on a Persian version of *Kalīlah wa Dimnah,* however, and on a version of the *Sendbād-nāmeh.* Rūdakī's poetry, modeled on the Arabic rules of prosody that without exception had been applied to Persian, already points ahead to many of the characteristic features of later Persian poetry. The imagery in particular is sophisticated, although when compared with the mannered writing of subsequent times his verse was considered sadly simple. From the 10th century onward, Persian poems were written at almost every court in the Iranian areas, sometimes in dialectical variants (for example, in Ṭabarestāni dialect at the Zeyārid court). In many cases the poets were bilingual, excelling in both Arabic and Persian (a gift shared by many non-Arab writers up to the 19th century).

Influence of Maḥmūd of Ghazna. The first important centre of Persian literature existed at Ghazna (present-day Ghaznī, Afg.), at the court of Maḥmūd of Ghazna (died 1030) and his successors, who eventually extended their empire to northwestern India. Himself an orthodox warrior, Maḥmūd in later love poetry was transformed into a symbol of "a slave of his slave" because of his love for a Turkmen officer, Ayāz. Under the Ghaznavids, lyric and epic poetry both developed, as did the panegyric. Classical Iranian topics became the themes of poetry, resulting in such diverse works as the love story of Vāmeq and ʿAzrā (possibly of Greek origin) and the *Shāh-nāmeh* ("Book of Kings"). A number of gifted poets praised Maḥmūd, his successors, and his ministers. Among them was Farrokhī of Seistan (died 1037), who was the author of a powerful elegy on Maḥmūd's death, one of the finest compositions of Persian court poetry.

Ferdowsī's literary achievement

Epic and romance. The main literary achievement of the Ghaznavid period, however, was that of Ferdowsī (died 1020). He compiled the inherited tales and legends about the Persian kings in one grand epic, the *Shāh-nāmeh,* which contains between 35,000 and 60,000 verses in short rhyming couplets. It deals with the history of Iran from its beginnings—that is, from the "time" of the mythical kings—passing on to historical events, giving information about the acceptance of the Zoroastrian faith, Alexander's invasion, and, eventually, the conquest of the country by the Arabs. A large part of the work centres on tales of the hero Rostam. These stories are essentially part of a different culture, thus revealing something about the Indo-European sources of Iranian mythology. The struggle between Iran and Tūrān (the central Asian steppes from which new waves of nomadic conquerors distributed Iran's urban culture) forms the central theme of the book; and the importance of the legitimate succession of kings, who are endowed with royal charisma, is reflected throughout the composition. The poem contains very few Arabic words and is often considered the masterpiece of Persian national literature, although it lacks proper historical perspective. Its episodes have been the inspiration of miniaturists since the 14th century. Numerous attempts have been made to emulate it in Iran, India, and Turkey.

The epics of Neẓāmī

Other epic poems, on a variety of subjects, were composed during the 11th century. The first example is Asadī's (died *c.* 1072) didactic *Garshāsb-nāmeh* ("Book of Garshāsb"), whose hero is very similar to Rostam. The tales of Alexander and his journeys through foreign lands were another favourite topic. Poetical romances were also being written at this time; they include the tale of *Varqeh o-Golshāh* by ʿEyyūqī (11th century) and *Vīs o-Rāmīn* by Fakhr od-Dīn Gorgānī (died after 1055), which has parallels with the Tristan story of medieval romance. These were soon superseded, however, by the great romantic epics of Neẓāmī of Ganja (died *c.* 1209), in Caucasia. The latter are known as the *Khamseh* ("Quintet") and, though the names of Vīs or Vāmeq continued for some time to serve as symbols of the longing lover, it was the poetical work of Neẓāmī that supplied subsequent writers with a rich store of images, similes, and stories to draw upon. The first work of his *Khamseh, Makhzan ol-asrār* ("Treasury of Mysteries"), is didactic in intention; the subjects of the following three poems are traditional love stories. The first is the Arabic romance of Majnūn, who went mad with love for Laylā. Second is the Persian historical tale of Shīrīn, a Christian princess, loved by both the Sāsānian ruler Khosrow II Parvīz and the stonecutter Farhād. The third story, *Haft peykar* ("Seven Beauties"), deals with the adventures of Bahrām Gūr, a Sāsānian prince, and seven princesses, each connected with one day of the week, one particular star, one colour, one perfume, and so on. The last part of the *Khamseh* is *Eskandar-nāmeh,* which relates the adventures of Alexander III the Great in Africa and Asia, as well as his discussions with the wise philosophers. It thus follows the traditions about Alexander and his tutor, Aristotle, emphasizing the importance of a counselor-philosopher in the service of a mighty emperor. Neẕāmī's ability to present a picture of life through highly refined language and a wholly apt choice of images is quite extraordinary. Human feelings, as he describes them, are fully believable; and his characters are drawn with a keen insight into human nature. Not surprisingly, Neẕāmī's work inspired countless poets' imitations in different languages—including Turkish, Kurdish, and Urdu—while painters constantly illustrated his stories for centuries afterward.

Other poetic forms. In addition to epic poetry, the lesser forms, such as the *qaṣīdah* and *ghazal,* developed during the 11th and 12th centuries. Many poets wrote at the courts of the Seljuqs and also at the Ghaznavid court in Lahore, where the poet Mas'ūd-e Sa'd-e Salmān (died 1121) composed a number of heartfelt *qaṣīdahs* during his political imprisonment. They are outstanding examples of the category of *ḥabsīyah* (prison poem), which usually reveals more of the author's personal feelings than other literary forms. Other famous examples of *ḥabsīyahs* include those written by the Arab knight Abū Firās (died 968) in a Byzantine prison; those by Muḥammad II al-Mu'tamid of Seville (died 1095) in the dungeons of the Almohads; those by the 12th-century Persian Khāqānī; those by the Urdu poets Ghālib, in the 19th, and Faiz, in the 20th century; and by the contemporary Turkish poet Nazim Hikmet (died 1963).

The most complicated forms were mastered by poets of the very early period, the limits of artificiality being reached in Azerbaijani *qaṣīdahs* by the poet Qaṭrān (died 1072), whose work displays virtuosity for virtuosity's sake. The court poets tried to top one another in the accumulation of complex metaphors and paradoxes, each hoping to win the coveted title "Prince of Poets." Anvarī (died *c.* 1189), whose patrons were the Seljuqs, is considered the most accomplished writer of panegyrics in the Persian tongue. His verses contain little descriptive material but abound in learned allusions. His "Tears of Khorāsān," mourning the passing of Seljuq glory, is among the best known of Persian *qaṣīdahs*. In the west of Iran, Anvarī's contemporary Khāqānī (died *c.* 1190), who wrote mainly at the court of the Shīrvān-Shāhs of Transcaucasia, is the outstanding master of the hyperbolic style. His mother was a Christian, and his imagery has more than the usual amount of allusions to Christian themes. His vocabulary seems inexhaustible; he uses uncommon rhetorical devices and very strong language. His poems, with their long chains of oath-formulae (*sowgandnāmeh*), are as impressive as his poignant antithetic formulations. Khāqānī's verses on the ruined Ṭāq Kisrā at Ctesiphon on the Tigris have become proverbial. His *qaṣīdahs* on the pilgrimage to Mecca, which also inspired his *masnavī, Tuḥfat al-'Irāqayn ol-'Erāqeyn* ("Gift of the Two Iraqs"), translate most eloquently the feelings of a Muslim at the festive occasion. In the hand of lesser poets, however, *qaṣīdah* writing became more and more conventionalized, repeating outworn clichés and employing inflated terms entirely devoid of feeling.

Decline of the *qaṣīdah* form

Scholarship: al-Bīrūnī. The Ghaznavid and Seljuq periods produced first-rate scholars such as al-Bīrūnī (died 1048) who, writing in Arabic, investigated Hinduism and gave the first unprejudiced account of India—indeed, of any non-Islāmic culture. He also wrote notable books on chronology and history. In his search for pure knowledge he is undoubtedly one of the greatest minds in Islāmic history. Interest in philosophy is represented by Nāṣer-e Khosrow (died 1087/88) who acted for a time as a missionary for the Ismā'īlī branch of Shī'ah Islām. His book about his journey to Egypt, entitled *Safar-nāmeh,* is a pleasing example of simple, clearly expressed, early Persian prose. His poetical works in the main seek to combine Greek wisdom and Islāmic thought: the gnostic Ismā'īlī interpretation of Islām seemed, to him, an ideal vehicle for a renaissance of the basic Islāmic truths.

Robā'īyāt: Omar Khayyam. The work done in mathematics by early Arabic scholars and by al-Bīrūnī was continued by Omar Khayyam (died 1122), to whom the Seljuq empire in fact owes the reform of its calendar. But Omar has become famous in the West through the free adaptations by Edward FitzGerald of his *robā'īyāt.* These quatrains have been translated into almost every known language and are largely responsible for colouring European ideas about Persian poetry. The authenticity of these verses has often been questioned. The quatrain is an easy form to use—many have been scribbled on Persian pottery of the 13th century—and the same verse has been attributed to many different authors. The latest research into the question of the *robā'īyāt* has established that a certain number of the quatrains can, indeed, be traced back to the great scientist who condensed in them his feelings and thoughts, his skepticism and love, in such an enthralling way that they appeal to every reader. The imagery he uses, however, is entirely inherited; none of it is original. (One of the most noted, and notorious, writers of this genre was the poetess Mahsaṭī [first half of the 12th century], who frequently addressed members of different professions in rather frivolous lines.) The quatrain was also popular as a means of embodying pieces of mystical wisdom. One has to do away with the old theory that the first author of such mystical *robā'īyāt* was Abū Sa'īd ibn Abū al-Khayr (died 1049). A number of his contemporaries, however, including Bābā Ṭāher 'Oryān (died after 1055), used simpler forms of the quatrain, sometimes in order to express their mystical concepts.

The mystical poem. Whereas the mystical thought stemming from Iran had formerly been written in Arabic, writers from the 11th century onward turned to Persian. Along with works of pious edification and theoretical discussions, what was to be one of the most common types of Persian literature came into existence: the mystical poem. Khwajah 'Abd Allāh al-Anṣārī of Herāt (died 1088), a prolific writer on religious topics in both Arabic and Persian, first popularized the literary "prayer," or mystical contemplation, written in Persian in rhyming prose interspersed with verses. Sanā'ī (died 1131?), at one time a court poet of the Ghaznavids, composed the first mystical epic, the didactic *Ḥadīqat al-ḥaqīqat wa sharī'at aṭ-ṭariqah* ("The Garden of Truth and the Law of the Path"), which has some 10,000 verses. In this lengthy and rather dry poem, the pattern for all later mystical *masnavīs* is established: wisdom is embodied in stories and anecdotes; parables and proverbs are woven into the texture of the story, eventually leading back to the main subject, although the argument is without thread and the narration puzzling to follow. Among Sanā'ī's smaller *masnavīs, Sayr al-'ibād ilā al-ma'ād* ("The Journey of the Servants to the Place of Return") deserves special mention. Its theme is the journey of the spirit through the spheres, a subject dear to the mystics and still employed in modern times as, for example, by Iqbāl in his Persian *Jāvīd-nāmeh* (1932). Sanā'ī's epic endeavours were continued by one of the most prolific writers in the Persian tongue, Farīd od-Dīn 'Aṭṭār (died *c.* 1220). He was a born storyteller, a fact that emerges from his lyrics but even more so from his works of edification. The most famous among his *masnavīs* is the *Manṭiq uṭ-ṭayr* (*The Conversation of the Birds*), modeled after some Arabic allegories. It is the story of 30 birds, who, in search of their spiritual king, journey through seven valleys. The poem is full of tales, some of which have been translated even into the most remote Islāmic languages. (The story of the pious Sheykh Ṣan'ān, who fell in love with a Christian maiden, is found, for example, in Kashmiri.) 'Aṭṭār's symbolism of the soul-bird was perfectly in accord with the existing body of imagery beloved of Persian poetry, but it was he who added a scene in which the birds eventually realize their own identity with God (because they, being *sī morgh,* or "30 birds," are identified with the mystical Sēmorgh, who represents God). Also notable are his *Elāhī-nāmeh,* an allegory of a king and his six sons, and his profound *Moṣībat-nāmeh* ("Book of Affliction"), which closes with its hero's being immersed in the ocean of his soul after wandering through the 40 stages of his search for God. The epic exteriorizes the mystic's experiences in the 40 days of seclusion.

Importance of Mawlānā Jalāl ad-Dīn ar-Rūmī. The most famous of the Persian mystical *masnavīs* is by Mawlānā ("Our Lord") Jalāl ad-Dīn ar-Rūmī (died 1273) and

Most famous Persian mystical *mas̄navī*

is known simply as the *Mas̄navī*. It comprises some 26,000 verses and is a complete—though quite disorganized—encyclopaedia of all the mystical thought, theories, and images known in the 13th century. It is regarded by most of the Persian-reading orders of Ṣūfis as second in importance only to the Qurʾān. Its translation into many Islāmic languages and the countless commentaries written on it up to the present day indicate its importance in the formation of Islāmic poetry and religious thought. Jalāl ad-Dīn, who hailed from Balkh and settled in Konya, the capital of the Rūm, or Anatolian Seljuqs (and hence was surnamed "Rūmī"), was also the author of love lyrics whose beauty surpasses even that of the tales in the *Mas̄navī*. Mystical love poetry had been written since the days of Sanāʾī, and theories of love had been explained in the most subtle prose and sensitive verses by the Ṣūfis of the early 12th century. Yet Rūmī's experience of mystical love for the wandering mystic, Shams ad-Dīn of Tabriz, was so ardent and enraptured him to such an extent that he identified himself completely with Shams, going so far as to use the beloved's name as his own pen name. His dithyrambic lyrics, numbering more than 30,000 verses altogether, are not at all abstract or romantic. On the contrary, their vocabulary and imagery are taken directly from everyday life, so that they are vivid, fresh, and convincing. Often their rhythm invites the reader to partake in the mystical dance practiced by Rūmī's followers, the Mawlawīyah. His verses sometimes approach the form of popular folk poetry; indeed, Rūmī is reputed to have written mostly under inspiration; and despite his remarkable poetical technique, the sincerity of his love and longing is never overshadowed, nor is his personality veiled. In these respects he is unique in Persian literature.

Zenith of Islāmic literature. During the 13th century, the Islāmic lands were exposed, on the political plane, to the onslaught of the Mongols and the abolition of the ʿAbbāsid caliphate, while vast areas were laid to waste. Yet this was in fact the period in which Islāmic literatures reached their zenith. Apart from Rūmī's superb poetry, written in the comparative safety of Konya, there was also the work of the Egyptian Ibn al-Fāriḍ (died 1235), who composed some magnificent, delicately written mystical poems in *qaṣīdah* style, and that of Ibn al-ʿArabī, who composed love lyrics and numerous theosophical works that were to become standard. In Iran, one of the greatest literati, Moṣleḥ od-Dīn Saʿdī (died 1292), returned in about 1256 to his birthplace, Shīrāz, after years of journeying; his *Būstān* ("The Orchard") and *Golestān* ("Rose Garden") have been popular ever since. The *Būstān* is a didactic poem telling wise and uplifting moral tales, written in polished, easy-flowing style and a simple metre; the *Golestān,* completed one year later, in 1258, has been judged ". . . the finest flower that could blossom in a Sultan's garden" (Herder). Its eight chapters deal with different aspects of human life and behaviour. At first sight, its prose and poetical fragments appear to be simple and unassuming; but not a word could be changed without destroying the perfect harmony of the sound, imagery, and content. Saʿdī's *Golestān* is thus essential in discovering the nature of the finest Persian literary style. Since the mid-17th century, its moralizing stories have been translated into many Western languages. Saʿdī was likewise the author of some spirited *ghazals*; he may have been the first writer in Iran to compose the sort of love poetry that is now thought of as characteristic of the *ghazal.* A few of his *qaṣīdahs* are also of note, although he is at his best in shorter forms. His elegant aphoristic poems, words of wisdom, and sensible advice all display what has been called the philosophy of common sense—how to act in any given situation so as to make the best of it both for oneself and others, basing one's conduct on the virtues of gentleness, elegance, modesty, and polite behaviour.

Saʿdī's "philosophy of common sense"

The influence of mysticism, on the one hand, and of the elaborate Persian poetical tradition, on the other, is apparent during the later decades of the 13th century, both in Anatolia and in Muslim India. The Persian mystic, Fakhr-ud-Dīn ʿIrāqī (died 1289), a master of delightful love lyrics, lived for almost 25 years in Multān (in present-day Pakistan), where his lively *ghazals* are still sung. His short treatises, in a mixture of poetry and prose (and written under Ibn al-ʿArabī's influence), have been imitated often. While in Multān he may have met the young Amīr Khosrow of Delhi (died 1325), who was one of the most versatile authors to write in Persian, not only in India but in the entire realm of Persian culture. Amīr Khosrow, son of a Turkish officer, but whose mother was Indian, is often styled, because of the sweetness of his speech, "the parrot of India." (In Persian, it should be noted, parrots are always "sugar-talking"; they are, moreover, connected with Paradise and are thought of as wise birds—thus models of the sweet-voiced sage.) He wrote panegyrics of seven successive kings of Delhi and was also a pioneer of Indian Muslim music. Imitating Neẓāmī's *Khamseh,* Khosrow introduced a novelistic strain into the *mas̄navī* by recounting certain events of his own time in poetical form, some parts of which are lyrics. His style of lyrical poetry has been described as "powdered"; and his *ghazals* contain many of the elements that in the 16th and 17th centuries were to become characteristic of the "Indian" style. Khosrow's poetry surprises the reader in its use of unexpected forms and unusual images, complicated constructions and verbal plays, all handled fluently and presented in technically perfect language. His books on the art of letter writing prove his mastery of high-flown Persian prose. Khosrow's younger contemporary, Ḥasan of Delhi (died 1328), is less well known and had a more simple style. He nevertheless surpassed Khosrow in warmth and charm, qualities that have earned him the title of "the Saʿdī of Hindustan."

Turkish literature. As for the literary developments in Turkey around 1300, the mystical singer Yunus Emre is the first and most important in a long line of popular poets. Little is known about his life, which he probably spent not far from the Sakarya River of Asia Minor. Before him, in Central Asia, the religious leader Ahmed Yesevi (died 1166) had written some rather dry verses on wisdom in Turkish. Yunus, in Anatolia, however, was the first known poet to have caught something of Rūmī's fervour and translated it into a provincial setting, creating ". . . a Turkish vernacular poetry that was to be the model for all subsequent literary productions of popular religion." Sometimes he used the inherited Arabo-Persian prosody, but his best poems are those written in four-line verses using syllable-counting metres. Yunus drew heavily on the reservoir of imagery that had been collected by the great Persian writing mystics, notably Rūmī; but his classical technique did not hinder the expression of his own unself-conscious simplicity, which led him to introduce new images taken from everyday life in Anatolian villages. His *ilahis* (hymns), probably written to be sung at the meetings of the Ṣūfis in the centres of their orders, are still loved by the Turks and memorized by their children.

Use of images from everyday life

Influence of Yunus Emre. The Turkish people rightly claim Yunus as the founder of Turkish literature proper. His poetry is considered the chief pillar of poetry of the Bektāshīyah Ṣūfī order, and many poets of this and other orders have imitated his style (though without reaching the same level of poetic truth and human warmth). Among the later poets claimed by the Bektāshīs may be mentioned Kaygusuz Abdal (15th century), who probably came from the European provinces of the Ottoman Empire. His verses are full of burlesque and even coarse images: in their odd mixture of worldliness and religious expression they are often as amusing as they are puzzling. In the 16th century, Pir Sultan Abdal (executed *c.* 1560) is noted for a few poems of austere melancholy. He was executed for collaboration with the Ṣafavids, the archenemies of the Ottomans; and in this connection it is worth remembering that the founder of the Iranian Ṣafavid dynasty, Shāh Esmāʿīl I (died 1524), wrote Turkish poetry under the pen name Khaṭāʾī and is counted among the Bektāshī poets.

Religious poetry. Mystically tinged poetry has always been very popular in Turkey, both in cities and rural areas. The best loved religious poem of all was, and still is, Süleyman Çelebi's (died 1419) *Mevlûd,* a quite short *mas̄navī* in honour of the Prophet Muḥammad's birth. This type of poetry has been known in the Islāmic countries since at least the 12th century and was soon adopted wherever Islām spread. There are a great number of *mevlûd* written in Turkish, but it was Süleyman Çelebi's unpretentious description of the great religious event that captured the hearts of the Turks; and it is still sung on many occasions (on the anniversary of a death, for example). The poem makes an excellent introduction to an understanding of the deep love for the Prophet felt by the pious Muslim.

Persian literature: 1300–1500. In the Iran of the Middle Ages, a vast number of poets flourished at the numerous courts. Not only professional poets but even the kings and princes contributed more or less successfully to the body of Persian poetry. Epics, panegyrics, and mystico-didactical poetry had all reached their finest hour by the end of the 13th century; the one genre to attain perfection slightly later was the *ghazal,* of which Moḥammad Shams od-Dīn Ḥāfeẓ (died 1389/90) is the incontestable master.

Lyric poetry: Moḥammad Shams od-Dīn Ḥāfeẓ. Ḥāfeẓ lived in Shīrāz; his pen name—"Who Knows the Qur'ān by Heart"—indicates his wide religious education, but little is known about the details of his life. The same is true of many Persian lyrical poets, since their products rarely contain much trustworthy biographical material. Ḥāfeẓ's comparatively small collection of work—his *Dīvān* contains about 400 *ghazal*s—was soon acclaimed as the finest lyrical poetry ever written in Persian. The discussion of whether or not to interpret its wine and love songs on a mystical plane has continued for centuries. Yet this discussion seems sterile since Ḥāfeẓ, whose verbal images shine like jewels, is an outstanding exponent of the ambiguous and oscillating style that makes Persian poetry so attractive and so difficult to translate. The different levels of experience are all expressed through the same images and symbols: the beloved is always cruel, whether a chaste virgin (a rare case in Persian poetry!) or a professional courtesan, or, as in most cases, a handsome young boy, or God himself, mysterious and unattainable—or even, on the political plane, the remote despot, the wisdom of whose schemes must never be questioned by his subjects. Since mystical interpretation of the world order had become almost second nature to Persians during the 13th century, the human beloved could effortlessly be regarded as God's manifestation; the rose became a symbol of highest divine beauty and glory; the nightingale represented the yearning and complaining soul; wine, cup, and cupbearer became the embodiment of enrapturing divine love. The poets' multicoloured images were not merely decorative embroidery but were a structural part of their thought. One must not expect Ḥāfeẓ (or any other poet) to unveil his personal feelings in a lyrical poem of experience. But no other Persian poet has used such complex imagery on so many different levels with such harmonious and well-balanced lucidity as did Ḥāfeẓ. His true greatness lies in this rather than in the content of his poetry. It must be stressed again that, according to the traditional view, each verse of a *ghazal* should be unique, precious for its own sake, and that the apparent lack of logic behind the sequence of verses was considered a virtue rather than a defect. (It may help to think of the glass pieces in a kaleidoscope, which appear in different patterns from moment to moment, yet themselves form no logical pattern.) To what extent an "inner rhythm" and a "contrapuntal harmony" can be detected in Ḥāfeẓ's poetry is still a matter for discussion; but that he perfected the *ghazal* form is indisputable. Whether he is praised as a very human love poet, as an interpreter of esoteric lore, or, as has been recently suggested, as a political critic, his verses have a continuing appeal to all lovers of art and artistry.

Use of a standard set of images and symbols

Parodies of classic forms. Ḥāfeẓ's contemporary in Shīrāz was the satirist ʿObeyd-e Zākānī (died 1371), noted for his obscene verses (even the most moralistic and mystical poets sometimes produced surprisingly coarse and licentious lines) and for his short *maṣnavī* called *Mūsh o-gorbeh* ("Mouse and Cat"), an amusing political satire. Since few new forms or means of expression were open to them, ʿObeyd and other poets began ridiculing the classic models of literature: thus, Bosḥāq (died *c.* 1426) composed odes and *ghazal*s exclusively on the subject of food.

Poetry of the Timurid period

The Timurid period in Iran produced only moderately good poetry, despite the rulers' interest in art. Allegorical *maṣnavī*s were much in vogue, such as the *Shabestān-e khayāl* ("Bedchamber of Fantasy") by the prolific writer Fattāḥī of Nīshāpūr (died 1448) and *Gūy o-chowgān* ("Ball and Polo-stick") by ʿĀrefī (died 1449); the latter work is an elaboration of the cliché that the lover is helpless before the will of his beloved, just as the ball is subject to the will of the polo-stick (". . . the head of the lover in the polo-stick of the beloved's tresses").

Eclecticism of ʿAbd or-Raḥmān Jāmī. The last great centre of Islāmic art in the region of Iran was the Timurid court of Herāt, where Dowlatshāh (died 1494) composed his much-quoted biographical work on Persian poets. The leading figure in this circle was ʿAbd or-Raḥmān Jāmī (died 1492), who is sometimes considered the last and most comprehensive of the "seven masters" in Persian literature, since he was a master of every literary genre and did not specialize in one form only, as Anvarī and Ḥāfeẓ, among others, had done. Jāmī wrote an excellent imitation of Neẓāmī's *Khamseh,* enlarging it by the addition of two mystical *maṣnavī*s into a septet called *Haft owrang* ("The Seven Thrones," or "Ursa Major"). His interest in Ṣūfism—he was initiated into the Naqshbandīyah order—is clear from his famous biographies of the Ṣūfī saints (which were an elaboration of a similar work by the 11th-century ʿAbd Allāh al-Anṣārī). In imitation of Saʿdī, Jāmī also composed the *Bahārestān* ("Orchard of Spring"), written in prose interspersed with verses. He left no less than three large divans, which contain work of high quality and demonstrate his gift for inventing picturesque images. Although his work abounds in lavishly ornamented verses, his style on the whole lacks the perfect beauty of Ḥāfeẓ's lyrics and is already tending toward the heavier, more opaque "Indian" style. Jāmī also wrote treatises about literary riddles and various kinds of intellectual games, of which Muslim society in the late 15th century was very fond and which remain a feature of erudite Persian and Turkish poetry. His influence on the work of later poets, especially in Ottoman Turkey, was very powerful.

An interesting aspect of the Timurid court in Herāt was the attention given to Chagatai Turkish, which was spoken in the eastern regions of Islām. ʿAlī Shīr Navāʾī, minister at the court (and a close friend of Jāmī), emphasized the beauties of his Turkic mother tongue as compared with Persian in his *Muḥākamat al-lughatayn* ("Judgment of the Two Languages"). He composed most of his lyrics and epics in Chagatai, which previously had been used by some members of the Timurid family and their courtiers for poetry but which became, thanks to him, an established literary medium. Even the arts-loving ruler of Herāt, Ḥusayn Bayqara (died 1506), wrote poetry in Turkic, following in every respect conventional literary taste.

Prose works: the "Mirror for Princes." During the first five centuries of Modern Persian literary life, a multitude of prose works were written. Among them, the "Mirror for Princes" deserves special mention. This genre, introduced from Persian into Arabic as early as the 8th century, flourished once more in Iran during the late 11th century. One important example is the *Qābūs-nāmeh* by the Zeyārid prince ʿOnṣor ol-Maʿālī Keykāvūs (died 1098), which presents "a miscellany of Islāmic culture in pre-Mongol times." At the same time, Niẓām al-Mulk (died 1092), the grand vizier of the Seljuqs, composed his *Seyāsat-nāmeh* ("Book of Government"), a good introduction to the statesman's craft according to medieval Islāmic standards. The *Seyāsat-nāmeh* was heavily influenced by pre-Islāmic Persian tradition. In the same period and environment, even a mystic like al-Ghazālī felt disposed to write a *Naṣīḥat al-mulūk* (Counsel for Kings), although the idealized relationship he makes between religious theory and practical statesmanship was not very realistic. A later mystic to compose a similar work was Sayyid ʿAlī Hamadhānī (died 1385), who had settled in Kashmir and initiated its Sūfi poetry. Others, especially in India, exhorted rulers in their writings.

The "Book of Government"

Belles lettres. Belles lettres proper found a fertile soil in Iran. The fables of *Kalīlah wa Dimnah,* for example, were retold several times in Persian. The most famous version, though a rather turgid one, is called *Anvār-e soheylī* ("Lights of Canopus") and was composed by a famous mystic, Ḥoseyn Wāʿeẓ-e Kāshefī of Herāt (died 1504). The "cyclic story" form (in which several unconnected tales are held together by a common framework or narrator device), inherited from India, became as popular in Iran as it had been in the Arabic-speaking countries. The *Sendbād-nāmeh* and the *Ṭūṭī-nāmeh* ("Parrot Book"), which is based on Indian tales, are both good examples of the popular method whereby a variety of instructive stories are skillfully strung together within a basic "running" story. The first comprehensive collection of entertaining prose is *Jawāmiʿ al-ḥikayat* ("Collections of Stories"), a veritable storehouse of tales and anecdotes, by ʿOwfī (died *c.* 1230). Anecdotes were an important feature of the biographical literature that became popular in Iran and Muslim India. Biographies of the poets of a certain age or of a specified area were collected together. They provide the reader with few concrete facts about the subjects concerned; but they abound in anecdotes, sayings, and verses attributed to the subjects, thus preserving material that otherwise might have been lost. Many of these biographical manuals, such as ʿOwfī's *Lubāb al-albāb* ("Quintessence of the Hearts") or Dowlatshāh's *Tazkirat ash-shuʿarā* ("Biography of the Poets"), make agreeable reading. The authors concerned wished to demonstrate their own erudition and rhetorical technique as much as to immortalize their subjects; consequently, their books are important equally as stylistic documents and as historical sources. One of the most remarkable works in this field is *Chahār maqāleh* ("Four Treatises") by Neẓāmī-ye ʿArūẓī, a writer from eastern Iran. Written in about 1156, this little book is an excellent introduction to the ideals of Persian literature and its writers, discussing in detail what is required to make a perfect poet, giving a number of instances of the sort of poetic craftsmanship thought especially admirable, and allowing glimpses into the various arts in which the literary man was expected to excel.

"Anecdotal" writing

This tendency toward "anecdotal" writing, which is also manifest in the work of a number of Arab historians, can be observed in the cosmographical books and in some of the historical books produced in medieval Iran. Ḥamdollāh Mostowfī's (died after 1340) cosmography, *Nuzhat al-qulūb* ("Pleasure of the Hearts"), like many earlier works of this genre, underlined the mysterious aspects of the marvels of creation and was the most famous of several instructive collections of mixed folkloristic and scientific material. Early miniaturists, too, loved to illustrate the most unlikely tales and pieces of information given in such works. Historical writing proper had been begun by the Persians as early as the late 10th century, when Balʿamī's abridged translation of aṭ-Ṭabarī's (died 923) vast Arabic chronicle first acquainted them with this outstanding piece of early Arabic historical literature. The heyday of historiography in Iran, however, was the Il-Khanid period (mid-13th to mid-14th century). Iran was then ruled by the successors of Genghis Khan, and scholars began to extend their interest back to the history of pre-Islāmic Central Asia, whence the rulers had come. *Tārīkh-e jehān-goshāy* ("History of the World Conqueror") by ʿAṭā Malek-e Joveynī (died 1283) and *Jāmiʿ at-tawārīkh* ("Collector of Chronicles") by the physician and vizier Rashīd ad-Dīn (executed 1318) are both outstanding examples of histories filled with valuable information. Although the writing of history became a firmly established art in Iran and the adjacent Muslim countries, the facts were unfortunately all too often concealed in a bombastic style and a labyrinth of cumbersome, long-winded sentences. A history written by Vaṣṣāf (died 1323) is the most notorious example of turgidity, but even his style was surpassed by some later writers. These stylistic tendencies deeply influenced Turkish prose writing: 17th-century Turkish historical works, such as those of Peçevi (died *c.* 1650) and Naima (died 1716), for this reason almost defy translation. Later Persian prose in India suffered from the same defects. This development in Persian and Turkish prose is also reflected in the handbooks on style and letter writing that were written during the 14th and 15th centuries and afterward. They urged the practice of all the artificial tricks of rhetoric by this time considered essential for an elegant piece of prose.

Popular literature. Islāmic literatures, however, should not be thought to consist only of erudite and witty court poetry, of frivolous or melancholy love lyrics full of literary conceits, or of works deeply mystical in content. Such works are counterbalanced by a great quantity of popular literature, of which the most famous expression is *Alf laylah wa laylah* (*The Thousand and One Nights,* also known as *The Arabian Nights' Entertainment*). The tales collected under this title come from different cultural areas; their nucleus is of Indian origin, first translated into Persian as *Hazār afsānak* ("Thousand Tales") and then into Arabic. These fanciful fairy tales were later expanded with stories and anecdotes from Baghdad. Subsequently, some tales—mainly from the lower strata of society—about rogues, tricksters, and vagabonds were added in Egypt. Independent series of stories, such as that of Sindbad the Sailor, were also included. The entire collection is very important as a reflection of several aspects of Oriental folklore and allows, now and then, glimpses into the court life of the various dynasties. Since its first translation into French (1704), it has inspired many Western readers' dreams about the "romantic" East.

The Thousand and One Nights

From pre-Islāmic times the Arabs had recounted tales of the *ayyām al-ʿArab* ("Days of the Arabs"), which were stories of their tribal wars, and had dwelt upon tales of the heroic deeds of certain of their brave warriors, such as ʿAntarah. Modern research, however, suggests that his story in its present setting belongs to the period of the Crusades. The Egyptian queen, Shajar ad-Durr (died 1250), and the first brave Mamlūk ruler, Baybars I (died 1277), as well as the adventures of the Bedouin tribe Banū Hilāl on its way to Tunisia, are all the subjects of lengthy popular tales.

In Iran, many of the historical legends and myths had been borrowed and turned into high literature by Ferdowsī. Accounts of the glorious adventures of heroes from early Islāmic times were afterward retold throughout Iran, India, and Turkey. Thus, the *Dāstān-e Amīr Ḥamzeh,* a story of Muḥammad's uncle Ḥamzah ibn ʿAbd al-Muṭṭalib, was slowly enlarged by the addition of more and more fantastic details. This form of *dāstān,* as such literature is called, to some extent influenced the first attempts at novel writing in Muslim India during the 19th century. The epics of Köroğlu are common to both Iranian and Turkish tradition. He was a noble warrior-robber who became one of the central figures in folk literature from Central Asia to Anatolia.

Some popular epics were composed in the late Middle Ages, having as their basis local traditions. One such epic had as its basis the Turco-Iranian legend of an 8th-century hero, Abū Muslim, another the Turkish tales of the knight Dānishmend. Other epics, such as the traditional Turkish tale of Dede Korkut, were preserved by storytellers who improvised certain parts of their tales (which were noted down only afterward). Also, the role of the Ṣūfī orders and of the artisans' lodges in preserving and transmitting such semihistorical popular epics seems to have been considerable. Apart from heroic figures, the Muslim peoples further share a comic character—basically a type of low-class theologian, called Nasreddin Hoca in Turkish, Juḥā in Arabic, and Mushfiqī in Tadzhik. Anecdotes about this character, which embody the mixture of silliness and shrewdness displayed by this "type," have amused generations of Muslims.

Popularity of romantic love stories

Shortly after the introduction of the printing press, Turkey and Iran began to produce cheap books, sometimes illustrated, containing popular romantic love stories. Large numbers of fairy tales were published in these cheap editions, and still other fairy tales have been collected by European and Muslim folklorists.

A truly popular poetry is everywhere to be found: lullabies sung by Baluchi, Kurdish, and Ibo mothers have obvious similarities; workers sing little rhythmical poems to accompany their work, and nomads remember the adventures of their ancestors in their ballads. Such popular poems often contain dialect expressions, and the metres differ from the classical quantitative system. Some of these simple verses, such as a two-line *lanḍay* in Pashto, are among the most graceful products of Islāmic poetry. Many folksongs—lullabies, wedding songs, and dirges—

have a distinct mystical flavour and reflect the simple Muslim's love for the Prophet and his trust in God's grace even under the most difficult circumstances. Irony and wit are features of the riddle poem, a favourite form among Muslims everywhere. Folk poets were also fond of humorous descriptions of imaginary disputations between two entities—they might compose dialogues between coffee and tobacco (Morocco), between a big and a small mosque (Yemen), between a cat and a dog, or between a boy and a girl. This kind of literature in the semicolloquial or dialectical Arabic poetry of the 17th and 18th centuries in Yemen, Upper Egypt, and central Arabia would bear a thorough study. All the Iranian and Turkic languages, too, possess a rich heritage of popular poetry, which in many cases appeals more immediately to modern tastes than does the rather cerebral high literature of the urban and court cultures.

THE PERIOD FROM 1500 TO 1800

According to Persian tradition, the last classic author in literature was Jāmī, who died in 1492. In that year, Christopher Columbus discovered America, and the Christians reconquered Granada, the last Moorish stronghold of Spain. The beginning of the 16th century was as crucial in the history of the Muslim East as in that of the Western Hemisphere. In 1501, the young Esmāʿīl founded the Ṣafavid rule in Iran, and the Shīʿah persuasion of Islām was declared the state religion. At the same time, the kingdoms of the last Timurid rulers in Central Asia were overthrown by the Uzbeks, who, for a while, tried to continue the cultural tradition in both Persian and Turkic at their courts in Bukhara. In 1526, after long struggles, one member of the Timurid house, Bābur, laid the foundation of the Mughal Empire in India. In the Near East, the Ottoman Turks, having expanded their empire (beginning in the late 13th century) from northwestern Anatolia into the Balkans, conquered crumbling Mamlūk Egypt and adjacent countries, including the sacred places of Mecca and Medina in 1516–17. Thus, three main blocks emerged, and the two strongholds of Sunnī Islām—Ottoman Turkey and Mughal India—were separated by Shīʿah Iran.

Decentralization of Islāmic literatures. Ṣafavid Iran, as it happened, lost most of its artists and poets to the neighbouring countries: there were no great masters of poetry in Iran between the 16th and 18th centuries. And while the Persian Shāh Esmāʿīl wrote Turkish mystical verses, his contemporary and enemy, Sultan Selim I of Turkey (died 1520), composed quite elegant Persian *ghazals*. Bābur (died 1530), in turn, composed his autobiography in Eastern Turkic.

Islāmic autobiographical literature

Bābur's autobiography is a fascinating piece of Turkish prose and at the same time one of the comparatively rare examples of Islāmic autobiographical literature. The classic example in this genre, however, was a lively Arabic autobiography by Usāmah ibn Munqidh (died 1188), which sheds much light upon the life and cultural background of a Syrian knight during the Crusades. A number of mystics, too, had written their spiritual autobiographies in a variety of languages, with varying degrees of artistic success. Bābur's book, however, gives a wonderful insight into the character of this intrepid conqueror. It reveals him as a master of concise, matter-of-fact prose, as a keen observer of daily life, full of pragmatic common sense, and also as a good judge of poetry. Bābur even went so far as to write a treatise in Turkish about versification. Many of his descendants, both male and female, inherited his literary taste and talent for poetry; among them are remarkably good poets in Persian, Turkish, and Urdu, as well as accomplished authors of autobiographies (Jahāngīr) and letters (Aurangzeb). Among the nobility of India, the Turkish language remained in use until the 19th century. Lovely Turkish verses were written, for example, by Akbar's general, Khān-e Khānān ʿAbd-ur-Raḥīm (died 1626), who was a great patron of fine arts and poetry.

In the Arab world, there was hardly a poet or original writer of note during the three centuries that followed the Ottoman conquest, apart from some theologians (ʿAbd al-Wahhāb ash-Shaʿrānī, died 1565; ʿAbd al-Ghanī an-Nābulusī, died 1731) and grammarians. Yet Arabic still remained the language of theology and scholarship throughout the Muslim world; both Turkey and India could boast a large number of scholars who excelled in the sacred language. In Ottoman Turkey, Taşköprüzāde (died 1560) compiled a historical survey of outstanding Turkish intellectuals in Arabic. Although a fine example of Islāmic learning, it does not compare in usefulness with the bibliographical work in Arabic by Hacı Halifa (Kâtib Çelebî; died 1658), which is a valuable source for modern knowledge of literary history.

New importance of Indian literature. India's share in the development of Arabic literature at this time was especially large. In addition to the quantity of theological work written in the language of the Qur'ān, from the conquest of Sind in 711 right up until the 19th century, much philosophical and biographical literature in Arabic was also being written in the subcontinent. Persian taste predominated in the northwest of India, but in the southern provinces there were long-standing commercial and cultural relationships with the Arabs, especially in Yemen and Ḥaḍramawt, and an inclination toward preserving these intact. Thus, much poetry in conventional Arabic style was written during the 16th and 17th centuries, mainly in the kingdom of Golconda. There are even attempts at the epic form. A century after the heyday of Arabic in the Deccan, Āzād Bilgrami (died 1786) composed numerous poetical and biographical works in Persian; but his chief fame was as the "Ḥassān of Hind," since he, like the Prophet Muḥammad's *protégé* Ḥassān ibn Thābit, wrote some powerful Arabic panegyrics in honour of the Prophet of Islām. He even attempted to make a comparison of the characteristics of Arabic and Sanskrit poetry and tried to prove that India was the real homeland of Islām. It should be added that al-Sayyid Murtaḍā az-Zabīd (died 1791), a leading philologist, author of the fundamental work of lexicography *Tāj al-ʿarūs* ("The Bride's Crown"), and commentator on Ghazālī's main work, was of Indian origin. Laudatory poems and belles lettres in Arabic were still popular in the early 19th century at the Shīʿite court of Lucknow, then the chief centre of Urdu poetry.

Poetry in conventional Arabic style

Indian literature in Persian. Nevertheless, the main contribution of Muslim India to high literature was made in the Persian tongue. Persian had been the official language of the country for many centuries. The numerous annals and chronicles that were compiled during the 14th and 15th centuries, as well as the court poetry, had been composed exclusively in this language even by Hindus. During the Mughal period, its importance was enhanced both by Akbar's attempt to have the main works of classical Sanskrit literature translated into Persian and by the constant influx of poets from Iran who came seeking their fortune at the lavish tables of the Indian Muslim grandees. At this time what is known as the "Indian" style of Persian emerged. The translations from Sanskrit enriched the Persian vocabulary, and new stories of Indian origin added to the reservoir of classical imagery. The poets, bound to the inherited genres of *mas̄navī, qaṣīdah,* and *ghazal,* tried to outdo each other in the use of complex rhyme patterns and unfamiliar, often stiff, metres. It became fashionable to conceive a poem according to a given *zamīn* ("ground"), in emulation of a classical model, and then to enrich it with newly invented tropes. The long-held ideal of "harmonious selection of images" was not always met. Difficult, even awkward grammatical constructions and inverted metaphors can be found. At times, pseudo-philosophical utterances in the second hemistich of a verse contrast strangely with semicolloquial expressions elsewhere. Objects recently introduced to India, such as the eyeglass or hourglass, were eagerly adopted as images by the poets, who wanted new-fangled conceits to bolster their tortuous inventiveness. Notwithstanding the colourful descriptive poems written in praise of such subjects as Mughal palaces, marvelously illuminated manuscripts, rare elephants, or court scenes, the general mood of lyric poetry became more gloomy. The transitory nature of the world, also a central theme in classical Persian poetry, was stressed and depicted in bizarre images: "burnt nest," "breakdown," "yawning" (indicating insatiable thirst); these were some of the new "stylish" words.

The works of ʿUrfī

Yet some truly great poets are to be found even in this period. ʿUrfī, who left Shīrāz for India and died in his mid-30s in Lahore (1592), is without doubt one of the few genuine masters of Persian poetry, especially in his *qaṣīdah*s. His verses pile up linguistic difficulties; yet their dark, glowing quality cannot fail to touch the hearts and minds even of critical modern readers—more so than the elegant but rather cerebral verses of his colleague Fayẕī (died 1595), one of Akbar's favourites. Fayẕī's brother Abū-ul-Faẕl ʿAllāmī (died 1602), the author of an important, though biased, historical work, deeply influenced the Emperor's religious ideas. Among 17th-century Mughal court poets, the most outstanding is Abū Ṭālib Kalīm (died 1651), who came from Hamadan. Abounding in descriptive passages of great virtuosity, his poignant and often pessimistic verses have become proverbial, thanks to their compact diction and fluent style. Also of some importance is Ṣā'ib of Tabriz (died 1677), who spent only a few years in India before returning to Iran. Yet, of his immense poetical output (300,000 couplets), the great majority belongs to the stock-in-trade expression of the Persian-speaking world. Other poets described the lives and adventures of members of the royal families, usually in verbose *mašnavī*s (this kind of descriptive historical poetry was practiced throughout Muslim India and also in Ottoman Turkey). Outside the Mughal environment, the lyrics and *mašnavī*s by Ẓuhūrī (died 1615) at the court of Bijāpur are charming and enjoyable. The heir apparent of the Mughal Empire, Dārā Shikōh (executed 1659), also followed Akbar's path. His inclination to mysticism is reflected in both his prose and poetry. The Persian translation of the *Upaniṣad*s, which he sponsored (and in part wrote himself), enriched Persian religious prose and made a deep impression on European idealistic philosophy in the 19th century. A group of interesting poets gathered about him, none of them acceptable to orthodoxy. They included the convert Persian Jew Sarmad (executed 1661), author of mystical *robāʿīyāt,* and the Hindu Brahman (died 1662), whose prose work *Chahār chaman* ("Four Meadows") gives an interesting insight into life at court. With the long rule of Dārā Shikōh's brother, the austere Aurangzeb (died 1707), the heyday of both poetry and historical writing in Muslim India was over. Once more, orthodox religious literature gained preeminence, while poets tried to escape into a fantasy world of dreams. The style of the two leading poets of this age, Nāṣir ʿAlī Sirhindī (died 1697) and Mīrzā Bēdil (died 1721), is convoluted and obscure, prompting the Persian poet Ḥazīn (died 1766), who came to India in the early 18th century, to write ironic comments about its incomprehensibility. Bēdil, however, was a very interesting writer. His lyric poetry is difficult but often rewarding, while his many philosophical *mašnavī*s deserve deep study. His prose work, interspersed with poetry, is called *Chahār ʿunṣur* ("Four Elements") and contains some biographical details. His prose is nearly as difficult as his poetry, and consequently his works rarely have been read west of India. His poetry, however, has had a great influence in Afghanistan and Central Asia. Many Persian-speaking people there consider him the forerunner of Tadzhik literature, since virtually everyone in Bukhara and Transoxania who tried his hand at poetry followed Bēdil's example. His ideas, sometimes astoundingly modern and progressive, have also impressed the 20th-century poet and philosopher Muḥammad Iqbāl in Muslim India.

Bēdil's progressive ideas

With Bēdil, the "Indian summer" of Persian literature comes to an end, even though the output of Persian poetry and prose during the 18th century in the subcontinent was immense. Some of the biographical dictionaries and handbooks of mysticism are valuable for the scholar but are less interesting as part of the general history of literature. The main vehicle of poetry now became Urdu, while mystical poetry flourished in Sindhi and Punjabi.

Pashto poetry: Khushḥāl Khān Khaṭak. From the borderlands of the Persian-speaking zone, culturally under the Mughal rule, one man deserves special attention. The chief of the Pashtun tribe of Khaṭak, Khushḥāl Khān (died 1689), rightly deserves to be called the "father" of Pashto poetry, for he virtually created a literature of his own in his mother tongue. His skill in translating the sophisticated traditions of Persian literature into the not too highly developed idiom of the Pashtuns is astonishing. His lively lyric poems are his finest works, reflecting that passionate love of freedom for which he fought against the Mughals. The poems he wrote from prison in "hell-like hot India" are as dramatic as they are touching in their directness. Many members of his family took to poetry; and during the 18th century original works, both religious and secular, were composed in Pashto, and the classics of Persian literature were translated into that language.

Ottoman Turkey. The development of literature in Ottoman Turkey is almost parallel with that of Iran and India. Yunus Emre had introduced a popular form of mystical poetry; yet the mainstream of secular and religious literature followed Persian models (although it took some time to establish the Persian rules of prosody because of the entirely different structure of the Turkish language). In the religious field, the vigour and boldness expressed in the poems of Nesimî (executed 1417) left their traces in the work of later poets, none of whom, however, reached his loftiness and grandeur of expression. The 14th- and 15th-century representatives of the classical style had displayed great charm in their literary compositions, their verses simple and pleasing. Sultan Cem (Jem; died 1495), son of Mehmed the Conqueror, is an outstanding representative of their number. But soon the high-flown style of post-classical Persian was being imitated by Ottoman authors, rhetoric often being more important to them than poetical content. The work of Bâkî (Bāqī; died 1600) is representative of the entire range of these Baroque products. Yet his breathtaking command of language is undeniable; it is brilliantly displayed in his elegy on Süleyman the Magnificent. In his time, according to a popular saying, one could find "a poet under every stone of Istanbul's pavement." Istanbul was the unique cultural centre of the Near East, praised throughout the ages by all who lived in the imperial city.

Poetry of Fuzûlî of Baghdad. Much greater than most of these minor poets, however, was a writer living outside the capital, Fuzûlî of Baghdad (died 1556), who wrote in Arabic, Persian, and Azeri Turkish. Apart from his lyrics, his Turkish *mašnavī* on the traditional subject of the lovers Majnūn and Laylā is admirable. From earliest times, Turkish poets had emulated the classical Persian romantic *mašnavī*s, sometimes surpassing their models in expressiveness. Fuzûlî's diction is taut, his command of imagery masterly. His style unfortunately defies poetical translation, and his complicated fabric of plain and inverted images, of hidden and overt allusions is well-nigh impossible for all but the initiated Muslim reader to disentangle. Fuzûlî, moreover, like his fellow poets, would blend Arabic, Persian, and Turkish constructions and words to make up a multifaceted unit. The same difficulty is found in Turkish prose literature of the same period. It is a major task to unravel the long trailing sentences of a writer such as Evliya Çelebî (died after 1679), who, in an account of his travels (*Seyahatnâme*), has left extremely valuable information about the cultural climate in different parts of the Ottoman Empire.

Emulation of classical Persian *mašnavī*s

Later developments. Growing interest in the Indo-Persian style, particularly in ʿUrfī's *qaṣīdah*s, led the 17th-century Ottoman poets to a new integrated style and precision of diction. An outstanding representative was Nefʿî, whose bent for merciless satire made him dreaded in the capital and eventually led to his assassination. At the start of the 18th century, a marked but short-lived movement in Turkish art known as the "Tulip Period" was the Ottoman counterpart of European Rococo. The musical poems and smooth *ghazal*s of Nedim (died 1730) reflect the manners and style of the slightly decadent, relaxed, and at times licentious high society of Istanbul and complement the miniatures of his contemporary Levnî. Good Turkish poetry is characterized by an easy grace, to be found even in such mystically tinged poems (thousands of which were written throughout the centuries) as those of Niyazî Misrî (died 1697). The Mevlevî (Mawlawī) poet Gâlib Dede (died 1799) was already standing at the threshold of what can now be recognized as modern poetical expression in some of the lyrical parts of his *mas̄navī,* called *Hüsn u aşk* ("Beauty and Love"), which brought fresh treatment to a well-worn subject of Iran's philosophical and secular literature. His work cannot be properly understood, however, without a thorough knowledge of mystical psychology, expressed in multivalent images.

Folk poetry. One branch of literature, however, was totally neglected by the sophisticated inhabitants of the Ottoman capital. Nobody thought much of the folk poets who wandered through the forgotten villages of Anatolia singing in simple syllable-counting verses of love, longing, and separation. The poems of the mid-17th-century figure Karacaoğlan, one of the few historically datable folk poets, give a vivid picture of village life, of the plight of girls and boys in remote Anatolian settlements. This kind of poetry was rediscovered only after the foundation of the Turkish Republic in 1923 and then became an important influence on modern lyric poetry.

EUROPEAN AND COLONIAL INFLUENCES: EMERGENCE OF WESTERN FORMS

The rise of nationalism. For the Islāmic countries, the 19th century marks the beginning of a new epoch. Napoleon's conquest of Egypt, as well as British colonialism, brought the Muslims into contact with a world whose technology was far in advance of their own. The West had experienced the ages of Renaissance, Reformation, and Enlightenment, whereas the once-flourishing Muslim civilization had for a long while been at a near stagnation point despite its remarkable artistic achievements. The introduction of Muslim intellectuals to Western literature and scholarship—the Egyptian aṭ-Ṭahṭāwī (died 1873), for example, studied in France—ushered in a new literary era the chief characteristic of which was to be "more matter, less art." The literatures from this time onward are far less "Islāmic" than those of the previous 1,000 years, but new intellectual experiences also led to "the liberation of the whole creative impulse within the Islāmic peoples" (Kritzeck). The introduction of the printing press and the expansion of newspapers helped to shape a new literary style, more in line with the requirements of the modern times, when "the patron prince has been replaced by a middle-class reading public" (Badawi). Translations from Western languages provided writers with the model examples of genres previously unknown to them, including the novel, the short story, and dramatic literature. Of those authors whose books were translated, Guy de Maupassant, Sir Walter Scott, and Anton Chekhov have been most influential in the development of the novel and the novella. Important also was the ideological platform derived from Tolstoy, whose criticism of Western Christianity was gratefully adopted by writers from Egypt to Muslim India. Western influences can further be observed in the gradual discarding of the time-hallowed static (and turgid) style of both poetry and prose; in the tendency toward simplification of diction; and in the adaptation of syntax and vocabulary to meet the technical demands of emulating Western models. Contact with the West also encouraged a tendency toward retrospection. Writers concentrated their attention on their own country and particular heritage, such as the "pharaoic myth" of Egypt, the Indo-European roots of Iran, and the Central Asian past of Turkey. In short, there was an emphasis on differentiation, inevitably leading to the rise of nationalism, instead of an emphasis on the unifying spirit and heritage of Islām.

Muslim intellectuals' introduction to Western scholarship

Arab literatures. Characteristically, therefore, given this situation, the heralds of Arab nationalism (as reflected in literature) were Christians. The historical novels of Jurjī Zaydān (died 1914), a Lebanese living in Egypt, made a deep impression on younger writers by glorifying the lion-hearted national heroes of past times. Henceforth, the historical novel was to be a favourite genre in all Islāmic countries, including Muslim India. The inherited tradition of the heroic or romantic epic and folktale was blended with novelistic techniques learned from Sir Walter Scott. Two writers in the front rank of Arab intellectuals were: Amīr Shakīb Arslān (died 1946), of Druze origin, and Muḥammed Kurd ʿAlī (died 1953), the founder of the Arab Academy of Damascus, each of whom, by encouraging a new degree of awareness, made an important contribution to the education of modern historians and men of letters. An inclination toward Romanticism can be detected in prose writing but not, surprisingly, in poetry; thus, the Egyptian al-Manfalūṭī (died 1924) poured out his feelings in a number of novels that touch on Islāmic as well as national issues.

Poetry. It is fair to say of this transition period that the poetry being written was not as interesting as the prose. The *qaṣīdah*s of the "Prince of Poets," Aḥmad Shawqī (died 1932), are for the most part ornate imitations of classical models. Even the "Poet of the Nile," Muḥammad Ḥāfiẓ Ibrahim (died 1932), who was more interested in the real problems of the day, was nonetheless content to follow conventional patterns. In his poems, Khalīl Muṭrān (died 1949) attempted to achieve a unity of structure hitherto almost unknown; and he also adopted a more subjective approach to expressive lyricism. Thus, he can be said to have inaugurated an era of "Romantic" poetry, staunchly defended by those men of letters who had come under English rather than French influence. These included the poet and essayist Ibrāhīm al-Māzinī (died 1949) and the prolific writer of poetry and prose ʿAbbās Maḥmūd al-ʿAqqād (died 1964).

Prose. A major contribution to the development of modern prose in the Arabic language was made by a number of writers born between 1889 and 1902. One of them, the "humanist" Taha Hussein, became well known in the West as a literary critic who attacked the historical authenticity of pre-Islāmic poetry and stressed the importance of Greek and Latin for the literatures of the modern Near East. He is also the author of a successful novel called *The Tree of Misery;* but his best creative writing is in his autobiographical notes, *al-Ayyām* ("The Days"), which describe in simple language the life of a blind Egyptian village boy. Taha Hussein's generation became more and more absorbed by the problems of the middle classes (to which most of them belonged), and this led them to realism in fiction. Some turned to fierce social criticism, depicting in their writings the dark side of everyday life in Egypt and elsewhere. The leading writer of this group is Maḥmūd Taymūr, who wrote short stories, a genre developed in Arabic by a Lebanese Christian who settled in the United States, the noted and versatile poet Khalil Gibran (Jibrān Khalīl Jibrān; died 1931). Muḥammad Ḥusayn Haykal (died 1956), a leading figure of Egyptian cultural and political life and the author of numerous historical studies, touched for the first time, in his novel *Zaynab* (1913), on the difficulties of Egyptian villagers. This subject quickly afterward became fashionable, although not all the writers had firsthand knowledge of the feelings and problems of the fellahin. The most fertile author of this group was al-ʿAqqād, who tirelessly produced biographies, literary criticism, and romantic poetry. To what extent the Islāmic reform movement led by Muḥammad ʿAbduh (died 1905) and his disciples, which centred on the journal *al-Manār* ("The Lighthouse"), has influenced present-day Arabic prose style cannot yet be ascertained. It has, however, been important in shaping the religious outlook of many authors writing in the 1920s and 1930s.

The diaspora. A considerable amount of Arabic literature has been produced by numerous writers who settled in non-Islāmic countries, especially in the United States and Brazil. Most of these writers came from Christian Lebanese families. A feeling of nostalgia often led them to form literary circles or launch magazines or newspapers. (The Arabic-language newspaper *al-Hudā* [or *Al-Hoda,* "The Guidance"], established in 1898, was published in New York City as *al-Hudā al-jadīdah* [*Al-Hoda Aljadidah,* or "The New Al-Hoda," or "The New Guidance"].) It was largely because of their work that the techniques of modern fiction and modern free verse entered Arabic literature and became a decisive factor in it.

The recurring theme in Lebanese fiction

One of the best known authors in this group was Amīn ar-Riḥānī (died 1941), whose descriptions of his journeys through the Arab world are informative and make agreeable reading. The fact that so many Lebanese emigrated to foreign countries led to the creation of a standard theme in Lebanese fiction: the emigrant who returns to his village.

Iraqi modern literature is best represented by "the poet of freedom" Maʿrūf ar-Ruṣāfī (died 1945), and Jamīl Sidqī az-Zahāwī (died 1936), whose satire "Rebellion in Hell" has incurred the wrath of the traditionalists.

Turkish literatures. The same changing attitude toward the function of literature and the same shift toward realism can be observed in Turkey. After 1839, Western ideas and forms were taken up by a group of modernists: Ziya Paşa (died 1880), the translator of Rousseau's *Émile* (which became a popular textbook for 19th-century Muslim intellectuals), was among the first to write in a less traditional idiom and to complain in his poetry—just as Ḥālī was to do in India a few years later—about the pitiable conditions of Muslims under the victorious Christians. Ziya Paşa, together with Şinasi (died 1871) and Namık Kemal (died 1888), founded an influential Turkish journal, *Tasvir-i Efkâr* ("Picture of Ideas"). The essential theme of the articles, novels, poems, and dramas composed by these authors is their fatherland (*vatan*), and they dared to advocate freedom of thought, democracy, and constitutionalism. Abdülhak Hâmid (died 1935), though considerably their junior, shared in their activities. In 1879 he published his epoch-making *Sahra* ("The Country"), a collection of ten Turkish poems that were the first to be composed in Western verse forms and style. Later, he turned to weird and often morbid subject matter in his poetic dramas. He, like his colleagues, had to endure political restrictions on writing, imposed as part of the harsh measures taken by Sultan Abdülhamid II against the least sign of liberal thought. Influenced by his work, later writers aimed to simplify literary language: Ziya Gökalp (died 1924) laid the philosophical foundations of Turkish nationalism; and Mehmed Emin, a fisherman's son, sang artless Turkish verses of his pride in being a Turk, throwing out the heavy rhetorical ballast of Arabo-Persian prosody and instead turning to the language of the people, unadulterated by any foreign vocabulary. The stirrings of social criticism could be discerned after 1907. Mehmed Akif (died 1936), in his masterly narrative poems, gave a vivid critical picture of conditions in Turkey before World War I. His powerful and dramatic style, though still expressed in traditional metres, is a testimony to his deep concern for the people's sorrows. It was he who composed the Turkish National Anthem after Mustafa Kemal Atatürk's victory; but soon afterward he left the country, disappointed with the religious policies of the Kemalists.

Atatürk's struggle for freedom also marks the real beginning of modern Turkish literature. The mainstream of novels, stories, and poems written during the 19th century had been replete with tears, world-weariness, and pessimism. But a postwar novel, *Ateşten gömlek* ("The Fire Shirt"), written by a woman, Halide Edib, reflected the brave new self-awareness of the Turkish nation. Some successful short stories about village life came from the pen of Ömer Seyfeddin (died 1920). The most gifted interpreter and harshest critic of Turkey's social structure was Sabaheddin Ali, who was murdered on his flight to Bulgaria in 1948. His major theme was the tragedy of the lower classes, and his writing is characterized by the same merciless realism that was later to be a feature of stories by many left-wing writers throughout the Islāmic world. The "great old man of Turkish prose," Yakup Kadri Karaosmanoğlu, displayed profound psychological insight, whether ironically describing the lascivious life in a Bektāshī centre or a stranger's tragedy in an Anatolian village. Most of the Turkish novelists of the 1920s and 1930s concentrated on the problems of becoming a modern nation, and in particular they reinterpreted the role of women in a liberated society.

The "great old man of Turkish prose"

Literary energies were set completely free when Atatürk introduced the Latin alphabet in 1928, hoping that his people would forget their Islāmic past along with the Arabic letters. From this time onward, especially after the language reform that was meant to rediscover the pre-Islāmic roots of the Turkish language, Turkish literature followed the pattern of Western literature in all major respects, though with local overtones. Poets experimented with new forms and new topics. They discovered the significance of the Anatolian village, neglected—even forgotten—during the Ottoman period. Freeing themselves from the traditional rules of Persian poetry, they adopted simpler forms from Europe. In some cases the skillful blending of inherited Ottoman grace and borrowed French lyricism produced outstandingly beautiful poems, such as those of Ahmed Haşim (died 1933) and of Yahya Kemal Beyatlı (died 1958), in which the twilight world of old Istanbul is mirrored in soft, evocative hues and melodious words. At the same time, the figure of Nazım Hikmet (died 1963) looms large in Turkish poetry. Expressing his progressive social attitude in truly poetical form, he used free rhythmical patterns quite brilliantly to enrapture his readers; his style, as well as his powerful, unforgettable images, has deeply influenced not only Turkish but also progressive Urdu and Persian poetry from the 1930s onward.

Persian literatures. In Iran, the situation to a certain extent resembled that in Turkey. While the last "classical" poet, Qāʾānī (died 1854), had been displaying the traditional glamorous artistry, his contemporary, the satirist Yaghmā (died 1859), had been using popular and comprehensible language to make coarse criticisms of contemporary society. As in the other Islāmic countries, a move toward simplicity is discernible during the last decades of the 19th century. The members of the polytechnic college Dār ol-Fonūn (founded 1851), led by its erudite principal Reẕā Qolī Khān Hedāyat, helped to shape the "new" style by making translations from European languages. Shāh Naṣer od-Dīn himself described his journeys to Europe in the late 1870s in a simple, unassuming style and in so doing set an example to future prose writers.

At the turn of the century, literature became for many younger writers an instrument of modernization and of revolution in the largest sense of the word. No longer did they want to complain, in inherited fixed forms, of some boy whose face was like the moon. Instead, the feelings and situation of women were stated and interpreted. Their oppression, their problems, and their grievances are a major theme of literature in this transition period of the first decades of the 20th century. The "King of Poets," Bahār (died 1951), who had been actively working before World War I for democracy, now devoted himself to a variety of cultural activities. But his poems, though highly classical in form, were of great influence; they dealt with contemporary events and appealed to a wide public.

One branch of modern Persian literature is closely connected with a group of Persian authors who lived in Berlin after World War I. There they established the Kaviani Press (named after a mythical blacksmith called Kaveh, who had saved the Iranian kingdom), and among the poems they printed were several by ʿAref Qazvīnī (died 1934), one of the first really modern writers. They also published the first short stories of Moḥammad ʿAlī Jamālzādeh, whose outspoken social criticism and complete break with the traditional inflated and pompous prose style inaugurated a new era of modern Persian prose. Many young writers adopted this new form, among them Ṣādeq Hedāyat (died 1951), whose stories—written entirely in a direct, everyday language with a purity of expression that was an artistic achievement—have been translated into many languages. They reflect the sufferings of living individuals; instead of dealing in literary clichês, they describe the distress and anxiety of a hopeless youth. The influence of Franz Kafka (some of whose work Hedāyat translated) is perceptible in his writing, and he has a tendency toward psychological probing shared by many Persian writers.

Authors of the Kaviani Press

As in neighbouring countries, women played a considerable role in the development of modern Persian literature. The lyrics of Parvīn Eʿteṣāmī (died 1940) are regarded as near classics, despite a trace of sentimentality in their sympathetic treatment of the poor. Some Persian writers whose left-wing political ideas brought them into conflict with the government left for the Tadzhik S.S.R. Of these, the gifted poet Lāhūtī (died 1957) is their most important representative.

India: Urdu and Persian. Persian literature in the Indian subcontinent did not have such importance as in earlier centuries, for English replaced Persian as the official language in 1835. Nevertheless, there were some outstanding poets who excelled in Urdu. One of them was Mīrzā Asadullāh Khān Ghālib (died 1869), the undisputed master of Urdu lyrics. He regarded himself, however, as the leading authority on high Persian style and was an accomplished writer of Persian prose and poetry. But much more important was a later poet, Sir Muḥammad Iqbāl (died 1938), who chose Persian to convey his message not only to the peoples of Muslim India but also to Afghans and Persians. Reinterpreting many of the old mystical ideas in the light of modern teachings, he taught the quiescent Muslim peoples self-awareness, urging them to develop their personalities to achieve true individualism. His first *maṡnavī*, called *Asrār-e khudī* (1915; "Secrets of the Self"), deeply shocked all those who enjoyed the dreamlike sweetness of most traditional Persian poetry. One of his later Persian works, *Payām-e Mashriq* (1923; "Message of the East"), is an effective answer to Goethe's *West-östlicher Divan* (1819). In the *Jāvīd-nāmeh* (1932) he poetically elaborated the old topic of the "heavenly journey," discussing with the inhabitants of the spheres a variety of political, social, and religious problems. Iqbāl's approach is unique. Although he used the conventional literary forms and leaned heavily on the inspiration of Jalāl ad-Dīn ar-Rūmī, he must be considered one of the select few poets of modern Islām who, because of their honesty and their capacity for expressing their message in memorable poetic form, appeal to many readers outside the Muslim world.

THE MODERN PERIOD

The modern period of Islāmic literatures can be said to begin after World War II. The topics discussed before then still appeared, but outspoken social criticism became an even more important feature. Literature was no longer a leisurely pastime for members of the upper classes. Writers born in the villages and from non-privileged classes began to win literary fame through their firsthand knowledge of social problems. Many writers started their careers as journalists, developing a literary style that retained the immediacy of journalistic observation.

Prose. In Egypt, a great change in literary preoccupations came about after 1952. The name of Najīb Maḥfūẓ is of particular importance. He was at first a novelist mainly concerned with the lower middle classes (his outstanding work is a trilogy dealing with the life of a Cairo family); but afterward he turned to socially committed literature, using all the techniques of modern fiction—of which he is the undisputed master in Arabic. Yūsuf Idrīs deals first and foremost with the problems facing poor and destitute villagers, a subject also treated in Sharqāwī's novel *al-Arḍ* (*The Earth;* 1954). In Turkey, Yaşar Kemal's village story *İnce Memed* has won acclaim for its stark realism. The young left-wing writers in Iraq and Syria share the critical and aggressive attitudes of their contemporaries in Turkey and Egypt and are involved in every political issue. Most of them have responded to the works of Bertolt Brecht and Karl Marx. They are also quite familiar with at least the externals of modern psychology. Freudian influence—often in its crudest form—can be detected in many modern short stories or novels in the Islāmic countries; and it is often the prelude to coarse descriptions of sexuality, appealing to the lowest instincts of the reading public. In the Near and Middle East, the existentialist philosophy gained many followers who tried to reflect its interpretation of life in their literary works. In fact, almost every current of modern Western philosophy and psychology, every artistic trend and attitude, has been eagerly adopted—though often only half-understood—by young Arab, Turkish, or Persian writers. Some of them, nevertheless, have achieved interesting results from time to time: an example is Laylā Baʿlabakkī, whose semiautobiographical novel, *I Live,* is regarded as an outstanding literary achievement in Arabic.

Poetry. *Arabic.* The new attitudes that have informed literature are even more conspicuous in poetry than in prose. Arabic poetry has at last freed itself completely from the fetters of classical tradition. Both French and English influences helped to shape the new art. The danger is that Western fashions are imitated uncritically, just as Arabic, Persian, or Turkish models were slavishly followed in the past. T.S. Eliot's poetry and criticism were influential in dethroning the Romanticism that many poets had adopted earlier, in the 1920s and '30s. One of the first and most important attempts at creating a modern Arabic poetic diction was made in the late 1940s by the Iraqi poet and critic Nāzik al-Malāʾikah, whose poems, in free but rhyming verse, give substance to the shadow of her melancholia. Free rhythm and a colourful imagination distinguish the best poems of the younger Arabs: even when their poems do not succeed, their experimentation, their striving for sincerity, their burning quest for identity, their rebellion against social injustice can be readily perceived. Indeed, one of the most noticeable aspects of contemporary Arabic poetry is its political engagement, evident in the poems of Palestinian writers such as Maḥmūd Darwīsh, whose verses once more prove the strength, expressiveness, and vitality of the Arabic language. An Iraqi, ʿAbdul Wahhāb al-Bayātī, combines political engagement with lyrical mysticism. Others, without withdrawing into a world of uncommitted dreams, manage to create an atmosphere that breaks up the harsh light of reality into its colourful components. Poets like the Lebanese Adonis (ʿAlī Aḥmad Saʿīd) and Tawfīq aṣ-Ṣāʾigh, or the Egyptian dramatist Ṣalāḥ ʿAbd aṣ-Ṣabur, make use of traditional imagery in a new, sometimes esoteric, often fascinating and daring way.

New use of traditional imagery

Persian. Almost the same situation developed in Iran. One notable poet was Forugh Farrokhzād, who wrote powerful yet very feminine poetry. Her free verses, interpreting the insecurities of the age, are full of longing; though often bitter, they are yet truly poetic. Poems by such critically minded writers as Seyāvūsh Kasrāʾī also borrow the classical heritage of poetic imagery, transforming it into expressions that win a response from modern readers.

Turkish. In Turkey, the adoption of Western forms began in the 1920s. Of major importance in modern Turkish literature was Orhan Veli Kanık, who combined perfect technique with "Istanbulian" charm. His work is sometimes melancholy, sometimes frivolous, but always convincing. He strongly influenced a group of poets whose names are connected with the avant-garde literary magazine *Varlik* ("Existence"). The powerful poetry of the leftist writer Nazım Hikmet has influenced progressive poets all over the Muslim world. It is still too early, however, to determine what will be most representative of modern Turkish poetry: a return to Anatolian subjects, sometimes in picturesque diction, influenced by earlier folk-poetry, or the continuation of lovely poems in praise of Istanbul; surrealism or a somewhat detached and ironic approach to a subject. The same question, indeed, could be raised of almost any contemporary literature in Islāmic lands.

The continuing problem of language

Contemporary features. In the Arab-speaking world, the problem of language has loomed large for many years. Classical high Arabic is still the common literary language of Morocco and Iraq, Tunisia and Kuwait. Spoken Arabic in dialectal variations is beginning to be used—but tentatively—in higher literature. It is more frequently employed in the popular spheres of theatre and cinema. But the local differences that exist in Arabic spoken from country to country have today become perceptible in literature; popular grammatical forms and syntactical constructions are occasionally used in modern poetry. A special problem arises in the North African countries, where French continues to be the chief literary language for most writers, especially in Morocco and Algeria. Yet there is no hard and fast rule: a leading member of the Senegal community, Amadou Bamba, who founded the politically important group of the Murīdīs, wrote (quite apart from practical words of wisdom in his mother tongue) some 20,000 mystically tinged verses in classical Arabic.

Throughout the Islāmic countries, the press and radio have helped to disseminate literary works; prizes for literary achievements have stimulated interest in writing; low-priced books have made the more or less valuable output of a growing number of writers available to the majority—the more so since literacy among the population steadily increases. But to what degree this means a continuation of the cultural role that Islāmic literatures have played in the formation and education of society over the centuries is not yet clear. Literature was never restricted to a privileged high society; in olden times even the illiterate villager and the "uneducated" womenfolk had a fund of poems, proverbs, songs, and quotations from classical sources that they knew by heart and to which they turned for both pleasure and spiritual strength.

One final symptom should be noted. The introduction of modern methods of criticism, of psychology and philosophy, has kindled a new interest in significant figures of the Islāmic past. Thus, to quote one instance, the figure of al-Ḥallāj (executed 922), who often served as a symbol figure of "the martyr of love" in both classical and folk poetry after the 11th century, has in recent years been made the subject of a Turkish drama, a Persian passion play, and an Arabic tragedy and plays an important role in Arabic, Turkish, Persian, and Indian Muslim lyrical poetry. He is interpreted as a symbol of suffering for one's ideals, and he is therefore acceptable both to conservative Muslims and to progressive social critics.

STUDY AND EVALUATION

The controversy over word and meaning

Early Islāmic criticism. The development of literature during the early Middle Ages soon produced among the Arabs much lively literary criticism. Even the choice of quotations made by the ancient grammarians from the classical stock of poetry implies a degree of critical (though subjective) activity. Attempts toward making a more objective study of poetic technique were first made in the late 9th century, when for the first time "beauties" and "faults" of verses were discussed and the ideals of the "new style" were defined by Ibn al-Mu'tazz in his *Kitāb al-badī'*. The relation between *lafẓ* (word) and *ma'nā* (meaning) has been a matter of some controversy—many earlier critics stress the importance of outward form rather than of content. There was some question, too, as to whether the most "poetical" verse was that which was the most "untrue"—that is to say, hyperbolic—or that which was closer to the heart of things. The matter was debated along with the problem of inspiration and imagination and their function in poetry. The most thorough analysis of the art of poetry was made by 'Abd al-Qāhir al-Jurjānī, who allowed equal weight to the idea and to the way it was expressed. An illuminating work about poetics was composed by the Tunisian critic al-Qarṭājannī (13th century), and this has been carefully studied by the German scholar Wolfhart Heinrichs in *Arabische Dichtung und griechische Poetik* (1969). This study analyzes al-Qarṭājannī's theories in relation to Aristotle's theories of poetics. (Heinrichs, one of the few Islāmic scholars specializing in the study of literary problems, has shown that classical Arabic criticism rarely interested itself in the poem as a whole but concentrated upon individual verses.) In later centuries, manuals of poetics and rhetoric written in every Islāmic country reveal the prevailing interest in purely formal problems.

Modern criticism. A similar interest long dominated the work of Western Orientalists. The first scholars who attempted to introduce Persian poetry to Western readers (such as Sir William Jones in the 18th century) thought it necessary to compare it with the compositions of Greek and Latin poetry. The verbal ingenuity of Ḥarīrī's *Maqāmāt* attracted the European scholars, who took great pleasure in disentangling the grammatically difficult forms. Pre-Islāmic poetry at first interested only the grammarian-antiquarian until its importance as a source of knowledge of early Bedouin life was recognized. The art of versification and problems of classical Arabic metrics are forever matters of discussion among Orientalists.

Although a large amount of translation, mainly from Persian poetry, was produced in the 18th and 19th centuries, most of it suffered for lack of proper understanding: the translators took the poetical statements about wine and love or the outbursts against established religious forms at their face value and failed to recognize them for the stereotyped forms and images they are. A deep study of the imagery of Persian, Turkish, and Arabic is required before their poetry and belles lettres can be properly understood and enjoyed. This was realized as early as 1818 by the Austrian Orientalist Joseph von Hammer-Purgstall (whose own translations from the three great Islāmic languages are, nevertheless, failures).

In the 20th century the critical study of imagery in Oriental poetry was taken up by Hellmut Ritter in his booklet *Über die Bildersprache Niẓāmīs* (1927; "On the Imagery of Neẓāmī"), which gives a most sensitive philosophical interpretation of Neẓāmī's metaphorical language and of the role of imagery in the structure of Neẓāmī's thought. Ritter's criticism is basic to the study of many other Persian poets. Slightly later, the Polish scholar Tadeusz Kowalski tried to interpret the "molecular" structure of Arabic literature—the absence of large units of thought or architectural structure—typical of the greater part of Islāmic literatures, which might be described as "carpet-like." This "molecular" structure can be related to the atomist theories and occasionalist world view embodied in Islāmic theology, which, unlike Christianity, does not admit of secondary causes and requires only short spans of hope from the faithful. In a number of articles, and in many books, E.G. von Grunebaum has pioneered this interpretation of literary structure. Other important critical works include S.A. Bonebakker's book on the rhetorical importance of *tawrīyah* (ambiguous wording); Manfred Ullmann's excellent study of *rajaz*-poetry and its place in Arabic literature; and C.H. de Fouchécour's detailed analysis of the descriptions of nature in early Persian poetry.

Among the Arabs themselves, modern literary criticism began during the early 1920s. Most famous was Ṭaha Ḥussein's attempt to prove the whole corpus of pre-Islāmic poetry as counterfeit. All the Islāmic countries, from Turkey to Pakistan, and especially Iran have sponsored reviews in which Western-trained scholars critically survey the literary achievements of the Islāmic world.

A full evaluation of literature as the most faithful mirror of past (and to some extent present-day) Islāmic life is still lacking. Notwithstanding the conventionalized style of most Islāmic poetry, a deeper study of individual poets' expressions, use of verbal and nominal forms, rhythmical preferences, and the like would certainly reveal more about the personalities of outstanding writers. The impact of poetry on the Islāmic mind was, and to some extent still is, much deeper than a modern Western reader might suppose. The poets must be viewed, therefore, in relation to their society, for their work corresponded to the measure of receptiveness, their new modes of expression developed according to the widening awareness of their audiences. They had to use a language and imagery to which those whom they addressed were accustomed. A new idea, embodied in traditional imagery and a beguiling metre, could capture the attention of thousands of people. The role of the poet as religious and political herald (even though his political thought was all too often subservient to courtly flattery) was widely acknowledged, and the impact of a poet like Muḥammad Iqbāl bears witness to the real power of poetical expression. Thus, even the most conventional Persian or Turkish poem can reflect certain attitudes of the Muslim mind more accurately than many a learned lecture. A modern short story, even if not particularly well wrought, often tells the reader more about the feelings and reactions of the people than scholarly sociological research papers can. The magic of language is still a living force in the East. (An.Sc.)

Music

The period of Islāmic music begins with the advent of Islām in about 610. A new art emerged, elaborated both from pre-Islāmic Arabian music and from important contributions by Persians, Byzantines, Turks, Berbers, and Moors. In this development the Arabian element acted as a catalyst, and, within a century, the new art was firmly established from Central Asia to the Atlantic. Such a fusion of musical styles succeeded because there were strong affinities between Arabian music and the music of the nations occupied by the expanding Arabic peoples. Not all Arab-dominated areas adopted the new art; Indonesia and parts of Africa, for example, retained native musical styles. The folk music of the Berbers in North Africa, the Moors in Mauretania, and other ethnic groups (*e.g.,* in Turkey) also remained alien to classical Islāmic music. The farther one looks from the axis reaching from the Nile Valley to Persia, the less one finds undiluted Islāmic music.

(It should be remembered that the word *music* and its concept were reserved for secular art music; separate names and concepts belonged to folk songs and to religious chants.)

NATURE AND ELEMENTS OF ISLĀMIC MUSIC

Islāmic music is characterized by a highly subtle organization of melody and rhythm, in which the vocal component predominates over the instrumental. It is based on the skill of the individual artist, who is both composer and performer and who benefits from a relatively high degree of artistic freedom. The artist is permitted, and indeed encouraged, to improvise. He generally concentrates on the details forming a work, being less concerned with following a preconceived plan than with allowing the music's structure to emerge empirically from its details. Melodies are organized in terms of *maqāmāt* (singular *maqām*), or "modes," characteristic melodic patterns with prescribed scales, preferential notes, typical melodic and rhythmic formulas, variety of intonations, and other conventional devices. The performer improvises within the framework of the *maqām,* which is also imbued with ethos (Arabic *ta'thīr*), a specific emotional or philosophical meaning attached to a musical mode. Rhythms are organized into rhythmic modes, or *īqā'āt* (singular *īqā'*), cyclical patterns of strong and weak beats.

Classical Islāmic music is the aristocratic music of the court and the upper class, which underwent development and modification in the hands of gifted musicians throughout several centuries. Rhythmic and melodic modes grew in number and complexity, and new vocal and instrumental genres arose. In addition, a body of theoretical works grew up, influencing both Islāmic and—in some cases—European music. Its later popularization did not alter its intimate and entertaining character.

The relation of music to poetry and dance. In pre-Islāmic times music was closely connected with poetry and dance. Being essentially vocal, pre-Islāmic music was an emotional extension of the solemn declamation of poems in Bedouin society. Later, the art of vocal composition itself was largely based upon prosody: only by respecting the poetic metre in the music could the text, when sung, be clear in meaning and correct in pronunciation and grammatical inflection. In turn, prosody itself was used to explain the musical rhythm.

The poet-musician

Words and rhetorical speech were the principal means through which the Bedouin expressed feelings. The *shā'ir,* or poet-musician, said to be possessed by supernatural powers, was feared and respected. His satirical song poems were a formidable arm against enemies, and his poems of praise enhanced the prestige of his tribe. Musician-poets, especially women, accompanied the warriors, inciting them by their songs, and those who fell in battle benefited from the elegies of the singer-poets. Musically, these elegies resembled the *ḥudā'* ("caravan song"), possibly used by camel drivers as a charm against the desert spirits, or *jinn.*

Music and dance were closely associated from early times. Bedouin music had a pronounced collective character, with well-defined functions and usages, and dance occupied an important place in Bedouin life. Most common was a simple communal dance that emphasized common, or social, rather than individual movement. Places of entertainment in the towns and oases employed professional dancers, mainly women. Art dancing embellished events in the courts of the Sāsānians, the pre-Islāmic rulers of Persia. In the Islāmic period, solo and ensemble forms of dance were an integral part of the intense musical activity in the palaces of the caliphs and in wealthy houses. Dance also was prominent in the *dhikr* ceremony of certain mystical fraternities; forms ranged from obsessional physical movements to refined styles similar to those of secular art dancing.

After the advent of Islām a deep change occurred in the social function of music. Emphasis was laid on music as entertainment and sensual pleasure rather than as a source of high spiritual emotion, a change mainly resulting from Persian influence. Knowledge of music was obligatory for the cultured person. Skilled professional musicians were highly paid and were admitted to the caliphs' palaces as courtesans and trusted companions. The term *ṭarab,* which designates a whole scale of emotions, characterizes the musical conception of the time and even came to mean music itself.

Music and religion. Fashionable secular music—and its clear association with erotic dance and drinking—stimulated hostile reactions from religious authorities. As Muslim doctrine does not sanction permitting or prohibiting a given practice by personal decision, the antagonists relied on forced interpretations of a few unclear passages in the Qur'ān (the sacred scripture of Islām) or on the *Ḥadīth* (traditions of the Prophet, sayings and practices that had acquired force of law). Thus both supporters and adversaries of music found arguments for their theses.

In the controversy, four main groups emerged: (1) uncompromising purists opposed to any musical expression; (2) religious authorities admitting only the cantillation of the Qur'ān and the call to prayer, or *adhān;* (3) scholars and musicians favouring music, believing there to be no musical difference between secular and religious music; and (4) important mystical fraternities, for whom music and dance were a means toward unity with God.

Religious music

Except in the Ṣūfī brotherhoods, Muslim religious music is relatively curtailed because of the opposition of religious leaders. It falls into two categories: the call to prayer, or *adhān* (in some places, *azān*), by the *mu'adhdhin,* or muezzin, and the cantillation of the Qur'ān. Both developed from relatively solemn cantillation to a variety of forms, both simple and highly florid. The cantillation of the Qur'ān reflected the ancient Arabic practice of declamation of poetry, with careful regard to word accents and inflections and to the clarity of the text. Yet it was possibly also influenced by early secular art song. Opponents of music considered the cantillation of the Qur'ān to be technically distinct from singing, and it acquired a separate terminology. Synagogues and the Eastern Christian churches, unhampered by such opposition, developed extensive musical repertories based on melodic modes: the Eastern churches used the eight modes of Byzantine music, while synagogue music followed the *maqām* system of Muslim art music.

Aesthetic traditions. Even in its most complicated aspects, Islāmic music is traditional and is transmitted orally. A rudimentary notational system did exist but it was used only for pedagogical purposes. A large body of medieval writing about music survives in which musical theory is related to various areas of intellectual activity, hence the extreme importance of understanding music as an element of the culture involved. The medieval writings fall mainly into two categories: (1) literary, encyclopaedic, and anecdotal sources, and (2) theoretical, speculative sources. The first group includes precious information on musical life, musicians, aesthetic controversies, education, and the theory of musical practice. The second deals with acoustics, intervals (distances between notes), musical genres, scales, measures of instruments, the theory of composition, rhythm, and the mathematical aspects of music. These documents show that, as in the modern era, medieval Islāmic music was principally an individual, soloistic art. Small ensembles were actually groups of soloists with the principal member, usually the singer, predominating. Being an essentially vocal music, it displayed many singing and vocal techniques, such as special vocal colour, guttural nasality, vibrato, and other stylistic ornaments. Although the music was based upon strict rules, preexisting melodies, and stylistic requirements, the performer enjoyed great creative freedom. The artist was expected to bring his contribution to a given traditional piece through improvisation, original ornamentation, and his own approach to tempo, rhythmic pattern, and the distribution of the text over the melody. Thus the artist functioned as both performer and composer.

The soloist's role

Melodic organization. Islāmic music is monophonic; *i.e.,* it consists of a single line of melody. In performance everything is related to the refinement of the melodic line and the complexity of rhythm. The notion of harmony is completely absent, although occasionally a simple combination of notes, octaves, fifths, and fourths, usually below the melody notes, may be used as an ornamentation. Among the elements contributing to the enrichment of the melody are microtonality (the use of intervals smaller than a Western half step or lying between a half step and a Western whole step) and the variety of intervals used. Thus the three-quarter tone, introduced into Islāmic music in the 9th or 10th century, exists alongside larger and smaller intervals. Musicians show a keen sensibility to nuances of pitch, often slightly varying even the perfect consonances, the fourth and fifth.

As the fourth is the basic melodic frame, theorists organized the intervals and their nuances into genres, or small units, often tetrachords (units the highest and lowest notes of which are a fourth apart), combining genres into larger units, or systems. More than 130 systems resulted; on these are based the musical scales of the *maqāmāt,* or modes. The scale of a *maqām* can thus be broken down into small units that are of importance in the formation of melodies. A *maqām* is a complex musical entity given distinct musical character by its given scale, small units, range and compass, predominant notes, and preexisting typical melodic and rhythmic formulas. It serves the musician as rough material for his own composition. Each *maqām* has a proper name that may refer to a place (as Hejaz, Iraq), to a famous man, or to an object, feeling, quality, or special event. Emotional or philosophical meaning (ethos, or *taʾthīr*) and cosmological background are attached to a *maqām* and also to the rhythmic modes. The Arabic term *maqām* is the equivalent of *dastgāh* in Persia, *naghmah* in Egypt, and *cbāṭ* in North Africa.

Rhythmic organization. Rhythms and their organization into cycles of beats and pauses of varying lengths (rhythmic modes, or *īqāʿāt*) are much discussed in theoretical writings and are of supreme importance in performance. Each cycle consists of a fixed number of time units with a characteristic distribution of strong and weak beats and pauses. In performance some of the pauses may be filled in, but the underlying pattern must be maintained. Parallel to the growth of the number of melodic modes—from 12 in the 8th century to more than 100 in the 20th—is the increase in the number of rhythmic modes from eight in the 9th century to more than 100 in the 20th.

Musical forms. The repertoire in common use comprises a wide variety of forms. One category includes unmeasured improvised pieces, such as the *layālī,* in which the singer puts forth the characteristics of the *maqām,* using long vocalises and meaningless syllables. An equivalent instrumental improvisation is called *taqsīm,* and this in some cases may be accompanied by a uniform pulsation, called *taqsīm ʿala al-wuḥdah.* The category of metrical songs embraces various poetic forms and metric structures, such as *qaṣīdah, dor,* and *muwashshaḥ.* Both categories, metrical and unmeasured, are almost always accompanied by either one or more instruments to enrich the performance. Important traditional forms combined both categories to create large compositions similar to a suite, using vocal and instrumental features. The whole was linked by the unity of the mode and a defined rhythmical development. Examples are the Andalusian *nūbah,* which survives in North Africa, the Persian *dastgāh,* the Turkish *fāṣil,* the Egyptian *waṣla,* and the Iraqi *macam.* Under the pressure of modernization and westernization have emerged new forms showing the influence of light dance music, operetta, and musical comedy.

Instruments of music. Instrumental music is not considered an independent art from vocal music. Yet many instruments were fully described by early writers, and their use in folk, art, religious, and military music pointed out. The most favoured instrument of ancient Near Eastern civilization, the harp, was gradually overshadowed by both long- and short-necked lutes.

Percussion instruments. Among idiophones (instruments the hard bodies of which vibrate to produce sound) commonly used are the *qaḍīb* ("percussion stick"), the *zil* and *sunūj* ("cymbals"), and the *kāṣāt,* or small finger cymbals. Membranophones, or vibrating membrane instruments, include a variety of tambourines, or frame drums, which all fall under the generic name *duff.* These include the North African *ghirbāl* and *bendīr,* instruments that have a number of "snares" across the skin and are used for folk dances; and the *dāʾirah,* or *ṭar,* with jingling plates or rings set in the frame. The *dāʾirah* and the vase-shaped drum *darabukka* (in Iran, *ẓarb*) are used in folk and art music, and the small kettledrums *naqqārah* and *nuqayrat* are used in art music and in military music (such as janissary music, the Turkish ensemble adopted by European military musicians). The large two-headed cylindrical drum, the *ṭabl* (Turkish *davul*), is generally played with the oboe-like *zornā* or *gayta* in processions and open-air ceremonies.

Wind instruments. Classed with the *zornā* and *gayta* as aerophones, or wind instruments, are the *būq,* or horn, the *nafīr,* or long trumpet, and a variety of flutes called *nāy* or *shabbābah.* Clarinetlike (single-reed) double-piped instruments such as the *dunay, zammārah,* and *urghūl* are used in folk events and open-air ceremonies.

Stringed instruments. Chordophones, or stringed instruments, constitute the most important family. The favourite instrument of Islāmic classical music is the *ʿūd,* a short-necked lute having four or five strings and resembling the Western lute, which derived from the *ʿūd.* In addition to holding musical supremacy, it was important in medieval theoretical and cosmological speculations. It has two derivatives in North Africa, the *kuwītra* and the *gunbrī.* The long-necked lutes favoured in Turkey, Iran, and the countries eastward include the *ṭunbūr, tār,* and *setār.* Another plucked instrument is the *qānūn,* or trapezoid-shaped psaltery, played at least from early medieval times. The trapezoidal dulcimer, or *sanṭūr,* the strings of which are struck with two thin sticks, is widespread and is especially prominent in Persian art music. Bowed lutes, or fiddles, include the *rabāb,* used by epic singers and beggars, and the *kamān,* or *kamanjā,* a hemispherically-shaped fiddle the body of which, like that of the *rabāb,* is pierced by the length of wood forming the neck (such instruments are known as spike fiddles). The violin, played either on the knee like the *kamanjā,* or beneath the collarbone, is also common.

Medieval contacts with Europe

The relation of Islāmic music to music of other cultures. The relation of Islāmic music to the West reveals itself in both musical theory and practice. By the 9th century many Greek treatises had been translated into Arabic. Arabic culture preserved Greek musical writings, and most of those that reached the West did so in their Arabic versions. Arab theorists followed Greek models, often developing them further. The Muslim occupation of Spain and Portugal and the Crusades to the Near East brought Europeans in contact with Arabic theoretical writings and the flourishing Islāmic art music. Musical instruments such as the lute, the rebec (a small bowed instrument derived from the *rabāb*), and the kettledrum (in the form of a pair of small kettledrums called nakers, from the Arabic *naqqārah*) became firmly established in European music. Arabic writings were translated, among them the *De scientiis,* a work on the arts and sciences by the great 10th-century philosopher and musician al-Fārābī (Latinized as Alpharabius). Such translations give further indication of the influence exerted by Muslim writers. Arabian influence on European medieval music is difficult to prove. Borrowed elements were possibly completely transformed. The influence of Islāmic music on European music is, at present, a subject of controversy.

As early as 711, Arab conquerors reached India, and Mongol and Turkmen armies later invaded the Near East, with resulting contact between Islāmic and Far Eastern music. There are similarities between the modal systems of India (the *rāga*s) and of the Near East (the *maqām* system) and between some cosmological and ethical conceptions of music. The migration of musical instruments from the Islāmic area to the Far East can also be traced. The Chinese oboe, the *sona,* apparently derived its name from its Near Eastern counterpart, the *zornā,* or *sornā.* The Indian long-necked lute sitar, having a different number of strings from the Persian *setār,* received its name, and perhaps part of its form, from the *setār.* The Chinese dulcimer, *yang ch'in* ("foreign zither"), originated in the Middle Eastern *sanṭūr.* On the other hand, the musical instruments appearing in the pre-Islāmic Ṭāq-e Bostān reliefs in Persia show a mouth organ similar to the Chinese *sheng,* indigenous to the Far East.

THE HISTORY OF ISLĀMIC MUSIC

The earliest extant writings on Islāmic music are from the end of the 9th century, more than 250 years after the advent of Islām. In the absence of historical documents, musicians, writers, and philosophers began to speculate on the origins of their music. They filled the gaps by legendary sources or vague traditions. Thus Lamak is said to have made the first lute from the leg of his dead son, whose loss he lamented with it. His lamentation is considered to be the first song.

Courtly music

The pre-Islāmic period. In nomadic encampments music emphasized every event in man's life, embellished social meetings, incited the warriors, encouraged the desert traveler, and exhorted the pilgrims to the black stone of the Kaʿbah (in Mecca), a holy shrine even in pre-Islāmic times. Among the earliest songs were the *ḥudāʾ* from which the *ghināʾ* derived, the *naṣb, sanad, rukbānī,* and the *hazāj,* a dancing song. In the markets of the Arabs, particularly the fair at the western Arabian town of ʿUkāẓ, competitions of poetry and musical performances were held periodically, attracting the most distinguished poet-musicians. Their music, more sophisticated than that practiced in the nomadic encampments, was related to that of the *qaynāt* ("singing girls"), who performed at court, in noble households, and in scattered taverns. Cultural contact with Byzantium was strong in the kingdom of Ghassān, where, in the 7th century, five Byzantine *qaynāt* were known to have performed songs of their homeland at court. The culture of the other Arabic kingdom of al-Ḥīrah under the Lakhmid dynasty was closely connected with that of Persia under the pre-Islāmic Sāsānian empire. The Sāsānians esteemed both secular and religious music. In the belief of the Mazdak sect (a dualistic Persian religion related to Manichaeanism, a Gnostic religion), music was considered as one of the four spiritual powers. In the king's entourage musicians occupied high rank. Some became famous, such as Bārbad, to whom is attributed the invention of the complicated pre-Islāmic system of modes. The compositions of Bārbad, who became a model of artistic achievement in Arabic literature, survived at least until the 10th century.

Sophisticated secular music

The beginning of Islām and the first four caliphs. Muḥammad was said to have been hostile to music and musicians; yet there are indications that he tolerated functional music such as war songs, pilgrimage chants, and public or private festival songs. In addition, he himself instituted in 622 or 623 the *adhān* ("call to prayer"), chanted by the *muʾadhdhin* (muezzin). For this task he chose the Abyssinian singer Bilāl, who became the patron of the *muʾadhdhin* and their guilds throughout the Islāmic world. Within 12 years after Muḥammad's death, the armies of Islām took possession of Syria, Iraq, Persia, Armenia, Egypt, and Cyrenaica (in modern Libya). The contact with the refined cultures of the conquered and the appearance of a new class of warriors who benefited from the spoils of the conquered nations deeply affected Arabian society. In spite of the austere regime of the four orthodox caliphs (632–660), joy of life and eagerness for pleasure dominated the two holy cities of Mecca and Medina. Wealthy men acquired slave musicians, who were often liberated and became the pillars of musical life. The wealthy competed with one another in the brilliance of the concerts held in their houses, and in sophisticated literary and musical salons, contests revealed and rewarded the best talents. In this milieu the great Islāmic musical tradition began to take shape, to be firmly established and codified in subsequent periods. A new generation of musicians was educated in the traditional manner and refined through constant hearing of the best music performed by the best masters. Through the contributions of the conquered "foreigners," and through intense emulation of their music, new techniques, improved instruments, and elaborated musical forms developed. Persian lute tuning was adopted for the lute (*ʿūd*), which became the classical instrument of the Arabs. Melodies and rhythms were regulated by a modal system that was later codified. Among the most famous female musicians was ʿAzza al-Maylāʾ, who excelled in *al-ghināʾ ar-raqīq,* or "gentle song." Her house was the most brilliant literary salon of Medina, and most of the famous musicians of the town came under her tutelage. Also famed were the female musician Jamīla, around whom clustered musicians, poets, and dignitaries; the male musician Ṭuways, who, attracted by the melodies sung by Persian slaves, imitated their style; and Ṣāʾib Khāthir, the son of a Persian slave. Songs were generally accompanied by the lute (*ʿūd*), the frame drum (*duff*), or the percussion stick (*qaḍīb*).

Further influence of conquered peoples

The Umayyad and ʿAbbāsid dynasties: classical Islāmic music. Under the Umayyad caliphate (661–750) the classical style of Islāmic music developed further. The capital was moved to Damascus (in modern Syria) and the courts were thronged with male and female musicians, who formed a class apart. Many prominent musicians were Arab by birth or acculturation, but the alien element continued to play a predominant role in Islāmic music. The first and the greatest musician of the Umayyad era was Ibn Misjaḥ, often honoured as the father of Islāmic music. Born in Mecca of a Persian family, he was a musical theorist and a skilled singer and lute player. Ibn Misjaḥ traveled to Syria and Persia, learning the theory and practice of Byzantine and Persian music and incorporating much of his acquired knowledge into the Arabian art song. Although he adopted new elements such as foreign musical modes, he rejected other musical traits as unsuitable to Arabian music. Knowledge of his contributions is contained in the most important source of information about music and musical life in the first three centuries of Islām. This is the 10th-century *Kitāb al-Aghānī,* or "Book of Songs," by Abū al-Faraj al-Iṣbahānī. In the 8th century Yūnus al-Kātib, author of the first Arabic book of musical theory, compiled the first collection of songs. Other notable musicians of the period were Ibn Muḥriz, of Persian ancestry; Ibn Surayj, son of a Persian slave and noted for his elegies and improvisations (*murtajal*); his pupil al-Gharīḍ, born of a Berber family; and the Negro Maʿbad. Like Ibn Surayj, Maʿbad cultivated a special personal style adopted by following generations of singers.

The Golden Age

By the end of the Umayyad period, the disparate elements of conqueror and conquered were fused into the style of classical Islāmic music. With the establishment of the ʿAbbāsid caliphate in 750, Baghdad (in modern Iraq) became the leading musical centre. The ʿAbbāsid caliphate is the period of the Golden Age in Islāmic music. Music, obligatory for every learned man, was dealt with in varied aspects—among them virtuosity, aesthetic theory, ethical and therapeutic goals, mystical experience, and mathematical speculation. The artist was required to possess technical proficiency, creative power, and almost encyclopaedic knowledge. Among the finest artists of the period were Ibrāhīm al-Mawṣilī and his son Isḥāq. Members of a noble Persian family, they were chief court musicians and close companions of the caliphs Hārūn ar-Rashīd and al-Maʾmūn.

Isḥāq, a singer, composer, and virtuoso lutenist, was the outstanding musician of his time. A man of wide culture, he is credited with authorship of nearly 40 works on music, which were subsequently lost. According to the "Book of Songs," he is the originator of the earliest Islāmic theory of melodic modes. Called *aṣbiʿ* ("fingers"), it structured the modes according to the frets of the lute and the fingers corresponding to them. Indications above each song in the "Book of Songs" show the mode, the type of third (major, minor, or neutral), and often the rhythmic mode. (The third is the interval encompassing three notes of the scale. It can vary considerably in exact size without losing its character. Western music uses the major and the minor third; much non-Western and folk music also uses a neutral third, between the major and minor in size.) The neutral third, introduced into Islāmic music about this time, increased the number of melodic modes from eight to 12 by making more intervals available from which to build melodies. At this time the number of rhythmic modes varied from six to eight, their actual structure and content differing from author to author.

Isḥāq and Ibrāhīm al-Mawṣilī actively participated in the contemporary controversy between modernism, a Persian romantic style tending toward exuberance of embellishments, and Arabian classicism, characterized by simplicity and artistic severity. The Mawṣilīs represented the older classical tradition; the proponents of modernism were Ibn Jāmiʿ and the celebrated singer Prince Ibrāhīm ibn al-Mahdī.

Theoretical writings

In the second half of the 8th century, the extensive Islāmic literature of music theory began to flourish. Greek treatises were translated into Arabic, and scholars, who were acquainted with the Greek writings, began to devote books or sections of books to the theory of music. In their works they expanded, changed, improved, or shed new light on Greek musical theory. The well-known philosopher al-Kindī, who was deeply immersed in Greek learning, wrote more than 13 musical treatises, including the earliest Arabic musical treatise that is known to have survived. He also dealt with the theory of ethos (*ta'thīr*) and with cosmological aspects of music. Members of the Ikhwān aṣ-Ṣafā, an important 10th-century brotherhood, dealt also with these two themes and advanced a theory of sound that went well beyond ancient Greek theories. Philosophers such as al-Fārābī, author of the monumental *Kitāb al-musīqī al-Kabīr* ("Grand Book on Music"), and Ibn Sīnā (known in Europe as Avicenna) dealt with such topics as the theory of sound, intervals, genres and systems, composition, rhythm, and instruments, as did others such as as-Sarakhsī, his contemporary Thābit ibn Qurrah, and Avicenna's pupil Ibn Zaylā. The last important theorist to emerge during the ʿAbbāsid period was Ṣafī ad-Dīn, who codified the elements of the modal practice as it was then known into a highly sophisticated system. His achievement became the chief model for subsequent generations. In the numerous treatises written between the 13th and 19th centuries, the system devised by Ṣafī ad-Dīn was split into multiple local traditions.

Islāmic music in Spain. Parallel to the flourishing of music at the eastern centres of Damascus and Baghdad, another important musical centre developed in Spain, first under the survivors of the Umayyad rulers and later under the Berber Almoravids (rulers of North Africa and Spain in the 11th and 12th centuries) and Almohads, who expanded into Spain after the fall of the Almoravids. In Spain, encounter with different cultures stimulated the development of the Andalusian, or Moorish, branch of Islāmic music. The most imposing figure in this development is Ziryāb (fl. 9th century), a pupil of Isḥāq al-Mawṣilī, who, because of the jealousy of his teacher, emigrated from Baghdad to Spain. A virtuoso singer and the leading musician at the court of Córdoba, Ziryāb introduced a fifth string to the lute, devised a number of new forms of composition, and developed a variety of new methods of teaching singing in his well-known school of music. Musical activity spread to large towns, and Seville became a leading centre of musical-instrument manufacture.

Poetic and musical forms

New poetic forms were developed, such as the *muwashshaḥ* and the *zajal,* that were freer in rhyme and metre than the classical *qaṣīdah* or formal ode. These innovations in prosody opened the way to further musical developments. Especially important was the *nawbah* ("suite"), a form that included songs and instrumental music, free or metrical, that were linked together by melodic mode and rhythmic patterns. The 24 traditional *nawbah*s were invested with symbolic and cosmological significance. After the expulsion of the Muslims from Spain in 1492 this musical tradition was transported to North African centres, where it partially survived.

After the Mongol invasion of Baghdad in 1258 and the Spanish reconquest of Granada in 1492, the magnificence of Islāmic culture gradually waned. Music continued to be cultivated, receiving new influences from Mongol and Turkmen conquerors. Persia enjoyed artistic independence for about 450 years, until 1918; but during this period a huge area, from the Balkans to Tunisia, was submitted to a strong Turkish influence, which itself was heavily influenced by Arab and Persian music.

The modern period. From the beginning of the 19th century, Islāmic music was affected by the intensification of contacts and relationships with Western music. For the first time Islāmic music existed in juxtaposition with Western music. For example, European composers and musicians were summoned to create military bands and conservatories in Turkey (1826) and in Persia (1856), and Giuseppe Verdi's opera *Aida* inaugurated the opera house in Cairo in 1871. Expanding contact with Western music caused certain alterations in traditional musical styles. There was a widespread musical renaissance, with two main centres: the leading school in Egypt was open to modernism and Western influences, while in Syria and Iraq traditional music was supported. Music in Syria and Iraq, together with North African, Iranian, and Turkish music, remained restricted to its own periphery. The Egyptian school developed Middle Eastern music in what can be called the mainstream style; and this music was widely diffused through the media of radio, television, recordings, and the cinema. Mainstream music borrowed instruments such as the cello, saxophone, and accordion; melodies and rhythms from European serious and light music; the concept of large ensembles; and the use of electronic amplification. Emphasis shifted from the display of individual virtuosity and personal creativity to performance as an ensemble, and the use of short songs underscored the separation, rather than the traditional union, of composer and performer. Classical and local genres coexist, however, with the innovative mainstream style.

Persian art music continues to be organized into 12 traditional modes, or *dastgāh,* each of which contains a repertory of from 20 to 50 small pieces called *gūsheh*s ("corners"). In performance of instrumental and vocal music, the artist improvises on the chosen *gūsheh*s of a *dastgāh* in a specific order.

Vocal music still predominates even in countries such as Iran, in which instrumental music is cultivated independently. Thus almost all of the Near Eastern musicians who are well known are singers; those particularly influential in the modern renaissance, in chronological order, include ʿAbduh al-Ḥamūlī, Dāhūd Ḥussnī, Sayyid Darwīsh, ʿAbd al-Wahhāb, Umm Kulthūm, Farid al-Aṭrash, Fayrouz, Rashid al-Hundarashi, Ṣadīqa al-Mulāya, and Muḥammad al-Gubanshi.

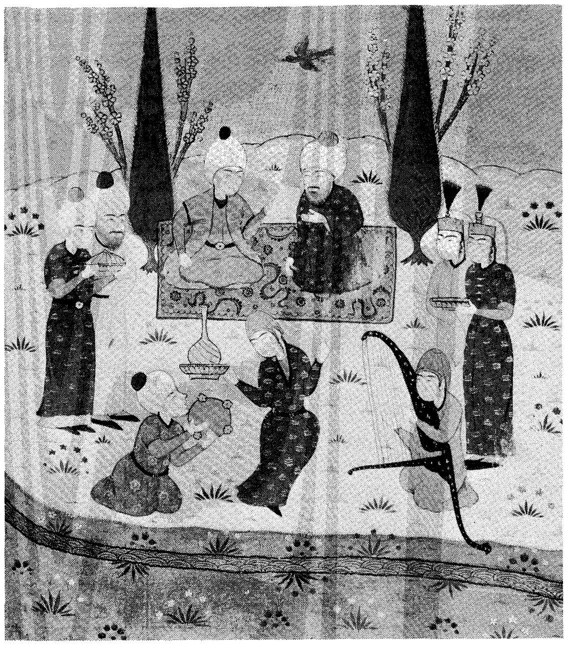
Theoretical developments

Modern Arab theorists also have produced valuable treatises. For example, the 19th-century theorists Michel Muchaqa of Damascus and Mohammed Chehab ad-Dīn of Cairo introduced the theoretical division of the scale into 24 quarter tones. In 1932 the international Congress of Arabian Music was held in Cairo, providing a forum for current analysis of subjects such as musical scales, modes, rhythms, and musical forms. (A.Sh.)

Dance and theatre

The performing arts have received comparatively little attention in the otherwise rich literature of the Islāmic peoples. This is most probably a result of the suspicions entertained by some orthodox Muslim scholars concerning the propriety of the dance and the theatre. Because this applies particularly in relation to the vexing theological question of human portrayal and its connection with idolatry, the performing arts have traditionally been regarded by the faithful with more than usual caution. Even as late as the 19th and early 20th centuries, most research on the subject, in what may loosely be called the Islāmic world, was carried out by Western scholars, chiefly from European nations; and only in the 20th century have indigenous scholars started publishing significant research on the subject.

There are no known references to the dance or theatre in pre-Islāmic Arabia, although nomad tribes were probably acquainted with the dance. The Islāmic peoples themselves seem to have developed this particular art form less than they did music or architecture; and, in addition to medieval Islām's cool attitude toward dance and theatre as art forms, it must be added that most women, leading a life of seclusion, could hardly be expected to play an active part in them. Nevertheless, there has been an active tradition of folk dance in most Islāmic countries, in addition to dancing as an entertainment spectacle and, particularly in Persia, as an art form. A ritual dance was instituted in



Dance as entertainment for the aristocracy, shown in "A Festive Party," manuscript illumination from the *Masnavī* of Jalāl ad-Dīn ar-Rūmī, AD 1295–96. In the British Museum (MS. OR. 7693, fol. 225 b.).

the Ṣūfī mystical order of the Mawlawīyah (Mevleviyah) in Turkey. The dance, performed by dervishes (members of the mystical order), is considered to be a manifestation of mystical ecstasy rather than an entertainment or an expression of aesthetic urges.

The theatre has not flourished as a major art under Islām, although as a form of popular entertainment, particularly in mime and shadow-puppet shows, it has persisted vigorously. Nevertheless, the theatre with live actors received support from the Ottomans in Turkey, and a live popular drama has been strong in Persia, where a passion play also took root. Otherwise, the theatrical record of Islām is meagre. Moreover, few neighbouring peoples had a well-developed theatre of their own; hence, outside stimulus was lacking, and the Islāmic disapproval of idolatry was so intense that, when the shadow theatre evolved in the East in the late Middle Ages, the puppets were regularly punched with holes to show that they were lifeless. Nonetheless, drama has had some ties with religion, as in Iran and other areas where the Shīʿite branch of Islām is concentrated. Here a passion play developed, rooted in traumatic memories of the bloody warfare of Islām's early years. This was a local phenomenon, uninfluenced by Christian Europe, and, though stereotyped, it movingly reenacted Shīʿite martyrdom.

Popular theatre

A popular theatre, frequently including dance, evolved independently from about the 17th century in some Muslim countries. West European and, later, U.S. influences were largely the main factors in the development of an artistic theatre in the 19th and 20th centuries. But conservative Muslims have consistently disapproved of theatre, and in Saudi Arabia, for example, no native theatrical establishment exists. In such an atmosphere, women's parts were at first taken by men; later, Christian and Jewish women took the roles, and only in the 20th century have Muslim women participated.

TYPES AND SOCIAL FUNCTIONS OF DANCE AND THEATRE

The dance. Folk dancing existed among medieval Islāmic peoples; but such sources as exist are mainly concerned with artistic dance, which was performed chiefly at the caliph's palace by skilled women. The aristocracy was quick to imitate this patronage by providing similar performances, its members vying with one another on festive occasions. One of these dances, the *kurrağ* (some times called *kurra*), developed into a song and dance festival held at the caliph's court. Since the latter part of the 19th century, the dancing profession has lost ground to the performance of U.S., Latin-American, and western European dances in cabarets. In a reaction that set in after World War II, fervent nationalists have tried to create native dance troupes, revive traditional motifs in costume and interpretation, and adapt tribal figures to modern settings. Few traditional dances have survived unchanged; among those that have are the dervish dances, performed mainly in Turkey.

Folk dance. Though now performed and fostered chiefly as an expression of national culture, folk dances were long regarded as pure entertainment and were either combined with theatrical shows or presented alone. Dance performances, accompanied by music, took place in a special hall or outdoors; many dancers, particularly the males, were also mimes. Sometimes the dance enacted a pantomime, as in Turkey, of physical love or of a stag hunt, representing the pursuit of a suspicious husband deceived by his wife.

Folk dance, except in Iran, has almost always been mimetic or narrative, a tradition still fostered by many tribes.

Dance as entertainment. The Turks considered dancing as a profession for the low-born; as a result, most dancers

Dervishes dancing in a *tekke,* engraving by J. Fougeron from *A Tour to the East in the Years 1763 and 1764, with Remarks on the City of Constantinople and the Turks,* by Frederick Calvert, 6th Baron Baltimore, 1767.

were members of minority groups: mostly Greeks, Jews, and Armenians. This judgment has usually applied to the status of professional dancers and indeed to most professional entertainers at most periods and in most societies until modern times. In 19th-century Egypt, both male and female dancers were regarded as public entertainers. Many of the women entertainers (*ghawāzī*) belonged to a single tribe and were usually considered little better than prostitutes. The erotic element in dancing has become focused in the belly dance, which has become the leading form of exhibition dance in modern Turkey and the Arab countries.

The mimetic tradition of folk dance has blended well in countries of the Sunnite persuasion with comedy and with the passion-play tragedy in Shīʿite countries. In recent years, however, the theatre has been increasingly divorced from the dance, with most plays being consciously modeled on European patterns; only in the operetta does the old combination remain.

Dance as an art form. In pre-Islāmic times in Iran, dance was both an art form and a popular entertainment. There are pictures of dancers in miniatures, on pottery, and on walls, friezes, and coins. Some of these ancient dances lived on partially in tribal dances, but again, under Islām's restrictions on women, the art became a male monopoly. Women were permitted to dance in private, however, as in the harem.

Iran is perhaps the only Muslim country with a tradition of dance regarded as an art form. When revived after World War II, folk dancing was encouraged and adapted for the foundation of a national ballet.

Muslim orthodoxy's very uncertainty over the exact status of the artistic dance ensured that it was always considered as an adjunct to music. Accordingly, although there are many detailed treatises on Islāmic music, none is available on dance.

Dervish dancing. There is one outstanding example of pure dance: that of the whirling dervishes, an art that has been practiced for more than seven centuries. The procedure is part of a Muslim ceremony called the *dhikr,* the purpose of which is to glorify God and seek spiritual perfection. Not all dervish orders dance; some simply stand on one foot and move the other foot to music. Those who dance, or rather, whirl, are the Mawlawī dervishes, an order that was founded by the Persian poet and mystic Jalāl ad-Dīn ar-Rūmī at Konya, in Anatolia, in the 13th century.

The performance, for which all of the participants don tall, brown, conical hats and black mantles, takes place in a large hall in the *tekke,* the building in which the dervishes live. The dervishes sit in a circle listening to music. Then, rising slowly, they move to greet the *shaykh,* or master, and cast off the black coat to emerge in white shirts and waistcoats. They keep their individual places with respect to one another and begin to revolve rhythmically. They throw back their heads and raise the palms of their right hands, keeping their left hands down, a symbol of giving and taking. The rhythm accelerates, and they whirl faster and faster. In this way they enter a trance in an attempt to lose their personal identities and to attain union with the Almighty. Later they may sit, pray, and begin all over again. The *dhikr* ceremony always ends with a prayer and a procession.

A storyteller in Kashmir.

The theatre. In lands where the Sunnite sect was strong, mime shows were frequent and popular attractions during the later Middle Ages. The Ottoman sultans were accompanied on military campaigns by their own troupe of actors; and, as the Ottoman Empire grew larger and richer, the court became ever more partial to entertainment, whether at the accession of a sultan, a royal wedding, a circumcision, an official visit, or a victory. On such occasions, dances and theatrical performances played their part along with parades, fireworks, music, mock fights, and circus performances in one huge, sumptuous pageant. This lavishing of entertainment reached a height of splendour that the admiring Ottoman aristocracy strove to imitate throughout the empire. In Arabia and North Africa, popular shows on a lesser scale were performed in the open air. Another aspect of the Islāmic theatre was represented in the shadow plays, which were given chiefly to while away the time during the month of fasting, Ramaḍān (the sacred ninth month of the Muslim year).

Actors at the Ottoman court

Among Shīʿites the passion play was regularly performed, by both professional and amateur actors. The performance always took place during the first 10 days of the month of Muḥarram (the first in the Muslim year), the period when the suffering and death of the descendants and relatives of the fourth caliph ʿAlī were commemorated. For generations this largely theatrical event served as a focal point of the year, gripping audiences in total involvement with its blend of symbolism and realism.

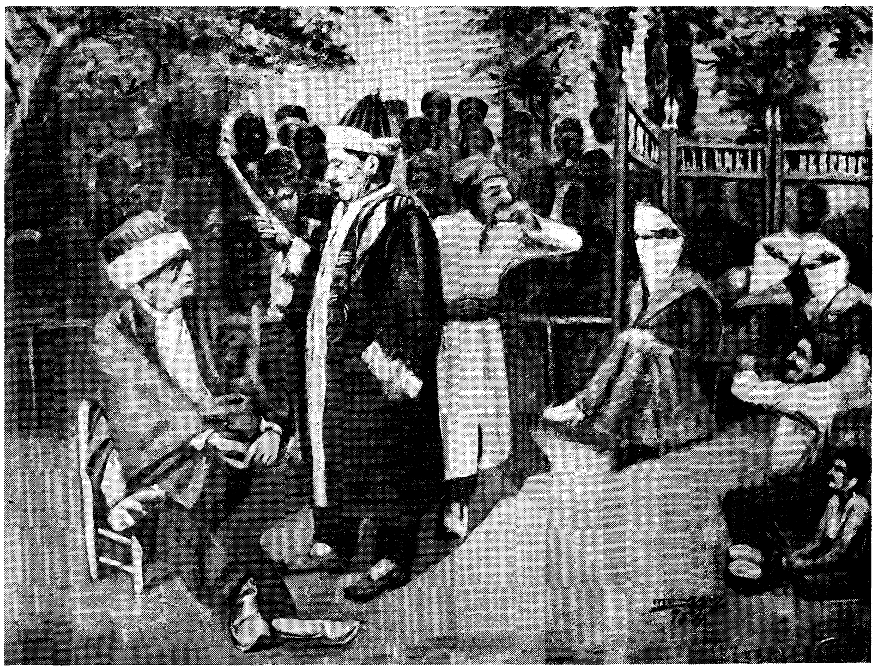
Mime shows. In the medieval Muslim theatre, mime shows aimed to entertain rather than to uplift their audiences. Regrettably, few mime shows were recorded in writing, and those that were recorded were set down primarily to serve as guidelines for directors, who might tamper with the wording, as in the improvisation of the Italian commedia dell'arte. Some plays were on historical themes, but preference was for comedies or farces with an erotic flavour. The audience was largely composed of the poor and uneducated.

A rudimentary theatrical form, the mime show long enjoyed widespread popularity in Anatolia and other parts of the Ottoman Empire. Called *meddah* (eulogist) or *mukallit* (imitator) in Turkish, the mimic had many similarities to his classical Greek forerunners. Basically he was a storyteller who used mimicry as a comic element, designed to appeal to his largely uneducated audience. By gesture and word he would imitate animals, birds, or local dialects; he was very popular in Arabic- and Turkish-speaking areas. Even today, he has not been wholly supplanted in the Islāmic world by literacy or by such modern entertainments as radio, television, and the cinema. Sometimes several *meddah*s performed together, and this may have been the source of a rural theatrical performance.

Ortaoyunu. The *ortaoyunu* (middle show) was the first type of genuine theatre the Turks, and possibly other Muslim peoples, ever had. The Ottoman sultans provided subsidies for *ortaoyunu* companies of actors, who consequently became generally accepted; also some were retained by the princes of the Romanian principalities under Ottoman rule. The fact that they continued to enjoy popularity to World War I may be explained by their simple dramatic appeal, which was coupled with sharp satire of the well-to-do and the ruling classes (but hardly ever of Islām). This irreverence frequently resulted in fines and imprisonment for the actors, but it never produced a basic change of style.

The first real theatre

During the 19th and 20th centuries, the *ortaoyunu* was generally performed in an open square or a large coffeehouse. There was no stage, and props were simple: they generally comprised a table or movable screen, while other



Ortaoyunu theatre, painting by Muazzez. In the collection of Dr. Metin And.
Metin And

objects were represented by paintings glued on paper. An orchestra of about four musicians enlivened the show and gave the performers, who were all male, their cues. Roles were generally stereotyped, with stock characters, such as a dandy, the foreign physician, and regional types (Kurds, Albanians, Armenians, Arabs, and Jews) quarreling and fighting in slapstick style. Mimicry was important, and some actors changed roles and costumes. The plot was flimsy, a mere frame for the dialogue, which was itself frequently improvised.

The marionette theatre. In comparison with *ortaoyunu,* the marionette theatre, although popular in Turkistan (under the name of *çadir hayâl*) and other parts of Muslim Central Asia, never really caught on in the Ottoman Empire.

Shadow plays (Karagöz). On the other hand, the shadow play had been widely popular for many centuries in Turkish- or Arabic-speaking countries. Its essence, like that of the mime shows, was entertainment without moral import; and few plays were recorded in writing beyond a sketch of the action. Most were comedies and farces that were performed for the enjoyment of an audience that was, for the most part, very poor and uneducated.

In Turkey, the Karagöz (a character, "Black-eye") theatre was the prevalent form of shadow play. This art apparently came from China or perhaps from Southeast Asia, as the French term *ombres chinoises* indeed hints, though the prevailing element of the grotesque was probably inherited from ancient Greece by way of Byzantium. The Karagöz was well known in Turkey during the 16th century but was so fully developed that it must have been introduced much earlier, and it quickly spread from Syria to North Africa and the Greek islands. Its performers were in great demand at the sultan's court as well as elsewhere, and they soon organized their own guild. Since only the framework of the play was sketched in writing, there was scope for a great deal of impromptu wit, and Karagöz shows, like the *ortaoyunu,* were inevitably satirical. But with the coming of motion pictures the Karagöz declined, and performances are now mostly confined to the month of Ramaḍān.

In the traditional performance of the Karagöz, the stage is separated from the audience by a frame holding a sheet; the latter has shrunk over the years from about six by 7½ feet (1.8 by 2.3 metres) to about three by two feet (0.9 by 0.6 metres). The puppets, which are flat and made of leather, are controlled by the puppeteers with rods and are placed behind the screen. An oil lamp is then placed still farther back so that it will throw the puppets' shadows onto the screen.

Traditional characters

A standard shadow play has three main elements: introduction, dialogue, and plot. The introduction is fairly stereotyped and consists of an argument and usually a quarrel between Karagöz and Hacivat, the two most com-

Marc Riboud—Magnum

mon characters. The former is a simple, commonsense fellow, while the latter is more formal and polished, if shallow and pedantic. The dialogue between the two varies with the occasion but always contains impromptu repartee, though most puppet masters have at least 28 different plots in stock—a different one for each night of Ramaḍān. Some are historical, many ribald, but all are popular entertainment. Additional characters or animals may be introduced, calling for great skill on the part of the puppet master and his assistant in manipulating several simultaneously, as well as in reciting the text in changing tones and playing music. Some have one or two musicians to help.

Mimicry and caricature, while essential to both the *meddah* and the *ortaoyunu,* are technically more developed in the shadow play. Here entire productions are based on a comedy of manners or of character. In addition to the stock characters from various ethnic groups, there is, for example, the drug addict who wraps his narcotic in dissolving gum before the fast begins so as not to sin, the light-headed Turk ("he who eats his inheritance") who is a prodigal and a debauchee, the highway robber, the stutterer, and the policeman.

Karagöz is the most frequently performed but not the sole type of shadow play in Muslim countries. In Egypt a shadow theatre is known to have existed as early as the 13th century, long before records of Karagöz shows were kept in Turkey. A physician, Muḥammad ibn Dāniyāl, wrote three shadow plays that have survived. They were performed in the 13th century and display humour and satire and the lampooning of match-making and marriage. These plays also introduce a parade of popular contemporary characters, many of whom earn their living in shady or amusing trades. A positively phallic element is as evident here as it is in the Karagöz.

The comic theatre in Iran

Iranian popular theatre. Popular theatre existed among the Iranians, who were proud of a long-lived cultural tradition and preserved their national language under Arab domination: indeed, even their branch of Islām, Shīʿism, set them apart from the Sunnism of the majority of Islām. The Ottomans' failure to conquer Iran increased competition between the respective intellectual elites. Iran had inherited a considerable theatrical tradition from pre-Islāmic times; it is not surprising that a popular comic theatre flourished there. The central figure of this theatre was the *Katchal Pahlavān* (or "bald actor"), and mimicry was important, both in comedy and in pantomime. The *Baqqal-Bāzī* ("Play of the Grocer"), in which a grocer repeatedly quarrels with his good-for-nothing servant, is a typical example of the popular comic tradition. The marionette theatre, or *Lobet-Bāzī,* while using Iranian puppets, was similar to its Turkish counterpart. At least five puppets appeared, and singing was an integral part of a production that sometimes resembled Italian and French puppet shows. The *ortaoyunu,* particularly in the region of Azerbaijan, is almost identical with the Turkish of the same name. The shadow play in Iran, however, has always been less popular and obscene than the Ottoman or Arab Karagöz.

Passion plays (taʿziyah). Quite different was the passion play, derived mainly from early Islāmic lore and assembled as a sequence of tragedies representing Shīʿite martyrdom. Both shadow and passion play were interlarded with musical prologues, accompaniment, and interludes; but these were not necessarily an integral part, serving rather to create a mood.

A preoccupation with religion is characteristic of Persian theatrical performances, and, during the first 10 days of the month of Muḥarram, the martyrdom of ʿAlī's descendants at the hands of the Umayyads is reenacted. Although these shows are also performed among Shīʿite Turks in Central Asia and Shīʿite Arab communities in Iraq and elsewhere, Iran is their centre. Some plays are satirical, directed against wrongdoers, but most form a set of tragedies, performed as passion plays on these 10 successive days. Named *taʿziyah* ("consolation"), this type of drama is an expression of Persian patriotism and, above all, of piety, both elements combining in an expression of the national religion, Shīʿism.

Background of the *taʿziyah*

In order to understand the mood of the *taʿziyah* it is necessary to remember that storytellers in Iran recite the gruesome details of the martyrdom of Ḥasan, Ḥusayn, and other descendants of ʿAlī all year long. Thus prepared, people swell the street processions during the days of Muḥarram, chain themselves, flagellate their bodies, and pierce their limbs with needles, shouting in unison and carrying images of the martyrs, made of straw and covered with blood—contrary to the injunctions of Islām. Sometimes men walk in the processions with heads hidden and collars bloodied, all part of a pageant dating from the 9th or 10th century. Its peak is reached daily in the play describing the martyrdom of ʿAlī's family and entourage, which used to be presented in the large mosques, but which, when the mosques proved too small, was given a special place. The roles of reciter of the martyrdom and of participant in a procession have blended over the years to produce the *taʿziyah* play, in which the reciters march in procession to the appointed place and there recite their pieces, which can be considered as a prologue before the play itself begins.

The chief incidents narrated in the *taʿziyah* are not necessarily presented in chronological order, but in any case the *taʿziyah* texts (manuscripts from the 17th and 18th centuries, thenceforth, printed texts) give an inadequate impression of their forceful effect. Indeed, the audience identifies itself so closely with the play that foreigners have, on occasion, been manhandled. Since half of the actors play the supporters of the ʿAlids and half play their opponents, the latter are sometimes attacked and beaten at the end of the play. The decor, too, is half-realistic and half-symbolic: blood is real, yet sand is represented by straw. The stage effects are frequently overdone, and this clearly further excites the audience. For instance, Ḥusayn's gory head is made to recite holy verses; or an armless warrior is seen to kill his opponent with a sword he holds in his teeth. The horses are real, although most of the other animals are played by humans. In general, the actors, though chiefly nonprofessional, infect the audience with their enthusiasm and absorption.

DANCE AND THEATRE IN MODERN TIMES

Developments in dance. Insofar as dance is related to the modern theatre, there is little difference between Muslim production and its European or American counterpart. Dance and drama are combined according to the artistic needs of the production or the personal tastes of the producer and director. Perhaps more important is the dance itself, independently performed as artistic self-expression. The geographical centre of folk dance is in the area east of the Mediterranean, though remnants of other cultures have survived. There are Balkan traces in western and northern Turkey, for example, and Berber and even black African traces in Morocco and elsewhere in North Africa.

Arab countries. In some Arab countries, dancing is popular, varying in town, village, or with nomad tribe. In the town, dancing is generally reserved for special occasions, chiefly Western social dances. On the other hand, villages have such favourites as the *dabkah.* The *dabkah* is danced mainly by men and is quite common in festivities in the area between northern Syria and southern Israel; for instance, the Druzes (sectarian Arab communities located in Lebanon, Syria, and Israel) are very fond of it. The performers dance in a straight line, holding handkerchiefs high in the air, while the first dancer in the row gives the sign for stepping or jumping. Among the Bedouin almost any pretext suffices for dancing, although since the mid-20th century dancing has been practiced most often at weddings and similar festivities. Usually two male dancers, or two rows of male dancers, repeatedly advance toward each other or the audience and retire. To this basic figure, there are numerous variations that give the different dances their names.

Turkey. The Turks are also lovers of music and dance and when they meet frequently sing and dance. There is no single national dance popular throughout the country; dances vary in the numbers required, some being for solo performance, others designed for pairs or groups, though nearly all have instrumental accompaniment. As illustration of the possibilities of a basic step, there are at least 40 variations of the group dance known as *bar,* a chain dance. Again, several folk dances have characteristics akin to pantomime, breaking up into five main types of imitation: village life, nature, combat, courtship, and animals or birds.

Opera is popular in Turkey, reflected in a long tradition of invitations to foreign companies, and the musical theatre, which frequently includes dancing, is also widespread. On the other hand, classical ballet was unknown until a school of ballet was opened by foreign teachers with government encouragement. Although most of the ballet performances are in Istanbul, they are well received on tour.

Iranian ballet

Iran. In Iran a national dance company was formed with government support after World War II, and ancient customs were revived. Until it was closed in 1979, the Iranian ballet company was outstanding in the Muslim world, drawing on ancient war dances, fire-priest dances, dervish dances, and tribal folklore, as well as on scenes and decor from painting, sculpture, and the rich imagery of classical Persian poetry. Various folk dances are likewise performed all over Iran; they are accompanied by music and reflect local traditions and customs. Some are mimetic, others erotic, others, again, war dances (chiefly in the mountain areas) and comic dances (usually with masks). Many of these are dying out as new tastes and customs evolve, and Iranian dance companies have tried to preserve some of these dying forms.

The contemporary theatre. The modern Muslim theatre is almost wholly a western European importation, unconnected with the traditional medieval theatre, which has almost completely disappeared, although there are vestiges of it.

Arab countries. Contemporary Arabic theatre owes much to the imaginative daring of the Naqqāsh family in 19th-century Beirut, which was then under Turkish rule. Significantly, they were Christians, then better educated and more cosmopolitan than Muslims, and they had the advantages of Beirut's contacts with Europe and position as the headquarters of missionary activity. A Beirut Maronite (a Roman Catholic following the Syrio-Antiochene rite, widespread in the area), Mārūn an-Naqqāsh (died 1855), who knew French and Italian as well as Arabic and Turkish, adapted Molière's *L'Avare* ("The Miser") and presented it on a makeshift stage in Beirut in 1848. He did so before a select audience of foreign dignitaries and local notables, and he wrote his play in colloquial Arabic and revised the plot to suit the taste and views of his audience. Further, he changed the locale to an Arab town and Arabicized the names of the participants. Other touches included instrumental and vocal music and the playing of women's roles by men, in the traditional manner. The above features characterized the Arabic theatre for about half a century. An-Naqqāsh, together with his family, composed and presented two other musical plays, one based on Molière's *Tartuffe,* the other on the story, in *The Thousand and One Nights,* of Abū al-Ḥasan, who became caliph for a day.

Egyptian theatre

Soon the main centre of Arabic theatre moved to Egypt, whose comparatively tolerant autonomy offered an atmosphere for literary and artistic creativity more congenial than other parts of the Ottoman Empire. Syrian and Lebanese intellectuals and actors emigrated there, particularly after the anti-Christian riots of 1860 in Syria. Though a somewhat crippled Arabic theatre continued in Syria, its influence was carried into Egypt by émigrés and later spread to other Arabic-speaking regions. The number of theatres, a potentially large public, the munificence of Egypt's rulers, increasing prosperity under British rule after 1882, and increasing education soon made Egypt the centre of Arabic theatre, a position it has successfully maintained since.

The colloquial Arabic of Egypt was increasingly employed in the theatre, and several companies toured the country and neighbouring parts. The composition of these companies was fluid, for the actors were prone to be fickle in their loyalties; nevertheless, certain types of Egyptian theatre can be discerned in the late 19th century and during the early 20th. Some, like the company of Salāmah Ḥijāzī, used music to such an extent that their productions approached being labelled opera or operetta. Others, like that of ʿAlī al-Kassār, specialized in downright farce, expressed in revue form, with a Nubian hero, the "Barbarin," who made a specialty of ridicule and mimicry. Yet others, like the company of Najīb ar-Rīḥānī, oscillating between outright farce and comedy, skillfully depicted contemporary Egyptian manners; in particular, Najīb ar-Rīḥānī created a character called Kish-Kish Bey, whose misadventures and unsolicited advice on every subject have made him a classic creation. A conventional theatre sprang up in Egypt, too, catering to a growing number of intellectuals and presenting dramas and tragedies in polished, literary Arabic. Its chief exponent was Jūrj Abyaḍ, who had spent time studying acting in Paris. In contrast, Yūsuf Wahbī's National Troupe performed realistic plays, usually dramas or melodramas, using either colloquial or literary Arabic and sometimes a combination of both.

The plays performed by the Egyptian troupes and others in Arabic-speaking lands developed through three overlapping but distinguishable stages: adaptations, translations, and original plays. Adaptations came first in the 19th century (see above). Translations of established works appealed to a discriminating public, but original plays, part of the evolution of modern Arabic literature, reflected a growing interest in political and social problems. The decline of foreign influence and the arrival of political independence encouraged creativity, which, however much under European influence, has some original works to its credit. Two 20th-century Arabic playwrights, both Egyptian, are Tawfīq al-Ḥakīm, a sensitive shaper of both social and symbolic dramas, and Maḥmūd Taymūr, a novelist and comedy writer who strikes deep into Egypt's social problems.

Turkey. The development of the modern Turkish theatre strongly resembles its Arabic counterpart. In Istanbul, theatrical performances were not unusual among the diplomatic and international set, and some local Turks were acquainted with them. Nonetheless, Turkish plays for live actors—barring *ortaoyunu*—date only from 1839. The first Turkish playhouse was built in Pera (now Beyoğlu), significantly in the middle of the foreign and embassy quarter of Istanbul. Many of the actors were members of non-Muslim minorities, such as the Armenian; and the first plays presented in Turkish were adaptations from the French, chiefly Molière. They were done during the 1840s, when music was an important item.

The Gedik Paşa Theatre

The Gedik Paşa Theatre, which is named for the area in Istanbul where it was located, was the first theatre in which Turkish plays were produced by native actors speaking in Turkish. The actors received a salary, and local writers presented their own plays. Originally built for foreign companies, the theatre was reconstructed in 1867 and reopened in 1868 for a Turkish company headed by an Armenian, Agop, who was later converted to Islām and changed his name to Yakup. For almost 20 years the Gedik Paşa Theatre was the dramatic centre of the city; and plays in translation were soon followed by original plays, several with a nationalist appeal, such as Namık Kemal's *Vatan yahut Silistre* (*Fatherland*), which was first produced in 1873. The actors had to struggle against prejudice and the playwrights against censorship (some of them were imprisoned or exiled), but the Turkish theatre spread beyond Istanbul in the 1870s and 1880s to such places as Adana (in southern Anatolia) and Bursa (just south of Istanbul, across the Sea of Marmara).

After the Young Turk Revolution of 1908, censorship was not relaxed, but interest in the theatre grew, particularly over political matters; and plays about the new constitution were written and performed. After the foundation of the Turkish Republic in 1923, the state subsidized several theatre companies and a school for dramatic arts, and an opera house was built in Ankara. Official support not only gave financial encouragement but also implied a change of attitude over such matters as the participation of Muslim women in productions.

By the middle of the 20th century, theatrical life was mostly centred on Istanbul and Ankara, although theatres and companies continued in the small towns too.

A growing number of original plays, some of which were influenced by American literature, have been written and produced; the standard has been higher than it was before World War I, when Turkish poetry and fiction were rather more impressive than the drama. Subjects, too, have been more diverse since that time. To topics such as the position of women, marriage and divorce, and the character of Islāmic institutions—all popular under the Ottomans—have been added the Greco-Turkish War, education, village conditions, secularization, class struggle, and psychological problems. The Dormen Theatre was founded in Istanbul in 1955 by Haldun Dormen; in the 1971 World Theatre season in London the company performed *A Tale of Istanbul,* a comedy that included elements of folklore, a puppet show, singing, and a belly dance. The Dormen Theatre also produces 20th-century Western plays.

Western European and Russian influences in Iran

Iran. In Iran the birth of the modern theatre dates from the second half of the 19th century. Adaptations and translations from European plays appeared in Persian, often with the location and names suited to Iran. Molière, again, was a favourite and western European influence considerable, though Russian literature also left its mark, particularly in Azerbaijan, whose northern population had a chance to watch Russian actors during World War I.

Playwrights began to write original plays almost at once; one of the earliest playwrights was an Azerbaijani, named Akhundof, living in the Caucasus. He wrote seven comedies ridiculing Persian and Causasian Muslim society; all were translated into Persian and printed in 1874. Other plays likewise showed pronounced yearnings for social reform presented in a satirical style; some of these were published in a magazine called *Tyatr* ("Theatre"), which first appeared in 1908. Another type was the patriotic play, extolling Iran's history.

Some pre-World War I pieces were designed for reading rather than production. They were performed usually in schools, but there were hardly any professional actors, and the stage and props were very simple. After World War I, suitable halls were built in Tehrān and other cities, but the iron hand of Reza Shah (1925–41) curtailed development through continuous censorship and surveillance. After 1942 many new companies were formed, and there was speedy development, with growing interest in social and political subjects, though competition from foreign films was considerable. The revolutionary Islāmic regime established in 1979 severely curtailed theatrical activity.

(J.M.L.)

Visual arts

In order to answer whether or not there is an aesthetic, iconographic, or stylistic unity to the visually perceptible arts of Islāmic peoples, it is first essential to realize that no ethnic or geographical entity was Muslim from the beginning. There is no Islāmic art, therefore, in the way there is a Chinese art or a French art. Nor is it simply a period art, like Gothic art or Baroque art, for once a land or an ethnic entity became Muslim it remained Muslim, a small number of exceptions like Spain or Sicily notwithstanding. Political and social events transformed a number of lands with a variety of earlier histories into Muslim lands. But, since early Islām as such did not possess or propagate an art of its own, each area could continue, in fact often did continue, whatever modes of creativity it had acquired. It may then not be appropriate at all to talk about the visual arts of Islāmic peoples, and one should instead consider separately each of the areas that became Muslim: Spain, North Africa, Egypt, Syria, Mesopotamia, Iran, Anatolia, India. Such, in fact, has been the direction taken by some recent scholarship. Even though tainted at times with parochial nationalism, the approach has been useful in that it has focused attention on a number of permanent features in different regions of Islāmic lands that are older than and independent from the faith itself and from the political entity created by it. Iranian art, in particular, exhibits a number of features (certain themes such as the representation of birds or an epic tradition in painting) that owe little to its Islāmic character since the 7th century. Ottoman art shares a Mediterranean tradition of architectural conception with Italy rather than with the rest of the Muslim world.

Such examples can easily be multiplied, but it is probably wrong to overdo their importance. For if one looks at the art of Islāmic lands from a different perspective, a totally different picture emerges. The perspective is that of the lands that surround the Muslim world or of the times that preceded its formation. For even if there are ambiguous examples, most observers can recognize a flavour, a mood in Islāmic visual arts that is distinguishable from what is known in East Asia (China, Korea, and Japan) or in the Christian West. This mood or flavour has been called decorative, for it seems at first glance to emphasize an immense complexity of surface effects without apparent meanings attached to the visible motifs. But it has other characteristics as well; it is often colourful, both in architecture and in objects; it avoids representations of living things; it gives much prominence to the work of artisans and counts among its masterpieces not merely works of architecture or of painting but also the creations of weavers, potters, and metalworkers. The problem is whether these uniquenesses of Islāmic art, when compared to other artistic traditions, are the result of the nature of Islām or of some other factor or series of factors.

These preliminary remarks suggest at the very outset the main epistemological peculiarity of Islāmic art: it consists of a large number of quite disparate traditions that, when seen all together, appear distinguishable from what surrounded them and from what preceded them through a series of stylistic and thematic characteristics. The key question is how this was possible, but no answer can be given before the tradition itself has been properly defined.

Such a definition can only be provided in history, through an examination of the formation and development of the arts through the centuries. For a static sudden phenomenon is not being dealt with, but rather a slow building up of a visual language of forms with many dialects and with many changes. Whether or not these complexities of growth and development subsumed a common structure is the challenging question facing the historian of this artistic tradition. What makes the question particularly difficult to answer is that the study of Islāmic art is still so new. Many monuments are unpublished or at least insufficiently known, and only a handful of scientific excavations have investigated the physical setting of the culture and of its art. Much, therefore, remains tentative in the knowledge and appreciation of works of Islāmic art, and what follows is primarily an outline of what is known with a number of suggestions for further work into insufficiently investigated areas.

Media and techniques

Each artistic tradition has tended to develop its own favourite mediums and techniques. Some, of course, such as architecture, are automatic needs of every culture; and, for reasons to be developed later, it is in the medium of architecture that some of the most characteristically Islāmic works of art are found. Other techniques, on the other hand, acquire varying forms and emphases. Sculpture in the round hardly existed as a major art form, and, although such was also the case of all Mediterranean arts at the time of Islām's growth, one does not encounter the astounding rebirth of sculpture that occurred in the West. Wall painting existed but has generally been poorly preserved; the great Islāmic art of painting was limited to the illustration of books. The unique feature of Islāmic techniques is the astounding development taken by the so-called decorative arts—*e.g.,* woodwork, glass, ceramics, metalwork, textiles. New techniques were invented and spread throughout the Muslim world—at times even beyond its frontiers. In dealing with Islām, therefore, it is quite incorrect to think of these techniques as the "minor" arts. For the amount and intensity of creative energies spent on the decorative arts transformed them into major artistic forms, and their significance in defining a profile of the aesthetic and visual language of Islāmic peoples is far greater than in the instances of many other cultures. Furthermore, since, for a variety of reasons to be discussed later, the Muslim world did not develop until quite late the notion of "noble" arts, the decorative arts have reflected far better the needs and ambitions of the culture as a whole. The kind of conclusion that can be reached about Islāmic civilization through its visual arts thus extends far deeper than is usual in the study of an artistic tradition, and it requires a combination of archaeological, art-historical, and textual information.

Definition of a culture through an art

An example may suffice to demonstrate the point. Among all the techniques of Islāmic visual arts, the most important one was the art of textiles. Textiles, of course, were used for daily wear at all social levels and for all occasions. But clothes were also the main indicators of rank, and they were given as rewards or as souvenirs by princes, high and low. They were a major status symbol, and their manufacture and distribution were carefully controlled through a complicated institution known as the *ṭirāz.* Major events were at times celebrated by being depicted on silks. Many texts have been identified that describe the hundreds of different kinds of textiles that existed. Since textiles could easily be moved, they became a vehicle for the transmission of artistic themes within the Muslim world and beyond its frontiers. In the case of this one technique, therefore, one is not dealing simply with a medium of the decorative arts but with a key medium in the definition of a given time's taste, of its practical functions, and of the ways in which its ideas were distributed. The more unfortunate point is that the thousands of fragments that have remained have not yet been studied in a sufficiently systematic way, and in only a handful of instances has it been possible to relate individual fragments to known texts. When more work has been completed, however, a study of this one medium should contribute significantly to the commercial, social, and aesthetic history of Islām, as well as explain much of the impact that Islāmic art had beyond the frontiers of the Muslim world.

The following survey of Islāmic visual arts, therefore, will be primarily a historical one, for it is in development through time that the main achievements of Islāmic art can best be understood. At the same time, other features peculiar to this tradition will be kept in mind: the varying importance of different lands, each of which had identifiable artistic features of its own, and the uniqueness of some techniques of artistic creativity over others.

ORIGINS

Assimilation of earlier artistic traditions

Islāmic visual arts were created by the confluence of two entirely separate kinds of phenomena: a number of earlier artistic traditions and a new faith. The arts inherited by Islām were of extraordinary technical virtuosity and stylistic or iconographic variety. All the developments of arcuated and vaulted architecture that had taken place in Iran and in the Roman Empire were available in their countless local variants. Stone, baked brick, mud brick, and wood existed as mediums of construction, and all the complicated engineering systems developed particularly in the Roman Empire were still utilized from Spain to the Euphrates. All the major techniques of decoration were still used, except for monumental sculpture. In secular and in religious art, a more or less formally accepted equivalence between representation and represented subject had been established. Technically, therefore, as well as ideologically, the Muslim world took over an extremely sophisticated system of visual forms; and, since the Muslim conquest was accompanied by a minimum of destruction, all the monuments, and especially the attitudes attached to them, were passed on to the new culture.

The second point about the pre-Islāmic traditions is the almost total absence of anything from Arabia itself. While archaeological work in the peninsula may modify this conclusion in part, it does seem that Islāmic art formed itself entirely in some sort of relationship to non-Arab traditions. Even the rather sophisticated art created in earlier times by the Palmyrenes or by the Nabataeans had almost no impact on Islāmic art, and the primitively conceived ḥaram in Mecca, the only pre-Islāmic sanctuary maintained by the new faith, remained as a unique monument that was almost never copied or imitated despite its immense religious significance. The pre-Islāmic sources of Islāmic art are thus entirely extraneous to the milieu in which the new faith was created. In this respect the visual arts differ considerably from most other aspects of Islāmic culture.

This is not to say that there was no impact of the new faith on the arts, but to a large extent it was an incidental impact, the result of the existence of a new social and political entity rather than of a doctrine. Earliest Islām as seen in the Qur'ān or in the more verifiable accounts of the Prophet's life simply do not deal with the arts, either on the practical level of requiring or suggesting forms as expressions of the culture or on the ideological level of defining a Muslim attitude toward images. In all instances, concrete Qur'ānic passages later used for the arts had their visual significance extrapolated.

There is no prohibition against representations of living things, and not a single Qur'ānic passage refers clearly to the mosque, eventually to become the most characteristically Muslim religious building. In the simple, practical, and puritanical milieu of early Islām, aesthetic or visual questions simply did not arise.

Influence of Islām in establishing a new artistic tradition

The impact of the faith on the arts occurred rather as the fledgling culture encountered the earlier non-Islāmic world and sought to justify its own acceptance or rejection of new ways and attitudes. The discussion of two examples of particular significance illustrates the point. One is the case of the mosque. The word itself derives from the Arabic *masjid,* "a place where one prostrates one's self (in front of God)." It was a common term in pre-Islāmic Arabic and in the Qur'ān, where it is applied to sanctuaries in general without restriction. If a more concrete significance was meant, the word was used in construct with some other term, as in *masjid al-ḥaram* to refer to the Meccan sanctuary. There was no need in earliest times for a uniquely Muslim building, for any place could be used for private prayer as long as the correct direction (*qiblah,* originally Jerusalem, but very soon Mecca) was observed and the proper sequence of gestures and pious statements was followed. In addition to private prayer, which had no formal setting, Islām instituted a collective prayer on Fridays, where the same ritual was accompanied by a sermon from the *imām* (leader of prayer, originally the Prophet, then his successors, and later legally any able-bodied Muslim) and by the more complex ceremony of the *khuṭbah,* a collective swearing of allegiance to the community's leadership. This ceremony served to strengthen the common bond between all members of the *ummah,* the Muslim "collectivity," and its importance in creating and maintaining the unity of early Islām has often been emphasized. There were two traditional locales for this event in the Prophet's time. One was his private house, whose descriptions have been preserved; it was a large open space with private rooms on one side and rows of palm trunks making a colonnade on two other sides, the deeper colonnade being on the side of the *qiblah.* The Prophet's house was not a sanctuary but simply the most convenient place for the early community to gather. Far less is known about the second place of gathering for the Muslim community. It was used primarily on major feast days, such as the end of the fasting period or the feast of sacrifice. It was called a *muṣallā,* literally "a place for prayer," and *muṣallā*s were usually located outside city walls. Nothing is known about the shape taken by *muṣallā*s, but in all probability they were as simple as pre-Islāmic pagan sanctuaries: large enclosures surrounded by a wall and devoid of any architectural or ornamental feature.

Altogether then there was hardly anything that could be identified as a holy building or as an architectural form. To be complete, one should add two additional features. One is an action, the call to prayer (*adhān*). It became, fairly rapidly, a formal moment preceding the gathering of the faithful. One man would climb on the roof and proclaim that God is great and that men must congregate to pray. There was no formal monument attached to the ceremony, though it led eventually to the ubiquitous minaret. The other early feature was an actual structure. It was the *minbar,* a chair with several steps on which the Prophet would climb in order to preach. The monument itself had a pre-Islāmic origin, but Muḥammad transformed it into a characteristically Muslim form.

With the exception of the *minbar,* only a series of actions was formulated in early Islāmic times. There were no forms attached to them, nor were any needed. But, as the Muslim world grew in size, the contact with many other cultures brought about two developments. On the one hand there were thousands of examples of beautiful religious buildings that impressed the conquering Arabs. But, more importantly, the need arose to preserve the restricted uniqueness of the community of faithful and to express its separateness from other groups. Islāmic religious architecture began with this need and, in ways to be described later, created a formal setting for the activities, ceremonies, and ideas that had been formless at the outset.

Muslim iconoclasm

A second and closely parallel development of the impact of the Islāmic religion on the visual arts is the celebrated question of a Muslim iconoclasm. As has already been mentioned, the Qur'ān does not utter a word for or against the representation of living things. It is equally true that from about the middle of the 8th century a prohibition had been formally stated, and thenceforth it would be a standard feature of Islāmic thought, even though the form in which it is expressed has varied from absolute to partial and even though it has never been totally followed. The justification for the prohibition tended to be that any representation of a living thing was an act of competition with God, for he alone can create something that is alive. It is striking that this theological explanation reflects the state of the arts in the Christian world at the time of the Muslim conquest—a period of iconoclastic controversy. It may thus be suggested that Islām developed an attitude toward images as it came into contact with other cultures and that its attitude was negative because the arts of the time appeared to lead easily to dreaded idolatry. While it is only by the middle of the 8th century that there is actual proof of the existence of a Muslim doctrine, it is likely that, more or less intuitively, the Muslims felt a certain reluctance toward representations from the very beginning. For all monuments of religious art are devoid of any representations; even a number of attempts at representational symbolism in the official art of coinage were soon abandoned.

This rapid crystallization of Islāmic attitudes toward images has considerable significance. For practical purposes, representations are not found in religious art, although matters are quite different in secular art. Instead there occurred very soon a replacement of imagery with calligraphy and the concomitant transformation of calligraphy into a major artistic medium. Furthermore, the world of Islām tended to seek means of representing the holy other than by images of men, and one of the main problems of interpretation of Islāmic art is that of the degree of means it achieved in this search. But there is a deeper aspect to this rejection of holy images. Although the generally Semitic or specifically Jewish sources that have been given to Islāmic iconoclasms have probably been exaggerated, the reluctance imposed by the circumstances of the 7th century transformed into a major key of artistic creativity the magical fear of visual imagery that exists in all cultures but that is usually relegated to a secondary level. This uniqueness is certainly one of the main causes of the abstract tendencies that are among the great glories of the tradition. Even when a major art of painting did develop, it remained always somehow secondary to the mainstream of the culture's development.

Both in the case of the religious building and in that of the representations, therefore, it was the contact with pre-Islāmic cultures in Muslim-conquered areas that compelled Islām to transform its practical and unique needs into monuments and to seek within itself for intellectual and theological justifications for its own instincts. The great strength of early Islām was that it possessed within itself the ideological means to put together a visual expression of its own, even though it did not develop at the very beginning a need for such an expression.

One last point can be made about the origins of Islāmic art. It concerns the degree of importance taken by the various artistic and cultural entities conquered by the Arabs in the 7th and 8th centuries, for the early empire had gathered in regions that had not been politically or even ideologically related for centuries. During the first century or two of Islām, the main models and the main sources of inspiration were certainly the Christian centres around the Mediterranean. But the failure to capture Constantinople and to destroy the Byzantine Empire also made these Christian centres inimical competitors, whereas the whole world of Iran became an integral part of the empire, even though the conquering Arabs were far less familiar with the latter than with the former. A much more complex problem is posed by conversions, for it is through the success of the militant Muslim religious mission that the culture expanded so rapidly. Insofar as one can judge, it is the common folk, primarily in cities, who took over the new faith most rapidly; and thus there was added in early Islāmic culture a folk element whose impact may have been larger than has hitherto been imagined.

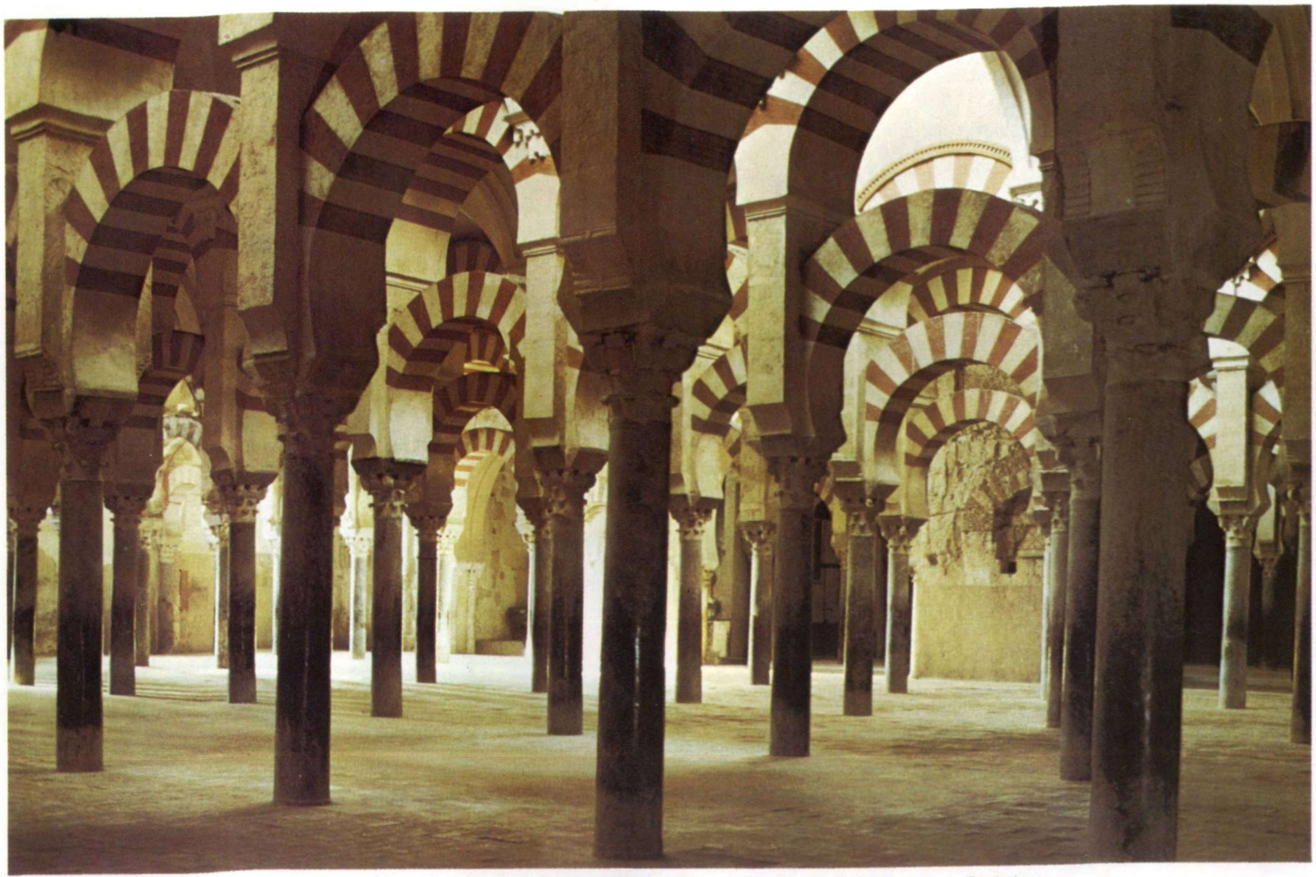
Folk element in Islāmic art

These preliminary considerations on the origins of Islāmic art have made it possible to outline several of the themes and problems that remained constant features of the tradition: a self-conscious sense of uniqueness when compared to others; a continuous reference to its own Qur'anic sources; a constant relationship to many different cultures; a folk element; and a variety of regional developments. None of these features remained constant, not even those aspects of the faith that affected the arts. But while they changed, the fact of their existence, their structural presence, remained a constant of Islāmic art.

EARLY PERIOD: THE UMAYYAD AND 'ABBĀSID DYNASTIES

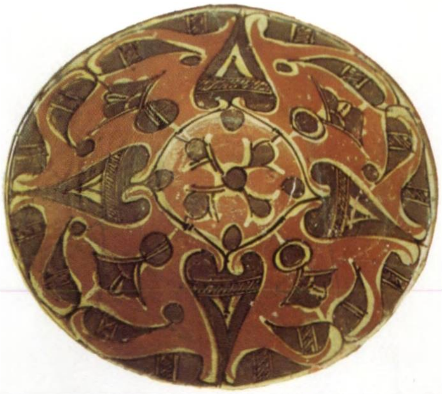
Of all the recognizable periods of Islāmic art, this is by far the most difficult one to explain properly, even though it is quite well documented. There are two reasons for this difficulty. On the one hand, it was a formative period, a time when new forms were created that identify the aesthetic and practical ideals of the new culture. Such periods are difficult to define when, as in the case of Islām, there was no artistic need inherent to the culture itself. The second complication derives from the fact that Muslim conquest hardly ever destroyed former civilizations with its own established creativity. Material culture, therefore, continued as before, and archaeologically it is almost impossible to distinguish between pre-Islāmic and early Islāmic artifacts. Paradoxical though it may sound, there is an early Islāmic Christian art of Syria and Egypt, and in many other regions the parallel existence of a Muslim and of a non-Muslim art continued for centuries. What did happen during early Islāmic times, however, was the establishment of a dominant new taste, and it is the nature and character of this taste that has to be explained. It occurred first in Syria and Iraq, the two areas with the largest influx of Muslims and with the two successive capitals of the empire, Damascus under the Umayyads and Baghdad under the early 'Abbāsids. From Syria and Iraq this new taste spread in all directions and adapted itself to local conditions and local materials, thus creating considerable regional and chronological variations in early Islāmic art.

From a historical point of view two major dynasties are involved. One is the Umayyad dynasty, which ruled from 661 to 750 and whose monuments are datable from 680 to 745. It was the only Muslim dynasty ever to control the whole of the Islāmic-conquered world. The second dynasty is the 'Abbāsid dynasty; technically its rule extended as late as 1258, but in reality its princes ceased to be a significant cultural factor after the second decade of the 10th century. The 'Abbāsids no longer controlled Spain, where an independent Umayyad caliphate had been established; and in Egypt as well as in northeastern Iran a number of more or less independent dynasties appeared, such as the Ṭūlūnids or the Sāmānids. Although recent research tends to make the conclusion less certain than it used to be for the Sāmānids and northeast Iran, the initial impulse for the artistic creativity of these dynasties came from the main 'Abbāsid centres in Iraq. While in detailed studies it is possible to distinguish between Umayyad and 'Abbāsid art or between the arts of various provinces, the key features of the first three centuries of Islāmic art (roughly through the middle of the 10th century) are the interplay between local or imperial impulses and the creation of new forms and functions.

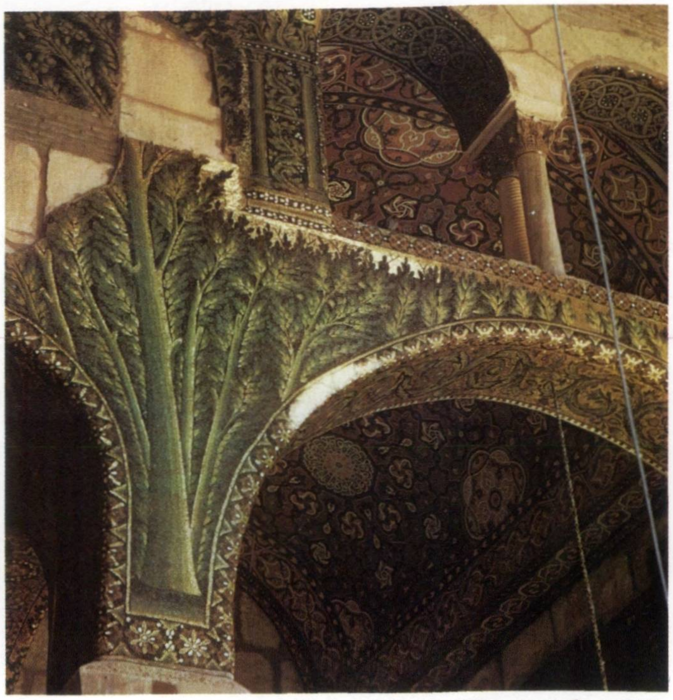


Interior of the Great Mosque of Córdoba, Spain, begun 785. The building is now a Christian cathedral.

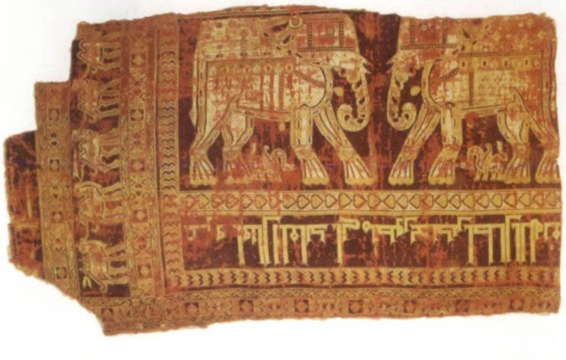
Umayyad and ʿAbbasid Art



Bowl from Nīshāpūr, lead-glazed earthenware with a slip decoration. In the Victoria and Albert Museum, London.



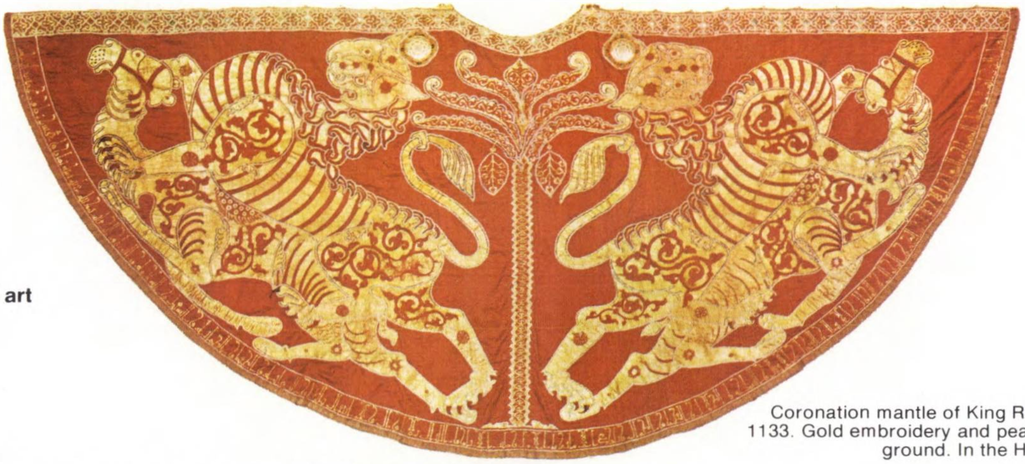
Mosaics decorating the portico of the Great Mosque of Damascus, Syria, 715.



Woven silk bearing the inscription "Glory and happiness to Qaid Abul Mansur Nudjkatin; may God continue his prosperity," 10th century. In the Louvre, Paris. 94 × 52 cm.

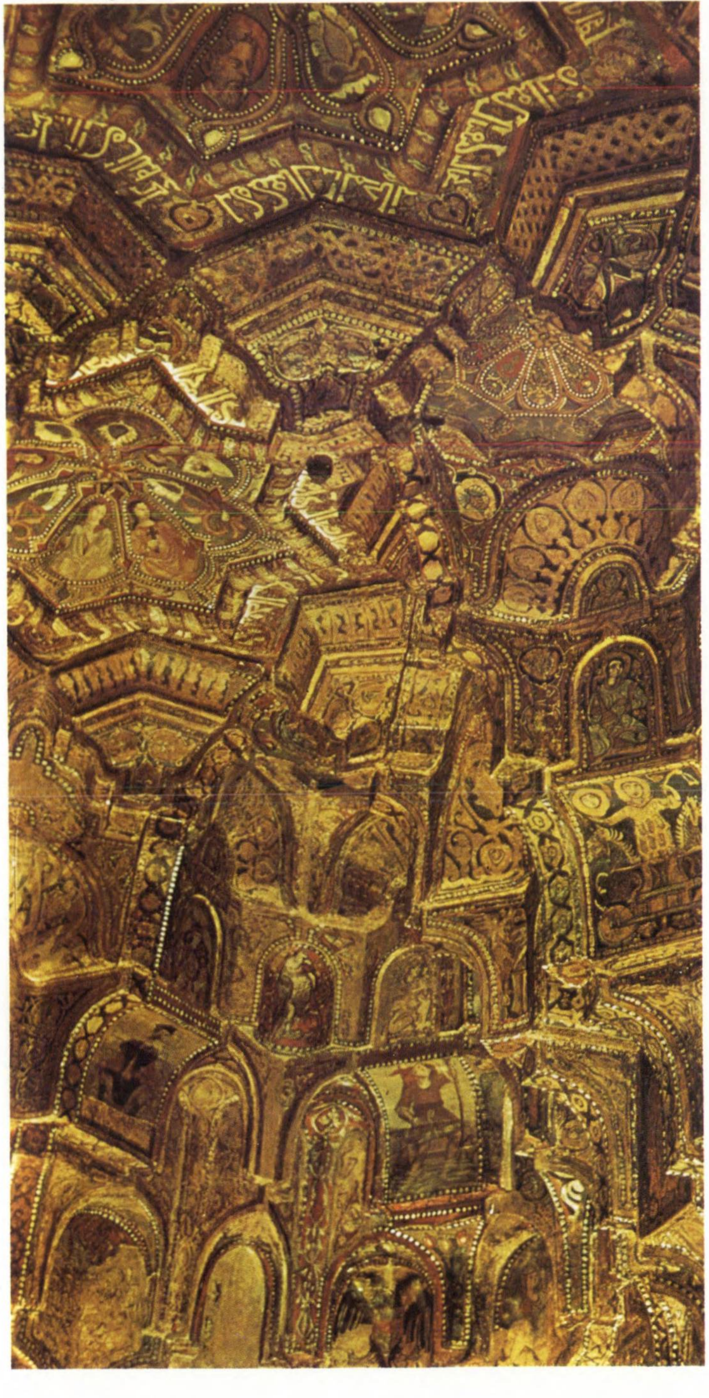
Plate 1: By courtesy of (centre left) the Victoria and Albert Museum, London; photographs, (top) Alfonso Gutierrez Escera—Ostman Agency, (bottom left) Cliche Musees Nationaux, (bottom right) J.E. Dayton, London

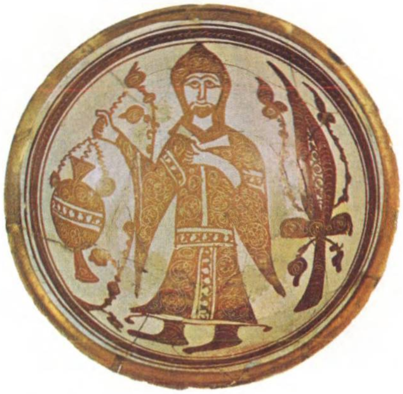
Fatimid art



Coronation mantle of King Roger II of Sicily, 1133. Gold embroidery and pearls on a red silk ground. In the Hofburg, Vienna.

Ceiling of the Capella Palatina, Palermo, Sicily. The chapel was built by the Norman kings of Sicily and decorated by Fātimid artists.





Bowl of lustre-ware by the potter Sa'ad, depicting a Christian priest swinging a censer, first half of the 12th century. In the Victoria and Albert Museum, London.

Bronze griffin. In the Camposanto, Pisa, Italy.

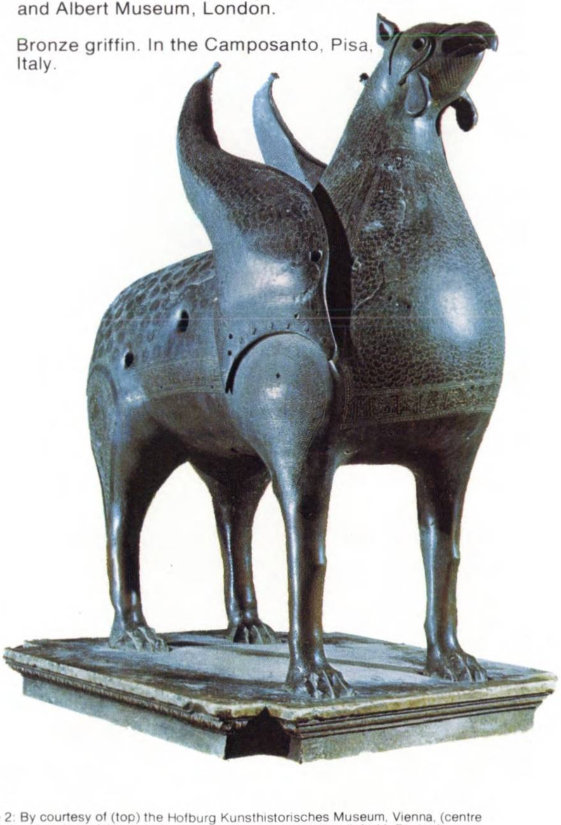


Plate 2: By courtesy of (top) the Hofburg Kunsthistorisches Museum, Vienna, (centre right) the Victoria and Albert Museum, London; photographs, (left) M. Desjardins—Realities, (bottom right) SCALA—Art Resource/EB Inc.

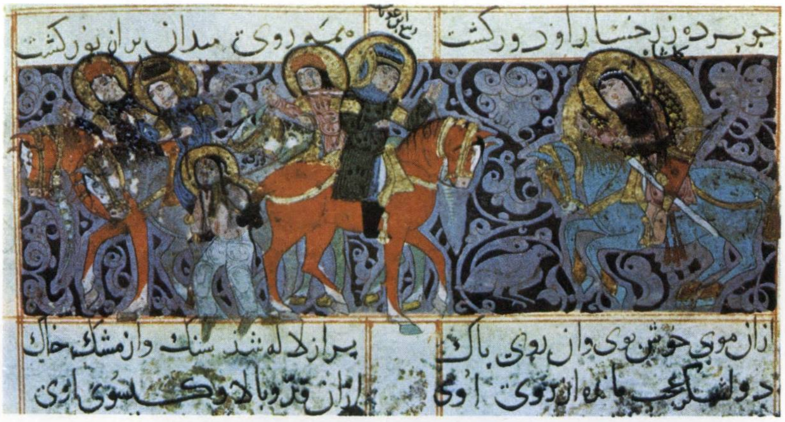
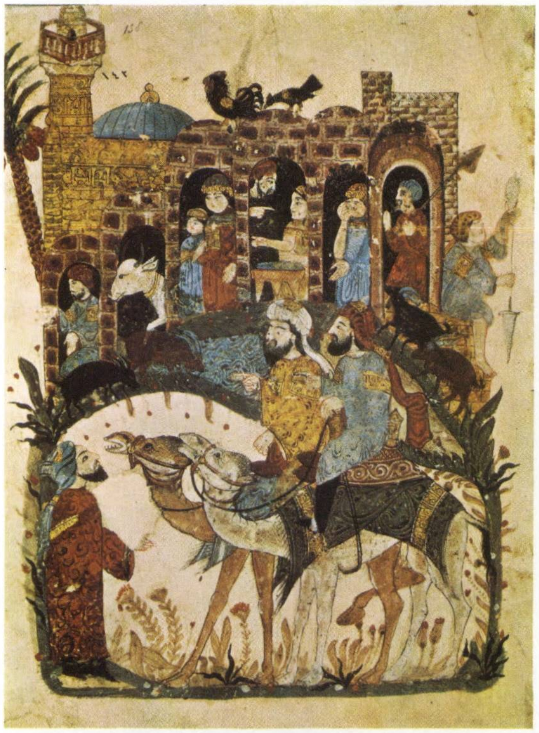
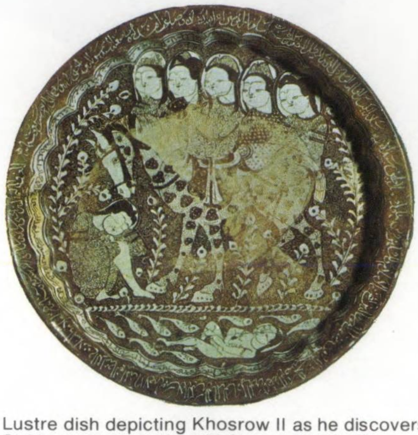
Seljuq art



"Golshāh has removed her veil during a battle," miniature from *Varqeh o-Golshāh,* 13th century. In the Topkapı Saray Museum, Istanbul. (Ms. Hazine 841, fol. 22.) 10.2 × 29.7 cm.

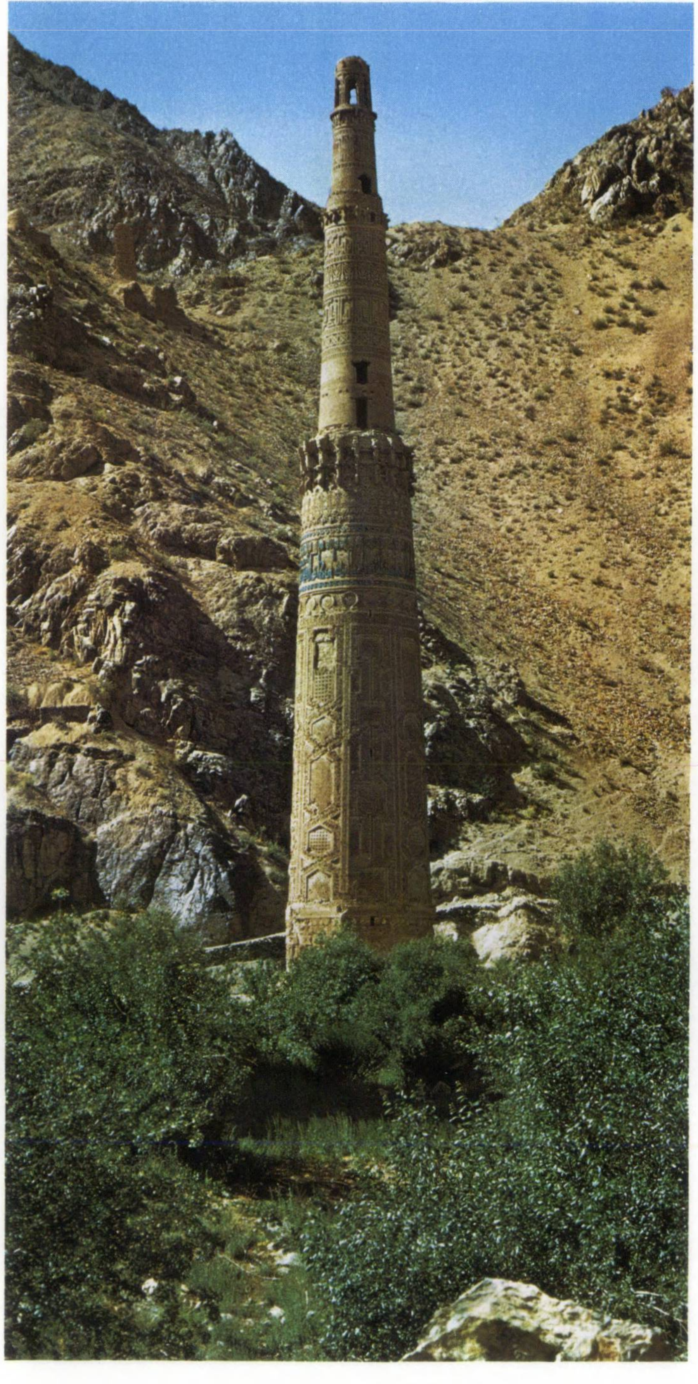


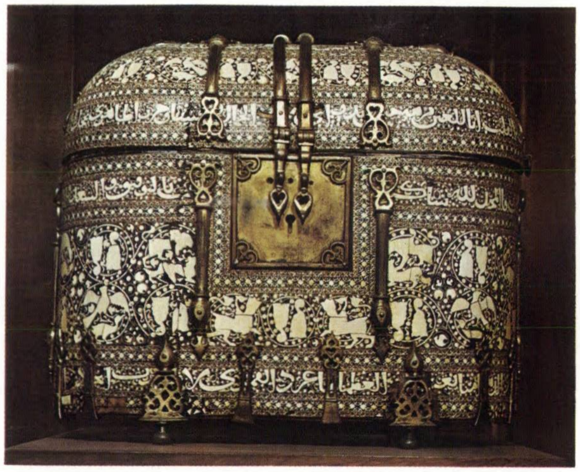
Discussion near a village, miniature painted by Yahyā ibn Mahmūd al-Wāsitī from the 43rd *maqāmah* of the *Maqāmāt* ("Assemblies") of al-Harīrī, 1237. In the Bibliothèque Nationale, Paris. (Ms. Arabe 5847, folio 138 r.). 34.8 × 26 cm.



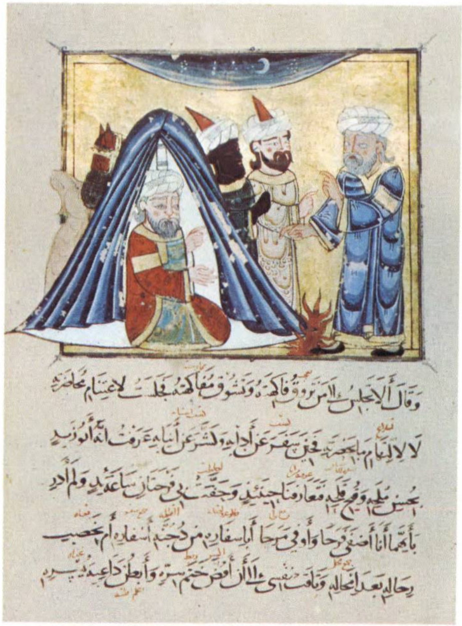
Lustre dish depicting Khosrow II as he discovers Shīrīn bathing, by Sayyid Shams ad-Dīn al Husani, from Kāshān, Iran, *c.* 1210. In the Freer Gallery of Art, Washington, D.C.

The minaret of Jām, Afghanistan, 1116–1202.



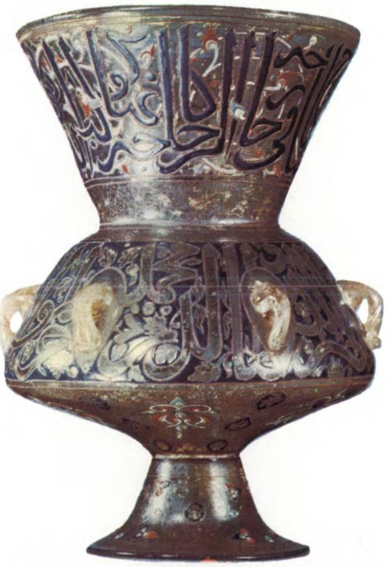


Ivory casket, 13th century. In the Palazzo Reale, Capella Palatina, Palermo, Sicily. 39 × 40 × 24 cm.

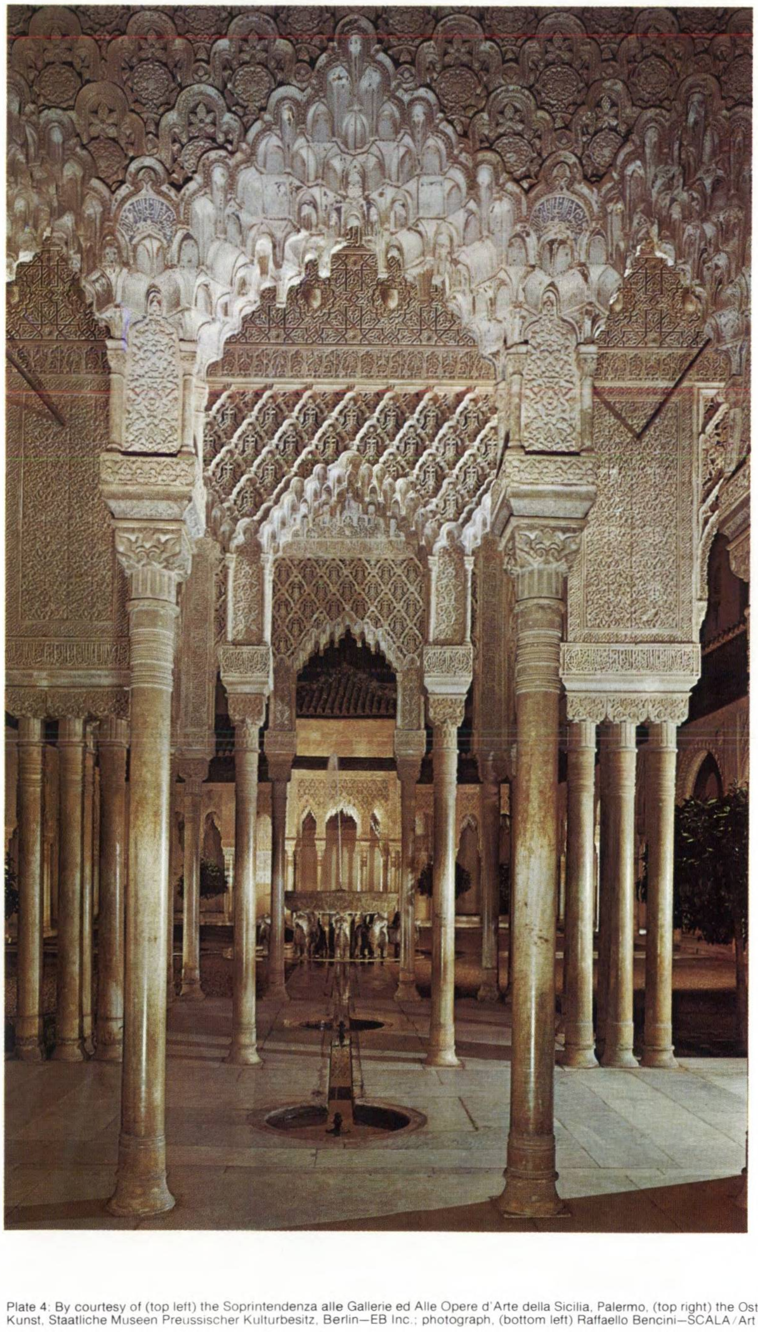


Al-Hārith talks to Abū Zayd in his tent, miniature from the 26th *maqāmah* of the *Maqāmāt* ("Assemblies") of al-Harīrī, probably Egyptian, 1334. In the Österreichische Nationalbibliothek, Vienna (MS. A. F. 9, folio 87 v). Miniature only, 13.7 × 15.8 cm.

Moorish and Mamluk art

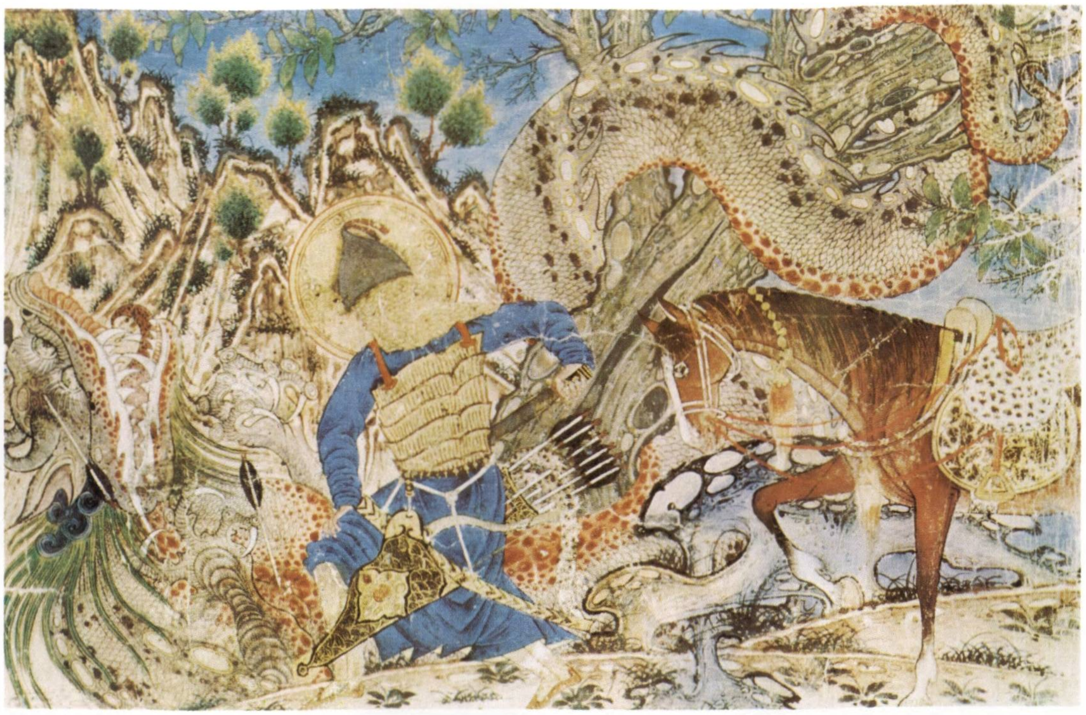


Hanging mosque lamp, enamelled and gilded glass, from Aleppo, Syria, *c.* 1300. In the Museum für Islamische Kunst, Staatliche Museen Preussischer Kulturbesitz, West Berlin.



Court of the Lions, the Alhambra, Granada, Spain, 14th century.

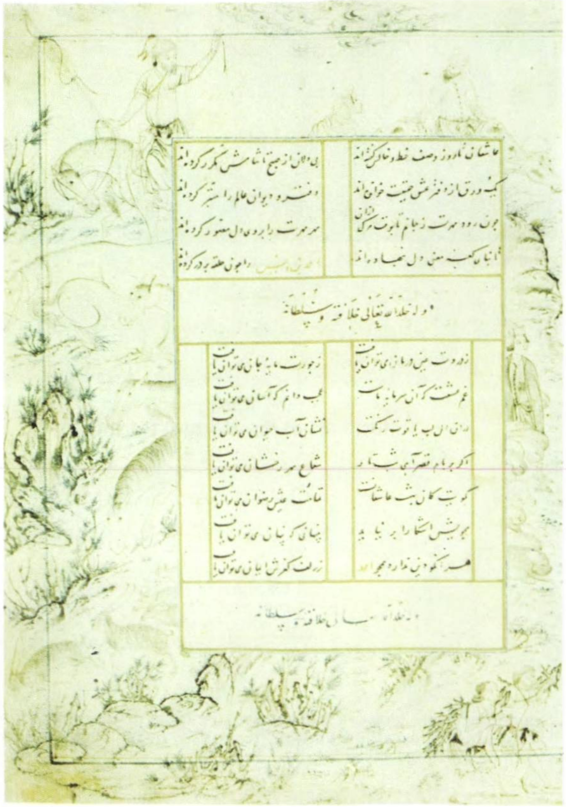
Plate 4: By courtesy of (top left) the Soprintendenza alle Gallerie ed Alle Opere d'Arte della Sicilia, Palermo, (top right) the Osterreichische Nationalbibliothek, Vienna, (bottom right) the Museum fur Islamische Kunst, Staatliche Museen Preussischer Kulturbesitz, Berlin—EB Inc.; photograph, (bottom left) Raffaello Bencini—SCALA/Art Resource from EB Inc.



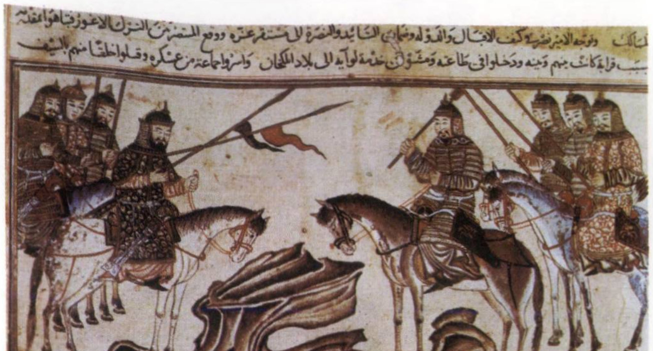
Bahrām Gūr killing a dragon, illustration from the *Shāh-nāmeh* ("Book of Kings") of Ferdowsī, known as the Demotte *Shāh-nāmeh*, 1320–60, from Tabriz, Iran. In the Cleveland Museum of Art. Height 40.6 cm.

Il-Khanid art of the Mongol Period

Pottery bowl from Kāshān, Iran, late 14th century. In the Victoria and Albert Museum, London.

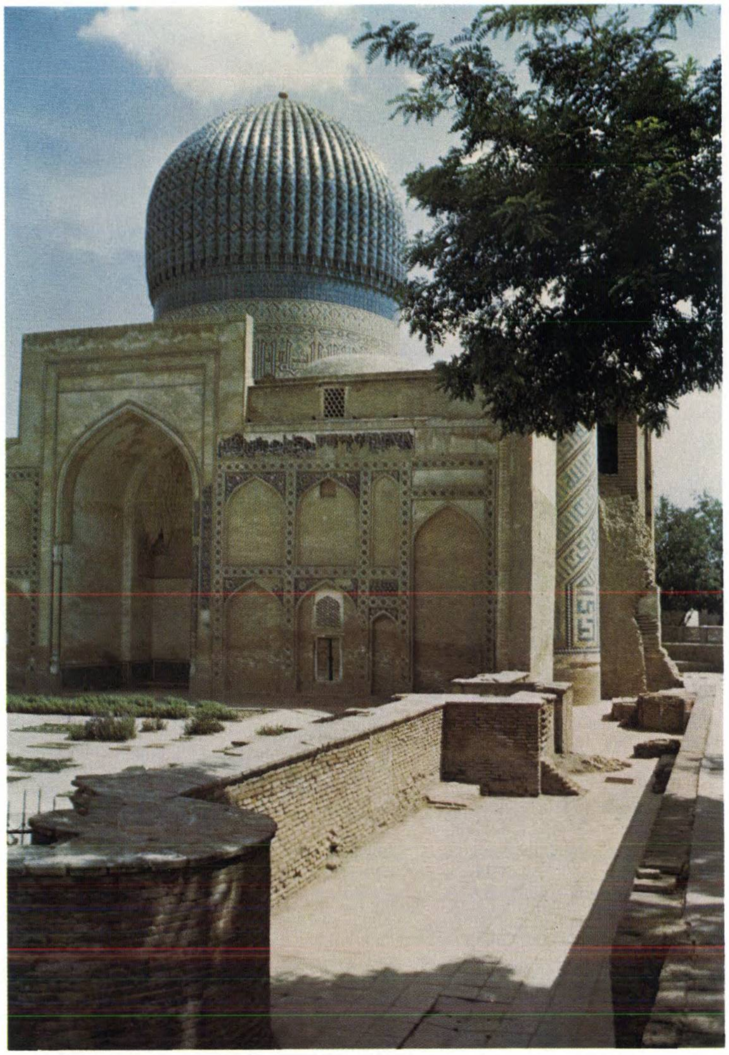


Diwān of Sultan Ahmad, pastoral border painted by Junayd, *c.* 1405, from Baghdad. In the Freer Gallery of Art, Washington, D.C. 29.2 × 20.3 cm.

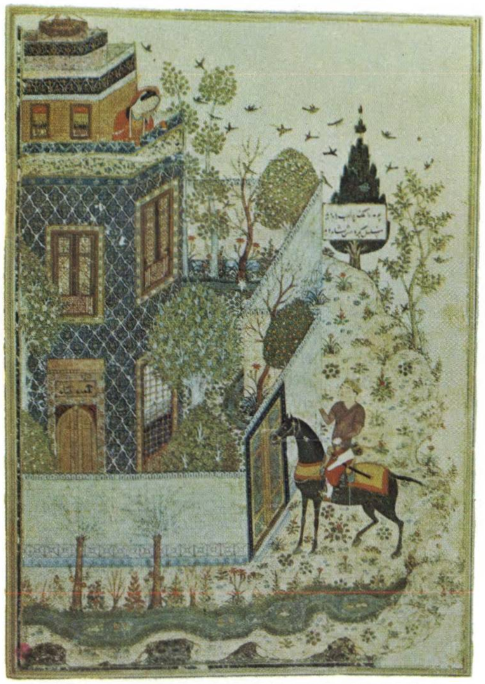


Mongol warriors, miniature from Rashīd ad-Dīn's *History of the World*, 1307. In the Edinburgh University Library, Scotland. Miniature only, 25 × 11.4 cm.

Plate 5: By courtesy of (top) the Cleveland Museum of Art, Ohio, Grace Rainey Rogers Fund, (centre left) the Victoria and Albert Museum, London, (bottom left) the Edinburgh University Library, Scotland, (bottom right) the Smithsonian Institution, Freer Gallery of Art, Washington, D.C.; photograph (centre left) John Webb

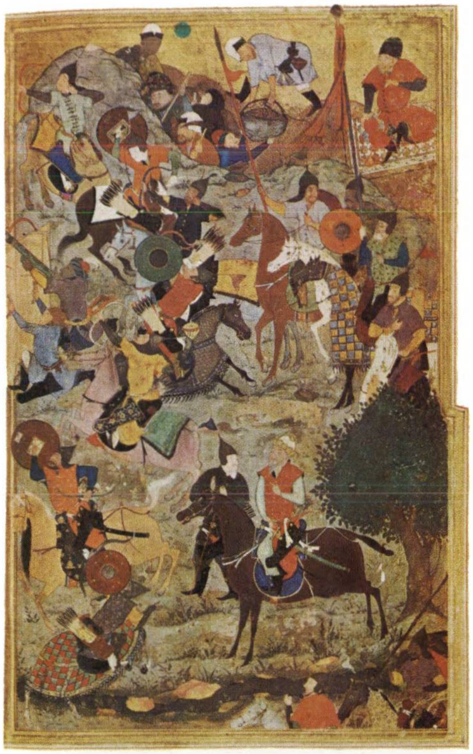


The mausoleum of Timur at Samarkand, 1434.



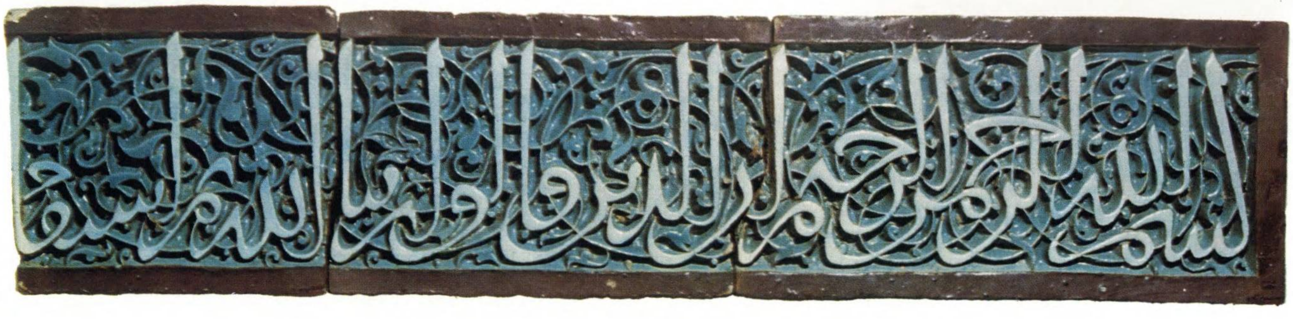
"Prince Humāy at the Gate of Humāyun's Castle," miniature painted by Junayd for the *Khamseh* of Khwāju Kermānī, 1396. In the British Library (MS. Add 18113, folio 18v). 29 × 20.2 cm.

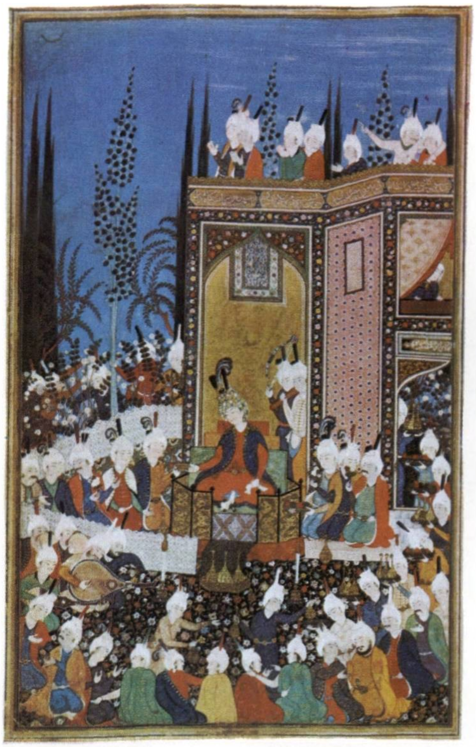
Timurid art of the Mongol Period



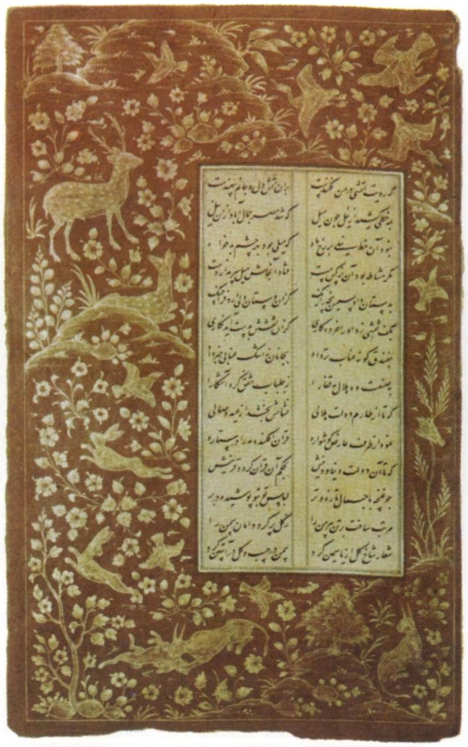
Capture of the fortress of the Knights Hospitallers at Smyrna, miniature from a *Zafar-nāmeh* (a life of Timur) by Behzād, *c.* 1490, from Herāt. In the John Work Garrett Library, Johns Hopkins University, Baltimore. 25.2 × 13 cm.

Section of relief tilework from the mausoleum of Bayram Khān at Fatḥābād, Uzbekistan, late 14th to early 15th century. In the Victoria and Albert Museum, London. Length 1.52 m.



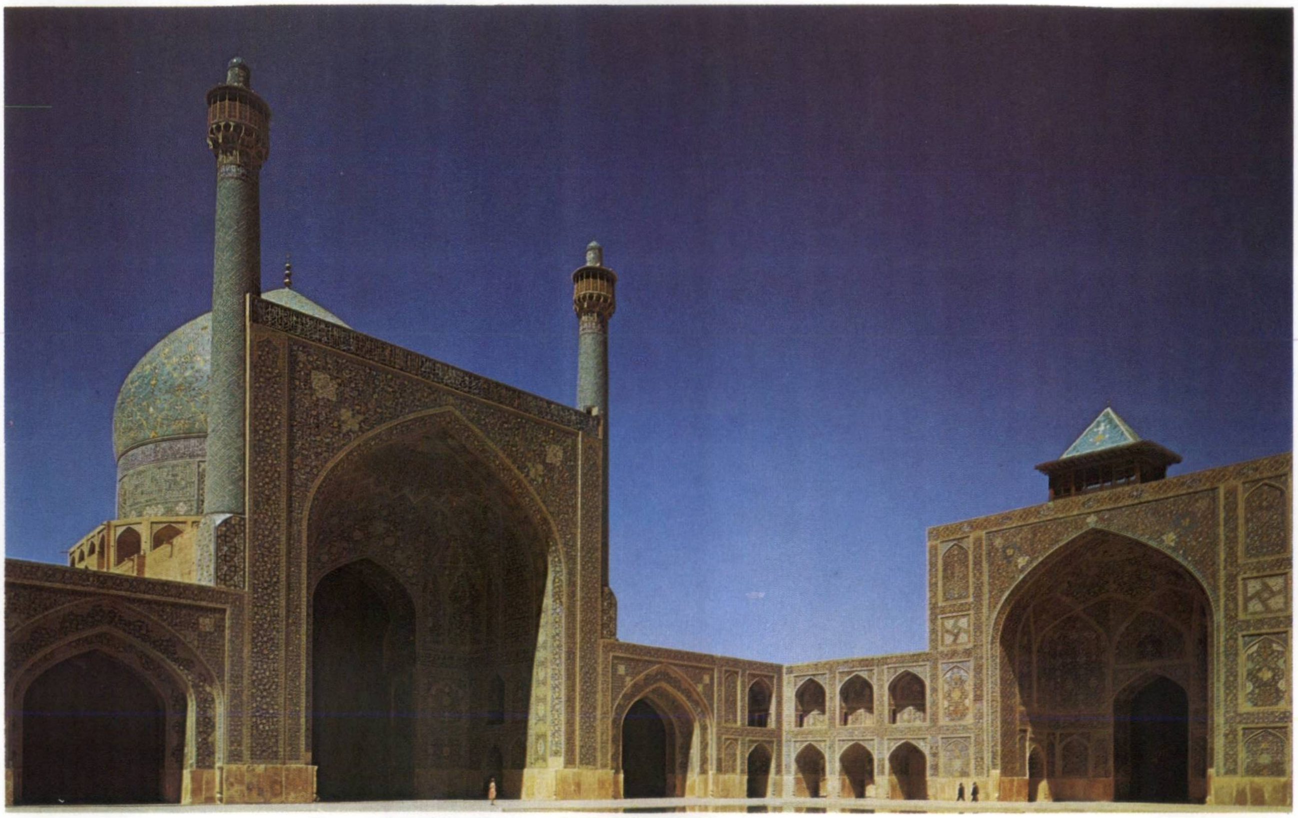


The Feast of 'Id, illustration from a *Divān* of Hāfez, signed Sultan Muhammad, *c.* 1520. In a private collection. 24 × 16 cm.



Miniature from *Yusof o-Zalikhā* by Jāmī, the text in small *nasta 'liq* calligraphy, 1557. In the Freer Gallery of Art, Washington, D.C. 25.2 × 15 cm.

Safavid art



Two *eyvān*s of the Masjed-e Shāh of 'Abbās I the Great at Isfahan, Iran, 17th century.

Plate 6: By courtesy of (centre right) the John Work Garrett Library, Johns Hopkins University, Baltimore, (bottom) Victoria and Albert Museum, London; photographs, (top right) reproduced by permission of the British Library, (top left) Alex Langley—Photo Researchers/EB Inc., (centre right) Walters Art Gallery, Baltimore, (bottom) John Webb

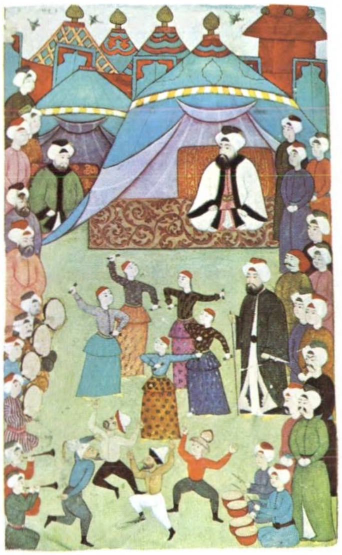
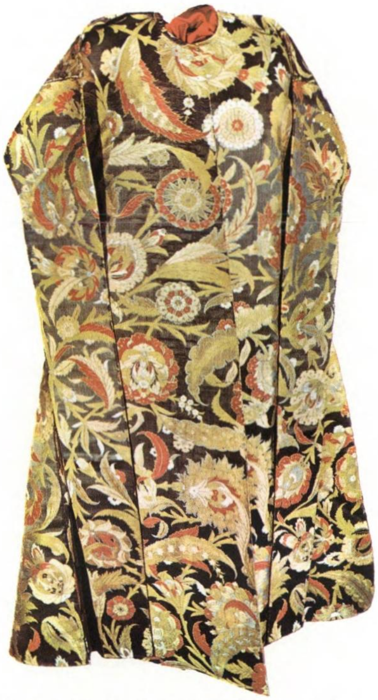
Interior of the Rüstem Paşa Mosque, Istanbul, showing the coloured tile decoration.

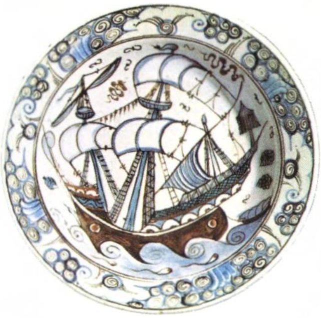
Ottoman art



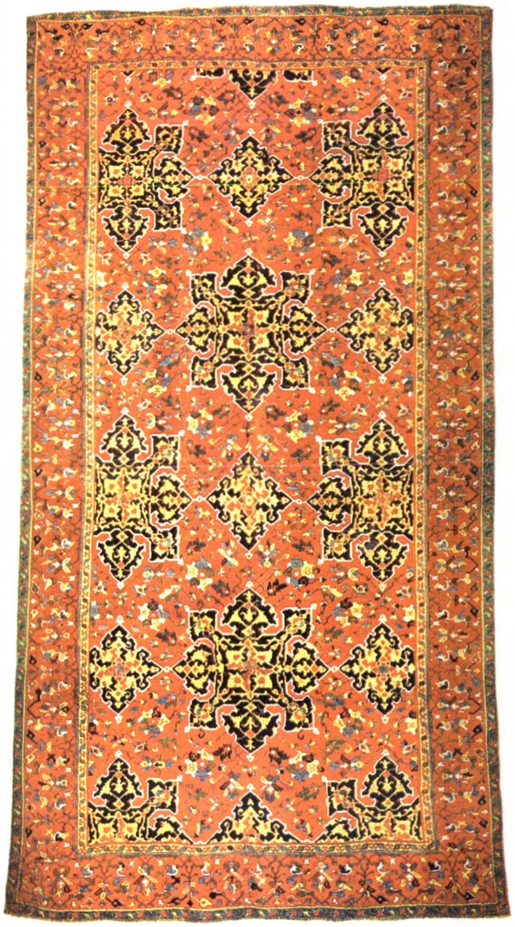
The Sultan watching dancers and comedians in the Hippodrome, illustration from the *Surname-i Vehbi* of Ahmed III (1703–30), painted by Levnî. In the Topkapı Saray Museum, Istanbul.



Silk caftan said to be that of Bayezid II (1481–1512). In the Topkapı Saray Museum, Istanbul.



Isnik ware dish, second half of the 16th century. In the Victoria and Albert Museum, London. Diameter 30.5 cm.



"Star Ushak" carpet from western Anatolia, late 16th to early 17th century. In the Metropolitan Museum of Art, New York City. 2.17 × 4.27 m.

Plate 8: By courtesy of (bottom left, centre) the Topkapı Saray Museum, Istanbul, (bottom centre) the Victoria and Albert Museum, London, (bottom right) the Metropolitan Museum of Art, New York, gift of Joseph V. McMullen; photographs, (top, bottom left, centre) Ara Guler—EB Inc., (bottom centre) John Webb, (bottom right) Otto E. Nelson

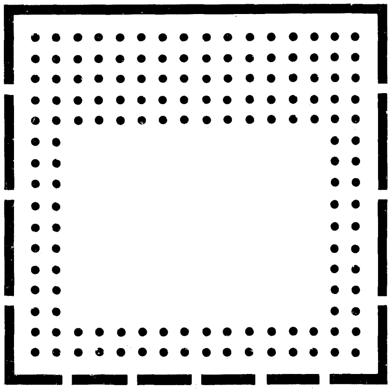
It is possible to study these centuries as a succession of clusters of monuments, but, since there are so many of them, a study can easily end up as an endless list. It is preferable, therefore, to centre the discussion of Umayyad and ʿAbbāsid monuments on the functional and morphological characteristics that identify the new Muslim world and only secondarily be concerned with stylistic progression or regional differences.

Origin of the mosque

Architecture. *Religious buildings.* The one obviously new function developed during this period is that of the mosque, or *masjid.* The earliest adherents of Islām used the private house of the Prophet in Medina as the main place for their religious and other activities and *muṣallā*s without established forms for certain holy ceremonies. The key phenomenon of the first decades that followed the conquest is the creation outside of Arabia of *masjid*s in every centre taken over by the new faith. These were not simply or even primarily religious centres. They were rather the community centres of the faithful, in which all social, political, educational, and individual affairs were transacted. Among these activities were common prayer and the ceremony of the *khuṭbah.* The first mosques were built primarily to serve as the restricted space in which the new community would take its own collective decisions. It is there that the treasury of the community was kept, and early accounts are full of anecdotes about the immense variety of events, from the dramatic to the scabrous, that took place in mosques. Since even in earliest times the Muslim community consisted of several superimposed and interconnected social systems, mosques reflected this complexity, and, next to large mosques for the whole community, tribal mosques and mosques for various quarters of a town or city are also known.

None of these early mosques has survived, and no descriptions of the smaller ones have been preserved. There do remain, however, accurate textual descriptions of the large congregational buildings erected at Kūfah and Basra in Iraq and at al-Fusṭāṭ in Egypt. At Kūfah a larger square was marked out by a ditch, and a covered colonnade known as a *ẓullah* (a shady place) was put up on the *qiblah* side. In 670 a wall pierced by many doors was built in place of the ditch, and colonnades were put up on all four sides, with a deeper one on the *qiblah.* In all probability the Basra mosque was very similar, and only minor differences distinguished the ʿAmr ibn al-ʿĀṣ mosque at al-Fusṭāṭ. Much has been written about the sources of this type of building, but the simplest explanation may be that this is the very rare instance of the actual creation of a new architectural type. The new faith's requirement for centralization, or a space for a large and constantly growing community, could not be met by any existing architectural form. Almost accidentally, therefore, the new Muslim cities of Iraq created the hypostyle mosque (a building with the roof resting on rows of columns). A flexible architectural unit, a hypostyle structure could be square or rectangular and could be increased or diminished in size by the addition or subtraction of columns. The single religious or symbolic feature of the hypostyle mosque was a *minbar* (a pulpit) for the preacher, and the direction of prayer was indicated by the greater depth of the colonnade on one side of the structure.

From E. Kuhnel, *Islamic Art and Architecture*



Plan of reconstructed mosque at Kūfah.

Versatility of the hypostyle plan

The examples of Kūfah, Basra, and al-Fusṭāṭ are particularly clear because they were all built in newly created cities. Matters are somewhat more complex when discussing the older urban centres taken over by Muslims. Although it is not possible to generalize with any degree of certainty, two patterns seem to emerge. In some cases, such as Jerusalem and Damascus and perhaps in most cities conquered through formal treaties, the Muslims took for themselves an available unused space and erected on it some shelter, usually a very primitive one. In Jerusalem this space happened to be a particularly holy one—the area of the Jewish Temple built by Herod I the Great, which had been left willfully abandoned and ruined by the triumphant Christian empire. In Damascus it was a section of a huge Roman temple area, on another part of which there was a church dedicated to St. John the Baptist. Unfortunately too little is known about other cities to be able to demonstrate that this pattern was a common one. The very same uncertainty surrounds the second pattern, which consisted in forcibly transforming sanctuaries of older faiths into Muslim ones. This was the case at Ḥamāh in Syria and at Yazd-e Khvāst in Iran, where archaeological proof exists of the change. There are also several literary references to the fact that Christian churches, Zoroastrian fire temples, and other older abandoned sanctuaries were transformed into mosques. Altogether, however, these instances probably were not too numerous, because in most places the Muslim conquerors were quite anxious to preserve local tradition and because few older sanctuaries could easily serve the primary Muslim need of a large centralizing space.

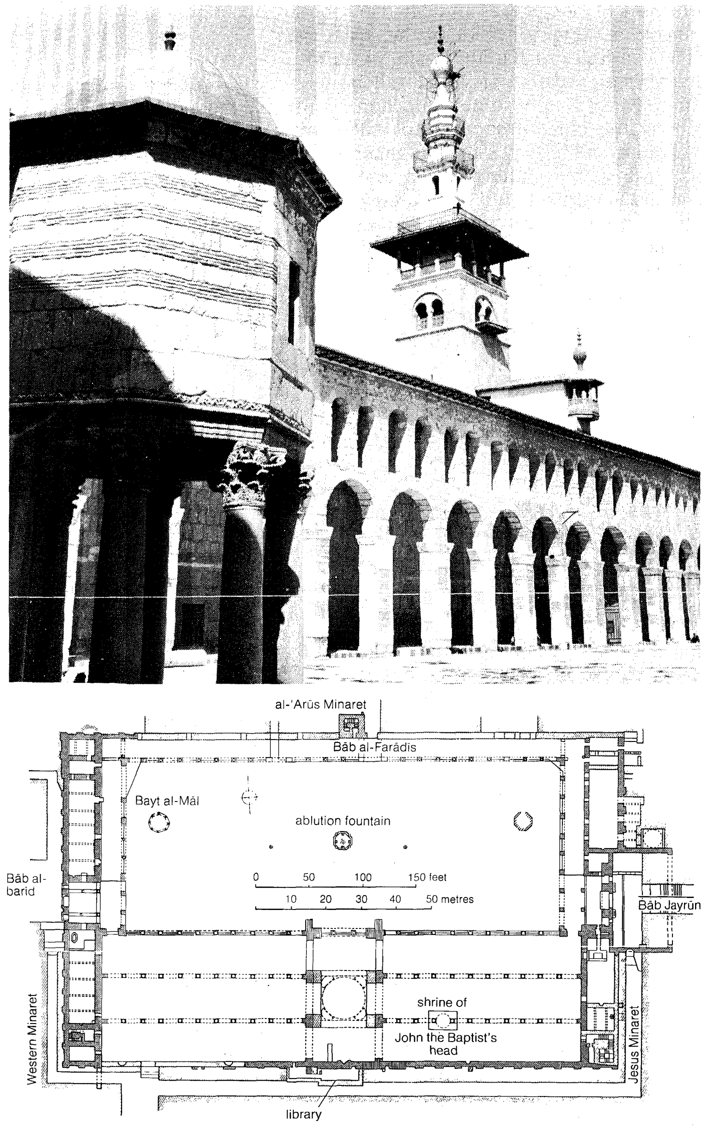
Transformation of existing pre-Islāmic sanctuaries into mosques

During the 50 years that followed the beginning of the Muslim conquest, the mosque, until then a very general concept in Islāmic thought, became a definite building reserved for a variety of needs required by the community of faithful in any one settlement. Only in one area, Iraq, did the mosque acquire a unique form of its own, the oriented hypostyle. Neither in Iraq nor elsewhere is there evidence of symbolic or functional components in mosque design. The only exception is that of the *maqṣūrah* (literally "closed-off space"), an enclosure, probably in wood, built near the centre of the *qiblah* wall. Its purpose was to protect the caliph or his replacement, for several attacks against major political figures had taken place. But the *maqṣūrah* was never destined to be a constant fixture of mosques, and its typological significance is limited.

During the rule of the Umayyad prince al-Walīd I (705–715), a number of complex developments within the Muslim community were crystallized in the construction of three major mosques, at Medina, Jerusalem, and Damascus. The very choice of these three cities is indicative: the city in which the Muslim state was formed and in which the Prophet was buried; the city held in common holiness by Jews, Christians, and Muslims, to which was rapidly accruing the mystical hagiography surrounding the Prophet's ascension into heaven; and the ancient city that became the capital of the new Islāmic empire. A first and essential component of al-Walīd's mosques was, thus, their imperial character; they were to symbolize the permanent establishment of the new faith and of the state that derived from it. They were no longer purely practical shelters but willful monuments.

Mosques of Medina, Jerusalem, and Damascus

Although the plans of al-Aqṣā Mosque in Jerusalem and of the mosque of Medina can be reconstructed with a fair degree of certainty, only the one at Damascus has been preserved with comparatively minor alterations and repairs. In plan the three buildings appear at first glance to be quite different from each other. The Medina mosque was essentially a large hypostyle with a courtyard. The colonnades on all four sides were of varying depth. Al-Aqṣā Mosque consisted of an undetermined number of naves (possibly as many as 15) parallel to each other in a north–south direction. There was no courtyard because the rest of the huge esplanade of the former Jewish temple served as the open space in front of the building. The Umayyad Mosque of Damascus is a rectangle 515 by 330 feet (157 by 100 metres) whose outer limits and three gates



Great Mosque of Damascus, Syria, built by al-Walīd I, 705–715. (Top) Courtyard with the Bayt al-Māl (treasury) on the left, beyond which can be seen one of the three towers that were the first minarets in Islām. (Below) Plan.

Paul Almasy

are parts of a Roman temple (a fourth Roman gate on the *qiblah* side was blocked). The interior consists of an open space surrounded on three sides by a portico and of a covered space of three equal long naves parallel to the *qiblah* wall that are cut in the middle by a perpendicular nave.

Appearance of the *mihrāb* and minaret

The three buildings share several important characteristics. They are all large spaces with a multiplicity of internal supports; and although only the Medina mosque is a pure hypostyle, the Jerusalem and Damascus mosques have the flexibility and easy internal communication characteristic of a hypostyle building. All three mosques exhibit a number of distinctive new practical elements and symbolic meanings. Many of these occur in all mosques; others are only known in some of them. The *miḥrāb,* for example, appears in all mosques. This is a niche of varying size that tends to be heavily decorated. It occurs in the *qiblah* wall, and, in all probability, its purpose was to commemorate the symbolic presence of the Prophet as the first *imām,* although there are other explanations. It is in Damascus only that the ancient towers of the Roman building were first used as minarets to call the faithful to prayer and to indicate from afar the presence of Islām (initially minarets tended to exist only in predominantly non-Muslim cities). All three mosques are also provided with an axial nave, a wider aisle unit on the axis of the building, which served both as a formal axis for compositional purposes and as a ceremonial one for the prince's retinue. Finally, all three buildings were heavily decorated with marble, mosaics, and woodwork. At least in the mosque of Damascus, it is further apparent that there was careful concern for the formal composition—a balance between parts that truly makes this mosque a work of art. This is particularly evident in the successful relationship established between the open space of the court and the facade of the covered *qiblah* side.

When compared to the first Muslim buildings of Iraq and Egypt, the monuments of al-Walīd are characterized by the growing complexity of their forms, by the appearance of uniquely Muslim symbolic and functional features, and by the quality of their construction. While the dimensions, external appearance, and proportions of any one of them were affected in each case by unique local circumstances, the internal balance between open and covered areas and the multiplicity of simple and flexible supports indicate the permanence of the early hypostyle tradition.

Either in its simplest form, as in Medina, or in its more formalized shape, as in Damascus, the hypostyle tradition dominated mosque architecture from 715 to the 10th century. As it occurs at Nīshāpūr in northeastern Iran, Sīrāf in southern Iran, al-Qayrawān (Kairouan) in Tunisia, and Córdoba in Spain, it can indeed be considered as the classic early Islāmic type. Its masterpieces occur in Iraq and in the West. The monumentalization of the early Iraqi hypostyle is illustrated by the two ruined structures in Sāmarrā', with their enormous sizes (790 by 510 feet [240 by 156 metres] for one and 700 by 440 feet [213 by 135 metres] for the other), their multiple entrances, their complex piers, and, in one instance, a striking separation of the *qiblah* area from the rest of the building. The best preserved example of this type is the mosque of Ibn Ṭūlūn at Cairo (876–879), where a semi-independent governor, Aḥmad ibn Ṭūlūn, introduced Iraqi techniques and succeeded in creating a masterpiece of composition.

Two classic examples of early mosques in the western Islāmic world of interest are preserved in Tunisia and Spain. In al-Qayrawān the Great Mosque was built in stages between 836 and 866. Its most striking feature is the formal emphasis on the building's T-like axis punctuated by two domes, one of which hovers over the earliest preserved ensemble of *miḥrāb, minbar,* and *maqṣūrah.* At Córdoba the earliest section of the Great Mosque was built in 785–786. It consisted simply of 11 naves with a wider central one and a court. It was enlarged twice in length, first between 833 and 855 and again from 961 to 965 (it was in the latter phase that the celebrated *maqṣūrah* and *miḥrāb,* comprising one of the great architectural ensembles of early Islāmic art, were constructed). Finally, in 987–988 an extension of the mosque was completed to the east that increased its size by almost one-third without destroying its stylistic unity. The constant increases in the size of this mosque are a further illustration of the flexibility of the hypostyle and its adaptability to any spatial requirement. The most memorable aspects of the Córdoba mosque, however, lie in its construction and decoration. The particularly extensive and heavily decorated

miḥrāb area exemplifies a development that started with the Medina mosque and would continue: an emphasis on the *qiblah* wall.

Early aberrant plans

Although the hypostyle mosque was the dominant plan, it was not the only one. From very early Islāmic times, a fairly large number of aberrant plans also occur. Most of them were built in smaller urban locations or were secondary mosques in larger Muslim cities. It is rather difficult, therefore, to evaluate whether their significance was purely local or whether they were important for the tradition as a whole. Since a simple type of square subdivided by four piers into nine-domed units occurs at Balkh in Afghanistan, at Cairo, and at Toledo, it may be considered a pan-Islāmic type. Other types, a single square hall surrounded by an ambulatory, or a single long barrel-vault parallel or perpendicular to the *qiblah,* are rarer and should perhaps be considered as purely local. These are particularly numerous in Iran, where it does seem that the mainstream of early Islāmic architecture did not penetrate very deeply. Unfortunately, the archaeological exploration of Iran is still in its infancy, and many of the mud-brick buildings from the early Islāmic period have been destroyed or rebuilt beyond recognition. As a result, it is extremely difficult to determine the historical importance of monuments found at Neyrīz, Moḥammadīyeh (near Nāʾīn), Fahraj (near Yazd), or Hazareh (near Samarkand). For an understanding of the mosque's development and of the general dynamics of Islāmic architecture however, an awareness of these secondary types, which may have existed outside of Iran as well, is essential.

The function of the mosque, the central gathering place of the Muslim community, became the major and most original completely Muslim architectural effort. The mosque was not a purely religious building, at least not at the beginning; but, because it was restricted to Muslims, it is appropriate to consider it as such. This, however, was not the only type of early Islāmic building to be uniquely Muslim. Three other types can be defined architecturally, and a fourth one only functionally.

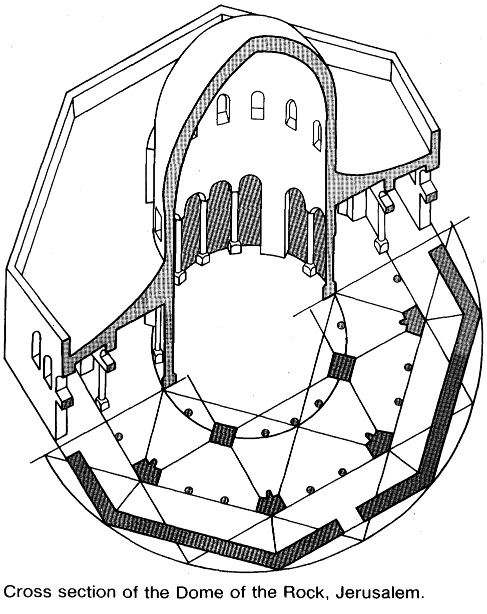
The first type, the Dome of the Rock in Jerusalem, is a unique building. Completed in 691, this masterwork of Islāmic architecture is the earliest major Islāmic monument. Its octagonal plan, use of a high dome, and building techniques are hardly original, although its decoration is unique. Its purpose, however, is what is most remarkable about the building. Since the middle of the 8th century, the Dome of the Rock has become the focal centre of the most mystical event in the life of the Prophet: his ascension into heaven from the rock around which the building was erected. According to an inscription preserved since the erection of the dome, however, it would seem that the building did not originally commemorate the Prophet's ascension but rather the Christology of Islām and its relationship to Judaism. It seems preferable, therefore, to interpret the Dome of the Rock as a victory monument of the new faith's ideological and religious claim on a holy city and on all the religious traditions attached to it.

The *ribāṭs* of the frontier

The second distinctly Islāmic type of religious building is the little-known *ribāṭ*. As early as in the 8th century, the Muslim empire entrusted the protection of its frontiers, especially the remote ones, to warriors for the faith (*murābiṭūn,* "bound ones") who lived, permanently or temporarily, in special institutions known as *ribāṭ*s. Evidence for these exist in Central Asia, Anatolia, and North Africa. It is only in Tunisia that *ribāṭ*s have been preserved. The best one is at Sūsah, Tunisia; it consists of a square fortified building with a single fairly elaborate entrance and a central courtyard. It has two stories of private or communal rooms. Except for the prominence taken by an oratory, this building could be classified as a type of Muslim secular architecture. Since no later example of a *ribāṭ* is known, there is some uncertainty as to whether the institution ever acquired a unique architectural form of its own.

The diverse functions of the Muslim mausoleum

The last type of religious building to develop before the end of the 10th century is the mausoleum. Originally Islām was strongly opposed to any formal commemoration of the dead. But three independent factors slowly modified an attitude that was eventually maintained only in the most strictly orthodox circles. One factor was the growth of the Shīʿite heterodoxy, which led to an actual cult of the descendants of the Prophet through his son-in-law ʿAlī. The second factor was that, as Islām strengthened its hold on conquered lands, a wide variety of local cultic practices and especially the worship of certain sacred places began to affect the Muslims, resulting in a whole movement of Islāmization of ancient holy places by associating them with deceased Muslim heroes and holy men or with prophets. The third factor is not, strictly speaking, religious, but it played a major part. As more or less independent local dynasties began to grow, they sought to commemorate themselves through mausoleums. Not many mausoleums have remained from these early centuries, but literary evidence is clear on the fact that the Shīʿite sanctuaries of Karbalāʾ and an-Najaf, both in Iraq,



Cross section of the Dome of the Rock, Jerusalem.

and Qom, Iran, already possessed monumental tombs. At Sāmarrā' an octagonal mausoleum had been built for three caliphs. The masterpieces of early funerary architecture occur in Central Asia, such as the royal mausoleum of the Sāmānids (known incorrectly as the mausoleum of Esmā'īl the Sāmānid) at Bukhara (before 942), which is a superb example of Islāmic brickwork. In some instances a quasi-religious character was attached to the mausoleums, such as the one at Tim (976), which already has the high facade typical of so many later monumental tombs. In all instances the Muslims took over or rediscovered the ancient tradition of the centrally planned building as the characteristic commemorative structure.

The *madrasah*

The fourth kind of Muslim building is the *madrasah,* an institution for religious training set up independently of mosques. It is known from texts that such privately endowed schools existed in the northeastern Iranian world as early as in the 9th century, but no description exists of how they were planned or looked.

Secular architecture. Whereas the functions of the religious buildings of early Islām could not have existed without the new faith, the functions of secular Muslim architecture have *a priori* no specifically Islāmic character. This is all the more so since one can hardly point to a significant new need or habit that would have been brought from Arabia by the conquering Muslims and since so little was destroyed in the conquered areas. It can be assumed, therefore, that all pre-Islāmic functions such as living, trading, and manufacturing continued in whatever architectural setting they may have had. Only one exception is certain. With the disappearance of Sāsānian kingship, the pre-Islāmic Iranian imperial tradition ceased, and elsewhere conquered minor kings and governors left their palaces and castles. A new imperial power was created, located first in Damascus, then briefly in the northern Syrian town of ar-Ruṣāfah, and eventually in Baghdad and Sāmarrā' in Iraq. New governors and, later, almost independent princes took over provincial capitals, which were sometimes old seats of government and, at other times, were new Muslim centres. In all instances, however, there is no reason to assume that for an architecture of power or of pleasure early Muslims would have felt the need to modify pre-Islāmic traditions. In fact there is much in early Islāmic secular architecture that can be used to illustrate secular arts elsewhere—in Byzantium, for example, or even in the West. If any new political or social entity is to succeed in preserving an identity of its own, however, it must give to its secular needs certain directions and emphases that will eventually establish a unique cultural image. This is what happened in the development of Umayyad and early ʿAbbāsid secular architecture.

Three factors contributed to the evolution of a new secular architecture. One was that the accumulation of an immense wealth of ideas, workers, and money in the hands of the Muslim princes settled in Syria and Iraq gave rise to a unique palace architecture. The second factor was the impetus given to urban life and to trade. New cities were founded from Sijilmāssah on the edge of the Moroccan Sahara to Nīshāpūr in northeastern Iran, and 9th-century Arab merchants traded as far away as China. Thus the second topic, to be treated below, will be the urban design and commercial architecture. The third factor is that, for the first time since Alexander the Great, a world extending from the Mediterranean to India became culturally unified. As a result, decorative motifs, design ideas, structural techniques, and artisans and architects—which until then had belonged to entirely different cultural traditions—were available in the same places. Early Islāmic princely architecture has become the best known and most original aspect of early Islāmic secular buildings.

The country princely palace complex

There are basically three kinds of these princely structures. The first type consists of 10 large rural princely complexes found in Syria, Palestine, and Transjordan dating from around 710 to 750: ar-Ruṣāfah, Qaṣr al-Ḥayr East, Qaṣr al-Ḥayr West, Jabal Says, Khirbat Minyah, Khirbat al-Mafjar, Mshattā, Qaṣr 'Amrah, Qaṣr al-Kharānah, and Qaṣr aṭ-Ṭūbah. Apparently these examples of princely architecture belong to a group of more than 60 ruined or only textually identifiable rural complexes erected by Umayyad princes. In the past a romantic theory had developed about their locations, suggesting that the remoteness of their sites expressed an atavistic hankering on the part of the Umayyad Arab rulers for the desert or at least the semiarid steppe that separates the permanently cultivated areas of Syria and Palestine from their original home in the north Arabian wilderness. This theory has been disproved, for every one of these has turned out to have been a major agricultural or trade centre, some of which were developed even before the Muslim conquest. Private palaces were built, notably at ar-Ruṣāfah, Qaṣr al-Ḥayr West, Khirbat al-Mafjar, Qaṣr ʿAmrah, and Mshattā. These must be considered as early medieval equivalents of the *villae rusticae* so characteristic in the ancient Roman period. Although each of these had a number of idiosyncrasies that were presumably inspired by the needs and desires of its owner, all of these structures tend to share a number of features that can best be illustrated by Khirbat al-Mafjar.

This palace, the richest of them all, contained a residential unit consisting of a square building with an elaborate entrance, a porticoed courtyard, and a number of rooms or halls arranged on two floors. Few of these rooms seem to have any identifiable function, although at Khirbat al-Mafjar a private oratory, a large meeting hall, and an anteroom leading to a cool underground pool have been identified. The main throne room was on the second floor above the entrance. Its plan is not known but probably resembled the preserved throne rooms or reception halls at Qaṣr 'Amrah and Mshattā, which consisted of a three-aisled hall ending in an apse (semicircular or polygonal domed projection) in the manner of a Roman basilica.

Next to an official residence, there usually was a small mosque, generally a miniaturized hypostyle in plan. The most original feature of these establishments was the bath. The bathing area itself is comparatively small, but every bath had its own elaborate entrance and contained a large hall that, at least in the instance of Khirbat al-Mafjar, was heavily decorated and of an unusual shape. It would appear that these halls were for pleasure—places for music, dancing, and probably occasional orgies. In some instances, as at Qaṣr 'Amrah, the same setting may have been used for both pleasure and formal receptions.

These palaces are important illustrations of the luxurious taste and way of life of the new Near Eastern aristocrats, who settled in the countryside and transformed some of it into places of pleasure. This aspect of these establishments is peculiar to the Umayyad dynasty in Syria and Palestine. Outside of this area and period only one comparable structure has been found—at Ukhayḍir in Iraq, which dates from the early 'Abbāsid period. A number of princely residences of the Central Asian or North African countryside are still too little known but appear not to have had the same development. The other important lesson to draw from them is that few of their features are original. All of them derive from the architectural vocabulary of pre-Islāmic times, and it is in the artistic traditions of the Mediterranean world that most of their sources are found, although the Mshattā throne room does have a number of Sāsānian elements. For this reason these palaces should be considered as major examples of pre-Islāmic secular architecture, for as interesting as these monuments are, they are not part of the Islāmic tradition.

The urban palace

A second type of princely architecture—the urban palace—has been preserved only in texts or literary sources, with the exception of the palace at Kūfah in Iraq. Datable from the very end of the 7th century, this example of princely architecture seems to have functioned both as a residence and as the *dār al-imārah,* or centre of government. This dual function is reflected in the use of separate building units and in the absence of much architectural decoration, which suggests that it reflected an austere official taste. Although suggestions concerning the plans used are occasionally encountered in literary sources, this information is not sufficient to define these early urban official buildings of the Muslims. Nothing is known, for instance, about the great Umayyad palace in Damascus aside from the fact that it had a green dome.

Also poorly documented is a development in urban aristocratic buildings that seems to have begun with the ʿAbbāsids during the last decades of the 8th century. This involved the construction of smaller palaces, probably pavilions in the midst of gardens in or around major cities.

The ʿAbbāsid palace-city

The third type of early Islāmic princely architecture is the palace-city. Several of these huge palaces are part of the enormous mass of ruins at Sāmarrā', the temporary ʿAbbāsid capital from 838 to 883. Jawsaq al-Khāqānī, for instance, is a walled architectural complex nearly one mile to a side that in reality is an entire city. It contains a formal succession of large gates and courts leading to a cross-shaped throne room, a group of smaller living units, basins and fountains, and even a racetrack. Too little is known about the architectural details of these huge walled complexes to lead to more than very uncertain hypotheses. Their existence, however, suggests that they were settings for the very elaborate ceremonies developed by the ʿAbbāsid princes, especially when receiving foreign ambassadors. An account, for instance, in Khaṭīb al-Baghdādī's (died 1071) *Ta'rīkh Baghdad* ("History of Baghdad") of the arrival in Baghdad of a Byzantine envoy in 914 illustrates this point. The meeting with the caliph was preceded by a sort of formal presentation intended to impress the ambassador with the Muslim ruler's wealth and power. Treasures were laid down, thousands of soldiers and slaves in rich clothes guarded them, lions roared in the gardens, and on gilded artificial trees mechanical devices made silver birds chirp. The ceremony was a fascinating mixture of a traditional attempt to recreate paradise on earth and a rather vulgar exhibition of wealth that required a huge space, as in the Sāmarrā' palaces. Another important aspect of these palace-cities is that they became part of a myth. The walled enclosure in which thousands lived a life unknown to others and into which simple mortals did not penetrate without bringing their own shroud was transformed into legend. It became the mysterious City of Brass of *The Thousand and One Nights,* and it is from its luxurious glory that occasionally a caliph such as Hārūn ar-Rashīd escaped into the "real" world. Even though there is inadequate information on the ʿAbbāsid palace-city, it was clearly a unique early Islāmic creation, and its impact can be detected from Byzantium to Hollywood.

Urban design

Islāmic secular architecture has left considerable information about cities, for systematic urbanization was one of the most characteristic features of early Muslim civilization. It is much too early to draw any sort of conclusion about the actual physical organization of towns, about their subdivisions and their houses, for only at al-Fusṭāṭ (Cairo) and Sīrāf in Iran is the evidence archaeologically clear, and much of it has not yet been properly published. A huge task remains to be done of relating immense amounts of textual material with scraps of archaeological information scattered from Central Asia to Spain, such as the outer walls and impressive gateway preserved at ar-Raqqah in Syria. In general it can be said that there does not seem to have been any idealized master plan for the internal arrangement of an urban site in contradistinction to Hellenistic or Roman towns. Even mosques or palaces were often located eccentrically and not in the middle of the town. Extraordinary attention was paid to water distribution and conservation, as demonstrated by the magnificent 9th-century cisterns in Tunisia, the 9th-century Nilometer (a device to measure the Nile's level) in Cairo, and the elaborate dams, canals, and sluices of Qaṣr al-Ḥayr in Syria. The construction of commercial buildings on a monumental scale occurred. The most spectacular example is the caravansary of Qaṣr al-Ḥayr East, with its magnificent gate.

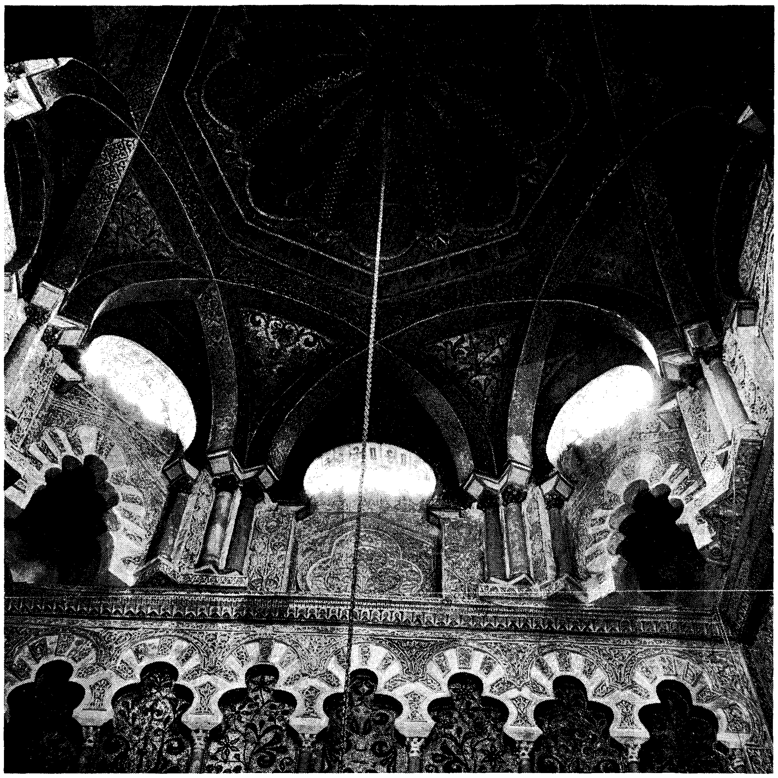
The concern for palaces and cities that characterized early Islāmic secular architecture shows itself most remarkably in the construction of Baghdad between 762 and 766–767 by the ʿAbbāsid caliph al-Manṣūr. It was a walled round city whose circular shape served to demonstrate Baghdad's symbolic identity as the navel of the universe. A thick ring of residential quarters was separated by four axial, commercial streets entered through spectacular gates. In the centre of the city there was a large open space with a palace, a mosque, and a few administrative buildings. By its size and number of inhabitants, Baghdad was unquestionably a city; however, its plan so strongly emphasized the presence of the caliph that it was also a palace.

Building materials and technology. The early Islāmic period, on the whole, did not innovate much in the realm of building materials and technology but utilized what it had inherited from older traditions. Stone and brick continued to be used around the Mediterranean, while mud brick usually covered with plaster predominated in Iraq and Iran, with a few notable exceptions like Sīrāf, where a masonry of roughly cut stones set in mortar was more common. The most important novelty was the rapid development in Iraq of a baked brick architecture in the late 8th and 9th centuries. Iraqi techniques were later used in Syria at ar-Raqqah and Qaṣr al-Ḥayr East and in Egypt. Iranian brickwork appears at Mshattā in Jordan. The mausoleum of the Sāmānids in Bukhara is the earliest remaining example of the new brick architecture in northeastern Iran. Wood was used consistently but has usually not been very well preserved, except in Palestine and Egypt where climatic (extreme dryness of Egypt), religious (holiness of Jerusalem sanctuaries), or historic (Egypt was never conquered) factors contributed to the continuous upkeep of wooden objects or architectural elements.

As supports for roofs and ceilings, early Islāmic architecture used walls and single supports. Walls were generally continuous, often buttressed with half towers, and rarely (with exceptions in Central Asia) were they articulated or broken by other architectural features. The most common single support was the base–column–capital combination of Mediterranean architecture. Most columns and capitals were either reused from pre-Islāmic buildings or were directly imitated from older models. In the 9th century in Iraq a brick pier was used, a form that spread to Iran and Egypt. Columns and piers were covered with arches. Most often these were semicircular arches; the pointed, or two-centred, arch was known, but it does not seem that its property of reducing the need for heavy supports had been realized. The most extraordinary technical development of arches occurs in the Great Mosque at Córdoba, where, in order to increase the height of the building in an area with only short columns, the architects created two rows of superimposed horseshoe arches. Almost immediately they realized that such a succession of superimposed arches constructed of alternating stone and brick could be modified to create a variety of patterns that would alleviate the inherent monotony of a hypostyle building. A certain ambiguity remains, however, as to whether ornamental effect or structural technology was the predominate concern in the creation of these unique arched columns.

Arches and vaulting

The majority of early Islāmic ceilings were flat. Gabled wooden roofs, however, were erected in the Muslim world west of the Euphrates and simple barrel vaults to the east. Vaulting, either in brick or in stone, was used, especially in secular architecture. Domes were employed frequently



Dome of the *miḥrāb* in the Great Mosque of Córdoba, Spain, *c.* 961.
Fritz Henle—Photo Researchers/EB Inc.

in mosques, consistently in mausoleums, and occasionally in secular buildings. Almost all domes are on squinches (supports carried across corners to act as structural transitions to a dome). Most squinches, as in the al-Qayrawān domes, are classical Greco-Roman niches, which transform the square room into an octagonal opening for the dome. In Córdoba's Great Mosque a complex system of intersecting ribs is encountered, while at Bukhara the squinch is broken into halves by a transverse half arch. The most extraordinary use of the squinch occurs in the mausoleum at Tim, where the surface of this structural device is broken into a series of smaller three-dimensional units rearranged into a sort of pyramidal pattern. This rearrangement is the earliest extant example of *muqarnas,* or stalactite-like decoration that would later be an important element of Islāmic architectural ornamentation. The motif is so awkwardly constructed at Tim that it must have derived from some other source, possibly the ornamental device of using curved stucco panels to cover the corners and upper parts of walls found in Iran at Nīshāpūr.

Architectural decoration. Early Islāmic architecture is most original in its decoration. Mosaics and wall paintings followed the practices of antiquity and were primarily employed in Syria, Palestine, and Spain. Stone sculpture existed, but stucco sculpture, first limited to Iran, spread rapidly throughout the early Islāmic world. Not only were stone or brick walls covered with large panels of stucco sculpture, but this technique was used for sculpture in the round in the Umayyad palaces of Qaṣr al-Ḥayr West and Khirbat al-Mafjar. The latter was a comparatively short-lived technique, although it produced some of the few instances of monumental sculpture anywhere in the early Middle Ages. A variety of techniques borrowed from the industrial arts were used for architectural ornamentation. The *miḥrāb* wall of al-Qayrawān's Great Mosque, for example, was covered with ceramics, while fragments of decorative woodwork have been preserved in Jerusalem and Egypt.

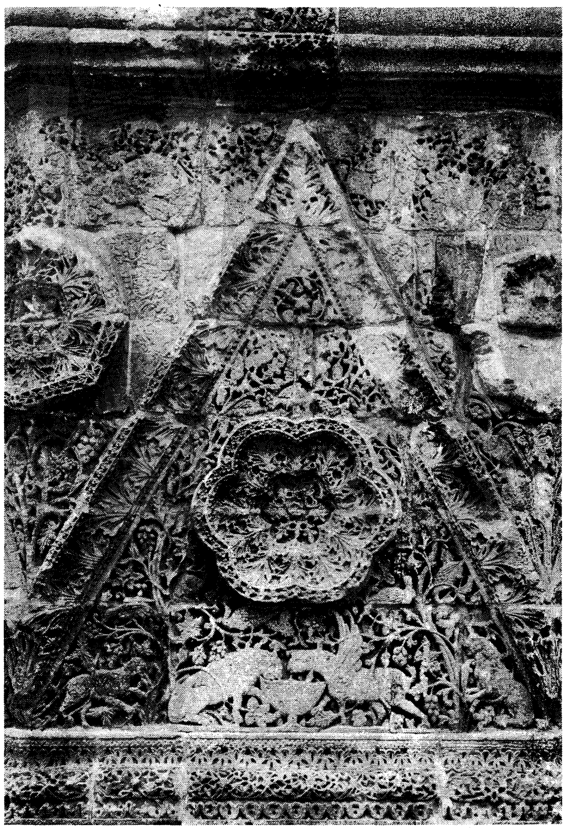
The themes and motifs of early Islāmic decoration can be divided into three major groups. The first kind of ornamentation simply emphasizes the shape or contour of an architectural unit. The themes used were vegetal bands for vertical or horizontal elements, marble imitations for the lower parts of long walls, chevrons or other types of borders on floors and domes, and even whole trees on the spandrels or soffits (undersides) of arches as in the Umayyad Mosque of Damascus or the Dome of the Rock; all these motifs tend to be quite traditional, being taken from the rich decorative vocabularies of pre-Islāmic Iran or of the ancient Mediterranean world.

Three kinds of early architectural decoration

The second group consists of decorative motifs for which a concrete iconographic meaning can be given. In the Dome of the Rock and the Umayyad Mosque of Damascus, as well as possibly the mosques of Córdoba and of Medina, there were probably iconographic programs. It has been shown, for example, that the huge architectural and vegetal decorative motifs at Damascus were meant to symbolize a sort of idealized paradise on earth, while the crowns of the Jerusalem sanctuary are thought to have been symbols of empires conquered by Islām. But it is equally certain that this use of visual forms in mosques for ideological and symbolic purposes was not easily accepted, and most later mosques are devoid of iconographically significant themes. The only exceptions fully visible are the Qur'ānic inscriptions in the mosque of Ibn Ṭūlūn at Cairo, which were used both as a reminder of the faith and as an ornamental device to emphasize the structural lines of the building. Thus the early Islāmic mosque eventually became austere in its use of symbolic ornamentation, with the exception of the *miḥrāb,* which was considered as a symbol of the unity of all believers.

Like religious architecture, secular buildings seem to have been less richly decorated at the end of the early Islāmic period than at the beginning. The paintings, sculptures, and mosaics of Qaṣr al-Ḥayr West, Khirbat al-Mafjar, Qaṣr ʿAmrah, and Sāmarrāʾ primarily illustrated the life of the prince. There were official iconographic compositions, such as the monarch enthroned, or ones of pleasure and luxury, such as hunting scenes or depictions of the prince surrounded by dancers, musicians, acrobats, and unclad women. Few of these so-called princely themes were iconographic inventions of the Muslims. They usually can be traced back either to the classical world of ancient Greece and Rome or to pre-Islāmic Iran and Central Asia.

The third type of architectural decoration consists of large panels, most often in stucco, for which no meaning or



Triangle stone relief from the facade of Mshattā in Transjordan, early 8th century. In the Islamisches Museum, Staatliche Museen zu Berlin.

By courtesy of the Islamisches Museum, Staatliche Museen zu Berlin

interpretation is yet known. These panels might be called ornamental in the sense that their only apparent purpose was to beautify the buildings in which they were installed, and their relationship to the architecture is arbitrary. The Mshattā facade's decoration of a huge band of triangles is, for instance, quite independent of the building's architectural parts. Next to Mshattā, the most important series of examples of the third type of ornamentation come from Sāmarrā', although striking examples are also to be found at Khirbat al-Mafjar, Qaṣr al-Ḥayr East and West, al-Fusṭāṭ, Sīrāf, and Nīshāpūr. Two decorative motifs were predominately used on these panels: a great variety of vegetal motifs and geometric forms. At Sāmarrā' these panels eventually became so abstract that individual parts could no longer be distinguished, and the decorative design had to be viewed in terms of the relationships between line and shape, light and shade, horizontal and vertical axes, and so forth. Copied consistently from Morocco to Central Asia, the aesthetic principles of this latter type of a complex overall design influenced the development of the principle of arabesque ornamentation.

Islāmic architectural ornamentation does not lend itself easily to chronological stylistic definition. In other words, it does not seem to share consistently a cluster of formal characteristics. The reason is that in the earliest Islāmic buildings the decorative motifs were borrowed from an extraordinary variety of stylistic sources: classical themes illusionistically rendered (*e.g.*, the mosaics of the Umayyad Mosque of Damascus), hieratic Byzantine themes (*e.g.*, the Umayyad Mosque of Damascus and Qaṣr ʿAmrah), Sāsānian motifs, Central Asian motifs (especially the sculpture from Umayyad palaces), and the many regional styles of ornamentation that had developed in all parts of the pre-Islāmic world. It is the wealth of themes and motifs, therefore, that constitutes the Umayyad style of architectural decoration. The ʿAbbāsids, on the other hand, began to be more selective in their choice of ornamentation.

Decorative arts. Very little is known about early Islāmic gold and silver objects, although their existence is mentioned in many texts as well as suggested by the wealth of the Muslim princes. Except for a large number of silver plates and ewers belonging to the Sāsānian tradition, nothing has remained. These silver objects were probably made for Umayyad and ʿAbbāsid princes, although there is much controversy among scholars regarding their authenticity and date of manufacture.

Būyid silks

For entirely different reasons it is impossible to present any significant generalities about the art of textiles in the early Islāmic period. Problems of authenticity are few. Dating from the 10th century are a large number of Būyid silks, a group of funerary textiles with plant and animal motifs as well as poetic texts. Very little order has yet been made of an enormous mass of often well-dated textile fragments, and therefore, except for the Būyid silks, it is still impossible to identify any one of the textile types mentioned in early medieval literary sources. Furthermore, since it can be assumed that pre-Islāmic textile factories were taken over by the Muslims and since it is otherwise known that textiles were easily transported from one area of the Muslim world to the other or even beyond it, it is still very difficult to define Islāmic styles as opposed to Byzantine or to Coptic ones. The obvious exception lies in those fragments that are provided with inscriptions, and the main point to make is therefore that one of the characteristic features of early Islāmic textiles is their use of writing for identifying and decorative purposes. But, while true, this point in no way makes it possible to deny an Islāmic origin to fragments that are not provided with inscriptions, and thus one must await further investigations of detail before being able to define early Islāmic textiles.

Early ceramics

The most important medium of early Islāmic decorative arts is pottery. Initially Muslims continued to sponsor whatever varieties of ceramics had existed before their arrival. Probably in the last quarter of the 8th century new and more elaborate types of glazed pottery were produced. This new development did not replace the older and simpler types of pottery but added a new dimension to the art of Islāmic ceramics. Because of the still incompletely published studies on the unfinished excavations carried out at Nīshāpūr, Sīrāf, Qaṣr al-Ḥayr East, and al-Fusṭāṭ, the scholarship on these ceramics is likely to be very much modified. Therefore, this section will treat only the most general characteristics of Islāmic ceramics, avoiding in particular the complex archaeological problems posed by the growth and spread of individual techniques.

The area of initial technical innovation seems to have been Iraq. Trade with Central Asia brought Chinese ceramics to Mesopotamia, and Islāmic ceramicists sought to imitate them. It is probably in Iraq, therefore, that the technique of lustre glazing was first developed in the Muslim world. This gave the surface of a clay object a metallic, shiny appearance. Egypt also played a leading part in the creation of the new ceramics. Since the earliest datable lustre object (a glass goblet with the name of the governor who ruled in 773, now in the Cairo Museum of Islamic Art) was Egyptian, some scholars feel that it was in Egypt and not Iraq that lustre was first used. Early pottery was also produced in northeastern Iran, where excavations at Afrāsiyāb (Samarkand) and Nīshāpūr have brought to light a new art of painted underglaze pottery. Its novelty was not so much in the technique of painting designs on the slip and covering them with a transparent glaze as in the variety of subjects employed.

While new ceramic techniques may have been sought to imitate other mediums (mostly metal) or other styles of pottery (mostly Chinese), the decorative devices rapidly became purely and unmistakably Islāmic in style. A wide variety of motifs were combined: vegetal arabesques or single flowers and trees; inscriptions, usually legible and consisting of proverbs or of good wishes; animals that were usually birds drawn from the vast folkloric past of the Near East; occasionally human figures drawn in a strikingly abstract fashion; geometric designs; all-over abstract patterns; single motifs on empty fields; and simple splashes of colour, with or without underglaze sgraffito designs (i.e., designs incised or sketched on the body or the slip of the object). All of these motifs were used on both the high-quality ceramics of Nīshāpūr and Samarkand as well as on Islāmic folk pottery.

Although ceramics has appeared to be the most character-

Spanish ivory carving

istic medium of expression in the decorative arts during the early Islāmic period, it has only been because of the greater number of preserved objects. Glass was as important, but examples have been less well preserved. A tradition of ivory carving developed in Spain, and the objects dating from the last third of the 10th century onward attest to the high quality of this uniquely Iberian art. Many of these carved ivories certainly were made for princes; therefore it is not surprising that their decorative themes were drawn from the whole vocabulary of princely art known through Umayyad painting and sculpture of the early 8th century. These ivory carvings are also important in that they exemplify the fact that an art of sculpture in the round never totally disappeared in the Muslim world—at least in small objects.

Assessment. There are three general points that seem to characterize the art of the early Islāmic period. It can first be said that it was an art that sought self-consciously, like the culture sponsoring it, to create artistic forms that would be identifiable as being different from those produced in preceding or contemporary non-Islāmic artistic traditions. At times, as in the use of the Greco-Roman technique of mosaics or in the adoption of Persian and Roman architectural building technology, early Islāmic art simply took over whatever traditions were available. At other times, as in the development of the mosque as a building type, it recomposed into new shapes the forms that had existed before. On the other hand, in ceramics or the use of calligraphic ornamentation, the early Islāmic artist invented new techniques and a new decorative vocabulary. Whatever the nature of the phenomenon, it was almost always an attempt to identify itself visually as unique and different. Since there was initially no concept about what should constitute an Islāmic tradition in the visual arts, the early art of the Muslims often looks like only a continuation of earlier artistic styles, forms, subjects, and techniques. Many mosaics, silver plates, or textiles, therefore, were not considered to be Islāmic until recently. In order to be understood, then, as examples of the art of a new culture, these early buildings and objects have to be seen in the complete context in which they were created. When so seen they appear as conscious choices by the new Islāmic culture from its immense artistic inheritance.

Question of an early Islāmic style

A second point of definition concerns the question of whether there is an early Islāmic style or perhaps even several styles in some sort of succession. The fascinating fact is that there is a clear succession only in those artistic features that are Islāmic inventions—nonfigurative ornament and ceramics. For it is only in development of these features that one can assume to find the conscious search for form that can create a period style. Elsewhere, especially in palace art, the Muslim world sought to relate itself to an earlier and more universal tradition of princely art; its monuments, therefore, are less Islāmic than typological. In the new art of the Muslim bourgeoisie, however, uniquely Islāmic artistic phenomena began to evolve.

Finally, the geographical peculiarities of early Islāmic art must be reiterated. Its centres were Syria, Iraq, Egypt, northwestern Iran, and Spain. Of these, Iraq was probably the most originally creative, and it is from Iraq that a peculiarly Islāmic visual koine (a commonly accepted and understood system of forms) was derived and spread throughout the Islāmic world. This development, of course, is logical since the capital of the early empire and some of the first purely Muslim cities were in Iraq. In western Iran, in Afghanistan, in northern Mesopotamia, and in Morocco the more atypical and local artistic traditions were more or less affected by the centralized imperial system of Iraq. This tension between a general pan-Islāmic vocabulary and a variable number of local vocabularies was to remain a constant throughout the history of Islāmic art and is certainly one of the reasons for the difficulty, if not impossibility, one faces in trying to define an Islāmic style.

MIDDLE PERIOD

The middle period in the development of Islāmic art extends roughly from the year 1000 to 1500, when a strong central power with occasional regional political independence was replaced by a bewildering mosaic of overlapping dynasties. Ethnically this was the time of major Turkish and Mongol invasions that brought into the Muslim world new peoples and institutions. At the same time, Berbers, Kurds, and Iranians, who had been within the empire from the beginning of Islām, began to play far more effective historical and cultural roles, shortlived for the Kurds, but uniquely important for the Iranians. Besides political and ethnic confusion, there was also religious and cultural confusion during the middle period. The 10th century, for example, witnessed the transformation of the Shīʿite heterodoxy into a major political and possibly cultural phenomenon, while the extraordinary development taken by the personal and social mysticism known as Ṣūfism modified enormously the nature of Muslim piety. Culturally the most significant development was perhaps that of Persian literature as a highly original new verbal expression existing alongside the older Arabic literary tradition. Finally, the middle period was an era of expansion in all areas except Spain, which was completely lost to the Muslims in 1492 with the conquest of the Kingdom of Granada by Ferdinand II and Isabella. Anatolia and the Balkans, the Crimea, much of Central Asia and northern India, and parts of eastern Africa all became new Islāmic provinces. In some cases this expansion was the result of conquests, but in others it had been achieved through missionary work.

The immense variety of impulses that affected the Muslim world during these five centuries was one of the causes of the bewildering artistic explosion that also characterizes the middle period. Although much work has been done on individual monuments, scholarship is still in its infancy. It is particularly difficult, therefore, to decide on the appropriate means of organizing this information: by geographical or cultural areas (*e.g.,* Iran, Egypt, Morocco), by individual dynasties (*e.g.,* Seljuqs, Timurids), by periods (*e.g.,* 13th century before the Mongol invasions), or even by social categories (*e.g.,* the art of princes, the art of cities). Thus, the five following divisions of Fāṭimid, Seljuq, Western Islāmic, Mamlūk, and Mongol Iran (Il-Khanid and Timurid) art are partly arbitrary and to a large extent tentative. Their respective importance also varies, for what is known as Seljuq art certainly overwhelms almost all others in its importance.

Fāṭimid art (909–1171). The Fāṭimids were technically an Arab dynasty professing with missionary zeal the beliefs of the Ismāʿīlī sect of the Shīʿite branch of Islām. The dynasty was established in Tunisia and Sicily in 909. In 969 the Fāṭimids moved to Egypt and founded the city of Cairo. They soon controlled Syria and Palestine. In the latter part of the 11th century, however, the Fāṭimid empire began to distintegrate internally and externally; the final demise occurred in 1171. But it is not known which of the obvious components of the Fāṭimid world was more significant in influencing the development of the visual arts: its heterodoxy, its Egyptian location, its missionary relationship with almost all provinces of Islām, or the fact that during its heyday in the 11th century it was the only wealthy Islāmic centre and could thus easily gather artisans and art objects from all over the world.

Architecture. The great Fāṭimid mosques of Cairo—al-Azhar (started in 970) and al-Ḥākim (*c.* 1002–03)—were designed in the traditional hypostyle plan with axial cupolas. It is only in such architectural details as the elaborately composed facade of al-Ḥākim, with its corner towers and vaulted portal, that innovations appear, for most earlier mosques did not have large formal gates, nor was much attention previously given to the composition of the exterior facade. The Fāṭimids' architectural traditionalism was certainly a conscious attempt to perpetuate the existing aesthetic system.

Architectural traditionalism

Although much less is known about it, the Great Palace of the Fāṭimids belonged to the tradition of the enormous palace-cities typical of the ʿAbbāsids. Mediterranean rather than Iranian influences, however, played a greater part in the determination of its uses and functions. The whole city of Cairo (Arabic: al-Qāhirah, meaning "the Victorious"), on the other hand, has many symbolic and visual aspects that suggest a willful relationship to Baghdad.

The originality of Fāṭimid architecture does not lie in works sponsored by the caliphs themselves, even though Cairo's well-preserved gates and walls of the second half of the 11th century are among the best examples of early medieval military architecture. It is rather the patronage of lower officials and of the bourgeoisie, if not even of the humbler classes, that was responsible for the most interesting Fāṭimid buildings. The mosques of al-Aqmar (1125) and of aṣ-Ṣāliḥ (*c.* 1160) are among the first examples of monumental small mosques constructed to serve local needs. Even though their internal arrangement is quite traditional, their plans were adapted to the space available in the urban centre. These mosques were elaborately decorated on the exterior, exhibiting a conspicuousness absent from large hypostyle mosques.

A second innovation in Fāṭimid architecture was the tremendous development of mausoleums. This may be explained partially by Shīʿism's emphasis on the succession of holy men, but the development of these buildings in terms of both quality and quantity indicates that other influential social and religious issues were also involved. Most of the mausoleums were simple square buildings surmounted by a dome. Many of these have survived in Cairo and Aswān. Only a few, such as the *mashhad* at Aswān, are somewhat more elaborate, with side rooms. The most original of these commemorative buildings is the Juyūshī Mosque (1085) overlooking the city of Cairo. Properly speaking, it is not a mausoleum but a monument celebrating the reestablishment of Fāṭimid order after a series of popular revolts.

The Fāṭimids introduced, or developed, only two major constructional techniques: the systematization of the four-centred "keel" arch and the squinch. The latter innovation is of greater consequence because the squinch became the most common means of passing from a square to a dome, although pendentives were known as well. A peculiarly Egyptian development was the *muqarnas* squinch, which consisted of four units: a niche bracketed by two niche segments, superimposed with an additional niche. The complex profile of the *muqarnas* became an architectural element in itself used for windows, while the device of using niches and niche segments remained typical of Egyptian decorative design for centuries. It still is impossible to say whether the *muqarnas* was invented in Egypt or inspired by other architectural traditions (most likely Iranian). Fāṭimid domes were smooth or ribbed and developed a characteristic "keel" profile.

Use of the squinch

In the use of materials (brick, stone, wood) and structural concepts, Fāṭimid architecture continued earlier traditions. Occasionally local styles were incorporated, among them features of Tunisian architecture in the 10th century or of upper Mesopotamian in the late 11th century.

Stone sculpture, stucco work, and carved wood were utilized for architectural decorations. The Fāṭimids also employed mosaicists, who mostly worked in places like Jerusalem, where they imitated or repaired earlier mosaic murals. Many fragments of Fāṭimid wall paintings have survived in Egypt. Most of them, however, are too small to allow for making any iconographic or stylistic conclusions, with the exception of the mid-12th-century ceiling of the Cappella Palatina at Palermo. Built by the Norman kings of Sicily, the palace chapel was almost certainly decorated by Fāṭimid artists, or at least the artists adhered to Fāṭimid models. The hundreds of facets in the *muqarnas* ceiling were painted, notably with many purely ornamental vegetal and zoomorphic designs but also with scenes of daily life and many subjects that have not yet been explained. Stylistically influenced by Iraqi ʿAbbāsid art, these paintings are innovative in their more spatially aware representation of personages and of animals. Very similar tendencies appear also in the stucco and wood sculptures of Fāṭimid decoration. The stunning abstraction of the architectural decoration at Sāmarrā' tends to give way to more naturalistically conceived vegetal and animal designs; occasionally whole narrative scenes appear carved on wood. Another decorative trend is especially used on 12th-century *miḥrāb*s: explicitly complicated geometric patterns, usually based on stars, which in turn generate octagons, hexagons, triangles, and rectangles. Geometry becomes a sort of network in the midst of which small vegetal units continue to remain, often as inlaid pieces. Long inscriptions written in very elaborate calligraphies also became a typical form of architectural decoration on most of the major Fāṭimid buildings.

A clear separation must be made between the decorative arts sought by Fāṭimid princes and the arts produced within their empire. Little has been preserved of the former, notably a small number of superb ewers in rock crystal. A text has survived, however, that describes the imperial treasures looted in the middle of the 11th century by dissatisfied mercenary troops. It lists gold, silver, enamel, and porcelain objects that have all been lost, as well as textiles (perhaps the cape of the Norman king Roger II [Kunsthistorisches Museum, Vienna] is an example of the kind of textiles found in this treasure). The inventory also records that the Fāṭimids had in their possession many works of Byzantine, Chinese, and even Greco-Roman provenance. Altogether, then, it seems that the imperial art of the Fāṭimids was part of a sort of international royal taste that downplayed cultural or political differences.

Ceramics, on the other hand, were primarily produced by local urban schools and were not an imperial art. The most celebrated type of Fāṭimid wares were lustre-painted ceramics from Egypt itself. A large number of artisans' names have been preserved, thereby indicating the growing prestige of these craftsmen and the aesthetic importance

Lustreware with figural decoration

of their pottery. Most of the surviving lustre ceramics are plates on which the decoration of the main surface has been emphasized. The decorative themes used were quite varied and included all the traditional Islāmic ones: *e.g.,* calligraphy, vegetal and animal motifs, arabesques. The most distinguishing feature of these Fāṭimid ceramics, however, is the representation of the human figure. Some of these ceramics have been decorated with simplified copies of illustrations of the princely themes, but others have depictions of scenes of Egyptian daily life. The style in which these themes have been represented is simultaneously the hieratic, ornamental manner traditional to Islāmic painting combined with what can almost be called spatial illusionism. Wheel-cut rock crystal, glass, and bronze objects, especially animal-shaped aquamaniles (a type of water vessel) and ewers, are also attributed to the Fāṭimids.

Book illustration. Manifestations of nonprincely Fāṭimid art also included the art of book illustration. The few remaining fragments illustrate that probably after the middle of the 11th century there developed an art of representation other than the style used to illustrate princely themes. This was a more illusionistic style that still accompanied the traditional ornamental one in the same manner as in the paintings on ceramics.

Transitional role of Fāṭimid art

In summary it would appear that Fāṭimid art was a curiously transitional one. Although much influenced by earlier Islāmic and non-Islāmic Mediterranean styles, the Fāṭimids devised new structural systems and developed a new manner of painting representational subjects, which became characteristic of all Muslim art during the 12th century. Neither documentary nor theoretical research in Islāmic art, however, has developed sufficiently to clearly establish whether the Fāṭimids were indeed innovators or whether their art was a local phenomenon that is only accidentally relatable to what followed.

Seljuq art. During the last decades of the 10th century, at the Central Asian frontiers of Islām, a migratory movement of Turkic peoples began that was to affect the whole Muslim world up to and including Egypt. The dominant political force among these Turks was the dynasty of the Seljuqs, but it was not the only one; nor can it be demonstrated, as far as the arts are concerned, that it was the major source of patronage in the period to be discussed anywhere but in Anatolia in the 12th and 13th centuries. The Seljuq empire, therefore, consisted of a succession of dynasties, and all but one (the Ayyūbids of Syria, Egypt, and northern Mesopotamia) were Turkic.

A complex feudal system was established and centred on urban areas. Cities were established or expanded, particularly in western Iran, Anatolia, and Syria. Militant Muslims, the Seljuqs also sought to revive Muslim orthodoxy. Although politically unruly and complicated in their relationships to one another, the successive and partly overlapping dynasties of the Ghaznavids, Ghūrids, the Great Seljuqs, Qarakhānids, Zangids, Ayyūbids, Seljuqs of Rūm, and Khwārezm-Shāhs (considering only the major ones) seem to have created a comparatively unified culture from India to Egypt. The art of the Seljuq period, however, is difficult to discuss coherently both because of the wealth of examples and because of the lack of synchronization between various technical and regional developments. This complex world fell apart under the impact of the Mongol invasions that, from 1220 until 1260, swept through the Muslim lands of the Near East.

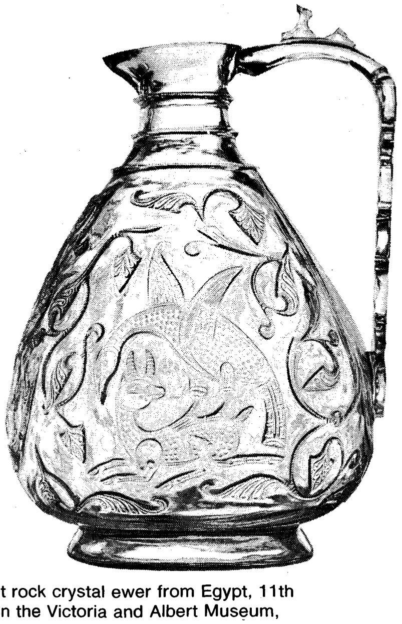
Architecture. The functions of monumental architecture in the Seljuq period were considerably modified. Large congregational mosques were still built. The earliest Seljuq examples occur in the two major new provinces of Islām—Anatolia and northwestern India—as well as in the established Muslim region of western Iran. In some areas, such as the Isfahan region, congregational mosques were rebuilt, while in other parts of Islām, such as Syria or Egypt, where there was no need for new large mosques, older ones were repaired and small ones were built. The latter were partly restricted to certain quarters or groups or were commissioned by various guilds, particularly in Damascus.

A curious side aspect of the program of building, rebuilding, or decorating mosques was the extraordinary development of minarets. Particularly in Iran, dozens of minarets are preserved from the 12th and 13th centuries, while the mosques to which they had been attached have disappeared. It is as though the visual function of the minaret was more important than the religious institution to which it was attached.

Small or large, mausoleums increased in numbers and became at this time the ubiquitous monument they appear to be. Most of the mausoleums, such as the tomb tower of Abū Yazīd al-Bisṭāmī (died 874) at Besṭām, were dedicated to holy men—both contemporary Muslim saints and all sorts of holy men dead for centuries (even pre-Islāmic holy men, especially biblical prophets, acquired a monument). The most impressive mausoleums, however, ones like the one of Sanjar at Merv, were built for royalty. Pilgrimages were organized and in many places hardly mentioned until then as holy places (*e.g.,* Meshed, Besṭām, Mosul, Aleppo); a whole monastic establishment serving as a centre for the distribution of alms was erected with hostels and kitchens for the pilgrims.

Origin and development of the *madrasah*

Although enormously expanded, mosques, minarets, and mausoleums were not new types of Islāmic architecture. The *madrasah* ("school"), however, was a new building



Wheel-cut rock crystal ewer from Egypt, 11th century. In the Victoria and Albert Museum, London. Ht. 21.5 cm.

Tomb tower at the shrine of Abū Yazīd al-Bisṭāmī at Besṭām, Iran, 1313.

Josephine Powell, Rome

type. There is much controversy as to why and how it really developed. Although early examples have been discovered in Iran, such as the 11th century *madrasah* of Khargird in Iran and at Samarkand, it is from Anatolia, Syria, and Egypt that most of the information about the *madrasah* has been derived. In the latter regions it was usually a privately endowed establishment reserved for one or two of the schools of jurisprudence of orthodox Islām. It had to have rooms for teaching and living quarters for the students and professors. Often the tomb of the founder was attached to the *madrasah*. Later *madrasahs* were built for two or three schools of jurisprudence, and the Mustanṣirīyah in Baghdad was erected in 1233 to be a sort of ecumenical *madrasah* for the whole of Sunnī Islām.

In the Seljuq period there occurred a revival of the *ribāṭ* inside cities. *Khānqāhs*, monasteries, and various establishments of learning other than formal *madrasahs* were also built.

An impressive development of secular architecture occurred under the Seljuqs. The most characteristic building of the time was the citadel, or urban fortress, through which the new princes controlled the usually alien city they held in fief. The largest citadels, like those of Cairo and Aleppo, were whole cities with palaces, mosques, sanctuaries, and baths. Others, like the Citadel of Damascus, were simpler constructions. Occasionally, as in the Euphrates valley, single castles were built, possibly in imitation of those constructed by the Christian crusaders. Walls surrounded most cities, and all of them were built or rebuilt during the Seljuq period.

Little is known about Seljuq palaces or private residences in general. A few fragments in Konya or in Mosul are insufficient to give a coherent idea about urban palaces, and it is only in Anatolia and in Central Asia that an adequate idea of other types can be obtained. Anatolian palaces are on the whole rather small villa-like establishments; but, in Afghanistan and Soviet Central Asia, excavations at Tirmidh, Lashkarī Bāzār, and Ghaznī have brought to light a whole group of large royal palaces erected in the 11th and early 12th centuries.

Seljuq commercial architecture

Commercial architecture became very important. Individual princes and cities probably were trying to attract business by erecting elaborate caravansaries on the main trade routes such as Rebāṭ-e Malek built between Samarkand and Bukhara in Iran. The most spectacular caravansaries were built in the 13th century in Anatolia. Equally impressive, however, although less numerous, are the caravansaries erected in eastern Iran and northern Iraq. Bridges also were rebuilt and decorated like the one at Cizre in Turkey.

The forms of architecture developed by the Seljuqs were remarkably numerous and varied considerably from region to region. Since the Iranian innovations dating from the 11th century and first half of the 12th century are the earliest and, therefore, probably influenced all other areas of the Seljuq empire, they will be discussed first.

Even though it is not entirely typical, the justly celebrated Great Mosque of Isfahan was one of the most influential of all early Seljuq religious structures. Probably completed around 1130 after a long and complicated

Brickwork facade of the caravansary of Rebāṭ-e Malek, 11th century.

history of rebuildings, it consisted of a large courtyard on which opened four large vaulted halls known as *eyvāns*; the *eyvāns* created the compositional axes of each side of the court. On the side of the *qiblah* the hall of the main *eyvān* was followed by a huge cupola. The area between *eyvāns* was subdivided into a large number of square bays covered by domes. The Isfahan mosque also had a unique feature: on the north side a single domed hall positioned on the main axis of the building was in all probability a formal hall for princes to change their clothes before entering into the sanctuary of the mosque.

Use of the *eyvān*

The two features of the Great Mosque at Isfahan that became characteristic of Seljuq mosques were the *eyvān* and the dome. The *eyvān* was an architectural element known already in Sāsānian architecture that had been used in residential buildings from Egypt to Central Asia before the 11th century. In fact, the use of the *eyvān* was not restricted to just mosques, but it also appears in palaces (Lashkarī Bāzār), caravansaries (Rebāṭ-e Sharaf), and in *madrasahs*. The *eyvān* was, in other words, a unit of architectural composition that had no specific use and, therefore, no meaning. In the mosques of the 12th century, four *eyvāns* were used, at least in the clearly definable architectural school of western Iran (*e.g.,* Ardestān, Zavāreh). This kind of composition had two principal effects. One was that the *eyvāns* centralized the visual effect of the mosque by making the courtyard the centre of the building. The other effect of this composition was that it broke up into four areas what had for centuries been a characteristic of the mosque: its single, unified space. The reasons for these developments are still speculative.

Whether large or small, cupolas or domes were used in mosques, caravansaries, and palaces. They were the main architectural features of almost all mausoleums, where they were set over circular or polygonal rooms.

Two characteristic Iranian architectural forms are not present in the Great Mosque of Isfahan but occur elsewhere in the city. One is the tower. Those narrow and tall (up to about 150 feet [50 metres]) were minarets, of which several dozen have been preserved all over Iran and Central Asia (such as the one at Jām). Shorter and squatter towers were mausoleums. These were particularly typical of northern Iran. The other characteristic architectural type exists only in Isfahan in a much-damaged state. It is the *pīshṭāq,* or a formal gateway that served to emphasize a building's presence and importance.

The *pīshṭāqs* of Isfahan

Domes and *eyvāns* indicate the central concern of Iranian construction during the Seljuq period: vaulting in baked brick became the main vehicle for any monumental construction (mud brick was used for secondary parts of a building, frequently for certain secular structures). A large and forcefully composed octagonal base developed the *muqarnas* squinch from a purely ornamental feature into one wherein both structural and decorative functions combined. In some later buildings, such as the mausoleum of Sanjar at Merv, a system of ribs was used to vault an octagonal zone. Seljuq architects sought to make their domes visible from afar and for this reason invented the double dome. Its outer shell was raised on a high drum, while the interior kept the traditional sequence: square base, zone of transition, and dome. Using this structural device, therefore, exterior height was achieved without making the exterior dome too heavy and without complicating the task of decorating the interior, always a problem in countries like Iran with limited supplies of wood for scaffolding. Domes along the *eyvāns* were another factor in contributing to the growing separation between the exterior and interior view of a building. There was also an emphasis on the visibility of a building from the exterior that is indicated by the construction of tall circular or polygonal minarets and high facades.

Architectural decoration was intimately tied to structure. Two mediums predominated. One was stucco, which continued to be used to cover large wall surfaces. The other was brick. Originating in the 10th-century architecture of northeastern Iran, brick came to be employed as a medium of construction as well as a medium of decoration. The complex decorative designs worked out in brick often had a rigidly geometric effect. Especially cut shapes of terracotta and brick, frequently produced in unusual sizes, served to soften these geometric patterns by modifying their tactile impact and by introducing additional curved or beveled lines to the straight lines of geometry.

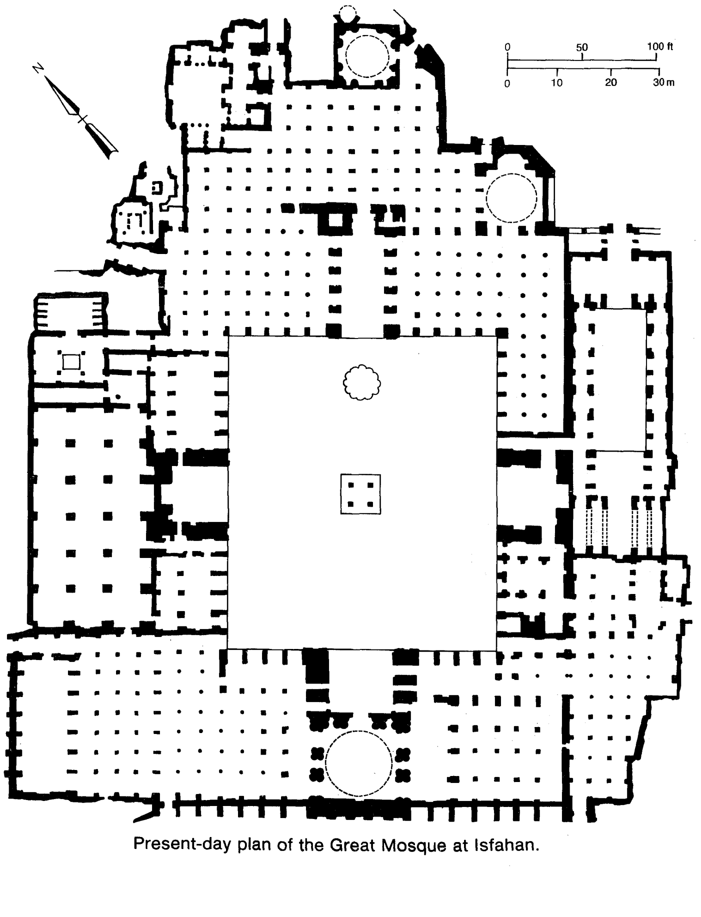
Paintings were used for architectural decoration, especially in palaces. From the second half of the 12th century coloured tiles began to be utilized to emphasize the contour of a decorative area in a structural unit; tiles were not used, however, to cover whole walls. There are also examples of architectural sculpture of animals and people.

Most of the decorative designs tended to be subordinated to geometry, and even calligraphic or vegetal patterns were affected by a seemingly mathematically controlled aesthetic. It has been suggested that these complex geometric designs were a result of an almost mystical passion for number theories that were popularized in 11th-century Iran by such persons as the scholar and scientist al-Bīrūnī or the poet-mathematician Omar Khayyam. But even if the impulses for geometric design were originally created at the highest intellectual level, the designs themselves rapidly became automatic patterns. Their quality was generally high, but a tendency toward facility can be observed in such buildings as Rebāṭ-e Sharaf.

In Iraq, northern Mesopotamia, Syria, and Egypt (after 1171), the architectural monuments do not, on the whole, appear as overwhelmingly impressive as those of Iran, largely because the taste of Umayyad and ʿAbbāsid times continued to dominate mosque architecture. It is in the construction of new building types, particularly the *madrasah,* that the most originality is apparent. The Syrian *madrasahs* in Damascus, like al-ʿĀdilīyah, aẓ-Ẓāhirīyah, or the works of Nureddin, tended also to follow a comparatively standardized plan: an elaborate facade led into a domed hallway and then into a court with at least one *eyvān.* Most of these *madrasahs* were small and were fitted into a preexisting urban pattern. The use of *eyvāns* and the construction of the many minarets found in Mosul or on the Euphrates certainly attest to the influence of Iranian Seljuq design.

The main achievement of Ayyūbid, Zangid, or Seljuq architecture in the Fertile Crescent was the translating into stone of new structural systems first developed in

From John D. Hoag, *Islamic Architecture;* copyright 1975 Electa Editrice, Milan



Present-day plan of the Great Mosque at Isfahan.

brick. The most impressive instance of this lies in the technically complex *muqarnas* domes and half domes or in the *muqarnas* pendentives of Syrian buildings. Elaborate *miḥrāb*s were also made of multicoloured stones that were carefully cut to create impressive patterns. The architecture of the Fertile Crescent, therefore, was still dominated by the sheer force of stone as a material for both construction as well as decoration, and, therefore, the architecture was more Mediterranean in effect than were the buildings of Iran.

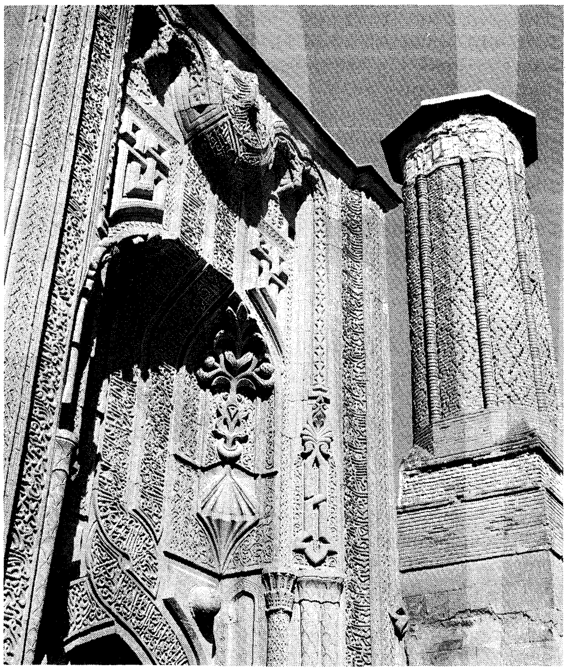
The hybrid style of Anatolia

This Mediterranean tendency was also evident in the 13th-century architecture of Seljuq Anatolia. This new province of Islām was rapidly populated with new immigrants and consequently gathered themes and motifs from throughout the Muslim world, as well as from the several native Anatolian traditions of Byzantine, Armenian, and Georgian architecture. The resulting assimilation of styles produced an overwhelmingly original architecture, for each building in Konya, Kayseri, Sivas, Divriği, Erzurum, or on the roads between them is a unique monument.

Functionally the buildings in Anatolia do not differ from those in other parts of the Muslim world. All the structural forms found in Syria and Iran can be found in Anatolia as well, although they have often been adapted to local materials. Three uniquely Anatolian architectural features, however, can be distinguished. One was limited to Konya at this time but would have an important widespread development later on. As it appears in the Ince or Karatay *medreses*, it consists of the transformation of the central courtyard into a domed space while maintaining the *eyvān*. Thus the centralized aspect of the *eyvān* plan becomes architecturally explicit. The second feature is the creation of a facade that usually consisted of a high central portal—often framed by two minarets—with an elaborately sculpted decorative composition that extended to two corner towers. The third distinguishing feature of Anatolian Seljuq architecture is the complexity of the types of funerary monuments that were constructed.

From the point of view of construction, most of Anatolian architecture is of stone. In Konya and a number of eastern Anatolian instances, brick was used. Barrel vaults, groin vaults, *muqarnas* vaults, squinch domes, pendentive domes, and the new pendentive known as "Turkish triangle" (a transformation of the curved space of the traditional pendentive into a fanlike set of long and narrow triangles built at an angle from each other) were all used by Anatolian builders, thereby initiating the great development of vault construction in Ottoman architecture (see below).

Ara Guler



Ince Minare at Konya, Tur., 1258. Detail view showing the sculptural ornamentation of the main facade portal and the decorative brickwork of the minaret.

Architectural decoration

Architectural decoration consisted primarily in the stone sculpture found on the facades of religious and secular buildings. Although influenced by Iran and Syria in many details, most Anatolian themes were original, although some exhibit Armenian and possibly Western influences. The exuberance of Anatolian architectural decoration can perhaps be best demonstrated in the facades of Sivas' Gök Medrese and of Konya's Ince Minare. In addition to the traditional geometric, epigraphic, and vegetal motifs, a decorative sculpture in the round or in high relief was created that included many representations of human figures and especially animals. Whether this sculpture is essentially a reflection of the decorative wealth of pre-Islāmic monuments in Anatolia, or whether it is the vestige of a pagan Turkish art that originated in Central Asia, is still an unsolved historical problem.

There are few examples of wall painting from Anatolia. Especially in Konya, however, a major art of painted-tile decoration did evolve, possibly developed by Iranian artists who fled from the Mongol onslaught.

In summing up the architectural development of the Seljuq period, three points seem to be particularly significant. One is the expansion of building typology and the erection of new monumental architectural forms, thus illustrating an expansion of patronage and a growing complexity of taste. The second point is that, regardless of the quality and interest of monuments in the Fertile Crescent, Egypt, and Anatolia, the most inventive and exciting architecture in the 11th and 12th centuries was that of Iran. But, far more than in the preceding period, regional needs and regional characteristics seem to predominate over synchronic and pan-Islāmic ones. Finally, there was a striking growth of architectural decoration both in sophistication of design and in variation of technique.

Other arts. Although probably not as varied as architecture, the other arts of the Seljuq period also underwent tremendous changes. They demonstrate an extraordinary artistic energy, a widening of the social patronage of the arts, and a hitherto unknown variety of topics and modes of expression. It was as though the Seljuq period was gathering a sort of aesthetic momentum, but this effort seems to have been curtailed by the Mongol invasion. Chronologically, almost all surviving documentation and examples of these arts date from the latter part of the period, after 1150. It is unclear whether this apparent date is merely an accidental result of what has been preserved and is known through 20th-century scholarship or whether it corresponds to some precise event or series of events.

Glass and textiles continued to be major mediums during the Seljuq period. Ceramics underwent many changes, especially in Iran, where lustre painting became widespread and where new techniques were developed for colouring pottery. Furthermore, the growth of tile decoration created a new dimension for the art of ceramics.

Inlaid metalwork became an important technique. First produced at Herāt in Iran (now in Afghanistan) in the middle of the 12th century, this type of decoration spread westward, and a series of local schools were established in various regions of the Seljuq domain. In this technique, the surfaces of utilitarian metallic objects (candlesticks, ewers, basins, kettles, and so forth) were engraved, and then silver was inlaid in the cut-out areas to make the decorative design more clearly visible.

Manuscript illustration also became an important art. Scientific books, including the medical manuals of Dioscorides and of Galen, or literary texts such as the picaresque adventures of a verbal genius known as the *Maqāmāt,* were produced with narrative illustrations throughout the text.

All of the technical novelties of the Seljuqs seem to have had one main purpose: to animate objects and books and to provide them with clearly visible and identifiable images. Even the austere art of calligraphy became occasionally animated with letters ending in human figures. The main centres for producing these arts were located in Iran and the Fertile Crescent. For reasons yet unknown, Egypt and Anatolia were far less involved. One reason may be that these two Seljuq provinces did not witness the same

Urban middle-class patronage

rise of an urban middle class as did Iran, Iraq, or Syria. It would seem from a large number of art objects whose patrons are known that the main market for these works of art was the mercantile bourgeoisie of the big cities and not, as has often been believed, the princes. Seljuq decorative arts and book illustration, therefore, reflect an urban taste.

The themes and motifs used were particularly numerous. In books they tend to be illustrations of the text, even if a manuscript such as the Schefer *Maqāmāt* (1237; Bibliothèque Nationale, Paris) sought to combine a strict narrative with a fairly naturalistic panorama of contemporary life. Narrative scenes taken from books or reflecting folk stories are also common on Persian ceramics. In all mediums, however, the predominant vocabulary of images is the one provided by the older art of princes; but its meaning is no longer that of illustrating the actual life of princes but rather that of symbolizing a good and happy life. The motifs, therefore, do not have to be taken literally. Next to princely and narrative themes, there are depictions of scenes of daily life, astronomical motifs, and a myriad of topics that can be described but not understood.

While it is possible within certain limits to generalize about the subject matter of Seljuq art, regional stylistic definitions tend to be more valid. Thus the bronzes produced in northeastern Iran in the 12th century are characterized by simple decorative compositions rather than by the very elaborate ones created by the so-called school of Mosul in Iraq during the 13th century. In general, the art of metalwork exhibits a consistently growing intricacy in composition and in details to the point that individual subjects are at times lost in overlapping planes of arabesques. Ceramic pieces of Iran have usually been classified according to a more or less fictitious provenance. Kāshān ware exhibits a perfection of line in the depiction of moon-faced personages with heavily patterned clothes, while Rayy ceramic work is less sophisticated in design and execution but more vividly coloured. Sāveh and Gurgān are still other Iranian varieties of pottery. With the exception of Kāshān ware, where dynasties of ceramicists are known, all these types of Iranian pottery were contemporary with each other. In Syria, Raqqah pottery imitated Iranian ceramic wares but with a far more limited vocabulary of designs.

The Baghdad, or Arab, school

The main identifiable group of miniature painters was the so-called Baghdad school of the first half of the 13th century. The group should be called the Arab school because the subject matter and style employed could have been identified with any one of the major artistic centres of Egypt and the Fertile Crescent, and very little evidence currently exists to limit this school to one city. The miniatures painted by these artists are characterized by the colourful and often humorous way in which the urbanized Arab is depicted. The compositions, often lacking in any strong aesthetic intent, are documentary caricatures in which the artist has recorded the telling and recognizable gesture or a known and common setting or activity. In many images or compositional devices one can recognize the impact of the richer Christian Mediterranean tradition of manuscript illumination. A greater attention to aesthetic considerations is apparent in the illustrated manuscript of the Persian epic *Varqeh o-Golshāh* (Topkapı Saray Museum, Istanbul), unique in the Seljuq period.

Western Islāmic art: Moorish. The 11th to 13th centuries were not peaceful in the Maghrib. Berber dynasties overthrew each other in Morocco and the Iberian Peninsula. The Christian reconquest gradually diminished Muslim holdings in Spain and Portugal, and Tunisia was ruined during the Hilālī invasion when Bedouin tribes were sent by the Fāṭimids to prevent local independence.

Austerity of North African architecture

Two types of structures characterize the Almoravid (1056–1147) and Almohad (1130–1269) periods in Morocco and Spain. One comprises the large, severely designed Moroccan mosques such as those of Tinmel, of Ḥasan in Rabat, or of the Kutubīyah in Marrakech. They are all austere hypostyles with tall, massive, square minarets. The other distinctive type of architecture was that built for military purposes, including fortifications and, especially, massive city gates with low-slung horseshoe arches, such as the Oudaia Gate at Rabat (12th century) or the Rabat Gate at Marrakech (12th century). Palaces built in central Algeria by minor dynasties such as the Zīrids were more in the Fāṭimid tradition of Egypt than in the Almoravid and Almohad traditions of western Islām. Almost nothing is known or has been studied about North African arts other than architecture because the puritanical world of the Berber dynasties did not foster the arts of luxury.

In North Africa the artistic milieu did not change much in the 14th and 15th centuries. Hypostyle mosques such as the Great Mosque of Algiers continued to be built; *madrasahs* were constructed with more elaborate plans; the Bū ʿInānīyah *madrasah* at Fès is one of the few monumental buildings of the period. A few mausoleums were erected such as the so-called Marīnid tombs near Fès (second half of the 14th century) or the complex of Chella at Rabat (mostly 14th century). Architectural decoration in stucco or sculpted stone was usually limited to elaborate geometric patterns, epigraphic themes, and a few vegetal motifs.

A stunning exception to the austerity of North African architecture exists in Spain in the Alhambra palace com-

plex at Granada. The hill site of the Alhambra had been occupied by a citadel and possibly by a palace since the 11th century, but little of these earlier constructions has remained. In the 14th century two successive princes, Yūsuf I and Muḥammad V, transformed the hill into their official residence. Outside of a number of gates built like triumphal arches and several ruined forecourts, only three parts of the palace remain intact. First there is the long Court of the Myrtles leading to the huge Hall of Ambassadors located in one of the exterior towers. This was the part of the Alhambra built by Yūsuf I. Then there is the Court of the Lions, with its celebrated lion fountain in the centre. Numerous rooms open off this court, including the elaborately decorated Hall of the Two Sisters and the Hall of the Abencerrajes. The third part, slightly earlier than the first two, is the Generalife; it is a summer residence built higher up the hill and surrounded by gardens with fountains, pavilions, and portico walks.

Importance of the Alhambra

The Alhambra is especially important because it is one of the few palaces to have survived from medieval Islāmic times. It illustrates superbly a number of architectural concerns occasionally documented in literary references: the contrast between an unassuming exterior and a richly decorated interior to achieve an effect of secluded or private brilliance; the constant presence of water, either as a single, static basin or as a dynamic fountain; the inclusion of oratories and baths; the lack of an overall plan (the units are simply attached to each other).

The architectural decoration of the Alhambra was mostly of stucco. Some of it is flat, but the extraordinarily complex cupolas of *muqarnas,* such as in the Hall of the Two Sisters, appear as huge multifaceted diadems. The decoration of the Alhambra becomes a sort of paradox as well as a tour de force. Weighty, elaborately decorated ceilings, for example, are supported by frail columns or by walls pierced with many windows (light permeates almost every part of the large, domed halls). Much of the design and decoration of the Alhambra is symbolically oriented. The poems that adorn the Alhambra as calligraphic ornamentation celebrate its cupolas as domes of heaven rotating around the prince sitting under them.

Islāmic art as such ceased to be produced in Spain after 1492, when Granada, the last Moorish kingdom in Spain, fell to the Christians; but the Islāmic tradition continued in North Africa, which remained Muslim. In Morocco the so-called Sharīfian dynasties from the 16th century onward ornamentally developed the artistic forms created in the 14th century.

Most of the best known monuments of western Islāmic art are buildings, although a very original calligraphy was developed. The other arts cannot be compared in wealth and importance either with what occurred elsewhere in Islām at the same time or with earlier objects created in Spain. There are some important examples of metalwork, wood inlaid with ivory, and a lustre-glaze pottery known as Hispano-Moresque ware. The fact that the latter was made in Valencia or Málaga after the termination of Muslim rule demonstrates that Islāmic traditions in the decorative arts continued to be adhered to, if only partially. The term Mudéjar, therefore, is used to refer to all the things made in a Muslim style but under Christian rule. Numerous examples of Mudéjar art exist in ceramics and

textiles, as well as in architectural monuments such as the synagogues of Toledo and the Alcazba in Seville, where even the name of the ruling Christian prince, Don Pedro, was written in Arabic letters. The Mudėjar spirit, in fact, permeated most of Spanish architectural ornament and decorative arts for centuries, and its influence can even be found in Spanish America.

Mudėjar art must be carefully distinguished from Mozarabic art: the art of Christians under Muslim rule. Mozarabic art primarily flourished in Spain during the earlier periods of Muslim rule. Its major manifestations are architectural decorations, decorative objects, and illuminated manuscripts. Dating mostly from the 10th and 11th centuries, the celebrated illuminations for the commentary on the Revelation to John by an 8th-century Spanish abbot, Beatus of Liėbana, are purely Christian subjects treated in styles possibly influenced by Muslim miniature painting or book illustration. The most celebrated example, known as the "Saint-Sever Apocalypse," is in the collection of the Bibliothėque Nationale in Paris.

Mamlūk art. The Mamlūks were originally white male slaves, chiefly Turks and Circassians from the Caucasus and Central Asia who formed the mercenary army of the various feudal states of Syria and Egypt. During the 13th century the importance of this military caste grew as the older feudal order weakened and military commanders took over power generally as nonhereditary sultans. They succeeded in arresting the Mongol onslaught in 1260 and, through a judicious but complicated system of alliance with the urban elite class, managed to maintain themselves in power in Egypt, Palestine, and Syria until 1517.

During the Mamlūk period Egypt and Syria were rich commercial emporiums. This wealth explains the quality and quantity of Mamlūk art. Most of the existing monuments in the old quarters of Cairo, Damascus, Tripoli, and Aleppo are Mamlūk; in Jerusalem almost everything visible on the Ḥaram ash-Sharīf, outside the Dome of the Rock, is Mamlūk. Museum collections of Islāmic art generally abound with Mamlūk metalwork and glass. Some of the oldest remaining carpets are Mamlūk. This creativity required, of course, more than wealth; it also required a certain will to transform wealth into art. This will was in part the desire of parvenu rulers and their cohorts to be remembered. Furthermore, architectural patronage flourished because of the institutionalization of the *waqf,* an economic system in which investments made for holy purposes were inalienable. This law allowed the wealthy to avoid confiscation of their properties at the whim of the caliph by investing their funds in religious institutions. In the Mamlūk period, therefore, there was a multiplication of *madrasah*s, *khānqāh*s, *ribāṭ*s, and *masjid*s, often with tombs of founders attached to them. The Mamlūk establishment also repaired and kept up all the institutions, religious or secular, that had been inherited by them, as can be demonstrated by the well-documented repairs carried on in Jerusalem and Damascus.

The influential role of the *waqf*

Architecture. The Mamlūks created a monumental setting for Syria and Egypt that lasted until the 20th century. It was at its most remarkable in architecture, and nearly 3,000 major monuments have been preserved or are known from texts in cities from the Euphrates to Cairo. No new architectural types came into being, although many more urban commercial buildings and private houses have been preserved than from previous centuries. The hypostyle form continued to be used for mosques and oratories, as in the Cairene mosques of Baybars I (1262–63), Nāṣir (1335), and Mu'ayyad Shaykh (1415–20). *Madrasah*s used *eyvān*s, and the justly celebrated *madrasah* of Sulṭan Ḥasan in Cairo (1356–62) is one of the few perfect four-*eyvān madrasah*s in the Islāmic world. Mausoleums were squares or polygons covered with domes. In other words, there were only minor modifications in the typology of architecture, and even the 15th-century buildings with interiors totally covered with ornamentation have possible prototypes in the architecture of the Seljuqs. Yet there are formal and functional features that do distinguish Mamlūk buildings. One is the tendency to build structures of different functions in a complex or cluster. Thus the Qalā'ūn mosque (1284–85) in Cairo has a mausoleum, a *madrasah,* and a hospital erected as one architectural unit. Another characteristic is the tendency of Mamlūk patrons to build their major monuments near each other. As a result, certain streets of Cairo, such as Bayn al-Qaṣrayn, became galleries of architectural masterpieces. The plans of these buildings may have had to be adapted to the exigencies of the city, but their spectacular facades and minarets competed with each other for effect. From the second half of the 14th century onward, building space for mausoleums began to be limited in Cairo, and a vast complex of commemorative monuments was created in the city's western cemetery. In Aleppo and Damascus similar phenomena can be observed.

Architectural changes in the Mamlūk period

Although Mamlūk architecture was essentially conservative in its development of building types, more originality is evident in the constructional systems used, although traditional structural features continued to be employed—*e.g.,* cupolas raised on squinches or more commonly pendentives, barrel and groin vaults, and wooden ceilings covering large areas supported by columns and piers. The main innovations are of three kinds. First, minarets became particularly elaborate and, toward the end of the period, almost absurd in their ornamentation. Facades were huge, with overwhelming portals 25 to 35 feet high.

A second characteristically Mamlūk feature was technical virtuosity in stone construction. At times this led to a superb purity of form, as in the Gate of the Cotton Merchants in Jerusalem or the complex of the Barqūq mosque in Cairo. At other times, as in the Mamlūk ar-

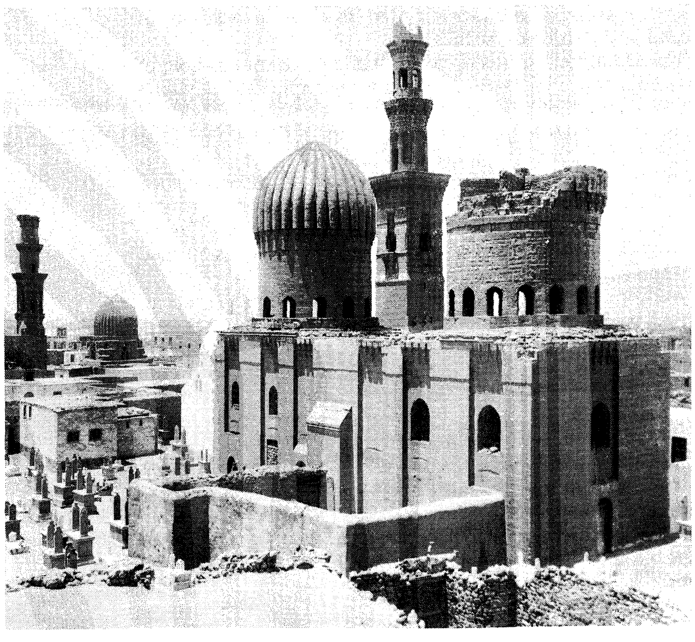
(Left) GEKS, (right) from B. Fletcher, *A History of Architecture on the Comparative Method;* Athlone Press of the University of London, London

chitecture of Baybars and Qā'it Bāy, there was an almost wild playfulness with forms. Another aspect of Mamlūk masonry was the alternation of stones of different colours to provide variations on the surfaces of buildings.

The third element of change in Mamlūk art was perhaps the most important: almost all formal artistic achievements rapidly became part of the common vocabulary of the whole culture, thus ensuring high quality of construction and decorative technique throughout the period.

With the exception of portals and *qiblah* walls, architectural decoration was usually subordinated to the architectural elements of the design. Generally the material of construction (usually stone) was carved with ornamental motifs. Stucco decoration was primarily used in early Mamlūk architecture, while coloured tile was a late decorative device that was rarely employed.

H. Roger-Viollet



Mamlūk tombs, Cairo, 14th–15th centuries.

Other arts. Like architecture, the other arts of the Mamlūk period achieved a high level of technical perfection but were often lacking in originality. The so-called "Baptistère de St. Louis" (*c.* 1310, Louvre) is the most impressive example of inlaid metalwork preserved from this period. Several Mamlūk illustrated manuscripts, such as the *Maqāmāt* (1334) in the Nationalbibliothek, Vienna, display an amazing ornamental sense in the use of colour on gold backgrounds. Mamlūk mosque lamps provide some of the finest examples of medieval glass. The wooden objects made by Mamlūk craftsmen were widely celebrated for the quality of their painted, inlaid, or carved designs. And the bold inscriptions that decorate the hundreds of remaining bronzes testify to the Mamlūks' mastery of calligraphy. None of these examples, however, exhibits much inventiveness of design.

Mongol Iran: Il-Khanid and Timurid periods. Seen from the vantage point of contemporary or later chronicles, the 13th century in Iran was a period of destructive wars and invasions. Such cities as Balkh, Nīshāpūr, or Rayy, which had been centres of Islāmic culture for nearly six centuries, were eradicated as the Mongol army swept through Iran. The turning point toward some sort of stability took place in 1295 with the accession of Maḥmūd Ghāzān to the Mongol throne. Under him and his successors (the Il-Khan dynasty), order was reestablished throughout Iran, and cities in northeastern Iran, especially Tabriz and Solṭānīyeh, became the main creative centres of the new Mongol regime. At Tabriz, for example, the Rashīdīyeh (a sort of academy of sciences and arts to which books, scholars, and ideas from all over the world were collected) was established in the early 14th century.

Existing under the Mongol rulers were a number of secondary dynasties that flourished in various provinces of Iran: the Jalāyirid dynasty, centred in Baghdad, controlled most of western Iran; the Moẓaffarid dynasty of southwestern Iran contained the cities of Isfahan, Yazd, and Shīrāz; and the Karts reigned in Khorāsān. Until the last decade of the 14th century, however, all the major cultural centres were in western Iran. Under Timur (1336–1405; the Timurid dynasty) and his successors, however, northeastern Iran, especially the cities of Samarkand and Herāt, became focal points of artistic and intellectual activity. But Timurid culture affected the whole of Iran either directly or through minor local dynasties. Many

Timurid monuments, therefore, are found in western or southern Iran.

Il-Khanid refinement and taste for the grandiose

Architecture. Stylistically, Il-Khanid architecture is defined best by buildings such as the mosque of Varāmīn (1322–26) and the mausoleums at Sarakhs, Merv, Rād-Kān, and Marāgheh. In all of these examples, the elements of architectural composition, decoration, and construction that had been developed earlier were refined by Il-Khanid architects. *Eyvān*s were shallower but better integrated with the courts; facades were more thoughtfully composed; the *muqarnas* became more linear and varied; and coloured tiles were used to enhance the building's character.

The architectural masterpiece of the Il-Khanid period is the mausoleum of Öljeitü at Solṭānīyeh. With its double system of galleries, eight minarets, large blue-tiled dome, and an interior measuring 80 feet (25 metres), it is clear that the building was intended to be imposing. Il-Khanid attention to impressiveness of scale also accounted for the ʿAlī Shāh mosque in Tabriz, whose *eyvān* measuring 150 by 80 by 100 feet (45 by 25 by 30 metres) was meant to be the largest ever built. The *eyvān* vault collapsed almost immediately after it had been constructed, but its walls, 35 feet (10 metres) thick, remain as a symbol of the grandiose taste of the Il-Khanids. In the regions of Isfahan and Yazd numerous smaller mosques (often with unusual plans) and less pretentious mausoleums, as well as palaces with elaborate gardens, were built in the 14th century. These buildings were constructed to provide a monumental setting for the Islāmic faith and for the authority of the state. The study of these buildings began only in the mid-20th century, and therefore no definitive conclusions have been reached as to whether regional or pan-Iranian stylistic and formal features predominated.

The Timurid period began architecturally in 1390 with the sanctuary of Aḥmad Yasavī in Turkistan. Between 1390 and the last works of Sultan Ḥusayn Bayqara almost a century later, hundreds of buildings were constructed at Herāt, many of which have been preserved, although few have been studied except by Soviet scholars. The most spectacular examples of Timurid architecture are found in Samarkand, Herāt, Meshed, Khargird, Tayābād, Baku, and Tabriz, although important Timurid structures were also erected in southern Iran.

Timurid concern with a commemorative architecture

Architectural projects were well patronized by the Timurids as a means to commemorate their respective reigns. Every ruler or local governor constructed his own sanctuaries, mosques, and, especially, memorial buildings dedicated to holy men of the past. While the Shāh-e Zendah in Samarkand—a long street of mausoleums comparable to the Mamlūk cemetery of Cairo—is perhaps the most accessible of the sites of Timurid commemorative architecture, more spectacular ones are to be seen at Meshed, Torbat-e Sheykh Jām, and Mazār-e Sharīf. The Timurid princes also erected mausoleums for themselves, such as the Gūr-e Amīr and the ʿIshrat-Khāneh in Samarkand.

Major Timurid buildings, such as the so-called mosque of Bībī Khānom, the Gūr-e Amīr mausoleum, the mosque of Gowhar Shād in Meshed, or the *madrasah*s at Khargird and Herāt, are all characterized by strong axial symmetry. Often the facade on the inner court repeats the design of the outer facade, and minarets are used to frame the composition. Changes took place in the technique of dome construction. The *muqarnas* was not entirely abandoned but was often replaced by a geometrically rigorous net of intersecting arches that could be adapted to various shapes by modifying the width or span of the dome. The Khargird *madrasah* and the ʿIshrat-Khāneh mausoleum in Samarkand are particularly striking examples of this structural development. The Timurids also made use of double domes on high drums.

In the Timurid period the use of colour in architecture reached a high point. Every architectural unit was divided, on both the exterior and interior, into panels of brilliantly coloured tiles that sometimes were mixed with stucco or terra-cotta architectural decorations.

Painting. A new period of Persian painting began in the Mongol era, and, even though here and there one can recognize the impact of Seljuq painting, on the whole it is a limited one. Although the new style was primarily expressed in miniature painting, it is known from literary sources that mural painting flourished as well. Masterpieces of Persian literature were illustrated: first the *Shāh-nāmeh* ("Book of Kings") by the 11th-century poet Ferdowsī and then, from the second half of the 14th century, lyrical and mystical works, primarily those by the 12th-century poet Neẓāmī. Historical texts or chronicles such as the *Jāmiʿ at-tawārīkh* ("Universal History of Rashīd ad-Dīn") were also illustrated, especially in the early Mongol period.

The first major monument of Persian painting in the Mongol period is a group of manuscripts of the *Jāmiʿ at-tawārīkh* (British Museum, London; University Library, Edinburgh; and Topkapı Saray Museum, Istanbul). The miniatures are historical narrative scenes. Stylistically they are related to Chinese painting—an influence introduced by the Mongols during the Il-Khanid period.

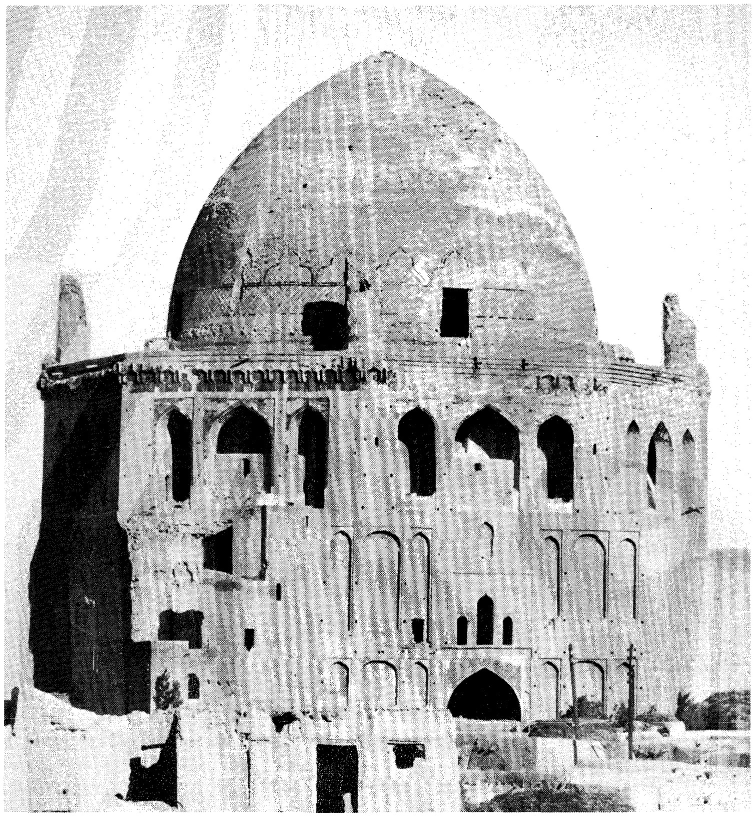
The expressive importance of the *Shāh-nāmeh* miniatures

Chinese influence can still be discovered in the masterpiece of 14th-century Persian painting, the so-called Demotte *Shāh-nāmeh.* Illustrated between 1320 and 1360, its 56 preserved miniatures have been dispersed all over the world. The compositional complexity of these paintings can be attributed to the fact that several painters probably were involved in the illustration of this manuscript and that these artists drew from a wide variety of different stylistic sources (*e.g.,* Chinese, European, local Iranian traditions). Its main importance lies in the fact that it is the earliest known illustrative work that sought to depict in a strikingly dramatic fashion the meaning of the Iranian epic. Its battle scenes, its descriptions of fights with monsters, its enthronement scenes are all powerful representations of the colourful and often cruel legend of Iranian kingship. The artists also tried to express the powerlessness of man confronted by fate in a series of mourning and death scenes.

The Demotte *Shāh-nāmeh* is but the most remarkable of a whole series of 14th-century manuscripts, all of which suggest an art of painting in search of a coherent style. At the very end of the period a manuscript such as that of the poems of Sultan Aḥmad (Freer Gallery of Art, Washington, D.C.) still exhibits an effective variety of established themes, while some of the miniatures in the Deutsche Staatsbibliothek, East Berlin, and in the Topkapı Saray, Istanbul, illustrate the astounding variety of styles studied or copied by Persian masters.

The lyric style

A more organized and stylistically coherent period in Persian painting began around 1396 with the Khwāju Kermānī manuscript (British Museum) and culminated between 1420 and 1440 in the paintings produced by the Herāt school, where the emperor Baysunqur created an academy in which classical Iranian literature was codified, copied, and illustrated. Although several *Shāh-nāmeh*s are known from this time, the mood of these manuscripts is no longer epic but lyrical. Puppet-like figures almost unemotionally engage in a variety of activities always set in an idealized garden or palace depicted against a rich gold background. It is a world of sensuous pleasure that also embodies the themes of a mystically interpreted lyrical poetry, for what is represented is not the real world but a divine paradise in the guise of a royal palace or garden. These miniatures easily became clichés, for later artists



Mausoleum of Öljeitü at Solṭānīyeh, 1305–13, Il-Khanid period.
Josephine Powell, Rome

endlessly repeated stereotyped formulas. But at its best, as in the Metropolitan Museum Neẓāmī, this style of Persian painting succeeds in defining something more than mere ornamental colourfulness. It expresses in its controlled lyricism a fascinating search for the divine, similar to the search of such epic characters as Neẓāmī, Rūmī, or Ḥāfeẓ—at times earthly and vulgar, at other times quite ambiguous and hermetic, but often providing a language for the ways in which human beings can talk about God.

Behzād and his school

Another major change in Persian painting occurred during the second half of the 15th century at Herāt under Ḥusayn Bayqara. This change is associated with the first major painter of Islāmic art, Behzād. Many problems of attribution are still posed about Behzād's art, and, in the examples that follow, works by his school, as well as images by the master's own hand, are included. In the Garrett *Ẓafar-nāmeh* (*c.* 1490), the Egyptian Cairo National Library's Būstān (1488), or the British Museum's Neẓāmī (1493–94), the stereotyped formulas of the earlier lyric style were endowed with new vitality. Behzād's interest in observing his environment resulted in the introduction of more realistic poses and the introduction of numerous details of daily life or genre elements. His works also reflect a concern for a psychological interpretation of the scenes and events depicted. It is thus not by chance that portraits have been attributed to Behzād.

Persian art of the Mongol period differs in a very important way from any of the other traditions of the middle period of Islāmic art. Even though Iran, like all other areas at that time, was not ethnically homogeneous, its art tended to be uniquely "national." In architecture nationalism was mostly a matter of function, for during this period the Shīʿites grew in importance, and new monumental settings were required for their holy places. Iranian individualism is especially apparent in painting, in which Chinese and other foreign styles were consistently adapted to express intensely Iranian subjects, thereby creating a uniquely Persian style.

LATE PERIOD

The last period of an Islāmic artistic expression created within a context of political and intellectual independence was centred in the Ottoman, Ṣafavid, and Mughal empires. Although culturally very different from each other, these three imperial states shared a common past, a common consciousness of the nature of their ancestry and of the artistic forms associated with it. Painters and architects moved from one empire to the other, especially from Iran to India; Ottoman princes wrote Persian poetry, and Ṣafavid rulers spoke Turkish. But most of all, they were aware of the fact that they were much closer to each other than to any non-Islāmic cultural entity. However different their individual artistic forms may have been, they collected each other's works, exchanged gifts, and felt that they belonged to the same world.

Ottoman art. The Ottomans were originally only one of the small Turkmen principalities (*beyliks*) that sprang up in Anatolia around 1300 after the collapse of Seljuq rule. In many ways, all the *beyliks* shared the same culture, but it was the extraordinary political and social attributes of the Ottomans that led them eventually to swallow up the other kingdoms, to conquer the Balkans, to take Constantinople in 1453, and to control almost the whole of the Arab world by 1520. Only in the 19th century did this complex empire begin to crumble. Thus, while Ottoman art, especially architecture, is best known through the monuments in Turkey, there is, in fact, evidence of Ottoman art extending from Algiers to Cairo in North Africa, to Damascus in the Levant, and in the Balkans from Sarajevo, Yugos., to Sofia, Bulg.

Origin of the *tekke* and *külliye*

Architecture. The grand tradition of Ottoman architecture, established in the 16th century, was derived from two main sources. One was the rather complex development of new architectural forms that occurred all over Anatolia, especially at Manisa, İznik, Bursa, and Selçuk in the 14th and early 15th centuries. In addition to the usual mosques, mausoleums, and *madrasahs*, a number of buildings called *tekkes* were constructed to house dervishes (members of mystical fraternities) and other holy men who lived communally. The *tekke* (or *zeviye*) was often joined to a mosque or mausoleum. The entire complex was then called a *külliye.* All these buildings continued to develop the domed, central-plan structure, constructed by the Seljuqs in Anatolia. The other source of Ottoman architecture is Christian art. The Byzantine tradition, especially as embodied in Hagia Sophia, became a major source of inspiration. Byzantine influence appears in such features as stone and brick used together or in the use of pendentive dome construction. Also artistically influential were the contacts that the early Ottomans had with

Italy. Thus, in several mosques at Bursa, Tur., there are stylistic parallels in the designs of the exterior facade and of windows, gates, and roofs to features found in Italian architecture. A distinctive feature of Ottoman architecture is that it drew from both Islāmic and European artistic traditions and was, therefore, a part of both.

The apogee of Ottoman architecture was achieved in the great series of *külliye*s and mosques that still dominate the Istanbul skyline: the Fatih *külliye* (1463–70), the Bayezid Mosque (after 1491), the Selim Mosque (1522), the Şehzade *külliye* (1548), and the Süleyman *külliye* (after 1550). The Şehzade and Süleyman *külliye*s were built by Sinan, the greatest Ottoman architect, whose masterpiece is the Selim Mosque at Edirne, Tur. (1569–75). All of these buildings exhibit total clarity and logic in both plan and elevation; every part has been considered in relation to the whole, and each architectural element has acquired a hierarchic function in the total composition. Whatever is unnecessary has been eliminated. This simplicity of design in the late 15th and 16th centuries has often been attributed to the fact that Sinan and many Ottoman architects were first trained as military engineers. Everything in these buildings was subordinated to an imposing central dome. A sort of cascade of descending half domes, vaults, and ascending buttresses leads the eye up and down the building's exterior. Minarets, slender and numerous, frame the exterior composition, while the open space of the surrounding courts prevents the building from being swallowed by the surrounding city. These masterpieces of Ottoman architecture seem to be the final perfection of two great traditions: a stylistic and aesthetic tradition that had been indigenous to Istanbul since the construction of the Byzantine church of Hagia Sophia in the 6th century and the other Islāmic tradition of domical construction dating to the 10th century.

The tragedy of Ottoman architecture is that it never managed to renew its 16th-century brilliance. Later buildings, such as the impressive Sultan Ahmed mosque in Istanbul, were mostly variations on Sinan's architecture, and sometimes there were revivals of older building types, especially in the provinces. Occasionally, as in the early 18th-century Nûruosman mosque in Istanbul, interesting new variants appear illustrating the little-known Turkish Baroque style. The latter, however, is more visible in ornamental details or in smaller buildings, especially the numerous fountains built in Istanbul in the 18th century.

The sources of the Turkish Baroque are probably to be sought in the Baroque architecture of Vienna and the bordering Austro-Hungarian states. Throughout the 18th and 19th centuries, a consistent Europeanization of a local tradition occurs in the Ottoman empire.

While mosques and *külliye*s are the most characteristic monuments of Ottoman architecture, important secular buildings were also built: baths, caravansaries, and especially the huge palace complex of Topkapı Saray at Istanbul, in which 300 years of royal architecture are preserved in its elaborate pavilions, halls, and fountains.

Other arts. Architectural decoration was generally subordinated to the structural forms or architectonic features of the building. A wide variety of themes and techniques originating from many different sources were used. One decorative device, the Ottoman version of colour-tile decoration, deserves particular mention, for it succeeds in transforming smaller buildings such as the mosque of Rüstem Paşa in Istanbul into a visual spectacle of brilliant colours. The history and development of this type of ceramic decoration is intimately tied to the complex and much controverted problem of the growth of several distinctive Ottoman schools of pottery: İznik, Rhodian, and Damascus ware. Both in technique and in design, Ottoman ceramics are the only major examples of pottery produced in the late Islāmic period.

Wide-spread use of tile decoration

Ottoman miniature painting does not compare in quality with Persian painting, which originally influenced the Turkish school. Yet Ottoman miniatures do have a character of their own, either in the almost folk art effect of religious images or in the precise depictions of such daily events as military expeditions or great festivals. Among the finest examples of the latter is the manuscript *Surname-i Vehbi* (Topkapı Saray Museum, Istanbul) painted by Levnî in the early 18th century.

The production of metalwork, wood inlaid with ivory, Usak carpets, and textiles flourished under the Ottomans, both in Istanbul workshops sponsored by the sultan and in numerous provincial centres. The influence of these ornamental objects on European decorative arts from the 16th through the 19th century was considerable.

Ṣafavid art. The Ṣafavid dynasty was founded by Esmāʿīl I (1501–24). The art of this dynasty reached its zenith during the reigns of Ṭahmāsp (1524–76) and of ʿAbbās I (1588–1629). This phase of the Ṣafavid period also marked the last significant development of Islāmic art in Iran, for after the middle of the 17th century original creativity disappeared in all mediums. Rugs and objects in silver, gold, and enamel continued to be made and exhibited a considerable technical virtuosity, even when they were lacking in inventiveness.

The Ṣafavids abandoned Central Asia and northeastern Iran to a new Uzbek dynasty that maintained the Timurid style in many buildings (especially at Bukhara) and briefly sponsored a minor and derivative school of painting. Only the great sanctuary of Meshed was being kept up and built-up, but, like many of the other religious sanctuaries of the time—Qom, an-Najaf, Karbalāʾ, it is still far too little known to lend itself to coherent analysis. For this is the time when Shīʿism became a state religion and for the first time in Islām there appeared an organized ecclesiastical system rather than the more or less loose spiritual and practical leadership of old. The main centres of the Ṣafavid empire were Tabriz and Ardabīl in the northwest, with Kazvin in the central region, and, especially, Isfahan in the west. The Ṣafavid period, like the Ottoman era, was an imperial age, and therefore there is hardly a part of Iran where either Ṣafavid buildings or major Ṣafavid restorations cannot be found. The dynasty spent much money and effort on the building of bridges, roads, and caravansaries to encourage trade.

Turkish Baroque style exemplified by the Fountain of Ahmed III, Istanbul, 1728.

Architecture. The best known Ṣafavid monuments are located at Isfahan, where ʿAbbās I built a whole new city. According to one description, it contained 162 mosques, 48 *madrasah*s, 1,802 commercial buildings, and 283 baths. Most of these buildings no longer survive, but what has remained constitutes some of the finest monuments of Islāmic architecture.

At the centre of Isfahan is the Meydān-e Shāh, a large open space, about 1,670 by 520 feet (510 by 158 metres), originally surrounded by trees. Used for polo games and parades, it could be illuminated with 50,000 lamps. Each side of the *meydān* was provided with the monumental facade of a building. On one of the smaller sides was the entrance to a large mosque, the celebrated Masjed-e Shāh. On the other side was the entrance into the bazaar or marketplace. On the longer sides were the small funerary mosque of Sheykh Loṭfollāh and, facing it, the ʿAlī Qāpū, the "high gate," the first unit of a succession of palaces and gardens that extended beyond the *meydān,* most of which have now disappeared except for the Chehel Sotūn, the palace of the "Forty Columns." The ʿAlī Qāpū was, in its lower floors, a semipublic place to which petitions could be brought, while its upper floors are a world of pure fantasy—a succession of rooms, halls, and balconies overlooking the city, which were purely for the prince's pleasure.

The Meydān-e Shāh

The Meydān-e Shāh unites in a single composition all the concerns of medieval Islāmic architecture: prayer, commemoration, princely pleasure, trade, and spatial effect. None of the hundreds of other remaining Ṣafavid monuments can match its historical importance, and in it also are found the major traits of Ṣafavid construction and decoration. The forms are traditional, for the most part, and even in vaulting techniques and the use of coloured tiles it is to Timurid art that the Ṣafavids looked for their models. The Persian architects of the early 17th century sought to achieve a monumentality in exterior spatial composition (an interesting parallel to the interior spaciousness created at the same time by the Ottomans); a logical precision in vaulting that was successful in the Masjed-e Shāh but rapidly led to cheap effects or to stucco imitations; and a coloristic brilliance that has made the domes and portals of Isfahan justly famous.

Painting. In the 16th and 17th centuries, possibly for the first time in Islāmic art, painters were conscious of historical styles—even self-conscious. Miniatures from the past were collected, copied, and imitated. Patronage, however, was fickle. A royal whim would gather painters together or exile them. Many names of painters have been preserved, and there is little doubt that the whim of patrons was being countered by the artists' will to be socially and economically independent as well as individually recognized for their artistic talents. Too many different impulses, therefore, existed in Ṣafavid Iran for painting to follow any clear line of development.

Importance of historical styles of painting

Three major painting styles, or schools (excluding a number of interesting provincial schools), existed in the Ṣafavid period. One school of miniature painting is exemplified by such masterpieces as the Houghton *Shāhnāmeh* (completed in 1537), the Jāmī *Haft owrang* (1556–1665; Freer Gallery of Art, Washington, D.C.), or the illustrations to stories from Ḥāfeẓ which have not been identified in detail (Fogg Art Museum, Cambridge, Mass., and in a private collection). However different they are from each other, these large, colourful miniatures all were executed in a grand manner. Their compositions are complex, individual faces appear in crowded masses, there is much diversification in landscape, and, despite a few ferocious details of monsters or of strongly caricaturized poses and expressions, these book illustrations are concerned with an idealized vision of life. The sources of this school lie with the Timurid academy. Behzād, Sulṭān Muḥammad, Sheykhzādeh, Mīr Sayyid ʿAlī, Āqā Mīrak, and Maḥmūd Muṣavvīr continued and modified, each in his own way, the ideal of a balance between an overall composition and precise rendering of details.

The miniatures of the second tradition of Ṣafavid painting seem at first to be like a detail out of the work of the previously discussed school. The same purity of colour, elegance of poses, interest in details, and assertion of the individual figure is found. Āqā Reẕā and Reẕā ʿAbbāsī (both active around 1600) excelled in these extraordinary portrayals of poets, musicians, courtiers, and aristocratic life in general.

Portraiture and genre painting

In both traditions of painting, the beautiful personages depicted frequently are satirized; this note of satirical criticism is even more pronounced in portraiture of the time. But it is in pen or brush drawings, mostly dating from the 17th century, that the third aspect of Ṣafavid painting appeared: an interest in genre, or the depiction of minor events of daily life (*e.g.,* a washerwoman at work, a tailor sewing, an animal). With stunning precision Ṣafavid artists showed a whole society falling apart with a cruel sympathy totally absent from the literary documents of the time.

While architecture and painting were the main artistic vehicles of the Ṣafavids, the making of textiles and carpets was also of great importance. It is in the 16th century that a hitherto primarily nomadic and folk medium of the decorative arts was transformed into an expression of royal and urban tasks by the creation of court workshops. The predominantly geometric themes of earlier Iranian carpets were not abandoned entirely but tended to be replaced by vegetal, animal, and even occasional human motifs. Great schools of carpetmaking developed particularly at Tabriz, Kāshān, and Kermān.

Mughal art. Since the culture of the Mughals was intimately connected to the indigenous Hindu traditions of the Indian subcontinent, their art will be treated only synoptically in this article. (For a more detailed account, the reader should see the section on Mughal art in the visual arts portion of the article SOUTH ASIAN ARTS).

The art of the Mughals was similar to that of the Ottomans in that it was a late imperial art of Muslim princes. Both styles were rooted in several centuries (at least from the 13th century onward) of adaptation of Islāmic functions to indigenous forms. It was in the 14th-century architecture of South Asian sites such as Tughluqābād, Gaur, and Ahmadābād that a uniquely Indian type of Islāmic hypostyle mosque was created, with a triple axial nave, corner towers, axial minarets, and cupolas. It was also during these centuries that the first mausoleums set in scenically spectacular locations were built. By then the conquering Muslims had fully learned how to utilize local methods of construction, and they adapted South Asian decorative techniques and motifs.

Mughal art was in continuous contact with Iran or, rather, with the Timurid world of the second half of the 15th century. The models and the memories were in Herāt or Samarkand, but the artists were raided from Ṣafavid Iran, and the continuous flow of painters from Iran to the Mughal empire is a key factor in understanding Mughal painting.

The mausoleum of Humāyūn in Delhi (1565–69), the city of Fateḥpūr Sīkri (from 1569 onward), and the Tāj Mahal at Āgra (1631–53) summarize the development of Mughal architecture. In all three examples it can be seen that what Mughal architecture brought to the Islāmic tradition (other than traditional Indian themes, especially in decoration) was technical perfection in the use of red sandstone or marble as building and decorative materials.

Mughal painting

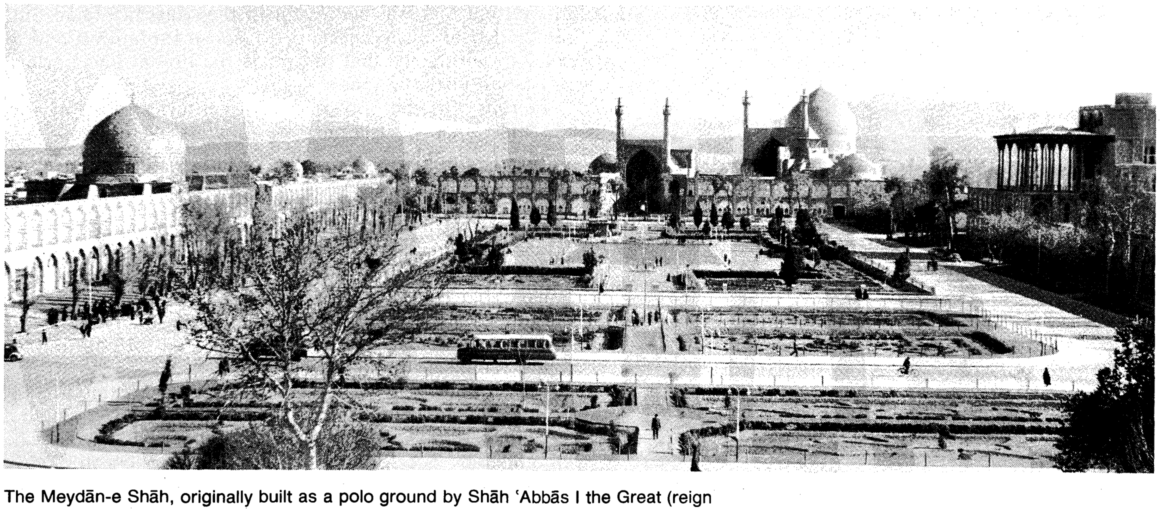
In Mughal painting the kind of subject that tended to be illustrated was remarkably close to those used in Ṣafavid history books—legendary stories, local events, portraits, genre scenes. What evolved quickly was a new manner of execution, and this style can be seen as early as about 1567, when the celebrated manuscript *Dāstān-e Amīr Ḥamzeh* ("Stories of Amīr Ḥamzeh") was painted (some 200 miniatures remain and are found in most major collections of Indian miniatures, especially at the Freer Gallery of Art, Washington, D.C.). Traditional Iranian themes—battles, receptions, feasts—acquired monumentality, not only because of the inordinate size of the images but also because almost all of the objects and figures depicted were seen in terms of mass rather than line. Something of the colourfulness of Iranian painting was lost, but instead images acquired a greater expressive power. Mughal portraiture gave more of a sense of the individual than did the portraits of the Ṣafavids. As in a celebrated representation of a dying courtier in the Boston Museum of Fine Arts, Mughal drawings could be poignantly naturalistic. Mood was important to the Mughal artist—in many paintings of animals there is a playful mood; a sensuous mood is evident in the first Muslim images to glorify the female body and the erotic.

In summary it can be said that the Mughals produced an art of extraordinary stylistic contrasts that reflected the complexities of its origins and of its aristocratic patronage.

ISLĀMIC ART UNDER EUROPEAN INFLUENCE AND CONTEMPORARY TRENDS

It is extremely difficult to decide when, how, and to what extent European art began to affect the art of the

Inge Morath—Magnum



The Meydān-e Shāh, originally built as a polo ground by Shāh ʿAbbās I the Great (reign 1588–1629), at Isfahan, Iran. Facing the square on the left is the mosque of Sheykh Loṭfollāh, in the centre the Masjed-e Shāh, and at the right the palace of ʿAlī Qāpū.

traditional Muslim world. Ottoman architecture was from the beginning affected by Western influences. In Mughal India, European landscapes and Western spatial concerns influenced painting in the 18th century; and Persian painting has exhibited constant Western influence since the 17th century. Thus, Islāmic art began to be affected by European traditions before Europe began (in the 18th and 19th centuries) its conquests of most of the Muslim world. Since the Ottomans ruled North Africa (except Morocco), Egypt, Syria, Palestine, as well as the Balkans, much of the Muslim world was first introduced to "modern" European art through its adaptation in Istanbul or in other major Ottoman cities like Smyrna or Alexandria.

European influence tended to have been mostly limited to architecture. Nineteenth-century European engineers and architects, for example, adapted modern structural technology and decorative styles to local Islāmic needs or idioms: the Sūq al-Ḥamīdīyah bazaar in Damascus was built with steel roofing; the Hejaz railway station at Damascus was decorated in a sort of Oriental Art Nouveau style.

Revival of the decorative arts

During actual European occupation of Muslim territory, there was a conscious revival of traditional decorative arts, but new techniques were often employed. This especially occurred in India and Morocco, where the retail success of an art object depended less on the local tradition than on the taste of the Europeans. What was romantic to a European, therefore, was no longer part of the world of the newly enriched and Europeanized Muslim. Much of the Europeanized architecture was drab and pretentious. The only real artistic accomplishment of this period was in the preservation and encouragement of the traditional techniques and designs of the decorative arts. The latter often had to be maintained artificially through government subsidies, for the local market, except in Morocco or India, was more easily seduced by second-rate European objects.

During the period of occupation it was questioned whether alien techniques necessarily brought with them new forms. This mood was clearly expressed in literature but less so in the visual arts, since the quality of Muslim art had deteriorated so much in the decades preceding European arrival that there was no longer a lively creative force to maintain. As various schools based on the École des Beaux-Arts in Paris were formed, however, the faculties and the students suffered from constant uncertainty as to whether they should preserve an art that was mostly artisanal or revolutionize it altogether.

20th-century currents

It is much more difficult to define in broad terms the characteristics of art in Muslim countries after the formation of independent countries in the 1940s and '50s. Extensive planning programs and building projects have been undertaken in even the poorest countries; and the wealthy Arab states, as well as pre-revolutionary Iran, transformed their traditional cities and countryside with spectacular modern complexes ranging from housing projects to universities. Many of these buildings were planned and constructed by Western firms and architects, and some are mere copies of European and American models, ill-adapted to the physical conditions and visual traditions of the Muslim world. Others are interesting and even sensitive projects: spectacular and technically innovative, such as the Intercontinental Hotel in Mecca (Frei and Otto) and the Haj Terminal of the King Abdul Aziz International Airport at Jidda, Saudi Arabia (the U.S. firm of Skidmore, Owings & Merrill); or intelligent and imaginative, such as the government buildings of Dhākā, Bangladesh (designed by the late Louis Kahn of the United States), or in the numerous buildings designed by the Frenchman André Ravereau in Mali or Algeria. Furthermore, within the Muslim world emerged several schools of architects that adopted modes of an international language to suit local conditions. The oldest of these schools are in Turkey, where architects such as Eldhem and Cansever, among many others, built highly successful works of art. Other major Muslim contributors to a contemporary Islāmic architecture are the Iranians Nader Ardalan and Kemzan Diba, the Iraqis Rifat Chaderji and Muhammad Makkiya, the Jordanian Rassem Badran, or the Bangladeshi Mazhar ul-Islam. Finally, a unique message was being transmitted by the visionary Egyptian architect Hassan Fathy, who, in eloquent and prophetic terms, urged that the traditional forms and techniques of vernacular architecture be studied and adapted to contemporary needs. Directly or indirectly, his work has inspired many young architects in the Muslim world and has led to a host of fascinating private houses, mosques, and educational facilities. The Aga Khan Award for Architecture was instituted to encourage genuine and contemporary architectural innovation in Muslim lands.

The results of dozens of new art schools and of a more enlightened patronage than during the 19th century are perhaps less spectacular in the other arts, and especially in painting. In spite of several interesting attempts to deal with calligraphy, with geometric designs, or with local folk arts, successes so far have not been clearly identified. But Turkey, Jordan, Egypt, Morocco, Iraq, Pakistan, and Indonesia all have produced talented artists.

EVALUATION

In order to evaluate and to understand a millenary artistic tradition spread over an area extending from Spain to India, the emphasis of this article has had to be on those features that relate the monuments to each other rather than on the myriad of characteristics that differentiate them. A few words about the latter are essential, however, for very soon after the formation of Islāmic culture (certainly by 1000), it seems clear that the nature of aesthetic impulses and of visual expectations began to vary. The question is one of determining what may be called the break-off points: the areas, moments, or forces that led to differentiations. One such point is the early 14th century, for almost everywhere in Islām artistic functions, forms, and techniques were renewed. And it is quite easy to separate the arts that followed the turn of the century from those that preceded it.

Importance of Iranian artistic traditions

Next to this chronological break-off, there are cultural ones, one might almost say ethnic ones, even though their ethnic association is often debatable. The clearest instance is that of Iran, whose artists and craftsmen, almost from the time of the first groups of Nīshāpūr ceramics, used distinctive techniques, styles, and especially subjects, many of which can be traced to pre-Islāmic times. The existence of a forceful Iranian personality in Islāmic art is self-evident, and its impact is found in almost all other subdivisions of the culture. Although it was not a single or even (until the 16th century) a politically or socially unified personality, it found uniqueness, possibly because it soon became (as early as in the 9th century) strongly conscious of its ancient past. The fact of that consciousness seems more important than the individual and on the whole scarce motifs it picked up from the past. A more curious example is that of the Ottomans and of the Arabs. For their ethnic past, in Central Asia and Arabia, respectively, played only a minor part in the formation of their art and was often intellectually rejected. At the same time and with notable exceptions, neither entity consistently sought models and ideas in the pre-Islāmic art of the region they had occupied. If they succeeded in creating an original artistic expression, it is in large part because of their success in creating a viable social order: the Ottoman imperial system of the 15th century, the urban order supported by military feudalism of Egypt, Syria, and North Africa. In these areas it is less a land than a society that provided the visual arts with their own distinctiveness, and it is only in recent years that Ottoman art began to be seen as Turkish and Mamlūk art as Arab. The case of India lies somewhere between the Iranian and Ottoman instances. Created by an imperial overlay on a powerful alien culture, it never entirely escaped the forms of the latter.

Thus, one can distinguish the following large cultural entities within Islāmic art: Ottoman, western Islāmic, Egypt and Fertile Crescent, Iran, India. They were all distinctive by the early 14th century. Detailed studies, of course, manage to find many additional subdivisions in time and space, and much mid-20th-century scholarship tended to work in those directions.

The unity of functions

Among the features that appear to unite these various traditions and especially to separate them collectively from other large artistic and cultural units is the unity of functions. There was created, in other words, an Islāmic religious and social function that is unique to Muslim lands. It was a diversified function, and its monuments are not alike in their forms. But they are alike in the human activity for which they were built. Limited in symbolic forms (*miḥrāb,* minaret, calligraphy as decoration), the Muslim function could be adapted to any architectural or ornamental tradition; and it was, not only in the cultures examined above, but in China, Indonesia, Africa—wherever Islām spread. The key concept here is that of a community of attitudes and of the uses of forms rather than of the making of forms.

There is a corollary to this conclusion that leads to the second level of an attempt to identify Islāmic visual arts as a whole; namely, that, as Islām limited its system of religious visual symbols, it developed a set of secular values. From the very beginning there occurred a major art of trade and of the city, as well as an art of the palace. More than any other culture and certainly earlier than any other, the Muslim world created a number of secular tastes and sponsored techniques of secular beautification. The result lies, on the one hand, in a striking succession of palaces from Khirbat al-Mafjar to the Alhambra or to Fatehpur Sīkri. It lies also in the impetus given to techniques of ceramics, textiles, and metalwork. These all tended to be the techniques of the artisan, and their importance lies not so much in the manufacture of an occasional object of art as in the raising of the level of quality of all industrial or decorative arts. This particular feature of the Islāmic tradition survived all political misfortunes. Remarkably beautiful objects were made as late as the early 19th century, and the techniques and traditions have often been revived in the 20th century with considerable success. Historically, Islāmic art became a sort of secular consciousness of artistic traditions elsewhere. Renaissance madonnas, for instance, were provided sometimes with halos containing Arabic inscriptions; bodies of saints were buried in Muslim cloth; Christian princes collected objects of Islāmic art; and *turquerie,* or Turkish themes, lay behind one of the styles of European decorative arts in the Baroque period of the 17th and 18th centuries. All this was possible also because the themes of Islāmic art almost never possessed the specificity of meaning that would make them unsuitable for use by others. Ambiguous in their abstraction of subjects and of styles, works of Islāmic art tended at times to the facile multiplication of known formulas. Yet again at this level, it was the user who determined the value of the form used.

The Islāmic visual vocabulary

All this is not to say that Islāmic art did not develop an internal visual vocabulary with a depth of its own. From the mosaics of the Umayyad Mosque of Damascus to the Alhambra or to certain Persian ceramics, one can determine the existence of concrete symbolic systems, royal and religious. It is even possible to see in the abstract arabesque or in certain uses of calligraphy attempts to express an early Muslim vision of the divine, while the glorious colour of Iranian mosques may reflect the more complex mystical thought of Shīʿism. There is no doubt that further research will provide many more examples of a meaningful visual symbolic system in the Muslim world. But in most instances that have already been studied—in particular Umayyad and Seljuq art—the remarkable point has been that such symbols did not last and that they were soon misunderstood or ignored. This refusal to be committed to visual symbols is reflected in the little that is known about Islāmic writing on art. It is only very incidentally that references are made to the value or meaning of visual expression; there are no theories on art, and even the religious injunctions against representations are a minute and almost incidental aspect of religious literature. Much more is known about individuals—ceramicists and metalworkers in early times, painters and architects in later times. The emphasis has always been on their technical skill, on their ability to do visual tricks, or on the speed and efficiency with which they created. The artist was regarded not as a prophet or a genius but as a technically equipped individual who succeeds in beautifying the surroundings of all men. It is in this manner that one can perhaps best define the Muslim artistic tradition: it avoided the conscious search for a unique masterpiece, and it did not build monuments for the eternal glory of God. It sought instead to please man and to make every moment of his life as attractive and enjoyable as possible. There is a hedonistic element in Islāmic art, therefore, but this hedonism is intellectually and emotionally mitigated by the conscious knowledge of the perishable character of all things human. In this fashion, Islāmic art seen as a whole is a curious paradox, for as it softened and embellished life's activities, it was created with destructible materials, thereby reiterating Islām's conviction that only God remains. (O.Gr.)

BIBLIOGRAPHY

Literature: JAMES KRITZECK (comp.), *Modern Islamic Literature: From 1800 to the Present* (1970), is a useful anthology of poetry and prose from different parts of the Muslim world. (*Arabic literature*): CARL BROCKELMANN, *Geschichte der arabischen Litteratur,* 2nd ed. (1943–49, and suppl., 1937–42), is the standard reference work containing information about almost every Arabic writer from pre-Islāmic to modern times. This work has been enlarged by FUAT SEZGĪN, *Geschichte des arabischen Schrifttums* (1967–), who has included many hitherto unknown books and manuscripts. R.A. NICHOLSON, *A Literary History of the Arabs,* 2nd ed. (1930, reprinted 1969), emphasizes poetry in the classical age; his *Studies in Islamic Poetry* (1921, reprinted 1963) contains the best analysis of al-Maʿarri's poetry. H.A.R. GIBB, *Arabic Literature,* 2nd rev. ed. (1963), is concise and informative; the German translation, *Arabische Literaturgeschichte* (1968), of Gibb's book has been enlarged by a section on modern Arabic literature by JACOB M. LANDAU and has an extensive bibliography on works of Islāmic literature translated into western European languages. GOTTHOLD WEIL, *Grundriss und System der altarabischen Metren* (1958), is an introduction to Arabic prosody. JOHANN FÜECK, *Arabiya: Untersuchungen zur arabischen Sprach- und Stilgeschichte* (1950), is an indispensable study of the development of a High Arabic style. GUSTAVE E. VON GRUNEBAUM, *Kritik und Dichtkunst: Studien zur arabischen Literaturgeschichte* (1955), contains essays on Arabic literature especially of the ʿAbbāsid period. Von Grunebaum's "Spirit of Islam as Shown in Its Literature," in his *Islam: Essays on the Nature and Growth of a Cultural Tradition,* 2nd ed. (1961, reprinted 1981), is an important essay mainly concerned with Ḥarīrī's *Maqāmāt,* and his "Acculturation as a Theme in Contemporary Arab Literature," in *Diogenes,* 39: 84–118 (1962), is a study on the problem of westernization in modern Arabic literature. ʿABDALQĀHIR AL-JURJĀNĪ, *Die Geheimnisse der Wortkunst* (*Asrār al-balāġa*) . . . (1959), is a German translation by HELLMUT RITTER of this classic on Arabic rhetoric. It is available also in the English translation, *The Mysteries of Eloquence,* ed. by HELLMUT RITTER (1954). ADOLF F. VON SCHACK, *Poesie und Kunst der Araber in Spanien und Sicilien,* 2nd ed., 2 vol. (1877), though often superseded by modern research, remains a charming introduction to the culture and art of Moorish Spain. U.M. DAUDPOTA, *The Influence of Arabic Poetry on the Development of Persian Poetry* (1934), attempts to show the formal influences of Arabic on early Persian poetry. ROGER ALLEN, *The Arabic Novel: An Historical and Critical Introduction* (1982), covers 1938–80. WOLFHART HEINRICHS, *Arabische Dichtung und griechische Poetik* (1969), is an important introduction to the literary criticism of classical Arabic literature.

(*Persian literature*): JAN RYPKA, *History of Iranian Literature* (1968; originally published in Czech, 1956), the standard work on Persian literature from its origins to the 20th century, includes folk literature and Tajik and Indo-Persian literature. See also CHARLES A. STOREY, *Persian Literature: A Bio-Bibliographical Survey,* 2 vol. in 4 (1970–72). EDWARD G. BROWNE, *A Literary History of Persia,* 4 vol. (1902–24, reprinted 1969–78), is an informative classic. A.J. ARBERRY, *Classical Persian Literature* (1958, reprinted 1967), is a classic work by one of the most prolific translators of Arabic and Persian poetry into English. ANTONINO PAGLIARO and ALESSANDRO BAUSANI, *Storia della letteratura Persiana* (1960), contains many interesting and unusual viewpoints. HERMANN ETHÉ, "Neupersische Literatur," and THEODOR NÖLDEKE, "Das iranische Nationalepos," in WILHELM GEIGER and ERNST KUHN (eds.), *Grundriss der iranischen Philologie,* vol. 2 (1896–1904, reprinted 1974), provides a masterly survey of classical Persian literature, including Indo-Persian. FRITZ M. MEIER (ed. and trans.), *Die schöne Mahsatī,* vol. 1 (1963), an immensely learned work centring around the poet Mahsatī, deals with the development of the *rubāʾī* and other forms of Persian poetry. HELLMUT RITTER, *Über die Bildersprache Nizāmīs* (1927), is the classic work on the imagery

in Neẓāmī's poetry. ANNEMARIE SCHIMMEL, *Stern und Blume* (1984), deals with imagery in Persian poetry. CHARLES H. DE FOUCHÉCOUR, *La Description de la nature dans la poésie lyrique persane du XI^e^ siècle* (1969), is a study of nature imagery in particular in early Persian poetry. FRIEDRICH RUCKERT, *Grammatik, Poetik und Rhetorik der Perser,* ed. by WILHELM PERTSCH (1874, reprinted 1966), a translation and commentary of a late Indo-Persian manual of rhetoric, is noted for its acute observations and amusing details. FINN THIESEN, *A Manual of Classical Persian Prosody* (1982), is an introduction to problems of Persian, as well as Turkish and Urdu, prosody.

(*Turkish literature*): E.J.W. GIBB, *A History of Ottoman Poetry,* 6 vol. (1900–09, reprinted 1958–67), the classical study of the historical developments of Turkish literature from its beginnings to 1900, includes many translations of poems. OTTO SPIES, *Die Türkische Prosa-literatur der Gegenwart* (1943), deals with Turkish prose after the revolution.

Music: "Bibliography of Asiatic Musics," in the MUSIC LIBRARY ASSOCIATION, *Notes,* 2nd series, vol. 5–6 (1947–49), an extensive bibliography compiled by five scholars, includes an important section on Islāmic music, with 592 references divided into categories dealing with music among Muslims in general, Arabic-speaking peoples, Turkic peoples, and Iranians and others. HENRY GEORGE FARMER, *A History of Arabian Music to the XIIIth Century* (1929, reprinted 1967), is still regarded as a key historical study. His "Music of Islam," in *The New Oxford History of Music,* vol. 1, pp. 421–77 (1957, reprinted 1966), is a good concise survey, as is PETER CROSSLEY-HOLLAND, "The Arabic World," in the *Pelican History of Music,* vol. 1, pp. 118–36 (1960, reprinted 1978). RODOLPHE VON ERLANGER (ed. and trans.), *La Musique Arabe,* 6 vol. (1930–59), includes French translations of the Arabic treatises by al-Fārābī, Avicenna, Ṣafī od-Dīn, and others (vol. 1–4) and devotes the last two volumes to an analytical study of contemporary Arabian music. CURT SACHS, *The Rise of Music in the Ancient World, East and West* (1943), has a large section on Arabic music in the context of an intercultural study. MEHDI BARKECHLI (ed.), *La Musique traditionnelle de l'Iran* (1963), gives a comprehensive musical transcription of the *Radīf* (modal systems of the Iranian traditional music). ADNAN SAYGUN, "La Musique Turque," in the *Encyclopédie de la Pléiade,* vol. 9, pp. 573–617 (1960); and ALEXIS CHOTTIN, *Tableau de la musique marocaine* (1939), discuss regional and local particularities and have useful bibliographies. AMNON SHILOAH, *Caractéristiques de l'art vocal arabe au moyen-âge* (1963), is an important essay on medieval Islāmic vocal music, and his *Theory of Music in Arabic Writings (c. 900–1900)* (1979), is an extensive analytical catalog of manuscripts and published sources on Arabic music. See also O. WRIGHT, *The Model System of Arab and Persian Music, A.D. 1250–1300* (1978), an analytical presentation of the system based on Persian and Arabic medieval treatises; KURT REINHARD and URSULA REINHARD, *Turquie* (1969), a comprehensive presentation of Turkish music in its diverse aspects; and ELLA ZONIS, *Classical Persian Music* (1973), a comprehensive historical study.

Dance and theatre: The classic work on the shadow play in the Middle East is still GEORG JACOB, *Geschichte des Schattentheaters im Morgan- und Abendland,* 2nd ed. (1925, reprinted 1972). METIN AND, *A History of Theatre and Popular Entertainment in Turkey* (1963–64), is a perceptive, scholarly account of the Turkish theatre in all its manifestations, and his *Pictorial History of Turkish Dancing* (1976) is an excellent study on the subject. CHRISTA URSULA SPULER, *Das türkische Drama der Gegenwart* (1968), treats in more detail 20th-century Turkish playwrights and theatrical literature. NICHOLAS N. MARTINOVICH, *The Turkish Theatre* (1933, reprinted 1968); and HELLMUT RITTER, *Karagös,* 3 vol. (1924–53), comprise translations of Turkish shadow plays into English and German, respectively. IGNACZ KUNOS, *Das türkische Volksschauspiel Orta ojnu* (1908), is an introduction to the *ortaoyunu* popular shows, with samples translated into German.

As for the Persian theatre and dance (mainly the latter), the most up-to-date book is MEDJID REZVANI, *Le Théâtre et la danse en Iran* (1962). PETER J. CHELKOWSKI (ed.), *Taʿziyeh: Ritual and Drama in Iran* (1979), is a collection of scholarly writings on the subject. CHARLES VIROLLEAUD, *Le Théâtre persan, ou le drama de Kerbéla* (1950), is a good sampling of *taʿziyah*s in French translation. The Arab theatre and dance (chiefly the former) are discussed in JACOB M. LANDAU, *Studies in the Arab Theater and Cinema* (1958), which also includes a detailed list of Arabic plays.

Visual arts: Among the numerous works dealing with Islāmic art as a whole, only one can be recommended as having a text of considerable merit—KATHARINA OTTO-DORN, *Kunst des Islam* (1964). An important, though partial, interpretation is found in TITUS BURCKHARDT, *Art of Islam: Language and Meaning* (1976). ALEXANDRE PAPADOPOULO, *Islam and Muslim Art* (1979, originally published in French, 1976), presents excellent photographic surveys. See also MILO CLEVELAND BEACH, *The Imperial Image: Paintings from the Mughal Court* (1981). K.A.C. CRESWELL, *A Bibliography of the Architecture, Arts and Crafts of Islam* (1961), with a supplement covering 1960–72 (1973), is a good bibliographical source; current literature on Islāmic art in all languages is surveyed in the *Abstracta Islamica,* published as an annual supplement to the *Revue des Études Islamiques* in Paris. Textual information about the arts has never been properly gathered. For a typical text on painters, see QĀDĪ AḤMAD, *Calligraphers and Painters,* trans. from the Persian by VLADIMIR MINORSKY (1959). The only lists of artists have been collected by LEO A. MAYER in several books, of which the most important are *Islamic Metalworkers and Their Works* (1959) and *Islamic Architects and Their Works* (1956). The vast majority of material on Islāmic art is to be found in periodicals rather than in books. The three publications that have dealt or deal systematically with all aspects of Islāmic art are *Ars Islamica* (irregular, 1934–51; reprinted in 16 vol., 1968), *Ars Orientalis* (irregular from 1954), and *Kunst des Orients* (annual from 1950). Articles are published in English, French, and German.

Area surveys: (*Spain*): MANUEL GÓMEZ-MORENO, *El arte árabe español hasta los almohades y arte mozárabe* (1951); and LEOPOLDO TORRES BALBÁS, *Arte almohade; arte nazarí; arte mudéjar* (1949). (*North Africa*): There is no recent general work dealing with all the arts; for architecture the indispensable manual is that of GEORGES MARÇAIS, *L'Architecture musulmane d'Occident* (1955), which deals also with Spain. (*Egypt*): DIETRICH BRANDENBURG, *Islamische Baukunst in Ägypten* (1966), is a convenient summary but does not supersede the exhaustive work of K.A.C. CRESWELL, *Muslim Architecture of Egypt,* 2 vol. (1952–59, reprinted 1979), going only up to the middle of the 14th century; and LOUIS HAUTECOEUR and GASTON WIET, *Les Mosquées du Caire,* 2 vol. (1932). A useful periodical is the *Journal of the American Research Center in Egypt.* (*Palestine, Syria*): There are no coherent works dealing with the whole area; JEAN SAUVAGET, *Alep* (1941), is a model (in French) of what can be done with a single city over the centuries; key journals are *Syria* (quarterly), *Levant* (annual), and *Quarterly of the Department of Antiquities in Palestine* (until 1950, when it was superseded in part by the annual publication of the Department of Antiquities of Jordan), and *Annales Archéologiques de Syrie* (annual). (*Iraq and upper Mesopotamia*): The main archaeological source is still FRIEDRICH SARRE and ERNST HERZFELD, *Archäologische Reise im Euphrat- und Tigris-Gebiet,* 4 vol. (1911–20); a model of archaeological history is ROBERT M. ADAMS, *Land Behind Baghdad* (1965). The main journals are *Sumer* (annual) and *Iraq* (semiannual). (*Anatolia*): ESIN ATIL (ed.), *Turkish Art* (1980), covers all fields evenly and has a good bibliography; see also YANNI PETSOPOULOS (ed.), *Tulips, Arabesques and Turbans: Decorative Arts from the Ottoman Empire* (1982). EKREM AKURGAL (ed.), *The Art and Architecture of Turkey* (1980), is a historical treatment of major and minor arts. The principal journals are *Anatolica* (annual) and *Anatolian Studies* (annual). (*Iran*): Nothing has superseded ARTHUR UPHAM POPE and PHYLLIS ACKERMAN (eds.), *A Survey of Persian Art from Prehistoric Times to the Present,* 3rd ed. (1977–). One may also consult ANDRÉ GODARD, *The Art of Iran* (1965, originally published in French, 1962); and the chapters by OLEG GRABAR in *The Cambridge History of Iran,* "The Visual Arts," vol. 4, pp. 329–63 (1975), and "The Visual Arts, 1050–1350," vol. 5, pp. 626–58 (1968). Important information is to be found in HANS E. WULFF, *The Traditional Crafts of Persia* (1966); and in several works by ARTHUR UPHAM POPE, such as *Persian Architecture* (1965). Periodicals of importance are the defunct *Athār-é Īrān* (1936–49), the *Bulletin of the American Institute for Persian Art and Archaeology,* and *Iran* (annual), the active journal of the British School. (*India*): Among several architectural surveys, PERCY BROWN, *Indian Architecture,* vol. 2, *The Islamic Period,* 6th ed. (1971), is the best. See also R. NATH, *History of Sultanate Architecture* (1978), and *History of Mughal Architecture* (1982); WAYNE E. BEGLEY, "Myth of the Taj Mahal and a New Theory of Its Symbolic Meaning," *The Art Bulletin,* 61:7–37 (March 1979); and ELIZABETH B. MOYNIHAN, *Paradise as a Garden* (1979).

Techniques: (*Architecture*): JOHN D. HOAG, *Islamic Architecture* (1976); GEORGE MICHELL (ed.), *Architecture of the Islamic World: Its History and Social Meaning* (1978); and NADER ARDALAN and LALEH BAKHTIAR, *The Sense of Unity: The Sufi Tradition in Persian Architecture* (1973, reprinted 1979). (*Painting*): RICHARD ETTINGHAUSEN, *Arab Painting* (1962); BASIL GRAY, *Persian Painting from Miniatures of the XIII–XVI Centuries* (1947); and DOUGLAS E. BARRETT and BASIL GRAY, *Painting of India* (1963, reissued 1978 as *Indian Painting*). See also OLEG GRABAR, *The Illustrations of the Maqamat* (1984). (*Metalwork*): EVA BAER, *Metalwork in Medieval Islamic Art* (1983); ASSADULLAH SOUREN MELIKIAN-CHIRVANI, *Islamic Metalwork from the Iranian World, 8–18th Centuries* (1982); and

JAMES W. ALLAN, *Islamic Metalwork: The Nuhad Es-Said Collection* (1982). The field owes much to the work of the late D.S. RICE: "Studies in Islamic Metalwork," *Bulletin of the School of Oriental and African Studies, University of London,* vol. 14–16 (1952–57); "Inlaid Brasses from the Workshop of Aḥmad al-Dhakī al-Mawṣilī," *Ars Orientalis,* 2:283–326 (1957); *The Wade Cup in the Cleveland Museum of Art* (1955); and *Le Baptistère de Saint Louis* (1951). See also RICHARD ETTINGHAUSEN, "The Wade Cup . . . ," *Ars Orientalis,* 2:327–366 (1957). (*Ceramics*): The key studies are ARTHUR LANE, *Early Islamic Pottery* (1947, reprinted 1965), and *Later Islamic Pottery,* 2nd ed. (1971). (*Carpets*): Among scholarly studies on carpets are those of KURT ERDMANN, especially *Oriental Carpets* (1960, reissued 1976; originally published in German, 2nd ed., 1960), and *Seven Hundred Years of Oriental Carpets* (1970; originally published in German, 1966). (*Ivories*): JOHN BECKWITH, *Caskets from Cordoba* (1960), is a scholarly study of Moorish ivory work. In addition, see ERNST KÜHNEL, *Die islamischen Elfenbeinskulpturen, VIII.–XIII. Jahrhundert* (1971).

Historical works: (*Early period*): Most of the problems are summarized in OLEG GRABAR, *The Formation of Islamic Art* (1973). For architecture the main books are K.A.C. CRESWELL, *Early Muslim Architecture* (vol. 1, 2nd ed., 1969; vol. 2, 1941; reissued 1979, 2 vol. in 3); R.W. HAMILTON, *Khirbat al-Mafjar* (1959); and JEAN SAUVAGET, *La Mosquée omeyyade de Médine* (1947). (*Middle period*): On the Faṭimids, see RICHARD ETTINGHAUSEN, "Painting in the Fatimid Period," *Ars Islamica,* 9:112–124 (1942). On the Seljuqs, for Iran, in addition to vol. 4 of *The Cambridge History of Iran,* see RICHARD ETTINGHAUSEN, "Some Comments on Medieval Iranian Art," *Artibus Asiae,* 31:276–300 (1969); for Syria and Egypt, one should consult ERNST HERZFELD, "Damascus," *Ars Islamica,* vol. 9–12 (1942–51); and JEAN SAUVAGET *et al., Les Monuments Ayyoubides de Damas,* 4 vol. (1938–50); and for Anatolia, KURT ERDMANN, *Das anatolische Karavansaray des 13 Jahrhunderts,* 3 vol. (1961–76). Major monuments are discussed by RICHARD ETTINGHAUSEN in "The Bobrinski Kettle," *Gazette des Beaux-Arts,* 24:193–208 (1943); "The Iconography of a Kāshān *Luster* Plate," *Ars Orientalis,* 4:25–64 (1961); "The Flowering of Seljuq Art," *Metropolitan Museum Journal,* 3:113–131 (1970); and ASSADULLAH SOUREN MELIKIAN-CHIRVANI (ed.), *Le Roman de "Varge et Golšâh"* (1970). Newer interpretations of the Alhambra are based on FREDERICK P. BARGEBUHR, *The Alhambra* (1968; originally published in Spanish, 1966); see also OLEG GRABAR, *The Alhambra* (1978). ESIN ATIL, *Renaissance of Islam* (1981), is a comprehensive study of Mamlūk art; see also SALEH L. MOSTAFA, *Kloster und Mausoleum des Farağ ibn Barqūq in Kairo* (1968). For Mongol architecture, see DONALD N. WILBER, *The Architecture of Islamic Iran: The Il Khānid Period* (1955, reprinted 1969); LISA GOLOMBEK, *The Timurid Shrine at Gazur Gah* (1969); and various accounts in the annual *Iran.* For painting, see ERNST J. GRUBE, *The Classical Style in Islamic Painting* (1968), but especially the rich volume of IVAN STCHOUKINE, *Les Peintures des manuscrits tîmûrides* (1954); and M.S. IPSIROGLU, *Painting and Culture of the Mongols* (1966; originally published in German, 1965). See also OLEG GRABAR and SHEILA BLAIR, *Epic Images and Contemporary History: The Illustrations of the Great Mongol Shahnama* (1980). (*Late period*): For Ottoman architecture, GODFREY GOODWIN, *A History of Ottoman Architecture* (1971); and APTULLAH KURAN, *The Mosque in Early Ottoman Architecture* (1968), supersede all previous work. Painting is covered in NURHAN ATASOY and FILIZ ÇAĞMAN, *Turkish Miniature Painting* (1974). For ceramics, see ARTHUR LANE, "The Ottoman Pottery of Isnik," *Ars Orientalis,* 2:247–282 (1957). For Ṣafavid architecture, see DONALD N. WILBER, *Persian Gardens and Garden Pavilions,* 2nd ed. (1979); RENATA HOLOD (ed.), *Studies on Isfahan* (1974); EUGENIO GALDIERI, *Eṣfahān, ʿAli Qāpū: An Architectural Survey* (1979); MARTIN BERNARD DICKSON and STUART C. WELCH (eds.), *The Houghton Shahnameh* (1981); and ANTHONY WELCH, *Artists for the Shah: Late Sixteenth-Century Painting at the Imperial Court of Iran* (1976). The most important publications on painting are both by IVAN STCHOUKINE, *Les Peintures des manuscrits Safavīs de 1502 à 1587* (1959), and *Les Peintures des manuscrits de Shāh ʿAbbās I^{er} à la fin des Safavīs* (1964). The principal work on India is STUART C. WELCH, *The Art of Mughal India* (1963, reprinted 1976). For contemporary architecture see RENATA HOLOD (ed.), *Architecture and Community* (1983), and the quarterly journal *Mimar,* published in Singapore.

(An.Sc./A.Sh./J.M.L./O.Gr.)

The Islāmic World

Adherence to Islām is a global phenomenon: Muslims predominate in some 30 to 40 countries, from the Atlantic to the Pacific and along a belt that stretches across northern Africa to the southern borders of the Soviet Union and the northern regions of the Indian subcontinent. Arabs account for fewer than one-fifth of all Muslims, more than half of whom live east of Karāchi, Pak. Despite the absence of large-scale Islāmic political entities, the Islāmic faith continues to expand, by some estimates faster than any other major religion.

The Muslim religion and the life of the Prophet Muḥammad are treated specifically in the article ISLĀM, MUḤAMMAD AND THE RELIGION OF. The literature, music, dance, and visual arts of Muslim peoples are treated in the article ISLĀMIC ARTS. Islām is also discussed in articles on individual countries or on regions in which the religion is a factor, such as EGYPT, IRAN, ARABIA, and NORTH AFRICA. Articles on individual branches or sects and concepts are found in the *Micropædia.* See, for example, AMERICAN MUSLIM MISSION; SUNNĪ; ḤADĪTH.

A very broad perspective is required to explain the history of today's Islāmic world. This approach must enlarge upon conventional political or dynastic divisions to draw a comprehensive picture of the stages by which successive Muslim communities, throughout Islām's 14 centuries, encountered and incorporated new peoples so as to produce an international religion and civilization.

In general, events in this article are dated according to the Gregorian calendar and eras are designated BCE (before the Common Era or Christian Era) and CE (Common Era or Christian Era), equivalent to BC (before Christ) and AD (Latin anno Domini). In some cases the Muslim reckoning of the Islāmic era is used, indicated by AH (Latin anno Hegirae). The Islāmic era begins with the date of Muḥammad's emigration (*hijrah*) to Medina, which corresponds to July 16, 622, in the Gregorian calendar. The term Islāmic refers to Islām as a religion. The term Islāmicate refers to the social and cultural complex historically associated with Islām and the Muslims, even when found among non-Muslims. Islāmdom refers to that complex of societies in which the Muslims and their faith have been prevalent and socially dominant.

The article is divided into the following sections:

Prehistory (c. 3000 BCE–CE 500)

The prehistory of Islāmdom is the history of central Afro-Eurasia from Hammurabi of Babylon to the Achaemenid Cyrus II in Persia to Alexander the Great to the Sāsānian emperor Nūshīrvān to Muḥammad in Arabia; or, in a Muslim view, from Adam to Noah to Abraham to Moses to Jesus to Muḥammad. The potential for Muslim empire building was established with the rise of the earliest civilizations in western Asia. It was refined with the emergence and spread of what have been called the region's Axial Age religions—Abrahamic, centred on the Hebrew patriarch Abraham, and Mazdean, focused on the Iranian deity Ahura Mazdāh—and their later relative, Christianity. It was facilitated by the expansion of trade from eastern Asia to the Mediterranean, and by the political changes thus effected. The Muslims were heirs to the ancient Egyptians, Babylonians, Persians, Hebrews, even the Greeks and Indians; the societies they created bridged time and space, from ancient to modern and from east to west.

THE RISE OF AGRARIAN-BASED CITIED SOCIETIES

In the 7th century CE a coalition of Arab groups, some sedentary and some migratory, inside and outside the Arabian Peninsula, seized political and fiscal control in western Asia, specifically of the lands between the Nile and Oxus (Amu Darya) rivers—territory formerly controlled by the Byzantines in the west and the Sāsānians in the east. The factors that surrounded and directed their accomplishment had begun to coalesce long before, with the emergence of agrarian-based citied societies in western Asia in the 4th millennium BCE. The rise of complex agrarian-based societies, such as Sumer, out of a subsistence agricultural and pastoralist environment, involved the founding of cities, the extension of citied power over surrounding villages, and the interaction of both with pastoralists.

This type of social organization offered new possibilities. Agricultural production and intercity trading, particularly in luxury goods, increased. Some individuals were able to take advantage of the manual labour of others to amass enough wealth to patronize a wide range of arts and crafts; of these, a few were able to establish territorial monarchies and foster religious institutions with wider appeal. Gradually the familiar troika of court, temple, and market emerged. The new ruling groups cultivated skills for administering and integrating non-kin-related groups. They benefited from the increased use of writing and, in many cases, from the adoption of a single writing system, such as the cuneiform, for administrative use. New institutions, such as coinage, territorial deities, royal priesthoods, and standing armies, further enhanced their power.

Court, temple, and market

In such town-and-country complexes the pace of change quickened enough so that a well-placed individual might see the effects of his actions in his own lifetime and be stimulated to self-criticism and moral reflection of an unprecedented sort. The religion of these new social entities reflected and supported the new social environments. Unlike the religions of small groups, the religions of complex societies focused on deities, such as Marduk, Isis, or Mithra, whose appeal was not limited to one small area or group and whose powers were much less fragmented. The relationship of earthly existence to the afterlife became more problematic, as evidenced by the elaborate death rites of Pharaonic Egypt. Individual religious action began to compete with communal worship and ritual; sometimes it promised spiritual transformation and transcendence of a new sort, as illustrated in the pan-Mediterranean mystery religions. Yet large-scale organization had introduced social and economic injustices that rulers and religions could address but not resolve. To many, an absolute ruler uniting a plurality of ethnic, religious, and interest groups offered the best hope of justice.

CULTURAL CORE AREAS OF THE SETTLED WORLD

By the middle of the 1st millennium BCE the settled world had crystallized into four cultural core areas: Mediterranean, Nile-to-Oxus, Indic, and East Asian. The Nile-to-Oxus, the future core of Islāmdom, was the least cohesive and the most complicated. Whereas each of the other regions developed a single language of high culture—Greek, Sanskrit, and Chinese, respectively—the Nile-to-Oxus region was a linguistic palimpsest of Irano-Semitic languages of several sorts: Aramaic, Syriac (eastern or Iranian Aramaic), and Middle Persian (the language of eastern Iran).

The Nile-to-Oxus region. The Nile-to-Oxus region differed in climate and ecology, too. It lay at the centre of a vast arid zone stretching across Afro-Eurasia from the Sahara to the Gobi; it favoured those who could deal with aridity—not only states that could control flooding (as in Egypt), or maintain irrigation (as in Mesopotamia), but also pastoralists and oasis dwellers. Although its agricultural potential was severely limited, its commercial possibilities were virtually unlimited. Located at the crossroads of the trans-Asian trade and blessed with numerous natural transit points, the region offered special social and economic prominence to its merchants.

The period from 800 to 200 BCE has been called the Axial Age because of its pivotal importance for the history of religion and culture. The world's first religions of salvation developed in the four core areas. From these traditions, for example, Judaism, Mazdeism, Buddhism, and Confucianism, derived all later forms of high religion, including Christianity and Islām. Unlike the religions that surrounded their formation, the Axial Age religions concentrated transcendent power into one locus, be it symbolized theistically or nontheistically. Their radically dualistic cosmology posited another realm, totally unlike the earthly realm and capable of challenging and replacing ordinary earthly values. The individual was challenged to adopt the right relationship with that "other" realm, so as to transcend mortality by earning a final resting place, or to escape the immortality guaranteed by rebirth by achieving annihilation of earthly attachment.

The Abrahamic and Mazdean traditions

In the Nile-to-Oxus region two major traditions arose during the Axial Age: the Abrahamic in the west and the Mazdean in the east. Because they required exclusive allegiance through an individual confession of faith in a just and judging deity, they are called confessional religions. The god of these religions was a unique all-powerful creator who remained active in history; and each event in the life of every individual was meaningful in terms of the judgment of God at the end of time. The universally applicable truth of these new religions was expressed in sacred writings. The traditions reflected the mercantile environment in which they were formed in their special concern for fairness, honesty, covenant keeping, moderation, law and order, accountability, and the rights of ordinary human beings. These values were always potentially incompatible with the elitism and absolutism of courtly circles. Most often, as for example in the case of the Achaemenid Empire, the conflict was expressed in rebellion against the crown or was adjudicated by viewing kingship as the guarantor of divine justice.

Although modern Western historiography has projected an East–West dichotomy onto ancient times, Afro-Eurasian continuities and interactions were well established by the Axial Age and persisted throughout premodern times. The history of Islāmdom cannot be understood without reference to them. Through Alexander's conquests in the 4th century BCE in three of the four core areas, the Irano-Semitic cultures of the Nile-to-Oxus region were permanently overlaid with Hellenistic elements, and a link was forged between the Indian subcontinent and Iran. By the 3rd century CE, crosscutting movements like Gnosticism and Manichaeism integrated individuals from disparate cultures. Similarly organized large, land-based empires with official religions existed in all parts of the settled world. The Christian Roman Empire was locked in conflict with its counterpart to the east, the Zoroastrian–Mazdean Sāsānian Empire. Another Christian empire in East Africa, the Abyssinian, was involved alternately with each of the others. In the context of these regional interrelationships inhabitants of Arabia made their fateful entrance into international political, religious, and economic life.

The Arabian Peninsula. The Arabian Peninsula consists of a large central arid zone punctuated by oases, wells, and small seasonal streams and bounded in the south by well-watered lands that are generally thin, sometimes mountainous coastal strips. To the north of the peninsula are the irrigated agricultural areas of Syria and Iraq, the site of large-scale states from the 4th millennium BCE. As early as the beginning of the 1st millennium BCE the southwest corner of Arabia, the Yemen, also was divided into settled kingdoms. Their language was a South Arabian Semitic dialect and their culture bore some affinity to Semitic societies in the Fertile Crescent. By the beginning of the Common Era (the 1st century AD in the Christian calendar) the major occupants of the habitable parts of the arid centre were known as Arabs. They were Semitic-speaking tribes of settled, semi-settled, and fully migratory peoples who drew their name and apparently their identity from what the camel-herding Bedouin pastoralists among them called themselves: *ʿarab.*

The Arab tribes

Until the beginning of the 3rd century of the Common Era the greatest economic and political power in the peninsula rested in the relatively independent kingdoms of the Yemen. The Yemenis, with a knowledge of the monsoon winds, had evolved an exceptionally long and profitable trade route from East Africa across the Red Sea and from India across the Indian Ocean up through the peninsula into Iraq and Syria, where it joined older Phoenician routes across the Mediterranean and into the Iberian Peninsula. Their power depended on their ability to protect islands discovered in the Indian Ocean and to control the straits of Hormuz and Aden as well as the Bedouin caravanners who guided and protected the caravans that carried the trade northward to Arab entrepôts like Petra and Palmyra. Participation in this trade was in turn an important source of power for tribal Arabs, whose livelihood otherwise depended on a combination of intergroup raiding, agriculture, and animal husbandry.

By the 3rd century, however, external developments began to impinge. In 226 Ardashīr I founded the Sāsānian Empire in Fars; within 70 years the Sāsānian state was at war with Rome, a conflict that was to last up to Islāmic times. The reorganization of the Roman Empire under Constantine the Great, with the adoption of a new faith, Christianity, and a new capital, Constantinople, exacerbated the competition with the Sāsānian Empire and resulted in the spreading of Christianity into Egypt and Abyssinia and the encouraging of missionizing in Arabia itself. There Christians encountered Jews who had been settling since the 1st century, as well as Arabs who had converted to Judaism. By the beginning of the 4th century the rulers of Abyssinia and Ptolemaic Egypt were interfering in the Red Sea area and carrying their aggression into the Yemen proper. In the first quarter of the 6th century the proselytizing efforts of a Jewish Yemeni ruler resulted in a massacre of Christians in the major Christian centre of Najrān. This event invited Abyssinian Christian reprisal and occupation, which put a virtual end to indigenous control of the Yemen. In conflict with the Byzantines, the Zoroastrian–Mazdean Sāsānians invaded Yemen toward the end of the 6th century, further expanding the religious and cultural horizons of Arabia, where membership in a religious community could not be apolitical and could even have international ramifications. The connection between communal affiliation and political orientations would be expressed in the early Muslim community and in fact has continued to function to the present day.

The long-term result of Arabia's entry into international politics was paradoxical: it enhanced the power of the tribal Arabs at the expense of the "superpowers." Living in an ecological environment that favoured tribal independence and small-group loyalties, the Arabs had never established lasting large-scale states, only transient tribal confederations. By the 5th century, however, the settled powers needed their hinterlands enough to foster client states: the Byzantines oversaw the Ghassānid kingdom; the Persians oversaw the Lakhmid; and the Yemenis (prior to the Abyssinian invasion) had Kindah. These relationships increased Arab awareness of other cultures and religions; and the awareness seems to have stimulated internal Arab cultural activity, especially the classical Arabic, or *muḍarī,* poetry, for which the pre-Islāmic Arabs are so famous. In the north, Arabic speakers were drawn into the imperial administrations of the Romans and Sāsānians; soon certain settled and semi-settled Arabs spoke and wrote Aramaic or Persian as well as Arabic, and some Persian or Aramaic speakers could speak and write Arabic. The prosperity of the 5th and 6th centuries, as well as the intensification of imperial rivalries in the late 6th century, seems to have brought the Arabs of the interior permanently into the wider network of communication that fostered the rise of the Muslim community at Mecca and Medina.

Formation and orientation (c. 500–634)

THE CITY OF MECCA: CENTRE OF TRADE AND RELIGION

Although the 6th-century client states were the largest Arab polities of their day, it was not from them that a permanently significant Arab state arose. Rather, it emerged among independent Arabs living in Mecca (Makkah) at the junction of major north–south and west–east routes, in one of the less naturally favoured Arab settlements of the Hejaz (al-Ḥijāz). The development of a trading town into a city-state was not unusual; but unlike many other western Arabian settlements, Mecca was not centred on an oasis or located in the hinterland of any non-Arab power. Although it had enough well water and springwater to provide for large numbers of camels, it did not have enough for agriculture; its economy depended on long-distance as well as short-distance trade.

Mecca under the Quraysh clans. Around the year 400 CE Mecca had come under the control of a group of Arabs who were in the process of becoming sedentary; they were known as Quraysh and were led by a man remembered as Quṣayy. During the generations before Muḥammad's birth in about 570, the several clans of the Quraysh fostered a development in Mecca that seems to have been occurring in a few other Arab towns as well. They used their trading connections and their relationships with their Bedouin cousins to make their town a regional centre whose influence radiated in many directions. They designated Mecca as a quarterly *ḥaram,* a safe haven from the intertribal warfare and raiding that was endemic among the Bedouin. Thus Mecca became an attractive site for large trade fairs that coincided with pilgrimage (*ḥajj*) to a local shrine, the Kaʿbah. The Kaʿbah housed the deities of visitors as well as the Meccans' supra-tribal creator and covenant-guaranteeing deity, called Allāh. Most Arabs probably viewed this deity as one among many, possessing powers not specific to a particular tribe; others may have identified this figure with the God of the Jews and Christians.

Quarterly haven at Mecca

The building activities of the Quraysh threatened one non-Arab power enough to invite direct interference: the Abyssinians are said to have invaded Mecca in the year of Muḥammad's birth. But the Byzantines and Sāsānians were distracted by internal reorganization and renewed conflict; simultaneously the Yemeni kingdoms were declining. Furthermore, these shifts in the international balance of power may have dislocated existing tribal connections enough to make Mecca an attractive new focus for supra-tribal organization, just as Mecca's equidistance from the major powers protected its independence and neutrality.

The Meccan link between shrine and market has a broader significance in the history of religion. It is reminiscent of changes that had taken place with the emergence of complex societies across the settled world several

Changes in religion: the sharing of deities

millennia earlier. Much of the religious life of the tribal Arabs had the characteristics of small-group, or "primitive," religion, including the sacralization of group-specific natural objects and phenomena and the multifarious presence of spirit beings, known among the Arabs as *jinn.* Where more complex settlement patterns had developed, however, widely shared deities had already emerged, such as the "trinity" of Allāh's "daughters" known as al-Lāt, Manāt, and al-ʿUzzāh. Such qualified simplification and inclusivity, wherever they have occurred in human history, seem to have been associated with other fundamental changes—increased settlement, extension and intensification of trade, and the emergence of lingua francas and other cultural commonalties, all of which had been occurring in central Arabia for several centuries.

New social patterns among the Meccans and their neighbours. The sedentation of the Quraysh and their efforts to create an expanding network of cooperative Arabs generated social stresses that demanded new patterns of behaviour. The ability of the Quraysh to solve their problems was affected by an ambiguous relationship between sedentary and migratory Arabs. Tribal Arabs could go in and out of sedentation easily, and kinship ties often transcended life-styles. The sedentation of the Quraysh did not involve the destruction of their ties with the Bedouin or their idealization of Bedouin life. Thus, for example, did wealthy Meccans, thinking Mecca unhealthy, often send their infants to Bedouin foster mothers. Yet the settling of the Quraysh at Mecca was no ordinary instance of sedentation. Their commercial success produced a society unlike that of the Bedouin and unlike that of many other sedentary Arabs. Whereas stratification was minimal among the Bedouin, a hierarchy based on wealth appeared among the Quraysh. Although a Bedouin group might include a small number of outsiders, such as prisoners of war, Meccan society was markedly diverse, including non-Arabs as well as Arabs, slave as well as free. Among the Bedouin, lines of protection for in-group members were clearly drawn; in Mecca, sedentation and socioeconomic stratification had begun to blur family responsibilities and foster the growth of an oligarchy whose economic objectives could easily supersede other motivations and values. Whereas the Bedouin acted in and through groups, and even regularized intergroup raiding and warfare as a way of life, Meccans needed to act in their own interest and to minimize conflict by institutionalizing new, broader social alliances and interrelationships. The market–shrine complex encouraged surrounding tribes to put aside their conflicts periodically and to visit and worship the deities of the Kaʿbah; but such worship, as in most complex societies, could not replace either the particularistic worship of small groups or the competing religious practices of other regional centres, such as aṭ-Ṭā'if.

Very little in the Arabian environment favoured the formation of stable, large-scale states. Therefore, Meccan efforts at centralization and unification might well have been transient, especially because they were not reinforced by any stronger power and because they depended almost entirely on the prosperity of a trade route that had been formerly controlled at its southern terminus and could be controlled elsewhere in the future, or exclude Mecca entirely. The rise of the Meccan system also coincided with the spread of the confessional religions, through immigration, missionization, conversion, and foreign interference. Alongside members of the confessional religions, unaffiliated monotheists, known as *ḥanīf*s, distanced themselves from the Meccan religious system by repudiating the old gods but embracing neither Judaism nor Christianity. Eventually in Mecca and elsewhere a few individuals came to envision the possibility of effecting supra-tribal association through a leadership role common to the confessional religions, that is, prophethood or messengership. The only such individual who succeeded in effecting broad social changes was a member of the Hāshim (Hāshem) clan of Quraysh named Muḥammad ibn ʿAbd Allāh ibn ʿAbd al-Muṭṭalib. One of their own, he accomplished what the Quraysh had started, first by working against them, later by working with them. When he was born, around 570, the potential for pan-Arab unification seemed nil; but after he died, in 632, the first generation of his followers were able not only to maintain pan-Arab unification but to expand far beyond the peninsula.

Concept of social unity through shared deity

THE PROPHET MUḤAMMAD

Muḥammad's years in Mecca. *Spiritual awakening.* Any explanation of such an unprecedented development must include an analysis not only of Muḥammad's individual genius but also of his ability to articulate an ideology capable of appealing to multiple constituencies. His approach to the role of prophet allowed a variety of groups to conceptualize and form a single community. Muḥammad was, according to many students of social behaviour, particularly well placed to lead such a social movement; in both ascribed and acquired characteristics he was unusual. Although he was a member of a high-status tribe, he belonged to one of its less well-placed clans. He was fatherless at birth; his mother and grandfather died when he was young, leaving him under the protection of an uncle. Although he possessed certain admirable personality traits to an unusual degree, his commercial success derived not from his own status but from his marriage to a much older woman, a wealthy widow named Khadījah. During the years of his marriage, his personal habits grew increasingly atypical; he began to absent himself in the hills outside Mecca to engage in the solitary spiritual activity of the *ḥanīf*s. At age 40, while on retreat, he saw a figure, whom he later identified as the angel Gabriel, who forced him to repeat these words: "Recite: In the name of God, the Merciful and Compassionate. Recite: And your Lord is Most Generous. He teaches by the pen, teaches man what he knew not." Although a few individuals, including his wife Khadījah, recognized his experience as that of a messenger of God, the contemporary religious life of most of the Meccans and the surrounding Arabs did not prepare them to share in this recognition easily.

Muḥammad's first recitation

Arabs did recognize several other types of intermediaries with the sacred. Some of the kings of the Yemen are said to have had priestly functions; and tribal leaders, *shaykh*s, in protecting their tribes' hallowed custom (*sunnah*), had a spiritual dimension. Tribal Arabs also had their *kāhin*s, religious specialists who delivered oracles in ecstatic rhymed prose (*sajʿ*) and read omens. They also had their *shā'ir*s, professionally trained oral poets who defended the group's honour, expressed its identity, and engaged in verbal duels with the poets of other groups. The power of the recited word was well established; the poets' words were even likened to arrows that could wound the unprotected enemy. Because Muḥammad's utterances seemed similar, at least in form, to those of the *kāhin*s, many of his hearers naturally assumed that he was one of the figures with whom they were more familiar. Indeed, Muḥammad might not even have attracted attention had he not sounded like other holy men; but by eschewing any source other than the one supreme being, whom he identified as Allāh ("the god") and whose message he regarded as cosmically significant and binding, he was gradually able to distinguish himself from all other intermediaries. Like many successful leaders Muḥammad broke through existing restraints by what might be called transformative conservatism. By combining familiar leadership roles with a less familiar one, he expanded his authority; by giving existing practices a new history, he reoriented them; by assigning a new cause to existing problems, he resolved them. His personal characteristics fit his historical circumstances perfectly.

Early reactions to Muḥammad's preachings

Public recitations. Muḥammad's first vision was followed by a brief lull, after which he began to hear messages frequently, entering a special physical state to receive them and returning to normalcy to deliver them orally. Soon he began publicly to recite warnings of an imminent reckoning by Allāh that disturbed the Meccan leaders. Muḥammad was one of their own, a man respected for his personal qualities. Yet weakening kinship ties and increasing social diversity were helping him attract followers from many different clans and also from among tribeless persons, giving all of them a new and potentially disruptive affiliation. The fundamentals of his message, delivered often in the vicinity of the Kaʿbah itself, questioned the very reasons for which so many people gathered there. If visitors to the Kaʿbah assumed, as so many Arabs did, that the deities represented by its idols were all useful and accessible in that place, Muḥammad spoke, as had Axial Age figures before, of a placeless and timeless deity that not only had created human beings, making them dependent on him, but would also bring them to account at an apocalypse of his own making. In place of time or chance, which the Arabs assumed to govern their destiny, Muḥammad installed a final reward or punishment based on individual actions. Such individual accountability to an unseen power that took no account whatsoever of kin relationships and operated beyond the Meccan system could, if taken seriously, undermine any authority the Quraysh had acquired. Muḥammad's insistence on the protection of the weak, which echoed Bedouin values, threatened the unbridled amassing of wealth so important to the Meccan oligarchy.

Efforts to reform Meccan society. Yet Muḥammad also appealed to the town dweller by describing the human being as a member of a polis (city-state) and by suggesting ways to overcome the inequities that such an environment breeds. By insisting that an event of cosmic significance was occurring in Mecca, he made the town the rival of all the greater cities with which the Meccans traded. To Meccans who believed that what went on in their town and at their shrine was hallowed by tribal custom, *sunnah,* Muḥammad replied that their activities in fact were a corrupt form of a practice that had a very long history with the god of whom he spoke. In Muḥammad's view, the Kaʿbah had been dedicated to the aniconic worship of the one God (Allāh) by Abraham, who fathered the ancestor of the Israelites, Isḥāq (Isaac), as well as the ancestor of the Arabs, Ismāʿīl (Ishmael). Muḥammad asked his hearers not to embrace something new, but to abandon the traditional in favour of the original. He appealed to his fellow Quraysh not to reject the *sunnah* of their ancestors, but rather to appreciate and fulfill its true nature. God should be worshiped not through offerings but through prayer and recitation of his messages, and his house should be emptied of its useless idols.

In their initial rejection of his appeal, Muḥammad's Meccan opponents took the first step toward accepting the new idea: they attacked it. For it was their rejection of him, as well as his subsequent rejection by many Jews and Christians, that helped to forge Muḥammad's followers into a community with an identity of its own and capable of ultimately incorporating its opponents. Muḥammad's disparate following was exceptionally vulnerable, bound together not by kinship ties but by a "generic" monotheism that involved being faithful (*muʾmin*) to the message God was sending through their leader. Their vulnerability was mitigated by the absence of formal municipal discipline; but their opponents within Quraysh could apply informal pressures ranging from harassment and violence against the weakest to a boycott against Muḥammad's clan, who were persuaded by his uncle Ṭālib to remain loyal even though most of them were not his followers. Meanwhile Muḥammad and his closest associates were thinking about reconstituting themselves as a separate community in a less hostile environment. In about 612 some 80 of his followers made an emigration (*hijrah*) to Abyssinia, perhaps assuming that they would be welcome in a place that had a history of hostility to the Meccan oligarchy and that worshiped the same god who had sent Muḥammad to them; but they eventually returned without establishing a permanent community. During the next decade, continued rejection intensified the group's identity and its search for another home. Although the boycott against Muḥammad's clan began to disintegrate, the deaths of his wife and his uncle, in about 619, removed an important source of psychological and social support. Muḥammad had already begun to preach and attract followers at market gatherings outside Mecca; now he intensified his search for a more hospitable environment. In 620 he met with a delegation of followers from Yathrib, an oasis about 200 miles to the northeast; in the next two years their support grew into an offer of protection.

Muḥammad's emigration to Yathrib (Medina). Like Mecca, Yathrib was experiencing demographic problems: several tribal groups coexisted, descendants of its Arab Jewish founders as well as a number of pagan Arab immigrants divided into two tribes, the Aws and the Khazraj. Unable to resolve their conflicts, the Yathribis invited Muḥammad to perform the well-established role of neutral outside arbiter (*ḥakam*). In 622, having sent his followers ahead, he and one companion, Abū Bakr, completed the community's second and final emigration, barely avoiding Quraysh attempts to prevent his departure by force. By the time of the emigration a new label had begun to appear in Muḥammad's recitations to describe his followers; in addition to being described in terms of their faithfulness (*īmān*) to God and his messenger, they were also described in terms of their undivided attention, that is, as *muslim*s, individuals who assumed the right relationship to God by surrendering (*islām*) to his will. Although the label *muslim,* derived from *islām,* eventually became a proper name for a specific historical community, at this point it appears to have expressed commonalty with other monotheists: like the others, *muslim*s faced Jerusalem to pray; Muḥammad was believed to have been transported from Jerusalem to the heavens to talk with God; and Abraham, Noah, Moses, David, and Jesus, as well as Muḥammad, all were considered to be prophets (*nabī*s) and messengers of the same God. In Yathrib, however, conflicts between other monotheists and the *muslim*s sharpened their distinctiveness.

Use of the terms *islām* and *muslim*

The forging of Muḥammad's community. As an autonomous community *muslim*s might have become a tribal unit like those with whom they had affiliated, especially because the terms of their immigration gave them no special status. Yet under Muḥammad's leadership they developed a social organization that could absorb or challenge everyone around them. They became Muḥammad's *ummah* ("community") because they had recognized and supported God's emissary (*rasūl Allāh*). The *ummah*'s members differed from one another not by wealth or genealogical superiority but by the degree of their faith and piety; and membership in the community was itself an expression of faith. Anyone could join, regardless of origin, by following Muḥammad's lead, and the nature of members' support could vary. In the concept of *ummah,* Muḥammad supplied the missing ingredient in the Meccan system: a powerful abstract principle for defining, justifying, and stimulating membership in a single community.

Muḥammad made the concept of *ummah* work by expanding his role as arbiter so as to become the sole spokesman for all residents of Yathrib, also known as Medina. Even though the agreement under which Muḥammad had emigrated did not obligate non-Muslims to follow him except in his arbitration, they necessarily became involved in the fortunes of his community. By protecting him from his Meccan enemies, the residents of Medina identified with his fate. Those who supported him as Muslims received special designations: the Medinans were called *anṣār* ("helpers"), and his fellow emigrants were distinguished as *muhājirūn* ("emigrants"). He was often able to use revelation to arbitrate. Because the terms of his emigration did not provide adequate financial support, he began to provide for his community through caravan raiding, a tactic familiar to tribal Arabs. By thus inviting hostility, he required all the Medinans to take sides. Initial failure was followed by success, first at Nakhlah, where the Muslims defied Meccan custom by violating one of the truce months so essential to Meccan prosperity and prestige. Their most memorable victory occurred in 624 at Badr, against a large Meccan force; they continued to succeed, with only one serious setback, at Uḥud in 625. From that time on, "conversion" to Islām involved joining an established polity, the successes of which were tied to its proper spiritual orientation, regardless of whether the convert shared that orientation completely. During the early years in Medina a major motif of Islāmic history emerged: the connection between material success and divine favour, which had also been prominent in the history of the Israelites.

The relation of material success to divine favour

The ummah's allies and enemies. During these years, Muḥammad used his outstanding knowledge of tribal relations to act as a great tribal leader, or *shaykh,* further expanding his authority beyond the role that the Medinans had given him. He developed a network of alliances between his *ummah* and neighbouring tribes, and so competed with the Meccans at their own game. He managed and distributed the booty from raiding, keeping one-fifth for the *ummah*'s overall needs and distributing the rest among its members. In return, members gave a portion of their wealth as *zakat,* to help the needy and to demonstrate their awareness of their dependence on God for all of their material benefits. Like other *shaykh*s, Muḥammad contracted numerous, often strategically motivated, marriage alliances. He was also more able to harass and discipline Medinans, Muslim and non-Muslim alike, who did not support his activities fully; he agitated in particular against the Jews, one of whose clans, the Banū Qaynuqa, he expelled.

Increasingly estranged from nonresponsive Jews and Christians, he reoriented his followers' direction of prayer from Jerusalem to Mecca. He formally instituted the *ḥajj* to Mecca and fasting during the month of Ramaḍān as distinctive cultic acts, in recognition of the fact that *islām,* a generic act of surrender to God, had become Islām, a proper-name identity distinguished not only from paganism but from other forms of monotheism as well. As more and more of Medina was absorbed into the Muslim community, and as the Meccans weakened, Muḥammad's authority expanded. He continued to lead a three-pronged campaign, against nonsupporters in Medina, against the Quraysh in Mecca, and against surrounding tribes; he even ordered raids into southern Syria. Eventually, Muḥammad became powerful enough to punish nonsupporters severely, especially those who leaned toward Mecca. For example, he had the men of the Qurayẓah clan of Jews in Medina executed after they failed to help him against the Meccan forces at the Battle of the Ditch in 627. But he also used force and diplomacy to bring in other Jewish and Christian groups. Because they were seen, unlike pagans, to have formed *ummah*s of their own around a revelation from God, Jews and Christians were entitled to pay for protection (*dhimmah*). Muḥammad thus set a precedent for another major characteristic of Islāmicate civilization, that of qualified religious pluralism under Muslim authority.

Muḥammad's later recitations. During these years of warfare and consolidation, Muḥammad continued to transmit revealed recitations, though their nature began to change. Some commented on Muḥammad's situation, consoled and encouraged his community, explained the continuing resistance of the Meccans, and urged appropriate responses. Some told stories about figures familiar to Jews and Christians, cast in an Islāmic framework. Though still delivered in the form of God's direct speech, the messages became longer and less ecstatic, less urgent in their warnings if more earnest in their guidance. Eventually they focused on interpersonal regulations in areas of particular importance for a new community, such as sexuality, marriage, divorce, and inheritance. By this time certain Muslims had begun to write down what Muḥammad uttered or to recite passages for cultic worship (*ṣalāt*) and private devotion. The recited word, so important among the Arab tribes, had found a greatly enlarged significance. A competitor for Muḥammad's status as God's messenger even declared himself among a nonmember tribe; he was Maslamah of Yamāmah, who claimed to convey revelations from God. He managed to attract numerous Bedouin Arabs but failed to speak as successfully as Muḥammad to the various available constituencies.

The importance of the recited word

Activism in the name of God, nonmilitary as well as military, would become a permanent strand in Muslim piety. Given the environment in which Muḥammad operated, his *ummah* was unlikely to survive without it; to compete as leader of a community he had to exhibit military prowess. (Like most successful leaders, however, Muḥammad was a moderate and a compromiser; some of his followers were more militant and aggressive than he, and some were less so.) Circumstantial necessity had ideological ramifications, too. Because Muḥammad as messenger was also, by divine providence, leader of an established community, he could easily define the whole realm of social action as an expression of faith. Thus Muslims were able to identify messengership with worldly leadership to an extent almost unparalleled in the history of religion. There had been activist prophets before Muḥammad, and there were activist prophets after him, but in no other religious tradition does the image of the activist prophet, and by extension the activist follower, have such a comprehensive and coherent justification in the formative period.

ISLĀM AT MUḤAMMAD'S DEATH

Muḥammad's continuing success gradually impinged on the Quraysh in Mecca. Some defected and joined his community. His marriage to a Quraysh woman provided him with a useful go-between. In 628 he and his followers tried to make an Islāmized *ḥajj* but were forestalled by the Meccans. At al-Ḥudaybiyah, outside Mecca, Muḥammad granted a 10-year truce on the condition that the Meccans would allow a Muslim pilgrimage the next year. Even at this point, however, Muḥammad's control over his followers had its limits; his more zealous followers agreed to the pact only after much persuasion. As in all instances of charismatic leadership, persisting loyalty was correlated with continuing success. In the next year the Meccans allowed a Muslim *ḥajj;* and in the next, 630, the Muslims occupied Mecca without a struggle. Muḥammad began to receive deputations from many parts of Arabia. By his death in 632 he was ruler of virtually all of it.

The Meccan Quraysh were allowed to become Muslims without shame. In fact, they quickly became assimilated to the actual *muhājirūn,* even though they had not emigrated to Yathrib themselves. Ironically, in defeat they had accomplished much more than they would have in victory: the centralization of all of Arabia around their polity and their shrine, the Kaʿbah, which had been emptied of its idols to be filled with an infinitely greater invisible power.

Because intergroup conflict was banned to all members of the *ummah* on the basis of their shared loyalty to the emissary of a single higher authority, the limitations of the Meccan concept of *ḥaram,* according to which the city quarterly became a safe haven, could be overcome. The broader solidarity that Muḥammad had begun to build was stabilized only after his death; and this was achieved, paradoxically, by some of the same people who had initially opposed him. In the next two years one of his most significant legacies became apparent: the willingness and ability of his closest supporters to sustain the ideal and the reality of one Muslim community under one leader, even in the face of significant opposition. When Muḥammad died, two vital sources of his authority ended—ongoing revelation and his unique ability to exemplify his messages on a daily basis. A leader capable of keeping revelation alive might have had the best chance of inheriting his movement; but no Muslim claimed messengership, nor had Muḥammad unequivocally designated any other type of successor. The *anṣār,* his early supporters in Medina, moved to elect their own leader, leaving the *muhājirūn* to choose theirs; but a small number of *muhājirūn* managed to impose one of their own over the whole. That man was Abū Bakr, one of Muḥammad's earliest followers and the father of his favourite wife, ʿĀ'ishah. The title Abū Bakr took, *khalīfah* (caliph), meaning deputy or successor, echoed revealed references to those who assist major leaders and even God himself. To *khalīfah* he appended *rasūl Allāh,* so that his authority was based on his assistance to Muḥammad as messenger of God.

ABŪ BAKR'S SUCCESSION

Abū Bakr soon confronted two new threats: the secession of many of the tribes that had joined the *ummah* after 630 and the appearance among them of other prophet figures who claimed continuing guidance from God. In withdrawing, the tribes appear to have been able to distinguish loyalty to Muḥammad from full acceptance of the uniqueness and permanence of his message. The appearance of other prophets illustrates a general phenomenon in the history of religion: the volatility of revelation as a source of authority. When successfully claimed, it has almost no competitor; once opened, it is difficult to close;

and, if it cannot be contained and focused at the appropriate moment, its power disperses. Jews and Christians had responded to this dilemma in their own ways; now it was the turn of the Muslims, whose future was dramatically affected by Abū Bakr's response. He put an end to revelation with a combination of military force and coherent rhetoric. He defined withdrawal from Muḥammad's coalition as ingratitude to or denial of God (the concept of *kufr*); thus he gave secession (*riddah*) cosmic significance as an act of apostasy punishable, according to God's revealed messages to Muḥammad, by death. He declared that the secessionists had become Muslims, and thus servants of God, by joining Muḥammad; they were not free *not* to be Muslims, nor could they be Muslims, and thus loyal to God, under any leader whose legitimacy did not derive from Muḥammad. Finally, he declared Muḥammad to be the last prophet God would send, relying on a reference to Muḥammad in one of the revealed messages as *khatm al-anbiyāʾ* ("Seal of the Prophets"). In his ability to interpret the events of his reign from the perspective of Islām, Abū Bakr demonstrated the power of the new conceptual vocabulary Muḥammad had introduced.

Ban on revelation and secession

Had Abū Bakr not asserted the independence and uniqueness of Islām, the movement he had inherited could have been splintered or absorbed by other monotheistic communities or by new Islām-like movements led by other tribal figures. Moreover, had he not quickly made the ban on secession and intergroup conflict yield material success, his chances for survival would have been very slim, because Arabia's resources could not support his state. To provide an adequate fiscal base, Abū Bakr enlarged impulses present in pre-Islāmic Mecca and in the *ummah.* At his death he was beginning to turn his followers to raiding non-Muslims in the only direction where that was possible, the north. Migration into Syria and Iraq already had a long history; and Arabs, both migratory and settled, were already present there. Indeed some of them were already launching raids when ʿUmar I, Abū Bakr's acknowledged successor, assumed the caliphate in 634. The ability of the Medinan state to absorb random action into a relatively centralized movement of expansion testifies to the strength of the new ideological and administrative patterns inherent in the concept of *ummah.*

Fusion of community and faith

The fusion of two once separable phenomena, membership in Muḥammad's community and faith in Islām—the mundane and the spiritual—would become one of Islām's most distinctive features. Becoming and being Muslim always involved *doing* more than it involved *believing.* On balance, Muslims have always favoured orthopraxy (correctness of practice) over orthodoxy (correctness of doctrine). Being Muslim has always meant making a commitment to a set of behavioral patterns because they reflect the right orientation to God. Where choices were later posed, they were posed not in terms of religion and politics, or church and state, but between living in the world the right way or the wrong way. Just as classical Islāmicate languages developed no equivalents for the words *religion* and *politics,* modern European languages have developed no adequate terms to capture the choices as Muslims have posed them.

Conversion and crystallization (634–870)

SOCIAL AND CULTURAL TRANSFORMATIONS

The Arab conquests are often viewed as a discrete period. The end of the conquests appears to be a convenient dividing line because it coincides with a conventional watershed, the overthrow of the Umayyad caliphs by the ʿAbbāsids. To illustrate their role in broader social and cultural change, however, the military conquests should be included in a period more than twice as long, during which the conquest of the hearts and minds of the majority of the subject population also occurred. Between 634 and 870 Islām was transformed from the badge of a small Arab ruling class to the dominant faith of a vast empire that stretched from the western Mediterranean into Central Asia. As a result of this long and gradual period of conversion, Arab cultures intermingled with the indigenous cultures of the conquered peoples to produce Islām's fundamental orientations and identities. The Arabic language became a vehicle for the transmission of high culture, even though the Arabs remained a minority; for the first time in the history of the Nile-to-Oxus region, a new language of high culture, carrying a great cultural florescence, replaced all previous languages of high culture. Trade and taxation replaced booty as the fiscal basis of the Muslim state; a nontribal army replaced a tribal one; and a centralized empire became a nominal confederation, with all of the social dislocation and rivalries those changes imply. Yet despite continuous internal dissension, virtually no Muslim raised the possibility of there being more than one legitimate leader. Furthermore, the impulse toward solidarity, inherited from Muḥammad and Abū Bakr, may have actually been encouraged by persisting minority status. While Muslims were a minority, they naturally formed a conception of Islāmic dominance as territorial rather than religious; and of unconverted non-Muslim communities as secondary members. In one important respect the Islāmic faith differed from all other major religious traditions: the formative period of the faith coincided with its political domination of a rich complex of old cultures. Thus, during the formative period of their civilization, the Muslims could both introduce new elements and reorient old ones in creative ways.

Arabic as a language of high culture

Just as Muḥammad fulfilled and redirected ongoing tendencies in Arabia, the builders of early Islāmicate civilization carried forth and transformed developments in the Roman and Sāsānian territories in which they first dominated. While Muḥammad was emerging as a leader in the Hejaz, the Byzantine and Sāsānian emperors were ruling states that resembled what the Islāmicate empire was to become. Byzantine rule stretched from North Africa into Syria and sometimes Iraq; the Sāsānians competed with the Byzantines in Syria and Iraq and extended their sway, at its furthest, across the Oxus River. Among their subjects were speakers and writers of several major languages—various forms of Aramaic such as Mandaean and Syriac; Greek; Arabic; and Middle Persian. In fact, a significant number of persons were probably bilingual or trilingual. Each empire had its official religion, Christianity and Zoroastrian–Mazdaism, respectively. The Sāsānian Empire in the early 7th century was ruled by a religion-backed centralized monarchy with an elaborate bureaucratic structure that was reproduced on a smaller scale at the provincial courts of its appointed governors. Its religious demography was complex—Christians of many persuasions, Monophysites, Nestorians, Orthodox, and others; pagans; gnostics; Jews; Mazdeans. Minority religious communities were becoming more clearly organized and isolated. The population included priests; traders and merchants; landlords (*dihqans*), sometimes living not on the land but as absentees in the cities; pastoralists; and large numbers of peasant agriculturalists. In southern Iraq, especially in and around towns like al-Ḥīrah, it included migratory and settled Arabs as well. Both empires relied on standing armies for their defense and on agriculture, taxation, conquest, and trade for their resources. When the Muslim conquests began, the Byzantines and Sāsānians had been in conflict for a century; in the most recent exchanges, the Sāsānians had established direct rule in al-Ḥīrah, further exposing its many Arabs to their administration. When the Arab conquests began, representatives of Byzantine and Sāsānian rule on Arabia's northern borders were not strong enough to resist.

ʿUMAR I'S SUCCESSION

ʿUmar I, successor to Abū Bakr

The spirit of conquest under ʿUmar I. Abū Bakr's successor in Medina, ʿUmar I (ruled 634–644), had not so much to stimulate conquest as to organize and channel it. As leaders he chose skillful managers experienced in trade and commerce as well as warfare and imbued with an ideology that provided their activities with a cosmic significance. The total numbers involved in the initial conquests may have been relatively small, perhaps less than 50,000, divided into numerous shifting groups. Yet few actions took place without any sanction from the Medinan government or one of its appointed commanders. The fighters, or *muqātilah,* could generally accomplish much more with Medina's support than without. ʿUmar, one of Muḥammad's earliest and staunchest supporters, had quickly developed an administrative system of manifestly superior effectiveness. He defined the *ummah* as a continually expansive polity managed by a new ruling elite, which included successful military commanders like Khālid ibn al-Walīd. Even after the conquests ended, this sense of expansiveness continued to be expressed in the way Muslims divided the world into their own zone, the Dār al-Islām, and the zone into which they could and should expand, the Dār al-Ḥarb, the abode of war. The norms of ʿUmar's new elite were supplied by Islām as it was then understood. Taken together, Muḥammad's revelations from God and his *sunnah* (precedent-setting example) defined the cultic and personal practices that distinguished Muslims from others: prayer, fasting, pilgrimage, charity, avoidance of pork and intoxicants, membership in one community centred at Mecca, and activism (*jihād*) in the community's behalf.

Distribution of booty among the *ummah*

Origin of the garrison mosque

Forging the link of activism with faithfulness. ʿUmar symbolized this conception of the *ummah* in two ways. He assumed an additional title, *amīr al-muʾminīn* ("commander of the faithful"), which linked organized activism with faithfulness (*īmān*), the earliest defining feature of the Muslim. He also adopted a lunar calendar that began with the emigration (*hijrah*), the moment at which a group of individual followers of Muḥammad had become an active social presence. Because booty was the *ummah*'s major resource, ʿUmar concentrated on ways to distribute and sustain it. He established a *dīwān,* or register, to pay all members of the ruling elite and the conquering forces, from Muḥammad's family on down, in order of entry into the *ummah.* The immovable booty was kept for the state. After the government's fifth-share of the movable booty was reserved, the rest was distributed according to the *dīwān.* The *muqātilah* he stationed as an occupying army in garrisons (*amṣār*) constructed in locations strategic to further conquest: al-Fusṭāṭ in Egypt, Damascus in Syria, Kūfah and Basra in Iraq. The garrisons attracted indigenous population and initiated significant demographic changes, such as a population shift from northern to southern Iraq. They also inaugurated the rudiments of an "Islāmic" daily life; each garrison was commanded by a caliphal appointee, responsible for setting aside an area for prayer, a mosque (*masjid*), named for the prostrations (*sujūd*) that had become a characteristic element in the five daily worship sessions (*ṣalāt*s). There the fighters could hear God's revelations to Muḥammad recited by men trained in that emerging art. The most pious might commit the whole to memory. There, too, the Friday midday *ṣalāt* could be performed communally, accompanied by an important educational device, the sermon (*khuṭbah*), through which the fighters could be instructed in the principles of the faith. The mosque fused the practical and the spiritual in a special way: because the Friday prayer included an expression of loyalty to the ruler, it could also provide an opportunity to declare rebellion.

The series of ongoing conquests that fueled this system had their most extensive phase under ʿUmar and his successor ʿUthmān ibn ʿAffān (ruled 644–656). Within 25 years, Muslim Arab forces created the first empire permanently to link western Asia with the Mediterranean. Within another century, Muslim conquerors surpassed the achievement of Alexander the Great, not only in the durability of their accomplishment but in its scope as well, reaching from the Iberian Peninsula to Central Asia. Resistance was generally slight and nondestructive, and conquest through capitulation was preferred to conquest by force. After Sāsānian al-Ḥīrah fell in 633, a large Byzantine force was defeated in Syria, opening the way to the final conquest of Damascus in 636. The next year, further gains were made in Sāsānian territory, especially at the Battle of al-Qādisīyah; in the next, the focus returned to Syria and the taking of Jerusalem. By 640, Roman control in Syria was over; by 641, the Sāsānians had lost all of their territory west of Zagros. During the years 642 to 646 Egypt was taken under the leadership of ʿAmr ibn al-ʿĀṣ, who soon began raids into what the Muslims called the Maghrib, the lands west of Egypt. Shortly thereafter, in the east, Persepolis fell; in 651 the defeat and assassination of the last Sāsānian emperor, Yazdegerd III, marked the end of the 400-year-old Sāsānian Empire.

ʿUTHMĀN'S SUCCESSION AND POLICIES

ʿUthmān's standardization of the Qurʾān

Discontent in ʿUthmān's reign. This phase of conquest ended under ʿUthmān and ramified widely. ʿUthmān may even have sent an emissary to China in 651; by the end of the 7th century Arab Muslims were trading there. The fiscal strain of such expansion and the growing independence of local Arabs outside the peninsula underlay the persisting discontents that surfaced toward the end of ʿUthmān's reign. The very way in which he was made caliph had already signaled the potential for competition over leadership and resources. Perceived as pliable and docile, he was the choice of the small committee charged by the dying ʿUmar with selecting one of their own number. Once in office, however, ʿUthmān acted to establish the power of Medina over and against some of the powerful Quraysh families at Mecca and local notables outside Arabia. He was accused of nepotism for relying on his own family, the Banū Umayyah, whose talents ʿUmar had already recognized. Among his many other "objectionable" acts was his call for the production of a single standard collection of Muḥammad's messages from God, which was known simply as the Qurʾān ("Recitation" or "Recitations"). Simultaneously he ordered the destruction of any other collections. Although they might have differed only in minor respects, they represented the independence of local communities. Above all, ʿUthmān was the natural target of anyone dissatisfied with the distribution of the conquest's wealth, since he represented and defended a system that defined all income as Medina's to distribute.

The difficulties of ʿUthmān's reign took more than a century to resolve. They were the inevitable result not just of the actions of individuals but of the whole process initiated by Muḥammad's achievements. His coalition had been fragile. He had disturbed existing social arrangements without being able to reconstruct and stabilize new ones quickly. Into a society organized along family lines, he had introduced the supremacy of trans-kinship ties. Yet he had been forced to make use of kinship ties himself; and, despite his egalitarian message, he had introduced new inequities by granting privileges to the earliest and most intensely devoted followers of his cause. Furthermore, personal rivalries were stimulated by his charisma; individuals like his wife ʿĀʾishah, his daughter Fāṭimah, and her husband ʿAlī frequently vied for his affection. ʿUmar's *dīwān* had, then, reinforced old inequities by extending privileges to wealthy high-placed Meccans, and it had introduced new tensions by assigning a lower status to those, indigenous or immigrant to the provinces, who joined the cause later (but who felt themselves to be making an equivalent or greater contribution). Other tensions resulted from conditions in the conquered lands: the initial isolation of Arab Muslims, and even Arab Christians who fought with them, from the indigenous non-Arab population; the discouragement of non-Arab converts, except as clients (*mawālī*) of Arab tribes; the administrative dependence of peninsular Arabs on local Arabs and non-Arabs; and the development of a tax system that discriminated against non-Muslims.

Intra-Muslim conflicts. The ensuing conflicts were played out in a series of intra-Muslim disputes that began with ʿUthmān's assassination and continued to the end of the period under discussion. The importance of kinship ties persisted, but they were gradually replaced by the identities of a new social order. These new identities resulted from Muslim responses to anti-Muslim activity as well as from Muslim participation in a series of controversies focused on the issue of leadership. Because the *ummah,* unified under one leader, was seen as an earthly expression of God's favour, and because God was seen as the controller of all aspects of human existence, the identities formed in the course of the *ummah*'s early history could fuse dimensions that secular modern observers are able to distinguish—religious, social, political, and economic. Furthermore, intra-Muslim rivalries changed during the conversion period; the meaningfulness of the new iden-

Unifying of the Muslim tradition

tities expanded as non-Muslims contributed to Islām's formation, through opposition or through conversion, and the key issues broadened as the participating constituencies enlarged. At first the disputes were coterminous with intra-Arab, indeed even intra-Quraysh, rivalries; only later did they involve persons of other backgrounds. Thus the faith of Islām was formed in conjunction with the crises that attended the establishment of rule by Muslims. Muslims might have produced an extremely localized and exclusivistic religion; but in spite of, and perhaps because of, their willingness to engage in continuing internal conflicts, they produced one of the most unified religious traditions in human history.

THE FOUR FITNAHS

By the end of the period of conversion and crystallization, Muslim historians would retrospectively identify four discrete periods of conflict and label them *fitnah*s, trials or temptations to test the unity of the *ummah.* Many historians also came to view some identities formed during the *fitnah*s as authentic and others as deviant. This retrospective interpretation may be anachronistic and misleading. The entire period between 656 and the last quarter of the 9th century was conflict-ridden, and the *fitnah*s merely mark periods of intensification; yet the most striking characteristic of the period was the pursuit of unity.

The first fitnah. In the first two *fitnah*s the claimants to the caliphate relied on their high standing among the Quraysh and their local support in either Arabia, Iraq, or Syria. Competition for the caliphate thus reflected rivalries among the leading Arab families as well as regional interests. The first *fitnah* occurred between ʿUthmān's assassination in 656 and the accession of his kinsman Muʿāwiyah I in 661 and included the caliphate of ʿAlī, the cousin and son-in-law of Muḥammad. It involved a three-way contest between ʿAlī's party in Iraq; a coalition of important Quraysh families in Mecca, including Muḥammad's wife ʿĀʾishah and Ṭalḥah and Zubayr; and the party of Muʿāwiyah, the governor of Syria and member of ʿUthmān's clan, the Banū Umayyah. Ostensibly the conflict focused on whether ʿUthmān had been assassinated justly, whether ʿAlī had been involved, and whether ʿUthmān's death should be avenged by Muʿāwiyah or by the leading Meccans. ʿAlī and his party (*shīʿah*) at first gained power over the representatives of the other leading Meccan families, then lost it permanently to Muʿāwiyah, who elevated Damascus, which had been his provincial capital, to the status of imperial capital. Disappointed at the Battle of Ṣiffīn (657) with ʿAlī's failure to insist on his right to rule, a segment of his partisans withdrew, calling themselves accordingly Khawārij (Kharijites; "seceders"). Their spiritual heirs would come to recognize any pious Muslim as leader. Meanwhile, another segment of ʿAlī's party intensified their loyalty to him as a just and heroic leader who was one of Muḥammad's dearest intimates and the father of his only male descendants.

The second fitnah. The second *fitnah* followed Muʿāwiyah's caliphate (661–680), which itself was not free from strife, and coincided with the caliphates of Muʿāwiyah's son Yazīd I (ruled 680–683), whom he designated as successor, and Yazīd's three successors. This *fitnah* was a second-generation reprise of the first; some of the personnel of the former were descendants or relatives of the leaders of the latter. Once again, different regions supported different claimants, as new tribal divisions emerged in the garrison towns; and once again, representatives of the Syrian Umayyads prevailed. In 680, at Karbalāʾ in Iraq, Yazīd's army murdered al-Ḥusayn, a son of ʿAlī and grandson of Muḥammad, along with a small group of supporters, accusing them of rebellion; and even though the Umayyads subdued Iraq, rebellions in the name of this or that relative of ʿAlī continued, attracting more and more non-Arab support and introducing new dimensions to his cause. In the Hejaz, the Marwānid branch of the Umayyads, descendants of Marwān I who claimed the caliphate in 685, fought against ʿAbd Allāh ibn az-Zubayr for years; by the time they defeated him, they had lost most of Arabia to Kharijite rebels.

Resistance to Muslim authority

During the period of the first two *fitnah*s, resistance to Muslim rule was an added source of conflict. Some of this resistance took the form of syncretic or anti-Islāmic religious movements. For example, during the second *fitnah,* in Iraq a Jew named Abū ʿIsā al-Iṣfahānī led a syncretic movement (that is, a movement combining different forms of belief or practice) on the basis of his claim to be a prophet (an option not generally open to Muslim rebels) and forerunner of the messiah. He viewed Muḥammad, as well as Jesus, as messengers sent not to all humanity but only to their own communities; so he urged each community to continue in its own tradition as he helped prepare for the coming of the messiah. In other areas, such as the newly conquered Maghrib, resistance took the form of large-scale military hostility. In the 660s the Umayyads had expanded their conflict with the Byzantine Empire by competing for bases in coastal North Africa; it soon became clear, however, that only a full-fledged occupation would serve their purposes. That occupation was begun by ʿUqbah ibn Nāfiʿ, the founder of al-Qayrawān (Kairouan, in modern Tunisia) and, as Sidi (Saint) ʿUqbah, the first of many Maghribi Muslim saints. It eventually resulted in the incorporation of large numbers of pagan or Christianized Berber tribes, the first large-scale forcible incorporation of tribal peoples since the secession of tribes under Abū Bakr. But first the Arab armies met fierce resistance from two individuals—one a man, Kusaylah, and one a woman, al-Kāhinah—who became Berber heroes. Berber resistance was not controlled until the end of the 7th century, after which the Berbers participated in the further conquest of the Maghrib and the Iberian peninsula.

During the caliphate of ʿAbd al-Malik ibn Marwān (ruled 685–705), which followed the end of the second *fitnah,* and under his successors during the next four decades, the problematic consequences of the conquests became much more visible. Like their Byzantine and late Sāsānian predecessors, the Marwānid caliphs nominally ruled the various religious communities but allowed the communities' own appointed or elected officials to administer most internal affairs. Yet now the right of religious communities to live in this fashion was justified by the Qurʾān and *sunnah;* as peoples with revealed books (*ahl al-kitāb*), they deserved protection (*dhimmah*) in return for a payment. The Arabs also formed a single religious community whose right to rule over the non-Arab protected communities the Marwānids sought to maintain.

The Dome of the Rock

To signify this supremacy, as well as his co-optation of previous legitimacy, ʿAbd al-Malik ordered the construction of the Dome of the Rock, a monumental mosque, in Jerusalem, a major centre of non-Muslim population. The site chosen was sacred to Jews and Christians because of its associations with biblical history; it held added meaning for Muslims, who believed it to be the starting point for Muḥammad's *miʿrāj* (midnight journey to heaven). Although this and other early mosques resembled contemporary Christian churches, gradually an Islāmic aesthetic emerged: a dome on a geometrical base, accompanied by a minaret from which to deliver the call to prayer; and an emphasis on surface decoration that combined arabesque and geometrical design with calligraphic representations of God's Word. ʿAbd al-Malik took other steps to mark the distinctiveness of Islāmic rule: for example, he encouraged the use of Arabic as the language of government and had Islāmized coins minted to replace the Byzantine and Sāsānian-style coinage that had continued to be used since the conquests. During the Marwānid period, the Muslim community was further consolidated by the regularization of the public cult and the crystallization of a set of five minimal duties (sometimes called pillars).

Yet the Marwānids also depended heavily on the help of non-Arab administrative personnel (*kuttāb;* singular, *kātib*) and on administrative practices (*e.g.,* a set of government bureaus) inherited from Byzantine and, in particular, late Sāsānian practice. Pre-Islāmic writings on governance translated into Arabic, especially from Middle Persian, influenced caliphal style. The governing structure at Damascus and in the provinces began to resemble pre-Islāmic monarchy, and thus appealed to a majority of subjects, whose heritage extolled the absolute authority of a divinely sanctioned ruler. Much of the inspiration for this development came from ʿAbd al-Malik's administrator in the eastern territories, al-Ḥajjāj ibn Yūsuf ath-Thaqafī, who was himself an admirer of Sāsānian practice.

The Marwānid caliphs, as rulers of Muslims and non-Muslims alike, had thus been forced to respond to a variety of expectations. Ironically, it was their defense of the importance and distinctiveness of the Arabic language and the Islāmic community, not their responsiveness to non-Muslim preferences, that prepared the way for the gradual incorporation of most of the subject population into the *ummah.* As the conquests slowed and the isolation of the fighters (*muqātilah*) became less necessary, it became more and more difficult to keep Arabs garrisoned. The sedentation of Arabs that had begun in the Hejaz was being repeated and extended outside the peninsula. As the tribal links that had so dominated Umayyad politics began to break down, the meaningfulness of tying non-Arab converts to Arab tribes as clients was diluted; moreover, the number of non-Muslims who wished to join the *ummah* was already becoming too large for this process to work effectively.

Simultaneously, the growing prestige and elaboration of things Arabic and Islāmic made them more attractive, to non-Arab Muslims and to non-Muslims alike. The more the Muslim rulers succeeded, the more prestige their customs, norms, and habits acquired. Heirs to the considerable agricultural and commercial resources of the Nile-to-Oxus region, they increased its prosperity and widened its horizons by extending its control far to the east and west.

Arabic as a lingua franca

Arabic, which occasionally had been used for administrative purposes in earlier empires, now became a valuable lingua franca. As Muslims continued to adapt to rapidly changing circumstances, they needed Arabic to reflect upon and elaborate what they had inherited from the Hejaz. Because the Qurʾān, translation of which was prohibited, was written in a form of Arabic that quickly became archaic to Muslims living in the garrisons, and because it contained references to life in Arabia before and during Muḥammad's time, full understanding of the text required special effort. Scholars began to study the religion and poetry of the *jāhilīyah,* the times of ignorance before God's revelation to Muḥammad. Philologians soon emerged, in the Hejaz as well as in the garrisons. Many Muslims cultivated reports, which came to be known as *ḥadīth,* of what Muḥammad had said and done, in order to develop a clearer and fuller picture of his *sunnah.* These materials were sometimes gathered into accounts of his campaigns, called *maghāzī.* The emulation of Muḥammad's *sunnah* was a major factor in the development of recognizably "Muslim" styles of personal piety and public decision making. As differences in the garrisons needed to be settled according to "Islāmic" principles, the caliphs appointed arbitrating judges, *qāḍī*s, who were knowledgeable in Qurʾān and *sunnah.* The pursuit of legal knowledge, *fiqh,* was taken up in many locales and informed by local pre-Islāmic custom and Islāmic resources. These special forms of knowledge began to be known as *ʿulūm* (singular, *ʿilm*); the persons who pursued them, as *ʿulamāʾ* (singular, *ʿālim*), a role that provided new sources of prestige and influence, especially for recent converts or sons of converts.

Muslims outside Arabia were also affected by interacting with members of the religious communities over which they ruled. When protected non-Muslims converted, they brought new expectations and habits with them; Islāmic eschatology is one area that reflects such enrichment. Unconverted protected groups (*dhimmī*s) were equally influential. Expressions of Islāmic identity often had to take into account the critique of non-Muslims, just as the various non-Muslim traditions were affected by contact with Muslims.

Interaction with non-Muslims

This interaction had special consequences in the areas of prophethood and revelation, where major shifts and accommodations occurred among Jews, Christians, Mazdeans, and Muslims during the first two centuries of their coexistence. Muslims attempted to establish Muḥammad's legitimacy as an heir to Jewish and Christian prophethood, while non-Muslims tried to distinguish their prophets and scriptures from Muḥammad and the Qurʾān. Within the emergent Islāmicate civilization, the separate religious communities continued to go their own way; but the influence of Muslim rule and the intervention of the caliphs in their internal affairs could not help but affect them. The Babylonian Talmud, completed during these years, bears traces of early interaction among communities. In Iraq caliphal policy helped promote the Jewish gaons (local rabbinic authorities) over the exilarch (a central secular leader). Mazdeans turned to the Nestorian Church to avoid Islām, or reconceptualized Zoroaster as a prophet sent to a community with a Book. With the *dhimmī* system (the system of protecting non-Muslims for payment), Muslim rulers formalized and probably intensified pre-Islāmic tendencies toward religious communalization. Furthermore, the greater formality of the new system could protect the subject communities from each other as well as from the dominant minority. So "converting" to Islām, at least in the Nile-to-Oxus region, meant joining one recognizably distinct social entity and leaving another. One of the most significant aspects of many Muslim societies was the inseparability of "religious" affiliation and group membership, a phenomenon that has translated poorly into the social structures of modern Muslim nations. In the central caliphal lands of the early 8th century, membership in the Muslim community offered the best chance for social and physical mobility, regardless of a certain degree of discrimination against non-Arabs. Among many astounding examples of this mobility is the fact that several of the early governors and independent dynasts of Egypt and the Maghrib were grandsons of men born in Central Asia.

The Marwānid Maghrib illustrates a kind of conversion more like that of the peninsular Arabs. After the defeat of initial Berber resistance movements, the Arab conquerors of the Maghrib quickly incorporated the Berber tribes en masse into the Muslim community, turning them immediately to further conquests. In 710 an Arab–Berber army set out for the Iberian Peninsula under the leadership of Ṭāriq ibn Ziyād (the name Gibraltar is derived from Jabal Ṭāriq, or "Mountain of Ṭāriq"). They defeated King Roderick in 711; raided into and through the Iberian Peninsula, which they called al-Andalūs; and ruled in the name of the Umayyad caliph. The Andalusian Muslims never had serious goals across the Pyrenees. In 732 Charles Martel encountered not a Muslim army but a summer raiding party; despite his "victory" over that party, Muslims continued their seasonal raiding along the southern French coast for many years.

Muslim Andalusia

Muslim Andalusia is particularly interesting because there the pressure for large-scale conversion that was coming to plague the Umayyads in Syria, Iraq, and Iran never developed. Muslims may never have become a majority throughout their 700-year Andalusian presence. Non-Muslims entered into the Muslim realm as Mozarabs, Christians who had adopted the language and manners, rather than the faith, of the Arabs. Given essentially the same administrative arrangements, the Iberian Christian population was later restored to dominance, while the Syrian Christian population was drastically reduced; but the Iberian Jewish population all but disappeared while the Nile-to-Oxus Jewish population survived.

The Berbers who remained in the Maghrib illustrate the mobility of ideologies and institutions from the central lands to more recently conquered territories. No sooner had they given up anti-Muslim resistance and joined the Muslim community than they rebelled again; but this time an Islāmic identity, Kharijism, provided the justification. Kharijite ideas had been carried to the Maghrib by refugees from the numerous revolts against the Marwānids. Kharijite egalitarianism suited the economic and social grievances of the Berbers as non-Arab Muslims under Arab rule. The revolts outlasted the Marwānids; they resulted in the first independent Maghribi dynasty, the Rustamid, founded by Muslims of Persian descent. The direct influence of the revolts was felt as late as the 10th century and survives among small communities in Tunisia and Algeria.

The third fitnah. Meanwhile, in the central caliphal lands, growing discontent with the emerging order crystallized in a multifaceted movement of opposition to the Marwānids. It culminated in the third *fitnah* (744–750), which resulted in the establishment of a new and final dynasty of caliphs, the ʿAbbāsids. Ever since the second *fitnah,* a number of concerned and self-conscious Muslims had begun to raise serious questions about the proper Muslim life and the Marwānids' ability to exemplify it, and to answer them by reference to key events in the *ummah*'s history. Pious Muslims tried to define a good Muslim and to decide whether a bad Muslim should be excluded from the community, or a bad caliph from office. They also considered God's role in determining a person's sinfulness and final dispensation. The proper relationship between Arab and non-Arab Muslims, and between Muslims and *dhimmī*s, was another important and predictable focus of reflection. The willingness of non-Arabs to join the *ummah* was growing; but the Marwānids had not found a solution that was either ideologically acceptable or fiscally sound. Because protected non-Muslim groups paid special taxes, fiscal stability seemed to depend on continuing to discourage conversion. One Marwānid, ʿUmar II (ruled 717–720), experimented unsuccessfully with a just solution. In these very practical and often pressing debates lay the germs of Muslim theology, as various overlapping positions, not always coterminous with political groupings, were taken: rejecting the history of the community by demanding rule by Muḥammad's family; rejecting the history of the community by following any pious Muslim and excluding any sinner; or accepting the history of the community, its leaders, and most of its members.

In the course of these debates the Marwānid caliphs began to seem severely deficient to a significant number of Muslims of differing persuasions and aspirations. Direct and implied criticism began to surface. Al-Ḥasan al-Baṣrī, a pious ascetic and a model for the early *ṣūfī*s, called on the Marwānids to rule as good Muslims, and on good Muslims to be suspicious of worldly power. Ibn Isḥāq composed an account of Muḥammad's messengership that emphasized the importance of the *anṣār,* the Yathribi tribes that accepted Muḥammad, and by implication the non-Arab converts (from whom Ibn Isḥāq himself was descended). The Marwānids were accused of *bidʿah,* new actions for which there were no legitimate Islāmic precedents. Their continuation of pre-Islāmic institutions—the spy system, extortion of deposed officials by torture, and summary execution—were some of their most visible "offenses." To the pious, the ideal ruler, or *imām* (the word also for a Muslim who led the *ṣalāt*), should, like Muḥammad, possess special learning and knowledge. The first four caliphs, they argued, had been *imām*s in this sense; but under the Umayyads the caliphate had been reduced to a military and administrative office devoid of *imāmah,* of true legitimacy. This piety-minded opposition to the Umayyads, as it has been aptly dubbed, now began to talk about a new dispensation. Some of the most vocal members found special learning and knowledge only in Muḥammad's family. Some defined Muḥammad's family broadly to include any Hāshimite; others, more narrowly, to include only descendants of ʿAlī. As the number of Muḥammad's descendants through ʿAlī had grown, numerous rebellions had broken out in the name of one or the other, drawing on various combinations of constituencies and reflecting a wide spectrum of Islāmic and pre-Islāmic aspirations.

Criticism of the Marwānid caliphs

In the late Marwānid period, the piety-minded opposition found expression in a movement organized in Khorāsān (Khurasan) by Abū Muslim, a semisecret operative of one particularly ambitious Hāshimite family, the ʿAbbāsids. The ʿAbbāsids, who were kin but not descendants of Muḥammad, claimed also to have inherited, a generation earlier, the authority of one of ʿAlī's actual descendants, Abū Hāshim. Publicly Abū Muslim called for any qualified member of Muḥammad's family to become caliph; but privately he allowed the partisans (*shīʿah*) of ʿAlī to assume that he meant them. Abū Muslim ultimately succeeded because he managed to link the concerns of the piety-minded in Syria and Iraq with Khorāsānian discontent. He played upon the grievances of its Arab tribes against the tribes of Syria and their representatives in the Khorāsānian provincial government, and on the millennial expectations of non-Arab converts and non-Muslims disenchanted with the injustices of Marwānid rule.

When in 750 the army organized and led by Abū Muslim succeeded in defeating the last Marwānid ruler, his caliph-designate represented only one segment of this broad coalition. He was the head of the ʿAbbāsid family, Abū al-ʿAbbās as-Saffāḥ, who now subordinated the claims of the party of ʿAlī to those of his own family, and who promised to restore the unity of the *ummah,* or *jamāʿah.* The circumstances of his accession reconfigured the piety-minded opposition that had helped bring him to power. The party (*shīʿah*) of ʿAlī refused to accept the compromise the ʿAbbāsids offered. Their former fellow-opponents did accept membership in the reunified *jamāʿah,* isolating the People of the Shīʿah and causing them to define themselves in terms of more radical points of view. Those who accepted the early ʿAbbāsids came to be known as the People of the Sunnah and Jamāʿah. They accepted the cumulative historical reality of the *ummah*'s first century: all of the decisions of the community, and all of the caliphs it had accepted, had been legitimate, as would be any subsequent caliph who could unite the community. The concept of *fitnah* acquired a fully historicist meaning: if internal discord were a trial sent by God, then any unifying victor must be God's choice.

Sunnites and Shīʿites. The historicists came to be known as Sunnites, their main opponents, as Shīʿites. These labels are somewhat misleading, because they imply that only the Sunnites tried to follow the *sunnah* of Muḥammad. In fact, each group relied on the *sunnah,* but emphasized different elements. For the Sunnites, who should more properly be called the Jamāʿi-Sunnites, the principle of solidarity was essential to the *sunnah.* The Shīʿites argued that the fundamental element of the *sunnah,* and one willfully overlooked by the Jamāʿi-Sunnites, was Muḥammad's devotion to his family and his wish that they succeed him through ʿAlī. These new labels expressed and consolidated the social reorganization that had been under way since the beginning of the conquests. The vast majority of Muslims now became consensus-oriented, while a small minority became oppositional. The inherent inimitability of Muḥammad's role had made it impossible for any form of successorship to capture universal approval.

When the ʿAbbāsids denied the special claims of the family of ʿAlī, they prompted the Shīʿites to define themselves as a permanent opposition to the status quo. The crystallization of Shīʿism into a movement of protest received its greatest impetus during and just after the lifetime of one of the most influential Shīʿite leaders of the early ʿAbbāsid period, Jaʿfar ibn Muḥammad (also called Jaʿfar aṣ-Ṣādiq; 765). Jaʿfar's vision and leadership allowed the Shīʿites to understand their chaotic history as a meaningful series of efforts by truly pious and suffering Muslims to right the wrongs of the majority. The leaders of the minority had occupied the office of *imām,* the central Shīʿite institution, which had been passed on from the first *imām,* ʿAlī, by designation down to Jaʿfar, the sixth. To protect his followers from increasing Sunnite hostility to the views of radical Shīʿites, known as the *ghulāt* ("extremists"), who claimed prophethood for ʿAlī, Jaʿfar made a distinction that both protected the uniqueness of prophethood and established the superiority of the role of *imām.* Since prophethood had ended, its true intent would die without the *imām*s, whose protection from error allowed them to carry out their indispensable task.

Crystallization of Shīʿite movement

Although Jaʿfar did develop an ideology that invited Sunnite toleration, he did not unify all Shīʿites. Differences continued to be expressed through loyalty to various of his relatives. During Jaʿfar's lifetime, his uncle Zayd revolted in Kūfah (740), founding the branch of the Shīʿism known as the *zaydīyah* (Zaydis), or Fivers (for their allegiance to the fifth *imām*), who became particularly important in southern Arabia. Any pious follower of ʿAlī could become their *imām,* and any *imām* could be deposed if he behaved unacceptably. The Shīʿite majority followed Jaʿfar's son Mūsā al-Kāẓim and *imām*s in his line through the 12th, who disappeared in 873. Those loyal to the 12 *imām*s became known as the Imāmīs or Ithnā ʿAsharīyah (Twelvers). They adopted a quietistic stance toward the status quo government of the ʿAbbāsids and prepared to wait until the 12th *imām* should return as the messiah

Branches of Shīʿism

to avenge injustices against Shīʿites and to restore justice before the Last Judgment. Some of Jaʿfar's followers, however, remained loyal to Ismāʿīl, Jaʿfar's eldest son who predeceased his father after being designated. These became the Ismāʿīlīyah (Ismāʿīlis) or Sabʿīyah (Seveners), and they soon became a source of continuing revolution in the name of Ismāʿīl's son Muḥammad at-Tamm, who was believed to have disappeared. Challenges to the ʿAbbāsids were not long in coming; of particular significance was the establishment, in 789, of the first independent Shīʿite dynasty, in present-day Morocco, by Idrīs ibn ʿAbd Allāh ibn Ḥasan II, who had fled after participating in an unsuccessful uprising near Mecca. Furthermore, Kharijite rebellions continued to occur regularly.

Legitimacy was a scarce and fragile resource in all premodern societies; in the early ʿAbbāsid environment, competition to define and secure legitimacy was especially intense. The ʿAbbāsids came to power vulnerable; their early actions undermined the unitive potential of their office. Having alienated the Shīʿites, they liquidated the Umayyad family, one of whom, ʿAbd ar-Raḥmān I, escaped and founded his own state in Andalusia. Although the ʿAbbāsids were able to buttress their legitimacy by employing the force of their Khorāsānian army, by appealing to their piety-minded support, and by emphasizing their position as heirs to the pre-Islāmic traditions of rulership, their own circumstances and policies militated against them. Despite their continuing preference for Khorāsānian troops, the ʿAbbāsids' move to Iraq and their execution of Abū Muslim disappointed the Khorāsānian chauvinists who had helped them. The non-Muslim majority often rebelled, too. Bih'āfrīd ibn Farwardīn claimed to be a prophet capable of incorporating both Mazdaism and Islām into a new faith. Hāshim ibn Ḥākim, called al-Muqannaʿ (the "Veiled One"), around 759 declared himself a prophet and then a god, heir to all previous prophets, to numerous followers of ʿAlī, and to Abū Muslim himself.

The ʿAbbāsid court at Baghdad

The ʿAbbāsids symbolized their connection with their pre-Islāmic predecessors by founding a new capital, Baghdad, near the old Sāsānian capital. They also continued to elaborate the Sāsānian-like structure begun by the Marwānid governors in Iraq. Their court life became more and more elaborate, the bureaucracy fuller, the inner sanctum of the palace fuller than ever with slaves and concubines as well as the retinues of the caliph's four legal wives. By the time of Hārūn ar-Rashīd (ruled 786–809), Europe had nothing to compare with Baghdad, not even the court of his contemporary Charlemagne (742–814). But problems surfaced, too. Slaves' sons fathered by Muslims were not slaves and so could compete for the succession. Despite the ʿAbbāsids' defense of Islām, unconverted Jews and Christians could be influential at court. The head (vizier or *wazīr*) of the financial bureaucracy sometimes became the effective head of government by taking over the chancery as well. Like all absolute rulers, the ʿAbbāsid caliphs soon confronted the insoluble dilemma of absolutism: the monarch cannot be absolute unless he depends on helpers, but his dependence on helpers undermines his absolutism. Hārūn ar-Rashīd experienced this paradox in a particularly painful way: having drawn into his service prominent members of a family of Buddhist converts, the Barmakids, he found them such rivals that he liquidated them within a matter of years. It was also during Hārūn's reign that Ibrāhīm ibn al-Aghlab, a trusted governor in Tunis, founded a dynasty that gradually became independent, as did the Ṭāhirids, the ʿAbbāsid governors in Khorāsān, two decades later.

The ʿAbbāsids' ability to rival their pre-Islāmic predecessors was enhanced by their generous patronage of artists and artisans of all kinds. The great 7,000-mile Silk Road from Ch'ang-an (now Sian, China) to Baghdad (then the two largest cities in the world) helped provide the wealth. The ensuing literary florescence was promoted by the capture of a group of Chinese papermakers at the Battle of Talas in 751. The ʿAbbāsids encouraged translation from pre-Islāmic languages, particularly Middle Persian, Greek, and Syriac. This activity provided a channel through which older thought could enter and be reoriented by Islāmicate societies. In the field of mathematics, al-Khwārizmī, from whose name the word *algorithm* is derived, creatively combined Hellenistic and Sanskritic concepts. The word *algebra* derives from the title of his major work, *Kitab al-jabr wa al-muqābalah* ("The Book of Integration and Equation"). Movements such as *falsafah* (a combination of the positive sciences with logic and metaphysics) and *kalām* (systematic theological discourse) applied Hellenistic thought to new questions. The translation of Indo-Persian lore promoted the development of *adab,* a name for a sophisticated prose literature as well as the set of refined urbane manners that characterized its clientele. Soon a movement called *shuʿūbīyah* arose to champion the superiority of non-Arabic tastes over the alleged crudeness of the poetry so dear to Arabic litterateurs. However, the great writer of early ʿAbbāsid times, al-Jāḥiẓ, produced a type of *adab* that fused pre-Islāmic and Islāmic concerns in excellent Arabic style. Many of these extra-Islāmic resources conflicted with Islāmic expectations. Ibn al-Muqaffaʿ, an administrator under al-Manṣūr (ruled 754–775), urged his master to emulate pre-Islāmic models, lest the law that the religious specialists (the *ʿulamāʾ*) were developing undermine caliphal authority irrevocably.

The ʿAbbāsids never acted on such advice completely; they even contravened it by appealing for piety-minded support. Having encouraged conversion, they tried to "purify" the Muslim community of what they perceived to be socially dangerous and alien ideas. Al-Mahdī (ruled 775–785) actively persecuted the Manichaeans, whom he defined as heretics so as to deny them status as a protected community. He also tried to identify Manichaeans who had joined the Muslim community without abandoning their previous ideas and practices. ʿAbbāsid "purification of Islām" ironically coincided with some of the most significant absorption of pre-Islāmic monotheistic lore to date, as illustrated by the stories of the prophets written by Al-Kisa'i, grammarian and tutor to a royal prince. Even though, like the Marwānids, the ʿAbbāsids continued to maintain administrative courts, not accessible to the *qāḍī*s, they also promoted the study of *ʿilm* and the status of those who pursued it. In so doing they fostered what Ibn al-Muqaffa' had feared—the emergence of an independent body of law, Sharīʿah, which Muslims could use to evaluate and circumvent caliphal rule itself.

Sharīʿah

A key figure in the development of Sharīʿah was Abū ʿAbd Allāh ash-Shāfiʿī, who died in 820. By his time Islāmic law was extensive but uncoordinated, reflecting differing local needs and tastes. Schools had begun to form around various recognized masters, such as al-Awzāʿī in Syria, Abū Ḥanīfah in Iraq, and Mālik ibn Anas, all of whom used some combination of local custom, personal reasoning, Qur'ān, and Ḥadīth. Ash-Shāfiʿī was born in Mecca, studied with Mālik, participated in a Shīʿite revolt in the Yemen, and was sent to Baghdad as a prisoner of the caliph. After his release he emigrated to Egypt, where he produced his most famous work. Like most other *faqih*s (students of jurisprudence, or *fiqh*), ash-Shāfiʿī viewed Muḥammad's community as a social ideal and his first four successors as rightly guided. So that this exemplary time could provide the basis for Islāmic law, he constructed a hierarchy of legal sources: Qur'ān; Ḥadīth, clearly traceable to Muḥammad and in some cases to his companions; *ijmāʿ* (consensus); and *qiyās* (analogy to one of the first three).

The way in which Islāmic law had developed had allowed many pre-Islāmic customs, such as the veiling and seclusion of women, to receive a sanction not given to them in the Qur'ān or the Ḥadīth. Ash-Shāfiʿī did not change that entirely. Law continued to be pursued in different centres, and several major "ways" (*madhhab*s) began to coalesce among Sunnites and Shīʿites alike. Among Sunnites, four schools came to be preeminent, Shāfiʿīyah (Shafiites), Mālikīyah (Malikites), Ḥanafīyah (Hanafites), and Ḥanābilah (Hanbalites), and each individual Muslim was expected to restrict himself to only one. Furthermore, the notion that the gate of *ijtihād* (personal effort at reasoning) closed in the 9th century was not firmly established until the 12th century. However, ash-Shāfiʿī's system was widely influential in controlling divergence and in limiting undisciplined forms of personal reasoning. It also stimulated the collecting and testing of *ḥadīth* for their unbroken traceability to Muḥammad or a companion. The need to verify *ḥadīth* stimulated a characteristic form of premodern Muslim intellectual and literary activity, the collecting of biographical materials into compendiums (*ṭabaqāt*). By viewing the Qur'ān and documentable *sunnah* as preeminent, ash-Shāfiʿī also undermined those in ʿAbbāsid court circles who wanted a more flexible base from which the caliph could operate. The Sharīʿah came to be a supremely authoritative, comprehensive set of norms and rules covering every aspect of life, from worship to personal hygiene. It applied equally to all Muslims, including the ruler, whom Sharīʿah-minded Muslims came to view as its protector, not its administrator or developer. While the caliphs were toying with theocratic notions of themselves as the shadow of God on earth, the students of legal knowledge were defining their rule as "nomocratic," based only on the law they protected and enforced.

According to the Sharīʿah, a Muslim order was one in which the ruler was Muslim and the Sharīʿah was enshrined as a potential guide to all; Muslims were one confessional community among many, each of which would have its own laws that would apply except in disputes between members of different communities. The Sharīʿah regulated relations and inequities among different segments of society, freeborn Muslim, slave, and protected non-Muslim. The process that produced Sharīʿah resembled the evolution of Oral Torah and rabbinic law, which the Sharīʿah resembled in its comprehensiveness, egalitarianism, and consensualism, in its absorption of local custom, in its resistance to distinguishing the sublime from the mundane, and in its independence from government. Like many Jews, many ultra-pious Muslims came to view the law as a divine rather than human creation.

Debate on the nature of the Qur'ān

The fourth fitnah. During the reign of al-Ma'mūn (813–833) the implications of all this *ʿilm*-based activity for caliphal authority began to become clear. Al-Ma'mūn came to the caliphate as the result of the fourth *fitnah*, which reflected the persisting alienation of Khorāsān. Al-Ma'mūn's father, Hārūn ar-Rashīd, provided for the empire to be divided at his death between two sons. Al-Amīn would rule in the capital and all the western domains; al-Ma'mūn, from his provincial seat at Merv in Khorāsān, would rule the less significant east. When Hārūn died, his sons struggled to expand their control; al-Ma'mūn won. During his reign, which probably represents the high point of caliphal absolutism, the court intervened in an unprecedented manner in the intellectual life of its Muslim subjects, who for the next generation engaged in the first major intra-Muslim conflict that focused on belief as well as practice. The Muslims, who now constituted a much more sizable proportion of the population but whose faith lacked doctrinal clarity, began to engage in an argument reminiscent of 2nd-century Christian discussions of the *logos*. Among Christians, for whom the Word was Jesus, the argument had taken a Christological form. But for Muslims the argument had to centre on the Qur'ān and its created or uncreated nature. Al-Ma'mūn, as well as his brother and successor al-Muʿtaṣim, was attracted to the Muʿtazilah (Mutazilites), whose school had been influenced by Hellenistic ideas as well as by contact with non-Muslim theologians. If the Qur'ān were eternal along with God, his unity would, for the Muʿtazilah, be violated. They especially sought to avoid literal exegesis of the Qur'ān, which in their view discouraged free will and produced embarrassing inconsistencies and anthropomorphisms. By arguing that the Qur'ān was created in time, they could justify metaphorical and changing interpretation. By implication, Muḥammad's position as deliverer of revelation was undermined because *ḥadīth* was made less authoritative.

The opponents of the Muʿtazilah, and therefore of the official position, coalesced around the figure of Aḥmad ibn Ḥanbal. A leading master of *ḥadīth*, he had many followers, some of them recent converts, whom he was able to mobilize in large public demonstrations against the doctrine of the created Qur'ān. Because viewing the Qur'ān as created would invalidate its absolute authority, Ibn Ḥanbal argued for an eternal Qur'ān and emphasized the importance of Muḥammad's *sunnah* to the understanding of it. By his time, major literary works had established a coherent image of the indispensability of Muḥammad's prophethood; in fact, just before the Muʿtazilite controversy began, Ibn Hishām had produced his classic recension of the *Sīrah*, or life, of Muḥammad, composed half a century earlier by Ibn Isḥāq. As in the early Christian Church, these were not merely dogmatic issues. They were rooted in the way ordinary Muslims lived, just as affection for a divine Christ had become popular sentiment by the time Arius and Athanasius debated. Although Muslims lacked an equivalent of the Christian Church, they resolved these issues similarly; like Jesus for the Christians, the Qur'ān for the Muslims was somehow part of God; *ḥadīth*-mindedness and emulation of Muḥammad's *sunnah* had become such an essential part of the daily life of ordinary people that the Muʿtazilite position, as intellectually consistent and attractive as it was, was unmarketable. In a series of forcible inquiries called *miḥnah*, al-Ma'mūn and al-Muʿtaṣim actively persecuted those who, like Ibn Ḥanbal, would not conform; but popular sentiment triumphed and after al-Muʿtaṣim's death the caliph al-Mutawakkil was forced to reverse the stand of his predecessors.

This caliphal failure to achieve doctrinal unity coincided with other crises. By al-Muʿtaṣim's reign the tribal troops were becoming unreliable and the Ṭāhirid governors of Khorāsān more independent. Al-Muʿtaṣim expanded his use of military slaves, finding them more loyal but more unruly, too. Soon he had to house them at Sāmarrā', a new capital north of Baghdad, where the caliphate remained until 892. For most of this period, the caliphs were actually under the control of their slave soldiery; and even though they periodically reasserted their authority, rebellions continued. Many were anti-Muslim, like that of the Iranian Bābak (whose 20-year-long revolt was crushed in 837); but increasingly they were intra-Muslim, like the Kharijite-led revolt of black agricultural slaves (Zanj) in southern Iraq (868–883). By 870, then, the Baghdad–Sāmarrā' caliphate had become one polity among many; its real rulers had no ideological legitimacy. At Córdoba the Umayyads had declared their independence; and the Maghrib was divided among several dynasties of differing persuasions, the Shīʿite Idrīsids, the Kharijite Rustamids, and the Jamāʿi-Sunnite Aghlabids. The former governors of the ʿAbbāsids, the Ṭūlūnids, ruled Egypt and parts of Arabia; Iran was divided between the Ṣaffārids, governors of the ʿAbbāsids in the south, and the Persian Sāmānids in the north.

Unifying forces in Islāmdom

The centrifugal forces represented by these administrative divisions should not obscure, however, the existence of numerous centripetal forces that continued to give Islāmdom, from Andalusia to Central Asia, other types of unity. The ideal of the caliphate continued to be a source of unity after the reality waned; among all the new states, no alternative to the caliphate could replace it. Furthermore, now that Muslims constituted a majority almost everywhere in Islāmdom, conflict began to be expressed almost exclusively in Islāmic rather than anti-Islāmic forms. In spite of continuing intra-Muslim conflict, Muslim worship and belief remained remarkably uniform. The annual pilgrimage to Mecca helped reinforce this underlying unity by bringing disparate Muslims together in a common rite. The pilgrimage, as well as the rise of prosperous regional urban centres, enhanced the trade that traversed Islāmdom regardless of political conflicts; along the trade routes that crisscrossed Eurasia, Islāmdom at its centre, moved not only techniques and goods but ideas as well. A network of credit and banking, caravansaries, and intercity mercantile alliances, tied far-flung regions together. Central was the caravan, then the world's most effective form of transport. The peripatetic nature of education promoted cross-fertilization. Already the *faqīr* (fakir), a wandering mendicant Ṣūfī dervish, was a familiar traveler. Across Islāmdom, similar mosque–market complexes sprang up in most towns; because municipal institutions were rare, political stability so unpredictable, and government intervention kept to a minimum (sometimes by design, more often by necessity), the Sharīʿah and the learned men who carried it became a mainstay of everyday life and social intercourse. The Sharīʿah, along with the widespread affection for the *sunnah* of Muḥammad, regulated, at least among pious Muslims, personal habits of the most specific sort, from the use of scent to the cut of a beard. Comprehensive and practical, the *sunnah* could amuse as well. When asked whether to trust in God or tie one's camel, so a popular *ḥadīth* goes, the Prophet replied, "Trust in God, then tie your camel."

The significance of *ḥadīth* and *sunnah* is represented by the ending date of the period of conversion and crystallization. No one can say exactly when the majority of Islāmdom's population became Muslim. Older scholarship looks to the end of the first quarter of the 9th century; newer scholarship to the beginning of the third quarter. In 870 a man died whose life's work symbolized the consolidation of Islām in everyday life: al-Bukhārī, who produced one of the six collections of *ḥadīth* recognized as authoritative by Jamāʿi-Sunnite Muslims. His fellow collector of *ḥadīth,* Muslim ibn al-Ḥajjāj, died about four years later. About the same time, classical thinkers in other areas of Islāmicate civilization died, among them the great author of *adab,* al-Jāḥiẓ (868/869), the great early ecstatic Ṣūfīs Abu'l Fayḍ Dhu'n-Nūn al-Miṣrī (861) and Abū Yazīd Bisṭāmī (874), the philosopher Yaʿqūb ibn Ishaq aṣ-Ṣabāḥ al-Kindī (870), and the historian of the conquests al-Balādhurī (*c.* 892). Men of different religious and ethnic heritages, they signified, by the last quarter of the 9th century, the full and varied range of intellectual activities of a civilization that had come of age.

Fragmentation and florescence (870–1041)

THE RISE OF COMPETITIVE REGIONS

The unifying forces operative at the end of the period of conversion and crystallization persisted during the period of fragmentation and florescence; but the caliphal lands in Iraq became less central. Even though Baghdad remained preeminent in cultural prestige, important initiatives were being taken from surrounding "regions": Andalusia; the Maghrib and sub-Saharan Africa; Egypt, Syria, and the holy cities (Mecca and Medina); Iraq; and Iran, Afghanistan, Transoxania, and, toward the end of the period, northern India. Regional courts could compete with the ʿAbbāsids and with each other as patrons of culture. Interregional and intra-regional conflicts were often couched in terms of loyalties formed in the period of conversion and crystallization, but local history provided supplemental identities. Although the ʿAbbāsid caliphate was still a focus of concern and debate, other forms of leadership became important. Just as being Muslim no longer meant being Arab, being cultured no longer meant speaking and writing exclusively in Arabic. Certain Muslims began to cultivate a second language of high culture, New Persian. As in pre-Islāmic times, written as well as spoken bilingualism became important. Ethnic differences were blurred by the effects of peripatetic education and shared languages. Physical mobility was so common that many individuals lived and died far from their places of birth. Cultural creativity was so noticeable that this period is often called the Renaissance of Islām.

New Persian language

Economic changes also promoted regional strengths. Although Baghdad continued to profit from its central location, caliphal neglect of Iraq's irrigation system and southerly shifts in the trans-Asian trade promoted the fortunes of Egypt; the opening of the Sahara to Maghribi Muslims provided a new source of slaves, salt, and minerals; and Egyptian expansion into the Mediterranean opened a major channel for Islāmicate influence on medieval Europe. Islāmdom continued to expand, sometimes as the result of aggression on the part of frontier warriors (*ghāzīs*), but more often as the result of trade. The best symbol of this expansiveness is Ibn Faḍlān, who left a provocative account of his mission in 921, on behalf of the Baghdad caliph, to the Volga Bulgars, among whom he met Swedes coming down the river to trade.

By the beginning of the period of fragmentation and florescence the subject populations of most Muslim rulers were predominantly Muslim, and nonsedentary peoples had ceased to play a major role. The period gave way to a much longer period (dated 1041–1405) in which migratory tribal peoples were once again critically important. In 1041 the reign of the Ghaznavid sultan Masʿūd I ended; by then the Ghaznavid state had lost control over the Seljuq Turks in their eastern Iranian domains and thus inaugurated Islāmdom's second era of tribal expansion. Because localism and cosmopolitanism coexisted in the period of fragmentation and florescence, the period is best approached through a region-by-region survey that underscores phenomena of interregional significance.

ANDALUSIA, THE MAGHRIB, AND SUB-SAHARAN AFRICA

Andalusia, far from the centre of Islāmdom, illustrated the extent of ʿAbbāsid prestige and the assertion of local creativity. In the beginning of the period, Islāmicate rule was represented by the Umayyads at Córdoba; established in 756 by a refugee from the ʿAbbāsid victory over the Syrian Umayyads, the Umayyad dynasty in Córdoba had replaced a string of virtually independent deputies of the Umayyad governors in the Maghrib. At first the Cordoban Umayyads had styled themselves *amīr*s, the title also used by caliphal governors and other local rulers; though refugees from ʿAbbāsid hostility, they continued to mention the ʿAbbāsids in the Friday worship session until 773. Their independence was not made official, however, until their best known member, ʿAbd ar-Raḥmān III (ruled 912–961), adopted the title of caliph in 929 and began having the Friday prayer recited in the name of his own house.

The fact that ʿAbd ar-Raḥmān declared his independence from the ʿAbbāsids while he modeled his court after theirs illustrates the period's cultural complexities. Like the ʿAbbāsids' and the Marwānids', ʿAbd ar-Raḥmān's absolute authority was limited by the nature of his army (Berber tribesmen and Slav slaves) and by his dependence on numerous assistants. His internal problems were compounded by external threats, from the Christian kingdoms in the north and the Fāṭimids in the Maghrib (see below). The Umayyad state continued to be the major Muslim presence in the peninsula until 1010, after which time it became, until 1031, but one of many independent city-states. Nowhere is the connection between fragmentation and florescence more evident than in the courts of these *mulūk al-ṭawāʾif,* or "party kings"; for it was they who patronized some of Andalusia's most brilliant Islāmicate culture. This florescence also demonstrated the permeability of the Muslim–Christian frontier. For example, the poet and theologian Ibn Ḥazm (994–1064) composed love poetry, such as *Ṭawk al-ḥamāmah* (*The Ring of the Dove*), which may have contributed to ideas of chivalric love among the Provençal troubadours.

The flowering of Islāmicate culture in Andalusia

In 870 the Maghrib was divided among several dynasties, all but one of foreign origin, and only one of which, the Aghlabids, nominally represented the ʿAbbāsids. The Muslim Arabs had been very different rulers than any of their predecessors—Phoenicians, Romans, Vandals, or Byzantines—who had occupied but not settled. Their interests in North Africa had been secondary to their objectives in the Mediterranean, so they had restricted themselves to coastal settlements, which they used as staging points for trade with the western Mediterranean or as sources of food for their "metropolitan" population. They had separated themselves from the Berbers with a fortified frontier. The Arabs, however, forced away from the coast in order to compete more effectively with the Byzantines, had quickly tried to incorporate the Berbers, who were also pastoralists. One branch of the Berbers, the Ṣanhājah, extended far into the Sahara, across which they had established a caravan trade with blacks in the Sudanic belt. At some time in the 10th century the Ṣanhājah nominally converted to Islām, and their towns in the Sahara began to assume Muslim characteristics. Around 990 a black kingdom in the Sudan, Ghana, extended itself as far as Audaghost, the Ṣanhājah centre in the Sahara. Thus was black Africa first brought into contact with the Muslim Mediterranean, and thus were the conditions set for dramatic developments in the Maghrib during the 12th and 13th centuries (see below, *Migration and renewal*).

In the late 9th century the Maghrib was unified and freed

Unification of the Maghrib

from outside control for the first time. Paradoxically, this independence was achieved by outsiders associated with an international movement of political activism and subversion. Driven underground by ʿAbbāsid intolerance and a maturing ideology of covert revolutionism, the Ismāʿīlī Shīʿites had developed mechanisms to maintain solidarity and undertake political action. These mechanisms can be subsumed under the term *daʿwah,* the same word that had been used for the movement that brought the ʿAbbāsids to power. The *daʿwah*'s ability to communicate rapidly over a large area rested on its traveling operatives as well as on a network of local cells. In the late 9th century an Ismāʿīlī movement, nicknamed the Qarāmiṭah (Qarmatians), had seriously but unsuccessfully threatened the ʿAbbāsids in Syria, Iraq, and Bahrain. Seeking other outlets, a Yemeni operative known as Abū ʿAbd Allāh ash-Shīʿī made contact, on the occasion of the *ḥajj,* with representatives of a Berber tribe that had a history of Kharijite hostility to caliphal control. The *ḥajj* had already become a major vehicle for tying Islāmdom's regions together, and Abū ʿAbd Allāh's movement was only one of many in the Maghrib that would be inaugurated thereby.

In 901 Abū ʿAbd Allāh arrived in the Petite Kabylie (in present-day Algeria); for eight years he prepared for an *imām,* preaching of a millennial restoration of justice after an era of foreign oppression. After conquering the Aghlabid capital al-Qayrawān (in present-day Tunisia), he helped free from a Sijilmassa prison his *imām,* ʿUbayd Allāh, who declared himself the *mahdī,* using a multivalent word that could have quite different meanings for different constituencies. Some Muslims applied *mahdī* to any justice-restoring divinely guided figure; others, including many Jamāʿi-Sunnites, to the apocalyptic figure expected to usher in the millennium before the Last Judgment; and still others, including most Shīʿites, to a returned or restored *imām.* Abū ʿAbd Allāh's followers may have differed in their expectations, but the *mahdī* himself was unequivocal: he was a descendant of ʿAlī and Fāṭimah through Ismāʿīl's disappeared son and therefore was a continuation of the line of the true *imām.* He symbolized his victory by founding a new capital named, after himself, al-Mahdīyah (in present-day Tunisia). During the next half century the "Fāṭimids" tried with limited success to expand westward into the Maghrib and north into the Mediterranean, where they made Sicily a naval base (912–913); but their major goal was Egypt, nominally under ʿAbbāsid control. From Egypt they would challenge the ʿAbbāsid caliphate itself. In 969 the Fāṭimid army conquered the Nile Valley and advanced into Palestine and southern Syria as well.

EGYPT, SYRIA, AND THE HOLY CITIES

The Fāṭimids in Cairo

The Fāṭimids established a new and glorious city, al-Qahirah ("The Victorious"; Cairo), to rival ʿAbbāsid Baghdad. They then adopted the title of caliph, laying claim to be the legitimate rulers of all Muslims as well as head of all Ismāʿīlīs. Now three caliphs reigned in Islāmdom, where there was supposed to be only one. In Cairo the Fāṭimids founded a great mosque–school complex, al-Azhar. They fostered local handicraft production and revitalized the Red Sea route from India to the Mediterranean. They built up a navy to trade as well as to challenge the Byzantines and underscore the ʿAbbāsid caliph's failure to defend and extend the frontiers. Fāṭimid occupation of the holy cities of Mecca and Medina, complete by the end of the 10th century, had economic as well as spiritual significance: it reinforced the caliph's claim to leadership of all Muslims; provided wealth; and helped him keep watch on the West Arabian coast, from the Hejaz to the Yemen, where a sympathetic Zaydī Shīʿite dynasty had ruled since 897. Fāṭimid presence in the Indian Ocean was even strong enough to establish an Ismāʿīlī missionary in Sind. The Fāṭimids patronized the arts; Fāṭimid glass and ceramics were some of Islāmdom's most brilliant. As in other regions, imported styles and tastes were transformed by or supplemented with local artistic impulses, especially in architecture, the most characteristic form of Islāmicate art.

The reign of one of the most unusual Fāṭimid caliphs, al-Ḥākim, from 996 to 1021, again demonstrated the interregional character of the Ismāʿīlī movement. Historians describe al-Ḥākim's personal habits as eccentric, mercurial, and unpredictable to the point of cruelty; his religious values, as inconsistent with official Ismāʿīlī teachings, tending toward some kind of accommodation with the Jamāʿi-Sunnite majority. After he vanished under mysterious circumstances, his religious revisionism was not pursued by his successors or by the Ismāʿīlī establishment in Egypt; but in Syria it inspired a peasant revolt that produced the Druze, who still await al-Ḥākim's return.

When the Fāṭimids expanded into southern Syria, another Shīʿite dynasty, the Ḥamdānid, of Bedouin origin, had been ruling northern Syria from Mosul since 905. In 944 a branch of the family had taken Aleppo; under the leadership of their most famous member, Sayf ad-Dawlah (ruled 945–967), the Ḥamdānids responded aggressively to renewed Byzantine expansionism in eastern Anatolia. They ruled from Aleppo until they were absorbed by the Fāṭimids after 1004; at their court some of Islāmdom's most lastingly illustrious writers found patronage. Two notable examples are the poet al-Mutanabbī (915–965), who illustrated the importance of the poet as a premodern press agent of the court, and al-Fārābī, who tried to reconcile reason and revelation.

Intellectual life under the Ḥamdānids

Al-Fārābī contributed to the ongoing Islāmization of Hellenistic thought. *Falsafah,* the Arabic cognate for the Greek *philosophia,* included metaphysics and logic, as well as the positive sciences, such as mathematics, music, astronomy, and anatomy. *Faylasūfs* often earned their living as physicians, astrologers, or musicians. The *faylasūf*'s whole way of life, like that of the *adīb,* reflected his studies. It was often competitive with that of more self-consciously observant Muslims because the *faylasūf* often questioned the relationship of revelation to real truth. The *faylasūfs* felt free to explore inner truths not exposed to the view of ordinary people; they practiced prudent concealment (*taqīyah*) of their deeper awareness wherever making it public might endanger the social order. The *faylasūfs* shared the principle of concealment with the Shīʿites; both believed, for rather different reasons, that inner truth was accessible to only a very few. This esotericism had counterparts in all premodern societies, where learning and literacy were severely restricted.

IRAQ

Cultural flowering in Iraq. By the late 9th and early 10th centuries the last remnant of the caliphal state was Iraq, under control of the Turkic soldiery. Political decline and instability did not preclude cultural creativity and productivity, however. In fact, Iraq's "generation of 870," loosely construed, contained some of the most striking and lastingly important figures in all of early Islāmicate civilization. Three of them illustrate well the range of culture in late 9th- and early 10th-century Iraq: the historian and Qurʾānic exegete aṭ-Ṭabarī (*c.* 839–923), the theologian Abū al-Ḥasan al-Ashʿarī (*c.* 873–*c.* 935), and the ecstatic mystic al-Ḥallāj (*c.* 858–922).

Aṭ-Ṭabarī

Abū Jaʿfar Muḥammad ibn Jarīr was born in Ṭabaristān, south of the Caspian Sea, and as a young man he traveled to Baghdad. Rarely could a man earn his living from religious learning; unless he found patronage, he would probably engage in trade or a craft. All the more astounding was the productivity of scholars like aṭ-Ṭabarī, who said that he produced 40 leaves a day for 40 years. The size of his extant works, which include a commentary on the Qurʾān and a universal history, testifies to the accuracy of his claim. His history is unique in sheer size and detail and especially in its long-term impact. His method involved the careful selection, organization, and juxtaposition of separate and often contradictory accounts cast in the form of *ḥadīth.* This technique celebrated the *ummah*'s collective memory and established a range of acceptable disagreement.

Al-Ashʿarī

Al-Ashʿarī, from Basra, made his contribution to systematic theological discourse (*kalām*). He had been attracted early to a leading Muʿtazilite teacher, but he broke away at the age of 40. He went on to use Muʿtazilite methods of reasoning to defend popular ideas such as the eternality and literal truth of the Qurʾān, and the centrality of Muḥammad's *sunnah* as conveyed by the *ḥadīth.*

Where his approach yielded objectionable results, such as an anthropomorphic rendering of God or a potentially polytheistic understanding of his attributes, al-Ashʿarī resorted to the principle of *bilā kayfah* ("without regard to the how"), whereby a person of faith accepts that certain fundamentals are true without regard to how they are true and that divine intention is not always accessible to human intelligence. Al-Ashʿarī's harmonization also produced a simple creed, which expressed faith in God, his angels, and his books, and affirmed belief in Muḥammad as God's last messenger and in the reality of death, physical resurrection, the Last Judgment, and heaven and hell. Taken together, aṭ-Ṭabarī's historiography and al-Ashʿarī's theology symbolize the consolidation of Jamāʿi-Sunnite, Sharīʿah-minded thought and piety.

Al-Ḥallāj

The most visible and powerful 10th-century exponent of Ṣūfism was al-Ḥallāj. By his day, Ṣūfism had grown far beyond its early forms, which were represented by al-Ḥasan al-Baṣrī (died 728), who practiced *zuhd,* or rejection of the world, and by Rābiʿah al-ʿAdawīyah (died 801), who formulated the Ṣūfī ideal of a disinterested love of God. The mystics Abū Yazīd Bisṭāmī (died 874) and al-Junayd (died 910) had begun to pursue the experience of unity with God, first by being "drunk" with his love and with love of him, and then by acquiring life-transforming self-possession and control. Masters (called *shaykh*s or *pīr*s) were beginning to attract disciples (*murīd*s) to their way. Like other Muslims who tried to go "beyond" the Sharīʿah to inner truth, the Ṣūfīs practiced concealment of inner awareness (*taqīyah*). Al-Ḥallāj, one of al-Junayd's disciples, began to travel and preach publicly, however. His success was disturbing enough for the authorities in Baghdad to have him arrested and condemned to death; he was tortured and beheaded, and finally his body was burned. Yet his career had shown the power of Ṣūfism, which would by the 12th century become an institutionalized form of Islāmic piety.

The Būyid dynasty. Long before, however, a major political change occurred at Baghdad. In 945 control over the caliphs passed from their Turkish soldiery to a dynasty known as the Būyids or Buwayhids. The Būyids came from Daylam, near the southern coast of the Caspian Sea. Living beyond the reach of the caliphs in Baghdad, its residents had identified with Imāmī Shīʿism. By about 930, three sons of a fisherman named Būyeh had emerged as leaders in Daylam. One of them conquered Baghdad, not replacing the caliph but ruling in his name. The fact that they were Shīʿite, as were the Idrīsids, Fāṭimids, and Ḥamdānids, led scholars to refer to the period from the mid-10th to mid-11th century as the Shīʿite century.

Būyid patronage of culture

Like other contemporary rulers, the Būyids were patrons of culture, especially of speculative thought (Shīʿism, Muʿtazilism, *kalām,* and *falsafah*). Jamāʿi-Sunnite learning continued to be patronized by the caliphs and their families. The Būyids favoured no one party over another. However, their openness paradoxically invited a hardening in Jamāʿi-Sunnite thought. Būyid attempts to maintain the cultural brilliance of the court at Baghdad were limited by a decline in revenue occasioned partly by a shift in trade routes to Fāṭimid Egypt, and partly by long-term neglect of Iraq's irrigation works. The caliphs had occasionally made land assignments (*iqṭāʿ*s) to soldiers in lieu of paying salaries; now the Būyids extended the practice to other individuals and thus removed an important source of revenue from central control. After 983, Būyid territories were split among various members of the family, and pressure was applied to their borders from both the west (by Ḥamdānids and Fāṭimids) and the east (by Sāmānids, Ghaznavids, and Seljuqs; see below).

The economic difficulties of Būyid Iraq promoted urban unrest, accounts of which provide a rare glimpse into the lives of ordinary Muslim town dwellers. Numerous movements served as outlets for socioeconomic grievances, directed most often toward the wealthy or the military. The concentration of wealth in the cities had produced a bipolar stratification system conveyed in the sources by a pair of words, *khāṣṣ* (special) and *ʿāmm* (ordinary). In the environment of 10th- and 11th-century Iraq, an instance of rising food prices or official maltreatment could easily spark riots of varying size, duration, and intensity. Strategies for protest included raiding, looting, and assault. Some movements were more coherently ideological than others, and various forms of piety could reflect socioeconomic distinctions. Some movements were particularly attractive to artisans, servants, and soldiers, as was the case with the proponents of Ḥadīth, whose mentor, Aḥmad ibn Ḥanbal (died 855), was viewed as a martyr because of his suffering at the hands of the Caliph. Other forms of piety, such as Shīʿism, could be associated with wealthier elements among the landowning and merchant classes.

Social action associations: *ʿayyār* and *futūwah*

Beneath the more organized forms of social action lay a more fluid kind of association, most often described by the labels *ʿayyār* and *futūwah.* These terms refer to individuals acting in concert, as needed, on the basis of certain rough-hewn concepts of proper male public behaviour. Such associations had counterparts in the late Hellenistic world, just as they have parallels in the voluntary protective associations formed in the 19th and 20th centuries whenever official institutions of protection have been either chronically or temporarily deficient. For some of the Islāmicate "gangs" or "clubs," thuggery may have been the norm; for others, the figure of the fourth caliph and first *imām,* ʿAlī, seems to have provided an exemplar. Even though Shīʿites had become a separate group with a distinctive interpretation of ʿAlī's significance, a more generalized affection for the family of the Prophet, and especially for ʿAlī, was widespread among Jamāʿi-Sunnites. ʿAlī had come to be recognized as the archetypal young male (*fatā*); a related word, *futūwah,* signified groups of young men who pursued such virtures as courage, aiding the weak, generosity, endurance of suffering, love of truth, and hospitality.

Premodern Islāmicate societies were characterized by a high degree of fluidity, occasionalism, and voluntarism in the structuring of associations, organizations, loyalties, and occupations. Although all societies must develop ways to maintain social boundaries, ease interaction among groups, and buffer friction, the ways in which Muslim societies have fulfilled these needs seem unusually difficult to delineate. For example, in Muslim cities of the period under discussion, the only official officeholders were appointees of the central government, such as the governor; the *muḥtasib,* a transformed Byzantine *agoranomos* who was monitor of public morality as well as of fair-market practice; or the *sahib ash-shurtah,* head of the police. In the absence of an organized church or ordained clergy, those whose influence derived from piety or learning were influential because they were recognized as such, not because they were appointed; and men of very different degrees of learning might earn the designation of *ʿālim.* Although the ruler was expected to contribute to the maintenance of public services, neither he nor anyone else was obligated to do so. Though the ruler might maintain prisons for those whose behaviour he disapproved, the local *qāḍī*s had need of none, relying generally on persuasion or negotiation and borrowing the caliphal police on the relatively rare occasion on which someone needed to be brought before them by force. There was no formalized mode of succession for any of the dynasties of the time. Competition, sometimes armed, was relied upon to produce the most qualified candidate.

Patronage was an important basis of social organization. The family served as a premodern welfare agency; where it was absent, minimal public institutions, such as hospitals, provided. One of the most important funding mechanisms for public services was a private one, the *waqf.* The *waqf* provided a legal way to circumvent the Sharīʿah's requirement that an individual's estate be divided among many heirs. Through a *waqf,* an individual could endow an institution or group with all or part of his estate, in perpetuity, before his death. A *waqf* might provide books for a school, candles or mats for a mosque, salaries of religious functionaries, or land for a hospital or caravansary. *Waqf* money or lands were indivisible, although they might contribute to the welfare of a potential heir who happened to be involved in the *waqf*-supported activity. The *waqf,* like other forms of patronage, provided needed social services without official intervention. On other occasions, wealthy individuals, especially those connected with the ruling family, might simply patronize favourite activities. In addition to patronage, many other overlapping ties bound individual Muslims together: loyalties to an occupation—soldier, merchant, learned man, artisan, government worker; loyalties to a town or neighbourhood, or to a form of piety, or to persons to whom one made an oath for a specific purpose; and ties to patron or to family, especially foster-parentage (*istināʿ*), the counterpart of which was significant in medieval Christendom.

The relationship of individual and group action

The Qurʾān and Sharīʿah discouraged corporate responsibility in favour of individual action; even the legal scope of partnership was limited. Yet the unstable political realities that had militated against the emergence of broad-based institutions sometimes called for corporate action, as when a city came to terms with a new ruler or invader. In those cases, a vaguely defined group of notables, known usually as *aʿyān,* might come together to represent their city in negotiations, only to cease corporate action when the more functional small-group loyalties could safely be resumed. Within this shifting frame of individuals and groups, the ruler was expected to maintain a workable, if not equitable, balance. More often than not the real ruler was a local *amīr* of some sort. For this reason, the de facto system of rule that emerged during this period, despite the persistence of the central caliphate in Baghdad, has sometimes been referred to as the *aʿyān–amīr* system.

The city's physical and social organization reflected this complex relationship between public and private, and between individual and group: physically separated quarters; multiple markets and mosques; mazelike patterns of narrow streets and alleys with dwellings oriented toward an inner courtyard; an absence of public meeting places other than bath, market, and mosque; and the concentration of social life in private residences. The *qāḍī* and *adīb* at-Tanūkhī provides a lively and humorous picture of 10th-century Baghdad, of a society of individuals with overlapping affiliations and shifting statuses: saints and scoundrels, heroes and rogues, rich men and poor. This mobility is illustrated by at-Tanūkhī's boast to a rival, "My line begins with me while yours ends with you." The prose genre of *maqāmah,* said to have been invented by al-Hamadhānī (died 1007), recounted the exploits of a clever, articulate scoundrel dependent on his own wits for his survival and success.

IRAN, AFGHANISTAN, AND INDIA

In the middle of the "Shīʿite century" a major Sunnite revival occurred in eastern Islāmdom in connection with the emergence of the second major language of Islāmicate high culture, New Persian. This double revival was accomplished by two Iranian dynasties, the Sāmānids and the Ghaznavids; Ghaznavid zeal even spilled over into India.

The Sāmānids. The Sāmānid dynasty (819–999) stemmed from a local family appointed by the ʿAbbāsids to govern at Bukhara and Samarkand. Gradually the Sāmānids had absorbed the domains of the rebellious Ṭāhirids and Ṣaffārids in northeastern Iran and reduced the Ṣaffārids to a small state in Sīstān. The Sāmānids, relying on Turkic slave troops, also managed to contain the migratory pastoralist Turkic tribes who continually pressed on Iran from across the Oxus River. In the 950s they even managed to convert some of these Turkic tribes to Islām.

The Sāmānid court at Bukhara attracted leading scholars, such as the philosophers Abū Bakr ar-Rāzī (died 925) and Avicenna (Ibn Sīnā; 980–1037), who later worked for the Būyids; and the poet Ferdowsī (died *c.* 1020). Though not Shīʿites, the Sāmānids expressed an interest in Shīʿite thought, especially in its Ismāʿīlī form, which was then the locus of so much intellectual vitality. The Sāmānids also fostered the development of a second Islāmicate language of high culture, New Persian. It combined the grammatical structure and vocabulary of spoken Persian with vocabulary from Arabic, the existing language of high culture in Iran. A landmark of this "Persianizing" of Iran was Ferdowsī's epic poem, the *Shāh-nāmeh* ("Book of Kings"), written entirely in New Persian in a long-couplet form (*masnavi*) derived from Arabic. Covering several thousand years of detailed mythic Iranian history, Ferdowsī brought Iran's ancient heroic lore, and its hero Rustam, into Islāmicate literature and into the identity of self-consciously Iranian Muslims. He began to compose the poem under the Sāmānids; but he dedicated the finished work to a dynasty that had meanwhile replaced them, the Ghaznavids.

Sebüktigin

The Ghaznavids. The Ghaźnavid dynasty was born in a way that had become routine for Islāmicate polities. Sebüktigin (ruled 977–997), a Sāmānid Turkic slave governor in Ghazna (now Ghaznī), in the Afghan mountains, made himself independent of his masters as their central power declined. His eldest son, Maḥmūd, expanded into Būyid territory in western Iran, identifying himself staunchly with Sunnite Islām. Presenting himself as a frontier warrior against the pagans, Maḥmūd invaded and plundered northwestern India, establishing a permanent rule in the Punjab; but it was through ruling Iran, which gave a Muslim ruler true prestige, that Maḥmūd sought to establish himself. He declared his loyalty to the ʿAbbāsid caliph, whose "investiture" he sought, and expressed his intention to defend Sunnite Islām against the Shīʿite Būyids. Although he and his regime were proud of their Turkic descent, Maḥmūd encouraged the use of New Persian, with its echoes of pre-Islāmic Iranian glory, for administration and for prose as well as poetry. This combination of Turkic identity and Persian language would characterize and empower many other Muslim rulers. To Ghazna Maḥmūd brought, sometimes by force, writers and artisans who could adorn his court. Among these was al-Bīrūnī (973–*c.* 1050), whose scholarly achievements no contemporary could rival. Before being brought to Ghazna, al-Bīrūnī had served the Sāmānids and the Khwārazm-Shāhs, a local dynasty just west of the Oxus River. His works included studies of astronomy (he even suggested a heliocentric universe), gems, drugs, mathematics, and physics; but his most famous book, inspired by accompanying Maḥmūd on his Indian campaigns, was a survey of Indian life, language, religion, and culture.

Like most other rulers of the day, Maḥmūd styled himself *amīr* and emphasized his loyalty to the caliph in Baghdad; but he and later Ghaznavid rulers also called themselves by the Arabic word, *sulṭān* (sultan). Over the next five centuries the office of sultan would become an alternative to caliph. The Ghaznavid state presaged other changes as well, especially by stressing the cleavage between ruler and ruled and by drawing into the ruling class not only the military but also the bureaucracy and the learned establishment. So tied was the ruling establishment to the ruler that it even moved with him on campaign. Ghaznavid "political theory" shared with other states the concept of the circle of justice or circle of power; *i.e.,* that justice is best preserved by an absolute monarch completely outside society; that such a ruler needs an absolutely loyal army; and that maintaining such an army requires prosperity, which in turn depends on the good management of an absolute ruler.

Bu'l-Fażl-i Bayhaqī (995–1077) worked in the Ghaznavid chancery and wrote a remarkable history of the Ghaznavids, the first major prose work in New Persian. He exhibited the broad learning of even a relatively minor figure at court; in his history he combined the effective writing skills of the chancery employee, the special knowledge of Qurʾān and *ḥadīth,* and the sophisticated and entertaining literature—history, poetry, and folklore—that characterized the *adīb.* He provided a vivid picture of life at court, graphically portraying the pitfalls of military absolutism—the dependence of the monarch on a fractious military and a large circle of assistants and advisors, who could mislead him and affect his decision making through internecine maneuvering and competition. In the reign of Maḥmūd's son, Masʿūd I, the weaknesses in the system had already become glaringly apparent. At the Battle of Dandānqān (1040), Masʿūd lost control of Khorāsān, his main holding in Iran, to the pastoralist Seljuq Turks; he then decided to withdraw to Lahore in his Indian domains, from which his successors ruled until overtaken by the Ghūrids in 1186.

THE DECLINE OF THE CALIPHATE AND RISE OF EMIRATES

By the end of Masʿūd's reign, government in Islāmdom had become government by *amīr.* Caliphal centralization had lasted 200 years; and even after the caliphal empire became too large and complex to be ruled from a single centre, the separate emirates that replaced it all defined their legitimacy in relation to it, for or against. In fact, the caliphate's first systematic description and justification was undertaken just when its impracticality was being demonstrated. As the Ghaznavids were ruling in Iran as "appointed" defenders of the caliph, a Baghdadi legal scholar named al-Māwardī retrospectively delineated the minimal requirements of the caliphate and tried to explain why it had become necessary for caliphal powers to be "delegated" in order for the *ummah*'s security to be maintained. Whereas earlier legists had tied the caliph's legitimacy to his defense of the borders, al-Māwardī separated the two, maintaining the caliph as the ultimate source of legitimacy and the guardian of pan-Islāmic concerns, and relegating day-to-day government to his "appointees." Al-Māwardī may have hoped that the Ghaznavids would expand far enough to be "invited" by the caliph to replace the uninvited Shīʿite Būyids. This replacement did occur, three years before al-Māwardī's death; however, it was not the Ghaznavids who appeared in Baghdad but rather the migratory pastoralist Turks who had meanwhile replaced them. The Seljuqs joined many other migrating groups to produce the next phase of Islāmicate history.

Migration and renewal (1041–1405)

Relationship of sedentary and migratory peoples

During this period, migrating peoples once again played a major role, perhaps greater than that of the Arabs during the 7th and 8th centuries. No other civilization in premodern history experienced so much in-migration, especially of alien and disruptive peoples, or showed a greater ability to assimilate as well as to learn from outsiders. Nowhere has the capacity of a culture to redefine and incorporate the strange and the foreign been more evident. In this period, which ends with the death in 1405 of Timur (Tamerlane), the last great tribal conqueror, the tense yet creative relationship between sedentary and migratory peoples emerged as one of the great themes of Islāmicate history, played out as it was in the centre of the great arid zone of Eurasia. Because this period can be seen as the history of peoples as well as of regions, and because the mobility of those peoples brought them to more than one cultural region, this period should be treated group by group rather than region by region.

As a general term "migrating" peoples is preferable because it does not imply aimlessness, as "nomadic" does; or herding, as "pastoralist" does; or kin-related, as "tribal" does. "Migrating" focuses simply on movement from one home to another. Although the Franks, as the crusaders are called in Muslim sources, differed from other migrating peoples, most of whom were pastoralists related by kinship, they too were migrating warriors organized to invade and occupy peoples to whom they were hostile and alien. Though not literally tribal, they appeared to behave like a tribe with a distinctive way of life and a solidarity based on common values, language, and objectives. Viewing them as alien immigrants comparable to, say, the Mongols, helps to explain their reception: how they came to be assimilated into the local culture and drawn into the intra-Muslim factional competition and fighting that was under way in Syria when they arrived.

TURKS

For almost 400 years a succession of Turkic peoples entered eastern Islāmdom from Central Asia. These nearly continuous migrations can be divided into three phases: Seljuqs (1055–92), Mongols (1256–1411), and neo-Mongols (1369–1405). Their long-term impact, more constructive than destructive on balance, can still be felt through the lingering heritage of the great Muslim empires they inspired. The addition of tribally organized warrior Turks to the already widely used Turkic slave soldiery gave a single ethnic group an extensive role in widening the gap between rulers and ruled.

Seljuq Turks. The Seljuqs were a family among the Oğuz Turks, a label applied to the migratory pastoralists of the Syrdarya–Oxus basin. Their name has come to stand for the group of Oğuz families led into Ghaznavid Khorāsān after they had been converted to Sunnite Islām, probably by Ṣūfī missionaries after the beginning of the 11th century. In 1040 the Seljuqs' defeat of the Ghaznavid sultan allowed them to proclaim themselves rulers of Khorāsān. Having expanded into western Iran as well, Toghrïl Beg, also using the title "sultan," was able to occupy Baghdad (1055) after "petitioning" the ʿAbbāsid caliph for permission. The Seljuqs quickly took the remaining Būyid territory and began to occupy Syria, whereupon they encountered Byzantine resistance in the Armenian highlands. In 1071 a Seljuq army under Alp-Arslan defeated the Byzantines at Manzikert north of Lake Van; while the main Seljuq army replaced the Fāṭimids in Syria, large independent tribal bands occupied Anatolia, coming closer to the Byzantine capital than had any other Muslim force.

Policies of Niẓām al-Mulk. The Seljuqs derived their legitimacy from investiture by the caliph, and from "helping" him reunite the *ummah;* yet their governing style prefigured the emergence of true alternatives to the caliphate. Some of their Iranian advisers urged them to restore centralized absolutism as it had existed in pre-Islāmic times and in the period of Marwānid–ʿAbbāsid strength. The best known proponent was Niẓām al-Mulk, chief minister to the second and third Seljuq sultans, Alp-Arslan and Malik-Shāh. Niẓām al-Mulk explained his plans in his *Seyāsat-nāmeh,* one of the best known manuals of Islāmicate political theory and administration. He was unable, however, to persuade the Seljuq sultans to assert enough power over other tribal leaders. Eventually the Seljuq sultans, like so many rulers before them, alienated their tribal supporters and resorted to the costly alternative of a Turkic slave core, whose leading members were appointed to tutor and train young princes of the Seljuq family to compete for rule on the death of the reigning sultan. The tutors were known as *atabeg*s; more often than not, they became the actual rulers of the domains assigned to their young charges, cooperating with urban notables (*aʿyān*) in day-to-day administration.

Founding of *madrasah*s

Although Niẓām al-Mulk was not immediately successful, he did contribute to long-term change. He encouraged the establishment of state-supported schools (*madrasahs*); those he personally patronized were called Niẓāmīyahs. The most important Niẓāmīyah was founded in Baghdad in 1067; here Niẓām al-Mulk gave government stipends to teachers and students whom he hoped he could subsequently not only appoint to the position of *qāḍī* but also recruit for the bureaucracy. Systematic and broad instruction in Jamāʿi-Sunnite learning would counteract the disruptive influences of non-Sunnite or anti-Sunnite thought and activity, particularly the continuing agitation of Ismāʿīlī Muslims. In 1090 a group of Ismāʿīlīs established themselves in a mountain fortress at Alamūt in the mountains of Daylam. From there they began to coordinate revolts all over Seljuq domains. Nominally loyal to the Fāṭimid caliph in Cairo, the eastern Ismāʿīlīs confirmed their growing independence and radicalism by supporting a failed contender for the Fāṭimid caliphate, Nizār. For that act they were known as the Nizārī Ismāʿīlīs. They were led by Ḥasan-e Ṣabbāḥ and were dubbed by their detractors the *hashīshīyah* (assassins) because they practiced political murder while they were allegedly under the influence of hashish.

Niẓām al-Mulk's *madrasah* system enhanced the prestige and solidarity of the Jamāʿi-Sunnite *ʿulamāʾ* without actually drawing them into the bureaucracy or combating anti-Sunnite agitation, but it also undermined their autonomy. It established the connection between state-supported education and office holding, and it subordinated the spiritual power and prestige of the *ʿulamāʾ* to the indispensable physical force of the military *amīr*s. Niẓām al-Mulk unintentionally encouraged the independence of these *amīr*s by extending the *iqṭāʿ* system beyond Būyid practice; he regularly assigned land revenues to individual military officers, assuming that he could keep them under bureaucratic control. When that failed, his system increased the *amīr*s' independence and drained the central treasury.

The *madrasah* system had other unpredictable results

Al-Ghazālī's teaching

that can be illustrated by al-Ghazālī, who was born in 1058 at Ṭūs and in 1091 was made head of the Baghdad Niẓāmīyah. For four years, to great admiration, he taught both *fiqh* and *kalam* and delivered critiques of *falsafah* and Ismāʿīlī thought. According to his autobiographical work *Al-Munqidh min aḍ-ḍalāl* (*The Deliverer from Error*), the more he taught, the more he doubted, until his will and voice became paralyzed. In 1095 he retreated from public life, attempting to arrive at a more satisfying faith. He undertook a radically skeptical reexamination of all of the paths available to the pious Muslim, culminating in an incorporation of the active, immediate, and inspired experience of the Ṣūfīs into the Sharīʿah-ordered piety of the public cult. For his accomplishments, al-Ghazālī was viewed as a renewer (*mujaddid*), a role expected by many Muslims to be filled by at least one figure at the turn of every Muslim century.

Ṭarīqah fellowships. In the 12th century Muslims began to group themselves into *ṭarīqah*s, fellowships organized around and named for the *ṭarīqah* ("way" or "path") of given masters. Al-Ghazālī may have had such a following himself. One of the first large-scale orders, the Qādirīyah, formed around the teachings of ʿAbd al-Qādir al-Jīlānī of Baghdad. Though rarely monastic in the European sense, the activities of a *ṭarīqah* often centred around assembly halls (called *khānqāh, zāwīyah,* or *tekke*) that could serve as places of retreat or accommodate special spiritual exercises. The *dhikr,* for example, is a ceremony in which devotees meditated on the name of God to the accompaniment of breathing exercises, music, or movement, so as to attain a state of consciousness productive of a sense of union with God. Although shortcuts and excesses have often made Ṣūfism vulnerable to criticism, its most serious practitioners have conceived of it as a disciplined extension of Sharīʿah-minded piety, not an escape. In fact, many Ṣūfīs have begun their path through supererogatory fulfillment of standard ritual requirements.

Thousands of *ṭarīqah*s sprang up over the centuries, some associated with particular occupations, locales, or classes. It is possible that by the 18th century most adult Muslim males had some connection with one or more *ṭarīqahs*. The structure of the *ṭarīqah* ensued from the charismatic authority of the master, who, though not a prophet, replicated the direct intimacy that the prophets had shared with God. This quality he passed on to his disciples through a hierarchically ordered network that could extend over thousands of miles. The *ṭarīqah*s thus became powerful centripetal forces among societies in which formal organizations were rare; but the role of the master became controversial because followers often made saints or intercessors of especially powerful Ṣūfī leaders and made shrines or pilgrimage sites of their tombs or birthplaces. Long before these developments could combine to produce stable alternatives to the caliphal system, Seljuq power had begun to decline, only to be replaced for a century and a half with a plethora of small military states. When the Frankish crusaders arrived in the Holy Land in 1099, no one could prevent them from quickly establishing themselves along the eastern Mediterranean coast.

FRANKS

The call for the Crusades. At the Council of Clermont in 1095 Pope Urban II responded to an appeal from the Byzantine emperor for help against the Seljuq Turks, who had expanded into western Anatolia just as the Kipchak Turks in the Ukraine had cut off newly Christian Russia from Byzantium. The First Crusade, begun the next year, brought about the conquest of Jerusalem in 1099. The Christian Reconquista (reconquest) of Spain was already under way, having scored its first great victory at Toledo in 1085. Ironically, modern historiography has concentrated on the crusades that failed and virtually ignored the ones that succeeded. In the four centuries between the fall of Toledo and the fall of Granada (1492), Spanish Christians replaced Muslim rulers throughout the Iberian Peninsula, although Muslims remained as a minority under Christian rule until the early 17th century. In the 200 years from the fall of Jerusalem to the end of the Eighth Crusade (1291), western European crusaders failed to halt the Turkish advance or to establish a permanent presence in the Holy Land. By 1187 local Muslims had managed to retake Jerusalem and thereby contain Christian ambitions permanently. By the time of the Fourth Crusade (1202–04) the crusading movement had been turned inward against Christian heretics such as the Byzantines.

Successful crusades in the Iberian Peninsula

Effect of the Crusades in Syria. The direct impact of the Crusades on Islāmdom was limited largely to Syria. For the century during which western European Christians were a serious presence there, they were confined to their massive coastal fortifications. The crusaders had arrived in Syria at one of its most factionalized periods prior to the 20th century. Seljuq control, never strong, was then insignificant; local Muslim rule was anarchic; the Seljuq regime in Baghdad was competing with the Fāṭimid regime in Egypt; and all parties in Syria were the target of the Nizārī Ismāʿīlī movement at Alamūt. The crusaders soon found it difficult to operate as more than just another faction. Yet the significance of the crusaders as a force against which to be rallied should not be underestimated any more than should the significance of Islāmdom as a force against which Christendom could unite.

The crusaders' situation encouraged interaction with the local population and even assimilation. They needed the food, supplies, and services available in the Muslim towns. Like their Christian counterparts in Spain, they took advantage of the enemy's superior skills, in medicine and hygiene, for example. Because warfare was seasonal and occasional, they spent much of their time in peaceful interaction with their non-Christian counterparts. Some early-generation crusaders intermarried with Arab Muslims or Arab Christians and adopted their personal habits and tastes, much to the dismay of Christian latecomers. An intriguing account of life in Syria during the Crusades can be found in the *Kitāb al-Iʿtibār* ("Book of Reflection"), the memoirs of Usamah ibn Munqidh (1095–1188). Born in Syria, he was a small boy when the first generation of Franks controlled Jerusalem. As an adult he fought with Saladin (see below) and lived to see him unite Egypt with Syria and restore Jerusalem to Muslim control. In this fine example of Islāmicate autobiographical writing, Usamah draws a picture of the Crusades not easily found in European sources: Christians and Muslims observing, and sometimes admiring, each others' skills and habits, from the battlefield to the bathhouse. Although the Franks in Syria were clearly influenced by the Muslims, the Crusades seem to have contributed relatively little to the overall impact of Islāmicate culture on Europe, even though they constituted the most prolonged direct contact.

Although the crusaders never formed a united front against the Muslims, Syrian Muslims did eventually form a united front against them, largely through the efforts of the family of the *amīr* Zangī, a Turkic slave officer appointed Seljuq representative in Mosul in 1127. After Zangī had extended his control through northern Syria, one of his sons and successors, Nureddin (Nūr ad-Dīn), based at Aleppo, was able to tie Zangī's movement to the frontier warrior (*ghāzī*) spirit. This he used to draw together urban and military support for a *jihād* against the Christians. After taking Damascus, he established a second base in Egypt. He offered help to the failing Fāṭimid regime in return for being allowed to place one of his own lieutenants, Saladin (Ṣalāḥ ad-Dīn Yūsuf ibn Ayyūb), as chief minister to the Fāṭimid caliph, thus warding off a crusader alliance with the Fāṭimids. This action gave Nureddin two fronts from which to counteract the superior seaborne and naval support the crusaders were receiving from western Europe and the Italian city-states. Three years before Nureddin's death in 1174, Saladin substituted himself for the Fāṭimid caliph he theoretically served, thus ending more than 200 years of Fāṭimid rule in Egypt. When Nureddin died, Saladin succeeded him as head of the whole movement. When Saladin died in 1193, he had recaptured Jerusalem (1187) and begun the reunification of Egypt and Syria; his successors were known, after his patronymic, as the Ayyūbids. The efforts of a contemporary ʿAbbāsid caliph, an-Nāṣir, to revive the caliphate seem pale by comparison.

The Ayyūbids ruled in Egypt and Syria until 1250, when they were replaced first in Egypt and later in Syria by

Final expulsion of crusaders by Ayyūbids

the leaders of their own slave-soldier corps, the Mamlūks. It was they who expelled the remaining crusaders from Syria, subdued the remaining Nizārī Ismāʿīlīs there, and consolidated Ayyūbid holdings into a centralized state. That state became strong enough in its first decade to do what no other Muslim power could: in 1260 at ʿAyn Jālūt, south of Damascus, the Mamlūk army defeated the recently arrived Mongols and expelled them from Syria.

MONGOLS

The Mongols were pagan, horse-riding tribes of the northeastern steppes of Central Asia. In the early 13th century, under the leadership of Genghis Khan, they formed, led, and gave their name to a confederation of Turkic tribes that they channeled into a movement of global expansion, spreading east into China, north into Russia, and west into Islāmdom. Like other migratory peoples before them, Arabs, Berbers, and Turks, they had come to be involved in citied life through their role in the caravan trade. Unlike others, however, they did not convert to Islām before their arrival. Furthermore, they brought a greater hostility to sedentary civilization, a more ferocious military force, a more cumbersome material culture, a more complicated and hierarchical social structure, and a more coherent sense of tribal law. Their initial impact was physically more destructive than that of previous invaders, and their long-term impact perhaps more socially and politically creative.

First Mongol incursions. The first Mongol incursions into Islāmdom in 1220 were a response to a challenge from the Khwārezm-Shāh ʿAlāʾ ad-Dīn Muḥammad, the aggressive reigning leader of a dynasty formed in the Oxus Delta by a local governor who had rebelled against the Seljuq regime in Khorāsān. Under Genghis Khan's leadership, Mongol forces destroyed numerous cities in Transoxania and Khorāsān in an unprecedented display of terror and annihilation. By the time of Genghis Khan's death in 1227, his empire stretched from the Caspian Sea to the Sea of Japan. A later successor, Möngke, decided to extend the empire in two new directions. From the Mongol capital of Karakorum, he simultaneously dispatched Kublai Khan to southern China (where Islām subsequently began to expand inland) and Hülegü to Iran (1256). Hülegü had already received Sunnite ambassadors who encouraged him to destroy the Ismāʿīlī state at Alamūt; this he did and more, reaching Baghdad in 1258, where he terminated and replaced the caliphate. The ʿAbbāsid line continued, however, until 1517; the Mamlūk sultan Baybars I, shortly after his defeat of the Mongols, invited a member of the ʿAbbāsid house to "invest" him and to live in Cairo as spiritual head of all Muslims.

The Mongol regimes in Islāmdom quickly became rivals. The Il-Khans controlled the Tigris–Euphrates valley and Iran; the Chagatai dominated the Syrdarya and Oxus basins, the Kābul mountains, and eventually the Punjab; and the Golden Horde was concentrated in the Volga basin. The Il-Khans ruled in the territories where Islām was most firmly established. They patronized learning of all types and scholars from all parts of the vast Mongol empire, especially China. Evincing a special interest in nature, they built a major observatory in Azerbaijan. Just as enthusiastically as they had destroyed citied life, they now rebuilt it, relying as had all previous invaders of Iran on the administrative skills of indigenous Persian-speaking bureaucrats. The writings of one of these men, ʿAṭā Malek Joveynī, who was appointed Mongol governor in Baghdad in 1259, described the type of rule the Mongols sought to impose. It has been called the military patronage state because it involved a reciprocal relationship between the foreign tribal military conquerors and their subjects. The entire state was defined as a single mobile military force connected to the household of the monarch; with no fixed capital, it moved with the monarch. All non-Turkic state workers, bureaucratic or religious, even though not military specialists, were defined as part of the army (*asker*); the rest of the subject population, as the herds (*raʿīyah*). The leading tribal families could dispose of the wealth of the conquered populations as they wished, except that their natural superiority obligated them to reciprocate by patronizing whatever of excellence the cities could produce. What the Ghaznavids and Seljuqs had begun, the Mongols now accomplished. The self-confidence and superiority of the leading families were bolstered by a fairly elaborate set of tribal laws, inherited from Genghis Khan and known as the Yasa, which served to regulate personal status and criminal liability among the Mongol elite, as did the Sharīʿah among Muslims. In Il-Khanid hands, this dynastic law merely coexisted but did not compete with Sharīʿah; but in later Turkic regimes a reconciliation was achieved that extended the power of the rulers beyond the limitations of an autonomous Sharīʿah.

Military patronage system of Mongol rule

Conversion of Mongols to Islām. For a time the Il-Khans tolerated and patronized all religious persuasions, Sunnite, Shīʿite, Buddhist, Nestorian Christian, Jewish, and pagan. But in 1295 a Buddhist named Maḥmūd Ghāzān became Khan and declared himself Muslim, compelling other Mongol notables to follow suit. His patronage of Islāmicate learning fostered such brilliant writers as Rashīd ad-Dīn, the physician and scholar who authored one of the most famous Persian universal histories of all time. The Mongols, like other Islāmicate dynasties swept into power by a tribal confederation, were able to unify their domains for only a few generations. By the 1330s their rule had begun to be fragmented among myriad local leaders. Meanwhile, on both Mongol flanks, other Turkic Muslim powers were increasing in strength.

To the east the Delhi Sultanate of Turkic slave soldiers withstood Mongol pressure, benefited from the presence of scholars and administrators fleeing Mongol destruction, and gradually began to extend Muslim control south into India, a feat that was virtually accomplished under Muḥammad ibn Tughluq. Muslim Delhi was a culturally lively place that attracted a variety of unusual persons. Muḥammad ibn Tughluq himself was, like many later Indian Muslim rulers, well read in philosophy, science, and religion. Not possessing the kind of dynastic legitimacy the pastoralist Mongols had asserted, he tied his legitimacy to his support for the Sharīʿah, and he even sought to have himself invested by the ʿAbbāsid "caliph" whom the Mamlūks had taken to Cairo. His concern with the Sharīʿah coincided with the growing popularity of Ṣūfism, especially as represented by the massive Chishti *ṭarīqah*. Its most famous leader, Niẓām ad-Dīn Awliyāʾ, had been a spiritual adviser to many figures at court before Muḥammad ibn Tughluq came to the throne, as well as to individual Hindus and Muslims alike. In India, Ṣūfism, which inherently undermined communalism, was bringing members of different religious communities together in ways very rare in the more westerly parts of Islāmdom.

To the west, the similarly constituted Mamlūk state continued to resist Mongol expansion. Its sultans were chosen, on a nonhereditary basis, from among a group of freed slaves who acted as the leaders of the various slave corps. At the death of one sultan the various military corps would compete to see whose leader would become the next sultan. The leaders of the various slave corps formed an oligarchy that exercised control over the sultan. Although political instability was the frequent and natural result of such a system, cultural florescence did occur. The sultans actively encouraged trade and building, and Mamlūk Cairo became a place of splendour, filled with numerous architectural monuments. While the Persian language was becoming the language of administration and high culture over much of Islāmdom, Arabic alone continued to be cultivated in Mamlūk domains, to the benefit of a diversified intellectual life. Ibn an-Nafīs (died 1288), a physician, wrote about pulmonary circulation 300 years before it was "discovered" in Europe. For Mamlūk administrative personnel, al-Qalqashandī composed an encyclopaedia in which he surveyed not only local practice but also all the information that a cultivated administrator should know. Ibn Khallikān composed one of the most important Islāmicate biographical works, a dictionary of eminent men. Sharīʿah-minded studies were elaborated: the *ʿulamāʾ* worked out a political theory that tried to make sense of the sultanate, and they also explored the possibility of enlarging on the Sharīʿah by reference to *falsafah* and Ṣūfism.

Cairo under Mamlūk rule

However, in much the same way as ash-Shāfiʿī had responded in the 9th century to what he viewed as dangerous legal diversity, another great legal and religious reformer, Ibn Taymīyah, living in Mamlūk Damascus in the late 13th and early 14th century, cautioned against such extralegal practices and pursuits. He insisted that the Sharīʿah was complete in and of itself and could be adapted to every age by any *faqih* who could analogize according to the principle of human advantage (*maṣlaḥah*). A Ḥanbalī himself, Ibn Taymīyah became as popular as his school's founder, Aḥmad ibn Ḥanbal. Like him, Ibn Taymīyah attacked all practices that undermined what he felt to be the fundamentals of Islām, including all forms of Shīʿite thought as well as aspects of Jamāʿi-Sunnite piety (often influenced by the Ṣūfīs) that stressed knowledge of God over service to him. Most visible among such practices was the revering of saints' tombs, which was condoned by the Mamlūk authorities. Ibn Taymīyah's program and popularity so threatened the Mamlūk authorities that they put him in prison, where he died. His movement did not survive, but when his ideas surfaced, in the revolutionary movement of the Wahhābīyah in the late 18th century, their lingering power became dramatically evident.

Further west, the Rūm Seljuqs at Konya submitted to the Mongols in 1243 but survived intact. They continued to cultivate the Islāmicate arts, architecture in particular. The most famous Muslim ever to live at Konya, Jalāl ad-Dīn ar-Rūmī, had emigrated from eastern Iran with his father before the arrival of the Mongols. In Konya, Jalāl ad-Dīn, attracted to Ṣūfī activities, attached himself to the master Shams ad-Dīn. The poetry inspired by Jalāl ad-Dīn's association with Shams ad-Dīn is unparalleled in Persian literature. Its recitation, along with music and movement, was a key element in the devotional activities of Jalāl ad-Dīn's followers, who came to be organized into a Ṣūfī *ṭarīqah* named the Mevleviyah (Mawlawīyah) after their title of respect for him, Mevlana ("Our Master"). In his poetry Jalāl ad-Dīn explored all varieties of metaphors, including intoxication, to describe the ineffable ecstasy of union with God.

Poetry of Jalāl ad-Dīn ar-Rūmī

Ascent of the Ottoman Turks. It was not from the Rūm Seljuqs, however, that lasting Muslim power in Anatolia was to come, but rather from one of the warrior states on the Byzantine frontier. The successive waves of Turkic migrations had driven unrelated individuals and groups across central Islāmdom into Anatolia. Avoiding the Konya state, they gravitated toward an open frontier to the west, where they began to constitute themselves, often through fictitious kinship relationships, into quasi-tribal states that depended on raiding each other and Byzantine territory and shipping. One of these, the Osmanlıs, or Ottomans, named for their founder, Osman I (ruled 1281–1324), was located not on the coast, where raiding had its limits, but in Bithynia just facing Constantinople. In 1326 they won the town of Bursa and made it their first capital. From Anatolia they crossed over into Thrace in the service of rival factions at Constantinople, then began to occupy Byzantine territory, establishing their second capital at Edirne on the European side. Their sense of legitimacy was complex. They were militantly Muslim, bound by the *ghāzī* spirit, spurred on in their intolerance of local Christians by Greek converts and traveling Ṣūfīs who gravitated to their domains. At the same time, *ʿulamāʾ* from more settled Islāmic lands to the east encouraged them to abide by the Sharīʿah and tolerate the Christians as protected non-Muslims. The Ottomans also cast themselves as deputies of the Rūm Seljuqs, who were themselves originally "deputized" by the ʿAbbāsid caliph. Finally they claimed descent from the leading Oğuz Turk families, who were natural rulers over sedentary populations. Under Murad I (ruled *c.* 1360–89) the state began to downplay its warrior fervour in favour of more conventional Islāmicate administration. Instead of relying on volunteer warriors, Murad established a regular cavalry, which he supported with land assignments, as well as a specially trained infantry force called the "new troops," Janissaries, drawn from converted captives. Expanding first through western Anatolia and Thrace, the Ottomans under Bayezid I (ruled 1389–1403) turned their eyes toward eastern and southern Anatolia; just as they had incorporated the whole, they encountered a neo-Mongol conqueror expanding into Anatolia from the east who utterly defeated their entire army in a single campaign (1402).

Timur's efforts to restore Mongol power. Timur (Tamerlane) was a Turk, not a Mongol; but he aimed to restore Mongol power. He was born a Muslim in the Syrdarya valley and served local pagan Mongol warriors and finally the Chagatai heir-apparent; but he rebelled and made himself ruler in Khwārezm in 1380. He planned to restore Mongol supremacy under a thoroughly Islāmic program. He surpassed the Mongols in terror, constructing towers out of the heads of his victims. Having established himself in Iran, he moved first on India and then on Ottoman Anatolia and Mamlūk Syria; but before he could consolidate his realm, he died. His impact was twofold: his defeat of the Ottomans inspired a comeback that would produce one of the greatest Islāmicate empires of all time, and one of the Central Asian heirs to his tradition of conquest would found another great Islāmicate empire in India. These later empires managed to find the combination of Turkic and Islāmic legitimacy that could produce the stable centralized absolutism that had eluded all previous Turkic conquerors.

ARABS

When the Fāṭimids conquered Egypt in 969, they left a governor named Zīrī in the Maghrib. By 1041 the dynasty founded by Zīrī declared its independence from the Fāṭimids, but it too was challenged by breakaways such as the Zanātah in Morocco and the Ḥammādids in Algeria. Gradually the Zīrids were restricted to the eastern Maghrib. There they were invaded from Egypt by two Bedouin Arab tribes, the Banū Halīl and the Banū Sulaym, at the instigation (1052) of the Fāṭimid ruler in Cairo. This mass migration of warriors as well as wives and children is known as the Hilālian invasion. Though initially disruptive, the Hilālian invasion had an important cultural impact; it resulted in a much greater spread of the Arabic language than had occurred in the 7th century and inaugurated the real Arabization of the Maghrib.

Hilālian invasion of the eastern Maghrib

BERBERS

When the Arab conquerors arrived in the Maghrib in the 7th century, the indigenous peoples they met were the Berbers, a group of predominantly but not entirely migratory tribes who spoke a recognizably common Hamito-Semitic language with significant dialectal variations. Berber tribes could be found from present-day Morocco to present-day Algeria, and from the Mediterranean to the Sahara. As among the Arabs, small tribal groupings of Berbers occasionally formed short-lived confederations or became involved in caravan trade. No previous conqueror had tried to assimilate the Berbers, but the Arabs quickly converted them and enlisted their aid in further conquests. Without their help, for example, Andalusia could never have been incorporated into the Islāmicate state. At first only Berbers nearer the coast were involved, but by the 11th century Muslim affiliation had begun to spread far into the Sahara.

The Ṣanhājah confederation. One particular western Saharan Berber confederation, the Ṣanhājah, was responsible for the first Berber-directed effort to control the Maghrib. The Ṣanhājah were camel herders who traded mined salt for gold with the black kingdoms of the south. By the 11th century their power in the western Sahara was being threatened by expansion both from other Berber tribes, centred at Sijilmassa, and from the Soninke state at Ghana to the south, which had actually captured their capital of Audaghost in 990. The subsequent revival of their fortunes parallels Muḥammad's revitalization of the Arabs 500 years earlier, in that Muslim ideology reinforced their efforts to unify several smaller groups. The Ṣanhājah had been in contact with Islām since the 9th century, but their distance from major centres of Muslim life had kept their knowledge of the faith minimal. In 1035, however, Yaḥyā ibn Ibrāhīm, a chief from one of their tribes, the Gudālah, went on *ḥajj*. For the Maghribi pilgrim, the cultural impact of the *ḥajj* was experienced not only in Mecca and

Yaḥyā ibn Ibrāhīm's conversion to Islām

Medina but also on the many stops along the 3,000-mile overland route. When Yaḥyā returned, he was accompanied by a teacher from Nafis (in present-day Libya), ʿAbd Allāh ibn Yasīn, who would instruct the Berbers in Islām as teachers under ʿUmar I had instructed the Arab fighters in the first Muslim garrisons. Having met with little initial success, the two are said to have retired to a *ribāṭ*, a fortified place of seclusion, perhaps as far south as an island in the Sénégal River, to pursue a purer religious life. The followers they attracted to that *ribāṭ* were known, by derivation, as *al-murābiṭūn* ("the people of the retreat"); the dynasty they founded came to be known by the same name, or Almoravids in its Anglicized form. In 1042 Ibn Yasīn declared a *jihād* against the Ṣanhājah tribes, including his own, as people who had embraced Islām but then failed to practice it properly. By his death in 1059, the Ṣanhājah confederation had been restored under an Islāmic ideology; and the conquest of Morocco, which lacked strong leadership, was under way.

The Almoravid dynasty. Ibn Yasīn's spiritual role was taken by a consultative body of *ʿulamāʾ*. His successor as military commander was Abū Bakr ibn ʿUmar. While pursuing the campaign against Morocco, Abū Bakr had to go south, leaving his cousin Yūsuf ibn Tāshufīn as his deputy. When Abū Bakr tried to return, Ibn Tāshufīn turned him back to the south, where he remained until his death in 1087. Under Ibn Tāshufīn's leadership, by 1082, Almoravid control extended as far as Algiers. In 1086 Ibn Tāshufīn responded to a request for help from the Andalusian party kings, unable to defend themselves against the Christian kingdoms in the north, such as Castile. By 1110 all Muslim states in Andalusia had come under Almoravid control.

Like most other Jamāʿi-Sunnite rulers of his time, Ibn Tāshufīn had himself "appointed" deputy by the caliph in Baghdad. He also based his authority on the claim to bring correct Islām to peoples who had strayed from it. For him "correct" Islām meant the Sharīʿah as developed by the Mālikī *faqih*s, who played a key role in the Almoravid state by working out the application of the Sharīʿah to everyday problems. Like their contemporaries elsewhere, they received stipends from the government, sat in the ruler's council, went on campaign with him, and gave him recommendations (*fatwa*s) on important decisions. This was an approach to Islām far more current than the one it had replaced, but still out of touch with the liveliest intellectual developments. During the next phase of Berber activism, newer trends from the east reached the Maghrib.

Ibn Tūmart's revolt

A second major Berber movement originated in a revolt begun against Almoravid rule in 1125 by Ibn Tūmart, a settled Maṣmūdah Berber from the Atlas Mountains. Like Ibn Yasīn, Ibn Tūmart had been inspired by the *ḥajj*, which he used as an opportunity to study in Baghdad, Cairo, and Jerusalem, acquainting himself with all current schools of Islāmic thought and becoming a disciple of the ideas of the recently deceased al-Ghazālī. Emulating his social activism, Ibn Tūmart was inspired to act on the familiar Muslim dictum, "Command the good and forbid the reprehensible." His early attempts took two forms, disputations with the scholars of the Almoravid court and public chastisement of Muslims who in his view contradicted the rules of Islām; he went so far as to throw the Almoravid ruler's sister off her horse because she was unveiled in public. His activities aroused hostility and he fled to the safety of his own people. There, like Muḥammad, he grew from teacher of a personal following to leader of a social movement.

Like many subsequent reformers, especially in Africa and other outlying Muslim lands, Ibn Tūmart used Muḥammad's career as a model. He interpreted the Prophet's rejection and retreat as an emigration (*hijrah*) that enabled him to build a community, and he divided his followers into *muhājirūn* ("fellow emigrants") and *anṣār* ("helpers"). He preached the idea of surrender to God to a people who had strayed from it. Thus could Muḥammad's ability to bring about radical change through renewal be invoked without actually claiming the prophethood that he had sealed forever. Ibn Tūmart further based his legitimacy on his claim to be a *sharīf* (descendant of Muḥammad) and the *mahdī*, not in the Shīʿite sense but in the more general sense of a human sent to restore pure faith. In his view Almoravid students of legal knowledge were so concerned with pursuing the technicalities of the law that they had lost the purifying fervour of their own founder, Ibn Yasīn. They even failed to maintain proper Muslim behaviour, be it the veiling of women in public or the condemning of the use of wine, musical instruments, and other unacceptable, if not strictly illegal, forms of pleasure. Like many Muslim revitalizers before and since, Ibn Tūmart decried the way in which the law had taken on a life of its own, and he called upon Muslims to rely on the original and only reliable sources, the Qurʾān and *ḥadīth.* Although he opposed irresponsible rationalism in the law, in matters of theological discourse he leaned toward the limited rationalism of the Ashʿarite school, which was becoming so popular in the eastern Muslim lands. Like the Ashʿarites, he viewed the unity of God as one of Islām's fundamentals and denounced any reading of the Qurʾān that led to anthropomorphism. Because he focused on attesting the unity of God (*tawḥīd*), he called his followers al-Muwaḥḥidūn (Almohads), "those who attest the unity of God." Ibn Tūmart's movement signified the degree to which Maghribis could participate in the intellectual life of Islāmdom as a whole; but his need to use Berber for his many followers who did not know Arabic also illustrates the limits of interregional discourse.

The Almohad dynasty. By 1147, 17 years after Ibn Tūmart's death, Almohads had replaced Almoravids in all their Maghribi and Andalusian territories. In Andalusia their arrival slowed the progress of the Christian Reconquista. There, as in the Maghrib, arts and letters were encouraged: an example is an important movement of *falsafah* that included Ibn Ṭufayl, Ibn al-ʿArabī, and Ibn Rushd (Latin Averroës), the Andalusian *qāḍī* and physician whose interpretations of Aristotle became so important for medieval European Christianity. During the late Almohad period in Andalusia the intercommunal nature of Islāmicate civilization became especially noticeable in the work of non-Muslim thinkers, such as Moses Maimonides, who participated in trends outside their own communities even at the expense of criticism from within. By the early 13th century, Almohad power began to decline; a defeat in 1212 at Las Navas de Tolosa by the Christian kings of the north forced a retreat to the Maghrib. But the impact of Almohad cultural patronage on Andalusia long outlasted Almohad political power; successor dynasties in surviving Muslim states were responsible for some of the highest achievements of Andalusian Muslims, among them the Alhambra palace in Granada. Furthermore, the 400-year southward movement of the Christian–Muslim frontier resulted, ironically, in some of the most intense Christian–Muslim interaction in Andalusian history. The Cid could fight for both sides; Muslims, as Mudejars, could live under Christian rule and contribute to its culture; Jews could translate Arabic and Hebrew texts into Castilian. Almohads were replaced in the Maghrib as well, through a revolt by their own governors: the Ḥafṣids in Tunis and the Marīnid Berber dynasty in Fès. There too, however, Almohad influence outlasted their political presence: both towns became centres, in distinctively Maghribi form, of Islāmicate culture and Islāmic piety.

Continued spread of Islāmic influence. As the Maghrib became firmly and distinctively Muslim, Islām moved south. The spread of Muslim identity into the Sahara and the involvement of Muslim peoples, especially the Tuareg, in trans-Saharan trade provided several natural channels of influence. By the time of the Marīnids, Ḥafṣids, and Mamlūks, several major trade routes had established crisscrossing lines of communication: from Cairo to Timbuktu, from Tripoli to Bornu and Lake Chad, from Tunis to Timbuktu at the bend of the Niger River, and from Fès and Tafilalt through major Saharan entrepôts into Ghana and Mali. The rise at Timbuktu of Mali, the first great western Sudanic empire with a Muslim ruler, attested the growing incorporation of sub-Saharan Africa into the North African orbit. The reign of Mansa Mūsā, who even went on pilgrimage, demonstrated the influence of Islām on at least the upper echelons of African society.

Travel writings of Ibn Baṭṭūṭah

The best picture of Islāmdom in the 14th century appears in the work of a remarkable Maghribi *qāḍī* and traveler, Ibn Baṭṭūṭah (1304–1368/77). In 1325, the year that Mansa Mūsā went on pilgrimage, Ibn Baṭṭūṭah also left for Mecca, from his hometown of Tangiers. He was away for almost 30 years, visiting most of Islāmdom, including Andalusia, all of the Maghrib, Mali, Syria, Arabia, Iran, India, the Maldive Islands, and, he claimed, China. He described the unity within diversity that was one of Islāmdom's most prominent features. Although local customs often seemed at variance with his notion of pure Islāmic practice, he felt at home everywhere. Despite the divisions that had occurred during Islām's 700-year history, a Muslim could attend the Friday worship session in any Muslim town in the world and feel comfortable, a claim that is difficult if not impossible to make for any other major religious tradition at any time in its history. By the time of Ibn Baṭṭūṭah's death, Islāmdom comprised the most far-flung yet interconnected set of societies in the world. As one author has pointed out, Thomas Aquinas (*c.* 1224–74) might have been read from Spain to Hungary and from Sicily to Norway; but Ibn al-ʿArabī (1165–1240) was read from Spain to Sumatra and from the Swahili coast to Kazan on the Volga River. By the end of the period of migration and renewal, Islām had begun to spread not only into sub-Saharan Africa but also into the southern seas with the establishment of a Muslim presence in the Straits of Malacca. Conversion to Islām across its newer frontiers was at first limited to a small elite, who supplemented local religious practices with Muslim ones. Islām could offer not only a unifying religious system but also social techniques, including alphabetic literacy, a legal system applicable to daily life, a set of administrative institutions, and a body of science and technology—all capable of enhancing the power of ruling elements and of tying them into a vast and lucrative trading network.

The period of migration and renewal exposed both the potentiality and the limitations of government by tribal peoples. This great problem of Islāmicate history received its most sophisticated analysis from a Maghribi Muslim named Ibn Khaldūn (1332–1406), a contemporary of Petrarch. His family had migrated from Andalusia to the Maghrib, and he himself was born in Ḥafṣid territory. He was both a *faylasūf* and a *qāḍī*, a combination more common in Andalusia and the Maghrib than anywhere else in Islāmdom. His *falsafah* was activist; he strove to use his political wisdom to the benefit of one of the actual rulers of the day. To this end he moved from one court to another before becoming disillusioned and retiring to Mamlūk Cairo as a *qāḍī*. His life thus demonstrated the importance and the constraints of royal patronage as a stimulant to intellectual creativity. In his *Muqaddimah* (the introduction to his multivolume world history) he used his training in *falsafah* to discern patterns in history. Transcending the critiques of historical method made by historians of the Būyid period, such as al-Masʿūdī, Miskawayh, and as-Suli, Ibn Khaldūn established careful standards of evidence. Whereas Muslim historians conventionally subscribed to the view that God passed sovereignty and hegemony (*dawlah*) from one dynasty to another through his divine wisdom, Ibn Khaldūn explained it in terms of a cycle of natural and inevitable stages. By his day it had become apparent that tribally organized migratory peoples, so favoured by much of the ecology of the Maghrib and the Nile-to-Oxus region, could easily acquire military superiority over settled peoples if they could capitalize on the inherently stronger group feeling (*ʿaṣabīyyah*) that kinship provides. Once in power, according to Ibn Khaldūn, conquering groups pass through a phase in which a small number of "builders" among them bring renewed vitality to their conquered lands. As the family disperses itself among sedentary peoples and ceases to live the hard life of migration, it becomes soft from the prosperity it has brought and begins to degenerate. Then internal rivalries and jealousies force one member of the family to become a king who must rely on mercenary troops and undermine his own prosperity by paying for them. In the end, the ruling dynasty falls prey to a new tribal group with fresh group feeling. Thus did Ibn Khaldūn call attention to the unavoidable instability of all premodern Muslim dynasties, caused by their lack of the regularized patterns of succession that were beginning to develop in European dynasties.

Consolidation and expansion (1405–1683)

Shifting power of Muslims and Europeans

After the death of Timur in 1405, power began to shift from migrating peoples to sedentary populations living in large centralized empires. After about 1683, when the last Ottoman campaign against Vienna failed, the great empires for which this period is so famous began to shrink and weaken, just as western Europeans first began to show their potential for worldwide expansion and domination. When the period began, Muslim lands had begun to recover from the devastating effects of the Black Death (1346–48), and many were prospering. Muslims had the best opportunity in history to unite the settled world, but by the end of the period, they had been replaced by Europeans as the leading contenders for this role. Muslims were now forced into direct and repeated contact with Europeans, through armed hostilities as well as through commercial interactions; and often the Europeans competed well. Yet Muslim power was so extensive, and the western Europeans such an unexpected source of competition, that Muslims were able to realize that their situation had changed only after they no longer had the strength to resist. Furthermore, the existence of several strong competitive Muslim states militated against a united response to the Europeans and could even encourage some Muslims to align themselves with the European enemies of others.

In this period, long after Islāmdom was once thought to have peaked, centralized absolutism reached its height, aided in part by the exploitation of gunpowder warfare and in part by new ways to fuse spiritual and military authority. Never before had Islāmicate ideals and institutions better demonstrated their ability to encourage political centralization, or to support a Muslim style of life where there was no organized state, be it in areas where Islām had been long established, or in areas where it was newly arrived. The major states of this period impressed contemporary Europeans; in them some of the greatest Islāmicate artistic achievements were made. In this period Muslims formed the cultural patterns that they brought into modern times, and adherence to Islām expanded to approximately its current distribution. As adherence to Islām expanded, far-flung cultural regions began to take on a life of their own. The unity of several of these regions was expressed through empire—the Ottomans in southeastern Europe, Anatolia, the eastern Maghrib, Egypt, and Syria; the Ṣafavids in Iran and Iraq; the Indo-Timurids (Mughals) in India. In these empires, Sunnite and Shīʿite became identities on a much larger scale than ever before, expressing competition between large populations; simultaneously Shīʿism acquired a permanent base from which to generate international opposition. Elsewhere, less formal and often commercial ties bound Muslims from distant locales; growing commercial and political links between Morocco and the western Sudan produced a trans-Saharan Maghribi Islām; Egyptian Islām influenced the central and eastern Sudan; and steady contacts between East Africa, South Arabia, southern Iran, southwest India, and the southern seas promoted a recognizable Indian Ocean Islām, with Persian as its lingua franca. In fact, Persian became the closest yet to an international language; but the expansion and naturalization of Islām also fostered a number of local languages into vehicles for Islāmicate administration and high culture—Ottoman, Chagatai, Swahili, Urdu, and Malay. Everywhere Muslims were confronting adherents of other religions, and new converts often practiced Islām without abandoning their previous practices. The various ways in which Muslims responded to religious syncretism and plurality continue to be elaborated to the present day.

Expansion of Muslim presence

This was a period of major realignments and expansion. The extent of Muslim presence in the Eastern Hemisphere in the early 15th century was easily discernible, but only with difficulty could one have imagined that it could soon produce three of the greatest empires in world history. From the Atlantic to the Pacific, from the Balkans to Sumatra, Muslim rulers presided over relatively small kingdoms; but nowhere could the emergence of a world-class dynasty be predicted. In Andalusia only one Muslim state, Granada, remained to resist Christian domination of the Iberian Peninsula. The Maghrib, isolated between an almost all-Christian Iberia and an eastward-looking Mamlūk Egypt and Syria, was divided between the Marīnids and Ḥafṣids. Where the Sahara shades off into the Sudanic belt, the empire of Mali at Gao was ruled by a Muslim and included several Saharan "port" cities, such as Timbuktu, that were centres of Muslim learning. On the Swahili coast, oriented as always more toward the Indian Ocean than toward its own hinterland, several small Muslim polities centred on key ports such as Kilwa. In western Anatolia and the Balkan Peninsula the Ottoman state under Sultan Meḥmed I was recovering from its defeat by Timur. Iraq and western Iran were the domains of Turkic tribal dynasties known as the Black Sheep (Kara Koyunlu) and the White Sheep (Ak Koyunlu); they shared a border in Iran with myriad princelings of the Timurid line; and the neo-Mongol, neo-Timurid Uzbek state ruled in Transoxania. North of the Caspian, several Muslim khanates ruled as far north as Moscow and Kazan. In India, even though Muslims constituted a minority, they were beginning to assert their power everywhere except the south, which was ruled by Vijayanagar. In Islāmdom's far southeast, the Muslim state of Samudra held sway in Sumatra, and the rulers of the Moluccas had recently converted to Islām and begun to expand into the southern Malay Peninsula. Even where no organized state existed, as in the outer reaches of Central Asia and into southern China, scattered small Muslim communities persisted, often centred on oases. By the end of this period, Islāmdom's borders had retreated only in Russia and Iberia; but these losses were more than compensated by continuing expansion in Europe, Africa, Central Asia, and South and Southeast Asia. Almost everywhere this plethora of states had undergone realignment and consolidation, based on experimentation with forms of legitimation and structure.

OTTOMANS

The conquest of Constantinople (1453)

Continuation of Ottoman rule. After the Ottoman state's devastating defeat by Timur, its leaders had to retain the vitality of the warrior spirit (without its unruliness and intolerance) and the validation of the Sharīʿah (without its confining independence). In 1453, Meḥmed II, the Conqueror, fulfilled the warrior ideal by conquering Constantinople (soon to be known as Istanbul), putting an end to the Byzantine Empire, and subjugating the local Christian and Jewish populations. Even by then, however, a new form of legitimation was taking shape. The Ottomans continued to wage war against Christians on the frontier and to levy and convert (through the *devşirme*) young male Christians to serve in the sultan's household and army; but warriors were being pensioned off with land grants and replaced by troops more beholden to the sultan. Except for those forcibly converted, the rest of the non-Muslim population was protected for payment according to the Sharīʿah and the preference of the *ulema* (the Turkish spelling of *ʿulamāʾ*), and organized into self-governing communities known as *millet*s. Furthermore, the sultans began to claim the caliphate because they met two of its traditional qualifications: they ruled justly, in principle according to the Sharīʿah, and they defended and extended the frontiers, as in their conquest of Mamlūk Egypt, Syria, and the holy cities in 1516–17. Meanwhile they began to undercut the traditional oppositional stance of the *ulema* by building on Seljuq and Mongol practice in three ways: they promoted state-supported training of *ulema*; they defined and paid holders of religious offices as part of the military; and they aggressively asserted the validity of dynastic law alongside Sharīʿah. Simultaneously, they emphasized their inheritance of Byzantine legitimacy by transforming Byzantine symbols, such as Hagia Sophia (Church of the Divine Wisdom), into symbols for Islām; and by favouring their empire's European part, called, significantly, Rūm.

Four-part administrative structure

Reign of Süleyman I. The classical Ottoman system crystallized during the reign of Süleyman I, the Lawgiver (ruled 1520–66). He also pushed the empire's borders almost to their furthest limits, to the walls of Vienna in the northwest, throughout the Maghrib up to Morocco in the southwest, into Iraq to the east, and to the Yemen in the southeast. During Süleyman's reign the Ottomans even sent an expedition into the southern seas to help Aceh against the Portuguese colonizers. In theory, Süleyman presided over a balanced four-part structure: the palace household, which contained all of the sultan's wives, concubines, children, and servants; the bureaucracy (chancery and treasury); the armed forces; and the religious establishment. Important positions in the army and bureaucracy went to the cream of the *devşirme,* Christian youths converted to Islām and put through special training at the capital to be the sultan's personal "slaves." *Ulema* who acquired government posts had undergone systematic training at the major *medrese*s (*madrasah*s) and so in the Ottoman state were more integrated than were their counterparts in other states; yet they were free-born Muslims, not brought into the system as slaves of the sultan. The ruling class communicated in a language developed for their use only, Ottoman, which combined Turkic syntax with largely Arabic and Persian vocabulary. It was in this new language that so many important figures demonstrated the range and sophistication of Ottoman interests, such as the historian Mustafa Naima, the encyclopaedist Kâtip Çelebi, and the traveler Evliya Çelebi. The splendour of the Ottoman capital owed not a little to Süleyman's chief architect, the Greek *devşirme* recruit Sinan, who transformed the city's skyline with magnificent mosques and *medreses.*

The extent of Ottoman administration. Even in North Africa and the Fertile Crescent, where Ottoman rule was indirect, the effect of its administration, especially its land surveys and *millet* and tax systems, could be felt; remnants of the Ottoman system continue to play a role in the political life of modern states such as Israel and Lebanon, despite the fact that Ottoman control had already begun to relax by the first quarter of the 17th century. By then control of the state treasury was passing, through land grants, into the hands of local *aʿyān,* and they gradually became the real rulers, serving local rather than imperial interests. Meanwhile discontinuance of the *devşirme* and the rise of hereditary succession to imperial offices shut off new sources of vitality. Monarchs, confined to the palace during their youth, became weaker and participated less in military affairs and government councils. As early as 1630, Sultan Murad IV was presented by one of his advisers with a memorandum explaining the causes of the perceived decline and urging a restoration of the system as it had existed under Süleyman. Murad IV tried to restore Ottoman efficiency and central control, and his efforts were continued by subsequent sultans aided by a talented family of ministers known as the Köprülüs. However, during a war with Austria and Poland from 1682 to 1699, in which a major attack on Vienna failed (1683), the Ottomans suffered their first serious losses to an enemy and exposed the weakness of their system to their European neighbours. They signed two treaties, at Carlowitz in 1699 and at Passarowitz in 1718, that confirmed their losses in southeastern Europe, signified their inferiority to the Habsburg coalition, and established the defensive posture they would maintain into the 20th century.

ṢAFAVIDS

The Ṣafavid state began not from a band of *ghāzī* warriors but from a local Ṣūfī *ṭarīqah* of Ardabīl in Azerbaijan. The *ṭarīqah* was named after its founder, Shaykh Ṣafī od-Dīn (1252/53–1334), a local holy man. As for many *ṭarīqah*s and other voluntary associations, Sunnite and Shīʿite alike, affection for the family of ʿAlī was a channel for popular support. During the 15th century Shaykh Ṣafī's successors transformed their local *ṭarīqah* into an interregional movement by translating ʿAlid loyalism into full-fledged Imāmi Shīʿism. By asserting that they were the Ṣūfī "perfect men" of their time as well as descendants and representatives of the last *imām,* they strengthened the support of their Turkic tribal disciples (known as the Kizilbash, or "Red

Heads," because of their symbolic 12-fold red headgear). They also attracted support outside Iran, especially in eastern Anatolia (where the anti-Ottoman Imāmi Bekṭāshī *ṭarīqah* was strong), in Syria, the Caucasus, and Transoxania. The ability of the Iranian Shīʿite state to serve as a source of widespread local opposition outside of Iran was again to become dramatically apparent many years later, with the rise of the ayatollah Ruhollah Khomeini's Islāmic Republic in the late 1970s.

Proclamation of Ismāʿīl I as shah

Expansion in Iran and beyond. By 1501 the Ṣafavids were able to defeat the Ak Koyunlu rulers of northern Iran, whereupon their teenage leader Ismāʿīl I (ruled 1501–24) had himself proclaimed shah, using that pre-Islāmic title for the first time in almost 900 years and thereby invoking the glory of ancient Iran. The Ṣafavids thus asserted a multivalent legitimacy that flew in the face of Ottoman claims to have restored caliphal authority for all Muslims. Eventually, irritant became threat: by 1510, when Ismāʿīl had conquered all of Iran (to approximately its present frontiers) as well as the Fertile Crescent, he began pushing against the Uzbeks in the east and the Ottomans in the west, both of whom already suffered from significant Shīʿite opposition that could easily be aroused by Ṣafavid successes. Having to fight on two fronts was the most difficult military problem any Muslim empire could face. According to the persisting Mongol pattern, the army was a single force attached to the household of the ruler and moving with him at all times; so the size of an area under effective central control was limited to the farthest points that could be reached in a single campaign season. After dealing with his eastern front, Ismāʿīl turned west. At Chāldirān (1514) in northwestern Iraq, having refused to use gunpowder weapons, Ismāʿīl suffered the kind of defeat at Ottoman hands that the Ottomans had suffered from Timur. Yet through the war of words waged in a body of correspondence between Shah Ismāʿīl and the Ottoman sultan Selim I, and through the many invasions from both fronts that occurred during the next 60 years, the Ṣafavid state survived and prospered. Still living off its position at the crossroads of the trans-Asian trade that had supported all previous empires in Iraq and Iran, it was not yet undermined by the gradual emergence of more significant sea routes to the south.

The first requirement for the survival of the Ṣafavid state was the conversion of its predominantly Jamāʿī-Sunnite population to Imāmi Shīʿism. This was accomplished by a government-run effort supervised by the state-appointed leader of the religious community, the *ṣadr.* Gradually forms of piety emerged that were specific to Ṣafavid Shīʿism; they centred on pilgrimage to key sites connected with the *imām*s, as well as on the annual remembering and reenacting of the key event in Shīʿite history, the caliph Yazīd I's destruction of Imām al-Ḥusayn at Karbalāʾ on the 10th of Muḥarram, AH 61 (680 CE). The 10th of Muḥarram, or ʿĀshūrāʾ, already marked throughout Islāmdom with fasting, became for Iranian Shīʿites the centre of the religious calendar. The first 10 days of Muḥarram became a period of communal mourning, during which the pious imposed suffering on themselves to identify with their martyrs of old, listened to sermons, and recited appropriate elegiac poetry. In later Ṣafavid times the name for this mourning, *taʿzīyeh,* also came to be applied to passion plays performed to reenact events surrounding al-Ḥusayn's martyrdom. Through the depths of their empathetic suffering, Shīʿites could help to overturn the injustice of al-Ḥusayn's martyrdom at the end of time, when all wrongs would be righted, all wrongdoers punished, and all true followers of the *imām*s rewarded.

Shah ʿAbbās I. The state also survived because Ismāʿīl's successors moved, like the Ottomans, toward a type of legitimation different from the one that had brought them to power. This development began in the reign of Ṭahmāsp (1524–76) and culminated in the reign of the greatest Ṣafavid shah, ʿAbbās I (ruled 1588–1629). Since Ismāʿīl's time, the tribes had begun to lose faith in the Ṣafavid monarch as spiritual leader; now ʿAbbās appealed for support more as absolute monarch and less as the charismatic Ṣufi master or incarnated *imām.* At the same time he freed himself from his unruly tribal *amīr*s by depending more and more on a paid army of converted Circassian, Georgian, and Armenian Christian captives. Meanwhile he continued to rely on a large bureaucracy headed by a chief minister with limited responsibilities; but, unlike his Ottoman contemporaries, he distanced members of the religious community from state involvement while allowing them an independent source of support in their administration of the *waqf* system. Because the Shīʿite *ʿulamāʾ* had a tradition of independence that made them resist incorporation into the military "household" of the shah, ʿAbbās' policies were probably not unpopular; but they eventually undermined his state's legitimacy. By the end of the period under discussion, it was the religious leaders, the *mujtahid*s, who would claim to be the spokesmen for the hidden *imām.* Having shared the ideals of the military patronage state, the Ottoman state became more firmly militarized and religious, as the Ṣafavid became more civilianized and secular. The long-term consequences of this breach between government and the religious institution were extensive, culminating in the establishment of the Islāmic Republic of Iran in 1978.

Ṣafavid capital at Isfahan

ʿAbbās expressed his new role by moving his capital in about 1597–98 to Isfahan in Fārs, the central province of the ancient pre-Islāmic Iranian empires and symbolically more Persian than Turkic. Isfahan, favoured by a high and scenic setting, became one of the most beautiful cities in the world, leading its boosters to say, "Isfahan is half the world." It came to contain, often thanks to royal patronage, myriad palaces, gardens, parks, mosques, *medrese*s, caravansaries, workshops, and public baths. Many of these still stand, including the famed Masjed-e Shah, a mosque that shares the great central mall with an enormous covered bazaar and many other structures. It was here that ʿAbbās received diplomatic and commercial visits from Europeans, including a Carmelite mission from Pope Clement XIII (1604) and the adventuring Sherley brothers from Elizabethan England. Just as his visitors hoped to use him to their own advantage, ʿAbbās hoped to use them to his, as sources of firearms and military technology, or as pawns in his economic warfare against the Ottomans, in which he was willing to seek help from apparently anyone, including the Russians, Portuguese, and Habsburgs.

Under Ṣafavid rule, Iran in the 16th and 17th centuries became the centre of a major cultural flowering expressed through the Persian language and through the visual arts. This flowering extended to Ṣafavid neighbour states as well—Ottomans, Uzbeks, and Indo-Timurids. Like other Shīʿite dynasties before them, the Ṣafavids encouraged the development of *falsafah* as a companion to Shīʿite esotericism and cosmology. Two major thinkers, Mīr Dāmād and his disciple Mullā Ṣadrā, members of the Ishrāqī, or illuminationist, school, explored the realm of images or symbolic imagination as a way to understand issues of human meaningfulness. The Ṣafavid period was also important for the development of Shīʿite Sharīʿah-minded studies, and it produced a major historian, Iskandar Beg Munshī, chronicler of ʿAbbās' reign.

Decline of central authority. None of ʿAbbās' successors was his equal, though his state, ever weaker, survived for a century. The last effective shah, Ḥusayn I (1694–1722), could defend himself neither from tribal raiding in the capital nor from interfering *mujtahid*s led by Mohammad Bāqir Majlisī (whose writings later would be important in the Islāmic Republic of Iran). In 1722, when Maḥmūd of Qandahār led an Afghan tribal raid into Iran from the east, he easily took Isfahan and destroyed what was left of central authority.

INDO-TIMURIDS (MUGHALS)

Foundation by Bābur. Although the Mongol-Timurid legacy influenced the Ottoman and Ṣafavid states, it had its most direct impact on Bābur (1483–1530), the adventurer's adventurer and founder of the third major empire of the period. Bābur's father, ʿUmar Shaykh Mīrzā (died 1494) of Fergana, was one among many Timurid "princes" who continued to rule small pieces of the lands their great ancestor had conquered. After his father's death the 11-year-old Bābur, who claimed descent not only from

Timur but also from Genghis Khan (on his mother's side), quickly faced one of the harshest realities of his time and place—too many princes for too few kingdoms. In his youth he dreamed of capturing Samarkand as a base for reconstructing Timur's empire. For a year after the Ṣafavid defeat of the Uzbek Muḥammad Shaybānī Khān, Bābur and his Chagatai followers did hold Samarkand, as Ṣafavid vassals; but when the Ṣafavids were in turn defeated, Bābur lost not only Samarkand but his native Fergana as well. He was forced to retreat to Kābul, which he had occupied in 1504. From there he never restored Timur's empire; rather, barred from moving north or west, he took the Timurid legacy south, to a land on which Timur had made only the slightest impression.

Victory in India

When Bābur turned toward northern India, it was ruled from Delhi by the Lodī sultans, one of many local Turkic dynasties scattered through the subcontinent. In 1526 at Pānīpat, Bābur met and defeated the much larger Lodī army. In his victory he was aided, like the Ottomans at Chāldirān, by his artillery. By his death just four years later, he had laid the foundation for a remarkable empire, known most commonly as the Mughal (*i.e.,* Mongol). It is more properly called Indo-Timurid because the Chagatai Turks were distinct from the surviving Mongols of the time and because Bābur and his successors acknowledge Timur as the founder of their power.

Bābur is also remembered for his memoirs, the *Bābur-nāmeh.* Written in Chagatai, then an emerging Islāmicate literary language, his work gives a lively and compelling account of the wide range of interests, tastes, and sensibilities that made him so much a counterpart of his contemporary, the Italian Niccolò Machiavelli (1469–1527).

Reign of Akbar. Süleyman's and ʿAbbās' counterpart in the Indo-Timurid dynasty was their contemporary, Akbar (ruled 1556–1605), the grandson of Bābur. At the time of his death, he ruled all of present-day India north of the Deccan Plateau and Gondwana, and more: one diagonal of his empire extended from the Hindu Kush to the Bay of Bengal; the other, from the Himalayas to the Arabian Sea. Like its contemporaries to the west, particularly the Ottomans, this state endured because of a regularized and equitable tax system that provided the central treasury with funds to support the ruler's extensive building projects as well as his *manṣabdār*s, the military and bureaucratic officers of the imperial service. For these key servants, Akbar, again like his counterparts to the west, relied largely on foreigners who were trained especially for his service. Like the Janissaries, the *manṣabdār*s were not supposed to inherit their offices, and, although they were assigned lands to supervise, they themselves were paid through the central treasury to assure their loyalty to the interests of the ruler.

Akbar's centralized state

Although Akbar's empire was, like Süleyman's and ʿAbbās', a variation on the theme of the military patronage state, his situation, and consequently many of his problems, differed from theirs in important ways. Islām was much more recently established in most of his empire than in either of the other two, and Muslims were not in the majority. Although the other two states were not religiously or ethnically homogeneous, the extent of their internal diversity could not compare with Akbar's, where Muslims and non-Muslims of every stripe alternately coexisted and came into conflict—Jacobites (members of the Monophysite Syrian church), Ṣūfīs, Ismāʿīlī Shīʿites, Zoroastrians, Jains, Jesuits, Jews, and Hindus. Consequently, Akbar was forced even more than the Ottomans to confront and address the issue of religious plurality. The option of aggressive conversion was virtually impossible in such a vast area, as was any version of the Ottoman *millet* system in a setting in which hundreds if not thousands of *millet*s could be defined.

In some ways Akbar faced, in exaggerated form, the situation that the Arab Muslims faced when they were a minority in the Nile-to-Oxus region in the 7th–9th century. Granting protected status to non-Muslims, even those who were not really "peoples of the book" in the original sense, with an organized religion of their own, was legally and administratively justifiable; but unless they could be kept from interacting too much with the Muslim population, Islām itself could be affected. The power of Ṣūfī *ṭarīqah*s like the influential Chishtis, and of the Hindu mystical movement of Gurū Nānak, were already promoting intercommunal interaction and cross-fertilization. Akbar's response was different from that of the ʿAbbāsid caliph al-Mahdi. Instead of institutionalizing intolerance of non-Muslim influences, and instead of hardening communal lines, Akbar banned intolerance and even the special tax on non-Muslims. To keep the *ʿulamāʾ* from objecting, he tried, for different reasons than had the Ottomans and Ṣafavids, to tie them to the state financially. His personal curiosity about other religions was exemplary; with the help of Abu'l-Faẓl, his Ṣūfī adviser and biographer, he established a kind of salon for religious discussion. A very small circle of personal disciples seems to have emulated Akbar's own brand of *tawḥīd-i ilāhī* ("divine oneness"). This appears to have been a general monotheism akin to what the *ḥanīf*s of Mecca, and Muḥammad himself, had once practiced, as well as to the boundary-breaking pantheistic awareness of great Ṣūfīs like ar-Rūmī and Ibn al-ʿArabī, who was very popular in South and Southeast Asia. Akbar combined toleration for all religions with condemnation of practices that seemed to him humanly objectionable, such as enslavement and the immolation of widows.

Continuation of the empire. For half a century, Akbar's first two successors, Jahāngīr and Shāh Jahān, continued his policies. A rebuilt capital at Delhi was added to the old capitals of Fatehpur Sīkri and Āgra, site of Shāh Jahān's most famous building, the Tāj Mahal. The mingling of Hindu and Muslim traditions was expressed in all the arts, especially in naturalistic and sensuous painting; extremely refined and sophisticated design in ceramics, inlay-work, and textiles; and in delicate yet monumental architecture. Shāh Jahān's son, Dārā Shikōh (1615–59), was a Ṣūfī thinker and writer who tried to establish a common ground for Muslims and Hindus. In response to such attempts, a Sharīʿah-minded movement of strict communalism arose, connected with a leader of the Naqshbandī *ṭarīqah* named Shaykh Aḥmad Sirhindī. With the accession of Aurangzeb (ruled 1659–1707) the tradition of ardent ecumenicism, which would reemerge several centuries later in a non-Muslim named Mohandas K. (Mahatma) Gandhi, was replaced with a stricter communalism that imposed penalties on protected non-Muslims and stressed the shah's role as leader of the Muslim community, by virtue of his enforcing the Sharīʿah. Unlike the Ottoman and Ṣafavid domains, the Indo-Timurid empire was still expanding right up to the beginning of the 18th century; but the empire began to disintegrate shortly after the end of Aurangzeb's reign, when Ṣafavid and Ottoman power were also declining rapidly.

Rise of communalism

Between the 15th and 18th century the use of coffee, tea, and tobacco, despite the objections of the *ʿulamāʾ*, became common in all three empires. Teahouses became important new centres for male socializing, in addition to the home, the mosque, the marketplace, and the public bath. (Female socializing was restricted largely to the home and the bath.) In the teahouses men could practice the already well-developed art of storytelling and take delight in the clever use of language. *The Thousand and One Nights* (*Alf laylah wa laylah*), the earliest extant manuscripts of which date from this period, and the stories of the Arabian hero ʿAntar must have been popular, as were the tales of a wise fool known as Mullah Nasroddin in Persian (Nasreddin), Hoca in Turkish, and Juḥā in Arabic. The exploits of Nasroddin, sometimes in the guise of Ṣūfī dervish or royal adviser, often humorously portray centralized absolutism and mysticism: "Nasroddin was sent by the King to investigate the lore of various kinds of Eastern mystical teachers. They all recounted to him tales of the miracles and the sayings of the founders and great teachers, all long dead, of their schools. When he returned home, he submitted his report, which contained the single word 'Carrots.' He was called upon to explain himself. Nasroddin told the King: 'The best part is buried; few know—except the farmer—by the green that there is orange underground; if you don't work for it, it will deteriorate; there are a great many donkeys associated with it.' "

TRANS-SAHARAN ISLĀM

When the Ottomans expanded through the southern Mediterranean coast in the early 16th century, they were unable to incorporate Morocco, where a new state had been formed in reaction to the appearance of the Portuguese. The Portuguese were riding the momentum generated by their own seaborne expansion as well as by the fulfillment of the Reconquista and the establishment of an aggressively intolerant Christian regime in the centre of the Iberian Peninsula. In Morocco, it was neither the fervour of warriors nor Shīʿite solidarity nor Timurid restoration that motivated the formation of a state; rather it was a very old form of legitimacy that had proved to be especially powerful in Africa, that of the *sharīf*s, descendants of Muḥammad. It had last been relied on with the Idrīsids; now the *sharīf*s were often associated with Ṣūfī holy men, known as marabouts. It was one such Ṣūfī, Sīdī Barakāt, who legitimated the Saʿdī family of *sharīf*s as leaders of a *jihad* that expelled the Portuguese and established an independent state (1511–1603) strong enough to expand far to the south. Meanwhile the greatest Muslim kingdom of the Sudan, Songhai, was expanding northward; and its growing control of major trade routes into Morocco provoked Moroccan interference. Invaded in 1591, Songhai was ruled as a Moroccan vassal for 40 years, during which time Morocco itself was experiencing political confusion and instability. Morocco was reunited in 1668 by the ʿAlawite *sharīf*s. A holy family of Sijilmassa, they were brought to power by Arab tribal support, which they eventually had to replace with a costly army of black slaves. Like the Saʿdīs, they were legitimated in two ways: by the recognition of leading Ṣūfīs and by the special spiritual quality (*barakah*) presumed to have passed to them by virtue of their descent from the Prophet through ʿAlī. Although they were not Shīʿites, they cultivated charismatic leadership that undermined the power of the *ʿulamāʾ* to use the Sharīʿah against them. They also recognized the limits of their authority as absolute monarchs, dividing their realm into the area of authority and the area of no authority (where many of the Berber tribes lived). Thus the Moroccan *sharīf*s solved the universal problems of legitimacy, loyalty, and control in a way tailored to their own situation.

Islāmic states in the Sudanic region

While the Saʿdī dynasty was ruling in Morocco, but long before its incursions into the Sahara, a number of small Islāmic states were strung from one end of the Sudanic region to the other: Senegambia, Songhai, Aïr, Mossi, Nupe, Hausa, Kanem-Bornu, Darfur, and Funj. Islām had come to these areas along trade and pilgrimage routes, especially through the efforts of a number of learned teaching-trading families such as the Kunta. Ordinarily the ruling elites became Muslim first, employing the skills of Arab immigrants, traders, or travelers, and taking political and commercial advantage of the Arabic language and the Sharīʿah without displacing indigenous religious practices or legitimating principles. By the 16th century the Muslim states of the Sudanic belt were in contact not only with the major Muslim centres of the Maghrib and Egypt, but also with each other through an emerging trans-Sudanic pilgrimage route. Furthermore, Islām had by then become well enough established to provoke efforts at purification comparable with the Almoravid movement of the 11th century. Sometimes these efforts were gradualist and primarily educational, as was the case with the enormously influential Egyptian scholar as-Suyūṭī (1445–1505). His works, read by many West African Muslims for centuries after his death, dealt with numerous subjects, including the coming of the *mahdī* to restore justice and strengthen Islām. He also wrote letters to Muslim scholars and rulers in West Africa more than 2,000 miles away, explaining the Sharīʿah and encouraging its careful observance.

Other efforts to improve the observance of Islām were more militant. Rulers might forcibly insist on an end to certain non-Muslim practices, as did Muḥammad Rumfa (ruled 1463–99) in the Hausa city-state of Kano, or Muḥammad I Askia, the greatest ruler of Songhai (ruled 1493–1528). Often, as in the case of both of these rulers, militance was encouraged by an aggressive reformist scholar like al-Maghīlī (flourished 1492), whose writings detailed the conditions that would justify a *jihād* against Muslims who practiced their faith inadequately. Like many reformers, al-Maghīlī identified himself as a *mujaddid*, a figure expected to appear around the turn of each Muslim century. (The 10th century of the *hijrah* era began in 1494.) To the east in Ethiopia, an actual *jihād* was carried out by Aḥmad Grāñ (*c.* 1506–43), in the name of opposition to the Christian regime and purification of "compromised" Islām. Further to the east, a conquest of Christian Nubia by Arab tribes of Upper Egypt resulted in the conversion of the pagan Funj to Islām and the creation of a major Muslim kingdom there. Although most indigenous West African scholars looked to foreigners for inspiration, a few began to chart their own course. In Timbuktu, where a rich array of Muslim learning was available, one local scholar and member of a Tukulor learned family, Aḥmad Bābā, was writing works that were of interest to North African Muslims. Local histories written in Arabic also survive, such as the *Taʾrīkh al-fattāsh* (written by several generations of the Kāti family, from 1519 to 1665), a chronological history of Songhai, or as-Saʿdī's *Taʾrīkh al-Sūdān* (completed in 1655). By the end of the period of consolidation and expansion, Muslims in the Sudanic belt were being steadily influenced by North African Islām but were also developing distinctive traditions of their own.

INDIAN OCEAN ISLĀM

A similar relationship was simultaneously developing across another "sea," the Indian Ocean, which tied South and Southeast Asian Muslims to East African and south Arabian Muslims the way the Sahara linked North African and Sudanic Muslims. Several similarities are clear: the alternation of advance and retreat, the movement of outside influences along trade routes, and the emergence of significant local scholarship. There were differences, too: Indian Ocean Muslims had to cope with the Portuguese threat and to face Hindus and Buddhists more than pagans, so that Islām had to struggle against sophisticated and refined religious traditions that possessed written literature and considerable political power.

The Aceh state

The first major Muslim state in Southeast Asia, Aceh, was established around 1524 in northern and western Sumatra in response to more than a decade of Portuguese advance. Under Sultan Iskandar Muda (ruled 1608–37), Aceh reached the height of its prosperity and importance in the Indian Ocean trade, encouraging Muslim learning and expanding Muslim adherence. By the end of the 17th century, Aceh's Muslims were in touch with major intellectual centres to the west, particularly in India and Arabia, just as West African Muslims were tied to centres across the Sahara. Because they could draw on many sources, often filtered through India, Sumatran Muslims may have been exposed to a wider corpus of Muslim learning than Muslims in many parts of the heartland. Aceh's scholarly disputes over Ibn al-ʿArabī were even significant enough to attract the attention of a leading Medinan, Ibrahim al-Kurani, who in 1640 wrote a response. The same kind of naturalization and indigenization of Islām that was taking place in Africa was also taking place here; for example, ʿAbd ar-Raʾūf of Singkel, after studying in Arabia from about 1640 to 1661, returned home, where he made the first "translation" of the Qurʾān into Malay, a language that was much enriched during this period by Arabic script and vocabulary. This phenomenon extended even to China. Liu Chih, a scholar born around 1650 in Nanking, created serious Islāmicate literature in Chinese, including works of philosophy and law.

In the early 17th century another Muslim commercial power emerged when its ruler, the prince of Tallo, converted; Macassar (now Ujung Pandang) became an active centre for Muslim competition with the Dutch into the third quarter of the 17th century, when its greatest monarch, Ḥasan ad-Dīn (ruled 1631–70), was forced to cede his independence. Meanwhile, however, a serious Islāmic presence was developing in Java, inland as well as on the coasts; by the early 17th century the first inland Muslim state in Southeast Asia, Mataram, was established. There Ṣūfī holy men performed a missionary function similar to that being performed in Africa. Unlike the more seriously Islāmized states in Sumatra, Mataram suffered, as did its counterparts in West Africa, from its inability to suppress indigenous beliefs to the satisfaction of the more conservative *'ulamā'*. Javanese Muslims, unlike those in Sumatra, would have to struggle for centuries to negotiate the confrontation between Hindu and Muslim cultures. Their situation underscores a major theme of Islāmicate history through the period of consolidation and expansion; that is, the repeatedly demonstrated absorptive capacity of Muslim societies, a capacity that was soon to be challenged in unprecedented ways.

Reform, dependency, and recovery (1683 to the present)

The history of the Muslims in modern times has often been explained in terms of the impact of "the West." From this perspective, the 18th century was a period of degeneration and a prelude to European domination, symbolized by Napoleon's conquest of Egypt in 1798. Given the events of the 1980s, however, it is possible to argue that the period of Western domination was an interlude in the ongoing development of indigenous styles of modernization. In order to examine that hypothesis, it is necessary to begin the "modern" period with the 18th century, when activism and revival were present throughout Islāmdom. The three major Muslim empires did experience a decline during the 18th century, as compared to their own earlier power and to the rising powers in Europe; but most Muslims were not yet aware that Europe was partly to blame. Similar decline had occurred many times before, a product of the inevitable weaknesses of the military conquest state turned into centralized absolutism, overdependence on continuous expansion, weakening of training for rule, the difficulty of maintaining efficiency and loyalty in a large, complex royal household and army, and the difficulty of maintaining sufficient revenues for an increasingly lavish court life. Furthermore, population increased, as it did almost everywhere in the 18th-century world, just as inflation and expensive reform reduced income to central governments. Given the insights of Ibn Khaldūn, however, one might have expected a new group with a fresh sense of cohesiveness to restore political strength.

Economic and social strengths in western Europe

Had Muslims remained on a par with all other societies, they might have revived. But by the 18th century one particular set of societies in western Europe had developed an economic and social system capable of transcending the 5,000-year-old limitations of the agrarian-based settled world as defined by the Greeks (who called it Oikoumene). Unlike most of the lands of Islāmdom, those societies were rich in natural resources (especially the fossil fuels that could supplement human and animal power) and poor in space for expansion. Cut off by Muslims from controlling land routes from the East, European explorers had built on and surpassed Muslim seafaring technology to compete in the southern seas and discover new sea routes—and, accidentally, a new source of wealth in the Americas. In Europe, centralized absolutism, though an ideal, had not been the success it was in Islāmdom. Emerging from the landed classes rather than from the cities, it had benefited from and been constrained by independent urban commercial classes. In Islāmdom, the power of merchants had been inhibited by imperial overtaxation of local private enterprise, appropriation of the benefits of trade, and the privileging of foreign traders through agreements known as the Capitulations.

In Europe independent financial and social resources promoted an unusual freedom for technological experimentation and, consequently, the technicalization of other areas of society as well. Unlike previous innovations in the Oikoumene, Europe's technology could not easily be diffused to societies that had not undergone the prerequisite fundamental social and economic changes. Outside of Europe, gradual assimilation of the "new," which had characterized change and cultural diffusion for 5,000 years, had to be replaced by hurried imitation, which proved enormously disorienting. This combination of innovation and imitation produced an unprecedented and persisting imbalance among various parts of the Oikoumene. Muslims' responses paralleled those of other "non-Western" peoples but were often filtered through and expressed in peculiarly Islāmic or Islāmicate symbols and motifs. The power of Islām as a source of public values had already waxed and waned many times; it intensified in the 18th and 19th centuries, receded in the early 20th century, and surged again after the mid-20th century. Thus European colonizers appeared in the midst of an ongoing process that they greatly affected but did not completely transform.

PRE-COLONIAL REFORM AND EXPERIMENTATION (1683–1818)

From the mid-17th century through the 18th and early 19th centuries certain Muslims expressed an awareness of internal weakness. In some areas, Muslims were largely unaware of the rise of Europe; in others, such as India, Sumatra, and Java, the 18th century actually brought European control. Responses to decline, sometimes official and sometimes unofficial, sometimes Islāmizing, sometimes Europeanizing, fell into two categories, as the following examples demonstrate.

In some areas, leaders attempted to revive existing political systems. In Iran, for example, attempts at restoration combined military and religious reform. Around 1730 a Turk from Khorāsān named Nāder Qolī Beg reorganized the Ṣafavid army in the name of the Ṣafavid shah, whom he replaced with himself in 1736. Nāder Shāh extended the borders of the Ṣafavid state further than ever; he even defeated the Ottomans and may have been aspiring to be the leader of all Muslims. To this end he made overtures to neighbouring rulers, seeking their recognition by trying to represent Iranian Shī'ism as a *madhhab* alongside the Sunnite *madhhabs*. After he was killed in 1747, however, his reforms did not survive and his house disintegrated. Karīm Khān Zand, a general from Shīrāz, ruled in the name of the Ṣafavids but did not restore real power to the shah. By the time the Qājārs (1779–1925) managed to resecure Iran's borders, reviving Ṣafavid legitimacy was impossible.

Restoration in the Ottoman Empire

In the Ottoman Empire, restoration involved selective imitation of things European. Its first phase, from 1718 to 1730, is known as the Tulip Period, because of the cultivation by the wealthy of a Perso-Turkish flower then popular in Europe. Experimentation with European manners and tastes was matched by experimentation with European military technology. Restoration depended on reinvigorating the military, the key to earlier Ottoman success, and Christian Europeans were hired for the task. After Nāder Shāh's defeat of the Ottoman army, this first phase of absolutist restoration ended, but the pursuit of European fashion had become a permanent element in Ottoman life. Meanwhile, central power continued to weaken, especially in the area of international commerce. The certificates of protection that had accompanied the Capitulations arrangements for foreign nationals were extended to non-Muslim Ottoman subjects, who gradually oriented themselves toward their foreign associates. The integration of such groups into the Ottoman state was further weakened by the recognition, in the disastrous Treaty of Küçük Kaynarca (1774), of the Russian tsar as protector of the Ottoman's Greek Orthodox *millet*. A second stage of absolutist restoration occurred under Selim III, who became sultan in the first year of the French Revolution and ruled until 1807. His military and political reforms, referred to as the New Order (Nizam-ı Cedid), went beyond the Tulip Period in making use of things European; for example, the enlightened monarch, as exemplified by Napoleon himself, became an Ottoman ideal. Here, as in Egypt under Muḥammad 'Alī (reigned 1805–48), the famed core of Janissaries that had been a source of Ottoman strength was destroyed and replaced with European-trained troops.

In other areas, leaders envisioned or created new social orders that were self-consciously Islāmic. The growing popularity of westernization and a decreasing reliance on Islām as a source of public values was counterbalanced in many parts of Islāmdom by all sorts of Islāmic activism, ranging from educational reform to *jihād*. "Islāmic" politics often were marked by an oppositional quality that drew on long-standing traditions of skepticism about government. Ṣūfism could play very different roles. In the form of renovated *ṭarīqah*s it could support reform and stimulate pan-Islāmic awareness. Ṣūfīs often encouraged the study of *ḥadīth* so as to establish the Prophet Muḥammad as a model for spiritual and moral reconstruction and to invalidate many unacceptable traditional or customary Islāmic practices. Ṣūfī *ṭarīqah*s provided interregional communication and contact and an indigenous form of social organization that could even lead to the founding of a dynasty, as in the case of the Libyan monarchy.

Ṣūfism could also be condemned as a source of degeneracy. The most famous and influential militant anti-Ṣūfī movement arose in the Arabian Peninsula and called itself al-Muwaḥḥidūn ("the Monotheists"); but it came to be known as Wahhābīyah, after its founder, Muḥammad ibn ʿAbd al-Wahhāb (1703–92). Inspired by Ibn Taymīyah (see above *Migration and renewal (1041–1405)*), Ibn al-Wahhāb argued that the Qurʾān and *sunnah* could provide the basis for a reconstruction of Islāmic society out of the degenerate form in which it had come to be practiced. Islām itself was not an inhibiting force; "traditional" Islām was. Far from advocating the traditional, the Wahhābīs argued that what had become traditional had strayed very far from the fundamental, which can always be found in the Qurʾān and *sunnah.* The traditional they associated with blind imitation (*taqlīd*); reform, with making the pious personal effort (*ijtihād*) necessary to understand the fundamentals. Within an Islāmic context, this type of movement was not conservative, because it sought not to conserve what had been passed down but to renew what had been abandoned. The Wahhābī movement attracted the support of a tribe in the Najd led by Muḥammad ibn Saʿūd. Although the first state produced by this alliance did not last, it laid the foundations for the existing Saudi state in Arabia and inspired similar activism elsewhere down to the present day.

Islāmic activism in West Africa

In West Africa a series of activist movements appeared from the 18th century into the 19th. There as in Arabia, Islāmic activism was directed less at non-Muslims than at Muslims who had gone astray. As in many of Islāmdom's outlying areas, emergent groups of indigenous educated, observant Muslims, such as the Tukulor, were finding the casual, syncretistic, opportunistic nature of official Islām to be increasingly intolerable. Such Muslims were inspired by reformist scholars from numerous times and places—al-Ghazālī, as-Suyūṭī, Maghili; by a theory of *jihād* comparable to that of the Wahhābīs; and by expectations of a *mujaddid* as the Islāmic century turned in AH 1200 (AD 1785). In what is now northern Nigeria, the discontent of the 1780s and '90s erupted in 1804, when Usman dan Fodio declared a *jihād* against the Hausa rulers. Others followed, among them Muhammad al-Jaylani in Aïr, Shehuh Ahmadu Lobbo in Macina, al-Ḥajj ʿUmar Tal (a member of the reformist Tijānī *ṭarīqah*) in Fouta Djallon, and Samory in the Malinke (Mandingo) states. *Jihād* activity continued for a century; it again became millennial near the turn of the next Muslim century in AH 1300 (AD 1882), as the need to resist against European occupation became more urgent. For example, Muḥammad Aḥmad declared himself to be the *mahdī* in the Sudan in 1881.

In the Indian Ocean area, Islāmic activism was more often intellectual and educational. Its best exemplar was Shāh Walī Allāh of Delhi (1702–62), the spiritual ancestor of many later Indian Muslim reform movements. During his lifetime the collapse of Muslim political power was painfully evident. He tried to unite the Muslims of India, not around Ṣūfism as Akbar had tried to do, but around the Sharīʿah. Like Ibn Taymīyah, he understood the Sharīʿah to be based on firm sources—Qurʾān and *sunnah*—that could with pious effort be applied to present circumstances. Once again, the study of *ḥadīth* provided a rich array of precedents and inspired a positive spirit of social reconstruction akin to that of the Prophet Muḥammad.

DEPENDENCY (1818–1962)

The many efforts to revive and resist were largely unsuccessful. By 1818, British hegemony over India was complete; and many other colonies and mandates followed between then and the aftermath of World War I. Not all Muslim territories were colonized, but nearly all experienced some kind of dependency, be it psychological, political, technological, cultural, or economic. Perhaps only the Saudi regime in the central parts of the Arabian Peninsula could be said to have escaped any kind of dependency; but even there oil exploration, begun in the 1930s, brought European interference. In the 19th century westernization and Islāmic activism coexisted and competed. By the turn of the 20th century secular ethnic nationalism had become the most common mode of protest in Islāmdom; but the spirit of Islāmic reconstruction was also kept alive, either in conjunction with secular nationalism or in opposition to it.

In the 19th-century Ottoman Empire, selective westernization coexisted with a reconsideration of Islām. The program of reform known as the Tanzimat, which was in effect from 1839 to 1876, aimed to emulate European law and administration by giving all Ottoman subjects, regardless of religious confession, equal legal standing and by limiting the powers of the monarch. In the 1860s a group known as the Young Ottomans tried to identify the basic principles of European liberalism and even love of nation with Islām itself. In Iran, the Qājār shahs brought in a special "Cossack Brigade," trained and led by Russians, while at the same time the Shīʿite *mujtahid*s viewed the decisions of their spiritual leader as binding on all Iranian Shīʿites and declared themselves to be independent of the shah. (One Shīʿite revolt, that of the Bāb [died 1850], led to a whole new religion, Bahāʾī.) Like the Young Ottomans, Shīʿite religious leaders came to identify with constitutionalism in opposition to the ruler.

Reaction against Europeans and westernization

Islāmic protest often took the form of *jihād* against the Europeans: by Southeast Asians against the Dutch; by the Sanūsī *ṭarīqah* over Italian control in Libya; by the Mahdist movement in the Sudan; or by the Ṣaliḥī *ṭarīqah* in Somalia, led by Sayyid Muḥammad ibn ʿAbd Allāh Ḥasan, who was tellingly nicknamed the Mad Mullah by Europeans. Sometimes religious leaders, like those of the Shīʿites in Iran, took part in constitutional revolutions (1905–11). Underlying much of this activity was a pan-Islāmic sentiment that drew on very old conceptions of the *ummah* as the ultimate solidarity group for Muslims. Three of the most prominent Islāmic reconstructionists were Jamāl ad-Dīn al-Afghānī, his Egyptian disciple Muḥammad ʿAbduh, and the Indian poet Sir Muḥammad Iqbāl. All warned against blind pursuit of Westernization, arguing that the blame for the weaknesses of Muslims lay not with Islām, but rather with Muslims themselves, because they had lost touch with the progressive spirit of social, moral, and intellectual reconstruction that had made early Islāmicate civilization one of the greatest in human history. Although al-Afghānī, who taught and preached in many parts of Islāmdom, acknowledged that organization by nationality might be necessary, he viewed it as inferior to Muslim identity. He further argued that Western technology could advance Muslims only if they retained and cultivated their own spiritual and cultural heritage. He pointed out that at one time Muslims had been intellectual and scientific leaders in the world, identifying a Golden Age under the ʿAbbāsid caliphate and pointing to the many contributions Muslims had made to "the West." Like al-Afghānī, Iqbāl assumed that without Islām Muslims could never regain the strength they had possessed when they were a vital force in the world, united in a single international community and unaffected by differences of language or ethnos. This aggressive recovery of the past became a permanent theme of Islāmic reconstruction. In many regions of Islāmdom the movement known as Salafīyah also identified with an ideal time in history, that of the "pious ancestors" (*salaf*) in the early Muslim state of Muḥammad and his companions, and advocated past-oriented change to bring present-day Muslims up to the progressive standards of an earlier ideal. In addition to clearly Islāmic thinkers, there were others, such as the Egyptian Muṣṭafā Kāmil, whose nationalism was not simply secular. Kāmil saw Egypt as simultaneously European, Ottoman, and Muslim. The Young Turk Revolution of

1908 was followed by a period in which similarly complex views of national identity were discussed in the Ottoman Empire.

RECOVERY (1922 TO THE PRESENT)

Progress of secular nationalism. Despite the ideological appeal of such positions, the need to throw off European control promoted the fortunes of secular nationalism and other narrower forms of loyalty. Especially after Japan's defeat of Russia in 1905, nationalist fervour increased. Sometimes it was associated with related ideologies, such as pan-Arabism, Pan-Turkism, or Arab socialism. Many nationalists enthusiastically admired things European despite the fact that they were committed to resisting or removing European control. Often accepting European assessments of traditional religion as a barrier to modernization, many nationalists sought an identity in the pre-Islāmic past. Kemal Atatürk looked to the Turkic past in Central Asia and Anatolia to transform Ottomanism into a Turkish identity not dependent on Islām. "Islāmic" dress was discouraged. Muslim males, who prayed with covered heads, were now asked to replace the fez, which could be kept on during prayer, with the brimmed hat, which could not. Arabic script, too closely associated with Islām, was replaced with the Roman, after the Cyrillic (the alphabet of Central Asian Turks) had been considered and rejected. In Iran, Reza Shah Pahlavi argued that the Islāmic period was but an accidental interlude in the continuous history, since Achaemenid times, of Iran as a unified entity. The Egyptian Taha Hussein connected his country's national identity with Pharaonic times and with Mediterranean–European culture; and therefore it could easily partake of modern Western civilization. Christians were thus as much Egyptians as were Muslims; the accompanying development of a standard literary Arabic, *fuṣḥā,* emphasized the unity of all Arabs, regardless of confession. These approaches allowed, indeed required, all religious communities to partake of a single legal and societal system, at the price of denying the public relevance of a primary loyalty for the majority of the population.

Other nationalists made more of Islām. In Saudi Arabia and Pakistan, for example, Islām played a primary role in the formation of a national identity. In Pakistan it provided, according to the statesman Mohammed Ali Jinnah, an alternative for Muslims who would otherwise have to share in an identity defined by a Hindu majority. In many Arab countries, especially in the Maghrib, secular nationalism's downgrading of Islām was muted by a qualified acceptance of Islām as one, but not the only, important source of loyalty. At the same time there were Muslims who opposed nationalism altogether. In India, Mawlanā Abu'l-'Alā' Mawdūdī, who was the founder of the Jamā'at-i Islāmī, opposed both secular and religious nationalism and argued for the Islāmization of society and an Islāmic alternative to nationalism. In Egypt, Sayyid Quṭb and Ḥasan al-Bannā', who were the mentors of the Muslim Brotherhood, fought for the educational, moral, and social reform of an Islāmic Egypt and indeed of all Islāmdom.

Opposition to nationalism

Creating national identities. Only a few existing states where Muslims predominate, such as Turkey and Saudi Arabia, had no colonial interval; most became independent after World War II. An even larger number of countries have Muslim minorities. Like the citizens of many new nations, Muslims have not found the creation of national identities to be easy, especially considering the pace at which it has had to occur. More than two-thirds of the world's nations have come into existence since the end of World War II; foreign dependency is a living memory for many of their citizens, or at least for the parents and grandparents of their citizens. Many of them are not nation-states—that is, states established by a group of people who decided that they belonged together and therefore went about acquiring sovereignty over a territory—but rather are state-nations, composed of groups of people who acquired or were given sovereignty over a territory and then had to develop a sense of nationality. The most obvious state-nations are Syria, Iraq, Lebanon, and Jordan. All resulted from the interaction of intra-European rivalry and diplomacy with the aspirations of a prominent Ottoman-Hāshimite sharifian family in Mecca to create a single Arab state in the East. Instead of a single state, however, three monarchies emerged: the kingdom of Ḥusayn ibn 'Alī in the Hejaz (to be replaced by the Saudis), the kingdom of Fayṣal I in Iraq (because he had to be compensated for being ousted from Syria), and the kingdom of Abdullah in Transjordan. Lebanon was carved from French Syria with borders that would establish a bare Christian majority loyal to the French. In Ottoman Palestine, Jewish nationalists clashed with Arab nationalists, at a time when both groups felt betrayed by the British. In subsequent armed clashes, Zionist groups defended a set of boundaries as artificial as many others, creating a state that has remained a target for anti-imperialist sentiment. Eventually, Jewish nationalism spawned another nationalism, that of the Palestinians, inchoate before the founding of Israel but crystallized by the failure of any party to the conflict—Arab states, foreign powers, Palestinian leaders, or Israel itself—to make a place for most of the former Arab residents of Palestine.

Many Muslim countries were united by negative nationalism, aimed at ejecting a common enemy; but turning negative into positive has been difficult. Rarely have the groups that achieved independence survived. Often, as in Libya or Iraq or Egypt, further revolutions have occurred, in many cases led by the military, whose role as a vehicle for modernization cannot be underestimated. Subsequent governments have had to deal with the social and economic problems that plague all developing countries, as well as with regional rivalries and conflicts. Almost nowhere did the colonizers leave an infrastructure sufficient to support the growth of population that European medicine and hygiene had produced.

Relation of religion and nationality. Given the multicommunal structure of premodern Muslim societies, the relation between religion and nationality has been another major problem. Nationalism has frequently led to competition and rivalry among a new nation's religious communities. As they became independent, citizens of the nations of Islāmdom could draw on no direct equivalent of national identity. The broadest identity was provided by membership in a pan-territorial community like the *ummah* of all Muslims, or the Greek Orthodox Church, or the Turkic tribes; the narrowest, family or neighbourhood. In the middle of the spectrum was membership in a local confessional community, with all its implications of status, occupation, manners, and customs. Citizens of the new nations would theoretically have to find an identity that could subsume and supersede all others; and the rulers of new nations would have to take the unprecedented step of declaring all citizens subject to the same law, rather than members of quasi-autonomous, self-governing religious communities with their own legal systems. Yet the significance of being a member of a religious community could not easily be undone or replaced.

Rivalry among religious communities

Many countries inherited a relatively simple form of this problem: the people within their borders were primarily of one faith, Islām, and of one form of that faith, the Sunnite. That majority adherence could in some way be associated with or bolster the national identity, while discomfiting only a small number of people. Turkey, Iran, Jordan, Indonesia, the Yemens, and all the states of North Africa and the Arabian Peninsula fall into this category. Even so, religious minorities in these countries (such as the Armenians) suffered and shrank; for Jews communal lines were hardened by the emergence of the state of Israel, the hostility it evoked from most Arab states, and its aggressive efforts at ingathering. The self-consciously Islāmic government in Iran has also introduced a religious intolerance that, while it is discouraged by the Sharī'ah, is encouraged by local sentiment as well as by the staunch nationalism Iran shares with secular states. In reaction to the Pahlavi state they overthrew, in which trying to restore Zoroastrianism had not been unthinkable, the leaders of the Islāmic Republic of Iran have associated being Iranian with being Muslim.

Farther from the centre of Islāmdom, Islām plays various roles as a minority religion. Among Turks in the southern republics of the Soviet Union, for example, Islām is an important source of identity. Muslims living in western Europe and the Americas are generally able to form communities and practice their religion as they will: in Canada, for example, Ismāʿīlī Muslims, under the guidance of Aga Khan IV, form a cohesive group that promotes the economic and cultural development of its members. In the United States, tenets of Islām were embraced by the founders of the American Muslim Mission (originally called Nation of Islam) in the early 1930s. As the community has developed, its leaders have increasingly emphasized the Qurʾān and Muḥammad's example as sources of authority.

Pan-Islāmic organizations

Survival of Islāmic activism. Although Islāmic activism never disappeared during the years in which Muslim countries were becoming independent, other ideological orientations seemed more important between the end of World War II and the declaration of the Islāmic Republic of Iran in 1979. Many Westerners or westernized Muslims expected religion to recede as modernization progressed. Already in the 1950s, however, the Muslim Brotherhood in Egypt called for an exclusively Islāmic state in place of the secular multi-communal state that Gamal Abdel Nasser had founded. In the early 1960s new circumstances were beginning to foster increased self-consciously Islāmic activity, some popular, some supported by official institutions. In these years critics of Mohammad Reza Shah Pahlavi began to rally around the exiled ayatollah Ruhollah Khomeini; the writings of ʿAli Shariʿati began to influence Muslims inside and outside Iran; and two great pan-Islāmic organizations were formed, the Muslim World League (1962) and the Organization of the Islāmic Conference (1971). Although Westerners have become most familiar with activism's violent forms, its educational, cultural, pietistic, and political dimensions have been more extensive. All these developments occurred in the wake of the formation of the Organization of Petroleum Exporting Countries in 1961 and culminated in Egypt's success in its war with Israel in 1973. The resurgence of economic and military power was not the only factor that could foster those who had maintained an interest in Islām all along. In a few parts of the Muslim world, petroleum-based prosperity promoted increased international influence and pride; elsewhere modernization was producing widespread educational and economic cleavages and populations with very low median ages. As dissatisfaction with the material failures of secular modernization grew, so did disenchantment with the Western ideologies that had undergirded it. While these other ideologies were being tried and discredited, Islām had remained relatively peripheral to public policy, and thus unassailable. All the while, citizens of Muslim countries were echoing the anti-imperialist rhetoric that was increasing throughout the developing world.

Situation of Muslim women. For women, modernization is especially problematic. Urged on the one hand to be liberated from Islām and thereby become modern, they are told by others to be liberated from being Western through being self-consciously Muslim. There is little information on the situation of ordinary women in premodern Islāmdom, but evidence from the modern period underscores the enormous variety of settings in which Muslim women live and work, as well as the inability of the stereotype of meek, submissive, veiled passivity to reflect the quality of their lives. As always, Muslim women live in cities, towns, villages, and among migratory pastoral tribes; some work outside the home, some inside, some not at all; some wear concealing clothing in public, most do not; for some, movement outside the home is restricted, for most not; and, for many, public modesty is common, as it is for many Muslim men. For many, the private home and the public bath continue to be the centres of social interaction; for others, the world of employment and city life is an option. As always, few live in polygamous families. Strict adherence to the Sharīʿah's provision for women to hold their property in their own right has produced Muslim women of great wealth, in the past as well as today. Clearly, any simple description of the lives of Muslim women is misleading.

Modern Islām's unifying forces. Modern Islāmdom can appear so diverse as to defy description, yet it is also held together by stronger centripetal forces than almost any other pan-national solidarity group. The *ḥajj* attracts more than 1,000,000 Muslims annually; and, despite significant religious cleavages, Islām remains one of the least sectarian of world religions. Most Muslims live in societies in which the force of tradition is very strong and in which modernization has also penetrated to some extent. The majority of Muslims remain, as they have always been, agricultural. A very small minority are migratory pastoralists; a larger minority are village, town, and city dwellers. In all settings tradition, including religious tradition, is being drawn upon as a source of change and modernization, with the consequence that the Western equation of modernization and secularization has been severely tested and even undermined.

Yet the role of tradition varies. Some Islāmic activists rely on a kind of secularized "cultural" Islām, somewhat like cultural Judaism, that depends very little on personal piety or the observance of Islāmic law or the many customs that have come to be associated with being Muslim, while others cling to the customs associated with Islām with little awareness of Islām's more learned side. Labels such as Shīʿite, which always carried an oppositional quality, may be formerly nonessential attributes that have become salient in the wake of the success of the ayatollah Khomeini in Iran. When disadvantaged persons who happen to be Shīʿites find an opening for communal protest, or when those for whom Shīʿite theology means little find its vision of justice and radical revolution appropriate to their specific circumstances, an old label acquires a new valence.

Like any other explanatory system, Islām has always had to provide a way of talking about the world, of establishing identity in the world, and of managing the world's affairs. In performing these functions, Islām has from its inception been forced to compete with other explanatory systems for the "mental space" of its adherents and simultaneously to define its stance toward preexisting and ongoing extra-Islāmic influences. Islām continues to compete, aided unwittingly by the weaknesses of its competitors, spurred on by the freshness of its own demands for public attention, and fueled by the remarkable ability of many of its adherents to respond to the connection between the mundane and spiritual that has been the hallmark of all religious life.

BIBLIOGRAPHY

Surveys: The most visionary general work on Islāmic history is MARSHALL G.S. HODGSON, *The Venture of Islam: Conscience and History in a World Civilization,* 3 vol. (1974), which sets Islām into a world historical context. A similar but shorter work, sumptuously illustrated, is FRANCIS ROBINSON, *Atlas of the Islamic World Since 1500* (1982).

Regions of Islāmdom: PETER B. CLARKE, *West Africa and Islam: A Study of Religious Development from the 8th to the 20th Centuries* (1982); JAMIL M. ABUN-NASR, *A History of the Maghrib,* 2nd ed. (1975); CLIFFORD GEERTZ, *Islam Observed: Religious Development in Morocco and Indonesia* (1968, reissued 1971); S.M. IKRAM, *Muslim Rule in India and Pakistan, 711–1858 A.C.,* rev. ed. (1966); RAPHAEL ISRAELI, *Muslims in China: A Study in Cultural Confrontation* (1980); and NEHEMIA LEVTZION (ed.), *Conversion to Islam* (1979).

Periods and aspects of Islāmicate history: On premodern Islāmicate social structure, see ROY P. MOTTAHEDEH, *Loyalty and Leadership in an Early Islamic Society* (1980); IRA LAPIDUS, *Muslim Cities in the Later Middle Ages* (1967); and S.D. GOITEIN, *A Mediterranean Society: The Jewish Communities of the Arab World as Portrayed in the Documents of the Cairo Geniza,* 4 vol. (1967–83). HAMILTON A.R. GIBB, *Studies on the Civilization of Islam* (1962, reissued 1982), is a collection of interpretive articles on history, historiography, literature, and philology. RENÉ GROUSSET, *The Empire of the Steppes: A History of Central Asia* (1970; originally published in French, 1939); and JOHN J. SAUNDERS, *The History of the Mongol Conquests* (1971), deal with the Mongol conquests. JOHN J. SAUNDERS (ed.), *The Muslim World on the Eve of Europe's Expansion* (1966), combines primary sources on the last three great empires; and the most comprehensive account of modern Islām, with an especially fine treatment of the 18th century, is JOHN OBERT VOLL, *Islam, Continuity and Change in the Modern*

World (1982). On Muslim women, see, for example, LOIS BECK and NIKKI KEDDIE (eds.), *Women in the Muslim World* (1978); ELIZABETH WARNOCK FERNEA and BASIMA QATTAN BEZIRGAN (eds.), *Middle Eastern Muslim Women Speak* (1977, reprinted 1984); and JANE I. SMITH (ed.), *Women in Contemporary Muslim Societies* (1980).

Collections of primary sources in English translation: ERIC SCHROEDER, *Muhammad's People* (1955); ARTHUR JEFFERY (ed.), *A Reader of Islam* (1962, reprinted 1980); JOHN ALDEN WILLIAMS (ed.), *Islam* (1961, reissued 1967), and *Themes of Islamic Civilization* (1971, reprinted 1982); WILLIAM H. MCNEILL and MARILYN ROBINSON WALDMAN, *The Islâmic World* (1973, reprinted 1983); JAMES KRITZECK, *Anthology of Islamic Literature* (1964, reissued 1975); and BERNARD LEWIS (ed.), *Islam: From the Prophet Muhammad to the Capture of Constantinople,* 2 vol. (1974, reissued 1976).

Major reference works: The Encyclopaedia of Islam, 5 vol. (1913–36), and a new edition, of which 5 vol. appeared from 1960 to 1986; *The Shorter Encyclopaedia of Islam* (1953, reprinted 1974), with articles culled from the *Encyclopaedia of Islam; The Cambridge History of Islam,* 2 vol. (1970, reprinted in 4 vol., 1980); JEAN SAUVAGET, *Jean Sauvaget's Introduction to the History of the Muslim East: A Bibliographical Guide* (1965, reprinted 1982; originally published in French, 2nd ed., 1961), a dated but still useful annotated bibliographic guide; and CLIFFORD EDMUND BOSWORTH, *The Islamic Dynasties: A Chronological and Genealogical Handbook,* rev. ed. (1980). JEAN JACQUES WAARDENBURG, *L'Islam dans le miroir de l'Occident,* 3rd rev. ed. (1970); and EDWARD W. SAID, *Orientalism* (1978, reissued 1979), are critiques of Western approaches to Islām.

(M.R.W.)

Israel

Israel (in full State of Israel; Hebrew Medinat Yisra'el; Arabic Dawlat Isrā'īl) is a Middle Eastern republic situated at the eastern end of the Mediterranean Sea. It is bounded to the north by Lebanon, to the northeast by Syria, to the east and southeast by Jordan, to the southwest by Egypt, and to the west by the Mediterranean Sea. The total area is 7,992 square miles (20,700 square kilometres) excluding East Jerusalem and other territories occupied in the 1967 war. Jerusalem is the capital and the seat of government.

Following the United Nations partition of Palestine, Israel emerged as a sovereign state on May 15, 1948. It was the first Jewish state to be established in nearly 2,000 years. Its creation represented a fulfillment of the historic ideal of the Jewish people stemming from the traditional religious belief in God's promise of the land of Israel to the people of Israel. The ideal found practical expression in a desire to forge a nation without dependence on the goodwill of others. The establishment of Israel as a member of the family of nations signified a decisive step in modern Jewish history.

Among the population of Israel are hundreds of thousands of immigrants, many of them survivors of Nazi persecution in Europe or victims of anti-Semitism elsewhere. Israeli society has engaged in pioneering activities, including the rehabilitation of neglected agricultural lands. This has led to the creation of a Jewish rural population, which, though it makes up only about one-eighth of the total, also represents something almost unknown in the Diaspora (the historical scattering of the Jews in countries outside of Palestine). The revival of the Hebrew language has helped to make possible the cultural integration of the newcomers.

Hostile relations between Israel and its neighbouring Arab states have prevailed from the outset, with Israel obtaining victories over the Arabs after battles fought in 1948–49, 1956, 1967, and 1973. Territory occupied by Israeli forces after the 1967 and 1973 conflicts—including East Jerusalem, the West Bank, the Gaza Strip, and the Golan Heights region of Syria—is not treated in this article, although it is still held by Israel.

The article is divided into the following sections:

Physical and human geography

THE LAND

Relief. Israel may be divided into four natural regions. These are (1) the Mediterranean coastal plain, (2) the hill regions of northern and central Israel, (3) the Great Rift Valley, and (4) the Negev.

The coastal plain is a narrow strip about 115 miles (185 kilometres) long, widening to a breadth of about 20 miles in the south. In the north of the country, the mountains of Galilee constitute the highest part of Israel; their highest point is Mt. Meron, or (in Arabic) Jebel Jarmaq (3,963 feet [1,208 metres]). To the east these mountains terminate in an escarpment overlooking the Great Rift Valley. The mountains of Galilee are separated from the hills of Samaria and Judaea to the south by the Plain of Esdraelon ('Emeq Yizre'el), which, running approximately northwest to southeast, connects the coastal plain with the Great

Rift Valley. The Mount Carmel range, which culminates in a 1,791-foot peak, reaches northwest from the hills of Samaria and Judaea almost to the coast of Haifa.

The Jordan River

The Great Rift Valley, a long fissure in the Earth's crust, begins beyond the northern frontier of Israel and runs the length of the country to the Gulf of Aqaba. The Jordan River, which forms part of the frontier between Israel and Jordan, runs southward from Dan on Israel's northern frontier, where it is 500 feet above sea level, first into ‘Emeq H̱ula (H̱ula Basin), then into the freshwater Sea of Galilee, also known as Lake Tiberias or Yam Kinneret (689 feet below sea level), and finally into the highly saline Dead Sea, which is about 1,312 feet below sea level and which represents the lowest point of a natural landscape feature on the Earth's surface. The Negev, in the southern part of Israel, forms an arrow-shaped wedge of territory that comes to a point at the port of Elat (Eilat) on the Gulf of Aqaba.

Drainage. The principal drainage system is represented by the Jordan River. Other principal rivers in Israel are the Yarqon, which empties into the Mediterranean near Tel Aviv; the Qishon, which runs through the western part of the Plain of Esdraelon to drain into the Mediterranean at Haifa; and a small section of the Yarmuk, a tributary of the Jordan. The remaining streams, usually seasonal, flow through streambeds called wadis.

Soils. The coastal plain is covered mainly by alluvial soils. Because of its proximity to the coastal plain, parts of the arid northern Negev, where soil development would not be expected, have windblown loess soils. The soils of Galilee change from calcareous rock in the coastal plain to cenomanian and turonian limestone in Upper Galilee and to Eocene formations (from 38,000,000 to 54,000,000 years old) in the lower part of the region. Rock salt and gypsum are abundant in the Great Rift Valley.

Climate. Israel experiences great climatic contrasts. In the south, rainfall is light, amounting to about one inch (25 millimetres) a year in the ‘Arava Valley south of the Dead Sea, while in the north it is relatively heavy, amounting to 44 inches a year in the Upper Galilee region. Annual rainfall occurs on from 40 to 60 days spread over a season between October and April. Summers are dry and hot, but in the coastal areas sea breezes exert a moderating influence. Temperature depends largely on elevation and distance from the sea. The average daily maximum temperature in the coastal areas ranges between about 90° F (32° C) in August to about 65° F (18° C) in January. At Elat, in the south, daytime temperatures reach about 70° F (21° C) in January and may rise as high as 114° F (46° C) in August. Relative humidity is highest near the coast and is higher on summer than on winter nights. The Jordan Valley is hotter and drier than the coast. The hill regions have occasional snows in winter.

Plant and animal life. Vegetation is widely varied. The original evergreen forests have largely disappeared because of many centuries of cultivation and goat herding. The hills are mostly covered by maquis (wild shrub vegetation), and only desert scrub grows wild in the Negev and on the sand dunes of the coastal plain. North of Beersheba most of the country is under cultivation or is used for hill grazing; where irrigation is available, citrus groves and eucalyptus (introduced from Australia) and conifer plantations flourish. Millions of trees have been planted under a reafforestation program.

Nature reserves

Animal life is similarly varied. Mammals include wildcats, wild boars, gazelles, ibex, jackals, hyenas, hares, coneys, badgers, and tiger weasels. Among the reptiles, the agama and gecko lizards, the viper, and the carpet viper are found. Birds include the partridge, tropical cuckoo, bustard, sand grouse, and desert lark. There are many kinds of fish and insects. Invasions of desert locusts sometimes occur. Several regions have been set aside as nature reserves, notably parts of the ‘Arava in the south and Mt. Carmel, Mt. Meron, and the remains of the H̱ula Lake and marshes in the north.

Settlement patterns. The character of many regions has been altered by new patterns of Jewish settlement. The first modern-day Jewish settlers established themselves on the coastal plain in the 1880s. Later they also moved into the valleys of the interior and into parts of the hill districts, as well as into the Negev. The formerly Arab-populated areas of the coastal plain, the Judaean foothills, and the Jordan and ‘Arava valleys became almost exclusively Jewish. Although the majority of the Bedouin of the Negev left the region when it became Israeli territory, the Negev remained largely the domain of Arab nomads. The non-Jewish population is concentrated mainly in the north, where Arabs constitute a substantial part of the population of Galilee.

Rural settlement. The rural Jewish population amounts to about one-tenth of the total Jewish population. More than half the rural inhabitants are immigrants who arrived after 1948; two-thirds of the settlements were established after that date. The settlements are organized into kibbutzim, which are collective groups voluntarily practicing joint production and consumption; moshavim, which are smallholders' cooperatives practicing joint sales and purchases, making common use of machinery, ideally prohibiting hired labour, and leasing national land, usually for 49 years; and individually owned farms or villages in which private ownership is practiced. The kibbutzim and moshavim perform pioneer work in underdeveloped areas and security functions in border areas, and they contribute substantially to the national ability to absorb new immigrants.

Of the total rural population only about one-fifth, including the Bedouin, is non-Jewish. Before 1948 Jewish and Arab agricultural settlements existed side by side but were completely independent of each other. Since then, however, the demand for labour has resulted in thousands of Arab workers from the villages and the occupied territories finding employment in the citrus groves, in industry, or as construction labourers. This movement, together with increased agricultural mechanization, has led to a drop in the number of Jewish agricultural workers. In Arab villages fewer than half of the adult labourers, both men and women, are engaged in working the land. There has been a growing tendency to practice intensive cultivation, to diversify crops, and to extend farm areas. Most Arab farmers work their own land; some either lease land or work for Arab or Jewish landlords.

New towns

Urban settlement. The great majority of the Jewish population is urban. With the increasing mechanization and efficiency of Jewish agriculture, the proportion of people living on the land has been decreasing. As a result of industrial and service sector development, the two large conurbations of Tel Aviv–Yafo and Haifa and of the city of Jerusalem contain about one-fourth of the total population. Great efforts have been made by the authorities to prevent overconcentration of population in these areas. In both the north and south, new towns have been built whose populations consist largely of new immigrants. These towns serve as centres of regional settlement or else fulfill special economic tasks such as the manufacture of textiles, clothing, or machinery.

The major urban centres inhabited by Arabs include cities and towns with both Arab and Jewish populations, such as Jerusalem, Haifa, ‘Akko, Lod (Lydda), Ramla, and Yafo, and towns with entirely Arab populations, such as Nazareth. In towns with both Arab and Jewish populations, many of the former differences in the way of life of the two communities are diminishing, even though Arabs and Jews usually live in different quarters.

THE PEOPLE

Groups historically associated with the contemporary country. Jews constitute more than four-fifths of the total population, Muslims about one-eighth, Christians a small percentage, and Druzes and others the remainder.

Jews. In origin, as well as in physical features, the Jewish population lacks uniformity. Immigrants differed in racial origin and culture and brought with them languages and customs from a variety of countries. Consciousness of geographic origin and descent is, however, gradually being superseded by a national consciousness, especially among the young. Religious Jewish groups immigrating to Israel generally continue to pray in the synagogues of their respective communities. The two main religious

groupings are formed by those who follow the Ashkenazic rite (of Jews from central and eastern Europe and their descendants in other parts of the world) and those who follow the Sefardic and Oriental rite (of Jews from the Mediterranean region and from the Middle and Far East). Thus there are traditionally two chief rabbis in Israel, one Ashkenazi and one Sefardi. Religious Jewry in Israel constitutes a significant and articulate section of the population. Disputes often arise between this group and a strong movement that seeks to prevent religious bodies and authorities from dominating national life.

Muslims. The largest religious minority group is the Muslims, who constitute more than two-thirds of the Arab population. Practically all of the Muslims adhere to the Sunnī rite. A minority are peasants, and most Muslims now live in towns. Like all other religious communities, the Muslims enjoy considerable autonomy in dealing with matters of marriage and divorce and have separate religious courts. The state supervises their religious institutions. Among the Muslims are the Bedouin, most of whom live in the Negev with the rest living in Galilee. New economic opportunities, and the fact that the borders with neighbouring Arab countries are closed, have encouraged the Bedouin to adopt a more sedentary mode of life.

Christians. Most Christians are town dwellers, and the majority speak Arabic. Christian communities exercise autonomy in religious and communal affairs. The Greek Orthodox and Greek Catholic (Melchite) are the largest of these, most of which are headquartered in Jerusalem. Apart from the Greek Orthodox patriarchate in Jerusalem, the Christian churches are dependent to a degree on supreme hierarchs abroad. These communities include Roman Catholics and Uniates (Melchites, Maronites, Chaldean Catholics, Syrian Catholics, and Armenian Catholics).

Jerusalem is also the seat of two Russian Orthodox missions: one represents the Moscow patriarchate and the other, the Russian church in exile. The Evangelical, Episcopal, and Lutheran churches are small and primarily Arabic-speaking.

The Druze community

Druzes. The Druzes, who live in villages in Galilee and on Mt. Carmel and who maintain excellent relations with the Israeli majority, have since 1957 constituted a separate Arab community. Most of the Druzes are agriculturists who preserve their traditional way of life. They pay homage to Jethro (Moses' father-in-law), whose putative grave is near Kefar Ḫittim in Galilee. The Druzes serve in the army.

Bahā'īs. The Bahā'ī faith is the only religion other than Judaism whose world centre is in Israel. A shrine, an archives building, and an administrative centre are located on Mt. Carmel in Haifa. There are a few hundred adherents, most of whom are employed at the centre in Haifa.

Circassians. The Circassians, who are Sunnī Muslims, emigrated from the Caucasus in the 1870s. They number a few thousand and live in villages in Galilee, preserving their language and their traditions. Older Circassians speak Arabic, but the younger generation speaks Hebrew. The men serve in the Israeli Army.

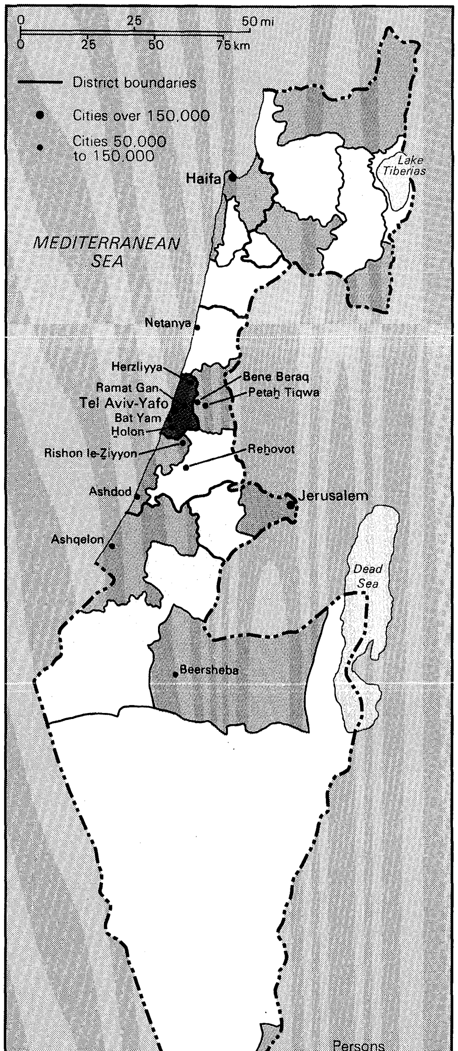
Samaritans. About half of the few hundred surviving members of the Samaritan community live near Tel Aviv in the town of Ḫolon. They preserve their separate religious and communal organization but participate in national life as part of the Jewish section of the population.

Demography. In 1948 the Jewish population in Israel numbered about 650,000. Between 1948 and 1970 about 1,300,000 Jewish immigrants entered the country, and about 200,000 Jews left it, although some later returned. Of the Jewish community the largest proportion was born in Israel, followed by those born in Europe and America, Africa, and elsewhere in Asia. In 1948 about 155,000 Arabs remained. Growth in the Arab population (not including those living in East Jerusalem) has been relatively large, including refugees who have returned. The average lifespan is one of the highest in the world.

THE ECONOMY

The increase in the Jewish population was the most distinctive cause of the rapid rise in the gross national product after 1948. Although most immigrants had to change occupations, a nucleus of highly skilled labour facilitated economic expansion. The establishment and rapid growth of institutions of higher learning and research helped increase the nation's potential. Large amounts of capital arrived in the form of money involving no financial obligation by the state. This included gifts from world Jewry, reparations from the Federal Republic of Germany for the persecution of Jews by Adolf Hitler, grants-in-aid from the U.S. government, and capital brought in by immigrants. It has been supplemented by loans and commercial credits and by foreign investment.

The goals of economic policy are continued economic growth, the reinforcement of a competitive capacity, and



Population density of Israel.

further integration of Israel's economy with the world economy. Progress toward these goals has been made under difficult conditions, which have included a rapid increase of population; a boycott and a blockade by the neighbouring Arab countries except, from 1979, Egypt; heavy expenditure on defense; a scarcity of natural resources, including water; a high standard of living; inflation; and a restricted home market that limits the economies of methods of mass production.

Resources. *Mineral resources.* Mineral resources include potash, bromine, and magnesium, the last two of which are obtained from the waters of the Dead Sea; copper ore, which is located in the ʿArava Valley; phosphates and small amounts of gypsum in the Negev; and some marble in Galilee. There are oil deposits in the northern Negev and south of Tel Aviv and deposits of natural gas also in the northern Negev and northeast of Beersheba. Limited exploitation of oil began in the 1950s.

Electric power resources. Electricity is principally generated from thermal stations. The electricity industry is nationalized, and the government has encouraged intensive rural electrification; electricity for agriculture and industry is provided at favourable rates.

Atomic energy. The Israel Atomic Energy Commission was established in 1952. It has undertaken a comprehensive survey of the country's natural resources and trains scientific and technical personnel. An atomic reactor was constructed with U.S. assistance south of Tel Aviv, and a second one was built with French help in the Negev.

Agriculture, forestry, and fishing. The expansion in the amount of irrigated land has been a major factor in raising the value of agricultural production. There has also been a great expansion in the cultivation of citrus and of such industrial crops as peanuts (groundnuts), sugar beets, and cotton, as well as of vegetables and flowers. The number of milk cows has increased greatly. Agriculture also has become greatly mechanized.

Scarcity of water

The main agricultural problem is scarcity of water. Water from the Jordan and Yarqon rivers and from Lake Tiberias (Sea of Galilee) is diverted by pipeline to arid areas in the south. Because of utilization of practically all of the country's potential water resources, further development of agriculture involves intensifying the yield from land already irrigated or obtaining more water by cloud seeding, reducing the amount of evaporation, desalinizing sea water, and diverting water from the occupied territories.

Because only a limited quantity of fish is available off Israel's Mediterranean and Red Sea coasts, Israeli trawlers sail to the rich fishing grounds off the Ethiopian coast and engage in deep-sea fishing in the Atlantic. Inland, fishpond production meets much of the domestic demand.

Industry. *Mining and quarrying.* The mining industry supplies local demands for fertilizers, detergents, and drugs, and also produces some exports. The Timna Copper Mines near Elat exported copper ore until they were closed in 1976; a plant in Haifa produces potassium nitrate and phosphoric acid, both for local consumption and for export. Products of the Haifa Oil Refineries include polyethylene and carbon black, which are used by the local tire and plastic industries. The electrochemical industry also produces food chemicals and a variety of other commodities. Oil pipelines run from the port of Elat to the Mediterranean. Israel has producing oil wells but continues to import some oil.

Manufacturing. Industrial growth has been especially rapid in electronics, weapons, transportation, machinery, and metals. The largest share of manufacturing output is accounted for by the food industry, after which the principal products are textiles, chemicals, and metals. The diamond-cutting and polishing industry ranks among the largest in the world. One of the largest industrial enterprises is Israel Aircraft Industries. Industries manufacturing military supplies and equipment have expanded considerably since the 1967 war—a circumstance that has stimulated the development of the electronics industry. The largest share of Israel's industrial exports are marketed in Europe, followed by the United States and Canada. The great majority of industries are privately owned.

Industrial expansion has been stimulated by the growth of local demand, which in turn has resulted from the growth of population and from the rise in the standard of living. Industry enjoys a high degree of protection against competitive imports. The government also assists industry by making loans available from the development budget at low rates of interest. The main limitations experienced by industry are the scarcity of raw materials and sources of energy, and the restricted size of the local market.

Tourism and shipping. Tourism is a growing industry and is one of the largest sources of foreign exchange. Shipping is a vital factor both in the economy and in communications with other countries. As a result of the closing of the land frontiers following the Arab blockade of Israel, shipping has played a major role in the transportation of supplies. It formerly was used to provide passage to Israel for immigrants. Israel's access routes to both the Atlantic and Indian oceans have stimulated a continuous growth of its merchant fleet.

Finance. Israel has commercial (deposit) banks and cooperative credit institutions, mortgage and investment credit banks, and other financial institutions that are supervised by the Central Bank of Israel. The banking system shows a high degree of specialization; commercial banks are, in general, restricted to short-term business. Medium- and long-term transactions are handled by institutions established to cater to the investment needs of the separate elements of the economy: agriculture, industry, housing, and shipping. These institutions are either fully owned by the government or are owned jointly by the banks and the government.

Israel has a managed floating currency. The Israeli shekel consists of 100 agorot. There have been numerous devaluations of Israeli currency, which led to the introduction of the shekel in February 1980 to replace the Israeli pound at the rate of 1 shekel for every 10 pounds. The Central Bank of Israel issues currency and acts as the government's sole fiscal and banking agent. Its major function is to regulate the money supply and short-term banking credit.

Trade. Imports are mainly raw materials, including rough diamonds, and capital goods. Exports include a variety of light industrial products, textiles, polished diamonds, fertilizer and chemical products, and agricultural produce (mainly citrus fruits).

Import–export balance

The central problem of foreign trade is the large and persistent deficit resulting from the imbalance of imports over exports. Free access to foreign markets is, therefore, vital for the further expansion of the economy. The fact that Israel is not a member of any of the regional economic groupings represents a considerable handicap. In 1964 Israel concluded a special agreement with the European Economic Community (EEC) and in 1975 attained a new agreement with the EEC. An attempt has also been made to ameliorate foreign trade problems by participating actively in the General Agreement on Tariffs and Trade (GATT), a specialized agency of the United Nations.

Administration of the economy. The management of Israel's economy has been conditioned by many dynamic, powerful, and often contradictory factors. The large imports of capital that have been derived from public and semipublic sources have passed through government channels or through public organizations. This has resulted in the enlargement of the sector of the economy that includes public and semipublic enterprises. At the same time, the government's policy has been directed toward liberalizing the economy. The socioeconomic structure of the economy is, therefore, diversified. The governmental, cooperative, and private sectors coexist in an economy that is subordinated to the broad objectives of state policy.

Taxation. The rates of taxation are among the highest in the world. Income, customs and excise, land, and luxury taxes are the main sources of revenue. The distribution between direct and indirect taxation has been altered over the years. Since the late 1950s the proportion of indirect taxation has increased.

Trade unions and employer associations. The General Federation of Labour in Israel (the Histadrut) is the largest labour union and the largest voluntary organization in the country. Since 1960 Arab workers have been admitted with full membership rights. The National Labour Federation is another major labour organization. The Manufacturers' Association of Israel and the Farmers' Union represent a large number of the country's employers.

Transportation. Road transport is of more significance than rail in internal communications. A combined road and rail system extends to the port of Elat.

Deepwater ports

Three modern deepwater ports—Haifa and Ashdod on the Mediterranean, and Elat on the Red Sea—are maintained and developed by the Israel Ports Authority.

The international airport at Lod is the country's largest. Regular flights are maintained by several international airlines, with EL AL Israel Airlines Ltd., Israel's national airline, accounting for the largest share of the traffic. Domestic aviation, operated by Arkia Israeli Airlines Ltd., has developed greatly in the late 20th century, with both planes and helicopters being used. Jerusalem (Ataroth), Tel Aviv (Sdeh-Dov), Elat, Rosh Pinna, and Haifa airfields serve the country's domestic air traffic.

ADMINISTRATIVE AND SOCIAL CONDITIONS

Government. *Constitutional framework.* Israel is a democratic republic with a parliamentary system of government. It has a strong cabinet, a multiparty system with two major parties, and a marked tendency toward political and administrative centralization. Israel does not have a formal written constitution. The foundation on which the system of government has been built is composed of legislation, administrative acts, and parliamentary practice.

The Knesset, or assembly, is a 120-member, single-chamber legislature that is elected every four years. In its internal organization and parliamentary procedure it has followed continental rather than Anglo-Saxon practices. Members exercise important functions in standing committees. Hebrew and Arabic, the country's two official languages, are used in all proceedings.

The president, who is the head of state, is elected by the Knesset for a five-year term, which can only be renewed once. The president has no veto powers and exercises only ceremonial functions.

The cabinet is the main policy-making body. Its members may be, but need not be, members of the Knesset. Following a general election or the resignation of a government, the president, after consultation with representatives of all parties, entrusts a member of the Knesset with the task of forming a cabinet. The prime minister is the leading figure in the cabinet and the government.

The state controller, an independent officer appointed by and responsible only to the Knesset, is the auditor of the government's financial transactions and is empowered to inquire into the efficiency of its activities.

The civil service is gradually developing into a politically neutral and professional body; previously, it tended to support the party in power. The extensive functions of the government have tended to result in a growing bureaucracy.

Local and regional government. Administratively, the country is divided into six districts—the Central, Jerusalem, Haifa, Northern, Southern, and Tel Aviv districts—and into 13 subdistricts. There are three types of local government councils—municipalities, local councils (for smaller settlements), and regional rural councils. The bylaws of the councils, as well as their budgets, are subject to approval by the Ministry of the Interior.

Israeli-occupied Arab territories. After the 1967 war Arab territories occupied by Israeli forces were placed under military administration. These territories included Jordanian territory on the west bank of the Jordan River (the West Bank), the Gaza Strip, the Sinai Peninsula region of Egypt, and the Golan Heights region of Syria. East Jerusalem was also occupied by Israeli forces, and Israeli authorities took over administration of the city as a single municipality; in 1967 East Jerusalem and adjoining villages were incorporated into the State of Israel—an action that is disputed abroad. Israel completed its withdrawal of civilian settlers and military personnel from the Sinai Peninsula in April 1982. In April 1981 the Golan Heights, however, was in effect annexed to Israel by the extension of Israeli law to the area.

Elections

The political process. Elections, which are nationwide, are by universal, direct suffrage, with secret balloting. The system of election is by proportional representation. All resident Israeli citizens are enfranchised upon completion of their 18th year; candidates for election must be at least 21 years old. Similar conditions govern elections to local government bodies.

Israel's party system is complex and volatile; splinter groups are commonly formed and party alliances often change. Political parties are both secular and religious; the secular parties are Zionist and range in orientation from Marxist to capitalist.

Cabinets are based on coalitions of varying political composition. For almost thirty years after the creation of Israel, the dominant party was the Israel Labour Party, a moderate social-democratic and Zionist group. While in power it held a majority in the cabinet, the premiership, and the major ministries. In 1977 the Israel Labour Party suffered its first defeat when the Likud bloc, an alliance of the extreme nationalist Herut Party and several other parties, gained ascendacy in the Knesset.

Israeli citizens take an active interest in public affairs. The pattern of Israel's social and economic organization favours the participation in state and public affairs of both trade unions and employers' organizations. The Arab community is allowed to play a full role in national politics, as long as it does not forcefully oppose the basic concepts of Zionism.

Justice. Municipal, religious, and military courts exercise a jurisdiction almost identical with that exercised by such courts during the period of the Palestine Mandate before the birth of Israel. Regional labour courts were established in 1969. Matters of marriage and divorce are dealt with by the religious courts of the various recognized communities. Capital punishment has been maintained only for genocide and crimes committed during the Nazi period. The judges of the magistrates', district, and supreme courts are appointed by the president, and every judge holds office for life.

Law is derived from a variety of sources, including Ottoman and British legislation and precedent, religious court opinion, and Israeli parliamentary enactments. Special investigative panels have been formed on unusual occasions—such as the war of 1973 and the massacres of Palestinians in Israeli-controlled sectors of Beirut in 1982—to issue reports and allocate responsibility among political and military leaders.

The armed forces. The Israel Defense Forces (IDF) is an integrated organization controlling land, sea, and air forces. A special force (Nahal) combines military and agricultural training and also engages in the establishment of new defense settlements on the borders. Youth Battalions deal with premilitary training of youth both in and out of school. There is compulsory military service for men and for women; Arabs, both Muslim and Christian, are exempted, but the IDF includes a minorities unit in which Druze, Circassian, Bedouin, and Christian Arabs may serve. After the period of conscription men and childless women undergo a period of regular reserve training.

The IDF is based essentially on the reserve service of the population, and thus continues to be a popular militia rather than a professional army. Civilian-military relations are based on the subordination of the army to civilian control. The defense of the country is based upon a regional defense system. The basic unit in the IDF is the brigade group. Any number of brigade groups can be combined under the command of divisional groupings in time of war. The rank of *rav-alluf* (lieutenant general) is held only by the chief of staff of the IDF. He is the senior military authority commanding all armed forces and is appointed by the government on the recommendation of the minister of defense.

The police services are a centralized agency under a ministry of the Interior. They are controlled by national headquarters and commanded by an inspector general. Prisons are administered by the Ministry of Police and are linked to a system for the rehabilitation of prisoners into society on their release.

Education. By enactment, education is obligatory and free for children between the ages of five and 15 and free, but not compulsory, for those 16 and 17. Young people between the ages of 14 and 18 who have not completed schooling are obliged to attend special classes. Parents may choose whether the children receive state lay education or state religious education. The school syllabus includes radio and television lessons in both Hebrew and Arabic. Special attention is given to agricultural and technical training. Adult education for immigrants assists them in their cultural integration. There are teachers' training colleges, including two for Arabs. The Ministry of Education, in conjunction with the military authorities, also has assumed responsibility for education in Israeli-occupied Arab territories.

Institutions of higher learning

In addition to the Hebrew University of Jerusalem (opened in 1925) and the Technion–Israel Institute of Technology in Haifa (opened in 1924), Israel has several institutions of higher learning that have been founded since 1948. These include the Weizmann Institute of Science in Reḥovot, the universities of Tel Aviv, Bar-Ilan, and Haifa, and Ben Gurion University of the Negev. Everyman's University, in Tel Aviv, was opened in 1974. The language of instruction in the universities is Hebrew, while the teaching system represents a mixture of European and American methods. Academic freedom in the universities is protected by Israeli law.

Health and welfare. The Ministry of Health maintains its own public and preventive services and supervises those of nongovernmental institutions. There are many voluntary organizations in the country dealing with first aid, children's health, and with the aged, crippled, and blind.

The Ministry of Social Welfare controls the service bureaus that deal with family, youth, and community welfare, as well as with rehabilitation of the handicapped. Social insurance is compulsory.

Wages and cost of living

Wage policy is determined by the trade unions and the employers' associations but is also influenced by the government, which not only applies moral suasion to both groups but is itself the largest employer in the country. Wage policy finds expression in cost-of-living allowance agreements, which are intended to safeguard the real value of wages against rises in consumer prices, and in wage agreements between employers and employees.

Israel's Jewish community is a dynamic society still in the process of social and economic formation. The most significant social divisions among Israelis are of a predominantly community nature. Eastern or Oriental Jews (Sefardim) tend to be poorer, less educated, and underrepresented in higher offices as compared to Western Jews (Ashkenazim). The social and economic divisions within the Arab community (especially among Muslims and Druzes) and between Arabs and Jews are still strong. Arabs are generally in the lower ranges of socioeconomic categories and consider themselves to be the victims of prejudice at the hands of Jewish Israelis. Changes in the late 20th century, however, have diminished some of the antagonisms between Jews and Arabs, as well as differences between urban and rural Arabs.

CULTURAL LIFE

The cultural milieu. Jews arriving from communities in many parts of the world have brought with them both their own cultural inheritance and aspects of individual majority cultures that they have absorbed over the centuries. The intermingling of the Ashkenazi, Sefardi, and Middle Eastern traditions has been of profound importance, although the arrival of immigrants from the Soviet Union has slowed the trend, common among immigrants from central Europe and America, toward creating a cultural synthesis embracing both East and West. There has been little cultural interchange between the Jewish and Arab sections of Israel's population, and the impact of Arab culture on Israeli cultural life has been insignificant. The revival of the Hebrew language has been of great importance. Jewish tradition, both religious and historical, and the Hebrew language together constitute the foundation of cultural life in Israel.

The state of the arts. The Israel Philharmonic Orchestra has an international reputation. Folk dancing and popular singing combine foreign elements with original creative manifestations. Different folk traditions, such as folk songs, musical instruments, and other expressions of popular culture, have been preserved mainly among the Oriental Jewish communities and among the rural Arab population. Painting and sculpture are still largely influenced by European schools, but local schools have begun to emerge. In literature and drama a concentration on themes of the Diaspora is giving way to an interest in national themes. Among Israel's most distinguished writers is Shmuel Yosef Agnon (1888–1970), who was awarded the Nobel Prize for literature in 1966.

Cultural institutions. In 1954 the Hebrew Language Academy was established as the supreme authority on all questions related to the language and its usages. The Israel Academy of Sciences and Humanities was founded in 1960. There are several hundred libraries in the country. The Jewish National and University Library in Jerusalem is particularly notable. Habima, Israel's national theatre, was founded in Moscow in 1917 and moved to Palestine in 1932. There are a number of other theatres in the country, some of them in the kibbutzim. There are many art galleries and museums; foremost among them is the Israel Museum in Jerusalem, which also houses part of the archaeological collection of the government's department of antiquities. Archaeological activities are initiated by the government and by Israeli academic institutions, as well as by foreign archaeological organizations. The discovery of the Dead Sea Scrolls in 1947 gave a powerful stimulus to biblical and historical research.

Archaeological activities

Press and broadcasting. Tel Aviv is the centre of newspaper publishing. Newspapers are often associated with a political party. Although most newspapers are written in Hebrew, there is a considerable circulation of papers published in Yiddish, English, German, Hungarian, French, Bulgarian, and Romanian. There are hundreds of other periodicals, of which more than half are in Hebrew.

Broadcasting is vested in a broadcasting authority whose members are appointed by the president. Languages of broadcast include Hebrew, Arabic, English, French, Yiddish, Russian, Georgian, Portuguese, Hungarian, Romanian, Ladino (a Spanish dialect of the Sefardic Jews), Moghrabit, (a dialect spoken by Jews in the Maghrib), and Persian. Television, which was introduced in 1966, consists of Hebrew and Arabic programs. There is also an educational television service. Radio programs are broadcast to many foreign countries. For statistical data, see the "Britannica World Data" section in the current *Britannica Book of the Year.* (E.E./W.L.O.)

History

ZIONISM

The Jewish nationalist movement, Zionism, has had as its goal the creation and support of a Jewish national state in Palestine, the ancient homeland of the Jews, which is called in Hebrew *Eretz Israel* (Land of Israel). Though Zionism originated in eastern and central Europe in the latter part of the 19th century, it is in many ways a continuation of the ancient and deep-felt nationalist attachment of the Jews and of the Jewish religion to Palestine, the promised land where one of the hills of ancient Jerusalem was called Zion. This attachment to Zion continued to inspire the Jews throughout the Middle Ages and found its expression in many important parts of their liturgy.

Early history. At the end of the Middle Ages a number of "messiahs" came forward with the claim to lead the Jews back to Palestine, and they were generally received with great enthusiasm by their fellow Jews. The most important of these messiahs were David Reubeni and his disciple Solomon Molcho in the first part of the 16th century and in the 17th century Shabbetai Tzevi, who proclaimed himself the Messiah in Turkey in 1648. Most European Jews believed in Shabbetai's mission, and many continued to do so even after he had become a Muslim.

The age of the Enlightenment in the second half of the 18th century, with its growth of religious toleration and its general universal and liberal ideas, laid the foundations in western Europe and North America for the emancipation of the Jews and their participation as citizens in the

Moses Mendelssohn

life of the nations in the midst of which they lived and whose members they became. The consequence was less emphasis among the Jews on traditional religious attitudes and more on assimilation of Western secular culture. This movement emerged also in Germany, where Moses Mendelssohn (1729–86), a philosopher and a friend of the great German writer Gotthold Ephraim Lessing, emphasized the spiritual and universal aspects of Judaism. He and a group of like-minded fellow Jews, most of them residents of Berlin and Königsberg in Prussia, wished to win the Jews over to modern Western civilization. The younger Jewish generation gladly seized the opportunity of intellectual enrichment and civic freedom that the new movement, originally called by the Hebrew name Haskala (Enlightenment), offered. Many went the way of complete assimilation, including the abandonment of the faith of their fathers. Others found their place as citizens of the Jewish faith in the new liberal and egalitarian societies emerging in the 19th century in western Europe and North America. Still others applied the new scholarship learned from Western civilization to a study of the Jewish past and produced, especially in Germany, works of lasting value in the rediscovery and reinterpretation of the ancient heritage. Some wealthy Jews—among them Sir Moses Montefiore and the Rothschild family—tried to help their coreligionists in less fortunate lands, especially in eastern Europe and in the Middle East, by establishing schools and introducing them to agriculture and to various trades. For reasons of religious piety, a small number of Jews, supported by donations from outside, settled in Palestine.

The interest in a return of the Jews to Palestine was kept alive in the first part of the 19th century more by Christian millenarians, especially in Great Britain, than by Jews themselves. Among the few Jews pleading then for a Jewish settlement or state was the American Mordecai Manuel Noah (1785–1851), who in 1813 became U.S. consul in Tunis and later high sheriff and surveyor of the port of New York. In 1825 he acquired Grand Island in the Niagara River and invited the Jews of the whole world to create a Jewish state, Ararat, there. In 1844 he pleaded with the Christian world in *Discourse on the Restoration of the Jews* to help the Jews resettle in Palestine. More important but not more successful were the attempts by Lord Shaftesbury, Sir Laurence Oliphant, and others in Great Britain to create a Jewish state in Palestine. Some political writers thought of a Jewish state in the Holy Land as a means of assuring the overland route to India. Others were inspired by religious or mystic ideas, "anxious to fulfill the prophecies and bring about the end of the world," as was the eccentric Oliphant. He was accompanied on one of his visits to the Middle East by Naphtali Herz Imber (1856–1909), a Hebrew poet of Polish origin, famous in the history of Zionism as the author of "ha-Tiqva" ("The Hope"), which became the Zionist national anthem, and of "Mishmar Ha-Yarden" ("The Watch on the Jordan"), a popular nationalist song.

These early sympathies with the return to Zion in the English-speaking world found their best literary portrayal in George Eliot's novel *Daniel Deronda* (1876). A German socialist, Moses Hess (1812–75), influenced by the example set by the unification of Italy, gave the first theoretical expression to Zionism among Jews, *Rome and Jerusalem* (1862; Eng. trans. 1918). This short book, which contained many thoughts later widely accepted by Jewish nationalists, combined ethical socialism, fervent nationalism, and religious conservatism. Hess believed that the historical ideal of the Jewish people could be realized only in their own historic homeland. He insisted that a moral and spiritual regeneration must precede the settlement there. He hoped that France, which he venerated as the home of the Revolution, would protect the Jewish settlement because it would wish to see the bridge across the Middle East held by a friendly people. Hess's book attracted no attention when it appeared. Only decades later was it rediscovered by the Zionist movement, which had by then developed in eastern and central Europe.

Emigration of Russian Jews to Palestine

The Love of Zion movement. Whereas in western Europe the Jews became in the 19th century an integral part of the nations whose citizens they were and fully adopted native language and culture, the Jews in eastern Europe, then identical with the Russian Empire, lived as a separate community with their own language, Yiddish, their own civilization, and their own economic structure. They did not enjoy political or legal equality with the Russians. Further, under the reactionary regime that set in after the reform age of Tsar Alexander II (1855–81), all hopes for Jewish emancipation were dashed. A wave of bloody pogroms, instigated or tolerated by the government, threatened Jewish lives and property. As a result large-scale emigration to western Europe and to the United States started. A very small trickle of Jewish youth from Russia also went to Palestine and founded there the first agricultural settlements. In 1882 Leo Pinsker (1821–91), a physician in Odessa, published *Auto-Emancipation* (Eng. trans. 1884), an appeal in German to the western European Jews to save the Jewish people from persecution and the misery of dispersion. He applied the ideas of 19th-century European nationalism and secularism to the Jews and propagated the necessity of concentrating them territorially, in Palestine or elsewhere. He found no echo among the western European Jews. But in Russia a small group, which took the name Ḥovevei Ẓiyyon (Lovers of Zion), gathered around him and formed a committee in Odessa to promote the settlement of Jewish farmers and artisans in Palestine. Though these early settlements were able to survive only with the help of Baron Edmond de Rothschild of Paris, they laid the foundations of practical Jewish colonization in Palestine.

The most prominent among these early Zionists was Asher Ginzberg (1856–1927), whose essays written under the pen name Aḥad Haʿam (One of the People) became classics of the modern Hebrew language that they helped to create. Aḥad Haʿam denied that the majority of the Jewish people could be settled in Palestine; the smallness of the country and the fact that it was inhabited by a large native population seemed to him to be insurmountable obstacles. But though Palestine according to him could not become a Jewish state, he believed in the creation of a Jewish cultural centre there, a place for the regeneration of Judaism, from which spiritual influences would radiate into all the many lands where Jews continued to live and which would awaken in their hearts a true "love of Zion."

This early Hebrew Renaissance in Russia also produced several great Zionist poets, among them Hayyim Nahman Bialik and Saul Tchernichowsky (1875–1943). At the same time the Yiddish language, an eastern European derivation from medieval German not to be confused with the ancient Semitic Hebrew tongue, was raised from a people's vernacular to a medium of art by a number of writers, the first of whom was S.J. Abramovich (1835?–1917), who wrote under the pen name Mendele Mokher Sefarim (Mendele the Itinerant Bookseller).

Theodor Herzl

Political Zionism. A new impetus was given to Zionism by Theodor Herzl, an Austrian journalist. In the multinational pre-World War I empire of the Habsburgs with its violent nationality struggles, the Jews found themselves in a difficult position. Except for eastern Europe, anti-Semitism was nowhere as strong as among the Austrian Germans, especially in Vienna where Herzl lived. The Dreyfus affair of the 1890s and its attendant outburst of anti-Semitism, which Herzl witnessed in 1895 as a newspaper correspondent in Paris, caused him to write a pamphlet, *Der Judenstaat* (*The Jewish State,* 1896). He regarded assimilation as most desirable but, in view of anti-Semitism, impossible. Against their own wishes, he believed, the Jews were forced by pressure from outside to form a nation. As such they could lead a normal existence only through concentration in one territory. Herzl had no living ties with Jewish and Hebrew traditional values. He never desired the rebirth of Hebrew as the Jewish national language. In his novel *Altneuland* (1902) he depicted the future Jewish life in Palestine in terms of life as he had known it among the liberal, assimilated central European Jews. In this novel, his testament to the movement, he rejected all narrow nationalism and demanded above all brotherly consideration for, and closest cooperation with, the Palestinian natives in a common homeland.

Herzl molded Zionism into a political movement of worldwide significance. He became its indefatigable organizer, propagandist, and diplomat. He convened in August 1897 the first Zionist Congress at Basel, Switzerland, which drew up a constitution for the movement. His friend Max Nordau participated in drawing up the Basel program of the movement, which proclaimed that "Zionism strives to create for the Jewish people a home in Palestine secured by public law."

To that end the movement was to promote on suitable lines the colonization of Palestine by Jewish rural and industrial workers; to reorganize the whole of Jewry by means of appropriate local and international institutions, in accordance with the laws of each country; to strengthen and foster Jewish national sentiment; and to obtain government consent where necessary to the attainment of the Zionist aims.

The centre of the movement was established in Vienna, where Herzl published the official weekly *Die Welt* ("The World"). The congresses met every year until 1901 and then every two years. Meanwhile Herzl entered into negotiations with the Turkish government in order to receive a charter establishing Palestine's autonomy, but the Turkish government rejected the proposals. Only in England did Herzl find sympathy, and for that reason he established the financial instruments of the movement in London. In 1903 the British government offered an area of 6,000 square miles (15,540 square kilometres) to the Zionist organization in the uninhabited highlands of Uganda. This offer led to violent controversy and even a split in Zionist ranks. A minority under the leadership of Israel Zangwill was willing to accept the offer. Members of this minority founded in 1905 the Jewish Territorial Organization with the aim of finding an autonomous territory for those Jews who could not or did not wish to remain in the countries in which they lived. The majority of the Zionists, most of them from Russia, insisted on Palestine as the only field of activity for Zionism, and the seventh Zionist Congress in 1905 rejected any colonization outside Palestine and its neighbouring countries. In 1904 in the midst of this bitter debate Herzl, only 44 years old, died.

The Jewish Territorial Organization

Pre-World War I Zionism. With the death of Herzl the leadership moved from Vienna to Germany, first to Cologne and then to Berlin. Austrian and German Jews led the movement, but its mass strength came from Russia. At that time only a very small minority of the Jews were organized in the Zionist movement. There was much opposition to Zionism in Jewish ranks, based partly on the conviction that the Jews had to become, or were already, an integral part of the nations among whom they lived and to which they belonged; partly on religious orthodoxy, which expected the return to Palestine only under divine guidance and the strict application of traditional religious laws; and partly on the conviction that the Jewish people could exist as a distinct national group in the Diaspora (state of dispersion), especially in countries of Jewish mass settlement and Yiddish folk culture. Among the last group was the Bund, a Jewish socialist party, founded in Russia in 1897. Jewish socialists were also organized as Zionists under the name of Poale Zion (Workers of Zion). Their first world conference was held in The Hague in 1907.

Of greater importance was the question of the position of traditional orthodoxy in the Zionist movement. In 1902 a number of Russian Zionists founded Mizraḥi as the party of religiously orthodox Zionists who insisted on the strict observance of Jewish religious laws in Palestinian Jewish life. The ideal of Herzl, on the other hand, had been a modern secular movement. The Zionist organization declared itself neutral in matters of religion, but from time to time the insistence of the religious groups upon observance of Jewish religious precepts caused conflicts within the movement.

Though Zionism represented only a minority of Jews, and in the Western lands only a small minority, it was the only worldwide democratically organized part of Jewry. It developed an active propaganda through orators and pamphlets, created its own newspapers in many languages, and gave an impetus to what was called a "Jewish renaissance" in letters and the arts. At the same time the failure of the Russian Revolution of 1905 and the wave of pogroms and the repressive measures that followed it disillusioned many in regard to Jewish emancipation in eastern Europe. Again as in 1882, but in growing numbers, Russian Jewish youth emigrated to Palestine to live there as pioneers in newly founded agricultural settlements in which they hoped to realize their nationlist and socialist ideals. They fought against the employment of "foreign" (Arab) labour on Jewish settlements and insisted on the use of Hebrew as the spoken language.

Further emigration of Russian Jews to Palestine

The growth of the Jewish settlement in Palestine was due to the practical Zionists, who were opposed by the political Zionists, who insisted on the granting of a charter as an essential prerequisite for colonization. With the growing strength of the Young Turk nationalist movement in Turkey, especially after 1908, the prospects of obtaining a charter dimmed considerably. But in spite of small financial means, urban development and agricultural settlement among the Jews in Palestine made steady progress. In 1914 there were about 90,000 Jews in Palestine, where the large majority of the population was Arab. There were 43 Jewish agricultural settlements with 13,000 settlers, many of them supported by Baron Rothschild.

The situation changed with the outbreak of World War I. Zionist work in Palestine came to a standstill. Turkey and Britain were at war. An opportunity offered itself for political Zionism to reassert itself and to combine the old British sympathies for Zionism with the opportunities of political warfare. As a result the centre of the Zionist movement shifted from Germany, Turkey's ally, to London. The leadership passed to Jews of Russian origin living in London—among them Chaim Weizmann and Nahum Sokolow. As a result of the Russian Revolution of November 1917 and of the consequent civil war with its pogroms perpetrated by the White armies and because of the intensified nationalism of the various succession states of post-World War I Europe, great misery spread among eastern European Jews. From then on the financial and economic strength of Zionism came from Jews in the United States, and the masses of its adherents from 1920 to 1938 came from Poland.

The Balfour Declaration. Weizmann and Sokolow were instrumental in causing a letter to be written by Arthur James (later Lord) Balfour, then British foreign secretary, to Lord Rothschild on November 2, 1917, declaring that "His Majesty's Government view with favour the establishment in Palestine of a national home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights to existing non-Jewish communities in Palestine, or the rights and political status enjoyed by Jews in any other country."

The British government hoped that a declaration in favour of Zionism would help to rally Jewish opinion, especially in the United States, to the side of the Allies, and that the settlement in Palestine of a Jewish population attached to Britain by ties of sentiment and interest might help to protect the approaches to the Suez Canal and the road to India. The Balfour Declaration fell short of the expectations of the Zionists, who had asked for the reconstitution of Palestine as *the* Jewish national home. Instead, the Balfour Declaration envisaged only the establishment *in* Palestine of *a* national home for the Jewish people. The declaration, nevertheless, aroused enthusiastic hopes among Zionists and seemed the fulfillment of Herzl's hopes. It was endorsed by the principal Allied powers, and through its acceptance by the Conference of San Remo in 1920, it became an instrument of British and international policy. The council of the League of Nations approved on July 24, 1922, a British mandate over Palestine that included the Balfour Declaration in the preamble and various provisions dealing with facilitating Jewish immigration. The mandate had been officially interpreted in a statement of June 3, 1922, in which Winston Churchill, the British colonial secretary, announced that the declaration meant not the "imposition of a Jewish nationality upon the inhabitants of Palestine as a whole, but the further development of the existing Jewish community, with the assistance of Jews of other parts of the world, in order that it may become a centre in which the Jewish people as a whole may take, on grounds of religion and race, an interest and a pride." His Majesty's government, he announced, had not contemplated at any time,

Endorsement of the Balfour Declaration

as appeared to be feared by the Arabs, "the disappearance or the subordination of the Arabic population, language, or culture in Palestine." (H.K.)

The period of the British mandate. Arab nationalists everywhere, fearing that the Zionists meant to make Palestine a Jewish state, declared their unconditional opposition to the Jewish ambitions there. The question was more immediately the concern of the Palestinian Arabs, who saw their interests as directly endangered by Zionist aims. Assured of general Arab support and somewhat misled by the pro-Arab sympathies of British mandatory officials, the Palestine Arabs saw no need to make concessions to Zionism beyond accepting the Jews already established in Palestine as a minority with guaranteed rights.

Concerns of the Palestinian Arabs

In September 1921 the British had promulgated a constitution that provided for the establishment of a Palestinian state in which Arabs and Jews would cooperate. The constitution, however, made concessions to Zionism that the Arabs were unwilling to accept, and it was not applied.

Since no constitutional Palestinian state could be established, the British continued direct rule. They also continued, however, to seek ways to create auxiliaries or partners in government, and in 1923 they offered each of the two major communities an "agency." The Jewish community accepted and formed the Jewish Agency in 1928, but the Arabs refused. As so often in the following years, the Arabs' political action amounted to abstention, while the Jewish community profited by creating a shadow government that enabled them to concentrate their efforts on achievement of their major objectives.

In August 1929 a dispute over the Jewish use of the Wailing Wall—the only remnant of Herod's Temple in Jerusalem, forming the outer wall of the Muslim Haram area—was followed by the first large-scale attacks upon Jews by Arabs. In the course of the troubles, the *muftī* of Jerusalem, Amin-el Husseini, emerged as the leader and champion of the Palestinian Arab cause.

The 1929 troubles led the British to establish a special commission under Sir Walter Shaw, which reported in March 1930 that the conflict was mainly the result of the disappointment of Palestinian Arab hopes for independence, and to the fact that Jewish expansion was creating a "landless and discontented" Arab class in the country. The Shaw Commission urged that restrictions be imposed on the management of the Jewish national home. A subsidiary commission under Lord Passfield was next sent to make concrete proposals, on the basis of which the Passfield White Paper, published in October 1930, recommended that Jews be forbidden to acquire more land while the Arabs were landless and that Jewish immigration be stopped as long as Arabs were unemployed. It renewed the offer of a legislative council that would serve as the basis of constitutional government, a proposal favoured by the Arab leaders but not by the Zionists. When the Arab leaders refused an invitation to discuss the constitutional issue with the Jewish leaders at a roundtable conference, the offer was allowed to lapse.

The Passfield White Paper

The Palestine revolt and the Peel Commission. Zionist pressure and British ambivalence worked against the strict application of the Passfield recommendations on Jewish immigration and purchase of land. When the mandatory government refused to take effective measures to forbid the sale of land to Jews and to stop the illegal Jewish immigration that increased with the persecution of the Jews in Germany after 1933, the Arab leaders announced a policy of noncooperation with the British and a boycott of British goods; at the same time, the existing restrictions on immigration, which were only partly effective, led to Jewish protests and riots.

In April 1936 an Arab High Committee was formed to unite the Palestinian Arabs in opposition to the Jews; its formation was followed by a renewal of Arab attacks on the Jews, soon developing into open war. The revolt of the Arabs continued during the next three years. In November 1936 a new commission, under Lord Peel, arrived to study the situation. The Arab leaders boycotted the commission until just before its departure. The commission's report, published in July 1937, emphasized that cooperation between Arabs and Jews in a Palestinian state was impossible; to the dismay of the Arabs, it recommended the partition of Palestine. The report made it clear that the establishment of a Jewish state would involve radical movements of population to secure the necessary Jewish majority, even in the parts of Palestine where the Jewish population was largest.

In September 1937 nonofficial representatives from the various Arab countries met at Blūdān in Syria and announced the complete rejection of the Peel proposals. In Palestine the publication of the Peel report was followed by renewed Arab terrorism and violence. The British thereupon disbanded the Arab High Committee and deported its leading members. The *muftī* and a few others escaped arrest and fled to Syria, which became the headquarters of a continuing Palestinian Arab insurrection. Before long, however, the insurrection lost its singleness of purpose and degenerated into an Arab civil war as the leaders of the revolt turned their energies against their political rivals.

The British government appointed a new commission under Sir John Woodhead to reconsider the partition plan suggested by the Peel Commission. The Woodhead report, published in November 1938, proposed a reduction of the Jewish share of Palestinian territory to about 400 square miles around Tel Aviv—the only area where the Jews constituted a majority. The Woodhead scheme was completely rejected by the Zionists and also rejected by the Arabs on principle. A conference of Jews and Arabs was next convoked, including Arab representatives from various countries. The conference met in London between February and March 1939, the British conferring with the Arab and Jewish delegations separately.

When no settlement between the two sides could be reached, the British government decided to impose its own terms, which were spelled out in a White Paper published in May 1939. International events were by then moving toward a second world war. This made British appeasement of the Arabs imperative, as German propaganda was gaining wide support in Arab nationalist circles; the Jews, persecuted in Germany, had no choice as to which side to support in the coming war. The White Paper of 1939 was a renewed concession to the Arab position. It stated that there would be no partition and that it was not British policy that the country should become either a Jewish state or an Arab state. It envisaged the establishment within 10 years of an independent "Palestine State." In the intervening period, Jews and Arabs would be invited to take an increasing share in the administration; and Jewish immigration into Palestine would be limited to a total of 75,000 during the next five years, after which no further immigration would be allowed without Arab consent. Land purchases by Jews from Arabs would be prohibited in some areas and restricted in others, in accordance with regulations to be published by the high commissioner.

The British White Paper of 1939

As a proposal for the final settlement of the Palestine question, the White Paper was opposed by both the Zionists and the Arabs. As a means for freezing the situation for the duration of the war, however, it succeeded. Between 1939 and 1945 Palestine was relatively quiet; only as World War II neared its end did the Arab–Jewish conflict resume.

The partition of Palestine and the emergence of Israel. Between 1922 and 1939 the Jewish population in Palestine had risen from 83,790 to 445,457 (30 percent of the total inhabitants). Tel Aviv had become a Jewish city of 150,000.

Until 1939 the plans to establish a Jewish state in Palestine had been compromised by the fact that there were not enough Jews there to secure a majority in a portion of Palestinian territory of the required size. As eastern Europe fell under German domination, however, Nazi persecution drove many more Jews to seek refuge in Palestine by illegal immigration; and when the systematic slaughter of the Jews of Europe began in 1942, the flow of immigrants broke all bounds.

Jewish militance

As the Jewish population swelled with this increase in refugees, the nature of Zionist activity in the country began to change and to tend more toward violence. Following the first Arab attacks on the Jews in 1921, a secret Jewish army called Haganah (Defense) had been formed.

Until 1936 Haganah restricted itself to purely defensive action, but during the years of the Arab revolt it became more aggressive; it also received some legal recognition when the British administration formed a Jewish Settlement Police drawn exclusively from Haganah and placed nominally under British command. In 1937 a more clandestine Jewish militia representing the extreme revisionist party within the World Zionist Organization had been formed—the Irgun Zvai Leumi (National Military Organization). During the early years of the war, Irgun followed the lead of the Jewish Agency and cooperated with Haganah; it soon resumed its extremist course, however, as Jewish refugees freshly arrived from Poland joined its ranks and took over its control. The Irgun leaders were convinced that Britain had betrayed the Zionist cause—an opinion that was shared by another terrorist organization, the Stern Group, or Gang, whose leader, Abraham Stern, was killed in a police raid in 1942. In the last years of the war, the Irgun and the Stern Group began resorting to terror against the British.

Meanwhile, the Jewish Agency, under its veteran leader Chaim Weizmann and younger leaders such as David Ben-Gurion, tried to maintain British goodwill by offers of help to the British war effort. They proposed formation of a Jewish Legion that would undertake the defense of Palestine. Though reluctant to sponsor a Zionist force, the British Army eventually formed a brigade of Jewish volunteers that was active late in the war in Africa and Europe.

Biltmore Resolution

Pressures for a Jewish state. A new Palestine policy was decided upon at a Zionist conference held in May 1942 at the Biltmore Hotel in New York City; it called for unrestricted Jewish immigration into Palestine and for the ultimate establishment of the country as a Jewish commonwealth. By the end of the war, Zionist political activity in the United States had succeeded in winning the U.S. government's support for Zionism, and Britain, unable to resolve the predicament on its own, was pleased to admit American involvement.

At the end of the war in Europe, the Jewish Agency addressed a memorandum to Britain demanding the full and immediate implementation of the Biltmore Resolution. Another memorandum followed in June 1945 demanding that immigration visas be issued for 100,000 European Jewish refugees awaiting admission into Palestine. By the time Japan surrendered in September, Haganah had gone into alliance with the Irgun and the Stern Group to present a united front in Palestine. The Jewish Agency stood ready to assume the provisional government of the Jewish state. In the absence of a unified Arab leadership in Palestine, Arab leaders from the neighbouring countries of Egypt, Syria, Lebanon, Transjordan, Iraq, Saudi Arabia, and Yemen, which in March 1945 had formed the League of Arab States, proclaimed their intent to take up the defense of the Arab cause in Palestine.

In the United States, Pres. Harry S. Truman took up the Zionist cause and urged that the European Jewish refugees be immediately admitted into Palestine. Beset by U.S. pressure, fighting a costly and unpopular war against Zionist guerrillas in Palestine, and seeing no practical solution, Britain participated in yet another commission, the Anglo-American Committee of Inquiry, which published its conclusions in April 1946. In essence, it recommended the immediate admission to Palestine of 100,000 Jewish refugees from Europe, the withdrawal of all restrictions on Jewish purchase of land, and the eventual incorporation of both communities in a binational state under United Nations trusteeship. The British government refused the central and immediate demand, admission of 100,000 refugees, and suddenly found itself involved in a war. Forced to maintain a large and costly military establishment when its electorate demanded demobilization and easement of the tax burden, with no end of the bloodshed in sight and with all its practical political and diplomatic ploys used and options closed, the British referred the question to the United Nations.

UNSCOP

The General Assembly voted on May 15, 1947, to create a Special Committee on Palestine (UNSCOP) to submit "such proposals as it may consider appropriate for the solution of the problem of Palestine." When it arrived in Jerusalem, UNSCOP was boycotted by the Arabs but actively aided by the Zionists. Few issues had been more studied than Palestine, and UNSCOP found nothing new but urgency. The only solution, it suggested, was partition, but it urged that the consequences of partition be mitigated by the maintenance of economic union. On November 29 the UN General Assembly approved, with slight frontier modifications, the UNSCOP recommendations.

The Palestine war. The UN decision was a major Zionist victory. Not only did it affirm the Zionist right—the fundamental point at issue and bitterly opposed by the Arabs—to establish a Jewish state in Palestine, but it also gave the state a territory that, although smaller than that proposed by the Jewish Agency, was far out of proportion to the relative numbers of Jews to Arabs in the country. It comprised more than half the territory of Palestine, including the greater part of the valuable coastal area, leaving only the narrow coastal strip of Gaza, half of Galilee, the Judean and Samarian uplands, and a bit of the Negev to the Arab state. Shocked and angry, the Arab leaders refused to recognize the validity of the UN decision and declared their determination to oppose it by force.

Deir Yāsīn

By January 1948 volunteers were arriving from the Arab countries to help the Palestinian Arabs, but they were soon overwhelmed by the Zionist forces. By May 13 the latter had secured full control of the Jewish share of Palestine and captured important positions in the areas allotted to the Arabs. The Irgun (whose distinction from the Haganah was not clear) stormed and captured the village of Deir Yāsīn and massacred much of the population. This highly publicized act terrorized the Arab villagers, who began a mass exodus from Palestine.

On May 14 the State of Israel was proclaimed and was immediately recognized by the Soviet Union and the United States. On the following day, as the British announced the end of their mandate in Palestine, troops of the modern Transjordanian army and their poorly trained and ill-equipped counterparts from Egypt, Syria, Lebanon, and Iraq entered the country. The Arab forces occupied the areas in the south and east, which were not yet controlled by the Jews, and tried to blockade Jewish Jerusalem.

The United Nations on May 20 appointed Count Folke Bernadotte af Wisborg as mediator to bring about a settlement between Israel and the Arab states. He obtained a brief cease-fire in June and a second one in July. On September 17, however, Bernadotte was assassinated by Jewish terrorists; he was suceeded by his deputy, Ralph J. Bunche of the UN Secretariat. Despite the orders of the United Nations, the truce was not observed faithfully by either side.

Between February and July 1949 the mediator secured separate armistice agreements between Israel and Egypt, Lebanon, Transjordan, and Syria. These agreements left Israel in possession of all the areas it had won by conquest: the whole of Galilee, the whole of the Palestinian coast minus a reduced Gaza Strip (occupied by Egypt), all of the Negev, and a strip of territory connecting the coastal region to the western section of Jerusalem. The remaining parts of Jerusalem (including the Old City), along with what remained of the Arab share of Palestine, were taken over by Transjordan, which then became the Hashemite Kingdom of Jordan. No entity remained that was officially called Palestine. The departure of hundreds of thousands of Palestinian Arabs had meanwhile left Israel with a substantial Jewish majority. (K.S.S./W.R.P./Ed.)

THE STATE OF ISRAEL

The emergence of Israel as a Jewish state on the former territory of Palestine was the central political issue of the Middle East after World War II. The energy, enthusiasm, and skill of the Zionists led to remarkable achievements. Essentially, Israel represented the coming of a modern European state into an underdeveloped area, and in that fact lay the crux of its achievement and its problems.

Deriving proportionally huge external financial and military support from Western governments (its relations with the Soviet Union, despite immediate recognition in 1948, have been strained), the Israelis also benefitted from a highly trained and motivated citizenry to create a unique nation-state. Ironically, they were assisted in this process by the surrounding Arab countries, because the state of siege in which they were forced to live helped to unite them against the common danger and gave them a sense of mission. And, finally, hanging as a tragic backdrop to the state was the memory of the Nazi holocaust, both a justification and a cause of the final push to success of the Zionist movement.

Israel after 1948. In 1948 David Ben-Gurion, the head of the Jewish Agency, became prime minister of the provisional government. Parliamentary elections in January 1949 yielded a Knesset (Parliament) in which the Mapai (Labour Party) of Ben-Gurion had the ascendancy. The new nation did not acquire a written constitution because of disagreement over what such a document should say about the relationship between religion and the state. In keeping with Zionist principle, the Knesset proclaimed Jerusalem the capital of Israel (even though only a section of the new city was actually held by Israel) and passed the Law of Return, which gave every Jew the right to immigrate.

Ben-Gurion formed a succession of coalition governments that kept him in power continuously (except in 1953–55, when his Mapai associate Moshe Sharett was prime minister) until his resignation in 1963. Levi Eshkol, also of the Mapai, followed as the head of another succession of coalition governments. Upon Eshkol's death in 1969, the Israel Labour Party, which had been formed in 1968 in order to unite the Mapai with the more leftist Ahdut Avodah and with the Rafi (a splinter party of the Mapai founded in 1965 by Ben-Gurion in association with Maj. Gen. Moshe Dayan), chose Golda Meir, former foreign minister and secretary general of the party, as prime minister.

Israel Labour Party

Gen. Yitzḥak Rabin, a native-born Israeli, became prime minister in 1974. Rapid inflation, the deep divisions inside the Labour coalition, Israel's relatively poor performance in the 1973 war, and the deep dissatisfaction of Oriental Jews with political domination by eastern Europeans helped bring about the victory of the Likud bloc, a right-wing coalition, and its candidate, Menachem Begin, in May 1977. Begin resigned in 1983, and the Likud bloc remained in power under Yitzḥak Shamir. In 1984 neither Labour nor Likud could form a coalition government by itself, so the two created a national unity government. Under the coalition agreement, Labour leader Shimon Peres served as prime minister and Shamir served as foreign minister until 1986, when the two officials switched portfolios. Because of sharp policy disagreements, the government was often deadlocked.

In the parliamentary elections of November 1, 1988, Likud and Labour won about the same number of seats, and in December the two parties renewed their coalition so that Shamir remained as prime minister and Peres served as finance minister. Major issues in the campaign were the Palestinian uprising that had begun in December 1987 and the differing approaches of the two parties toward the peace process. Likud opposed an international peace conference, encouraged building many more Jewish settlements in the occupied territories, and wished to retain control over all of the West Bank and Gaza Strip. Since Labour adopted the opposite position on these matters, it withdrew from the governing coalition, and for the first time in the history of the country the Knesset voted no confidence in the government on March 15, 1990.

The Arab-Israeli dispute. To large numbers of Jews throughout the world, the State of Israel symbolized the hopes and aspirations of the Jews as a people. To its neighbours, Israel remained an alien presence forcibly established on Arab soil and consequently unacceptable. At a minimum, they demanded a return to frontiers fixed by the 1947 UN partition and repatriation of the Palestinian refugees who had fled the country. Because of Arab hostility toward Israel, the government maintained restrictions on the civil liberties of Arab citizens of Israel.

The precarious frontiers of Israel were periodically exposed to guerrilla raids from the neighbouring countries. Israel reacted against such raids by joining with France and Great Britain to attack Egypt in 1956 but was forced by international pressure to return Sinai and Gaza to Egyptian control in 1957.

The Arab-Israeli war of 1967. While the direct causes of the Six-Day War of June 1967 were Egypt's provocations directed against Israel, the war was, in a more profound sense, another battle of the wars of 1948–49 and 1956. The immediate causes of the war began with Syria's announcement in May 1967 that Israel was massing troops on its border; Egypt felt obliged to come to the defense of Syria. Pres. Gamal Abdel Nasser thereupon called for the immediate withdrawal of the UN Emergency Force from the Israel–Egypt cease-fire lines and closed the Strait of Tiran to Israeli shipping. Moshe Dayan became the Israeli minister of defense.

Six-Day War

On May 30 King Hussein of Jordan signed a mutual defense pact with Nasser, convincing the Israeli cabinet that an Arab attack was imminent. Israel attacked first with a preemptive strike on June 5; the Israeli Air Force caught the Egyptian Air Force on the ground, largely destroying the Arab world's most effective military force. In Sinai in the following days the Israeli Army smashed the Egyptian troops. King Hussein chose to enter the war; the price Jordan paid was the loss of East Jerusalem and the West Bank. Syria in turn suffered an Israeli frontal assault that pushed through the Golan Heights. By the time the UN Security Council managed to effect a cease-fire on June 11, Israel had won a spectacular military victory over all three of its opponents, gaining by its success a new sense of security from the fear of defeat.

Consequences of the 1967 war. Israel immediately annexed the Old City of Jerusalem. Arabs who lived there could choose Israeli or Jordanian citizenship; almost all continued their Jordanian identity. In the West Bank and Gaza Strip, Israel, ruling through a military administration, began constructing a series of settlements for Jewish Israelis. The Arabs who lived in those areas had neither Israeli citizenship nor any real voice in determining their own fate.

Following the shock of the Arab defeat in the 1967 war, the Palestinians concluded that only they could regain what they viewed as their homeland. The Palestine Liberation Organization (PLO) began making raids into Israel and Israeli-occupied territory. Israeli forces retaliated by attacking the "host" countries, Jordan and Lebanon. Since the Palestinians increasingly insisted on their right to act independently, Jordan became an armed camp in which the royal government was but one among several powers. During "Black September" of 1970 King Hussein's army wiped out the Palestinian military. Driven from Jordan, the PLO focused its activities on Lebanon.

Israel, having fought Egypt to a stalemate in a war of attrition along the Suez Canal in 1969–70, now turned to the PLO in Lebanon. Israeli strategy was to induce the Lebanese to crush the PLO in their country as King Hussein had done in Jordan, but this policy did not succeed since the Lebanese armed forces were weak and the Lebanese polity was divided over what its reaction to Israeli pressure should be.

The war of 1973. When Nasser died in 1970, he was succeeded by Anwar el-Sādāt. As Sādāt became frustrated by his inability to change the diplomatic situation, he decided on a limited war with Israel. By the end of June 1973 Sādāt and Pres. Ḥafiz al-Assad of Syria had made plans for a coordinated surprise attack. Fighting started on the Syrian and Egyptian fronts on October 6—for the Jews, Yom Kippur, the holiest day of the year, and for the Muslims, the 10th day of Ramaḍān, the anniversary of a crucial battle fought by the Prophet Muḥammad. Despite initial setbacks, once Israel was fully mobilized the Israel Defense Forces assumed the offensive. As Israeli forces crossed the Suez Canal and moved to surround the Egyptian Third Army, the United States and the Soviet Union entered into a grave crisis that threatened to lead to a nuclear world war. A compromise was worked out between the two superpowers, and a UN-monitored cease-fire took effect on October 24. On the Syrian front, a similar cease-fire arrangement finally became fully effective only in May 1974. During the October fighting, Israel gained additional territory along the Suez Canal (Egyptian

Surprise attack

armed forces were present on both sides of the canal as well), and Israel took more land from Syria beyond the cease-fire lines of 1967, coming closer to Damascus.

The United States brokered disengagement agreements between Israel and Egypt and between Israel and Syria. As Israel implemented these arrangements, Israeli forces withdrew from designated territories, Egyptian or Syrian forces moved forward in limited numbers, and UN forces were stationed in between.

Moves toward peace. Most Israelis welcomed U.S. Secretary of State Henry Kissinger's "step-by-step" approach to peace, since Israel not only gained the prospect of a final end to the Arab-Israeli dispute but also secured increased American diplomatic and economic assistance. In 1977 the new U.S. administration of Pres. Jimmy Carter issued a joint note with the Soviet Union outlining a basis for peace in the Middle East. Israel and Egypt, fearing this initiative, moved rapidly toward ending 30 years of war with the dramatic trip of President Sādāt to Israel in November 1977. Sādāt told the Knesset that he believed peace could be established by breaking the psychological barriers of suspicion and fear between the two nations. Menachem Begin, the new Israeli prime minister, endorsed the concept of a peace of mutual reconciliation. In September 1978, under the direct supervision of President Carter, a framework for peace was announced at Camp David, Maryland.

The actual peace treaty between Egypt and Israel—signed in Washington, D.C., on March 26, 1979—gave Israel a complete peace, full diplomatic recognition by Egypt, and limits on Egyptian armaments in the Sinai and gave Egypt the reoccupation, in stages, of its lands lost in the 1967 war and the vague assurances of the creation of a self-governing authority for the Palestinians living in the West Bank and Gaza Strip.

The PLO and most Arab countries opposed the treaty, decrying the continued Israeli presence in the occupied territories and the failure to include the PLO in the negotiations. Israel continued to approve new Jewish settlements in the occupied territories despite the opposition of the United States and the danger such action posed to the peace process. Talks on Palestinian autonomy, provided for by the peace treaty, proved fruitless.

Despite the assassination of President Sādāt on October 6, 1981, Egypt, under its new president, Hosnī Mubārak, continued with the peace process. Israel fulfilled the 1979 peace by returning the last segment of the Sinai Peninsula to Egyptian control in April 1982. During that period, however, Israel's desire for peace with the other Arab states and autonomy for the Palestinians was called into doubt by several Israeli actions: the removal of elected Arab mayors from office in West Bank towns, the declaration of undivided Jerusalem as the eternal capital of Israel, the bombing of a nuclear reactor in Iraq so as to preserve Israel's nuclear warfare monopoly in the Middle East, and the annexation of the Golan Heights.

Declaration of Jerusalem as capital

Having neutralized Egypt, the largest and most powerful of the Arab states, Begin and Defense Minister Ariel Sharon, a hero of the 1973 war, planned an invasion of Lebanon to secure the elimination of the PLO and the selection of a new president of Lebanon who would sign a peace treaty with Israel along the lines of the Egyptian-Israeli treaty of 1979. On June 6, 1982, Israel invaded Lebanon and subsequently defeated the PLO, the Syrian armed forces, and assorted leftist Lebanese groups. By June 13, Israeli forces and their Phalangist Lebanese allies had encircled West Beirut, and the trapped PLO and Syrians were forced to agree to leave the city. The assassination of the pro-Israeli Lebanese president-elect, Bashir Gemayel, provoked Israeli troops to move into West Beirut, where they allowed Lebanese Christian Phalangists to massacre Palestinian civilians in two refugee camps.

Israel had succeeded in forcing the PLO out of most of Lebanon, but the Israeli-Lebanese troop-withdrawal agreement, which was tantamount to a peace treaty, failed since Syria and many Lebanese violently opposed it. Even with U.S. support, the new Lebanese president, Amin Gemayel, failed to unite his country behind a pro-Israeli foreign policy. Instead, the United States was forced to withdraw by February 1984, and Israel finished its slow retreat by June 1985. Lebanon slid even further into chaos while Israel retained a sphere of influence only in the extreme southern part of Lebanon.

Repeated attempts by the PLO and Jordan to form a joint negotiating team to meet with Israel were blocked by the Israelis, who refused to deal with the PLO. Instead of negotiations, raids and counterraids continued between the Israelis and the Palestinians. Perhaps the most spectacular of these was the Israeli attack on PLO headquarters in Tunis on October 1, 1985.

The intifada. A large-scale uprising by the Palestinians in the occupied territories began on December 8, 1987. This "shaking" (*intifada* in Arabic) came after 20 years of Israeli occupation; the Palestinians felt that there was no other way to accomplish their goals of self-government and national independence except by revolt. The *intifada* took a number of different forms: boycotts of Israeli goods, attacks against Israeli settlers, demonstrations to show public support for Palestinian nationhood, and rock throwing by youths against Israeli soldiers. In the first year alone, more than 300 Palestinians were killed, thousands were wounded, and 20,000 more were imprisoned. Israel's reaction was one of armed suppression of the revolt, including the use of rigorous tactics by the Israeli military, whose severity was condemned not only by the Palestinians but also by many Israelis.

Reaction to *intifada*

The Labour and Likud parties agreed that the *intifada* must be suppressed before changes took place in the status of the occupied territories. King Hussein of Jordan did not wait to see the outcome of the *intifada;* instead, he announced on July 31, 1988, that Jordan was severing its official claims to the West Bank and East Jerusalem. On November 15 the PLO National Council voted to declare the establishment of "a Palestinian state with Jerusalem as its capital" despite actual Israeli control over the territory claimed by the new state.

Israel was faced with a number of dilemmas: whether it should annex the territories and thereby dilute its Jewish majority, return the conquered lands to Jordanian control, hoping for an exchange of land for peace, or deal with the PLO and thereby accept the idea of Palestinian nationhood. Istanbul

Istanbul (formerly Constantinople, ancient Byzantium, Turkish İstanbul) is the largest city and seaport of Turkey. It was formerly the capital of the Byzantine Empire, of the Ottoman Empire, and—until 1923—of the Turkish Republic.

The old, walled city of Istanbul stands on a triangular peninsula between Europe and Asia. Sometimes as a bridge, sometimes as a barrier, Istanbul for more than 2,500 years has stood between conflicting surges of religion, culture, and imperial power. For most of those years it was one of the most coveted cities in the world.

The name Byzantium may derive from that of Byzas, who, according to legend, was leader of the Greeks from the city of Megara who captured the peninsula from pastoral Thracian tribes and built the city about 657 BC. In 196 BC, having razed the town for opposing him in a civil war, the Roman emperor Septimius Severus rebuilt it, naming it Augusta Antonina in honour of his son. In AD 330, when Constantine the Great dedicated the city as his capital, he called it New Rome. The coinage, nevertheless, continued to be stamped Byzantium until he ordered the substitution of Constantinopolis. In the 13th century Arabs used the appellation Istinpolin, a "name" they heard Byzantines use—*eis tēn polin*—which, in reality, was a Greek phrase that meant "in the city." Through a series of speech permutations over a span of centuries, this name became Istanbul. Until the Turkish Post Office officially changed the name in 1926, however, the city continued to bear the millenary name of Constantinople.

This article is divided into the following sections:

Physical and human geography

THE LANDSCAPE

The city site. The old city contains about nine square miles (23 square kilometres), but the present municipal boundaries stretch for more than 98 square miles, including areas on both sides of the Bosporus and the Sea of Marmara. The original peninsular city has seven hills requisite for Constantine's "new Rome." Six are crests of a long ridge above the Golden Horn; the other is a solitary eminence in the southwest corner.

By long tradition, the waters washing the peninsula are called "the three seas": they are the Golden Horn, the Bosporus, and the Sea of Marmara. The Golden Horn is a deep, drowned valley about 4$^1/_2$ miles (seven kilometres) long. Early inhabitants saw it as being shaped like a deer horn, but modern Turks call it the Haliç (Canal). The Bosporus (Boğazici) is the channel connecting the Black Sea (Kara Deniz) to the Mediterranean (Ak Deniz) by way of the Sea of Marmara (Marmara Deniz) and the straits of the Dardanelles. The narrow Golden Horn separates the old city of Stamboul to the south from the "new" city of Beyoğlu to the north; the broader Bosporus divides European Istanbul from the city's districts on the Asian shore—Üsküdar (ancient Chrysopolis) and Kadiköy (ancient Chalcedon).

Like the forces of history, the forces of nature impinge upon Istanbul. The great rivers pouring off the plains of Russia and middle Europe—the Danube, Don, Dnestr, and Dnepr—make the Black Sea colder and less briny than the Mediterranean. The Black Sea waters thrust southward through the Bosporus, but beneath them the salty warm waters of the Mediterranean push northward as a powerful undercurrent running through the same channel.

Climate. The prevailing wind, the northeast wind, or *poyraz,* comes from the Black Sea, giving way at times during the winter to an icy blast from the Balkans—the northwest wind, known as the *karayel,* or Black Veil, capable of freezing solid the Golden Horn and even the Bosporus. When the *lodos,* or southwest wind, blows, it can raise storms on the Sea of Marmara.

Istanbul's disasters

Fire, earthquake, riot, and invasion have ravaged the city many times. More than 60 conflagrations have been important enough to be recorded in history, and there remain scorched stretches of the old city that have never been rebuilt. Fifty major earthquakes and innumerable less serious temblors have shaken the city since the time of Constantine the Great. The fall of each empire has also been followed by devastation and a period of decay for the capital.

The city plan. Many of the burned-out neighbourhoods have slowly been rebuilt, while a continuing program of street improvement has pushed wide avenues through some of the meanest quarters of the old city. There remain, however, numbers of unpaved alleys overhung with decrepit wooden houses.

The Golden Horn, Istanbul. The two mosques in the background are (centre left) Hagia Sophia and (centre right) the Mosque of Süleyman.

Ara Gule

The city walls

Stamboul is still a walled city. The land walls, which isolate the peninsula from the mainland, were breached only once, by the cannon of Mehmed II (the Conqueror) in 1453, at the spot since called Cannon Gate (Top Kapısı). The walls are four and a half miles long and consist of a double line of ramparts—the inner built in 413, the outer in 447—protected by a moat. The higher inner wall is about 30 feet (9 metres) high and 16 feet thick and is studded with 60-foot towers about 180 feet apart. Of 92 turrets originally on the outer wall, 56 are still standing.

The sea walls were built in 439. Only short sections of their 30-foot-high masonry still remain along the Golden Horn. Intact, these walls had 110 towers and 14 gates. The walls along the Sea of Marmara, which stretch about five miles from Seraglio Point, curving around the bottom of the peninsula to join the land walls, had 188 towers; they were, however, only about 20 feet high, because the Marmara currents provided good protection against enemy landings. Most of these walls still stand.

Within the city walls are the seven hills, their summits flattened through the ages, their slopes still steep and toilsome. Geographers number them from the seaward tip of the peninsula, proceeding inland along the Golden Horn, the last hill standing alone where the land walls reach the Sea of Marmara.

The Golden Horn

The Galata and Atatürk bridges cross the Golden Horn to Beyoğlu. Each day before dawn their centre spans are swung open to allow passage to seagoing ships. The shores of the Horn, served by water buses, are a jumble of docks, warehouses, factories, and occasional historical ruins. Ferries to the Asian side of Istanbul leave from under the Galata Bridge. Istanbul's Bosporus Bridge (completed in 1973), with a main span of 3,524 feet, is one of the world's longest suspension bridges.

Beyoğlu, considered to be "modern Istanbul," remains, as it has been since the 10th century, the foreign quarter. Warfare and fires have left standing only a few structures that were built earlier than the 19th century.

The approach from the Golden Horn is steep, and a funicular railway runs between the Galata waterfront and the Pera Plateau. On the heights are the big hotels and restaurants, the travel bureaus, theatres, the opera house, the consulates, and many Turkish government offices.

From the 10th century onward, Galata was an enclave for foreign traders—principally the Genoese—who enjoyed extraterritorial privileges behind their walls. After the Ottomans took the city in 1453, all foreigners who were not citizens of the empire were restricted to this quarter. Around palatial embassies were compounds that included schools, churches, and hospitals for the various nationalities. Eventually Galata became too crowded, so that the tide of building moved higher up the slope to the open country of Pera. For centuries, foreigners who wished to visit Stamboul, where the Court was installed, could do so only if accompanied by one of the sultan's Janissaries.

Remains of Constantine's city

Architecture. *Byzantine monuments.* Nothing remains of the Byzantium that Constantine chose as the site of New Rome, and almost nothing is left of the mighty city he built there. Constantine's column, the Burnt Column (Çemberlitaş), a shaft of porphyry drums bound by metal laurel leaves, still stands near the Mosque of Nûruosman, but there is no proof that any building in the city dates from his period. He completed the Hippodrome that Septimus Severus had restored, but it was enlarged and rebuilt by his successors until the 5th century. Only its curved end remains, with three columns along the central spina—an obelisk removed from Egypt by the Roman emperor Theodosius I, a masonry obelisk of Constantine VII Porphyrogenitus (AD 905–959), and a Delphic column formed by three entwined serpents (now headless) cast after the Battle of Plataea, when the Greeks defeated the Persians in 479 BC.

Of the myriad columns that decorated Constantinople, there remain standing only the base of the column of the emperor Arcadius (reigned 383–408) in the Cerrahpaşa quarter; a column of the emperor Marcian (reigned 450–457) that the Turks call Kıztaşı; the Column of the Virgin, in the Fatih quarter; and, in the grounds of the Topkapı Palace, a perfectly preserved Corinthian column thought to be from the reign of another emperor, Claudius II Gothicus (268–270).

Spanning the valley between the third and fourth hills is the two-story limestone aqueduct built in 366 by the emperor Valens. Some of the enormous open-water cisterns of the Byzantine epoch now serve as market gardens. The closed cisterns, of which there are more than 80 remaining, include one of the most beautiful and mysterious structures of Istanbul, the Basilican Cistern, or Yerebatan Sarayı (underground palace), near the Hagia Sophia; its 336 columns rise from the still, black waters to a vaulted roof.

The Golden Gate is a triumphal arch from about 390 and was built into the defenses of Theodosius II, near the junction of the land and sea walls. The marble-clad bases of its two large towers still stand, and three arches decorated with columns stretch between them.

Monuments on the Seven Hills and Their Slopes

First Hill
Hagia Sophia
Church of St. Irene
Mosque of Kiiçük Ayasoya
(Church of SS. Sergius and Bacchus)
Mosque of Sokullu Mehmed Paşa
Mosque of Ahmed I (Blue Mosque)
Fountain of Ahmed III
The Museums
Çinili Kiosk (Pavilion of Tiles)
Basilican Cistern
(Yerebatan Sarayı)
Hippodrome
Topkapı Palace (Seraglio)
Marmara Sea Walls

Second Hill
Mosque of Nûruosman
The Burnt Column (Çemberlitaş)
The Great Bazaar (Kaplı Çarşı)

Third Hill
Mosque of Vefa Kilise
(Church of St. Theodore Tiro)
Mosque of Bayezid II
Mosque of Laleli
Mosque of Şehzade
Mosque of Süleyman, and tombs
Mosque of Bodrum
(Monastery of Myrelaion)
Mosque of Kalendarhane
(Monastery of Akataleptos)
Aqueduct of Valens

Fourth Hill
Mosque of the Fatih (Conqueror)
Mosque of Mollazeyrek
(Church of Christ Pantokrator)
Mosque of Eski İmaret
(Church of Christ Pantepoptes)

Fifth Hill
Mosque of Ahmed Paşa (Church of St. John the Baptist in Trullo)
Mosque of Gül
(Church of St. Theodosia)
Mosque of Fethiye (Church of the Pammakaristos Virgin)
Church of St. Mary of the Mongols
Greek Patriarchal Church of St. George

Sixth Hill
Mosque of Kari
(Church of St. Saviour in Chora)
Mosque of Mihrimah
Adrianople Gate (Edirne Gate)
Tekfur Sarayı (Palace of Constantine)

Seventh Hill
Mosque of Hekimoğlu Ali Paşa
Mosque of Ramazan Efendi
Seven Towers Castle (Yedikule)
Mosque of Koca Mustafa Paşa
(Church of St. Andrew in Krisei)
Mosque of İmrahor (Church of St. John of the Stoudion)

The only well-preserved example of Byzantine palace architecture is the shell of a three-story rectangular building of limestone and brick, laid in patterns and stripes. Dating from about 1300, it is called the Palace of Constantine (Tekfur Sarayı) and is attached to the land walls not far from the Golden Horn.

The Hagia Sophia

The largest legacy from the capital of the vanished empire is constituted by 25 Byzantine churches. Many of these are still in use—as mosques. The largest of the churches is considered one of the great buildings of the world. This is the Hagia Sophia, whose name means "Divine Wisdom." Its contemporary and neighbour, St. Irene, was dedicated to "Divine Peace." Many art historians deem the dome (105 feet in diameter) of Hagia Sophia to be the most beautiful in the world. The church, which shared its clergy with St. Irene, is said to have been built by Constantine in 325 on the foundations of a pagan temple. It was enlarged by the emperor Constans and rebuilt after the fire of 415 by the emperor Theodosius II. The church was burned again in the Nika Insurrection of 532 and reconstructed by Justinian. The structure now standing is essentially the 6th-century edifice, although an earthquake tumbled the dome in 559, after which it was rebuilt to a smaller scale and the whole church reinforced from the outside. It was restored again in the mid-14th century. In 1453 it became a mosque with minarets, and a great chandelier was added. In 1935 it was made into a museum. The walls are still hung with Muslim calligraphic disks.

The Church of SS. Sergius and Bacchus was erected by Justinian between 527 and 536 as a thank offering. The two soldier-saints allegedly appeared to the emperor Anastasius I to intercede for Justinian, who had been condemned to death for conspiracy. The church is built as a domed octagon within a rectangle, with a columned and galleried Byzantine interior. It is also called the Mosque of Küçük Ayasofya (Little Sophia) and can be considered an architectural parent of Justinian's reconstruction of the Hagia Sophia. The Church of St. Saviour in Chora (now called the Mosque of Kari) is near the Adrianople Gate. It was restored in the 11th century and remodelled in the 14th; the building is now a museum renowned for its 14th-century mosaics, marbles, and frescoes. Over the central portal is a head of Christ with the inscription, "The land of the living." When it was made a mosque, it acquired the narthex (an enclosed passage between the main entrance and the nave), portico, and minarets.

A massive tower that dominates the Galata district was built by the Genoese traders in 1349 as a watchtower and a fortification for their walled enclave.

The Sinan architectural tradition

Turkish monuments. When the Turks took possession of Constantinople, they covered the spines of the seven hills with domes and minarets, changing the character of the city. Like the Greeks, the Romans, and the Byzantines, the new rulers loved the city and spent much of their treasure and energy on its embellishment. The Ottoman dynasty, which lasted from 1300 to 1922, continued to build new important structures almost until the end of their line. The most imposing of their mosques were constructed from the mid-15th to the mid-16th century, and the greatest of the architects all bore the name of Sinan. They were Atik Sinan (the Elder), Sinan of Balıkesir, and Mimar Koca Sinan (Great Architect Sinan). Although the building was deeply influenced by the Persian-born traditions of the Seljuqs (once masters of the Ottomans), the style was blended with prevailing Hellenic and Byzantine traditions of the city. Mimar Koca Sinan's masterpiece—and his burial place—is the Mosque of Süleyman (1550–57), inspired by, but not copied from, the Hagia Sophia. It ranks as another of the world's great buildings. Probably the most popularly known of all the mosques in Istanbul is the Blue Mosque, that of the Mosque of Ahmed I (Ottoman sultan from 1603 to 1617), which has six minarets instead of the customary four.

The mosques of the 18th century and later show the deleterious effects of importing European architects and craftsmen, who produced baroque Islāmic architecture (such as the Mosque of the Fatih, rebuilt between 1767 and 1771) and even Neoclassical styles, as in the Dolmabahçe Mosque of 1853, now the Naval Museum.

The big mosques were built with ancillary structures, such as a Qur'ānic school (*medrese*), baths (*hamam*) for purification, a hostel and kitchen for the poor (*imaret*), or tombs of royalty and distinguished persons.

There are more than 400 fountains in Istanbul. Some simply flow from wall niches, but others, erected as public philanthropies, are pavilions. The most magnificent of these was built by the sultan Ahmed III in 1728, behind the apse of Hagia Sophia. It is square, with marble walls and bronze gratings, a mixture of the Turkish with the Western rococo style.

Topkapı Palace

To the north of it, toward the Golden Horn and occupying the whole tip of the promontory, is the sultan's Seraglio (Topkapı Palace), enclosed in a fortified wall. It was begun in 1462 by Mehmed II and served as the residence of the sultans until the beginning of the 19th century. It was to this palace that foreign ambassadors were accredited, and they were admitted through the Imperial Gate, or Bab-i-Hümayun, mistranslated by Westerners as "Sublime Porte." The Seraglio consists mostly of small buildings grouped around three courts. The most significant buildings are the Çinili Kiosk (Pavilion of Tiles) built in 1472, the Audience Chamber (Arzodası), the Hirkaiserif, a sanctuary containing relics of the Prophet Muḥammad, and the elegant Baghdad Kiosk commemorating the capture of Baghdad in 1638. The Seraglio houses the sultan's treasure and has important collections of manuscripts, china, armour, and textiles. After the abandonment of the Old Seraglio, the sultans built for themselves palaces along the Bosporus, such as the Beylerbey Palace (1865), the lavish Dolmabahçe Palace (1853), the Çeragan Palace built in 1874 and burned in 1910, and the Yıldız Palace, which was the residence of Abdülhamid II, Ottoman sultan from 1876 to 1909.

The Great Bazaar (Kaplı Çarşi), founded early in the Turkish regime, but often subject to fire and earthquake, had 4,000 shops around two central distributing houses. The district is laid out on a grid plan. It still boils with life and the pursuit of piasters.

THE PEOPLE

Istanbul, like other major cities, attracts an increasing number of migrants from the countryside. These migrants have contributed to the use of shantytowns called *gecekondu* (literally "set down by night") that have no sanitation facilities. Some migrants work as porters, bearing upon their backs burdens of immense size and weight. The Turkish Muslim majority continues to grow, and the Christian and Jewish minorities continue to shrink both in percentage of the whole and in numbers.

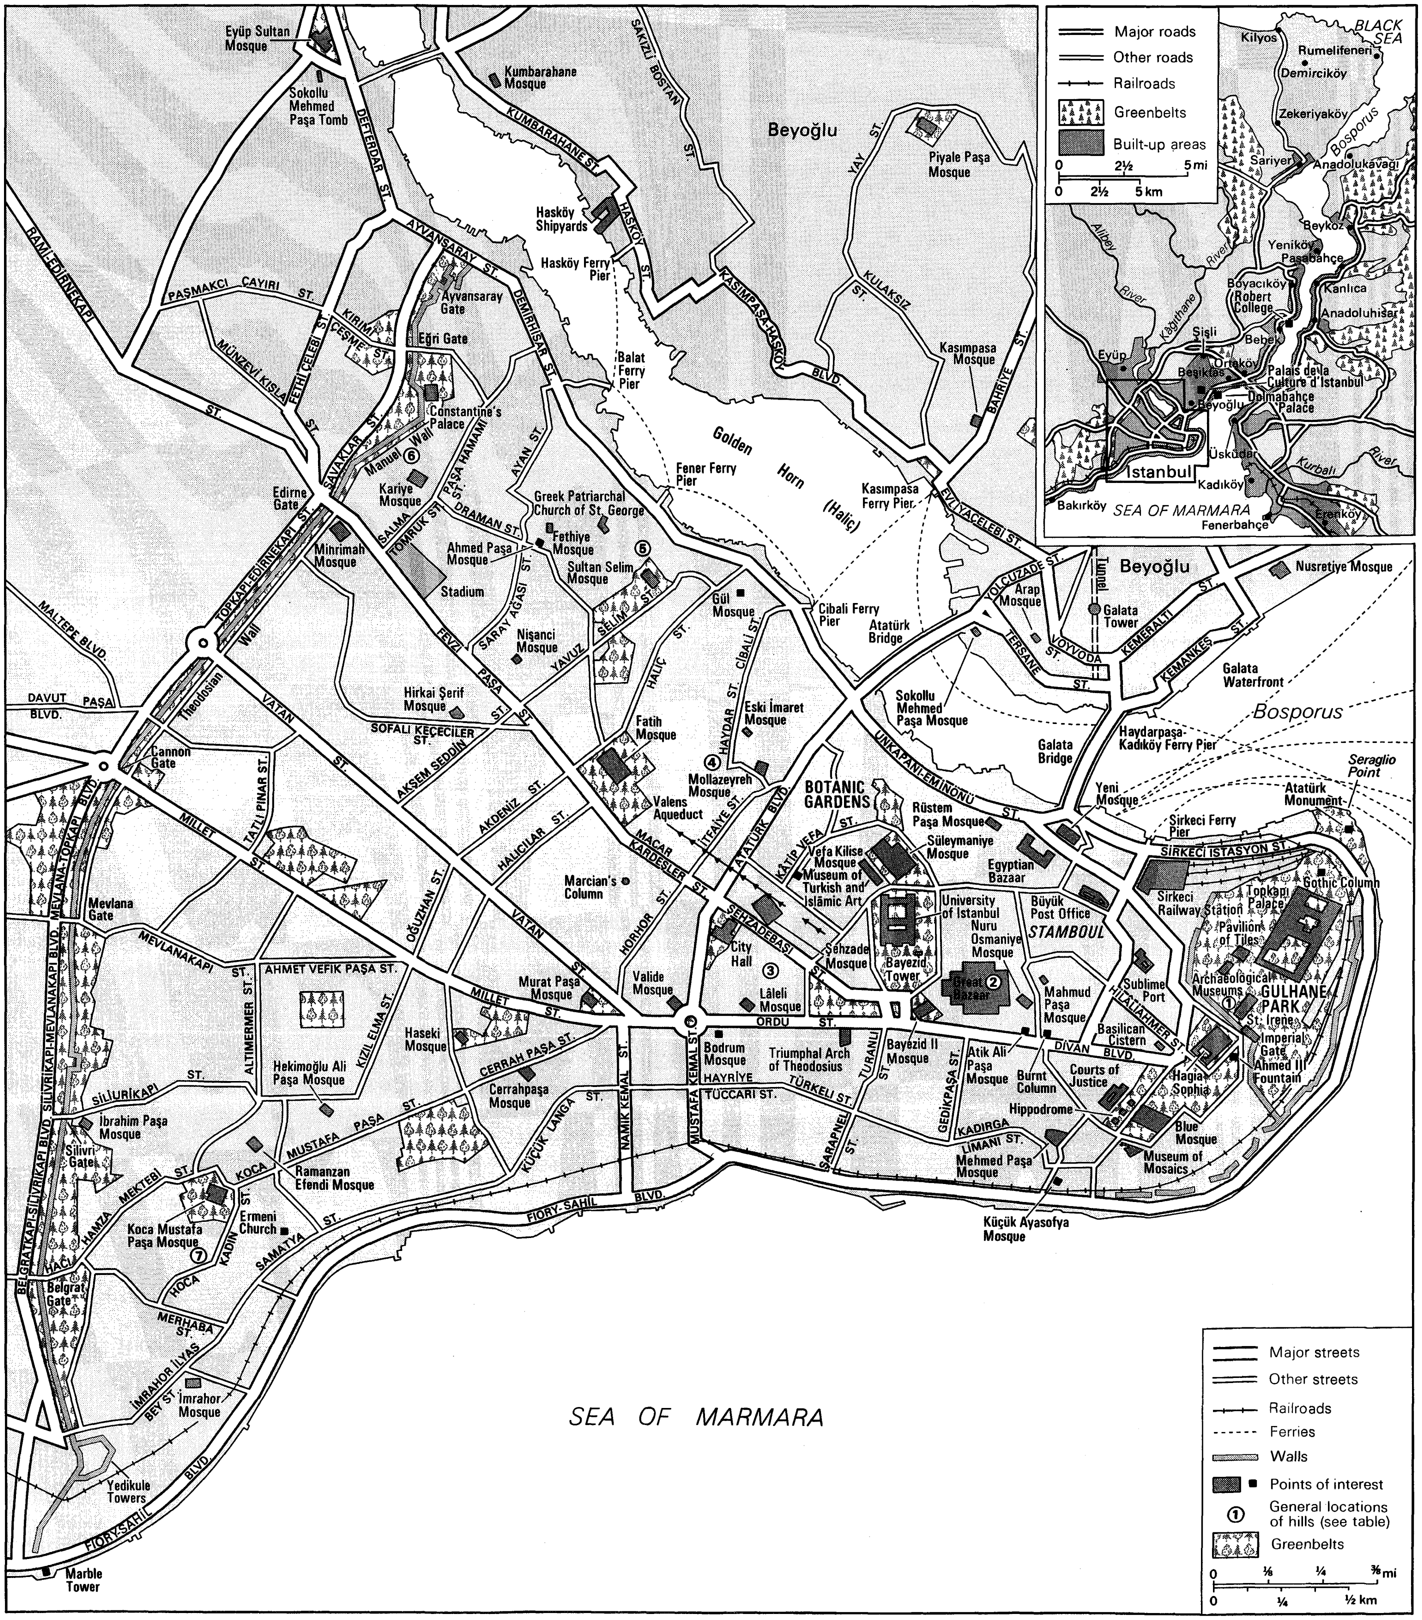
THE ECONOMY

Industry. Istanbul is Turkey's largest port and is the hub of its industry. Textiles, flour milling, tobacco processing, cement, and glass are the city's principal manufactures.

Transportation. Tourism is a growing source of income for Istanbul. There is rail service along the walls of the old city, and Haydarpaşa station, on the Asian side of the city, is the starting point of the Baghdad Railway. Maritime services include many forms of transport, from harbour dinghies and small ferries to international liners. Yeşilköy Airport is about 17 miles to the west of the city. Buses provide internal urban transportation, and the ferries range as far as the Kızıl Adalar (Princes Islands), several hours sailing to the south.

ADMINISTRATIVE AND SOCIAL CONDITIONS

Government. The mayor, appointed by the president of the republic, serves as prefect of Istanbul city and gover-



Istanbul and (inset) its metropolitan area.

nor of Istanbul *il* (province). The municipality, which was organized by Constantine as 14 districts in imitation of Rome, is now divided into 12 circumscriptions (*kazas*), each governed by a *kaymakam*. These are, in the old city, Eminönü and Fatih; on the European side above the Golden Horn, Eyüp, Gakirkoy, Beyoğlu, Şişli, Beşiktas, and Sarıyer; and across the Bosporus on the Asiatic side, Beykoz, Üsküdar, Kadıköy, and Adalar.

Public utilities. While Istanbul has a chlorinated and filtered water supply and sewage disposal system, these facilities are not sufficient to meet the increased need created by the influx of rural migrants to the city. Water supply is a problem particularly in the summer when rivers run dry; at this season tap water is likely to flow only sporadically, except in luxury hotels. Electric power supplies have been increased to help promote industrial expansion.

Health. Most of the health services of Istanbul *il* (province) are concentrated in the municipality. There are more than 70 hospitals, about half of which are public.

Istanbul's universities

Education. The first University of Istanbul was founded in 425 by Theodosius II and was succeeded by Istanbul University (İstanbul Ünıversitesi), founded in 1453. The university now includes faculties of letters, science, law, medicine, and forestry located in the former Seraskerat (war ministry) between the Great Bazaar and the Mosque of Süleyman. There is also a technical university on the Galata side of the Horn as well as an Academy of Fine Arts and schools of technology, commerce, and economics. Foreign educational institutions include the American Robert College for boys (founded in 1863) and the American College for girls (founded in 1871), both on the Bosporus.

CULTURAL LIFE

The Palais de la Culture d'Istanbul is an important centre for the arts. Facilities include a concert hall, art gallery, and two theatres. It is the home of the Istanbul Municipal Symphony Orchestra and the Istanbul City Opera. The municipal theatre operates several playhouses, and there are many theatre companies.

A large number of learned societies and research institutes are headquartered in the city, including the Geographical Institute (Coğrafya Enstitüsü), German and French archaeological institutes, and the Turkish Folklore Society (Türk Halk Bilgisi Derneği). There is a nuclear research centre at Küçük Çekmece.

There are many public and private libraries. The small, specialized Köprülü Library (1677) has books from early Ottoman presses and handwritten works more than 1,000 years old. Many of the city's mosques, palaces, and monuments, as mentioned earlier, contain museums; other museums include the Archaeological Museums of Istanbul (Istanbul Arkeoloji Müzeleri), the Museum of Turkish and Islāmic Art (Türk ve Islam Eserleri Müzesi), and the Museum of the Janissaries (Türkiye Askeri Müzesi).

The Hippodrome is now a public garden; there are also numerous other public parks. A unique feature of the city is its market gardens; these kitchen gardens are associated with the open cisterns that formed early Constantinople's water-supply system. The cisterns have been partially built over and are called Çukur Bostan (Hollow Gardens).

Football (soccer) is a popular sport, and Istanbul has three stadiums—Mithatpaşa, Fenerbahçe, and the indoor Spor ve Sergi Sarayı. There are facilities for tennis, fencing, mountain climbing, riding, golf, and water sports. Florya and Ataköy are popular beaches on the Sea of Marmara.

History

THE EARLY PERIOD

The founding of Byzantium

Byzantium. Byzantium was one of the many colonies founded from the end of the 8th century onward along the coasts of the Bosporus and the Black Sea by Greek settlers from the cities of Miletus and Megara.

The Persian king Darius I took the settlement in 512 BC; it slipped from Persian grasp during the Ionian revolt of 496, only to be retaken by the Persians. In 478 an Athenian fleet captured the city, which then became a rich and important member of the Delian League. As Athenian power waned during the Peloponnesian War, Byzantines acknowledged Spartan overlordship. Although Alcibiades besieged and retook the city, Sparta reasserted its domination after defeating Athens in 405 BC.

In 343 BC Byzantium joined the Second Athenian League, throwing off the siege of Philip II of Macedon three years later. The lifting of the siege was attributed to the divine intervention of the goddess Hecate and was commemorated by the striking of coins bearing her star and crescent. Byzantium accepted Macedonian rule under Alexander the Great, regaining independence only with the eclipse of Macedonian might. In the 3rd century BC, the city's treasury was drained to buy off marauding Gauls. A free city under Rome, it gradually fell under imperial control and briefly lost its freedom under the emperor Vespasian. When, in AD 196, it sided with the usurper Pescennius Niger, the Roman emperor Septimus Severus massacred the populace, razed the walls, and annexed the remains to the city of Perinthus (or Heraclea, modern Marmaraereğlisi), in Turkey.

Subsequently, Septimus Severus rebuilt the city on the same spot but on a grander scale. Although sacked again by Gallienus in 268, the city was strong enough two years later to resist a Gothic invasion. In the subsequent civil wars and rebellions that broke out sporadically in the Roman Empire, Byzantium remained untouched until the arrival of the emperor Constantine I—the first Roman ruler to adopt Christianity. Overcoming the army of the rival emperor, Licinius, at nearby Chrysopolis, on September 18, 324, Constantine became head of the whole Roman Empire, east and west. He decided to make Byzantium his capital.

The New Rome

Constantinople. Within three weeks of his victory, the foundation rites of New Rome were performed, and the much-enlarged city was officially inaugurated on May 11, 330.

It was an act of vast historical portent. Constantinople was to become one of the great world capitals, a font of imperial and religious power, a city of vast wealth and beauty, and the chief city of the Western world. Until the rise of the Italian maritime states, it was the first city in commerce, as well as the chief city of what was, until the mid-11th century, the strongest and most prestigious power in Europe.

Constantine's choice of capital had profound effects upon the ancient Greek and Roman worlds. It displaced the power centre of the Roman Empire, moving it eastward, and achieved the first lasting unification of Greece.

Culturally, Constantinople fostered a fusion of Oriental and Occidental custom, art, and architecture. The religion was Christian, the organization Roman, and the language and outlook Greek. The concept of the divine right of kings, rulers who were defenders of the faith—as opposed to the king as divine himself—was evolved there. The gold *solidus* of Constantine retained its value and served as a monetary standard for more than a thousand years. As the centuries passed—the Christian Empire lasted 1130 years—Constantinople, seat of empire, was to become as important as the empire itself; in the end, although the territories had virtually shrunk away, the capital endured.

Constantine's new city walls tripled the size of Byzantium, which now contained imperial buildings, such as the completed Hippodrome begun by Severus, a huge palace, legislative halls, several imposing churches, and streets decorated with multitudes of statues taken from rival cities. In addition to other attractions of the capital, free bread and citizenship were bestowed on those settlers who would fill the empty reaches beyond the old walls. There was, furthermore, a welcome for Christians, a tolerance of pagan beliefs, and benevolence toward Jews.

Constantinople as a religious capital

Constantinople was also an ecclesiastical centre. In 381 it became the seat of a patriarch who was second only to the bishop of Rome; the patriarch of Constantinople is still the nominal head of the Orthodox Church. Constantine inaugurated the first ecumenical councils; the first six were held in or near Constantinople. In the 5th and 6th centuries emperors were engaged in divising means to keep the Monophysites attached to the realm. In the 8th and 9th centuries Constantinople was the centre of the battle between iconoclasts and the defenders of icons. The matter was settled by the seventh ecumenical council against the iconoclasts, but not before much blood had been spilled and countless works of art destroyed. The eastern and western wings of the church drew further apart, and after centuries of doctrinal disagreement between Rome and Constantinople a schism occurred in the 11th century. The Pope originally approved the sack of Constantinople in 1204, then decried it. Various attempts were made to heal the breach in the face of the Turkish threat to the city, but the divisive forces of suspicion and doctrinal divergence were too strong.

By the end of the 4th century, Constantine's walls had become too confining for the wealthy and populous metropolis. St. John Chrysostom, writing at the end of that century, said many nobles had 10 to 20 houses and owned from one to 2,000 slaves. Doors were often made of ivory, floors were of mosaic or were covered in costly rugs, and beds and couches were overlaid with precious metals.

The pressure of population pressing from within, and the barbarian threat from without, prompted the building of walls further inland at the hilt of the peninsula. These new walls of the early 5th century, built in the reign of Theodosius II, are those that stand today.

In the reign of Justinian I (527–565) medieval Constantinople attained its zenith. At the beginning of this reign the population is estimated to have been about 500,000. In 532 a large part of the city was burned and many of the population killed in the course of the repression of the Nika Insurrection, an uprising of the Hippodrome factions. The rebuilding of the ravaged city gave Justinian the opportunity to engage in a program of magnificent construction, of which many buildings still remain.

In 542 the city was struck by a plague that is said to have killed three out of every five inhabitants; the decline of Constantinople dates from this catastrophe. Not only the capital but the whole empire languished, and slow recovery was not visible until the 9th century. During this period the city was frequently besieged—by the Persians and Avars (626), the Arabs (674 to 678 and again from 717 to 718), the Bulgars (813 and 913), the Russians (860, 941, and 1043), and by a wandering Turkic people, the Pechenegs, (1090–91). All were unsuccessful.

In 1082 the Venetians were allotted quarters in the city itself (there was an earlier cantonment for foreign traders at Galata across the Golden Horn) with special trading privileges. They were later joined by Pisans, Amalfitans, Genoese, and others. These Italian groups soon obtained a stranglehold over the city's foreign trade—a monopoly that was finally broken by a massacre of Italians. Not for some time were Italian traders permitted once more to settle in Galata.

Crusader rule

In 1203 the armies of the Fourth Crusade, deflected from their objective in the Holy Land, appeared before Constantinople—ostensibly to restore the legitimate Byzantine emperor, Isaac II. Although the city fell, it remained under its own government for a year. On April 13, 1204, however, the crusaders burst into the city to sack it. After a general massacre, the pillage went on for years. The crusading knights installed one of themselves, Baldwin of Flanders, as emperor, and the Venetians—prime instigators of the crusade—took control of the church. While the Latins divided the rest of the realm among themselves, the Byzantines entrenched themselves across the Bosporus at Nicaea (now İznik) and at Epirus (now northwestern Greece). The period of Latin rule (1204 to 1261) was the most disastrous in the history of Constantinople. Even the bronze statues were melted down for coin; everything of value was taken. Sacred relics were torn from the sanctuaries and dispatched to religious establishments in western Europe.

In 1261 Constantinople was retaken by Michael VIII Palaeologus, Greek emperor of Nicaea. For the next two centuries the shrunken Byzantine Empire, threatened both from the West and by the rising power of the Ottoman Turks in Asia Minor, led a precarious existence. Some construction was carried out at the end of the 13th and the beginning of the 14th centuries, but thereafter the city was in a state of decay, full of ruins and tracts of deserted ground, contrasting with the prosperous condition of Galata across the Golden Horn, which had been granted to the Genoese by the Byzantine ruler Michael VIII. When the Turks crossed into Europe in the mid-14th century, the fate of Constantinople was sealed. The inevitable end was retarded by the defeat of the Turks at the hands of Timur (Tamerlane) in 1402; but in 1422 the Ottoman sultan of Turkey, Murad II, laid siege to Constantinople. This attempt failed, only to be repeated 30 years later. In 1452 another Ottoman sultan, Mehmed II, proceeded to blockade the Bosporus by the erection of a strong fortress at its narrowest point; this fortress, called Rumeli Hisarı, still forms one of the principal landmarks of the straits. The siege of the city began in April 1453. The Turks had not only overwhelming numerical superiority but also cannon that breached the ancient walls. The Golden Horn was protected by a chain, but the Sultan succeeded in hauling his fleet by land from the Bosporus into the Golden Horn. The final assault was made on May 29, and, in spite of the desperate resistance of the inhabitants aided by the Genoese, the city fell. The last Byzantine emperor, Constantine XI Palaeologus, was killed in battle. For three days the city was abandoned to pillage and massacre, after which order was restored by the Sultan.

Capture by the Turks

CENTURIES OF GROWTH

When Constantinople was captured, it was almost deserted. Mehmed II began to repeople it by transferring to it populations from other conquered areas such as the Peloponnese, Salonika (modern Thessaloníki), and the Greek islands. By about 1480 the population rose to between 60,000 and 70,000. Hagia Sophia and other Byzantine churches were transformed into mosques. The Greek patriarchate was retained, but moved to the Church of the Pammakaristos Virgin (Mosque of Fethiye), later to find a permanent home in the Fener (Phanar) quarter. The Sultan built the Old Seraglio (Eski Saray), now destroyed, on the site occupied at present by the university, and a little later the Topkapı Palace (Seraglio), which is still in existence; he also built the Eyüp Mosque at the head of the Golden Horn and the Mosque of the Fatih on the site of the Basilica of the Holy Apostles. The capital of the Ottoman empire was transferred to Constantinople from Adrianople (Edirne) in 1457.

After Mehmed II, Istanbul underwent a long period of peaceful growth, interrupted only by natural disasters—earthquakes, fires, and pestilences. The sultans and their ministers devoted themselves to the building of fountains, mosques, palaces, and charitable foundations so that the aspect of the city was soon completely transformed. The most brilliant period of Turkish construction coincides with the reign of the Ottoman ruler Süleyman the Magnificent (1520–66).

Westernization of the city

The next major change in the history of Istanbul occurred at the beginning of the 19th century, when dismemberment of the Ottoman Empire was approaching. This period was known as the era of internal reforms (Tanzimat). The reforms were accompanied by serious disturbances, such as the massacre of the Janissaries in the Hippodrome (1826). With the triumph of the progressive Ottoman sultan Mahmud II over the conservative opposition, the westernization of Istanbul started apace. There was an ever-growing influx of European visitors who, since the 1830s, could reach Istanbul by steamship. The first bridge across the Golden Horn was built in 1838. In 1839 the Ottoman sultan Abdülmecid I issued a charter guaranteeing to all his subjects, whatever their religion, the security of their lives and fortunes. The process of westernization was further accelerated by the Crimean War (1853–56) and the quartering of British and French troops in Istanbul. The latter part of the 19th and the beginning of the 20th centuries were marked by the introduction of various public services: the European railroad extending to Istanbul was begun in the early 1870s. The underground tunnel joining Galata to Pera was completed in 1873; a regular water supply for Istanbul and the settlements on the European side of the Bosporus was brought from Lake Terkos on the Black Sea coast (29 miles from the city) by the French company, La Compagnie des Eaux, after 1885; electric lighting was introduced in 1912 and electric street cars and telephones in 1913 and 1914. An adequate sewage system had to wait until 1925 and later.

MODERN ISTANBUL

In the first quarter of the 20th century, there were various disruptions marking the death of the Ottoman Empire and the birth of modern Turkey. In 1908 the city was occupied by the army of the Young Turks who deposed the hated sultan Abdülhamid II. During the Balkan Wars (1912–13) Istanbul was nearly captured by the Bulgarians. Throughout World War I the city was under blockade. After the conclusion of the Armistice (1918) it was placed under British, French, and Italian occupation that lasted until 1923. The Greco-Turkish War in Asia Minor, as well as the Russian Revolution, brought thousands of refugees to Istanbul. With the victory of the Nationalists under Mustafa Kemal Atatürk, the sultanate was abolished, and the last Ottoman sultan, Mehmed VI, fled from Istanbul (1922). After the signing of the Lausanne Treaty, Istanbul was evacuated by the Allies (October 2, 1923), and Ankara was chosen as the capital of Turkey (October 13, 1923). On October 29, the Turkish Republic was proclaimed. Because of Turkey's neutrality during most of World War II, Istanbul suffered no damage, although a German invasion was feared after the Balkans had been conquered by the Axis. The influx of automobiles brought acute traffic problems to Istanbul, and large tracts of the city were demolished or cleared to make way for modern highways.

(B.E.)

Italian Literature

Vernacular Italian literature had its beginnings in the 13th century. Until that time nearly all literary work was written in Latin, was predominantly practical in nature, and was produced by writers trained in ecclesiastical schools. In literary quality and variety it fell short of the standard set by France. Only small fragments of Italian vernacular verse before the end of the 12th century have been found, although a number of legal documents were written in the vernacular.

This article traces the development of Italian literature from early French-inspired works to the diverse writings of present-day authors.

The article is divided into the following sections:

EARLY VERNACULAR LITERATURE

Franco-Italian literature. French prose and verse romances were popular in Italy from the 12th to the 14th century. Stories from the Carolingian and Arthurian cycles, together with free adaptations from the classics, were read by the literate, while French minstrels recited verse in public places throughout northern Italy. By the 13th century a "Franco-Italian" literature had developed; Italians copied French stories, often adapting and extending various episodes and sometimes creating new romances in French about characters from French works. In this literature, though the language used was French, the writers often unconsciously introduced elements from their own dialects, according to their varying knowledge of French. Writers of important prose works such as Martino da Canale and Brunetto Latini—who wrote *La Cronique des Veniciens* (1275; "Chronicle of the Venetians") and *Li Livres dou trésor* (*c.* 1260; "The Books of the Treasure"), respectively—were much better acquainted with French, while poets such as Sordello of Mantua wrote lyrics in Provençal revealing an exact knowledge of the language and of Provençal versification. Provençal love lyrics were, in fact, as popular as the French romances, and Italian writers carefully studied anthologies of the verse.

The Sicilian school. In the cultured environment of the Sicilian court of the Holy Roman emperor Frederick II, who ruled the Sicilian kingdom from 1208 to 1250, lyrics modeled on Provençal forms and themes were written in

The origins of the vernacular lyric

the vernacular. Poets were careful to eliminate narrowly local elements from their language and used words characteristic of the troubadour tradition. Poetry was considered an escape from serious matters of life, and it is significant that it was the love poetry of Provence—and not the political poetry—that was imitated by the Sicilian school.

The Tuscan poets. Sicilian poetry continued to be written after the death of Frederick II, but the centre of literary activity moved to Tuscany, where interest in the Sicilian lyric had led to several imitations by Guittone d'Arezzo and his followers. Although Guittone experimented with elaborate verse forms, his language mingled dialect elements with Latinisms and Provençalisms and had none of the beauty of the southern school.

The new style. While Guittone and his followers were still writing, a new development appeared in love poetry, marked by a concern for precise and sincere expression and a new, serious treatment of love. It became customary to speak of a new school of poets of the *dolce stil novo,* or *nuovo* ("sweet new style"), an expression used by Dante Alighieri in *La divina commedia* (*Purgatorio,* Canto XXIV, line 27) in a passage where he emphasized delicacy of expression suited to the subject of love. The major *stil novo* poets were Guido Guinizelli of Bologna, Guido Cavalcanti, Dante (in his poems in *La vita nuova*), and Cino da Pistoia, together with the lesser poets Lapo Gianni, Gianni Alfani, and Dino Frescobaldi.

Dante's *Vita nuova*

These poets seem to have been influenced by each other's work. Guido Guinizelli was best known for his canzone, or poem, beginning "Al cor gentil ripara sempre amore" ("Love always finds shelter in the gentle heart"), which posed the question of the relationship between love of woman and love of God. His poetry was immediately appreciated by Cavalcanti, a serious and extremely talented lyric poet. Most of his poems were tragic and denied the ennobling effect of love suggested by Guinizelli. Dante greatly admired Cavalcanti, but his concept of love, inspired by his love for Beatrice, who died young (in 1290), had much more in common with Guinizelli's. Dante's *Vita nuova* (*c.* 1293; *The New Life*) is the story of his love in poems linked by a framework of eloquent prose: God is the "root" of Beatrice, and she is able to mediate God's truth and love and inspire love of God—but her death is necessary for her lover to reach a state of purification. Cino da Pistoia used the vocabulary of the *stilnovisti,* as these poets were called, in an original and lighthearted way. A comparison of their language with the earlier Tuscan poets reveals extensive refinement of Tuscan dialects. Purely local characteristics were removed, and the standard literary language of Italy had been created.

Comic verse. Giocoso, or comic, verse was a complete contrast to serious love poetry. The language was often deliberately unrefined, colloquial, and sometimes obscene, in keeping with the themes dealt with in the poetry. This kind of verse belongs to a European tradition, owing something to the satirical Goliard poets of the 12th and 13th centuries, who wrote Latin verses in praise of pleasure or in vituperation of women or personal enemies or the church. The comic poets—whose usual verse form was the sonnet—were all cultured men. The earliest of them was Rustico di Filippo, who produced both courtly love poetry and coarse, sometimes obscene verse of the "realistic" kind. The best known and most versatile was Cecco Angiolieri, whose love poetry often skillfully parodied the *stil novo* writers and whose favourite subject was his father's meanness. Folgore di San Gimignano was known for his sonnets (following Latin models) on the worldly pleasures he considered as suitable to different months and different days of the week.

Religious poetry. The beautiful and famous *Cantico di frate sole* (*c.* 1225; "Canticle of the Sun") of St. Francis of Assisi was one of the earliest Italian poems. It was written in rhythmical prose that used assonance in place of rhyme and was in the Umbrian dialect; in it God is praised through all the things of his creation. It is probable that St. Francis also composed a musical accompaniment, and after his death the *lauda* became a common form of religious song used by the confraternities of lay people who gathered to sing the praises of God and the saints and to recall the life and Passion of Christ. The one real poet of the *laude* was Jacopone da Todi, a Franciscan and a mystic. His *laudi* were mostly concerned with the theme of spiritual poverty. Though Jacopone did not write with conscious art, some of the *laudi* were very fine.

The pessimism of northern Italian poetry

In northern Italy religious poetry was mainly moralistic and pervaded by a pessimism rooted in heretical ideas derived from Manichaeism, which saw the world and the body as being evil and under Satan's control. Giacomino da Verona, a Franciscan, author of *De Jerusalem celesti* (*c.* 1250; "On Heavenly Jerusalem") and *De Babilonia civitate infernali* (*c.* 1250; "On the Infernal Babylonian State"), was the liveliest and most imaginative of this group.

Prose. Literary vernacular prose began in the 13th century, though Latin continued to be used for writings on theology, philosophy, law, politics, and science.

The founder of Italian rhetorical prose style, Guido Faba, a rhetorician, illustrated his teaching by examples of prose styles in Bolognese. Guittone d'Arezzo, his most notable follower in epistolography, tended toward an extravagant style. In contrast with Guittone's style is the clear scientific prose of Ristoro d'Arezzo's *Della composizione del mondo* (1282; "On the Composition of the World") and the simple narrative of the Florentine collection of tales *Il novellino* (written in the late 13th century, published in 1525 as *Le ciento novelle antike; Il Novellino, the Hundred Old Tales*). The masterpiece of 13th-century prose is Dante's *Vita nuova.* Though not yet completely at ease in vernacular prose, Dante combined simplicity with great delicacy and a poetic power that derived from the mysterious depth beneath certain key words.

THE 14TH CENTURY

The literature of 14th-century Italy dominated Europe for centuries to follow and may be regarded as the starting point of the Renaissance. Three names stand out: Dante, Petrarch, and Boccaccio.

Dante. Dante Alighieri is one of the most important and influential names in all European literature, but it was only after his exile (1302) that he set out to write more ambitious works. *Il convivio* (*c.* 1304–07; "The Banquet"), revealing his detailed knowledge of scholastic philosophy, was the first great example of a treatise in vernacular prose: its language avoided the ingenuousness of popular writers and the artificiality of the translators from Latin. *De vulgari eloquentia* ("On Vernacular Eloquence"), written about the same time, contained the first theoretical discussion and definition of the Italian literary language. Both these works remained unfinished. In a later doctrinal work, *De monarchia* (written *c.* 1313; Eng. trans., *De Monarchia*), Dante expounded his political theories, which demanded the coordination of the two medieval powers, pope and emperor.

La divina commedia

Dante's genius found its fullest development in *La divina commedia* (written *c.* 1310–21; *The Divine Comedy*), an allegorical poem in terza rima (stanzas of three lines of 11 syllables each, rhyming *aba, bcb, cdc,* etc.), the literary masterpiece of the Middle Ages and one of the greatest products of any human mind. The central allegory of the poem was essentially medieval, taking the form of a journey through the world beyond the grave, with, as guides, the Roman poet Virgil and Beatrice, who symbolize reason and faith, respectively. The poem is divided into three *cantiche,* or narrative poems: *Inferno, Purgatorio,* and *Paradiso.* They are subdivided into various schematically symbolic areas, and each contains 33 cantos, with one canto as an overall prologue. Dante, through his experiences and encounters on the journey, gains understanding of the gradations of damnation, expiation, and beatitude, and the climax of the poem is his momentary vision of God. The greatness of the poem lies in complex imaginative power of construction, inexhaustible wealth of poetry, and continuing significance of spiritual meanings.

Petrarch. The intellectual interests of Petrarch (Francesco Petrarca, died 1374) were literary rather than philosophical; his political views were more realistic than Dante's and his poetic technique more elaborate though less powerful. Petrarch's influence on literature was enormous and lasting—stretching through the Italian humanists of the following century to poets and scholars throughout western Europe. He rejected medieval Scholasticism and took as his models the classical Latin authors and the Church Fathers. This convergence of interests is apparent in his philosophical and religious works. Humanist ideals inspired his Latin poem *Africa* (begun *c.* 1338) and his historical works, but the autobiographical *Secretum meum* (written 1342–58; *Petrarch's Secret*) is most important for a full understanding of his conflicting ideals. The *Rime,* or *Canzoniere*—a collection of sonnets, songs, six-line verses, ballads, and madrigals, dating from 1330 until his death—gave these ideals poetic expression. Although this collection of vernacular poems intended to tell the story of his love for Laura, it was in fact an analysis and evocation not of present love but of the passion that he had overcome. The main element of this poetry was therefore in the elaboration of its art, even if it always reflected the genuine spiritual conflicts exposed in the *Secretum.* In addition to the *Canzoniere* Petrarch wrote a vernacular allegorical poem, *Trionfi* (1351–74; *Triumphs*), in the medieval tradition, but it lacked the moral and poetical inspiration of Dante's great poem.

The literary phenomenon known as Petrarchism developed rapidly within the poet's lifetime and continued to grow during the following three centuries, deeply influencing the literatures of Italy, Spain, France, and England. His followers did not merely imitate but accepted his practice of strict literary discipline and his forms, including that for the sonnet—without which the European literary Renaissance would be unthinkable.

Boccaccio. Boccaccio's writings were purely literary, without any ideological implications. His first romance, *Il filocolo* (*c.* 1336; "Love's Labour"), derived from the French romance *Floire et Blancheflor,* was little more than literary experiment. Inability to write on an epic scale was evident in his two narrative poems *Il filostrato* (*c.* 1338; "Frustrated by Love") and *Teseida* (*c.* 1340; *The Book of Theseus*), while his *Ameto* (1341–42), a novel written in prose and verse, and his *Fiammetta* (*c.* 1343; *Amorous Fiammetta*), a prose novel, showed the influence of classical literature on the formation of his style. The *Decameron* (1348–53), a prose collection of 100 stories divided into 10 "days," was Boccaccio's most mature and important work. Its treatment of contemporary urban society ranged from the humorous to the tragic. Stylistically the most perfect example of Italian classical prose, it had enormous influence on Renaissance literature.

The *Decameron*

Boccaccio shared the humanist interests of his age, as shown in his Latin epistles and treatises. An admirer of Dante, he also wrote a *Trattatello in laude di Dante* (written *c.* 1360; "Treatise in Praise of Dante"; Eng. trans., *The Life of Dante*) and a commentary on the first 17 cantos of the *Inferno.* He contributed to allegorical poetry with *L'amorosa visione* (written 1342–43).

Popular literature and romances. During the second half of the 14th century, Florence remained a centre of culture, but its literature developed a more popular character. The best known representative of this development was Antonio Pucci (died 1388), whose vast production included the *Centiloquio* (written after 1348; "One Hundred Tales"), a versification of Giovanni Villani's *Cronica.* Florentine narrative literature was represented by the *Pecorone* (written *c.* 1378; "Dullard"), stories by Ser Giovanni Fiorentino after a pattern established by Boccaccio, and Franco Sacchetti's *Trecentonovelle* (written *c.* 1390; "300 Short Stories"), which provide colourful and lively descriptions of people and places.

The recasting of the Carolingian and Arthurian cycles continued along lines established during the 13th century. Compilations in prose and verse became commoner, and Franco-Venetian literature gained in literary value. Epic legends were turned into romantic stories, which appealed more to their audiences in town squares and other public places. Novels by Andrea da Barberino, *cantari* with legendary subjects by Antonio Pucci, and the anonymous *Pulzella gaia, Bel Gherardino, Donna del Vergiù,* and *Liombruno* were written in the popular style consistent with their practical aim.

Religious and historical literature. The most important author of religious literature was Jacopo Passavanti, whose *Specchio di vera penitenza* ("The Mirror of True Penitence") was a collection of sermons preached in 1354. Less polished, but of greater literary value, were translations of legends collected in the anonymous *Fioretti di San Francesco* (*The Little Flowers of St. Francis of Assisi*).

Vernacular historiography of this period could be described as popular literature, with Florence as its main centre, whose two principal chroniclers were Dino Compagni and Giovanni Villani. Compagni wrote his chronicle between 1310 and 1312, after having taken part in the political struggles of his town; his dramatic account of the episodes and the liveliness of his prose made it the most original work of medieval historiography. Villani's *Cronica* in 12 books, written from 1308 to 1348, was less personal; it followed the medieval tradition by beginning with the building of the Tower of Babel and included many legends. The last six books, which cover the period from Charles of Anjou's Italian expedition (1265) to the author's own time, are of importance to historians. His prose lacked the dramatic power of Compagni's, but his work may be described as the greatest achievement of Italian vernacular historiography during the Middle Ages.

The Florentine chroniclers

From Boccaccio's death to about the middle of the 15th century, Italian poetry suffered a decline. The following period was to be characterized by critical and philological activity rather than by original creative work.

THE RENAISSANCE

The age of humanism. The European Renaissance had really begun in 14th-century Italy with Petrarch and Boccaccio. The 15th century, devoid as it was of major poetic works, was nevertheless of very great importance because it was the century in which a new vision of human life, embracing a different conception of man and life as well as more modern principles of ethics and politics, gradually found its expression. This was the result, on the one hand, of the rediscovery of classical antiquity, and, on the other, of political conditions quite different from those of previous centuries. With regard to the second point, nearly all Italian princes competed with each other in the 15th century to promote culture by patronizing research, offering hospitality and financial support to literary men of the time, and founding libraries. As a consequence, their courts became centres of research and discussion, thus making possible the great cultural revival of the period. The most notable courts were that of Florence, under Lorenzo de' Medici, "the Magnificent"; that of Naples, under the Aragonese kings; that of Milan, first under the Visconti and later the Sforza family; and finally the papal court at Rome, which gave protection and support to a large number of Italian and Byzantine scholars. As for the first point, the search for lost manuscripts of ancient authors, begun in the second half of the previous century, led to an extraordinary revival of interest in classical antiquity: in particular, much research was devoted to Plato and Greek philosophy in general, a fact that was to have profound influence on the thinking of the Renaissance as a whole.

By and large, the new culture of the 15th century was a revaluation of man. Humanism opposed the medieval view of man as a being with relatively little value and extolled him as the centre of the universe, the power of his soul as linking the temporal and the spiritual, and earthly life as a realm in which the soul applies its powers. These concepts, which mainly resulted from the new interest in Plato, were the subject of many treatises, the most important of which were Giannozzo Manetti's *De dignitate et excellentia hominis* (completed in 1452; *On the Dignity of Man*) and Pico della Mirandola's *Oratio de hominis dignitate* (written 1486; *Oration on the Dignity of Man*). The humanist vision evolved during this period condemned many religious tenets of the Middle Ages still widely prevalent: monastic ideals, for example, were attacked by Leonardo Bruni, Lorenzo Valla, and Poggio Bracciolini. Forthright though these attacks were, humanism was not essentially anti-Christian, for it generally remained faithful to Christian beliefs, and the papal court itself regarded humanism as a force to be assimilated rather than defeated.

Italian humanist view of man

In the first half of the century humanists, with their enthusiasm for Latin and Greek literature, had a disdain for the Italian vernacular. Their poetic production, inspired by classical models and written mostly in Latin or occasionally Greek, was abundant but of little value. Writing in a dead language and closely following a culture to which they had enslaved themselves, they rarely showed originality as poets. Among the few notable exceptions are Giovanni Pontano, Michele Marullo Tarcaniota, Angelo Ambrogini Poliziano (Politian), and Jacopo Sannazzaro. These poets sometimes succeeded in creating sincere poetry in which the conventional themes of 15th-century lyrics were expressed with new, original intimacy and fervour.

The rise of vernacular literature. Toward the middle of the 15th century Italian began to oust Latin as the literary language. The Certame Coronario, a public poetry competition held in Florence in 1441 with the intention of proving that the spoken language was in no way inferior to Latin, marked a definite change. In the second half of the century there were a number of works of merit inspired either by Carolingian legends or by the new humanist culture.

The chivalrous epic of Carolingian legends, which had degenerated into clichés, was given a new lease on life by two poets of very different temperament and education: Matteo Maria Boiardo, whose *Orlando innamorato* (1483; "Orlando in Love") reflected past chivalrous ideals as well as contemporary standards of conduct and popular passions; and Luigi Pulci, whose *Morgante,* published before 1480, was pervaded by a new bourgeois and popular morality.

The new ideals of the humanists were most complete in Angelo Ambrogini Poliziano (Politian), Jacopo Sannazzaro, and Leon Battista Alberti, three outstanding figures who combined a wide knowledge of classical antiquity with a personal and often profound inspiration. Politian's most important Italian work was *Stanze per la giostra* (1475–78; "Stanzas for the Joust"), which created a mythical world in which concepts of classical origin were relived in a new way. The same could be said of Sannazzaro's *Arcadia* (1504), a largely autobiographical work in verse and prose that remained widely influential up to the 18th century. A more balanced view of contemporary reality was given in Alberti's literary works, which presented a gloomy picture of human life, dominated by man's wickedness and the whims of fortune. As for Lorenzo de' Medici, patron of many men of letters, he himself had a vast poetic output, though this is more notable for documentary than for literary value.

Pietro Bembo's view of language

Pietro Bembo of Venice published his *Prose della volgar lingua* ("Writings in the Vulgar Tongue") in 1525. In this work, which was one of the first Italian grammars, Bembo demanded an Italian literary language based on 14th-century Tuscan models, particularly Petrarch and Boccaccio. He was opposed by those who thought that a literary language should be based on existing linguistic developments, particularly by Gian Giorgio Trissino, who developed Dante's theories on Italian as a literary language. In practice the problem was both linguistic and stylistic, and there were in the first half of the 16th century a great number of other contributors to the question, but Bembo's theories did finally triumph in the second part of the century. This was due to a large extent to the activities of the Florentine Accademia della Crusca, and this more scientific approach to the language question resulted in the academy's first edition of an Italian dictionary in 1612.

During the first decades of the 16th century, treatises on poetry were still composed according to humanist ideas and the teachings of the Roman Augustan poet Horace. It was only after 1536, when the original classical Greek text of Aristotle's *Poetics* was first published, that a gradual development became apparent in aesthetic theory. The traditional principle of imitation was now better analyzed, emphasis being given to the imitation of classical authors rather than to that of nature. The three unities of tragedy (time, space, action) were among the rhetorical rules then reestablished. The classical conception of poetry as a product of imagination supported by reason was at the basis of 16th-century rhetoric, and it was this conception of poetry, revived by Italian literature, that triumphed in France, Spain, and England during the following century.

Political, historical, biographical, and moral literature. Niccolò Machiavelli's works reflected Renaissance thought in its most original aspects, particularly in the objective analysis of human nature. Machiavelli has been described as the founder of a new political science: politics divorced from ethics. His own political experience was at the basis of his ideas, which he developed according to such general principles as the concepts of *virtù* ("power") and *fortuna* ("chance"). He considered *virtù* to be power with a practical aim that should struggle against *fortuna,* which represented the forces of violence and irresponsibility. His famous treatise *Il principe* (*The Prince*), composed in 1513, revealed the author's prophetic attitude, based on observation of contemporary political affairs. Its description of a model ruler became a code for the wielding of absolute power throughout Europe for two centuries. Machiavelli's *Discorsi sopra la prima deca di Tito Livio* (*c.* 1513–21; *Discourse on the First Ten Books of Titus Livius*), showed the same realistic attitude: public utility was placed above all other considerations, and political virtue was distinguished from moral virtue. His seven books on *Dell'arte della guerra* (1521; *The Art of War*), concerning the creation of a modern army, were more technical, while his historical works, including the *Istorie fiorentine* (1520–25; *Florentine History*), exemplified theories expounded in his treatises. Machiavelli also holds a place in the history of imaginative literature, above all for *La Mandragola* (1518), one of the outstanding comedies of the century.

The Prince

Although more of an individualist and pragmatist than Machiavelli, Francesco Guicciardini was the only 16th-century historian who could be placed within the framework of the political theories he constructed. He drew attention to the self-interest of those involved in political actions and made Machiavelli's theories appear idealistic by contrast. One of Guicciardini's main works, his *Ricordi* (1512–30; "Remarks"), has a place among the most original political writings of the century. Guicciardini was also the first, in his *Storia d'Italia* (1537–40), to compose a truly national history of Italy, setting it in a European context and attempting an impartial analysis of cause and effect.

Giorgio Vasari's *Vite de' più eccellenti architetti, pittori et scultori italiani da Cimabue insino a' tempi nostri* (1568; *Lives of the Painters, Sculptors, and Architects*) not only contained more than 200 biographies but also was the first proper critical and historical appraisal of Italian art. The autobiography of the sculptor and goldsmith Benvenuto Cellini (written 1558–66, published 1728) was remarkable for its spontaneity and its use of popular Florentine language.

Castiglione's *Cortegiano*

The highest moral aspirations of the Renaissance are expressed in Baldassare Castiglione's *Cortegiano* (published 1528; *The Courtier*), which deals with the perfect courtier, the noble lady, and the relationship between courtier and prince. It became one of the most influential books of the century. Giovanni della Casa was the author of another famous treatise, the *Galateo* (*c.* 1551–54; "Manners"; Eng. trans., *Galateo*), a book on courtesy in which the author's witty mind and the refinement of contemporary Italian society found full expression. The life of the period was also vividly reflected in the work of Pietro Aretino, who was called "the scourge of princes" by Ariosto. His *Ragionamenti* (1534-36; "Discussions") were written in a spontaneous style and showed a sensuous and unscrupulous nature.

Poetry. Lyric poetry in the 16th century was dominated by the model of Petrarch mainly because of the acceptance of the Renaissance theory of imitation and the teaching of Bembo. Almost all the principal writers of the century wrote lyric poems in the manner of Petrarch. Some originality was to be found in Della Casa's poems, and Galeazzo di Tarsia stood out from contemporary poets by virtue of a vigorous style. Also worthy of note are the passionate sonnets of the Paduan poet Gaspara Stampa and those of Michelangelo.

The tradition of autobiographical, humorous, and satirical verse was kept alive during the 16th century, when it reached some real stature with Francesco Berni, whose burlesque poems, mostly dealing with indecent or trivial subjects, showed his stylistic skill. Didactic poetry, already cultivated by humanist writers, was also continued during this period, chiefly by Giovanni Rucellai, who recast in *Le api* (1539; "The Bees") the fourth book of the Roman poet Virgil's *Georgics,* and Luigi Alamanni, in six books about rustic life called *La coltivazione* (1546).

The most refined expression of the classical taste of the Renaissance was to be found in Ludovico Ariosto's *Orlando furioso* (1516; Eng. trans., *Orlando Furioso*), which embodied many episodes derived from popular medieval and early Renaissance epics; but the poem's unique qualities derived from Ariosto's sustained inspiration and technique and detached ironical attitude to his characters. *Orlando furioso* was the most perfect expression of the literary tendencies of the Italian Renaissance at this time, and it exercised enormous influence on later European Renaissance literature. Ariosto also composed comedies that, by introducing imitation of Latin comedy, marked the beginning of Renaissance drama in the vernacular.

There were also attempts to renew the epic by submitting the tradition of chivalry to Aristotle's rules of composition. Gian Giorgio Trissino, a theorist on language, wrote according to the strictest Aristotelian rules, while Luigi Alamanni tried to focus the narrative on a single character in *Girone il cortese* (1548; "Girone the Courteous") and *Avarchide* (1570), an imitation of the *Iliad* of Homer. Giambattista Giraldi, while more famous as a tragic playwright, was a literary theorist who tried to apply his theories to his own poem *Ercole* (1557; "Hercules").

Fidenziana and macaronic poetry

Two burlesque medley forms of verse were invented during the century. *Fidenziana* poetry derives its name from a work by Camillo Scroffa, a poet who wrote in a combination of Latin words and Italian form and syntax. Macaronic poetry, on the other hand, is a term given to verse consisting of Italian words used according to Latin form and syntax. Teofilo Folengo, a Benedictine monk, was the best representative of macaronic literature, and his masterpiece was a poem in 20 books called *Baldus* (1517). A tendency to parody, ridiculing the excesses of humanist literature, was present in both the *fidenziana* and macaronic verse.

Torquato Tasso was the last great poet of the Italian Renaissance and one of the greatest of Italian literature. In his epic *Gerusalemme liberata* (1581; *Jerusalem Delivered*) he summed up a literary tradition typical of the Renaissance: the classical epic renewed according to the spiritual interests of his own time. Whereas most of Tasso's work shows a conflict between a desire to express himself according to classical ideals and a tendency to moralize, some of his works reflected his spontaneous inspiration. *L'Aminta* (1573), a joyous and uninhibited drama, was the best example of Tasso's youthful poetry and belonged to the new literary genre of pastoral (dealing with idealized rural life). *Gerusalemme liberata*, however, was the result of a balance in the poet's conflicting aspirations: a Christian subject dealt with in a classical way. In the subsequent *Gerusalemme conquistata* (1593; "Jerusalem Vanquished"), Tasso recast his poem according to strict Aristotelian rules and the ideals of the Roman Catholic Church's reaction against the Protestant Reformation, known as the Counter-Reformation. Tasso's conflict had ended in the victory of the moralistic principle: poetically the new poem was a failure. Tasso also wrote shorter verses throughout his life, including religious poems, and his prose works show a style no longer exclusively dominated by classical models.

Drama. Trissino's *Sofonisba* (written 1514–15) was the first tragedy of Italian vernacular literature; its structure derived from Greek models, but its poetic qualities were somewhat mediocre. Toward the middle of the 16th century Giambattista Giraldi (Cinzio) reacted against imitation of Greek drama by proposing the Roman tragedian Seneca as a new model, and in nine tragedies and tragicomedies—written between 1541 and 1549—he showed some independence from Aristotelian rules. He greatly influenced European drama, particularly the English of the Elizabethan period.

Italian comedies

Italian comedies of the century, inspired by Latin models, possessed greater artistic value than tragedies, and they reflected contemporary life more fully: they could be considered as the starting point for modern European drama. To the comedies of Ariosto and Machiavelli should be added a lively play, *La Calandria* (first performed 1513; *The Follies of Calandro*), by Cardinal Bernardo Dovizi da Bibbiena, and five equally amusing comedies written by Pietro Aretino. Giordano Bruno, a great Italian philosopher who wrote dialogues in Italian on his new cosmology and antihumanist ideas, also wrote a comedy, *Il candelaio* (1582; *The Candlemaker*).

Since the mid-20th century Angelo Beolco ("Il Ruzzante") has become generally recognized as the most powerful dramatist of the 16th century. His works, written in rustic Paduan dialect, treat the problems of the countryside with profound seriousness. Another dialect playwright of the same century, now also more widely appreciated, is the Venetian Andrea Calmo, who showed a nice gift for characterization in his comedies of complex amorous intrigue.

Narrative. The classicist trend established by Pietro Bembo also affected narrative literature, for which the obvious model was Boccaccio's *Decameron.* Originality and liveliness of expression were to be found in the 22 stories called *Le cene* (written after 1549; "The Suppers") of the Florentine apothecary Anton Francesco Grazzini. The worldly monk Agnolo Firenzuola produced several stories, including the fable *Asino d'oro* (1550), a free version of Apuleius' *Golden Ass.* The cleric and short-story writer Matteo Bandello started a new trend in 16th-century narrative with 214 stories that were rich in dramatic and romantic elements while not aiming at classical dignity. This trend was partly followed also by Giraldi in his collection of 112 stories called *Gli ecatommiti* (1565; "The Hundred Stories").

17TH-CENTURY LITERATURE

The 17th century in Italian literature is usually described as a period of "decadence" in which writers who were devoid of sentiment resorted to exaggeration and tried to cloak an utter poverty of matter beneath an exuberance of form. (In this period, it is said, freedom of thought was fettered by the Accademia della Crusca of Florence, whose aim it was to maintain the purity of the Tuscan tongue; by the Counter-Reformation; and by the political supremacy of Spain.) This style of writing was not, however, simply an Italian phenomenon. It was at this time that "Gongorism" (the ingenious, metaphorical style of the poet Luis de Góngora) flourished in Spain, and the witty, figurative verse of the Metaphysical poets was popular in England. Far from being exhausted, indeed, this was an extremely vital period, so much so that a new and more comprehensive understanding of the literature of the Italian Baroque has been formulated by scholars conversant with the changing attitude toward this phase of civilization in Germany, France, and England.

Poetry and prose. The popularity of satire was a reaction against prevailing conditions. Prominent in this genre was Salvator Rosa, who attacked in seven satires the vices and shortcomings of the age. Alessandro Tassoni acquired great fame with *La secchia rapita* (1622; *The Rape of the Bucket*), a mock-heroic poem that is both an epic and a personal satire. The greatest poet of the period was Tommaso Campanella, a Dominican friar, less well-known for his rough-hewn, philosophical verses than for the *Città del sole* (1602; *Campanella's City of the Sun*), a vision of political utopia, in which he advocated the uniting of humanity under a theocracy based on natural religion.

The influence of Marino

The principal representative of Italian writing during this period was Giambattista Marino, author of a large collection of lyric verse (*La lira* [1608–14; "The Lyre"] and *La sampogna* [1620; "The Syrinx"]), and a long mythological poem, *Adone* (1623). Marino derived inspiration from the poetry of the late 16th century, but his aim—typical of the age—was to excite wonder by novelty. His work is characterized by "conceits" of fantastic ingenuity, farfetched metaphor, sensuality, extreme facility, and a superb technical skill. His imitators were innumerable, and most 17th-century Italian poets were influenced by his work.

Gabriello Chiabrera, soberer in style than Marino, was successful in imitating the metres of classical poetry (especially of the Greek Pindar) and excelled in the composition of musical canzonets (short lyrical verses). Toward the end of the century a patriotic sonneteer, Vincenzo da Filicaia, and Alessandro Guidi, who wrote exalted odes, were hailed as major poets, though Guidi's verse is now seen as little more than rhetoric.

Among prose writers the satirist Traiano Boccalini stood out with *Ragguagli di Parnasso* (1612–13; *Advertisements from Parnassus*) in the fight against Spanish domination. A history of the Council of Trent (which defined Catholic doctrines in reaction to the Reformation) was written by Paolo Sarpi—advocate of the liberty of the Venetian state against papal interference—and a history of the rising of the Low Countries against Spain by Guido Bentivoglio. The Venetian novels of Girolamo Brusoni are still of interest, as are the travels of Pietro della Valle and the tales of Giambattista Basile. All the restless energy of this period reached its climax in the work of Galileo, a scientist who laid the foundations of mathematical philosophy and earned a prominent place in the history of Italian literature through the vigour and clarity of his prose.

The music drama; Accademia dell'Arcadia. With the rise of the music drama and the opera, Italian authors worked to an increasing extent with the lyric stage. Librettos written by poets such as Ottavio Rinuccini were planned with dramatic and musical artistry. During the 17th century a popular spirit entered the opera houses: intermezzi (short dramatic or musical light entertainments) were required between the acts, a practice that undermined the dramatic unity of the performance as a whole, and toward the end of the century every vestige of theatrical propriety was abandoned. The spread of Marino's influence was felt by many to be an abuse. In 1690 the Accademia dell'Arcadia was founded in Rome for the express purpose of eradicating "bad taste." The purpose of Arcadia was in tune with a genuinely felt need. Many of its members were rationalist followers of Descartes with severe classical sympathies, but their reaction consisted mainly in imitating the simplicity of the nymphs and shepherds who were supposed to have lived in the golden age, and thus a new artifice replaced an old one. A typical exponent of the Arcadian lyric was Pietro Metastasio, the 18th-century reformer of the operatic libretto.

18TH-CENTURY DEVELOPMENTS

Reform of the tragic theatre. In 1713 Francesco Scipione Maffei, an antiquary of Verona, produced *Merope*—a tragedy that met with great success and pointed the way toward reform of the Italian tragic theatre. Between 1726 and 1747 Antonio Conti—an admirer of Shakespeare—wrote four Roman tragedies in blank verse. It was not until 1782 and the writing of *Saul,* however, that an important Italian tragedian finally emerged in the person of Vittorio Alfieri. In strong contrast with Pietro Metastasio's and Paolo Rolli's *melodrammi*—librettos set to music or sometimes performed as plays in their own right—Alfieri's tragedies are harsh, bitter, and unmelodious. He chose classical and biblical themes, and through his hatred of tyranny and love of liberty he aspired to move his audience with magnanimous sentiments and patriotic fervour. Alfieri's influence in the Romantic period and the Risorgimento was immense, and, like Carlo Goldoni, he wrote an important autobiography, which gives a revealing account of his struggles to provide Italy with a corpus of drama comparable with that of the other European nations.

Goldoni's reform of the comedy. Metastasio's reform of the operatic libretto was paralleled in the mid-18th century by Goldoni's reform of comedy. Throughout the 17th century the commedia dell'arte—a colourful pantomime of improvisation, singing, mime, and acrobatics, often performed by actors of great virtuosity—had gradually replaced regular comedy, but by the early 18th century it had degenerated into mere buffoonery and obscenity with fixed characters and mannerisms. The dialogue was mostly improvised, and the plot—a complicated series of stage directions, known as the scenario—dealt mainly with forced marriages, star-crossed lovers, and the intrigues of servants and masters. Goldoni succeeded in replacing this traditional type of theatre with written works whose wit and vigour are especially evident when the Venetian scene is portrayed in a refined form of the local dialect. Perhaps because of his prolific output his work has sometimes been thought of as lacking in depth. His social observation is acute, however, and his characters are beautifully drawn. *La locandiera* (1753; "The Innkeeper"; Eng. trans., *Mirandolina*), with its heroine Mirandolina, a feminist before feminism's time, has things to say about class and the position of women that can still be appreciated today. Goldoni's rival and bitter controversialist, fellow Venetian Carlo Gozzi, also wrote comedy and satirical verse.

The world of learning. Giambattista Vico, Ludovico Antonio Muratori, Apostolo Zeno, and Scipione Maffei were writers who reflected the awakening of historical consciousness in Italy. Muratori collected the primary sources for the study of the Italian Middle Ages; Vico, in *Scienza nuova* (1725–44; *The New Science*), investigated the laws governing the progress of the human race and from the psychological study of man endeavoured to infer the laws by which civilizations rise, flourish, and fall. Giovanni Maria Mazzuchelli and Gerolamo Tiraboschi devoted themselves to literary history. Literary criticism also attracted attention; Gian Vincenzo Gravina, Vico, Maffei, Muratori, and several others, while advocating the imitation of the classics, realized that it should be cautious and thus anticipated critical standpoints that were later to come into favour.

The Enlightenment. With the end of Spanish domination and the spread of the ideas of the Enlightenment from France, reforms were gradually introduced in various parts of Italy. The new spirit of the times led men—mainly of the upper middle class—to enquire into the mechanics of economic and social laws. The ideas and aspirations of the Enlightenment as a whole were effectively voiced in such organs of the new journalism as Pietro Verri's periodical *Il Caffè* (1764–66; "The Coffeehouse"). A notable contributor to *Il Caffè* was the philosopher and economist Cesare Beccaria, who in his pioneering book *Dei delitti e delle pene* (1764; *On Crimes and Punishments*) made an eloquent plea for the abolition of torture and the death penalty.

Parini and the literary revival

More than anyone else, Giuseppe Parini seems to embody the literary revival of the 18th century. In *Il giorno* (published in four parts, 1763–1801; "The Day"), a long social satire of the rights of blood, he described a day in the life of a young Milanese patrician and revealed with masterly irony the irresponsibility and futility of a whole way of life. His *Odi* (1795; "Odes"), which are imbued with the same spirit of moral and social reform, are among the classics of Italian poetry.

The satire in the *Sermoni* (1763; "Sermons") of Gasparo Gozzi (elder brother of Carlo) is less pungent, though directed at similar ends, and in his two periodicals—*La Gazzetta veneta* and *L'Osservatore*—he presented a lively chronicle of Venetian life and indicated a practical moral with much good sense. Giuseppe Baretti—an extremely controversial figure who published a critical journal called *La Frusta letteraria* ("The Literary Whip"), in which he castigated "bad authors"—had learned much through a lengthy sojourn in England, where his friendship with Samuel Johnson helped to give independence and vigour, if not always accuracy, to his judgments. The *Viaggi di Enrico Wanton* (1749–64), a philosophical novel in the form of an imaginary voyage by the Venetian Zaccaria Seriman, was the most all-embracing satire of the time.

LITERARY TRENDS OF THE 19TH CENTURY

The 19th century was a period of political ferment in Italy, and many outstanding writers were involved in public affairs. Much of the literature written with a political aim, even when not of intrinsic value, became part of Italy's national heritage and inspired not only those for whom it was written but all who valued freedom.

Romanticism. Foremost among writers in early struggles for his country's unity and freedom from foreign domination was Ugo Foscolo, who reconciled passionate feeling with a formal perfection inspired by classical models. His *Ultime lettere di Jacopo Ortis* (1802; "Jacopo Ortis' Last Letters") was an epistolary story of a young man forced to suicide by frustrated love for both a woman and his fatherland. It was extremely moving and popular, as was a poem, "Dei sepolcri" (1807; "On Sepulchres"), where, in fewer than 300 lines, he wrote lyrically on the theme of inspiration to be found at the tombs of the great, exhorting Italians to be worthy of their heritage. This poem influenced the Italian Risorgimento, or national revival, and a passage in which Florence was praised because it kept in Sta. Croce the ashes of Michelangelo, Machiavelli, and Galileo is still very popular in Italy. Two odes celebrating the divine quality of beauty, 12 sonnets ranking with the best of Petrarch's and Tasso's, and an unfinished poem, "Le grazie" ("The Graces"), also testified to Foscolo's outstanding poetic merit. As an exile in England from 1816 until his death in 1827, he wrote remarkable critical essays on Italian literature for English readers.

In Foscolo patriotism and classicism united to form almost one passion, but Vincenzo Monti was outstanding for mobility of feeling. He saw danger to his country in the French Revolution and wrote "Il pellegrino apostolico" (1782; "The Apostolic Pilgrim") and *La bassvilliana* (1793; *The Penance of Hugo*); Napoleon's victories aroused his praise in "Prometeo" (*c.* 1805; "Prometheus"), "Il bardo della selva nera" (1806; "The Bard of the Dark Wood"), and "La spada di Federico II" (1806; "The Sword of Frederick II"); in "Il fanatismo" and "La superstizione" (1797) he attacked the papacy; later he extolled the Austrians. Thus every great event made him change his mind, through lack of political conviction, yet he achieved greatness in *La bellezza dell'universo* (1781; "The Beauty of the Universe"), the lyrics inspired by domestic affections, and in a translation of the *Iliad,* a masterpiece of Neoclassical beauty.

Classicism, purism, and the reaction of Romanticism

Melchiorre Cesarotti occupied a prominent position in the world of learning at the end of the 18th century, and his translations of James Macpherson's Ossian poetry, *Poesie di Ossian* (1763–72), influenced Foscolo, Leopardi, and others by their mysterious and gloomy fantasy, so alien from classical inspiration; *Saggio sulla filosofia delle lingue* (1785; "Essay on the Philosophy of Languages") was an important essay in the dispute on the Italian language. The trend was toward pedantic classicism as a reaction against an excessive Gallicism favoured by some 18th-century writers. Among the purists was Antonio Cesari, who brought out a new enlarged edition of the *Vocabolario della Crusca* (the first Italian dictionary, published by the Accademia della Crusca in 1612). He wrote *Sopra lo stato presente della lingua italiana* (1810; "On the Present State of the Italian Language") and endeavoured to establish the supremacy of Tuscan and of Dante, Petrarch, and Boccaccio as models. But a Lombard school opposed this Tuscan supremacy. Monti, its leader, issued *Proposta di alcune correzioni ed aggiunte al vocabolario della Crusca* (1817–26; "Proposal for Some Corrections and Additions to the Crusca Dictionary"), which attacked the Tuscanism of the Crusca. By contrast, the patriot Pietro Giordani—for a time a journalistic colleague of Monti—was a great exponent of *purismo.* His views did not stem from literary pedantry, however, but from a concern that all social groups throughout Italy should have a common means of communication. In this respect he was linguistically opposed to the poet Carlo Porta, who lampooned the aristocracy and clergy and expressed sympathy with the humble and wretched in a lively Milanese dialect. All Italy took part in the disputes about language, literature, and politics.

The publication of *Il Conciliatore*

An artificial form of classicism was associated with the Napoleonic domination of Italy, so that when Napoleon fell, forces antagonistic to classicism arose. Literary Romanticism had already won favour with the French, who erroneously thought themselves akin to German Romantics. Between 1816 and 1818 a battle was fought for Romanticism, particularly in Milan, where a Romantic periodical, *Il Conciliatore* (1818–19; "The Peacemaker"), was published. Giovanni Berchet (patriotic poet and author of *La lettera semiseria di Grisostomo,* a manifesto of Romanticism published in 1816), Silvio Pellico, Ludovico di Breme, Giovita Scalvini, and Ermes Visconti were among its contributors. Their efforts were silenced in 1820 when several were arrested by the Austrian police because of their liberal opinions; among them was Pellico, who later wrote a famous account of his experiences, *Le mie prigioni* (1832; *My Prisons*).

Alessandro Manzoni (grandson of Cesare Beccaria) was the chief exponent of Italian Romanticism, but perhaps an even higher claim to fame was his contribution to the resolution of the language problem. In 1821 he started working on a panoramic novel about the lives of simple people placed against a background of major historical events, and, in order that this should be accessible to a wide readership, he decided to write it in an idiom as close as possible to modern educated Florentine speech. This was a formidable enterprise for someone whose first languages were French and Milanese dialect—and to whom spoken Florentine was virtually a foreign tongue—and for the first draft (completed in 1823) he had to resort to Francesco Cherubini's Italian-Milanese dictionary. The second draft was published in 1825–27 under the title *I promessi sposi* (*The Betrothed*); and the final definitive edition came out in 1840–42 after a long, painstaking process of revision aimed at making the text conform more closely with colloquial Florentine usage. The result of this effort was clear, expressive prose—neither pretentious nor provincial—and the way in which the novel caught the public's imagination attested to Manzoni's success in addressing the sort of people to whom conventional literary Italian was almost as remote as Latin. Ironically, Manzoni the innovator became, in his turn, the model for a new kind of purism, with "Manzonians" composing works in an affected Tuscan, and it required authors with fresh ideas—not poor imitators—to continue the task of disencumbering and modernizing written Italian.

Manzoni's genius as a poet showed in the odes "Il cinque maggio" (1821; "The Fifth of May"; Eng. trans., "The Napoleonic Ode"), written on the death of Napoleon, and "Marzo 1821," and in passages of *Inni sacri* (1812–22; *Sacred Hymns*), five poems in celebration of church festivals, describing human affections. His tragedies, *Il conte di Carmagnola* (performed 1820; "The Count of Carmagnola") and *Adelchi* (1822), marked a victory of Romanticism over classicism; they contained passages of great lyrical beauty but lacked strong dramatic power.

Leopardi's pessimism

The foremost Italian poet of the age was Giacomo Leopardi, an outstanding scholar and thinker whose philological works together with his philosophical writings, *Operette morali,* would alone place him among the great writers of the 19th century. Embittered by solitude, sickness, and near penury, from the age of 20 he realized the vanity of hope. Though he developed a doctrine of universal pessimism, seeing life as evil and death as the only comfort, the poetry based on these bitter, despairing premises was far from depressing. Most of Leopardi's poems were contained in one book, *I canti* ("Songs"; Eng. trans., *The Poems of Leopardi*), first published in 1831. Some were patriotic and were once very popular; but the best came from deeper lyrical inspiration. Among them were a meditation on infinity; "A Silvia," on the memory of a girl who died when he was 20; "Le ricordanze," an evocation of his childhood; "Il passero solitario," comparing the lonely poet and a sparrow that sings by itself; and "La quiete dopo la tempesta" and "Il sabato del villaggio," two pictures of village life. They balance depth of meaning and formal beauty, simplicity of diction, intensity, and verbal music.

The Risorgimento and after. Circumstances made it inevitable that Italian Romanticism should become heavily involved with the patriotic myths of the Risorgimento; yet, while this served a useful civic purpose at the time, it did not encourage literature of consistent artistic merit or enduring readability. Of the writings produced by figures associated in some way with Italy's struggle for nationhood, it tends to be the less typical ones that attract attention today: the dialect poetry of Giuseppe Gioacchino Belli describing the life of contemporary papal Rome; verses by

Giuseppe Giusti satirizing petty tyrants, political turncoats, and coarse parvenus; or the works of the republican Roman Catholic from Dalmatia, Niccolò Tommaseo. The undoubted masterpiece of Risorgimento narrative literature is Ippolito Nievo's *Confessioni di un italiano* (published posthumously in 1867; "Confessions of an Italian"; Eng. trans., *The Castle of Fratta*), which marks Nievo as the most important novelist to emerge in the interval between Manzoni and Verga. Giuseppe Mazzini's letters can still be studied with profit, as can the memoirs of Luigi Settembrini (*Ricordanze della mia vita* [1879–80; "Recollections of My Life"]) and Massimo D'Azeglio (*I miei ricordi* [1868; *Things I Remember*]). D'Azeglio's historical novels or those of Francesco Guerrazzi now have a rather limited interest; and Mazzini's didactic writings—of great merit in their good intentions—are generally regarded as unduly oratorical. Giovanni Prati and Aleardo Aleardi, protagonists of the "Second Romanticism," wrote poetry of a sentimentality that helped to provoke a variety of reactive movements, including *scapigliatura* and *verismo*.

The works of Carducci

Giosuè Carducci was an outstanding figure whose enthusiastic support for the national cause during the struggle of 1859–61 was changed to disillusionment by the difficulties in which the new kingdom was involved. The bitterness of some of his poetry revealed frustration and rebelliousness. *Rime nuove* (*The New Lyrics*) and *Odi barbare* (*The Barbarian Odes*), both of which appeared in the 1880s, contained the best of his poetry: memories of childhood, evocations of landscape, laments for domestic sorrows, an inspired representation of historical events, an ambitious effort to resuscitate the glory of Roman history, and an anachronistic but sincere cult of pagan civilization. He tried to adapt Latin prosody to Italian verse, which sometimes produced good poems, but his opposition to Romanticism and his rhetorical tirades provoked a strong reaction, and his metrical reform was short-lived. He was also a scholarly historian of literature, and his literary essays had permanent value, although philosophical criticism such as that of De Sanctis was uncongenial to him. Both his poetry and his criticism were cited when he was awarded the Nobel Prize for Literature for 1906.

A figure connected politically with the Risorgimento but remembered chiefly for his critical writings was Francesco De Sanctis, whose most important works consisted of various critical essays and *Storia della letteratura italiana* (1870–71; *History of Italian Literature*). His main tenet was that literature was to be judged not on its intellectual or moralistic content so much as by the spirit of its "form," and the role of the critic was to discover how this form had been unconsciously and spontaneously conceived by studying its creator's temperament and background and the age in which he lived. De Sanctis was not properly appreciated in his day but came into his own at the turn of the century when Benedetto Croce rescued his works from oblivion.

While Carducci was still alive, Giovanni Pascoli acquired a reputation and succeeded him in the chair of Italian literature at the University of Bologna. His art was often impressionistic and fragmentary, his language occasionally laborious, but his lyricism, at first timid in inspiration in *Myricae* (1891; "Tamarisks"), rose to fuller tones when he attempted the loftier themes of antiquity: Roman heritage and greater Italy. His original vein still found expression in *Canti di Castelvecchio* (1903; "Songs of Castelvecchio") and in the classicism of *Poemi conviviali* (1904; "Convivial Poems"). Later he produced—both in humanistic Latin and in self-consciously elaborate Italian—heroic hymns in honour of two sacred cities, Rome and Turin.

Scapigliati

The veristi and other narrative writers. The patriotic niceties and sentimental Romanticism of much Risorgimento writing inevitably provoked a reaction. The first serious opposition came from the *scapigliati* ("libertines" or "bohemians"), adherents of an antibourgeois literary and artistic movement that flourished in Milan and Turin during the last four decades of the 19th century and whose declared aim was to link up with the most advanced Romantic currents from abroad. Unfortunately the movement—perhaps by its very nature—lacked intellectual cohesion and tended to cultivate the eccentric as an end in itself. The *scapigliati,* however, made a useful contribution in social criticism and in their informal linguistic approach. Among the foremost *scapigliati* were Giuseppe Rovani, whose monumental novel about Milanese life, *I cento anni* (*The Hundred Years*), was issued in installments (1856–58 and 1864–65); Emilio Praga, a poet tormented by contradictions; and Arrigo Boito, poet, musician, and librettist for Giuseppe Verdi's *Falstaff* and *Otello.*

Verismo and *veristi*

A more lasting and fruitful successor to conventional Italian Romanticism was *verismo* ("realism"; first theoretically expounded by Luigi Capuana in 1872), a movement initially inspired by the French Naturalist writers and influenced by positivist and determinist ideas. The *veristi* were not concerned with sermons or noble sentiments but with observable phenomena. When they dealt with the Risorgimento, they showed it warts and all. The greatest of *verismo* narrators was without a doubt Giovanni Verga, who explained in a preamble to a short story, "L'amante di Gramigna" (1880; Eng. trans., "Gramigna's Lover"), that in a perfect novel the sincerity of its reality would be so evident that the hand of the artist would be absolutely invisible and the work of art would seem to have matured spontaneously without any point of contact with its author. At times Verga almost seems to have achieved this unattainable goal, and in his two great narrative works dealing with the victims of social and economic change, *I malavoglia* (1881; "The Unwilling"; Eng. trans., *The House by the Medlar Tree*) and *Mastro-don Gesualdo* (1889), the reader often has the sensation of being put down in an unfamiliar milieu and—as would happen in real life—left to pick up the threads from gossip and chance remarks. Another *verista,* Federico De Roberto, in his novel *I vicerè* (1894; *The Viceroys*), has given a cynical and wryly funny account of an aristocratic Sicilian family that adapted all too well to change. Luigi Capuana, the founder of *verismo* and most rigorous adherent to its impersonal method of narration, is known principally for his dramatic psychological study, *Il marchese di Roccaverdina* (1901; "The Marquis of Roccaverdina").

In their search for documentary exactitude the *veristi* paid close attention to background. For Verga, De Roberto, and Capuana, this was Sicily. Matilde Serao, on the other hand, has given a detailed and colourful reportage of the Neapolitan scene, while Renato Fucini conveyed the atmosphere of traditional Tuscany. Emilio De Marchi, another writer in the realist mold, has Milan for his setting and in *Demetrio Pianelli* (1890) has painted a candid but essentially kindly portrait of the new Milanese petite bourgeoisie. Antonio Fogazzaro was akin to the *veristi* in his powers of observation and in his descriptions of minor characters; but he was strongly influenced by Manzoni, and his best narrative work, *Piccolo mondo antico* (1895; *The Little World of the Past*), is a nostalgic look back to a supposedly less individualistic age when inner tranquillity was seemingly achieved by devotion to a shared ideal. The *veristi* had a leavening effect on Italian literature generally, and their influence can be discerned, among others, in the early novels of the Sardinian Grazia Deledda (awarded the Nobel Prize for Literature for 1926) and in the distinguished narrative works of the Sienese writer Federigo Tozzi, including *Con gli occhi chiusi* (1919; "With Closed Eyes") and *Tre croci* (1920; *Three Crosses*).

THE 20TH CENTURY

Gabriele D'Annunzio's nationalism. After unification the new Italy was preoccupied with practical problems, and by the early 20th century a great deal of reasonably successful effort had been directed toward raising living standards, promoting social harmony, and healing the split between church and state. It was in this prosaic and pragmatic atmosphere that the middle classes—bored with the unheroic and positivist spirit of former decades—began to feel the need for a new myth. Thus it is easy to understand how imaginations across the political spectrum came to be fired by the extravagant personality of Gabriele D'Annunzio—man of action, nationalist, literary virtuoso, and (not least) exhibitionist—whose life and art seemed to be a blend of Jacob Burckhardt's "complete man" and the superman of Friedrich Nietzsche. At a distance from those times, it should be possible to evaluate D'Annunzio more clearly. There is, however, no critical consensus about his writings, although he is generally praised for his autobiographical novel, *Il piacere* (1889; *The Child of Pleasure*), for his mature poetry, and for his late memoirs.

Benedetto Croce's criticism. Although D'Annunzio's fame was worldwide, the function of modernizing intellectual life fell mainly to Benedetto Croce in almost 70 books and in the bimonthly review *La Critica* (1903–44). Perhaps his most influential work was literary criticism, which he expounded and continually revised in articles and books spanning nearly half a century.

Croce's beliefs implied condemnation of Fascism's ideology, but he was not seriously molested by the Fascist regime, and through the darkest days *La Critica* remained a source of encouragement to at least a restricted circle of freedom-loving intellectuals. Unfortunately, his highly systematized approach to criticism led to a certain rigidity and a refusal to recognize the merits of some obviously important writers, and this was undoubtedly one reason why after World War II his authority waned. His monumental corpus of philosophical, critical, and historical works of great scholarship, humour, and common sense remains, however, the greatest single intellectual feat in the history of modern Italian culture.

Literary trends before World War I. While Croce was starting his arduous task, literary life revolved mainly around reviews such as *Leonardo* (1903), *Hermes* (1904), *La Voce* (1908), and *Lacerba* (1913), founded and edited by relatively small groups. The two main literary trends were: *crepuscolarismo,* which favoured a colloquial style to express memories of sweet things past, as in the work of Guido Gozzano and Sergio Corazzini; and *futurismo,* loathing of traditional art and demanding complete freedom of expression, whose leader was Filippo Tommaso Marinetti, editor of *Poesia,* a fashionable cosmopolitan review. Both *crepuscolari* and *futuristi* were part of a complex European tradition of disillusionment and revolt, the former inheriting the sophisticated pessimism of French and Flemish "decadents," the latter taking part in an episode in the history of western European avant-garde developed from the French poets Stêphane Mallarmé and Guillaume Apollinaire to the Cubist, Surrealist, and Dada movements. Both shared a feeling of revulsion against D'Annunzian flamboyance and rhetoric, from which they attempted to free themselves and, paradoxically, from which they derived elements of their style (the "crepuscular" mood of D'Annunzio's *Poema paradisiaco* [1893] and most Futuristic "new theories"—identification of art with action, heroism, and speed, free use of words—being implied in his *Laus Vitae* [1903; "In Praise of Life"]).

Crepuscolarismo and *futurismo*

The "return to order." The end of World War I saw a longing for the revival of tradition, summed up in the aims of the review *La Ronda,* founded in 1919 by Vincenzo Cardarelli and others, which advocated a return to classical stylistic values. This led to an excessive cult of form in the narrow sense—as exemplified by the elegant but somewhat bloodless essays (*elzeviri*) published in Italian newspapers on page three—and obviously fitted in with the stifling of free expression under Fascism. The sterility of this period, however, should not be exaggerated. The 20 years of Fascist rule were hardly conducive to creativity, but in the dark picture there were a few glimmers of light. With 1923 came the publication of Italo Svevo's *Coscienza di Zeno* (*The Confessions of Zeno*), a gem of psychological observation and Jewish humour, which a few years later was internationally "discovered" through the mediation of James Joyce. The surreal writings of Massimo Bontempelli (*Il figlio di due madri* [1929; "The Son of Two Mothers"]) and of Dino Buzzati (*Il deserto dei Tartari* [1940; *The Tartar Steppe*]) were perhaps in part an escape from the prevailing political climate, but they stand up artistically nonetheless. Riccardo Bacchelli, with *Il diavolo a Pontelungo* (1927; *The Devil at the Long Bridge*) and *Il mulino del Po* (1938–40; *The Mill on the Po*), produced historical narrative writing of lasting quality. Aldo Palazzeschi, in *Stampe dell'Ottocento* (1932; "Nineteenth Century Engravings") and *Sorelle Materassi* (1934; *The Sisters Materassi*), reached the height of his storytelling powers. Meanwhile, the Florentine literary reviews *Solaria, Frontespizio,* and *Letteratura,* while having to tread carefully with the authorities, provided an outlet for new talent. Carlo Emilio Gadda had his first narrative work (*La Madonna dei filosofi* [1931; "The Philosophers' Madonna"]) published in *Solaria,* while the first part of his masterpiece, *La cognizione del dolore* (*Acquainted with Grief*), was serialized between 1938 and 1941 in *Letteratura.* Novelists such as Alberto Moravia, Corrado Alvaro (*Gente in Aspromonte* [1930; *Revolt in Aspromonte*]), and Carlo Bernari had to use circumspection in stating their views but were not completely silenced. Ignazio Silone, having chosen exile, could speak openly in *Fontamara* (1930). Antonio Gramsci, an unwilling "guest" of the regime, gave testimony to the triumph of spirit over oppression in *Lettere dal carcere* (1947; *Letters from Prison*).

Sterility and creativity under Fascism

Luigi Pirandello. Drama, which a few playwrights and producers were trying to extricate from old-fashioned realistic formulas and more recent superhuman theories, was increasingly dominated by Luigi Pirandello. His own experience of the "unreal," through his calamitous family life and his wife's insanity, enabled him to see the limitations of realism. From initial short-story writing, in which he explored the incoherence of personality, the lack of communication between individuals, the uncertain boundaries between sanity and insanity or reality and appearance, and the relativity of truth, he turned to drama as a better means of expressing life's absurdity and the ambiguous relationship between fact and fiction.

To multiply the fragmentation of the levels of reality, Pirandello tried to destroy conventional dramatic structures and to adopt new ones: a play within a play in *Sei personaggi in cerca d'autore* (1921; *Six Characters in Search of an Author*) and a scripted improvisation in *Questa sera si recita a soggetto* (1930; *Tonight We Improvise*). This was a way of transferring the dissociation of reality from the plane of content to that of form, thereby achieving an almost perfect unity between ideas and dramatic structure. Pirandello's plays, including perhaps his best, *Enrico IV* (1922; *Henry IV*), often contain logical arguments: several critics, including Croce, were misled into thinking that he intended to express in this way a coherent philosophy, whereas he used logic as a dramatic symbol. Pirandello was awarded the 1934 Nobel Prize for Literature.

Pirandello's play within a play

The Hermetic movement. Poetry in the Fascist period underwent a process of involution, partly influenced by French Symbolism, with its faith in the mystical power of words, and partly under the stress of changed political conditions after World War I, during which literature had declined. Many poets of the wartime generation, weary of tradition and rhetoric, had been seeking new expression: some, like the *futuristi,* had tried to work rhetoric out of their system by letting it run amok; others, such as Camillo Sbarbaro (*Pianissimo* [1914], *Trucioli* [1920; "Shavings"]), cultivated a style purified of unessential elements. Out of those efforts grew a poetry combining the acoustic potentialities of words with emotional restraint and consisting mainly of fragmentary utterances in which words were enhanced by contextual isolation and disruption of syntactic and semantic links. The resultant obscurity compensated poets for loss of influence in a society subservient to dictatorship by turning them into an elite and allowed some, notably Eugenio Montale (who won the Nobel Prize for Literature for 1975), to express their pessimism covertly. The name of this movement, *ermetismo* ("Hermeticism"), hinted at both its aristocratic ambitions and its esoteric theory and practice. Its leader, Giuseppe Ungaretti, tried to charge each word of his early poems with such intensity of meaning that concern with technical problems often overshadowed emotion, thus producing supremely stylized forms. Thus, what in the 1920s had appeared revolutionary proved later to be only another facet of the formalistic tradition. Against this background of refinement, obscurity, and unreality, only the simple and moving poems of Umberto Saba preserved an immediate appeal.

Experiments in obscurity

Social commitment and the new realism. During World War II the walls of the hermetic ivory tower began to crumble. Ungaretti's style became so articulate as to be almost unrecognizable. Salvatore Quasimodo adopted a new engagé, or committed, style, which won critical admiration, including the 1959 Nobel Prize for Literature, and others followed suit in a drift toward social realism.

Social realism

This development had been foreshadowed by some writers under Fascism. In 1929 Alberto Moravia had written a scathing indictment of middle-class moral indifference, *Gli indifferenti* (1929; *Time of Indifference*). Carlo Bernari wrote a novel about the working classes, *Tre operai* (1934; "Three Workmen"); Cesare Pavese produced *Paesi tuoi* (1941; "Your Lands"; Eng. trans., *The Harvesters*); and Elio Vittorini wrote *Conversazione in Sicilia* (1941; *Conversation in Sicily*); all definitely promised a new literary development. From these and from aspects of American literature (William Faulkner, Erskine Caldwell, John Steinbeck, John Dos Passos, and Ernest Hemingway, translated mainly by Elio Vittorini and Pavese) postwar writing took its cue. Certain English literature, the homegrown *veristi,* and the ideas of Marxism were also an influence on postwar authors, to whom in varying degrees the rather imprecise label of Neorealism was attached. It was a stimulating time in which to write, with a wealth of unused material at hand. There were the social and economic problems of the south, described by Carlo Levi in his poetic portrait of Lucania, *Cristo si è fermato a Eboli* (1945; *Christ Stopped at Eboli*), and by Rocco Scotellaro (*Contadini del sud* [1954; "Peasants of the South"]) and Francesco Jovine (*Le terre del Sacramento* [1950; "The Lands of the Sacrament"; Eng. trans., *The Estate in Abruzzi*]). Vivid pictures of the Florentine working classes were painted by Vasco Pratolini (*Il quartiere* [1945; "The District"; Eng. trans., *The Naked Streets*] and *Metello* [1955]) and of the Roman subproletariat by Pier Paolo Pasolini (*Ragazzi di vita* [1955; *The Ragazzi*] and *Una vita violenta* [1959; *A Violent Life*]). There were memories of the north's struggle against Fascist and Nazi domination from Vittorini and from Beppe Fenoglio (*I ventitrè giorni della città di Alba* [1952; "The 23 Days of the City of Alba"]). There were sad tales of lost war by Giuseppe Berto (*Il cielo è rosso* [1947; *The Sky Is Red*] and *Guerra in camicia nera* [1955; "A Blackshirt's War"]) and by Mario Rigoni Stern (*Il sergente nella neve* [1952; "The Sergeant in the Snow"; Eng. trans. in *The Lost Legions; Three Italian War Novels*]). By contrast, there were humorous recollections of provincial life under Fascism—for example, Mario Tobino's *Bandiera nera* (1950; "Black Flag") and Goffredo Parise's *Prete bello* (1954; "The Handsome Priest"; Eng. trans., *The Priest Among the Pigeons*). In contrast to the more topical appeal of these writings the great virtue of Pavese's narrative was the universality of its characters and themes. Among his finest works may be numbered *La casa in collina* (1949; *The House on the Hill*) and *La luna e i falò* (1950; *The Moon and the Bonfire*). Also of lasting relevance is Primo Levi's moving account of how human dignity survived the degradations of Auschwitz (*Se questo è un uomo* [1947; *If This Is a Man*]).

Other writings. Literary tastes gradually became less homogeneous. On the one hand, there was a rediscovery as an experimentalist of Carlo Emilio Gadda, whose best works had been written between 1938 and 1947. On the other, there was the runaway success of Giuseppe Tomasi di Lampedusa's old-fashioned historical novel *Il gattopardo* (1958; *The Leopard*), a soft-focused, flattering view of a family similar to the one described so pitilessly by Federico De Roberto in *I vicerè.* For this reason, it is easier to see Italian writing in terms of individual territory rather than general trends. Carlo Cassola's most memorable novels use the stillness of rural Tuscany as a background to the interior reality of its inhabitants, and in this his lineage can be traced to other Tuscan writers such as Romano Bilenchi (*La siccità* [1941; "The Drought"]) and Nicola Lisi (*Diario di un parroco di campagna* [1942; "Diary of a Country Priest"]) or in some respects back to Federigo Tozzi. Especially typical of Cassola's works are *Il taglio del bosco* (1953; *The Felling of the Forest*), *Un cuore arido* (1961; *An Arid Heart*), and *Un uomo solo* (1978; "A Man by Himself"). Giorgio Bassani's domain is the sadly nostalgic world of Ferrara in days gone by, with particular emphasis on its Jewish community (*Il giardino dei Finzi-Contini* [1962; *The Garden of the Finzi-Continis*]). Italo Calvino concentrated on fantastic tales (*Il visconte dimezzato* [1952; *The Cloven Viscount*], *Il barone rampante* [1957; *The Baron in the Trees*], and *Il cavaliere inesistente* [1959; *The Nonexistent Knight*]) and, later, on moralizing science fiction (*Le cosmicomiche* [1965; *Cosmicomics*] and *Ti con zero* [1968; *t zero*]). Paolo Volponi's province is the human aspect of Italy's rapid postwar industrialization (*Memoriale* [1962], *La macchina mondiale* [1965; *The Worldwide Machine*], and *Corporale* [1974]). Leonardo Sciascia's sphere is his native Sicily, whose present and past he displays with concerned and scholarly insight, with two of his better known books—in the format of thrillers—covering the sinister operations of the local Mafia (*Il giorno della civetta* [1963; *The Day of the Owl*] and *A ciascuno il suo* [1966; "To Each His Own"; Eng. trans., *A Man's Blessing*]). Giuseppe Berto, after a Neorealistic phase, plunged into the world of psychological introspection (*Il male oscuro* [1964; "The Dark Sickness"] and *La cosa buffa* [1966; "The Funny Thing"]). Natalia Ginzburg's territory is the family, whether she reminisces about her own (*Lessico famigliare* [1963; *Family Sayings*]), handles fictional characters (as in *Famiglia* [1977]), or ventures into historical biography (*La famiglia Manzoni* [1983]). Giovanni Arpino excelled at personal sympathies that cross cultural boundaries (*La suora giovane* [1959; *The Novice*] and *Il fratello italiano* [1980; "The Italian Brother"]). Fulvio Tomizza also tackled this theme in *L'amicizia* (1980; "The Friendship"). Meanwhile, Alberto Moravia and Mario Soldati defended their corners as never less than conspicuously competent writers. Moravia generally plowed a lone furrow. Of his mature writings, *Agostino* (1944), *Il conformista* (1951; *The Conformist*), and *La noia* (1960; "The Tedium"; Eng. trans., *Empty Canvas*) stand out as particular achievements. Soldati, in works such as *Le lettere da Capri* (1953; *The Capri Letters*) and *Le due città* (1964; "The Two Cities")—and in a later novel, *L'incendio* (1981; "The Fire"), which takes a quizzical look at the modern art business—showed himself to be a consistently skilled and entertaining narrator. There are many other accomplished authors who could be classified in this way, including Elsa Morante, who with *La storia* (1974; *History*) carved a unique niche for herself. Set in Rome during the years 1941–47, this combination of fact and allegory is a tour de force and one of the most remarkable narrative works to have come out of Italy since World War II.

Creative diversity

BIBLIOGRAPHY. GIULIANO PROCACCI, *History of the Italian People* (1970; 2nd Italian ed., 1968), provides an excellent general background. Histories of the literature include FRANCESCO DE SANCTIS, *History of Italian Literature,* 2 vol. (1931; reissued 1968; originally published in Italian, 1870); ROBERT ANDERSON HALL, *A Short History of Italian Literature* (1951); ERNEST HATCH WILKINS, *A History of Italian Literature,* rev. ed. (1974); JOHN H. WHITFIELD, *A Short History of Italian Literature,* 2nd ed. (1980); and ITALO DE BERNARDI and G. BARBERO, *Profilo storico della letteratura* (1983). PETER BONDANELLA and JULIA CONAWAY BONDANELLA (eds.), *Dictionary of Italian Literature* (1979), is a guide to authors, genres, schools, and periods of Italian literary history; see also the *Enciclopedia della letteratura Garzanti,* 4th ed. (1982), for cautious but sound views.

Studies that concentrate on specific periods or trends of Italian literary history include ADOLF GASPARY, *The History of Early Italian Literature to the Death of Dante* (1901; originally published in German, 1885); PIERO BOITANI (ed.), *Chaucer and the Italian Trecento* (1983); DAVID MARSH, *The Quattrocento Dialogue: Classical Tradition and Humanist Innovation* (1980); BERNARD WEINBERG, *A History of Literary Criticism in the Italian Renaissance,* 2 vol. (1961, reprinted 1974); JEFFERSON B. FLETCHER, *Literature of the Italian Renaissance* (1934, reprinted 1964); JOHN A. SYMONDS, *Renaissance in Italy,* 7 vol. (1875–86); VIOLET PAGET, *Studies of the Eighteenth Century in Italy,* new ed. (1887, reissued 1978); ANTONIO CIPPICO, *The Romantic Age in Italian Literature* (1918); LANDER MACCLINTOCK, *The Age of Pirandello* (1951, reprinted 1968); BENJAMIN CRÉMIEUX, *Panorama de la littérature italienne contemporaine* (1928), which contains still fascinating insights; SERGIO PACIFICI, *A Guide to Contemporary Italian Literature: From Futurism to Neorealism* (1962, reissued 1972), and *The Modern Italian Novel from Capuana to Tozzi* (1973); and JOHN GATT-RUTTER, *Writers and Politics in Modern Italy* (1978), a study of the relationship between politics and literature since World War II.

(G.A./S.Ra./G.P.Gi./D.M.Wh./F.Do./G.Car./Jo.M.)

Italy

With a shape that has been likened frequently to a high-heeled boot apparently about to prod its triangular subject island of Sicily, the peninsular home of the European nation of Italy (officially Italian Republic; Italian Italia, or Reppublica Italiana) juts deep into the Mediterranean Sea. Another important island, Sardinia, lies some 160 miles (260 kilometres) west of its "shin." The magnificent mountain barrier of the Alps forms a northern boundary which, historically, has hindered marauders less than might be supposed; these mountains separate Italy from France, Switzerland, Austria, and Yugoslavia and extend all the way down the Italian peninsula as a less elevated chain, the Apennines. Areas of plain, which are practically limited to the great northern oval of the Po Valley, cover a mere 23 percent of the total national area of 116,000 square miles (301,000 square kilometres); 42 percent is hilly and 35 percent mountainous, providing variations to the generally temperate climate.

The mountainous landscape of Italy has long influenced political and economic developments in the region by encouraging numerous independent states and by permitting in many regions only a meagre agriculture, providing grain sufficient only for a subsistence economy. Increased cultivation has caused deforestation. Since much of the land is mountainous, the population is dense. Since World War II, increasing numbers of Italians have abandoned the countryside for the rapidly industrializing cities, often creating severe dislocations in traditional ways of life.

The Italian economy, now ranked high in the world, blends areas as diverse as the "industrial triangle," formed by Milan, Turin, and Genoa, dating from around 1900, and the notoriously backward regions of the south and the islands, which are, however, being developed, mostly with state aid.

Agriculture, which operates often in difficult natural and economic conditions, contributes about 10 percent of the gross national product (GNP); industry, about 40 percent; and public and private services, nearly half. Sufficient wheat is grown for the population, and vegetables, fruit, wine, and oil are cultivated in suitable districts. Cattle raising, however, is less advanced; meat and dairy produce are imported.

Italian industry includes every type of production. Though mineral resources are scarce, imported raw materials since World War II have boosted siderurgy (the metallurgy of iron and steel), other metallurgy, and construction. The chemical industry also flourishes, and textiles constitute one of Italy's largest industries. Services, particularly tourism, are very important, and efforts have been made to provide comprehensive networks of *autostrade* (express highways). The heavy international exchange reflects an increasingly unfavourable balance of payments.

The peninsula has a proud tradition dating from the days of the ancient Roman Empire. From its unification in the second half of the 19th century until 1946, Italy was a monarchy. Then it became a parliamentary republic, operating under a constitution of 1948. The republic is subdivided into regions (*regioni*), provinces (*provincie*), and municipalities (*comuni*); these local bodies enjoy a certain autonomy, especially the regions, which differ widely in economic development. A similar diversity characterizes political life, which features a multiplicity of parties. The powerful Christian Democrat Party (Democrazia Cristiana, or DC) and the strong Italian Communist Party (Partito Comunista Italiano, or PCI) generally obtain strong showings in elections, and there are a number of smaller parties, representing groups of right-wing, centre, and left-wing persuasions. No party enjoys a dependable majority, and coalition governments have been notoriously unstable in the post-World War II decades.

Workers' unions have been increasingly important in national life. They are grounded in various confederations, principally the Confederazione Generale Italiana del Lavoro (General Confederation of Labour, or CGIL), controlled in effect by the Communist Party. Employers' groups and the great state bureaucracies also form important pressure groups in this often sharply polarized society.

Italy is part of the European Economic Community (EEC, or Common Market), and of the Council of Europe and belongs to many other international organizations. With its strategic geographical position on the southern flank of Europe, Italy has since World War II played a fairly important role in the North Atlantic Treaty Organization (NATO). (Li.L.)

The article is divided into the following sections:

PHYSICAL AND HUMAN GEOGRAPHY

The land

RELIEF

Italy is largely mountainous, with 35 percent of its territory occupied by ranges that are higher than 2,300 feet (702 metres), 42 percent by hills, and only 23 percent by plains. There are two mountain systems: the scenic Alps, part of which lie within the neighbouring countries of France, Switzerland, Austria, and Yugoslavia; and the Apennines, which form the spine of the entire peninsula and of the island of Sicily. A third mountain system exists in the two large islands to the west, Italian Sardinia and French Corsica.

Mountain ranges. The rugged Alps run in a broad west-to-east arc from the Colle di Cadibona (Cadibona Pass), near Savona, on the Gulf of Genoa, to the north of Trieste, at the head of the Adriatic Sea. The section properly called Alpine is the border district that includes the highest masses, made up of weathered Hercynian rocks, dating from the Carboniferous or the Permian periods (345,000,000–225,000,000 years ago). The Alps have rugged, very high peaks, reaching more than 13,000 feet in various spectacular formations, characterized as pyramidal, pinnacled, rounded, or needlelike. The valleys were heavily scoured by glaciers operating in the Quaternary Period (the last 2,500,000 years); there are still more than 1,000 glaciers left, though in a phase of retreat, more than 100 having disappeared in the last half century or so.

The three main Alpine groups

The Alpine mountain mass falls into three main groups: the Western Alps, running north to south in Italy from Aosta to the Cadibona Pass, with the Gran Paradiso (13,323 feet [4,061 metres]) and Monte Viso (12,602 feet [3,841 metres]); the Central Alps, running west to east, from the Western Alps to the Brenner Pass, leading into Austria and the upper Adige, also with high peaks, such as Monte Bianco (15,771 feet [4,807 metres]), the Matterhorn (14,692 feet [4,478 metres]), Monte Rosa (Italy's highest peak, shared with Switzerland, 15,203 feet [4,634 metres]), and Ortles (12,792 feet [3,899 metres]); and the Eastern Alps, running west to east from the Brenner to Trieste and including the Dolomites (Alpi Dolomitiche), with Monte Marmolada (10,964 feet [3,342 metres]). The Italian foothills of the Alps, which reach no higher than 8,200 feet, lie between these great ranges and the Po Valley. They are composed mainly of limestone and sedimentary rocks. A notable feature is the karst system of underground caves and streams that are especially characteristic of the Carso, the limestone plateau between the Eastern Alps and Illyria.

The Apennines are the long system of mountains and hills that run down the Italian peninsula from the Cadibona Pass to the tip of Calabria and continue in the island of Sicily. The range is about 745 miles long; it is only about 20 miles wide at either end but about 120 miles wide in the Central Apennines, east of Rome, where the Gran Sasso d'Italia group provides the highest peak (9,560 feet [2,914 metres]) and the only glacier on the peninsula, Calderone, the southernmost in Europe. The Apennines are predominantly of sandstone and limestone marl (clay) in the north; of limestone and dolomite (magnesian limestone) in the centre; and of limestone, weathered rock, and Hercynian granite in the south. On either side of the central mass are grouped two considerably lower masses, composed in general of more recent and softer rocks, such as sandstone. These are the sub-Apennines, which run in the east from Monferrato to the Golfo di Taranto and in the west from Florence southward through Tuscany and Umbria to Rome. This latter range is separated from the main Apennines by the valleys of the Arno and the Tiber rivers. At the outer flanks of the sub-Apennines two allied series of limestone and volcanic rock extend to the coast. They include, on the west, the Alpi Apuane (Apuan Alps), which are famous for their marbles; farther south, the Colline Metallifere (Ore Mountains; more than 3,400 feet), abundant in minerals; then various extinct volcanoes occupied by crater lakes, such as that of Bolsena; then cavernous mountains, such as Lepini and Circeo, and the partially or still fully active volcanic group of the Campi Flegrei and Vesuvius; and finally the limestone mountains of the peninsulas of Amalfi and Cilento. The extensions on the Adriatic coast are simpler, comprising only the small promontory of Monte Conero, the higher peninsula of Promontorio del Gargano (Gargano Plateau; 3,461 feet), and the Salentine Peninsula, in Puglia. All of these are limestone.

In Sardinia there are two mountain masses, separated by the long plain of Campidano, which runs from the Golfo dell'Asinara southeastward across the island to the Golfo di Cagliari. The group in the southwest is small and low, formed from sediments, mostly mineralized, of the early Paleozoic Era (perhaps 570,000,000 to 225,000,000 years ago). The northeastern mass reaches a height of more than 6,000 feet at Gennargentu; the underlying foundation is basically metamorphic (heat-altered) rock, and it is covered in the northeast by Paleozoic granite and partially covered in the northwest by Mesozoic limestones (65,000,000 to 225,000,000 years old) and by sandstone and Cenozoic (65,000,000 to 2,500,000 years old) clays. There are caves on the seacoast and inland where limestones predominate.

Present volcanic action had its first origins in the Pliocene Epoch and Quaternary Period (covering the last 7,000,000 years) and is represented by the Campi Flegrei, which is near Naples, and by the neighbouring islands, such as Ischia; by Vesuvius; by the Isole Eolie; and by Etna, which is on the island of Sicily. Phenomena that are related to volcanism include thermal springs in the Colli Euganei, *vulcanelli* (mud springs) at Viterbo, and emissions of gas at Pozzuoli.

Seismic activity, leading to earthquakes, is rare in the Alps and the Po Valley; it is infrequent but occasionally strong in the Alpine foothills; and it may be catastrophic in the central and southern Apennines and on Sicily. Seaquakes sometimes occur in Sicily, such as that at Messina in 1908.

The plains. Plains cover only 23 percent of the area of Italy. Some of these, such as the Po Valley and the Tavoliere di Puglia (Plain of Puglia), are ancient sea gulfs filled by alluvium. Others, such as the Tavoliere di Lecce (Plain of Lecce), in Puglia, flank the sea on rocky plateaus about 65 to 100 feet high and are formed of ancient land levelled by the sea and subsequently uplifted. Plains in the interior, such as the long Val di Chiana (Chiana Valley), are made by alluvial or other filling of ancient basins. The most extensive and important plain in Italy, that of the Po Valley, occupies more than 17,000 square miles of the 27,000 square miles of Italian plain land. It ranges in altitude from sea level up to 1,800 feet, the greater part being below 330 feet. Through it runs the Po River and all its tributaries and the Rivers Reno, Adige, Piave, and Tagliamento. The plain falls into several natural divisions. At its highest end, by the Alpine foothills, it is made up of parallel *ferretto* (red loam composed of ferrous clay) ridges, running from north to south, with areas of gravel and permeable sand between them. This section of the plain is terraced and unproductive, although the rainfall is high. Below this is the section where the rivers rise, their waters eventually providing vital irrigation both for the *marcite* (winter pastures) and for the intensive agriculture of the fertile lower plain. Other notable plains include the *maremme* of Tuscany and Lazio, reclaimed marshland with dunes at the edge of the sea; the Agro Pontino, a recently reclaimed seaward extension of the Roman countryside (*campagna*); the fertile Pianura Campana (Plain of Campania) around Vesuvius; and the rather arid Tavoliere di Puglia. In Sicily the Piana di Catania (Plain of Catania) is a good area for growing citrus fruit.

Coastal areas. The seacoasts are quite varied. Along the two Ligurian rivieras, on either side of Genoa, the coast alternates in rapid succession between high, rocky zones and level gravel. From Tuscany to Campania there are long, sandy, crescent beaches and abundant dunes, which are separated by rocky eminences. The coast of Calabria is high and rocky, though sometimes broken by short beaches. The coast of Puglia and, indeed, most of the Adriatic coast is level, although it is dominated by terraced gradients. The majestic delta of the Po, extending from Rimini to Monfalcone, is riddled with the lagoons that are familiar to visitors to Venice. The Carso, the limestone coastal region between Trieste and Istria, is rocky.

DRAINAGE AND SOILS

Rivers. Italian rivers are comparatively short; the longest, the Po, is only 400 miles long. Only three major rivers flow into the Ionian Sea, while Puglia has virtually only two rivers flowing to the Adriatic. Along the Adriatic coast a good number run parallel like the teeth of a comb down from the Apennines through Molise, Abruzzi, and the Marche regions. The rivers that flow into the Tyrrhenian Sea are longer and more complex and carry greater quantities of water. These include the Volturno, in Campania; the Roman Tiber; and the Arno, which flows through Florence and Pisa. The rivers of the Ligurian rivieras are mainly short and swift flowing; a few are important simply because cities, such as Genoa, or bathing resorts, such as Rapallo, are built on their deltas. But the prince of Italian rivers is the Po. Rising in the Monviso area, it runs across the Pianura Lombarda (Plain of Lombardy), through various important cities, such as Turin and Cremona, and is steadily enlarged by the numerous tributaries that join it, especially on its left bank. The Po debouches south of Venice, forming a large delta. In the Veneto there are also rivers that are not tributaries of the Po. One of these, the Adige, at 254 miles the second longest river in Italy, flows through Verona and debouches near Adria, south of Venice. The rivers in the south have imposing floods during winter storms, and those that run through zones of impermeable rock may become dangerous; yet during the summer many of these rivers are completely dry. The rivers of the centre and north are dry in the winter, because their headwaters are frozen, but they become full in the spring from melting snow and in the autumn from rainfall.

Lakes. There are about 1,500 lakes in Italy. The most common type is the small, elevated Alpine lake formed by Quaternary glacial excavation during the last 25,000 years. These are of major importance for hydroelectric schemes. Other lakes, such as Bolsena and Albano, in Lazio, occupy the craters of extinct volcanoes. There are also coastal lakes, such as those of Lesina and Varano, in Puglia; and lakes resulting from prehistoric faulting, such as the Lago di Alleghe, near Belluno. The best known, largest, and most important of the Italian lakes are those cut into valleys of the Alpine foothills by Quaternary glaciers. These, which are listed in order of size, are the Lago di Garda, Lago Maggiore, and the lakes of Como, Iseo, and Lugano. They have a semi-Mediterranean climate and are surrounded by groves of olive and citrus trees. Italy also has considerable areas in which, as a result of porous rock, the water systems run underground, forming subterranean streams, sinkholes, and lakes. These are often associated with caves, the most famous of which are those of Castellana, in Puglia.

The lakes

The soils. Varying climatic conditions in successive eras and differences in altitude and in types of rock have combined to produce in Italy a wide range of soils. Very common is dark-brown podzol, typical in mountains with a lot of flint, where the rainfall is heavy, as in the Alps above about 300 feet. In the Apennines, brown podzolic soils predominate, supporting forests and meadows and pastures. Brown Mediterranean soils are also characteristic of the Apennines and are suitable for agriculture. Renzinas, typically humus-carbonates, are characteristic of limestone and magnesian limestone mountain pastures and of many meadows and beech forests of the Apennines. Red earth—the famous terra rossa, derived from the residue of limestone rocks—is found not only in the extreme south (in Puglia, for instance) but also in Venetia, where it is the usual soil in vineyards, olive groves, and gardens. Sparse rocky earth, clays, dune sands, and gravel are found in the high mountains, in some volcanic zones, and in gullies in the sub-Apennines. There is also a red loam, or *ferretto,* composed of ferrous (iron) clay.

CLIMATE

Geographically, Italy lies in the temperate zone. Because of the considerable length of the peninsula, there is a variation between the climate of the north, attached to the European continent, and that of the south, surrounded by the Mediterranean. The Alps are a partial barrier against westerly and northerly winds, while both the Apennines and the great plain of northern Italy produce special climatic variations. Sardinia is subject to Atlantic and Sicily to African winds. In general, four meteorological situations dominate the Italian climate: the Mediterranean winter cyclone, with a corresponding summer anticyclone; the Alpine summer cyclone, with a consequent winter anticyclone; the Atlantic autumnal cyclone; and the eastern Siberian autumnal anticyclone. The meeting of the two last-mentioned air masses brings heavy and sometimes disastrous rains in the autumn.

The seven main climatic zones

Italy can be divided into seven main climatic zones. In the most northerly, the Alpine Zone, which has a continental mountain climate, temperatures are lower and rainfall higher in the east than in the west. The average temperature at Bardonecchia, in the west, is 45.3° F (7.4° C), and the rainfall is 26 inches (660 millimetres); at Val d'Ampezzo, in the east, the figures are 43.9° F (6.6° C) and 41.5 inches. In the Valle d'Aosta, in the west, the permanent snow line is at 10,200 feet, but in the Julian Alps it is as low as 8,350 feet. In autumn and in late winter the hot, dry wind that is known as the foehn blows from Switzerland or from Austria, and in the east the cold, dry bora blows with gusts of up to 125 miles per hour. Rain falls in the summer in the higher and more remote areas and in the spring and autumn at the periphery. Snow falls only in the winter, but the snowfall varies from about 10 to 32 feet in different years and in relation to the exact altitude or closeness of the sea. More snow falls in the foothills than in the mountains and more in the Eastern than in the Western Alps. Around the lakes the climate is milder, the average temperature in January at Milan being 34° F (1° C); at Salò, on Lago di Garda, it is 39° F (4° C).

The Po Valley has hot summers but severe winters, worse in the interior than toward the eastern coast. At Turin the winter average is 32.5° F (0.3° C) and the summer average 74° F (23° C). Rain falls mainly in the spring and autumn and increases with the altitude. There is scant snow, and that falls only on the high plain. The temperatures of places along the Adriatic coast rise steadily from north to south, partly because of the descending latitude and partly because the prevailing winds are easterly in the north but southerly in the south. The average annual mean temperature rises from 56.5° F (13.6° C) at Venice to 60° F (16° C) at Ancona and 63° F (17° C) at Bari. There is scant rain: Venice has 29.5 inches, Ancona 25.5 inches, and Bari 23.6 inches.

In the Apennines the winters vary in severity according to the altitude. Except at specific locations, there are but moderate amounts of both rain and snow, but in the cyclonic conditions of midwinter there may be sudden snowfalls in the south. The annual mean temperatures are 53.8° F (12.1° C) at Urbino, in the east, and 54.5° F (12.5° C) at Potenza, in Lucania; the annual rainfall is, respectively, 35 inches and 39.6 inches. Along the Tyrrhenian coast, on the Ligurian rivieras in the north, both temperature and rainfall are influenced by full exposure to the noonday sun; the nearness of the sea, with its prevailing southwesterly winds; and the Apennine Range that protects the area from the cold north winds. The eastern Riviera has more rain than the western: rainfall at San Remo, on the western Riviera, is 26.7 inches, but at La Spezia, on the eastern Riviera, it is 45.2 inches. Farther south, where the coastal area extends a great distance inland and is flatter, the mean temperature and annual rainfall are 58.6° F (14.8° C) and 30.3 inches at Florence and 61.9° F (16.6° C) and 31.4 inches at Naples. As a rule, the Tyrrhenian coast is warmer and more rainy than the Adriatic coast. Both Calabria and Sicily are mountainous regions that are surrounded by the Mediterranean, and they therefore have higher temperatures than the Italian mainland high regions farther north. Winter rains are scarce in the interior and heavier in the west and north of Sicily. At Reggio di Calabria the annual mean temperature is 64.7° F (18.2° C) and rainfall 22.4 inches; at Palermo, in Sicily, they are 64.4° F (18.0° C) and 38.2 inches. The sirocco, which is a hot, very humid, and depressing wind, blows frequently from Africa and the Near East. In Sardinia, conditions are more turbulent on the western side, and the island suffers from the cold mistral blowing from the northwest and also from the sirocco blowing from the southeast. At Sassari, in the northwest, the annual mean temperature is 62.6° F (17.0° C) and the rainfall 22.8 inches, while at Orosei, on the east coast, the temperature is 63.5° F (17.5° C) and the rainfall 21.2 inches.

PLANT LIFE

The native vegetation of Italy reflects the diversity in the prevailing physical environment in different parts of the country. There are at least three zones of differing vegetation, the Alps, the Po Valley, and the Mediterranean–Apennine area.

The three vegetation zones

From the foot of the Alps to their highest peaks, three bands of vegetation can be distinguished. First, around the Lombard lakes, the most common trees are the evergreen cork oak, the European olive, the cypress, and also the cherry laurel. Slightly higher, on the mountain plain, the beech is ubiquitous, giving place gradually to the deciduous larch and the Norway spruce. In the high-altitude zone, twisted shrubs, including rhododendron, green alder, and dwarf juniper, then give way to pastureland that is covered with grasses and sedges and wildflowers such as gentian, dryad, rock jasmine, campion, sea bindweed, primrose, and saxifrage. Farther up there is curved sedge, with the dwarf willow and the lovely anthophytes. On the snow line there are innumerable mosses, lichen, and flags, as well as a few varieties of hardy pollenating plants, such as saxifrage.

In the Po Valley almost nothing remains of the original forests; almost all of the vegetation has been planted or disposed by human activity. Poplars predominate where there is abundant water, but in the drier, more gravelly zones there are a few sedges. On the clayey upland plains, heather abounds, and there are forests of Scotch pine. There are the usual grasses beside the streams and in the bogs and water lilies and pondweed on the banks of the marshes. But the heavily predominant plants are the cultivated crops—wheat, corn (maize), potatoes, rice, and sugar beets. In the Apennine zone along the whole peninsula, a typical tree is the holm oak, while the area closer to the sea is characterized by the olive, oleander, carob, mastic, and the Aleppo pine. There is a notable development of pioneer sea grape on the coastal dunes. The Mediterranean foothill area is characterized by the cork oak and the Aleppo pine. Higher up, in southern Italy, there are still remaining traces of the ancient mountain forest, with truffle oak, chestnut, flowering ash, Oriental oak, white poplar, and Oriental plane. There are quite extensive beechwoods in Calabria (on La Sila and Aspromonte mountains) and Puglia and the silver fir and various kinds of pine in Abruzzi and Calabria. Where the forests have been destroyed in the strictly Mediterranean section of the Apennines, a scrub that is called macchia has grown up. On the island of Sardinia the destruction of the carob forests and on the Tavoliere di Puglia the decay of olive trees and shore vegetation have produced steppes of tough plants such as the various sorts of feather grass. Mountain meadowlands are found in Calabria and Basilicata, usually with vetch, bent grass, and the white asphodel. The Apennine pasturelands are very much like those of the Alps. The papyrus is quite common in Sicily as a freshwater plant.

ANIMAL LIFE

The extent of animal life in Italy has been much reduced by the long presence of human beings. In the Alps there are quite a number of animals, such as marmots, that hibernate and others that change their protective colouring according to the season, such as the ermine, the mountain partridge, and the Alpine rabbit. Larger mammals include the ibex, which is protected on the Gran Paradiso, the chamois in the Central Alps, and the roe in the Eastern Alps. The lynx, the stoat, and the brown bear (protected in Adamello and Brenta) are now rare. Alpine birds include the black grouse, the golden eagle, and, more rarely, the capercaillie, or wood grouse. Among the reptiles are vipers and among the amphibians the Alpine salamander and Alpine newt. Species that are found in the Alps also exist in other high mountain regions, where there are, however, more foxes and wolves. In Abruzzi the brown bear may be found and on the island of Sardinia the fallow deer, the mouflon sheep, and the wild boar. Among the freshwater fish are the brown trout, the sturgeon, and the eel. Among sea fish, besides common species such as the red mullet and the dentex, there are, especially in southern waters, the white man-eater shark, the bluefin tuna, and the swordfish. Among invertebrates, there is an abundance of red coral and commercial sponge on the rocks of the warm southern seas. In caves the greater horseshoe bat is found.

TRADITIONAL REGIONS

Italy is divided into 20 administrative regions, which correspond generally with historical traditional regions, though not always with exactly the same boundaries. A better known and more general way of dividing Italy is into four parts: the north, the centre, the south, and the islands.

Problems of regional division

The north includes such traditional regions as Piedmont, which is marked with some French influence and the seat of united Italy's royal dynasty, with Liguria extending southward around the Gulf of Genoa; the Milanese, which has been long celebrated for its productive agriculture and vigorously independent city communes and is now for its industrial output; and the Veneto, once the territory of the far-flung Venetian Empire and reaching from Brescia to Trieste in its greatest extent. The centre includes Emilia, with its prosperous farms; the Marche, on the Adriatic side; Tuscany and Umbria, which are treasured vestiges of Etruscan civilization and the great Renaissance traditions of art and culture; Latium (Lazio) and the Campagna, whose beautiful hills encircle the eternal city of Rome; and the Abruzzi and the Molise, regions of the highest central Apennines, which used to support a wild and remote people. The south (Mezzogiorno) includes Naples and its surrounding fertile Campania; the poorer regions of Puglia, with its great plain crossed by oleander-bordered roads leading to the low Murge Salentine (Murge Hills) and the heel of Italy, and Basilicata, Lucania, and Calabria, which was once brigand haunted. Finally, in the islands of Sicily and Sardinia are people who take pride in holding themselves apart from the inhabitants of mainland Italy.

Today, the north is heavily populated, with numerous industrial cities and intensive agriculture, attracting steady migration from the south. The centre, focussed on Florence and Rome, traditionally an area of agriculture and local crafts, is becoming increasingly industrialized. The south, with the two ports of Bari and Naples and some recently developed industry, still preserves much of the traditional ways of life. The two islands, Sicily and Sardinia, are extensively cultivated, with citrus fruit and vineyards, pasture for sheep, fisheries, and a decreasing sulfur- and zinc-mining industry. The south and the islands are changing a great deal and gradually becoming more modernized. Within these four main divisions, the variety of the much smaller traditional regions is very great and depends on history as well as topography and economic conditions. Examples of different areas include Brianza, in Lombardy, a hilly region, highly industrialized; Monferrato, a group of hills in the Piedmont, given over to the production of wine; Mugello, the large, hilly basin of the Sieve River in Tuscany, strictly an agricultural area; Chianti, a hilly area of Tuscany famous for its vineyards and wines; and the Tavoliere di Puglia, as the tableland of Foggia is called, a dry and backward region where very ancient agricultural methods are still practiced. For a more thorough discussion of these regions, see elsewhere in this article.

SETTLEMENT PATTERNS

Rural areas. The majority of the population of Italy live in cities and villages; only a fraction live in hamlets, in very small clusters of houses, or in isolated houses.

Hydroelectric works and the Alpine landscape

In the long Alpine valleys the economy was always both agricultural and commercial, and there are many towns, such as Aosta and Bolzano, at the outlets of the lateral valleys. In settlements higher up or on the slopes of hills, an agricultural economy has remained predominant. On spurs of hillocks at the heads of valleys there are often old castles, originally built there for defense. The perpetual subdivision of landholdings makes a purely agricultural economy precarious in this region except in the upper Adige, where the Germanic system of primogeniture survived, producing the *masi,* family holdings that are passed on to the eldest son intact. Cattle raising remains profitable, but woodlands yield less return. Since the 1920s, hydroelectric works have been a feature of the Alpine rural scene, based on natural or artificially created lakes. These rural areas now also include an increasing number of tourist centres, such as Courmayeur and Valle d'Ampezzo. Although these developments have reduced both the seasonal and the permanent migration away from this area, rural living is, nevertheless, declining sharply here. In the band of Alpine and Apennine foothills, the villages, often situated on the knolls and flanks of the hills, are linked by roads that hold to the heights, away from the humid valley floors. Each village is usually grouped round a church, a castle, or a nobleman's palace, with its fields on the slopes around it and woodlands lower down. There are innumerable plum and cherry orchards and, above all, vineyards; their wines (Conegliano, Veronese, and Monferrato) are famous. Businesses are usually small or of only moderate size. Lombardy is the only area in which the ancient rural way of life has been displaced by the development of heavy industry. The population of its rural districts has been increased by migration from the neighbouring mountains and from the south. The Padano–Venetian–Emilian plain is the most important agricultural and stockbreeding region of Italy. The upland plain has now been virtually overrun by the great industrial centres such as Turin, Milan, and Busto Arsizio, but the lowland plain remains socially as well as economically rural. Wheat and corn are the most common crops, though each district has its specialty, such as sugar beet, grapes, and fruit.

Apennine settlement patterns

Villages high in the Apennines are less prosperous than those of similar altitude in the Alps. They are still isolated, the ground is infertile, and land is rarely owned by those who work it. These hopeless conditions have caused the more enterprising residents to emigrate to the north, leaving the villages in an even more desperate situation. Tourism and the expansion of cottage craft industries, such as the porcelain making at Gúbbio, near Perugia, have helped these towns survive. The lower hills and plains of Italy are covered with agricultural villages in which a wide variety of crops and vegetables are grown. The fields are heavily cultivated, but their yield is low. Specialized cultivation is more profitable, such as that in the south of hard-grain wheat, olives, almonds, figs, carobs, and hazelnuts. In Puglia and Basilicata large farms are staffed by labourers who live in urban centres, such as Cerignola and Altamura, and travel to work in the countryside. Some fertile and well-watered plains, such as the Neapolitan *campagna,* have a high level of productivity, especially of market vegetables. Here there is direct ownership of land and fairly dense settlement. In Sicily, settlement is minimal and scattered. Wheat is extensively cultivated. Especially on the coasts, pastureland is extensive though not very profitable; there is efficient cultivation of grapes, olives, citrus fruits, and vegetables, all of which bring the island some revenue, because they can be marketed as early produce. In Sardinia the settlement is also sparse and mainly inland, because of the need, in historical times, to avoid the dangers of malaria in low-lying areas and also of the risk of attack by pirates. Although islanders, the Sardinians have never wanted to work on the sea, and most of their fishing industry is carried on by men from the mainland. There are extensive meadows and forests.

Urban centres. From classical times and earlier, Mediterranean peoples have had highly developed urban centres. For historical as well as geographical reasons, Italy has never been dominated by one city, each district tending to possess its own urban centre. Today, there are several cities with a population of more than 1,000,000; but many more cities have a population of more than 100,000. Of these, almost half, including Sassari and Pisa, are on or near the sea; a similar proportion are in the north, and the rest are in the centre, in the south, and on Sicily and Sardinia. This irregularity of urban settlement reflects the economic imbalance among different parts of the country. The distribution of Italian cities also reflects historical and geographical conditions. In the Po Valley, cities such as Milan, Pavia, and Cremona are well placed for commerce, being situated at the confluence of roads or rivers. Another group of cities are those on the coast, built at the mouths of rivers, or on lagoons protected by sandbars; these include Savona, Genoa, Naples, Messina, Palermo, Ancona, and Venice. These cities, which originally grew up so close to each other, have, with increased population and industrialization, merged into enormous metropolitan complexes, sometimes characterized as mega-cities, such as that surrounding Milan. There are now several metropolitan areas in Italy, including Milan, Naples, Rome, Turin, Genoa, Florence, Palermo, and Bologna. (G.Na.)

The people

GROUPS HISTORICALLY ASSOCIATED WITH CONTEMPORARY ITALY

Non-Italian speakers

Ethnic and linguistic groups. Linguistically, modern Italy is fairly homogeneous. Non-Italian-speaking groups, a small minority, live mostly in the north of the country, where linguistic borders do not always coincide with political ones. The most important minority is the German-speaking population of the Adige River's upper reaches, in the province of Bolzano. It comprises most of the province's total population, while most of the rest speak Italian, and a few speak Ladine, a Neo-Latin language, a variation of which is also spoken in Switzerland. In 1921 there were about 195,600 German-speaking inhabitants; after an emigration during World War II, the German community started to expand again, with a relatively high birth rate. There were also once German-speaking minorities in Piedmont, Lombardy, and Venetia municipalities.

Slovene is spoken by a minority in the province of Trieste. Linguistic minorities exist in many municipalities scattered throughout the country. In some cases these groups have been rapidly diminishing. Among the Greeks, Albanians, and others, often only the older people speak the language. The Greek, Albanian, and Catalan minorities are historically interesting, because they are descended mostly from immigrants of the 14th and 15th centuries, and their language has retained archaisms while also being influenced by Italian.

Religions and races. *The religious background.* The overwhelming majority of Italians are Roman Catholics. Membership of other religious groups is marginal, and includes Evangelicals, Jews, and Greek Orthodox. The Jewish population was significantly reduced by Nazi and Fascist persecution, and since World War II their numbers have increased only through immigration.

Anthropological differences. The Italians vary anthropologically from area to area. The results of a survey based on about 300,000 conscripts born between 1859 and 1863 have been confirmed by subsequent research. They provide interesting conclusions about Italians from different regions in the late 19th century, though internal migration has made great subsequent changes.

Skull types

The cephalic index, a measure of the proportions of the skull, decreases from north to south; that is, brachycephalic (squat-headed) people are found in the Po Valley and around the Alps, extending into central Italy as far as the province of Rieti, though less marked. A similar area, even narrower, includes part of the Abruzzi, Campania, and Basilicata. Conversely, all the south is generally dolichocephalic (long-headed), particularly Calabria, southern Puglia, and Sicily, and most of all Sardinia. The north has some areas of pronounced dolichocephaly in east Liguria, southern Piedmont, and particularly northwest Tuscany.

In stature the inhabitants are generally smaller in the south. Three areas have relatively tall inhabitants: the largest area covers part of Venetia, the second is halfway between Tuscany and Emilia, and the third is in northeast Lombardy. The areas of small stature stretch from southern Marche to the south, becoming gradually more pronounced, especially in Sardinia. Although the greatest dolichocephaly and the smallest stature seem to coincide, there is no correlation; the small stature is largely the product of socioeconomic environment.

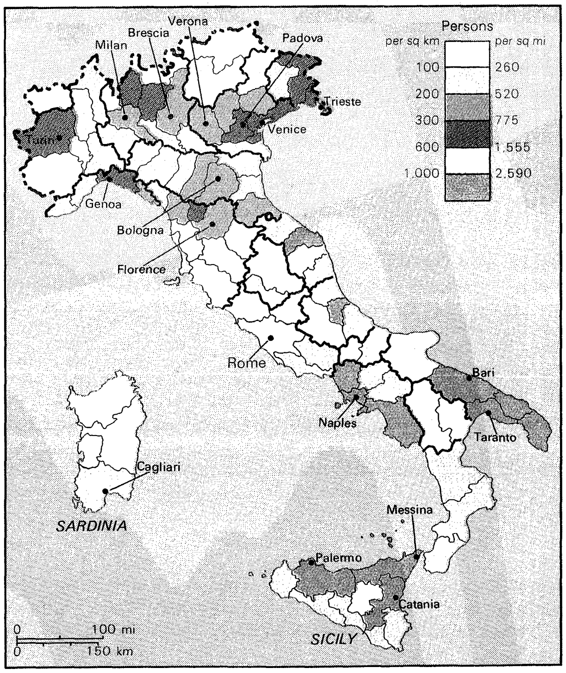
Italians are predominantly dark, though fair types are found in northern Italy, relatives of the fair natives of Savoy, Switzerland, and Austria. Throughout the Po Valley the people are notably darker than in Tuscany, Umbria, and Marche, in central Italy. Another area with fair types is found slightly farther south, in Sannio and Irpinia. Sardinia, again, has the highest frequency of dark types.

Despite modifications through internal migration, this analysis of anthropological characteristics is still reliable for studying the origins of Italians.

DEMOGRAPHY

Throughout the centuries Italy's population has shared many changes with other European countries. The mid-14th-century plague reduced its population considerably, and a long period of population growth ended at the beginning of the 17th century. From the early 18th century until the unification (in 1861), a slight, steady growth prevailed, though it was interrupted during the Napoleonic Wars.

From the latter half of the 19th century to the latter half of the 20th century, the population density more than doubled. The population increase is less than that for many other European countries. In the mid-20th century the rate of increase reached a level comparable to those in Great Britain, France, and West Germany. Population density is high for a country with territory that is one-third (35.2 percent) mountainous; only about one-half of the land is fit for arable farming.



Population density of Italy.

Checks to the population spiral

Birth and death rates. The decline of the birth rate during the 1890s, reflecting a growing awareness of family-planning techniques, occurred a decade or two after the death rate started to fall. The decline of each continued until the 1950s, levelling off thereafter. Migration drained the population until the eve of World War I; the loss was reduced between the wars, increasing again after World War II. Over the entire period, the net loss of the population has been several million people. The rate of natural population increase was particularly high in the decades when emigration was highest, although there is no obvious causal relationship between the two. The actual rate of increase of the population has remained approximately constant throughout the century. Fertility and mortality follow more advanced Western countries, although with a delay of one or more decades. The halt in the decline of Italy's birth rate lagged behind other countries because of its lower social and economic level and its slower development up to World War II. Peculiar to Italy are regional differences, particularly between north and south.

Regional differences. During the mid- and late 1900s most of the population in much of the north and the centre (particularly in Liguria, Piedmont, Friuli-Venezia Giulia, Tuscany, and Emilia) was not reproducing itself; that is to say, the average number of children per couple was under two. The south and the islands, on the other hand, had a comparatively high rate.

Factors tending to eradicate regional differences include high internal mobility, the policy of social and economic development for the south, the spread of mass communications, and the abolition of laws forbidding the advertisement of contraceptives and birth-control information.

Life expectancy. The mortality development follows a more uniform pattern. The death rate has declined significantly since 1880. But the death-rate level is heavily affected by the changing age structure and, since the 19th century, by the aging of the population.

The doubling of life expectancy since the late 19th century is well in line with European trends, reflecting higher nutritional and sanitation standards, improved medical care, and advances in medicine and pharmacology. Regional contrasts of mortality are less marked than those of fertility. Differences nonetheless arise, as a result of incidence of infectious diseases and deaths induced by "exogenous" factors, or peculiar environmental features. Malaria, typhus, and cholera once ravaged the south, while pellagra was a widespread cause of death in Lombardy and Venetia. Such incidences have been very much reduced by the advances of medicine, but mortality—particularly infant mortality—is still very much influenced by inadequate living conditions.

The decline in mortality rates is approximately the same for the four areas. Their relative situation has remained unchanged, with a much higher infant-mortality rate in the south and in the islands than in the rest of the country. The gap between Italy and other large western European countries is still considerable, though it is gradually narrowing. The poorer regions of Italy seem to have some advantages over the centre and north in their lower incidence of cancer and cardiovascular diseases.

Expectancy of life at birth is a good yardstick of the general sanitary conditions of the population. The south and the islands have nearly caught up with the rest of the country.

Migration. Italy is traditionally a country of emigration. Almost always Italians go in quest of work abroad, sometimes for a few years, sometimes for life. A little more than one-third of the total emigrated between the late 19th and late 20th centuries.

Changing character of emigration

The course of transatlantic emigration. During the 1860s and 1870s emigration emanated from the north, which long had contact with foreign countries. Emigration was largely associated with particular professions and skills: woodcutters and bricklayers went to neighbouring Alpine countries; farmers, vine growers, artists, and peddlers to North America. During the 1880s, however, emigration became a mass phenomenon, gradually involving the poor rural populations of the south. The flow rapidly increased as a result of improved internal and transatlantic transport facilities; the south's economic crisis, which hit both agriculture and industry, particularly in the late 1880s and 1890s; and the growing demand for labour in North and South America. Although emigration to Switzerland, Austria, and France was considerable, the destination was primarily transatlantic from the late 1880s to the early 1920s; about three-quarters of all the transatlantic emigrants since the late 19th century travelled during these four decades. Of the total of 12,000,000 who travelled in 100 years, about half went to the U.S., one quarter to Argentina, 1,300,000 to Brazil, and almost 1,000,000 to

Canada and Australia. During 1900–14, Italian emigration reached its peak, with 523,000 in 1906 and 565,000 in 1913, but the U.S.'s immigration acts of 1921 and 1924 practically closed the most important foreign labour market. Emigration to Brazil also declined considerably early in the 20th century because of the critical economic conditions of that country, and emigration to Argentina at the end of the 1920s slowed to a trickle. Subsequently, the economic depression, Fascism—which was hostile to emigration—and World War II practically eliminated emigration. After the war the very high unemployment revived emigration to South America, particularly Argentina and Venezuela. Traditional overseas emigration, however, had ended; with the economy's expansion, the decline of unemployment, and the assimilation of Italian minorities abroad, emigration for life fell to less than one-fifth of the total emigration. Departures to the U.S. and Canada in this period averaged 30,000 a year and to Australia about 15,000. An extraordinary feature in the early 1980s was that the number of returnees exceeded the number of departures.

Migration of the European labour market

European migration. During the mid-1900s, when there was still a considerable manpower surplus in the south, the islands, and parts of the north and centre, many of the unemployed took advantage of the tempting opportunities in other European countries, with rapidly expanding economies and pressing demands for labour. Thus, emigration to West Germany and Switzerland increased, while that to France (a traditional destination for Italian emigrants) and Belgium started to dwindle. This new wave was very different from the transatlantic emigration. Now the proportion of males was very high and entire families rare, because some countries refused entry to workers' relatives and some suffered from a housing shortage. The length of stay was very short, and repetitive expatriation for further periods of work abroad became common. As a result, the communities of Italian workers in Switzerland and West Germany became highly unstable, with a rapid exchange of individuals; many social and family problems were created both in the areas of origin and in the host countries. In the 1960s, migration between continental countries began to decrease, and Italian labour more often found worthwhile positions at home. Restrictive regulations, too, reduced the number of Italian workers in Switzerland.

Population movement within Italy. *Interregional flow.* Internal migration is a very important factor in the regional redistribution of the Italian population. In recent years the populations of the south and areas such as Venetia have had a much higher natural growth rate than the rest of the country. Nevertheless, the population's regional distribution has remained stable, with internal compensatory exchanges of population.

Since the unification of Italy, internal movements have followed the same direction, south to north and east to west: from the regions of the south and from the islands (especially Sicily) to centre regions—*e.g.,* Lazio–Rome and Tuscany—to the northwest—*e.g.,* Lombardy, Liguria, and Piedmont; and from the northeast (*e.g.,* Venetia) to the northwest. Movements from Emilia, Marche, and Umbria to other regions of the northwest and the centre have also been considerable. Mobility has grown exceptionally swiftly since World War II, corresponding to economic expansion, particularly in the industrial triangle of Lombardy–Piedmont–Liguria. Allied factors have been the reduction of unemployment in the north and a persistent labour surplus in the south. Italy is one of the few countries having a registration system for changes of residence from one commune to another.

Urbanization. Another aspect of the population redistribution in Italy, the vast urbanization, was especially rapid during the mid-20th century. The transformation of the economy that time—from mainly agricultural to mainly industrial—has strongly affected the distribution between rural and urban areas. The percentage of the labour force engaged in the primary sector has dwindled in the last several decades. A drop in the proportion of people living in the smaller *comuni* has been accompanied by a shift toward the large urban areas. The proportion of residents in the largest urban areas has tripled since the late 1800s. (M.L.-B.)

The economy

ITALY IN THE WORLD CONTEXT

Italy's economic growth after World War II was spectacular. At the end of the war, the country's economy lay in ruins, although much of the industrial machinery in the north had been saved from destruction. By 1951, prewar levels of production had been regained, and the next 20 years saw almost uninterrupted growth. Italy's economic growth since has been more sporadic, however, as it has faced rising labour costs and lower productivity, increasing petroleum prices, and worldwide recession. Italy cannot yet be classified as a mature industrial economy, although the transition period from a primarily agricultural society to a predominantly industrial one is nearing completion. The growing importance of Italy as an economic power can be gauged from the fact that, while the population of Italy has fallen, the proportion of Italy's national income to the world total has risen. Italy's greatest success in postwar years has been the rapid growth in industrial production, matched only by West Germany and Japan. The expansion of foreign trade has been a major factor in Italy's economic growth.

RESOURCES

Mineral resources. In terms of mineral resources Italy is one of the poorest countries in Europe. Both metalliferous and nonmetalliferous minerals are generally nonexistent or in short supply. The extractive industry has grown at a slower rate than other sectors because of both the poor quality of some minerals, such as coal, and the increasing inefficiency of the mines. Many of the sulfur mines in central Sicily and the coal mines in southwest Sardinia have been closed since World War II, and the decline continues. Italy has sufficient reserves of only a few minerals, such as mercury, sulfur, rock salt, and marble, while deposits of iron ore, coal, oil, and natural gas are meagre. Further reserves of hydrocarbons are being sought, especially in offshore areas. Italy also produces small quantities of zinc, lead, bauxite, pyrites, and a number of other minerals. Coal production now accounts for only a fraction of Italy's needs, and millions of tons a year are imported, mainly from the U.S., the EEC, eastern Europe, and Japan. Italy is a leading supplier of mercury, located mainly in the central part of the country, which accounts for a significant portion of the world output.

Deposits of both oil and natural gas exist in Italy, but the reserves of the former are rapidly being exhausted. After the discoveries of oil made in the 1950s at Ragusa and Gela, in Sicily, production rose and then gradually declined. The discovery of natural gas in the Po Valley and in various zones of southern and central Italy, including Sicily, raised hopes that Italy might be able to produce enough for domestic needs. Further deposits were discovered in the offshore Adriatic in the late 1960s, estimated at 2,120,000,000,000 cubic feet. Despite these discoveries, Italy initiated massive imports from diversified sources, both to meet the increased demand and to conserve total known deposits. Imported supplies came from Libya, the Soviet Union, and The Netherlands. Exploration, especially in the offshore areas, was intensified, above all by the State Hydrocarbons Corporation, the Ente Nazionale Idrocarburi (ENI).

Oil production accounts for only a minute part of domestic consumption. Imports of crude oil come mainly from the Middle East, Libya, and the Persian Gulf.

Italy's output of iron ore accounts for a small part of domestic needs. Imports come mainly from Liberia, Canada, Venezuela, and Brazil. Production of other minerals, such as pyrites, lead, zinc, and bauxite—deposits of which are scattered throughout the country—has been more or less static. Discoveries of rock salt, above all in Sicily, have boosted production. The quarrying industry—especially for marble and travertine (a hot-spring limestone deposit) from the world-famous quarries at Massa and Carrara (where Michelangelo, among other artists, found his raw material)—has enjoyed a modest but steady growth in postwar years, mainly as a result of the renewed popularity of the materials in the construction industry. Mining accounts for a very small percentage of the GNP.

Biological resources. Geologically, Italy is still at a very unstable stage of development. Earthquakes and tremors are quite frequent all over the mainland. Italy is characterized by a wide variety of climatic differences, topography, and soil types. For the most part, the terrain is rugged, arid, and unsuitable for intensive cultivation, except in the Po Valley, the plains of Puglia, and Campania. As a result of low rainfall, vegetation is sparse in parts of the country, especially in sectors of the Apennine Mountains. It has been mainly the pressure of population, however, leading to the cultivation of land generally unsuited for such use, that has caused widespread soil erosion and endangered the hydrogeological equilibrium of the land. The movement from the land of more than 6,000,000 peasants since 1945 has increased the dangers of neglect of property that was formerly cultivated or tended. Despite the exodus to the towns, about half of the productive land is still cultivated. As a result, Italy is deficient in timber and forest products, although the government is pursuing an active policy of reforestation. The balance of Italy's timber needs consists of imports of sawn wood, most of which comes from Austria and Sweden.

Timber production

Broad-leaved trees make up most of Italy's forest area, and conifers make up about one-fifth. Broad-leaved forests are fairly well spread over the country, with the exception of the Puglia, Sicilian, and Sardinian regions. Conifers are for the most part concentrated in the Alpine foothills, especially in the Alto-Adige region adjacent to the Austrian border. Because Italy is not well endowed with rivers, with the exception of the Po and the various smaller rivers that flow into the sea at or near the Po Delta on the northeast coast, intensive agriculture is concentrated in the overcrowded coastal plains, the mountain foothills, and above all in the Po Valley, the most fertile part of Italy. The need for land suitable for agriculture has led to many programs of land reclamation and improvement, especially in the south.

Hydroelectric resources. The three main lakes of northern Italy (Como, Maggiore, and Garda) are the source of six small rivers that flow southward into the Po River. These, together with the Bronta, La Sila, Tagliamento, and Adige rivers, which have their sources in the Alps, are the origin of most of Italy's hydroelectric power. As a result, more than half of the electricity produced in the northern regions of Piedmont, Lombardy, Alto-Adige, Venetia, and Friuli-Venezia Giulia is hydroelectric. Other regions of Italy with a similar proportion of hydroelectric power are Umbria, Abruzzo, and Calabria—all hilly or mountainous zones. Hydroelectric resources have been exploited almost to the maximum and account for more than one-fifth of the total energy output.

Power potential of the lakes

AGRICULTURE, FORESTRY, AND FISHERIES

Agriculture in Italy remains an important sector of the economy in terms of both employment and its contribution to the gross national product. Despite a number of agricultural reforms and EEC membership, agriculture is still backward by western European standards. The typical Italian farm is small, relatively unproductive, and geared more to subsistence than to modern market-oriented farming. Since 1945 there has also been a limited redistribution of land to small farmers, mainly under the 1950 agrarian reform acts. This has not stopped a massive flight from the land.

In Italy the complex land-tenure system is gradually being simplified by new legislation. The majority of farms are run by the owner and his family, without the employment of wage labourers; the remainder are run mainly under a sharecropping or rent system or, in the case of larger farms, with the employment of day labourers or permanent staff. The aim of agricultural policy since World War II has been to modernize agriculture by the development of efficient and well-organized farms, thus improving living standards for those working the land. This policy has been only partially successful. Objectives have been pursued largely through Green Plans, concentrating on mortgages and loans, land, irrigation, crop improvement, increasing profitable forms of production and productivity, and raising incomes.

The Green Plans

The most important areas for growing hard-grain wheat are in southern Italy, in the Sicilian and Puglian regions. Together they account for more than half of national production. The balance needed to meet domestic requirements is met by imports, mainly from the U.S. and Argentina. Domestic production of other cereals, notably rye, barley, and oats, has also been insufficient. The land area devoted to corn (maize) growing has been steadily increasing, but imports are still necessary. Italy is Europe's leading rice producer, most of it being grown in Piedmont and Lombardy; a large portion of its crop is exported to other European countries.

Wine and olive oil. Italy's most important agricultural products are wine and olive oil. Italy vies with France as the world's leading wine producer. A large quantity of the wine produced is not considered of high quality, but in a number of regions there are wines that compare favourably with the best. The government is active in upgrading Italian wines, and the system of *appellation contrôlée* (registered trade names) is gradually being extended to a wide range of Italian wines. Olives are grown principally in southern Italy; Puglia and Calabria are the main producing regions. Olive-oil production has been erratic. The grape and olive crops are of considerable economic importance to Italian agriculture, as most are processed on the farms themselves. Wine is exported in large quantities, although competition is particularly strong from other European countries, especially France and Spain.

Tomatoes and fruit growing. This crop has been one of the mainstays of agriculture in the south, particularly in Sicily and Campania, and canned tomatoes and tomato paste are exported throughout the world. Competition from Greece, Portugal, and Spain, however, has seriously eroded some traditional markets. Italy produces about one-half of all fruit grown in the original EEC area. Peaches, pears, and apples are very important and are grown primarily in the northeastern regions of the country. Citrus-fruit growing is also a major agricultural activity in southern Italy, especially in Sicily. Citrus fruits account for almost one-third of the value of Sicily's entire agricultural output. Because of high costs, the difficulties of mechanization in dense fruit groves, and an absence of marketing cooperatives, Sicily has sometimes been unable to sell all its crop, and consequently much has been withdrawn from the market.

Citrus fruits

Livestock. Production of livestock is inadequate, since with rising living standards the demand for meat has risen. The dairy industry also fails to satisfy domestic needs. Although a wide variety of cheese is produced—from goat, buffalo, and sheep milk, as well as from that of cows—it is done so mainly as a craft industry. As a result, imports of butter, cheese, and other dairy products are extensive.

Fisheries. Italy's waters are not well stocked with fish. Anchovies, sardines, and tuna account for a sizeable part of the total catch, while an important part of the remainder is made up of mackerels, mollusks, and shellfish. The gap between supply and demand is filled by large imports of fresh, frozen, dried, and salted fish coming mainly from Norway, Denmark, Japan, and Spain. The fishing industry still remains primarily an individual enterprise, although cooperatives and a few large fleets continue to expand. Some funds have been allocated for the renewal of fleets, but radical structural changes in the industry appear unlikely. Some fishing banks in or near Italian coastal waters are already exhausted, and many fishermen have left the industry in search of more profitable occupations.

Individualism in the fishing industry

INDUSTRY

Mining and quarrying. Mining is not an important sector of the Italian economy, and employment in it is rapidly declining. Coal and lignite production is declining gradually, as is that of sulfur, one of the few mineral resources to be found in any quantity in Italy. In any case, coal is gradually being replaced by oil, electricity, and natural gas. Likewise, production of iron ore, in which Italy is equally deficient, is destined to decline. The only sectors in which an increase is expected are in the mining of mercuric ores, rock and potassic salts (from deposits in Sicily), zinc, and asbestos, and in the extraction of natural gas. Quarrying activity remains high, however, especially because of the demand for marble, gravel, and other materials for the construction and road-building industries.

Manufacturing. The most remarkable feature of postwar economic development has been the spectacular increase in manufacturing. Since 1948, relative political stability has increased business confidence and led to annual industrial investment of more than 20 percent of produced income. Other important factors were Marshall aid (a special U.S.-financed aid program after World War II), safeguarding Italy during the crucial recovery period from 1946 to 1951 from balance-of-payments problems; an orthodox but sound monetary policy; and the liberalization of trade. The last factor has been especially important, since Italy's economic growth has been primarily based on exports. Another fundamental reason for Italy's rapid growth of manufacturing output has been the abundance of manpower. Italy's geographical position—near the oil fields of North Africa and the Middle East—was also an important stimulus to industry as a whole and to the development of the refining and petrochemical industries.

The steel industry. Despite a lack of mineral resources, a major expansion of the steel industry was begun in the early 1950s—one of the most farsighted and courageous decisions taken by the government. The steel industry has been the backbone of Italy's industrialization. Steel production has dramatically increased, as has crude-steel production. There have also been important qualitative changes in the industry.

Automobiles and electrical appliances. Parallel with the development of the steel industry has been that of the engineering and allied sectors. The automobile industry has grown spectacularly. Fiat is the main manufacturer, and the state-owned Alfa Romeo produces more expensive cars. The electrical appliance industry has played a major role in postwar industrial development, creating a European-wide market for refrigerators, cookers, washing machines, and dishwashers by selling at highly competitive prices and by using the latest production techniques.

The textiles industry. The textiles industry remains one of Italy's most important manufacturing industries. Silk production is centred in Lombardy, Piedmont, and Venetia but is also found throughout the country. Other important products include artificial and synthetic fibres and cotton, wool, and jute yarn. A large number of part-time piece-rate workers are employed.

Widening of the industrial base

Industrial diversification. An important element of Italy's manufacturing growth has been the widening of the base of industry. There has been a shift of emphasis from food and textiles to chemicals, steel, and engineering products. Large companies tend to dominate these new industries, but a vast number of small- and medium-sized companies, especially in the engineering and metalworking industries, are still important. Gradually, however, a process of consolidation is taking place, especially in those industries in which large-scale production is necessary for competitiveness. With Alfa Romeo, Fiat has run the automobile industry since it took over minor competitors such as Lancia, OM, and Autobianchi. Fiat and a rubber-and-cables company, Pirelli, have been instrumental in European mergers, Fiat taking an interest in the French companies Citroën and Michelin and Pirelli integrating its operations with that of the English company Dunlop. Other important companies in their respective sectors are Olivetti, making typewriters, calculating machines, and computer terminals; SNIA Viscosa, which leads the field in artificial fibres; and Montecatini Edison, which assumed control of SNIA in 1972, in the chemicals and pharmaceuticals sectors. The bulk of manufacturing output, however, comes from the small- and medium-sized companies, which are mainly concentrated in the north and centre.

ENERGY

By European standards, per capita power consumption is relatively low. Italy, mainly as a result of its proximity to the North African and Middle Eastern oil fields, has come to rely massively on oil for its energy requirements. Much of the crude oil is destined for re-export as refined petroleum products. Imports of oil are made by all the international companies as well as by Italy's State Hydrocarbons Corporation (Ente Nazionale Idrocarburi; ENI). Intensive exploration efforts by the ENI have resulted in a number of finds in Tunisia, Iran, Libya, and elsewhere. The ENI has also been searching for hydrocarbons in Italy. Discoveries in the Adriatic Sea have boosted reserves of gas, mainly in the Po Valley, Sicily, and parts of southern Italy. To conserve these domestic deposits as long as possible and to meet rising demand, the ENI has embarked on a large-scale import program of natural gas from diversified sources, including Algeria, Libya, The Netherlands, and the Soviet Union. Italy has also been developing its hydroelectric, nuclear, and coal-fired capabilities.

The State Hydrocarbons Corporation (ENI)

FINANCE

Italy's financial and banking system has a number of unique features, although its framework is similar to that of other European countries. The Bank of Italy is the central bank and the sole bank of issue. Power in monetary policy is vested in the Interministerial Committee for Credit and Savings, headed by the minister of the Treasury. In practice, the Bank of Italy enjoys wide discretionary powers and plays an important role in economic policy-making. Its primary functions include the control of credit and the formation and execution of monetary policy. There are three main types of banking and credit institutes. First, there are the commercial banks, which include three national banks, several chartered banks, the popular cooperative banks, whose activities do not extend beyond the provincial level, and ordinary private banks. Second, there is a special category of savings banks organized on a provincial or regional basis. Finally, there are the investment institutes, which collect medium and long-term funds by issuing bonds and supply medium- and long-term credit for industry, public works, and agriculture. The three national banks (Banca Commerciale Italiana, Banco di Roma, and Credito Italiano) are all owned by the largest state holding group, the Istituto per la Ricostruzione Industriale (Industrial Reconstruction Institute, or IRI). Many other important banks are also regulated by public law. Both these and the national banks are therefore subject to special government control and influence, although they act as normal profit-making banks in every respect. The savings banks are in a similar position, as are some of the major medium- and long-term-credit institutes, including the Istituto Mobiliaro Italiano (IMI), which is directly owned by the government and provides a considerable part of long- and medium-term funds for industry.

There are many institutes of various kinds supplying medium- and long-term credit. These special credit institutes have as their prime aim the increase of the flow and the reduction of the cost of development finance, either to preferential areas or to priority sectors (for example, agriculture or research) or to medium- and small-sized business. In addition to this network of special credit institutes, there is a subsystem of credit under which the government shoulders part of the interest burden.

The bond market in Italy is well developed. Mainly as a result of the special structure of government-sponsored institutes for development finance and subsidized interest rates, the growth of the capital market and stock exchanges is far less important than in other non-Communist industrialized countries. Consequently, the issuing of industrial debentures, too, except by the state holding corporation (IRI) and a few private and public companies, has been relatively meagre. There has been a high degree of self-financing by companies. The development of the stock exchange in Italy has been hampered by the archaic structure and rules of the markets and by tax problems connected with the registration of shares. Italy has also lagged in the development of mutual funds or unit trusts.

TRADE

Foreign trade makes a large contribution to the gross national product and economic growth. In absolute terms, however, Italy began to develop its foreign trade at a low point, and its rapid growth since the 1950s should be seen as a recovery from a low base rather than as a phenomenal growth. The main factors enabling Italy to catch up with its west European neighbours were relatively low labour costs, a much greater rise in productivity than in wage increases, and above all an abundance of manpower. The liberalization of international trade and the rise in demand in other countries were prerequisites to Italy's foreign-trade boom.

Trade deficit

While Italy has consistently had a trade deficit since 1957, the gap between imports and exports in most years has been narrow. At the same time, Italy has always had a considerable surplus of invisible exports, notably tourism and emigrants' remittances, which led to a structural surplus in the 1960s. This situation changed in 1970, however, when imports so outstripped exports that the invisible receipts were unable to bridge the gap. Italy in recent years has suffered from severe inflation, high unemployment, and chronic trade deficits.

In view of Italy's meagre natural resources, exports consist almost entirely of manufactured goods and agricultural produce. Engineering products, automobiles, and household appliances have been in the vanguard of Italy's export development, supplementing such traditional exports as fresh and processed fruit and vegetables, textiles, leather, and marble goods. Other products exported by Italy on a large scale include petroleum products and chemicals. The main impetus toward the growth in exports comes from three main sectors—transport equipment, machinery of all types, and clothing and textiles.

Imports, on the other hand, consist, to a large extent, of raw materials for industry, such as oil, iron ore, coal, cotton, and copper; foodstuffs, especially meat and cereals; and investment and consumer goods. The demand for foodstuffs has been particularly high; meat and cereal imports increased especially rapidly as living standards rose. Similarly, the propensity to import machinery and equipment with a high technological content has grown along with the process of industrialization in Italy. Another feature of Italy's trading pattern has been the rapid growth of trade with its Common Market partners. Italy has also been a pioneer of East–West trade, trading with the members of Comecon (Council for Mutual Economic Assistance, the east European Common Market).

ADMINISTRATION OF THE ECONOMY

The private sector. Italy's economy is characterized by a small number of large private and publicly owned industrial groups and a large number of medium-sized and small companies. The vast majority of small firms are of the artisan type; there are also many medium-sized industrial firms. At the other end of the scale there are the large private groups such as Fiat, Pirelli, Olivetti, and the labour-intensive household-appliance and textile companies. For the most part, private industry is located in the triangle formed by the cities of Milan, Turin, and Genoa, but other regions, in particular the northeastern ones of Venetia and Emilia-Romagna, developed an extensive network of industries in the mid-1900s. Central Italy has become increasingly industrialized. In the south and islands, industry tends to be concentrated in certain highly populated areas, such as Bari, Naples, and eastern Sicily, although incentives to encourage the further industrialization of the relatively poor south have been in force since the 1960s. Until the mid-1960s the burden of industrialization in the south had fallen almost entirely on the government and the public sector, while private industry invested mainly in capital-intensive sectors such as petrochemicals, which did little to boost employment. By fiscal and other incentives the government sought to encourage the growth of medium-sized and small industries in depressed areas. Foreign investment—mainly from the U.S.—played a significant role in the postwar development of Italy. The oil industry was the principal beneficiary, followed by the chemical, pharmaceutical, and engineering sectors.

The public sector and the role of government. By comparison with the other economies of western Europe, the public sector plays an exceptionally large role in Italian economic life. In addition, Italy has a unique formula for operating the majority of the state-owned corporations under the government's control. This formula applies in the case of the three major state holding corporations, the Istituto per la Ricostruzione Industriale (IRI), the Ente Nazionale Idrocarburi (ENI), and the Ente Finanziaria per L'Industria Meccanica (EFIM), all of which are responsible to the Ministry of State Participations, created in 1956. The IRI is organized on a pyramid basis, with the holding company at the top, a middle layer of financial holding companies divided according to the sector of activity, and below them a mass of operating companies, many of which are partly owned by private shareholders and quoted on the stock exchange. The IRI's activities are extremely widespread, including a number of major banks, Alitalia (the national airline), RAI-TV (the state radio and TV network), telephone and cable companies, manufacturing companies (such as Alfa Romeo, making automobiles and commercial vehicles), Italsider (the largest steel manufacturer), engineering companies, shipyards and shipping companies, and expressway construction. The ENI, the second largest state holding company, operates in the oil and natural-gas fields but also has interests in textiles, nuclear energy, and chemicals. Apart from this special involvement of the state in public utilities, manufacturing, and services, the government also controls the bulk of electricity generation and distribution through the nationalized electricity corporation (ENEL), almost the entire railway and road network, and the monopoly of tobacco and cigarette manufacture and salt. The IRI also has an important role in the Italian economy. Its function has been to act as a propellant to the industrialization of Italy and in some cases to act as a protective umbrella for industries in declining sectors; even more important, it also bypasses the archaic and generally inefficient bureaucracy. The IRI built the bulk of Italy's extensive expressway system in record time and is now increasingly called in to carry out public works of all kinds that the state administration had proved incapable of executing. A prime example was the low-cost public-housing program that the government began implementing in the 1970s. The IRI and the ENI between them have made a vital contribution to the growth of the Italian economy since the 1950s. In particular, the two groups have been the principal investors in the underdeveloped southern part of Italy. Although responsible to the Ministry of State Participations, both the IRI and the ENI enjoy considerable financial and operative autonomy. This autonomy is reinforced by the fact that these state corporations do not obtain their funds from the Treasury. The lack of unified control over state corporations and the absence of centralized planning have reinforced their independence.

Main public corporations

Economic policy is established by the Interdepartmental Committee of Economic Planning and carried out under the supervision of the Minister for State-Controlled Enterprises and the Court of Accounts. Many public corporations carry on economic activity in competition with similar private companies, but the most notable form of state intervention in industry and business concerns is through state-run holding companies such as IRI and ENI. The state usually but not necessarily has a controlling interest in the companies in which it holds stock. Public corporations are also responsible for most medium- and long-term loans and about half of all life insurance.

The government has also intervened on a massive scale in the development of the southern part of Italy and the islands, known as the Mezzogiorno. The southern Italy development fund, called the Cassa per il Mezzogiorno, was set up in 1950, to stimulate investment in agriculture and industry in the south between 1951 and 1970. This institution represented the first step by the Italian government toward national economic planning. An attempt at more widespread planning came in 1954, but it was not until 1967 that the First Five-Year Plan was approved by Parliament. The plan, which was of the flexible type, updated annually, was binding only on the public sector. In the 1980s an economic reform package was initiated in order to cut consumption and reduce public spending. The national economic planning body (Comitato Inter-

The five-year plans

ministeriale per la Programmazione Economica, or CIPE) was assigned overall responsibility for development of the south, with the Cassa per il Mezzogiorno acting as the executive body, as well as supervising overall planning in Italy.

Taxation. One important feature of the Italian fiscal system is the low percentage of receipts accounted for by income tax levied on persons and companies. The main source of revenue comes from various taxes on goods and services, in particular a general tax (IGE) normally levied on all transactions. Indirect taxes, on the consumer, monopolies, and business transactions, make up the rest.

In the 1950s and 1960s both the complications of the tax system and the ease with which many direct taxes could be evaded reduced the government's possibilities of using fiscal policies as an instrument of economic management. Furthermore, Italy traditionally relied on monetary rather than fiscal policy to direct the economy. While tax evasion in effect constituted a huge subsidy to the self-employed and the rich, it also acted, more significantly, as a powerful stimulus for growth, since firms benefitted from the weakness of the tax system too. By 1970, however, it was generally agreed that a better tax base to implement social reforms—housing, hospitals, schools, and urban transport—was badly needed. The first answer to this problem was the tax-reform bill of 1971, which introduced a single progressive tax on personal income. A major reform of indirect taxation was introduced in 1973, when the value-added tax replaced the turnover tax and a number of other indirect taxes.

Principal trade unions

Trade unions and employer associations. The Italian union movement that emerged after World War II and 20 years of suppression under the Fascist regime had, not surprisingly, strong political orientations. In 1947 breakaways from the Communist- and Socialist-dominated General Confederation of Labour led to the formation of two rival union confederations—the Confederazione Italiana Sindacati Lavoratori (Italian Confederation of Workers' Trade Unions, or CISL), which was dominated by Catholics and adherents of the Christian Democrat Party, and the Unione Italiana del Lavoro (Italian Union of Labour, or UIL), controlled by a troika of Socialists, Social Democrats, and Republicans. The biggest of the three union movements remained the Communist-dominated General Confederation of Labour (CGIL), which until the late 1960s was considered a voice of Communist Party policy. Although relatively weak in numbers and lacking in funds to sustain the cost of prolonged strikes, the unions showed a new aggressiveness toward the end of the 1960s and won major wage increases. At the same time, as a result of the weakness of the government and the political parties, the unions took on a mantle of authority. A series of 24-hour general strikes took place, calling for reforms including pensions, more and cheaper housing, and a new approach to the problems of the depressed south. While the unions acquired new status and authority, production was badly affected at a time when industry was suffering from sharply rising costs. In the 1970s the unions extended their intervention beyond wages and political and social reforms to the organization of productive methods inside factories. The principal problem for the unions is to reforge the unity of the three main confederations.

General Confederation of Industry

The principal employers' association in Italy is the Confindustria (General Confederation of Industry). Under its wing are a vast number of smaller employers' associations organized either on territorial or on industrial lines. Confindustria has exercised considerable political and economic influence. When it lost a determined battle against the nationalization of electricity in 1962, however, its influence waned for several years. Its loss of influence was accentuated when its traditional political ally, the conservatively oriented Liberal Party, was replaced in the government by the Socialists in the same period. Confindustria, however, regained some of its old vigour, partly as a result of a thorough reorganization.

Current economic policies. After the reconstruction following World War II, a main objective of economic policy was to ensure rapid growth while maintaining a strong currency and external-payments position. To a large extent this goal was achieved with the aid of an adroit monetary policy, the development of a highly successful export trade, large-scale imports of raw materials, and the liberalization of trade. Less successful were the efforts to reduce unemployment and underemployment, to develop southern Italy and the islands, and to reduce the disparity in incomes between industry and agriculture. In the space of only 20 years, however, Italy achieved a wealth that few could have predicted in 1945. Subsequent economic policies were directed at maintaining an annual growth rate while transferring resources on a far larger scale from private to public consumption. Much of the success of economic policies depends on political stability and modernization of the machinery of state.

In 1970 there was the beginning of a break in the almost uninterrupted growth since 1950. A large increase in costs, reducing the competitiveness of Italian exports, plus stagnating investments, forced the government to intervene with inflationary measures. Growing inflation accompanied by high unemployment, however, subsequently prompted the government to pursue restrictive measures, including reductions in public spending.

(E.I.U.)

TRANSPORTATION

Movement patterns and means of transportation. As a source of revenue, transportation has accounted for 10 percent of Italy's gross national product since World War II, while net investments in it have averaged around 6 percent of the national total. The proportion of the national wealth actually tied up in transportation is tending to diminish because of rapid obsolescence of transportation equipment and structures and the slowness of appropriate renewal projects. The Italian roads are approaching saturation, while costs of maintenance and modernization are rising. Attempts to alleviate road traffic include modernizing the railways and building subway networks. A law effective since 1969 provided that metropolitan systems should be financially supported by each interested municipality.

The capital investment background

Traffic is most intense in northwest Italy, where Turin, Genoa, and Milan form the industrial triangle; but a dense road network there distributes traffic fairly evenly. The traffic magnet of northeast Italy is paradoxically the canal-riddled city of Venice, the country's third largest port. The most popular route is Venice–Padua–Verona–Milan, which, with Genoa, forms Milan's second traffic outlet. In summer the traffic density more than doubles, with tourists travelling to Venice and the coast.

In central Italy, traffic is massed on the north–south Bologna–Florence–Rome route, and, except on the Florence–Livorno tourist route, there is little east–west traffic. This concentration has isolated certain zones, such as southern Tuscany and northern Lazio (Latium). Umbria is more developed, with important steelworks at Terni and industrialization progressing rapidly along the Terni–Perugia route. Traffic in the Abruzzi is insignificant, but the new Rome–l'Aquila–Pescara highway should open the depressed region to development.

Rome is the traffic hub of central Italy, and, while traffic with Lazio is rather low, the level is high toward the south (Latina) and the southeast (Frosinone), where industry is developed. The density remains constant along the whole route from Rome to Naples, declining sharply farther south, where conditions are more backward. The small flow of traffic along the national coastal route reflects Mezzogiorno's economic depression. The Adriatic coastal route, the Naples–Bari route, and the Taranto–Cosenza route are little used; traffic increases along the Adriatic, between Puglia (Foggia, Bari, and Taranto) and the areas of the Po Valley, and becomes heavier, in fact, than between Naples and Rome.

Sicily and Sardinia have little traffic. On Sicily the Messina–Palermo, Agrigento–Palermo, and Messina–Catania–Syracuse routes are pre-eminent, with the heaviest traffic on the stretch between Catania and Syracuse. On Sardinia the only significant route is Cagliari–Oristano–Sassari.

Components of Italian transportation. *The road net-*

Categories of roads

work. The Italian road network is subdivided into four administrative categories—express highways (*autostrade*) and national, provincial, and municipal roads (*strade statali, strade provinciali, strade comunali,* respectively), to which urban streets can be added.

The mid-1900s witnessed extensive construction of express highways. The principal branches are the Po Valley, joining Turin, Milan, Austria, and Yugoslavia, with important branches to ports and mountain passes; the peninsular route, joining Milan to Naples via Bologna, Florence, and Rome (the Autostrada del Sole); the Tyrrhenian coastal route from the French border to Reggio Calabria in the far south, passing through Genoa, Rome, and Naples; the Adriatic coastal route from Bologna, joining the Tyrrhenian route in Calabria; and its Sicilian extension, the Messina–Palermo highway.

The two coastal routes are linked by two transverse highways, Rome–Pescara and Naples–Bari. Construction of the network was impeded by mountainous stretches, which were traversed by tunnels and viaducts, some of them splendid examples of modern architecture, such as the elevated roadway joining the Tyrrhenian coastal route to the Genoa road. Most highways have four lanes (the Milan–Turin has six) and are 50 feet wide, with shoulders of 10 feet and a central reservation. The construction and administration have been entrusted both to state-run and to private companies. The chief concession holder is the Autostrade agency of the national Istituto per la Ricostruzione Industriale (IRI). There are tolls, calculated on distance travelled and legal horsepower, to cover construction costs.

In the north, highway traffic is mainly commercial, the coastal routes concentrate on tourist areas, and in the south they open up economically backward areas. Serious saturation occurs on certain stretches due to increased traffic flow.

The completion of the southern network is envisaged to redress the balance between north and south. The 13-kilometre Mount Frejus highway tunnel was opened in 1980 and links Italy to France through the Alps.

The *strade statali* have been relieved of much of the long-distance traffic by the *autostrade.* These national roads now carry local traffic, which is dense in places. The principal national highways are the consular roads, so-called because they follow the roads built by ancient Rome's consuls. They radiate from Rome to various parts of Italy, the most famous being the Via Aurelia, linking Rome and Genoa, the Via Cassia, linking Rome and Genoa via Florence, and the Via Appia, linking Rome and Brindisi. Other important national highways are the Padana, joining Turin to Venice via Milan; the Emilia, joining Milan with Bologna and the Adriatic; and the Brenner Highway, from Pisa to the Brenner Pass.

Strade statali are maintained by a state agency, the Azienda Nazionale Autonoma della Strada (the ANAS, or National Road Board). A flow of more than a million new vehicles a year makes widening a continuing necessity.

Railways. Italian railway lines are administered by the Azienda Autonoma delle Ferrovie dello Stato (the FS, or Italian State Railway Board). The FS also administers maritime lines and bus services.

The three types of railway network

The railway network is of three types: national, regional, and urban (metropolitan). Over long distances the railways have advantages over road transportation, and the national lines are therefore the most heavily used. The network of principal national lines corresponds to that of the express highways: parallel to each express highway is a railway line, electrified and with a double track.

The most important line is the peninsula route Milan–Bologna–Florence–Rome–Naples, of which the most heavily used stretches are Milan–Bologna and Rome–Naples; the first section of the high-speed direct Florence–Rome railway was opened in 1977. The Turin–Milan–Venice and Milan–Genoa lines link the industrial belt of the country with Genoa and Venice for freight transportation. Other principal lines are the Genoa–Rome–Reggio Calabria–Palermo and Bologna–Ancona–Bari coastal routes. The principal mountain routes linking the Italian railways with the rest of Europe are Turin–Frejus (to France), Milan–Simplon Tunnel (to Switzerland), Verona–Brenner (to Austria and Germany), and Venice–Tarvisio (to eastern Europe). Railway traffic, which had levelled off with the completion of the numerous express highways, began increasing again in the late 1960s with attractive new rolling stock and improved tracks.

Whereas the long-distance railway network is satisfactory, the regional lines are not. Competition from road transportation, the antiquated lines (mostly single-track and not electrified), and the state of the track have brought these lines into disuse, and many have been abandoned for more economical buses. The increasing saturation of the highways and the commuters' need for rapid and economical service have, however, made reopening the abandoned lines seem attractive. There have been efforts to reorganize them on a metropolitan basis and to introduce second tracks and electrification for key sections in order to reduce travelling time.

Efforts have also been made to coordinate the regional trains with urban traffic networks. The former usually run with the great national lines in the vicinity of the cities. Because the national trains have the right of way there are slowdowns and reductions in frequency. These might be prevented by integrating regional with metropolitan lines.

Railways, with stiff competition from automobiles and a tariff policy that tends to emphasize the social uses of trains (*i.e.,* that provide for low fares), are increasing their unprofitability. The FS has been striving for competitiveness by renovating and modernizing.

Water transportation. The principal dry-cargo Italian ports are Venice, Cagliari, Civitavecchia, and Piombino, while those handling chiefly petroleum products are Genoa, Augusta, Trieste, Bari, and Savona. Those handling both sorts are Naples and Livorno.

Most port traffic consists of imports, land transportation being preferred for exports.

Many ports are inadequate. The more congested larger ports, such as Genoa, Savona, Venice, and Livorno, have imposed primage (a small addition or percentage added to the freight rates) at the time of entry and sometimes at departure, which increases production costs.

In the north of Italy there are only a few large ports, such as Savona, Genoa, and Venice. Nearby, there are industrial ports, such as La Spezia and Ravenna, ports of local importance, such as Oneglia and Monfalcone, fishing ports, such as Chioggia, and tourist ports, such as the numerous ones of the Ligurian Riviera. Half of the commercial port traffic is concentrated on only one-tenth of the coastline. The industries of Lombardy and Piedmont make heavy demands on the maritime outlets, particularly at Genoa, which, although the most extensive and important Italian port, has great difficulty in expanding because of the mountains surrounding it.

In central and southern Italy there are several harbours, but most are modest and function locally. There are a few large ports in these regions, some born of recent industrial development, such as Augusta (about 15 miles north of Syracuse in Sicily), a petroleum port that serves an immense refinery. Prospects for the central southern ports depend on industrialization in the hinterland.

The coastal navigation on the Genoa–Gela–Taranto–Venice route is very important, as are the lesser ports of La Spezia, Civitavecchia, Naples, Ravenna, Trieste, and Cagliari.

Air transportation. Alitalia, the air-transport company, is part of the Istituto per la Ricostruzione Industriale group, in which the government participates. Rome, Milan, Naples, Genoa, Venice, Palermo, Catania, and Turin all have major airports, foremost being the airports of Rome (Fiumicino, Ciampino, and Urbe) and the Milanese airports (Linate and Malpensa). Italian airport traffic has a high rate of increase, calling for improvement of airports, services, and instruments for controlling air traffic. Aircraft enterprises, though few, have reached high technical levels, participating in international construction projects and producing aircraft on foreign license. Electronic and air-space plants have been planned for the south as part of its development.

(M. Del V.)

Administrative and social conditions

GOVERNMENT

Constitutional framework. The Italian state grew out of the Kingdom of Piedmont and Sardinia, where, in 1848, King Charles Albert introduced a constitution that remained the basic formal law of his kingdom and, later, of Italy for nearly 100 years. It provided for a bicameral Parliament with a Cabinet appointed by the king. With time, the power of the crown gradually diminished, and ministers became responsible to Parliament rather than to the king. Although the constitution remained formally in force after the Fascists seized power in 1922, it was devoid of all substantial value. On June 2, 1946, after the end of World War II, the Italians voted in a referendum to replace the monarchy with a republic. A Constituent Assembly worked out a new constitution, which came into force on January 1, 1948.

The constitution has built-in guarantees against easy amendment, in order to make it virtually impossible to substitute for it a dictatorial regime. It is upheld and watched over by the Constitutional Court. The republican form of government cannot be changed. The constitution contains some perceptive principles, applicable from the moment it comes into force, and some programmatic principles, which can be realized only by further precise legislation.

The constitution is preceded by the statement of certain basic principles, including the definition of Italy as a democratic republic based on work, in which sovereignty belongs to the people. Other principles concern the inviolable rights of man, the equality of all citizens before the law, and the obligation of the state to abolish social and economic obstacles that limit the freedom and equality of citizens and hinder the full development of individuals. The constitution guarantees many forms of personal freedom: the privacy of correspondence; the right to travel at home and abroad; the right of association for all purposes that are legal, except in secret or paramilitary societies; and the right to hold public meetings, if these are consistent with security and public safety. There is no press censorship, and freedom of speech and writing is limited only by standards of public morality. The constitution stresses the equality of the spouses in marriage and of their children, although the old Civil Law Code regards the husband as head of the household. Family law has seen many reforms, including the introduction of divorce.

Personal freedom

One special article in the constitution concerns the protection of linguistic minorities. Religious liberty is conditioned by the Lateran Treaty made with the Vatican in 1929, which asserts that both state and Roman Catholic Church are independent and sovereign in their own spheres. The constitution establishes the liberty of all religions before the law but adds that churches other than the Roman Catholic Church are free to act according to their charters only so long as they do not conflict with the general law. The Catholic Church has retained considerable privileges, particularly in tax exemptions and in jurisdiction over church marriages in cases of nullity. The position of the Catholic Church is the cause of considerable friction in Italian political life. Despite the liberal tendencies of the Second Vatican Council, the church defends its privileges tenaciously and continues to fight any lay attempts to reform, for example, certain aspects of family law and divorce law.

The constitution is upheld by the Constitutional Court, which comprises 15 judges, of whom five are nominated by the president of the republic, five by Parliament, and five by various legal bodies. Members must have certain legal qualifications and experience. The term of office is nine years, but Constitutional Court judges are not eligible for re-appointment. The court performs four major functions. First it judges the constitutionality of state and regional laws and of acts having the force of law. Secondly, the court resolves conflicts of competence of jurisdiction between ministries of administrative offices of the central government or between the state and a particular region or between two regions. Thirdly, it judges indictments instituted by Parliament. When acting as a court of indictment, the 15 Constitutional Court judges are joined by 15 additional lay judges chosen by Parliament. Fourthly, the court determines whether or not it is permissible to hold referendums on particular topics. The constitution specifically excludes from the field of referendums financial decisions, the granting of amnesties and pardons, and the ratification of treaties.

The legislature. Parliament is bicameral and comprises the Chamber of Deputies and the Senate, both elected by popular vote and with equal powers. In theory, the Senate should represent the regions and in this way differ from the lower chamber, but in practice the only real difference between them lies in the minimum age required for the electorate and the candidates: 18 and 25, respectively, for deputies and 25 and 40 for senators. Deputies and senators alike are elected for a term of five years, which can be extended only in case of war. Parliamentarians cannot be penalized for opinions expressed or votes cast, and constituents cannot oblige their deputy to vote according to their wishes. Deputies and senators enjoy immunity from arrest, criminal trial, and search. Their salary is established by law, and they qualify for a pension.

Both houses are officially organized into parliamentary parties. Each house is also organized into standing committees, which reflect the proportions of the parliamentary groups. Besides studying bills, these committees act as legislative bodies. The new parliamentary rules have followed the United States' pattern and have given the standing committees extensive powers of control over the government and administration. Parliament also sets up special joint investigatory committees.

Special majorities are required for constitutional legislation and for the election of the president of the republic, Constitutional Court judges, and members of the Superior Council of the Judiciary. An unusual feature of Italian parliamentary procedure is use of a secret ballot. Votes of confidence are necessarily made openly, while voting in presidential elections is by secret ballot; in normal divisions, voting can be either open or secret, though the secret ballot is generally preferred. While granting parliamentarians greater independence, it enables them to vote contrary to party instructions. Moreover, it effectively prevents any control of the representatives by the electorate.

Secret voting in Parliament

The two houses meet jointly to elect and swear in the president of the republic and to elect one-third of the members of the Superior Council of the Judiciary and one-third of the judges of the Constitutional Court. They may also do so to indict the president of the republic, the president of the Council of Ministers, or any individual ministers.

Each year, the budget and the account of expenditure for the past financial year are presented to Parliament for approval. The budget, however, does not cover all public expenditure, nor does it include details of the budgets of many public bodies, over which, therefore, Parliament has no adequate control. International treaties are ratified by means of special laws.

The most important function of Parliament is ordinary legislation. Bills may be presented in Parliament by the government, by individual members, or by other bodies, such as the National Council of Economics and Labour, various regional councils, or communes. Bills are passed either by the standing committees or by Parliament as a whole. In either case, the basic procedure is the same. First, there is a general debate followed by a vote; secondly, each separate article of the bill is discussed and voted on; finally, a last vote is taken on the entire bill. All bills must be approved by both houses before they become law, so, whenever one house introduces an amendment to the draft approved by the other house, the latter must approve the amended draft. The law is then promulgated by the president of the republic unless he considers it unconstitutional or inappropriate; in that case, he remands the bill to Parliament for reconsideration. If the bill is, nevertheless, passed a second time, the president is obliged to promulgate it. The law comes into force when published in the *Gazzeta Ufficiale.*

The presidential office. The president of the republic is irremovable, and his seven years of office cannot be shortened. He is elected by a college comprising both chambers of Parliament, together with three representatives from every region. The two-thirds majority required guarantees that the president is acceptable to a sufficient proportion of the populace and of those in public life. The minimum age for presidential candidates is 50. If the president is temporarily unable to carry out his functions, the president of the Senate acts as his deputy. If the impediment is permanent or if it is a case of death or resignation, a presidential election must be held within 15 days.

Special powers and responsibilities are vested in the president of the republic. In certain cases, his powers exceed those of the government, which must, however, always countersign his acts. He can be indicted for high treason or failure to uphold the constitution. He has the power to call special sessions of Parliament, to promulgate laws and delay legislation, to authorize the presentation of government bills in Parliament, to promulgate executive orders, and, with Parliamentary authorization, to ratify treaties and declare war. He commands the armed forces and presides over the Supreme Council of Defense and the Superior Council of the Judiciary. He has the power to dissolve Parliament either on his own initiative or at the request of the president of the Council of Ministers. He may appoint five life members of the Senate and appoints five of the 15 Constitutional Court judges. He also appoints the president of the Council of Ministers, the equivalent of a prime minister. It is his duty, whenever a government is defeated, after consulting eminent politicians and party leaders, to appoint the person most likely to win the confidence of Parliament; the large number of political parties gives him a very real choice. The president of the republic grants amnesties and pardons on the advice of Parliament.

The government. The government comprises the president of the Council of Ministers and the various other ministers responsible for particular departments, whom he has nominated. They are appointed to office by the president of the republic. Each new government must receive a vote of confidence in both houses of Parliament within 10 days of its appointment. If at any time the government fails to maintain the confidence of either house, it must resign. Splits in the coalition of two or more parties that had united to form a government have sometimes caused resignations of governments. The president of the Council of Ministers is not merely the first among ministers of equal merit but is solely responsible for directing government policy and coordinating administrative policy and activity. Ministers are responsible jointly for the acts of the council, such as the emanation of decree laws and, severally, for the acts of their ministries. The government is the summit of executive power. In times of emergency, it can issue decree laws signed by the president of the republic, provided such laws are presented to Parliament for authorization the day they are issued and receive its approval within 60 days. Without such approval they automatically lapse. The government and, in certain cases, individual ministers issue administrative regulations and provisions, which are promulgated by presidential decree.

President of the Council of Ministers

Regional and local government. The republic is divided into regions, provinces, and communes. There are 15 ordinary regions and an additional five (Sicilia [Sicily], Sardegna [Sardinia], Trentino-Alto Adige, Friuli-Venezia Giulia, and Valle d'Aosta) to which special autonomy has been granted. The regions with ordinary powers are Piemonte (Piedmont), Lombardia (Lombardy), Veneto, Liguria, Emilia-Romagna, Toscana (Tuscany), Umbria, the Marche, Lazio (Latium), Abruzzi, Molise, Campagnia, Puglia (Apulia), Basilicata, and Calabria. Italy can thus be considered a regional state. The modern regions correspond to the traditional territorial divisions. The powers of the five special regions derive from special statutes adopted through constitutional laws. The organs of regional government are the Regional Council, a popularly elected deliberative body with power to pass laws and issue administrative regulations, the Giunta Regionale, an executive body elected by the council from among its own members, and the president of the Giunta Regionale. The Giunta Regionale and its president are required to resign if they fail to retain the confidence of the council. Voting in the regional councils is rarely by secret ballot.

Participation in national government is a principal function of the regions: regional councils may inaugurate parliamentary legislation, propose referendums, and appoint three delegates to assist in presidential elections. In regional legislation the five special regions have exclusive competence in certain fields, while the ordinary regions have competence within the limits of fundamental principals established by state laws and including areas such as agriculture, forestry, and town planning. The legislative powers of both special and ordinary regions are subject to certain constitutional limitations, the most important of which is that regional acts may not conflict with national interests. The regions can also enact legislation necessary for the enforcement of state laws when the latter contain the necessary provisions. The regions have administrative competence in all fields where they have legislative competence. Additional administrative functions can be delegated by state laws. The provision that normally regional administration is to be carried out at provincial and commune level aims at avoiding excessive bureaucracy. The regions are financially autonomous; they have the right to acquire property and the right to collect certain revenues and taxes.

The state has powers of control over the regions. The validity of regional laws that are claimed to be illegal can be tested in the Constitutional Court, while those considered inexpedient can be challenged in Parliament. State supervisory committees presided over by government-appointed commissioners exercise control over administrative acts. The government has power to dissolve regional councils that have acted contrary to the constitution or have violated the law. In such an event, fresh elections must be held within three months.

Communes

The organs of the commune, the smallest local government unit, are the popularly elected common council, the Giunta Comunale, or executive body, and the mayor. Both the Giunta Comunale and the mayor are elected by the council from among its own members. The communes have the power to establish and collect local taxes; they have their own police; they issue ordinances and run certain public health services; and they are responsible for such services as public transport, garbage collection, and street lighting. Control over the activity of the communes, until recently vested in the state and exercised by the prefects, has been transferred to the regions. Common councils may be dissolved for reasons of public order or for continued neglect of their duties.

The organization of the provinces, units midway in size between regions and communes, is analogous to that of the communes; they have councils, giunte, and presidents.

There are certain central-government officials whose duties lie in the sphere of local government. These include the government commissioner of the regions, who supervises the administrative functions performed by the state and coordinates them with those performed by the region; the prefect, resident in each province, who is responsible for enforcing the orders of central government and has powers of control over the state organs of the province and communes; and the *questore,* who is the provincial chief of the state-run police. Certain local-government officials also have central-government duties: among them are the president of the Giunta Regionale who, in directing the administrative functions that the state delegates to the region, performs a specific state duty; and the mayor of a commune who, in his capacity as an agent of the central government, registers births, deaths, marriages, and migrations, maintains public order (though, in practice, this is dealt with by the police), and can, in cases of emergency, issue ordinances concerning public health, town planning, and the local police.

The political process. *Elections.* In Italy there are parliamentary, regional, and local elections. Systems of proportional representation are used in the elections of the Chamber of Deputies and the Senate. Regional elections are governed by state laws and are also based on proportional representation. A system of limited vote is used in municipal elections by communes with less than 5,000 inhabitants, while the more highly populated communes use a list system of proportional representation. The system used in provincial elections is analogous to that used in senatorial elections.

Political parties. The constitution guarantees all citizens the right to associate freely in political parties in order to contribute through democratic procedure to the determination of national policy. The essential characteristic of a democracy is the existence of rival political parties. A plurality of parties is encouraged by systems of proportional representations and in Italy has led to the formation of several principal parties, as well as other smaller parties. Participation in the primary elections (to make up the lists of candidates) is strictly limited to party members and hence is free from outside control. Parties are not required to publish accounts or disclose the source of their income, which frequently comes from public bodies, pressure groups, and individuals.

The chief Italian political parties are the Democrazia Cristiana (DC; Christian Democratic Party); the Partito Comunista Italiano (PCI; Italian Communist Party); the Partito Socialista Italiano (PSI; Italian Socialist Party); the Partito Socialista Democratico Italiano (Italian Social Democrats); the Partito Liberale Italiano (PLI; Italian Liberal Party); the Movimento Sociale Italiano (MSI; Italian Social Movement [neo-Fascists]); the Partito Repubblicano Italiano (PRI; Italian Republican Party); the Partido Radicale (PR; Radical Party); and the Südtiroler Volkspartei, or the Partito Populare Sud Tirolese (SVP; South Tirolean People's Party).

The Christian Democratic Party, in practice supported by the church hierarchy, aims to unite all Italian Catholics in a single political grouping. For this reason it contains both highly conservative and strongly progressive elements. The consequent difficulty in forming coherent policies reduces its electoral impact. The Italian Communist Party is the largest European Communist party outside the Soviet bloc. As an opposition party it wins most of the floating protest votes of the electorate, besides those of its own members. The Socialist Party, a section of the Socialist International, was formed in 1967 by the amalgamation of the Italian Socialist Party, led by Pietro Nenni, with the Italian Social Democrats, led, until his election as president of the republic in 1964, by Giuseppe Saragat. The merger of these two parties was dissolved in 1969. The Socialist Party of Proletarian Unity, a left-wing group that had seceded from the Socialists in 1963, merged with the Communists in 1972.

The Liberal Party and Republican Party are the successors of two political movements that originally contributed to the unification of Italy. The Liberals stress the importance of personal initiative and freedom. The Republicans have attempted to show themselves as representative of the democratic left. A more particularist party was the Italian Democratic Party of Monarchist Unity, the vehicle of those seeking a return of the monarchy. It had some contact with the Italian Social Movement, a neo-Fascist party, appealing not only to the few who want a return of Fascism but to others who consider the government coalitions too left-wing. These two parties merged in 1972. The Radical Party campaigns on civil rights issues. Finally, the South Tirolean People's Party exists to unite the German-speaking population of that area and to gain greater political and administrative autonomy for the province of Bolzano within the region of Trentino-Alto Adige.

Trade unions. The constitution establishes the right to organize trade unions. The right to strike is guaranteed by the constitution and remains a very potent weapon in the hands of the trade unions. Unofficial and wildcat strikes also occur. Civil servants are covered by the general right to strike but the Constitutional Court has established that strikes by those engaged in fundamental public services are unlawful.

The participation of the citizen. The constitution seeks to establish the effective participation of all citizens in the political, economic, and social organization of the country. This, however, is a stated ideal rather than a binding obligation, and it has not and perhaps cannot be fully realized. In practice, except for the few who can become political commentators of some sort and so influence public opinion, the opportunities for participation are restricted to those connected with elections. All citizens of 21 years and over may vote in national, regional, and local elections. Partly because voting is considered a civic duty and partly because of spontaneous involvement, the turnout for elections in Italy is very high, reaching more than 90 percent of the electorate for parliamentary elections. Citizens may also subscribe to national referendums or petitions, the purpose of which is the abrogation of a law or an executive order; such a petition must be signed by 500,000 members of the electorate or sponsored by five regional councils. In certain circumstances national constitutional amendments are subject to a more ordinary form of referendum, in which the electorate vote in favour or against specific proposals. Abrogative referendums are provided for in relation to all regional legislation, and there is provision in some regions for holding ordinary referendums. The constitution also provides that 50,000 members of the electorate may jointly present to Parliament a draft bill.

Voting

On a more executive level, the right of workers to take part in the management of companies is guaranteed by the constitution but lacks enabling legislation. Participation in politics and public affairs through the medium of the press and radio and television is restricted to a relatively small number of individuals and to certain, mainly political, groups. The press is free but, because of high production costs, it is run either by public or private industrial groups or by political parties. The Radiotelevisione Italiana (RAI) is a state-run monopoly sanctioned by the Constitutional Court. It should provide equal facilities to all groups and individuals, but it is widely claimed that this impartiality has not been realized.

JUSTICE

The Italian judicial system consists of a series of courts and a body of career judges who are civil servants. Frequently, cases are heard by a collegial bench consisting of two or more judges, and the legal profession provides for interchangeability between the position of judge and of prosecuting attorney. The courts form either part of the regular court hierarchy or are special courts with a specific and limited competence. The judicial system is unified, and every court is part of the national network. The highest court in the regular hierarchy is the Court of Cassation; it has appellate jurisdiction and gives judgments only on points of law. The 1948 constitution prohibits special courts with the exception of administrative courts and courts martial, although a vast network of tax courts has survived from an earlier period. The administrative courts have two functions: the protection of *interessi legittimi,* individual interests strictly connected with public interests and protected only for that reason, and the supervision and control of public funds. Administrative courts are also provided by the judicial sections of the Council of State, the oldest juridical-administrative advisory organ of government. The Court of Accounts has both an administrative and a judicial function; the latter involves primarily fiscal affairs. The courts martial have criminal jurisdiction in cases involving military personnel on active service and even over reserve personnel on unlimited leave, with respect to certain military crimes. The Superior Council of the Judiciary, provided for by the constitution and intended to guarantee the independence of the judiciary, was only formed in 1958.

Italian law is codified and is fundamentally based on Roman law, in particular, as regards civil law. The codes of the Kingdom of Sardinia in civil and penal affairs, derived from the French Napoleonic model, were extended to the whole of Italy when unification was achieved in the mid-19th century. In the period between World Wars I and II, these codes were revised. The Constitutional Court has declared a number of articles unconstitutional. Besides the codes, there are innumerable statute laws that integrate the codes and regulate areas of law, such as public law, for which no codes exist.

The constitution stresses the principle that the judiciary should be independent of the legislature and the executive.

For this reason jurisdictional functions can be performed only by ordinary magistrates, and extraordinary tribunals may not be set up. Judges cannot be dismissed.

ARMED FORCES

The armed forces are commanded by the president of the republic, who also presides over the Supreme Council of Defense, comprising the president of the Council of Ministers, the ministers of Defense, Foreign Affairs, Industry, and the Treasury, and the chief of staff. Military service is obligatory. Italy's military expenditure is one of the highest in the world. Although the constitution specifies that the armed forces must embody the democratic spirit of the republic, their activity is free from any political control. Italy's adhesion in 1949 to the North Atlantic Treaty Organization transferred to the allied command a certain degree of control over the Italian forces.

Conscription

There are two police forces in Italy with general duties: the Pubblica Sicurezza, which is under the authority of the home secretary, and the Carabinieri, a corps of the armed forces that is, therefore, under the minister of Defense. The functions of the police are the prevention and suppression of crime; both functions are performed by both police forces. The administrative police to whom preventative duties are assigned see that the activities of individuals and of groups do not contravene the law. Their authority stems from a Fascist law of 1931 only partially modified by Constitutional Court decisions but reduced by a law of 1956 that requires that restraint be imposed on potential offenders by court order only. The administrative police are also responsible for the issue of passports and other permits. The constitution places the judicial police, who are engaged in suppressing crime, under the authority of the courts, but the actual subordination of the two forces to the two government ministries conflicts with their technical subordination to the judiciary. Besides these two police forces, there are also special police for customs, excise and revenue, and communal police and prison guards. There are also private police that operate in a limited field under the supervision of the regular police.

EDUCATION

The constitution guarantees the freedom of art, science, and teaching, the existence of private schools (mainly run by religious bodies) alongside the state schools, and the independence of the universities. It further states that the public schools are open to all and makes provision for scholarships and grants. Education is compulsory only from the ages of six to 14 years. The school system begins with kindergarten for the three- to six-year-olds. Elementary schools are attended between the ages of six and 11, at which stage most children go on to secondary schools for 11- to 14-year-olds, but those wishing to study music go directly to the conservatories. Postsecondary schooling is not compulsory and includes a wide range of technical and trade schools, art schools, teacher-training schools, and scientific and classical grammar schools. Pupils from these schools can then go on to university, where courses vary from four to six years.

Maintenance grants are few and inadequate, and the high cost of supporting children while they study, particularly at trade or grammar schools and at university level, when they could otherwise be earning, effectively limits higher education to a privileged elite.

HEALTH AND WELFARE

Health. The constitution guarantees the protection of health as an individual right and a community interest; the support of those who are unable to work and are indigent; and the right of workers to social-insurance benefits in the case of accident, illness, disablement, old age, or unemployment. A comprehensive national health service and national medical insurance were introduced in 1980. Special doctors in the provinces and communes are responsible for the public health of their respective areas. The Instituto Nationale della Previdenza (INPS) provides a system of social benefits, including unemployment, disability, retirement pensions, and family allowances. Industrial injuries protection is also state-provided.

Housing. A law was passed in 1971 to facilitate and speed up communal expropriation of sites suitable for subsidized housing and introduce advantageous terms for the leasehold purchase of the property. Until the early 1970s there was little low-cost housing, and purchase of property had been far beyond the means of the average family. Through the 1960s, many thousands were homeless and living in caves, cellars, shacks, and warehouses.

Zoning regulations for building are established by the communes under state supervision. Historic monuments and natural-beauty spots are protected by law and come under the control of the Ministry of Education; but, despite this supervision, public as well as private development has depredated cities, countryside, and coastline.

Social and economic divisions. The constitution asserts the right of every worker to an adequate wage and the right of equal pay and maternity benefits for women. However, Italy is a country of great social and economic differences. A very small elite enjoys great wealth, while the largest stratum of society lives in varying degrees of poverty. Inherited fortunes have survived, and industrial wealth is aggregated in economic empires as well as being concentrated geographically in the Milan–Turin–Genoa triangle. The economic underdevelopment of the south has been a chronic problem. The average annual family budgets give a very rough idea of the differences in spending capacity of the various categories of workers. The vast differences in the educational level of the population also testify to the cultural extremes prevalent in Italy and invite conjecture as to the underlying economic circumstances that may have caused them.

Social inequalities

Cultural life

CULTURAL MILIEU

The country now called Italy has resulted from the amalgamation of many small territories. Political unification took place in 1861, but unification is still incomplete as a cultural and social process. In the matter of language, however, Italian is the standard commonly used for official, formal, and literary purposes and taught in the schools to natives and foreigners. The varied dialects, including Tuscan—the language of Florence and its territory and used by Dante, Petrarch, and Boccaccio in their writings—are now usually spoken and only to a limited extent written. Regional differences in self-expression still persist, and Tuscan remains to some extent a linguistic invention in regions that are not Tuscany. The other dialects (as they are disparagingly called), including Gallo-Italian, Venetian, Corsican, Central Italian, and Southern Italian, embody ways of thought and speech that are not simply different modes of expression but represent many different ideological, psychological, and cultural worlds. All speech forms called Italian belong to the Romance languages.

Another sign of imperfect national unity is the regions' jealousy of one another. The division between the north and the south (the Mezzogiorno) is the sharpest of all. The prosperous, progressive, industrial society of the north looks down on the backward, impoverished, primitively agricultural Mezzogiorno regions south of Naples in Puglia, Basilicata, Lucania, and Calabria. To many northerners the increasing efforts of government to assist the economy of the south are so much money poured down the drain in a hopeless cause. For his part, the southern day labourer remains suspicious of the central government despite the aid it offers the south through the introduction of civil-works projects and of industry bringing alternative employment. The administration has been indifferent to his desperate needs too long and has tacitly left him to his master, the absentee proprietor of the vast farm, or *latifundium,* on which he and his companions labour. In western Sicily this resentment of central authority is carried so far as to secure general acquiescence in the activities of the Mafia, underlining the fact that the Mafia indeed was once a secret society pledged to wage a perpetual struggle against the oppression of foreign rulers.

North versus south

The problem of regionalism, seen most clearly in the language question and the division between the north and the south, is basic to the Italian scene. But with the country's industrial development and its liberation after World War II from the political stultification of Fascism, a ferment of change and uncertainty has transformed society, especially in the large urban centres. The capture of foreign markets by the Italian automobile and gasoline industries and by agricultural cooperatives has strengthened Italy's economic links with other countries. Great impetus has been given to this process by the country's membership in the Common Market.

At the social level the transformation has been encouraged by the growth of the communications media, especially television. The result is that the old provincialism, wherein each city seemed to have its own life-style, is disappearing. The position of the sexes, too, is changing with regard to each other. The position of woman, politically enfranchised in the 20th century, marks an advance toward freedom. Continuing as a wage or salary earner even after marriage, she is no longer destined from an early age to household matriarchy, exerting her influence on the family from within it in counterpoise to her husband's more explicit rights. Men and women are less oppositely polarized in their confrontation with each other: to a novel extent they have become rivals in the same sphere of action.

The authority of the Roman Catholic Church may have been discreetly ignored in the past, but it was seldom openly challenged, other than by a minority of professed anticlericals. Now a more general disregard of the church and its system is evident in the extent to which life has become secularized and in the decline in church attendance. The struggle with the church over divorce—previously unobtainable in Italy under the terms of the state's Lateran Treaty (1929)—was a momentous one, rousing the devout and the diehard to an impassioned stand against it, before the divorce law was introduced in 1970. In the following year, the government introduced measures offering new possibilities in the way of birth control.

The *dolce vita*

In Rome especially, a feature of the generally prosperous, if erratic, postwar era has been the *dolce vita* ("sweet life") attitude of internationalized café society. The *dolce vita* was a reaction of release from the conventional family code of Italian life. Its philosophy was one of experiment in an Existentialist moral incertitude, rather than simple hedonism. The drifting, day-to-day existence of the practitioners of this way of life—the *pappagalli* ("parrots"), press and street photographers and jacks-of-all-trades pestering film stars and pretty girls on Rome's Via Veneto for preference—was symbolic of the *dolce vita* and its ephemeral futility. The *vitelloni* ("big calves"), young loungers of no occupation, have been another symptom of this unsettled period.

Italian culture has felt the impact of avant-garde modes of feeling and expression but in a rarefied way among few people. Traditional culture, of "aristocratic" and "educated" derivation, is disdained, ridiculed, and opposed by forward-looking intellectual elements who are aware of transatlantic developments in the arts and who claim to represent the advanced contemporary art situation in Italy. Yet the populace prefers the traditional culture and ignores the products of the cultural elite. The resulting split between the collective psychology and intellectual culture continues. The people remain unmoved before the constructions of the laboratories of the intellectual "upper classes," which are an exorcism of past culture and a rupture of continuity with its traditions. At the opposite pole, the "upper classes," having lost confidence in themselves in isolation, have abandoned their dream of universal interpretation and instead attempt to contribute to culture by elaborating intrinsically empty constructions inspired by a preoccupation with technique; the technique itself is regarded as a method of seeking truth and interpreting reality but is no more than a stratagem for filling an unexpected vacuum in ideology.

CONTRIBUTIONS OF THE ARTS

Italy was in the forefront of the development of the arts in the Renaissance, that crucial and brilliant period of transition when European culture emerged from the Middle Ages and entered into the modern age. This rebirth received impetus from a reappraisal of the classical Greek and Roman world after centuries of supposed ecclesiastical obscurantism. Artists and scholars in Italy were especially well placed to take the lead in such a revival since they lived in what was the very heartland of the ancient Roman Empire, and the material remains of its civilization, whether as stone structures or as texts, lay beside them.

Literature. Through Dante, Petrarch, and Boccaccio, Italian literature blossomed to supreme greatness early; after Ariosto and Tasso in the later Renaissance it declined somewhat into formalism but renewed some of its fire through the Romantics, Vittorio Alfieri, Ugo Foscolo, Alessandro Manzoni, and Giacomo Leopardi; and then, in the 20th century, Gabriele D'Annunzio represented the last flowering of Romanticism. Since then, the writers who have made the most significant contribution to their country's literature have turned their backs on the rhetorical Romantic tradition. The plays of Luigi Pirandello (who died in 1936), inventive, psychologically disturbing, and impassive in their mood, and his terse, hard-edged short stories heralded a new attitude and a new technique; his masterpiece, the play *Henry IV,* with its thrillingly presented intersecting planes of normality and madness, comparable to the analysis made of pictorial reality by Picasso's Cubism, is as fresh as anything written since by the French Existentialists Camus and Sartre. This new mood, this dry tone, is realized also in the work of the novelists of Realism, or Verismo, who have been the dominant figures in modern Italian literature: Verismo was initiated by Giovanni Verga; after him Italo Svevo (Ettore Schmitz), disregarded by all except James Joyce and Eugenio Montale until the end of his life because the Italian literati were averse to his unadorned style, is now seen as one of the ironists of modern European literature.

The Realist novelists

Since Svevo's death in 1928, the novelists Ignazio Silone, Cesare Pavese, and Alberto Moravia and the poets Montale and Giuseppe Ungaretti have been outstanding figures. It is in the work of the Realist and Neo-Realist novelists that the attempt of Italian writing to come to terms with the modern world and its political and social pressures can be best appreciated. The works of Pavese and Moravia, the first with his acknowledged debt to the economical, crisp style of Ernest Hemingway and the other with his remorseless analysis from the standpoint of a European Existentialist intellectual, are far removed from the rhetoric and Latinist abstraction of the traditional plane of ideas of Italian letters.

The visual arts. The great names in Italian art and architecture through the centuries make a long catalog: those of Giotto, Donatello, Brunelleschi, Michelangelo, Leonardo da Vinci, Titian, Bernini, and Tiepolo call up a host of others. But continuous subjection to foreign powers had an enfeebling effect on Italy's artistic contribution, which sank into provincialism. Ties with European art were renewed about 1910 by the work of the painter Amedeo Modigliani and by the Futurist movement, which found its most characteristic expression of mechanistic dynamism in the work of its leader, the poet Filippo Marinetti (died 1944), and the painters Umberto Boccioni and Giacomo Balla. Futurism was succeeded by the "metaphysical painting" of Giorgio De Chirico, at one time associated with the Surrealists for his timeless dream landscapes until he turned his back on this early work to produce, from the 1950s on, canvases loaded with reminiscence of traditional styles. Giorgio Morandi's subtle, quietist paintings of endlessly varied arrangements of bottles, pans, and jars are a product of metaphysical painting and, since his death in 1964, have become perhaps more highly regarded than the work of any other contemporary Italian painter. Lucio Fontana's work exemplifies the modern artist's solitary quest for form: blank canvas opened by a knife slash; an arrangement of pebble grains stuck onto the unicoloured canvas; and a room swathed in nylon textile (at the Palazzo Grassi in Venice in 1960).

The Rational Architecture movement of 1927 has produced one of the outstanding Italian architect-engineers of the 20th century in Pier Luigi Nervi, architect of the Turin exhibition complex and, with Marcel Breuer and Bernard Zehrfuss, of the UNESCO headquarters in Paris. Innovative

Italian architect-engineers

educational architecture is represented in Milan's Istituto Marchiondi by Vittoriano Viganò. The work of Nervi and of such other architect-engineers as Giovanni Ponti (who worked with Nervi on the Pirelli skyscraper in Milan) and the builders of hydroelectric dams in Africa and elsewhere represents their country's most serious contribution to modern art in hauntingly beautiful constructional work of which Brunelleschi himself might have been proud. Other movements have come and gone, that of the Six in Turin, the Roman school, and the school of Milanese Expressionism, to which the sculptor Giacomo Manzù once belonged.

Music. Italian music has been one of the supreme expressions of that art in Europe: Gregorian chant, troubadour song, the madrigal, the work of Palestrina and Monteverdi and of composers such as Vivaldi, Alessandro and Domenico Scarlatti, and Cimarosa, followed by the 19th-century flowering of Italian opera in the hands of Rossini, Donizetti, Bellini, and, greatest of all, Giuseppe Verdi. Arrigo Boito and Giacomo Puccini garnered the Verdian heritage, and then Verismo, or Realism, made itself felt in operatic tradition as in literature in the work of Pietro Mascagni and others. Since World War II, in the post-Schoenberg world of serial music, two Italians have made significant contributions: Luigi Dallapiccola and Luigi Nono.

Theatre. Theatrical production in Italy in the latter half of the 20th century has employed all forms of the art of theatre, from grand opera to the puppet show. Opera productions, notably at La Scala opera house in Milan, as well as at other opera houses such as the San Carlo in Naples and at the Teatro la Fenice in Venice, are world famous; and an annual summer production of an opera in the Roman amphitheatre in Verona also attracts foreign visitors. Modern operas by Italian composers that have been staged include *Il convento veneziano* by Alfredo Casella and *Sette canzoni* by Gian Francesco Malipiero.

In the drama the Italian theatre has been active in producing outstanding contemporary European work and in staging important revivals. Not a great deal of major new work has been offered to it by native playwrights: nothing to rival the work of Luigi Pirandello earlier in the century. Outstanding productions have included those of the company of the Teatro Stabile della Città di Genova and of the Piccolo Teatro of Milan. Leading producers, working with various companies, have been Giorgio Albertazzi (who caused a stir in the cinema with his film of Moravia's novel *Il conformista* ["The Conformist"] in 1971), Gianfranco De Bosio, Giuseppe Patroni-Griffi, Giorgio di Lullo, Luigi Squarzina, and Giorgio Strehler. New plays of the period include Primo Levi's documentary dramatization of his experiences in a Nazi death camp, *If This Be a Man;* Griffi's Pirandellian comedy *Imagine, One Evening at Dinner;* Franco Brusati's *La pietà di novembre* (*The Other Face of November*); and Moravia's symbolic anti-Nazi drama *Il dio Kurt* ("God Kurt").

Italy exercises a notable influence throughout Europe in the field of ballet, and contemporary Italian ballets include *Balli plastici* by Fortunato Depero, *Coro di morti* and *La follia di Orlando* by Goffredo Petrassi, and *Marsia* by Luigi Dallapiccola.

Motion pictures. It is in the cinema that Italy has probably made its most significant contribution to contemporary art on an international scale. Before World War II the Italian film industry had produced epic films that were by no means negligible in quality. But just after World War II Italy caught the world's eye, first with the Neo-Realism of the films of Roberto Rossellini and Vittorio De Sica in particular, dealing in a matter-of-fact way with conditions in Italy at the end of and just after that war, and later with the more freely imaginative interpretation of Realism exemplified in the films of such directors as Michelangelo Antonioni, Federico Fellini, Cesare Zavattini, Pier Paolo Pasolini, and Luchino Visconti. The trenchantly laconic statement of many of these films and their affinity with the attitudes of Existentialist thinking marked a development in cinematic imagination that had a cross-fertilizing influence, in particular, on the young French filmmakers of the "New Wave."

Neo-Realism in films

CULTURAL INSTITUTIONS

Academies and societies. Academies and societies representative of almost every academic and social activity have proliferated in Italy as nowhere else. Literary art and academies flourish in the major Italian cities that are regional capitals. Indeed, academies of fine arts had their origins in Italy, the Accademia di Belle Arti of Florence (founded as the Accademia del Disegno) in 1563 and that of Perugia in 1573. Rome's Accademia di San Luca was a guild of painters, founded in 1577; today its collections are open to the public. Italy's most famous learned society is the Accademia Nazionale dei Lincei, of which Galileo was once a member. The most distinguished literary society is the Accademia della Crusca, founded in Florence in 1582, whose *Vocabolario della Crusca* stabilized the Italian literary language on the basis of Tuscan speech. There are likewise many historical and scientific societies including the Accademia del Cimento, established (1657) in Florence.

A feature of Italian academic life is the contribution made by the foreign schools maintained in Rome by the United States, France, West Germany, Great Britain, and others for the study of Italian architecture, art, and archaeology.

The foreign schools in Rome

Among cultural institutions, the society Italia Nostra, with membership open to the general public, holds a special place. Its importance lies in the work it does to call attention to the care of the country's architectural treasures and to the preservation of what is left of the beauty of its landscape, rural and urban, from the encroachments of industry and bad building and the effects of environmental pollution. Italians traditionally have been indifferent toward matters not immediately affecting them and are disinclined to bestir themselves in public causes. The efforts of Italia Nostra have made them aware of the penalty of such indifference. The society has encouraged coordinated study and planning by industry, local authority, and government to resolve the conflicting needs of conservation and of industry—and the provision of work is vital in a country where underemployment is chronic.

Galleries and museums. Italy is exceptionally rich in architectural monuments, in art galleries and museums, and in examples of architecture of the past still in use, as well as of ancient ruins; indeed, churches, palaces, villas, and other buildings that are works of art in their own right often also contain art treasures in the shape of frescoes on their walls, easel pictures and sculpture, and furniture and ornaments. The regionalism of Italy is typified by its art galleries and museums. The national galleries at Florence and Bologna are also municipal institutions, and indeed the great galleries of Italy are often concerned with their own regional heritage—the Capitoline Museum and the Borghese Gallery in Rome are mainly built up of the work of painters and sculptors working in Rome, even if they were not all strictly of the Roman school; the Pinacoteca di Brera in Milan has the most representative collection of north Italian painting of the Lombard school; the Accademia in Venice of Venetian painting; the Uffizi and the Palazzo Pitti galleries in Florence are supreme for Florentine painting; the Galleria Nazionale dell'Umbria in Perugia contains magnificent examples of the Umbrian school; the Pinacoteca Nazionale in Siena of the Sienese school; the Palazzo Bianco in Genoa of the Genoese school; and so on.

It must be understood, of course, that the galleries also contain masterpieces of other Italian schools and indeed from foreign countries, but their collections are built up around the body of regional work exhibited. Other major galleries and museums besides those mentioned above include the Vatican and Lateran museums and the Galleria Nazionale d'Arte Moderna in Rome; the Museo Nazionale del Bargello and the Museo dell'Opera del Duomo in Florence; the Galleria d'Arte Moderna, the Castello Sforzesco, and the Pinacoteca Ambrosiana in Milan; the Galleria e Museo Estense in Modena; the Museo Archelogico Nazionale, the Museo Civico Filangieri, the Museo Principe Diego Arangona Pignatelli Cortes, and the Museo e Gallerie Nazionale di Capodimonte in Naples; the Galleria Nazionale in Palermo; the Palazzo Doges and Museo Civico Correr in Venice.

ENTERTAINMENT

Festivals. Regional life in Italy is typified by diversity of costume and cuisine and by a great variety of festivals. The latter are, however, changing in character, and many civil and religious festivals are no longer forceful expressions of local idiosyncrasies that brought them into being; as in most other Western countries, an element of unreality enters the dressing up in clothes belonging to bygone days and only brought out once or twice a year. The appeal to the tourist industry helps as much as anything to keep festivals alive.

The Italians are a lively Mediterranean people, and the climate of their country is favourable to social exchange and display out of doors. The *passeggiata,* or "promenade," conducted with conversation and gossip up and down the main street or about the principal square at noon and evening, is still a feature of urban provincial life. In the same spirit of outward projection, Italians enjoy festivals and processions. Festivals in Italy are indeed manifold and can be divided into two main kinds, religious and secular, though the religious observations generally extend their impulse to cover a good deal of accompanying secular celebration. The secular festivals and sometimes the religious festivals contain strong elements of folklore.

Religious festivals. Many places hold special religious festivals and great processions in costume on such holy days as Easter, Corpus Christi, and the Feast of the Assumption. At Christmas the crib (*presepio*) is set up in churches, and children receive their presents at Epiphany, the feast of the three kings, from the fairy-witch Befana. The New Year is celebrated with fireworks and noise, supposedly to aid in driving away the devil. At Epiphany, in Rome, it is the custom to bring presents for children in the Piazza Navona, and at the Feast of St. Anthony there, on January 17, priests of the Church of St. Eusebio bless working animals and pets paraded by their owners.

In Palermo the Festival of St. Rosalia is held in July, with a procession and illuminations. In Naples the Miracle of St. Januarius, a procession of the vial containing that saint's dried blood, which is said to become liquefied again upon invocation, is held at special times. Venice holds two festivals, in memory of the cessation of the plagues of 1576 and 1630, respectively: the first festival is the Feast of the Redeemer, held on the third Sunday in July, when a bridge of boats is built across the wide channel of the Canale della Giudecca, a solemn high mass is held in the church of the Redentore, and a breathtaking fireworks display takes place at night; the second is held on November 21, at the church of Sta. Maria della Salute. At Bari the feast of the patron saint of the city and of sailors, St. Nicholas, is held on May 8 and is attended by many pilgrims who take part in an illuminated procession in boats in the harbour.

Secular festivals. Secular festivals take a number of forms, including modern arts and crafts festivals, and, as a general rule, the more local they are, the more vitality they have. At Bari the Levant Fair, which lasts for two weeks or more in September and in conjunction with which a motor show is held, is an important regional fair. Earlier, in May, the city holds a famous procession, the Vidua Vidua, and a folklore festival, while Foggia, not far away, conducts a flower show and fair with outdoor opera. Still in the same region, Brindisi holds a parade of horses and riders in medieval costume. In Naples the Festival of Piedigrotta commemorates the Battle of Velletri (1744), and people go to the Grotta Nuova to hear new songs sung for the event. At Cocullo, in the Abruzzi, on the first Thursday in May, St. Domenic's statue is carried in procession, live poisonous snakes writhing round it to be made harmless and later bought by apothecaries for the medicinal properties of their venom. One of the best known to foreigners is the Corso del Palio (Parade of the Banner), held in Siena on July 2 and August 16; it is a parade and horse race around the main square, which is said to go back to 1275, with the riders in medieval costume of the colours of their respective city districts.

The Siena Palio

Siena, Mantua, and Spoleto hold notable music festivals. Still in central Italy, Arezzo holds its Giostra del Saraceno, a tournament originating in the 13th century, in June. On the first Sunday in May and on June 24, Florence holds its Calcio, a kind of football match dating back to 1530, in costume. At Pescara, on the Adriatic, an international folklore festival is held. Varese, in Lombardy, holds a national festival of mountain singing in December. In Piedmont, Aosta holds a Battle of Queens in October. And the Ligurian riviera resorts enjoy celebrated Battle of Flowers festivals. Famous Venetian festivals include La Sensa (on Ascension Day), the Regata Storica (regatta) on the Grand Canal, and festivals of drama, music, and films.

Sports. Cycling, football, basketball, tennis, motoring, motorcycling, winter sports, and hunting are popular sports and recreations in Italy. The major sporting events are the professional cycle races, chief among them the Tour of Italy road race, which attracts the best foreign as well as Italian professional road-racing cyclists, and the major professional football matches. In football every sizable town supports its own professional team; teams from Milan and Turin play before capacity crowds in their stadiums and have provided much of the national talent that took Italy into the final of the World Cup in 1970.

Other major sporting events include the Italian Grand Prix motor race at Monza, the international Italian Tennis Championship at Rome, the Martini Fencing Trophy at Turin, and the Show Jumping Championships at Rome.

Tourism. For centuries foreigners have been attracted to Italy by its varied architectural monuments, scenery, and climate; Rome, the "Eternal City," has drawn visitors to it especially for its classical antiquities and as an early centre of Christianity and the seat of the head of the Roman Catholic Church. In the 18th century it became a custom for English gentlemen or for their sons in the company of a tutor to make the Grand Tour, an educative tour of western Europe in which the visit to Italy was the highlight. In the 19th century a number of English literary figures chose to live in Italy for a time, and their example led to the growth of little colonies of expatriates, principally in Florence and Rome, who were pleased to receive visiting fellow countrymen.

The Grand Tour

By the 20th century the pleasure of a trip to Italy ceased to be reserved for a well-to-do, cultivated minority when the rise of the tourist industry in the hands of experienced travel agents removed much of the expense and even peril of travel in Italy and made it possible for thousands to enjoy it. Since World War II, flies and mosquitos, formerly two of the greatest enemies of the traveller in Italy, have almost been eliminated. But from the 1960s onward the Italian tourist industry has also felt competition from such countries as Spain, Portugal, and Yugoslavia, where the cost to the tourist has been lower than in Italy.

Foreign visitors once sought the great cultural centres of Rome, Florence, Venice, and Naples, but many now spend time at coastal resorts and islands or among the Alpine hills and lakes of the north: the Ligurian and Amalfi rivieras; the northern Adriatic coast; the small islands in the Tyrrhenian Sea (Elba, Capri, Ischia, Ponza, Lipari, Stromboli); the "Emerald Coast" of Sardinia; Sicily, especially the resort of Taormina; the National Park of the Gran Paradiso and the Dolomites in the Western and Eastern Alps, respectively; the north Italian lakes (especially Maggiore, Como, and Garda); and the National Park of the Abruzzi, easily reached by a highway from Rome.

Most Italians take their holidays in their own country and after much the same pattern as that of foreign visitors, with the addition of much visiting of near relatives; but they make more use of the southern Adriatic beaches in Puglia, at Manfredonia, Siponto, and the little villages around the foot of the Promontorio del Gargano (Gargano Promontory) and down the same coast at Trani, Bari, and Brindisi. They have also been able to keep the Calabrian beaches much to themselves, at Crotone and Reggio Calabria, for example, and up the Tyrrhenian coast to Paestum and Salerno. But all these places are being increasingly frequented by foreign visitors.

PRESS AND BROADCASTING

Press. The Italian press is generally provincial and local in outlook, though the major daily newspapers carry foreign news and comment on it. The dailies that command most notice abroad have included the *Corriere della sera* and *Il Giorno* of Milan, *La Stampa* of Turin, and *Il Messaggero* and *Il Tempo* of Rome. Political parties publish or control newspapers, and daily newspapers are issued in the large regional capitals.

Broadcasting. Radiotelevisione Italiana (RAI) conducts all broadcasting and is a state enterprise. Programming includes current news, culture, sports, light music, debates, interviews with people prominent in contemporary Italian life, classical music, and jazz.

Television programming includes variety shows, film cycles, quiz programs, musical games, athletic events, news broadcasts (*telegiornale*), programs for children, political debates, investigations in depth into contemporary problems (*boomerang*), theatre, etc. Dramatized novels, foreign-language courses, and football matches are also broadcast. For statistical data, see the "Britannica World Data" section in the current *Britannica Book of the Year.*

(Ed.)

HISTORY

Italy in the early Middle Ages

THE BARBARIAN INVASIONS

Italy in the 5th century. Toward the middle of the 5th century, Italy was the only province of the Western Empire in which Germanic barbarian peoples had not established permanent occupation. Imperial dignity retained considerable prestige, and the new capital, Ravenna, chosen for its easily defensible position and its lines of communication by sea to the East, was enriching itself with splendid monuments.

Although no barbarian successor state had been established in Italy, groups and individuals of barbarian origin had acquired great importance in the political and social life of the peninsula. Barbarians made careers for themselves in the army, and some of them attained positions of great power, married into the imperial houses, and even deposed and created emperors. Such a barbarian was Ricimer, *magister militum* ("master of the soldiers") of the Western emperor Avitus. As a barbarian and an Arian, Ricimer could not be emperor, but his strength in Italy was such that he deposed three emperors in the mid-5th century. Ricimer was succeeded briefly by the Burgundian Gundobad, who in 473 placed Glycerius on the throne. Two years later, contingents of the barbarian tribes of the Scyri, Heruli, and Rugii chose one Odoacer as their leader. In 476 the last Roman emperor, young Romulus Augustulus, was deposed, bringing the Western Empire to an end. Odoacer ruled over Italy in the double capacity of king of the barbarians and of *patricius*—that is, as an unrecognized representative of the Eastern ruler.

Overthrow of the Western Empire

The accomplishment of these barbarians cannot be dismissed as a purely negative one. However crude and brutal they may have been, they made a place for themselves in the Roman world, which they defended to the best of their abilities. Ricimer led the long struggle against the Vandals, a Germanic tribe that swept through Spain and North Africa, led a seaborne expedition to Italy, and in 455 sacked Rome. Odoacer, in his turn, compelled the Vandal king Gaiseric to give back Sicily and succeeded in occupying Dalmatia. In short, these barbarian generals and their rough-and-ready soldiers, although they oppressed local populations, had a role to play as defenders of the empire, and it would be a mistake to blame them for the decay of Roman civilization. Indeed, the Romans in Italy had been accustomed for centuries to contact and cohabitation with the barbarians. Between the last half of the 4th and the first half of the 5th century, many barbarian prisoners were farmed out to the countrysides and cities of the north in order to repopulate them. These Goths, Huns, Alemanni, and others have left their traces in place-names throughout the region.

The reign of the Ostrogoths. In 488 Italy was invaded from the east by a new barbarian army, that of the Ostrogoths, which, after a succession of victories climaxed by the siege of Ravenna in 493, destroyed Odoacer's feeble regime. The invaders this time were not merely armed groups; they comprised an entire population (numbering perhaps some 300,000) that had left the Balkans with the firm intention of settling in Italy. The Eastern emperor Zeno had encouraged their migration because he was dissatisfied with Odoacer's rule in Italy and was also anxious to remove the Ostrogoths from the Byzantine frontiers. The Ostrogoth leader was the able Theodoric, who had lived for a long time as a hostage in the Eastern court, where he grew to appreciate Roman-Byzantine civilization.

Theodoric ruled over Italy both as king of his own people and as *magister militum* of the Eastern emperor. The main feature of Theodoric's policy was to keep Ostrogoths and Romans apart, allotting to the former the exercise of arms and to the latter posts in the civil government. This was, he thought, the only way for the Ostrogoths to keep the upper hand, since their numbers were few in comparison with those of the local population. This separatist policy was based on a difference of religion, since the Ostrogoths were Arians and the Romans were Catholics; the policy included the prohibition of *connubium,* or mixed marriages. But it was, fundamentally, contrary to historical reason, since it was inevitable that, in time, the two peoples should be drawn closer together.

There were signs of crisis in 519, when Theodoric suspected Zeno of plotting against him. He attacked the Roman leaders who had lent him their support. The senators Albinus, Boethius, and Symmachus were tried and condemned to death in 524–525; Pope John I was arrested and died in prison in 526.

When Theodoric died in 526, his Italian policy had to be considered a failure. But, in any event, Italy and Sicily (Sardinia and Corsica were still under Vandal rule) had enjoyed a period of tranquillity and well-being under his government. There had been a renaissance of Classical culture, as witnessed by the writers Boethius and Cassiodorus, who lived at Theodoric's court. And the capital cities—Pavia, Verona, and, above all, Ravenna—were adorned with splendid buildings and monuments.

Reconquest by Byzantium. Theodoric left the kingdom in the hands of his daughter Amalasuntha, who ruled as regent for her son Athalaric. When Athalaric died prematurely in 534, she had to share the throne with her cousin Theodahad, head of the Goth nationalist faction, which within a year found a way of getting rid of her. This assassination furnished a pretext for Justinian I, the Eastern emperor, to continue the reconquest of the lands along the western Mediterranean, already begun with general Belisarius' victorious expedition against the Vandals of Africa (533–534). Belisarius then launched a campaign in Italy, disembarking in Sicily in 535. The war went first one way and then the other; it was long lasting (until 553) and exhausting and destructive for both armies and civilian populations. In spite of their stubborn resistance, the successive Ostrogoth kings—Witigis, Totila, and Teias—could not prevent the occupation carried out by the troops of Belisarius or his successor Narses. The Eastern Empire retook Sicily, Sardinia, and Corsica. The Ostrogoths were killed, taken prisoner, or dispersed, and, of their stay in Italy, very few traces remain.

Extermination of the Ostrogoths

The whole of Italy returned to direct dependence on the empire, though under quite different conditions than before; it was no longer a centre of power and privilege but a mere outlying province. With the promulgation of the Pragmatic Sanction in 554, Justinian gave Italy a new ordering, creating a *praefectura Italiae* (with its capital at Ravenna), subdivided into 11 provinces in which there was a clear-cut separation between civilian and military authority. Sicily was governed directly from Constantinople, while Sardinia and Corsica were lumped into the Exarchate of Africa. This was the beginning of a long period of Byzantine influence in Italy, not only political but cultural and artistic as well. Roman law, revived and codified under Justinian, came into widespread use; the magnificent basilicas were built in Ravenna; and Byzantine architecture and mosaics adorned Rome and other places. But the Byzantine government, avid for taxes and heedless of its subjects' religious convictions, provided considerable opposition, of which the popes later took advantage in order to bolster their authority. The popes also could count on the support of increasingly numerous monasteries. Saint Benedict of Nursia (Norcia) had laid out a model of monastic organization and rules during the tragic epoch of the Greco-Gothic War, and the monasteries later became strongholds of the Catholic religion and the Latin tradition.

THE LOMBARDS

The conquest and the political structure. In 568 a new Germanic people, the Lombards, appeared at the eastern gateways of Italy, coming from Pannonia and Noricum. Their numbers were about equal to those of the Ostrogoths, but they were considerably cruder, had no links with the Byzantine Empire, and looked on Italy as a land to be conquered. The Byzantines, whose Italian forces were meagre, put up their first resistance at Pavia (Ticinum), which fell to the Lombard king Alboin after a three-year siege. The clergy and population of many places (Aquileia, Milan, and elsewhere) fled before the Lombard invasion to inaccessible coastal areas, where they could count on the protection of the Byzantines, who still controlled the seas. The Lombards soon occupied the whole interior of the peninsula as far south as Benevento. Their administrative units were called "duchies," a name reflecting the fact that their army units were led by *duces.* There were 35 such duchies, named after their capital cities. Among the most important of these were Forum Julii (the present-day Cividale del Friuli), Brescia, Pavia, Pistoia, Lucca, Spoleto, and Benevento. The occupied territory as a whole took the name of Longobardia or Langobardia (Lombardy). Later on, this appellation was restricted to the central and northern region, seat of the capital, just as it came to be the case with the Byzantine territories, collectively known as Romania, a name that subsequently came to apply only to the Romagna, with its capital at Ravenna.

The Lombard duchies

Within each duchy the land was divided for ownership or tax purposes into *farae,* groupings of related families that made up the social and military fabric of the Lombard people. About the administrative structure little information remains, most of it being from an account by the 9th-century historian Paul the Deacon. It is certain, however, that the class of the Roman *possessores* was broken up and practically destroyed. This was true particularly during the Interregnum (574–584), when the initial unity of the Lombards was attenuated and the "dukes" ruled independently, some of them even passing over to the service of the empire. The dukes, however, soon realized the danger of such a state of anarchy in the face of the hostile

Italy under the Lombards and the Byzantine Empire, *c.* 603.

Byzantines and also of the Franks, who were pressing at the northern borders, and they restored the kingdom with Authari as their king (584–590). The king was transformed from a military leader into a regular monarch, as half of the occupied lands were incorporated into a royal domain.

The Lombards introduced radical change in the peninsula. Whereas the Goths and other barbarians had respected the Roman political and administrative framework, the Lombards did away with it completely in favour of their own customs. The only institutions to be saved were the churches. The king promulgated laws and pronounced judgments together with the assembly of the *arimanni* or *exercitales,* composed of all the freemen able to bear arms. Such, at least, was the theory, but, since the Lombard *farae* were widely dispersed, in practice the assembly of the *arimanni*—the *gairethinx*—was soon replaced by the *gasindi,* a group of councillors close to the king and of such powerful nobles (*adalingi*) as were able to make prolonged stays at the court. The court, housed in the royal palace of Pavia, grew in importance with the concentration of government power and the differentiation of offices; within it there was even a remarkable school of law. The conquered territory was ruled locally by dukes and *gastaldi,* the former as heads of family lines, the latter as royal officials. The *gastaldi* were originally in charge of crown possessions, but their authority grew, to the detriment of that of the dukes. In some cases, *gastaldi* took the place of rebellious dukes; in others they ruled a provincial city from the start. In the reign of Rothari (636–652), it seems that there were, in the cities, *gastaldi* appointed by the king to watch over the dukes, and there were rural military–judicial units where *gastaldi* ruled. At the time of King Liudprand (712–744), when the government was further centralized, newly conquered lands were made into *gastaldatus,* directly dependent upon the capital at Pavia. The duchies of Spoleto and Benevento, on the other hand, had a development of their own, and the *gastaldi* were appointed by the dukes.

The reign of King Agilulf

Authari tried, by both arms and treaties, to hold back the Franks and the Byzantines; in order to combat the former, he allied himself to Garibald, duke of Bavaria, by marrying his daughter Theodelinda. She was a Catholic, and it was on her initiative, with that of Pope Gregory the Great, that there was a first move to convert the Lombards, who were Arians or pagans. After the death of Authari (590), Theodelinda married Agilulf, duke of Turin, who held the throne from 591 to 615 and completed the occupation of the hinterland of Venetia. Together with the dukes of Spoleto and Benevento, Agilulf led expeditions to central and southern Italy and intended to occupy Rome until the strong-minded Pope Gregory dissuaded him. Aware of the spiritual power of the church, Agilulf adopted a pro-Catholic policy; he allowed Adaloald, his son by Theodelinda, to receive a Catholic baptism and favoured the Irish monk Columban, who in 612 founded the monastery of Bobbio, near the lines of communication between the Po Valley and the Byzantine territories of Lunigiana and Liguria.

Rothari, an Arian elected in the wave of a reaction to Agilulf's indulgence toward Catholicism, extended the Lombard kingdom to its greatest territorial extent, with the conquest of the Ligurian coast and of Oderzo in Venetia. He is famous for his Edict of 643, the first codification of Lombard customs. The edict, written in Latin, shows some influence of the secular life of the Romans and of the church. There is an effort to contain the *faida*—that is, personal revenge—by means of the *guidrigild,* an objective and closely calculated compensation for damage done, which reflects the social rank of the damaged party and, by extension, the whole structure of this barbarian society, divided into *arimanni, aldii* (semi-freed men), and slaves.

After Rothari there was a long period of contested successions, of rebellions, and of struggles among the dukes until the election in 712 of Liudprand, the greatest of the Lombard kings. In this period, beneath the violence of political events, a silent and deep transformation was taking place. Conversion to Catholicism was becoming widespread. With conversion came a new closeness, indeed the beginning of a fusion, between the Lombards and the native Romans. The two peoples were drawn gradually together by everyday life, by participation in the same liturgy, by common hostility toward Byzantium and mistrust of Rome, by the use of a common Latin language, and by devotion to the monarchy. Although certain social and juridical distinctions were slow to disappear, they increasingly lost their original ethnic imprint. The consequences of this transformation can be seen in the structure of the state and its political aims. Liudprand founded and protected churches and monasteries, based his laws on religious principles, contributed to the struggle against the Arabs of Provence (in southern France), and gave the bishops an important share in public life and in the administrative and judiciary branches of the government. He sought also to enlarge the kingdom. In 728, taking advantage of the wave of discontent and rebellion aroused in the Byzantine parts of Italy by Emperor Leo III the Isaurian's decree condemning the cult of images (the beginning of the famous Iconoclastic Controversy; 725), he invaded the Exarchate of Ravenna and the Pentapolis (territory south of Ravenna), threatening Ravenna and advancing toward Rome. He claimed to be a defender of orthodoxy and the Pope, but the latter, Gregory II, was alarmed by his approach and sought the support of the dukes of Spoleto and Benevento. Liudprand, sensitive to the Pope's admonitions, withdrew after turning over to him the castle of Sutri (728), though he still had to face the rebel dukes. His later expeditions into the exarchate and the Roman duchy met with only ephemeral success, as was the case with the first occupation of Ravenna (739). His expansionist policy failed not only because of the resistance he encountered but also because his Catholic faith stayed him from attacking the Pope with armed force.

The papal alliance with the Franks

After Liudprand, Aistulf (749–756) continued the same expansionist policy. Aistulf occupied Ferrara, Comacchio, and Ravenna and acquired control of the duchy of Spoleto. The papacy, alarmed by the Lombard advance, turned for support to the powerful Frankish kingdom in northern Europe. In 754 Pope Stephen II went to France, where he anointed and crowned King Pepin the Short, thereby consecrating the legitimacy of the Carolingian dynasty. In return, Pepin and his major dignitaries promised a Frankish intervention in Italy and restitution to the Patrimony of St. Peter of the territories to which the popes made claim. This alliance between the Holy See and the Frankish monarchy had a decisive influence upon Western history; it marked the beginning of the collapse of the Lombard kingdom, the formation of a papal state, and the renewal of the idea of a universal empire. Pepin came twice down to Italy, defeating Aistulf and forcing him to give to the Church of Rome the territory he had wrested from the Byzantines. The new Lombard king, Desiderius (757–774), tried at first to allay the Frankish threat by alliance: he gave his two daughters in marriage to Pepin's sons, Charlemagne and Carloman. But he failed in his intent. When he made a new break with Pope Adrian I in 772, Charlemagne, then occupying the Frankish throne (and having repudiated his Lombard wife), descended upon Italy (773–774), defeated Desiderius and his son Adelchis, and put an end to the Lombard kingdom. The duchy of Spoleto came under his rule, although keeping a character of its own. Benevento, however, remained independent.

The Lombards left a lasting imprint upon Italian history, even if it is not always possible to establish how many customs of the period from the 6th to the 8th century were theirs and how many should be attributed to the crude conditions into which Roman society, in an economic and cultural regression, had fallen. The Regnum Langobardorum (Regnum Italiae) survived for centuries within the new medieval empire, mostly as an ideal but retaining, nevertheless, some of its political and juridical structures (the coronation of the king at Pavia, Milan, or Monza, the archbishop of Cologne's custody of the record office, the institution of counts and judges). The Lombards left noteworthy traces in the fields of law (particularly penal law) and art (sculpture and jewelry). Excavations of the necropolises of Cividale del Friuli, Bolsena, Nocera Umbra, Benevento, and other places have brought to light swords, buckles, gold pectoral crosses, coins, and other objects linked by a definitive common style. Noteworthy are the stylization of the animals, the use of precious stones, and the taste for braided ornamentation. The Lombards were quick to learn Latin and were definitely bilingual toward the end of their rule. Traces of the Lombard language are to be found as late as the 10th century; even more important was the incorporation into Latin of certain words that subsequently passed into Italian.

The Frankish conquest lowered the conquered Lombards to the level of the Romans, thereby hastening the process of integration, already well under way by the end of the 7th century. This integration was chiefly of the masses, since aristocratic families and certain permanent groupings maintained, because of their privileges, a separated position, although they, too, gradually fused with the new society. From the integration of Romans and Lombards, a new people—the Italians—was born.

The Exarchate of Ravenna

Byzantine territories in Italy. At the beginning of the 7th century, after the first wave of the Lombard conquests, the Byzantines retained scattered areas along the coast. Of the ancient province Venetia et Istria there remained not only Istria but also the coast of the northern Adriatic, with a wedge-like extension pointing in the direction of Oderzo. This last separated Friuli from Treviso, for which reason Rothari later took it over. The inhabitants of Aquileia, Concordia (now Concordia Sagittaria), Altino, Treviso, Padua (Padova), Monselice, and Oderzo, cities attacked or destroyed during the successive conquests, sought refuge on the marshy coast or on the islands of the Lagoon (Laguna Veneta), where formerly there were only a few fishermen's villages. Farther south lay the Exarchate of Ravenna, corresponding to the present-day Romagna, with the addition of Bologna and part of Emilia. Ravenna was the headquarters of the exarch, the empire's chief representative, who had jurisdiction over all of Italy except Sicily (Sardinia, Corsica, and the Balearic Islands belonged to the Exarchate of Africa). Ravenna was also the seat of an important archbishopric, which the emperors favoured in every possible way in order to set it against Rome. As early as the end of the 7th century, it obtained the privilege of autonomy. The territory of the Exarchate was contiguous with that of the Pentapolis, the five cities of which were probably those of Rimini, Pesaro, Ancona, Numana, and Osimo, but the full extent of which was approximately the same as that of the present-day region of the Marches. A line of strongholds, some of them along the Via Flaminia and others on a lesser road to the west, connected the Pentapolis with the duchy of Perugia and this to the duchy of Rome (present-day Lazio). Territorial continuity was thus achieved between the lands on the Adriatic and those on the Tyrrhenian Sea, and a sort of diaphragm was set up between Tuscia (Tuscany) on the west and the duchy of Spoleto in the east. Lunigiana and maritime Liguria were isolated and could not long resist the invaders; in 640 they were conquered and occupied by Rothari. The duchy of Naples was better protected by virtue of its location and its access to communications by sea. At the southernmost end of the peninsula, divided by the territory of Benevento, were the two regions of Calabria (present-day Puglia) and Bruttium (present-day Calabria). The Byzantines also possessed Sicily and the other islands, which, between 650 and 750, had to be defended not so much from the Lombards as from the Arabs of North Africa.

Byzantine administration

An important change had come about at this time in the Byzantine administration. In the face of the Lombard invasion, the classic principle, reasserted by Justinian, of the separation between military functions and civil functions was abolished. Thus, the exarch acted as both military and administrative leader. His powers were much broader: he could make peace, contract alliances, adjudicate lawsuits, make official appointments, intervene in the affairs of the church, and confirm the election of the pope. At a lower level the same thing held true: the dux combined civil and military powers, administered justice, saw to the collection of taxes, and named the executives of his *officium.*

Byzantine rule in Italy was anything but tranquil, quite aside from the struggle against the Lombards. The remoteness of the emperor and his preoccupation with resistance to the Arabs made for a certain independence on the part of his subordinates, but, at the same time, it deprived them of the military and financial support that they needed for administrative purposes. The imperial officials had to provide for themselves with whatever means they could find on the spot. Moreover, their efforts were hampered by the emperor's intervention in religious affairs. Such intervention was often motivated by the necessity of resolving differences in the eastern provinces and creating a greater spiritual unity with which to resist external enemies. But, when the emperors pronounced themselves on doctrinal matters, they sometimes offended the religious conscience of the Italic peoples and aroused their enmity, which was often fostered by the bishops and especially by the pope. At times, the imperial officials found themselves in the embarrassing situation of carrying out orders directed against the popes, orders that encountered resistance on the part not only of the people but also of the militiamen who were supposed to execute them. For, since Byzantine soldiers were few in number, defensive and policing tasks were carried out by a locally recruited militia, the *scholae.*

There resulted considerable political and administrative confusion. Exarchs, dukes, and tribunes often carried out policies of their own, in opposition to one another and to imperial orders; local aristocrats joined the game to further their own advantage. When Justinian II ordered the arrest of Pope Sergius I (687–701), the militias of Ravenna and the Pentapolis marched on Rome (*c.* 694) in order to protect him. Thus, there was no repetition of the case of Pope Martin I, who was arrested by the emperor Constans II and died in exile in 655. Similar rebellions took place in the first years of the 8th century in Rome, in 711–712 in Ravenna, and in 717–718 in Sicily, premonitory of the major crisis at the time of the Iconoclastic Controversy. From that year (725) up to 751, the date of the Lombard occupation of Ravenna and the end of the exarchate, the impulse of the Italic people toward autonomy was accelerated. The Greek dukes were driven out and replaced by local rulers; the pope in Rome and the archbishop in Ravenna acquired greater political power, while Venice, Gaeta, Naples, Sorrento, and Amalfi found in independence an incitement to seeking their fortune in sea trade. In short, the Byzantine possessions in Italy, already geographically scattered and progressively diminishing in size, finally lost political cohesion; the emperor's sovereignty over the cities and over Sardinia became purely nominal. Exceptions were Sicily (soon to be conquered by the Arabs), Puglia, and Calabria, which remained under the direct rule of Byzantium. Indeed, with the new Macedonian dynasty begun by Basil I (867–886), Byzantium resumed an active role in southern Italy, determined by the military prowess of the strategist Nicephorus Phocas. After the Arabs had been expelled from Taranto and from the Ionian coast and after the princes of Benevento had been driven to the north, the Puglian region, together with the Capitanata and the Gargano peninsula, came to form the theme of Longobardia, while Calabria, a base essential to what was left of Sicily, was liberated from Arab occupation and made into the theme of Calabria. The division into thema fitted into the new political and military organization imposed upon the Eastern Empire by Leo VI the Philosopher (886–912). The conquest and re-organization of southern Italy were accompanied by new Eastern monastic institutions, notably those of the Basilian monks, that had great importance not only from a political but also from a religious and cultural point of view. Byzantine rule in the south lasted until 1071, when Bari, the seat of the emperor's representative, fell to the Normans.

The duchies of Spoleto and Benevento. The duchy of Spoleto was formed at the beginning of the Lombard invasion. Its first duke, Faroald (*c.* 571–591), and his successor, Ariulf (591–601), staked out boundaries that lasted until the Carolingian age. The duchy did not precisely coincide with any of the natural geographical regions of Italy. It occupied the eastern part of Umbria (the western part, with the fortresses or cities of Amelia, Narni, Terni, Perugia, and Gubbio, made up the Byzantine corridor between Rome and Ravenna), a southern area of the Marches (with Fermo and Camerino), and a strip in the northern section of the Abruzzi. Politically, it had an autonomous development, even if there were, in certain periods, close ties with the Lombard kingdom.

The autonomy of Spoleto

There were many reasons for this autonomy, first among them being its geographical isolation in an inaccessible and impregnable area of the central Apennines, which was further cut off from the Lombard kingdom by the Rome–Ravenna corridor. The dukes of Spoleto could pursue policies of their own, and they knew quite well how to assert themselves in the complex diplomatic and military interplay of their immediate neighbours—the popes, the exarchs, and the dukes of Benevento—none of whom was powerful enough to crush them. The Lombard kings might have had such power, but they exercised it in a reluctant and intermittent fashion.

Later, Charlemagne was able to impose his rule upon the duchy, but even he did not deprive it of its political and administrative individuality. A succession of dukes of Frankish origin supported the Carolingians in their expansionist designs upon Benevento. Meanwhile (in the first years of the 9th century), it seems that Spoleto acquired Chieti and Ortona, while Fermo and Camerino became independent and jointly formed first a "county" (*comitatus*) and then a "march" (*marca*). During the period of confusion and struggle after the end of the Carolingian dynasty (the deposition of Charles the Fat), a duke of Spoleto, Guy, managed to have himself crowned king of Italy at Pavia (889) and emperor at Rome (891). His son Lambert was emperor after him, but, by then, the title had no real meaning.

In the 10th century, the history of the duchy of Spoleto became increasingly confused and obscure. Dukes followed one after the other in rapid succession, but no one of them was able to found a dynasty. Later, with the houses of Franconia and Swabia, it passed into the hands of the great German vassals until, through the efforts of Innocent III and Gregory IX, it became a province of the Papal States.

The duchy of Benevento, too, goes back to the early years of the Lombard invasion, and its origins are bound up with the names of its first two dukes, Zotto (died 591) and Arichis (died *c.* 641), who led its extensive conquests. The distant Lombard kings had neither lands nor officials in the duchy. Indeed, Grimoald, duke of Benevento, entered the contest for the Lombard throne, was elected king, and reigned from 663 to 671, leaving Benevento in the hands of his son Romuald, who left it, in turn, to his descendants. A hereditary right was clearly established.

The borders of the duchy varied, but, except for some temporary conquests (Bari, Taranto, and Brindisi), they enclosed the southern part of the Abruzzi; Molise; the interior of Campania (with Capua and Salerno on the Tyrrhenian Sea); Lucania, with a piece of coastline on the Ionian Sea; and strips of northern Puglia (with Lucera) and Calabria. The territory was divided into some 30 administrative units ruled by ducal *gastaldi,* who enjoyed full civil and military powers. Like Spoleto, Benevento was a landlocked state, with no interest in sea trade and an agricultural economy that could not prosper because of the mountainous terrain and the lack of communications. A military regime, continuous wars, and social oppression made it a backward and conservative zone as compared to the Lombards' other Italian possessions.

Benevento's resistance to the Carolingians

With Arichis II (758–788), son-in-law of King Desiderius, the duchy of Benevento became the last seat of resistance (at times open, at others undeclared) to the Carolingians: as such it was changed from a duchy into a principality, and the capital was moved to Salerno. Lombard traditions lingered, and, even after the 9th century, there were expressions of "national" consciousness. A form of writing, the "Beneventan hand," remained independent of the "Caroline hand." The cultural and religious centre of the whole region was Montecassino, where the influence of the Cluniac reform was felt in the 10th century. Grimoald III, son of Arichis II, continued to combat the Carolingians, but, after his death in *c.* 806, a series of internal struggles led to a division into two principalities: Benevento and Salerno. A third territory gradually broke away from these two and became the independent county (later principality) of Capua. All three principalities fell into the hands of the Normans. Benevento was captured by Robert Guiscard in 1081 and immediately turned over to the Papal States, to which it belonged, with few interruptions, until 1860. Salerno and Capua were absorbed by the new Norman state.

CAROLINGIAN AND FEUDAL ITALY

The kingdom of Italy. In April 774, after sweeping away weak Lombard resistance, Charlemagne arrived in Rome, placed a new act of donation to the Roman Church (confirming Pepin's of 18 years before) on the tomb of the Apostle Peter, and acquired the title of *rex Francorum et Langobardorum* ("king of the Franks and Lombards"). A few pockets of rebellion remained (Benevento, Trento, Friuli), which obliged him to return to Italy in 776 and in 780–781. On this last occasion, his son Pepin was crowned in Rome by Pope Adrian I as "king of Italy." In a fourth descent upon Italy, in 787, Charlemagne defeated Arichis of Benevento and also Adelchis, son of Desiderius, who had landed in Calabria with Byzantine re-enforcements. The duchy of Spoleto and the march of Fermo were added to the kingdom.

In the following years, Charlemagne campaigned against the Saxons, the Arabs in Spain, the Bavarians, and the Avars—making himself master of a large part of western Europe and winning immense prestige. The logical consequence was the famous *renovatio imperii,* or second edition of the empire, in the 9th century, the attempt to give Charlemagne's conquests a political unity and an ideological basis. The reconstructed empire drew inspiration both from the unforgotten traditions of ancient Rome and from a religious ideal. At the same time, it reflected political and social realities in the process of transformation, which had been deeply influenced by the law, customs, and national characteristics of the Germanic peoples. But the medieval empire, at the time of Charlemagne and in its successive restorations, was never a true state but rather a symbol of the community of peoples of Christian Europe. Even contemporaries referred to it as an *imperium plurimarum nationum,* an empire of many nations.

The coronation of Charlemagne

The coronation of Charlemagne as emperor on Christmas Day, 800, in Rome, aroused the opposition of the Byzantines. But the differences between them were soon overcome, and in 812 they made a peace agreement. From the death of Pepin (810) until 887, Italy was governed by Carolingian princes, and, in spite of the dismemberments to which the empire was subjected, it retained the political and territorial setup of the time of the Carolingian conquest. Bernard, son of Pepin, eventually rebelled, but he was captured and blinded and died in 818. His successor, Lothair I, son of Louis I the Pious, took on the title of emperor. Of considerable importance is the Constitutio Romana, put out by him in 824, in which he prescribed that the pope, after he had been elected by the clergy and people of Rome, must swear allegiance to the emperor. By virtue of the territorial division of 843, Lothair retained the title of emperor (implying the possession of Italy) and also a long, narrow strip of territory between France and Germany that took from him its name of Lorraine. This division took no account of ethnic and linguistic differences but affirmed, rather, the principle that the possessor of the imperial crown must necessarily possess the capitals of the empire, Rome and Aix-la-Chapelle (Aachen).

The son and successor of Lothair, Ludwig II (855–875), bore the double title of king and emperor but reigned over Italy only. There ensued a renewal of Carolingian power and polity in the peninsula and a new wave of expansion toward the south. Ludwig made numerous expeditions into southern Italy, where political fragmentation and continuous differences among the local rulers invited raids on the part of the Arabs, who were just completing their conquest of Sicily. But political, military, and climatic difficulties thwarted the ambitious project of driving out the Arabs and achieving pacification.

The last Carolingians

The last Carolingians to govern Italy—in spite of the fact that their main interests lay elsewhere—were Charles II the Bald (875–877), Carloman (877–879), and Charles III the Fat (880–887).

Politically and administratively, Charlemagne's conquest did not cause the Lombard kingdom to be annexed to the Frankish state; on the contrary, it kept a juridical character all its own. There was, at first, a sort of "personal" union, inasmuch as, for a while, Charlemagne had two crowns; later, the kingdom of Italy had its own sovereigns, chosen from the Carolingian dynasty. Most often, however, these were emperors who enjoyed also the title of king of Italy. Noteworthy is the fact, remarked above, that the appellation Regnum Italiae took the place of Regnum Langobardorum. As the conquered Lombards' memory of their glorious past faded, a historical and geographical term that reflected the peninsula's allegiance to the empire came into use.

Under the Carolingians, no important changes were made in the central administration. Pavia remained the capital and seat of the court, government offices, and the assembly. The assembly was made up of the dignitaries of the kingdom, including numerous ecclesiastics who in the Carolingian age played a greatly increased role in the state; the assembly's legislative powers, however, were less than they had been in the Lombard period. Laws decreed by the emperor for the whole empire applied also to Italy, and in the palace of Pavia a special authority was exercised by the *comes sacri palatii,* or count palatine, who headed the royal tribunal.

Carolingian administration

More drastic modifications were imposed upon the outlying administration. The Lombard duchies were eliminated and were replaced by new districts, or counties, ruled by counts; that is, royal representatives with military and judicial functions, drawn from the Frankish aristocracy. The county organization in Italy, however, was not as widespread and important as was formerly supposed; certainly, it cannot be compared to that of the Frankish kingdom. Counts were not installed everywhere; in some places the old Lombard *gastaldi* remained after making an act of submission. In others, Lombard *gastaldi* and judges stayed on, alongside the counts, and exercised a judiciary function rivalling theirs. This was the case mostly in the cities, traditionally seats of government and the administration of justice. Because the greater part of the cities were also diocesan headquarters, the Frankish counts found other powerful and prestigious rivals among the bishops. Another limitation of the counts' power derived from the institution of the *missi dominici,* pairs of itinerant controllers, one a cleric and the other a layman, who made periodical visits to the counties and presided over their judiciary assemblies (*placita*). Thus, in Italy the Frankish counts found no way of taking root in a background so different from their own. Some of them moved into country estates and castles, from which they could exercise no more than a limited jurisdiction; others returned home. There were, of course, exceptions. The count-duke of Spoleto and the count-marquis of Friuli ruled over frontier territories where the powers of the *gastaldi* and bishops had been limited from the start and where it was easy to establish dynasties.

Aside from the greater or lesser ability of the Carolingian counts to settle on their Italian lands, they did, very definitely, introduce a new mentality and new systems into governmental practice. Like other functionaries, they were chosen among the *fideles* or *vassi* of the sovereign and bound to him by personal as well as bureaucratic dependency. It often happened that the holder of a public *honor* or *officium* held also, as a vassal of the king, lands *in benefice* far from his own county. And often these lands, as those belonging to churches and monasteries, had immunities or special privileges, consisting of relief from subjection to the royal courts and exemption from the payment of tribute. Because of the progressive weakening of the central power between the mid-9th and mid-10th centuries, this period is rightly called one of feudal anarchy. Central and northern Italy witnessed continuous and ferocious struggles among the noble families. Marquises of Friuli, Ivrea, and Tuscany and dukes of Spoleto disputed the titles of king and emperor, calling, at intervals, for aid from the powerful lords of Carinthia, Provence, and Burgundy. Holders of the royal crown between 888 and 961 were Berengar I of Friuli, Guy of Spoleto and his son Lambert, Arnulf of Carinthia, Ludwig III of Provence, Rudolph II of Burgundy, Hugh of Provence and his son Lothar II, Berengar II of Ivrea and his son Adalbert. A few of them held the imperial crown as well; the last was Berengar I, who reigned until 924.

Decline of central government

In view of the inadequacy of the central power and the general political insecurity, to which must be added repeated incursions of Arabs and Hungarians, there was considerable local individuality in the feudal forms prevalent all over Europe. The exemptions and privileges connected with feudal lands and ecclesiastical properties were extended until, to include administration of petty justice, the control exercised by the *missi dominici* was reduced, and, indeed, the *missaticum* was conceded to bishops and feudatories, thus increasing their power and autonomy; *honores* and *officia* became feudal benefices, so that the recipients could hold them in perpetuity and eventually transmit them to their children; bishops obtained increasing administrative power because, in the rulers' view, they could hold lay feudal elements in check. As a result of these developments, the state was no longer run by a central government (except for the remnants surviving at Pavia) but by a hierarchy of noblemen who were bound by a relationship of personal dependency and closely linked to individual localities and to the land.

It would be naïve to give an absolute value to the term feudal anarchy and to think that feudalism represented a pure and simple degeneration of the preceding political system. The fact is that the preceding system had broken down, and another one—feudalism—had to be found to take its place. Feudalism, in spite of its great disadvantages, was an orderly construction, and, as such, it served as the framework of European society for a number of centuries. Although feudalistic fragmentation favoured disagreement among the powerful, it had in some ways a positive function; for example, the efficient organization of local defense against Hungarian incursions. In the course of the 10th century, the plains of northern Italy were covered with *castra;* that is, fortified areas where the people could store food and take refuge in case of danger. At the same time, city walls were restored and fortified by order of the bishops. These local enterprises were important in speeding the demographic and economic recovery that was already under way.

Frankish feudalism, whether because of the influence of Roman law or because of local conditions, did not long keep its original character. The accordance of a "Lombard" fief (*jure Langobardorum*) demanded only an oath of loyalty on the part of the vassal, without any ceremony of homage. The next step was the hereditary conception of the fief (with division, real or theoretic only, among all the sons) and the fragmentation of feudal rights. This explains the unrest of the first decades of the 11th century, culminating in the famous Constitutio de Feudis of 1037, with which Emperor Conrad II conceded the inheritability of minor fiefs.

The origin of the Papal States. Between the middle of the 9th and the middle of the 10th centuries, an event portentous for Italian and world history took place: the formation of the temporal states of the church. It was the end result of a long and complex historical development, in which varied elements—religious, political, military, and cultural—played a part. The first to be considered is the progressive detachment, mentioned above, of the peoples of Byzantine Italy from Byzantium itself. The popes often had to stand up against the interference of the *basileus* in religious affairs and the claims to superiority of the patriarch of Constantinople and to protect the population from Byzantine officials and tax collectors. For this reason the popes came to be considered the leaders of what might be called a national movement. Moreover, the popes took an active part in aid to the poor, especially in Rome. For this purpose they drew upon the church's considerable financial resources and did what the negligent Byzantine government left undone. Meanwhile, all over the West, the authority and prestige of the popes were growing. Everywhere, Rome was looked to as the centre of spiritual and civil union of all the peoples of the West.

The decisive development in the creation of the Papal

Benefits of the papal and dynastic alliance

States was the alliance between the papacy and the new Carolingian dynasty. The alliance benefitted both parties: for the papacy, the Franks were strong enough to hold both the Lombards and the Byzantines in check, but far enough away that, unlike the Lombards, they represented no imminent threat; for the Carolingians, the popes' spiritual prestige ensured the legitimacy of their dynasty. In 756, on his second Italian campaign, Pepin ceded to the papacy the former Byzantine territories of the Exarchate of Ravenna, the Pentapolis, and the duchies of Rome and Perugia. This donation was confirmed and amplified by Charlemagne but not recognized in Constantinople. Thus, the temporal rule of the Roman see was founded on an insecure legal basis. It was no longer a personal and private matter, such as the previous *patrimonium beati Petri,* but neither was it public, *pleno jure*—that is, with an explicit recognition of sovereignty. The religious significance of the donation, however, with its sacred and intangible character, together with the effective exercise of power that followed, eventually lent sanction to the popes' temporal rule. It is equally true that the Frankish king, as a *patricius Romanorum* (the title conferred by Pope Stephen II upon Pepin in 754), had taken on the right and the duty of protecting Rome and the pope against all enemies; hence, the emperor's function as *advocatus ecclesiae,* which came to be an integral part of the ideology of the medieval empire. Although the concept was generally accepted, its application raised serious problems and complicated the relationship between the empire and the papacy.

There has been and still is considerable discussion of the circumstances of the notorious Donation of Constantine, which is so closely linked to the beginnings of the church's temporal power. This was a forgery, a pretended document in which the Emperor, after narrating his miraculous recovery from leprosy and his subsequent conversion by Pope Sylvester, donated to this pope the Lateran palace, Rome, Italy and its islands, and, indeed, the entire western part of the empire. The whole thing is probably the work of a cleric attached to the Roman Curia, between the pontificates of Stephen II and Adrian I. The size and vagueness of the donation make it a statement of principle rather than a legal proof; this is confirmed by the importance that is given in the document to the concession to the pope of the diadem, purple garments, and other symbols of empire and also the equality established between the papal dignitaries and those of the imperial court. It seems as if the forger's primary intent was to establish the pope's claim to a *dignitas* equal to that of the emperor and as if the territorial donation was merely a corollary of that dignity. The use made of the document in the Roman Curia confirms this interpretation. In any case, the Donation of Constantine is an extremely important document for understanding the development of the political ideology of the papacy.

During the reign of Charlemagne, the popes had little chance to make a political place for themselves in the framework of the empire. Pope Leo III had, indeed, crowned the emperor in 800, but there was no doubt that Charlemagne was the dominant partner in the alliance. A few decades later, however, there was a radical reversal in the situation: the various partitions of imperial territories, the wars among Charlemagne's successors, and the Norman invasions had brought the empire to a state of crisis. Energetic popes, such as Nicholas I (858–867) and John VIII (872–882), took the political initiative and tried to save what was salvageable of the empire's unity. For this purpose they had to emphasize the principle of their authority in temporal affairs. John VIII, for instance, declared that it was up to the pope to choose the future emperor (a declaration that was the beginning of the legend that Leo III was the creator of the Holy Roman Empire). The pope was no longer presented as the officiator of a religious ceremony; he appears, rather, as the bestower of the imperial crown.

Papal influence in temporal affairs

The pope's growing political authority and prestige of this period underwent a later eclipse. But the accumulation of past experience was not lost. It served as a testing ground at the period of the struggle over investitures in the 11th century, when the doctrines of the Curia began to take more definite shape. For the moment, the popes were involved in the general process of political fragmentation and feudal localization that characterized Italian and European history in the 10th century. Whereas, for a time, they had held first place on the political scene, after the death of John VIII they remained in the shadow of one or the other faction contending for power in Rome.

Political morality had sunk to a low level in the 9th and 10th centuries; political murders were frequent, and many popes were imposed by force. Notorious is the posthumous trial of Pope Formosus (897), whose corpse was dug up, judged before a council, and then thrown into the Tiber. Yet, in spite of everything, there were examples of civic conscience and even of moral stature. The *vestararius* Theophylactus, a papal official who founded the fortune of his family, and his daughter Marozia, successively the wife of Alberic I of Spoleto, Guy of Tuscany, and Hugh of Provence and, hence, involved in the major political currents of the time, stand out as examples of boundless energy and genuine constructive ability. Marozia's son, Alberic II, assumed the title of *princeps atque omnium Romanorum senator* and ruled over Rome from 932 to 954. Alongside episodes of violence, one finds remembrance of the traditions of Classical antiquity and a desire to restore order to both church and state. Alberic, for example, led an expedition against the monastery of Farfa in Sabina, where religious life was in decay, and turned the monastery over to Cluniac reformers.

But it is in the struggle against the Muslims that one finds the brightest sporadic examples of faith, patriotism, and courage on the part of the popes, the aristocracy, and the people of Rome between the 9th and 10th centuries. The Arab threat was very real. In 846 the Arabs had sailed up the Tiber and sacked the basilicas of St. Peter and St. Paul. Pope Leo IV and the Romans replied by raising walls around St. Peter's (the "Leonine city") and stretching a chain across the river. In 849 a Muslim fleet was defeated at the mouth of the Tiber by ships belonging to a league made up of Rome, Gaeta, Naples, and Amalfi. John VIII tried his best to maintain a united front of southern princes against the Arabs, though without success. Indeed, the Muslims built a military base at the mouth of the Garigliano, which became the departure point for destructive expeditions against the towns and rich monasteries of the interior. "Redacta est terra in solitudine" ("The land was given up to wilderness"), wrote one chronicler. Finally, Pope John X, a creature of Theophylactus, managed to rebuild the league, which now included a Byzantine fleet; in 915 he personally led a successful attack on the base on the Garigliano. At this period of Roman history, traditionally known as the Iron Age of the papacy, there existed a vital impulse, an exceptionally powerful charge of energy, and an organizing ability that were not confined to the pursuit of personal ambitions but were often inspired by idealistic political purposes.

The Arab threat

Venice and the cities of Campania. Venice is one of the few Italian cities stemming from the Middle Ages and the only one to have a demographic, economic, urban, cultural, and political character of an individual and exceptionally original kind. During the barbarian invasions of the 5th and 6th centuries, the clergy and many of the people of the interior of Venetia sought refuge on the coast and on the coastal islands between Grado and Chioggia. There, they soon developed an intensely associative life, witnessed by the transfer of the patriarchate of Aquileia to Grado and by the creation of the new bishoprics of Caorle, Eraclea, Iesolo, Torcello, Malamocco, and Olivolo (Venice), which, one by one, inherited the ecclesiastical structures of the hinterland dioceses. The increase of the population and the consequent necessity of procuring supplies and transportation stimulated economic development. Not all the refugees were poor; among them there was a majority of *possessores* who had brought with them their transportable wealth and hence were able to put up capital for commercial enterprises. At the same time, the *possessores* kept—or later recovered—at least part of their landholdings in the back country. In the 8th and 9th centuries, there arose an aristocratic and business-minded class that exploited its capital in trade, transportation, salt mines, and moneylending, a class that was fated to play more and more of a role in politics.

Politically, the various centres in the process of formation along the coast and on the Lagoon joined together toward the end of the 7th century in a duchy ruled by a Byzantine duke. The seat of the duchy was first at Eraclea, then, after about 740, at Malamocco, and finally at Rialto, the first nucleus of Venice, from the beginning of the 9th century, a period of decisive importance for that city. The Carolingians, who at first tried to conquer Venice, gave up this idea and, in 812, made peace with Byzantium through the Treaty of Aix-la-Chapelle. Venice found itself in the best possible position for economical and political development, as an indispensable intermediary for the relationship between East and West.

The economic growth of Venice

The principal reason for Venice's extraordinary economic growth lay in the change undergone by the economy of the whole Mediterranean area. With the Arab conquest of Syria and Egypt, the Eastern Empire had lost two major markets and also an important source of its food supplies. No longer was there sea traffic between France and the East passing through the western Mediterranean. Under these circumstances the Po Valley assumed an important role, because of its agricultural production and also because the navigability of the river as far as Pavia assured communications with western Europe. Venice found itself at the crossroads of East and West, which needed each other economically even if, politically, they were divided. Thanks to its independent status and the enterprising spirit of its citizens, it succeeded in putting them in touch and becoming the great trading place for goods (silk, spices, and luxury objects from the East; wheat, oil, and salt from the West) and moneys (Byzantine, Lombard, and even Arab gold coins and Carolingian silver). Later Venice took advantage of its privileged position to make contact with Egypt, Sicily, and the Arab world in general, with which it traded in pelts, wood, arms, and slaves.

As in the other Byzantine territories in Italy, Venice gradually acquired autonomy in the 8th century. *Tribuni, magistri militum,* and *duces* were less and less often chosen by the emperor or his representatives and more frequently elected on the spot. In these choices, quite naturally, the interests of the local aristocracy prevailed. The post of tribune, which was both civil and military, soon became hereditary and so, later on, did that of the duke (subsequently called doge), though with alternating families and with factional strife. Important among these families or dynasties were those founded by Agnello Parteciaco (or Partecipazio; 810–827) and Pietro Candiano (887), which alternately held rule until 976. In that year the first Orseolo came to the fore and founded a new house, the greatest member of which was Pietro II (991–1008). After obtaining recognition of his authority from Byzantium, he carried out an intelligent policy of territorial and commercial expansion. In 1000, to free the Adriatic from pirates' raids, he conquered the coast of Dalmatia as far south as Kotor and assumed the title of *dux Veneticorum et Dalmaticorum.* Then, in 1002, he gave aid to the Byzantines when they were defending Bari against the Saracens. But his dynasty lasted no later than 1032.

The role of the doge

At the time of the Orseoli, the doge was similar to a king. He commanded the armed forces, presided over the court of appeals, appointed government officials, and discharged public funds. He also controlled the church, at least in its material possessions, appointments, and benefices. In all his administrative functions, particularly those concerned with the administration of justice, he was assisted by a *curia ducis,* or ducal council, composed of high government officials, judges, the patriarch, the bishops, and the abbots of the major monasteries. Representatives of the people, called *boni homines* or *fideles,* had seats there as well, but it is likely that they, like the other members, were chosen by the doge. There existed also a *concio civium,* an assembly of all the freemen of the duchy that met on important and solemn occasions. It is probable that this assembly complied with the will of the wealthy landowners and merchants established at Rialto, who, toward the middle of the 12th century, gave the Commune Veneciarum its oligarchic character.

There are interesting analogies but also striking differences between Venice and the maritime cities of Campania: Gaeta, Naples, Sorrento, and Amalfi. They, too, were in the Byzantine sphere and won increasing independence and also importance in sea trade; but the stuff of their history was far more brittle, and they met a very different fate. The essential difference is this: the Campanian cities, surrounded and threatened by hostile or potentially dangerous powers (the Byzantines, the Saracens, the Lombards of Capua, Benevento, and Salerno) never enjoyed a security such as that of Venice. On the contrary, they were constantly forced to remain on guard and on the defensive, with diplomacy and arms, until they were definitively absorbed into the Norman kingdom. Because of the continuous political tension, the aristocracy of these cities could not or would not transform itself into merchants, such as those of Venice, but remained land bound and warlike, while the merchants, drawn from the middle class, were socially and, above all, politically weak. Norman rule, when it came along, merely gave definite sanction to a pre-existent state of affairs. The small centres—Sorrento and Amalfi—once they were amalgamated with a vaster and centralized governmental apparatus, lost all autonomy and were cut back to the limitations of local power. The big city, Naples, did, indeed, maintain and increase its importance (especially later on, under the House of Anjou).

Sicily under the Arabs. From the second half of the 7th century, Sicily was the object of Arab attacks from Africa. The real Muslim conquest, however, took place in the 9th century. Opportunity was provided by the rebellion of the commander of the Byzantine fleet, Euphemius of Messina, who turned for help to the Emir of al-Qayrawān (in present-day Tunisia), a member of the Aghlabid dynasty. His appeal was answered, and an Arab army landed at Mazara in 827. The Arabs soon discarded Euphemius and continued the expedition on their own, conquering Mineo and then Palermo (831). The Byzantines put up a long and stubborn resistance; Syracuse held out until 878, when it was mercilessly plundered. The island became an Aghlabid province, passing after 910 into the hands of the Fāṭimids, the Shīʿite dynasty that in 972 moved its capital to Cairo. From the middle of the 10th century until 1040, Sicily was an emirate, to all effects and purposes independently ruled by the Kalbī family. After 1040 internal dissension divided Sicily into small local lordships until the Normans took advantage of such obvious political weakness and, after a 30-year war (1061–91), imposed their rule.

For approximately 200 years, Sicily was the chief base for Arab expansion on the seas and along the coasts of central and southern Italy. They were not always engaged in piracy and war against the Christians; there were truces and trade agreements and profitable exchanges at a cultural as well as a commercial level. Indeed, political agreements and alliances were sometimes set up between Christian and Muslim princes.

Sicilian prosperity under the Arabs

In these two centuries Sicily enjoyed economic prosperity and an intellectual flowering. The natives were treated with respect and allowed to keep their Christian faith, although this meant that they had to pay tribute money and were in a position of legal inferiority. By right of conquest, land became largely the property of the state or of individual Arabs. There was intense agrarian colonization and much breaking up of large holdings, accompanied by technical improvements, particularly in irrigation. Vineyards were destroyed, but new products—citrus fruits, sugarcane, date palms, and mulberry trees (for raising silkworms)—were introduced. The capital city of Palermo was thickly inhabited and prosperous, with a busy harbour and much handicraft activity. In Palermo and elsewhere, the Muslims built castles, palaces, mosques, and elaborate gardens. Poetry, law, the arts, and the study of the Qurʾān were held in honour, especially at the Kalbī court.

CITIES AND COUNTRYSIDE IN THE EARLY MIDDLE AGES

Urban crisis: the "villae." The period between AD 96 and 180, the Age of the Antonines, was perhaps the happiest in the history of Roman cities. The emperors' policy benefitted the senatorial class—that is, the landowners who held municipal magistracies and made up the strongest single support of the government. Hence, it promoted the development of cities as centres of power and control over vast territories. But this system had its weak points, above all its finances, which steadily took a turn for the worse. In the 3rd and 4th centuries the taxes imposed on the prosperous urban class and the enforced contributions and furnishings of supplies became ruinous. City administrators, harassed by the hostile policy of the military monarchy, gave up their posts and retired to their country estates. The cities, left in the hands of greedy officials, exposed to the violence of military garrisons and barbarian invaders, and ruined by inflation, began to decrease in population and to decay. This was the fate of almost all the cities of the West, Rome included.

The duties of the citizen

In spite of depopulation and economic crisis, Italian cities retained some of their ancient importance. In the 4th century there began a movement toward popular control within the cities. Although it is difficult to measure its exact extent and value, it is an index and demonstration of a collective identity bound up with an urban tradition that endured even through the dark period between Classical antiquity and the Middle Ages. There are some legislative texts from which it appears quite clearly that the Roman state tried to persuade the citizenry of the cities to assume greater responsibilities. An imperial decree of 384 made it obligatory for citizen groups to attend to the repair of walls and aqueducts; in 396 there was instituted a special tax upon all *possessores* for the maintenance of the walls; in 400–401 it was established that only *collegiati* and *corporati* citizens could rent communal lands in or near the city; in 440 city dwellers were obliged to serve, under arms, for the protection of walls and gates. This last decree had serious implications. Not only did it point up the impotence of the central government, but it also contradicted the fundamental Roman principle of separation between civil and military powers. And there was more. In 443 it was established that the whole population of a city should take part in decisions regarding the transfer of municipal properties. By a decree in 458, the entire citizenry was allowed to participate in the election of the *defensor civitatis*—that is, the official, formerly appointed by the central government, who supplemented or took the place of the *curiales.*

Just at the time when there was a tendency to entrust collective responsibilities to the city populations, these populations were increasingly drawn together by a common faith and participation in the same liturgical and sacramental life. For it was in the 4th and the 5th centuries that conversion to Christianity became practically universal in the cities (though not yet in the countryside). The result was a communitarian experience of a new kind that did away with many legal and social differentiations of the Classical age. All these facts point to a new evaluation of the period of the late Roman Empire. Although it is traditionally defined as one of decadence, corruption, and disorganization, such a definition is not all-embracing. The life of those days contained new elements, which held hope for the future, chief among them the development of a civic conscience. People once passive and divided were driven by necessity to become aware of themselves, to organize, to express in a different sort of community the ideals of their faith and the object of their aspirations.

Without doubt the decay of the cities had a causal relationship to the increase and enlargement of *villae* and *saltus,* the tilled or wooded lands that became, more and more, centres of production, social organization, and defense. Soon they obtained exemptions; they could shut the door on the tax collector and get their farmers relieved of military service. One can imagine the attraction of these privileges upon small landholders; by an act called *accomendatio,* they ceded ownership of their lands (conserving its use) to a *possessor,* in return for his protection. The *possessores* were now real local *domini,* or masters. They administered petty justice, collected rents and taxes, held absolute power over their slaves, were accompanied by armed followers (*comites* or *buccellarii*), and sometimes had private churches.

The labour force

As for internal organization, the *villae,* successors to the earlier latifundia, inherited at the start their workings, which were based on slave labour. Later, there came important changes. When the wars of conquest were over, the number of newly captured slaves diminished and that of the older ones diminished as well, because of a low birth rate and also because religion and custom favoured setting them free. Besides these, there were the *accomendati,* the free small landowners who had joined their farms to a large estate. Part of the landed unit, divided into *mansi,* was occupied by farmers or freed slaves, and the *mansi* formed a *massaricium;* a larger part, made up of fields and woods, formed the *dominicum* and was worked by slaves or servants, sometimes with the aid of the free farmers. If the estate had an area of no more than 100 or so acres (40 or so hectares), it was a *curtis,* but, if it was larger (some had an area of as much as 2,500 acres [1,000 hectares]), it was divided into several *curtes,* each with its administrative centre, its *dominicum,* and its *massaricium.* This was the sort of farm estate that antiquity handed down to the Middle Ages, but there were, as shall be seen, other sorts as well.

The villas were not the only form of agricultural organization. Alongside them there were public demesnes belonging to cities, country districts (*pagi*), villages (*vici*), and valley communities (*comunalia, conciliaricia, vicanalia, compascua*), allods (private and free property), and, finally, the great rural properties of ecclesiastical organizations. For lack of data, one cannot say in what proportion each of these types existed. But it is clear that, at least in Italy, they were all represented, even if not uniformly. In the Po Valley, for instance, it seems that there was a majority of small and middling landowners and that only in the 4th century did larger agglomerations come into being, but never, even then, as large as the African *saltus* and the latifundia of Sicily.

It is probable also that, in Italy, the Lombards substantially altered the property structure, especially that of the *villae.* Lack of documentation prevents any definite statement, but it is known that the Roman landowning class was practically wiped out and that the farmers were made tributaries (*tertiatores*). One may most logically presume that the great latifundia were broken up and fell into the hands of the native farmers and the Lombard families that settled in the same countryside. This process was abetted by the Germanic concept of *gewere,* which linked the enjoyment or possession of an object to a right of ownership. Farmers in Italy had, on the whole, an advantage over those of the countries (France, the Rhineland, the region of the Moselle) where there was direct continuity between the Roman villa and the early medieval lordship over the land. This is a fact that may contribute to understanding the development of the Italian agricultural class in the 9th and 10th centuries.

The breakup of the latifundia did not prevent a reintegration of land, under different conditions, through the great increase of ecclesiastical wealth at the end of the Lombards' rule and the beginning of that of the Carolingians. One must remember, also, the survival of the great *curtes regiae,* such as Sospiro, Corteolona, and Bene Vagienna, of which the last named had an area of more than 75,000 acres (30,000 hectares).

Bishops and cities. The link between the bishop and the city was first sanctioned at the Council of Sardica in 343, where it was established that only an important city could be a bishop's seat, "ne vilescat nomen episcopi et auctoritas" ("lest the name and authority of the bishop be taken lightly"). Pope Leo I, toward 446, repeated the same concept, which later served as the basis of a corollary in reverse: there must be a bishopric in every important city. Such statements testified to a long-standing state of affairs—that is, to the increase of episcopal authority from 313 on.

After the Edict of Milan in 313, which extended toleration to the Christians, bishops took an increasing part in urban life. The good works demanded of their religious office included the relief of suffering and the prevention of disaster. They sponsored many charities, such as the distribution of food and the construction of hospitals, protected the poor from the rich and sometimes from the tax collector, exercised an influence over the behaviour of magistrates, both local and national, made up for the deficiencies of public officials (*e.g.*, the construction of an aqueduct at Vercelli and of dikes on the Po River at Piacenza), represented the cities in their dealings with the barbarian soldiery, and either directed or participated in the defense of the walls. These episcopal activities answered a deep-seated need of the times and were well received not only by the local populations but also by the state, which, indeed, acknowledged and encouraged them.

The *episcopalis audientia*

In this connection one must recall the so-called *episcopalis audientia.* In 318, only five years after the Edict of Milan, Constantine decreed that, in a dispute between Christians, the decision pronounced by a bishop should be equivalent to an unappealable civil verdict and be so executed by the appropriate imperial government officials. Decrees dating from 333, 398, 408, and 452 confirmed this recognition of the *episcopalis audientia,* although placing certain limitations upon it. Evidently legislators saw advantages to the state in the bishops' justice. It was preferred by a large part of the population (*e.g.*, that converted to Christianity); it was less bound to juridical formalism and hence more in tune with the new social mentality (*i.e.*, more just); and, finally, it cost nothing. With Justinian the *episcopalis audientia* became more infrequent, chiefly because in a totally Christianized state the bishops were inserted into the regular juridical organization. The Code of Justinian gave bishops supervision over civil judges and provided that, in certain cases, they should take the latter's place. Justinian's Code assigned other administrative tasks to the bishops, particularly in the field of public works. Plainly, bishops were now considered, juridically, pillars of the governmental structure.

This increase of the bishops' power is not difficult to understand. First, there was the sacred character of their office as successors to the Apostles and bearers of their mission. Then, there was the continuity and stability of the office; a bishop's tenure was for life, and this gave it an obvious superiority over the precarious condition of the imperial and city magistrates. Another consideration was the prestige lent to the bishop by the wealth of which he disposed. And even more important was the manner of his election. According to custom, he was chosen by the clergy and people of the city, gathered together on the cathedral green. This made the bishop, theoretically, the representative and fiduciary of the entire population; no other magistrate had the same broad following or moral authority.

Throughout the 5th and 6th centuries and up to the Lombard invasion, the union between the bishops and the citizenry became increasingly close, so that ecclesiastical and civic affairs were closely intertwined. *Fidelis,* one of the faithful, was a synonym of *civis,* or citizen. Everyday life followed the hours of the liturgy, and both the geographical and the administrative layout centred around the cathedral. The assembly mentioned above dealt with both church and city affairs; the cathedral green or square where it met was usually a marketplace as well.

The Lombards did not break up this union; indeed, to some extent they reinforced it. In hard or dangerous times the people gathered around the bishops for comfort and protection. The bishops are chiefly to be credited for the conservation of the civil and civic traditions of Rome, including the principles of Roman law, inasmuch as they probably continued, officially or privately, to act as judges or arbiters of disputes among Christians. But this was essentially a period of transition. In the time of Liudprand, after the mass conversion of the Lombards, the bishops resumed their collaboration with the government, and this role was further strengthened during the age of the Carolingians. The Carolingian counts did not long succeed in stemming the power of the bishops, and the latter became, in most cases, masters of the cities. In the 9th and 10th centuries they obtained a succession of sovereign privileges, especially when it came to the construction and defense of city walls and the concession of markets (Bergamo, Mantua, Modena, Como, Vercelli, Cremona, and others). The bishops collected tithes from their own faithful and virtually exercised civil as well as ecclesiastical rule of the entire district. This explains why, toward the middle of the 10th century, some of them bore the title of count, which was simply an acknowledgment of the authority they had in civil affairs.

The episcopal vassals

For aid in their governing functions, the bishops needed trusted men, chosen from either clergy or laity. In the oldest times there existed a *defensor ecclesiae* (a layman) and then a *vicedominus* (an ecclesiastic). Later, in the prefeudal and feudal ages, there were *advocati, confanonerii,* or *vexilliferi,* and other minor officials who were chosen among families that favoured the bishop and who received fiefs, income, and benefices from church property. But this ever more numerous and demanding class of episcopal vassals, augmented by minor feudatories and by the *cives majores* or *boni homines*—that is, the petty landowners or lessees originating in the country and, in the city, exercising the specialized professions of judge, notary, doctor, or merchant—was the one that brought on a crisis of the bishops' rule. The way was opened to the formation of the communes, end results of a process of profound social change taking place in the 9th and 10th centuries.

Economy and society in pre-communal Italy. In the period roughly between 750 and 1000, during which East and West grew apart economically as well as politically, Italy was still, however, in the ambit of Byzantine power; that is, the south depended on Byzantium directly, while the Lombard and Carolingian north were linked to it indirectly. The fact is important, for it signifies that Italy never, or practically never, had a closed economy. On the contrary, commercial exchanges always flourished; there were many markets and an absolutely necessary circulation of money. Even the Lombards struck coins, among them the gold *tremissi,* minted in Lucca and Pavia. No comparison can be made between the economic structures of Italy and those of France in the 8th and 9th centuries. If the expression "economy of the *curtis*" may apply to continental Italy, it means only that most of the agricultural production was organized in *curtes*—that is, in farm units—and has no implication of autarchy or of doors closed to the outside world.

In southern Italy, trade relations with Byzantium and the East in general were quite active and favoured by political circumstances. Amalfi had colonies and warehouses at Constantinople, Antioch, and Durazzo; its ships sailed up the Adriatic and the Po River all the way to Pavia, put into the Arab ports of Sicily, and made their way along the Tyrrhenian coast as far as Rome, Pisa, and Genoa. On the opposite shore, Bari, which had become the capital of Byzantium's Italian possessions, had trade with Constantinople, Durazzo (Albanian Durrës), Greece, and the ports of Asia Minor and Syria. Along with Siponto, to the north, Bari was the embarkation point for pilgrims going to the Holy Land. And it was through Bari, Siponto, Trani, and Barletta that Byzantium got its supplies of Puglian grain. There can be no doubt, then, that southern Italy was a part of the Byzantine sphere, the economy of which was based on the exchange of goods and money. Even the Arabs contributed to the Byzantine economy, above all through their commercial dealings with Amalfi. Their gold dinar was as acceptable as the Byzantine bezant or hyperper.

Importance of the Po Valley

As for the north, the Po Valley became an important source of wheat and foodstuffs to the Byzantines after their loss of Egypt. The Lombards were not gifted for trade, but they did not prevent natives or other foreigners from engaging in it. An edict of King Aistulf of 754, concerning military service, put *negotiatores,* or merchants, on the same plane as landowners; both categories were divided into three classes, according to the amount of money and property in their possession.

The great artery, then, was the Po, navigable all the way to Pavia, and with it may be grouped the rivers flowing into it from the north—Ticino, Lambro, Adda, Oglio, and Mincio—all navigable for short distances. At the points where these entered the Po, there were small ports and customs offices; the great marketplace was the capital of the kingdom, Pavia. The first traders to sail up the Po were *milites* of Comacchio, bringing salt from the Lagoon to the interior; in 715 they obtained special privileges from Liudprand. The Venetians followed and then merchants from other cities with access to the river system—Cremona, Mantua, Ferrara, Piacenza, Milan, and Pavia.

The development of trade in the Po Valley cannot be understood unless notice is taken of the arrangement of land ownership. This was when the great ecclesiastical holdings were being put together; they had existed before, to be sure, but not in such numbers nor on such a large scale. The many new monasteries founded under the Lombard and Carolingian kings, the donations and legacies that they received, the exemptions and privileges that they enjoyed, the pressures and force of attraction that they exercised in regard to small landowners—all these contributed to enormous episcopal and monastic holdings, unlimited in size and tax free. Frequently, there was a surplus of agricultural production available to meet market demands. In brief, the motivation of the development of trade in the Po River Valley lay in the following factors: bishops and abbots found there the means with which to build and ornament their churches and also to forward their power politics; merchants made considerable profits, as did the government of Pavia and the other cities and potentates from the imposition of tolls and customs fees; new highways of trade were opened up and made operative through the Alps in the direction of central Europe, thereby making the fortune of such favourably situated centres as Milan.

It is not by mere chance that, at the marketplace of Pavia, there were warehouses belonging to the bishops of Lodi, Milan, Piacenza, Reggio Emilia, and, perhaps, Genoa, to the monasteries of St. Ambrose of Milan, St. Antoninus of Piacenza, Bobbio, St. Julia of Brescia, Nonantola, and even to such Frankish monasteries as St. Martin of Tours and Cluny. The operative merchants were not only from Venetia but from Gaeta, Salerno, and Amalfi as well; there were even some Anglo-Saxons among them. This constitutes further proof that the Po Valley was a meeting place of the Eastern and Western economic areas and that, for a time, Pavia shared with Venice the role of intermediary that Venice later played alone.

Secular holdings seem to have had no economic function equal to that of ecclesiastical ones. Probably only the *curtes regiae* had the same acreage. One need only recall that St. Julia of Brescia had 60 *curtes,* more than 700 serfs attached to the *dominicum,* and some 800 farming families to the *massaricium.* The *curtes regiae* did not have the same productivity, since they were made up largely of woods and fallow meadows. As for other secular estates, it seems reasonable to believe that they were, from the start, subdivided and increasingly so because of separate inheritances. The existence of a large fief, or feudal domain, did not necessarily make for economic capacity; lands enfeoffed to the second degree escaped the control of the overall owner. Even if he could count on the yield from widely scattered *curtes,* he could not set up a single management comparable to that of the monasteries.

It must also be noted that during the 9th and 10th centuries a class of peasant was evolving. There was a scarcity of prebendary serfs (*praebendarii*), those worst treated and assigned to the house and land of the master; parts of the *dominicum* were divided into *mansi* and turned over to *casati,* serfs, or *massari.* This made for an increase of the population attached to the soil and for a betterment of its condition, since obligations toward the master were limited and stipulated in writing. Another improved status was that of the *libellarii*—that is, the freemen bound by a written lease (*libellum*). Formerly, these men had been obliged to work the land with their own hands, but, little by little, they won the right to sublease and thus to collect rent. Many of them went to live in the cities. At the very beginning of the 11th century, a rising movement was taking place that was to change medieval society.

Italy under the Saxon and Franconian emperors

THE MAINLAND

The imperial restoration of 962. Toward the middle of the 10th century the Kingdom of Italy was torn by the struggles among the great feudal lords. Upon the death of Lothair II, son of Hugh of Provence (950), Berengar II of Ivrea, who, with his son, Adalbert, already held virtual power, was crowned king. But an opposition, headed by a courageous woman, Adelaide, daughter of Rudolph of Burgundy and widow of Lothair, called for help from Otto I of Germany. Otto, whom Berengar, when an exile in Germany, had already asked to intervene in Italian struggles for power, came to Italy (951), donned the royal crown at Pavia, and married Adelaide. Soon after, by a compromise, Berengar and Adalbert regained rule over Italy, though as vassals of the German king. But the marches of Verona, Friuli, Trent, and inland Istria (all lying across northeast Italy) were given to Henry, duke of Bavaria, to ensure the German king's access to Italy. Some years later, Berengar faced further opposition, and Pope John XII (originally Octavian, son of Alberic, prince of the Romans, and the first pope to change his name) asked Otto to intervene. Otto returned and, in 962, was crowned, together with Adelaide, in Rome. Berengar was soon captured and deported to Germany; later, John XII was accused of betrayal and was deposed, the new emperor replacing him with another Roman, Leo VIII.

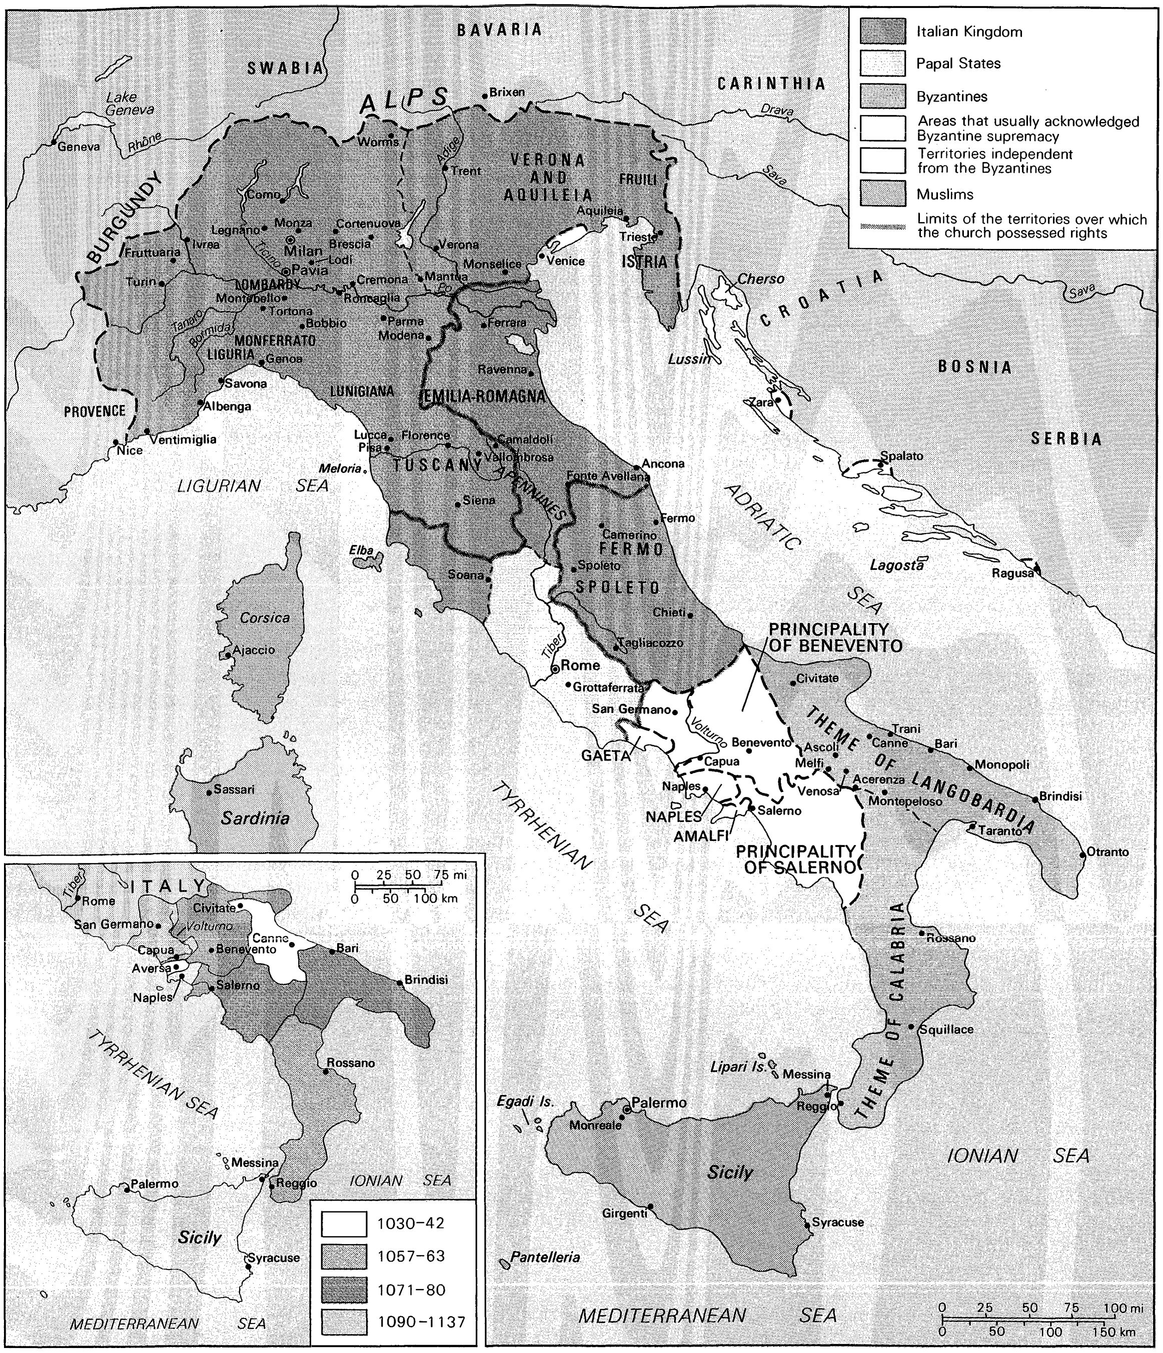
Intervention from Germany

Otto I was obviously appealing to the by now legendary tradition of Charlemagne and trying to restore the Carolingian empire. Otto, like Charlemagne, had won great prestige; he had ruled Germany firmly and, in 955, at Lechfeld (in Bavaria) had defeated the Magyars, preventing their invasion of western Europe; he had ably pursued a policy of penetration and conversion among the Slavs, creating the archbishopric of Magdeburg (in modern East Germany) and a chain of frontier marches from the Baltic down to Bohemia; and he had made himself felt in France, Burgundy, and Italy. Now the time had come to obtain a title symbolizing his rule over Europe.

Here, then, was a superstate, an *imperium plurimarum nationum* ("empire of many nations"); the idea of universality was still of the essence, but it corresponded less to reality than in Charlemagne's day because various countries, especially France, remained outside. From now onward the empire's universality was to be a symbolic aspiration rather than the exercise of power, except in Germany, Italy, and, after 1032, Burgundy, where the emperor held the crown and the *potestas* ("power") of a king. Thus, with Otto I, the empire assumed some of the characteristics that were to remain throughout the Middle Ages. The emperor had first to be the king of Germany, elected by the German princes and crowned at Aix-la-Chapelle (Aachen), whereafter he would have the further title of "king of the Romans" to indicate that he was a candidate for the imperial throne. Then he would be crowned king of Italy (at Pavia—and then at Monza or Milan) and king of Burgundy, after which he would receive the imperial crown from the pope in Rome. This was the lasting structure of what was to be called the "Holy Roman Empire of the German nation." Within this framework there later operated both the new imperial doctrine of Frederick Barbarossa (emperor in the 12th century), intended to strengthen the power and universality of the empire on the basis of Justinian law, and the theories of the Curia (the papal court), which sought to give the pope power to choose and, possibly, also to depose the emperor at will.

Shaping of the Holy Roman Empire concept

For the moment, the most obvious upshot of Otto's actions in 962 and after was the control he had won over the papacy, which went far beyond that of a Charlemagne or a Lothair I. For although the *privilegium Ottonianum* ("privilege belonging to Otto") of 962 confirmed the donations made by preceding sovereigns (except for the area around Ravenna), it also stipulated that the Romans should ask the emperor's approval of a candidate for the papacy and that the newly elected pope should pledge allegiance. Shortly thereafter, Otto assumed the right to nominate the pope—the logical consequence of his policy toward the church. In order to control the feudal lords he sought support from bishops and abbots, giving them fiefs and various privileges. To some bishops, German as well as Italian, he gave the title of count, forming a vassalage all the stronger because it was not hereditary. Thus the ecclesiastical hierarchy became increasingly tied to the



Italy during the second half of the 10th century and (inset) the Norman conquest of south Italy.

feudal structure of society and the state and, hence, to temporal interests. The state, rather than the church and its discipline, benefitted; and herein lay the reason for the great conflict that arose between papacy and empire in the next century.

Expansion in south Italy and Otto I's successors. Otto I was also concerned with expansion in south Italy and struck an alliance, aimed against the Byzantines, with Pandulf, known as "Ironhead," prince of Capua and Benevento, to whom in 967 he ceded the duchy of Spoleto and the march of Camerino. His power politics were fruitless, but his diplomacy succeeded, resulting in a marriage between his son Otto II and Princess Theophano, daughter of the Byzantine emperor Romanus II, in 972. After his father's death in 973, Otto II pursued the same expansionist policy in the south, where he claimed new rights through his marriage. Preoccupied by the landing in Calabria (Italy's "toe") of some Arabs from Sicily, he led an army against them in 981. Unfortunately, his ally Pandulf died just then; and Otto, far from his bases, was defeated in 982, at Punta Stilo. He was organizing a revenge expedition when, aged 28, he died in Rome in 983.

Reign of Otto III

His son and successor, Otto III (983–1002), elaborated an imperial ideology mingling elements of the Roman-Byzantine tradition and Christian mysticism. Before Otto III came of age, the uneasy rule of the empire was wisely maintained by his mother, Theophano, and his grandmother Adelaide. The young prince was brought up among the armies guarding the eastern frontier; but he had more than a military education, having been instructed in religion, Greek, and Latin, as well as German, while he even tried writing. This culture, then unusual for a layman, explains his later behaviour. In 996, when he came of age, he went to Rome, named as pope his cousin Bruno of Carinthia (now southwest Austria), who took the name of Gregory V, and received the emperor's crown from him. By nominating the pope, Otto hoped, like his father and grandfather before him, to remove the papacy from Roman factions and restore its universal mission. There was, however, stubborn opposition; a powerful Roman patrician, John Crescentius, ran Gregory V out of the city and put an anti-pope in his place. Otto brought Gregory back to Rome, put down the rebellion, and had Crescentius tortured and killed (998). A year later, when Gregory died, Otto nominated his former teacher, Gerbert of Aurillac, archbishop of Rheims, who took the name of Sylvester II. This was the formative moment of the young emperor's religious and universal ideal. He settled the court in the imperial palaces on Rome's Palatine Hill and restored Byzantine offices and ceremonies. From a Rome that was again the centre of the empire and the *caput mundi* ("head of the world"), emperor and pope, in perfect accord, were to eliminate abuses, reform the clergy, and extend Christendom. The peoples of eastern Europe came under this plan, and it was now that the duchies (later kingdoms) of Poland and Hungary entered the orbit of the Catholic Church.

Otto III acquired intense but tormented religious feelings from such spiritual leaders as Adalbert of Prague, Nilus of Rossano, Odilo of Cluny, and Romuald of Camaldoli; but his political and religious dream was even shorter than his 22-year life. In northern Italy he had to face one Arduin of Ivrea, who was struggling against the local bishops and had executed one of them; in Rome, a new rebellion enforced Otto's flight, and he died in 1002 before he could return to the city.

Italian unrest. After Otto's death, Arduin had himself proclaimed king of Italy in 1002 by a hastily assembled group of nobles. But his adversaries, many of them bishops, produced a rival, Henry II, duke of Bavaria, of a collateral branch of the House of Saxony. Henry overcame Arduin in Italy in 1004 and was in his turn crowned king of Italy at Pavia, though a fight between local citizens and the German soldiers considerably damaged the city. Henry II immediately returned to Germany, leaving Arduin some freedom of action. He came back in 1013–14 to receive the imperial crown from Pope Benedict VIII; and in Rome, too, a violent anti-German reaction occurred, with Arduin's supporters participating. The failed revolt and other circumstances persuaded Arduin to retire to the monastery of Fruttuaria, where he died in 1015. Henry II returned for the third and last time in 1021. In agreement with Pope Benedict VIII, he concentrated on southern Italy, where shortly before had occurred a revolt, led by one Melus of Bari, against the Byzantines. Henry died in 1024 in Germany, whereupon the citizens of Pavia destroyed the royal palace.

Revolts against foreign rule

Feudal and ecclesiastical developments. The real significance of Arduin's action is in representing the reaction of feudal laymen to excessive episcopal power. Arduin had the support of the *secundi milites,* the minor vassals or vavasours, seeking better positions in episcopally controlled administrations. At first Henry II quite naturally sought episcopal support, installing trustworthy German clerics, some of them court chaplains or even members of his family, in such northern Italian sees as Como, Cremona, Trieste, Lodi, Turin, and Ravenna. Later on, under pressure from below, he tended to favour the vavasours and the *cives* ("citizens") and to limit the bishops' privileges.

Between the late 10th and the early 11th centuries several large marches, governed by powerful noble families, often originating north of the Alps or bound by relationship or interests to families of Provence, Burgundy, and Germany, came into being. These marches were not organic territorial units, made up of a certain number of counties; for cities had acquired some autonomy under episcopal rule, and in the countryside privileged ecclesiastical properties and new feudal or landed estates were forming. In any case, the noble families of the marches were powerful through having their own domains, even if scattered and not adjacent to each other. Only toward 1200 did great families tend to subdivide branches, each linked to a locality whence it took its name. For instance, the Obertinghi, descendants of a Count Obert (who acquired status first with Berengar and then with Otto I), possessed, besides their own march (composed of Genoa, Luni, Bobbio, and Tortona), the counties of Milan and, in the 12th century, Cavallo and Monselice. The descendants of the Obertinghi include the Estes, the Malaspinas, and the Pallavicini.

The division of the great families

The march of Verona, which included the whole of Venetia, Trentino, Trieste, and inland Istria, had a particular status, being part of Germany. Meanwhile, within it the ecclesiastical principalities of Trento, Aquileia, and Trieste were forming. Within the Kingdom of Italy were the new marches: Ivrea (or Anscarica, from the name of its local dynasty); Turin (or Arduinica), which included western Piedmont all the way to Ventimiglia and Albenga on the present Franco-Italian border; western Liguria (or Aleramica), later divided into the two marches of Monferrato and Savona; eastern Liguria (or Obertenga), extending southward from the Po and Tanaro rivers to include Genoa and the coast southeast of it all the way to Luni; and the march of Canossiana (or Attoniana), which extended from the Apennines near Modena and Reggio Emilia to beyond the Po and the vicinity of Mantua and Brescia. Besides these new marches were older ones such as Tuscia (Tuscany), soon to be joined to the Canossiana. Theoretically dependent upon Tuscia was Corsica, which actually was abandoned to Saracen invasions, but which in the 11th century became an independent republic called the Terra di Comune (Land of the Commune). There were also the duchy of Spoleto and the march of Fermo-Camerino (eastward from Camerino to the coast).

The House of Franconia and the struggle over investitures. The insurrection of Pavia in 1024 and the destruction of the *palatium* ("palace") had grave consequences. The authority of the Count Palatine was lost, and the royal court and the central administrative offices disappeared. With even more important results, so did the Royal Chamber, which had rigidly controlled the city's craft guilds and collected taxes and donations. Under milder episcopal government, citizens enjoyed greater economic and political freedom. The greatest advantage accrued, however, to Milan, which practically escaped from the domination of the nearby capital and was able to expand. The people of Milan seemed to be unified under their bishops' guidance and to have political aspirations, based on awareness of the city's economic development and on pride in their religious tradition, the Ambrosian rite.

A great Milanese archbishop, Heribert of Intimiano, set the trend of Italian politics in the critical period that followed the death of Henry II. He and his followers called upon the Duke of Franconia, later known as Conrad II, a Salian, who founded a new imperial dynasty. Conrad was crowned king of Italy at Pavia in 1026 and emperor in Rome the year after. Present at this second ceremony were two sovereigns: Canute (Knut), king of England, Denmark, and Norway; and Rudolph III, king of Burgundy, who thus bore witness to the prestige of the imperial crown.

Feudal upheavals. Conrad II rearranged the major Italian fiefs. First he joined together the marches of Attoniana and Tuscia, an exceptionally large and important territory destined to play a decisive role in future events, under the rule of the faithful margrave Boniface of Canossa. Then, in keeping with the German emperors' perennial need to control all the roads giving access to Italy, he detached the bishopric of Trent from the march of Verona and joined it to the duchy of Carinthia, establishing at the same time direct imperial rule over the patriarchate of Aquileia, which acquired a more clearly defined territorial and feudal identity and was governed by German patriarchs.

Redeployment of localities

In 1032, after the death of Rudolph III of Burgundy, Conrad II inherited his kingdom but had to make good his claim by military occupation. In this successful process (which led to his coronation as king of Burgundy in 1033) he was aided by an Italian contingent led by Archbishop Heribert and Boniface of Tuscia, together with a minor Burgundian noble, Humbert the Whitehanded, ancestor of the House of Savoy. The expedition had still other results. Upon their return to Lombardy the lesser vassals, or *secundi milites,* who had undergone considerable hardships and financial sacrifices in order to follow Heribert, revolted against him.

This rebellion, the first of many social upheavals, had its roots in the time when Landolph of Carcano was archbishop of Milan (983) and many properties of the Milanese church were enfeoffed to his supporters and members of his family. This made for a powerful and privileged class, called the *novitii capitanei* to distinguish them from others with powers derived from the breakup of the possessions of the counts, who took in the tax (*decima*) paid by country parishes and held jurisdictions (*districtus*). In their turn the *capitanei,* by sub-enfeoffing, had created a class of lesser vassals, bound to military service but without any hold on the land. These *secundi milites* had grown in numbers and, beginning with the time of Arduin, had been demanding a definition of their rights and possessions. Inimical to the *secundi milites,* or vavasours, were not only the *capitanei,* and hence Heribert, but also the *cives,* that is, the merchants, money changers, magistrates, doctors, and notaries in the city who owned nonfeudal houses and lands. The *cives* had, indeed, interests quite separate from those of the vavasours; and they saw Heribert as a man able to increase the city's political power and forward its economic development. The vavasours, on the other hand, found support in the rural nobility of the counties of Martesana and Seprio, which was already in conflict with the *capitanei* and Heribert; in the cities pitted against Milan, such as Pavia, Lodi, and Cremona; and, to some extent, in the *rustici,* that is, the peasants, who were equally oppressed by feudal holders of *districtus* and by allod (nonfeudal property) owners and lessees (*livellari*), who did not themselves till the land.

Unexpected results of intervening in class conflict

Such was the array of forces when Conrad intervened in behalf of the vavasours. With the Constitutio de Feudis (Constitution Concerning Fiefs) of 1037 he established the rule that no vavasour could be deprived of his fief without a sentence passed by his peers. A fief, moreover, was entailed to the owner's children or nearest relations. This was a radical change in an imperial policy that heretofore had favoured the bishops. But the results were not what Conrad had expected. The vavasours, once they were pacified, made peace with the *capitanei,* while, on the other hand, Heribert and many other bishops were antagonized. Conrad faced up to the new situation by striking an alliance with the secular lords. Then he returned to Germany, dying there in 1039.

Henry III and the ecclesiastical reform movement. Conrad was succeeded by his son, Henry III, who for several years was involved in a struggle against Bohemia and Hungary and had to neglect his Italian affairs. Meanwhile, a civic revolt took place in Milan. The *cives,* who had stretched their muscles in previous episodes of a similar kind, drove Heribert, the *capitanei,* and the vavasours out of the city. Then for three years (1042–45), under the leadership of the noble Lanzone, they stood off the siege of their adversaries. Eventually there was a reconciliation; *capitanei* and vavasours came to terms with the *cives* and returned to the city. It was no commune, but there were the bases of a commune's foundation: the deposition of the archbishop and the solidarity of the three main social classes, with the idea that there must be cooperation among them.

Henry III had to deal with circumstances very different from those familiar to his father, but he showed remarkable ability in adjusting himself to them, particularly in the understanding with which he treated the *cives* of Milan, Ferrara, and Mantua. He realized that the bulwark they provided against the encroachments of the bishops and their feudatories might strengthen the empire. At the same time he assured himself of the loyalty of the bishops, especially those whose sees straddled the roads to Germany, such as Como, Trent, and Verona, or which were the centres of large territories, such as Aquileia and Ravenna. To these sees and to the rule of various cities of Venetia he named trusted Germans. As a successor to Heribert in Milan he chose a country cleric, extraneous to the cathedral hierarchy, which was linked to the families of the *capitanei* and expected to furnish a candidate for the archbishopric. Obviously Henry shared his predecessors' rigid concept of the supremacy of the emperor over the bishops. But one cannot fully understand his policy unless one takes into account certain other local conditions that influenced him, above all the religious revival of the 11th century. For Henry was sensitive to demands for clerical reform and considered that he must eliminate abuses and make the church respectable.

Reorganization of the monasteries

In Italy there was much religious ferment. Already in the 10th century the Cluny reform had reached Italy, resulting in the founding or re-ordering of monasteries at Pavia, Rome, Fara Sabina, Pomposa (Ravenna), Fruttuaria (Piedmont), and Cava dei Tirreni (Naples). But the Cluny reform had lost its initial impact, and its strictly monastic ideal was not broad or strong enough; everywhere were complaints about unworthy prelates, the church's temporal interests and submission to secular power, and the clergy's practice of simony (traffic in ecclesiastical preferment) and concubinage. On the one hand, a reaction occurred in the rise of religious orders of hermits and cenobites founded by Romuald of Ravenna (at Camaldoli), Peter Damiani, his disciple and biographer (at Fonte Avellana), and John Gualbert (at Vallombrosa), all of them fired by asceticism; on the other hand (but a little later, beginning in 1057), there was a violent popular protest, represented chiefly by the reform party known as the Patarines of Milan and Florence, against bishops linked too closely to the empire and against the unseemly behaviour of the clergy. This latter movement was strictly secular and worked from below, its religious motivation having economic factors. The promoters were unwilling to leave to the clergy the profitable administration of the church's wealth, which they felt should be used by the whole community. In southern Italy there was a particular movement of reform of the monastic rule of the Basilians, which was inspired by Nilus of Rossano, founder of the monastery of Grottaferrata.

Henry III, in contact with the chief monastic reformers—Odilo of Cluny, Peter Damiani, Alinard of Lyons—favoured the reformed congregations and influenced the choice of bishops and even popes. He took drastic action on his first visit to Italy, in 1046: a schism in Rome had led to the election of three popes, and Henry voided all three elections and named a man of high moral calibre, Suitger, bishop of Bamber, in Bavaria, Germany, who took the name of Clement II. Subsequently he named three other reputable German bishops: Damas II, Leo IX, and Victor II.

The choice of Leo IX (1049–54) was of especial importance. As Bruno, bishop of Toul, in northeast France, he belonged to a noble Alsatian family related to that of the Emperor and had close connections with the reformers of Lorraine. No sooner was he elected than he undertook an energetic policy of reform. In Rome and Pavia, and later in France and Germany, he presided over a succession of councils that condemned the worst abuses—simony, concubinage, and the usurpation of ecclesiastical benefits. Unworthy prelates were deposed and there was a restatement of the laity's obligation of tithing. Such policies were extended even to southern Italy, where the situation was complicated by the presence of Normans and Byzantines. On various occasions the Pope and his supporters called attention to the necessity of respecting Canon Law in regard to the election of bishops. Leo himself gave the example when, even after the Emperor had chosen him, he insisted upon being regularly elected by the clergy and people of Rome. The reformers brought equal energy to bear on their support of the principle of the authority of the see of Rome over the universal church. Their defense of this principle came to a climax during the conflict with the patriarch of Constantinople, Michael Cerularius, which led to the definite schism between the Eastern and Western churches in 1054. The situation was changing: popes were no longer figureheads produced, amid intercity strife, by the counts of Tusculum; they were foreigners, aware of their worldwide responsibilities and bolstered by the emperor's power. The initiative of reform passed into their hands while Henry III was detained in Germany and after his death (1056), when his son Henry IV was a minor and the empire was in a long period of weakness. As the popes recaptured the leadership of Western Christianity, they perceived that the first step toward reform was the elimination of secular interference with church govern-

Incipient clash between emperor and pope

ment—hence the inevitable conflict with imperial power and the later "struggle over lay investiture." With Leo IX the clash was only latent; it did not break out until the time of his successors. Eventually the emperors' weapon of reform was turned against them.

Among Leo IX's successors Nicholas II (1059–61), of Burgundian origin, deserves special mention. At the Lateran synod of 1059 he decreed that from then on the pope should be elected by the cardinals, approved by the rest of the clergy, and acclaimed by the people, while the emperor could only give a generic assent after the election was over. By this decree the choice of the pope was removed not only from the emperor but from the Roman factions as well, and the form that it took then has since endured. This undermining of the imperial prerogative was possible only because Henry IV was not yet of age. And, as substitute for the German emperor's support, Nicholas II made, also in 1059, an agreement with the Normans, naming Robert Guiscard duke of Apulia and Calabria and receiving his oath of allegiance.

Further erosion of imperial power. After Nicholas' death, events followed a logical development. On one side there was the reform party, headed by the new pope, Alexander II (born Anselm of Baggio), representative of the intransigent and often violent popular movement of the Patarines of Milan. This party could count on such fiery preachers and debaters as Peter Damiani and Humbert of Silvacandida and on the interested support of the Norman princes. Against it stood a "conservative" party, composed of members of the imperial court, German bishops, and their Italian fellows linked to the empire and its traditional policy. This latter group had many "clients" and dependents, especially in Lombardy, Venetia, and Romagna, roughly, the area between Geora and Ravenna. Originally it refused to recognize Alexander II and put up an anti-pope, Cadalus of Parma (Honorius II), who was deposed in 1064.

In 1073 Gregory VII (formerly Archdeacon Hildebrand of Sovana), a trusted counsellor of his predecessors and the soul of the reform movement, became pope. He was intensely moral and uncompromising, determined to attack abuses at the root, and in 1075 forbade, under penalty of excommunication, any secular power to concede the investiture of abbeys or bishoprics. This signified a definite negation of the hierarchical feudal system upon which the empire and its single states were based and affirmed the church's complete independence from lay domination. It was a revolutionary act, to which Henry IV replied, after some hesitation, by the Diet of Worms of 1076, which branded the Pope as unworthy and illegitimate and removed him from the throne. This was the beginning, on the basis of the political differences outlined above, of the investiture struggle, which had its beginnings in Italy but soon spread to the rest of Europe.

The humiliation of Canossa

Gregory VII made a rapid and effective reply. He excommunicated the Emperor, released his subjects from their allegiance to him, and thus favoured a revolt of the German princes. Henry IV found himself in a critical situation and came precipitately down to Italy with a small escort in order to obtain the Pope's pardon and removal of the excommunication. The meeting took place in February of 1077 at the castle of Canossa, where Gregory VII was the guest of Matilda, countess of Tuscany, a strong supporter of his policy. Henry had to humble himself to receive absolution, but the danger temporarily blew over. There was a continuation of the crisis, however, in 1080, when the Pope once more excommunicated the Emperor, relieved his subjects of their vows, and recognized Rudolf of Rheinfelden, long since chosen by the German princes, as German king. After this, events became favourable to Henry. At a council meeting at Brixen, where many bishops from northern Italy were present, he had an anti-pope elected (Guibert, archbishop of Ravenna, who took the name of Clement III) and defeated Rudolf of Rheinfelden in a battle in which the latter received wounds that led to his death. In 1081 Henry returned to Italy with an army, defeated the militia of Matilda of Canossa, and for three years besieged Rome. In 1084 he was crowned emperor by the anti-pope but soon after was driven from the city by Robert Guiscard and his Normans, who had come to rescue Gregory VII, who died at Salerno a year later.

The struggle was resumed, after a brief interval, by the next pope, Urban II (1088–99), of French origin. He was supported by Matilda's militia and won success for the reformist, or "Gregorian," party among the cities and bishops of the north. Henry's last resistance was overcome, and, frustrated and embittered by the rebellion of his own sons, he died in 1106.

Henry V, his son and successor (1106–25), and a new pope, Paschal II (1099–1118), tried to settle the controversy peacefully. The Pope proposed the abolition of imperial investiture and, in return, the clergy's renunciation of fiefs and benefices. The idea was Utopian because too many private interests were involved, and, indeed, the German bishops bitterly opposed it. Tension continued, complicated by the fact that Countess Matilda, upon her death in 1115, left all her properties—both fiefs and allods—to the Roman Church. The former, because they had been granted by the empire, should rightfully have returned to it; hence another conflict.

The investiture question finally reached a compromise solution in the Concordat of Worms (1122), drawn up between Henry V and Calixtus II. It was stipulated that the emperor should no longer concede a religious investiture with the symbols of ring and staff. In Germany, an elected bishop or abbot was to receive from the sovereign only temporal investiture (with a sceptre), which would be followed by religious consecration; in Italy, this consecration was to precede temporal investiture and the latter was to take place without the sovereign's presence.

Beginning of the papacy's paramountcy

After 70 years of bitter struggle the system remained substantially the same as before. Yet great social and political changes had taken place. First of all, the Church of Rome had taken the place of the empire as the pilot of Western Christendom; the most obvious proof is the First Crusade, an imperial sort of enterprise but eminently the work of Pope Urban II. The prestige of the Roman see was very high; and the Normans of southern Italy, the Christian states of Spain, England, Hungary, Croatia, and even the princedom of Kiev recognized in it some sort of feudal superiority and had recourse to it for protection. Within the church itself there was a radical transformation. The necessity of closing ranks in the struggle against secular interference caused the popes, in particular Gregory VII, to strengthen the central authority, that is, that of the apostolic see over the bishops. This determined what was to be for centuries the structure of the church, rigidly hierarchical and centred in the papal Curia, with a clergy to which all sacramental prerogatives and disciplinary powers were entrusted and a laity that had no more than a passive role. At the same time a new, theocratic theology was developed. The temporal was subordinated to the spiritual; and it became the popes' right and duty to intervene in such events as the election or deposition of an emperor, conflicts among states, and violated oaths that imperilled peace among Christians and their souls' salvation. Gregory VII was the great artificer of these ecclesiastical and political doctrines, which inspired the project of collecting and defining the articles of canon law.

Another important aspect of this period was the impulse given to civic life and liberty, especially in central and northern Italy. The investiture struggle was actually not a mere political and economic conflict between two great powers. It had also an ideological content, which aroused the participation of the masses. Popes and emperors vied for the citizens' support by the concession of exemptions and privileges. In the cities and fortified castles, groups, alliances, and various *conjurationes* (agreements) were constantly forming. Writers distributed polemical pamphlets discussing such matters as the validity of a sacrament administered by an unworthy priest, the sale of church offices, the grant of contracts in return for political favours, resistance to authority, people's rights, the *libertas ecclesiae* ("freedom of the church"), the articles of Roman law, and laymen's participation in religious life. A world was in ferment, opening up to new ideas and experiences acquired by living together. The most important end result was to be the establishment of the communes.

NORMAN SICILY

The Normans' arrival. Small groups of Normans arrived in southern Italy in the early 11th century. They were adventurers and skilled men-at-arms, seeking their fortune in a smiling land and one divided into so many small, conflicting states that it was easy to enlist in the service of one or another. Gradually the Norman leaders got themselves lands of their own and settled down, pursuing at the same time a policy of expansion. After 50 or 60 years the newcomers constituted an important political and military power, which proceeded to place southern Italy and Sicily under its rule.

In 1017 Pope Benedict VIII called upon a contingent of Norman knights to support the revolt of Melus of Bari against the Byzantines. Subsequently, other Norman mercenaries took part in the wars between Naples and Capua. Sergius IV, duke of Naples, in order to win over the Norman leader, Ranulph Drengo I, gave him his sister for a wife and made him count of Aversa (1030). This first territorial acquisition was followed by others in Apulia and its vicinity, effected by another Norman group headed by the Hauteville brothers (William "Iron Arm" the first among them). The cities and towns in question were Ascoli Satriano, Venosa, Lavello, Monopoli, Trani, Civitate, Canne, Montepeloso, Acerenza, and, above all, Melfi. The possession of these places was legalized by feudal investitures granted by Prince Gaimar IV of Salerno in 1042. Only four years later Henry III gave imperial investiture to Raymond of Aversa and Drogo of Hauteville, brother of William. Probably this was the confirmation of preceding investitures conceded by Gaimar, together with recognition of the superiority that Drogo had asserted over all the other Norman knights who had settled in Apulia.

Resistance of Leo IX to the Normans

Actually, the continuous state of war favoured the concentration of power in a single hand, such as that of Humphrey, successor to his brother Drogo, who came up against the hostility of Pope Leo IX. This pope is important not only in the history of the reform of the church but also for his policy in southern Italy. Fearful of the Normans' growing power, as it threatened the city of Benevento (35 miles northeast of Naples), which he had recently added to his possessions, he strove to bring about an alliance between the two emperors—German and Byzantine—against the Normans. Failing, he went in person to war but was defeated and taken prisoner in the battle of Civitate in 1053. Humphrey had the intelligence to give him honourable treatment and to set him free. Thus, there came into being an agreement between the papacy and the Normans, furthered at Melfi in 1059, when Robert Guiscard, Humphrey's younger stepbrother and successor, pledged allegiance to Pope Nicholas II and assumed the title of *dux Apulie et Calabrie et futurus Sicilie* ("duke of Apulia and Calabria and the future duke of Sicily"). The same pledge was made by Richard of Aversa on behalf of the principality of Capua. These were acts of great historical importance, inasmuch as the Normans legitimized their conquests, past and future, and the popes established their feudal sovereignty over all of southern Italy and Sicily, thus making concrete a long-standing aspiration to political and religious control there and establishing a diplomatic and military base for the coming struggle over investiture.

Norman expansion. Robert Guiscard and his younger brother Roger (the "Great Count") rapidly extended their conquests, beginning with Calabria. In 1060, Roger captured Reggio and soon after Messina, which served as a beachhead for the conquest of Sicily. The island was divided and politically weak, but the Arabs put up a stubborn resistance, which was not overcome until 1091. Meanwhile, on the mainland, just above Italy's "heel," Bari (1071) and Salerno (1077) fell into Norman hands; and the whole territory was united under the rule of Guiscard. Only the Norman principality of Capua-Aversa and the Byzantine duchy of Naples kept a certain autonomy, the former until 1156, the latter until 1137.

In conquering Sicily, the "Great Count" Roger acted as vassal and representative of his brother Robert and hence with a certain de facto independence of the Church of Rome. Moreover, he staved off the formation of too-powerful feudal lordships such as the Norman knights had set up in the former Byzantine and Lombard territories, keeping a large part of the conquered lands and using viscounts and army leaders—officials directly dependent upon him—to govern the island. In short, Count Roger managed to create a centralized and efficient governmental structure linked only in name to the duchy of Apulia and its feudal superior, the papacy. It further happened that, in 1098, Pope Urban II conferred upon Count Roger and his successors an "apostolic delegation," by which they were legally recognized as the pope's representatives for Sicily's ecclesiastical affairs. This amounted to official recognition of the power that Roger had acquired over the Sicilian churches during and after the conquest. The situation was very different from that of 1059, when Robert Guiscard had to recognize the pontiff's jurisdiction over the churches of Apulia and Calabria.

The importance of this became obvious when Roger II (son of the "Great Count") brought about the unification of the Norman territories (1127) and created the new Kingdom of Sicily, with its capital in Palermo (1120). This kingdom was born as a solidly organized and centralized state, with an efficient bureaucratic administration that had authority over both clerics and feudatories. The only thing that Roger II did not completely eliminate was the feudal overlordship of the papacy, which he sought to reduce to a mere formality.

The authority of the Norman king

Norman administration. The Norman rule of southern Italy and Sicily has a historical importance comparable to that of Britain (set up at the same period) for its solidity and duration. The king's authority was conceived as absolute and deriving directly from God, a concept influenced by that of Roman–Byzantine autocracy, as can be seen in the body of law of the assizes of Ariano, applicable to the entire kingdom, put out in 1140. The sovereign was assisted by a *magna curia* composed of the top officials of the kingdom, the princes of royal blood, and the chief prelates and feudatories. In spite of the presence of the last-named category, the curia did not represent the feudal class. It was open, on the grounds of position or career, to men of diverse social ranks and conditions, primarily Normans (and later Franco-Normans and Anglo-Normans), then Italians, Greeks, Lombards, Arabs, and Jews. The major officials were five in number: the Seneschal, in charge of everyone connected with the court; the grand chamberlain, who watched over finances; the chancellor; the "protonotary," head of the notaries; and the admiral, leader of both land and sea forces. The very titles have mixed Norman, Roman–Byzantine, and Arab origins.

As for the ordering of the provinces, the kingdom was divided into circumscriptions ruled by justiciaries and chamberlains, the first having administrative functions and feudal and penal jurisdiction, the second controlling finances and civil lawsuits. Lands belonging to the royal domain and lands enfeoffed both came under the provincial administration; obviously the barons' immunities were quite limited. Equally limited were those of the bishops. The Byzantine imperial–papal model, joined to the traditions of the Norman conquest of Sicily and the privilege of apostolic delegation, had resulted in a rigid subordination of clergy to the state. Feudatories and bishops, tightly controlled as they were by the sovereign, took part in the great assemblies of the kingdom (*curiae generales* or *colloquia*), called together for the proclamation of laws, though they played no active role except at moments of crisis for the monarchy (as in 1189).

Status of the cities

The cities, especially those of the Apulian and Campanian coasts, had by 1000 achieved some autonomy and economic development. Gradually they were incorporated, through treaties and agreements, into the Norman state and legally passed into the royal domain. They were considered mainstays of the governmental structure, but this was too rigid and authoritarian to allow them their former independence. Their autonomy was lost, except for brief intervals, until the statutory revival of the *universitates* (the whole number of citizens) at the end of the Angevin and the beginning of the Aragonese period (in the 16th century). The domain cities entered the *curiae generales* only in 1208 and were permanently incorporated from 1232.

The Norman dynasty continued after Roger II by direct descent, with William I ("the Bad") and William II ("the Good"). When the latter died, leaving no heirs, there was a violent struggle between a nationalist faction that proclaimed the illegitimate royal prince Tancred king and the supporters of Constance, daughter of Roger II, who had married Henry VI, son of Frederick Barbarossa. The latter won, and the Norman crown passed into the hands of the House of Swabia.

The Norman rule over Sicily was not only the embodiment of an orderly and strong government; it provided a place for the meeting and fusion of different traditions, which together produced a vigorous and original civilization. The liberal cultural tradition of the Arab emirs was continued by Roger II. What is left of Arab–Norman architecture (S. Giovanni degli Eremiti, the Zisa, and the Cuba of Palermo, northwest Sicily; and the cathedrals of Monreale, southwest of Palermo, and Cefalù, on Sicily's north coast) and of Byzantine mosaics (in the Palatine Chapel and La Martorana of Palermo and the cathedral of Cefalù) indicate a high level of civic life and culture.

(Gi.Ma.)

ITALY AND SICILY IN THE 12TH AND 13TH CENTURIES

The Hohenstaufen emperors. The conflict (mentioned above) between the empire and the papacy began soon after Frederick I Barbarossa, the second German king of the Hohenstaufen dynasty, had been crowned emperor (1155). The decrees of Roncaglia (1158), issued at the beginning of his second Italian expedition, with the assistance of members of the new Bolognese law school, placed imperial policy on a new basis. Frederick's predecessors Lothair II (or III) the Saxon and Conrad III had only rarely intervened in the affairs of northern and central Italy. Conrad III never came to Italy at all. By the time of Frederick Barbarossa's first expedition (1154–55) the communes had greatly increased their power, and no organized attempt had been made to check them. Frederick tried to strike at the core of the problem by claiming for the empire the royal rights (regalia) that had in so many cases been usurped by the communes.

The real victims of this usurpation, however, had been the bishops and the nobility, who for a long time had been in possession of most of the regalia. The innumerable grants of royal rights had formed an integral part of the traditional system of imperial government. Frederick intended to replace it, to a wide extent, by one of direct control. Imperial officials were to administer town and countryside; and if the communes were to be left some of their liberties, they were to owe them entirely to the emperor. In fact, the Emperor began soon to differentiate between the communes; those that took his side were granted considerable concessions, such as free elections of the consuls. The violent resistance of Milan and other towns was largely responsible for this turn of Frederick's policy. It was significant that Milan's enemies, such as Lodi and Cremona, vigorously assisted in the siege of that town and shared in its destruction in 1162.

The Veronese and Lombard leagues

On the other hand, the revival of the struggle between empire and papacy provided the anti-imperial towns with a powerful ally. The double papal election of 1159 led to a schism; and while Frederick recognized Victor IV, Alexander III was prepared to support any communal reaction against the Emperor. After the fall of Milan, Venice, threatened by the extension of imperial power, had taken the initiative in founding the Veronese League (1164); and in 1167 a second league was formed between several Lombard towns. In the same year, the two leagues joined and entered into close contact with Alexander. In the meantime, Frederick had taken Rome; but an epidemic had decimated his army (1167), and his return route to Germany was almost cut by the Lombard revolt (1168). As a result, imperial authority practically collapsed in Lombardy and was much weakened in Tuscany.

After his return to Italy, Frederick was prepared to give up the execution of the Roncaglian decrees, as was shown in the negotiations of Montebello (1175); but these negotiations were ineffective, and in 1176 Frederick was defeated by Milan near Legnano. In 1177 Frederick concluded the separate peace of Venice with Alexander III, and an armistice with the Lombard League was culminated after six years by the peace of Constance (1183). The Lombard communes were left the regalia inside the towns and, on certain conditions, in the territory, and they retained nearly all their liberties. But the consuls were to be invested by the emperor (a right of which he seems hardly ever to have made use). The peace, however, concerned only Lombardy. In Tuscany, Spoleto, and the Marches, the imperial position had been greatly strengthened during the previous years; and the administrative reorganization that had failed in Lombardy was carried out with considerable success in that region. Moreover, Frederick was preparing the extension of German rule to the kingdom of Sicily.

Imperial ambitions in Sicily

The emperors had made repeated attempts at conquering the Norman kingdom. In 1137 Lothair II had achieved a short-lived success in Apulia; in 1166–67 Frederick had planned an attack on the kingdom. In 1184 the Sicilian heiress Constance, King Roger's daughter, was betrothed to Frederick's son and successor Henry, an event of far-reaching importance for Italy and the empire.

At Frederick's death in 1190, Henry VI had already begun to assert his and his wife's claims to Sicily, King Roger's grandson William II having died in 1189. But resistance led by Tancred, an illegitimate grandson of King Roger, was strong; and it was not until 1194 that Henry succeeded in conquering the kingdom. He left the Norman regime unchanged; the highly centralized Sicilian state was an invaluable addition to the resources of the empire in Italy.

Henry's unsuccessful plan to make the empire hereditary rather than elective would have led to permanent union, since the Sicilian crown was hereditary. Placing imperial rule on a stronger basis than it had ever possessed, it would have been fraught with dangers for the political independence of the papacy. Thus the papacy made a determined effort, after Henry's death in 1197, to destroy the union of Sicily and the empire.

Henry's death was followed by a disputed imperial election; in Italy imperial administration disintegrated rapidly, the communes recovering everywhere what they had lost. Pope Innocent III (1198–1216) took full advantage of this reaction and substituted papal government for imperial administration in the duchy of Spoleto and in the march of Ancona, thus once more extending the Papal States to the Adriatic Sea. Constance of Sicily renounced the imperial crown on behalf of her son Frederick, the new king of Sicily, and appointed Pope Innocent III to be his guardian after her death (1198). The next step in the separation of Sicily from the empire was the renunciation of that kingdom by the German king Otto IV (1201), a Welf who had been recognized by Innocent against the Hohenstaufen Philip of Swabia. But after his imperial coronation in 1209, Otto turned to its conquest, the continuity of imperial policy proving stronger than promises and a change in dynasty.

In Sicily, the preceding years had been marked by internal disorders that threatened to destroy the work of the Norman monarchy. In 1211 Pope Innocent decided to play off the young king Frederick against Otto by supporting his new election as future emperor in Otto's stead. Crowned as German king at Mainz (1212), Frederick II grew rapidly more powerful; and the Battle of Bouvines (1214) sealed Otto's fate. But the success of papal policy was only temporary, for Frederick did not keep his promise to separate Sicily from the empire.

Between 1220 and 1250 Frederick continued with great vigour and much success the policy of his German and Norman ancestors in Italy and Sicily. The years after his imperial coronation in 1220 were devoted mainly to rebuilding and consolidating the structure of the Norman monarchy. Further reforms took place in later years, and the Constitutions of Melfi of 1231 admirably reflected the spirit and working of the highly centralized and bureaucratic Sicilian state. In northern Italy, active intervention began in 1226 and immediately led to the revival of communal resistance; and when in 1227 the new pope, Gregory IX, excommunicated Frederick after his failure to keep the date appointed for the crusade, the pattern of the reign of Frederick I was reproduced, the papacy allying itself with the Lombard towns against the Emperor.

The Peace of San Germano (1230) between Pope and Emperor was of short duration. Open war with the Lombards broke out again in 1236; the great defeat of the league at Cortenuova (1237) was not fully exploited by Frederick; and in 1239 Gregory once more excommunicated the Emperor. The capture of Rome then became a major objective; Frederick may have been on the eve of attaining it at the time of Gregory's death (1241). In 1244 peace negotiations with Innocent IV and the league broke down, and Innocent deposed the Emperor at the Council of Lyons (1245). In the following years the struggle continued with unprecedented violence. Despite numerous setbacks, the imperial cause seemed to be in the ascendant when Frederick suddenly died in 1250.

Changes in mainland government

After 1237 he had reorganized imperial administration in northern and central Italy, introducing and adapting Sicilian methods of government. Vicars general with wide authority governed new provinces, while under them local officials administered towns and countryside. The preponderance of natives of the Sicilian kingdom in the Italian administration significantly contrasted with the leading role played by Germans under Frederick I and Henry VI. Sicily had become the main pillar of imperial rule in Italy, and its great resources held out a substantial promise of success. At the same time, Frederick tried to preserve the support of the German princes by far-reaching concessions (1232).

Frederick's death was a turning point in the history of Italy; it marked the end of the Hohenstaufen policy of placing the country under a centralized monarchical government. The conflicts between Frederick's successors and the papacy continued until 1268. In 1265, Pope Clement IV invested Charles of Anjou with the Sicilian kingdom, where King Manfred, Frederick's illegitimate son, had been consolidating his power. In 1266, Manfred was defeated and killed in the Battle of Benevento. Two years later, Frederick's young grandson Conradin made a supreme effort to save the fortunes of his house; after a triumphant entry into Rome he was beaten by Charles at Tagliacozzo (1268) and executed at Naples.

During the struggles between papacy and empire Italy had become divided into two parties, papalist and imperialist, which in the course of the 13th century assumed the names of Guelf and Ghibelline. This had not only affected relations between states but had also divided the population of the towns, thus giving fresh impetus to local factions. The names remained a tragic legacy of the Hohenstaufen period to the political life of Italy.

Monarchies and communes in the 13th century. By the end of the 12th century, the communes had triumphed in Lombardy and Tuscany; but although the communal movement extended also to other parts of the country, it did not prevail everywhere. Large regions of Italy retained or developed monarchical institutions: foremost, the Sicilian kingdom, but also the papal states Piedmont and Sardinia. Feudalism formed an important element of monarchical Italy, which represented also in this respect a contrast to the antifeudal policy of the communes. With other European countries, monarchical Italy had in common the development of assemblies of estates (*parliamenti*), in which the towns were represented. Originating primarily from the earlier feudal assemblies, the parliaments of the 13th and 14th centuries reflected the attempt to give the towns, together with the feudal classes, an influential place in the political structure of the monarchical states. They thus constituted also a new development in the position of the towns, which often enjoyed considerable local autonomy under monarchical control. Conditions varied considerably, however, both with regard to the functions of the parliaments and the rights of the towns. Thus the Papal States, comprising many communes that had been only recently acquired, contrasted with the Sicilian kingdom, in which the towns had remained strictly subjected to the monarchy from the time of the Norman conquest, whatever the privileges that had been granted to them.

In communal Italy the internal conflicts that began to disrupt the communes in the 12th century created new and far-reaching problems. Caused by rivalries and feuds within the ruling oligarchies and already, sometimes, by social conflicts, they led, toward the end of the 12th century, to the institution of a single executive magistrate (*podesta*). This innovation, however, did not put an end to internal strife. While the consular government disappeared at the beginning of the 13th century, it became the general rule for the *podesta* to be a citizen of another town so that the executive could no longer be the object of family rivalry. The struggles between the municipal parties, led by powerful families from which they often took their names, became a permanent feature of communal politics; and strife was intensified by the custom of the blood feud (*vendetta*) and by the expulsions of the defeated party. The growth of Guelfism and Ghibellinism gave the local parties endless possibilities of outside support and added fresh violence to their struggles. But they were no longer alone in their desire for political control.

The *podesta*

The increase of economic prosperity and the growth of the town populations led to a challenge of the virtual rule of the aristocracy in the communes. The prosperity was primarily the result of the expansion of Italian trade and the development of Italian banking and industry. The Crusades provided Venice, Pisa, and Genoa and, indirectly, other towns with new trading centres on the fringe of Asia; the Fourth Crusade, which established the Latin Empire at Constantinople in 1204, gave Venice a colonial dominion in the Levant, the economic value of which was immeasurably great. The restoration of the Byzantine Empire under Michael VIII Palaeologus in 1261 was not a serious blow to Venice's new dominion, but it gave Genoa vast commercial opportunities at Venice's expense. The Sicilian policy of the papacy after 1250—the offers of the kingdom first to Edmund, son of Henry III of England, and then to Charles of Anjou—provided Italian bankers and merchants with new fields of action. Hand in hand with increasing prosperity went immigration into the towns, the new citizens being recruited from all classes.

The *popolo*

The rise of the merchant and craft guilds was closely related to these developments, another form of organization of the *popolo* being military companies. The *popolo* roughly corresponded to the middle classes, and the final stage of its political formation was reached when it was organized like a commune, with an executive, councils, and statutes of its own. Conflicts between the aristocracy and the *popolo* began early but generally did not reach full strength until the 13th century. A first attempt to settle them led in Milan and other Lombard towns to the government's being shared between the two classes. Later in the 13th century, the organized *popolo* sometimes succeeded in establishing control of the commune, as in Florence in 1250 and 1282.

Instability and civic strife were generally traits of the 13th-century communes. The fate of the vanquished was bitter, the political exile becoming a typical figure; and the victor's desire for permanent power was determined not only by ambition but also by the fear of the consequences of defeat. To grant special powers to the leader of one's party or of the *popolo* might appear the easiest method to achieve this end; but the breaking down of constitutional limitations opened the road for the establishment of despotic government.

Interstate conflicts

Interstate conflicts, which had existed even before the rise of the communes, were a constant feature of Italian politics from the 12th century onward. Caused by quarrels over boundaries, by commercial and political rivalry, or by Guelf and Ghibelline loyalties, they present a bewildering picture, which nevertheless reveals some patterns. Thus the conflicts between Pisa and Genoa, the principal rivals on the Tyrrhenian coast, both aiming at control of Sardinia, continued intermittently throughout the 12th and 13th centuries and culminated in Pisa's decisive naval defeat off Meloria in 1284, which sealed its decline as a great maritime power. In the meantime, the struggle between Genoa and Venice over the eastern trade, beginning in the 12th century, had been intensified by the establishment of Venice's Levantine dominion in 1204 and the restoration of the Byzantine Empire in 1261. Commercial rivalry must have been largely responsible for

Milan's traditional enmity with Pavia and Cremona. In Tuscany, the struggles between Pisa and Lucca began in the 11th century. Lucca, once the most powerful Tuscan town, had been overtaken by Pisa, the chief Tuscan port. Florentine expansion led to mortal enmity between Florence and Siena from the 12th century onward, whereas Florence's growing economic and political power brought about struggles with Pisa from the beginning of the 13th. One effect of these conflicts was that the emperors always succeeded in enlisting the services of communes against other communes. Another result of the conflicts and of the territorial policy of the communes in general could be the acquisition of city-states by more powerful neighbours. But in this respect, too, the rise of the *signori* (seigniories; see below) proved a new departure. (Ed.)

Italy in the late Middle Ages and the Renaissance

SOCIAL AND POLITICAL DEVELOPMENT

The 14th and 15th centuries coincided, in the history of Italy, with the age of the Renaissance; hence, Italian social and political development in this period has been an object of special interest. Not only did it supply the context for brilliant achievements in artistic and literary culture; in addition, these centuries saw the emergence in Italy of patterns of social and political organization that have been conventionally taken as marking the end of the Middle Ages and the beginning of the modern era for the rest of the European continent. According to this view, Italy, in the phrase of Jacob Burckhardt, from his classic *Die Kultur der Renaissance in Italien* ("The Civilization of the Renaissance in Italy"), published in 1859, was "the education of Europe."

Withdrawal of imperial and papal authority. Fundamental to the history of Italy during this period was the virtual withdrawal from the peninsula of both universal powers, the empire and the papacy, whose long struggle, although for centuries disrupting Italian political life, had at least given some unity to its history. The emperors of the 14th and 15th centuries, chiefly concerned with promoting their dynastic interests in Germany, were generally indifferent to Italy. Although they occasionally descended into the peninsula for the prestige of a coronation in Rome and to derive income from selling titles and privileges to local powers, none made a significant effort to impose imperial rule in Italy. And, with the exception of a rare and anachronistic idealist such as the poet Dante, who hailed the visit of Henry VII to Italy in 1310 as the onset of a golden age of peace under orderly imperial rule, Italians were equally indifferent to this traditional source of political authority. Towns and nobles were concerned only to exploit a connection with the emperor in order to consolidate their merely local power or to extort from him the recognition of their own claims as the price of a support that was little more than nominal.

At about the same time, the efforts of the papacy to transcend local politics by a strong reassertion of its universal authority over the powers of Europe met with a major defeat that effectively removed the pope as a strong presence in Italian affairs for most of the 14th century. When Philip IV of France insisted on his right to tax the French clergy to finance war with England, Pope Boniface VIII delivered a stern rebuke in the bull *Clericis Laicos,* which was followed by an emphatic assertion of papal authority in a second bull, *Unam Sanctam* (1302). The French king accepted the challenge. He accused the Pope of heresy for claiming to stand above all secular rulers and dispatched a small army under Guillaume de Nogaret, from the French base in Angevin southern Italy, to the papal residence at Anagni, with the aim of seizing the Pope and carrying him off to France to be tried and deposed. Nogaret forced himself briefly into Boniface's presence and announced his errand; and, although the Frenchman was expelled from Anagni before he could carry out his mission, the aged pope died a few weeks later. The consequences were disastrous for the papacy as an Italian institution. French pressures on the demoralized papal court secured the election of a new French pope, Clement V (1305–14), who soon moved the papacy from Rome to Avignon, in southern France; and there it remained until 1377. The popes in Avignon by no means forgot Italy, but their absence from the peninsula substantially reduced the role they could play in its affairs.

Papacy at Avignon

General characteristics of Italian society. With the two great powers thus absent from the scene, the peoples of Italy were left to determine their own destinies during the 14th and 15th centuries largely without external interference; some historians have seen in this period a great but missed opportunity to construct for Italy a national state comparable to the monarchies developing north of the Alps. This view seems, however, to be based on reading back into the remote past a conception of Italy as a latent political unity that largely reflects the presuppositions of the unification movements of modern Italian history. In fact, since its forcible unification under Roman rule in antiquity, Italy had disintegrated into innumerable local units, and the withdrawal of both the imperial and the papal powers now deprived it of the little coherence its political history had revealed in earlier centuries of the Middle Ages. Italy differed from states such as France or England in its social composition, in its geographical divisions, and above all in its lack of a monarchy around which national institutions and sentiment could be organized. Without such a cohering power, the Italian towns and principalities were neither unified nor in any way checked in their claims to independence; nor were they any longer forced into mutual alliance—as during the time of the Lombard League (formed to combat the Hohenstaufen emperors of the 12th and 13th centuries)—by a mutual need to resist its encroachments. Thus, the history of Italy in the age of the Renaissance consists first of all of the separate histories of a large number of particular political entities, often widely different from each other, that happened to be located on the Italian peninsula and were drawn into relationships with one another less by a sense of community than by their mutual antagonisms.

Some conditions and experiences were, nevertheless, common to most of the inhabitants of Italy. One was precisely this peculiarly local orientation of Italian life, which, to a larger degree than elsewhere in Europe, was centred in towns. These had a certain family resemblance to one another, above all in the intense loyalty they commanded; Italian townsmen saw themselves primarily as inhabitants of particular communities, not as divided members of an Italian nation. Their ardent local patriotism found expression in devotion to local saints, in similar myths about the origins and uniqueness of their towns and in literary compositions praising them, and, negatively, in traditions of enmity with other towns. Their devotion to local independence was manifested in constant appeals for liberty, which to them meant above all the right of self-determination, of freedom from control by any external authority. In the 14th century this concept found juridical definition in the work of commentators on Roman law, common to most of Italy, and notably in that of Bartolus of Saxoferrato (1314–57). Although they still admitted the theoretical supremacy of the emperor, the lawyers adapted theory to practical reality by developing the principle that any community has an original and inborn right to govern itself. In addition, Italy, during these centuries, increasingly shared a common language. Although local dialects continued to flourish, Tuscan, the language of Dante—partly because of the distinction with which he had used it—increasingly became the customary speech of educated men.

Spread of Tuscan language

The Italian towns not only found means to resist the intrusion of imperial authority into their affairs; they also generally worked to reduce that of ecclesiastical authority. Without attacking the theoretical supremacy of the pope, townsmen tended to regard the church, like their secular governments, as for all practical purposes a local affair. Communities erected their own church buildings and quite naturally adopted a proprietary attitude toward them, and in the 14th century they were taking various steps to bring the clergy under local control. In Venice, for example, the Senate appointed bishops, and the government restricted papal taxation of the local clergy and tried clerical lawbreakers in secular courts. In Florence the government also controlled the operations of the Inquisition and abolished many clerical privileges. Such actions were accompanied by a defiance of the traditional sanctions by which the papacy had been accustomed to discipline the faithful to obedience. Florence between 1376 and 1378 and Venice on several occasions chose to ignore a papal interdict. The particularization of Italian life was increasingly ecclesiastical as well as political.

These tendencies reflected not only pressures for local autonomy but also the increasing laicization of Italian society. The precocity of Italian economic development meant that in Italy laymen were rich, educated, ambitious, and assertive to a larger degree than elsewhere in Europe. They were particularly inclined to resent the claims of the clergy to special privileges such as exemption from lay courts or from taxation and to resist any effort by the ecclesiastical authorities to control social and political life—for example, by applying the church's usury laws, which restricted the lending of money for interest. They saw priests not as superior to other men but as primarily the servants of the communities whose spiritual needs they were supposed to meet; in some areas of Italy it was common for parish priests to be elected by the more substantial laymen of the parish. This should not be taken, however, as a sign of any decline in religious fervour. The 14th and 15th centuries were, in fact, a peculiarly devout age in the history of Italy, but Italian devotion now took on a special quality. It found expression in spontaneous and local confraternities of laymen for the purposes of performing pious works and devotional exercises together. Numerous Italian saints, often with lay backgrounds, arose during this period. Lay heretical movements, often strongly anticlerical, were also still active, especially in the 14th century; an example is the Fraticelli, a radical spiritual branch of the Franciscan Order, who were treated with some indulgence by the Florentine and some other secular authorities.

Increased size of cities

The special piety of the age was related to developments in 14th-century economic and social life, which, in spite of wide local variation, also affected most Italians in this period. At the beginning of the 14th century, Italy was reaching the climax of a long period of prosperity, based on commerce, that had accelerated since the start of the Crusades. This commerce had nourished the growth of urban population. At the beginning of the 14th century, three of the cities of Italy and Sicily—Palermo, Venice, and Florence—had populations in excess of 100,000. These three were the largest cities in Europe. Milan and Genoa, with well over 50,000, were not all that far behind; and Bologna, Padua, Siena, and Perugia, with populations of between 20,000 and 50,000, were also sizable cities. Numerous lesser communities were also regarded, by the standards of the time, as major towns.

Crises of the 14th century. The long period of growing prosperity was brought to an end in the middle decades of the 14th century by a great catastrophe that reflected basic weaknesses in the medieval economy. In the decade after 1340, Italy—along with other parts of western and central Europe—was afflicted by successive waves of pestilence, above all by the Black Death (bubonic plague) of 1347 and 1348. Every part of Italy was affected, rural areas as well as towns, the rich along with the poor. In the major cities of Italy for which reasonable estimates are possible, the death rate seems to have been as high as 50 or 60 percent within a period of only a few months. This disaster, furthermore, proved to be only the beginning of a prolonged demographic crisis. Subsequent epidemics followed, in a regular cycle, about every 10 or 15 years, so that the rapid population recovery that usually follows periods of high mortality was regularly wiped out. The danger of death from disease—not only plague but also dysentery, cholera, typhus, typhoid, or smallpox—now became the normal condition of life, as it had scarcely been earlier; and this was to remain the case until well into the 17th century.

Most historians have explained this development as a result of the pressure of expanding population on a limited food supply. By the early 14th century most arable land had been brought under cultivation; intensive exploitation of the soil had reduced the productivity of older regions; and it is possible that a slight change in the climate, bringing cooler weather and unwanted heavy rains in the growing season, may also have been a contributory factor. Thus, agricultural surpluses could no longer tide people over bad years, and the result was periodic undernourishment, which increased susceptibility to disease.

Economic results of plague

The results of so fundamental a modification in the condition of human life brought a considerable change in the atmosphere of Italy in the 14th century. One result was psychological: the optimism of the preceding period came to an end, giving way to a climate of fear and anxiety that was also increased by political disasters, such as the steady expansion of Turkish power at the expense of Christendom in the eastern Mediterranean, and by the disorders of civil life resulting from endemic local warfare. This sense of insecurity was reflected in an intensified religious attitude. Not only were laymen more pious, but the numbers of Italians in holy orders increased, and piety and morality grew more rigid. The results of the pestilence and economic regression were also serious for the highly developed economies of the major Italian cities. Since the demand for goods fell with the depletion of the population, and labour costs increased for the same reason, both prices and profits declined; and the level of business activity fell sharply, especially in that international commerce in which Italy had established its leadership. The famous business enterprises of the Medici in 15th-century Florence were substantially smaller than those of the great Florentine banking and commercial firms of the earlier 14th century, the Bardi and Peruzzi. This reflects the fact that the recovery both of population and of economic activity was slow. Although a distinct upturn was evident by the earlier 15th century and was more pronounced in some parts of Italy and in some segments of the economy than in others, most of this period was characterized by relative, though probably not absolute, economic depression. The brilliance of Italian Renaissance culture was based partly on the restricted opportunities for business expansion, so that wealthy men had both the leisure and capital to devote to other interests.

Economic difficulties doubtless intensified the internal struggles that, continuing from the previous period, increasingly disrupted the life of most of the towns of Italy in the 14th century. Individuals, families, economic groups, and social classes engaged each other in a long struggle that dramatized the need for more effective government that would somehow be able to subordinate competing special interests to the general welfare. By the 14th century the disorderly tendencies of the old feudal nobility had been largely contained, and this group had been generally assimilated into the life of the towns. Another group was now dominant: that of the great merchants, bankers, and industrialists who, organized in their guilds, directed the most profitable economic enterprises of their communities. But the significance of their triumph for the quality of urban life in Italy should not be exaggerated. In sharp contrast to the rest of Europe, there was in Italy no radical distinction between the life-styles and the culture of nobles and merchants. Old aristocratic families often built palaces, settled in the towns, and even engaged in business, instead of remaining proudly aloof from urban life; and merchants tended to absorb their values, buying estates of their own in the countryside and investing in agriculture and reading chivalric romances as well as the classics. Jousting was a favourite diversion of Italian townsmen. Intermarriage between the two groups was also common.

Urban violence

But, in spite of this social and cultural amalgamation and perhaps in part because of the pretensions and militant traditions of the nobility, life in the towns of Italy was increasingly violent. Members of the ruling groups engaged in constant struggles for power with each other, and they also came into regular conflict with groups lower on the social scale, which they everywhere tended to exploit. These lesser elements in Italian society included the guilds of skilled artisans and small tradesmen, which resisted efforts to reduce their political rights, and an unorganized mass of city dwellers, usually of peasant origin, who formed a growing urban proletariat that was denied participation in the political life of the town. Between these groups and also among factions within them, there was constant tension, which exploded in periodic and often bloody civil strife. The result was a high degree of instability, rapid changes in political fortune, brutal seizures of power, conspiracies and aggressions, insecurity, and disorder.

THE ITALIAN STATES IN THE 14TH CENTURY

These conditions prepared the way for a characteristic development in the Italian towns of the 14th century, the rise to power of governments dominated by individual despots (signori). This process, already well under way in the previous century, now became general, especially in the north of Italy, where the disorderly republican rule of the communes gave way, in town after town, to government by one man. In some communities the dominant group imported an outsider, known as a *podesta,* to maintain order; the lordship of the Este family in Ferrara was established in this way. More usual, however, was the appointment of a captain of the people, an officer originally intended to check the growing power of the urban patriciate on behalf of the lesser guilds. Given resources to accomplish this purpose, he was likely to extend his authority by degrees, until it amounted to virtual control over the town and could then be made hereditary. This was the road to power for the Della Scala family in Verona, for the Carrara in Padua, for the Gonzaga in Mantua, and for the Visconti in Milan. Eventually, such lords might detach themselves altogether from the popular origins of their powers, perhaps buying from the emperor the title of imperial vicar or duke in order to emphasize their independence from popular control.

Once established, the signori consolidated their power by the centralization of the agencies of government in a purely personal regime. The lord, though he might continue to respect some of the forms of communal government, in practice exercised unrestricted authority over his subjects. He stood above the law, and his power was limited only by the danger of overstepping what was tolerable to his subjects, who, together, might be more powerful than himself. But he generally had the advantage of a monopoly of military force, for the old communal armies had largely disappeared. Even in republics, ruling groups feared to arm the discontented populace, and busy merchants had little interest in bearing arms themselves. The result was a general tendency to rely on mercenary armies led by military entrepreneurs (*condottieri*), who sold themselves to the highest bidder. Thus, armed force escaped popular control, and the unreliability of such armies, together with the disorders they often provoked, contributed to the increasing decadence of Italian military power in the 14th and 15th centuries.

Mercenary armies

It was once supposed that the rise of the signori was almost universal and was therefore the essential element in Italian political life during the age of the Renaissance. But it has now been clearly demonstrated that a major group of towns escaped conversion into despotism—notably Venice, in the north, and the more important communities of Tuscany, including Florence, Siena, Lucca, and Pisa. In these places merchant groups were usually too firmly in control to need the help of a strong man to preserve order. They could accomplish this, for the most part, by themselves, and so the republican forms of government, which they could dominate, were preserved. In these communities government still rested in theory with the whole body of citizens, though practice was far from democratic. Citizenship was variously defined, but participation in politics was regularly the monopoly of older and more substantial families. Republican governments were, nevertheless, based on what has been called the ascending theme in politics. According to this view, power is not imposed from above but resides initially in the community itself, the ends of government are defined by the community in accordance with its sense of its own special needs, and ruling authority is only delegated to public officials, who remain responsible to those with whose affairs they are entrusted. Such conceptions, the direct antithesis of the descending theme that dominated most medieval political thought, were elaborated in the *Defensor pacis* ("Defender of Peace") of Marsilio of Padua (1324), a work that makes it clear that, even on a theoretical level, the significance of the Italian achievement in politics was not limited to the construction of despotism.

In one respect, however, despotisms and republics were alike: both types of government tended to expand by absorbing their smaller neighbours and gradually constructing larger regional states. Thus, in the 14th and earlier 15th centuries, the chaotic pattern of innumerable petty political units in northern and central Italy gave way, largely through conquest but on occasion by purchase, to a few much larger units. Verona, for example, had by 1335 absorbed Vicenza, Treviso, Padua, and Reggio; and by the end of the 14th century Florence had taken over much of Tuscany. But such regional empires were likely to be unstable and at best were often a mixed benefit. Although they could be exploited economically, they also posed problems of administration and control that further taxed the political and military resources of the major states. The citizens of the absorbed towns resented external rule and were likely to revolt at every opportunity. Moreover, the extended territories to be defended and eventually the rival ambitions of the larger powers to absorb lesser powers brought them into dangerous confrontations with each other.

Milanese despotism. The most aggressive Italian state of the 14th century was Milan, whose history may be taken as additional illustration of many of these generalizations. The city had long suffered from the same complicated struggles and internal disorders that plagued other communities, and its troubled populace finally turned for protection to the Visconti, a noble family with large lands outside the city. Beginning as captains general of the people, the heads of the family also exploited a paper allegiance to the emperor to establish an increasing independence from popular control. But, as with other successful despotisms, the chief basis of their power was the support of substantial groups in Milan who, at least initially, appreciated their ability to preserve order, together with their increasing control of military force. As a result, they were able to dominate one area of government after another: legislation, taxation and expenditures, the judicial system, and foreign policy.

The Visconti family

The rise of the family began with a division of the Milanese patriciate in the 13th century into factions led by the rival families of the Della Torre and the Visconti; these bore, respectively, the old Guelf and Ghibelline labels denoting the pro-papal or pro-imperial parties, though, as elsewhere, these terms were becoming increasingly unreal. The Ghibelline faction was led, after 1277, by Ottone Visconti, archbishop of Milan, whose family claimed aristocratic origins going back to the early 9th century, owned large estates just outside the city, and had long exploited local ecclesiastical office on behalf of its younger sons. Ottone succeeded in defeating his rivals, became virtual ruler of the city, and secured the election of his nephew Matteo as captain general in 1287. Matteo was responsible for a close alliance with the Emperor, an alliance that played a large part in the history of the family. He was appointed imperial vicar of Lombardy, and, although he was briefly expelled from the city by the partisans of the Della Torre, he was able to return after the imperial expedition of Henry VII in 1310, which he had supported. The Della Torre were now permanently crushed, and Matteo was made captain general for life. In 1317 he was able to make his position hereditary, and his successors extended their power step by step, notably under Azzo Visconti (1328–39).

This process was brought to a climax by Gian Galeazzo (1351–1402), who bought the title of duke from the Emperor in 1395 and married a daughter into the princely French House of Orléans, an alliance with unhappy consequences for the future of Italy. Developing his government into something like a modern bureaucracy, he emphasized his power and remoteness from the people with an elaborate court etiquette and replaced the honourable title of citizen so long borne by the Milanese with the more ambiguous name of subject. And, with so much power at home, he came close to conquering and uniting into a single state much of the north of Italy; by 1402 he was threatening to subjugate even Florence, when he was suddenly carried off by the plague.

The effectiveness of Milanese despotism has sometimes been taken to illustrate one of the most significant aspects of the Italian political achievement in this period. In this view, the tyrants of the Italian Renaissance pointed the way to modern politics by being the first rulers to conceive of the state and its government as, in Burckhardt's famous phrase, "a work of art"; that is, a product of rational planning, deliberate calculation, and the careful adaptation of means to ends. Thus, disregarding their own theoretical subordination to the emperors, the Visconti dukes claimed an absolute authority over all their subjects, nobles and townsmen alike. They replaced elected officials with their own men, upon whose loyal service in enforcing obedience to themselves they could depend; they taxed and spent at will; they imposed uniform laws over their state; they took possession of all fortified points, dispossessing the local nobility; and they were even able to institute a censorship over mail and a kind of passport system to control travel. Such an accumulation of measures is indeed impressive and certainly suggestive for the techniques of later European despotism; but it is doubtful that they really reflected a kind of blueprint for the state. As was done elsewhere, the dukes in Milan actually improvised their policies piecemeal to meet particular problems or take advantage of special opportunities as they arose.

Such government, nevertheless, had obvious attractions in a period of general disorder, advantages that were widely advertised throughout Italy by Visconti propagandists such as the Humanist Pier Candido Decembrio (1392–1477). But the people of Milan paid dearly for Visconti order with the loss of their freedom, a loss the significance of which was often highlighted by the ducal government's abuse of its power. Gian Galeazzo's predecessor Bernabò, for example, extorted huge sums from his helpless subjects, and some of his successors in the 15th century were notorious for an arbitrary ruthlessness against which there was no recourse. The rule of despots such as the Visconti was merely personal, and it never succeeded in creating the modern type of institutional state, independent of the individual ruler and able to rely for its stability on the loyalty of the subject. Selfish special interests were kept in check, to be sure, but they were subordinated to the special interest of the ruler, not to the general welfare. And the memory of communal self-government and the resentment of the suppressed special interests persisted in the Milanese state. When the last of the Visconti died in 1447, the Milanese people made a pathetic effort to restore republican government. But the Ambrosian Republic, as it called itself in memory of the great 4th-century Milanese saint Ambrose, could not solve the problems republics had failed to deal with earlier; above all, it could not control the restive Milanese territory beyond the confines of the city. Thus, by 1450 the republic had been overthrown by Francesco Sforza, one of the great *condottieri* of the age, who had served Milan in the past, and a new despotism replaced the old. Milan therefore continued as the outstanding representative of Italian despotism among the Italian states, in both its strengths and its limitations.

Florence in the 14th century. The history of Florence in this period is better known than that of any other place in Italy. This is partly because of the richness of the Florentine archives but chiefly because the importance of the city for Renaissance culture has attracted special attention to its political and social development. That attention has focussed especially on the survival of republicanism in Florence, in which it contrasted strikingly with the despotism of so many other communities, notably that of Visconti Milan. Because they continued to participate in politics and to take some responsibility for the general welfare, Florentines tended to develop explicit loyalties and a habit of participation in public affairs, and their practice can be seen as an important precedent for posterity. Yet the survival of the republic was often precarious in the 14th century, and, in much of the 15th, republican forms of government were little more than a facade for the personal rule of the Medici. Thus, the history of Florence reveals both similarities to and differences from that of Milan.

Florentine republicanism

The independence of Florence was protected by its strength as the largest city of Tuscany and by its surrounding circle of mountains; and its prosperity was nourished by a relatively diversified economy. This economic activity had developed later than the enterprises of the maritime cities and even of Milan. Still a small town at the end of the 12th century, Florence at the end of the 13th had only recently become prosperous. Because of its inland location, it did not specialize in international trade, though, situated on the major north–south route of the peninsula, it actively participated in it. In addition, Florence had become a major centre for cloth manufacturing, especially of woolens, taking advantage of the decline of the cloth industry in Flanders. Since Florence was a major power in the Guelf alliance, its merchants began, in the 13th century, to lend money to popes, for whom they also served as tax collectors throughout Europe, and also to nobles and other rulers. During the 14th and 15th centuries the great business firms of Florence engaged simultaneously in these and in other activities, such as mining. They established a network of agencies abroad, extending from the eastern Mediterranean to England and the Low Countries. The huge Bardi enterprise of the earlier 14th century, for example, had branches in all the larger towns of Italy and in Antwerp, Bruges, Paris, London, Avignon, Rhodes, Cyprus, and Constantinople. The great Florentine merchants also acquired estates in the surrounding countryside, the *contado,* which they actively supervised and from which they drew their food. This connection with the land was typical of the relation between town and *contado* in Italy.

The disorderly Florentine nobility had been largely excluded from political life by a new constitution in 1282, which vested the government in an elected council whose members, called priors, served for very short terms. This meant frequent elections and changes in the membership of the government, and it encouraged a high degree of public interest and participation in politics; it also made for uncertainty. But the restriction of participation in the political life of Florence to members of the organized guilds gave effective control over the government of the city to the more substantial business interests; the great majority of the priors in the earlier 14th century came from just three guilds, which represented the wealthiest men of Florence: the cloth finishers, the wool merchants, and the bankers, all of whom tended, like others in their position, to favour policies advantageous to themselves. Thus, they taxed property in the surrounding countryside but not in the city itself (where their own possessions chiefly lay), while, within the city, taxes were levied largely on necessities, especially food, consumed by the lower classes. The ruling group retained its old Guelf orientation, a residue of the 13th-century alliance with the papacy against the empire, not as a token of political subordination to the popes but, on the contrary, because this tradition represented the freedom of the city from any external control. This orientation also had continuing practical value. Dedicated to maintaining the Angevin rule over Naples that had been arranged by the Pope between the years 1265 and 1268 in order to exclude the Hohenstaufen emperors from Italy, the Florentine ruling class maintained close relations with southern Italy, facilitating the economic exploitation of the Kingdom of Naples by Florentine businessmen, who collected its taxes, monopolized its grain trade, and reaped huge profits. To idealists such as Dante, the result of such prosperity was a gross materialism in which the traditional values of a simpler age were in decay.

The three ruling guilds

Despite its injustices, the system worked well enough during good times, and the peace of the city was only occasionally disrupted by factional disputes in which those who lost (such as Dante himself) were exiled from Florence. But the political organization tended to break down in a crisis, and after 1340 Florence was in serious trouble. As a leading centre of international commerce and finance, it was badly hurt by the general economic decline that began in the following decade, which in its case was aggravated by special circumstances. The leading business houses of the city had made huge loans to England to finance Edward III's war against France, and much of the capital of Florence was tied up in this dubious enterprise. Thus, the subsequent repudiation of his debts by Edward III brought general disaster to the city, and meanwhile the ruling group had been further discredited by the failure of its attempt to conquer the neighbouring city of Lucca. In these circumstances, in an effort to preserve its control over Florence, it imported a French adventurer, Walter of Brienne, who called himself duke of Athens, to preserve order. But, in a manner familiar elsewhere, this man chose to rule for his own ends, and soon all groups in the city united to expel him and save the republic. Indeed, the failure of this experiment was followed by several decades of more popular government as new men came into Florence from the countryside to replenish the losses of population during the Black Death and, in a time of relative social mobility, rose in Florentine society.

The social dislocations caused by the plague thus combined with the strains of the expansion of Florentine dominion over much of Tuscany during the 14th century to produce important changes in Florence. The newcomers from the countryside were needed to replace those who had died; and, as business again slowly began to improve, some of them did well enough to rise in the world and to challenge the older ruling group. The expenses of prolonged warfare gave them an opportunity: the government badly needed money, and any man with the resources to lend it was able to claim the political influence that accompanied being a creditor of the state, regardless of his family background. In the interest of protecting its investments, this latter group of moneylenders was also concerned to make government more efficient. As a result, the procedures of government became more bureaucratic, professional, and impersonal.

Another decade of turbulence after 1375 imposed a further test on Florence, and again it emerged with its republican institutions stronger than before. This period of crisis began with a war against the papacy, a result both of the growing territorial expansionism of Florence and of the disorders in the Papal States during the Pope's absence in Avignon. These tended to spread into adjacent areas of Tuscany, until the Florentines felt compelled to intervene, thus antagonizing the papacy. The ensuing struggle was known as the War of the Eight Saints (1375–78), so called after the committee that supervised it on the Florentine side, and it raised the most serious ideological questions. The Pope, by imposing an interdict on the city and excommunicating its leaders, converted the conflict from a localized and purely political war into an alleged rebellion against ecclesiastical authority. The implied suggestion that Florence had no basis for its existence as an independent and secular state and no right to conduct a policy based on a sense of its own interests brought into question the fundamental issue of Florentine liberty. Florence found a spokesman in its chancellor, the learned Humanist Coluccio Salutati, whose broad propaganda campaign represented the war as a struggle "for the salvation of Italy and the liberty of all." The whole episode was accompanied by vast republican enthusiasm. Although the war itself was inconclusive, Florence came out of it with a deepened sense of the value of its liberty and also of the essentially secular quality of politics.

Revolt of the *ciompi*

This crisis gave way to a new one in 1378 with the revolt of the *ciompi*, workers in the Florentine wool industry, an event that has usually been interpreted as an uprising of the working class against the business group that had long controlled the government as well as the economy of Florence (and it may be that the recent war, waged in the name of liberty, had aroused some radical democratic ferment). More recently, however, this view has proved incorrect; the true leaders of the Ciompi Revolt, it is now clear, were not workers but disaffected members of the old ruling group itself. They managed to form a new government, with a somewhat more democratic constitution, that retained power until 1382. But the new group was unable to maintain order, and the previous rulers then returned to power in a strengthened position; and, in the period that lay ahead, political power gradually contracted once again. Florence remained in this situation until the end of the 14th century, and the continuation of the same group in control of the government through the first third of the 15th century indicates that the republic had attained a new level of stability. Doubtless, a gradual, though incomplete, economic recovery was helpful. In addition, the brief Florentine experiments with dictatorship and revolution also probably contributed to the stability of the republic. They interrupted the tendency of the merchant oligarchy to abuse its position, displaced groups that had long enjoyed authority, and opened up opportunities for new men to rise into the ruling class. The narrowly oligarchical character of the government remained, but in Florence the oligarchs seemed to have learned something from events and to have developed both a broader understanding of their own interests than elsewhere and greater sensitivity to public needs. Thus, faced with a financial crisis in 1427, the government adopted a new and more equitable form of taxation, based, after a careful survey of individual property, on wealth. In this, they displayed a willingness to assume a major responsibility for the support of the state, instead of shifting it to other and poorer men. It is understandable, therefore, that Florentines remained reasonably united in their support of the state; and their city survived as a republic while many other Italian cities were turning to despotism.

Venice in the 14th century. One other great Italian city remained a republic and for reasons partly similar to those that influenced the history of Florence. This was Venice, in which the domination of a merchant oligarchy was even more complete than in Florence. But in other respects the history of Venice was different. Its rise to economic power was not of recent origin but extended back over many centuries; and its island location, detached from the mainland, freed it from the problem, so troublesome to many other states, of imposing discipline on a disorderly landed nobility. The society of Venice was, therefore, unusually homogeneous, and its ruling patriciate had a tradition of solidarity very different from that of individualistic and turbulent Florence. This solidarity was reflected in the active role of the government in the organization and regulation of all aspects of the Venetian economy. The state built a large part of the Venetian merchant fleet in its Arsenal; it organized and directed the convoys in which Venetians transported their commodities on the seas; it imposed standards on Venetian manufactured goods and inspected them for quality in order to maintain the competitive position of the city. It also regulated prices and wages, for, in Venice, guild organization lacked the strength and independence it had in Florence. The relative internal peace of Venice, so widely admired elsewhere, depended largely on the combination of this solidarity with the great prosperity it produced and in which most Venetians shared, though the tranquillity of Venice, known as the Serenissima, "most serene city," and the high degree of personal freedom that went with it—including a tolerance for Jews, Greek Christians, and even Muslims that shocked contemporaries—were generally attributed to the wise arrangement of its institutions and the rigour and equity of Venetian justice.

Venetian tolerance

Political rights in Venice had been restricted in 1297 to those families at that time sitting in the Great Council. Occasional gestures of discontent with this arrangement were ruthlessly suppressed by the Council of Ten, an agency established early in the 14th century that proved singularly effective throughout the long history of Venice in protecting the established government of the city. Since the Great Council was too large to function as an effective governing body, the chief legislative and policy decisions of the republic were the work of the Senate, a body with great prestige, most of whose members were elected by the Great Council. Despotism from above was avoided by such close restrictions on the doge, the executive head of the state, that he was little more than a figurehead except in times of special crisis. The Venetians tended to choose for this post not vigorous leaders but old men for whom it was a reward for a long career of services to the state.

But the republican institutions of Venice were little threatened from either above or below. Venetian society was united in an immensely profitable commerce with the eastern Mediterranean, in which Venice had long been the chief middleman in meeting the needs of all Europe. Although the 14th century brought an end to the regular movement of Venetian galleys into the Atlantic and northward to England and the Low Countries, Venice remained one of the busiest ports of Europe, and its overland trade through the Alps into central Europe continued to expand. The 14th century also saw the decisive triumph of Venice over Genoa, its great rival in the commerce of the East. A series of wars finally culminated in a great naval victory at Chioggia in 1380. Genoa's fleet was destroyed, and it never fully recovered from the defeat. Relieved of this competition and with the gradual improvement of business, Venice entered, in the earlier 15th century, into perhaps the most prosperous period of its history. Its internal stability owed much to this prosperity.

The Venetian empire

Venice also differed from the other states of Italy in one crucial respect. It was not a purely Italian power but the possessor of a great empire consisting of a string of commercial bases extending down the east coast of the Adriatic to the islands of the Aegean and including the great island of Cyprus. A good deal of this empire was acquired in the 14th century in the course of the wars with Genoa. Much of the attention of the republic was directed to its administration, for which Venice developed a body of able patrician officials that has been compared with the British colonial service of more recent centuries. And, concerned with the maintenance of this empire on which its trade depended, Venice could not confine its attention, as did the other Italian states, to the Italian peninsula; indeed, throughout most of the 14th century it remained largely aloof from the affairs of the mainland. The main interest of Venice, in fact, was directed to the larger politics of the eastern Mediterranean. This preoccupation became even stronger in the 15th century, when its interests there began to be challenged by the expanding Ottoman Empire. Against this power Venice fought a long series of delaying actions, in which periods of active warfare were regularly interrupted by intervals of peace and friendly commercial intercourse, at which the official conscience of Christendom professed to be scandalized. Self-righteous indignation against Venice on this score, combined with resentment at its detachment from Italian affairs and envy of its wealth, made it from an early point unpopular with other states. At the same time, Venice acquired a singular reputation for political prudence.

The Papal States. Although Milan was a despotism, and Florence and Venice were republics, they were alike in that each was based on a city that, at least in practice, insisted on its absolute independence from any external control. In this respect, the other major political entities of Italy were somewhat different. The Papal States, extending southward from the River Po, across the Apennines from Tuscany, and then cutting across the centre of the peninsula, included a considerable variety of political units. In the north and centre, Emilia and Umbria had a number of major towns, among them Ferrara, Rimini, Bologna, and Perugia. These were similar in important respects to the towns of northern Italy and Tuscany. Ferrara had evolved in the familiar way from a free commune into a relatively stable and well-governed despotism under the Este dukes; because of its location, it tended to fall under the political and cultural influence of Venice. Rimini was taken over by the Malatesta family. Bologna, though remaining nominally a republic, was dominated by the Bentivoglio family. Perugia fell to the Baglioni family. But these communities, whatever their forms of government, also owed obedience to the pope, whose authority over them involved an ambiguous mixture of spiritual and secular claims. And the pope, though often in no position to do so, was constantly concerned to exact from them what he considered due both to himself and to St. Peter.

Much of the central and most of the southern part of the Papal States consisted largely of feudal domains, some of considerable size, whose proprietors were as likely to rebel against papal control as against that of any secular lord. And, in the absence of the papacy during its residence in Avignon, the Papal States, never very firmly ruled by the popes, disintegrated almost completely. The despots in the towns expelled papal officials and ruled in complete independence; since papal taxation had been heavy and papal authority an irritating infringement on local liberty, these actions were often popular. The nobility fought each other, terrorized the countryside, and did as they pleased, and bandits also made the region everywhere unsafe.

Rome in the 14th century

The restiveness of the Papal States extended also to the city of Rome, which in the early 14th century and in the absence of the papal court was little more than a small provincial town, now overshadowed by the ruins of its glorious past. Economically dependent primarily on the exploitation of pilgrims, Rome had for some time been dominated by a struggle for control between the two great families of the Orsini and the Colonna. Rome nevertheless provided, in the mid-14th century, the unlikely setting for a curious attempt, inspired by memories of its past greatness, to restore a republican government that could lead Christendom in a general movement of moral recovery. It was led by a young notary, Cola di Rienzo, who headed a revolution in 1342 in which the great nobles were expelled and a republic established. But, after obtaining papal approval of this action on a visit to Avignon, Rienzo's idealism grew increasingly extravagant. It became gradually apparent that he saw in the rebirth of the Roman Republic the start of a general rebirth of order and virtue in the Western world. He developed an increasingly messianic conception of himself and dispatched letters to the various cities of Italy and to European princes invoking their support for his program of world reform. But his pretensions eventually antagonized the distant pope, and Rienzo lacked political talents of a practical kind. His enemies combined against him: in 1354 he was overthrown and killed, and Rome returned to its old ways. The episode is, nevertheless, instructive for the mood of Italy in the difficult middle decades of the century. It reveals something of the tension, the despair over the condition of Italy and of the world, and the apocalyptic hope for a dramatic change in the spiritual and political climate that agitated the peoples of Italy during this unhappy period.

The Great Schism

The turbulence of both Rome and the Papal States provides a partial explanation for the long residence of the papacy in Avignon, in spite of the fervent appeals of such figures as the poet Petrarch and St. Catherine of Siena for the return of the pope to Italy. The pope's absence from his traditional home was a major element in the pessimistic mood of the age. Yet the papal court had never ceased to be concerned with the condition of the Papal States; and, in the decade following the death of Rienzo, Gil Álvarez Carrillo de Albornoz, a Spanish cardinal acting as the pope's legate, began the difficult task of reducing them to obedience by a shrewd mixture of force and diplomacy. By 1377 his successors had made enough progress to permit the pope's return. But this achievement was largely thrown away by the Great Schism of 1378 to 1417. The return of Pope Gregory XI to Rome in January 1377 had been greeted with deep joy in Italy, but the aged pope died early the next year. The cardinals were largely Frenchmen who would have preferred to remain in Avignon, but the Roman populace was determined that the next pope should be an Italian. Accordingly, when the Sacred College assembled for this crucial election, a mob gathered outside their meeting place and threatened violence unless its wishes were met. Under these conditions, the cardinals chose the bishop of Bari, who assumed the name of Urban VI. But, on the ground that this choice had been coerced, a group of dissident French cardinals withdrew to Fondi in the shadow of the French-dominated Kingdom of Naples, held a second election, and chose one of their own number as pope. Calling himself Clement VII, he soon moved back to Avignon, and there were now two popes. Under such circumstances the authority of the Pope in Rome was again seriously weakened. Rebellious elements in the Papal States were able to play off one pope against another and to disregard the claims of both, and the Papal States once again fell apart. Another consequence of this situation was the dependence of the popes in Rome on the support of other Italian powers, at times Naples but, more significantly, Florence. The enmity that had produced the War of the Eight Saints (1375–78) gave way to a close friendship that was all the more needed in Rome, since the rivalry with the French papacy in Avignon was accompanied by periods of tension with the Angevin rulers to the south. Humanist scholars from Florence were now regularly employed at the papal court.

Naples and Sicily. The history of Naples and Sicily in this period is largely a story of dynastic changes within the framework of a backward and feudalized society. The effective control imposed by the Hohenstaufen emperor Frederick II collapsed after his death, and the habit of rebellion against central authority long encouraged by the papacy made monarchy in both places constantly precarious. Government in both regions has been described as despotism tempered by revolt. The power of great noble families also kept towns in a condition of political inferiority, and for the same reason class distinctions remained strong. Southern Italy experienced little of that mingling of nobles and townsmen so characteristic of society in the north. Thus, the contrast between southern Italy and the urbanized north was even greater than in the case of the Papal States. Yet, because of their dynastic ties with great powers outside Italy, Naples and Sicily regularly played an important part in the affairs of the peninsula.

The union of Naples and Sicily under the French House of Anjou, arranged by the Pope in the 1260s, had ended in 1282 with the popular revolt known as the Sicilian Vespers. Peter III of Aragon was invited to become king of Sicily on the strength of a distant family connection with the Hohenstaufen line, and Sicily was henceforth under Aragonese rule. The Angevins remained, however, in control of the Kingdom of Naples, supported by the popes, whose feudal suzerainty they continued to acknowledge; this connection became even stronger during the residence of the papal court at Avignon. The direct Angevin line ended in 1382 with the death of Queen Joan I; the one positive accomplishment of her disturbed reign had been the recognition of Aragonese rule in Sicily by a treaty of 1372. Her will had named Louis, duc d'Anjou, brother of Charles V of France, as her heir, and this bequest was to be the basis of future French claims to the kingdom. But, with the support of the Pope in Rome in his capacity as feudal overlord of Naples, the will was set aside in favour of a junior branch of the family, represented by Charles of Durazzo, who became King Charles III of Naples. Angevin rule continued until 1435; then, once again, the direct dynastic line was extinguished with the death of Queen Joan II. She, too, tried to pass on the rule of the kingdom to the French House of Anjou, but she had also made an earlier bequest to Alfonso V the Magnanimous, the Aragonese ruler of Sicily, who won control of the kingdom by 1442. Thus, Naples and Sicily, separated for a century and a half, were reunited under a single head. They remained so only until Alfonso's death in 1458, but both regions thereafter remained under different branches of the House of Aragon.

Other Italian states. It has been convenient for historians to portray Italy in the age of the Renaissance largely in terms of Milan, Florence, Venice, the Papal States, and Naples and Sicily. But it should not be forgotten that there were other parts of Italy whose territories were not always and in some cases were never included in these larger entities. Thus, in the northwest Alpine region were the feudalized territories of the House of Savoy, divided into three branches, which ruled Savoy, Vaud, and Piedmont. In view of the future importance of this dynasty for Italian history, it should be noted that Savoy was not yet considered an Italian power, being still oriented to France and Switzerland; and it remained during the 14th and 15th centuries largely apart from Italian affairs. To the south of Piedmont lay Genoa, but, in spite of its commercial power of an earlier age, it, too, especially after its final defeat by Venice, played no great independent part in the political events of the peninsula. Without a surrounding province like that controlled by Florence, Genoa was frequently at the mercy of the more powerful adjacent states, and its external weakness was compounded by its singular internal instability. The struggle for control of its republican government produced frequent revolutions. An effort in 1339 to produce some order in Genoese affairs by instituting a doge, on the Venetian model, proved unavailing. In the summer of 1393, for example, this office changed hands five times. Such turbulence was an invitation to conquest; Genoa fell to the French in 1396 and later to Milan. And, though its citizens were constantly prone to rebellion against foreign rulers, they never developed the civic spirit of the Florentines or the cohesion of the Venetians.

The House of Savoy

Between Milanese-dominated Lombardy and the Venetian lagoons lay another urbanized area that, during the 14th century, preserved an existence separate from that of the great powers in the north. The most important political centres here were Verona, Padua, and Mantua, all republics that had gone the standard way toward despotism in the later 13th and earlier 14th centuries. Mastino Della Scala, a leading citizen of Verona, began the process there, first becoming captain of the people and then securing his independence from the commune by acquiring the title of imperial vicar. This dignity was then passed on to his brother and his nephews. In the 14th century his family was succeeded in the lordship of the city by the Scaligeri, who were notable as patrons of the arts. Paduan republicanism lasted longer: the city gave up its freedom only in 1318, when Jacopo di Carrara became its lord. Mantua had a similar history. Before the end of the 13th century, it had fallen under the control of the Bonacolsi, who remained in power till 1328, when, with some popular support, they were overthrown by Luigi Gonzaga. The firm rule of the latter established his family securely in a control that lasted until the early 18th century.

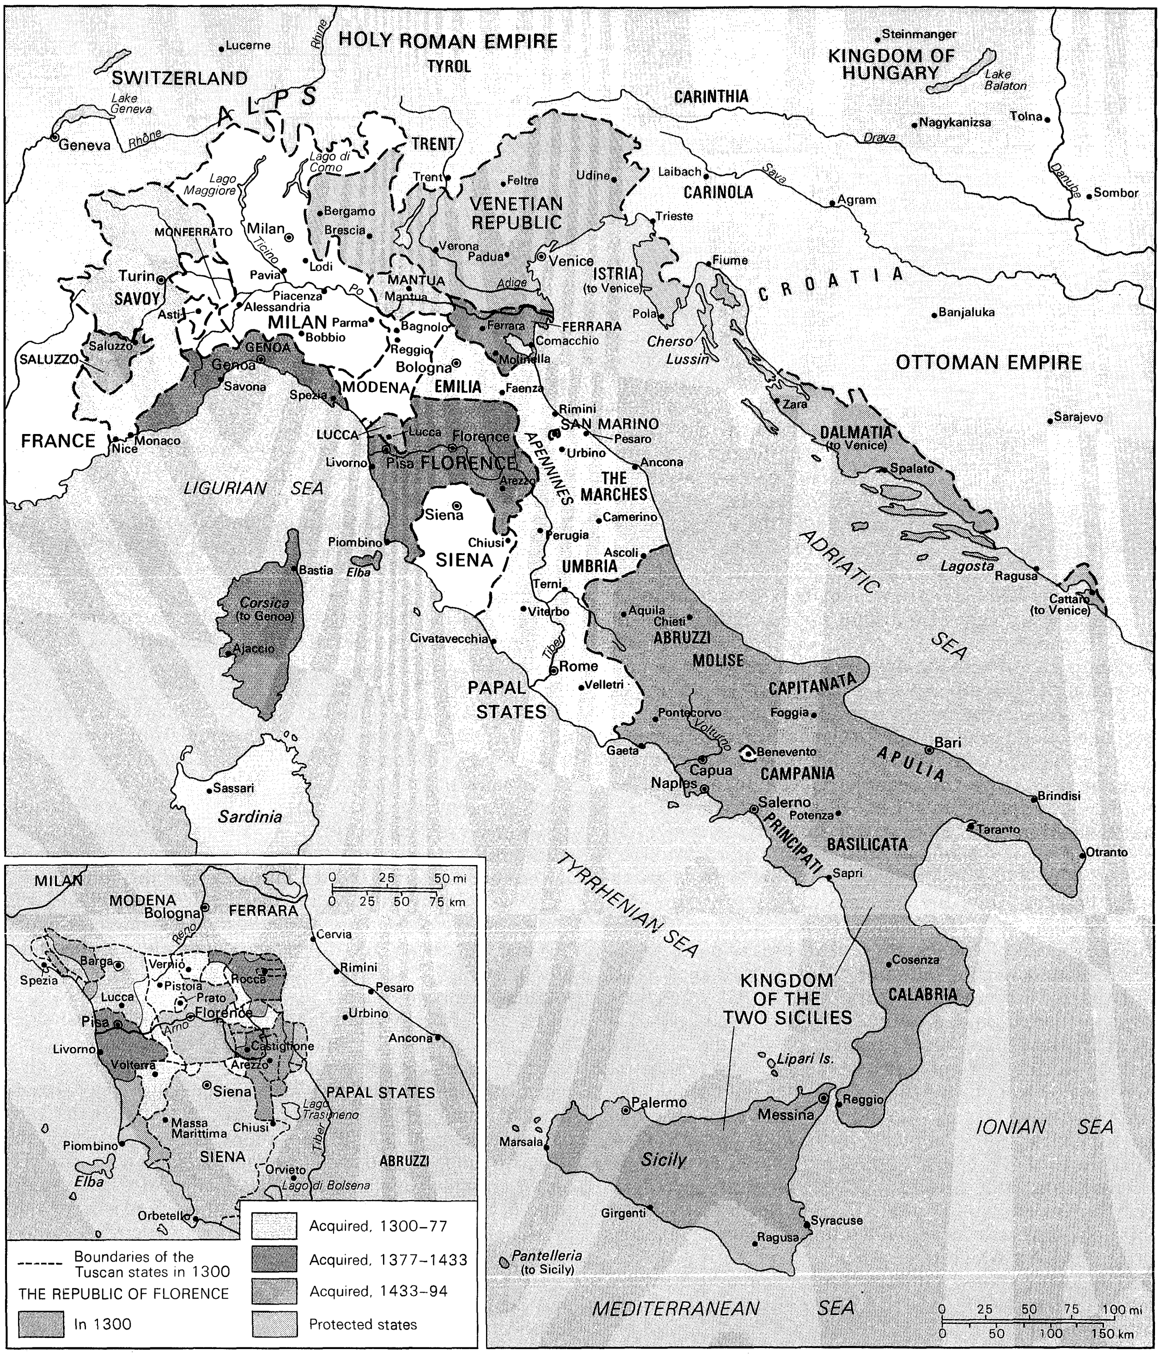
THE ITALIAN STATES IN THE 15TH CENTURY

Expansion of the major Italian powers. Even the degree of 14th-century Italian political consolidation that makes it possible for historians to present the later history of Italy in terms of the five major powers should not be exaggerated. Some lesser powers, such as the republics of Lucca and Siena, managed to preserve their independence intact, while the coherence of territories subjugated by the major powers remained limited and their stability uncertain. This was notably true in the case of Naples and the Papal States, but it was also often true of the territories gathered together under the rule of Florence; and the conquests of any individual Visconti duke of Milan were always liable to fall apart at his death.

This weakness notwithstanding, there was, in the late 14th and earlier 15th centuries, a significant shift in the interests of the major Italian powers: all, apart from the papacy, now paralyzed by the Schism, sought to expand their territorial authority. As a result, the concern of governments tended to shift from the internal struggles of an earlier period, first to conflicts with neighbouring powers and eventually to wars on a larger, sometimes peninsular scale. This was as true of the republics as it was of the despotic states. Florence, its commercial expansion inhibited by an inland location, sought a seaport on the western coast. This was the reason for its conquest of Pisa in 1406, and the addition of Livorno (Leghorn) by purchase from Genoa in 1421 gave it full control of the Tuscan coastline. By the next year the first Florentine galleys were heading directly to the Levant and soon thereafter to the European Atlantic ports.

Territorial expansion

Meanwhile, Venice had been abandoning its long isolation from the mainland and decided to conquer and organize for itself a substantial dependent state. Its motives were twofold. First, it needed to make secure its overland trade routes, which meant that it could no longer countenance the existence of a strong and hostile power between the head of the Adriatic and the passes through the Alps. Second, it required a nearby agricultural province under its own permanent control as a source of food, especially since Turkish conquests had made imports of grain from the Black Sea increasingly uncertain. The danger that Milan might move into the territories adjacent to the Venetian lagoons also impelled Venice to act. In the first decades of the 15th century it conquered the lands of the tyrants of Verona and Padua, who had been levying heavy duties on Venetian goods passing through their territories and occasionally actually cutting off Venetian food supplies. The wisdom of these conquests was long debated in Venice, whose power had so long been based rather on



Italy in the 15th century and (inset) Florentine expansion.

the sea than the land; although it now had its own farms and had achieved secure access to the northern passes, the results were not altogether advantageous. Venice was henceforth far more involved in the political struggles of Italy, with new responsibilities and new demands on its resources. And its new conquests on the mainland further antagonized other powers already alarmed by its vast wealth. Before long, charges would be heard that Venice aimed to conquer the whole of Italy—indeed, to establish an empire over all Europe.

At the same time, the broadening of its contacts with the rest of Italy brought Venice into closer contact with the cultural movements of the Renaissance. Up to this time it had remained a self-centred, materialistic, and culturally backward community of merchants. But the conquest of Padua gave it control of the liveliest university centre in Italy, and its ablest young men proceeded to take full advantage of the new opportunities that this presented. Educated at the University of Padua, they brought back literary and scientific interests to Venice. By the later 15th century, aided by its overseas contacts with the Greek East and above all by its development as a major printing centre, Venice had become the capital of Greek learning in Europe as well as a point of diffusion for the Latin classics. Meanwhile, leading painters from the mainland had begun to visit the city, and Venetian painters began to absorb new ideas and to develop a Venetian school of Renaissance art.

The crisis of Florentine republicanism. For the time being, however, the greatest danger to the peace of Italy and the independence of other powers was Visconti Milan, especially under Gian Galeazzo, created duke of Milan by the German king Wenceslas in 1395. His conquests had played some part in influencing Venice to expand onto the mainland, but he posed a particular threat to Florence. Indeed, because of its central location on the Italian peninsula, Florence found itself regularly confronting aggressive princes seeking expansion from either the north

Milanese conquests

or the south. It had been particularly alarmed by the conquests of Gian Galeazzo, who expanded his empire steadily southward after 1385, taking special advantage of the disarray of the Papal States during these years of the Schism. By 1400 he had gathered in much of the northern domains of the popes, and Lucca, Pisa, and Siena had accepted his lordship; Bologna fell to his armies in 1402. He seemed invincible, and Florence—next in his path and fighting alone—appeared doomed. Florence was immediately saved by his unexpected death in 1402, but this did not end the danger from Milan. Gian Galeazzo's younger son, Filippo Maria Visconti, attempted to reassemble the Milanese empire after 1420. Once again, Florence was in danger of conquest by a despot, though this time it did not fight entirely alone: in 1425 it concluded an alliance against Milan with Venice, its sister republic, and the threat was once more contained. This alliance was also decisive for Venice; henceforth, it would play an active part in the larger affairs of Italy. Meanwhile, between the two onslaughts from Milan, another danger to Florence had come from the opposite direction. King Ladislas of Naples saw in the troubles of the Papal States an opportunity for his ambitions. Early in the 15th century he began to meddle in their affairs, and in 1404 a popular revolt in Rome—encouraged by him—forced the Pope to turn to him for protection. He succeeded in dominating the Papal States, and from this base he twice sent his armies into Tuscany, in 1408–09 and 1412–14.

On each occasion the Florentines had professed to see in the threat to themselves an attempt to subjugate the whole of Italy under a single ruler. Doubtless, they exaggerated both the intentions of the conqueror and the possibility that this might be accomplished. Neither Ladislas nor the Visconti dukes seem to have intended to assemble more than a strong regional state, and their resources were certainly inadequate for the control of the large, diverse, and divided Italian peninsula. Nevertheless, the long period of danger to Florence coincided with the emergence among its citizens of a new political mentality.

Hans Baron, a historian of the Italian Renaissance, has argued that this crisis of Florentine liberty, especially in its most acute phase, between 1400 and 1402, was the major watershed between an age still essentially medieval and the beginnings of a characteristically modern intellectual and political culture. Basing his argument on the chronology of a series of significant Florentine documents, Baron shows that before 1400 most thoughtful Florentines, wearied by constant disorder, had often longed, like medieval thinkers such as Dante, for a strong autocratic government that could preserve the peace of the state and allow them to devote themselves to the private satisfactions of a contemplative life. Already enthusiastic students of the classics, they had, like other medieval men, idealized the benevolent despotism of imperial Rome; their hero was Caesar, who had overthrown the disorderly republic. But now, faced with the loss of their liberty and the prospect of absorption into a larger despotic state, they became increasingly conscious of their heritage of republican freedom and the human values it fostered. Thus, the Humanists of Florence, led by Leonardo Bruni (1369–1444), began to praise the human values of freedom and the obligations of active citizenship. They found their model now in the Roman Republic, in which medieval thinkers had taken little interest, and they applauded not Caesar but Brutus and Cassius, who had assassinated him in the name of liberty. In this way, the citizens of Florence began to formulate a new political ideal of peculiar importance for the future of politics. In addition, conscious, through their awakened love for Florence, of its special identity, they began to consider its development in time; and from this crisis of embattled Florence there emerged the rich tradition of Florentine historiography.

Florentine historiography

The histories composed by Bruni and his successors, in a long series of works that reached a climax with Niccolò Machiavelli and Francesco Guicciardini in the next century, reveal the importance of the contribution of Italy in this period, and especially of Florence, to the formation of modern political attitudes. They exhibit two characteristics hardly present before in the European mind. One is the assumption that historical development proceeds through a succession of natural causes, with the implication that these may be understood by men and to some degree controlled by intelligent and well-informed action. But, perhaps even more important, these historical writings also express a feeling for the particular political community as a concrete and continuing entity that is independent of the men and governments in power at any given time and worthy of human affection, loyalty, and support. In this sense, the historical experience of Italy helped to bring modern consciousness of the state and modern patriotism to birth.

There has been a good deal of resistance to Baron's understanding of the significance of the Florentine experience. Some of it has come out of a reluctance to attribute any major shift in fundamental attitudes to a particular set of episodes concentrated within a very few years. It has also been argued that Baron's dating of the documents is wrong or that the Humanists who gave such eloquent expression to Florentine ideals were only paid propagandists who had no personal commitment to what they wrote. But Baron's case has largely withstood these attacks, and there has been no convincing alternative explanation for the remarkable power of Florentine political and historical thought.

The Papal States in the 15th century. During the 15th century, substantial changes took place in the domains of the pope, following the settlement of the Schism in 1417. Once again the papacy was faced with the difficult task of restoring order in possessions that had fallen apart. And now the difficulties were even more serious. Despots once more controlled the major towns of the Papal States; *condottieri,* mercenary leaders, were carving out principalities for themselves; and, meanwhile, other powers on the peninsula were constantly fishing in these troubled waters. The successes of Gian Galeazzo Visconti had been facilitated by papal weakness, and Milan remained a potential danger. Venice was extending its sphere of influence southward toward Ferrara, one of the more independent towns of the papal domain. There was constant friction along the borders of the Florentine state, and the continuing tension between Anjou and Aragon in the south was a matter of regular concern to the pope. He had also to keep an eye on the possibility of further republican uprisings in Rome. Nevertheless, Martin V (1417–31) made a substantial beginning toward the recovery of papal authority, and his successor Eugenius IV (1431–47) continued the process. Eugenius' decision in 1442 to recognize Alfonso of Aragon as king of Naples, although it resulted in a cooling of papal friendship with Florence, strengthened the security of the Papal States; and by the middle of the century the pope had enough real power to be treated as an equal among the princes of Italy.

But much remained to be done, and control over their Italian domains remained a problem for the popes throughout the century. Even the great Pius II (1458–64), though primarily concerned with restoring papal authority in all Europe and organizing a crusade against the Turks, was forced to devote a large share of his time to the rule of the Papal States, raising armies and negotiating alliances against his own rebellious subjects. Notable among these was the notorious Sigismondo Malatesta, tyrant of Rimini, who was at last brought to obedience, though even he had to be left in possession of that town with the title of papal vicar. Popes of the later 15th century also made use of members of their own families, especially vigorous young nephews, to control their possessions. Unlike most local nobles, such men could be trusted to obey the pope, although the practice led to charges of nepotism that increased the discontent of religious reformers. Sixtus IV (1471–84) was particularly given to nepotism; thus, he made his nephew Piero Riario a cardinal at the age of 25. Meanwhile, the ambitions of such relatives of the pope to carve out territories for themselves also promoted the recovery of papal control. But the task moved slowly, though it received impetus through the conquests of Cesare Borgia, the illegitimate son of Pope Alexander VI (1492–1503).

Papal nepotism

The despotisms of the 15th century. Although dynasties changed, the internal histories of the despotic states of Italy were little different in the 15th century from what they had been in the 14th. The reign of Alfonso I the Magnanimous nevertheless gave southern Italy after 1442 a period of unusual strength. Not only did he rule over both Naples and Sicily, which were thus reunited for the first time in a century and a half; he was also, as Alfonso V, king of Aragon and thus a power in the whole western Mediterranean. Strengthened by papal recognition, he was sought as an ally by the other princes of Italy. He also displayed a personal dignity, an interest in Renaissance culture that made Naples briefly a major centre for literature and the arts, and a strength of character long absent among the rulers in the south. But on his death in 1458 his possessions were divided. Aragon and Sicily went to his brother John, the Kingdom of Naples to his legitimized bastard Ferrante (Ferdinand I; 1458–94) and subsequently to Ferrante's son Alfonso II. This division once more left the kingdom in its earlier state of weakness. In addition, Ferrante proved treacherous, cruel, and incompetent, so that his more powerful subjects, always close to revolt, thought again of resurrecting the old claims of the French House of Anjou.

The new Sforza rulers of Milan behaved much like the Visconti had done. Achieving power in 1450, Francesco Sforza was an able ruler who conquered Genoa in 1463 and meanwhile cultivated closer relations with France; he dispatched his son, Galeazzo Maria, to aid Louis XI in his war against the rebellious French nobility. But Galeazzo Maria, duke of Milan from 1466 to 1476, lacked his father's competence. Cruel and tyrannical, he was assassinated by a group of republican conspirators, although republican sentiment was generally dead in Milan after so long a period of princely control. The assassination was therefore not followed by a popular uprising, and the infant son of the dead duke, Gian Galeazzo II, succeeded his father under the regency of his mother. But the nominal rule of a minor under a female regent was too precarious to survive. In 1480 the young duke's uncle, the ambitious Lodovico il Moro, with the support of both the Pope and the French king, managed to seize control of the ducal government, displacing the boy's mother as regent. Given the unscrupulous habits of the age, this was ominous for Gian Galeazzo II.

Florence under the Medici. While the Papal States were being centralized, and princely government was entrenching itself further in southern Italy and Milan, republicanism was also faring less well in Florence, which, under the concealed dictatorship of the Medici, tended to become increasingly like the despotisms of the peninsula. The old Florentine oligarchy, led by Rinaldo degli Albizzi, had prepared the way for this development by its own ineptitude; between 1429 and 1433 it had failed disastrously in another (and unpopular) attempt to conquer Lucca. This project had been opposed by Cosimo de' Medici (the Elder), a prominent banker of the city, who had made what seemed to the old ruling families a dangerous appeal for popular support, and they had accordingly sent him into exile. But, discredited by defeat, the oligarchy was overthrown in 1434, and Cosimo returned in triumph to assume control of Florentine affairs. He remained a private citizen, however, governing Florence more like a modern big-city political boss than a Renaissance tyrant. The election of officials loyal to himself was assured by eliminating his opponents from the lists of those eligible for office, although the forms of republican government were retained. Initially a popular choice to control the government, Cosimo continued to command broad public support. He maintained order; the lavish expenditures from his private fortune on the patronage of literature, the arts, and especially architecture made him popular with the Florentines; and his ability to keep Florence at peace after so many years of warfare particularly endeared him to the public. In spite of this popularity, however, his dominance saw the beginning of a significant shift in the political climate of the city. Government by an active and concerned citizenry gradually gave way to rule through a bureaucracy responsible only to Cosimo and his successors. The Humanist Leonardo Bruni, now chancellor of the republic, spent much of his later years reading Plato instead of celebrating the benefits of republican freedom.

Cosimo de' Medici (the Elder)

Florentine republicanism was by no means dead, and the indirect nature and tact of Medici rule was a tribute to the continuing vitality of the old republican tradition. Indeed, Cosimo understood that he could disregard it only at his peril. The old families that had previously controlled Florence were constantly restive, and Cosimo felt the need to send some of their leaders into exile. Republican sentiment also gave support to occasional conspiracies against Medici rule. When Cosimo died in 1464, the leadership of Florence passed to his son Piero (1464–69), despite an abortive attempt to restore popular control by a return to free elections. Two years later the republican enemies of the Medici struck at them in the Pitti Conspiracy. But its failure left the Medici more firmly in power than before, and on Piero's death the government was inherited by his young sons, Lorenzo and Giuliano.

The plot against the Medici

Once again an opportunity seemed to present itself for a return to the old order in the city. Enmity had been growing between Florence and the papacy of Sixtus IV over lands claimed both by Florence and by one of the Pope's nephews. It reached a climax in a plot involving both Rome and the enemies of the Medici in Florence, under the leadership of the Pazzi family. In 1478 the conspirators attempted to assassinate both the Medici brothers during a mass in the cathedral of Florence. Giuliano was stabbed to death, but Lorenzo escaped and henceforth ruled alone; meanwhile, Medici partisans hanged the conspirators in the streets, among them the Archbishop of Florence. To revenge this sacrilege, the Pope excommunicated Lorenzo, placed the city under an interdict, and declared war, in which he was joined by his vassal Ferrante (Ferdinand I) of Naples. But at this juncture Lorenzo carried out a sudden diplomatic coup. He made a quick personal visit to Naples, where he persuaded Ferrante to abandon the papal alliance and sign a treaty of friendship with Florence. The crisis was finally resolved with Lorenzo's public apology to the Pope, and matters proceeded as before. Under Lorenzo, known as the Magnificent as much for his personal style as for a patronage of learning and the arts that exceeded even the generosity of his grandfather, the rule of the Medici resumed its development toward something resembling the princely governments elsewhere in Italy. Lorenzo married into the aristocratic Orsini family of Rome, in an alliance that symbolized the acceptance of the Medici by the great nobles of Italy; and, as his negotiation with Ferrante illustrates, he was able to deal on equal terms with other princes. Yet even at this point the rule of the Medici differed from that of the naked despots elsewhere. Lorenzo continued to respect republican institutions even as he controlled them, and it is significant that much of the power of the family, as well as its ability to dazzle Florentines by its generous support of culture, depended on profits from the wide business interests of the Medici. Cosimo had been an astute businessman as well as a politician; and Lorenzo kept a hand in the extensive enterprises of the Medici bank, although, distracted from full attention to business by his political and cultural activities, he allowed too much freedom to the managers in his branches throughout Europe. (The imprudence of the latter led to the decline of the firm, and later representatives of the family were compelled to depend on other sources of income.) But, meanwhile, the ties between Florentine business activity and government persisted, and this helps to explain continuing support for the Medici. In addition, dread of the inconveniences that would arise from further violent changes in government also contributed to their support. Florence had experienced enough disruption in the past, and a sense of relief at the maintenance of order at home and peace abroad, both attributed to Medici rule, worked against further change. Later Florentines would look back on the period of Medici domination as a golden age of prosperity and tranquillity.

Venice in the 15th century. Only Venice, among the great powers in 15th-century Italy, remained true to the substance as well as the forms of its republican constitution, though Venetian society, too, displayed significant changes after the conquests on the mainland. Its wealthier families began a process, which would accelerate in the next century, of withdrawal from the city to newly acquired estates on the mainland, and this group began to develop a way of life similar to that of the ruling groups elsewhere. Meanwhile, the relative equality of the patriciate gave way to an increasingly wide division between poor nobles and a few rich, powerful, and increasingly aristocratic families. Discontent was still kept in check, however, by the general prosperity of this period and by an effective system of poor relief and other social services. Moreover, as Venice came more regularly into contact with the other Italian powers, its ruling group showed signs of an increasingly self-conscious republicanism that contrasted strikingly with the eclipse of republican sentiment in Florence. Complacent and secure, Venice had been backward, compared with Florence, in the development of an articulate political culture. But by the middle of the 15th century Venetians were beginning to celebrate the virtues of their republican constitution, which they interpreted as explaining the remarkable stability of Venetian life, in contrast to the turbulence common to the rest of Italy. These discussions eventually culminated in Gasparo Contarini's *De magistratibus et republica Venetorum* (1543; "Concerning the Magistrates and the Republic of the Venetians"), an early classic of republican and constitutional thought that was widely read throughout Europe. About the middle of the century Venetians also began to take an interest in the history of their own city somewhat similar to that displayed by the Florentines of an earlier generation. The Venetian histories of Marc'Antonio Sabellico and Bernardo Giustiniani marked the beginning of a long and distinguished tradition of Venetian political historiography. During the same period Venice also began its development as a major centre of European artistic and musical life; here, too, it had earlier been remarkably backward. The optimism of this period in the history of the Venetian Republic was only slightly disturbed by occasional wars with the Turks, although the struggle of 1463–70 resulted in the loss of the island of Euboea (modern Evvoia), in the Aegean; Argos, in the Peloponnese; and Scutari (modern Shkodër, Albania).

The rise of Venetian republicanism

Changes in Italian society. Centralization in the Papal States, the long continuation of princely rule in other parts of Italy, and Medici rule in Florence were together bringing profound if gradual changes to Italian society. Habits of dependence on despotic princes became ever more deeply engrained, court ceremonial became increasingly formal, class divisions became more and more rigid, and the way of life of the ruling circles gathered around princes was increasingly differentiated from that of other men. A culture of citizens was slowly being transformed into a culture of courtiers. Men increasingly developed a personal style appropriate for those attendant upon princes, who spent much of their time on country estates and who often cultivated the extravagant ways and even the physical skills of an earlier nobility. Baldassare Castiglione's treatise on courtly manners, *Il cortegiano* (1528), gave eloquent expression to this new human ideal, so different from that of the republican citizen. It has been argued that the social and political changes of later 15th-century Italy therefore prepared the way for the reception of Italian influence at the great royal courts of western Europe in the 16th century.

Italy as a political system. Meanwhile, the conflicting interests of the increasingly consolidated major states of Italy kept them in close contact with each other, and during the 15th century Italy exhibited many of the features of a miniature international system. Some scholars have seen in this system a significant anticipation of the modern principle of the balance of power, a persistent theme in later international relations. Indeed, by the end of the century, Italian observers of the shifting political scene were explicitly using the language of equilibrium to describe its workings.

The emergence of Italy as a kind of system based on the five major powers was possible only after it had become clear that none of them was, in fact, strong enough to absorb the others. Yet even the dangers of Visconti expansion of Milanese territory had led, in the first half of the 15th century, to the creation of a fairly clear alignment of powers: Florence and Venice joined in a republican alliance against Milan, while the Visconti, after Aragonese rulers replaced the Florence-oriented Angevins in the south, found support in Naples.

The alignment became even clearer, though on a somewhat different basis, after the middle of the century. When Francesco Sforza seized power in Milan in 1450, he promptly became embroiled with Venice, which had taken advantage of the preceding period of confusion in Milan to seize some minor territories on the border. At this point Cosimo de' Medici, persuaded that the growing power of Venice was beginning to pose an even greater danger to the interests of Florence than the aggressions of Milan, abruptly switched alliances by supporting the new despot of Milan. The shift may also be taken as a symptom of the decline of republicanism in Florence; with the triumph of the Medici, the differences between Florence and Milan were less important, although the alliance with Milan was unpopular with many of Cosimo's subjects. The diplomatic revolution was completed when Venice turned to Naples, and general war seemed near when Pope Nicholas V intervened as peacemaker. After taking Constantinople in 1453, the Turks seemed poised to invade Italy; and it was also possible that France might intervene in Milan on the basis of claims arising from the marriage of Gian Galeazzo Visconti's daughter Valentina with Louis de France, duc d'Orléans, in 1389. Pope Nicholas V therefore managed to persuade the Italian states of the necessity for mending their differences so that they could present some common front to the outside world. The result was the Peace of Lodi in 1454, in which the coup of Francesco Sforza was recognized by all, and peace was maintained on the basis of the new balance, which aligned Florence and Milan against Venice and Naples, with the papacy as a kind of counterweight. This peace managed a precarious survival for the next 40 years, although imperilled again and again as one state or other attempted to secure particular advantages.

The Peace of Lodi

The result was a series of crises of increasing gravity, which have been compared with those in the 20th century that brought Europe to both world wars. They were so serious because it was increasingly apparent that Italy was not alone in Europe and that great outside powers were more and more inclined to intervene in its affairs. And there were pretexts enough. The Spanish House of Aragon and the French House of Anjou were still rivals for the control of southern Italy, and France had old claims on Milan. Thus, the crises among the Italian states not only illustrated the weakness and division of the peninsula but invited the attention and ultimately the intervention of outside forces of far greater strength.

The first crisis came four years after the Peace of Lodi. On the death of Alfonso the Magnanimous in 1458, Pope Calixtus III (1455–58), incited by Francesco Sforza (who, in turn, was trying to strengthen his own position by promoting the interests of his French allies against his Aragonese enemies), was disposed not to recognize the accession of Ferrante on the ground that an illegitimate son could not inherit the Kingdom of Naples. This brief crisis was ended, however, by the Pope's death. Pius II, his successor, alarmed by the possibility of a French intervention in Naples, recognized Ferrante as king. But in 1460 an even more serious situation developed. An expeditionary force, representing the interest of the Angevin claimant René and based on Milanese-controlled Genoa, invaded the Neapolitan kingdom; with the help of some of Ferrante's own perennially rebellious subjects, it won a series of early victories. Ferrante was saved this time by the arrival of mercenaries from Albania and a revolt in Genoa, and by 1464 the Angevin forces had given up and returned home. But Naples was not the only area of danger. In 1467 a famous *condottiere,* Bartolomeo Colleoni, attempted to carve out a state in northern Italy at the expense of Florence and Milan. Long in the service of Venice, he had probably received Venetian encouragement. But his ambitions were blocked by a rival army under Federigo of Urbino, and the otherwise indecisive battle of Molinella put an end to his hopes.

The Florentine Pazzi Conspiracy

Even more serious was the Florentine Pazzi Conspiracy against Lorenzo de' Medici in 1478, which, given the alignments of the peninsula, had serious implications for the general peace. Lorenzo's success in detaching Ferrante of Naples from the Pope averted general war. A further factor in inducing the Pope to make peace with Florence was the Turkish seizure of Otranto, in the south of Italy, a move that was taken by contemporaries as a preparation for a larger Turkish effort to conquer the peninsula. After 1480, Venetian ambitions led to still another crisis. A quarrel had broken out between Venice and the city of Ferrara over the control of salt production in the northern Adriatic. Ferrara was supported by Naples, Florence, and Milan, all alarmed by the growing power of the Venetians. Venice was backed by the Pope, who wanted to assert his authority over Ferrara, and by Genoa, again revolting against Milanese control. In the course of the ensuing war, troops from Naples and Florence invaded the Papal States. Partly for this reason but partly because he was himself uneasy over Venetian victories in the north, Pope Sixtus IV switched sides. Nevertheless, although now fighting almost the whole of Italy, Venice did well enough to keep some of its conquests when peace was made at Bagnolo in 1484. The most alarming aspect of this episode, however, was the interest in the war displayed by outside powers, an interest that Venice had encouraged. At their moment of greatest danger, the Venetians had tried to attract the new French king, Charles VIII, who had also personally inherited the claims of Anjou to Naples, to invade Italy; and they had promised him their help in the conquest of Naples. Meanwhile, King Ferdinand II of Aragon was negotiating with both sides. Conflicts within Italy were clearly providing increasing temptations to the great monarchies of western Europe.

There were obviously, therefore, serious weaknesses in the workings of the Italian system. Its individual members had no dependable sense of the common interest; Italy was for them, quite literally, only a geographical expression. Indeed, even particular states were badly served by the political situation. The interests of dynasties too often took precedence over the needs of their peoples and certainly over the interests of Italy as a whole. But, above all, the Italian system was not self-contained. Insecure, disgruntled, or ambitious elements in Italy tended regularly to look for support outside. However novel the political history of Italy may have been in some respects during this period, therefore, and however suggestive for the future of European political development, its modernity should not be exaggerated.

Yet, if the Italian states did not entirely anticipate the later conduct of international relations by means of a balance of power, there is no doubt about the contribution of Italy to the techniques of diplomacy. The articulation of Italy into a group of self-consciously independent states that ignored their theoretical unity in a larger Christian commonwealth—whether under pope or emperor—had prepared the way for this development, since diplomacy in the modern sense can be conducted only by fully sovereign states. The needs of commerce and the feverish political actions of the 14th and 15th centuries had impelled the various Italian powers to create suitable instruments for dealing with other powers: foreign offices staffed by able men, which collected information, kept records, and carried on an extensive correspondence; and, above all, a system of permanent ambassadors residing in foreign capitals, commissioned to report on conditions abroad and to negotiate on behalf of the states they represented. The diplomatic machinery developed by Venice was particularly efficient, though it was by no means unique. Venetian ambassadors were carefully chosen for regular three-year terms and periodically transferred from one place to another. Their duties remarkably anticipated those of modern diplomats. They received detailed instructions on being sent abroad; they were expected to maintain a high standard of living, in keeping with the dignity of the republic; they entertained and paid ceremonial visits; and they prepared elaborate dispatches and reports, which are still today among the historian's richest sources of information about all aspects of European society for several centuries. In its development of standards for diplomacy and international communication in a new political world composed of sovereign states, 14th- and 15th-century Italy served as a model for the rest of Europe.

The French invasion. No diplomatic skills, however, could save Italy from the consequences of its weaknesses, which in the end brought about the long-impending tragedy of foreign invasion that was largely to end the independence of the Italian peoples until the 19th century. In the last decade of the 15th century Lodovico il Moro, uncle to the legitimate Sforza duke of Milan, was eager to take the place of his nephew, whom he held a virtual prisoner. The young duke, however, had recently married the granddaughter of Ferrante of Naples, Isabella of Aragon, who in 1490 gave birth to a son. The disposition of the Milanese duchy was now of direct concern to Naples. To solve his personal dilemma, Lodovico, oblivious to the larger interests of Italy, invited the French into the peninsula, in the expectation that they would deal with his enemies in the south and thus open the way to his assumption of the ducal title in Milan.

Charles VIII's ambition

Charles VIII of France was attracted to Italy by various considerations. In addition to the French claims to lordship over both Naples and Milan (which latter claim Lodovico had chosen to forget), he seems to have been influenced by the medieval ideal of a mission for the French nation, on behalf of all Christendom, to set Italy to rights and purify the church; from Italy he dreamed of then leading a crusade against the Turks. Among his advisers, most of whom had more material ambitions, was Cardinal Giuliano della Rovere, a disappointed candidate in the recent papal election and an enemy of Alexander VI. And spiritual impulses emanating from Italy itself may have encouraged such ideals. Lorenzo the Magnificent had died in 1492 and was succeeded by his less competent son Piero. In these circumstances a republican reaction again gathered in Florence and found a leader in the Dominican friar Girolamo Savonarola (1452–98). A powerful and demagogic preacher of repentance, Savonarola began by denouncing the wickedness of his times, daring even to include the Medici rulers in his indictment; he predicted terrible catastrophes as a result of God's wrath on Italy; and he called for reforms that, as became increasingly clear, involved the restoration of the Florentine republic on a basis more democratic than had ever before been established in the history of the city. Since he also strongly denounced the Pope, it is not surprising that Alexander VI (1492–1503) soon became one of Savonarola's greatest enemies. A member of the Spanish Borgia family, Alexander was shameless in exploiting his papal office to promote its interests; and at the same time he was particularly aggressive in imposing his authority over the Papal States, a task for which he was employing his natural son Cesare. Against this—to contemporaries—scandalous pontiff, who eventually excommunicated him, as well as against the more general wickedness of Italy, Savonarola called for the intervention of a foreign "scourge of God," whose invasion and chastisement of Italy would open a new age of righteousness.

Lodovico had probably hoped that the mere threat of French invasion would be enough to deter his Aragonese enemies but that, if it did come, it would move by sea from Genoa; and, indeed, Charles VIII prepared a fleet there under the Duc d'Orléans. But the main thrust of his attack, coordinated with a revolt of pro-French forces in the Kingdom of Naples under Antonello Sanseverino, prince of Salerno, was by land. His army, 30,000 strong, which included Balkan, Swiss, and German mercenaries, as well as heavy artillery of a kind not before used in Italy, entered the peninsula through Milanese territory in October 1494. This development was shortly followed by the death of the young duke Gian Galeazzo, perhaps by poison, and Lodovico was promptly proclaimed duke.

The reaction of the rest of Italy was irresolute and nicely illustrates the failure of the various powers to consider the larger interests of the peninsula. Venice remained entirely aloof, while Florence and the papacy wavered before siding with Naples (and even then they offered only token resistance). Meanwhile, the French advance down the peninsula was rapid. The forces of the few Italian *condottieri* that presented themselves to resist the French were used to a less aggressive style of warfare and quickly collapsed. Soon after the middle of November 1494, Charles had reached Florence. From there he proceeded quickly to Rome, where the Pope promptly came to terms with him in a treaty that allowed the French unhindered passage through the Papal States, and by February 1495 he was in possession of the city of Naples. The rest of the Neapolitan kingdom had rapidly fallen to pro-French forces, in spite of Alfonso II's abdication in favour of his more popular son Ferrantino; and the French king was able to take possession without fighting a major battle.

The consequences of these events were especially momentous for Florence. Discredited by his oscillations and then by a policy of cooperation with the invader, which involved the surrender of important Tuscan strongholds to the French, Piero was overthrown and fled from the city during a revolt that left Florence under the leadership of Savonarola. The Friar then proclaimed the restoration of the republic and sponsored a new constitution, more democratic than Florence had ever known. At first the new regime was immensely popular. It was accompanied by a wave of patriotic and moral fervour marked by dramatic renunciations of the vanities of Renaissance culture and by an enforced purity of manners that briefly transformed Florence into a city of saints regarding itself as a model for the reform of all Christendom. But the extravagances of Savonarola's program, his excommunication by the Pope, and the inability of the new government to recover Pisa, which had with French support rebelled against Florentine rule, led to growing opposition against Savonarola. Eventually he fell from power and was executed in 1498, though the reconstituted republic continued in existence.

Florence under Savonarola

But meanwhile the French were running into difficulties. Their economic and political exploitation of Naples and their brutality proved that the new master was no improvement over the old. Revolts, encouraged by the former Aragonese rulers who had taken refuge in Sicily, had broken out even before Charles started back to France. Even more serious, for the rest of Italy as well as for the French king, was the intervention of Ferdinand II the Catholic, king of Aragon. This had both diplomatic and military aspects. Encouraged by Ferdinand, the states of Italy (with the exception of Florence, whose external affairs remained under French control) at last recognized the need for solidarity. At the end of March, the Pope, Venice, and Milan joined the Spanish king and the German emperor in the League of Venice. Its general purpose was the defense of Italy against aggression, its immediate aim the expulsion of the French. But the adherence of Spain and the empire brought these powers, as well as the French, now regularly into the politics of the peninsula; it meant that, henceforth, Italy would no longer be able to control its own affairs.

The league immediately put an army into the field, which met the returning French forces early in July 1495 in the Battle of Fornovo. Although the Italians on this occasion fought well, the French were able to continue their retreat from the peninsula, and both sides claimed victory. But in the meantime, Aragonese forces had been recovering control of Naples. With the surrender of the French garrison that Charles had left behind, less than a year later nothing remained of the French conquests but an unhappy legacy of intervention that, in the next generation, ended the independence and the liberty of the peoples of Italy until the movement of national unification in the 19th century. A major chapter in the history of Italy had ended.

THE LESSONS OF HISTORY

Machiavelli. The effort to define the significance of this chapter in Italian history, at once so full of promise and in the end so tragic, has been a major concern of European historians of all subsequent generations. It began immediately in the writings of Niccolò Machiavelli, who, born in 1469, had lived through many of the disasters that were to spell the end of the freedom of Italy and, out of an intense patriotism, was concerned to understand their causes. His analysis is of particular interest since it reflects the experience of a direct and highly sophisticated participant in major events. Machiavelli had served as a diplomat and secretary in the restored Florentine Republic after the downfall of Savonarola. When the Medici were reinstated in 1512, he lost his official position; and while in retirement he set down his reflections on history and politics in a number of famous works, particularly *The Prince,* the *Discourses on the First Ten Books of Livy,* and the *History of Florence.* The first of these consists of advice to a ruler on how to secure absolute control over a state, together with a celebrated "Exhortation to Liberate Italy from the Barbarians"; the second includes eloquent passages on the superiority of a republic over all other forms of government, while the third seems not to achieve any definite conclusion. Historians have, therefore, long discussed the mutual relationship of these works, their apparent inconsistency, and the extent to which each may represent Machiavelli's true thought. It may be, however, that their apparent contradictions really indicate his uncertainties about the proper course of action in a bewildering and disorderly world. In any case, these works are instructive as an early effort to evaluate the troubled political history of Italy in the 14th and 15th centuries, for the remedies they prescribe for the maladies of the peninsula, and for their usefulness in revealing the importance of Italian history in the development of the European political understanding.

The Prince

Contemplating the past disorders of Italy, its present vulnerability to foreign intervention, and perhaps most directly the recent instability of his own beloved Florence, Machiavelli saw clearly that something had gone seriously wrong. Comparison with other, more successful polities, especially with the Roman Republic, helped him to identify the trouble. The Italians of the 14th and 15th centuries, he decided, had failed to preserve the political virtues, the decisiveness, and the sense of civic responsibility that had so long characterized the Romans and accounted for their political effectiveness. Their religious fervour, the most effective of social bonds, had declined and for this he blamed the intrusions of the papacy into politics. Since the early Middle Ages, he noted, popes had regularly invited foreigners into the peninsula to serve their own political ends; the result had been both the degradation of the spiritual power and the weakness and disunity of Italy. Furthermore, the rulers of Italy had employed unreliable mercenary armies to do their fighting instead of creating loyal citizen armies; hence, military power in Italy had been too decadent to oppose the challenge from without. And their failures of leadership and their struggles with one another had opened the peninsula to invasion.

Machiavelli then turned to a consideration of possible remedies. Although he considered a republic superior to all other types of government, experience had made him a pessimist. Looking back on what had happened to republics in the past, he developed a view of history according to which the selfishness of men will regularly subvert the state, reduce it to chaos, and require strong and ruthless leadership to set it to rights again. This cycle would recur again and again, human nature never changing, and it seemed obvious to him that in his own time Italy was passing through the most disorderly phase of the political cycle, in which the most urgently needed quality was leadership. These views are probably the explanation for the republican author's flirtation with the idea of a tyrant: an extraordinary problem required extraordinary measures, perhaps even the most cynical and brutal actions, for the restoration of political health. If successful at home, moreover, the prince might be able to organize a general Italian effort to expel the barbarians, though it seems unlikely that Machiavelli, a Florentine to the core, envisaged the formation of a united Italian state. In the long run, however, the prince would play his proper role in the historical cycle if, through sound laws and wise discipline, he prepared his subjects for the restoration of an effective republic—the only kind of political organization capable, Machiavelli believed, of the greatest achievements. Notable here, too, however, is a degree of hope that suggests the inadequacy in his grasp of the contrast between the resources of Italy and the vast power of the French and

Machiavelli's cyclic view of history

Spanish monarchies. It was already much too late for such reforms as Machiavelli dreamed of.

Implicit in Machiavelli's reflections are attitudes toward politics that demonstrate the value of the peculiarly Italian exposure of educated townsmen to the problems of political life. Machiavelli obviously believed that it is useful to analyze political situations and problems, to draw lessons from historical experience, and thereby to establish the principles on which sound political calculations and decisions can be based. In his view, man, by taking thought, can add a cubit to his political stature, at least in the short run. The political virtues can be encouraged through deliberate action by governments; rulers can control events and solve problems and can thereby triumph over the bludgeonings of fortune. To this extent Machiavelli makes explicit that tendency in the Italy of his time to conceive of government as a series of problems in the adaptation of means to ends, as a matter of rational calculation based on a knowledge of men and of the workings of institutions. For this reason (though in other respects he was too passionately committed to warrant such a title), he has been hailed as the father of modern political science. But equally important was his concern with the welfare of the state, conceived as an end in itself. The good was, for Machiavelli, quite simply what serves to preserve and strengthen the state; the bad is whatever tends to destroy it, since states are the only effective source of order in human affairs and, hence, of the happiness of men. From this standpoint all religious and ethical criteria are irrelevant to politics; and "reason of state," the famous phrase now permanently associated with the great Florentine and the source of much of the opprobrium heaped upon him by posterity, is the only measure of political wisdom. In thus making the state independent of all ideal considerations, Machiavelli's thought to some extent paralleled the growing tendency of the Italian states since the 14th century to pursue particularist interests regardless of the common good. Machiavelli, while a witness to the political failure of 14th- and 15th-century Italy, also reflected its most significant political achievements; and he was able, from his study of Italian events, to formulate basic political principles that other, more homogeneous states were later more effectively to pursue.

Later estimates of the period. While Machiavelli was something of a political scientist as well as a historian, Francesco Guicciardini (1483–1540) abandoned the effort to extract generalizations about political behaviour from history. He was a somewhat younger Florentine who had also seen much active political service. By his time the crisis of Italy had become desperate, and thus in his experience the world seemed too disorderly and unpredictable to warrant Machiavelli's type of reflection. But his great *History of Italy,* which reviews the 15th century before concentrating on the events of his own lifetime, exhibits many of the same concerns and the same cool skills in the analysis of events and the understanding of their causes as those apparent in the works of Machiavelli. Guicciardini's picture of the 15th century is highly idealized: it is, for him, an age of unequalled peace and prosperity for which he gives major credit to the Medici. The sequel he represents as a tragedy, for which he blames the blind passions, the selfishness, and the errors of individual rulers—especially the pope and Lodovico il Moro; and he shows in great detail how their machinations brought foreign invasion to Italy. The interpretations of Machiavelli and Guicciardini, widely read throughout Europe, were to become the classic account of Italian history in this period.

Guicciardini's *History of Italy*

This account was little changed until the 19th century. During the long domination of the Italian peninsula by foreign powers, historical composition generally languished. Even less than earlier was it possible to conceive of Italy as a unity about which it was possible to write an integrated history; and students of the Italian past were unable to go beyond erudite compilations of historical data that made sense only in local terms. This was true even of the *Annali d'Italia* (1744–49; "Annals of Italy"), by the great 18th-century scholar Ludovico Muratori, which details the events of Italy year by year but gives little sense of their meaning as a whole.

The modern understanding of Italian history in the 14th and 15th centuries begins with Simonde de Sismondi's *Historie des républiques italiennes du moyen âge* (1807–18; "History of the Italian Republics in the Middle Ages"). Inspired by the romantic liberalism of the earlier 19th century and beginning to think in national terms, Sismondi attributed all that was great in the life of Italy to the freedom of the medieval communes. From this standpoint the 14th and 15th centuries seemed a period of tragic and progressive decline, in which republican liberty was everywhere undermined by tyranny. The failure of the communities of Italy, corrupted by despotism, to unite had opened the way to foreign domination. Sismondi's vision of Italy in the period was also reflected in volume 7 of the French historian Jules Michelet's *Histoire de France* (1833–62) entitled *La Renaissance.*

Sismondi's republican emphasis was largely displaced by the great work of the Swiss historian Jacob Burckhardt, *The Civilization of the Renaissance in Italy* (1859). For Burckhardt, Italy had made a distinct break with its medieval past at the end of the 13th century and thereafter pointed to the modern world in a number of highly significant ways: in the amoral calculations that characterized its political life, in the interest in the human personality and external nature that characterized Renaissance culture, and in a paganism and immorality that pervaded many aspects of Italian life. These tendencies were, however, all expressions of a deeper quality, a fundamental individualism, which Burckhardt considered to be the central feature of the age in Italy. Its cause he found essentially in political conditions: most notably in the anarchy of the Italian peninsula in the later 13th century; he held especially that the dissolution of the traditional sources of order, papal and imperial authority, had created an atmosphere of insecurity and unrestraint that was favourable to the emergence of ruthless individuals. Thus, tyrants, whose power depended on personal gifts rather than on a legitimate relation to larger patterns of traditional order, came to dominate Italian society, making common cause with the Humanists, whose eminence similarly depended on their unique individual gifts. Although Burckhardt called his book an essay, the breadth of its vision of Italian culture as a whole made it a model for a new kind of synthetic history.

Burckhardt's analysis

If its interpretation depended above all on the political conditions of the peninsula, its scope gave special influence to his understanding of this aspect of Italian life. For most of the following century, writers on this period of Italian history tended to follow Burckhardt.

Burckhardt had seen that Italy in the 14th and 15th centuries was not a political unity but a congeries of particular entities united chiefly by common tendencies in political life and also by a largely common culture. But, even while he was writing, the political unification taking place in Italy was producing in Italians a tendency to regard the Italy of earlier centuries as a political whole containing in embryo the national state of the future. The result was, among Italian historians of Italy (though less commonly among outsiders), a revolutionary new vision of the past. Historians such as Carlo Cipolla, in his *Storia della signorie italiane dal 1313 al 1530* (1881; "History of the Italian Lordships from 1313 to 1530"), and Pietro Orsi, author of *Signorie e principati* (1900; "Lordships and Principates"), followed Burckhardt's emphasis on despotism but, lacking a modern concern with those social and cultural elements in Italian life that were common to much of the peninsula, tried to present the political history of Italy as a unified narrative. This effort has persisted in the more recent works of Luigi Simeoni, *Le Signorie* (1950; "The Lordships"), and of Nino Valeri, *L'Italia nell'età dei principati dal 1343 al 1516* (1949; "Italy in the Age of the Principates from 1343 to 1516"). (The latter, however, makes a far more effective attempt to integrate social and cultural with political history.) Such works are characterized by an uneasy tension between their authors' concern to present the history of Italy as a whole and the need to do justice to the intricate wealth of local detail provided in the histories of separate states.

(W.J.Bo.)

Italy in the 16th–18th centuries

EARLY MODERN PERIOD, 16TH AND 17TH CENTURIES

Expulsion of the French. The restoration in Naples of Ferdinand II in 1495 was through the combined effort of military forces furnished by the Venetians, who occupied several important cities in Puglia and meant to remain there; of Ferdinand the Catholic, who sent Gonzalo de Córdoba from Sicily to Calabria; and of Ferdinand II himself, who, landing at Naples, strove to regain the hereditary lands of his ancestors. Defeated in several battles and unable to receive supplies from their homeland because the Spanish fleet controlled the seas, the French finally abandoned southern Italy. Before they left they signed an armistice (February 27, 1497) with Frederick I of Aragon, uncle of King Ferdinand (who had unexpectedly died the previous October).

French abandonment of southern Italy

French acquisition of Milan. The new king was a moderate with humanist leanings; he wanted to pacify the kingdom and consolidate his power. But neither Charles VIII nor his successor, Louis XII (ruled 1498–1515), had given up the idea of acquiring Naples, and they made an agreement with the Spanish to garrison a number of fortresses there. Indeed, Louis XII, bent on enforcing his claim to the Duchy of Milan by a war of conquest, made concessions to the monarchs with whom his predecessor had negotiated the acquisition of Naples. Torn by internal discord, without allies, and poorly defended, Milan easily succumbed (1499).

Franco-Spanish division of Naples. This turmoil had fateful repercussions in the Kingdom of Naples. Neither by lenience nor by arms could Frederick appease the recalcitrant feudal lords, headed by the pro-French House of Sanseverino, to whose branches Charles VIII had restored vast feudal estates. Meanwhile, the acquisition of Milan had put Louis XII in a more favourable supply position; his diplomacy aimed at partitioning the territory of the kingdom with King Ferdinand the Catholic, as agreed to in the Treaty of Granada (1500). The Spaniards had not taken kindly to the fact that Alfonso V had given the Kingdom of Naples to his illegitimate son Ferdinand I in 1458. More seriously, Naples' present weakness stimulated the French and Turks, thus jeopardizing the security of Sicily, to which the kings of Aragon attached the highest importance.

King Frederick approached the Ottoman Empire for help. The latter, emboldened by its successes against the Venetians in the Aegean Sea, seemed ready to spill over into the Mediterranean. Thereupon Pope Alexander VI publicly proclaimed a crusade and called upon the Christian nations to participate in it (1493); this furnished Frederick's enemies with a pretext to invoke the Treaty of Granada.

French and Spanish invasion

Invaded by the French from the north and the Spaniards from the south, in 1501 Naples bowed to the conquerors, who proceeded to divide it according to the prearranged agreements: Louis XII gained Campagna with Naples and the Abruzzi; Ferdinand the Catholic obtained Calabria and Puglia. Frederick of Aragon spent his remaining days in France on a feudal estate and with a pension granted him by Louis XII, to whom he had surrendered his rights to the lost kingdom.

French losses in Italy. But territorial and fiscal differences soon developed between the occupying armies, which degenerated into a war. The Spaniards, led by Gonzalo de Córdoba (el Gran Capitán), forced the French to return to their native land. The two rival monarchs agreed on a three-year truce (March 31, 1504), which held firm; the French, beset by more pressing problems, preferred to allow the fate of the Kingdom of Naples to remain an open diplomatic question.

France attached utmost importance, however, to its possession of Lombardy, because of its high level of culture and because it was the gateway to Italy. The French fought long and ruinous wars for Lombardy, withstanding a coalition formed by Pope Julius II (reigned 1503–13), consisting of the Papal States, Venice, the Habsburgs, and the House of Aragon. Julius viewed France's presence in Lombardy as the real threat to the freedom of Italy, which he identified with the territorial independence of the Holy See.

The military superiority of the Spanish Habsburg bloc, led by Emperor Charles V (ruled 1519–56), prevailed at the Battle of Pavia (1525), and the French were driven out of the Duchy of Milan. Restored provisionally to the last heir of the Sforza dynasty, the duchy reverted to Spanish rule after his death (1535) and remained a feudal dependency of the Holy Roman Empire.

Italy under Spanish domination. Sealed by the treaties of Barcelona (1529) and Cateau-Cambrésis (1559), Spanish Habsburg domination of Italy lasted until 1700, when, as that royal line died out, the French Bourbons and the Austrian Habsburgs vied for the Spanish Habsburg inheritance. The treaties of Utrecht (1713) and Rastatt (1714), acknowledging the transplanting of a branch of the Bourbons in Spain, allotted to the Austrian Habsburgs—for balance-of-power reasons—the inheritance of Ferdinand II of Aragon and of Charles V.

Ruling several states (Milan, Naples, Sicily, Sardinia) by direct rule and maintaining a protectorate over others (including Genoa and Florence), Spain considered Italy a part of its world empire and a rampart against the Ottoman Empire and its satellites, the Barbary States of North Africa.

Economic decay in the 16th century

This situation coincided with a slow general decay that developed in Italy during the 16th century. This decay resulted from diverse causes. The economies of the mercantile states were harmed by the shift in the centre of world trade from the Mediterranean to the Atlantic, following the geographical explorations and discoveries of the 15th–16th centuries. Moreover, industrial, merchant, and banking capital began to develop in central and western Europe, thus eliminating the Italian economic traders, who were now reduced to regional proportions within their own country. The ruin of many public and private fortunes went hand in hand with a depletion of the creative energies that had flourished in Italy at the height of the Renaissance and with a marked decline in civic virtues. Added to this was Spain's political domination—part cause and part effect—which restricted the already limited mobility of such healthy states as the Venetian Republic.

Absolutism, characteristic of the European monarchies of that day, drove Spain to consolidate its rule in Italy. Spain aimed to centralize its administration, even if it was unable to improve the conditions of the people. The old privileged classes found their political influence weakened, yet retained their juridical and fiscal privileges on their huge estates. But these estates themselves, no longer run by watchful and diligent feudal lords, most of whom had been drawn to the cities, now were in the less able hands of managers eager to get rich and climb the social scale.

Spain showed no desire to make serious changes in the administrative apparatus of the state, although demands were urgent. (Studies by experts disturbed by mounting poverty called for reforms in legislation, taxation, social welfare, food distribution, and public health in order to renovate and move this closed, stationary, indolent world off dead centre.)

The authoritarian attitude based itself on the need to protect the state from disturbing confrontations, in both the political and the religious fields. In religious matters this covered not only questions of morality but also intellectual manifestations, judged in terms of formal logic and theological dogma, in which knowledge and faith were held to be inviolably one. Serious breakdowns in morals and discipline had disturbed the Catholic Church, and many requests had arisen for internal reform. In an atmosphere of change, imbued with a feeling for freedom that was inherent in Renaissance culture, the ideas of the Reformation had aroused widespread interest in Italy. The lowest common denominator of this movement was the free examination of sacred texts; in Italy there arose groupings of dissident monks, some of them also political in nature. With the Council of Trent (1545–63), the church carried out its long-projected reform: the doctrinal authority of church teachings and traditions was restored.

Thus Catholicism, having been reformed and having become a sponsor of socially beneficial works, was now adamantly defended, with church and state in complete accord. Press censorship and the tribunals of the Inquisition became the dreaded instruments of the church's rule. A good many intellectuals who had breathed the free air of Renaissance thought were the victims; two of the most noteworthy were Giordano Bruno in philosophy and Galileo in science.

Accord between church and state

Although state and church defended religion as the spiritual cement of the social community, other points of friction disturbed their relations. In the Spanish-ruled states, disputes arose because of the rulers' tendency to chip away at the church's immunity in jurisdictional and financial affairs, in line with absolutist practice. But in Venice, as a result of a conflict with Pope Paul V (1605), there emerged the modern rational principle of the secular state (see below *The Republic of Venice*).

With the poetry of Torquato Tasso, in the second half of the 16th century, the flourishing period of great literary creation in Italy came to a close. Empty formalism gained the upper hand, mirroring the arrogance, ostentation, and frivolousness of the leading classes. Some patriotic poems were anti-Spanish in tenor, but they could not generate and arouse popular feelings of revolt. In the figurative arts the Baroque was a pleasing and novel way of expressing beauty; but this vein soon dried up, giving way to indefinite, sensual, heavy-handed virtuosity in painting and sculpture.

As the 17th century faded, there appeared the first signs of a reawakening of community awareness of the country's needs. Criticism of the administrative structure grew increasingly sharp. Contacts were resumed with the cultures of more advanced European nations. When the Spanish Habsburg line died out with Charles II in 1700, Spain, weakened and helpless, realized that the spread of this reawakening meant the crumbling of its power in Italy.

Spanish Habsburg rule in Naples, Sicily, Sardinia, and Milan. The basic aim of Ferdinand the Catholic and of his nephew and successor at the head of the Spanish states (1516), the Habsburg Charles I (Emperor Charles V after 1519), was to consolidate power in the Kingdom of Naples, eliminating the sources of its internal and external weakness, whether the unruly feudal barons, France's ambitions, or the Ottoman and Berber threats in the Mediterranean.

The Kingdom of Naples. France's futile attempt to conquer southern Italy in 1528 gave the pro-French barons their last chance to rebel. Charles V ordered his forceful viceroy, Pedro de Toledo (served 1532–53), to root out any desire for political power on the part of the feudal aristocracy. Resistance in the capital city of Naples, led by a segment of the rebellious nobility, prevented the viceroy from introducing the Inquisition into the kingdom, a move he had sought in order to crush political opposition as well as Protestant-inspired religious dissidence; but in general he established centralized, absolutist rule. It was tightened by his successors, more concerned with the interests of the king of Spain than with conditions in the Kingdom of Naples.

Traditionally, the Naples Parliament—made up of two *bracci* ("branches"), one feudal and the other appointed by the crown—had been authorized to grant the government power to levy ordinary as well as special taxes, in exchange for various *grazie* ("favours"), but after 1642 it was no longer summoned. Instead, the practice developed of looking upon the municipal government of the city of Naples as the representative of the kingdom. This was a medieval-type aristocratic administration: the executive consisted of six representatives of the city's *seggi* ("districts")—five noblemen and one chosen by the upper and middle bourgeoisie. The one elected representative was generally a tool of the viceroy. Food was the chief worry of the public authorities. With its heterogeneous population continually increasing, Naples became one of the most populous cities in Europe, its lower classes swarming, poverty-stricken, coarse, and quick to riot.

Municipal government of Naples

In the provinces the bureaucratic and military apparatus was a far cry from the needs of a centralized, absolutist regime. Old families, deeply francophile, declined or disappeared; but others took their place, most of them Genoese in origin, rewarded by Charles V and Philip II for their financial aid. Continuous demands for funds forced the government to dispose of more and more crown lands, thus extending the feudal area to almost two-thirds of the kingdom. Meanwhile, the management of the landed estates deteriorated by the large landowners moving to the cities and farming out their estates to contractors who exploited them recklessly. There was a rural and urban middle class in the most important centres of the kingdom, but it was not an independent social force mindful of the common good.

This was a sluggish, inert society, culturally cut off from the forward-moving nations of Europe. Forced to contribute financially and militarily to an empire staggering under its own weight, the Kingdom of Naples could not escape the general decline that characterized the multinational complex ruled by Madrid. These, along with such woes of its own as epidemics, natural disasters, Berber incursions, and princely abuses of power, afflicted the people, intensifying their tendency toward apathy, resignation, and religious fatalism.

Occasional popular explosions of wrath did occur, as when taxes were increased or prices of basic necessities rose steeply. The most significant of these revolts broke out in Naples in June–July 1647, provoked by price increases in a number of staple foodstuffs. It bore the name of Masaniello (Tomaso Aniello), a young fisherman who first led the uprising; but Masaniello was actually a tool in the hands of a clever lawyer, Giulio Genoino, who hated the nobles because of their dominant position in the Municipal Council and vowed to raise the people's representative from his subordinate role. This frightened the viceroy, despite the insurgents' proclamation of loyalty to the King of Spain; he appeased them by granting various concessions, which he revoked as soon as he could strike back. An early victim of this counterattack was Masaniello, who was assassinated on July 16, 1647. The movement then began more and more to assume the character of open rebellion against Spain, while in the provinces the rural and urban masses revolted against the diehard feudal lords with unusual violence. As the crisis worsened, Cardinal Mazarin, prime minister of France under Louis XIII, used aiding the rebels as a pretext for attacking Spain in the Kingdom of Naples. But before preparations were well under way, Mazarin was forestalled by the Duc de Guise, heir to the rights of the French House of Anjou to the Neapolitan throne and a favourite of the French king. The rebels' extremist faction in Naples had proclaimed a republic and invited de Guise to take command, in dictator fashion, of the armed forces mustered to defend it. But de Guise and the republic were swept away by a Spanish expedition to southern Italy; and in the countryside the barons joined with government forces to repress the revolts and restore law and order.

Rebellion against Spain

Still lurking within the hearts of the feudal aristocrats, however, was resentment of Spanish domination and centralized power. Indeed, once Spain had fallen into decay and the conflict sharpened between Louis XIV and the Austrian Habsburgs for the succession to Charles II, the last and heirless descendant of Charles V, a section of the Neapolitan aristocracy conspired on behalf of the Habsburgs (1700; the so-called Conspiracy of the Prince of Macchia). The nobles hoped to restore the kingdom's independence by placing a Habsburg prince at its head and to regain the privileges of the feudal nobility.

The Austrian Habsburgs occupied the Kingdom of Naples in 1707 and had its conquest ratified by the treaties of Utrecht and Rastatt. But they maintained Naples as a viceroyalty and, faithful to their own brand of absolutism, paid no heed to the Neapolitan barons. The Austrian Habsburg government developed no program of reforms, contenting itself with bringing a certain amount of order into the central administration. Moreover, it had fewer financial problems than did Spain, so it could nourish the ambition of controlling all Italy (Sicily was added to Naples in 1718 as a result of the anti-Bourbon coalition of the Quadruple Alliance).

A new crisis developed in Europe in 1733 with the War of the Polish Succession. In 1734 Don Carlos, son of Philip V of Spain and Elizabeth Farnese, was crowned king of Naples and Sicily.

Sicilian loyalty to Spain

The Kingdom of Sicily. Sicily developed institutions and aspects of community life akin to those of Naples. But there were differences, which arose because the island had followed a different historical path after the revolution of 1282 (Sicilian Vespers). After Sicily's absorption by Aragon in the early 1400s, its longing for independence had survived for a time and at moments had even flared up. To dampen any such desire, John II of Aragon consented to make his firstborn (the future Ferdinand II the Catholic) king of Sicily (1460). A subsequent plot to place the island under French rule—hatched in 1523 by the Imperatore brothers and encouraged by the French monarch while the Habsburg Charles V, then king of Sicily, was at war with France—was brutally crushed. The long reign, the prestige, and the political moderation of Charles V, and common problems of security in the Mediterranean, combined to stabilize relations with the Sicilians and make them loyal subjects of the Catholic kings. Spain attached great importance to Sicily, not only because it considered the island a bulwark of its power in the Mediterranean but also because Sicily produced much wheat and was a good market for Spanish goods.

The socioeconomic organization of the island was strictly feudal, with the upper aristocracy, owners of huge landed estates and with hosts of retainers in every segment of society, the dominant class. The barons, maintaining full control of their estates and wielding power in the Sicilian Parliament by means of the feudal *braccio* ("branch"), became part of the constitutional fabric of the regime and one of the pillars of the state.

The Parliament, composed of three *bracci*—feudal, ecclesiastic, and royal—was charged with voting the amounts required for ordinary and special taxes, a task it performed along traditional lines but with the feeling that in this domain it was sovereign and represented the nation. Aristocratic interference was evident even in the administration of the big cities, except for Messina, which was a busy trading centre controlled by a wealthy bourgeoisie. Because the island remained loyal, Spain had no intention of disturbing the existing system; indeed, it even reinforced the spirit of its inherently conservative policies. Nor were there significant changes under Victor Amadeus II of Savoy, who held royal title to Sicily in 1713–18, under the Austrian Habsburgs, who controlled it in 1718–34, or under the Bourbon regime established in 1734.

Sardinia. Sardinia was closely linked with Spain, its firm ties the outcome of a deep-going process of assimilation. Many Spaniards had come to Sardinia and been assimilated into this patriarchal society led by a powerful feudal class, whose chief source of wealth was sheep raising. Neither the crown nor the island's ruling class felt any inclination to alter a system based on a solid feudal-monarchist regime—the viceroy was generally a Sardinian and the Parliament was divided into three *stamenti* ("branches"). The population, peace-loving and inured to harsh living conditions, had only limited relations with Italy. Under such circumstances, Sardinia in 1720 went over to Victor Amadeus II of Savoy, together with the royal title, in exchange for Sicily (see below *The Austrian government in Italy in the 18th century*).

The Duchy of Milan. One of the most prominent states in Italy in the late Middle Ages, Milan was attached to Spain in 1540. When Charles V took this step, after long and fruitless negotiations with France, he was prompted by considerations of Milan's strategic importance as well as its economic development in agriculture, industry, and trade.

Supreme power was in the hands of a governor, assisted by consultative councils; the Senate, patterned by Louis XII after the Parlement of Paris, remained unchanged and controlled the whole administrative apparatus of the state. But overall directives and guidance came from Madrid. To this end, Philip II in 1558 set up in Madrid the Council of Italy, whose members included two councillors from Milan and two from Sicily.

The church had tremendous influence on the government and social life of Milan. In the wake of the Council of Trent, Cardinal Charles Borromeo enthusiastically fostered reforms in Milan; his nephew, Cardinal Federico Borromeo, followed his example. The zeal accounted for many institutions that were socially beneficial—some new, others revived. But when the church claimed full jurisdiction over these institutions, it collided with the Spanish-oriented political rulers, and the old church–state struggle reappeared.

The highborn, on the other hand, lost much of their vigour. No longer involved in their former productive activities, they masked their moral and economic impoverishment with bizarre and ostentatious pomp, called *spagnolismo* ("Spanishism"). And Spain's concern for the economy could not prevent a decline. The process was hastened by military levies and requisitions (in the wars for Monferrato and the Valtellina, which Spain sought to annex), famines, plagues, and the soaring prices of basic commodities. The people gave vent to their discontent by rioting on various occasions. Thus, there was no sense of shock when Lombardy passed from Spanish rule to that of the Austrian Habsburgs, who had long coveted it.

Spain and the independent states of Italy. Relations between Spain and those Italian states that remained independent followed a different course. Functioning in a system that underwent little change until the downfall of the dominant power, some of them may be considered satellites of Spain, others independent entities.

The Spanish satellite states

Disregarding the independent territories in central-southern Italy that were small in area and of minor political importance—*e.g.,* the duchies of Modena, Reggio, and Ferrara of the dukes of Este, the Duchy of Mantua and Monferrat of the Gonzagas, the Duchy of Parma and Piacenza of the Farnese family, the Republic of Lucca—the satellite group included the Duchy of Savoy in Piedmont, the Republic of Genoa in Liguria, and the Duchy (later the Grand Duchy) of Tuscany (Florence) in Tuscany, ruled by the Medici family; the Papal States and the Republic of Venice were independent of Spain.

The Duchy of Savoy. With the Treaty of Cateau-Cambrésis (1559), Savoy, hitherto occupied by the French, was restored to Emmanuel Philibert, victor at the Battle of St. Quentin, with the pledge that he remain neutral both toward the French, guarding the Alps, and the Spaniards, masters of Lombardy. Philibert (ruled 1559–80) rebuilt and strengthened Savoy, maintaining equal distance between the two powers. His son Charles Emanuel I (ruled 1580–1630), avid for territorial expansion, joined in the wars of the period variously allied with Spain and France but without profiting from his participation. At his death the dukedom fell under the ever more oppressive rule of France, which the Bourbon Henry IV restored to the rank of a great power. Not until the advent of Victor Amadeus II (ruled 1675–1730) did the duchy recover from its humiliating subjection.

The Republic of Genoa. Genoa was reduced to a protectorate under Charles V and subsequently under Spain, which looked upon it as a base from which to control the Tyrrhenian Sea. This actually came to pass when Andrea Doria, a powerful Genoese shipowner, defected from the King of France and, with his fleet, entered the service of the Habsburgs (1528), convinced that such a move would favour the economic interests of the city as well as his own. Events vindicated his decision. Doria gained the favour of Charles V by rendering great service in the Emperor's later Mediterranean campaigns; and he prepared a constitutional reform by which the powers of the Genoese Republic would be concentrated in the hands of the faction loyal to him. In 1547 the opposing faction, the pro-French Fieschi, tried to oust Doria's nephew Giannettino; but the movement failed, as did other anti-Spanish uprisings in Italy that same year.

Genoa's weaknesses

The spirit of factionalism died down, but at the same time the mercantile spirit had lost its vitality—the old maritime leaders, losing interest in the sea, began to invest in landed property with a sure return; unemployment swelled; the state staggered under a load of debts. An especially thorny matter was the insubordination of Corsica, harshly exploited by the Banco di San Giorgio, an organ of the Genoese government that administered the island. The dukes of Savoy played on Genoa's weaknesses and its people's distaste for aristocratic government by fomenting numerous conspiracies in the 17th century; similarly, they found Liguria a tempting prize. The republic foiled these manoeuvres; but having refused to break away from Spain, it was bombarded and blockaded in 1684 by Louis XIV. The following year, abandoned by its Spanish ally, Genoa had to submit to Louis XIV's exacting terms.

The Duchy of Tuscany. The Republic of Florence also came into Spain's orbit. Charles V, implementing his agreement of 1529 with the Medici pope Clement VII, conquered the republic by force of arms. Then, in 1531, Charles named Alessandro de' Medici duke of Florence with hereditary rights. Alessandro was assassinated in 1537 in an atmosphere of hatred spawned by his own dissoluteness and of intrigue by republicans and those who favoured an oligarchy. The Florentines ran a serious risk that Spain, using the pretext that the French would intervene to foster a resurgent republic, might occupy Florence. The danger was avoided when, in the same year, Cosimo de' Medici occupied the throne as Cosimo I; he was swiftly recognized by the Senate of Forty and accepted by the people.

The reign of Cosimo I

Cosimo, with farsighted realism, allied himself with Charles V. With the latter's consent he waged war on the Republic of Siena (1552–55), which was pro-French, and annexed its territory except for five seaports that Spain kept for itself; these five constituted the Stato dei Presidi ("State of the Garrisons") and were placed under the dependency of the Kingdom of Naples. The acquisition of Siena extended Florence's rule over Tuscany and enhanced Cosimo's prestige. Moreover, Cosimo worked tirelessly to restore, consolidate, and modernize the state. Inequalities between the capital and the annexed towns were reduced, finances reorganized, land reclamation carried out, ports built, and a strong navy and regular militia created. Attesting to his esteem, Cosimo I had the title of grand duke conferred on him by Pope Pius V in 1569. His successor, Francesco I, was confirmed in this title in 1576 by the Holy Roman Emperor.

Nevertheless, Florentine industry, banking, and trade slowly declined, and Florence lost its former European outlook and became provincial in nature. Land became the pivot of the region's economy and the source of financial profit. Attempts under Cosimo I and his immediate successors to forge an economic policy independent of Spain failed.

The Papal States. The popes Paul III (reigned 1534–49) and Paul IV (1555–59), bent on safeguarding the independence of the Papal States, could not check the expansion of Spanish power in Italy. The papacy saw a lessening of its power as a supranational state as the process of secularization in international relations advanced in Europe. Even its role as head of a major Italian state declined. In 1563 the Council of Trent finished its task of synthesizing the Catholic Counter-Reformation. Implementing the council's resolutions, the popes laboured to reform and re-establish the church, and religious matters occupied most of their time and attention. Pope Pius V (reigned 1566–72) promoted the alliance of Spain, Venice, and the other Italian states that defeated the Turks at the Battle of Lepanto (1571), thus ending Turkish expansion on the high seas. Pope Gregory XIII (reigned 1572–85) reformed the calendar and gave it his name. Pope Sixtus V (reigned 1585–90) also distinguished himself at the helm of state. Pontiffs such as these repressed brigandage, reorganized the court system, and built magnificent public works in Rome. The city took on new beauty as a result of the artistic flowering of the period. Furthermore, the territories of Ferrara, Urbino, and Castro were again brought under the direct rule of the church.

In the never-ending antagonism between Bourbons and Habsburgs in Catholic Europe, the popes were proponents of a balance of power. Yet it was a troubled time for the church because of jurisdictional disputes with Spain (even though that nation was a bulwark of Catholicism), because the papacy's good relations with France deteriorated markedly under Louis XIV, and because the power of the Papal States was eroding.

Papal disputes with Spain

The Republic of Venice. Venice, at the outset of the 16th century the most powerful state in Italy, suffered from defeats in 1509 by the League of Cambriai and from Spain's subsequent takeover of Lombardy, the crowning triumph in the Spanish struggle with France for hegemony beyond the Alps. Venice—a rich, solid, and unified political entity—was far from exhausted. But under pressure from the Spanish Habsburgs straining to expand from Lombardy into Venetia, and from the Austrian Habsburgs jealous of its supremacy in the Adriatic, Venice could no longer count on its alliance with France or with the other Italian states; it weakened politically as well as economically. The growing use of the Atlantic as a sea route stripped Venice of its monopoly in the spice trade; and the expansion of the Ottoman Empire deprived Venice of several Aegean and Black Sea islands and ports of call and sharply curtailed its trade with the countries bordering on those waters.

In 1605 a bitter dispute between Venice and Pope Paul V broke out because two monks involved in common-law crimes had been tried in a secular court. This episode dramatized the diametrically opposed attitudes of church and state: on the one hand, the medieval idea of theocratic universality, which had been repressed but was reaffirmed by Pius V in the edition of the papal bull *In Coena Domini* (1568); and on the other, a modern concept affirming complete state sovereignty in temporal matters. This latter concept, product of a long political and juridical tradition in Venice, found a vigorous advocate in the state theologian Paolo Sarpi, and the republic would not give in, even when threatened with a papal interdict. Mediation by Henry IV of France brought a resolution of the controversy, from which Venice emerged with dignity.

Venice stubbornly defended its Near Eastern possessions against the Turks with its fleet, the chief element in its remaining power on the international scene, and its considerable financial resources. At Lepanto the Venetian fleet made a decisive contribution to the victory of the Christian armada. Worn out by 25 years of war, it had to yield the island of Candia (1669); but it acquired the Peloponnese (formally recognized in the Treaty of Carlowitz, 1699) by defeating the Turks beneath the walls of Vienna in its last great triumph in the East.

In the 18th century the ruling class, as in other Italian states, withdrew from commercial pursuits and, as a result, the vitality of public life declined, making Venice easy prey to the invading French Revolutionary armies in 1797.

(E.Po.)

ITALY IN THE 18TH CENTURY

The aftermath of the War of the Spanish Succession

The early 18th century witnessed profound changes in Europe, arising out of what has been defined as the first world conflict in modern history: the War of the Spanish Succession (1701–14). The old political system was no more; from its ashes arose a new pattern of state relations, ratified on the diplomatic level by the treaties of Utrecht (1713) and Rastatt (1714). In Italy the Duchy of Milan and Mantua, the Kingdom of Naples, and Sardinia passed to the Austrian House of Habsburg. Sicily went to Victor Amadeus II of Savoy, who bore the title of king; a succession of surrenders, however, forced even Sicily into the Austrian orbit, with Sardinia transferred to Victor Amadeus II as compensation (Treaty of The Hague, 1720). Meanwhile, Tuscany, when the Medici dynasty became extinct, went to Francis Stephen (Peace of Vienna, 1738), duke of Lorraine and husband of Maria Theresa of Austria. This intricate diplomatic game, punctuated by acute military crises, continued until the Treaty of Aachen in 1748. By its terms Milan was ceded to the Habsburgs in exchange for some slight territorial adjustments in favour of the Piedmontese; Don Carlos, the Bourbon Infante of Spain, was confirmed as king of Naples and Sicily, which had been conquered in 1734; and his brother Philip was accorded the Duchy of Parma and Piacenza. Thus, in approximately half a century, the political situation in the Italian peninsula had completely changed and now settled into a long state of equilibrium. This new situation gave the Italian states undeniable advantages. They found themselves incorporated into a political system that proved more vital and energetic than the previous one and that bore a distinctly European cast. Italy was thrown open to the ideas of the Enlightenment and swept by profound desires for reform in every field. Obviously, a historical process so vast in scope could not be effected swiftly and along predetermined lines; it was conditioned by a variety of factors growing out of specific local situations and the overall political evolution.

Lombardy. The Austrian armies, with the support of Piedmontese troops, entered Milan on September 26, 1706. On March 13, 1707, an armistice with France formally ratified Austrian occupation. Austria sought to impose its own Italian policy firmly and decisively, using its base in Milan to strive for complete control of the peninsula and to expel potential rivals. But it was thwarted by an unfavourable set of circumstances. Internal crises and international complications forced the Habsburgs to extract financial resources from their new possession; and their methods were at times crude and arbitrary. As a result the governors of Milan had to resort to a policy of drastic financial retrenchment, thereby leaving a thin margin for any attempts at governmental reform.

Government reforms. After the storms of the Spanish succession had subsided, the foundation for future reforms was laid. But a terrible economic depression in the 1730s, on top of a renewed outbreak of devastating war in Lombardy, blocked these meagre efforts at reform and paralyzed government activity.

The great powers of Europe concentrated their aims and efforts at preventing Austrian domination over Italy and half of Europe; and they were joined by the House of Savoy, dispassionately opportunistic as always. These were the critical years of the wars of the Polish and the Austrian Succession, during which Austria lost Milan more than once, only to finally regain it in 1747. When things returned to normal with the Treaty of Aachen, the Austrian government readied a plan for a long-overdue and sweeping reorganization of the state. Recent events had laid bare frightening gaps in Milan's economic and social structure. Its technicians and administrators, most of them outrun by events, remained a dangerous source of tensions, so that the government was forced increasingly to intervene in order to safeguard its power. In its interventions it drew on long experience in centralized rule, so that local political elements and their institutions were stifled. Reorganization of Milan was decided upon from 1748 on. Despite obstacles and resistances interposed by the privileged and conservative elements of the population, many varied and weighty problems of the economy were tackled.

Reorganization of Milan

After 1750 important reforms were instituted in the system of labour contracts and tax collections; the administrative code in force under the Spanish was simplified; and a land survey was made. These reforms were technically valuable. But even more important was the logic inherent in the overall reform policy, which was essentially designed to strengthen the central power at the expense of local authorities and of special interests that were particularist and anti-centralist.

The decade 1750–60 ended on a positive note for the Austrians in Lombardy. Their activity there had undoubtedly struck the first serious blows at an antiquated state apparatus and system of living. Once under way, therefore, the process began to develop an independent and irrepressible momentum of its own. Requests and demands of the population grew more and more insistent; the solutions adopted, usually compromises, proved less and less adequate.

A new and more powerful wave of reform hit Milan after 1760, involving again the system of labour contracts, customs, and tolls. This led in 1765 to the creation of a higher body of study and verification, the Supreme Economic Council. The reorganization of the local administrative and political apparatus continued, chiefly at the expense of the Senate, the judiciary, and the highest public offices (even the governorship was reduced to a bureaucratic function). Nor was this done purely by chance: it was in those three areas that the Austrian government had encountered the stiffest resistance. The reforms were always carefully circumscribed so as not to provoke violent reaction. This was also true of church–state relations, with the abolition of the Inquisition and the secularization of censorship while problems of a delicately theological nature were set aside for a time.

The rule of Joseph II. Maria Theresa's death (1780) and the autonomous rule of Joseph II mark a radical turning point in Habsburg policy toward its possessions. The new emperor was, spiritually and ideologically, the product of an age of rationalism and enlightenment, and his behaviour differed markedly from his mother's ponderous and prudent ways. What had been calculation and necessity in Maria Theresa became in Joseph dictate of conscience and adherence to principles; hence the flexible style and comportment of the former and the stubborn, rigid, and unyielding behaviour of the latter. The idea of the state as the organ of absolute power above and against traditional rights, class privileges, and local autonomy was at the root of Joseph's personal and political morality. He promoted centralism and denied any autonomy to persons, institutions, or regions in the state. Like the other Italian possessions, Lombardy was caught up in the fever of the overall reorganization undertaken by the Emperor with utter disregard for consequences. A Government Council made up of six departments suddenly supplanted existing administrative and judicial bodies. A veritable storm blew up over church–state relations, but this time the controversy spilled over into theology as well, including matters of church ritual, in which the government interfered arbitrarily and at times ridiculously. Such passion for reform, though it furnished the Milanese with the tools for modernizing their state and rationalizing its developing economy, did not always find favour with the various segments of the population. Significantly, the intellectuals abandoned the line of collaboration with the Austrian government that they had followed under Maria Theresa and took the lead in opposing what they now called the new despotism. The price the Milanese had to pay for the Emperor's policies in Lombardy must have seemed too high; Joseph II's efforts, massive but lacking flexibility, left the real needs of the state misunderstood or neglected.

Enlightened Despotism

Leopold II, who succeeded his brother in 1790, made an attempt to improve relations by softening Joseph's harshest measures; but Leopold died barely two years later, and his successor, Francis II, was too much absorbed in international affairs to be concerned with Lombardy. Defeated by the French in 1796, the Austrians ended wretchedly, at least for the moment, their political presence in northern Italy.

Tuscany. The Peace of Vienna (1738) ratified on the diplomatic level the results of the War of the Polish Succession. By the terms of the peace, Tuscany was awarded to Francis of Lorraine (reigned 1738–65), and a new phase in the history of the grand duchy began.

The government of Francis of Lorraine. The functions of government were assigned to a Regency Council. With Francis at war with the Turks, two of his representatives presided over the council's work, first Prince Marc de Craon and then Count Emanuel de Richecourt. The ministers were confronted with corruption and malfunction in every branch of the government, both civil and military. These ills were piled on top of the basic problems of Tuscan society inherent in the country's political and economic structure, including the overweening power of an oligarchy over the regency councillor, the pro-Spanish inclinations of a section of public opinion, the disorganization of trade, and the burden of tax-free church property. It quickly became clear, above all to Richecourt, that it was essential to formulate a detailed and thoroughgoing plan of reform that would wipe out abuses and unfair privileges of the elite castes. But the reactions to Richecourt's initial measures and the delicate state of international affairs made it imprudent, for the time being, to proceed along the path of reform. The Spaniards, meanwhile, tried unsuccessfully to install the Bourbon prince Philip in Tuscany. But at the beginning of 1739 Francis of Lorraine entered Florence, visited the principal cities, and departed, leaving in charge a regency again headed by Richecourt. Until 1765 Francis' administration sought to promote general economic progress and welfare. It had some striking successes, particularly in getting rid of institutions that still bore the medieval stamp. Marked improvements were made in administering the economy: trade was liberalized and the public debt reorganized; measures were taken to benefit agriculture. The government moved to rescind feudal legislation and abolish church privileges. In sum, Francis' achievements were far from negligible, even though his political activity in Tuscany had to remain quite limited, since Tuscany was only one of the many provinces in the Habsburg Empire. Francis was crowned Holy Roman Emperor in 1745 (as Francis I), and thenceforth had to immerse himself in far graver and more complicated political problems.

Economic improvements

The government of Peter Leopold. Only with the 25-year rule of Grand Duke Peter Leopold (reigned 1765–90) was Tuscany vouchsafed a genuine revival, with an intense social and political development that no longer benefitted special interests alone. This second son of Francis of Lorraine remained in Florence until 1790, when he ascended the imperial throne as Leopold II. With his advent in Florence, relations between the grand duchy and the court of Vienna were completely altered, though he evoked frequent expressions of reserve and concern in circles close to Empress Maria Theresa by placing in responsible posts Tuscan experts and men of enlightenment, with whose help the most effective reforms were launched. Important steps were taken toward ending internal restrictions on the grain trade; the traditional farming out of taxes was abolished and the tax system overhauled. Immediately thereafter, laws were passed regulating the church's landed property; the enormous holdings of the church were thus broken up and redistributed more equitably.

The decade 1770–80 saw other significant reforms: the abolition of a law defining the jurisdiction of corporations; the suppression of specific statutes and tribunals as well as the high tribunals of Commerce and of the Arts and Professions; and the stimulation of commercial and industrial activity by jettisoning various duties, tolls, and privileges. The entire bureaucratic and administrative state apparatus was fundamentally transformed. The antiquated state structure set up to serve the city-state of Florence was replaced by a modern organization in which the interests of individual institutions coincided with the general interests of the grand duchy. Nor were problems of public safety or those pertaining to military matters ignored; special attention was paid to draining and reclaiming the malaria-infested marshes—an age-old barrier to development of the whole region.

In the decade 1780–90 Peter Leopold included programs of even vaster scope; *e.g.,* church reform, a new constitution, and efforts to increase the peasants' landholdings. He did away with tax exemption for the church, its chief privilege under the old order, and he abolished the Inquisition and suppressed the Society of Jesus (the Jesuits), despite sharp resistance. But when he moved onto jurisdictional ground and sought to reform the church along clearly Jansenist lines he aroused fierce opposition.

A basic factor in restructuring the economy was the grant to small landowners of vast holdings that had formerly been state property. To strengthen and consolidate Austrian rule in Tuscany, Peter Leopold deemed it essential to create a new class of independent small farmers, who would constitute a genuine social base for the government, and he planned to transform the grand duchy from an absolute to a constitutional monarchy, in which the people would have representative bodies—a revolutionary step. Apparently, Peter Leopold was convinced that the monarchy could continue to function solidly only by strengthening its relations on the political and institutional level with the new social strata. The beneficiaries of the agrarian reform thenceforth constituted the pivot of the social structure in Tuscany. His plan for a constitutional monarchy, however, did not materialize because of the still considerable weakness of the new social groups on which the future political structure was to be based, and because Vienna was opposed to any such political orientation on the part of its Italian dominions.

The new Austrian class in Tuscany

In 1787 a new penal code, the Leopoldine code, was promulgated. Calling for the abolition of the death penalty and torture, it broke sharply with the tradition of judicial cruelty and thereby propelled Tuscany, in this respect, into the vanguard of the nations of Europe. In 1790 Peter Leopold was called to Vienna and, on the death of his brother Joseph, named emperor; in March 1791 his son Ferdinand succeeded him as head of the grand duchy (as Ferdinand III).

Leopold's forced departure and the transfer of his powers brought violent disorders in Tuscany in 1790 and again in 1795. They appeared first in an anti-Jansenist guise but quickly turned into a revolt against hunger, poverty, and the high cost of living, which the people attributed to their lack of freedom. The influence of the contemporaneous French Revolution was strong. Faced with such disorders, the regency yielded, and Leopold, in Vienna, was forced to sanction, for the moment, the repeal of free trade in grain. What had in fact occurred was a reaction to the reform policies of 25 years of Leopold's rule, fomented by the clergy and civil servants who had remained hostile to the innovations that had stripped them of prestige and power. In addition, the poorer classes, victims of social inequities and hard hit economically, were exploited and manipulated by the reactionaries. The result was crisis and decline, virtually until 1799.

Naples and Sicily under the Habsburgs. *The mainland.* Naples, too, was acquired by the Habsburgs as a result of the War of the Spanish Succession. Austrian troops entered Naples in 1707 and were warmly received by the people. The most active segments of society—the provincial barons, the urban patricians, and the secular middle classes—each formulated their demands in a different way. But in substance each group demanded a greater measure of autonomy designed to strengthen local powers, a viable economy that could cope with anticipated financial pressures, and a reorganization of the juridical and administrative system. The delicate international situation, to which the Habsburgs had to devote their undivided attention, quickly revealed how unattainable all these demands were. Nevertheless, something was done on behalf of the viceroyalty of Naples when Cardinal Vincenzo Grimani became viceroy (1708–10). While vigorously pursuing a line of stern authority, he drew upon the best energies of the native population and endeavoured to soften social differences and to lighten financial burdens. But in the final years of the War of the Spanish Succession, these needs became more pressing, and the Austrians had to cast about for funds. Thus, the efforts to recognize the state's finances were rendered vain, and Naples once more found itself on the brink of collapse.

Demands for change

When the war ended, the Austrians were able to pay more attention to their new acquisition. The choice of Wierich Lorenz, Graf von Daun, as viceroy (1713–19) signalled a new political course. Daun embarked on the thoroughgoing and long-term project of restoring the economic and financial health of the state. He also engaged in a controversy with the papacy over church government, over which the state traditionally enjoyed extensive control. During these years such institutions as the Collateral Council, an expression of local political power, were strengthened; university reform was attempted; and notable successes were registered in the controversy with the church. A series of international complications, however, forced Charles VI to adopt a financially oppressive policy toward Naples. Vast sums of money went more and more frequently to Vienna, under the name of donations, further impoverishing the land. In exchange, grants and privileges were extended, but almost exclusively to the feudal groups. Thus, Neapolitan society was dealt a setback.

With the return of peace and the arrival in Naples of a new viceroy, Cardinal Michael Friedrich von Althann (1722–28), Habsburg policy took a new turn. Reinforcing the central government, reviving the economy, and easing relations with the church, in line with improved relations between Rome and Vienna, were the aims Althann tenaciously pursued. But his policies offended several groups; these included the nobility, hit hard by the harsh tax measures and forced to relinquish their traditional powers in such areas as the judiciary, and the secular-minded citizenry, resentful of the viceroy's new pro-church attitude. Despite opposition, Althann first planned a new enumeration of the hearths in the country, in order to get a clearer picture of population distribution and thus institute fairer taxation. Next, he sponsored the creation of the Banco di San Carlo, a move that provoked dangerous social tensions. The bank was established with a view to reacquiring large estates for the crown as well as to recoup lost revenues, rather than for serving as a stimulus to revive stagnant economic activities, especially in trade, by distributing large amounts of capital to individual citizens. The nobility saw in the bank an assault on the rentier economy on which it lived and prospered; the middle classes feared it would become the instrument for even more burdensome taxes. The social unrest these measures caused led to Althann's downfall.

The following years brought famine, economic crisis, and an atmosphere of imminent war, which forced the situation to the breaking point. The Austrians could not escape the consequences of the crushing financial burden; since the latter overhung all their policies, every attempt at reform was thwarted. When Don Carlos of Spain ascended the throne of the reborn kingdom, the population and the political authorities welcomed him warmly.

The reign of Charles VI

Sicily. Following the Hague Treaty (1720), the Habsburgs yielded possession of the port of Antwerp, in deference to the requests of England and Holland, and recognized Philip V as king of Spain. As compensation Charles received Sicily, taken from Victor Amadeus II of Savoy, in exchange for Sardinia.

Sicily suddenly proved to be a difficult land to rule, even though Charles VI and his ministers did not stint in their efforts to win over the Sicilians. The first period of the new government was made even more difficult because of the permanent garrisoning of German soldiers on the island, thus giving rise to numerous abuses and clashes. When a functioning civil government was finally set up, Sicily's age-old ills—feudal arrogance, administrative and economic disorder, corruption and chaos in the courts, and municipal particularism—became glaringly evident. An excessive tax load was placed on taxpayers already staggering under their burden, and on many occasions the island parliament was called upon to vote huge levies needed for imperial policy.

But in at least some respects Austria's rule was energetic and mindful of Sicilian interests. Charles VI really tried to lift the island out of the economic and commercial swamp in which it was foundering. He sought to reactivate Sicily's ports, particularly Messina, which was made a free port in 1728, with the aim of reviving the economy in the whole Messina area, especially by attracting foreign commerce and shipping. Measures were taken to cope with a crisis in grain—Sicily's traditional source of wealth—and to improve the declining silk industry and allied activities. The results, however, were far less than anticipated, largely because of a drastic worsening in the general economic situation, and to some extent because Charles' policies promised more than they could achieve. A series of measures adopted around 1730 produced disastrous results, laying the groundwork for economic collapse and probably hastening the political breakdown.

As for relations with the church—especially tricky in Sicily, where the sovereign had the role and functions of apostolic legate—Charles VI proceeded cautiously but firmly. He reassured everyone by his orthodox defense of the faith, even permitting the Inquisition to continue to function, but he was adamant about maintaining the legateship. Aided by loyal and able church ministers, he waged a lively and eventually victorious polemic with popes Innocent XIII and Benedict XIII. The solution, arrived at in 1728, was completely satisfactory to both parties and was given force of law in a papal bull.

The few years of Austrian rule failed to make a dent in many other aspects of Sicilian society. Austria's monetary policy, for example, failed and its cultural policy was weak. Defeated by a Spanish army, the Habsburgs left Sicily in 1734. (G.d'A.)

The first Bourbon period in the south (1734–99). Don Carlos ruled Naples–Sicily as Charles VII, winning popularity by making it an independent kingdom for the first time in two centuries. When he succeeded to the Spanish throne as Charles III in 1759, he left the kingdom to his son Ferdinand, appointing his minister Bernardo Tanucci and a council of regency to rule until Ferdinand came of age in 1767.

In the prevailing spirit of Enlightened Despotism, Tanucci sponsored reforms to modernize the state and increase its power at the expense of traditional institutions. Ferdinand had little aptitude for government, and came to be dominated by his wife, the Austrian archduchess Maria Carolina, whom he had married in 1768. Opposed to Tanucci's pro-Spanish policies, Maria Carolina secured his dismissal in 1776 and, beginning in 1779, replaced him by promoting the rise to power of an English émigré, Sir John Acton.

In the 1790s, Acton and Maria Carolina aligned Naples with Austria and Britain in their struggle against Revolutionary France. When French forces occupied the mainland portion of the kingdom in 1799, the Bourbon government sought refuge in Palermo under British protection. (Ed.)

Revolution, restoration, and unification

THE FRENCH REVOLUTIONARY PERIOD

In the spring of 1796 the French Revolutionary armies burst into Italy. But they had been long preceded by a considerable incursion of revolutionary ideas. As early as the summer of 1788, the Italian newssheets had given priority to "the latest news from France," where a grim struggle between the crown and the Parlement of Paris was taking place. As the Revolution developed, the circulation of these papers increased; they were soon accompanied by a spate of pamphlets, and then, from 1791 onward, by the graphic testimony of émigrés. Despite the vigilant surveillance of the various Italian governments, revolutionary ideas spread widely. Italian public opinion, however, was seldom able before 1796 to distinguish the different forces at war in the political life of France, and the simplistic image of two monolithic fronts—monarchists on the one side, and revolutionaries on the other—remained the prevalent one.

The early years. By 1789 the period of reforms in Italy had come to a close. But those who had hoped much from the work of the enlightened princes had been severely disappointed. The reforms had not widened political power, nor had constitutional steps been taken to confer administrative and governmental responsibilities on the educated classes, the landowners, and the entrepreneurs. Only now, in the light of the French example, could things perhaps be changed.

The rise of the Masons

In the Italy of the old regime, there had been no representative political life. But the increase in the number of Masonic lodges at the end of the 18th century demonstrated the desire for secret discussion of problems different from those that were agitating the academies and the agrarian societies. Not all the Freemasons became supporters of the Revolution and of the French, but many of them did so. The moderate and constitutional demands of the Masonic lodges began to be accompanied by more democratic demands, and there were in Milan, Bologna, Rome, and Naples cells of Illuminati, republican freethinkers, after the pattern recently established in Bavaria by Adam Weishaupt.

The Italian governments were unanimous in opposing France and the ideas of the Revolution. Piedmont actually joined the First Coalition, an alliance made in 1793 of powers opposed to Revolutionary France. Savoy and Nice were invaded as early as the autumn of 1792. Although the King of Naples was forced to yield when the French fleet threatened his capital in December 1792, the other states pursued a policy of stern police repression. Denunciations and trials show how the people of the various Italian states looked to the "French system" as the only effective remedy for their own grievances. In 1792 the Piedmontese tenant farmers, reduced to starvation by the great capitalistic landlords, reminded the King of what was going on in Paris; at Rome the bourgeois entrepreneurs protested against clerical misgovernment and against the temporal power of the papacy; and in the Venetian provinces the nobility and the bourgeoisie brought charges against the aristocratic regime of Venice.

These hopes took concrete form as organized conspiracies in only two states—Piedmont and the Kingdom of Naples. In the south the first pro-revolutionary centres developed in connection with the Masonic lodges; an example is the Celestini Lodge at Naples. But bourgeois elements, with republican and democratic ideals, soon broke away from these and evolved a conspiracy, which was discovered, and the leaders executed in October 1794. The trials, followed by many arrests, sent a stream of emigrants flowing into France, where they later became significantly active.

The Oneglia experiment

Both those who did no more than complain and those who had the courage to conspire hoped to make their countries into modern states, with new, impartial laws and where subjects had a share in politics and government—aims that were sufficiently moderate. But the emigrants, who put themselves at the service of the French government, had a much clearer consciousness of the real aims of revolution. Perhaps the most important among them was Filippo Buonarroti, a Tuscan of an ancient noble family who emigrated to Corsica in 1789 and became a most active revolutionary agent; then, in 1794, he was attached to the French Army of Italy and was appointed National Commissary at Oneglia, a Ligurian town conquered from the King of Sardinia. Here he established a republic based on the views of the French revolutionary leader Robespierre, rallying the Italian exiles, abolishing seigneurial rights, and instituting the deistic cult of the Supreme Being. This extremism was disapproved of by those who gained power in 1794 when Robespierre and the Jacobins fell, and, after less than a year, Buonarroti was recalled to France (March 1795) and sent to prison; after his release he took part in the conspiracy for an armed rising planned by François-Noël (Gracchus) Babeuf and discovered in May 1796. But the example of Oneglia was never forgotten by those Italians who took their ideas from Robespierre and the Jacobins.

French invasion of Italy. The French campaign in Italy, which led to the rise of Napoleon Bonaparte, began in March 1796. In April the Piedmontese army was defeated, and, by the Peace of Paris (May 15, 1796), King Victor Amadeus III of Sardinia was forced to cede the Transalpine provinces and grant the French armed forces passage. On the same day Napoleon entered Austrian-owned Milan; then he pursued the Austrian Army into the territory of the Venetian Republic. During April 1797 the whole Po plain fell into the hands of the French, and the Peace of Tolentino (February 19, 1797) obliged the Pope to surrender Bologna and the northern Papal States. The duchy of Modena was occupied, and the French pushed on into Tuscany as far as Livorno. After defeats in Venetian territory at Arcole and Rivoli (winter 1796–97), the Austrians capitulated at Mantua. With his rear thus protected, Napoleon turned his offensive northward and, crossing the Tagliamento River, entered Austrian territory and by April 1797 was in close reach of Vienna. At Leoben the Austrian plenipotentiaries halted his advance toward the capital with "Preliminaries" (negotiations held on April 18, 1797) that anticipated the partition of Venetia and recognized Napoleon's conquests of Belgium and Lombardy. In the period of peace that followed, the peninsula enjoyed a short period of democracy, which was ended by the Austro-Russian offensive of April 1799.

It is to this brief but decisive period in Italian history that the origins of the Risorgimento, the great Italian national revival of the 19th century, must be traced. Insofar as the Risorgimento involved the formation of political groups affirming the right of the Italian people to achieve a government suited to its desires and its traditions and the growth of a feeling of nationalism and individual responsibility, it certainly began at this time.

The Neapolitan historian Vincenzo Cuoco wrote in 1800 that the Italian Revolution had been a "passive revolution" that, imported from France, had no real roots and had not been the expression of a national governing class. This criticism of the Jacobin rule in Italy between 1796 and 1799 has been continually repeated up to the present day. Historians, feeling the need to distinguish among the several types of republicanism, have characterized the strictly "Jacobin" group as ideologically descended from Robespierrism and the heroic days of the French Terror of 1793–94. But this is to attribute too much ideological rigidity to men who often, from political necessity, shifted their position. It was with no sense of inconsistency that those who had supported the most radical republican democracy later assumed administrative and governmental responsibilities in the Napoleonic Kingdom of Italy from 1805 and in Joachim Murat's (French general; Napoleon's brother-in-law) Kingdom of Naples from 1808.

Yet, among the Italian Francophiles, some distinction needs to be made between the moderates and the extreme democrats. This lay essentially in the different meanings given by each group to the concept of popular sovereignty, to which all alike paid lip service. The doctrine of equality, for instance, could be restricted to a doctrine of equal rights before the law or enlarged to shake the foundations of private property. The differing views of the two groups could also be seen in their attitude to practical details such as taxation, schemes for public education, and for regulating industry and the labour market.

Napoleon's notion of the "sister republics"

The Italian republics of 1796–99. Meanwhile, political initiative was entirely with the French. The Directory, the government set up in France following the adoption of the moderate Thermidorian constitution (known as the Constitution of the Year III), regarded the unexpected conquests in Italy primarily as a bargaining point, but Napoleon, commander of the armies in Italy, strongly favoured the rise there of "sister republics." To organize such new states, which would accept the French hegemony and show promise of financial, political, and administrative stability, Napoleon realized that he must support not the democrats but the moderates, who were in a position to control the economy and public opinion and to crush any possible popular uprisings.

The prevalence of conservative and moderate forces in the cities of Emilia (especially in Bologna) persuaded Napoleon and the agents of the Directory to found the first democratic state there. Thus arose the Cispadane Republic, which, at the Congress of Modena (ended March 1, 1797), adopted a constitution modelled on that of Thermidor but with perhaps greater emphasis on limiting the hegemony of the Catholic Church. Lombardy, where the political struggle was more intense and the democratic party more active, was kept for a longer time under a provisional government, so that the "sister state" in that area, known as the Cisalpine Republic, was not proclaimed until June 29, 1797. The Cispadane Republic was fused with it a month later, Napoleon and the Directory regarding the danger of setting up an overstrong state as offset by its anti-Austrian function and by the weakening of the Italian democrats that would follow from their subjection to a central government more easily controllable from Paris. Yet the Cisalpine Republic proved to be the most restless of the states that the French set up in the peninsula—witness the suppression there of newspapers, the temporary detention of journalists and writers, the dissolution of democratic clubs, and the necessity in 1798 of organizing no less than four coups d'etat to exclude from the two legislative assemblies (Consiglio degli Juniori, Consiglio dei Seniori) and the Cisalpine Directory those who most strongly resisted orders from Paris. The moderates now began to emerge as the coming ruling and bureaucratic class, not only because they were protected by the French but also because they had actual capacity and previous administrative experience.

The Ligurian Republic, proclaimed on June 6, 1797, after uprisings there by the pro-French "patriots" against the aristocratic government, had a less troubled history. The moderates, many of them members of the old aristocracy and working hand in glove with the Directory, always retained control and quashed the democrats' hopes of fusion with the Cisalpine Republic.

In northern Italy there were no other Jacobin republics. In Piedmont, the King, after suppressing a series of conspiracies with much bloodshed, was forced by the French to leave the country in December 1798; in February 1799 the kingdom was annexed to France. Venetia, already tampered with by the "Preliminaries" of 1797 drawn up at Leoben, was ceded to Austria by Napoleon by the Peace of Campo Formio (October 17, 1797), which marked yet another stage in the Italian democrats' disillusionment with the "liberators," notably shown in Ugo Foscolo's novel *Le ultime lettere di Jacopo Ortis* (1798; "Last Letters of Jacopo Ortis").

Invasion of the Papal States

Though the First Coalition formed to resist the French had now been dissolved, French penetration into Italy continued, and, as a result of the Pope's hostile attitude and the revolutionary ferment in Rome, the Papal States were invaded in January 1798, and the Roman Republic was proclaimed on March 15; Pope Pius VI withdrew to Tuscany. The French occupation weighed heavily on Rome, as it did elsewhere; and there, too, the balance of power swung to the moderates and conservatives, though perhaps the democratic opposition, consolidated around the Constitutional Club, was freer than elsewhere in Italy. From this milieu came the *Pensieri politici* (1798; "Political Meditations") of the southern exile Vincenzio Russo, one of the most important examples of Italian Jacobin thought.

With Napoleon's departure from Italy in November 1797 for his ill-starred Egyptian expedition, the Italian situation changed. In November 1798 the Bourbon king Ferdinand IV of Naples, yielding to English pressure, crossed the papal border and in a swift campaign occupied Rome to reestablish the pope's dominion there. But the counteroffensive was not long in coming, and, while the Bourbon army was dispersing, the French entered Naples on January 23, 1799, although they were held up for three days by popular resistance. The Bourbon court, protected by the English fleet, prudently retired to safety in Sicily. Thus was born the Parthenopean Republic, which, though its authority extended over only some of the southern provinces—the others remaining either in the throes of anarchy or under Bourbon control—was the most democratic of the Italian states set up between 1796 and 1799. Against the Directory's wishes, the military commander Jean-Étienne Championnet and the commissary Marc-Antoine Jullien (a former Babeufist) set up a revolutionary government, and for a few months the intellectual elite of the south enthusiastically participated in the revolutionary experience.

Collapse of the republics. The political situation was rapidly degenerating, however. The Second Coalition against France had been formed in March 1799, and Austro-Russian troops, after occupying the Cisalpine Republic, reached Turin in less than two months; the whole Po plain was thus lost, and the greater part of the French Army abandoned Naples. But the destruction of the Parthenopean Republic was the work of bands of peasants organized by Cardinal Fabrizio Ruffo, a faithful adherent of the King who had landed in Calabria in February; they quickly disposed of the weak democratic militia. Their Armata della Santa Fede (Army of the Holy Faith) was the most important jacquerie (peasant uprising) in the history of modern Italy; invoking God and the King, they devastated the castles of the aristocracy and occupied the communal land that the barons had usurped; they also massacred the bourgeoisie who had set up provisional municipalities. The struggle against the Jacobins and the French was transformed into a great anti-aristocratic movement, which the monarchy skillfully turned to advantage. Naples surrendered on June 23, 1799, and soon afterward the King returned from Sicily; at the behest of the English admiral Horatio Nelson and of Queen Maria Carolina (sister of Marie-Antoinette of France), and after summary trials, the King ordered the execution of more than 100 patriots, to whom the terms of surrender had granted safe-conduct. Thus the best among the southern administrators were destroyed. King Ferdinand's role as a reformer was now a thing of the past.

Nelson and Naples

Between March and July 1799, the French occupied Tuscany and were driven out of it by a violent peasant uprising (the "Viva Maria"), which developed into a march on the cities, where there were massacres of Jews (at Siena) and of citizens who were, or were presumed to be, Jacobins. The rising re-established the power of the rural clergy and the landowning aristocracy.

In September 1799 the Roman Republic finally fell. All Italy was reconquered, and the French resisted only in Genoa, while a stream of Jacobins took refuge in France. The three years of revolution were ended.

The pro-French "patriots" had completely failed to enlist the support of the masses. From the summer of 1796, the rural districts were in ferment, almost always in opposition to the new rulers; there were peasant marches on cities such as Pavia, Bergamo, Brescia, and those of the Romagna and later of Tuscany, while armed bands, especially in the Marches, Tuscany, and the Kingdom of Naples, controlled or reconquered whole regions. Even in some cities, such as Verona, and especially in Naples, the popular dislike of the French and the Jacobins was clearly apparent. The influence of the clergy and the inordinate taxes levied by the republican regimes do not suffice to explain this reactionary alignment, which was, in fact, much deeper seated; only the gradual formation and development of a grass-roots opposition movement would prove capable of weaning the populace from its innate and instinctive conservatism.

Defeated in the internal political struggle, the Italian Jacobins also suffered disillusion with regard to their French ally. Contributions originally levied for military purposes had everywhere degenerated into pure pillage; the constitutions of the new republics were dictated by the French; members of the opposition were imprisoned or driven out of office by coups d'etat; and, finally, Napoleon had adopted an undisguisedly autocratic policy, shown by his reinstatement of the King in Piedmont in the summer of 1796 and by his arbitrary cession of Venetia to Austria in 1797. But their disillusionment with the French, however severe, was unlikely ever to reconcile the Jacobins with the absolute monarchs; rather, it strengthened their nationalism. In Piedmont there was an anti-French, unionist, and democratic organization (the Raggi), and everywhere the need was felt for strong nationalist governments that would lead the country toward unity and independence.

The French Consulate, 1799–1804. Having become master of France by his coup d'etat of 18 Brumaire (November 9, 1799), Napoleon renewed his Italian conquests. Expected by the Austrians to use the Mont Cenis pass, he crossed the Alps by the Great St. Bernard, almost without opposition, and reoccupied Milan on June 2, 1800. A few days later he inflicted a definitive defeat on the enemy at Marengo, between the Bormida and the Po rivers. Defeated also in Germany, the Second Coalition fell to pieces; by the Treaty of Lunéville (February 9, 1801), Austria returned the Cisalpine territory and some portions of Venetia; and the Ligurian Republic was reestablished. Piedmont was reannexed to France in September 1802, together with Elba and Piombino, as also was the duchy of Parma, although official status was not given to this de facto arrangement until 1808. Austrian influence was ended even in Tuscany, where Louis, son of Ferdinand, the Spanish duke of Parma, was enthroned as king of Etruria. In northern Italy, Austria kept only Venetia, whereas France, directly or indirectly, maintained control from the Alps to the Tuscan Maremma, while the restored papal and Bourbon governments further south had little power.

Melzi and the second Cisalpine Republic

The second Cisalpine Republic, established in June 1800, soon proved to be a transitional regime, since it lacked the necessary joint support of the moderates and landowners. Napoleon's most trusted councillor in Paris for Italian affairs was the Milanese patrician Francesco Melzi d'Eril. This statesman, who in 1796–99 had hoped to see upper Italy united in a constitutional monarchy under a Habsburg or a Bourbon ruler, was the most clear-sighted exponent of the views of the old moderate ruling class, still yearning for absolute and enlightened governments. Napoleon favoured the formation of a large Italian state, provided that he could control it. He wanted an Italian republic with a constitution similar to that then operative in France, with the central authority vested in the president and with the representative structure weak and divided among three "estates," the landed proprietors, the merchants and traders, and the learned men and clerics. In such a state he wanted as president either himself or a member of his family. At Melzi's insistence, the new state was established not by a mere edict issued by the French first consul (Napoleon) but by an Italian Constitutional Assembly that met at Lyon, in France, in January 1802. Napoleon appointed Melzi, who was supported by the majority of the deputies, vice president (he himself had become president only after resistance on the fourth vote) and accepted the change of name from the meaningless Cisalpine Republic to Italian Republic.

Melzi pursued a policy of amalgamation. Though the majority of the prefectures and ministries were in the hands of notables, who were often nobles as well, members of the democratic opposition were also gradually included, being given important administrative, cultural, and military posts. The formation of an Italian army was, during the whole Napoleonic period, one of the major concerns of the government, and enduring nationalist sentiments matured among its ranks. Serving as administrators and politicians, the nobles and the educated bourgeoisie for the first time felt an urge to govern and defend their country. Neither the constant French interference and taking of financial levies nor the absence of an Italian foreign policy diminished their enthusiasm for their new political role.

The Napoleonic Empire, 1804–14. When the first consul became emperor, the Italian Republic became a kingdom (proclaimed on March 17, 1805); King Napoleon appointed as viceroy his stepson Eugène de Beauharnais, and Melzi stepped aside. The more docile Antonio Aldini became secretary of state in his place. Italian autonomy was still further limited; but the Napoleonic victories, constantly increasing the territory of the kingdom, provided some compensation. By the Treaty of Pressburg (December 26, 1805), Venetia was annexed, and, with a separate constitution, Dalmatia and Istria were joined to it; in April 1808 the Marches, too, became part of the kingdom, which, by the Treaty of Schönbrunn (October 14, 1809), lost its nominal sovereignty over Dalmatia and Istria; these, together with Trieste, with other territories taken from Austria, and with Ragusa (modern Dubrovnik, Yugoslavia), became the seven French *départements* of the Illyrian provinces. France directly annexed Liguria (June 4, 1805) and Tuscany (in effect from January 1806, formally from March 2, 1809). And with Napoleon's abolition in 1809 of the temporal power of the papacy, Pope Pius VII, who then excommunicated him, was imprisoned, first in France and later at Savona, in northwestern Italy.

As emperor of France or as king of Italy, Napoleon thus directly controlled all upper and middle Italy. During his rule far-reaching reforms were brought about. Though the new codes of law were almost all translated wholesale from the French, without consideration for Italian traditions, they nevertheless introduced at a stroke, particularly in the field of criminal law, a modern jurisprudence notably sensitive to the rights of the individual. Properties held in mortmain, the old feudal ecclesiastical tenure, specifically those of the regular clergy, were transferred to the state and sold, and the remaining feudal rights and jurisdictions were abolished. Road systems were everywhere improved; and both primary and higher education were widely diffused. The increased pressure of taxation was thus compensated for by a network of new and improved services that were to hasten Italian economic and social progress.

The Continental System, a blockade designed to close the whole of the European continent to British trade, proclaimed on November 21, 1806, was freely broken everywhere, including on the Italian coastline; its true meaning was that of favouring French industry, particularly the silk industry. But the war economy stimulated Italian production and led to the development of industries such as the machine industry and metallurgy and to important public works.

In the south, after the repressions and executions of 1799, the Bourbons experimented with some cautious reforms, mainly fiscal and anti-feudal, in order to further strengthen the loyalty of the rural population, which had already proved so valuable. But the Neapolitan government was desperately weak, both militarily and politically; and, between February and March 1806, the French were able to occupy the whole country, while the court once again took refuge in Sicily. On March 30, 1806, Joseph Bonaparte, brother of Napoleon, was proclaimed king of the Two Sicilies; when he became king of Spain in 1808, he was succeeded as king of Naples by one of the most famous French generals, Joachim Murat. Despite this dynastic change, the nine years of French rule in the south can be considered as a whole and represent the most profound and effective reform movement that the country had hitherto experienced.

King Joachim of Naples

King Joachim was more independent of Paris than King Joseph; in his reign not only were there fewer French ministers and councillors in relation to Neapolitan officials, but he also opposed Napoleon over the application of the Continental System. During the 10 years of French rule, feudal privileges and immunities were finally abolished; but even thus mulcted, the landed aristocracy were still able to retain economic supremacy in the country. Extensively buying up the confiscated property of the church and of other proscribed landowners, they thus subverted Joachim's plan to establish small peasant holdings. Much common land originally usurped by large landowners was, however, recovered, and the position of the *galantuomini*, or bourgeoisie, was definitely strengthened. Fiscal, judicial, educational, and administrative reforms were introduced in line with those already made in the Kingdom of Italy.

Meanwhile, both Sardinia, where the court of Savoy took refuge, and Sicily remained apart from the Napoleonic world. In Sicily, the Bourbons were under a strict English control that, originally purely military and naval, soon became political. When, in 1811–12, the court was in conflict with the Sicilian nobles over fiscal matters and arrested the leaders among them, the British commander, Lord William Bentinck, intervened and enforced the adoption of an extremely moderate constitution that left great power to the nobles, though it markedly limited the absolute power of the king. Sicily then experienced a short and intense period of autonomy and political ferment, which was ended in 1816 when the restored Bourbons abolished the constitution and reunited the island to the kingdom.

The Napoleonic regime fell in Italy as it did in the rest of Europe. Eugène, the viceroy of Italy, and Joachim, the king of Naples, with their respective armies had taken part in the fatal Russian campaign of 1812, but, at the moment of defeat, Joachim deserted Napoleon, returned to Naples, and, after making terms with the Austrians, advanced with his Neapolitan troops as far as the Po (March 1814); Eugène, defeated by the Austrians and Neapolitans, was able, by the terms of the Armistice of Schiarino-Rizzino (April 16), to retain Lombardy; but an insurrection that broke out at Milan on April 20 allowed the Austrians to occupy the entire country.

THE RESTORATION PERIOD

The Vienna settlement. At the Congress of Vienna, held by the victorious allies to resettle Europe, it was decided to restore the Bourbons to Naples. It was for this reason that, seizing the opportunity of Napoleon's return to power during the Hundred Days, King Joachim changed sides yet again and, on March 15, 1815, declared war on Austria and, by the Proclamation of Rimini (March 30, 1815), incited the Italians to a nationalist war. Quickly defeated, he was forced to abdicate in May; after taking refuge in Corsica, he landed at Pizzo di Calabria to reconquer the kingdom but was immediately captured by the Bourbons and executed in October 1815.

The Congress of Vienna established the political condition of Italy that lasted until unification. The emperor of Austria, Francis I, became king of Lombardy-Venetia, which was thus incorporated into the Habsburg states, and the former episcopal principality of Trent was directly annexed to Austria. King Victor Emmanuel I of Savoy, in addition to recovering his dominions, acquired the entire Ligurian territory; the duchy of Parma went to the daughter of Francis I and wife of Napoleon, Marie-Louise of Habsburg, but at her death it was to revert to the House of Bourbon-Parma, which meanwhile was granted the duchy of Lucca; the Habsburg-Estes returned to Modena, further acquiring the duchy of Massa by inheritance in 1825; in Tuscany, the House of Lorraine added to its former domains the State of the Presidi and the reversion of Lucca when the Bourbons should return to Parma (this did not take place until 1847); the Pope recovered his temporal dominions in Italy; and the Bourbon Ferdinand IV of Naples, with the new title of King Ferdinand I of the Two Sicilies, reoccupied his possessions.

Restored hegemony of Austria

Thus the Vienna settlement brought about the disappearance of the three aristocratic republics of Venice, Genoa, and Lucca; it strengthened Piedmont and restored the undisputed hegemony of Austria. Austrian troops garrisoned Ferrara, ready to intervene in case of trouble in the Papal States; Austria was given the right to intervene if necessary in the Kingdom of the Two Sicilies; members of the House of Habsburg reigned in Parma, Modena, and Florence; while Venetia and Lombardy became in practice provinces of the Austrian empire. Only Piedmont remained outside the system that Metternich, the Austrian foreign minister and later chancellor, had imposed on Italy; but, under the secret protection of Russia, its government proved to be equally reactionary.

On April 7, 1815, Francis I proclaimed the formation of the Lombardo-Venetian kingdom; but the new state was a fiction because the two regimes remained separated, each directly subject to the central ministries in Vienna. Thus Milan lost its role of capital city; the majority of the Napoleonic bureaucracy was liquidated, and the centralizing authority of Vienna became all-pervasive; many reforms, especially in jurisprudence, were abolished. Discontent proved general, and Austria reacted by increasingly severe police measures and stricter censorship, suppressing, for example, the best liberal and romantic periodical, *Il Conciliatore* ("The Conciliator"), after only a very brief existence (September 1818–October 1819).

Returned from exile in Sardinia, Victor Emmanuel I of Savoy abolished all the laws promulgated by the French and removed from public office all those who had collaborated with them. He invited the Jesuits back into the kingdom and turned many educational institutions over to the clergy. Hence, a liberal opposition was not long in forming among the nobility and the bourgeoisie.

Francis IV of Modena showed an equally conservative intransigence, whereas in Parma Marie-Louise instituted a mild rule and maintained the principal French reforms. Though many of these were soon abolished in Tuscany by Ferdinand III of Lorraine, the enlightened legislation, economic liberalism, and lax policing and censorship characterizing his rule and that of his successor, Leopold II, made the duchy a haven for liberals. It also stimulated cultural activity: at Florence many Italian writers—such as the poet Giacomo Leopardi, the historian Pietro Colletta, and Niccolò Tommaseo—gathered around the Gabinetto (studio), founded by Gian Pietro Vieusseux; Florence was also the birthplace of a famous periodical, *L'Antologia* (1821–33; "The Anthology").

In the Papal States the Restoration, brought about mainly by the diplomacy of the cautious secretary of state, Cardinal Ercole Consalvi, was characterized by increased centralization of government. And, because the public offices were a monopoly of the clergy, the bourgeoisie and the educated classes, who, under the French and Italian regimes, had held some responsibility, became deeply discontented, especially in the Romagna.

The Carbonari

In the Kingdom of Naples the victorious powers had made sure that the Bourbons would not repeat the reprisals of 1799. The Restoration appeared to begin well, under the balanced policy of the minister Luigi de' Medici, who absorbed the greater part of Murat's capable bureaucracy. Many of the French reforms, both administrative and judicial, were retained, but concessions made to the church by the Concordat of 1818 and strict financial economies hampered the advancement of the bourgeoisie. It was especially among these, the *galantuomini* ("gentlemen"), that discontent found an outlet in an imposing conspiratorial organization, the Carbonari. Already founded during the French period, with a vaguely nationalistic program, it now became more widespread, formulating definitely constitutional aims; the southern bourgeoisie were determined to take part in political life and openly to forward their own interests. From the south the lodges of the Carbonari quickly spread throughout Italy, finding their chief centres of support in the Marches, the Romagna, Piedmont, and Milan.

Events in the 1820s. *Effects of the Spanish Revolution.* The Spanish Revolution of 1820 had repercussions in Italy. In the Kingdom of Naples, former members of Murat's army, connected with the Carbonari, marched on the capital (July 2, 1820) to the cry of "Long live liberty and the constitution" and found immediate support among the bourgeoisie and in the army. The King was forced to yield (July 1820) to the liberals' demand for the introduction of the Spanish constitution of 1812; it not only limited the king's power but also decreased centralization and thus reduced the influence of the capital. But the new regime proved short-lived, for it had too many enemies: the King himself, eager to recover his absolute power; Sicily, attempting a separatist revolution (July 15–17), which was violently suppressed by the Neapolitan constitutional government; and, most serious, Austria, which had been given at Vienna the right of intervening to maintain the restored monarchy. In January 1821 Metternich was able to convoke an international congress at Laibach, attended by representatives of the great powers and of the Italian states, and by King Ferdinand himself. Overcoming the weak Anglo-French opposition, the King obtained approval for military intervention. Accordingly, the Austrian Army descended on the kingdom and, defeating the constitutional troops, occupied Naples on March 23, 1821, re-establishing the King's absolute government.

In Piedmont, the more liberal and cultivated wing of the nobility was hostile to Victor Emmanuel I's reactionary position, and the Carbonarian bourgeoisie, with its constitutional hopes, allied itself with them. In the wake of the events at Naples, a conspiracy was set in motion, supported by the Lombard liberals and receiving the covert approval of Charles Albert of Savoy, prince of Carignano, successor-designate to the throne under Salic law. Between March 9 and 13, the revolt, organized by the military and the bourgeoisie, spread from Alessandria to Turin; the King abdicated in favour of his brother Charles Felix and, in the latter's absence, appointed Charles Albert as regent. On March 14 the Regent proclaimed the Spanish constitution, though its adoption was to be contingent upon the new king's approval. But, from his refuge in Modena, Charles Felix refused to accept it, and, with Austrian assistance and the troops that had remained loyal to him, he rapidly reoccupied the country. Three of the conspirators were executed, and the many prison sentences meted out and the rigorous purge of the army provoked a massive emigration. Charles Albert regained the confidence of the new king, but the reconciliation caused a breach between him and the liberals that persisted after he succeeded to the throne in 1831.

Federati conspiracy

In Lombardy-Venetia there was no revolution, but a complex organization of opponents of the regime was discovered and suppressed. The Carbonarian lodge in Milan was attacked in October 1820, and some of the conspirators were deported. In March 1821 the police found the first evidence of the conspiracy of the *federati,* led by the Milanese nobleman Federico Confalonieri, whose program, though more moderate than that of the Carbonari, was no less anti-Austrian and constitutional; from December 1821 to January 1823, members of the conspiracy were discovered even in the army and the upper bureaucracy. Many received death sentences, all eventually commuted to long terms of imprisonment.

Economic slump and revival. The political reactionism (which was prolonged in the Romagna by executions until 1828) was accompanied during this decade by a general economic recession. After the famine of 1816–17, Russian grain flooded the Italian markets, and there was a crisis of agricultural overproduction; the desperate poverty of the peasantry led to widespread pellagra, brigandage, and grain riots. The slump continued unabated until nearly 1830, when successful mulberry cultivation brought renewed rural prosperity and was sufficient, particularly in

Piedmont and Lombardy, to reestablish agricultural credit and provide capital for the development of the textile and some engineering industries.

Renewed prosperity brought leisure for cultural activities, and the economic and social problems of the country began to be discussed in many periodicals; the most important of these was the Milanese *Annali universali di statistica* ("Universal Annals of Statistics"), whose editor-in-chief for some years was the philosopher Gian Domenico Romagnosi and in which his pupil Carlo Cattaneo began to set forth his ideas. In fact, the ranks of the political and cultural opposition, hitherto comprising only the Lombard and Tuscan moderates, would soon include democrats and Catholics.

The rebellions of 1831 and their aftermath. The failure of the uprisings of 1831 proved that the Carbonari were coming to the end of their usefulness. The hopes raised by the revolution in Paris in July 1830 had set on foot a conspiratorial movement that had spread from Modena to the cities of Emilia, chiefly as a result of the efforts of two Carbonari, Enrico Misley and Ciro Menotti. Unfortunately, they relied on the sympathy of Duke Francis IV of Modena, who was willing to countenance changes that might enlarge his small state. But, when he learned that the plot was known to the Austrian police, he had Menotti and 43 other conspirators arrested. Immediately afterward a revolt overthrew the papal government in Bologna and in a few days spread to the duchies of Modena and Parma, to the Romagna, the Marches, and Umbria, leaving only Lazio under papal rule. But for various reasons the new provisional governments of the rebel cities failed to organize a unified military defense; help they had hoped for from the French was not forthcoming, and thus the Austrian Army was able to re-establish the rule of legitimacy during March 1831.

The rise of Mazzini

The moderate liberal leaders, most of them Carbonari, had shown their readiness to treat with the absolute monarchs and had deeply distrusted those republicans and democrats who sought to achieve unification by force of arms. Another component element of the ultimate unification movement was the Adelfi, the group comprising followers of Filippo Buonarroti, the former Babeufist who had taken part in the events of 1796. Ultimately, the task of organizing the democratic and republican opposition conspiracy was undertaken by a young Genoese, Giuseppe Mazzini. Exiled to France at the age of 25 in 1830, he found himself turning away from both the Carboneria and Buonarrottism. In distinction from the Carboneria, his organization, Giovane Italia (Young Italy), was unionist and republican; but, though it put its trust in the education and participation of the people, it had no egalitarian and Jacobin leanings. The new faction spread, especially in upper Italy, with amazing rapidity, absorbing the Buonarrotian and Carbonarian groups. In 1833–34 the first abortive Mazzinian uprisings took place in Savoy and at Genoa, the latter organized by Giuseppe Garibaldi, who then fled to France; in 1834 the Austrian police identified as many as 2,000 members of Giovane Italia in Lombardy. In 1836 Mazzini, who had established firm relationships with revolutionaries in other countries and had joined them in founding the Giovane Europa (Young Europe), left Switzerland and settled in London.

The repressions they had suffered and witnessed, together with the reinforcement of the conservative status quo in Europe, convinced the moderates that it was useless to organize conspiracies with limited membership, that what was needed was to educate public opinion. Meanwhile, the peace forcibly imposed on the peninsula from 1831 to 1848 favoured economic development, notable everywhere except in the south. The south, in fact, remained backward, and the growth of bourgeois property that resulted from the division of the great feudal holdings did nothing to change this. Thus the imbalance between north and south, which would be felt even more acutely after national unification, continued to grow. Genoa and Milan became two of the chief financial centres of Europe; Piedmontese and Lombard industry expanded rapidly; in Venetia important land-reclamation projects were completed, while, in Tuscany, banks and commercial establishments did a flourishing trade, connected especially with the port of Livorno. Throughout the country the construction of a railway network increased commerce and gave rise to subsidiary industries. This economic revival made it more difficult for the governments to tighten police control; at Milan in 1839, Carlo Cattaneo began publishing his periodical *Politecnico,* in which he argued that the progress of science and technology depended upon government reforms. In the same year Pisa saw the first congress of Italian scientists, which was to reconvene annually down to 1847, assuming a more markedly nationalistic character with each passing year.

Liberal Catholicism

Thus conditions gradually became more favourable for the moderates to realize their aims of increasing education and abolishing censorship and police surveillance. In the cause of unification they sought to standardize tolls and trade practices, increase cultural exchanges throughout the country, and, above all, finally to establish representative institutions suitable to Italian traditions and to Catholicism, the religion of the majority of citizens. Liberal Catholicism found its most important expression in Italy in Vincenzo Gioberti's *Del primato morale e civile degli italiani* (1843; "On the Moral and Civil Primacy of the Italians"), in which he affirmed the idea of progress as a return of the existent to the idea, of man to God, realizable only through the mediation of the church. Gioberti envisioned a new and positive role for the temporal power of the papacy, advocating the development of a federated Italy, free from the Austrian hegemony, under the nominal presidency of the pope. His ideas were influential among important sections of the clergy and among Catholics in general. Under different formulations, the new papalist movement struck root and found its best propagandists and theoreticians in Cesare Balbo, Niccolò Tommaseo, and the Jesuit Antonio Rosmini-Serbati.

The renewal of Mazzinian attempts at armed rebellion (among them the celebrated and ill-fated expedition of the Venetian Bandiera brothers, who landed in Calabria in July 1844 and, with seven companions, were executed by a firing squad), all suppressed with bloodshed, increased the esteem felt for the moderates both by governments and the general public. The election of Pope Pius IX in 1846 augured well for the future of the Papal States; his nomination was the result of anti-Austrian feeling, and at the beginning he showed liberal leanings. His first step was the granting of an amnesty to those who had been sentenced for political reasons; this was followed by a gradual removal from governmental posts of the most reactionary prelates, then by permission to publish political periodicals; finally, in April 1847, he instituted a council of state that, though only on a consultative level, gave to the laity a share in public life. Influenced by this liberalism, rulers elsewhere in Italy granted some reforms; one of the most important was the press law of May 1847, by which Grand Duke Leopold II removed restrictions from the press in Tuscany. But the reforms encouraged extremists, and the reactionary powers of Europe became convinced that the peace of Italy was in danger. In July 1847 Metternich sent Austrian troops to occupy papal Ferrara. This intervention stimulated cordiality and cooperation among the Italian rulers, led by Charles Albert of Piedmont, whose relations with Austria were particularly strained. But, while the sovereigns were discussing the formation of an Italian customs union, rendered more urgent by the famine of 1847, the people began to rise.

The revolutions of 1848. On January 9 the first of the revolutions of 1848 broke out in Sicily, in Palermo. Starting as a popular insurrection, it soon acquired overtones of Sicilian separatism and, supported by the nobility and the bourgeoisie, spread throughout the entire island. Individual reforms were no longer enough to content the revolutionaries, who were determined to have new and more liberal constitutions. Ferdinand II of the Two Sicilies was the first to grant one (January 29, 1848), and the other rulers were compelled to follow his example—Leopold II on February 17, Charles Albert on March 4, and Pius IX on March 14. The only Italian rulers who did not yield were the Austrians, who instead reinforced their garrisons in Lombardy-Venetia, arrested the two famous

Charles Albert's declaration of war

leaders of the opposition at Venice, Daniele Manin and Niccolò Tommaseo, and others at Milan, and suppressed the student demonstrations at Padua and Pavia. But on March 22 and 23, when revolution broke out at Budapest and Vienna, Venice and Milan freed themselves by swift and victorious insurrections. In the course of a few days, almost the whole of Lombardy-Venetia was lost to the Austrians, and their army fell back into the Quadrilateral (the land lying between Mantua, Verona, Peschiera, and Legnago). On March 23 Charles Albert declared war on Austria; it was a risky military decision to take, but chances for a nationalist war seemed good, and he had to assume the lead in order to prevent republican domination of the revolutionary movement. He annexed Parma and Modena, which had already driven out their dukes, and won a few other victories. But then the reverses began. Pius IX, Leopold II, and Ferdinand II, who had at first sent troops to support the Piedmontese army, hastened to withdraw them; the Pope's allocation of April 29 to the cardinals showed his unwillingness to further a nationalist movement and did much to discredit the papacy among patriots. Lombardy and Venetia, though not without opposition, accepted annexation to Piedmont, but the Piedmontese regular army was unable to stand up to the Austrian counteroffensive; after a series of lost battles, Charles Albert was finally defeated at the gates of Milan and on August 6 withdrew behind the Ticino River, leaving the Austrians in possession of the city and the duchy, which a popular insurrection had freed only a few months earlier. The accusation of "royal treachery," which the Lombard democrats then formulated, long survived in Italian political polemics.

By the terms of the Armistice of Salasco (August 9, 1848), the Piedmontese army withdrew from Lombardy. But within Piedmont the new constitution was not abrogated, and revolutionary and democratic ideas remained alive.

The forces of reaction triumphed throughout Europe. At Vienna, Prague, Budapest, and Paris, the revolutions of 1848 were stifled; in Naples the King regained power in a coup on May 15, subsequently reconquering Sicily, while at Rome more conservative policies were followed. But Venice, under the dictatorship of Daniele Manin, refused to accept the Armistice of Salasco and resisted the Austrian siege. In Tuscany, Leopold II, finding that the democrats, led by Giuseppe Montanelli and Francesco Domenico Guerrazzi, were gaining over the moderate ministers and aiming at an Italian Constituent Assembly, fled to Gaeta (February 1849); meanwhile, at Florence, a predominantly democratic provisional government was formed. At Rome, the minister Pellegrino Rossi, a former Carbonaro who had returned from France and embarked on a policy of conciliation, was assassinated (November 15, 1848), and the democrats controlled the situation; in consequence Pius IX fled in disguise (November 24), also taking refuge in Gaeta. At Rome the constitutional government convoked a Constituent Assembly with universal suffrage, which, meeting on February 5, proclaimed the republic. The Italian revolution seemed to have been reborn, and the Piedmontese democrats impelled Charles Albert to renew the war with Austria (March 20, 1849). But on March 23 he was routed at Novara and, on the same day, abdicated and went into exile. He was succeeded by Victor Emmanuel II, to whom the Austrian commander conceded an honourable armistice so as not to weaken the monarchical and moderate forces to the advantage of the democrats. The defeat of Piedmont made the position of the democrats and republicans impossible. In Tuscany the moderates called back the Grand Duke, who returned with Austrian troops that crushed a democratic insurrection at Livorno (May 1849); the reconquest of Brescia in March, after 10 days of fighting, left Venice isolated, though it held out against the Austrian Army until August. The Roman Republic, led by Mazzini and Garibaldi, held out until July 3 against the French corps that the new president of the republic, Louis-Napoleon, had dispatched to repay his clerical supporters. The dispossessed sovereigns everywhere returned, abrogated the constitutions, dissolved the parliaments, and, especially at Naples, filled up the prisons.

UNIFICATION

Cavour enters the Cabinet

The role of Piedmont. The exception to this picture of reaction was Piedmont. There King Victor Emmanuel found himself governing with a Parliament whose democratic majority was unwilling to ratify the treaty of peace with Austria, which was indispensable if the defeated country was to be reorganized. By the skillfully worded Proclamation of Moncalieri (November 20, 1849), which contrasted his policy favourably with that of the other Italian rulers, he inaugurated fresh elections, in which the moderate party emerged victorious. The new ministry was headed by Massimo d'Azeglio, a moderate trusted by the King; the most important of his measures was the Siccardi law curtailing ecclesiastical jurisdiction. In October 1850 Camillo di Cavour entered the Cabinet and, from that time, substantially directed financial policy toward free exchange, arranging international commercial treaties and drawing on foreign credit to reduce the public debt and to develop the railway system. This dynamism was displeasing to the conservatives and to the more cautious moderates, including Azeglio himself, who was displaced in 1852 as a result of Count Cavour's alliance (known as the *connubio*) with the Deputies of the left centre. Despite a series of disagreements between Cavour and the King, who was influenced by the clerical party and had some absolutist leanings, various ecclesiastical, fiscal, and judicial reforms were introduced. The prestige of the Piedmontese government both in Italy and internationally was also reinforced by a variety of factors.

In March 1854 France and England had intervened in support of Turkey against Russia in the Crimea; to obtain the support of Austria, they were prepared to guarantee the status quo in Italy, which only Piedmont at that time was in a position to disrupt. But Cavour, anticipating events, concluded an alliance with the Western powers and sent an expeditionary force to the Crimea, where (May 1855) it performed brilliantly. Thus he was able to sit among the victors at the Congress of Paris (February 1856) and there to affirm that the only threat to the peace of Italy and the only pretext for subversive plots was the burdensome Austrian overlordship. It was a tremendous achievement.

Meanwhile, the democratic and republican movement led by Mazzini was losing ground and crumbling. The failure of the Barraba, an attempt in February 1853 by the population of Milan to overpower the Austrian garrison; the discovery and execution at Belfiore (1852–53) of conspirators concerned in a plot centred at Mantua; and other abortive attempts to launch uprisings in Lunigiana and Cadore all contributed to discredit and discourage the democrats. Mazzini's isolation was completed by his known support of the Sapri expedition (June–July 1857), in which Carlo Pisacane, a Neapolitan Socialist with whom he had been in deep ideological disagreement, landed on the coast of Campania with 300 companions; the expedition ended in a massacre.

The democrats, then, were divided and unable to carry on the revolution. There was nothing to be hoped for in the restored governments. In Lombardy-Venetia, Austria had carried out stern measures of repression, while, in Rome, Pius IX, influenced by the secretary of state Cardinal Giacomo Antonelli, refused to grant any reforms. There was now no room left for the liberal Catholicism of the years following 1848. At Naples as in the duchies, reaction became intractable; in Tuscany the Grand Duke tried vainly to make the country forget that he had recovered his throne only by the help of Austria.

Società Nazionale Italiana

The War of 1859. So only in Piedmont was there any hope left for the reformers. There Cavour succeeded in establishing in 1857 a monarchist–unionist party, the Società Nazionale Italiana (Italian National Society), to which the presidency of Manin and the vice presidency of Garibaldi gave a wider appeal than if it had been staffed only by moderates. Though not outlawing conspiratorial movements, Cavour wanted to solve the Italian question by international politics rather than by revolution. At a secret conference held at Plombières, France (July 1858), he arranged with the emperor Napoleon III that the French would intervene in Italy should Piedmont be invaded by Austria; he was clearly planning the complete expulsion of Austria from the peninsula. The price he was to pay for this help was the cession of Nice and Savoy to France and the suppression of the Mazzinian party, erroneously thought by Napoleon to be responsible for the dynamite attack made on him at Paris on January 14, which was, in fact, planned by the Romagno Felice Orsini. The Franco-Piedmontese alliance was finally concluded in January 1859, and, with Napoleon's approval, Victor Emmanuel delivered a speech from the throne in which he declared himself ready to hear the "cry of woe" against Austria that was rising in every part of Italy. Meanwhile, the military party in Vienna was urging the emperor Francis Joseph to declare war. On April 23 an insulting ultimatum demanding that Piedmont demobilize was rejected, and three days later the Austrian Army took the offensive. Thus, as Cavour had hoped, the proviso for French intervention became operative. The allies were victorious in the battles of Magenta, San Martino, and Solferino (June 1859), but, while the routed Austrian Army was in retreat, Napoleon III suddenly signed the Armistice of Villafranca with the Austrians. This sudden change of policy was caused by events in Italy, where unification seemed about to become a reality. At Florence on April 27, Leopold II was overthrown by an insurrection and fled, while the government passed to the moderates, with Baron Bettino Ricasoli as the emerging leader; in June the duchies of Parma and Modena revolted, followed by the Legations (the northern Papal States). The Marches and Umbria also rebelled but were quickly reconquered by papal troops. The liberated provinces declared their wish to be united to Piedmont, but France then, no more than at any time in the past, did not want a united Italy. At Villafranca it was arranged that Napoleon III should receive Lombardy from Austria and cede it to Piedmont; the sovereigns of Modena and Tuscany were to be restored, and plans were made to establish a federation among the rulers of the Italian states. This was a serious defeat for Cavour's policy, and he resigned in July 1859, the King replacing him in the government by Urbano Rattazzi. But England was particularly opposed to the forceful restoration of the rulers of Emilia and Tuscany, and even Napoleon III, who meanwhile had increased his prestige in France by the annexation of Nice and Savoy, was unenthusiastic; in this climate of international opinion, Cavour's policy soon returned to favour, and he resumed office on January 21, 1860. A series of plebiscites were then held in Tuscany and Emilia, all of which declared for union with Piedmont. The fear of a democratic revolution, the need to weaken Austria, and Great Britain's desire to set up a strong Italian state to balance France all induced the European powers to assist the Piedmontese monarchy in obtaining this great success.

Garibaldi and the Thousand. But the democratic party refused to admit that the national revolution was in any way complete, when so many parts of Italy remained under their old sovereigns. The most suitable place for a democratic revival was Sicily, where autonomous opposition to the Bourbon government was endemic and extremist. In April 1860 a popular insurrection broke out in Palermo (the *rivolta della Gancia*), which, though it was quickly quelled, spread through the cities and the countryside under the unmistakable influence of Mazzinian agents. It was then, at the beginning of May 1860, that the democrats showed that they were able to overcome the deep differences that had divided them during the previous decade. The Expedition of the Thousand, which, with the tacit approval of Cavour, set sail from Quarto, near Genoa, under the command of Garibaldi, had been principally recruited among the bourgeoisie of Lombardy and Venetia but also contained volunteers from all the old states and represented the most divergent forces.

Despite the scant preparation, the expedition, which was almost entirely without arms, after disembarking at Marsala on May 11 conquered nearly the whole of Sicily in less than three months. The factors that made this possible were the revolutionary ferment already existing there and Garibaldi's military skill. But the attitude of the Sicilian peasants proved ambivalent; at first welcoming the invaders, they later became disappointed by the failure to partition the feudal estates, and they even fought the Garibaldians. Though on May 14 he had proclaimed himself "Dictator in the name of Victor Emmanuel, king of Italy," Garibaldi had set up a provisional Sicilian government, actually directed by his associate Francesco Crispi, which came into serious conflict with Cavour's emissaries to the island; Cavour was afraid of a turn toward republicanism. Meanwhile, the European powers attempted to mediate, and the new king of the Two Sicilies, Francis II, granted a constitution and promised autonomy and pardon to the Sicilian rebels. But without the consent—and apparently even against the wishes—of Victor Emmanuel, Garibaldi crossed to Calabria on August 19, 1860, and on September 7 made a triumphant entry into Naples, which the King had abandoned, fleeing to Gaeta. On October 1 the last serious Bourbon resistance was overcome at the Battle of the Volturno, near Caserta. But the prestige of Garibaldi and of the democrats had grown too great, and it was time Cavour resumed the initiative. Persuading Napoleon III to make only a formal protest, he occupied the Marches and Umbria (September 1860); so as not to offend Napoleon's clericalism, it was agreed that Rome and Lazio should remain under the pope, while the rest of Italy was to become a moderate constitutional kingdom. On October 26, 1860, Victor Emmanuel, having entered Neapolitan territory with his army, met Garibaldi, who hailed him as "king of Italy"; during October and November, the formerly papal and Bourbon provinces voted by plebiscites to be annexed to the kingdom of Italy. The kingdom's inauguration was formally proclaimed on March 17, 1861, by a Parliament meeting in Turin, and soon afterward (March 25 and 27) Cavour affirmed the necessity that, with the approval of France and with the famous formula "a free church in a free state," Rome should become the Italian capital; but, when he died, on June 6, 1861, the "Roman question," with many others, remained unsolved.

Garibaldi enters Naples

The kingdom proclaimed

Condition of the Italian kingdom. In 1861 the kingdom had 26,000,000 inhabitants, 78 percent of whom were illiterate, while 70 percent of its active population were engaged in agriculture. Thus it seemed unlikely that Italy could make the economic progress shown by other European countries in that period. The group that had gained the majority in Parliament in 1861 was the moderate-conservative right, based principally on an alliance between the Piedmontese group, headed by Giovanni Lanza and Quintino Sella, which controlled industries and banks, and a Tuscan group, led by Bettino Ricasoli, which was interested in commerce and transportation. This political class wanted a centralized governmental structure that would allow the Parliament and hence the executive power to control the local administrations, especially where democratic forces or autonomistic aspirations might otherwise become preponderant. By a series of laws in 1865, they effected legislative unification and established firm central control over the provinces and their communes through the appointment of regional prefects. The democratic opposition, entirely preoccupied with the problems of freeing Rome and Venetia, made little resistance to this authoritarian construction of the state.

Centralization certainly provided no remedy for the serious economic imbalance between north and south. The free-trade policy of the right-wing politicians ruined the weak industries of the south, especially the woolen industry in the Salerno district, which had hitherto been protected. Moreover, the south had few railways, which were built under contracts that suggested government corruption; and the systems of poor relief and education were, and remained, miserably inadequate. Naples, which in 1861 had 447,000 inhabitants and was the most populous city in Italy (Turin came next, with only 205,000), was afflicted with pauperism and viewed with jealousy by the smaller cities of the south. Yet the most intense wretchedness was in the rural districts, where the peasants had totally failed to acquire any proportion of the expropriated estates. Consequently, many of them took to an especially violent form of brigandage, which, though it was organized by former Bourbon officials and even by Bourbon emissaries loyal to the exiled Francis II, was primarily a peasant war directed especially against the agrarian bourgeoisie. The movement was harshly suppressed by troops, and at least 5,000 peasants were executed; but it was not brought to an end until 1865. Public opinion, however, remained largely dominated by the political problem of completing the country's unification. The democrats wanted above all to solve the Roman question, and, when Ricasoli's ministry (June 1861–March 1862) was succeeded by that of Urbano Rattazzi, a Piedmontese lawyer apparently more liberal than Ricasoli, it seemed that the time had come. In July and August, Garibaldi, despite government prohibition, raised armed bands in Sicily and began moving up the peninsula again to march on Rome; but Rattazzi, preoccupied with the attitude of France and Austria, and realizing that French troops were garrisoning Rome, had the army disperse the Garibaldian troops rounded up at Aspromonte, in Calabria, where (August 29, 1862) Garibaldi was wounded and put under arrest for two months. The scandal that followed brought about the fall of the government. An attempt at a partial solution of the Roman question was made by the ministry (March 1863–September 1864) of Marco Minghetti. By the Convention of September (signed at Paris on September 15, 1864), Napoleon III agreed to gradually withdraw French troops from papal territory in the course of the next two years; in return, Italy undertook to respect papal rule and—by a secret clause—to transfer the capital from Turin to Florence. When this condition became public, there was an uprising in Turin, with 30 dead (September 21–22), and Minghetti was forced to resign.

The Roman question

The adherence of Venetia and Rome. Two years later, attention was diverted from Rome to Venice by the outbreak of war (June 1866) between Austria and Prussia. Italy, governed by the ministry of the Piedmontese Alfonso La Marmora, took the opportunity to attack the Austrian-held lands in Italy but was defeated on land at Custoza on June 24 and at sea off Lissa on July 20. The unification of Italy. The dates are those of annexation, first to the Kingdom of Sardinia and, after 1861, to the Kingdom of Italy.

the Garibaldian volunteers in Trentino had some success. By the Treaty of Vienna (October 3, 1866), Italy, through the mediation of Napoleon III, obtained the cession of Venetia. After a short-lived Minghetti ministry, Rattazzi returned to power, giving tacit consent to the stationing of Garibaldian bands along the papal boundary; but Rattazzi resigned, and meanwhile Garibaldi went into action and was defeated by French troops at Mentana (November 3); upon re-entering Italian territory, he was arrested and sent to the island of Caprera, between Corsica and Sardinia, where he had property.

Both diplomatically and militarily Italy had suffered a marked loss of prestige. Nor was the internal situation happy. There were separatist revolts in Palermo (1866) and others around Parma (1869) because of the tax on milling grain; furthermore, financial restrictions, necessary in order to effect reorganizations and to support the army, made the government unpopular.

The ministry of Giovanni Lanza and Quintino Sella, formed in December 1869, was perhaps the most typical among those of the right wing—it repressed the Mazzinians, advocated free trade, and was prudent in foreign affairs, with a pro-French bias. But, despite its lack of brilliance and its subservience to France—shown when it almost yielded to King Victor Emmanuel's desire to intervene in the Franco-Prussian war of 1870—it achieved the solution of the Roman question. This was made possible because the defeat and abdication of Napoleon III ended French protection of the papacy. On September 20, 1870, after a symbolic resistance by the papal army, Italian troops entered Rome, opening a breach in the wall of Porta Pia. The Pope, refusing to accept the situation, forthwith withdrew inside the Vatican.

With the taking of Rome, the geographical unification of Italy was completed. But an equally important popular unification remained totally unachieved. A vast gulf continued to divide the small proportion, perhaps 2 percent, of the population that, on the basis of a property suffrage, enjoyed electoral rights and was represented in moderate and anticlerical chambers and governments from the mainly illiterate masses, who, preponderantly peasant and Catholic, were beginning to be stirred by working class and Socialist doctrines. (Ma.B.)

DEVELOPMENTS FROM 1870 TO 1914

Once unification was achieved with the capture of Rome (even though Trent and Trieste, the *terre irredente,* or "unredeemed areas," still under Austrian rule, remained outside the boundaries), and once the Roman question was provisionally, albeit unilaterally, settled with the enactment of the Law of Guarantees (May 13, 1871), which guaranteed the pope full ecclesiastical freedom, the Giovanni Lanza–Quintino Sella government focussed its attention on domestic problems. The most crucial of these was the need to improve the financial situation, and this was accomplished in 1876 by holding back public expenditure and increasing revenue by taxation.

Financial problems

Minghetti's last ministry. When Lanza fell in June 1873, Marco Minghetti, who succeeded him in July, attacked the problem of the inflationary paper currency circulation that grew substantially after the introduction of forced currency under the Act of April 20, 1874, which stipulated the volume of currency to be put into circulation for about 20 years; this act set up a consortium of six major issuing private banks (with the result that no state central bank was established). But the Minghetti Cabinet failed to secure adoption of the fiscal measures it had submitted to the Chamber, which was therefore dissolved (September 20, 1874). The ensuing elections resulted in a heavy gain for the left. Next to the traditional, moderately progressive Piedmontese left, headed by Agostino Depretis, and the more consistently progressive left of the other north central regions (both representing the middle class groups of the north), the southern left, the champion of the interests of the landed bourgeoisie of the south and more moderate than the traditional left, showed a remarkable gain.

In spite of these differences, the left, after its success at the polls in 1874, presented a more solid parliamentary front than did the right: indeed, the disagreement within the right on the question of "saving" the railroads by making their operation a state responsibility was responsible in March 1876 for the downfall of the last government of the traditional right, brought about by the Tuscan rightist group's aligning itself with the left against state operation of the railroads. The right, the "moderate" heirs of Cavour, who had built up the unitary state, unified the national market, and set the country's financial house in order, was now succeeded by the left, a party whose leadership consisted mainly of men of the Risorgimento democracy who, unlike the more strictly orthodox Mazzinian republicans, had accepted the monarchist–liberal solution. More resolutely secular and anticlerical than the right, the left had a broader social base extending to the upper levels of the urban working classes, with whose support it was prepared to widen the narrow bases of the unitary state: its program's chief elements were extension of the franchise, compulsory elementary education, tax reform, abolition of the forced currency, and appointment of mayors by election.

Disagreement within the parliamentary right

Depretis and the parliamentary left, 1876–87. In the decade after 1876, Italian public life was dominated by Depretis, the leader of the left, who was president of the Council almost uninterruptedly from March 25, 1876, until his death on July 29, 1887, and who headed eight administrations in which he reserved almost invariably the internal-affairs portfolio and often the foreign-affairs portfolio for himself. A skilled parliamentarian, a talented administrator, and a realistic and flexible statesman, Depretis proceeded with caution in carrying out the program of the left, partly because of the internal divergences within the left itself, which comprised—from left to right—the extreme group of Agostino Bertani, still open to republican promptings; Francesco Crispi's group, clinging to the democratic traditions of the Risorgimento; the Lombard progressive left of Giuseppe Zanardelli and Benedetto Cairoli; and Giovanni Nicotera's group, predominantly southern, bestowing political patronage and more conservative. Nonetheless, on July 15, 1877, the Coppino Act was passed, making the first two years of elementary schooling compulsory, a provision that, though inadequate, helped to lower the level of illiteracy. In 1882 a reform increased the electorate to 6.9 percent of the total population, including a substantial number of workers in the north. The forced currency was abolished between 1881 and 1883. On January 1, 1884, the unpopular grist tax was finally repealed. The Railroad Agreements Act (April 27, 1885) vested responsibility for operating the railroads in private companies and strengthened the hand of the southerners. Public expenditure, however, rose noticeably from 1881 because of increased allocations for the armed forces, and the deficit created was aggravated by the minister Agostino Magliani's "exuberant" financial policy.

Finally, the free-trade tradition was abandoned, and a protectionist measure in favour of industry was enacted in 1878; in 1887 a general tariff was introduced to provide much greater protection for some branches of industry. Because of the widespread farming crisis of the 1880s, the import duty on grains was raised substantially, jeopardizing the already depressed living standard of the lower income groups. The tariffs of 1887 strengthened a political block within the mainly southern group of absentee owners of large estates and those entrepreneurial groups of the upper middle class and of the bourgeois-minded nobility who had directed the Risorgimento process.

"Transformism"

One basic feature of Depretis' politico-parliamentary system much criticized as a source of political corruption and degradation was "transformism," whereby moderate or conservative deputies moved over to the benches of the leftist majority because they had had more than their fill of the wrangling over the ideals and programs of the rightist era and because priority was given to economic and administrative matters, on which agreement in Parliament was now made easier.

Not even under the personal influence of the new king, Umberto I, who succeeded Victor Emmanuel II in 1878, did the left change the foreign-policy aims pursued by the right from 1870 to 1876, namely, to terminate the alliance with France and to seek closer relationships with Germany and Austria-Hungary, as promoted by Marquis Emilio Visconti-Venosta. The policy of cautious reflection required for the consolidation of the young Italian state was, however, offset by the isolation of Italy, which became obvious during the eastern crisis of 1877–78 and at the Congress of Berlin and especially at the tension over the French occupation of Tunisia in 1881.

The Triple Alliance

This isolation ended in 1882, when Italy concluded the Triple Alliance with Germany and Austria-Hungary. The treaty, which had a stabilizing effect on domestic policy, provided, among other things, that Germany, Austria-Hungary, and Italy would undertake to support each other if ever attacked by other powers and that the other two contracting parties would remain neutral if the third was forced into declaring war on another power. The Triple Alliance, from which Italy derived no great advantages, was nevertheless renewed in 1887 on rather more favourable terms that, in addition to giving Italy anti-French assurances that the status quo in the Mediterranean would be maintained, allowed it in substance to request that Trentino and Trieste be ceded to it in the event of any encroachment by Austria in the Balkans.

Colonial expansionism became more marked as imperialistic interests developed. The government acquired Aseb (Assab) in 1882, previously in the possession of the Rubbatino shipping company from 1869 to 1870, and Italian forces occupied Mesewa (1885), a bridgehead for subsequent penetration into Eritrea that was interrupted by the defeat at Dogali (January 26, 1887).

Crispi, to 1891. *"Strong" foreign policy.* Depretis was succeeded by Francesco Crispi, a former Mazzinian who had accepted the constitutional monarchy and whose initial democratic fervour had been steadily waning. His coming to power (August 1887) ushered in a new phase of Italian policy characterized by motives of prestige and colonial expansionist trends at the international level and by a "strong" line at home. An admirer of Bismarck and a fervent nationalist, Crispi adopted an intransigent attitude toward France both in the matter of trade relations and in dealing with the problems created by spheres of influence in the Mediterranean, while forging closer links with the Central Powers, especially Germany.

Expansion in East Africa

Crispi then emphasized the imperialistic aspects of colonial expansion in East Africa. The outcome was the protectorate established over the Somali sultanates of Obbia and Migiuritinia (1889) and later extended to the coast of Benadir; the occupation of the interior of Eritrea (1889), recognized by Menelik II, emperor of Ethiopia, in the Treaty of Ucciali (May 2, 1889); and the attempt to impose an Italian protectorate on Ethiopia.

Domestic policy. In domestic policy, Crispi, the guiding spirit of the industrial–agricultural block consolidated in 1887, encouraged the trends toward authoritarianism that emerged on several occasions from 1861 onward. The first phase of Crispi's decade was also characterized by legislative activity that, while seeking to strengthen the executive by enhancing the authority of the president of the council, began to broaden the basis of public life and to provide a more honest and efficient administration: the extended franchise in local government elections; the elective appointment of mayors by commune councils; reform of the system of administrative law; and promulgation of a new criminal code, the Zanardelli code, which abolished the death penalty and granted some freedom to strike. In addition, Crispi's minister of finance (1889–90), Giovanni Giolitti, reduced the deficit by strict economy.

The Rudinì government and Giolitti's first administration. In February 1891 Crispi resigned, and, after a brief administration (February 1891–May 1892) headed by Marquis Antonio Starabba di Rudinì, who renewed the Triple Alliance for 12 years, Giolitti became prime minister on May 25, 1892. Giolitti, a Piedmontese who had played no part in the Risorgimento, followed a more progressive line.

The years 1870–90 witnessed the emergence and early stages of two movements, one Socialist and the other Catholic, that were radically to alter the nature of the political struggle. The first organizational framework of incipient Italian Socialism on a nationwide scale was the Italian Federation of the International Workingmen's Association (Rimini Conference, August 4, 1872), whose constitution—partly inspired by Mikhail Bakunin, the Russian anarchist—was made possible by the radicalization of the younger republican generation, which had sympathized with the Paris Commune of 1871. The First International, whose orientation was anti-authoritarian, anarchistic, and collectivist in Italy, spread chiefly to Naples, Sicily, and central Italy, recruiting its supporters from among the urban workers and young intellectuals. But it failed to enlist support among the peasantry, in spite of the rural insurrectionist movement that the internationalists started in 1877 and that they thought should have been supported by the peasants of the south. The futility of the insurrectionist method brought the International, after 1877, to a crisis aggravated by the abandonment of their positions by some of its leaders, including Andrea Costa, founder of the Revolutionary Socialist Party of Romagna in 1881 (as from 1884 the Italian Revolutionary Socialist Party). Moreover, in 1882, the Italian Labour Party (Partito Operaio Italiano) came into existence in Milan and rallied Lombardy workers to a labour program based on trade union opposition. The same years witnessed completion of the transition from radical democracy to Socialism of a group of Lombardy intellectuals, among them Filippo Turati and Leonida Bissolati, who assimilated Marxist ideas; another intellectual, Antonio Labriola, advocated the establishment in Italy of a Marxist Socialist culture free of Positivist contamination from which, in his opinion, the Lombardian Socialist group was not immune.

Birth of organized Italian Socialism

Among the Catholics, the "intransigent" element, defenders of the rights of the papacy against the "usurping" Italian state and advocates of political abstentionism, prevailed over the clerico-moderates, who favoured an accommodation with the state. The "intransigents" acquired an effective organizational instrument in the *Opera dei congressi* (1875), promoting—especially from 1885 onward—a range of economic and social activities, mainly in north central rural areas.

With these developments in mind, Giolitti tried to introduce a financial policy that would lighten the burden on the lower income classes but also would permit more freedom in political and trade union organization. It is not by pure chance that, during Giolitti's first administration, the Italian Socialist Party (PSI) was founded (August 1892) as an entity separate from the Anarchists. The continuation of this policy was nevertheless impeded by Giolitti's resignation (November 24, 1893) because of the Banca Romana scandal, in which the financial aspects were compounded with political corruption.

The Banca Romana scandal

Crispi, 1893–96. Giolitti was again succeeded by Crispi at a time when the economic and bank crisis had become more acute and in Sicily the Fasci dei Lavoratori movement (unions of labour, especially of peasant groups, linked with the PSI) had become more extensive. In order to deal with the tense situation, Crispi made use of the law enforcement authorities and exercised emergency powers: disbandment of the Fasci and declaration of a state of siege in Sicily and Lunigiana, where an uprising fomented by the Anarchists had been attempted (January 1894); adoption of "anti-Anarchist" laws; and disbandment of the PSI (October 1894).

Crispi later succeeded in establishing equilibrium in the credit sector by reorganizing the banks, whereby the Banca d'Italia came out on top as the leading issuing bank; and he strengthened his parliamentary position through the elections of May 1895, held after a revision of the electoral rolls had reduced the number of voters to the detriment of leftist opposition parties.

The discontent engendered by Crispi's policy, particularly noticeable in the north, expressed itself over the African crisis. The annexation of Tigre as part of Eritrea (October 1895) actually forced the emperor Menelik II, who had already denounced the Treaty of Ucciali in 1893, into war. The campaign ended in an Italian defeat (Aduwa), forcing Crispi to resign on March 5, 1896. Thus there came to a close, with a heavy deficit, an era of Italian foreign policy characterized by an ill-prepared imperialistic drive.

Rudinì, 1896–98. Rudinì, who succeeded Crispi for the

Treaty of Addis Ababa

second time (May 1896), settled the African problem by the Treaty of Addis Ababa (October 1896), which recognized the independence of Ethiopia and left Italy in possession of Eritrea up to the Mareb line and the Somali Protectorate. His domestic policy, however, was vague, wavering between the pressures of the conservative right—which sought the replacement of the parliamentary type of government by the "constitutional" type, with ministers responsible only to the sovereign—and the pressures of the radical left. Rudinì began by adopting a tolerant attitude (amnesty for political prisoners) and introduced some social welfare measures, but a Cabinet reshuffle (July 1896) shifted the balance to the right, thrusting the radicals into opposition.

Finally, Rudinì's inadequacy became apparent in the crisis of 1898, when, as a result of the rise in grain prices, heightened tension convulsed the whole country and culminated in mass demonstrations in Milan. He called the army into the Lombard capital, then in a state of siege, and resorted to severe repression.

When Rudinì resigned in view of the Chamber's hostility (June 18, 1898), Luigi Pelloux, who succeeded him, girded himself to continue repression; and, when—after he had prepared a bill highly detrimental to constitutional freedoms—the extreme left resorted to parliamentary obstruction, he promulgated the repressive laws by royal decree and adjourned the Chamber. This authoritarian gambit backfired: the elections of June 1900 were a triumph for the extreme left, forcing Pelloux to resign.

Agriculture and industry, 1870–90. From 1870 to 1900, Italy remained a predominantly farming country whose agriculture was characterized by major discrepancies and striking contrasts. In the Po Valley of the north, with the help of development projects, the large estates, with their capitalistic owner-managers, continued to gain ground, as did a class of capitalist entrepreneurs ("tenant farmers") employing hordes of farmhands. In the central regions (Tuscany, the Marches, Umbria, and part of Emilia), the predominant system was sharecropping. The south was both the realm of the large estates and also of peasant holdings often too small to offer their owners a bare livelihood and therefore compelling them to work as labourers or tenants on the large estates.

Crisis in agriculture

The unification of the market and the construction of the railroad network spurred production, especially of specialized crops intended for export (olive oil, wine, citrus fruits), but, except for the capitalistic estates of the north, the increase in output was generally from the steady expansion of the area under cultivation rather than from the investment of capital. Agriculture suffered severely from the effects of the crisis of the 1880s. The general drop in prices and output had been of particular significance for grains. The state's endeavour to cope with the situation by taxing grains (1887), while it enabled the big southern farms to survive, was detrimental to the small- and medium-scale wine-growing peasants of the south, who found themselves—because of the trade war with France—excluded from one of their principal markets.

In 1870 Italy did not yet possess an industrial base of significant proportions, even though, in the northern regions, there were signs of a developing manufacturing industry, especially in the textile sector (silk, cotton, and wool). The industrial "takeoff" was held back not so much by the low level of capital formation as by the smallness of the domestic market and by the tendency to invest in speculative rather than directly productive ventures. This being so, state intervention, particularly the policy of protectionism (tariffs of 1878 and 1887), enabled steady progress to be made in the textile sector, now assured of the domestic market, while the establishment of Terni and other complexes launched the iron and steel industry in the direction of modern production.

The three decades under discussion witnessed an initial phase of expansion, although it was slowed down by recurrent crises, as a result of which the gross product of industry at the end of the century still amounted to only around 20 percent of the overall gross national product. Lastly, per capita income remained essentially at a standstill, and the standard of living remained low.

Accession of Victor Emmanuel III

Saracco, 1900–01, and Zanardelli, 1901–03. Giuseppe Saracco, who succeeded Pelloux (June 1900–February 1901), was a "caretaker" minister who withdrew the drafts of illiberal laws and launched a policy of détente that was not even interrupted by the assassination of Umberto I (July 29, 1900) by an Anarchist, because the new king, Victor Emmanuel III, showed his desire to guarantee constitutional freedoms. On Saracco's resignation, a government was formed by Giuseppe Zanardelli, whose minister of the interior, Giolitti, inspired his policy. The Zanardelli–Giolitti administration (February 1901–October 1903) marked a turning point in Italian life, ushering in a period of renunciation of conservative authoritarianism and of liberalization of domestic policy.

The Giolitti era. When he became president of the Council in November 1903, Giolitti dominated the scene until the outbreak of World War I, heading three administrations (November 1903–March 1905; May 1906–December 1909; March 1911–March 1914) apart from a few intervening caretaker cabinets (Alessandro Fortis, March 1905–February 1906; Sidney Sonnino, February–May 1906 and December 1909–March 1910; Luigi Luzzatti, March 1910-March 1911).

Social reform and the growth of organized labour. Giolitti sought to bring the radical and Socialist left into the constitutional picture and to introduce a policy of reform to meet the demands of the upper strata of the working classes. He abandoned the posture of repressing the labour movement, recognized the freedom to organize and to strike, and remained largely neutral in labour disputes. A series of accompanying legislative innovations, while of limited scope, helped to better the lot of the working classes (restraints on the employment of child and female labour; 24 consecutive hours of rest per week in industry; measures to benefit workers in rice fields, etc.). Lastly, the Credaro Act (1911) made state bodies responsible for operating elementary schools.

Giolitti's policy encouraged the rapid growth of the organized labour movement. Hence, in 1901 there was a noteworthy expansion of the trade federations and the trade-union councils (town-based territorial organs), which became increasingly socialistic and which also engaged in educational and assistance activities. Concurrently there was a gradual spread of the peasants' associations in regions with big capitalistic farms (Po Valley and part of Apulia). In this way masses of farm labourers were organized and, in 1900–01, set off a wild wave of strikes designed to raise low wages and improve harsh working conditions. The farm labourers' organization found its rallying point in the constitution of the Federazione Nazionale dei Lavoratori della Terra (National Federation of Agricultural Workers), or Federterra (157,000 members in 1910). Federterra, however, mainly reflected the aspirations of the labourers (more farmhands and fewer peasants) and made "socialization" of the land the central theme of its program. This limited its penetration into the regions of small peasant holdings and sharecroppers, where the peasants' main desire was to own their piece of land. National unification of the Socialist-oriented trade unions occurred in 1906 with the establishment of the Confederazione Generale del Lavoro (CGL), or General Confederation of Labour. The CGL soon became an efficient organ (384,000 registered members in 1911), but its cautious reformism benefitted the more advanced labour categories, concentrated in the north, and neglected the strata of less skilled and unorganized workers, chiefly in the south.

Catholic trade unions

Even the Catholics, who had entered the field of trade union organization after the publication of *Rerum Novarum* (1891), stepped up their activity, especially among the peasants of the north central region and the textile workers' branch, where women predominated (104,000 registered members in the Catholic, or "white," trade unions in 1910).

Domestic policy. Giolitti succeeded in moving farther ahead with his domestic policy also, thanks to the support of the reformist wings of the PSI (Turati, Claudio Treves, Ivanoe Bonomi, Leonida Bissolati), which predominated in the parliamentary group and the CGL and often lent Giolitti support in Parliament but refused to join his administrations. But the "Socialist revolutionary" movement, which had no specific ideology, and the "revolutionary trade unionism" splinter group, which was influenced by the ideas of the French revolutionary syndicalist Georges Sorel and which quit the PSI in 1907, were fiercely hostile to Giolitti.

During the Giolitti period, Parliament and government were active in the economic and financial sectors, even in relation to the economic expansion of those years. When the railroad agreements of 1885 expired in 1905, responsibility for running the railroads was taken over by the state; in June 1906 legislation was enacted to convert the public debt from 5 to 3.75 percent (and later to 3.5 percent), an operation that was successful because of the sound state of the national financial situation, which showed a surplus up to 1909–10; in 1912 it was the turn of the state life insurance monopoly, and, at the same time, a great impetus was given to public works.

Against this, one unworthy aspect of "Giolittism" was the use made by Giolitti of political patronage to maintain his power, which he did with an unscrupulousness that reached its climax during the elections.

Foreign policy. In foreign policy Giolitti tried to find Italy an alternative to the Triple Alliance and subordination to Germany. In addition to improved relations with England, the rapprochement with France, started by Rudinì, who had settled the Tunisian question in 1896 and ended the trade war with France (by means of a trade treaty of November 21, 1897), was encouraged. This led to the Italo-French agreements of 1902, which delimited the spheres of influence of the two countries in North Africa and pledged them to mutual neutrality in the event of aggression by third parties. As a corollary, relations with Austria grew worse because of the friction created by recurrent irredentism, Italy's commercial penetration of the Balkans, and Italy's interest in Albania, as did relations with Germany, especially after the Moroccan crisis of 1905, during which Italy maintained an impartial position between France and Germany. The tension with Austria became acute in 1908, when Austria's occupation of Bosnia without compensation for Italy placed the Triple Alliance in jeopardy.

The conquest of Libya

Giolitti strengthened the Italian position in the Mediterranean with the conquest of Libya (Italo-Turkish War of 1911–12), which was opposed by the nationalists, who were starting to grow aggressive and were supported by sectors of the Catholic world. But the Libyan war had important domestic repercussions. The conflict upset the delicate internal balance of the PSI and caused it to break away from the reformist movement of the right wing (Bissolati, Bonomi, Angelo Cabrini) in favour of the war, while the reformists of the left, with Turati, remained true to the anti-colonialist tradition of Italian Socialism. Moreover, there emerged a new left, nurtured on idealistic volunteerism, whose most typical representative was Benito Mussolini, the creator of an eclectic platform founded on criticism of parliamentarianism, on antimilitarism, and on the advocacy of revolutionary violence.

The situation having changed thus, Giolitti could no longer count on the PSI for support and therefore turned to the Catholics. The latter agreed to give their support in the 1913 elections—the first with virtually universal suffrage—to the governmental candidates (the Gentiloni Pact). The liberal–Catholic alliance, concluded as an anti-Socialist measure, did not, however, prevent the government's relative defeat, the Catholics, PSI Socialists, and the Reformist Socialist Party of Bonomi and Bissolati all gaining seats at the expense of the liberal groups.

The economy. The turn of the century and the Giolitti period were years of growth for the Italian economy. Farm production actually rose, thanks to internal and export demand, to mounting investments in capitalistically structured estates, and to the completion of land-improvement projects in Emilia-Romagna. But, above all, the industrialization process gathered speed, with a growth rate of industrial output of 6.7 percent per annum for the period 1896–1908. Both the spread of "mixed" banking and the increase of capital stock in industry contributed to this growth. In addition to the textile industry, the electric power (Edison) and the metallurgical industries became increasingly important. And per capita income in 1910–14 was 28.8 percent higher than in 1896–1900.

Industrial concentration in the north

The industrial concerns, however, were concentrated in the northwestern part of the country, which in 1911, with 27 percent of the total population, accounted for about 58 percent of the total industrial workers. Industrialization was practically nonexistent in the rural and backward south, aggravating the so-called southern problem. Emigration, mainly from the southern regions, started as a large-scale exodus in 1880 and grew to an annual average of 600,000 emigrants from the start of the 20th century to 1914, mostly headed for the Americas.

WORLD WAR I AND THE RISE OF FASCISM

The Salandra government. Giolitti, who resigned in March 1914 because of the radicals' switchover to the opposition, was succeeded by Antonio Salandra, heading a government that was expected to leave the way open again for Giolitti. But the outbreak of World War I drastically altered the nature of the political struggle. Salandra, after weathering a series of storms culminating in Red Week (serious popular uprisings that occurred in the Marches and the Romagna in June), coolly faced up to the war crisis. He ruled that the provisions of the Triple Alliance did not apply to Austria's attack on Serbia and therefore decided on neutrality (August 2, 1914). In the following months, however, Salandra considered intervening on the side of the Allies, particularly after the disappointing outcome of the attempt to bargain for the *terre irredente* with Austria. Meanwhile, the neutralists in Italy consisted of Giolitti supporters, Socialists, and Catholics. The interventionists included republicans, reformists of the Bissolati–Bonomi school, some splinter groups of liberal democrats, who regarded the conflict as the last war of independence and the final achievement of national unity, and expansionist and imperialistic-minded elements; these were later joined by revolutionary-Socialist and anarcho–trade-unionist groups and by Mussolini, therefore expelled from the PSI.

The Treaty of London

When negotiations with Austria broke down, Salandra sought contacts with the Allies that finally led to the Treaty of London (April 26, 1915), which remained secret; in return for intervention on the Allies' side, Italy was to receive Trentino, Trieste, Alto Adige (South Tirol) up to the Brenner Pass, Gorizia and Istria up to the Quarnaro, and northern Dalmatia. The Prime Minister, denouncing the Triple Alliance on May 4, was, however, forced to resign (May 13) by the neutralist majority in the Chamber. The interventionists stepped up their pressure with a well-orchestrated propaganda campaign and aggressive street demonstrations. The King refused the Prime Minister's resignation (May 16th) and took the decision to intervene, a decision that, while not formally exceeding his constitutional authority, nevertheless ran counter to the feelings of the majority in the country. The Salandra government thus took over full powers and, on May 24, declared war on Austria.

Entrance into the war and the peace settlement. Salandra resigned in June 1916 after Austrian success in Trentino, and a national coalition government was formed under Paolo Boselli, who declared war on Germany (August 28, 1916). His government respected constitutional freedom and tolerated the pacific-neutral PSI, even after violent antiwar demonstrations in Turin in August 1917. Boselli was toppled after the Battle of Caporetto disaster (October 1917), and the new government was formed in November by Vittorio Emanuele Orlando, who, at one of the most critical junctures in the history of united Italy, led the country on to victory.

The "mutilated victory"

Having got out of the war, Italy was shaken by a crisis in which the political, economic, and social elements were intermeshed. Nationalists and imperialists, dissatisfied with the peace conference at which the Allies, while granting Trent, Trieste, and the Brenner frontier, did not recognize Italy's claims to Fiume (modern Rijeka, Yugoslavia) and Dalmatia and its expansionist aims in Albania and Asia Minor, began to bandy about the myth of the "mutilated victory." The middle classes felt the effects of inflation acutely and were terrified by the atmosphere of social tension; the industrialists and farmers were anxious about the turmoil stirred up by the workers, which, on a scale hitherto unknown, was assuming the political character of a struggle to take over the state; the peasant masses pressed that the prospect of "land for the peasants;" glibly conjured up in time of need by the leading groups, should be realized.

Nitti, 1919–20. Orlando, depressed by the course the Paris negotiations were taking, resigned on June 19, 1919; and Francesco Saverio Nitti, a democrat and an expert on the problems of the south, formed a government of the left and Giolitti supporters. Nitti did indeed promote the passage of progressive social legislation (compulsory unemployment, sickness, and old-age insurance) and tried, unsuccessfully, to introduce the eight-hour working day. But the increase in social strife obliged him to call often on the police to quell the turmoil.

In the elections of November 16, 1919, the first held on the basis of universal suffrage and proportional representation, the PSI scored a triumph (30 percent of the votes and 156 seats in the Chamber). The results were likewise favourable for the Italian Popular Party (PPI), the Catholic but formally nondenominational party founded in January 1919 by Don Luigi Sturzo and campaigning for improvement of peasant small holdings and for administrative decentralization (20.5 percent of the votes and 100 seats). But the elections disappointed the liberals, democrats, and rightists. Thus it became difficult to form stable governments, which would henceforth require the support either of the rigidly intransigent Socialists or the Populists.

As regards foreign policy, Nitti renounced the claims to Dalmatia and to the colonies, thus incurring the accusation of "capitulator" from the nationalist groups of the right. Against this background the question of Fiume became more embittered. Fiume, claimed by both Italy and Yugoslavia, was occupied in a piratical *coup de main* led by Gabriele D'Annunzio (September 12, 1919).

Fiume seized

Giolitti's last ministry: growth of Fascism. Internal tension and the difficult parliamentary situation led to Nitti's resignation (June 9, 1920). The 78-year-old Giolitti now served his last term as prime minister, supported by the liberal democrats and, conditionally, by the Populists. Giolitti concluded with Yugoslavia the Treaty of Rapallo (November 12, 1920), which made Fiume a free state and gave Italy some Dalmatian islands.

Giolitti then tried to deal with the domestic situation by his old method of staying neutral in labour disputes and using the police to maintain law and order. In this way he weathered the crisis of the September 1920 "occupation of the factories" by workers in Turin and Milan. He cut the budgetary deficit by increasing tax revenue (*e.g.,* special capital levy, heavier death duties, and taxes on higher income brackets) and reducing expenditure.

Still, Giolitti's experiment turned out to be not enough to control the critical events in which the country was embroiled. He could not count on the PSI's support. The PSI's "maximalist" left (victorious in the party congress of October 1919) harped on revolution and the dictatorship of the proletariat, although its verbal extremism was not matched by capacity to guide the masses. Moreover, the anti-electoral Communist splinter group of Amadeo Bordiga and that of Antonio Gramsci's "New Order" organized themselves on the left of the maximalists. These splinter groups, having broken away from the PSI in January 1921, formed the Italian Communist Party (PCI).

Birth of the Italian Communist Party and of Fascism

Meanwhile, Fascism was developing menacingly. Launched in Milan on March 23, 1919, by Mussolini, the Fascist movement did not at once take a precise ideological stance and combined pragmatist, revolutionary–trade-unionist, nationalist, imperialist, and irrationalist elements in its platform; its program laid stress on direct opposition to Socialism and "Bolshevism" and on collaboration between management and labour in production to further the higher interests of the "nation." Fascism availed itself flexibly of the elements of disillusionment and discontent prevailing in the country: nationalistic hysteria intensified by the "mutilated victory"; the operational difficulties of the parliamentary state; the effects of the economic situation; management's anxiety about the growth of trade unionism (CGL's registered membership rose from 249,000 at the end of 1918 to 2,320,000 at the end of 1920); and the middle classes' fear of Socialism.

After a difficult beginning (in the 1919 elections the Fascist vote was insignificant), Fascism gathered strength after D'Annunzio's seizure of Fiume (supported by Mussolini) and especially after the failure of the occupation of the factories, the turning point of Socialist fortunes. Allying itself with the traditionally more reactionary groups of the Italian ruling classes, Fascism became a kind of armed reaction against the working classes. Deploying "punitive expeditions" by paramilitary "squads," Fascist strategy succeeded, from the late 1920s onward, in throwing the Socialist and trade union movement into disorder, first in the Po Valley and then in the northern cities, not sparing even the Catholic organizations.

The victory of Fascism. The victory of Fascism, a predominantly urban movement with a broad lower middle class base, reached rural areas in 1921–22; it was encouraged by the indecision of the Socialists, who were torn with strife—in October 1922 a further schism saw the expulsion of the reformists, who formed the Unitary Socialist Party (PSU). But the movement was cold-shouldered by Giolitti and other liberal democrats, who believed that they could "constitutionalize" Fascism and absorb it within the liberal state. When the Chamber was dissolved, Giolitti announced new elections for May 15, 1921, and formed a governmental National Bloc comprising, besides the liberals, democrats, nationalists, and Fascist candidates. Nevertheless, out of 535 seats, the left gained 123 seats, plus 15 to the Communists, and the Populists obtained 108 seats, but, within the National Bloc (275 seats), the Fascists succeeded in securing 35.

Having changed from a movement into a party and dropping republicanism at the Congress of Rome (November 1921, 300,000 registered members), Fascism, under the weak governments that followed Giolitti (Bonomi, July 1921–February 1922; Luigi Facta, February–October 1922), set off to conquer power. When the last attempt to block his way, the general strike proclaimed on July 31, 1922, misfired, Mussolini carried out the March on Rome (October 28, 1922), aided by the surrender of the King, who refused to sanction a state of siege and entrusted Mussolini with a mandate to form a new government, which took office on October 31.

The March on Rome

The kingdom and Fascism

BEFORE WORLD WAR II

First years of Fascist government. Fascism did not work immediately for a complete breakdown of the Italian political and constitutional system; and Mussolini's first government included liberal and populist ministers. But the establishment of a totalitarian regime, with power vested in the Fascist Party and, through it, in its leader, or *duce,* was the goal. Accordingly, as one act of violence against its opponents followed another, Fascism institutionalized its own armed force by setting up the Voluntary Militia for National Security (January 1923) and transformed the electoral system in its own favour (the Acerbo Act, which made the kingdom a single national constituency and assigned an absolute majority—51 percent—of the seats in the Chamber to the party holding the relative majority).

At the elections of April 6, 1924, held in a suffocating atmosphere, 64 percent of the votes went to the "national" government lists (374 deputies, 275 of them officially Fascists), except in northern Italy, where more votes went to the opposition.

Assassination of Matteotti

The assassination by Fascists of the PSU deputy, Giacomo Matteotti (June 10, 1924), who had denounced in the Chamber the violence of the electoral campaign, created tension. Fascism, morally isolated, went through a phase of disbandment, while the opposition groups (Aventinians, named after the ancient Roman *plebs'* secession from the Roman assembly on Aventine hill—signifying withdrawal from the political scene) stopped their parliamentary work in protest. But the indecision of the Aventinians and the attitude of the King, who did not revoke Mussolini's mandate, allowed Fascism to climb back again. After having assumed full responsibility for what had happened (speech in the Chamber, January 3, 1925), Mussolini abandoned collaboration with supporting groups and set up a total dictatorship.

Between 1925 and 1926, Italy was thus transformed into a police state: the activity of Parliament, the parties, and trade unions was increasingly curtailed, and freedom of the press and association became a sham. An act of December 24, 1925, made the president of the Council "head of the government" with no responsibility to Parliament, removable only by the sovereign, and the sole person competent to lay down the agenda of the two chambers. Further provisions ended any autonomy in local government. Representatives of the Confederazione Generale dell'Industria and the Confederazione delle Corporazioni (*i.e.,* the Fascist-oriented trade unions) signed an agreement in October 1925 asserting that they alone represented the industrialists and the workers, respectively. A few months later other laws (April 3 and July, 1926) confirmed this trade union monopoly and empowered the Fascist unions to draw up collective labour contracts; in addition, strikes and lockouts were prohibited, and the authority to settle collective-bargaining disputes was vested in the labour judiciary. Lastly, provision was made for setting up national bodies to maintain liaison among the trade union organizations of the various factors of production by branches of production; they were called corporations and regarded as the cornerstone of the corporate state, which was to be founded on cooperation of the classes and the integrated organization of production to further the development of "national power."

Provision for the Fascist corporation

The dictatorship completed. An attempt on his life (October 31, 1926) gave Mussolini the opportunity to abolish all remaining freedoms. Provisions were introduced to disband all the parties, end the parliamentary mandate of 120 Aventinians, restore the death penalty for some political prisoners and introduce special police measures ("forced residence" and "admonishment"), and set up the Special Tribunal for the Defense of the State. A new criminal code and code of criminal procedure (limiting rights of defense and abolishing the jury) and a new Public Security Consolidation Act took effect in 1931.

Mussolini continued to build up a totalitarian state, in which everything was subordinated to the personal will of the *duce.* A new electoral law (March 16, 1928) finally subordinated the Chamber, with the introduction of a single list of candidates selected by the Fascist Grand Council and submitted as a whole for approval by plebiscite. The Grand Council, set up as a party organ early in 1923, was "constitutionalized" (December 1928) and became a state organ in the service of Mussolini.

The regime then embarked on a campaign to make the country Fascist, using radio, press, and school, dragooning the young into paramilitary organizations, and making party membership obligatory for admission to government service, including the judiciary. The corporate structure, however, remained a facade. The corporations, numbering 22, were not established until 1934, although the Ministry of Corporations had been set up as early as July 1926. Even though granted wide powers of overall economic control, the corporations confined themselves to advisory activities and had little impact on economic and social life.

Lastly, the constitutional reform of January 1939, replacing the Chamber of Deputies by the Chamber of Fasces and Corporations, whose membership was automatic by virtue of membership of other Fascist organs, was of virtually no consequence.

The Lateran Treaty

In the matter of state–church relations, Fascism concluded the Lateran Treaty with the Holy See (February 11, 1929). These pacts, which enhanced Mussolini's prestige and enabled him to use the church hierarchy in certain cases to support the regime, repealed the Law of Guarantees of 1871, created the State of Vatican City, and affirmed the catholicity of the Italian state, recognizing religious marriage as valid in civil law and introducing religious teaching in intermediate-level schools.

As from 1926, the opposition to Fascism decided to act under cover or to emigrate. The Communists chose the first alternative and focussed their program on internal affairs: they fomented strikes and disturbances and infiltrated the very mass organizations of Fascism. The price they paid was high (the party leader, Gramsci, arrested in 1926, died in penal servitude in 1937; and over 4,000 of the approximately 4,700 people sentenced by the Special Tribunal were Communists); but the uninterrupted existence of the PCI created the conditions for its growth as a major party after the fall of Fascism. The same alternative was chosen by "Justice and Liberty," an intellectual liberal-Socialist movement founded by Gaetano Salvemini, Carlo Rosselli, Emilio Lussu, Ernesto Rossi, and others in 1929 and destined to amalgamate with the Action Party (PdA) in 1949. Catholic opposition was expressed within traditional organizations, such as Catholic Action, a training ground for many cadres of the future Christian Democratic Party; liberal opposition was exemplified by Benedetto Croce and the group associated with him in the periodical *La Critica.*

Socialists in exile

The two Socialist parties (PSI and PSU, reunited in 1930) and the Republican party (PRI) were reconstituted in exile; in 1927 they organized the Anti-Fascist Action Coalition. With the disbandment of the coalition (1934), while the Socialists in Italy became reorganized in Rodolfo Morandi's Internal Centre, Socialists and Communists in exile (under the "popular front" policy) signed a united action agreement in August 1934.

Fascist foreign policy. In foreign policy, after an initial phase of moderation (Italian–Yugoslav Agreement of Rome, January 27, 1924, which gave Italy Fiume; good relations with Great Britain; accession to the Treaty of Locarno, October 1925), Mussolini pursued an expansionist policy, based on revision of the peace treaties and the Italian presence in the Mediterranean and Danube–Balkan areas. The often inconsistent dynamism of Fascist foreign policy grew more intense after 1930; thus there was the Four Power Pact of June 7, 1933, between Italy, Germany, France, and Great Britain on the revision of treaties, which Mussolini hoped would allow him to lay the groundwork for Italian hegemony in central Europe but which was rendered meaningless by the French attitude of suspicion; the Austrian-Hungarian agreement of March 1934, designed to protect Austria's independence from Hitler's threats; and the Stresa Conference (April 1935), at which the Italians, French, and British adopted a position in favour of Austria's territorial integrity and against the rearming of Nazi Germany.

Soon after Stresa, Mussolini, erroneously believing that these agreements had given him a free hand, turned his attention to colonial expansion, namely to Ethiopia, which he attacked on October 2, 1935. The war ended victoriously for Italy, and, in May 1936, Victor Emmanuel III donned the ephemeral crown of the Empire of Ethiopia.

The "Rome–Berlin Axis"

Meanwhile, the ties between Fascist Italy and Nazi Germany led to the Berlin agreements of October 23, 1938—the "Rome–Berlin Axis," which provided for a joint military effort to support Gen. Francisco Franco in the Spanish Civil War. Directly after the occupation of Albania (April 1939), the Italian–German alliance was finally consolidated by the Pact of Steel (May 22, 1939), which was of both a defensive and offensive nature.

The economy under Fascism. *Economic advance in the mid-1920s.* As regards the economy, Fascist policy followed a liberal line favouring private enterprise up to 1925. Traditional customs protectionism, embodied in the tariff of 1921, had been reduced by trade agreements; but previous governments' progressive measures, such as state life insurance and compulsory registration of share certificates, were abolished. The year 1925 ushered in a period of state intervention, with measures to reduce the balance-of-payments deficit, including the attempt to obtain from domestic sources the grain required to meet national needs regardless of cost; higher customs tariffs; and the vesting of power in the minister of finance to prohibit certain imports and to set quotas. But, since the lira continued to drop in value, the government was obliged in 1926 to declare the Banca d'Italia the only issuing bank and to stabilize the currency by revaluation (92.46 lire to the pound sterling, the so-called "90 quota"), which was, however, too high and harmful to exports. Thus began a period of deflation, with a drop in prices damaging to agriculture, wage and salary cuts, and a rise in unemployment.

Nevertheless, in spite of the negative effects of the "90 quota," the Italian economy followed a rising trend up to 1929. The national income climbed from 95,000,000,000 lire (at 1938 prices) in 1921 to 124,600,000,000 in 1929, thanks to the manufacturing boom (from 54 to 90 between 1921 and 1929, base year 1938 = 100). In particular, the electric power, chemical, and metallurgical industries made headway, with streamlining that strengthened monopolistic complexes such as Edison, Snia Viscosa, Fiat, Montecatini, and Pirelli.

The Institute for Industrial Reconstruction

Effect of the world depression. The world depression of 1929 had serious repercussions on industrial output and on the banking system. As a result, there was a further increase in state intervention, namely, the establishment in 1933 of a state agency, the Institute for Industrial Reconstruction (IRI), to rescue some major banks encumbered by locked-up capital, which meant that a substantial part of the credit system was immobilized. Moreover, by increasing the share participations of the rescued banks, IRI—and hence the state—became a shareholder in a complex of companies that, in 1939, represented more than 44 percent of Italy's share capital and acquired a controlling interest in a group of them equivalent to 18 percent of the total capital. Thus there emerged a striking feature of the modern Italian economy; namely, the coexistence of frequently interlinked private and public sectors.

The measures introduced as a result of the 1929 depression, especially those of 1935, made it easier to launch the policy of "autarky" designed to make the Italian economy self-sufficient. In addition to the impetus given to grain production—which expanded, however, at the expense of specialized crops—there was exploration for minerals, expansion of hydroelectric plants, reorganization of the iron and steel industry by the establishment of a holding company of IRI (Finsider), and promotion of the armaments industries.

Industry revived, but the recovery was moderate, so that on the eve of World War II Italy was still primarily an agricultural country. As before, industrial enterprises, especially the major ones, continued at the close of the 1930s to be concentrated in the north, while the south remained an agricultural and depressed area with a population of poor peasants and labourers.

ITALY IN WORLD WAR II

Mussolini's fall from power. On the outbreak of World War II in 1939, Italy first adopted a position of nonbelligerence, entering on Germany's side (June 10, 1940) only when German successes in France misled Mussolini into believing that Germany's victory was a certainty. But soon the unfavourable course of the military operations, revealing the country's lack of preparedness and the adventurousness of Mussolini's policy, widened the gap between the majority of the country, sorely pressed by the war, and the regime—a gap illustrated by strikes in many factories of the north in March 1943.

The landing of the Allies in Sicily (July 10, 1943) was the death knell of Fascism. Mussolini, in the minority at a meeting of the Grand Council (July 25) at which it was proposed to deprive him of authority and to restore power to the crown, was placed under arrest by the King, belatedly anxious to dissociate his responsibilities from those of the *Duce,* while the unsuccessful reaction of the Fascist Party and the wave of anti-Fascist demonstrations following Mussolini's fall brought about the regime's collapse.

Armistice with the Allies

The Badoglio government. The government of Marshal Pietro Badoglio, appointed by the King and consisting of military men and technicians, negotiated with the Allies. On September 3 the armistice of Cassibilie was signed, providing for the Italian armed forces' unconditional surrender and the establishment of an Allied administration. The announcement of the armistice, made by Badoglio over the radio on September 8, caused the disbandment or transfer to the Germans of almost all the Italian units in the peninsula, France, and the Balkans; and the country, thrown into confusion, came to be divided in two by the front line. In the south, controlled by the Allies, who were fighting the Wehrmacht up the peninsula, the Badoglio government declared war on Germany (October 13, 1943), thus securing the status of "co-belligerent" for Italy; in the north, under German occupation, after Mussolini's rescue by German parachutists (September 12, 1943) and the reconstitution of the Fascist Party (now called the Republican Fascist Party), the Italian Social Republic came into existence (September 17) as an ally of Germany.

The Committee of National Liberation and the Resistance

Emergence of anti-Fascist parties: the liberation of Italy. Meanwhile, emerging anti-Fascist parties were active. Among those with the largest following were the Christian Democrats (DC), a Christian-based party formed of various Catholic-oriented groups; the Socialist Party of Proletarian Unity (PSIUP), the result of the merger of the PSI and the Proletarian Unity Movement (founded by Lelio Basso in January 1943); and the PCI. These three parties, together with the smaller parties (Liberal, Action, Republican, and Labour Democracy), set up at Rome on September 9, 1943, the Committee of National Liberation (CLN), which called on Italians to fight against Nazism–Fascism. Thus the Resistance began. The armed struggle grew with the emergence of large partisan formations that went to make up, as from June 1944, the military command of the Corps of Volunteers for Liberty. The partisans' activities, which continually harassed the Nazi–Fascist troops at great sacrifice of life (about 36,000 killed in Resistance ranks and about 10,000 civilians killed in reprisals), were supported by the strikes of March 1944 and the spring of 1945 in northern Italy.

The anti-Fascist parties in the south, who had refused representation in the government as being prejudiced in favour of the abdication of King Victor Emmanuel III and his son Umberto, changed their attitude after the U.S.S.R. recognized the Badoglio government (March 1944) and after the concurrent about-face of the PCI, whose secretary, Palmiro Togliatti, on March 31 proposed the formation of a provisional government of national unity. Thus the CLN parties were admitted to the Badoglio administration (which came to power on April 22), and royal powers were transferred to Prince Umberto. When Rome was liberated (June 4–5, 1944), Umberto was proclaimed lieutenant general, and a coalition government of the CLN parties headed by Bonomi was formed, but under virtual Allied control. A Constituent Assembly, once territorial liberation was completed, was to be convened to solve the constitutional question, and the government entered a crisis (December 1944) because of disputes over purging Fascist elements from the administration (which the left wished to have carried out more decisively) and over the powers of the CLN (which the moderates wished to be limited). A second edition of the Bonomi administration was characterized by a move to the right.

The "northern wind"

Parri's coalition government, June–December 1945. After the liberation (to which the general partisan uprising of April 1945 contributed), the long negotiations to form a government that would fulfill the desire for political and social renewal, expressed with much greater forcefulness in the north than in the south (the so-called "northern wind"), led to the formation of a coalition government of the CLN parties (June 1945) headed by Ferrucio Parri (of the PdA) as a compromise between the opposing candidacies of the Socialist Pietro Nenni and the Christian Democrat Alcide De Gasperi. In the Parri administration, profound differences soon ended the unity achieved during the Resistance and set the pattern of political deployment that characterized the following years. On the one side stood the PSIUP and the PCI, whose mass support came from the industrial and labourer proletariat of the north and the sharecroppers of the centre. The extreme left wished to set up an advanced popular democracy and to transform the social structure through antimonopolist measures (nationalization, worker-based management councils, etc.) and the limination of ownership of large estates through land reform. The left was opposed by the Christian Democrats (backed by the liberals), an interclass and moderate party worried about the "Communist" danger, an anxiety shared by the rightist Uomo Qualunque (UQ) movement with its Fascist nostalgia.

The Parri administration tackled the problem of Sicilian separatism and reopened the question of purging, which Parri tried to extend to private industry, but his leftist leanings led, in November 1945, to the withdrawal from the Cabinet of the liberal ministers, soon to be followed by the Christian Democrats, and to the government's subsequent downfall. This was the beginning—with a coalition Cabinet of the CLN parties, except for PdA—of the long series of administrations of De Gasperi, who turned out to be the ablest Italian political leader since Cavour. De Gasperi, supported by the Allies, soon formulated Italian policy along moderate lines.

Abdication of Victor Emmanuel III

After the local government elections of March–April 1946 had strengthened the majority parties of the DC, PSIUP, and PCI, and after the abdication (May 9–10) of Victor Emmanuel III in favour of his less compromised son Umberto (Umberto II), there were held simultaneously on June 2—with universal suffrage including women—a referendum on the constitution and elections for a Constituent Assembly whose powers were limited to the drafting of a constitution and the ratification of treaties. In the constitutional referendum, 12,717,923 votes (54 percent) were cast for a republic; in the elections to the Constituent Assembly, held on the basis of proportional representation, the Christian Democrats (DC) scored a clear victory (8,101,004, or 35.2 percent), followed by the PSIUP (4,758,129, or 20.7 percent) and the PCI (4,356,686, or 18.9 percent). The liberals, on the other hand, saw their ranks sorely depleted as compared with the pre-Fascist period (6.8 percent), while the UQ vote (5.3 percent) was greater than expected, above those of the PRI, monarchists, and PdA.

The republic

THE DE GASPERI ERA, 1945–53

In the new De Gasperi administration, set up with the participation of the DC, PSIUP, PCI, and PRI, the differences between the DC and the leftists became stronger because De Gasperi took conservative steps to strengthen the powers of the state in the maintenance of law and order. In January 1947, moreover, the conflicting trends within the PSIUP led to the breaking away of the rightist wing (Giuseppe Saragat, Ludovico D'Aragona, and others), which favoured the Western democracies and was "autonomist" vis-à-vis the PCI, while the leftist elements (Nenni, Morandi, Basso) favoured close cooperation with the Communists. The seceders thus founded the Socialist Party of Italian Workers (PSLI), while the PSIUP changed its name to the PSI, which was joined in October 1947 by the majority of the dissolved PdA.

The peace treaty

Foreign policy aligned with the West. Meanwhile, after De Gasperi's visit to the United States in January 1947, which, in the climate of the Cold War, implied a choice of side, the Italian government signed the peace treaty on February 10, 1947. The treaty, which seemed to the public to be extremely severe, not only limited the armed forces and laid down the scale of reparations but also provided for some frontier adjustments with France (Tende-Brigue, Mont Cenis, etc.), the surrender of the Dodecanese Islands—occupied during the Italian–Turkish War—to Greece, and renunciation of the colonies (Eritrea eventually went to Ethiopia, Libya became independent, and a ten-year trusteeship over Somalia was assigned to Italy). Trieste was temporarily constituted a Free Territory subdivided into two zones, under Anglo-American military and Yugoslav military administration, respectively. As for the Alto Adige, the De Gasperi–Grüber agreement of September 5, 1946, whereby Austria recognized the Brenner frontier and Italy undertook to grant the region a broad measure of self-government, was included in the treaty.

Politics at home. After signature of the peace treaty, the "imposed coexistence" of the DC and the leftist groups in the administration became more difficult. De Gasperi resigned on May 12, 1947, and formed a one-party Christian Democratic (plus a few independents) government. Strengthened by the success of anti-inflationary measures and by the failure of leftist disturbances to bring down the government, as well as by economic aid from the United States (Marshall Plan and OECD), De Gasperi broadened his administration in December by including PSLI and PRI representatives.

The republican constitution

The Constituent Assembly had completed its work by approving on December 22, 1947, the text of the new constitution, which entered into force on January 1, 1948. The republican constitution, the result of compromise (the case of article 7 is typical: it provided for the inclusion of the Lateran Treaty in the new constitution), embodied the innovative ideas of the Resistance period, laid down the "right to work" as a basic human right, and repudiated war. The separation of powers was upheld: the executive (entrusted to the president of the republic, elected for a term of seven years by the two branches of the legislature in joint session), the legislative (assigned to the Chamber of Deputies and the Senate, both elected on the basis of universal suffrage), and the judicial; and locally autonomous regions were established, although their coming into operation was long delayed.

The elections of April 18, 1948, were characterized by awareness that a decisive choice was involved. The result was an unexpectedly overwhelming victory of the DC (48.5 percent of the votes, with an absolute majority of the seats in the Chamber, 304 out of 574), which secured the support of the clergy and of a larger cross section of the conservative electorate. The Communists and Socialists, united in the Popular Democratic Front, did not manage, with 31 percent, to improve on their positions of 1946. The DC's gains, however, were mainly at the expense of the right: liberals and UQ, standing as the National Bloc (3.8 percent), and the Italian Social Movement (MSI), a neo-Fascist group (2 percent). De Gasperi, who, with an absolute majority in the Chamber, could have formed a one-party government, preferred instead to build a broader base, initiating the period of "centrism" (fifth De Gasperi administration, with the DC, PSLI, PRI, and PLI [the Partito Liberale Italiano], May 1948–January 1950; sixth De Gasperi administration, tripartite without the PLI, January 1950–July 1951; seventh De Gasperi administration, the DC and PRI, July 1951–July 1953). During the years of centrism, Italy entered the Western bloc, acceding to the North Atlantic Treaty Organization and joining the Council of Europe and the European Coal and Steel Community.

Domestic policy and the economy. In domestic policy, there were developments in trade unionism: the unity achieved in June 1944, when the Italian General Confederation of Labour (CGIL) was reconstituted, came to an end. The Catholic trade unions broke away from the CGIL (a member of the Soviet-oriented World Federation of Trade Unions) and organized the Free General Italian Confederation of Labour (LCGIL). In June 1949 the Social Democrat and Republican trade unions constituted the Italian Federation of Labour (FIL). In 1950 the LCGIL and the FIL merged into the Italian Confederation of Workers' Trade Unions (CISL), while in the same year two new central trade union organs came into being, the Italian Union of Labour (UIL), a coalition of some of the Social Democrat and Republican trade unions, and the neo-Fascist Italian Confederation of National Workers' Trade Unions (CISNAL).

Industrial progress

In the same years, after the prewar level of production had been restored in 1949, the industrial sector made rapid progress, assisted by the abundance of cheap labour. This dynamism led to the establishment of a competitive iron and steel industry, to the beginning of the radical transformation of the chemical sector with the discovery of large methane deposits in the Po Valley and the entry of the Edison company on the scene, and to the founding of the National Hydrocarbons Authority (ENI), a public corporation set up in 1953; the automobile industry also began to expand. Even though there was large-scale state intervention in such branches as iron and steel and chemicals, management of the economy remained largely in the hands of private enterprise. Nevertheless, Italy remained an agricultural country as regards employment, more than 8,000,000 people being employed in farming as against some 6,000,000 in industry in 1953.

Under the pressure of peasant unrest (squatting in 1949–50), the centrist administrations sought to introduce reforms into the rural areas, particularly in the south. Thus a special act (May 1950) for the Sila, a zone in Calabria, and the so-called *stralcio* law ("provisional order") on land reform (October 1950) were passed, providing for the expropriation of about 1,700,000 acres (700,000 hectares) for distribution among designated families (approximately 270,000 acres [110,000 hectares] at the end of 1960). But these measures did not go far enough. In an effort to narrow the widening gap between the north and south, the Southern Fund was set up in 1951 and helped to build infrastructures but did not succeed in stimulating widespread industrialization. In spite of the economic recovery, Italy continued to suffer from mass unemployment, which led once again to emigration.

Shortly before the election of 1953, the DC induced Parliament to pass—amid bitter attacks of the opposition parties—an act that would have given 65 percent of the seats in the Chamber to the party, or group of allied parties, polling 50.01 percent of the votes. But the results of the June 7, 1953, elections prevented this "legislative swindle" from going through. The four "allied" centre parties obtained only 49.85 percent of the votes, showing a general drop as compared with 1948, particularly for the DC and the PSDI (Italian Social Democratic Party, the name adopted from January 1952 by the PSLI). (F.d.Pe.)

SUCCESSORS OF DE GASPERI

Years of instability. *Government.* The second republican administration saw six successive Christian Democrat one-party administrations between 1953 and 1958. The limited capacity of these governments to manoeuvre severely curtailed their ability to pass important legislation. Thus laws for instituting the regions (except for those with special statutes), for establishing the Constitutional Court, and for replacing the Fascist codes were postponed. On the credit side, the governments between 1953 and 1958 could claim only the Ten-Year Plan for Growth and Development (Vanoni Plan), which, however, did not become operational; the strengthening of ENI, which was given exclusive rights to explore for oil and methane in the Po Valley; and the largely unsuccessful effort to stimulate the industrialization of the south. As for foreign policy, the Trieste question was settled (October 1954), administration of the two zones being assigned to Italy and Yugoslavia, respectively.

Settlement of the Trieste question

The government's relative lack of mobility, however, was offset by movement within the parties. In the DC, Amintore Fanfani, leader of the party left, who became secretary general in July 1954 following De Gasperi's death that year, sought to reorganize the party and to make it more independent of the parallel organs. In the PSI, with the atmosphere of international détente that had set in, the autonomist current (Nenni) favoured breaking away from the PCI and collaborating with the government on a reform program. In the PCI, Togliatti, after the 20th congress of the Communist Party of the Soviet Union and the events in Hungary (1956), based the PCI's position on the noninevitability of war, on a democratic advance toward Socialism, on "national roads to Socialism," and on the "polycentrism" of the international Communist movement. The PLI, under its new secretary, Giovanni Malagodi (1954), moved to the right, establishing closer links with the business world.

The elections of May 1958 revealed the substantial stability of the electorate, with slight gains for the DC (42.2 percent) at the expense of the rightists. Following the elections, the DC and the PSI moved toward a rapprochement. The progressive attitudes of the church under Pope John XXIII (1958) also favoured this trend. The result—after considerable intraparty manoeuvring and a series of unstable governments, including a right-wing administration (Fernando Tambroni, March–July 1960) that aroused fears of a Fascist-style revival—was the "opening to the left" (*apertura a sinistra*). The formation of a left-of-centre government came during Fanfani's fourth administration (February 1962–May 1963). The coalition included the DC, the PSDI, and the PRI. The PSI, as agreed upon, maintained its abstention, which was interpreted as a show of confidence in the government. In the elections of May 1962, Antonio Segni was chosen president of the republic.

Opening to the left

Industrial development. The years 1952–62 saw the doubling of the national income and a 62 percent increase in per capita income. This "economic miracle" was largely the result of the development of manufacturing, which made Italy a predominantly industrial country. Industrial production rose from 27 to 44 percent of total output, while employment in this sector grew from 29.6 to 38.6 percent of the working population. At the same time, employment in agriculture fell from 39.6 to 27 percent (and still further in subsequent years) of the people, with a mass migration from the countryside. The population shifts from the countryside to the towns and from south to north, involving millions of people, created serious overcrowding, urban sprawl, and substandard housing in many parts of the northern "industrial triangle" (Milan, Turin, Genoa). The increase in investments, the technological modernization and rationalization of plants, the creation of the European Economic Community (EEC), and the successes achieved by semipublic enterprises in the iron and steel sector were matched by the surplus of manpower, which helped to depress wage levels and encouraged further emigration.

The parliamentary shift to centre–left. The elections for the fourth republican administration (April 1963) disappointed the two left-of-centre protagonists. The DC (38.3 percent) lost part of its conservative support to the PLI while the PSI remained at a standstill. The PCI and the PSDI both gained. After a short-lived (June–November 1963) Christian Democrat government under Giovanni Leone, Aldo Moro finally formed (December 5) a left-of-centre "organic government" (one with direct Socialist [PSI] participation) committed to the adoption of economic programming, establishment of locally autonomous regions, and reform in the urban, school, and agricultural sectors. The PSI, however, faced internal difficulties. The leftist splinter group, opposed to collaboration with the DC, left the party to set up (December 1963) the Italian Socialist Party of Proletarian Unity (Partito Socialista Italiano di Unità Proletaria, or PSIUP), which was joined by some 20 percent of the PSI parliamentarians. President Segni resigned (because of illness) in December 1964 and was replaced on December 28 by Giuseppe Saragat.

Presidency of Saragat

The Moro government, faced with inflation (closely connected with an expansion in consumption caused by higher wage levels) and a distressing balance-of-payments deficit, introduced measures to hold back consumption. It also contracted for a loan of $225,000,000 with the U.S. Treasury and the International Monetary Fund. The economic situation brought the reform policy to a halt and led to a new series of crises. In March 1966, for the third time, Moro formed a centre-left government, which was finally able to introduce reforms such as the act on economic programming, a prerequisite for instituting the locally autonomous regions. Measures dealing with university reform and family rights, however, were delayed.

The Christian Democrats, meanwhile, were torn between leftist elements, which favoured détente in relations with the Communists, and right-of-centre elements opposed to any such rapprochement. The warring Socialist factions managed to reunite and at a joint congress (October 1966) formed the Unified Socialist Party (Partito Socialista Unificato, or PSU).

In the elections of May 19–20, 1968, the DC held its ground (39.1 percent), but the PSU suffered heavy losses and some of the Socialist voters switched to the PCI and, especially, the PSIUP. The Monarchists practically vanished, and the PLI and the MSI also fell behind. Giovanni Leone headed a Christian Democrat one-party caretaker administration from June to November 1968, when Mariano Rumor formed (December 13) a coalition of the DC, PSI, and PRI. Rumor's coalition lasted until July 1969, when the PSI's social democrat wing split off. Rumor, therefore, formed a new one-party government (August 1969) that had to face acute political and social tensions. The three major national trade-union confederations struck for the renewal of their contracts and for a new domestic policy

Rumor coalition

(November 19). This critical situation was exacerbated by an attempt to blow up a Milan bank (December 12, 1969) in which several persons were killed.

Faced with this situation, the left-of-centre parties formed a government to offer better guarantees of stability and efficiency. After a long crisis, which began on February 7, 1970, a third Rumor left-of-centre coalition was set up in April. It introduced some highly significant legislation, including the Workers' Statute (offering more effective guarantees of the workers' freedom and dignity and trade-union liberty in business enterprises), the referendum to repeal legislation, and the regional finance act. On July 6 Rumor unexpectedly resigned. He was replaced (August 6) by another Christian Democrat, Emilio Colombo, under whose leadership the centre–left coalition passed two measures that had aroused great controversy, the Divorce Bill and the Finance Bill. Colombo's government, however, was unable to halt the deterioration of the economy, and he resigned in January 1972.

Elections in May failed to resolve the political deadlock. Giulio Andreotti headed a centre–right government until he was succeeded in July 1973 by a Rumor-led centre–left coalition of Christian Democrats, Republicans, Socialists, and Social Democrats. The Communists and the trade unions adopted a tolerant attitude. In February 1974, however, the Republicans withdrew over economic policy, and Rumor formed a new administration in March, excluding the Republicans but dependent upon their parliamentary support. The right wing of the Christian Democrats forced the government to hold a referendum on the Divorce Law in May 1974. Despite strong opposition from the Roman Catholic Church, a large majority favoured the law, and the referendum was considered a severe setback for the Christian Democrats. In October, after a prolonged Cabinet crisis, the Rumor administration resigned. Italy remained without a government until the end of November, when Moro formed a coalition of Christian Democrats and Republicans. Depending on the parliamentary support of parties outside the coalition, this government was extremely weak.

Referendum on the Divorce Law

Successive governments had failed to cope with the decline of the economy and public services, corruption in high places, and the growth of lawlessness. In the regional elections of June 1975, the voters registered their discontent: the Communists attracted 33 percent of the vote. The Christian Democrats still led, with 35 percent, but their domination of political life was clearly threatened. In reaction, the party replaced Amintore Fanfani—the long-time secretary general and a stout opponent of any rapprochement with the Communists—with Benigno Zaccagnini. The Communists, meanwhile, rather than favouring the formation of a left-wing coalition government, continued to press for the "historic compromise" (*compromesso storico*), a program for Italy's future based on an alliance of Communists and Christian Democrats.

Moro's coalition collapsed in January 1976 after the withdrawal by the Socialists. To stave off a general election, regarded as futile by the major parties, Moro formed a minority Christian Democrat administration a month later. Without adequate support in Parliament, however, the government was forced to hold a general election in June. The Communists showed increased strength, receiving more than 34 percent of the vote. The Christian Democrats continued to reject the "historic compromise" and insisted on excluding the Communists from power. They were forced to seek assurances of Communist abstention, however, before a new government could be formed. At the end of July, Giulio Andreotti formed a new government, which introduced severe austerity measures to deal with the continuing economic crisis.

In July 1977, after four months of negotiations, the Communists at last received a measure of participation in the government. The opposition parties gained a significant voice in policy making, but they still had no direct role in government. The initial program included measures to strengthen the economy and to uphold law and order. Communist support for the Christian Democrats alienated the extreme left, some of whom resorted to the violent political tactics already associated with the extreme right. The arrangement, however, enhanced the authority of the government, which no longer feared defeat in Parliament, and suited both Christian Democrats and Communists.

Despite a number of parliamentary crises and increasing political violence during the autumn of 1977 and the first half of 1978, the agreement held firm. The most sensational episode in the long series of political kidnappings, shootings, and "kneecappings" of prominent businessmen, intellectuals, and members of the judiciary was the abduction of the Christian Democratic Party leader and former premier, Aldo Moro, on March 16 by members of the Red Brigades (Brigate Rosse), an extreme left-wing terrorist group. The attack took place shortly before Parliament began its debate on a vote of confidence for the latest Andreotti Cabinet, which had taken office March 13. The kidnappers attempted to bargain with the government for release of brigade members then on trial. After long and agonized debate, the government refused to negotiate with the Red Brigades.

Moro murder

Moro's bullet-riddled body was found near the centre of Rome on May 9. A week later, on May 14–15, in local elections involving about 10 percent of the electorate, the Communist Party obtained 16 percent less of the popular vote than the Christian Democrats, compared with a difference of only 3.3 percent between the two parties in 1976. The vote was widely interpreted as a sympathy vote for the Christian Democrats. (C.G.Se.)

On June 15 Pres. Giovanni Leone resigned because of allegations connecting him to the Lockheed bribery scandal in which the American aircraft company was said to have bribed high military officials and politicians to facilitate purchase of Lockheed aircraft. Alessandro Pertini, a Socialist, succeeded Leone in July as Italy's seventh president, to serve a seven-year term. When his term expired, the nearly 90-year-old Pertini was succeeded in 1985 by Francesco Cossiga, a Christian Democrat.

The rapid turnover of centre–left coalition governments, usually under Christian Democratic leadership, continued into the 1980s. The election of 1983 led to the republic's first Socialist-led coalition, the premiership being taken over by the leader of the Socialist Party, Bettino Craxi. This coalition nearly collapsed in 1985, in connection with events following the hijacking of the Italian cruise ship *Achille Lauro* by four Palestinians claiming to be members of the Palestine Liberation Front, a splinter group of the PLO, but Craxi was able to win a vote of confidence in the Chamber of Deputies by a secure margin.

Despite the history of rapid government turnovers—well over 40 since the establishment of the republic in 1946—the Italian political scene has remained remarkably stable. Since the election of 1963 government coalitions have been centre–left. Although the Communists have never been officially part of the government, they have, through various agreements, been able to exert influence on governmental decisions.

Economic troubles. Even though inflation and economic stagnation have troubled the Italian economy since about 1969, it, nonetheless, has shown remarkable resiliency. For the five-year period ending in 1976, Italy ranked seventh among the West's main industrial powers in its gross domestic product. In its economic growth rate, only Canada and Japan exceeded the Italian achievement during that period.

The government made numerous efforts to stabilize the economy. The most serious problem besetting the economy was the increasingly high level of public spending. To ease the problem, the Craxi government passed an austerity budget in 1983, which included measures such as tax increases, cuts in social services and pensions, and a proposal to modify the highly controversial *scala mobile,* the inflation-linked quarterly wage adjustment. Italy's economic problems, however, are substantially alleviated by a vigorous "submerged economy," which operates outside of government control and which is estimated to amount to as much as one-third of the national income.

For later developments in the political history of Italy, see the *Britannica Book of the Year* section in the BRITANNICA WORLD DATA ANNUAL. (C.G.Se./Ed.)

TRADITIONAL REGIONS

The regions in this section are arranged according to geographical location. First will be found the regions in northern Italy (Liguria, Lombardy, Piedmont, Sardinia, and Venetia); next, those in central Italy (Tuscany, Emilia-Romagna, and the Papal States); lastly, those in southern Italy (Mezzogiorno and Sicily).

Liguria

PHYSICAL AND HUMAN GEOGRAPHY

Liguria, the smallest of the regions of Italy, is composed of the provinces of Genoa, Imperia, La Spezia, and Savona. With an area of 2,089 square miles (5,410 square kilometres), Liguria is shaped like a semicircle, reaching from the mouth of the Roia River to that of the Magra and from the French-Italian frontier to Tuscany. The region is dominated by the Maritime Alps as far as the Cadibona Pass and by the Ligurian Apennines east of that point. The narrow, picturesquely indented coastal fringe, the Italian Riviera, is customarily divided into a western section, the Riviera di Ponente, and an eastern section, the Riviera di Levante, the point of division being the apex of the Ligurian arc at Voltri. The mountains rise steeply behind the coast, and small rivers that cut deeply into the mountains form narrow valleys. The port city of Genoa (Genova) is the capital of Genoa (Genova) Province and figures prominently in the history of Liguria. It stands at the head of a large gulf, close to the Lombard Plain and the Alpine passes leading north.

Because of the shelter from the winter winds afforded by the Alps and the Apennines, Liguria is particularly favoured in the production of early vegetables, flowers (especially in the westernmost section), olives, and wine. Some livestock is raised in the mountains. Industries are concentrated in and around the city of Genoa, around Savona, and along the shores of the Gulf of La Spezia. Genoa and La Spezia contain the leading shipyards of Italy, and La Spezia is Italy's major naval base. Iron and steel and machinery are produced in Savona, Imperia, and Genoa; chemicals and petrochemicals at Genoa and at Vado outside Savona. Textiles and food industries are located in nearly all the major cities. Many forms of handicrafts, including ceramics, weaving, and ivory and filigree work, are also produced. Not least among the region's sources of income is the tourist trade, and there are numerous resorts scattered all along the coast.

The main railroad lines connect Genoa with Nice and Marseille in France to the west, with Pisa and Rome to the southeast, and with Milan, Turin, and Switzerland to the north. An automobile toll road runs from Genoa to the Po Valley.

HISTORY

Ancient history. In the earliest historical period, Liguria referred to an area where in the Early Iron Age Hallstatt culture there was great similarity in the Urnfield pottery and metal types (including a peculiar razor type) between Catalonia, Languedoc, Roussillon, southern Switzerland, and northern Italy, through all of which burial in flat graves was prevalent. It has been argued that it was to this Early Iron Age cultural unity that the Greeks applied the ethnic name "Liguri," although the objection can be raised that this identity in Urnfield types no longer applied at the period of the first Greek settlements.

The affinities that exist between the peoples stretching from the Pyrenees to the Arno in prehistoric times are Neolithic rather than Iron Age, and it is probable that the Urnfield elements of the Early Iron Age left the indigenous ethnic stratum undisturbed. This stratum was basically a Neolithic one, and it is to this or rather to types of Neolithic culture in this area that archaeologists are now apt to apply the ethnic term Ligurian. This Neolithic mode of life continued in village settlements in remote places despite intrusive Celtic elements of later Urnfield invasion, and it was probably to loose political groupings of these people that classical authors attach the name. Rough handmade pottery with finger-impressed decoration of basically Neolithic type has been found in the lowest levels of the Greek city of Ampurias in Spain and of the southern French Celtic fortresses of Ensérune and Cayla de Mailhac, at both of which Iberian influence was strong from the 5th century BC onward.

No texts speak of Ligurians (or of Iberians for that matter) in southern Gaul as nations or attribute definite racial characteristics to them. They were said in classical sources to have made up the indigenous population of the northwestern Mediterranian coast from the mouth of the Ebro River in Sapin to the mouth of the Arno River in Italy. Scholars have had difficulty differentiating the Liguri from Iberians. Ancient authors (Strabo, Diodorus Siculus) describe them as a rough and strong people whose piracy the Romans deplored. These, however, are late texts and refer to the Celticized Ligurians (Celtoligures) between the Rhône and the Arno rivers. Strabo tells us distinctly that they were of a different race from the Gauls or Celts, and Diodorus mentions that they lived in villages and made a difficult living from the rocky mountainous soil.

Their boldness caused them to be in great demand as mercenaries. They served Hamilcar in 480 BC and the Sicilian Greek colonies in the time of Agathocles and openly sided with Carthage in the Second Punic War. Not until 180 BC were steps taken for their final reduction by Rome, when under the proconsuls P. Cornelius Cethegus and M. Baebius 40,000 Ligurians were deported to Samnium and settled near Beneventum (Benevento).

Stretching from Gaul to Etruria, Liguria was made the ninth division of Italy by Augustus and contained the following tribes: the Friniates on the northern slopes of the Apennines, the Briniates and the Apuani in the Vara and Magra valleys respectively, the Genuates around Genoa, and the Veturii to the west of these, the Vediantiti around modern Vence, the Intemelii whose capital was Albium Intemelium (modern Ventimiglia), and the Ingauni whose capital was Albium Ingaunum (modern Albenga). North of the Apennines there were lesser tribes, the Vagienni around Augusta Vagiennorum (modern Bene), the Statielli around Aquae Statiellae (modern Acqui). The Taurini near modern Turin and many other tribes listed by Pliny and Livy were also considered Ligurians.

Origins and early history (to the 10th century) of Genoa. In ancient times, Genoa was first the site of a Ligurian fort, and in the 5th and 4th centuries BC its fine natural harbour made it a commercial emporium with Etruscan, Phoenician, and Greek contacts. From the 3rd century BC it was a major Roman station on the coastal route to Provence; another road led into Lombardy. The barbarians who overran Italy when the Roman Empire dissolved were defeated by the Byzantine general Belisarius in the mid-6th century AD, and Genoa remained under Byzantine rule until its conquest in about 643 by the Lombards, who destroyed its walls and allowed its trade to decay. Yet even in the 10th century, when Genoa was repeatedly sacked by the Saracens, a bare minimum of urban life and overseas trade still survived.

Genoa in the 11th–19th centuries. Genoa began to emerge as a leading power as early as the 11th century. The Muslim raids had provoked the local nobles to lead Genoa's fishermen and farmers, often in alliance with Pisa, in retaliatory attacks against the Muslims in Corsica, Sardinia, Sicily, and the Balearics. The spoils were invested in new ventures in Naples and Amalfi, in Sicily, Spain, and North Africa. After 1097 participation in the Crusades brought the Genoese profitable opportunities to hire out shipping and lend money, and Genoa secured trading quarters and privileges in Syrian and Byzantine ports. The Genoese extended their dominion eastward and westward along the coast, developed business activities inland, and supplemented meagre local produce by importing foodstuffs and raw materials; they became experts and innovators in shipbuilding, navigation, and cartography,

Genoese expansion

in industrial and banking techniques, and in types of contracts that enabled even poor men to form partnerships and invest capital in lucrative overseas trade.

The commune of Genoa. The gradual evolution of the commune of Genoa, whose autonomy received recognition from the Holy Roman Emperor in 1162, provided a form of government that alleviated social tension and assisted the landed nobility and the flourishing bourgeoisie to collaborate in foreign enterprises. Perpetual strife among the magnates, however, led in 1191 to the appointment of a foreign podesta (chief magistrate). Despite further innovations, such as a local *capitano del popolo* ("captain of the people") in 1257, internal dissensions continued to encourage foreign intervention. In 1339 the Genoese Simone Boccanegra became the first of a series of local rulers, called "doges," who were chosen for life but could seldom diminish faction and disorder.

Trade rivalries. Genoa's remarkable expansion involved constant struggles with trade rivals. In 1204 the Venetians manipulated the Fourth Crusade to secure predominance in Byzantium; but the Genoese reversed the position by assisting the exiled emperor Michael Palaeologus to recapture Constantinople in 1261. In 1284 Genoa's fleet destroyed Pisan sea power at the Battle of Meloria. Corsica and Sardinia were long-established spheres of influence and colonization, but Genoese merchants were able to penetrate to distant India and England; to set up colonies in the Crimea, at Phocaea with its alum monopoly, and on Chios with its mastic; to bring back slaves and gold from North Africa; and to establish commercial communities in Cyprus and Castile.

Genoa became one of Europe's largest cities; by 1300 its population possibly approached 100,000. It had strong walls, grand patrician palaces, and churches built in black and white marble stripes. Luxurious living standards were based, in part, on imported domestic slaves.

In the 14th century, European colonial rivalries were heightened by a general economic recession and, from 1348 onward, by the disastrous visitations of the Black Death (plague). A series of bitter wars against the Aragonese, who secured control of Sardinia, and against the Venetians came to a climax in 1380, when the Genoese narrowly failed to capture Venice itself.

Genoa was as successful overseas as Venice even though the Genoese lacked the disciplined constitution and public spirit that enabled Venice to run a rigidly state-controlled colonial empire, and despite Genoa's weakness in the face of public bankruptcy and private individualism. From 1396, however, internal disorder resulted in repeated submission to foreign rule by the French and by Milan. The amalgamation in 1405 of many government creditors to form the independent Banco di San Giorgio saved the Genoese government by taking over the disastrous national debt; but the bank secured so many privileges that it came to rival the state itself. After 1453 the Genoese lost all their Black Sea and Levantine colonies except Chios to the Turks, yet they found the resilience to diversify their activities and shift them westward, discovering new commodities and markets. Genoese entrepreneurs intensified their initiatives in Aragon, Castile, and Portugal and participated in new ventures along the African coast and in the Atlantic isles. Christopher Columbus, the discoveror of America in 1492, was a Genoese.

Foreign influence

Alliance with Spain. In 1528, in the midst of a great European struggle for supremacy, the famous Genoese admiral Andrea Doria shifted his service from France to the Holy Roman Emperor Charles V (Charles I of Spain); Genoa escaped French domination through a Spanish alliance that allowed Genoese financiers, the great specialists in exchange operations, to handle huge sums for the Spanish crown. The Genoese controlled Spanish and Neapolitan trade, and Peruvian silver poured into their banks; by about 1570 they were the principal bankers of Catholic Europe. Also in 1528 Andrea Doria introduced a new constitution giving power to the magnates, with doges elected for two-year periods. This regime provided an era of more stable though increasingly oligarchic government.

Loss of independence. Real decadence came as Genoa was increasingly excluded from the prosperous Northern and Atlantic economy. Its fortunes were dictated by the great European succession wars. The city was ruinously bombarded by the French in 1684; was occupied in 1746 by the Austrians, against whom there was a popular uprising; and lost its last Mediterranean colony, Corsica, to France in 1768. In 1796 Napoleonic troops occupied Genoa, which sustained a terrible Austrian siege in 1800. The Genoese expelled the French in 1814, but the next year's peace treaty gave Genoa to Piedmont. The resulting discontent, both republican and anti-Piedmontese, shaped Genoa-born Giuseppe Mazzini, the great prophet of the Italian Risorgimento. In 1860 Giuseppe Garibaldi sailed for Sicily from Genoa with his army of liberation.

Genoa since 1860. Genoa became the major port of the new unified Italy, rivalling Marseille in France. Railway building, industrial development, and shipbuilding yards all inserted Genoa into the great industrial complex of northern Italy, while the Simplon and other Alpine tunnels greatly enlarged its hinterland. Genoa has an important university and the other attributes of a great modern city. Its revolutionary traditions erupted in a successful insurrection against the Germans in April 1945. The heavy damage sustained during World War II was repaired, and Genoa has remained one of Italy's greatest towns.

(A.T.L./G.Kh.)

Lombardy

PHYSICAL AND HUMAN GEOGRAPHY

The northern region of Lombardy (Italian Lombardia) is composed of the provinces of Bergamo, Brescia, Como, Cremona, Mantova, Milano, Pavia, Sondrio, and Varese. With an area of 9,191 square miles (23,804 square kilometres), it is the leading industrial and commercial region of Italy and one of the country's best farming areas.

Physically, Lombardy may be divided into three zones: a northern, mountainous zone; a median, hilly zone; and a southern, flat zone. The northern zone is divided into the Alpine and the pre-Alpine zones. The Alpine zone, where crystalline rocks prevail, comprises part of the Leopontine and Rhaetian Alps, the Orobie Alps, the Ortles, and the Adamello. In the Bernina it reaches a height of 13,304 feet (4,058 metres) and has many glaciers. The pre-Alpine zone, mostly calcareous, though also dolomitic, attains less elevated heights but occasionally rises above the 8,000-foot line. It is particularly beautiful at some of its massifs, such as the Grigne. The hilly zone, partly composed of a morainic material with some morainic amphitheatres, is gently undulating. The alluvial plain, sloping northwest–southeast, is divided into high and low areas; the former has a gravelly soil, poor in superficial water; the latter, with plentiful moisture content, is separated from the former by the spring line where the waters, hidden in the subsoil at the higher level, gush out.

Lombardy has many rivers, all tributaries of the Po. The principal ones are the Ticino; the Adda, with its affluents the Brembo and Serio; the Oglio, with its affluents the Mella and the Chiese; and the Mincio. The Valtellina and the Brembana, Seriaria, Camonica, Trompia, and Sabbia valleys are among the most beautiful in Italy. The region also has many Alpine, pre-Alpine, and infra-morainic lakes, containing all or part of Lake Garda, the largest lake in Italy, Lake Maggiore, the Lake of Lugano, Lake Como, Lake Iseo, Lake Idro, Lake Varese, and the lakes of the Brianza (Pusiano, Annone, Alserio, and Segrino).

The climate, though in the main continental, is variable, because of the great differences of height and the presence of large water areas; it is most continental on the lower plain at Milan, Pavia, and Cremona. The rainfall, not less than 24 inches (610 millimetres) annually in the area near the Po, reaches 80 inches in the mountainous regions.

Lombardy has a higher than average population density. The density is greatest in the pre-Alpine zone and on the plains, the areas of intense economic, agricultural, and industrial development.

Agriculture, especially on the plains, is industrialized, and high productivity is achieved by scientific use of fertilizers and by irrigation. Grasslands, where grass is mowed up to eight times a year in the *marcite* ("flooded meadows"), cereal growing (rice, wheat, and corn [maize]), and sugar-beet cultivation are characteristic of the low plains; the higher plains grow cereals, green vegetables, fruit trees, and mulberries. The hilly zone has fruit and chestnut trees; the climate and soil around the lakes are especially suitable for olive trees and limes. In the pre-Alpine zone vines grow at altitudes as high as 2,400 feet above sea level, and on the Alps there is excellent grazing. In the Alpine hamlets cattle breeding is scientifically practiced; about half of the cattle are milk producing. Pigs are also raised, and sheep are bred for both wool and meat. Honey is another important product. Lombardy ranks high in the production of silk cocoons.

A national park, of about 350 square miles, was set up at Stelvio in 1935 for the preservation of indigenous animal life.

Lombardy is part of the industrial triangle of northern Italy, marked by the cities of Genoa, Turin, and Milan. The Milan metropolitan area is known for steel and iron, automobiles and trucks, machine tools and machines, chemicals and pharmaceuticals made in Milan, Monza, Sesto San Giovanni, and other centres. Brescia, Pavia, and Cremona manufacture trucks, engines, and machinery; Como, Legnano, and Gallarate, textiles; the Brianza district, furniture; Vigevano and Varese, leather. Food industries are located in many of the smaller towns. Milan is the leading industrial city of Italy, its principal banking centre, and its leader in wholesale and retail trade. The region's railway network radiates from Milan, which has direct rail communications with Switzerland, France, and West Germany through the Simplon and St. Gotthard passes; with Turin and Paris via the Mont Cenis rail line; with Venice, Trieste, and Yugoslavia to the east; with Genoa, Bologna, Rome, and Bari to the south and southeast. Automobile expressways connect Milan with Turin, Genoa, Venice, and Florence, and there are excellent highways throughout Lombardy.

HISTORY

The Lombards appear in classical writings of the 1st century AD as one of a number of tribes who formed the Suebi. Their home was then evidently in northwestern Germany, on the left bank of the lower Elbe River. If distinctive types of late Iron Age pottery and brooches are rightly associated with them, their settlements extended both west and east of the medieval Bardengau, which, with its principal community, Bardowiek (near Lüneburg), preserves the second element of their tribal name (Langobardas; classical Latin Langobardi, medieval Latin Longobardi). According to a tradition written down in the 7th century they arrived there from a more northerly home. The same source asserts that they got their name from their long, uncut beards; but a different explanation is possible.

Before AD 6, Roman soldiers had fought against them; in AD 17 they supported the Cherusci against the Marcomanni; and shortly after AD 47 they helped reestablish a deposed ruler of the Cherusci. About AD 166 Lombards were among the barbarians who attacked the Danube frontier. The main body of the Lombards, however, is generally thought to have pursued a settled pastoral existence in northern Germany until the beginnings of the great migrations late in the 4th century, and even after this others remained to be absorbed by the expanding Saxons. The tradition written down in the 7th century that the migration southward was associated with a change from leadership by a duke to rule by a king, in the person of Agelmund, may be authentic. The same source's account of the stages by which the Lombards moved to the middle Danube is extremely obscure. There is some archaeological evidence, however, that they established themselves successively along the upper Elbe and in the later Moravia, where in the mid-5th century they were temporarily part of the Hunnish empire of Attila.

4th-century migrations

At the end of 487 the kingdom of the Rugii, which roughly coincided with Austria north of the Danube, was destroyed, and the Lombards occupied the area. Contact with the Ostrogoths and Franks brought them into touch with late Roman culture. The earliest examples of elaborately decorated brooches, in which the styles and techniques current in these societies have in turn been adapted to Lombard taste, appear in their graves shortly after this. In the early 6th century the Lombards temporarily expanded toward the Tisa River, which may have been one reason for the war fought *c.* 508 under their king Tato against the Heruli and their king Rudolf, which ended in the almost complete destruction of the Heruli. The Lombards then, according to their 8th-century historian Paulus Diaconus, "began of their own accord to seek occasions of war." At this period also they probably received their first Christian missionaries. When, later, they entered Italy they were certainly Arians; but there is evidence that at one time they had favoured orthodoxy and subsequently changed, possibly under Gothic influence. Tato was killed *c.* 510 by his nephew Waccho, who ruled for 30 years, his kingdom extending across the Danube as far as Lake Balaton. Shortly after 536 the Byzantine emperor Justinian I made a treaty with him directed against the Gepidae who held the country east of the Danube. But for nearly a decade the Lombards gained little or no advantage from it, since Waccho's successor, from *c.* 540 to 546, was a minor. In 546 Audoin began a new royal dynasty; and at the beginning of his reign he and his subjects were allowed to establish themselves in the formerly Ostrogothic lands as far as and even beyond the Save. At that time, it seems, they began to adapt their tribal organization and institutions to the imperial military system of the period, in which a hierarchy of dukes, counts, and others commanded warrior bands formed from related families or kin groups. For two decades intermittent wars with the Gepidae alternated with truces and the attempts of both sides to gain imperial support for their own ends. About 565 Audoin died. In the same year the Avars appeared in the west; with them Audoin's son and successor Alboin made a compact to destroy the Gepidae. The decisive battle (*c.* 567), however, was fought between the Lombards and the Gepidae only. The latter were destroyed and their king killed, and Alboin married his daughter Rosamund.

Even before this the Lombards seem to have had their eyes on Italy, where the Byzantine armies had recently overthrown the Ostrogothic kingdom. In the spring of 568, having arranged with the Avars that they could return to and reclaim their lands in Pannonia if they did not like Italy, they crossed the Julian Alps.

The Lombards' invasion of northern Italy was almost unopposed, and by September 569 they had conquered all the principal cities north of the Po except Pavia. Subsequently Alboin sent armies across the Apennines; in 571 he may have threatened Rome itself, though only western Emilia and part of Tuscany were permanently conquered at this time. Simultaneously two other armies respectively occupied Spoleto with the land eastward to the Adriatic and Benevento with adjacent areas of southern Italy. Pavia fell in 572. Shortly afterward Alboin was murdered in revenge for having forced his wife to drink from her dead father's skull. The 18-month rule of his successor, Cleph, was marked by the ruthless treatment of the Italian landowners.

On his death the Lombards chose no successor. Instead the dukes, who with their followings had been or were now associated with one of the cities in the occupied area, exercised authority in their particular city-territories. Place-names and archaeological evidence indicate that the war bands that settled south of the Apennines were fewer than those that settled in the Po Valley and the northeast. But everywhere the Lombards were outnumbered by the native population, and they seem to have established themselves in groups in easily defended positions on the outskirts of the cities or in similar "castles" in the countryside. For a time they may have lived largely on tribute, though quite early many of them must have acquired lands of their own.

The 10-year "rule of the dukes" was later viewed as one of violence and disorder, in which the church suffered at least as much as the native landowners. In 584, however, threatened by a Frankish invasion that the dukes had provoked, the Lombards made Cleph's son Authari king; and when he died in 590 he was succeeded by Agilulf, duke of Turin, who married his widow Theodelinda, a Bavarian and a Catholic. A Franco-Byzantine alliance, which this marriage was partly intended to counter, had inflicted serious defeats on the Lombards by 590, but Agilulf was subsequently able to recover most of what had been lost. In the next decade Rome itself was threatened, first by the Duke of Spoleto and subsequently by Agilulf, being saved only by the efforts of Pope Gregory I. By 605 the Lombards were in complete control of the Po Valley and Emilia east of the Panaro; the Byzantines retained only the Venetian coastal strip, the Ligurian coast, the Po basin and the Adriatic coast southward, Perugia and the adjacent Apennine crossings, Rome and its neighbourhood, and Naples and small areas in the southeast and southwest. In 643 a Lombard army under King Rothari (reigned 636–652) occupied Liguria.

When Authari became king, the dukes surrendered half their estates for his maintenance and his court, and royal officials knowns as gastaldi were appointed to administer them and (eventually) to act as a check on the power of the dukes. Border duchies such as Friuli and Trento were always difficult to control, and except for relatively brief periods the dukes of Spoleto and Benevento were able to act independently of the king; but the internal weaknesses of the Lombard kingdom must not be exaggerated. By the 620s Pavia was emerging as something like a capital. The royal palace (built by Theodoric the Ostrogoth) was the centre of an administrative organization whose officials and techniques, like the documents they wrote, owed much to Roman traditions as transmitted by the Byzantines. Rothari's "Edict" of 643, in which the laws of his people were recorded for the first time, illustrates many aspects of this "Romanization"; but it also shows how tenaciously the Lombards maintained many of their Germanic customs—though some, such as vendetta, had been modified by Christian and royal influence.
