How to use the MICROPAEDIA

The 12 volumes of the MICROPAEDIA contain tens of thousands of shorter articles on specific persons, places, things, and ideas, arranged in alphabetical order. The MICROPAEDIA can be used as an information resource on its own; and it can function as support for the longer articles in the MACROPAEDIA (to which it refers whenever appropriate). The MICROPAEDIA in turn is supported by references in the INDEX and by the lists of suggested readings in the PROPAEDIA. Finally, the MICROPAEDIA is the portion of the *Encyclopædia Britannica* best suited for the reader who wishes to browse among the countless subjects in all fields of human learning and history in all times and places.

Alphabetization

Entry titles are alphabetized according to the English alphabet, A to Z. All diacritical marks (such as in ö, ł, or ñ) and foreign letters without parallels in English (such as ayin [ʿ] and hamza [ʾ]) are ignored in the alphabetization. Apostrophes likewise are ignored. Titles beginning with numbers, such as **1812, War of**, are alphabetized as if the numbers were written out (**Eighteen-twelve, War of**).

Alphabetization proceeds according to the "word-by-word" principle. Thus, **Mount Vernon** precedes **mountain**; any **John** entry precedes **John Henry**, which in turn precedes **Johne's disease**. Any character or string of characters preceding a space, hyphen, or dash is treated as a word and alphabetized accordingly. Thus, **De Broglie** precedes **debenture**, and **jack-o'-lantern** precedes **jackal**. Titles with identical spellings are arranged in the following order: (1) persons, (2) places, (3) things.

For many rulers and titled nobility, chronological order, as well as alphabetical order, governs placement. Rulers of the same given name (*e.g.,* William) may be grouped together, separate from other entries, and indicated by the symbol •. They may be subgrouped alphabetically by country and, within each country, arranged chronologically (**William I**, **William II**, etc.). Nobility or peers of the same titled name (*e.g.,* **Essex, EARLS OF**) are similarly grouped together, separate from other entries; they are indicated by the symbol • and arranged chronologically.

Places with identical names are arranged in the alphabetical order of the countries where they are located. Identical place-names in the same country are alphabetized according to the alphabetical order of the state, province, or other political subdivision where they are found.

Entry arrangement

The titles of entries are arranged according to the forms commonly found in indexes and dictionaries, with some special conventions.

Entry titles for certain physical features, institutions, structures, events, and concepts are ordinarily inverted to place the substantive word first. Thus, the Bay of Bengal is entered as **Bengal, Bay of**; the Bank of England as **England, Bank of**; the Tower of London as **London, Tower of**; the Siege of Vienna as **Vienna, Siege of**; and the balance of power as **power, balance of.** If the name of a physical feature, institution, structure, event, or concept has two or more descriptors, it is entered under the descriptor appearing first. Thus, the Episcopal Church in Scotland is entered as **Episcopal Church in Scotland** (not **Scotland, Episcopal Church in**); the Leaning Tower of Pisa as **Leaning Tower of Pisa**; and the kinetic theory of gases as **kinetic theory of gases**.

The entries for most Western persons are arranged so that one can read a name in correct order by beginning after the first comma, proceeding to the end of the boldface type, returning to the beginning word or words, and proceeding forward to the first comma. Thus, the entry **March, Patrick Dunbar, 2nd Earl of**, is read "Patrick Dunbar, 2nd Earl of March"; the entry **Orléans, Louis, duc d'**, is read "Louis, duc d'Orléans." Names of Far Eastern origin are given in Oriental order, with the surname preceding the personal name (*e.g.,* **Tōjō Hideki**, **Deng Xiaoping**, **Nguyen Cao Ky**).

Cross-references

Some cross-reference entries appear in the MICROPAEDIA for the purpose of leading a reader from names that are familiar to alternate names that may not be. Cross-references also appear frequently within or at the ends of standard entries, where they are identified by *see, see also, see under, q.v.* (*quod vide,* "which see"), or *qq.v.* (*quae vide,* "which see," plural).

Certain entries serve both as relatively brief essays on general subjects and as cross-references to the same subjects treated at greater length and in greater depth in the MACROPAEDIA. Such an entry (*e.g.,* **igneous rock**) begins with a definition of the subject and then provides the following cross-reference: "A brief treatment of igneous rocks follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

Entries on certain broad subjects (*e.g.,* **music**) direct the reader to several relevant articles in the MACROPAEDIA and also to the PROPAEDIA for listings of related articles in the MICROPAEDIA.

Abbreviations

Abbreviations used in the MICROPAEDIA are given in a list that appears at the end of every MICROPAEDIA volume.

Territorial boundaries

In articles and maps indicating disputed geopolitical boundaries and territories, the attribution of sovereignty or administrative subordination to any specific area does not imply recognition of the status claimed by an administering power.

otter, any of several species of semi-aquatic mammals in four genera of the weasel family (Mustelidae). They have the same general proportions as a weasel—the lithe, slender body, long neck, small ears, and short legs. The head is flattened, and the base of the tail is almost as thick as the body. Few other animals produce a fur so highly valued by man and so durable; the darker furs of northern animals are the most prized.

Otters swim easily with webbed feet, and can travel underwater for 0.4 kilometre (¼ mile) without surfacing for air. They prefer to travel by water but, their short legs notwithstanding, can travel on land faster than a man can run. Their food consists of all manner of small aquatic animals, including fish, which they catch sometimes by teamwork; they also prey on other small mammals. A litter of one to five young is born after a gestation of 61–63 days.

Unlike almost all other wild animals, otters are playful as adults. A favourite sport is sliding down a steep bank of mud or snow and plunging into water or a snowdrift. Otters are intelligent, friendly, and inquisitive. When obtained young, they can be trained readily.

Among the best-known otter species are the following:

African small-clawed otter (*Aonyx philippsi*) of western and central Africa, found principally in rain forests and mountain streams; also called Liberian otter; considered as three species (*Paraonyx philippsi, P. congica*, and *P. microdon*) by some authors; length about 95 centimetres (38 inches), including the 35-cm tail; weight about 7 kilograms (15 pounds); shining, dark-brown fur, pale markings on throat and face; claws, blunt and short on the partly webbed forefeet and entirely webbed hindfeet.

Central American otter (*Lutra annectens*) of Central and South America; also called southern river otter; coat, yellowish to reddish brown with grayish brown underparts.

Clawless otter (*Aonyx capensis*) of central and southern Africa, generally found near slow-moving water; also called African (or cape) clawless and giant African otter; length, 95–100 cm exclusive of the flattened, 55-cm tail; weight, 14–27 kg; fur, brown with pale chin and throat patches; claws lacking except for rudimentary claws on third and fourth hindtoes.

Common otter: see Eurasian otter and river otter, below.

Eurasian otter (*Lutra lutra*) of Eurasian and North African rivers; also called common and Old World otter; length, 56–83 cm, exclusive of the 36–55-cm tail; shoulder height, about 30 cm; weight, 6–15 kg; fur, brown, paler below, white on cheeks and throat.

Giant (Brazilian giant) otter (*Pteronura brasiliensis*), very rare species confined to slow-flowing rivers and streams of South America; species endangered as a result of hunting; also called saro and margin-tailed, or flat-tailed, otter for its flattened, ridged tail; feet, completely webbed; fur, brown with a large whitish chest patch; probably the largest otter, attaining a length of 1–1.5 m, excluding the 0.7-m tail.

Hairy-nosed otter (*Lutra sumatrana*) of southern Asia, named for its finely haired nose pad; length about 130 cm, including the 50-cm tail; coat, reddish brown with whitish throat, chin, and cheeks.

Oriental small-clawed otter (*Aonyx cinerea* separated as *Amblonyx cinerea* by some authors), of Southeast Asia; also called Asian clawless and Indian small-clawed otter; sometimes tamed and used to catch fish; weight 2.7–5.4 kg; length 56–61 cm, excluding the 31-cm tail; fur, dark brown, paler below, with whitish throat and face markings.

River otter (*Lutra canadensis*) of North American lakes and streams; also called land, common, North American, and Virginia otter; head and body length, 65–75 cm; tail length, 30–50 cm; weight, 5–12 kg; fur, glossy, dark brown, usually paler ventrally, with contrasting whitish throat and muzzle markings.

Sea (great sea) otter (*Enhydra lutris*), rare, completely marine species of the North Pacific, usually in kelp beds; floats on its back with a stone on its chest, opening mollusks by smashing them on the stone; hindfeet large, broad, flipperlike; forefeet reduced; coat (the most expensive otter fur) thick, lustrous, reddish to dark brown, often grizzled; head and body, 76–120 cm; tail length, 25–37 cm; weight, 16–41 kg; hunted almost to extinction by 1910, now fully protected and gradually increasing in numbers.

Smooth-coated otter (*Lutra perspicillata*) of Southeast Asia, separated as *Lutrogale perspicillata* by some authors; also called smooth, or smooth Indian, otter and simung; coat, sleek reddish to blackish brown, often lighter ventrally and marked by whitish face and throat patches; length 66–74 cm exclusive of the flattened, 43–46-cm tail.

otter shrew, any of the three species of west equatorial African mammals composing the subfamily Potamogalinae of the tenrec (*q.v.*) family (Tenrecidae). Some authors separate them as the family Potamogalidae (of the order Insectivora). They are carnivorous and semi-aquatic, in streams and estuaries. All are long bodied, with laterally flattened tails, used for propulsion underwater, and dense brown and white fur. The largest species is *Potamogale velox,* often called giant water shrew; it may be 64 centimetres (25 inches) long, including its 29-cm tail. It has skin flaps on the inner sides of the hindfeet. The two species of the genus *Micropotamogale* (including *Mesopotamogale*) are smaller.

otterhound, dog breed first described in the 14th century. Developed to hunt otters, it resembles a rough-coated bloodhound and has a large head, pendulous ears, and a dense, shaggy, water-resistant coat. Its webbed feet make it an excellent swimmer. It stands 24 to 26 inches (61 to 66 centimetres), weighs 55 to 65 pounds (25 to 30 kilograms), and is usually blue-gray or yellowish brown with black-and-tan markings.

Öttingen–Schrattenhofen faience, German tin-glazed earthenware made in Bavaria in the 18th and 19th centuries. The factory was first established at Öttingen in 1735 and two years later was moved to Schrattenhofen. The ware is characteristic of much produced in Bavaria—*e.g.,* cylindrical beer tankards—and the decoration is likewise Bavarian in the Rococo style. The factory also produced less ornate ware and, in later years, like many German faience centres, a cream-coloured earthenware inspired by that of Wedgwood.

BAVARIA

•Otto II, also called OTTO OF NORDHEIM, German OTTO VON NORDHEIM (d. Jan. 11, 1083), duke of Bavaria and also a leading noble in Saxony, the most implacable opponent of the German king Henry IV.

In 1061, Agnes of Poitou, regent for her young son Henry IV, invested Otto with the duchy of Bavaria. The following year, however, he helped Archbishop Anno of Cologne to kidnap Henry IV, an act that deprived Agnes of the regency. From then until the end of Henry's minority, Otto was prominent in the government of the German state. Along with other Saxon nobles, he did not hesitate to take advantage of Henry's minority to usurp part of the King's demesne. In 1070 Otto was accused of complicity in a plot to murder the King and was deprived of his Bavarian and Saxon possessions. Taken prisoner in 1071, he was restored to his lands in Saxony in 1072.

Shortly after the Saxon uprising against Henry IV broke out in 1073, Otto assumed its leadership. The short-lived Peace of Gerstungen (1074) stipulated Otto's restoration to Bavaria. But when Henry resumed war in June 1075, Otto was taken prisoner again. Around Christmas of that year, however, Henry not only pardoned Otto but also gave him a high administrative post in Saxony.

Nevertheless, after the excommunication and deposition of Henry by Pope Gregory VII over the investiture of bishops (1076), Otto rejoined the Saxon rebels. As soon as his restoration to Bavaria was assured, he assented to the election of Rudolf of Rheinfelden as German king in opposition to Henry (1077). A skillful fighter, Otto inflicted losses on Henry's forces in 1078 and in January 1080 and won the battle on the Elster River in October of that year; but Rudolf received a mortal wound in the battle. The forces opposing Henry then elected Hermann of Salm as anti-king, but Hermann's chief military support collapsed with Otto's death less than three years later.

•Otto (b. April 27, 1848, Munich—d. Oct. 11, 1916, Schloss Fürstenreid, near Munich), insane king of Bavaria, younger son of King Maximilian II.

Otto fell insane in 1872 and, from 1880 onward, had to be kept under strict surveillance. When his elder brother, King Louis II, likewise insane, died in 1886, he became king under the regency first of his uncle Luitpold, the heir apparent, and then (1912) of Luitpold's son Louis, who made himself king, as Louis III, on Nov. 5, 1913, even though his cousin Otto was still alive.

GERMANY/HOLY ROMAN EMPIRE

•Otto I, byname OTTO THE GREAT, German OTTO DER GROSSE (b. Nov. 23, 912—d.

May 7, 973, Memleben, Thuringia), duke of Saxony (as Otto II, 936–961), German king (from 936), and Holy Roman emperor (962–973), who consolidated the German *Reich* by his suppression of rebellious vassals and his decisive victory over the Hungarians. His use of the church as a stabilizing influence created a secure empire and stimulated a cultural renaissance.

Early years. Otto was the son of the future king Henry I, of the Liudolfing, or Saxon, dynasty, and his second wife, Matilda. Little is known of his early years, but he probably shared in some of his father's campaigns. He married Edith, daughter of the English king Edward the Elder, in 930; she obtained as her dowry the flourishing town of Magdeburg. Nominated by Henry as his successor, Otto was elected king by the German dukes at Aachen on Aug. 7, 936, a month after Henry's death, and crowned by the archbishops of Mainz and Cologne.

While Henry I had controlled his vassal dukes only with difficulty, the new king firmly asserted his suzerainty over them. This led immediately to war, especially with Eberhard of Franconia and his namesake, Eberhard of Bavaria, who were joined by discontented Saxon nobles under the leadership of Otto's half-brother Thankmar. Thankmar was

defeated and killed, the Franconian Eberhard submitted to the King, and Eberhard of Bavaria was deposed and outlawed. In 939, however, Otto's younger brother Henry revolted; he was joined by Eberhard of Franconia and by Giselbert of Lotharingia and supported by the French king Louis IV. Otto was again victorious: Eberhard fell in battle, Giselbert was drowned in flight, and Henry submitted to his brother. Nevertheless, in 941 Henry joined a conspiracy to murder the King. This was discovered in time, and, whereas the other conspirators were punished, Henry was again forgiven. Thenceforward he remained faithful to his brother and, in 947, was given the dukedom of Bavaria. The other German dukedoms were likewise bestowed on relatives of Otto.

Foreign conquests. Despite these internal difficulties, Otto found time to strengthen and to extend the frontiers of the kingdom. In the east the margraves Gero and Hermann Billung were successful against the Slavs, and their gains were consolidated by the founding of the Monastery of St. Maurice in Magdeburg, in 937, and of two bishoprics, in 948. In the north, three bishoprics (followed in 968 by a fourth) were founded to extend the Christian mission in Denmark. Otto's first campaign in Bohemia was, however, a failure, and it was not until 950 that the Bohemian prince Boleslav I was forced to submit and to pay tribute.

Having thus strengthened his own position, Otto could not only resist France's claims to Lorraine (Lotharingia) but also act as mediator in France's internal troubles. Similarly, he extended his influence into Burgundy. Moreover, when the Burgundian princess Adelaide, the widowed queen of Italy whom the margrave Berengar of Ivrea had taken prisoner, appealed to him for help, Otto marched into Italy in 951, assumed the title of king of the Lombards, and married Adelaide himself, his first wife having died in 946. In 952 Berengar did homage to him as his vassal for the kingdom of Italy.

Otto had to break off his first Italian campaign because of a revolt in Germany, where Liudolf, his son by Edith, had risen against him with the aid of several magnates. Otto found himself compelled to withdraw to Saxony; but the position of the rebels began to deteriorate when the Magyars invaded Germany in 954, for the rebels could now be accused of complicity with the enemies of the *Reich.* After prolonged fighting, Liudolf had to submit in 955. This made it possible for Otto to defeat the Magyars decisively in the Battle of the Lechfeld, near Augsburg, in August 955; they never invaded Germany again. In the same year Otto and the margrave Gero also won a victory over the Slavs. A further series of campaigns led, by 960, to the subjection of the Slavs between the middle Elbe and the middle Oder. The archbishopric of Magdeburg was founded in 968 with three suffragan bishoprics. Even Mieszko of Poland paid tribute to the German king.

Coronation as emperor. In May 961 Otto procured the election and coronation of the six-year-old Otto II, his elder son by Adelaide, as German king. Then he went for a second time to Italy on the appeal of Pope John XII, who was hard pressed by Berengar of Ivrea. Arriving in Rome on Feb. 2, 962, Otto was crowned emperor, and 11 days later a treaty, known as the *Privilegium Ottonianum,* was concluded, to regulate relations between emperor and pope. This confirmed and extended the temporal power of the papacy, but it is a matter of controversy whether the proviso enabling the emperor to ratify papal elections was included in the original version of the treaty or added in December 963, when Otto deposed John XII for treating with Berengar and set up Leo VIII as pope. Berengar was captured and taken to Germany, and in 964 a revolt of the Romans against Leo VIII was suppressed.

When Leo VIII died in 965, the Emperor chose John XIII for pope, but John was expelled by the Romans. Otto, therefore, marched for a third time to Italy, where he stayed from 966 to 972. He subdued Rome and even advanced into the Byzantine south of Italy. Prolonged negotiations with Byzantium resulted in the marriage of Otto II to the Byzantine princess Theophano, in 972. Having returned to Germany, the Emperor held a great assembly of his court at Quedlinburg on March 23, 973. He died in Memleben several weeks later and was buried in Magdeburg at the side of his first wife.

Assessment. Otto I's achievement rests mainly on his consolidation of the *Reich.* He deliberately made use of the bishops to strengthen his rule and thus created that "Ottonian church system of the *Reich*" that was to provide a stable and long-lasting framework for Germany. By his victorious campaigns, he gave Germany peace and security from foreign attack, and the preeminent position that he won as ruler gave him a sort of hegemony in Europe. His Italian policy and the acquisition of the imperial crown constituted a link with the old Carolingian tradition and was to prove a great responsibility for the German people in the future. All areas under Otto's rule prospered, and the resultant flowering of culture has been called the Ottonian renaissance.

•**Otto II** (b. 955—d. Dec. 7, 983, Rome), German king from 961 and Holy Roman emperor from 967, sole ruler from 973, son of Otto I and his second wife, Adelaide.

Otto continued his father's policies of promoting a strong monarchy in Germany and of extending the influence of his house in Italy. In 961 he was crowned co-regent king of Italy and Germany with his father and was made co-regent emperor in 967. On April 14, 972, he married the Byzantine princess Theophano. At his father's death in 973 he was accepted without opposition as successor, although revolts in the duchy of Bavaria and in Lorraine occupied the early years of his reign. Bavaria, the most independent of the duchies, rebelled in 974, under the leadership of its duke, Henry II the Quarrelsome, Otto's cousin. It was not until 978 that Bavaria was pacified, the same year that Lothair, king of France, invaded Lorraine. In 979 Otto received the submission of Bohemia and Poland, and in 980 Lothair renounced his claim to Lorraine. Having thus secured his German dominions, Otto marched into Italy in 980, where German rule had been maintained by an imperial party headed by Hugh, marquis of Tuscany. Otto invaded southern Italy and was decisively defeated there by the Arabs in 982. In 983 he summoned a diet at Verona, where his young son, Otto III, was crowned German king. Otto II died in 983 while attempting to bring Venice under imperial control. His absence from Germany had occasioned revolts along its borders, and after his defeat in Calabria in

982 the German position east of the Elbe collapsed because of a revolt by the Danes and an invasion by the Slavs. Nonetheless, Otto left a firmly established realm to his son and successor Otto III.

• **Otto III** (b. July 980—d. Jan. 23, 1002, near Viterbo, Italy), German king and Holy Roman emperor who planned to recreate the glory and power of the ancient Roman Empire in a universal Christian state governed from Rome, in which the pope would be subordinate to the emperor in religious as well as in secular affairs.

Son of the Holy Roman emperor Otto II and Empress Theophano, Otto III was elected German king in June 983 and crowned at Aachen in December, shortly after his father's death. But the child king was seized by Henry II the Quarrelsome, the deposed duke of Bavaria, in an attempt to secure the regency, if not the throne, for himself. In May 984, however, Henry was forced by the imperial diet to turn the child over to his mother, who served as regent until her death in 991; Otto's grandmother, the dowager empress Adelaide, assumed the regency until the King came of age in 994.

In 996, heeding an appeal by Pope John XV for help in putting down a rebellion led by the Roman noble Crescentius II, Otto crossed the Alps. Declared king of Lombardy at Pavia, he reached Rome after the Pope's death, whereupon he secured the election of his 23-year-old cousin, Bruno of Carinthia, as Gregory V, the first German pope. Gregory, who crowned Otto emperor on May 21, 996, was driven from Rome after the Emperor's return to Germany by Crescentius, who then installed John XVI as pope. The Emperor marched back into

Italy in late 997; taking Rome in February 998, he executed Crescentius, deposed John, and reinstated Gregory.

Otto then proceeded to make Rome his official residence and the administrative centre of the empire. Instituting elaborate Byzantine court ceremonies and reviving ancient Roman customs, he assumed the titles "the servant of Jesus Christ," "the servant of the apostles," and "emperor of the world" and saw himself as the leader of world Christianity. When Gregory V died (999), Otto had the Frenchman Gerbert of Aurillac, his former tutor who agreed with his concept of a theocratic emperor, installed as Pope Sylvester II.

In 1000 Otto made a pilgrimage to the tomb of the mystical archbishop Adelbert of Prague at Gniezno, which he established as the archbishopric of Poland. When in January 1001 Tibur, Italy, rebelled against Otto, he laid siege to the town, forced its surrender, and then pardoned its inhabitants. Angered by this action, the Romans, who wanted the rival town destroyed, rebelled against the Emperor (February 1001) and besieged his palace. After placating the rebels momentarily, Otto withdrew to the monastery of St. Apollinaris, near Ravenna, to do penance. Unable to regain control of the imperial city, he requested military support from his cousin Henry of Bavaria, who was to succeed him as German king and later as emperor. Shortly before the Bavarian troops arrived at his headquarters, Otto died.

• **Otto IV,** also called OTTO OF BRUNSWICK, German OTTO VON BRAUNSCHWEIG (b. *c.* 1175/*c.* 1182—d. May 19, 1218, Harzburg Castle, Lower Saxony), German king and Holy Roman emperor, candidate of the German anti-Hohenstaufen faction, who, after rivalling against two Hohenstaufen kings, was finally deposed.

A member of the Welf dynasty, Otto was a son of Henry the Lion of Brunswick and Matilda, daughter of Henry II of England. Brought up at the court of his uncle Richard I of England, Otto was made earl of York in 1190 and count of Poitou and duke of Aquitaine in 1196. Under both kings Richard and John, English diplomatic and financial help were to be of great assistance to Otto in his struggles with the Hohenstaufens.

When the Hohenstaufen emperor Henry VI died in September 1197, his heir, Frederick II, was an infant. Therefore the German princes favouring the Hohenstaufens elected Frederick's uncle, Philip of Swabia, as German king in March 1198. The opposing party, led by Archbishop Adolf of Cologne, however, elected Otto in June 1198.

War ensued between the two factions. In 1201 Otto obtained the support of Pope Innocent III after agreeing to the papacy's territorial claims in central Italy. In 1204, however, some of Otto's chief supporters in Germany, including Archbishop Adolf, went over to Philip's side. When, in early 1208, Otto held only the Welf allodial lands (hereditary possessions independent of any feudal investiture) in Brunswick, even Pope Innocent recognized Philip as king.

When in June 1208 Philip was murdered by a German count to whom he had refused to give one of his daughters in marriage, many of Philip's former supporters made overtures to Otto, who agreed to a new election. Chosen king at Frankfurt in November 1208, he strengthened his position by his betrothal to Philip's 10-year-old daughter Beatrix the Elder. The Pope recognized Otto again after the King reaffirmed the papacy's claims in central Italy.

When in August 1209 Innocent received him at Viterbo, Italy, Otto refused to concede to the church all the lands that the papacy had been claiming from the empire. He agreed, however, not to claim suzerainty over Sicily, of which the young Frederick of Hohenstaufen had in 1198 been crowned king as a vassal of the papacy, because the pope's policy aimed at preventing a reunion of the German and Sicilian crowns. Otto was crowned emperor in Rome on Oct. 4, 1209.

Soon, however, it became evident that Otto did not intend to keep his word. After occupying Tuscany, he invaded the mainland part of Frederick's kingdom of Sicily. Disregarding his excommunication by Innocent, Otto in November 1210 conquered southern Italy. By the time Apulia had fallen, an assembly of princes at Nürnberg declared him deposed and invited Frederick to take his place.

When Otto returned to Germany in March 1212, in order to retain the support of at least part of the Hohenstaufen faction, he married Philip's daughter Beatrix, but lost that support when she died within three weeks of their marriage. Frederick, who arrived in Germany in September 1212, soon prevailed in the southern duchies, but Otto and his supporters held out against him in the lower Rhine district and northeastern Germany. In alliance with his uncle, King John of England, Otto then invaded France, which supported Frederick. Disastrously defeated at the Battle of Bouvines (July 27, 1214), Otto was deserted by nearly all his supporters. He was formally deposed as king in 1215. By the time of his death, three years later, his power was confined again to his Brunswick dominions.

GREECE

• **Otto,** (b. June 1, 1815, Salzburg, Austria—d. July 26, 1867, Bamberg, Bavaria), first king of modern Greece (1832–62), who governed his country autocratically until he was forced to become a constitutional monarch in 1843. Attempting to increase Greek territory at the expense of Turkey, he failed and was overthrown.

The second son of King Louis I of Bavaria, Otto was chosen king of Greece by the great powers at the conference of London in May 1832. The Greek National Assembly confirmed his selection in August 1832, and he arrived in Greece on Feb. 6, 1833, accompanied by several Bavarian advisers. He instituted a new legal code and organized a regular army, but the Bavarians' absolutist rule and heavy taxation led to discontent, which was appeased by the resignation of Otto's chancellor, Joseph Ludwig von Armansperg, in 1837. After failing to annex Crete in 1841, an attempt that alienated Great Britain, the Greeks staged a revolt in 1843. Otto, a Roman Catholic in an Eastern Orthodox country, was forced to grant a constitution specifying that his eventual successor be Orthodox. A Greek oligarchy now replaced the former Bavarian one. The King toyed with the "Great Idea," the reestablishment of the former Byzantine Empire with its capital at Constantinople; but his intervention

against Turkey in the Crimean War (1853–56) merely provoked a Franco-British occupation of the Piraeus, and he failed to gain any additional territory for Greece. Otto's backing of Austria in the Italian War of Independence (1859) further damaged his prestige. He was finally deposed in a revolt on Oct. 23, 1862, and returned to Bavaria.

Otto OF FREISING (b. *c.* 1111—d. Sept. 22, 1158, Morimond, Champagne), German bishop and author of one of the most important historico-philosophical works of the Middle Ages.

Otto entered (1132 or 1133) the Cistercian monastery at Morimond in eastern Champagne and became its abbot in 1138 but was immediately called as bishop to Freising in Bavaria. As half-brother of the Hohenstaufen German king Conrad III and as uncle of Frederick I Barbarossa, Otto influenced the policy of the Empire and was present at the imperial diet of Besançon in the County of Burgundy (1157).

Otto's *Chronica sive historia de duabus civitatibus* is a history of the world from the beginning to 1146. Following St. Augustine, it interprets all secular history as a conflict between the *civitas Dei* ("the realm of God") and the world; and it views its contemporary period as that in which Antichrist (the principal personage of power opposed to Christ) is to appear. His second work, the *Gesta Friderici,* deals with the house of Hohenstaufen and with the deeds of Frederick Barbarossa up to 1156.

Otto, Nikolaus August (b. June 10, 1832, Holzhausen, Nassau—d. Jan. 26, 1891, Cologne), German engineer who developed the four-stroke internal-combustion engine, which offered the first practical alternative to the steam engine as a power source.

Otto built his first gasoline-powered engine in 1861. Three years later he formed a partnership with the German industrialist Eugen Langen, and together they developed an improved engine that won a gold medal at the Paris Exposition of 1867.

In 1876 Otto built an internal-combustion engine utilizing the four-stroke cycle (four strokes of the piston for each explosion). The four-stroke cycle was patented in 1862 by the French engineer Alphonse Beau de Rochas, but since Otto was the first to build an engine based upon this principle, it is commonly known as the Otto cycle. Because of its reliability, its efficiency, and its relative quietness,

Otto's engine was an immediate success. More than 30,000 of them were built during the next 10 years, but in 1886 Otto's patent was revoked when Beau de Rochas' earlier patent was brought to light.

Otto, Rudolf (b. Sept. 25, 1869, Peine, Prussia—d. March 6, 1937, Marburg, Ger.), German theologian, philosopher, and historian of religion, who exerted worldwide influence through his investigation of man's experience of the holy. *Das Heilige* (1917; *The Idea of the Holy,* 1923) is his most important work.

Early life and academic career. Otto was the son of William Otto, a manufacturer. Little is known of Otto's early life, except that he was educated at the gymnasium in Hildesheim before becoming a student of theology and philosophy at the University of Erlangen and, later, at the University of Göttingen, where he was made a *Privatdozent* ("lecturer") in 1897, teaching theology, history of religions, and history of philosophy. In 1904 he was appointed professor of systematic theology at Göttingen, a post he held until 1914, when he became professor of theology at the University of Breslau. In 1917 he became professor of systematic theology at the University of Marburg and for one year (1926–27) served as rector of the university. He retired from his university post in 1929, though he continued to live in Marburg the rest of his life.

affairs. He was a member of the Prussian Parliament from 1913 to 1918 and a member of the Constituent Chamber in 1918, where he asserted a liberal and progressive influence. And he was later to concern himself with the political questions of the Weimar Republic. Otto also participated widely in Christian ecumenical activities, both as they related to divisions within the Christian community and as they concerned relations between Christianity and other religions of the world.

Scholarly pursuits. What initially prompted Otto's inquiry into man's experience of the holy was a specifically Christian, even Protestant, concern that had awakened in him while studying the life and thought of Martin Luther. This concern—to elucidate the distinctive character of the religious interpretation of the world—is reflected in his first book, *Die Anschauung vom heiligen Geiste bei Luther* (1898; "The Perception of the Holy Spirit by Luther"). He was to expand his inquiry in his book, *Naturalistische und religiöse Weltansicht* (1904; *Naturalism and Religion,* 1907), in which he contrasted the naturalistic and the religious ways of interpreting the world, first indicating their antitheses and then raising the question of whether the contradictions can be or should be reconciled.

Otto resisted an easy reconciliation between the world view offered by the sciences and the religious interpretation but opposed equally the religionist's hostility toward science and the scientist's disregard of religion. The two perspectives, he insisted, are to be embraced and heeded for what they purport to disclose concerning the world in which men live. It was clear, however, that Otto's principal concern was to justify and to clarify what it is that the religious interpretation of the world, even within its rational aspect, conveys to man as a distinctive dimension of understanding beyond the discoveries of the sciences and the generalized knowledge following from them. Five years later came his work, *Kantische-Fries'sche Religionsphilosophie* (1909; *The Philosophy of Religion Based on Kant and Fries,* 1931), a discussion of the religious thought of the German philosophers Immanuel Kant and Jacob Friedrich Fries, in which he sought to specify the kind of rationality that is appropriate to religious inquiry.

During 1911–12 Otto undertook an extended journey, visiting many countries of the world, beginning with North Africa, Egypt, and Palestine, continuing to India, China, and Japan, and returning by way of the United States. These experiences were to set his problem in a worldwide context, turning him to an extended and searching exploration of the diverse ways in which the religious response had manifested itself among various religions of the world. He proved to be remarkably well equipped for such an exploration, both in his mastery of languages and his knowledge of the history of world religions. In addition to being at home with the languages of Near Eastern religions, he had mastered Sanskrit sufficiently to translate many ancient Hindu texts into German as well as to write several volumes comparing Indian and Christian religious thought.

Influence of Schleiermacher. Otto's initial mentor guiding his inquiry into the specific character of the religious response was the eminent German philosopher and theologian Friedrich Schleiermacher. It was Schleiermacher's early work, specifically his book *Über die Religion. Reden an die Gebilden unter ihren Verächtern* (1799; *On Religion: Speeches to Its Cultured Despisers,* 1893), to which Otto gave particular attention. What appealed to him in this work was Schleiermacher's fresh way of perceiving religion as a unique feeling or awareness, distinct from ethical and rational modes of perception, though not exclusive of them. Schleiermacher was later to speak of this unique feeling as man's "feeling of absolute dependence." Otto was deeply impressed by this formulation and credited Schleiermacher with having rediscovered the sense of the holy in the post-Enlightenment age. Yet he later criticized the formulation on the grounds that what Schleiermacher had pointed up here was no more than a close analogy with ordinary, or "natural," feelings of dependence. For "absolute dependence" Otto substituted "creature-feeling." Creature-feeling, he said,

> is itself a first subjective concomitant and effect of another feeling element, which casts it like a shadow, but which in itself indubitably has immediate and primary reference to an object outside of the self.

Otto called this object "the numinous" or "Wholly Other"—*i.e.,* that which utterly transcends the mundane sphere, roughly equivalent to "supernatural" and "transcendent" in traditional usage.

The Idea of the Holy. Various influences had played upon Otto's reflections through the years, aiding him in reformulating the religious category that was to carry him beyond Schleiermacher. His early teacher at Göttingen, Albrecht Ritschl, had located religion in the realm of value judgments, whereas, more significantly, his theological colleague at Göttingen, Ernst Troeltsch, sought for a religious a priori as the ground of religious interpretation and judgment. Otto was impressed by William James's shrewd insights in *The Varieties of Religious Experience* (1902), yet he found James's empirical method inadequate for interpreting such phenomena. Otto was particularly attracted to the thought of J.F. Fries, already mentioned, whose notion of *Ahndung* (obsolete form of *Ahnung;* literally, "presentiment," or "intuition"), a yearning that yields the feeling of truth, opened up to him a way of dealing with religious phenomena sensitively and appropriately. These "feelings of truth" Otto sought to schematize in his *Idea of the Holy.*

In that work, however, Otto was conscious of moving beyond his previous efforts, exploring more specifically the nonrational aspect of the religious dimension, for which he coined the term numinous, from the Latin *numen* ("god," "spirit," or "divine"), on the analogy of "ominous" from "omen." The numinous, the awe-inspiring element of religious experience, Otto contended,

> evades precise formulation in words. Like the beauty of a musical composition, it is non-rational and eludes complete conceptual analysis; hence it must be discussed in symbolic terms.

Thus, *The Idea of the Holy,* while benefitting from earlier studies, represented for Otto a new venture and a radical shift in the nature and ground of his inquiry. The concern here was to attend to that elemental experience of apprehending the numinous itself. In such moments of apprehension, said Otto,

> we are dealing with something for which there is only one appropriate expression, *mysterium tremendum*. . . . The feeling of it may at times come sweeping like a gentle tide pervading the mind with a tranquil mood of deepest worship. It may pass over into a more set and lasting attitude of the soul, continuing, as it were, thrillingly vibrant and resonant, until at last it dies away and the soul resumes its "profane," non-religious mood of everyday experience. . . . It has its crude, barbaric antecedents and early manifestations, and again it may be developed into something beautiful and pure and glorious. It may become the hushed, trembling, and speechless humility of the creature in the presence of—whom or what? In the presence of that which is a *Mystery* inexpressible and above all creatures.

Although the *mysterium,* which Otto represents as the form of the numinous experience, is beyond conception, what is meant by the term, he insists, is something intensely positive. *Mysterium* can be experienced in feelings that convey the qualitative content of the numinous experience. This content presents itself under two aspects: (1) that of "daunting awfulness and majesty," and (2) "as something uniquely attractive and *fascinating.*" From the former comes the sense of the uncanny, of divine wrath and judgment; from the latter, the reassuring and heightening experiences of grace and divine love. This dual impact of awesome mystery and fascination was Otto's characteristic way of expressing man's encounter with the holy.

Later works. Otto employed the method he had developed in *The Idea of the Holy* in three major publications that followed: *West-Östliche Mystik* (1926; *Mysticism East and West,* 1932); *Die Gnadenreligion Indiens und das Christentum* (1930; *India's Religion of Grace and Christianity,* 1930); and *Reich Gottes und Menschensohn* (1934; *The Kingdom of God and Son of Man,* 1938). Of the three books, the latter is especially important for glimpses of new insight that seem to point beyond the earlier, more widely acclaimed volume; it renders the hint of ultimacy that appears in present history.

Otto's concern with experiencing the numinous also gave rise to experimenting with new forms of liturgy designed to give urgency and vividness to such experiences in Protestant services of worship under critically controlled conditions. Here he employed a "Sacrament of Silence" as a culminating phase, a time of waiting comparable to the Quaker moment of silence, which he acknowledged to have been the stimulus to his own innovation.

Otto took all religions seriously as occasions to experience the holy and thus pressed beyond involvement in his own historic faith as a Christian to engage in frequent encounter with people of other religious traditions. He had much respect for the distinctive characteristics of the various religions and thus resisted universalizing religion in the sense of reducing all to the lowest common denominator. Yet he strongly argued for a lively exchange between representatives of the various religions. It was this concern that led him to create in Marburg the Religious Collection of religious symbols, rituals, and apparatus on a worldwide basis for purposes of inspection and study and to advocate establishing an Inter-Religious League as "a cultural exchange in which the noblest . . . of our art and science and of our whole spiritual heritage would be mutually interpreted and shared."

Personal life and characteristics. Otto never married, but he shared his home with his widowed sister and her daughter. A tall, erect man of subtle mien and movement, Otto created an imposing presence. His students at Marburg called him "Der Heilige" ("the Holy One" or "the Saint"). Someone said of him after his death, "After all, he was something of a king; yet a king who did not lack humility."

Rudolf Otto was first and foremost a scholar, absorbed in his special field of inquiry and rigorous in the pursuit of it. This fact in itself presented him on initial contact as being austere in manner and remote in his reflections. People who encountered him did not readily intrude upon the man or engage him in light conversation. To interrupt his reflections, they felt, one must have something of significance to talk about. That this was in part a facade of their own making, based upon the impressiveness of the man himself, was discovered again and again by those who came to know him well, for, despite this outward austerity, Otto was a gentle person, reticent in his response to people. Yet he could be gracious and outgoing once the barrier of formality had relaxed. Nevertheless, the style of the man was that of a serious and dedicated scholar, and no amount of congeniality or friendliness dispelled that tone of an encounter with him. (B.E.M.)

ottoman, deeply upholstered seat of any shape, with or without a back, introduced into Europe in the late 18th century from Turkey, where, piled with cushions, it was the central piece of domestic seating. One of the early versions was designed as a piece of fitted furniture to go entirely around three walls of a room, and from this evolved a smaller version, designed to fit the corner of a room.

As the 19th century progressed, ottomans became circular or octagonal, either with arms radiating from the centre, which divided the seating space into sections, or with a central, padded column, which often supported a plant or statue and against which one could lean. The growth of club life stimulated the proliferation of ottomans, many of which also came to have hinged seats underneath for holding magazines and the like. The ottoman footstool, a closely allied piece of furniture, was an upholstered footstool on four legs, which could also be used as a fireside seat.

Ottoman carpet, any floor covering handwoven under the earlier Ottoman sultans of Turkey. Extremely fine, handsome carpets—of wool on a foundation of silk, having floral patterning, often with schemes of large or small circular medallions—and comparable prayer rugs were made for the court, possibly at Bursa in the 16th century.

Coarser, all-wool examples were made in Cairo after the conquest in 1517 and probably also in Anatolia. In due course many of these carpets were exported to southern Europe, where they have been preserved. Although

Ottoman Empire, an empire created by Turkish tribes in Anatolia that lasted from the decline of the Byzantine Empire in the 14th century until the establishment of Turkey as a republic in 1922. It was named for Osman (Arabic ʿUthmān), an amīr (prince) in Bithynia who began the conquest of neighbouring regions and who founded the empire's dynasty around 1300.

A brief treatment of the Ottoman Empire follows. For full treatment, *see* MACROPAEDIA: Turkey and Ancient Anatolia.

The first period of Ottoman history, from 1300 to 1481, was one of almost continuous expansion through war, alliance, and outright purchase of territory. Under Osman and his successors Orhan (ruled 1324–60), Murad I (1360–89), and Bayezid I (1389–1402), nearly all of Anatolia was conquered. Alliances with various factions within the Byzantine Empire won the Ottomans a foothold in Europe in about 1346, and from Gallipoli they moved into Thrace, Macedonia, Bulgaria, and Serbia. At Kosovo in 1389 Murad defeated the Balkan allies to complete Ottoman domination of that territory. Bayezid further strengthened Ottoman rule and was awarded the title of sultan by the Caliph of Cairo. The rapid advance of Ottoman power attracted the notice of the Tatar leader Timur, however, who turned from his conquest of India to protect his western flank. He defeated an Ottoman army at Ankara in 1402.

Timur left as quickly as he had come, but years passed before the Ottomans could resume their conquests. Of Bayezid's four sons, Mehmed (Muḥammad) I emerged as sultan in 1413; under him and his successors Murad II (1421–51) and Mehmed II (1451–81), the empire reasserted control of Europe south of the Danube, defeating a crusader army at Varna in 1444. In 1453 Constantinople was taken, and in subsequent years Morea, Trebizond, Bosnia, Albania, the Crimea, and other areas were conquered or annexed.

Of the many unique military and administrative forms evolved by the Ottomans, the most notable included the *devşirme* system, whereby Christian youths from the Balkans were drafted and converted to Islām for a lifetime of service. The military arm supplied by the *devşirme* system was the Janissary corps, an infantry group attached to the person of the sultan. Mehmed II developed the practice of requiring all members of the government and army, Turkish or Balkan, Muslim or non-Muslim, to accept the status of personal slave of the sultan. By that means he hoped to ensure the indivisibility of power, with the entire ruling class sworn to absolute obedience.

Under Selim I (1512–20) Ottoman expansion resumed. His defeat of the Mamlūks in 1516–17 doubled the size of the empire at a stroke by adding to it Syria, Palestine, Egypt, and Algeria. The reign of his son Süleyman I (1520–66), known in Europe as "the Magnificent," was a golden age of Ottoman power and grandeur. He conquered Hungary from the Habsburgs, annexed Tripoli, extended the empire southeastward through Mesopotamia to the Persian Gulf, and made the Ottoman navy dominant in the eastern Mediterranean. After Süleyman's reign, decline set in. Even though territorial expansion continued yet a while—Murad III (1574–95) conquered the Caucasus and seized Azerbaijan from Iran—administrative and social weaknesses became insidious. The decline of the empire after Süleyman is attributed to the increasing lack of ability of the sultans who followed him, the ever-increasing power of the *devşirme* class and the tensions it created within the ruling class, the erosion of Ottoman industry, the decline of Ottoman-controlled trade routes with the development of better navigation, and sudden leaps in population and the subsequent decline of urban centres. Reforms instituted in the 17th century were too weak and narrow to arrest the decline. Meanwhile, the powerful nation-states arising in Europe during this period formed alliances to drive the Ottoman off the continent.

Decline accelerated in the 18th century, which saw the decay of rural administration into small, feudal-like states and increased unrest in the cities, disrupting food supplies and leading to widespread famine. Few of the innovations in technology that underlay Europe's prosperity made their way into the empire. Early in the 18th century some aristocrats did adopt Western styles (the Tulip Period), and later in the century Selim II tried to modernize the government; but in a reactionary revolt led by Mustafa IV in 1807, the empire returned to traditional ways.

By the accession of Mahmud II in 1808, the Ottoman situation appeared desperate. Local authorities openly opposed the central government, while the empire was at war with both England and Russia. In the next few decades Mahmud II reestablished some order with military modernization and governmental reorganization, but the boundaries of the empire continued to shrink. Mahmud's sons, Abdülmecid I and Abdülaziz, enacted a series of liberal and modernizing reforms called the Tanzimat, which were widely viewed in the West as an effort to encourage friendly relations with European powers. Among the reforms were the first comprehensive education system and the westernization of commercial, maritime, and penal codes. The centralization of power removed all checks on the power of the emperor, but in 1876 Abdülhamid II agreed to the first constitution in any Islāmic country. Two years later, by the Treaty of San Stefano and negotiations at the Congress of Berlin, the empire was forced to give up Romania, Serbia, Montenegro, Bulgaria, Cyprus, and other territories. Abdülhamid was able to hold the empire together for the rest of the century by reminding Europeans that the Turks within their own borders were kept peaceful by its preservation, but the final years of his reign were marked by revolts, notably that of the Young Turks in 1908. The Balkan wars of 1912–13 all but completed the empire's expulsion from Europe. After disastrous defeat in World War I and a revolution immediately after, the 36th and final Ottoman emperor, Mehmed VI Vahideddin, was overthrown in 1922 and modern Turkey formed.

Ottonian art, painting, sculpture, and other visual arts produced during the reigns of the German Ottonian emperors and their first successors from the Salic House (950–1050). As inheritors of the Carolingian tradition of the Holy Roman Empire the German emperors also assumed the Carolingian artistic heritage, the conscientious revival of late antique and Early Christian art forms (*see* Carolingian art). Ottonian art later developed a style of its own, however, distinct from the Carolingian tradition, particularly in painting, ivory carving, and sculpture. Ottonian illuminators were less concerned with naturalism and more with expression through sober, dramatic gesture and heightened coloration. Ivory carving continued to be produced for liturgical purposes; as can be seen in scenes from the ivory plaques of the "Magdeburg Antependium" (*c.* 970), carvings have a characteristic restraint, the narrative is conveyed through simple gestures and enlivened by an original kind of decoration such as that in the strongly patterned background. An important development in Ottonian art was that of large-scale sculpture. Stone sculpture continued to be rare, but wooden crucifixes such as the over-life-size Gero Crucifix (before 986; Cathedral of Cologne) and wooden reliquaries covered with gold leaf began a return to sculpture in the round. Bronze casting, an antique art practiced also by the Carolingians, flourished. Its most impressive manifestation was in relief-covered bronze doors commissioned by Bishop Bernward of Hildesheim (died 1022) for his cathedral.

Ottonian architecture was more conservative, expanding and elaborating Carolingian forms rather than developing a new style. The westwork, or fortress-like construction with towers and inner rooms through which one entered the nave, and outer crypt, or chapel complexes below and beyond the eastern apse (projection at the end of the church), were retained and enlarged; the Carolingian double apses (projections at each end of the nave) were elaborated with double transepts. Ottonian architecture was more regulated than Carolingian, with simple interior spaces and a more systematic layout. St. Michael's (founded *c.* 1001), Hildesheim, exemplifies this regularity, with two crypts, two apses, and two transepts, each with a crossing tower. The achievements of Ottonian artists provided background and impetus for the new monumentality distinguished as Romanesque (*q.v.*).

Ottumwa, city, seat (1844) of Wapello County, southeastern Iowa, U.S., on the Des Moines River, 83 mi (134 km) southeast of Des Moines. Settled in 1843 as Louisville, it was renamed (1845) Ottumwa, an Indian word meaning "rippling waters." Following a damaging flood (1947), the city recovered its position as a commercial and manufacturing centre with a locally financed program of self-help, "Operation Bootstrap." Meatpacking and the manufacture of farm equipment are the chief industries. Ottumwa is the home of Iowa Technical Institute (1962), Ottumwa Heights College (1925), and Indian Hills Community College (1966). Otway, Thomas (b. March 3, 1652, Trotton, near Midhurst, Sussex, Eng.—d. April 14, 1685, London), English dramatist and poet, one of the forerunners of sentimental drama through his convincing presentation of human emotions in an age of heroic but artificial tragedies. His masterpiece, *Venice Preserved,* was one of the greatest theatrical successes of his period.

Otway studied at Winchester College and at the University of Oxford but left in 1671 without taking a degree. He went to London, where he was offered a part by Aphra Behn in one of her plays. He was overcome by stage fright, and his first performance was his last. His first play, a rhyming tragedy called *Alcibiades,* was produced at the Duke's Theatre at Dorset Garden in September 1675. The part of Draxilla in this play was created by the well-known actress Elizabeth Barry, and Otway fell violently in love with her. Six unsigned love letters, said to be addressed to Barry, were published in a collection that appeared in

1697, 12 years after Otway's death. His second play, *Don Carlos,* produced in June 1676, had an immense success on the stage and is the best of his rhymed heroic plays. *Titus and Berenice,* adapted from Molière, and *The Cheats of Scapin,* adapted from Jean Racine, were published together in 1677.

In 1678 Otway obtained a commission in an English regiment serving in the Netherlands, and he was abroad when his first comedy, *Friendship in Fashion,* was staged. His next play, *Caius Marius,* a curious mixture of a story from Plutarch with an adaptation of *Romeo and Juliet,* was staged in 1679. He published his powerful, gloomy autobiographical poem, *The Poet's Complaint of His Muse,* in 1680.

Otway's most memorable dramatic work was done in the last years of his short life. In the spring of 1680 his fine blank-verse domestic tragedy *The Orphan* had great success on the stage. On March 1 in the same year his best comedy, *The Souldier's Fortune,* probably drawn from his military experience, was produced. *Venice Preserved,* also written in blank verse, was first performed at the Duke's Theatre in 1682. Until the middle of the 19th century it was probably revived more often than any poetic play except those of Shakespeare. John Dryden, who wrote the prologue, praised it highly. Otway's tragedies, particularly *Venice Preserved,* are notable for their psychological credibility and their clear and powerful presentation of human passions.

Many of the peaks are snow- and glacier-covered, including Wildspitze (12,382 feet [3,774 m]), the highest point both in the range and in the Austrian Tirol. The Ötztaler Ache, a tributary of the Inn River, divides the main part of the range to the southwest from the Stubaier Alpen section to the northeast. The Ortles range across the Adige River in Italy is sometimes considered part of the Ötztal Alps.

Ōu Mountains, Japanese ŌU-SAMMYAKU, range forming the backbone of northeastern Honshu, Japan, and extending for 310 miles (500 km) south from Aomori *ken* (prefecture) to Fukushima *ken.* Geologically, dominant Tertiary sediments are occasionally interrupted by intrusions of the basement granitic and gneissic core. These intrusions, such as Mount Waga, frequently attain much higher elevations than the surrounding formations. The margins of the mountains drop down by fault scarps to the Kitakami River valley in the east and to a row of longitudinal basins in the west.

The elevation of the range is greatly modified by the overlapping of the Nasu Volcanic Zone. From north to south the overtowering volcanic groups, each bearing the name of its major peak, are Hakkōda, Iwate, Sugawa, Funagata, Zaō, Azuma, and Bandai. The eruption of Mount Bandai in 1888 resulted in debris accumulation on its northern flank and the consequent formation of numerous lakes, thereby greatly altering the drainage pattern of the entire area.

A salient feature of the Ōu Mountains is the row of depressions along its axis. Significant among them are, from north to south, the Hanawa and Shizukuishi basins, the Waga River valley, and the Onikōbe and Inawashiro basins.

Ou River, Laotian NAM OU, river in northern Laos, one of the 12 principal tributaries of the Mekong River; it is 236 miles (380 km) long. The Ou River rises on the Chinese frontier north of Muang Ou Nua and flows south and southwest through the gorges and mountain valleys of the northernmost part of Laos before joining the Mekong at Ban Pak Ou, 15 miles (24 km) above Louangphrabang town. The Ou is navigable as far north as Hatsa, just northeast of Phôngsali town. The lower Ou River valley, supporting a Lao rice culture, also carries a part of the road linking northern Vietnam with the Mekong River valley.

Ou-yang Hsiu, Pinyin OUYANG XIU, courtesy name (Wade–Giles romanization) YUNG-SHU, literary name TSUI-WENG, canonized name WEN-CHUNG (b. 1007, Mien-yang, Szechwan, China—d. 1072, Honan), Chinese poet, historian, and statesman of the Sung dynasty, who reintroduced the simple "ancient style" in Chinese literature and sought to reform Chinese political life through classical Confucian principles.

Ou-yang Hsiu was the son of a judge in Mien-yang, Szechwan province. His father died when Ou-yang was three, and he and his mother went to live with his uncle in Hupeh. Although the story that the family was so poor that he had to learn writing in the sand with a reed is apocryphal, they probably lived in straitened circumstances.

In 1030 he placed first in the doctoral examinations and was appointed a judge at the western capital, Lo-yang. He was already known as a brilliant young writer, and at Lo-yang he befriended the renowned essayist Yen Shu and the poet Mei Yao-ch'en. These friendships not only enhanced Ou-yang's status but, more important, reinforced his strong preference for the simplicity and clarity of the "ancient style." Some years before, he had read the works of Han Yü, the great master of T'ang-dynasty literature, whose pure and easy "ancient style," free of outworn metaphors and allusions, had greatly impressed him. Eventually, his leadership and advocacy of that style paved the way for a new literary movement.

In 1034 he was appointed a collator of texts in the imperial library at the capital, K'ai-feng. Two years later, when Fan Chung-yen, a government official, was banished, at the insistence of an imperial counselor, for speaking out against certain official practices and institutions, Ou-yang did not hesitate to attack the counselor in writing. As a result, he, too, was banished and demoted to low judicial office in Hupeh and Hunan provinces, where he wrote the *Hsin Wu-tai shih* ("New History of the Five Dynasties"), a history of a period of political chaos lasting through almost the entire 10th century. Ou-yang's strong sense of fairness led him to devote separate sections to political outcasts such as martyrs, rebels, and traitors, a radical departure from previous dynastic histories.

Highly recommended by Fan Chung-yen, who was back at the capital, and other high officials, Ou-yang was recalled to the capital in 1043 to become imperial counselor. When Fan and others were dismissed for forming a private group of political reformers, Ou-yang, in a notable essay on partisanship, defended associations of gentlemen as politically constructive. His courage and forthright opinions earned the respect of the emperor, Jen Tsung, and he was commissioned to record Jen Tsung's daily life and to draft edicts. His frank opinions and severe criticisms of others created many enemies, and in 1045 he was accused of and tried for having had illicit relations with his niece many years before—a charge to which his romantic life, during his days in Lo-yang, lent support. Although he was finally acquitted, his reputation was seriously impaired.

He was demoted and sent to Anhwei province, where he served as magistrate of one county after another. The beautiful countryside intensified his partiality for wine. He called himself the "Old Drunkard," built a pavilion of that name, and wrote an essay about it, which has become one of the most celebrated works in Chinese literature. After a term (1050) as defense commander of the southern capital of Kuei-te, in Honan Province, he was recalled to the capital in 1054 to become an academician of the Hanlin Academy.

It had been more than nine years since he was exiled from the capital, and the new appointment signified a promotion. As always, his moral courage and outspoken manner did not endear him to his colleagues. He was first ordered to write the *Hsin T'ang shu* ("New History of the T'ang Dynasty"). A year later, with his work only begun, he was sent as ambassador to the Manchurian Khitans, who ruled most of Northern China. In 1057 he was placed in charge of civil service examinations. He favoured those who wrote in the "ancient style" but failed those who employed literary embellishments. For thus imposing his own ideas of literature on the traditional examination system, he was physically attacked by disgruntled candidates. He survived, however, and the literary style championed by him set a new course for Chinese literature. He praised and promoted brilliant young writers such as Wang An-shih and Su Tung-p'o.

When the "New History" was finished in 1060, he was rapidly promoted to the highest councils of state, leaving a remarkable record in social, financial, and military affairs. Eventually his position at court became untenable, however, and at 60 he was approaching the end of his political career. He was falsely accused of having an affair with his daughter-in-law, a charge that injured his prestige and left him increasingly isolated in the capital. He repeatedly asked to be relieved, but instead the new emperor sent him to be magistrate successively in Anhwei, Shantung, and Honan.

In Shantung he opposed the reforms of his former protégé Wang An-shih, particularly a system of loans to farmers at a low interest rate, and refused to carry them out in his districts. It is clear that by this time he had become a disappointed conservative. In 1071 he was retired with the title of grand preceptor of the crown prince. He intended to make his permanent home in beautiful Anhwei, the place of his Old Drunkard Pavilion (Ts'ui-weng T'ing), but within months he died in his 66th year.

The personal influence and many-faceted activity of Ou-yang Hsiu had a lasting effect. As a statesman he worked to regenerate political life through classical Confucian principles; he criticized fearlessly, and he recommended the promotion of able men who eventually led opposing parties. He was early captivated by writings of Han Yü, whose opposition to Buddhism he shared, though in a more moderate form. He revived Han's advocacy of a simpler, more direct prose like that of Mencius, to replace the mannered and excessively rhythmic style then popular, and his writings in the resultant *ku-wen* style established a model emulated thenceforth. He emancipated the *fu* prose-poems from strict conventions and left superb examples of these as well as of the newer *tz'u* (lyrics to popular tunes) and other literary forms. In his "New History of the Five Dynasties" and "New History of the T'ang Dynasty," he amplified the standard history form and praised or censured men and institutions through terse but exact descriptions implying moral judgment, in supposed emulation of Confucius. As a scholar he ignored later commentaries and instead sought a fresh and immediate understanding of early texts. He contributed to archaeological study and as a painter helped create the new *wen-jen-hua* (literati) style. His preserved writings include not only his histories but more than 150 chapters of poems, state papers, letters, and other smaller pieces. His library consisted of 10,000 books and a large collection of literary remains and archaeological records from ancient times. He was honoured posthumously with the title Wen-chung (literary and loyal).

Ouachita Geosyncline, a linear trough in the Earth's crust in which rocks of the Paleozoic Era (from 225,000,000 to 570,000,000 years ago) were deposited along the southern margin of North America, from Mississippi to eastern Mexico. Most of the belt is overlain by undisturbed, younger rocks of the Mississippi Embayment and the Gulf Coastal Plain, but marginal parts of the belt are exposed in the Ouachita Mountains of Arkansas and Oklahoma, the Marathon uplift of western Texas, and scattered remnants in northeastern Mexico. The oldest exposed rocks are of Cambrian age; the youngest are Middle Pennsylvanian, in the Ouachita Mountains, and Late Pennsylvanian, in the Marathon uplift. The geosyncline's rocks of Cambrian through Devonian age consist of dark, siliceous shales, sandstones, and cherts, which indicate slow deposition over a long period of time. Its Mississippian through Pennsylvanian rocks, on the other hand, consist of thick sequences of shales and sandstones deposited rapidly in a subsiding trough.

Deformation of the geosyncline probably began during Early Paleozoic time in the buried interior portions of the geosyncline, but the marginal exposed portions were not deformed until the Late Pennsylvanian Period in the Ouachita Mountains and Early Permian in the Marathon uplift. Deformation, based on the evidence now available, seems to have shifted through time from the interior portions of the geosyncline northward to the marginal portions. The name Ouachita orogeny is applied to the event that resulted in the folding and northward thrusting of the exposed marginal part of the geosyncline.

The Ouachita Geosyncline may represent a southward continuation of the Appalachian Geosyncline, which was displaced westward by the opening up of the Gulf of Mexico in the Early Mesozoic.

Ouachita Mountains, a rugged range of large hills that continues the Ozark Plateau in the United States. The Ouachita Mountains extend approximately 225 miles (360 km) east to west from Little Rock, Ark., to Atoka, Okla., and north to south, approximately 50–60 miles (80–95 km) from the Arkansas River Valley to the northern margin of the Coastal Plain. The ridges trend generally east–west and are approximately the same height.The highest elevation (2,950 feet [899 m]) in the range is Rich Mountain in Le Flore County, Okla., near the Arkansas line. Hot Springs National Park lies in the Ouachita Mountains. The word Ouachita is derived from an Indian tribal name. Oak and pine forests cloak the hills, and cultivation is restricted to the more favourable valley bottoms.

Ouachita orogeny, a mountain-building event that resulted in the folding and faulting of exposed strata in the Ouachita Geosyncline in the southern portion of the United States in Arkansas, Oklahoma, and the Marathon uplift region of West Texas. The deformation is Late Paleozoic in age, probably culminating between the Late Pennsylvanian and the Early Permian (about 280,000,000 years ago). The orogeny resulted in a northward and westward compression in the geosynclinal strata onto adjacent platform rocks.

Ouachita River, river rising in the Ouachita Mountains of west-central Arkansas, U.S., and flowing in a generally southeasterly direction to join the Red River in Louisiana after a course of 605 miles (973 km). The lower 57 miles (92 km) of the Ouachita (from its confluence with the Tensas River) is known as the Black River (*q.v.*). Most of the Ouachita's 25,000-square-mile (65,000-square-kilometre) drainage basin lies in the upper Coastal Plain of Arkansas and Louisiana and in the alluvial valley of the Mississippi. Chief tributaries are the Boeuf (*q.v.*) and Tensas rivers entering from the east, Bayou Bartholemew from the west, and the Saline River from the north.

The Ouachita has been a navigation route since the late 18th century. Six locks and dams were built on the river prior to 1924. There are three multipurpose dams (hydropower, flood control, recreational facilities) on the upper Ouachita within the Ouachita Mountains: Blakely Mountain (1955) and Carpenter (1931) dams near Hot Springs National Park, impounding Lakes Ouachita and Hamilton, and Remmel Dam (1924), impounding Lake Catherine.

The chief cities along the river are Arkadelphia and Camden, Ark. (the latter linked to the Ouachita by a channel [1950]), and Monroe, La. Formerly called the Washita River, the name Ouachita is derived from that of an Indian tribe.

Ouaddaï, also spelled WADAI, historic and cultural region in eastern Chad, central Africa. The chief city of the region is Abéché. The region's area of savanna grasslands roughly corresponds to the formerly independent Ouaddaï Muslim sultanate (*see* Wadai, Kingdom of).

Crossed by caravans linking the Sahara with equatorial Africa and by Muslim pilgrim routes from West Africa toward Mecca, Ouaddaï is an amalgam of cultural and ethnic influences. The dominant people, the Maba, a Negroid, Sudanic people, are Muslims. Their main economic activity is raising cattle. Other inhabitants include Arabs and Fulani and various other peoples.

Though Arab geographers had described the area, Ouaddaï was not generally known to Europeans until after 1873, when it was explored by the German geographer Gustav Nachtigal. The history of Ouaddaï before the 17th century is uncertain, but in about 1640 a Maba chieftan, Abd-el-Kerim, conquered the country and overthrew the Tungur, a dynasty originating in Darfur to the east. For the next 200 years there were intermittent wars with the kingdoms of Bagirmi and Kanem-Bornu, many for the purpose of maintaining Ouaddaï's supply of slaves and eunuchs for shipment to Arab courts in the north.

Muḥammad al-Sharīf, who was sultan of Ouaddaï from 1835 to 1858, introduced the Sanūsīyah Islāmic brotherhood into the region, and it remained the dominant political and religious force until Ouaddaï was conquered by the French. Although it had been recognized as within the French "sphere of influence" according to an Anglo-French agreement of 1899, Ouaddaï retained its effective independence until 1904, when Ouaddaïans attacked French outposts in the Chari region. Fighting continued sporadically until 1908, when the Ouaddaï sultan, Doud Murra, proclaimed a holy war (jihad) against the French. Dividing his army into units under feudal lords, he was no match for French troops and was soundly defeated. By 1912 the French had pacified the area and abolished the sultanate. A famine in 1913–14 devastated Ouaddaï. From an estimated population of more than 2,000,000 in the 1870s, the inhabitants were reduced to about 300,000 by 1917.

After independence in 1960, banditry, long prevalent in Ouaddaï under the French, evolved into guerrilla warfare on the part of the Muslim population against the southern Christians and animists who dominated Chad's government. Fighting in this region continued sporadically into the 1980s because of the country's continuing civil war.

Ouagadougou, also spelled WAGADUGU, capital and largest town of Burkina Faso (formerly Upper Volta), West Africa. It was the capital of the historic Mossi kingdom of Wagadugu (founded in the 15th century) and the seat of the *morho naba* ("great king") of the Mossi people. Islām became the religion of

the kings under Naba Dulugu (ruled 1796?–1825?). The *morho naba* still lives in the city, though his powers have been greatly eclipsed by the French colonial and post-independent administrations.

Ouagadougou is a city of large trees and modern public buildings abutting traditional residential neighbourhoods. It has a market, a crafts centre, the national museum, and the University of Ouagadougou (1969). It is connected by rail to the Atlantic port of Abidjan, Côte d'Ivoire (Ivory Coast), and has an international airport. Major products include textiles, carbonated beverages, matches, and footwear. Pop. (1985 est.) 359,801.

Ouargla, also spelled (after 1981) WARGLA, town, east-central Algeria. It is situated on the western edge of a sebkha (large, enclosed basin) in the Sahara. One of the oldest settlements in the Sahara was made by the Ibāḍīyah, a Muslim heretical sect, at nearby Sedrata in the 10th century (ruins remain). In the 11th century they were attacked by Sunnite Muslims and fled to Ghardaïa, 118 miles (190 km) west-northwest. The Ouargla site was then set-

tled by Berbers and black Africans. The town remained autonomous but for a brief period of Turkish control in the 16th century. The French gained possession in 1872, and the present town was built around Fort Lutaud to the south after 1928.

Ouargla is dominated by a large mosque and is walled with six gates. It has an arcaded marketplace and a Saharan museum. The town is surrounded by date palm groves and fruit and vegetable gardens irrigated by numerous wells, tapped from the underground Wadi Mya. There is a trade in livestock, woolen carpets, and basketry. Nearby oil wells to the southwest and at Hassi Messaoud, 50 miles (80 km) east-southeast, with its valuable deposits of oil and natural gas, have boosted the local economy and population. The town also has an airport. Pop. (1977 prelim.) mun., 77,354.

Ouarzazate, town, south-central Morocco. It lies on the Saharan side of the High Atlas mountains and is situated in the valley of the River Ouarzazate near its juncture with the River Drâa. The town originated as a military post during the French occupation (1932–56). Still a military centre with a fortress, it is also an important oasis and road junction linked to Marrakech by way of n'Tichka Pass.

Ouarzazate is situated in an arid region that extends from the crests of the High Atlas southward to the borders of the Sahara. Habitations exist only in the valleys, chiefly those of the Dadès and Drâa. The region's greatest economic resource lies in the manganese mines of Imini and the cobalt mines of Bou-Azzer, but it also has large deposits of copper. The agricultural potential of the Drâa valley was enhanced in the early 1970s with the com-

Oud, Jacobus Johannes Pieter (b. Feb. 9, 1890, Purmerend, near Amsterdam—d. April 5, 1963, Wassenaar, near The Hague), Dutch architect notable for his pioneering role in the development of modern architecture.

Oud was educated in Amsterdam and at the Delft Technical University, after which he worked with a number of architects in Leiden and Munich. In 1916 he met Theo van Doesburg, and together the two men founded in 1917 the influential review *De Stijl,* which set forth the theories of the de Stijl group of avant-garde artists. Oud soon became the chief proponent of the de Stijl idiom in modern architecture. Among his earliest architectural projects in this austere, highly geometric style were theoretical projects for houses at Scheveningen (1917) and for a factory at Purmerend (1919). He designed a hotel at Noordwijkerhout (1917) and the Allegonda villa at Katwijk (1917). These and other buildings featured subtle oppositions of horizontal and vertical lines; long, straight walls wrapping into smoothly rounded corners; building units enclosing an open space; and simplified rectilinear and circular forms that achieve a subtly poised equilibrium despite their assymmetrical arrangement.

In 1918 Oud was appointed housing architect to the city of Rotterdam, in which post he was required to supply sorely needed mass housing for workers. The housing blocks he subsequently designed and built at Spangen (1918), Tusschendijken (1920), and Hoek van Holland (1924–27) had a sober and functional austerity that contrasted strongly with the picturesque elaboration of detail typical of the school of Amsterdam led by Michel de Klerk. His Café de Unie (1924–27, destroyed in 1940) and Kiefhoek estate (1925–27), both in Rotterdam, also emphasized de Stijl principles, although by then he was tending toward separation from the movement. Oud's book *Höllandische Architektur* (1926) gave him an international reputation.

Among his late works are the monumental and somewhat ornate Shell Building (1938) in The Hague, which disappointed some because of Oud's evident abandonment in it of de Stijl principles. The Bio-Children's Convalescent Home (1952–60) near Arnhem, however, convincingly demonstrated Oud's continuing mastery of the elegant geometrical compositions typical of what had become known as the International Style.

Oudenaarde (Flemish), French AUDENARDE, municipality, East Flanders province, west-central Belgium. It lies along the Scheldt (Schelde) River south of Ghent. A prosperous tapestry-making centre in the Middle Ages, its industry declined in the 15th century with the success of the Gobelin tapestry weavers (trained in Oudenaarde), many of whom later went to Paris. It was at Oudenaarde in 1708, during the War of the Spanish Succession, that the French Army was vanquished by Eugene of Savoy and the duke of Marlborough.

Oudenaarde's landmarks include the town hall (1526–36) with its five-story belfry, the 13th-century Cloth Hall, the Church of St. Walburga with its carillon, and the Church of Our Lady of Pamele (1325). The old bishop's residence (1600) was the birthplace of Margaret of Parma, natural daughter of Charles V and Johanna van der Gheenst.

Beer and textiles are the main products of Oudenaarde, which includes the outly-

Oudenaarde, Battle of (July 11, 1708), victory over the French won by the duke of Marlborough and Prince Eugene of Savoy during the War of the Spanish Succession; it eventually led to the Allied (Anglo-Dutch-Austrian) recapture of Ghent and Bruges, which had been captured by the French on July 4–5.

The battle was fought north of the town of Oudenaarde between an Allied army of 80,000 men under Marlborough and Eugene and a French army of 85,000 men under the marshal Louis-Joseph, duc de Vendôme, and Louis, duc de Bourgogne. The French were preparing to besiege Oudenaarde and were caught off guard. The Allied army, which had marched 50 miles (80 km) in 65 hours, crossed the Scheldt River on July 11 and immediately attacked before the French could deploy properly. The French command had been divided: Bourgogne had wanted to retreat and only at the last moment consented to Vendôme's plea to stand and fight. All afternoon a bitter and confused battle raged. Unnoticed by the French, Marlborough sent a Dutch force on a long detour to the west. It struck the French right flank while Eugene pressed against the French left. By the time darkness forced a halt, the French had lost 6,000 killed or wounded and another 9,000 captured. The Allies suffered about 4,000 casualties. The next day Vendôme rallied the defeated army and repulsed the Allies at Ghent. Marlborough recaptured Ghent and Bruges in January 1709, and the French withdrew to their own border.

Oudinot, Nicolas-Charles, DUC (duke) DE REGGIO (b. April 25, 1767, Bar-le-Duc, Fr.—d. Sept. 13, 1847, Paris), general, administrator, and marshal of France in the Napoleonic Wars whose career illustrates the opportunities to rise in the French Army after the Revolution.

Oudinot was the son of a businessman. In 1784 he joined France's royal army but, since commoners were barred from promotion, resigned in 1787. After the French Revolution, however, he became the leader of Meuse volunteers (1792) and was transferred to the regular army the following year, rising to general of brigade (1794) for his heroic resistance at Kaiserslautern. Becoming general of division (1799) and chief of staff under André Masséna, Oudinot fought in Switzerland and Italy and then commanded an elite division of grenadiers (1805–07) in fighting at Austerlitz and Ostrolenka.

Oudinot was promoted to marshal after the Battle of Wagram (1809) and was created duke of Reggio in 1810. After serving as administrator in Holland (1809–12) and fighting in the Russian campaign, he was badly defeated in 1813 at Grossbeeren, Prussia, after which he was superseded by Michel Ney. Following Napoleon's abdication in 1814, Oudinot rallied to Louis XVIII, remaining loyal to him during the Hundred Days (1815). He served in Spain in 1823 and was governor of the Invalides (veterans' hospital) from 1842 until his death.

Oudry, Jean-Baptiste (b. March 17, 1686, Paris—d. April 30, 1755, Beauvais, Fr.), French Rococo painter, tapestry designer, and illustrator, considered one of the greatest animal painters of the 18th century.

"The Calling of the Hounds," tapestry by Jean-Baptiste Oudry, 1742–45; in the Palazzo Pitti, Florence
SCALA—Art Resource/EB Inc.

He first studied portrait painting with Nicolas de Largillière, a portraitist of Parisian society, through whom he made many connections. His early portraits are often arcadian in setting and tender and sentimentally charming in the Rococo tradition. In his early career he executed many still lifes that were used as decorative inserts for paneled rooms. After he was made a member of the French Royal Academy in 1719, his work consisted largely of animal paintings, tapestry designs, and book illustrations.

In 1734 Oudry was made head of the Beauvais tapestry works. Some of his designs brought the company wide fame, such as those for the tapestry series "Country Amusements" (1730), "Moliere's Comedies" (1732), and "The Fables of La Fontaine" (1736). The designs for the last series were related to the 277 illustrations Oudry did for a four volume edition of the *Fables*. His other book illustrations included those for editions of *Don Quixote* and *Le Roman comique*. In 1736 he was made inspector general of the Gobelins tapestry factory and designed a series of tapestries (1736–49) depicting the hunts of Louis XV. He was also commissioned to paint the dogs of the king's pack and was appointed official painter of the royal hunts. Oudry's tapestries, like his paintings, were highly regarded for their tonal subtlety and lively study of nature. Among his later still lifes is the well-known "White Duck" (1753), a tour de force of precise drawing and delicate white-on-white tonalities. Oudry's services were sought not only by Louis XV but by Tsar Peter the Great of Russia, the queen of Sweden, and the prince of Mecklenburg-Schwerin.

Oudtshoorn, town, south-central Cape Province, South Africa. It is located about midway between Cape Town (west) and Port Elizabeth (east) on the banks of Grobbelaars River. First settled in 1847, it was named (in 1863) after a baron who died in 1773 enroute to his governorship at the Cape, and it officially became a town in 1887. Situated in the Little Karroo (a narrow plain between high mountains) at 1,007 feet (307 m) above sea level, Oudtshoorn is sheltered by the Swartberg on the north and by the Outeniqua mountains to the south. It is a centre of agricultural trade for dairy products, alfalfa (lucerne), fruit, vegetables, and tobacco, but it is particularly well-known for its extensive ostrich farms and its ostrich feather industry. Roads and railway link Oudtshoorn with other parts of Cape Province. The C.P. Nel Museum (1953) contains a collection of pioneer antiques. The limestone Cango (Kango) Caves (declared a natural monument in 1938) are known for stalactites and are 17 miles (27 km) to the north of the town in the foothills of the Swartberg. Pop. (1984 est.) mun., 43,347.

oued (dry streambed): *see* arroyo.

Oued, el-, town, largest of the Souf Oases in northeastern Algeria. It lies 50 miles (80 km) west of the Tunisian border. Surrounded by the sand dunes of the Grand Erg (sand dunes) Oriental, the Souf Oases extend for 25 miles (40 km) northwest to southeast. A river (*oued*) once flowed to the east, but it was swallowed by the encroaching sands. The town sits in the midst of the oasis and has narrow, winding streets, with cube-shaped buildings of clay-stone topped by cupolas. The houses are clustered, creating the image of a "Town of a Thousand Domes," so-called by the French writer-adventuress Isabella Eberhardt (1877–1904). The town's fortress mosque and use of arcades and arches reflect both Moorish and Roman influence. Date-palm groves are grown in man-made, funnel-shaped craters that are protected from the sand by woven palm walls and are close enough to groundwater to eliminate irrigation.

Ouémé River, Ouémé also spelled WEME, river rising in the Atacora massif in northwestern Benin, West Africa. It is about 310 miles (500 km) in length and flows southward, where it is joined by its main affluent, the Okpara, on the left and by the Zou on the right. It then divides into two branches, one discharging into Lake Nokoué in the Niger Delta near Cotonou and the other into Lagoon Porto-Novo. Rain forests grow along the shores; navigation, although impeded by rapids, is possible during the rainy season. The river's fish, including freshwater and processed, is exported to Nigeria and Togo. Millet, sweet potatoes, and yams are cultivated, and the Ouémé Valley development scheme has been undertaken to improve agriculture.

Ouenza, town, northeastern Algeria. It lies near the eastern border with Tunisia. The nearby Mount Ouenza (4,226 feet [1,288 m]) is the site of extensive iron-ore deposits, making the town one of Algeria's leading mining centres. Pop. (1977 prelim.) mun., 31,867.

Ouessant Island, French ÎLE D'OUESSANT, also called USHANT ISLAND, a rocky island, Finistère *département,* off the western tip of Bretagne, western France. The island, about 5 miles (8 km) long and 2 miles (3 km) wide, has an area of 6 square miles (15 square km). Its lighthouse, the Phare de Créac'h, marks the south entrance to the English Channel, the north entrance light being at Land's End, England. Lampaul, the little port that is the capital of Ouessant, is the chief settlement of the island's fishermen; its fields, which cover only a small fraction of the island, traditionally have been worked by the fishermen's wives. A large but indecisive action was fought off Ouessant in July 1778 between British and French fleets. Pop. (1982) 817.

Ouezzane, city, north-central Morocco. It lies at the southwestern edge of the Rif Mountains. Ouezzane is situated on the northern slope of Mount Bouhelal, at an elevation of 1,066 feet (325 m). It was founded in 1727 as a religious community on the site of a village named Dechra Jebel er-Rihan ("Village of the Mount of Myrtles") by Moulay ʿAbd Allāh, a descendant of Idrīs II. It has served as a *zāwiyah* (monastic complex) of the Taiba (a Ṣūfī [mystical] brotherhood). Ouezzane is considered to be one of the sacred cities of the Maghrib, the region in North Africa comprising the Atlas Massif and the Mediterranean coastal plain of Morocco, Algeria, and Tunisia, and is hence a pilgrimage centre. In 1920 the city was occupied by the French. Cereals and cattle are raised in the vicinity of Ouezzane, and the city also serves as a local market centre. Pop. (1982) mun., 40,485.

Oughtred, William (b. March 5, 1574, Eton, Buckinghamshire, Eng.—d. June 30, 1660, Albury, Surrey), English mathematician and Episcopal minister who invented the earliest form of the slide rule, two identical linear or circular logarithmic scales held together and adjusted by hand. Improvements involving the familiar inner rule with tongue-in-groove linear construction came later.

In 1604 Oughtred became vicar of Shalford, Surrey, and subsequently rector of Albury. Although his years in the ministry included the period of the Commonwealth, when more than 8,000 clerics were deprived of their charges, he was permitted to continue in his parish.

Oughtred's most important published work was the *Clavis Mathematicae* (1631; "The Keys to Mathematics"), which included a description of Hindu-Arabic notation and decimal fractions and a considerable section on algebra. He experimented with many different algebraic symbols and was responsible for the use of the symbol "::" in writing a proportion and the symbol "×" for multiplication. His work on slide rules was an adaptation to a physical scale of the tabular logarithms of John Napier of Scotland. His early form of circular slide rule was invented before 1632 and the pair of rectilinear, relatively slidable members by 1633. His claim of priority of the circular rule was contested by one of his former students, Richard Delamaine the Elder. Oughtred's *Trigonometria* (1657) treated plane and spherical trigonometry.

Ouham River, river, one of the main headwaters of the Chari River, central Africa. It rises in two main branches in the elevated plateau country of the western Central African Republic; it then flows north, crossing the international frontier into Chad, where it is known as Baḥr Sara, and joins the Chari just north of Sarh. The Ouham's length, from its longest (eastern) branch to its junction with the Chari, is estimated at 420 miles (676 km); it is navigable for commercial traffic in its lower course.

Ouida, pseudonym of MARIA LOUISE RAMÉ, or DE LA RAMÉE (b. Jan. 1, 1839, Bury St. Edmunds, Suffolk, Eng.—d. Jan. 25, 1908, Viareggio, Italy), English novelist, known for her extravagant melodramatic romances of fashionable life.

Ouida's father was a teacher of French, and the pseudonym "Ouida" derived from a childhood version of "Louisa." Her first novel, *Granville de Vigne* (renamed *Held in Bondage,* 1863), was first published serially in 1860. Her stirring narrative style and a refreshing lack of sermonizing caught the public's fancy and made her books extraordinarily popular. *Strathmore* (1865) and *Chandos* (1866) were followed by *Under Two Flags* (1867). After traveling in Italy, Ouida settled at Florence in 1874, and, among many subsequent novels, *Moths* (1880) was one of her best. She was the author of a number of animal stories, of which *A Dog of Flanders* (1872) was long a children's favourite. Reckless extravagance reduced her to acute poverty in later life.

Ouidah, also spelled WHYDAH, town, southern Benin, West Africa. It lies along the Gulf of Guinea. The town was the main port of the Kingdom of Abomey in the 18th and 19th centuries. Portuguese, French, Dutch, Danish, British, and Americans all vied for a share of the slave and palm-oil trade made available through Ouidah by the efficiently organized and centralized kingdom. In 1893 the area came under French control. Some of the old forts, a cathedral, and a temple of the Abomey traditional religion remain. Coconut, palm, and coffee are grown in the area. Ouidah is connected by road and railway to Cotonou, 20 miles (32 km) east, the major port and commercial centre of Benin. Pop. (1979 prelim.) 6,407.

Ouija board, in occultism, a device ostensibly used for obtaining messages from the spirit world, usually employed by a medium during a séance. The name derives from the French and German words for "yes" (*oui* and *ja*). The Ouija board consists of an oblong piece of wood with letters of the alphabet inscribed along its longer edge in a wide halfmoon. On top of this, a much smaller, heart-shaped board is placed, mounted on casters, which enable it to slide freely.

Each participant lightly places a finger on the small board, which then slides about because of the resultant pressure. The letters pointed out by the apex of the board may in some instances spell out words or even sentences. In the late 19th century, when the Ouija board was a popular pastime, it was fashionable to ascribe such happenings to discarnate spirits; more recent opinion is skeptical.

Ouimet, Francis (b. May 8, 1893, Brookline, Mass., U.S.—d. Sept. 2, 1967, Newton, Mass.), American amateur golfer whose success did much to remove the British upper-class stigma from the game and to popularize it in the United States.

After starting as a caddie and working in a dry-goods store to earn his expenses, he gained a limited recognition until the 1913 U.S. Open championship. In that event he tied the English professionals Harry Vardon and Ted Ray and then defeated them in the playoff. That victory gave golf an impetus in the United States that has accelerated ever since. Ouimet won the U.S. Amateur championship in 1914 (when he also won the French Amateur) and in 1931. He played on the U.S. Walker Cup team from 1922 through 1936 and was nonplaying captain from 1936 through 1949, excluding the war years. Elected captain of the Royal and Ancient Golf Club of St. Andrews in 1951, he was the first non-Briton to receive this honour.

Oujda, city, extreme northeastern Morocco. It lies near the Moroccan–Algerian border. Founded in 944 by Zanātah Berbers, the city was fought over by Berbers, Arabs, and Turks and destroyed and rebuilt so often that it was called Medinet el-Haira, "City of Fear." Peace finally came after the French occupation in 1907. The Moroccan and Algerian railways meet at Oujda, the main function of which is as a frontier post. It is also a tourist centre, has an international airport, and owes some growth to the coal, lead, and zinc mines to the south. There are traces of ancient walls, but the city's appearance is generally modern, with wide avenues and parks. Oujda is near Sidi Yahya oasis, a legendary burial place of John the Baptist and site of the Battle of Isly, where the French defeated the Moors in 1844. It is connected by road and railway with Taza.

Olives and grapes are grown in the irrigated, fertile plain in which the town is situated. Cereals (primarily wheat), sheep, and goats are raised on the plain, and esparto grass, bailed and exported for use in making paper, grows throughout the area. Large deposits of anthracite coal are located near Jerada, a lead mine is at Touissit, and lead metal is produced at Oued el-Heïmer. Pop. (1982) mun., 260,082.

Oulu, in full OULUN LÄÄNI, Swedish ULEÅBORGS LÄN, *lääni* (province), central Finland, bounded on the west by the Gulf of Bothnia and on the east by the Soviet Union. It has a land area of 21,956 square miles (56,866 square km). It was founded in 1776 when the former province of Ostrobothnia was replaced by the *läänit* (provinces) of Oulu and Vaasa. Oulu included all of Finnish Lapland until 1938, when the *lääni* of Lappi was created out of the northern portion. Level along the coast, the province rises in the east to forested hills; the large Oulujärvi (lake) is situated in its south-central part. Economic activities are dominated by agriculture (mostly barley with some oats), forestry, iron mining at Otanmäki, cattle raising, and the manufacture of wood products. Principal towns are Oulu (the administrative capital), Kajaani, and Raahe. Pop. (1986 est.) 431,981.

Oulu, Swedish ULEÅBORG, city, capital of Oulun *lääni* (Oulu province), west-central

Finland, at the mouth of the Oulu River on the Gulf of Bothnia. During the European Middle Ages a trading post was located on the site. In 1590 the prospering settlement was fortified, and town rights were granted in 1610. The fortress was destroyed by an explosion in 1793, and the city was almost completely destroyed by fire in 1822; but it became one of Finland's major commercial centres in the 19th century. An important seaport, the city specialized in the export of wood tar; the tar depots and harbour facilities were destroyed, however, during the Crimean War by the British. During World War II, many sections of the city were destroyed, and postwar building has modernized it considerably.

Oulu has been the seat of a bishopric since 1900, and its cathedral was built in 1830–32, incorporating the remains of an earlier church destroyed in 1822. The city is an important educational centre, with a university (founded 1959), a summer university, and the district hospital. The city's industries include lumber, flour, and cellulose mills, as well as shipyards, fisheries, tanneries, and a foundry. The Meri Rapids, on which the city is located, provide hydroelectric power and are also a major tourist attraction. Oulu is connected by air, rail, and sea to the rest of Finland. Pop. (1986 est.) mun., 97,297.

Oum el-Bouaghi, also called (after 1981) OUM EL-BOUAGUL, formerly CANROBERT, town, northeastern Algeria. The town is situated in the high plains of the Tell Atlas about 40 miles (65 km) southeast of Constantine city. This extensive high-plains region receives about 20 inches (500 mm) of rain annually, and the town is a principal trading centre for the wheat, barley, figs, and olives grown nearby. The area was chosen to demonstrate the *autogestion* (self-managed farms) advocated by Ahmed Ben Bella in the first years of Algerian independence from France, so that workers could share in the management and profits of the land. Salt marshes (chotts) provide seasonal grazing pastures for sheep. Pop. (1987 prelim.) 44,199.

Oum er-Rbia, Wadi, chief river of central Morocco, rising in the Moyen (Middle) Atlas mountains and flowing generally westward for 345 miles (555 km) to the Atlantic Ocean near Azemmour. Although not navigable, it is a perennial, torrential river and a major source of hydroelectric power and irrigation: dams on the river include Afourer, Kasba Zidania, Im Fout, Daourat, Sidi Saïd Maachou, and Bine el-Ouidane (on the Wadi el-Abid). The Tessaout and el-Abid, both of which join the Oum er-Rbia from the south, are the main tributaries. Agricultural products grown in the river's basin include citrus fruits, wheat, grapes, cotton, and flax.

Oun Kham (b. 1811/16—d. Dec. 15, 1895), ruler of the Lao principality of Luang Prabang (1872–94), whose troubled reign ended with the establishment of a French protectorate over Laos.

From the 1870s northern Laos increasingly was beset by invading bands of Chinese (Ho, or Haw) freebooters and bandits, against whom Oun Kham's weak forces were powerless. When he was unable to resist effectively an attack on Luang Prabang in 1885, his overlord, the king of Siam (Thailand), dispatched an army to defend the area, as well as commissioners to run his state. When the Siamese army left in 1887, the band of the Tai pirate Deo Van Tri overwhelmed Luang Prabang, and Oun Kham took refuge at Pak Lay, near the Siamese border, with the assistance of the French vice-consul Auguste Pavie in Luang Prabang. Pavie quickly ingratiated himself with Oun Kham, who felt that the Frenchman had saved his life—a gesture that was not forgotten.

His health in grave condition after his escape, Oun Kham spent two years in Bangkok, the Siamese capital. He was reinstalled as sovereign in Luang Prabang in 1889 and reigned until 1894, when he was replaced by his son, Kham Suk, who reigned as King Zakarine. Following the Franco-Siamese Conflict of 1893, Luang Prabang and the rest of Laos was transferred by treaty from Siam to France.

ounce, also called SNOW LEOPARD (*Leo uncia*), long-haired cat, family Felidae, grouped with the lion, tiger, and others as one of the big, or roaring, cats. The ounce inhabits the mountains of central Asia and the Indian subcontinent, ranging from an elevation of about 1,800 m (about 6,000 feet) in the winter to about 5,500 m (18,000 feet) in the summer. Its soft coat, consisting of a dense, insulating

undercoat and a thick outercoat of hairs about 5 cm (2 inches) long, is pale grayish with dark rosettes and a dark streak along the spine. The underparts, on which the fur may be 10 cm (4 inches) long, are uniformly whitish. The ounce attains a length of about 2.1 m (7 feet) including the 0.9-metre- (3-foot-) long tail; it stands about 0.6 m (2 feet) high at the shoulder and weighs 23–41 kg (50–90 pounds). It hunts at night and preys on various animals, such as marmots, wild sheep, and domestic livestock. Its litters of two to four young are born after a gestation period of approximately 93 days.

The ounce has often been placed, with the other big cats, in the genus *Panthera*. Because of certain of its skeletal features, it has also been separated by some authorities as the sole member of the genus *Uncia*. The ounce is listed as an endangered species in the *Red Data Book.*

ounce, unit of weight in the avoirdupois system, equal to $^1/_{16}$ pound ($437^1/_2$ grains), and in the troy and apothecaries' systems, equal to 480 grains, or $^1/_{12}$ pound. The avoirdupois ounce is equal to 28.35 grams. As a unit of volume, the fluid ounce is equal to $^1/_{16}$ of a pint, or 29.57 millilitres, in the U.S. Customary System and to $^1/_{20}$ of a pint, or 28.41 millilitres, in the British Imperial System. As a unit of weight, the ounce derives from the Roman uncia (meaning "twelfth part"), which was $^1/_{12}$ of a Roman foot. The standard or physical embodiment of the Roman foot, a copper bar, constituted the Roman pound standard and was divided along its length into 12 equal parts, called unciae. Thus, uncia designated both a unit of weight and one of length and is the source of the modern terms inch and ounce.

Oundle, market town, East Northamptonshire district, county of Northamptonshire, England, on the River Nene. The manor was granted to the feudal landowner John, Earl of Bedford, after the dissolution of the monasteries under Henry VIII in the 1530s. The Church of St. Peter, with its crocketed spire, has work in Early English, Decorated, and Perpendicular styles. Oundle School, a well-known public (independent, fee-paying) school for boys founded in 1556 under the will of Sir William Laxton, lord mayor of London, was granted a royal charter in 1930. The school became famous under the headmastership (1892–1922) of Frederick William Sanderson (*q.v.*). The town itself, small and residential in character, with buildings of local gray limestone, has a twice-yearly fair. Pop. (1980) 3,283.

Ouologuem, Yambo, pseudonym UTTO RODOLPH (b. Aug. 22, 1940, Bandiagary, Mopti region, French Sudan [now The Sudan]), Sudanese writer who was highly acclaimed for his first novel, *Le Devoir de violence* (1968; *Bound to Violence*), which received the Prix Renaudot. With this work, Ouologuem became the first African writer to receive a major French literary award.

Ouologuem was born to a ruling-class family and attended local schools in addition to a lycée in Bamako, Mali; he received degrees in philosophy, literature, and English in Paris in 1962. He also studied for his doctorate in sociology in Paris.

His best-known work, *Le Devoir de violence,* is an epic about a fictitious Sudanese empire, in which hundreds of years of African history are unfolded and in which three forces down through the centuries are responsible for the black man's "slave mentality"—the ancient African emperors, the Arabs, and finally, since the mid-1800s, the European colonial administrators—reducing the black man to "négraille" (a word coined by Ouologuem, meaning "nigger rabble" in its translation). The work was highly controversial, some critics claiming it to be a new form of African literature, others maintaining that it was highly derivative of Graham Greene's *It's a Battlefield* (1934) and of a work by André Schwarz-Bart, *Le Dernier des Justes* (1959; *The Last of the Just*). Ouologuem viewed the African's lot as a legacy of violence and, in modern times, as a duty of violence toward white misconceptions of blacks that impose on him a slave mentality and character.

Ouologuem's bitterness about white attitudes also appears in some of his poems, and his *Lettre à la France nègre* (1969) attacks the "noble" sentiments that have been expressed by paternalistic French liberals about Africa.

Other works include *Les Milles et un bibles du sexe* (1969; "The Thousand and One Bibles of Sex"), published under his pseudonym, Utto Rodolph. Ouologuem also coauthored French-language textbooks for foreigners under the title *Terres du Soliel* (1971; "Lands of the Sun").

Our Father, the Latin *Pater Noster,* the first words of the Lord's Prayer (*q.v.*).

Ourinhos, city, south-central São Paulo *estado* ("state"), Brazil. It lies at 1,568 feet (478 m) above sea level along the Paranapanema River, near the border of Paraná state. Once called Jacarèzinho, the city was made the seat of a municipality in 1948. Principal crops of the region include coffee, alfalfa, cotton, rice, and corn (maize). Industrial plants in Ourinhos process agricultural products and also manufacture liquor, metal goods, and ammunition. The city is linked by railroad and highway to the state capital, São Paulo, 220 miles (350 km) east, and to neighbouring urban centres in São Paulo and Paraná states. It also has an airfield. Pop. (1980 prelim.) 52,698.

Ouro Prêto, city, southeastern Minas Gerais *estado* ("state"), Brazil. It lies on the lower slopes of the Serra do Oro Prêto, a spur of the Serra do Espinhaço, at 3,481 feet (1,061 m) above sea level, in the Doce River drainage basin.

Within a decade of its founding in 1698 as a mining settlement, Ouro Prêto became the centre of the greatest gold and silver rush in the Americas to that date. It still resembled a boom town when it was given city status in 1711 with the name Vila Rica. It was made capital of the newly created Minas Gerais captaincy in 1720. In 1823, after Brazil's independence was won from Portugal, Ouro Prêto was named capital of Minas Gerais province. In 1897, however, because of transportation difficulties the capital was transferred to Belo Horizonte (40 mi [65 km] northwest), worsening the economic decline that had already begun in Ouro Prêto. The opening of an Alcan aluminum factory at nearby Saramenha in 1979 helped to revive the city's economy. The Universidade Federal de Ouro Prêto (1969) is located there. The city is linked to Belo Horizonte by highway and railroad.

Ouro Prêto lives largely in the past. In 1933 it was decreed a national monument and the surrounding region a national park, so that the city's elaborate (mostly late 18th-century) public buildings, churches, and houses might be preserved or restored; they make the place a veritable open-air museum. In the late 1970s a federally funded restoration project was begun. The old colonial governor's palace houses a mining school (founded 1876) and a museum that contains an outstanding collection of minerals native to Brazil. The massive colonial penitentiary contains the Museum of the Inconfidência, dedicated to the history of gold mining and culture in Minas Gerais. The colonial theatre, restored in 1861–62, is the oldest in Brazil. The city has many Baroque churches. Religious architecture and sculpture attained great perfection in the city under the skillful hands of Antônio Francisco Lisboa, better known as Aleijadinho (Little Cripple). The church of São Francisco de Assis and the facade of the church of Nossa Senhora do Carmo are his masterpieces. Pop. (1980 prelim.) 27,821.

Ouroboros, emblematic serpent of ancient Egypt and Greece represented with its tail in its mouth continually devouring itself and being reborn from itself. A Gnostic and alchemical symbol, Ouroboros expresses the unity of all things, material and spiritual, which never disappear but perpetually change form in an eternal cycle of destruction and re-creation.

In the 19th century, a vision of Ouroboros gave the German chemist Friedrich August Kekule von Stradonitz the idea of linked carbon atoms forming the benzene ring.

Ouse, River, also called GREAT OUSE, river in England, draining the East Midlands at the Fens. It rises 5 mi (8 km) west of Brackley, Northamptonshire, and flows past Buckingham, Bedford, Huntington, and St. Ives to Earith and thence via the Fens to The Wash, a shallow inlet of the North Sea. For the first 100 mi it follows an irregular, meandering course, its gradient falling from 20 ft per mi (4 m per km) above Buckingham to 2 ft per mi toward Earith. From Earith to its mouth, a distance of 35 mi, the course is almost entirely artificial, having been straightened and having had its flow controlled by sluices. The average gradient there is very slight. Parts of the upper valley are followed by the Grand Union Canal. Locks make the river navigable upstream to Bedford. Coarse fishing and gravel extraction are important.

The river is sometimes called the Great Ouse to distinguish it from other English rivers of the same name in West Sussex and North Yorkshire.

Ouse, River, river in north central England draining the central Pennines (via its tributaries) and the Vale of York. It is formed by the confluence of the Swale and Ure rivers east of Boroughbridge in central North Yorkshire county. The Ouse flows generally southeastward for 60 mi (99 km) through the city of York and parish (town) of Selby to join the River Aire (at the Humberside county boundary) north of Goole. Nine miles east of Goole the Ouse merges with the north-flowing River Trent to form the River Humber (en route to the North Sea). The average discharge of the Ouse into the Humber is about 3,500 cu ft/sec (100 cu m/sec). The lower Ouse is a major transportation route for industrial products and raw materials (including steel, coal, and textiles); it is connected to the Aire and Calder Navigation, one of England's most important inland waterway systems, that extends into the heavily industrialized county of West Yorkshire. Assorted crops including barley, wheat, potatoes, and sugar beets are grown along its adjacent plain.

Deep-shaft coalfields in the Ouse basin emerged as the United Kingdom's most important new source of coal in the late 1970s, and as new mines opened in the early 1980s north of Selby, the economic significance of the Ouse as a transportation route increased.

Ousmane, Sembène (b. Jan. 1, 1923, Ziguinchor-Casamance, Senegal), Senegalese writer whose historical-political novels and work as a film director since the mid-1960s earned him an international reputation.

Ousmane spent his early years as a fisherman on the Casamance coast. He studied at the École de Céramique at Marsassoum and then moved to Dakar, where he found work as a bricklayer, plumber, and apprentice mechanic until he was drafted into the French Army in 1939. In 1942, during World War II, he joined the Free French forces and landed in France for the first time in 1944. After demobilization he remained in France, working as a docker in Marseille, and became a militant trade unionist.

Ousmane taught himself to read and write in French and in 1956 published his first novel, *Le Docker noir* ("The Black Docker"), based on his experiences in Marseille. After a spinal disorder forced him to give up physical labour, he made literature his livelihood. Among the works that followed were *O pays, mon beau peuple!* (1957; "O My Country, My Beautiful People"), and *Les Bouts de bois de dieu* (1960; *God's Bits of Wood,* 1970), which depicts the African workers' railroad strike to obtain decent wages and working conditions in 1947–48, an early attempt to combat the most flagrant abuses of colonialism, and which was translated into several languages; a volume of short stories entitled *Voltaïque* (1962), *L'Harmattan* (1964, publ. in *Présence Africaine;* "The Storm"), and *Xala* (1974; Eng. trans. 1976), which also provided the subject of one of his best films. In about 1960 Ousmane became interested in motion pictures, in an attempt to reach an African popular audience, 80 percent of whom didn't know French or have access to books in any language. After studying at the Moscow Film School he returned to Africa, and made three short subject films, all reflecting a strong social commitment, and in 1966 a feature film, *La Noire de . . .* (*Black Girl*), the first ever produced by an African filmmaker. It depicted the virtual enslavement of an illiterate girl from Dakar employed as a servant by a French family. The film won a major prize at the 1967 Cannes Film Festival.

With *Mandabi* ("The Money Order"), a comedy of daily life and corruption in Dakar, Ousmane in 1968 made the revolutionary decision to film not in French but in the Wolof language. All his subsequent films were in Wolof. His masterpiece, *Ceddo* (1977; "Outsiders"), an ambitious, panoramic account of aspects of African religions, was banned in his native Senegal.

Out Islands, the islands that make up The Bahamas apart from New Providence Island. Extending eastward off the Florida coast to just north of Hispaniola are about 3,000 islands and rocks, with a combined area of about 4,000 sq mi (10,360 sq km). About 20 of the islands are permanently inhabited. Pop. (1980) 74,068.

Outardes River, French RIVIÈRE AUX OUTARDES, river in Côte-Nord (North Shore) region, east central Quebec province, Canada, rising in the Otish Mountains and flowing southward for 300 mi (480 km) through Lake Plétipi to the St. Lawrence River, 18 mi southwest of Baie-Comeau. Named after the numerous wild geese for which it is famous, the Outardes River, with its many rapids and falls, attracted hydroelectric development in the 1930s and, in the 1960s, the Manicouagan-Outardes Project of Hydro-Quebec.

Outback, in Australia, any inland area remote from large centres of population. Generally, the term is applied to semiarid inland areas of eastern Australia and to the arid centre of the Western Plateau and its semiarid northern plains (in Western Australia) where bodies of water are scattered and frequently dry. The Macdonnell, Musgrave, and Petermann mountain ranges and four major deserts, the Gibson, the Great Sandy, the Great Victoria, and the Tanami, are situated in this latter region. The term has been in use since the 19th century and has many compounds and derivatives, such as "back of Bourke," "back of beyond," "back country," and "backblocks." Terms with similar meaning include "the bush" and "never-never land." Since the mid-1870s, cattle have been raised on the meagre vegetation of the far north, and, beginning in the late 1800s, sheep have been kept on large landholdings called stations. This pastoral activity continues in the Outback together with opal mining and oil production. Stations provide basic economic necessities in the Outback by shipping in supplies from cities. The Royal Flying Doctor Service provides medical assistance to people in the Outback, and correspondence schools of the air instruct pupils using two-way radio equipment and television.

outcaste, in the Hindu caste system, an individual or group that has been thrown out of caste, usually for some ritual offense. The outcasting may be temporary or permanent. In the 19th century, a Hindu faced excommunication for going abroad, where it was presumed he would be forced to break caste restrictions and, as a result, become polluted. Such an offender would be reinstated upon completion of the proper observances, usually culminating in payment of a fine or giving a feast for caste brethren.

To be permanently outcaste was more serious, as it deprived the offender both of a social or economic support group and of a marriage partner. Offspring of certain intercaste unions (traditionally the union of a Brahman mother and a Śūdra father) were considered outcastes. Outcastes might be adopted into an existing caste of low status or form a new caste. Because of their precarious economic position, outcastes frequently were forced to take on polluting jobs no one else wanted to do; thus they became not only outcastes but untouchables.

Some tribal groups in and around India and all foreigners were automatically perceived as *avarṇa* ("casteless," or "out of caste").

Outcault, Richard Felton (b. Jan. 14, 1863, Lancaster, Ohio, U.S.—d. Sept. 25, 1928, Flushing, N.Y.), American cartoonist and creator of the "Yellow Kid," a comic cartoon series that was influential in the development of the comic strip.

Outcault studied art in Cincinnati, Ohio, and in Paris and later contributed to *Judge* and *Life,* humour magazines that had begun publication in the early 1880s. By 1885 he was drawing comic cartoons based on life in the slums for the rejuvenated *New York World,* purchased by Joseph Pulitzer in 1883. Outcault's drawing of an urchin wearing a nightshirt was selected for a colour-production test conducted by the *World* on Feb. 16, 1896. The bright yellow-clad figure attracted such wide attention that the urchin was named the "Yellow Kid." Almost from the first, slangy messages appeared on the nightshirt. Outcault was hired away from the *World* later that year by William Randolph Hearst, owner of *The New York Journal.* Pulitzer outbid Hearst, and then Hearst outbid Pulitzer, at which point Pulitzer gave up and hired George Luks to draw the "Yellow Kid." The press war and the shenanigans over Outcault's services resulted in the expression "yellow journalism" for sensational and unscrupulous publishing. The success of the "Yellow Kid" led to the introduction of many other comics.

In 1897 Outcault left the *Journal* for *The New York Herald,* where in 1902 he created "Buster Brown," his second important cartoon character. Neat and prissy in appearance, Buster was a mischief-maker who carried out his pranks in a genteel setting far removed from the tough, vigorous slum of the "Yellow Kid." The strip is remembered chiefly for the subsequent use of the name Buster Brown in advertising a wide range of products.

Outer Banks, also called THE BANKS, chain of islands extending southward for 175 miles (282 km) along the coast of North Carolina, U.S., from Back Bay, Va., to Cape Lookout, N.C. Generally covered with sand dunes, the islands range from a few feet to more than 100 feet (160 m) in height. They are inhabited by some fishermen and farmers, and the area attracts bird hunters and sports fishermen. The Atlantic Intracoastal Waterway threads its way between Outer Banks and the mainland. The Banks are full of shipwrecks and pirate lore and have several historical sites, notably Roanoke Island (*q.v.*), where an unsuccessful English colony was established in 1585, and Kitty Hawk, where the Wright brothers made the first powered airplane flight.

Outer Hebrides, islands off the northwestern coast of Scotland, administered as the Western Isles Area, one of the three Islands areas of Scotland. As their name suggests, the Outer Hebrides lie farther away from the Scottish mainland than do the islands of the Inner Hebrides. The Outer Hebrides stretch 130 miles (210 km) from Lewis Island in the north to Barra Head Island in the south. They are separated from the Inner Hebrides in the north by the North Minch and Little Minch channels and in the south by the Sea of the Hebrides. The Outer Hebrides lie in a crescent about 40 miles (65 km) from the Scottish mainland. The largest islands of the Outer Hebrides are Lewis, Harris, North Uist, Benbecula, South Uist, and Barra. About 40 miles (65 km) northwest of the main chain is the island of St. Kilda.

Many of the islands in the Outer Hebrides are uninhabited, and almost all of the population lives on Lewis and Harris. There has been considerable depopulation of the islands in the 20th century, primarily because of the lack of economic opportunities. The islands are one of the few areas in Scotland where Scottish Gaelic is still spoken as the everyday language.

Wildlife is abundant in the Outer Hebrides. The more isolated islands contain large seabird populations, including gannets, fulmars, and puffins. Red deer is found on the northern islands, a primitive wild sheep is native to Soay Island, and the Atlantic gray seal inhabits many coastal areas. The vegetation of the islands consists mostly of grassland and tundralike herbage, with peat bogs frequently found in the poorly drained lowlands. The islands' barren and rock-strewn eastern coasts contrast sharply with the white sand beaches backed by grassy plains (the *machair*) found along the western coasts. Trees are few, and for the most part the scenery is open and bleak. The harsh environment and scanty, poor soil limit cultivation to hardy fodder crops, potatoes, and a few vegetables.

Crofting (tenant farming) is the traditional mainstay of the economy and is still widely practiced. The typical croft is just a few acres with a handful of sheep, a cow, and enough crops to supplement the diet and provide a small income. Peat is cut in the extensive moors of the islands' interior and is used to heat the crofters' homes. The islands are also known for their high-quality Harris tweed, which is traditionally woven on handlooms by the crofters at home. Fishing is also important, though it has declined since the heyday of herring fishing during the early part of the century.

The Outer Hebrides have been inhabited for at least 4,000 years, and prehistoric remains are numerous, including the fine Megalithic stone circle at Callanish (Lewis). Equal in importance to Stonehenge, the Callanish megaliths are aligned to make a rough Celtic cross 405 feet (123 m) north to south and 140 feet (43 m) east to west. Several smaller stone circles in the area align with Callanish.

Stornoway on Lewis is the chief town and administrative centre of the islands. It has a good natural harbour and contains ship repair facilities and a construction yard for the nearby offshore oil industry.

Outer Space Treaty, formally TREATY ON PRINCIPLES GOVERNING THE ACTIVITIES OF STATES IN THE EXPLORATION AND USE OF OUTER SPACE, INCLUDING THE MOON AND OTHER CELESTIAL BODIES (1967), international treaty binding the parties to use outer space only for peaceful purposes. In June 1966 the United States and the Soviet Union submitted draft treaties on the uses of space to the United Nations. These were reconciled during several months of negotiation in the Legal Subcommittee of the UN Committee on the Peaceful Uses of Outer Space, and the resulting document was endorsed by the UN General Assembly on Dec. 19, 1966, and opened for signature on Jan. 27, 1967. The treaty came into force on Oct. 10, 1967, after being ratified by the United States, the Soviet Union, the United Kingdom, and several other countries.

Under the terms of the treaty, the parties are prohibited from placing nuclear arms or other weapons of mass destruction in orbit, on the Moon, or on other bodies in space. Nations cannot claim sovereignty over the Moon or other celestial bodies. Nations are responsible for their activities in space, are liable for any damage caused by objects launched into space from their territory, and are bound to assist astronauts in distress. Their space installations and vehicles shall be open, on a reciprocal basis, to representatives of other countries, and all parties agree to conduct outer-space activities openly and in accordance with international law.

Outjo, town, northwestern Namibia. The town is situated on a cluster of low hills at an elevation of 4,135 feet (1,260 m). It lies within an arid region that has accessible underground water supplies, and it has the character of a frontier outpost.

Thomas Lambert, the first European settler, arrived there in 1880, and German colonial authorities established a military post at Outjo in 1895. It became a municipality in 1944. The town is a trading centre for the surrounding ranching and stock-raising area, and the local industries for the most part produce meat and dairy products and Karakul lambs' wool. A branch railway from Otjiwarongo, 29 miles (47 km) to the southeast, terminates at Outjo. Repeated raids by Owambo (Ovambo) guerrillas of the South West Africa People's Organization (SWAPO), an Owambo (Ovamboland) and southern Angola-based group demanding South African troop withdrawal from what was then South West Africa/Namibia, plagued ranchers of Outjo and the surrounding area in the late 1970s and '80s. Pop. (1983 est.) 4,380.

outlawry, act of putting a person beyond the protection of the law for his refusal to become amenable to the court having legal jurisdiction. In the past, this deprivation of legal benefits was invoked when a defendant or person was in civil or criminal contempt of court, and, in cases of alleged treason or the commission of a felony (referred to as major outlawry), it amounted to a conviction as well as an extinction of civil rights. In England, on proof of the mere fact of major outlawry, the offender was sentenced to death and was often killed on sight or during the effort to arrest him. Conviction for major outlawry also effected the immediate forfeiture of all property and possessions to the crown and prevented the receipt of any property. In civil proceedings outlawry was formally abolished in England in 1879. Under English law outlawry can now be invoked only for one accused of criminal charges.

In other countries outlawry in civil actions was virtually unknown, but manifestations of it, ranging from informal social ostracism to formal statutory proscription, were used as a criminal sanction. Conviction did not always result in sentence of death, but often the punishment involved transportation or exile for the offender, thereby completely stripping him of the benefits of his native land.

Some societies practiced a social form of outlawry on people not even accused of an offense but characterized by some manner of physical or mental abnormality. In India, for example, persons affected with leprosy were placed under ban and disability and driven from their communities to live in leper colonies, without the ordinary benefits of society.

Outram, Sir James, 1ST BARONET (b. Jan. 29, 1803, near Butterley, Derbyshire, Eng.—d. March 11, 1863, Pau, Fr.), English general and Indian political officer known, because of his reputation for chivalry, as "the Bayard of India" (after the 16th-century French soldier Pierre Terrail, seigneur de Bayard).

He was educated at Marischal College, Aberdeen, and went to Bombay as a cadet in 1819. After serving with distinction in the early stages of the First Afghan War (1839–42), he was appointed political agent in Sind. Though dismissed on the appointment to Sind of Sir Charles Napier, he persuaded the independent chieftains of Sind to accept a harsh new treaty. According to its terms his prize money amounted to 30,000 rupees, which he gave to charitable institutions in India because he considered the war unjust. He served as resident at Baroda and Lucknow, where he carried out the annexation of the state of Oudh in 1856. He successfully commanded an expedition against Persia in 1857 and was created lieutenant general.

At the outbreak of the Indian Mutiny of 1857 he was recalled from Persia, given command of two divisions, and resumed his commissionership of Oudh. During the mutiny he was appointed to succeed Sir Henry Havelock at Cawnpore (Kānpur), but instead he magnanimously asked to serve under Havelock during the first siege of that city. In 1858 he was awarded a baronetcy and appointed military member of the governor-general's council. In 1860 he returned to England. Outram is buried in Westminster Abbey, and a full-length bronze figure of him stands on the Thames Embankment near Charing Cross, London.

Outremeuse, Jean d' (b. 1338?—d. 1399?), French author of two romanticized but fascinating historical works. The first, *La Geste de Liège,* is a leisurely account, partly in prose, partly in verse, of the mythical history of his native city. *Ly Myreur des Histors* ("The Mirror of History") is even more ambitious, purporting to be a history of the world from the Flood up to the 14th century.

D'Outremeuse was no accurate historian, but his fictionalized accounts of the past offer insights into the workings of a medieval mind. It is also possible to discover, amidst a great deal of pure invention, unique evidence about the author's time and especially about literature in his age.

Outremont, city, Montréal region, southern Quebec province, Canada. It lies in the centre of Montreal Island, adjoining Montreal city. Originally called Côte-Sainte-Catherine, it was renamed in 1875 for its location in relation to Montreal—on the far side of Mont-Royal. The city, a part of the Montreal Metropolitan Corporation, is now primarily a high-density residential suburb. Inc. town, 1895; city, 1915. Pop. (1981) 24,338.

outwash, deposit of sand and gravel carried by running water from the melting ice of a glacier and laid down in stratified deposits. An outwash may attain a thickness of 100 m (328 feet) at the edge of a glacier, although the thickness is usually much less; it may also extend many kilometres in length. For example, outwash deposits from the Wisconsin Glaciation can be traced to the mouth of the Mississippi River, 1,120 km (700 miles) from the nearest glacial terminus.

The sheet of outwash may be pitted with undrained kettles or dissected by postglacial streams. Outwash plains are commonly crossbedded with units of alternating grain size. The ordinarily gentle slope causes the larger material to be dropped nearest the glacier, while the smaller grain sizes are spread over greater distances. Striated pebbles are uncommon because the striations are worn away during transport. Outwashes are the largest of the fluvioglacial deposits and provide a considerable source of windblown material. When confined within valley walls, the outwash deposit is known as a valley train.

Ouvéa Island, also called UVÉA, or UEA, ISLAND, French ILE OUVÉA, or UVEA, or UEA, northernmost of the Loyalty Islands, an island group within the French overseas territory of New Caledonia, southwestern Pacific Ocean. Ouvéa is a crescent-shaped atoll, 30 miles (50 km) long and 4½ miles (7 km) wide, with a total area of 51 square miles (132 square km). The most fertile of the group, it is wooded and exports copra. Faiaué (Fayaoué), on the southeast coast, is the chief village and administrative centre. Several tourist facilities lie on the 20-mile (32-kilometre) beach that borders the large lagoon. Both a Samoan and a Vanuatan language are used. Pop. (1983) 2,772.

Ovando, Nicolás de (b. *c.* 1451, Brozas, Castile [now in Spain]—d. *c.* 1511), Spanish military leader and first royal governor of the West Indies. He was the first to apply the encomienda system of Indian forced labour, which became widespread in Spanish America, and he founded a stable Spanish community in Santo Domingo that became a base and model for later settlement.

The son of a noble family, he grew up close to the court of Ferdinand and Isabella and was among the companions of the heir apparent to the throne. As a knight of the military Order of Alcántara, Ovando assisted in reforming the order, and as a reward for his services he was chosen to replace Francisco de Bobadilla as governor of the Spanish colonies in the West Indies. He arrived in Santo Domingo in 1502 with more than 2,000 colonists and the largest fleet that had ever sailed to the New World.

The natives of Santo Domingo, however, were reluctant to work for the Spanish colonists, and Ovando, with royal authority, established the paternalistic encomienda system. Intended to offer the Indians food and security in exchange for their labour, it quickly became a means for simple and brutal exploitation. Perhaps fearing him as a rival, Ovando let Christopher Columbus linger for a year without help in Jamaica, where the explorer had run aground on his fourth voyage to America. On learning of Ovando's harsh treatment of the Indians, the authorities in Spain recalled him in 1509. He returned to Spain, where he wrote his memoirs and published a map of Santo Domingo.

ovary, in botany, enlarged basal portion of the pistil, the female organ of a flower. The ovary contains ovules, which develop into seeds upon fertilization. It will mature into a fruit, either dry and parchmentlike or fleshy, enclosing the seeds.

A simple or unicarpellate ovary is formed from a single carpel, an evolutionarily modified leaf. It has one chamber (locule), within which are the ovules. A multicarpellate ovary consists of more than one carpel and may have one or more locules.

Ovary position is a useful feature in classification. An ovary attached to the receptacle above the attachment of other floral parts is termed superior; when it lies below the attachment of other floral parts, it is inferior. *See also* flower.

ovary, in zoology, female reproductive organ in which sex cells (eggs or ova) are produced. The usually paired ovaries of female vertebrates produce both the sex cells and the hormones necessary for reproduction. In some invertebrate groups such as coelenterates, formation of ovaries is associated with the seasons. Many invertebrates have both ovaries and testes in one animal, and some species undergo sex reversal. *See also* egg; gonad.

In humans, ovaries of the newborn and young child are a mass of elongated tissue; as the female reaches adolescence, the ovaries gradually enlarge and change their shape. The adult ovaries are almond-shaped and are about 4 centimetres (1.6 inches) long, 2 centimetres (0.8 inch) wide, and 1.5 centimetres (0.6 inch) thick; the two ovaries weigh from 4 to 8 grams (0.15 to 0.3 ounce). The ovaries are attached to the uterus and the fallopian tubes by several ligaments. The surfaces of the ovaries are usually uneven and have areas of scar tissue. Hollow balls of cells—follicles—containing immature egg cells are present in the ovaries at birth; there are usually 150,000 to 500,000 follicles at this time. When the female reaches adolescence and young adulthood, the number has been reduced to only about 34,000. As a woman ages, the follicles gradually diminish in number until, at menopause and the cessation of reproductive powers, the few remaining follicles degenerate. During the active child-bearing years, normally between the ages 13 and 50, only 300 to 400 of the follicles undergo maturation. In about every four weeks of the active reproductive years, one follicle from only one of the two ovaries matures; the egg inside the follicle is extruded from the ovary into the rest of the reproductive tract for fertilization. If the egg is not fertilized by the male sperm, it passes from the body during the process of menstruation (*q.v.*).

The ovaries also function as endocrine glands by secreting two hormones, estrogen and progesterone, into the bloodstream. Estrogen, which is secreted by the ovarian follicle, controls the development of the secondary sex characteristics such as enlargement of the breasts, growth of pubic hair, and the increased amount of fat on the hips and buttocks; estrogen also stimulates growth of the uterine lining during the menstrual cycle. Progesterone is secreted from the cells of the corpus luteum, a body that develops at the site of the mature follicle upon release of the egg. Progesterone helps the fertilized egg to secure itself to the uterus and to develop into an embryo.

The centre of the ovary, called the medulla, is a core of connective tissue consisting of blood vessels, lymphatic ducts, and nerve fibres. The thick layer covering the medulla is the cortex, which contains the follicles and ova. As a follicle matures, it enlarges and migrates to the surface of the ovary. When an egg is discharged from a follicle, blood and yellow cells move into the empty follicular cavity to fill it; this tissue becomes the corpus luteum. If the egg is fertilized, the corpus luteum remains until the end of pregnancy; during this time the corpus luteum secretes progesterone. If the ovum is not fertilized, the corpus luteum becomes a whitish scar mass, known as corpus albicans, which, usually, eventually disappears.

After menopause, the ovaries shrink in size and usually consist of old fibrous tissue. The production of estrogen drops considerably but does not totally cease. *See also* ovulation.

For a depiction of the ovaries in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

ring, and black-edged orange crown, the bird looks like a small thrush. Its song, "tee-cher," is repeated with increasing intensity in dank woods. The ovenbird walks, unlike most other wood warblers, which hop. Its nest is a dome of grass placed on the ground.

The term ovenbird is also used broadly for members of the tropical American family Furnariidae (*q.v.*) and especially for members of the genus *Furnarius* (also known by the Spanish name hornero, meaning "baker"). They are 15–20 centimetres (6–8 inches) long, reddish brown, and thrushlike, common in open country throughout most of South America. On a branch, post, or roof ledge, the hornero builds an ovenlike nest of mud and grass, about 30 cm high, with an enclosed nest chamber.

over-the-counter market, trading in stocks and bonds that does not take place on stock exchanges; such trading is most significant in the United States, where requirements for listing stocks on the exchanges are quite strict. It is often called the "off-board market," and sometimes the "unlisted market," though the latter term is misleading because some securities so traded are listed on an exchange. Over-the-counter trading is most often accomplished by telephone, telegraph, or leased private wire.

In this market, dealers frequently buy and sell for their own account and usually specialize in certain issues. Schedules of fees for buying and selling securities are not fixed, and dealers derive their profits from the markup of their selling price over the price they paid. The investor may buy directly from a dealer willing to sell stocks or bonds that he owns or with a broker who will search the market for the best price.

Bonds of the U.S. government ("treasuries"), as well as many other bond issues and preferred-stock issues, are listed on the New York Stock Exchange but have their chief market over-the-counter. Other U.S. government obligations, as well as state and municipal bonds, are traded over-the-counter exclusively.

A third market has developed because of the increased importance of institutional investors, such as the mutual funds, who deal in large blocks of stock. Trading is done in shares listed on the exchanges but takes place over-the-counter; this permits large-quantity discounts not possible on the exchanges, where brokerage fees are fixed.

Much of the regulation of the over-the-counter market is effected through the National Association of Securities Dealers, Inc., created in 1939 by an act of Congress to establish rules of conduct and protect members and investors from abuses. Although retail prices of over-the-counter transactions are not publicly reported, the NASD began publishing interdealer prices for the issues on its national list in February 1965.

Overbeck, Johann Friedrich (b. July 3, 1789, Imperial Free City of Lübeck—d. Nov. 12, 1869, Rome), Romantic painter of Christian religious subjects, who was leader of a group of German artists known as the Nazarenes, or Lucas Brotherhood (Lukasbund).

In 1806 Overbeck entered the Academy of Vienna, where, disappointed in the academic approach to teaching, he and Franz Pforr in 1809 founded the Lucas Brotherhood. They sought to revive the medieval artists' guilds and to renew the arts through Christian faith (in 1813 Overbeck joined the Roman Catholic Church). For artistic inspiration they turned to Albrecht Dürer and to Italian Renaissance art, particularly the works of Perugino and early Raphael.

In 1810 the Lucas Brotherhood went to Rome. Their style was characterized by precise outlines; clear, bright colours; and an emphasis on Christian symbolism. Communally, the

brotherhood executed the frescoes of "Joseph Sold by His Brethren" at the Casa Bartholdy (1816) and the interior pavilion (1817–29) at the Villa Massimo in Rome. In the Portiuncula Chapel at Assisi, Overbeck painted "Rose Miracle of St. Francis" (1829), usually considered his major work.

As he advanced in years, Overbeck's painting became pallid and stereotyped. Yet these late works greatly influenced Christian devotional art of the 19th century and the paintings of the Pre-Raphaelite Brotherhood. His more vital early pictures and drawings, however, were rediscovered and appreciated early in the 20th century.

Overbury, Sir Thomas (baptized June 18, 1581, Compton Scorpion, Warwickshire, Eng.—d. Sept. 15, 1613, London), English poet and essayist, victim of an infamous intrigue at the court of James I. His poem *A*

Wife, which pictured the virtues that a young man should demand of a woman, played a large role in the events that precipitated his murder.

Overbury was educated at Oxford and entered the Middle Temple, London, in 1598.

Having traveled in the Low Countries, in 1606 he became secretary and close adviser to Robert Carr, the king's favourite who was to become earl of Somerset. Overbury was knighted in 1608, and Carr became Viscount Rochester in 1611.

In 1611 Rochester became enamoured of Frances Howard, wife of the Earl of Essex. Lady Essex soon secured a divorce from her husband with the intention of marrying Rochester. Overbury feared that Rochester's prospective marriage would reduce his own influence over Rochester, however, and he tried strongly to dissuade the latter from marrying her. Overbury also circulated manuscript copies of *A Wife* at court, where the poem was interpreted as an indirect attack on Lady Essex. This incurred the displeasure of the king and enabled Lady Essex' powerful relatives to have Overbury imprisoned in the Tower. Rochester acceded to Overbury's imprisonment only until he could marry Lady Essex, but she herself was evidently determined to have Overbury murdered there. She secretly arranged to have him slowly poisoned to death, which he was.

Three months after Overbury died, Rochester, now Earl of Somerset, married Lady Essex. Two years passed before public suspicions were aroused over what had taken place, but then investigations were undertaken and the participants in Overbury's murder were put on trial. Four accomplices in the murder were convicted and executed; the Earl and Countess of Somerset were also convicted but were pardoned by the king.

Overbury's *A Wife* was published in 1614 and went through several editions within a year because of the publicity aroused by Overbury's victimization. Its real literary value lies in the *Characters,* ultimately 82, that were added to the second and subsequent editions. These prose portraits of Jacobean types, drawn with wit and satire, give a vivid picture of contemporary society and are important as a step in the development of the essay. A few were by Overbury, but most were contributed by John Webster, Thomas Dekker, and John Donne.

Overijssel, *provincie* (province), northeastern Netherlands, extending northward "beyond the IJssel," a distributary of the Rhine, from the provinces of Gelderland to Drenthe and Friesland and lying between Germany (east) and Flevoland Province (west). Drained by the IJssel, Vecht, Zwarte Water, and Regge rivers and the Twente, Overijssel, and numerous smaller canals, it occupies an area of 1,289 square miles (3,339 square km). Its capital is Zwolle. First known as the lordship of Oversticht, a part of the secular domain of the bishops of Utrecht, it was sold to Charles V in 1527 and was incorporated in the Dutch dominions of the Habsburgs. Overijssel was one of the seven original United Provinces of the Netherlands. In medieval times its Hanseatic towns—Kampen, Deventer, and Zwolle—were among the most important in the Netherlands, until the ascendancy of Amsterdam *c.* 1500.

Most of Overijssel is a varied glaciated delta with sandy soil and low hills that were originally covered with heath, patches of woodland, and moist swampy meadows. High-peat regions once extended to the northeast. The largely coastal area north of Zwolle consists of low peat, partly covered with clay. This northwestern part is primarily pasture, supporting cattle and dairying; in the sand regions there is dairying as well as mixed farming. The central Salland district has orchards.

The province has become highly industrialized. The Twente district in the southeast, where cotton spinning, weaving, and bleaching came into prominence in the 19th century, is one of the principal centres of the Dutch textile industry. The main centres are Enschede, Almelo, Hengelo, and Oldenzaal. Other important industrial centres are Deventer, Kampen, and Zwolle. There are two national parks (1934; 1957) in the northwest, preserving peat bogs and marsh plants and providing sanctuaries for waterfowl. Pop. (1986 est.) 998,751.

Øverland, Arnulf (b. April 27, 1889, Kristiansand, Nor.—d. March 25, 1968, Oslo), Norwegian poet and Socialist whose poems helped inspire the Norwegian resistance movement during the German occupation in World War II.

He studied philology briefly at King Frederick's University. His first book of poems, *Den ensomme fest* (1911; "The Lonely Feast"), was immediately acclaimed for its style, its clarity, and its economy. All his life Øverland was an uncompromising defender of the oppressed, but not until after World War I, in his *Brød og vin* (1919; "Bread and Wine"), did he develop a radical opposition to bourgeois society and to Christianity and recognize a need to make his poetry into a social weapon. His poems of the 1930s were intended to alert Norwegians to the danger of Fascism and Nazism. The best-known of these is "Du må ikke sove!" (1937; *You Must Not Sleep!*). The poems that he directed against the Nazi occupation and that he wrote and distributed secretly in 1940 led to a four-year imprisonment in a German concentration camp. When he was liberated in May 1945, the Norwegian government presented him with the old home of the great national poet, Henrik Wergeland, as an expression of gratitude.

Overseas Surveys, Directorate of, surveying, mapping, and aerial photography agency of the Overseas Development Administration (ODA) of the United Kingdom, founded in 1946 to provide advice to the ODA and foreign governments and organizations on technical matters concerning all aspects of surveying and mapping. The maps are produced by modern aerial photography and photogrammetric methods. Aerial photography missions are flown mainly by air survey companies of the United Kingdom, and directorate surveyors are sent overseas to establish horizontal and vertical ground control for the photography. Survey control is permanently marked and coordinated so that the surveys may form the basis for future work. After maps are compiled from the aerial photography, plots of the maps are checked and annotated by the local survey department. Final maps are drawn at directorate headquarters and printed by the Ordinance Survey of Great Britain. The directorate's technical libraries provide facilities for consultation of survey data and maps of the countries in which the directorate has worked. The directorate also disseminates information on new techniques and equipment in the fields of surveying, photogrammetry, and cartography.

Overton, Richard (fl. 1631–64), English pamphleteer and a Leveler leader during the English Civil Wars and Commonwealth.

The details of Overton's early life are obscure, though he probably lived in Holland and studied at Queens' College, Cambridge, before becoming a professional actor and playwright in Southwark. In 1640 he became a political activist, writing some 50 tracts attacking the Church of England, monopolies, the Earl of Strafford (Charles I's controversial adviser), and civil law. In *Man's Mortality* (1643), he argued that the soul as well as the body dies and must be resurrected. His tracts of 1645–46, published under the pseudonym Martin Marpriest, castigated the Presbyterians and the Westminster Assembly of Divines for their intolerance. In a series of 40 tracts published between 1645 and 1649 and 20 editorials in the Leveler newspaper, *The Moderate* (1648–49), he enunciated his radical political theory, with its key ideas of popular sovereignty, the equality of all men under natural law, republican government, and the social contract as the foundation of government and society. He also demanded major social and legal reforms, including the abolition of mandatory tithes, the return of enclosed lands to communal use, and university reform.

Within the Leveler movement, of which he was a key leader, Overton worked as a theorist, a journalist, and a political organizer. He was especially effective with the use of mass petitions espousing the Leveler cause. For his efforts he was imprisoned in Newgate (1646–47) and the Tower of London (1649). By the time of his release in November 1649, the government had suppressed the Leveler movement, but in 1654 Overton was still trying to create an alliance of Levelers, army republicans, and Royalists to topple Oliver Cromwell. Although Overton had to flee to the Continent, he was back and plotting again by 1656. He apparently continued to support republican causes into the early 1660s, after which nothing is known of him. His career is recounted in M. Gimelfarb-Brack, *Richard Overton* (1980).

overtone, faint tone sounding above the fundamental tone when a string or air column vibrates as a whole, producing the fundamental (first partial, or first harmonic); if it vibrates in sections, it produces overtones (upper partials, or harmonics). The listener normally hears the fundamental pitch clearly; with concentration he can hear the faint overtones.

Harmonics are a series of overtones resulting when the partial vibrations are of equal sections (*e.g.,* halves, thirds, fourths). As the vibrating sections become smaller, the harmonics are higher in pitch and successively closer together. The frequencies of the upper harmonics form simple ratios with the frequency of the first harmonic, or fundamental (*e.g.,* 2:1, 3:1, 4:1).

Some musical instruments—among them those whose sounds result from the vibration of metal, wood, or stone bars; of cylinders; of plates (*e.g.,* cymbals, bells, marimbas); or of membranes (drums)—produce nonharmonic overtones, or partials—that is, tones the frequencies of which (and, therefore, the pitches of which) lie outside the harmonic series. Musical timbre, or tone colour, is greatly affected by the particular overtones favoured by a given instrument. Thus, the clarinet owes much of its mellow sound to lower overtones, as opposed to the more nasal oboe, which lacks them. *See also* combination tone.

overture, musical composition, usually the orchestral introduction to a musical work (often dramatic), but also an independent instrumental work. Early operas opened with a sung prologue or a short instrumental flourish, such as the trumpet "Toccata" that opens Claudio Monteverdi's *Orfeo* (1607). Subsequent 17th-century operas were sometimes preceded by a short instrumental piece called a sinfonia, sonata, or, often in Venice, canzona. The first significant use of a full-scale overture, however, was made by Jean-Baptiste Lully, in works such as his opera *Thésée.* His musical form, known as the French, or Lullian, overture, opens with a slow section in dotted rhythms, followed by a quick section in fugal, or imitative, style; it often concluded with a slow passage that sometimes was expanded into a full third section—either a repetition of the initial slow section or a dance form such as a minuet or gavotte.

Lully's overture form was widely copied, by composers of not only opera (Henry Purcell in *Dido and Aeneas*) but also oratorios (Handel in the *Messiah*). Lully's use of a dance form to conclude an overture influenced the development of the orchestral suite, in which a French overture is followed by a series of dances. J.S. Bach's four orchestral "Overtures" are examples of this form of suite, which persisted into the mid-18th century.

The Italian overture became firmly established after 1680 in the operas of Alessandro Scarlatti. It is in three sections, the first and third in quick time and the second in slow time (allegro–adagio–allegro). It provided the model for the earliest symphonies, which consisted of three movements. The works of both C.P.E. Bach and Jiří Antonín Benda contain Italian overtures.

A more modern form of the opera overture was established by Christoph Gluck, who in the dedication of his opera *Alceste* (1767) declared that the overture should prepare the audience for the plot of the play. In *Alceste* and in *Iphigénie en Tauride,* the overtures, instead of closing before the curtain rises, merge into the mood of the opening act. Richard Wagner later used a similar technique in operas, such as *Tristan und Isolde.* Mozart in his overtures also set the emotional tone of the drama to follow. In his *Don Giovanni* and *Die Zauberflöte* (*The Magic Flute*) he alludes to themes from the operas. Similar thematic anticipation occurs in the works of Beethoven, Wagner, and Carl Maria von Weber.

Another trend, particularly in French operas by Daniel Auber and François Boieldieu (early 19th century), was established by the overture made up of a potpourri of tunes from the opera—a form common in musical comedies and operettas. In Italy during the same period, the overture simply served to attract the audience's attention; Gioacchino Rossini, for example, often used one overture for more than one opera.

Many overtures of the 18th and 19th centuries were derived from the sonata form. But toward the end of the 19th century the overture was frequently replaced by a short prelude in free form, which led directly into the opening scene—Wagner's *Lohengrin* and Giuseppe Verdi's *Aida* contain such preludes. Introductions to Claude Debussy's *Pelléas et Mélisande* and Benjamin Britten's *Peter Grimes* likewise consist only of a few bars of music. In Pietro Mascagni's *Cavalleria rusticana* the prologue is an aria sung in front of the curtain.

The concert overture, based on the style of overtures to romantic operas, became established in the 19th century as an independent, one-movement work, which took either the classical sonata form or the free form of a symphonic poem. Examples of such works include Felix Mendelssohn's *Hebrides* overture and Sir William Walton's *Portsmouth Point* overture. Concert overtures were also written for performance on special occasions, *e.g.,* Brahms's *Academic Festival Overture.* Other works, such as Mendelssohn's *Overture to A Midsummer Night's Dream* and Beethoven's overture to Goethe's *Egmont,* originally were intended to be performed as an introduction to a spoken play.

Overweg, Adolf (b. July 24, 1822, Hamburg—d. Sept. 27, 1852, Maduari, Chad), German geologist, astronomer, and traveller and the first European to circumnavigate and map Lake Chad. Overweg was also a member of a pioneering mission to open the Central African interior to regular trade routes from the north coast of the continent.

In 1849 Overweg joined an expedition, headed by the English explorer James Richardson, which was mounted by the British government for the purpose of opening commercial relations with the kingdoms of Central Africa. The expedition left Tripoli, in Libya, in the spring of 1850 and crossed the Sahara southward. Early in 1851 the group split up, and Overweg went on alone by way of Zinder (in present south central Niger) to Kukawa (northeast Nigeria), where he joined Heinrich Barth (*q.v.*), the expedition's scientist (and, after the death of Richardson, leader). The two spent 18 months exploring southward to Adamawa emirate (Nigeria) and the Benue River, around Lake Chad and to the southeast, till Overweg's death.

Ovid, Latin in full PUBLIUS OVIDIUS NASO (b. March 20, 43 BC, Sulmo, Roman Empire—d. AD 17, Tomis, Moesia), Roman poet noted especially for his *Ars amatoria* (*Art of Love*) and *Metamorphoses.* On unrevealed charges of immorality, the emperor Augustus banished him in AD 8 to Tomis, a remote corner of the empire on the Black Sea, where he continued to write, notably the *Tristia* (*Sorrows*).

Early years. Publius Ovidius Naso was, like most Roman men of letters, a provincial. He was born at Sulmo (modern Sulmona), a small town about 90 miles (140 kilometres) east of Rome. More than once in his poetry

he refers affectionately to the green and pleasant fields of his native land. His family was old and respectable, sufficiently well-to-do for his father to be able to send him and his elder brother to Rome to be educated. At that time Ovid must have been about 12 years old, having passed rapidly through the primary and secondary stages of his education. At Rome he embarked, under the best teachers of the day, on the third stage, that of the schools of rhetoric.

In these establishments Roman boys studied to achieve absolute mastery of the art of fluent extempore speaking on any subject. For the majority, since philosophy tended to be despised by practical men, this was the final and most important part of their education. The method used was that of formal declamation on prescribed themes, usually of a legal or pseudo-legal character. These themes were based on imaginary situations that were often improbable and sometimes bizarre. In contrast to his brother, whose early death robbed the Roman bar of a promising recruit, Ovid had no liking for the legalistic exercises most in vogue. The elder Seneca (*c.* 55 BC–*c.* AD 37), who has left us a valuable account of Ovid at this period of his life, remarks that he was irked by formal argument and preferred the themes called "ethical," in which the point at issue turned on moral and psychological considerations. There is no doubt that Ovid's time in the schools profoundly affected his poetry. Oratory as there practiced was "rhetorical" in the most extreme sense, dominated by constant striving for effect, by the search for point, paradox, and antithesis and by the ambition to outdo the previous speaker by some fresh and ingenious perversion of probability. The intensely competitive atmosphere was calculated to foster Ovid's natural gift for effective expression and to encourage his interest in the communication of emotion.

As a member of the Roman knightly class (whose rank lay between the commons and the Senate) Ovid was marked by his position, and intended by his father, for an official career. First, however, he spent some time at Athens (then a favourite finishing-school for young men of the upper classes) and travelled in Greek lands with his friend Pompeius Macer, like himself a poet. This experience bore fruit in his poetry, in the form of mythological associations that are firmly rooted in the classical landscapes. Afterward, Ovid dutifully held some minor judicial posts, the first steps on the official ladder, but he soon decided that public life did not suit him. One legacy of this period would seem to be the predilection for legal phrases and metaphors that he shows in his earlier poems. From now on Ovid abandoned business to cultivate poetry and the society of poets, including his contemporary Sextus Propertius and the somewhat older Horace. Virgil he had not met, and Tibullus died before he could get to know him well. It is interesting and may be significant that the warmest tribute Ovid pays to a contemporary poet is to Tibullus, in a funeral elegy on his death. Tibullus, like himself, was a member of the literary circle of the patron Marcus Valerius Messala, whereas Virgil, Horace, and Propertius all belonged to the group around Gaius Maecenas, which was more representative of what might be called the Augustan establishment. Certainly the type of poetry he wrote during the first period of his career reflects a view of life, love, and poetry at odds with the "official" moral attitudes encouraged by Augustus.

His first poems, the *Amores* (*Loves*), were published at intervals, beginning in about 20 BC, in five books. They form a series of short poems in the elegiac metre depicting the various phases of a love affair with a woman called Corinna. Inspiration and treatment, however, are more intellectual than emotional, and the collection verges on a tongue-in-cheek mockery of the genre. A poem that was later to play a part in his downfall, the *Ars amatoria*, was published *c.* 1 BC. The message of this brilliant treatise on the art of seduction and intrigue was essentially subversive of the official program of moral reforms then being fostered by Augustus, and it cannot have been well received by those who were seriously committed to the goals and aspirations of Augustanism. It also included a number of references, in their contexts both flippant and tactless, to symbols of Augustus' personal prestige. A mock recantation that soon followed, the *Remedia amoris* (*Cure for Love*), cannot have helped matters. During this period Ovid also published his *Epistulae Heroidum* (*Letters from Heroines*), a series of clever, though in sum perhaps monotonous, dramatic soliloquies. While the theme of these character sketches is love, the material is mythological; and here can be seen, in embryo, the *Metamorphoses*.

Maturity: the major poems. As a writer of love elegy, Ovid had spoken in character, claiming the respect and attention due to experience and even revelation. Perhaps the fruits of some wild oats may be detected in the *Amores, Ars amatoria,* and *Remedia amoris,* but the biographer must discount most of Ovid's protestations as properly belonging to a conventional literary pose. In fact Ovid seems to have been, by contemporary standards, a respectable family man. He was first married for a short time, when very young, to a wife of whom he says no more than that she was unsuitable. To his second wife he imputes no blame, but this marriage also was brief. His third union, to a member of an important noble family, was stable and apparently based on mutual affection. We hear also of one daughter, perhaps of the second marriage. Having published a substantial body of highly original work, Ovid was by now established as the leading living poet of Rome (Horace, the last of the great Augustans, had died in 8 BC, and there were no other possible rivals). In the last poem of the *Amores,* Ovid had promised that he would soon turn to more ambitious themes. This promise he now redeemed by the publication of work in three major genres.

His tragedy *Medea* has been lost. It was praised by the critic Quintilian and the historian Tacitus and can hardly have failed to influence Seneca's play on the same theme.

Ovid's *Fasti* (*Calendar*) is an account of the Roman year and its religious festivals, consisting of 12 books, one to each month, of which the first six survive. The various festivals are described as they occur and are traced to their legendary origins. Such "aetiological" poetry was characteristic of poets of the Hellenistic Age (after 323 BC), especially of Callimachus; and in choosing this genre Ovid was deliberately challenging Propertius' claim to be "the Roman Callimachus." Thus the *Fasti* was a national poem, intended to take its place in the Augustan literary program and perhaps designed to rehabilitate its author in the eyes of the ruling dynasty. It contains a good deal of flattery of the imperial family and much patriotism, for which the undoubted brilliance of the narrative passages does not atone.

The *Metamorphoses* must also be interpreted against its contemporary literary and political background. Even Virgil and Horace, the most "Augustan" of the Augustans, had shown reluctance to produce on demand the sort of official poetry that is apt to be expected of a poet laureate—martial epics celebrating important victories and the like. When Virgil did finally write his epic, the *Aeneid,* it was a very different poem from what contemporaries had been led to expect. The unique character of Virgil's poem, which immediately became canonized as the national epic, posed a problem for his successors. After Virgil, a straightforward historical or mythological epic would represent an anticlimax. Ovid was warned against this pitfall alike by his instincts and his intelligence; he chose, as Virgil had done, to write an epic on a new plan, unique and individual to himself.

The *Metamorphoses* is a long poem in 15 books, written (unlike all Ovid's other surviving works) in hexameter verse. It is a collection of mythological and legendary stories in which metamorphosis (transformation) plays some part, however minor. The stories are told in chronological order from the creation (the first metamorphosis, of chaos into order) to the death and deification of Julius Caesar (the culminating metamorphosis, again of chaos—that is, the Civil Wars—into order—that is, the Augustan Peace). The importance of metamorphosis is more apparent than real; the essential theme of the poem is passion, and this gives it more unity than all the ingenious linking and framing devices the poet uses. The erotic emphasis that had dominated Ovid's earlier poetry has now been broadened and deepened into an exploration of nearly every variety of human emotion—for his gods are nothing if not human. This undertaking brought out, as his earlier work had not, Ovid's full powers: his wit and rhetorical brilliance, his mythological learning, his gifts of narrative and description, and the peculiar qualities of his fertile imagination. Like most classical Latin poetry, the *Metamorphoses* is a highly literary work. The vast quantities of verse in both Greek and Latin that Ovid had read and assimilated are transformed, through a process of creative adaptation, into original and unforeseen guises. The style also represents an individual modification of inherited usage. It is designed to respond unobtrusively to the many variations of genre and tone within the poem and also to carry the reader at an equable and agreeable pace through its considerable length. In both material and treatment the *Metamorphoses* is not merely un-Augustan: it is, language apart, as much Greek as Roman. By AD 8, if not yet formally published, it was complete; and it was at that precise moment, when Ovid seemed securely placed on a pinnacle of successful achievement, that there fell a blow that shattered his life.

Banishment and death. Ovid was at the time on the island of Elba. He was recalled to Rome for a personal interview with Augustus, in which, after a dressing down, he was banished to Tomis on the Black Sea. The reasons for his punishment are mentioned several times by Ovid himself: a poem—the *Ars amatoria*—and another unnamed offense. What the latter was he does not specify beyond insisting that it was an indiscretion, not a crime. The precise relationship between the two charges is obscure: the *Ars amatoria* had been published several years previously; that it was brought up against its author now seems to imply that it was connected in some way with the more recent *error.* Whatever this was, it was taken as a personal affront to Augustus and his family and bitterly resented as such.

No successful man lacks enemies, as Ovid himself had remarked in the *Remedia amoris.* Not only in the *Ars amatoria* but also in some parts of the *Metamorphoses* is there apparent disrespect for certain officially approved values that might have been enough, skillfully exploited, to create an image of their author as a social and political dissident. If Augustus' mind had already been poisoned against Ovid, or if he had been abruptly reminded of these earlier pinpricks by Ovid's *error,* whether or not it was serious, he may have grasped at the opportunity to rid Rome of a man who, if not dangerous, was personally offensive to him.

Ovid's situation was curious. The charge on which he was arraigned was one of high treason (Latin *majestas*), which could cover a multitude of sins. He was tried in the Emperor's private court, and the sentence was personally decided and pronounced by the Emperor. In effect he was to be detained at Augustus' pleasure. He was deprived of neither his citizenship nor his property, nor was he forbidden to write poetry or to communicate with his family and friends. Yet his books were removed from the public libraries, and none of the poems sent from Tomis in the first years of his exile, except those to his wife and to Augustus, is addressed to its recipient by name. Clearly, Ovid was unsafe to know; and until the death of Augustus, at least, his poetry must have circulated privately. The mystery that still surrounds the episode itself shows that Augustus was successful in stifling overt comment.

Toward the end of AD 8 Ovid set out for Tomis, where he arrived in the spring of the following year. The place (modern Constanţa, Rom.) was a semi-Hellenized port on the extreme edge of the Roman Empire, exposed to periodic attacks by the surrounding barbarian tribes. Books and civilized society were lacking; little Latin was spoken; the climate was severe. From time to time there was actual danger and, with other able-bodied citizens, Ovid took his turn in the home guard. He was alone, for his wife had stayed in Rome to protect his property and to make what intercession she could through influential friends. She was never to see him again. In his solitude and depression, he turned again to poetry, now of a more personal and introspective sort. The *Tristia* and *Epistulae ex Ponto* (*Letters from the Black Sea*) are all, in various guises, appeals for clemency. All, even those to his wife, are "public" poems, intended to present his case to the Emperor and, eventually, to the world. Though not written as spiritual autobiography, they nevertheless offer a unique document of the life of a poet in exile. Properly understood, they are as revealing of their author as anything he ever wrote. Particularly interesting is the apologia that forms the second book of the *Tristia:* a puzzling poem that may have damaged his case more than it helped because, to whatever flattery and self-abasement he descends in this and the other poems of exile, he never withdraws from the one position with which his personal self-respect was identified—his status as a poet. Again and again it is implied or even stated outright that over poetry the Emperor has no power. Critics who find Ovid's conduct in adversity unmanly have failed to see that, in what mattered most to him, he never yielded.

That his poetical powers were not as yet seriously impaired is shown by his poem *Ibis.* This, written not long after his arrival at Tomis, is a long and elaborate curse directed at an anonymous enemy. It is a tour de force of abstruse mythological learning, composed largely without the aid of books. But in the absence of any sign of encouragement from home, Ovid lacked the heart to continue to write the sort of poetry that had made him famous, and the later *Epistulae ex Ponto* make melancholy reading. Yet life was not uniformly gloomy. As Ovid settled down and became reconciled to the fact that Tomis was his home, he began to see some virtues in the place and its inhabitants. He took an interest in local history and politics and even wrote poetry in the local language, Getic. He seems to have been genuinely touched by the honours which the Tomitans paid him. Nevertheless, death, when it came, cannot have been wholly unwelcome.

In classical antiquity, Ovid's influence on later poetry was primarily technical. He had perfected both the elegiac couplet and the hexameter as all-purpose metres and as instruments of fluent communication. Even the poets most obviously indebted to Virgil betray Ovid's influence in nearly every line. In the European Middle Ages, like most ancient writers, he was regarded as an authority, a source of doctrine and erudition. The *Metamorphoses,* in particular, offered one of the most accessible and attractive avenues to the riches of Greek mythology. But his chief appeal, then and subsequently, stems from the humanity of his writing: its gaiety, its sympathy, its exuberance, its pictorial and sensuous quality. It is these things, together with his apparently genuine liking for women as a sex, that have recommended him, down the ages, to the troubadours and the poets of courtly love, to Chaucer, Shakespeare, Goethe, and Ezra Pound. Oviedo, *provincia,* coextensive with the northern half of the historic kingdom of Asturias and the modern Asturias *comunidad autónoma* ("autonomous community"), northern Spain. Its area of 4,079 square miles (10,565 square km) is largely mountainous, with a rugged coastline dented by *rías* (inlets) of the Bay of Biscay. The main river is the Nalón, though the Sella and Navia are also important. Oak, chestnut, and apple trees abound, and apple cider is the typical drink of the region and one of its exports. Corn (maize) and rye are grown, and the province is one of Spain's largest producers of potatoes. It also has a substantial cattle and dairy industry.

The wealth of Oviedo, however, is in its coalfields, which extend throughout the Nalón basin and cover more than 1,000 square miles (2,600 square km). Oviedo is the most important mining and metallurgical province in Spain. A great industrial complex has been built up at Avilés and has resulted in a large increase in its population. Mieres is a busy mining and smelting centre. Gijón's seaport, Puerto del Musel, is Spain's foremost coal-exporting port. There is an armaments factory at Trubia. The provincial capital, Oviedo (*q.v.*), is a cultural and communications hub. Pop. (1982 est.) 1,140,239.

Oviedo, Latin OVETUM, capital of Oviedo *provincia,* in the *comunidad autónoma* ("autonomous community") of Asturias, northern Spain, on a hill surrounded by mountains and a fertile plain. It lies 18 miles (29 km) southwest of Gijón. Founded as a monastery by Fruela I in 757, it became the capital of the kingdom of Asturias in 810. It was one of the few Spanish towns never conquered by the Moors during the Middle Ages. Outstanding landmarks include the cathedral (begun in 1388, on the site of the original monastery), the sacristy of which houses part of the chapel built by Alfonso II in 802 to guard Christian relics rescued from the Moors; the bishop's palace (*c.* 1500–1700); and the Convent of San Vicente (1493), which now houses the provincial museum. The University of Oviedo was founded in 1608.

The city's economy relies heavily on the mining (coal and iron) in its environs. Industry includes food processing and some light manufacturing. Pop. (1988 est.) 190,073.

The ruling families entered the highlands from the northeast in the 17th century, subduing and incorporating the indigenous cattle-keeping peoples. They divide into 22 chiefdoms about half of which were tributary to a larger chiefdom before effective Portuguese occupation in the 20th century. Each chiefdom had a paramount chief, council, and subchiefs.

A household usually comprises the male head, his several wives, and dependent children. The kinship system features double descent, land being inherited in the paternal line and movable property in the maternal. Initiation schools exist for boys and girls of certain families only. Agriculture is the chief economic activity, main crops being corn (maize) and beans. Most Ovimbundu men and boys hunt, but there are also professional hunters. Domestic animals include cows, sheep, and goats; oxen are used for transport. Cattle are a measure of wealth, but few families own large herds. Beeswax was and still is an important item of trade.

Ovimbundu were formerly traders with other African peoples and with the Portuguese. Each trading caravan had a professional leader and diviner. Trade agreements linking the independent chiefdoms led to development of regional specialization, such as metalwork and corn-meal production. Large-scale trading activities declined with the suppression of the slave trade and the construction of the Benguela Railway in 1904. In the late 20th century, the Ovimbundu provided the major popular support for Jonas Savimbi and the National Union for the Total Independence of Angola (UNITA) guerrillas.

oviparity, expulsion of undeveloped eggs rather than live young. The eggs may have been fertilized before release, as in birds and some reptiles, or are to be fertilized externally, as in amphibians and many lower forms. In general, the number of eggs produced by oviparous species greatly exceeds the number of offspring from species that bear live young, but the chances of survival are diminished because of the lack of maternal protection. *Compare* viviparity.

Oviraptor, genus of small, light predaceous dinosaurs found as fossils in Late Cretaceous deposits of eastern Asia (the Late Cretaceous epoch occurred 97.5 to 66.4 million years ago). *Oviraptor,* about 1.3 m (4 feet) long, was a biped that walked on two long, well-developed hind limbs. The forelimbs were long and slender, with three long, clawed fingers clearly suited for grasping, ripping, and tearing. *Oviraptor* had a short skull, with very large eyes surrounded by a bony ring. It possibly was capable of stereoscopic vision and must have been able to judge distances quite well; it apparently was more dependent upon sight than upon smell for procuring food. The jaws lacked teeth but were probably sheathed with a horny, beaklike covering. The remains of *Oviraptor* have been found in association with the nests of other dinosaurs, and the likelihood that it ate dinosaur eggs led to its name (Latin *ovum,* "egg"; *raptor,* "robber").

Ovonramwen, also called OVERAMI (d. January 1914, Calabar, Southern Nigeria [now Nigeria]), West African ruler who was the last independent oba (king) of the 500-year-old kingdom of Benin (in present-day Nigeria). Ovonramwen tried to maintain his independence in the face of increasing British pressure but was able to delay for only a few years the annexation of his kingdom by the colony of Nigeria.

He was called Idugbowa until he took the title Ovonramwen upon becoming oba. He succeeded to a kingdom much reduced by growing British commercial and colonial encroachment from its greatest extent (*c.* 1700). He attempted to seal Benin to Europeans but by 1892 was forced to sign a protection treaty with the British administration. Disputes over trade along the Benin River (1892–94) led to a campaign against Benin; the murder of the

British acting consul general in January 1897 precipitated a full-scale military expedition, which captured Benin City in February 1897. Ovonramwen surrendered to the British in August and died in exile.

Øvre Anarjåkka National Park, Norwegian ØVRE ANARJÅKKA NASJONALPARK, national park in the southeastern Finnmark Plateau region, northern Norway, bordering the Lemmenjoki National Park of Finland. The largest Norwegian national park, it covers an area of about 537 square miles (1,390 square km) and ranges in elevation from 705 to 1,938 feet (215 to 591 m). Low hills covered by birch forest and pine forest and dotted by bogs and lakes are characteristic of the area. Large numbers of reindeer graze in the park during winter, and its other animals and plant life are quite varied.

Øvre Dividal National Park, Norwegian ØVRE DIVIDAL NASJONALPARK, national park in the eastern part of the Dividal valley, Troms county, Norway. With an area of about 286 square miles (741 square km), it was established in July 1971 by royal decree. The landscape varies from lowland forests of pine and birch to low hills and mountain plateaus with lakes and bogs interspersed throughout. A sparse pine forest supports bear, lynx, wolverine, and wolf. Large numbers of tame reindeer from Sweden come to graze in the park during summer.

ovulation, release of a mature egg from the female ovary; the release enables the egg to be fertilized by the male sperm cells. Normally, in human beings, only one egg is released at one time; occasionally, however, two or more erupt during the menstrual cycle. The egg erupts from the ovary on the 14th to 16th day of the approximately 28-day menstrual cycle. If fertilization does not occur, the egg is passed from the reproductive tract during menstrual bleeding, which starts about two weeks after ovulation. Occasionally, cycles occur in which an egg is not released; these are known as anovulatory cycles.

Prior to eruption from the ovary, an egg first must grow and mature. Until stimulated to grow, the primary egg cell passes through a period of dormancy that may last several years. The egg cell is surrounded by a capsule of cells known as the follicle. The follicular wall serves as a protective casing around the egg and also provides a suitable environment for egg development. As the follicle ripens, the cell wall thickens and a fluid is secreted to surround the egg. The follicle migrates from within the ovary's deeper tissue to the outer wall. Once the follicle reaches the surface of the ovary, the follicular wall thins. Pressure caused by the follicle and fluid against the ovary's surface causes bulging of the ovarian wall. When the follicle ruptures, the egg and fluid are released along with some torn patches of tissue. The cells, fluid, and egg are directed into the nearby fallopian tube, which serves as a passageway by which the egg reaches the uterus and as a site for fertilization of the released egg by sperm.

The hormones that stimulate ovulation are produced in the pituitary gland; these are known as the follicle-stimulating hormone and luteinizing hormone. After the egg leaves the ovary, the walls of the follicle again close, and the space that was occupied by the egg begins to fill with new cells known as the corpus luteum. The corpus luteum secretes the female hormone progesterone, which helps to keep the uterine wall receptive to a fertilized egg. If the egg is not fertilized, the corpus luteum stops secreting progesterone about nine days after ovulation. If the egg becomes fertilized, progesterone continues to be secreted, first by the corpus luteum and then by the placenta, until the child is born. Progesterone blocks the release of more hormones from the pituitary gland, so that further ovulation does not normally occur during pregnancy. *See also* menstruation; oogenesis.

ovule, plant structure that develops into a seed when fertilized. In gymnosperms (conifers and allies) the ovules lie uncovered on the scales of the cone. In angiosperms (flowering plants), one or more ovules are enclosed by the ovary (portion of the carpel, or female reproductive organ). Each ovule is attached by its base to the stalk (funiculus) that bears it. A mature angiosperm ovule consists of a food tissue covered by one or two future seed coats. A small opening (the micropyle) in the integuments at the apex of the ovule permits the pollen tube to enter and discharge its sperm nuclei into the embryo sac, a large oval cell in which fertilization and development occur. Variations in form and position of the ovule are significant in plant classification: orthotropous ovules stand out straight into the cavity of the ovary; campylotropous ovules are at right angles to the funiculus; anatropous ovules are directed back toward the funiculus. Intermediate forms also occur.

ovum, plural OVA, single cell released from either of the female reproductive organs, the ovaries, which is capable of developing into a new organism of the same species when fertilized (united) with a sperm cell.

The outer surface of each ovary is covered by a layer of cells (germinal epithelium); these surround the immature egg cells, which are present in the ovaries from the time of birth. A hollow ball of cells, known as the follicle, encompasses each ovum. Within the follicle the ovum gradually matures (*see* oogenesis). It takes approximately four months for a follicle to develop once it is activated. Some follicles lie dormant in the ovaries for 40 years before they mature; others degenerate and never develop. During a woman's child-bearing years, 300 to 400 follicles mature and emit eggs capable of being fertilized. By the time a woman reaches menopause, most of the remaining follicles have degenerated.

A follicle-stimulating hormone, secreted into the bloodstream by the pituitary, causes ovum growth. After the egg matures, a second hormone from the pituitary, luteinizing hormone, is liberated; this causes the egg's release, called ovulation (*q.v.*).

As the ovum develops, the walls of the follicle expand by adding new cells. The follicle and ovum slowly migrate through the tissue of the ovary until they cause a bulge in the surface of the organ. The hollow cavity between the egg and the follicular wall usually contains a fluid secreted by the follicular cells. This keeps the ovum moist and provides a suitable growing environment. When the follicle ruptures, the egg is released from the ovary and is then captured and guided by the fallopian tubes. Muscular contractions of the fallopian tubes move the egg to the cavity of the uterus.

The ovum itself has a central nucleus that contains the female's genetic material; this, with the genetic material in the sperm cell, determines the inherited characteristics of the child. Surrounding the nucleus is a cell plasma, or yolk, that contains nutritional elements essential to the developing egg cell.

If an egg does not become fertilized within 24 hours of its eruption, it begins to degenerate. After the egg is fertilized it undergoes a series of cell divisions. If at an early stage of its development the fertilized egg splits into two parts that continue to grow, identical twins will result; incomplete division will result in Siamese twins, born physically joined. Fraternal twins result when two separate eggs are released and independently fertilized. *See also* implantation.

Owain, also spelled OWEN, name of Welsh princes, grouped below chronologically and indicated by the symbol •.

•Owain AP GRUFFUDD: *see* Glendower, Owen.

•Owain CYFEILIOG (b. *c.* 1130—d. *c.* 1197), Welsh warrior-prince of Powys and poet of distinct originality among the *gogynfeirdd* (court poets).

After ruling over the people of Powys from 1149 to 1195, Owain retired to the Cistercian monastery of Strata Marcella (Ystrad Marchell), which he had established in 1170. He died and was buried there, despite his previous excommunication (1188) for failing to support the Third Crusade. As prince of Powys he was known for his sympathetic attitude toward the English.

Hirlas Owain ("The Drinking Horn of Owain"), the only poem that remains of Owain's compositions, is noteworthy for its dramatic presentation. It is set at court, where his warriors, weary from battle, are gathered at the banquet table. Each stanza begins with instructions to the cupbearer to pour a drink for a hero; he then bestows praise on the man as the drink is poured.

•Owain GWYNEDD, also called OWAIN AP GRUFFYDD, Gruffydd also spelled GRUFFUDD (d. 1170), last great king of North Wales (Gwynedd) who helped advance Welsh independence against Norman and English dominance.

Together with his brother Cadwaladr, Owain led three expeditions (1136–37) against the English stronghold of Ceredigion to the south. The brothers ravaged the region and established themselves there. Upon his father's death in 1137, Owain took the throne of North Wales. During the reign of the English king Stephen, Owain extended the boundaries of northern Wales almost to the city of Chester. Henry II, who succeeded to the English throne in 1154, challenged Owain in 1157. Both sides fared badly, and an agreement was reached whereby Owain withdrew to Rhuddlan and the River Clwyd and rendered homage. He kept the terms of the agreement until 1165, when he combined forces with Rhys ap Gruffydd, his nephew and the prince of South Wales, and with Owain Cyfeiliog (of the Powys region) against Henry. Thwarted by bad weather and unequal knowledge of the region, Henry was forced to turn back and yield the region to the Welsh. Owain once more regained the castles of Basingwerk and Rhuddlan and pushed the borders of Gwynedd to the estuary of the River Dee. He maintained northern Welsh independence throughout his lifetime, but succeeding generations were unequal to the task and Gwynedd officially fell to the English in 1283.

Owambo, also called OVAMBOLAND, geographic region, northern Namibia. Owambo is bordered by the Kaokoland (Kaokoveld) region on the west and by the Kavango region on the east. The border with Angola lies to the north. Most of semiarid Owambo is an extremely flat plain covered by white sands. It is crossed by a series of low-gradient, often parallel, south-oriented dry watercourses (*oshanas*), collectively called the Cuvelai, which occasionally feed the Etosha Pan (a huge salt pan) to the south of Owambo with rainwater. The water supplied by the *oshanas* and the man-made feeder canals of Owambo has been augmented by a project sponsored by the South African government to connect the main irrigation canals from the Calueque Dam (on the Kunene River in southern Angola) to Owambo and to develop the hydroelectric potential of the complex above the Ruacana Falls (at the Namibia and Angola border, 40 miles [64 km] downriver from the Calueque Dam). Owambo is generally grass-covered, and dispersed clusters of baobab, palm, and wild fig trees are commonplace in the area of greater rainfall in the north.

According to tradition, the Owambo (Ovambo; or Ambo as called in Angola) people, for whom the region is named, migrated to their present location from central Africa. Consisting of seven different tribes, they comprise about half of South West Africa/Namibia's population. They live mostly alongside the *oshanas*; grow corn (maize), millet, pumpkins, and melons; and raise goats and dairy cattle.

Finnish Lutheran missionaries arrived at Owambo in 1870, and Anglican and Roman Catholic missionaries entered the area later. The Finns, in particular, have continued to supply the Owambo with hospitals and churches. Owambo became a part of the German Empire in 1884. Upon the defeat of the Germans in World War I, Owambo, together with the rest of South West Africa, became a mandated territory administered by South Africa. Fighting between the South West Africa People's Organization (SWAPO; an Owambo- and southern Angola-based group protesting South Africa's continued political control of the mandated territory) and South African forces intensified in Owambo between the late 1960s and the 1980s.

The main road through the region links it with Angola and the copper- and lead-mining centre of Tsumeb to the southeast. The region's population is concentrated in the central north along the Angolan border. Oshakati, Ondangwa, Oshikango, and Ombalantu are the principal settlements.

Owatonna State School for handicapped children was founded in 1886. The innovative American architect Louis Sullivan designed the National Farmers' Bank Building (1908) in the city. Owen, Alun (Davies) (b. Nov. 24, 1925, Liverpool), Welsh dramatist for radio, television, screen, and stage whose work often reflects the cultural and religious conflicts of the city where he was born.

Of Welsh origin, he attended school in Wales and Liverpool and began his theatrical training as an assistant stage manager in repertory theatre (1942) and then became a stage and screen actor. He started writing for radio and television in 1957, quickly proving his sharp ear for dialogue and his gift for characterization. His television plays, numbering more than 50, sometimes concentrated on the seamier aspects of city life, as in *No Trams to Lime Street* (1959; published 1961). His quartet of plays, televised as *Male of the Species* (1969), with Laurence Olivier, Paul Scofield, Sean Connery, and Michael Caine, was immensely successful and was produced for the stage in 1974. But, although the play set out to depict the exploitation of women, the protagonist of the piece, Mary MacNeil, emerges as a willing victim and the men in her life as attractive. Critics cited this as "unconscious male chauvinism."

Owen won critical acclaim for his stage plays, which included *Progress to the Park* (published 1962) and *The Rough and Ready Lot* (published 1960), both of which were broadcast in 1958 and produced for the stage in 1959 and which depicted religious and cultural bigotry. The former concerns the destruction of the love between a Protestant boy and a Catholic girl in Liverpool of the late 1950s; the play offers no solutions, but through its characterizations it clearly represents the situation as Owen perceived it. In *The Rough and Ready Lot,* the four main characters, "soldiers of fortune" fighting for the independence of South American Indians, all represent opposing views of life. Three extremists—a political revolutionary, a fanatical Catholic, and a "realist"—all expound eloquently their respective positions, yet the theme of the work becomes clear when the fourth protagonist—the one who makes no judgments on life—is the only one to survive the ordeal.

In 1961 Owen received the Screenwriters Guild Award for *The Rose Affair* (produced for television 1961; published 1962; produced for stage 1966), a modern-day version of the fairy tale "The Beauty and the Beast," and another play, *A Little Winter Love,* was produced in 1963. Among Owen's screen credits is the script for the Beatles' first film, *A Hard Day's Night* (1964). In the 1970s and '80s Owen produced plays mainly for television, such as *Colleagues* (1982).

Owen, Daniel (b. Oct. 20, 1836, Mold, Flintshire, Wales—d. Oct. 22, 1895, Mold), writer, considered the national novelist of Wales. He was a natural storyteller whose works, set in his own time, introduced a wealth of vivid and memorable characters that have given him a place in his national literature comparable to that of Dickens in English.

The son of a coal miner and the youngest of six children, he received little formal education and at the age of 12 was apprenticed to a tailor. In 1864 he started to preach, and in the following year he enrolled in Bala Calvinistic Methodist College but returned home before completing the course. He resumed preaching and soon began writing for publication.

His works include the novels *Hunangofiant Rhys Lewis* (1885; "Autobiography of Rhys Lewis"); *Profedigaethau Enoc Huws* (1891; "The Trials of Enoc Huws"); and *Y Dreflan, ei Phobl a'i Phethau* (1881; "Dreflan, Its People and Its Affairs"), which describes the life around the Welsh chapel. *Offrymau Neilltuaeth* (1879; "Offering of Seclusion") is a volume of sermons and portraits of Methodists; *Y Siswrn* (1888; "The Scissors") is a collection of poems, essays, and stories. Besides the vigour of his diction, his works contain pungent humour and freedom from didacticism, qualities not generally found in 19th-century Welsh literature.

Owen, Goronwy (b. Jan. 1, 1723, Llanfair Mathafarn Eithaf, Anglesey, Wales—d. July 1769, Brunswick, Va. [now in U.S.]), clergyman and poet who revived classicism in modern Welsh literature. He reintroduced the *cywydd* and the *awdl,* poetic forms used by the medieval Welsh bards, with their traditional correctness but with fresh content.

It was while he was at Donnington, Shropshire, serving as master of the local school and curate of Uppington, that Owen attracted attention as a poet. Other poets gathered around him, establishing a classical school of poetry that is still alive. In 1757, despite his excessive drinking, he obtained an appointment, through the efforts of friends, as headmaster of the grammar school attached to the College of William and Mary, in Williamsburg, Va. After losing this mastership ("for riotous living"), he became minister of St. Andrew's, Brunswick County, where he remained until he died.

Among his best known poems are "The Day of Judgment," "The Gem or the Precious Stone," "The Lineage and Attributes of the Muse," and "Cywydd in Answer to Huw the Red Poet."

Owen, John (b. 1616, Stadhampton, Oxfordshire, Eng.—d. Aug. 24, 1683, London), English Puritan minister, prolific writer, and controversialist. He was an advocate of Congregationalism and an aide to Oliver Cromwell, the lord protector of England from 1653 to 1658.

Appointed rector of Fordham, Essex, in 1642, Owen was made vicar at nearby Coggeshall in 1646 after preaching a notable sermon before

Parliament the same year. At Coggeshall he came out in favour of Congregational autonomy in church government; his compendium of principles of church polity was published as *Eschol: . . . or Rules of Direction for the Walking of the Saints in Fellowship* (1648). His frequent preaching before Parliament led to his attachment to Cromwell, whose policies against the monarchy Owen began to support. After the execution of King Charles I by Cromwell's partisans in January 1649, Owen accompanied Cromwell on his military ventures to Ireland and Scotland (1649–50).

As chancellor of Oxford, Cromwell appointed Owen vice chancellor in 1652, a post he held until 1657. He was also dean of Christ Church Cathedral (1651–60) and was elected in 1654 to represent Oxford in Parliament, but he was later disqualified because of his clerical vocation. Reserved in his support of Cromwell, Owen opposed plans to offer the English crown to him and avoided participation in Cromwell's installation in the office of lord protector in 1653. Owen abandoned politics on the restoration of the monarchy in 1660, when the House of Commons removed him from his position as Christ Church dean.

Among his works are historical treatises on religion, several studies of the doctrine of the Holy Spirit, and defenses of Nonconformist, or Puritan, views. An edition of his *Works,* edited by W.H. Goold, fills 24 volumes (1850–55).

Owen, Sir Richard (b. July 20, 1804, Lancaster, Lancashire, Eng.—d. Dec. 18, 1892, London), British anatomist and paleontologist who is remembered for his contributions to the study of fossil animals and for his strong opposition to the views of Charles Darwin.

Owen was educated at Lancaster Grammar School and was apprenticed in 1820 to a group of Lancaster surgeons. In 1824 he went to Edinburgh to continue medical training, but in 1825 he transferred to St. Bartholomew's Hospital in London. He was admitted to the Royal College of Surgeons of England, where he was engaged as curator of the Hunterian Collections (made by John Hunter, the renowned anatomist) and set up in medical practice. In 1830 he met Georges Cuvier, a celebrated French paleontologist, and the following year visited him in Paris, where he studied specimens in the National Museum of Natural History. Elected a Fellow of the Royal Society in 1834, in 1836 Owen became Hunterian professor at the Royal College of Surgeons and in 1837 its professor of anatomy and physiology, as well as Fullerian professor of comparative anatomy and physiology at the Royal Institution. Leaving medical practice and devoting himself to research, he was appointed superintendent of the natural history departments of the British Museum in 1856. From then until his retirement in 1884 he was largely occupied with the development of the British Museum (Natural History) in South Kensington, London. On retirement he was created a knight of the Order of the Bath.

Among Owen's earliest publications were the Descriptive and Illustrated Catalogue of the physiological series of Comparative Anatomy contained in the Museum of the Royal College of Surgeons in London (1833), which enabled him to acquire a considerable knowledge of comparative anatomy. His *Memoir on the Pearly Nautilus* (1832) was a classic, and he became a highly respected anatomist. By 1859, the year of the publication of Charles Darwin's *Origin of Species,* however, Owen's judgment was muddied by his sense that his own preeminence in biology was about to be lost, and he set about to discredit Darwin, who had been a good friend and colleague for 20 years. Owen wrote a very long anonymous review of the book (*The Edinburgh Review,* 1860), on which Darwin commented:

> It is extremely malignant, clever, and I fear will be very damaging.... It requires much study to appreciate all the bitter spite of many of the remarks against me.... He misquotes some passages, altering words within inverted commas....

Owen is also said to have coached Bishop Wilberforce in his debate against Thomas Huxley, one of Darwin's chief defenders. As Darwin's thesis began to become more accepted in the scientific community, Owen shifted his position somewhat; although he denied Darwinian doctrine, he admitted the accuracy of its basis, claiming to have been the first to have pointed out the truth of the principle on which it was founded.

Among Owen's notable writings are *Odontography* (1840–45), a major study of the structure of teeth; *Lectures on Comparative Anatomy and Physiology of the Vertebrate Animals* (1846); *A History of British Fossil Mammals and Birds* (1846); *A History of British Fossil Reptiles* (1849–84); and *On the Anatomy of Vertebrates* (1866–68).

Another notorious error by Owen involved *Archaeopteryx,* the first known fossil bird, an object Owen had obtained for the museum and had described for publication in 1863. The fossil was reexamined in 1954, and scientists determined that Owen had got it upside down, dorsal for ventral, and had missed its two most important features: the breastbone, which was flat, proof that the bird could not fly but glided; and the natural cast of the brain case, which was like that of a reptile.

BIBLIOGRAPHY. The only biography of the subject is *The Life of Richard Owen,* 2 vol. (1894–95, reprinted 1975), written by his grandson, Richard Owen. It contains a full bibliography of Owen's work.

Owen, Robert (b. May 14, 1771, Newtown, Montgomeryshire, Wales—d. Nov. 17, 1858, Newtown), Welsh manufacturer turned reformer, one of the most influential utopian socialists of the early 19th century. His New Lanark mills in Lanarkshire, with their social and industrial welfare programs, became a place of pilgrimage for statesmen and social reformers. He also sponsored or encouraged many experimental "utopian" communities, including one at New Harmony, Ind., U.S.

Early life. Owen attended local schools until the age of 10, when he became an apprentice to a clothier. His employer had a good library, and young Owen spent much of his time reading. He did so well in business that by the time he was 19 he had become superintendent of a large cotton mill in Manchester, which he soon had made one of the foremost establishments of its kind in Great Britain. Owen made use of the first American sea island cotton (a fine, long-staple fibre) ever imported into the country and made improvements in the quality of the cotton spun. On becoming manager and a partner in the Manchester firm, Owen induced his partners to purchase the New Lanark mills in Lanarkshire.

The success at New Lanark. In the town of New Lanark lived 2,000 people, 500 of whom were young children from the poorhouses and charities of Edinburgh and Glasgow. The children, especially, had been well treated by the former proprietor, but the condition of the people was unsatisfactory. Crime and vice bred by demoralizing conditions were common, education and sanitation alike were neglected, and housing conditions were intolerable. Owen improved the houses and, mainly by his own personal influence, encouraged the people in habits of order, cleanliness, and thrift. He opened a store at which goods of sound quality could be bought at little more than cost price and at which the sale of alcoholic beverages was placed under strict supervision. His greatest success, however, was in the education of the young, to which he devoted special attention. In 1816 he opened the first infant school in Great Britain at the New Lanark mills and thereafter gave it his close personal supervision.

Though Owen at first was regarded with suspicion as an outsider, he soon won the confidence of the people. The mills continued to thrive commercially, but some of Owen's schemes entailed considerable expense, which displeased his partners. Finally, frustrated by the restrictions imposed on him by his partners, who wished to conduct the business along more ordinary lines, he organized a new firm in 1813. Its members, content with a 5 percent return on their capital and ready to give freer scope to his philanthropy, bought out the old firm. Stockholders in the new firm included the legal reformer Jeremy Bentham and the Quaker William Allen.

His philosophy of social reform. In the same year (1813) Owen published two of the four essays in *A New View of Society; or, Essays on the Principle of the Formation of the Human Character,* in which he expounded the principles on which his system of educational philanthropy was based. Having at an early age lost all belief in the prevailing forms of religion, he had thought out for himself a creed that he took to be an entirely new and original discovery.

The chief points in Owen's philosophy were that man's character is formed by circumstances over which he has no control and that he is not a proper subject either of praise or of blame. These convictions led him to the conclusion that the great secret in the right formation of man's character is to place him under the proper influences from his earliest years. The irresponsibility of man and the effect of early influences are the keynote of Owen's whole system of education and social amelioration.

For the next few years, Owen's work in New Lanark was to have a national, even European, significance. New Lanark became a place of pilgrimage for social reformers, statesmen, and royal personages. According to the unanimous testimony of all who visited it, the results achieved by Owen were singularly good. Children brought up on his system were generally felt to be graceful, genial, and unconstrained; health, plenty, and relative contentment prevailed. The business was a commercial success.

In 1815 Owen, apparently single-handedly, started agitation for factory reform, with only little effect, and by 1817 his work as a practical reformer had given way to ideas—still vital—that were to make him the forerunner of socialism and the cooperative movement. Owen argued that the competition of human labour with machinery was a permanent cause of distress and held that the only effective remedy lay in the united action of men and the subordination of machinery to man. His proposals for the treatment of pauperism were based on those principles.

Owen recommended that villages of "unity and cooperation" be established for the unemployed. Each village would consist of about 1,200 persons living on 1,000 to 1,500 acres

(400 to 600 hectares); all would live in one large structure built in the form of a square, with public kitchen and messrooms. Each family would have its own private apartment and the entire care of the children until the age of three, after which they would be raised by the community. Parents would have access to them at meals and all other proper times. Such communities, Owen believed, might be established by individuals, by parishes, by counties, or by the state; in each case there would be supervision by duly qualified persons. Work and the enjoyment of its results would be shared in common.

The size of the projected community had been suggested by that of the village of New Lanark, and Owen soon advocated an extension of the scheme to the reorganization of society in general. Under his plan, largely self-contained communities of from 500 to 3,000 would first be set up, mainly agricultural and possessing the most modern machinery. As they increased in number, he wrote, "unions of them, federatively united, should be formed in circles of tens, hundreds, and thousands," until they embraced the whole world in a common interest.

The community at New Harmony. Owen's plans for the cure of pauperism were received with considerable favour until, at a large meeting in London, Owen declared his hostility to the received forms of religion. Many of his supporters believed that this action made him suspect to the upper classes, though he did not lose all support from them. To carry out his plan for the creation of self-contained communities, in 1825 he bought 30,000 acres of land in Indiana from a religious community and renamed it New Harmony. For a time, life in the community was well ordered and contented under Owen's practical guidance, but differences about the form of government and the role of religion soon appeared, and numerous attempts at reconstruction failed to compose them, though it is agreed that an admirable spirit prevailed amid all the dissensions. Owen withdrew from the community in 1828, having lost £40,000—80 percent of his fortune. The other chief Owenite community experiments were in Great Britain—at Queenwood, Hampshire (1839–45), in which Owen took part for three years; at Orbiston, near Glasgow, Lanarkshire (1826–27); and at Ralahine, County Cork (1831–33); he was not directly concerned with either of the later communities.

Leadership of the trade union movement. In his "Report to the County of Lanark" (a body of landowners) in 1820, Owen declared that reform was not enough, that a transformation of the social order was required. His proposals for communities attracted the younger workers, brought up under the factory system, and between 1820 and 1830 numerous societies were formed and journals organized to advocate his views. The growth of labour unionism and the emergence of a working-class point of view caused Owen's doctrines to be accepted as an expression of the workers' aspirations, and when he returned to England from New Harmony in 1829 he found himself regarded as their leader. In the unions, Owenism stimulated the formation of self-governing workshops. The need for a market for the products of such shops led to the formation of the National Equitable Labour Exchange in 1832, applying the principle that labour is the source of all wealth.

The unprecedented growth of labour unions made it seem possible that the separate industries and eventually all industry might be organized by these bodies. Owen and his followers carried on ardent propaganda all over the country, with the result that the new National Operative Builders Union turned itself into a guild to carry on the building industry, and the Grand National Consolidated Trades Union was formed (1834). Though the enthusiasm of the unions and the numbers of labourers joining them were remarkable, determined opposition by employers and severe repression by the government and law courts ended the movement within a few months. It was two generations before socialism, first popularly discussed at this time, again influenced unionism. Throughout these years Owen's community ideas maintained a hold, and ultimately they provided the basis for the worldwide consumers' cooperative movement. After 1834 Owen devoted himself to preaching his educational, moral, rationalist, and marriage-reform ideas. At the age of 82 he became a spiritualist. He died six years later at Newtown.

Owen's autobiography, *The Life of Robert Owen,* was published in two volumes in 1857–58 (reprinted 1971). (D.F.Do./Ed.)

Owen, Robert Dale (b. Nov. 9, 1801, Glasgow, Scot.—d. June 24, 1877, Lake George, N.Y., U.S.), American social reformer and politician. The son of the English reformer Robert Owen, Robert Dale Owen was steeped in his father's socialist philosophy while growing up at New Lanark in Scotland—the elder Owen's model industrial community. In 1825 father and son immigrated to the United States to set up another self-sufficient socialist community at New Harmony, Ind.

Robert Dale Owen edited the community's newspaper, the *New Harmony Gazette,* until 1827, when he became associated with the controversial reformer Fanny Wright. They traveled together to Wright's experimental community of Nashoba, Tenn., which was dedicated to the education and gradual emancipation of slaves, and from there went on to Europe.

Upon returning to the United States, Owen and Wright revisited the Nashoba and New Harmony communities, then in a state of decay. They settled in New York, where Owen edited the *Free Enquirer.* The paper opposed evangelical religion and advocated more liberal divorce laws, more equal distribution of wealth, and widespread industrial education; it was at the centre of radical free thought in New York. For two years, Owen, with Wright and other radicals, sought to turn the New York Workingmen's Party away from Thomas Skidmore's belief in an equal division of property. They successfully ousted Skidmore, but later their own program of social reform through public education was also repudiated.

After a brief trip to England in 1832, Owen returned to New Harmony. He served three terms in the Indiana legislature (1836–1838), where he advocated the allocation of government funds for public schools, and two terms in the U.S. House of Representatives, where he introduced the bill creating the Smithsonian Institution.

Owen was defeated for a third term in Congress and went back to Indiana, where he advocated property rights for married women and liberalization of divorce laws. Appointed chargé d'affaires at Naples in 1853 and minister to Italy in 1855, Owen spent much of the 1850s abroad. Upon his return in 1858, he became an outspoken proponent of emancipation; at the outbreak of the American Civil War, he urged an end to slavery in a letter to President Lincoln, a letter that Secretary of the Treasury Salmon Chase said greatly influenced the president.

In 1863 Owen headed a committee to investigate the condition of the freedmen and wrote a book on his findings, *The Wrong of Slavery* (1864). In it he surprised many people by counseling a 10-year delay in granting the newly emancipated slaves the right to vote.

Owen spent his final years writing a novel (*Beyond the Breakers,* 1870) and his autobiography (*Threading My Way,* 1874).

Owen, Wilfred (b. March 18, 1893, Oswestry, Shropshire, Eng.—killed in action Nov. 4, 1918, France), English poet noted for his anger at the cruelty and waste of war and his pity for its victims. He also is significant for his technical experiments in assonance, which were particularly influential in the 1930s.

Owen was educated at the Birkenhead Institute and matriculated at the University of London; after an illness in 1913, he lived in France. He had already begun to write and, while working as a tutor near Bordeaux, was preparing a book of "Minor Poems—in Minor Keys—by a Minor," which was never published. These early poems are consciously modeled on John Keats; often ambitious, they show enjoyment of poetry as a craft.

In 1915 Owen enlisted in the Artists' Rifles. The experience of trench warfare brought him to rapid maturity; the poems written after January 1917 are full of anger at war's brutality, an elegiac pity for "those who die as cattle," and a rare descriptive power. In June 1917 he was invalided home and while in a hospital near Edinburgh met Siegfried Sassoon, who shared his feelings about the war and who became interested in his work. Reading Sassoon's poems and discussing his work with Sassoon revolutionized Owen's style and his conception of poetry. Despite the plans of well-wishers to find him a staff job, he returned to France in August 1918 as a company commander. He was awarded the Military Cross in October and was killed a week before Armistice Day.

Published posthumously by Sassoon, Owen's single volume of poems contains the most poignant English poetry of the war. His collected poems, edited by C. Day-Lewis, were published in 1964; his collected letters, edited by his younger brother William Harold Owen and J. Bell, were published in 1967.

BIBLIOGRAPHY. Harold Owen, *Journey from Obscurity,* 3 vol. (1963–65), is a memoir written by his brother. Jon Stallworthy, *Wilfred Owen* (1974, reprinted 1988), emphasizes the war's effect on Owen's poetic development.

Owen Stanley Range, segment of the central highlands of New Guinea, occupying the southeastern "tail" of the island. The range rises abruptly from the coastal plain to a height of 9,000 feet (2,750 m) and extends for 200 miles (300 km). The massif ranges in width from 25 to 70 miles (40 to 115 km). Its highest point is Mount Victoria (13,240 feet [4,040 m]). Rainfall on the forested slopes gives rise to several rivers, including the Kemp Welch and Yodda (flowing south) and the Musa (north). The range is named after British Captain Owen Stanley, who explored the coast of New Guinea from 1845 to 1850. In 1942 Japanese forces began an overland crossing of the range in an attempt to capture Port Moresby. They were met by Allied troops and, after a prolonged fight, had to concede their first land defeat of World War II.

Owendo, deepwater port, northwestern Gabon, on the north shore of the Gabon Estuary; it serves the national capital, Libreville (9 miles [15 km] north-northwest), and was designed to handle ore vessels. It has a seaplane base and road connections with Libreville, Cocobeach, Médouneu, and Kango. In 1978 the first 115-mile (185-kilometre) segment of the Trans-Gabon Railway was opened, linking Owendo with Ndjolé in the interior. Further construction extended the line toward the mineral-rich northeast, to carry iron ore from Belinga (as well as timber and agricultural products from Belinga, Makokou, Booué, Alembé, and Kango) to the coast for export. In Owendo, sawmills and a plywood factory process hardwoods (notably okoumé) for export, and there is a pelletization factory for iron ore and a hydroelectric power station. An experimental stock-raising station and a technical school are in the town.

broad jump (also called long jump) that stood for 25 years and who won four gold medals in the 1936 Olympic Games in Berlin. His four Olympic victories were a blow to Adolf Hitler's intention to use the games to show Aryan superiority.

As a student in a Cleveland high school, Owens won three events in the 1933 National Interscholastic Championships, Chicago. In one day, May 25, 1935, while competing for Ohio State University (Columbus) in a Western Conference (Big Ten) track-and-field meet at the University of Michigan (Ann Arbor), Owens equaled the world record for the 100-yard dash (9.4 s) and broke the world records for the 220-yard dash (20.3 s), the 220-yard low hurdles (22.6 s), and the running broad jump (8.13 m [26 feet 8¼ inches]). As a member of the United States team in the 1936 Olympic Games, Owens tied the Olympic record in the 100-metre run (10.3 s); broke Olympic and listed world records in the 200-metre run (20.7 s) and the running broad jump (8.06 m; his world-record leap in 1935 had not yet been officially accepted); and ran the final segment for the world-record-breaking U.S. 400-metre relay team (39.8 s). For a time, Owens held alone or shared the world records for all sprint distances recognized by the International Amateur Athletic Federation.

After retiring from competitive track, Owens engaged in boys' guidance activities, made goodwill visits to India and the Far East for the U.S. Department of State, served as secretary of the Illinois State Athletic Commission, and worked in public relations.

Owensboro, city, seat (1815) of Daviess county, on the Ohio River in northwestern Kentucky, U.S., 38 miles (61 km) southeast of Evansville, Ind. Founded about 1800, it was known to early flatboat men as Yellow Banks, from the colour of the clay along its high riverbanks. The town, laid out in 1816, was first named Rossborough but was later changed to Owensboro to honour Colonel Abraham Owen, a veteran of early Kentucky wars. During the American Civil War, it was the site of the Federal Camp Silas B. Miller. A Confederate attack was repelled in 1862, but, in August 1864, guerrillas attacked and burned part of the town, including the courthouse.

The city is the centre of a rich oil and agricultural (tobacco, corn [maize], wheat, soybeans, and fruit) region. Manufactures include bourbon whiskey, alloy steel, chemicals, furniture, radio tubes, and cigars. It is the site of Kentucky Wesleyan (1858) and Brescia (1950) colleges and the Natural Science Museum. Annual events include the Festival of the Arts (September) and the Owensboro Hydroplane Regatta (June). Inc. town, 1817; city, 1866. Pop. Owerri (people): *see* Itsekiri.

Owerri, town, capital of Imo state, southern Nigeria, at the intersection of roads from Aba, Onitsha, Port Harcourt, and Umuahia. It is the chief trade centre (yams, cassava, taro, corn [maize], and palm products) for a region of modified rain forest that also yields rubber for export. Although there is as yet little industrial development, one factory produces galvanized sheet-iron. The town is the seat of the New (Federal) University of Imo, Alvan Ikoku College of Education, and several secondary schools. It is known for its handicraft centres. Owerri is also served by a general hospital. The town is located in one of the most densely populated areas of Nigeria and is inhabited by the predominantly Christian Ibo people. Pop. (1983 est.) 35,010.

owl, any member of the order Strigiformes, nocturnal birds of prey.

A brief treatment of owls follows. For full treatment, *see* MACROPAEDIA: Birds.

According to some classifications, there are three extant families in the order: Strigidae (typical owls), Tytonidae (barn owls and grass owls), and Phodilidae (bay owls). Unlike other birds of prey, owls have virtually noiseless flight, the butterfly-like flapping of wings being muffled by the velvety surface of the flight feathers. Owls are protectively coloured, generally in shades of brown. Many species, such as the scops and screech owls, show two phases of coloration, one in which the brown tends toward red and one in which it tends toward gray. The females are usually larger than the males. Owls often go unnoticed because of their nocturnal habit. They nest in buildings, holes in trees, or nests abandoned by other birds. Some, such as the burrowing owl, nest on the ground or in holes abandoned by other animals. The white eggs are usually nearly round.

With their round, forward-looking eyes, large heads, and sharply hooked beaks, owls are easily recognized. Their hearing and vision are acute. The disk framing the face on most nocturnal species helps reflect sound to the ears, thus aiding the bird in locating its prey. In many species the ear openings are asymmetrical, further increasing the ability to localize sounds. Some species can turn their heads as much as 270° in one direction. Most owls are nocturnal and prey on insects, birds, or small mammals. The fish owl, with bristly foot pads that help hold fish, and the hawk owl, which often hunts by day, are less typical. All these birds produce "owl pellets," composed of the regurgitated, indigestible portions of their prey, such as bone, fur, and chitin.

Barn owls have heart-shaped facial disks, weakly forked tails, long legs, relatively small eyes, and no ear tufts; bay owls are similar, but the facial disk does not cross the forehead.

The approximately 120 species of typical owls (Strigidae) have larger, more prominent eyes and rounded tails. Many species have ear tufts. They range in size from the tiny 13–15-centimetre (5–6-inch) elf owl to the 70-centimetre (2.3-foot) eagle owl. Found worldwide except for Antarctica, owls occur in habitats ranging from tundra to scrubby desert, although most species, such as the horned and wood owls, prefer wooded areas.

owl-faced monkey, also called HAMLYN'S MONKEY (*Cercopithecus hamlyni*), arboreal guenon found in heavy forest of the Congo basin. The owl-faced monkey is greenish gray with black underparts and forelimbs and silver-gray on the lower back and base of the tail. The distinguishing feature is a white streak that runs the length of the nose and gives it an owllike appearance. *See also* guenon.

owl-fly, large neuropteran fly of the family Ascalaphidae, having membranous wings and long, clubbed antennae. The larva camouflages itself with debris or hides beneath bark to await prey. The adults are found mainly in the tropics but are quite common in the southwestern and southern United States. They are frequently mistaken for dragonflies.

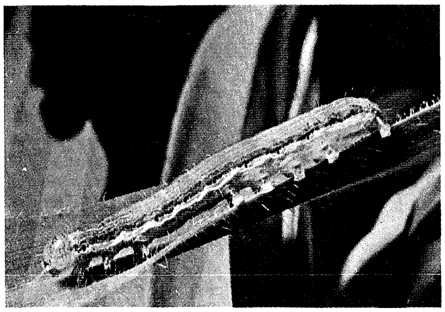
solitary night birds belonging to the genus *Aegotheles* and comprising the family Aegothelidae. They are closely related to frogmouths, in the order Caprimulgiformes. These inhabitants of forests resemble small owls with very wide mouths nearly hidden by long bristles; they also perch like owls but have tiny feet. They eat insects, which they catch either on the wing or by pouncing from a branch. Their call is a soft churring or whistling. They lay three to five eggs in a hole in a tree or sandbank.

The best-known species is the owlet nightjar (*A. cristatus*)—in Australia often called the moth owl—22 cm (9 inches) long, gray above and brown below. Other species, 19–30 cm (7–12 inches) long, occur in New Guinea, New Caledonia, and the Moluccas.

owlet moth, also called MILLER, any of the more than 20,000 species in the cosmopolitan insect family Noctuidae (order Lepidoptera), having powdery, dusky wings. This large group is divided by some authorities into many families.



Armyworm, larva of the owlet moth *Pseudaletia unipuncta*
William E. Ferguson

The wingspan of these triangular-shaped, stout-bodied moths ranges from 8 to 305 mm (1/3 to 12 inches). Although most have dull coloration, some tropical species are bright and iridescent. Owlet moths are mainly night fliers, and many are attracted to lights. Hearing organs on the thorax consist of a tightly stretched membrane that is protected by an expanded hood. Most adults, using their well-developed mouthparts, feed on fruits, sap, or sweet fluids. Some species migrate northward after breeding in tropical regions. Many species have protective coloration.

The larvae vary from dull to colourful and from smooth to hairy. Many species feed on foliage and seeds, others bore in stems and fruits, and a few prey on scale insects. Larvae of some species known as cutworms attack such plants as corn (maize), grasses, tomatoes, and beans at night, severing roots and stems near ground level. Larvae of other species may eat foliage or fruits; still others (*e.g.,* the glossy cutworm, *Crymodes devastator*) live underground and feed on plant roots. The larvae of *Pseudaletia unipuncta,* called armyworms, travel along the ground in large groups, destroying corn, small grains, sugarcane, cotton, and other crops. The name armyworm is also generally applied to caterpillars of several other lepidopteran species that may migrate to new feeding grounds in large groups. The corn earworm, the destructive larval stage of the cosmopolitan moth *Heliothis zea,* is also known as the cotton bollworm, tomato fruitworm, vetch worm, or tobacco budworm, depending upon its host. Many larvae pupate underground with cocoons; others make strong silken cocoons incorporating wood chips, larval hairs, and other material.

ownership, the legal relation between a person (individual, group, corporation, or government) and an object. The object may be corporeal, such as furniture, or completely the creature of law, such as a patent, copyright, or annuity; it may be movable, such as an animal, or immovable, such as land. Because the objects of property and the protected relations are different in every culture and vary according to law, custom, and economic system and the relative social status of those who enjoy its privileges, it is difficult to find a least common denominator of "ownership." Ownership of property probably means at a minimum that one's government or society will help to exclude others from the use or enjoyment of one's possession without one's consent, which may be withheld except at a price.

Legal relations with respect to objects are described in the following articles: property law; copyright; patent; trademark; trust. Related information may be found in the articles bankruptcy; contract; mortgage.

Owo, town, Ondo state, southwestern Nigeria, at the southern edge of the Yoruba Hills (elevation 1,130 feet [344 m]) and at the intersection of roads from Akure, Kabba, Benin City, and Siluko. A major collecting point for cocoa, it also serves as a market centre (yams, cassava, corn [maize], rice, palm oil and kernels, pumpkins, okra). Cotton and teak are cultivated in the surrounding area, which was originally covered with dense tropical rain forest. Owo has secondary schools, a Federal Polytechnic, St. John's Teacher Training College, a government trade institute, a museum, and several hospitals. Pop. (1989 est.) 193,900.

Owyhee River, river formed by the junction of several forks in the southwestern corner of Idaho, U.S. It flows northwest across the Oregon boundary and north through Malheur county and empties into the Snake River south of Nyssa, Ore., after a course of 250 miles (402 km). The Owyhee Dam (1932) impounds Lake Owyhee. The river was named Owyhee (an early spelling of Hawaii) in memory of Hawaiians killed near the stream in 1819.

ox (*Bos taurus,* or *B. taurus primigenius*), a domesticated form of the large horned mammals that once moved in herds across North America and Europe (whence they have disappeared) and Asia and Africa, where some still exist in the wild state. South America and Australia have no wild oxen. Oxen are members of the Bovidae family.

The castrated male of *B. taurus* is a docile form especially useful as a draft animal in many less developed parts of the world. Oxen are also used for food in some areas.

oxalic acid, also called ETHANEDIOIC ACID, a colourless, crystalline, toxic organic compound belonging to the family of carboxylic acids. Oxalic acid is widely used as an acid rinse in laundries, where it is effective in removing rust and ink stains because it converts most insoluble iron compounds into a soluble complex ion. For the same reason, it is the chief constituent of many commercial preparations used for removing scale from automobile radiators.

The formula of oxalic acid is ($C_2H_2O_4$); its usual form is that of the crystalline hydrate, $(COOH)_2 \cdot 2H_2O$. Known as a constituent of wood sorrel as early as the 17th century, oxalic acid was first prepared synthetically in 1776. It is manufactured by heating sodium formate in the presence of an alkali catalyst, by oxidizing carbohydrates with nitric acid, by heating sawdust with caustic alkalies, or by fermentation of sugar solutions in the presence of certain molds.

Oxalis, genus of small herbaceous plants, in the family Oxalidaceae, comprising about 850 species, native primarily to southern Africa and tropical and South America. A few South American species have edible tubers or roots, but most members of the genus are familiar as garden ornamentals. The name is derived from the Greek word *oxalis* ("acid") because the plants have an acidic taste. The common wood sorrel (*O. acetosella*) of eastern North America and Great Britain is a small, stemless plant with cloverlike three-parted leaves. The leaves arise from a creeping, scaly rootstock, and the flowers are borne singly on a stalk that arises from the leaf axil. The flowers have five white, purple-veined petals. The fruit is a capsule that splits open by valves. The seeds

have a fleshy coat, which curls back elastically, ejecting the true seed. The leaflets, as in other species of the genus, fold back and droop at night. Besides the wood sorrel, about 20 other species occur in North America, among which are the yellow wood sorrel (*O. stricta*), of the eastern United States and Canada, with yellow flowers; the violet wood sorrel (*O. violacea*), of the eastern United States, with rose-purple flowers; the redwood wood sorrel (*O. oregana*), of the coast redwood belt from California to Oregon, with pink to white flowers; and *O. cernua,* known as Bermuda buttercups, with showy yellow flowers, native to southern Africa and naturalized in Florida and the Bermudas. Another yellow-flowered kind is the weedy, creeping oxalis (*O. corniculata*). Both *O. stricta* and *O. corniculata* are widely naturalized in the Old World. The tubers of *O. tuberosa,* the oca of South America, and the roots of *O. deppei,* a bulbous Mexican species, are edible.

oxbird, any of certain small sandpipers, especially the dunlin (*q.v.*). In Africa the buffalo weaver (*q.v.*) and the oxpecker are called oxbirds.

oxbow lake, small lake located in an abandoned meander loop of a river channel. It is generally formed as a river cuts through a meander neck to shorten its course, causes

the old channel to be rapidly blocked off, and then migrates away from the lake. If only one loop is cut off, the lake formed will be crescent shaped, whereas if more than one loop is cut off, the lake will be serpentine or winding. Eventually, oxbow lakes are silted up to form marshes and finally meander scars, marked by different vegetation or the absence of cultivation. The lakes commonly are filled with clay-sized sediment that is less easy to erode than surrounding material and thus may cause a more complex meandering system in its parent stream.

Oxenstierna (af Södermöre), Axel, Greve (Count), Oxenstierna also spelled OXENSTJERNA (b. June 16, 1583, Fånö, near Uppsala, Swed.—d. Aug. 28, 1654, Stockholm), chancellor of Sweden (1612–54), successively under King Gustav II Adolf and Queen Christina. He was noted for his administrative reforms and for his diplomacy and military command during the Thirty Years' War. He was created a count in 1645.

Rise to chancellorship. Oxenstierna was born of a noble family that had played a considerable part in Sweden's history. After

receiving his education at Rostock and other German universities, he was appointed to a post in the exchequer and later he was made a member of the council of state. He soon established an ascendancy in that body, and on the death of Charles IX in 1611, it was he who extorted from the new king, Gustav II Adolf, a charter guaranteeing the nation against the royal abuses that had latterly prevailed. One of Gustav's first acts was to appoint Oxenstierna chancellor (January 1612).

Oxenstierna had emerged as the champion of the aristocracy against the violence of the monarchy, and the charter might well have initiated a constitutional struggle if strong ties of respect and affection had not soon developed between the King and Chancellor. They became, indeed, ideal collaborators and share the credit for the achievements of the reign. Oxenstierna's contributions were in the spheres of administrative reform and diplomacy.

He drafted the *riksdagsordning* ("parliamentary law") of 1617, which stabilized the constitution of the Riksdag; he drew up the ordinance of 1619 on the development of the towns; he carried through a reform in local government in 1623; and he issued a chancery ordinance in 1626 that organized the business of that office. He was mainly responsible for the building of the house of the nobility in Stockholm and for the *riddarhusordning* ("upper house law"; 1626), which divided the nobility into three classes and specified the members of each. As a diplomat he was entrusted with a long succession of major negotiations, including the Peace of Knäred (with Denmark, 1613), the Truce of Ogra (with Poland, 1622), and the negotiations with Denmark at Sjöaryd (1624).

When Gustav transferred his war against Poland to Prussia in 1626, Oxenstierna was brought over and installed as governor general, and it was he who negotiated the advantageous Truce of Altmark with Poland in 1629. In November 1631 the King called him to Germany.

Oxenstierna had been more reluctant than Gustav to intervene in Germany and would probably have preferred, in the first instance, a final settlement with Denmark—always, in his view, Sweden's main enemy. Moreover, he disliked the French alliance, considered that Gustav made a capital error in not marching on Vienna after the Battle of Breitenfeld, disapproved the King's candidature for the Polish throne in 1632, and tacitly opposed the project for marrying Christina to the electoral prince of Brandenburg, Frederick William. His removal to Germany placed the main burden of Swedish diplomacy again on his shoulders, but the King also now entrusted him with military commands, such as the formation and leadership of the army that relieved Gustav at Nürnberg in August 1632.

The war after Gustav's death. The death of Gustav, in November 1632, put the supreme direction of the Swedish cause in Germany into Oxenstierna's hands. Preserving to himself much of the king's authority and prestige, he negotiated with electors as an equal, and the project of making him elector of Mainz was canvassed. In the League of Heilbronn (1633), he created a *corpus evangelicorum* of the kind that Gustav had planned, with himself as its director, but he never managed to persuade the North German princes to join it. The disaster at Nördlingen (1634) destroyed his hopes of keeping Sweden's allies loyal, and many of them made peace at Prague in 1635. The renewal of the truce with Poland was purchased (to Oxenstierna's indignation) only by sacrificing the tolls that the Swedes had been levying in the Prussian harbours from 1627. Faced with overwhelming financial and military difficulties, he was for a time the virtual prisoner of his mutinous unpaid soldiery. He hesitated long between buying a peace on the best terms that he could get and accepting a French alliance and indefinite continuation of the war; it was not until 1638 that the intransigence of the Holy Roman emperor, Ferdinand III, forced him to the second alternative. Thenceforward he was the strongest advocate of fighting on until peace could be had on really favourable terms. Political enemies at home accused him of prolonging the war for his own ends, but the terms obtained by Sweden under the Peace of Westphalia, in 1648, justified his obstinacy. Meanwhile, he had launched the sudden attack on Denmark in 1643; the morality of it was dubious, but at Brömsebro in 1645 he was able to dictate a peace that wiped out the humiliations suffered at Knäred in 1613.

Oxenstierna and Queen Christina. As chancellor, Oxenstierna was one of the five regents who were to govern Sweden during Christina's minority; he also drew up (probably with Gustav's approval) the *regeringsform* ("form of government") accepted by the Riksdag in 1634. It was not until his return to Sweden in 1636 that he participated in the regency's government, but for the next eight years or so he was the real ruler of the country. His relations with the Queen, after she attained her majority (1644), were never as cordial as with her father; she saw in him the leader of an aristocracy anxious to limit the crown's powers and perhaps even to set up a republic. Others disliked him as the defender of noble privileges and noble encroachments on the liberties of the peasantry, though he repeatedly urged moderation on his colleagues in this regard. He had to face the intrigues of a hostile party at court, and he clashed with Christina on foreign and ecclesiastical policy, on the question of the succession, and on her proposal to abdicate. After 1650, however, relations improved, and he was as firmly established in office as at any time in his career when he died in 1654.

Sagacious, imperturbable, courageous, and industrious, unhurried in negotiation, and not without a pungent humour, Oxenstierna felt the service of the state to be equally congenial and obligatory. Though he never forgot the interests of his class, it may fairly be said that as a rule his single-minded patriotism transcended them. (M.Ro.)

Oxenstierna, Bengt Gabrielsson, Greve (Count) (b. July 16, 1623, Morby Castle, Sweden—d. July 12, 1702, Stockholm), Swedish statesman who, as the principal foreign policy adviser of King Charles XI, established a virtually neutral foreign policy for Sweden, breaking the existing alliance with France and forming ties with the Netherlands, England, and the Holy Roman Empire.

Bengt Oxenstierna, a relative of Axel Oxenstierna, began his career as a diplomat at the Congresses of Osnabrück and Nürnberg,

which were held in connection with the Peace of Westphalia (1648), which ended the Thirty Years' War. After serving as president of the tribunal at Wismar (now in Germany), one of Sweden's German possessions, he joined (1655) the Polish campaign of King Charles X and fought with distinction in the defense of Toruń (1658). A councillor of state from 1654, he helped negotiate the Treaty of Oliva (1660), by which Poland ceded to Sweden its last Baltic territories.

After diplomatic service in Livonia, Wismar, and Vienna, Oxenstierna helped negotiate the treaties of Nijmegen (1678, 1679), which concluded the Dutch War (1672–78), in which Sweden had fought on the French side. Appointed head of the chancellery in 1680, Oxenstierna soon assumed control of Sweden's foreign affairs. By negotiating an alliance with the Netherlands and the Holy Roman emperor in the Treaty of The Hague (1681), he reversed Sweden's long-standing policy of alliance with France.

Recognizing the threat to the European balance of power posed by the personal alliance of England and the Netherlands under William III in 1688, Oxenstierna helped maintain the neutrality of Sweden during the ensuing War of the Grand Alliance (1689–97) between France and the major European powers. He gained a mediating role for Sweden in the Treaty of Rijswijk (1697), which ended the war. After the accession of Charles XII in 1697, Oxenstierna's influence declined greatly. After the outbreak of the Great Northern War (1700–21), Charles disregarded Oxenstierna and made his decisions in the field.

OXFAM, abbreviation of OXFORD COMMITTEE FOR FAMINE RELIEF, privately funded, British-based agency that provides relief and development aid to impoverished or disaster-stricken communities worldwide. The original OXFAM was founded at Oxford, Eng., in 1942 to raise funds for the feeding of hungry children in war-torn Greece. The organization grew as it provided aid to refugees in the years following World War II. Its aid emphasis shifted in the 1960s to helping improve agriculture and food production in the more impoverished countries of the world. OXFAM developed an overseas network of field directors to administer its aid projects, but its goal was to provide manpower and training funds so that indigenous peoples could learn to help themselves. A large network of British volunteers helped in raising local funds for such projects. During the 1970s associate OXFAM organizations were formed in the United States, Canada, Belgium, and Australia. OXFAM organizations also continued to provide emergency aid for areas stricken by droughts, floods, earthquakes, and other natural catastrophes.

Oxford, district (city), county of Oxfordshire, England, best known for the University of Oxford, which is located within it.

Situated between the Upper River Thames (known in Oxford as the Isis) and the Cherwell, just north of their confluence, the town was first occupied in Saxon times as a fording point. Earlier peoples had spurned the valley lowlands in favour of the drier uplands to the north and south. Oxford eventually became a Thames *burg*, built to defend the northern frontier of Wessex from Danish attack. The first written mention of the town was in the Anglo-Saxon Chronicle (912), when it was observed that Edward the Elder "held Lurdenbryg [London] and Oxnaford and all the lands pertaining thereto." Except for the Saxon Romanesque tower of St. Michael's Church in Cornmarket Street, little remains of the Saxon settlement at Oxford.

Robert d'Oilly was appointed the first Norman governor of Oxford and was responsible for building Oxford Castle, of which all that remains is the motte (mound) and the tower of the Church of St. George in the castle. The site today is occupied by the local prison. Robert also built Oxford's first bridges (Magdalen, Folly, and Hythe). The Normans constructed a stone wall around the settlement. This wall enclosed an area of approximately 95 acres (38 hectares). Little now remains of it except for a few short sections, such as that standing in the grounds of New College. Established as a diocese in 1542, the first Oxford see was Osney Priory (destroyed), but in 1546 this designation was bestowed on St. Frideswide Priory, the "chapel" of Christ Church College and the smallest of all the cathedrals in England.

Oxford is known as the "City of Spires" because of its beautiful skyline of Gothic towers and steeples. Most of these belong to the university, which is the oldest in England. The University of Oxford's buildings were mostly built in the 15th, 16th, and 17th centuries. The earliest colleges of Oxford were University College (1249), Balliol (1263), and Merton (1264). Each college is built around two or three quadrangles, with a chapel, hall, library, and walled gardens. After the university was founded in the second half of the 12th century Oxford remained a market town, but this function declined in importance from the 13th century on. The town's subsequent history became the history of the university, although there was always a certain antipathy between "town and gown." This found its most violent expression in the Massacre of St. Scholastica's Day in 1355.

In the English Civil War Oxford's strategic importance made the city the Royalist headquarters to which the King retired after his defeats at Edgehill, Newbury, and Naseby. In May 1646 the Parliamentary commander in chief, Lord Fairfax, besieged the city, which finally surrendered to him on June 24th. The town became an important stagecoach junction point, and a considerable number of inns from the stagecoach era still exist. During the 18th century a canal network linking Oxford with various parts of the country was also developed, and in 1835 the Great Western Railway from London to Bristol was begun.

In 1801 Oxford was still a small market town of about 12,000 persons, many of whom depended on the university for a livelihood, but by the beginning of the 20th century printing and publishing industries had become firmly established in the town, and the manufacture of preserves (especially marmalade) was also important. By 1901 there were about 50,000 people in Oxford. The English industrial magnate William Morris (later Lord Nuffield) started a motor-car industry at Cowley, just outside the city, and today this, together with associated heavy and electrical engineering enterprises, is the main industrial concern in the local economy. In 1926 a pressed-steel factory for car bodies was also set up in Cowley, and in 1929 the city's boundaries were extended to include this industrial quarter. Oxford Polytechnic, one of England's newest major institutions of higher education, was founded in 1970. Pop. (1981) 99,195.

Oxford, city, Lafayette County, northern Mississippi, U.S. It is situated 62 miles (100 km) southeast of Memphis, Tenn. Originating as a trading post, it was incorporated in 1837 as the county seat and named for the English centre of learning, reflecting the townspeople's early desire for a university. The University of Mississippi (Ole Miss), chartered 1844, was opened there in 1848. The university served as a hospital when the city was occupied by Federal forces during the Civil War (December 1862–August 1864). In the fall of 1962 Oxford was torn by white rioting over the enrollment of a black student, James H. Meredith, at the University of Mississippi during the desegregation of the state educational system. The novelist William Faulkner, who was born in New Albany, 32 miles (51 km) east-northeast, lived in Oxford. Rowan Oak, his home from 1930 until his death in 1962, where he wrote his tales of Jefferson (Oxford) and Yoknapatawpha (Lafayette) County, is on Garfield Street. The city has economic interests in agriculture (poultry, dairying, truck farming, corn [maize], and cotton), lumbering, and manufacturing (electric motors, appliances). The Sardis Reservoir and Holly Springs National Forest are located nearby. Pop. (1984 est.) 10,263.

Oxford, EARLS OF, titled English nobility of three creations, in the families de Vere, Harley, and Asquith, grouped below chronologically and indicated by the symbol •.

• Oxford, Robert de Vere, 9th earl of (b. 1362—d. 1392, Louvain, Neth.), favourite of King Richard II of England (ruled 1377–99) during that monarch's minority. He led the group of courtiers who unsuccessfully supported Richard's efforts in 1385–87 to wrest control of the government from powerful nobles.

Through his mother, a descendant of King Henry III (ruled 1216–72), de Vere succeeded to his father's earldom in 1371. After the accession of his close friend Richard II, Oxford, who was already great chamberlain by hereditary right, became a privy councillor and Knight of the Garter. He was made marquess of Dublin—the first Englishman to be granted the title marquess—in 1385 and duke of Ireland in 1386.

Oxford's elevation caused much resentment among the King's ambitious enemies, such as his uncle Thomas of Woodstock, duke of Gloucester. Oxford further enraged Gloucester by divorcing the Duke's niece in 1387. Further, Oxford and his Royalist party acquired a reputation for frivolity and incompetence. On Nov. 17, 1387, Gloucester demanded the arrest of Oxford and other leading Royalists. Oxford organized an army in northwest England, but his force was routed by Gloucester at Radcot Bridge, Oxfordshire, on December 20. He escaped in disguise to the Netherlands and died in exile. As a result of Oxford's defeat, Richard was forced to submit to the Merciless Parliament of 1388 and to the five lords appellant who controlled the realm until 1389, when the King asserted his authority by proclaiming his minority at an end.

• **Oxford, John de Vere, 13th earl of** (b. Sept. 8, 1442—d. March 10, 1513), English soldier and royal official, a Lancastrian leader in the Wars of the Roses. He helped to restore the deposed King Henry VI (1470) and later (1485) to secure the English throne for the last surviving male claimant from the House of Lancaster, Henry Tudor, earl of Richmond, afterward King Henry VII.

He was the second son of John de Vere, 12th earl, who, with his eldest son, Aubrey, was executed (February 1462) under the Yorkist king Edward IV. Several years later, the younger John de Vere fled to France with the "kingmaker," Richard Neville, earl of Warwick. Returning with Warwick in a successful attempt to restore Henry VI (September–October 1470), he was made constable of England, supplanting John Tiptoft, earl of Worcester, who had put de Vere's father and brother to death and was in turn executed by de Vere. After leading the Lancastrian vanguard in the Battle of Barnet, Hertfordshire (April 14, 1471), in which Warwick was killed and the Yorkists were victorious, de Vere was again exiled to France.

Once more returning to Britain, he captured the island of St. Michael's Mount, Cornwall (1473), but surrendered after a siege and was imprisoned. On escaping (August 1484), he joined Henry Tudor, who was preparing to invade Wales and then England from France. For his service as commander of the right wing in Henry's victory at Bosworth Field, Leicestershire (Aug. 22, 1485), de Vere was again restored to his title and estates and was made chamberlain and admiral of England. Subsequently, he fought in the victory of Henry VII's army at Stoke, Nottinghamshire (June 16, 1487), the last battle of the Wars of the Roses, and crushed the 7th Baron Audley's Cornish rebels at Blackheath, south of London (1497).

• **Oxford, Edward de Vere, 17th earl of** (b. April 12, 1550, Castle Hedingham, Essex, Eng.—d. June 24, 1604, Newington, Middlesex), lyric poet and dramatist, patron of the acting company Oxford's Men, who became, in the 20th century, the strongest candidate proposed (next to Shakespeare himself) for the authorship of Shakespeare's plays.

He studied at Cambridge and succeeded to the earldom in 1562. He was the ward of Queen Elizabeth's principal minister, William Cecil (later Lord Burghley), whose daughter, Ann Cecil, he married in 1571. He travelled on the Continent (1574–76) and became for awhile estranged from his wife and Lord Burghley. Because of his extravagance he fell into disgrace at court but was restored to favour in 1583. In 1586 he was granted an annuity by the Queen, perhaps for his services in maintaining the company of actors he had taken over from the Earl of Warwick in 1580.

In his youth he had written some plays, none of which is extant. He was a notable patron of writers and employed John Lyly, the author of the novel *Euphues,* as his secretary for many years.

The Oxfordian theory of Shakespearean authorship was first advanced in 1920 in *"Shakespeare" Identified in Edward de Vere, the Seventeenth Earl of Oxford,* a study by J. Thomas Looney.

Oxford's death date (1604) has proved a major embarrassment to the advancement of the Oxfordian theory, because according to standard chronology, 14 of Shakespeare's plays, including many of the most important ones, were staged after that time.

• **Oxford (and Mortimer), Robert Harley, 1st earl of,** EARL MORTIMER, BARON HARLEY OF WIGMORE (b. Dec. 5, 1661, London—d. May 21, 1724, London), statesman who headed the Tory ministry from 1710 to 1714. Although by birth and education he was a Whig and a Dissenter, he gradually over the years changed his politics, becoming the leader of the Tory and Anglican party.

Harley came from a Presbyterian family; he was first elected to Parliament in 1688. Within several years he became, with Paul Foley, leader of a coalition of Whigs and moderate Tories opposed to the government of King William III. Convinced (wrongly) that the Peace of Rijswijk (1697) would usher in an era of pacific relations, he called for a smaller army than that favoured by William, and he further angered his sovereign by attacking royal largesse and insisting on a reduced budget.

Harley was speaker of the House from 1701 to 1705 and secretary of state from 1704 to 1708. During this period Harley, along with John Churchill, 1st duke of Marlborough, and Lord Treasurer Sidney Godolphin, dominated the government of Queen Anne (ruled 1702–14) and directed the war against the French (War of the Spanish Succession, 1701–14).

Although Harley became the Queen's favourite, his anti-Whig attitudes brought him into conflict with his two colleagues, who in February 1708 forced him to resign. He then allied with the Tories, while the Whigs occupied all major government offices. Because of the growing closeness of his cousin and ally, Lady Abigail Masham, to the Queen, Harley remained influential. In 1710 public dissatisfaction with the Whig-directed war and with the handling of the Sacheverell affair (*see* Sacheverell, Henry), enabled Anne to dismiss Godolphin and install Harley as chancellor of the Exchequer at the head of a Tory ministry. Although he secured a great majority at the general election, his new ministry was more radically Tory than Harley wished. He now reached the peak of his career; and, after surviving a murderous assault by the Marquis de Guiscard, a French spy who had been arrested and was being interrogated at a privy council meeting, Harley was created earl of Oxford and made lord treasurer and Knight of the Garter in 1711. By funding the most pressing portion of the national debt in the South Sea Company stock (1711) and by securing a reasonable peace at Utrecht (1713), Oxford dealt with two crucial issues, but he was now threatened by the intrigues of his protégé and colleague, Henry Saint John, Viscount Bolingbroke. Avid for power, Bolingbroke, like Godolphin earlier, could argue the need for an alliance with a party; and the Schism Act (1714) abolishing the Dissenting academies, in one of which Oxford himself had been educated, was his pledge to the high Tories. The struggle between them became the more desperate, because both had been discountenanced by George, the Hanoverian heir to the throne, for making peace at Utrecht, and both engaged in questionable, if not treasonable, correspondence with James Edward, the Old Pretender, with whom the relations of both were shattered by his refusal to change or dissemble his Catholicism, finally announced in March 1714. Oxford, now preoccupied with nepotism, was in physical and mental decline, but Anne stubbornly kept him in office till July 27, 1714, five days before her death.

Permanently exiled from power by the Hanoverian succession, Oxford was imprisoned in 1715; an impeachment of him collapsed in 1717 because of differences between the two houses of Parliament and among the Whigs themselves, but Oxford played no further part of importance in parliamentary politics or Jacobite conspiracy.

Oxford formed a great library and collection of manuscripts, both of which were enlarged by the second earl. In 1753 the manuscripts were bought by the nation to form the Harleian Collection in the British Museum and Library. His life is recounted in O.B. Miller's *Robert Harley, Earl of Oxford* (1925), and A. McInnes's *Robert Harley* (1970).

Oxford, Provisions of (1258), a plan of reform accepted, in return for the promise by his barons of financial aid, by the English king Henry III. It can be regarded as England's first written constitution.

Henry, bankrupted by a foolish venture in Sicily, summoned Parliament in the spring of 1258 (the Easter Parliament, or the so-called Mad Parliament). In return for a badly needed grant of revenue, Henry grudgingly agreed to abide by a program of reform to be formulated by a 24-man royal commission, half of whom were to be chosen by the king, half by the baronial party. The report of the commission (issued *c.* June 10) is known as the Provisions of Oxford.

The Provisions, confirmed by an oath of "community" of the magnates, were to remain in effect for 12 years and provide the machinery through which the necessary reforms could be accomplished. The government was placed under the joint direction of the king and a 15-member baronial council that was to advise the king on all important matters. All high officers of the realm were to swear allegiance to the king and the council. Parliament was to meet three times a year to consult on further reforms. A justiciar was appointed (for the first time since 1234) to oversee local administration, and the majority of sheriffs were replaced by knights holding land in the shires that they administered.

Annulled by papal bulls in 1261 and 1262 and by Louis IX of France in the Mise of Amiens (January 1264), the Provisions were restored by baronial action in 1263 and, in modified form, in 1264 but finally annulled by the Dictum of Kenilworth (October 1266).

Oxford, University of, English autonomous institution of higher learning at Oxford, Oxfordshire, Eng. It lies along the Upper River Thames (called by Oxonians the Isis), 50 miles (80 km) north-northwest of London.

Sketchy evidence indicates that schools existed at Oxford as soon as the early 12th century. By the end of that century a university was well established, perhaps resulting from the barring of English students from the University of Paris about 1167. Oxford was modeled on the University of Paris, with initial faculties of theology, law, medicine, and the liberal arts.

In the 13th century the university gained added strength, particularly in theology, with the establishment of several religious orders, principally Dominicans and Franciscans, in the town of Oxford. The university had no buildings in its early years; lectures were given in hired halls or churches. The various colleges of Oxford were originally merely endowed boardinghouses for impoverished scholars. They were intended primarily for masters or bachelors of arts who needed financial assistance to enable them to continue study for a higher degree. The earliest of these colleges, University College, was founded in 1249. Balliol College was founded in about 1263, and Merton College in 1264.

During the early history of Oxford its reputation was based on theology and the liberal arts. But it also gave more serious treatment to the physical sciences than did the University of Paris: Roger Bacon, after leaving Paris, conducted his scientific experiments and lectured at Oxford from 1247 to 1257. Bacon was one of several influential Franciscans at the university during the 13th and 14th centuries. Among the others were Duns Scotus and William of Ockham. John Wycliffe (*c.* 1330–84) spent most of his life as a resident Oxford doctor.

Beginning in the 13th century the university was strengthened by charters from the crown, but the religious foundations in Oxford town were suppressed during the Reformation. In 1571 an act of Parliament led to the incorporation of the university. The university's statutes were codified by its chancellor, Archbishop William Laud, in 1636. In the early 16th century professorships began to be endowed, and in the latter part of the 17th century interest in scientific studies increased substantially. During the Renaissance, Desiderius Erasmus carried the new learning to Oxford, and such scholars as William Grocyn, John Colet, and Sir Thomas More enhanced the university's reputation. Since that time Oxford has traditionally held the highest reputation for scholarship and instruction in the classics, theology, and political science.

In the 19th century the university's enrollment and its professorial staff were greatly expanded. The first women's college at Oxford, Lady Margaret Hall, was founded in 1878, and women were first admitted to full membership in the university in 1920. In the 20th century Oxford's curriculum was modernized. Science came to be taken much more seriously and professionally, and many new faculties were added, including ones for modern languages, political science, and economics. Postgraduate studies also expanded greatly in the 20th century.

The colleges and collegial institutions of the University of Oxford include All Souls (1438), Balliol (1263–68), Brasenose (1509), Christ Church (1546), Corpus Christi (1517), Exeter (1314), Green (1979), Hertford (1874), Jesus (1571), Keble (founded 1868, inc. 1870), Lady Margaret Hall (founded 1878, inc. 1926), Linacre (1962), Lincoln (1427), Magdalen (1458), Merton (1264), New (1379), Nuffield (founded 1937, inc. 1958), Oriel (1326), Pembroke (1624), Queen's (1340), St. Anne's (founded 1879, inc. 1952), St. Antony's (1950), St. Catherine's (1962), St. Cross (1965), St. Edmund Hall (1278), St. Hilda's (founded 1893, inc. 1926), St. Hugh's (founded 1886, inc. 1926), St. John's (1555), St. Peter's (founded 1947, inc. 1961), Somerville (founded 1879, inc. 1926), Trinity (1554–55), University (1249), Wadham (1612), Wolfson (1966), and Worcester (1283, inc. 1714).

Oxford houses the Bodleian Library and the Ashmolean Museum (*qq.v.*). The Oxford University Press, established in 1478, is one of the largest and most prestigious university publishers in the world.

Oxford has been associated with many of the greatest names in British history, from John Wesley and Cardinal Wolsey to Oscar Wilde and Sir Richard Burton to Cecil Rhodes and Sir Walter Raleigh. The astronomer Edmond Halley studied at Oxford, and the physicist Robert Boyle performed his most important research there. Prime ministers who studied at Oxford include William Pitt the Elder, George Canning, Sir Robert Peel, William Gladstone, Lord Salisbury, H.H. Asquith, Clement Atlee, Anthony Eden, Harold Macmillan, Edward Heath, Sir Harold Wilson, and Margaret Thatcher.

Oxford English Dictionary, The (OED), definitive historical dictionary of the English language, originally consisting of 12 volumes and a one-volume supplement. The dictionary is a corrected and updated revision of *A New English Dictionary on Historical Principles* (*NED*), which was published in 10 volumes from Feb. 1, 1884, to April 19, 1928, and which was designed to provide an inventory of words in use in English since the middle of the 12th century (and in some cases even earlier). In 1933 the *New English Dictionary* was reissued in 12 volumes (along with a one-volume supplement) as *The Oxford English Dictionary.* Both the *NED* and *OED* were published by the Clarendon Press of Oxford.

Arranged in order of historical occurrence, the definitions in the *OED* are illustrated with about 5,000,000 dated quotations from English-language literature and records. The aim of the dictionary (as stated in the 1933 edition) is "to present in alphabetical series the words that have formed the English vocabulary from the time of the earliest records down to the present day, with all the relevant facts concerning their form, sense-history, and etymology."

The publication of the dictionary was first suggested to the Philological Society (London) in 1857, and the collection of materials began soon thereafter. Editorial work began in 1879 with the appointment of James Murray, who was at that time president of the Philological Society, as editor in chief. Murray, during his term as editor, was responsible for approximately one-half of the dictionary, including the letters *a* through *d, h* through *k, o, p,* and *t.* Succeeding editors included Henry Bradley, William Alexander Craigie, and C.T. Onions.

A micrographically reproduced two-volume edition of the 1933 12-volume *OED* and its supplement appeared in 1971, entitled *The Compact Edition of the Oxford English Dictionary.*

A Supplement to the Oxford English Dictionary, 4 vol. (1972–86), treating words that came into use in the English-speaking world after the preparation of the *OED,* was begun in 1955 under the editorial direction of R.W. Burchfield and was published by the Clarendon Press.

The second edition of *The Oxford English Dictionary,* known as *OED2,* was published in 20 volumes in 1989 by the Oxford University Press. Its coeditors were John A. Simpson and Edmund S.C. Weiner. The second edition includes in one alphabetical sequence all the words defined in the original 12-volume *OED* and the 5 supplementary volumes. During the making of the *OED2,* the text of the entire dictionary was transferred to an electronic data base.

Oxford Group (revivalistic movement): *see* Moral Re-Armament.

Oxford Movement, 19th-century movement centred at the University of Oxford that sought a renewal of "catholic," or Roman Catholic, thought and practice within the Church of England in opposition to the Protestant tendencies of the church. An immediate cause of the movement was the change that took place in the relationship between the state and the established Church of England from 1828 to 1832. Laws that required members of municipal corporations and government-office holders to receive the Eucharist in the Church of England were repealed, and a law was passed that removed most of the restrictions formerly imposed on Roman Catholics. For a short time it seemed possible that the Church of England might be disestablished and that it might lose its endowments. Consequently, many loyal Anglicans wished to assert that the Church of England was not dependent on the state and that it gained its authority from the fact that it taught Christian truth and its bishops were in the apostolic succession (*i.e.,* able to trace their authority and office back in an unbroken line to the Apostles). The movement rapidly became involved in theological, pastoral, and devotional problems.

Leaders of the movement were John Henry Newman (1801–90), a clergyman and subsequently a convert to Roman Catholicism and a cardinal; Richard Hurrell Froude (1803–36), a clergyman; John Keble (1792–1866), a clergyman and poet; and Edward Pusey (1800–82), a clergyman and professor at Oxford.

The ideas of the movement were published in 90 *Tracts for the Times* (1833–41), 24 of which were written by Newman, who edited the entire series. The Tractarians asserted the doctrinal authority of the catholic church to be absolute, and by "catholic" they understood that which was faithful to the teaching of the early and undivided church. They believed the Church of England to be such a catholic church.

Some of the movement's followers gradually moved closer to the beliefs of the Roman Catholic Church, and controversies over the Tractarians' ideas developed. In 1845 Newman joined the Roman Catholic Church, and, subsequently, several others also joined.

Keble and Pusey remained active leaders of the movement, which gradually spread its influence throughout the Church of England. Some of the results were increased use of ceremony and ritual in church worship, the establishment of Anglican monastic communities for men and for women, and better-educated clergy who were more concerned with pastoral care of their church members.

Oxfordshire, county of south-central England, bounded on the north by Warwickshire and Northamptonshire, on the west by Gloucestershire and Wiltshire, on the south by Berkshire, and on the east by Buckinghamshire. It comprises five districts—Cherwell, Oxford, South Oxfordshire, Vale of White Horse, and West Oxfordshire—with an area of 1,007 square miles (2,608 square km).

The county consists of two upland areas divided by a broad vale, about 10 miles (16 km) wide. The North Oxfordshire Heights, rising to 700 ft (210 m) at Edgehill in the northeast of the county, are developed on oolitic limestone and related strata of the Jurassic period. The Berkshire Downs and White Horse Hill are developed on Cretaceous chalk. The intervening clay vale stretches from northeast to southwest. It is divided into the Oxford Clay Vale and the White Horse Vale by an outcrop of Corallian limestone, giving rise to the Oxford Heights.

Oxfordshire is located almost entirely within the Thames Basin. The river flows northeastward along the Oxford Clay Vale, receiving the Rivers Windrush, Evenlode, and Cherwell from the north and the Ock and its tributaries from the south. There is an elbow of capture, where the drainage system has become connected to a former portion of a neighbouring system, to the east of Oxford, from which the Thames flows southward through the Goring Gap. There is little glacial drift except in the northeast corner of the county. Gravel deposits, both plateau (North Leigh, Combe, and Tiddington) and flood plain (Bampton, Oxford, and Dorchester) are important economically.

Numerous Paleolithic and Mesolithic artifacts have been recovered from the flood-plain gravels that border the Thames. Neolithic tools and pottery have similarly been located at many points in the county. A number of long barrows and the Rollright Stones on the Oxfordshire–Warwickshire border also date from this period. The major archaeological monument in the county, dating from the Iron Age, is the Uffington White Horse, which is carved into the chalk of the White Horse Hill. The monument is 360 ft long and has a maximum height of 130 ft. Dorchester and Alchester, situated on the Roman road from Silchester to Watling Street and Towcester, were the most important sites in Roman Oxfordshire. Subsequent Saxon settlement in the county was concentrated at valley sites along the line of the Thames and its major tributaries, and Oxfordshire was successively part of the Anglo-Saxon kingdoms of Wessex and Mercia. During the 10th and 11th centuries the area was overrun by the Danes.

At the time of Domesday Book (1086), the record of William I the Conqueror's land survey of England, the county was fairly well populated, the major centres being Oxford itself, Wallingford, Abingdon, and Bampton. All were incipient towns with regular markets. The medieval period is commemorated by numerous ecclesiastical and domestic buildings. Iffley church, just south of Oxford, is one of the best examples of pure Romanesque style in England; Adderbury, south of Banbury, has a cruciform Decorated style church, and that at Minster Lovell is pure Perpendicular style. Secular buildings include Broughton Castle (14th century), Stonor Park, Stanton Harcourt (1450), Chastleton, and Blenheim Palace (early 18th century), built near Woodstock for the Duke of Marlborough, a member of one of the great political dynasties of England. The county saw action during the English Civil War (1642–51). The towns of Oxford, Banbury, and Wallingford were all besieged by Parliamentary forces at some time, and Oxford was the Royalist headquarters.

The economy of modern Oxfordshire is basically agricultural. The North Oxfordshire Heights are important for sheep and arable farming, mostly on large farms. From medieval times until quite recently wool was a mainstay of the economy. The clay vale is mainly sown to grass, milk and beef being produced. The White Horse Vale and the northern slope of the Downs are noted for fruit production.

Ironstone is mined near Banbury, and clay, sand, and gravel are also worked in various parts of the county. Cowley, a suburb of Oxford, is the major industrial centre, producing motor vehicles and pressed steel. Banbury, with light engineering, and Witney, with blanket manufacture, are also important centres. Paper mills are located at Wolvercote, Shiplake, Sandford, and Eynsham, using pure stream water. Pop. (1983 est.) 550,300.

oxidation-reduction reaction, also called REDOX REACTION, any of a large and diverse class of chemical processes mostly involving the transfer of oxygen atoms, hydrogen atoms, or electrons from one substance to another.

A brief treatment of oxidation-reduction reactions follows. For full treatment, *see* MACROPAEDIA: Chemical Reactions.

Before the role of electrons in chemical reactions was elucidated, the term oxidation was applied to reactions in which an element gained oxygen, as in the burning of carbon, $C + O_2 \rightarrow CO_2$, or the rusting of iron, $4Fe + 3O_2 \rightarrow 2Fe_2O_3$; the term reduction designated a reaction by which an element lost oxygen, such as the reduction of copper by hydrogen, $CuO + H_2 \rightarrow Cu + H_2O$.

Today it is understood that most oxidation-reduction processes (usually called redox reactions) involve the transfer of oxygen atoms, hydrogen atoms, or electrons. These reactions are characteristically coupled—*i.e.,* whenever an oxidation reaction occurs, a reduction reaction also takes place. When hydrazine, for example, loses hydrogen and is oxidized to nitrogen gas in the reaction $N_2H_4 \rightarrow N_2 + 2H_2O$, oxygen gains hydrogen and is thereby reduced, forming water.

Many substances in water solution ionize. Nickel chloride ($NiCl_2$), for example, dissociates into its charged constituents as symbolized by the reaction $NiCl_2 \rightarrow Ni^{2+} + 2Cl^-$. The electrolysis of such solutions results in an oxidation process at the anode and a reduction process at the cathode. For the electrolysis of $NiCl_2$ the anode reaction is $2Cl^- \rightarrow Cl_2 + 2e^-$ and the cathode reaction $Ni^{2+} + 2e^- \rightarrow Ni$. These reactions involving electrons are called half reactions or oxidation-reduction couples. In theory, every oxidation-reduction reaction may be broken up into two couples that indicate the mechanism by which electrons are transferred. Oxidation and reduction occur simultaneously and in equivalent amounts; *i.e.,* the number of electrons lost is equal to the number gained. The relative potentials of the two couples determine the direction in which the reaction will proceed.

The most powerful reducing agents include such highly electropositive metals as sodium, which readily reduce the compounds of the noble metals and also liberate hydrogen from water. Among the most powerful oxidizing agents are fluorine and ozone. These readily liberate oxygen from water.

Each atom that participates in a redox reaction is assigned an oxidation number that signifies the atom's excess or deficiency of electrons. For instance, the Na^+ ion has an oxidation number of +1 because it is deficient of one electron. Sulfate ion (SO_4^{2-}) has an overall oxidation number of −2, which is the sum of the oxidation numbers of its constituent atoms. Each oxygen atom has two spare electrons; their total contribution to the sulfate oxidation number therefore is −8. Sulfur has an oxidation number of +6, which, when added to the contribution from oxygen, gives a total oxidation number of −2 for the sulfate ion. In an electronically neutral substance, the sum of the oxidation numbers is zero—*e.g.,* sodium sulfate (Na_2SO_4). The oxidation number of the two sodium atoms (+2 in total) balances the negative oxidation number of the sulfate ion (−2). Hence, if an atom or ion increases its oxidation number, it has been oxidized through loss of electrons; whereas if its oxidation number decreases, it has been reduced.

Certain elements assume the same oxidation number in different compounds; others, notably the nonmetals and the transition elements, can assume a variety of oxidation numbers. For example, fluorine, the most electronegative of the elements, has the oxidation number −1 in all of its compounds; nitrogen can have any oxidation number between −3 (as in ammonia, NH_3) and +5 (as in nitric acid, HNO_3).

In the nomenclature of inorganic compounds, it is accepted practice to indicate the oxidation number of an element that may exist in more than one oxidation state by a roman numeral in parentheses after the name of the element; *e.g.,* iron(II) chloride ($FeCl_2$) and iron(III) chloride ($FeCl_3$).

oxide, any of a large and important class of chemical compounds in which oxygen is combined with another element.

Nearly all the elements form oxides, which vary in properties from those of typical metal oxides—crystalline solids containing the oxide ion, O^{2-}, that react with water to form alkalies or with acids to form salts—to those of typical nonmetal oxides—volatile compounds in which the oxygen atoms are covalently linked to the nonmetal atom and that react with water to form acids or with alkalies to form salts. Thus, calcium, a metal, forms calcium oxide (CaO), which reacts with water to form calcium hydroxide, a strong alkali, and with hydrochloric acid to form calcium chloride, a salt; sulfur, a nonmetal, forms sulfur trioxide (SO_3), which reacts with water to form sulfuric acid, a strong acid, and with sodium hydroxide to form sodium sulfate, a salt. Oxides, such as those of aluminum, zinc, or tin, that form salts by reacting with either acids or alkalies, are called amphoteric; for example, aluminum oxide (Al_2O_3) reacts with hydrochloric acid to form aluminum chloride and with sodium hydroxide to form sodium aluminate.

Certain organic compounds react with oxygen or other oxidizing agents to produce substances called oxides. Thus, amines, phosphines, and sulfides form amine oxides, phosphine oxides, and sulfoxides, respectively, in which the oxygen atom is covalently bonded to the nitrogen, phosphorus, or sulfur atom. The so-called olefin oxides are cyclic ethers.

oxide mineral, any naturally occurring inorganic compound with a structure based on close-packed oxygen atoms in which smaller, positively charged metal ions occur in interstices. Oxides are distinguished from other oxygen-bearing compounds such as the silicates, borates, and carbonates, which have a readily definable group containing oxygen atoms covalently bonded to an atom of another element. Hydroxides are usually not included with oxide minerals.

The oxide minerals can be grouped as simple oxides and multiple oxides. Simple oxides are a combination of one metal and oxygen, whereas multiple oxides have two nonequivalent metal sites. The oxide structures are usually based on cubic or hexagonal close-packing of oxygen atoms with the octahedral or tetrahedral sites or both occupied by metal ions; symmetry is typically cubic, hexagonal, trigonal, or tetragonal.

The simple oxides can be subdivided on the basis of the ratio of the numbers of atoms of metal and oxygen, giving general formulas of the A_xO_y type. In such formulas A represents a metal atom, and x and y represent integers. Chemical compositions then fall into categories such as those designated AO, A_2O, A_2O_3, AO_2. Specific simple oxide minerals include periclase (MgO), cuprite (Cu_2O), hematite (Fe_2O_3), and uraninite (UO_2).

Complex oxides show a more varied chemistry, often with extensive solid solution. Most common is the spinel group, with the general formula AB_2O_4, in which A and B are ions of different metals, the same metal with differ-

ent oxidation states, or a combination of the two; *A*-divalent, *B*-trivalent is the commonest. Frequently occurring divalent ions include magnesium, iron, zinc, and manganese, while common trivalent ions are aluminum, iron, manganese, and chromium.

Oxide minerals occur as decomposition products of sulfide minerals, in pegmatites, early crystallizing minerals in ultrabasic rocks, and as accessory minerals in many igneous rocks.

oxidoreductase, any member of a class of enzymes, commonly known as dehydrogenases or oxidases, that catalyze the removal of hydrogen atoms and electrons from the compounds on which they act. Substances called coenzymes, associated with the oxidoreductase enzymes and necessary for their activity, accept the hydrogen and electrons, which—in metabolic systems of animals—eventually are transferred to oxygen. Other enzymes of this group catalyze such reactions as the oxidation of aldehydes and ketones to carboxylic acids and the dehydrogenation of amino acids.

oxime, any of a class of nitrogen-containing organic compounds usually prepared from hydroxylamine and an aldehyde, a ketone, or a quinone. Oximes have the structure

$$\begin{matrix} X \\ & \searrow \\ & & C=N-OH, \\ & \nearrow \\ Y \end{matrix}$$

in which X and Y are hydrogen atoms or organic groups derived by removal of a hydrogen atom from an organic compound. Because most oximes are solids with characteristic melting points, they are useful in identifying liquid aldehydes and ketones.

Oximes can also be made by the action of hydrogen-donating reagents upon certain nitro compounds or by the isomerization of nitroso compounds. The oximes obtained from aldehydes (aldoximes) can be dehydrated to form nitriles. Other useful chemical reactions of oximes include conversion to amines (by treatment with hydrogen or other reducing substances) and to amides (by the action of strong acids or of phosphorus pentachloride). A large-scale application of this conversion to amides is the transformation of cyclohexanone oxime to caprolactam, the starting material for nylon 6.

oxisol, intensely weathered soil type of the humid tropics and subtropics. Diagnostic of these soils is a subsurface horizon depleted in most of the common soil minerals and containing only hydrated oxides of iron and aluminum, plus kaolinite clays and quartz sand. Where exposed to repeated wetting and drying, the iron oxides cement soil particles to form ironstone "hardpans" (also called laterite). Oxisols develop on heavily eroded ancient upland land surfaces, commonly in association with ultisol soils. The world's two largest areas of oxisols are in the Amazon Basin of South America and the Congo Basin of Africa. With careful fertilization, oxisols on the islands of Hawaii and the Caribbean yield large crops of sugarcane, bananas, pineapple, coffee, and rice.

Oxley, John (Joseph William Molesworth) (b. 1783/85?, near Westow, Yorkshire, Eng.—d. May 26, 1828, Kirkham, Australia), surveyor-general and explorer who played an important part in the exploration of eastern Australia and also helped open up Van Diemen's Land (later Tasmania).

Oxley joined the British navy as a midshipman in 1799 and arrived in Australia as a master's mate in 1802. He worked on coastal surveys and in 1805 was put in command of the *Buffalo* by Governor Philip King, and in 1806 he commanded another ship to Van Diemen's Land. Commissioned a lieutenant in England in 1807, he returned to Sydney (1808) with a land grant of 600 acres (240 hectares), bringing goods as an investment. In 1809 he wrote a report on the settling of Van Diemen's Land and returned to England.

Oxley was appointed surveyor-general of New South Wales, retired from the navy, and returned to Sydney in 1812. He then explored as much territory as he had surveyed in the early years: in 1817 with George Evans in the Lachlan River region and in 1818 along the Macquarie River, failing to find these rivers' sources but opening up much land for sheepherding. His *Two Expeditions into the Interior of New South Wales* (1820) was the first description of the area and provided the basis for later explorations by Charles Sturt and T.L. Mitchell.

His coastal surveys included the charting of Jervis Bay and Port Macquarie (1819). In 1823, returning from Port Curtis, he explored Moreton Bay and 50 miles (80 km) up the Brisbane River. His reports resulted in penal settlements at Port Macquarie and Port Curtis.

From his return in 1812, Oxley had business interests; he was agent for companies and creditors, engaged in cattle raising, and was a breeder of prize sheep; he also served as bank director and agricultural adviser. On his expanded holdings he built his estate at Kirkham in 1815. Oxley was also active in the Bible Society, institutions for orphans, and the Philosophical Society and served as a magistrate and legislator. He died in straitened circumstances.

Oxnard, city, Ventura County, California, U.S., near the Pacific coast, between Los Angeles and Santa Barbara. Founded in 1898, it developed around a sugar-beet factory financed by Henry Oxnard. The surrounding alluvial plain was the basis for agricultural industries. With the development of harbour facilities at adjacent Port Hueneme and nearby military installations, the city grew rapidly and acquired diversified manufactures. Oxnard College opened in 1975. Oxnard Air Force Base is 5 miles (8 km) northeast. Oxnard is the headquarters of the offshore Channel Islands National Monument. Inc. 1903. Pop. (1986 est.) city, 130,800; Oxnard–Ventura metropolitan area (PMSA), 611,000.

oxpecker, also called TICKBIRD, either of the two species of the African genus *Buphagus,* of the family Sturnidae (order Passeriformes). Both species—the yellow-billed (*B. africanus*) and the red-billed (*B. erythrorhynchus*)—are brown birds 20 cm (8 inches) long, with wide bills, stiff tails, and sharp claws. They cling to cattle and big-game animals to remove ticks and maggots from their hides; when alarmed, the birds hiss, alerting their hosts to possible danger. Though they rid animals of pests, oxpeckers also take blood from the sores, which may be slow to heal.

oxygen (O), nonmetallic chemical element of Group VIa of the periodic table. Oxygen is a colourless, odourless, tasteless gas, the most plentiful element in the Earth's crust; its most important compound is water.

Oxygen was discovered in about 1772 by a Swedish chemist, Carl Wilhelm Scheele, who obtained it by heating potassium nitrate, mercury(II) oxide, and many other substances. An English chemist, Joseph Priestley, independently discovered oxygen in 1774 by the thermal decomposition of mercury(II) oxide and published his findings the same year, three years before Scheele published. A French chemist, Antoine Lavoisier, first recognized the gas as an element (1775–77), coined its name, and (in opposition to the phlogiston theory) explained combustion as a union of oxygen with the burning material.

Occurrence, properties, and uses. The proportion of oxygen by volume in the atmosphere is 21 percent, by weight in seawater 85.7 percent, and in the Earth's crust 46.6 percent. (Certain recent figures suggest an even higher percentage of oxygen in seawater and in the Earth's crust.)

During respiration, animals and lower plants take oxygen from the atmosphere and return to it carbon dioxide, whereas by photosynthesis, higher (green) plants assimilate carbon dioxide in the presence of sunlight and evolve free oxygen. Almost all the free oxygen present in the atmosphere is the result of photosynthesis. About 3 parts of oxygen by volume dissolve in 100 parts of freshwater at 20° C (68° F) and slightly less than this in seawater. Dissolved oxygen is essential for respiration of fish and other marine life.

Below −183° C (−297° F), oxygen is a pale blue liquid; it becomes solid at about −218° C (−360° F). Gaseous oxygen on Earth and in the lower atmosphere consists almost entirely of molecules of two atoms, O_2. Triatomic oxygen, O_3, called ozone (*q.v.*), and monatomic oxygen, O, are more predominant in the upper atmosphere, where ozone shields the Earth from the Sun's ultraviolet radiation. Pure oxygen is 1.1 times heavier than air.

The chief source of commercial oxygen is the atmosphere, from which it is separated by liquefaction and by fractional distillation. Of the main components of air, oxygen has the highest boiling point and therefore is less volatile than nitrogen and argon. Since the 1970s commercial oxygen or oxygen-enriched air has gradually replaced ordinary air in steelmaking and other metallurgical processes and in the chemical industry for the manufacture of such oxidation-controlled chemicals as acetylene, ethylene oxide, and methanol. Medical applications of oxygen include use in oxygen tents, inhalators, and pediatric incubators. Oxygen-enriched gaseous anesthetics insure life support during general anesthesia. Oxygen is a significant element in a number of industries that use kilns. Oxygen in its liquid state is also used to fuel rocket engines.

Natural oxygen consists of a mixture of three stable isotopes: oxygen-16 (99.759 percent), oxygen-17 (0.037 percent), and oxygen-18 (0.204 percent). Four artificially prepared radioactive isotopes of mass numbers 14, 15, 19, and 20 are known. The longest lived, oxygen-15 (124-sec half-life), has been used to investigate respiration in mammals.

Compounds. Oxygen has a valence of two and forms a large range of covalently bonded compounds, among which are oxides of nonmetals, as water (H_2O), sulfur dioxide (SO_2), and carbon dioxide (CO_2); organic compounds such as alcohols, aldehydes, and carboxylic acids; common acids such as sulfuric (H_2SO_4), carbonic (H_2CO_3), and nitric (HNO_3); and corresponding salts, such as sodium sulfate (Na_2SO_4), sodium carbonate (Na_2CO_3), and sodium nitrate ($NaNO_3$). Oxygen is present as the oxide ion, O^{2-}, in the crystalline structure of solid metallic oxides such as calcium oxide, CaO; metallic superoxides, such as potassium superoxide, KO_2, contain the O_2^- ion, whereas metallic peroxides, such as barium peroxide, BaO_2, contain the O_2^{2-} ion. For further information about the various classes of oxygen compounds, *see* oxide; peroxide.

oxygen cycle, circulation of oxygen in various forms through nature. Free in the air and dissolved in water, oxygen is second only to nitrogen in abundance among uncombined elements in the atmosphere. Plants and animals use oxygen to respire and return it to the air and water as carbon dioxide (CO_2). CO_2 is then taken up by algae and terrestrial green plants and converted into carbohydrates during the process of photosynthesis, oxygen being a byproduct. The waters of the world are the main oxygen generators of the biosphere; their algae are estimated to replace about 90 percent of all oxygen used. Oxygen is involved to some degree in all the other biogeochemical cycles.

Despite the burning of fossil fuel and the reduction of natural vegetation (on land and in the sea), the level of atmospheric oxygen appears to be relatively stable because of the increase in plant productivity resulting from agricultural advances worldwide.

oxygen group element, also called CHALCOGEN, any of the five chemical elements comprising Group VIa of the periodic classification—namely, oxygen (O), sulfur (S), selenium (Se), tellurium (Te), and polonium (Po).

A brief treatment of the oxygen group elements follows. For full treatment, *see* MACROPAEDIA: Chemical Elements. *See also* MICROPAEDIA for entries on each member of this group.

In cosmic abundance oxygen ranks fourth among the elements, after hydrogen, helium, and neon. In mass, however, it makes up approximately 20 percent of the Earth's lower atmosphere, about 46 percent of its solid crust, and nearly 90 percent of its waters. Sulfur is widely scattered throughout the universe, but is only ninth among all elements in total abundance. It accounts for about 12 percent of the mass of certain meteorites, but constitutes only from 0.03 to 0.06 percent of the Earth's crust. Selenium, tellurium, and polonium are much rarer than sulfur.

The chalcogens are distinguished by an electron configuration in which six electrons occupy the outermost shell. Any atom having such an electronic structure tends to form a stable shell of eight electrons by adding two more and producing an ion with a double negative charge. This tendency to form negatively charged ions is quantitatively expressed in terms of two properties: electronegativity (the assumption of a partial negative charge when present in covalent combination) and electron affinity (the ability of a neutral atom to take up an electron and form a negative ion). With the exception of fluorine, oxygen has the highest electronegativity and electron affinity of any known element. Both these properties decrease in intensity among the other chalcogens with increasing atomic number and mass.

Another property common to all the chalcogens except polonium is catenation—*i.e.,* the bonding of an atom to an identical atom. Sulfur manifests this mode of combination most distinctly.

Oxyrhynchus, also spelled OXYRYNKHOS, ancient capital of the 19th Upper Egyptian nome (province), on the western edge of the Nile Valley, in al-Minyā *muḥāfaẓah* (governorate). It is best-known for the numerous papyri uncovered there, first by B.P. Grenfell and A.S. Hunt (1897–1907), and later by Italian scholars early in the 20th century. The papyri—dating from about 250 BC to AD 700 and written primarily in Greek and Latin but also in demotic Egyptian, Coptic, Hebrew, Syriac, and Arabic—include religious texts (*e.g.,* miracles of Sarapis, early copies of the New Testament, and such apocryphal books as the *Gospel of Thomas*) and also masterpieces of Greek classical literature. Among the papyri were texts once considered lost, including selections of early Greek lyric poetry, Pindar, dramatists such as Menander and Callimachus, and innumerable prose works of oratory or history, such as those of the Oxyrhynchus historian. The modern village of al-Bahnasā is located on the site.

oxytocin, hormone used clinically to help begin or to continue labour, to control bleeding following delivery, and to stimulate the secretion of breast milk. Oxytocin was first synthesized (along with the related antidiuretic hormone [ADH]) by Vincent du Vigneaud in 1953, and he received the Nobel Prize for Chemistry in 1955 for this work. Synthetic oxytocin has since become widely used in obstetric practice.

Natural oxytocin is secreted by the posterior pituitary gland, which holds and secretes oxytocin produced by the hypothalamus. Oxytocin causes milk to be ejected from the breasts during lactation; the amount of oxytocin produced naturally, however, has little effect on uterine contractions and does not stimulate labour. When synthetic oxytocin is infused in larger amounts, however, it causes smooth muscle in the wall of the uterus to contract and initiate the process of labour. Smooth muscle cells in the uterus contain proteins that bind specifically to oxytocin; the number of these oxytocin receptors increases during late pregnancy. Oxytocin's effect on uterine smooth muscle is dependent on the presence of estrogen, and for that reason oxytocin has little effect on the uterus during the early stages of pregnancy; near term, however, it is very effective and successfully produces uterine contractions in 80–90 percent of the women to whom it has been administered.

Oya Current, Japanese OYASHIO, also called KURIL CURRENT, surface oceanic current flowing southwest along the Kamchatka Peninsula and the Kuril Islands. Meeting the Kuro Current Extension east of Japan, part of the cold, less saline water of the Oya Current sinks below the Kuro Current and continues southward; the confluence of these currents is marked by fogbanks. The Oya Current is thought to transport about 530,000,000 cubic feet (15,000,000 cubic m) of water per second.

Oyama, city, Tochigi *ken* (prefecture), Honshu, Japan, on the Omoi River. A castle town during the Middle Ages, it became a post station and river port during the Tokugawa era (1603–1867). The transport centre of southern Tochigi prefecture, Oyama is the hub of three major railways. Communication facilities and proximity to Tokyo made the city an industrial suburb of the Tokyo–Yokohama metropolitan area after World War II. Major industries include the manufacture of mining and transport equipment and the refining of aluminum. The commercial sector of the economy has shown only slow growth; dried gourd shavings are a special product of the surrounding region. The Oyama Radio Transmitting Station, one of the largest in the Orient, is located outside the city. Pop. (1986 est.) 135,218.

Oyapock River, Portuguese RIO OIAPOQUE, river in northeastern South America. It rises in the Tumuc-Humac Mountains and flows northeast for 311 miles (500 km) to empty into the Atlantic near Cape Orange. It forms the border between French Guiana and the Brazilian territory of Amapá. Near its mouth are the ports of Saint-Georges, French Guiana; and Oiapoque and Ponta dos Índios, Braz.

Oyem, town, northern Gabon, on a plateau at an elevation of about 3,000 feet (900 m). It is an administrative and transport centre for an agricultural area. Cocoa and coffee, grown on mixed plantations, are the most important cash crops and are trucked northwest to the Cameroon ports of Kribi and Douala for export. Rubber and potatoes are also cultivated. Oyem has a hospital, Roman Catholic and Protestant churches, an agricultural school, a government secondary school, and a customs station. Pop. (1985 est.) 89,600.

Oyo, state, western Nigeria, comprising former Oyo and Ibadan provinces carved out of the former Western State in 1976. With an area of 14,558 square miles (37,705 square km), it is bounded by the states of Kwara on the north, Ogun on the south, and Ondo on the east, and by the Republic of Benin on the west. The state has tropical rain forest in the southeast and a "derived" savanna in the north that is largely the result of clearing and burning the former forest cover to provide land for cultivation. The Ogun and the Oshun are the most important rivers. Oyo State is inhabited mainly by the Yoruba people.

The economy of Oyo is based chiefly on agriculture and handicrafts. Agricultural products include yams, corn (maize), cassava, beans, millet, plantains, tobacco, cocoa, palm oil and palm kernels, cotton, kola nuts, indigo, and fruits. The state is also noted for its cottage industries consisting of cotton spinning, weaving, dyeing, leatherworking (sheep and goat skins), wood carving, and mat making. Industries in Ibadan, the state capital and second largest city in Nigeria, include a cannery, a brewery, a publishing industry, a tobacco processing factory, wood and steel furniture factory, and a motor vehicle assembly plant. Oshogbu has a textile industry, a food-processing plant, and a steel-rolling mill. Deposits of tin, columbite, gold, and marble are worked. Ibadan is the site of the International Institute of Tropical Agriculture, the Cocoa Research Institute of Nigeria, and the Federal Agricultural Research Institute. Among the state's tourist attractions are the Ibadan University Zoo, the Agodi Zoological Garden, the Mbari Arts Center at Oshogbo, and the residential palaces of Yoruba rulers in Ilesha, Oyo, Ife-lodun, and Ogbomoso. There are universities at Ife-lodun and Ibadan, a college of arts and sciences at Ife-lodun, a college of education at Ilesha, and a number of teacher training colleges. The Lagos–Ibadan highway links the northern and southern parts of the state. Pop. (1984 est.) 8,732,300.

Oyo, town, central Oyo State, southwestern Nigeria. It was declared the new seat of the *alafin* of Oyo (the political leader of all Yoruba people) by Alafin Atiba in the mid-1830s, after Old Oyo, also called Katunga (80 miles [129 km] north-northeast), the capital of the Oyo Empire, was completely destroyed by Fulani conquerors from Ilorin (60 miles [97 km] northeast). New Oyo was aligned with Ibadan (32 miles [51 km] south) in the mid-19th-century Yoruba civil wars. Following an invasion by Dahomeyan forces in 1887, the *alafin* of Oyo joined with Lagos against the French and, in the treaty of 1888, placed all of Yorubaland under British protection.

The *alafin,* now a traditional ruler, has only nominal sovereignty over other traditional Yoruba chiefs. From the *ida oranyan* ("sword of state") given to him by the traditional *oni* ("king") of Ife (who is the spiritual head of the Yoruba people), the *alifin* derives the spiritual authority for his rule. At nearby Koso is the Shango shrine to the Yoruba god of thunder and lightning, which plays a ceremonial role in the installation of a new *alafin.*

The economy of modern Oyo is based chiefly on agriculture and handicrafts. Products include tobacco (for the cigarette factory at Ibadan), teak, and cotton. The town is a traditional centre of cotton spinning, weaving, and dyeing (with locally grown indigo). It is also famous for carved calabashes (gourds), leatherwork (especially cushions) in goatskins and sheepskins, wood carving, and mat making. Local trade is primarily in yams, corn (maize), sorghum, cassava, poultry, okra, and beans.

By the 1860s a Yoruba Mission (Anglican) was established in Oyo, which is now the site of St. Andrew's College (founded 1897), one of the oldest teacher-training institutes in Nigeria. The town also has secondary schools, a government vocational centre, and several hospitals. It lies on the main highway north from Lagos city and is a hub for local roads serving the state. Pop. (1983 est.) 185,300.

Oyo empire, Yoruba state north of Lagos, in present-day Nigeria, that dominated, during its apogee (1650–1750), most of the countries between the Volta River in the west and the Niger River in the east.

According to traditions, Oyo derived from a great Yoruba ancestor and hero, Oduduwa, who came from the east to settle at Ile-Ife and whose son became the first *alafin,* or ruler, of Oyo. Linguistic evidence suggests that two waves of immigrants came into Yorubaland between 700 and 1000, the second settling at Oyo in the open country north of the Guinea forest. This second state became preeminent among all Yoruba states because of its favourable trading position, its natural resources, and the industry of its inhabitants.

Early in the 16th century Oyo was a minor state, powerless before its northern neighbours Borgu and Nupe—by whom it was conquered in 1550. The power of Oyo was already growing, however, by the end of the century, thanks to the *alafin* Orompoto, who used the wealth derived from trade to establish a cavalry force and to maintain a trained army.

Oyo subjugated the kingdom of Dahomey in the west in two phases (1724–30, 1738–48) and traded with European merchants on the coast through the port of Ajase (Porto-Novo). As Oyo's wealth increased so did its leaders' political options; some wished to concentrate on amassing wealth, while others advocated the use of wealth for territorial expansion. This difference was not resolved until the *alafin* Abiodun (reigned approximately 1770–89) conquered his opponents in a bitter civil war and pursued a policy of economic development based primarily on the coastal trade with European merchants.

Abiodun's neglect of everything but the economy weakened the army, and thus the means by which the central government maintained control. His successor, the *alafin* Awole, inherited local revolts, an administration tenuously maintained by a complex system of public service, and a decline in the power of tributary chiefs. The decline was exacerbated by quarrels between the Alafin and his advisers; it continued throughout the 18th century and into the 19th, when Oyo began to lose control of its trade routes to the coast. Oyo was invaded by the newly risen Fon of Dahomey, and soon after 1800 it was captured by militant Fulani Muslims from Hausaland in the northeast.

Oyono, Ferdinand Léopold (b. Sept. 14, 1929, Ngoulemakong, Cameroon), African statesman, actor, and comic writer whose two best-known works—*Une Vie de boy* (1956; *Houseboy*) and *Le Vieux Nègre et la médaille* (1956; *The Old Man and the Medal*), written while he was studying law and administration in Paris—reflect the growing sentiment of anticolonialism of the 1950s.

During the 1950s, while writing his first two books, Oyono worked in Paris as an actor on stage and on television. In 1960, however, he returned to Cameroon and entered the diplomatic corps, becoming special envoy in 1961–62 to Guinea, Mali, Senegal, and Morocco. Between 1963 to 1975 he was ambassador to Liberia, the Benelux countries, the European Common Market, France, Italy, Tunisia, Morocco, and Algeria. He then served the United Nations (UN) as chairman of the Security Council, of the UNICEF Board, of the Security Council's Political Committee, and of the Council on Namibia. After serving as ambassador to the United Kingdom (1984–85), Oyono returned to Cameroon to take posts in the Cabinet.

Oyono's first book, *Houseboy,* is written in the form of a diary. It depicts honestly but with humour the often brutal life of a houseboy in the service of a French commandant. *The Old Man and the Medal* satirizes colonialism through the eyes of a God-fearing and loyal old villager who completely reverses his opinion of the white man on the same day that he is to receive a medal for his "service" (sacrifices of his sons and land) to France. In both novels Oyono's indictment of paternalistic missionaries and administrators is clear. He perfected an ironic tone that conveys the full tragedy and pain of the lives of the common people, usually illiterate peasant farmers, who naively accept the doctrines of French colonialism. In mocking the foibles of the self-deluded colonial masters as well as the simple villagers, Oyono often paints hilarious portraits, putting his early experience as an actor in theatrical farce to good use. A third novel, *Chemin d'Europe* (1960; "The Road from Europe"), tackles the somewhat different problem of a young man who is better educated than his peers but still lacks the skills needed to assure him of success.

Oyono-Mbia, Guillaume (b. 1939, Mvoutessi, Cameroon), African dramatist and short-story writer, one of bilingual Cameroon's few writers to achieve success both in French and in English. Oyono-Mbia attended the Collège Evangélique at Limbamba and then went to England, graduating from the University of Keele in 1968. With skills often compared to those of Molière, Oyono-Mbia exercised an unusual ability to create comedies that play well both on stage and on radio. Among them are *Trois prétendants . . . un mari* (1962; *Three Suitors . . . One Husband*), *Until Further Notice* (1967), *Notre fille ne se mariera pas!* (1969; "Our Daughter Will Not Marry!"), and *His Excellency's Train* (1969), all written on his favourite theme of youth versus adult, modernity versus tradition.

In the 1970s his penchant for satire was also evident in three volumes of amusing tales of life in his native village, *Chroniques de Mvoutessi* (1971–72; "Chronicles of Mvoutessi"). From 1969 Oyono-Mbia was professor of literature at the University of Yaoundé in Cameroon. Between 1972 and 1975 he was chief administrative officer in the Office of Cultural Affairs in the Ministry of Information and Culture.

Oyrat, also spelled OIRAT, any of the peoples speaking western dialects of the Mongol language group.

In the 13th century the western Mongols were enemies of the eastern Mongols of Genghis Khan's empire. During the following centuries the western Mongols maintained a separate existence under a confederation known as the Dörben Oyrat (Four Allies, from which the name Oyrat is derived); at times they were allies, at times enemies, of the eastern Mongols in the Genghis Khan line. Part of the western Mongols remained in their homeland, northern Sinkiang, or Dzungaria, and western Mongolia. Another part of the Oyrat confederation, including all or some of the Torgut, Khoshut, Dorbet (or Derbet), and other groups, moved across southern Siberia to the southern Urals at the beginning of the 17th century. From there they moved to the lower Volga; and for a century and a half, until 1771, they lived as nomads both to the east and to the west of the lower Volga. During the course of the 18th century they were absorbed by the Russian Empire, which was then expanding to the south and east. In 1771 those on the left bank, to the east of the Volga, returned to China. The right-bank Kalmyk (*q.v.*), comprising the contemporary Torgut, Dorbet, and Buzawa, remained in Russia.

Considerable numbers of Oyrat still live in the Sinkiang and Tsinghai regions of northwest China, where an estimated 100,000 speak Oyrat dialects; another 50,000 speakers live in the western portions of the Mongolian People's Republic, where they have been dominated by the numerically preponderant Khalkha.

oyster, any member of the families Ostreidae (true oysters) or Aviculidae (pearl oysters), bivalve mollusks found in temperate and warm coastal waters of all oceans. Bivalves known as thorny oysters (*Spondylus*) and saddle oysters (*Anomia*) are sometimes included in the group.

True oysters have been cultivated as food since pre-Christian times. Pearl oysters also have long been valued for the precious pearls that develop in them. (*See also* pearl.)

The two valves of the oyster shell, which differ in shape, have rough surfaces that are often a dirty gray. The upper valve is convex, or higher at the middle than at the edges. The lower valve, fixed to the bottom or to another surface, is larger, has smoother edges, and is rather flat. The inner surfaces of both valves are smooth and white.

The valves are held together at their narrow ends by an elastic ligament. A large central muscle serves to close the valve against the pull of the ligament. As the valves are held slightly open, tiny hairlike structures (cilia) draw water inward by means of wavelike motions. Two to three gallons may pass through the oyster in an hour. Minute organic particles, filtered from the water, serve as food.

Oysters, in turn, are eaten by birds, starfishes, and snails, as well as by fishes, including skates. The oyster drill (*Urosalpinx cinenea*), a widely occurring snail, drills a tiny hole through the oyster shell with its tongue, then sucks out the living tissue.

Like other bivalves, most oysters are either male or female, although hermaphroditism also occurs. *Ostrea edulis* exhibits a phenomenon called rhythmical hermaphroditism, in which an individual alternates sexes seasonally or with changes in water temperature. Oysters breed in the summer. The eggs of some species are released into the water before fertilization by the sperm; the eggs of others are fertilized within the female. The young are released as ciliated spheres known collectively as spat, which swim for several days before attaching themselves permanently to a site. Edible oysters are ready for harvesting in three to five years.

True oysters (family Ostreidae) include species of *Ostrea, Crassostrea,* and *Pycnodonte.* Common *Ostrea* species include the European flat, or edible, oyster, *O. edulis;* the Olympia oyster, *O. lurida;* and *O. frons. Crassostrea* species include the Portuguese oyster, *C. angulata;* the North American, or Virginia, oyster, *C. virginica;* and the Japanese oyster, *C. gigas.* Pearl oysters (family Aviculidae) are mostly of the genus *Meleagrina,* sometimes called *Pinctada* or *Margaritifera.*

O. edulis occurs from the coast of Norway to waters near Morocco, through the Mediterranean Sea, and into the Black Sea. It is hermaphroditic and attains lengths of about 8 cm (about 3 inches). *O. lurida,* of the Pacific coastal waters of North America, grows to about 7.5 cm (3 inches). *C. virginica,* native to the Gulf of Saint Lawrence to the West Indies and about 15 cm (6 inches) long, has been introduced into Pacific coastal waters of North America. Up to 50,000,000 eggs may be released by the female at one time. Commercially, *C. virginica* is the most important North American mollusk. *C. angulata* occurs in coastal waters of western Europe. *C. gigas,* of Japanese coastal waters, is among the largest oysters, attaining lengths of about 30 cm (1 foot). Like *C. virginica,* the Sydney rock oyster (*Crassostrea commercialis*) changes sex; born male, it changes to female later in life. It is the most economically important Australian edible oyster.

Oysters are shucked and eaten raw, cooked, canned, or smoked; small quantities are frozen. Popular varieties include the blue point and lynnhaven—forms of *C. virginica* (harvested, respectively, from the Blue Point, Long Island, and Lynnhaven Bay, Va., regions); as well as the colchester of Britain and the marennes of France. The colchester and marennes are forms of *O. edulis.*

Pearls are formed in oysters by the accumulation of nacre, the material lining the oyster shell, around a solid piece of foreign matter that has become lodged inside the shell. Pearls formed in edible oysters are lustreless and of no value. The best natural pearls occur in a few Oriental species, particularly *Meleagrina vulgaris,* native to the Persian Gulf. This species is found mainly at depths of 8 to 20 fathoms (48 to 120 feet). Pearls are taken mostly from oysters more than five years old. Cultured pearls are grown around bits of mother-of-pearl inserted manually into the oyster. Most cultured pearls are grown in Japanese or Australian coastal waters.

Oyster Bay, town (urbanized township), Nassau County, southeastern New York, U.S., that occupies 108 square miles (280 square km), extending from the north to south shores on central Long Island, and comprises more than 30 incorporated villages and unincorporated communities. The first settlers, led by Peter Wright, Samuel Mayo, and the Reverend William L. Leverich, arrived at Oyster Bay Harbor from Rhode Island in 1653. The first town meeting was held in 1660, and the town was granted a governor's patent in 1667. During the Revolutionary War, Raynham Hall (1738, now a museum) served as British Army headquarters, and Sally Townsend, who lived there, provided information that led to the capture of Major John André, a British spy. Notable colonial landmarks in the area include Wisteria House at Oyster Bay, the Friends Meeting House at Matinecock, and Tryon House and Carman Homestead at Massapequa Park. By the early 19th century the town was essentially rural, although the whaling industry flourished. After the arrival of the Long Island Rail Road in 1836, followed by the trolley car at the turn of the century, a number of large estates were built by financial and industrial tycoons. Oyster Bay gained fame through its most notable resident, President Theodore Roosevelt, whose three-story mansion "Sagamore Hill" (built 1880 at Cove Neck) became the summer White House (1901–09); it is now a national historic site. The Theodore Roosevelt Memorial and Trailside Museum are nearby, and Roosevelt's grave is in the adjacent Young's Cemetery.

The town continued to be almost entirely rural-residential until it experienced a pre-World War II growth of the aircraft industry at Bethpage and Farmingdale. Oyster Bay now has a broad-based diversified economy with planned industrial parks at Bethpage, Farmingdale, Hicksville, Jericho, Plainview, Syosset, and Woodbury. Educational institutions in the town include the State University of New York Agricultural and Technical College (established 1912) at Farmingdale, the State University of New York College (1968) at Old Westbury, and the C.W. Post Center of Long Island University (1955) at Brookville. The Nassau County Charter of 1936 preserved the rights of existing incorporated villages but denied the right of unincorporated communities to incorporate. Villages include Massapequa Park (Inc. 1931) and Oyster Bay Cove (Inc. 1931). Important unincorporated communities are Oyster Bay "village," Jericho, Massapequa, East Massapequa, Hicksville, Plainview, and South Farmingdale. Pop. (1984 est.) 312,-268.

oystercatcher, any of several shorebirds, notable for their long, flattened, orange-red bills, constituting the genus *Haematopus,* family Haematopodidae. Found in temperate to tropical parts of the world, oystercatchers are stout-bodied birds measuring 40 to 50 cm (16 to 20 inches) long, with thick, pinkish legs; long, pointed wings; and a long, wedge-shaped bill. Their plumage varies from black and white,

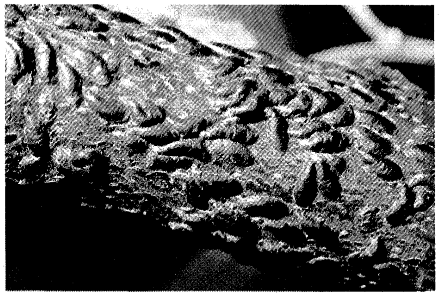
including a bold white wing patch, to entirely black.

Oystercatchers feed largely on mollusks (such as oysters, clams, and mussels), attacking them as the tide ebbs, when their shells are exposed and still partially open. These birds nest on the ground, usually laying their two to four eggs in the sand.

There are about seven species. Among them is the European oystercatcher (*H. ostralegus*), of Europe, Asia, and Africa, which is black above and white beneath. The American oystercatcher (*H. palliatus*), of coastal regions in the Western Hemisphere, is dark above, with a black head and neck, and white below. The black oystercatcher (*H. bachmani*), of western North America, and the sooty oystercatcher (*H. fuliginosus*), of Australia, are dark except for the pinkish legs.

oystershell scale (*Lepidosaphes ulmi*), an insect (order Homoptera) whose protective covering resembles a miniature oystershell. The oystershell scale inflicts great damage on the trees and shrubs on which it lives. Control is by dormant spray and natural enemies—*i.e.,* birds, mites, and parasitic wasps.



Oystershell scale (*Lepidosaphes ulmi*)
E.S. Ross

The life histories of the oystershell scale, as well as the cover of the adult female, vary according to the host. The oystershell scale is found on lilacs, beeches, maples, willows, and many ornamentals. The oystershell scale occurs in almost every state in the United States and was probably introduced from Europe.

Oz, Amos (b. May 4, 1939, Jerusalem), Israeli novelist and short-story writer. He also edited the influential Israeli periodical *Siach lochamium* ("The Seventh Day").

Oz was educated at the Hebrew University of Jerusalem and at the University of Oxford. He served in the Israeli army (1957–60, 1967, and 1973) and, in addition to writing, worked as a part-time schoolteacher and labourer.

Oz's symbolic, poetic novels reflect the splits and strains in Israeli life. Locked in conflict are the traditions of intellect and the demands of the flesh, reality and fantasy, rural Zionism and the longing for European urbanity, and the values of the founding settlers and the perceptions of their skeptical offspring. Unable to share the optimistic outlook and ideological certainties of Israel's founding generation, Oz presents an ironic view of reality in which Israeli society is unapologetically scrutinized. His works include *Maʿkom aḥer* (1966; *Elsewhere, Perhaps*), *Mikhaʾel sheli* (1968; *My Michael*), *Ad mʿavet* (1971; *Unto Death*), *La-gaʿat ba-mayim, la-gaʿat ba-ruwaḥ* (1973; *Touch the Water, Touch the Wind*), *Artsot ha-tan* (1976; *Where the Jackals Howl, and Other Stories*), *Po ya-sham be-Erets-Yiśraʾel bi-setay* (1982; *In the Land of Israel*), and *Menu hah nekhonah* (1982; *A Perfect Peace*).

Öz Beg, also spelled UZBEK, in full GHIYATH AL-DIN MUHAMMAD ÖZ BEG (fl. 14th century), Mongol leader and khan of the Golden Horde, or Kipchak empire, of southern Russia, under whom it attained its greatest power; he reigned from 1313 to 1341. Öz Beg was a convert to Islām, but he also welcomed Christian missionaries from western Europe into his realm. Öz Beg encouraged the predominance of the princes of Moscow among his Christian vassals; his name survives today in that of the Uzbek people of the Soviet Union.

Ozaki Kōyō, pseudonym of OZAKI TOKUTARŌ (b. Jan. 28, 1869, Edo [now Tokyo]—d. Oct. 30, 1903, Tokyo), novelist, essayist, and haiku poet, one of the pioneers of modern Japanese literature.

In 1885, with a group of friends, he formed the *Kenyūsha,* a magazine and literary association that exercised a major influence in the development of the Japanese novel for nearly 20 years. Through his study of Tokugawa-period (1603–1867) literature, he led a revival of interest in the 17th-century writer Ihara Saikaku, whose sharp perceptions he blended with his own poetic aesthetic to create a style of romantic realism. Kōyō was active in the movement to create a new colloquial literary language. His elaborate style was well-suited to love themes and descriptions of women. Early fictional works such as *Ninin bikuni iro zange* (1889; "Amorous Confessions of Two Nuns") and *Kyara makura* (1890; "The Perfumed Pillow") reflect his interest in 17th- and 18th-century literature. Later he displayed a more realistic tendency in *Tajō takon* (1896; "Tears and Regrets") and *Kokoro* (1903; "The Heart"). His masterpiece was the novel *Konjiki yasha* (1897–1902; *The Golden Demon*), which portrayed the social cost of modernization when the power of money wins out over human affection and social responsibility. Kōyō's guidance was eagerly sought by young writers. Two of his best-known disciples were the romantic-short-story writer Izumi Kyōka and the naturalistic novelist Tokuda Shūsei.

Ozaki Yukio (b. Dec. 24, 1858, Kanagawa, Sagami province, Japan—d. Oct. 6, 1954, Zushi, Kanagawa prefecture), noted democratic politician who was elected to the Japanese House of Representatives a total of 25 times and is considered the "father of parliamentary politics" in that country.

Originally a journalist, Ozaki joined the government as a follower of the politician and later prime minister Ōkuma Shigenobu. When Ōkuma resigned in 1881 as a result of the Cabinet's failure to adopt his radical proposals for the creation of a new constitution, Ozaki followed him into opposition. In 1898 Ozaki was back in the government, serving as education minister in the new, and short-lived, Ōkuma Cabinet. He was forced to resign, however, after a slip of the tongue in which he referred to the imperial Japanese state as a republic. From 1903 to 1912 he served as mayor of Tokyo, and in 1912 he led the rank-and-file members of the Friends of Constitutional Government (Rikken Seiyūkai) party into the streets to rally popular support against the oligarchical Cabinet of the former general Katsura Tarō. Within a few months the movement that Ozaki had helped form resulted in the fall of Katsura's government and the gradual creation of a cabinet responsible to the majority party in the Japanese Diet, or parliament.

In 1915, while serving as minister of justice in Ōkuma's second Cabinet, Ozaki denounced the bribery and corruption carried on by Ōkuma during the election. He thereafter refused to affiliate with any faction or party but remained until his death a powerful force, always fighting for the expansion of democratic politics in Japan. He was especially active in the struggle for universal manhood suffrage, which was established in 1925.

Ozamiz, city, on Zamboanga peninsula, northwestern Mindanao, Philippines. The city lies on Panguil Bay, an extension of Iligan Bay of the Bohol (Mindanao) Sea. It was the site of Spanish fortifications dating from 1574, with one extant fort surviving from 1707. Incorporated in 1948, it is the largest population centre in the area. The city is an active port and an important centre for processing coconuts. It has an airport. Pop. (1980) 77,832.

Ozanam, Antoine Frédéric (b. April 23, 1813, Milan—d. Sept. 8, 1853, Marseille), French historian, lawyer, and scholar who founded the Society of St. Vincent de Paul.

While a student at a Roman Catholic school in Lyon, he underwent a "crisis of doubt" but came through the experience with a deep-rooted belief in both Catholicism and the religious necessity for charity. In Paris, where he went to study law, Ozanam met the leaders of the French Catholic revival.

In 1833 he and fellow students at the Sorbonne organized a Conference of Charity to help the poor. Two years later, the group adopted the formal title and rules of the Society of St. Vincent de Paul, now highly regarded for its charitable acts. Before Ozanam's death the society numbered about 2,000 centres in 29 countries.

Ozanam was also known for his brilliant papers on law, literature, history, and social doctrine. Among his principal writings are *Dante et la philosophie catholique au XIII^e siècle* (1845; "Dante and Catholic Philosophy in the 13th Century"); *Les Poètes franciscains en Italie au XIII^e siècle* (1852; "Franciscan Poets in Italy in the 13th Century"), an edition of early Franciscan poetry; and *La Civilisation chrétienne chez les Francs* (1849; "Christian Civilization Among the Franks").

Ozanam was notable for his insistence that charity be extended to non-Catholics and to other countries, at the time an unusual belief. He encouraged Roman Catholics to play a part in the evolution of the democratic state, and he remained a clear-sighted theorist of social reform while opposing both the abuses of laissez-faire economic liberalism and any recourse to socialism. His exposition of Roman Catholic social doctrine in his lectures while teaching commercial law at Lyons foreshadowed in their authoritative orthodoxy Pope Leo XIII's encyclical *Rerum novarum* of 1891. The cause for Ozanam's beatification was presented in 1923.

Ozark, city, seat of Dale county, southeastern Alabama, U.S. It was known as Woodshop until renamed in 1851 for the Ozark Indians. Following World War II, its economy was boosted by the expansion of nearby Fort Rucker as an aviation centre, a complex that includes the U.S. Army Aviation Center and Aviation School and the Army Aviation Museum. Ozark is a shipping centre for livestock, peanuts (groundnuts), pecans, corn (maize), cotton, and timber. It is the site of the Alabama Aviation and Technical College (1955). Inc. 1870. Pop. (1988 est.) 14,979.

Ozark Mountains, also called OZARK PLATEAU, heavily forested group of highlands in the south-central United States, extending southwestward from St. Louis, Mo., to the Arkansas River. The mountains occupy an area of about 50,000 square miles (130,000 square km), of which 33,000 square miles (85,500 square km) are in Missouri, 13,000 square miles (33,700 square km) in northern Arkansas, and the remainder in southern Illinois and southeastern Kansas. The Ozarks and the adjacent Ouachita Mountains represent the only large area of rugged topography between the Appalachians and the Rockies. The highest peaks, many exceeding 2,000 feet (600 m), are in the Boston Mountains in Arkansas. The highest point in Missouri is Taum Sauk Mountain (1,772 feet [540 m]), west of Ironton, in the St. Francois Mountains. The Ozark region, characterized by many underground streams and springs, is drained by the Osage, Gasconade, White, and Black rivers. Lake of the Ozarks, impounded by Bagnell Dam on the Osage River, provides power and recreation facilities. Taneycomo Lake, Bull Shoals Lake, and Table Rock State Park also are recreation areas.

Tourism, one of the region's chief industries, was given impetus by Harold Bell Wright's novel *The Shepherd of the Hills* (1907), which romanticized the Missouri Ozarks. Other economic assets include timber (mainly hardwoods), agriculture (livestock, fruit, and truck farming), and lead and zinc mining.

The word Ozark is probably a corruption of Aux Arc, the name of a French trading post established in the region in the 1700s.

Ozark National Forest, national forest embracing parts of the Ouachita and Boston mountains in northwestern Arkansas, U.S. It is drained by tributaries of the Arkansas River and surrounded by large reservoirs. Established in 1908, it covers a total area of 2,339 square miles (6,058 square km). Apart from its main section (devoted primarily to timber, watershed, and wildlife protection), there are five smaller divisions: Magazine Mountain, Arkansas' highest point, 2,753 feet (839 m); Boston Mountain, encompassing Devil's Den State Park; Lake Wedington; Henry Koen Experimental Forest; and Sylamore (Blanchard Springs). Headquarters are at Russellville.

ozarkodiniform, conodont, or small fossil that is toothlike in form and structure, that has a prominent, centrally located denticle flanked on either side by smaller, less pointed denticles. In some forms the row of denticles may be straight, whereas in others it is curved. Ozarkodiniforms are especially useful as index, or guide, fossils in studies of the Silurian period (438 to 408 million years ago).

Ozarks, Lake of the, lake in south-central Missouri, U.S., one of the largest man-made lakes in the United States. It is impounded by Bagnell Dam, built (1931) across the Osage River to provide hydroelectric power for the St. Louis area. Covering an area of 93 square miles (242 square km), the lake is 125 miles (200 km) long and has a shoreline of about 1,300 miles (2,100 km). In the scenic Ozark Mountains, the lake, with facilities for fishing and water sports, is a popular recreation and resort area. There are several limestone caverns nearby, and Lake of the Ozarks State Park includes most of the Grand Glaize arm of the lake, with 89 miles (143 km) of shoreline. The Harry S. Truman Dam and Reservoir, completed in 1981, impounds the Osage and Grand rivers to further extend facilities at the lake's western end.

Ozawa, Seiji (b. Sept. 1, 1935, Hoten, Manchukuo), Japanese American conductor, especially noted for his energetic style and his sweeping performances of 19th-century Western symphonic works.

Ozawa evinced interest in Western music as a child in Japan and hoped to become a pianist. At the age of 16, however, he sustained injuries to his hands, and turned then to conducting, studying with Hideo Saito at the Toho School in Tokyo. After conducting with Japanese orchestras, in 1959 he went to Europe, where he won the Besançon International Conductors' Competition. During the following summer he studied under Charles Munch at the Berkshire Music Festival in the United States, where he won the Koussevitzky Prize. At that time he began a long and fruitful association with the Boston Symphony Orchestra. After a further year of study with Herbert von Karajan in Berlin, Ozawa was engaged as an assistant conductor of the New York Philharmonic by Leonard Bernstein. Subsequently, he was music director of the Ravinia Festival in Chicago (1964–68). He became music director of the Toronto Symphony Orchestra in 1965 and of the San Francisco Symphony Orchestra in 1970. In 1973 he was appointed conductor and music director of the Boston Symphony Orchestra, for years the exclusive preserve of European conductors.

Ozenfant, Amédée (b. April 15, 1886, Saint-Quentin, Fr.—d. May 4, 1966, Cannes), French painter and art theoretician who cofounded the 20th-century art movement known as Purism.

Ozenfant studied art in his hometown and in 1906 went to Paris to study painting and architecture at the Académie de La Palette, where he was influenced by Pointillism. He became enamoured of Cubism, and in 1915 he founded with Max Jacob and Guillaume Apollinaire the review *L'Élan,* in which they touted the movement's principles. By 1917, however, Ozenfant had become disillusioned with Cubism, feeling that it had sacrificed its original purity and rigour and had become instead a mere decorative vehicle. He became associated with Le Corbusier, and within a year they formulated and published the manifesto of what they called Purism in *Après le Cubisme* (1918; "After Cubism"). In 1919 they founded the avant-garde review *L'Esprit Nouveau,* in which they explored the sources and directions of contemporary art. Ozenfant's definitive work on this subject, the two-volume *L'Art* (*The Foundations of Modern Art*) was published in 1928. From 1931 to 1938 he worked on a massive figural composition done in the Purist style and entitled "Vie" ("Life"). Ozenfant moved to London in 1935 and founded there the Ozenfant School of Fine Arts, which he relocated to New York City three years later. He returned to France in 1955.

As a theoretician Ozenfant advanced the principles of order, rationality, and precision and called for a new classicism based upon the aesthetic of modern technology. His own painting stressed clarity, serenity, and economy of means; in his still lifes the objects are reduced to flat planes of colour existing in a rigid architectonic framework.

ozier pattern, in tableware, molded basket-weave pattern produced in Germany in the 1730s on Meissen porcelain tableware. It was probably one of the numerous inventions of the celebrated modeler Johann Joachim Kändler. There are four basic types of ozier molding: the *ordinair-ozier* ("ordinary ozier"), a kind of zigzag basket weave; the *alt-ozier* ("old ozier"), which has radial ribs; the *neu-ozier* ("new ozier"), the ribs of which resemble the curves of an *S,* appearing around 1742; and the *Brühlsches Allerei-Dessin* ("Brühl's varied design"), a pattern of basketwork and molded motifs, such as shells and flowers, surrounded by Rococo scrollwork. Like much else that originated at Meissen, ozier molding was copied by other German porcelain factories, as well as porcelain factories in Chantilly, Fr.; Copenhagen; and Chelsea, Eng.

Ozma, Project, attempt undertaken in 1960 to detect radio signals generated by hypothetical intelligent beings living near stars other than the Sun. Some 150 hours of intermittent observation during a four-month period detected no recognizable signals. Frank D. Drake, director of the search, named the project for the princess of Oz, an imaginary and marvelous distant place described in tales by the American writer L. Frank Baum.

The search was carried out with the aid of a special receiver attached to a radio telescope 26 m (85 feet) in diameter at the U.S. National Radio Astronomy Observatory at Green Bank, W.Va. The receiver was tuned to wavelengths near 21 cm, which is the wavelength of radiation emitted naturally by interstellar hydrogen; it was thought that this would be familiar, as a kind of universal standard, to anyone attempting interstellar radio communication. The telescope was aimed at two nearby stars (Epsilon Eridani and Tau Ceti, both about 11 light-years from the Earth) that resemble the Sun and seem reasonably likely to have inhabited planets.

A second experiment, called Ozma II, was conducted at the same observatory by Benjamin Zuckerman and Patrick Palmer, who intermittently monitored more than 650 nearby stars for about four years (1973–76).

ozokerite, also spelled OZOCERITE (from Greek *ozokēros,* "odoriferous wax"), naturally occurring, light yellow to dark brown mineral wax composed principally of solid paraffinic hydrocarbons (compounds chiefly of hydrogen and carbon atoms linked in chains). Ozokerite usually occurs as thin stringers and veins filling rock fractures in areas of mountain building. It is believed to have been deposited when the petroleum containing it percolated through the rock fissures; in Utah, U.S., this process is exposed in fissures cut by mine drifts. Large deposits occur in Galicia (in modern Poland), Romania, the Soviet Union, and Utah.

The deposits in Galicia and Utah have been mined, but production decreased after 1940 because of competition from paraffin wax obtained by cooling from distilled petroleum. Mined ozokerite is purified by boiling in water (its melting point is 58°–100° C [130°–212° F]); the wax rises to the surface and is refined with sulfuric acid and decolorized with charcoal. Ozokerite has a higher melting temperature than typical synthetic petroleum wax, a desirable property in the manufacture of carbon paper, leather polishes, cosmetics, electrical insulators, and candles.

Ozolua, original name OKPAME (d. 1504), African king, the greatest warrior-king of Benin (in present Nigeria).

Ozolua was able to extend the boundaries of Benin from the Niger River in the east virtually to Lagos in the west. Tradition calls him the first ruler in West Africa to have had contact with the Portuguese explorers who were just then exploring the western coast of sub-Saharan Africa.

The youngest son of another great Benin ruler, Ewuare the Great, Ozolua embarked on his systematic reduction of surrounding peoples from the moment he was named oba (king) in 1481. Known as "the Conqueror," he is said to have consolidated the area he subjugated by a complicated network of marriage and diplomatic obligations. He encouraged trade with the Portuguese (*c.* 1500) and allowed them to establish missionary stations.

ozone (O_3), triatomic allotrope of oxygen (a form of oxygen in which the molecule contains three atoms instead of two as in the common form) that accounts for the distinctive odour of the air after a thunderstorm or around electrical equipment. The odour of ozone around electrical machines was reported as early as 1785; ozone's chemical constitution was established in 1872. Ozone is an irritating, pale-blue gas that is explosive and toxic, even at low concentrations. It occurs naturally in small amounts in the Earth's stratosphere, where it absorbs solar ultraviolet radiation, which otherwise could cause severe damage to living organisms on the Earth's surface. Under certain conditions, photochemical reactions between nitrogen oxides and hydrocarbons in the lower atmosphere can produce ozone in concentrations high enough to cause irritation of the eyes and mucous membranes.

Ozone usually is manufactured by passing an electric discharge through a current of oxygen or dry air. The resulting mixtures of ozone and original gases are suitable for most industrial purposes, although purer ozone may be obtained from them by various methods; for example, upon liquefaction, an oxygen–ozone mixture separates into two layers, of which the denser one contains about 75 percent ozone. The extreme instability and reactivity of concentrated ozone makes its preparation both difficult and hazardous.

Ozone is 1.5 times as dense as oxygen; at −112° C (−170° F) it condenses to a dark blue liquid, which freezes at −251.4° C (−420° F). The gas decomposes rapidly at temperatures above 100° C (212° F) or, in the presence of certain catalysts, at room temperatures. Although it resembles oxygen in many respects, ozone is much more reactive; hence, it is an extremely powerful oxidizing agent, particularly useful in converting olefins into aldehydes, ketones, or carboxylic acids. Because it can decolorize many substances, it is used commercially as a bleaching agent for organic compounds; as a strong germicide it is used to sterilize drinking water as well as to remove objectionable odours and flavours. *See also* ozonosphere.

ozonide, any of a class of chemical compounds formed by reactions of ozone (*q.v.*) with other compounds. Organic ozonides, often made from olefins (*q.v.*), are unstable, most of them decomposing rapidly into oxygen compounds, such as aldehydes, ketones, and peroxides, or reacting rapidly with oxidizing or reducing agents. A few inorganic ozonides are known, containing the negatively charged ion O_3^-; an example is potassium ozonide (KO_3), an unstable, orange-red solid formed from potassium hydroxide and ozone that, upon heating, decomposes into oxygen and potassium superoxide (KO_2).

ozonosphere, region in the upper atmosphere between about 10 and 50 km (6 and 30 miles) altitude, in which there are appreciable concentrations of ozone and in which the temperature distribution is largely determined by the radiative properties of ozone.

Ozone has the formula O_3; it is always present in trace quantities in the Earth's atmosphere, but its largest concentrations are in the ozonosphere. There it is formed primarily as a result of shortwave solar ultraviolet radiation (wavelengths shorter than 242 nanometres), which dissociates normal molecular oxygen (O_2) into two oxygen atoms. These oxygen atoms then combine with nondissociated molecular oxygen to yield ozone. Ozone, once it has been formed, can also be easily destroyed by solar ultraviolet radiation of wavelengths less than 300 nanometres.

Because of the strong absorption of solar ultraviolet radiation by molecular oxygen and ozone, solar radiation capable of producing ozone cannot reach the lower levels of the atmosphere, and the photochemical production of ozone is not significant below about 20 km (12 miles). This absorption of solar energy is very important in producing a temperature maximum at about 50 km (30 miles), called the stratopause, or the mesopeak. Also, the presence of the ozone layer in the upper atmosphere, with its accompanying absorption, effectively blocks almost all solar radiation of wavelengths less than 290 nanometres from reaching the Earth's surface, where it would injure or kill most living things.

Certain air pollutants, particularly chlorofluorocarbons, halons (chlorofluorobromine compounds), and nitrogen oxides, can diffuse into the ozonosphere and destroy ozone. (*See* chlorofluorocarbon.) In the mid-1980s scientists discovered that a "hole" developed periodically in the ozonosphere above Antarctica; it was found that the ozone layer there was thinned by as much as 40–50 percent from its normal concentrations. This severe regional ozone depletion was explained as a natural phenomenon, but one that was probably exacerbated by the effects of chlorofluorocarbons and halons. Concern over increasing global ozone depletion led to international restrictions on the use of chlorofluorocarbons and halons, to scheduled reductions in their manufacture, and to regulation of the permissible amount of nitrogen oxides in automobile exhaust gases.

Even though the ozone layer is about 40 km (25 miles) thick, the total amount of ozone, compared with more abundant atmospheric gases, is quite small. If all of the ozone in a vertical column reaching up through the atmosphere were compressed to sea-level pressure, it would form a layer only a few millimetres thick.

Ozu Yasujirō (b. Dec. 15, 1903, Tokyo—d. Dec. 12, 1963, Tokyo), motion-picture director who originated the *shomin-geki* ("common-people's drama"), a genre of film dealing with lower-middle-class Japanese family life. Because of the centrality of domestic interrelationships in his films, their detailed character portrayals, and the pictorial beauty of their images, Ozu was considered the most typically Japanese of all directors and received more honours in his own country than did any other director.

Raised in Tokyo, Ozu became an assistant cameraman for the Shōchiku Motion Picture Company, Tokyo, in 1923. By the mid-1920s he was a director, but not until the early 1930s did he establish his reputation by such outstanding *shomin-geki* silent comedies as *Daigaku wa deta keredo* (1929; *I Graduated, But . . .*) and *Umarete wa mita keredo* (1932; *I Was Born, But . . .*). Ten years later *Toda-ke no kyodai* (1941; *The Toda Brother and His Sisters*), a consideration of Japanese attitudes toward motherhood, was his first box-office success.

Ozu made no films from 1942 to 1947. In 1947 *Nagaya shinshi roku* (*The Record of a Tenement Gentleman*) initiated a series of pictures in which a further refinement of style was combined with a concern for postwar conditions. Plot was almost eliminated, while atmosphere and detailed character studies became preeminent. He almost totally abandoned such devices as camera movement in favour of straight pictorial shots. *Banshun* (1949; *Late Spring*), *Bakushu* (1951; *Early Summer*), *O-chazuke no aji* (1952; *The Flavour of Green Tea over Rice*), *Tōkyō monogatari* (1953; *Tokyo Story*), and *Sōshun* (1956; *Early Spring*) exemplify this style and helped to establish Ozu as an internationally prominent director. Such later films as *Early Autumn* (1961) and *An Autumn Afternoon* (1962) show Ozu's mastery of the decorative use of colour in motion pictures.

P-38, also called LOCKHEED LIGHTNING, fighter-interceptor aircraft, a single-seat, twin-engine, mid-wing monoplane used by the U.S. Army Air Force during World War II. The P-38 was the first military aircraft produced by the Lockheed Aircraft Corporation, on a development specification calling for a speed of at least 360 miles per hour (580 kilometres per hour) at 20,000 feet (6,100 m). After an unsuccessful version was flown by the Royal Air Force in late 1941, the P-38F appeared in early 1942; it had a top speed of 395 mile/h (636 km/h) at 25,000 feet (7,620 m). Later versions could attain 414 mile/h (666 km/h).

The P-38 became the principal U.S. fighter escort for medium bombers in Europe, and it was also widely used in the Pacific. The pilot's position was protected with armour and a windshield of bulletproof glass. Armament varied in successive models, but most of the Lightnings carried a 20-millimetre cannon and four .50-calibre machine guns in the nose. It could carry 1,600 pounds (725 kg) of bombs on racks beneath the pilot's nacelle, and late in the war it carried clusters of rockets on wing racks. After the P-38 was superseded as a bomber escort (by the P-51), many of the planes were modified as two-seat fighter-bombers and others for photoreconnaissance (under the designations F-4 and F-5, respectively).

P-47, also called THUNDERBOLT, fighter and fighter-bomber aircraft used by the Allied air forces during World War II. A single-seat, single-engine, low-wing monoplane, it was developed in the United States by Republic Aviation to meet the need for a high-speed long-range fighter. It first flew in 1941 and went into production the following March; it was in action from British bases a year later. Variously modified as production went on, the P-47 had an armour-protected cockpit and carried eight .50-calibre machine guns. It had a maximum bomb load of 2,500 pounds (1,135 kg), and could carry 10 5-inch (13-centimetre) rockets beneath its wings. With all its arms and armour, it had a maximum speed of 440 miles per hour (708 kilometres per hour) and a ceiling of 40,000 feet (12,200 m). More Thunderbolts—15,683—were built for the Allied air services than any other fighter. It remained in service until 1955.

P-51, also called MUSTANG, one of the finest fighter aircraft of World War II, a single-seat, single-engine, low-wing monoplane that was produced by North American Aviation for Britain's Royal Air Force (RAF) and later was adopted by the U.S. Army Air Force (USAAF). Its prototype was designed to British specifications and first flew in late 1940, just months after the design work began. It went into service in November 1941. With a low-altitude-rated Allison engine and a maximum speed of about 390 miles per hour (628 kilometres per hour), it was used for low-level tactical photoreconnaissance duties, with a camera mounted behind the pilot. The Mustang was equipped with four .50-calibre and four .30-calibre machine guns, although one model had four 20 mm cannons, and another (the A-36A) was a dive bomber for the USAAF. In late 1942 the airframe was adapted for the Rolls-Royce Merlin engine and, starting in late 1943 with the P-51B, was built in vast numbers for the USAAF and some for the RAF. With a maximum speed of about 440 mile/h (708 km/h), the P-51D version (six .50-calibre machine guns, three in each wing) was a superb long-range offensive fighter, escorting U.S. bombers from England to Berlin in 1944, and to Tokyo from the Pacific island bases in 1945. It played a significant part in the final defeat of the German Luftwaffe and remained operational until the 1950s, being used for ground attack in the early days of the Korean War. A few were still being used for civil air racing as late as 1987.

p–n junction, in electronics, the electrical contact in transistors and related devices between two different types of material called *p*-type and *n*-type semiconductors. These materials are formed by the deliberate addition of impurities to pure semiconductor materials, such as silicon. Materials of *p*-type contain holes, vacancies formerly occupied by electrons (negatively charged particles), simulating positively charged particles, whereas *n*-type materials contain electrons. Electrical current flows more easily across such a junction in one direction than in the other.

If the positive pole of a battery is connected to the *p*-side of the junction, and the negative pole to the *n*-side, the Fermi levels of the two materials are altered in such a way as to promote the flow of charge across the junction. If the battery is connected in the opposite direction, the Fermi levels are altered in the reverse direction, so that very little charge can flow. This property of the *p–n* junction is called rectification.

Pa, Pinyin BA, ancient tribe and later an ancient Chinese feudal state that came into being in the 11th century BC, under the Western Chou. It was situated in the Chia-ling valley of what is now central Szechuan. Pa established relations with the mid-Yangtze kingdom of Ch'u in the 5th century BC. Shortly before 316 BC, the state was conquered by the Ch'in and incorporated into the Ch'in empire. In the middle of the 3rd century BC, the Pa region became part of the kingdom of Shu and was totally independent of northern and central China. The central region of Szechuan is still sometimes known as the Pa region.

Pa-an, Burmese HPA-AN, town, capital of Karen state, southern Myanmar (Burma). Situated on the left bank of the Salween River, 27 miles (43 km) north of Moulmein (Mawlamyine), it has an airfield and is linked by road west to Thaton and across the Dwana Range to Thailand. Pop. (1983) 282,069.

Pa Hsien, Pinyin BA XIAN, English EIGHT IMMORTALS, heterogeneous group of holy Taoists, each of whom earned the right to immortality and had free access to the Peach Festival of Hsi Wang Mu, Queen Mother of the West. Though unacquainted in real life, the eight are frequently depicted as a group—bearing gifts, for instance, to Shou Hsing, god of longevity, to safeguard their immortality.

In Chinese art they sometimes also stand alone or appear in smaller groups. Four of them, for example, recline beneath a pine tree: Chung-li Ch'üan and Lü Tung-pin are drinking wine heated by Li T'ieh-kuai while Lan Ts'ai-ho entertains them on a flute. Lists vary, but the other four immortals are usually identified as Chang Kuo-lao, Han Hsiang, Ts'ao Kuo-chiu, and Ho Hsien-ku (*qq.v.*).

Pa Sak River, river in central Thailand. It rises in the northern portion of the Phetchabun Range and flows south through a narrow valley for 319 miles (513 km). It empties into the Lop Buri River at Phra Nakhon Si Ayutthaya, north of Bangkok. Lomsak, Phetchabun, and Sara Buri are the main towns on its banks. Below Sara Buri town, the Pa Sak is dammed for irrigation.

Paarl, town, Cape province, South Africa, east of Cape Town, on the Groot-Berg River between the Paarl Mountain and the Drakenstein Range. Settled in 1688 by Huguenots, who introduced viticulture, it is still known for its vineyards and wine making; it also produces citrus fruits, tobacco, and olives. Manufactures include cigarettes, textiles, and processed foods. Paarl is an educational centre, and the movement to recognize Afrikaans as a national and written language originated there. Pop. (1985) mun., 63,671.

Paasche index, index developed by German economist Hermann Paasche for measuring current price or quantity levels relative to those of a selected base period. It differs from the Laspeyres index (*q.v.*) in that it uses current-period weights; that is, in computing the index, a commodity's price relative (ratio of current price to base-period price) is weighted by the commodity's relative importance to all purchases in the current period. The index is arrived at by taking the ratio of the total cost of purchasing a specified bundle of current-period commodities valued at current prices to the value of those same commodities at base-period prices and multiplying by 100.

The Paasche price index tends to understate price increases, since it already reflects some of the change in consumption patterns with which consumers respond to price increases—*i.e.,* increased consumption of goods that show little or no price change.

Paasikivi, Juho Kusti (b. Nov. 27, 1870, Tampere, Fin.—d. Dec. 14, 1956, Helsinki), Finnish statesman and diplomat who, as prime minister (1918, 1944–46) and then president (1946–56) of Finland, cultivated harmonious relations with the Soviet Union in an effort to ensure some measure of independence for Finland.

Paasikivi studied law and history at the universities of Stockholm, Uppsala, and Leipzig and from 1902 to 1903 was a lecturer in law at the University of Helsinki. He subsequently turned to financial administration and banking and insurance activities. Paasikivi was a political realist who took the view that small nations could not permanently hope to oppose the power politics of large ones. Thus, in the struggle to preserve Finland's autonomy under Russian rule (the country was then a grand duchy within the Russian Empire), he sided with the Compliers of the Old Finnish Party, who were willing to "comply" with recent illegal Russian decrees affecting Finnish internal affairs. In 1907 Paasikivi was elected a member of the Finnish Eduskunta (Parliament), and the following year he became minister of finance. He resigned in 1909 in protest against Russian attempts to illegally carry out the Russification of his country.

Paasikivi briefly served in 1918 as prime minister of the first government of newly independent Finland, in which capacity he favoured

a pro-German policy and a monarchy for his country. He headed the Finnish delegation that on Oct. 14, 1920, signed at Tartu, Estonia, the peace treaty with the U.S.S.R., after warning his government against trying to take advantage of Russia's temporary weakness. In independent postwar Finland he became prominent as a banker and businessman.

In 1936 Paasikivi was appointed minister to Sweden. He was recalled from Stockholm in October 1939 to lead the delegation that unsuccessfully attempted to reach a peace settlement with the U.S.S.R. over that nation's demands for strategically important bits of Finnish territory; he advocated acceding to the Soviets' demands. In March 1940 Paasikivi was the logical choice to negotiate peace with the U.S.S.R. and thus end the Russo-Finnish War that Finland was clearly losing; as chairman of the Finnish-Russian Peace Commission, he signed the treaty whereby Finland ceded to Russia approximately one-tenth of its territory, with a population of almost 500,000. Soon afterward, in March 1940, he was appointed minister to Moscow, but he resigned from this position in May 1941 when it became clear that his government would side with Nazi Germany in the approaching conflict with the Soviet Union. Virtually retired from politics for the next three years, Paasikivi was recalled to service to take part in the abortive peace negotiations between Finland and the U.S.S.R. in the spring of 1944. In November 1944, after the approaching Soviet victory over Germany had become apparent even to pro-Nazi Finns, the conciliatory Paasikivi was asked to serve as prime minister of a government pledged to peaceful cooperation with the Soviet Union. Until the end of his prime ministry in March 1946 he made sure that the peace conditions of the Russo-Finnish armistice of September 1944 were faithfully carried out.

Paasikivi succeeded Marshal C.G. Mannerheim as president of the Finnish republic in March 1946, and he served in that capacity until February 1956. As president he stood more aloof from party politics than any of his predecessors. His aims, which he pursued with considerable success, were to remain absolutely uncompromising over Finnish independence while so handling Finland's foreign relations as to avoid all conflict with Soviet interests and inspire the Soviet Union with confidence in Finnish sincerity. Paasikivi was instrumental in regaining Porkkala (1955), which had been leased to the Soviet Union for a naval base in 1944. Although pursuing a policy of cooperation with his powerful neighbour, he firmly resisted Communist penetration in Finland; Paasikivi's strategy became the fundamental basis of Finland's foreign policy in the post-World War II era.

pabbajjā (Pāli: "to wander forth"), Sanskrit PRAVRAJYĀ, Buddhist rite of ordination by which a layman becomes a novice (Pāli *sāmaṇera;* Sanskrit *śrāmaṇera*). The ceremony is also the preliminary part of higher ordination, raising a novice to a monk (*see* upasampadā).

In some Theravāda countries such as Burma, the rite is normally held for every Buddhist boy at the age of puberty. In Tibet and China a probationary period of study is required before the candidate becomes a novice, during which he does not receive tonsure and is not exempt from military service.

Details of the ceremony vary from country to country. In most instances, the candidate appears before an assembly of 10 (in some cases fewer) ordained monks and asks for admission to the order as a novice. His head and face are shaved, and he presents the upper and lower robes of the novice for consecration by the officiating abbot or senior monk. The candidate puts on the monastic robes and returns. He then asks for the Threefold Refuge (in the Buddha, the teaching, and the order) and the 10 precepts (ethical code; *see* sīla) to be administered to him. The rite is concluded with his obeisance to the senior monks and his request for forgiveness of his faults.

The novice lives in the monastery for a period varying from a few days to several months and accompanies the monk on the daily alms rounds, but he is not allowed to participate in the fortnightly recitation of the patimokkha (the rules of monastic discipline).

Pabianice, town and suburb of Łódź city, in Łódź *województwo* (province), central Poland, in the Łódź highlands on the Dobrzynka River. The second most important town in the Łódź industrial region, it lies on the Łódź–Wrocław rail line and is a major textile centre. The oldest community in the region, it was first settled in the 11th century and was granted town rights in 1297. Because it lay on the trade route between Kraków and Gdańsk (Danzig), it prospered. A late 16th-century Renaissance castle in the town now houses a museum. Pop. (1985 est.) 72,600.

Pābna, also spelled PUBNA, city, west-central Bangladesh. It lies along the Ichāmati River, which is a tributary of the Padma (Ganges). An industrial centre, Pābna has jute mills and is noted for its hosiery and handloomed products. Historical remains include the Hindu temple of Jor Bāṅgla and the Pābna Jubilee tank (water reservoir; excavated 1887). Pābna was incorporated a municipality in 1876; it has Jinnah Park, a mental hospital, and two government colleges affiliated with the University of Rājshāhi.

The surrounding area lies within the angle formed by the confluence of the Padma and Jamuna rivers. A wide alluvial plain is intersected by a network of streams, and many villages are accessible only by boat during the rainy season. The soil, enriched by flood deposits, supports rice, jute, sugarcane, and pulses. Pop. (1981) city, 101,080.

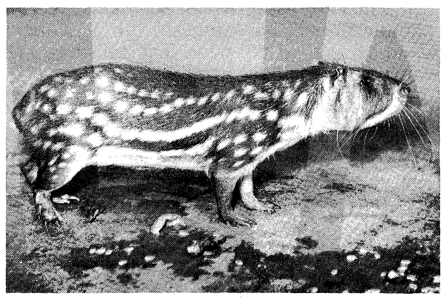
Pabst, G(eorg) W(ilhelm) (b. Aug. 27, 1885, Raudnice, Bohemia, Austria-Hungary—d. May 29, 1967, Vienna), German motion-picture director whose films were among the most artistically successful of those produced in the 1920s. Pabst's films are marked by his deep insight into the human personality and his ability to create moving and original characters, particularly female ones; by his constant concern with social and political issues, as well as with the impact that societal problems have on individual human beings; and by powerful editing that gave meaning to each shot while creating smooth transitions between scenes.

Pabst was educated in Vienna and at 20 began a career as a stage actor in Zürich. He performed in Salzburg, Austria, Berlin, and New York City before turning to the cinema. Pabst's first film was *Der Schatz* (1923; *The Treasure*), about the passions aroused while its characters search for hidden treasure. His first successful film as a director was *Die freudlose Gasse* (1925; *The Joyless Street*), which became internationally famous as a grimly realistic portrayal of life in inflation-ridden postwar Vienna. His second successful film was *Geheimnisse einer Seele* (1926; *Secrets of a Soul*), a realistic consideration of psychoanalysis that harked back to Expressionist themes in its detailed examination of a disturbed consciousness. *Die Liebe der Jeanne Ney* (1927; *The Love of Jeanne Ney*) was a love story that incorporated documentary shots to heighten the realism of its postwar setting. The picture is most highly praised, though, for its photography and its smooth cuts of one scene into another. With these three films Pabst became an internationally prominent director.

His films of the late 1920s and '30s contained a stronger emphasis on the interrelationship between social conditions and the individual. Outstanding motion pictures of this type were *Abwege* (1928; *Crisis*), *Die Büchse der Pandora* (1929; *Pandora's Box*), and *Das Tagebuch einer Verlorenen* (1929; *Diary of a Lost Girl*). The latter two films are particularly notable for the performances in them of the actress Louise Brooks, who epitomized Pabst's ideal of feminine eroticism. In the early 1930s Pabst took up a left-wing viewpoint in such films as *Westfront 1918* (1930), a realistic portrayal of the trench warfare of World War I, *Die Dreigroschenoper* (1931; *The Threepenny Opera*), and *Kameradschaft* (1931; *Comradeship*), in which a mine disaster is met by the combined rescue efforts of French and German workers in an example of international cooperation.

By the mid-1930s the overall quality of Pabst's films was declining. He moved to Paris and attempted a ponderous three-language version of *Don Quixote* (1933) as well as several melodramas. Returning to Germany at the outbreak of World War II, he reluctantly directed films such as *Komödianten* (1941; *Comedians*) and *Paracelsus* (1943). His most outstanding postwar film was *Der letzte Akt* (1955; *The Last Act,* or *The Last Ten Days*), a re-creation of the final days of the Hitler regime.

paca, also called SPOTTED CAVY (*Cuniculus paca*), stout-bodied, tailless rodent, family Dasyproctidae (order Rodentia), found chiefly in lowland forests from Mexico to Brazil.



Paca (*Cuniculus paca*)
Lloyd G. Ingles

A white-spotted, brown animal, large for a rodent, the paca may attain a length of about 75 cm (29 inches). It has a relatively large head and bony swellings on its cheekbones that serve as resonating chambers in sound production. The paca is nocturnal and eats leaves, roots, and fruit, occasionally damaging sugarcane or other crops. It lives in a burrow, swims well, and when pursued heads for water in an attempt to escape. The female usually bears one young per litter.

The mountain paca (*Stictomys,* or *Cuniculus, taczanowskii*) is a highland paca found in the Andes. It is smaller than the lowland form and has thicker fur. Both species are locally valued as food. For false paca, *see* pacarana.

Pacaraima Mountains, also spelled PAKARAIMA, Portuguese SERRA PACARAIMÃ, Spanish SIERRA PACARAIMA, also called (in Guyana) PAKARAIMA MOUNTAINS, central tabular upland of the Guiana Highlands in Brazil, Venezuela, and Guyana. The Pacaraima Mountains form the drainage divide between the Orinoco Valley to the north and the Amazon Basin to the south. Extending for 250 mi (400 km) in an east–west direction, the mountains mark the borders between Brazil and southeastern Venezuela and between Brazil and west central Guyana. Mount Roraima (9,094 ft [2,772 m]) is highest in elevation. The rivers that rise on the plateau tops pour over the cliffed edges in spectacular waterfalls, such as the Kaieteur Falls in Guyana.

pacarana, also called BRANICK'S RAT (*Dinomys branickii*), rare South American rodent of the valleys and lower slopes of the Andes Mountains. The only living member of the family Dinomyidae (order Rodentia), the pacarana is a diurnal, terrestrial rodent that eats leaves, fruit, and other vegetation.

The pacarana is heavy bodied and has small ears, a relatively large head, and coarse, white-spotted, black or brown fur. Large for a rodent, it attains a length of about 90 to 100 centimetres (35 to 39 inches) including its thick, hairy tail.

Pacatus Drepanius, Latinius, Latinius also spelled LATINUS (fl. *c.* AD 390), Gallo-Roman orator and poet, the author of an extant panegyric addressed to Theodosius I at Rome in 389 after the defeat of the usurper Maximus. He was a friend of Symmachus, the champion of paganism, and of the Christian poet Ausonius.

It is uncertain whether Pacatus was pagan or Christian; in his speech he denounced Maximus' persecution of the Priscillianist heretics. In 390 Pacatus received the proconsulship of Africa and later held other high offices.

pacemaker, electronic cardiac-support device that produces rhythmic electrical impulses that take over the regulation of the heartbeat in patients with certain types of heart disease.

A healthy human heart contains its own electrical conducting system capable of controlling both the rate and the order of cardiac contractions. Electrical impulses are generated at the sinoatrial node in the right atrium, one of the chambers of the heart. They then pass through the muscles of both atria to trigger the contraction of those two chambers, which forces blood into the ventricles. The wave of atrial electrical activity activates a second patch of conductive tissue, the atrioventricular node, initiating a second discharge along an assembly of conductive fibres called the bundle of His, which induces the contraction of the ventricles. When electrical conduction through this system is interrupted, as is the case in a number of diseases including congestive heart failure and as an aftereffect of heart surgery, the condition is called heart block. An artificial pacemaker may be employed temporarily until normal conduction returns, or permanently to overcome the block.

In temporary pacing, a miniature electrode attached to fine wires is introduced into the heart through a vein, usually in the arm. The pacing device, an electric generator, remains outside the body and produces regular pulses of electric charge to maintain the heartbeat. In permanent pacing, the electrode may again be passed into the heart through a vein or it may be surgically implanted on the heart's surface; in either case the electrode is generally located in the right ventricle. The electric generator is placed just beneath the skin, usually in a surgically created pocket below the collarbone.

The first pacemakers were of a type called asynchronous, or fixed, and they generated regular discharges that overrode the natural pacemaker. The rate of asynchronous pacemakers may be set at the factory or may be altered by the physician, but once set they will continue to generate an electric pulse at regular intervals. Most are set at 70 to 75 beats per minute. More recent devices are synchronous, or demand, pacemakers that trigger heart contractions only when the normal beat is interrupted. Most pacemakers of this type are designed to generate a pulse when the natural heart rate falls below 68 to 72 beats per minute. These instruments have a sensing electrode that detects the atrial impulse.

Once in place, the electrode and wires of the pacemaker usually require almost no further attention. The power source of the implanted pulse generator, however, requires replacement at regular intervals, generally every four to five years. Most current pacemakers use batteries as a power source, but there has been some exploration of generators energized by radioactive isotopes such as plutonium-238.

Pachacamac, creator deity worshipped by the pre-Inca maritime population of Peru; it was also the name of a pilgrimage site in the Lurín Valley (south of Lima) dedicated to the god and revered for many centuries. After the Incas conquered the coast, they did not attempt to replace the ancient and deeply rooted worship of Pachacamac but instead incorporated him into their own pantheon. Pachacamac was believed to be a god of fire and a son of the sun god; he rejuvenated the world originally created by the god Viracocha and taught men the crafts. Pachacamac was also believed to be invisible and thus was never represented in art.

The ruins of the shrine in the Lurín Valley include several pyramids and temples and are partially restored. The site may have served as the central city of a coastal "kingdom" from *c.* 1000 to *c.* 1440.

Pachacamac, large pre-Columbian ruin located in the Lurin Valley on the central coast of present-day Peru. The earliest major occupation and construction of Pachacamac dates to the Early Intermediate Period (*c.* 200 BC–AD 600) and to a culture generally known as Early Lima (Maranga, Interlocking style). The terraced adobe pyramid and temple known as the Temple of Pachacamac belongs to this time and culture, and Pachacamac's fame as the seat of an oracle probably began in the Early Intermediate Period. During the Middle Horizon (AD 600–1000) it continued as a major centre and place of pilgrimage and was probably the principal establishment of the Huari Empire on the coast. In late pre-Columbian times the Inca constructed the large Temple of the Sun at the site, and the Oracle of Pachacamac, to which the early Spanish explorers refer, probably was associated with a shrine in this temple. The shrine and temple were sacked by Francisco Pizarro's soldiers during the Spanish conquest (*c.* 1532).

Pachacuti Inca Yupanqui, also called PACHACUTEC (fl. 15th century), Inca emperor (1438–71), an empire builder who, because he initiated the swift, far-ranging expansion of the Inca state, has been likened to Philip II of Macedonia. (Similarly, his son Topa Inca Yupanqui is regarded as a counterpart of Philip's son Alexander III the Great.)

Pachacuti first conquered various peoples in what is now southern Peru and then extended his power northwesterly to Quito, Ecuador. He is said to have devised the city plan adopted for his capital, Cuzco (in present southern Peru).

Pachaimalai Hills, range of hills in Tamil Nādu state, southern India, an eastward extension of the Eastern Ghāts in the northeastern Tamilnād Uplands. The Pachaimalai Hills, together with the Javādi, Shevaroy, and Kalrāyan hills, separate the Cauvery River basin in the south from the Pālār River basin in the north. Extending over approximately 5,200 sq mi (13,500 sq km), they form a discontinuous line of highlands with a general elevation of from 1,770 ft (540 m) to 4,620 ft. The region consists of rounded hills composed of granitic gneiss. The hills have scrub jungles on broken ground and sal (*Shorea*) forests on the flat hilltops. Loamy and clayey soils are found in the valleys. The Vellār, Pālār, and Ponnaiyār rivers are dry for much of the year. The economy of the region is based on agriculture; rice, jowar (sorghum), sugarcane, gram (chick-pea), peanuts (groundnuts), and bajra (pearl millet) are subsistence crops. Coffee, cashews, and pepper are important plantation crops raised for export. Large-scale industries produce textiles, foodstuffs, and chemicals; engineering is also important. Cottage industries include mat and basket weaving, carpentry, blacksmithing, and the manufacture of *bidi* (cigarettes). Iron ore, manganese, beryl, and zinc are mined. About three-fifths of the area's population live in the Coimbatore-Madurai Uplands. The *caṅkam* period in Tamil literature flourished in the area during the Cēra, Cōla, and Pāṇḍya dynasties. Roads from the northern upland region to the eastern seaboard run along the valleys or other gaps between the hill ranges. Tiruvannāmalai, Āttūr, Rānipet, and Chengam are important towns. The hills are named after the Pachaimalaiyali peoples who live in the region.

Pacheco, Francisco (b. 1564, Sanlúcar de Barrameda, Spain—d. 1654, Seville), Spanish painter, teacher, and scholar. Although an undistinguished artist himself, he is remembered as the teacher of both Velázquez and Alonso Cano and as the author of *Arte de la pintura* (1649), a treatise on the art of painting that is the most important document for the study of 17th-century Spanish art.

Moving to Seville early in his life, he studied painting under Luis Fernández, learning primarily by copying the work of Italian Renaissance masters. After visiting (1611) Madrid and Toledo, where he studied the work of El Greco, he returned to Seville and opened an academy. His instructions were marked by an emphasis on academic correctness. The official censor of the Inquisition in Seville, he concerned himself with the proper way of depicting religious themes and images.

Such paintings as the "Last Judgment" (1614) in the convent of Santa Isabel and the "Martyrs of Granada" (Granada) are highly imitative and rigid works, monumental but unimpressive. Although Velázquez became Pacheco's son-in-law, he was uninfluenced by his father-in-law's art.

Pacheco's *Arte de la pintura,* in addition to chapters on iconography and the theory and practice of painting, includes a series of biographies of contemporary Spanish painters that is most valuable to scholars.

Pacheco, José Emilio (b. June 30, 1939, Mexico City) Mexican critic, novelist, short-story writer, translator, and poet. His poetry transmits his metaphysical concerns in brilliant images.

Pacheco was educated at the National Autonomous University of Mexico. He wrote several plays there that were never produced, and he edited the literary supplement of the review *Estaciones* (1957–58). His first published work, a collection of short stories—*La sangre de Medusa* (1958; "The Blood of Medusa")—shows the influence of Jorge Luis Borges. *Los elementos de la noche* (1963; "The Elements of the Night") is a collection of his poems published in periodicals from 1958 to 1962. The poems of *El reposo del fuego* (1966; "The Sleep of the Fire") contemplate a world in disintegration, and the novel *Morirás lejos* (1967; "You Will Die Far Away") documents the purges of Jews throughout history. *No me preguntes cómo pasa el tiempo* (1969; *Don't Ask Me How the Time Goes By,* 1978) includes poems in which there is a nostalgic desire to relive the past, sometimes coupled with a fine sense of irony. The short stories in *El principio del placer* (1972; "The Pleasure Principle") are united by the recurrent theme of anguish, reinforcing Pacheco's concept of history as a cyclical series of events that continue to haunt mankind. In the poems of *Islas a la deriva* (1976; "Islands Adrift"), Pacheco reinterprets history and mythology.

Pacheco's later books include *Ayer es nunca jamás* (1978; "Yesterday Is Not Ever"), *Desde entonces: poemas 1975–1978* (1980; "Since Then: Poems 1975–1978"), and *Tarde o temprora* (1980; "Sooner or Later"). His works in English include *Tree Between Two Walls* (1969), *The Lost Homeland* (1976), and *Signals From the Flames* (1980). He also edited *La poesía mexicana de siglo XIX* (1965) and *Antología del Modernismo, 1884–1921* (1978).

Pacheco Pereira, Duarte (fl. late 15th–early 16th century), Portuguese sea captain and explorer who may have discovered Brazil in 1498, two years before Pedro Alvarez Cabral explored the Brazilian coast. Because of his military exploits in India, the poet Camões called him Aquiles Lusitano (the Portuguese Achilles).

Pacheco Pereira, reared at the Portuguese court, was an educated man, serving as a squire to King John II. He became an expert cartographer as well as a pilot and shipmaster. He explored the coast of Africa in 1488, returning with Bartolomeu Dias, who had discovered the Cape of Good Hope. Pacheco Pereira sailed with Dias in 1500 on the voyage during which Dias claimed Brazil for the King of Portugal. In 1505 Pacheco Pereira helped defend the Portuguese trading station at Cochin, India, against attacks by the ruler of Calicut. With about 200 Portuguese, Pacheco Pereira successfully held off armies that numbered well over 20,000 men.

Returning to Portugal in 1505, Pacheco Pereira received many honours. He collected his logbooks and charts and wrote a valuable account of Portuguese exploration (published in modern editions in 1892 and 1903). He was appointed governor of São Jorge da Mina but fell into disgrace when enemies reported that he had embezzled official funds. He was exonerated, but he died shortly thereafter in poverty.

Pachelbel, Johann (baptized Sept. 1, 1653, Nürnberg—d. March 3, 1706, Nürnberg), German composer known for his works for organ and one of the great organ masters of the generation before J.S. Bach.

Pachelbel studied organ at Altdorf and Regensburg and held posts as organist in Vienna, Stuttgart, and other cities. In 1695 he was appointed organist at the St. Sebalduskirche in Nürnberg, where he remained until his death. He also taught organ, and one of his pupils was Johann Christoph Bach, who in turn gave his younger brother Johann Sebastian Bach his first formal keyboard lessons.

All Pachelbel's work is in a contrapuntally simple style. His organ compositions show a knowledge of Italian forms derived from Frescobaldi through J.J. Froberger. Of special importance are his chorale preludes, which did much to establish the chorale melodies of Protestant northern Germany in the more lyrical musical atmosphere of the Catholic south. His popular *Canon in D Major* was written for three violins and continuo and was published with a gigue in the same key. His son, Wilhelm Hieronymous Pachelbel, was also an organist and composer.

Pacher, Michael (b. *c.* 1435, County of Tirol—d. August 1498, Salzburg?, Archbishopric of Salzburg), late Gothic painter and wood-carver, one of the earliest artists to introduce the principles of Renaissance painting into Germany.

Little is known of Pacher's early life, but he is thought to have gone to Italy, where he was much impressed by the experiments in perspective of two eminent northern Italian artists of the Renaissance, Jacopo Bellini and Andrea Mantegna. That trip must have occurred sometime before Pacher began work on the St. Wolfgang altarpiece of the Pilgrimage Church of Sankt Wolfgang in Upper Austria (centre completed in 1479; wings completed in 1481). The large figures placed close to the picture plane and seen from a low viewpoint, the deep architectural perspective, and the dramatic foreshortening in such scenes as the "Expulsion of the Money Changers from the Temple" and the "Nativity" betray knowledge of Mantegna's frescoes in the Church of the Eremitani in Padua. Pacher, however, rejected Mantegna's statuesque compositions in favour of a dynamic sense of movement. In contrast to the painted wings, the carved and painted centre of the altarpiece, showing the "Coronation of the Virgin," exhibits no Italian characteristics. Instead, its intricate carving that accentuates minute detail, the bright polychrome and sweeping draperies are wholly northern in spirit.

In the "Altarpiece of the Church Fathers" (*c.* 1483; Alte Pinakothek, Munich), Pacher uses direct and reflected light to create a convincing spatial ambience within a shallow depth.

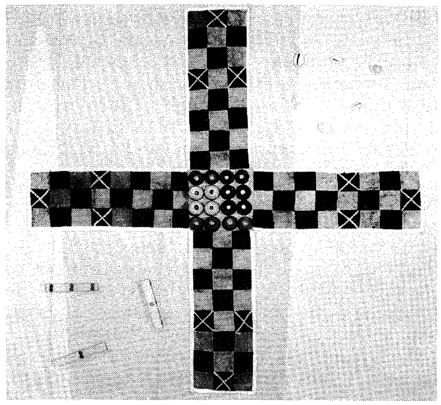
Meyer Erwin—EB Inc.

His narrow niches are dominated by the four monumental figures of the Fathers of the Church. The back of the altarpiece exhibits scenes from the life of St. Wolfgang and is notable for its attenuated male nude, whose idealized form and sharp outline again reflect Pacher's knowledge of Mantegna's art. Such late works as the "Betrothal of the Virgin" and the "Flagellation" (both *c.* 1484; Museum Mittelalterlicher Österreichischer Kunst, Vienna) repudiate his early dynamic compositions and introduce a new, static serenity. The faces and drapery are more idealized and more monumental than in his early works, and the figures are emphasized at the expense of the architectural background.

Pachisi, also called LUDO, or PARCHEESI, board game, sometimes called the national



Indian Pachisi board of cloth with painted wood pieces and cowrie shells as dice; in the collection of R.C. Bell

R.C. Bell

game of India. Four players in opposing partnerships of two attempt to move pieces around a cross-shaped track. Moves are determined by throws of cowrie shells or dice. Each player has four pieces, which begin at the centre space, move down the middle track nearest the player, and counterclockwise around the outer track of the board. The partnership whose pieces first complete the course by returning to the centre space is the winner.

Marked squares along the course represent castles in which the occupying pieces cannot be captured. An occupied castle is open to the player's other pieces or those of his partner but closed to those of his opponents. Pieces resting on other squares are captured and sent back to the centre to begin again if an opposing piece lands on the square they occupy.

Pachmann, Vladimir von, also called VLADIMIR DE PACHMAN (b. July 27, 1848, Odessa, Ukraine—d. Jan. 6, 1933, Rome), Russian pianist known for his performances of Frédéric Chopin. Pachman studied in Vienna and made his debut in 1869 in Odessa. Though his early concerts were successful, he was extremely self-critical and withdrew for long periods of study. He later toured widely in Europe and the United States Pachmann's performances were almost exclusively devoted to works of Chopin, which he played in an intimate, miniature style. His playing was noted for its fine pianissimo shadings and for its smooth touch. His concerts were enlivened by his eccentric gestures, muttered comments, and remarks addressed to the audience.

Pachomius, SAINT (b. *c.* 290, probably in Upper Egypt—d. 346; feast day May 9), founder of Christian cenobitic (communal) monasticism, whose rule (book of observances) for monks is the earliest extant.

Of Egyptian origin, Pachomius encountered Coptic, or Egyptian, Christianity among his cohorts in the Roman emperor Constantine's North African army and, on leaving the military in about 314, withdrew alone into the wilderness at Chenoboskion, near his Theban home. Soon after, he joined the hermit Palemon and a colony of solitaries (anchorites) in the same area at Tabennisi, on the east bank of the Nile. With a talent for administration, Pachomius built the first monastic enclosure, replacing the scattered hermits' shelters, and he drew up a common daily program providing for proportioned periods of work and prayer patterned about a cooperative economic and disciplinary regimen.

This rule was the first instance in Christian monastic history of the use of a cenobitic, or uniform communal, existence as the norm, the first departure from the individualistic, exclusively contemplative nature that had previously characterized religious life. Pachomius, moreover, instituted a monarchic monastic structure that viewed the relationship of the religious superior's centralized authority over the community as the symbolic image of God evoking obedient response from man striving to overcome his egocentrism by self-denial and charity. By the time he died, Pachomius had founded 11 monasteries, numbering more than 7,000 monks and nuns.

Though none of Pachomius' manuscripts has survived, his life and bibliography have been preserved by the 5th-century historian Palladius in his *Lausiac History.* The Rule of Pachomius is extant only in the early-5th-century Latin translation of St. Jerome.

Pachuca, in full PACHUCA DE SOTO, capital city, Hidalgo *estado* ("state"), east-central Mexico. It was one of the first settlements in New Spain and lies in a rich mining district in the Sierra Madre Oriental, 7,959 feet (2,426 m) above sea level. Its first silver mine was discovered in 1534, although it is said that some of the mines were known to pre-Columbian Indians. The nearby Real del Monte mine, begun in 1739 and still in operation, is one of the most extensive mining properties in the world. The patio, or Mexican, process of separating silver from the ore by amalgamation with mercury was perfected in Pachuca by Bartolomé de Medina in the 16th century, and the Pachuca tank used in the cyanide process was developed there in the 20th century. The government has sought to counteract declining mineral production by increasing industrialization. Industries include smelting works and numerous metallic-ore reduction plants. Pachuca has a school of mines and metallurgy, founded in 1877, and it houses the Autonomous University of Hidalgo (1961). Pop. (1980) 110,351.

Pachycephalosaurus, genus of large and unusual dinosaurs found as fossils in Late Cretaceous deposits of North America (the Cretaceous period dates from 144 to 66.4 million years ago). *Pachycephalosaurus,* which grew to be about 9 m (30 feet) long, was a biped with strong hind limbs and much less developed forelimbs. The unusual and distinctive feature of *Pachycephalosaurus* is the high, domelike skull formed by a thick mass of solid bone grown over the tiny brain. The growth of bone obliterated normal openings found in the skulls of related forms. Abundant bony knobs in front and at the sides of the skull further added to the unusual appearance. *Pachycephalosaurus* and closely related forms thus are known as the bone-headed dinosaurs.

Pachymeres, George (b. 1242, Nicaea, Empire of Nicaea [now İznik, Turkey]—d. *c.* 1310, Constantinople [now Istanbul]), outstanding 13th-century Byzantine liberal-arts scholar, whose chronicle of the Palaeologus emperors is the period's main historical source.

Upon the fall in 1262 of the Latin Eastern Empire (established in 1204) and the return of the Byzantine emperor Michael VIII Palaeologus, Pachymeres went to Constantinople and was ordained to the Greek Orthodox ministry. While executing ecclesiastical and political functions, he taught the liberal arts at the patriarchal academy of the Basilica of Hagia Sophia.

Strongly opposed to union of the Eastern church with the Latin, Pachymeres recorded with studied neutrality the tumultuous upheavals marking the reigns of two Palaeologus emperors, the pro-unionist Michael VIII and the anti-unionist Andronicus II. This chronicle, the *Hrōmaikē historia* ("Roman [*i.e.,* Eastern] History"), a 13-volume continuation of the work of George Acropolites, is Pachymeres' principal work. A unique eyewitness record, *Hrōmaikē historia* emphasizes the theological nature of the events it describes, a characteristic that marked subsequent Byzantine chronicles. Pachymeres depicts the period of the two Palaeologus emperors in the light of the dispute between Eastern patriarchal autonomy and Western papal supremacy. Despite its turgid style, *Hrōmaikē historia* is particularly valuable for its accounts of Latin military campaigns throughout Byzantium, the construction of frontier defenses against Slavic and Turkish incursions, and the growth of the Byzantine feudal nobility by astute manipulation of land deeds at the expense of centralized imperial authority.

Pachymeres also composed a theological treatise on the doctrine of the Trinity and proposed a compromise between the Greek and Latin speculative interpretations of the Holy Spirit's relationship to the Father and the Son.

Pachymeres' lectures at Constantinople's academy evolved into the *Syntagma tōn tessarōn mathēmatōn* ("Compendium of Four Mathematics"), a type of classical handbook on mathematics, music, geometry, and astronomy. The *Syntagma,* with its innovative use of Arabic numbers, became the standard academic text in Greek Byzantine culture.

Other works include a compendium of the philosophy of Aristotle, of which only the book on logic has been published; a paraphrase of texts from Pseudo-Dionysius the Areopagite; and a series of exercises in rhetoric.

Pacific, War of the (1879–83), conflict involving Chile, Bolivia, and Peru, which resulted in Chilean annexation of valuable disputed territory on the Pacific coast. It grew out of a dispute between Chile and Bolivia over control of a part of the Atacama Desert that lies between the 23rd and 26th parallels on the Pacific coast of South America. The territory contained valuable mineral resources, particularly sodium nitrate.

National borders in the region had never been definitively established; the two countries negotiated a treaty that recognized the 24th parallel as their boundary and that gave Chile the right to share the export taxes on the mineral resources of Bolivia's territory between the 23rd and 24th parallels. But Bolivia subsequently became dissatisfied at having to share its taxes with Chile and feared Chilean seizure of its coastal region where Chilean interests already controlled the mining industry.

Peru's interest in the conflict stemmed from its traditional rivalry with Chile for hegemony on the Pacific coast. Also, the prosperity of the Peruvian government's guano (fertilizer) monopoly and the thriving nitrate industry in Peru's Tarapacá province were related to mining activities on the Bolivian coast.

In 1873 Peru agreed secretly with Bolivia to a mutual guarantee of their territories and independence. In 1874 Chilean–Bolivian relations were ameliorated by a revised treaty under which Chile relinquished its share of export taxes on minerals shipped from Bolivia, and Bolivia agreed not to raise taxes on Chilean enterprises in Bolivia for 25 years. Amity was broken in 1878 when Bolivia tried to increase the taxes of the Chilean Antofagasta Nitrate Company over the protests of the Chilean government. When Bolivia threatened to confiscate the company's property, Chilean armed forces occupied the port city of Antofagasta on Feb. 14, 1879. Bolivia then declared war on Chile and called upon Peru for help. Chile declared war on both Peru and Bolivia (April 5, 1879).

Chile easily occupied the Bolivian coastal region (Antofagasta province) and then took the offensive against more powerful Peru. Naval victories at Iquique (May 21, 1879) and Angamos (Oct. 8, 1879) enabled Chile to control the sea approaches to Peru. A Chilean army then invaded Peru. An attempt at mediation by the United States failed in October 1880, and Chilean forces occupied the Peruvian capital of Lima the following January. Peruvian resistance continued for three more years, with U.S. encouragement. Finally, on Oct. 20, 1883, Peru and Chile signed the Treaty of Ancón, by which Tarapacá province was ceded to the latter.

Chile was also to occupy the provinces of Tacna and Arica for 10 years, after which a plebiscite was to be held to determine their nationality. But the two countries failed for decades to agree on what terms the plebiscite was to be conducted. This diplomatic dispute over Tacna and Arica was known as the Question of the Pacific. Finally, in 1929, through the mediation of the United States, an accord was reached by which Chile kept Arica; Peru reacquired Tacna and received $6,000,000 indemnity and other concessions.

During the war Peru suffered the loss of thousands of people and much property, and, at the war's end, a seven-month civil war ensued; the nation foundered economically for decades thereafter. In 1884 a truce between Bolivia and Chile gave the latter control of the entire Bolivian coast (Antofagasta province), with its nitrate, copper, and other mineral industries; a treaty in 1904 made this arrangement permanent. In return Chile agreed to build a railroad connecting the Bolivian capital of La Paz with the port of Arica and guaranteed freedom of transit for Bolivian commerce through Chilean ports and territory. But Bolivia continued its attempt to break out of its landlocked situation through the La Plata river system to the Atlantic coast, an effort that led ultimately to the Chaco War (1932–35) between Bolivia and Paraguay. *See also* Chaco War.

Pacific Coast, region, western North America, possessing two unifying geologic and geographic properties—the Pacific Ocean, which constitutes a natural western border, and the coastal mountain ranges that form the eastern border of the region. The most commonly accepted definition of the Pacific Coast is largely a political one: it defines the region as comprising the U.S. states of California, Oregon, Washington, Idaho, Alaska, and western Montana and the Canadian province of British Columbia, formerly a part of the old Oregon Country. Hawaii is frequently included statistically in the "Pacific" states of the United States, even though, as a group of Polynesian volcanic and coral islands lying more than 2,000 miles (3,200 km) off the U.S. Pacific Coast, it has little in common geologically or sociologically with the mainland states.

Before Europeans reached North America, the Pacific Coast was inhabited by native peoples belonging to several culture areas and language families, including the California Indians, the Salishan- and Nadene-speaking Indians of the Pacific Northwest, the Eskimo-Aleut groups of the Bering Sea area, and the Indians of the Columbia Plateau. The Spaniards were the first to explore the Pacific Coast following Vasco Núñez de Balboa's discovery of the Pacific Ocean in 1513. By the time of the American Revolution the Spaniards had already gained familiarity with the California coast, cruised in Alaskan waters, established a base of sorts in Nootka Sound on Vancouver Island, and used the coastal waters for part of the famed Manila–Acapulco galleon trade. The Spanish hold on California was to remain unchallenged for three centuries.

During the first half of the 19th century, the presence of Americans in California and U.S. official desire to acquire West Coast ports were among the significant factors bringing on the war with Mexico in 1846–48. By the terms of the Treaty of Guadalupe Hidalgo in 1848, California was included in the Mexican territory ceded to the United States. The discovery of gold in California on Jan. 24, 1848, led the next year to the famous gold rush of the forty-niners, and in 1850 California was admitted to the Union as the 31st state.

The northern portion of the Pacific Coast, called the Pacific Northwest, had a somewhat different history from that of California. Initial Russian interest in the Bering Strait area led to the formation in 1799 of the Russian-American Company, which established trading posts in parts of Alaska. In 1867 Russia sold Alaska to the United States, and in 1958 Alaska became the 49th state in the Union.

North of California lay the Oregon Country, a region roughly as large as Alaska and possessing strikingly varied physical features, soil, and climate bound together by the mighty Columbia River. The discovery of Oregon's rich fur resources led, at the beginning of the 19th century, to an accelerated British and U.S. competition in the establishment of inland trading operations, resulting in overlapping claims to the Oregon Country. After a period of agreed-upon joint occupation, the 49th parallel was established in 1846 as a permanent boundary line to Puget Sound (but not including Vancouver Island). What had begun as a small American overland migration to Oregon in 1841 (by way of the Oregon Trail) gained momentum, and after the boundary settlement the tide of migration grew steadily; in 1848 Oregon was made a U.S. territory. Oregon was admitted to the Union in 1859, Washington in 1889, and Idaho in 1890.

The British area north of the 49th parallel was dominated by the fur trade until the gold strike of 1858. Vancouver Island united with the booming Colony of British Columbia in 1866, and in 1871 the colony became a province of Canada. First connected to the eastern provinces by railroad in 1885, British Columbia developed its timber and agriculture and its Pacific shipping trade. By the second half of the 20th century it had become one of Canada's wealthiest, most urbanized, and most racially diverse provinces.

Until the admission of Hawaii as a state in 1959, the American Pacific Coast represented the western borderland area of the United States. As such, the people and the press of this region displayed over the years a degree of regional self-consciousness. Isolation from the rest of the country was early corrected by Pacific Coast efforts to bring about a union of Eastern and Western lines of transportation and communication, an enhancement of maritime trade, and adequate Pacific Coast military defenses. Since then the Pacific Coast has been obliged to cope with many problems of a peculiarly Western nature. For example, Oriental and Mexican immigration has been a major Pacific Coast concern, as was the rapid urban population growth as a result of World War II. Another problem peculiar to this region has been the heavy dependence of West Coast business enterprises upon Eastern capital investment.

The people of the Pacific Coast are generally credited with being individualistic, exuberant, and optimistic in spirit, casual in dress, and innovative in business management.

Pacific Coast Ranges, mountain ranges that constitute a major physical feature of western North America. They run parallel to the Pacific coasts of California, Washington, and Oregon for 4,500 miles (7,250 km) in the United States and extend north into Canada for about 1,000 miles (1,600 km) and south into Mexico for about 800 miles (1,300 km).

A brief treatment of the Pacific Coast Ranges follows. For full treatment, *see* MACROPAEDIA: North America.

The Coast Ranges are separated from the higher Sierra Nevada and Cascade mountains to the east by broad depressions known in Oregon and Washington as the Willamette Valley–Puget Sound region and in California as the Central Valley. On the west the coastal plain is very narrow, and deep water occurs within 25 miles (40 km) of the coast. The Coast Ranges can be divided into six distinct sections, each of different geological origin and with its own distinctive topography. The sections include, from north to south, the coastal ranges of British Columbia, the marginal Coast Ranges of Washington and Oregon, the northern Coast Ranges between the Klamath Mountains of Oregon and San Francisco, the central Coast Ranges south of San Francisco, the Transverse Ranges near Los Angeles, and the Peninsular Ranges extending into Baja California. The average elevation is about 3,300 feet (1,000 m) above sea level, but some peaks and ridges rise to more than 6,600 feet (2,000 m) in elevation. The highest peak, San Gorgonio, reaches 11,500 feet (3,506 m) in the eastern Transverse Ranges. The upper slopes of the Olympic Mountains in the extreme northwestern corner of Washington support the largest active glaciers in the United States outside of Alaska.

The climate of the Pacific Coast Ranges is characterized by cool summers and mild winters in the north and drier summers in the south. The rain forests of the northern Coast Ranges, including the giant redwood forests, are among the most lush in the world. Fauna includes big-game animals such as bear, elk, and deer and small fur-bearing animals such as beaver, muskrat, rabbit, and bobcat. Resource-rich, the California region is noted for gold, petroleum, vineyards, and a large supply of fruits, nuts, and vegetables. The region is subject to occasional earthquakes, landslides, and forest fires.

Pacific Grove, resort and residential city, Monterey county, western California, U.S. It lies along Monterey Bay and adjoins the city of Monterey. Founded in 1874 by Methodists as a religious retreat, the city remains a centre for conferences of religious and other groups. Pacific Grove is the northern terminus of the scenic Seventeen Mile Drive from Carmel. The famous Butterfly Trees on Lighthouse Avenue are covered each winter by monarch butterflies that migrate from Canada and Alaska. Point Pinos Lighthouse is on the bay. The city is the site of the Hopkins Marine Station of Stanford University and has a natural-history museum. Inc. 1889. Pop. (1986 est.) 16,746.

Pacific Islands, island geographical region of the Pacific Ocean. It comprises three ethnogeographic regions—Melanesia, Micronesia, and Polynesia—but conventionally excludes the neighbouring island continent of Australia. The Pacific Island region covers almost 500,000 square miles (1,300,000 square km) of land, of which New Zealand and New Guinea island make up approximately 90 percent, and millions of square miles of ocean. It is a mixture of independent states, associated states, integral parts of non-Pacific Island nations, and dependent states.

The great arc of islands located north and east of Australia and south of the equator is called Melanesia (from the Greek words *melas,* "black," and *nēsos,* "island") after the predominantly dark-skinned peoples of New Guinea island, the Bismarck Archipelago, the Solomon Islands, Vanuatu (the New Hebrides), New Caledonia, and Fiji.

North of the equator and east of the Philippines is another island arc that ranges from Palau (Belau), Guam, and the Northern Mariana Islands in the west through the Federated States of Micronesia (the Caroline Islands), Nauru, and the Marshall Islands all the way to Kiribati (the Gilbert Islands). This is Micronesia, so named because of the smaller size of these islands and atolls.

In the eastern Pacific, and largely enclosed within a huge triangle formed by the Hawaiian Islands in the north, New Zealand to the southwest, and Easter Island far to the east, are the "many" (poly) islands of Polynesia. Other components of this widely scattered collection, again generally from west to east, are Tuvalu (the Ellice Islands), Wallis and Futuna Islands, Tokelau, Western Samoa, American Samoa, Tonga, Niue, the Cook Islands, and French Polynesia (including the Society, Tuamotu, and Marquesas islands). In this, the last section of the Pacific Ocean to be inhabited, the islanders share a cultural tradition that relates them closely to many Fijians. Fiji, indeed, is actually a transitional territory between Melanesia and Polynesia. The estimated population of the Pacific Islands (excluding New Zealand and Papua New Guinea, but including the Hawaiian Islands) was 3,364,000 in 1988.

The Pacific Islands are treated in a number of MACROPAEDIA articles. For treatment of the region and individual island groups and states, *see* Pacific Islands. For treatment of Hawaii, *see* United States of America. For treatment of New Zealand, *see* New Zealand.

For current history and for statistics about the administration, society, and economy of the Pacific Islands, *see* BRITANNICA WORLD DATA ANNUAL.

The land. The main Pacific Islands span the equator obliquely from northwest to southeast and can be divided into two major physiographic regions by island type: continental and oceanic. The continental islands, lying southwestward of the Andesite Line of extreme volcanic and earthquake activity, are associated with the ancient continental platforms of Asia and Australia (now partly submerged) and differ in a number of ways from the oceanic islands to the northeast in the deeper Pacific basin. The continental type of island derives from volcanic rock high in silica and alumina (andesite). Continental islands are generally larger (the Marianas, New Guinea, the Bismarcks, the Solomons, Vanuatu, Fiji, New Caledonia, and the North and South islands of New Zealand) and have richer mineral-bearing soils than their oceanic counterparts.

The parent lava material of the oceanic type of island is basalt. Oceanic islands are differentiated as high volcanic-based islands, such as Hawaii, or low coral islands and atolls, such as the Marshalls.

The climate of the Pacific Islands is generally tropical (except in New Zealand, which has a temperate climate), with temperatures, humidity, and rainfall relatively uniform throughout the year; there is slightly less rainfall from December to February north of the equator and from June to September south of the equator. Temperature varies from an annual average at both Nauru and Kiribati of 82° F (28° C) to an average of 66° F (19° C) at Norfolk Island, one of the southernmost Pacific Islands. Precipitation decreases generally southward and eastward from more than 120 inches (3,050 mm) at the island of Yap (Federated States of Micronesia) in the northwest to about 30 inches (750 mm) at Kanton (Canton) Island to the east (along the equator).

Most vegetation in the Pacific Islands is derived from Indonesia and New Guinea, and generic variety declines eastward across the Pacific. Local environmental differences and relative isolation have resulted in the evolution of numerous new endemic species. The introduction of new species from throughout the world has also markedly altered island flora. About 2 percent of the total land area is arable and, outside of New Zealand and Papua New Guinea, is devoted mostly to the cultivation of coconut and cassava. Most of the larger islands also support some livestock. As much as three-fifths of the Pacific Islands' total land area is forested. Most Pacific Islands are poor in mineral resources.

The people. People of European origin account for as much as one-third of the Pacific Islands' population if New Zealand is included in the total and less than one-tenth if it is not; outside of New Zealand the largest concentration of people of European origin is in Hawaii. If the Melanesians in Papua New Guinea are excluded from the Melanesian total, then the Polynesians are the largest indigenous group in the Pacific Islands. Otherwise the Melanesians are the largest indigenous group in the Pacific Islands, with those in Papua New Guinea accounting for two-fifths of the Melanesian total. Polynesians are concentrated in New Zealand (with two-fifths of the Polynesian total), Hawaii, Western Samoa, French Polynesia, and Tonga. Several hundred distinct languages are spoken in the Pacific Islands and are mostly Austronesian in origin. Most islanders have some familiarity with English or French; one or the other of these is the official language of virtually all Pacific Islands. Christianity has largely supplanted traditional animism.

The population of the Pacific Islands (excluding New Zealand with its majority of people of European descent and Papua New Guinea with its majority of Papuans) is concentrated in Hawaii (which has one-third of the region's total population), Fiji (more than one-fifth of the region's total), and the Solomon Islands. Western Samoa, French Polynesia, New Caledonia, Vanuatu, and Guam have populations in excess of 100,000. Most Pacific Islands are densely populated; the population density ranges from about 21 persons per square mile (8 per square km) in New Caledonia to almost 1,000 per square mile in Nauru. The population of the Pacific Islands is concentrated along the coasts. The crude birth rate is relatively high by world standards in all but a few Pacific Islands; the generally high rate of natural increase on most of the smaller islands is partially offset by emigration to the United States, Australia, and New Zealand.

The economy. Except for Hawaii and New Zealand, the Pacific Islands have a generally developing mixed economy in which both public and private sectors participate. The gross national product (GNP) per capita varies widely among the Pacific Islands, from very low in Tuvalu, Kiribati, and the Solomons to within the range of developed countries in New Zealand and French Polynesia. The Hawaiian Islands have the highest GNP per capita.

Agriculture, fishing, and services are generally the largest sectors of most of the islands' economies, and mining is important on a few of the islands. Subsistence farming predominates on all but the largest Pacific Islands (excluding Hawaii and New Zealand), where generally some cash crops besides coconuts are also grown. Sweet potatoes, cassava, taro, breadfruit, and bananas are the main subsistence crops of most of the islands. Almost all the islands grow coconuts, which, with copra, are a major export. Sugarcane, pineapple, citrus fruits, mango, papaya, coffee, and cacao are cash crops in Hawaii, Fiji, French Polynesia, New Caledonia, Papua New Guinea, Western Samoa, and the Cook Islands.

Pastureland is available only on the larger islands, including Hawaii, New Caledonia, Fiji, Vanuatu, and the Solomons; all raise pigs, cattle, and chickens commercially and are self-sufficient in milk and meat. New Zealand is noted for sheep and cattle rearing. Villagers on the smaller Pacific Islands and New Guinea rear pigs and some goats on subsistence farms.

There are commercially exploitable forests in Fiji, New Caledonia, New Zealand, Papua New Guinea, the Solomons, Western Samoa, and Vanuatu that produce timber, sawn wood, and wood products for domestic consumption and export. The other islands generally must import quality lumber.

Subsistence fishing is important on all the islands (except Hawaii and New Zealand) and forms a major source of protein in local diets. The Solomons, Kiribati, and Fiji account for approximately four-fifths of the regional catch (excluding that from Hawaii and New Zealand), much of it by commercial fishing operations. Deep-sea fishing, mostly for tuna, is conducted throughout the Pacific.

Mineral production is limited to a few of the high continental islands. New Caledonia produces nickel, ferronickel, chromite, cobalt, stone, sand, and gravel. Fiji produces gold and telluride ores, silver, and lime. Nauru mines phosphates. The Solomon Islands produce gold, silver, and lime from seashells. New Guinea produces copper and gold, and New Zealand extracts coal and natural gas.

The manufacturing sector, except in Hawaii and New Zealand, is mostly undeveloped and limited to processing fish and agricultural products and producing handicrafts. The only islands outside Hawaii and New Zealand with significant manufacturing industries, most of which produce import substitution goods, are Guam, Fiji, New Caledonia, French Polynesia, Papua New Guinea, and the Solomons. Regional electricity is generated primarily from imported fuels.

Tourism is very important to the Pacific Ocean islands. It centres on fine beaches, good fishing and boating, and local customs and crafts and has benefited from the development of overseas jet air transport. French Polynesia, Guam, Hawaii, Fiji, and New Zealand have the most developed tourist industry, but the other islands are rapidly developing facilities. Most dependent Pacific Islands states receive budgetary and development aid, mainly from the continental governing nations, while the smaller independent island states receive aid particularly from Australia and New Zealand, as well as from Japan, the United Kingdom, and the United States.

Air transport and interisland shipping are the principal means of transport. American Samoa, the Cook Islands, Fiji, French Polynesia, Guam, Hawaii, the Marshalls, New Caledonia, New Zealand, Papua New Guinea, the Solomons, and Western Samoa have international airports. Extensive road networks are limited to the large high islands.

Most Pacific Islands' annual imports (excluding New Zealand and Papua New Guinea) far exceed exports. Remittances from expatriates and tourism only partially offset the trade deficits. Copra, minerals, coffee, tea, cocoa, spices, sugar, and frozen or tinned fish are among the leading exports, mainly to Japan, France, the United States, and Australia. Machinery and transport equipment, mineral fuels, food, and manufactured goods are among the chief imports and come mainly from Australia, France, Japan, and the United States. Only a very small percentage of the Pacific Islands' external trade is intraregional.

Government and social conditions. The independent states of the Pacific Islands include six constitutional monarchies (Fiji, New Zealand, Papua New Guinea, Tonga, Tuvalu, and Western Samoa), three republics (Kiribati, Nauru, and Vanuatu), and one parliamentary state (the Solomon Islands). Dependent islands and island groups include the unincorporated U.S. territories (American Samoa, Guam, Johnston, Midway, and Wake islands), the self-governing states associated with New Zealand (the Cook Islands and Niue and the New Zealand territory of Tokelau), the islands governed by Australia (Norfolk, Lord Howe, and the Torres Strait islands), the French overseas territories (French Polynesia, New Caledonia, and Wallis and Futuna), and the U.K. colony of Pitcairn Island. Integral parts of non-Pacific Island nations include the U.S. state of Hawaii and Easter Island (a province of Chile). The former United Nations Trust Territory of the Pacific Islands was a U.S.-administered mandated trust territory comprising Palau (Belau), the Federated States of Micronesia, the Marshall Islands, and the Northern Mariana Islands. In 1986 the Trust Territory was dissolved for all but Palau, whose political status remains contested. The other island groups achieved full self-government under various political arrangements with the United States, except for the Northern Mariana Islands, which remained a U.S. commonwealth.

Except for Easter Island, which is governed by a governor from Chile, all the inhabited island states and territories have varying degrees of autonomy and self-government with representatives elected by universal or limited adult suffrage. Traditional chiefs retain considerable influence where indigenous peoples remain in the majority. Judicial systems variously follow American, British, and French models, with some indigenous input on certain islands. Easter Island follows the legal system of Chile.

Only a few islands have social-security and pension systems, mainly because indigenous island culture includes community provisions for caring for the elderly and the disabled. Health conditions vary throughout the region. The best conditions and highest ratio of medical personnel to population are found in American Samoa, the Cook Islands, Fiji, French Polynesia, Guam, Hawaii, Nauru, New Caledonia, New Zealand, Niue, Tokelau, Wallis and Futuna, and Western Samoa. The principal diseases on those islands are hypertension, diabetes, cancer, heart disease, and respiratory diseases. On other islands, poor sanitation and poor hygiene result in a prevalence of malaria, gastrointestinal illness, diarrhea, filariasis, parasitic infections, tuberculosis, influenza, and skin diseases; infant mortality rates are high and life spans are relatively short. Isolated atolls frequently lack freshwater sources other than rain and generally have the lowest levels of health care.

Primary and secondary education is available in virtually all island groups. Schools are usually operated by both government and church or missionary organizations. Secondary, technical, and teacher-training schools are usually found on the main islands of each state. Universities are located in Fiji, Guam, Hawaii, New Zealand, Papua New Guinea, the Solomon Islands, and Western Samoa. Fiji's University of the South Pacific maintains branch campuses on other islands.

Cultural life. Polynesian and Melanesian cultures tend to be best-represented on islands that retain majority indigenous populations. Micronesian culture has survived best in Yap, Truk, and Palau. In other islands, such as Hawaii, French Polynesia, and New Caledonia, indigenous culture has blended with European, Japanese, and American cultures, and integrated societies have evolved.

Missionary activity during the 19th century in most islands resulted in the destruction of statues, carvings, religious sites, and artifacts and the abandonment of dances, songs, and ceremonies of the pre-European cultures. There are notable pre-European archaeological remains in Easter Island, Fiji, throughout French Polynesia, the Solomon Islands, Palau, and Pohnpei (Federated States of Micronesia), all of which were indigenous political and religious centres.

Independence and tourism have led to some resurgence of indigenous costumes, dances, rituals, and handicrafts, all of which are attractions for visitors, though in many places their original religious meanings have been lost. The extension of air service and the growing impact of technologically advanced Western culture, however, increasingly infringe on traditional island life-styles, even on the remotest islands and atolls, as well as in the interior of New Guinea. Moreover, the Pacific islanders, traditionally a mobile people, have increased their movement both within and out of the region as economic opportunities have shifted.

History. The peopling of the Pacific Islands is clouded with uncertainty. Western Melanesia was probably settled by Austronesians from the Philippines and Indonesia between 3000 and 2000 BC. Eastward migrations by these peoples extended to western Micronesia, central and eastern Melanesia, and western Polynesia (2000–1000 BC) and was followed by the settlement of uninhabited adjacent islands. During the 1st millennium AD the greatest migrations to Polynesia took place. Polynesian and some Micronesian cultures developed highly stratified social structures with hereditary chieftainships. Melanesian cultures were less concerned with hereditary social rank than with gaining individual prestige.

The first European exploration of the Pacific Islands was led by Ferdinand Magellan between 1520 and 1521. Spanish, Dutch, and English explorers followed during the 16th, 17th, and 18th centuries, one of the more renowned being Captain James Cook in the mid-18th century. European missionaries and trading societies were established on many of the islands in the 18th and 19th centuries. By the late 19th century the major European powers had established colonial spheres of influence and trade throughout the Pacific. The Germans and Spanish dominated Micronesia. The English became established in parts of Melanesia and Polynesia (including New Zealand), while the French annexed Tahiti and nearby islands, creating French Polynesia. In 1898 the United States annexed the Hawaiian Islands and in 1899 acquired Guam after defeating Spain in the Spanish-American War. Spain's loss to the United States prompted the Spanish to sell what were to become the Trust Territory Islands—*i.e.*, the Marshalls, the Carolines, and Palau—to Germany.

During World War I the colonial structure of the Pacific Islands was altered as Japan occupied the German possessions, while New Zealand took Samoa. Following the end of the war these islands were mandated to Japan and New Zealand by the League of Nations.

Between the world wars, Japan fortified its Pacific acquisitions and used them as launching bases for invading much of the rest of Micronesia and Melanesia during World War II. Many of the islands, such as Guadalcanal in the Solomons, were occupied by U.S. forces after bitter fighting in 1943–45. In 1947 the United Nations granted the former Japanese possessions of Micronesia to the United States as a strategic trust territory, and French Polynesia, New Caledonia, and Wallis and Futuna became overseas territories of France. The United States admitted Hawaii as its 50th state in 1959.

Many of the Pacific Islands achieved independence or a degree of self-government after World War II. Western Samoa (1962), Nauru (1968), Fiji and Tonga (1970), Solomon Islands and Tuvalu (1978), Kiribati (1979), and Vanuatu (1980) have all achieved independence. The individual states of the U.S. Trust Territories achieved self-government in the mid-1980s. There has also been a movement for independence in French Polynesia.

Pacific Islands, Trust Territory of the, former United Nations strategic-area trusteeship that was administered by the United States from 1947 to 1986. The territory consisted of more than 2,000 islands scattered over about 3,000,000 square miles (7,770,000 square km) of the tropical western Pacific Ocean, north of the equator between latitudes 1° and 22° N and longitudes 130° and 172° E. Most of the islands are quite small, the total land area amounting only to about 700 square miles (1,800 square km). The trust territory covered the region known as Micronesia ("tiny islands") and was composed of three major island groups—the Marianas, the Carolines, and the Marshalls. Guam, the southernmost of the Marianas, was excluded from the trust territory. The islands of Kapingamarangi and Nukuoro, which are culturally Polynesian rather than Micronesian, were included. The trust territory's seat of government was Saipan in the Northern Marianas.

Portuguese and Spaniards first began to explore the Micronesian region in the 16th century. Later explorers, traders, and whalers included the British, Germans, Russians, Japanese, and Americans. Spain at first expanded its control throughout Micronesia with little opposition from the other European powers. In the late 19th century, however, Spain's domination of the region was challenged by Germany and the United Kingdom. To consolidate its hold in the region, Spain proclaimed sovereignty over the Marshall and Caroline groups in 1874. Germany moved into the Marshall Islands uncontested, and the two countries shared power in Micronesia until the Spanish-American War (1898). Spain's defeat in that conflict caused it to cede Guam to the United States and sell its remaining possessions in Micronesia to Germany, which then controlled virtually the entire region.

At the outbreak of World War I Japan immediately moved militarily to take over Germany's possessions in Micronesia. After Germany was defeated, Japan sought to incorporate Micronesia into its empire, but the League of Nations made the islands a mandate to be administered by Japan. Nevertheless, the Tokyo government developed the territory as though it exercised full sovereignty. The region became a strategic battleground during World War II, the United States finally securing the islands in the course of its Pacific campaign. After Japan's defeat the United States remained in control of the islands, and in 1947 they became a United Nations trusteeship under U.S. administration.

The legal basis for government within the area was laid down in the Code of the Trust Territory, enacted in 1952. The code defined citizenship, provided a formal law code, and created six administrative districts. The code recognized customary law and allowed for appointed, rather than elected, officials. The U.S. government was responsible for the territory's civil administration. During the 1950s, criticisms of the administration of the territory from the UN Trusteeship Council and from within the United States brought increased attention to a movement toward autonomy. In 1965 the territory elected the Congress of Micronesia, endowing it with legislative powers. In a 1975 plebiscite the Northern Marianas group voted to become a commonwealth of the United States and, from 1976, was administered separately from the rest of the territory. The remaining island groups were reorganized again into six districts, which in 1978 voted on a proposed constitution for the Federated States of Micronesia. Four of these districts (Kosrae, Pohnpei, Truk, and Yap; all in the Carolines) approved the constitution and were established as the new federation in 1979. The two dissenting districts, the Marshall Islands and Palau (or Belau, in the Carolines), formed republics in 1979 and 1981, respectively. The Federation and two republics approved and voted in popular referenda (1982–83) for compacts of free association with the United States. Free association, as defined in the compacts, gave the republics full internal self-government and substantial authority in foreign affairs, but vested the United States with full responsibility and authority for their defense for a number of years.

In 1986 the U.S. government declared the Trust Territory agreements no longer in effect. (The approval of the UN Security Council was technically necessary for the cessation of the trusteeship, but politically motivated efforts by the Soviet Union to obstruct the decolonization process necessitated a unilateral U.S. termination of the trusteeship, which was approved by a majority vote of the Trusteeship Council of the UN.) The Federated States of Micronesia and the Republic of the Marshall Islands thus became sovereign, self-governing states with the United States responsible for their security and defense, and the Northern Mariana Islands formally became a commonwealth of the United States. The Republic of Palau's entry into a compact of free association was delayed pending formal Palauan approval of the compact.

Pacific League, one of the two leagues of professional baseball teams in Japan (the other being the Central League). The Pacific League was founded in 1950. It has six teams, some of whose names and hometown designations have changed over the years. The league consists of the Orix Braves, Kintetsu Buffaloes, Lotte Orions, Daiei Hawks, Nippon Ham Fighters, and Seibu Lions. The regular playing season culminates in the Japan Series, a seven-game series between the respective champion teams of the Pacific and Central leagues.

Pacific Ocean, body of salt water extending from the Antarctic region in the south to the Arctic in the north and lying between the continents of Asia and Australia on the west and North and South America on the east.

A brief treatment of the Pacific Ocean follows. For full treatment, *see* MACROPAEDIA: Pacific Ocean.

The Pacific Ocean occupies about one-third of the surface of the Earth and is by far the largest of the world's oceans. Its area, excluding adjacent seas, encompasses approximately 63,800,000 square miles (165,250,000 square km). It has twice the area and more than twice the water volume of the Atlantic—the next-largest ocean. Its area exceeds that of the whole land surface of the globe, Antarctica included. The mean depth of the Pacific (excluding adjacent seas) is 14,050 feet (4,280 m). The western Pacific is noted for its many peripheral seas. From north to south they include the Bering Sea, Sea of Okhotsk, the Sea of Japan, the Yellow Sea, the East China Sea, and the South China Sea. The great rivers of eastern Asia—including the Amur, the Huang Ho, the Yangtze, the Hsi, and the Mekong—enter the Pacific indirectly by way of peripheral seas.

To the east of the meridian of 150° W, the relief of the Pacific Ocean floor is considerably less pronounced than it is to the west. Submerged oceanic ridges found at depths of less than 2,000 feet (600 m) rise at points to form several archipelagos in the western Pacific. These ridges include the Aleutian ridge in the northwestern Pacific; the series of ridges extending southward through the

Kurils, Bonin, the Marianas, Yap, and Palau (Belau); those extending eastward from Palau, including the Bismarck, the Solomons, and Santa Cruz ridges; and finally the ridges extending southward from the Samoan islands, those of Tonga, Kermadec, Chatham, and Macquarie.

Water temperatures in the northern Pacific tend to be higher than those in the southern Pacific because the ratio of land to sea areas is larger in the north than in the south and because the ice-clad continent of Antarctica influences water temperature. The Pacific waters within the belt of calms and variable winds near the Equator have lower salinities than those in the trade-wind belts.

The most important influence on the vertical circulation of the Pacific is the cold water generated around the Antarctic continent. This dense circumpolar water sinks and then spreads northward to form the bottom layer of the greater part of the Pacific. Cold, deep water flows northward in the western Pacific in a relatively well-defined current from the vicinity of Antarctica to Japan. Branches from this deep mainstream convey cold water eastward and then poleward in both hemispheres.

Deepwater circulation is influenced by the descent of surface water at zones of convergence of neighbouring water flows. In the zone known as the Pacific Tropical Convergence, water sinks to a depth of about 300 feet (91 m) before it spreads laterally. The Pacific Subtropical convergences are located between the parallels of 35° and 40° N and S. Water that sinks at the convergences spreads laterally at increasing depths as the distance from the Equator increases. The most important convergence in the Pacific is the Antarctic Convergence, which lies about 55° to 65° south in the southern Pacific.

Pacific Railway Acts (1862, 1864), two measures that provided federal subsidies in land and loans for the construction of a transcontinental railroad across the United States.

The first Pacific Railway Act (July 1, 1862) authorized the building of the railroad and granted rights of way to the Union Pacific to build westward from Omaha, Neb., and to the Central Pacific to build eastward from Sacramento, Calif. The act also granted 10 alternate sections of public domain land per mile on both sides of the railway, and it provided loan bonds for each mile of track laid. The loans were repayable in 30 years, and the dollars per mile escalated in accord with the difficulty of the terrain.

Two years later, the railroads were still hampered in their quest for sufficient capital for the vast construction project. Congress obliged with the second Pacific Railway Act (July 2, 1864), which doubled the size of the land grants and allowed the railroads to sell their own bonds. After the transcontinental railroad was completed in 1869, congressional investigations revealed that some railroad entrepreneurs had illegally profiteered from the two Pacific Railway Acts.

Pacific Scandal (1872–73), charges of corruption against Canadian prime minister John Macdonald in awarding the contract for a transcontinental railroad; the incident resulted in the downfall of Macdonald's Conservative administration.

One of the conditions under which British Columbia entered the Dominion of Canada (1871) was that a railway to link that province with the east be constructed within 10 years. In 1872 a contract for construction of such a railway was awarded to a syndicate headed by Sir Hugh Allan, a Canadian shipowner and financier. Allan was a heavy contributor to the Conservative campaign in the 1872 election, and Macdonald's Liberal opponents accused him of having awarded the contract in return for this financial support (April 1873). The charges led to the resignation of the Macdonald government on November 5 and to the cancellation of the contract. In the election of January 1874, the Conservatives were badly beaten.

Pacific Ten Conference, byname PAC TEN, West Coast American collegiate athletic association that grew out of the Athletic Association of Western Universities (AAWU), itself a descendant of the Pacific Coast Intercollegiate Athletic Conference (PCIAC), which began in 1915. Members are the University of California at Berkeley, the University of California at Los Angeles (UCLA), the University of Southern California (USC), the University of Oregon, Oregon State University, Stanford University, the University of Washington, Washington State University, the University of Arizona, and Arizona State University.

The original PCIAC foundered during a series of withdrawals from the conference in 1959 and 1960, resulting from dissatisfaction with penalties assessed several members for conference rule violations. Later Washington, California, UCLA, and USC formed the AAWU, which evolved into the present-day conference.

pacifism, the opposition to war and violence as a means of settling disputes. Pacifism may entail the belief that the waging of war by a state and the participation in war by an individual are absolutely wrong, under any circumstances.

In the ancient world, war was taken for granted as a necessary evil by some societies, while in others it was not even regarded as an evil. Individual voices in various lands decried the evils of war, but the first genuinely pacifist movement known came from Buddhism, whose founder demanded from his followers absolute abstention from any act of violence against their fellow creatures. In India the great Buddhist-influenced king Aśoka in the 3rd century BC definitely renounced war, but he was thinking primarily of wars of conquest. In succeeding ages Buddhism does not seem to have been very successful in restraining the rulers of countries in which it was adopted from making war. This may be because the Buddhist rule of life, as generally understood, served as a counsel of perfection which comparatively few could be expected to follow in its entirety.

In classical antiquity, pacifism remained largely an ideal in the minds of a few intellectuals. The Greek conceptions of peace—including Stoicism—were centred on the peaceful conduct of the individual rather than on the conduct of whole peoples or kingdoms. In Rome the achievement of *pax,* or peace, was defined as a covenant between states or kingdoms that creates a "just" situation and that rests upon bilateral recognition. This judicial approach was applicable only to the "civilized world," however. Thus the Pax Romana of the 1st and 2nd centuries AD was not really universal because it was always regarded as a peace for the civilized world alone and excluded the barbarians. And since the barbarian threat never ended, neither did the wars Rome waged to protect its frontiers against this threat.

Christianity, with its evangelical message, offered considerations in support of individual nonviolence as well as of collective peacefulness. Jesus' spoken words as recorded in the New Testament could be interpreted as a kind of pacifism and in fact were so interpreted by many of Jesus' early radical followers. As a rule, however, the "peace" that Jesus spoke of was only open to minorities or to sects that practiced a rigorous ethics, while the Christian Church itself had to compromise with worldly necessities. "The question of soldiers"—the inconsistency between the pursuit of peace and fighting in wars—was disturbing to Christians from the time of Jesus. However, in the early 3rd century, certain passages in the Gospels were interpreted to indicate that armies were not only acceptable but necessary in order to fight against demons. In the early 5th century, St. Augustine wrote *De Civitate Dei* (*The City of God*), which presented a distinction between worldly and supraworldy peace. He felt that worldly peace was acceptable only if it was in accord with Christian law, and it was the duty of the worldly state to serve the church and to defend itself against those who wished to undermine the church's authority. These ideas prevailed throughout the Middle Ages and were often tied with the myth of an eschatological emperor who would suppress nonbelievers and lead the world to peaceful times. Like the Roman *pax,* Christian peace needed to be perpetually defended. There was a never-ending threat posed by non-Christians, who were viewed as demonic.

Since the Renaissance, concepts of pacifism have been developed with varying degrees of political influence. A great deal of pacifist thought in the 17th and 18th centuries was based on the idea that a transfer of political power from the sovereigns to the public was a crucial step toward world peace, since wars were thought of as arising from the dynastic ambitions and power politics of kings and princes. Thus was propagated the illusion that monarchies tended toward wars because the sovereigns regarded their states as their personal property and that compared to this, a republic would be peaceful. The offshoot of these theories was the creation of pacifist organizations in 19th-century Europe in which such ideas as general disarmament and the instigation of special courts to hear international conflicts were entertained. The theme of pacifism thereby caught the public interest and inspired an extensive literature. Some of these ideas were later realized in the Court of Arbitration in The Hague, the League of Nations, the United Nations, and temporary disarmament conferences, but their overall effect was limited. In the 19th century, for instance, the real maintenance of a relative peace resulted from the statesmanlike political establishment of a balance of power among the five great European states. The succeeding century, with its two world wars, its nuclear stalemate, and its unending succession of conflicts among developed and developing nations, has been notable chiefly for the utter irrelevance of pacifist principles and practices.

Pacifism is not a part of Communist ideology. Lenin rejected it outright, and in the work of Karl Marx, "revolution" and "war" are synonymous. Their theories and those of Friedrich Engels advocate the necessity of "just" war against the capitalistic classes, with the goals of a classless society and universal peace following the world-revolutionary victory of the international proletariat.

There are two general approaches or varieties of pacifist behaviour and aspirations. The one rests on the advocacy of pacifism and the complete renunciation of war as a policy to be adopted by a nation. The other stems from the conviction of an individual that his personal conscience forbids him to participate in any act of war and perhaps in any act of violence whatsoever.

The arguments for pacifism as a possible national policy run on familiar lines. The obvious and admitted evils of war are stressed—the human suffering and loss of life, the economic damage, and perhaps above all, the moral and spiritual degradation war brings. Since World War II increasing emphasis has also been laid on the terrible powers of destruction latent in nuclear weapons. Pacifist advocates often assume that the abandonment of war as an instrument of national policy will not be possible until the world community has become so organized that it can enforce justice among its members. The nonpacifist would, in general, accept what the pacifist says about the evils of war and the need for international organization. But he would claim that the pacifist has not faced squarely the possible evils that would result from the alternative policy of a nation's nonresistance in the face of external aggression: the possible mass deportations and even mass exterminations and the subjection of conquered peoples to totalitarian regimes that would suppress just those values which the pacifist stands for.

Pacifists may claim that these evils can be met by nonviolence, *i.e.,* the general attitude of friendliness and benevolence which, it is claimed, may disarm even the most savage aggressors. Nonviolence could also mean nonviolent resistance, which relies on the difficulties and inconvenience that can be caused to the conqueror or oppressor by a general refusal of the public to cooperate. But 20th-century history shows a striking number of occasions on which nonviolent tactics such as these entirely failed to disarm the enemy or even to preserve the communities practicing them. Pacifist Christian sects have often been the objects of the most ruthless persecution in a time period stretching from the European Middle Ages to the Nazi regime of Adolf Hitler. The story of the persecution of the Jews over many centuries is only too familiar, though for generations they practiced nonviolence toward their persecutors. It seems that pacifist or nonviolent methods can only be effective against a power that has no very strong motives for going to extremes of suppression or one that is governed at least in part by the same moral scruples that actuate the pacifists themselves. It seems clear to most nonpacifists that complete nonresistance to external aggression would sooner or later lead to foreign domination of one's country, perhaps by the most fanatical and ruthless powers.

Personal pacifism is a relatively common phenomenon compared to national pacifism. Members of several small Christian sects who try to literally follow the precepts of Jesus Christ have refused to participate in military service in many nations and have been willing to suffer the criminal or civil penalties that followed. Not all of these and other conscientious objectors are pacifists, but the great majority of conscientious objectors base their refusal to serve on their pacifist convictions. There are, moreover, wide differences of opinion among pacifists themselves about their attitude toward a community at war, ranging from the very small minority who would refuse to do anything that could help the national effort to those prepared to offer any kind of service short of actual fighting.

pacinian corpuscle, oval, layered structure serving as the terminal capsule of certain sensory nerve endings. They are particularly found in the deeper skin and subcutaneous tissues of the hands and feet. They are thought to be sensitive to pressure and to vibrations up to 400 cycles per second. Pacinian corpuscles are named for the 19th-century Italian anatomist Filippo Pacini, who first described them. *See also* Meissner corpuscle; Ruffini ending.

Pack, Otto von (b. 1480?—d. Feb. 8, 1537, Brussels), German politician whose intrigues and forgeries almost caused a general war between Germany's Catholic and Protestant princes in 1528.

Pack, a Saxon nobleman, studied law at the University of Leipzig, after which he entered the service of George, duke of Saxony. By 1519 most important governmental matters in Saxony were entrusted to him, and he represented his ruler at the Reichstag (imperial Diet) from 1522 to 1526. His perpetual lack of funds, however, soon led him into a number of fraudulent schemes. The most serious of these became known as the Pack Affairs (Packsche Händel). After a meeting between the Holy Roman emperor Ferdinand I and a number of Catholic princes at Breslau (1527), Pack reported to Philip the Magnanimous, the Protestant landgrave of Hesse, that an offensive alliance had been formed against Germany's Protestant rulers. Philip immediately formed a defensive league with the elector John the Steadfast of Saxony (1528) and attacked the cities of Würzburg and Bamberg. Simultaneously, he published a copy of the alleged Catholic treaty, provided by Pack. The document was immediately exposed as a forgery, but Philip, unconvinced, protected the culprit until 1529. After being expelled from Hesse, Pack became a fugitive until captured and beheaded in Brussels almost seven years later.

pack ice, floating mass of ice formed from seawater in the Earth's polar regions. Pack ice expands during winter to cover about 5 percent of the northern oceans and 8 percent of the southern oceans. When melting occurs in spring and summer, the margins of the pack ice retreat.

A brief treatment of pack ice follows. For full treatment, *see* MACROPAEDIA: Ice and Ice Formations.

As seawater freezes, minute pools of salty water called brine pockets are entrapped. Once an ice field has formed, brine pockets migrate downward through the ice block in response to gravity and thermal gradients. After a few weeks to a few months, the surface of the ice becomes lower in salt content than the deeper layers. In the summer, when the ice temperature rises, there is a rapid increase in the migration of salt out of the ice. The sea-ice surface becomes potable and, in fact, is used by Eskimos as a source of fresh water.

Also characteristic of frozen salt water is that, even after freezing, the water below the ice will continue to turn over, or circulate. As the surface water near the ice becomes colder, it becomes heavier and sinks, resulting in a continuous turnover or vertical circulation of the water beneath the ice.

In the Northern Hemisphere during September and October, the air temperature lowers sufficiently to form a thin sheet of ice on some polar seas. The freezing temperature for average northern ocean water of about 3.5 percent salt composition by weight (usually designated 35 parts per thousand) is −1.8° C (28.7° F). Initially the ice film is entirely fresh, but as more ice crystals form, brine pockets become entrapped between lamellae (very fine layers) of tiny ice plates. Owing to slight breezes and water motion, the thin sheets of ice jostle about and, after a few hours, form a field of ice paddies; these disks of ice are known as pancake ice. If the temperature remains below freezing, the pancake ice coalesces as more ice forms, and within a few days the ice cover can be 8–10 cm (3–4 inches) thick with a slightly corrugated surface. As seawater continues to freeze at the bottom edges and sides of ice floes and fields, pressures associated with the stresses and strains caused by water and wind movement result in a hummocking and ridge development in some places and open water in others. With alternating freezing, partial melting, snow, and wind and swell, the ice field develops over a matter of a few weeks to a month into ocean cover 15–60 cm (6 inches–2 feet) deep. At this point the ice field is still navigable by most large vessels; however, if a vessel finds itself in the far north two weeks after the commencement of active surface freezing (in late October), it is in peril of being locked in for the remainder of the winter.

The pack ice of the Northern Hemisphere covers an average area of about 10,600,000 square km (4,100,000 square miles), filling the Arctic Ocean Basin and adjacent North Atlantic Ocean. The polar ice field consists of about 4,700,000 square km (1,800,000 square miles) of 3–6-metre- (10–20-foot-) thick polar ice that never melts. The motion of the polar ice follows a giant clockwise eddy with a centre at approximately 85° N, 170° W. Together with Arctic Basin seasonal sea ice, this Arctic pack exits into the northern Atlantic through two ice streams. The major exit of drifting pack ice from the Arctic Basin is along the eastern side of Greenland. The second icy arm of the north consists of a discharge through the Canadian-Arctic Archipelago and along the eastern North American shore.

Approximately twice as much pack ice forms in the oceans surrounding Antarctica as is found in the Arctic. The maximum area of Antarctic pack ice is about 20,000,000 square km (7,700,000 square miles). The Antarctic pack ice forms a fairly constant band of drifting sea ice around the continent in a giant clockwise eddy, with the farthest northern extent occurring at the end of the austral (southern) winter in October. The greatest extension of pack ice in the South Pacific sector is found in about latitude 62° S, and in the South Atlantic pack ice extends to 52° S.

packaging, the technology and art of preparing a commodity for convenient transport, storage, and sale.

Though the origins of packaging can be traced to the leather, glass, and clay containers of the earliest Western commercial ventures, its economic significance has increased dramatically since the start of the Industrial Revolution. Packages on the contemporary market are designed to protect goods from the hazards of handling and environmental conditions; to provide a manageable unit of the packaged product for the producer, distributor, and consumer; and to identify the product in a way that appeals to the potential purchaser. Packages must also be easy to manufacture and to fill, and they must be inexpensive relative to the price of the final, packaged product.

Materials used in the transport of substantial loads of goods include corrugated or solid cardboard for lighter materials, metal for liquid goods, and wood for heavy or bulky loads. Timber cases and crates are widely used for weights of more than 220 pounds (100 kg), while below this weight fibreboard, either solid or corrugated, is the favoured material. Wooden pallets have replaced crates in some instances. Plastic has also been used extensively as an impact buffer and, because of its high durability and insulation qualities, as a shipping material for liquids and perishable foodstuffs. The most widely used material in the packaging of goods for consumers is the cardboard carton, since it is light in weight and inexpensive and can be easily manufactured, printed, and stored. Cartons are made in a great variety of shapes and sizes. Nearly half of these containers serve as containers of food. Cans of tin-plated steel, both those that are permanently sealed and those with tops that can be lifted and replaced, are also used predominantly for food storage. Tin-plate containers are also used to hold paints and varnishes and tobacco, medical, and cosmetic products. While such tin plate is durable and highly resistant to chemical and mechanical damage, aluminum is lighter and more malleable but interacts more readily with chemical agents. Aluminum provides bottle caps and easy-open tops for cans. Most aerosol (pressurized) containers, which deliver liquid products in the form of a spray, are based on metal cans.

Glass containers are easily mass-produced using high-temperature furnaces and molding machines, and they can also be reused. Containers made of glass are durable, chemical resistant, and can be kept highly sanitary and are therefore ideal for the storage of solid and liquid foods, drugs, and cosmetic products. Recent developments in the plastics industry have also provided polyvinyl chloride, polypropylene, polyethylene, and polystyrene as packaging materials. Plastics are often produced in the form of trays, bags, bottles, boxes, and transparent film, through thermoforming and injection- or blow-molding processes. Their light weight, flexibility, and insulating qualities make them especially useful for pressurized packages and containers of foods to be boiled or frozen. Collapsible plastic tubes are widely used to hold cosmetics, toiletry, and pharmaceutical substances.

The particular nature of the packaged products requires care in the selection and design of container materials. The movement of fragile materials requires a thorough assessment of the degree of fragility, the potential hazards of transport, and the cost and efficiency of practical containers, in order to maximize protection and minimize shipping expenses. A variety of containers have also been designed to handle products that are sensitive to light, temperature, air, moisture, and contact with chemicals.

Other packaging considerations include the nature of the intended market, the role of packaging in product use, and the expense of package production. When the product handled is food, packaging must be designed to retard spoilage and prevent physical damage and exposure to contaminants. Package closures must provide adequate sealing, and they must be sanitary and mechanically safe. Labeling for packages must be easy to print and to affix to the container material.

The most efficient and economical method of filling liquid containers is often through the application of vacuum suction around the container opening, which draws the liquid from a feeding tube into the container until it is full and the vacuum seal breaks. Liquids can also be packaged in amounts premeasured by volume or determined by gravity-powered flow into the container for a measured length of time. Powders, granular products, and capsules or tablets are also commonly filled in units of volume or weight, though tablets are sometimes counted before packaging. Sophisticated mechanized processes have been developed that can open, fill, and seal cardboard containers with maximum efficiency. The same technique is applicable to the filling of bags, whether they are made of plastic, paper, or textiles, although many products are still packaged in bags by hand.

Packard, David (b. Sept. 7, 1912, Pueblo, Colo., U.S.), American electrical engineer and entrepreneur, a cofounder of the Hewlett-Packard Company, a manufacturer of electronic measurement equipment.

After receiving his B.A. from Stanford University, Stanford, Calif., in 1934, Packard worked for the General Electric Company in Schenectady, N.Y. In 1938 he returned to Stanford, where he earned the degree of electrical engineer, and in 1939 he and William R. Hewlett established their firm in Packard's garage with capital of $538. The company, in which Packard proved to be an expert administrator and Hewlett provided many technical innovations, grew into the world's largest producer of electronic testing and measurement devices. Packard served as Hewlett-Packard's president from 1947 to 1964, chief executive officer from 1964 to 1968, and chairman of the board from 1964 to 1968 and from 1972.

In 1968 President Richard M. Nixon appointed Packard deputy to Secretary of Defense Melvin Laird. Packard served until 1971, when he resigned and returned to Hewlett-Packard the next year as chairman of the board. In the 1970s and '80s Packard was a prominent adviser to the White House on defense procurement and management. Packard received numerous awards, including the Presidential Medal of Freedom and the Encyclopædia Britannica Achievement in Life Award.

packing, in mathematics, a type of problem in combinatorial geometry that involves placement of figures of a given size or shape within another given figure—with greatest economy or subject to some other restriction. The problem of placement of a given number of spheres within a given volume of space is an example of a packing problem.

Pacorus, also called PACORUS I (d. 38 BC), Parthian prince, son of King Orodes II (reigned *c.* 57–37/36 BC); he apparently never ascended the throne.

In the summer of 51 BC Pacorus was sent to invade Syria with an army commanded by Osaces, an older warrior. Osaces, however, was killed in battle, and early the next year Orodes, learning that one of his satraps was conspiring to make Pacorus king, recalled his son. In 45 Pacorus intervened in Roman politics by leading a Parthian force to help one of Pompey's generals who was besieged in Apamea (a city in northwestern Mesopotamia) by Augustus' forces.

Orodes later decided to support the refugee republican general Quintus Labienus; thus Pacorus led an army into Syria and Palestine while Labienus occupied Cilicia and overran southern Anatolia. In 39 Mark Antony sent Publius Ventidius against Labienus, who was defeated and killed. Pacorus returned to Syria, was lured into battle by Ventidius, and was defeated and killed. His head was displayed in the cities of Syria to convince them of the futility of hoping for Parthian support against the Romans.

Pacorus II (fl. 1st and 2nd centuries AD), king of Parthia (reigned AD 78–*c.* 115/116). Little is known of his reign, which seems to have been filled with rebellions and the rule of counterkings (Artabanus IV, Osroes, and Vologases II).

In 110 Pacorus sold the Parthian client kingdom of Osroëne to Abgar VII, son of Izates, ruler of Adiabene. It is uncertain whether Pacorus was alive when the Roman emperor Trajan invaded Mesopotamia (114–115).

Pact of ———: *see under* substantive word (*e.g.,* Locarno, Pact of).

Pacuvius, Marcus (b. 220 BC, Brundisium, southern Italy—d. *c.* 130, Tarentum), the greatest Roman tragic dramatist before Accius.

The bearer of an Oscan name, he was probably educated at Tarentum and must have been equally at home in Oscan, Latin, and Greek, as was his uncle and teacher, the poet Quintus Ennius. As a young man he followed Ennius to Rome, where he joined the circle of the younger Scipio, becoming known for his painting as well as for his knowledge of Greek dramatists and of Greek poetics. He confined himself almost entirely to writing tragedies, although he is said to have composed some satires in the manner of Ennius.

Thirteen titles and fragments amounting to about 440 lines are all that survive of Pacuvius' dramatic output. Apart from one Roman national drama, *Paullus* (celebrating the victory of Lucius Aemilius Paullus over Perseus of Macedonia in 168 BC), the 12 plays that he translated and adapted from original plays by Sophocles and other Greeks may represent his entire output.

As a playwright, Pacuvius was admired by the Romans for his elevated style, his command of pathos, and his scholarly treatment of obscure Greek mythological themes. Cicero considered him the greatest Roman writer of tragedy up to that time. Other ancient Roman writers, however, ridiculed Pacuvius for his pompous style and for certain peculiarities of diction that are evident even in the surviving fragments of his work. His plays continued to be produced until the end of the Roman Empire.

Padang, *kotamadya* (municipality) and *kabupaten* (regency), capital of Sumatera Barat *provinsi* ("province"), Indonesia. Padang is the chief port on Sumatra's western coast and is now the main city of the Minangkabau people of West Sumatra. It was the site of Dutch settlements early in the 17th century, and warehouses and a small fort were erected in 1667. The town was held by the British (1812–18) and prospered during the 19th century with the opening up of the highlands' mineral wealth, tourist traffic, and construction of coastal and inland railways. The city's port, formerly Emmahaven, lies at the mouth of the Padang River at a point 5 miles (8 km) south of the city on Teluk Bay. Originally a bunker port for coal from the Umbilin coalfields, it now ships principally coffee and copra. Padang has an airport and is the site of Andalas University. Pop. (1980) city, 408,922; regency, 459,660.

Padang, Urang (Indonesian ethnic group): *see* Minangkabau.

Padang Highlands, region near the western coast of the island of Sumatra, Indonesia. It is part of the Barisan Mountains of Sumatera Barat *provinsi* ("province"). The highest among several volcanoes in the highlands is Mount Merapi (9,485 feet [2,891 m]). A favourite resort area because of its climate, the region has superb scenery and is the source of four major rivers (the Rokan, Kampar, Inderagiri, and Batanghari). The Umbilin coalfields are also located in the region. Good roads connect with Padang, Medan, and Pakanbaru. The two major towns of the region are Bukittinggi and Sawahlunto, both connected by rail to Padang. The region produces rice, coffee, coconuts, tobacco, and tea and is homeland to the Minangkabau people.

padauk, any of several species of tropical trees of the genus *Pterocarpus.* Padauks of the Indo-Malaysia region have a tendency to be larger than related species elsewhere. They are highly prized as shade trees and for their red or reddish brown wood. The blood-red sap is used commercially; a red dyewood known as "Red Saunders," which is obtained from the padauk, was formerly exported in quantity from India.

paddle tennis, small-scale form of tennis similar to a British shipboard game of the 1890s. Frank P. Beal, a New York City official, introduced paddle tennis on New York playgrounds in the early 1920s. He had invented it as a child in Albion, Mich. It became popular, and national championship tournaments are still held in the United States. Platform tennis, a later development, is sometimes called paddle tennis.

Instead of rackets, short-handled, rectangular wooden bats, or paddles, are used with a slow-bouncing ball of sponge rubber. Courts, about half the size of regulation lawn-tennis courts, at first were 39 by 18 ft (11.9 by 5.5 m), about one-fourth the size of a regulation tennis court. Adults used a court measuring 44 by 20 ft. In 1959 the United States Paddle Tennis Association (founded 1923; until 1926 the American Paddle Tennis Association) enlarged the court to 50 by 20 ft and revised the ball and the rules to speed up the game.

Rules and scoring are similar to tennis, except that adults are allowed only one serve. If it is a fault, the server loses the point. Children may take two serves overhand and play on a smaller court.

paddle wheel, method of ship propulsion that was once widely employed but is now almost entirely superseded by the screw propeller. Early experiments with steam-driven paddles acting as oars led several inventors, including Robert Fulton, to mount the paddles in a wheel form, either at the stern or at the sides of the vessel.

The device is highly efficient and is competitive even with modern propellers; it was supplanted by the latter because of the paddle wheel's vulnerability to damage in storms and its emergence from the water when the ship rolled heavily, which made steering difficult. For inland navigation these defects were insignificant, and paddle-wheel steamers long continued to operate on many rivers.

paddlefish, also called DUCKBILL CAT, either of two species of archaic freshwater fish with a paddle-like snout, wide mouth, smooth skin, and cartilaginous skeleton. A relative of the sturgeon, the paddlefish is of the family Polyodontidae and the order Acipenseriformes. It feeds with mouth gaping open, gill rakers straining plankton from the water.

The American paddlefish (*Polyodon spathula*), also called spoonbill, is greenish or gray and averages about 18 kilograms (40 pounds). It lives in open waters of the Mississippi Basin. The other known species (*Psephurus gladius*), a larger fish with more slender snout, inhabits the Yangtse River Basin. The flesh of both species is somewhat like catfish; the roe can be made into caviar.

Paddock, Charlie, byname of CHARLES WILLIAM PADDOCK (b. Aug. 11, 1900, Gainesville, Texas, U.S.—d. July 21, 1943, near Sitka, Alaska), U.S. sprinter, world-record holder for the 100-metre dash (1921–30) and the 200-metre dash (1921–26). He also held the world record for the 100-yard dash (1921, 1924–26) and the 220-yard dash (1921–26). In addition, he was a member of a world-record-holding 4 × 100-metre team (1920–24).

Paddock ran for the University of Southern California (Los Angeles), from which he was graduated in 1922. He served in the U.S. Field Artillery (1918–19) during World War I. In the 1920 Olympic Games at Antwerp, he won the gold medal for the 100-metre race, the silver medal for the 200-metre race, and a gold medal as a member of the 4 × 100-metre relay team. In the 1924 Olympic Games at Paris, he placed fifth in the 100-metre race and won the silver medal in the 200-metre race.

After his retirement from running, Paddock went into the newspaper business and was a successful writer, editor, and publisher. He died in a plane crash while serving in the Marine Corps during World War II.

paddy, also called RICE PADDY, small, level, flooded field used to cultivate rice in southern and eastern Asia. Wet-rice cultivation is the most prevalent method of farming in the Far East, where it utilizes a small fraction of the total land yet feeds the majority of the rural population. Rice was domesticated as early as 3500 BC, and by about 2,000 years ago it was grown in almost all of the present-day cultivation areas, predominantly deltas, floodplains and coastal plains, and some terraced valley slopes.

Many paddies are flooded by rivers and rainfall during monsoon season, while others must be irrigated. The paddies have an impermeable subsoil and are bordered by earthen bunds to hold an average of 4–6 inches (10–15 centimetres) of water in the field for three-quarters of the growing season. In all countries, excluding India, paddies are worked by family labour alone and by the same methods as were used 2,000 years ago: hand cultivation with hoe and spade, or water-buffalo-, horse-, or ox-drawn plough with metal share.

Paderborn, city, North Rhine-Westphalia *Land* (state), central Germany, on the Pader River, a small affluent of the Lippe, formed from rain seepage on the slope of the Eggegebirge and emerging from below the cathedral in about 200 springs. Paderborn was the birthplace of the Holy Roman Empire when Charlemagne met Pope Leo III there in 799 to discuss the founding of a German nation. Excavation of Charlemagne's palace began in 1964. Paderborn has been the seat of a bishopric from 805; it joined the Hanseatic League in the 13th century. It was ruled by prince-bishops from *c.* 1100 until 1802, when it passed to Prussia under an agreement with France.

Massive destruction in World War II greatly altered the town's appearance, but some old buildings survived, and many have been restored. Particularly notable are the three-gabled Renaissance town hall (1613–16), the Baroque Franciscan church (1681) with a fine facade by Antonio Petrini, and the cathedral (11th–13th century) with a typically Westphalian tower and a monumental carved portal. Other buildings include several 11th–13th-century churches, the classical Gymnasium (high school; 1612), the philosophy and theology academy, and the Jesuit church (1682–86). The diocesan museum contains the "Madonna" of Bishop Imad, an important 11th-century sculpture.

Paderborn is the marketing and export centre for the surrounding agricultural region; Paderborn bread, cattle, and beer are well known. The city is also a centre of heavy industry and of the manufacture of textiles, chemicals, and building materials. Pop. (1989 est.) 114,148.

Paderewski, Ignacy (Jan) (b. Nov. 18, 1860, Kuryłówka, Podolia province in Russian Poland—d. June 29, 1941, New York City), Polish pianist, composer, and statesman, who was prime minister of Poland in 1919.

The son of a steward of a Polish landowner, he studied music from 1872 at the Warsaw Conservatory and from 1878 taught piano there. In 1880 he married one of his pupils, Antonina Korsak, who died in childbirth the following year. Encouraged and financed by the actress Helena Modrzejewska (Modjeska), he studied in Vienna from 1884 to 1887 under Theodor Leschetizky, who did much to improve a limited technique. During this period he also taught at the Strasbourg Conservatory. Between 1887 and 1891 he made his first public appearances as a pianist, in Vienna, Paris, London, and New York City. His success with the public was overwhelming; his personality on the concert platform, like that of Liszt, his predecessor among piano virtuosos, generated a mystical devotion. Among his colleagues, however, he was more envied than respected. Chopin (whose works he edited), Bach, Beethoven, and Schumann were the chief composers of his repertory. In 1898 he settled at Riond Bosson near Morges in Switzerland and the following year married Helena Gorska, Baroness von Rosen. In 1901 his opera *Manru*, dealing with life in the Tatra Mountains, was given at Dresden. In 1909 his *Symphony in B Minor* was given at Boston,

and in the same year he became director of the Warsaw Conservatory.

Throughout his life Paderewski was a staunch patriot. In 1910 he presented to the city of Kraków a monument commemorating the victory of the Poles over the Teutonic Order. During World War I he became a member of the Polish National Committee and was appointed its representative to the United States, where he urged President Woodrow Wilson to support the cause of Polish independence. Wilson included Poland's cause as the thirteenth of his Fourteen Points of Jan. 8, 1918.

After the war the provisional head of state, Józef Piłsudski, asked Paderewski to form in Warsaw a government of experts free from party tendencies. This was formed on Jan. 17, 1919. Paderewski reserved the portfolio of foreign affairs for himself, but his premiership was not a success. As a virtuoso Paderewski was accustomed to flattery, and he resented criticism. His ambition was to be elected president of the Polish Republic, but he was supported by no political party. On Nov. 27, 1919, he resigned the premiership and returned to Riond Bosson. He never revisited Poland. In 1921 he resumed his musical career, giving concerts in Europe and the United States, mainly for war victims.

At the beginning of World War II, in October 1939, a Polish government-in-exile, formed in Paris with General Władysław Sikorski as prime minister, offered Paderewski the chairmanship of the Polish National Council. After the French capitulation in 1940, he went to the United States. He died soon after and was buried in Arlington National Cemetery.

Padilla, Juan (b. *c.* 1500, Andalusia, Spain—d. 1542, near modern Herington, Kan., U.S.), first Christian missionary martyred within the territory of the present United States.

After serving as a soldier, Padilla joined the Franciscans in Andalusia. He went to Spanish Mexico in 1528 and in the following year accompanied an expedition to Nueva Galicia (northwestern Mexico). There he spent most of his remaining years, except for a trip in 1533 to Tehuantepec, in southern Mexico, with the Spanish conqueror Hernán Cortés. He founded the first Franciscan friaries at Zapotlán, Tamazula, and Tulantizingo, where he became abbot.

In 1540–41 he accompanied the Spanish explorer Francisco Vázquez de Coronado in his fruitless quest for a legendary kingdom of riches called Quivira, probably in modern Kansas. The disappointed Coronado and his company returned to Mexico, but Padilla decided to go back to Quivira with some companions. After working for many months among the Wichita Indians, he was on his way to visit the Guas tribe but was ambushed by them while within sight of his companions, who escaped to Mexico.

Padilla, Juan de (b. 1490?, Toledo, Castile—d. April 24, 1521, Villalar, Spain), aristocratic Spanish military leader of the Castilian Comunidades (Communeros) in their unsuccessful revolt (1520–21) against the government of the Habsburg emperor Charles V (King Charles I of Spain).

Padilla was a member of an ancient noble family of Toledo. Charles, who came to the Spanish throne in 1516, had inflamed national opinion by his appointing to high posts foreigners who carried out arbitrary and exploitative actions. Demands soon arose for the imposition of traditional Castilian constitutional checks on royal power. Padilla had personal grievances against Charles as well and took part in dissident activities in Toledo in late 1519 and early 1520. Summoned in April 1520 to appear before the king at Santiago, Padilla instead took up arms in support of a popular uprising in Toledo.

A circular letter from Toledo to other Castilian cities in revolt invited them to meet at Avila. When the municipalities, supported by the nobles and clergy, set up the Junta Santa (a revolutionary junta) there (July–August 1520), Padilla was named captain general of its forces, and on August 29 he took Tordesi-

llas, thereby assuring the junta's control over Charles's mother, the hereditary queen Joan the Mad, who had been living there since she had gone insane in 1506.

The junta soon alienated the nobility by its popular demands, and Charles cleverly moved to secure the nobility's loyalty. The junta also courted defeat in the field by replacing Padilla with Don Pedro Girón, an important nobleman. After Charles's troops had recovered Tordesillas (December 5) and Girón had defected, the Junta Santa recalled Padilla. Padilla's reappointment was received with a great outpouring of popular enthusiasm. He occupied Torrelobatón on Feb. 28, 1521. Seven weeks later, however, on the advance of royal forces, he attempted to retreat but was defeated and captured at Villalar (April 23, 1521). He was executed the next day along with other leaders of the revolt.

Padjelanta National Park, park in Norrbotten *län* (county), northwestern Sweden, adjoining Norway (west) and Sarek National Park (east). It is the largest of the Swedish national parks and one of the largest parks in Europe, with an area of 776 square miles (2,010 square km). It was established in 1962. Padjelanta National Park contains several lakes, the largest of which are Virihaure, Vastenjaure, and Salojaure, as well as mountains, valleys, and glaciers. Some species of its alpine flora are not found elsewhere in Sweden, *e.g.,* the sandwort *Arenaria humifusa,* the cinquefoil *Potentilla hypartica,* and the felwort *Gentianella aurea.* Among its fauna are the wolverine, Arctic fox, and brown bear; its birdlife includes the golden eagle and merlin.

Padma 'byung-gnas (Buddhist mystic): *see* Padmasambhava.

Padma River, main channel of the Ganges River below its bifurcation into the Bhagirathi and Padma rivers in extreme western Bangladesh. Flowing southeastward, the Padma receives the mighty Jamuna (Brahmaputra) River near Rājbāri and then continues southeastward through central Bangladesh to join the Meghna River through a channel 2 miles (3 km) wide, known as the Kirtimasa. The combined streams continue south as the Meghna before entering the Bay of Bengal. The Padma is navigable for its entire 190-mile (300-kilometre) course by river steamer. Its main tributary is the Mahānanda; its principal distributary is the Madhumati.

Padmasambhava, also called GURU RIMPOCHE, Tibetan SLOB-DPON ("Teacher"), or PADMA 'BYUNG-GNAS ("Lotus Born") (fl. 8th century), legendary Indian Buddhist mystic who introduced Tantric Buddhism to Tibet and who is credited with establishing the first Buddhist monastery there.

According to tradition, he was a native of Udyāna (now Swat, Pak.), an area famed for its magicians. Padmasambhava was a Tantrist and a member of the Yogācāra sect and taught at Nalanda, a centre of Buddhist studies in India. He was invited to Tibet in 747 by King Thī-srong-detsan and arrived at Samye (Bsan-yas), where he is said to have exorcised demons that were inhibiting the construction of a Buddhist monastery by causing earthquakes. He supervised the completion of the monastery in 749.

The Tibetan Buddhist sect Rnying-ma-pa (the Old Order) claims to follow most closely Padmasambhava's teachings, emphasizing Tantric ritual, worship, and Yoga. Texts basic to the sect's teachings, which were said to have been buried by Padmasambhava, began to be found around 1125. He also had many Tantric books translated from the original Sanskrit into Tibetan.

Padre Island, barrier reef, 113 miles (182 km) long and up to 3 miles (5 km) wide, lying along the Gulf Coast of Texas, U.S. The reef extends south from Corpus Christi to Port Isabel and is separated from the mainland by Laguna Madre. The island consists largely of grassy dunes and a broad beach that yields shellfish such as clams and marine snails. The area is well known for its mackerel, sailfish, and tarpon fishing and for its abundant variety of birds, particularly the heron, tern, white pelican, and frigate bird. In 1962 most of Padre Island was designated a national seashore.

Padri War (1821–37), armed conflict in Minangkabau (Sumatra) between reformist Muslims, known as Padris, and local chieftains assisted by the Dutch. In the early 19th century the puritan Wahhābīyah sect of Islām spread to Sumatra, brought by pilgrims who entered the island through Pedir, a northern port. The Padris, as these Sumatran converts to Wahhābīyah came to be known, objected to local institutions that were not in accordance with the pure teaching of Islām. This jeopardized the power of the local chiefs, whose authority was based on adat, or customary law. In the ensuing conflict between the Padris and local chiefs, the Padris, using Bondjol as their base, launched guerrilla war against the chiefs. The Dutch, afraid of the influence of the Muslim reformists, sided with the chiefs but were still engaged in the Java War (1825–30) and thus unable to send troops to crush the Padris until the end of that war. Tuanku Imam Bondjol, the leader of the Padris, surrendered to the Dutch in 1832 but soon renewed his rebellion. The war continued until 1837, when the Dutch seized Bondjol. The war allowed the Dutch to extend their control into the interior regions of Sumatra.

Padua, Italian PADOVA, Latin PATAVIUM, city, capital of Padova province, Veneto region, northern Italy, on the River Bacchiglione, west of Venice. The Roman Patavium, founded, according to legend, by the Trojan hero Antenor, it was first mentioned in 302 BC, according to the Roman historian Livy, who was born there (59 BC). The town prospered greatly and, in the 11th–13th century, was a leading Italian commune. The poet Dante lived there, and St. Anthony of Padua is buried there. It was governed by the Carrara family from 1318 to 1405, when it passed to Venice, which held it until 1797. Under Austrian dominion from 1815 to 1866, it was active in the Risorgimento (movement for Italian independence); a rising took place there in February 1848. It was heavily bombed in World War II, and the frescoes by Andrea Mantegna in the Church of the Eremitani were almost completely destroyed.

Prato della Valle and the cupolas of the Church of Santa Giustina, Padua, Italy

J. Allan Cash

The Scrovegni Chapel (1303–05) contains famous frescoes by Giotto, and the Scuola del Santo ("School of the Saints," a medieval trade-guild building) has frescoes by Titian. The cathedral (rebuilt 1552) has a Romanesque baptistery. The Basilica of San Antonio (1232–1307) contains the tomb of the saint and has statues and reliefs by Donatello on the high altar. In the piazza before the basilica is Donatello's magnificent equestrian bronze statue (set up in 1453) of the Venetian condottiere Erasmo da Narni (called Gattamelata). Other notable secular landmarks include the Ragione Palazzo (1218–19; rebuilt 1306); the Capitano Palazzo (1532), now the university library; and the 16th–17th-century Bo Palazzo, which forms the nucleus of the university. Founded in 1222, the university is the oldest in Italy after Bologna.The civic museum has a fine art gallery as well as historical and archaeological exhibits, libraries, archives, and collections of sculpture and coins. The botanical garden, which dates from 1545, is the oldest in Europe. West of the botanic garden is the Prato della Valle, a large oval piazza surrounded by a canal and bordered by a group of statues of well-known Paduans.

An important rail and road junction, the city is a lively agricultural, commercial, and industrial centre. Manufactures include electrical and agricultural machinery, motorcycles, chemicals, and artificial and synthetic textiles. Pop. (1988 est.) mun., 223,907.

Padua, University of, Italian UNIVERSITÀ DEGLI STUDI DI PADOVA, autonomous coeducational state institution of higher learning in Padua, Italy. The university was founded in 1222 by a secession of about a thousand students from the University of Bologna, reinforced by additional migrations from Bologna in 1306 and 1322. Like Bologna, it was a student-controlled university, with students electing the professors and fixing their salaries. In 1228 a number of students seceded from Padua to Vercelli, but the university survived the secession and the vicissitudes of local despotism to achieve its greatest distinction in the 15th and 16th centuries, becoming one of the two or three leading universities of Europe. Among its professors were famous Renaissance philosophers, humanists, and scientists, including Galileo.

In the Middle Ages Padua was mainly a school of civil and canon law, and its faculties of philosophy, law, theology, and medicine grew only gradually. The university's students were originally organized into four groups according to their geographic origin. In 1399 the university was divided into two separate schools, one for the arts and medicine and one for law. The two schools were not reunited under one administration until the early 19th century.

The university's botanical garden, founded in 1545, is the oldest in Europe. Its astronomical observatory was founded in 1761. Modern faculties include law, political science, arts and literature, philosophy, education, mathematics, physics and natural sciences, economics and commerce, statistics, pharmacy, agriculture, engineering, and medicine. The Geologic Institute contains a geological museum.

Paducah, city, seat of McCracken county, southwestern Kentucky, U.S., at the confluence of the Ohio (there bridged to Brookport, Ill.) and Tennessee rivers. The site, known as Pekin, was part of a grant to George Rogers Clark, soldier and frontiersman. At his death his brother William, who was coleader of the Lewis and Clark Expedition, received the land, laid out the town in 1827, and named it for Paduke, a Chickasaw Indian chief who lived in the vicinity. During the American Civil War, because of its strategic river facilities, the city was occupied by Union forces under General Ulysses S. Grant and was raided by General Nathan B. Forrest, a Confederate cavalry leader.

Paducah is now an important market for tobacco, timber, strawberries, corn, livestock, and coal. Located in one of the world's greatest power-generating areas, its growth has been greatly stimulated by the Tennessee Valley Authority and Atomic Energy Commission (now U.S. Department of Energy) projects. Recreational facilities are provided by nearby Kentucky Lake and Kentucky Dam Village State Park. Paducah Community College was founded in 1932. Inc. city, 1856. Pop. (1986 est.) 28,370.

paean, solemn choral lyric of invocation, joy, or triumph, originating in ancient Greece where it was addressed to Apollo in his guise as Paean, physician to the gods. Paeans were sung at banquets following the boisterous dithyrambs, at the festivals of Apollo, and at public funerals. It was the custom for them to be sung by an army on the march and before going into battle, when a fleet left the harbour, and after a victory. Paeans were later addressed to other gods as well as to men like the 5th-century-BC Spartan commander Lysander, who were more or less deified for their achievements.

paedo- (combining form, "child"): *see under* pedo-, except as below.

paedogenesis, also spelled PEDOGENESIS, reproduction by sexually mature larvae, usually without fertilization. The young may be eggs, such as are produced by *Miastor,* a genus of gall midge flies, or other larval forms, as in the case of some flukes. This form of reproduction is distinct from neotenic reproduction in its parthenogenetic nature (*i.e.,* no fertilization occurs) and the eventual maturation or metamorphosis of the parent organism into its adult form.

paedomorphosis, also spelled PEDOMORPHOSIS, retention by an organism of juvenile or even larval traits into later life. There are two aspects of paedomorphosis: acceleration of sexual maturation relative to the rest of development (progenesis) and retardation of bodily development with respect to the onset of reproductive activity (neoteny).

Classic examples include certain amphibian species in which development is arrested so that the larval form and aquatic habit persist as the organism attains sexual maturity and becomes capable of reproduction. In some species only a few morphological features are retarded, but the number of features retarded may differ from species to species. Adult humans, for example, display various neotenic body features that other adult primates do not.

In other species all morphological development is retarded; the organism is juvenilized but sexually mature. Such shifts of reproductive capability would appear to have adaptive significance to organisms that exhibit it. In terms of evolutionary theory, the process of paedomorphosis suggests that larval stages and developmental phases of existing organisms may give rise, under certain circumstances, to wholly new organisms.

Paekche, one of three kingdoms into which ancient Korea was divided before 660. Occupying the southwestern tip of the Korean peninsula, Paekche is traditionally said to have been founded in 18 BC in the Kwangju area by a legendary leader named Onjo. By the 3rd century AD, during the reign of King Koi (234–286), Paekche emerged as a fully developed kingdom. By the reign of King Kŭnch'ogo (346–375), it had established control over a region that included the whole Han River basin in central Korea.

In the late 5th century the northern Korean kingdom of Koguryŏ deprived Paekche of its territory in the Han River basin, and it moved its capital south to Ungjin (present Kongju). In the reign of King Sŏng (523–554), the kingdom was forced to move its capital even further south to Sabi (present Puyŏ), as more of its territory was occupied by Koguryŏ.

The kingdom was divided into five administrative districts. There were 16 official grades in the central government, and the 6 officials of the first grade formed a kind of cabinet. The highest-ranking official, called *sangjwapyong,* was elected every three years.

Buddhism flourished, and many temples were built. Confucianism also prospered, producing a large number of eminent scholars. Paekche visual arts reveal technical maturity along with warm human qualities, sometimes held to reflect the influence of southern Chinese art of the Six Dynasties period. These qualities are evident, for example, in softly modeled Buddha statues in relaxed poses, with their distinctive and expressive "Paekche smile."

In an attempt to contain Koguryŏ's attacks and recover some of its lost territory in the Han River basin, Paekche allied itself with Silla, the other southern Korean state, but it eventually lost this territory to Silla. In 660 its defeat by the allied forces of Silla and the Chinese T'ang dynasty (618–907) brought an end to its rule. Eight years later Silla's forces defeated the northern Korean state of Koguryŏ and united the Korean peninsula under the Unified Silla dynasty (668–935).

Paeligni, ancient people of central Italy, whose territory lay inland on the eastward slopes of the Apennines. Though akin to the Samnites, they formed a separate league with their neighbours the Marsi, Marrucini, and Vestini. This league appears to have broken up after the Second Samnite War (304 BC), when each tribe came into an alliance with the Romans that lasted until the Social War (90–88 BC). This war ended when the Paeligni and the other allies were finally granted Roman citizenship.

The Paeligni's oldest Latin inscriptions probably date from shortly after the Social War, although the Paelignian dialect doubtlessly lasted to about 50 BC. Similar dialects were spoken by the Marrucini and Vestini; together they formed a group known as Northern Oscan.

paella, in Spanish cuisine, a dish of saffron-flavoured rice cooked with meats, seafood, and vegetables. Originating in the rice-growing areas on Spain's Mediterranean coast, the dish is especially associated with the region of Valencia. The paella takes its name from the *paellera*, the utensil in which it is cooked, a flat round pan with two handles; paella is traditionally eaten from the pan.

To prepare the paella, pieces of meats such as chicken, pork, or rabbit and seafood such as clams, shrimps, mussels, crayfish, and squid are sauteed in olive oil with onions, garlic, and herbs and removed from the pan. Rice, tomatoes, saffron, and stock are simmered together, the meats and seafood mixed in, and the dish is garnished with peas, pimientos, and other vegetables. Traditional paellas are made out of doors over a wood fire.

Paeonia, the land of the Paeonians, originally including the whole Axius (Vardar) Valley and the surrounding areas, corresponding to parts of what is now northern Greece, southern Yugoslavia, and western Bulgaria. The Paeonians, probably of mixed Thraco-Illyrian origin, were weakened by the Persian invasion (490 BC), and those tribes living along the Strymon River fell under Thracian control. The growth of Macedonia forced the remaining Paeonians northward, and in 358 BC they were defeated by Philip II of Macedonia. The native dynasty, however, continued to be highly respected: about 289 BC, King Audoleon received Athenian citizenship, and his daughter married Pyrrhus, king of Epirus. Under the Romans, Paeonia was included in the second and third districts of Macedonia. By AD 400, however, the Paeonians had lost their identity, and Paeonia was merely a geographical term.

Paeoniales, the peony order of dicotyledonous flowering plants comprising the peony family (Paeoniaceae) and the genus *Paeonia*, with about 33 species distributed in Europe, Asia, and western North America. They are perennial (long-lived) herbs or sometimes shrubby plants up to about two metres (six feet) tall that grow from stout rootstocks. The leaves are alternately produced along the stems and are divided into three lobes, each lobe being further divided into three smaller lobes. The flowers are radially symmetrical, bisexual, and large, with 5 sepals, 5 petals (some-

times 10), and an indefinitely large number of stamens (male pollen-producing structures). The female parts are superior (*i.e.,* positioned above the attachment point of the other flower parts) and consist of two to five separate, large, more or less fleshy pistils or ovaries containing many ovules, which develop into large seeds that are at first red in colour, later turning a shining black and bearing a fleshy appendage called an aril.

The order is considered to be related to the order Dilleniales, although traditionally it has been placed near the buttercup family (Ranunculaceae), a position still defended by some authorities.

Economically the group is important for the very popular flower garden peony (*q.v.*) in a wide range of form and colour. Several species of southern Europe and Asia were cultivated for food and as a medicinal herb.

Paeonius (fl. 450–400 BC), Greek sculptor, native of Mende in Thrace, a contemporary and follower of the sculptors Phidias and Polyclitus who is famous for his statue of the Nike, or "Winged Victory" (*c.* 420 BC; Archaeological Museum, Olympia) found in Olympia in 1875. An inscription on its pedestal states that the statue commemorated a victory of the Messenians and the Naupactians over an unnamed enemy, probably the Spartans. The inscription also states that Paeonius won a competition for the construction of the *akrōtērion* (the ornamental device at the peak or corner of a gable) for a temple.

Paer, Ferdinando (b. June 1, 1771, Parma, Duchy of Parma—d. May 3, 1839, Paris), composer who, with Domenico Cimarosa and Nicola Antonio Zingarelli, was one of the principal composers of Italian opera buffa of his period. Paer produced his first opera, *Orphée et Euridice*, in Parma in 1791. From 1797 to 1802 he was in Vienna, where his most successful opera, *Camilla*, was produced in 1799. He was in Dresden from 1802 to 1807 and then went to Paris, where he became chapelmaster to Napoleon, conducted at the Opéra-Comique, and (1812–27) directed the Italian Opera. His most successful opera of this period was *Le Maître de chapelle* (1821; *The Chapelmaster*). In addition to his 43 operas he also composed religious and chamber music and secular cantatas.

Paeroa, borough, northern North Island, New Zealand, on the Ohinemuri River near its junction with the Waihou. Paeroa (from a Maori word meaning "long ridge") was founded in the early 1880s as a port for the Ohinemuri goldfield, 5 mi (8 km) southeast. Mining was shifted to the underground Komata Reefs (6 mi northeast) from 1891 to the 1930s. Gazetted a borough in 1915, Paeroa was regularly served by river shipping until 1947. It is a hub of rail lines and highways to Auckland and Tauranga. Basically a farming centre, Paeroa is nationally known for its mineral drinking water. Pop. (1983 est.) 3,680.

Paestum, Greek POSEIDONIA, ancient city in Lucania, Italy, 22 miles southeast of modern Salerno and five miles south of the Silarus (modern Sele) River, noted for its Greek ruins and for what are believed to be the only examples of classical Greek wall painting. Founded probably *c.* 600 BC by colonists from Sybaris, it became a flourishing town by 540. Paestum came under Lucanian domination from *c.* 390 until 273, when Rome made it a Latin colony. The city supported Rome during the Second Punic War. The gradual silting up of the mouth of the Silarus created a malarial swamp, and Paestum was finally deserted after being sacked by Muslim raiders in AD 871.

The so-called Temple of Ceres at Paestum
Alinari—Art Resource/EB Inc.

The site, rediscovered in the 18th century, contained pottery and excellently preserved walls and temples. Its best known buildings are the so-called Temple of Ceres (in fact dedicated to Athena), the basilica probably dedicated to Hera, and a temple of Hera called the Temple of Neptune. In July 1969 a farmer uncovered the limestone roof of an ancient Lucanian tomb that contained frescoes in the early classical style.

Paetus, Thrasea (Roman senator): *see* Thrasea Paetus, Publius Clodius.

Páez, Indians of the southern highlands of Colombia. The Páez speak a Chibchan language very closely related to that of the now extinct Pijao and Coconuco (*see* Chibchan languages).

The Páez inhabit the high mountains and plateaus, their chief crop being potatoes. Many also grow such nontraditional crops as wheat and coffee. Each family farms its own land, but the lands of the church are cultivated by communal labour. Most planting is done with digging sticks. Settlements are dispersed, each family living on its own land. Houses are made of poles, sometimes being double walled with mud and stones between.

Clothing formerly consisted simply of a small woollen blanket, but after the Spanish conquest rough cotton shirts and later trousers and shirts were introduced for men and skirts and ponchos for women. Modern crafts include pottery, weaving, and basketry. Before Spanish rule, stone and gold and copper were worked. Polygyny was also common, but Roman Catholicism has enforced monogamy. Traditional puberty rites and menstrual taboos continued to be observed well into the 20th century. The Páez were estimated to number about 60,000 in the 1970s.

Páez, José Antonio (b. June 13, 1790, Aricagua, Venezuela—d. May 7, 1873, New York City), soldier and politician, a leader in Venezuela's independence movement and its first president. In the crucial early years of Venezuelan independence, he served his country as a moderate dictator.

Páez was a part-Indian *llanero,* one of the horsemen of the plains. Beginning as a ranch hand, he quickly acquired both land and cattle. In 1810 he joined the revolutionary movement against Spain as the leader of a band of *llaneros.* Becoming chief Venezuelan commander to Simón Bolívar, the liberator of northern South America, Páez and his men helped secure victories at Carabobo (1821) and Puerto Cabello (1823) that resulted in the complete withdrawal of the Spanish. In 1826, after rebelling against the authority of Gran Colombia, of which Venezuela was a province, Páez was appointed military and civilian head of his country. In 1829 he successfully led the movement that resulted in Venezuela's becoming a sovereign nation.

He was elected president in 1831 and controlled the country either as chief executive or as a power behind titular presidents until 1846. He usually respected the constitution, permitted limited freedom of the press, and promoted agriculture and industry. He curbed the power of the church in secular affairs but supported its religious authority.

In 1846 his own candidate for president turned against him, and he was imprisoned and later forced into exile. He returned to Venezuela in 1861, ruling for a short period as a severely repressive dictator, only to be forced again into exile in 1863. He spent most of his remaining years in New York City, where he published his autobiography in 1867–69.

Páez (Xaramillo), Pedro, also called PERO PÁEZ (b. 1564, Olmedo, Spain—d. May 20, 1622, Gorgora, Eth.), learned Jesuit priest who, in the tradition of Frumentius—founder of the Ethiopian Church—went as a missionary to Ethiopia, where he became known as the second apostle of Ethiopia.

Páez entered the Society of Jesus in 1582 and sailed for Goa, in India, in 1588. En route to Ethiopia (1589) he was captured by Turkish pirates and enslaved until 1596, when he returned to Goa. He finally reached Ethiopia in 1603. There he learned two of the main languages, translated a catechism, and wrote a treatise on the theological errors of the Ethiopian Church and a history of the country. Páez succeeded in converting the formerly Monophysite king Susenyos of Ethiopia to orthodoxy, and for a while most of Ethiopia was Roman Catholic. Páez was the first European to visit Lake Tana, the source of the Blue Nile in northwestern Ethiopia, where he died of fever.

Pagadian, chartered city, western Mindanao, Philippines. Located on Pagadian Bay (a northern extension of Illana Bay), it is an important port shipping rice and corn (maize); coconuts are the principal commercial crop in the region. Fishing is the primary occupation of the city's inhabitants, and lumbering is also important. The city is a major point of entry for Visayan (Cebuano) migrants, who have resettled in the adjacent areas. Inc. city, 1969. Pop. (1980) 80,861.

Pagalu, formerly ANNOBÓN, volcanic island in the South Atlantic Ocean near the Equator. Located about 350 miles (565 km) southwest of continental Equatorial Guinea, it occupies an area of 6.5 square miles (17 square km) and rises to an elevation of 2,200 feet (671 m). A part of Equatorial Guinea, the island constitutes one of the three provinces of the country. Fishing and lumbering activities are centred in San Antonio, the chief settlement. Pop. (1983 prelim.) 3,000.

Pagan (d. 1880, Mandalay, Burma), king of Burma (1846–53), whose government suffered defeat in the Second Anglo-Burmese War, after which Rangoon, the province of Pegu, and other areas in southern Burma were annexed by the British.

Pagan deposed his father, the insane king Tharrawaddy, in 1846. Although Pagan was not one of Burma's more enlightened monarchs, he acted with tact and restraint during the crisis preceding the war. Part of his undoing was the aggressive policy of Lord Dalhousie, the governor general of India, who declared that "of all the Eastern nations with which the Government of India has had to do, the Burmese were the most arrogant and overbearing."

In 1851 Pagan's governor in Rangoon, Maung Ok, charged the captains of two British merchant ships with murder, embezzlement, and evading customs fees. They were forced to pay several hundred rupees before being allowed to return to Calcutta, where they demanded compensation from the Burmese government. Dalhousie sent an emissary with a letter to the King requesting compensation that amounted to £920 and the dismissal of Maung Ok. Pagan agreed to replace Maung Ok, but the emissary's lack of tact and violation of his instructions made it impossible for the new governor to deal with him. On Jan. 6, 1852, the British were evacuated, and the harbour blockaded. Three days later British warships began firing on the city.

On Feb. 7, 1852, Pagan wrote Dalhousie, protesting the acts of aggression in Rangoon and expressing hope that the governor general would repudiate them. A few days before, the governor of Rangoon had offered to pay the compensation for the two ship captains. On February 13, however, Dalhousie sent an ultimatum to the King, demanding an indemnity equivalent to £100,000. Pagan did not answer the ultimatum, which expired on April 1, and a few days later British troops entered Burmese territory. Rangoon was taken and, by December 1852, Lower Burma was occupied. On Feb. 18, 1853, Pagan was deposed by his brother, Mindon, who favoured reconciliation with the British.

Pagan, village, central Upper Burma, on the left bank of the Irrawaddy River and about 90 miles (145 km) southwest of Mandalay. The site of an old capital city of Burma, Pagan is a pilgrimage centre and contains ancient Buddhist shrines that have been restored and redecorated and are in current use. Ruins of other shrines and pagodas cover a wide area. An earthquake on July 8, 1975, severely damaged more than half of the important structures and irreparably destroyed many of them. The whole of the Buphaya pagoda, for nine centuries a landmark for river boatmen, tumbled into the Irrawaddy and was carried off by the waters. The village also has a school for lacquer ware, for which the region is noted. Pop. (latest census) 2,825.

Pagan's importance lies in its heritage rather than its present. It was first built probably in AD 849 and, from the 11th century to the end of the 13th, was the capital of a region roughly the size of modern Burma. In 1287 it was overrun by the Mongols in the course of their wide-ranging conquests, and it never recovered its position thereafter, although a little desultory building continued on Buddhist shrines.

Old Pagan was a walled city, its western flank resting on the Irrawaddy River. It was the focus of a network of highroads by means of which its rulers could command a large region of fertile plains and could dominate other major Burmese dynastic cities, such as Pegu. From the port of Thiripyissaya, further down the river, important overseas trade was conducted with India, Ceylon, and other regions of Southeast Asia. The walls of the old city, within which lies a substantial area of the modern town, probably originally contained only royal, aristocratic, religious, and administrative buildings. The populace is thought to have lived outside in homes of light construction closely resembling those occupied by the present-day Burmese. The walled city, whose moats were fed by the Irrawaddy, was thus a sacred dynastic fortress. The circuit of its walls and river frontage is some two and a half miles, and there is evidence that perhaps as much as a third of the old city has been washed away by the river. Because building was principally in brick, decoration was carried out in carved brick, in stucco, and in terra-cotta. The earliest surviving structure is probably the 10th-century Nat Hlaung Gyaung. The shrines that stand by the Sarabha Gate in the eastern wall, although later than the wall they adjoin, are also early. These are shrines of protecting *nats*—the traditional spirit deities of the animist ethnic Burmese.

Between *c.* 500 and 950, people of the Burmese ethnic group had been infiltrating from the north into a region occupied by other peoples; these people already had been converted to Indian religion, especially the Mahāyāna Buddhism of Bihār and Bengal. Under King Anawrahta (reigned 1044–77) the ethnic Burmese finally conquered the other peoples of the region, including a people called the Mon, who were previously dominant in the south. They transported the Mon royal family and their scholars and craftsmen to Pagan, making it the capital and centre of an official, fundamentalist form of Hīnayāna (Theravāda) Buddhism adopted from Ceylon (*c.* 1056). This initiated the period of Pagan's greatness, which was sustained at first by Mon artistic traditions. The construction and existence of the enormous number of monasteries and shrines built during the next 200 years was made possible both by the enormous wealth of the royal exchequer and by the large number of slaves, skilled and unskilled, whose working lives were dedicated to the support of each institution. The city became one of the most important centres of Buddhist learning in the East.

Lesser buildings are grouped around the more important pagodas and temples. Scattered around these are smaller pagodas and buildings, some of which may once have been aristocratic palaces and pavilions later adapted to monastic uses—*e.g.,* as libraries and preaching halls. All are based on Indian prototypes, modified during subsequent development by the Mon. The principal architectural theme is the Buddhist stupa, a tall bell dome, designed originally to contain near its apex the sacred relics of Buddhist saints. Another is the high, terraced plinth, which may be supplemented by stairs, gateways, extra stupas, and pinnacles and symbolizes a sacred mountain. During the course of artistic evolution the themes were frequently combined, and the combination opened into a complex rectangular hall with porticos extended from the sides, crowned by a stupa or, in some cases, by a rectangular tower of curved outline reminiscent of the contemporary Indian Hindu shrine tower. Interior arches and vaults, both rounded and pointed, are, however, constructed by a true radiating-arch technique that was not used in India. A vista across the site of Pagan shows a series of variations and combinations of the themes. Many buildings, especially those no longer in use and hence unrestored, bear substantial remains of external, decorative stucco and terra-cotta, adding flamboyance to the finely proportioned rectilinear structures, and internal paintings and terra-cottas recording Buddhist legend and history.

Anawrahta constructed the Shwezigon pagoda. Nearby he built a *nat* shrine with images. The Shwezigon is a huge, terraced pyramid, square below, circular above, crowned by a bell-shaped stupa of traditional Mon shape and adorned with stairways, gates, and decorative spires. It is much revered and famous for its huge golden umbrella finial encrusted with jewels. It was considerably damaged in the earthquake of 1975. Also revered are the late 12th-century pyramidal Mahābodhi, built as a copy of the temple at the site of the Buddha's enlightenment at Bodh Gayā, in India, and the Ananda temple mountain just beyond the east gate, founded in 1091 under King Kyanzittha. By the time the Thatpyinnyu temple was built (1144), Mon influence was waning, and a Burmese architecture had evolved. Its four stories, resembling a two-staged pyramid, and its orientation are new. Its interior rooms are spacious halls, rather than sparsely lit openings within a mountain mass, as in the earlier style. This building combined the functions of stupa, temple, and monastery. The Burmese style was further developed in the great Sulamani temple and culminated in the Gawdawpalin, dedicated to the ancestral spirits of the dynasty (late 12th century), whose exterior is decorated with miniature pagodas, the interior with extremely lavish, coloured surface ornament. Paganini, Niccolò (b. Oct. 27, 1782, Genoa—d. May 27, 1840, Nice, Fr.), Italian composer and principal violin virtuoso of the 19th century. A popular idol, he inspired the Romantic mystique of the virtuoso and revolutionized violin technique.

Paganini, etching by Luigi Calamatta after a drawing by J.-A.-D. Ingres, 1818

After initial study with his father, he studied with a local violinist, G. Servetto, and then with the celebrated Giacomo Costa. He made his first appearance in 1793 and then studied with Alessandro Rolla and Gaspare Ghiretti at Parma. In 1797, accompanied by his father, he toured Lombardy, where with each concert his reputation grew. Gaining his independence soon after, he indulged excessively in gambling and romantic love affairs. At one point he pawned his violin because of gambling debts; a French merchant lent him a Guarneri violin to play a concert and, after hearing him, gave him the instrument.

Between 1801 and 1807 he wrote the *24 Capricci* for unaccompanied violin, displaying the novel features of his technique, and the two sets of six sonatas for violin and guitar. He reappeared in Italy as a violinist in 1805 and was appointed director of music at Piombino by Napoleon's sister, Élisa Bonaparte Baciocchi. He later gave recitals of his own compositions in many towns in Italy and in 1815 formed his long attachment with the dancer Antonia Bianchi.

In 1828 Paganini had great success in Vienna, and his appearances in Paris and London in 1831 were equally sensational. His tour of England and Scotland in 1832 made him a wealthy man. In 1833 he settled in Paris, where he commissioned Berlioz to write his symphony *Harold en Italie*. Paganini thought the challenge of its viola solo was too slight, however, and he never played it. Following the failure of the Casino Paganini, a gambling house in which he had invested, he went to Marseille in 1839, then to Nice.

Paganini's romantic personality and adventures created in his own day the legend of a Mephistophelean figure. Stories circulated that he was in league with the devil and that he had been imprisoned for murder; his burial in consecrated ground was delayed for five years. He was long regarded as a miser, but a more accurate portrait would consider his desire to be free from a train of dependent followers and their importunities for his largesse. His gift of 20,000 francs to the struggling composer Berlioz was an act of generosity seemingly uncharacteristic; possibly Paganini, recognizing in "Beethoven's successor" a worthy talent, thought it was his duty to come to the composer's aid.

His violin technique, based on that of his works, principally the *Capricci*, the violin concertos, and the sets of variations, demanded a wide use of harmonics and pizzicato effects, new methods of fingering and even of tuning. In performance he improvised brilliantly. He was also a flamboyant showman who used trick effects such as severing one or two violin strings and continuing the piece on the remaining strings. His technical innovations were imitated by later virtuosi, notably Pablo Sarasate and Eugène Ysaÿe. His other works include 6 violin concertos, of which the first, in D major, is especially popular; 12 sonatas for violin and guitar; and 6 quartets for violin, viola, cello, and guitar. The influence of his virtuosity extended to orchestral as well as to piano music. His influence on Liszt was immense. Themes from the *Capricci* inspired works by Liszt, Schumann, Brahms, and Rachmaninoff.

Pagasaí, Gulf of, Modern Greek PAGASITIKÓS KÓLPOS, historically GULF OF PAGASAE, gulf of the Aegean Sea, *nomós* (department) of Magnisía, Thessaly, Greece. Known also as the Gulf of Vólos, it is almost landlocked by a fishhook prong of the Magnesia peninsula, which forms the Dhíavlos (strait) Tríkkeri. At the head of the gulf is Vólos, the primary port of Thessaly. It lies on the site of ancient Iolcos and its port, Pagasae, from whence is derived the gulf's present name. In Greek myth the king of Iolcos, Pelias, dispatched Jason from Pagasae in the ship "Argo" to search for the Golden Fleece.

page, in medieval Europe, a youth of noble birth who left his home at an early age to serve an apprenticeship in the duties of chivalry in the family of some prince or man of rank. Beginning as assistants to squires who attended knights and their ladies, pages were trained in arms and in the art of heraldry and received instruction in hunting, music, dancing, and such other accomplishments as befitted their social status. Later, pages were promoted to be squires and from that status were frequently advanced to knights.

In Great Britain, pages of honour are boys from 13 to 17 years of age who act as ceremonial attendants to the sovereign. In the United States, Capitol pages are boys and girls from 14 to 18 years of age who are appointed from the home districts of the members of Congress to run errands and carry messages for the House of Representatives, Senate, and the Supreme Court.

economic development and was briefly prime minister of Australia in 1939.

A physician in New South Wales, Page entered the federal Parliament in 1919. In 1920 he helped found the Australian Country Party (now National Party of Australia), and in the following year he became the party's leader. He formed a coalition with the Nationalist Party to create the Bruce–Page ministry of 1923–29, which was noted for its economic program. As federal treasurer in the ministry, he was responsible for the National Insurance Bill, coordination of federal loan policy, and strengthening of the commonwealth bank. Although he served in the federal Cabinet for the next three decades, his influence was greatest in the 1920s.

Page was minister of commerce (1934–39, 1940–41) under Joseph Lyons and Robert Menzies and served as prime minister for 19 days following Lyon's death. In 1934 he established the Australian Agricultural Council, which sought government emphasis on rural production. He was knighted in 1938. As minister of health under Menzies (1949–56), he introduced a comprehensive national health plan. Page became the first chancellor of the University of New England, then Australia's only rural university, in 1955 and remained in Parliament until 1961. His autobiography, *Truant Surgeon*, was published in 1963.

Page, Sir Frederick Handley (b. Nov. 15, 1885, Cheltenham, Gloucestershire, Eng.—d. April 21, 1962, London), British aircraft designer who built the Handley Page 0/400, the world's first twin-engine bomber and one of the largest planes used in World War I.

Trained as an electrical engineer, Page turned his interest to flight and in 1909 founded Handley Page, Ltd., the first British aircraft manufacturing corporation. During World War

I he produced the first twin-engine bomber, which was capable of carrying 1,800 pounds (815 kg) of bombs. He then designed the V-1500 four-engine bomber, built to fly from England to Berlin with a bomb load of three tons. The war ended before it could be used. Handley Page Transport, Ltd., was formed in 1919 to conduct airline flights from Britain to France, Belgium, The Netherlands, and Switzerland; it later merged to form Imperial Airways.

Page, Geraldine (b. Nov. 22, 1924, Kirksville, Mo., U.S.—d. June 13, 1987, New York City), versatile American actress noted primarily for her interpretations of the heroines of Tennessee Williams' plays.

Page attended the Goodman Theatre School of Drama in Chicago (1942–45) and later studied at the Herbert Berghof School and the American Theatre Wing drama school in New York City. She appeared regularly in stock productions in the Chicago area until 1952, when she was offered the role of Alma in the Off-Broadway production of Williams' *Summer and Smoke,* which was acclaimed by audience and critics alike. In 1953 she did a radio version of Williams' *Glass Menagerie* and began to appear in Broadway productions, most notably in Andre Gide's *The Immoralist* (1954), N. Richard Nash's *The Rainmaker* (1954–55), Terrance Rattigan's *Separate Tables* (1957–58), Williams' *Sweet Bird of Youth* (1959–60), Eugene O'Neill's *Strange Interlude* (1963), Williams' *Clothes for a Summer Hotel* (1980), and John Pielmeier's *Agnes of God* (1982). Much of her best work on the stage was done with the director José Quintero.

Page's motion pictures included *Hondo* (1954), *Summer and Smoke* (1961), *Sweet Bird of Youth* (1962), *The Day of the Locust* (1975), *Interiors* (1978), and *Harry's War* (1981). She received an Oscar for her lead performance in *The Trip to Bountiful* (1985), and she won Emmy awards for her appearances in Truman Capote's television plays *A Christmas Memory* (1966) and *The Thanksgiving Visitor* (1968).

Page, Thomas Nelson (b. April 23, 1853, Oakland plantation, near Beaver Dam, Va., U.S.—d. Nov. 1, 1922, Oakland, Calif.), American author whose work fostered romantic legends of Southern plantation life.

Page attended Washington College (now Washington and Lee University), taught for a year, and in 1874 graduated in law from the University of Virginia. He practiced until 1893, when he moved to Washington, D.C., and devoted himself to writing and lecturing. He first won notice with the story "Marse

Chan" in the *Century Illustrated Magazine.* This and similar stories were collected in what is probably Page's most characteristic book, *In Ole Virginia, Marse Chan, and Other Stories* (1887), reflecting the glamorous life of the old antebellum regime and the tumults of the Civil War. His essays and social studies, including *Social Life in Old Virginia* (1897) and *The Old Dominion—Her Making and Her Manners* (1908), have the same tone as his fiction. From 1913 to 1919 Page served as U.S. ambassador to Italy. His other works include *Two Little Confederates* (1888), a children's tale; *The Burial of the Guns; and Other Stories* (1894); *The Old Gentlemen of the Black Stock* (1897); and *Red Rock* (1898), which told of Southerners rebelling against Reconstruction.

Page, Walter Hines (b. Aug. 15, 1855, Cary, N.C., U.S.—d. Dec. 21, 1918, Pinehurst, N.C.), journalist, book publisher, author, and diplomat who, as U.S. ambassador to Great Britain during World War I, worked strenuously to maintain close relations between the two countries while the United States remained neutral and who, from an early stage of the war, urged U.S. intervention on an unwilling President Woodrow Wilson.

Page worked as a journalist in various parts of the United States in the 1880s and '90s and from 1898 to 1899 was editor of *The Atlantic Monthly.* In January 1900 he and Frank N. Doubleday founded the publishing house of Doubleday, Page and Company (afterward Doubleday and Company, Inc.) and the magazine *The World's Work,* which he edited until 1913. In 1911 he was one of the first to propose Woodrow Wilson as a presidential candidate. One of Wilson's first acts after his inauguration in March 1913 was to appoint Page ambassador to Great Britain.

A firm believer in Anglo-American superiority in cultural and political matters, Page at first worked amicably with both Wilson and the British government and was largely responsible for the repeal of a U.S. Panama Canal toll schedule that the British considered discriminatory. By the outbreak of war in August 1914 he had become popular with the upper class and the general public in Great Britain. Unlike Wilson, however, Page

soon came to view the war as an attempt by imperial Germany to rule Europe and to substitute Prussian militaristic autocracy for the democratic ideal. Outwardly conforming to U.S. neutrality, Page expressed his disagreement with Wilson's policy of noninvolvement in private messages to the president. When the British steamship *Lusitania* was sunk by a German submarine (May 7, 1915), with the loss of more than 100 American lives, Page called for a U.S. declaration of war. He insisted then and later that U.S. intervention at that time would have resulted in a swift victory for the Allies. In April 1917, when Wilson did ask Congress to declare war on Germany, he used the arguments that Page had been using for two and a half years.

Always in precarious health and further weakened by his labours as ambassador, Page became so ill in August 1918 that Wilson acquiesced in his retirement. Page died shortly after returning home. An authoritative work on his career is Burton J. Hendrick's *Life and Letters of Walter H. Page,* 3 vol. (1922–25).

Page, William (b. Jan. 23, 1811, Albany, N.Y., U.S.—d. Oct. 1, 1885, Tottenville, Staten Island, N.Y.), American painter known for his sedate portraits of prominent mid-19th-century Americans and Britons.

Page was trained and initially influenced by the famed inventor and Romantic painter Samuel F.B. Morse. From 1849 to 1860 he lived in Rome, where he painted portraits of friends such as Robert and Elizabeth Barrett Browning. His best-known works, "Self-Portrait" (1860; Detroit Institute of Arts) and

pageant, a large-scale, spectacular theatrical production or procession. In its earlier meanings the term denoted specifically a car or float designed for the presentation of religious plays or cycles. By extension, the term came to mean not only the apparatus for the presentations but the presentations themselves. Because these plays were generally accompanied by great ceremony and showmanship, pageant has come to mean also any lavish production, whether indoors or outdoors, without regard to any specifically religious content. The showy public procession known as a parade is a type of pageant.

Pageants are usually used as a means of expressing national, communal, religious, or other kinds of group purpose or identity. In primitive societies processions have always been one of the most basic demonstrations of communal unity. The occasions for such processions varied greatly, ranging from fertility rites to the casting out of evil spirits to displays of military strength. Once such periods of festivity and spectacle have been established, they and the customs and processions connected with them have tended to be passed down from one culture to the next. Thus, for example, the carnival processions that precede Lent in many Roman Catholic countries are probably derived from the ancient Roman pagan feasts of the Saturnalia, the Lupercalia, and the Bacchanalia, which were occasions for parades, music, sacrifices, and general merrymaking.

An essential feature of pageantry through the ages has been the element of drama, in which the theme of a procession is illustrated with spoken words or simple dramatic action. Pageant dramas were an integral part of the major festivals of the Roman Catholic church, and these religious pageants gradually developed into the mystery plays and other theatrical precursors of Western secular drama. In some pageants, the staged presentation or dramatic storytelling is completely preeminent over simple spectacle and crowd-pleasing display. Two such pageant dramas are especially notable. Among the Shīʿite Muslims, a passion play known as the *taʿziyah* ("consolation") is performed during the first 10 days of the month of Muharram. Recounting, in often highly emotional and graphic detail, the martyrdom of the descendants of ʿAli, the son-in-law of Muḥammad, the pageant retains elements that date back to the 10th century. The *Passionsspiel* (a presentation of Christ's last hours on earth) of the village of Oberammergau in Bavaria is perhaps the best-known religious pageant drama in the West.

Coronations, royal weddings, and state visits have been the occasion for pageantry since ancient times and were especially prominent in Europe during the Middle Ages and afterward. Such entertainments included both processions and set pieces of entertainment, the latter usually representing allegorical figures who delivered their speeches against a backdrop of spectacular mechanical effects. The marriage of Louis XII of France to Mary Tudor in 1514 and the meeting of Henry VIII of England and Francis I of France in 1520 are examples of notable occasions that were marked by sumptuous and elaborate pageantry. The elaborate court masques staged for the English monarchs of the 16th and 17th centuries were a form of pageantry; essentially, these were entertainments that led up to a dance or a masked ball. Ben Jonson wrote and Inigo Jones designed some of the most famous of these masques, which illustrated a simple theme with lavish embellishments of music, poetry, costumes, and ever-changing scenery.

The use of such lavish pageantry by a single privileged class (*i.e.,* the court and aristocracy) has necessarily disappeared in the modern world, where all members of the community demand equal rights to enjoyment of the splendour of a pageant. These democratic tendencies are particularly apparent in modern carnival processions, such as those in Rome, Venice, Nice, and Rio de Janeiro; the Fasching carnivals in Munich and Cologne; and the Mardi Gras in New Orleans, in which thousands or tens of thousands of these cities' inhabitants dress up in showy costumes and take part in a procession along with floats, displays, flowers, music, and general merriment. Japan is particularly rich in such public festivals, with each city and many towns having their own particular and individualized celebrations, often involving processions of carriages and boats, effigies and shrine cars, contests, and colourful costumes.

State and military functions have long provided notable opportunities for parades and pageantry. State pageants celebrate such events as national independence, military victories, or other important historical events. Perhaps the highest expression of military pageantry was the ancient Roman custom of the triumph (*q.v.*), in which a victorious general took part in a procession through Rome along with his troops, the prisoners and spoils of war, and magistrates and members of the Senate. Modern examples of military pageantry include the gigantic victory parades held in the Allied capitals after World Wars I and II. Communist countries have adopted May 1 as the occasion for great military parades. The military parade, either by active servicemen or by veterans of past wars, remains one of the pillars of modern pageantry.

Much pageantry through the centuries has focused on contests or races. In medieval Europe, for example, jousts and tournaments were often the scenes of elaborately staged martial demonstrations. The town of Siena, Italy, is the annual setting for the Corsa del Palio, a horse race and festival that shows many elements of a pageant: jockeys are dressed in traditional medieval costumes, horses and riders are blessed in local churches, and the prize, a religious banner, is solemnly carried in procession the day before the race. The Rose Bowl Parade in Pasadena, Calif., one of the most famous parades in the world, precedes the annual Rose Bowl college football game.

The early 20th century saw a revival of a "pure" form of pageant (one that is first and foremost historical drama), most notably in the works of Louis N. Parker. Parker's insistence on accurate retellings of history, use of natural settings with little or no artificial scenery, and reliance on amateur actors served to repopularize the pageant as historical drama. Max Reinhardt also made notable contributions to modern pageant drama with his efforts to stage plays in many different kinds of locales. These efforts to emulate the past, however, have remained subsidiary to the main surviving forms of pageantry, namely the parade, the carnival, and the festival procession, at least one of which is practiced in practically every nation and which fulfill the assertion of national or communal identity in modern mass societies.

pageant wagon, wheeled vehicle used in the processional staging of medieval vernacular cycle plays. Processional staging is most closely associated with the English cycle plays performed from about 1375 until the mid-16th century in such cities as York and Chester as part of the Corpus Christi festival, but it was also common in Spain, Belgium, and the Netherlands. Each play in the cycle may have been mounted on an individual pageant wagon and performed at different locations throughout the vicinity. The pageant wagon may also have been drawn alongside a scaffold wagon, using the scaffold as a temporary stage, or been pulled up to a fixed platform stage for the duration of the play.

The pageant wagons, or large carts, each containing from one to three mansions, or scenic locales, were constructed by the trade guilds and were dismantled at the close of the season each year and stored. As no detailed description of English pageant wagons or the particulars of staging plays on the wagons had survived, there is considerable scholarly controversy both as to the actual appearance of the wagons and as to the method used for staging the plays.

Paget, Sir James, 1ST BARONET (b. Jan. 11, 1814, Great Yarmouth, Norfolk, Eng.—d. Dec. 30, 1899, London), British surgeon and physiologist who is considered (with Rudolf Virchow) to be a founder of the science of pathology.

Working at St. Bartholomew's Hospital, London (1834–71), Paget discovered (1834) in human muscle the parasitic worm that causes trichinosis. Paget was a professor of anatomy and surgery (1847–52) and was later vice president (1873–74) and president (1875) of the Royal College of Surgeons. He rendered

excellent descriptions of breast cancer, an early indication of breast cancer known as Paget's disease (1874; an inflammatory cancerous condition around the nipple in elderly women), and Paget's disease of bone (1877; a bone inflammation also known as osteitis deformans). Also named for him is Paget's abscess, one recurring about the remains of a former abscess. He was one of the first to recommend surgical removal of bone-marrow tumours (myeloid sarcoma) instead of amputation of the limb.

A surgeon of international repute, he served as surgeon extraordinary (1858–67), sergeant surgeon extraordinary (1867–77), and sergeant surgeon (1877) to Queen Victoria. He was created a baronet in 1871. Among his works are *Lectures on Tumours* (1851), *Lectures in Surgical Pathology* (1863), and *Clinical Lectures and Essays* (1875).

Paget's disease of bone, also called OSTEITIS DEFORMANS, moderately common chronic disease of middle age, characterized by local disorganized bone-destructive processes alternating with bone-constructive activity. The disease leads to deformity, fracture, and imbalance in calcium metabolism and carries with it an increased risk of cancer, particularly osteosarcoma. The long bones, vertebrae, pelvis, and skull are most commonly affected, in men more often than in women. In the bone-destructive stages, bones soften and become a site for the pooling of blood, which may lead to heart or circulatory trouble; calcium builds up in the blood as it is lost from bones, sometimes resulting in kidney stones or systemic calcium poisoning. In bone-constructive stages, bones are dense and brittle and fracture easily. There is no generally accepted treatment for the disease, which is named for Sir James Paget, who first described it.

Pagninus, Santes, also called PAGNINI, or PAGNINO (b. Oct. 18, 1470, Lucca, Republic of Lucca [now in Italy]—d. Aug. 24, 1536, Lyon, Fr.), Dominican scholar whose Latin version of the Hebrew Bible—the first since St. Jerome's—greatly aided other 16th-century scriptural translators.

In 1487 he joined the Dominicans at Fiesole, Republic of Florence, where he became a disciple of Girolamo Savonarola. In 1516 he went to Rome, where Pope Leo X encouraged his work. From 1523 to 1526 he lived in Avignon, then settled in Lyon, where in 1528 he published his Latin translation of the entire Bible, apparently the first to divide chapters into numbered verses. In 1529 Pagninus issued a Hebrew lexicon, *Thesaurus linguae sanctae* ("Thesaurus of the Sacred Language"), which was frequently republished.

Pagninus' translation was remarkably literal, so, despite his inelegant, even crude, style, his Bible was reprinted several times. Although more accurate than the Vulgate, and hence more useful to other translators needing help with Hebrew or Greek, Pagninus' version was not intended to supersede the Vulgate except for purely scholarly purposes; it is now chiefly of historical interest.

Pagnol, Marcel Paul (b. Feb. 25, 1895, Aubagne, Fr.—d. April 18, 1974, Paris), French writer and motion-picture producer-director who won both fame as the master of stage comedy and critical acclaim for his filmmaking. He was elected to the French Academy in 1946, the first filmmaker to be so honoured.

Pagnol's father was superintendent of the town's schools, and Pagnol likewise trained for a teaching career. He obtained his teacher's diploma from the faculty of letters of the University of Montpellier. He wrote poetry, novels, and plays while working as a teacher. After World War I Pagnol published the novel *Pirouettes* and had several plays produced in the provinces. He transferred to teach at a school in Paris in 1922, and there, three years later, his play *Les Marchands de gloire* (1925; *The Merchants of Glory*), written with Paul Nivoix, opened to high critical praise. Because of its unpopular subject matter, war profiteering, the play did not have wide appeal and closed after a few performances. Undaunted, Pagnol finally in 1926 had a hit with *Jazz,* which won both critical and popular success. *Topaze* (1928) secured Pagnol's reputation as a major French playwright. *Topaze* ran for two years in Paris and was later adapted for the Broadway stage and made into a film in 1933. His next three comedies—*Marius* (1929), *Fanny* (1931), and *César* (1936), known as the Marseille trilogy—deal with the lives of a Marseille fishmonger, Fanny, her lover Marius who goes off to sea, César the father, and his friend Panisse. The salty language of the people and Pagnol's ability to capture the atmosphere of the port at Marseille made the plays universally appealing, and the films made from them influenced the later Neorealists. The plays also inspired the Broadway musical *Fanny,* which was later adopted into a motion picture.

In 1931 Pagnol decided to become a filmmaker. He opened his own movie studio in 1933 and went on to direct such award-winning films as *Angèle* (1934), *Regain* (1937; *Harvest*), *La Femme du boulanger* (1938; *The Baker's Wife*), *La Fille du puisatier* (1940; *The Well Digger's Daughter*), and *Les Lettres de mon moulin* (1954; *Letters from My Windmill*). His films are set in Provence and were often adapted from stories by Jean Giono. They depict the lives of the farmers and shopkeepers of rural southern France and feature tightly constructed plots and realistic dialogue. Pagnol wrote extensively on filmmaking and was the author of three autobiographical volumes.

Pago Pago, formerly PANGO-PANGO, port and administrative capital (since 1899) of American Samoa, on the south shore of Tutuila island, southwestern Pacific Ocean. It is situated at the head of a densely wooded and steep-sided inlet forming a deeply indented, landlocked harbour. The site was chosen in 1872 by Commander R.W. Meade, who negotiated facilities for a coaling station for the U.S. Navy from the Samoan high chief Mauga. It remained an active naval base from

1900 to 1951 and is now a regular port of call for all types of vessels. Canned tuna is the dominant export. Pago Pago International Airport (formerly Tafuna), built partly on a fringing reef, opened in 1964 and has stimulated tourist traffic. Pago Pago is no longer the shabby place depicted by Somerset Maugham in his short story "Rain" but has assumed a modern look, with new homes, roads, and other amenities. It has worldwide radio and telegraph communications. Pop. (1985 est.) 3,400.

pagoda, in East and Southeast Asia, a towerlike, multistoried structure of stone, brick, or wood, usually associated with a Buddhist temple complex. The pagoda derives from the stupa of ancient India, which was a dome-shaped commemorative monument, usually erected over the remains or relics of a holy man or king. The hemispherical domed stupa of ancient India evolved into several distinct forms in various parts of Southeast and East Asia. The finial, or decorative crowning ornament of the stupa, became more elongated and cylindrical until the stupa's upper portion took on an attenuated, towerlike appearance. This stupa form was adopted by Buddhism as an appropriate form for a monument enshrining sacred relics and became known to Westerners as a pagoda. The Buddhist pagoda was elaborated in Tibet into a bottle-shaped form; it took pyramidal or conical designs in Burma, Thailand, Cambodia, and Laos; and in China, Korea, and Japan, it evolved into the best-known pagoda form. The latter was a tall tower consisting of the vertical repetition of a basic story unit in regularly diminishing proportions. The stories can be circular, square, or polygonal. Each story in an East Asian pagoda has its own prominent projecting roof line, and the whole structure is capped by a mast and disks. The pagoda form is intended primarily as a monument and has very little usable interior space.

pagoda tree, any of several trees of erect, conical form suggesting a pagoda, particularly *Sophora japonica,* commonly called the Japanese pagoda tree, or the Chinese scholar tree. A member of the pea family (Fabaceae), it is native to East Asia and is sometimes cultivated in other regions as an ornamental. It grows 12–23 m (about 40–75 feet) tall. The alternate, compound leaves consist of 7 to 17

leaflets. The yellowish white flowers, about 1 cm (0.4 inch) long, grow in loose, showy clusters 30–35 cm (12–14 inches) long. The fruit is a pod 5–7.5 cm (2–3 inches) long.

The pagoda dogwood is *Cornus alternifolia,* a member of the family Cornaceae; it is used in landscaping for its horizontal branching habit.

Pahang, region, eastern West Malaysia (Malaya). Its eastern coastline stretches along the South China Sea. Pahang occupies the vast Pahang River basin, which is enclosed by the Main Range to the west and the eastern highlands to the north.

A Chinese chronicle by Cha Ju Kua (*c.* 1225) mentions the Pahang region as subject to the Sumatran kingdom of Srivijaya. After the 15th century it was part of the kingdom of Malacca and later came under the control of Johore to the south. The representatives from Johore eventually established an independent sultanate, which received British protection in 1887. Pahang became one of the Federated Malay States in 1895 and after World War II joined the Federation of Malaya.

Although most of the region is dense jungle, its central plains are intersected by numerous rivers, and along the coast there is a 20-mile (32-kilometre) wide expanse of alluvial soil that includes the deltas and estuarine plains of the Kuantan, Pahang, Rompin, Endau, and Mersing rivers. The region's thinly settled population consists of Malays, Chinese, and seminomadic Aboriginals. Malay farmers and fishermen live along the rivers and coast. Chinese dominate the larger towns to the west. Kuantan and Pekan are the largest settlements in the region.

The Pahang region is linked by road to Kuala Lumpur and Singapore, and the centrally located Gemas–Kelantan railway passes through the Pahang region, terminating in the Kelantan region to the north. Kuantan, the Malay Peninsula's most important east coast port, is supplemented by new port facilities at Tanjung Gelang; river transport, though highly localized, is important in the roadless interior.

Rubber estates are located along the Pahang River, the railway, and the major roads. Rice is extensively farmed in the coastal river deltas. Other products include coconuts, tobacco, gutta-percha (a tough latex derivative), rattan, and hemp. Large-scale development projects have resulted in the clearing of hundreds of square miles of jungle forest for oil-palm and rubber plantations and the resettling of several hundred thousand people in new villages. There are large iron ore reserves at Rompin (mining ceased in 1970), gold is mined at Raub, and at Sungai Lembing one of Malaya's major mines for deep-vein tin has been in operation since 1888. Malaysia's substantial oil and natural gas fields lie offshore in the South China Sea.

Taman Negara (national park), with an area of 1,677 square miles (4,343 square km) and the site of Mount Tahan (7,185 feet [2,190 m]), highest mountain of the Malay Peninsula, is in the northeast portion of Pahang. The Kerau Wildlife Reserve is located in the centre of the region.

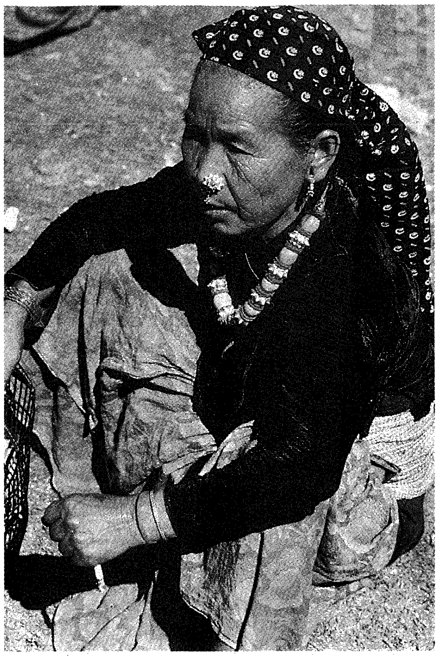
Pahang River, river in Pahang region, West Malaysia (Malaya). It is the longest river on the Malay Peninsula. It rises in two headstreams, the Jelai and Tembeling, about 10 miles (16 km) north of Jerantut and flows south past Temerloh, paralleling the Main Range to Mengkarak, where, at the break of slope between the mountains and the plains, it abruptly turns eastward. The river then completes its 271-mile (436-kilometre) course, through alluvial plains more than 20 miles (32 km) wide, to empty into the South China Sea at Pekan.

Navigable upstream by shallow-draft boats for about 250 miles (400 km), the Pahang was a vital link in the porterage route between the Malay Peninsula's east and west coasts during the 15th and 16th centuries. Settlers later moved upriver, establishing rubber and coconut plantations along its banks. Deforestation in the river's basin has led to heavy flooding during the monsoon season (November–February).

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Pahāṛī, also called PARBATE, KHĀSĀ, or CHETRĪ, people of mixed descent who constitute about three-fifths the population of Nepal and a majority of the population of neighbouring Himalayan India (in Himachal Pradesh and northern Uttar Pradesh). They speak languages belonging to the Indo-Aryan branch of the Indo-European family; the people are historically ancient, having been mentioned by the authors Pliny and Herodotus and figuring in India's epic poem, the *Mahābhārata*. Their numbers were estimated to be about 20,000,000 in the late 20th century.

The great majority of the Pahāṛī are Hindus, but their caste structure is less orthodox and less complex than that of the plains to the south. Usually they are divided into the



Pahāṛī woman of Pokhara, Nepal

high "clean" or "twice-born" castes (Khasia, or Ka) and the low "unclean" or "polluting" castes (Dom). Most of the high-caste Pahāṛī are farmers; the Dom work in a variety of occupations and may be goldsmiths, leatherworkers, tailors, musicians, drummers, and sweepers.

Polyandry is apparently widespread (several brothers, in particular, may share one or more wives), but other marital arrangements are certainly more common; some families have an equal number of husbands and wives; in a few, one husband has several wives; and some families have only one husband and one wife. Most girls are married before they are 10 years old, though they do not cohabit with their husbands until they are mature. There is a double standard of sexual behaviour for women, who must be faithful to their husbands while living with them; when a married woman goes home to visit her parents, however, she is permitted the liberties of an unmarried girl.

The Pahāṛī are an agricultural people, cultivating terraces on the hillsides. Their chief crops are potatoes and rice. Other crops include wheat, barley, onions, tomatoes, tobacco, and various vegetables. Sheep, goats, and cattle are kept. The spinning of wool is done by everyone, while weaving is carried on by members of a lower caste.

Pahari languages, group of Indo-Aryan languages spoken in the lower ranges of the Himalayas (*pahāṛī* is Hindi for "of the mountains"). Three divisions are distinguished: Eastern Pahari, represented by Nepali of Nepal; Central Pahari, spoken in the north of Uttar Pradesh state; and Western Pahari, found around Simla in Himachal Pradesh state. The most important language is Nepali (Naipali), also called Khas-kura and Gorkhali (Gurkhali). Because many of the inhabitants of Nepal speak Tibeto-Burman languages, Nepali has borrowed many Tibeto-Burman idioms. The Nepali language was taken to Nepal by the Gurkha conquerors in 1769. The chief Central Pahari languages are Garhwali and Kumauni. Western Pahari includes a great number of dialects, of which the most important are Sirmauri, Kiunthâli, Jaunsari, Chameali, Churahi, Mandeali, Gadi, and Kuluhi. Pahari dialects have several linguistic features in common with Rajasthani and Kashmiri.

Pahari painting, style of miniature painting and book illustration that developed in the independent states of the Himalayan foothills in India. The style is made up of two markedly contrasting schools, the bold intense Basohli and the delicate and lyrical Kangra. Pahari painting—sometimes referred to as Hill painting (*pahārī*, "of the hills")—is closely related in conception and feeling to Rājasthanī painting and shares with the Rājput art of the North Indian plains a preference for depicting legends of the cowherd god Krishna.

The earliest known paintings in the hills (*c.* 1690) are in the Basohli idiom, a style that continued at numerous centres until about mid-18th century. Its place was taken by a transitional style sometimes referred to as pre-Kangra, which lasted from about 1740 to 1775. During the mid-18th century, a number of artist families trained in the late Mughal style apparently fled Delhi for the hills in search of new patrons and more settled living conditions. The influence of late Mughal art is evident in the new Kangra style, which appears as a complete rejection of the Basohli school. Colours are less intense, the treatment of landscape and perspective is generally more naturalistic, and the line is more refined and delicate.

By 1770 the lyrical charm of the Kangra school was fully developed. It reached its peak during the early years of the reign of one of its important patrons, Rājā Sansār Chand (1775–1823).

The school was not confined to the Kangra state but ranged over the entire Himalayan foothill area, with many distinctive idioms. As the independent states in the foothills were

small and often very close to each other, it is difficult to assign a definitive provenance to much of the painting.

The life and loves of Krishna as expressed in the poetic works the *Bhāgavata-Purāṇa* and the *Gītagovinda* make up the commonest theme of the paintings, together with other Hindu myths, hero-heroine and *rāgamālā* (musical modes) series, and portraits of hill chiefs and their families. After 1800 the school began to decline, though painting of inferior quality continued to be done through the remainder of the 19th century.

Pahiatua, borough, southern North Island, New Zealand, at the confluence of the Mangatainoka River and Mangaramarama Creek, 80 mi (130 km) northeast of Wellington. It was founded in 1881 by Scandinavian immigrants and gazetted a borough in 1892. The town was almost totally destroyed in 1897 when a fire occurred in the surrounding Forty Mile Bush Forest. Pahiatua now serves an area of dairy, mixed, and fat-lamb farming and has various light industries. On the Napier–Palmerston North State Highway, it is linked to the North Island Main Trunk Railway by a 1.5-mi spur. The name Pahiatua comes from a Maori term meaning "the place of a god." Pop. (1983 est.) 2,600.

Pahlavi alphabet, Pahlavi also spelled PEHLEVI, writing system of the Persian people from the 2nd century BC until the advent of Islām (7th century AD); the Zoroastrian sacred book, the Avesta, is written in a variant of Pahlavi called Avestan. The Pahlavi alphabet developed from the Aramaic alphabet and occurs in at least three local varieties: northwestern, called Pahlavik or Arsacid; southwestern, called Parsik or Sāsānian; and eastern. All were written from right to left. Of the 22 letters in Aramaic, most came to represent more than one sound in Pahlavi; several were not used at all, and one evolved into two letters in Pahlavi. Northwestern Pahlavi had 20 letters, and southwestern had 19. Avestan, a cursive script, has 50 distinct letters and was perhaps separately invented, patterned after Pahlavi.

A peculiarity of the Pahlavi writing system was the custom of using Aramaic words to represent Pahlavi words; these served, so to speak, as ideograms. An example is the word for "king," in Pahlavi *shāh,* which was consistently written *m-l-k* after the Aramaic word for "king," *malka,* but read as *shāh.* A great many such ideograms were in standard use, including all pronouns and conjunctions and many nouns and verbs, making Pahlavi quite difficult to read.

Pahlavi Dam: *see* Dez Dam.

Pahlavi language, also spelled PEHLEVI, major form of the Middle Persian language (*see* Persian language), which existed from the 3rd to the 10th century and was the official language of the Sāsānian Empire (AD 226–652). It is attested by Zoroastrian books, coins, and inscriptions. Pahlavi books were written in a confusing writing system of Aramaic origin called the Pahlavi alphabet. The major part of Pahlavi literature is religious, including translations from and commentaries on the Avesta. Little has survived from pre-Islāmic times, and the *Bundahishn* and *Dēnkart,* both Zoroastrian religious works, date from the Islāmic period. Manuscripts were preserved by the Parsis (Zoroastrians) of Bombay and elsewhere. Pahlavi was superseded by Modern Persian, written in the Arabic alphabet.

Pai, Pinyin BAI, also spelled PO, also called MIN-CHIA, people of Yunnan Province in southwest China. Min-chia is the Chinese (Wade-Giles) name for them; they call themselves Pai or Po in their own language, which has been classified in the Yi group of the Tibeto-Burman languages. Until recently the language was not written. It contains many words borrowed from Chinese but is itself a non-Chinese, tonal, polysyllabic language with a markedly different grammatical structure.

Occupying a triangular area from Shih-ku on the upper Yangtze River down to Hsia-kuan at the foot of Erh Hai (lake), the Pai in the late 1970s were estimated to number nearly 1,000,000, of whom 480,000 lived on the fertile plain between the Ts'ang Shan (mountains) and the lake.

Since the establishment of the People's Republic of China, the Pai, in accordance with the Communist policy toward non-Chinese peoples, have been given status as a national minority and are now organized in the Ta-li Pai Autonomous Prefecture. Ta-li, a county seat, was from the 6th to 9th century the capital of the kingdom of Nan-Chao. The Pai probably already formed the bulk of the population of the district at that time.

Most of the Pai are cultivators of wet rice, along with various vegetables and fruits. Those in the hills grow barley, buckwheat, oats, and beans. The lake is heavily fished.

They have their own social and kinship organization, based on the village and the extended family (parents, married sons, and their families). Marriages are generally monogamous, although the well-to-do may take concubines. Cousins may marry. Their religion differs little from that of the Chinese; they venerate local deities and ancestral spirits as well as Buddhist and Taoist gods.

Pai-ch'eng, also called T'AO-AN, Pinyin BAICHENG or TAOAN, city, Inner Mongolian Autonomous Region (*tzu-chih-ch'ü*), China. It is a county-level municipality (*shih*) and the administrative centre of Pai-ch'eng Prefecture (*ti-ch'ü*). The region was originally a hunting ground reserved for the Mongols and was not opened for legitimate colonization by the Chinese until 1902; it is an area of extensive agriculture with pastoral activities playing a major role.

Pai-ch'eng was first established as a county seat, called Ching-an, in 1904; it remained a place of minor importance until the opening of the railway from Tsitsihar to Ssu-p'ing in 1920. In 1930 another line was opened to Wu-lan-hao-t'e (now K'o-erh-ch'in-yu-i-ch'ien-ch'i, in Inner Mongolia), enabling Pai-ch'eng to become the market centre for the Mongolian border area; another line to the east was constructed by the Japanese in the 1930s.

P'ai-cheng had only a small population at the end of World War II; it had a small generating plant and a paper mill but little industry. Since 1949 more small-scale industry has been established, based on local agriculture. Pai-ch'eng, however, remains essentially an administrative and commercial centre. Coal mines are located nearby. Pop. (mid-1970s est.) 100,000–300,000.

pai-hua (Chinese: "colloquial language"), vernacular style of Chinese adopted as a written language in a movement to revitalize the Classical Chinese literary language and make it more accessible to the common people. Started in 1917 by the philosopher and historian Hu Shih, the *pai-hua* literary movement succeeded in making *pai-hua* the language of textbooks, periodicals, newspapers, and public documents, thus causing a definite change in Chinese cultural life.

pai-miao (Chinese: "plain drawing"), Pinyin BAIMIAO, in Chinese painting, brush technique that produces a finely controlled, supple ink outline drawing without any colour or wash (diluted ink or paint applied in broad sweeps) embellishment. It is commonly used for figure painting, in which precise description is important.

Painting, chiefly of flowers or bamboo, characterized by distinctly outlined coloured areas, is called *kou-le-hua.* Painting without outline but rather with forms achieved by washes of ink and colour is known as *mo-ku,* or "boneless."

Pai River, Wade–Giles romanization PAI HO, Pinyin BAIHE, river in Hopeh Province, northern China, rising near the Great Wall near Kuyüan and flowing generally southeast past Tunghsien, east of Peking, to join the Yungtin Ho (river) after a course of 300 mi (480 km).

Pai-se, also called PO-SE, Pinyin BAISE or BOSE, city in western Kwangsi Chuang Autonomous Region (*tzu-chih-ch'ü*), China. It is a county (*hsien*) seat and the administrative centre of Pai-se Prefecture (*ti-ch'ü*) on the borders of Yunnan and Kweichow provinces. Pai-se is on the Yu Chiang (river), which flows southeast to Nan-ning, and is situated at its junction with its tributary, the Ssu-ch'eng Ho. It is at the limit of navigation on the Yu Chiang for small craft and is also at the centre of a highway network radiating to the north and west. Transport routes also lead into the neighbouring provinces of Yunnan and Kweichow, linking them with Nan-ning and central Kwangsi. Until comparatively recent times, Pai-se was in the territory of non-Chinese tribes and was only loosely controlled by the Chinese. A subdistrict (*t'ing*), Pai-se was set up and fortified in 1730 as a garrison among the tribes, but not until 1875 was a regular civil administration established. During the late 19th century, Pai-se became a trading centre, and a considerable colony of merchants from Canton settled there. The goods collected for export include kapok (floss used as stuffing), ramie (a textile fibre), aniseed, edible fungi, and various herbs. In the 19th and the early 20th centuries it was a centre of the opium traffic, with processed opium from Yunnan and Kweichow being collected there by Cantonese merchants for shipment to Nan-ning, Canton, Hong Kong, and Shanghai. Since 1949 some minor industry has developed, including sugar refining, tobacco curing, rice milling, and ceramic manufacture. Pop. (mid-1970s est.) 10,000–50,000.

paideia (Greek: "education," or "learning"), system of education and training in classical Greek and Hellenistic (Greco-Roman) cultures that included such subjects as gymnastics, grammar, rhetoric, music, mathematics, geography, natural history, and philosophy. In the early Christian era the Greek *paideia,* called *humanitas* in Latin, served as a model for Christian institutions of higher learning, such as the Christian school of Alexandria in Egypt, which offered theology as the culminating science of their curricula. The term was combined with *en kykōi* ("complete system," or "circle") to identify a large compendium of general education, hence "encyclopaedia."

Paige, Satchel, byname of LEROY ROBERT PAIGE (b. July 7, 1906?, Mobile, Ala., U.S.—d. June 8, 1982, Kansas City, Mo.), U.S. athlete, a professional baseball pitcher who earned legendary fame during his many years in the Negro leagues; he finally was allowed to enter the major leagues in 1948, after the unwritten rule against black players was relaxed. A right-handed, loose-jointed "beanpole" standing 6 feet 3½ inches, Paige had considerable pitching speed and developed a comprehensive mastery of slow-breaking deliveries.

In his later years Paige, a humorous man, derived much amusement from the controversy about his age; his birth date is sometimes placed as early as Dec. 18, 1899. He was surely well past his prime in 1948 when team owner Bill Veeck signed him for the Cleveland Indians, but he helped to spark that team to American League pennant and World Series victories that year. When Veeck purchased the

St. Louis Browns, Paige joined that team and was its most effective relief pitcher from 1951 through 1953.

Before his major league career, Paige was a pitcher for various teams in the Negro Southern Association and the Negro National League. Wearing a false red beard, he also played for the bearded House of David team. A true "iron man," he pitched in the Caribbean, Central America, and South America during the northern winter. As a barnstormer he would travel as many as 30,000 miles a year while pitching for any team willing to meet his price. In 1935 he pitched every day for 29 days.

Despite the colour bar, Paige faced the best major league players in exhibition games before 1948. He once struck out Rogers Hornsby, probably the greatest right-handed hitter in baseball history, five times in one game. In Hollywood in 1934 Paige scored a spectacular 1–0 victory in 13 innings over Dizzy Dean, who won 30 games for the St. Louis Cardinals that year. Paige was elected to the Baseball Hall of Fame in 1971.

Päijänne, Lake, lake located in parts of the *läänit* (provinces) of Keski-Suomi, Häme, and Mikkeli, south central Finland. It has an area of 421 sq mi (1,090 sq km), making it the largest single Finnish lake. It has a maximum depth of 305 ft (93 m) and is about 85 mi (135 km) long and between 2 and 18 mi wide. The lake is broken by thousands of islands. Jyväskylä, at the northern tip of the lake, and Heinola, on a southeastern branch of the lake, are the principal towns. They are connected by ship service with the major city of Lahti to the south of Lake Päijänne via the Vesijärven Kanava (canal) and lake. The Päijänne lake system is drained southward to the Gulf of Finland by the Kymijoki (river). The irregular shoreline around Lake Päijänne is heavily forested and supports important timber operations that use the lake as a means of transport. Numerous villages dot the shore of the lake, and many private villas are located on the quiet bays off its southern end.

pain, experience associated with injury or some type of damage to the body. Pain helps to preserve the organism by securing withdrawal from harmful agents. Alternatively, in sick people, pain may secure the rest that is needed for healing. Nature often is overabundant, however, and pain at times appears unnecessarily severe. This happens especially in some cases of damage to the nervous system.

Although the experience of pain is psychological and subjective, scientists know much about its anatomical and physiological bases. A minimal effective condition for the experience of pain is any stimulus that can cause tissue damage, even if slight and easily reversible. There is evidence that persons learn to discriminate the experience of pain as a result of events in infancy. Withdrawal from damaging stimuli occurs readily and early in humans and other animals. There are indications, however, that undue protection from the experience of damage reduces the ability to feel pain or to discriminate the stimuli that give rise to it. Not only does the unburned child not fear the fire, he may less readily have pain or know what it is when he is ultimately burned.

There is a very small number of persons born without the ability to feel pain at all, or else very little. Although they may survive without disability, they are at greater risk of suffering, or neglecting, burns, fractures, or infections. A similar effect has been produced in one recorded case by accidental damage to part of the midbrain. The life expectancy in these cases is shorter than average.

Even in people without this disability severe injury quite often does not cause pain; on the other hand, pain in adults often occurs for psychological reasons, in circumstances such that a physical basis for this bodily experience is, apparently, either absent or secondary. Thus an important proportion of persons with pain have their pain not because of any physical disease but because of emotional disorders (see below, *Psychological and emotional factors*). Nevertheless, pain is primarily associated with injury. To allow for this, for the learning of pain, for its usual subjective patterns, and for the frequent lack of evidence of a physical basis, pain has been defined operationally as an unpleasant experience, primarily associated with injury to tissue, and described in terms of such damage.

Neurophysiological bases. Before the 19th century, theorists, physicians, and others tended to think of pain as an emotion rather than as a sensory experience. Anatomical and neurophysiological discoveries overwhelmingly resulted in its later classification as a sensory activity. More modern research, however, does not sustain such a limited sensory classification, although the neurophysiological basis remains extremely important.

Pain is generally reported after injurious stimuli (or others, such as electric shock, which are not always damaging) are applied to normal skin or other tissues that contain microscopic structures called free nerve endings. Free nerve endings seem to subserve other experiences besides pain and are widely distributed to internal and external body surfaces; from them nerve fibres conduct impulses to the spinal cord. A stimulated point on the skin that is supplied by free nerve endings can, under varying circumstances, give rise to reports of other experiences (*e.g.,* heat, cold) as well as pain. Thus it can be argued that pain can best be related to variable anatomic and physiological *patterns* rather than to specific, unchanging neural pathways, each resembling the track of an isolated single railway line.

Nevertheless, there is also evidence that some nerve fibres in the vicinity of their receptors (*i.e.,* near such peripheral parts of the body as the skin) do respond in a fairly specific way to noxious stimulation. Accordingly, even at the most peripheral level it seems that there are some fixed elements that contribute to the physiological basis for the experience of pain. Their effects, however, seem to be modified by other concomitant patterns of activity deeper within the nervous system. In general, the nerve fibres that respond in a fixed way to noxious stimulation belong to the smaller myelinated and to the unmyelinated groups of fibres. (Myelinated fibres are those covered with a fatty sheath that seems to have an insulating function.) These conduct impulses more slowly than the larger fibres, which have been related to such sensory experiences as touch and pressure.

Some of the so-called pain fibres are distributed to what is named (from its appearance) the posterior horn of gray matter in the spinal cord. Here they appear to be in close relationship to the substantia gelatinosa, an area lying at the tip of the posterior horn. Additional fibres cross from the two posterior horns to the opposite side of the spinal cord where they run in an area of white matter known as the anterolateral column. Several tracts run in this column, including a spino-thalamic tract that goes to the thalamus, which serves as a kind of relay centre in the brain. There is a wealth of evidence that interruption of this tract either by injury or disease (sometimes very highly localized damage) results in loss of the ability to feel pain from stimuli applied to the opposite side of the body in parts below the level of interruption.

Such loss is found to be an invariable consequence of full interruption of the pathways mentioned; more spatially restricted loss occurs after injuries to individual nerves. In a small proportion of cases, damage to the pathways may result in the spontaneous occurrence of pain, referred to the area supplied by the pathway, as well as a loss of sensory input. When this pain follows from damage to peripheral nerves, it is usually reported as burning in character and is called causalgia. After a limb is lost, the amputee normally still experiences the impression that it remains; this effect of a phantom limb is also sometimes accompanied by phantom pain (often very unpleasant). Spontaneous discomfort similar to causalgia can occur when there is damage to more centrally located structures (such as the spinal cord or the thalamus) and is known as central pain. It is convenient to call central pain, phantom-limb pain, and causalgia, jointly, neurogenic pain.

A coherent theory is thus available to account for experienced variations in pain by invoking the influence both of local peripheral events and of higher levels in the nervous system. Stated in neurophysiological language, this theory accounts for many of the observed phenomena. While it allows for fixed peripheral input, it also places particular weight on the pattern of input and on the possibility of psychological influence associated with relevant brain processes.

Psychological and emotional factors. Some theories of pain are given primarily in psychological terms without specifying possible neural bases for them. As noted above, pain frequently is attributed to psychological (*e.g.,* emotional) factors. Secondly, an emotional state (*e.g.,* anxiety) often can enhance or abate pain that arises from observable physical sources. In consequence it is often convenient to talk of pain in introspective terms whenever its possible neurophysiological basis remains incompletely explained.

Limited evidence indicates that persistent muscle tension will give rise to pain, as in holding an unfamiliar posture on a long journey. Similarly, there may be contraction of muscles as a result of anxiety, particularly in the neck and scalp. Tension in these muscles produces pain, notably headache, which generates further anxiety and alarm; this makes the pain even worse, in what seems to be a vicious circle. Relaxation and the easing of anxiety frequently bring relief. Such pain may be called psychosomatic; *i.e.,* it seems to be a bodily effect stemming from a psychological disturbance.

Sometimes pain seems to arise from an idea. The psychoanalyst Sigmund Freud reported the case of a man who attended an operation in which his brother's hip joint was to be straightened under an anesthetic. The joint was frozen in place by some abnormal adhesions that had to be broken; when a loud crack was heard, the man said he felt a pain in his own hip at the same moment, in what might be interpreted as sympathetic identification. Pain can arise as a hallucination as well; this may happen among people who are severely depressed and occasionally among those who suffer from schizophrenia or epilepsy.

Alleviation of pain. In addition to physical lesions in the body generally and in the nervous system especially, factors related to pain include age, sex, occupation, social circumstances, learning effects, and anxiety. There is much evidence that pain can be alleviated by drugs and psychiatric techniques designed to reduce anxiety. Although analgesics such as acetylsalicylic acid (aspirin) have a special pharmacological effect in the relief of pain, any drug or other measure that increases confidence and abates fear also will ease pain.

When drugs work by altering mood, their effect is partly attributable to the effects of suggestion and the expectation that relief will occur. This commonplace placebo effect (*e.g.,* relief by swallowing sugar pills) seems actually to result in less pain to the extent that the sufferer believes he will improve, becomes more confident, has more hope, and less anxiety. With such drugs as aspirin, part of the benefit is attributable to direct pharmacological effects on anxiety and hence on pain, and part to the psychological expectation of relief.

The abolition of pain by trance states, including hypnosis, has long been accepted. Without taking all claims at their face value, it can be accepted that the modification of attitudes does at times abate pain. While this holds for moderate and slowly rising intensities of pain, it seems much less effective for sudden or severe pain. Nevertheless, under special circumstances (as in battle), severe wounds may not be noticed until later.

Pain seems alleviated to a very similar extent by hypnosis, placebos, suggestion, psychotherapy, and other means that relieve anxiety, including sedatives and the milder analgesics. For effective relief, more severe pain with a mainly organic basis tends to require potent drugs, local anesthesia, or neurosurgery. Surgical operations on selected portions of the brain may be effective in pain relief, although such methods are applied highly selectively and are not routine.

Since the 1970s, it has been known that the perception of pain is mediated by neurochemicals called endorphins, which seem to function as the body's own analgesics. High concentrations of endorphins alleviate pain, apparently by binding to specific brain tissues that are involved in the perception of pain. It is probable that many of the therapeutic measures that help relieve pain do so by increasing the level of endorphins. For example, acupuncture appears to function at least partly in this way. In addition, morphine, heroin, and other opiates—which are among the most potent (and dangerous) analgesics known—are chemically similar to endorphins and seem to achieve their pain-relieving effects by binding to the same sites as do endorphins.

Chronic pain. Chronic pain is a much more complex problem than acute or short-term pain, and invariably has behavioral components that are best dealt with by a combination of psychological and physical approaches. Pain control for the chronic sufferer can employ a variety of methods: acupuncture, hypnosis, drugs, biofeedback, electrical stimulation, chemical nerve blocks, severing of peripheral or spinal cord nerves, and even brain surgery. For many chronic sufferers, however, pain is a learned phenomenon that can persist even in the absence of an organic basis. Pain has proved to be a highly malleable response, conditioned partly by anxiety and fear but also susceptible to rewards derived from the disability, such as financial gain, increased leisure time, freedom from work and interpersonal demands, and extra attention.

Psychologist Wilbert Fordyce, a pioneer in the behavioral approach to pain treatment, distinguishes between the type of pain that is a direct response to a stimulus and the type that is learned and therefore susceptible to "unlearning." Many pain clinics operate on Fordyce's principle that pain behaviours (*e.g.,* complaining and limping) may have been reinforced by some of the rewards of pain. These behaviours are closely tied to the actual experience of pain, and if they can be eliminated, the pain will be at least partly ameliorated. In such clinics patients are rewarded for "well" behaviour.

Insight therapy (*e.g.,* psychoanalysis or Gestalt therapy) may be another means for helping patients understand why they are emotionally dependent on their pain and learn less debilitating ways to get their needs satisfied. In some cases, pain may be a manifestation of depression, in which case therapy and antidepressant medication may bring relief. *See also* behaviour therapy; biofeedback.

Paine, John Knowles (b. Jan. 9, 1839, Portland, Maine, U.S.—d. April 25, 1906, Cambridge, Mass.), U.S. composer and organist, the first American to win wide recognition as a composer and the first professor of music at a U.S. university.

After a thorough musical grounding in Portland, Paine completed his studies in Berlin (1858–61). In 1861 he initiated a series of organ recitals and lectures in Boston that led to his appointment (1862) as professor of music at Harvard. The music department he organized there became a model for those of many other American universities.

Both as a teacher and as a composer he was a major influence on the development of music in the United States. His works, generally modelled on the German classics, include two symphonies, a *Mass in D* (1866–67), and the oratorio *St. Peter* (1872).

Paine, Robert Treat (b. March 11, 1731, Boston—d. May 11, 1814, Boston), American politician, jurist, member of the Continental Congress (1774–78), and signer of the Declaration of Independence.

Paine graduated from Harvard in 1749 and, after trying teaching and the ministry, turned to the study of law and was admitted to the Massachusetts bar in 1757. An early champion of the patriot cause, he gained recognition throughout the colonies in 1770 when he was chosen as a prosecuting attorney in the murder trial of British soldiers involved in the Boston Massacre of March 5, 1770. He was elected several times to the Massachusetts legislature in the 1770s, and became the state's first attorney general in 1777. He helped draft the state constitution in 1780, and from 1790 to 1804 served as a judge of the state supreme court. Long interested in astronomy, Paine was a founder of the American Academy of Arts and Sciences in 1780.

Paine, Thomas (b. Jan. 29, 1737, Thetford, Norfolk, Eng.—d. June 8, 1809, New York City), English-American writer and political pamphleteer whose "Common Sense" and "Crisis" papers were important influences on the American Revolution. Other works that contributed to his reputation as one of the greatest political propagandists in history were *Rights of Man,* a defense of the French Revolution and of republican principles; and *The Age of Reason,* an exposition of the place of religion in society.

Life in England and America. Paine was born of a Quaker father and an Anglican mother. His formal education was meagre, just enough to enable him to master reading, writing, and arithmetic. At 13 he began work with his father as a corset maker and then tried various other occupations unsuccessfully, finally becoming an officer of the excise. His duties were to hunt for smugglers and collect the excise taxes on liquor and tobacco. The pay was insufficient to cover living costs, but he used part of his earnings to purchase books and scientific apparatus.

Paine's life in England was marked by repeated failures. He had two brief marriages. He was unsuccessful or unhappy in every job he tried. He was dismissed from the excise office after he published a strong argument in 1772 for a raise in pay as the only way to end corruption in the service. Just when his situation appeared hopeless, he met Benjamin Franklin in London, who advised him to seek his fortune in America and gave him letters of introduction.

Paine arrived in Philadelphia on Nov. 30, 1774. His first regular employment was helping to edit the *Pennsylvania Magazine.* In addition Paine published numerous articles and some poetry, anonymously or under pseudonyms. One such article was "African Slavery in America," a scathing denunciation of the African slave trade, which he signed "Justice and Humanity."

Paine had arrived in America when the conflict between the colonists and England was reaching its height. After blood was spilled at the Battle of Lexington and Concord, April 19, 1775, Paine argued that the cause of America should not be just a revolt against taxation but a demand for independence. He put this idea into "Common Sense," which came off the press on Jan. 10, 1776. The 50-page pamphlet sold more than 500,000 copies within a few months. More than any other single publication, "Common Sense" paved the way for the Declaration of Independence, unanimously ratified July 4, 1776.

During the war that followed, Paine served as volunteer aide-de-camp to General Nathanael Greene. His great contribution to the patriot cause was the 16 "Crisis" papers issued between 1776 and 1783, each one signed "Common Sense." "The American Crisis. Number I," published on Dec. 19, 1776, when George

Washington's army was on the verge of disintegration, opened with the flaming words: "These are the times that try men's souls." Washington ordered the pamphlet read to all the troops at Valley Forge.

In 1777 Congress appointed Paine secretary to the Committee for Foreign Affairs. He held the post until early in 1779, when he became involved in a controversy with Silas Deane, a member of the Continental Congress, whom Paine accused of seeking to profit personally from French aid to the United States. But in revealing Deane's machinations, Paine was forced to quote from secret documents to which he had access as secretary of the Committee for Foreign Affairs. As a result, despite the truth of his accusations, he was forced to resign his post.

Paine's desperate need of employment was relieved when he was appointed clerk of the General Assembly of Pennsylvania on Nov. 2, 1779. In this capacity he had frequent opportunity to observe that American troops were at the end of their patience because of lack of pay and scarcity of supplies. Paine took $500 from his salary and started a subscription for the relief of the soldiers. In 1781, pursuing the same goal, he accompanied John Laurens to France. The money, clothing, and ammunition they brought back with them were important to the final success of the Revolution. Paine also appealed to the separate states to cooperate for the well-being of the entire nation. In "Public Good" (1780) he included a call for a national convention to remedy the ineffectual Articles of Confederation and establish a strong central government under "a continental constitution."

At the end of the American Revolution, Paine again found himself poverty-stricken. His patriotic writings had sold by the hundreds of thousands, but he had refused to accept any profits in order that cheap editions might be widely circulated. In a petition to Congress endorsed by Washington, he pleaded for financial assistance. It was buried by Paine's opponents in Congress, but Pennsylvania gave him £500 and New York a farm in New Rochelle. Here Paine devoted his time to inventions, concentrating on an iron bridge without piers and a smokeless candle.

In Europe: "Rights of Man." In April 1787 Paine left for Europe to promote his plan to build a single-arch bridge across the wide Schuylkill River near Philadelphia. But in England he was soon diverted from his engineering project. In December 1789 he published anonymously a warning against the attempt of Prime Minister William Pitt to involve England in a war with France over Holland, reminding the British people that war had "but one thing certain and that is increase of taxes." But it was the French Revolution that now filled Paine's thoughts. He was enraged by Edmund Burke's attack on the uprising of the French people in his *Reflections on the Revolution in France,* and, though Paine admired Burke's stand in favour of the American Revolution, he rushed into print with his celebrated answer, *Rights of Man* (March 13, 1791). The book immediately created a sensation. At least eight editions were published in 1791, and the work was quickly reprinted in the U.S., where it was widely distributed by the Jeffersonian societies. When Burke replied, Paine came back with *Rights of Man, Part II,* published on Feb. 17, 1792.

What began as a defense of the French Revolution evolved into an analysis of the basic reasons for discontent in European society and a remedy for the evils of arbitrary government, poverty, illiteracy, unemployment, and war. Paine spoke out effectively in favour of republicanism as against monarchy and went on to outline a plan for popular education, relief of the poor, pensions for aged people, and public works for the unemployed, all to be financed by the levying of a progressive income tax. To the ruling class Paine's proposals spelled "bloody revolution," and the government ordered the book banned and the publisher jailed. Paine himself was indicted for treason, and an order went out for his arrest. But he was en route to France, having been elected to a seat in the National Convention, before the order for his arrest could be delivered. Paine was tried in absentia, found guilty of seditious libel, and declared an outlaw, and *Rights of Man* was ordered permanently suppressed.

In France Paine hailed the abolition of the monarchy but deplored the terror against the royalists and fought unsuccessfully to save the life of King Louis XVI, favouring banishment rather than execution. He was to pay for his efforts to save the King's life when the radicals under Robespierre took power. Paine was imprisoned from Dec. 28, 1793, to Nov. 4, 1794, when, with the fall of Robespierre, he was released and, though seriously ill, readmitted to the National Convention.

While in prison, the first part of Paine's *Age of Reason* was published (1794), and it was followed by Part II after his release (1796). Although Paine made it clear that he believed in a Supreme Being and as a deist opposed only organized religion, the work won him a reputation as an atheist among the orthodox. The publication of his last great pamphlet, "Agrarian Justice" (1797), with its attack on inequalities in property ownership, added to his many enemies in establishment circles.

Paine remained in France until Sept. 1, 1802, when he sailed for the United States. He quickly discovered that his services to the country had been all but forgotten and that he was widely regarded only as the world's greatest infidel. Despite his poverty and his physical condition, worsened by occasional drunkenness, Paine continued his attacks on privilege and religious superstitions. He died in New York City in 1809 and was buried in New Rochelle on the farm given to him by the state of New York as a reward for his Revolutionary writings. Ten years later, William Cobbett, the political journalist, exhumed the bones and took them to England, where he hoped to give Paine a funeral worthy of his great contributions to humanity. But the plan misfired, and the bones were lost, never to be recovered.

Assessment. At Paine's death most U.S. newspapers reprinted the obituary notice from the *New York Citizen,* which read in part: "He had lived long, did some good and much harm." This remained the verdict of history for more than a century following his death, but in recent years the tide has turned: on Jan. 30, 1937, *The Times* of London referred to him as "the English Voltaire," and on May 18, 1952, Paine's bust was placed in the New York University Hall of Fame. (P.S.F.)

BIBLIOGRAPHY. The first comprehensive edition of Paine's works is that of Moncure D. Conway, *The Writings of Thomas Paine,* 4 vol. (1894–96). This has been replaced by Philip S. Foner, *The Complete Writings of Thomas Paine,* 2 vol. (1945). Several later discoveries of Paine's writings are in A.O. Aldridge, "Some Writings of Thomas Paine in Pennsylvania Newspapers," *American Historical Review,* 56:832–838 (1951). Richard Gimbel, *Thomas Paine Fights for Freedom in Three Worlds* (1961), offers an annotated bibliography of Paine's works. The first worthwhile biography, though entirely uncritical, was Moncure D. Conway, *The Life of Thomas Paine,* 2 vol. (1892). A.D. Aldridge, *Man of Reason* (1959), is an insightful, scholarly biography with chapter notes. David Freeman Hawke, *Rebel!* (1974), includes an invaluable bibliography.

Painesville, city, seat (1840) of Lake County, northeastern Ohio, U.S., near the mouth of the Grand River and Lake Erie, 30 mi (48 km) northeast of Cleveland. The site, first settled permanently by Gen. Edward Paine with a party of 66, was laid out around 1805; it was known variously as The Opening, Oak Openings, and Champion (for Henry Champion, original owner of the plot). In 1816 the community was renamed to honour Paine and was incorporated as a village in 1832. Jonathan Goldsmith, an architect of the Western Reserve period, built many elegant homes there in the 1820s, some of which survive. The Cleveland, Painesville and Ashtabula (now Penn Central) Railroad came through in 1853, and the nursery business, now extensive, began in 1854. Lake Erie College (founded as Willoughby Seminary for women in 1847) was moved to Painesville in 1856. The village remained mainly residential and became a city in 1902. Since 1940 it has developed industrially as part of Lake Erie's "chemical shore." Pop. (1980) 16,391.

Painlevé, Paul (b. Dec. 5, 1863, Paris—d. Oct. 29, 1933, Paris), French politician, mathematician, and patron of aviation who was premier at a crucial period of World War I and again during the 1925 financial crisis.

Educated at the École Normale Supérieure and the University of Paris, where he received

his doctorate in mathematics in 1887, Painlevé taught at the universities of Lille and Paris and the École Polytechnique. He was a distinguished mathematician, and among his awards was the Grand Prix des Sciences Mathématiques (1890). He returned to the École Normale Supérieure to teach in 1897.

Painlevé took special interest in the infant science of aviation, becoming a theoretician of heavier-than-air flight. He was the first Frenchman to fly with Wilbur Wright, at Auvours in 1908, and the following year created the first course in aeronautical mechanics at the École Aéronautique.

Becoming interested in politics, Painlevé was elected to the Chamber of Deputies from a Paris constituency in 1906. He served as minister of education and minister of inventions in the wartime government of Aristide Briand, and, as war minister from March to September 1917, made the controversial decision to replace Gen. Robert-Georges Nivelle with Gen. Philippe Pétain after the costly failure of Nivelle's offensive in May. In September 1917 he formed his own ministry and the following month agreed to the establishment of the Supreme Allied Council at Versailles, choosing as the French representative Gen. Ferdinand Foch, who later became Allied commander. Painlevé resigned in November, however, and was succeeded as prime minister by Georges Clemenceau.

Painlevé was one of the founders of the Cartel des Gauches, a coalition of Socialists and radicals, which defeated the rightist Bloc National in the general elections of 1924. He became premier in April 1925 but resigned in November because neither his ministers nor French financial interests could agree on a solution to the financial crisis engendered by the devaluation of the franc. Subsequently, he served as war minister in the governments of Aristide Briand and Raymond Poincaré and was air minister in 1930–31 and 1931–32.

Although not an outstanding political leader, Painlevé was a brilliant mathematician. He is remembered for his work in transformations and, especially, in differential equations and in the theory of functions; one type of function became known as Painlevé's transcendants. He was elected a member of the Académie des Sciences in 1900.

paint, decorative and protective coating commonly applied to rigid surfaces as a liquid consisting of a pigment suspended in a vehicle, or binder. The vehicle, usually a resin dissolved in a solvent, dries to a tough film, binding the pigment to the surface.

A brief treatment of paint follows. For full treatment, *see* MACROPAEDIA: Industries, Chemical Process.

Paint was used for pictorial and decorative purposes in the caves of France and Spain as early as 15,000 BC. The earliest pigments, which were natural ores such as iron oxide, were supplemented by 6000 BC in China by calcined (fired) mixtures of inorganic compounds and organic pigments; vehicles were prepared from gum arabic, egg white, gelatin, and beeswax. By 1500 BC the Egyptians were using dyes such as indigo and madder to make blue and red pigments. The exploitation of linseed oil (a drying oil useful as a vehicle) and zinc oxide (a white pigment) in the 18th century brought a rapid expansion of the European paint industry. The 20th century saw important developments in paint technology, including the introduction of synthetic polymers as vehicles and of synthetic pigments; a new understanding of the chemistry and physics of paints; and coating materials with greater fire retardancy, corrosion resistance, and heat stability. Most significant was a return to water-based paints in the form of latex paints that combine easy application and cleanup with reduced hazard of fire.

In modern paint manufacture, pigment particles are dispersed in the vehicle by cylindrical mills that tumble heavy metal or ceramic balls through the paint, or by sand grinders that circulate a suspension of sand through the paint at high speed.

The basic white pigments include zinc oxide, zinc sulfide, lithopone, and titanium dioxide. Most black pigments are composed of elemental carbon. Common red pigments include the minerals iron oxide, cadmium, and cuprous oxide and various synthetic organic pigments. Yellow and orange pigments include chromates, molybdates, and cadmium compounds. Blue and green pigments are either inorganic (synthetic ultramarines and iron blues) or organic (phthalocyanines). Extenders or fillers are sometimes added to paint to increase its spreadability and strength.

Painted Desert, section of the high plateau in north central Arizona, U.S., extending from the Grand Canyon in a southeasterly direction along the north side of the Little Colorado River to Holbrook. It is approximately 150 mi (240 km) long and 15–50 mi wide and covers an area of 7,500 sq mi (19,400 sq km). The name was first used in 1858 by a government explorer, Lieut. Joseph C. Ives, to describe the area's brilliantly coloured shales, marls, and sandstones, which are banded with vivid red, yellow, blue, white, and lavender. At times the air glows with a pink mist or purple haze of desert dust. Elevations range from 4,500 ft (1,370 m) to 6,500 ft. The rolling surface is broken by isolated buttes and is bounded on the north by vermilion cliffs, rising to broad, flat-topped mesas. Marks of volcanic activity are abundant and widely scattered. The region is barren and arid, with 5–9 in. (127–229 mm) of annual precipitation and temperature extremes of −25° to 105° F (−31° to 41° C). Part of the eastern section is within the Petrified Forest National Park and contains the Black Forest, one of the four remarkable areas of petrified trees of Mesozoic age, about 170,000,000 years old. Navajo and Hopi Indian reservations occupy a large part of the Painted Desert, and these tribes use the variegated, brightly coloured sands for their famous ceremonial sand paintings.

painted lady, any of certain butterflies of the genus *Vanessa* (family Nymphalidae, order Lepidoptera), specifically *V. virginiensis* in North and Central America and *V. cardui* in Africa and Europe. The adults have broad wings (span about 4 to 5 centimetres [1½ to 2 inches]), with beautifully elaborate patterns of reddish-orange, brown, white, and blue scales. Vast numbers travel northward in spring across the Mediterranean from Africa to Europe, migrating thousands of kilometres. A few of the next generation travel southward during late summer, but most perish in the northern winter. Painted lady larvae in the Americas feed on plants that are members of the family Compositae, while larvae in Africa and Europe eat thistles and stinging nettles.

painted snipe, either of two species of marsh birds comprising the family Rostratulidae (order Charadriiformes). They are boldly marked birds with a snipelike body and bill. Painted snipes are about 25 centimetres (10 inches) in length and are brown and white in colour.

The Old World painted snipe (*Rostratula benghalensis*) ranges from Africa to Australia and Japan and has yellowish "spectacles" around the eyes. The South American painted snipe (*Nycticryphes semicollaris*) is a darker bird with a yellow-striped back.

In both species the female is larger and brighter in colour than the male. She courts the male, and he undertakes most of the nesting duties. Painted snipes nest on the ground, the Old World painted snipe laying four eggs, the South American species laying two eggs. The downy young readily take to the water.

timetres (4 to 7 inches) long. It has red and yellow markings on its relatively flat, black or greenish-brown upper shell.

The painted turtle usually lives in quiet, shallow bodies of fresh water, especially those with thickly planted mud bottoms. It feeds on plants, small animals, and some carrion. It often basks in large groups on logs and other objects, and in many areas it hibernates during the winter.

Painter, Theophilus Shickel (b. Aug. 22, 1889, Salem, Va., U.S.—d. Oct. 5, 1969, Fort Stockton, Texas), American zoologist and cytologist who first identified individual genes in the chromosomes of fruit flies.

He received a Ph.D. degree from Yale (1913) and was a member of the faculty there (1913–16). In 1916 he joined the faculty of the University of Texas, where, in 1946, he became president. Painter early realized that the unusually large cells of the salivary glands of *Drosophila* fruit flies are particularly well suited for studies of genes and chromosomes. In 1933 he published a drawing of a section of a *Drosophila* chromosome showing more than 150 bands, which, for the first time, allowed determination of the precise loci, or positions, of genes.

Painter, William (b. *c.* 1540—d. February 1594, London), English author whose collection of tales, *The Palace of Pleasure,* based on classical and Italian originals, was a sourcebook for many Elizabethan dramatists.

Educated at St. John's College, Cambridge, he was ordained in 1560. In 1561 he became a clerk of the ordnance in the Tower of London, a position in which he appears to have amassed a fortune out of public funds. In 1591 his son Anthony confessed that he and his father had abused their trust, but Painter retained his office until his death.

The first volume of *The Palace of Pleasure,* which appeared in 1566, contained 60 tales. It was followed in the next year by a volume including 34 new stories. An improved edition (1575) contained seven more new stories. To its popularity, and that of similar collections, is due the high proportion of Elizabethan plays with Italian settings.

The early tragedies *Appius and Virginia, a Tragedy,* by John Webster, and *The Tragedy of Tancred and Gismund,* by Robert Wilmot, were taken from Painter's book, and it was also the source for Shakespeare's *Timon of Athens* and *All's Well That Ends Well* (and probably for details in *Romeo and Juliet* and *The Rape of Lucrece*), for Beaumont and Fletcher's *Triumph of Death,* and for James Shirley's *Loves Crueltie.*

painting, a form of aesthetic expression in which designs—representational, imaginative, or abstract—are created in two dimensions by the application of pigments or other coloured media to a flat surface. The elements of design are line, form, colour, tone, and texture, and they may be combined in an infinite variety of ways. Painting may be done for ceremonial, devotional, decorative, rhetorical, or other motives. The range of possible media includes oil paints, watercolours, pastels, lacquer, sand, and light itself.

Painting is treated in a number of articles in the MACROPAEDIA. For general treatments of painting, its history and place among the arts, *see* Aesthetics; Arts, Classification of the; Folk Arts; Painting, The Art of; Painting, The History of Western. pair production, in physics, formation or materialization of two electrons, one negative and the other positive (positron), from a pulse of electromagnetic energy traveling through matter, usually in the vicinity of an atomic nucleus. Pair production is a direct conversion of radiant energy to matter. It is one of the principal ways in which high-energy gamma rays are absorbed in matter. For pair production to occur, the electromagnetic energy, in a discrete quantity called a photon, must be at least equivalent to the mass of two electrons. The mass m of a single electron is equivalent to 0.51 million electron volts (MeV) of energy E as calculated from the equation formulated by Albert Einstein, $E = mc^2$, in which c is a constant equal to the velocity of light. To produce two electrons, therefore, the photon energy must be at least 1.02 MeV. Photon energy in excess of this amount, when pair production occurs, is converted into motion of the electron–positron pair. If pair production occurs in a track detector, such as a cloud chamber, to which a magnetic field is properly applied, the electron and the positron curve away from the point of formation in opposite directions in arcs of equal curvature. In this way pair production was first detected (1933). The positron that is formed quickly disappears by reconversion into photons in the process of annihilation with another electron in matter.

Internal pair production, a species of gamma decay (*q.v.*), occurs when an unstable nucleus that has at least 1.02 MeV of excess energy directly ejects an electron–positron pair created within its own electromagnetic field without first producing a gamma photon.

País, El (Spanish: "The Country"), daily newspaper published in Madrid, an independent paper dedicated to the promotion of democratic ideals in post-Franco Spain.

Established in 1976, it was enthusiastically received from the start. The idea of founding such a journal originated with the son of the philosopher José Ortega y Gasset, and he set up the company in 1972. The venture was approved by the government about the time of Franco's death, and six months later the first issue appeared.

El País set out to be a highly readable, serious, literate national newspaper appealing to diverse interests and schools of political thought. It covers local, national, and international news thoroughly and offers sections on culture and society, sports, and business and finance.

Paisiello, Giovanni, Paisiello also spelled PAESIELLO (b. May 9, 1740, Taranto, Kingdom of Naples—d. June 5, 1816, Naples), Neapolitan composer of operas admired for their robust realism and dramatic power.

Paisiello's father, a veterinary surgeon who intended him for the legal profession, enrolled him, at the age of five, at the Jesuit school in Taranto. When his talent for singing became obvious, he was placed in the Conservatorio di S. Onofrio at Naples. Paisiello's earliest efforts in composition were for the church. For the theatre of the conservatory he wrote some intermezzi, one of which attracted so much notice that he was invited to write two operas, *La Pupilla,* for Bologna, and *Il Marchese Tulipano,* for Rome. His reputation established, he settled for some years at Naples, where he produced a series of successful operas. In 1776 Paisiello was invited by the empress Catherine II to St. Petersburg, where he remained for eight years.

Among the works he produced for Catherine was *Il Barbiere di Siviglia* (1782; *The Barber of Seville*), which some consider his masterpiece, on a libretto by Giuseppe Petrosellini, after Beaumarchais' comedy *Le Barbier de Séville.*

In 1784 Paisiello left Russia and, after a brief sojourn in Vienna, where he composed for Joseph II, entered the service of Ferdinand IV of Naples. During his 15 years as music director there, he composed several of his best operas, including *La Molinara* (1788) and *Nina* (1789). After many vicissitudes resulting from political and dynastic changes, he was invited to Paris in 1802 by Napoleon. Paisiello conducted the music of the court in the Tuileries; the Parisian public, however, received his opera *Proserpine* (1803) without enthusiasm. Disappointed at the failure of his only opera with a French libretto, he returned to Naples. There he was reinstated in his former appointment by Joseph Bonaparte and Joachim Murat, but he was unable to meet the demands for new works. The power of the Bonaparte family was tottering, and Paisiello's fortunes fell with it.

Paisiello is known to have composed about 100 operas. His church music comprises about 40 masses and many smaller works. His instrumental music includes symphonies, a harp concerto, string quartets, and sonatas for harp and for violin and cello. In the 20th century, *Il Barbiere* and *La Molinara* were revived, and several of his operas and piano concerti, string quartets, and keyboard pieces were republished.

Paisley, large burgh, industrial centre, and seat of Renfrew district, Strathclyde region, Scotland, situated on the River White Cart, a tributary of the Clyde. Paisley developed as a village clustered around a Cluniac abbey founded in 1163. The original abbey was burned down in 1307, and the present building dates from the 15th century.

By the early 18th century, Paisley had developed into a manufacturing centre for the hand-loom weaving of linen. At the end of the century the new town was laid out over much of the ground that once belonged to the abbey. Paisley became famous for its Paisley shawls in silk and cotton and later in wool that were copies of the Asian shawls sent back by soldiers serving in India. A priceless collection is on exhibit in the Paisley museum. Later, the manufacture of linen thread gave way to that of cotton, and Paisley grew rapidly. The town's modern industry includes chemical and dye production; engineering, shipbuilding, and food-processing industries; and textile and thread manufacturing. A government-sponsored industrial estate, opened in 1937, contains more than 150 factories. Paisley has many fine buildings, including the town hall, public library and museum, the Coats Observatory, the Thomas Coats Memorial Church, and a modern College of Technology. Pop. (1981) 84,593.

machine-woven wool equivalents were made at Paisley to supply the insatiable demand that had been created for "cashmere" shawls. Paisley shawls, in fine wool and sober colouring, were beautiful in their own right. Their rich, abstract, curvilinear patterns, modified from their Kashmir counterparts and deriving ultimately from Mughal art, have continued to be widely adopted in modern textiles, especially for clothing. A motif resembling an enlarged comma (well-known in Mughal decorative art) is the one by which most people recognize a paisley pattern.

Paisley, Ian (Richard Kyle) (b. April 6, 1926, Armagh, County Armagh, N.Ire.), militant Protestant leader in the sectarian strife that divided Northern Ireland from the 1960s.

Son of a Baptist minister who broke away from his Armagh congregation and established his own church in Ballymena, County Antrim, Paisley likewise became a maverick churchman. After studying at schools of the Reformed Presbyterian Church in South Wales and Ireland, he was ordained in 1946. In 1951 he and his followers formed a new sect, the Free Presbyterian Church of Ulster, which, in two decades, expanded rapidly, establishing some 30 churches and acquiring about 20,000 members and perhaps 200,000 sympathizers in Northern Ireland.

From the 1960s to the 1980s Paisley became the voice of extreme Protestant opinion, leading demonstrations and rallies throughout Northern Ireland. He was repeatedly sentenced to imprisonment for unlawful assembly, once (in 1966) for leading a march through a Roman Catholic area of Belfast. Repeatedly he attacked the government ministers in London for conferring with the ministers in Dublin, arguing vitriolically that the British were siding with the Roman Catholic hierarchy against Ulster. He also sought to demonstrate in Rome and Geneva against the papacy and ecumenism.

In 1970 he was elected to a seat in the British House of Commons, and in 1979 he was elected to the European Parliament. He co-founded the Democratic Unionist Party in 1972 and organized a parliamentary group of Protestant fighters called the Third Force.

Paiute, also spelled PIUTE, two distinct American Indian groups that speak languages of the Numic (formerly called Plateau Shoshonean) group of the Uto-Aztecan family. The Southern Paiute, who speak Ute, at one time occupied southern Utah, northwestern Arizona, southern Nevada, and southeastern California, the last group being known as Chemehuevi. The Spaniards who traversed some of the Paiute territories in the 16th and 17th centuries left them undisturbed. Although encroached upon and directed into reservations by the U.S. government in the 19th century, the Southern Paiute had comparatively little friction with whites; and many stayed scattered in the territories, working on the ranches of whites or remaining on the fringes of white settlements.

The Northern Paiute (called Paviotso in Nevada) are related to the Mono (*q.v.*) of California; they have been known derogatorily as Diggers, and occupied east central California, western Nevada, and eastern Oregon. An offshoot, the Bannock (*q.v.*), lived with the Shoshoni in southern Idaho, where they were buffalo hunters. After 1840, with the rush of European prospectors and farmers and the consequent despoiling of their already meagre supply of food plants, the Northern Paiute acquired guns and horses and fought at intervals with the whites until 1874, when the last Paiute lands were appropriated by the U.S. government.

The Northern and Southern Paiute were traditionally food collectors who subsisted primarily on seed, pine nuts, and small game, although many Southern Paiute planted small gardens. They occupied temporary brush shelters, wore little or no clothing except rabbit-skin blankets, and made a variety of baskets for gathering and cooking food. Families were affiliated through intermarriage; but there were no formal bands or territorial organizations, except in the more fertile areas such as the Owens Valley in California. Little of the old customs survive, except for shamanism. In the late 20th century the Northern and Southern Paiute numbered about 4,000, living largely near or on reservations.

pajamas, also spelled PYJAMAS, loose, lightweight trousers worn in the East, or a loose two-piece suit of silk, cotton, or synthetic material worn for sleeping or lounging.

They were introduced in England as lounging attire in the 17th century but soon went out of fashion. About 1870 they reappeared in

Pajon, Claude (b. 1626, Romorantin, near Blois, Fr.—d. Sept. 27, 1685, Orléans), French Protestant theologian who was influential during the later Reformation.

Pajon studied at Saumur and became a pastor at Machenoir. He was made a professor of theology at Saumur in 1666, but had to resign in 1668 after controversy arose over his views. Though he repeatedly declared his allegiance to orthodox Reformed views as set forth by the Synod of Dort (1618–19), Pajon's teaching that sins were caused by ignorance led some of his colleagues to question his orthodoxy.

In 1668 Pajon became a pastor at Orléans. There again he was the subject of controversy; he was accused of Pelagianism and Arminianism and was examined on his views in 1676 by the Reformed theologian Jean Claude. The outcome was unsatisfactory to the authorities, who took measures against theological candidates who echoed Pajon's views. He did not set forth his tenets in a systematic treatise but in his correspondence and lectures. He held that the spirit of God operated through human reason, which will accept the Word if circumstances are propitious, a view that was in conflict with the Calvinist doctrine of salvation by grace alone.

Pajou, Augustin (b. Sept. 19, 1730, Paris—d. May 8, 1809, Paris), French sculptor and decorator known mainly for his portrait busts of figures, such as his patroness, Madame du Barry (Louvre, Paris), and for directing the decoration of the Versailles opera house.

Pajou, a student of the sculptor Jean-Baptiste Lemoyne, won the Prix de Rome (1748) and spent a dozen years in Italy. He was elected to the Paris Academy in 1760. He executed bas-reliefs and small decorative fig-

ures in bronze, silver, and marble and later did work on the court of the Palais Royal, Paris, and the cathedral at Orléans. A directive from King Louis XVI for the creation of statues honouring great Frenchmen led him to do many busts, including those of such persons as Georges Buffon, René Descartes, and J.-B. Bossuet. Appointed keeper of the king's antiquities (1777), he was commissioned to complete the Fontaine des Innocents, Paris, in the manner of Jean Goujon. Pajou's "Psyche Abandoned" (1791) offers an example of his graciously seductive style. It is one of the few creations in which he restrained his usual decorativeness in favour of classical purity.

Pakistan, officially ISLĀMIC REPUBLIC OF PAKISTAN, Urdu ISLĀM-Ī JAMHŪRĪYA-E PĀKISTĀN, Asia's seventh largest country, occupying the northwestern portion of the Indian subcontinent. It covers an area of 307,374 square miles (796,095 square km), excluding

the Pakistani-held part of Jammu and Kashmir in the northeast. The capital is Islāmābād. The country extends for more than 990 miles (1,600 km) from south to north and for about 550 miles (880 km) from west to east. It is bounded to the west by Iran, to the north by Afghanistan, to the northeast by China, to the east and southeast by India, and to the south by the Arabian Sea. The population in 1990, including Afghan refugees and residents of Pakistani-occupied Jammu and Kashmir, was estimated to be 122,666,000.

A brief treatment of Pakistan follows. For full treatment, *see* MACROPAEDIA: Pakistan.

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. Pakistan can be divided physiographically into four regions: the great highlands, the Baluchistan Plateau, the Indus Plain, and the desert areas. The Himalayan and Trans-Himalayan mountain ranges (the Karakoram and the Pamirs), rising to an average elevation of more than 20,000 feet (6,000 m) and including some of the world's highest peaks, such as K2 (28,251 feet [8,611 m]) and Nānga Parbat (26,660 feet [8,126 m]), make up the great highlands, which occupy the northernmost portion of the country. The Baluchistan Plateau, a broken highland region about 1,000 feet (300 m) in elevation with many ridges crossing it from northeast to southwest, occupies the western and southwestern sectors of the country. The Indus Plain, the most prosperous agricultural region of Pakistan, covers an area of 200,000 square miles (520,000 square km) in the east and extends for 650 to 700 miles (1,000 to 1,100 km) from the rim of the Potwar Plateau in northern Pakistan southward to the Arabian Sea. In the southeast are the desert areas, from north to south, the Thal, the Cholistan, and the Thar, all three northward or westward extensions of the Thar Desert of western India. The southwestward-flowing Indus is the principal river; its major tributaries are the Chenāb, Jhelum, Rāvi, and Sutlej. Most of the country has little seismic activity, but the Quetta region and northern Pakistan are subject to severe earthquakes.

The climate is continental and is characterized by extreme variations of temperature. January (winter) temperatures range from 57° F (14° C) in the Indus Plain to 68° F (20° C) along the coast and to 4° F (−20° C) in the high mountains (above 15,000 feet [460 m]). July (summer) temperatures range from 32° F (0° C) in the high mountains to 84° F (29° C) along the coast and to 95° F (35° C) in the southeastern deserts. The southwest monsoon (July–October) provides rainfall of about 6 to 8 inches (150 to 200 mm) on the coast, 15 inches (380 mm) in the river valleys, and 40 inches (1,000 mm) or more in the mountainous northern areas. Rainfall varies from year to year, and successive periods of flooding and drought are not uncommon.

Pakistan's natural vegetation, except for forested mountain slopes, is largely limited to tough grasses, dry bushes, and scrub trees, though some riverine forests occur along the lower Indus River. Wildlife abounds in the northern mountains and includes brown bear, black Himalayan bear, leopard, and several species of wild sheep.

Pakistan has known deposits of coal, iron ore, chromite, gypsum, copper, rock salt, marble, and other mineral resources that remain largely unexploited. Natural gas is by far the most valuable resource, with proven reserves accounting for about 0.5 percent of the world's total.

The people. Pakistan's population is a complex mixture of indigenous peoples. The population's racial characteristics have been affected by successive waves of Aryans, Persians, Greeks, Pashtuns (Pathans), and Mughals coming from the northwest. Arabs have also left their mark on the population. Each of Pakistan's languages has a strong regional focus, and no single language can be said to be common to the whole population. The predominant linguistic group in Pakistan is Punjabi (almost one-half of the population); others include Pashto (one-eighth), Sindhi (one-eighth), Saraikī (one-tenth), Urdu, and Baluchi. In addition, there are refugees from Afghanistan and Iran in Pakistan. Urdu is the language used by most educated Punjabis and is the nation's official language. Almost all of the population is Muslim; Hindus and Christians make up small minority groups.

Birth and death rates are high, and measures have been taken to reduce them. By encouraging female employment and family planning, the government attempted, though unsuccessfully, to lower fertility levels. Almost one-half of the population is less than 15 years of age. The population is concentrated in the fertile Indus River valley and along that river's major tributaries in the northeastern and northern portions of the country. By contrast, western and southwestern Pakistan are sparsely inhabited. Although only one-third of the nation's population is urban, the influx of rural migrants to Pakistan's few and crowded cities causes housing shortages and slums and overburdens transportation. Karāchi is the country's largest city. Hyderābād, Multān, Lahore, Rāwalpindi, and Faisalābād are other major cities.

The economy. Pakistan has a developing mixed economy that is largely based on agriculture, light industries, and services. Many of the nation's heavy industries were nationalized in the early 1970s and have been undermined by poor management. Banks were nationalized in 1974. Although the gross national product (GNP) is increasing more rapidly than the population, the GNP per capita is among the lowest in Asia.

Agriculture accounts for approximately one-fifth of the GNP and employs more than one-half of the work force. Agricultural output has been kept low by the prevalence of sharecroppers who have little incentive to increase production; land reform and progressive taxes have been introduced in an attempt to reduce the number of sharecroppers. One-fourth of the total land area is arable, and most of the arable land is under irrigation. Irrigation, however, is inefficiently allocated. Dramatic increases in wheat production were made possible in the 1960s and '70s by the use of improved strains. These increases enabled Pakistan to become agriculturally self-sufficient, though there are occasional shortages of staples.

Wheat is the chief staple, and sugarcane is widely grown. Cotton and rice are major export crops. The number of livestock per person is high, but the production of meat and milk remains low because of inadequate feed and poor management. Goats and sheep are the most numerous animals, followed by cattle, buffalo, and camels.

Forests cover less than 4 percent of the total land area, and most of the wood removed annually is used for fuel. Fishing, mostly in the Indian Ocean, is an important industry.

Mining, which is largely controlled by the government, accounts for about 2 percent of the GNP, and large quantities of petroleum, iron, and steel must be imported. Coal and iron ore, both of which are mostly low-grade, some petroleum, and substantial quantities of natural gas are extracted. Limestone, chromite, and gypsum are widely mined.

Manufacturing accounts for approximately one-sixth of the GNP and employs one-eighth of the work force. Textiles, particularly cotton textiles, are the chief manufacture and are a leading export. Small-scale industries are generally more productive than the heavy industries controlled by the government. Trade and commerce employ about one-sixth of the work force.

Pakistan's major exports of raw cotton, cotton yarn, cotton fabrics, rice, leather, and woolen carpets are imported by Japan, the United States, West Germany, the United Kingdom, and Italy. Imports, mainly from these same countries, include nonelectric machinery, mineral oils, chemicals, transport equipment, and edible oils.

About half of Pakistan's electricity is generated by hydroelectric power plants. Most of the remainder is produced by fossil fuels, with a small portion from nuclear power.

Underemployment is widespread. Emigration has depleted the skilled work force, and there is a shortage of technicians, engineers, doctors, and various craftsmen. Remittances from Pakistanis working abroad are a major source of foreign exchange.

Budgetary revenue is derived primarily from tariffs and excise taxes. Expenditures are directed primarily to defense, payment of the public debt, development, grants to the provinces, and government administration.

Government and social conditions. After several years of military rule, full civilian government was restored with parliamentary elections held in 1988. Under the amended 1973 constitution, the president appoints as prime minister the leader of that political party which can muster a voting majority in the National Assembly. Pakistan's judicial system is headed by the Supreme Court, and each province has a high court. The Federal Shariat Court, a court of Islāmic law (Sharīʿah), was set up in the 1980s.

Pakistan's social-welfare services are limited. Health facilities and medical personnel are scarce and often inaccessible, serious infectious diseases are widespread, and diet is often deficient.

Only about one-fourth of Pakistan's overall population is literate, and the proportion for women is even lower at about one-sixth. Primary education is free, but less than half of all school-aged children are enrolled. Newspapers, which have been periodically censored, cover political news almost exclusively. Because of the extent of illiteracy, radio is the most important communications medium; government radio broadcasts in more than 20 languages.

Recent domestic and international emphasis on Islāmic ideology has brought about a strong identification with Islāmic culture in Pakistan. *Qawwālī*, a form of devotional singing, is very popular. Public poetry recitations called *mushāʿirah*s are organized like musical concerts. Urdu, Sindhi, and Pashto poets are regional and national heroes. Western-style literary activity is carried on in all of the modern languages of Pakistan, but especially in Urdu, Baluchi, Pashto, Punjabi, Sindhi, and English. The preeminent cultural figure in Urdu is the 19th–20th-century poet and philosopher Muḥammad Iqbāl, acclaimed as the spiritual father of modern Pakistan.

History. Early settlements in the Baluchistan region of Pakistan date from about 3500 BC. By the end of the 4th millennium BC, many settlers had migrated eastward from Baluchistan to the Indus River valley, where several urban civilizations arose, such as the Harappan. The Indus Valley Civilization ended abruptly about 1500 BC. During the 2nd millennium BC, Aryan-speaking peoples migrated into the region.

Buddhist writings of the 6th and 5th centuries BC mention the state of Gandhāra in the Indus River valley. In 327 BC Alexander the Great entered Gandhāra seeking to conquer the extremities of the Achaemenid empire of Persia.

Pakistan was subsequently part of the Indic Mauryan empire during the 3rd century and part of the 2nd century BC and later, in the 1st and 2nd centuries AD, part of the Indic Kuṣāṇa (Kushān) kingdom.

The Guptas ruled over northern India, including the Indus River valley, during a period in which Hindu culture crystallized (320–540).

The first Muslim conquests occurred in Baluchistan during the 8th century, and Muslims were active in the region from that time. In the 13th century Muslim power was consolidated into a sultanate centred on Delhi that continued to rule most of the subcontinent until the early 16th century.

The Mughal dynasty controlled the subcontinent between 1526 and 1761. The British East India Company ousted other colonial powers and then subdued the Mughal state in 1757. For a century the East India Company controlled most of the subcontinent, but in 1858 the British government assumed responsibility for the region following the 1857 mutiny of the Indian recruits in the Bengal army. During the period of British colonial rule, what is now (Muslim) Pakistan was administratively part of (largely Hindu) India.

Early expressions of Indian nationalism crystallized in the Hindu-dominated Indian National Congress (1885) and in the All-India Muslim League (1906).

In the decades following 1857 the Muslims sought to cooperate with the British, but, after World War I and the partition of the Ottoman Empire, they began to oppose British rule. The Muslim nationalist leader in this period was Mohammed Ali Jinnah (1876–1949).

By 1940 the Muslim League, led by Jinnah, endorsed the concept of the partition of British India into separate Hindu and Muslim nations (*i.e.,* India and Pakistan). The new state of Pakistan (a geographically discontinuous nation composed of East Pakistan and West Pakistan, separated from each other by Indian territory) came into existence as a dominion within the Commonwealth in August 1947, with Jinnah as governor-general. The comparatively backward areas of Sind, Baluchistan, and the North-West Frontier came to Pakistan intact; the Punjab and Bengal were divided between Pakistan and India, while Kashmir remained disputed territory. Tension with India over Kashmir gradually increased, resulting in full-scale war in 1965.

In East Pakistan demands grew for Bengali autonomy, and civil war between East and West Pakistan erupted in 1971. Aided by an invasion of the Indian army, East Pakistan became the independent country of Bangladesh in 1972. West Pakistan retained the name Pakistan. Zulfikar Ali Bhutto led Pakistan from 1971 until he was overthrown by General Mohammad Zia-ul-Haq in a military coup in 1977. After Zia's death in 1988, Bhutto's daughter, Benazir, became prime minister after winning the parliamentary elections held that year. She was the first woman leader of a Muslim state in the modern era.

Pakistan, Church of, denomination inaugurated in Pakistan in 1970 and comprising former Anglican, Methodist, Scottish Presbyterian, and Lutheran churches and mission bodies. It is the only church in the world joining Lutherans with Anglicans, Methodists, and Presbyterians and one of three in which Anglicans and Methodists unite, the others being the churches of North and South India.

Next to the Roman Catholic church, the Church of Pakistan is the largest Christian body in a country that is 97 percent Muslim. Christian missions in what is now Pakistan originated in the 16th century, proselytizing among Hindus, Sikhs, and Muslims. Until the partition of India in 1947, missionary activities were concentrated on Hindu Punjabis. Members of the church are mostly from lower income levels, often landless farm workers.

In addition to initiating development projects, the Church of Pakistan provides teachers, social workers, and medical personnel. Most colleges and schools founded by this denomination have been nationalized. Two theological seminaries, two colleges, and a hospital remain affiliated with the church. Headquarters are in Sialkot, Pak.

Pakokku, town, central Myanmar (Burma), on the Irrawaddy River below its junction with the Chindwin. A trading centre for the Chindwin and Yaw river valleys, the town deals in timber and palm sugar and is the head of downstream Chindwin navigation. It has an airfield and a diesel-electric plant. The model village of Kyauksauk is immediately northwest.

The area east of Pakokku is characteristic of Myanmar's dry zone, with undulating gravelly and sandy land. The Chindwin and Irrawaddy rivers provide alluvium and are utilized for irrigation. To the west, over the Shinmataung and Tangyi ridges, the region is drained by the Yaw and Myittha rivers. Peanuts (groundnuts), millet, and sesame are the principal crops. In the riverine areas sugar is produced from the toddy palm. Rice, gram, peas, beans, tobacco, and corn (maize) are also grown, the latter primarily for its husk, which is used for cheroot wrappers under the name of *yawpet.* The western forests yield teak. In the Yaw River valley, cutch, a yellow dye, is extracted from a type of small acacia tree. The Yenangyat oil field is to the south of the town. Nearby riverine towns include Gangaw and Tilin on the Myittha and Pauk and Seikpyu on the Yaw. The inhabitants are mainly Burman. Pop. (latest est.) 33,138.

Pakxé, also spelled PAKSE, town, in the southern panhandle of Laos at the confluence of the Xédôn and Mekong rivers. Before 1966 Pakxé functioned as the chief port of entry of Laos. East of Pakxé begins the rolling Bolovens Plateau, nearly 3,300 feet (1,000 m) high, for whose products—teak, tea, cinchona, kapok, and cardamom—Pakxé is the distributing centre. The town's industries include several sawmills, manufacture of bricks and tiles, and an ice plant; there is also an agricultural experimental station, a criminal court of appeals, and a secondary school. In 1970 the Selabam Dam of the Mekong River Valley Plan opened on the lower Xédôn, providing electricity for Pakxé and irrigation for the surrounding region. Pakxé is linked by road to the Thailand border and to Kampuchea (Cambodia). Pop. (1985) 47,000.

Pāla DYNASTY, ruling dynasty in Bihār and Bengal, India, from the 8th to the 12th century. Its founder, Gopāla, was a local chieftain who rose to power in the mid-8th century during a period of anarchy. His successor, Dharmapāla (reigned *c.* 770–810), greatly expanded the kingdom and for a while was in control of Kannauj. Pāla power was maintained under Devapāla (reigned *c.* 810–850), who carried out raids in the north, the Deccan, and the peninsula; but thereafter the dynasty declined in power, and Mahendrapāla, the Gurjara-Pratihāra emperor of Kannauj in the late 9th and early 10th centuries, penetrated as far as northern Bengal. Pāla strength was restored by Māhīpāla I (reigned *c.* 988–1038), whose influence reached as far as Vārānasi (Benares), but on his death the kingdom again weakened.

Rāmapāla (reigned *c.* 1077–1120), the last important Pāla king, did much to strengthen the dynasty in Bengal and expanded its power in Assam and Orissa; he is the hero of a Sanskrit historical poem, the *Rāmacarita* of Sandhyākara. On his death, however, the dynasty was virtually eclipsed by the rising power of the Senas, although Pāla kings continued to rule in southern Bihār for 40 years. The main capital of the Pālas appears to have been Mudgagiri (Monghyr) in eastern Bihār.

The Pālas were supporters of Buddhism, and it was through missionaries from their kingdom that Buddhism was finally established in Tibet. Under Pāla patronage a distinctive school of art arose, of which many noteworthy sculptures in stone and metal survive.

palace, royal residence, and sometimes a seat of government or religious centre. The word is derived from the Palatine Hill in Rome, where the Roman emperors built their residences. As a building it should be differentiated from a castle, which was originally any fortified dwelling.

Later, the ornate homes of the nobility of all ranks in England, France, and Spain came to be known as palaces (as did the residence of the exiled popes in Avignon), and eventually the name was applied to a number of large and imposing buildings, both public and private. In the United States, for example, there are colonial governor's palaces located in Williamsburg, Va.; Santa Fe, N.M.; and San Antonio, Texas. Because of its colonial connotations the name Presidential Palace was rejected in favour of Executive Mansion for the White House. Also, France has the so-called Palaces of Justice.

Palaces, because of the power of the patron and the money and labour available for their construction, often represented the epitome (or in some cases, extreme examples) of the architectural and social values of the culture and age in which they were built. For this reason, they are of prime interest to archaeologists.

The earliest-known palaces are those built in Thebes by King Thutmose III (reigned 1504–1450 BC) and by Amenhotep III (reigned 1417–1379 BC) of Egypt. Excavations of Amenhotep's palace reveal a rectangular outer wall enclosing a labyrinth of small, dark rooms and courtyards, a pattern broadly repeated in Eastern palaces of later ages. In Assyria, for instance, much larger palaces were built at Nimrūd, at Nineveh, and at Khorsabad, where the palace of Sargon II (reigned 721–705 BC) extended over more than 23 acres (9 hectares), built on a platform within two sets of city walls and containing two huge central courts and a disorganized mass of smaller courtyards and rooms.

The architects of ancient Babylon achieved greater symmetry, using hallways and repeated groupings of rooms. In the 6th, 5th, and 4th centuries BC, vast Persian palaces were built at Susa and at Persepolis, where the residences of three kings (Darius I, Xerxes I, and Artaxerxes III) perch on three low platforms raised upon a main platform that was within the city walls. Minoan palaces on Crete at Phaestus, Knossos (where one staircase rose three stories), and elsewhere achieved even greater grandeur. It was in Rome and the eastern Roman empire, however, that palaces in the sense of centres of power reached their peak. More than 1,000,000 square feet (90,000 square m) of the Palatine Hill were devoted to palaces built by emperors between AD 3 and 212. At Constantinople the Sacred Palace is a conglomeration of Byzantine churches, schools, and residences that covers an area of 400,000 square yards (334,000 square m).

More recent Eastern palaces, such as those in the Forbidden City of China and the Imperial palaces of Japan, also consist of a series of buildings (in these cases, low pavilions mostly of highly decorated wood construction) within vast walled gardens.

In the New World, palaces tended to be less complex, such as the Mayan governor's palace at Uxmal (*c.* AD 900) and the Zapotec palace at Mitla (*c.* AD 1000), which were one-storied carved structures with many rooms. As in the East, though, these palaces were the centres of government as well as the residences of the culture's leaders.

In western Europe after the Middle Ages (when palace building declined in favour of castle construction), palaces tended to be single buildings, ornately designed and decorated in the style of the era, and often but not always set in richly landscaped gardens. In Renaissance Italy every prince had his royal *palazzo,* such as the Pitti Palace (begun 1458) in Florence and the many splendid palaces lining the Grand Canal in Venice. France built royal *palais* throughout the country (notably the Louvre [begun 1546] and Versailles [begun 1661]), and Spanish *palacios* include El Escorial (1559–84) outside Madrid and the Alhambra (1238–1358) in Granada. The British have three royal palaces—Buckingham, St. James's, and Whitehall—all of which are today symbols and residences rather than true seats of government.

Palace Museum, also called IMPERIAL PALACE MUSEUM, Chinese (Wade–Giles romanization) KU-KUNG PO-WU YÜAN, Pinyin GUGONG BOWUYUAN ("Ancient Palace Museum"), in Peking, museum housed in the main buildings of the former Imperial Palaces. The museum displays valuable objects from Chinese history.

The palace itself consists of many separate halls and courtyards. The outer buildings of the palace became a museum in 1914, although the Imperial family lived in the private apartments until 1924. Many of the halls surrounding the museum are presented as they would have appeared in dynastic times. The main buildings of the museum include the Hall of the Preservation of Harmony, which displays a fine collection of works of art, many from the imperial treasures. Among the more impressive works is a 47-foot- (14-metre-) long Yüan fresco that was taken from the Xinghua (Hsing-hua) Temple. A large number of clocks and clockwork figures are displayed in the gallery behind the Palace of Earthly Tranquillity. Other areas of the palace contain displays of bronzes, sculptures, pottery and porcelain, jade, and silks. Some of the treasures are exhibited in the northeast corner of the palace, known as the Palace of Peace and Longevity. These include priceless objects of precious metals and jewels and some examples of the 3,000 pieces that formed the imperial tableware.

Palace Museum of Venice, Italian MUSEO DEL PALAZZO DI VENEZIA, in Rome, museum occupying part of the papal apartment of the first great Renaissance palace of Rome. Dating from the middle of the 15th century, the palace was built for Cardinal Pietro Barbo, later Pope Paul II. Displayed are fine medieval and Renaissance sculptures and a series of 15th-century carved and inlayed *cassoni,* or chests. Paintings include works attributed to Giovanni Bellini, Giorgione, Taddeo Zuccari, Benozzo Gozzoli, and other Renaissance masters. Sculptures by Andrea Sansovino, Alessandro Vittoria, Alessandro Algardi, Pompeo Leoni, and Giambologna as well as fine examples of 17th-century Chinese porcelain and tapestries and maiolica are also in the collection; it includes many examples of minor decorative arts as well.

Palacio Valdés, Armando (b. Oct. 4, 1853, Entralgo, Spain—d. Feb. 3, 1938, Madrid), one of the most popular 19th-century Spanish novelists, distinguished by his optimism, his charming heroines, his realism, and his qualities of moderation and simplicity.

After studying law at the University of Madrid, he began his literary career as a critic but soon turned to the novel. His novels are largely autobiographical, particularly *Riverita* (1886), *Maximina* (1887), and *La novela de un novelista* (1921; "The Novel of a Novelist"). He had an early interest in science, and his work reveals a temporary phase of Naturalism, notably *La espuma* (1890; *The Froth*) and *La fe* (1892; *Faith*). *Marta y María* (1883), with its biblical Martha and Mary theme, is his most profound work. Local colour of Asturias, his native province, abounds in *Marta y María,* as it does in his other Asturian novels, *José* (1885), a realistic picture of seafaring life, and *La aldea perdida* (1903; "The Lost Village"), on the destruction of rural life by civilization. His occasionally excessive sentimentality is mitigated by sincerity and humour.

Palacký, František (b. June 14, 1798, Hodslavice, Moravia, Austrian Empire [now in Czechoslovakia]—d. May 26, 1876, Prague), the founder of modern Czech historiography and a leading figure in the political life of 19th-century Bohemia.

He early came into contact with the resurgence of national feeling that had begun to influence Czech and Slovak intellectuals. His early writings were concerned with aesthetics. In 1823 he settled in Prague, where he was enabled by noble patronage and by an advantageous marriage to devote himself to his scholarly and patriotic interests. In 1827 he became editor of the journal of the Bohemian museum, in which he published articles on aesthetics and on the Czech language (arguing against any far-reaching changes).

In 1832 he began his magnum opus, a history of the Czech nation in Bohemia and Moravia to 1526. Published as *Geschichte von Böhmen,* 5 vol. (1836–67), and *Dějiny národu českého* (1848–76), the work lucidly presents Palacký's conception of the nature of Czech history as "the constant contact and conflict between the Slavs on the one hand and Rome and the Germans on the other." Thus the Hussite period became the central episode of Czech history, epitomizing the national and the religious struggle.

As a politician, Palacký supported the Austro-Slavic conception of a federal Austria, composed of nationalities with equal rights. He was chairman of the Prague Slavic congress in 1848 and attended the constituent assembly that met in Kroměříž (Kremsier) in 1848–49. After the failure of the revolutionary movements Palacký retired from active politics until 1861, when he became a deputy in the Reichsrat.

In his *Idea státu rakouského* (1865; "Idea of the Austrian State"), Palacký propounded a federalism based not on nationalities but on the historic provinces of the Habsburg empire. His influence on Czech political thought and historiography was immense. The liberal nationalism of Tomáš Masaryk and his generation owed much to Palacký.

Palade, George E(mil) (b. Nov. 19, 1912, Iaşi, Rom.), Romanian-born American cell biologist who developed tissue-preparation methods, advanced centrifuging techniques, and conducted electron microscopy studies that resulted in the discovery of several cellular structures. With Albert Claude and Christian de Duve he was awarded the Nobel Prize for Physiology or Medicine in 1974.

Palade received a degree in medicine from the University of Bucharest in 1940 and remained there as a professor until after World War II. He immigrated to the United States in 1946 and began work at the Rockefeller Institute in New York.

Palade performed many studies on the internal organization of such cell structures as mitochondria, chloroplasts, the Golgi apparatus, and others. His most important discovery was that microsomes, bodies formerly thought to be fragments of mitochondria, are actually parts of the endoplasmic reticulum (internal cellular transport system) and have a high ribonucleic acid (RNA) content. They were subsequently named ribosomes. He became a naturalized citizen of the United States in 1952 and in 1958 a professor of cytology at Rockefeller Institute, which he left in 1972 to direct studies in cell biology at Yale University Medical School.

Palaeologus FAMILY, Byzantine family that became prominent in the 11th century and the members of which married into the imperial houses of Comnenus, Ducas, and Angelus. Michael VIII Palaeologus, emperor at Nicaea in 1259, founded the dynasty of the Palaeologi in Constantinople in 1261. His son Andronicus II (reigned 1282–1328) and his grandson Michael IX (d. 1320) succeeded Michael as co-emperors. Michael IX's son Andronicus III (1328–41) left the throne to his infant son John V (1341–91), whose rule was disputed by John VI Cantacuzenus (1347–54) and later by his grandson, John VII (1390). John V was succeeded, however, by his second son, Manuel II (1391–1425). John VIII (1425–48) was a son of Manuel II, and his brother Constantine XI (1449–53) became the last Byzantine emperor. Other brothers were Demetrius and Thomas, despots of the Morea until 1460. Thomas died at Rome in 1465; his daughter Zoë married Ivan III of Russia. Another branch of the family, descended from Theodore, son of Andronicus II, held the marquisate of Montferrat from 1305 to 1533.

Palaeoscincus, genus of armoured herbivorous dinosaurs of the Late Cretaceous epoch (97.5 to 66.4 million years ago). *Palaeoscincus,* heavily protected by bony armour, was a massive animal that may have weighed as much as 3½ tons and was rather clumsy in appearance. The teeth were poorly developed, and the brain was very small and primitive.

Palaeospondylus, genus of enigmatic fossil vertebrates that were very fishlike in appearance but of uncertain relationships. *Palaeospondylus,* from the Middle Devonian epoch (387 to 374 million years ago), has been found in the Old Red Sandstone rocks in the region of Achannaras, Scot. Hundreds of specimens are known, yet the position of this genus in relation to other fishlike vertebrates is still poorly understood. *Palaeospondylus* was about 5 cm (about 2 inches) long. Unlike most of the contemporary forms of the Middle Devonian, the skeleton of *Palaeospondylus* was very well ossified, and no dermal armour was present, a feature prominent among the placoderms. A well-developed caudal, or tail, fin was present.

Palaic language, ancient Indo-European language of northwest Anatolia. Modern knowledge of the language comes from 21 passages dealing with the cult of the deity Ziparwa that appear in the cuneiform tablets found in the ruins of the Hittite archives at Boğazköy (the ancient Hattusa, in modern Turkey). In its inflectional systems and pronoun forms, it appears to be very close to the Hittite and Luwian languages, with which it is placed in the Anatolian subgroup of the Indo-European language family.

Palais-Royal Theatre, French THÉÂTRE DU PALAIS-ROYAL, Paris playhouse most noted for 17th-century productions by Molière.

The Palais-Royal traces its history to a small private theatre in the residence of Cardinal Richelieu. Designed by architect Jacques Lemercier, this theatre became known by the name of the residence, the Palais-Cardinal; it was the first theatre in France with movable scenery wings and a permanent proscenium arch. It opened, with the royal court attending, with a production of Jean Desmarets's *Mirame* in 1641. Following Richelieu's death, the palace became royal property, and, as the Palais-Royal, the theatre was used for courtly entertainments. In 1660 the theatre was given to Molière and his troupe, who occupied it until the dramatist-actor's death in 1673. Jean-Baptiste Lully requisitioned the Palais-Royal for his Royal Academy of Music, and it became the home for his opera productions. The theatre burned down in 1763 and was rebuilt, only to burn again in 1781. The entire area was then redeveloped into an amusement area by its owner, the Duke de Chartres. It contained a number of theatres, many called Palais-Royal at various times. One of these, which had opened in 1790 as the Variétés-Amusantes, was renamed the Théâtre de la République by the actor François-Joseph Talma and his compatriots during the Revolution; under Napoleon it was made the home of the Comédie-Française and became known as the Théâtre-Français. In 1831 a theatre at the opposite end of the palace was renamed the Théâtre du Palais-Royal; it was dedicated to popular comedy.

Palamas, Saint Gregory (b. Nov. 11/14, 1296, Constantinople [now Istanbul, Tur.]—d. 1359, Thessalonica, Byzantine Empire [now in Greece]; canonized 1368), Orthodox monk, theologian, and intellectual leader of Hesychasm, an ascetical method of mystical prayer that integrates repetitive prayer formulas with bodily postures and controlled breathing. He was appointed bishop of Thessalonica in 1347. In 1368 he was acclaimed a saint and was named "Father and Doctor of the Orthodox Church."

Born at Constantinople of a distinguished family with ties to the imperial court, Palamas mastered the classical philosophies of antiquity at the imperial university. In 1316, however, he renounced a political career in order to become a monk at Mount Athos in northeastern Greece, the spiritual centre of Greek Orthodoxy. For 25 years he immersed himself in study and reflection on the sacred Scriptures and the writings of the Church Fathers; he was introduced to contemplative prayer by a spiritual master and in turn became a master for other initiates. Raids by the Turks in about 1325 forced him to interrupt his monastic life on Mt. Athos and to flee to Thessalonica and Macedonia. He was ordained a priest in 1326 and later, with 10 companions, retired to a hermitage in Macedonia.

He returned to Mt. Athos in 1331 to the community of St. Sabas and *c.* 1335 was chosen a religious superior (*hēgoumenos*) of a neighbouring convent. Because of differences with the monks who considered his spiritual regimen too strict, he resigned after a short term and returned to St. Sabas.

In 1332 Palamas entered into a theological dispute that lasted for a quarter of a century and involved polemics with a series of Greek and Latin Scholastic theologians and certain rationalistic Humanists. His first adversary was Barlaam the Calabrian, a Greek monk residing in Italy who visited Constantinople and other Orthodox monastic centres to engage in philosophical disputation for intellectual prestige. Expounding a mode of theological agnosticism, Barlaam denied that any rational concepts could express mystical prayer and its divine–human communication even metaphorically. Subsequently, he composed a satirical work defaming Hesychasm by referring to its adherents as "men with their souls in their navel" (Greek *omphalopsychoi*). The image derived from the Hesychast meditative posture of focussing the eyes on a spot below the chest in order to heighten the mystical experience. Palamas responded to this attack by composing his "Apology for the Holy Hesychasts" (1338), also called the "Triad" because of its division into three parts.

The "Apology" established the theological basis for mystical experience that involves not only the human spirit but the entire human person, body and soul. This doctrine attempts to articulate a prayer experience that devotees call "the deification of the entire man," a reference to the Hesychasts' claim of an inner transformation effected by a mystical illumination uniting man with God in the depths of his spirit. Hesychast spirituality strove to bridge the gulf between human and divine existence. It held the necessity of an intermediary relationship between man's world (immanence) and God's eternity (transcendence). Hesychast prayer aspires to attain the most intense form of God–man communion in the form of a vision of the "divine light," or "uncreated energy," analogous to the Gospel account of Christ's transfiguration on Mt. Tabor, as noted in the Gospel According to Matthew 16:17 and Mark 8:9. The corporeal disposition for this contemplative state involves intense concentration and a methodical invocation of the name of Jesus (the Hesychastic "Jesus prayer"). Palamas emphasized the nonmaterialistic nature of Hesychast spirituality by explaining that the experience of inner light was not available to all but only to the "pure of heart" empowered by grace to perceive it.

After a succession of public confrontations with critical theologians and Humanists, and a politically motivated excommunication in 1344, Palamas had his teaching systematized in the *Hagioritic Tome* ("The Book of Holiness"), which became the fundamental textbook for Byzantine mysticism. The Hesychast controversy became part of a larger Byzantine political struggle that erupted in civil war. At its conclusion in 1347, Palamas, with support from the conservative, anti-Zealot party, was appointed bishop of Thessalonica. His administrative duties, together with continued writings against his Humanist critics, occupied him for the rest of his life.

In his fusion of Platonic and Aristotelian philosophy, used as a vehicle to express his own spiritual experience, Palamas set a definitive standard for Orthodox theological acumen. At the provincial Council of Constantinople in 1368, nine years after his death, he was acclaimed a saint and titled "Father and Doctor of the Orthodox Church," thus placing him among the ranks of those who determined the ideological shape of the Eastern Church.

Palamás, Kostís (b. Jan. 25 [Jan. 13, old style], 1859, Patras, Greece—d. Feb. 27, 1943, Athens), Greek poet who played an important part in the evolution of modern Greek literature.

He was educated at Mesolongion and at Athens. The central figure in the Demotic movement of the 1880s, which sought to shake off traditionalism and draw inspiration for a new literary and artistic style from the life and language of the people, Palamás became the founder of the "new school of Athens," which condemned romantic exuberance and reverted to a purer and more restrained type of poetry. In 1886 Palamás published his first collection of poems, the *Tragoudia tes Patridos mou* ("Songs of My Country"), followed by the *Iamboi kai Anapaestoi* ("Iambs and Anapaests"; 1897), the *Asalefte Zoe* (1904; Eng. trans. by A.E. Phoutrides, *Life Immovable,* 1904), the *Dodecalogos tou Gyftou* (1907; "The Twelve Lays of the Gypsy") and the *I flogera tou Vasilia* (1910; "The King's Flute").

Palamás was the first poet to express the national sufferings and aspirations of the Greeks, and with his lyricism, metrical variety, and robust language he remoulded a great deal of Greek history, mythology and philosophy, fusing it with many Western European and even Eastern ideas. His play, the *Trisevgene* (1903; "The Thrice Noble"), has lyric rather than dramatic merits. He also wrote short stories and his criticism raised the standard of modern Greek literary criticism.

Palāmau, district, Bihār state, northeastern India. Its area (about 4,940 sq mi [12,800 sq km]) consists of lower spurs of the Choṭa Nāgpur plateau, drained by tributaries of the Son River and the North Koel River. Rice, corn (maize), and oilseeds are the major crops, and forest products (including lac) are important. Coal, bauxite, dolomite, and iron ore deposits are worked. Daltonganj is the district headquarters. Pop. (1981) 1,917,528.

Palamedes, in Greek legend, the son of Nauplius, king of Euboea, and a hero of the Trojan War. During the siege of Troy, Palamedes alternated with two other Greek heroes, Odysseus and Diomedes, in leading the army in the field, but his ability aroused their envy. In the epic version they drowned him while fishing or persuaded him to seek treasure in a well, which they thereupon filled with stones. In the tragic version Agamemnon (king of Mycenae, or Argos), Diomedes, and Odysseus had an agent steal into his tent and conceal a letter that contained money and purported to come from King Priam of Troy. They then accused Palamedes of treasonable correspondence with the enemy, and he was stoned to death.

Palamedes had a reputation for sagacity, and the ancients attributed a number of inventions to him, including the alphabet, numbers, weights and measures, coinage, and the practice of eating at regular intervals. He is now generally considered to be a personification of Phoenician culture, the source of many of these developments.

Palana, urban settlement and centre of Koryak autonomous *okrug* (area), Kamchatka *oblast* (administrative region), far eastern Russian Soviet Federated Socialist Republic, on the western coast of Kamchatka Peninsula on the Palana River, 5 mi (8 km) from its mouth on the Sea of Okhotsk. The area was formed in 1930. The settlement has a regional museum. Pop. (1974 est.) 3,300.

Palangkaraya, *kotamadya* (city), capital of Kalimantan Tengah *propinsi* (Central Borneo province), Borneo, Indonesia, situated to the west of the Sungai (stream) Kahayan. It was occupied by the Japanese during World War II and was the principal city of Great Dayak, an autonomous state (one of five) created in 1945 that became part of the Republic of Indonesia in 1950. The population consists mainly of the native Dayaks together with Chinese and Japanese settlers. Most of the Dayaks have retained traditional animist beliefs, although some have been converted to Christianity. Household industries include wood carving, plaiting, weaving, and beadwork. Riverine transport connects the city with Kualakurun and Banjarmasin. An airport links it with Sampit, Balikpapan, and Pangkalangbuun. The Universitas Palangka Raya (founded 1963) is located in the city. Pop. (1980) 60,447.

Pālanpur, town, administrative headquarters of Banās Kāntha district, Gujarāt state, west central India, in the lowlands between the Arāvalli Range and the Kāthiāwār Peninsula. The former capital of the princely state of Pālanpur, the town is now a trade and processing centre for agricultural produce and a rail and road junction. Pālanpur is also known for its handicrafts. Pop. (1981) 61,262.

Pālār River, river in southern India, rising near the Ponnaiyār River, southwest of Chintāmani, Karnātaka state, and flowing 183 mi (295 km) southeastward through Tamil Nādu state to the Bay of Bengal, south of Madras. Its major tributaries are the Ponnai and Cheyyār rivers.

The flow of the Pālār is irregular, with considerable variations from year to year. Although it generally does not flood, heavy rains have caused the river to remain in flood for as long as six months. The river has been dammed for irrigation, especially in North Arcot and Chingleput districts of Tamil Nādu. The largest towns along its banks are Vellore, Arcot, and Chingleput.

palas, plural PALASY, flat-surfaced handwoven floor covering from the Caucasus, Turkistan, or parts of Iran. In the rest of Iran, the Balkans, and Anatolia, the name for similar pieces is kilim. The Caucasian *palas* is a slit tapestry in technique, the Shirvan variety designed without a border as a series of transverse bands carrying bold polygonal ornaments in vivid colouring. A Karabagh rug may be planned with diagonal rows of highly geometric palmette forms within a narrow border on all sides.

A Kurdish *palas* might have a honeycomb pattern of ornamented hexagons with no real border or a set of transverse bands much narrower than those in the Shirvan *palas*. Turkmen *palasy,* usually of Yomut workmanship,

are brocadings of several types, the most common showing a diamond grid with a narrow border on all sides and long aprons at both ends. Much of the ground shows through between and around the brocaded motifs.

palatal, in phonetics, a consonant sound produced by raising the blade, or front, of the tongue toward or against the hard palate just behind the alveolar ridge (the gums). The German *ch* sound in *ich* and the French *gn* (pronounced *ny*) in *agneau* are palatal consonants. English has no purely palatal consonants, except for the *y* sound (a semivowel) in "you." (The *sh* sound in "ship" and the *zh* sound represented as *z* in "azure" are usually classified as palato-alveolar sounds.)

palatalization, in phonetics, the production of consonants with the blade, or front, of the tongue drawn up farther toward the roof of the mouth (hard palate) than in their normal pronunciation. Palatalized consonants in Russian are pronounced as if attempting simultaneously to pronounce a particular consonant and a *y* sound; in English, the *ny* in "canyon" approximates a palatalized sound. Palatalized consonants may be distinguished from palatal consonants, in which the front of the tongue and the hard palate form the primary articulation.

Palatalization also refers to the process of sound change in which a nonpalatal consonant, like *k,* changes to a palatal consonant, like *ch* or *sh*; *e.g.,* French *chaîne* (pronounced with an initial *sh* sound) developed from Latin *catena* (pronounced with an initial *k* sound).

palate, in vertebrate anatomy, the roof of the mouth, separating the oral and nasal cavities. It consists of an anterior hard palate of bone and, in mammals, a posterior soft palate that has no skeletal support and terminates in a fleshy, elongated projection called the uvula.

The hard palate, which composes two-thirds of the total palate area, is a plate of bone covered by a moist, durable layer of mucous-membrane tissue, which secretes small amounts of mucus. This layer forms several ridges that help grip food while the tongue agitates it during chewing. The hard palate provides space for the tongue to move freely and supplies a rigid floor to the nasal cavity so that pressures within the mouth do not close off the nasal passage. In many lower vertebrates the hard palate bears teeth.

The soft palate is composed of muscle and connective tissue, which give it both mobility and support. This palate is very flexible. When elevated for swallowing and sucking, it completely blocks and separates the nasal cavity and nasal portion of the pharynx from the mouth and the oral part of the pharynx. While elevated, the soft palate creates a vacuum in the oral cavity, which keeps food out of the respiratory tract.

The first well-developed palates are found in the reptiles, although only in the form of a hard partition. Palates similar to those in humans occur only in birds and some mammals. In a few whales the mucous membrane forms toughened plates known as baleen, or whalebone.

In the human abnormality of cleft palate, the separation between the nose and mouth is incomplete, allowing food to enter the nose and interfering with speech. This condition can be corrected surgically.

Palatinate, German PFALZ, in German history, the lands of the count palatine, a title held by a leading secular prince of the Holy Roman Empire. Geographically, the Palatinate was divided between two small territorial clusters: the Rhenish, or Lower, Palatinate and the Upper Palatinate. The Rhenish Palatinate included lands on both sides of the middle Rhine River between its Main and Neckar tributaries. Its capital until the 18th century was Heidelberg. The Upper Palatinate was located in northern Bavaria, on both sides of the Naab River as it flows south toward the Danube, and extended eastward to the Bohemian forest. The boundaries of the Palatinate varied with the political and dynastic fortunes of the counts palatine.

In early medieval Germany, counts palatine served as stewards of royal territories in the absence of the Holy Roman emperors. In the 12th century the lands of the counts palatine of Lotharingia (Lorraine) were formed into the separate territory of the (Rhenish) Palatinate. In 1214 the Holy Roman emperor Frederick II granted these lands to Louis I, Duke of Bavaria, of the house of Wittelsbach. This ancient Bavarian dynasty, in one or another of its branches, was to rule the Palatinate through its subsequent history. In 1329, in an internal dynastic settlement, the North Mark of Bavaria was detached from the Bavarian Wittelsbachs and given to the branch of the family which also held the Rhenish territories. The North Mark thereafter was known as the Upper Palatinate. In the 14th and 15th centuries, the counts palatine brought firm rule and prosperity to their lands. They fought for the rights of the German princes against the universalist ambitions of popes and emperors. They won the right to participate in the election of the emperor, a right confirmed by the Golden Bull of 1356, which made the elector palatine the chief secular prince of the Holy Roman Empire.

The Palatinate remained Roman Catholic during the early Reformation but adopted Calvinism in the 1560s under Elector Frederick III. The Palatinate became the bulwark of the Protestant cause in Germany. Elector Frederick IV became the head of the Protestant military alliance known as the Protestant Union in 1608. His son Frederick V's acceptance of the Bohemian crown in 1619 contributed to the beginning of the Thirty Years' War, a war that proved disastrous to the Palatinate. Frederick V was driven from Bohemia in 1620 and, in 1623, was deprived of his German lands and electoral dignity, which were given to Bavaria. Catholic troops devastated the Rhenish Palatinate. The Peace of Westphalia (1648) restored the Rhenish lands, as well as a new electoral dignity, to Frederick's son Charles Louis. The Upper Palatinate, however, remained with Bavaria thereafter.

During the War of the Grand Alliance (1689–97), the troops of the French monarch Louis XIV ravaged the Rhenish Palatinate, causing many Germans to emigrate. Many of the early German settlers of America (the Pennsylvania Dutch) were refugees from the Palatinate. During the French Revolutionary and Napoleonic wars the Palatinate's lands on the west bank of the Rhine were incorporated into France, while its eastern lands were divided largely between neighbouring Baden and Hesse. After the defeat of Napoleon (1814–15), the Congress of Vienna gave the east-bank lands to Bavaria. These lands, together with some surrounding territories, again took the name of Palatinate in 1838. French troops temporarily occupied the Rhineland territories after Germany's defeat in World War I.

After World War II, parts of the Rhenish territories were incorporated into the newly constituted federal *Land* (state) of Rheinland-Pfalz (Rhineland-Palatinate) in (then West) Germany. *See* Rheinland-Pfalz.

palatine, any of diverse officials found in numerous countries of medieval and early modern Europe. Originally the term was applied to the chamberlains and troops guarding the palace of the Roman emperor. In Constantine's time (early 4th century), the designation was also used for the senior field force of the army that might accompany the emperor on his campaigns.

During the early European Middle Ages the term palatine applied to various officials among the Germanic peoples. The most important of these was the count palatine, who in Merovingian and Carolingian times (5th through 10th century) was an official of the sovereign's household, in particular of his court of law. The count palatine was the official representative at court proceedings such as oath takings or judicial sentences and was in charge of the records of such proceedings. At first he examined cases in the king's court and was authorized to carry out the decisions; later he had his own court in which he was allowed certain discretion in making decisions. In addition to his judicial responsibilities, the count palatine had administrative functions dealing with the king's household.

Under the German kings of the Saxon and Salian dynasties (919–1125), the function of the counts palatine corresponded to those of the Carolingian *missi dominici,* who were representatives of the king in the provinces, responsible for the administration of the royal domain and for the disposition of justice in certain duchies, such as Saxony and Bavaria, and, in particular, Lotharingia (Lorraine). When other palatine rights were absorbed by ducal dynasties, local families, or, in Italy, by bishops, with little of the authority retained, the count palatine of Lotharingia, whose office had been attached to the royal palace at Aachen from the 10th century onward, became the real successor to the Carolingian count palatine. From his office grew the Countship Palatine of the Rhine, or simply the Palatinate, which, from the time of the emperor Frederick I Barbarossa (d. 1190), became a great territorial power. The term palatine recurs in the 14th century, when the emperor Charles IV instituted a court body of household counts palatine, but they had only voluntary jurisdiction and some honorific functions.

In England the term palatinate, or county palatine, was applied in the Middle Ages to counties the lords of which, whether lay or ecclesiastical, exercised powers normally reserved to the crown. Likewise, there were palatine provinces among the English colonies in North America: Lord Baltimore was granted palatine rights in Maryland in 1632, as were the proprietors of Carolina in 1663.

The word *palatinus* and its derivatives also translate the titles of certain great functionaries in eastern Europe, such as the Polish *wojewoda,* a military governor of a province.

Palatine Chapel, also called PALACE CHAPEL, German PFALZKAPELLE, also called OCTAGON, German OKTOGON, the imperial chapel of Charlemagne, now forming part of the Cathedral of Aachen, Germany. Aachen was the capital of Charlemagne's kingdom, and the Palatine Chapel was part of a complex of buildings that was erected in 790–805 to serve as his court and as the national church of his empire. The chapel is the only surviving structure of these and is in fact the most important surviving example of Carolingian architecture. It was designed by Odo of Metz and was modeled by him after the Byzantine-style Church of San Vitale at Ravenna. The chapel itself is a domed central octagon that is surrounded by a 16-sided ambulatory. The cupola crowning the chapel's dome rises to a height of 101.5 feet (30.9 m); the chapel was for many centuries the tallest stone building in Germany. The chapel contains Charlemagne's marble-slab throne, which was used for the coronations of 32 Holy Roman emperors in the period from 936 to 1531. During the Gothic period, a choir, several chapels, and a vestibule were added to the chapel, and the enlarged building subsequently was designated the Cathedral of Aachen.

Palatine Hill, Italian MONTE PALATINO, four-sided plateau rising 131 feet (40 m) south of the Forum in Rome and 168 feet (51 m) above sea level. It has a circumference of 5,700 feet (1,737 m). The city of Rome was founded on the Palatine, where archaeological discoveries range from prehistoric remains to the ruins of imperial palaces.

The Palatine is topographically intricate and scenically attractive, despite a general starkness that is allayed by the artistically landscaped vegetation. Level upon level of multistory buildings has been built on previous sites and structures. According to ancient Roman legend, the founders of Rome, Romulus and Remus, twin sons of Mars, were abandoned as infants on the flooding Tiber River and were deposited by the receding waters at the foot of the Palatine. The legend purports that they were nurtured by a she-wolf whose cave, or Lupercal, was on the slopes of the Palatine and were raised by a shepherd who kept his flocks on the slopes of the Palatine, the centre from and around which Rome grew. The Palatine consisted originally of three summits: the Germalus to the north; the Velia, a kind of isthmus that linked the Palatine to the neighbouring Esquiline Hill; and the Palatium to the south. The Palatium was the highest of the summits and later gave its name to the entire hill.

During the Republican era many temples and houses of leading citizens were built on the Palatine, and during the empire it became the city's aristocratic quarter. Augustus was born and established his imperial residence there; Domitian had the topography greatly transformed by the architect Rabirius.

With the fall of the empire, the architecture upon the Palatine, too, fell into disrepair. It was transformed in the European Middle Ages into a stronghold but was later completely abandoned. The Italian Renaissance brought about a resurgence in the value of the land, and noble Roman families again built their houses there.

Palau (Caroline Islands): *see* Babelthuap.

Palau, also spelled BELAU, or PELEW, officially REPUBLIC OF PALAU, internally self-governing republic of the western Pacific Ocean, composed of an island group known as the Palau islands to the north and the four small, isolated coral islands of Sonsorol, Merir, Pulo Anna, and Tobi and the adjacent atoll of Helen Reef to the southwest. Encompassing about 340 islands and having a land area of 188 square miles (488 square km), the islands form the western end of the Caroline Islands chain. Palau has a northeast-southwest extent of about 400 miles (640 km). Its nearest neighbours include the Philippines (west), Yap Island in the Federated States of Micronesia (northeast), and Irian Jaya province of Indonesia (south). The population in 1990 was estimated at 14,300.

A brief treatment of Palau follows. For information about regional aspects of Palau, *see* MACROPAEDIA: Pacific Islands.

The land. Palau's major populated islands are Babelthuap, Koror, Malakal, Arakabesan, and Peleliu. All of these islands lie within a single barrier reef enclosing a 489-square-mile (1,267-square-kilometre) lagoon on the west side. Nearby Angaur Island (southwest) and Kayangel Atoll (north) lie outside the barrier reef, however. Babelthuap is the largest island (153 square miles [137 square km]) of the main group. Koror Island, just south of Babelthuap, is the provisional capital and largest population centre. It rises to 2,061 feet (628 m). Arakabesan and Malakal islands are of volcanic origin; Babelthuap and Koror are partly elevated limestone, partly volcanic; and Auluptagel, Ngargol, Urukthapel, Peleliu, and Angaur are of raised coral limestone. Of the Palau island group, Peleliu alone is flat.

Palau's climate is tropical and shows little monthly variation, with a mean annual temperature on Koror of 81° F (27° C) and rainfall of 150 inches (3,800 mm) a year on Koror and 130 inches (3,302 mm) on Angaur. The islands of the Palau group are fertile, with mangrove swamps along the coasts, backed by savanna and coconut and pandanus palms rising to rain forests in the hills. The outlying coral islands are mostly wooded and support coconut palms. Crocodiles, poisonous sea snakes, and the almost extinct dugong, or sea cow, are found in the Palau island group.

The people. The Palau islands' position on the western threshold of Oceania and their proximity to insular Southeast Asia have led to a considerable admixture of peoples. Palauans are of mixed Malay, Melanesian, Filipino, and Polynesian ancestry. About three-fifths of the total population lives in Koror and about one-third on Babelthuap. Most of the people live in traditional villages, and they are predominantly Christian. Palauan (related to Indonesian), Sonsorolese-Tobian, and English are spoken.

The economy. The major source of employment in Palau is government service. Subsistence farming, the raising of pigs and poultry, and fishing are the principal economic activities in the rural areas. Taro, cassava, and sweet potatoes are staples; oranges, breadfruit, and bananas are also grown. Coconut-oil, tuna, copra-cake, and scrap-metal exports are the main sources of revenue. There is also some tourism. Imports include foodstuffs and manufactured goods.

Koror has a good system of paved roads. Most transportation between the islands is by boat or air, but Koror is connected by bridge with Babelthuap and by causeways with Arakabesan and Malakal islands. The main port, a radio station, and a television station are at Koror. An international airport is located on Babelthuap.

Government and social conditions. The Palauan government is headed by a popularly elected president and has a bicameral legislature consisting of a House of Delegates and a Senate. A hospital on Koror and dispensaries on the inhabited islands provide health care. The populated islands have primary schools, and Koror has secondary schools. The Micronesian Occupational College on Koror was established in 1969.

History. Visited by the Spanish navigator Ruy López de Villalobos in 1543, the islands remained under nominal Spanish ownership for more than three centuries. In 1899 the Palau group, together with the Mariana and Caroline islands, was sold to Germany. Copra production was increased, and phosphate deposits on Angaur were mined (these were exhausted in 1955). The Palau islands were occupied in 1914 by Japanese forces, who further developed mining, plantation agriculture, and commercial fishing. A major Japanese naval stronghold in World War II, the group fell to U.S. forces in 1944.

Palau became part of the United Nations Trust Territory of the Pacific Islands under U.S. administration in 1947. A constitution was adopted in 1981 (following two prior referenda), and elections were held in the same year. The country became an internally self-governing republic in 1981. Palau signed a Compact of Free Association with the United States in 1982; this compact required the United States to provide economic aid to Palau in exchange for the right to build and maintain U.S. military facilities on the island group. In separate referenda since 1983 the compact repeatedly failed to gain the 75 percent popular approval required to override Palau's constitutional ban on vessels armed with or powered by nuclear materials. In the late 20th century Palau was the last trusteeship of the original United Nations trust territory. The other three Pacific island groups dissolved their trusteeships in 1986—the Marshall Islands and the Federated States of Micronesia entering into free association with the United States and the Northern Mariana Islands becoming a U.S. Commonwealth territory.

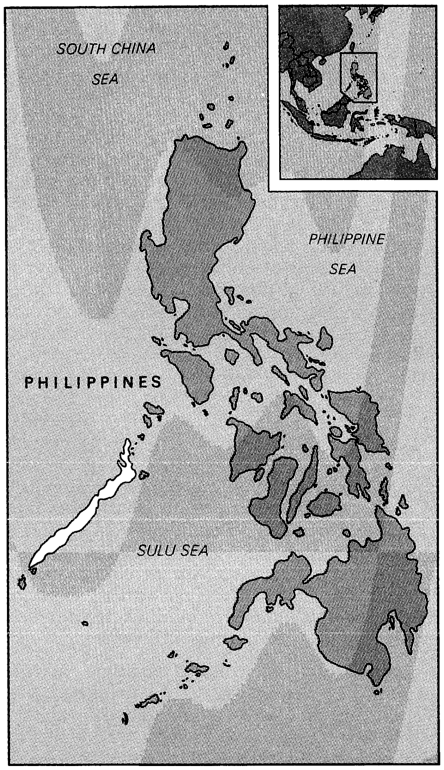
Palauan language, major language of the Republic of Palau, which is situated in the western Pacific Ocean. The language is classified as belonging to the eastern branch of the Austronesian (Malayo-Polynesian) family of languages. Like Chamorro, which is spoken in the Mariana Islands, it is considered to be of the Indonesian type of languages, with closest relations to the Philippine languages. Palauan, with about 12,000 speakers in the late 20th century, is characterized by a small phonemic inventory and the use of phonemic stress.

Palaung, also called TA-ANG, hill people of the Shan region and adjacent areas of eastern Myanmar (Burma), as well as southwestern Yunnan province of China. They numbered about 240,000 in the late 20th century and speak dialects of the Palaungic branch of Austro-Asiatic languages. The Palaung's language is quite distinct from the Tai speech of the Shan (*see* Tai), with whom they live closely intermingled. Their area has a long history as a centre of tea production.

Some Palaung groups are organized in patrilineal lineages similar to those of the Kachin, their neighbours to the north; elsewhere their organization is more like that of the Shan. Shan-type Buddhism coexists with various local cults based on ancestor worship. The Palaung language resembles that of the head-hunting Wa farther east, but there is otherwise no close cultural connection between the two groups.

Palaungic languages, also called PALAUNG-WA, branch of the Mon-Khmer group of the Austro-Asiatic languages. Palaungic languages are spoken primarily in Myanmar (Burma) and secondarily in Thailand, Vietnam, and Yunnan province in China. Included are Palaung, spoken in Myanmar; Mang, spoken in Vietnam; Lawa, a Thai language; and Danaw, Kawa-Yunnan, Angku, Khamed, and Wa (or Kwa), spoken in Myanmar and China. The Khmuic languages, spoken primarily in Laos, are sometimes classified together as an eastern branch of the Palaungic languages.

Palawan, island, the southwesternmost large island of the Philippines. Palawan is long and narrow and trends northeast–southwest between the South China and Sulu seas. It has an area of 4,550 square miles (11,785 square km), a maximum width of 24 miles (39 km),



Palawan

and a mountainous backbone that runs its entire 270-mile (434-kilometre) length, with Mount Mantalingajan (6,840 feet [2,085 m]) in the south as its highest peak. The Balabac–Bugsuk group of islands off the southern tip is a remnant of a land bridge that connected Palawan and Borneo during the Pleistocene epoch (1,600,000 to 10,000 years ago); for this reason the animal life and vegetation are more closely related to those of Borneo than to those of the other Philippine islands. Palawan's long, irregular coastline is fringed with coral reefs and has numerous offshore islets. A discontinuous coastal plain that seldom extends more than 5 miles (8 km) inland supports most of the island's population. The plain, which is best developed on the southeastern coast, constitutes the main agricultural area and has the island's only all-weather road.

About 1,800 smaller islands and islets lie near Palawan; the main island groups are the Calamian (north), the Dumaran–Cuyo (northeast), and the Balabac–Bugsuk (south). Puerto Princesa, on the east-central coast of Palawan island, is the island's largest city.

Scattered settlement and shifting agriculture predominate, with rice as the main food crop. Corn (maize), beans, and sweet potatoes are also grown. Large-scale commercial fishing operations are carried out at Puerto Princesa and Taytay. Mineral resources include mercury, silica, and chromite. Most of the island is the forest homeland of the Batah, Palawan, and Tagbanuas ethnic groups. Christian migrants (Visayans, Tagalogs, Ilocanos, and Bicolanos) have settled in the north and east. There are some Moro (Muslim) villages in the south. The Tabon Caves on the isolated southwestern coast of Palawan are an important archaeological site. Pop. (1980) 311,548.

Pālayankottai, also called PĀLAMCOTTAH, town, southern Tamil Nādu state, southeastern India. It lies across the Tāmbraparni River from its twin city of Tirunelveli. Pālayankottai is a residential and educational centre in the Tirunelveli urban agglomeration. It is a major centre of Christian missions in southern India and has private Christian schools and Christian and other colleges affiliated with Madurai-Kamaraj University. Cotton and palmyra are the chief commercial agricultural products grown in the surrounding region. Pop. (1981) 87,302.

Palazzo Ducale (Venice): *see* Doges' Palace.

Palazzolo Acreide, town, Siracusa *provincia,* southeastern Sicily, Italy, in the Iblei Mountains, west of Syracuse. The successor to the Syracusan colony of Acrae (founded nearby in 664 BC), which was ravaged by the Muslims in the 9th century, the town was ruled by a succession of families in the European Middle Ages, later passing to the Kingdom of the Two Sicilies and eventually to the Kingdom of Italy. It was largely destroyed by the earthquake of 1693, and most of the buildings date from the 18th century.

On the site of Acrae (Akrai) are the remains of a Greek theatre and council house. The *templi ferali* ("temples of the dead"), carved in the rock, contain Greek inscriptions and votive niches. The Santoni are 12 life-size rock carvings of deities, including Cybele, the Great Mother of the Gods, dating from the 3rd century BC. The Iudica Palace houses objects from the ruins.

Palazzolo Acreide has a hydroelectric-power plant, and olives, grain, citrus fruits, and almonds are grown. Pop. (1988 est.) mun., 10,007.

pale (from Latin *palus,* "stake"), district separated from the surrounding country by defined boundaries or distinguished by a different administrative and legal system. It is this definition of pale from which the phrase "beyond the pale" is derived.

In imperial Russia, what came to be called the Pale of Settlement (Cherta Osediosti) came into being as a result of the introduction of large numbers of Jews into the Russian sphere after the three partitions of Poland (1772, 1793, 1795). Adjusting to a population often banned from Russia altogether was a problem that Russian leadership solved by allowing Jews to remain in their current areas of residence and by permitting their settlement in areas of the Black Sea littoral annexed from Turkey, where they could serve as colonists. In three decrees, or ukases, issued in 1783, 1791, and 1794, Catherine II the Great restricted the commercial rights of Jews to those areas newly annexed. In ensuing years, this area became a strictly defined pale, as legal restrictions increasingly proscribed Jewish settlement elsewhere.

During the 1860s a few exceptions were made to the increasing restriction of Jews to settlement only in the pale—which by the 19th century included all of Russian Poland, Lithuania, Belorussia, most of the Ukraine, the Crimea, and Bessarabia. Some merchants and artisans, those with higher educations, and those who had completed their military service could settle anywhere but in Finland. In the 1880s, however, the pendulum swung back toward restriction. A period of reaction arrived with the ascension of Tsar Alexander III in 1881. That year, the new tsar promulgated the "Temporary Laws," which, among many regressive measures, prohibited further Jewish settlements outside the pale; and Christians within the pale were allowed to expel Jews from their areas. Occasionally, new areas were proscribed, such as the city and province of Moscow in 1891. Nevertheless, the census of 1897 indicated that most Jews remained confined to the pale. Almost 5,000,000 lived within it; only about 200,000 lived elsewhere in European Russia. The pale ceased to exist during World War I, when Jews in great numbers fled to the interior to escape the invading Germans. The Provisional Government formally abolished it in April 1917.

Other examples of pales include the English pales in Ireland and France. "The Pale" in Ireland (so named after the late 14th century) was established at the time of Henry II's expedition (1171–72) and consisted of the territories conquered by England, where English settlements and rule were most secure. The pale existed until the entire area was subjugated under Elizabeth I (reigned 1558–1603). Its area, which varied considerably depending upon the strength of the English authorities, included parts of the modern counties of Dublin, Louth, Meath, and Kildare. The Calais pale in northern France (1347–1558) had a perimeter extending from Gravelines in the east to Wissant in the west and enclosing a hinterland 6–9 miles (10–14 km) deep.

Palembang, *kotamadya* (municipality) and capital, Sumatera Selatan *provinsi* (province), Indonesia, lying on both banks of the Musi River. Sumatra's largest city, it was long the chief town of the Palembang sultanate. The city served as the capital of the Buddhist Śrivijaya empire from the 7th century until the kingdom was overthrown by the Hindu Majapahit empire in the 14th century. Palembang subsequently fell under Islāmic rule about 1500. In 1617 the Dutch East India Company set up a trading post there and in 1659, following several massacres of its employees, built a fort. Intermittently under British suzerainty (1811–14; 1818–21), the sultanate was finally abolished by the Dutch (1825). Occupied by Japan during World War II, the city was temporarily capital of the autonomous state of South Sumatra (from 1948) until included in the Republic of Indonesia (1950).

Important landmarks are the Great Mosque (1740; minaret 1753), tombs of several sultans, a museum, a centre for training in public administration, Sriwijaya University (1960), and the provincial-parliament building. The port city is accessible to ocean traffic on the Musi River and has considerable trade with ports

on the Malay Peninsula, Thailand, and China as well as other Indonesian ports. Exports include rubber, coffee, timber, petroleum products, coal, tea, spices, resin, rattan, cinchona, and pepper. There are also shipyards, iron foundries, machine shops, rubber plants, and a fertilizer factory. The suburbs of Sungaigerong and Pladju, located to the east, have large oil refineries. Served by rail and road, the city of Palembang also has an airport. Pop. (1984 est.) 903,000.

Palencia, inland *provincia,* in the Castile-León *comunidad autónoma* ("autonomous community"), northern Spain, bounded by the provinces of Cantabria (north), Burgos (east), Valladolid (south), and Valladolid and León (west). Formed in 1833, it has an area of 3,102 square miles (8,035 square km). The north is traversed by the Cantabrian Mountains, rising to 6,644 feet (2,025 m) in the Brezo Mountains. The remainder of Palencia, the fertile Campos Plain, belongs to the great Castilian tableland. In the south is a marsh or lake, known as Nava Lake; and the principal rivers are the Pisuerga and Carrión. Minerals have been found in the mountains, but only coal and small quantities of copper are worked. The Castilla Canal (built 1753–1832), on which the provincial capital, Palencia, is located, connects the province with Valladolid and is used for irrigation as well as transport.

Wheat and other cereals, vegetables, sugar beets, hemp, and flax are grown; sheep raising is extensive; and there are manufactures of linen and woolen stuffs, porcelain, leather, paper, and rugs. Apart from Palencia, the capital city, the chief centres are Venta de Baños, Barruelo de Santullán, Dueñas, and Paredes de Nava. Pop. (1988 est.) 190,167.

Palencia, capital of Palencia *provincia,* in the Castile-León *comunidad autónoma* ("autonomous community"), north-central Spain, on the Campos Plain southwest of Burgos. Called the Pallantia by the ancient Greek geographers Strabo and Ptolemy, it was the chief town of the Vaccaei, an Iberian tribe. Its history during the Gothic and Moorish periods is obscure, but it was the seat of the Castilian kings and their Cortes (courts of a parliamentary or advisory nature) in the 12th and 13th centuries. In 1520 Palencia participated in the ultimately unsuccessful revolt of the Castilian cities (*comuneros*) against the Holy Roman emperor Charles V. The university founded there in 1208 by Alfonso VIII was removed in 1239 to Salamanca. The Gothic cathedral, begun in 1321, completed in 1504, and dedicated to San Antolín, occupies the site of a church erected (1026–35) by Sancho III Garcés of Navarre and Castile over the cave of San Antolín. The cathedral contains El Greco's "St. Sebastian" and other valuable paintings, old Flemish tapestry, and magnificent carved woodwork and stonework. Portions of the hospital of San Lázaro are said to date from the time of the Cid, the Spanish soldier-hero celebrated in Spain's epic poem *El cantar de mío Cid,* who married Jimena in Palencia in 1074.

Palencia is an important communications centre. Its economy is based on the manufacture of iron, rugs, alcohol, leather, soap, porcelain, linen, cotton, wool, machinery, and matches. Pop. (1988 est.) 76,692.

Palenque, also called GUARINE, Indian tribe of northern Venezuela at the time of the Spanish conquest (16th century). The Palenque were closely related to the neighbouring Cumanagoto (*q.v.*); their language probably belonged to the Arawakan family. They were a tropical-forest people known to eat human flesh, to be warlike, and to live in settlements surrounded by palisades (*palenques*). The Patángoro (*q.v.*) of Colombia were also sometimes called Palenque because of their fortified settlements.

Palenque, ruined ancient Mayan city of the Classic period (*c.* AD 300–900) in what is now Chiapas state, Mexico, about 80 miles (130 km) south of Ciudad del Carmen. Its original name was lost, and thus it was named after the neighbouring village of Santo Domingo del Palenque. The Palenque builders used plaster to obtain a smooth finish unlike the usual Mayan tooled-limestone construction. They used carving, however, on the interior walls; the best examples are on tablets affixed to the

walls with plaster. Stucco and terra-cotta images have been found. The Palace shows three parallel walls housing two corridors covered with pointed vaults of the Palenque style.

One of the largest and best-preserved structures, the Temple of the Inscriptions, is noted for its hieroglyphic inscriptions. In 1952 a crypt was discovered under the temple, in which were found the jade-ornamented remains of what may have been a ruler-priest of the 7th century AD. The small Temple of Beau Relief is noted for a large stucco bas-relief of a beautifully modeled, enthroned figure.

paleoanthropology, also spelled PALAEOANTHROPOLOGY, also called HUMAN PALEONTOLOGY, interdisciplinary branch of anthropology concerned with the origins and development of early humans. Fossils are assessed by the techniques of physical anthropology, comparative anatomy, and the theory of evolution. Artifacts, such as bone and stone tools, are identified and their significance for the physical and mental development of early humans interpreted by the techniques of archaeology and ethnology. Dating of fossils by geologic strata, chemical tests, or radioactive-decay rates requires knowledge of the physical sciences.

Paleocene epoch, also spelled PALAEOCENE EPOCH, major worldwide division of Early Tertiary rocks and time that began about 66.4 million years ago and lasted about 8.6 million years; the earliest division of the Tertiary period, it precedes the Eocene epoch and follows the Cretaceous period. Because marine rocks of the Paleocene epoch are limited in occurrence, much of the information about the Paleocene comes from terrestrial deposits. Subdivisions of the Paleocene vary from region to region; in Europe, for example, at least three stages of the Paleocene are recognized—the Danian, the Montian, and the Thanetian. In North America, especially in the San Juan River basin of New Mexico and southern Colorado, where Paleocene continental deposits are well developed and sequences are based on mammalian evolution, local names (such as the Puercan, the Torrejonian, and the Tiffanian) were assigned to the various stages.

The Paleocene record of North America affords the most complete picture of Paleocene life and environments; elsewhere, Paleocene animals, especially mammals, are lacking, rare, or of late Paleocene age. Late Paleocene faunas are known from the regions of Cernay, Fr.; Gashato, Mong.; and the Chico River region of Patagonian Argentina.

The Paleocene of North America was characterized by a general warming trend in climatic conditions, with little or no frost; seasonal variations probably consisted of alternations of dry and wet seasons. Among the most prominent features of Paleocene vertebrate faunas are the complete absence of dinosaurs and other reptilian groups that were dominant during the Cretaceous and the rapid proliferation and evolution of the mammals. Paleocene mammals include representatives of many groups or orders that are still extant, although the Paleocene forms are mostly archaic or highly specialized. In terms of proportions and relative abundance, however, Paleocene faunas are dominated by mammals that have no living representatives. Paleocene mammalian faunas include Cretaceous species such as opossum-like marsupials and, especially, the archaic and unusual multituberculates, herbivorous animals that had teeth very similar in some respects to those of the later, more advanced rodents. The condylarths, very important elements of Paleocene faunas, include forms that were trending toward herbivorousness while still retaining primitive traits of their insectivore-carnivore progenitors. Primates became more abundant in the middle Paleocene and displayed characteristics intermediate between the insectivores and lemurs, especially in terms of dental anatomy.

Late in the Paleocene, mammalian evolution showed a trend toward larger forms and more varied assemblages. The primitive mammalian carnivores, the creodonts, appear late in the Paleocene, as do large herbivores, ancestral rodents, and the first tarsioid primates. The Gashato fauna from Mongolia contains the remains of the earliest-known hare, *Eurymylus,* and among Paleocene mammals from South America are many early representatives of animals that dominated later Tertiary faunas in the region.

paleoclimatology, also spelled PALAEOCLIMATOLOGY, scientific study of the extended climatic conditions of past geologic ages. Paleoclimatologists seek to explain climate variations for all parts of the Earth during any given geologic period, beginning with the time of the Earth's formation. Many related fields contribute to the field of paleoclimatology, but the basic research data are drawn mainly from geology and paleobotany; speculative attempts at explanation have come largely from astronomy, atmospheric physics, meteorology, and geophysics.

Two major factors in the study of both ancient and present-day climatic conditions of the Earth are the changes in the relationship between the Earth and the Sun (*e.g.,* the slight alteration in the configuration of the Earth's orbit) and the changes in the surface of the planet itself (such phenomena as volcanic eruptions, mountain building, and the dispersal of the continents after the breakup of the supercontinent Pangaea). Some of the questions that were studied in the past have been largely explained. Paleoclimatologists found, for example, that the warmth of the northern hemispheric landmasses during at least 90 percent of the last 570 million years is mainly due to the drift of the continents across the latitudes; until about 150 million years ago, both North America and Europe were much closer to the equator than they are today. Other questions, such as the reasons behind the irregular advances and retreats of the ice sheets (*i.e.,* glacial and interglacial episodes), are much more difficult to explain, and no completely satisfactory theory has been presented.

Paleogene period, also spelled PALAEOGENE PERIOD, older of the two stratigraphic divisions of the Cenozoic era (the Cenozoic era began about 66.4 million years ago and extends to the present). The Paleogene, whose beginning coincides with that of the Cenozoic era, lasted about 42.7 million years and was followed by the Neogene period. The Paleogene, which means "ancient-born," includes the Paleocene (Palaeocene), Eocene, and Oligocene epochs. The term Paleogene was devised in Europe to emphasize the similarity of marine fossils found in rocks of the first three Cenozoic epochs, as opposed to the later fossils of the Neogene period. In North America the designations Paleogene and Neogene have not gained wide usage, and the Cenozoic is divided only into the Tertiary period (about 66.4 million to 1.6 million years ago) and the Quaternary period (about 1.6 million years ago to the present). Thus, the Paleogene period may also be considered to be roughly equivalent to the first two-thirds of the Tertiary period.

paleogeography, also spelled PALAEOGEOGRAPHY, the geography of selected portions of the Earth's surface at specific times in the geologic past. This geography consists of interpreted reconstructions, produced in map form, which represent visual summaries of a wide variety of complex geologic information. The maps provide a series of relatively instantaneous views of the Earth through geologic time. Paleogeographic maps may be as simple as those that merely give the former distribution of ancient lands and seas. They may be extremely comprehensive, however, showing the occurrence and distribution of fossil, plant, and animal communities, environments of sedimentation (*e.g.,* deltas, reefs, deserts, or deep-sea basins), areas undergoing uplift and erosion or subsidence and deposition, and major climatic zones. Interpretations of the distant geologic past are based largely on observations of the rocks of the Earth's crust in light of knowledge of present geologic processes. Virtually all the scientific specialties within the geologic sciences contribute to paleogeography. The disciplines of stratigraphy and sedimentology, paleontology and paleoecology, structural geology and geophysics, and petrology and geochemistry are particularly important.

Usually, a paleogeographic map covers a certain interval of time and thus represents the average geologic situation during that interval. Time intervals for any particular paleogeographic reconstruction should, however, be short, relative to the rates of geologic change in the area.

There are three main techniques for determining geologic time intervals. One is by measuring the radioactivity of rocks. The technique of dating rocks by measuring ratios of radioactive parent-to-daughter isotopes always involves certain intrinsic sources of error, and the time of formation of a rock is given as a range of years rather than as a unique point in time. The second technique for dating rocks is by correlating the similarity of fossil remains. Differing evolutionary stages of organisms provide a useful chronology for establishing the time equivalence of rocks in separate parts of the world. Rates of evolutionary change, however, usually are not sufficiently great to discriminate events of less than several million years' duration. A relatively new technique for establishing instants in time is that provided by study of paleomagnetic reversals. At specific times in the past the polarity of the Earth's magnetic field reversed, and each reversal was essentially instantaneous. A sequence of reversals has been established for the last 7 million years from the polarity and orientation of fine-grained iron oxides found in deep-sea sediments and terrestrial lava flows. Paleomagnetic reversals may ultimately provide the instant-time signatures so necessary for accurate reconstruction of the Earth's geologic history.

The simplest kind of paleogeography is that showing the location of ancient lands and seas. The data that bear on such a reconstruction include the distribution of marine and nonmarine sedimentary rocks as defined by their fossil flora or fauna. Fossil organisms, however, can provide much more detailed information than whether their enclosing sedimentary rocks were deposited on land or in the sea. Terrestrial and marine environments include a wide range of habitats (*e.g.,* upland plains or plateaus, deserts, forests, river valleys, swamps and lakes, tidal flats, beaches, lagoons, reefs, deltas, or open ocean) in each of which there lives an assemblage of animals and plants specially adapted to the ecology of the particular habitat. Knowledge of the ecologic requirements of fossil organisms thus allows more refined interpretation of the paleogeography than simply designating "land" or "sea."

Fossil land plants have long been used as climatic indicators in paleogeographic studies. When internal cellular structure is preserved, it is possible to determine if the plant lived in an arid or wet climate and if there were marked seasonal changes in temperature or rainfall. In geologically younger rocks containing fossil plants that have living descendants, one can define the past climate from the environmental preferences of the living form.

Plants provide other fossil traces besides bits and pieces of leaves, stems, or fruits. In fact, most paleoclimatological interpretation is based upon the study of fossil spores and pollen, the microscopic reproductive bodies of plants that have extremely resistant outer coverings. Because of the great durability of spores and pollen, and their very great initial abundance, fossil spores and pollen can be obtained from many terrestrial or even marginal marine sedimentary deposits that may otherwise lack larger plant remains.

Marine plants, especially the calcareous algae, are also found and recognized in the fossil state. Not only will they indicate the marine origin of the rocks in which they occur but, because of the need for light for photosynthesis, the marine environment will be identified as being relatively shallow (solar radiation does not penetrate much beyond several hundred feet of seawater).

Fossil vertebrates, whether fish, amphibians, reptiles, birds, or mammals, are also useful in paleogeography. Like plants, individual vertebrate species have characteristic adaptations to their environment, so that their distribution in ancient rocks is a guide to the occurrence and extent of those environments.

Shelly marine invertebrates, including microscopic calcareous and siliceous protists, sponges, corals, ectoproct bryozoans, brachiopods, mollusks, echinoderms, and arthropods, are also used regularly by paleontologists to define environments within ancient seas.

Not all evidence of past life found in rocks is so direct as the presence of the hard skeletal remains of shelly invertebrates, calcareous algae, or plants. Indeed, much of the evidence is quite indirect. The occurrence of oil and gas whose organic constituents are derived from fossil marine life usually defines the origin of the containing strata as marine, although, after formation in the source rock, oil and gas can migrate to the reservoir rocks whose origin might actually be nonmarine. Coprolites, which are the fossilized fecal remains of animals, can occasionally provide some paleogeographic data. Other interesting indirect evidence of life is that of tracks, trails, and burrows made by ancient animals.

Paleogeographic data are not confined to fossil remains. Rocks of all sorts, fossiliferous or not, are used for paleogeographic reconstruction. Igneous, sedimentary, and metamorphic rocks are the products of a variety of processes occurring at the Earth's surface or within its crust. The environments in which rocks originate are distributed along geographic trends, and the composition, texture, and internal structures characteristic of these environments are often recorded within the individual rock types. Analysis of the rock record at a specific point in the geologic past allows definition and interpretation of these major rock-forming environments and indicates their geographic distribution.

paleogeology, also spelled PALAEOGEOLOGY, the geology of a region at any given time in the distant past. Paleogeologic reconstructions in map form show not only the ancient topography of a region but also the distribution of rocks beneath the surface and such structural features as faults and folds. Maps of this kind help investigators to better determine the instances of deformation events in a region, the stream-drainage patterns now buried under layers of sediment, and the extent of ancient oceans and seas. They also provide a useful tool for petroleum geologists, enabling them to identify geologic structures where oil or natural gas may be trapped.

paleography, also spelled PALAEOGRAPHY, study of ancient and medieval handwriting. The primary tasks of the paleographer are to read the writings of the past and to assign them a date and a place of origin. As a rule, paleography deals with Greek and Latin scripts and their derivatives, excluding Egyptian, Hebrew, and Middle and Far Eastern scripts.

A brief treatment of paleography follows. For full treatment, *see* MACROPAEDIA: History, The Study of.

Paleography is the study of handwriting found on ancient and medieval documents of papyrus, parchment, and paper. From its beginnings as a science in 1681, paleography has been concerned with correctly reading such writings and assigning to them a date and a place of origin. The paleographer must know the language of the texts, the abbreviations used, and the various styles of handwriting.

A knowledge of writing materials is essential to the study of ancient handwriting. The oldest material, papyrus, used as early as 3500 BC, was made by pasting together a crosshatch of papyrus reeds and treating the surface until it was smooth. Climate was instrumental in its preservation. The dry climate of Egypt kept documents intact, but the dampness of Europe destroyed them. Parchment (sheepskin or goatskin) and vellum (calfskin) were used in ancient times and are still used today. Because writing material made from animal skins was expensive, it was often scraped clean and used again. Inexpensive writing material was provided by wax tablets: wooden frames filled with melted black wax. Although wax tablets were primarily used as notebooks are used today, many permanent documents were written on wax. Paper, first used in China, became readily available in the Arab world in the 9th century and in Europe in the 14th.

The properties of the writing material used determined the form of the book. In Greece, papyrus sheets were pasted together, slightly overlapping, and made into a roll. The codex, the book form known today, was made of parchment because papyrus was too brittle to be folded. First used for account books, the codex became popular when Christians used it for the Gospels.

Implements for writing on these surfaces were of great variety. A reed pen, and later a metal pen, was used in Greek and Roman times; a stylus of a hard substance like bone or metal was used to inscribe the wax tablets. Where reeds did not grow, the quill of a feather became the writing instrument. Ink either came from the cuttlefish's black secretion or was a concoction made from soot and gum or from oak apples soaked in a ferrous sulfate solution.

In order to analyze a text, the paleographer must know the different handwriting styles and the times and places of their use. The Greek capital (majuscule) letters that were used for inscribing stone and for writing on papyrus gradually became more rounded and elegant in the hands of the literary circles of Alexandria, Egypt, where many Greeks settled. A cursive script, used for everyday affairs, was widely adopted, and so much of it is preserved that it gives a day-by-day account of the lives of the ancient Greeks.

The capital letters of the Latin alphabet were used when writing on stone, but rarely on parchment. A more flowing script called rustic, applied with brush or thick pen, was used to paint notices on walls in the 1st century AD. By the 4th century another script, called uncial, existed. As in Greek writing, in Latin, too, a cursive script developed for everyday use. Other Latin alphabet scripts were devised in other parts of the West, most notably in Ireland, where the lovely insular script was used in monasteries. In England insular script and uncial script came together with the arrival of missionaries from Rome after 597. The emperor Charlemagne was instrumental in the development of Caroline miniscule (small) script that is very similar to modern typefaces. Its rounded style was made more angular by 12-century Gothic scribes; but by the 15th century the style had returned to the original form and was adopted by Italian printers.

Ancient abbreviation plagues paleographers. Ends of words were omitted (suspension) or letters in the middle of the word were deleted (contraction), and the change was marked by a symbol (similar to our modern apostrophe). More than 13,000 signs and devices that mark such changes were in use in the Middle Ages. However, the knowledge of these abbreviations helps date documents. The style of handwriting and the content of the document (when a historical event is relayed) are also used to ascertain date of composition.

Paleographers learn to identify different scribes by their characteristic handwriting and from this identify the periods in which they wrote. Not all scribes, however, are reliable. Some were actually illiterate, employed to copy documents because they could write—not read—a fine hand. An error made by one copyist was reproduced and added to by others who used his text as a model. Gothic scripts with many vertical strokes might be rendered gibberish by a scribe who had no knowledge of the language. This "minimum corruption" of vertical strokes is a problem common in paleography.

One aspect of this science needs no expertise to be enjoyed, that of book decoration. Painstaking artistic practice coupled with a highly individual artistic freedom produced books with elaborately adorned capital letters and delicate scripts complemented by finely executed miniature paintings that served as illustrations of the text. These illuminated manuscripts, most notably those from 7th-century Irish monasteries, are among the great art treasures of the world.

As in all art, the possibility of forgery exists and, in the Middle Ages, was proved in cases in which monasteries forged deeds to lands that were threatened by an unsympathetic monarchy. Today, forgeries are attempted because of the high prices paid for ancient documents, but modern detection devices like ultraviolet light quickly reveal the counterfeit.

paleohydrology, also spelled PALAEOHYDROLOGY, science concerned with hydrologic systems as they existed during previous periods of Earth history. Changing hydrologic conditions are inferred from the evidence of the alteration, deposition, and erosion in rocks from these periods. Paleohydrology also deals with the changes in the floral and faunal assemblages through geologic time that have been greatly influenced by hydrologic change.

Paleolithic Period, also spelled PALAEOLITHIC PERIOD, also called OLD STONE AGE, ancient cultural stage, or level, of human development, characterized by the use of rudimentary chipped stone tools.

At sites dating from the Lower Paleolithic Period (about 2,500,000 to 200,000 years ago), simple pebble tools have been found in association with the remains of what may have been the earliest human ancestors. A somewhat more sophisticated Lower Paleolithic tradition, known as the Chopper chopping-tool industry (*q.v.*), is widely distributed in the Eastern hemisphere. This tradition is thought to have been the work of the hominid species named *Homo erectus*. Although no such fossil tools have yet been found, it is believed that *H. erectus* probably made tools of wood and bone as well as stone.

Around 700,000 years ago, a new Lower Paleolithic tool, the hand ax, appeared. The earliest European hand axes are assigned to the Abbevillian industry (*q.v.*), which developed in northern France in the valley of the Somme; a later, more refined, hand ax tradition is seen in the Acheulian industry (*q.v.*), evidence of which has been found in Europe, Africa, the Middle East, and Asia. Some of the earliest known hand axes were found at Olduvai Gorge (Tanzania) in association with remains of *H. erectus*. Alongside the hand ax tradition there developed a distinct and very different stone tool industry, based on flakes of stone: special tools were made from worked (carefully shaped) flakes of flint. In Europe, the Clactonian industry (*q.v.*) is one example of a flake tradition. The early flake industries probably contributed to the development of the Middle Paleolithic flake tools of the Mousterian industry (*q.v.*), which is associated with the remains of Neanderthal man.

Werner Forman Archive

The Upper Paleolithic Period (beginning about 40,000 years ago) was characterized by the emergence of regional stone tool industries, such as the Perigordian, Aurignacian, Solutrean, and Magdalenian of Europe, as well as other localized industries of the Old World and the oldest known cultures of the New World. Principally associated with the fossil remains of anatomically modern humans (Cro-Magnon man), Upper Paleolithic industries are characterized by the greater complexity, specialization, and variety of tool types and by the emergence of distinctive regional artistic traditions.

Two forms of Paleolithic art are known to modern scholars: small sculptures, and monumental paintings, incised designs, and reliefs on the walls of caves. Such works were produced throughout the Mediterranean region and other scattered parts of Eurasia and Africa but survived in quantity only in eastern Europe and parts of Spain and France.

Small sculptured pieces evidently dominated the Upper Paleolithic artistic traditions of eastern Europe; typical were small, portable clay figurines and bone and ivory carvings. The works from this area include simple but realistic stone and clay animal figurines, as well as carved stone statuettes of women, referred to by scholars as Venus figures. These small, stylized figures are characteristically rotund, emphasizing parts of the female body associated with sexuality and fertility; many are so abstract that only protuberant breasts and exaggerated hips are clearly distinguishable.

Monumental arts flourished in western Europe, the province of the so-called Franco-Cantabrian school (*q.v.*), where limestone caves provided a sheltered surface for painting, incised designs, and relief carvings. These caves have preserved much small carving of fine quality and an abundant and varied sample of prehistoric graphic art, ranging from simple finger tracings in clay to sophisticated polychrome paintings, generally depicting animals, of dynamic naturalism and exquisite design. The function or purpose of art in Paleolithic life remains a subject of debate. Some scholars see the human and animal representations as evidence of the use of magical rites to ensure success in hunting or to guarantee fertility. Others have suggested that Paleolithic artists' accurate representations of animals' coats may be an early attempt to produce a seasonal notation system. Another viewpoint, disregarding utility altogether, sees the art of Paleolithic peoples solely as an outgrowth of a basic human need to creatively record and reproduce aspects of the world around us.

Paléologue, Maurice-Georges (b. Jan. 13, 1859, Paris—d. November 1944, Paris?), French diplomat and writer who encouraged the Franco-Russian alliance before and during World War I.

Paléologue entered the diplomatic service at an early age and went successively to Tangier, Rome, Germany, the East, Korea, and Bulgaria. He became in 1909 deputy director and in 1911 director of affairs in the foreign office. Shortly before the outbreak of World War I, Paléologue was appointed ambassador to St. Petersburg (Leningrad), and he retained this post until the Bolshevik Revolution in 1917. During the war he consolidated the Franco-Russian alliance and helped to ensure effective military action on the part of Russia. In 1920 he was secretary general of the ministry of foreign affairs.

Paléologue published in 1921–22, under the title of *La Russie des Tsars pendant la grande guerre* ("Tsarist Russia During the Great War"), records of his diplomatic experiences in St. Petersburg. He also wrote critical works on Vauvenargues and Alfred de Vigny (1890) and several novels. He was admitted to the French Academy in 1928.

paleomagnetism: *see* remanent magnetism.

paleontology, also spelled PALAEONTOLOGY, scientific study of life of the geologic past that involves the analysis of plant and animal fossils, including those of microscopic size, preserved in rocks. It is concerned with all aspects of the biology of ancient life forms: their shape and structure, evolutionary patterns, taxonomic relationships with each other and with modern living species, geographical distribution, and interrelationships with the environment. Paleontology is mutually interdependent with stratigraphy and historical geology because fossils constitute a major means by which sedimentary strata are identified and correlated with one another. Its methods of investigation include that of biometry (statistical analysis applied to biology), which is designed to provide a description of the forms of organisms statistically and the expression of taxonomic relationships quantitatively.

Paleontology has played a key role in reconstructing the Earth's history and has provided much evidence to support the theory of evolution. Data from paleontological studies, moreover, have aided petroleum geologists to locate deposits of oil and natural gas. The occurrence of such fossil fuels is frequently associated with the presence of the remains of certain ancient life-forms.

Paleontological research dates back to the early 1800s. In 1815 the English geologist William Smith demonstrated the value of using fossils for the study of strata. About the same time the French zoologist Georges Cuvier initiated comparative studies of the structure of living animals with fossil remains.

Paleosiberian, also spelled PALAEOSIBERIAN, member of the peoples of northeastern Siberia who are believed to be remnants of earlier and more extensive populations pushed into this area by later Neosiberians. The Paleosiberians include the Chukchi (*q.v.*), Koryak, Kamchadal, Yukaghir (*q.v.*), and Ket (*q.v.*). The Chukchi and Koryak are traditional reindeer breeders and hunters; maritime groups are sea-mammal hunters and fishers. The Kamchadal are sedentary fishers, and the Yukaghir were formerly hunters.

Paleosiberian languages, also called PALEO-ASIATIC, or HYPERBOREAN, languages spoken in northern Asia (Siberia) that belong to four genetically unrelated groups—Yeniseian, Luorawetlan, Yukaghir, and Gilyak. The Yeniseian group contains at least four languages—Ket, Kott, Arin (Arrin), and Assan—of which only Ket (about 1,000 speakers) is still in use. The Luorawetlan family is usually divided into five languages: Chukchi (about 13,000 speakers), Koryak (about 8,000 speakers), Kamchadal, Aliutor, and Kerek. Kamchadal, Aliutor, and Kerek each has fewer than 350 speakers. With about 450 speakers, the only living language of the Yukaghir group is Yukaghir proper (or Odul), although the extinct Omok and Chuvan languages also belonged to this group. Gilyak (about 4,000 speakers) is an individual language unrelated to any of the other Paleosiberian groups.

A brief treatment of the Paleosiberian languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World.

The Paleosiberian languages are spoken by a small number of people scattered over a wide area. Speakers of Luorawetlan languages, for example, live in the extreme northeast corner of Siberia and extend south into the Kamchatka Peninsula. Gilyak is spoken on and near the island of Sakhalin, just north of Japan. Far to the west, 2,400 miles (3,900 km) from Kamchatka, live speakers of the Yeniseian group. Yukaghir is found in only a few settlements, widely removed from one another. In the vast territories between all these groups, and among the groups themselves, live speakers of non-Paleosiberian language families like Uralic, Tungus, and Turkic.

The Paleosiberian languages, although unrelated, have been classed together since the middle of the 19th century. They were thought to have been the remnants of a greater language family that had once extended over a broader expanse of Asia, a hypothesis first proposed by Leopold von Schrenck. Yeniseian, Luorawetlan, and Yukaghir languages were in fact once spoken over a larger territory than they are today, and Gilyak probably extended further to the west. However, this does not imply that these languages had a common ancestor. There may have been an even greater diversity of language families in prehistoric Siberia before the advancement of Uralic, Tungus, and Turkic peoples.

Ket, Yukaghir, and Gilyak have not been shown to be genetically related to other language families like Sino-Tibetan, Caucasian, or Uralic, although many theories have been offered proposing such connections. In particular, a Yukaghir-Uralic hypothesis based on structural similarities between the two groups has been much discussed, but this remains to be conclusively demonstrated.

The Paleosiberian languages today are written in a Cyrillic-based script. The Yukaghir, and to some extent the Koryak as well, previously used a pictographic writing, cutting figures into birch bark. A literary language has now been established for each Paleosiberian language. Increasing bilingualism (with Russian) and continued education have helped shape emerging modern native literatures drawn on Russian models.

The numerous loanwords in the Paleosiberian languages can be traced to various sources. A large portion of borrowed vocabulary, especially technical terms, is from Russian. Most loanwords, however, come from Tungus (a branch of Altaic) and from Turkic languages like Yakut. Ket has some words from Selkup (a Uralic language), and Chukchi has a vocabulary from Eskimo. The reindeer terminology of Gilyak is borrowed from a Tungus language with which it is no longer in contact. Gilyak also has some words from Ainu, a language of northern Japan.

The four Paleosiberian groups share some linguistic features. They all make extensive use of compounding. Postvelar consonants (*i.e.,* sounds formed further back in the mouth than the sound of the letter *k*) are common. Another characteristic is that of vowel harmony. The Paleosiberian languages also show consonant alternations and, except in Yukaghir, rich consonant clusters.

Beyond this, the Paleosiberian languages have few similarities, and individual languages may resemble languages of other families more than they do each other. Gilyak, for example, shares certain grammatical categories with Japanese. Yukaghir shares some grammatical categories with Uralic, in particular a special conjugation for verbs with objects and another conjugation for negative verbs. Luorawetlan shows a tendency toward complex compounding and ergative constructions (where the agent is not expressed as subject). Ket is distinguished by its succinct verbal complexity.

Paleozoic Era, also spelled PALAEOZOIC, major interval of geologic time extending from 570 to 245 million years ago. It is the first era of the Phanerozoic Eon.

A brief treatment of the Paleozoic Era follows. For full treatment, *see* MACROPAEDIA: Geochronology.

Eras have traditionally been named to reflect major changes in the development of life on Earth. The Paleozoic, from the Greek for "ancient life," is followed by the Mesozoic ("intermediate life") and Cenozoic ("recent life"). The Paleozoic is divided into six periods: the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, and Permian (*qq.v.*).

The early Paleozoic (roughly the first 160 million years) was characterized by widespread uplifts and downwarps of the Earth's crust, which resulted in mountain building and geosynclines (downward flexing) in parts of North America, Europe, and Asia. Great seas were formed in the southern areas of the emergent landmasses. Much of North America was covered by a warm shallow sea with many coral reefs. In the later Cambrian and subsequent periods, episodes of mountain building followed. There is no evidence of a cold climate during this time; glaciations once thought to belong to the Cambrian Period are now known to have taken place in Precambrian time.

Fossils from the early Paleozoic include such invertebrates as worms and primitive invertebrate shells like *Volborthella, Hyolithes,* and others. Indeed, it was during the Cambrian Period that many of today's invertebrate groups first came into being. In the Cambrian Period the trilobites, marine arthropods whose skeletons are divided into three longitudinal lobes, were the most abundant faunal group and are among the most frequently found fossil forms today. By the end of the Late Cambrian several marine life-forms were abundant: graptolites, cephalopods, brachiopods, and trilobites were the four dominant groups that gave rise to a flourishing fauna of bryozoans (marine colonial animals), mollusks such as the earliest gastropods (snails and slugs), ostracods (small bivalved crustaceans), eurypterids (large arthropods, now extinct), and others. Primitive fish also appeared during the early Paleozoic. The plants of this time were predominantly algae, with some mosses and ferns.

The late Paleozoic, which extended from about 410 to 245 million years ago, saw tremendous changes wrought in the Earth. Both plant and animal life flourished in the great, warm, shallow seas, and the various convolutions of the Earth laid down extensive mineral deposits. Much of the copper, gold, lead, zinc, and other minerals mined today derive from Devonian times in the late Paleozoic; and the mining activities in modern times have greatly expanded geologic knowledge about this time interval. Huge swampy forest regions covered much of the northern continents, and these were repeatedly and suddenly invaded by the seas, which buried the vegetation, then covered it with silt. When the sea subsequently withdrew, the forests revived and were again buried in rhythmic cycles that are now evident in deposits called cyclothems. Heat and pressure transformed the buried vegetation into the oil and coal so important to the modern world.

During the Devonian Period animal life emerged from the ocean, and various species adapted themselves to breathing air and moving about on land. This happened by way of the amphibians, which evolved with considerable diversity in the Carboniferous and Permian periods, ranging in length from several centimetres to 3 m (a few inches to 10 feet). When desert conditions began to prevail again in the Permian, the amphibians were succeeded by a new form, the reptiles, who could lay eggs in the desert that would hatch and bring forth young quite independent of water. The reptiles then developed rapidly into a number of diversely adapted species.

The late Paleozoic also saw the beginning of insect life. More than 500 species are known from fossils found in Carboniferous coal deposits, including dragonflies over 60 cm (2 feet) across and winged cockroaches measuring up to 30 cm (1 foot). Thus the first steps were taken for life-forms to invade the air, but it would be some time yet before the reptiles grew wings, which led eventually to that dominant aerial form, the birds.

Fishes underwent rapid development in the late Paleozoic. Sharks and sharklike forms were common; the largest, *Dinichthys* (now extinct), was more than 6.8 m (22 feet) long, with massive bony armour plates protecting its head and hinged to body armour around the neck region. The Sarcopterygii, the fleshy-finned bony fishes, developed the ability to breathe air, which enabled them to survive in deserts in times of drought: five genera of these Dipnoi still survive. The crossopterygian fishes gave rise to amphibians.

Late Paleozoic flora saw a profusion of land plants. Ferns grew to tree size in the Carboniferous forests. The cordaiteans, the precursors of the conifers, first appeared in the Lower Carboniferous.

Another development of the late Paleozoic was the occurrence of several major glaciations. South America, Africa, Antarctica, and Australia show early glacial deposits; such conditions threatened much warmwater life with extinction. A second and a third glaciation followed, and then, at the end of the Paleozoic Era, came one of the greatest crises in the history of life. The climate warmed, and there was no further glaciation for many millions of years. Of the life-forms adapted to cold water, most were nearly halved, both in variety and in numbers. On land, as well, some 75 percent of the amphibian families and more than 80 percent of the reptiles were extinct by the end of the Permian.

Palermo, ancient (Latin) PANORMUS, capital of the autonomous *regione* of Sicily in the Italian Republic and an important port since antiquity.

The city was founded by Phoenician traders in the 8th century BC. It later became a Carthaginian settlement until its capture by the Romans in 254 BC. The city decayed under Roman rule but prospered after AD 535, when the Byzantine general Belisarius recovered it from the Ostrogoths. The Arabs conquered Palermo in 831, and the city flourished as a centre of rich trade with North Africa. Palermo's golden age, however, came during the Norman era (1072–1194), when it was the capital of the Kingdom of Sicily.

A distinctive Arab-Norman architecture is represented by the cathedral, founded in 1185. From the same period date the Royal Palace, the churches of Santo Giovanni degli Eremiti (1132) and the Martorana (1143), and several country palaces around the city, such as the Cuba and the Zisa.

Norman rule in Sicily was replaced in 1194 by that of the German Hohenstaufen dynasty. The Hohenstaufen Holy Roman emperor Frederick II shifted the centre of imperial politics to southern Italy and Sicily, and the cultural brilliance of his court at Palermo was renowned throughout western Europe. The city declined under succeeding Hohenstaufen rulers. It was conquered by the French Charles of Anjou in 1266, but Angevin oppression was ended in 1281 by a popular uprising called the Sicilian Vespers. Palermo then came under Aragonese rule.

After 1412 the crown of Sicily was united with that of Aragon (and later Spain), and Palermo took on a new aspect of prosperity. In the 16th and 17th centuries Spanish viceroys fostered the reconstruction of the city, but the city experienced repeated risings of the urban poor.

In the wake of the War of the Spanish Succession (1701–14), Palermo passed for a short time under the rule of Victor Amadeus II of Savoy and, after 1718, of the Austrian Habsburgs. In the resettlement of Europe after the Napoleonic Wars, Sicily-Naples was given to the Spanish Bourbons. Revolts against Bourbon rule erupted in Naples in 1820 and 1848, and in 1860 Garibaldi liberated the city.

Palermo was attached to the newly reformed Kingdom of Italy and recovered its prosperity.

The city was severely bombarded in July 1943, when it was taken by Allied troops. In 1948 regional autonomy was granted to Sicily within the Italian Republic, and Palermo was restored as the leading city on the island. New industries developed in manufacturing, chemicals, and printing, but the problems of endemic poverty in parts of the city remain. The port operates both merchant and passenger lines to Tunisia and Naples and handles foreign trade. Citrus fruits, cereals, fresh fish, and chemicals are among Palermo's principal exports. Pop. Palermo Stone, one of the basic sources of information about the chronology and cultural history of Egypt during the first five dynasties (*c.* 2925–*c.* 2325 BC). Named for the Sicilian city where it has been preserved since 1877, the black basalt stone is one of six existing fragments, all similar in scale and arrangement, that probably originally stood in Egyptian temples or other important buildings. It is inscribed on both sides with horizontal lines of hieroglyphic text, the top row listing the names of predynastic rulers. The following rows, each headed by the name of a different king, are divided into compartments, each compartment signifying one year. Within the compartments the hieroglyphs always list one or more memorable events of that year. Thus the original monument was apparently a year-by-year record of all the kings from the 1st through the 5th dynasty, although the last name preserved on the stone is that of Neferirkare, the third of the nine kings of the 5th dynasty. The stone was probably copied under Shabaka, of the 25th dynasty, from an original on more perishable material.

Palés Matos, Luis (b. March 20, 1898, Guayama, P.R.—d. Feb. 23, 1959, San Juan), poet, considered by many to be Puerto Rico's most distinguished lyric poet, who enriched the vocabulary of Spanish poetry with words, themes, symbols, images, and rhythms of African and Afro-American folklore and dance.

Palés Matos wrote his first poetry, which was collected in *Azaleas* (1915), in imitation of the fashionable modernist trends, but he soon found his own direction in his personal interpretation (as a white man) of black culture. His poems on black themes, published in periodicals, firmly established his literary reputation and gave impetus to the developing concern of Spanish-Americans with their African heritage.

Palés Matos, unlike some of his contemporaries and disciples in what became known as the Negro poetry movement, did not strive for authenticity. He preferred to evoke a culture as a poet rather than as a sociologist. For this freely inventive approach to black themes, he was sometimes criticized by those more concerned with accuracy than with poetic merit; his ironic, often skeptical note has been interpreted by some as condescension. His mastery of poetic form and language is acknowledged, however, even by those who find his approach offensive. Although he was best known and most influential for his "Negro poetry," his reflective and introspective personality found expression in poetry of many other moods and themes. *Poesía, 1915–56* (1957), a collection of much of his poetry, reveals his more personal side as a lyric poet and as a melancholy man, ill at ease in the modern world.

Palestine, region of the eastern Mediterranean, comprising parts of modern Israel and Jordan. The area referred to as Palestine today generally extends from the Mediterranean Sea on the west to the Jordan River on the east and from the international boundary of Israel and Lebanon in the north to Gaza in the south. In the 20th century the region has been the object of conflicting claims between Jewish and Arab national movements.

The territory was occupied in biblical times by the kingdoms of Israel and Judah. Also called the Holy Land, it is sacred in varying degrees to Judaism, Christianity, and Islām. For Judaism, Palestine, called Eretz Yisra'el ("Land of Israel"), has traditionally been the land promised by God, a uniquely sacred place, and the seat of national independence. For Christianity, it is the scene of the life and ministry of Jesus and the Apostles, with especially revered places. For Islām, certain sites associated with the Prophet Muḥammad are holy places. A local Palestinian Arab nationalism developed during the period of the Zionist settlement (from the early 1920s) and especially since the establishment of the State of Israel (1948); it claims Palestine as the homeland and domain of the Arab peoples who have inhabited it since the Muslim conquest in the 7th century.

A brief treatment of Palestine follows. For full treatment, *see* MACROPAEDIA: Palestine.

The name Palestine is derived from the Greek Palaistina, which comes from the Hebrew Pleshet ("Land of the Philistines"), referring to a small coastal area northeast of Egypt, also called Philistia. The Romans used the term Syria Palaestina in the 2nd century BC for the southern third of the province of Syria, including the former Judaea. The name Palestine was revived as an official title for a portion (all of the territory from the Jordan River westward to the Mediterranean coast) of a mandate given to the British after World War I.

Palestine's frontiers have fluctuated widely throughout history, but it has usually embraced the territory from the Mediterranean and the coastal plain in the west, through the transitional zone of Ha-Shefela, to the hill country of Judaea and Samaria, heartland of the ancient Hebrew kingdoms. The Wilderness of Judaea (Midbar Yehuda) slopes down eastward to the Jordan River valley, the northern section of the East African Rift system. In the south is the Negev, a dry, rugged area ending at the Gulf of Aqaba. In the north the broad, fertile Plain of Esdraelon divides Samaria (south) from the hill country of Galilee, the highest and best-watered part of Palestine as described here. In the east of Galilee lie the Sea of Galilee and the now-drained Ḥula Valley. Kings David and Solomon, however, ruled (*c.* 1000) over a kingdom that included much of modern Lebanon and Syria.

Palestine is a land of sharp contrasts; only 14 miles (23 km) separate an elevation of 2,694 feet (821 m) above sea level north of Jerusalem from the shores of the Dead Sea, approximately 1,312 feet (400 m) below sea level (lowest point on the Earth's land surface). The country has a moderate Mediterranean winter-rainfall climate, with average annual precipitation decreasing farther inland—*i.e.,* to the east.

Settled since early prehistoric times, Palestine has been held by virtually every power of the Middle East, among them Egypt, Assyria, Babylonia, Persia, Alexander the Great's empire and those of his successors (the Ptolemies and Seleucids), the Romans, Byzantines, Umayyads, ʿAbbāsids, Fāṭimids, crusaders, Ayyūbids, Mamlūks, and Ottoman Turks. After World War I Palestine was administered by Great Britain under a mandate of the League of Nations; the mandate incorporated the Balfour Declaration of 1917, which stated that British policy favoured the establishment of a national home for the Jewish people in Palestine. Britain governed Palestine until 1948; its administration, however, satisfied neither the majority Arabs nor the growing Jewish population. After World War II Britain's continued rule of Palestine became untenable, and the problem was turned over to the United Nations General Assembly, which recommended (Nov. 29, 1947) the establishment of separate Arab and Jewish states in Palestine. The State of Israel was proclaimed on May 14, 1948, and the last British officials left Palestine. The regular armies of the surrounding Arab states, which did not recognize Israel's claim, entered Palestine. From the ensuing war, Israel emerged with about 50 percent more land than it had been allotted under the UN plan, including all of Galilee, the coast, a reduced Gaza Strip (occupied by Egypt), all of the Negev, and northwestern Jerusalem. About 720,000 Palestinian Arabs fled Israel and became refugees in surrounding Arab countries. In 1950 the Kingdom of Jordan formally annexed some 2,000 square miles (5,180 square km) on the west bank of the Jordan River (known since as the West Bank), which had been envisaged as part of an Arab state in the UN plan. (Jordan's action was not generally recognized.) The West Bank was seized and occupied by Israel in 1967, together with the Gaza Strip, the Sinai Peninsula, the Golan Heights, and East Jerusalem. Under the terms of the Camp David accords (1979), Israel returned the Sinai Peninsula to Egypt in 1979–82, but the West Bank, the Gaza Strip, the Golan Heights, and East Jerusalem remained in Israeli hands.

The Arab League at a summit meeting in Rabat (Morocco) in October 1974 recognized the Palestine Liberation Organization (PLO) as the sole spokesman for the Palestine Arabs. As enunciated in its 1969 charter, the PLO long claimed as its goal the elimination of Israel and the conversion of the territory encompassed by the Palestine mandate into an independent country of Muslims, Christians, and Jews. In 1988, however, the PLO for the first time expressed its support for a two-state solution to the Palestine problem—*i.e.,* the creation of a Palestinian state that would coexist with neighbouring Israel. (*See also* Arab-Israeli wars; Palestine Liberation Organization.)

Palestine Liberation Organization (PLO), Arabic MUNAẒẒAMAT AT-TAḤRĪR FILASṬĪNIYAH, umbrella political organization claiming to represent the world's estimated 4,450,000 Palestinians—those Arabs who lived in mandated Palestine before the creation there of the state of Israel in 1948, as well as their descendants. It was formed in 1964 to centralize the leadership of various Palestinian groups that previously had operated as clandestine resistance movements, but it came into prominence only after the Arab-Israeli war of June 1967. The movement is dedicated to the creation of a "democratic and secular" Palestinian state.

In the Palestine war of 1948 and in the subsequent hostilities, the Arab states took the lead in the fight against Israel, while their Palestinian fellow Arabs played a more or less passive role. After the defeat of the Arab states by Israel in the Six-Day War of 1967, the PLO came to be recognized as the spokesman of the Palestinians and the promoter of a distinctively Palestinian ideology.

Major factions within or associated with the PLO include Fatah (*q.v.*), the Popular Front for the Liberation of Palestine (*q.v.;* PLFP), and the Popular Democratic Front for the Liberation of Palestine (*q.v.;* PDFLP). Terrorist organizations connected with the PLO have included the Black September group of Fatah and the PLFP-General Command.

Membership within the PLO has varied with the reorganizations and internal disagreements of its constituent bodies. Moderate factions within the PLO are inclined to accept a negotiated settlement with Israel that would yield a Palestinian state. Other, more radical factions are steadfast in their goals of the destruction of Israel and its replacement with a secular state in which Muslims, Jews, and Christians would participate as equals. Funding for the PLO has been received from sympathetic nations and from taxes levied on the salaries of Palestinian workers.

In 1969 Yasir Arafat, leader of Fatah, the largest Palestinian group, was named chairman of the PLO. From the late 1960s, the PLO organized and launched military operations against Israel from its bases in Jordan. The PLO came into growing conflict with the government of King Hussein of Jordan in 1970, however, and in 1971 was forcibly expelled from Jordan by the Jordanian army. It shifted its bases to Lebanon.

From 1974 Arafat advocated the PLO's withdrawal from international terrorism outside of Israel and the world community's acceptance of the PLO as the legitimate representative of the Palestinian people. In 1974 the Arab heads of state recognized the PLO as the sole legitimate representative of all Palestinians. The PLO was admitted to full membership in the Arab League in 1976. The PLO was excluded from the negotiations between Egypt and Israel that resulted in 1979 in a peace treaty; the treaty returned the Israeli-occupied Sinai Peninsula to Egypt, but the negotiations failed to win Israel's agreement to the establishment of a Palestinian state in the West Bank and Gaza Strip. Continuing PLO attacks on Israeli territory from Syrian-occupied Lebanon led Israel to invade Lebanon on June 6, 1982, in an effort to neutralize Palestinian and Syrian troops based there. After several weeks of fighting, Israeli troops surrounded Beirut, which for several years had been the PLO's headquarters. As a result of negotiations, most Palestinians evacuated the Lebanese capital of Beirut for transportation to sympathetic Arab nations.

Increasing dissatisfaction with Arafat's leadership arose in the PLO after his withdrawal from Beirut to Tunis, Tun., and in 1983 Syrian-backed PLO rebels supported by Syrian troops forced Arafat's remaining troops out of Lebanon. Arafat retained the support of some Arab leaders and eventually was able to reassert his leadership of the PLO.

On Nov. 15, 1988, the PLO proclaimed the "State of Palestine," a kind of government-in-exile; and on April 2, 1989, the PLO's governing body, the Palestine National Council, elected Arafat president of the new quasi-state. The PLO during this period also recognized Israel's right to exist, thus appearing to drop its goal of eliminating Israel in favour of a policy accepting separate Israeli and Palestinian states, with the latter occupying the West Bank and the Gaza Strip. Negotiations between Israelis and Palestinians were inhibited, however, by many suspicions and barriers, including (1) Israel's statute of 1986 outlawing Israeli contacts with the PLO and (2) the persistence of militant PLO factions willing to pursue terrorist actions against Israel.

Palestinian Talmud, also called TALMUD YERUSHALMI, one of two compilations of Jewish religious teachings and commentary that was transmitted orally for centuries prior to its compilation by Jewish scholars in Palestine. The other such compilation, produced in Babylon, is called the Babylonian Talmud, or *Talmud Bavli. See* Talmud.

Palestrina, Giovanni Pierluigi da (b. *c.* 1525, Palestrina, near Rome—d. Feb. 2, 1594, Rome), Italian Renaissance composer of more than 105 masses and 250 motets, a master of contrapuntal composition.

Palestrina lived during the period of the Catholic Counter-Reformation and was a primary representative of the 16th-century conservative approach to church music.

Life. Palestrina was born in a small town where his ancestors are thought to have lived for generations, but as a child he was taken to nearby Rome. In 1537 he was one of the choirboys at the basilica of Sta. Maria Maggiore, where he also studied music between 1537 and 1539. In 1544 Palestrina was engaged as organist and singer in the cathedral of his native town. His duties included playing the organ, helping with the choir, and teaching music. His pay was that of a canon and would have been received in money and kind. His prowess at the church there attracted the attention of the bishop, Giovanni Maria Ciocchi del Monte, who later became Pope Julius III.

In 1547 Palestrina married Lucrezia Gori. Three sons were born to them: Rodolfo, Angelo, and Iginio. Only the last outlived his father. In 1551 Palestrina returned to Rome, where he assumed the first of his papal appointments, as musical director of the Julian Chapel choir, and thus was responsible for the music in St. Peter's. Before he was 30 he published his first book of masses (1554), dedicated to Julius III, and the following year he was promoted to singer in the Pontifical Choir. About this time he became composer to the papal chapel. Palestrina repaid the Pope's patronage by composing a mass in his honour. Yet he did not neglect the secular side of his art, for his first book of madrigals (secular and spiritual part-songs) appeared in 1555, unfortunately at a time when the lenient regime of Julius III had given way to the sterner discipline of Paul IV. A decree of the new pope forbade married men to serve in the papal choir, and Palestrina, together with two of his colleagues, received a small pension by way of compensation for their dismissal.

For the next five years Palestrina directed the choir of St. John Lateran, but his efforts were continually thwarted by singers whose quality was almost as limited as their number, which was restricted because very little money was available for music. Nevertheless, he gained admission for his eldest son, Rodolfo, then about 13, as a chorister. Eventually he broke away from this uncongenial milieu. The chapter archives of St. John Lateran record that in July 1560 he and his son suddenly departed.

A year passed before Palestrina found employment. In March 1561 he accepted a new post at Sta. Maria Maggiore. This post was more congenial to him and he remained at it for about seven years. At the invitation of Cardinal Ippolito d'Este he then took charge of the music at the Villa d'Este in Tivoli, a popular summer resort near Rome. He was in the Cardinal's service for four years, at which time he also worked as music master for a newly formed Seminarium Romanum (Roman Seminary), where his sons Rodolfo and Angelo became students.

Palestrina received an offer in 1568 to become musical director at the court of the emperor Maximilian II in Vienna. He refused the position because of the low salary and a disinclination to leave Rome. Palestrina's terms were also too high when he was invited to the court at Mantua in 1583. The composer and the duke of Mantua, Guglielmo Gonzaga, an amateur musician of some pretensions, did become friends, however, and Palestrina was commissioned to write special compositions for the ducal chapel of Sta. Barbara.

With the death in 1571 of the composer Giovanni Animuccia, musical director at the Vatican since 1555, there was a chance for Palestrina to return to his old post as musical director of the Julian choir. The chapter, eager to have him back, increased the salary, and he forthwith returned to St. Peter's. When his growing fame as a composer prompted Sta. Maria Maggiore to rehire him, St. Peter's again raised his salary. In acknowledgment of his position as the most celebrated Roman musician, he was given in 1578 the title of master of music at the Vatican Basilica.

The series of epidemics that swept through central Italy in the late 1570s carried off his wife and his two elder sons, both of whom showed great musical promise. He himself fell seriously ill. Grieving over his wife's death, he announced his intention of becoming a priest, to the delight of the pope, Gregory XIII. After having been made a canon, however, he renounced his vows in order to marry (1581) Virginia Dormoli, widow of a wealthy merchant. Although he spent considerable time administering her fortune, he retained his position at St. Peter's and continued to compose.

Although an attempt in 1585 to make Palestrina musical director of the Pontifical Choir proved abortive, he was considered by all the popes under whom he served as the official composer for the choir, and it is recorded that he marched at the head of the pontifical singers on the occasion of erecting the great Egyptian obelisk in the piazza of St. Peter's.

Pope Gregory XIII had commissioned Palestrina and Annibale Zoilo to restore the plainchant, or plainsong (a traditional liturgical chant sung in unison), then in use to a more authentic form. The task proved too great, and Palestrina's editorial work gave way to a flow of creative music. Much of it was published during the last 12 years of his life, including volumes of motets (choral compositions based on sacred texts), masses, and madrigals. He also helped to found an association of professional musicians called the Vertuosa Compagnia dei Musici.

Two years before Palestrina's death, the new pope, Clement VIII, increased his pension, and the same year, in a singular mark of respect and admiration, fellow composers paid their elderly senior the compliment of writing 16 settings of the Vesper Psalms to his praise. In return, Palestrina sent them a motet on the appropriate text: *Vos amici mei estis* "You are my friends, if you do what I teach, said the Lord."

Music. Palestrina's musical output, though vast, maintained a remarkably high standard in both sacred and secular works. His 105 masses embrace many different styles, and the number of voices used ranges from four to eight. The time-honoured technique of using a cantus firmus (preexistent melody used in one voice part) as the tenor is found in such masses as *Ecce sacerdos magnus; L'Homme armé; Ut, re, mi, fa, sol, la; Ave Maria; Tu es Petrus;* and *Veni Creator Spiritus.* These titles refer to the source of the particular cantus firmus. Palestrina's mastery of contrapuntal ingenuity may be appreciated to the fullest extent in some of his canonic masses (in which one or more voice parts are derived from another voice part). His ability to ornament and decorate a solemn plainchant, making it an integral part of the texture and sometimes almost indistinguishable from the other, freely composed parts, is evident from some of his masses based on hymn melodies.

By far the greatest number of masses employ what has come to be known as the parody technique, by which a composer made use either of his own music or that of others as a starting point for the new composition. Many other masses derive from musical ideas by Palestrina's predecessors or contemporaries. Yet another type of mass is demonstrated by the nine works written for Mantua; in these the Gloria and Credo sections are so arranged that plainsong and polyphony alternate throughout. Finally, there is a small but important group of masses that are in free style, the musical material being entirely original. Perhaps the best known example is the *Missa brevis* for four voices.

Palestrina's motets, of which more than 250 are extant, display almost as much variety of form and type as do his masses. Most of them are in some clearly defined form, occasionally reflecting the shape of the liturgical text, though comparatively few are based on plainsong. Many of them paraphrase the chant, however, with an artistry that is every bit as successful as that of the masses. On the same level as the canonic masses are such motets as *Cum ortus fuerit* and *Accepit Jesus calicem,* the latter apparently a favourite of the composer's—an assumption justified because he is depicted holding a copy of it in a portrait now in the Vatican.

His 29 motets based on texts from the Song of Solomon afford numerous examples of "madrigalisms": the use of suggestive musical phrases evoking picturesque features, apparent either to the ear or to the eye, sometimes to both. In the offertories, Palestrina completely abandons the old cantus firmus technique and writes music in free style, whereas in the hymns he paraphrases the traditional melody, usually in the highest voice. In the *Lamentations of Jeremiah* he brings effective contrast to bear on the sections with Hebrew and Latin text, the former being melismatic (floridly vocalized) in style and the latter simpler and more solemn. His Magnificats are mainly in four sets of eight, each set comprising a Magnificat on one of the eight "tones": *alternatim* structure is used here as in the Mantua masses.

Although Palestrina's madrigals are generally considered of less interest than his sacred music, they show as keen a sense for pictorial and pastoral elements as one finds in any of his contemporaries. Over and above this, he is to be remembered for his early exploitation of the narrative sonnet in madrigal form, notably in *Vestiva i colli,* which was frequently reprinted and imitated. His settings of Petrarch's poems also are of an exceptionally high order.

At the end of the 19th century the view that Palestrina represented the loftiest peak of Italian polyphony was in some ways detrimental to his reputation, for it cast his music into rigid preconceptions. Even more unfortunate was the insistence on "counterpoint in the style of Palestrina" in the examination requirements of academies and universities, for such requirements stultified a style that Palestrina had used with great flexibility. Generations of fledgling composers were taught to revere the music of Palestrina as a symbol of all that was pure in ecclesiastical counterpoint. Indeed, the greater part of his musical output, and in particular his masses (where his unerring sense of tonal architecture may be heard at its best), still remains worthy of admiration.

Palestrina, unlike Bach, did not have to be rediscovered in the 19th century, though the dissemination of his achievement was helped by the interest of Romantic composers. There always was a Palestrinian tradition, mainly because his music supplied the need for a well-regulated formal system to be used by the embryonic composer in presenting himself to the musical world. Strict counterpoint was associated with a technique acquired in this way. In his day, Palestrina was a senior figure who, utilizing the dominant style of his time, created works notable for their spiritual qualities and technical mastery.

Paley, William (b. July 1743, Peterborough, Northamptonshire, Eng.—d. May 25, 1805, Lincoln, Lincolnshire), English Anglican priest, Utilitarian philosopher, and author of influential works on Christianity, ethics, and science, among them the standard exposition in English theology of the teleological argument for the existence of God.

His major works are *The Principles of Moral and Political Philosophy* (1785), the subject of lectures at the University of Cambridge; *A View of the Evidence of Christianity* (1794), which was required reading for entrance to Cambridge until the 20th century; and *Natural Theology* (1802), based on John Ray's *Wisdom of God Manifested in the Works of the Creation* (1691). In *Natural Theology*, Paley used the analogy of the watch: both the world and the watch presuppose a maker. The book strongly influenced Charles Darwin.

Paley, William S(amuel) (b. Sept. 28, 1901, Chicago), U.S. broadcaster, first president (1928–46) and chairman of the board (1946–82) of Columbia Broadcasting System (CBS).

Paley was the son of an immigrant Russian who conducted a thriving cigar business in Chicago. The family moved to Philadelphia when Paley was ready for college, and he entered the Wharton School of Finance at the University of Pennsylvania. There he earned a bachelor's degree and entered the new cigar business the family had set up in Philadelphia. He became vice president, and he signed an early radio advertising contract for the firm's products. He became convinced that radio advertising had an important future, and when the opportunity appeared he bought a small radio network, which in 1929 he renamed Columbia Broadcasting System. He promptly began to build it into one of the world's leading radio and television networks. Paley retained or hired such entertainment stars as Bing Crosby, Kate Smith, the Mills Brothers, Will Rogers, Eddie Cantor, and Bob Hope, luring some of them from rival networks.

During World War II Paley served the U.S. government as supervisor of the Office of War Information (OWI) in the Mediterranean, and later as chief of radio in the OWI's Psychological Warfare Division (1944–45), finally becoming deputy chief of the Psychological Warfare Division.

Back at CBS after the war Paley supported and encouraged Edward R. Murrow in building an outstanding news staff. In 1966 Paley waived the CBS mandatory retirement rule so that he could remain active as chairman of the board. He remained as chairman until 1983. He won many honours, including the U.S. Order of Merit, the French Croix de Guerre, and the Italian Order of the Crown.

Pālghāt, town, administrative headquarters of Pālghāt district, central Kerala state, southwestern India. The town lies on the Ponnāni River in a break in the Western Ghāts range known as the Pālghāt Gap. Its location has always given the town strategic and commercial importance. It is a marketplace for grain, tobacco, textiles, and timber; its industries include tobacco processing, rice milling, weaving, and light manufacturing. In Pālghāt are Government Victoria College (established 1888) and an engineering college. Across the river, to the north, is the rail junction of Olavakod. Pālghāt has an ancient fort, captured by the British temporarily in 1783 and permanently in 1790.

Pālghāt district, 1,699 sq mi (4,400 sq km) in area, mostly consists of a stretch of coastal plain between the Ghāts and the Arabian Sea; the hills of the Ghāts extend into the district's southeastern corner. Ponnāni, 50 mi (80 km) to the west, is its outport. Pop. (1981) town, 111,245; metropolitan area, 117,956; district, 2,044,399.

Pālghāt Gap, major break in the Western Ghāts mountain range, in southwestern India. Located between the Nīlgiri Hills (north) and the Anaimalai Hills (south), it is about 20 mi (32 km) wide and straddles the Kerala–Tamil Nādu border, serving as a major communication route between these two states. Highways and rail lines through the gap connect Pālghāt in Kerala with Coimbatore and Pollāchi in Tamil Nādu. Pālghāt Gap also influences southern India's climate; the southwest monsoons as well as storms from the Bay of Bengal cross the mountains through the opening.

Palgrave, Francis Turner (b. Sept. 28, 1824, Great Yarmouth, Norfolk, Eng.—d. Oct. 24, 1897, London), English critic and poet, editor of the influential anthology *The Golden Treasury.*

Palgrave spent many years in the education department of the civil service and from 1885 to 1895 was professor of poetry at Oxford. He was a friend of many notables of the time: the statesman William Gladstone (to whom in 1846 he was assistant private secretary) and the poets Robert Browning, Alfred Tennyson, and Matthew Arnold. Of his original verse, *Visions of England* (1880–81) is the best known. His greatest service to poetry, however, was his compilation of *The Golden Treasury of English Songs and Lyrics* (1861), a comprehensive,

well-chosen anthology, carefully arranged in its sequence. Palgrave's choice of poems was made in consultation with Tennyson. The *Anthology* had great influence on the poetic taste of several generations and was of particular value in popularizing Wordsworth. The original selections were modified in later editions.

Pāli, town, administrative headquarters of Pāli district, Rājasthān state, northwestern India, just north of the Bāndi River, a tributary of the Lūni. A trade centre in ancient times, Pāli is divided into an ancient and modern quarter; it has several historic temples. Now chiefly an agricultural market centre, it is connected by road and rail with Beāwar and Jodhpur. Industries include textile and oil mills, cotton printing and dyeing, copper working, and ivory and sandalwood handicrafts. Pāli has a hospital and also a college affiliated with the University of Rājasthān.

Pāli district (4,784 sq mi [12,391 sq km]), formerly a part of Jodhpur princely state, comprises a tract of plain bordered (east) by the Arāvalli Range and drained by the Lūni River and its tributaries. The district has oil and textile mills, metalworks, and cotton-ginning factories. The chief crops include wheat, jowar (sorghum), oilseeds, and cotton. Pop. (1981) town, 91,568; district, 1,274,504.

Pāli language, sacred language of the Theravāda Buddhist canon, a Middle Indo-Aryan language of north Indian origin. On the whole, Pāli seems closely related to the Old Indo-Aryan Vedic and Sanskrit dialects but is apparently not directly descended from either of these. Its use as a Buddhist canonical language came about because the Buddha opposed the use of Sanskrit, a learned language, as a vehicle for his teachings, and encouraged his followers to use vernacular dialects. In time, his orally transmitted sayings spread through India to Ceylon (*c.* 3rd century BC), where they were written down in Pāli (1st century BC), a literary language of rather mixed vernacular origins. Pāli eventually became a revered, standard, and international tongue. The language and the Theravāda canon known as *Tipiṭaka* (Sanskrit *Tripiṭaka*) were brought to Burma, Thailand, Cambodia, Laos, and Vietnam. Pāli died out as a literary language in mainland India in the 14th century but survived elsewhere until the 18th.

Pāli literature, body of canonical texts and commentaries in the sacred Pāli language of Theravāda Buddhism. *See* Tipiṭaka.

Palimé, formerly KPALIMÉ, town, Kloto *préfecture,* in Plateaux economic *région,* southwestern Togo, western Africa, situated about 70 miles (110 km) northwest of Lomé, the national capital. The town lies in a mountainous area important for cultivation of coffee, cacao, and oil palms. A large portion of these crops is transported from Palimé by road and rail to Lomé. Palimé serves as a major centre for commercial trade in Togo. The Ewe people inhabit the town and surrounding area. Pop. (1981) 27,669.

palimpsest, manuscript in roll or codex form carrying a text erased, or partly erased, underneath an apparent additional text. The underlying text is said to be "in palimpsest," and, even though the parchment or other surface is much abraded, the older text is recoverable in the laboratory by such means as the use of ultraviolet light. The motive for making palimpsests usually seems to have been economic—reusing parchment was cheaper than preparing a new skin. Another motive may have been directed by Christian piety, as in the conversion of a pagan Greek manuscript to receive the text of a Father of the Church.

palindrome, word, number, sentence, or verse that reads the same backward or forward. The term derives from the Greek *palin dromo* ("running back again").

Examples of word palindromes include "civic," "madam," "radar," and "deified." Numerical palindromes include sequences that read the same in reverse order (*e.g.,* 1991), as well as those that can be read upside down and backward (*e.g.,* 1961). Examples of sentences include "Able was I ere I saw Elba" and "Lewd did I live & evil I did dwel." Examples of verse include (in Latin) "Roma tibi subito motibus ibit amor" and "Signa te, signa temere me tangis et angis." Some persons have refined upon the palindrome and composed verses each word of which is the same read backward as forward—for instance, that of William Camden:

> Odo tenet mulum, madidam mappam tenet Anna,
> Anna tenet mappam madidam, mulum tenet Odo.

The following is still more complicated, as it can be read in four ways—upward and downward as well as backward and forward:

```
S A T O R
A R E P O
T E N E T
O P E R A
R O T A S
```

This Latin palindromic square, which was found on a Roman wall in Cirencester, Eng., and in Pompeii, Italy, may be translated: "Arepo the sower holds the wheels with care." As late as the 19th century it was graven on amulets and charms and laid upon pregnant women to ensure safe delivery. Like the sign of the fish (an acrostic: Greek *ichthys,* "fish," happens to have the first letters of the Greek words for Jesus Christ, God's son, Saviour), the square may have been used to identify fellow Christians in the days of persecution, for its letters form a cross with the word *tenet* and can be arranged in the cross

```
        P
        A
        T
        E
        R
PATERNOSTER
        O
        S
        T
        E
        R
```

with four letters remaining: *A, O, A,* and *O.* These, placed at the extremities, can represent alpha and omega. Though some, because of the early date of the eruption that destroyed Pompeii (AD 79), suggest a Jewish origin, the threefold Christian symbols, cross, prayer, and quotation, seem to confute them; moreover, the letters of the square can be rearranged to spell *Oro Te, Pater; oro Te, Pater; sanas:* "I pray to thee, Father. Thou healest." Thus the palindrome, now merely a game, had a serious beginning.

Palio, The, Italian CORSO DEL PALIO ("Course of the Banner"), festival of medieval origin conducted annually in certain Italian cities and featuring bareback horse races. Best known to foreigners is the Palio of Siena. Horse racing in Siena dates from 1232. The Palio was first held in 1482 as a civic celebration. The current course was formally established in 1659 and has been held semiannually on July 2 and on August 16 since 1701, except during wartimes. Lasting about a minute, the race consists of three turns around the Piazza del Campo, the main city square.

Preceding the horse race, a splendid parade is staged by representatives of the 17 ward organizations of the city, called *contrade,* which now function as social clubs but which in the European Middle Ages were rival military companies. Ten *contrade* compete in each race, which is run with intense partisan spirit, rampant distrust, and occasional scuffles. It is widely acknowledged that the outcome is determined by bribery. Each *contrada* hires a professional jockey to dress in the 15th-century costume in its colours. Riding without saddle or stirrups, whipping their competitors' horses as they race for the Palio (Latin term for the silk standard painted in black and gold), the riders finish with cannon fire signaling the end of the race. Though the race is considered a secular event, each horse is blessed in the church of its *contrada* by the parish priest before the race begins. The festival is enhanced by drummers and flag throwers who demonstrate their arts using the colourful banners of their respective *contrade.*

Palisa, Johann (b. Dec. 6, 1848, Troppau, Silesia [now Opava, Czech.]—d. May 2, 1925, Vienna, Austria), Silesian astronomer best known for his discovery of 120 asteroids. He also prepared two catalogs containing the positions of almost 4,700 stars.

Palisa briefly was an assistant astronomer at the observatories in Vienna and Geneva before being appointed director (1872–80) of the Austro-Hungarian naval observatory at Pola (now Pula, Yugos.), a position that carried with it the rank of commander. From 1880 to 1919 he was a member of the staff at the Vienna Observatory. By 1891, when the photographic plate was first used in astronomy, he had found 83 of the 120 asteroids he eventually identified by visual observation alone. His star catalogs were published in 1899, 1902, and 1908.

Palisades, The, sandstone bluffs 200–540 feet (60–165 m) high along the west side of the Hudson River, southeastern New York and northeastern New Jersey. They are an extension of the Catskill Mountains. Rising vertically from near the water's edge, they are characterized by uplifts, faults, and columnar structure developed by slow cooling of molten material near the end of the Triassic period (245 to 208 million years ago). The Palisades Interstate Park Commission, established in 1900 and headquartered in Bear Mountain, N.Y., oversees 16 park units along the river, occupying a total area of 77,321 acres (31,292 hectares), mostly in New York but also including one park in New Jersey. Linking the various units is the 42-mile (68-kilometre) Palisades Interstate Parkway, extending northward from George Washington Bridge, Fort Lee, N.J., to Bear Mountain Bridge, N.Y. The largest unit is Harriman State Park (46,181 acres [18,689 hectares]). Facilities for hiking, swimming, fishing, boating, camping, picnicking, and skiing are available.

The term Palisades, now quasi-generic for a line of cliffs, was apparently first used in reference to these columnar formations along the Hudson.

Palissy, Bernard (b. 1509, St. Avit, near Lacapelle Biron, Fr.—d. 1590, Paris), French Huguenot potter and writer, particularly associated with decorated rustic ware, a type of earthenware covered with coloured lead glazes sometimes mistakenly called faience (tin-glazed earthenware).

Palissy began as a painter of glass, but, after journeys in the south and in the Ardennes brought him into contact with humanists, he settled as a surveyor and potter in Saintes, near La Rochelle. Persecuted as a Protestant, he was imprisoned until the constable of Montmorency employed him in the decoration of the Château d'Ecouen. His appointment, about 1565, as "inventor of rustic pottery to the king and the queen mother" enabled him to work in Paris. In 1570, helped by his sons, he built a pottery grotto for Catherine de Médicis in the garden of the Tuileries.

From 1575, in Paris, Palissy gave public lectures on natural history, which, published as *Discours admirables* (1580; Eng. trans. *Admirable Discourses*), became extremely popular, revealing him as a writer and scientist, a creator of modern agronomy, and a pioneer of the experimental method, with scientific views generally more advanced than those of his contemporaries. After seeing a white glazed cup, probably Chinese porcelain, he determined to discover the secrets of its manufacture. His early researches are described in *De l'art de la terre.*

As the struggle against Protestants grew, Palissy took refuge in the homes of the Princess of Sedan and Robert de la Marck in eastern France, returning to Paris in 1575. Imprisoned in the Conciergerie for religious reasons in 1588, he was transferred to the Bastille, where he died.

Palissy's pottery generally consists of oval or circular dishes, ewers, and sauceboats, decorated with plants and animals and allegorical and mythological scenes. Some of his pottery had marbled reverse surfaces, and some pieces were reproductions of objects by such leading French metalworkers of the 16th century as François Briot.

Palissy probably did not use the potter's wheel. His best-known pieces were apparently pressed into a mold and finished by modeling or the application of ornament molded in relief. His authentic productions bear no signature or mark. His molds were used later during the 17th century at Avon near Fontainebleau and at Manerbe, Calvados, where a few lead-glazed earthenware statuettes were made. Between 1840 and 1870 copies were executed by Jean-Charles Avisseau of Tours and by Georges Pull of Paris.

Palk Strait, inlet of the Bay of Bengal, between southeastern India and northern Sri Lanka and bounded on the south by Pāmban Island (India), Adam's (Rama's) Bridge (a chain of shoals), and Mannar Island (Sri Lanka). The strait is 40–85 miles (64–137 km) wide and 85 miles long. It receives several rivers, including the Vaigai (India), and it contains many islands of Sri Lanka. The port of Jaffna, the commercial centre for northern Sri Lanka, has trade with the state of Tamil Nādu, India. The southwestern portion of the strait is also called Palk Bay.

Pālkonda Hills, series of ranges in southern Andhra Pradesh state, southern India. The hills trend northwest to southeast and form the central part of the Eastern Ghāts. Geologically they are relics of ancient mountains formed during the Cambrian Period (500,000,000 to 570,000,000 years ago) that were subsequently eroded by the Penner River and its tributaries. The Punchu and Cheyyeru rivers join in a spectacular confluence in a gorge in the corridor between the Velikonda and the Pālkonda Hills. Formed of quartzites, slates, and lavas, the Pālkondas reach an elevation of 3,000 ft (900 m) in the south. The valleys between the mountains are drained by streams, many of which, having been dammed for storage tanks, provide irrigation for cultivation. The main crops are jowar (sorghum) and peanuts (groundnuts).

P'alkwanhoe (Korean: Assembly of P'alkwan), most important of Korea's ancient national festivals, a ritualistic celebration that was essentially Buddhist in form but tinged with elements of Taoism and indigenous folk beliefs. Some historians think P'alkwanhoe was originally a state-sponsored cultural festival that developed from the harvest festivals of earlier days. The festival, which seems to have been firmly established in AD 551 at a time when Buddhism was recognized as the state religion, was conducted by Buddhist priests and apparently included prayers for the welfare of the state. During the festival, lamps were lit, incense was burned, the royal palace was elaborately decorated, and there was joyous singing and dancing. The king participated by receiving congratulations from foreign merchants, provincial ministers, and ordinary citizens and by dispensing food and even wine, which was forbidden at other times. The royal P'alkwan treasury (P'alkwanbo) took care of all expenses but sometimes relied on contributions from the aristocracy.

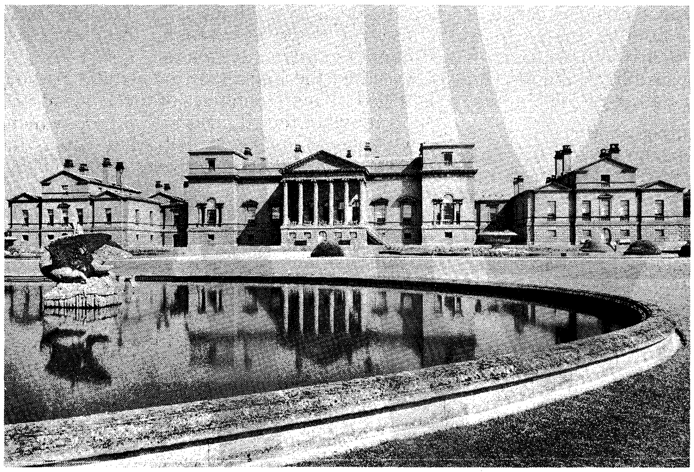
The festival still survives in certain rural areas of Korea and includes prayers to heaven, mountains, rivers, and the dragon.

pall (liturgical vestment): *see* pallium.

pall-mall, French PAILLE-MAILLE (from Italian *pallamaglio, palla,* "ball," and *maglio,* "mallet"), obsolete game of French origin, resembling croquet. An English traveller in France mentions it early in the 17th century, and it was introduced into England in the second quarter of that century. Thomas Blount's *Glossographia* (1656) described it as "a game wherein a round bowle is with a mallet struck through a high arch of iron (standing at either end of an alley) which he that can do at the fewest blows, or at the number agreed on, wins. This game was heretofore used in the long alley near St. James's and vulgarly called Pell-Mell." The pronunciation here described as vulgar afterward became classic, a famous London street having been named after a pall-mall alley. A mallet and balls used in the game were found in 1845 and are now in the British Museum: the mallet resembles that used in croquet, but its head is curved; the balls are of boxwood and about one foot in circumference. The 17th-century diarist Samuel Pepys described the alley as of hard sand "dressed with powdered cockle-shells." The length of the alley varies, the one at St. James being close to 800 yards long.

Palladian window, in architecture, three-part window composed of a large, arched central section flanked by two narrower, shorter sections having square tops. This type of window, popular in 17th- and 18th-century English versions of Italian designs, was inspired by the so-called Palladian motif, similar three-part openings having been featured in the work of the 16th-century Italian architect Andrea Palladio; his basilica at Vicenza, designed in 1546, was especially rich in these. Because the motif was first described in the work *L'architettura* (1537), by the Italian architect Sebastiano Serlio, it is also known as the Serlian motif, or Serliana, and the window derived from it may be called a Serlian window. It is also sometimes referred to as a Venetian window.

Palladianism, style of architecture based on the writings and buildings of the humanist and theorist from Vicenza, Andrea Palladio (1508–80), perhaps the greatest architect of the latter 16th century and certainly the most influential. Palladio felt that architecture should be governed by reason and by the principles of classical antiquity as it was known in surviving buildings and in the writings of the 1st-century-BC architect and theorist Vitruvius. Palladianism bespeaks rationality in its clarity, order, and symmetry, while it also pays homage to antiquity in its use of classical forms and decorative motifs. Few architects beyond Palladio's immediate disciple Vincenzo Scamozzi (1552–1616) were interested in pursuing the most erudite aspect of Palladio's work—his investigation of harmonic proportions—and in the hands of all too many followers of the next two centuries, Palladianism tended to become a sterile academic formula devoid of Palladio's own forcefulness and poetry. His true heirs have been those, from Gian Lorenzo Bernini (1598–1680) to the contemporary American architect John Hejduk, who have reinvestigated the basic principles of his architecture from other viewpoints.



Holkham Hall, by William Kent, Palladian style, begun 1734, Norfolk, Eng.
A.F. Kersting

Inigo Jones, who introduced Palladian architecture into England, might be said to be one of those, as his works were not copies of Palladio's buildings but, rather, re-creations in the same spirit. Upon his return from a trip to Italy (1613–14), Jones created a Palladian style in London; this style was based upon the knowledge he had acquired from his study of Palladio's writings and from his own first-hand examination of ancient and Renaissance architecture. Outstanding among the preserved examples are the Queen's House at Greenwich (completed 1635), the Banqueting House at Whitehall (1619–22), and the Queen's Chapel at St. James Palace (1623).

At the beginning of the Georgian period (1714–1830), a second and more consuming interest in Palladio developed. Partly as a reaction to the grandiose architecture of the later Stuarts, the newly powerful Whigs expressed a desire to return to a more rational and less complicated style. Their wish coincided with the publication of an English translation of Palladio's treatise *I quattro libri dell' architettura* (1570; *Four Books on Architecture,* 1715) and the first volume of Sir Colin Campbell's study of classical buildings in Great Britain, *Vitruvius Britannicus* (1715). Campbell, the first practitioner of the new and more literal English Palladianism, built Houghton Hall in Norfolk (begun 1722) and Mereworth Castle in Kent (*c.* 1722). The wealthy amateur architect Richard Boyle, 3rd earl of Burlington, and his protégé William Kent complete the triumvirate responsible for the second phase of the style. Burlington's home, Chiswick House (begun 1725), was designed by him as a reinterpretation of Palladio's Villa Rotonda. Holkham Hall, Norfolk (begun 1734), was built by Kent, who is also credited with having invented the English landscape garden.

In the 18th century a revival of Palladianism in England spread to Italy and thence throughout most of Europe and the American Colonies. Among the notable architects of this movement were Francesco Maria Preti in Italy, Thomas Jefferson in America, Georg Knobelsdorff in Germany, and Pieter Post and Jacob van Campen in the Netherlands. The style spread to Russia through the work of the Scottish-born Charles Cameron and the Italian Giacomo Quarenghi, and it was also important in Sweden and Poland. By shortly after 1800 the style had succumbed everywhere to a new taste for classicism derived directly from antiquity instead of seen through Palladio's Renaissance eyes.

Palladio, Andrea, original name ANDREA DI PIETRO DELLA GONDOLA (b. Nov. 30, 1508, Padua, Republic of Venice—d. August 1580, Vicenza), Italian architect, regarded as the greatest architect of 16th-century northern Italy. His designs for palaces (palazzi) and villas, notably the Villa Rotonda (1550–51) near Vicenza, and his treatise *I quattro libri dell'architettura* (1570; *The Four Books of Architecture,* 1716) made him one of the most influential figures in Western architecture.

Early life and works. Palladio was born in the northern Italian region of the Veneto, where, as a youth, he was apprenticed to a sculptor in Padua until, at the age of 16, he moved to nearby Vicenza and enrolled in the guild of the bricklayers and stonemasons. He was employed as a mason in workshops specializing in monuments and decorative sculpture in the style of the Mannerist architect Michele Sanmicheli of Verona.

Between 1530 and 1538 Count Gian Giorgio Trissino, a Humanist poet and scholar, was rebuilding his villa at Cricoli outside Vicenza in the ancient Roman, or classical, style. Palladio, working there as a mason, was noticed by Trissino, who undertook to expand his practical experience with a Humanist education. The Villa Trissino was rebuilt to a plan reminiscent of designs of Baldassarre Pe-

Osvaldo Bohm

ruzzi, an important High Renaissance architect. Planned to house a learned academy for Trissino's pupils, who lived a semimonastic life studying mathematics, music, philosophy, and classical authors, the villa represented Trissino's interpretation of the ancient Roman architect and theorist Vitruvius (active 46–30 BC), whom Palladio was later to describe as his master and guide. The name Palladio was given to Andrea, after a Humanist habit, as an allusion to the mythological figure Pallas Athena and to a character in Trissino's poem "Italia liberata dai goti." It indicates the hopes Trissino had for his protégé.

At the Villa Trissino, Palladio met the young aristocracy of Vicenza, some of whom were to become his patrons. By 1541 he had stylistically assimilated the Mannerist works of Michele Sanmicheli and the High Renaissance buildings of Jacopo Sansovino, whose library of St. Mark's in Venice had been begun in 1536. He had probably been introduced in Padua to Alvise Cornaro, whose designs were the first to import the Roman Renaissance style to northern Italy. Palladio may also have met a prominent Mannerist architect and theoretician, Sebastiano Serlio, who was in Venice at that time and whose third and fourth books on architecture (*L'architettura;* 1540 and 1537, respectively) were to be an inspiration to him.

In about 1540 Palladio designed his first villa, at Lonedo for Girolamo de' Godi, and his first palace, in Vicenza for Giovanni Civena. The Villa Godi has a plan clearly derived from the Villa Trissino but with similarities to traditional Venetian country houses. It contains all the elements of Palladio's future villa designs, including symmetrical flanking wings for stables and barns and a walled courtyard in front of the house. In elevation the Palazzo Civena is close to the High Renaissance palace type developed in the early 16th century in Rome. In plan it resembles Sanmicheli's Palazzo Canossa (*c.* 1535) in Verona. An innovative feature is the use of traditional arcaded pavement of northern Italy behind the main elevation, an idea that Palladio reinterpreted in imitation of an ancient Roman forum.

Visits to Rome and work in Vicenza. In 1541 and again in 1547 Palladio visited Rome with Trissino. These visits greatly affected his palace designs. On them, he saw the work of the greatest architects of the Roman High Renaissance style, Donato Bramante, Peruzzi, and Raphael, generally more remembered for his painting than for his architecture. He also measured ancient Roman antiquities, notably the baths. Palladio's principal ideas on palace design were formed between his first works of 1540 and his visit to Rome in 1554–56.

In 1546 Palladio prepared designs for the reconstruction of the 15th-century town hall in Vicenza, known since then as the Basilica, and in 1548 these plans were accepted, though much earlier designs, drawn in 1534 by the Mannerist architect and painter Giulio Romano and by several other distinguished architects, had been previously rejected. This was his first major public commission, and the work, which was not actually finished until 1617, involved recasing a vast hall with a two-story arcade of white stone to serve as a buttress to the old structure. Suited to both the Gothic style of the original structure and the dimensions of the classical orders, Palladio's arcade was of great proportional subtlety. The architectural motifs used were taken from Serlio and from Sansovino's library of St. Mark's in Venice. Up to 1556 Palladio produced three basic palace types. The first, in 1550, was the Palazzo Chiericati, in which he extended his Palazzo Civena forum idea of a block with its axis parallel to the pavement, which it envelops in a loggia, or roofed open gallery. The tripartite division of the colonnaded elevation, which gives the building a definite central focus, was an innovation. The second, in 1552, was seen in the Palazzo Iseppo Porto, Vicenza, in which he stated in its clearest form his reconstruction of a Roman house. The facade was closely based on the Roman Renaissance palace type, such as Bramante's House of Raphael (*c.* 1514), which Palladio had drawn in Rome. But it was planned in what Palladio believed to be the ancient Roman style. Two tetrastyle halls with four columns each were placed on opposite sides of a court surrounded by a giant colonnade of Corinthian columns. The third, in 1556, was in the Palazzo Antonini in Udine, which has a square plan with a central four-column tetrastyle hall and the service quarters asymmetrically to one side. The facade has six columns, which are attached to the wall rather than freestanding and which are centrally placed on each of the two floors, surmounted by a pediment or a low-pitched gable—a device normally used in his villas.

Palladio further developed the basic plan of his Palazzo Iseppo Porto in the Palazzo Thiene (*c.* 1545–50), Vicenza, the largest and most problematical of his palace designs, of which only the side and rear blocks were completed. Four wings, containing a combination of rectangular rooms and small octagons, similar to those of the Roman public baths, are symmetrically placed around a huge court. The elevations are of a grandeur unequalled in Palladio's other work. The design is the first in which Palladio was influenced deeply by the prevailing contemporary style of Mannerism and especially by Giulio Romano, who was in Vicenza when the project was begun.

During his stay in Rome, from 1554 to 1556, Palladio in 1554 published *Le antichità di Roma* ("The Antiquities of Rome"), which for 200 years remained the standard guidebook to Rome. In 1556 he collaborated with the classical scholar Daniele Barbaro in reconstructing Roman buildings for the plates of Vitruvius' influential architectural treatise (written after 26 BC) *De architectura* (*On Architecture*). The new edition was published in Venice in 1556.

Palladio's elevations have always a central emphasis that reflects the axial symmetry of the plan. This is developed in the Palazzo Valmarana, Vicenza, of 1565, along with an increasing use of stucco surface reliefs and giant orders, or columns, extending more than one story. The latter are both Mannerist elements, used particularly by Michelangelo. Giant orders were also used in the massive and unfinished Palazzo Porto-Breganze of *c.* 1570 and finally in the Loggia del Capitanio of 1571. The latter was built in emulation of many similar loggias, such as those of Florence and Venice. The lower floor was to be a raised platform open to the square and the upper a meeting hall. The original decoration was adapted to symbolize the contribution of Vicenza to the Venetian victory over the Turks at Lepanto in 1571, and a triumphal-arch motif was added to the side elevation. But the cost of the victory so impoverished the government that only three bays, or sections, were built of a possible five or seven intended.

Though Palladio absorbed contemporary Mannerist motifs, his plans and elevations always retained a repose and order not associated with Mannerist architecture, particularly that of Michelangelo and Giulio Romano. When the simplicity of his early designs was abandoned, it was largely to incorporate details warranted by the examination of buildings of the late Roman Empire, reflecting archaeological study common to his period.

Palladio's villas were less affected by his visits to Rome. For practical reasons these buildings were always of stuccoed brickwork with a minimum of carved-stone detail. His aim was to recreate the Roman villa as he had come to understand it from Latin descriptions in the writings of Pliny and Vitruvius. His villas were built for a capitalist gentry who, during the period of Palladio's maturity, gained in prosperity and found new economic outlets in agricultural improvement and land reclamation. He developed the prototype plan of Villa Trissino with many variations at Cricoli. The plan could change in scale and function to serve as a summer residence of an urban aristocrat or the estate headquarters of a gentleman farmer. Included in the former category are the least typical and most widely copied of Palladio's villa designs, the villa for Giulio Capra, called the Villa Rotonda, near Vicenza. This was a hilltop belvedere, or summer house, with a view, of completely symmetrical plan with hexastyle, or porticoes on each of four sides and central circular halls surmounted by domes. The Villa Trissino at Meledo, of the same type, was to have curved wings attached to the main portico. This was a device Palladio usually used when less consideration had to be given to farming and agricultural use of the land. Although the Villa Trissino was not built, it was a most influential design because it was illustrated in the *Quattro libri.*

Palladio adapted the classical temple front to the facades of his villas because it had the dignity suitable for an entrance. He reasoned that, since ancient temples such as the Pantheon in Rome had pedimented porticoes, houses, which preceded temples, would also have had them. Sometimes, as at the Villa Cornaro (*c.* 1560–65) at Piombino Dese and the Villa Pisani (*c.* 1553–55) at Montagnana, the portico is two-storied, with principal rooms on two floors. Normally (as at the Villa Foscari at Mira, called Malcontenta [1560]; the Villa Emo at Fanzolo [late 1550s]; and the Villa Badoer), the porch covers one major story and the attic, the entire structure being raised on a base that contains service areas and storage. In a third type the temple front covers the whole front of the house, as at the Villa Barbaro (*c.* 1555–59) at Maser, which Palladio designed for his friend the scholar Daniele Barbaro. This villa retains the contemporary fresco interiors painted by the Venetian master Paolo Veronese (*c.* 1528–88) and is one of the few interiors to survive from Palladio's day.

At the Villa Thiene (*c.* 1550) at Quinto, he started to build a grandiose house planned on the lines of his reconstruction of a Roman villa shown in the *Quattro libri,* but it was never finished. At the Villa Sarego (*c.* 1568–69) at Santa Sofia a similar inward-facing complex was also planned but not completed. This design differs from the normal villa in its two-story rusticated colonnade forming loggias to rooms arranged around three sides of a court. It is reminiscent of the court to the Pitti Palace in Florence, built in 1550 by the Mannerist architect and sculptor Bartolommeo Ammannati (1511–92).

Palladio's villas were planned as total complexes but could be built in part to satisfy the owner's immediate requirements. He attached great importance to the courts that flanked or stood in front of the house, since they extended its axial symmetry and proportion.

At the end of 20 years of intensive building, Palladio in 1570 published *I quattro libri dell'architettura.* This work was a summary of his studies of classical architecture. He used a number of his own designs to exemplify the principles of Roman design. The first book contains studies of materials, the classical orders, and decorative ornaments; the second, many of Palladio's designs for town and country houses, together with his classical reconstructions. His executed designs are frequently corrected, particularly in the case of early works like the Villa Godi. They are marked with dimensions according to a system of mathematical ratio. The ratios employed are based upon the musical intervals that were in use in Palladio's day, and it was believed that numerical equivalents would result in a beautiful building, since it would be designed within a universal mathematical order. The third book contains designs for bridges, ancient town planning, and basilicas, or ancient Roman oblong halls for public assembly, later adopted as a prototype for the Christian church. The fourth book has to do with the reconstruction of ancient Roman temples.

Venetian period. After 1570 Palladio's life was centred on the building of churches in Venice. In the Veneto, because of a war with the papacy, few churches had been built in the first half of the century, and there are no church designs in his early drawings. Palladio's first design was for the facade of San Pietro di Castello (1558) in Venice—a design that does not survive. In about the 1560s he was working on monastic commissions in Venice for Santa Maria della Carità and for the refectory and cloisters of San Giorgio Maggiore. In the early 1560s he designed the facade for San Francesco della Vigna, at Venice, which had been built according to Sansovino's designs of 1534 but was never finished. Palladio's facade became a design prototype for classical churches with a high nave, or central aisle, and lower aisles. He resolved this by intersecting classical temple fronts—one joining the side aisles and the other, grander front superimposed upon it and covering the higher elevation of the nave. This ingenious solution was refined and perfected in the facades of San Giorgio Maggiore (1566, completed in 1610) and Il Redentore (1576, completed in 1592). The liturgical revival of the Counter-Reformation opposed the centrally planned church, requiring separate functions for different parts of a Latin-cross church. Palladio's proposals for a circular church for Il Redentore, therefore, were rejected. In both churches the nave is a hall of gray stone columns, lit from windows at high level and covered with a plain stucco barrel vault. The interiors are a chaste white with no decoration. In Il Redentore the apse is lit from the dome above and from the choir, which stands behind a semicircular screen of columns.

At the end of his life, in 1579, Palladio designed a central-plan church as a chapel at Maser. It is a shallow Greek cross covered by a circular dome. Internally, the complex decoration of all surfaces relates it in style more closely to Palladio's late palace designs than to his churches. This was followed by a similar unexecuted project, San Nicola di Tolentino (1579) in Venice. These demonstrate Palladio's ideal church plan and follow his reconstruction of the Pantheon in the *Quattro libri* and paralleling designs by Giacomo da Vignola (1507–73), the leading architect in Rome after Michelangelo.

With the death of Sansovino in 1570, Palladio became the leading architect of the Veneto region. Until then he had failed to gain official state patronage, and his designs for palaces in Venice, known from the *Quattro libri* and from drawings, had never found patrons. His later civic work in Venice consisted of advice on fortifications, designs for decorations used on state occasions, and interiors for the Doges' Palace. In 1572 his two sons died, and afterward he lived a secluded life, publishing only an illustrated edition of Julius Caesar's *Commentaries* as a memorial.

Palladio's last commission came in 1579–80—to build a theatre in Vicenza for the Accademia Olimpica for the performance of classical dramas. The design of the Teatro Olimpico was in the nature of an academic exercise, being based on the reconstruction of the ancient Roman theatre at Orange, in France.

When Palladio died he left a considerable number of unfinished buildings, including the Basilica in Vicenza, the two Venetian churches, the Villa Rotonda, and the Teatro Olimpico. These were continued by his followers, notably Vincenzo Scamozzi (1552–1616) and O. Bertotti-Scamozzi (1719–90), but, because of the changing taste of the period, they were not strictly in accordance with Palladio's designs.

Assessment. Palladio is one of the most influential figures in the whole development of Western architecture. The qualities that made him influential were numerous and varied. His palaces and villas were imitated for 400 years all over the Western world; he was the first architect to systematize the plan of a house and consistently to use the ancient Greco-Roman temple front as a portico, or roofed porch supported by columns (this was probably his most imitated architectural feature), and finally, in his *I quattro libri dell'architettura,* he produced a treatise on architecture that, in popularizing classical decorative details, was possibly the most influential architectural pattern book ever printed.

The influence of Palladio's buildings and publications reached its climax in the architecture of the 18th century, particularly in England, Ireland, the United States, and Italy, creating a style known as Palladianism, which in turn spread to all quarters of the world.

Palladium, in Greek religion, image of the goddess Pallas (Athena), especially the archaic wooden statue of the goddess that was preserved in the citadel of Troy as a pledge of the safety of the city. As long as the statue was kept safe within Troy, the city could not be conquered. It was said that Zeus, the king of the gods, threw the statue down from heaven when the city of Ilium (Greek Troy) was founded and that the Greek warriors Odysseus and Diomedes carried it off from the temple of Athena in Troy, thus making the Greek capture of Troy possible. Many cities in Greece and Italy claimed to possess the genuine Trojan Palladium, but it was particularly identified with the statue brought to Italy by the hero Aeneas after Troy's destruction and preserved in the shrine of the goddess Vesta at Rome. The Palladium was a common subject in Greek art, as was its theft in literature. The story of its fall from heaven perhaps signifies that the Palladium was originally a baetyl, or sacred stone.

palladium (Pd), chemical element, lightest and lowest-melting of the platinum metals of Group VIII of the periodic table, used especially as a catalyst (a substance that speeds up chemical reactions without changing their products) and in alloys. A precious, gray-white metal, palladium is extremely ductile and easily worked. Palladium is not tarnished by the atmosphere at ordinary temperatures. Thus, the metal and its alloys serve as substitutes for platinum in jewelry and in electrical contacts; the beaten leaf is used for decorative purposes. Relatively small amounts of palladium alloyed with gold yield the best white gold. Palladium is used also in dental alloys. The largest use of the pure metal is for electrical contacts in telephone equipment. Palladium coatings, electrodeposited or chemically plated, have been used in printed-circuit components.

Native palladium, though rare, occurs alloyed with a little platinum and iridium in Colombia (department of Chocó), in Brazil (Itabira, Minas Gerais), in the U.S.S.R. (Ural Mountains), and in South Africa (the Transvaal). Palladium occurs in the Earth's crust at an abundance of 0.015 parts per million. For the mineralogical properties of palladium, *see* native element (table). Palladium also occurs alloyed with native platinum. It was first isolated (1803) from crude platinum by the English chemist and physicist William Hyde Wollaston. He named the element in honour of the newly discovered asteroid Pallas. Palladium is also associated with a number of gold, silver, copper and nickel ores. It is generally produced commercially as a by-product in the refining of copper, and nickel ores. For specific information about the mining and recovery of palladium, *see* MACROPAEDIA: Industries, Extraction and Processing.

Surfaces of palladium are excellent catalysts for chemical reactions involving hydrogen and oxygen, such as the hydrogenation of unsaturated organic compounds. Under suitable conditions, palladium absorbs more than 900 times its own volume of hydrogen; it expands and becomes harder, stronger, and less ductile in the process. A metallic or alloylike hydride is formed from which the hydrogen can be removed by increased temperature and reduced pressure. Because hydrogen passes rapidly through the metal at high temperatures, heated palladium tubes impervious to other gases function as semipermeable membranes and are used to pass hydrogen in and out of closed gas systems or for hydrogen purification.

Palladium is attacked more readily by acids than any of the other platinum metals. It dissolves slowly in nitric acid to give palladium nitrate, $Pd(NO_3)_2$, and with concentrated sulfuric acid it yields palladium sulfate, $PdSO_4 \cdot 2H_2O$. A series of palladium compounds can be prepared with the +2 oxidation state; numerous compounds in the +4 state and a few in the 0 state are also known. Among the transition metals palladium has one of the strongest tendencies to form bonds with carbon. All palladium compounds are easily decomposed or reduced to the free metal. An aqueous solution of potassium tetrachloropalladate(II), K_2PdCl_4, serves as a sensitive detector for carbon monoxide or olefin gases because a black precipitate of the metal appears in the presence of exceedingly small amounts of those gases. Natural palladium consists of a mixture of six stable isotopes: palladium-102 (0.96 percent), palladium-104 (10.97 percent), palladium-105 (22.23 percent), palladium-106 (27.33 percent), palladium-108 (26.71 percent), and palladium-110 (11.81 percent).

Palladius (b. *c.* 363, Galatia, Anatolia—d. before 431, Aspuna), Galatian monk, bishop, and chronicler whose *Lausiac History,* an account of early Egyptian and Middle Eastern Christian monasticism, provides the most valuable single source for the origins of Christian asceticism.

Palladius took up the ascetical life himself, first at the Mount of Olives, the scene of Christ's Passion outside Jerusalem, then in Egypt in the Nitrian desert, now Wādī an-Naṭrūn, to avail himself of the advice of the 4th-century pioneer monks Macarius and Evagrius Ponticus. Returning to Palestine *c.* 399 because of poor health, he was named bishop of Helenopolis, near modern Istanbul.

Soon after 400, Palladius began an extended defense of his articulate theological mentor St. John Chrysostom, patriarch of Constantinople, against charges of heresy. Enemies both at the rival theological school of Alexandria, Egypt, and at Constantinople's imperial court, embarrassed by Chrysostom's moral exhortations and envious of his office, accused him of doctrinal errors. For Palladius' support of Chrysostom at Byzantium and at Rome, the Eastern Roman emperor Arcadius exiled him for six years, during which time, *c.* 408, he wrote his *Dialogue on the Life of St. John Chrysostom.* Styled after the manner of Plato's *Phaedo,* it provides data with which to reconstruct the political–theological controversy.

In 413, after his banishment was lifted, Palladius became bishop of Aspuna in Galatia, and during 419–420 he composed his chronicles on "The Lives of the Friends of God," referring to the earliest Christian ascetics in the various wilderness areas of Egypt and Asia Minor. This *Lausiac History,* dedicated to Lausus, chamberlain of Emperor Theodosius II, is a fusion of personal experiences with secondary accounts of desert monasticism. Although sometimes credulous in repeating legendary narratives modeled after the classical Greek form of heroic epic, Palladius also exhibits a sober humanism that avoids pious ascetical theory, as in his reaction to monastic vanity: "To drink wine with reason is better than to drink water with pride." After previous doubts, 20th-century scholarship has verified the authenticity of the *Lausiac History* as well as part of a treatise on ascetical ideals of India.

Pallas, second largest known asteroid and the second such object to be discovered. It was detected in 1802 by the German astronomer and physician Wilhelm Olbers following the discovery of Ceres, the largest asteroid, the year before. It was named after Pallas Athena, the Greek goddess of wisdom.

Pallas measures 608 kilometres (377 miles) in diameter. Its orbital inclination to the plane of the ecliptic (*i.e.,* Earth's orbital plane) is rather large at nearly 35°, but its semimajor axis and period are typical for asteroids, at 2.77 astronomical units (414,390,000 km) and 4.61 years, respectively. This places Pallas within the asteroid belt between Mars and Jupiter. Pallas is thought to be spheroidal in shape, because it seems massive enough for gravity to have pulled its constituent material into that shape during formation. Based on studies of its reflecting spectrum, the surface of Pallas appears to be essentially that of the early forming, dark, carbon-rich stony asteroids (carbonaceous chondrites). Pallas differs, however, in having water locked into its surface material (*i.e.,* not in free ice or liquid form) and a higher proportion of magnesium in its stony inclusions. Pallas' albedo is 0.09, somewhat greater than typical carbonaceous chondrite asteroids.

Pallas, Peter Simon (b. Sept. 22, 1741, Berlin—d. Sept. 8, 1811, Berlin), German naturalist who advanced a theory of mountain formation and, by the age of 15, had outlined new classifications of certain animal groups.

In 1761 he went to England to study natural-history collections and to make geological observations. He was appointed professor of natural history at the Imperial Academy of Sciences, St. Petersburg (now Leningrad), in 1768. About the same time he joined a scientific expedition to Russia and Siberia. For the next six years he traveled across the length and breadth of the vast empire. He found a wide distribution of mammoth and rhinoceros fossils, including some with their hairy hides

preserved, in the Siberian ice. He returned to St. Petersburg in 1774 with a great amount of data and many fossil specimens, but he had ruined his health. He published his major findings from the expedition in three volumes, *Reise durch verschiedene Provinzen des russischen Reichs* (1771–76; "Journey Through Various Provinces of the Russian Empire"). His chief geological contribution, based largely on his study of the Ural and Altai mountain ranges of Siberia, was the recognition of a temporal sequence of rocks from the centre to the flanks of a range.

pallasite, any stony iron meteorite containing about 50 percent olivine as well as kamacite, plessite, taenite, and troilite. The olivine is present as single crystals larger than those in any other meteorite type and may form aggregates. The olivine is usually swathed by kamacite that does not show the Widmanstätten pattern (bands of kamacite with narrower bands of taenite, the meshes being a mixture of the two); kamacite forms a large part of the metal found in pallasites. The centres of large areas of metal, however, are able to develop Widmanstätten structure.

Pallas's cat, also called STEPPE CAT, or MANUL (*Felis manul*), small, long-haired cat (family Felidae) native to deserts and rocky, mountainous regions from Tibet to Siberia. It was named for the naturalist Peter Simon Pallas. The Pallas's cat is a soft-furred animal about the size of a house cat and is pale silvery gray or light brown in colour. The end of its

tail is ringed and tipped with black, and some individuals have vague, dark markings on the body. The fur of the underparts is about twice as long as that of the upperparts and possibly represents an adaptation to the cat's habitual lying and crouching on cold ground.

Head and body length ranges from 45 to 60 centimetres (18 to 24 inches) with an additional 23–30 cm for the tail; weight ranges from 2.5 to 3.5 kilograms (5.5 to 7.7 pounds). The Pallas's cat is distinguished by a broad head with high-set eyes and low-set ears. It has been suggested that the positioning of these features is an adaptation for peering over rocky ledges; the supposition is that the cat thus exposes only a small part of itself to its prey of small mammals (such as pikas and rodents) and birds.

Pallava DYNASTY, early 4th-century to late 9th-century southern Indian line of rulers whose members originated as indigenous subordinates of the Sātāvahanas in the Deccan, moved into Andhra, and then to Kāñcī (Kānchipuram in modern Tamil Nadu state, India), where they became rulers. Their genealogy and chronology are highly disputed. The first group of Pallavas was mentioned in Prākrit (a simple and popular form of Sanskrit) records, which tell of King Viṣṇugopa, who was defeated and then liberated by Samudra Gupta, the emperor of Magadha, in about the middle of the 4th century AD. A later Pallava king, Siṃhavarman, is mentioned in the Sanskrit *Lokavibhāga* as reigning from AD 436.

The Pallavas were the emperors of the Dravidian country and rapidly adopted Tamil ways. Their rule was marked by commercial enterprise and a limited amount of colonization in Southeast Asia, but they inherited rather than initiated Tamil interference with Ceylon.

The Pallavas supported Buddhism, Jainism, and the Brahminical faith and were patrons of music, painting, and literature. Their greatest monuments are architectural, in particular the Shore Temple, the various other temples carved from granite monoliths, and the

Varāha cave (7th century) at Mahābalipuram (Māmallapuram), once a flourishing port. The mother of the Pallava ruler Siṃhaviṣṇu (mid-6th century) may have been a Christian. Mahendravarman I wrote (*c.* 620) the *Mattavilasa-prahasana,* a farce in Sanskrit.

In general, the Pallava rulers were ineffective in withstanding military pressure from the Western Cālukya dynasty, and their capable feudatories, the Cōḷas, gradually ousted them from power. In about 880 the Pallava dominions passed to the Cōḷa kings.

Pallenberg, Max (b. Dec. 18, 1877, Vienna—d. June 26, 1934, Karlsbad, Austria), Italian-born actor, an exponent of the Austrian tradition of extempore farce, whose talents contributed to the evolution of German theatrical practice.

Pallenberg's career started in Vienna (1909) with appearances in popular revues and operettas, but soon he was at Berlin's Deutsches Theater working with Max Reinhardt. Pallenberg became known for his comic improvisational skills, a talent that created difficulties for the actors who worked with him but that gave his performances an immediacy and authenticity valued by critics and audiences alike. He continued to work with Reinhardt in farces that exploited his talent for improvisation but was soon given more conventionally structured roles as well.

Pallenberg was particularly well received in his portrayals of the Cashier in Georg Kaiser's *Morn to Midnight,* the Barker in Ferenc Molnar's *Liliom,* and Argon in Molière's *Imaginary Invalid.* Pallenberg's stellar role, however, came under the direction of Erwin Piscator in the latter's 1928 production of Bertolt Brecht's dramatic adaptation of Jaroslav Hašek's novel *The Good Soldier Schweik.* As the befuddled underdog Schweik, Pallenberg created the perfect foil for Piscator's multimedia "epic theatre" event, which used cutout cartoon characters, animated film, treadmills, signboards, and abstract lighting to condemn bureaucratic manipulation and callousness. He was forced to leave Germany in the early 1930s because his wife, the operetta star Fritzi Massary, was Jewish; Pallenberg was killed in an airplane crash on the way to a theatrical appearance.

pallium, also called PALL, liturgical vestment worn over the chasuble by the pope, archbishops, and some bishops in the Roman Catholic Church. It is bestowed by the pope on archbishops and bishops having metropolitan jurisdiction as a symbol of their participation in papal authority. It is made of a circular strip of white lamb's wool about two inches wide, is decorated with four black crosses, and is placed over the shoulders. Two vertical bands, each decorated with a cross, extending from the circular strip in the front and back, give the pallium a Y-shaped appearance.

The pallium probably developed from the ancient Greek himation, called pallium by the Romans, a common outer garment formed from a rectangular piece of cloth draped around the body as a mantle or folded and carried over the shoulder when not needed for warmth. Gradually, the pallium became narrower and resembled a long scarf. The Y-shaped pallium probably developed during the 7th century.

The use of the pallium by church officials developed from the secular tradition of emperors and other high officials wearing a special scarf as a badge of office. The pallium was worn by many bishops in the 4th and 5th centuries, and in the 6th century the pope was conferring it as a symbol of distinction. Since the 9th century, an archbishop cannot exercise his metropolitan jurisdiction until he

has received the pallium from the pope. He can wear it only within his own province; only the pope can wear it anywhere.

The equivalent vestment in the Eastern churches is the omophorion, a long, white silk or velvet embroidered scarf, worn by bishops celebrating the holy liturgy.

palm, order name ARECALES, any flowering plant of the order Arecales and of the single family in the order, Arecaceae (Palmae).

A brief treatment of palms follows. For full treatment, *see* MACROPAEDIA: Angiosperms.

Many of the approximately 2,600 known species of the order are economically important. Palms furnish food, shelter, clothing, timber, fuel, building materials, fibres, starch, oils, waxes, wines, and a host of minor products for indigenous populations in the tropics. Palms are chiefly tropical and subtropical trees, shrubs, and vines, usually having a tall, unbranched, columnar trunk. The trunk is crowned by a tuft of large, pleated, fan- or feather-shaped leaves with stout sheathing and often prickly petioles (stalks), the persistent bases of which frequently clothe the trunk. The small, usually unisexual flowers are produced in large clusters. The stem, or trunk, may vary from the length and width of a pencil to a height of about 60 metres (about 200 feet) and a diameter of about 1 m. The leaves may vary in length from several centimetres to more than 9 m. Seeds may be smaller than a match head or the size of a large melon. The great centres of palm distribution are tropical America (with more than 500 species concentrated in Brazil alone) and tropical Asia. Among the most important palms are:

Arenga pinnata (*saccharifera*), the sugar palm, occurs in Malaysia. It grows about 12 m tall and frequently has 20–28 feather-shaped leaves. Sugar, wine, and arrack, a distilled liquor, are processed from the sap. Sago, a starch, is made from the pith. The leaves yield a moisture-resistant fibre.

Attalea cohune (cohune palm), occurring in Central America, grows about 18 m tall and has erect, plume-shaped leaves. Oil from the seeds is used in soap. The related *A. funifera* of the Amazon region of South America yields a water-resistant fibre.

Borassus flabellifer (palmyra palm), occurring in tropical Asia, grows about 20 m tall and has fan-shaped leaves. Fibre from various parts of the plant are made into brooms, hats, and mats. The fruits and seeds are edible.

Chrysalidocarpus lutescens (areca palm), native to Madagascar, sometimes is grown indoors as an ornamental. It grows to about 10 m and has feather-shaped leaves about 60 centimetres (2 feet) long.

Coccothrinax argentea (*garberi*), biscayne, or silver, palm, is a stemless species native to the southeasternmost United States. The fan-shaped leaves are silvery beneath.

Cocos nucifera, coconut palm, originated in Malaysia but has been widely distributed in tropical coastal regions. The tree grows about 30 m tall and has feather-shaped leaves. The nuts—40 to 100 are produced each year—grow to about 25 cm in diameter. The fibre of the nut husk is called coir (*q.v.*). The white meat of the nut is eaten raw or shredded and dried for use in confections. When dried for industrial purposes, it is called copra (*q.v.*). Liquid in the core of the nut, known as coconut milk, is a tasty beverage. Palm wine, arrack, and vinegar are made from the flower buds. Baskets and mats are made from the leaves. The trunk yields a useful timber.

Copernicia cerifera (carnauba palm), occurring in tropical South America, grows to about 10 m tall and has fan-shaped leaves. The trunk is swollen near the base. Carnauba wax—used in polishes, varnishes, and candles—is obtained from the leaves.

Hyphaene thebaica (doum palm), an African species, is unusual because of its many-branched stem. It is known in some areas as Egyptian doom palm and gingerbread tree.

Lodoicea maldivica (*callipyge*), commonly called coco de mer (*q.v.*) or double coconut, occurs in the Seychelles Islands of the Indian Ocean. It grows about 30 m tall.

Phoenix dactylifera (date palm), native to the Middle East and cultivated for its fruit since about 6000 BC, grows 30 m tall and has feathery leaves. A tree may bear as much as 250 kilograms (550 pounds) of dates (*see* date palm) annually for 100 years or more.

Royal palm (*Roystonea regia*)
E.R. Degginger—EB Inc.

Roystonea regia (royal palm), an erect, beautiful species native to the southeastern United States, the West Indies, and tropical America, grows to about 30 m tall and has graceful feathery leaves and a smooth, pale gray trunk resembling concrete in colour and texture. It is often grown as an ornamental.

Sabal palmetto (cabbage palmetto), occurring in the southeastern United States and the West Indies, grows to about 24 m tall and has fan-shaped leaves. The water-resistant trunk is used as wharf piling; the trees are commonly grown for shade and as ornamentals along avenues. The buds are edible, mats and baskets are sometimes made from the leaves, and stiff brushes are made from the stems. *S. texana,* a similar species, occurs in the southwestern United States and in Mexico.

Palm Beach, town, Palm Beach county, southeastern Florida, U.S., on a narrow barrier beach between the Atlantic Ocean (east) and Lake Worth (west). The latter, actually a lagoon (part of the Atlantic Intracoastal Waterway), is bridged to West Palm Beach. In 1878 a shipwrecked cargo of coconuts was washed onto the barren, sandy beach and took root. Early settlers also gathered the nuts and planted them to create a palm-shaded haven, which was named Palm City in 1880. Renamed Palm Beach in 1887, it developed as a resort after Henry Flagler extended the Florida East Coast Railroad to West Palm Beach in 1894 and opened his Royal Poinciana Hotel. Palm Beach was frequented by wealthy and famous personages and remains one of the most luxurious winter resorts in the United States, with hotels, clubs, private estates, and yacht facilities. It is strictly zoned and has no manufacturing. Inc. 1911. Pop. (1988 est.) 11,670.

palm-chat (species *Dulus dominicus*), songbird of Hispaniola (Haiti and the Dominican Republic) and nearby Gonâve Island, which may belong in the waxwing family (Bombycillidae) but which is usually separated as the family Dulidae. This 19-centimetre (7.5-inch) bird has a stout bill, and its plumage is greenish brown above and whitish, with dark streaking, below (in both sexes). Palm-chats feed in flocks on berries and flowers. They build a large communal nest in a tree, with a private-entrance chamber for each of up to 30 pairs.

palm chestnut, edible nut of the peach palm (*Bactris Gasipaes,* or in some classifications *Guilielma Gasipaes*), family Palmaceae, grown extensively from Central America as far south as Ecuador. The typical 18-metre (60-foot) mature peach palm bears up to five clusters of 50 to 80 orange-yellow fruits, each 5–7.5 cm (about 2–3 inches) in diameter. The fruit keeps well on the tree and after it is harvested. Its somewhat dry and mealy flesh, easily separated from the seed after boiling in salted water, is fermented into a beverage.

The 2-centimetre seed, or nut, is conical with a black, thin, hard shell. The flavour of the white inner kernel resembles that of the coconut. The plentiful oil from the seeds is used locally in cooking. The hard wood of the tree is used as a building material and in bow making.

Palm Springs, city, Riverside county, southern California, U.S., in the Coachella Valley, at the foot of Mount San Jacinto (10,804 feet [3,293 m]). Originally known as Agua Caliente ("Hot Water") for its hot springs, by 1872 it had become a stage stop between Prescott, Ariz., and Los Angeles. In 1884 Judge John Guthrie McCallum established the Palm Valley Colony on the site that later developed as a model desert resort. Incorporated as a city in 1938, it includes within its boundaries parts of the Agua Caliente Indian reservation. Palm Springs developed into a glamorous desert resort and residence, frequented by Hollywood film stars and other luminaries. It has luxurious hotels, fashionable restaurants and boutiques, and vast recreation areas for tennis, swimming, hiking, skiing, and especially golf (some 50 golf courses lie within a 20-mile radius). The Joshua Tree National Monument is nearby. Pop. (1988 est.) 31,280.

Palm Sunday, also called SECOND SUNDAY OF THE PASSION, in the Christian tradition, first day of Holy Week and the Sunday before Easter, commemorating Jesus Christ's triumphal entry into Jerusalem. It is associated in the Roman Catholic church (and others) with the blessing and procession of palms (leaves of the date palm or twigs from locally available trees). These special ceremonies were taking place toward the end of the 4th century in Jerusalem and are described in the travelogue *Peregrinatio Etheriae* (*The Pilgrimage of Etheria*). In the West the earliest evidence of the ceremonies is found in the Bobbio Sacramentary (8th century). During the European Middle Ages the ceremony for the blessing of the palms was elaborate: the procession began in one church, went to a church in which the palms were blessed and returned to the church in which the procession had originated for the singing of the liturgy. The principal feature of the liturgy that follows the procession is the chanting by three deacons of the account of the Passion of Christ (Matthew 26:36–27:54). Musical settings for the crowd parts are sometimes sung by the choir. After the reform of the Roman Catholic liturgy for Holy Week in 1955, the ceremonies were somewhat simplified. In Roman Catholicism the day is now called officially the Second Sunday of the Passion, or Palm Sunday.

In the Byzantine liturgy the Eucharist on Palm Sunday is followed by a procession in which the priest carries the icon representing the events being commemorated. In the Anglican churches some of the traditional ceremonies were revived in the 19th century, but in the majority of Protestant churches the day is celebrated without ritual ceremonies.

Palma, in full PALMA DE MALLORCA, capital of the Balearic Islands comprising Baleares *provincia* and *comunidad autónoma* ("autonomous community"), Spain, in the western Mediterranean Sea. The city lies on the southwestern coast of the Bay of Majorca in the centre of the island of Palma, which is 10 miles (16 km) wide. Little is known of Palma before 123 BC, when the Romans conquered Majorca, making the archipelago a Roman province. Attacked by the Vandals in the 5th century, it became part of the Byzantine Empire a century later. In the 8th century it fell to the Arabs, and in 1229 it was conquered by James I of Aragon. On his death it became independent but was again incorporated into Aragon by Peter IV in the 14th century. In 1469 it became part of the Spanish monarchy upon the marriage of Ferdinand II of Aragon and Isabella I of Castile.

The old quarters of Palma have many notable homes built in the 16th and 18th centuries. Historic buildings include the Gothic cathedral (1230–1601); Bellver Castle (14th century), on the hill of the same name; La Lonja (early 15th century), the former exchange, now a museum; Almudaina Palace (restored in the 12th and 16th centuries), former residence of the Arab dynasty, and now the captain general's headquarters; the Consulate of the Sea (Consulado del Mar; 17th century); the bishop's palace (17th century); and the town hall (16th century) housing the archives of the old kingdom of Majorca. The modern city, with its fine buildings, promenades, and gardens, stretches along the coast for 7 miles (11 km). Palma's cultural facilities include a section of the University of Barcelona and art museums and galleries.

The city's economy is varied, with tourism and the manufacture of furniture, footwear, and fabrics as the most important factors.

Palma's many craftsmen produce embroidery, pottery, artistic glasswork and ironwork, palmetto and raffia basketwork, and olive woodcarving. Palma is linked to the mainland by frequent air and steamer services. Pop. (1982 est.) 319,620.

Palma, Jacopo, original name JACOPO NEGRETI, also called PALMA VECCHIO (b. *c.* 1480, Serinalta, Republic of Venice—d. July 30, 1528, Venice), Venetian painter of the High Renaissance, noted for the craftsmanship of his religious and mythological works. He may have studied under Giovanni Bellini, the originator of the Venetian High Renaissance style.

Palma specialized in the type of contemplative religious picture known as the *sacra conversazione* (a group of historically unrelated sacred personages grouped together). To his late 15th-century subject matter he applied the idyllic vision of Giorgione in colour and fused soft-focus effects. Palma's particular refinement of the Giorgionesque technique was his use of transparent glazes, most of which later deteriorated. Monumental figures, loose technique, and blond tonality characterize his finest work, such as the "Sta. Barbara Altarpiece" (*c.* 1510; Sta. Maria Formosa, Venice). Palma developed an ideally feminine, blonde, pretty type, which may be seen in such works as the "Three Sisters" (Staatliche Kunstsammlungen, Dresden). This work, along with many of his later paintings, shows the influence of Lorenzo Lotto. Sixty-two of Palma's works remained unfinished at his death and were finished by his pupils. Presumably this accounts for the variable quality of his work.

Palma, Ricardo (b. Feb. 7, 1833, Lima—d. Oct. 6, 1919, Lima), Peruvian writer best known for his collected legends of colonial Peru, one of the most popular collections in Spanish-American literature.

At the age of 20 he joined the Peruvian Navy and in 1860 was forced by political exigencies to flee to Chile, where he devoted himself to journalism. Six years later he returned to Lima to join the revolutionary movement against Spain. He also took part in the War of the Pacific (1881) and during the Chilean occupation courageously protested against the wanton destruction of the famous National Library by Chilean troops. After the war Palma was commissioned to rebuild the National Library; he remained its curator until his death. In 1887 he founded the Peruvian Academy.

Palma's literary career began in his youth with light verses, romantic plays, and translations from Victor Hugo. His *Anales de la inquisición de Lima* (1863; "Annals of the Inquisition of Lima") was followed by several volumes of poems. His fame derives chiefly from his charmingly impudent *Tradiciones peruanas* (1872; "Peruvian Traditions")—short prose sketches that mingled fact and fancy about the pageantry and intrigue of colonial Peru. His sources were the folktales, legends, and racy gossip of his elders, in addition to historical bits gleaned from the National Library. The first six volumes of this series appeared between 1872 and 1883; they were followed by *Ropa vieja* (1889; "Old Clothes"), *Ropa apolillada* (1891; "Moth-Eaten Clothes"), *Mis últimas tradiciones* (1906; "My Last Traditions"), and *Apéndice a mis últimas tradiciones* (1910; "Appendix to My Last Traditions").

Palma Soriano, city, central Santiago de Cuba province, eastern Cuba. Lying on the Río Cauto, on the northern slopes of the Sierra Maestra, Palma Soriano is a commercial and manufacturing centre for the agricultural and pastoral hinterland, which yields sugarcane, cacao, coffee, corn (maize), fruits, and cattle. Coffee, soft drinks, and furniture are the main industrial products. Manganese is found in the vicinity. Palma Soriano is on the central highway and a major railroad and has an airfield. Pop. (1981) 56,389.

Palmares, Republic of, autonomous enclave in Alagoas state in northeastern Brazil during the period 1605–94; it was formed by the coalescence of as many as 10 separate communities (called *quilombos* or *mocambos*) of fugitive black slaves. The state owed its prosperity to abundant irrigated agricultural lands and to the abduction of slaves from Portuguese plantations. (In Palmares, captured slaves remained in bondage, but runaways became free citizens.)

By the 1690s Palmares numbered 20,000 inhabitants, ruled according to a melange of Central African norms by an elected chief called Ganga Zumba ("Great Lord") who allocated landholdings, appointed officials (usually his own relatives), and resided in a fortified royal enclave called Macoco. Between 1680 and 1686, six Portuguese expeditions attempted to conquer Palmares and failed. Finally the governor of Pernambuco engaged an army of *bandeirantes* under the command of Domingos Jorge Velho, who defeated a *palmarista* force led by a nephew of the last of Palmares' five rulers, on Feb. 6, 1694, putting an end to the republic.

Palme, (Sven) Olof (Joachim) (b. Jan. 30, 1927, Stockholm—d. Feb. 28, 1986, Stockholm), prime minister of Sweden (1969–76, 1982–86), prominent leader of the Swedish Social Democratic Workers' Party (Sveriges Socialdemokratiska Arbetar Partiet), Sweden's oldest continuing party. He became Sweden's best-known international politician.

Born into a wealthy Stockholm family, he studied at Kenyon College, Ohio, U.S. (B.A., 1948), and at the law faculty of Stockholm University, obtaining a law degree in 1951. An active member of the Social Democrats from the early 1950s, Palme became Prime Minister Tage Erlander's personal secretary in 1953 and entered the Swedish Parliament in 1958. Palme joined the Social Democratic government in 1963 as minister without portfolio. In 1965 he advanced to the post of minister of communication and in 1967 to the dual post of minister of education and ecclesiastical affairs. He succeeded Erlander as party secretary and as prime minister in 1968. Soon afterward his attacks on U.S. war policy in Vietnam and his acceptance of U.S. Army deserters who sought refuge in Sweden led to strained relations between his country and the United States. (He denied the deserters official political refugee status, however, saying that one could not be a refugee from a free country.)

The 1976 general election resulted in the defeat of the Social Democrats after 44 years in power. Between terms in office Palme continued to be active in his party and maintained his strong pacifist stance. He served as president of the Nordic Council from 1979 to 1980, chaired the Independent Commission on Disarmament and Security in Geneva, and acted as UN special envoy to mediate in the war between Iran and Iraq. After his 1982 election Palme tried to reinstate Socialist economic policies in Sweden, and he continued to be outspoken on matters of European security. He was assassinated by a gunman in 1986.

Palmela, Pedro de Sousa Holstein, duque de (duke of), also called (1812–23) CONDE (count) DE PALMELA, or (1823–33) MARQUÊS (marquess) DE PALMELA (b. May 8, 1781, Turin, Piedmont—d. Oct. 12, 1850, Lisbon), Portuguese liberal statesman and supporter of Queen Maria II.

He was born abroad during his father's tour of duty in the diplomatic corps. His family, and particularly his mother, had suffered from the Marquês de Pombal's despotism. Educated abroad and at Coimbra, Port., Palmela entered the army in 1796 and the foreign service in 1802. He was a friend of Madame de Staël and of Alexander von Humboldt and campaigned with Wellington in the Peninsular War. Palmela represented Portugal in Rome (1802), Spain (1810), and Great Britain (1812). With the title of count (from 1812), he also took part in the Congress of Vienna. In 1817 he was appointed Portuguese minister of foreign affairs, but it was only in 1820 that he arrived in Rio de Janeiro, where the court then was, so that he did not serve long. He returned to Portugal with King John VI in 1821 and was created a marquess in 1823. In later years he was for short periods minister of foreign affairs again (1835), president of the chamber of peers (1841), and prime minister (1842 and 1846).

A moderate liberal along British lines, he urged John VI to embrace constitutionalism. Having allied himself with the Liberals on John VI's death (1826), Palmela stalwartly identified himself with the movement that in 1834 put Maria II on the throne; and it was largely thanks to his subsequent efforts that she remained queen. Duke of Palmela from 1833, he was active in politics and diplomacy almost until his death.

Palmer, city, southern Alaska, U.S., on the Matanuska River. Established *c.* 1916 as a station on the Matanuska branch of the Alaska Railroad, it was supposedly named for George Palmer, a late 19th-century trader. In the 1930s Palmer became the seat of the Alaska Rural Rehabilitation Corporation, a supply centre for farm families moving to Alaska from the Midwest. The city, 40 mi (64 km) northeast of Anchorage and on a railroad, grew as a market for agricultural products of the Matanuska Valley. It is the site of Matanuska-Susitna Community College. Inc. city, 1951. Pop. (1982 est.) 2,504.

Palmer, A(lexander) Mitchell (b. May 4, 1872, Moosehead, Pa., U.S.—d. May 11, 1936, Washington, D.C.), American lawyer, legislator, and U.S. attorney general (1919–21) whose highly publicized campaigns against suspected radicals touched off the so-called Red Scare of 1919–20.

A devoted Quaker from his youth, Palmer—later nicknamed the "Fighting Quaker"—was educated at Swarthmore College, Swarthmore, Pa. He was admitted to the Pennsylvania bar in 1893, practiced law at Stroudsburg, Pa., and became active in state Democratic Party affairs. He served in the U.S. House of Representatives (1909–15) and played a prominent role in securing the Democratic presidential nomination for Woodrow Wilson in 1912. He ran for the Senate in 1914 but was defeated. Upon U.S. entry into World War I, Palmer was appointed alien property custodian. In 1919 he was named U.S. attorney general by President Wilson. During his two years at that post, he used the Espionage Act of 1917 and the Sedition Act of 1918 as a basis for launching an unprecedented campaign against political radicals, suspected dissidents, left-wing organizations, and aliens. He deported the self-avowed anarchist Emma Goldman and others suspected of subversive activities. On Jan. 2, 1920, government agents in 33 cities rounded up thousands of persons, many of whom were detained without charge for long periods. The disregard of basic civil liberties during the "Palmer raids," as they came to be known, drew widespread protest and ultimately discredited Palmer, who nevertheless justified his program as the only practical means of combating what he believed was a Bolshevik conspiracy to overthrow the U.S. government. Although he lost the Democratic presidential nomination in 1920, Palmer remained active in the Democratic Party until his death, campaigning for, among others, presidential candidates Al Smith and Franklin D. Roosevelt.

Palmer, Arnold (Daniel) (b. Sept. 10, 1929, Youngstown, Pa., U.S.), professional American golfer, the first to win the Masters Tournament (Augusta, Ga.) four times and the first to earn $1,000,000 in tournament prize money. From 1954, when he became a professional, through 1975 he won 61 tournaments sanctioned by the Professional Golfers' Association of America (PGA). As the leading figure in world golf from the late 1950s through the middle 1960s, he attracted a vast following known as "Arnie's Army."

The son of a greenskeeper, Palmer attended Wake Forest (N.C.) University and served in the U.S. Coast Guard. He turned professional

after winning the 1954 U.S. Amateur championship. In addition to his four victories in the Masters Tournament (1958, 1960, 1962, 1964), he won the U.S. Open (1960) and the British Open (1961–62). He won the PGA Senior Open in 1980 and 1981.

An astute businessman, he served as president of the highly successful Arnold Palmer Enterprises and was national spokesman for such companies as Hertz Rent-a-Car and Pennzoil. He also wrote a number of books, either autobiographical or concerned with the techniques of golf.

Palmer, E(dward) H(enry) (b. Aug. 7, 1840, Cambridge, Cambridgeshire, Eng.—d. Aug. 11, 1882, Wādī Sidr, Egypt), English Orientalist, distinguished as a linguist and as a traveler, among whose many translations is a version of the Qur'ān—the sacred scripture of Islām—that, despite some inaccuracies, captures the spirit and poetry of the original.

As a student, Palmer showed remarkable linguistic ability; in 1867 he was elected a fellow in Oriental studies at the University of Cambridge. The following year he joined an ordnance survey expedition tracing the route taken by the Israelites from Egypt through the Sinai Desert to Jerusalem; in 1870 he accom-

panied Charles Tyrwhitt Drake, an explorer, on a further desert exploration. Both journeys he described in *The Desert of the Exodus,* 2 vol. (1871). The same year he published *Jerusalem, the City of Herod and of Saladin,* a Muslim view of the history of the city. He was professor of Arabic at Cambridge during 1871–81. In 1882 he was asked by the British government to enlist the sheikhs' support for the proposed British occupation of Egypt and to take measures ensuring the safety of the Suez Canal. His first mission was successful, but he was ambushed and killed on a second.

Palmer's many publications include *Oriental Mysticism* (1867) and *The Song of the Reed and Other Pieces* (1877), which include translations from the Persian and Arabic as well as original poems.

Palmer, Geoffrey (Winston Russell) (b. April 21, 1942, Nelson, N.Z.), New Zealand Labour Party leader and prime minister of New Zealand for a year in 1989–90.

Palmer was educated at the Victoria University of Wellington (B.A., LL.B.) and at the University of Chicago (U.S.). He worked as a solicitor for a Wellington law firm (1964–66) before turning to teaching, becoming a lecturer in political science at Victoria University of Wellington (1968–69), professor of law at the universities of Iowa and of Virginia (1969–73), and professor of English and New Zealand law at Victoria again (1974–79). After joining the New Zealand Labour Party in 1975, he was elected to Parliament in a by-election in 1979. He became personal assistant to the prime minister Wallace Edward Rowling and soon was deputy leader of the party (1983–89) and deputy prime minister and minister of justice and attorney general (1984–89).

When Prime Minister David Russell Lange, suffering serious setbacks in party loyalties and public opinion, resigned in August 1989, he nominated Palmer as his successor, and party leaders confirmed the choice. One year later, in September 1990, Palmer resigned for virtually the same reasons.

Palmer, Nathaniel B(rown) (b. Aug. 8, 1799, Stonington, Conn., U.S.—d. June 21, 1877, San Francisco, Calif.), American sea captain and explorer after whom Palmer Land, a stretch of western Antarctic coast and islands, is named.

Palmer went to sea at the age of 14. He served first as a sailor on a blockade runner in the War of 1812. He later became a sealer, and his South Sea explorations were largely stimulated by the desire to locate new seal rookeries. Becoming captain of the schooner *Galina* in 1818, Palmer began explorations of the Cape Horn region and western Antarctic the following year. On these and subsequent voyages he discovered the Gerlache Strait and Orleans Channel in Antarctica as well as the South Orkney Islands.

From 1822 to 1826 he engaged in trade on the Spanish Main and helped to transport troops and supplies to Simón Bolívar during the war of South American independence. Throughout much of his career Palmer displayed a keen interest in shipbuilding and helped to design packets (passenger boats), pleasure yachts, and clipper ships.

Palmer, Potter (b. May 20, 1826, Albany county, N.Y., U.S.—d. May 4, 1902, Chicago, Ill.), American merchant and real-estate promoter who was responsible for the development of much of the downtown district and the Lake Shore Drive area of Chicago after Chicago's great fire of 1871.

Palmer started as a clerk in a general store in Durham, N.Y. He was store manager in two years and opened his own dry-goods store the following year (1847) in Oneida, N.Y. In 1852 his father helped supply the capital for Palmer to open a dry-goods store in Chicago. There Palmer developed practices new to retailing at the time, including allowing goods to be returned for either a full refund or an exchange, sending goods to customers on approval, and offering bargain sales. He also stressed advertising and attractive displays of merchandise. In 1867 he sold his share in the business to his partners, Marshall Field and Levi Z. Leiter.

With the money that he had made in retailing, he bought a 0.75-mile (1.2-kilometre) stretch of State Street, at that time an undeveloped lane on the outskirts of downtown, and transformed it into Chicago's major retail thoroughfare. In the great fire of 1871 most of his 32 buildings were destroyed. Borrowing $1,700,000, he built larger buildings than before, including the second Palmer House, a large hotel. Palmer also reclaimed the swampland north of Chicago's commercial district, developing it into the beautiful Lake Shore Drive area.

Palmer's wife, Bertha Palmer, *née* Honoré (b. May 22, 1849, Louisville, Ky., U.S.—d. May 5, 1918, Osprey, Fla.), whom he married in 1871, aided him in his financial dealings and became the social leader of Chicago and a noted philanthropist.

Palmer, Roundell: *see* Selborne, Roundell Palmer, 1st Earl of.

Palmer, Samuel (b. Jan. 27, 1805, London, Eng.—d. May 24, 1881, Redhill, Surrey), English painter and etcher of visionary landscapes who was a disciple of William Blake.

Palmer's father, a bookseller, encouraged him to become a painter. By 1819 he had already exhibited small landscape studies at the Royal Academy. The works that survive from 1819 to 1821 are able but conventional. In the following years, however, there are signs of a profound change in his thinking, perhaps connected with his conversion from the Baptist faith to a personal form of High Anglicanism and with his discovery of medieval art.

A sketchbook of 1824 (British Museum), rediscovered in 1956, already shows all the elements of his visionary style: a mystical but precise depiction of nature and an overflowing religious intensity, united by a vivid recreation of the pastoral conventions. In October 1824 the painter John Linnell took him to see William Blake, who encouraged Palmer in the mystical direction he was taking and provided examples of his own work for Palmer to follow. Blake's influence can be seen clearly in the "Repose of the Holy Family" (1824–25) and the series of sepia drawings of 1825.

In 1826 Palmer visited Shoreham in Kent, and the following year he settled there. His Shoreham paintings became more naturalistic but were still charged with visionary intensity. The years 1827–30 were his most productive, but after 1830 his work shows unmistakable signs of artistic decline. As his religious fervour faded, the precarious balance between realism and vision was lost. He left Shoreham for London in 1834, and expeditions to Wales and Italy confirmed the break with his own past.

Palmer's real forebears are writers rather than painters. He read with enthusiasm the writings of the German mystic Jakob Böhme, the pastoral poems of John Milton, and above all the works of John Bunyan, whose "Countrey of Beulah" is the nearest equivalent to Palmer's "Valley of Vision."

Palmer, (Edward) Vance (b. Aug. 28, 1885, Bundaberg, Queen., Australia—d. July 15, 1959, Melbourne, Vic.), Australian author of novels, short stories, and plays whose work is noted for disciplined diction and frequent understatement. He is considered one of the founders of Australian drama.

Born and educated in Queensland, Palmer published his first work in English magazines when he was only 17 years old. Two years later he went to London to become a writer, meeting with some success. He returned, however, by way of Finland, Russia, Siberia, and the East and spent several years working at a variety of jobs in the Australian outback. He next took up writing again, traveling to London and the United States, then serving with Australian forces during World War I. From 1922 to 1926 he and his wife, Nettie (*née* Janet Higgins, also a writer), helped organize the Pioneer Players, a theatrical company in Melbourne specializing in Australian drama.

Of his novels, *The Passage* (1930), set in the Caloundra area of Queensland, is considered the best. It describes the life of a family and the subtle links between its members and their environment. *Golconda* (1948) describes the conflict between miners and management in the Mount Isa area of Queensland; it is the first volume of a political trilogy that includes *Seedtime* (1957) and *The Big Fellow* (1959). He also wrote several plays on political themes. His short stories have been collected in four volumes: *Separate Lives* (1931); *Sea and Spinifex* (1934); *Let the Birds Fly* (1955); and *The Rainbow Bird* (1956). He also wrote two volumes of balladlike poetry, of which *The Forerunners* (1915) is considered the best, and several volumes of essays and literary criticism.

Palmer Archipelago, also called ANTARCTIC ARCHIPELAGO, island group off the northwestern coast of the Antarctic Peninsula, from which it is separated by Gerlache and Bismarck straits. The archipelago, which includes the islands of Anvers (46 miles [74 km] long by 35 miles [56 km] wide), Liège, Brabant, and Wiencke, was discovered in 1898 by the Belgian explorer Adrien de Gerlache. Argentina and the United Kingdom have operated research stations in the islands, which are claimed by both these countries and Chile.

Palmer Land, broad southern part of the Antarctic Peninsula, about 400 miles (640 km) east of Peter I Island (in the Bellingshausen Sea), claimed by Britain as part of the British Antarctic Territory. It is named after its discoverer, Nathaniel Palmer, captain of a U.S. sealing vessel, who led an expedition to Antarctica in 1820. Palmer Land is mountainous, attaining elevations varying between 6,600 and 13,800 feet (2,000 and 4,200 m), and covered by thick glaciers except for its most precipitous peaks and cliffs, some of which form stretches of the coastline along the Weddell Sea. A number of minerals have been identified in Palmer Land, including magnetite, hematite, limonite, chalcopyrite, pyrite, and azurite, and traces of gold and silver have been discovered. The Siple research station (U.S.) is located in Palmer Land.

Palmerston (of Palmerston), Henry John Temple, 3rd Viscount, BARON TEMPLE OF MOUNT TEMPLE, byname PAM (b. Oct. 20, 1784, Broadlands, Hampshire, Eng.—d. Oct. 18, 1865, Brocket Hall, Hertfordshire), English Whig-Liberal statesman whose long career, including many years as British foreign secretary (1830–34, 1835–41, 1846–51) and prime minister (1855–58, 1859–65), made him a symbol of British nationalism.

Lord Palmerston, *c.* 1860

Early life. The christening of Henry John Temple in the "House of Commons church" of St. Margaret, Westminster, was appropriate. His father, a cultured grand seigneur and dilettante politician, failed in his ambition to convert his Irish peerage into a United Kingdom peerage, which would have condemned his son (known as Harry) to a seat in the House of Lords. Instead, with a break of less than a year (in 1835), Harry Temple was to sit in the Commons from 1807 until he died as prime minister on the eve of his 81st birthday. After two years in Italy and Switzerland with his family, young Temple went to Harrow School in May 1795. Its classical curriculum was supplemented by French, Italian, and some German from a tutor brought home from Italy. In November 1800, Temple entered the University of Edinburgh.

In April 1802 Temple succeeded to his father's title and estates as 3rd Viscount Palmerston and to a burden of debt that conspired, along with a sense of public duty, to make him seek public office; the fact was, he could never afford to be out of office long. He soon began to extend and embellish the house and gardens of Broadlands in Hampshire and, from the mid-1820s, improved his Irish estates in County Sligo. Having survived a youth of ill health, he later displayed a rare stamina, cultivated by regular exercise. Entering St. John's College, Cambridge, in October 1803, Palmerston was still an undergraduate when he contested the vacancy in the university parliamentary representation resulting from the death of William Pitt in January 1806. He lost then and again in the general election of 1807, but he sat for the University of Cambridge from 1811 to 1831.

Political life, 1807–30. Only after being made a junior lord at the admiralty in the Tory government of 1807 did Palmerston become a member of Parliament by a transaction with the patron of the pocket borough of Newport, Isle of Wight. Studious at Cambridge, though no recluse, the young junior minister was thought a bit of a prig. As he passed into middle age 20 years later, he was thought of politically as a dull dog; for, after refusing the chancellorship of the Exchequer from the prime minister Spencer Perceval in 1809, he took the office of secretary at war. The office was humdrum, and its parliamentary duties were light. He rejected the post office in 1821 because it would have taken him to the House of Lords; and he resisted other offers because they would have taken him to Dublin, the Caribbean, or Calcutta. Palmerston would not forgo the delights of the London society centring on Almack's social club, the three principal hostesses of which—Lady Jersey, the Princess Lieven, and Lady Cowper (whom he married in 1839 after she was widowed)—were all probably his mistresses; he was known widely as "Lord Cupid." Because in 1827 the ultra-Tories refused to serve under Canning, Palmerston at last reached the Cabinet. But the offer of the Exchequer by Canning was withdrawn, and it was as secretary at war that Palmerston sat in the cabinets of George Canning, Viscount Goderich, and the Duke of Wellington.

Known initially as a Pittite and condemned by Radicals as a follower of Viscount Castlereagh, who was hostile to civil liberties, Palmerston acquiesced in the switch from unmoving resolution to "Liberal Toryism" over which Lord Liverpool presided in 1821–23. But Palmerston was not an intimate of Canning and his follower, the financier and statesman William Huskisson, nor of Sir Robert Peel. Only after Canning's death, when Palmerston applauded "the great strides which public opinion has made in the last few years," could he be considered a Canningite. As such, he resigned, reluctantly, when Wellington drove Huskisson out of office in mid-1828; but he never closed the door to overtures from Wellington. He had owed his return to the Cambridge seat in Parliament in 1826 to the Whigs—he was opposed by two ministerial colleagues hostile (as he was not) to Catholic Emancipation—and of the Whigs who sat with him in the cabinets of Canning and Goderich, he said that he liked them much better than the Tories and agreed with them much more. Palmerston, whose maiden speech in February 1808 had been a defense of a British attack on the Danish fleet to deny it to Napoleon, became in Cabinet entranced with foreign affairs and adopted a position on events in Greece and Portugal in advance of the other Canningites. This he made public in the House on June 1, 1829, when he complained that Wellington had made Britain the keystone of the arch of European absolutism. The circulation of his speech as a pamphlet indicates that Palmerston had decided to play for high political stakes. By interrogating the Tory government from a Whiggish point of view all through 1830 and by rejoicing at the Paris revolution of that year, he qualified himself to become foreign secretary when Wellington's resistance to all parliamentary reform led to the creation of a Whig-Canningite coalition under Earl Grey.

Views on liberalism and conservatism. The Reform Bills of 1831 and 1832 were more considerable than Palmerston liked, and he tried to modify them. Failing, he blamed "the stupid old Tory party" for making them necessary by refusing minor concessions, emphasized the "final" nature of the 1832 Act, and proclaimed his confidence that the landed interest would continue to prevail in politics as he thought it should. From 1849 to 1865 he came to personify the opposition of the landsmen and many of the middle classes to the enfranchisement of trade unionists and to resist fiscal and legislative assaults on landed property, opining (with regard to Ireland) that "tenant right was landlord's wrong." After one term (1832–35) as member for South Hampshire, he was defeated; and for the rest of his life he represented the Devon market town of Tiverton. A racehorse owner, he combined the conservatism of the countryman with a concern for the expansion of the manufacturer's foreign markets. His standard text was that reform in 1832 had prevented social revolution and that enlightened legislation thereafter was producing social peace. This made him proud of his country and more than ever inclined to exhort foreign autocrats and bureaucrats to behave like sensible Whigs and Canningites.

Palmerston believed that something like the British system of responsible government would be good for all European states and that it would become the norm (as by the first decade of the 20th century it had). No English ministry was doing its duty, he declared, if inattentive to the interests of constitutional states, which were Britain's natural allies. He persuaded himself that "the selfish interests and political influence of England were best promoted by the extension of liberty and civilisation," and even, against the evidence, that constitutional governments would be pro-British. Rebuked for "missionary diplomacy" not intended to lead to action but to inflame international relations, he retorted that ineffective protest was better than tacit acquiescence in wrong and that opinions were mightier than armies. He was charged with "disturbing the peace of Europe by giving encouragement to every revolutionary and anarchical set of men." Yet his opinions on foreign and domestic matters were all of a piece. He did not want democratic or republican, least of all "Red," regimes abroad any more than at home. But he regarded the mission of Lord Minto to the Italian courts, on the eve of the revolutions of 1848, as mediatorial, not inflammatory; its object was to show the rulers of Europe that they should have their minor revolutions, lest worse befall them.

Views on nationalism. Palmerston was a British nationalist; he said that the country had no permanent allies, only permanent interests. The idea that, because he applauded the cause of Liberalism in Europe, he wished to tear up the Treaty of Vienna is nonsense. It was true that he was instrumental in securing confirmation of the independence of Greece and Belgium; but for Polish, Magyar, and Romanian patriotic causes he lifted not a finger. Palmerston was a philhellene; but by the time he became foreign secretary the only question was whether Greece should be a viable size, wholly independent of Turkey and under the surveillance of Britain, France, and Russia. By 1832 he had achieved this objective.

The Belgian revolt of 1830 was a fait accompli, and it had become a British interest to secure Dutch recognition of it without allowing the French to profit by intervening. In this matter, as chairman of the London Conference, Palmerston first showed his diplomatic proficiency. The outcome was an independent constitutional Belgium, with its neutrality guaranteed by the Five Powers in a famous "scrap of paper."

If he wanted Italian federation or unification, it was from no addiction to the national principle in the abstract, and, if he wanted the Austrians out of Italy, it was not primarily because they were illiberal. His view was that Austria had been put into northern Italy in 1815 to provide a barrier against French aggression. Through mismanagement the Austrians had contrived to raise so much "national hatred" against themselves that their presence in Italy was a danger to the general peace, and it was weakening the Habsburg Empire as well. An able speech in Parliament on July 21, 1849, gave the coldest comfort to the Hungarians, against whose bid for independence Austria had to seek Russian aid. Palmerston said, wholly sincerely, that "the political independence and liberties of Europe are bound up . . . with the maintenance and integrity of Austria as a great European Power." Austria was, after all, Britain's natural ally in the Balkans.

Palmerston's fears of France and Russia. Of the great powers, Palmerston felt that only Russia and France might directly threaten British interests, which he interpreted widely and in which he certainly included all the routes to India and the Far East via the Mediterranean; from concern for India sprang Persian and Afghan wars as well as the Crimean War. It was Palmerston's objective never to find France and Russia arrayed together against Britain and to practice the technique of "restraint by cooperation." The France of Louis-Philippe acted for most of the 1830s as Britain's ally, and Palmerston's riposte to Metternich's coalition of the three emperors (of Austria, Prussia, and Russia) at Münchengrätz in 1833 was the 1834 Quadruple Alliance of Britain and France with the constitutional parties in Spain and Portugal. The French, however, became irked at the restraining element in British cooperation and did not see why they should not be as predominant in Spain as the British were in Portugal. Relations, therefore, deteriorated even before there was an open breach in 1839–40 on the Eastern Question (regarding the Ottoman Empire). Palmerston's mobilization of the powers to isolate France and confine Muḥammad ʿAlī Pasha to Egypt gave him (1840) a major diplomatic and parliamentary triumph, achieved amid the doubts, fears, and opposition of Cabinet colleagues.

Relations with France were unnecessarily bad when Palmerston left office in 1841. His condemnation of Lord Aberdeen for appeasing France and the United States also contributed to a feeling in the highest Whig circles that he ought not to return to the foreign office; and his refusal to take any other appointment was made the excuse for the prime minister, Lord John Russell, declining to form a government to repeal the Corn Laws in December 1845. In mid-1846, when Russell did form a government, Palmerston became foreign secretary again. After the revolution in 1848, as in 1830, Palmerston was concerned with both protecting the new French regime and deterring it from going to war. He and the Tsar, both standing for the Treaty of Vienna and the balance of power, saluted one another from the twin rocks that stood amid the revolutionary tide.

The popular hero. In 1848–49 Palmerston was more intent upon preserving the general peace than upon patronizing Liberalism. In 1849–51, however, he won Radical applause for his denunciations of the cruelty of counter-revolutionaries; for his release of British arms to Sicilian insurgents and his later endorsement of William Ewart Gladstone's exposure of King Ferdinand's treatment of political prisoners; by his evident approval of the hostile reception given to the Austrian general Julius, Freiherr von Haynau, when he visited Britain; by his pressure on the Turks; and by his acceptance, when the defeated Hungarian patriot Lajos Kossuth visited Britain, of addresses describing the rulers of Austria and Russia in Kossuthian terms.

This propagandist diplomacy infuriated Prince Albert and embarrassed Cabinet colleagues who, like Queen Victoria, were not kept fully informed. But Palmerston defeated Russell's intention of removing him from the foreign office by a famous dusk-to-dawn speech on July 8, 1850, in which he defended the British bombardment of Athens and the sabotaging of an agreement reached in London with France and Russia over British subjects' claims against Greece. His popularity as "the most English minister who ever governed England" was such that Russell did not dare dismiss him until December 1851, when Palmerston, to stand well with the ruler of France, approved the coup d'etat by which President Bonaparte overthrew the constitution of the Second Republic.

Palmerston at once brought about the fall of the Russell government and might have joined the minority Tory government if the prime minister, Lord Derby, had been willing to abandon his protectionist policies. He served as a reforming home secretary in a Peelite–Whig coalition under Aberdeen, which in 1854 took Britain into the Crimean War against Russia and allied with France in defense of Turkey. His resignation in December 1853, avowedly in opposition to Russell's reform bill, was ascribed to discontent with an infirm diplomacy. A switch to a more belligerent posture was regarded as the price of his immediate return.

Premierships. Under Aberdeen, Palmerston was a more loyal and reasonable colleague than was Russell. When Russell resigned as leader of the House of Commons because he would not oppose a motion for inquiry into the misconduct of the Crimean War, Palmerston succeeded him. With public opinion behind him, Palmerston became prime minister. His attempts to galvanize the war effort and remedy gross defects in many branches of the services were partly nullified by bad appointments at home and in the Crimea. He was pressured by the French to make peace (1856) on terms he thought inadequate but which forced Russia to give up its control of the mouth of the Danube. He submitted to restraints by colleagues in quarrels with the United States, but when the Tory opposition, with Peelites and Cobdenites (followers of the free-trade activist Richard Cobden), narrowly defeated him on the China War, Palmerston confidently appealed to the electors against "an insolent barbarian" at Canton violating British persons and property. The considerable majority achieved in the April 1857 election was a personal triumph, but it melted away when he did not make the lion's roar sufficiently loud in response to French attacks on Britain for harbouring refugees conspiring to murder Napoleon III; and Palmerston's government resigned after defeat in the House (February 1858).

After the election of 1859 denied the Tories a majority, Palmerston resumed the premiership with Russell and the Peelite Gladstone, all being pro-Italian against Austria. This triumvirate ruled until Palmerston died. Palmerston knew that he would be able to rely on the Tories for support if Gladstone resigned and linked himself with the Radical John Bright. Although his determination that Britain "should count for something in the transactions of the world" was successfully challenged by Bismarck in the Schleswig-Holstein affair, 1863–64, Palmerston retained great prestige at home; and on the eve of his death he greatly enlarged the Liberal majority in an election on the cry "Leave it to Pam." It was rightly said, after his death, that "the exceptional sway of Lord Palmerston could not be reproduced by any other statesman, or any combination" and that "the reign of *moderate* Liberalism" was over. He had been a conservative statesman using radical tools and keeping up a show of liberalism in his foreign policy; after him the defense of the Conservative cause would revert to the Conservative Party. Palmerston North, city, southern North Island, New Zealand, overlooking the Manawatu River. The settlement, named after Lord Palmerston, prime minister of England, was founded in 1866 and declared successively a town (1868), a borough (1877), and a city (1930). Junction of road and rail lines to Wellington (87 mi [140 km] southwest) and Auckland (339 mi northwest), it is a communications, commercial, and service centre for the pastoral and mixed-farming Manawatu Plain and its bordering hills. Industries include food processing, printing, brewing; the manufacture of brick, tile, footwear, clothing, fertilizer, and pharmaceutical supplies; general and electrical-engineering works; and motor- and tractor-assembly plants. The Royal New Zealand Air Force jet-engine testing facility, workshops, and aircraft-assembly factory are there. The city has become a university and research centre with Massey University (founded 1926; university status 1963), the New Zealand Dairy Research Institute, and the Palmerston North Medical Research Foundation. Pop. (1983 est.) 61,400.

Palmgren, Selim (b. Feb. 16, 1878, Pori, Fin.—d. Dec. 13, 1951, Helsinki), Finnish pianist and composer who helped establish the nationalist movement in Finnish music.

He studied at the Helsinki Conservatory in 1895 and with Ferrucio Busoni in Germany (1899–1901). In 1909 he became conductor at Turku, Fin., where he produced his opera

Daniel Hjort (in Swedish, 1910; revised in 1929 for performance in Finnish). Palmgren toured widely as a pianist and as accompanist to his wife, the singer Maikki Pakarinen. He taught at the Eastman School of Music, Rochester, N.Y. (1923–26), became a music critic in Helsinki, and taught composition at the Sibelius Academy in Helsinki (1939–51). Palmgren is best known for his small piano pieces, among them the "Finnish Lyric Pieces," inspired by folk songs. In his larger piano works, notably his five piano concerti, he was influenced by Franz Liszt.

Palmira, city, Valle del Cauca department, southwestern Colombia, in the rich Cauca Valley, 3,284 ft (1,001 m) above sea level. Founded in 1688, the city has long been an important agricultural and livestock-raising centre. Now the second largest city in its department, Palmira is referred to as the "agricultural capital of Colombia"; tobacco, coffee, sugarcane, rice, and grain are grown in the area. The city houses an agricultural experiment station and a college of agronomy. Palmira is accessible by the Pan-American Highway and railroad from Cali, the departmental capital, and from other cities in the Cauca Valley. Pop. (1973) 143,092.

palmistry, also called CHIROMANCY, or CHIROSOPHY, reading of character and divination of the future by interpretation of lines and undulations on the palm of the hand. The origins of palmistry are uncertain. It may have begun in ancient India and spread from there. It was probably from their original Indian home that

the traditional fortune-telling of the Gypsies was derived. The chiromantic art has been known in China, Tibet, Persia, Mesopotamia, and Egypt, and it underwent significant development in ancient Greece. Medieval palmistry was pressed into service by the witch-hunters, who interpreted pigmentation spots as signs of a pact with the Devil. After a period of disrepute, palmistry flourished again in the Renaissance. In the 17th century, attempts were made to develop empirical and rational foundations for its basic principles. After a second ebb, during the Enlightenment, it underwent a popular revival in the 19th century with the work of Casimir d'Arpentigny, Louis Harmon (byname Cheiro), and William Benham. In the 20th century, palmistry has received renewed attention and interpretation by, among others, followers of C.G. Jung.

Although there is no scientific support for the contention that the physical features observed in palmistry have psychic or occult predictive meaning, the human hand does show evidence of the person's health, cleanliness, and occupational and nervous habits (*e.g.*, as evidenced by calluses or nail-biting). Hands are routinely examined in medical diagnosis and provide clues with which the palmist may often astound the unsophisticated.

Palmyra, also called TADMUR, TADMOR, or TUDMUR, ancient Syrian city, now in Ḥimṣ *muḥāfaẓah* (governorate), Syria. The name Palmyra is the Greek and Latin form of Tadmur, Tadmor, or Tudmur, the pre-Semitic name of the site, still in use in modern times. Although Tadmur and its inhabitants are mentioned as early as the 19th century BC on a Cappadocian tablet, the city did not attain prominence until the 3rd century BC, when the Seleucids probably made the road through Palmyra one of the routes of east–west trade.

Although at first autonomous, Palmyra came under Roman control at least by the time of the emperor Tiberius (AD 14–37). The emperor Hadrian visited (*c.* AD 129) the city, which thereafter became a *civitas libera* (free city). Later it was granted by Caracalla the title of *colonia*, with exemption from taxes. The 3rd century AD was the great age of Palmyra.

When the Sāsānians supplanted the Parthians in Iran and southern Mesopotamia (AD 227), the road to the Persian Gulf was soon closed to Palmyrene trade. These difficulties plus the instability of the Roman Empire favoured the setting up of the personal rule of the family of Septimius Odaenathus. He was appointed governor of Syria Phoenice by the emperor Valerian, but it was apparently Gallienus (AD 253–268) who conferred on him the title of *corrector totius Orientis* ("governor of all the East"). Both Odaenathus and his eldest son, the heir apparent, were assassinated, however, reputedly at the command of Odaenathus' wife, Zenobia. She governed effectively, and in 270 the armies of Palmyra conquered most of Anatolia (Asia Minor) and Zenobia declared Palmyra's independence from Rome. The emperor Aurelian, however, regained Anatolia and Palmyra in AD 272.

The city remained the chief station on the *strata Diocletiana*, a paved road that linked Damascus to the Euphrates. But in 634 it was taken by Khālid ibn al-Walīd in the name of the first Muslim caliph, Abū Bakr (AD 632–634).

The language of Palmyra was Aramaean; it had two systems of writing: a monumental script and a Mesopotamian cursive—reflecting the city's position between East and West. The great bilingual inscription known as the Tariff of Palmyra and the inscriptions carved below the statues of the great caravan leaders are sources of knowledge of the organization and nature of Palmyra's trade. The Palmyrenes exchanged goods with India via the Persian Gulf route and also with such cities as Coptos on the Nile, Rome, and Doura-Europus in Syria.

The principal deity of the Aramaeans of Palmyra was Bol (probably Baal, Lord). Bol soon became Bel by assimilation to the Babylonian Bel-Marduk, both of whom presided over the movements of the stars: the Palmyrenes associated Bel with the sun and moon gods, Yarhibol and Aglibol. Another heavenly triad formed around the Phoenician god Baal Shamen, the "lord of heaven," more or less identical with Hadad. A monotheistic tendency emerged in the 2nd century AD with the cult of an Unnamed God, "he whose name is blessed forever, the merciful and good."

The ruins at Palmyra clearly reveal the network plan of the ancient city. Along the principal street, oriented east–west, a double portico is ornamented with three nymphaea. To the south are the agora, the Senate House, and the theatre. Other ruins include a vast complex called Diocletian's Camp and the chief Palmyrene sanctuary, dedicated to Bel, Yarhibol, and Aglibol. In architecture the Corinthian order marks almost all the monuments, but the influence of Mesopotamia and Iran is also clearly evident.

Modern Tadmur, at the site of ancient Palmyra, is situated on the Kirkuk (Iraq)–Tripoli (Lebanon) pipeline and at the junction of motor routes through the Syrian Desert. Pop. (1985 est.) 20,627.

Palmyra, town (township), Wayne county, western New York, U.S., on the New York State Barge Canal, 20 miles (32 km) east-southeast of Rochester. Founded in 1789 as a frontier town and named for the ancient Syrian city, the locale is associated with Joseph Smith, whose supposed visions there led to his founding the Church of Jesus Christ of Latter-day Saints (the Mormon Church) in 1830 at Fayette, 28 miles (45 km) southeast. Smith's boyhood Palmyra home (restored) is near Sacred Cove, where his first vision occurred in 1823. At nearby Hill Cumorah, as directed by the angel Moroni, he is said to have unearthed (1827) the Golden Plates from which he translated the *Book of Mormon.* A 40-foot (12-metre) monument to the angel crowns the hill, site of an annual Mormon pageant that takes place for seven nights beginning in late July. The village of Palmyra was separately incorporated in 1819. Dairy and vegetable farms are in the area, and feed, pickles, vinegar, and sauerkraut are processed; mechanical packings and paper boxes are manufactured. Pop. (1986 est.) 3,870.

Palmyra Atoll, formerly SAMARANG, coral atoll, unincorporated territory of the United States, in the Northern Line Islands in the west-central Pacific Ocean, 1,000 miles (1,600 km) southwest of Honolulu. It comprises 50 islets with a combined area of 4 square miles (10 square km) and an average height of only 6 feet (2 m) above sea level. Sighted in 1802 by the American ship *Palmyra,* the island was annexed by the Kingdom of Hawaii in 1862 and by Britain in 1889. By an act of the U.S. Congress in 1898, Palmyra was included with the Hawaiian Islands and was then annexed to them in 1912. During World War II the atoll's central lagoon and joined islets were used as landing strips. When Hawaii became a state in 1959, Palmyra was not included. The atoll, once a producer of copra, is now privately owned but is under the administration of the U.S. Department of the Interior. There are no permanent inhabitants.

Palmyrenian alphabet, Semitic script used in Palmyra, a city on the trade routes between Syria and Mesopotamia, from the 3rd to the 2nd century BC until shortly after the conquest of the city by the Romans in AD 272. Developed from the Aramaic alphabet, Palmyric had 22 letters and was written from right to left. It occurred in two forms: a rounded, cursive form derived from Aramaic about 250 BC and a decorative monumental script developed from the cursive form in the 1st century BC.

Palmyrenian inscriptions have been found in Palmyra, Palestine, and Egypt and elsewhere in North Africa and from as far afield as the Black Sea coast, Hungary, Italy, and England. The earliest surviving Palmyrenian inscription dates from 44 BC; the last dates from AD 274.

Palni Hills, range of hills, an eastward extension of the Western Ghāts, southwestern Tamil Nādu state, southern India. A continuation of the Anaimalai Hills in Kerala state, the Palnis are about 45 miles (70 km) wide and 15 miles (23 km) long. In the south the hills terminate abruptly in steep slopes.

The upper Palnis, in the west, consist of rolling hills covered with coarse grasses; dense forests grow in the valleys. Peaks include Vandaravu, 8,376 feet (2,553 m); Vembādi Shola, 8,221 feet (2,505 m); and Karunmakadu, 8,042 feet (2,451 m). The town of Kodaikānal is located in a high basin averaging 7,000 feet (2,150 m) above sea level. Hill villages cultivate vegetables and fruits such as potatoes, beans, root crops, pears, and peaches. There are also bauxite mines.

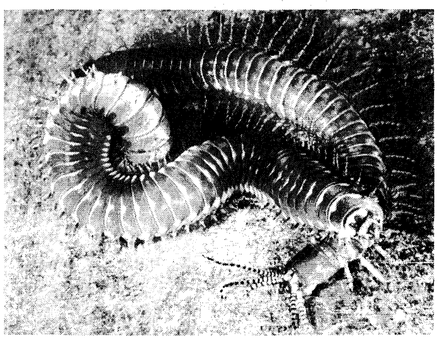
The lower Palnis, in the east, form a confused jumble of peaks averaging 3,000–5,000 feet (900–1,500 m) above sea level and separated by steep wooded valleys. Teak trees have been extensively planted. Important cash crops include coffee, bananas, cardamom, citrus fruit, and turmeric.

Palo Alto, city, Santa Clara county, California, U.S., on the western shore of San Francisco Bay. Gaspar de Portolá's 1769 expedition is said to have camped near El Palo Alto (referring to "the tall [redwood] tree"). The site was developed in 1891 as a "dry" village for Stanford University, and deeds still prohibit liquor sales. The city received its name from Senator Leland Stanford's "Palo Alto" farm. Stimulated by the university and by urban growth of the west bay shore area, Palo Alto developed research-oriented light industries including aerospace, communications, and electronics. Inc. 1939. Pop. (1988 est.) 57,517.

Palo Alto, Battle of (May 8, 1846), first clash in the Mexican War, fought at a small site in southeastern Texas about 9 miles (14.5 km) northeast of Matamoros, Mex. Mexican troops had crossed the Rio Grande to besiege Fort Brown and to threaten General Zachary Taylor's supply centre. General Taylor and his army met the invaders at Palo Alto with superior artillery. Despite the greater numbers and crack cavalry units of the Mexican army, commanded by General Mariano Arista, the Mexicans suffered heavier casualties. Disheartened by their lack of success, they retired the next day to a defensive position farther south.

palo verde (Spanish: "green wood"), any member of the genera *Cercidium* and *Parkinsonia,* of the pea family (Fabaceae), comprising a small group of trees and shrubs scattered through the arid regions of the southwestern United States, Mexico, Central America, and Venezuela. Three species of palo verde are native to the United States; two of them become treelike. Blue palo verde (*C. floridum*) is a bushy tree that grows up to 9 m (30 feet) high, found in desert areas of southern California, Arizona, and northwestern Mexico, including the Baja California peninsula. It is usually a short-trunked, intricately branched tree, with smooth, conspicuously green bark and minute leaves that fall after the rainy season. The bright-yellow flowers, borne in clusters, are followed by cylindrical, beanlike pods approximately 7.6 cm (3 inches) long. The blue palo verde is a characteristic woody plant along washes in the Colorado desert. Border palo verde (*C. macrum*), a Mexican tree, grows only as far north as southeastern Texas. It is readily distinguished from the blue palo verde by its flattened, podlike fruits. Mexican palo verde (*Parkinsonia aculeata*) occurs in southwestern Arizona and from Texas to Florida.

palolo worm, any of various segmented marine worms of the families Eunicidae and Nereidae (class Polychaeta, phylum Annelida). The palolo worm exhibits unique breeding behaviour: during the breeding season, always at the same time of year, the worms break in half; the tail section, bearing reproductive cells, separates and swims to the surface, where it releases eggs and sperm.



Palolo worm (*Eunice*)
Jacques Six

Adults of the family Eunicidae are about 40 cm (16 inches) long and are divided into ringlike segments, each with paddlelike appendages bearing gills. Several sensory tentacles grow from the head. A pharynx that may be thrust forward is armed with teeth. Males of this family are reddish brown; females are bluish green.

The palolo worm of the South Pacific (*Palolo siciliensis* [*P. viridis* or *Eunice viridis*]) inhabits crevices and cavities in coral reefs. As the breeding season approaches, the tail end of the body undergoes a radical change. The muscles and most of the organs degenerate, and the reproductive organs rapidly increase in size. The limbs on the posterior segment become more paddlelike. After the animal backs part way out of its tubelike burrow, the posterior section breaks free and swims to the surface as a separate animal, complete with eyes. The anterior end, still attached to its tube, regenerates a new posterior end.

The free-swimming section always makes its appearance in the early morning for two days during the last quarter of the Moon in October. Twenty-eight days later, it appears in even greater numbers in the final quarter of the November Moon. At the surface of the sea the sperm and eggs are discharged, and fertilization occurs. Palolo tails, considered a delicacy by the Polynesians, are gathered in vast numbers during swarming.

Widely distributed in the rock coral of the West Indies is the Atlantic palolo (*E. furcata,* or *E. schemocephala*), which swarms during the last quarter of the June–July Moon. The Japanese palolo (*Tylorrhynchus heterochaetus*), also considered a food delicacy, lives in the coastal waters of Japan.

Palomar, Mount, peak (6,126 feet [1,867 m]) in the Cleveland National Forest, southern California, U.S., about 40 miles (65 km) north-northeast of San Diego. The Palomar Mountain State Park (1,887 acres [764 hectares]) extends up the mountain slope, and the Palomar Observatory, one of the Hale Observatories, occupies a 720-acre (290-hectare) plateau at the top and can be reached by the Highway to the Stars. The peak was once called Smith Mountain but reverted to its Mexican name, Palomar (meaning "place of the pigeons"), in 1901.

Palomar Observatory, astronomical observatory located on Mount Palomar, about 40 miles (65 km) north-northeast of San Diego, Calif. The observatory is the site of the famous Hale telescope, a reflector with a 5-metre (200-inch) aperture that has proved instrumental in cosmological research. Built in 1948 and named in honour of the American astronomer George Ellery Hale, this high-magnification telescope was the largest instrument of its kind until 1976. Other important instruments at Palomar include a wide-angle Schmidt telescope, which has a 0.9-metre (36-inch) aperture and 1.2-metre (48-inch) mirror. This instrument was used in the early 1950s to produce the monumental *National Geographic Society–Palomar Observatory Sky Survey,* a star atlas containing photographs of more stars and nebulae than had been cataloged in any previous collection. It was employed again during the mid-1980s for a photographic mapping of the entire sky.

The Palomar Observatory was founded in 1948 by the California Institute of Technology in Pasadena and was operated jointly with the

Mount Wilson Observatory as the Hale Observatories until 1980.

Palomino, colour type of horse distinguished by its cream, yellow, or gold coat and white or silver mane and tail. The colour does not breed true. Horses of proper colour, of proper saddle-horse type, and from at least one registered parent of several light breeds can be registered as Palominos. This colour is popular for pleasure and parade classes. Their type and use depend upon their breeding and training. They may conform to the breed types of several light breeds, such as Arabian or American Quarter horse. Two associations, the Palomino Horse Breeders of America, established in 1941, and the Palomino Horse Association, established in 1936, register Palominos.

Palomino DE CASTRO Y VELASCO, in full ANTONIO ACISELO PALOMINO DE CASTRO Y VELASCO (b. 1655, Bujalance, Spain—d. August 1726, Madrid), Spanish painter, scholar, and author, the last court painter to King Charles II of Spain.

After study at the University of Córdoba, Palomino was a student of the painter Valdes Leal and later Alfaro. In 1688 Palomino was appointed court painter and continued to concentrate on easel work until 1699. Thereafter he assisted Luca Giordano in the fresco decoration of El Escorial and continued to execute numerous large frescoes in churches in Madrid, Salamanca, Córdoba, Granada, and El Paular. Influenced by both Juan Carreño de Mirauda and Claudio Coello, he specialized in elaborate allegorical paintings marked by effects of light and a dignified elegance, as in "St. Michael" (Kansas City, Mo.).

He is most remembered for his writings. *El museo pictórico y escala óptica* (1715–24; "The Pictorial Museum and Optical Scale") consists of two volumes, one on the theory and the other on the practice of painting, together with a collection of the lives of eminent Spanish painters and sculptors and of artists from other countries who worked in Spain. Modeled on Giorgio Vasari's biographies of Italian artists, it is the most valuable source for the history of Spanish painting in the 16th and 17th centuries.

Palta, Ecuadorian Indian ethnolinguistic group that lived in the Andean highlands at the time of the Spanish conquest (16th century). Although the Ecuadorian highlands are still inhabited by persons of Indian descent, the languages, cultures, and tribal affiliations existing at the time of the conquest have disappeared and little is known of them. The Palta language probably belonged to the Arawakan language family. The Palta appear to have moved into the highlands from the tropical forests to the east not long before the conquest. They were mainly farmers who grew corn (maize), potatoes, beans, squash, avocados, and tropical fruits. Settlements were dispersed, each family living on its own farmland; houses were made of mud and thatch. Little is known about Palta crafts, religion, or social structure.

Palu, city, capital of Sulawesi Tengah *provinsi* ("province"), Celebes, Indonesia, located at the mouth of a small estuary on the Makassar Strait and surrounded by hills. It is connected by road with Toboli and Tomini on the eastern coast of the province and with Donggala, Mapida, and Mapaga on the western coast. The population consists mainly of Buginese and Makasarese; Islām is the dominant religion, although there are a few Christians. The majority of Palu's inhabitants are seafarers and traders. Much of the trade is by small craft and is localized along the western coast. Household industries include wood carving, sawmilling, plaiting, and basket and mat making. Small factories process food, and boats are built and repaired. Deep-sea fishing is also economically important. Copra and timber are exported. Pop. (1980) 298,584.

Paludan, (Stig Henning) Jacob (Puggaard) (b. Feb. 7, 1896, Copenhagen—d. Sept. 26, 1975, Birkerød, near Copenhagen), Danish novelist and conservative critic whose work expressed a mistrust—based on the fear of Americanization of European culture—of Danish society and of the generation that followed World War I.

Paludan traveled to Ecuador and the United States after World War I. He was the leading critic of the conservative Copenhagen newspaper *Dagens Nyheder* and was the editor of *Hasselbalchs Kulturbibliotek,* a book series that popularized arts and letters. He translated several books into Danish, most notably Sinclair Lewis' *Dodsworth.* His foremost contribution, however, is that of his novels. *Fugle omkring fyret* (1925; *Birds Around the Light*), *Markerne modnes* (1927; "The Ripening Fields"), and his monumental epic novel *Jørgen Stein,* 2 vol. (1932–33) were among his most widely known and translated works.

Paludan-Müller, Frederik (b. Feb. 7, 1809, Kerteminde, on the Island of Fyn, Den.—d. Dec. 28, 1876, Copenhagen), Danish poet who achieved early acclaim in the Danish Romantic movement for his Byronic epic *Danserinden* (1833; "The Danseuse").

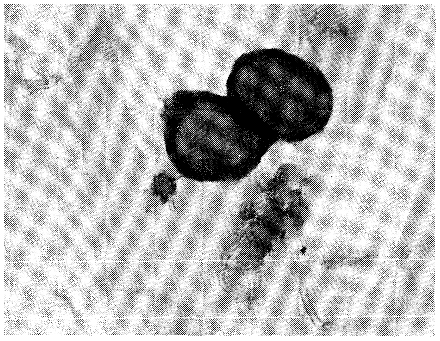
The son of a bishop, he was educated at the University of Copenhagen. Later, after he was rescued from a mental and religious crisis by a happy marriage, he became a moralist and a critic of Romantic values. His *Adam Homo,* 3 vol. (1841, 1848), a lengthy satirical epic in three parts, is counted among the most important works of Danish literature. Its autobiographical hero, Adam Homo, is a worldly success who suffers the loss of his soul. He is saved only by the devotion of his jilted sweetheart Alma. Adam Homo is said to have been Ibsen's model for the character of Peer Gynt.

palygorskite, a fibrous magnesium aluminum silicate. The structure of palygorskite contains extended silicon-oxygen sheets, justifying the retention of the mineral in the layer silicate family, but the tetrahedral SiO_4 groups forming these sheets are oriented in such a manner as to develop extended lathlike features that give rise to the fibrous morphology. The mineral occurs in sediments from playa lakes and saline deposits, in desert soils, and in calcareous material. Attapulgite is a variety of palygorskite found in Attapulgus, Ga. For chemical formula and physical properties of attapulgite, *see* clay minerals (table).

palynology, scientific discipline concerned with the study of plant pollen and spores and certain microscopic planktonic organisms, in both living and fossil form. The field is associated with the plant sciences as well as with the geologic sciences, notably those aspects dealing with stratigraphy, historical geology, and paleontology. Accordingly, the scope of palynologic research is extremely broad, ranging from the analysis of pollen morphology with electron microscopes to the study of organic microfossils (palynomorphs) extracted from ancient coals.



Fossil pollen found in a 6,500-year-old peat bog, used for palynology research
Bruce Iverson

As pollen and spores are produced in large numbers and dispersed over large areas by wind and water, their fossils are recoverable in statistically significant assemblages in a wide variety of sedimentary rocks. Moreover, because pollen and spores are highly resistant to decay and physical alteration, they can be studied in much the same way as the components of living plants. Identification of pollen and spore microfossils has greatly aided delineation of the geographical distribution of many plant groups from early Cambrian time (590,000,000 years ago) to the present.

Important, too, is the fact that the evolutionary sequence of organisms based on the large fossil remains of plants in sedimentary rocks is recorded by the sequence of plant microfossils as well. Such microfossils are thus useful in determining geologic age and are especially important in sediments devoid of large fossils. Because of their abundance and minute size, microfossils can be extracted from small samples of rock secured in drilling operations. Palynological analysis therefore is of practical application to petroleum exploration and to other geologic research involving subsurface sediments and structures.

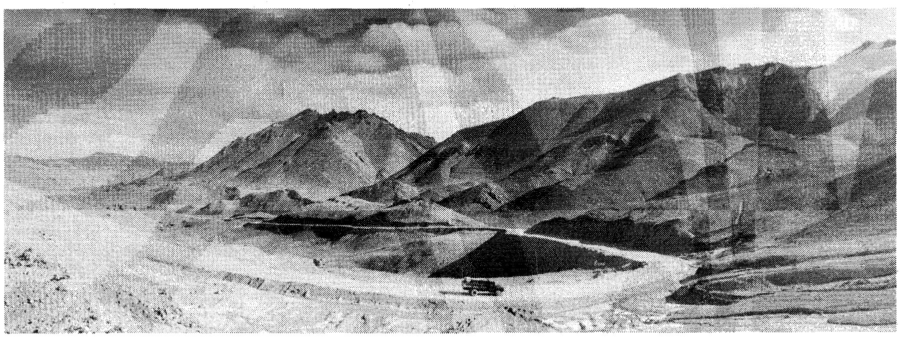
The phases of palynology that deal exclusively with fossils are outgrowths and extensions of techniques and principles developed in the study of peat deposits of northern Europe during the early 1900s. In such research the presence, absence, and relative abundance of the pollen of various species of trees from known depths in the bog were ascertained statistically. Inasmuch as forest composition determines the pollen types trapped on the surface of a bog at any given time, it follows that changes in the pollen content reflect regional changes in forest composition. It was established that alterations in forest makeup were induced by climatic change over the many thousands of years since glacial ice disappeared from northern Europe. A relationship was thus established between the pollen content of the peat, the age (*i.e.*, position in the bog), and climate. Application of such findings proved invaluable in subsequent studies of ancient climate, particularly the glacial and interglacial stages of the Pleistocene Epoch (about 2,000,000 to 10,000 years ago).

pamaquine, synthetic chemical drug introduced into medicine in 1926. It is related to both quinine and quinacrine and is used in treating malaria. It was the first of a series of important antimalarial drugs to be derived from 6-methoxyquinoline, a constituent of the naturally occurring drug quinine.

Pamaquine is a liquid; its solid salt, pamaquine pamoate, was used successfully in the treatment of malaria, although toxic reactions led to its displacement by related but less toxic drugs, such as chloroquine, primaquine, and amodiaquin. Toxic effects include blood diseases such as methemoglobinemia and leukopenia as well as toxic hepatitis.

Pamirs, also called PAMIR, highland region of central Asia, centred in the Gorno-Badakhshan autonomous *oblast* (province) of the Tadzhik Soviet Socialist Republic of the Soviet Union.

A brief treatment of the Pamirs follows. For full treatment, *see* MACROPAEDIA: Asia.



The Osh–Khorog highway through the Pamirs in Tadzhik S.S.R., U.S.S.R.
K. Garenskikh/TASS from Sovfoto

The Pamirs include a combination of east–west and north–south ranges, with the former predominating. The highland covers an area of approximately 3,250 square miles (8,400 square km), bounded on the north by the Trans-Alay Mountains; on the east by the Sarykol Range, which forms the border between China and the Soviet Union; on the south by Lake Zorkul, the Pamir River, and the source of the Pyandzh River bordering Afghanistan; and on the west by the north–south segment of the Pyandzh valley.

In the eastern Pamirs, rounded mountain ranges of medium relief rise from a high foundation and are separated by wide, flat-bottomed valleys. Peaks average 20,000 feet (6,100 m) or more above sea level, but their relative heights above their foundations do not generally exceed 3,300 to 5,900 feet (1,000 to 1,800 m). In the western Pamirs, however, the relief is extreme and sharply disjointed, alternating between low ranges and Alpine ridges capped by glaciers and cut by deep, narrow ravines with high, rapid rivers. Communism Peak in the Academy of Sciences Range rises to 24,590 feet (7,495 m) in the northwest, the highest point in the system and in the Soviet Union.

The majority of the region's rivers, most notably the Pyandzh and the Pamir, drain toward the basin of the Amu Darya (river), which flows into the Aral Sea; a few rivers contribute their waters to the Tarim Basin. The climate of the Pamirs is arid and continental, characterized by very low amounts of precipitation and snow coverage and great variations in temperature. These climatic features are more pronounced in the eastern ranges, and, as a result, only low-growing plants survive the severe conditions of the cold, high mountain desert. The vegetation of the western ranges is richer, especially along the river valleys at lower elevations, where dense willow, birch, and poplar forests grow. Among the sparse wildlife are the *arkhar* (a mountain sheep) and the *kiik* (a mountain goat).

In the sparsely populated Pamirs area, which has an average density of only a few persons per square mile, about nine-tenths of the inhabitants are Tadzhiks, who live in the western Pamirs; in the eastern Pamirs live the Kirgiz. Nearly all are peasants whose chief occupation is farming small fields and orchards and raising sheep and goats. There are a few automobile roads through the area, some of which follow ancient caravan routes through mountain passes to China and Afghanistan. However, many routes are accessible only to pedestrians and pack animals. Industry in the Pamirs includes several small hydroelectric power stations, a few small antimony, mercury, and silver mines in the west, and brown coal and salt mines in the east.

Pamlico, Algonkian-speaking Indians who lived along the Pamlico River in what is now Beaufort county, N.C., when first encountered by Europeans. These sedentary agriculturalists were almost destroyed by smallpox in 1696, and in 1710 the 75 survivors lived in a single village. They joined with part of the Tuscarora and other tribes in a war against white settlers (1711–13); at the close of the war those Tuscarora under treaty with the English agreed to exterminate the Pamlico. The surviving remnant were probably incorporated as slaves to the Tuscarora.

Pamlico Sound, shallow body of water along the eastern shore of North Carolina, U.S., separated from the Atlantic Ocean by narrow barrier beaches (the Outer Banks) of which Cape Hatteras is the easternmost. The sound extends 80 miles (130 km) south, then southeastward, from Roanoke Island, and is 8–30 miles (13–48 km) wide. It receives the Tar-Pamlico and Neuse-Trent rivers, while the main inlets from the ocean are Ocracoke and Hatteras. Numerous swans, geese, and ducks nest along the coastal waters, and there is some commercial fishing, especially for oysters. The name is derived from that of an extinct local Indian tribe.

Pampa (fl. 940), South Indian poet and literary figure called *ādikavi* ("first poet") in the Kannada language, who created a style that served as the model for all future works in the Kannada language.

Although Pampa's family had been orthodox Hindus for generations, his father, Abhirāmadevarāya, together with his whole family, was converted to the Jaina faith. True to his rearing, Pampa cared little for material possessions and gave freely of what he had. He esteemed his guru, Devendramuni, and his royal patron, Arikēsarī, highly and lauded both in his writings.

Pampa's great work was the *Ādipurāṇa* ("First [or Original] Scriptures"), in which Jaina teaching and tenets are expounded. Another epic of his creation is the *Pampa-Bhārata* (*c.* 950; Bhārata is both the ancient name for India and the name of a famous king), in which Pampa likens his royal master to the mythical hero Arjuna in the *Mahābhārata* ("Great Bhārata").

Pampa, city, seat (1902) of Gray county, northern Texas, U.S., 55 miles (88 km) northeast of Amarillo. Located in the Texas Panhandle, the city serves as the centre of an oil-producing, wheat-growing, and cattle-raising area. Its economy is based mainly on petroleum, natural gas, chemicals, and related industries. It is headquarters for one of the world's largest producers of carbon black and oil-field equipment. Other economically important activities include meat-packing and clothing manufacturing. Founded in 1888 on the Santa Fe Railroad, it was named for the supposed resemblance of the surrounding prairie lands to the Argentine Pampas. Inc. city, 1912. Pop. (1986 est.) 23,241.

Pampanga River, Spanish RÍO GRANDE DE PAMPANGA, river in Luzon Island, Philippines, rising in several headstreams in the Caraballo Mountains and flowing south for about 120 miles (190 km) to empty into northern Manila Bay in a wide, swampy delta. The Candaba Swamp, covering more than 200 square miles (500 square km) when flooded, has been formed north of the delta where the Angat River joins the Pampanga. Other major tributaries are the Chico Pampanga and the Lubao. There are extensive fishponds and a large-scale irrigation project on the lower course of the Pampanga.

Pampangan, also called KAPAMPANGAN, cultural-linguistic group of the Philippines. The Pampangan, numbering about 1,970,000 in the late 20th century, live principally in the central plain of Luzon Island but also inhabit other portions of the island. Their region, extending north from Manila Bay, has a relatively high population density; there are many tenant farmers and landless workers. Their religion is Christian, predominantly Roman Catholic.

The Pampangan language is closely related to others of the central Philippines, all of which belong to the Austronesian (Malayo-Polynesian) family of languages.

Pampas, the, also called THE PAMPA, Spanish LA PAMPA, vast plain extending westward across central Argentina from the Atlantic coast to the Andean foothills, bounded by the Gran Chaco (north) and Patagonia (south). The name comes from a Quechua Indian word meaning "flat surface." It has a gradual slope from northwest to southeast, from about 1,640 feet (500 m) above sea level at Mendoza to 66 feet (106 m) at Buenos Aires. Apart from a few sierras in the northwest and south, most of the region appears perfectly flat. Several smaller plains in other parts of South America, such as the desert of northern Chile, are also referred to by the term Pampas.

The Argentine Pampas covers an area of approximately 295,000 square miles (760,000 square km) and is divided into two distinct zones. The dry Pampas in the west, which includes most of La Pampa province, is largely barren, with great saline areas, brackish streams, and sandy deserts. The humid Pampas in the east, a much smaller area that includes part of Buenos Aires province, is temperate and well-watered and is the economic heart of the nation and the country's most populated area. The soil consists chiefly of fine sand, clay, and silt washed down toward the Atlantic by the great rivers or blown in dust storms from the west. Cool winds from the south periodically meet warm air from the tropical north, creating violent gales accompanied by heavy rain in the neighbourhood of Buenos Aires. These storms are known as pamperos. Characteristic animals of the Pampas include foxes, skunks, small herds of guanaco, viscachas, bush dogs, and many bird species related to the sparrows, hawks, and waterfowl of the North American prairies.

The region has been transformed since the middle of the 19th century. The Spaniards had introduced cattle and horses but had made no attempt toward land development. The animals were rounded up by gauchos, who were celebrated for their horsemanship, hardiness, and lawlessness. After liberation from Spain (1816) and the pacification of the Indians who roamed the plains, landowners began to employ immigrants (chiefly Italians) to cultivate their estancias (ranches), sowing alfalfa for fodder, corn (maize), and finer pastures. They fenced their lands and imported pedigreed sheep and cattle from Great Britain. Railways were built across the Pampas, the gauchos gradually became peons (labourers), and horses were replaced by tractors. The southeastern area between Mar del Plata and Tandil, being relatively cool and containing much swampy land, was devoted to the breeding of high-grade sheep and cattle, while the western belt (from Bahía Blanca to Santa Fe) was cultivated principally for alfalfa and wheat. Around Rosario, corn (maize) and flax are the chief crops, and some livestock is raised. The vicinity of Buenos Aires has been developed to supply the capital with vegetables, fruit, and milk.

The Pampas served as background in Argentina's gauchoesque literature, including such notable works as José Hernández' *El gaucho Martín Fierro* (1872) and Ricardo Güiraldes' *Don Segundo Sombra* (1926), and also as the theme for a great deal of Argentina's musical folklore.

pampas cat (*Felis colocolo*), small cat, family Felidae, native to South America. It is about 60 cm (24 inches) long, including the 30-centimetre tail. The coat is long-haired and grayish with brown markings which in some individuals may be indistinct. Little is known about the habits of the pampas cat. It is reported to live in thick shrubbery and to hunt birds and small animals at night.

pampas grass (*Cortaderia selloana*), one of more than 20 species of tall, reedlike Central and South American and New Zealand grasses comprising the genus *Cortaderia* (family Poaceae). Female plants bear silvery, plumelike flower clusters about 30 to 90 cm (1 to 3 feet) tall. Pampas grass is cultivated as a lawn ornamental in warm parts of the world.

pamphlet, brief booklet; in the UNESCO definition, it is an unbound publication that is not a periodical and contains no fewer than 5 and no more than 48 pages, exclusive of any cover.

After the invention of printing, short unbound or loosely bound booklets were called pamphlets. Since polemical and propagandist works on topical subjects were circulated in this form, the word came to be used to describe them. Librarians and bibliographers generally classify as a pamphlet any short work, unbound or bound in paper covers. Although the word tract is almost synonymous, it generally describes religious publications.

Pamphlets were among the first printed materials, and they were widely used in England, France, and Germany. The first great age of pamphleteering was inspired by the religious controversies of the early 16th century. In France so many pamphlets were issued in support of the Reformed religion that edicts prohibiting them were promulgated in 1523, 1553, and 1566. In Germany the pamphlet was first used by the leaders of the Protestant Reformation to inflame popular opinion against the pope and the Roman Catholic Church. Martin Luther was one of the earliest and most effective pamphleteers. The coarseness and violence of the pamphlets on both sides and the public disorder attributed to their distribution led to their prohibition by imperial edict in 1589.

The pamphlet was popular in the Elizabethan age, being used not only for religious controversy but also by such men as Thomas Dekker, Thomas Nashe, and Robert Greene for romantic fiction, autobiography, scurrilous personal abuse, and social and literary criticism.

In France didactic and abusive religious pamphleteering gave way to a more flippant and lively writing that satirized the morals of the court and the chief ministers. The pamphlets of Blaise Pascal, known as *Les Provinciales,* raised the form to the level of literature. In England pamphlets gained increasing propagandist influence during the political and religious controversies of the 17th century. They played an important role in the debates between Puritan and Anglican, and king and Parliament in the years before, during, and after the English Civil Wars. At the time of the Restoration in England in 1660, the flow of pamphlets was checked, their range restricted to some extent by newspapers and periodicals. During the Revolution of 1688, however, pamphlets increased in importance as political weapons. The development of party politics gave employment to pamphleteers, including such writers as Joseph Addison, Richard Steele, Matthew Prior, Francis Atterbury, and Jonathan Swift.

The pamphlet continued to have a powerful influence throughout the 18th century. In North America, pre-Revolutionary political agitation stimulated the beginning of extensive pamphleteering; foremost among the writers of political pamphlets was Thomas Paine, whose "Common Sense" appeared in January 1776. After the United States was founded, another wave of pamphleteering was caused by the proposal of a new constitution in 1787. From this material there emerged *The Federalist Papers,* contributions made to the discussion of government by the revolutionary pamphleteers Alexander Hamilton, John Jay, and James Madison. *The Federalist* may also be regarded as marking the end of the era of the political pamphlet; thereafter political dialogue was largely carried on in newspapers, periodicals, and bound books.

Noted pamphleteers of 18th-century France—Voltaire, Jean-Jacques Rousseau, Montesquieu, and Denis Diderot, among others—used pamphlets to express the philosophy of the Enlightenment. These pamphlets were reasoned discourses, though with the arrival of the French Revolution, they once again became powerful polemical weapons. The revolution itself produced many popular anonymous pamphlets, slandering the queen and the nobility and commenting on events. The most complete collection of Revolutionary pamphlets can be found in the Bibliothèque Nationale, Paris. The revolution also occasioned one of the most outstanding English pamphlets, Edmund Burke's *Reflections on the Revolution in France* (1790). It provoked many replies, the most famous of which is Thomas Paine's *Rights of Man* (1791–92).

In 19th-century France, Paul-Louis Courier wrote polemic masterpieces. In England the pamphlet played a part in all political movements of the 19th century. Most notable were pamphlets on Chartism, Irish Home Rule, and the Oxford Movement. At the turn of the century, Fabian Society members George Bernard Shaw, Beatrice Webb, and Graham Wallas propagated political doctrine in a series of pamphlets.

In the 20th century the pamphlet has more often been used for information than for controversy, chiefly by government departments and learned societies.

Pamphylia, ancient maritime district of southern Anatolia, originally a narrow strip of land that curved along the Mediterranean between Cilicia and Lycia, but that under Roman administration included large parts of Pisidia to the north. The Pamphylians, a mixture

of aboriginal inhabitants, immigrant Cilicians, and Greeks, never acquired great political significance and ran the gauntlet of Anatolian conquerors: Phrygians, Lydians, Persians, Alexander the Great and his successors, and, finally, the Romans. In the 1st century BC they joined with Pisidians and Cilicians in piratical raids on Mediterranean shipping. The Pamphylians became largely Hellenized in Roman times and have left memorials of their civilization at Perga, Aspendus, and Side.

Pamplona, city, Norte de Santander department, northeastern Colombia, in the Andean Cordillera (mountains) Oriental at an elevation of 7,503 ft (2,287 m), on the Río Pamplonita. Founded in 1548, it was famed during the colonial era for its mineral production. Though it has been damaged by earthquakes (most severely in 1644 and 1875), much colonial architecture survives. Particularly noteworthy are the cathedral and the former monasteries of San Francisco, Santo Domingo, and San Agustín. The city's industries include textile mills, breweries, and distilleries. Gold and coal are mined in the vicinity. The University of Pamplona was founded in 1960. Pamplona lies on the Pan-American Highway, 45 mi (72 km) southeast of Cúcuta, the departmental capital. Pop. (1973) 32,946.

Pamplona, capital of Navarra province and autonomous community (region), northeastern Spain, on the western bank of the Río Arga in the fertile La Cuenca region, just south of Bayonne, Fr. According to tradition, it was founded in 75 BC by Julius Caesar's rival Pompey (Gnaeus Pompeius Magnus) as a military settlement during his campaign against Quintus Sertorius, leader of a revolt against Rome. The city's first name was Pompeiopolis, or Pompaelo (corrupted by the Moors to Banbalūnah). It was almost derelict after Moorish and Frankish invasions and the final dismantling of its defenses by the Frankish king Charlemagne in 778. Pamplona was made capital of the kingdom of Navarre by Sancho III of Navarre (1000–35), his new foundation being known as the Ciudad de la Navarrería. In 1512 the armies of Ferdinand the Catholic entered Pamplona, and the portion of Navarre south of the Pyrenees was incorporated into Castile. The citadel built by Philip II of Spain in 1571 made Pamplona the most strongly fortified town of the north. After the First Carlist War (1833–39), Pamplona ceased (1841) to be the capital of the Navarre kingdom but became capital of the new Navarra province.

The medieval core of the town, La Navarrería, is dominated by the cathedral, mostly 14th- to 15th-century French Gothic but with Romanesque remnants and a Neoclassical facade. Notable, too, is the Gothic church (13th–14th century) in the old district of San Saturnino or Cernín (*i.e.,* San Saturninu, who traditionally evangelized the city). Other important buildings include the Cámara de Comptos (royal treasury, *c.* 1364); the Casa Consistorial (1741, with Baroque facade); and the Diputación Provincial (Neoclassical) with the Archivo General de Navarra adjoining. The centre of the city, linking old with new, is the porticoed Plaza del Castillo. Pamplona has various museums and institutions of higher education. The University of Navarra was established at Pamplona in 1952.

The city's chief tourist attraction is the Fiesta de San Fermín (honouring St. Fermin, its first bishop), described in Ernest Hemingway's novel *The Sun Also Rises* (1926). Starting on July 6, the eve of the saint's festival, the fiesta lasts until the 14th, with daily bullfights preceded each morning by the famous *encierro* ("enclosing") of the bulls, when they are driven through the streets behind crowds of skillfully dodging men and boys.

Situated in an irrigated cereal-producing area, Pamplona is a flourishing agricultural centre. The city's ancient crafts of wineskin, sandal, rope, and pottery making coexist with the manufacture of kitchenware, liquor, paper, and chemicals, and the milling of flour and sugar. Industrialization has produced a suburban belt of factories and workers' dwellings. Pamplona is important for communications between Spain and France. Pop. (1982 est.) 186,363.

Pan, in Greek mythology, a fertility deity, more or less bestial in form; he was associated by the Romans with Faunus (*q.v.*). Originally an Arcadian deity, his name is a Doric contraction of *paon* ("pasturer") but was com-

monly supposed in antiquity to be connected with *pan* ("all"). His father was generally said to be Hermes; his mother, however, was often named Penelope, probably not the wife of Odysseus but commonly identified with her, and consequently one or another of the characters in the *Odyssey* was sometimes called his father. Pan was generally represented as a vigorous and lustful figure having the horns, legs, and ears of a goat; in later art the human parts of his form were much more emphasized. He haunted the high hills and his chief concern was with flocks and herds, not with agriculture. Like a shepherd he was a piper, and he rested at noon. Pan was insignificant in literature, aside from Hellenistic bucolic, but he was a very common subject in ancient art. His rough figure was antithetical to, for example, that of Apollo, who represented culture and sophistication; hence the story of their musical contest.

Pan, also called PANGUINGUE, card game, expanded form of the game Cooncan, or Conquian, and one of the earliest of the Rummy games. Pan is popular in the western United States, where it is played as a gambling game in many clubs. Eight packs of 40 cards (the 8, 9, 10 not being used) are used, ranking K (high) to A (low). The game is best with 6 or 7 players, although as many as 15 may play. Each player is dealt 10 cards, 5 at a time. The rotation is to the right, as in Cooncan. The remainder of the pack is placed face down on the table to form the stock, and the top card is turned face up beside it to begin the discard pile.

The object of the game is to meld 11 cards. After the deal, players may decide whether to stay in the game or drop the hand; if they drop, they usually must pay a forfeit.

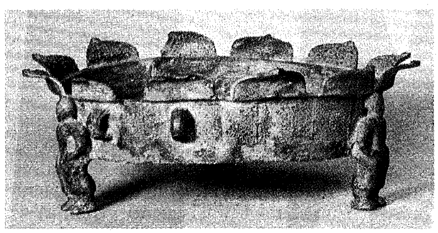
Melds, as in Rummy, are either sequences of three or more cards in the same suit or groups of three or more cards of the same rank. In Pan, groups of aces or kings (noncomoquers) are valid regardless of suits; groups of other ranks (comoquers) must be either all of one suit or all of different suits. Certain melds, called conditions, entitle the player to collect from all other players. Valles, or value cards, are 3s, 5s, and 7s. Conditions and their usual collections are a group of valles of one suit (2 units), a group of nonvalles of one suit (1), low sequence of 3–2–A (1), and high sequence of K–Q–J (1). In some games, conditions in spades collect double.

In play, each player in turn draws one card from the top of the stock or the discard pile. Some rules forbid drawing from the discard pile; others allow it only if the card drawn may be melded at once. After drawing, the player may meld or add (lay off) as many cards as he wishes to his previous melds. Then he must discard one card. When a player has melded all 10 cards of his original hand, he must continue to draw and discard until he can meld or lay off the card drawn.

Players may split or borrow cards from previous melds to form new ones, providing that they leave valid melds. Conditions formed by splitting or borrowing collect as if they were entirely new.

The first player to meld 11 cards wins the deal and collects a previously established sum from all players who did not drop. He also collects from them again for all of his conditions and takes the forfeits of players who did drop.

p'an, Pinyin PAN, type of Chinese bronze vessel produced during the Shang (18th–12th century BC) and, more commonly, during the Chou (1111–255 BC) dynasties. A low bowl



Bronze *p'an,* late Warring States, *c.* 3rd century BC; in the Asian Art Museum of San Francisco, The Avery Brundage Collection

By courtesy of the Asian Art Museum of San Francisco, The Center of Asian Art and Culture, The Avery Brundage Collection or pan used as a serving dish or for ceremonial washing, the *p'an* is generally circular and supported on a low ring base. Sometimes there are two vertical handles, and occasionally there are legs attached to the base.

The bronze *p'an* shape has a Neolithic (*c.* 3000–1500 BC) pottery predecessor. The base and the narrow exterior surfaces of the bowl support a limited series of decorative motifs; the broad, flat interior of the vessel is often used for a more elaborate design or for a long inscription.

Pan-African Congress (PAC), in full (since 1964) PAN-AFRICAN CONGRESS OF AZANIA, also called PAN-AFRICANIST CONGRESS, political organization of South African blacks who joined together to work for majority rule and equal rights. (Azania is an African name for South Africa.)

The PAC was formed in April 1959 as an offshoot of the more moderate and multiracial African National Congress (ANC). The founder and chairman of PAC was Robert Sobukwe, who claimed that the ANC was contaminated by non-African influences. The PAC originally advocated such methods of political pressure as strikes and boycotts. On March 21, 1960, a year after its formation, it sponsored a nationwide one-day protest against the laws requiring blacks to carry passes. Sobukwe and others were arrested.

During one such demonstration, at Sharpeville in the Transvaal, police fired into a crowd, killing 69 Africans and wounding 180. In further response to the demonstration, the government outlawed the PAC (as well as the ANC) as of April 8, 1960. Sobukwe remained in prison or under some form of restriction until his death in February 1978. Some members of the PAC went abroad, establishing centres in London and Dar es Salaam, Tanz. The PAC became involved in armed struggle about 1961, and a number of arrests related to both the armed struggle and the clandestine activities of the PAC and the ANC occurred throughout the late 1960s and the '70s. The PAC cultivated sympathy for the cause in the United Nations, the Organization of African Unity, and the World Council of Churches, while other members remained in South Africa as an underground movement. In 1985 the PAC reiterated its "Africans-only" policy but announced willingness to work with the ANC and other antiapartheid groups. The ban on the organization was lifted early in 1990.

Pan Am Corporation, holding company established in 1984, its chief subsidiary being Pan American World Airways, Inc. The airline was founded in 1927 (as Pan American Airways, a name retained until 1950) and, by the late 20th century, had service to cities in many countries in North and South America, the Caribbean Islands, Europe, Asia, Africa, and the Middle East. Headquarters are in the Pan Am Building in New York City.

The company was incorporated in 1927 by a former World War I naval aviator, Juan Terry Trippe, who secured a contract to fly mail between Key West, Fla., and Havana. The airline's first passenger service—between these cities—began the next year. (One of the employee pilots and a surveyor of new routes was Charles A. Lindbergh.) By the end of 1929 Pan Am had a 12,000-mile (19,000-kilometre) route linking the United States, Cuba, Haiti, Dominican Republic, Puerto Rico, Mexico, British Honduras, Panama, and Colombia. Pan Am inaugurated the first transpacific flights (from San Francisco to Manila) in 1936, with the famous *China Clipper;* the first transatlantic flights (from New York City to Lisbon) in 1939, with the *Yankee Clipper;* and the first round-the-world flights (from New York to New York eastbound) in 1947.

In the late 1970s Pan American competed with Eastern Airlines and Texas International Airlines for control of a major domestic carrier, National Airlines, Inc. In 1980 it won and completed the purchase, giving it an extensive network of routes along the eastern U.S. seaboard and points west. National was formed in 1929, when founder George Theodore Baker (1900–63) began the National Airlines Air Taxi System in Chicago. In 1934 he moved to Florida; in 1937 he reincorporated as National Airlines, Inc.; and in 1944 it became a major airline with the award of the lucrative tourist route between New York and Florida. In 1986 United Airlines, Inc., took over by purchase Pan American's routes to cities in Asia and the South Pacific. Pan American thus largely abandoned its Pacific routes to concentrate on its European, Middle Eastern, and South American traffic.

Pan American's system includes Pan Am Express, Inc., with connecting flights in Canada, the United States, and Europe, and Pan Am Shuttle, Inc., which serves the New York City–Boston and New York City–Washington markets.

Pan-American conferences, various meetings between representatives of some or all of the independent states of the Western Hemisphere (Canada usually excluded). Between 1826 and 1889, several meetings between American states were held to discuss problems of common defense and juridical matters. The First International Conference of American States (1889–90), held largely as the result of the efforts of the U.S. secretary of state James G. Blaine, established the International Union of American Republics (later called the Pan-American Union), with its headquarters in Washington, D.C. Subsequent conferences dealt with such matters of common concern as arbitration of financial and territorial claims, extradition of criminals, codification of international law, copyrights, patents and trademarks, and the status of aliens and diplomatic personnel. The Inter-American Conference for the Maintenance of Peace, held in 1936 at the request of President Franklin D. Roosevelt, at Buenos Aires, adopted a draft treaty for the peaceful resolution of conflicts between American states; conferences held in 1938 (at Lima), 1945 (at Chapultepec in Mexico City), and 1947 (at Quitandinha, near Petrópolis, Brazil) considered the problems of hemispheric defense, reciprocal assistance, and solidarity. The Ninth International Conference of American States, at Bogotá (1948), led by the United States, reconstituted the Pan-American organization as the Organization of American States (OAS). *See also* American States, Organization of.

Pan American Games, Spanish JUEGOS PANAMERICANOS, quadrennial sports event for the nations of the Western Hemisphere, patterned after the Olympic Games and sanctioned by the International Olympic Committee.

The Pan American Games had their inception at a meeting of the Pan American Congress at Buenos Aires in 1940, attended by representatives of the national Olympic committees of 16 countries. Because of World War II, the games scheduled to be held in 1942 were not held until 1951. The first games were held in Argentina. Some 2,000 athletes represented 20 Western Hemisphere nations in a program of 19 sports: athletics (track-and-field), baseball, basketball, boxing, cycling, equestrian events, fencing, gymnastics, pentathlon, polo, rowing, shooting, soccer, swimming and diving, tennis, water polo, weight lifting, wrestling, and yachting. Judo, synchronized swimming, and volleyball were added later.

Pan-American Highway, network of highways connecting North America and South America. Originally conceived in 1923 as a single route, the concept grew to include a great number of designated highways in participating countries. The Inter-American Highway, from Nuevo Laredo, Mex., to Panama City (3,350 miles [5,390 km]), is a part of it.

The Mexican section was built and financed entirely by Mexico, while the sections through the smaller Central American countries were built with U.S. assistance. The whole system, when completed through Chile, Argentina, and Brazil, will total nearly 16,000 miles (26,000 km). In the 1980s a portion about 240 miles (400 km) long, called the Darien Gap highway (located in Panama and Colombia), remained uncompleted.

Pan Ch'ao, Pinyin BAN CHAO (b. AD 32, An-ling, Ku-fang [now Hsien-yang, Shensi province], China—d. 102, Lo-yang, Honan province, China), Chinese general and colonial administrator of the Han dynasty (206 BC–AD 220) who reestablished Chinese control over Central Asia. The brother of the historian Pan Ku (32?–92), Pan Ch'ao early tired of literary pursuits and turned to military affairs. In 73 he was dispatched with a small force on a mission to pacify the Hsiung-nu tribes who had been raiding China's northwestern borders. By playing on the internal dissensions among the tribes, he quickly succeeded. His efforts were frustrated, however, by his recall three years later.

Several years elapsed before Pan Ch'ao was permitted to resume his mission, but he soon had the entire Tarim Basin (in modern Sinkiang Uighur Autonomous Region) under his control. He was made *tu hu* (protector general) of the western regions in 91, and he expanded his conquests across the Pamirs to the shores of the Caspian Sea. Only Parthia (in modern Iran) separated him from the outer reaches of the Roman Empire, and he sent an envoy to contact Roman authorities. The man, however, turned back after reaching the Persian Gulf.

In 102 Pan Ch'ao's sister, Pan Chao, a well-known scholar, successfully petitioned the emperor to allow Pan Ch'ao to return home, where he died a month later. Two of his sons maintained Chinese control in Central Asia for a brief period.

Pan Chao, Pinyin BAN ZHAO (b. *c.* AD 45, An-ling, Ku-fang [now Hsien-yang, Shensi province], China—d. *c.* 115, China), renowned Chinese scholar and historian of the Eastern Han dynasty.

Daughter of a prominent family, she married at the age of 14, but her husband died while she was still young. She never remarried, devoting herself instead to literature and the education of her son. Her father, Pan Piao (AD 3–54), apparently had begun a history of the Former Han dynasty (206 BC–AD 8). After his death, Pan Chao's brother Pan Ku (AD 32?–92) was given a post by the emperor as official historian and was ordered to complete the work. The resulting *Han shu* ("Book of Han") is one of the best-known histories ever written and the model for all future dynastic histories in China. Pan Chao, who assisted her brother with the work during his lifetime, was commissioned by the emperor to complete it after Pan Ku's death.

Because of her reputation as a scholar and an exemplary widow, Pan Chao also was made a lady in waiting to the empress. In 101, while in the palace, she wrote a memorial to the throne that led to the recall of her other brother, the general Pan Ch'ao, to the capital after 30 years of extraordinary military and colonial service in Central Asia. Pan Chao wrote many beautiful poems and essays, the most famous of which is *Nü shih* (106; "Lessons for Women").

Pan-ch'iao, also spelled PAN KIAO, *shih* (municipality) and seat of T'ai-pei *hsien* (county), northern Taiwan, 4 mi (7 km) southwest of Taipei city, in the northern part of the western coastal plain. Situated on the eastern bank of Tan-shui Ho (Tamsui River), it flourished in the early 18th century and is the centre of the agricultural region producing tea, rice, sweet potatoes, and citrus fruits. Pan-ch'iao is on the West Line branch of the Taiwan Railway. Its chief industries are textile production and food canning; coal is mined and clay is extracted nearby. The oriental garden of the Lin-pen Yüan and T'zu Hu (Lake Mercy), about 13 mi southwest of Pan-ch'iao, are tourist attractions. Pop. (1979 est.) 377,523.

Pan-Germanism, German PANGERMANISMUS, or ALLDEUTSCHTUM, movement whose goal has been the political unification of all people speaking German or a Germanic language. Some of its adherents favoured the unification of only the German-speaking people of central and eastern Europe and the Low Countries (Dutch and Flemish being regarded as Germanic dialects). The movement had its roots in the desire for German unification stimulated by the war of liberation (1813–15) against Napoleon I and fanned by such early German nationalists as Friedrich Ludwig Jahn and Ernst Moritz Arndt. Advocates of the Grossdeutschland solution wished also to include the Germans of the Austrian Empire in one German nation. Others wished also to include the Scandinavians. Writers such as Friedrich List, Paul Anton Lagarde, and Konstantin Franz argued for German hegemony in central and eastern Europe—where German domination in some areas had begun as early as the 9th century AD with the *Drang nach Osten* (expansion to the East)—to ensure European peace. The notion of the superiority of the "Aryan race" proposed by Joseph-Arthur, comte de Gobineau, in his *Essai sur l'inégalité des races humaines* (1853–55; *Essay on the Inequality of Human Races,* 1907), influenced many Germans to extol the Nordic, or German, "race."

The Pan-German Movement was organized in 1894, when Ernst Hasse, a professor at Leipzig and a member of the Reichstag (parliament), set up the Alldeutscher Verband (Pan-German League) on the basis of the loosely organized Allgemeiner Deutscher Verband (General German League) founded in 1891. Its purpose was to heighten German nationalist consciousness, especially among German-speaking people outside Germany. In his three-volume work, *Deutsche Politik* (1905–07), Hasse called for German imperialist expansion in Europe. Georg Ruter von Schönerer and Karl Hermann Wolf articulated Pan-Germanist sentiments in Austria-Hungary and also attacked Slavs, Jews, and capitalism. These ideas did much to mold the mind of Adolf Hitler. Under the Weimar Republic (1919–33), Pan-Germanists continued to press for expansion; the most articulate and active force toward that end was Hitler and the Nazi Party. Expansionist propaganda was buttressed by a theory called geopolitics, which made history subject to a kind of geographical determinism. The expansionism preached by Munich professor Karl Haushofer, together with Ewald Banse, author of *Raum und Volk im Weltkriege* (1932), and Hans Grimm, author of *Folk ohne Raum* (1926), was put into practice by Hitler in his annexation of Austria and the German-speaking area of Czechoslovakia and in the demands he made on Poland that led to the outbreak of World War II. Defeat in 1945 not only brought an end to the Third Reich and its European hegemony but also resulted in the expulsion of Germans from formerly German areas of eastern Europe, the loss of a large portion of territory on Germany's eastern frontier, and the division of the remaining German territory into two states. Since then Pan-Germanism has diminished in influence.

pan-hu, Pinyin BANHU, bowed-string instrument of China, especially popular in the northern regions. The bow is threaded between the two strings, which are stretched over a small bamboo bridge resting on a wooden soundboard. It is played in an upright position, and bowing is done close to the top of the resonator. A soprano version tuned a fifth apart and an alto version tuned a fourth apart are popular. The performance of the *pan-hu* is characterized by frequent use of rapid separate bowing and glissandos.

Pan Kiao (Taiwan): *see* Pan-ch'iao.

P'an Ku, Pinyin PAN GU, central figure in Chinese Taoist legends of creation. P'an Ku, the first man, is said to have come forth from chaos (an egg) with two horns, two tusks, and a hairy body. Some accounts credit him with the separation of heaven and earth, setting the sun, moon, stars, and planets in place, and dividing the four seas. He shaped the earth by chiselling out valleys and stacking up mountains. All this was accomplished from P'an Ku's knowledge of yin-yang, the inescapable principle of duality in all things.

Another legend asserts that the universe derived from P'an Ku's gigantic corpse. His eyes became the sun and moon, his blood formed rivers, his hair grew into trees and plants, his sweat turned to rivers, and his body became soil. The human race, moreover, evolved from parasites that infested P'an Ku's body. These creation myths date from the 3rd to the 6th century. Artistic representations frequently depict P'an Ku as a dwarf clothed with leaves.

Pan Ku, Pinyin BAN GU (b. AD 32?, Ch'ang-an, China—d. AD 92), Chinese scholar-official of the Eastern, or Later, Han dynasty and one of China's most noteworthy historians. His *Han shu,* or *The History of the Former Han Dynasty,* became the model most frequently used by later Chinese historians.

Pan Ku was the son of Pan Piao (AD 3–54), an intellectual and antiquarian who was given a court appointment by the Emperor during the early years of the restoration of the Han dynasty. Disliking court life, Pan Piao pleaded poor health and retired, thereafter devoting himself to the independent study of history. He collected material for the continuation of Ssu-ma Ch'ien's great history of China, the *Shih-chi,* which had begun with the earliest dynasties and stopped midway through the Western, or Former, Han dynasty.

After his father's death, Pan Ku continued this historiographical undertaking. In the course of it, however, he was imprisoned for tampering with dynastic records. His twin brother, Pan Ch'ao, an outstanding general who extended China's western frontier to the Pamirs, interceded so successfully that Pan Ku was not only acquitted but was also appointed by the Emperor to the office of official historian.

With all obstacles now removed, he spent the next 16 years compiling and editing the vast *Han shu,* which became the prototype for the official histories of successive ruling houses in China, recording the administrations of their predecessors. Although modelled on the *Shih-chi,* the *Han shu* was not merely a supplement to that long-range work but was a new and comprehensive record of the Han Empire, from its beginning down to the regime of the reformer Wang Mang, who had proclaimed his own short-lived dynasty in AD 9.

Pan Ku went back to the beginning of the Han, duplicating almost verbatim most of the documents Ssu-ma Ch'ien had used for that part of the Han period he had treated, excising redundancies or simplifying the prose that seemed to him awkward or obscure. And, since Pan Ku's own age enjoyed widening education, bureaucratic proliferation, improved writing materials and techniques, and standardized orthography, he had an even larger body of recent records from which to select. Dealing with a period of roughly 200 years, the *Han shu* is much longer than the *Shih-chi,* which purports to cover 3,000 years.

Both Ssu-ma Ch'ien and Pan Ku were court officials, and they inevitably used the official record of the lives of the emperors and their close relatives (and of the often more decisive activities of their civil and military administrators) to form their main chronological narrative. This constitutes Pan's part 1, the basic annals. He adopted Ssu-ma Ch'ien's methods for other parts: part 2, charts and diagrams of events, genealogies, persons, etc.; part 3, treatises on a wide range of topics, such as court ceremony, music, money and taxes, and navigation; and part 4, single or grouped biographies of memorable persons other than emperors. To these subjects he added new ones on natural phenomena, on geography, and on bibliography, a descriptive account of the books preserved in the Imperial library—invaluable to later scholars trying to judge textual authenticity and family lineages after many works had vanished. Pan Ku eliminated Ssu-ma Chi'en's fifth category of "hereditary houses," since China was no longer a collection of competing states.

When the historian felt his task to be essentially completed, he apparently decided to participate more actively in the politics of his day. He had been at least on the periphery of intellectual controversy regarding the interpretation of the Confucian Classics—by no means a mere antiquarian pursuit but one fraught with political implications, as he remarked in one of his few personal observations in the *History.* Editorship of the *Pai-hu t'ung,* or "Symposium in the White Tiger Hall," which deals with this subject, is ascribed to him.

In his middle 40s, however, Pan Ku chose to undertake something more adventurous. Leaving the finishing touches on the *Han shu* to his sister Pan Chao, also an extraordinary scholar (not to be confused with his brother Pan Ch'ao), he joined the staff of the general Tou Hsien and accompanied him in successful campaigns against the northern Hsiung-nu tribes. The following victory inscription composed by Pan Ku was carved in stone 1,000 miles beyond the frontier:

> Our trained soldiery came hither on a campaign against barbarian hordes. We chastised Turkic insolence and restored our supremacy in this distant land. Across these vast plains they went back to their northern home, while our splendid troops set up this trophy that the achievements of our glorious Emperor should be heard of ten thousand generations hence.

The Emperor, however, who was 14 years old and Tou Hsien's nephew, became alarmed at the general's self-importance and, suspecting him of excessive ambitions, exiled him to his own lands. Pan Ku's fate was one common throughout Chinese history; his superior's fall implicated him, and he was incarcerated for interrogation. Falling ill in prison, he died there at the age of 60. His sister duly rounded out the vast *Han shu* manuscript and was officially sanctioned to instruct other scholars on its contents.

For centuries the Chinese have debated the relative merits of the history of the single, self-contained dynasty such as Pan Ku's, and the comparatively rare histories that span the rise and fall of successive hegemonies and systems, which are claimed to reflect more effectively the lessons of history. Obviously, the general historian must build on the work of those dealing with shorter periods, and the two kinds of enterprise cannot be compared qualitatively on the basis of scope. As a historian, Pan Ku must be evaluated on other grounds in relation to his predecessor and to the next great long-range narrator, Ssu-ma Kuang, who wrote more than 1,000 years later. Since both were more inclined to offer interpretations and personal comments, their commentaries appear to be more colourful and sometimes more interesting. Pan Ku, on the other hand, is admired for his thoroughness and his virtually complete objectivity.

Indeed, one might call Pan Ku a historiographer rather than a historian. He undertook simply to represent the Han dynasty and empire as factually as possible through an organized compendium of existing documents; hence the title *Han shu*—literally, "Han Documents."

Pan Ku's prose style, to which he more or less adjusted the documents he incorporated, was simple, lucid, uneccentric, and not especially vivid. It was terse but not lapidary; somewhat more carefully regulated than Ssu-ma Ch'ien's, it was still, probably, not altogether remote from the spoken Chinese of his own day and class. It was a model of what came to be known as the Han style, revived many centuries later in reaction to excessively elaborate prose.

When practicing the dominant literary form of his time, the *fu*, or rhymed prose, however, Pan Ku could be as extravagant, bizarre, and exhibitionistic as others displaying their talents in this fashionable genre. His two rhymed prose compositions on the merits of the successive Han capitals (the new one, of his present masters, of course, winning out) spawned many imitations, especially for their exhibition of unusual words. In a simpler vein he wrote some rather inconsequential verses modelled on the popular folk songs of his day. His name has been attached, spuriously, to a collection of anecdotes and hearsay about the reign of the Han emperor Wu Ti.

P'an-lung-ch'eng, Pinyin PANLONGCHENG, Chinese archaeological site from about the middle of the Shang dynasty period (18th–12th century BC). The site, located near the confluence of the Yangtze and Han-shui rivers in central Hupei, consists of five graves and two storage pits that were first excavated in 1963 and a town wall and palace foundations that were uncovered in 1974.

P'an-lung-ch'eng was an ancient walled town of *hang-tu* construction, covering an area of 850 by 950 feet (260 by 290 metres). Chinese archaeologists have reconstructed its probable layout. There was a large palace, which was a hall in four bays surrounded by a continuous corridor. This is apparently a typical Shang palace type. A wooden coffin found in one of the tombs was incised with an animal mask and designs of thunderclouds. These are the earliest wood carvings yet found in China. Among more than 60 objects also discovered were several bronze axes with cicada and dragon decorations. Buried together with the owner of these were three sacrificed slaves.

Pan Piao, Pinyin BAN BIAO (b. AD 3, Fu-feng, China—d. 54, China), eminent Chinese official of the Han dynasty (206 BC–AD 220) who is reported to have begun the famous *Han shu* ("Book of Han"), considered the Confucian historiographic model on which all later dynastic histories were patterned.

Pan Piao intended the work to supplement the *Shih-chi* ("Historical Records") of the famous historian Ssu-ma Ch'ien (*c.* 145–85 BC) and to cover the period from 104 BC, the last year covered by Ssu-ma. Pan died before the writing was completed, at which point it was taken over by his son Pan Ku. Pan Ku did not live to finish the work, ultimately completed by Pan Piao's daughter Pan Chao, China's most famous woman scholar.

Pan-p'o-ts'un, Pinyin BANPOCUN, one of the most important sites yielding remains of the Painted Pottery, or Yang-shao, culture of late Neolithic China. Located in the northwestern Chinese province of Shensi, Pan-p'o-ts'un was excavated by members of the Chinese Academy of Sciences in 1953 and 1955.

The large Neolithic settlement was situated on a low river terrace and contained multi-shaped clay huts, with floor levels often below the ground. Each hut had an earthen pillar in the middle to support a thatched roof, which was reinforced with clay. All dwellings contained several fireplaces and a number of storage areas. Several kilns were found on the site, as well as a number of fine specimens of coloured red and gray bowls and jars. Some coarse sandy ware decorated with black geometric figures has also been found.

Most of the Pan-p'o-ts'un people's tools were bone, though they also had some polished and chipped stone implements. They were agriculturalists whose primary grain was millet. Bones of pigs, dogs, and sheep have been found around the village, indicating the presence of domestic animals. Children were buried in small urns, adults in rectangular pits.

Pan-Scandinavianism, also called SCANDINAVIANISM, or SCANDINAVISM, an unsuccessful 19th-century movement for Scandinavian unity that enflamed passions during the Schleswig-Holstein crises. Like similar movements, Scandinavianism received its main impetus from philological and archaeological discoveries of the late 18th and the 19th century, which pointed to an early unity. It was also spurred by the rise of Pan-Germanism and by a general fear of Russian expansion. Generally a middle-class and student movement calling for varying forms of cultural and political unity, Scandinavianism was a significant force from 1845 to 1864. It clashed with Pan-Germanism over the Schleswig-Holstein question, and Swedish and Norwegian volunteers joined the Danes during the Schleswig War (1848–50). When Sweden-Norway refused to join Denmark after hostilities over the duchies again erupted in 1864, however, Scandinavianism became bankrupt. Thereafter it remained strong only among the Swedish minority in Finland. There has been a resurgence of Pan-Scandinavian sentiment in the latter part of the 20th century.

Pan-shan (Chinese writer and statesman): *see* Wang An-shih.

Pan-shan ware, Pinyin BANSHAN, type of Chinese Neolithic painted pottery. The name is that of the site in the Kansu Province of North China in which this pottery was found in a grave in 1923. As with all Neolithic ware, the dating is conjectural; but Pan-shan ware is generally considered to date from between 2500 and 2000 BC; some authorities extend the limits as far back as 3000 BC, while others believe them to be as late as the early Shang dynasty, *c.* 1500 BC. Most of the specimens are urns, some quite large; and a few deep bowls have been found. The body is a reddish brown; the decoration, mostly in black pigment probably applied with a brush, consists of geometric patterns or stylized figures of men, fish, and birds; and there is no glaze. Although coiling was common, some of the wares were probably shaped on a slow, or hand-turned, wheel. The handles are set low on the body of the urns, and the lower part of the body is left undecorated—as with most Greek Proto-Geometric funerary ware, to which there is a certain likeness. The paucity of Neolithic Chinese pottery at the time of the discovery gave the find an importance out of proportion to its size. Since the 1950s, however, the large amount of archaeological activity in China has placed Pan-shan in a larger framework of Neolithic Chinese ware.

Pan-Slavism, 19th-century movement that recognized a common ethnic background among the various Slav peoples of eastern and east central Europe and sought to unite those peoples for the achievement of common cultural and political goals. The Pan-Slav movement originally was formed in the first half of the 19th century by West and South Slav intellectuals, scholars, and poets, whose peoples were at that time also developing their sense of national identity. The Pan-Slavists engaged in studying folk songs, folklore, and peasant vernaculars of the Slav peoples, in demonstrating the similarities among them, and in trying to stimulate a sense of Slav unity. As such activities were conducted mainly in Prague, that city became the first Pan-Slav centre for studying Slav antiquities and philology.

The Pan-Slavism movement soon took on political overtones, and in June 1848, while the Austrian Empire was weakened by revolution, the Czech historian František Palacký convened a Slav congress in Prague. Consisting of representatives of all Slav nationalities ruled by the Austrians, the congress was intended to organize cooperative efforts among them for the purpose of compelling the Emperor to transform his monarchy into a federation of equal peoples under a democratic Habsburg rule.

Although the congress had little practical effect, the movement remained active, and by the 1860s it became particularly popular in Russia, to which many Pan-Slavs looked for leadership as well as for protection from Austro-Hungarian and Turkish rule. Russian Pan-Slavists, however, altered the theoretical bases of the movement. Adopting the Slavophile notion that western Europe was spiritually and culturally bankrupt and that it was Russia's historic mission to rejuvenate Europe by gaining political dominance over it, the Pan-Slavists added the concept that

Russia's mission could not be fulfilled without the support of other Slav peoples, who must be liberated from their Austrian and Turkish masters and united into a Russian-dominated Slav confederation.

Although the Russian government did not officially support this view, some important members of its foreign department, including its representatives at Constantinople and Belgrade, were ardent Pan-Slavists and succeeded in drawing both Serbia and Russia into wars against the Ottoman Empire in 1876–77.

When efforts were made in the early 20th century to call new Pan-Slav congresses and revive the movement, the nationalistic rivalries among the various Slav peoples prevented their effective collaboration.

p'an-t'ao, Pinyin PANTAO (Chinese: "flat peach"), in Chinese Taoist mythology, the peach of immortality that grew in the garden of Hsi wang mu ("Queen Mother of the West"). When the fruit ripened every 3,000 years, the event was celebrated by a sumptuous banquet attended by the Pa Hsien ("Eight Immortals").

Hsi wang mu presented the *p'an-t'ao* to favoured mortals such as the Chou-dynasty emperor Mu-wang (10th century BC) and the Han-dynasty emperor Wu-ti (141–87 BC). The first Ming-dynasty emperor (14th century AD) is said to have been presented with a *p'an-t'ao* stone identified, by 10 engraved characters, as formerly belonging to Wu-ti. Flat peaches from Chekiang province were sent each year to the imperial palace in Peking before the founding of the Chinese Republic (1912).

Pan-Turanianism, also called PAN-TURANISM, late 19th- and early 20th-century movement to unite politically and culturally all the Turkic, Tatar, and Uralic peoples living in Turkey and across Eurasia from Hungary to the Pacific. Its name is derived from *Tūrān,* the Persian word for Turkistan (*i.e.,* the land to the north of Iran). It was popular mainly among intellectuals and developed from a now largely discarded theory of the common origin of Turkish, Mongol, Tungus, Finnish, Hungarian, and other languages (the Ural-Altaic languages). In the half-century before World War I, some Hungarians sought to encourage Pan-Turanianism as a means of uniting Turks and Hungarians against the Slavs and Pan-Slavism. The movement was never more than a sidelight, however, to the more important Pan-Turkism.

Pan-Turkism, political movement of the late 19th and early 20th century, which had as its goal the political union of all Turkish-speaking peoples in the Ottoman Empire, Russia, China, Iran, and Afghanistan. The movement, which began among the Turks in the Crimea and on the Volga, initially sought to unite the Turks of the Ottoman and Russian empires against the growing Russian tsarist domination.

In 1883 İsmail Gasprinski, a Crimean Turk, proclaiming the "unity in language, thought and action" of all the Turkish-speaking peoples in the Russian and Ottoman empires, established the Turkish newspaper *Tercüman* in the Russian Crimea. In 1911 Yussuf Aktshura Oghlu founded in Constantinople (Istanbul) a similar paper, *Türk Yurdu* ("The Turkish Homeland"). At the same time, prominent Turkish writers such as Ziya Gökalp and Halide Edib Adıvar, author of the novel *Yeni Turan* (1912; "The New Turan"), glorified the common legendary past and the future of the Turkish race. Their symbol was a she-wolf (*Bozkurt*), regarded as the mother of the race and worshiped before the Turkish conversion to Islām.

During the years 1913–18, when Turkey was involved in a bitter struggle with Russia, Pan-Turkish propaganda was officially promoted by the Ottoman government. In the 1920s and '30s Kemal Atatürk deemphasized Pan-Turkism, instead encouraging Turkish nationalism within Turkey. During World War II, the revival of Pan-Slavism under Stalin and the Russian threat to Turkish autonomy, brought a renewed, though slight, interest in Pan-Turkism among some Turks. The demand for a federation of Turkish states continued after World War II among the Turkish-speaking Islāmic peoples in the Soviet Union.

Panaetius (b. Lindus, Rhodes; fl. *c.* 180–109 BC), the founder of Roman Stoic philosophy, and a friend of Scipio Aemilianus and of Polybius.

A pupil in Athens of Diogenes of Seleucia and of Antipater of Tarsus, Panaetius also studied the philosophies of Plato and of Aristotle. Many years resident in Rome, he was an influential member of the Scipionic circle and was invited to be Scipio's sole companion on an ambassadorial visit to the Orient in about 140 BC. Panaetius succeeded Antipater as head of the school and passed the last 20 years of his life in Athens. While adhering to fundamental Stoic teaching, Panaetius tempered the rigid austerity of the ancient Stoa and introduced a new humanist note. He appears to have written less voluminously than other leading Stoics, and none of the five treatises attributed to him is extant. His important ethical treatise *On the Appropriate* was Cicero's model for the first two books of the *De Officiis.* His chief disciple was Poseidonius of Apamea.

Panaji, also spelled PANJIM, town, capital of Goa state, western India, on the Mandāvi River. It was a tiny village until the mid-18th century, when repeated plagues forced the Portuguese to abandon their capital of Velha Goa (Old Goa, or Ela). Panaji became the capital in 1843. The town contains colonial houses and plazas, and by law all the houses must be whitewashed annually. Chiefly an administrative centre, in the 1970s Panaji also grew in commercial importance, and an

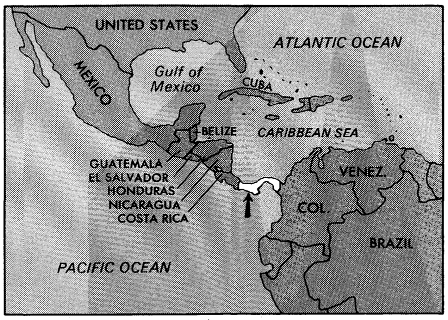
industrial estate was developed nearby. Numerous Portuguese and Marāṭhā ruins can be found in the environs. Pop. (1981) town, 43,-165; metropolitan area, 77,226.

Panama, officially REPUBLIC OF PANAMA, Spanish REPÚBLICA DE PANAMÁ, country of Central America occupying the southernmost extension of the isthmus connecting with the northwestern corner of South America, covering 29,762 square miles (77,082 square km). The capital is Panama City. It is a narrow, curved strip of land, bordered on the north (along a 720-mile [1,160-kilometre] coastline) by the Caribbean Sea, on the east by Colombia, on the south (along a rugged 1,050-mile [1,690-kilometre] coastline) by the Pacific Ocean, and on the west by Costa Rica. The population in 1990 was estimated to be 2,418,000.

A brief treatment of Panama follows. For full treatment, *see* MACROPAEDIA: Central America; Latin America, The History of. For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. The Panamanian landscape consists of three distinct areas: the lowlands, or hot lands, lying at elevations below 2,300 feet



Panama

(700 m), which make up more than 85 percent of the country's territory; the temperate lands, situated at elevations of between 2,300 and 4,900 feet (1,500 m); and the highlands, or cold lands, lying more than 4,900 feet above sea level. The highlands include the inactive Barú Volcano (11,401 feet [3,475 m]), the country's highest peak, located in the central Tabasará Mountain Range; the northeastern mountain arc, including the San Blas and Darién mountains; the southeastern mountain arc; and the southern volcanic chains. The lowlands include the plains near the gulfs of Panamá and Chiriquí, the Bayano and Chucunaque river basins, and the plains of the Caribbean region. On Panama's continental shelf are more than 1,600 islands. Its coasts have many bays, gulfs, peninsulas, and capes.

Panama has approximately 500 rivers, most of which have their sources in the highlands. They include the Tuira, Bayano, Sixaola, Changuinola, Chiriquí Viejo, and Santa María.

Panama has mostly a tropical, rainy climate, with warm days and cool nights throughout the year. Only the savanna area situated on the Pacific coast experiences a marked dry season for part of the year. The annual average temperature on both coasts is about 80° F (27° C), and it ranges from 50° to 66° F (10° to 19° C) in the mountains. The period of heaviest rainfall is from May to December. Rainfall averages more than 117 inches (2,972 mm) a year on the Caribbean coast and 63 inches (1,600 mm) on the Pacific coast. More than one-half of Panama is forested, largely with tropical rain forest. Swamp woods, including mangrove trees, cativo, and orey, are abundant. On the wet Caribbean coast the forest is evergreen, while on the drier Pacific side the forest is partly deciduous. There are at least 2,000 different species of flowering plants, including the Holy Ghost orchid (the national flower). Among the animal life are the giant anteater, bush dog, ocelot, jaguar, Central American tapir, and American crocodile. Panama is generally poor in natural resources, but it has large reserves of copper ore.

The people. In the 16th century, when the Spaniards first colonized the isthmus, Panama was occupied by Cuna, Guaymí, Chocoe (Chocó), and other Indian groups. The mingling of Spaniards with the Indians gave rise to a mestizo population. With the introduction of black Africans, other mixed races developed. North Americans (mainly from the United States), French, and Chinese arrived to work on railroad projects in the 19th century. During the construction of the Panama Canal, more American nationals went to Panama, as did blacks from the Caribbean islands, Spaniards, Italians, and Greeks.

The most numerous of the Indian groups are the Guaymí, who live in the western part of the country. Their language is called *movere,* or the "language of the plains." Next in terms of numbers are the Cuna, who live in the San Blas Archipelago and on the coast nearby, as well as in other parts of the isthmus and along the shores of the Tuira River and its tributaries; they speak the Cuna language. The Chocoe groups live mainly in the eastern one-third of the country. Mestizos are the largest population group in the southwest and central parts of Panama. The Antillean blacks are a small minority who live primarily in Panama City. Spanish is the official language of Panama. Roman Catholicism is the religion of nearly nine-tenths of the population, but the constitution guarantees freedom of worship.

The birth rate is the lowest in Central America, while the death rate is also comparatively low. The annual rate of population growth has declined steadily since the early 1960s, influenced by a decrease in levels of immigration since World War II. Somewhat more than half the population is urban.

Economy. Panama has a market economy based on services, primarily transportation, communications, and storage connected with the Panama Canal, international banking, and tourism. The gross national product (GNP) is growing at about the same rate as the population. The GNP per capita is significantly higher than those found in the rest of Central America.

Agriculture accounts for about one-tenth of the GNP but employs nearly one-third of the labour force. The principal food crops are rice, corn (maize), sugarcane, beans, bananas, and plantains; the country is largely self-sufficient in foods, except for wheat. Bananas, sugar, coffee, and cacao are the principal cash crops and are among Panama's most important exports. Livestock raising is traditionally important. Fishing is a growing industry, with shrimp, lobster, prawns, and fishmeal being important exports.

The mineral industry is of only minor significance to the country's economy. Manufacturing, concentrated in and around Panama City, centres on food products, cement and building materials, petroleum products, clothing, paper products, and furniture. Several large projects, including the 86-mile (138-kilometre) trans-Panama oil pipeline, have stimulated growth in the construction industry. About three-fourths of Panama's electricity is generated from hydroelectric sources and the remainder from imported fuels.

The service sector accounts for about three-fourths of the GNP and employs more than half of the labour force. Since the late 1960s Panama has developed into a major international financial centre, capitalizing on favourable banking laws, good communication and transportation facilities, the absence of exchange controls, and the full transferability of the Panamanian currency, the balboa, with U.S. currency. Service receipts from the Panama Canal are a major contribution to the economy.

Panama's main trading partners, the United States, Mexico, Japan, Germany, and other Latin-American countries, supply fuels and lubricants, machinery and transportation equipment, basic manufactures, chemicals and chemical products, and food products. The Colón Free Zone (Zona Libre de Colón), established in 1953, has become one of the world's largest trading centres, providing warehousing, assembly, and transshipment services. Service exports are of greater importance to the economy than product exports; services to the Panama Canal and the free zone, international banking, and tourism receipts offset the traditionally large deficit in the trade (merchandise) balance.

Government and social conditions. Panama is a civilian republic. The constitution of 1972 originally granted legislative responsibility to a democratically elected National Assembly of community representatives, which met once a year for 30 days. When the assembly was not in session, legislative authority was assumed by a smaller National Legislative Council consisting of members both appointed by the assembly and elected by popular vote. Under a series of constitutional amendments approved in 1983, the National Assembly was abolished, while the National Legislative Council became the fully elected Legislative Assembly consisting of 67 members. The president, who is elected by popular vote and serves a five-year term, selects cabinet ministers and other key officials. The judiciary in Panama is headed by the Supreme Court of Justice. There are two major political parties in Panama—the Democratic Revolutionary Party (Partido Revolucionario Democrático), a left-of-centre, pro-government organization; and the National Opposition Front (Frente Nacional Opositora), a loose coalition of opposition parties.

The government's social-welfare system provides employed persons with sickness and maternity benefits and old-age, disability, and survivor's pensions.

Health conditions in Panama are adequate except in urban slum areas, where tuberculosis is still common. Most residents have access to medical care of some kind; the ratio of doctors to people is significantly higher than that found in the other Central American countries. Panama's infant mortality rate is one of the lowest in Latin America, and life expectancy is about 70 years for males and 74 years for females, which is high by Latin-American standards.

All children must either complete six grades of primary education or attend school through the age of 15. Nearly nine-tenths of primary-school-age children are enrolled in classes. Primary graduates may attend secondary schools, which are divided into two cycles of three years each. The upper cycle awards the *bachillerato,* a degree required for admission to Panama's schools of higher learning, which include the University of Panama (1935) and the University of Santa María la Antigua (1965).

Panamanian music and dance are among the most colourful to be found in the Americas. Panamanians still enjoy the *tamborito,* an African dance that is performed to the accompaniment of drums and handclapping. The nation's most popular folk song is the *mejorana,* which was brought from Spain during the 18th century. There are a number of established cultural institutions.

History. There may have been as many as 750,000 Indians in Panama when the Spanish arrived in 1501, but they were decimated by exploitation, disease, and murder. The first successful Spanish settlement was under the leadership of Vasco Núñez de Balboa (1510–14). He was replaced by Pedro Arias Dávila (Pedrarias) in 1514. In 1519 Pedrarias founded Panama City and moved the administration to the Pacific side of the isthmus. Panama developed into a transshipment centre for both Spanish and colonial goods. The trade fairs that were held at Portobelo until 1748 attracted British pirates who ravaged the Panamanian coast until 1688. In 1751 Panama became a dependency of Santa Fe de Bogotá in Colombia.

Panama proclaimed its independence from Spain in 1821 after Simón Bolívar cleared New Granada (present-day Ecuador, Colombia, Panama, and Venezuela) of Spanish and loyalist forces, but after a few months it voluntarily joined the Colombian union. Three attempts to secede from Colombia in the 1830s met with defeat.

The California gold rush of 1849 brought prosperity to Panama. Many prospectors chose the Panamanian route to California instead of the arduous overland U.S. trail. The U.S.-financed Panama Railway was opened in 1855 and led directly to the founding of the city of Colón. A French company, headed by Ferdinand de Lesseps, was given a concession to build a canal across the isthmus in 1879, but its work came to a halt in 1889.

Between 1850 and 1900 Panama had 40 administrations, 50 riots, 5 attempted secessions, and 13 U.S. interventions. American interest in a canal heightened in the early years of the 20th century, and, when the Colombian Senate put off ratifying a canal treaty, the United States lent its support to a Panamanian separatist movement, recognizing the Panamanian insurrection on Nov. 6, 1903, and concluding the Hay–Bunau-Varilla canal treaty on November 18. The treaty gave the United States control over the Panama Canal Zone in perpetuity, and the completed canal was opened in 1914.

The post-World War II situation was stormy in Panama. Riots were frequent and anti-U.S. sentiment widespread. In 1968 the National Guard staged a successful coup under Colonel Omar Torrijos Herrera, who negotiated the Panama Canal Treaty of 1977. Under the treaty Panama assumed jurisdiction over the former U.S. Canal Zone, but responsibility for operation of the canal itself remained with the United States through 1999.

The political upheaval that characterized much of the late 20th century in Panama reached a crisis point in December 1989 when U.S. troops invaded Panama and overthrew the country's de facto ruler, General Manuel Antonio Noriega, commander of the Panama Defense Forces.

Panama, Gulf of, Spanish GOLFO DE PANAMÁ, inlet of the Pacific Ocean, bordering the southern side of the Isthmus of Panama. It is 115 miles (185 km) across at its widest point and 100 miles (160 km) long. The gulf is relatively shallow and separates the

mountain ranges of western Panama from the beginning of the Colombian Serranía de Baudó. Its western part is indented as Parita Gulf, its northern as the Bay of Panama, and its eastern as San Miguel Gulf. The Pearl Islands (*q.v.*), which have important fisheries, are in the gulf, and Panama City is the main urban centre on the gulf shore.

Panama, Isthmus of, Spanish ISTMO DE PANAMÁ, land link extending east–west about 400 mi (640 km) from the border of Costa Rica to that of Colombia. It connects North and South America and separates the Caribbean Sea (Atlantic Ocean) from the Gulf of Panama (Pacific Ocean). The narrowest part of the Americas (30–120 mi wide), it embraces the Republic of Panama; its narrowest sections are the isthmuses of Darién (east) and Chiriquí (west). The terrain alternates between mountains, tropical rain forests, and coastal plains.

The isthmus was first inhabited by Indians migrating from the Andes and the West Indies. The Spanish explorer Rodrigo de Galván Bastidas was the first European to visit the area (1501). The following year Christopher Columbus landed on the north coast and named Portobelo ("beautiful harbour"). During colonial times, the isthmus, crossed by the Cruces Mule Trail, was a source of friction between the Spanish and English. Despite constant attacks by English pirates, it remained in Spanish hands until independence early in the 19th century. Following the California Gold Rush of 1849, the Transisthmian Railway was constructed, and the towns of Portobelo and Colón experienced a tremendous economic boom. The opening of the Panama Canal in 1914 resulted in a heavy population migration to what was then the Canal Zone. The strategic importance of the isthmus accounts for much of Panama's turbulent history.

Panama Canal, canal of the lake-and-lock type connecting the Atlantic and Pacific oceans through the narrow Isthmus of Panama in Central America. Its length from deep water in the Atlantic to deep water in the Pacific is 50.7 mi (81.6 km). It is one of the two most strategic artificial waterways in the world, the other being the Suez Canal; ships sailing between the east and west coasts of the United States, for example, can shorten their voyage by about 8,000 nautical miles by using the Panama Canal instead of rounding Cape Horn.

A brief treatment of the Panama Canal follows. For full treatment, *see* MACROPAEDIA: North America: *Panama Canal.*

Although it remains one of the great engineering feats of the world, construction of the Panama Canal presented problems from the beginning. In 1879 Ferdinand de Lesseps, the French diplomat who had supervised excavation of the Suez Canal, formed the Compagnie Universelle du Canal Interocéanique and began work the following year on cutting a sea-level channel through the isthmus. Poor planning, disease, and accusations of fraud led to the collapse of the enterprise in 1889, and in 1894 the French company was reorganized as the Compagnie Nouvelle du Canal de Panama. In 1903 the Hay–Bunau-Varilla Treaty between Panama and the United States granted the United States canal-building rights and the sole right to operate and control the Canal Zone (*q.v.*). The Compagnie Nouvelle du Canal de Panama sold its holdings to the United States in 1904.

The principal decision facing American engineers was whether to build a sea-level or a high-level, lake-and-lock canal. In 1879 the French engineer Adolphe de Lépinay had proposed damming the torrential Chagres River on the Atlantic side of the isthmus and the Río Grande on the Pacific side, creating navigable lakes in their respective valleys that would be connected by a cut through the continental divide. Although rejected by the original French company and by early U.S. commissions that favoured a sea-level canal, Lépinay's proposal was the basis for the final plan drafted in 1906 by John F. Stevens, chief engineer of the U.S. Isthmian Canal Commission. Construction under U.S. supervision, which had begun in 1904, accelerated after Congress adopted Stevens' plan, and the Panama Canal opened to traffic on Aug. 15, 1914. Following numerous disputes between the United States and Panama over the sovereignty of the waterway, the Panama Canal Treaty of 1977 established that the Republic of Panama would take complete control of the canal in the year 2000.

The canal runs due south from its Atlantic entrance, a 7-mi dredged channel in Bahía Limón (Limón Bay), for a distance of 11.5 mi to the Gatún Locks, a series of three locks that raise ships 85 ft (26 m) to man-made Lago Gatún (Lake Gatún). It continues south and then southwest through a channel in Lago Gatún for nearly 24 mi to Gamboa, where the Gaillard (Culebra) Cut begins. The channel through the Gaillard Cut is 8 mi long and 500 ft wide, winding through the continental divide to the locks at Pedro Miguel. At the Pedro Miguel Locks, a single lock lowers ships 31 ft to a small lake, through which vessels pass one mile to the locks at Miraflores. The Miraflores Locks constitute a 54-ft, two-step drop down from the lake level to the sea-level dredged channel, 8 mi long, leading to the Pacific terminus in the Bahía de Panamá.

Except for small craft, no vessel can pass through the locks of the Panama Canal under its own power. Vessels are taken in tow by towing locomotives that operate on cog tracks on the lock walls at 2 mi per hour; six locomotives are usually used for each vessel. The locks are duplicate, so that ships may pass in opposite directions simultaneously. With waiting time, ships require about 24 to 30 hours to negotiate passage. Crude oil and petroleum products, grains, and coal and coke are the three principal commodity groups transported through the canal.

Panama City, Spanish PANAMÁ, capital of the Republic of Panama and of Panamá province, located near the Pacific entrance of the Panama Canal, on the Bay of Panama. The site was originally an Indian fishing village; the name *Panamá* means "many fish." The old city (Panamá Viejo) was founded in 1519 by Gov. Pedro Arias Dávila and was

made the seat of both secular and ecclesiastical authority. From the Andean countries bullion was shipped northward by sea to Panama City and from there was carried across the isthmus by pack animals to Nombre de Dios or Portobelo on the Caribbean coast for shipment to Spain. The city prospered until the depredations of pirates and privateers curtailed trade. In 1595 Sir Francis Drake tried unsuccessfully to send a force across the isthmus to sack old Panama; in 1671, however, Henry (afterward Sir Henry) Morgan completely destroyed it. The new city (Panamá Nuevo) was rebuilt 5 mi (8 km) west of the old site in 1674 by Alonso Mercado de Villacorta, a Spanish conquistador. Political and economic decline followed, and in 1751 the city and area became part of New Granada and eventually part of Colombia. During the 19th century, Panama was the scene of much disorder. In 1903 independence from Colombia was declared there, and the city was made the national capital. In the Hay–Bunau-Varilla Treaty of 1903, the United States was given the right to keep order in the city and to maintain hygiene. Both rights were yielded in treaties of 1936 and 1959, respectively.

Following the opening of the canal (1914), Panama City developed rapidly. It became a polyglot modern city with cabarets, nightclubs, and squalid slums (later partially cleared). The title to the water and sewer systems, built by the United States, was turned over to the government of the republic in 1942, and in 1953 their management was also transferred. The city was the site of Latin-American congresses in 1826, 1939, and 1959.

The port facilities serving Panama City lie in adjacent Balboa, and many canal employees live in suburban Ancón. The city's economy is largely dependent on canal traffic and on providing services for canal personnel. Industries include breweries, oil refineries, steel-rolling mills, and clothing and wood factories. Panama City is linked with Colón by the canal, the Ferrocarril de Panama (Panama Railroad), and the Transisthmian Highway and with David and Chepo by the Carretera Interamericana (Pan-American Highway). It is served by an international airport at Tocumen, 17 mi (27 km) from the city.

The city retains many reminders of colonial times, including several plazas, the cathedral (begun 1673), which contains Bartolomé Murillo's painting of the Virgin of the Rosary, and the San Francisco church (now renovated). Modern buildings include the Palace of Justice, La Presidencia, the National Palace, and the hotel El Panamá. Panama City is the seat of the national university (founded 1935), the University of Santa María La Antigua (1965), and schools of dance, music, art, and theatre associated with the National Institute of Culture. There are a number of academies, libraries, museums, and research institutes. The Gorgas Memorial Laboratory of Tropical and Preventive Medicine was established there in 1928. Pop. (1984 est.) city, 424,204; metro. area, 1,116,823.

Panama City, seat (1913) of Bay County, northwestern Florida, U.S., port of entry on St. Andrew Bay (Gulf of Mexico), 98 mi (158 km) east of Pensacola. The first English settlement (*c.* 1765), known as Old Town, was a fishing village later called St. Andrew. In 1909 Panama City (then a village, named by developer George W. West for the Canal Zone city) merged with St. Andrew and Millville to form the present city. During the Revolution the area was settled by British Loyalists, who established indigo plantations and engaged in lumbering and naval stores industries. Saltworks on St. Andrew Bay, established to serve the Confederacy, were destroyed by Union raids from the sea in 1863. During World War II the city became a shipbuilding and war industrial centre, and the population grew rapidly. Its landlocked, deepwater harbour is on the Atlantic Intracoastal Waterway. The Naval Coastal Systems Center, a diving school, is in Panama City, and Tyndall Air Force Base is nearby. Fish, paper, chemicals, and tourism (especially sports fishing) are the chief economic factors. Panama City is the seat of Gulf Coast Community College (1957). Pop. (1982 est.) city, 34,565; (1984 est.) metropolitan area (MSA), 108,500.

Panama disease, also called BANANA WILT, a devastating disease caused by the soil-inhabiting fungus species *Fusarium oxysporum* variety *cubense,* which is widespread in Asia, Africa, Australia, Pacific Islands, the Caribbean, Central and South America, and wherever susceptible banana cultivars, such as 'Gros Michel,' are grown.

Banana trees afflicted with Panama disease
W.H. Hodge

The *Fusarium* fungus invades young roots or root bases, often through wounds. Some infections progress into the rhizome (rootlike stem) followed by rapid invasion of the rootstock and leaf bases. Spread occurs through vascular bundles, which become discoloured brown or dark red, and finally purplish or black. The outer edges of older leaves turn yellow. Within a month or two all but the youngest leaves turn yellow, wilt, collapse, and hang downward, covering the trunk (pseudostem) with dead brown leaves. All aboveground parts are eventually killed, although fresh suckers form at the base. These later wilt and the entire stool dies, usually within several years.

The best long-range control is to breed and grow highly resistant cultivars. *See also* Fusarium wilt.

Panasqueira, tungsten mine, Castelo Branco district, central Portugal. Located in the Serra (mountains) da Estrela, it is about 5 mi (8 km) northwest of the village of Silvares. The mine was the fifth leading producer of tungsten in the world in the early 1980s. During World War II, Portugal was both publicly criticized and privately admired for allowing this strategic mineral to be exported from Panasqueira to both Axis and Allied powers. Efficient mechanization of the mine has increased productivity. Small amounts of tin and copper are also extracted.

Panathenaea, in Greek religion, an annual Athenian festival of great antiquity and importance. It was eventually celebrated every fourth year with great splendour, probably in deliberate rivalry to the Olympic Games. The festival consisted solely of the sacrifices and rites proper to the season (mid-August) in the cult of Athena, the city protectress. At the Great Panathenaea, representatives of all the dependencies of Athens were present, bringing sacrificial animals. After the presentation of a new embroidered robe to Athena, the sacrifice of several animals was offered. The great procession, made up of the heroes of Marathon, is the subject of the frieze of the Parthenon. The Athenian statesman Pericles (*c.* 495–429 BC) introduced a regular musical contest in place of the recitation of rhapsodies (portions of epic poems), which were a long-standing accompaniment of the festival. The contest took place in the odeum, originally built for the purpose by Pericles himself.

In addition to major athletic contests, many of which were not included at Olympia, several minor contests also were held between the Athenian tribes.

Panay, island, westernmost of the Visaya group, central Philippines, surrounded by the Sibuyan, Visayan, and Sulu seas; the Guimaras Strait to the southeast separates it from Negros. Roughly triangular in shape, it has an area of 4,446 sq mi (11,515 sq km). A rugged, almost unpopulated mountain range parallels its western coastline. Between the range and a hilly eastern portion, a densely populated, intensely farmed (sugarcane, rice) fertile plain extends for about 95 mi (155 km) from the northern to the southern coasts. A wide lowland on the southeast is formed by the deltas of the Jalaud, Jaro, and Sibalom rivers.

There are large concentrations of fishponds in the north and east, and mineral deposits include coal and copper. The inhabitants are primarily of the Hiligaynon (Ilongo) ethnolinguistic group, and nomadic Negritos live in the mountainous areas. The island is divided into Aklan, Antique, Capiz, and Iloilo provinces (*qq.v.*). Its chartered cities are Roxas and Iloilo City. Pop. (1980) 2,595,314.

Pañca-tantra, also spelled PANCHATANTRA (Sanskrit: "Five Chapters"), collection of Indian animal fables, which has had extensive circulation both in the country of its origin and throughout the world. In Europe the work was known under the name *The Fables of Bidpai* (after the narrator, an Indian sage, Bidpai, called in Sanskrit Vidyāpati), and one version reached there as early as the 11th century.

In theory, the *Pañca-tantra* is intended as a textbook of *artha* ("worldly wisdom"); the aphorisms tend to glorify shrewdness and cleverness more than the helping of others. The original text is a mixture of Sanskrit prose and stanzas of verse, with the stories contained within one of the five frame stories. The introduction, which acts as an enclosing frame for the entire work, attributes the stories to a learned Brahmin named Vishṇuśarman, who used the form of animal fables to instruct the three dull-witted sons of a king.

The original Sanskrit work, now lost, may have originated at any time between 100 BC and AD 500. It was translated into Pahlavi (Middle Persian) by the Persian royal physician Burzoe in the 6th century. Although this work also is lost, a Syriac translation of it has survived, together with the famous Arabic translation, by Ibn al-Muqaffaʿ (died AD 760), known as *Kalīlah wa Dimnah,* after the two jackals that figure in the first story. The *Kalīlah wa Dimnah* led to various other versions, including a second Syriac version and an 11th-century version in Greek, the *Stephanites kai Ichnelates,* from which translations were made into Latin and various Slavic languages. It was the 12th-century Hebrew version of Rabbi Joel, however, that became the source of most European versions.

The 17th-century Turkish translation, the *Hümayun-name,* was based on a 15th-century Persian version, the *Anwār-e Suhaylī.* The *Pañca-tantra* stories also traveled to Indonesia through Old Javanese written literature and possibly through oral versions. In India the *Hitopadeśa* ("Good Advice"), composed by Nārāyaṇa in the 12th century and circulated mostly in Bengal, appears to be an independent treatment of the *Pañca-tantra* material.

Pāñcarātra, early Hindu religious movement whose members worshipped the deified sage Nārāyaṇa (who came to be identified with Lord Vishnu) and that, in merger with the Bhāgavata (*q.v.*) sect, formed the earliest sectarian movement within Hinduism. The new group was a forerunner of modern Vaiṣṇavism, or the worship of Vishnu.

The Pāñcarātras originated in the Himalayan region perhaps in the 3rd century BC. The name of the cult is attributed to a sacrifice continuing for five days (*pañca-rātra*) performed by Nārāyaṇa by which he obtained superiority over all beings and became all beings.

The Pāñcarātra doctrine was first systematized by Śāṇḍilya (*c.* AD 100?), who composed several devotional verses about the deity Nārāyaṇa; that the Pāñcarātra system was also known in South India is evident from 2nd-century-AD inscriptions. By the 10th century the sect had acquired sufficient popularity to leave its influence on other groups, though criticized by Śaṅkara and other orthodox figures as nonmonastic and non-Vedic.

Pancasila, also spelled PANTJASILA, English FIVE PRINCIPLES, the Indonesian state philosophy, formulated by the Indonesian nationalist leader Sukarno. It was first articulated on June 1, 1945, in a speech delivered by Sukarno to the preparatory committee for Indonesia's independence, which was sponsored by the Japanese during their World War II occupation. Sukarno argued that the future Indonesian state should be based on the Five Principles: Indonesian nationalism; internationalism, or humanism; consent, or democracy; social prosperity; and belief in one God. The statement was not well received by the Japanese authorities, but independence preparations for Indonesia were continued. Before Indonesia's independence was declared, however, the Japanese had surrendered and Britain had taken control of the country.

The Five Principles have since become the blueprint of the Indonesian nation. In the constitution of the Republic of Indonesia promulgated in 1945, the Five Principles were listed in a slightly different order and in different words: the belief in one God, just and civilized humanity, Indonesian unity, democracy under the wise guidance of representative consultations, and social justice for all the peoples of Indonesia.

pañcāyat (caste government): *see* panchayat.

Pānch Mahāls, district, Gujarāt state, west central India, bounded by the states of Rājasthān (northeast) and Madhya Pradesh (east). Its 3,423-sq-mi (8,866-sq-km) area rises from lowlands into foothills of the Vindhya Range and is largely rough and wooded. The valleys produce bajra (pearl millet), corn (maize), cotton, and gram (chick-pea). Manganese is mined near Shivrājpur. Godhra, the district headquarters, Dohad, and other principal towns are served by a railway and highways. Pop. (1981) 2,321,689.

Panchatantra (Indian animal fables): *see* Pañca-tantra.

panchayat, also spelled PANCHAYET, or PUNCHAYET, Hindi PAÑCĀYAT, the most important adjudicating and licensing agency in the self-government of an Indian caste. There are two types: permanent and impermanent. Literally, a panchayat (from Sanskrit *pañca,* "five") consists of five members, but usually there are more; the panchayat has a policy committee, however, often numbering five.

The panchayat sits as a court of law. Cases are heard in open meetings in which all members of the caste group concerned are entitled to take part. Any evidence that has any conceivable bearing on the case is admissible; it can be produced by either party, by onlookers, or by members of the council. Types of offenses adjudicated in meetings of the panchayat are breaches of eating, drinking, or smoking restrictions; infractions of marriage rules; breaches of a caste's customs in feast; breaches of its trade rules; the killing of certain animals, notably cows; causing injury to a Brahman; and, less commonly, criminal and civil cases actionable before a court of law. Panchayats of Muslim castes try only a few of the offenses, as the rest fall under *fiqh,* or Islāmic law.

Penalties take the form of fines (paid by distributing sweets to a caste group or by contributing to a caste fund), the obligation to offer a feast to the *berādarī* (family brotherhood) or to Brahmans, and temporary or permanent excommunication. Pilgrimage and self-humiliation are sometimes levied, but physical punishment is now uncommon.

The passing of the Evidence Act by the British in 1872, with its strict rules of admissible evidence, led to a bypassing of the panchayat by some caste members who began to take their cases directly to the state court (*see* Indian Evidence Act). Some castes try cases that have come up before a state court or retry them after the verdict of the state court has been given. The Congress Party in India has made a point of creating village panchayats as local instruments of government, the so-called panchayat raj, or government by panchayats.

Paṇchen Lama, title of the line of reincarnated lamas in Tibet who head the influential Tashilhunpo monastery (near Zhikatse) and who until recent times were second only to the Dalai Lamas in spiritual authority within the dominant Dge-lugs-pa sect of Tibetan Buddhism.

The title Paṇchen (a short form of the Sanskrit-Tibetan Paṇḍita Chen-po, or "Great Scholar") was that traditionally given to head abbots of the Tashilhunpo monastery, who were chosen for their maturity and learning. In the 17th century the fifth Dalai Lama declared that his tutor, Blo-bzang chos-kyi-rgyal-mtshan (1570–1662), who was the current Paṇchen Lama, would be reincarnated in a child. He thus became the first of the line of reincarnated lamas, reappearing as Blo-bzang-ye-shes (1663–1737), Blo-bzang-dpal-ldan-ye-shes (1737–80), Blo-bzang-bstan-pa'i-nyi-ma (1781–1854), Bs-tan-pa'i-dbang-phyug (1854–82), and Chos-kyi Nyi-ma (1883–1937). They were each regarded as physical manifestations of the self-born Buddha, Amitābha. (Sometimes the three lamas who preceded Blo-bzang chos-kyi-rgyal-mtshan as abbots of Tashilhunpo are also included in the list of reincarnations.)

Disagreements between the government of the Dalai Lama and the Tashilhunpo administration over tax arrears led to the Paṇchen Lama's flight to China in 1923. A boy born of Tibetan parents in about 1938 in Tsinghai Province, China, Bskal-bzang Tshe-brtan, was recognized as his successor by the Chinese government but without having gone through the usual exacting tests that determine rebirth. He was brought to Tibet in 1952 under Communist military escort and enthroned as head abbot of Tashilhunpo. The Paṇchen Lama remained in Tibet in 1959 after the popular revolt and the Dalai Lama's flight into exile, but his refusal to denounce the Dalai Lama as a traitor brought him into disfavour with the Chinese government, which imprisoned him in Peking in 1964. He was released in the late 1970s and died in 1989.

Panchimalco, town, southern El Salvador. It lies in the Pacific coastal range, just south of San Salvador. The population is made up primarily of descendants of Pipil Indians, who are noted for their handwoven textiles and for their traditional (pre-Columbian) dress and customs. Pop. (1985 est.) 5,094.

pancreas, compound gland common to all vertebrates; it functions both as an exocrine gland discharging digestive enzymes into the gut and as an endocrine gland secreting insulin and glucagon, vital in carbohydrate (sugar) metabolism, into the bloodstream. The term also designates a gland found in many invertebrates, the primary function of which is the secretion of digestive enzymes.

In humans, the pancreas is attached to the duodenum, the upper portion of the small intestine. A large main duct, the duct of Wirsung, collects pancreatic juice and empties into the duodenum. In many individuals a smaller duct (duct of Santorini) also empties into the duodenum. Enzymes active in the digestion of carbohydrate, fat, and protein flow from the pancreas through these ducts continuously and at an increased rate when food is present in the small intestine. Their flow is controlled by the vagus nerve and by the hormones secretin and pancreozymin, which are produced in the intestinal mucosa.

When food enters the duodenum, secretin and pancreozymin are released into the bloodstream by the duodenum's secretory cells. When these hormones reach the pancreas, its cells are stimulated to produce and release large amounts of water, bicarbonate, and digestive enzymes, which then flow into the intestine.

The cells in the pancreas that produce digestive enzymes are called acinar cells (Latin *acinus,* "grape"), so named because the cells aggregate to form bundles that resemble a cluster of grapes. Located between the clusters of acinar cells are scattered patches of another type of secretory tissue, collectively known as the islets (or islands) of Langerhans, named for the 17th-century German pathologist Paul Langerhans. The islets are responsible for the secretion of insulin and glucagon, which control the amount of sugar stored in the body. Insulin stimulates the body's cells to remove sugar from the bloodstream and utilize it. Glucagon has the opposite effect of insulin; it releases stored sugar and increases the blood-sugar level, acting as a control mechanism whenever the body produces too much insulin. The islets of Langerhans secrete insulin and glucagon directly into the bloodstream.

The pancreas may be the site of acute and chronic infections, tumours, and cysts. Should it be removed surgically, life can be sustained by the administration of insulin and of potent pancreatic extracts. Approximately 80 to 90 percent of the pancreas can be removed surgically without producing either endocrine (insulin and glucagon) or exocrine (water, bicarbonate, and enzymes) insufficiency.

pancreatitis, inflammation of the pancreas. Development of the disorder has been associated with intake of alcohol and with obstruction of pancreatic ducts. The process of inflammation starts with the escape of activated pancreatic enzymes into the tissues of the pancreas. These digestive juices cause chemical irritation, with edema (collection of fluid) and with congestion of the blood vessels. Often the inflammation then subsides, but occasionally there is bleeding, necrosis of pancreatic tissue, and formation of pus. Infection may set in. With recovery the necrotic areas are replaced with scar tissue.

The onset of pancreatitis may bring severe pain, most acute when the affected person is lying on his back. There may be slight fever, and the blood pressure may be somewhat higher than usual. If the attack is severe, the skin may be cold and moist, the pulse feeble and rapid, and the temperature below normal. Treatment of acute pancreatitis is directed toward control of pain, prevention or alleviation of shock, inhibition of the secretion of pancreatic juices, and avoidance of infection. Lost fluids and salts are replaced.

In chronic pancreatitis, with its repeated attacks, much of the pancreas may be destroyed, with resultant deficiency in the amounts of pancreatic juices secreted. Islet cells of the pancreas may also be destroyed, so that the secretion of insulin is depleted and diabetes mellitus develops. Management of this disorder includes a low-fat diet, abstinence from overeating and from intake of alcohol, the administration of pancreatic extracts, and control of diabetes, if it has developed.

pancreozymin (hormone): *see* cholecystokinin/pancreozymin.

panda, either of two species of East Asian mammals that are classed together because of shared characteristics of tooth structure, skull architecture, penis shape, and pattern of fur colour. The two species, the giant panda and the lesser panda, are classified by some authorities with the bears and the raccoons, respectively, but other authorities place them together within a separate family, the Ailuridae (order Carnivora).

The bearlike black-and-white panda popular in zoos is the giant panda (*Ailuropoda melanoleuca*). Armand David, a Jesuit missionary, discovered some panda furs in 1869, but no European observed a live giant panda in the wild until the Stötzner Expedition of 1913–15. The giant panda has been classified by some authorities as an aberrant bear (family Ursidae), but its skull and dental structure have no resemblance to those of bears. The giant panda once ranged over comparatively large tracts of China and Burma, but the destruction of its forest habitat has reduced the species to a handful of small, remote bamboo forests in mountainous areas of Szechwan province in west-central China. The panda is classified as an endangered species, and fewer than 1,000 specimens still exist in the wild, while another 100 or so are kept in zoos in China or other countries. The wild areas that pandas inhabit have been set aside by the Chinese government as nature preserves.

The giant panda grows to a length of 1.5 m (5 feet) and a weight of about 100 kg (220 pounds). It has a distinctive coloration consisting of a dense creamy white coat of fur marked with a broad black band across the shoulders and forelegs, black hind legs, and blobs of black colour on the ears and around the eyes. It feeds almost exclusively on bamboo and is able to grasp the young stems and leaves of this plant with the aid of a special thumblike structure on its front foot. The panda's broad, massive teeth are well-suited for chewing and grinding bamboo plant parts, but its digestive system is that of a carnivore, and so the animal is unable to digest cellulose, which is the main constituent of bamboo. Consequently, the panda must consume enormous quantities of bamboo in order to obtain from this plant the nourishment it needs; the average panda eats 30–60 pounds (14–27 kg) of bamboo leaves, stems, and shoots a day. Pandas must spend about 16 hours a day foraging and feeding. Pandas in captivity, by contrast, subsist happily on a diet of cereals, milk, and garden vegetables.

The giant panda has a lumbering gait on the ground but is an agile tree climber. It lives alone except when breeding. Mating usually takes place in March to May, and a litter

of one or two young is born in August or September. The newborn panda is a tiny, blind, hairless creature weighing only about 4 ounces (125 g), and the mother cares for the helpless and immobile infant by holding it to her chest with her large forepaws. The young panda opens its eyes at about 45 days of age and begins to crawl about at 75 days, at which time it begins to grow rapidly. It begins to eat bamboo at about five months of age and adopts a solitary lifestyle at 18 months of age. Pandas in the wild have a slow reproductive cycle, and pandas in captivity are bred only with the greatest difficulty. Thus the species may not be able to replace those members in the wild who are killed by poaching or who are menaced by loss of habitat.

Giant pandas in captivity engage in clownish antics that are very appealing to human onlookers, but pandas are actually somewhat irascible, short-tempered animals. The Chinese government has made it a practice to give or lend giant pandas to other nations as a special mark of friendship. Su-Lin, the first of the giant pandas to be exhibited in the West, reached the United States as an infant in 1936 and was a popular attraction at the Brookfield Zoo, near Chicago, until his death in 1938. Two others, a male and a female (at the National Zoo in Washington, D.C.), were a gift of the Chinese government to the United States in 1972. Since then several other zoos have received pandas.

The lesser (red, or common) panda (*Ailurus fulgens*) has been classified with the raccoon family (Procyonidae) because of its resemblance to those animals. It ranges from the eastern Himalayas to western China. Sometimes called bear cat, or cat bear, it has soft, thick fur—rich reddish brown above and black underneath; the face is white, with a stripe of red-brown from each eye to the corners of the mouth, and the bushy tail is faintly ringed. The head and body length of the lesser panda is 50–65 cm (20–26 inches); the tail, 30–50 cm (12–20 inches) long; and the weight ranges from 3 to 4.5 kg (6.5 to 10 pounds). It lives high in the mountains among rocks and trees and climbs with agility. It is nocturnal and may live alone, in pairs, or in family groups. Its diet consists mainly of fruit and other plant material. The litters generally contain one or two young born in spring after a gestation period of about 130 days. The lesser panda is gentle and easily tamed but usually resents being handled.

Pandanales, the screw-pine order of monocotyledonous flowering plants, containing the screw-pine family, Pandanaceae, with three genera of trees, shrubs, and vines. Members of the genus *Pandanus* (more than 650 species) produce from their trunks and branches stiltlike aerial prop roots that support the plants and give them a distinctive appearance, the main root usually decomposing in time. The genus *Freycinetia* (65 species) consists of shrubby vines that climb by means of aerial roots like those of *Pandanus* but that are much more slender. The genus *Sararanga* (two species) consists of trees that lack both aerial roots and the spiral leaf arrangement found in the other plants of the order. In nearly all members of the order, numerous long, narrow, parallel-veined, palmlike leaves with spiny margins and midribs are produced in tufts at the branch tips in three or four close, twisted ranks around the stem, forming the screwlike helices of leaves that give the common name screw-pine to these plants. The plants grow along seacoasts and in marshy places and forests of tropical and subtropical regions, especially in Asia and Africa.

The flowers are simple, petalless, usually densely clustered, and either male or female, the sexes being produced on different plants.

The fruits of many are heavy ball-shaped or conelike aggregates produced by the coalescence of the developing ovaries of many adjacent flowers. Often there are hollow spaces inside the fruits that aid in distribution by floating. Fruit-eating birds are also thought to distribute the seeds of some.

Much use is made of the leaves for thatching, mats, hats, ropes, twine, sails for small boats, baskets, and fibre products, especially from the textile screw-pine, or pandanus palm (*Pandanus tectorius*). Fibres are also obtained from the aerial roots. The fruits and seeds of some species are edible (*e.g., P. utilis* and the Nicobar Islands breadfruit, *P. leram*). A few species are grown as greenhouse subjects (*e.g., P. pygmaeus, P. veitchi,* and *P. utilis*). The candelabrum, or chandelier, tree (*P. candelabrum*) is especially favoured as an outdoor ornamental in warm regions and as a conservatory plant and houseplant.

The order is considered to be related to the cattail order (Typhales) and the Panama hat palm order (Cyclanthales), but the relationships are not clear.

Pandarus, in Greek legend, son of Lycaon, a Lycian. In the *Iliad* he broke the truce between the Trojans and the Greeks by treacherously wounding Menelaus, the king of Sparta; he was finally slain by the warrior Diomedes. In the medieval tale of Troilus and Cressida, as well as in Shakespeare's play by the same name, Pandarus acted as the lovers' go-between; hence the word "pander."

Pandects, Latin PANDECTAE, also called DIGEST, collection of passages from the writings of Roman jurists, arranged in 50 books and subdivided into titles according to the subject matter. In AD 530 the Roman emperor Justinian entrusted its compilation to the jurist Tribonian with instructions to appoint a commission to help him. The Pandects were published in AD 533 and given statutory force (*see also* Justinian, Code of). Early in the 19th century the term Pandectists was applied to the historical school of Roman-law scholars in Germany who resumed the scientific study of the Pandects. The leader of the school was Friedrich Karl von Savigny.

Pandharpur, town, southern Mahārāshtra state, western India. It lies along the Bhīma River, west of Sholāpur city. Easily reached by road and rail, it is a religious town visited throughout the year by thousands of Hindu pilgrims. Four major annual festivals are held in the town in honour of the deities Viṭhoba, an incarnation of Vishnu, and his consort, Rukmiṇī. The main temple was built in the 12th century by the Yādavas of Devagiri. The town is also associated with the Mahārāshtra poet-saints devoted to the Bhakti cult. Pop. (1981) 64,380.

Pandit, Vijaya Lakshmi, *née* SWARUP KUMARI NEHRU (b. Aug. 18, 1900, Allahābād, India), Indian political leader and diplomat, one of the world's leading women in public life in the 20th century.

She was the daughter of Motilal Nehru, a nationalist leader, and sister of Jawaharlal Nehru, the first prime minister of independent India. In 1921, after receiving a private education in India and abroad, she married Ranjit S. Pandit (d. 1944), a fellow Congress worker. In her family's tradition she became an active worker in the Indian nationalist movement and was imprisoned three times by the British authorities in India. She entered municipal government in Allahābād (western

India) before entering the legislative assembly of the United Provinces (later Uttar Pradesh) and becoming minister for local self-government and public health (1937–39), the first Indian woman to hold a cabinet portfolio.

With the coming of Indian independence, Pandit entered on a distinguished diplomatic career, leading the Indian delegation to the United Nations (1946–48, 1952–53) and serving as India's ambassador to Moscow (1947–49) and to Washington and Mexico (1949–51). In 1953 Pandit became the first woman to be elected president of the UN General Assembly. From 1954 to 1961 she was Indian high commissioner (ambassador) in London and concurrently ambassador to Dublin. She served as governor of the state of Mahārāshtra from 1962 to 1964, and from 1964 to 1968 she was a member of the Indian Lok Sabha (Parliament), representing the constituency formerly represented by her brother, Jawaharlal Nehru.

In 1977 Pandit left the Congress Party to join the Congress for Democracy, which had merged with the Janata Party. A year later she was appointed the Indian representative to the UN Human Rights Commission, and in 1979 she published *The Scope of Happiness: A Personal Memoir.*

Pando, department, northern Bolivia, bounded north and east by Brazil and west by Peru. Created in 1938, the area of 24,644 sq mi (63,827 sq km) lies in the humid Amazon Basin. It is drained by many rivers, the largest of which is the Madre de Dios (*q.v.*). The main economic resources are forest products: rubber, Brazil nuts, and hardwoods. Cobija (*q.v.*), the capital, can be reached by air, but, otherwise, transportation is by river. Isolation, poor communications, and sparse population hinder development of the region. Pop. (1984 est.) 45,645.

Pandora (Greek: All-Giving), in Greek mythology, the first woman. After Prometheus, a fire god and divine trickster, had stolen fire from heaven and bestowed it upon mortals, Zeus, the king of the gods, determined to counteract this blessing. He accordingly commissioned Hephaestus (a god of fire and patron of craftsmen) to fashion a woman out of earth, upon whom the gods bestowed their choicest gifts. She had or found a jar—the so-called Pandora's box—containing all manner of misery and evil. Zeus sent her to Epimetheus, who forgot the warning of his brother Prometheus and made her his wife. Pandora afterward opened the jar, from which the evils flew out over the Earth. According to another version, Hope alone remained inside, the lid having been shut down before she could escape. In a later story the jar contained not evils but blessings, which would have been preserved for the human race had they not been lost through the opening of the jar out of curiosity by man himself.

Pandulph, also spelled PANDULF, Italian PANDOLPHO (b. Rome—d. Sept. 16, 1226, Rome), papal legate to England and bishop of Norwich who was deeply involved in English secular politics.

Pope Innocent III sent him to England in an effort to secure King John's acceptance of Stephen Langton as archbishop of Canterbury. When the negotiations failed, John was excommunicated, and England was placed under papal interdict. On May 15, 1213, however, Pandulph accepted John's personal submission and surrender of the country as a fief of the Pope, whose vassal the King became. John also permitted Langton to assume the see of Canterbury. Allying himself with John, Pandulph used ecclesiastical censures, including excommunication, to avert a threatened French invasion of England and suspended Archbishop Langton for refusing to excommunicate the barons and for extracting the Magna Carta (charter of liberties) from the King (June 19, 1215). For these services John rewarded Pandulph with the see of Norwich.

After John's death (Oct 18/19, 1216), Pandulph was prominent in the regency for the boy king Henry III until 1220 or 1221, when Langton induced Innocent's successor, Pope Honorius III, to recall him.

Panduranga, Ramchandra (Indian rebel leader): *see* Tantia Topi.

Panduro, Leif (b. April 18, 1923, Frederiksberg, Den.—d. Jan. 16, 1977, Asserbo), Danish novelist and dramatist a social critic who wrote in a satirical, humorous vein.

His first novel, *Av, min guldtand* (1957; "Off, My Gold Tooth"), is an ironic, at times hilarious description of small-town life, based to a large extent on Panduro's own experiences. The same is the case in his next novel, *Rend mig i traditionerne* (1958; "Kick me in the Traditions"), a study of a schoolboy and his puberty crisis reminiscent of J.D. Salinger's *The Catcher in the Rye* of 1951. *De uanstaendige* (1960; "The Indecent Ones") is a critical account of the Danish middle class during the German occupation. Panduro's most ambitious novel is *Øgledage* (1961; "Saurian Days"), which makes use of a sophisticated, modernistic narrative technique. The saurians of the title refer to those who protest against the deadening conventions of everyday life. The conflict between instinctive energies and the demands of conformity becomes the central theme in several of Panduro's novels from the 1960s—*Fern fra Danmark* (1963; "Far from Denmark"), *Fejltagelsen* (1964; "The Mistake"), and *Den gale mand* (1965; "The Crazy Man"). Panduro could see no easy resolution of this antagonism and the breakdowns of his main characters confirm the repressive nature of even a seemingly idyllic society like Denmark.

Panduro produced a number of scripts for radio, television, and film, becoming one of the most successful Scandinavian dramatists of the 1970s with such works as *Farvel, Thomas* (1968; "Goodbye, Thomas") and *I Adams verden* (1973; "In Adam's World").

Pāṇḍya DYNASTY, Tamil rulers in the extreme south of India of unknown antiquity (they are mentioned by Greek authors in the 4th century BC). The Roman emperor Julian received an embassy from a Pāṇḍya *c.* AD 361. The dynasty revived under Kaḍuṅgōn in the early 7th century AD and ruled from Madura or farther south until the 16th century. The small but important (9th–13th century) dynasty of Pāṇḍya of Ucchangi, a hill fort south of the Tuṅgabhadra River, may have originated from the Madura family.

The Pāṇḍya kings were called either Jatavarman or Māravarman. From being Jains they became Śaivas (worshippers of Śiva) and are celebrated in the earliest Tamil poetry. They ruled extensive territories, at times including the Cēra (or Kerala) country, the Cōḷa country, and Ceylon through collateral branches subject to Madura. The "Five Pāṇḍyas" flourished from the 12th to the 14th century and eventually assumed control of all the plains of the extreme south as far north as Nellore (1257). Family quarrels, however, and Muslim invasions, from 1311, culminating in the foundation of the Madura sultanate, weakened Pāṇḍya influence. By 1312 control over Kerala was lost, and by the mid-16th century all their territories had passed into other hands.

panegyric, eulogistic oration or laudatory discourse that originally was a speech delivered at an ancient Greek general assembly (*panēgyris*), such as the Olympic and Panathenaic festivals. Speakers often took advantage of these occasions, when Greeks of various cities were gathered together, to advocate Hellenic unity. With this end in view and also to gratify their audience, they tended to expatiate on the former glories of Greek cities; hence came the encomiastic associations that eventually clung to the term panegyric. The most famous ancient Greek panegyrics to survive intact are the *Panegyricus* (*c.* 380 BC) and the *Panathenaicus* (*c.* 340 BC), both by Isocrates.

Akin to panegyric was the *epitaphion*, or funeral oration, such as Pericles' funeral speech as recorded by Thucydides, a panegyric both on war heroes and on Athens itself.

In the 2nd century AD, Aelius Aristides, a Greek rhetorician, combined praise of famous cities with eulogy of the reigning Roman emperor. By his time panegyric had probably become specialized in the latter connection and was, therefore, related to the old Roman custom of celebrating at festivals the glories of famous men of the past and of pronouncing *laudationes funebres* at the funerals of eminent persons.

Another kind of Roman eulogistic speech was the *gratiarum actio* ("thanksgiving"), delivered by a successful candidate for public office. The *XII Panegyrici Latini*, an ancient collection of these speeches, includes the *gratiarum actio* delivered by Pliny the Younger when he was nominated consul by the emperor Trajan in AD 100. Late Roman writers of the 3rd to the 5th century indiscriminately praised and flattered the emperors in panegyrics that were sometimes written in verse.

Although primarily a literary form associated with classical antiquity, panegyric continued to be written on occasion in the Middle Ages, often by Christian mystics in praise of God, and in the Renaissance and Baroque periods, especially in Elizabethan England, in Spain during the Siglo de Oro (Golden Age), and in France under the reign of Louis XIV.

panēgyris (Greek: "gathering"), plural PANĒGYREIS, in Greek religion, an ancient assembly that met on certain fixed dates for the purpose of honouring a specific god. The gatherings varied in size from the inhabitants of a single town to great national meetings, such as the Olympic Games. The religious aspect of the meetings was by far the most important, and included prayers, feasts, and processions. The populace, however, was probably more attracted to the amusements, games, fairs, and festive orations (panegyrics) that occurred at the gatherings.

panel painting, painting executed on a rigid support—ordinarily wood or metal—as distinct from painting done on canvas. Before canvas came into general use at the end of the 16th century, the panel was the support most often used for easel painting. A variety of woods has been used, including beech, cedar, chestnut, fir, larch, linden, white poplar, mahogany, olive, dark walnut, and teak. Wooden panels were usually boiled or steamed to remove gum and resin and thereby prevent splitting and then were coated with size (a glutinous material) to fill pores and with gesso (a mixture of glue and whiting), on which the painting was executed. Metals used for panel paintings include silver, tin, lead, and zinc. During the Middle Ages, especially in Russia, paintings were executed on panels over which leather had been stretched.

paneling, also spelled PANELLING, in architecture and design, decorative treatment of walls, ceilings, doors, and furniture consisting of a series of wide, thin sheets of wood, called panels, framed together by narrower, thicker strips of wood. The latter are called styles (the external vertical strips), muntins (the internal vertical strips), and rails (the horizontal strips).

Simple paneling on doors was used in Classical architecture, both Greek and Roman, as it was in the transitional Italian Romanesque interiors. Its extensive use on walls and furnishings, however, began in the Gothic period. The richness and warmth of interior wood paneling is a highly characteristic aspect of the Tudor and Elizabethan styles of decoration in England. Early Tudor walls are profusely carved, often in fielded panels, in which the central area is raised above the framing. One particularly popular form of fielded panel was the linenfold, featuring stylized carvings that represent vertically folded linen; Hampton Court Palace near London contains many superb examples. In the English Renaissance, paneling became simpler; in the France of kings Louis XIV and XV, it was lavish and ornate; and in the Italian Renaissance, architects restricted its use to ceilings. In 17th-century New England, paneling was used but without decoration; in the 18th century it became more decorative, especially in the Southern colonies.

In all of these historical instances the paneling was almost always made of either oak or pine. In the 20th century an enormous variety of materials came into use: solid wood (walnut, mahogany, birch, redwood), plywood (a thin wood veneer on a plywood base), vinyl with surface imitating wood grain, hardboard (or pressed wood), pegboard, and even translucent materials such as lucite.

Paneth, Friedrich Adolf (b. Aug. 31, 1887, Vienna—d. Sept. 17, 1958, Vienna), Austrian chemist who with George Charles de Hevesy introduced radioactive tracer techniques (1912–13).

Paneth, the son of noted physiologist Joseph Paneth, studied at Munich, Glasgow, and Vienna, then held positions at the Radium Institute, Vienna, and at research facilities in Prague, Hamburg, Berlin, and Königsberg. Upon the rise of the Nazi movement, he went to England and took a position as guest lecturer at the Imperial College of Science and Technology, London (1933–38), and then became professor of chemistry at the University of Durham (1939). In 1953 he returned to West Germany as director of the Max Planck Institute at Mainz.

Between 1918 and 1922 Paneth prepared hydrides of bismuth, lead, and polonium with radioactive isotopes. Beginning in 1929 he furnished proof of the brief existence of the methyl and ethyl free radicals. His microanalytical work in rare gases led him to study the composition of the atmosphere and to conclude that the composition of air is constant at least to an altitude of approximately 61 km (38 miles). His measurement of helium from the radioactive decomposition of meteorites and terrestrial rocks led to methods for ascertaining their age.

Paneth cell, specialized type of epithelial cell found in the mucous-membrane lining of the small intestine and of the appendix, at the base of tubelike depressions known as Lieberkühn glands. Named for the 19th-century Austrian physiologist Joseph Paneth, the cell has one nucleus at its base and densely packed secretory granules throughout the rest of its body. Their function is not totally known, nor is their manner of discharging their granules. They are known to secrete large amounts of protein-rich material and are thought to secrete the enzyme peptidase, which breaks peptide molecules into amino acids suitable for assimilation by the body. In humans the granules are found to contain carbohydrates, proteins, and radioactive zinc. In mice a specific protein, lysozyme, known to destroy some bacteria, is believed to be present in the granules. This suggests that the Paneth cell might also have an antibacterial function.

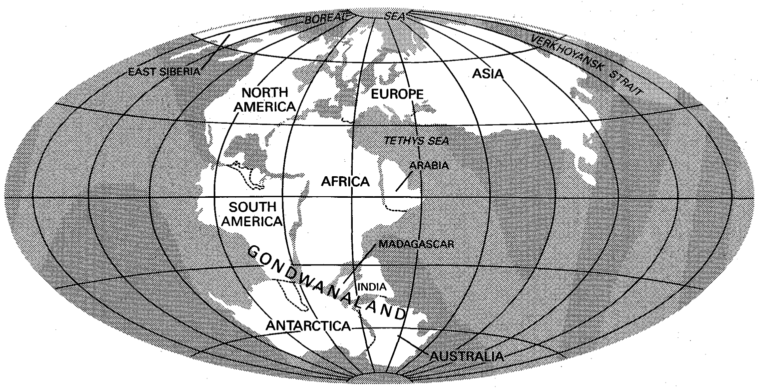
Panevėžys, city, north-central Lithuanian Soviet Socialist Republic, on the Nevėžis River. First mentioned in documents in 1503, it was chartered as a district town in 1842 and became a regional economic centre.

Agricultural trade is important; the leading industry is food processing (especially sugar refining). There are metalworks, glassworks, and a large flax-processing plant. The city has schools of technology, music, and medicine. The Panevėžys Drama Theatre, a celebrated Lithuanian national institution, was founded in 1940. Pop. (1986 est.) 119,000.

Pang-pu, Pinyin BANGBU, city in north-central Anhwei *sheng* (province), China. The name is mentioned in the early 1st millennium BC in connection with the myths surrounding the cultural hero Emperor Yü. Throughout most of Chinese history, however, it was only a small market town and port on the middle course of the Huai River. The city comprises two parts—greater Pang-pu, on the southern bank of the Huai, and little Pang-pu, on the northern bank.

Pang-pu's modern growth began with the construction in 1912 of the great trunk railway from Tientsin to P'u-k'ou, opposite Nanking, on the Yangtze River—a route that crossed the Huai. The river traffic on the Huai made Pang-pu the natural collecting centre for the agricultural produce, especially grain, cotton, peanuts (groundnuts), and soya beans, from much of northern Anhwei. Pang-pu's importance as a communication centre was further increased with the completion in 1944 of a railway linking it to Ho-fei and to the Huai-nan coalfield. In addition, it is also the centre of a road network, connecting it with K'ai-feng in Honan province to the northwest and with Ho-fei to the south. Since 1949, particularly since the improvement of the Huai River system and the restoration of the Grand Canal, Pang-pu's position as the chief commercial centre of the middle Huai Valley has been consolidated. Industrial growth, however, has been comparatively slow. There are coal mines at Huai-yüan, to the northwest, and copper mines have been reported opened in the vicinity. Pop. (1985 est.) 390,900.

Pangaea (from Greek *pangaia,* "all earth"), hypothetical protocontinent proposed by the German meteorologist Alfred Wegener in 1912 as a part of his theory of continental drift (*q.v.*). According to this theory, Pangaea was composed of continental sial (granitic rock), which was balanced isostatically in a layer of denser material (basalt), called sima, constituting the uppermost portion of the Earth's mantle. The protocontinent supposedly covered about half the Earth and was completely surrounded by a world ocean called Panthalassa. During the Jurassic Period (approximately 136,000,000 to 190,000,000 years ago), Pangaea began to break apart. Its segments Laurasia (composed of all the present-day northern continents) and Gondwanaland (all of the present southern continents) gradually receded, resulting in the formation of the Atlantic Ocean.



Pangaea

The breakup of Pangaea is now explained in terms of plate tectonics (*q.v.*). This theory states that the Earth's outer shell, or lithosphere, consists of large, rigid plates, which move relative to each other and interact at their margins, where they diverge, converge, or slip past one another. Pangaea split apart at one of the divergent plate boundaries, and a rift developed beneath the continent. As the two segments of the continent pulled farther apart, molten rock material from the asthenosphere, the layer underlying the lithosphere, flowed upward to fill the void, creating the floor of the new Atlantic Ocean basin.

Pangaion, Mount, also spelled PANGEON, PANGAEUM, PANGAEOS, or PANGAIOS, Modern Greek PANGAÍON ÓROS, mountain, at the mouth of the Strymon river, northeastern Kavála *nomós* (department), Macedonia, Greece. Its highest point is 6,417 feet (1,956 m). The upper slopes are formed by fracturing of marble rock; gold and silver mineral deposits mined from ancient times are found at lower elevations. Mount Pangaion is rich in forest and streams and is surrounded by the fertile alluvial plain of the Strymon, on which crops such as tobacco, cotton, rice, and olives are cultivated intensively. In ancient times, the peak was the home of a cult of Dionysus. The ancient Thracians exploited its gold and silver, trading their metals for goods supplied by the Amphipolitans and Neapolitans. Its famed wealth led to constant strife in the region, however, until Philip II of Macedon gained control in the 4th century BC. Situated on the east side of the mountain are the monastery of Eikosiphoinissis, containing some ancient manuscripts, and the church of Zoodochos Pighi, founded in the 6th century AD. The usual base for the ascent of Mount Pangaion is either of the towns of Elevtheroupolis or Pravion.

Pangalos, Theodoros (b. Jan. 11, 1878, Salamís, Greece—d. Feb. 26, 1952, Athens), soldier and statesman who for eight months in 1926 was dictator of Greece.

After service in World War I and the unsuccessful Greek campaign in western Turkey (1921–22), Pangalos was appointed minister of war shortly after the abdication of King Constantine (1922). He directed the military court that condemned those responsible for the rout of Greek forces at Afyon, Tur., in August 1922 and the later massacre of Greeks in Smyrna (now İzmir, Tur.). In 1923 he was also commander in chief in Thrace. In June 1925 he staged a coup and had himself installed as prime minister, and on Jan. 3, 1926, he proclaimed himself dictator. In April he procured his own election as president but was deposed on Aug. 22, 1926, in a coup by his own Republican Guard. His arbitrary rule brought an eight-month suspension of Parliament, a deterioration in relations with Bulgaria (October 1925), and unsuccessful attempts to regulate public morality. After retiring from public life he was sentenced to two years' imprisonment in a building scandal (1930). In World War II he was accused of having collaborated with the Germans and Italians, but the charges remained unsubstantiated.

Pangani, historic town, northeastern Tanzania, eastern Africa, at the mouth of the Pangani River, on the Pemba Channel of the Indian Ocean. The town was formerly a slave-trading depot at the terminus of Arab caravan routes from the interior. Pangani is now an important commercial centre, producing sisal, corn (maize), bananas, and cassava. Pop. (1978 prelim.) 5,368.

Pangasinan, ninth largest cultural-linguistic group of the Philippines. Numbering about 1,263,000 in the late 20th century, the Pangasinan occupy the west-central area of the island of Luzon. They are predominantly Roman Catholic. There has been considerable intermarriage with the Ilocanos from northern Luzon, an adjacent cultural-linguistic group with whom they share many traditions. Their language belongs to the Austronesian (Malayo-Polynesian) family of languages. The area inhabited by the Pangasinan is one of the richest agricultural regions of the Philippines. The chief crop is rice, much of which goes by rail to the Manila markets. Minor crops are corn (maize), coconuts, mangoes and other tropical fruits, sugarcane, and tobacco.

Pangkalpinang, city (*kotamadya*) and chief settlement of Bangka island, Sumatera Selatan *provinsi* ("province"), Indonesia, located in the east-central part of the island. It is a major port on the Java Sea and has an airport. The city's population consists mostly of Hakkas, originally from Kwangtung province, China. Locally they are called Perankan (Indonesian: "Children of the Indies"), and they speak a creolized Hakka dialect. Household industries include wood carving, metalwork, weaving, plaiting, and basket making. Coastal vessels are built and repaired there, and deep-sea fishing is important. The island of Bangka produces pepper, and tin from mines on the island is smelted at Pangkalpinang. The city exports tin, pepper, fish, and copra. It is connected by road to other municipalities and towns on the island. Pop. (1980) 90,096.

Pangkor Engagement (1874), treaty between the British government and Malay chiefs in Perak, the first step in the establishment of British dominion over the Malay states. In January 1874, Governor Andrew Clarke of the Straits Settlements, prompted by the local trading community, organized a meeting between British, Malay, and Chinese leaders to settle a Perak succession dispute and to stop warfare between Chinese secret societies. Named after Pangkor Island, off the Perak coast, the engagement adjudicated these issues. The complicated Perak succession controversy was settled in favour of Raja Abdullah, the candidate supported by Lower Perak chiefs, who had been passed over in the 1871 succession. Ismail, the Upper Perak contender, absent from the meeting, was pensioned off with an annual allowance and was granted the honorific title of *sultan muda.* In return for British backing, Abdullah agreed to accept a British resident (adviser) with broad powers at his court. The Chinese-secret-society issue was settled in the separate Chinese Engagement (*q.v.*). Similar agreements were later signed with other Malay states, achieving de facto British rule of the Malay Peninsula by 1914.

pangolin, also called SCALY ANTEATER, any of the armoured placental mammals of the order Pholidota. Pangolin, from the Malayan meaning "rolling over," refers to this animal's habit of curling into a ball when threatened. About eight species of pangolins, usually considered to be of the genus *Manis,* family Manidae, are found in tropical Asia and Africa. Pangolins are 30 to 90 cm (1 to 3 feet) long exclusive of the tail and weigh from 5 to 27 kg (10 to 60 pounds). Except for the sides of the face and underside of the body, they are covered with overlapping brownish scales composed of cemented hairs. The head is short and conical, with small, thickly lidded eyes and a long, toothless muzzle; the tongue is wormlike and extensile, up to 25 cm (10 inches) in length. The legs are short, and the five-toed feet have sharp claws. The tail, about as long as the body, is prehensile, and, with the hind legs, it forms a tripod for support.

Some pangolins, such as the African black-bellied pangolin (*Manis longicaudata*) and the Chinese pangolin (*M. pentadactyla*), are almost entirely arboreal; others, such as the giant pangolin (*M. gigantea*) of Africa, are terrestrial. All are nocturnal and able to swim a little. Terrestrial forms live in burrows. Pangolins feed mainly on termites but also eat

ants and other insects. They locate prey by smell and use the forefeet to rip open nests.

Their means of defense are the emission of a odorous secretion from large anal glands and the ploy of rolling up, presenting erected scales to the enemy. Pangolins are timid and live alone or in pairs. Apparently usually one young is born at a time, soft-scaled at birth, and carried on the female's back for some time. Life span is about 12 years.

Pangolins were once grouped with the true anteaters, sloths, and armadillos in the order Edentata, mainly because of superficial likenesses to South American anteaters. Pangolins differ from edentates, however, in many fundamental anatomical characteristics.

The earliest fossil Pholidota are bones indistinguishable from those of the African giant pangolin, found in a cave in India and dating to the Pleistocene Epoch (about 10,000 to 2,500,000 years ago).

Panguna, mining town and site of a large open-pit copper mine in the south-central interior of Bougainville Island, Papua New Guinea. Conzine Riotinto, an Australian mining company, began prospecting for copper in the Crown Prince Range at Panguna in the early 1960s. Subsequently, Bougainville Copper Ltd. was set up, and roads, a pipeline to convey the copper concentrate to the drying and loading installations at Loloho on Arawa Bay, and the nearby dormitory town of Arawa were built. The mine was brought into production in 1972 and has become one of the world's largest copper producers, with most of the concentrate exported to Japan and Germany. Gold is also extracted from the ore. Built in ribbon formation in the valleys of the Crown Prince Range, Panguna includes the company's administration offices, several housing areas, and canteens, all for the employees of the mining company and their dependents. Pop. (1981 prelim.) 3,487.

Panhard, René (b. 1841, Paris—d. 1908, La Bourbole, Fr.), French automobile engineer and manufacturer who, with Émile Levassor, produced the first vehicle with an internal-combustion engine mounted at the front of the chassis rather than under the driver's seat. Their vehicle became the prototype of the modern automobile. It had a sliding gear transmission and a differential gear with power transmitted to the rear axle by a chain drive.

Panhard, a graduate of the École Centrale des Arts et Manufactures, in 1886 joined Levassor, who had gained control of the French rights to the Daimler patents. In 1891–92 Panhard and Levassor built their vehicle with the front-mounted engine to Levassor's design. It was put on sale in 1892 and competed successfully in early races.

panic, in economics, acute financial disturbance, such as widespread bank failures, feverish stock speculation followed by a market crash, or a climate of fear caused by economic crisis or the anticipation of such crisis. The term is applied only to the violent stage of financial convulsion and does not extend to the whole period of a decline in the business cycle. *Compare* depression; recession.

Until the 19th century, economic fluctuations were largely connected with shortages of goods, market expansion, and speculation, as in the incident known as the South Sea Bubble (1720), when stock speculation reached panic proportions in both France and England. Panics in the industrialized societies of the 19th and 20th centuries, however, have reflected the increasing complexity of advanced economies and the changed character of their instability. A financial panic has quite often been a prelude to a crisis that extended beyond commercial activities into sectors of consumption and capital-goods industries. The Panic of 1857 in the United States, for example, was the outcome of a number of developments, including the railroads' defaulting on their bonds, the resultant decline in the value of rail securities, and the tying up of bank assets in nonliquid railroad investments. Its effects were also complex, including not only the closing of many banks but also a sharp increase in unemployment in the United States and a money-market panic on the European continent. The Panic of 1873, which began with financial crises in Vienna in June and in New York City in September, marked the end of the long-term expansion in the world economy that had begun in the late 1840s. The greatest panic, however, was the crisis in 1929, which rocked the U.S. economy, shattered world economic relations, and brought about the Great Depression.

panicum, any of nearly 600 species of forage and cereal grasses in the genus *Panicum* (family Poaceae), distributed throughout tropical and warm temperate regions. These plants are annuals and perennials; many are tufted or have underground stems.

Many species of *Panicum,* known as millet (*q.v.*), are cultivated in Europe and Asia as crop plants and in the United States for forage, hog feed, and birdseed. Guinea grass (*P. maximum*), a tall African plant, also is cultivated for forage, especially in tropical America and southern North America. Switch grass (*P. virgatum*) is an erect, tough perennial, 1 to 2 m (about 3 to $6\frac{1}{2}$ feet) tall, that grows in clumps; its spikelets may be reddish. It is a major constituent of tall grass prairie in North America and is a valuable forage grass. It is sometimes used for erosion control because its thick underground stems send up new plants.

Witchgrass (*P. capillare*), a tufted annual, is a common weed in fields and disturbed areas. Its large, purplish flower clusters break off and are blown by the wind. Vine mesquite grass (*P. obtusum*) is planted for erosion control in the southwestern United States.

Pānihāti, town, south-central West Bengal state, northeastern India, just east of the Hooghly River, part of the Calcutta urban agglomeration. Connected by road and rail with Calcutta, it is a rice trade centre; its major industries include cotton milling, tanneries, and the manufacture of chemicals, pottery, cement, glass, paint, and rubber goods. With the southern suburb of Āgarpārā, it was constituted a municipality in 1900, when it was separated from Barrackpore (*q.v.*) municipality. Pop. (1981) 205,518.

Panikkar, Kavalam Madhava (b. June 3, 1895, Travancore, India—d. Dec. 10, 1963, Mysore), Indian statesman, diplomat, and scholar.

Educated at the University of Oxford, Panikkar read for the bar at the Middle Temple, London, before returning to India, where he then taught at Alīgarh and Calcutta universities. He turned to journalism in 1925 as editor of the *Hindustan Times.* He entered political life in the service of the Indian princes, becoming secretary to the chancellor of the Chamber of Princes (organization of rulers of the princely states). He also served as the foreign minister of the state of Patiala and as foreign minister and later as chief minister of the state of Bīkaner (1944–47). After India gained its independence, he was entrusted with greater responsibilities as ambassador to China (1948–52), Egypt (1952–53), and France (1956–59). Late in life, he

returned to academia and was vice-chancellor of the University of Mysore at his death.

Panikkar's interest in European influence on Asia was reflected in his studies of the Portuguese and the Dutch in Malabar (in South India) and especially in his *Asia and Western Dominance* (1953). *In Two Chinas* (1955) revealed his sympathy with Communist China. He also wrote plays and novels.

Panin, Nikita Ivanovich, Graf (Count) (b. Sept. 29 [Sept. 18, Old Style], 1718, Gdańsk, Pol.—d. April 11 [March 31], 1783, St. Petersburg [now Leningrad]), statesman who served as a chief diplomatic adviser to Catherine II the Great of Russia (reigned 1762–96).

Son of the Russian commandant at Pärnu (Pernau), Estonia, Panin entered the Russian army in 1740, was appointed Russia's minister to Denmark in 1747, and was then transferred to Sweden, where he served from 1748 to 1760, officially acting as a major opponent of the pro-French party in Sweden and personally developing liberal political views and an appreciation of constitutional forms of government.

When Russia reversed its foreign policy in 1756 and entered the Seven Years' War as an ally of France and Austria, his position grew more difficult; he was about to retire in 1760 when Empress Elizabeth (reigned 1741–62), finding him one of the most learned and accomplished gentlemen of Russia, recalled him to St. Petersburg to supervise the education of the grand duke Paul, son of her heir, the future Peter III (reigned 1762), and his wife, the future Catherine II (reigned 1762–96).

Though Panin urged that Paul be named emperor and Catherine act only as regent when Peter was overthrown in 1762, he became a trusted adviser to Catherine, particularly in foreign affairs, and was given the formal position of head of the foreign college (department of foreign affairs) in 1763. As such, he developed the concept of the "Northern Accord," an alliance system involving Russia, Prussia, Poland, Sweden, and, perhaps, Great Britain aimed against the Franco-Austrian bloc, and tried to direct Russia's foreign policy toward forming that alliance system.

In conjunction with that concept, however, Panin advocated the development of Poland

into a strong, independent state that would maintain friendly relations with Russia. This position brought him into conflict with Frederick II of Prussia, with whom Panin had cultivated close relations, as well as with Catherine, both of whom preferred that Poland remain weak and subservient. Upon Catherine's insistence, Panin first implemented her plan to place her former lover Stanisław Poniatowski on the Polish throne and effectively subordinate Poland to Russia (1764), then participated in the negotiations with Prussia and Austria (1770–71) that culminated in the first partition of Poland (1772).

Despite the failure of his grand scheme, Panin continued to urge close Russo-Prussian relations. But Catherine preferred to improve Russia's relations with Austria and, as she succeeded, Panin's position of influence declined. She finally dismissed him in May 1781 after they quarrelled over her plan (1780) to organize the protection of neutral shipping against British interference during the American Revolution.

Panin and members of the Vorontsov family were the leaders of a movement to redefine the position of the Russian gentry. Inspired by the concept of the nobility in England and Sweden, the program called for recognizing the gentry's intangible rights and privileges and for securing it from arbitrariness by the government. Only the upper stratum of the nobility was enlisted in support of this movement. It failed because after Peter III's overthrow Catherine, backed by her high-ranking nobles, refused to establish the privy council that Panin proposed.

Pānīpat, city, Karnāl district, Haryāna state, northwestern India, connected by road and rail with Delhi (south) and Ambāla (north). The plain of Pānīpat was the site of three decisive battles in Indian history in the 16th and 18th centuries. Wool and cotton milling, saltpetre refining, and the manufacture of

glass, electrical appliances, and bricks are the chief industries. Constituted a municipality in 1867, Pānīpat has three colleges affiliated with Kurukshetra University. Pop. (1981) 137,927.

Pānīpat, Battles of (1526, 1556, 1761), three military engagements, important in North Indian history, fought at Pānīpat, a level plain suitable for cavalry movements, about 50 miles (80 kilometres) north of Delhi. The first battle (April 21, 1526) was between the Mughal chief Bābur, then ruler of Kābul, and Sultan Ibrāhīm Lodī of Delhi. Although the Sultan's army outnumbered the Mughals', it was unused to the wheeling tactics of the cavalry and suffered from deep divisions. Ibrāhīm was killed, and his army was defeated. This marked the beginning of the Mughal Empire in India.

The second battle (Nov. 5, 1556) ended in a victory for Bayram Khān, the guardian of the young Mughal emperor Akbar, over Hemū, the Hindu general of an Afghan claimant who had proclaimed himself independent. It marked the restoration of Mughal power after the expulsion of the emperor Humāyūn by Shēr Shāh the Afghan in 1540.

The third battle (Jan. 14, 1761) ended the Marāthā attempt to succeed the Mughals as rulers of India and marked the virtual end of the Mughal Empire. The Marāthā army, under the Bhāo Sahib, uncle of the Peshwa (chief minister), was trapped and destroyed by the Afghan chief Aḥmad Shāh Durrānī. This began 40 years of anarchy in northwestern India and cleared the way for later British supremacy.

Panizzi, Sir Anthony, original name ANTONIO GENESIO MARIA PANIZZI (b. Sept. 16, 1797, Brescello, Italy—d. April 8, 1879, London), Italian patriot and man of letters who became famous as a librarian at the British Museum and played a part in the unification of Italy.

In 1822 Panizzi was forced into exile to avoid arrest as a revolutionary. He arrived in England in 1823 and, after teaching Italian at Liverpool, became professor of Italian at University College, London (1828–37). In 1831 he was named assistant librarian at the British Museum and became principal librarian in 1856. As a librarian and administrator, Panizzi was responsible for the reorganization and the new spirit of energy and concern for scholarship that made the museum one of the world's great centres of culture. He planned and began work on the general catalog; secured strict enforcement of the 1842 Copyright Act; drew up a report on the library's deficiencies that led to an increased grant for book purchases in 1845; improved staff conditions by insisting on the museum's recognition as a branch of the civil service; and was responsible, through his friendship with Thomas Grenville, for the bequest of the Grenville library in 1846. He is best remembered, however, for designing and supervising the building of the Reading Room, opened in May 1857.

Although he became a British citizen in 1832, Panizzi continued to further the cause of Italian liberty through his friendship with influential Liberal statesmen in England, with Thiers in France, and with the Italian leaders. After the unification of Italy, he declined invitations from Garibaldi and Cavour to return as senator or as a member of the Council of Public Instruction, preferring to continue to serve as "unofficial ambassador" in London.

Panizzi's literary works include editions of Boiardo's *Orlando innamorato* and Ariosto's *Orlando furioso* (1830–34) and of Boiardo's minor poems (1835). In his later years he was a close friend of Prosper Mérimée. He retired in 1866 and was knighted in 1869.

Panjgūr, town, administrative headquarters of Panjgūr district, Makrān division, Baluchistan province, Pakistan. Situated on the south bank of the Rakhshān River in the Siāhān Range, the town is a market centre and in summer is the temporary seat of most of Makrān's division offices. It has an overhead water storage tank and is connected by road to Turbat and Pasni to the southwest.

Panjgūr district, which had been part of the former Makrān district, consists mostly of mountains intersected by the Rakhshān and Gwārkoh (Gwārgō) river valleys and is semi-arid. It is inhabited mainly by Baluchi who are pastoral sheep-breeders. Dates, wheat, barley, *jowār* (sorghum), and rice are raised. Pop. (1981 prelim.) town, 10,000; district, 161,000.

Panjnad River, river in Punjab Province, Pakistan, formed just below Uch by successive junctions of the Sutlej, Beās, Rāvi, Jhelum, and Chenāb rivers. The Panjnad (literally Five Rivers) flows 44 mi (71 km) southwest to its junction with the Indus near Mithankot, forming in its course part of the boundary between Muzaffargarh, Bahāwalpur, and Rahīmyār Khān districts. A barrage located just after its junction with the Chenāb is part of the Sutlej Valley irrigation project.

Pankhurst, Dame Christabel Harriette (b. Sept. 22, 1880, Manchester—d. Feb. 13, 1958, Los Angeles, Calif., U.S.), suffragette leader credited with organizing the tactics of the militant British suffrage movement.

A daughter of suffrage activist Emmeline Pankhurst and a sister of Sylvia Pankhurst, Christabel Pankhurst advocated the use of militant tactics to win the vote for women in England. With her mother she founded the Women's Social and Political Union in 1903. Reflecting the Union's slogan, "Deeds not Words," Pankhurst, with Annie Kenney, fired the opening salvo in the militant suffrage campaign by disrupting a Liberal Party meeting in Manchester in 1905. Her action (she unfurled a banner reading "Votes for Women") received worldwide attention after she was sent to jail.

Pankhurst subsequently directed a campaign that included direct physical action, hunger strikes, and huge open-air rallies. During World War I, she declared a suffrage truce and helped to lead the war effort in England; in 1928 women became enfranchised in that country. In later life Pankhurst became a religious evangelist.

In 1936 she was created a Dame Commander of the Order of the British Empire.

frage whose 40-year campaign achieved complete success in the year of her death, when British women obtained full equality in the voting franchise. Her daughter Christabel Harriette (afterward Dame Christabel) Pankhurst (1880–1958) also was prominent in the woman suffrage movement.

In 1879 Emmeline Goulden married Richard Marsden Pankhurst, lawyer, friend of John Stuart Mill, and author of the first woman suffrage bill in Great Britain (late 1860s) and of the Married Women's Property acts (1870, 1882). Ten years later she founded the Women's Franchise League, which secured (1894) for married women the right to vote in elections to local offices (not to the House of Commons). From 1895 she held a succession of municipal offices in Manchester, but her energies were increasingly in demand by the Women's Social and Political Union (WSPU), which she founded in 1903 in Manchester. The union first attracted wide attention on Oct. 13, 1905, when two of its members, Christabel Pankhurst and Annie Kenney, thrown out of a Liberal Party meeting for demanding a statement about votes for women, were arrested in the street for a technical assault on the police and, after having refused to pay fines, were sent to prison.

From 1906 Emmeline Pankhurst directed WSPU activities from London. Regarding the Liberal government as the main obstacle to woman suffrage, she campaigned against the party's candidates at elections, and her followers interrupted meetings of Cabinet ministers. In 1908–09 Pankhurst was jailed three times, once for issuing a leaflet calling on the people to "rush the House of Commons." A truce that she declared in 1910 was broken when the government blocked a "conciliation" bill on woman suffrage. From July 1912 the WSPU turned to extreme militancy, mainly in the form of arson directed by Christabel from Paris, where she had gone to avoid arrest for conspiracy. Pankhurst herself was imprisoned, and, under the Prisoners (Temporary Discharge for Ill-Health) Act of 1913 (the "Cat and Mouse Act"), by which hunger-striking prisoners could be freed for a time and then reincarcerated upon regaining their health to some extent, she was released and rearrested 12 times within a year, serving a total of about 30 days. With the outbreak of World War I in 1914, she and Christabel called off the suffrage campaign, and the government released all suffragist prisoners.

During the war Pankhurst, who previously had made three tours of the United States to lecture on woman suffrage, visited the United States, Canada, and Russia to encourage the industrial mobilization of women. She lived in the United States, Canada, and Bermuda for several years after the war. In 1926, upon returning to England, she was chosen Conservative candidate for an east London constituency, but her health failed before she could be elected. The Representation of the People Act of 1928, establishing voting equality for men and women, was passed a few weeks before her death. Pankhurst's autobiography, *My Own Story,* appeared in 1914.

P'anmunjŏm, village, central Korea, in the demilitarized zone established after the Korean War, 5 miles (8 km) east of Kaesŏng and 3 miles (5 km) south of the 38th parallel, on the Kyŏngŭi high road (from Seoul to Sinŭiju). It was the location of the truce conference that was held for two years (1951–53) between representatives of the United Nations forces and the opposing North Korean and Chinese armies during the war. After the armistice, signed there July 27, 1953, both the liaison officers and the guards of the four countries forming the Neutral Nations Supervisory Commission (Sweden, Switzerland, Poland, and Czechoslovakia) were located there. In 1968 the U.S. intelligence ship *Pueblo* was seized off the North Korean coast by North Korean patrol boats, and its officers and crew were incarcerated and charged with espionage. P'anmunjŏm was then used as the negotiation site between the United States and North Korea, and the crew were released through the village. Subsequently, it has served as a meeting place for conferences between North and South Korea, including Red Cross conferences to establish means of communication and contact between people on either side of the truce line.

Panna, town, northern Madhya Pradesh state, central India. The town grew in importance when Chhatrasal, ruler of Bundelkhand, made it his capital in 1675. It is a trade centre for agricultural products, timber, and cloth fabrics; handloom weaving is the major industry. Buildings of historical importance include the marble-domed Swami Prān Nāth Temple (1795) and Shri Baldeoji Temple. Constituted a municipality in 1921, Panna has colleges affiliated with Awadesh Pratap Singh University.

The surrounding region comprises much of the former princely states of Panna and Ajaigarh. It consists of a hilly region known as the Panna Range, a branch of the Vindhya Range. There are important diamond mines located in Panna, which have been worked since the 17th century and are India's only producing diamond mines. Rice, wheat, sorghum, and oilseeds are the chief crops; there are several fisheries. Pop. (1981) town, 30,389; metropolitan area, 33,674.

Panneton, Philippe, pseudonym RINGUET (b. April 30, 1895, Trois-Rivières, Que., Can.—d. Dec. 29, 1960, Lisbon, Port.), French-Canadian novelist whose best-known works present the individual caught in the transition from primitive rural to modern urban life.

Panneton practiced medicine in Montreal and taught medicine at the University of Montreal. He was a cofounder of the French-Canadian Academy. From 1956 until his death, Panneton served as Canadian ambassador to Portugal. *Trente arpents* (1938; *Thirty Acres*), Panneton's major work, deals with the plight of the small French-Canadian farmer forced by the economic and social upheavals of the late 19th and early 20th centuries into migration to the city. In other novels, such as

Fausse monnaie (1947; "False Money") and *Le Poids du jour* (1948; "The Heaviness of the Day"), he continued his examination of the lives of displaced peasants. He also published a volume of short stories and two historical sketches.

Pannini, Giovanni Paolo, Pannini also spelled PANINI (b. 1691, Piacenza, Duchy of Parma and Piacenza [now in Italy]—d. 1765, Rome), the foremost painter of Roman topography in the 18th century. His real and imaginary views of the ruins of ancient Rome embody precise observation and tender nostalgia, combining elements of late classical Baroque art with those of incipient Romanticism.

His early education included instruction in the art of perspective, and he may have studied *quadratura* (scenic perspective or design) with Ferdinando Galli Bibiena. He probably began painting in Piacenza, but his early activity remains entirely conjectural. Pannini settled in Rome in 1711 and shortly thereafter entered the studio of Benedetto Luti.

In 1718–19 Pannini was admitted into the Academy of St. Luke. His reception piece, "Alexander Visiting the Tomb of Achilles" (1719), is typical of his earlier easel paintings, having small figures dwarfed by an elaborate architectural construction derived from Bolognese theatrical scenography. Many of his canvases prior to 1730 feature explicit historical or religious subjects. His frescoes at the Villa Patrizi (1718–25, later destroyed) established Pannini's fame in this field. Later decorations include those at the Palazzo Alberoni (*c.* 1725; now Senato Palazzo), displaying his talent as a quadraturist, and at Santa Croce in Gerusalemme (*c.* 1725–28).

Toward 1730 Pannini began to specialize in the depiction of Roman topography. To satisfy tourists' demands for his paintings, Pannini frequently repeated subjects yet always retained his spontaneity by varying composition and details. Pannini's oeuvre included interiors of Roman buildings, old and new; most famous are the many versions depicting the Pantheon and St. Peter's. He was admitted into the French Academy in 1732 and subsequently became its professor of perspective. His greatest pupil was Hubert Robert. In 1754 Pannini became principal of the Academy of St. Luke. He painted little after 1760.

Pannonia, province of the Roman Empire, corresponding to present western Hungary and parts of eastern Austria and northern Yugoslavia. The Pannonians were mainly of Illyrians, but there were some Celts in the western part of the province. The Roman conquest of the area began in 35 BC under Octavian (later the emperor Augustus) and was completed in 14 BC with the capture of Sirmium (Sremska Mitrovica, Yugos.), the key town of the Sava Valley. The Pannonian tribes, joined by the Dalmatians, revolted in AD 6, posing the gravest threat to Italy since Hannibal's invasion. After the revolt was put down, Pannonia was organized as a separate province and garrisoned with three legions. The emperor Tra-

jan divided the province in about AD 106. The western and northern districts comprised Pannonia Superior, which was the focal point of the Roman wars with the Marcomanni in the reign of Marcus Aurelius (161–180), who died at Vindobona (Vienna). The southern and eastern districts were organized as Pannonia Inferior under Diocletian (reigned 284–305). Pannonia Superior was divided into Pannonia Prima and Pannonia Ripariensis or Savia, and Pannonia Inferior was divided into Valeria and Pannonia Secunda.

The inhabitants of Pannonia retained their own culture into the 2nd century AD, but Romanization did proceed rapidly, especially in the west. In the 1st century AD, Emona (Ljubljana, Yugos.) and Savaria (Szombathely, Hung.) were made Roman colonies; and Scarbantia (Sopron, Hung.) and other cities were made municipia (self-governing communities). Pannonia was the birthplace of several Roman emperors of the 3rd century, and the province provided large numbers of troops for the Roman army. The grave barbarian threat in the 4th century AD forced the Romans to withdraw after 395. From that time, Pannonia ceased to exist as a separate unit.

Panofsky, Erwin (b. March 30, 1892, Hannover, Ger.—d. March 14, 1968, Princeton, N.J., U.S.), U.S. art historian whose writings are distinguished for their variety of subject, critical penetration, erudition, and rich allusiveness to literature, philosophy, and history.

Panofsky was educated at the University of Freiburg in Breisgau and was professor at the University of Hamburg from 1926 to 1933. He first went to the United States in 1931 as visiting professor at New York University, New York, and in 1935 became professor of art history at The Institute for Advanced Study, Princeton, N.J.

Among Panofsky's major works in English are *Studies in Iconology: Humanistic Themes in the Art of the Renaissance* (1939); *The Codex Huygens and Leonardo da Vinci's Art Theory* (1940); *Albrecht Dürer* (2 vol.; 1943, 3d ed., 1948), also republished, with full text and illustrations but without the handlist of Dürer's works, as *The Life and Art of Albrecht Dürer* (1955); (ed. and trans.) *Abbot Suger on the Abbey Church of St. Denis and Its Art Treasures* (1946); *Gothic Architecture and Scholasticism* (1951); *Early Netherlandish Painting, Its Origin and Character* (2 vol.; 1953); *Meaning in the Visual Arts* (1955), a collection of nine of Panofsky's most important articles and essays on a wide variety of subjects; with Dora Panofsky, *Pandora's Box: the Changing Aspects of a Mythical Symbol* (1956); *Renaissance and Renascences in Western Art* (1960); *The Iconography of Correggio's Camera di San Paolo* (1961); and *Tomb Sculpture* (1964).

panopticon, architectural form for a prison designed by Jeremy Bentham in the late 18th century. It consisted of a circular, glass-roofed, tanklike structure with cells along the external wall facing toward a central rotunda; guards stationed in the rotunda could keep all the inmates in the surrounding cells under constant surveillance. Although Bentham's novel idea was not incorporated in the plans for penal institutions built at that time, its design had some influence on future construction. For example, a prison incorporating the essential features of the panopticon was erected in the United States at Stateville, near Joliet, Ill., in the early 20th century.

panorama, in the visual arts, continuous narrative scene or landscape painted to conform to a flat or curved background, which surrounds the viewer or is unrolled before him. Panoramas are usually painted in a broad and direct manner, akin to scene, or theatrical, painting. Popular in the late 18th and 19th centuries, the panorama was essentially the

antecedent of the stereopticon and of motion pictures, especially animations and the process called Cinerama. The true panorama is exhibited on the walls of a large cylinder, the earliest version about 60 feet (18 metres) in diameter and later ones as large as 130 feet (40 metres) in diameter. The viewer, who stands on a platform in the cylinder centre, turns around and successively sees all points of the horizon. The effect of being surrounded by a landscape or event may be heightened in various ways: filling the space between the viewer and the cylinder walls with three-dimensional objects that gradually blend into the picture or the use of indirect lighting to give the illusion that light is emanating from the painting itself.

The first panorama was executed by the Scottish painter Robert Barker, who exhibited in Edinburgh in 1788 a view of that city, followed by panoramas of London and battle scenes from the Napoleonic Wars. Another early panorama painter, the American John Vanderlyn (1775–1852), painted in 1816–19 "The Palace and Gardens of Versailles" (preserved in the Metropolitan Museum of Art, New York City), exhibiting it until 1829 in a rotunda he built on a leased corner of City Hall Park in New York City. By the mid-19th century panoramas became a widespread, popular form of entertainment. Among the major works of this period was Henri Philippoteaux's "Siege of Paris," depicting an event in the Franco-Prussian War. His son Paul painted the panorama "The Battle of Gettysburg" (1883), exhibiting it in several American cities before its permanent installation in Gettysburg, Pa. At mid-century the rolled panorama, a kind of portable mural, became a popular amusement and educational device. Accompanied by a lecture and often music, the painting, on canvas and wound between two poles, would slowly be unrolled behind a frame or revealed in sections. Sometimes theatrical realism was utilized in the form of real steam, smoke, and sound effects. Among the longest and most ambitious of these rolled panoramas was one 1,200 feet (370 metres) long (deceptively advertised as three miles [nearly five kilometres] in length), depicting the landscape along the entire course of the Mississippi River, by the American John Banvard.

A higher form of panoramic art is the Chinese and Japanese traditional hand scroll painting on paper or silk.

panpipe, also spelled SYRINX, wind instrument consisting of cane pipes of different lengths tied in a row or held together by wax (metal, clay, or wood instruments are also made) and generally closed at the bottom. They are blown across the top, each providing a different note. The panpipe was widespread

in Neolithic and later cultures, especially in Melanesia and Aboriginal South America.

In the Greek legend of Pan the invention of the instrument is ascribed to the nymph Syrinx. In Europe it has been mainly a shepherd's instrument and has so endured in the Pyrenees. In Romania, however, it is played among professional *lăutari* (fiddlers); their panpipe, the *nai,* has from 19 to 22 pipes tuned diatonically (*i.e.,* to a seven-note scale), semitones being made by tilting the pipes toward the lips. The panpipe also has a long tradition in the Far East.

panpsychism (from Greek *pan,* "all"; *psychē,* "soul"), a philosophical theory asserting that a plurality of separate and distinct psychic beings or minds constitute reality. Panpsychism is distinguished from hylozoism (all matter is living) and pantheism (everything is God). For Gottfried Wilhelm Leibniz, the 17th-century German philosopher and a typical panpsychist, the world is composed of atoms of energy that are psychic. These monads have different levels of consciousness: in inorganic reality they are sleeping, in animals they are dreaming, in man they are waking; God is the fully conscious monad.

In 19th-century Germany, Arthur Schopenhauer asserted that the inner nature of all things is will—a panpsychistic thesis; and Gustav Theodor Fechner, founder of experimental psychology and ardent defender of panpsychism, contended that even trees are sentient and conscious. In the United States, Josiah Royce, an absolute Idealist, not only followed Fechner in affirming that heavenly bodies have souls but also adopted a unique theory that each species of animal is a single conscious individual—incorporating into itself the individual souls of each of its members.

Among other 20th-century philosophers, Alfred North Whitehead may fittingly be called a panpsychist inasmuch as in his philosophy each actual entity is capable of prehensions that involve feelings, emotions, consciousness, and so on.

pansy, any of several popular violets (*Viola* species), of the family Violaceae. Native to Europe, the wild, or field, pansy (*Viola tricolor*) is ancestor to one of the oldest cultivated flowering plants. It is an annual or a short-lived perennial and grows about 15 to

30 centimetres (6 to 12 inches) tall. It has heart-shaped or rounded leaves at the base and oblong or oval leaves growing from the stems. The velvety flowers, usually in combinations of blue, yellow, and white, are about 2.5 to 5 cm across and have five petals. Four petals are in pairs; the fifth has a short spur. The plant grows best in rich soil in a damp, cool climate.

The cultivated, or garden, pansy (*V. wittrockiana*) is a hybrid of *V. tricolor* with such species as *V. cornuta,* the tufted pansy or horned viola, *V. lutea,* and *V. altaica.* The wild pansy (*V. tricolor*), also known as johnny-jump-up, heartsease, and love-in-idleness, has been widely naturalized in North America. The flowers of this form are mostly purple and less than 2 cm across.

Pantaloon, Italian PANTALONE, stock character of the 16th-century Italian commedia dell'arte; he was a cunning and rapacious yet often deceived Venetian merchant. The name is thought to be derived from the phrase *pianta leone* (Italian: "plant the lion") referring to the Lion of St. Mark, the emblem of the Venetian flag.

red breeches and stockings, a pleated black cassock, slippers, and a soft brimless hat. Later versions of the character sometimes wore long trousers (pantaloons). His mask was gaunt and swarthy with a large hooked nose, and he had a disorderly gray goatee.

The humour of the role stemmed from Pantaloon's avarice and his amorous entanglements. An abject slave to money, he would starve his servant until he barely cast a shadow. If he discharged him, he made certain to do so before dinner. If married, he was a foil for his wife, who was young, pretty, disrespectful, and completely untrustworthy, and for the intrigues and deceits of his daughters and servant girls. Although anxious about his reputation, he engaged in flirtations with young girls who openly mocked him.

In the Italian commedia, Pantaloon was frequently paired with Dottore (*q.v.*) as a parent or guardian of one of the lovers. The French variant evolved from Pantalone when the commedia dell'arte companies played in France. In Elizabethan England, Pantaloon came to mean simply an old man. In 18th-century London, Pantaloon, minus his long coat, was one of the characters of the harlequinade (*q.v.*), the English pantomime version of the commedia dell'arte.

Pantanal, floodplain, northwestern Mato Grosso do Sul and southern Mato Grosso states, southwestern Brazil, extending about 100 mi (160 km) along the eastern bank of the upper Paraguay River. The swampy, marshland region is traversed by several tributaries of the Paraguay, including the São Lourenço and the Taquari. The Pantanal is frequently flooded, but its rich grazing lands support cattle raising.

Pantar Island, Bahasa Indonesia PULAU PANTAR, also called PANDAI, island in the Alor group, Nusa Tenggara Timur *propinsi* (East Nusa Tenggara province), Indonesia. Pantar lies about 45 mi (72 km) north of Timor, across the Selat (strait) Ombai. It is 30 mi long north–south, 7 to 18 mi wide east–west, and has an area of 281 sq mi (728 sq km). Most of the island is flat except for a hilly area in the northeast that rises to a height of about 3,000 ft (914 m). Rainfall is heavy but intermittent, and there is a dry season. Most of the population is engaged in agriculture, producing rice, corn (maize), and cotton. There are coconut plantations along the coast. Livestock is raised on the grasslands that cover much of the island, and there is considerable deep-sea fishing. Industry includes batik printing, wood carving, and the making of musical instruments. Transport is mostly by boat to other islands in the Alor group and to Timor Timur province. The population is mostly Muslim, together with a few Christians. The chief towns are Kabir and Kayan.

Pantelleria Island, Italian ISOLA DI PANTELLERIA, Latin COSSYRA, Italian island in the Mediterranean Sea between Sicily and Tunisia; it forms part of Trapani province, Sicily. Of volcanic origin, it rises to 2,743 ft (836 m) at the extinct crater of Magna Grande and has an area of 32 sq mi (83 sq km). The last eruption (underwater to the west of the island) took place in 1891, but hot mineral springs and fumaroles testify to continued volcanic activity. The island is fertile but lacks fresh water. A fortified Neolithic village (*c.* 3000 BC) has been excavated on the west coast, with remains of huts, pottery, and obsidian tools. To the southeast are tombs, known as *sesi,* similar to the *nuraghi* of Sardinia, comprising rough lava towers with sepulchral chambers in them. After a considerable interval, during which the island probably remained uninhabited, the Phoenicians established a trading station there in the 7th century BC. Later controlled by the Carthaginians, it was occupied by the Romans in 217 BC. Under the Roman Empire it served as a place of banishment. About AD 700 the Christian population was annihilated by the Arabs, from whom the island was taken by the Norman Roger II of Sicily in 1123. The Spanish Requesens family were princes of Pantelleria from 1311 until the town of Pantelleria was sacked by the Turks in 1553. The island's strategic situation in the narrow passage separating the eastern and western Mediterranean induced the Italian government of Benito Mussolini to fortify it as a base, from which Allied convoys were attacked in World War II. The installations and the town of Pantelleria were destroyed by intensive Allied air assault in 1943.

The main occupations are fishing and farming, and sweet wine and raisins are exported. The chief town, Pantelleria, is on the northwest, on the sole harbour; there is also a penal colony located there. Pop. (1981 prelim.) mun., 7,860.

pantheism, the doctrine that the universe conceived of as a whole is God and, conversely, that there is no God but the combined substance, forces, and laws that are manifested in the existing universe. The cognate doctrine of panentheism asserts that God includes the universe as a part though not the whole of his being.

A brief treatment of pantheism and panentheism follows. For full treatment, *see* MACROPAEDIA: Religious and Spiritual Belief, Systems of.

The adjective pantheist was coined by the Rationalist freethinker John Toland in his book *Socinianism Truly Stated* (1705). The noun pantheism was first used a few years later by one of Toland's opponents. K.C.F.

Krause introduced the term panentheism in 1828 as a designation for his own philosophy. Both of these terms have been applied retrospectively to aspects of numerous philosophical traditions, both Eastern and Western.

There are several discernible types of pantheism, ranging from those that attribute consciousness to nature as a whole (panpsychism) to those that interpret the world as merely an appearance and ultimately unreal (acosmic pantheism), and from the rational Neoplatonic or emanationistic strain to the intuitive, mystical strain. A mingling of these types characterizes Hindu and Buddhist doctrines; pantheism of one form or another is deeply rooted in the *Vedas*, the *Upaniṣads*, and the *Bhagavadgītā*. Numerous Greek philosophers, notably Xenophanes, Heracleitus, Anaxagoras, Plato, Plotinus, and the proponents of Stoicism, contributed to the foundations of Western pantheism. Through Neoplatonism and Judeo-Christian mysticism, the tradition was continued in the medieval and Renaissance periods by John Scotus Erigena, Meister Eckehart, Nicholas of Cusa, Giordano Bruno, and Jakob Böhme.

It was at the advent of the modern era in Western philosophy that the Jewish rationalist Benedict Spinoza (1632–77) formulated the most thoroughly pantheistic system. Spinoza insisted that there could be by definition only one unlimited substance possessing an infinitude of attributes. Therefore, God and Nature are but two names for one identical reality; otherwise, God-and-world would be a greater totality than God alone. The necessity of God thus implies the necessity of the world and precludes any possibility of freedom.

Pantheism has traditionally been rejected by orthodox Christian theologians because it is interpreted to obliterate the distinction between the creator and creation, to make God impersonal, to imply a purely immanent rather than transcendent deity, and to exclude human and divine freedom. In the words of Samuel Johnson, the doctrine "confounds God with the universe."

Panentheism constitutes a middle way between the denial of individual freedom and creativity, characterizing many of the varieties of pantheism, and the remoteness of the divine, characterizing classical theism. Although elements of quasi-panentheism reach as far back as Plato's *Laws*, it is in 19th-century German Idealism (Johann Gottlieb Fichte, Friedrich Wilhelm Joseph von Schelling, Georg Wilhelm Friedrich Hegel) and 20th-century process philosophy (Alfred North Whitehead) that the doctrine receives systematic elaboration. Charles Hartshorne, a follower of Whitehead, provided the definitive theological analysis of panentheism, based upon the analogy of an organism (God) comprising individual, semiautonomous cells (all known and unknown constituents of reality).

Pantheon, in Rome, building begun in 27 BC by the statesman Marcus Vipsanius Agrippa, probably as a building of the ordinary classical temple type—rectangular with a gabled roof supported by a colonnade on all sides. It was completely rebuilt by the emperor Hadrian sometime between AD 118 and 128, with some alterations made in the early 3rd century by the emperors Lucius Septimius Severus and Caracalla. It is a circular building of concrete faced with brick, with a great concrete dome rising from the walls and a front porch, probably reassembled from Agrippa's building by Severus or Caracalla, of Corinthian columns supporting a gabled roof with triangular pediment. Beneath the porch are huge bronze double doors, 24 feet (7 m) high, the earliest-known large examples of this type.

Pantheon, Rome, begun by Agrippa in 27 BC, completely rebuilt by Hadrian *c.* AD 118–*c.* 128
Frederico Arborio Mella

The Pantheon is remarkable for its size, its construction, and its design. The dome was the largest built until modern times, measuring about 142 feet (43 m) in diameter and rising to a height of 71 feet (22 m) above its base. There is no external evidence of brick arch support inside the dome, except in the lowest part, and the exact method of construction has never been determined. Two factors, however, are known to have contributed to its success: the excellent quality of the mortar used in the concrete and the careful selection and grading of the aggregate material, which ranges from heavy basalt in the foundations of the building and the lower part of the walls, through brick and tufa (a stone formed from volcanic dust), to the lightest of pumice toward the centre of the vault. In addition, the uppermost third of the drum of the walls, seen from the outside, coincides with the lower part of the dome, seen from the inside, and helps contain the thrust with internal brick arches. The drum itself is strengthened by huge brick arches and piers set above one another inside the walls, which are 20 feet (6 m) thick.

The porch is conventional in design, but the body of the building, an immense circular space lit solely by the light that floods through the 27-foot (8-metre) "eye," or oculus, opening at the centre of the dome, was revolutionary; possibly this was the first of several great buildings of antiquity that were designed to favour the interior rather than the exterior. In contrast with the plain appearance of the outside, the interior of the building is lined with coloured marble; the walls are marked by seven deep recesses, screened by pairs of columns whose modest size gives scale to the immensity of the rotunda. Rectangular coffers, or indentations, were cut in the ceiling probably under Severus and decorated with bronze rosettes and molding.

The Pantheon was dedicated in AD 609 as the Church of the Santa Maria Rotonda, or ad Martyres, which it remains today. The bronze rosettes and moldings of the ceiling and other bronze embellishments have disappeared in the course of time, and a frieze of stucco decoration was applied to the interior directly beneath the dome in the late Renaissance. Otherwise, the building exists entirely in its original form.

Panthéon, in Paris, building begun about 1757 by architect Jacques-Germain Soufflot as the Church of Sainte-Geneviève to replace a much older church of that name on the same site. It was secularized during the French Revolution and dedicated to the memory of great Frenchmen, receiving the name Panthéon. Its design exemplified a general movement (Neoclassicism) to return to a strictly logical use of classical architectural elements. The Panthéon is a cruciform building with a high dome over the crossing and lower saucer-shaped domes (covered by a sloping roof) over the four arms. The facade, like that of the Roman Pantheon, is formed by a porch of Corinthian columns and triangular pediment attached to the ends of the eastern arm.

The interior is decorated with mosaics and paintings of scenes from French history, some of which were executed by Puvis de Chavannes. The pediment has sculptures by Pierre-Jean David d'Angers of post-Revolutionary patriots. The Panthéon was reconsecrated and resecularized several times during the 19th century, serving as a church in 1828–30 and in 1851–70. Today it is a civic building.

panther, either of two mammals of the cat family (Felidae), the leopard or the puma (*qq.v.*).

panting, a method of cooling, used by many mammals, most birds, and some reptiles, accomplished by means of the evaporation of water from internal body surfaces. As the animal's body temperature rises, its respiration rate increases sharply; cooling results from the evaporation of water in the nasal passages, mouth, lungs, and (in birds) air sacs. Like other forms of evaporative cooling (*e.g.,* perspiration), panting expends large amounts of water, which must be replaced if the animal is to maintain effective heat regulation.

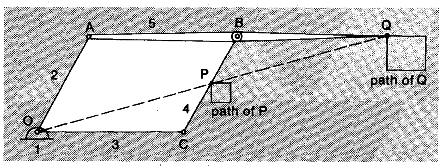
pantograph, instrument for duplicating a motion or copying a geometric shape to a reduced or enlarged scale. It consists of an assemblage of rigid bars adjustably joined by pin joints; as the point of one bar is moved over the outline to be duplicated, the motion is translated to a point on another bar, which makes the desired copy according to the predetermined scale. In the Figure the links 2, 3, 4, and 5 are connected by pin joints at O, A, B, and C. Joint O is fixed to a support, while joints A, B, and C are free to move. Link 5 is a solid bar continuing on to Q. Point P is the guided point and is usually fixed on link



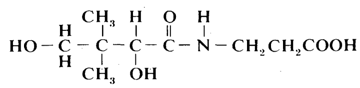
Pantograph

4. As P is guided on a specific path, such as the square in the Figure, point Q will follow a similar path on an enlarged scale. Conversely, if point Q is guided, point P will follow a similar path on a reduced scale.

The links in a pantograph may be arranged in other ways, but they all contain a parallelogram. Pantographs are used for reducing or enlarging engineering drawings and maps and for guiding cutting tools over complex paths. Artists specializing in miniatures use pantographs to achieve greater detail in their finished works.

pantomime: *see* mime and pantomime.

pantothenic acid, a water-soluble vitamin essential in animal metabolism. Pantothenic acid, a growth-promoting substance for yeast and certain bacteria, appears to be synthesized by intestinal flora in the higher animals. The vitamin, although widespread in nature—especially in yeasts, liver, kidney, and eggs—does not occur in a free form in animal tissues. The nature of the bound form was clarified through the discovery and synthesis (1947–50) of the compound pantetheine, which contains pantothenic acid combined with the compound thioethanolamine. Pantetheine is part of two larger compounds (coenzyme A and acyl-carrier protein) that promote a large



number of metabolic reactions essential for the growth and well-being of animals. In the absence of pantothenic acid (or its dietary equivalents: pantetheine, coenzyme A, or acyl-carrier protein), experimental animals fail to grow, develop skin lesions, and frequently show a graying of the hair. A dietary deficiency severe enough to lead to clear-cut disease has not been described in humans.

Pánuco River, Spanish RÍO PÁNUCO, river in Veracruz *estado* ("state"), east-central Mexico. Formed by the junction of the Moctezuma and Tamuín rivers on the San Luis Potosí–Veracruz state line, the Pánuco meanders generally east-northeastward past the town of Pánuco to the Gulf of Mexico about 6 miles (10 km) below Tampico. Just upstream from Tampico and Ciudad Madero, the Pánuco is joined by the Tamesí, which forms the Veracruz–Tamaulipas border. Principal headstreams of the Pánuco include the Santa María, which arises in the inland plateau near San Luis Potosí and becomes the Tamuín as it descends from the Sierra Madre Oriental, and the Moctezuma, which flows through the mountains from southern Querétaro state. The river system (316 miles [508 km] long including the Santa María) has considerable economic importance. It has served to drain Texcoco (*q.v.*) and other interior lakes via a system of tunnels and channels; its waters are used to irrigate the fertile La Huasteca lowlands, and its lower course is navigable (ocean vessels can be accommodated at Tampico).

Panuridae, family of songbirds, order Passeriformes, consisting of the parrotbills and bearded tits, about 19 species of small titmouselike birds found in the thickets of temperate Eurasia.

Members range in size from 10 to 17.5 cm (4 to 7 inches) long. They are distinguished (except for the bearded tit) from all other songbirds by having a sideways flattened bill, like that of a parrot. They are active in flocks, as they wander through brush and thickets, hunting seeds, berries, and small insects.

Formerly considered a subfamily (Paradoxornithinae) of the babbler family (Timaliidae) or a subfamily (Panurinae) of the Old World flycatcher family (Muscicapidae), they have also been raised to the family Paradoxornithidae. Their true status is still problematic.

The Panuridae belongs to the songbird suborder (Passeres).

Panyassis (fl. 5th century BC, Ionia), epic poet from Halicarnassus, on the coast of Asia Minor. The Roman rhetorician Quintilian stated that some later critics regarded Panyassis' work as being second only to Homer. His chief poems, extant only in fragments, were the *Heracleia,* describing the mythical adventures of the hero Heracles (Hercules), and the *Ionica,* relating the founding of Ionic Greek colonies in Asia Minor.

Panza, Sancho, Don Quixote's squire in the novel *Don Quixote* by Cervantes, a short, potbellied peasant whose gross appetite, common sense, and vulgar wit serve as a foil to the mad idealism of his master. He is famous for his many pertinent proverbs. Cervantes used the psychological differences between the two characters to explore the conflict between the ideal and the real and based much of his novel's narrative development on their personal relationship.

panzer division, German PANZERDIVISION ("armoured division"), a self-contained, combined-arms military unit of the German army, built around and deriving its mission largely from the capabilities of armoured fighting vehicles. A panzer division in World War II consisted of a tank brigade with four battalions; a motorized infantry brigade with four rifle battalions; an artillery regiment; and reconnaissance, antitank, and engineer battalions and service units. Early in the war the panzer divisions used mostly light tanks, and later mostly medium tanks.

The first three panzer divisions were created in October 1935, and by the outbreak of war in 1939 there were six. Panzer divisions formed the decisive striking force of the German army in the campaigns against Poland in 1939, The Netherlands, Belgium, Luxembourg, and France in 1940, and the Balkans and the Soviet Union in 1941. In the campaign against France, there were 10 panzer divisions incorporating all the German tanks in that campaign—2,574 out of the 3,400 tanks that Germany possessed. After the French campaign the number of panzer divisions was doubled, and in 1941 17 of them, grouped in four panzer armies, spearheaded the German invasion of the Soviet Union.

Since World War II, despite the acquisition of more advanced weapons and changes in ratios among constituent elements, the panzer division's mission has not undergone significant change. It remains the principal offensive element of the German army.

p'ao, wide-sleeved robe of a style worn by Chinese men and women from the Han dynasty (206 BC–AD 220) to the end of the Ming dynasty (1644). The *p'ao* was girdled about the waist and fell in voluminous folds around the feet. From the T'ang period (618–907), certain designs, colours, and accessories were used to distinguish rank; the emperor, for example, wore a dark-coloured *p'ao* on which the 12 imperial symbols were displayed, and the *p'ao* worn by officials was red with large squares containing symbolic birds or animals ("mandarin squares") on the breast.

When the Manchus overthrew the Ming, it was decreed that a new style of dress should replace the *p'ao*. The *p'ao* style, which had been adopted by the Japanese court in the 8th century, has been basically retained in the Japanese kimono.

Pao-chi, Pinyin BAOJI, city in western Shensi *sheng* (province), China. Situated on the north bank of the Wei River, it has been a strategic and transportation centre since early times, controlling the northern end of a pass across the Tsinling Mountains, the only practicable route from the Wei valley into Szechwan province and the upper valley of the Han River. It is also at the western end of the intensively cultivated Wei valley and is at the centre of a network of routes into Kansu province and the Ningsia Hui autonomous region.

Surrounded by mountains to the south, north, and west, it was the major western defensive outpost of the metropolitan district around Sian (Ch'ang-an) in early times. Under the T'ang dynasty (618–907) in the 7th century, it was first given the name Pao-chi, which it has retained ever since; at the same time, the county seat was moved to its present site from its former position some 8 miles (13 km) to the northeast.

Pao-chi's modern importance has resulted from its improved communications. The Lunghai Railway was extended from Sian to Pao-chi on the eve of the war in 1937 and was subsequently extended westward to T'ien-shui by 1947. Since 1949 this railway has been extended to Lan-chou, where it links with the trunk line into central Asia and with the northern line to Pao-t'ou (Inner Mongolia) and Peking. In 1958 a further rail link (later electrified) was completed from Pao-chi southwest to Ch'eng-tu in Szechwan, where it links with the various new railways of the southwest. China's first electrified rail line was completed between Pao-t'ou and Ch'eng-tu in the late 1960s.

Pao-chi is an important commercial centre, collecting goods from a wide area, and has some industry, in particular, cotton textiles, metallurgy, machinery, electronics, and chemicals. Pop. (1988 est.) 301,000.

pao-chia, Pinyin BAOJIA, traditional Chinese system of collective neighbourhood organization, by means of which the government was able to maintain order and control through all levels of society, while employing relatively few officials.

A collective neighbourhood guarantee system was first instituted during the Warring States Period, when groups of 5 households formed a *wu.* This method of organization was revived in a different form during the Northern Wei dynasty (AD 386–534/535) but did not take on the name by which it is now known until the Sung dynasty (960–1279), when a *pao-chia* system was instituted by the great reformer Wang An-shih as a military measure. Under Wang's scheme, 10 households formed a *pao,* and 5 *pao* a *ta-pao.* Each *pao-chia* was made responsible for supplying the government with a certain number of trained and armed militiamen.

During the Ming dynasty (1368–1644), the *pao-chia* system often coincided with the *li-chia* (*lijia*) system, which had been established for the collection of land and labour taxes. But it also began to assume the separate function of overseeing the moral conduct of members of the community. The Ch'ing dynasty (1644–1911) perfected the system. Under the Ch'ing, a *pao-chia* unit ideally consisted of 10 families formed into a *chia* and 10 *chia*s formed into a *pao,* all under the supervision of an elected chief. The chief of each unit was responsible for preserving the public order; he also maintained the local census records and acted as an intelligence agent for the central government. *Pao-chia* organization began to deteriorate about the middle of the 19th century, when central control over local government began to erode.

From November 1934 until 1949, when the People's Republic was established, the *pao-chia* system was practiced throughout China.

Pao-ting, Pinyin BAODING, city, Hopeh *sheng* (province), China. It is situated on the edge of the North China Plain at the foot of the Wu-hui Mountains, a section of the T'ai-hang Mountains, and stands on the Tang River, a tributary of the Ta-ch'ing River. Situated on the main road from Peking through western Hopeh, it is southwest of the capital, roughly midway between Peking and Shih-chia-chuang. To the west, a route leads into northern Shansi *sheng* via the Lung-ch'üan Pass.

Pao-ting is in an area of old-established settlement. Before the Ch'in dynasty (221–206 BC) it was part of the state of Chao. During the period to AD 581, counties of various names were established in the district and formed parts of a variety of higher administrations. In 581 the Sui dynasty (581–618) changed the county's name to Ch'ing-yüan, which it retained until 1958. The area was of major strategic importance from early times. During the T'ang dynasty (618–907) it was the headquarters of one of the armies guarding the northeastern frontier against the Khitan, a Ural-Altaic people, and it later became a key garrison for government forces defending access to Shansi against the autonomous provinces of Hopeh. During the Five Dynasties (907–960) and the early years of the Sung dynasty (960–1126) it was a military prefecture on the contested border between the Sung and the Liao in the north. Under the Yüan (Mongol) dynasty (1279–1368) the area it administered became Pao-ting Circuit (*lu*). The transfer of the capital to Peking in Yüan and Ming (1279–1644) times meant a reversal of its strategic role so that it became the chief defensive bastion protecting Peking against attack from the south or incursions over the passes of the T'ai-hang Shan. Under the Ming it was the administrative centre of the Pao-ting Prefecture (*fu*), and under the Ch'ing dynasty (1644–1911) it became even more important. It was both the seat of the provincial government of Chihli and also the alternative seat, with Tientsin, of the military governor of Chihli. The city was heavily fortified, with walls more than 5 mi (8 km) in circumference, enclosing the government offices of the province, the military governor's offices, extensive barracks, and a military academy.

Although Pao-ting was primarily an administrative city, with extensive service industries, it was also a notable centre of learning. Under the Ming and Ch'ing it had many well-known schools, and in the reign of the emperor Yung-cheng (1723–35) a famous library, the Lien-ch'ien Shu-yüan, was founded there, which later became the Hopeh Library.

As a communication centre, it also had commercial importance. It was the centre of a rather dense road network and in 1905 was joined to Peking and Tientsin, and later to Han-k'ou, by the Peking to Wu-han railway. It was also a commercial centre, collecting grain, wool, cloth, cotton, cottonseed oil, and various agricultural products.

The city maintained its administrative importance both under the Japanese occupation before and during World War II and under the Communist government that came to power in 1949. Until 1958 it remained the provincial capital and the seat of the Hopeh People's Assembly. In that year the provincial administration was transferred to Shih-chia-chuang, and the name of the city was formally changed from Ch'ing-yüan to Pao-ting. The city has continued to grow, however. There are a number of light industrial plants, mostly small scale, as well as a medium-sized thermal generating plant. In the drive for fertilizer production in the mid-1960s, an ammonium carbonate plant was built there. Pop. (1953) 197,000; (1958 est.) 250,000; (1980 UN est.) 621,000.

Pao-t'ou, Pinyin BAOTOU, city in the Inner Mongolian Autonomous Region of China. A prefecture-level municipality, Pao-t'ou is situated on the north bank of the Huang Ho (Yellow River) on its great northern bend. The river and its upper tributaries are navigable westward as far as Hsi-ning in Tsinghai Province and Lan-chou in Kansu Province, but southward the main stream is impeded by rapids.

Pao-t'ou is of comparatively recent origin. Although the region was colonized and garrisoned during the T'ang dynasty (618–907), it was afterward occupied by Mongol tribes, and as late as the 1730s Pao-t'ou was merely a hamlet. As the Ch'ing dynasty (1644–1911) strengthened its grip on the Mongol border regions, Pao-t'ou gradually developed into a market town. It was walled in 1871 and eventually given the status of an administrative county in 1925.

Its modern growth began with the construction of a railway link with Peking, completed in 1922. It then grew rapidly into a major commercial centre for trade with Mongolia and with Northwest China, controlling a marketing area including most of what is now Ningsia Hui Autonomous Region, Kansu, Tsinghai, and parts of the Mongolian People's Republic. Exports were mostly hides, wool, and felt; chief imports were cloth, grain, drugs, and tea. The wool and hides collected by local merchant firms and by traders from Peking and Tientsin were transported to Tientsin for export. The area along the northern loop of the Huang Ho had been colonized by Chinese settlers from the 1880s onward, and Pao-t'ou became the major commercial centre for this Chinese community. The city grew rapidly, and during the Japanese occupation (1937–45) Pao-t'ou was a centre of the autonomous government of Meng-chiang. The Japanese began the development of light industry there and also discovered rich coal and mineral deposits nearby.

After 1949 Pao-t'ou was completely transformed. Its rail link with Peking, destroyed during the Chinese Communist Revolution in 1949, was restored in 1953 and double-tracked in the late 1950s. In 1955 construction was begun of a line following the Huang Ho to Lan-chou, where it now connects with other rail links to Szechwan Province, to central China, and to Wu-lu-mu-ch'i in the Sinkiang Uigur Autonomous Region. Under the First Five-Year Plan (1953–57), Pao-t'ou was the site of a major integrated iron and steel complex, based on the rich iron-ore deposits at Pai-yün-o-po to the north, with which it has been linked by rail; on coking coal from Shih-kuai-kou in the Ta-ch'ing Shan; and on local limestone. The complex was part of the move to relocate heavy industry centres away from the coastal zone. The completion of the industrial installation was announced in 1961, but full operation was not achieved until the late 1960s, allegedly because of the withdrawal of Soviet advisers and non-delivery of Soviet equipment.

An aluminum industry based on the use of large thermal generating plants and a local sugar-refining industry have also been developed. Pao-t'ou has become one of China's chief industrial centres and constitutes a major industrial base not merely for Inner Mongolia and the Northwest but also for China as a whole. Although its growth has been phenomenal, some of it is due to the expansion of the municipal area to include the coal mines to the east and the iron and steel complex to the west. Pop. (1983 est.) 1,042,000.

Pao-t'ou carpet, floor covering handwoven in Pao-t'ou, in the Inner Mongolian Autonomous Region of China, noted for its high-quality of workmanship and materials. The designs usually consist of landscapes or religious symbols, although horse, stag, lion, and dragon motifs are also used.

Pao-t'ous are executed in fine wool dyed blue, brown, red, and beige. The foundation weave is of cotton.

Paola, also spelled PAWLA, or PAULA, town, eastern Malta, just south of Valletta and adjacent to Tarxien to the southeast. Founded in 1626 by the Grand Master of the Hospitallers (Knights of St. John of Jerusalem), Antoine de Paule, it remained a small village until the late 19th century, when it grew rapidly as a residential district for workers from the adjacent Grand Harbour dockyards. It has a well-preserved Neolithic temple and the Hal Saflieni Hypogeum (catacombs), discovered in 1902. Pop. (1983 est.) 12,362.

Paoli, Pasquale (b. April 26, 1725, Stretta di Morosaglia, Corsica—d. Feb. 5, 1807, London), Corsican statesman and patriot who was responsible for ending Genoese rule of Corsica and for establishing enlightened rule and reforms.

The son of Giacinto Paoli, who led the Corsicans against Genoa from 1735, Pasquale followed his father into exile at Naples in 1739,

studying at the military academy there and preparing to continue the fight for Corsican independence. In 1755 he returned to Corsica and, after overcoming the Genoese faction, was elected to executive power under a constitution more democratic than any other in Europe. For the next nine years, under the principles of enlightened despotism, he transformed Corsica, first by suppressing the system of vendetta and substituting order and justice, then by encouraging mining, building up a naval fleet, and instituting national schools and a university. At the same time he continued the war, first against Genoa and after 1764 against Genoa's ally, France. France bought Corsica in 1768 and invaded the island and defeated the nationalists in 1769. Paoli fled to England, received a pension from George III, and lived in London for the next 20 years.

Appointed lieutenant general and military commandant during the French Revolution, Paoli returned to Corsica in July 1790. Breaking with France in 1793, he once more led the fight for independence and, with British naval support, expelled the French in 1794. He then offered the sovereignty of Corsica to George III, who accepted and sent Sir Gilbert Elliot as viceroy. Elliot in turn chose not Paoli but Pozzo di Borgo as his chief adviser. Disappointed and not wishing to cause internal strife, Paoli retired to England in 1795, where he received a British government pension.

Paolo (Italian personal name): *see under* Paul, except as below.

Paolo UCCELLO, original name PAOLO DI DONO (painter): *see* Uccello, Paolo.

Paolo, Veneziano, also called MASTER PAOLO (b. *c.* 1300?, Venice—d. Sept. 1362, Venice), a principal Venetian painter of the Byzantine style in 14th-century Venice. Paolo and his son Giovanni signed a "Coronation of the Virgin" (Frick Collection, New York City) in 1358 that is the last known work by him. A second "Coronation of the Virgin" (National Gallery, Washington, D.C.), which is dated 1324, is also attributed to Paolo. Other known works of Paolo's are dated 1333, 1347, and 1353.

Paolo's style exhibits the conventional

gold-threaded draperies, flat space, and static compositions of the Byzantine style, but in some of his works an Italian-inspired fluidity is evident.

Paolozzi, Eduardo (Luigi) (b. March 7, 1924, Leith, near Edinburgh), British sculptor, considered one of the most radical artists of his period in Great Britain.

Born of Italian parents, Paolozzi attended Edinburgh College of Art (1943) and the Slade School of Art in London (1944–47). Paolozzi avoided the dominant influence of Henry Moore and, while working in Paris in the late 1940s, was most strongly affected by Giacometti and Klee, as well as Dadaism and Surrealism. His early sculptures juxtaposed insect and marine images in cement relief.

His mature work, usually of bronze, steel, or other alloys, fuses engineering concepts with a traditional idea of the human figure. The semiabstract totemic sculptures suggest robots with stylized anatomical features—*e.g.*, "Japanese War God" (1958) and "Medea" (1964).

In addition to doing sculpture, Paolozzi makes prints and textile designs, and in 1983 he completed a series of mosaic panels that were highly praised by the London Arts Council. He was elected to the Royal Academy of Arts in 1979.

papacy, the system of central government of the Roman Catholic Church, the largest of the three major branches of Christianity, presided over by the pope, the bishop of Rome.

A brief treatment of the papacy follows. For full treatment, *see* MACROPAEDIA: Roman Catholicism.

The papal system, which has not gone undisputed, developed over the centuries since the early church until 1870 when the first Vatican Council officially defined as a matter of faith the absolute primacy of the pope and his infallibility when pronouncing on "matters of faith and morals." According to this definition, the pope exercises judicial, legislative, and executive authority over the church as the direct successor of St. Peter, who is thought to have been the head of the apostles and the first bishop of Rome. His authority rested on the words of Jesus quoted in Matthew 16:18–19 and elsewhere which have been interpreted as giving him authority in Heaven and on Earth in the place of Jesus. The early history of the papacy can be told as the history of the development of this Petrine theory, and the later history as the development of the claim to both spiritual and temporal authority over Christian society.

Though it is probable that St. Paul was martyred in Rome, there is no historical evidence that St. Peter was the first leader of the church of Rome nor that he was martyred there during a persecution of the Christians (*c.* AD 67). By the end of the 1st century, however, the see of Rome seems to have been accorded a place of honour among the bishoprics claiming apostolic foundation, perhaps because of Rome's claim to the graves of both Peter and Paul, its many martyrs and defense of what has triumphed as orthodoxy, and its status as the capital of the Roman Empire.

In the middle of the 3rd century, Pope Stephen I (reigned 254–257) and St. Cyprian, bishop of Carthage, clashed over Stephen's claim to exercise doctrinal authority over the universal church. In the 4th and 5th centuries, the growing power of the see of Constantinople as the capital of the Eastern Empire challenged that of Rome. Over Pope Leo I's objections, the Council of Chalcedon, called by the Eastern emperor in 451 and largely directed by him, accorded the patriarch of Constantinople the same primacy in the East as Rome held in the West. This was the first decisive demonstration of the Eastern Church's historic rejection of Rome's claim to hegemony based on the Petrine theory, which culminated in the final schism between the two churches in 1054.

During the next centuries of increasing political chaos, popes were often forced to trade their spiritual power for imperial protection. After the demise of effective Roman or Byzantine imperial control over Italy, the Roman pope became the representative of Roman imperial glory to the new Frankish and other German kingdoms. Stephen II (reigned 752–757) and other popes, in linking the fate of the Roman primacy to the support of Charlemagne and his house, gained a powerful protector and, through the Donation of Constantine forgeries, temporal power in Italy. However, they did not gain the freedom to exercise the spiritual power over the universal church for which they had hoped, since Charlemagne and his successors ignored the pope's claim to the right to crown the emperor and instead followed in the footsteps of their Byzantine and Roman predecessors by asserting a large measure of control over the Frankish church and the papacy itself.

During the late 9th and 10th centuries, the decadence of the papal court and political conditions in Italy led to the virtual takeover of the papacy by the German emperors. By 1049 the papacy's desperate need for reform was met in the person of Pope Leo IX, a reformer whose attitudes had been shaped in Burgundian and Lorraine monastic reform movements. A significant point in the so-called Gregorian reform begun by Leo, and in the history of the papacy itself, was the Investiture Conflict, which was precipitated by Gregory VII (Hildebrand) in 1075 when he threatened to excommunicate any civil ruler who attempted to invest the holder of an ecclesiastical office with the symbols of power, a practice which emphasized the control the lay ruler had over the selection and operation of bishops and local clergy. In this assertion the papacy committed itself to a course which it would be unable to maintain.

Continuing the legacy of Gregory VII, later popes seriously meddled in political issues in an attempt to prove the validity of papal monarchy, rather than mere papal leadership, of Christian society. Thirteenth-century centralization of administrative as well as jurisdictional power in the Curia (the body of officials surrounding the pope) led to increasing financial difficulties and eventually to the practice of "selling" benefices and other church services. This and other corruptions of the papal court, as well as the "Babylonian Captivity" of the papacy at Avignon, France (1309–77), led to both the conciliar movement, an attempt by bishops to regain control over the church, and loud calls for sacramental and organizational reform.

The Renaissance popes, most of whom were too involved in political and financial alliances to do more for the church than patronize the arts, were unable to deal with or to understand the significance of the Protestant Reformation of the 16th century. In the aftermath of the schism, the papacy finally acceded to demands for reform by calling the Council of Trent (1545), which instituted what has been called the Counter-Reformation. The theological and ecclesiastical decisions of this council largely determined the shape of the Catholic Church until the second half of the 20th century.

The alignment of the papacy with conservative political forces during the 19th century resulted in the loss of liberal and modernizing influences within the church and the loss of the Papal States to the new Kingdom of Italy. Divested of its temporal power, the papacy increasingly turned to its spiritual or teaching authority to retain control over Catholics, proclaiming infallibility and espousing the Ultramontane position (the idea that the pope is the absolute ruler of the church). A generally unfavourable view toward liberal ideas and modern culture persisted until the time of the second Vatican Council, called by Pope John XXIII in 1962. The theological and organizational changes made at Vatican II significantly revitalized the church and opened it to new reform, ecumenical dialogue, and the increased participation of bishops, clergy, and laity. Toward the end of the century, however, the papacy met with increasing controversy in regard to what were seen by many as uniquely modern moral, ethical, and political issues.

Papadopoulos, Dimitrios (Orthodox patriarch): *see* Dimitrios.

Papago, North American Indians who traditionally inhabited the desert regions of Arizona and northern Sonora, south of the Pima Indians (*see* Pima). The Papago speak a Uto-Aztecan language, a dialectal variant of Piman, and culturally they are similar to the Pima (*see also* Uto-Aztecan languages). There are, however, certain dissimilarities. The drier, harsher habitat of the Papago made intensive farming difficult and increased their reliance on wild foods. The lack of water necessitated a sort of seasonal nomadism, whereby the Papago spent the summer in "field villages" and the winter in "well villages."

The Papago did not have irrigated fields like those of the Pima but practiced flash-flood farming. After the first rains, seeds were planted in the alluvial fans at the mouths of washes that marked the maximum reach of the water after flash floods. Because the floods could be heavy while they lasted, it was necessary for the seeds to be planted deeply, four to six inches usually. Reservoirs, to impound runoff waters along the flood channels, and some ditches and dikes were constructed by Papago men. Women were responsible for gathering wild foods.

The shifting residential pattern and the wide dispersal of the Papago fields made large villages and tribal political organization impossible. The largest organizational unit appears to have been a group of related villages. Villages tended to be composed of several families related through the male line. The Papago have had much less contact with whites than the Pima, and they have retained some elements of aboriginal culture. In the late 20th century they numbered about 8,300 located on three reservations in southern Arizona (the Papago, Gila Bend, and San Xavier reservations) and a few hundred more in scattered villages in northwestern Sonora.

*Until the 4th century the popes were usually known only as bishops of Rome. †The higher number is used if Felix (II), who reigned from 355 to 358 and is ordinarily classed as an antipope, is counted as a pope. ‡Though elected on March 23, 752, Stephen (II) died two days later before he could be consecrated and thus is ordinarily not counted. The issue has made the numbering of subsequent Stephens somewhat irregular. §Either Leo VIII or Benedict V may be considered an antipope. ‖ A confusion in the numbering of popes named John after John XIV (reigned 983–984) resulted because some 11th-century historians mistakenly believed that there had been a pope named John between antipope Boniface VII and the true John XV (reigned 985–986). Therefore they mistakenly numbered the real popes John XV to XIX as John XVI to XX. These popes have since customarily been renumbered XV to XIX, but John XXI and John XXII continue to bear numbers that they themselves formally adopted on the assumption that there had indeed been 20 Johns before them. In current numbering there thus exists no pope by the name of John XX. ¶In the 13th century the papal chancery misread the names of the two popes Marinus as Martin, and as a result of this error Simon de Brie in 1281 assumed the name of Pope Martin IV instead of Martin II. The enumeration has not been corrected, and thus there exist no Martin II and Martin III.

dier and statesman who late in life organized a political party and became premier (1952–55) of Greece.

Papagos, commissioned in 1906, saw his first service in the Balkan Wars (1912–13). He took part in the Greek invasion of Turkey (1919–22), won promotion to the rank of major general (1927), and became corps commander and minister of war (1935); the following year he was named chief of staff. Although at the time of the Italian attack on Greece (October 1940) he conducted, as commander in chief, a passive, basically defensive campaign, he nonetheless succeeded in driving the Italians back into Albania. His defenses soon crumbled, however, against the later German onslaught (April 1941), and he was taken to Germany as a hostage. Liberated in 1945, he directed postwar operations in Greece against communist guerrillas and was appointed field marshal in 1949.

In May 1951 Papagos resigned as military commander in chief to form a new political party, the Greek Rally, which soon became the strongest political force in Greece. Enjoying wide popularity and modeling himself after Charles de Gaulle, Papagos led his party to a decisive victory in the elections of November 1952 and became premier. He died in office.

papain, a protein-digesting enzyme present in the milky juice of the papaya. Its action resembles that of protein-digesting enzymes found in animals. Papain is used in biochemical research involving the analysis of proteins, in preparations of various remedies for indigestion, in tenderizing meat, and in enzyme-action cleansing agents for soft contact lenses. A related enzyme from the same source is chymopapain, which has different characteristics of mobility and solubility. It is used to shrink or dissolve ruptured disks in certain kinds of lumbar spine injuries, and otherwise as a digestant of protein.

papal infallibility, in Roman Catholic theology, the doctrine that the pope, acting as supreme teacher and under certain conditions, cannot err when he teaches in matters of faith or morals. As an element of the broader understanding of the infallibility of the church, this doctrine is based on the belief that the church has been entrusted with the teaching mission of Jesus Christ and that, in view of its mandate from Christ, it will remain faithful to that teaching through the assistance of the Holy Spirit. As such, the doctrine is related to, but distinguishable from, the concept of indefectibility, or the doctrine that the grace promised to the church assures its perseverance until the end of time.

The term infallibility was rarely mentioned in the early and medieval church. Critics of the doctrine have pointed to various occasions in the history of the church when popes are said to have taught heretical doctrines, the most notable case being that of Honorius I (625–638), who was condemned by the third Council of Constantinople (680–681, the sixth ecumenical council).

The definition of the first Vatican Council (1869–70), established amid considerable controversy, states the conditions under which a pope may be said to have spoken infallibly, or ex cathedra ("from his chair" as supreme teacher). It is prerequisite that the pope intend to demand irrevocable assent from the entire church in some aspect of faith or morals. Despite the rarity of recourse to this claim, and despite the emphasis given to the authority of the bishops in the second Vatican Council (1962–65), the doctrine remained a major obstacle to ecumenical endeavours in the late 20th century and was the subject of controversial discussion even among Roman Catholic theologians.

Papal States, also called CHURCH STATES, Italian STATI PONTIFICI, or STATI DELLA CHIESA, territories of central Italy over which the pope had sovereignty from 756 to 1870. Included were the modern Italian provinces of Lazio, Umbria, Marche, and part of Emilia-

Romagna, although the extent of the territory, along with the degree of papal control, varied over the centuries.

As early as the 4th century, the popes had acquired considerable property around Rome (called the Patrimony of St. Peter). From the 5th century, with the breakdown of Roman imperial authority in the West, the popes' influence in central Italy increased as the people of the area relied on them for protection against the barbarian invasions. When the Lombards threatened to take over the whole peninsula in the 750s, Pope Stephen II (III) appealed for aid to the Frankish ruler Pepin III the Short. On intervening, Pepin "restored" the lands of central Italy to the Roman see, ignoring the claim of the Byzantine (East Roman) Empire to sovereignty there. This Donation of Pepin (754) provided the basis for the papal claim to temporal power, while by the Treaty of Pavia (756) the Lombard king Aistulf ceded territory in northern and central Italy. The pope consequently became ruler of the area around Ravenna, the Pentapolis (along the Adriatic from Rimini to Ancona), and the Roman region. By alliance with the Normans in the late 11th century, the duchy of Benevento was acquired in 1077.

Through the European Middle Ages the popes were able to maintain their sovereignty over this territory despite the rise of local feudal lords in the 9th and 10th centuries and, more importantly, despite a clash with the German Holy Roman emperors that lasted from the Investiture Controversy of the mid-11th century until the 14th century. Relations with the emperors were exacerbated by controversy over the allodial lands of the countess Matilda of Tuscany, donated (1102) to the papacy but finally left (1111) to the emperor Henry V. But papal sovereignty was more nominal than real. The rise of commune governments, especially in the Romagna, weakened the popes' authority. With the transfer of the papal residence from Rome to Avignon (1309–77), local independence prevailed in the Papal States, a situation that continued through the end of the Great Schism in 1417. Many towns nominally held as vicariates granted by the pope were in fact ruled by local families.

From the mid-15th century the Renaissance popes sought to reestablish papal authority in central Italy. Under Julius II (pope from 1503 to 1513), the States reached their definitive boundaries, stretching from Parma and Bologna in the north, along the Adriatic coast, through Umbria, to the Campagna, south of Rome. These popes, however, failed in their attempt to make the papacy a force in international politics, and, by the end of the 16th century, the papal territory was merely one of a number of petty Italian states.

In the 17th and 18th centuries the trend toward centralization at the expense of local independence, begun by the Renaissance popes, continued, although the clerical-run government made little progress in improving the backward economic condition of the Papal States.

When the French, under Napoleon, secured domination of the Italian peninsula in the late 1790s, the States were taken from the pope in 1798–99 (to be included in the Cisalpine and Roman republics) and again in 1808–09 (to be included in the Italian kingdom and the French empire). Liberal ideas introduced into the Papal States during the French Revolution continued to play a role there after the restoration of the States to the pope by the Congress of Vienna (1815). In opposition to unenlightened clerical rule, revolts occurred in the States in 1830–31 and again in 1849, when another short-lived Roman Republic was established.

Through the Risorgimento (movement for Italian unification during the 19th century), the existence of the Papal States proved an obstacle to national union both because they divided Italy in two and because foreign powers intervened to protect papal independence. Annexation of the Papal States to the new Italian nation, however, was eventually achieved. After Austria's defeat in 1859, the papal territories of Romagna, Umbria, and Marche voted to join the Italian kingdom. With the withdrawal of French troops from Rome in 1870, the remaining papal territory—the area around Rome—was taken by Italian forces, and Rome was made capital of Italy. The popes refused to recognize the loss of their temporal power and remained "prisoners in the Vatican." The question of the pope's relation to the Italian state was unsettled until the Lateran Treaty of 1929 set up an independent Vatican City state.

Papaloapan River, Spanish RÍO PAPALOAPAN, river in Veracruz state, southeastern Mexico. It is formed by the junction of several rivers near the Veracruz–Oaxaca border and meanders generally northeastward for 76 miles (122 km) to Alvarado Lagoon, 10 miles (16 km) south-southeast of Alvarado. The chief headstreams include the Santo Domingo, Chichicatiapa, and San Cristóbal, which rise in the Sierra Madre Oriental. Since 1947 the Papaloapan River basin has been developed and colonized by the government. Swampy lowlands have been drained and reclaimed, dams for flood control and hydroelectric power built, farmlands apportioned, and settlers moved in from elsewhere in Mexico. The project's success has led to similar schemes in other parts of the gulf lowlands. The Papaloapan system is navigable for 150 miles (240 km) upstream from Alvarado Lagoon.

Papandreou, Andreas (Georgios) (b. Feb. 5, 1919, Chios, Greece), premier of Greece (1981–89).

Son of Georgios Papandreou, he attended the American College in Athens and studied law at the University of Athens. A Trotskyite, he was imprisoned briefly by the dictator Ionnis Metaxas and, when freed, fled to the United States, where he received a Ph.D. (1943) from Harvard University and obtained U.S. citizenship (1944). After serving in the U.S. Navy, he taught at Harvard, the University of Minnesota, and the University of California, Berkeley (1955–63). When his father became prime minister of Greece in 1963, Andreas gave up his U.S. citizenship and returned to his native country, winning election to the Greek Parliament. His close association with the left wing of his father's party, the Centre Union, and his rapid rise in the government and the party hierarchy created controversies that contributed to the fall of his father's government in 1965.

Papandreou was jailed for eight months after the military coup of 1967 and was then released. He again went into exile, teaching in Stockholm and Toronto and leading the democratic resistance to the junta from overseas. After the collapse of the Greek military dictatorship in 1974, he returned home and formed the left-wing Panhellenic Socialist Movement (PASOK). His new party won a steadily increasing share of the popular vote in the elections of 1974 and 1977, and in 1981 PASOK won a sweeping victory, capturing 172 of the 300 seats in Parliament.

As a candidate, Papandreou had advocated quasi-socialist domestic reforms while also calling for the removal of U.S. military bases from Greece. He also advocated Greece's withdrawal from NATO. But once in power, he pursued more moderate policies. The marriage and religious laws were liberalized, and some government functions were decentralized; but the United States' leases on its military bases in Greece were renewed, and Greece remained in NATO. The government did take a hard stance on the continued Turkish occupation of part of Cyprus, however.

Papandreou's combination of pragmatic policies with a strident anti-American rhetoric proved popular. His party won a decisive victory in the general elections of 1985, and he continued as prime minister. Late in Papandreou's second term, his government was weakened by a grave financial scandal that forced the dismissal or resignation of three Cabinet ministers. Papandreou's popularity was further diminished by his highly publicized relationship with a much younger woman while he was still married to his second wife. In the elections of June 18, 1989, PASOK lost its majority in Parliament, and Papandreou resigned from office on June 19.

Papandreou, Georgios (b. Feb. 13, 1888, Kaléntzi, Greece—d. Nov. 1, 1968, Athens), Greek liberal politician who was three times prime minister of his country.

Papandreou studied at Athens University (L.L.D., 1911) and in Germany. He began his political career in 1915, served as governor of the Aegean Islands (1917–20), and was minister of education (1929–33) in the liberal antimonarchist government of Eleuthérios Venizélos. He broke away from the left wing of the Liberal Party and in 1935 founded the Democratic Socialist Party. During the dictatorship of Ioannis Metaxas, he was in exile, and he was imprisoned by the Germans in 1942–44 during World War II. Managing to escape, he then headed the Greek coalition government (initially a government-in-exile) from April 1944 until after the German army withdrew from Greece in October 1944, but he resigned in December of that year as the country slipped into civil war. From 1946 to 1952 he held ministerial posts in several governments. During a subsequent period in opposition, he merged his Democratic Socialist Party with the Liberal Party and in 1961 organized a new centre-left coalition, the Centre Union.

In 1963 the Centre Union won a bare electoral majority, and Papandreou became prime minister; but he resigned shortly afterward to seek an absolute majority, which he obtained in new elections in 1964. As prime minister Papandreou introduced a program of social reforms more far-reaching than those sought by previous governments, and he also criticized what he viewed as the excessive influence of the United States in his country. A crisis developed in 1965 over Papandreou's insistence on giving ministerial posts to his son Andreas, and he also clashed with the Greek king, Constantine, over the control of conservative officers in the army. In July 1965 the king dismissed Papandreou from the prime ministry, after which a period of political instability ensued in Greece. In 1967, when it became clear that Papandreou's party was again headed for victory in upcoming general elections, a military junta seized power in Greece and arrested Papandreou and his son. They were later released, but the elder Papandreou died soon afterward.

Papanicolaou's stain, also called PAP SMEAR, laboratory method of staining smears of various body secretions from the respiratory, digestive, or genitourinary tract, for the examination of cast-off body cells, to detect the presence of cancer. The Pap smear is notably reliable in detecting the early stages of cancer in the uterine cervix. For such a Pap smear, two specimens are usually taken for laboratory staining and examination, one consisting of vaginal secretions obtained by suction (aspiration) or with a spatula, and the other of scrapings of the surface of the cervix, at the site where cancerous growth frequently originates. While the cervical scrapings provide material for highly accurate interpretations, the vaginal smear gives reliable results as well and may reveal malignant cells not only from the cervix but also from the endometrium (the mucous coat of the uterus) and the ovaries.

Papaveraceae, poppy family of the order Papaverales, comprising approximately 26 genera of mostly herbaceous plants but including some woody, small trees and shrubs. The family is outstanding for its many garden ornamentals and pharmaceutically important plants. Most species are found in the Northern Hemisphere.

All species have bisexual, regular, cup-shaped flowers with one superior pistil (female structure) and many stamens (male parts). They have 2 or 3 conspicuous, separate sepals and 4 to 12 or more separate petals. The fruit is a capsule, the leaves are usually deeply cut or divided into leaflets, and the sap is coloured.

Opium, from which morphine, heroin, and codeine are derived, is from the opium poppy (*Papaver somniferum*), which is native to Asia Minor. Numerous other members of the family are valuable ornamental plants, including about 50 species of the genus *Papaver* (poppy). Other genera of the Papaveraceae distinguished for their ornamental species include: *Meconopsis, Eschscholzia* (California poppy), *Hunnemannia, Dendromecon* (bush poppy), *Stylophorum, Chelidonium* (celandine), *Sanguinaria* (bloodroot), *Platystemon* (creamcups), *Romneya, Macleaya, Stylomecon, Bocconia,* and *Eomecon.* The genera *Argemone* (prickly poppy), *Glaucium* (horned poppy), and *Papaver* contain weedy species.

Papaverales, the poppy order of flowering plants, belonging to the class known as dicotyledon (characterized by the presence of two seed leaves). The order is composed of 45 genera and 640 species in three families. Its most familiar flowers are the poppy (*q.v.*) of the Papaveraceae and the bleeding heart (*q.v.*) of the Fumariaceae. This order mostly is herbaceous (nonwoody) and is distributed worldwide, primarily in temperate regions.

A brief treatment of Papaverales follows. For full treatment, *see* MACROPAEDIA: Angiosperms.

Features that characterize the Papaveraceae family are regular (radially symmetrical) flowers, bud-enclosing sepals, and regularly inserted stamens. Although some are treelike, the majority of Papaveraceae are annual or perennial herbs. Members of the *Papaver* genus include *P. somniferum,* which yields opium—a complex of 20 alkaloids (and other compounds) including morphine, heroin, and codeine. Members of the Fumariaceae family develop irregular (bilaterally symmetrical) flowers, with small sepals and six stamens in two groups. The family is valued for the beauty of its cultivated and wildflower members. Hypecoaceae, a family of herbs with one genus and 15 species, is native to regions that extend from the Mediterranean area to China. Its floral features, including free petals and four free stamens, place it between the Papaveraceae and the Fumariaceae.

In several species of Papaverales, rhizomes (horizontal stems), taproots, bulblets, and tubers give rise to colonies of plants. The major method of reproduction, however, is by sexual means. Flowers in the poppy family develop in four or more whorls, with two sepals, 4 to 6 (or 8 to 12) petals, numerous stamens, and a pistil composed of many joined carpels. Green sepals shed as the flower opens. Ovules arise along ridges on the inside of the one-chambered, superior ovary, and seeds are many. Some flowers are self-pollinated in the closed condition, but insects, especially bees, facilitate cross-pollination in all other species. After fertilization, the ovary becomes the fruit.

papaya, also called PAPAW, or PAWPAW, succulent fruit of a large plant (*Carica papaya*) of the family Caricaceae, considered a tree, though its palmlike trunk, up to 8 m (26 feet) tall, is not as woody as the designation generally implies. The plant bears no lateral branches but is crowned by deeply lobed leaves, sometimes 60 cm (2 feet) across, borne on hollow petioles 60 cm long. Normally, the species is dioecious, male and female flowers being produced on separate plants; but hermaphroditic forms are known, and numerous irregularities in the distribution of the sexes are common. Male flowers are borne in clusters on stalks 90 cm (3 feet) long; the flowers are funnel-shaped, about 2.5 mm (0.1 inch) long, and whitish, and the corolla is five-lobed, with 10 stamens in the throat. The female flowers are considerably larger, on very short stalks, and often solitary in the leaf axils; they have five fleshy petals that are united toward the base and a large cylindrical or globose superior ovary that is crowned by five fan-shaped sessile stigmas.

The fruit is commonly spherical to cylindrical in form, is 75–500 mm (3–20 inches) or even more in length, and sometimes weighs as much as 9 to 11.5 kg (20 to 25.5 pounds). In general character it strongly resembles a muskmelon. The very juicy flesh is deep yellow or orange to salmon-coloured and about 25 mm (1 inch) thick. Along the walls of the large central cavity are attached the numerous round, wrinkled, black seeds, the size of peas.

G.R. Roberts

Though its origin is rather obscure, the papaya may represent the fusion of two or more species of *Carica* native to Mexico and Central America. Today it is cultivated throughout the tropical world and into the warmest parts of the subtropics.

The papaya fruit is slightly sweet, with an agreeable musky tang, which is more pronounced in some varieties and in some climates than in others. It is a popular breakfast fruit in many countries and is also used in salads, pies, sherbets, juices, and confections. The unripe fruit can be cooked like squash.

The unripe fruit contains a milky juice in which is present a protein-digesting enzyme known as papain, which greatly resembles the animal enzyme pepsin in its digestive action. This juice is used in the preparation of various remedies for indigestion and in the manufacture of meat tenderizers.

Papayas are usually grown from seed. Their development is rapid, fruit being produced before the end of the first year. Under favourable conditions, a plant may live five years or more.

Papeete, commune, capital of French Polynesia, lying on the northwest coast of Tahiti. A gracious tropical city with tall palms and abundant flowers, Papeete is one of the largest urban centres in the South Pacific. Its excellent harbour made it, by 1829, a place of

trade and a favourite port of call for whalers. After annexation by the French (1880), it was made the seat of the governor, and in 1890 it became a commune.

Papeete is now a major stop for transpacific ships and airlines, with modern harbour facilities and, at nearby Faaa, a jet airport. Copra, sugarcane, mother-of-pearl, vanilla, and coffee are exported. It is a major tourist base serving both Tahiti and the other French Polynesian islands. A power plant supplies electricity for the island. The suburbs of Papeete grew rapidly in the early and mid-1970s, with an influx of people from other parts of French Polynesia. The population also includes Chinese and Europeans. Pop. (1983) 23,496.

Papen, Franz von (b. Oct. 29, 1879, Werl, Ger.—d. May 2, 1969, Obersasbach, W.Ger.), German statesman and diplomat who played a leading role in dissolving the Weimar Republic and in helping Adolf Hitler to become German chancellor in 1933.

The scion of a wealthy Catholic landowning family, Papen began his career as a professional soldier. At the beginning of World War I, he was military attaché in Washington, but after being implicated in cases of espionage and sabotage, he was recalled in 1915 at the request of the U.S. government. Until the end of the war he served as chief of staff of the 4th Turkish Army in Palestine. Returning after the war to Germany, Papen, a monarchist,

decided to enter politics. From 1921 to 1932, he was a deputy in the Reichstag (federal lower house) and belonged to the ultraright wing of the Catholic Centre Party. Though he had certain links with German monarchists, former aristocrats, big business circles, and the German Army, Papen himself had no political following. His elevation to the chancellorship (June 1, 1932), engineered by Pres. Paul von Hindenburg's adviser Gen. Kurt von Schleicher, came as a complete surprise to the public.

Papen established a rightist, authoritarian government without a political base or voting majority in the Reichstag. In an effort to appease the Nazis, who formed the second largest party in Parliament, he lifted the ban on the Nazis' paramilitary Sturmabteilung (SA) on June 15 and deposed the Social Democratic government of Prussia on July 20. In foreign affairs, he achieved the virtual cancellation of Germany's reparations obligations under the Treaty of Versailles. Hitler, however, who wanted to rule Germany himself, remained in opposition. Papen's reactionary policies and his efforts to replace Germany's Weimar constitution with authoritarian rule alienated Schleicher, who wished to establish a broad national front that would have a real popular mandate. Accordingly, Schleicher induced a number of Cabinet ministers to reject Papen's policies; Papen thereupon resigned and was, on December 4, succeeded as chancellor by Schleicher.

Incensed at his ouster and determined to gain revenge on Schleicher, Papen came to terms with Hitler (Jan. 4, 1933) and persuaded Hindenburg to appoint the Nazi leader to the chancellorship. As vice chancellor, Papen, whose fellow non-Nazi nationalists received a majority of the ministerial posts, naively thought he could restrain the Nazis. Though he soon realized how mistaken he had been, he continued to serve Hitler. Papen narrowly escaped with his life during Hitler's purge of the SA on June 30, 1934, and he resigned the vice chancellorship three days later. He was then sent as ambassador to Austria (1934–38), for whose annexation to Germany he worked. He eventually became ambassador to Turkey (1939–44), where he attempted to keep that country out of an alliance with the Allies.

Papen was arrested by the Allies in April 1945 and placed on trial as a war criminal. Found not guilty by the Nürnberg tribunal of conspiracy to prepare aggressive war, he was sentenced to eight years' imprisonment by a German court as a major Nazi, but in 1949, on his appeal, was released and fined. Papen's memoirs, *Der Wahrheit eine Gasse* (*Memoirs*), appeared in 1952.

paper, matted or felted sheet, usually made of cellulose fibres, formed on a wire screen from water suspension.

A brief treatment of paper follows. For full treatment, *see* MACROPAEDIA: Industries, Chemical Process.

Paper has been traced to China in about AD 105. It reached Central Asia by 751 and Baghdad by 793, and by the 14th century there were paper mills in several parts of Europe. The invention of the printing press in about 1450 greatly increased the demand for paper, and at the beginning of the 19th century wood and other vegetable pulps began to replace rags as the principal source of fibre for papermaking.

Before 1798, Nicholas-Louis Robert constructed the first paper-making machine. Using a moving screen belt, paper was made one sheet at a time by dipping a frame or mold with a screen bottom into a vat of pulp. A few years later the brothers Henry and Sealy Fourdrinier improved Robert's machine, and in 1809 John Dickinson invented the first cylinder machine.

Although almost all steps in papermaking have become highly mechanized, the basic process has remained essentially unchanged. First, the fibres are separated and wetted to produce the paper pulp, or stock. The pulp is then filtered on a woven screen to form a sheet of fibre, which is pressed and compacted to squeeze out most of the water. The remaining water is removed by evaporation, and the dry sheet is further compressed and, depending upon the intended use, coated or impregnated with other substances.

Differences among the grades and types of paper are determined by several factors: the type of fibre used; the preparation of the pulp, either by mechanical (groundwood) or chemical (primarily sulfite, soda, or sulfate) methods, or by a combination of the two; by the addition of other materials to the pulp, among the most common being bleach or colouring and sizing, the latter to retard penetration by ink; by conditions under which the sheet is formed, including its weight; and by the physical or chemical treatments applied to the finished sheet.

Although wood has become the major source of fibre for papermaking, rag fibres are still used for paper of maximum strength, durability, and permanence. Recycled wastepaper (including newsprint) and paperboard are also important sources. Other fibres used include straw, bagasse (residue from crushed sugarcane), esparto, bamboo, flax, hemp, jute, and kenaf. Some paper, particularly specialty items, is made from synthetic fibres.

Weight or substance per unit area, called basis weight, is measured in reams (now commonly 500 sheets). Paper is also measured by caliper (thickness) and density. The strength and durability of paper is determined by factors such as the strength and length of the fibres, as well as their bonding ability, and the formation and structure of the sheet. The optical properties of paper include its brightness, colour, opacity, and gloss. Among the most important paper grades are bond, book, bristol, groundwood and newsprint, kraft, paperboard, and sanitary.

paper birch (*Betula papyrifera*), also called CANOE BIRCH, SILVER BIRCH, or WHITE BIRCH, ornamental, shade, and timber tree of the family Betulaceae, native to northern and central North America.

Usually about 18 metres (60 feet) tall but occasionally reaching 40 m, the tree has ovate, dark-green, sharp-pointed leaves about 10 centimetres long. The bark, brown at first, whitens and peels into paper-thin layers, marked by narrow horizontal pores, or lenticels. On the copper-coloured inner bark, the pores are bright orange. Short, pendulous branches and their numerous flexible twigs create a lacy silhouette in winter.

The western paper birch (*B. papyrifera* variety *commutata*) of Canada and the western U.S. is about 30 m tall, with orange-brown to nearly white bark; the smaller northwestern paper birch of western North America (variety *subcordata*) is 18 m high and has orange-brown to silver-gray bark, purplish, red-brown twigs, and small, heart-shaped leaves, about six cen-

timetres long; the mountain paper birch (variety *cordifolia*), with white bark, is a small, sometimes shrubby tree of Canada and the eastern and midwestern U.S. In the Alaska paper birch (variety *humilis*) the nearly triangular leaves are about four centimetres long, the bark white to red brown; the Kenai birch (variety *kenaica*), found in Alaska from sea level to altitudes of 665 m, is rarely 12 m tall and has white bark, tinged orange or brown.

Paper birch is fast growing but short-lived and susceptible to borers when cultivated south of its natural range. The close-grained, almost white wood is used for turned articles, woodenware, pulp, and fuel. North American Indians used the thin, water-impervious bark for roofing and canoes.

paper chromatography, in analytical chemistry, technique for separating dissolved chemical substances by taking advantage of their different rates of migration across sheets of paper. It is an inexpensive but powerful analytical tool that requires very small quantities of material.

The method consists of applying the test solution or sample as a spot near one corner of a sheet of filter paper. The paper is initially impregnated with some suitable solvent to create a stationary liquid phase. An edge of the paper close to the spot is then immersed in another solvent in which the components of the mixture are soluble in varying degrees. The solvent penetrates the paper by capillary action and, in passing over the sample spot, carries along with it the various components of the sample. The components move with the flowing solvent at velocities that are dependent on their solubilities in the stationary and flowing solvents. Separation of the components is brought about if there are differences in their relative solubilities in the two solvents. Before the flowing solvent reaches the farther edge of the paper, both solvents are evaporated, and the location of the separated components is identified, usually by application of reagents that form coloured compounds with the separated substances. The separated components appear as individual spots on the path of the solvent. If the solvent flowing in one direction is not able to separate all the components satisfactorily, the paper may be turned 90° and the process repeated using another solvent. Paper chromatography has become standard practice for the separation of complex mixtures of amino acids, peptides, carbohydrates, steroids, purines, and a long list of simple organic compounds. Inorganic ions can also readily be separated on paper. *Compare* thin-layer chromatography.

paper folding, Japanese ORIGAMI, art of folding objects out of paper without cutting, pasting, or decorating. Its early history is not known, though it seems to have developed from the older art of folding cloth.

In Japan, origami has reached its greatest development, with hundreds of traditional folds and an extensive literature dealing with the art. Japanese folds divide roughly into two categories: figures used in ceremonial etiquette (such as *noshi,* folded decorations attached to gifts); and birds, animals, fish, insects, flowers, human figures, furniture, and other objects. Some of the animals have amusing action features; best known are the bird that flaps its wings when its tail is pulled and the frog that hops when its back is tapped. Yoshizawa Akira of Tokyo is considered the greatest of modern paper folders. He wrote several books on origami and created a large number of new, often fantastically complex, figures possessing great realism and delicate beauty.

Paper folding also has flourished in Spain and South America. Miguel de Unamuno, Spanish writer and philosopher, made a hobby of paper folding. He invented many new animal constructions and wrote *Amor y pedagogía* (1902), a humorous essay on the art. In South America, Vicente Solórzano Sagredo of Argentina was the leading expert on paper folding and the author of the most comprehensive manuals on the art in Spanish. George Rhoads of Evanston, Ill., and Giuseppe Baggi of New York also achieved distinction in this art.

Apart from the Oriental tradition, the folding of coloured papers into ornamental designs was introduced by Friedrich Froebel into the kindergarten movement that he initiated in Germany in the 19th century. Later, the Bauhaus, a famous German school of design, stressed the folding of paper as a method of training students for commercial design. The use of folded paper in mathematical recreations is similarly independent of origami. Particularly intriguing are A.H. Stone's flexagons (1939), a variety of paper structures that alter their faces in curious ways when properly flexed.

paper pulp, raw material for paper manufacture that contains vegetable, mineral, or man-made fibres. It forms a matted or felted sheet on a screen when moisture is removed.

Rags and other fibres, such as straw, grasses, and bark of the mitsumata and paper mulberry (kozo), have been used as paper pulp. Except for certain special papers (*e.g.,* asbestos paper), nearly all papers are made of cellulosic (vegetable) fibres. The most abundant source of cellulose is the forest, though trees differ in the value of their fibre for making paper. The fibre of flax, cotton, jute, sisal, manila hemp, and the like usually comes to the paper industry as a secondary product, after serving other uses. Agricultural wastes—straw, corn stalks, bagasse (sugarcane waste), bamboo, and some other grasses—are used for making certain grades. Finally, one of the most important sources of pulp is the fibre recovered from old papers, rags, and cardboard boxes.

Wood pulps may be classified into two general groups, mechanical and chemical. Mechanical pulp, generally called groundwood, is usually produced by a mechanical grinding process and is not further classified except as fine, coarse, or bleached. Chemical pulps are classed as unbleached sulfite (strong and news grade), bleached sulfite (dissolving and paper grade), bleached and unbleached sulfate (kraft), and soda. "Semichemical" is a term applied to a process of cooking followed by mechanical treatment. Spruce, balsam fir, and hemlock are considered the best woods for sulfite and mechanical pulping; several varieties of pine are used for sulfate (kraft) pulping; hardwoods are pulped by all of the pulping processes. The chief European pulpwoods are Norway spruce, Scotch pine, and various hardwoods. *See also* kraft process; sulfite process.

paper wasp (*Polistes*), any of a worldwide genus of insects of the family Vespidae (order Hymenoptera). A striking-looking wasp, about 16 millimetres long, it has orange antennae, wings, and tarsi; the body is jet black with narrow yellow bands and paired segmental spots. The sting is painful but less toxic to humans than that of the more familiar species of wasps and hornets (*Vespa, Vespula*). The nest is made of a paperlike material, fashioned from wood which the females have chewed and mixed with saliva to form a paste. There are about 100 cells for larvae in a single nest, which is attached by a short stalk to some sort of protective overhang.

paperbark tree, any of several small trees belonging to the genus *Melaleuca,* in the myrtle family (Myrtaceae), characterized by their whitish papery bark. They are native to Australia and nearby islands.

Melaleuca quinquenervia, also called punk tree and tea tree, grows to a height of 8 metres (25 feet); it has spongy white bark that peels off in thin layers. *M. leucadendron,* also called river tea tree, is sometimes confused with the former; its leaves provide cajeput oil, used for medicinal purposes in parts of the Orient. The common name swamps paperbark is applied to *M. ericifolia,* which often grows in clumps, and to *M. rhaphiophylla.* These shrubs and small trees are sometimes cultivated in warm areas for their whitish to yellowish terminal flower clusters.

Paphlagonia, ancient district of Anatolia adjoining the Black Sea, bounded by Bithynia in the west, Pontus in the east, and Galatia in the south. The Paphlagonians were one of the most ancient peoples of Anatolia. Passing under the rule of Lydia and Persia, they submitted to Alexander the Great (333 BC), after which they enjoyed a measure of independence. In the 3rd and 2nd centuries BC Paphlagonia was gradually absorbed by the

expanding Pontic kingdom on its eastern border. When the Pontic kingdom under Mithradates VI was destroyed by Pompey in 65 BC, the coastal districts of Paphlagonia (including its capital at Sinope) were attached to Roman Bithynia while the interior regions were left under native rulers. Upon the extinction of the native dynasty (*c.* 6 BC), the remainder of the territory was incorporated into the Roman province of Galatia. Upon the division of the empire in the 4th century AD, Paphlagonia became a separate Roman province.

Paphos, Greek PÁFOS, modern town and administrative district and name of two ancient cities on the west coast of the Republic of Cyprus. The older ancient city (Greek Palaipaphos) was located at modern Pírgos (Kouklia); New Paphos, which had already superseded Old Paphos in Roman times, was 10 mi (16 km) farther west. New Paphos and Ktima together form modern Paphos.

Paphos, settled by Greek colonists in the Mycenaean period, contained a famous temple of Aphrodite and was the legendary site where Aphrodite was born from the sea foam. In Hellenic times Paphos was second only to Salamis in extent and influence among the states of Cyprus. The Cinyrad dynasty ruled Paphos until its final conquest by Ptolemy I of Egypt (294 BC). Old Paphos dwindled in influence after the fall of the Cinyradae, the foundation of New Paphos, and the Roman conquest of Cyprus (58 BC). It was finally deserted after the 4th century AD.

New Paphos, the port town of Old Paphos, became the administrative capital of the whole island in Ptolemaic and Roman times and head of one of the four Roman districts. The city was attacked and destroyed by Muslim raiders in AD 960. The modern town began to grow only after the British occupation in 1878. The harbour, centre of the city's life, was improved in 1908 and 1959, but remains too small to handle large commercial traffic, and thus serves only an active local fishing fleet, which lost local fishing grounds and some 200 vessels after the Turkish occupation of 1974, though fish landings recovered by the late 1970s. Despite economic difficulties arising from the settlement there of some 5,000 Greek Cypriot refugees after 1974, by the end of the decade the city had become the focus of strong economic development, including an industrial estate, and tourist hotels. Manufacturing consists of small enterprises producing clothing, footwear, canned meat, beverages, and vegetable oils. Local points of interest include Orthodox churches, the Djami Kebir Mosque, Paphos Castle, and Frankish baths.

Paphos district is bounded by the districts of Limassol and Nicosia on the east, and is bordered by the Mediterranean Sea (including Khrysokhou Bay on the northeast) on the south, west, and north. It covers an area of 538 sq mi (1,373 sq km). The Troödos Mountains, reaching an elevation of 4,468 ft (1,362 m) at Mt. Tripylos on the border with Nicosia district, dominate the landscape except for coastal lowlands with indented and rocky shores. In the southwestern part of the district, the mountains descend in a series of stepped foothills to the coastal plain. A network of rivers including the Khrysokhou and Dhiarrisos rises in the Troödos Mountains and flows radially to drain into the Mediterranean Sea. In the 6th century BC the region was probably part of the petty Kingdom of Paphos. Under the Romans it was one of the four districts into which Cyprus was divided. The Turks occupied the region in 1570. It became part of the Republic of Cyprus in 1960.

The economy of the district is predominantly agricultural and cereals, legumes, vegetables, and citrus fruits are grown. A large-scale irrigation project provides water for a major citrus growing area in the district. Olives, carob, apples, pears, and cherries are grown on hillsides and mountain slopes. Deep-sea fishing is also practiced. Industries produce beverages, shoes, plastics, bricks, canned fruit and vegetables, and vegetable oils. Copper is mined. Paphos, the administrative headquarters of the district, is linked by roads to Ktima, Kouklia, and Peyia. Pop. (1982 est.) town, 13,100; (1973) district, 57,100.

Papiamento, also spelled PAPIAMENTU, creole language based on Spanish, spoken on the islands of Curaçao, Aruba, and Bonaire, in the Caribbean Sea. Papiamento is apparently based on a Spanish pidgin or creole language, with early influences from Portuguese and, more recently, strong Dutch influences (Dutch is the official language of Curaçao). Twenty-five percent of the vocabulary of Papiamento is of Dutch origin; the remainder is primarily from Spanish or Portuguese. Although Papiamento has no official status, it is widely used on Curaçao and is more often recognized as a "real" language than formerly. As is usual with pidgins and creoles, Papiamento's grammar and syntax have become changed and simplified from those of Spanish, the parent language. An example of a sentence in Papiamento is: *E mâma ta'a mand' e jú bái bende piská,* Spanish *La mamá mandaba al hijo que vaya a vender pescado,* "The mother sent the boy to go and sell fish."

Papias (fl. early 2nd century), bishop of Hierapolis, Phrygia, whose work "Explanation of the Sayings of the Lord," although extant only in fragments, provides important apostolic oral source accounts of the history of primitive Christianity and of the origins of the Gospels.

According to the 2nd-century theologian Irenaeus, Papias had known the Apostle John. The 4th-century church historian Eusebius of Caesarea (*q.v.*) critically records that Papias derived his material not only from John the Evangelist but also from John the Presbyter, through whose influence he had infected early patristic theologians with a false Judeo-Greek millenarianism, the apocalyptic teaching that Christ would reappear to transform the world into a 1,000-year era of universal peace, and had implicated Christ in fantastic parables. Eusebius' antipathy to Papias consequently led him to edit severely the latter's text and preserve only short excerpts.

Papias' interpretation of the Gospels was used by Eastern and Western Christian theologians down to the early 4th century.

papier-mâché, repulped paper that has been mixed with glue or paste so that it can be molded. The art of making articles of papier-mâché, beautifully decorated in Oriental motifs and handsomely lacquered, was known in the East centuries before its introduction in Europe. Molded paper products were first made in France in the early part of the 18th century and, later, in Germany and England. Different processes were used; for instance, several sheets of paper glued together could be pressure molded into such articles as trays and furniture panels. Although production has declined since the 19th century, papier-mâché is still used for toys, masks, model scenic materials, and the like.

papillon, breed of toy dog known from the 16th century, when it was called a dwarf spaniel. A fashionable dog, it was favoured by Madame de Pompadour and Marie Antoinette, and it appeared in paintings by some of the Old Masters. The name papillon (French: "butterfly") was given to the breed in the late 19th century, when a variety with large, flaring ears resembling the wings of a butterfly came into vogue. There is another variety of papillon, with drooping ears. A slender, graceful dog with a plumed tail, the papillon stands 11 inches (28 centimetres) or less and weighs up to 11 pounds (5 kilograms). The coat is soft, full, and usually white with patches of black or of pale tan to dark reddish brown.

Papin, Denis (b. Aug. 22, 1647, Blois, Fr.—d. *c.* 1712, London), French-born British physicist who invented the pressure cooker and suggested the first cylinder and piston steam engine. Though his design was not practical, it was improved by others and led to the development of the steam engine, a major contribution to the Industrial Revolution. Papin assisted the Dutch physicist Christiaan Huygens with his air-pump experiments and went to London in 1675 to work with the English physicist Robert Boyle.

In 1679 Papin invented his steam digester (pressure cooker), a closed vessel with a tightly fitting lid that confines the steam until a high pressure is generated, raising the boiling point of the water considerably. A safety valve of his own invention prevented explosions. Observing that the enclosed steam in his cooker tended to raise the lid, Papin conceived of the use of steam to drive a piston in a cylinder, the basic design for early steam engines; he never built an engine of his own, however.

H. Roger-Viollet

In 1705 the German physicist and philosopher Gottfried Wilhelm Leibniz sent Papin a sketch of the first practical steam engine, built by Thomas Savery of England. That sketch stimulated Papin to further work, culminating in his *Ars Nova ad Aquam Ignis Adminiculo Efficacissime Elevandam* (1707; "The New Art of Pumping Water by Using Steam"). In 1709 he built a man-powered paddle-wheel boat that successfully demonstrated the practicability of using the paddle wheel in place of oars on steam-driven ships. Later that same year Papin returned to London, where he lived in obscurity until his death.

Papineau, Louis Joseph (b. Oct. 7, 1786, Montreal—d. Sept. 23, 1871, Montebello, Que., Can.), politician who was the leader of the French-Canadians in Lower Canada (now

in Quebec) in the period preceding an unsuccessful revolt against the British government in 1837.

Papineau was elected a member of the House of Assembly of Lower Canada in 1808. During the War of 1812 against the United States, he served as an officer in the Canadian militia. He became speaker of the house in 1815 and was already recognized as leader of the French-Canadian Party in its struggle against the English-dominated government of Lower Canada. In 1820 he was appointed a member of the executive council by the governor, Lord Dalhousie, but he resigned three years later, realizing that he had no real influence. Papineau went to England in 1822 to speak out in behalf of the French-Canadians, and he thereafter remained bitterly opposed to British government in Canada. Lord Dalhousie refused to confirm Papineau's speakership in 1827 and resigned when the House supported Papineau.

To achieve reforms for French-Canadians, Papineau began to work with William Lyon Mackenzie, leader of the Reform Party in Upper Canada (now in Ontario). In 1834 Papineau inspired the 92 Resolutions, a statement of French-Canadian demands and grievances, which was passed by the assembly. Lord Gosford, the governor, was authorized in 1837 to reject the demands and to appropriate provincial revenues without the assembly's consent. Papineau protested with inflammatory speeches. Hostilities broke out that November, and Papineau was forced to escape to the United States. He went to Paris in 1839 and remained there until 1844, when a general amnesty was granted.

During his absence, the British Parliament had united Upper and Lower Canada, as Canada West and Canada East (Act of Union, 1840). Papineau sat in the House of Commons in 1848–54, but he never regained his former dominance or his leadership of the French-Canadians. He agitated for the redivision of Canada and for independence from Great Britain, then retired to private life in 1854.

Papini, Giovanni (b. Jan. 9, 1881, Florence—d. July 8, 1956, Florence), journalist, critic, poet, and novelist, one of the most outspoken and controversial Italian literary figures of the early and mid-20th century. He was influential first as a fiercely iconoclastic editor and writer, then as a leader of Italian Futurism, and finally, after his reconversion in 1920 to Roman Catholicism, as a prolific (though sometimes unorthodox) spokesman for religious belief.

Educated at the University of Florence, Papini soon became a literary leader in Florence. He was a founder of an influential Florentine literary magazine, *Leonardo* (1903). During this period he wrote several violently anti-traditionalist works, such as *Il crepuscolo dei filosofi* (1906; "The Twilight of the Philosophies"), in which he expressed disenchantment with traditional philosophies. *Leonardo* was discontinued in 1907, and Papini moved on to the staffs of *L'Anima* and *La Voce.* Then he wrote one of his best known and most frequently translated books, the autobiographical novel *Un uomo finito* (1912; *A Man—Finished;* U.S. title, *The Failure,* both 1924), a candid account of his early years in Florence and his desires for ideological certainty and personal achievement.

Papini had already become an enthusiastic adherent of Futurism (*q.v.*), and he founded another Florentine periodical, *Lacerba* (1913), to further its aims. The magazine lasted two years and he later lost interest in the Futurist movement.

In 1920 Papini was reconverted to the Roman Catholicism in which he had been reared. A number of religious works followed, notably *Storia di Cristo* (1921; *The Story of Christ,* 1923), a vivid and realistic re-creation of the life of Jesus; *Pane e vino* (1926; *Bread and Wine,* 1923), a volume of religious poetry; and *Sant'Agostino* (1929; *St. Augustine,* 1930). Some of his later works were not uncritical of the church, however; for example, *Lettere agli uomini di papa Celestino VI* (1946; *Letters of Pope Celestine VI to All Mankind,* 1948) and *Il diavolo* (1953; *The Devil,* 1954), both of which contained unorthodox views.

Among Papini's many other books (he wrote more than 60) are three early collections of literary essays, the best known of which is *Ventiquattro cervelli* (1912; *Four and Twenty Minds,* 1970), a discussion of major European literary giants including, rather characteristically, an essay on Papini himself. He also published some early poetry and short stories; a biography of Dante, *Dante vivo* (1933; *Dante Living,* 1935), an opinionated but often insightful work that won the Mussolini Prize (Papini had become a fervent Fascist); a *Storia della letteratura italiana* (1937; "History of Italian Literature"); and also a biography (1949) of Michelangelo.

Papinian, Latin in full AEMILIUS PAPINIANUS (b. *c.* AD 140, probably at Emesa, Syria—d. 212), Roman jurist who posthumously became the definitive authority on Roman law, possibly because his moral highmindedness was congenial to the world view of the Christian rulers of the postclassical empire. The most important of his works are two collections of cases: *Quaestiones* (37 books) and *Responsa* (19 books). In the postclassical law schools the third-year students, who were called Papinianistae, used the *Responsa* as the basis of the curriculum. The Law of Citations (AD 426) of the emperor Theodosius II made Papinian predominant among five classical jurists whose works were to be authoritative in legal proceedings. His books were written in precise and elegant Latin.

Papinian held high public office under the emperor Lucius Septimius Severus (reigned AD 193–211). He was killed at the order of Severus' son and successor, Caracalla, perhaps for refusing to supply a legal excuse for the new emperor's murder of his brother and political rival, Geta.

Papinius Statius, Publius: *see* Statius.

papovavirus, any of a group of viruses constituting the family Papovaviridae, responsible for a variety of abnormal growths in animals: warts (papillomas) in humans, dogs, and other animals; tumours (polyomas) in mice; and vacuoles (open areas) in cells of monkeys. The virus particle lacks an outer membrane; is spheroidal, about 45 nanometres (nm; 1 nm $= 10^{-9}$ metre) across; is covered with 42 subunits called capsomeres; and contains deoxyribonucleic acid (DNA). Papovaviruses develop in the nuclei of cells, in which they can be seen in apparent crystalline arrangements.

Papp, Joseph, original name JOSEPH PAPIROFSKY (b. June 22, 1921, Brooklyn, N.Y., U.S.), U.S. theatrical producer and director, founder of the New York Shakespeare Festival and the Public Theatre. He was considered a major innovative force in U.S. theatre in the second half of the 20th century.

Papp studied acting and directing at the Actor's Laboratory Theatre in Hollywood from 1946 to 1948, when he became its managing director. In 1950 he took a position as assistant stage manager of the national touring company of Arthur Miller's *Death of a Salesman.* In 1954, after two years as a stage manager for the CBS television network in New York City, Papp founded the Shakespeare Workshop, which in 1960 became the New York Shakespeare Festival, a unique institution in the New York theatrical milieu. The festival gave free dramatic performances in various locations around the city, including outdoor productions in Central Park. (In 1962 the company received a newly built, permanent home in the park, the Delacorte Theatre.) Papp worked with little or no pay for several years to establish the festival, soliciting foundation grants and municipal support and producing and directing the majority of the plays himself.

In 1967 he founded the Public Theatre, which concentrated on contemporary and experimental dramas. Several of its productions eventually travelled to Broadway, including *Sticks and Bones* (1971), *That Championship Season* (1972), and *A Chorus Line* (1975). (The old Astor Library in Lower Manhattan was "recycled" into a seven-theatre complex to serve as the Public's physical plant.) Papp also served on various public committees concerned with theatre and was an adjunct professor of directing at Yale and Columbia universities.

pappataci fever, also called PHLEBOTOMUS FEVER, THREE-DAY FEVER, or SAND FLY FEVER, acute, infectious, febrile disease caused by a virus and producing temporary incapacitation. It is transmitted by the bloodsucking female sand fly, *Phlebotomus papatasii,* and is prevalent in the moist subtropical countries of the Eastern Hemisphere lying between latitude 20° and 45° N, particularly around the Mediterranean Sea, in the Middle East, and in parts of India. It breaks out in epidemic form during the summer season following the breeding of this species of fly, but the reservoir for the virus between epidemics is unknown. The sand fly becomes infected as a result of biting an infected person when the virus is circulating in the patient's blood; *i.e.,* from 48 hours before until 24 hours after the onset of fever. The virus then requires seven to ten days to incubate, after which the sand fly remains infected for life.

Man becomes infected from the bites of infected female sand flies. The virus multiplies and becomes widely disseminated throughout the body; and within two and one-half to five days after exposure there is suddenly a feeling of lassitude, abdominal distress, and dizziness, followed within one day by a chilly sensation and a rapid rise in temperature during the next day or two to 102°–104.5° F (38.8°–40.3° C). As in dengue, there are severe frontal headache and postorbital pain, intense muscular and joint pains, and a flushed appearance of the face but no true rash or subsequent scaling. During the first day of fever there is an accelerated pulse. Usually after two days the temperature slowly returns to normal; only rarely is there a second episode of fever. Following the febrile period there is great fatigue and weakness, accompanied by slow pulse and frequently subnormal blood pressure. Convalescence may require a few days or several weeks, but the prognosis is always favourable. Treatment is entirely symptomatic.

Sand flies breed in vegetation within a few hundred feet of human habitations. However, these breeding places are difficult to discover, rendering larvicidal control impractical. The bloodsucking females feed only from sunset to sunrise and only at ground level, so that sleeping above the ground floor provides moderately good protection. Ordinary mosquito netting and screening are useless, because unfed female flies can pass through their 18-mesh squares. Insect repellents, such as dimethyl phthalate, when applied to exposed skin, will keep sand flies away for a few hours, but the use of insecticide sprays on verandas, on screens, around doors and windows, and within habitations will readily kill all adult sand flies that alight on the sprayed surfaces.

Pappenheim, Gottfried Heinrich, Graf zu (count of) (b. May 29, 1594, Treuchtlingen, Bavaria [Germany]—d. Nov. 17, 1632, Leipzig), German cavalry commander conspicuous early in the Thirty Years' War.

Pappenheim served with the Catholic League, headed by the elector Maximilian I of Bavaria and commanded by Johann Tserclaes, Graf von Tilly. Idolized by his regiment of cuirassiers, the Pappenheimers, he proved a tempestuous cavalry officer, always charging ahead of his men, frequently wounded, and ruthless. He fought in the Bohemian War of 1620 and for the next two years campaigned in the Rhine against Ernst von Mansfeld, the feared mercenary serving Protestant Bohemia. He then served with the Spaniards in Lombardy and with the Grisons (1623–26). Recalled by Maximilian, he quelled a rebellion of Upper Austrian peasants in 1626 and conquered Wolfenbüttel (1627) in the Danish War. In the Swedish War he showed great courage in storming Magdeburg (1631), skillfully covered Tilly's retreat, and executed independent actions against the Swedes in northwestern Germany. In November 1632 Pappenheim, by this time an imperial field marshal, was mortally wounded while reinforcing Albrecht von Wallenstein's imperial army against the Swedish king at the Battle of Lützen.

Pappus OF ALEXANDRIA (fl. *c.* AD 320), the last great Greek geometer, whose *Synagoge* (*c.* AD 340; "Collection") incorporates a wealth of mathematical writings, many of them no longer available in any other form, but whose efforts to arrest the general decay of mathematics were unsuccessful. The *Synagoge* was made up of eight books, of which the first and part of the second are lost. His other works include commentaries on the *Analemma* (on an astronomical instrument) of Diodorus; on Ptolemy's *Almagest* (the classical astronomical work of his day), *Planisphaerium,* and *Harmonica;* and on Euclid's *Elements.* One of Pappus' own theorems is still cited as the basis of modern projective geometry.

The *Synagoge* contains a systematic account of the most important works in ancient Greek mathematics, with historical annotations, improvements and alterations of existing theorems and propositions, and original material. This work was intended as a guide to be used with the original works. Included are systematic introductions to each book, setting forth clearly the contents and general scope of the topics to be treated.

Book 1 covered arithmetic; the existing fragment of Book 2 sets forth a system of continued multiplication coupled with the expression of large numbers in terms of tetrads (powers of 10,000). Book 3 contains problems in plane and solid geometry, including that of finding two mean proportionals between two given lines. Pappus gave several solutions to this problem, one of them his own, and included a method of approximating continually to a solution, the significance of which he apparently failed to appreciate. The study of the arithmetic, geometric, and harmonic means and the problem of representing all three in one geometric figure served as an introduction to a general theory of means. He distinguished among 10 kinds of means with examples. Book 3 also reveals how each of the five regular polyhedra may be inscribed in a sphere.

Included in Book 4 are various theorems on the circle that circumscribes three given circles tangent to one another. Also considered are certain properties of various curves, including the Spiral of Archimedes, the conchoid of Nicomedes (fl. *c.* 240 BC), and the quadratrix of Hippias of Elis (fl. *c.* 430 BC). Proposition 30 describes the construction of a curve of double curvature called by Pappus the helix on a sphere. The area of the surface included between this curve and its base is found by the classical method of exhaustion equivalent to integration. The rest of the book concerns the trisection of any angle and the solution of problems by means of special curves.

Book 5 concerns the areas of different plane figures and the volumes of different solids; the 13 semiregular polyhedra discovered by Archimedes; and the surface and volume of a sphere.

Book 6 comments on problems of geometry and astronomy treated by Theodosius of Bithynia, Autolycus of Pitane, Aristarchus, and Euclid.

Book 7 explains the terms analysis and synthesis and the distinction between theorem and problem. Also the works of Euclid, Apollonius of Perga, Aristaeus, and Eratosthenes of Cyrene, 33 in all, are enumerated, as well as the famous problem of Pappus, which inspired René Descartes and the theorems rediscovered by and named after Paul Guldin (1577–1643) of Switzerland.

Book 8 deals principally with mechanics; interspersed are some questions on pure geometry.

Pappus' commentary on Euclid's theory of irrational numbers is extant in an Arabic translation and traces the historical development of the theory of irrationals.

paprika, spice made from the pods of *Capsicum annuum,* an annual shrub belonging to the nightshade family, Solanaceae, and native to tropical areas of the Western Hemisphere, including Mexico, Central America, South America, and the West Indies.

C. annuum is cultivated throughout most of the world for its pods, often called chili peppers, or chilies. The species includes most of the sweet peppers and many of the pungent, strong-flavoured types. Depending on the variety, the pods may be 0.5 inch to 1 foot (12.5 mm to 0.3 m) in length, with a long, round, or conical shape, and yellow, brown, purple, or red colour. A spongy central column bears the flat, kidney-shaped seeds.

Crops are planted in early spring and harvested in the summer and fall, when the pods are glossy and ripe. The pods are then dried and ground to produce paprika. When mild paprikas are made, the central core is first removed.

Paprika has some sugar content, varying with the variety, and is richer in vitamin C than the citrus fruits. Pungency is imparted by the nitrogen compound capsaicin, which is usually lower in *C. annuum* than in other plants of the same genus. A colouring agent, oleoresin of paprika, is extracted from the ground pods and used to impart bright red colour to meat and sausage products and to other processed foods.

The rose paprika of Hungary is generally considered the finest variety. It is made from choice dark red pods that have a sweet flavour and aroma. A sharper Hungarian variety, *Koenigspaprika,* or king's paprika, is made from the whole pepper.

Paprika is a popular seasoning in many cuisines. Its bright colour makes it an excellent garnish for nonsweet, light-coloured foods. It is frequently used in the cooking of Spain, Mexico, and the countries of the Balkan Peninsula. It is especially associated with Hungarian cuisine and is essential for such hot, spicy, Hungarian stew dishes as *gulyás* (called goulash in the United States), *pörkölt, paprikás,* and *tokány.*

Papua, Gulf of, inlet of the Coral Sea (southwestern Pacific) indenting the southeast coast of the island of New Guinea. About 225 miles (360 km) wide, it extends 95 miles (150 km) into south-central New Guinea. From west to east it is entered by the Fly, Bamu, Turama, Kikori, Purari, Lakekamu, and Vanapa rivers. Offshore natural gas deposits have been found in the Gulf of Papua.

Papua New Guinea, island country in the southwest Pacific Ocean, encompassing the eastern half of the island of New Guinea and a chain of tropical islands (including the Bismarck Archipelago and Bougainville), covering an area of 178,704 square miles (462,840 square km). The capital is Port Moresby. Papua New Guinea is bounded on the west by Indonesia's half of the island (Irian Jaya) and on the north by the Pacific Ocean, on the east by the Pacific and the Solomon Sea, and on the south by the Coral Sea and Torres

Strait, which separates the island from Australia. The population in 1990 was estimated to be 3,671,000.

A brief treatment of Papua New Guinea follows. For information on regional aspects of Papua New Guinea, *see* MACROPAEDIA: Pacific Islands.

For current history and for statistics on Papua New Guinea's society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. About 85 percent of Papua New Guinea's total land area lies on the island of New Guinea. The terrain ranges from extensive swampy lowland plains in the south and north to high central mountains, the Highlands, which extend from the eastern reaches of the island to Indonesia on the west, rising to 14,793 feet (4,509 m) in Mount Wilhelm. Broad, fertile upland basins lie in the Highlands at elevations of 4,500 feet (1,400 m) or higher. The larger outlying islands, such as Bougainville, New Ireland, and New Britain are predominantly high volcanic types fringed by low-lying coral formations. The lowlands north of the central Highlands are drained by the Sepik River, which flows generally eastward into the Bismarck Sea. The southern marshes and plains are drained eastward into the Gulf of Papua (Coral Sea) by the Fly River. Papua New Guinea lies wholly within the tropics, and its climate is monsoonal. Temperatures are high in most of New Guinea's lowland areas and along the coast, averaging about 81° F (27° C), and much cooler in the Highlands, at about 68° F (20° C). The northwest monsoon season is from December to March; the southeast monsoon season is from May to October. Rainfall usually exceeds 60 inches (1,500 mm) everywhere except in the portion of the south coast in the Port Moresby area. On the southward-facing slopes of the Highlands rainfall frequently exceeds 300 inches (7,600 mm) annually.

More than 70 percent of Papua New Guinea is covered with dense tropical rain forest. The country's soils are generally thin, washed-out, and of low fertility, but some good volcanic and alluvial soils are found in the lowlands and outlying islands. Lowland rain forest is the dominant vegetation cover. The animal life is closely related to that of Australia and includes such marsupials as wallabies and several species of the phalanger family, as well as many tropical birds. There are also many species of nonpoisonous snakes.

Yimas village, East Sepik province, Papua New Guinea

Only about 1 percent of the country's land area is arable, with about half devoted to root crops. Papua New Guinea's extensive mineral resources include copper, gold, silver, and chromite. There are also reserves of petroleum and natural gas.

The people. Papua New Guinea's ethnic composition is extremely complex. There are more than 700 ethnic entities, which can be divided into two large groups: Papuan, comprising more than four-fifths of the total population, and Melanesian, less than one-sixth; the rest are Polynesian, Chinese, and European. Ethnic Papuans live in the interior and southern sections, and Melanesian peoples live in the north and east and in the outlying islands. More than 700 languages, mostly Papuan, are found within the country. English is the official language, although it is spoken by only a small percentage of the population. About half of the populace speak Tok Pisin, a Melanesian pidgin, and a small minority speak Hiri, or Police, Motu; both languages are used as a lingua franca. The majority of the population live in simple villages and practice subsistence agriculture. Although almost three-fifths of the populace are Protestants (the largest portion of which are Lutherans) and nearly a third are Roman Catholics, traditional religious beliefs and rituals are still widely practiced.

More than two-fifths of the population of Papua New Guinea is under 15 years of age. The population density is low, particularly in the vast marshy basins of the Fly and Sepik rivers. A majority of the populace is rural, and the growing urban population amounts to less than one-seventh of the total, about two-thirds of it concentrated in five major cities: Port Moresby, Lae, Madang, Wewak, and Goroka. Birth and death rates are high; infant mortality, though very high, has declined, owing to the expansion of preventive-medical services and malaria-eradication programs, the introduction of maternal and child health services, and general improvements in diet and hygiene. Life expectancy is about 54 years for both sexes.

Economy. Papua New Guinea possesses a developing mixed economy based to a large extent on the export of mineral and agricultural products. The gross national product (GNP) is growing almost as rapidly as the population.

Agriculture accounts for one-third of the GNP and employs about four-fifths of the work force. Most of the population exists primarily in a subsistence, nonmonetarized but largely self-sufficient economy. Yams, taro, sago, and bananas are lowland staples, while the sweet potato is the main highland food. Cash crops grown on plantations and smallholder farms include coffee, cacao, copra, palm oil, tea, and rubber.

Mining, accounting for about one-eighth of the GNP and employing less than 1 percent of the work force, is dominated by gold and copper production, although silver is also mined.

The manufacturing sector accounts for one-tenth of the GNP and is limited by an extremely small internal market and an inadequate infrastructure. Beverages, processed foods, wood products, textiles, metal goods, concrete, and twist tobacco are produced on a small scale. Machinery, transport equipment, food, mineral fuels, and manufactured goods are imported. Electricity is largely generated from imported petroleum. Services, including trade and finance, account for more than one-third of the GNP and employ about one-sixth of the work force. Papua New Guinea offers tax incentives to foreign investors and receives economic aid from Australia. Principal trading partners include Australia, Japan, Germany, and the United States.

Government and social conditions. The 1975 constitution of Papua New Guinea vests executive power in the National Executive Council headed by the prime minister. The prime minister is the leader of the majority party in the single-chamber National Parliament. The British monarch continues to be the nominal head of state and is represented by a governor-general who is a citizen of Papua New Guinea. The Supreme Court is the highest court of appeal.

Hospitals are located in all provinces, and church-related health agencies operate in many rural areas. Major diseases include respiratory infections, gastroenteritis, malaria, and malnutrition. Education in Papua New Guinea is controlled by the government with missions and churches playing an important role. Fees are charged for primary and secondary education. There are teacher-training and vocational schools, as well as technical and secretarial colleges. The country has two universities—the University of Papua New Guinea and the University of Technology, both founded in 1965.

The government encourages revival of traditional dancing styles, craft work, cooking techniques, and folklore. The Papua New Guinea National Museum and Art Gallery has more than 20,000 ethnographic items exhibited.

History. It has been speculated that migrations from Southeast Asia via Indonesia to New Guinea occurred about 50,000 years ago. The earliest people on the island were hunters; agriculture was introduced through later migratory movements. New Guinea, especially the western half, Irian Jaya, was known to Indonesian and Asian seafarers centuries before it was known to Europeans. In 1512 the Portuguese sighted the New Guinea coast but made no landing until 1527. Inigo Ortiz de Retes claimed the island for Spain in 1545, but the first European attempt at colonization was made in 1793 by Lieutenant John Hayes, a British naval officer, near Manokwari, now in Irian Jaya. The Dutch, however, claimed this western half of the island as part of the Dutch East Indies in 1828. John Moresby of Great Britain surveyed the southern coast of the eastern half in the 1870s and by 1884 annexed New Guinea's southeastern quadrant for Britain. In the same year, the German New Guinea Company took over the northeastern quadrant.

In 1906 British New Guinea was passed to Australia, and its name was changed to the Territory of Papua. When World War I broke out in 1914, Australian armed forces occupied German New Guinea, and it was under their administration for the next seven years. In 1921 the League of Nations gave Australia a mandate to govern German New Guinea (except for Nauru and Micronesia). The Japanese invaded New Guinea and part of Papua in 1942; by 1945 the territory had been recovered by Australia. The administration of Papua and the New Guinea mandate was then combined into the Territory of Papua and New Guinea. Dutch New Guinea was annexed to Indonesia in 1969 as the province of Irian Jaya. In December 1973 Papua New Guinea became self-governing; it achieved complete independence from Britain in September 1975, becoming, at that time, a full member of the Commonwealth. Papua New Guinea also maintains observer status in the Association of Southeast Asian Nations. In 1989 secessionist rebels on Bougainville Island closed the island's copper mine, a major source of revenue for the country.

Papuan languages, a group of some 700 languages spoken in an area centred on New Guinea. Some of these languages (350–450 of them) have been shown to be related and are known as the Central New Guinea macrophylum; the remaining 250–350 languages are of doubtful or unknown affiliation.

A brief treatment of the Papuan languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World.

The Papuan languages are spoken in an area centred on New Guinea and extending from the islands of Alor, Halmahera, and Timor in the west to the Santa Cruz Archipelago in the east. The term Papuan was originally used merely to set these languages apart from the Austronesian and Australian languages; they were thought to be unrelated to one another. Since the late 1950s linguistic research has shown that about 350–450 of the Papuan languages constitute the Central New Guinea macrophylum (a macrophylum being a group of languages related less closely than those of a language family or stock). The number of speakers of each language varies from a few hundred to a few thousand, although Enga, numerically the largest language, has more than 160,000 speakers. Even related languages generally show considerable diversity, especially in vocabulary. A few basic grammatical characteristics, however, are shared by many languages. In many instances it is difficult to determine the borderline between languages and dialects, despite the presence of marked differences between two forms of speech. Recent research has resulted in the preliminary classification of most of the Papuan languages. Grammatical and lexical studies have been prepared, and folklore has been collected.

Most Papuan languages show extreme grammatical complexity. Their verbs reflect a wide range of numbers and other features of the subject as well as of the direct and indirect objects and the beneficiary. Verbs also indicate tense, aspect, mood, and the direction and circumstances in which the action that they designate is performed. There are, basically, two major types of verb forms in many Papuan languages. The normal type occurs in sentences in which only one action is referred to; the second, which may be called the special verb form, occurs in sentences which mention more than one action. Many of the languages have gender and noun class systems, some with up to 10 or more classes. Complex variations of adjectives, numerals, demonstratives, and subject and object markers often result, as these words have special forms for each of the various classes of nouns. Tonal systems, in which changes of pitch in words and syllables affect meaning, interact in intricate fashion with patterns of stress and syllable length.

Groups of languages that are more distantly related than those of a family or stock but more closely related than those of a macrophylum are divided into phyla. Apart from the isolates, there are 21 known Papuan phyla. Eight of these are small, with two to six languages each; six constitute the Central New Guinea macrophylum; and three more can tentatively be included in it. The Central New Guinea macrophylum comprises (1) the East New Guinea Highlands phylum, (2) the Finisterre–Huon phylum, (3) the Central and South New Guinea phylum, (4) the West New Guinea Highlands phylum, (5) the South-East New Guinea phylum, and (6) the Madang phylum. The tentative member phyla are (1) the Adelbert Range phylum, (2) the Middle Sepik–Upper Sepik–Sepik Hill phylum, and (3) the Anga stock. Some Papuan languages are difficult to classify because of strong Austronesian influence upon them. Most Papuan languages are of only regional importance, but a few have achieved some cultural significance because of their use as missionary languages.

papyrology, the care, reading, and interpretation of ancient documents written on papyrus, which is of prime importance in Egyptian, Middle Eastern, and Classical archaeology.

Most papyrus documents have been found in Egypt, where the papyrus plant was cultivated for the manufacture of writing material and the dry climate favoured preservation. Papyrus documents have been found dating from as early as about 2600 BC (a blank roll of papyrus, *c.* 3000 BC, was excavated in a 1st-dynasty tomb), and there are important documents from the Hyksos period to the end of the New Kingdom (*c.* 1630–1075 BC)—*e.g.,* the Rhind (mathematical) Papyrus, the Edwin Smith Surgical Papyrus, and the Turin Papyrus (*q.v.*), as well as literary compositions—but the majority of them date from Hellenistic and Roman times (4th century BC–6th century AD) and are written either in Egyptian demotic script, Greek, or Latin. Since they began to be collected in the late 18th and early 19th centuries, they have become an important source of information about the ancient Mediterranean world and an invaluable aid to the study of Classical literature and ancient religions. More than 2,500 papyrus copies of Greek and Roman literary works have been discovered; many of these works were previously unknown, and some were known only from references in ancient authors. One of the most spectacular of these discoveries was a manuscript of Aristotle's *Constitution of Athens,* found by an American missionary in Egypt in 1890. New biblical manuscripts have also come to light, and the papyrus scrolls found in the Dead Sea area since the late 1940s have been an outstanding aid to the study of ancient Judaism and early Christianity.

papyrus, writing material of ancient times and also the plant from which it was derived, *Cyperus papyrus* (family Cyperaceae), also called paper plant. The papyrus plant was long-cultivated in the Nile delta region in Egypt and was collected for its stalk or stem, whose central pith was cut into thin strips, pressed together, and dried to form a smooth, thin writing surface.

Paypyrus is a grasslike acquatic plant that has woody, bluntly triangular stems and grows up to 4.6 m (about 15 feet) high in quietly flowing water up to 90 cm (3 feet) deep. The triangular stem can grow to a width of as much as 6 cm (2.5 inches). The papyrus plant is now often used as a pool ornamental in warm areas or in conservatories. The dwarf papyrus (*C. isocladus,* also given as *C. papyrus* 'Nanus'), up to 60 cm (2 feet) tall, is sometimes potted and grown indoors.

The ancient Egyptians used the stem of the papyrus plant to make sails, cloth, mats, cords, and, above all, paper. Paper made from papyrus was the chief writing material in ancient Egypt, was adopted by the Greeks, and was extensively used in the Roman Empire. It was used not only for the production of books (in roll or scroll form) but also for correspondence and legal documents. Pliny the Elder gave an account of the manufacture of paper from papyrus. The fibrous layers within the stem of the plant were removed, and a number of these longitudinal strips were placed side by side and then crossed at right angles with another set of strips. The two layers formed a sheet, which was then dampened and pressed. Upon drying, the gluelike sap of the plant acted as an adhesive and cemented the layers together. The sheet was finally hammered and dried in the sun. The paper thus formed was pure white in colour and, if well-made, was free of spots, stains, or other defects. A number of these sheets were then joined together with paste to form a roll, with usually not more than 20 sheets to a roll.

Papyrus was cultivated and used for writing material by the Arabs of Egypt down to the time when the growing manufacture of paper from other plant fibres in the 8th and 9th centuries AD rendered papyrus unnecessary. By the 3rd century AD, papyrus had already begun to be replaced in Europe by the less-expensive vellum, or parchment, but the use of papyrus for books and documents persisted sporadically until about the 12th century.

papyrus column, in Egyptian religion, amulet that conveyed freshness, youth, vigour, and the continuance of life to its wearer. The amulet, made of glazed ware or various types of stone, was shaped like a papyrus stem and bud. Its significance was perhaps derived from its ideographic value (Egyptian *wadj,* "green, fresh, vigorous"); for, just as the plant itself was vigorous and growing, so also would the wearer of the papyrus column amulet possess these qualities.

Pará, *estado* ("state") of northern Brazil through which the Lower Amazon River flows to the sea. It is bounded on the north by Guyana, Suriname, and the Brazilian territory of Amapá, on the northeast by the Atlantic Ocean, on the east by the Brazilian states of Maranhão and Tocantins, on the south by Mato Grosso, and on the west by Amazonas. It is the second largest state in Brazil and has an area of 481,871 square miles (1,248,-042 square km). The capital and chief city is Belém.

Belém was founded by the Portuguese in 1615, chiefly to keep other European nations from settling there. Spanish Jesuit missions were the first settlements upstream, including Santarém in 1661; they were finally expelled by the Portuguese in 1710. Pará was made a captaincy in 1652, reunited with Maranhão in 1654, and re-established in 1772. It did not acknowledge the Brazilian Empire established in 1822 but yielded to force in 1823. It became a state when the new Brazilian republic was founded in 1889. Between 1850 and 1910 there was a period of feverish economic activity in the state as workers went out into the forests to tap the rubber trees. Rubber in large quantities was shipped out through Belém, and the city grew rapidly in size and importance. Production dropped quickly after 1910, however.

The dominant physical feature of Pará is the outlet of the Amazon River, which crosses the state for about 500 miles (800 km) from west to east before entering the Atlantic Ocean. The lower Amazon River valley is comparatively narrow, the territory on both sides rising in steep bluffs about 150 to 200 feet (50 to 60 m) above the river to the level of the ancient plateau that once covered this part of the continent. The chief towns in the state are located on the bluffs. To the north rise the Guiana Highlands, and on the south the country rises in forested terraces and is broken by escarpments caused by the erosion of the northern slope of the great central plateau of Brazil.

The state is crossed by the equator, and the climate is equatorial. The average annual temperature is 78° F (26° C), with a range between the coldest and warmest months of between 2° and 3° F (1.1° and 1.7° C). Rainfall, which occurs throughout the year, and humidity are high. Average annual rainfall is more than 59 inches (1,500 mm).

An enormous amount of water pours into the ocean through the state of Pará. The Amazon itself winds about on its floodplain, leaving a maze of abandoned channels in the form of oxbow lakes and an intricate crescentic pattern of levees and swamps. At Óbidos the Amazon's floodplain is scarcely a mile in width, but it opens out again downstream. The Amazon receives the water of several great tributaries, including, from west to east on the southern side, the Tapajóz, the Xingu, and the Tocantins. At the mouth of the Amazon is Marajó Island, as well as several other large islands. Marajó Island is 183 miles (295 km) long and 124 miles (200 km) wide, with an area of 18,519 square miles (47,964 square km). Except for a few patches of savanna, most of the state is covered with dense, tropical rain forest, or selva, with thousands of species of broadleaf evergreen trees. The soil under the selva, where little light reaches the ground, is deeply leached and, when the forest is cleared, quickly loses its capacity to produce crops. The largest land animal of the selva is the tapir; there are many smaller animals, including several species of cat.

Pará's population density is higher than that of the other states (Acre, Amazonas, and Rondônia) and territories (Roraima and Amapá) that make up the northern region of Brazil. The state's population is concentrated in the few cities and towns; the largest is Belém on the Pará River, and others include Santarém on the Tapajóz and Maraba on the Tocantins. There are a few small settlements and trading posts on the principal rivers and tributaries, and there are also plantations and small, scattered groups of Indians. Some groups of Indians are so remote and isolated that well into the second half of the 20th century they still had no contact with modern civilization.

Ethnically the population is composed of people of European, Indian, and mixed European and Indian ancestry. Since the 1930s, Japanese have settled in northern Pará. In Pará, health, education, and welfare programs in the cities are limited; outside the cities they are almost nonexistent.

Belém is the leading educational and cultural centre of northern Brazil. It has a university (founded 1957), a normal school to train teachers, an institute for research on tropical diseases, and an institute specializing in tropical agriculture.

The economy of Pará (*i.e.,* Belém and its environs) is based primarily on the collection and export of forest products, chiefly Brazil nuts, *malvas* (a palm-shaped herb), medicinal herbs, organic oils and insecticides, tropical fruits, and fibres. Since World War II some plantation products have been introduced with considerable success by Japanese colonists, including jute along the Amazon River and black pepper just to the south of Belém and near Santarém in the north. And with the opening and development of the Amazon region, some large foreign companies have located their plants in Pará.

Transportation within the state and externally is almost entirely by water, road, or air. The main port for Amazon River craft as well as for international and coastal shipping is Belém, and the Belém Airport is the principal air facility in northern Brazil.

The construction of the Belém do Pará-Brasília Highway, the Transamazônica Highway running west from Belém to the Peruvian border, and the Cuiaba–Santarém Highway, all of which were built during the 1970s, have led to a new tide of pioneer settlement and resource development in the hitherto most isolated parts of the Amazon Basin. Pop. (1988 est.) 4,617,000.

para-aminobenzoic acid (PABA), also called AMINOBENZOIC ACID, a vitamin-like substance and a growth factor required by several types of microorganisms. In bacteria, PABA is used in the synthesis of the vitamin folic acid. The drug sulfanilamide is effective in treating some bacterial diseases because it prevents the bacterial utilization of PABA in the synthesis of folic acid.

PABA is not an essential nutrient for vertebrates, since they do not synthesize their own folic acid. PABA is present in high concentrations in brewer's yeast, and it is perhaps best-known as an ultraviolet screen and as an active ingredient of some sun lotions.

para-aminosalicylic acid (PAS), also called AMINOSALICYLIC ACID, chemotherapeutic drug used in combination with isoniazid or the antibiotic streptomycin to treat tuberculosis. *Para*-aminosalicylic acid (PAS), which is administered orally, is only slightly antituberculotic when used alone. It was introduced in the treatment of tuberculosis in 1946. The use of *para*-aminosalicylic acid in combination with isoniazid or streptomycin helps reduce or delay the development of resistant strains of the tubercle bacillus.

Pará River, Portuguese RIO PARÁ, channel of the Amazon delta that passes to the south and east of Marajó Island, in northeastern Pará state, northern Brazil. It carries a small part of the discharge of the Amazon River eastward and northward to the Atlantic Ocean, off Cape Maguarinho. Its width varies from 5 to 40 miles (8 to 65 km), and its entire 200-mile (320-kilometre) length is navigable. Because it receives the Tocantins River from the south, the Pará is often called an estuary of that river. Belém, the capital of Pará state, lies on the Pará River's right (south) bank, near the mouths of the Guamá and Guajará rivers. The tidal bore of the Amazon is strong on the Pará, reaching 12 feet (4 m) in height.

parable (from Greek *parabolē,* "comparison," or "similitude"), short fictitious narrative by which moral or spiritual relations are set forth. The term originally referred to a Greek rhetorical figure, a kind of extended simile, involving the use of a literary illustration. The parable differs from the fable in the inherent plausibility of its story and in the exclusion of anthropomorphic animals or inanimate creatures, but it resembles it in the essential qualities of brevity and simplicity. The storytelling aspect of a parable is usually subordinated to the analogy it draws between a particular instance of human behaviour and human behaviour at large. The simple narratives of parables give them a mysterious, suggestive tone and make them especially useful for the teaching of moral and spiritual truths. Parables can often be fully understood only by an informed elite, who can discern the meaning within their brief, enigmatic structures.

The most famous parables are in the New Testament; in them, Jesus uses the form to illustrate his message to his followers by telling a fictitious story that is nevetheless true-to-life. There are also parables in the Old Testament (II Samuel 12:1–9; II Samuel 14:1–13), but they have suffered in popularity by comparison with the New Testament ones.

Throughout Christian history, the pious tale or parable has been a popular preaching device. The more paradoxical aspects of the parable were revived in the 19th century through treatises on Christian faith and practice written by the Danish philosopher Søren Kierkegaard. His use of the form influenced the enigmatic works of Franz Kafka and the writings of Albert Camus.

parabola, open curve, a conic section produced by the intersection of a right circular cone and a plane parallel to an element of the cone. As a plane curve, it may be defined as the path (locus) of a point moving so that its distance from a fixed line (the directrix) is equal to its distance from a fixed point (the focus).

The vertex of the parabola is the point on the curve that is closest to the directrix; it is equidistant from the directrix and the focus. The vertex and the focus determine a line, perpendicular to the directrix, that is the axis of the parabola. The line through the focus parallel to the directrix is the latus rectum (straight side). The parabola is symmetric about its axis, moving farther from the axis as the curve recedes in the direction away from its vertex. Rotation of a parabola about its axis forms a paraboloid (*q.v.*).

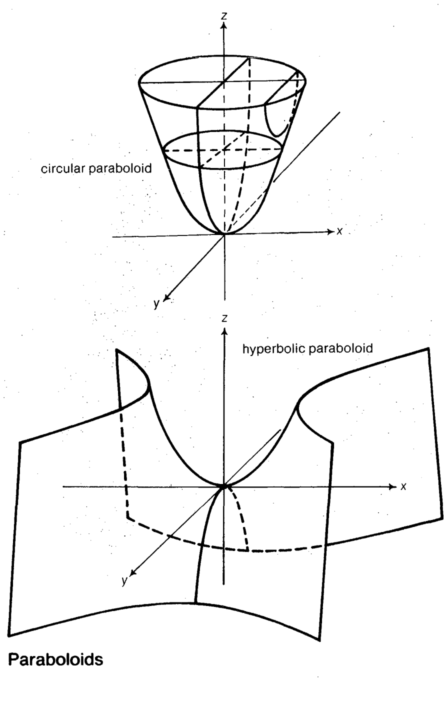
The parabola is the path, neglecting air resistance and rotational effects, of a projectile thrown outward into the air. The parabolic shape also is seen in certain bridges, forming arches.

For a parabola the axis of which is the x axis and with vertex at the origin, the equation is $y^2 = 2px$, in which p is the distance between the directrix and the focus.

parabolic equation, any of a class of partial-differential equations arising in the mathematical analysis of diffusion phenomena, as in the heating of a slab. The simplest such equation in one dimension, $u_{xx} = u_t$, governs the temperature distribution at the various points along a thin rod from moment to moment. The solutions to even this simple problem are complicated, but they are constructed largely from a function called the fundamental solution of the equation, given by an exponential function, $\exp[(-x^2/4t)/t^{1/2}]$. To determine the complete solution to this type of problem, the initial temperature distribution along the rod and the manner in which the temperature at the ends of the rod is changing must also be known. These additional conditions are called initial values and boundary values, respectively, and together are sometimes called auxiliary conditions.

In the analogous two- and three-dimensional problems, the initial temperature distribution throughout the region must be known, as well as the temperature distribution along the boundary from moment to moment. The differential equation in two dimensions is, in the simplest case, $u_{xx} + u_{yy} = u_t$, with an additional u_{zz} term added for the three-dimensional case. These equations are appropriate only if the medium is of uniform composition throughout, while, for problems of nonuniform composition or for some other diffusion-type problems, more complicated equations may arise. These equations are also called parabolic in the given region if they can be written in the simpler form described above by using a different coordinate system. An equation in one dimension the higher-order terms of which are $au_{xx} + bu_{xt} + cu_{tt}$ can be so transformed if $b^2 - 4ac = 0$. If the coefficients a, b, c depend on the values of x, the equation will be parabolic in a region if $b^2 - 4ac = 0$ at each point of the region.

paraboloid, an open surface generated by rotating a parabola (*q.v.*) about its axis. If the axis of the surface is the z axis and the vertex is at the origin, the intersections of the surface with planes parallel to the xz and yz planes are parabolas (*see* Figure, top). The intersections of the surface with planes parallel to and above the xy plane are circles. The general equation for this type of paraboloid is $x^2/a^2 + y^2/b^2 = z$.



Paraboloids

If $a = b$, intersections of the surface with planes parallel to and above the xy plane produce circles, and the figure generated is the paraboloid of revolution. If a is not equal to b, intersections with planes parallel to the xy plane are ellipses, and the surface is an elliptical paraboloid.

If the surface of the paraboloid is defined by the equation $x^2/a^2 - y^2/b^2 = z$, cuts parallel to the xz and yz planes produce parabolas of intersection, and cutting planes parallel to xy produce hyperbolas. Such a surface is a hyperbolic paraboloid (*see* Figure, bottom).

A circular or elliptical paraboloid surface may be used as a parabolic reflector. Applications of this property are used in automobile headlights, solar furnaces, radar, and radio relay stations.

paracanthopterygian, any member of the superorder Paracanthopterygii, a group of bony fishes comprising six orders and containing about 1,160 species. Well-known forms include the anglerfish and the commercially valuable cod, but the toadfish, clingfish, and beardfish also belong to this group.

A brief treatment of the paracanthopterygians follows. For full treatment, *see* MACROPAEDIA: Fishes.

Most paracanthopterygians are found worldwide in oceans; only the trout perch of North America lives solely in freshwater. The codfish, which grows up to 2 m (about 7 feet) long, is the largest species; they may weigh as much as 90 kg (200 pounds). Some goosefish may also reach about two metres in length, with a body weight of 35 kg (75 pounds).

The distinguishing features of paracanthopterygians are a distinctive jaw musculature, the structure of the caudal (tail) vertebrae, and the placement of the pelvic fins in the middle of the body or toward the head. Fossil forms have been found that date from the Cretaceous period (144 million to 66.4 million years ago).

Paracas, culture centred on the peninsula of the same name, located in present-day southern Peru in the vicinity of Ica, during the Early Horizon and the Early Intermediate periods (*c.* 900 BC–AD 400). The Paracas culture's earlier phase, called Paracas Cavernas, is related to the Chavín culture (*c.* 1000–400 BC). The pottery of the period is not well-fired and was sometimes painted after firing. The Paracas cultures of the middle Early Intermediate Period (*c.* AD 1–400) are referred to as the Paracas Pinilla and the Paracas Necrópolis phases. These periods show an improvement in pottery making. The Paracas Necrópolis people were named for and described by the study of cemeteries discovered at Cerro Colorado. The people wrapped the mummified corpses of their deceased, along with funeral offerings, in embroidered cloaks, which are among the finest examples of the art of textile making. The multicoloured designs on these textiles bear a definite relationship to those of painted pottery of the contemporaneous and later Nazca culture. These people also engaged in artificial deformation of the skull by binding the skull in infancy.

Paracel Islands, Wade-Giles romanization HSI-SHA CH'ÜN-TAO, Pinyin XISHA QUNDAO, Vietnamese QUAN DAO HOANG SA, group of about 130 small coral islands and reefs in the South China Sea. They lie about 250 miles (400 km) east of central Vietnam and about 220 miles (350 km) southeast of Hainan Island, China. Apart from a few isolated, outlying islands (Triton in the south, Lincoln in the east), they are divided into the Amphitrite group in the northeast and the Crescent group in the west. The low, barren islands, none of which exceeds 1 square mile (2.5 square km), lack fresh water. Turtles live on the islands, and seabirds have left nests and guano deposits, but there are no permanent human residents.

China, Taiwan, and Vietnam all claim the archipelago. In 1932 French Indochina announced the annexation of the Paracels and established a weather station there. Japan occupied some of the islands during World War II (1939–45) but later withdrew and, in 1951, renounced its claims there. By 1947 Chinese troops occupied Woody Island, the main island of the Amphitrite group. On Prattle Island, the largest of the Crescent group, the original weather station continued to be operated by French Indochina and its successor, Vietnam. With the political separation of the two Chinas and Vietnams, the number of claimants doubled: while the People's Republic of China and South Vietnam actually occupied the islands, Taiwan and North Vietnam declared themselves the heirs of legitimate Chinese and Vietnamese claims. The discovery of oil deposits under the South China Sea led to a crisis early in 1974 when, in reaction to Vietnamese contracts with foreign oil companies, China attacked the islands from sea and air, captured the weather station crew, and assumed control of the entire archipelago. In the 1980s the Paracels, still occupied by China, remained a subject of contention.

Paracelsus, byname of PHILIPPUS AUREOLUS THEOPHRASTUS BOMBASTUS VON HOHENHEIM (b. Nov. 11 or Dec. 17, 1493, Einsiedeln, Switz.—d. Sept. 24, 1541, Salzburg, Archbishopric of Salzburg [now in Austria]), German-Swiss physician and alchemist who established the role of chemistry in medicine. He published *Die grosse Wundartzney* ("Great Surgery Book") in 1536 and a clinical description of syphilis in 1530.

Early life. Paracelsus was the only son of a somewhat impoverished German doctor and chemist. Theophrastus, as he was first called, was a small boy when his mother died; his father then moved to Villach in southern Austria. There the boy attended the Bergschule, founded by the wealthy Fugger family of merchant bankers of Augsburg, where his father taught chemical theory and practice. Youngsters were trained at the Bergschule as overseers and analysts for mining operations in gold, tin, and mercury, as well as iron, alum, and copper-sulfate ores.

The young Paracelsus learned from miners' talk of metals that "grow" in the earth, watched the seething transformations in the smelting vats, and perhaps wondered if he would one day discover how to transmute lead into gold, as the alchemists sought. Thus Paracelsus early gained insight into metallurgy and chemistry that, doubtless, laid the foundations of his later remarkable discoveries in the field of chemotherapy.

In 1507, at the age of 14, he joined the many vagrant youths who swarmed across Europe in the late Middle Ages, seeking famous teachers at one university after another. During the next five years Paracelsus is said to have attended the universities of Basel, Tübingen, Vienna, Wittenberg, Leipzig, Heidelberg, and Cologne but was disappointed with them all. He wrote later that he wondered how "the high colleges managed to produce so many high asses," a typical Paracelsian jibe.

Rejection of traditional education and medicine. His attitude upset the schoolmen. "The universities do not teach all things," he wrote, "so a doctor must seek out old wives, gipsies, sorcerers, wandering tribes, old robbers, and such outlaws and take lessons from them. A doctor must be a traveller, . . . Knowledge is experience." Paracelsus held that the rough-and-ready language of the innkeeper, barber, and teamster had more real dignity and common sense than the dry-as-dust scholasticism of Aristotle, Galen, and Avicenna, the recognized Greek and Arab medical authorities of his day.

Paracelsus is said to have graduated from the University of Vienna with the baccalaureate in medicine in 1510, when he was 17. He was, however, delighted to find the medicine of Galen and the medieval Arab teachers criticized in the University of Ferrara, where, he always insisted, he received his doctoral degree in 1516 (university records are missing for that year). At Ferrara he was free to express his rejection of the prevailing view that the stars and planets controlled all the parts of the human body. He is thought to have begun using the name "para-Celsus" (above or beyond Celsus) at about that time, for he regarded himself as even greater than Celsus, the renowned 1st-century Roman physician.

Clearly a man of this type could never settle for long in any seat of learning, and so, soon after taking his degree, he set out upon many years of wandering through almost every country in Europe, including England, Ireland, and Scotland. He then took part in the "Netherlandish wars" as an army surgeon, at that time a lowly occupation. Later he went to Russia, was held captive by the Tatars, escaped into Lithuania, went south into Hungary, and again served as an army surgeon in Italy in 1521.

Ultimately his wanderings brought him to Egypt, Arabia, the Holy Land, and, finally, Constantinople. Everywhere he sought out the most learned exponents of practical alchemy, not only to discover the most effective means of medical treatment but also—and even more important—to discover "the latent forces of Nature," and how to use them. He wrote:

> He who is born in imagination discovers the latent forces of Nature.... Besides the stars that are established, there is yet another—*Imagination*—that begets a new star and a new heaven.

Height of his career. After about 10 years of wandering, he returned home in 1524 to Villach to find that his fame for many miraculous cures had preceded him. When it became known that the Great Paracelsus, then aged 33, had been appointed town physician and lecturer in medicine at the University of Basel, students from all parts of Europe began to flock into the city. Pinning a program of his forthcoming lectures to the notice board of the university on June 5, 1527, he invited not only students but anyone and everyone. The authorities were scandalized and incensed by his open invitation. Ten years earlier Luther had nailed his Theses on Indulgences to the doors of the Wittenberg Schlosskirche. Later, Paracelsus wrote:

> Why do you call me a Medical Luther? . . . I leave it to Luther to defend what he says, and I will be responsible for what I say. That which you wish to Luther, you wish also to me: you wish us both in the fire.

Three weeks later, on June 24, 1527, surrounded by a crowd of cheering students, he burned the books of Avicenna, the Arab "Prince of Physicians," and those of the Greek physician Galen, in front of the university. No doubt his enemies recalled how Luther, just six and a half years before at the Elster Gate of Wittenberg on Dec. 10, 1520, had burned a papal bull that threatened excommunication. Paracelsus seemingly remained a Catholic to his death, although it has been said that his books were placed on the *Index Expurgatorius.* Like Luther, he also lectured and wrote in German rather than Latin, for he loved the common tongue.

Despite his bombastic blunders, he reached the peak of his tempestuous career at Basel. His name and fame spread throughout the known world, and his lecture hall was crowded to overflowing. He stressed the healing power of nature and raged against those methods of treating wounds, such as padding with moss or dried dung, that prevented natural draining. The wounds must drain, he insisted, for "If you prevent infection, Nature will heal the wound all by herself." He attacked venomously many other medical malpractices of his time and jeered mercilessly at worthless pills, salves, infusions, balsams, electuaries, fumigants, and drenches, much to the delight of his student-disciples.

Paracelsus' triumph at Basel lasted less than a year, however, for he had made too many enemies. By the spring of 1528, he was at loggerheads with doctors, apothecaries, and magistrates. Finally, and suddenly, he had to flee for his life in the dead of night. Alone and penniless he wandered toward Colmar in Upper Alsace, about 50 miles north of Basel. He stayed at various places with friends. Such leisurely travel for the next eight years allowed him to revise old manuscripts and to write new treatises. With the publication of *Die grosse Wundartzney* in 1536 he made an astounding comeback; this book restored, and even extended, the almost fabulous reputation he had earned at Basel in his heyday. He became wealthy and was sought by royalty.

In May 1538, at the zenith of this second period of notoriety, he returned to Villach again to see his old father, only to find that he had died four years previously. In 1541 Paracelsus himself died in mysterious circumstances at the age of 48 at the White Horse Inn, Salzburg, where he had taken up an appointment under the prince-archbishop, Duke Ernst of Bavaria.

Assessment. His medical achievements were outstanding. In 1530 he angered the city council of Nürnberg by writing the best clinical description of syphilis up to that time, maintaining that it could be successfully treated by carefully measured doses of mercury compounds taken internally, thus foreshadowing the Salvarsan treatment of 1909. He stated that the "miners' disease" (silicosis) resulted from inhaling metal vapours and was not a punishment for sin administered by mountain spirits. He was the first to declare that, if given in small doses, "what makes a man ill also cures him," an anticipation of the modern practice of homeopathy. Paracelsus is said to have cured many persons in the plague-stricken town of Stertzing in the summer of 1534 by administering orally a pill made of bread containing a minute amount of the patient's excreta he had removed on a needle point.

He was the first to connect goitre with minerals, especially lead, in drinking water. He prepared and used new chemical remedies, including those containing mercury, sulfur, iron, and copper sulfate, thus first uniting medicine with chemistry, as the first *London Pharmacopoeia,* in 1618, indicates. Paracelsus, in fact, contributed substantially to the rise of modern medicine, including psychiatric treatment. Carl Gustaf Jung, the psychiatrist, wrote of him that "We see in Paracelsus not only a pioneer in the domains of chemical medicine, but also in those of an empirical psychological healing science." (J.G.H.)

parachute, umbrella-like device for slowing the descent of a body falling through the atmosphere. Originally conceived for human use either as a sport or to provide a safe escape from a disabled aircraft, parachutes have found wide employment in war and peace for safely dropping supplies and equipment as well as personnel, and for slowing a returning space capsule after re-entry into the Earth's atmosphere.

The parachute was invented at virtually the same time as the balloon but independently of it. The principle had been recognized by several writers, including Leonardo da Vinci; the first man to demonstrate it in action was Louis-Sébastien Lenormand of France in 1783. Lenormand jumped from a tree with two parasols; a few years later, other French aeronauts jumped from balloons; André-Jacques Garnerin was the first to use a parachute regularly, making a number of exhibition jumps, including one of about 8,000 feet (2,400 metres) in England in 1802.

Early parachutes were made of canvas; later, silk was employed. The first successful descent from an airplane was by Capt. Albert Berry of the U.S. Army in 1912. But in World War I, although parachutes were used with great frequency by observers escaping

from captive balloons, they were considered impractical for airplanes, and only in the last stage of the war were they finally introduced. In World War II, however, parachutes were extensively employed for a variety of purposes by the Germans, including landing special troops for combat, supplying isolated or inaccessible troops, infiltrating agents into enemy territory, and stabilizing and retarding airborne weapons. With the increased speed of aircraft the ejection seat was developed, which shot the pilot free of the disabled aircraft and automatically opened his chute after he had cleared it.

Modern man-carrying parachutes are made of nylon and assembled in a pack containing the parachute canopy, a small pilot parachute that assists in opening the canopy, and suspension lines, attached to a harness worn by the user. The canopy is given extraordinary strength by fabrication from up to 28 separate panels, or gores, each made of smaller sections, sewn together in such a way that a tear will usually be confined to the section in which it originates. The direction of the weave in each section adds further strength. The pack is fitted to the parachutist's back or front and opened by a ripcord that can be activated manually, by an automatic timing device, or by a line fastened to the aircraft. The harness is so constructed that deceleration, gravity, and wind forces are transmitted to the wearer's body with maximum safety and minimum discomfort.

Several forms of parachute have been developed for special purposes. The ring or ribbon parachute, invented in Germany during World War II, is composed of a number of concentric rings of radiating ribbons of fabric with openings between them that permit some airflow; such a chute has high aerodynamic stability and performs heavy-duty functions well, as in dropping heavy cargo loads or braking aircraft in short landing runs. Gliding parachutes have been designed to take advantage of the natural glide potential of chutes in general through manipulation of the suspension lines.

Parachutes designed for opening at supersonic speeds have radically different contours from conventional canopy chutes; they are made in the form of a cone, with air allowed to escape either through pores of the material or through a large circular opening running around the cone. Still another type, the bal-lute, is closed and becomes inflated by air taken in by special openings in the sides.

To permit escape from an aircraft flying at supersonic speeds, the parachute is designed as part of an assembly that includes the ejection seat. A small rocket charge ejects pilot, seat, and parachute; when the pilot is clear of the seat, the parachute opens automatically.

Sport parachuting, or sky diving, became an international athletic event in the 1950s. A new component, the sleeve, has made sport parachutes, or parafoils, exceptionally safe by drawing the parachutist upright and by making entanglement in the chute impossible. A sport parachute has an airfoil section and can be controlled very accurately.

paradise, in religion, a place of exceptional happiness and delight. The term paradise is often used as a synonym for the Garden of Eden before the expulsion of Adam and Eve. An earthly paradise is often conceived of as existing in a time when heaven and earth were very close together or actually touching, and when humans and gods had free and happy association. Many religions also include the notion of a fuller life beyond the grave, a land in which there will be an absence of suffering and a complete satisfaction of bodily desires. Accounts of a primordial earthly paradise in the higher religions range from that of a garden of life (Judaism, Christianity, Islām) to that of a golden age of human society at the beginning of each cycle of human existence (Buddhism, Hinduism). A final state of bliss is variously conceived of as a heavenly afterlife (Islām, Christianity), union with the divine (Hinduism), or an eternal condition of peace and changelessness (Buddhism).

In Christianity, paradise is pictured as a place of rest and refreshment in which the righteous dead enjoy the glorious presence of God. In its view of the heavenly afterlife, Islām views paradise as a pleasure garden in which the blessed experience the greatest sensual and spiritual happiness.

paradox, apparently self-contradictory statement, the underlying meaning of which is revealed only by careful scrutiny. The purpose of a paradox is to arrest attention and provoke fresh thought. The statement "Less is more" is an example. Francis Bacon's saying, "The most corrected copies are commonly the least correct," is an earlier literary example. In George Orwell's anti-utopian satire *Animal Farm* (1945), the first commandment of the animals' commune is revised into a witty paradox: "All animals are equal, but some animals are more equal than others." Paradox has a function in poetry, however, that goes beyond mere wit or attention-getting. Modern critics view it as a device, integral to poetic language, encompassing the tensions of error and truth simultaneously, not necessarily by startling juxtapositions but by subtle and continuous qualifications of the ordinary meaning of words.

When a paradox is compressed into two words as in "loud silence," "lonely crowd," or "living death," it is called an oxymoron.

paradoxes of Zeno, statements made by the Greek philosopher Zeno of Elea, a 5th-century-BC disciple of Parmenides, a fellow Eleatic, designed to show that any assertion opposite to the monistic teaching of Parmenides leads to contradiction and absurdity. Parmenides had argued from reason alone that the assertion that only Being *is* leads to the conclusions that Being (or all that there is) is (1) one and (2) motionless. The opposite assertions, then, would be that instead of only the One Being, many real entities in fact are, and that they are in motion (or could be). Zeno thus wished to reduce to absurdity the two claims, (1) that the many are and (2) that motion is.

Plato's dialogue, the *Parmenides,* is the best source for Zeno's general intention, and Plato's account is confirmed by other ancient authors. Plato referred only to the problem of the many, and he did not provide details. Aristotle, on the other hand, gave capsule statements of Zeno's arguments on motion; and these, the famous and controversial paradoxes, generally go by names extracted from Aristotle's account: the Achilles (or Achilles and the tortoise), the dichotomy, the arrow, and the stadium.

The Achilles paradox (*q.v.*) is designed to prove that the slower mover will never be passed by the swifter in a race. The dichotomy paradox is designed to prove that an object never reaches the end. Any moving object must reach halfway on a course before it reaches the end; and because there are an infinite number of halfway points, a moving object never reaches the end in a finite time. The arrow paradox endeavours to prove that a moving object is actually at rest. The stadium paradox tries to prove that, of two sets of objects traveling at the same velocity, one will travel twice as far as the other in the same time.

If, in each case, the conclusion seems necessary but absurd, it serves to bring the premise (that motion exists or is real) into disrepute, and it suggests that the contradictory premise, that motion does not exist, is true; and indeed, the reality of motion is precisely what Parmenides denied.

Paradoxides, genus of trilobites (an extinct group of arthropods) found as fossils in Middle Cambrian rocks of North America and western Europe (the Cambrian Period began 570,000,000 years ago and lasted 70,000,000 years). *Paradoxides* has a well-developed head

region terminating laterally in pointed spines that vary in development from species to species; the tail region is poorly developed. The body is well-segmented, and the axial lobe tapers to the minuscule pygidium (tail). Some species of *Paradoxides* attained large size (45 cm, or 18 inches). *Paradoxides* is useful in correlating Middle Cambrian rocks and time.

Paradoxides Series, rocks deposited during the Middle Cambrian Period in western Europe and Scandinavia and in eastern North America (the Cambrian Period lasted from 570 million to 500 million years ago). The Paradoxides Series is characterized by the fossil occurrence of trilobites of the family Paradoxididae and other trilobites, such as the genera *Agnostus* and *Eodiscus.*

paraffin hydrocarbon, also called ALKANE, any of the saturated hydrocarbons having the general formula C_nH_{2n+2}, C being a carbon atom, H a hydrogen atom, and *n* an integer. The paraffins are major constituents of natural gas and petroleum. Paraffins containing fewer than 5 carbon atoms per molecule are usually gaseous at room temperature, those having 5 to 15 carbon atoms are usually liquids, and the straight-chain paraffins having more than 15 carbon atoms per molecule are solids. Branched-chain paraffins have a much higher octane number rating than straight-chain paraffins and, therefore, are the more desirable constituents of gasoline. The hydrocarbons are immiscible with water but are soluble in absolute alcohol, ether, and acetone. All paraffins are colourless.

paraffin oil: *see* kerosine.

paraffin wax, colourless or white, somewhat translucent, hard wax consisting of a mixture of solid straight-chain hydrocarbons ranging in melting point from about 48° to 66° C (120° to 150° F). Paraffin wax is obtained from petroleum by dewaxing light lubricating oil stocks. It is used in candles, wax paper, polishes, cosmetics, and electrical insulators. It assists in extracting perfumes from flowers, forms a base for medical ointments, and supplies a waterproof coating for wood. In wood and paper matches, it helps to ignite the matchstick by supplying an easily vaporized hydrocarbon fuel.

Paraffin wax was first produced commercially in 1867, less than 10 years after the first petroleum well was drilled. Paraffin wax precipitates readily from petroleum on chilling. Technical progress has served only to make the separations and filtration more efficient and economical. Purification methods consist of chemical treatment, decolorization by adsorbents, and fractionation of the separated waxes into grades by distillation, recrystallization, or both. Crude oils differ widely in wax content.

Synthetic paraffin wax was introduced commercially after World War II as one of the products obtained in the Fischer–Tropsch reaction, which converts coal gas to hydrocarbons. Snow-white and harder than petroleum paraffin wax, the synthetic product has a unique character and high purity that make it a suitable replacement for certain vegetable waxes and as a modifier for petroleum waxes and for some plastics, such as polyethylene. Synthetic paraffin waxes may be oxidized to yield pale-yellow, hard waxes of high molecular weight that can be saponified with aqueous solutions of organic or inorganic alkalies, such as borax, sodium hydroxide, triethanolamine, and morpholine. These wax dispersions serve as heavy-duty floor wax, as waterproofing for textiles and paper, as tanning agents for leather, as metal-drawing lubricants, as rust preventives, and for masonry and concrete treatment.

Parafusulina, genus of extinct fusulinid foraminiferans (single-celled animals with a hard, complexly constructed shell) found as fossils in Permian marine rocks (the Permian Period began 286 million years ago and ended 245 million years ago). *Parafusulina* is more specifically restricted to the Leonardian and Guadalupian stages, smaller divisions of Permian rocks and time, and is thus an excellent index, or guide, fossil. The shell is characterized by distinct flutings, and the details of internal structure are best studied in thin section.

paragenesis, the sequence in which the minerals are formed in an ore deposit. Variations in the pressure and temperature and in the chemical constituents of a hydrothermal solution will result in the precipitation of various minerals at different times within the same ore deposit. The general sequence of deposition is gangue minerals (silicates and carbonates) first; oxide minerals next, with the sulfides and arsenides of iron, nickel, cobalt, and molybdenum contemporaneous with or closely following the oxides, and the lead and zinc sulfides following them; and lastly the native metals and tellurides followed by the antimony and mercury sulfides. The paragenesis at any particular location may be complicated if the ore deposit has been formed by more than one period of hydrothermal activity.

paragonimiasis, infection caused by *Paragonimus westermani*, or lung fluke, a parasitic worm some 8 to 12 millimetres (0.31 to 0.47 inch) long. It is common in Japan, Korea, China, the Philippines, and Indonesia and has also been reported in parts of Africa and South America. The worm lives in the lungs of the infected individual, where it produces small cysts with fibrous walls. When a cyst in the lung ruptures, the eggs of the worm are coughed up in the sputum, some of which is swallowed so that the eggs are passed in the feces. Finding their way to water, the eggs hatch into larvae, which then infect water snails. When the larvae emerge from the snails, they enter and infect freshwater crabs and crayfish. Man acquires the infection by eating undercooked crab or crayfish harbouring the fluke larvae. The pulmonary lesions and symptoms resemble those of tuberculosis in many respects. Definitive diagnosis is obtained by finding the fluke eggs in the sputum, which may be bloodstained and purulent. In heavy infestations, lesions may also be found in the liver, skeletal muscle, and brain. Bithionol is an effective drug against the fluke. In the absence of reinfection, gradual recovery takes place after the worms die. Prevention consists of the thorough cooking of shellfish; salting, pickling, or soaking in rice wine is usually not effective in killing the infective larvae.

paragonite, mica mineral similar to muscovite, a basic silicate of sodium and aluminum; a member of the common mica group. It was thought to be an uncommon mineral, but experiment and investigation have shown that it is widespread in metamorphic schists and phyllites, in gneisses, in quartz veins, and in fine-grained sediments. It seems probable that much paragonite has been mistaken for muscovite. Fine-grained paragonite, like muscovite, is called sericite or white mica. For chemical formula and detailed physical properties, *see* mica (table).

Paraguaçu River, Portuguese RIO PARAGUAÇU, river, in central and eastern Bahia state, eastern Brazil, rising in the Chapada Diamantina and flowing northward and then eastward for approximately 300 mi (500 km). It empties into Baía de Todos os Santos (All Saints Bay), just below Maragogipe. The river is navigable from its mouth for only about 25 mi as far as Cachoeira. The region around its upper course yields black industrial diamonds. Principal river towns, apart from Cachoeira, are Andaraí and Itaetê. In the late 1970s the Brazilian government began projects for irrigation, cattle raising, fruit cultivation, and electrification of sites in the Paraguaçu River Valley.

Paraguaná Peninsula, Spanish PENÍNSULA DE PARAGUANÁ, Falcón state, northwestern Venezuela, between the Caribbean Sea on the east and the Golfo de Venezuela on the west. Of low elevation, the peninsula has infertile soil and is sparsely populated, but the development of the petroleum industry, especially in the 1950s and 1960s, has given Paraguaná great economic importance. Pipelines lead from the oil fields at Lake Maracaibo to the large oil refineries at Amuay and Punta Cardón on the western side of the peninsula, where coastal indentations permit easy access by deep-draft tankers. In the 1960s Punto Fijo emerged as the peninsula's major urban centre. Coro (*q.v.*), the state capital, lies at the base of the isthmus linking the peninsula to the mainland and is connected by highways with the oil-refining centres of the peninsula and with Venezuela's principal highland cities.

Paraguarí, department, southern Paraguay, bounded south by Misiones department, and west by Ñeembucú department. The territory, 3,361 sq mi (8,705 sq km) in area, is drained by the Río Tebicuary, a tributary of the Paraguay River, and by Laguna Verá, the nation's largest lake, on the department's western border. Northern Paraguarí contains part of the forested extension of the Brazilian Highlands that reach westward to Asunción, including the Cordillera (mountains) de los Altos, of which Cordillera Ybycurí is the third largest peak in Paraguay at 2,065 ft (630 m) above sea level. Southern Paraguarí consists of rich agricultural lowlands producing tropical subsistence and cash crops. Population is well distributed, and there are many processing and marketing centres. In 1936, 100 Japanese families invited to immigrate by the Paraguay government settled in La Colmena. Near Caapucú, the principal centre of southern Paraguarí, are important iron-ore reserves. The department is served by the main Asunción–Villarrica railway, which passes through Paraguarí (*q.v.*), the departmental capital, and by the Asunción–Encarnación highway. Pop. (1982 prelim.) 205,160.

Paraguarí, capital, Paraguarí department, southern Paraguay. It lies on the southern slopes of the forested extension of the Brazilian Highlands, including la Cordillera (mountains) de los Altos, that reach westward to Asunción. Originally a Jesuit mission, the city was formally organized in 1775. In 1811, when Paraguay stood aside from the Argentine colonies in their revolt against Spain, Paraguarí was the scene of an important battle in which the Argentines were repulsed and Paraguay's independence was secured. Paraguarí is now the commercial and manufacturing centre of a fertile and active agricultural hinterland. Cotton, tobacco, sugarcane, oranges, rice, corn (maize), hides, and petitgrain (a base for perfume made from bitter orange leaves) are among its products. Ceramic works, tanneries, and food-processing plants are located in the area. The city is also the headquarters of Paraguay's artillery regiment and school. Santo Tomás grottoes, on a nearby hill, are noted for their hieroglyphic inscriptions, presumably the work of early indigenous peoples; one long cavern is a centre of Good Friday pilgrimage. Paraguarí is accessible by railway or highway from Asunción, Villarrica, and Encarnación. Pop. (1982 prelim.) 2,724.

Paraguay, officially REPUBLIC OF PARAGUAY, Spanish REPÚBLICA DEL PARAGUAY, landlocked country of south central South America, covering an area of 157,048 sq mi (406,752 sq km). The capital is Asunción. The country lies between latitudes 19° and 28° S (about 616 mi [992 km] from northwest to southeast) and longitudes 54° and 63° W (about 425 mi at its widest from east to west). Paraguay is bordered on the east by Brazil; on the southeast, south, and southwest by Argentina; and on the north and northwest by Bolivia. The population in 1984 was estimated at 3,445,000.

The article that follows is a summary of significant detail about Paraguay. Fuller treatment is provided in the following MACROPAEDIA articles. For geography and history, *see*

The land. The Paraguay River, flowing from north to south, divides Paraguay into two distinct geographical regions: the Región Oriental (Eastern Region) and the Región Occidental (Western Region). The Región Oriental, with about 40 percent of the country's land area, is an extension of the Brazilian Plateau; it varies in elevation from about 165 ft (50 m) above sea level at the southwestern corner of the country to a few scattered hills that rise to about 2,500 ft. About 80 percent of the entire country is lower than 1,000 ft in elevation. The Cordillera de Amambay (Amambay Mountains) runs approximately north to south along part of the eastern border with Brazil; it then runs eastward as the Cordillera de Mbaracayú. To the west of these mountains lies the broad valley of the Paraguay River. The Región Occidental (also called Chaco Boreal [Northern Chaco]), which covers about three-fifths of the country, forms the northern part of the hot and semiarid plains of the Gran Chaco, a flat and largely featureless region that also extends into Bolivia and Argentina. Three navigable rivers, the Paraguay in the north, the Alto Paraná in the east and south, and the Pilcomayo in the southwest trace four-fifths of the country's perimeter. These major rivers, providing the country with access to the distant Atlantic Ocean and with sites for hydroelectric power, are of vital importance to the nation's economic life.

Paraguay's climate is subtropical; temperatures range between 77° F (25° C) and 104° F (40° C) in the summer (October–March), and between 50° F (10° C) and 68° F (20° C) in the winter (April–September). The annual average rainfall varies from 67 in. (1,702 mm) in the southeast, to 55 in. along the Paraguay River, and 23 in. in the west. The entire country is subject to periodic floods and droughts, which cause severe agricultural losses.

About two-fifths of the Eastern Region and more than one-half of the Chaco are forested. More than 500 species of hardwood have been identified, including urunday, lapacho, and quebracho. Much of the Chaco is covered by cacti and thorny scrubs. Animals found in

Paraguay include deer, wild pig, jaguar, wolf, fox, armadillo, and anteater.

Although the mineral resources of Paraguay are scarce, the country has great hydroelectric potential. It is estimated that upon completion of hydroelectric projects at Itaipú, Yacyretá-Apipé, and Corpus on the Alto Paraná River, Paraguay will become the largest exporter of electric power in the world.

The people. Paraguay's population had a growth rate of 3.2 percent annually during the 1970s. The general population density is low, although it is distributed unevenly; more than 95 percent of the population lives in the eastern region on less than 40 percent of national territory. The young and dependent age groups are large, with approximately 45 percent of the population under 15 years of age. Ninety-five percent of the population is mestizo (mixed Spanish and Guaraní Indian). There are much smaller groups of Indians, blacks, Caucasians, and Asians living in the Chaco and the forests of eastern Paraguay. Most of the population speaks Spanish and about half of the population is bilingual. Roman Catholics comprise 95 percent of the population; other religious groups include Mennonites and adherents of Eastern religions.

Population growth is encouraged and a relatively high birth rate of close to 37 births per 1,000 population has been achieved. Child abandonment and high maternal mortality, however, are serious and persisting problems. The infant mortality rate is exhorbitant, at 48.6 infant deaths per 1,000 live births. The nation's death rate is approximately 7 deaths per 1,000 population, and life expectancy is approximately 60 years for males and 64 for females. Poor sanitation and malnutrition persist in rural areas and urban slums.

Approximately two-fifths of the population resides in urban areas. Asunción, the capital, has 434,928 inhabitants (1978 est.). Construction of the Itaipú dam has provided impetus for the growth of several new urban settlements. Emigration has slowed since the early 1970s because of an improved economy.

The economy. Paraguay has a developing market economy that is based largely on agriculture, trade and services, and light industries. The dam construction on the Paraná River has stimulated economic growth, and the gross national product (GNP) grew at an annual rate of more than 10 percent between 1976 and 1980. The GNP totalled U.S. $4,110,000,000 in 1980; the GNP per capita, which has grown more rapidly than the population, was $1,340.

Agriculture accounts for nearly one-third of the GNP and employs approximately one-half of the work force. Pastures occupy two-fifths of the land and support more than 5,000,000 cattle and other livestock. The European Economic Community has restricted imports of meat from Paraguay since 1974, with the result that the cultivation and export of cotton and soybeans have expanded rapidly. More than 1,800,000 tons of soybeans are harvested annually. Sugarcane, cassava, and corn (maize) are also important crops. The production of maté (Paraguayan tea) is declining.

Forests cover one-half of the land, and forestry has expanded to meet the growing demand of domestic construction. Sawmills and woodworking industries have benefitted from government restrictions on the export of logs.

The country's limited mining industry accounts for less than 1 percent of the GNP. There are significant deposits of limestone, salt, kaolin, and apatite. Fuels must be imported, and the government is developing a plant to produce alcohol to be mixed with gasoline.

Manufacturing accounts for approximately one-fifth of the GNP and employs some 15 percent of the work force. Manufactures are in large part based on domestic raw materials and include cement, leather, textiles, refined sugar, and lumber. Foreign investment in industry is encouraged by various tax incentives, and tariffs are lowered on imports of certain raw materials and capital goods.

Paraguay has been self-sufficient in electric power since 1976 and exports electricity to Brazil and Argentina. Production of electricity totalled 810,000,000 kW-hr in 1980 and was almost entirely generated from hydroelectric plants.

Paraguay has access to Atlantic shipping via the Paraná River; large vessels navigate the Paraguay River between Asunción and Concepción. All but one-tenth of the country's roads are unpaved.

National revenues ordinarily exceed or equal expenditures, and the government has attempted to minimize expansionary pressures on the money supply resulting from a massive influx of foreign exchange. Revenues are largely derived from various domestic taxes and tariffs; expenditures are chiefly allocated to defense, education, and public works. External public debt has increased more than sixfold since 1970.

Administrative and social conditions. Paraguay is a constitutional republic. The government is highly centralized, with a powerful executive branch. Its constitution, adopted in 1967 and amended in 1977, concentrates executive power in the president, who is directly elected to a five-year term. The president governs with the assistance of the appointed Council of State, an advisory body composed of his own appointed Council of Ministers and representatives of various sectors of society. The president has broad authority, including the power to legislate by decree when Congress is recessed. Regular legislative power is vested in the bicameral Congress consisting of a 60-member Chamber of Deputies and a 30-member Senate. Members are elected concurrently with the president to a five-year term. The party that wins the largest number of votes in the election receives two-thirds of the seats in each chamber. The remaining seats are apportioned among the minority parties on the basis of votes received

Political parties are legally free to organize, but they must be recognized by the executive branch in order to participate in elections, and they are closely regulated. The dominant party is the Colorado Party. The judicial system is headed by the Supreme Court, consisting of five justices appointed by the president. The armed forces total 16,000 men, more than three-quarters of them in the army.

Paraguay's social welfare system provides cash and medical care for sickness, maternity, and work injury; and pensions for old age, invalidism, disability, and loss of support. Although health facilities are improving in number, they remain largely concentrated in urban areas. In the nation at large there are about 14 hospital beds per 1,000 inhabitants, but in rural areas there can be as few as 2 beds per 1,000. Physicians number about 1,300, or 3.6 per 1,000 inhabitants, a ratio that compares unfavourably with most South American countries. Endemic diseases include hepatitis, typhoid, and diptheria. Inadequate shelter during the winter months is the chief cause of persisting influenza, pneumonia, and tuberculosis. Shanty towns have grown up on the outskirts of Asunción to accommodate the growing population of urban migrants.

The literacy rate is a relatively high 90 percent for men and 82 percent for women. Elementary education is free and compulsory between the ages of 7 and 14, however schools are not available in some remote areas. Enrollment of school-aged children in elementary schools is 85 percent, while in secondary schools it is only 20 percent. There are technical and scientific institutes as well as two universities. The National University of Asunción provides free higher education.

Although freedom of the press is guaranteed in the constitution, in practice the press has found it prudent to exercise self-restraint in criticism of the government. The Paraguayan press is relatively young; the oldest existing daily, *La Tribuna*, was founded in 1925. Radio and television, supervised by the state's National Telecommunications Administration, are almost entirely privately owned and commercially operated.

The main characteristic of Paraguayan culture is its fusion of both the Guaraní and Spanish traditions. Folklore, the arts, and literature reflect this dual origin. The country's outstanding handicraft is the production of ñandutí lace, which is thought to represent a combination of 16th-century needlepoint lace-making techniques from Europe with Guaraní traditions.

Paraguay's principal cultural institutions are located in Asunción. There are learned societies concerned with Paraguayan and Guaraní history and culture, as well as various other societies and research institutes. The Normal School of Music, the Conservatory of Music, the National Academy of Fine Arts, and the Asunción Symphony Orchestra are located there. Paraguay has museums of ethnography, natural history, and military history, as well as museums with collections of the work of Paraguayan artists.

History. Indian tribes speaking the Guaraní language occupied the region between the Paraguay and Paraná rivers long before the arrival of Europeans. They were seminomadic peoples practicing agriculture, hunting, and fishing in a land rich in natural resources.

Alejo García, making his way from the Brazilian coast in 1524, and Sebastian Cabot, sailing up the Paraná in 1526, were the earliest European explorers in the area. Domingo Martínez Irala established the first colonial settlement in Asunción in 1537. From this date until the establishment of the viceroyalty of Río de la Plata (1776), Asunción was the centre of Spanish power in southeastern South America. Prior to 1776 the colony was known as a large Jesuit settlement, with more than 30 *reducciones* (Indian missions). Between 1721 and 1735 many landowners waged a struggle to overthrow the Jesuits' monopoly of trade with the Indians. This led to the eventual ouster of the Jesuits in 1767.

The local metropolis of Buenos Aires was made capital of the viceroyalty of Río de la Plata in 1776, and in 1810 the city cast off Spanish rule and attempted to reconstitute the viceroyalty under its own rule. Paraguayans refused to accept rule from Buenos Aires, and sought help from the Portuguese to repulse attacks from the city's junta. The Paraguayan people then disposed of their Spanish governor and declared their independence in 1811.

After a short period of anarchy, José Gaspar Rodríguez Francia, called by the Indians "El Supremo," set up a dictatorship that lasted until 1840. Francia adopted a policy of isolationism in an effort to preserve the homogeneous character of Paraguay and strengthen the nation's spirit of self-reliance. In the two dictatorships that followed, Carlos Antonio López (1840–62) and his son Francisco Solano López (1862–70) abandoned Francia's isolationism, extended education, and opened the country up for trade and development.

Paraguayans feared the aspirations of Brazil and Argentina, and the increasing domination of Uruguay by Brazil eventually sparked a war in 1865. Paraguay attacked Brazil and in doing so violated Argentine territory. The Triple Alliance of Argentina, Brazil, and Uruguay invaded Paraguay. Paraguayan soldiers and citizens fought a tenacious defensive war until 1870. Paraguay was devastated and foreign troops occupied the country for six years.

Political clashes, coups d'etat, and civil wars succeeded one another during the remainder of the century. During World War I Paraguay was neutral, and some economic expansion took place. Tensions over Paraguay's western boundary with Bolivia increased rapidly during the early 20th century. Both countries constructed forts along the border, and sporadic skirmishes over many years led to the Chaco War (1932–35). The peace of 1938 gave Paraguay most of the disputed territory, but Bolivia acquired an outlet to the Paraná River.

Colonel Rafael Franco, leader of the Febristas, seized power in 1936. The government soon fell, however, and General José Félix Estigarribia, hero of the Chaco War, was elected president (1939). Estigarribia died unexpectedly in 1940, and Paraguay was ruled by various dictators until 1954, when General Alfredo Stroessner seized power. Stroessner remained in power until he was overthrown in a military coup in 1989. His eight successive terms as president marked the longest period of unbroken rule by one individual in a Latin-American country in the 20th century. During his rule Paraguay made significant economic progress; inflation was kept low, and health and educational services and the road network were improved. Stroessner's regime, however, engaged in the systematic repression of political opposition.

Paraguay River, Portuguese RIO PARAGUAI, Spanish RÍO PARAGUAY, river, the fifth largest in South America and the principal tributary of the Paraná River. Rising in the Mato Grosso region of Brazil at 980 feet (300 m) above sea level, it crosses Paraguay to empty into the Paraná near the Argentine border; it is 1,584 miles (2,550 km) long.

A brief treatment of the Paraguay River follows. For full treatment, *see* MACROPAEDIA: South America.

The source and upper course of the Paraguay are in Brazil, where it demarcates part of the frontier with Paraguay before entering Paraguay itself, which it traverses from north to south. It then forms the frontier between Paraguay and Argentina for the last 150 miles (240 km) of its course before joining the Paraná River, which then flows into Argentina.

Inaccessible to oceangoing ships, the river is used only for local traffic; steamers from Buenos Aires, capital of Argentina, ply upstream as far as Asunción, the capital of Paraguay. Often flowing through country rife with malaria and other tropical diseases and subject for much of its length to seasonal flooding, the Paraguay River constitutes more of an obstacle than an aid to the development of its basin.

The Paraguay has varying rates of flow between its source and mouth. Above Corumbá (Brazil), the highest rate of flow occurs in February and the lowest rate occurs from July to August. Downstream from Corumbá the highest rate of flow occurs in July and the lowest from December to January. The upper Paraguay (down to Concepción, Paraguay) floods from December to March, while the middle Paraguay (from Concepción to Asunción) floods from May to June. Flooding on the lower Paraguay takes place in February, and the river's flood area exceeds 30,000 square miles (78,000 square km). The predominant climate of the Paraguay drainage basin, which has an area of 380,000 square miles (980,000 square km), is of the hot and humid savanna type, characterized by dry winters and heavy rains in the summer. Forest and grassland are found along the banks of the Paraguay. In the lowlands of eastern Paraguay, forest cover and savanna grasslands alternate. The river's fish population includes the dorado (a fish resembling salmon), the piranha, and the pacu (which resembles bass). The basin is sparsely populated and largely economically underdeveloped. Livestock raising and subsistence agriculture are the principal modes of livelihood. The river has a mean annual discharge of 68,000 cubic feet per second (1,900 cubic m/sec).

Paraguayan War, also called WAR OF THE TRIPLE ALLIANCE (1864–70), the bloodiest conflict in Latin-American history, fought between Paraguay and the allied countries of Argentina, Brazil, and Uruguay.

Paraguay had been involved in boundary and tariff disputes with its more powerful neighbours, Argentina and Brazil, for years. The Uruguayans had also struggled to achieve and maintain their independence from those same powers, especially from Argentina.

In 1864 Brazil helped the leader of Uruguay's Colorado Party to oust his Blanco Party opponent, whereupon the dictator of Paraguay, Francisco Solano López, believing that the regional balance of power was threatened, went to war with Brazil. Bartolomé Mitre, president of Argentina, then organized an alliance with Brazil and Colorado-controlled Uruguay (the Triple Alliance), and together they declared war on Paraguay on May 1, 1865.

López' action, following his buildup of a 50,000-man army, then the strongest in Latin America, was viewed by many as aggression for self- and national aggrandizement; but, as the war wore on, many Argentines and others saw the conflict as Mitre's war of conquest.

At the opening of the war, in 1865, Paraguayan forces advanced through Argentina northward into the Brazilian province of Mato Grosso and southward into the province of Rio Grande do Sul. Logistical problems and the buildup of the allied troop strength, which soon outnumbered Paraguay's by 10 to 1, then forced the Paraguayans to withdraw behind their frontiers. In June 1865, Brazilian naval forces defeated a Paraguayan flotilla on the Paraná River at Riachuelo, near the Argentine city of Corrientes; by January 1866 the allies had blockaded the rivers leading to Paraguay. In April, Mitre led an allied invading force into southwestern Paraguay but was prevented from advancing for two years. Fierce battles were fought; the most notable, won by the Paraguayans at Curupayty in September 1866, inhibited any allied offensive for nearly a year. Both sides suffered heavy losses in the campaign.

In January 1868 Mitre was replaced as commander in chief by the Brazilian marquess (later duke) de Caxias. In February Brazilian armoured vessels broke through Paraguayan defenses at the river fortress of Humaitá, near the confluence of the Paraná and Paraguay rivers, and pressed on to bombard Asunción, the capital. In the Campaign of Lomas Valentinas in December, the Paraguayan army was annihilated. López fled northward and carried on a guerrilla war until he was killed on March 1, 1870.

The Paraguayan people had been fanatically committed to López and the war effort, and as a result they fought almost literally to the last man. The war left Paraguay utterly prostrate; its prewar population of approximately 525,000 was reduced to about 221,000 in 1871, of which only about 28,000 were men. During the war the Paraguayans suffered not only from the enemy but also from malnutrition, disease, and the domination of López, who tortured and killed countless numbers. Argentina and Brazil annexed about 55,000 square miles (140,000 square km) of Paraguayan territory: Argentina took much of the Misiones region and part of the Chaco between the Bermejo and Pilcomayo rivers; Brazil enlarged its Mato Grosso province from annexed territory. They both demanded a large indemnity (which was never paid) and occupied Paraguay until 1876. Meanwhile, the Colorados had gained control of Uruguay, and they retained that control until 1958.

Paraíba, also called PARAHYBA, or PARAHYBA DO NORTE, *estado* ("state") of northeastern Brazil. Primarily an agricultural state, Paraíba is bounded by the states of Rio Grande do Norte on the north, Ceará on the west, and Pernambuco on the south and by the Atlantic Ocean on the east. Its area is 21,765 square miles (56,372 square km). Its chief river, the Paraíba, rises on the Pernambuco border and enters the Atlantic Ocean near the state capital, João Pessoa. The only other large city is Campina Grande, a cotton-shipping centre farther inland.

Paraíba is a name of Tupí Indian origin formed from the words *para* and *hiba,* meaning "arm of the river." The name of the capital was itself formerly Paraíba, but it was changed to honour the memory of a former governor, João Pessoa, a reformist and national vice-presidential candidate whose assassination in 1930 helped spark the revolution that brought Getúlio Vargas to national power in Brazil.

Northeastern Brazil was the first part of the country to become wealthy when, in the 16th century, the Portuguese established the world's first large-scale sugarcane plantations there with African slave labour. Founded on Aug. 5, 1585, as the captaincy of Itamaracá (a captaincy being a kind of fiefdom granted by the Portuguese crown), Paraíba shared in the sugarcane riches of the period; and, because sugar required large investments and cheap labour, economic and political power fell into the hands of a few wealthy landowning families. In the 18th century, cotton, Paraíba's chief product today, was first produced and became a significant export.

Physiographically, Paraíba in the east has a narrow coastland of sandy beaches and dunes off which deep-sea fishermen, or raftsmen, ride the surf on tree-trunk rafts. There is no coastal plain; from this seaboard the land rises abruptly to coastal mesas, which, together with a few inland river valleys, provide the principal wealth of the state—cotton, sugar, and sisal, together with tobacco, corn (maize), cassava, cacao, banana, pineapple, oiticica oil, livestock, and hides. These coastal areas, enjoying dependable rainfall, were once covered by dense tropical forests, but from the early period of plantations on they were cleared for crops and pastures. To the west, behind the zone of coastal mesas, a hilly upland known as the Bordorema Plateau occupies most of the central part of the state. Columbium, tantalum, and a variety of minerals are mined on the plateau, though their economic importance is less than that of agriculture. The plateau is a semi-arid region once covered by deciduous, thorny scrub woodland called caatinga. In the caatinga there are only small areas of forest on the tops of the higher mountains. Generally, though, the area is dry not so much because of a lack of measurable rain as because of the unevenness of the rainfall and the poor drainage. Rain falls in summer and autumn and evaporates quickly or, partly because of man's excessive clearing of the land, runs off the impermeable ground, leaving sandy gullies and pebble-strewn stretches of dry earth. Life in the caatinga country thus depends on irrigation; the federal government has built a number of reservoirs; however, the nature of the hilly land permits irrigated crops to be raised only around the margins of the lakes behind the dams. Finally, Paraíba's farthest western section consists of broad plains—peneplains, or semi-arid flatlands, developed by erosion, with only a few tablelands called *chapadas* remaining from an earlier era.

Since the 1960s Paraíba has been developing industrially; two industrial parks in João Pessoa and Campina Grande house a wide range of industries, including clothing, agricultural machinery, cellulose, plastics, soaps, synthetic fibres, stoves, and rubber shoes. The Transamazonica Highway links Cruzeiro do Sul in Acre near the Peruvian border with João Pessoa, passing through Patos and Campina Grande. Other highways crosscut the state to connect it with the rest of Brazil; in the early 1970s power lines brought electrical energy from Pernambuco and distributed it among all the towns of Paraíba.

A university, the Universidade Federal da Paraíba, founded in 1955, has campuses in João Pessoa, Campina Grande, Areia, Bananeiras, Cajazeiras, Sousa, and Patos. Pop. (1984 est.) 2,971,000.

Paraíba do Sul River, Portuguese RIO PARAÍBA DO SUL, river, in eastern Brazil, formed by the junction of the Paraibuna and Paraitinga rivers, east of São Paulo, between Mogi das Cruzes and Jacareí. It flows east-northeastward, receiving tributaries from the Serra da Mantiqueira and the Serra do Mar and forming part of the border between Minas Gerais and Rio de Janeiro states. From its initial elevation of 5,000 ft (1,500 m), the river descends gradually until it reaches São Fidélis, where it emerges through a series of falls to the coastal plain and enters the Atlantic Ocean near São João da Barra after a course of 700 mi (1,100 km).

The Paraíba do Sul has long played a vital role in the social and economic life of Brazil, for its lower course is navigable, and several large cities, including Volta Redonda, are located on its banks. Some of its tributaries, notably the Piraí, have been used for power and irrigation.

parakeet, also spelled PARRAKEET, any of numerous seed-eating parrots of small size, slender build, and long, tapering tail. In this sense the name is given to some 115 species in 30 genera of the subfamily Psittacinae (family Psittacidae) and has influenced another parrot name, lorikeet (*see* parrot). To indicate size

only, the name is sometimes extended to little parrots with short, blunt tails, as the hanging parrots, or bat parrotlets, *Loriculus* species, popular cage birds in their native area, India to Malaya and the Philippines.

Parakeets occur worldwide in warm regions; they are abundant from India and Sri Lanka to Australia and the Pacific Islands, throughout Southeast Asia, and in tropical America. Typically they form large flocks and may be serious pests in grainfields. Most species lay four to eight eggs in a tree hole. Dozens of colourful kinds are kept as pets. All are highly active and need much room; most are pugnacious—notably when paired—toward other birds; and a few become good, though small-voiced, mimics. Many colour varieties and intergeneric hybrids are known in the wild as well as in aviaries.

The most popular caged parakeet is the budgerigar, or shell parakeet (*Melopsittacus undulatus*). Mistakenly called lovebird, this 19-centimetre (7½-inch) parakeet has hundreds of colour mutations from the green and yellow basic stock; but cheek spots and close barring on the upper parts usually persist. Sexes look alike but may differ seasonally in colour of the cere, the bare skin at the base of the bill. Budgerigars are seed eaters; in the wild, they form large flocks in Australia's grasslands. They breed colonially, in tree holes, laying six to eight eggs twice a year. Most budgerigars are hardy, surviving for 5 to 10 years.

The Australian parakeets, or rosellas, *Platycercus* species, have scalloped backs and underparts, black shoulders, distinctive cheek and throat markings, and long, broad tails that are centrally greenish or bluish with a blue and white margin. The seven species, averaging 26–36 cm (10–14 in.) in length, are also called harrakeets.

The smaller broad-tailed parrots are the five species of *Psephotus,* which have no specific group name. Female rosellas are duller than males. Popular caged birds, rosellas are hardy and prolific but notoriously quarrelsome with other species.

homey), West Africa. It is the terminus of the so-called Benin–Niger Railway, which was originally planned to extend to the Niger River. The railway runs northward from Cotonou, Benin's major port and commercial centre on the Gulf of Guinea, to Parakou, whence goods must be transported by road to the navigable Niger River and into landlocked Niger. Parākramabāhu I, also called PARĀKRAMABĀHU THE GREAT (b. *c.* 1123, Punkhagama, Ceylon—d. 1186, Polonnaruwa), Sinhalese king of Ceylon (1153–86) who united the island under one rule, reformed Buddhist practices, and sent successful expeditionary forces to India and Burma.

The son of Manabharana (one of Ceylon's four regional lords), who controlled the south and who died while Parākrama was still a boy, Parākrama succeeded his father's successor, Siri Megha, the de facto ruler of Ceylon. He won and maintained control only after several battles and counterrevolutions.

Parākramabāhu designed a government of 12 provincial governors, princes, army generals, and leading merchants. He reformed the Buddhist establishment by expelling lax monks and by building new temples. He allowed Hindus freedom of worship.

paraldehyde, also called PARACETALDEHYDE, colourless liquid of disagreeable taste and pungent odour used in medicine as a sedative–hypnotic drug and in chemistry in the manufacture of organic chemicals. When administered as a medicine, it is largely excreted by the lungs and gives an unpleasant odour to the breath. It is most useful for recalcitrant cases and is an older drug for treatment of acute alcoholic dementia.

Paraldehyde is produced for commerce by polymerizing acetaldehyde with a trace of sulfuric acid; the resulting liquid is then neutralized with calcium carbonate and purified by fractional distillation. Paraldehyde boils at 124° C (255° F) and melts at a temperature of 12.5° C (54.5° F).

parallax, in astronomy, the difference in direction of a celestial object as seen by an observer from two widely separated points. The measurement of parallax is used directly to find the distance of the body from the Earth (geocentric parallax) and from the Sun (heliocentric parallax). The two positions of the observer and the position of the object form a triangle; if the base line between the two observing points is known and the direction of the object as seen from each has been measured, the apex angle (the parallax) and the distance of the object from the observer can be found simply.

In the determination of a celestial distance by parallax measurement, the base line is taken as long as possible in order to obtain the greatest precision of measurement. For the Sun and Moon, the base line used is the distance between two widely separated points on the Earth; for all bodies outside the solar system, the base line is the axis of the Earth's orbit. The largest measured stellar parallax is 0.76″, for the nearest star, Alpha Centauri; the smallest that can be directly measured is about 25 times smaller, but indirect methods discussed below permit calculation of the parallax, inversely proportional to the distance, for more and more distant objects but also with more and more uncertainty.

The parallax of the Sun or Moon is defined as the difference in direction as seen from the observer and from the Earth's centre. In Figure 1, let O be the observer on the surface of the Earth, E the centre of the Earth, and M the position of the Moon; then the angle OME is the parallax. This varies with the altitude of the Moon. If the Moon is directly overhead, the parallax is zero, and parallax is greatest when the body is on the horizon. At an angular distance z from the zenith, Z, we find from the triangle OME that $\sin p = a/r \sin z$. When $z = 90°$, $\sin p = a/r$ and this value is called the horizontal parallax or, briefly, the parallax. For all bodies except the Moon, p is so small that it does not differ appreciably from $\sin p$, and it is usually expressed in an-

gular measure. The definitions of lunar and solar parallax must be further refined because of the spheroidal figure of the Earth. The numerical values generally given are those of the equatorial horizontal parallax. The solar parallax is usually derived from measurements of the positions of other bodies of the solar system.

Lunar parallax. The first parallax determination was for the Moon, by far the nearest celestial body. Hipparchus (150 BC) determined the Moon's parallax to be 58′ for a distance of approximately 59 times the Earth's equatorial radius as compared with the modern value of 57′02.6″; that is, a mean value of 60.2 times. Lunar parallax is directly determined from observations (*see* Figure 2) made at two places, such as G, Greenwich, Eng., and C, the Cape of Good Hope, that are nearly on the same meridian. Angles z_1 and z_2 are observed, and other data are obtained from the latitudes of the observatories and the known size and shape of the Earth. In practice, stars near the Moon are observed also to eliminate errors of refraction and instruments.

Another method rests on a comparison of the force of gravity at the Earth's surface with its value at the Moon. If M and m are the masses of the Earth and Moon, r the mean distance, P the sidereal period of revolution of the Moon about the Earth and k the constant of gravitation, $k(\mathrm{M}+m)=4\pi^2r^3/\mathrm{P}^2$ where $\pi=3.14$. Also, g, the value of gravity at the Earth's surface, determined from pendulum observations, is equal to $k\mathrm{M}/a^2$. Hence

$$\left(\frac{a}{r}\right)^3 = 4\pi^2\frac{\mathrm{M}}{\mathrm{M}+m}\cdot\frac{a}{g\mathrm{P}^2} \qquad (1)$$

As the quantities on the right-hand side are known with great accuracy, a/r is accurately determined as 57′2.7″.

Radar measures of the distance from the Earth to the Moon have provided a recent value of the lunar parallax. Radar ranges have the advantage of being a direct distance measure, although the ranges are affected by variations in the surface topography of the Moon and require assumptions about the lunar radius and the centre of mass.

The International Astronomical Union in 1964 adopted a value of 57′02.608″ for the lunar parallax corresponding to a mean distance of 384,400 kilometres.

Solar parallax. The basic method used for determining solar parallax is the determination of trigonometric parallax. In accordance with the law of gravitation, the relative distances of the planets from the Sun are known, and the distance of the Sun from the Earth can be taken as the unit of length. The measurement of the distance or parallax of any planet will determine the value of this unit. The smaller the distance of the planet from the Earth, the larger will be the parallactic displacements to be measured, with a corresponding increase in accuracy of the determined parallax. The most favourable conditions are therefore provided by the observation, near the time of opposition, of planets approaching close to the Earth. The determination can be based either on simultaneous or nearly simultaneous observations from two different places on the Earth's surface, or on observations made after sunset and before sunrise at the same place, when the displacement of the place of observation produced by the rotation of the Earth provides the base line for the measurements.

The first reasonably accurate determination of the Sun's parallax was made in 1672 from observations of Mars at Cayenne, French Guiana, and Paris, from which a value of 9.5″ was obtained.

Methods depending on velocity of light are also employed to ascertain solar parallax. The value of the velocity of light has been determined with very high precision and may be utilized in several different ways. A direct method is the converse of the procedure of Ole Rømer in the discovery of the velocity of light; *i.e.,* to use the light equation, or time taken by the light to reach us at the varying distances of Jupiter, but great accuracy is hardly obtainable in this way. A second method is by means of the constant of aberration, which gives the ratio of the velocity of the Earth in its orbit to the velocity of light. As aberration produces an annual term of amplitude 20.496″ in the positions of all stars, its amount has been determined in numerous ways. Observations made at Greenwich in the years 1911 to 1936 gave the value 20.489″ ± 0.003″ leading to the value 8.797″ ± 0.013″ for solar parallax.

This method is not free from the suspicion of systematic error.

The velocities of stars toward or away from the Earth are determined from spectroscopic observations. By choosing times when the orbital motion of the Earth is carrying it toward or from a star, astronomers are able to determine mathematically the velocity of the Earth in its orbit. In this way the solar parallax was found from observations at the Cape of Good Hope to be 8.802″ ± 0.004″.

Radar measures of the distance from the Earth to Venus have provided the best determination of the solar parallax. By measuring the flight time of a radar pulse to Venus, the distance between the two planets can be obtained, allowing the determination of the unit distance between the Earth and the Sun.

The present value for the radar astronomical unit is 149,598,000 km ± 200 km, corresponding to a solar parallax of 8.79414″ ± 0.00004″. The principal limitations of the method are its dependence on knowledge of the planetary orbits, the uncertainty in the value of the velocity of light, and the possibility of electromagnetic effects in the Earth–Venus plasma delaying the radar pulse.

Gravitational methods are still another means of determining solar parallax. In lunar theory there is a term of period one month known as the parallactic inequality. The coefficient of the term contains the ratio of the parallaxes of the Sun and Moon as a factor. The coefficient's large size makes it of value.

The ratio of the combined mass of the Earth and the Moon to that of the Sun may be determined from the disturbing action of the Earth and Moon on the elliptic motion of the planets. The ratio of the Moon's mass to that of the Earth is 1/81.30, and thus the ratio of the Earth's mass to that of the Sun is found. In a manner similar to that described above for the Moon's parallax, the solar parallax is then derived.

At the General Assembly of the International Astronomical Union in 1964 the value 8.79405″ (8.794″) for the solar parallax was adopted, corresponding to an astronomical unit of 149,600,000 km.

Stellar parallax. The stars are too distant for any difference of position to be perceptible from two places on the Earth's surface; but, as the Earth revolves at 149,600,000 km from the Sun, stars are seen from widely different viewpoints during the year. The effect on their positions is called annual parallax, defined as the difference in position of a star as seen from the Earth and Sun. Its amount and direction vary with the time of year, and its maximum is a/r, where a is the radius of the Earth's orbit and r the distance of the star (Figure 3). The quantity is very small and never reaches 1/206,265 in radians, or 1″ in sexagesimal measure.

Direct measurement. The introduction of the photographic method by F. Schlesinger in 1903 considerably improved the accuracy of stellar parallaxes. In practice a few photographs are taken when the star is on the meridian shortly after sunset at one period (epoch) of the year and shortly before sunrise six months later. Since the star's positions also change because of its motion across the sky (proper motion), a minimum of three such sets of observations is necessary for obtaining the parallax. From approximately 25 photographs taken over five epochs, the parallax of a star usually is determined with an accuracy of about ± 0.010″ (probable error), even though the diameter of the photographic disk of the star is rarely less than 2.0″.

The unit in which stellar distances are expressed by astronomers, the parsec, is the distance of a star whose parallax is 1″. This is equal to 206,265 times the Earth's distance from the Sun, or approximately 30,000,000,000,000 km. When p is measured in seconds of arc and the distance d in parsecs, the simple relation $d = 1/p$ holds. One parsec is equal to 3.26 light years.

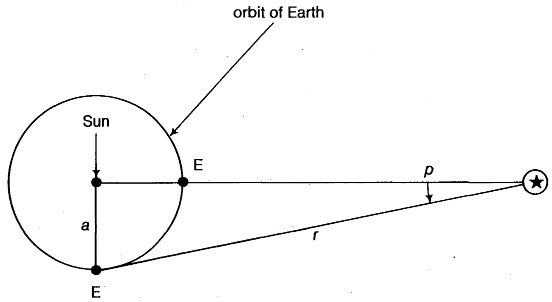

Figure 3: Stellar parallax

The star with the largest known parallax, 0.76″, is Alpha Centauri. Fifty-eight separate stars are known within a distance of five parsecs from the Sun. These stars include the bright stars Alpha Centauri, Sirius, Procyon, and Altair, but the majority are faint telescopic objects.

Indirect measurement. For stars beyond a distance of 30 parsecs (parallactic angle 0.03″), the trigonometric method is in general not sufficiently accurate, and other methods must be used to determine their distances.

The parallax can be derived from the apparent magnitude of the star if there are any means of knowing the absolute magnitude of the star—*i.e.,* the magnitude the star would have at the standard distance of 10 parsecs. For many stars a reasonable estimate can be made from their spectral types or their proper motions. The formula connecting the absolute magnitude, M, and the apparent magnitude, m, with parallax, p, is

$$M = m + 5 + 5 \log p \qquad (2)$$

expressing the condition that the light received from a star varies inversely as the square of the distance.

Some groups of stars, such as the Hyades cluster in Taurus and the Ursa Major cluster, have proper motions converging toward a definite point on the celestial sphere and are called moving clusters. The apparent convergence is due to the effect of perspective on parallel motions. Once the direction toward the convergent point is known, and the proper and radial motion of a member star is known, the parallax can be determined from the geometry.

One method of indirect measurement involves the determination of mean, or average, stellar parallaxes. The solar system is moving through space with a velocity of 19.5 km per second, carrying it four times the Earth's distance from the Sun in one year. This produces a general drift in the angular movement of the stars away from the apex, or point in the sky to which the movement is directed. Were the stars at rest, this would give a ready means of determining their individual distances. As the stars are all moving, the method gives the average distance of a group of stars examined, on the assumption that their peculiar motions are eliminated. In this way the mean parallaxes of stars of successive apparent magnitudes, of different galactic latitudes, and of different spectral types are obtained. Thus the mean parallax of fifth magnitude stars (*i.e.,* of stars just visible to the naked eye) is 0.018″, and of the 10th magnitude stars (*i.e.,* of stars each giving about 1/100 of the light of a star of the fifth magnitude) is 0.0027″.

Stellar parallaxes are also deduced from spectroscopic observations. The spectra of nearly all stars can be grouped into a small number of classes, which form a continuous sequence depending on the effective (surface) temperatures of the stars. The Henry Draper (HD) classification, which is of this kind, uses the letters O–B–A–F–G–K–M to denote classes with temperatures descending from about 30,000 K for class O to about 2,500 K for class M. The HD system has been generally adopted, usually in combination with a decimal subdivision for refined work.

Empirical studies show that the spectra of the stars also include important clues to their true luminosities. In 1914 Walter Adams and Arnold Kohlschütter established the spectroscopic differences between giant and dwarf stars of the same spectral type and laid the foundation for the determination of spectroscopic parallaxes. These differences, depending upon the intrinsic brightness of the star, allow an estimate of its absolute magnitude, and the parallax can then be deduced by means of the equation (2) given above. This method has been applied to most of the brighter stars in the Northern Hemisphere, using stars of known parallax as standards.

A two-dimensional classification system of stellar spectra, which has been universally adopted, has greatly improved the accuracy of spectroscopic parallaxes. The system, called the MK system, assigns a precise system of Draper classes and five luminosity classes, using the Roman numerals I to V. The system divides the majority of stars into supergiants, bright giants, subgiants, and main sequence (dwarf) stars, depending upon their intrinsic brightness, as determined from the spectral lines most sensitive to this property. The luminosity classes are then calibrated in terms of absolute magnitude.

The colours of the stars can also be used as indicators of their absolute magnitude, as first shown by Ejnar Hertzsprung in 1905 and 1907. A measure of the colour of a star is the difference in brightness, measured in magnitudes, in two selected wavelength bands of its spectrum. Initially the difference between the visual and the photographic magnitude of a star was defined as the colour of its light and called its colour index. A comparison between the colour index and the spectral classification of a star has made it possible to develop a quantitative method of measuring a star's absolute magnitude. Several photometric systems have been developed. The most widely used system is the two-dimensional quantitative classification method based upon photoelectric measurements in three wavelength bands in the ultraviolet, blue, and yellow (or visual) regions of the spectrum, hence called the *UBV* system. The system of the two colour indices *U-B* and *B-V* is calibrated in terms of spectral class and luminosity class on the MK system, based upon a set of standard stars. The relationship between the two indices in the *UBV* system and the absolute magnitudes for the main-sequence stars is of particular interest. By means of this relationship and the inverse square law, it is possible to determine the distances to galactic clusters from photoelectric observations of main-sequence stars in these clusters. In other words, such photometric parallaxes are obtained from a comparison of the observed apparent magnitudes of the stars and the absolute magnitudes inferred from their spectral types.

If the relative orbit of a visual binary system is known, the following relation connects the combined mass, M, of the two stars, expressed in the Sun's mass as unit; the orbital period, P, expressed in years, the semimajor axis of the relative orbit; a, expressed in seconds of arc; and the parallax p: $p = a/\sqrt[3]{MP^2}$. Both a and P are known, but not M; it will be noted that an error in the value of M gives rise to a much smaller error in p. Thus, for instance, increasing M by a factor of 8 only halves the value of p. The value of p obtained by assuming the combined mass to be equal to the mass of the Sun is called the hypothetical parallax.

In many visual pairs the complete orbit has not been observed. If s denotes the apparent distance in seconds of arc and ω the relative motion in seconds of arc per year, a hypothetical parallax can be derived from the formula $p = 0.418\sqrt[3]{s\omega^2}$. By use of the relationship between mass and luminosity of a star, it is possible, knowing the spectral type of the star, to derive a correcting factor that will give a more accurate value of the parallax. Parallaxes so determined are called dynamical parallaxes.

parallel, imaginary line extending around the Earth parallel to the equator; it is used to indicate latitude. The 38th parallel, for example, has a latitude of 38° N or 38° S. *See* latitude and longitude.

parallel bars, gymnastic apparatus invented in the early 19th century by the German Friedrich Jahn, usually considered the father of gymnastics. It is especially useful in improving upper-body strength. The two bars, made of wood, are 0.05 m (2 inches) oval in cross section, 3.5 m (11.5 feet) long, 1.7 m (5 feet 5 inches) high, and 42 to 48 cm (16.5 to 19 inches) apart. Height and width of the bars are usually adjustable. In competitive performances, for men only, movements combine swings, vaults, strength, and balance, although swings and vaults must predominate. Movements below the bars and the release and regrasping of the bars are also required. *See also* uneven parallel bars.

parallelism, in rhetoric, component of literary style in both prose and poetry, in which coordinate ideas are arranged in phrases, sentences, and paragraphs that balance one element with another of equal importance and similar wording. The repetition of sounds, meanings, and structures serves to order, emphasize, and point out relations. In its simplest form parallelism consists of single words that have a slight variation in meaning: "ordain and establish" or "overtake and surpass." Sometimes three or more units are parallel; for example, "Reading maketh a full man, conference a ready man, and writing an exact man" (Francis Bacon, "Of Studies"). Parallelism may be inverted for stronger emphasis; *e.g.,* "I have changed in many things: in this I have not" (John Henry Newman, *Apologia pro Vita Sua,* 1864). Parallelism lends wit and authority to the antithetical aphorism; *e.g.,* "We always love those who admire us, but we do not always love those whom we admire" (La Rochefoucauld, *Maximes,* 1665).

Parallelism is a prominent figure in Hebrew poetry as well as in most literatures of the ancient Middle East. The Old Testament and New Testament, reflecting the influence of Hebrew poetry, contain many striking examples of parallelism, as in the following lines from the Psalms: "but they flattered him with their mouths; they lied to him with their tongues" (Psalms 78:36); "we will not hide them from their children, but tell to the coming generation the glorious deeds of the Lord" (78:4).

paralysis, also called PALSY, loss or impairment of voluntary muscular power. For paralysis from psychiatric causes, *see* hysteria.

Most of the commonly encountered diseases that produce paralysis can be divided into two main groups depending on whether they entail structural alterations in nervous or muscular tissue, or lead to metabolic disturbances in neuromuscular function.

Some act in a systematic way and affect one of the three elements in the motor system (upper and lower neuron and muscle) more or less extensively and exclusively. More often, however, one element or neighbouring portions of two of the three elements are involved over a limited extent by a single focal lesion.

The most common cause of hemiplegia (paralysis of the muscles of the lower face, arm, and leg on the side opposite the main lesion) is damage to the corticospinal (pyramidal) tracts and associated motor tracts in one hemisphere of the brain from obstruction (blood clot, or thrombosis) or rupture (cerebral hemorrhage) of a major cerebral artery. Brain tumour is another but less common cause of hemiplegia and develops and increases in severity gradually over a period of weeks or months. When the lesion is in the left hemisphere in a right-handed person, the resulting right hemiplegia is often associated with one of the various forms of aphasia, such as inability to sound words, to write, or to read.

Bilateral hemiplegia with pseudobulbar palsy results from diffuse, bilateral brain disease such as occurs in severe cerebral arteriosclerosis or cerebral vascular syphilis. The terms cerebral palsy and spastic diplegia refer to bilateral hemiplegia resulting from prenatal developmental brain defects or from injury to the brain at birth.

The spinal cord is rarely the site of vascular obstruction or hemorrhage. The more common causes of damage to the pyramidal tracts in the cord include deformities of the spinal column from bone and joint disease and from injury to the spine with fracture and dislocation, spinal cord tumours, and a number of inflammatory and degenerative diseases and changes associated with pernicious anemia. One of the most common causes of progressive spastic paraplegia in persons past middle age is spinal degenerative arthritis, with protrusion of an intervertebral disk cartilage into the lower cervical portion of the spinal canal.

Of the diseases that attack lower motor neurons and result in flaccid paralysis with muscular wasting, the most common are poliomyelitis and polyneuritis, the former affecting the cell bodies of bulbar and spinal motor neurons and the latter affecting their peripheral processes. Bell's palsy is a peripheral neuritis of unknown cause affecting a single nerve trunk—the facial nerve—and resulting in paralysis of all the muscles of one side of the face. In the majority of cases, recovery eventually occurs.

Diseases that result in paralysis through primary changes in muscle tissue are fewer than the above. Of the conditions belonging in this category, progressive muscular dystrophy is the only one apparently confined to the muscles. This is a familial, hereditary disease characterized by progressive, symmetrical muscular weakness and wasting. One rare variety has its onset before puberty, is more common in boys, and usually progresses to severe disability within a few years. It is known as pseudohypertrophic muscular dystrophy. The other types of dystrophy, in general, begin in adolescence or young adult life, and the two sexes are about equally affected. The progress of these other forms is slow; and life expectancy is not necessarily shortened, nor is severe disability inevitable.

Muscular weakness without structural alteration in nerve or muscle tissue may be a symptom of disturbances in metabolism arising from a wide variety of causes. Among such conditions are diseases of the endocrine glands, certain intoxications, and several metabolic defects.

The most common example of a metabolic disorder in neuromuscular function of unknown cause is myasthenia gravis. In this condition there is muscular weakness, without atrophy, which may be mild or severe and either generalized or restricted to a few muscle groups. Some of the muscles innervated by cranial nerves are affected in almost every case. The weakness of myasthenia gravis results from a localized defect in the chemical processes involved in the transmission of impulses from motor nerve endings to muscle fibres. Although the cause of this defect and its precise nature are unknown, several drugs facilitate the transmission of impulses from nerve to muscle. One of these, neostigmine, has proved to benefit most patients but does not correct the basic, unknown defect.

paramagnetism, kind of magnetism characteristic of materials weakly attracted by a strong magnet, named and extensively investigated by the British scientist Michael Faraday beginning in 1845. Most elements and some compounds are paramagnetic. Strong paramagnetism (not to be confused with the ferromagnetism of the elements iron, cobalt, nickel, and other alloys) is exhibited by compounds containing iron, palladium, platinum, and the rare-earth elements. In such compounds atoms of these elements have some inner electron shells that are incomplete, causing their unpaired electrons to spin like tops and orbit like satellites, thus making the atoms a permanent magnet tending to align with and hence strengthen an applied magnetic field.

Strong paramagnetism decreases with rising temperature because of the de-alignment produced by the greater random motion of the atomic magnets. Weak paramagnetism, independent of temperature, is found in many metallic elements in the solid state, such as sodium and the other alkali metals, because an applied magnetic field affects the spin of some of the loosely bound conduction electrons. The value of susceptibility (a measure of the relative amount of induced magnetism) for paramagnetic materials is always positive and at room temperature is typically about 1/100,000 to 1/10,000 for weakly paramagnetic substances and about 1/10,000 to 1/100 for strongly paramagnetic substances.

Paramanuchit, also called PARAMANUJITA JINORASA (b. 1791—d. Dec. 9, 1852), prince-patriarch of the Siamese Buddhist church who was a prolific writer on patriotic and moralistic themes in verse and prose. He became abbot of Watphra Jetubon and was later created *krom somdec-phra Paramanujit,* prince-patriarch of the church.

Paramanuchit's masterpiece is the *Taleng Phai* ("The Defeat of the Mons"), the heroic epic of the struggle of King Naresvara of Ayutthaya to liberate his country from Myanmar (Burmese) rule and of his famous single combat with the crown prince of Myanmar in 1590. His concluding section of the *Samuddhaghosa,* a folktale adapted from a collection called the *Paññāsajātaka,* which had been left unfinished since the 18th century, is distinguished for the beauty of its descriptive passages. His prose is equally valued for its eloquence and descriptive power. He also contributed to the collection of literary inscriptions on stone at Watphra Jetubon under the patronage of King Rama III, by writing classic models of Siamese poetry that still remain.

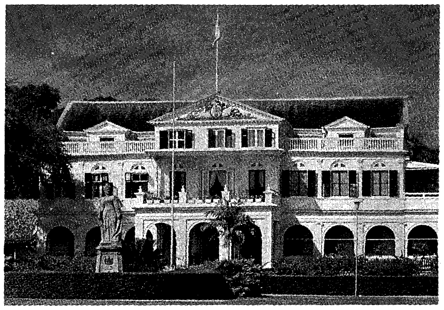
Paramaribo, largest town, capital, and chief port of Suriname (formerly Dutch, or Netherlands, Guiana). It lies 9 miles (15 km) from the Atlantic Ocean on the Suriname River. It originated as an Indian village that became a French settlement (*c.* 1640) and was later the site of an English colony planted in 1651 by Lord Willoughby of Parham. In 1667 Paramaribo was one of the settlements ceded to the Dutch under the Treaty of Breda, commencing the period of Dutch colonial rule that was interrupted only by brief periods of British control (1799–1802 and 1804–15). Since World War II the town has grown considerably because of tourism and industries, including paint, margarine, and cement factories and a brewery that makes beer from rice.



Government House, Paramaribo, Suriname
EB Inc.

Paramaribo is built on a shingle reef that stands 16 feet (5 m) above the river at low tide. Access from the sea is limited by a sandbar that allows a depth of about 20 feet (6 m). Much of the distinctive Dutch colonial architecture, as well as a canal system, remains. Paramaribo has the Suriname Museum and an extensive library, as well as the botanic gardens and Government House. Schools include the Anton de Kom University of Suriname (1968), Suriname Agricultural Research Center (1965), and Suriname College of Medicine (1969). The 17th-century Fort Zeelandia is nearby. An international airport, 25 miles (40 km) south, highways, and a railroad serve the town. Pop. (1986 est.) 77,558.

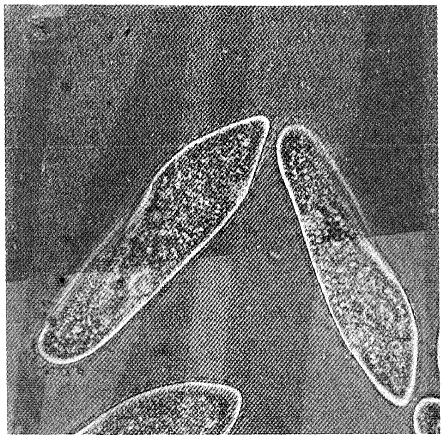
Paramecium, genus of free-living protozoans of the holotrichous order Hymenostomatida. There are at least eight well-defined species; all can be cultivated easily in the laboratory. Although they vary in size, most *Paramecium* species are about the size of the period at the end of this sentence. The basic shape varies, depending on the species: *P. caudatum* is elongated and gracefully streamlined and *P. bursaria* resembles a footprint. The term paramecium is also used to refer to individual organisms in a *Paramecium* species.

These microscopic single-celled organisms are completely covered with fine hairlike filaments (cilia) that beat rhythmically to propel them and to direct bacteria and other food particles into their mouths. On the ventral surface an oral groove runs diagonally posterior to the mouth and gullet. Within the gullet, food particles are transformed into food vacuoles, and digestion takes place within each food vacuole; waste material is excreted through the anus.

A thin layer of clear, firm cytoplasm (ectoplasm) lies directly beneath the flexible body membrane (pellicle) and encloses the inner, more fluid portion of the cytoplasm (endoplasm), which contains granules, food vacuoles, and crystals of different sizes. Embedded in the ectoplasm are spindle-shaped bodies (trichocysts) that may be released by chemical, electrical, or mechanical means. Originally believed to be a defense reaction, they appear to be extruded as a reaction to injury or for use as an anchoring device.

A paramecium has two, occasionally three, contractile vacuoles located close to the surface near the ends of the cell. They function in regulating the water content within the cell and may also be considered excretory structures since the expelled water contains metabolic wastes.

Paramecia have two kinds of nuclei: a large ellipsoidal nucleus called a macronucleus and



Paramecium caudatum (highly magnified)
John J. Lee

at least one small nucleus called a micronucleus. The organism cannot survive without the macronucleus; it cannot reproduce without the micronucleus. The macronucleus is the centre of all metabolic activities and, like the micronucleus, contains genes that bear hereditary information. The micronucleus is necessary for conjugation.

Strictly speaking, the only type of reproduction in *Paramecium* is asexual binary fission in which a fully grown organism divides into two daughter cells. *Paramecium* also exhibits several types of sexual processes. Conjugation (cross-fertilization) consists of the temporary union of two organisms and the exchange of micronuclear elements. Without the rejuvenating effects of conjugation, a paramecium ages and dies. Only mating types, or genetically compatible organisms, can unite in conjugation. *P. aurelia* has 34 hereditary mating types that form 16 distinct mating groups, or syngens (now considered separate species by many authorities). Autogamy (self-fertilization) is a similar process that occurs in one animal. In cytogamy, another type of self-fertilization, two animals join together but do not undergo nuclear exchange.

paramedical personnel, also called PARAMEDICS, health-care workers who provide clinical services to patients under the supervision of a physician. The term generally encompasses nurses, therapists, technicians, and other ancillary personnel involved in medical care but is frequently applied specifically to highly trained persons who share with physicians the direct responsibility for patient care. This category includes nurse practitioners, physician's assistants, and emergency medical technicians. These paramedical workers perform routine diagnostic procedures, such as the taking of blood samples, and therapeutic procedures, such as administering injections or suturing wounds; they also relieve physicians of making routine health assessments and taking medical histories. Paramedical training generally prepares individuals to fill specific health-care roles and is considerably less comprehensive than the education required of physicians.

parameters, variation of, general method for finding a particular solution of a differential equation by replacing the constants in the solution of a related (homogeneous) equation by functions and determining these functions so that the original differential equation will be satisfied.

To illustrate the method, suppose it is desired to find a particular solution of the equation $y'' + p(x)y' + q(x)y = g(x)$. To use this method, it is necessary first to know the general solution of the corresponding homogeneous equation—*i.e.,* the related equation in which the right-hand side is zero. If $y_1(x)$ and $y_2(x)$ are two distinct solutions of the equation, then any combination $ay_1(x) + by_2(x)$ will also be a solution, called the general solution, for any constants a and b.

The variation of parameters consists of replacing the constants a and b by functions $u_1(x)$ and $u_2(x)$ and determining what these functions must be to satisfy the original nonhomogeneous equation. After some manipulations, it can be shown that if the functions $u_1(x)$ and $u_2(x)$ satisfy the equations $u'_1y_1 + u'_2y_2 = 0$ and $u_1'y_1' + u_2'y_2' = g$, then $u_1y_1 + u_2y_2$ will satisfy the original differential equation. These last two equations can be solved to give $u_1' = -y_2g/(y_1y_2' - y_1'y_2)$ and $u_2' = y_1g/(y_1y_2' - y_1'y_2)$. These last equations either will determine u_1 and u_2 or else will serve as a starting point for finding an approximate solution.

pāramitā, in Mahāyāna ("Greater Vehicle") Buddhism, any of the perfections, or transcendental virtues, practiced by bodhisattvas ("Buddhas-to-be") in advanced stages of their path toward enlightenment. The six virtues are generosity (*dāna-pāramitā*); morality (*śīla-pāramitā*); perseverance (*kṣānti-pāramitā*); vigour (*vīrya-pāramitā*); meditation, or concentration (*dhyāna-pāramitā*); and wisdom (*prajñā-pāramitā*). Some lists expand the virtues to 10 by adding skill in the means of helping others (*upāya* [*kauśalya*]-*pāramitās*), profound resolution to produce enlightenment (*praṇidhāna-pāramitā*), perfection of the 10 powers (*bala-pāramitā*), and practice of transcendent knowledge (*jñāna-pāramitā*).

Paramount Communications Inc., formerly (1958–60) GULF & WESTERN CORPORATION, (1960–86) GULF + WESTERN INDUSTRIES, INC., and (1986–89) GULF + WESTERN INC., one of the largest and foremost communications and media conglomerates in the United States. The present form of the corporation is the result of a transformation from one of the most diverse American corporations into one focusing on the entertainment and publishing fields. Headquarters are in New York City.

Gulf + Western was founded by Charles Bluhdorn, an Austrian immigrant, in 1958. Bluhdorn combined the Michigan Bumper Corporation, founded in 1934, with a Houston automotive-parts manufacturer to form Gulf + Western, intending to make automotive replacement parts on the Gulf Coast and then to ship them west. Bluhdorn began accumulating other companies at a rapid rate, and Gulf + Western developed into a patchwork of mostly unrelated and successful companies.

In addition to motion-picture and television production and distribution, educational and consumer publishing, cable television networks, professional sports teams, and sports facilities, Gulf + Western's other major operating areas included auto-parts supplying, cigar and apparel manufacturing, natural-resource development, paper and building products, and financial services. Gulf + Western also had foreign agricultural and mining interests.

In the early 1980s Gulf + Western began to expand its holdings in the media and communications fields and to sell its unrelated businesses. In 1989 its name was changed to Paramount Communications Inc., reflecting the new concentration on entertainment and publishing. Among the major businesses owned by Paramount Communications are Paramount Pictures Corporation, Madison Square Garden, and Simon and Schuster, Inc.

Paramount Pictures Corporation, one of the first and most successful of the Hollywood motion-picture studios.

Established in 1914 when W.W. Hodkinson's film-distributing firm offered Adolph Zukor's Famous Players Film Company, the Jesse L. Lasky Feature Play Company, and other producers an outlet for their movies, it quickly rose to prominence by featuring such popular stars as Mary Pickford, "Fatty" Arbuckle, and, later, Rudolph Valentino; by introducing the first "big western," *The Covered Wagon* (1923); and by opening branches in Great Britain and France. *The Ten Commandments* (1923; 1956) and *The King of Kings* (1927), biblical epics directed by Cecil B. deMille, were produced under Paramount's auspices. Paramount was declared bankrupt in 1933 but was reorganized two years later. The studio built up a reputation for producing light entertainment with such films as *Going My Way* (1944) and the "road" comedies of Bob Hope, Bing Crosby, and Dorothy Lamour—*e.g., Road to Zanzibar* (1941) and *Road to Rio* (1947).

In the 1950s Paramount introduced VistaVision, a wide-screen process that retained the colour and image clarity of the smaller screen. The company merged with Joseph E. Levine, Inc., in the 1960s. In 1966 Gulf + Western Industries took over control of the corporation. Paramount Pictures became a key element in the restructuring of Gulf + Western from a diverse conglomerate into one focusing on media and communications—a transformation reflected when Gulf + Western changed its name to Paramount Communications Inc. in 1989.

Paraná, city, capital of Entre Ríos *provincia,* eastern Argentina, near the Paraná River, opposite Sante Fe. Founded as a parish in 1730

The Cathedral of Paraná, Arg.

and formerly called Bajada de Santa Fe, the city had little importance until 1853, when it was made capital of the Argentine Confederation. Until 1862, while Buenos Aires was separated from the confederation, Paraná was the residence of the federal authorities, which boosted its economic, cultural, and population growth. Development was sustained after it was made the provincial capital in 1882.

Because of flood dangers, Paraná (Guaraní Indian for "father of the rivers") stands on high ground 2 miles (3 km) from the riverbank and is linked by rail and road to its port, Bajada Grande. The city has two national historic monuments—the Cathedral of Paraná (1883), which houses the image of Our Lady of the Rosary, and the building of the Senate of the Argentine Confederation (1858). Other notable buildings include the home of General Justo José de Urquiza (Argentina's first president), the Bishop's Palace, and the Museum of Entre Ríos. A base of the Argentine Air Force is located there. Pop. (1980) 161,638.

Paraná, *estado* ("state") of southern Brazil, bounded to the east by the Atlantic Ocean, on the south by the state of Santa Catarina, on the southwest by Argentina, on the west by Paraguay, on the northwest by the state of Mato Grosso do Sul, and on the north and northeast by São Paulo state. Its area is 77,048 square miles (199,554 square km). Paraná, named for the Paraná River (Rio Paraná), which forms its west and northwestern border, has its capital, Curitiba, in the eastern part of the state.

After a century of gradual penetration by bands of Spanish explorers from São Paulo and by Jesuit missionaries, the territory of the present state was occupied, to a large extent, by the forces of a Portuguese emissary, Gabriel de Lara, in the 1640s. Gold was discovered at several locations in the 17th century and attracted settlers. Eventually recognized as belonging to Portugal's sphere of influence, rather than Spain's, the territory was attached at first to the captaincy of São Paulo and subsequently to the province of the same name. Paraná became a separate province of the Brazilian Empire in 1853 and later a state of the Brazilian Republic in 1891.

Paraná can be divided into five topographic zones, each running approximately northeast to southwest. Proceeding westward there is the coastal region, fringed with dunes and mangrove swamps and backed by the high mountain ranges of the Serra do Mar to the west. The Serro do Mar, rising to the peak of Serra da Graciosa (6,193 feet [1,888 m]), forms a watershed between the coastal region and the first of the three successive plateaus farther westward, each lower than the one before. The first plateau, which lies at a height of between 2,700 and 3,000 feet (800 and 900 m) above sea level, is formed mainly of crystalline rock. On the western side of the first plateau, a cuesta (an escarpment with a steep slope on one side and a gentle slope on the other) rising to heights of from 3,500 to 3,800 feet (1,050 to 1,150 m) marks the beginning of the second plateau. A basaltic scarp with a maximum elevation of 3,800 feet rises at the western border of the second plateau, forming the eastern edge of the third plateau, which slopes westward and downward until it reaches the fringes of the Paraná River.

Three major rivers cross the second and third plateaus. Two of them, the Iguaçu and the Ivaí rivers, flow westward and are immediate tributaries of the Paraná River. The third major river is the Tibagi, which flows northward to join the Paranapanema River tributary of the Paraná. The Paraná River borderland (comprising the fifth topographic zone) has low elevations and steep gullies and is dominated by rain forest.

Paraná state, the northern region of which crosses the Tropic of Capricorn, has a moderately warm climate. Winters are dry in the northwest, while other parts receive adequate precipitation throughout the year. Summers are hot in the lower elevations and cooler—below 72° F (22° C)—at the higher elevations. On the coast the annual mean temperature is 70° F (21° C) at Paranaguá, and the rainfall reaches 81 inches (2,057 mm) annually, with the largest amounts falling in January and February.

Dense tropical rain forest extends along certain tracts of the Atlantic coast and over the uplands into the Paraná River borderland. Some areas of the state consist of treeless savanna, and there are localized bushlands.

The people of the state are largely of Portuguese-Brazilian descent. After the Portuguese, waves of other immigrants began to arrive as labourers and businessmen; these included Poles, Ukrainians, Italians, Germans, Arabs, Dutch, and Japanese. The common language is Portuguese, and the principal religion is Roman Catholicism.

The state is responsible for primary and secondary education. Among the institutions of higher learning are the Federal University of Paraná and the Catholic University of Paraná, both located in Curitiba.

Paraná is one of the richer states of Brazil. Intensively developed plantations have made Paraná one of Brazil's chief producers of coffee, the most important centres for this crop being Umuarama, Rondon, and Londrina. Other important crops are Indian or Paraguay tea (maté), cotton, peanuts (groundnuts), and ramie (a strong, lustrous fibre capable of being spun or woven). Lumbering is also economically important.

Corn (maize) is grown for the most part around Ivaiporã, Rondon, and Toledo; rice, cassava, potatoes, beans, oats, rye, barley, and wheat are cultivated quite widely, as are garlic, onions, tomatoes, and soybeans. Sugarcane is grown mainly around Porecatu. Fruit production includes oranges, bananas, grapes, and pineapples.

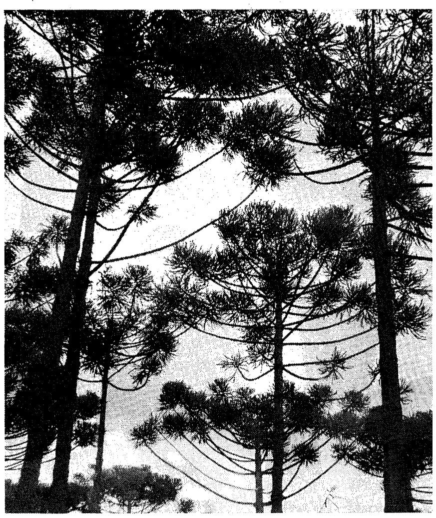
Paraná's livestock herds have been much enlarged and improved with help from government agencies. Pigs, sheep, cattle, and horses are raised. Dairy products and wool are marketed from the northern and eastern parts of the state.

In addition to a regular output of dolomite (a type of limestone or marble), lead, iron, talc, and lime, Paraná produces coal from Venceslau Brás and cement from Rio Branco do Sul.

The main railroad in Brazil from São Paulo to the south traverses the eastern half of Paraná state; an important branch line from Ponta Grossa serves Curitiba and the Atlantic ports. Highways link the state with São Paulo to the north and Santa Catarina to the south. The rivers are generally navigable only for limited distances. Paranaguá and Antonina are the chief seaports, and Curitiba and Londrina the chief airports.

Several towns have public libraries, the most notable at Curitiba. The theatre at Guaíra, the best known in the state, is widely known in South America; its architecture is in the modern style. Pop. (1988 est.) 8,308,000.

Paraná pine, also called BRAZILIAN PINE, or CANDELABRA TREE (*Araucaria angustifolia*), an important evergreen timber conifer of the family Araucariaceae, native to the mountains of southern Brazil. The Paraná pine grows to 30 m (100 feet) high and bears branches in a circle about the stems. As the tree matures,



Paraná pine (*Araucaria angustifolia*)

the lower branches drop off, leaving a long, bare trunk with a crown of upturned branches tufted at the ends.

Paraná Plateau, lava plateau, one of the world's largest, lying mostly in Rio Grande do Sul and São Paulo states, southern Brazil. Its formations of solidified sheets of lava rock (diabase) also appear in Uruguay, Argentina, and Paraguay. Where the diabase is exposed at the surface, it weathers into a well-drained, dark purple soil known as *terra roxa,* famous as a producer of coffee. Other crops grown there include *feijão* (beans), corn (maize), rice, cotton, and potatoes. The plateau is dissected by rivers, between which the surface is flat-topped.

Paraná River, Portuguese RIO PARANÁ, Spanish RÍO PARANÁ, river of South America, the second longest after the Amazon, rising on the plateau of southeast-central Brazil and flowing generally south to the point where, after a course of 3,032 miles (4,880 km), it joins the Uruguay River to form the extensive Río de la Plata estuary of the Atlantic.

A brief treatment of the Paraná River follows. For full treatment, *see* MACROPAEDIA: South America.

The Paraná River's drainage basin, with an area of about 1,081,000 square miles (2,800,000 square km), includes the greater part of southeastern Brazil, Paraguay, eastern Bolivia, and northern Argentina. From its origin at the confluence of the Grande and Paranaíba rivers to its junction with the Paraguay, the river is known as the Alto (Upper) Paraná. This upper course has three important tributaries, namely the Tietê, the Paranapanema, and the Iguaçu, all three having their sources near the Atlantic coast in southeastern Brazil. The Alto Paraná's passage through the mountains was formerly marked by the Guaíra Falls; this series of massive waterfalls was completely submerged in the early 1980s by the reservoir of the newly built Itaipú dam complex, which spans the Paraná River.

From its confluence with the Iguaçu River to its junction with the Paraguay River, the Alto Paraná continues as the frontier between Paraguay and Argentina. When it is joined by the Paraguay, it becomes the lower Paraná and commences to flow through only Argentine territory. Near Santa Fé, the lower Paraná receives its last considerable tributary, the Salado River. Between Santa Fé and Rosario the delta of the Paraná begins to form, being 11 miles (18 km) wide at its upper end and 40 miles (65 km) wide at its lower end. Within the delta the river divides again and again into distributary branches, the most important being the last two channels formed, the Paraná Guazú and the Paraná de las Palmas.

The volume of the lower Paraná River is dependent on the amount of water it receives from the Paraguay River, which provides about 25 percent of the total; the Paraná's annual average discharge is 610,740 cubic feet per second (17,290 cubic metres per second). The basin of the Alto Paraná has a hot and humid climate all the year round. The winters are dry and summers are rainy. The middle and lower basins have a subtropical climate of temperate humidity, with less plentiful rainfall but without seasonal differences. The Alto Paraná has two zones of vegetation, forests to the east and savanna to the west. Forests continue along the Paraná downstream to Corrientes, where the savanna begins to dominate both banks. The Paraná River has a rich and varied animal life that includes many species of edible fish. Much of the Paraná basin is economically unexploited. The main dam of the huge Itaipú project on the Paraná River was completed in 1982 and had a power generating capacity of 12,600 megawatts. The lower river is a transport route for agricultural products, manufactured goods, and petroleum products, and its waters are used for irrigation of the adjacent farmlands.

Paranaguá, port, southeastern Paraná *estado* ("state"), Brazil, on Paranaguá Bay, at the foot of the coastal Serra do Mar, 18 mi (29 km) from the open Atlantic. It was founded in 1585 by Portuguese explorers. Surviving colonial landmarks include the fort of Nossa Senhora dos Prazeres (1767), the Baroque Museum of Archaeology and Popular Art (formerly the Colegio dos Jesuitas), the São Benedictus church, and a 17th-century fountain.

By the mid-20th century Paranaguá had become Brazil's largest coffee-exporting port as well as the chief port (hides, paper, maté [tea], *feijão* [beans], cotton, plywood, bananas, sugar) of Paraná state. An oil terminal was built there in the late 1970s. Paranaguá is linked to Curitiba, the state capital (65 mi inland), by rail and highway and serves as a free port for Paraguay. Pop. (1980 prelim.) 68,366.

Paranaíba River, Portuguese RIO PARANAÍBA, south central Brazil, rising on the western slopes of the Serra da Mata da Corda and flowing west-southwestward for about 600 mi (1,000 km); it collects eight sizable tributaries along its course to join the Grande River and form the Paraná River. The river constitutes the border between Minas Gerais and Goiás states and briefly separates Minas Gerais from Mato Grosso do Sul state. Diamond washings are along its course. In the late 1970s, the Brazilian government began irrigation projects in the Paranaíba River Valley for cattle raising and cultivation of sugarcane, rice, corn (maize), cassava (for alcohol production), vegetables, *feijão* (beans), peanuts (groundnuts), bananas, and cotton. A hydroelectric plant was built at São Simão, about 60 mi north of the junction of the Paranaíba and Araguaia rivers.

Paranapanema River, Portuguese RIO PARANAPANEMA, river, rising south of São Paulo in the Serra do Paranapiacaba, southeastern Brazil, and flowing in a west-northwesterly direction for 560 mi (900 km) before entering the Paraná River at Pôrto São José. After receiving the Itararé, it forms part of the São Paulo–Paraná state border. There are numerous rapids along its course, which is navigable only for the last 50 mi. Dam-flood control projects are near Piraju and Jacarèzinho. Coffee and cotton are grown in the river basin, which occupies part of the fertile Paraná Plateau. Tributaries include the Rio das Cinzas and Rio Tibagi, the latter having an important hydroelectric station near Monte Alegre.

Parañaque, town, Rizal province, central Luzon, Philippines, on the southeastern shore of Manila Bay. Its site was occupied by small vegetable farms until the mid-20th century, when expanding urbanization transformed the town into a southern suburb of Manila. The Manila International Airport to the east occupies Nichols Field, a former U.S. air base. Parañaque has long been noted for intricate hand embroidery, which has continued as a household industry. Fishing from rafts mounted with *salambaos* (large nets) is an important activity. The Manila Bay Beach Resort, a national park, is located there. Pop. (1980) mun., 208,552.

Parandowski, Jan (b. May 11, 1895, Lemberg, Austria-Hungary—d. Sept. 26, 1978, Warsaw), Polish writer, essayist, and translator.

He graduated from the classical *gimnazjum* of Lwów and, together with the entire Polish elite, was transported to Russia when the tsarist army occupied eastern Galicia at the beginning of World War I. Returning home after the Russian Revolution, he completed his education in 1923 at the University of Lwów, where he read classical philology and archaeology. Shortly afterwards he visited France, Italy, and Greece. He published a dozen books, ranging from historical novels to travelogues, that had Greek or Italian themes or subject matter. One notable exception was a novel, *Niebo w płomieniach* (1936; "Heaven in Flames"), detailing the experiences of a young man who undergoes a religious crisis. From 1933 Parandowski was chairman of the Polish PEN writers' organization and vice president of the International PEN (from 1962).

Parangaba, city, northern Ceará state, northeastern Brazil, immediately southwest of Fortaleza, the state capital, and part of its metropolitan area. Until the 1940s it was a small cotton-producing centre on the site of an old Indian village, Parangaba (formerly Porangaba), but has since experienced phenomenal suburban growth. Cashew nuts and carnauba wax are produced in the region. Pop. (1980 prelim.) 226,749.

paranoia, the central theme of a group of psychotic disorders characterized by systematic delusions. The word paranoia was used by the ancient Greeks, apparently in much the same sense as the modern popular term insanity. Since then it has had a variety of meanings. Toward the end of the 19th century it came to mean a delusional psychosis, in which the delusions develop slowly into a complex, intricate, and logically elaborated system, without hallucination and without general personality disorganization. In contemporary psychiatric practice, the term paranoia is generally reserved for all rare, extreme cases of chronic, fixed, and highly systematized delusions. All the rest are called paranoid disorders. Some psychiatrists, however, have come to doubt the validity of paranoia as a diagnostic category, claiming that what has in the past been considered paranoia is actually a variety of schizophrenia (*q.v.*).

One of the most common delusions in paranoid disorders is that of persecution. A chief contributing factor is an exaggerated tendency to self-reference; *i.e.*, to systematically misinterpret remarks, gestures, and acts of others as intentional slights or as signs of derision and contempt directed at him. Self-reference becomes paranoid delusion when a person persists in believing that he is the target of hostile actions or insinuations, aimed at him by some enemy or band of enemies, when this is actually not the case. The identifying marks of delusional conviction are (1) readiness to accept the flimsiest evidence in support of the belief and (2) inability to entertain seriously any evidence that contradicts it.

In addition to the common persecutory type of paranoid reaction, a number of others have been described, most notably paranoid grandiosity, or delusions of grandeur (also known as megalomania), characterized by the false belief that one is a superlative person.

Paranthropus, fossil hominid genus initially assigned by Robert Broom to a robust form of australopithecine found at Kromdraai and Swartkrans, S.Af. The remains are known as *Australopithecus robustus* to scholars who do not consider it a separate genus from other australopithecines.

paraphrase, in music, the recomposition of a phrase, melody, section, or entire piece for use in another, favoured especially during the Renaissance for masses and motets, but also for keyboard works, where the melody is frequently broken up, with new notes interpolated occasionally, and condensed. A paraphrased melody may appear in one voice part of the new composition, as in the motet *Alma redemptoris mater* (*Beloved Mother of the Redeemer*) by Guillaume Dufay, or in all voice parts through the technique of melodic imitation, as in the *Missa pange lingua* (mass on the plainsong hymn "Pange lingua" ["Sing, My Tongue"]) by Josquin des Prez.

In 19th-century music, the term acquired slightly different connotations, when piano and other virtuosos engaged in elaborate paraphrases of operas as well as of each other's works.

paraplegia, paralysis of the legs and lower part of the body. Often it involves loss of sensation (of pain, temperature, vibration, and position) as well as loss of motion. It may also include paralysis of the bladder and bowels. Paraplegia may be caused by injury to or disease in the lower spinal cord or peripheral nerves or by such brain disorders as cerebral palsy. Some paraplegics are able to walk with the aid of braces and crutches. Quadriplegia involves paralysis of both arms and both legs. *See also* paralysis.

parapsychological phenomenon, also called PSI PHENOMENON, any of several types of events that cannot be accounted for by natural law or knowledge apparently acquired by other than usual sensory abilities. The discipline concerned with investigating such phenomena is called parapsychology.

Parapsychological phenomena of two types have been described. They may be cognitive, as in the case of clairvoyance, telepathy, or precognition (*qq.v.*); here one person is believed to have acquired knowledge of facts, of other people's thoughts, or of future events, without the use of the ordinary sensory channels—hence the term extrasensory perception (*q.v.*; ESP), often used to designate these phenomena. Alternatively, parapsychological phenomena may be physical in character: the fall of dice or the dealing of cards is thought to be influenced by a person's "willing" them to fall in a certain way; or objects are moved, often in a violent fashion, by poltergeists (*see* poltergeist). The term psychokinesis (*q.v.*) is often used in this connection. The general term psi has become established to denote all kinds of parapsychological phenomena.

Scientific interest in the subject is of relatively recent origin, but belief in the reality of such phenomena has been widespread since the earliest recorded times. Before the rise of modern science the causation of all complex physical phenomena was very poorly understood, and hence appeals to nonmaterial agencies (ghosts, sorcerers, demons, mythological beings) took the place of a causal, scientific explanation. Even so, there were widespread debates about the reality of phenomena that obviously transcended the bounds of everyday happenings, such as veridical prophecies, as by the oracle of Delphi, or the revival of the dead.

The existence of parapsychological phenomena continues to be a subject of dispute, although societies for the study of psychic phenomena, made up of eminent scientists and laymen, have been in existence for over a century. In 1882 the Society for Psychical Research was founded in London, followed six years later by the founding of a similar society in the United States, partly through the efforts of psychologist William James. Such societies were founded later in most European countries, and active work is carried on, particularly in The Netherlands, France, Italy, the Soviet Union, and Japan. Universities have been slower to recognize psychical research as a serious subject for study. The activities of the parapsychological laboratory at Duke University, Durham, N.C., under the American parapsychologist J.B. Rhine from the 1930s to the 1960s attracted considerable interest. A department of psychical research later was opened at the University of Utrecht under W.H.C. Tenhaeff.

One of the reasons for interest in psychical research in the last half of the 19th century was the rise of the spiritualist movement that grew out of the acceptance of spirit communication as real and the use of this as the basis of a new religion. Some of the early psychical researchers were also spiritualists, as, for example, British spiritualist F.W.H. Myers and the British physicist Sir Oliver Lodge. Other psychical researchers (such as the French physiologist Charles Richet) accepted paranormal activity as real but rejected the spiritualist explanation, while others were not committed to either view.

Discussion about parapsychological phenomena has sometimes assumed emotional overtones, unsuitable to scientific discipline, and outspoken but contradictory opinions are still frequently voiced. Believers and nonbelievers in psi may base their belief or disbelief on what they consider to be the scientific evidence, on their personal experiences, or on some larger system of attitudes and values into which ESP does or does not fit. When such extreme and contradictory views are widely held, it is almost certain that the evidence is not conclusive either way and that confident conclusions are unlikely to be supported by a survey of all the known facts.

Paraschwagerina, genus of extinct fusulinid foraminiferans (protozoans with a relatively large shell readily preservable in the fossil record), the fossils of which are restricted to marine rocks; the animal probably lived in clear water, far from the shoreline. The various species are excellent index, or guide, fossils for the Early Permian (which occurred from 286 to 258 million years ago) and allow the correlation of sometimes widely separated rock units.

parasitism, relationship between two species of plants or animals in which one benefits at the expense of the other, without killing it. Parasitism is differentiated from parasitoidism, a relationship in which the host is killed by the parasite; parasitoidism occurs in some Hymenoptera (ants, wasps, and bees), Diptera (flies), and a few Lepidoptera (butterflies and moths): the female lays her eggs in or on the host, upon which the larvae feed on hatching.

Parasites may be characterized as ectoparasites—including ticks, fleas, leeches, and lice—which live on the body surface of the host and do not themselves commonly cause disease in the host; or endoparasites, which may be either intercellular (inhabiting spaces in the host's body) or intracellular (inhabiting cells in the host's body). Intracellular parasites—such as bacteria or viruses—often rely on a third organism, known as the carrier, or vector, to transmit them to the host. Malaria, which is caused by a protozoan of the genus *Plasmodium* transmitted to humans by the bite of an anopheline mosquito, is an example of this type of interaction. The plant disease known as Dutch elm disease (caused by the fungus *Ceratocystis ulmi*) can be spread by the European elm bark beetle.

A form of parasitism called brood parasitism is practiced by the cuckoo and the cowbird, which do not build nests of their own but deposit their eggs in the nests of other species and abandon them there. Though the cowbird's parasitism does not necessarily harm its host's brood, the cuckoo may remove one or more host eggs to avoid detection, and the young cuckoo may heave the host's eggs and nestlings from the nest.

Another form of parasitism, such as that practiced by some ants on ants of other species, is known as social parasitism. Parasites may also become parasitized; such a relationship, known as hyperparasitism, may be exemplified by a protozoan (the hyperparasite) living in the digestive tract of a flea living on a dog.

parasitology, the study of animal and plant parasitism as a biological phenomenon. Parasites occur in virtually all major animal groups and in many plant groups, with hosts as varied as the parasites themselves. Many parasitologists are concerned primarily with particular taxonomic groups and should perhaps be considered students of those groups, rather than parasitologists per se; others are interested in parasitism as an evolutionary phenomenon and work with a number of taxonomic groups. The science has a number of branches (*e.g.,* veterinary, medical, or agricultural parasitology).

The history of parasitology is scattered among a number of other disciplines, especially zoology. Many highly evolved parasites remained essentially unknown or misunderstood until the advent of the microscope in the mid-17th century. A pioneer in the field of intestinal parasitology was the mid-19th century Belgian biologist P.J. van Beneden, who unraveled the life history of tapeworms and many other groups.

Paráskhos, Akhilléfs (b. March 6, 1838, Návplion, Greece—d. Jan. 26, 1895, Athens), Greek poet who was the central figure of the Greek Romantic school of poetry in its second and last period (*c.* 1850–80). His models were Alfred de Musset, Victor Hugo, and Lord Byron, but he fell short of their achievement.

Paráskhos' unrestrained manner and grandiloquent language owed much to the Phanariote poets, whose tradition he continued. He touched on all the usual Romantic subjects, but love and patriotism were his favourites. In his numerous lyrics he made use of both "refined" Greek, inherited from the Byzantine scholars, and the spoken language, but his vocabulary remained as limited as his ideas. Perhaps no other modern Greek poet was more admired by his contemporaries. His poems were published in Greek in two volumes (1881, 1904).

Paraśurāma (Sanskrit: "Rāma with the Ax"), sixth of the 10 *avatāra*s (incarnations) of the Hindu god Vishnu. The *Mahābhārata* ("Great Epic of the Bharata Dynasty") and the *Purāṇas* ("Ancient Lore") record that Paraśurāma was born to the Brahman sage Jamadagni in order to deliver the world from the arrogant oppression of the baron or warrior caste, the Kshattriyas. He killed all the male Kshattriyas on earth 21 successive times (each time their wives survived and gave birth to new generations) and filled five lakes with blood. Scholars view the legend as reflecting strife between the two classes of society in pre-Buddhist India. Paraśurāma is the traditional founder of Malabar and is said to have bestowed land there on members of the priestly caste whom he brought down from the north in order to expiate his slaughter of the Kshattriyas. He is sometimes said to have lived on earth during the lifetime of the seventh *avatāra,* Rāma, and to have expressed some jealousy of the younger incarnation.

parasympathomimetic drug, any drug that mimics the action of the neurotransmitter acetylcholine. *See* cholinergic drug.

parathion, an organic phosphorus compound well known as an insecticide that is extremely toxic to humans. The compound acts in mammals, as in insects, as a cholinesterase inhibitor (cholinesterase being the enzyme that controls the normal functioning of the nervous system), causing death by inducing respiratory failure. The specific antidote for poisoning by parathion and other organophosphorus insecticides is atropine. Parathion and similar insecticides must be handled with great care because the substance is toxic if swallowed, inhaled, or absorbed through the skin. Parathion may be rendered nontoxic by application of an alkaline solution.

parathyroid adenoma, also called OSTEITIS FIBROSA CYSTICA, or VON RECKLINGHAUSEN'S DISEASE OF BONE, uncommon disorder characterized by loss of mineral materials from the skeleton, the development of brown cystic bone tumours and of kidney stones, and progressive kidney insufficiency. Increase in the number (hyperplasia) of secretory cells of one or more of the parathyroid glands results in an excess of parathormone in the circulation. The action of parathormone removes calcium from the bones; the calcium may then be deposited elsewhere, as in kidney stones.

Symptoms include chronic tiredness and sleepiness, weakness, loss of appetite, constipation, nausea, thirst, and sometimes personality changes. Pain accompanies weakening of bones, and in 25 percent of cases so-called brown tumours develop in the ends of long bones; pathological fractures are not uncommon. The teeth become loose in their sockets, and the lamina dura, or compact bone lining of the sockets, disappears. The disease is twice as frequent in women as in men and usually begins in middle age. Persons with preexisting peptic ulcers are more likely to develop hyperparathyroidism. Treatment usually includes surgical excision of the hyperplastic parathyroid.

parathyroid gland, endocrine gland occurring in all vertebrate species from amphibia upward, usually located close to and behind the thyroid gland and secreting parathormone, a hormone that regulates and maintains a normal calcium level in the blood serum. Human parathyroid tissue is brownish red, and the tiny glands may number as few as two and as many as eight on each side of the thyroid. Microscopically, they are made up of closely packed epithelial cells separated by thin fibrous bands; occasionally the cells are arranged in circles with an open centre (alveolar arrangement), which may contain a colloid material.

The exact action of the internal secretion of these glands is not clear. It is believed that the parathyroid hormone plays an important role in stabilizing the calcium concentration of the body fluids—a very important function, since a lowering of the calcium ion concentration results in a condition of increased excitability of nerves and muscles known as tetany, which results in muscular spasms, convulsions, and sometimes dementia. Under normal conditions a small drop in the calcium concentration of the body fluids results in increased activity of the parathyroid glands, which raises the calcium concentration by mobilizing some of the skeletal calcium. On the other hand, a rise in body fluid calcium concentration above the normal is counteracted by a reduction or cessation of secretion of parathyroid hormone.

The internal secretion of the parathyroids also affects the metabolism of phosphorus, an excess of the hormone resulting in a lowering of inorganic phosphate concentration in the blood serum and an increased excretion of phosphate in the urine. Reduced parathyroid function is accompanied by a rise in the inorganic phosphate of the serum and a lessened urinary output of phosphate.

Parathyroid hormone appears to play a role in the regulation of magnesium metabolism as well, possibly increasing the excretion of that electrolyte.

paratyphoid fever, infectious disease similar to typhoid, though usually milder, caused by any of several organisms: *Salmonella paratyphi* (paratyphoid A), *S. schottmulleri* (paratyphoid B), or *S. hirschfeldii* (paratyphoid C). The means of infection, spread, clinical course, pathology, diagnosis, prevention, and treatment are similar to those for typhoid.

Whereas typhoid and paratyphoid A are strictly human diseases, the paratyphoid B organism has been found in other animals and fowl, and accordingly these represent additional means of contamination of food and water. *See also* typhoid.

Parbhani, town, east-central Mahārāshtra state, western India, on the Manmād-Hyderābād railway, about 10 miles (16 km) south of the Dudna River. Its name refers to the Prabhāvatī Temple, which was forcibly converted to a mosque during the Mughal period. Now a commercial centre, the town has little industry. The economy of the surrounding region is almost wholly agricultural; the chief crops are jowar (sorghum), bajra (pearl millet), and cotton. Pop. (1981) 109,364.

parchment, the processed skins of certain animals—chiefly sheep, goats, and calves—that have been prepared for the purpose of writing on them. The name apparently derives from the ancient Greek city of Pergamum (modern Bergama, Tur.), where parchment is said to have been invented in the 2nd century BC. Skins had been used for writing material even earlier, but a new, more thorough method of cleaning, stretching, and scraping made possible the use of both sides of a manuscript leaf, leading to the supplanting of the rolled manuscript by the bound book (codex).

Parchment made from the more delicate skins of calf or kid or from stillborn or newly born calf or lamb came to be called vellum, a term that was broadened in its usage to include any especially fine parchment. The vellum of most early manuscripts, through the 6th century AD, is of good quality. After this, as demand increased, a great amount of inferior material came on the market, but by the 12th century, when large numbers of manuscripts were being produced in western Europe, a soft, pliant vellum was in vogue. In Constantinople, a sumptuous form was produced at an early date by dyeing the material a rich purple and lettering it in silver and gold, a practice condemned as a useless luxury in a well-known passage of St. Jerome. The purple dye was subsequently abandoned, but the practice of "illuminating" parchment manuscripts in gold, silver, and other tints flourished throughout the European Middle Ages.

In modern usage, the terms parchment and vellum may be applied to a type of paper of high quality made chiefly from wood pulp and rags and frequently having a special finish.

parchment worm (genus *Chaetopterus*), any of several species of segmented worms of the class Polychaeta (phylum Annelida), especially *C. variopedatus* of the Atlantic and Pacific oceans. They live on the sea bottom in U-shaped tubes that are lined with parchment-like material. Parchment worms grow to a length of about 25 cm (10 inches).

Pardo Bazán, Emilia, condesa de (countess of) (b. Sept. 16, 1852, La Coruña, Spain—d. May 12, 1921, Madrid), Spanish author of novels, short stories, and literary criticism.

Pardo Bazán attained early eminence with her polemical essay *La cuestión palpitante* (1883; "The Critical Issue"). It discussed Émile Zola and Naturalism, made French and Russian literary movements known in Spain, and started an important literary controversy in which she championed a brand of Naturalism that affirmed the free will of the individual. Her finest and most representative novels are *Los Pazos de Ulloa* (1886; *The Son of a Bondwoman*) and its sequel, *La madre naturaleza* (1887; "Mother Nature")—studies of physical and moral ruin among the Galician squirearchy, set against a beautiful, natural background and a moral background of corrupting power. *Insolación* ("Sunstroke") and *Morriña* ("The Blues"; both 1889) are excellent psychological studies. Her husband separated from her because her literary reputation scandalized him. Pardo Bazán was professor of Romance literature at the University of Madrid. In 1916 she was accorded the distinction—unusual for a woman in those days—of a chair of literature.

pardon, in law, release from guilt or remission of punishment. In criminal law the power of pardon is generally exercised by the chief executive officer of the state. Pardons may also be granted by a legislative body, often through an act of indemnity, anticipatory or retrospective, for things done in the public interest that are illegal.

A pardon may be full or conditional. It is conditional when its effectiveness depends on fulfillment of a condition by the offender, usually a lesser punishment, as in the commutation of the death sentence.

The effect of a full pardon is unclear in some jurisdictions. In England it is said that a full pardon clears the person from all infamy, removing all disqualifications and other obloquy, so that a pardoned person may take action for defamation against anyone who thereafter refers to him as a convict. In the United States the matter is much less clear, although the Supreme Court has held that a pardon blots out guilt and makes the offender "as innocent as if he had never committed the offense." Some states in the United States have held that a pardon does not remove the disqualification from holding public office and that a pardoned offender may still be refused a license to engage in a business or profession. The difficulty stems from lack of differentiation between pardons granted for reasons of clemency and those granted from a belief in the accused's innocence. Continental European and Latin-American countries generally have detailed statutory provisions governing the law of pardon.

Pardubice, German PARDUBITZ, city, Východočeský *kraj* (region), Czechoslovakia, at the confluence of the Labe and Chrudimka rivers, east of Prague. Originating in the 13th century as a trade mart, it received civil rights in 1340 and by 1490 had become a possession of the Czech Pernštejn family, who renovated it in Renaissance style during the 16th century. The town was razed by Swedish troops in 1645. Its square is an architectural showplace, with a row of outstanding patrician houses, a 16th-century Gothic castle, and the Green Gate (Zelená brána, 1507). Kunětická hora, 4 miles (6 km) northeast, is a cone-shaped basaltic hill (1,006 feet [305 m]), site of a prehistoric burial ground and topped by a 15th-century castle ruin.

Pardubice is known for horse racing, particularly its Grand Pardubice Steeplechase, and for motorcycle track meets. It has a regional museum for Eastern Bohemia and a College of Chemical Technology (1950). Industries include engineering, sugar refining, brewing, and, since World War II, oil refining. The town is an important road and rail junction and a cultural and administrative centre. Pop. (1988 est.) 95,540.

Paré, Ambroise (b. 1510, Bourg-Hersent, Fr.—d. Dec. 20, 1590, Paris), French physician, one of the most notable surgeons of the European Renaissance, regarded by some medical historians as the father of modern surgery.

About 1533 Paré went to Paris, where he soon became a barber-surgeon apprentice at the Hôtel-Dieu. He was taught anatomy and surgery and in 1537 was employed as an army surgeon. By 1552 he had gained such popularity that he became surgeon to the king; he served four French monarchs: Henry II, Francis II, Charles IX, and Henry III.

At the time Paré entered the army, surgeons treated gunshot wounds with boiling oil since such wounds were believed to be poisonous. On one occasion, when Paré's supply of oil ran out, he treated the wounds with a mixture of egg yolk, rose oil, and turpentine. He found that the wounds he had treated with this mixture were healing better than those treated with the boiling oil. Sometime later he reported his findings in *La Méthod de traicter les playes faites par les arquebuses et*

aultres bastons à feu (1545; "The Method of Treating Wounds Made by Harquebuses and Other Guns"), which was ridiculed because it was written in French rather than in Latin. Another of Paré's innovations that did not win immediate medical acceptance was his reintroduction of the tying of large arteries to replace the method of searing vessels with hot irons to check hemorrhaging during amputation.

Unlike most surgeons of his time, Paré resorted to surgery only when he found it absolutely necessary. He was one of the first surgeons to discard the practice of castrating patients who required surgery for a hernia. He introduced the implantation of teeth, artificial limbs, and artificial eyes made of gold and silver. He invented many scientific instruments, popularized the use of the truss for hernia, and was the first to suggest syphilis as a cause of aneurysm (swelling of blood vessels).

Parecis Mountains, Portuguese SERRA DOS PARECIS, mountains, Rondônia and Mato Grosso *estados* ("states"), west-central Brazil. Rising out of the tropical rain forests of Rondônia, near the Bolivian border, the range extends southeastward for 500 miles (800 km) to the vicinity of Diamantino in Mato Grosso. Its northwestern section consists of rolling plateaus, which rise to more than 2,300 feet (700 m) above sea level in the southeast. On its northern and western slopes rise the Juruena and Guaporé rivers, both tributaries of the Amazon; from the range's southern flanks come headwaters of the Paraguay River.

paregoric, also called CAMPHORATED OPIUM TINCTURE, narcotic preparation principally used as an antiperistaltic for the treatment of diarrhea. In early medical writings the term paregoric sometimes was used in reference to soothing medicaments in general.

The preparation is made from opium tincture (laudanum) or from powdered opium and includes anisi oil, camphor, benzoic acid, glycerin, and diluted alcohol. The usual adult dose is 5–10 millilitres, which corresponds to 2–4 milligrams of anhydrous morphine.

Pareja, Juan de, byname EL ESCLAVO (Spanish: "The Slave") (b. *c.* 1610, Seville—d. 1670, Madrid), Spanish painter and student of Diego Velázquez.

A mulatto, Pareja was Velázquez' slave and accompanied him on his second visit to Italy (1649–51), where Velázquez painted his portrait. The portrait was purchased at auction by the Metropolitan Museum in 1970 for nearly $5.5 million, a record at the time. According to early writers, Pareja painted in the manner of Velázquez, but his only known portrait is a crude reflection of Velázquez' style. While in Rome, Pareja was granted his freedom (1650) by Velázquez.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

parenchyma, in plants, tissue typically composed of living cells that are thin-walled, unspecialized in structure, and therefore adaptable, with differentiation, to various functions. Parenchyma may be compact or have extensive spaces between the cells. It is often called ground, or fundamental, tissue and makes up the mesophyll (internal layers) of leaves and the cortex (outer layers) and pith (innermost layers) of stems and roots; it also forms the soft tissues of fruits. Cells of this type are also contained in xylem (wood) and phloem (bast, or food-conducting, cells) as transfer cells (*see* phloem) and, with both xylem and phloem as bundle sheaths, the cells that surround the vascular strands.

parent, one who has begotten offspring, or one who occupies the role of mother or father. In Western societies, parenthood, with its several obligations, rests strongly on biological relatedness. This is not the case in all societies: in some, a distinction is made between a biological parent and social parent, with the former producing the child and latter raising the child and acting as a mother or father in as affective or legal a sense as biological parents are expected to do in Western society. This distinction is particularly common in the case of fathers, and to accommodate it anthropologists have developed separate kinship terms: a "genitor" is a biological father, and a "pater" is a social one.

Parentalia, Roman religious festival held in honour of the dead. The festival, which began at noon on February 13 and culminated on February 21, was essentially a private celebration of the rites of deceased family members. It was gradually extended, however, to incorporate the dead in general. During the days of the festival, all temples were closed and no weddings could be performed. On the last day a public ceremony, the Feralia, was held, during which offerings and gifts were placed at the graves and the anniversary of the funeral feast was celebrated.

paresis, also called BRAIN SYPHILIS, SYPHILITIC MENINGOENCEPHALITIS, GENERAL PARALYSIS OF THE INSANE, or DEMENTIA PARALYTICA, psychosis caused by widespread destruction of brain tissue occurring in some cases of late syphilis. Mental changes include gradual deterioration of personality, impaired concentration and judgment, delusions, loss of memory, disorientation, and apathy or violent rages. Convulsions are not uncommon, and while temporary remissions sometimes occur, untreated paresis is eventually fatal.

Paresis occurs most frequently in men between 35 and 50 years of age. The malarial treatment of paresis, effective because the malarial fever destroys the syphilitic microorganisms, was initiated in 1917 by the Austrian physician Julius Wagner von Jauregg; it has been supplanted by the use of antibiotics. *See also* syphilis.

Pareto, Vilfredo (b. July 15, 1848, Paris—d. Aug. 20, 1923, Geneva), Italian economist and sociologist, known for his theory on mass and elite interaction as well as for his application of mathematics to economic analysis.

After his graduation from the University of Turin (1869), where he had studied mathematics and physics, Pareto became an engineer and later a director of an Italian railway and was also employed by a large ironworks. Residing in Florence, he studied philosophy and politics and wrote many periodical articles in which he first analyzed economic problems with mathematical tools. In 1893 he was chosen to succeed Léon Walras in the chair of political economy at the University of Lausanne, Switz.

Pareto's first work, *Cours d'Économie Politique* (1896–97), included his famous but much-criticized law of income distribution, a complicated mathematical formulation in which Pareto attempted to prove that the distribution of incomes and wealth in society is not random and that a consistent pattern appears throughout history, in all parts of the world and in all societies.

In his *Manuale d'economia politica* (1906), his most influential work, he further developed his theory of pure economics and his analysis of ophelimity (power to give satisfaction). He laid the foundation of modern welfare economics with his concept of the so-called Pareto optimum, stating that the optimum allocation of the resources of a society is not attained so long as it is possible to make at least one individual better off in his own estimation while keeping others as well off as before in their own estimation. He also introduced "curves of indifference," analytical instruments that did not become popular until the 1930s.

Believing that there were problems that economics could not solve, Pareto turned to sociology, writing what he considered his greatest work, *Trattato di sociologia generale* (1916; *Mind and Society*), in which he inquired into the nature and bases of individual and social action. Persons of superior ability, he argued, actively seek to confirm and aggrandize their social position. Thus social classes are formed. In an effort to rise into the elite of the upper strata, privileged members of the lower-class groups continually strive to use their abilities and thus improve them; the opposite tendency obtains among the elite. As a result, the best-equipped persons from the lower class rise to challenge the position of the upper-class elite. There thus occurs a "circulation of elites." Because of his theory of the superiority of the elite, Pareto sometimes has been associated with fascism.

pareve, also spelled PARVE, or PARVEH (Yiddish: "neutral"), in the observance of Jewish dietary laws (*kashrut*), those foods that may be eaten indiscriminately, with either meat dishes or dairy products—two general classes of food that may not be consumed at the same meal. Fruits and vegetables are classified as pareve unless cooking or processing alters their status. In modern times, cakes and similar foods are classed as pareve, provided they are made with vegetable oil (rather than butter) and with "neutral" liquids substituted for milk.

parfleche, tough, folded rawhide carrying bag made by the Plains Indians of North America; more loosely applied, the term also refers to many specialized rawhide articles. The Plains Indians had an abundant source of hides in the buffalo they hunted, but, as they were nomadic, they had little opportunity to tan the skins. Parfleche, or rawhide, was prepared by

cleaning and dehairing the skin and then by stretching it and allowing it to dry in the sun. This process created a stiff but durable leather that was used for many items, including bags, thongs, and war shields.

The parfleche bag, or trunk (valise), was assembled by folding the two ends of a long, rectangular piece of rawhide over to meet and form a kind of envelope. The two flaps were thonged together, and the whole was used in tandem with another, similar parfleche, one strapped to each side of a horse. The maximum dimensions of the parfleche were generally 2 feet (60 cm) by 3 feet (90 cm). The large flat surface of the parfleche bag was invariably painted with colourful, basically geometric, abstract designs; a sharpened porous buffalo bone served as an effective paint brush. Sometimes the rawhide was incised to highlight a design.

Párga, port of the *nomós* (department) of Préveza, on the Ionian Sea opposite the island of Paxos (Paxoí), Greece. In 1401 it welcomed the Venetians, who built (1572) the mole that forms the present harbour, over which stands a Venetian fortress. For three centuries quasi-independent under Venice, it went to France in 1797 and two years later came under Russian protection after capture by a Russian fleet. It was part of the independent Ionian Republic until 1807 when, under the Treaty of Tilsit, it was returned to France. In 1814, however, the city accepted British protection.

In 1819 England invoked the Russo-Turkish Convention of 1800, by terms of which Párga reverted to Turkey, provided that no mosque be built or Muslim settle there. Rather than submit to Turkish rule, about 4,000 Pargiotes elected in 1819 to migrate to the Ionian Islands, and the Turkish government was constrained to pay them compensation. A few families returned in 1822. Párga was taken by the Greeks in the Balkan Wars (1912–13) and annexed to Greece in 1913. Pop. (1981) 1,892.

Parhae, Chinese P'O-HAI, state established in the 8th century among the Tungus tribes of northern Manchuria (Northeast Provinces) and northern Korea by a former Korean general, Tae Cho-yang. The ruling class consisted largely of the former aristocrats of Koguryŏ, which had occupied most of northern Korea and Manchuria before it was conquered by the state of Silla in 668. Parhae was considered the successor state to Koguryŏ.

Parhae, like Silla, became a tributary state of the Chinese T'ang dynasty (618–907) and was prevented by the T'ang from developing friendly relations with Silla. Its trade and cultural relations were largely with the nomadic tribes of the north and with Japan and China. Parhae appears to have enjoyed high prosperity; indeed, in its heyday it was referred to in Korea as *Haedong-songguk,* "the prosperous country of the East." The territory at this time extended from the Sungari and Amur rivers in northern Manchuria down to the northern half of Korea.

Parhae bore a strong cultural resemblance to Koguryŏ. The surviving Buddhist images and stone lanterns suggest that Buddhism played a predominant role in the life of the Parhae people. The government administration was modelled after the T'ang bureaucracy.

Parhae's rule was brought to an end in 927, when it was conquered by the Khitan tribes of Central Asia, who were soon to form the Liao dynasty (947–1125) on China's northern borders.

parhelion, also called MOCK SUN, or SUN DOG, atmospheric optical phenomenon appearing as luminous spots 22° on each side of the Sun and at the same elevation as the Sun. Usually, the edges closest to the Sun will appear reddish. Other colours are occasionally visible, but more often the outer portions of each spot appear whitish.

Parhelia occur when the Sun or Moon shines through a thin cloud composed of hexagonal ice crystals falling with their principal axes vertical, as opposed to the halo phenomenon that occurs when the principal axes are randomly arranged in a plane perpendicular to the Sun's or Moon's rays. The red end of the spectrum, being bent the least, appears on the inside, with the blue, when visible, appearing on the outside. *See also* halo.

pari-mutuel (French *pari,* "bet"; *mutuel,* "mutual"), plural PARI-MUTUELS, or PARIS-MUTUELS, method of wagering introduced in France in about 1870 by Parisian businessman Pierre Oller. Subsequently it became one of the world's most popular methods of betting on horse races. Most systems are operated by the racetrack, although in France a national pari-mutuel system with offtrack branches was established in 1891. In pari-mutuel betting, the player buys a ticket on the horse he wishes to back. The payoff to winners is made from the pool of all bets on the various entries in a race, after deduction of an operator's commission and tax. The system has the advantages of always giving the operator a profit and allowing any number of bettors to win.

An important innovation in pari-mutuel betting came in the 1920s with the development of the totalizator, a mechanical device for issuing and recording betting tickets. Modern totalizators, usually computers, calculate betting pools and current odds on each horse and flash these figures to the public at regular intervals. They may also display race results, payoff amounts, running times, and other information. Increasingly sophisticated equipment has encouraged introduction of a variety of combination bets, such as the daily double (picking winners in two specified races, usually the first two), exacta or perfecta (picking the first two finishers in a race in precise order), quinella (picking the first two finishers in a race regardless of order), pick six (picking the winners in six consecutive races, usually the second through the seventh), and many others.

Pari-mutuel betting is still most practiced in horse racing but has an important place in other sports as well, most notably dog racing and jai alai.

Paria, Gulf of, inlet of the Caribbean Sea, lying between the Venezuelan coast (including the mountainous Paria Peninsula) and Trinidad. Extending about 100 mi (160 km) east–west and 40 mi north–south, it is linked with the Caribbean to the north by the islands of Dragon's Mouth and with the Atlantic to the south by the Serpents Mouth (both 10 mi wide). It receives the San Juan River and several arms of the Orinoco River Delta, including the Caño Mánamo. Gulf ports, including San Fernando and Port of Spain (Trinidad) and Güiria, Irapa, and Pedernales (Venezuela), handle shipments of petroleum, iron ore, bauxite, lumber, and agricultural products. Columbus, while on his third voyage (1498), probably first sighted South America when he sailed into the Gulf of Paria.

pariah, member of a low-caste group of Hindu India, formerly known as "untouchables" but renamed by the Indian social reformer Mahatma Gandhi as Harijans (children of the god Hari Viṣṇu, or, simply, children of God). The word pariah—originally derived from Tamil *paṛaiyar,* "drummer"—once referred to the Paraiyan, a Tamil caste group of labourers and village servants of low status, but the meaning was extended to embrace many groups outside the so-called clean caste groups, with widely varying degrees of status. *See also* untouchable.

Parian Chronicle, also called MARMOR PARIUM (Latin: Parian Marble), document inscribed on marble in the Attic Greek dialect containing an outline of Greek history from the reign of Cecrops, legendary king of Athens, down to the archonship of Diognetus at Athens (264/263 BC). The years are reckoned backward from the archonship of Diognetus and further specified by the reigns of kings or the archons of Athens. The author gave little attention to constitutional history or battles but recorded the dates of the establishment of festivals, of the introduction of various kinds of poetry, of the births and deaths of the poets, and of their victories in contests of poetic skill.

One large fragment, bought at Smyrna in the early 17th century, is at the Ashmolean Museum, Oxford. Another, found on Paros in 1897, is now in the Paros Museum.

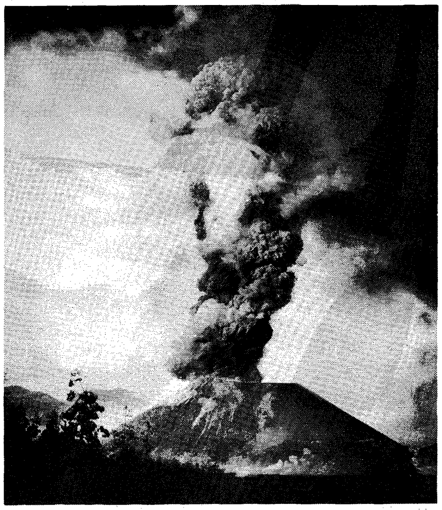
rett, in imitation of Sèvres biscuit (fired but unglazed porcelain). Its name is derived from its resemblance to Parian marble.

A great many figures, some extremely large, were made in this medium. Most of them consist of either sentimental subjects or quasi-erotic nudes, which were popular in Victorian art. In the United States, Parian ware was manufactured by Norton and Fenton.

Parícutin, volcano, western Michoacán state, west-central Mexico, just north of the volcano Tancítaro Peak and 20 miles (32 km) west-northwest of Uruapan. It is one of the youngest volcanoes on Earth.



Parícutin volcano in eruption, western Michoacán state, Mexico
Ewing Galloway

On Feb. 20, 1943, it began to erupt in an open field. The fire, lava, and ashes destroyed and buried two villages and hundreds of homes. A partially buried church at the edge of the lava flows is a local tourist attraction. In the first year, the volcano's cone had risen 1,475 feet (450 m) from the base (at 7,480 feet [2,280 m] above sea level) and had buried the village of Parícutin. Its peak reached an elevation of 9,210 feet (2,808 m) in 1952, when the eruption finally ended.

Paridae, songbird family, order Passeriformes, consisting of the titmice and chickadees, about 64 species of small, gregarious birds, primarily of the Northern Hemisphere and Africa.

Members range in size from 7.5 to 20 cm (3 to 8 inches) long. They have short, stout, pointed bills, nostrils concealed by thick feathers, strong feet, and rounded wings. These active, curious birds are similar to crows in trainability. They feed chiefly on insects but eat fruit also. A popular American species is the black-capped chickadee (*Parus atricapillus*); in Europe there is the similar willow tit (*P. montanus*), immortalized by Gilbert and Sullivan.

The long-tailed tits (*Aegithalos* and other genera) are sometimes given family rank as the Aegithalidae; and the penduline tits (*Remiz* and other genera) are sometimes similarly ranked as the Remizidae. They appear to be related to the crow-jay complex (family Corvidae). The Paridae belongs to the songbird suborder (Passeres).

parietal bone, cranial bone forming part of the side and top of the head. In front each parietal bone adjoins the frontal bone; in back, the occipital bone; and below, the temporal and sphenoid bones. The parietal bones are marked internally by meningeal blood vessels and externally by the temporal muscles. They meet at the top of the head (sagittal suture) and form a roof for the cranium. The parietal bone forms in membrane (*i.e.,* without a cartilaginous precursor); the sagittal suture closes between ages 22 and 31. In primates that have large jaws and well-developed chewing muscles (*e.g.,* gorillas and baboons), the parietal bones may be continued upward at the midline to form a sagittal crest. Among early hominids, *Paranthropus* (also called *Australopithecus robustus*) sometimes exhibited a sagittal crest.

For a depiction of the parietal in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

parietal cell, also called OXYNTIC CELL, or DELOMORPHOUS CELL, in biology, one of the cells that are the source of the hydrochloric acid and most of the water in the stomach juices. The cells are located in glands in the lining of the fundus, the part of the stomach that bulges above the entrance from the esophagus, and in the body, or principal part, of the stomach.

Parilia, ancient Roman festival celebrated annually on April 21 in honour of the god and goddess Pales, the protectors of flocks and herds. The festival, basically a purification rite for herdsmen, beasts, and stalls, was at first celebrated by the early kings of Rome, later by the *pontifex maximus,* or chief priest. The Vestal Virgins opened the festival by distributing straw and the ashes and blood of sacrificial animals. Ritual cleaning, anointment, and adornment of herds and stalls followed, together with offerings of simple foods. The celebrants jumped over a bonfire three times to complete the purification, and an open-air feast ended the festival.

According to later tradition, April 21 was the day on which Romulus began building the city of Rome and was thus celebrated as the *dies notalis* of the city.

Parima Mountains, Spanish SIERRA PARIMA, Portuguese SERRA PARIMA, range in northern Brazil and southern Venezuela. It is an outlying range of the Guiana Highlands and extends south-southeastward for about 200 miles (320 km), separating Venezuela from Roraima territory, Brazil. Its peaks, largely unexplored, reach an elevation of 5,000 feet (1,500 m) above sea level.

Headstreams of the Orinoco River rise on the western flanks, and headstreams of the Branco River descend from the eastern slopes. The range connects with Pacaraima Mountains in the northeast.

Parini, Giuseppe (b. May 22/23, 1729, Bosisio, near Milan [Italy]—d. Aug. 15, 1799, Milan), Italian prose writer and poet remembered for a series of beautifully written Horatian odes and particularly for *Il giorno,* a satiric poem on the selfishness and superficiality of the Milanese aristocracy.

Of humble origins, Parini was educated by the Barnabites in Milan. A volume of Arcadian verse, *Alcune poesie di Ripano Eupilino* (1752), brought him into literary circles; the following year he joined the prestigious Milanese Accademia dei Trasformati ("Academy of the Transformed").

In 1754 Parini was ordained priest and entered the household of Duke Gabrio Serbelloni as tutor to the duke's oldest son. He remained there until 1762, unhappy and badly treated; but he won ample revenge, first in *Dialogo sopra la nobiltà* (1757), a discussion between the corpse of a nobleman and the corpse of a poet about the true nature of nobility, and next through his masterpiece, the satiric poem *Il giorno* (4 books, 1763–1801; *The Day*).

The first two parts of *Il giorno* brought Parini literary renown; he became editor of the *Gazzeta di Milano* and then a humanities professor in the Palatine and Brera schools. In Milan he met the young W.A. Mozart, who composed an operatic score for his play *Ascanio in Alba* (opera performed 1771). When the French took Milan in 1796, Parini, rather uncomfortably, held a government post for three years.

The most important of Parini's other works are his odes (*Odi,* published 1795), composed over a period of about 20 years. Parini also wrote several literary tracts and an aesthetic treatise, *Dei principi generali e particolari delle belle lettere* (1801).

Paris, also called ALEXANDROS (Greek: "Defender"), in Greek legend, son of King Priam of Troy and his wife, Hecuba. A dream regarding his birth was interpreted as an evil portent, and he was consequently expelled from his family as an infant. Left for dead, he was either nursed by a bear or found by shepherds. He was raised as a shepherd, unknown to his parents. As a young man he entered a boxing contest at a Trojan festival, in which he defeated Priam's other sons. After his identity was revealed, he was received home again by Priam.

The "judgment of Paris" was and continues to be a popular theme in art. According to legend, Paris was chosen by Zeus to determine which of three goddesses was the most beautiful. Rejecting bribes of kingly power from Hera and military might from Athena, he chose Aphrodite and accepted her bribe to help him win the most beautiful woman alive. His seduction of Helen (the wife of Menelaus, king of Sparta) and refusal to return her was the cause of the Trojan War. During the war Paris seems to have had a secondary role: a good warrior but inferior to his brother Hector and to the Greek leaders whom he faced. Menelaus would have defeated Paris in single combat, but Aphrodite rescued him, and the war continued.

Near the end of the war, Paris shot the arrow that, by Apollo's help, caused the death of the hero Achilles. Paris himself, soon after, received a fatal wound from an arrow shot by the archer Philoctetes.

Paris, city and capital of France, located in the north-central part of France on both sides of the Seine River, 233 miles (375 km) upstream from the English Channel. Its ideal crossroads location has enabled Paris to thrive for more than 2,000 years as the country's leading centre of population, culture, and economic activity.

A brief treatment of Paris follows. For full treatment, *see* MACROPAEDIA: Paris.

The Seine follows a curved course through the city and forms two islands: the Île de la Cité and Île Saint-Louis. The city occupies a central position in the rich agricultural region known as the Paris Basin. The region has a temperate maritime climate with warm summers and fairly mild winters. The mean temperature is about 50° F (10° C); January averages about 38° F (3° C) and July about 65° F (18° C). Rainfall is fairly evenly distributed, though somewhat heavier in the summer and autumn; average annual precipitation is about 24 inches (619 mm).

Paris is the leading industrial city of France. Manufacturing industries predominate in the northern suburbs, and among the most developed are the automobile and aeronautics industries, electronics industries, chemical and pharmaceutical industries, and food industries. A second major type of industry is the manufacture of luxury articles, including precious metalware, leather crafts, china, and haute couture (fashion design). These occupations are mostly concentrated within the central *arrondissements*. The outlying *arrondissements* specialize in such trades as furniture making, shoemaking, precision-tool production, and the manufacture of optical instruments. Printing and publishing are found in the Quartier Latin (Latin Quarter) and the rue (street) Réamur at the centre of the city. The Greater Paris area also produces three-quarters of French motion pictures, and tourism is an important industry. Many banks and businesses have their headquarters in Paris, including the Banque de France, which has the French national gold reserve in vaults underneath its building. Near the bank is the Bourse (Stock Exchange). The city's central market, the Halles, was closed in 1969, and new markets were installed at Rungis, near Orly.

The city of Paris had its beginnings on the Île de la Cité, where the splendid 12th-century cathedral of Notre Dame is located. Connected by bridge to the Île de la Cité is Île Saint-Louis, where old houses and narrow streets date back to the 17th century. On the Right Bank of the Seine, east of Île Saint-Louis, is the Place de la Bastille, where the July 14, 1789, capture of the Bastille prison helped launch the French Revolution. Between Île Saint-Louis and the Place de la République is the Hôtel de Ville (City Hall). Stretching along the river, the palace of the Louvre, one of the world's most celebrated museums, houses an art collection that ranks among the largest and finest in existence. Other notable museums include the Orsay Museum of 19th-century art and civilization and the National Museum of Modern Art in Pompidou Centre. Northward of the Louvre lies the Place de l'Opéra, the location of the Paris Opera House and National Academy of Music. In the Place de la Concorde, just northwest of the Louvre, stood the guillotine where, during the French Revolution, Louis XVI and Marie-Antoinette were executed in 1793. From the Place de la Concorde, the tree-lined Champs-Élysées leads up a gentle rise to the Arc de Triomphe, commissioned by Napoleon in 1806. Also on the Right Bank of the Seine is the district of Montmartre, dominated by the Sacred Heart Basilica (Basilique du Sacré Coeur). With its cafes and bistros, it is a centre of nightlife and a renowned haunt of poets and painters. On the Left Bank of the Seine are the Champ-de-Mars and the Eiffel Tower, a visual symbol of Paris. The oldest part of the Left Bank is the Latin Quarter, in which stands the Sorbonne (founded about 1257, now part of the University of Paris). Many other educational institutions are clustered near the Sorbonne. Nearby are the Cluny Museum, with a rich collection of medieval art, and the Panthéon, where many of France's notables are buried. Transportation in Paris and its inner suburbs is organized by the RATP (Régie Autonome des Transports Parisiens) through the double network of the Métro (underground railway) and buses. The Réseau Express Régional (RER), a network of express rail lines, runs to the outer suburbs. France's roads and railways have been designed to converge on the capital from all directions. Paris is the largest inland port in France and is served by an excellent system of waterways. The city has two major airports, the Orly and the Charles de Gaulle, serving national and international flights. Area city, 41 square miles (105 square km); metropolitan region, 805 square miles (2,118 square km). Pop. (1982) city, 2,165,-892; metropolitan area, 10,210,059.

Paris, city, seat of Bourbon county, north-central Kentucky, U.S., on the South Fork of Licking River, in the Bluegrass region. First settled about 1775, it was founded as Hopewell (1789) and was called Bourbontown before it was renamed Paris (1790) in appreciation of French aid during the Revolutionary War. Bourbon whiskey was first distilled there in 1790. Duncan Tavern Historic Shrine (1788), once the rendezvous of frontiersmen such as Daniel Boone, has been restored. A few miles east is Old Cane Ridge Meeting House (1791), where in 1804 Barton W. Stone started a movement called the New Lights, which merged in 1832 with the "Campbellites" to become the Disciples of Christ, or Christian Church. The basic farm economy (livestock, thoroughbred horses, seed processing) is supplemented by the manufacture of textiles and mining machinery. Inc. city, 1862. Pop. (1984 est.) 7,893.

Paris, city, seat (1844) of Lamar county, northeastern Texas, U.S., on a ridge between the Red and Sulphur rivers, 106 miles (171 km) northeast of Dallas. Laid out in 1845 and named for Paris, Fr., it developed after the arrival of the railroad in 1876. The city was replanned after a disastrous fire in 1916. A shipping point for cotton, grain, and livestock of the Blacklands Belt, it also has some light manufacturing. Paris Junior College was established in 1924. The Gambill Wildlife Refuge on Lake Gibbons and the Flying Tigers Air Museum are nearby. Inc. town, 1874; city, 1905. Pop. (1986 est.) 27,311.

Paris, Banque Nationale de, nationalized French commercial-banking company. It has branches and representatives in more than 75 countries. Headquarters are in Paris.

The bank was created in 1966 when French Finance Minister Michel Debré combined two existing banks to make the largest bank on the European continent. The two merged banks were Banque Nationale pour le Commerce et l'Industrie (established in 1932) and Comptoir National d'Escompte de Paris (established in 1848), both nationalized in 1945.

Banque Nationale provides domestic-banking services for individuals and corporations, investment banking, advisory services, and foreign and international banking services. The bank acts as a managing underwriter for most debt securities of the French government, underwrites corporate securities, and provides markets for Eurocurrency securities in Paris. It also provides financing for French export companies and credit lines for foreign companies buying French exports. Many of the international-banking services are provided through foreign banks, subsidiaries, and associated banks.

Paris, Commune of (1871), also called PARIS COMMUNE, insurrection of Paris against the French government from March 18 to May 28, 1871. It occurred in the wake of France's defeat in the Franco-German War and the collapse of Napoleon III's Second Empire (1852–70).

The National Assembly, which was elected in February 1871 to conclude a peace with Germany, had a royalist majority, reflecting the conservative attitude of the provinces. The republican Parisians feared that the National Assembly meeting in Versailles would restore the monarchy.

To ensure order in Paris, Adolphe Thiers, executive head of the provisional national government, decided to disarm the National Guard (composed largely of workers who fought during the siege of Paris). On March 18 resistance broke out in Paris in response to an attempt to remove the cannons of the guard overlooking the city. Then, on March 26, municipal elections, organized by the central committee of the guard, resulted in victory for the revolutionaries, who formed the Commune government. Among those in the new government were the so-called Jacobins, who followed in the French Revolutionary tradition of 1793 and wanted the Paris Commune to control the Revolution; the Proudhonists, socialists who supported a federation of communes throughout the country; and the Blanquistes, socialists who demanded violent action. The program that the Commune adopted, despite its internal divisions, called for measures reminiscent of 1793 (end of support for religion, use of the Revolutionary calendar) and a limited number of social measures (10-hour workday, end of work at night for bakers).

With the quick suppression of communes that arose at Lyon, Saint-Étienne, Marseille, and Toulouse, the Commune of Paris alone faced the opposition of the Versailles government. But the Fédérés, as the insurgents were called, were unable to organize themselves militarily and take the offensive, and, on May 21, government troops entered an undefended section of Paris. During *la semaine sanglante,* or "bloody week," that followed, the regular troops crushed the opposition of the Communards, who in their defense set up barricades in the streets and burned public buildings (among them the Tuileries Palace and the City Hall [Hôtel de Ville]). About 20,000 insurrectionists were killed, along with about 750 government troops. In the aftermath of the Commune, the government took harsh repressive action: about 38,000 were arrested and more than 7,000 were deported.

Paris, (Bruno-Paulin-)Gaston (b. Aug. 9, 1839, Avenay, Fr.—d. March 6, 1903, Cannes), greatest French philologist of his age.

After a thorough education in German universities and at the École des Chartes in Paris, he succeeded his father as professor of French medieval literature at the Collège de France. He was one of the founders and directors of *Revue critique* and of *Romania,* the leading journal devoted to French philology.

A scholar of enormous erudition and exemplary thoroughness, Paris is also remarkable for his efforts to present the findings of research in a form suitable for the general reading public. He became a member of the

Paris, Matthew (d. 1259), English Benedictine monk and chronicler, known only through his voluminous and detailed writings, which constitute one of the most important sources of knowledge of events in Europe between 1235 and 1259.

Paris was admitted a monk at the Abbey of St. Albans in England in 1217, and in 1248 he was sent to Norway to reform the Benedictine Monastery of St. Benet Holm on the island of Nidarholm. Apart from this mission and occasional visits to the royal court at Westminster, Winchester, and elsewhere, he remained at St. Albans, assiduously recording contemporary events. His *Chronica majora* incorporates Roger Wendover's *Flores historiarum* and continues it from 1235 to 1259. His other chronicles—the *Historia Anglorum,* the *Flores historiarum,* and the *Abbreviatio chronicorum*—are all abridged from his *Chronica majora* but contain some additional matter. Matthew also wrote a history of his own house, the *Gesta abbatum monasterii Sancti Albani.* Autograph manuscripts of all these works survive. He wrote biographies of Saint Alban, Edward the Confessor, Thomas Becket, and Edmund Rich, in Anglo-Norman verse, and of Stephen Langton and Edmund Rich, in Latin prose.

As a chronicler, Matthew is noteworthy for his detailed knowledge of events all over Europe; for his use of information obtained from the leading figures of his day, such as Henry III and Richard, Earl of Cornwall, both of whom he knew well; for the large number of documents that he included either in his chronicle or in an appendix to it; and for the outspoken expression of his prejudices against, in particular, the king, the foreign favourites at court, and the papacy.

Paris, Pact of: *see* Kellogg–Briand Pact.

Paris, (Louis-) Philippe (-Albert) d'Orléans, comte de (count of) (b. Aug. 24, 1838, Paris, Fr.—d. Sept. 8, 1894, Stow House, Twickenham, Middlesex, Eng.), pretender to the French throne after the death of Louis-Philippe (1850). The death of his father, Ferdinand, Duke d'Orléans, son and heir of Louis-Philippe, in 1842 made the young Philippe heir to the throne and the candidate of the Orleanists; the title of Count de Paris was created for him.

During the Revolution of 1848 he was taken into exile in England. He and his brother Robert, Duke de Chartres, served as volunteers under the Federal general George B. McClellan in the American Civil War in 1861–62. Back in England, the count married his cousin, Isabelle d'Orléans-Montpensier, in 1864.

After the downfall of Napoleon III (1870), he returned to France as a private person. At Frohsdorf, in Austria, he recognized the right of Henri d'Artois, Count de Chambord, to the French crown (August 1873); but this Legitimist–Orleanist entente broke down in 1875. When the Count de Chambord died (1883), most French Legitimists acknowledged the Count de Paris as the heir to the throne; but the success of his Paris reception celebrating his daughter Marie-Amélie's marriage in Lisbon to the future Carlos I of Portugal provoked the French republican government to pass the law of June 1886 expelling the heads of all formerly sovereign houses from France. The count retired to England, and, when General Georges Boulanger failed in his machinations, all hopes of an early restoration of the French monarchy were extinguished.

paris, plaster of, quick-setting gypsum plaster consisting of a fine, white powder, calcium sulfate hemihydrate (*see* calcium), which hardens when moistened and allowed to dry. Plaster of paris is prepared by heating calcium sulfate dihydrate, or gypsum, to 120°–180° C (248°–356° F). With an additive to retard the set, it is called wall, or hard wall, plaster.

Used since ancient times, plaster of paris is so called because gypsum was early used near Paris to make plaster and cement. Plaster of paris is also used to precast and hold parts of ornamental plasterwork placed on ceilings and cornices and is used in medicine to make plaster casts to protect broken arm, leg, or other bones while they heal. Some modern sculptors work directly in plaster of paris. The speed at which the plaster sets gives the work a sense of immediacy and enables the sculptor to achieve his original idea quickly.

Paris, Treaties of (1814–15), two treaties signed at Paris respectively in 1814 and 1815 that ended the Napoleonic Wars. The treaty signed on May 30, 1814, was between France on the one side and the Allies (Austria, Great Britain, Prussia, Russia, Sweden, and Portugal) on the other. (Spain made the same treaty with France in July.) Napoleon had abdicated as France's emperor in April, and the victorious Allies, even after nearly a quarter century of war, gave generous terms to France under the restored Bourbon dynasty. France was allowed to retain its boundaries of Jan. 1, 1792, keeping possession of the enclaves annexed in the early years of the French Revolution. France was restored most of its foreign colonies, but Tobago and Saint Lucia in the West Indies and the Ile-de-France (now Mauritius) in the Indian Ocean were ceded to Great Britain. The treaty dealt only in general terms with the disposal of the European territories taken from the French empire and ended with the provision that all of the powers engaged on either side in the war should send plenipotentiaries to the Congress of Vienna to complete those arrangements.

The second treaty between France and the Allies, of Nov. 20, 1815, was signed in an altogether different spirit from the first. Napoleon had escaped from Elba and been welcomed by the French, and, consequently, war between France and the Allies had resumed and continued until Napoleon was defeated at the Battle of Waterloo. The second treaty abandoned the lenient spirit of the first and exacted indemnities from France, partly in the form of territory and partly in money. The French frontier was changed from that of 1792 to that of Jan. 1, 1790, thus stripping France of the Saar and Savoy. France had to pay an indemnity of 700,000,000 francs and to support an army of occupation of 150,000 men on its soil for three to five years.

Paris, Treaty of (1856), treaty signed on March 30, 1856, in Paris that ended the Crimean War. The treaty was signed between Russia on one side and France, Great Britain, Sardinia-Piedmont, and Turkey on the other. Since the western European powers had fought the war to protect Ottoman Turkey from Russia, the treaty gave special attention to this problem. The signatories guaranteed the independence and territorial integrity of Turkey. Russia was obliged to surrender Bessarabia (situated at the mouth of the Danube) to Moldavia, which along with Walachia were reorganized as autonomous states under Ottoman suzerainty. (These two principalities later joined to form Romania.) The Black Sea was neutralized (*i.e.,* its waters were closed to all warships), and the Danube River was opened to the shipping of all nations.

Paris I–XIII, Universities of, French UNIVERSITÉS DE PARIS I À XIII, universities founded in 1970 under France's 1968 Orientation Act reforming higher education. They replaced the former University of Paris, one of the archetypal European universities, founded about 1170.

The medieval University of Paris grew out of the cathedral schools of Notre-Dame and, like most other medieval universities, was a kind of corporate company that included both professors and students. With papal support, Paris soon became the great transalpine centre of Christian orthodox theological teaching. At the end of the 13th and during the 14th centuries, it was the most celebrated teaching centre of all Christendom. Its famous professors included Alexander of Hales, St. Bonaventure, Albertus Magnus, and Thomas Aquinas.

The university was originally divided into four faculties: three "superior," theology, canon law, and medicine; and one "inferior," arts. In the faculty of arts, the trivium (grammar, rhetoric, and dialectic) and the quadrivium (arithmetic, geometry, astronomy, and music) were taught together with general scientific, literary, and general culture. Aristotelian philosophy was an especially important field of study in the arts faculty. Each faculty was headed by a dean, and the dean of the faculty of arts had by the 14th century become the head of the collective university under the title of rector.

Many colleges were built to accommodate the students. The most celebrated college of Paris was the Sorbonne, founded by the theologian Robert de Sorbon about 1257. Because its halls were the scene of numerous theological disputations, the name Sorbonne became a popular term for the theological faculty of Paris.

The University of Paris remained a spokesman for Roman Catholic orthodoxy, and its educational program, which was founded on Scholastic dialectics, became rigidly fixed. As a result, the university made little contribution to the humanistic studies of the Renaissance, and the university subsequently declined under the impact of the Reformation and the ensuing Counter-Reformation. With the French Revolution (1789–99) and Napoleon's subsequent reorganization of many of France's institutions, the University of Paris became one of the academies of the newly created University of France. Among its several faculties were some that were later abandoned (*e.g.,* theology in 1886), and others, such as science and pharmacy, that were new. Teaching at the university had by then become secular—that is, independent of political or religious doctrine.

At mid-20th century (when the University of France, as a central organizing body, had given place to the Ministry of Public Instruction), the University of Paris had again become a preeminent scientific and intellectual centre. The most distinguished professors lectured there, and there were more than 600 professorial chairs. In May 1968 a protest initiated by students at the Sorbonne grew into a serious national crisis. This led to a major educational reform that decentralized schools and gave students greater participation in university administration.

Paris Basin, geographic region of France, constituting the lowland area around Paris.

Geologically it is the centre of a structural depression that extends between the ancient Armorican Massif (west), the Massif Central (south), and the Vosges, Ardennes, and Rhineland (east). The area, which forms the heartland of France, is drained largely by the Seine River and its major tributaries converging on Paris. The natural vegetation of the basin has been almost entirely lost to the works of man, except for a few relict forests.

Paris Codex, Latin CODEX PERESIANUS, along with the Madrid and Dresden codices, one of the three richly illustrated glyphic texts of the pre-Conquest Mayan period known to have survived the book burnings by the Spanish clergy during the 16th century. Its Latin name comes from the name Perez, which was written on the torn wrappings of the manuscript when it was discovered in 1859 in an obscure corner of the Bibliothèque Nationale in Paris.

The Paris Codex is devoted almost entirely to Mayan ritual and ceremony, such as the ceremony held to celebrate the end of a 20-year period. The codex is fragmentary and in poorer condition than either of the other known codices. It is composed of paper made from tree bark and is fashioned in a long strip and folded like a screen. The eleven individual leaves provide 22 pages of columns of glyphs and pictures of the gods. The set of year-bearers appearing in the codex offers a clue to the date of its production, placing it midway between the Classic and Conquest periods of Mayan history.

Paris-Match, weekly pictorial magazine published in France since 1949 as successor to *L'Illustration* (1843–1944), which was discredited during World War II. A popular pictorial-news and current-events magazine aimed at the lower-middle class, it features picture stories on public affairs, profiles of government officials and assorted celebrities, and stories on consumer products. Its format resembles that of the American magazine *Life,* and it is similarly noted for its topicality and outstanding photography.

Paris-Match was acquired by Jean Prouvost, publisher of the daily *Le Figaro,* who led *Paris-Match* to attain high prestige and financial success. It appeals to a broad spectrum of the French middle class and is one of the most widely circulated magazines in France.

Paris Observatory, French OBSERVATOIRE DE PARIS, national astronomical observatory of France, under the direction of the Academy of Sciences. It was founded by Louis XIV at the instigation of J.-B. Colbert, and construction at the site in Paris began in 1667. Gian Domenico Cassini was the first of four generations of his family to hold the post of director of the observatory.

The observatory was enlarged in 1730, 1810, 1834, 1850, and 1951. The Paris building now houses the headquarters of the International Time Bureau, which standardizes the time determinations of the world's observatories. In 1926 the solar observatory at Meudon, on the outskirts of Paris, was taken over by the Paris Observatory. A radio astronomy station is maintained at Nançay, about 160 km (100 miles) south of Paris.

Paris Opéra, formally ACADÉMIE NATIONALE DE MUSIQUE, opera company in Paris that for more than two centuries was the chief performer of serious operas and musical dramas in the French language. It is one of the most venerable operatic institutions in the world. It was established as the Royal Academy of Music (Académie Royale de Musique) under a patent granted by Louis XIV in 1669. The company's first performance was *Pomone* (1671), a pastoral by the composer Robert Cambert and the poet Pierre Perrin. In 1672 the Royal Academy of Dance was amalgamated with the Royal Academy of Music.

In the 17th and 18th centuries the Paris Opéra's productions were dominated by a series of operatic giants. Jean-Baptiste Lully, who profoundly influenced the development of French opera, ruled the Opéra from 1672 until his death in 1687. In 1733 Jean-Philippe Rameau, Lully's equal in the history of French opera, began his 30 years as the leading operatic figure in France, with *Hippolyte et Aricie.* Christoph Gluck, the leader of the movement for operatic reform, was associated with the Opéra from 1773 to 1779.

The French Revolution of 1789 prompted the Paris Opéra to produce a series of operas on revolutionary subjects. In the middle and late 19th century, grand opera, exemplified in the works of Giacomo Meyerbeer, flourished in the company's repertory. The Opéra underwent a decline in the 20th century, and attempts to rejuvenate it began at mid-century. Its administration was joined with that of the Opéra-Comique, which traditionally stages works with spoken dialogue. From 1875 to 1990 the Paris Opéra was housed in the Théâtre Nationale de l'Opéra, an architectural landmark that is better known simply as the Opéra. In the latter year the company occupied its new home in the Opéra de la Bastille building.

Paris Opéra Ballet, ballet company established in France in 1661 by Louis XIV as the Royal Academy of Dance (Académie Royale de Danse) and amalgamated with the Royal Academy of Music in 1672. As part of the Théâtre National de l'Opéra, the company dominated European theatrical dance of the 18th and early 19th centuries. Its artists developed the basic techniques of classical ballet: Pierre Beauchamp, the company's first director, codified the five basic ballet positions, and the virtuosos Jean Balon, Louis Duport, Marie Camargo, and Gaetano and Auguste Vestris extended the range of dance steps, especially the jumps and leaps.

In 1832 the company opened the era of Romantic ballet by presenting Filippo Taglioni's *La Sylphide.* The company's dancers of this period included Jules Perrot, Arthur Saint-Léon, Fanny Elssler, and Carlotta Grisi, who created the title role in *Giselle* at the Paris Opéra in 1841.

The company's decline at the end of the 19th century was arrested by Jacques Rouché, director of the Paris Opéra and the Opéra-Comique from 1914 to 1944. After the successful avant-garde productions of Sergey Diaghilev's Ballets Russes at the Opéra, Rouché engaged the Russian guest artists Michel Fokine, Anna Pavlova, and Bronisława Nijinska and in 1930 appointed Serge Lifar director of the company. Principal performers under Lifar included Yvette Chauviré, Solange Schwarz, Marjorie Tallchief, Michel Renault, and George Skibine. In 1976 dancer Violette Verdy became the first female director of the company.

Paris Peace Conference (1919–20), the meeting that inaugurated the international settlement after World War I.

Although hostilities had been brought formally to an end by a series of armistices between the Allies and their adversaries—that of Salonika (Thessaloníka) with Bulgaria on Sept. 29, 1918, that of Mudros with Turkey on October 30, that of Villa Giusti with Austria-Hungary on November 3, and that of Rethondes with Germany on November 11—the conference did not open until Jan. 18, 1919. This delay was attributable chiefly to the British prime minister, David Lloyd George, who chose to have his mandate confirmed by a general election before entering into negotiations.

Lloyd George's arrival in Paris was followed on Jan. 12, 1919, by a preliminary meeting of the French, British, U.S., and Italian heads of government and foreign ministers—respectively Georges Clemenceau and Stephen Pichon; Lloyd George and Arthur James Balfour; Woodrow Wilson and Robert Lansing; and Vittorio Emanuele Orlando and Sidney Sonnino—at which it was decided that they themselves, with the Japanese plenipotentiaries, would constitute a Supreme Council, or Council of Ten, to monopolize all the major decision making. In March, however, the Supreme Council was, for reasons of convenience, reduced to a Council of Four, numbering only the Western heads of government, as the chief Japanese plenipotentiary, Prince Saionji Kimmocho, abstained from concerning himself with matters of no interest to Japan. The foreign ministers continued to meet as a Council of Five dealing with secondary matters.

The five Great Powers likewise controlled the Supreme Economic Council, created in February 1919 to advise the conference on economic measures to be taken pending the negotiation of peace. Specialized commissions were appointed to study particular problems: the organization of a League of Nations and the drafting of its Covenant; the determination of responsibility for the war and guarantees against a renewal of it; reparations; international labour legislation; international ports, waterways, and railroads; financial questions; economic questions of a permanent sort; aviation; naval and military matters; and territorial questions.

Major products of the conference were (1) the Covenant of the League of Nations, which was submitted in a first draft on Feb. 14, 1919, and finally approved, in a revised version, on April 28, (2) the Treaty of Versailles, presented at last to a German delegation on May 7, 1919, and signed, after their remonstrances, on June 28, (3) the Treaty of Saint-Germain, presented to an Austrian delegation in a rough draft on June 2, 1919, and in a fuller version on July 20 and signed on September 10, and (4) the Treaty of Neuilly, presented to a Bulgarian delegation on Sept. 19, 1919, and signed on November 27. There had been wrangling among the Allies over both the treaties with Germany and those with Austria. Concerning the former, the Americans and the British resisted French demands affecting Germany's western frontier and the Polish demand, supported by France, for Danzig (Gdańsk), while the Americans also objected to Japanese claims to Germany's special privileges in Shantung, China. Concerning the latter treaty, the Italians and the Yugoslavs quarreled over the partition of Austria's former possessions on the Adriatic.

The formal inauguration of the League of Nations on Jan. 16, 1920, brought the Paris conference to an end, before the conclusion of treaties with Turkey (1920, 1923) or with Hungary (1920).

Paris Zoo, zoological park comprising the Menagerie of the Botanical Garden (Ménagerie du Jardin des Plantes) and the Zoological Park of Paris (Parc Zoologique de Paris), both services of the French National Museum of Natural History. In 1793 the Jardin des Plantes, which was originally a botanical garden, also became the first public zoo in France. The compact 6.5-hectare (16-acre) area, with formal 18th-century landscaping, was retained when the Jardin was renovated between 1918 and 1939. It holds more than 930 specimens of about 275 animal species, including the rare Przewalski's horse and the onager; it has had excellent success breeding these species, as well as gorals, chamois, and European bison.

In 1934 the Parc Zoologique, a modern 17-ha (42-ac) zoo with spacious natural-habitat surroundings, was opened in a wooded area, the Bois de Vincennes. Its landmark is the Grand Rocher, a 71-m- (236-ft-) high artificial mountain with winding paths for wild sheep. The zoo has more than 950 specimens of nearly 225 species. It has had notable success in breeding the okapi and giraffe, and houses more than 40 species of antelope and many deer, including the rare Eld's deer for which the zoo maintains the international studbook.

parish, in some Christian church polities, geographical unit served by a pastor; it is a subdivision of a diocese. In the New Testament, the Greek word *paroikia* means sojourning, or temporary, residence. In the very early church, the parish was the entire body of Christians in a city under the bishop, who stood in the same relationship to the Christians of the entire city as does the parish priest to the parish in modern times. In the 4th century, when Christianity in western Europe spread to the countryside, Christians in an important village were organized into a unit with their own priest under the jurisdiction of the bishop of the nearest city. The unit was called a parish.

In Anglo-Saxon England the first parish churches were founded in important administrative centres. They were called minsters, and subsequently old minsters, to distinguish them from the later village churches. When the Church of England became independent of Rome during the 16th century, it retained the parish as the basic unit of the church.

The parish system in Europe was essentially created between the 8th and 12th centuries. The Council of Trent (1545–63) reorganized and reformed the parish system of the Roman Catholic Church to make it more responsive to the needs of the people.

In civil government the parish is the lowest unit of government in England. In the United States, Louisiana is divided into parishes, the equivalent of counties in other states.

Parisien Libéré, Le (French: "The Free Parisian"), morning daily newspaper published in Paris, one of the largest and most influential in France. It was established in Paris in 1944 as an organ of the French underground during the latter part of the German occupation in World War II. The paper used a sensational makeup style with numerous headlines and photos on its front page and with the text of news articles often confined to inside pages.

After the war *Le Parisien Libéré* successfully competed with the welter of new dailies and by the 1960s, it had the second largest circulation in France. Faced with union difficulties and mounting costs, the paper's owner, Emilien Amaury, in 1975 moved the printing operations of *Le Parisien Libéré* to Saint-Ouen and Chartres. The union problems were settled in 1977, but the readership of *Le Parisien Libéré* had dropped somewhat. By the mid-1980s it had recovered.

parity, in economics, equality in price, rate of exchange, purchasing power, and wages.

In international exchange, parity refers to the exchange rate between the currencies of two countries making the purchasing power of both currencies substantially equal. Theoretically, exchange rates of currencies can be set at a parity or par level and adjusted to maintain parity as economic conditions change. The adjustments can be made in the marketplace, by price changes, as conditions of supply and demand change. These kinds of adjustment occur naturally if the exchange rates are allowed to fluctuate freely or within wide ranges. If, however, the exchange rates are stabilized or set arbitrarily (as by the Bretton Woods Conference of 1944) or are set within a narrow range, the par rates can be maintained by intervention of national governments or international agencies (*e.g.*, the International Monetary Fund).

In U.S. agricultural economics, the term parity is used for a system of regulating the prices of farm commodities, usually by government price supports and production quotas, in order to provide farmers with the same purchasing power that they had in a selected base period. For most farm commodities the base period has been 1910–14. For example, the average price received per bushel of wheat during 1910–14 was 88 cents; if the prices paid by farmers for other goods quadrupled, the parity price for wheat would be $3.52 per bushel.

Parity is also used in personnel administration in establishing equitable wage schedules between certain classes of employees. A parity ratio may be set, for instance, between the salaries of policemen and the salaries of firemen.

parity, in physics, property important in the quantum-mechanical description of a physical system. In most cases, it relates to the symmetry of the wave function representing a system of fundamental particles. A parity transformation replaces such a system with its mirror image. Stated mathematically, the spatial coordinates describing the system are inverted through the point at the origin; that is, the coordinates x, y, and z are replaced with $-x$, $-y$, and $-z$. In general, if a system is identical to the original system after a parity transformation, the system is said to have even parity. If the final formulation is the negative of the original, its parity is odd. For either parity the physical observables, which depend on the square of the wave function, are unchanged. A complex system has an overall parity that is the product of the parities of its components.

Until 1956 it was assumed that, when an isolated system of fundamental particles interacts, the overall parity remained the same, or was conserved. This conservation of parity implied that, for fundamental physical interactions, it is impossible to distinguish right from left and clockwise from counterclockwise. The laws of physics, it was thought, are indifferent to mirror reflection and could never predict a change in parity of a system. This law of the conservation of parity was explicitly formulated in the early 1930s by the Hungarian-born physicist Eugene P. Wigner and became an intrinsic part of quantum mechanics.

In 1956 the Chinese-born physicists Tsung-Dao Lee and Chen Ning Yang proposed that parity is not always conserved. For subatomic particles, three basic interactions are important: electromagnetic, strong, and weak. Lee and Yang showed that the evidence for parity conservation applies only to the first two interactions and not to the weak interaction. The fundamental laws governing weak interactions should not be indifferent to mirror reflection, and, therefore, weak interactions should show some measure of built-in right- or left-handedness that might be experimentally detectable. The following year (1957) it was conclusively proven that the electrons ejected along with antineutrinos from certain unstable cobalt nuclei in the process of beta decay, a weak interaction, are predominantly left-handed. The spin vector of these electrons is opposite to their direction of travel; that is, their spin rotation is that of a left-handed screw. Nevertheless, it is believed, because of strong theoretical grounds (*i.e.*, the CPT theorem), that, when the operation of parity reversal P is joined with two others, called charge conjugation C and time reversal T, the combined operation does leave the fundamental laws unchanged.

park, large area of ground set aside for recreation. The earliest parks were those of the Persian kings who dedicated many square miles to the sport of hunting; by natural progression such reserves became artificially shaped by the creation of riding paths and shelters until the decorative possibilities became an inherent part of their character. A second type of park derived from such open-air public meeting places as that in ancient Athens, where the functions of an exercising ground, a social concourse, and an athletes' training ground were combined with elements of a sculpture gallery and religious centre.

In the parks of post-Renaissance times there were extensive woods, rectilinear *allées* stretching between one vantage point and another, raised galleries, and, in many cases, elaborate aviaries and cages for wild beasts, attesting to the hunting proclivities of the lords. Later the concept of the public park was somewhat domesticated. An area devoted simply to green landscape, a salubrious and healthful breathing space as a relief from the densely populated and industrialized city of the mid-19th century, became of vital importance. Examples of this type park are Birkenhead park in England (1844) by Sir Joseph Paxton; Jean Charles Alphand's Bois de Boulogne, outside Paris; Central Park in New York City by F.L. Olmsted and C. Vaux; Friedrich-Wilhelms-garten in Germany; the Botanic Gardens in Melbourne, Australia; and Akashi Park in Kōbe, Japan. The design was generally romantic in character. The primary purpose was to provide for passive recreation—walking and taking the air in agreeable and natural surroundings reminiscent of the unspoiled country.

What primarily differentiates modern parks is their accommondation for active recreation. Park areas differ greatly from country to country, and their designs reflect differences in climate, cultural attitudes, social habits, and pastimes. In the gardens of the Generalife, a Spanish family may enjoy its holiday outing in a shaded *bosque* near a cool fountain. On an evening in Venice a procession with banners and torches may sweep into one of the little piazzas. In the Buttes-Chaumont in Paris children reach out from wooden horses on the merry-go-round to spear a brass ring. During the bright summer weekends in Stockholm, residents cultivate vegetables in allotment gardens leased to them by the park department. In Israel, Iran, and Pakistan, basketball, soccer, and kabadei (a game like rugby) are played in parks; in Japan, volleyball, tennis, and sumō (wrestling) may be seen. Almost universally, there is recognition of the creative possibilities of leisure and of community responsibility to provide space and facilities for recreation.

The facilities include outdoor theatres, zoos, concert shells, historical exhibits, concessions for dining and dancing, amusement areas, boating, and areas for sports of all kinds, such as fly-casting pools and skating rinks. There is always the danger that the original reason for creating the park—*i.e.,* to bring a part of nature within reach of the city dweller—will be sacrificed to its specific recreational functions. It is difficult to keep the balance, as the tempo of urban life is mounting and with it the requirements for intensive use.

Another danger to the public park is the automobile. With the tremendous growth in automobile traffic and, consequently, increasing pressure from traffic authorities for more land, there has been hardly a major city that has not lost sections of its parks to highways. There has been a growing awareness, particularly in Europe, that large-scale urban planning should be carried out in such a way that traffic functions are clearly separate and do not encroach on other spheres. In the United States, there have been victories for the park user against the automobile; in San Francisco, the state freeway was halted at the city limits, and in New York City, Washington Square was closed to traffic.

It is unfortunate that the word park has come to connote almost exclusively the "romantic" style park or English garden of the 19th century. In truth, there are other traditions whose influence has been equally vital. How different from the Parisian Buttes-Chaumont, for instance, are the Tuileries across the river. These were laid out under the supervision of Marie de Médicis in the style of the Boboli Gardens in Florence. Versailles, the Belvedere Park in Vienna, the Vatican Gardens in Rome, Hellbrun in Salzburg, Blenheim in England, Drottningsholm in Sweden, and Peterhof in the U.S.S.R. are all parks that were planned in the Italian Baroque tradition. They were not intended to be a foil or escape from the oppressive city but rather to be its central dramatic focus—a display for the opulence of rulers, a piazza for the moving of great crowds, from the tournament and guild ceremonies of Florence in the 17th century to the formal pageantry of the court. It was in the Baroque park that the handling, control, and stimulation of crowds in the open air developed as one of the great arts of the urban designer.

Another park tradition that has had worldwide influence is that of Islām. In Teheran, Marrakech, Seville, Lahore, and Delhi, this tradition is the dominant one and, as with all parks developed according to the climate, social custom, and religious ethos. The original Muslim idea was to think of the garden as a paradise, a symbol of the afterlife as an oasis of beauty blooming in the earthly desert. Water and the cypress are the two main elements. Within the park, then, is water, the symbol of purity, in the four-way river of paradise, and trees (above all the cypress, symbolizing life), surrounded by high walls to keep out the dry wind. Everywhere, in keeping with Muslim belief, the design pattern is abstract rather than figurative. The fundamental idea creates its own specific technical skills; nowhere is there more artful use of irrigation for plants, of jets of water to cool the air, of orchards for shade, of colour to break up the sun's glare, or of the use of masonry patterns than in these Islāmic gardens.

The Taj Mahal in India dates from the 17th century, when by the testament of Shah Jahan this area of 20 acres was to be maintained as a public grounds in perpetuity, where the poor could walk and pick fruit. In China and Japan a similar opening of the royal precinct for public enjoyment, as with the Winter Palace or the Katsura Imperial Villa Gardens in Kyōto, has been a more recent development. The great religious shrines, however, have always resembled Western parks. The Horimonji temple in Tokyo, the Mimeguri shrine, the great Buddhist temple at Ise, and the Inner (Shintō) shrine, at Mieshima are examples of an age-old garden tradition in which man is but "one of a thousand things" and where nature is presented in an idealized and symbolic way as an object for contemplation and spiritual enjoyment. In their techniques of horticulture and in their use of stones, water, and surface textures, the gardens of the Far East are of a high level. This Eastern tradition had its effect on European park design in the 18th century and again in the 20th century, as in the grounds for the UNESCO building in Paris, designed by Isamu Noguchi. Park, Mungo (b. Sept. 10, 1771, Fowlshiels, Selkirk, Scot.—d. *c.* January 1806, near Bussa on the Niger River), Scottish explorer of the Niger.

Educated as a surgeon at the University of Edinburgh, Park was appointed a medical officer in 1792 on a vessel engaged in the East Indies trade. His subsequent studies of the plant and animal life of Sumatra won for him the backing of the African Association to explore the true course of the Niger. Beginning his exploration at the mouth of the Gambia River on June 21, 1795, Park ascended that river for 200 miles to Pisania (now Karantaba, The Gambia), a British trading station. Hampered by fever and formidable hardships, he crossed the unknown territory of the upper Sénégal Basin. He was imprisoned by an Arab chief for four months but escaped on July 1, 1796, to continue his journey with little more than a horse and a compass. On July 20 he reached Ségou (now in Mali) on the Niger, which he followed downstream for 80 miles to Silla. Finally forced to turn back for lack of supplies, Park, travelling on foot, took a more southerly route on his return. After traversing mountainous country, he arrived at Kamalia in Mandingo country, where he lay dangerously ill with fever for seven months. With the assistance of a slave trader, he reached Pisania on June 10, 1797. He returned to Britain to write an account of his adventures, *Travels in the Interior Districts of Africa* (1797), which became a popular success and made him famous.

Two years later Park married and practiced medicine in Peebles, Peeblesshire, until asked by the government to head a second expedition to the Niger. Commissioned a captain, he led a party of 40 Europeans to Pisania and, on Aug. 19, 1805, with only 11 survivors, reached Bamako (now in Mali) on the Niger. Resuming the journey by canoe, he and his companions reached Ségou, where the local ruler gave him permission to continue his voyage down the unexplored river. Hoping to reach the coast at the end of January 1806, he set sail with eight companions from Sansanding, a little below Ségou, on Nov. 19, 1805. Reports that the expedition had met with disaster soon reached the settlements on the

Gambia. In 1812 it was learned that when the explorers reached the rapids at Bussa, about 1,000 miles below Sansanding, they were attacked by natives, and Park was drowned.

Park, Orlando (b. Oct. 13, 1901, Elizabethtown, Ky., U.S.—d. Sept. 23, 1969, Evanston, Ill.), U.S. entomologist known chiefly for his work on the biology and taxonomy of insects comprising the family Pselaphidae, a group of small, short-winged, mold beetles that commonly live in ant nests.

Several years after acquiring his Ph.D. at the University of Chicago, Park joined the faculty of Northwestern University, Evanston, Ill., from which he ultimately retired (1968) as chairman of the biology department. During his years in Evanston, Park also served as a research associate at the Chicago Natural History Museum (1955–69), where developed one of the world's finest collections of pselapid beetles.

Prior to his entomological investigations, Park had devoted much effort to animal ecology, the study of the interrelationships of organisms with their environment and the interactions between individuals within a population and between individuals of different populations. His books *A Laboratory Introduction to Animal Ecology and Taxonomy* (1939) and *Principles of Animal Ecology* (1949) helped to establish some of the basic principles and methods of this field of biology.

Park, Robert E(zra) (b. Feb. 14, 1864, Harveyville, Pa., U.S.—d. Feb. 7, 1944, Nashville, Tenn.), sociologist noted for his work on ethnic minority groups, particularly the U.S. black population, and on human ecology, a term he is sometimes credited with having

coined. He was one of the leading figures in what came to be known as the "Chicago school" of sociology.

Park studied under the philosophers John Dewey (at the University of Michigan), William James and Josiah Royce (both at Harvard), and the sociologist Georg Simmel (in Germany). All his graduate work was done after 11 years' experience as a newspaper reporter in various large cities, where his interest in social problems was stimulated. He taught at Harvard (1904–05), the University of Chicago (1914–33), and Fisk University, Nashville, Tenn. (1936–43).

In 1906 Park wrote two magazine articles about the oppression of the Congolese by Belgian colonial administrators. Turning to the study of the black population in his own country, he became secretary to Booker T. Washington and is said to have written most of Washington's book *The Man Farthest Down* (1912). He believed that a caste system produced by sharp ethnic differences tends, because of the division of labour among the castes, to change into a structure of economic classes.

With Ernest W. Burgess, Park wrote a standard text, *Introduction to the Science of Sociology* (1921). In *The Immigrant Press and Its Control* (1922), Park argued that foreign-language newspapers in the long run would promote assimilation of immigrants. Three volumes of his *Collected Papers*, edited by Everett C. Hughes and others, were published between 1950 and 1955. The second volume deals with the city and also with human ecology, which was the title of a course taught by Park at the University of Chicago in 1926.

Park, Thomas (b. Nov. 17, 1908, Danville, Ill., U.S.), U.S. animal ecologist known for his experiments with beetles in analyzing population dynamics.

After earning a Ph.D. from the University of Chicago in 1932, Park taught at Johns Hopkins University, Baltimore, and at the University of Chicago. He wrote, with others, *Principles of Animal Ecology* (1949), which applied principles first formulated in studies of plant ecology to animal relationships in an evolutionary perspective. He was president of the American Association for the Advancement of Science in 1961, and he received the

Eminent Ecologist Citation from the Ecological Society of America in 1971.

Using two species of flour beetles, *Tribolium confusum* and *T. castaneum,* Park studied the efforts of competition caused by overcrowding. By analyzing birth and death rates, he found that in any mixed population one of the species always declined in numbers and became extinct, while the other increased in numbers in a characteristic percentage of tests. Overcrowding always led to a decrease in the a birth rate of the less fit species with an increase in disease, malformations, and death rate. Some scientists think that the implications of Park's experiments on insects may be applied to human populations as well.

Park Chung Hee (b. Sept. 30, or Nov. 14, 1917, region of Taegu, Korea—d. Oct. 26, 1979, Seoul), South Korean general and politician, president of the Republic of Korea (South Korea) from 1963 to his death, whose 18-year rule brought about enormous economic expansion at the cost of civil liberties and political freedom.

Born into an impoverished rural family, Park graduated (1937) with top honours from Taegu Normal School, after which he taught primary school. After attending a Japanese military academy, Park served as a second lieutenant in the Japanese army during World War II and became an officer in the Korean army when Korea was freed from Japanese rule after the war. In 1948 Park was sentenced to death for taking part in a revolt of junior officers who did not want to see Korea arbitrarily divided by the Allies. After turning prosecution witness and implicating the other officers as communists, Park was pardoned and restored to rank.

He was made a brigadier general (1953) during the Korean War and was promoted to general in 1961. In the same year, he led a bloodless coup (May 16) that overthrew the Second Republic. He remained the leader of the junta until two years later, when he won the first of his three terms as president of the Third Republic.

At home Park maintained a policy of guided democracy; in foreign affairs he continued his predecessors' close relations with the United States. Park was responsible in large part for South Korea's economic miracle; the programs he initiated gave his country one of the fastest-growing economies in the world, showing the best growth of any developing nation. His regime achieved a remarkable economic growth (more than 10 percent per year), transforming an impoverished, largely rural society into an industrial nation with exports of naval vessels, textiles, automobiles, and television sets. He brought electricity and piped water throughout South Korea.

Democracy, however, was curtailed, with restrictions on personal freedoms, suppression of the press and opposition parties, and control over the judicial system and the universities. He organized and expanded the dreaded Korean Central Intelligence Agency (KCIA), claiming that all his measures were necessary to fight communism. The last free election was in 1971, when Park narrowly beat his opponent, Kim Dae Jung. On Oct. 17, 1972, Park declared martial law, and one month later a new constitution was approved that gave him sweeping powers, including the right to appoint one-third of the members of the National Assembly. He grew increasingly harsh toward political dissidents. After Park's dismissal (1979) of a popular opposition leader from the National Assembly, Korea erupted with the worst riots and demonstrations since 1964, when Park established diplomatic relations with Japan. Park was assassinated—after two earlier, unsuccessful attempts, including one (1974) in which his wife was killed—by his life-long friend Kim Jae Kyu, the head of the KCIA.

Park Forest, village, Cook county, northeastern Illinois, U.S., southern residential suburb of Chicago. Developed after World War II, it attracted widespread interest because its planners assumed responsibility for all phases of community development. It was designed by Elbert Peets for American Community Builders, Inc., primarily for middle-income families, to include rental and privately owned dwellings as well as schools, churches, shopping centres, municipal services, and an industrial park. Park Forest was incorporated in 1949 and received national attention when William H. Whyte, Jr., wrote a series of articles (published 1956 as *The Organization Man*) about the manners, morals, and home life of young executives, based on research done in that community. Governor's State University was established (1969) in adjacent Park Forest South. Pop. (1988 est.) 25,832.

Park Range, segment of the Rocky Mountains, extending south-southeastward for about 200 miles (320 km) from Carbon county, Wyo., to northwestern Park county, Colo., U.S. The range lies largely within Medicine Bow, Pike, Arapaho, Routt, and White River national forests and includes the Mosquito (Colorado), Gore (Colorado), and Sierra Madre (Wyoming) subranges. Many peaks surpass 14,000 feet (4,300 m), with Mount Lincoln (14,286 feet [4,354 m]) the highest point. Major highways cut through Vail (10,603 feet [3,232 m]) and Rabbit Ears (9,426 feet [2,873 m]) passes, leading to popular winter-sports areas. The headstreams of the North and South Platte rivers rise in the range.

Park Ridge, city, Cook county, northeastern Illinois, U.S., northwestern suburb of Chicago. Founded in 1856 as Pennyville (later called Brickton), it developed as a residential community after the arrival of the Chicago and North Western Railway (1856). It was renamed (1873) in the belief that it included the highest ridge in the county. Park Ridge is known for its special educational facilities, including Park Ridge Youth Campus (1877; originally Park Ridge School for Girls, established for unwed pregnant girls). O'Hare International Airport is nearby. Inc. village, 1873; city, 1910. Pop. (1988 est.) 37,229.

Parker, Alton B(rooks) (b. May 14, 1852, Cortland, N.Y., U.S.—d. May 10, 1926, New York City), American jurist and Democratic presidential nominee in 1904, defeated by the incumbent, Theodore Roosevelt.

Having practiced law in Kingston, N.Y., Parker was elected surrogate of Ulster county in 1877 and reelected six years later. He also was active in state Democratic Party affairs. He was appointed to the New York Supreme Court in 1885, the state Appeals Court in 1889, and the appellate division of the state Supreme Court in 1896. From 1898 to 1904 Parker was chief justice of the New York Court of Appeals. On the bench, he was noted for upholding the rights of labour. Nominated on the first ballot at the Democratic convention in 1904, Parker, representing the Eastern, pro-gold-standard wing of the party, differed little from his opponent, President Theodore Roosevelt. Parker was soundly defeated, taking only 38 percent of the popular vote and winning 140 electoral votes to Roosevelt's 336. Thereafter he practiced law.

Parker, Charlie, byname of CHARLES CHRISTOPHER PARKER, JR., also called BIRD, or YARDBIRD (b. Aug. 29, 1920, Kansas City, Kan., U.S.—d. March 12, 1955, New York City), American alto saxophonist, composer, and bandleader who is considered by many to have been the greatest improviser in jazz history and the father of the modern jazz style known as bebop. His first recordings with trumpeter Dizzy Gillespie during the mid-1940s set the pace for the jazz of the next two decades.

Parker's style began with the advanced swing-era approaches of Buster Smith and Lester Young, heard by him during the 1930s in Kansas City, Mo. In 1939 Parker moved to New York City, playing at Monroe's Uptown House on 52nd Street. After playing in the Earl Hines and Billy Eckstine bands with Dizzy Gillespie, Parker and Gillespie left to front their own quintet in 1945. The Dial and Savoy recordings of the late 1940s contain the definitive examples of Parker's playing, including such tunes as "Now's the Time," "Billie's Bounce," and "KoKo."

Parker absorbed a wide range of musical influences, including Afro-American folk forms as well as 20th-century concert music. His favourite musical phrases became the vocabulary of, and eventually provided the melodic clichés for, modern jazz improvisers. More than 20 years after his death, new recordings of such tunes of his as "Confirmation," "Donna Lee," "Scrapple from the Apple," and "Ornithology" were still being made. His music became the subject of scholarly treatises and was taught within the college jazz curriculum much as the work of J.S. Bach is taught to conservatory students. Most influential innovators who followed him had at least some of their roots in his style; saxophonists Sonny Rollins, John Coltrane, and Ornette Coleman all showed some Parker influence in their earliest recordings.

Parker made common the use of quick tempos and the practice of adding and implying extra chords within existing chord progressions. His phrasings employed unique hesitations and abrupt endings. Though many of his followers insisted on double-timing their solos as he had, none showed his exuberance or the imagination that moved the spontaneous embellishments with which he decorated his own lines, nor did they show Parker's technical mastery of his instrument.

Parker, Dorothy (b. Aug. 22, 1893, West End, N.J., U.S.—d. June 7, 1967, New York City), American short-story writer and poet chiefly known for her witty remarks.

Parker grew up in New York City, where—after graduation from Miss Dana's School in Morristown, N.J.—she became drama critic for the magazine *Vanity Fair.* She and two other writers for the magazine—Robert Benchley, the humorist, and Robert Sherwood, then a drama critic and later to become a playwright—formed the nucleus of the Algonquin Round Table, an informal luncheon club held at New York's Algonquin Hotel.

Discharged from *Vanity Fair* in 1920 for the acerbity of her drama reviews (she wrote, for example, of the young Katherine Hepburn that she "ran the gamut of emotions from A to B"), she became a free-lance writer. She initiated a personal kind of book reviewing in *The New Yorker* magazine as "Constant Reader." Starting in 1927 and appearing intermittently until 1933, some of these reviews have been collected in *A Month of Saturdays* (1971). Her first volume of verse, *Enough Rope*, was a best-seller when it appeared in 1926. Two other books of verse, *Sunset Gun* (1928) and *Death and Taxes* (1931), were collected with it in *Collected Poems: Not So Deep as a Well* (1936).

In 1929 she won the O. Henry Award for the best short story of the year with "Big Blonde," a compassionate account of an aging party girl. *Laments for the Living* (1930) and *After Such Pleasures* (1933) were collections of her short stories, combined and augmented in 1939 as *Here Lies.* Characteristic of both the stories and verses is a view of the human situation as simultaneously tragic and funny.

In 1933 she and her second husband, Alan Campbell, went to Hollywood to collaborate as film writers, receiving screen credits for more than 15 films, including *A Star Is Born,* nominated for an Academy Award. She became active in left-wing politics, disdained her former role as a smart woman about town, reported from the Spanish Civil War, and discovered that her beliefs counted against her employment by the studios in the fervour of anticommunism that seized Hollywood after World War II. She wrote book reviews for *Esquire* magazine and collaborated on two plays: *The Coast of Illyria* (first performance 1949), about the English essayist Charles Lamb, performed briefly in Dallas, Texas, and London; and *The Ladies of the Corridor* (1953), about lonely widows in side-street New York hotels, which had a short run on Broadway. An earlier play, *Close Harmony,* written with Elmer Rice, also had a short New York run in 1924.

Parker's witty remarks remain popular. When told of former U.S. president Calvin Coolidge's death, she is said to have asked, "How can they tell?" She also is responsible for the couplet "Men seldom make passes / at girls who wear glasses."

Parker, Francis (Wayland) (b. Oct. 9, 1837, Bedford, N.H., U.S.—d. March 2, 1902, Chicago), a founder of progressive elementary education in the United States and organizer of the first parent-teacher group at Chicago.

At age 16 he began to teach and five years later became school principal at Carrollton, Ill. (1858). He was commissioned a lieutenant in the Union Army (1861) and rose to the rank of lieutenant colonel. Teaching in various places after the American Civil War, Parker experimented with teaching methods in an attempt to change the rigid formalism prevalent in American schools. In 1872 he went to Germany to study educational methods pioneered by Johann F. Herbart and others.

Returning to the United States (1875), he became school superintendent for Quincy, Mass. He brought science, arts, and crafts into the curriculum and advocated pupil self-expression, socialized activity, and a humanized, informal instruction stressing children's individuality. Children learned the alphabet by reading simple words, rather than by memorization; arithmetic by manipulating objects, rather than by dealing with abstractions; and geography by taking field trips.

After serving as supervisor of the Boston school system (1880–83), Parker was appointed principal of the Cook County Normal School at Chicago, which became noted for its liberalizing influence on American education. In 1899 an endowment made it pos-

sible for him to establish a private normal school, the Chicago Institute, which two years later became associated with the University of Chicago on his becoming the first director of the University's School of Education.

Parker, Sir (Horatio) Gilbert, BARONET (b. Nov. 23, 1862, Camden East, Ont., Can.—d. Sept. 6, 1932, London), British novelist of popular adventure and historical romances whose most widely known work was *The Seats of the Mighty* (1896), a novel of the 17th-century conquest of Quebec.

From 1885 to 1889 Parker traveled widely in Australia and the South Seas, after which he settled in London and began writing his spirited stories and novels, in which he skillfully combined energetic action, vivid characterizations, and rich local colour with accuracy of historical detail. In politics Parker became a prominent imperialist and was a member of Parliament from 1900 to 1918. He was knighted in 1902, made a baronet in 1915, and a privy councillor in 1916. (His marriage resulted in no issue, and the baronetcy became extinct upon his death.)

Parker, Horatio (William) (b. Sept. 15, 1863, Auburndale, Mass., U.S.—d. Dec. 18, 1919, Cedarhurst, N.Y.), composer, conductor, and teacher, prominent member of the turn-of-the-century Boston school of U.S. composers. Parker studied in Boston and Munich. Returning to New York, he taught at the National Conservatory of Music, then directed by Antonin Dvořák. In 1894 he became professor of music at Yale, where he was active in choral conducting. He also founded the New Haven Symphony Orchestra.

Parker's principal compositions are his choral works, which include his masterpiece, the oratorio *Hora Novissima* (1893); the ode *Hymnos Andron;* and the morality *The Dream of Mary.* He also wrote two operas, *Mona* (1912) and *The Fairyland* (1915), as well as organ works, piano pieces, chamber music, orchestral works, and a book, *Music and Public Entertainment* (1911).

Parker, Matthew (b. Aug. 6, 1504, Norwich, Norfolk, Eng.—d. May 17, 1575, Lambeth, London), Anglican archbishop of Canterbury (consecrated 1559) and moderate Reformer under Queen Elizabeth I, who carried out a religious settlement in which the Church of England maintained a distinct identity apart from Roman Catholicism and Protestantism, thus alienating the Puritans, who sought complete integration with the Protestant Reformation. Parker supervised the formulation of the Thirty-nine Articles (the Anglican summation of doctrine), initiated liturgical reforms, and wrote several scholarly treatises on English church history.

Parker, Quanah (b. 1845?, near Wichita Falls, Texas, U.S.—d. Feb. 23, 1911, near Fort Sill, Okla.), aggressive Comanche leader who mounted an unsuccessful war against white invaders in southeast Texas (1874–75); he later became the main spokesman and peacetime leader of the Indians in that area, a role he performed for 30 years.

Quanah was the son of Chief Peta Nocone and Cynthia Ann Parker, a white woman captured by the Comanches as a child. Quanah added his mother's surname to his own. He was a member of the fierce Kwahadi band—particularly bitter enemies of the buffalo hunters who had appropriated their best land on the Texas frontier. In order to stem the onslaught of Comanche attacks on settlers and travelers, the U.S. government assigned the Indians to reservations in 1867. Parker and his band, however, refused to cooperate and continued their raids. In June 1874 Parker gathered some 700 warriors from among the Comanche, Cheyenne, and Kiowa and attacked about 30 white buffalo hunters quartered at Adobe Walls, Texas. The U.S. military retaliated in force, but Parker's group held out on the Staked Plains for almost a year before he finally surrendered at Fort Sill.

Eventually agreeing to settle on the reservation in southwestern Oklahoma, Parker persuaded other Comanche bands to conform. During the next three decades he was the main interpreter of white civilization to his people, encouraging education and agriculture and becoming a successful businessman while maintaining his own Indian culture.

Parker, Robert LeRoy: *see* Cassidy, Butch.

Parker, Theodore (b. Aug. 24, 1810, Lexington, Mass., U.S.—d. May 10, 1860, Florence), U.S. Unitarian theologian, pastor, scholar, and social reformer active in the anti-slavery movement. Theologically, he repudiated much traditional Christian dogma, putting in its place an intuitive knowledge of God derived from man's experience of nature and insight into his own mind. He resembled Ralph Waldo Emerson and other New England Transcendentalists in his emphasis on intuition but differed in the way he tempered his romanticism with rationalist and scientific interest.

Although Parker passed the entrance examination for Harvard College in 1830, he had no funds to attend. He was allowed, however, to take the examinations for his course of study without enrolling and was granted an honorary degree. He then attended Harvard Divinity School, from which he graduated in 1836. The next year he was ordained pastor of the Unitarian Church in West Roxbury, Mass.

By 1841 he had formulated his liberal religious views and had incorporated them in the sermon "The Transient and Permanent in Christianity." The transient, to him, was Christianity's theological and scriptural dogma, and the permanent was its moral truths. He elaborated his views in lectures published as *A Discourse of Matters Pertaining to Religion.* Opposition to his liberalism increased, and he soon resigned his pastorate. His supporters founded the 28th Congregational Society of Boston and installed him as minister.

Believing that the moral truths of Christianity had application to contemporary social problems, Parker worked for prison reform, temperance, women's education, and other such causes. He made impassioned speeches against slavery, helped fugitive slaves to escape, and wrote an Abolitionist tract, *A Letter to the People of the United States Touching the Matter of Slavery* (1848). He also served on the secret committee that aided the Abolitionist John Brown.

Parkersburg, city, seat (1801) of Wood County, western West Virginia, U.S., at the confluence of the Ohio (there bridged to Belpre, Ohio) and Little Kanawha rivers. Settled *c.* 1785 as Neal's Station on a land tract originally purchased by Alexander Parker of Pittsburgh, it was first chartered by Virginia in 1820 and rechartered by West Virginia in 1863. The discovery in the 1890s of the nearby Burning Springs oil field stimulated industrial growth. Manufactures are well diversified and include oil-well equipment, glass and porcelain products, rayon, shovels, steel castings, and chemicals. The city is also an agricultural-marketing centre. Mountain State (Business) College (1868), Ohio Valley College (1960), and Parkersburg Community College (1971) are in the city. Blennerhassett Island in the Ohio River, 2 mi (3 km) south, was the home of Harman Blennerhassett, a wealthy Irishman who supposedly plotted with Aaron Burr to seize the Southwest and set up an empire; their plot was discovered in 1806, but both were acquitted of treason. Inc. city, 1911. Pop. (1950) 29,684; (1970) 44,208; (1980) 39,967.

Parkes, town, east central New South Wales, Australia, in the Lachlan River Valley. Originally known as Bushman's, it was founded in 1862 as a reef- and alluvial-gold centre, and it was renamed after Sir Henry Parkes, a state premier, in 1873. Proclaimed a municipality in 1883, it is a commercial centre for a sheep-, grain-, fruit-, pig-, and poultry-farming area of the Western Slopes region, it is a rail junction on the Newell Highway, with air connections to Sydney (185 mi [298 km] southeast). Industries include iron foundries, steel fabrication works, sawmills, joineries, rail workshops, and agricultural machinery plants. One of the world's largest (210 ft [64 m]) bowl-shaped radio telescopes, operated by the Commonwealth Scientific and Industrial Research Organization, is at Alectown (15 mi north). Pop. (1981) 9,047.

Parkes, Alexander (b. Dec. 29, 1813, Birmingham, Warwickshire, Eng.—d. June 29, 1890, West Dulwich, near London), British chemist and inventor noted for his development of various industrial processes and materials. Much of Parkes's work was related to metallurgy. He was one of the first to propose introducing small amounts of phosphorous into metal alloys to enhance their strength. One of his most significant inventions was a method of extracting silver from lead (1850). This procedure, commonly called the Parkes process, involves adding zinc to lead and melting the two together. When stirred, the molten zinc reacts and forms compounds with silver as well as with any gold, copper, and nickel present in the lead. These zinc compounds are lighter than the lead and, on cooling, form a crust that can be readily removed.

Another of Parkes's important contributions was the discovery of the cold vulcanization process (1841), a method of waterproofing fabrics by means of a solution of rubber and carbon disulfide. Parkes also produced a flexible, durable material called Parkesine (*c.* 1855) from a mixture of chloroform and castor oil that led to the development of the first plastic, celluloid (*q.v.*).

Parkes, Frank Kobina, in full FRANCIS ERNEST KOBINA PARKES (b. 1932, Korle Bu, Gold Coast), journalist, broadcaster, and widely anthologized poet whose style and great confidence in the future of Africa owe much to the Senegalese poet David Diop.

Parkes was educated in Accra, Ghana, and Freetown, Sierra Leone. He worked briefly as a newspaper reporter and editor and in 1955 joined the staff of Radio Ghana as a broadcaster. He was president of the Ghana Society of Writers and published a volume of poems, *Songs from the Wilderness* (1965).

His poetry, a rhythmic free verse with much repetition of words and phrases, tends to romanticize and glorify all that is African, from the blackness of African skin to indigenous music, dancing, and ritual. He recalls his continent's past sufferings, exhorts the reader to do something about oppression of blacks that still exists (in South Africa, for example), and criticizes world powers for their concern with atomic weapons and the Moon landings rather than with human needs. He admonishes colonial administrators of the past for the legacy they have left behind them. A great faith, similar to Diop's, in the ability of Africans to bring about a glorious future through their own efforts is revealed.

From the early 1970s Parkes worked for the Ministry of Information in Acara. Although a number of his poems have been collected in anthologies of African and Ghanian poetry—most notably *Messages* (1971) and *Katchikali* (1971)—*Songs from the Wilderness* is Parkes's only published volume of poetry.

Parkes, Sir Henry (b. May 27, 1815, Stoneleigh, Warwickshire, Eng.—d. April 27, 1896, Sydney), a dominant political figure in Australia during the second half of the 19th century, often called the father of Australian federation. He served five terms as premier of New South Wales between 1872 and 1891.

Parkes became politically prominent in 1849 as a spokesman for ending transportation of convicts to Australia from England. The following year he launched the *Empire,* a newspaper he ran until 1858 and through which he campaigned for fully representative government. He first held public office in 1854 and served almost without interruption as a representative and often as a minister or premier until 1894.

Parkes's educational work resulted in the Public Schools Act of 1866 and the Public Instruction Act of 1880, which introduced compulsory free education and severed connections between the church and the public schools. In his ministries between 1872 and 1887 he established New South Wales as a free-trade colony. He was knighted in 1877. In his fourth administration (1887–89) he carried through measures to improve railways and public works and to limit Chinese immigration.

Parkes first spoke for federation in 1867 and later presided over the National Australasian Convention in 1891. He withdrew support from the resulting Commonwealth of Australia Bill, however, and federation was postponed until 1901. After the elections of 1891 Parkes lost his position of political leadership. His autobiography, *Fifty Years in the Making of Australian History,* appeared in 1892. *Henry Parkes: A Biography* by A. W. Martin was published in 1980.

Parkhurst, Helen (b. March 7, 1887, Durand, Wis., U.S.—d. June 1, 1973, New Milford, Conn.), U.S. educator, author and lecturer who devised the Dalton Laboratory Plan and founded the Dalton School.

Parkhurst was teaching in a one-room Wisconsin school at the age of 16, and she was graduated four years later from Wisconsin State Teachers College. After doing graduate work at Columbia University, she studied at the universities of Rome and Munich and with Maria Montessori. Much later (1943), she earned a master's degree in education at Yale.

She taught again briefly in Wisconsin, then moved to Tacoma, Wash. (1910–11), where she conceived what came to be the Dalton Plan. She returned to teach at Wisconsin Central State Teachers College (1912–14) and, after further work with Montessori, set up her own school in New York City in 1916.

She had developed an experimental plan for the high school in Dalton, Mass., and drew on it for her New York school, which she conducted on a contractual basis with her students. Pupils worked in "laboratory brigades" on specific assignments for which they contracted. There were no tests or examinations, and external discipline was minimal. As they worked on assignments, students submitted progress reports to teachers.

Parkhurst remained headmistress of New York's Dalton School until her retirement in 1942. Over the final three decades of her life she lectured throughout the world, wrote books, and produced radio and television shows for and about young people ("Child's World," "Know Your Child," "Children Should Be Heard," and "It's a Problem"). Her books included *Education on the Dalton Plan* (1922), *Work Rhythms in Education* (1935), *They Found Johnny* (1947), *Exploring the Child's World* (1951), and *Undertow* (1959).

Parkinson, C(yril) Northcote (b. July 30, 1909, Barnard Castle, Durham, Eng.), British historian, author, and formulator of "Parkinson's Law," the satirical dictum that "Work expands to fill the time available for its completion." A relatively obscure academic prior to the enunciation of his "law," which first appeared in an essay in the London *Economist* in 1955, Parkinson later devised a second law, "Expenditure rises to meet income," detailed in *The Law and the Profits* (1960).

After receiving a B.A. and M.A. from Cambridge University and a Ph.D. in history from Kings College, London, in 1935, Parkinson taught at various schools in England and, from 1950 to 1958, in Malaya. He based his comments regarding the nature of bureaucracy on his experiences as a British army staff officer during World War II. Administrators make work for each other, he said, so that they can multiply the number of their subordinates and enhance their prestige. His second law was intended as a jibe at government functionaries, who he thought were inclined to expand their own ranks indefinitely, so long as taxes could be raised. Written in a deadpan but mercilessly funny style, Parkinson's *Economist* essays were issued in book form in *Parkinson's Law, or The Pursuit of Progress* (1958).

Apart from the books that made him famous, Parkinson wrote numerous historical works, including the critically acclaimed *The Evolution of Political Thought* (1958). Interested in naval history since childhood, he also wrote several novels with maritime themes.

Parkinson's disease, also called SHAKING PALSY, PARALYSIS AGITANS, PARKINSON'S SYNDROME, or PARKINSONISM, a relatively common chronic movement disorder of the central nervous system that is marked by tremor and weakness of resting muscles, stooped posture, slow and shuffling gait accompanied by a sense of propulsion, and muscular rigidity of the trunk and limbs, with a notable fixity of facial expression. A distinction should be made between Parkinson's disease—a chronic disease of unknown origin, treatable but incurable—and forms of parkinsonism caused by other diseases or by drugs and which may be completely reversible.

The onset of Parkinson's disease usually occurs in late adult life, but it may begin as early as the third decade. The course is slowly progressive over 10 to 20 or more years. The first symptom may be the scuffing of one foot in walking, a sense of heaviness of a limb, or a gentle tremor of one hand; the other symptoms follow in slow procession. The handwriting becomes small, and this and other manual skills are gradually lost. Speech is poorly articulated, and swallowing and chewing are laborious. Locomotion becomes increasingly difficult, and ultimately the patient finds it an effort even to rise from bed or a chair or to walk; and there is a tendency to lose balance and to fall. In the advanced stages, the patient is greatly handicapped in all voluntary movements but usually is not paralyzed. An unexpected call for action may momentarily excite the patient to perform some movement with surprising facility. The senses and the intellect are not damaged, except with the usual aging process. There is a slight tendency for more than one member of a family to be affected, but a genetic link is not commonly accepted.

Parkinsonism is at least partially the result of the destruction of dopamine-producing cells in the substantia nigra in the midbrain. (Dopamine is a significant neurotransmitter.) Symptoms of the disease are alleviated by administration of L-dopa, the metabolic precursor of dopamine, although this treatment is not without undesirable side effects, such as vomiting, cardiac arrhythmias, and tics. One experimental treatment that reportedly produced striking results involved transplantation of tissue from the adrenal gland into the area of the brain that controls movement.

Parkman, Francis (b. Sept. 16, 1823, Boston—d. Nov. 8, 1893, Jamaica Plain, Mass., U.S.), American historian noted for his classic seven-volume history of *England and France in North America,* covering the colonial period from the beginnings to 1763.

Early years. Parkman was the son of Francis Parkman, a leading Unitarian minister of Boston. As a boy, he met many of his father's literary friends and read widely in the family library. He spent many summers at his grandparents' farm in nearby Medford, while during the rest of the year he was drilled in Greek, Latin, and mathematics at the Chauncy Place School, in Boston, in preparation for Harvard.

At college Parkman, a talented linguist, read almost as many books in foreign languages as in English, including the original texts of great historians of antiquity and Italian writers such as Niccolò Machiavelli. He also devoured the major works of French literature and history. In serious archival studies he was encouraged by his Harvard teacher, the renowned historian Jared Sparks. Sparks, a man drawn to adventure and exploration, exerted an enormous influence on an impressionable undergraduate such as Parkman.

Though teachers and books helped to shape Parkman's thinking in his formative years, he gathered data, as indicated by his letters and journals, through direct observation. During his college years he exhausted friends who struggled to keep pace with him on woodland expeditions through New England and southeastern Canada. Yet he did not neglect to participate in whiskey punch and Indian war cries that sometimes followed dormitory suppers. Pretty girls and horses, he concluded, were "the 'first-ratest' things in nature." After a breakdown in health during his last year in college, he made a grand tour of Europe in 1844. His particular interest in the Roman Catholic Church prompted him to observe it at close range, even to the extent of living for a short time in a monastery in Rome. In the following year, he toured historic sites in the northwest of America and, to please his father, completed requirements for a law degree at Harvard. In the summer of 1846 he embarked on a journey to the Great Plains in which he traveled a portion of the Oregon Trail to Fort Laramie.

Literary career. Parkman's literary career had its real beginning after he returned from the West. Despite temporary illness and partial loss of sight, he managed to write a series of Oregon Trail recollections for the *Knickerbocker Magazine.* Published in 1849 as *The California and Oregon Trail,* the book's title was misleading because Parkman had ventured nowhere near California. He keenly regretted the "publisher's trick" of the mention of California as a stimulus to better sales. The book, in later editions called *The Oregon Trail; Sketches of Prairie and Rocky-Mountain Life,* became one of the best-selling personal narratives of the 19th century.

The Oregon Trail served notice that a new writer, at home on the frontier as well as in staid, provincial Boston, had appeared. *History of the Conspiracy of Pontiac,* completed just before his marriage to Catherine Scollay Bigelow in 1851, was his first historical work, a comprehensive survey of Anglo-French history and Indian affairs in North America, culminating in the great Ottawa chief's "conspiracy" and Indian war of 1763. In the "dark years" of illness following the death of his young son (1857) and his wife (1858), Parkman entered a period of depression and semi-infirmity. His complaints of heart trouble, insomnia, painful headaches, semiblindness, water on the knee, and finally arthritis and rheumatism, which fill his correspondence, were probably the result of an underlying neurosis. By personalizing his illness and calling it the "enemy," Parkman seems to have forced himself to play the role of a man of action at the cost of great tension. His struggle against the "enemy" enabled him to maintain his self-respect and appears to be at least partly responsible for the powerful drive and creative force behind his writings.

By the time the American Civil War ended, Parkman had at least partly overcome his personal "enemy" of illness to complete his *Pioneers of France in the New World,* a vivid account of French penetration of the North American wilderness that created a setting for his later volumes. In the 27 years following the Civil War, Parkman (who had to content himself with writing militant, patriotic letters to the press during the conflict) completed his elaborate series by writing six more historical works in addition to the *Pioneers. The Jesuits in North America in the Seventeenth Century* (1867) is a powerful narrative of the tragedy of the Jesuit missionaries whose missions among the Hurons were destroyed by persistent Iroquois attacks, and his *La Salle and the Discovery of the Great West,* first published in 1869 as *The Discovery of the Great West* but later revised after French documents were made available, is in many respects one of the best one-volume biographies in the English language. La Salle, a hardy, gallant figure who overcame almost every obstacle in his path, was a heroic figure almost made for Parkman's pen. *Count Frontenac and New France Under Louis XIV* (1877) tells the story of New France, the early French settlement in Canada, under its most formidable governor, a man of vanity, courage, and audacity. Yet it was in *Montcalm and Wolfe* (1884)—a true biography of the French general Marquis de Montcalm and the English general James Wolfe, both of whom died at the Battle of Quebec in 1759—that Parkman not only reached his highest achievement in character portrayal but also showed how great biography can be used to penetrate the spirit of an age. By contrast, Parkman's *The Old Régime in Canada,* published in 1874, provides a sweeping panorama of New France in her infancy and youth, a pioneer work in social history that holds the interest of the reader no less than his narrative volumes. Parkman's literary artistry is perhaps best studied in his *Half-Century of Conflict,* completed shortly before his death. This final link in his history *England and France in North America* is a fascinating but complex account of events leading up to the French and Indian War.

Assessment. Parkman portrayed the Anglo-French and Indian wars as part of a struggle between contesting civilizations, in which the interior wilderness acted as a modifying force on rival colonial cultures. Perhaps Parkman's greatest achievement was his skill in recognizing the dramatic potentials in the raw materials of history, so that he could create a narrative both historically accurate and, as he said, "consistent with just historic proportion." When he wrote that his aim was "to get at the truth," he explained the lifelong search for factual data that underlies his entire work. Not all of his interpretations have been accepted unquestioningly, but Parkman's genius with the pen was such that his main figures—Frontenac, Montcalm, Wolfe, La Salle, and Pontiac—are not so much remembered today because of what they did but because Parkman made them the heroes of his history of Anglo-French rivalry in North America.

Parlement, the supreme court under the ancien régime in France. It developed out of the *curia regis* ("king's court") in which the early Capetian kings periodically convened their principal vassals and prelates to deliberate with them on feudal and political matters. It also dealt with the few legal cases submitted to the king as sovereign judge.

Throughout the 12th century and in the first decades of the 13th, the *curia regis* grew in importance, and professional advisers, *consiliarii,* were added to its membership. Meanwhile, by a slow process, the judicial sessions came to be differentiated from its meetings for other business; by the middle of Louis IX's reign (1226–70) these judicial sessions were being described as *curia regis in parlemento* ("speaking"), or Parlement. A system of appeal also grew up, with the Parlement hearing appeals against the judgments of *baillis* (representatives of the royal administration in the provinces); and cases concerning the royal towns were likewise decided by the Parlement. Furthermore, the expansion of the royal domain enlarged the competence of the *curia in parlemento,* which moreover could serve politically to strengthen the royal power by means of its *arrêts* (final decisions), since these expressed the king's law with incontestable authority.

Louis IX had his *curia in parlemento* installed in a special Chambre aux Plaids, or pleading chamber, on what is now the site of the modern Palais de Justice in Paris. The Grand Chambre, as the Chambre aux Plaids grew to be called, remained the core of Parlement, although other *chambres* grew up alongside it. Other *chambres* were the Chambre des Enquêtes (*q.v.;* inquiry) and the Chambre des Requêtes (*q.v.;* petitions), both instituted in the 14th century; the Chambre de la Tournelle (the criminal chamber), formally instituted in the 16th century, but in existence much earlier; and the Chambre de l'Édit (set up in the 16th century to deal with Huguenot affairs, but finally abolished in 1669).

Vacant seats in the Parlement in the later Middle Ages were supposed to be filled by election or co-optation; but from the 14th century members had resigned in favour of their sons or of someone willing to pay a specified price. In 1552 venality was formally recognized by the crown. Attempts to abolish it later in the century came to nothing; and in 1604 the "annual right," or *paulette* (devised by financier Charles Paulet), was established, enabling officeholders to ensure the hereditability of their offices by paying one-sixtieth of its purchase price every year. The office of premier president, heading Parlement, however, could be acquired only by a nominee of the crown.

Originally there was only one Parlement, that of Paris. Later others were created for the provinces, but the Parlement of Paris retained jurisdiction over nearly half of the kingdom.

The political pretensions of the Parlements were based on their registration of the king's edicts and letters patent. Before registering a measure, the Parlements examined it to see whether it conformed with the principles of law and justice and with the interests of the king and realm; if it did not, they withheld registration and addressed remonstrances to the king. If the king wished to force registration, he had to either send a *lettre de jussion,* ordering it, or come in person, to hold a *lit de justice,* at which his actual presence suspended any delegation of authority to his magistrates; but the right of remonstrance remained a counterbalancing influence in relation to the royal power.

During the 16th and early 17th centuries the Parlements took up a course of systematic opposition. Although this was restricted under Louis XIV, it was resumed in the 18th century. By that time opposition of the members was motivated, to a large extent, by anxiety to maintain their own privileges; but it served to focus more general feelings of political and social discontent. At the same time the Parlements were looked upon as a source of privilege and reaction and were swept away early in the French Revolution (1789).

Parléř, Petr (b. 1330, Swäbisch Gmünd, Württemberg—d. July 13, 1399, Prague), best known member of a famous German family of masons, his works exemplify the tendency toward profuse ornamentation and technical ostentation that are characteristic of late Gothic architecture.

At the age of 23 Parléř was called by King Charles IV of Bohemia to Prague to continue the cathedral church of St. Vitus. Seemingly influenced by English late Gothic style, he built complicated vaults with hanging bosses and ribs rising free through space; these vaults were the first real net vaults on the Continent. Parléř was also the first to use an even number of sides for the polygon of a choir (at Kuttenberg, Czech., in 1360). His sculptural work and vault innovations greatly influenced subsequent architecture.

Parliament (from Old French *parlement,* Latin *parliamentum*), the original legislative assembly of England, Scotland, or Ireland and successively of Great Britain and the United Kingdom; the national and provincial legislatures in some countries that were once British colonies are also known as Parliaments. The British Parliament consists of the sovereign, the House of Lords, and the House of Commons (*see* Lords, House of; Commons, House of).

Modern Parliaments have developed from the fusion, during the reign (1272–1307) of Edward I, of two English governmental institutions. One of these, sometimes described as a *colloquium,* was a meeting of the Magnum Concilium, or Great Council, comprising the lay and ecclesiastical magnates, summoned to treat with the king on the affairs of the realm. Often, in practice, they were asked to agree to the levying of specific taxes. The Norman Magnum Concilium, in feudal terms a gathering of the king's tenants in chief, was not greatly dissimilar from the old Anglo-Saxon Witan, a meeting of the king's wise men. The second, and newer, institution was the Curia Regis, the King's Court, or Council, a much smaller body of semiprofessional advisers; at those of its meetings that came to be called *concilium regis in parliamento* ("the king's council in parliament"), judicial problems might be settled that had proved beyond the scope of the ordinary law courts dating from the 12th century. Joint meetings of the two bodies were held at the king's discretion and were attended by those explicitly summoned.

Early in the 14th century the practice developed of conducting debates between the lords spiritual and temporal in one chamber, or "house," and between the knights and burgesses in another. Strictly speaking, there were, and still are, three houses: the king and his council, the lords spiritual and temporal, and the commons. But the Lancastrian kings were usually forced to take all their councillors from among the lords, and under the Tudors it became the practice to find seats among the Commons for privy councillors who were not lords. Meanwhile, the greater cohesion of the Privy Council achieved in the 14th century separated it in practice from Parliament; and the decline of Parliament's judicial function led to an increase in its legislative activity, originating now not only from royal initiative but by petitions, or "bills," framed by groups within Parliament itself. Bills, if assented to by the king, became acts of Parliament; eventually, under Henry VI, the assent of the Lords and Commons also became necessary. Under the Tudors, though it was still possible to make law by royal proclamation, the monarchs rarely resorted to such an unpopular measure, and all major political changes were effected by acts of Parliament.

To these developments was added that of keeping a Parliament in being for several sessions, and there thus grew up a class of almost professional parliamentarians, some of whom were used by the king to secure assent to his measures and others who would disagree with some of those measures and encourage the Commons to reject them, though the firm idea of a formed "opposition" did not develop until much later.

In the 17th century the Parliament became a revolutionary body and was the centre of resistance to the king during the English Civil War (1642–51). The Restoration period (1660–88) saw the development of the Whig and Tory factions, ancestors of the later political parties. After the Glorious Revolution of 1688, William III chose his council, or officers of state, from among these party members in Parliament—at first from both parties and then, finding this unworkable, from the party commanding a majority in the Commons. Under Queen Anne this council, or Cabinet, as it came to be known, became a distinct policy-making body, usually meeting alone without the Queen. Subsequently, under the first two Georges, who were politically ineffectual, Robert Walpole, as leader of the Whigs, of the Commons, and of the Cabinet, became the real head of government, the "prime" minister (*see* prime minister); he set the principle that the Cabinet must act as a unit. Later, particularly after 1830, the party system became entrenched, and all members of Parliament began using a party label. Effective power was passing from the monarch, and the power of the House of Lords, too, would be diminished in the late 19th and early 20th centuries.

Parliament, Admonition to, Puritan manifesto, published in 1572 and written by the London clergymen John Field and Thomas Wilcox, that demanded that Queen Elizabeth I restore the "purity" of New Testament worship in the Church of England and eliminate the remaining Roman Catholic elements and practices from the Church of England. Reflecting wide Presbyterian influence among Puritans, the admonition advocated greater direct reliance on the authority of the Scriptures and also church government by ministers and elders rather than by a higher order of clergy (bishops). The Queen, however, resisted this document. The authors were imprisoned and the leader of the Presbyterians, Thomas Cartwright, was forced to flee England after publishing "A Second Admonition to Parliament" in support of the first. The clergy who refused to conform to the compulsory form of worship that had been promulgated by Elizabeth in 1559 (as the Act of Uniformity) lost their pulpits or were imprisoned.

Parliament, Houses of, also called WESTMINSTER PALACE, in the London borough of Westminster, the seat of the legislative body of the United Kingdom of Great Britain and Northern Ireland. A royal palace said to have existed at Westminster under Canute originally occupied the site of the present Houses of Parliament. The building, however, spoken of by William Fitzstephen as an "incomparable structure," was built by Edward the Confessor (died 1066) and enlarged by William I the Conqueror. In 1512 the palace suffered greatly from fire and thereafter ceased to be used as a royal residence. St. Stephen's Chapel, traditionally founded by King Stephen, was used from 1547 for the meetings of the House of Commons, held previously in the chapter house of Westminster Abbey; the Lords used another apartment of the palace. A fire in 1834 destroyed the whole palace except the historic Westminster Hall and St. Stephen's Chapel.

Sir Charles Barry, assisted by A.W.N. Pugin, designed the present buildings in the Gothic Revival style. Construction was begun in 1840 and finished in 1867. The Commons Chamber was burned out in an air raid during World War II but was restored and reopened in 1950. The House of Lords is an ornate chamber 97 feet (29.5 metres) in length; that of the Commons is 70 ft long. The southwestern Victoria Tower is 336 ft high. The Clock Tower, 329 ft in height, contains the clock famous for its 13-ton bell, Big Ben (*q.v.*), upon which the hours are struck. The bell is named after Sir Benjamin Hall, first commissioner of works.

Parliament Act of 1911, act passed Aug. 10, 1911, in the British Parliament which deprived the House of Lords of its absolute power of veto on legislation. The act was proposed by a Liberal majority in the House of Commons.

Chancellor of the Exchequer David Lloyd George, in his 1909 "People's Budget," had included a tax on the "unearned increment" of land enhanced in value by industrial or other developments nearby. (The budget also included higher death duties and a higher income tax.) The Lords rejected the land tax on the grounds that such a tax involved a land-valuation plan and did not belong in a finance bill. Their veto held up the national finances and caused a struggle between the two houses. To solve the crisis, two general elections were called in 1910. The second gave authority to carry a Parliament Bill that would end such struggles. The bill was endangered by the House of Lords' veto power; so the Liberal government threatened a mass creation of Liberal peers, if the Lords failed to pass it.

Under the act, any bill passed by the House of Commons in three separate sessions without being altered could be presented for the royal assent without the consent of the Lords, providing that two years had elapsed since the bill had been introduced. (The royal assent is required for an act of Parliament to become law.) Financial measures could now be presented one month after they passed the House of Commons. The maximum period that the House of Commons could remain in session was reduced from seven years to five.

In subordinating the House of Lords to the House of Commons, the 1911 Act was regarded as another step in the gradual democratization of the British Constitution.

parliamentary procedure, also called RULES OF ORDER, the generally accepted rules, precedents, and practices commonly employed in the government of deliberative assemblies. Such rules are intended to maintain decorum, to ascertain the will of the majority, to preserve the rights of the minority, and to facilitate the orderly transaction of the business of an assembly.

Rules of order had their origin in the early British Parliaments. Sir Thomas Smyth wrote (1562–66) an early formal statement of procedures in the House of Commons, *De Republica Anglorum* (published 1583). *Lex Parliamentaria* (1689) was a pocket manual for members of Parliament; it includes many precedents that are now familiar. It drew from the *Journal* of the House of Commons points such as the following: one subject should be discussed at a time (adopted 1581); the chair must always call for the negative vote (1604); personal attacks and indecorous behaviour are to be avoided in debate (1604)—"He that digresseth from the Matter to fall upon the Person ought to be suppressed by the Speaker.... No reviling or nipping words must be used"; and debate must be limited to the merits of the question (1610)—"A member speaking, and his speech, seeming impertinent, and there being much hissing and spitting, it was conceived for a Rule, that Mr. Speaker may stay impertinent speeches."

In British America, colonists depended heavily on procedures developed in Parliament and, under written charters and grants, gained experience in governing under written documents. That experience later led to the framing of state constitutions and the U.S. Constitution. Thomas Jefferson's *Manual of Parliamentary Practice* (1801) was the first to interpret and define parliamentary principles for the new U.S. democracy.

The modern system of general parliamentary law and practice is, in many respects, at wide variance with the current systems of procedure of both Parliament and the U.S. Congress. Rules designed for legislatures that are often bicameral with paid memberships, that meet in continuous session, that require a majority for a quorum, and that delegate their duties largely to committees address special legislative requirements. They are as a whole unsuited to the needs of an ordinary assembly. Writing for a previous edition of *Encyclopædia Britannica,* Clarence Cannon, who was U.S. congressman from Missouri, 1923–64, observed:

> ...there has been simultaneously developed through years of experiment and practice a simpler system of procedure adapted to the needs of deliberative assemblies generally and which, though variously interpreted in minor detail by different writers, is now in the main standardized and authoritatively established.

An early U.S. attempt to serve "assemblies of every description... especially... those not legislative in their character" was *Cushing's Manual* (1845), prepared by Luther S. Cushing (1803–56), a jurist and clerk of the House of Representatives of Massachusetts. Of lasting service has been *Robert's Rules of Order,* codified by a U.S. Army officer, Henry M. Robert (1837–1923) (*q.v.*). Published initially in 1876, it went through various editions and reprintings and continues to be published in periodic editions.

A "deliberative assembly," to which parliamentary law is ordinarily applied, has the following characteristics, according to *Robert's Rules of Order Newly Revised* (7th ed., 1970; Chapter 1, section 1): it is an independent or autonomous group convened to determine in free discussion "courses of action to be taken in the name of the entire group"; the "group is of such size—usually any number of persons more than about a dozen—that a degree of formality is necessary in its proceeding"; members are free to act; each member's vote has equal weight; "failure to concur... does not constitute withdrawal from the body"; and members present act for the entire membership "subject only to such limitations as may be established by the body's governing rules." The will of such a deliberative assembly is expressed by its action on proposals submitted for consideration in the form of motions or resolutions offered by members. In order to make a motion, a member ordinarily must rise and address the chair and secure recognition. If the motion is in order and is seconded by another member, it is "stated" by the presiding officer. Then it is subject to the action of the assembly.

Motions may be classified as main motions that introduce a proposition and as secondary motions, designed to affect the main motion or its consideration. A main motion is in order only when there is no other business before an assembly. It yields in precedence to all other questions.

Secondary motions may be subdivided into (1) subsidiary, (2) incidental, and (3) privileged. Subsidiary motions are applicable to other motions for the purpose of modifying the main question or affecting its consideration and disposition. They have precedence of the motion to which applied but yield to privileged and incidental motions. The subsidiary motion to lay on the table is, in U.S. usage, a motion to suspend consideration of the question until such time as the assembly may determine to take it from the table for further consideration. The motion is not debatable and may not be amended, postponed, committed, divided, or reconsidered. The purpose of the motion for the previous question is to close debate peremptorily and bring the assembly to an immediate vote on the pending question. It precludes both debate and amendment and requires a two-thirds vote for passage under general parliamentary procedure. It yields to the motion to table, to the question of consideration, and to privileged and incidental motions and may be reconsidered, but takes precedence of motions to postpone, amend, and commit. The motion to close or extend debate is in order under general parliamentary law and is subject to the rules governing the previous question. The motions to commit, recommit, and refer are practically equivalent and provide for reference of the pending proposition to a committee. The motion to recommit may be amended as by adding instructions to the committee as to time and manner of report. Debate on the motion is limited to the question of reference and instructions. It takes precedence of motions to amend and indefinitely postpone but yields to other subsidiary motions and to all incidental and privileged motions.

Motions to amend—calling for changes in the text or terms of the proposition—require a second and must be reduced to writing if requested by the chair. There is no limit to the number of amendments that may be proposed and new amendments may be offered as rapidly as the pending amendment is disposed of. Amendments in the second degree—that is, amendments to amendments—are admissible but amendments in the third degree—that is, amendments to amendments to amendments—are not in order. Only four amendments in the first and second degrees may be pending simultaneously, as follows: amendment; amendment to the amendment; substitute for the amendment (*i.e.,* when it is desired to replace the entire pending amendment); and amendment to the substitute. The amendment must, of course, be offered first and the substitute before the amendment to the substitute, but otherwise there is no rule governing the order in which the four amendments may be presented. They must, however, be voted on in the following order: first, amendments to the amendment; second, amendments to the substitute; third, the substitute; and last, the amendment. Motions to amend will not be entertained unless germane or relevant to the main question. This motion yields to all privileged, incidental, and subsidiary motions except indefinite postponement. It is subject to amendment, to the operation of the previous question, and to reconsideration, and when laid on the table carries with it the proposition proposed to be amended. Likewise, when the main question is laid on the table, postponed or recommitted, all pending amendments accompany it. (British usage differs: a proposal laid on the table of a British deliberative or legislative assembly has been put forth for consideration.)

Incidental motions include questions arising incidentally in the consideration of other questions and decided before disposition of the one to which they are incident. They have no relative rank and merely take precedence of the pending question in the consideration of which they have arisen. All are undebatable with the exception of appeal. They comprise motions to suspend the rules, withdraw motions, read papers, raise the question of consideration, raise questions of order and appeal, reconsider, take up out of order, determine method of procedure, divide pending questions, and raise questions relating to nominations. The motion temporarily to suspend the rules may not be debated or reconsidered and is not subject to the application of any subsidiary motion. The vote required to pass the motion is ordinarily fixed by the rules of the assembly and in the absence of such provision is two-thirds of those present and voting. The question of whether the assembly desires to take up a proposition regularly presented for its consideration may be tested by raising the question of consideration, which may be moved at any time before actual consideration commences and does not require a second. The assembly may by a two-thirds adverse vote decline to take up any business it prefers not to consider.

Privileged motions relate to matters of such urgent importance that they supersede temporarily pending business. They take precedence of all other motions and may be offered while other questions are pending. In this class of motions is the motion to fix the time at which to adjourn, to adjourn, to take a recess, and to raise questions of privilege, all of which are undebatable.

Points of order may be made while another has the floor and when the question concerns the use of unparliamentary language. The question must be raised at the time the proceeding giving rise to the objection occurs. Debate on questions of order may be closed by the presiding officer at any time.

The motion to reconsider must be made by one who voted with the prevailing side but may be seconded by any member. The motion is of the highest privilege. If agreed to, the motion reopens the entire question for further action.

Unclassified here are motions to take from the table, to discharge a committee, to accept the report of a committee, to rescind, to repeal, to annul, to expunge, and to permit a member to resume the floor after having been called to order for words spoken in debate.

To debate a question, a member must be recognized by the presiding officer for that purpose. The presiding officer should first recognize the mover of a proposition or the member of a committee presenting a report and should endeavour to alternate recognitions between those favouring and those opposing a question. Under general parliamentary procedure, a member securing the floor may speak without limit. In conventions, it is customary to adopt a rule at the opening session limiting debate to a specified number of minutes. In debate a member must confine remarks to the question under consideration, must avoid personalities, and must not arraign motives. A presiding officer who is a member of the assembly has the right to debate and to participate in the proceedings but should call another to the chair before taking the floor and should not resume it again until the pending question has been decided.

Voting may be by ballot, by division (that is, a rising, or standing, vote), viva voce (the presiding officer deciding by the volume of voices), by show of hands, by tellers who may take the count in various ways, and by yeas and nays (the clerk calling the roll and recording each vote as given). If there is doubt as to the result of a voice vote, any member may request a division; the presiding officer thereupon proceeds to take a rising vote. Only members in attendance may vote unless provision has been made for proxy votes. A tie vote defeats an affirmative motion. The presiding officer, if a member of the assembly, may vote to break a tie or to make one.

The committee of the whole consists of the entire assembly acting as a general committee. It affords greater freedom of consideration, but in bodies other than legislative assemblies it is rarely used.

Parma, city, capital of Parma province, in the Emilia-Romagna region of northern Italy, on the Parma River, northwest of Bologna. Founded by the Romans along the Via Aemilia in 183 BC, Parma was important as a road junction; its trade flourished, and it obtained Roman citizenship. It became an episcopal see in the 4th century and was later destroyed by the Ostrogoth king Theodoric. The city was rebuilt in the Middle Ages and was ruled by its bishops from the 9th century. Parma enjoyed communal liberty in the late 12th and 13th centuries, until its involvement in the struggles between the Holy Roman Empire and the papacy in the early 14th century led to its subjugation by a series of lordships. Made part of the Duchy of Parma and Piacenza by Pope Paul III in 1545, it was held by the Farnese dukes and later passed to the Austrians, from whom it was taken by Napoleon, who in 1815 gave it to his second consort, Marie Louise of Austria. In 1831 and 1848 it took part in the risings for independence and in 1861 became part of united Italy (*see also* Parma and Piacenza, Duchy of). During World War II the city was extensively damaged by Allied bombardment.

Famous natives of Parma include the music conductor Arturo Toscanini, the architect and sculptor Benedetto Antelami, and the painters Correggio (Antonio Allegri) and Parmigianino (Francesco Mazzola). The printer and typeface designer Giambattista Bodoni worked and died there.

The city's imposing Romanesque cathedral, rebuilt after an earthquake in the 12th century, contains magnificent works by Antelami and Correggio, and there are sculptures by Antelami and others of his school in the nearby baptistery (1196–1260). The church of S. Giovanni Evangelista (1494–1510) has frescoes by Correggio and arabesques by Michelangelo Anselmi. The church of Sta. Maria della Steccata (1521–39), the burial place of the Farnese family, is in the form of a Greek cross with a cupola displaying frescoes by Parmigianino. The 16th-century abbey of S. Paolo, with the Camera della Badessa (Room of the Abbess), has been splendidly decorated by Correggio. Notable secular landmarks include the Palazzo della Pilotta (begun 1583), residence of the Farnese dukes, containing the picture gallery, the Biblioteca Palatina (Palatine Library), and the National Museum of Antiquities; the partly ruined Palazzo Ducale (1564); and the Farnese Theatre (1618), all of which were restored after World War II. The university was founded in the 11th century and reorganized in 1601 by Ranuccio I Farnese.

Parma is an important rail and road junction on the main routes from Milan to Bologna. Its economy is mainly agricultural. Parmesan cheese is world famous. Machinery, pharmaceuticals, fertilizer, shoes, and alcohol are also made. Pop. (1983 est.) mun., 178,310.

Parma, city, Cuyahoga County, northeastern Ohio, U.S., a southern suburb of Cleveland. Settled by New Englanders in 1816, it was known as Greenbriar until 1826, when it became the township of Parma, named for the Italian city. A small section seceded to form Parma Heights in 1912, and in 1924 the remainder of the township became the village of Parma. After a 1931 proposal for annexation to Cleveland was defeated, Parma was organized (1932) as a city. Manufactures include automotive parts, tools, and dies and metal stampings. Pop. (1980) 92,548.

Parma, Alessandro Farnese, duque de (duke of): *see* Farnese, Alessandro.

Parma and Piacenza, Duchy of, the northern Italian cities of Parma and Piacenza, with their dependent territories, detached from the Papal States by Pope Paul III in 1545 and made a hereditary duchy for his son, Pier Luigi Farnese (died 1547). It was retained by the Farnese family until the family's extinction in 1731, when it passed to the Spanish Bourbons in the person of Don Carlos (the future Charles III of Spain). Except for one brief interruption, the Spanish Bourbons controlled the duchy until 1808, when it was formally annexed to France as the *département* of Taro.

In 1814 the Congress of Vienna gave the duchy to Napoleon's consort, Marie-Louise. With her death, in 1847, Parma and Piacenza were restored to the Bourbons, whose reign was periodically troubled by revolution and assassination. Louise of Bourbon-Berry, regent for her infant son Robert, transferred her powers to a provisional government on June 9, 1859, which paved the way for the annexation of Parma and Piacenza to Piedmont-Sardinia in March 1860. Piedmont-Sardinia became part of the Kingdom of Italy in 1861.

Parmelia, largest genus of foliose (leafy) lichens, which includes among its members the species commonly known as crottle and skull lichen. Crottle, the largest foliose lichen, resembles crumpled leather and sometimes grows 90 to 120 centimetres in diameter. It is characterized by a black underside. The central portion may die out, leaving a toad-stool-like "fairy ring." It is used as a reddish-brown cloth dye and was once considered a cure for epilepsy and the plague.

The so-called skull lichen (*P. saxatilis*) is a common variety that grows in flat gray-brown rosettes (5 to 10 centimetres across). According to folk superstition, it was believed to be an effective treatment for epilepsy if found growing on an old skull, especially that of an executed criminal.

Parmenides (b. *c.* 515 BC), Greek philosopher of Elea in southern Italy who founded Eleaticism, one of the leading pre-Socratic schools of Greek thought. His general teaching has been diligently reconstructed from the few surviving fragments of his principal work, a lengthy three-part verse composition titled *On Nature.*

Parmenides held that the multiplicity of existing things, their changing forms and motion, are but an appearance of a single eternal reality ("Being"), thus giving rise to the Parmenidean principle that "all is one." From this concept of Being, he went on to say that all claims of change or of non-Being are illogical. Because he introduced the method of basing claims about appearances on a logical concept of Being, he is considered one of the founders of metaphysics.

Plato's dialogue the *Parmenides* deals with his thought. An English translation of his work was edited by L. Tarán (1965).

Parmenio (b. *c.* 400 BC—d. 330, Ecbatana, Media), Macedonian general usually considered the best officer in the service of Philip II and his son Alexander the Great.

During the reign of Philip, Parmenio won a great victory over the Illyrians (356). In 336 he was sent with Amyntas and Attalus, his son-in-law, to Asia Minor to make preparations for the conquest of Asia. In the confusion that followed Philip's murder, he declared for Alexander and assisted in the murder of members of the faction opposed to Alexander. Parmenio became Alexander's second in command throughout the conquest of Persia and commanded the left wing of the army at the battles of Granicus, Issus, and Gaugamela. When Alexander continued eastward after the conquest of the Persian Empire, he left Parmenio in Media to guard his communications. During the campaign, Philotas, Parmenio's son, was charged with conspiring to murder Alexander, tried, and put to death. Though it is likely that Philotas was innocent, Alexander had Parmenio murdered.

Parmentier, André, English ANDREW PARMENTIER (b. July 3, 1780, Enghien, Austrian Netherlands—d. Nov. 26, 1830), Belgian-born American horticulturist, responsible for exhibiting many plant species in America.

Parmentier was the son of a linen merchant and was educated at the University of Louvain. His brothers were all horticulturists, the eldest being director of the Duc d'Arenberg's park at Enghien. In 1824 André lost his capital in speculation and immigrated to New York, where he established a commercial nursery and botanical garden. He imported plants and contributed to horticultural journals. Although he designed and laid out grounds, it is as a plantsman that he is remembered.

Parmesan, Italian PARMIGIANO-REGGIANO, hard, sharp cow's-milk cheese used primarily in grated form. The original Parmigiano-Reggiano is produced within a strictly delineated region in Italy that includes the towns of Parma, Modena, and Mantua and part of Bologna. The official name, along with the year the cheese was made, is stenciled on the rind of the approximately 75-pound (34-kilogram) cylinders. The tough, brownish-gold oily rind encases a gold interior of granular texture that gets quite brittle when aged. Parmesan is made only from April to November and must be aged at least two years. At this age it has a rich, savoury flavour and is consumed as a snack or after meals, as well as in cooking. Freshly grated Parmesan has considerably more flavour than ungrated. The widely, and often poorly, imitated original is considered one of the world's great cheeses.

Parmigianino, also called PARMIGIANO, byname of GIROLAMO FRANCESCO MARIA MAZZOLA, or MAZZUOLI (b. Jan. 11, 1503, Parma, Duchy of Milan—d. Aug. 24, 1540, Casalmaggiore, Cremona), painter who was one of the first artists to develop the elegant and sophisticated version of Mannerist style that became a formative influence on the post-High Renaissance generation.

There is no doubt that Correggio was the strongest single influence on Parmigianino's early development, but he probably was never a pupil of that master. The influence is apparent in Parmigianino's first important work, the "Mystic Marriage of St. Catherine" (*c.* 1521). About 1522–23 he executed two series of frescoes: one series in two side chapels of S. Giovanni Evangelista, in Parma, executed contemporaneously with Correggio's great murals on the dome and pendentives of that church, and the other, representing the "Legend of Diana and Actaeon," on the ceiling of a room in the castle of Fontanellato just outside Parma. The scheme of the latter decoration recalls Correggio's work in the Camera di San Paolo in Parma.

In 1524 Parmigianino moved to Rome, taking with him three specimens of his work to impress the pope, including the famous self-portrait that he had painted on a convex panel from his reflection in a convex mirror. His chief painting done in Rome is the large "Vision of St. Jerome" (1527). Although this work shows the influence of Michelangelo, it was Raphael's ideal beauty of form and feature that influenced his entire oeuvre. While at work on the "Vision of St. Jerome" in 1527 he was interrupted by soldiers of the imperial army taking part in the sack of Rome, and he left for Bologna. There he painted one of his masterpieces, the "Madonna with St. Margaret and Other Saints." In 1531 he returned to Parma, where he remained for the rest of his life, the principal works of this last period being the "Madonna dal Collo Lungo" (1534; "Madonna of the Long Neck") and the frescoes on the vault preceding the apse of Sta. Maria della Steccata. The latter were to have been only part of a much larger scheme of decoration in the church, but Parmigianino was extremely dilatory over their execution, and he was eventually imprisoned for breaking his contract.

Parmigianino was one of the most remarkable portrait painters of the century outside Venice. Some of his best portraits are in Naples, in the Museo e Gallerie Nazionali di Capodimonte, including the "Gian Galeazzo Sanvitale" (1524) and the portrait of a young woman called "Antea" (*c.* 1535–37).

The style that he developed was, in its suave attenuations and technical virtuosity, one of the most brilliant and influential manifestations of Mannerism. It was an extreme development of Raphael's late manner and weakened the naturalistic basis inherent in High Renaissance art.

Parmigianino's works are distinguished by ambiguity of spatial composition, by distortion and elongation of the human figure, and by the pursuit of what the art historian Vasari called "grace"; that is to say, a rhythmical, sensuous beauty beyond the beauty of nature. This last quality of attenuated elegance is evident not only in Parmigianino's paintings but also in his numerous and sensitive drawings. One of the first Italian artists to practice etching, Parmigianino used the etching needle with the freedom of a pen, usually to reproduce his own drawings, which were in great demand.

Parnaíba, port city, northwestern Piauí state, northeastern Brazil, on the Rio Igaraçu, an outlet of the Rio Parnaíba, 9 mi (14 km) upstream from the Atlantic Ocean. Founded in 1761 and given city status in 1884, Parnaíba is the most important trade and distributing centre of the river valley. The chief products shipped from Parnaíba and its outport, Luís Correia (just to the northeast), are carnauba wax, cotton, babassu palm oil, sugar, cattle, chemicals, and hides. The city is also accessible by road and air. Pop. (1980) 102,181.

Parnaíba River, Portuguese RIO PARNAÍBA, river, northeastern Brazil, rising in the Serra da Tabatinga and flowing north-northeastward for 1,056 mi (1,700 km) to empty into the Atlantic Ocean, forming a delta at its mouth. In addition to marking the border between the states of Maranhão and Piauí, the Parnaíba has great economic importance. Although its middle and upper reaches are interrupted by waterfalls, it is navigable by shallow-draft vessels from its mouth at least as far south as the junction of the Rio Canindé. Important river ports include Piauí's three major cities, Teresina (the state capital), Floriano, and Parnaíba.

Parnassia, genus of North American perennial herbs more commonly known as grass of Parnassus (*q.v.*).

Parnassian, French PARNASSIEN, member of a group of 19th-century French poets headed by Leconte de Lisle, who stressed restraint, objectivity, technical perfection, and precise description as a reaction against the emotionalism and verbal imprecision of the Romantics. The poetic movement led by the Parnassians that resulted in experimentation with metres and verse forms and the revival of the sonnet paralleled the trend toward Realism in drama and the novel that became evident in the late 19th century. Initially taking their themes from contemporary society, the Parnassians later turned to the mythology, epics, and sagas of exotic lands and past civilizations, notably India and ancient Greece, for inspiration. The Parnassians derived their name from the anthology to which they contributed: *Le Parnasse Contemporain* (3 vol., 1866, 1871, 1876), edited by Louis-Xavier de Ricard and Catulle Mendès and published by Alphonse Lemerre. Their principles, though, had been formulated earlier in Théophile

Gautier's preface to *Mademoiselle de Maupin* (1835), which expounded the theory of art for art's sake, in Leconte de Lisle's preface to his *Poèmes antiques* (1852), and in *La Revue Fantaisiste* (1860), founded by Mendès. Gautier's *Émaux et camées* (1852), a collection of carefully worked, formally perfect poems, pointed to a new conception of poetry and influenced the works of major Parnassians such as Albert Glatigny, Théodore de Banville, François Coppée, Léon Dierx, and José Maria de Heredia. Heredia, the most representative of the group, looked for precise details, double rhymes, sonorous words, and exotic names, and concentrated on making the 14th line of his sonnets the most striking.

The influence of the Parnassians was felt throughout Europe and was particularly evident in the Modernist movement of Spain and Portugal and in the Jeune Belgique (Young Belgium) movement. In the late 19th century a new generation of poets, the Symbolists, followers of Stéphane Mallarmé and Paul Verlaine, themselves Parnassians in their youth, broke away from precise description in search of an art of nuance and musical suggestion.

parnassian butterfly, any member of the insect subfamily Parnassiinae of the cosmopolitan family Papilionidae (order Lepidoptera). The parnassian (*Parnassius*), also known as apollo, found in mountainous alpine regions

in Asia, Europe, and North America, is a medium-sized butterfly, generally with translucent white, yellow, or gray wings with dark markings and usually a red or orange spot on the hindwing.

Unlike most butterflies, parnassians pupate inside cocoon-like webs, usually constructed among leaves or in rubbish piles. They are prized among butterfly collectors because of their coloration. Parnassians are sometimes separated into their own family, Parnassiidae.

Parnassus, Mount, Modern Greek óros parnassós, mountain barren limestone spur of the Pindus Mountains, central Greece, running northwest–southeast on the borders of the *nomoí* (departments) of Phocis, Fthiótis, and Boeotia. Rising to a maximum elevation of 8,061 ft (2,457 m) in Mt. Parnassus, within sight of Delphi, it extends to Cape Opus on the Gulf of Corinth. In ancient times Parnassus was sacred to the Dorians and in mythology to Apollo and the Corycian nymphs. On a plateau between the summit and Delphi was the Corycian stalactite cave sacred to the nymphs and Pan. For the Roman poets, Parnassus' Castalian spring was a source of inspiration; they favoured Parnassus over Mt. Helicon as the home of the Muses. Parnassus is rich in bauxite, which is mined and converted into alumina and aluminum at nearby factories. A ski centre was opened above Arachova in 1977.

Parnell, Charles Stewart (b. June 27, 1846, Avondale, County Wicklow, Ire.—d. Oct. 6, 1891, Brighton, Sussex, Eng.), Irish nationalist, member of the British Parliament (1875–91), and the leader of the struggle for Irish Home Rule in the late 19th century. In 1889–90 he was ruined by proof of his adultery with Katherine O'Shea, whom he subsequently married.

Early life. During Parnell's youth, the anti-British traditions and atmosphere of his home were significantly different from those of the majority of the Anglo-Irish Protestant landowning class to which he belonged. They did not, however, prevent his parents from giving him an education normal for his class. He went to three English boarding schools, where he seems to have been unhappy, and to Cambridge, where in 1869, after an undistinguished career, he was suspended for a relatively minor breach of discipline and decided not to return.

The Home Rule League and the Land League. The Ireland to which Parnell returned was in ferment. The government's oppressive measures against the revolutionary Irish Republican Brotherhood (the Fenians) aroused intense national feelings among even the moderate Irish. In 1870 a new political group, the Home Rule League, was set up to press for Irish autonomy in local government; in 1874 it returned 56 candidates to Parliament, where they formed a party under the nominal leadership of Isaac Butt. Though socially conservative and deferential to the opinions of the Roman Catholic hierarchy, all appealed in some degree to the national sentiments of the electorate. Parnell, an eminently suitable Home Rule candidate, was elected to Parliament for Meath in April 1875. Within two years he distinguished himself by his indifference to the opinion of the House of Commons and his sensitivity to Irish nationalist opinion. He embraced the policy of obstructing English legislation to draw attention to Ireland's needs, and his handsome presence and commanding personality gave him a powerful appeal. In September 1877 the Home Rule Confederation of Great Britain elected Parnell its president; he had become, at the age of 31, the most conspicuous figure in Irish politics.

In 1878 an agricultural crisis in Ireland seemed to threaten a repetition of the terrible famine and mass evictions of tenant farmers of the 1840s. To resist eviction and make Irish landlordism unworkable, the Irish Land League was founded in 1879 by a Fenian, Michael Davitt. Many moderates condemned the league, but Parnell identified himself with it and became its first president, thus becoming the centre of the great "new departure" national movement in which revolutionary devotion was combined with agrarian agitation and was supported by the obstructionist tactics of the "active section" in Parliament. Soon after the general election of 1880, Parnell was elected chairman of the Home Rule group in the new Parliament. After the rejection by the House of Lords of a moderate measure for Irish land reform, Parnell organized a massive land agitation, for which he then won the support of the clergy and of "moderate" opinion. It was combined with parliamentary obstruction on so large a scale that ultimately 36 Irish members were suspended. At this time Parnell rejected a policy of secession from Parliament, put forward by the Land League.

The passage in 1881 of Gladstone's Land Act, which conceded the principle that fair rents could be judicially determined, presented Parnell with a serious test of statesmanship. Its passage was unquestionably a great achievement for the Land League, but the most active Land Leaguers were not content, and a split in the movement seemed likely. This Parnell avoided by pursuing a policy moderate in substance—testing the act by bringing selected cases before the land commission—but making speeches couched in violent language. As a result, probably in accordance with his wish, he was, on Oct. 13, 1881, lodged in Kilmainham jail, Dublin. This assured his continued popularity and absolved him of responsibility for subsequent events.

Parnell's arrest was followed by the suppression of the Land League and a winter of sporadic local terror. It became clear to the government that only Parnell could restore order. In the spring of 1882 Parnell began negotiations for his release, conducted in the main through Capt. William O'Shea, a "moderate" Home Rule member, whose wife had been Parnell's mistress since 1880. A settlement was reached, the so-called Kilmainham Treaty, whereby tenants were to obtain substantial concessions and Parnell was to use all his influence to decrease further agitation.

The murders by nationalists in Phoenix Park, Dublin, of the chief secretary and the permanent undersecretary, which occurred within a few days of Parnell's release (May 2, 1882), caused a general revulsion against terrorism, and Parnell had little difficulty in bringing the nationalist movement again under firm discipline, subordinating the Irish National League (the successor to the Land League) to the Home Rule Party in Parliament.

Parliamentary manoeuvres. The Kilmainham Treaty ended the revolutionary phase of the "new departure." The results of by-elections showed that Parnell's leadership was unquestioned, except in eastern Ulster, and, after the Reform Bill of 1884 extended the franchise to agrarian workers, it became apparent that Parnell was likely in the next Parliament to lead a party of between 80 and 90 members. With this potential strength Parnell became a force to be reckoned with. He contemptuously refused overtures made for his support by the radical wing of the Liberal Party led by Joseph Chamberlain and Charles Wentworth Dilke.

The Tory advances to him led very quickly to a combination in which Tories and Irish voted together to defeat the Liberal government (June 1885), and in the election campaign that followed (November–December 1885), Parnell, having failed to get a satisfactory Home Rule statement from Gladstone, issued the "vote-Tory manifesto." Although the Irish could put the Liberals out, they could not keep the Tories in. In these circumstances, the Tories immediately broke with them and announced the intention of reintroducing coercion in Ireland. Parnellites and Liberals voted together to bring down the government, and Gladstone took office in February 1886. For his continuation in office he depended on Irish support.

There followed the curious and ominous episode of the Galway election. Parnell, under pressure from the O'Sheas and Joseph Chamberlain, put forward Captain O'Shea as Home Rule candidate, although he had refused to take the pledge "to sit and vote with the party." The evidence suggests that Chamberlain was attempting to undermine Parnell's authority and split his party. If so, he failed. A mutiny of a small faction was quelled and O'Shea was elected.

Although Gladstone's Home Rule proposals—involving a wide measure of autonomy—fell short of nationalist aspirations, Parnell accepted them as a basis of settlement and enlisted public opinion in their support. The introduction of the bill, though it was later rejected by the Commons on the second reading (June 1886), was regarded as his personal triumph. When the Conservative Lord Salisbury succeeded Gladstone as prime minister, Parnell withdrew to some extent from active political life. This was partly due to ill health but also to political reasons. With the Irish party firmly allied to the opposition, there was now no room for parliamentary obstruction. Parnell would neither challenge Gladstone's leadership nor appear as his henchman. He also held aloof in Ireland from the ingenious rent-withholding combination known as the plan of campaign, devised by William O'-Brien.

Despite his relative inactivity Parnell was kept before the public through the efforts of his enemies. On April 18, 1887, *The Times* published a facsimile of a letter purporting to be written by Parnell condoning the Phoenix Park murders of May 1882. Parnell immediately denounced it as a forgery. Nearly two years later the forger, a journalist named Richard Pigott, collapsed under cross-examination before an investigating commission. Parnell, after Pigott's suicide in Madrid soon afterward, was transformed in the eyes of the English liberals from a dubious ally into a hero and martyr. This brief period was the peak of Parnell's career.

Parnell's fall. On Dec. 24, 1889, Captain O'Shea filed a petition for divorce, naming Parnell as corespondent. Although Parnell's liaison had been known to some members of the Irish party, nationalist Ireland in general took it that the proceedings represented another attempt to wreck Home Rule. This was given colour by the fact that O'Shea was a follower of Joseph Chamberlain. The theory that there were political motives behind the divorce proceedings is not necessarily false. The suit being undefended, the court returned a verdict against Parnell and Katherine O'-Shea on Nov. 17, 1890.

The initial reaction of the Irish public was to uphold Parnell. In Britain, however, Nonconformist opinion was so hostile that the Irish parliamentary party found itself in an agonizing dilemma. Parnell was determined to hold the leadership and defy Gladstone. If the party upheld Parnell they would be destroying the Liberal alliance, and with it the hopes of Home Rule in their generation. If they rejected Parnell, they would be turning against him at the bidding of an Englishman. After a long and emotional debate, the majority rejected his leadership; a sizable minority remained with him.

There followed a series of bitter electoral campaigns. The Roman Catholic hierarchy, although slow to pronounce, now declared Parnell morally unfit for leadership. His marriage to Katherine O'Shea in June 1891 exacerbated Catholic opposition. He himself displayed feverish energy and increasing recklessness, directing his appeal more and more to the revolutionary elements. This appeal left a deep impression on the young but was rejected by the majority of the nation. When his principal ally, the nationalist *Freeman's Journal,* fell to his enemies shortly after his marriage, his cause was clearly lost. He died at his wife's home in Brighton in October 1891 and was buried in Glasnevin Cemetery, Dublin. The city, Parnellite to the end, gave him a magnificent funeral. (C.C.O'B.)

of Alexander Pope, who relied on Parnell's scholarship in his translation of the *Iliad.* Parnell's poetry, written in heroic couplets, was esteemed by Pope for its lyric quality and stylistic ease. Among his best poems are "An Elegy to an Old Beauty" and "Night Piece on Death," said to have influenced Thomas Gray's "An Elegy Written in a Country Church Yard."

Parnell contributed to *The Spectator* and the *Guardian* and was a member, with Swift and Gay, of the literary Scriblerus Club. After Parnell's death, Pope collected his poetry and published it in a volume called *Poems on Several Occasions* (1722). The work was republished in 1770 with additional poems and a life of Parnell by Oliver Goldsmith.

Parni, also called APARNI, one of three nomadic or seminomadic tribes in the confederacy of the Dahae living east of the Caspian Sea; its members founded the Parthian empire. After the death of Alexander the Great (323 BC) the Parni apparently moved southward into the region of Parthia and perhaps eastward into Bactria. They seem to have adopted the speech of the native Parthians and been absorbed into the settled population. According to tradition Arsaces I (reigned *c.* 250 BC–*c.* 211 BC) was the first ruler of the Parthians and founder of the Parthian empire; a governor under Diodotus, king of the Bactrian Greeks, he revolted and fled westward to establish his own rule. The ruling family of the Parni in Parthia became known as the Arsacid dynasty, and Parthian kings were called Arsaces.

Pärnu, Russian PYARNU, formerly (until 1918) PERNOV, city, Estonian S.S.R., at the mouth of the Pärnu River on Pärnu Bay of the Gulf of Riga. First mentioned in 1251 as a member of the Hanseatic League, Pärnu was successively controlled by the Teutonic Knights, the Poles, the Swedes, and finally the Russians. It is now significant as a port, holiday resort, and centre of light industry, including food, wood, and leather processing. Pop. (1987 est.) 53,000.

Paro, town, western Bhutan, in the Himalayas on the Paro River. Centred on Fort Paro, a large rectangular building with a seven-story tower, it was the main cultural, commercial, and political centre of the country until the national capital was settled at Thimphu in 1962; Paro remains the summer capital. It is connected by the Indo-Bhutan National Highway to Phuntsholing on the Indian border, and it has an air landing strip. The Paro River valley, with temperatures ranging from an average of 40° F (4° C) in January to 75° F in July and annual rainfall averaging 30–35 inches (760–890 mm), is intensively cultivated; it is one of the most densely settled regions of Bhutan. Pop. (latest est.) 10,000.

parochial education, education offered institutionally by a religious group. In the United States, parochial education refers to the schooling obtained in elementary and secondary schools that are maintained by Roman Catholic parishes, Protestant churches, or Jewish organizations; that are separate from the public school systems; and that provide instruction based on sectarian principles.

Roman Catholic parochial schools in the United States are organized on a diocesan basis and are supported principally by voluntary offerings from the parishioners and by tuition. The administration of the schools of a diocese is the direct responsibility of the bishop. This work is usually delegated to a priest appointed by the bishop, who is given the title of superintendent of schools or secretary for education. Most dioceses have a school board made up of members appointed by the bishop. Usually this board has no administrative power but acts in an advisory capacity to the bishop and his chief school officer.

The Roman Catholic schools teach the same subjects as the public schools, but two important differences should be noted. In the Roman Catholic curriculum, a course in Christian doctrine is included that presents the matters of faith and morals that are the teachings of the Roman Catholic church. Other courses, particularly in such areas as the social studies and humanities, are often given a Roman Catholic orientation.

Diocesan systems are often organized on a statewide or regional basis in order to share certain educational advantages and to exchange ideas and programs for the betterment of their teachers and schools. All diocesan systems are members of the National Catholic Educational Association.

Among Protestant groups that maintain parochial school systems in the United States, the Lutheran bodies are by far the most active, with around 190,000 children in Lutheran schools. Smaller school systems are sponsored by the Seventh-day Adventists, the National Union of the Christian Schools, the Protestant Episcopal Church, the National Association of Christian Schools (evangelical), and the Quakers, Mennonites, Baptists, Methodists, and Presbyterians.

The administration of most Protestant schools is in the hands of a board of education elected by the sponsoring group—either individual congregation, association of congregations, or association of individuals. This board selects a principal and in cooperation with him develops the policies that control the school program.

The teachers in Protestant schools are drawn from denominational teachers colleges and liberal arts colleges. Special training in Bible and doctrine is required, in addition to the general requirements set for teachers at the elementary and secondary levels. While the course of study for each grade in Protestant schools is substantially the same as that offered in the public schools, Christianity is made a unifying and integrating factor in the educational program.

The Jewish day school or "complete" school (*i.e.*, the Jewish parochial school) in the United States is an educational institution in which a combined program of Jewish and general studies is offered. There are four types of institutions that provide intensive Jewish religious education as well as a complete course of study in general subject matter. The Talmudic day school makes provision for the study of the Hebrew texts of the Pentateuch and major portions of the Prophets and Scriptures, including the Masoretic commentaries, and places great stress on teaching of the Talmud. The secular studies meet the requirements of the city and state authorities. The modern day school stresses the study of Hebrew language, the Bible, Jewish history, prayers, and selected portions from the Talmud. All instruction is in the Hebrew language, with the secular subjects generally being given equal attention and equal time. The integrated day school aims to achieve a blending of instruction in Judaism and secular subjects, while the Hebrew-English private school emphasizes the study of general subjects and provides opportunities for Jewish learning for only five hours a week.

The majority of day schools (85 percent) are sponsored by Orthodox groups. Some that fall in the category of modern day schools are conducted by Conservative and other groups. Day schools operated by Yiddish culture groups include Yiddish language and literature among the basic subjects of instruction.

The two principal national organizations for the support of Jewish education are Torah Umesorah (National Society for Hebrew Day Schools) and the National Council for Torah Education.

parody (Greek *parodeia,* "a song sung alongside another"), in literature, a form of satirical criticism or comic mockery that imitates the style and manner of a particular writer or school of writers so as to emphasize the weakness of the writer or the overused conventions of the school. Differing from burlesque by the depth of its technical penetration and from travesty, which treats dignified subjects in a trivial manner, true parody mercilessly exposes the tricks of manner and thought of its victim yet cannot be written without a thorough appreciation of the work that it ridicules.

An anonymous poet of ancient Greece imitated the epic style of Homer in *Batrachomyomachia* (*The Battle of the Frogs and Mice*), one of the earliest examples of parody; Aristophanes parodied the dramatic styles of Aeschylus and Euripides in *The Frogs*; Chaucer parodied the chivalric romance in "The Tale of Sir Thopas" (*c.* 1375), as did Cervantes in *Don Quixote* (1605); Rabelais parodied the Scholastics in *Gargantua and Pantagruel* (1532–34); Shakespeare mimicked Christopher Marlowe's high dramatic style in the players' scene in *Hamlet* and was himself parodied by John Marston, who wrote a travesty of *Venus and Adonis* entitled *The Metamorphosis of Pigmalions Image* (1598). The 2nd Duke of Buckingham in *The Rehearsal* (1671) and Sheridan in *The Critic* (1779) both parodied the heroic drama, especially Dryden's *Conquest of Granada* (1670); John Phillips in *The Splendid Shilling* (1705) caught all the superficial epic mannerisms of Milton's *Paradise Lost* (1667); Racine parodied Corneille's lofty dramatic style in *Les Plaideurs* (1668, "The Litigants "); Fielding parodied Richardson's sentimental novel *Pamela* (1740–41) in *Shamela* (1741) and *Joseph Andrews* (1742) and mimicked the heroic play in *Tom Thumb* (1730).

In England the first collection of parodies to score a wide success was *Rejected Addresses* (1812) by Horace and James Smith, a series of dedicatory odes on the reopening of the Drury Lane Theatre in the manner of such contemporary poets as Scott, Byron, Southey, Wordsworth, and Coleridge. Unique among the Victorians is Lewis Carroll, whose parodies preserve verses that would otherwise not have survived—*e.g.,* Robert Southey's "Old Man's Comforts" (the basis for "You Are Old, Father William") and the verses of Isaac Watts that gave rise to "How Doth the Little Crocodile" and "The Voice of the Lobster."

In the United States the 19th-century poems of Poe, Whitman, Whittier, and Bret Harte were mimicked by their contemporaries, particularly by the poet and translator Bayard Taylor. Because of the variety of accents of 19th-century immigrants, U.S. parody often played on dialect—*e.g.,* Charles G. Leland's *Hans Breitmann's Ballads* first published under that title in 1884, a parody of the German poets Heine and Uhland in macaronic German American. Among more modern parodists, Samuel Hoffenstein is outstanding for his carefully damaging versions of A.E. Housman and the Georgian poets.

The art of parody has been encouraged in the 20th century by such periodicals as *Punch* and *The New Yorker.* The scope of parody has been widened to take in the far more difficult task of parodying prose. One of the most successful examples is Sir Max Beerbohm's *Christmas Garland* (1912), a series of Christmas stories in the style and spirit of various contemporary writers, most notably Henry James. Another innovation is double parody, invented by Sir John Squire in the period between World Wars I and II; it is the rendering of the sense of one poet in the style of another—*e.g.,* Squire's version of Thomas Gray's "Elegy Written in a Country Churchyard" written in the style of Edgar Lee Masters' *Spoon River Anthology* resulted in "If Gray Had Had to Write His Elegy in the Cemetery of Spoon River Instead of in That of Stoke Poges." Also outstanding among modern parodists have been Sir Arthur Quiller-Couch, Stephen Leacock, and E.B. White.

parody, in music, originally the creative reworking of several voice parts of a preexistent composition to form a new composition, frequently a mass; in modern musical usage, parody usually refers to the humorous imitation of a serious composition. The earliest known parody masses date from the late 14th century, and the procedure became common in the 15th and 16th centuries. The composer of a parody mass used as his model a vocal work such as a chanson, madrigal, or motet, freely reorganizing and expanding the original material, often inserting new sections between borrowed, modified passages. A parody mass is known by the name of its model; *e.g., Missa Malheur me bat* by Josquin des Prez, a reworking of Jean d'Okeghem's chanson "Malheur me bat" ("Misfortune Has Struck Me").

The process of parody also facilitated arrangements of vocal works for lute or keyboard, such as Peter Philips' arrangement for virginal (harpsichord) of the chanson "Bon jour, mon coeur" ("Good Day, My Heart") by Orlando di Lasso.

In more recent times the term musical parody came to signify the humorous application of new texts to preexistent vocal pieces, as well as both serious and ironic references to particular musical styles. Mozart's *Ein musikalischer Spass* (*A Musical Joke;* K. 522, 1787), deliberately violates any number of technical conventions, concluding with glaringly "wrong" notes; the endless, rapid repetitions of the word amen in Hector Berlioz' oratorio *L'Enfance du Christ* (*The Childhood of Christ;* Opus 25, 1854) clearly poke fun at the absurdities of much early 19th-century liturgical music.

Jacques Offenbach in his operettas (*e.g., Orpheus in the Netherworld*) frequently parodied serious opera. Similarly, Gustav Mahler, Arnold Schoenberg, and others have parodied the styles of predecessors and contemporaries as well as specific genres, including fashionable dances from the valse to the tango and the fox-trot. An American master of musical parody was Charles Ives (1874–1954).

parole, form of supervised conditional liberty from prison granted prior to the expiration of the sentence. As a form of correctional treatment, parole is designed to enhance the protection of the community through the supervision and rehabilitation of selected offenders following their release from prison. The modern use of parole as a correctional method stems from a change in penal philosophy to emphasize reform and rehabilitation rather than retribution and punishment.

Parole systems are usually administered by the ministry of justice, although in Mexico and South Africa the program is run by the ministry of welfare. In a few countries, parole is a function of the judiciary.

Eligibility for parole is governed by statutes that provide either definite or indeterminate sentences (*see* indeterminate sentence) and define offenses for which parole may be granted. In some jurisdictions, eligibility for parole is prohibited by statute for offenders convicted of such serious crimes as narcotics peddling, armed robbery, kidnapping, rape, or murder.

Parole supervision ranges from little more than a periodic police check to intensive supervision by trained personnel. Conditions of parole vary widely but usually define minimum standards of conduct, delimit freedom of movement, and require the parolee to report regularly to a parole officer. Violation of the conditions of parole may constitute grounds for parole revocation and reincarceration.

Páros, island, one of the Cyclades in the Aegean Sea, Greece, separated from Náxos on the east by a channel 4 mi (6 km) wide. With an area of 75 sq mi (194.5 sq km), it is formed by a single peak, Profítis Ilías (classical Marpessa), 2,530 ft (771 m) in height, which slopes evenly on all sides to a maritime plain that is broadest on the northeast and southwest sides. The island is mainly composed of marble. On a bay on the northwest lies the capital, Páros (or Paroikía,), occupying the site of the ancient and medieval capital. The small harbour is excelled by that of Náousa on the north side. White, semitransparent Parian marble (*Paria Marmara*), used for sculpture and quarried from subterranean pits on the north side of Mt. Marpessa, was the chief source of wealth for ancient Páros. Several of the marble tunnels have survived.

Páros shared the early Bronze Age culture of the Cyclades. Traditionally it was first colonized by Arcadians and then by Ionians. In the 7th century BC Parian colonies were sent to Thasos and to Parium on the Sea of Marmara and in 385 to the island of Pharos (Hvar, Yugoslavia) in the Adriatic. In 490 Páros joined the Persians and sent a ship to Marathon; in retaliation, its capital was attacked by an Athenian fleet under Miltiades. Páros also sided with Persia's king, Xerxes I, but after the Battle of Artemisium (480) its contingent remained in Kíthnos. After 480 a member of the Delian League, it joined the Second Athenian League in 378. On its political decline it passed to the Ptolemies of Egypt and thence to Roman rule. Following the brief Latin conquest of Constantinople (AD 1204), Páros was subject to Venice, becoming in 1389 an independent duchy. In 1537 it was taken by the Turks and was annexed to Greece in 1830 after the War of Greek Independence.

It is an important archaeological site. The Parian Chronicle, found in about 1627, is a marble inscription giving an account of artistic milestones in early and classical Greece. North of the capital is a sanctuary of Delian Apollo and Artemis. The present economy depends largely on locally grown cereals, grapes, figs, olives, and tobacco. Separated from Páros on the southwest by a channel 1.4 mile (2.2 km) wide is the once-attached island of Andíparos (Antiparos), the ancient Oliarus, whose limestone cavern is a tourist attraction. Pop. (1981) capital, 2,716; island, 7,881.

Parra, Nicanor (b. Sept. 5, 1914, San Fabian, Chile), one of the most important Spanish-American poets of his time, the originator of so-called antipoetry.

Parra studied mathematics and physics at the University of Chile in Santiago and pursued advanced studies at Brown University, Providence, R.I., U.S. (1943–45), and at the University of Oxford. From 1952 he taught theoretical physics at the University of Chile.

His first book of poetry, *Cancionero sin nombre* (1937; "Songbook Without Name") received mixed reviews. Later, Parra renounced these poems, but the use of colloquial, often irreverent language, the light treatment of classical forms, and the humorous tone of the poems presage his later antipoetry.

With *Poemas y antipoemas* (1954; *Poems and Antipoems*), Parra's attempts at liberating poetry to make it more accessible to the masses gained him national and international fame. These poems treat common, everyday problems of a grotesque and often absurd world in clear, direct language and with black humour and ironic vision.

After experimenting with the local speech and humour of the Chilean lower classes in *La cueca larga* (1958; "The Long Cueca [Dance]"), Parra published *Versos de salón* (1962; "Verses of the Salon"), which continued the antipoetic techniques of his earlier works. *Obra gruesa* (1969; "Big Work") is a collection of Parra's poems except for his first book. The book is marked by a tone of dissatisfaction intensified by the use of prosaic language, cliché, and ironic wordplay.

In 1967 Parra began to write experimental short poems which he later published as a collection of postcards entitled *Artefactos* (1972; "Artifacts"). In these he attempted to reduce language to its simplest form without losing its social and philosophical impact.

Parramatta, city within the Sydney metropolitan area, New South Wales, Australia. It lies along the 15-mile- (24-kilometre-) long Parramatta River (which enters Port Jackson harbour). Founded in 1788 by Governor Arthur Phillip as a western agricultural outlying farm colony of Sydney and called Rose Hill, it was renamed Parramatta, an Aboriginal word meaning "plenty of eels" and "head of river," the year after it was proclaimed a town in 1790. In its early years it was larger and of greater importance than Sydney. Incorporated as a municipality in 1861, it became a city in 1938 and was expanded in 1948, 1959, and 1972 by the inclusion of surrounding centres. It serves a region with plant nurseries and mixed vegetable farms and is industrialized to include motor-vehicle-body assembly, flour milling, and textile, paint, tile, tire, and asbestos manufacture. Parramatta, the second oldest European settlement in Australia (after Sydney), has many historic buildings, including Elizabeth Farm House (1793; the nation's oldest home still standing), Experiment Farm Cottage (1798), and the Kings School (1832). Pop. (1981) 130,943.

Parrhasius (fl. 5th century BC, Athens), one of the greatest painters of ancient Greece.

Parrhasius was born in Ephesus, Ionia (now part of Turkey), and later settled in Athens. He was praised by ancient critics as a master of outline drawing, and he apparently relied on subtle contours rather than the new technique of chiaroscuro to suggest the mass of the human body. He also tried to portray various psychological states and emotions in his depictions of the face. Many of his drawings on wood and parchment were preserved and highly valued by later painters for purposes of study. His picture of Theseus adorned the Capitol in Rome; other works were chiefly mythological groups. His picture of the Demos, the personified people of Athens, was particularly famous. None of his works or copies thereof survive.

Parrington, Vernon L(ouis) (b. Aug. 3, 1871, Aurora, Ill., U.S.—d. June 16, 1929, Winchcombe, Gloucestershire, Eng.), American literary historian and teacher who influenced American historical and literary thought.

Parrington grew up in Emporia, Kan., and was educated at the College of Emporia and Harvard University. He taught English and modern languages at the College of Emporia (1893–97), at the University of Oklahoma, Norman (1897–1908), and at the University of Washington, Seattle (1908–29). Parrington reappraised American literary history in his major work, *Main Currents in American Thought*, 2 vol. (1927), which won a Pulitzer Prize in 1928. A third volume with the subtitle *The Beginnings of Critical Realism in America*, incomplete at his death, was edited by E.H. Eby and was published in 1930. Parrington, a Jeffersonian liberal, interpreted the history of American literature in light of the concept of democratic idealism, which he saw as a characteristic American idea. He also wrote *The Connecticut Wits* (1926) and *Sinclair Lewis, Our Own Diogenes* (1927).

Parris, Alexander (b. Nov. 24, 1780, Hebron, District of Maine, Mass., U.S.—d. June 16, 1852, Pembroke, Mass.), American architect, a principal exponent of the Greek Revival style in early 19th-century Massachusetts.

Parris was apprenticed to a carpenter as a boy and subsequently studied design in Portland, Maine. His houses in that city include the Hunnewell-Shepley House (1805) and the Preble house (1807–08). In the War of 1812 Parris commanded a company of engineers and after the war moved to Boston.

An early Boston project was the David Sears House (1816) on Beacon Street, now the Somerset Club. He was also responsible for numerous other private homes in Boston. One of Parris' best-known designs is his St. Paul's Church (1819), which, with its graceful Ionic portico fronting a Greek-temple-type structure, marked the beginning of the Greek Revival style in America.

During the second half of the 20th century, the renovation of Boston's Faneuil Hall district brought attention to Parris' Quincy Market (1825), which was reopened as a farmers' market. The structure is notable for its monumentally simplified geometric forms and its system of post-and-lintel supports built of granite.

Among Parris' works outside Boston is the Unitarian Church at Quincy, called the Stone Temple (1828), a severe and impressive building that shelters the burial vaults of presidents John Adams and John Quincy Adams.

Parris Island, one of the Sea Islands in Port Royal Sound, just south of Port Royal, in Beaufort county, southern South Carolina, U.S. Spanish Franciscans and Jesuits came there in the 1520s and attempted to establish missions among the Indians. It became the site of Santa Elena, the capital of Spanish Florida. There are remains of the more recent of two forts called San Felipe, the oldest European military structure found in the United States, and of Fort San Marcos; the original site of Fort San Felipe (1566) has not been located. The 5.5-mile- (14-kilometre-) long island was used as a coaling station by Union forces during the Civil War. In 1876 it was made a naval station and named for Colonel Alexander Parris, public treasurer of South Carolina in the early 18th century. Since 1915 it has been a U.S. Marine Corps Recruit Depot, where thousands of marines are now trained annually. Pop. (1980) 2,296.

Parrish, (Frederick) Maxfield (b. July 25, 1870, Philadelphia—d. March 10, 1966, Plainfield, N.H.), American illustrator and painter who was perhaps the most popular commercial artist in the United States in the first half of the 20th century.

The son of an artist, Parrish was educated at Haverford College, Pa., and studied art at the Pennsylvania Academy of Fine Arts (1891–94) and the Drexel Institute of Art in Philadelphia. He did many posters, magazine covers, and book and advertising illustrations in the following years, and he also painted murals. By the 1920s he was the highest-paid commercial artist in the nation. His popularity began to decline in the late 1930s, but his illustrations never lost favour with some segments of the American public, and there was a renewed appreciation of his work in the 1960s and '70s. Parrish is best known for his depictions of fantasy landscapes populated by attractive young women. He used meticulously defined outlines and intricately detailed natural backgrounds, and his unusual colours give his pictures a dreamlike and idyllic atmosphere.

parrot, any of several hundred species of the bird family Psittacidae, order Psittaciformes. (*See* psittaciform.)

The classification of psittaciform birds is problematic; the entire group is under frequent taxonomic review. The nomenclature is vexed by the inaccurate use of scientific names by aviculturists and dealers and by the vague application of traditional popular group names. There are about 300 species of parrots distributed in approximately 75 to 80 genera and 6 subfamilies, as follows:

Strigopinae, comprising the owl parrot, also known as the kakapo (*Strigops habroptilus*), a rare New Zealand bird once thought extinct, survives as a scant population on South Island.

The Nestorinae comprise two species in the genus *Nestor*. The kea, *N. notabilis,* occasionally attacks sheep to get at the fat around the kidneys. The kaka, *N. meridionalis,* a gentler forest bird, is often kept as a pet. Both are from New Zealand. A related species, the Norfolk Island parakeet (genus Cyanomorphus), is endangered and may actually be extinct.

The Loriinae comprise about 60 species in 15 genera and are found in Australia, New Guinea, and many Pacific islands. These are the lories (with short tails) and lorikeets (with longer, pointed tails). All have a slender, wavy-edged beak and a brush-tipped tongue for extracting nectar from flowers and juices from fruits.

Micropsittinae, six species in the genus *Micropsitta,* on New Guinea and nearby islands. These are the pygmy parrots, smallest mem-

bers of the family. They live in forests, where they live on insects and fungi.

Cacatuinae, about 17 species in 5 genera; Australia, New Guinea, and nearby islands. The group includes the large cockatoo (*q.v.*) species and the cockatiel (*Nymphicus hollandicus*), a smaller bird. They are crested and have heavy beaks for cracking nuts.

Psittacinae, the true parrots, about 220 species in 60 genera; worldwide in warm regions. In this varied assemblage the tongue is blunt; the birds eat seeds, buds, and some fruit and insects. Many members of the subfamily are known simply as parrots but some have group names (*see* conure; lovebird; macaw; parakeet).

Among all the psittaciform birds, the gray parrot (*Psittacus erithacus*) of Africa is unsurpassed as a talker; the male may perfectly echo human speech. Captive birds are alert and, for a parrot, relatively good-tempered. Individuals are said to have lived 80 years. About 33 centimetres (13 inches) long, the bird is light gray except for its squared, red tail and bare, whitish face; sexes look alike. Common in the rain forest, gray parrots eat fruits and seeds; they damage crops but are important propagators of the oil palm.

Equally good as mimics are the Amazon parrots. The 26 species of *Amazona*—often simply called parrots—are chunky birds, mostly 25 to 40 cm (10 to 16 in.) long, with slightly erectile crown feathers and a rather short, squared tail. Their predominantly green plumage is marked with other bright colours, chiefly on the upper head; sexes look alike. Amazon parrots live in rain forests of the West Indies and Mexico to northern South America. They are difficult to breed and may be aggressive as well as squawky.

Common in aviaries is the blue-fronted Amazon, *A. aestiva,* of Brazil, which has a blue

forehead, yellow or blue crown, yellow face, and red shoulders. *A. ochrocephala,* of Mexico and from Ecuador and Brazil, has some yellow on head and neck, a red wing patch, and yellow tail tip.

The monk, or green, parakeet (*Myiopsitta monachus*), one of the hardiest parrot species, is native to South America but has escaped from captivity in the U.S. and attempted to nest in several states. Its large stick nest is unique among parrots.

Other remarkable parrots include the caiques, *Pionites* species, small, short-tailed South American birds similar to conures in build and habits.

The night parrot (or night parakeet), *Geopsittacus occidentalis,* a nearly extinct Australian bird, feeds at night on spinifex grass seeds and dozes under a tussock by day. Its nest, in a bush, is a twig platform entered by a tunnel. Equally unusual is the ground parrot (or ground parakeet), *Pezoporus wallicus,* rare and local in wastelands of coastal southern Australia and western Tasmania. Formerly hunted with dogs, it runs in the grass, flushes like a quail, and makes a sudden deceptive pitch. It eats seeds and insects; its nest is a leaf-lined depression under a bush. usually rather blunt-headed and deep-bodied, and often very brightly coloured. They have large scales and a characteristic birdlike beak formed by the fused teeth of the jaws. The beak is used to scrape algae and the soft part of coral from coral reefs and is strong enough to leave noticeable scars in the coral. The fish grind their food and bits of coral with plate-like teeth in their throats.

Parrot fishes range to a length of about 1.2 metres (4 feet) and weight of about 20 kilograms (45 pounds), or occasionally larger. They are variable in colour, the male of a species often differing considerably from the female, and the young may differ from the adult.

Parrot fishes are edible but are not, as a group, of great economic importance. The surf, or rivulated, parrot fish (*Callyodon fasciatus*) is an Indo-Pacific representative of the family; it grows to 46 centimetres (18 inches) or more, and the male is green and orange or red, the female blue and yellow. Atlantic species include the rainbow parrot fish, which grows to about 90 centimetres and is bright orange and green with a blue beak, and the queen parrot fish (*Scarus vetula*), which grows to about 50 centimetres and is blue with green, red, and orange if male but reddish or purplish with a white stripe if female.

parrotbill, also called CROW-TIT, any of 14 species of the songbird family Panuridae (order Passeriformes) that have a deep and compressed bill like a parrot's. They occur in brushy grasslands of central and eastern Asia. A typical species is Gould's parrotbill (*Paradoxornis flavirostris*); 18 centimetres (7 inches) long, it is brown above and white below, with a heavy-looking head and black markings around the eyes and in the ear region. Some of the smaller species, formerly separated as *Suthora,* are brightly coloured; an example is

Parrott, Robert Parker (b. Oct. 5, 1804, Lee, N.H., U.S.—d. Dec. 24, 1877, Cold Spring, N.Y.), U.S. inventor who developed the rifled cannon known as the Parrott gun, the most formidable cannon of its time.

Parrott was graduated from the U.S. Military Academy, West Point, N.Y., in 1824 but resigned from the army in 1836 to become superintendent of the West Point Foundry. In 1861 he patented both a method of building stronger cannon by shrinking bands of wrought iron around a cast breech and a projectile suitable for muzzle-loading rifled cannon. The projectile had an encircling brass ring that expanded upon firing to fit the rifling grooves of the barrel. Parrott guns were widely used on land and at sea during the U.S. Civil War.

ton, Sussex), composer, writer, and teacher, influential in the revival of English music at the end of the 19th century.

While at Eton, where he studied composition, he took the bachelor of music degree from Oxford (1867). Among his later teachers, the pianist Edward Dannreuther particularly influenced him.

Parry's *Scenes from Prometheus Unbound* (1880) was the first of a series of choral works that showed his gift for the massive effects that characterized English music of the rest of the 19th century. Among his works are *Blest Pair of Sirens* (1887) for chorus and orchestra; the oratorios *Judith* (1888), *Job* (1892), and *King Saul* (1894); and his *Songs of Farewell* (1916–18). His unison song "Jerusalem" (1916), a setting of words from William Blake's *Milton,* became almost a second national anthem during and after World War I. His other works include five symphonies, *Symphonic Variations,* chorale preludes for organ, motets, and many songs.

In 1883 Parry was appointed choragus (festival conductor) of Oxford and joined the staff of the Royal College of Music, London, becoming its director in 1894. In 1900 he became professor of music at Oxford. He was knighted in 1898 and created a baronet in 1903. (He died without sons, and the baronetcy became extinct.) His writings on music include *Studies of Great Composers* (1886), *The Evolution of the Art of Music* (1896), *Johann Sebastian Bach* (1909), and *Style in Musical Art* (1911).

Parry Sound, town, seat of Parry Sound District, southeastern Ontario, Canada, on the eastern shore of Georgian Bay of Lake Huron, at the mouth of the Seguin River, 120 mi (190 km) north of Toronto. Named in honour of the Arctic explorer Sir William Parry, the town was founded in the mid-19th century by W.H. Beatty, a British land surveyor. Its deep-water harbour on landlocked Parry Sound and its position on two transcontinental railroads and the Trans-Canada Highway have fostered the town's development as a merchandising, distributing, and shipping centre for the surrounding lumbering and mining region. A gateway to the Thirty Thousand Islands of Georgian Bay (*q.v.*), Parry Sound is a popular summer resort. In 1980 the township of McDougall was merged with Parry Sound. Inc. 1888. Pop. (1981) 6,124.

parsec, unit for expressing distances to stars and galaxies, used by professional astronomers. It represents the distance at which the radius of the Earth's orbit subtends an angle of one second of arc; thus a star at a distance of one parsec would have a parallax of one second, and the distance of an object in parsecs is the reciprocal of its parallax in seconds of arc. For example, the nearest triple-star system, Alpha

Centauri, has a parallax of 0.753 second of arc; hence, its distance from the Sun and the Earth is 1.33 parsec. One parsec equals 3.26 light-years, which is equivalent to 3.09×10^{13} kilometres (1.92×10^{13} miles). In the Milky Way Galaxy, wherein the Earth is located, distances to remote stars are measured in terms of kiloparsecs (1 kiloparsec = 1,000 parsecs). The Sun is at a distance of 8.5 kiloparsecs from the centre of the Milky Way system. When dealing with other galaxies or clusters of galaxies, the convenient unit is the megaparsec (1 megaparsec = 1,000,000 parsecs). The distance to the Andromeda Galaxy (Messier 31) is about 0.7 megaparsec. Some galaxies and quasars have likely distances on the order of about 3,000 megaparsecs, or 9,000,000,000 to 10,000,000,000 light-years.

Parsi, also spelled PARSEE, member of a group of followers in India of the Iranian prophet Zoroaster; the Parsis, whose name means "Persians," are descended from Persian Zoroastrians who emigrated to India to avoid religious persecution by the Muslims. They live chiefly in Bombay and in a few towns and villages mostly to the north of Bombay, but also at Karachi (Pakistan) and Bangalore (Karnataka, India). Although they are not, strictly speaking, a caste, since they are not Hindus, they form a well-defined community.

The exact date of the Parsi migration is unknown. According to tradition, the Parsis initially settled at Hormuz on the Persian Gulf, but finding themselves still persecuted they set sail for India, arriving in the 8th century. The migration may in fact have taken place as late as the 10th century, or in both. They settled first at Diu in Kāthiāwār but soon moved to Gujarāt, where they remained for about 800 years as a small agricultural community.

With the establishment of British trading posts at Surat and elsewhere in the early 17th century, the Parsis' circumstances altered radically, for they were in some ways more receptive of European influence than the Hindus or Muslims and they developed a flair for commerce. Bombay came under the control of the East India Company in 1668 and, since complete religious toleration was decreed soon afterward, the Parsis from Gujarāt began to settle there. The expansion of the city in the 18th century owed largely to their industry and ability as merchants. By the 19th century they were manifestly a wealthy community, and from about 1850 onward they had considerable success in heavy industries, particularly those connected with railways and shipbuilding.

Contact of the Parsis with their fellow countrymen appears to have been almost completely severed until the end of the 15th century, when, in 1477, they sent an official mission to the remaining Zoroastrians in Iran, a small sect called Gabars by the Muslim overlords. Until 1768 letters were exchanged on matters of ritual and law; 17 of these letters (*Rivayat*s) have survived. As a result of these deliberations, in which the Parsis' traditions were in conflict with the purer traditions of the Gabars, the Parsis, in the 18th century, split into two sects on questions of ritual and calendar. *See also* Zoroastrianism.

Parsippany–Troy Hills, township, Morris County, northeastern New Jersey, U.S., extending eastward from the Appalachian hills to the Passaic River swamps. Early settlers were Abraham and Zackariah Baldwin, missionaries; Zackariah's tombstone is in the old Parsippany Cemetery. Local iron-ore deposits attracted other settlers. About 1713 John Cobb set up a forge at what then became known as Forge Pond in Troy. In the mid-18th century, David and Samuel Ogden established the Boone Town Iron Work, the site of which is now covered by the Jersey City Reservoir. Historic houses include Beverwyck (home of Lucas von Beverhoudt and a meeting place for George Washington and his aides) and the home of William Livingston, New Jersey's first governor. Parsippany, which has had more than 50 different spellings, is derived from Parsippanong, an Indian name for a local stream, meaning perhaps "the Place Where the Waters Rush Through." The name Troy appears on pre-Revolutionary maps, but its origin is unknown. Originally, Parsippany and Troy Hills were included in Whippanong Township (renamed Hanover in 1740). They amalgamated and were incorporated in 1928 when Hanover Township was divided into smaller units. Mainly residential, the community has some light manufacturing including chemicals and cosmetics. Pop. (1980) 49,868.

parsley (*Petroselinum crispum,* or *Petroselinum sativum*), hardy biennial herbs of the family Apiaceae, or Umbelliferae, native to Mediterranean lands. Parsley leaves were used by the ancient Greeks and Romans as a flavouring and garnish for foods. The com-

pound leaves—deep green, tender, and curled or deeply frilled—that develop in a cluster the first season of growth are used fresh or dried today, the mildly aromatic flavour being popular in fish, meats, soups, sauces, and salads. Parsley is often the principal ingredient of bouquet garni and fines herbes.

In the second season of growth, seed stalks rise about three feet (one metre) tall and are topped by compound umbels of small, greenish-yellow flowers followed by tiny fruits, or seeds, similar to those of a carrot but without spines. Parsley seedlings are small and weak; they emerge with difficulty from heavy, crusty soils.

Parsley contains less than 0.5 percent essential oil, the principal component of which is a pungent, oily, green liquid called apiol.

Hamburg parsley, or turnip-rooted parsley (*P. crispum* var. *tuberosum*), is grown for its large, white, parsnip-like root, popular in Europe.

parsnip (*Pastinaca sativa*), member of the parsley family (Apiaceae), cultivated since ancient times for its large, tapering, fleshy white root, edible and with a distinctive flavour.

Parsnip (*Pastinaca sativa*)
G.R. Roberts

The root is found on roadsides and in open places in Great Britain and throughout Europe and temperate Asia. It was introduced in the Americas early in the 17th century and has become extensively naturalized in North America.

Parsnip seed is sown in the spring, thinly in rows about a half metre apart, and the plants are thinned to stand five to seven centimetres (two to three inches) apart in the row. At the end of summer the solids of the root consist largely of starch, but a period of low temperature changes much of the starch to sugar. The root is hardy and not damaged by hard freezing of the soil. It is sweet in flavour and is usually served as a cooked vegetable.

Parsons, Sir Charles Algernon (b. June 13, 1854, London—d. Feb. 11, 1931, Kingston, Jamaica), British engineer whose invention of a multi-stage steam turbine revolutionized marine propulsion.

Parsons entered the Armstrong engineering works at Newcastle upon Tyne in 1877. In 1889, after working for several other companies, he established his own works at Newcastle for the manufacture of steam turbines, dynamos, and other electrical apparatus.

The turbine Parsons invented in 1884 utilized several stages in series; in each stage the expansion of the steam was restricted to the extent that allowed the greatest extraction of kinetic energy without causing the turbine blades to overspeed. Parsons' turbine was fitted with a condenser in 1891 for use in electric generating stations, and in 1897 it was successfully applied to marine propulsion in the "Turbinia," a ship that attained a speed of 34½ knots, extraordinary for the time. The turbine was soon used by warships and other steamers.

In addition to the chairmanship of C.A. Parsons and Company, Parsons held directorial positions on the boards of several other electrical supply and engineering companies. He was made a fellow of the Royal Society (1898), was awarded the Royal Society's Rumford Medal (1902), and was president of the Institute of Marine Engineers (1905–06) and of the British Association (1919–20). He was knighted in 1911 and given the Order of Merit in 1927.

In addition to his turbine, Parsons invented a mechanical reducing gear, which, when placed between the turbine and a screw propeller, greatly improved the efficiency of both. He also invented nonskid automobile chains. A collection of his scientific papers and addresses was published in 1934.

Parsons, Elsie (Worthington) Clews (b. Nov. 27, 1875, New York City—d. Dec. 19, 1941, New York City), U.S. sociologist and anthropologist whose studies of the Pueblo and other Indians of the southwestern United States remain standard references.

After receiving her Ph.D. in sociology from Columbia University (1899), Elsie Parsons taught for several years at Barnard College, New York City. Her earlier writings reflect concern over restrictions imposed on women in many cultures and periods. *The Old-Fashioned Woman* (1913), containing her views on post-Victorian society, includes a discussion of sexual relations. Since the subject matter was considered scandalous, she published the work under the pseudonym John Main. Though she advocated women's rights, her fundamental concern came to be the individual's right of expression without limitation because of race, sex, or social class.

After a visit to the American Southwest (1915), where she met the anthropologists Franz Boas and Pliny E. Goddard, Elsie Parsons began a 25-year career of field study and writing on the Indians of the Americas. Aware of the need for exactness and detail, she collected a vast amount of Pueblo data that led to useful and influential syntheses of knowledge, culminating in *Pueblo Indian Religion*, 2 vol. (1939). Her interest in all possible influences on Pueblo peoples led her to investigations among Indians of the Great Plains and of Mexico, Peru, Ecuador, and the Caribbean. The Zapotec Indians of the state of Oaxaca, in Mexico, were the subject of her widely acclaimed work *Mitla: Town of the Souls* (1936). The results of her Andean researches appeared in *Peguche, Canton of Otavalo* (1945). She also did considerable work on the folklore of New World black people. At the close of her career, she became the first woman to be elected president of the American Anthropological Association, but she did not live to deliver her inaugural address, which dealt with the abuse of anthropology to further racist schemes.

Parsons, Robert, Parsons also spelled PERSONS (b. June 24, 1546, Nether Stowey, Somerset, Eng.—d. April 15, 1610, Rome), Jesuit who, with Cardinal William Allen, organized Roman Catholic resistance in England to the

Protestant regime of Queen Elizabeth I. He favoured armed intervention by the continental Catholic powers as a means of restoring Catholicism in England, and he probably encouraged the numerous plots against the Queen's life.

Early in 1575 Parsons was forced to resign his teaching position at the University of Oxford because his sympathies lay with the proscribed Roman Catholic religion. He went to Rome and there, on July 4, 1575, entered the Society of Jesus. In 1580 Parsons and his colleague Edmund Campion reentered England to minister to English Catholics. In a year of clandestine activity he did much to bolster their morale; he preached, wrote religious books and pamphlets, and set up a secret printing press.

After Campion's arrest in July 1581, Parsons returned to the Continent and was assigned by William Allen—an influential English Catholic living abroad—the task of directing from abroad the Jesuit mission to England. In 1588 he was sent to Spain, where he spent nearly nine years establishing seminaries for English priests at Valladolid, Seville, and Madrid. He died at the English College in Rome.

Parsons wrote many incisive works. His *Christian Directorie* (1585) became a devotional classic for Protestants as well as for Catholics.

Parsons, Talcott (b. Dec. 13, 1902, Colorado Springs, Colo., U.S.—d. May 8, 1979, Munich), U.S. sociologist and scholar whose theory of social action influenced the intellectual bases of several disciplines in modern sociology. His work is concerned with a general theoretical system for the analysis of society rather than with narrower empirical studies.

After receiving his B.A. from Amherst College (1924), Parsons studied at the London School of Economics and at the University of Heidelberg, where he received his Ph.D (1927). He joined the faculty of Harvard University as instructor in economics; he began to teach sociology in 1931, became full professor in 1944, and was appointed chairman of the new department of social relations in 1946, a post he held until 1956. He remained at Harvard until his retirement in 1973. Parsons served as president of the American Sociological Society in 1949. He united clinical psychology and social anthropology with sociology, a fusion still operating in the social sciences.

In his first major work, *The Structure of Social Action* (1937), Parsons drew on elements from the works of several European writers (Alfred Marshall, Vilfredo Pareto, Émile Durkheim, and Max Weber) to develop a common systematic theory of social action based on a voluntaristic principle (*i.e.*, the choices among alternative values and actions must be at least partially free). Parsons defines the locus of sociological theory as residing not in the internal field of personality as developed by Freud and Max Weber but in the external field of institutional structures developed by society, operating to determine action and deriving continuity through action. In *The Social System* (1951), he turned his analysis to large-scale systems and the problems of the social order, integration, and equilibrium. He advocated a structural-functional analysis, a study of the ways in which the interrelated and interacting units that form the structures of a social system contribute to the development and maintenance of that system.

Other works by Parsons include *Essays in Sociological Theory* (1949; rev. ed. 1954), *Structure and Process in Modern Societies* (1960), *Societies: Evolutionary and Comparative Perspectives* (1966), *Sociological Theory and Modern Society* (1967), *Politics and Social Structure* (1969), and *The American University* (1973; with Gerald M. Platt and Neil J. Smelser).

Critical assessments of Parsons' work, spanning nearly half a century at Harvard, have been published in two volumes of essays in his honour by sociologists who were former students or colleagues: *Stability and Change* (Bernard Barber, Alex Inkeles, eds.; 1971) and *Explorations in General Theory in Social Sciences* (Jan J. Loubser, Rainer C. Baum, eds.; 1971).

Parson's Cause, dispute involving Anglican clergy in colonial Virginia, arising (1755, 1758) when laws commuted clerical salaries, previously paid in tobacco, to currency at the rate of twopence a pound when tobacco was selling at sixpence a pound. A royal veto (1759) encouraged the clergy to sue for back pay. In the most publicized case (1763), Patrick Henry defended a Hanover County parish against a suit by the Rev. James Maury, assailing the crown interference and inducing the jury to return only one penny damages for the plaintiff. After a general twopenny act (1769) that reflected going rates, the clergy gave up their protest.

Parsons table, also called T-SQUARE TABLE, simple, sturdy rectangular table having straight lines, overall flush surfaces, and square legs that form the four corners of the top and whose diameter is identical with the thickness of the top. It is not certain who designed the Parsons table, and it may have been the result of a class project, but prototypes exist in the early work of both the French interior designer Jean-Michel Frank (1896–1941) and the U.S. industrial and motion-picture interior designer Joseph B. Platt (1895–1968), both of whom were connected with the Paris branch of the Parsons School of Design in the 1920s and early 1930s.

The earliest versions were small, square occasional tables constructed of solid wood and covered with such textured surfaces as parchment, snakeskin, decoupage, straw marquetry, leather, sharkskin, or eggshell lacquer. Later, square and oblong models of various sizes often made of printed composition board or plastic, served as desks, sideboards, and game, lamp, and dining tables.

Pārśvanātha, also called PARŚVA, 23rd Tīrthaṅkara, or saint, of the present age, according to the Jaina religion of India. Pārśvanātha (Sanskrit: Lord Serpent) was the first Tīrthaṅkara for whom there is historical evidence, but what is known of his life is intricately interwoven with myth and legend. He is said to have preceded by about 250 years Mahāvīra, the most recent Tīrthaṅkara, who

died probably in 527 BC. Mahāvīra's parents followed the teachings of Pārśvanātha, and Mahāvīra himself is said to have joined the religious order founded by Pārśvanātha for some time. The four vows that Pārśvanātha made binding on members of his community (not to take life, not to steal, not to lie, not to own property) became, with the addition of the explicitly stated vow of celibacy introduced by Mahāvīra, the five great vows (*mahāvrata*s) of later Jainism. Pārśvanātha allowed monks to wear an upper and lower garment, while Mahāvīra himself gave up clothing. The two sets of views were eventually reconciled, and the followers of Pārśvanātha were won over to Mahāvīra's reforms.

The legends surrounding Pārśvanātha emphasize his association with serpents. His mother is said to have seen a black serpent crawling by her side before his birth, and in sculpture and painting he is always identified by a canopy of snake hoods shown over his head. According to accounts in the Jaina text the *Kalpa-sūtra*, Pārśvanātha once saved a family of serpents that had been trapped in a log in an ascetic's fire. The snake, later reborn as Dharaṇa, the lord of the underworld kingdom of *nāga*s (snakes), sheltered Pārśvanātha from a storm sent by an enemy demon.

Partāpgarh, also spelled PARTĀBGARH, or PRATĀPGARH, town, Chittorgarh district, Rājasthān state, northwestern India. The town was founded in 1689 and was the capital of the former princely state of Partābgarh (founded in the 15th century), which became part of the state of Rājasthān in 1948. Historic monuments include a palace and several ancient Jaina and Hindu temples. Partāpgarh is an agricultural market centre, with handloom weaving and cotton-ginning industries. Partāpgarh has a government college affiliated with the University of Rājasthān. Pop. (1981) 22,903.

Partāpgarh, also spelled PARTĀBGARH, or PRATĀPGARH, district, Uttar Pradesh state, northern India. Part of the Ganges alluvial plain, it is 1,440 sq mi (3,730 sq km) in area and is bounded on the southwest by the Ganges River and drained by one of its tributaries, the Sai. The district is fertile and partially forested, although there are small, barren saline areas. Rice, barley, millet, and sugarcane are grown, and hemp and hides are produced. Salt, potassium nitrate, and limestone are mined. Bela Pratāpgarh, the district headquarters, lies on the Sai River at a junction of roads and rail lines and is a trade centre for agricultural products. Pop. (1981) Bela Pratāpgarh town, 49,932; district, 1,801,049.

partbook, usual form in which vocal or instrumental polyphonic music was handwritten or printed in the 15th and 16th centuries. Each partbook contained the notation of only one voice, or part. The parts of madrigals, however, were sometimes published crosswise on single sheets, which allowed each of the singers seated around a rectangular table to sing from his particular part. Most commonly there were four partbooks: *cantus* (also *discantus* or *superius*), *altus, tenor,* and *bassus;* additional parts were either indicated *quinta vox,* etc., or were subdivisions of one of the principal parts—*e.g., cantus* I and *cantus* II.

Partch, Harry (b. June 24, 1901, Oakland, Calif., U.S.—d. Sept. 3, 1974, San Diego, Calif.), visionary and eclectic composer and instrument builder, largely self-taught, whose compositions are remarkable for the complexity of their scores (each instrument has its own characteristic notation, often involving 43 tones to each octave) and their employment of unique instruments of his invention. Partch's early works are mainly vocal, based on texts collected during his travels as a hobo during the Depression (*The Letter, a Depression Message from a Hobo Friend,* 1943; *8 Hitchhiker Inscriptions from a California Highway Railing*).

Later his interest in mythology and the occult led him to the magical sounds of common materials such as light bulbs and bowls. Instruments such as the boo (bamboo marimba, 1955–56), marimba eroica (1951–55, the largest plank 8 feet [2.4 metres] long), cloud-chamber bowls, mazda marimba, and many others resulted; some of these were exhibited at the San Francisco Museum of Art (1966) and at the Whitney Museum of American Art in New York.

Typical of his works of the 1950s are *Oedipus* (1951; Partch's first large dramatic work), the theatre pieces *Plectra and Percussion Dances* (1952), the dance satire *The Bewitched* (1955), and the soundtrack of the film *Windsong* (1958). The enormous suite *And on the Seventh Day Petals Fell on Petaluma* (1963–64, revised 1966) comprises 23 one-minute duets and trios among 20 instruments, followed (by means of electronic dubbing) by 10 quartets and quintets and a final septet. The traditional process of development is ignored; musical ideas are simply stated, then abandoned.

Later Partch was involved with "tactile" theatre pieces, which have the nature of rituals. In 1949 he summarized his esoteric theories in a book, *The Genesis of a Music.* In 1953 he began issuing his own recordings, and in 1966 he won an award from the National Institute of Arts and Letters.

Parteciaco FAMILY, also spelled PARTECIPAZIO, noted Venetian family that produced seven doges between 810 and 942, as well as many bishops and church officials.

The first *dux*, or doge, in the family was one Ursus (or Orso I Parteciaco), who ruled from 727 to 739; but the real founder of the dynasty was Agnello Parteciaco (died 827). Opposing a faction that had placed Venice under the control of Charlemagne's son Pepin, Frankish king of Italy, Agnello moved the government from the island of Malamocco (now Lido) to its present site on the Rialto group of islands, where political independence could be more easily maintained. He undertook the building of many bridges connecting the islands and began the construction of the first Doges' Palace. A merchant as well as a statesman, he obtained important commercial privileges from the Byzantine emperors Leo V the Armenian and Michael II.

Agnello was succeeded by his sons Giustiniano and Giovanni I. Giustiniano is known to economic historians because of his will, which contained large bequests of pepper and other spices, demonstrating that Venice was already engaged in large-scale trade with the Levant in the early 9th century. In 828, during Giustiniano's reign, the remains of St. Mark were smuggled out of Alexandria and the building of a basilica was begun on the site of the present St. Mark's to house the relics. During the rule of Orso II (864–881), many reforms were accomplished, including a reorganization of the national church.

parterre, the division of garden beds in such a way that the pattern is itself an ornament. It is a sophisticated development of the knot garden, a medieval form of bed in which various types of plant were separated from each other by dwarf hedges of box, thrift, or any low-growing controllable hardy plant.

As the patterned area became of greater importance in the 16th century, it became necessary to make it more permanent and precise than was possible with plants. The hedges were replaced by wooden or leaden shapes or by lines of shells or coal, and the areas between were filled with coloured sand or stone chips. The design and making of parterres was a principal gardening skill in the late 17th century, and writers distinguished many sorts, one of which was a plain bowling green of turf. At the end of the 16th century the English philosopher Francis Bacon was the first of many to complain of the artificiality of these gardens, and, with the advent of the *jardin anglais* (*q.v.*) in the 18th century, the elaborate parterre disappeared until the 19th century, when it returned in the form of "carpet-bedding."

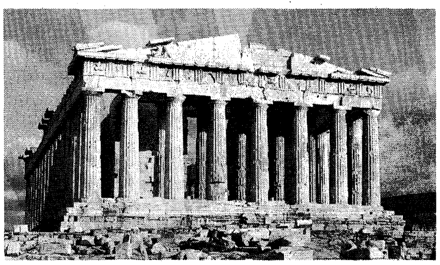
Parthenius OF NICAEA (fl. 1st century BC, Rome), Greek poet and grammarian, described as the "last of the Alexandrians."

Born in Nicaea in Asia Minor, Parthenius was captured in the third Mithradatic war and taken to Italy, where he became Virgil's teacher in Greek. His collection of 36 love stories made for the poet Cornelius Gallus has survived, and fragments from two funeral poems, one on his wife Arete, have come to light in papyri. He also wrote an encomium of the same lady in three books. His poems were favourite reading of the emperors Tiberius and Hadrian.

parthenocarpy, development of fruit without fertilization. The fruit resembles a normally produced fruit but is seedless. Varieties of the pineapple, banana, cucumber, grape, orange, grapefruit, persimmon, and breadfruit exemplify naturally occurring parthenocarpy. Seedless parthenocarpic fruit can be induced in nonparthenocarpic varieties and in naturally parthenocarpic varieties out of season by a type of artificial pollination with dead or altered pollen or by pollen from a different type of plant. The application of synthetic growth substances in paste form, by injection, or by spraying, also causes parthenocarpic development.

parthenogenesis, biological reproduction that involves development of a female (rarely a male) gamete (sex cell) without fertilization. It occurs commonly among lower plants and invertebrate animals, particularly rotifers, aphids, ants, wasps, and bees. An egg produced parthenogenetically may be either haploid (*i.e.,* with one set of dissimilar chromosomes) or diploid (*i.e.,* with a paired set of chromosomes).

Parthenon, chief temple of the Greek goddess Athena on the hill of the Acropolis at Athens. It was built in the mid-5th century BC and is generally considered to be the culmination of the development of the Doric order, the simplest of the three classical Greek architectural orders. The name Parthenon refers to the cult of Athena Parthenos (Athena the Virgin) that was associated with the temple.



Parthenon, on the Acropolis, Athens, by Ictinus and Callicrates, 447–432 BC
Alison Frantz

Directed by the Athenian statesman Pericles, the Parthenon was built by the architects Ictinus and Callicrates under the supervision of the sculptor Phidias. Work began in 447 BC, and the building itself was completed by 438 BC. The same year a great gold and ivory statue of Athena, made by Phidias for the interior, was dedicated. Work on the exterior decoration of the building continued until 432 BC.

Although the rectangular white marble Parthenon has suffered damage over the centuries, including the loss of most of its sculpture, its basic structure has remained intact. A colonnade of fluted, baseless columns with square capitals stands on a three-stepped base and supports an entablature, or roof structure, consisting of a plain architrave, or band of stone; a frieze of alternating triglyphs (vertically grooved blocks) and metopes (plain blocks with relief sculpture, now partly removed); and, at the east and west ends, a low triangular pediment, also with relief sculpture (now mostly removed). The colonnade, consisting of 8 columns on the east and west and 17 on the north and south, encloses a walled interior rectangular chamber, or cella, originally divided into three aisles by two smaller Doric colonnades closed at the west end just behind the great cult statue. The only light came through the east doorway, except for some that might have filtered through the marble tiles in the roof and ceiling. Behind the cella, but not originally connected with it, is a smaller, square chamber entered from the west. The east and west ends of the interior of the building are each faced by a portico of six columns. Measured by the top step of the base, the building is 101.34 feet (30.89 metres) wide and 228.14 ft long.

The Parthenon embodies an extraordinary number of architectural refinements, which combine to give a plastic, sculptural appearance to the building. Among them are an upward curvature of the base along the ends and repeated in the entablature; an imperceptible, delicate convexity (entasis) of the columns as they diminish in diameter toward the top; and a thickening of the four corner columns to counteract the thinning effect of being seen at certain angles against the sky.

The sculpture decorating the Parthenon rivalled its architecture in careful harmony. The metopes over the outer colonnade were carved in high relief and represented, on the east, a battle between gods and giants; on the south, Greeks and centaurs; and on the west, probably Greeks and Amazons. Those on the north are almost all lost. The continuous, low-relief frieze around the top of the cella wall, representing the annual Panathenaic procession of citizens honouring Athena, culminated on the east end with a priest and priestess of Athena flanked by two groups of seated gods. The pediment groups, carved in the round, show, on the east, the birth of Athena and, on the west, her contest with the sea-god Poseidon for domination of the region around Athens. The entire work is a marvel of composition and clarity, which was further enhanced by colour and bronze accessories.

The Parthenon remained essentially intact until the 5th century AD, when Phidias' colossal statue was removed and the temple was transformed into a Christian church; by the 7th century, certain structural alterations in the inner portion had also been made. The Turks, after their capture of Athens in 1458, adopted the Parthenon as a mosque, without material change except for the raising of a minaret at the southwest corner. During the bombardment of the Acropolis in 1687 by Venetians fighting the Turks, a powder magazine located in the temple blew up, destroying the centre of the building. In 1801–03, a large part of the sculpture that remained was removed, with Turkish permission, by the English nobleman Thomas, Lord Elgin, and sold in 1816 to the British Museum in London. Other sculptures from the Parthenon are now in the Louvre, in Copenhagen, and elsewhere, but many are still in Athens.

Parthenopean Republic, Italian REPUBBLICA PARTENOPEA, French RÉPUBLIQUE PARTHÉNOPÉENNE, short-lived republic in Naples proclaimed on Jan. 23, 1799, after a popular uprising of pro-French republicans resulted in the ouster of King Ferdinand IV. A counterrevolution the same year, aided by a papal army and an English fleet under Horatio Nelson and marked by wholesale butcheries of the republicans, resulted in the eventual return of Ferdinand to Naples in 1802, sanctioned by the Peace of Amiens. In 1806 Napoleon revenged himself by sending an invasion force under his brother Joseph, who was proclaimed king of Naples on March 30, 1806. Ferdinand fled to Sicily.

Parthia, ancient land corresponding roughly to the modern region of Khorāsān in Iran; the term is sometimes also used in reference to the Parthian Empire (247 BC–AD 224). The first certain occurrence of the name is as Parthava in the Bīsitūn inscription (*c.* 520 BC) of the Achaemenian king Darius I, but Parthava may be only a dialectal variation of the name Parsa (Persian).

Nothing is known of the history of Parthia while it was part of a satrapy of the Achaemenian Empire. It was joined to Hyrcania (present Gorgān, Iran) in the time of Alexander the Great, and the two remained together as a province of the Seleucid kingdom. During the reigns of Seleucus I (312–281 BC) and Antiochus I Soter (281–261) the Parni (Aparni) nomads probably moved from Central Asia into Parthia and seem to have adopted the speech of the Parthians and been absorbed into the settled population.

Traditionally, the first ruler of the Parthians and founder of the Parthian Empire, Arsaces I, was a governor under Diodotus, king of the Bactrian Greeks, who revolted and fled westward to establish his own rule. By 200 BC Arsaces' successors were firmly established along the southern shore of the Caspian Sea. Later, through the conquests of Mithradates I (reigned 171–138 BC) and Artabanus II (reigned 128–124 BC), all of the Iranian Plateau and the Tigris-Euphrates Valley came under Parthian control. The Parthians, however, were troubled by nomad attacks on their northeastern borders and also by the threat of Roman domination. Their most famous victory over Roman forces was at Carrhae (Harran) in 53 BC. Although one of their capitals, Ctesiphon, was later occupied by the Romans, the Parthians were successful in at least setting a limit to Roman expansion eastward.

The earliest Parthian capital was probably at Dara (modern Abivard); one of the later capitals was Hecatompylos, probably near modern Dāmghān. The empire was governed by a small Parthian aristocracy, which successfully made use of the social organizations established by the Seleucids and which tolerated the development of vassal kingdoms. Although not an inventive people, the Parthians' control of most of the trade routes between Asia and the Greco-Roman world brought them great wealth, which they used on their extensive building activities. The empire lacked tight internal control, however, and in AD 224 Ardashīr, a local ruler in southern Iran, revolted and established the Sāsānian Empire.

Parthian language, Middle Iranian language that originated in the ancient province of Parthia (mainly the northeastern corner of modern Iran) and became the official language of the Arsacid period of Persian dynastic history (2nd century BC to 3rd century AD). Among the earliest records of the language are more than 2,000 ostraca (inscribed pottery fragments), largely records of wine deliveries dating from the 1st century BC, which were discovered in Soviet excavations (1949–58) at Nisa, an Arsacid capital near present-day Ashkhabad in the Turkmen S.S.R. Parthian is also attested by inscriptions of the first Sāsānian kings (224–303), which were accompanied by a Middle Persian version. Manichaean Parthian literature is a very rich source for the language and includes the outstanding hymn cycles of the poet Mar Ammo (second half of the 3rd century). Parthian script was derived from the Aramaic alphabet.

Parti Québécois, English QUEBEC PARTY, minor Canadian political party founded in 1968 by René Lévesque and other French Canadian separatists in the largely French-speaking province of Quebec.

In 1968 Lévesque merged his Mouvement Souveraineté-Association, a movement advocating Quebec sovereignty in a new kind of looser association of Canadian provinces, with other separatist groups to form the Parti Québécois. Unsuccessful in the Quebec provincial elections of 1970 and 1973, the party in 1976 won 71 of 110 seats in the provincial National Assembly. The following year, with Lévesque as premier, the Assembly decreed French the only official language of government and business in Quebec. In 1980 Lévesque hazarded a referendum seeking approval for the provincial government to negotiate a new status and relationship with the rest of Canada. The separatists lost, garnering only 40.4 percent of the vote; even a small majority of French speakers voted against the proposal.

Although the party won 80 of 122 seats in the 1981 election, membership declined thereafter as separatist fervour waned. In 1985 the independence plank was removed from the party's platform, and, following a series of defections and by-election defeats that year, Lévesque resigned. Elections in December 1985 swept the party from power.

Parti Radical-Socialiste (France): *see* Radical-Socialist Party.

Parti Républicain (France): *see* Republican Party.

Parti Rouge, English RED PARTY, radical party formed in Lower Canada (now in Quebec) in about 1849 and inspired primarily by the French-Canadian patriot Louis Joseph Papineau. In general the Parti Rouge advocated a more democratic system of government, with a broadly based electorate, and the abolition of the old feudal laws that still survived in Quebec. It also opposed the political influence of the Roman Catholic clergy in French Canada.

In later years the party became more moderate, and in the 1860s it merged with the Liberal Party of Quebec.

partial derivative, in mathematics, rate of change of a function of several variables with respect to changes in one only—that is, in the case when all variables except one are held constant. Given a function $f(x, y) = z$, the partial derivative of z with respect to x, holding y constant, may be denoted by z_x. For example, if $z = 2x^2y + 3$, then $z_x = 4xy$ and $z_y = 2x^2$. Second partial derivatives and those of higher orders may also be taken.

partial differential equation, in mathematics, equation relating a function of several variables to its partial derivatives. A partial derivative of a function of several variables expresses how fast the function changes when one of its variables is changed, the others being held constant (*see* ordinary differential equation). The partial derivative of a function is again a function, and, if $f(x, y)$ denotes the original function of the variables x and y, the partial derivative with respect to x—*i.e.,* when only x is allowed to vary—is written as $f_x(x, y)$, $\partial f/\partial x$, or $f_1(x, y)$, in which the numerical subscript corresponds to the position of the variable in the parentheses. The operation of finding a partial derivative can be applied to a function that is itself a partial derivative of another function to get what is called a second-order partial derivative, written as $f_{xy}(x, y)$, $\partial^2 f/\partial y \partial x$, or $f_{12}(x, y)$, in the case in which the partial derivative with respect to y of the function $f_x(x, y)$ is to be found. The order and degree of partial differential equations are defined the same as for ordinary differential equations.

In general, partial differential equations are difficult to solve, but techniques have been developed for simpler classes of equations called linear, and for classes known loosely as "almost" linear, in which all derivatives of order higher than one occur to the first power and their coefficients involve only the independent variables.

particle, body of negligible dimensions but usually definite mass. If a body does not rotate or if rotational effects can be neglected, the body can be treated as a single particle with all its mass concentrated at its centre of mass. If rotational effects cannot be neglected, the body must be treated as a system of particles, using rigid-body equations that are extensions of Newton's equations. Whether a body should be treated as a particle or a rigid body depends on the dimensions of the body compared with the distances traveled and the nature of the paths traversed. Stars and planets are many thousands of kilometres in diameter but are so small compared with their orbital paths that they may be treated as particles in space; the rotation of a cannonball has negligible influence on its motion as a projectile but cannot be neglected if it is rolling on the ground.

particle accelerator, any of various devices that increase the speed and kinetic energy of electrically charged atomic and subatomic particles. Particle accelerators serve as important research tools in nuclear and high-energy physics, providing investigators with a means of studying the structure and properties of the atomic nucleus and the interactions of subatomic particles. They also are employed for industrial radiography, cancer therapy, radioactive isotope production, and various other purposes.

A brief treatment of particle accelerators follows. For full treatment, *see* MACROPAEDIA: Particle Accelerators. For recent developments in the technology of particle accelerators, *see* the article "Physics" in the BRITANNICA WORLD DATA ANNUAL.

In 1932 the British physicists J.D. Cockcroft and E.T.S. Walton first observed the disintegration of a nucleus by artificially accelerated particles. Thereafter, the importance of accelerators in basic research became comparable to that of microscopes and telescopes. The particles accelerated are commonly the nuclei of light atoms, such as the proton from hydrogen or the alpha particle from helium; heavier nuclei may also be used, as well as electrons, which are lighter than any nucleus. The energy of an accelerated particle is expressed in units of electron volts (eV). Frequently employed multiple units are kiloelectron volts (keV; 1,000 eV), megaelectron volts (MeV; 1,000,000 eV), and gigaelectron volts (GeV; 1,000,000,000 eV).

Accelerators are generally differentiated according to the arrangement of their accelerating electric fields. They are classified into two basic types: linear and cyclic.

Linear accelerators. In a linear accelerator (commonly abbreviated linac), the path of the particle is a straight line and its final energy is the sum of the voltages generated by the accelerating mechanisms along that line. There are two different kinds of linear devices—the traveling-wave linear accelerator and the standing-wave linear accelerator. The first variety utilizes a traveling longitudinal electromagnetic field to impart kinetic energy to electrons. Its design and operation are based on the generation of the proper electromagnetic wave with electrical power of large peak values at microwave frequencies (*e.g.,* 3,000 megahertz). The acceleration chamber of this kind of machine is an evacuated cylindrical pipe that functions as a waveguide for the accelerating field. The phase velocity of an electromagnetic wave in a cylindrical pipe is greater than the speed of light in free space. Consequently, the wave must be slowed down by the insertion of metal irises several centimetres apart inside the pipe. Pulses of electrons are injected into the pipe at speeds approximately half that of light. During the first stage of acceleration, the electrons are made to gather in bunches, which are then accelerated to nearly the speed of light. Subsequently, the electrons move with the crest of the electromagnetic wave. The largest traveling-wave linac yet constructed is able to accelerate electrons to more than 20 GeV.

The second type of linear device accelerates protons by means of standing electromagnetic waves. Protons are roughly 2,000 times more massive than electrons and thus require a different mode of acceleration. A standing-wave linac consists of a cylindrical vacuum tank that houses a series of drift tubes separated by gaps. A particle injected into the tank is accelerated each time it passes across one of the gaps by an electric field generated by an electromagnetic wave of radio frequency. The successive drift tubes permit the particle to coast from one accelerating gap to another without losing velocity. The most powerful standing-wave linacs are capable of about 200 MeV. Accelerators of this kind are commonly used as a source of protons for higher-energy cyclic devices.

Cyclic accelerators. These accelerators are so designed that the path of a particle is bent by the action of a magnetic field into a spiral or a closed curve that is roughly circular. The particle travels many times through the accelerating mechanisms; the final energy depends on the magnitude of the voltage and the number of times the particle passes through. Cyclic accelerators include a variety of devices, the most important of which are the cyclotron and the synchrotron.

In a cyclotron two semicircular hollow electrodes called dees are arranged within a vacuum chamber between the poles of a magnet. Protons, deuterons, or other heavier ions starting near the centre circulate inside the electrodes, crossing the gap between them twice per revolution. A high-frequency potential difference impressed across the dees will produce repeated acceleration at each crossing provided its frequency is very close to the circulation frequency of the ions. The resultant path of the particles is a spirallike series of semicircles of increasing radius. Some means of focusing is required; otherwise an ion will spiral into the dees and be lost. By arranging a small radial decrease in the magnetic field, a slight outward curvature to the magnetic field is obtained. The magnetic force on the particle then always has a small component toward the median plane of motion and pushes the particle back toward the plane. This is important because the total length of the spiral path that the particle traverses may be a hundred metres or more. The necessity of this focusing, together with the effect of relativity in increasing the mass of the particle as its energy increases, makes inevitable a difference between the circulation frequency of the particle and the oscillation frequency of the accelerating potential over a considerable portion of the path. Under these circumstances the particle will get out of step with the dee voltage. The effect accumulates with each revolution, and, if many revolutions are made, the particle will ultimately arrive at a phase in which the voltage is of the opposite sign, which means that the particle will be decelerated. Hence, a large number of revolutions has to be avoided and a very high voltage must be put on the dees. Because of this, most cyclotrons can attain only about 10 to 50 MeV, though a few are capable of higher energies.

A device known as the synchrocyclotron was designed to overcome the energy limitation of the cyclotron. A synchrocyclotron provides a means of varying the frequency applied to the dees in accordance with the needs of magnetic focusing and the relativistic increase in the mass of a particle. The scheme is made practical by the existence of phase-stable orbits. Such an orbit is one in which the circulation frequency of a particle is the same as the oscillation frequency of the dee voltage. The circulation frequency of the particle decreases with increasing radius because of the decreased value of the magnetic field and the relativistic increase in the mass of the particle. When the frequency of the oscillation approaches the circulation frequency of the particles in the centre of the machine, some of the particles are caught in phase-stable orbits. As the frequency of the oscillator is decreased, the particles tend to stay in these orbits by absorbing energy from the electric field of the dees. By keeping in synchronism with the radio frequency, the particles gain energy and move in orbits of increasing radius up to the maximum allowed by the magnet design. An important advantage of the synchrocyclotron is that there is no limit on the number of revolutions the particle may make to obtain the desired energy.

The synchrotron employs the principle of phase stability to maintain synchronism between the circulating particle and an applied high-frequency electric field. A magnetic field deflects particles in a circular orbit, and the intensity of the field is modulated cyclically from low to high field strength to maintain orbits of nearly constant radius as the particle gains energy. Since the magnetic field is used to maintain the orbit but not for acceleration, magnetic field lines are needed only in the annular region defined by the orbit. This field is produced by a ring magnet. The relatively low weight and cost of such a magnet, compared with the solid-core magnets required for cyclotrons, give the synchrotron a significant economic advantage for high particle energies. Acceleration is effected by radio-frequency voltages. The peak accelerating voltage is ordinarily about twice as large as the average energy gain per turn would require to provide the margin for phase stability.

Electrons are well-suited for acceleration in a ring-shaped magnetic field because they acquire a speed essentially equal to the speed of light at relatively low energies; for higher energies, they circulate about an orbit of fixed radius at constant frequency. Synchrotrons designed specifically for electron acceleration, however, have certain limitations. When deflected in a magnetic field, electrons radiate electromagnetic energy in a continuous spectrum extending into the X-ray region, with an intensity that increases with the third power of electron energy. This radiated energy must be restored by the high-frequency accelerating system. The practical limit on the energy of electron synchrotrons is thus set by the cost of the system.

The highest-energy accelerators so far constructed are proton synchrotrons. Whereas the most powerful electron synchrotron can attain energies of only about 12 GeV, the largest proton devices regularly operate at 800 GeV. The mode of operation of both types of synchrotrons is similar, but there are certain key differences. The speed of a proton does not approach that of light until its energy exceeds 1 GeV, and so the frequency of the accelerating voltage has to be modulated to keep it proportional to the speed of the particle during the initial stage of the acceleration process. Furthermore, a proton does not lose a substantial amount of energy by radiation at energies attainable by existing techniques. As a consequence, the limit on the energy of a proton synchrotron is set by the cost of the magnet ring, which increases only as the first power of the energy or even more slowly.

Over the years researchers have developed several other kinds of accelerators. One of these is the microtron, a cyclic electron accelerator that somewhat resembles a cyclotron in operation. Microtrons have the advantage that the accelerated particles are easily guided out of the magnetic field. Another device used for particle acceleration is the storage ring, which typically consists of a pair of annular vacuum chambers. Such devices, however, are more commonly utilized for storing beams of high-energy particles and effecting near head-on collisions between them. These collisions make it possible to examine interactions at energies not economically feasible with other types of accelerating devices.

particleboard, construction material consisting of flakes, shavings, or splinters of wood glued together in the form of sheets. The particles are mixed with resin, water repellents, and mildew inhibitors, formed into mats, hot-pressed, trimmed to the appropriate size and shape, and finally sanded. Particleboard was developed in the 1940s, when suitable synthetic resins became available; it has made possible the use of residues from lumber production and logging. Particleboard is usually manufactured in thicknesses of 6–25 mm (1/5–1 inch) and in three grades of density. It may be covered with resin-impregnated paper, plastics, or other finishes.

particularism, also called HISTORICAL PARTICULARISM, school of anthropological thought associated with the work of Franz Boas and his students (among them Ruth Benedict, Margaret Mead, and A.L. Kroeber), whose studies of culture emphasized the integrated way of life distinctive of a people. As a philosophy, particularism differed from evolutionism, diffusionism, and geographical determinism, all of which had their adherents at the time in their approach to the question of the existence of general laws of culture.

Boas' own work emphasized studies of individual cultures, each based on its unique history. The anthropologist's primary assignment, in Boas' view, was to describe the particular characteristics of a given culture, with a view toward reconstructing the historical events that led to its present structure. Implicit in this approach was the notion that hypotheses regarding evolutionary development and the influence of one culture on another should be secondary to the careful and exhaustive study of particular societies. Boas urged that the historical method, based on the description of particular culture traits and elements, supplant the comparative method of the evolutionists, who used their data to rank cultures in an artificial hierarchy of achievement. He rejected the assumption of a single standard of rationality to which all cultures could be compared. Under Boas' influence, the particularist approach dominated American anthropology for the first third of the 20th century.

parting, in metallurgy, separating silver from bullion or from doré (gold–silver bars) by placing them in a bath of hot, concentrated sulfuric acid or strong nitric acid to dissolve the silver. Since all gold ores contain some silver and silver ores some gold, the mixture of silver and gold must be purified and then parted. The silver forms water-soluble compounds, silver sulfate or silver nitrate, leaving a residue of gold that is filtered off and washed. The clear solution, containing the silver compounds, is electrolyzed or is treated with ferrous sulfate or copper or iron to precipitate the silver, which is then washed, dried, and melted down to give silver of 99.5 percent purity, or 995 fine.

Partisan, Serbo-Croatian PARTIZAN, member of a Yugoslav guerrilla force led by Josip Broz Tito and his Communists in World War II against the Axis powers and the royalist resistance force, the Chetniks. Germany and Italy invaded and occupied Yugoslavia in April 1941, but it was not until Germany invaded the Soviet Union in June of that year that the Yugoslavian Communists started organizing Partisan detachments to lead popular uprisings against the Axis occupation. By September 1941 a large part of both Serbia and Montenegro had been liberated by the Partisans and Chetniks, but these two movements soon became involved in a civil war with each other, mostly on the Chetniks' initiative, and in November 1941 the Germans drove both resistance forces out of Serbia. In the next two years the Partisans had difficult militarily struggles against the Germans, but their forces grew in size while those of the Chetniks lost ground. This was partly because the Partisans were able to attract Yugoslavs of all ethnic nationalities by their policy of unified resistance to the Axis invaders. This was in notable contrast to the Chetniks, who were Serbian-oriented and who were basically unwilling to fight the Germans.

By late 1943 it became clear to the Allies that the Partisans were fiercely resisting the Germans while many Chetniks were in fact collaborating with the latter. The Allied governments accordingly withdrew their support from the Chetniks and recognized Tito as the head of the Yugoslav resistance. Anglo-American arms and equipment thenceforth were supplied in ever-increasing amounts to the Partisans and became an important factor in the latter's growing military strength. By the end of 1943 the Partisans had grown to about 300,000 troops and were holding down about 20 German divisions. The Partisans provoked seven major German offensives, thus drawing large numbers of enemy forces from other Allied fronts. By the summer of 1944 the Partisans controlled most of the mountainous part of Yugoslavia. In October, Partisan forces took part in the liberation of Belgrade by the Soviet Red Army.

During the war the Partisans held two political conferences (Bihać, November 1942; Jajce, November 1943) at which they established local and federal provisional governments within the areas that they had liberated; the network of Partisan-controlled local governments contributed to the Communists' political success after the war. By 1945 Tito's Communists had established their political and military control over the entire country. The loyalty to Tito and the sense of nationalism that developed among the Partisans during the war enabled Tito to withstand Stalin's political attacks in 1948.

partition, in mathematics and logic, division of a set of objects into a family of subsets that are mutually exclusive and jointly exhaustive; that is, no element of the original set is present in more than one of the subsets, and all the subsets together contain all the members of the original set.

A related concept, central to the mathematical topics of combinatorics and number theory, is the partition of a positive integer—that is, the number of ways that an integer n can be expressed as the sum of k smaller integers. For example, the number of ways of representing the number 7 as the sum of 3 smaller whole numbers ($n = 7$, $k = 3$) is 4 ($5 + 1 + 1$, $4 + 2 + 1$, $3 + 3 + 1$, and $3 + 2 + 2$).

Partizansk, formerly (until 1972) SUCHAN, city, Primorsky Kray (region), far eastern Russian Soviet Federated Socialist Republic. It lies in the valley of the Partizanskaya River. It was formed in 1932 by the amalgamation of mining settlements that developed near mine shafts in a bituminous coal basin. A thermal power station serving the region is located in the northern suburb of Uglekamensk (formerly Severny [Northern] Suchan). Partizansk has clothing factories and a mining college. Pop. (1974 est.) 49,000.

partnership, voluntary association of two or more persons for the purpose of managing a business enterprise and sharing its profits or losses. In the usual partnership, each general partner has full power to act for the firm in carrying on its business; thus, partners are at once proprietors and also agents of their copartners. Not only is each partner individually liable to third persons for the obligations incurred for the firm, but each is equally liable for obligations incurred by copartners when they are acting within the scope of the firm's business.

If a partner has paid or been required to pay creditors of the firm from personal assets, other partners may be expected to contribute on an equal or some other agreed-upon basis. If copartners have become insolvent, however, this remedy to the problem of unlimited personal liability may be inadequate. The alternative of restricting a partner's liability to third persons on a pro rata basis or of limiting it to the property held in common never gained foothold in the common law. Unlimited personal liability has been one factor restricting the partnership form of business to small enterprises.

Unlike the corporation, the partnership is generally regarded merely as an aggregation of persons doing business under a common name and not as a legal entity separate and apart from its shareholders. The implication of this is that the earnings of the partnership will be taxed only as personal earnings of the partners. Although corporations are usually organized to have perpetual existence, partnerships may be dissolved at any time upon withdrawal of a partner and by operation of law upon the death of a partner. Dissolution may be avoided by issuing transferable shares, but this device is not feasible except by a large organization, in which, as in the case of a corporation, operating control can be centralized in a board of managers. *Compare* limited liability.

Parton, Sara Payson Willis, *née* GRATA PAYSON WILLIS, pseudonym FANNY FERN (b. July 9, 1811, Portland, Maine, U.S.—d. Oct. 10, 1872, New York City), American author who, under the pen name Fanny Fern, was one of the most popular American woman writers in the 19th century.

Parton's sketches, often dealing with domestic life, were originally published in periodicals in Boston and New York City. They were first collected in *Fern Leaves from Fanny's Port-Folio* (1853), which sold a remarkable 100,000 copies its first year. The success of this and other books led to an offer by the *New York Ledger* that made Parton one of the first woman newspaper columnists in America; from 1855 until her death, she reached an audience estimated at 500,000 readers weekly. Parton was married three times: in 1837 to Charles H. Eldredge (d. 1846), a banker; in 1849 to Samuel P. Farrington, a Boston merchant (divorced three years later); and in 1856 to James Parton (1822–91), a biographical writer.

Parton's writings are considered valuable not for their literary content or style but for their social history and as a mirror of popular taste in the mid-19th century. In addition to her articles, Parton wrote a number of bestselling books, including *Ruth Hall* (1855) and *A New Story Book for Children* (1864).

partridge, any of many small game birds native to the Old World and belonging to the family Phasianidae (order Galliformes). They are larger than quails, with stronger bills and feet. (For New World birds erroneously called partridges, *see* grouse; quail. For dwarf partridges of India called bush quail and for the Mexican bird called long-tailed partridge, *see* quail.)

The typical partridge of Europe is the gray partridge (*Perdix perdix*), called Hungarian (or hun) partridge in North America, where it was introduced in 1889 (Virginia) and again, much more successfully, in 1908–09 (Alberta). It ranges throughout the British Isles and across Europe to the Caspian region. The gray partridge has a reddish face and tail, gray breast,

barred sides, and a dark U shape on the belly; sexes look alike. The hen lays about 15 eggs in a grassy cup in grainfields or hedges. A large male is 30 cm (12 inches) long and may weigh 0.33 kg ($3/4$ pound). Gray partridges prefer farmlands, where family groups (coveys) forage for seeds and insects.

In the rock partridges (*Alectoris*), both sexes have red legs and bill, and the male has blunt leg spurs. The chukar (*A. chukar*), stocked in many countries, is native from southeastern Europe to India and Manchuria (Northeast Provinces). It has a brown back with strongly barred sides and a black-outlined whitish throat. The crested wood partridge, or roulroul (*Rollulus roulroul*), of Malaysia has an iridescent blue-green body, red feet and eye region, and crimson crest.

Francolins are partridges with leg spurs. The 5 Asian and about 35 African species of *Francolinus* are prized game birds, 25–40 cm (10–16 inches) long, with big bills and strong legs; most are an intricately patterned brown, but some are patterned in black, white, or red.

The snow partridge (*Lerwa lerwa*) of high mountains of south-central Asia resembles a ptarmigan in appearance and habits.

Partridge, Eric (Honeywood) (b. Feb. 6, 1894, Waimata Valley, Gisborne, N.Z.—d. June 1, 1979, Moretonhampstead, Devon, Eng.), New Zealand-born English lexicographer, best-known for his *A Dictionary of Slang and Unconventional English* (1937; revised ed. 1970).

Partridge served with the Australian Infantry in World War I and with the Royal Air Force in World War II. He was a fellow at the University of Oxford (1921–23), lectured at English universities, and then ventured into publishing with his Scholartis Press (1927–31). Thereafter, he was a free-lance lexicographer and author. *Usage and Abusage* (1942), *Shakespeare's Bawdy* (1947), *Origins: An Etymological Dictionary of Modern English* (1958; 4th ed., 1966), and *A Dictionary of Catch Phrases* (1977) were among his scholarly and lively books.

partridgeberry (*Mitchella repens*), North American plant of the madder family (Rubiaceae), growing in dry woods from southwestern Newfoundland to Minnesota and southward to Florida and Texas. It is evergreen, with nearly round, 18-millimetre (0.7-inch) leaves, often variegated with white lines; a slender, often whitish, trailing stem; and white flowers, often borne in pairs, which are replaced by scarlet, edible but almost tasteless berrylike drupes. The flowers occur in long-styled and short-styled forms, as in the primrose. The plant, also called checkerberry, squawberry, teaberry, running box, two-eyed berry, squaw vine, and twinflower, is a good wild-garden plant for shady places. It is popular in winter terrariums because of its diminutive size and attractive colour contrast of berries and leaves.

parturition, also called BIRTH, or CHILDBIRTH, the process of bringing forth an infant from the uterus.

A brief treatment of parturition follows. For full treatment, *see* MACROPAEDIA: Reproduction and Reproductive Systems.

Childbirth in humans is divided into two stages. The first stage, dilatation, is characterized by the opening up of the cervix until it is about 4 inches (10 cm) in diameter, large enough for an infant's head to pass through. Rhythmic muscular contractions of the uterus force the sac of amniotic fluid, which has held the fetus throughout pregnancy, down into the cervix and compresses its contents until it bursts. At the onset of labour, uterine contractions occur every 20 or 30 minutes and last about 40 seconds. When the cervical opening is fully dilated, contractions may recur every three minutes. The period of dilatation varies greatly; in women having their first baby it may take 14 hours, while in those who have borne several children it may require less than an hour.

In the second stage of labour, expulsion, the baby is pushed through the birth canal. In normal deliveries, the crown of the baby's head emerges first, followed by the shoulders, one at a time. The lower part of the baby's body slides out quickly. In first births, the expulsion of the child takes about an hour. Expulsion may be complicated by the incorrect positioning of the baby for delivery. In such cases, the child's position can be changed manually or with forceps. Sometimes, as when it is lying transversely across the mother's pelvis, the baby must be delivered surgically.

The pain of labour can be relieved by the use of analgesic drugs, but these pose some degree of danger to the mother and baby and must be used carefully. If the mother is unconscious owing to a general anesthetic, she will not be able to augment the uterine contractions by bearing down, nor will she experience the birth of the child. Local anesthetics in the genital and pelvic region are sometimes used instead.

The technique of natural childbirth was developed in the 1940s to reduce dependence on anesthesia. Because fear and tension are largely responsible for much of labour pain, pregnant women are often educated in the process of childbirth. In addition, they are taught exercises to strengthen the muscles involved in labour and breathing techniques to reduce pain. If a difficult delivery is expected, natural childbirth is not encouraged.

Several factors may lead to complications in childbirth—*e.g.*, abnormal bleeding, placenta previa (expulsion of the placenta before the child), knotting of the umbilical cord, failure of the mother's blood to clot, weak uterine contractions, and rupture of the uterus. If delivery through the birth canal is likely to prove hazardous to the mother or the child, a cesarean section is performed. This procedure involves making an abdominal incision in the mother through which the baby is removed. The type of incision that is involved in a modern cesarean section and the scar it leaves in the uterine wall usually do not prevent a woman from delivering naturally in subsequent births.

Paru River, Portuguese RIO PARU, river, northern Brazil, rising on the southern slopes of the Tumuc-Humac Mountains, on the Suriname border, and flowing for about 500 miles (800 km) south-southeastward through Pará state. It empties into the Lower Amazon River just above Almeirim. The Paru is navigable for 50 miles (80 km) above its mouth.

Parulidae, the songbird family of birds, order Passeriformes, consisting of the woodwarblers and bananaquits. The Parulidae comprise about 119 species of small, active birds, notable for their bright spring plumage and dazzling snatches of song, that live in the forests of the Western Hemisphere.

Songbird species range in size from 10 to 18.5 cm (4 to 7.5 inches) long. They have slender, pointed bills, pointed wings, and rounded tails. Most glean small insects among foliage of trees or shrubs; a few forage on the ground. The yellow-breasted chat (*Icteria virens*), the largest of the family, is an excellent mimic and a strong singer. The ovenbird (*Seiurus aurocapillus*), yellow throat (*Geothlypis trichas*), and American redstart (*Setophaga ruticilla*) are distinctive songsters with easily recognizable melodies.

Bananaquits (*Coereba*) and conebills (*Conirostrum*) of Latin America are sometimes given family rank (as the Coerebidae). The Parulidae belongs to the songbird suborder (Passeres).

parure, matched set of jewelry consisting of such pieces as earrings, bracelet, brooch, necklace, and ring. By the mid-17th century, jewels had ceased to be created as individual works of art expressing some idea or fancy and had instead become mere personal ornaments that were beautiful but lacking in any deeper significance. Consequently, as the forms of jewels tended to become stereotyped, the matching set of jewels, or parure, became the dominant style in jewelry.

In about 1700, parures consisted of earrings, brooch, necklace or clasp, ring, and sometimes shoulder brooches or buckles, all set with diamonds, either alone or in combination with rubies, topazes, sapphires, or emeralds. In the 18th century the kings of France had parures of great splendour, most made of diamonds

and including shoe buckles, coat decorations, insignia, and sword hilts. For state occasions, the 19th-century Napoleonic court imitated the parures of the ancien régime, with the addition of a jeweled coronet of classic form. Parures of semiprecious stones were made for everyday wear and for the less affluent. Parures continue to be a staple element in jewelry design.

Pārvatī (Sanskrit: "Daughter of the Mountain"), wife of the Hindu god Śiva (Shiva). Pārvatī is the benevolent aspect of the goddess Śakti and is sometimes identified with Umā. The legendary account of her marriage relates that she won Śiva's notice only after severe ascetic discipline. The couple had two children, the elephant-headed Gaṇeśa and the six-headed Skanda. Pārvatī is often represented in sculpture with Śiva—as an attendant figure, or looking on as he performs a miraculous feat, or engaged in a game with him in their mountain kingdom Kailāsa—and is always depicted as a mature and beautiful woman. The *Tantras*—texts of sects worshiping Śiva—

Parys, resort town, northern Orange Free State, South Africa. It is situated on the southern bank of the Vaal River. Parys was founded in 1873 and most likely named by a German surveyor named Schilbach, who had fought in the siege of Paris in 1870. Parys officially became a town in 1887. Tobacco, corn (maize), sorghum, and cattle are raised in the surrounding area. Industries produce processed tobacco, bolts and nuts, hosiery, baskets, farming implements, and milled flour. The Vaal River is dammed by a high barrage and is about ½ mile (0.8 km) wide at Parys. The river's banks have a luxuriant growth of willows, and there are a number of islands in the river that are tourist attractions. Parys lies on the national road from Bloemfontein to Johannesburg. Pop. (1984 est.) mun., 32,400.

Paryuṣaṇa (Sanskrit), Prākrit PAJJUSAṆA, a popular eight-day festival in Jainism, a religion of India. It generally is celebrated by members of the Śvetāmbara sect from the 13th day of the dark half of the month Bhādrapada (August–September) to the 5th day of the bright half of the month. Among Digambaras, a corresponding festival is called Daśalakṣaṇa, and it begins immediately following the Śvetāmbara Paryuṣaṇa.

Paryuṣaṇa closes the Jaina year. Jainas make confessions at the meetinghouse so that no quarrel is carried over into the new year, and many lay members temporarily live the lives of monks, an observance called *poṣadha*. The fourth day of Paryuṣaṇa coincides with the birth anniversary of Mahāvīra.

The last day of the festival, Bhadra-śukla-pañcamī ("Fifth Day of the Bright Fortnight of Bhādra"), is also an ancient Indian festival day known to Hindus as Ṛṣi-pañcamī ("The Fifth of the Seers"), the day on which Hindus pay homage to the seven seers, who are identified with the seven stars of the constellation Ursa Major, then visible. On that day Jainas distribute alms to the poor and take out a Jina (saviour) image in a procession that is headed by an ornamental pole called Indradhvaja ("Staff of Indra"). The *Kalpa-sūtra,* a sacred text that describes the lives of the Jinas, is read before the laity by monks, and the miniature paintings illustrating the incidents are shown and revered. The last day is a day of fasting, though the very pious observe a fast throughout the eight-day festival.

Pas-de-Calais, *département,* Nord-Pas-de-Calais *région,* northern France, extending southeast from the English Channel and separated from Belgium by Nord *département.* Created from the historic province of Artois (*q.v.*) and a part of Picardy, it has an area of 2,576 square miles (6,671 square km). The coastline runs north from the boundary of Somme *département* at the Authie River, past Le Touquet-Paris-Plage and Boulogne (*qq.v.*), to Cap Gris-Nez on the Strait of Dover (French Pas de Calais). It continues east-northeast past Calais (*q.v.*) to the estuary of the Aa River bordering Nord. Low and marshy to the south and northeast, the coast has high chalk cliffs around Cap Gris-Nez and Cap Blanc-Nez, facing the cliffs of Dover in England across the English Channel. Extending inland from the Boulogne region, the chalk hills of Artois rise to 700 ft (210 m) and are the watershed of several rivers flowing north to Flanders and south to the Canche, which enters the Channel at Le Touquet-Paris-Plage.

The climate is mild with moderate rainfall. Agriculture thrives: dairy farming and market gardening are intensively pursued in the coastal lowlands, on which large areas have been reclaimed and canalized. Inland, cattle are raised, and sugar beets, cereals, and fodder are grown.

The eastern half of the *département,* which embraces part of the coal basin extending across northern France into Belgium, is highly industrialized. The greatest number of pits is in the Béthune–Liévin–Lens–Hénin–Beaumont–Liétard area, in which coking plants, blast furnaces, steel mills, metalworks, and chemical installations are concentrated. The area is densely populated. Pas-de-Calais is skirted by the Lille–Paris motorway, which passes east of Arras, the capital, in which such industries as textiles and food processing long have been established. Textile, metal, and cement industries are among those in the Calais-Boulogne region. Calais, which, with Boulogne, receives most of the surface traffic from England, is France's major passenger harbour, while Boulogne is France's major fishing harbour.

The *département* has seven *arrondissements:* Arras, Béthune, Boulogne-sur-Mer, Calais, Lens, Montreuil, and Saint-Omer. It is in the educational division of Lille. Pop. (1982) 1,412,413.

pas de deux (French: "step for two"), dance for two performers. The strictly classical balletic pas de deux followed a fixed pattern: a supported adagio, a solo variation for the male dancer, a solo variation for the female dancer, and a coda in which both participants displayed their virtuosity.

pas d'élévation (French: "high steps"), all jumping and leaping movements in classical ballet. The steps are admired for the height at which they are performed and for the dancer's ability to ascend without apparent effort and to land smoothly. Dancers famed for aerial manoeuvres of this kind include Jean Balon, a French dancer of the late 17th century, and Nijinsky, reportedly an early master of the *entrechat-dix* (jump with five leg crossings). *Pas d'élévation* include cabriole, entrechat, and jeté (*qq.v.*).

Pasadena, city, Los Angeles County, California, U.S., located in the San Gabriel Valley, at the base of the San Gabriel Mountains. Once part of Rancho San Pasqual, it was founded in 1874 by Thomas B. Elliott as Indiana Colony; the name Pasadena (Chippewa: "crown of the valley") was adopted in 1875. Growth as a winter resort and citrus centre was stimulated by the Santa Fe Railroad, and later freeway construction brought it within easy commuting distance to Los Angeles, 12 mi (19 km) southwest.

Based on the California Institute of Technology (1891), which includes the Jet Propulsion Laboratory operated in conjunction with the National Aeronautics and Space Administration, the city has become a centre of research and light manufacturing, chiefly scientific and precision instruments and electronic, aircraft, and missile components.

Pasadena City College (1924), Pacific Oaks College (1945), Ambassador College (1947), and Art Center College of Design (1930) are in the city, which is also the home of the State Theatre of California (formerly Pasadena Community Playhouse). The Pasadena Art Museum is renowned for its collection. The New Year's Day Tournament of Roses (first introduced in 1890) features a televised parade and the Rose Bowl football classic between the champion teams of West Coast and Midwestern U.S. universities. Inc. 1886. Pop. (1980) 119,374.

Pasadena, city, Harris County, southeastern Texas, U.S., bordering Houston (west) between the Houston Ship Channel and the Clear Lake area. Founded in 1895 by J.H. Burnett, its Spanish name, meaning "land of flowers," was inspired by blooming fields along Vince's Bayou. Rapid post-World War II growth was stimulated by adjacent industrial development, particularly petrochemicals and aerospace. Pasadena is the seat of San Jacinto College (1960) and the Texas Chiropractic College (1908). Inc. 1929. Pop. (1980) 112,560.

Pasadenan orogeny, a period of folding and thrust faulting of rock strata in the Coast Ranges of California in middle Pleistocene time (the Pleistocene Epoch began about 2,500,000 years ago and ended 10,000 years ago). This period marks the final disappearance of older, Tertiary depositional troughs in the Coast Range area and probably is only one of a series of deformational events related to the movement of the Pacific Plate in relation to the North American Plate in western California.

Pasargadae, first dynastic capital of the Achaemenian Empire, situated northeast of Persepolis in modern southwestern Iran. Traditionally, Cyrus II the Great (reigned 559–*c.* 529 BC) chose the site because it lay near the scene of his victory over Astyages the Mede

(550). The name of the city may have been derived from that of the chief Persian tribe, the Pasargadae.

The majestic simplicity of the architecture at Pasargadae reflects a sense of balance and beauty that was never equalled in either earlier or later Achaemenian times. The principal buildings stand in magnificent isolation, often with a common orientation but scattered over a remarkably wide area. The dominant feature of the citadel is a huge stone platform, projecting from a low, conical hill. Two unfinished stone staircases and a towering facade of rusticated masonry were evidently intended to form part of an elevated palace enclosure. An abrupt event, however, brought the work to a halt, and a formidable mud-brick structure was erected on the platform instead. It is possible that the building represents the famous treasury surrendered to Alexander the Great in 330 BC.

To the south of the citadel was an extensive walled park with elaborate, irrigated gardens surrounded by a series of royal buildings. One building, designed as the sole entrance to the park, is notable for a unique four-winged, crowned figure that stands on a surviving doorjamb; the figure appears to represent an Achaemenian version of the four-winged genius (guardian spirit) found on palace doorways in Assyria.

Farther to the south, the tomb of Cyrus still stands almost intact. Constructed of huge, white limestone blocks, its gabled tomb chamber rests on a rectangular, stepped plinth, with six receding stages. In Islāmic times the tomb acquired new sanctity as the supposed resting place of the mother of King Solomon. At the extreme southern edge of the site, an impressive rock-cut road or canal indicates the course of the ancient highway that once linked Pasargadae with Persepolis.

After the accession of Darius I the Great (522 BC), Persepolis replaced Pasargadae as the dynastic home.

Pasay, also called RIZAL CITY, chartered city, Rizal province, central Luzon, Philippines, situated on the eastern shore of Manila Bay. A major residential suburb of Manila (immediately north), it is well known for the nightclubs that line the waterfront along Roxas (formerly Dewey) Boulevard. Pasay is densely populated and highly commercialized. Araneta University (1946) is located in the city. Both the domestic and international airports are on its outskirts. Inc. city, 1947. Pop. (1980) mun., 287,770.

Pascagoula, city, seat (1812) of Jackson County, southeastern Mississippi, U.S., situated on Pascagoula Bay of Mississippi Sound, at the mouth of Pascagoula River adjacent to

Moss Point (north), 21 mi (34 km) east of Biloxi. The Gulf Coast settlement developed around the Old Spanish Fort built in 1718 by the Frenchman Joseph Simon de la Pointe. It thrived in the 19th century as a lumber-shipping port. The Pascagoula River is known locally as the Singing River because of strange humming sounds audible in its vicinity. Legends have linked the "singing" with the death chant of the Pascagoula Indians who chose to commit mass suicide in its waters rather than suffer extinction at the hands of the more powerful Biloxi tribe.

A seaport and fishing and shipbuilding centre, the city also has industries manufacturing paper products, petroleum, chemicals, and clothing. The Bayou Casotte Industrial Park is immediately east. Inc. village, 1892; city, 1904. Pop. (1980) 29,318.

Pascal (popes): *see under* Paschal.

pascal, abbreviation PA, unit of pressure in the metre-kilogram-second (SI) system; named in honour of Blaise Pascal, 17th-century mathematician and physicist. A pascal is a pressure of one newton per square metre; this unit is inconveniently small for many purposes, and the kilopascal (kPa) of 1000 newtons per square metre is more commonly used in engineering work (one pound per square inch equals 6.895 kPa).

Pascal, Blaise (b. June 19, 1623, Clermont-Ferrand, Fr.—d. Aug. 19, 1662, Paris), French mathematician, physicist, and religious philosopher and writer who was the founder of the modern theory of probabilities. His ideas on inner religion influenced Jean-Jacques Rousseau, Henri Bergson, and the Existentialists.

A brief account of the life and works of Blaise Pascal follows; for a full biography, *see* MACROPAEDIA: Pascal.

At the age of 17 Pascal published an essay on mathematics that was highly regarded in the academic community and praised by Descartes. He invented the first digital calculator (1642–44) to assist his mathematician father in local administration. Further studies in geometry, hydrodynamics, and hydrostatic and atmospheric pressure led him to invent the syringe and the hydraulic press and to discover Pascal's law of pressure (1647–54).

By the end of 1653 Pascal had begun to feel religious scruples; and the "night of fire" which he experienced on Nov. 23, 1654, he believed to be the beginning of a new life. Though he never became one of the solitaries at the convent of Port-Royal, it was henceforth only at their request that he was ever to take up his pen. In 1655 he entered Port-Royal, where he wrote *Les Provinciales,* a defense of Jansenism against the Jesuits, and the *Pensées.*

Les Provinciales were an immediate success, and their popularity has remained undiminished. This they owe primarily to their form, in which for the first time bombast and tedious rhetoric as exemplified by J.L. Guez de Balzac and Antoine Lemaistre are replaced by variety, brevity, tautness, and precision of style; as Nicholas Boileau recognized, they mark the beginning of modern French prose. The *Pensées,* inappropriately named by the editors when it appeared posthumously, consisted of his notes and manuscript fragments of his Christian apologetics. Pascal spent his last years in scientific research and good works.

Pascal's principle, also called PASCAL'S LAW, in fluid (gas or liquid) mechanics, statement that in a fluid at rest in a closed container a pressure change in one part is transmitted without loss to every portion of the fluid and to the walls of the container. The principle was first enunciated by French scientist Blaise Pascal.

Pressure is equal to the force divided by the area on which it acts. According to Pascal's principle, in a hydraulic system a pressure exerted on a piston produces an equal increase in pressure on another piston in the system. If the second piston has an area ten times that of the first, the force on the second piston is ten times greater, though the pressure is the same as that on the first piston. This effect is exemplified by the hydraulic press, based on Pascal's principle, which is utilized in such applications as hydraulic brakes.

Pascal also discovered that the pressure at a point in a fluid at rest is the same in all directions; the pressure would be the same on all planes passing through a specific point. This fact is also known as Pascal's principle, or law.

Paschal, also spelled PASCAL, Latin PASCHALIS, or PASQUALIS, name of Roman Catholic popes and antipopes, grouped below chronologically and indicated by the symbol •.

• Paschal (I) (d. 692, Italy), antipope against both the rival antipope Theodore and the legitimate pope St. Sergius I during 687.

After the death of Pope Conon in September 687, the Roman populace proceeded to enthrone both Paschal, then an archdeacon, and the archpriest Theodore. No agreement could be reached, and neither Paschal nor Theodore would renounce their claims. To resolve the dispute, the higher clergy, supported by the Roman army, elected the priest Sergius. Among those who supported Sergius was Paschal's patron, John Platyn, the imperial deputy at Ravenna; having been bribed by Paschal into influencing his original nomination, Platyn was also bribed with gold to support Sergius, who was consecrated on Dec. 15, 687. Theodore ceded, but Paschal refused to submit and was deposed and imprisoned in a monastery until his death.

• Paschal I, SAINT (b. Rome—d. Feb. 11, 824, Rome; feast day May 14), pope from 817 to 824.

A priest who had served in the Curia, Paschal was an abbot when elected pope immediately after the death of his predecessor, Stephen IV (V), on Jan. 26, 817. During his pontificate Paschal was continually concerned with the relation of the papacy to the recently founded Frankish Empire under Charlemagne's son and successor, Louis I the Pious. Louis forcibly imposed on the church an unprecedented reform and reorganization of monasteries and dioceses while concurrently arranging the empire and trying to reconcile the safeguarding of Christian order and unity.

Paschal secured from Louis the independence of the Roman see, its suzerainty over the states of the church, and the right of Romans to freedom of election. In 823 he crowned Louis's son Lothair I as co-emperor, a deed that was signficant because it initiated the handing of a sword by the pope to the emperor as a symbol of the temporal power that was to suppress evil. Meanwhile, in Rome an anti-Frankish movement was developing, which Paschal supposedly joined. Some of his servants executed at the Curia two leaders of the Frankish party accused of plotting against Paschal and of favouring imperial control of Rome. Louis ordered an investigation at which Paschal was forced to clear himself by an oath of purgation. The exact proceedings of this investigation are clouded by intrigue and the argument that no mortal can judge a pontiff. It is known, however, that Paschal was hated, and the emotions aroused by the executions caused considerable trouble that necessitated firmer supervision of Rome by the imperial court.

Paschal was further faced with the revival of Iconoclasm (destruction of images) in the East under the Byzantine emperor Leo V the Armenian. The Eastern abbot Theodore Studites, leading defender of orthodoxy and of the veneration of icons, appealed to the Pope, who dispatched legates to Constantinople. Paschal's intervention proved unsuccessful, but he did supply refuge for the Greek monks who fled to Rome.

Paschal's contribution to the building activity in Rome typifies the period that followed Charlemagne's consecration as Holy Roman emperor. Sta. Prassede and the annexed chapel of S. Zeno, both containing magnificent mosaics, were his work; he also built Sta. Maria in Domnica and rebuilt Sta. Cecilia. He was responsible for the translation of the relics of many martyrs, including those of St. Cecilia, from the catacombs to Rome.

• Paschal II, original name RANIERO, Latin RANIERUS (b. Bieda di Galeata, near Ravenna—d. Jan. 21, 1118, Rome), pope from 1099 to 1118.

He entered a monastery as a boy and was made cardinal by Pope St. Gregory VII *c.* 1080. He was legate to Spain under Pope Urban II, whom he was elected to succeed on Aug. 13, 1099.

Although Paschal fostered the First Crusade and followed Gregory's great policies of church reform, his pontificate was dominated by the Investiture Controversy—the long conflict between popes and secular rulers over control of ecclesiastical appointments. In 1107 settlements on the issue of lay investiture were made with kings Henry I of England and Philip I of France (who was excommunicated for his unsanctioned marriage to Bertrada in 1100 but absolved in 1104).

Paschal's struggles with the Holy Roman emperors Henry IV and Henry V, however, proved inconclusive. After unsuccessful negotiations in 1106, 1107, and 1110, he officially condemned Henry V, who invaded Italy. They met at Sutri, where Henry renounced the right to investiture, and Paschal agreed to have the German church return all lands and rights received from the crown—an agreement that, when promulgated at St. Peter's in Rome on Feb. 12, 1111, caused a tumult among the German bishops. They felt deprived of power, and their protests killed the pact. A popular rising forced Henry to leave Rome temporarily, and he took Paschal as prisoner. After two months of harsh captivity, Paschal consented to Henry's demands on royal investiture of bishops, and on April 13, 1111, he crowned Henry as Holy Roman emperor.

Strong opposition arose in the Curia against Paschal. A council declared invalid the privilege he had granted Henry, and, against his will, Archbishop Guido of Vienne excommunicated the Emperor. Paschal finally revoked the privilege in 1112 and renewed his earlier condemnations of regal investiture in 1116.

The problem remained unsolved until 1122, when Pope Calixtus II concluded the Concordat of Worms, which secured peace between the church and the empire.

• **Paschal (III),** original name GUIDO DA CREMA (d. Sept. 20, 1168, Rome), antipope from 1164 to 1168.

Against Pope Alexander III, he was one of the original supporters of the antipope Victor IV, whom he succeeded on April 22, 1164, becoming the second antipope set up by the Holy Roman emperor Frederick I Barbarossa. Elected through the influence of Rainald of Dassel, Frederick's chancellor and vicar in Italy, he won only limited allegiance in the empire. By imperial command in 1165 he canonized Charlemagne at Aachen, a decree never confirmed by the church, although Charlemagne is now regarded as having been informally beatified.

Paschal was enthroned when Rome was seized by Frederick, whom Paschal crowned (for a second time) in August 1167, together with his wife, Béatrix. After a sudden outbreak of pestilence destroyed the imperial army, Frederick retreated to Germany in the spring of 1168, accompanied by Paschal.

Paschal controversies, in the Christian Church, disputes concerning the correct date for observing Easter (Greek *Pascha*). The earliest controversy was over the question of whether Easter should always be celebrated on a Sunday or on the actual day of the Jewish lunar month (14th of Nisan) on which the Paschal lamb was slaughtered. The latter practice, followed by the church in the Roman province of Asia, was generally condemned at the end of the 2nd century because it meant celebrating Easter when the Jews were keeping Passover.

Later controversies concerned the different methods of calculating the Paschal moon, until in the 6th century the computations of Dionysius Exiguus were generally accepted in the West. The Celtic Church, however, did not accept this method until the 7th century (*see* Whitby, Synod of), and there were some difficulties in Gaul in the 8th century.

In the Eastern Orthodox Church, Easter is often observed on a later Sunday than in the Western Church, partly because it adheres to the Julian calendar for the movable year. In the West the subject has ceased to be a matter of dispute, and the second Vatican Council stated in 1963 that there was no objection in principle to observing Easter on a fixed Sunday (probably early in April).

Paschal lamb, in Judaism, the lamb sacrificed at the first Passover, on the eve of the Exodus from Egypt, the most momentous event in Jewish history. According to the story of the Passover (Exodus, chapter 12), the Jews marked their doorposts with the blood of the lamb, and this sign spared them from destruction.

In early Jewish history an unblemished year-old lamb sacrificed in the Temple of Jerusalem on the 14th of Nisan to commemorate the eve of the Exodus was later eaten by the family. For those who had been impeded from visiting the Temple at the prescribed time, a second Passover festival was permitted a month later. In modern times Jews use a roasted shank bone at the seder (*q.v.*) meal as symbolic of the Paschal lamb. St. Paul, drawing a parallel with the sacrifice made by Jesus, referred to Christ as the Paschal lamb (I Corinthians 5:7); hence, the Christian view of Christ as the spotless Lamb of God who by his death freed mankind from the bonds of sin.

Paschasius Radbertus, SAINT (b. *c.* 785, Soissons, Fr.—d. *c.* 860; feast day April 26), French abbot, theologian, and author whose monograph *De corpore et sanguine Christi* ("Concerning Christ's Body and Blood") later became the dominant interpretation of the Eucharist (*q.v.*).

Abandoned as an infant, Paschasius was raised by the monks of St. Peter's, Soissons. Later, he joined the Benedictine abbey of Corbie, near Amiens, under St. Adalhard the Elder and his brother and successor, St. Wala, whose biographies Paschasius was to write. Well read in the Scriptures and patristic works, he was ordained deacon and subsequently became novice master and headmaster at Corbie and at the daughter abbey of New Corbie, Westphalia (now in Höxter, Ger.), which in 822 he had assisted in founding. Under Paschasius' leadership the Corbie schools became famous.

He was elected, *c.* 843, fourth abbot of Corbie. During his office there were disturbances in the monastery and his plans for reform were opposed. His *De corpore,* written in 831 and revised in 844, when he presented it to King Charles II the Bald of the West Frankish kingdom, was seriously challenged by the monk Ratramnus (*q.v.*), who *c.* 850 wrote his famous eucharistic treatise *De corpore et sanguine Domini* ("Concerning the Lord's Body and Blood") partially in reply to Paschasius. Paschasius was further criticized by Rabanus Maurus, abbot of Fulda and later archbishop of Mainz.

Paschasius attended the synods of Paris (847) and Quercy (849). He resigned his abbacy *c.* 851 and retired to the monastery of Saint-Riquier to write in peace, although his last years were supposedly spent at Corbie. During succeeding centuries his eucharistic views were dominant, particularly during the 11th-century eucharistic controversy associated with the noted theologian Berengar of Tours, who was condemned at the Council of Vercelli in 1050 for sympathizing with Ratramnus' views (then falsely attributed to the Irish philosopher and theologian John Scotus Erigena). Modern theologians, however, recognize faults in Paschasius' doctrine. H. Peltier's *Pascase Radbert* appeared in 1938, followed by C. Gliozzo's *La dottrina in Paschasio Radberto e Ratramno, monaci di Corbia* ("The Doctrine of Paschasius Radbertus and Ratramnus, Monks of Corbie") in 1945.

Pascin, Jules, original name JULIUS PINCAS (b. March 31, 1885, Vidin, Bulg.—d. June 1, 1930, Paris), painter of the school of Paris renowned for his delicate draftsmanship and sensitive studies of women.

Born of Italian-Serbian and Spanish-Jewish parents, Pascin spent a number of years in Austria and Germany working for such satirical journals as the *Lustige Blätter* and *Simplicissimus.* In 1905 he moved to Paris where he continued to produce tragically satirical drawings of the demimonde. At the outbreak of World War I he travelled for a while in the United States, where he became a citizen, returning to Paris in 1920. There he began to create a series of large-scale, representational, and very sensitively drawn biblical and mythological paintings. Later he turned to the material for which he is generally known, the delicately toned, thinly painted, but poetically bitter and ironic studies of women, generally prostitutes. On the eve of an important one-man show of his work Pascin hanged himself.

Pasco, department (formed 1944) of central Peru, stretching from the Andes eastward to the Amazon Basin. It occupies an area of 8,438 sq mi (21,854 sq km). Western Pasco, a mountainous and rugged area, is drained by the headwaters of the Río Huallaga. Eastern Pasco, which comprises the steep, rain-drenched eastern slopes of the Andes and the forested plains beyond, is drained by the Río Pachitea. Western Pasco is one of the world's richest and most productive mining regions. Silver ores at Cerro de Pasco (*q.v.*), the departmental capital, were discovered in 1630. Copper has become more important than silver, and numerous other minerals, including lead, zinc, gold, vanadium, and bismuth, are also mined. Pop. (1984 est.) 249,700.

Pasco, city, seat (*c.* 1890) of Franklin County, southeastern Washington, U.S., situated at the confluence of the Snake and Columbia rivers, opposite Kennewick and immediately southeast of Richland. Established in 1880, when the Northern Pacific Railway (now Burlington Northern) reached that point, it was probably named by railroad surveyors for Cerro de Pasco, Peru. It is a busy river port, as well as a rail centre. The Ice Harbor Dam, 13 mi (21 km) up the Snake River, impounds Lake Sacajawea and is the first of four dams that permit navigation to Lewiston, Idaho, 140 mi east. Pasco is the seat of Columbia Basin College (1955). Inc. 1891. Pop. (1980) city, 17,944; (1982 est.) Richland–Kennewick–Pasco metropolitan area (SMSA), 153,600.

Pascoli, Giovanni (b. Dec. 31, 1855, San Mauro di Romagna, Kingdom of Sardinia—d. April 6, 1912, Bologna, Italy), Sardinian classical scholar and poet whose graceful and melancholy Italian lyric poems, perfect in form, rhythmic in style, and innovative in wording, were an important influence on the *crepuscolari* ("twilight poets"; *see* crepuscolarismo).

Pascoli had an extremely painful childhood: his father was mysteriously assassinated when he was 12, his mother died when he was 13, and five other children in the family died by the time he reached adulthood. He also experienced a long period of psychological duress while studying on a scholarship at the University of Bologna under the great poet Giosuè Carducci. Pascoli was arrested and imprisoned for a few months in 1879 for preaching political anarchy. Following his imprisonment he took his younger siblings to live with him, and from 1882 began a career of teaching, first in secondary schools and then in various Italian universities, as professor of Greek, Latin, and Italian literature. In 1905 he was appointed to the chair of Italian literature at the University of Bologna.

Pascoli's first literary work, a great success, was *Myricae* (1891; "Tamarisks"), a volume of short, delicate, musical lyrics inspired by nature and domestic themes and reflecting the psychological unrest of his student years. Some easing of inner turmoil is apparent in his next volume, usually considered his best, *Canti di Castelvecchio* (1903, definitive ed., 1907; "Songs of Castelvecchio"), a collection of moving evocations of his sad childhood and celebrations of nature and family life. Subsequent volumes include the classically inspired and more formal *Poemi conviviali* (1904) and two collections influenced by Virgil's *Georgics,* Carducci's work, and the French Symbolists: *Primi poemetti* (1904, originally published as *Poemetti,* 1897) and *Nuovi poemetti* (1909). Pascoli's Latin poems won poetry prizes and exhibited a fluent skill; Gabriele D'Annunzio considered him the finest Latin poet since the Augustan age. During his later years Pascoli wrote several nationalistic and historic poetic works, notably *Poemi del Risorgimento* (1913). English translations of his poems were published in 1923 and 1927. He also translated poems of Wordsworth, Shelley, and Tennyson. An Italian literary award, the Pascoli Prize, was established in 1962 to commemorate the 50th anniversary of his death, and his birthplace was named San Mauro Pascoli.

Pasek, Jan Chryzostom (b. *c.* 1636, Węgrzynowice, near Rawa Mazowiecka, Kingdom of Poland [now in Poland]—d. Aug. 1, 1701, Niedzieliska, near Kraków?), Polish soldier best remembered for his memoirs, which provide an excellent example of Polish Baroque prose.

Pasek received some education in a Jesuit school. He enlisted in the army at age 19, seeing service against the Swedes in Poland, with the Danes against the Swedes in Denmark, and against Muscovy and, later, Turkey. He retired after 11 years of service and married. Lawsuits that arose from his various excesses eventually resulted in his sentence to exile, but the sentence was never enforced. Toward the end of his life he wrote down anecdotes of his life.

Discovered in the 19th century, Pasek's *Pamiętniki* (1836; "Memoirs") is a lively, humorous work that gives a vivid description of the life of an independent, resourceful man of action. In it he relates tales of the 17th-century Swedish and Muscovite wars, the catastrophic last years of the reign of King John II Casimir (1648–68), and the incompetent rule of King Michael Wiśniowiecki (1669–73), and he concludes his narrative with the splendid reign of King John III Sobieski (1674–96). Pasek was an excellent raconteur and a keen observer of the people with whom he came in contact. Both the style and the characters and events of his memoirs influenced a number of later Polish writers.

Pasewalk, town, Mecklenburg-West Pomerania *Land* (state), northeastern Germany, on the Ücker River about 18 miles (29 km) south of Ueckermünde and about 24 miles (39 km) west of Szczecin (Stettin), Poland. Pasewalk is a rail junction, and the town's economic activities include food processing (potato-flour milling), manufacturing (machinery and electrical equipment), metalworking, and lumbering.

Pasewalk contains a 13th–15th-century church and the remains of old town walls and gates. The town passed to Sweden in 1648 and to Prussia in 1720, when it became part of Pomerania. Pop. (1988 est.) 15,682.

pasha, Turkish PAŞA, title of a man of high rank or office in the Ottoman Empire and North Africa. It was the highest official title of honour in the Ottoman Empire, always used with a proper name, which it followed. It was given to soldiers and high civil officials, not to men of religion, and was purely personal and not hereditary, except in 19th-century Egypt. Very occasionally in early times it was applied to a woman; *Validepasha* was the title of the mother of the pasha of Egypt.

The title first appeared in the 13th century among the Seljuqs. Among the Ottomans it was given to a brother and son of Sultan Orhan. Later it became the prerogative of provincial governors and the viziers of the central administration. In the Tanzimat period (19th century) its use was extended to the four highest grades of the civil and military services.

On the fall of the Ottoman dynasty, pasha was reserved only for soldiers but, even after the Turkish Republic finally abandoned its use in 1934, the title survived in former Ottoman possessions—*e.g.,* in Egypt until 1952. By Turks it is still used in conversation as a mark of respect to a social superior.

Pashto language, also called PUSHTU, PAKHTO, or AFGHAN, Eastern Iranian language spoken by the Pashtun in eastern Afghanistan and northern Pakistan. Its dialects fall into two main divisions: the southern, which preserves the ancient *sh* (as in "Pashto") and *zh* sounds, and the northern, which has *kh* (as in "Pakhto") and *gh* sounds instead. Written in a modified Arabic alphabet, Pashto shows strong Indian influence, many Arabic and Persian loanwords, and numerous archaic Persian features. It has been attested from the beginning of the 16th century and became prominent after the creation of the Afghan state in the 18th century. In 1936 Pashto was declared the national language of Afghanistan, and instruction in it is now compulsory. Dari is the other official language.

Pashto literature exists certainly from the 17th century, less certainly from the 11th. The national poet of Afghanistan, Khushḥāl Khān (1613–94), chief to the Khaṭak tribe, wrote spontaneous and forceful poetry of great charm. His grandson Afḍal Khān was the author of a history of the Pashtun. Popular mystical poets were ʿAbd ar-Raḥmān and ʿAbd al-Ḥamīd, in the late 17th or early 18th century, and Aḥmad Shāh Durrānī, founder of the Afghan nation, was himself a poet. The Pashto Academy publishes a variety of literary works.

Pashtun, also spelled PUSHTUN, or PAKHTUN, Hindustani PATHAN, Persian AFGHAN, Pashto-speaking people of southeastern Afghanistan and northwestern Pakistan. They constitute the majority of the population of Afghanistan and bore the exclusive name of Afghan before that name came to denote any native of the present land area of Afghanistan.

The origins of the Pashtun are unclear. Pashtun tradition asserts that they are descended from Afghana, grandson of King Saul of Israel, though most scholars believe it more likely that they arose from an intermingling of ancient Aryans from the north or west with subsequent invaders. Several Pashtun tribes are known to have moved from Afghanistan to Pakistan between the 13th and 16th century. Each tribe, consisting of kinsmen who trace descent in the male bloodline from a common tribal ancestor, is divided into clans, subclans, and patriarchal families. Tribal genealogies establish rights of succession and inheritance and the right to use tribal lands and to speak in tribal council. Disputes over property, women, and personal injury often result in blood feuds between families and whole clans; these may be inherited unless settled by the intervention of clan chiefs or by tribal council.

The Pashtun are farmers, herdsmen, and warriors. Most tribesmen are sedentary farmers, combining cultivation with animal husbandry; some are migratory herdsmen and caravaners. Large numbers of them have always been attracted to military service.

There are estimated to be about 7,500,000 Pashtun in Afghanistan and 14,000,000 in Pakistan. They comprise about 60 tribes of varying size and importance, each of which occupies a particular territory. In Afghanistan, where Pashtun are the predominant ethnic group, the main tribes—or, more accurately, federations of tribes—are the Durrānī south of Kābul and the Ghilzay east of Kābul.

In Pakistan, Pashtun predominate north of Quetta between the Sulaimān Range and the Indus River. In the hill areas the main tribes are, from south to north: the Kākaṛ, Shērāni, and Ustarāna south of the Gumal River; the Maḥsūd, Darwēsh Khēl, Wazīrī, and Biṭanī between the Gumal River and Thal; the Tūrī, Bangash, Ōrakzay, Afrīdī, and Shinwārī from Thal to the Khyber Pass; and the Mahmand, Utmān Khēl, Tarklānī, and Yūsufzay north and northeast of the Khyber.

The settled areas include lowland tribes subject to direct administration by the provincial government. The main tribes there are, from south to north: the Banūchī and Khaṭak from the Kurram River to Nowshera; and the Khalīl and Mandāṇ in the Vale of Peshāwar.

Pashupati, town, central Nepal, situated in the Kāthmāndu Valley on the Bāghmati River, just east of Kāthmāndu. Regarded as the holiest place in Nepal, it is the site of an ancient Śaivite (*i.e.,* devoted to the Hindu god Śiva) temple of Paśupatinātha (Pashupatinath). The temple is built in pagoda style with gilt roof, and the banks of the Bāghmati are paved for several hundred yards. There are numerous other shrines in the vicinity. The Śivarātri festival in February or early March attracts Hindu pilgrims from India and other foreign countries. Pious Hindus also go there to die, believing that they will find salvation if they expire with their feet in the sacred waters of the river at Pashupati.

Pašić, Nikola (b. Dec. 31 [Dec. 19, Old Style], 1845, Zaječar, Serbia [now in Yugoslavia]—d. Dec. 10, 1926, Belgrade), prime minister of Serbia (1891–92, 1904–05, 1906–08, 1909–11, 1912–18) and prime minister of the Kingdom of Serbs, Croats, and Slovenes (1918, 1921–24, 1924–26). He was one of the founders, in 1918, of the kingdom that would later (from 1929) be called Yugoslavia.

Early career. Pašić, who was born into a family of modest means, studied engineering in Belgrade and then graduated from the Zürich Polytechnikum, where his interest in contemporary liberalism and democratic institutions was stimulated by the Russian anarchist Mikhail Bakunin. Returning to Serbia (1873), he joined the Socialist group led by Svetozar Marković and, as editor of the newspaper *Oslobodjenje* ("Liberation"), became an important exponent of Marković's views. Having concluded that King Milan Obrenović's oligarchy was depriving Serbia both of progressive leadership and of national perspective, Pašić decided to enter politics actively. Elected to parliament in 1878, he worked, as leader of the opposition, against the authoritarian monarchy in an endeavour to establish a parliamentary democracy. He also helped to found the Radical Party (1881).

When a popular rising instigated against Milan's government by the Radicals in Zaječar (1883) led to further repression and to the severe punishment of many Radical leaders, Pašić was forced to flee through Austria to Bulgaria. After Milan's abdication in favour of his son Alexander (1889), Pašić returned to Serbia from exile and was then elected president of the Skupština (Parliament) and, on two occasions, mayor of Belgrade. Pašić served as premier for the first time from February 1891 to August 1892 and as foreign minister accompanied the new king, Alexander Obrenović, on a state visit to Russia (1892), where he established firm personal and political ties with the tsarist regime. He became Serbian minister to St. Petersburg in 1893 but resigned in protest at former king Milan's illegal return to Serbia (1894).

After an unsuccessful attempt on Milan's life in 1899, trumped-up charges of regicide were brought against the members of the Radical Party. Pašić, who was among those sentenced to death, won himself an amnesty and then left the country voluntarily to return only when Milan had finally withdrawn.

When Alexander was overthrown and the Karageorgević dynasty, in the person of King Peter I, was restored by the bloody coup d'etat of 1903, Pašić finally emerged as the dominant political figure in Serbia. As leader of the Radical Party, he concentrated his efforts on establishing the party both as the backbone of the new regime and as the moving force in Serbian politics. From December 1904 to May 1905 he served as premier and as minister for foreign affairs—displaying great skill by counteracting Austria-Hungary's attempts to impose a tariff war on Serbia. He held both posts again from May 1906 to June 1908 and was again reappointed premier in October 1909, only to be replaced in 1911 by Milan Milovanović, his greatest political rival. Though Pašić cooperated with Milovanović in concluding a pact with Bulgaria—from which was eventually to develop the Balkan League, whose aim was war against Turkey—younger politicians and many military leaders continually conspired to remove him from his position as party leader, and in 1912 his imminent dismissal was avoided only by Milovanović's sudden death. Thenceforth reinstated as premier and minister for foreign affairs, Pašić led Serbia through two victorious wars, the first against Turkey (1912) and the second against Bulgaria (1913).

Despite his increased prestige, further attempts were made to oust Pašić from office in the months preceding the start of World War I. The accession as regent of Prince Alexander (King Peter's younger son) on June 24, 1914, gave Pašić some support, however, and his position was further confirmed when the threat of war with Austria-Hungary prevented forthcoming new elections from being held.

Leadership during World War I. After the murder of Archduke Francis Ferdinand by a Serb nationalist at Sarajevo on June 28, 1914, Pašić was most compliant in dealing with the

formidable terms of Austria-Hungary's ultimatum to Serbia but was nevertheless unable to avert the Austrian declaration of war on Serbia on July 28. World War I initially silenced Serbian political discord: parliament, which had already been dissolved, reassembled at Niš, and in November 1914 a coalition government under Pašić's premiership was formed.

The Austro-German conquest of Serbia forced Pašić's government and the army to withdraw from Serbia to Corfu (winter 1915). Pašić remained prime minister of the government-in-exile throughout World War I. He also remained interested in the union of Serbia with provinces inhabited predominantly by Serbs, but not in the formation of a federal Yugoslavia with Serbs, Croats, and Slovenes autonomous and equal. When the coalition government broke up in 1917, Pašić continued to govern with a homogeneous Radical Cabinet. When his position was still further weakened by the fall of Russia's tsarist regime (1917), he was obliged temporarily to abandon his strict Pan-Serbian attitude and to negotiate on equal terms with Ante Trumbić's Yugoslav Committee, a body of South Slav exiles from Austria-Hungary with its seats in London and Paris. The resulting Corfu Declaration (July 1917) laid down the broad lines for a postwar unified Yugoslav state.

Postwar career. As World War I neared its end, Pašić stubbornly insisted that Serbia, as the dominant political and military force among the South Slavs, had the exclusive right to speak on the Allied side on their behalf. In November 1918, however, Pašić, under pressure from the Serbian opposition and from the Allied governments, joined delegates from the Yugoslav Committee, from the National Council recently formed in Zagreb and from the Serbian opposition, in signing a declaration that provisionally envisaged a Yugoslavia in which the Serbian government should share power with the representatives of Austria-Hungary's former South Slav subjects. But the Serbian government, which Pašić himself had secretly dissuaded, rejected the declaration. As a result, when Austria-Hungary collapsed, the Allies were unable to agree on a solution for the relations of the South Slavs with Serbia, while Italy reasserted its territorial claims to South Slavic territory under a secret wartime pact (Treaty of London) made between it and the Allied Powers. Despite the danger, Pašić persevered in his obstructive tactics toward the Yugoslav Committee and to the National Council in Zagreb.

Nevertheless, an uneasy compromise was finally achieved when Serbia and the South Slav provinces were united on Dec. 1, 1918, as the Kingdom of Serbs, Croats, and Slovenes. Though he was denied the premiership of the kingdom, Pašić went with Trumbić and Vesnić as one of the new state's delegates to the Peace Conference at Versailles (1919).

Pašić failed fully to comprehend the fateful difference between Serbia's homogeneity and the complexity of the new kingdom, which comprised several nations, each with its own distinct historical development and cultural identity. Ignoring requests for individual recognition from Croats, Slovenes, Macedonians, and Bosnian Muslims, he continued to regard them simply as Serbs—albeit Serbs of three religions and several names. When, therefore, he was reappointed premier in 1921 he immediately pushed through parliament a unitary constitution for the new nation that, under the guise of establishing a homogeneous state, actually confirmed the existing Serbian hegemony and, by abolishing historic and autonomous provinces, established a strongly centralized regime under a powerful monarchy. He eliminated the Democrats from the government (winter 1921) and formed an entirely Radical Cabinet. He failed to secure a majority in the elections of March 1923 but stayed safely in office, thanks to blunders by the opposition. Though from July to October 1924 he had to give way to a coalition government under Ljubomir Davidović, by adroit interparty manoeuvring he was able immediately afterward to return to power much stronger than before. His relations with King Alexander and with the Anticentralist Croats and Slovenes nevertheless became increasingly strained. In February 1925 Pašić was forced to dissolve parliament, but by adopting drastic measures—among them the imprisonment of Stjepan Radić and other Croatian Peasant Party leaders—he secured a small working majority. A temporary political collaboration with Radić later the same year failed to produce a stable government, and, when Radić publicly criticized the still-increasing tendency toward centralization and unification, Pašić had to resign in March 1926. He died in the following December, three weeks before his 81st birthday.

Carlo Sforza's *Pachitch et l'union des Yougoslaves* (1938; *Fifty Years of War and Diplomacy in the Balkans: Pashich and the Union of the Yugoslavs*) is the only known biography of Pašić in English.

Pasig River, river draining Laguna de Bay, the largest lake in the Philippines, into Manila Bay at Manila. It flows north-northwest through the market town of Pasig and bisects Manila, then enters the bay between the North and South harbours. Its length is 14 mi (23 km). The wharves and quays at the river's mouth served the early interisland trade during the Spanish colonial period. At that time the Pasig was home for a large barge- and raft-dwelling population. The shallow and sluggish stream is now spanned by nine bridges and is navigable by small craft, but its port functions have decreased.

Pasionaria, La: *see* Ibarruri, Dolores.

Pasiteles (fl. 1st century BC), Greek sculptor notable for having written a book, in five volumes, about works of art throughout the world. None of Pasiteles' own sculpture has survived.

Little is known about Pasiteles. He was born in a Greek city in southern Italy and became a Roman citizen in 90/89. He made an ivory and gold statue of Zeus for the temple of Metellus. It is believed that he was one of the originators of the methods of exact copying of statuary by means of plaster casts and the pointing machine, without which the thousands of copies from original Greek statues that were disseminated throughout Greco-Roman civilization could never have been produced. He also worked from nature, however, as is shown in Pliny's story that while sketching a lion he was almost killed by a panther.

Paskevich, Ivan Fyodorovich, Graf Yerevansky (Count of Erivan), Knyaz Varshchavsky (Prince of Warsaw) (b. May 19 [May 8, old style], 1782, Poltava, Russia—d. Feb. 1 [Jan. 20, O.S.], 1856, Warsaw), military officer and administrator in the Russian government who suppressed the Polish insurrection of 1830–31.

Having entered the Russian Army through the imperial institution for pages in 1800, Paskevich gained combat experience fighting against the Turks (1806–12) and against the French during 1812–14 in the Napoleonic Wars. He eventually became one of the emperor Nicholas I's closest associates.

After the revolutionary Decembrists tried to establish a constitutional regime in Russia at the time of Nicholas' accession to the throne, Paskevich participated in their trial; later, appointed governor and military commander in chief of the Caucasus (1827), he treated the Decembrist exiles under his jurisdiction with

particular severity. After the Russo-Persian war broke out in 1826, he seized the military initiative from the Persians and captured the fortress of Erivan (Yerevan; October 1827) and was rewarded with the title count of Erivan. With successive victories he forced the Persians to cede the provinces of Nakhichevan and Erivan (*i.e.,* Persian Armenia) to Russia (1828; Treaty of Turkmanchay).

Immediately afterward, with the onset of the Russo-Turkish War of 1828–29, Paskevich captured strategic Turkish strongholds, enabling Russia, when it concluded the Treaty of Adrianople with the Turks (1829), to annex territory around the mouth of the Danube River and in eastern Asia Minor. Promoted to the rank of field marshal (1829), he was transferred to Poland (June 1831) to command the Russian forces suppressing the Polish rebels. Despite his overcautiousness and indecisiveness, Paskevich defeated the rebels and was given the title prince of Warsaw. He was subsequently appointed viceroy of Poland and from 1832 to 1856 ruled dictatorially there, trying to Russify the country both culturally and administratively.

When the Hungarian Revolution broke out in March 1848 and the Austrian government requested military assistance from Russia, Paskevich commanded the Russian troops that invaded Hungary in June 1849. Although his forces suffered badly from disease and his leadership was less effective than it had been during the Polish uprising, the rebels were finally suppressed; hoping to receive better treatment from the Russians than from the Austrians, they surrendered directly to Paskevich at Világos (Aug. 13, 1849). For a brief period during the Crimean War he commanded the Russian armies in the western war zone (April–June 1854), but after being defeated by the Turks at Silistria (June 8, 1854) he was relieved of his post.

Pasolini, Pier Paolo (b. March 5, 1922, Bologna, Italy—d. Nov. 2, 1975, Ostia, near Rome), Italian motion-picture director, poet,

and novelist, noted for his socially critical, stylistically unorthodox films.

The son of an Italian army officer, Pasolini was educated in schools of the various cities of northern Italy where his father was successively posted. He attended the University of Bologna, studying art history and literature. Pasolini's stay of refuge among the oppressed peasantry of the Friuli region during World War II led to his later becoming a Marxist, albeit an unorthodox one. His poverty-stricken existence in Rome during the 1950s furnished the material for his first two novels, *Ragazzi di vita* (1955; *The Ragazzi*) and *Una vita violenta* (1959; *A Violent Life*). These brutally realistic depictions of the poverty and squalor of slum life in Rome were similar in character to his first film, *Accattone* (1961), and all three works dealt with the lives of thieves, prostitutes, and other denizens of the Roman underworld.

Pasolini's best known film, *Il Vangelo secondo Matteo* (1964; *The Gospel According to Saint Matthew*), is an austere, documentary-style retelling of the life and martyrdom of Jesus Christ. The comic allegory *Uccellacci e Uccellini* (1966; *The Hawks and the Sparrows*) was followed by two films attempting to re-create ancient myths from a contemporary viewpoint, *Oedipus Rex* (1967) and *Medea* (1969). Pasolini's use of eroticism, violence, and depravity as vehicles for his political and religious speculations in such films as *Teorema* (1968; "Theorem") and *Porcile* (1969; "Pigsty") brought him into conflict with conservative elements of the Roman Catholic Church. He then ventured into medieval eroticism with *Il Decamerone* (1971) and *The Canterbury Tales* (1972). In addition to his motion pictures, Pasolini published numerous volumes of poetry and several works of literary criticism.

Paspalum, genus of annual and perennial grasses of the family Poaceae, containing about 400 species distributed throughout warm regions of the world. Some are valuable forage grasses. *P. dilatatum,* a South American species, is also grown in Australian and North American (where it is known as dallis grass) pastures. *Paspalum urvillei,* known as vasey grass in North America, is grown as hay in other areas in which it is native. Water couch, or knotgrass (*P. distichum*), forms large, flat mats along shores and in ditches in North and South America and Europe; it is used as a lawn grass in Australia.

Pasquier, Étienne (b. June 7, 1529, Paris—d. Aug. 30, 1615, Paris), French lawyer and man of letters who is known for his *Recherches de la France,* 10 vol. (1560–1621), which is not only encyclopaedic but also an important work of historical scholarship.

Pasquier studied under the great Humanist legal scholars François Hotman, Jacques Cujas, and Andrea Alciato, and was called to the bar at Paris (1549) and began to practice law there. In 1557 he married a wealthy young widow whom he had defended in court. He became ill in 1560 and convalesced in Amboise and Cognac, where he began work on his *Recherches,* with which he was occupied, off and on, for the next 40 years.

Pasquier hoped that his work would show the people of France the glory of their history and institutions. He consulted original sources, primarily court and government documents, in preference to relying on chronicles. Literary criticism was added later, as were materials from specific periods of French history. Pasquier's correspondence, which was published in 1619, provides a vivid commentary on the political and military aspects of the Wars of Religion (1562–98) and contains discussions of historical and literary problems.

Although a moderate in most respects, Pasquier spent much of his life fighting the

Jesuits. In 1565 he successfully defended the University of Paris in a suit instituted by the Jesuits, who sought to teach there. His *Catéchisme des Jésuites* (1602; "The Jesuit Catechism") was bitterly satirical. The university trial brought him fame, and he became counsel for many important clients, primarily in cases involving property disputes. He became a commissioner at the assize court at Poitiers in 1579 and at Tours in 1583, and in 1585 Henry III appointed him advocate general in the Chambre des Comptes at Paris.

Pasquier retired from forensic work in 1604 to devote full time to his writing, publishing many more books of the *Recherches.* During this period he also wrote *L'Interprétation des "Institutes" de Justinien* (1847), a work that dealt as much with French law as with Roman law. Near the end of his life he turned to biblical exegesis. He wrote some minor poetry in the style of the Pléiade and some excellent literary criticism.

Pasquier, Étienne(-Denis), duc de (duke of) (b. April 21, 1767, Paris—d. July 5, 1862, Paris), French statesman and the last chancellor of France.

A descendant of the celebrated 16th-century lawyer and man of letters Étienne Pasquier, he became a counsellor in the Paris Parlement in 1787. During the Revolution his father, also a counsellor, was guillotined, and Pasquier himself was arrested as a royalist (1794). He was set free during the Thermidorian reaction and was later created baron (1808) by Napoleon and appointed to the council of state and to the prefecture of police (1810). On the restoration of the monarchy in 1814 Louis XVIII made him director of highways and bridges. He later served as minister of justice and foreign minister and was created duke in 1821. Nine years later he was made president of the Chamber of Peers, which enabled him to sit as supreme judge in political trials. Pasquier was appointed chancellor of France when that office was revived in 1837. He was created duc in 1844, and the hereditary succession to the title was secured for his adopted son, E.-A.-G. d'Audiffret-Pasquier. Pasquier retired from public life on the Revolution of February 1848, which replaced the monarchy with the Second Republic (1848–52).

pasquinade, brief and generally anonymous satirical comment in prose or verse that ridicules a contemporary leader or national event. Pasquinade is derived from "Pasquino," the popular name for the remains of an ancient Roman statue unearthed in Rome in 1501. "Pasquino," supposedly named after a local shopkeeper near whose house or shop the statue was discovered, was the focus for bitingly critical political squibs attached to its torso by anonymous satirists. These pasquinades and their imitations, some ascribed to important 16th-century writers such as Aretino, were collected and published. After the 16th century the vogue of posting pasquinades died out, and the term acquired its more general meaning.

Pass Christian, city, Harrison County, southeastern Mississippi, U.S., just west-southwest of Gulfport, on the Mississippi Sound. It is named for the nearby deepwater channel known as Christian's Pass linking the Gulf of Mexico with Lake Pontchartrain, supposedly navigated in 1699 by Christian L'Adnier, a member of the crew of the French explorer Pierre Le Moyne, sieur d'Iberville. Originally settled by the French and Spanish, it became a trading centre with the opening of the Mississippi Territory. A U.S. garrison was stationed there in 1811, and the misnamed Battle of Pass Christian, fought (1814) during the War of 1812 nearby in the Saint Louis bay, was the last naval engagement (a British victory) to take place in continental U.S. waters against a foreign foe. The first yacht club on the Gulf coast was organized at Pass Christian in 1849, and the town (inc. 1848) became a popular resort for plantation owners. Later, the railroads brought an influx of winter visitors from the North among whom were presidents Theodore Roosevelt, Woodrow Wilson, and Harry S. Truman. A sand beach 28 mi (45 km) long extends from Pass Christian through Gulfport to Biloxi. The town remains as a year-round resort with some fishing interests. Pop. (1980) 5,014.

passacaglia (Italian, from Spanish *passacalle,* or *pasacalle:* "street song"), musical form of continuous variation in $\frac{3}{4}$ time; and a courtly dance. The dance, as it first appeared in 17th-century Spain, was of unsavoury reputation and possibly quite fiery. In the French theatre of the 17th and 18th centuries it was a dance of imposing majesty. Little is known of the actual dance movements and steps. Musically the passacaglia is nearly indistinguishable from the contemporary chaconne; contemporary writers called the passacaglia a graver dance, however, and noted that it was identified more frequently with male dancers.

Both dances gave rise to musical forms. Baroque composers used the two names indiscriminately, writing rondeaux (pieces with recurring refrains) as well as variation forms under both titles (*see* chaconne). Musicians conflict and hedge in defining the two forms. One opinion is that the chaconne is a series of variations over a short repeated theme (ostinato) in the bass—a basso ostinato, or ground bass—whereas in the passacaglia the ostinato may appear in any voice. Another view is that the passacaglia uses an ostinato normally in the bass but possibly in any voice; but the chaconne consists of variations over a harmonic ground, like a jazz riff, a series of chords that underlies the variations. Such a series may imply a constant bass line (of the chords), but merely as a component of the harmony.

Examples of passacaglias include Bach's *Passacaglia and Fugue, in C Minor,* for organ; Walter Piston's *Passacaglia* for piano; and the music of Act I, scene 4, of Alban Berg's opera *Wozzeck.* The dance's original name survives in the *pasacalle,* a lively folk dance for couples popular in western South America.

passage rite, also called RITE OF PASSAGE, French RITE DE PASSAGE, any of numerous ceremonial events, existing in all historically known societies, that mark the passage of an individual from one social or religious status to another. Many of the most important and common rites are connected with the biological stages of life—birth, maturity, reproduction, and death; other rites celebrate changes that are wholly cultural, such as initiation into special societies or groups.

A brief treatment of passage rites follows. For full treatment, *see* MACROPAEDIA: Rites and Ceremonies, Sacred.

The worldwide distribution of passage rites first attracted the attention of the French anthropologist and folklorist Arnold van Gennep, who coined the term *rite de passage* in 1909. Van Gennep emphasized the structural analogies among such various rites by demonstrating that all are characterized by three phases: separation, transition, and reincorporation. Though van Gennep cautioned that these three categories are not developed to the same extent by all peoples or in every set of ceremonies, he declared them to constitute a universal pattern.

The first phase, separation, entails symbolic behaviour that severs the individual from a previously fixed point in the social structure. The old status is erased in preparation for a new one. During the middle phase the ritual subject, or "passenger," stripped of all manifestations of rank or role, enters into a suspended, or liminal, state between past and future identities eluding the usual cultural categories of classification. This phase is frequently likened to death, or to being in the darkness of the womb awaiting a rebirth. In the final phase the ritual subject emerges from the threshold and is reincorporated in society in his new social or religious role.

Rites of passage are characteristically rich in symbolism. The transformative process is expressed in several motifs which have a wide geographical and cultural distribution. In the widespread ritual reenactment of death and rebirth, initiates are ceremonially "killed" to remove them from their former life, treated as infants in the transitional period, and made to mature into their new status. Successful passage of ordeals form a regular feature of the transitional requirements, and doorways are often used to signify entry into the new domain. The new status is usually indicated by some alteration of the body (*e.g.,* circumcision, removal of teeth, tattooing and scarification, dressing of the hair, etc.) or by the addition of special clothing and ornaments.

Most scholarly interpretations of passage rites have considered their sociological function. Social systems require a certain amount of equilibrium in order to function smoothly. Changes in either individuals or groups threaten to disrupt this equilibrium. The primary sociological function of rites of passge, then, is to foster the achievement of a new state of equilibrium after such changes, to restore social order and thereby maintain the society as a system of congruent parts. A rite of passage, being a dramatization of the individual's entry into the new order, characteristically provides instruction and gives assurance of the mastery of a new role to the affected individual. It also serves as an opportunity for the community to demonstrate support of its constituents.

The equally important psychological function of passage rites has received less scholarly attention. According to some interpretations, these rites serve to bridge critical stages in the life process and to help the individual confront certain uncontrollable aspects of the world he inhabits. By providing a predictable, communal context for individual experience, rites of passage act psychotherapeutically to alleviate the inevitable anxiety that accompanies change.

Passaic, city, Passaic County, New Jersey, U.S., on the Passaic River. Established by the Dutch in 1678 as a fur-trading post 9 mi (14.5 km) north of Newark and originally called Acquackanonk, it was renamed for the Passaic River in 1854. During the American Revolution it was occupied by George Washington's troops, and following their retreat the British general Cornwallis was quartered there. Passaic thrived as a river port until the completion of the Morris Canal between Newark and Phillipsburg (1831) and the building of the railroad reduced river commerce. With the construction of a dam (*c.* 1850), Passaic became a textile centre. With industrial expansion, the population grew from 6,532 in 1880 to 54,773 in 1910, the increase including large numbers of eastern European immigrants, especially Hungarians, Slovaks, and Poles. Once a leading woollen producer, Passaic's last mill ceased operation *c.* 1955. The city was the scene of serious labour struggles, notably a construction workers' riot (1906) and textile strikes (1926) against a wage cut and involving the right of free assembly. Still an industrial city, its chief products include rubber goods, communications equipment (television tubes and receivers), textile machinery, clothing, and handkerchiefs. Inc. 1873. Pop. (1980) city, 52,463; (1982 est.) Bergen–Passaic metropolitan area (SMSA), 1,293,200.

Passaic River, river, rising near Morristown, southeastern Morris County, northeastern New Jersey, U.S. It flows south past Millington, then north and east to Paterson and its Great Falls (70 ft [21 m] high), from which point it turns south and east past Passaic and Newark and into Newark Bay. Some 80 mi (130 km) long and with a drainage area of 935 sq mi (2,422 sq km), it has been intensively developed as a source of power and of water. Its most serious of many floods occurred in 1903. Major tributaries are the Whippany, Rockaway, Pequannock, Wanaque, and Ramapo rivers. The name is derived from an Algonkian word meaning "peaceful valley."

Passamaquoddy, Algonkian-speaking Indians who lived on Passamaquoddy Bay, St. Croix River, and Schoodic Lake on the boundary between what are now Maine and New Brunswick. They belonged to the Abnaki (*q.v.*) confederacy, and their language was closely related to that of the Malecite (*q.v.*). They depended on hunting and fishing for subsistence; birch bark and wood were used for manufacture. Villages, consisting of conical dwellings and a large council house, were sometimes palisaded. A tribal council of the war chief, the civil chief, and representatives of each family decided most important matters; a general council of the entire tribe decided war matters.

The pressure of white settlement restricted their territory, and in 1866 they were settled mainly at Sebaik, on the south side of the bay, and on Lewis Island. The Passamaquoddy and the Penobscot (*q.v.*) send to the Maine state legislature a representative who serves without a seat or vote and is permitted to speak only on matters of tribal concern. In the late 20th century there were two Passamaquoddy reservations in Maine and a total tribal population of more than 1,000.

Passamaquoddy Bay, inlet of the Bay of Fundy (Atlantic Ocean), between southwestern New Brunswick, Can., and southeastern Maine, U.S., at the mouth of the St. Croix River. Deer Island and Campobello Island are in its southern part. The bay has an immense tidal flow, with about 70,000,000,000 cu ft (2,000,000,000 cu m) entering and leaving twice daily on the turn of the tide. Passamaquoddy is derived from an Amerindian term meaning "place where pollock leap out of the water."

Passarowitz, Treaty of (July 21, 1718), pact signed at the conclusion of the Austro-Turkish (1716–18) and the Venetian–Turkish (1716–18) wars at Passarowitz (now Požarevac, Yugos.). By its terms the Ottoman Turks lost substantial territories in the Balkans to Austria, thus marking the end of Ottoman westward expansion.

In 1715 the Ottomans forced Venice to surrender the Morea (the Peloponnesus Peninsula, Greece), the major Venetian gain under the Treaty of Carlowitz (1699), and threatened Venetian possessions in Dalmatia and the Ionian Islands. At this point Austria intervened by concluding an alliance with Venice (1716). In ensuing hostilities the Ottomans suffered a series of disastrous defeats at the hands of the Habsburg general Prince Eugene of Savoy. In 1718, at the initiation of Great Britain and Holland, whose eastern Mediterranean trade was disrupted by the war, a treaty was concluded at Passarowitz that provided for a 24-year peace between the Ottoman Empire and Austria and that gave to Austria the Banat of Temesvár (the last important Ottoman stronghold in Hungary), Little Walachia, and Belgrade with parts of northern Serbia. The pact stipulated that Venice surrender the Morea to the Ottomans while retaining the Ionian Islands and making gains in Dalmatia. At the same time an Austro-Turkish commercial treaty was signed, granting Austria commercial privileges in the Ottoman Empire.

Passau, city, Bavaria *Land* (state), southeastern Germany, at the confluence of the Danube, Inn, and Ilz rivers, on the Austrian border. Originating as the Celtic settlement of Bojodurum, it was later the site of a Roman camp, Castra Batava, and was made an episcopal see in 739. The bishops became princes of the Holy Roman Empire in 1217 and ruled Passau until 1803, in spite of citizens' revolts for municipal freedom. Fires in 1662 and 1680 caused great damage, and subsequent rebuilding gave the town a Baroque character. It is dominated by the Oberhaus Fortress (1219), the site of a museum, and the cathedral (1668), which incorporates the remains of an earlier Gothic structure. The cathedral contains one of the largest church organs in the world, with 17,000 pipes (1928). The bishops' palace (1712–30) and numerous fine churches in varied styles recall the era of the prince-bishops. The Gothic town hall (1298–1389) has paintings depicting episodes in the town's past, including its association with the Nibelungen legends. The Niedernburg convent (founded 8th century) contains the tomb of Gisela, the first queen of Hungary.

Passau was an important medieval trade and shipping centre. The Inn salt trade and the making of knife and sword blades were traditional occupations. It has become the economic, cultural, and communications centre of southeastern Bavaria. Passau has city and state libraries, a municipal theatre, and other cultural institutions. Industries include a bell foundry, brewing, and the manufacture of optical instruments, textiles, and tobacco. There is also a tourist trade and a steamer service to Vienna. Pop. (1989 est.) 49,137.

passenger pigeon (*Ectopistes migratorius*), migratory bird hunted to extinction by man. Billions of these birds inhabited eastern North America in the early 1800s; migrating flocks darkened the skies for days. As settlers pressed westward, however, passenger pigeons were slaughtered by the million yearly and shipped by railway carloads for sale in city markets. From 1870 the decline of the species became precipitous, and it became officially classified as extinct when the last known representative died on Sept. 1, 1914, in the Cincinnati (Ohio) Zoo.

The passenger pigeon resembled the mourning dove and the Old World turtledove but was bigger (32 centimetres [about 13 inches]), with a longer pointed tail. The male had a pinkish body and blue-gray head. A single white egg was laid in a flimsy nest of twigs; more than 100 nests might occupy a single tree. The natural enemies of the passenger pigeon were hawks, owls, weasels, skunks, and arboreal snakes.

The pigeon sometimes foraged in newly planted grainfields but otherwise did little damage to crops. Its greatest legacy to man was the impetus its extinction gave to the conservation movement. A monument to the passenger pigeon, in Wisconsin's Wyalusing State Park, declares: "This species became extinct through the avarice and thoughtlessness of man."

passepied (French: "passing feet"), English PASPY, lively dance of Brittany adopted *c.* 1650 by French and English aristocrats, who, during the century of its popularity, frequently danced it dressed as shepherds and shepherdesses. As a court dance the passepied lost its original chain formations and became, like the minuet, a couple dance with figures. Its name probably refers to its characteristic step: the feet crossed and recrossed while gliding forward, one foot often striking the other.

The music, which begins with an upbeat in fairly rapid $\frac{3}{4}$ or $\frac{3}{8}$ time, appears occasionally among the optional movements, or *galanteries,* of the suite, notably in Bach's *Partita in G Major* and English *Suite No. 5.*

Passerat, Jean (b. Oct. 18, 1534, Troyes, Fr.—d. Sept. 14, 1602, Paris), French poet, author of some elegant and tender verse, and one of the contributors to the "Satire Ménippée," the manifesto of the moderate Royalist party in support of Henry of Navarre's claim to the throne.

Passerat, detail of a portrait
H. Roger-Viollet

Passerat studied at the University of Paris, became a teacher at the Collège de Plessis, and in 1572 was made professor of Latin at the Collège de France, where he wrote scholarly Latin works and commentaries on Catullus, Tibullus, and Propertius. He also composed poetry, his best pieces being his short ode "Du premier jour de mai" ("On the First Day of May") and a charming villanelle "J 'ai perdu ma tourterelle" ("I Have Lost My Turtle Dove"). His exact share in the "Satire Ménippée" (1594) is variously stated, but it is generally agreed that he wrote much of the verse. His lines "Sur la journée de Senlis," in which he commends the duc d'Aumale's ability in running away, became a celebrated political song.

Passeres, bird suborder (order Passeriformes) that includes all songbirds. Birds belonging to the suborder Passeres are also referred to as oscines. *See* songbird.

Passeridae, sparrow weaver family of small gregarious birds, based on the genus *Passer*, the well-known sparrows. In this work these birds are classified as a subfamily (Passerinae) in the weaverfinch family (Ploceidae), order Passeriformes.

passeriform, also called PASSERINE, or PERCHING BIRD, member of the largest order of birds (Passeriformes), containing about 5,100 species as compared to 3,500 species for all other birds. The passeriform birds are true perching birds, with four toes, three directed forward and one backward. This order is generally divided into the suboscines, containing some 1,100 species, and the oscines, or songbirds, with about 4,000 species.

A brief treatment of passeriforms follows. For full treatment, *see* MACROPAEDIA: Birds.

Passerines are small to medium-sized land birds. Most are insectivorous, although they have adapted many different ways of obtaining food. Some eat fruits and seeds.

Humans have long enjoyed passerines for their songs and their almost infinite variety of colours, patterns, and behavioral traits. This admiration can be hazardous to the existence of some bird species. They are widely kept as cage birds, and until the mid-20th century a number of species of passeriforms were commonly slaughtered for their colourful feathers. Many countries now prohibit the capture and sale of nearly all native songbirds. The birds are still, however, an important food source in certain countries, and are considered delicacies in others.

Passerines are a major factor in maintaining balance in nature. They consume large amounts and varieties of food—grains, fruits, insects, small amphibians—and in turn serve as food for other animals; they act as hosts for parasites; they pollinate plants and flowers and carry seeds to new locations. They can be agricultural pests by their depredations of grain crops.

Most passerines are solitary nesters; a single monogamous pair maintains a territory large enough to support all their mating season activities—courtship, mating, nesting, and food gathering. Nests may be located on the ground, on riverbanks, in rock crevices, on ledges, or in a wide variety of trees, grasses, and shrubs. Most species build cup-shaped open nests. Others, such as the ovenbird, form domed or ball-shaped nests of mud with small entrances on the side or top.

Passerines lay clutches of anywhere from 1 to 14 eggs. As a rule, the female alone incubates the eggs, although occasionally incubation is shared with the male. Incubation lasts from 11 to 21 days. In most species the male helps feed the young, which remain in the nest for 8 to 30 or 35 days but most commonly from 10 to 15 days. After the young fledge, they stay near the nest for some days or weeks before becoming fully independent.

An outstanding characteristic of most perching birds is their ability to sing. The 4,000 songbird (or oscine) species are most notable for their vocalizations, but other members of the order also can produce a variety of sounds. The songbirds have a highly complex vocal organ called a syrinx. Only the male of most passerine species, however, sings a true song.

A characteristic behaviour pattern peculiar to passerines is the practice of anting. About 30 passerine families actively or passively manipulate ants exuding formic acid to crawl through their feathers. Some authorities believe this is a form of stimulation, but others argue that the birds do this to help with feather maintenance. They avoid stinging ants. Some passerines also follow columns of army ants to devour other insects and small animals fleeing from their path.

Although all passerines can perch, not all do so habitually. A number of ground-dwelling species (some tapaculos, larks, pipits) have modified the characteristic four-toed perching foot into a flatter, longer version to aid in walking and running. Other passerines, such as swallows that spend much time airborne, have small, weak feet. And still others, such as woodcreepers and nuthatches that often cling and climb vines and trees, have strong, curved, sharp claws. Most passerines have moderately curved sharp claws.

Passerine bills are broadly classified into eight types that indicate the bill's function or the bird's major food source. The bill types are insectivorous, omnivorous, toothed, tearing, probing, frugivorous (heavily built for tearing apart tough fruits), serrated (found in birds needing plant cutters), and conical (for seed eating).

The males of the order tend to have brighter colours and more striking patterns on their feathers than do females and juvenile birds, which are cryptically coloured to aid in concealment. Many species, especially those in temperate climates, have a bright plumage during breeding season and a dull one in winter.

Studies of modern birds have led to a general agreement that perching birds developed from more than one ancestral type; however, the fossil record gives little definite evidence of direct ancestors. Although some authorities believe that passerines arose about 120,000,000 years ago, the earliest fossils found date from about 40,000,000 years ago.

Passiflorales, the passion-flower order of dicotyledonous flowering plants comprising five families of herbs, shrubs, trees, and vines, mostly of warm regions. The largest genus in the order is *Passiflora,* the passion-flower (*q.v.*) genus, with about 400 species, many of which are highly prized for their showy, unusual flowers.

The plants are characterized by the presence of radially symmetrical male, female, or bisexual flowers with three to five sepals, petals, and stamens (male pollen-producing structures) and a usually one-chambered, superior ovary (*i.e.,* the female structure positioned above the attachment point of the other flower parts) composed of three to five carpels (ovule-bearing segments) with indefinitely numerous ovules attached to the inner ovary walls. Nearly all species have seeds that bear a fleshy appendage called an aril. The flower is also distinctive in most species in having a gynophore or androphore, a pedestal-like structure in the centre of the flower that carries the reproductive parts of both sexes. In the passion-flower family there is an additional whorl of tendril-like structures in the flower called the corona. The fruits are capsules or berries.

Many *Passiflora* species produce edible fruits, such as the giant granadilla (*P. quadrangularis*); sweet calabash, sweet cup, or pomme d'or (*P. maliformis*); the yellow granadilla, or belle apple (*P. laurifolia*); and the purple granadilla

(*P. edulis*). Another important member of the order is the papaya (*Carica papaya,* family Caricaceae), a columnar tree with large leaves in a bunch at the top like palm trees, source of the papaya fruit of the tropics. *Passiflora* and *Carica* are the only genera cultivated to any extent.

The order is considered to be evolutionarily derived from the violet order (Violales). The families are Passifloraceae (12 genera and 600 species), Turneraceae (7 genera and 120 species), Malesherbiaceae (1 genus with 35 species), Achariaceae (3 genera and 3 species), and Caricaceae (4 genera and 55 species).

Grant Heilman—EB Inc.

The wild passion-flower, passion vine, or maypop (*P. incarnata*) climbs about 3 to 9 metres (10 to 30 feet) high and has pink and white flowers about 4 to 7½ centimetres (1½ to 3 inches) across and a yellow, berrylike, edible fruit about 2 inches long. The yellow passion-flower (*P. lutea*) is a smaller plant with greenish-yellow flowers and purple fruits.

Some highly perfumed passion fruits are eaten as delicate dessert fruits, as the giant granadilla (*P. quadrangularis*). The purple granadilla (*P. edulis*) and the yellow granadilla (*P. laurifolia*), as well as the wild passion-flower, are widely grown in tropical America for their fruit. *Passiflora maliformis* is the sweet calabash of the West Indies. The size of these fruits usually does not exceed that of a hen's egg, but that of the giant granadilla is like a gourd and may weigh up to seven or eight pounds.

The passion-flower blossom varies in form from a shallow saucer shape to a long cylindrical or trumpet-shaped tube, producing at its upper border five sepals, five petals, and many threadlike or membranous outgrowths from the tube, which constitute the most conspicuous and beautiful part of the flower, called the corona. From the base of the inner part of the tube rises a stalk bearing above the middle a ring of five stamens (the male pollen-producing structures). Above the stamens is the female structure, or ovary, at the top of which arise three widely spreading styles. Each style ends in a button-like stigma, giving an appearance rather like a large-headed nail. The ovary, with a single compartment, contains numerous seeds arranged in three groups and ripens into a berrylike or capsular fruit.

The passion-flower blossom is often used to symbolize events in the last hours of the life of Christ, the Passion of Christ, which accounts for the name of the group. Thus, the corona represents the crown of thorns; the styles represent the nails used in the Crucifixion; the stamens represent the five wounds; and the five sepals and five petals represent 10 of the apostles, excluding Judas, who betrayed Jesus, and Peter, who denied him three times on the night of his trial.

Passion music, musical setting of the suffering and Crucifixion of Christ, based either on biblical texts or poetic elaborations. Dating from the 4th century onward, they range from unaccompanied plainsong to compositions for soloists, chorus, and orchestra. In the medieval Passion the deacon sang the entire text. A range of 11 notes was divided into three parts: the lowest four notes were used for the part of Christ, the middle register for the Evangelist, and the top four notes for the *turba* ("crowd"), which comprised all the other characters. Each of the vocal ranges was distinguished by a characteristic method of performance.

From the 15th century onward, the three parts often were sung by three deacons; in consequence, the dramatic nature of the text was heightened, and the congregation could follow the narrative easily. In the 13th century the Passions were adapted as music-drama. Two versions are found in the famous German manuscript *Carmina Burana*. Later Passion plays abound, and they tended to become longer and more complex. In the early 15th century, wealthy establishments had small choirs capable of singing the *turba* parts. One of the first composers to set this music polyphonically (for more than a single melodic part) was the Burgundian Gilles Binchois (*c.* 1438). The type of Passion in which plainsong alternated with polyphony was set by fine composers throughout Europe.

Latin and German Passion texts were used in Germany early in the Protestant Reformation. The Lutheran composer Johann Walther created a setting of the Passion according to St. Matthew (*c.* 1550) that was still popular in 1806. Other German Passions adopted a style called motet Passion because the entire text is set polyphonically, as in a motet. The 16th-century French composer Antoine de Longaval, who made extensive use of the plainsong formulas, was more concerned with declamation of the text than with elaborate polyphony. Among the Germans, Jacob Handl and Leonhard Lechner produced dignified settings.

The Longaval setting inspired motet Passions by 16th-century Franco-Flemish composers, whereas Antonio Scandello, an Italian working at Dresden, produced a hybrid setting of the Passion according to St. John in German. He amalgamated the two types by setting the *turba* music for five voices, contrasting this with the single line of the Evangelist and with three-part settings of the words of Peter, Pilate, and other characters, while the words of Jesus are in four-part harmony.

The solo vocal and multipart choral styles of Italian Baroque music were strongly influential in Germany. The St. Matthew Passion setting of Thomas Selle (1599–1663) uses a double chorus extensively, while his setting of the St. John Passion incorporates instruments and a "distant choir." Contrast between the interlocutors is achieved by assigning particular instruments or groups to different characters. Chorales, or hymn tunes, were introduced into the German Passions by Johann Theile and Johann Kuhnau. The three unaccompanied Passions by the celebrated composer Heinrich Schütz return to the more austere type.

Settings of the Passion were rare in 17th-century Italy and France, for elaborate music was unwelcome during Holy Week. The St. John Passion setting of Alessandro Scarlatti is a strictly liturgical work that follows the text with scrupulous accuracy and refrains from undue elaboration. In France, Marc-Antoine Charpentier's Passion displays an intensity of emotion and contrast of tone-colour.

Hamburg witnessed early attempts at operatic settings of the Passion, based on new librettos paraphrasing biblical texts. These rhymed, sentimental accounts appealed to German audiences but were not entirely approved by the clergy. The reaction to this trend came with Christian Heinrich Postel's version of the St. John Passion, set by Handel in 1704, and with the St. John and St. Matthew Passions by J.S. Bach. Bach's Passions made the texts important and dignified and wedded to them music of remarkable fervour, heightening the drama by interplay of choral and instrumental forces alternating with vocal solos.

C.P.E. Bach wrote two Passions challenged in popularity only by Karl Heinrich Graun's *Der Tod Jesu* (*Jesus' Death*), famous even outside Germany. Throughout the Classical and Romantic periods, the Passion written as an oratorio was usual, commonly using a large orchestra and chorus. Haydn and Beethoven set fashions in the writing of Passion oratorios. The English composer Sir John Stainer's *The Crucifixion* (1887) achieved great popularity. Passion music of the 20th century includes an oratorio *St. Luke Passion* of Krzysztof Penderecki, a Polish composer, St. Mark Passions by Charles Wood (England), Lorenzo Perosi (Italy), and Kurt Thomas (Germany), and *The Passion of Christ* by Arthur Somervell (England).

Passion play, religious drama of medieval origin dealing with the suffering, death, and Resurrection of Christ. Early Passion plays (in Latin) consisted of readings from the Gospel with interpolated poetical sections on the events of Christ's Passion and related subjects, such as Mary Magdalene's life and repentance, the raising of Lazarus, the Last Supper, and the lament of the Virgin Mary. Use of the vernacular in these interpolations led to the development of independent vernacular plays, the earliest surviving examples being in German. Such plays were at first only preludes to dramatic presentations of the Resurrection. The introduction of Satan (which became typical of German and Czech plays), and thus of introductory representations of the fall of Lucifer and the Fall of man (as in the early 14th-century Vienna Passion), and of scenes from the Old Testament and of the Last Judgment, led to development of cyclic plays similar to the Corpus Christi cycles. The great Celtic Passion cycles of Cornwall and Brittany, and the St. Gall Passion play (which begins with the entry of St. Augustine, who introduces the Old Testament prophets and patriarchs, and also includes the marriage at Cana), exemplify this type of Passion play.

The Tirol plays early formed a separate group, representing only scenes from the Passion and Resurrection. The Bohemian plays, such as the St. Eger Passion, developed from a simpler version of the Vienna Passion, were also distinct in style and incident.

The earliest Passion plays of France and Flanders are thought to have their source in a nondramatic narrative poem of the 13th century, the *Passion des jongleurs*. These plays became highly elaborated in the course of their development, culminating in performances (Mons, 1501; Valenciennes, 1547) lasting more than a week. Confraternities were founded for performance of Passion plays, the most famous being the Confrérie de la Passion (1402). Passion plays were also performed in Spain, Italy, and elsewhere, with local variations.

By the 16th century, many of the Passion plays, debased by secular influences, had degenerated into mere popular entertainments, full of crude slapstick and buffoonery. Many were forbidden by ecclesiastical authorities, and many more were suppressed after the Reformation.

The most famous of the Passion plays to survive into the 20th century is that performed at Oberammergau, in the Bavarian Alps. According to tradition, the play has been presented every 10 years since 1634, in fulfillment of a vow made after the village was spared an epidemic of plague (shifting to decennial years in 1700), except in 1870 during the Franco-Prussian War and World War II, when religious plays were banned. It remains an entirely local production, with villagers taking all the parts and singing in the chorus. Since 1930 roofed seats have protected the audience from the weather. The production runs from May through September. Some villagers and some Jewish organizations have protested anti-Semitic overtones in the 1860 text. Traditional Passion plays have also been revived in villages in the Austrian Tirol. In northern Spain, during Lent and Holy Week, a Catalan Passion play is performed by villagers; and in Tegelen, in The Netherlands, a modern play

by the Dutch poet Jacques Scheurs is given every five years.

Passionist, member of CONGREGATION OF THE PASSION, formally CONGREGATION OF THE DISCALCED CLERKS OF THE MOST HOLY CROSS AND PASSION OF OUR LORD JESUS CHRIST (C.P.), a religious order of men in the Roman Catholic Church, founded by Paolo Francesco Danei (now known as St. Paul of the Cross) in Italy in 1720 to spread devotion to the sufferings and death on the Cross of Jesus Christ.

In regions where the church is established this apostolate (religious activity) is fulfilled especially by the preaching of missions and retreats; in other regions foreign missions are conducted. The members of the order follow an austere rule of life that calls for common recitation of the liturgical office, three days of fasting each week, and other penances. Their habit consists of a black tunic and mantle with a leather belt and rosary. The tunic and mantle have a heart-shaped badge, bearing a white cross and three nails with the inscription *Jesu XPI Passio* (Passion of Jesus Christ).

St. Paul also founded the Passionist Nuns (Nuns of the Cross and Passion of Our Lord Jesus Christ), approved by Pope Clement XIV in 1771. Passionist Sisters were established in 1852 in England.

påssjo, the sacred area in a Lapp *kota,* or tent, found directly behind the central hearth; it was furnished with a separate entrance and sometimes set off with poles to separate it from the living space in the rest of the *kota.* The *påssjo* held the cooking utensils, dishes, and food of the household, as well as all objects of value, such as the men's hunting weapons, which the women were not allowed to touch. The Lapp shaman, the *noiade,* also stored his magic drum, the *kobdas,* and other magic implements there. The *påssjo* was strictly forbidden to women. Bear hunters left for and returned from a hunt through the *påssjo* door, after which the women spat alder juice upon them. The dead were also removed through this back door. The entire Lapp *kota* was a microcosmic representation of the ordered cosmos in the Lapp's world view. In such an arrangement the *påssjo* represented the centre of the universe, its most sacred locality.

Passo Fundo, city, northern Rio Grande do Sul state, southern Brazil, lying near the headwaters of the Rio Passo Fundo at 2,326 ft (709 m) above sea level. It was founded in 1857 and given city status in 1890. The city is a service centre for an agricultural and livestock-raising area. In addition to flour mills and plants processing meat and maté (tea), there is some lumbering and sawmilling. A hydroelectric plant serves the city. The Universidade de Passo Fundo (1968) is located there. Passo Fundo, 140 mi (225 km) northwest of Pôrto Alegre, the state capital, is accessible by railway, road, and air. Pop. Passos, city, southwestern Minas Gerais state, Brazil, on the Rio da Bocaina near the Rio Grande, at 2,388 ft (728 m) above sea level. It was made a seat of a municipality in 1848 and became a city 10 years later. Rice, corn (maize), sugarcane, cotton, coffee, and livestock are processed in the city and transported by rail and road to Belo Horizonte, the state capital, 183 mi (295 km) east-northeast. Pop. (1980 prelim.) 56,998.

Passover, Hebrew PESAḤ, or PESACH, in Judaism, one of three major Pilgrim Festivals, this one commemorating the "passing over" of the forces of destruction, or the sparing of the firstborn of the Israelites, when the Lord "smote the land of Egypt" on the eve of the Exodus (Nisan 14). The Jews, in accordance with the Lord's orders to Moses, had marked their doorposts with the blood of a lamb to signify that they were children of God.

The festival is celebrated for seven days in Israel and by Reform Jews, and for eight days elsewhere, though the seven-day period from Nisan 15 to 22 is more properly the festival of "unleavened bread" (*see* matza). Passover commences with a special family meal, the seder, at which foods of symbolic significance are eaten; the seder also includes prayers and traditional recitations. In the Ashkenazi synagogues, the Song of Solomon (Song of Songs) is read from the Megillot on the Sabbath as part of the liturgy. Though the festival is meant to be one of great rejoicing, recalling the greatest event in Jewish history, strict dietary laws must be observed, and special prohibitions restrict work at the beginning and end of the celebration. *See also* seder.

Passy, Frédéric (b. May 20, 1822, Paris—d. June 12, 1912, Paris), French economist and advocate of international arbitration who was co-winner (with Jean-Henri Dunant, founder of the Red Cross) of the first Nobel Peace Prize (1901).

Passy, 1901

H. Roger-Viollet

After serving as auditor for the French Council of State (1846–49), Passy devoted himself to writing, lecturing, and organizing on behalf of various economic reforms and philanthropies. An ardent free trader, he belonged to the 19th-century liberal tradition of the British economists Richard Cobden and John Bright, whom he knew personally.

Passy's work for peace began during the Crimean War (1853–56). His plea for peace in the periodical *Le Temps* (1867) helped to avert war between France and Prussia over Luxembourg. In the same year he founded the Ligue Internationale de la Paix, later known as the Société Française pour l'Arbitrage entre les Nations. After the Franco-German War (1870–71) he proposed independence and permanent neutrality for Alsace-Lorraine. As a member of the French Chamber of Deputies (from 1881), he successfully urged arbitration of a dispute between France and The Netherlands concerning the French Guiana–Surinam boundary. He assisted in founding the International Parliamentary Union (1889) and remained active in the peace movement for the rest of his long life.

pasta, any of several starchy food preparations (*pasta alimentaria*) frequently associated with Italian cuisine and made from semolina, the granular product obtained from the endosperm of a type of wheat called durum, containing a large proportion of gluten (elastic protein). It is formed into ribbons, cords, tubes, and various special shapes, all originally developed for specific characteristics, such as ability to retain heat or hold sauces.

In commercial processing, the semolina, mixed with warm water, is kneaded into a smooth, stiff dough and extruded. The dough, moved forward while it is being compacted and mixed, is forced through perforated plates, or dies, that form it into the desired shape. Hollow tubular forms, such as macaroni, result when the perforations are small and contain steel pins; smaller holes without pins produce spaghetti; flat ribbonlike types are made by slitted perforations. Shell forms are produced by a special die; small fancy shapes are produced by rotary knives slicing the dough as it emerges from the die. The formed dough is next dried, reducing moisture content from about 31 percent to approximately 12 percent. Drying is carefully regulated, as very rapid drying may result in cracking, and very slow drying may produce stretching or encourage the growth of mold or of organisms that produce souring.

Doughs may be coloured with spinach juice, producing green pasta; with beet juice, resulting in red types; and with eggs, adding bright-yellow colour. Eggs are frequently added to homemade pastas.

Among the popular cord forms are spaghetti ("little string"), a finer type called spaghettini, and the very fine vermicelli ("little worms"). Tubular types include macaroni, shaped into tubes of ½-inch (12.7-millimetre) diameter, such variations as the small elbow-shaped pieces called *dita lisci,* and the large, fluted, elbow-shaped pieces called rigatoni. Ribbon types include the wide lasagna and the narrow linguini. Farfels are ground, granulated, or shredded. The wide variety of special shapes includes *farfalloni* ("large butterflies"), *lancette* ("little spears"), *fusilli* ("spindles"), and *ricciolne* ("little curls").

Pastas are prepared by boiling and may be cooked until firm and resilient to the bite (*al dente*) or until very tender. Prepared Italian style, they may be tossed with butter, cheese, and seasoning (nutmeg, pepper) or served with a variety of sauces—tomato, cream, seafood, or others. Shaped pastas are often stuffed with meat, cheese, spinach, or a combination of these and other ingredients. Pastas are also cooked in soups and are used in casseroles and other dishes that call for the use of noodles, a similar starch preparation (*see* noodle). Uncooked pastas retain their freshness from three to six months.

Pasta, Giuditta (Maria Costanza), *née* NEGRI (b. Oct. 28, 1797, Saronno, near Milan—d. Apr. 1, 1865, Blevio, Como, Italy), reigning

Italian soprano of her time, acclaimed for her vocal range and expressiveness.

She studied with Bonifazio Asioli and Giuseppe Scappa at Milan and made her debut there in 1815 in Scappa's *Le tre Eleonore.* She gave a brilliant performance in 1821 at the Théâtre-Italien in Paris as Desdemona in Gioacchino Rossini's *Otello,* and in 1824 she conquered London in a series of Rossini roles, including Semiramis in *Semiramide.*

Pasta's vocal range and dramatic power were so remarkable that several leading composers wrote operas for her, including Giovanni Pacini, *Niobe* (1826); Vincenzo Bellini, *Ernani, Beatrice di Tenda, Norma,* and *La sonnambula;* and Gaetano Donizetti, *Anna Bolena.* Even after her voice gave way in the late 1830s, she performed in London and St. Petersburg, until in 1850 she retired to teach at her villa on Lake Como.

paste, heavy, very transparent flint glass that simulates the fire and brilliance of gemstones because it has relatively high indices of refraction and strong dispersion (separation of white light into its component colours). From a very early period the imitation of gems was attempted. The Romans in particular were very skillful in the production of coloured-glass pastes, which copied especially emerald and lapis lazuli. With an increasing demand for jewelry, the number of imitations steadily increased. In 1758 the Viennese goldsmith Joseph Strasser succeeded in inventing a colourless glass paste that could be cut and that superficially approached the sparkle of genuine diamond; the products of this paste are called strass stones.

Before 1940 most imitation gems were made from glass with a high lead content. Such glasses were called paste because the components of the mixture were mixed wet to ensure a thorough and even distribution. Colourless paste is commonly formulated from 300 parts of silica (silicon dioxide, SiO_2), 470 of red lead (a lead oxide, Pb_3O_4), 163 of potassium carbonate (K_2CO_3), 22 of borax (a sodium borate, $Na_2B_4O_7 \cdot 10H_2O$), and 1 of white arsenic (arsenic oxide, As_2O_3). Pigments may be added to give the paste any desired colour: chromium compounds for red or green, cobalt for blue, gold for red, iron for yellow to green, manganese for purple, and selenium for red.

Pastes are softer than ordinary or crown glass but have a higher index of refraction and dispersion that give them great brilliancy and fire. The cheaper paste imitations are pressed or molded, but, on the better-quality stones, the facets are cut and polished. Molded-glass imitations can be identified with a hand lens, because the edges between the facets are rounded whereas cut glass has sharp edges. Cut paste stones may be distinguished from real ones in several ways: (1) paste has air bubbles, natural stones do not; (2) paste is a poor conductor of heat, and so paste stones feel warm to the touch; and (3) paste, like all glass, has an easy conchoidal fracture, yielding brilliant curved surfaces particularly on the girdle (the widest part) of mounted stones near the mounting prongs. Other differentiation methods involve hardness (paste is softer than real stones and will not scratch ordinary glass), index of refraction (1.50–1.80, less than diamond at 2.42), specific gravity (between 2.5 and 4.0, depending on the amount of red lead used), and isotropic character (because paste has the same properties in all directions, it shows only single refraction and no dichroism, whereas most natural stones are partially doubly refractive and dichroic).

pastel, dry drawing medium executed with fragile, finger-size sticks. These drawing crayons, called pastels, are made of powdered pigments combined with a minimum of non-greasy binder, usually gum tragacanth or, from the mid-20th century, methyl cellulose. Made in a wide range of colour values, the darkest in each hue consists of pure pigment and binder, the others having varying admixtures of inert whites. Once the colours are applied to paper, they appear fresh and bright. Because they do not change in colour value, the final effect can be seen immediately. Pastel remains on the surface of the paper and thus can be easily obliterated unless protected by glass or a fixative spray of glue size or gum solution. Fixatives, however, have a disadvantage in that they tend to change the tone and flatten the grain of pastel drawings. When pastel is applied in short strokes or linearly, it is usually classed as drawing; when it is rubbed, smeared,

and blended to achieve painterly effects, it is often regarded as a painting medium. The latter technique was principally used until the late 19th century, when the linear method came to be preferred. Special papers for pastel have been made since the 18th century with widely varying textures, some like fine sandpaper, with a flocked or suedelike finish, prominently ribbed or strongly marked by the drying felts.

Pastels originated in northern Italy in the 16th century and were used by Jacopo Bassano and Frederico Barocci. The German artist Hans Holbein the Younger and the French artists Jean and François Clouet did pastel portraits in the same period. The greatest popularity of the medium came in the 18th century, when it was primarily used for portraiture. Rosalba Carriera (Italian), Jean-Baptiste Chardin, François Boucher, Maurice-Quentin de La Tour, Jean-Baptiste Perronneau (all French), Jean-Étienne Liotard (Swiss), and Anton Raphael Mengs (German) were among the major masters of pastel. Largely revived and revitalized in the last third of the 19th century by the French artist Edgar Degas, pastels figure importantly in the work of such artists as Auguste Renoir, Henri de Toulouse-Lautrec, Odilon Redon, Gustave Moreau, Edouard Vuillard, Pierre Bonnard (all French), Mary Cassatt (American expatriate), and Paul Klee (Swiss).

Pasternak, Boris (Leonidovich) (b. Feb. 10 [Jan. 29, Old Style], 1890, Moscow—d. May 30, 1960, Peredelkino, near Moscow), Russian poet whose novel *Doctor Zhivago* helped win him the Nobel Prize for Literature in 1958 but aroused so much opposition in the Soviet Union that he declined the honour. An epic of wandering, spiritual isolation, and love amid the harshness of the Russian Revolution and its aftermath, the novel became an international best-seller but circulated only in secrecy and translation in his own land.

Pasternak grew up in a cultured Jewish household. His father, Leonid, was an art professor and a portraitist of novelist Leo Tolstoy, poet Rainer Maria Rilke, and composer Sergey Rachmaninoff, all frequent guests at his home, and of Lenin. His mother was the pianist Rosa Kaufman.

Young Pasternak himself planned a musical career, though he was a precocious poet. He studied musical theory and composition for six years, then abruptly switched to philosophy courses at Moscow University and the University of Marburg (Germany). Physically disqualified for military service, he worked in a chemical factory in the Urals during World War I. After the Revolution he worked in the library of the Soviet commissariat of education.

His first volume of poetry was published in 1913. In 1917 he brought out a striking second volume, *Poverkh baryerov* ("Over the Barriers"), and with the publication of *Sestra moya zhizn* (1922; "My Sister Life") he was recognized as a major new lyrical voice. His poems of that period reflected Symbolist influences. Though avant-garde and esoteric by Russian standards, they were successful. From 1933 to 1943, however, the gap between his work and the official modes (such as Socialist Realism) was too wide to permit him to publish, and he feared for his safety during the purge trials of the late 1930s. One theory is that Stalin spared him because Pasternak had translated poets of Stalin's native Georgia. His translations, which were his main livelihood, included renderings of William Shakespeare, Johann Wolfgang von Goethe, English Romantic poets, Paul Verlaine, and Rainer Maria Rilke.

Although Pasternak hoped for the best when he submitted *Doctor Zhivago* to a leading Moscow monthly in 1956, it was rejected

with the accusation that "it represented in a libelous manner the October Revolution, the people who made it, and social construction in the Soviet Union." The book reached the West in 1957 through an Italian publishing house that had bought rights to it from Pasternak and refused to return it "for revisions." By 1958, the year of its English edition, the book had been translated into 18 languages.

In the Soviet Union, the Nobel Prize brought a campaign of abuse. Pasternak was ejected from the Union of Soviet Writers and thus deprived of his livelihood. Public meetings called for his deportation; he wrote Premier Nikita S. Khrushchev, "Leaving the motherland will equal death for me." Suffering from cancer and heart trouble, he spent his last years in his home at Peredelkino.

Pasternak's works in English translation include short stories, the autobiographical *Okhrannaya gramota* (1931; *Safe Conduct*), and the full range of his poetic output, which ended on a note of gravity and quiet inwardness.

In 1987 the Union of Soviet Writers posthumously reinstated Pasternak, a move that gave his works a legitimacy they had lacked in the Soviet Union since his expulsion from the writers' union in 1958 and that finally made possible the publication of *Doctor Zhivago* in the Soviet Union. In addition to effecting Pasternak's rehabilitation, the review commission, headed by poet Andrey Voznesensky, recommended that Pasternak's home in Peredelkino be made a museum.

Pasteur, Louis (b. Dec. 27, 1822, Dole, Fr.—d. Sept. 28, 1895, Saint-Cloud, near Paris), French chemist and microbiologist who proved that microorganisms cause fermentation and disease; among other achievements, he originated the process called pasteurization.

A brief account of the life and works of Louis Pasteur follows. For a full biography, *see* MACROPAEDIA: Pasteur.

Pasteur, after what seemed like an unpromising start, began the serious study of chemistry at the Sorbonne in 1843 and received his doctorate of sciences in 1847. He worked on the polarization of light by chemical compounds. In 1848 he was appointed professor of physics at Dijon and in 1849 was called to Strasbourg as professor of chemistry; in 1854 he became dean of the science faculty at the University of Lille. From 1857 to 1867 he was director of scientific studies at the École Normale Supérieure. He found means of saving the beer, wine, and silk industries of France and other countries when they were threatened by inimical microorganisms. In 1873 he became a member of the French Academy of Medicine, and in 1874 he received a life pension from the National Assembly.

In 1881 Pasteur was first to vaccinate sheep against anthrax; he was elected (1882) a member of the French Academy, and in 1885 he used vaccination for the first time against rabies. In 1888 the Pasteur Institute was established in Paris, and he served as its head until his death. His *Oeuvres complètes,* 7 vol. (1922–39), and *Correspondance, 1840–1895,* four parts (1940–51), were edited by his grandson Joseph Louis Pasteur Vallery-Radot (known as Pasteur Vallery-Radot).

Pasteurella, genus of rod-shaped bacteria named in honour of Louis Pasteur and causing several serious diseases in domestic animals and milder infections in humans. The species are microbiologically characterized as gram-negative, nonmotile, facultative anaerobes (not requiring oxygen) that have a fermentative type of metabolism. They are 0.3 to 1 μm (micrometre; 1 μm = 10^{-6} metre) across by 1–2 μm long. The infections they cause, referred to by the general term pasteurelloses, are widespread, being transmitted by direct contact and, in some cases, by certain species of ticks and fleas. The genus is closely related to the genera *Haemophilus* and *Actinobacillus,* and together the three genera form the family Pasteurellaceae.

Pasteurella multocida is pathogenic for many animals, causing fowl cholera, blood poisoning in ruminants, pneumonia in young cattle, and respiratory infection in cattle and humans. *P. pneumontropica* produces respiratory infection in laboratory rodents and rabbits, and *P. haemolytica* is a cause of sheep pneumonia. *P. multocida* and *P. pneumotropica* are also often found in the mouths of healthy cats and dogs and can cause infection in bite wounds of those animals.

The agents of tularemia and bubonic plague, previously designated *P. tularensis* and *P. pestis*, respectively, have been reclassified as *Francisella tularensis* and *Yersinia pestis.*

Control by vaccine is variable, as is treatment with penicillin and other antibiotics, such as tetracycline.

pasteurellosis, any bacterial disease caused by *Pasteurella* species. The name is sometimes used interchangeably with the so-called shipping fever, a specific type of pasteurellosis (caused by *Pasteurella multocida*) that commonly attacks animals under stress, as during shipping. In this type of pasteurellosis, fever is followed by respiratory difficulty, which may lead to pneumonia and more severe symptoms. Treatment includes isolation, rest, and antibiotic therapy. Some immunity may be gained from antiserums and other preventive preparations. *P. haemolytica,* another organism that causes pasteurellosis, can produce pneumonia in sheep and cattle and septicemia in other animals.

pasteurization, heat-treatment process that destroys pathogenic microorganisms in certain foods and beverages. It is named for the French scientist Louis Pasteur, who in the 1860s demonstrated that abnormal fermentation of wine and beer could be prevented by heating the beverages to about 57° C (135° F) for a few minutes. Pasteurization of milk, widely practiced in several countries, notably the United States, requires temperatures of about 63° C (145° F) maintained for 30 minutes or, alternatively, heating to a higher temperature, 72° C (162° F), and holding for 15 seconds (and yet higher temperatures for shorter periods of time). The times and temperatures are those determined to be necessary to destroy the *Mycobacterium tuberculosis* and other more heat-resistant of the non-spore-forming, disease-causing microorganisms found in milk. The treatment also destroys most of the microorganisms that cause spoilage and so prolongs the storage time of food.

Ultra-high-temperature (UHT) pasteurization involves heating milk or cream to 138°to 150° C for one or two seconds. Packaged in sterile, hermetically sealed containers, UHT milk may be stored without refrigeration for months. Ultrapasteurized milk and cream are heated to at least 138° C for at least two seconds, but because of less stringent packaging they must be refrigerated. Shelf life is extended to 60–90 days. After opening, spoilage times for both UHT and ultrapasteurized products are similar to those of conventionally pasteurized products.

Pasteurization of some solid foods involves a mild heat treatment, the exact definition of which depends on the food. Radiation pasteurization refers to the application of small amounts of beta or gamma rays to foods to increase their storage time.

Pasto, city, capital of Nariño department, southwestern Colombia, situated 8,291 feet (2,527 m) above sea level at the base of extinct Galeras Volcano (13,999 feet [4,267 m]). Founded in 1539, Pasto was a royalist stronghold during the revolution against Spain. Although now less important as a trade centre than it was in the colonial era, Pasto controls traffic between Ecuador and the Cauca Valley and is the commercial centre for the surrounding agricultural and gold-mining area. The University of Nariño grew from a college established in Pasto in 1827 (university status, 1964). The city lies on the Pan-American Highway, 76 miles (122 km) from the Ecuadorian border, and is linked by road with the Pacific port of Tumaco. The area for which Pasto is an urban centre contains a large Indian population. Pop. (1985) 197,407.

Paston Letters, the largest surviving collection of 15th-century English correspondence, invaluable to historians and philologists, preserved mainly in the British Museum. Part is derived from the circle of the career soldier Sir John Fastolf (*c.* 1378–1459), and part is from the correspondence of the Paston family, Fastolf's neighbours in eastern Norfolk.

One of Fastolf's servants, William Worcester, collected material for personal historical research as well as evidence for several lawsuits involving Fastolf. The Pastons involved in the letters include William (d. 1444), who became a justice of the Court of Common Pleas; his son John I (d. 1466), a London lawyer; John's two sons, John II (d. 1479) and John III (d. 1503), both of whom were knighted; and their respective wives and children. The collection of more than 1,000 items contains legal records, local and national news, and gossip; through all this, the characters of the writers emerge vividly.

Reasons for the initial preservation of the letters must include the desirability, in the litigious world of 15th-century Norfolk, of possessing all possible evidence that might be valuable in lawsuits; employees and estate managers too were eager to preserve their warrants for their expenditures and actions.

How the Paston Letters were kept from the 15th to the 18th century is unknown, but in 1735 Francis Blomefield explored the muniment room at Oxnead, the Paston family seat in Norfolk. He preserved letters judged "of good consequence in history," these eventually being acquired by the Bodleian Library, Oxford, and the British Museum. John Fenn of East Dereham, Norfolk, edited four volumes of *Original Letters* (1787–89); a fifth volume, completed by William Frere, was published posthumously in 1823. The collection was reedited by James Gairdner as *The Paston Letters, 1422–1509* in six volumes in 1904.

The collection remains of outstanding interest to philologists as evidence of the English language at a crucial period in its development. For historians, the letters are a primary source for the political history of 15th-century England and also for the domestic history of medieval English provincial society.

Pastor, Ludwig, FREIHERR (baron) VON CAMPERSFELDEN (b. Jan. 31, 1854, Aachen, Prussia [Germany]—d. Sept. 30, 1928, Innsbruck, Austria), German author of one of the monumental papal histories, *Geschichte der Päpste seit dem Ausgang des Mittelalters,* 16 vol. (1886–1933; *History of the Popes from the Close of the Middle Ages*).

While a student, Pastor became acquainted with the leading historians of his day. He became a lecturer at the University of Innsbruck (1881), where, in 1887, he was appointed professor of modern history. He later became director (1901) of the Austrian Historical Institute, Rome, and Austrian ambassador (1920) to the Vatican. He was knighted by Emperor Francis Joseph of Austria in 1908 and was created a baron in 1916.

Pastor's works include more than 12 monographs, the best-known being his *Geschichte der Päpste.* In 1881 Pastor caused Pope Leo XIII to open the Vatican archives, heretofore unavailable to scholars; Pastor also consulted archives throughout Europe. His papal history emphasized objective scholarship, treated dark periods of the papacy with frankness, and concentrated on individual popes rather than on the papacy as an institution. Another major work is his edition of *Geschichte des deutschen Volkes,* 8 vol. (1893–1926; "History of the German People"), by one of his former teachers, Johannes Janssen.

Pastor, Tony, in full ANTONIO PASTOR (b. May 28, 1837, New York City—d. Aug. 26, 1908, Elmhurst, N.Y., U.S.), impresario and comic singer, considered the father of vaudeville in the United States.

An entertainer from the age of six, Pastor appeared at P.T. Barnum's American Museum in New York City as a child prodigy and then appeared in minstrel shows and in

the circus before he first performed in a variety show in 1861. He opened his own variety theatre in New York City in 1865 and the Fourteenth Street Theatre (New York City) in 1881. Though at the time variety shows featured coarse humour and were considered to be unsuitable entertainment for ladies, Pastor advertised his Fourteenth Street Theatre as "the first specialty and vaudeville theatre of America, catering to polite tastes, aiming to amuse, and fully up to current times and topics." His unexpected success encouraged other theatre managers to adopt his code of prohibitions, and a more wholesome form of vaudeville soon replaced the earlier form.

Pastora Gómez, Edén, byname ZERO, or COMMANDER ZERO (b. 1937?), Nicaraguan guerrilla leader and legendary fighter.

A military commander of the Sandinista movement, Pastora led the assault on the national palace in Managua on Aug. 22, 1978. Twenty-three men under his command took about 1,000 hostages, about half of them legislators and other government officials, including José Somoza Abrego, nephew of President Anastasio Somoza Debayle, and Somoza's cousin, Luis Paillais Debayle. The government capitulated to the insurgents' demands, freeing 59 political prisoners and paying a reputed ransom of $500,000. The guerrillas, including Pastora, were flown to exile in Panama. This episode initiated a period of heightened political strife that resulted in Somoza's departure from the country and the assumption of power by the Sandinista junta on July 20, 1979. Pastora was named deputy interior minister.

The junta never allotted Pastora much political power, but because of his enormous popularity with the masses he was prominent in every national celebration. In July 1981 Pastora resigned as vice minister of defense and voluntarily exiled himself. He later condemned the junta that he had helped to power for its repressiveness and failure to live up to its ideals and founded an insurgent group, which eventually disbanded because of Pastora's refusal to join the U.S.-supported rebels.

pastoral literature, class of literature that presents the society of shepherds as free from the complexity and corruption of city life. Many of the idylls written in its name are far remote from the realities of any life, rustic or urban. Among the writers who have used the pastoral convention with striking success and vitality are the classical poets Theocritus and Virgil and the English poets Edmund Spenser, Robert Herrick, John Milton, Percy Bysshe Shelley, and Matthew Arnold.

The pastoral convention sometimes uses the device of "singing matches" between two or more shepherds, and it often presents the poet and his friends in the (usually thin) disguises of shepherds and shepherdesses. Themes include, notably, love and death. Both tradition and themes were largely established by Theocritus, whose *Bucolics* are the first examples of pastoral poetry. The tradition was passed on, through Bion, Moschus, and Longus, from Greece to Rome, where Virgil (who transferred the setting from Sicily to Arcadia, in the Greek Peloponnese, now the symbol of a pastoral paradise) used the device of alluding to contemporary problems—agrarian, political, and personal—in the rustic society he portrayed. His *Eclogues* exerted a powerful effect on poets of the Renaissance, including Dante, Petrarch, and Giovanni Boccaccio in Italy; Pierre de Ronsard in France; and Garcilaso de la Vega in Spain. These were further influenced by medieval Christian commentators on Virgil and by the pastoral scenes of the Old and New Testaments (Cain and Abel, David, the Bethlehem shepherds, and the figure of Christ the good shepherd). During the 16th and 17th centuries, too, pastoral romance novels (by Jacopo Sannazzaro, Jorge de Montemayor, Miguel de Cervantes, and Honoré d'Urfé) appeared, as did in the 15th and 16th centuries the pastoral drama (by Torquato Tasso and Battista Guarini).

In English poetry there had been some examples of pastoral literature in the earlier 16th century, but the appearance in 1579 of Edmund Spenser's *Shepheardes Calender,* which imitated not only classical models but also the Renaissance poets of France and Italy, brought about a vogue for the pastoral. Sir Philip Sidney, Robert Greene, Thomas Nash, Christopher Marlowe, Michael Drayton, Thomas Dekker, John Donne, Sir Walter Raleigh, Thomas Heywood, Thomas Campion, William Browne, William Drummond, and Phineas Fletcher all wrote pastoral poetry. (This vogue was subjected to some satirical comment in William Shakespeare's *As You Like It*—itself a pastoral play.) The first English novels, by Robert Greene and Thomas Lodge, were written in the pastoral mode. Apart from Shakespeare, playwrights who attempted pastoral drama included John Lyly, George Peele, John Fletcher, Ben Jonson, John Day, and James Shirley.

The climax of this phase of the pastoral tradition was reached in the unique blend of freshness and learned imitation achieved by the poetry of Herrick and of Andrew Marvell. Later 17th-century work, apart from that of Milton, was more pedantic. The 18th-century revival of the pastoral mode is chiefly remarkable for its place in a larger quarrel between those Neoclassical critics who preferred "ancient" poetry and those others who supported the "modern." This dispute raged in France, where the "ancient" sympathy was represented in the pastoral convention by René Rapin, whose shepherds were figures of uncomplicated virtue in a simple scene. The "modern" pastoral, deriving from Bernard de Fontenelle, dwelled on the innocence of the contemporary rustic (though not on his miseries). In England the controversy was reflected in a quarrel between Alexander Pope and Ambrose Philips, though the liveliest pastorals of the period were by John Gay, whose mode was burlesque (and whose *Beggar's Opera* is ironically subtitled "A Newgate Pastoral"—Newgate being one of London's prisons).

A growing reaction against the artificialities of the genre, combined with new attitudes to the natural man and the natural scene, resulted in a sometimes bitter injection of reality into the rustic scenes of such poets and novelists as Robert Burns, George Crabbe, William Wordsworth, John Clare, George Eliot, Thomas Hardy, George Sand, Émile Zola, B.M. Bjørnson, and Knut Hamsun. Only the pastoral elegy survived, through Shelley and Matthew Arnold.

In the time since Wordsworth, poets have sometimes revived the pastoral mode, though usually for some special purpose of their own—often ironic, as in the eclogues of Louis MacNeice, or obscure, as when W.H. Auden called his long poem *The Age of Anxiety* "a baroque eclogue." *See also* elegy.

Pastorius, Francis Daniel (b. Sept. 26, 1651, Sommerhausen, Bavaria [Germany]—d. *c.* Jan. 1, 1720, Germantown, Pa. [now U.S.]), German educator, humanitarian, author, and public official who helped settle Pennsylvania and was founder of Germantown, Pa.

After graduating from the University of Altdorf in 1676, Pastorius practiced law in Germany and, from 1680 to 1682, traveled throughout western Europe as a tutor to a young German noble. In April 1683 he became the agent for an association of German Quakers, called the Frankfurt Land Company, who wished to purchase land within the Pennsylvania proprietorship. Pastorius arrived in Philadelphia that summer, purchased 15,000 acres of land from William Penn, and in the autumn established the settlement of Germantown.

Pastorius served Germantown and the province of Pennsylvania until his death. He was the settlement's first mayor and acted in that capacity as well as being town clerk until the community lost its charter in 1707. He also was a member of Pennsylvania's assembly in 1687 and 1691.

Pastorius taught at the Friend's school in Philadelphia from 1698 to 1700. He later founded his own school in Germantown and taught there for 17 years. In 1688 he was one of several Pennsylvania Quakers who signed a protest against keeping slaves that, though unsuccessful, was the first of its kind in the English colonies. He spoke several languages, kept an extensive library, and was well-versed in numerous fields of knowledge. He wrote a number of works in both German and English, among them *A New Primmer or Methodical Directions to Attain the True Spelling, Reading, and Writing of English,* first sold in 1698.

Pastoureaux (French: "Shepherds"), the participants in two popular outbreaks of mystico-political enthusiasm in France in 1251 and 1320. The first Pastoureaux were peasants in northeastern France who were aroused in 1251 by news of reverses suffered by King Louis IX in his first crusade against the Muslims. Accusing the nobles, clergy, and bourgeoisie of indifference to the king's fate, they began pillaging churches and towns. The regent of France, Blanche of Castile, who initially supported the movement, easily had the Pastoureaux put down and dispersed.

More serious was the mass rising of the Pastoureaux in 1320, directed against Philip V, whom they blamed for not undertaking a crusade. Led on by unfrocked priests and charlatans, the Pastoureaux converged on Paris. There they held the king besieged and helpless while they sacked the city and expanded their ranks with convicts released from the prisons. Still clamouring for a crusade, they marched, about 40,000 strong, southwestward into the Garonne Valley, indulging in pogroms against Jews and lepers on the way. They were finally routed by the seneschal of Carcassonne; scattered bands still roamed through southern France in 1322.

pastry, stiff dough made from flour, salt, a relatively high proportion of fat, and a small proportion of liquid. It may also contain sugar or flavourings. Most pastry is leavened only by the action of steam, but Danish pastry is raised with yeast. Pastry is rolled or patted out into thin sheets to line pie or tart pans and to enclose fillings. Poultry, tenderloin of beef and other cuts of meat, and pâtés are sometimes prepared *en croûte*, wrapped in a pastry crust. Thicker sheets may be formed into cases, pinwheels, crescents, or braids, with or without fillings and glazes or icings.

Variations in technique and ingredients yield pastries of varying texture. For a flaky pastry, low-gluten flour is quickly blended with butter, lard, or vegetable shortening so that the fat is broken into bits. A minimum of liquid is used, and the pastry is handled as little as possible. The extreme of flaky pastry is *pâté feuill-etée*, which is formed by folding and refolding a butter-filled pastry to form hundreds of layers of flour and butter that rise in the oven to 12 times the height of the uncooked pastry. A yeast dough is layered with butter in a similar manner to produce *wienbrod*, or Danish pastry. A short pastry is one in which the ingredients are well amalgamated so that the baked pastry is tender and fine-textured, tending to crumble rather than flake. In pastries requiring tensile strength, high-gluten flour is preferred, with eggs and a higher proportion of liquid adding to the malleability of the dough. Phyllo and strudel pastries are of this type, rolled or stretched out to paper thinness.

Pastry War (1838–39), brief and minor conflict between Mexico and France, arising from the claim of a French pastry cook living in Tacubaya, near Mexico City, that some Mexican army officers had damaged his restaurant. A number of foreign powers had pressed the Mexican government without success to pay for losses that some of their nationals claimed they had suffered during several years of civil disturbances. France decided to back up its demand for 600,000 pesos by sending a fleet to Veracruz, the principal Mexican port on the Gulf of Mexico. After bombarding the fortress of San Juan de Ulúa, situated on a reef outside the harbour, and occupying the city (April 16, 1838), the French won a guarantee of payment through the good offices of Great Britain and withdrew their fleet (March 9, 1839). The most important domestic result of the conflict was the further enhancement of the prestige and political influence of the dictator Antonio López de Santa Anna, who lost a leg in the fighting.

Pāśupata, perhaps the earliest Hindu sect to worship the god Śiva (Shiva) as the supreme deity; it gave rise in turn to numerous subsects that flourished in Gujarāt and Rājasthān, at least until the 12th century, and also travelled to Java and Cambodia. The sect takes its name from Paśupati, an epithet of Śiva meaning Lord of Cattle, which was later extended to convey the meaning "Lord of Souls."

The Pāśupata sect is mentioned in the Indian epic the *Mahābhārata*. Śiva himself was believed to have been the first preceptor of the system. According to legends contained in later writings such as the *Vāyu-Purāṇa* and the *Liṅga-Purāṇa*, Śiva revealed that he would make an appearance on Earth during the age of Lord Vishnu's appearance as Vāsudeva-Krishna. Śiva indicated that he would enter a dead body and incarnate himself as Lakulin (or Nakulin or Lakulīśa, *lakula* meaning "club"). Inscriptions of the 10th and 13th centuries appear to corroborate the legend, as they refer to a teacher named Lakulin, who was believed by his followers to be an incarnation of Śiva. On analogy with the Vāsudeva cult, some historians place the rise of the Pāśupatas as early as the 2nd century BC, while others prefer the 2nd century AD as a date of origin.

The ascetic practices adopted by the Pāśupatas included the thrice-daily smearing of their bodies with ashes, meditation, and chanting the symbolic syllable "om." The school fell into disrepute when some of the mystical practices were distorted. Out of the Pāśupata doctrine developed two extreme schools, the Kālāmukhas and the Kāpālikas, as well as one moderate sect, the Śaivas (also called the Siddhānta school). The Pāśupatas and the extreme sects were called Atimārgika (schools away from the path) to maintain their distinction from the more rational and acceptable Śaivas, whose development led into modern Śaivism. *See also* Kāpālika and Kālāmurkha.

Pasuruan, Dutch PASOEROEAN, *kotamadya* (city) and *kabupaten* (regency), Jawa Timur *propinsi* (East Java province), Java, Indonesia, on Selat (strait) Madura. The Dutch first established a fort at Pasuruan in 1707. It was the capital of a residency from 1811 to 1934, which, by transferring to Malang in 1934, precipitated the industrial decline of the town, with much of its trade being diverted to Probolinggo. The city has institutes of forestry and copper mining, a research institute for pulmonary diseases, a hospital, and a number of schools. Industries include rice milling, tanneries, light engineering, shipbuilding, and cabinetmaking. The surrounding district is a fertile rice-growing area, supplying the local mills. The Surabaya–Banyuwangi railway passes through Pasuruan. Pop. (1980) city, 95,864; regency, 1,034,967.

Patagonia, semiarid, scrub plateau in southern Argentina. It is the largest desert in the Americas, with an area of about 260,000 sq mi (673,000 sq km). Its approximate boundaries are the Río Colorado in the north, the Atlantic Ocean in the east, the Río Coig in the south, and the Andes in the west.

The following article summarizes information about Patagonia; for full details, *see* MACROPAEDIA: South America.

The Patagonian tableland is a region of vast, steppe-like (virtually treeless) plains. Along the Río Negro, the land rises westward in a series of fairly level plains from about 300 ft (90 m) at the Atlantic coast to about 3,000 ft at the base of the Andes. South of the Río Negro, the plains are more irregular. The Atlantic coast consists largely of high cliffs separated from the sea by a narrow coastal plain. Basaltic sheets cover the tableland east of Lakes Buenos Aires and Pueyrredón. Areas of hilly land are composed of resistant crystalline rocks. The deep, wide valleys bordered by high cliffs that cut the tableland from west to east are all beds of rivers including the Colorado, Negro, Chubut, Chico, and Santa Cruz, that flow from the Andes to the Atlantic.

The northern zone of Patagonia is semiarid, with annual mean temperatures between 54° and 68° F (12° and 20° C); the rainfall varies from 4 to 17 in. (101 to 432 mm) annually. The southern zone has a cold, dry climate, with temperatures that are higher along the coast than they are inland and with strong west winds. The northern zone consists primarily of open bushland. Grasses flourish in the sandy areas, and irrigated crops including peaches, plums, almond, grapes, vegetables, and alfalfa are grown in the valleys. The varied animal life includes guanaco, llama, fox, skunk, mountain cats, puma, eagle, sparrow hawk, and a wide variety of snakes and lizards.

Among the Patagonia's important natural resources are petroleum around Comodoro Rivadavia, Plaza Huincul, and Cartriel; iron ore at Sierra Grande in Río Negro province; copper in Neuquén province; and uranium and manganese in Chubut province.

Pātan, town, Mehsāna district, Gujarāt state, west central India, situated on the Saraswati River in the lowlands between the Arāvalli Range and the Gulf of Cambay. Once capital of the Chāvada and Solaṅki dynasties (720–1242), it was sacked in 1024 by Maḥmūd of Ghazna. Pātan is a commercial centre for agricultural produce; industries include cotton milling, weaving, embroidering, and wood and ivory carving. Pottery and swords are also manufactured in the town, which is served by a railroad. Pop. (1981) 79,196.

Patángoro, also spelled PANTÁGORO, Indian people of western Colombia, apparently extinct since the late 16th century. They spoke a language of the Chibchan family. The Patángoro were agricultural, raising corn (maize), sweet manioc (yuca), beans, avocados, and some fruit. Land was cleared by slash-and-burn methods, and planting was done with digging sticks by the sisters of the man who owned the field. Fishing was an important food source, but hunting was not; and there were no domesticated animals except possibly tamed fledglings. Their villages of 50 to 100 houses, located in high places, were sometimes fenced by wooden palisades for defense purposes. Clothing was minimal: men went naked, and women wore a small cotton apron. Skull deformation was practiced, and feathers, beads, and (rarely) gold ornaments were worn. Little is known about Patángoro crafts, although evidently pottery was made. Marriage consisted of a trade between two men of their sisters, and most men had several wives, who were often themselves sisters. Marriages were ended without formality if the husband or the wife's brother so wished; in such a case the divorced wife was returned in exchange for the sister originally traded. The Patángoro recognized several deities, the most important of which was Am, a wind god.

Their methods of warfare were cruel. They fought continually with their neighbours and killed and ate their prisoners.

Patañjali, also called GONARDĪYA, or GONIKĀPUTRA (fl. 2nd century BC or 5th century AD), author or one of the authors of two great Hindu classics: the first, *Yoga-sūtras,* a categorization of Yogic thought arranged in four volumes with the titles "Psychic Power," "Practice of Yoga," "Samādhi" (transcendental state induced by trance), and "Kaivalya" (liberation); and the second, the *Mahābhāṣya* ("Great Commentary"), which is both a defense of the grammarian Pāṇini against his chief critic and detractor Kātyāyana and a refutation of some of Pāṇini's aphorisms.

The *Yoga-sūtras* seems to span several centuries, the first three volumes apparently written in the 2nd century BC and the last book in the 5th century AD. Authorities therefore tend to credit more than one author writing under this name, although there is wide variance in opinion. There is a possibility that many men used this name, as it was used by the authors of a number of other works on such diverse subjects as medicine, metrics, music, and alchemy. The name itself is obviously a pseudonym, since it denotes no caste and implies divine descent from the Great Serpent, Śeṣa.

Patarine, also spelled PATARENE, Italian PATARINO, plural PATARINI, member of a medieval group of lay craftsmen, tradesmen, and peasants organized in Milan about 1058 to oppose clerical concubinage and marriage; the group later widened its attack to oppose generally the papacy's moral corruption and temporal powers. The Patarine movement was so called because, under the leadership of Arialdus (Arialdo), a deacon of Milan, its members used to assemble in the Pataria, or ragmen's quarter of the city (*pates* being a dialectal word for "rag"). Viewed by the church as heretical, the Patarines, though short-lived in terms of organized activities, became an impetus for a large number of religious-reform movements that arose during the decline of the feudal system and the beginnings of the aspirations to power of the peasant and middle classes.

In the 13th century the name was appropriated by the Cathari, who said it came from *pati* ("to suffer"), because they endured hardship for their faith.

patas monkey (*Erythrocebus*, or *Cercopithecus, patas*), long-limbed quadrupedal monkey, family Cercopithecidae. Because of its colour and habits, it is also called red guenon and Hussar, military, and dancing red monkey. The adult patas monkey has a shaggy red coat set off by a white mustache and white underparts. It is about 50–70 cm (20–28 inches) long excluding the tail of about the same length. Omnivorous and predominantly terrestrial, it lives in bands in the grass and scrub regions of Central Africa. Single young are born, possibly only at a certain time of year, after a gestation period estimated at 170 days. The patas monkey is said to be a good pet but is somewhat delicate in captivity.

patch box, small, usually rectangular, sometimes oval box used mostly as a receptacle for beauty patches, especially in the 18th century. During the days of Louis XV, black patches of gummed taffeta were popular with fashionable women (and sometimes men) who wanted to emphasize the beauty or whiteness of their skin.

The patches varied in form and design from simple spots, stars, or crescents to elaborate animals, insects, or figures. Patches had their own tacit language: a patch at the corner of the eye could indicate passion, one at the middle of the forehead could express dignity. Women sometimes carried their patch boxes (which sometimes also contained rouge) with them. A gift of a patch box could be a costly expression of admiration and sentiment, for they were usually gold, sometimes enameled or painted with amorous scenes and encrusted with jewels.

patch test, controlled application of biological or chemical substances to the skin in order to detect if the subject has an allergic hypersensitivity to one of them. The test was originally developed to test new chemical compounds for their allergic potential on animals but has since become widely used to diagnose allergies in humans. Patch testing is usually done on the skin of the upper back or the outer arm. Small amounts of test substances diluted in a solvent such as water or petroleum jelly are applied to the skin under a patch of cloth or soft paper and an impermeable membrane. The patch is left in place for 48 hours, after which the skin reaction is examined and scored from 0 (no apparent reaction) to 4+, indicating severe blistering as well as angry redness of the exposed skin. Patch testing is an extremely accurate indicator of allergic sensitivity.

Patchen, Kenneth (b. Dec. 13, 1911, Niles, Ohio, U.S.—d. Jan. 8, 1972, Palo Alto, Calif.), American experimental poet, novelist, painter, and graphic designer.

Itinerant in his youth and only occasionally a student, Patchen worked at many jobs before beginning to write and paint. He published many collections of verse from 1936 on, notably *Collected Poems* (1968), and several novels, including *The Journal of Albion Moonlight* (1941), *Memoirs of a Shy Pornographer* (1945), and *See You in the Morning* (1948). He also wrote plays and other works, all of which exhibit a combination of high idealism, abhorrence of violence, isolation from the mainstream of American thought, and shock at materialistic secularism.

patchwork, the piecing together of shaped bits of fabric. This craft, practiced since early Egyptian times, was extremely popular in Medieval and Renaissance Europe, when it was used for dresses, wall and bed hangings, and ecclesiastical decorations.

Patchwork quilts, usually featuring geometrical patterns, were designed in America by early settlers for utilitarian reasons. The quilts became especially popular in the 18th and 19th centuries and remain a folk art in 20th-century America.

pâté (French: "paste"), in French cuisine, a filled pastry, analogous to the English pie. The term pâté is also used, with modifiers, to denote two other distinct preparations: pâté *en terrine,* a meat, game, or fish mixture wrapped in suet or other animal fat or lining and cooked in a deep oval or oblong dish, without pastry, and served cold; and pâté *en croûte,* a meat, game, or fish filling cooked in a crust and served hot or cold. It is from pâté *en terrine,* more properly abbreviated *terrine,* that the pâté of British and American usage derives.

Certain pâtés are traditionally associated in France with specific occasions. The Pâté *de Pâques,* for example, which is filled with either ground meat, slices of pork, chicken, or rabbit, and hard-boiled egg slices, is an Easter specialty of the Poitou region. Pâté de foie gras, a pastry that is filled with liver of specially fattened goose or duck, is a world-renowned delicacy.

pâte-sur-pâte (French: "paste on paste"), method of porcelain decoration in which a relief design is created on an unfired, unglazed body by applying successive layers of white slip (liquid clay) with a brush. The technique was first employed by the Chinese in the 18th century. It was introduced in Europe in about 1850 at Sèvres, where it was perfected by Marc-Louis Solon, who later worked for Minton. The technique was also used in the

Pategi, town, Kwara state, west-central Nigeria. It lies on the south bank of the Niger River opposite the town of Mureji and the mouth of the Kaduna River. Founded in the late 16th century by the king of the Nupe peoples, the town, the name of which means "small hill," became the capital of the Pategi emirate in 1898. Idrisu Gana, the leader of the Kede (a subgroup of the Nupe), had given aid to the Royal Niger Company in its conquest of Bida, a Fulani-dominated Nupe town (28 miles [45 km] north-northeast), in 1897; and, in return, the company recognized him as the king of the Nupe and the first emir of Pategi. Most of the inhabitants of the area are Muslim Nupe people.

Pategi is a collecting point for the rice grown on the floodplains of the Niger and for dried fish. It is also a market centre for rice, yams, sorghum, millet, corn (maize), sugarcane, kola nuts, peanuts (groundnuts), palm produce, and cotton. Pop. (latest census) 5,399.

Patel, Vallabhbhai Jhaverbhai, byname SARDĀR PATEL (Hindi: "Leader Patel") (b. Oct. 31, 1875, Nadiād, Gujarāt, India—d. Dec. 15, 1950, Bombay), Indian barrister and statesman, one of the leaders of the Indian Na-

tional Congress during the struggle for Indian independence. During the first three years of Indian independence after 1947, he served as deputy prime minister, minister of home affairs, minister of information, and minister of states.

Early life. Patel was born into a self-sufficient landowning family of the Leva Patidar caste. Reared in an atmosphere of traditional Hinduism, he attended primary school at Karamasad and high school at Petlād but was mainly self-taught. Patel married at the age of 16, matriculated at 22, and passed the district pleader's examination, which enabled him to practice law. In 1900 he set up an independent office of district pleader in Godhra, and two years later he moved to Borsad, in Kheda district.

Legal career. As a lawyer, Patel distinguished himself in presenting an unassailable case in a precise manner and in challenging police witnesses and British judges. In 1908 Patel lost his wife, who had borne him a son and daughter, and thereafter remained a widower. Determined to enhance his career in the legal profession, Patel traveled to London in August 1910 to study at the Middle Temple. There he studied diligently and passed the final examinations with high honours.

Returning to India in February 1913, he settled in Ahmadābād, rising rapidly to become the leading barrister in criminal law at the Ahmadābād bar. Reserved and courteous, he was noted for his superior mannerisms, his smart, English-style clothes, and his championship in bridge at Ahmadābād's fashionable Gujarāt Club. He was, until 1917, indifferent to Indian political activities.

In 1917 Patel found the course of his life changed after having been influenced by Mohandas K. Gandhi. Patel adhered to Gandhi's satyagraha (policy of nonviolence) insofar as it furthered the Indian struggle against the British. But he did not identify himself with Gandhi's moral convictions and ideals, and he regarded Gandhi's emphasis on their universal application as irrelevant to India's immediate political, economic, and social problems. Nevertheless, having resolved to follow and support Gandhi, Patel changed his style and appearance. He quit the Gujarāt Club, dressed in the white cloth of the Indian peasant, and ate in the Indian manner.

From 1917 to 1924 Patel served as the first Indian municipal commissioner of Ahmadābād and was its elected municipal president from 1924 to 1928. Patel first made his mark in 1918, when he planned mass campaigns of peasants, farmers, and landowners of Kaira district, Gujarāt, against the decision of the Bombay government to collect the full annual revenue taxes despite crop failures caused by heavy rains.

In 1928 Patel successfully led the landowners of Bārdoli in their resistance against increased taxes. His efficient leadership of the Bārdoli campaign earned him the title *sardār* ("leader"), and henceforth he was acknowledged as a nationalist leader throughout India. He was considered practical, decisive, and even ruthless, and the British recognized him as a dangerous enemy.

Political philosophy. Patel, however, was no revolutionary. In the crucial debate over the objectives of the Indian National Congress during the years 1928 to 1931, Patel believed (like Gandhi and Motilal Nehru, but unlike Jawaharlal Nehru and Subhas Chandra Bose) that the goal of the Indian National Congress should be dominion status within the British Commonwealth—not independence. In contrast to Jawaharlal Nehru, who condoned violence in the struggle for independence, Patel ruled out armed revolution, not on moral but on practical grounds. Patel held that it would be abortive and would entail severe repression. Patel, like Gandhi, saw advantages in the future participation of a free India in a British Commonwealth, provided that India was admitted as an equal member. He emphasized the need to foster Indian self-reliance and self-confidence, but, unlike Gandhi, he did not regard Hindu-Muslim unity as a prerequisite for independence.

Patel disagreed with Jawaharlal Nehru on the need to bring about economic and social changes by coercion. A conservative rooted in traditional Hindu values, Patel belittled the usefulness of adapting socialist ideas to the Indian social and economic structure. He believed in free enterprise, thus gaining the trust of conservative elements, and thereby collected the funds that sustained the activities of the Indian National Congress.

Patel was the second candidate after Gandhi to the presidency of the 1929 Lahore session of the Indian National Congress. Gandhi shunned the presidency in an attempt to prevent the adoption of the resolution of independence and exerted pressure on Patel to withdraw, mainly owing to Patel's uncompromising attitude toward the Muslims; Jawaharlal Nehru was elected. During the 1930 Salt Satyāgraha, (prayer and fasting movement), Patel served three months' imprisonment. In March 1931 Patel presided over the Karāchi session of the Indian National Congress. He was imprisoned in January 1932. Released in July 1934, he marshaled the organization of the Congress Party in the 1937 elections and was the main contender for the 1937–38 Congress presidency. Again, because of Gandhi's pressure, Patel withdrew and Jawaharlal Nehru was elected. Along with other Congress leaders, Patel was imprisoned in October 1940, released in August 1941, and imprisoned once more from August 1942 until June 1945.

During the war Patel rejected as impractical Gandhi's nonviolence in the face of the then-expected Japanese invasion of India. On the transfer of power, Patel differed with Gandhi in realizing that the partition of the subcontinent into Hindu India and Muslim Pakistan was inevitable, and he asserted that it was in India's interests to part with Pakistan.

Patel was the leading candidate for the 1945–46 presidency of the Indian National Congress, but Gandhi once again intervened for the election of Nehru. Nehru, as president of the Congress, was invited by the British viceroy to form an interim government. Thus, in the normal course of events, Patel would have been the first prime minister of India. During the first three years of independence, Patel was deputy prime minister, minister of home affairs, minister of information, and minister of states; above all, his enduring fame rests on his achievement of the peaceful integration of the princely Indian states into the Indian Union and the political unification of India. patent, a government grant of the exclusive right to make, use, or sell an invention, usually for a limited period. Patents are granted to new and useful machines, manufactured products, and industrial processes and to significant improvements of existing ones. Patents are also granted to new chemical compounds, foods, and medicinal products, as well as to the processes for producing them. Patents can even be granted to new plant or animal forms developed through genetic engineering.

The first recorded patent for an industrial invention is the one granted in 1421 in Florence to the architect and engineer Filippo Brunelleschi. The patent gave him a three-year monopoly on the manufacture of a barge with hoisting gear used to transport marble. It appears that such privileged grants to inventors spread from Italy to other European nations over the next two centuries. In many cases such grants dealt with the importation and establishment of new industries, as in England at the time of Queen Elizabeth I. It soon became apparent that unlimited duration of exclusive rights created unfair monopolies, and in 1623 Parliament enacted the Statute of Monopolies. Although it prohibited most royal monopolies, it specifically reserved the right to grant "letters patent" for inventions of new manufactures for up to 14 years. In the United States, Article I, Section 8 of the Constitution authorizes Congress to create a national patent system to "promote the Progress of Science and useful Arts" by "securing for limited Times to . . . Inventors the exclusive Right to their respective . . . Discoveries." Congress passed the first U.S. Patent Statute in 1790. France enacted its patent system the following year. By the end of the 19th century many countries had patent laws, and today there exist approximately 100 separate jurisdictions regarding patents.

In most cases an invention must be considered novel and useful in order to receive a patent. It must also represent a relatively significant advance in the state of the art and can not merely be an obvious change from what is already known to people with ordinary skill in the art. Such stipulations are meant to reduce the number of inventions that modify existing products in minimal ways. Patents are frequently granted for improvements of previously patented articles or processes if the requirements of patentability are otherwise met.

A patent is recognized as a species of property and has the attributes of personal property. It may be sold (assigned) to others or mortgaged or may pass to the heirs of a deceased inventor. Because the patent gives the owner the right to exclude others from making, using, or selling the invention, he or she may authorize others to do any of these things by a license and receive royalties or other compensation for the privilege. If any persons make use of a patented invention without authorization, their infringement can be brought to court in a suit filed by the patent holder, who may ask for an amount of money in damages as well as a court injunction to prevent further infringement.

The duration of patents varies, ranging from 16 to 20 years in most countries. In some countries, like France, certain types of patents are given shorter terms because the inventions have an overall general usefulness. After the patent term expires, the invention is open to public use. In socialist countries like the Soviet Union, where property is treated differently, patents per se have not been recognized. Instead, certificates are issued to inventors to ensure that they receive some form of compensation for their work. This, however, is changing. For example, China, which modeled its earlier patent system on that of the Soviet Union, enacted a wholly revised patent law in 1985. In many respects it mirrors the patent law of European countries, with the exception that enterprises rather than individuals are the usual grantees of Chinese patent rights.

In most countries, patents are granted only after examination of a patent application by trained inspectors, who review prior inventions and patents. Countries vary widely as to the rigour of such examinations. Most countries, in instances of competing claims to an invention, grant the patent to the first to file the application. The United States constitutes the major exception to this rule, granting priority to the party who can prove it was the first actually to invent regardless of time of filing.

It does not always follow that a patent holder will market an invention or even license it to someone who wants to. Such a situation might keep a useful invention from being of service to the public. Thus many laws, from the 19th century on, have included various clauses that stipulate compulsory "working" of an invention. This means that the patentee must manufacture the invention or license it to someone who will. This is also the case when the main patent generates other "dependent" patents; the main patentee may be legally compelled to grant licenses to those who hold dependent patents. Occasionally, companies holding patents may manage to form monopolies that affect entire fields of commerce. Antitrust suits brought by the government may force such companies to license those patents. In the United States, there is no requirement to "work" a patent. An issued U.S. patent that has never been turned into a commercial reality remains the property of the inventor (unless assigned by the inventor) and is presumed to be as valid as one that has spawned an entire new industry.

With the ever-increasing scope of commerce and international business concerns, there has been a need for bilateral patent agreements between nations. In general, inventors must apply for patents in each country where they wish to manufacture, use, or sell their inventions. International efforts have been made to facilitate this process. The first effort to ease multinational patent differences was the International Convention for the Protection of Industrial Property, originally adopted in Paris in 1883 and amended several times since. It gave inventors who file an application in one member country the benefit of using that first filing date for applications in other member states. Similarly, the 1970 Patent Cooperation Treaty simplifies the filing of patent applications on the same invention in different countries by providing, among other things, centralized filing procedures and a standardized application format. More recently, the European Patent Convention, implemented in 1977, created a European Patent Office that can issue a European patent, which acquires the status of a national patent in each of the member nations designated by the applicant.

patent ductus arteriosus, persistence of a channel that shunts blood between the pulmonary artery and the aorta. Normally, after birth, the pulmonary artery carries blood depleted of oxygen and laden with carbon dioxide from the right lower chamber of the heart to the lungs, where the excess carbon dioxide is removed from the blood and replaced with oxygen. Before birth the fetus depends upon its mother's circulation for this function and not on its own lungs. Consequently, most of the blood pumped into the pulmonary artery is shunted through the ductus arteriosus into the aorta for distribution into the general circulation. Normally at birth the ductus arteriosus constricts and closes, becoming a fibromuscular cord.

Persistence of the open passage is a congenital defect that ordinarily causes no symptoms. It is diagnosed from characteristic abnormalities of the heart sounds. If the passageway is large, it can have serious effects, acting as a shunt that carries blood from the aorta into the pulmonary artery. This reversal of the shunt pathway occurs because, as a normal part of the changes from fetal to postnatal circulation, the blood pressure in the aorta rises greatly, while that in the pulmonary artery falls. As a consequence of this shunt, the blood may be routed two or three times from the left ventricle to the lungs before it follows its normal course into the systemic circulation. The left side of the heart is thus greatly overworked and becomes enlarged, and the lungs become congested and their network of blood vessels suffers damage from excessive blood pressure. As a result, the victim's body is deprived of adequate oxygen during exertion—or, in extreme cases, even during rest. The oxygen deprivation is indicated by cyanosis (a bluish discoloration of the skin).

Infants with patent ductus arteriosus can be treated with drugs that effectively close the shunt in many cases. If drug therapy is unsuccessful, the ductus can be tied off surgically.

patent theatre, any of several London theatres that, through government licensing, held a monopoly on legitimate dramatic production there between 1660 and 1843. In reopening the theatres that had been closed by the Puritans, Charles II issued Letters Patent to Thomas Killigrew and William Davenant giving them exclusive right to form two acting companies. Killigrew established The King's Servants at Drury Lane, where they stayed. Davenant established The Duke of York's Servants at Lincoln's Inn Fields, from which they moved to Dorset Garden, finally settling at Covent Garden in 1732.

The legality of the patents, though continually questioned, was confirmed by Parliament with the Licensing Act of 1737, affirming Drury Lane and Covent Garden as the only legitimate theatres in England. Parliament began authorizing "theatre royals" outside of London in 1768, however, and in 1788 a bill was passed permitting local magistrates to license theatres outside a 20-mile radius of London. In London, evasion of the law was common, with unlicensed theatres offering undefined "public entertainments" and pantomime. In 1766 a third London theatre patent was issued to Samuel Foote for operation of the Haymarket Theatre during the summer months, and in 1807 the Earl of Dartmouth, as lord chamberlain, loosely interpreted the Licensing Act and began licensing other theatres in London. The Theatre Regulation Act of 1843 finally abolished the exclusive rights of the patent theatres to present legitimate drama.

Pater, Walter (Horatio) (b. Aug. 4, 1839, Shadwell, London, Eng.—d. July 30, 1894, Oxford, Oxfordshire), English critic, essayist, and humanist whose advocacy of "art for art's sake" became a cardinal doctrine of the movement known as Aestheticism.

Pater was educated at King's School, Canterbury, and at Queen's College, Oxford, where he studied Greek philosophy under Benjamin Jowett. He then settled in Oxford and read with private pupils. In 1864 he was elected to a fellowship at Brasenose College. Pater's early intention to enter the church gave way at this time to a consuming interest in classical studies. Pater then began to write for the reviews, and his essays on Leonardo da Vinci, Sandro Botticelli, Pico della Mirandola, Michelangelo, and others were collected in 1873 as *Studies in the History of the Renaissance* (later called simply *The Renaissance*). His delicate, fastidious style and sensitive appreciation of Renaissance art in these essays made his reputation

as a scholar and an aesthete, and he became the centre of a small group of admirers in Oxford. In the concluding essay in *The Renaissance,* Pater asserted that art exists for the sake of its beauty alone, and that it acknowledges neither moral standards nor utilitarian functions in its reason for being. These views brought Pater into an association with Swinburne and with the Pre-Raphaelites.

Marius the Epicurean (1885) is his most substantial work. It is a philosophical romance in which Pater's ideal of an aesthetic and religious life is scrupulously and elaborately set forth. The setting is Rome in the time of Marcus Aurelius; but this is a thin disguise for the characteristically late-19th-century spiritual development of its main character. *Imaginary Portraits* (1887) are shorter pieces of philosophical fiction in the same mode. *Appreciations* (1889) is a return to the critical essay, this time largely on English subjects. In 1893 came *Plato and Platonism,* giving an extremely literary view of Plato and neglecting the logical and dialectical side of his philosophy. Pater's *Greek Studies* (1895), *Miscellaneous Studies* (1895), and *Essays from The Guardian* (privately printed, 1896; 1901) were published posthumously; also published posthumously was his unfinished romance, *Gaston de Latour* (1896).

The primary influence on Pater's mind was his classical studies, coloured by a highly individual view of Christian devotion and pursued largely as a source of extremely refined artistic sensations. In his later critical writings Pater continued to focus on the innate qualities of works of art, in contrast to the prevailing tendency to evaluate them on the basis of their moral and educational value.

Pater's early influence was confined to a small circle in Oxford, but he came to have a widespread effect on the next literary generation. Oscar Wilde, George Moore, and the aesthetes of the 1890s were among his followers and show obvious and continual traces both of his style and of his ideas.

Paterna ware, tin-glazed earthenware produced in the 14th and 15th centuries at Paterna, near Valencia, in eastern Spain. Although pottery was produced in Paterna as early as the 12th century under the Almohads, it was not famous until the reign of the Naṣrids (1230–1492), the last Islāmic dynasty of Spain. Like the works of the other great Hispano-Moresque pottery centres, Valencia, Manises, and Málaga, the stylistic origins of Paterna ware may be traced ultimately to the Middle East. Paterna ware is somewhat plainer in style, however, than the lustreware (pottery painted with metallic pigments) produced by these other cities, but the decorative effects are highly refined. Representational and abstract designs are usually combined in a rather formal, geometric manner. In spite of occasional Gothic motifs, Paterna ware has a strong Oriental quality, particularly evident in its stylized representations of animal figures. Greens, blues, manganese violets, and browns are the favourite colours painted on a white background. The most common surviving forms of Paterna ware are large plates and bowls, examples of which may be seen in the Louvre, in Paris.

Paternò, town, Catania *provincia,* eastern Sicily, Italy, situated at the southwestern foot of Mount Etna, overlooking the Simeto River, just northwest of Catania. Paternò is believed to occupy the site of the ancient Siculian town of Hybla Major or Hybla Geleatis. Paternò suffered heavily from Allied bombing in

World War II. It is dominated by the restored Norman castle (1073, rebuilt 14th century), and there are several medieval churches. It is a holiday resort with hot mineral springs, and citrus fruits and grapes are cultivated. Pop. (1984 est.) mun., 46,540.

Paterson, city, seat (1837) of Passaic County, northeastern New Jersey, U.S., situated on the Passaic River, 12 mi (19 km) northwest of New York City. It was founded after the American Revolution by advocates of American industrial independence from Europe who saw the Great Falls of the Passaic, which drop 70 ft (21 m), as the best potential industrial site on the Atlantic Seaboard. The enterprise was chartered by the New Jersey legislature in 1791 as the Society for Establishing Useful Manufactures (SUM); the city was named for Gov. William Paterson, one of the framers of the U.S. Constitution.

A successful enterprise, SUM ultimately sold waterpower and building space to private manufacturers. The earliest industries were cotton mills, and in 1828 Paterson mechanics joined mill workers in the first recorded sympathy strike in America. Samuel Colt produced his first revolvers at the Old Gun Mill (preserved) in 1836. By 1837, when the locomotive industry was established, machine manufacturing had become important. The silk industry was introduced in 1839, and linen thread manufacture was begun in 1864. The city was the scene of many labour disputes, but by the mid-20th century it had become a centre of widely diversified industrial activity, including the manufacture of textiles, machinery, machine tools, and chemicals.

The William Paterson College of New Jersey (which was established as a normal school in 1855) is located at nearby Wayne. Paterson Museum is known for its collection of New Jersey rocks and Indian relics. One of the first successful submarines, the *Fenian Ram,* which was built by John P. Holland and sank in the Passaic River in 1881, was recovered in 1927 and placed on exhibit in Westside Park. Lambert Castle (1891) in the Garret Mountain Reservation houses the Passaic County Historical Society Museum. In 1976 the Great Falls area was designated a national historic site. Inc. 1851. Pop. (1984 est.) city, 138,818; Bergen-Passaic metropolitan area (PMSA), 1,299,500.

Paterson, A(ndrew) B(arton), byname BANJO PATERSON (b. Feb. 17, 1864, Narrambla, N.S.W., Australia—d. Feb. 5, 1941, Sydney), Australian poet and journalist noted for his composition of the internationally famous song "Waltzing Matilda." He achieved great popular success in Australia with *The Man from Snowy River and Other Verses* (1895), which sold more than 100,000 copies before his death, and *Rio Grande's Last Race and Other Verses* (1902), which also went through many editions.

Educated as a lawyer, Paterson practiced in Sydney until 1900, then became a journalist, covering the Boer War in South Africa and traveling on assignment to China and the Philippines. He became editor of the *Sydney Evening News* in 1904 but left this post two years later to edit the Sydney *Town and Country Journal.* He later took up ranching; but when World War I broke out, he traveled to Europe for the *Sydney Morning Herald* and later served with the armed forces in France and Egypt. After the war, he spent the rest of his life as a journalist. In 1905 Paterson published a collection of popular Australian songs, *The Old Bush Songs: Composed and Sung in the Bushranging,* and he also published *Digging and Overlanding Days,* another success. The famous "Waltzing Matilda" appeared in 1917 as part of a collection of verses entitled *Saltbush Bill, J.P., and Other Verses.* He also wrote a volume of verse for children (*The Animals Noah Forgot,* 1933) and some short stories.

Paterson, Sir Alexander (Henry) (b. Nov. 20, 1884, Bowden, Cheshire, Eng.—d. Nov. 7, 1947, London), penologist who modified the progressive Borstal system of English reformatories for juvenile offenders to emphasize its rehabilitative aspects.

Before serving as a prison commissioner (1922–47), Paterson had worked with discharged Borstal boys. He was therefore well qualified to undertake reform of the system, emphasizing special location and treatment on reformatory lines of prisoners from age 16 to 21 selected from the ordinary prisons. (The Borstal system had been implemented in 1902 by Sir Evelyn Ruggles-Brise at Borstal, Kent.) Among Paterson's innovations were the introduction of the Borstal house system, in which groups of delinquents live in individual houses, each with its own trained and dedicated housemaster and house staff who try to influence the boys by good example and a training program that includes hard but interesting work, extended education, and sports. Paterson emphasized that rehabilitation consists of sparking a drive for reform within the delinquent rather than imposing it upon him.

Paterson was knighted in 1947.

Paterson, William (b. April, 1658, Tenwald, Dumfries, Scot.—d. Jan. 22, 1719), Scottish founder of the Bank of England, writer on economic issues, and the prime mover behind an unsuccessful British settlement at Darién on the Isthmus of Panama.

By 1686 Paterson was a London merchant and a member of the Merchant Taylors' Company. In 1694 he organized the Bank of England, an institution long desired by the London merchants. He withdrew as a director the next year, following a policy disagreement. After an unsuccessful attempt to organize a rival bank in London, Paterson resumed efforts to start a colony at Darién. Along with a group of Scottish and English merchants seeking investment outlets, he secured in 1695 the passage by the Scottish Parliament of the Act for a Company Trading to Africa and the Indies. Paterson was deprived of his position in the company by the directors because he was suspected of being involved with a loss of company funds, although his guilt was never proved. He nevertheless accompanied the expedition in 1698 as a private citizen.

Paterson lost much of his financial investment in the affair. His wife and child died at Darién, and he was forced to return to England after falling gravely ill. Thereafter, Paterson continued agitation for new expeditions to the West Indies. Shortly before his death, the British government paid him an indemnity for his losses incurred in his ill-fated expedition.

Paterson, William (b. Dec. 24, 1745, County Antrim, Ire.—d. Sept. 9, 1806, Albany, N.Y., U.S.), Irish-born jurist, one of the framers of the U.S. Constitution, U.S. senator (1789–90) and governor of New Jersey (1790–93). He also served as an associate justice of the U.S. Supreme Court from 1793 to 1806.

Paterson emigrated to New Jersey with his family in 1747. He graduated in 1763 from the College of New Jersey (now Princeton University), studied law, and began to practice in 1769. He served twice in the provincial congress (1775–76), was a delegate to the state constitutional convention (1776), and from 1776 to 1783 was attorney general of New Jersey. In 1787 Paterson headed the New Jersey delegation to the federal Constitutional Convention, where he played a leading role in the opposition of the small states to representation according to population in the federal legislature. As an alternative to the Virginia (or large-state) Plan, Paterson submitted the New Jersey (or small-state) Plan, also called the Paterson Plan, which advocated an equal vote for all states. The issue was finally resolved with the compromise embodied in the bicameral legislature.

Paterson was instrumental in securing ratification of the final document in New Jersey and was elected one of the state's first two U.S. senators. Resigning his seat in 1790, he served as governor of New Jersey until 1793, when he was named an associate justice of the U.S. Supreme Court. The city of Paterson, N.J., was named for him.

Pathé, Charles (b. Dec. 25, 1863, Paris—d. Dec. 26, 1957, Monte-Carlo), French pioneer motion-picture executive who controlled a vast network of production and distribution facilities that dominated the world film market during the first years of the 20th century.

Pathé
H. Roger-Viollet

With his brother Émile, he founded Pathé Frères (Pathé Brothers, 1896) in Paris, a company that manufactured and sold phonographs and phonograph cylinders. The company placed the Kinetoscope, Thomas A. Edison's newly invented viewing device, in theatres throughout France. Using the camera developed by Louis and Auguste Lumière, Pathé Frères filmed numerous short subjects, the majority of which are sensational criminal adventures, melodramatic love stories, and comic anecdotes. In 1909 Pathé produced his first "long film," *Les Misérables,* a four-reel screen version of the novel by Victor Hugo. That same year he originated the *Pathé Gazette* in France (U.S.: 1910; U.K.: 1911), which was an internationally popular newsreel until 1956. In 1914 Pathé Frères released from its studios in the United States the first episodes of *The Perils of Pauline,* one of the earliest and best remembered screen serials. The company also began publishing the screen magazine *Pathé Pictorial.*

Pathé Frères, with production facilities in France, England, and the United States and distribution offices throughout the world, was an enormously lucrative company. Profits on some pictures were 50 to 100 times the original cost of production. In 1917 Pathé began to sell the company's equipment, production studios, and exhibition circuits. He retired in 1929, but the company remained in existence as a leading film distributor.

Pathet Lao, left-oriented nationalist group in Laos that took control of the country in 1975. Founded in 1950, the Pathet Lao (Lao Country) movement joined with the Viet Minh, the Communist-oriented Vietnamese nationalist organization, in armed resistance to French rule in Indochina. In 1956 a legal political wing, the Lao Patriotic Front (Neo Lao Hak Xat), was founded and participated in several coalition governments. In the 1960s and early '70s the Pathet Lao fought a civil war against the U.S.-backed Vientiane regime, winning effective control in the north and east. In the spring of 1975 Pathet Lao forces consolidated their power throughout the country. The Vientiane government fell in May 1975, and Pathet Lao leaders formed a new government.

pathetic fallacy, poetic practice of attributing human emotion or responses to nature, inanimate objects, or animals. The practice is a form of personification that is as old as poetry, in which it has always been common to find smiling or dancing flowers, angry or cruel winds, brooding mountains, moping owls, or happy larks. The term was coined by John Ruskin in *Modern Painters* (1843–60). In some classical poetic forms such as the pastoral elegy, the pathetic fallacy is actually a required convention. In Milton's "On The Morning of Christ's Nativity," all aspects of nature react affectively to the event of Christ's birth.

The Stars with deep amaze
Stand fixt in steadfast gaze

Ruskin considered the excessive use of the fallacy the mark of an inferior poet. Later poets, however—especially the Imagists of the early 20th century, as well as T.S. Eliot and Ezra Pound—used the pathetic fallacy freely and effectively.

pathology, medical specialty concerned with the determining causes of disease and the structural and functional changes occurring in abnormal conditions. Early efforts to study pathology were often stymied by religious prohibitions against autopsies, but these gradually relaxed during the late Middle Ages, allowing autopsies to determine the cause of death, the basis for pathology. The resultant accumulating anatomical information culminated in the publication of the first systematic textbook of morbid anatomy by the Italian Giovanni Battista Morgagni in 1761, which located diseases within individual organs for the first time. The correlation between clinical symptoms and pathological changes was not made until the first half of the 19th century.

The existing humoral theories of pathology were replaced by a more scientific cellular theory; Rudolf Virchow in 1858 argued that the nature of disease could be understood by means of the microscopic analysis of affected cells. The bacteriologic theory of disease developed late in the 19th century by Louis Pasteur and Robert Koch provided the final clue to understanding many disease processes.

Pathology as a separate specialty was fairly well established by the end of the 19th century. The pathologist does much of his work in the laboratory and reports to and consults with the clinical physician who directly attends to the patient. The types of laboratory specimens examined by the pathologist include surgically removed body parts, blood and other body fluids, urine, feces, exudates, etc. Pathology practice also includes the reconstruction of the last chapter of the physical life of a deceased person through the procedure of autopsy, which provides valuable and otherwise unobtainable information concerning disease processes. The knowledge required for the proper general practice of pathology is too great to be attainable by single individuals, so wherever conditions permit it, subspecialists collaborate. Among the laboratory subspecialties in which pathologists work are neuropathology, pediatric pathology, general surgical pathology, dermatopathology, and forensic pathology.

Microbial cultures for the identification of infectious disease, simpler access to internal organs for biopsy through the use of glass fibreoptic instruments, finer definition of subcellular structures with the electron microscope, and a wide array of chemical stains have greatly expanded the information available to the pathologist in determining the causes of disease. Formal medical education with the attainment of an M.D. degree or its equivalent is required prior to admission to pathology postgraduate programs in many Western countries. The program required for board certification as a pathologist roughly amounts to five years of postgraduate study and training.

Pathum Thani, town and *changwat* (province) in the Central region of Thailand. The provincial capital, Pathum Thani town, is a rice-collecting and milling centre north of Bangkok on the west bank of the Mae Nam (river) Chao Phraya. The province, with an area of 589 sq mi (1,526 sq km), occupies the low, well-irrigated plains of the Chao Phraya and is intensively farmed in rice. Fishing is a secondary economic activity. Pop. (1983 est.) town, 11,583; province, 357,809.

Patiāla, city, administrative headquarters of Patiāla district, Punjab state, northwestern India. The city lies on a major rail line, as well as on a branch of the Sirhind Canal. Founded in 1763 as the capital of the princely state of Patiāla, it is a trade and industrial centre; weaving, cotton ginning, distilling, and manufacturing are among its industries. Punjabi University (established 1962) and 13 affiliated colleges are located in the city, as are an old fort and a modern sports stadium.

Patiāla district, 1,752 sq mi (4,538 sq km) in area, is a dry region watered only by a few *cos* (seasonal streams). Wheat, cotton, corn (maize), and gram (a legume) are the chief crops grown. The princely state of Patiāla, of which the present district was a part, was the most important in the Punjab. It merged with independent India in 1948, and the district became part of the reorganized Punjab state in 1966. Besides Patiāla, other important towns are Nābha, Samāna, and Rājpura. Pop. (1981) city, 205,141; metropolitan area, 206,144; district, 1,568,898.

pātimokkha (Pāli: "that which is binding"), Sanskrit PRĀTIMOKṢA, Buddhist monastic code; a set of 227 rules that govern the daily activities of the monk and nun. The prohibitions of the *pātimokkha* are arranged in the Pāli canon according to the severity of the offense—from those that require immediate and lifelong expulsion from the order, temporary suspension, or various degrees of restitution or expiation to those that require confession only. Also given are rules for settling disputes within the monastic community. The entire *pātimokkha* is recited during the *uposatha,* or fortnightly assembly of Theravāda monks.

A comparable set of 250 monastic rules is contained in the Sanskrit canon of the Sarvāstivāda (Doctrine That All Is Real) tradition that was widely known in northern Buddhist countries. The Mahāyāna tradition in China and Japan more generally rejected those rules that were not applicable locally and substituted disciplinary codes that differed from sect to sect and sometimes even from monastery to monastery.

Patinir, Joachim (de), Patinir also spelled PATINIER, or PATENIER (b. *c.* 1485, Bouvignes, near Dinan, Namur—d. Oct. 5, 1524, Antwerp), painter, the first Western artist known to have specialized in landscape painting. Little is known of his early life, but his work reflects an early knowledge of the painting of Gerard David, the last of the Early Netherlandish painters. He may have studied under Hieronymus Bosch, the painter of fantastic allegories and landscapes.

Patinir seems to have made a practice of supplying landscape settings for figure compositions painted by other Flemish masters, but the only known example of his collaborations is the "Temptation of St. Anthony" (*c.* 1520–24; Prado, Madrid), in which Quentin Massys painted the figures. He did not, however, paint pure landscape pictures, and all

his work has a nominal religious subject. Its novelty, anticipated in a different vein by Bosch, lay in the fact that the religious motif in such works as the "Flight into Egypt" (1515–20; Musée Royal des Beaux-Arts, Antwerp), the "St. Christopher" (*c.* 1515–24; Prado, Madrid), and the "St. Jerome" (Prado) was much reduced in scale and immersed in the phenomena of the natural world. The basic elements of his landscape style—the high viewpoint overlooking vast tracts, where earthy brown foregrounds merge into woodland and meadow greens and again into the hazy blues of distant mountains—do not differ from those of his predecessors, particularly Gerard David. Yet the picturesque melancholy with which he invests the woods and rivers and the great ghostly rocks that jut up abruptly in the middle distance of such paintings as his "Baptism of Christ" (*c.* 1515–20; Kunsthistorisches Museum, Vienna) and his "Crossing the Styx" (*c.* 1520–24; Prado) strike a personal note that won Patinir instant success and many imitators.

Patiño, José Patiño, marqués de (marquess of) (b. April 11, 1666, Milan—d. Nov. 3, 1736, San Ildefonso, Spain), Spanish statesman, who was one of the most outstanding ministers of the Spanish crown during the 18th century.

Patiño followed his father in entering the service of the Spanish government in Italy. Later, during the War of the Spanish Succession, he went to Spain and Philip V nominated him to a place on the Council of Military Orders (1707). As intendant first in Extremadura and then in Catalonia, he rendered important services during the siege of Barcelona (1714) and the reconquest of Majorca (1715), and was responsible for implementing the new financial and administrative system introduced by Philip V in 1715. Giulio Alberoni, who now came to direct Spanish affairs, regarded Patiño as his only reliable subordinate and placed him in charge of the rebuilding of the Spanish Navy as *intendente general de marina* (January 1717). At the same time he was appointed superintendent of Seville, where he also controlled trade with the Spanish colonies. In these various capacities, Patiño was responsible for the fitting-out and dispatch of the expeditions which conquered Sardinia and Sicily in 1717–18.

Sudden promotion came to Patiño in May 1726, when, following the fall from power of the Barón de Riperdá, he was appointed Minister for the Navy and the Colonies. Shortly afterward he was also placed in charge of the national finances and foreign affairs. He retained all these offices until his death.

Patiño's great achievement was his creation of the Spanish Navy. This twice enabled Spain to go to war with Great Britain (1718 and 1739), permitted the conquest of Oran in 1732, and allowed a vigorous enforcement by Spain of its traditional monopoly of trade with its American colonies.

patio, in Spanish and Latin-American architecture, a courtyard within a building, open to the sky. It is a Spanish development of the Roman atrium and is comparable to the Italian cortile. The patio was a major feature in medieval Spanish architecture. Seville cathedral has a patio, as did the ducal palace at Guadalajara (1480–92; destroyed 1936), which was a transitional work displaying Moorish, Gothic, and Renaissance architectural details.

During the Spanish Renaissance the patio became a standard element in houses. It differed from its Italian counterpart in having a greater degree of seclusion, possibly due to Moorish custom. In the Alcazar, Toledo (*c.* 1537–53; destroyed 1936–39), the patio could only be seen through a few doorways.

Because of the climate of the Spanish peninsula, arcades surrounding patios took on special importance as shelters and came to be richly decorated. The patio was imported by the Spanish to Latin America, where it is a characteristic feature of ecclesiastic and larger secular and domestic structures.

The patio of contemporary suburban houses in the United States is a small outdoor area adjoining or partially enclosed by the house. It is often paved and provided with some kind of shade.

patio process, also called MEXICAN PROCESS, method of isolating silver from its ore that was used from the 16th to early in the 20th century; the process was apparently common in America before the arrival of the Europeans.

The silver ore was crushed and ground by mule power in arrastras, shallow circular pits paved with stone. Large blocks of stone attached by beams to a central rotating post were dragged around the arrastra, reducing the ore to a fine mud. This was then spread over a courtyard or patio, sprinkled with mercury, salt, and copper sulfate, and mixed by repeatedly driving mules over it. Chemical reactions freed the silver from its compounds and caused it to dissolve in the mercury. When the amalgamation was complete, the material was agitated with water in large tubs and the mud run off. The amalgam remaining at the bottom was collected and heated to drive off the mercury. The process, especially suitable for the silver ores of the dry, barren areas of Mexico, was responsible for a large proportion of the world's silver production for 350 years; it was finally displaced by the cyanide process early in the 20th century.

Patkul, Johann Reinhold von (b. July 27, 1660, Stockholm—d. Oct. 10, 1707, Kazimierz, near Poznań, Pol.), Baltic German diplomat who played a key role in the initiation of the Northern War (1700–21).

Born to the Livonian German gentry, Patkul entered the Swedish army in Livonia in 1687. After serving as a representative of the Livonian landowners to the Swedish court in 1690–91, Patkul was arrested and sentenced to death for sedition by the Swedes in 1694 for airing the Livonians' grievances over land questions. He escaped to western Europe, however, via Courland.

Making the acquaintance of highly placed Saxon officials in 1698, Patkul gained an audience in the following year with King Augustus II of Poland (who was also the elector of Saxony), during which he interested the King in a Saxon–Russian alliance against Sweden. Patkul then led negotiations that resulted in the Saxon–Polish–Russian–Danish coalition, which started the Northern War against Sweden in 1700. Patkul entered the Russian diplomatic and military service in 1703, and thereafter he tried unsuccessfully to bring Prussia into the war. In 1707, after angering the Saxons by intriguing with Austria, he was delivered to the Swedish forces in Poland and tortured to death at Kazimierz for desertion and treason.

Patmore, Coventry (Kersey Dighton) (b. July 23, 1823, Woodford, Essex, Eng.—d. Nov. 26, 1896, Lymington, Hampshire), English poet and essayist whose best poetry is in *The Unknown Eros and Other Odes,* containing mystical odes of divine love and of married love, which he saw as a reflection of Christ's love for the soul.

After his father fled to France to escape his creditors, Patmore obtained a position in the library of the British Museum, London, and worked there for 19 years. He published a vast novel in verse, telling the story of two marriages, beginning in the 1850s with *The Angel in the House,* consisting of *The Betrothal* (1854) and *The Espousals* (1856), and continuing with *The Victories of Love* (1863),

consisting of *Faithful for Ever* (1860) and *The Victories of Love* (1863).

In 1864 Patmore became a Roman Catholic and married Marianne Byles. *The Unknown Eros* appeared in 1877, but, despite the originality of the poems, they were not widely appreciated. *Amelia* (1878) virtually ended his poetic output, and in later years he concentrated on essays—original and provocative—on literature, art, philosophy, and politics, chiefly for the *St. James's Gazette,* later partly collected in *Principle in Art* (1889) and *Religio Poetae* (1893). Marianne died in 1880, and Patmore married Harriet Robson in 1881. His last work was a collection of aphorisms, *The Rod, the Root, and the Flower* (1895). Patmore's seminal study of *English Metrical Law* (1857) was greatly admired by Gerard Manley Hopkins.

Pátmos, island, the smallest and most northerly of the original 12, or Dodecanese, Greek islands, only 11 sq mi (28 sq km) in area. The barren, arc-shaped island consists of three deeply indented headlands joined by two narrow isthmuses; its maximum elevation is near the centre in Óros (mountain) Áyios Ilías (883 ft [269 m]). Several islets belonging to Pátmos form a semicircle on the east, strongly suggesting that in prehistoric times Pátmos was shattered by the explosion of a giant volcano and is now partially submerged. The only evidence of active vulcanism is a hot-air vent near Psallídha. An ancient acropolis lies on the northern isthmus. The chief town, Pátmos, stands on a ridge in the south central sector.

Successively settled by Dorians and Ionians, Pátmos received scant mention by such ancient writers as Thucydides (5th century BC), Strabo (fl. early 1st century AD), and Pliny (1st century AD). Under the Romans it was a place for exiles, the most noted of whom was John, author of the Fourth Gospel, sent there according to tradition *c.* AD 95. Both the Gospel and the Revelation to John are said to have been written there by John.

During the Middle Ages, Pátmos appears to have been deserted, probably because of Saracen raids. In 1088 the Byzantine emperor Alexius I Comnenus granted the island to an abbot, who founded a monastery dedicated to St. John on the southern part of the island. Its library contains a celebrated collection of manuscripts and printed books begun by St. Christodoulos. The autonomy of the monastery was confirmed under Venetian rule (1207–1537); during the Turkish occupation (1537–1912) annual tribute was required from the monks. The port of Skála grew out of the original settlement around the monastery. Lacking permanent watercourses but having numerous springs, the island yields grapes, cereals, and vegetables, though not enough for domestic needs. Sponge fishing is the main economic activity. Pátmos is the seat of a school of theology founded in 1669. Pop. (1981) 2,534.

Patna, ancient PĀṬALIPUTRA, capital of Bihār state, northern India. Pāṭaliputra was founded in the 5th century BC by Ajātaśatru, king of Magadha (South Bihār). His son Udāya (Udāyin) made it the capital of Magadha, which it remained until the 1st century BC. The second Magadha dynasty, the Maurya, ruled in the 3rd and early 2nd centuries BC until the city was sacked in 185 by Indo-Greeks. The Śuṅga dynasty then began, ruling until about 73 BC. Pāṭaliputra remained a centre of learning and in the 4th century AD became the Gupta capital. It declined and was deserted by the 7th century. The city was refounded as Patna by an Afghan ruler in 1541 and again rose to prosperity under the Mughal Empire. It passed to the British in 1765. Extensive archaeological excavations have been made in the vicinity.

Prominent among its modern structures are the Government House, the Assembly Chambers, the Oriental Library, a medical college, and an engineering college. Its historic monuments include the mosque of Ḥusayn Shāh of Bengal (1499); the Sikh Temple associated with the 10th Gurū, Govinda Singh; and the granary at Bankipore (now Bānkipur; 1786), popularly called the Golghar. paṭolā, type of silk sari (characteristic garment worn by Indian women) of Gujarati origin, the warp and weft being tie-dyed (*see* bāndhanī work) before weaving according to a predetermined pattern. It formed part of the trousseau presented by the bride's maternal uncle. Although extant *paṭolās* of Gujarāt do not predate the late 18th century, their history certainly goes back to the 12th century, if not earlier. The technique was also adopted by the weavers of Andhra Pradesh, especially at Pochampalli, where coarse cotton yarn was used as weaving material.

Patterns such as a dancing girl, elephant, parrot, pipal leaf, floral spray, watercress, basketwork, diaper (overall diamond pattern) with a double outline, and flowers were employed on a deep-red ground. The extraordinary laboriousness of the work and the high cost of production led to decreased demand and the decline of this important craft. The technique of *paṭolā* weaving was not confined to India but was also known in Indonesia, where it was called *ikat.*

Paton, Alan (Stewart) (b. Jan. 11, 1903, Pietermaritzburg, Natal, S.Af.—d. April 12, 1988, near Durban, Natal), one of the foremost writers in South Africa, best-known for his first novel, *Cry, the Beloved Country* (1948), which brought international attention to the problem of apartheid in South Africa.

In 1935 Paton left his teaching position to direct Diepkloof Reformatory for delinquent urban African boys, near Johannesburg. The success of *Cry, the Beloved Country,* which he wrote during his tenure at the reformatory, led him to resign his post for full-time writing.

Both *Cry, the Beloved Country* and his next novel, *Too Late the Phalarope* (1953), exhibit a characteristic balanced, economical, rhythmic prose, which has, especially in dialogue, a singing psalmodic tone. The Diepkloof period provided additional material for some short stories. During that period of his life, Paton became involved in South African politics. In 1953 the Liberal Party of South Africa was formed to offer a nonracial alternative to apartheid; Paton was its national president until its enforced dissolution (a ban on "mixed" racial parties) in 1968. His active opposition to the policy of apartheid led to confiscation of his passport from 1960 to 1970.

His work for the liberal cause included a fortnightly column, "The Long View," for the liberal journal *Contact.* These pieces, along with some public speeches, were collected in *The Long View* (1968) and *Knocking on the Door* (1975). Mainly commentaries on people and affairs, they are diverse in tone: angry, witty, compassionate, and profound.

Paton wrote two notable biographies, *Hofmeyr* (1964), a massive study of the brilliant parliamentarian and Cabinet minister Jan Hofmeyr, and *Apartheid and the Archbishop: The Life and Times of Geoffrey Clayton, Archbishop of Cape Town* (1973). *Towards the Mountain* (1980) is an autobiography of his first 45 years. In *Ah, But Your Land Is Beautiful* (1981), Paton returned to a fictional account of events in South Africa. The second volume of his autobiography, *Journey Continued,* was published shortly after his death.

Patos, city, west-central Paraíba *estado* ("state"), northeastern Brazil, on the Espinharas River at 804 feet (245 m) above sea level. Given city rank in 1903, Patos is a commercial centre for an agricultural hinterland, yielding principally cotton and *feijão* (beans). The city's varied industries include shoe factories, cotton-textile mills, granaries, and vegetable-oil factories. Goods are transported by rail and road to João Pessoa (the state capital) to the east, to Recife, and to other communities in Paraíba and neighbouring states. Pop. (1980) 58,705.

Patos de Minas, city, west-central Minas Gerais *estado* ("state"), Brazil, at 2,808 feet (856 m) above sea level in the highlands. Made the seat of a municipality in 1866, it gained city status in 1892 with the name of Patos, which was lengthened in 1944 to Patos de Minas. Agriculture (*feijão* [beans], corn [maize], cassava, rice, coffee, and oranges) phosphate-fertilizer processing, and livestock raising are the main sources of income. Dairy products, *xarque* (jerked beef), and hog by-products are processed in the city, which is linked by air and by roads with railroad connections to Belo Horizonte, the state capital, 314 miles (506 km) east-southeast. Pop. (1980) 59,849.

Patos Lagoon, Portuguese LAGOA DOS PATOS, shallow lagoon in Rio Grande do Sul *estado* ("state"), Brazil; it is the largest lagoon in Brazil and the second largest in South America. The lagoon is 180 miles (290 km) long and up to 40 miles (64 km) wide, with an area of more than 3,900 square miles (10,100 square km). A sandbar that is 20 miles (32 km) wide separates the lagoon from the Atlantic in the north, but the sandbar narrows in the south, where smaller lagoons predominate. The lagoon receives the Jacuí River (via the Guaíba River) in the north and the Mirim Lagoon overflow (via São Gonçalo Canal) in the south. A mile-wide channel leads to the Atlantic at the city of Rio Grande in the south. The dredged channel allows vessels to ply between Rio Grande and Pôrto Alegre, the state capital. The waters of the Patos Lagoon are fished.

Pátrai, also called PATRAE, or PATRAS, city, capital of the *nomós* (department) of Achaea, and chief port of the Peloponnese and one of the largest ports in Greece, on the Gulf of Patraïkós.

A legendary federation of three villages—Aroë, Antheia, and Mesatis—Pátrai received its name from the Achaean leader Patreus and became one of the 12 cities of Achaea. About 280 BC it helped to form the anti-Macedonian Achaean League. After the Battle of Actium (31 BC), the Roman emperor Augustus colonized it, and as such it prospered commercially until about the 3rd century AD. St. Andrew, the first disciple of Christ, is said to have been crucified there.

In the 8th and 9th centuries its population was increased by refugees from the Slavic invasion of the Peloponnese; St. Andrew was confirmed as patron for his supposed role in resisting the combined Slavic and Saracen attack of 805 or 807. In 1205 it became a Frankish barony and the seat of an autonomous Latin archbishop, who later sold it to Venice (1408). It was long contested by Venetians and Turks. Pátrai was the see of Bishop Germanos, who in 1821 raised the standard of the Greek War of Independence at Kalávrita. The Turks burned the city (which was not freed until 1828) before retreating, and the current grid plan of Pátrai dates from the reconstruction.

Since 1899 the seat of a metropolitan bishop of the Orthodox church, Pátrai was previously an archbishopric. The chief exports are currants, sultanas, tobacco, olives and olive oil, figs, citrons, wine, brandy, hides, and valonias (dried acorn cups used in tanning and leather dressing).

An important port of call on shipping lanes between Greece and the West, it is linked by rail to Corinth, Athens, and Kalámai. The port is overlooked by a Byzantine-Turkish-Venetian fortress on the site of the ancient acropolis and is a major port for car-ferry services between Greece and the east coast of Italy. Pop. (1981) 142,163.

patralatā, decorative motif in Indian art, consisting of a lotus rhizome (underground plant stem). A cosmology that identifies water as the source of all life had a great influence on early Indian art, and, of its visual symbols, the lotus is the most important and has been

a dominant motif in Indian decoration from the earliest times.

The *patralatā,* with flowers issuing from a central undulating stem, is found carved on monuments at Bhārhut (2nd century BC) and Sānchi (1st century BC). Relatively naturalistic in the earlier monuments, the motif was progressively stylized, finally culminating in rich, foamlike foliated scrolls that have little resemblance to the lotus plant. The *patralatā* also appears in the Islāmic art of India, in which it is assimilated to the arabesque motif.

patria potestas, in Roman family law, power that the father exercised over his children and his more remote descendants in the male line, whatever their age, as well as over those brought into the family by adoption. This power meant originally not only that he had control over the persons of his children, amounting even to a right to inflict capital punishment, but that he alone had any rights in private law. Thus, acquisitions of a child became the property of the father. The father might allow a child (as he might a slave) certain property to treat as his own, but in the eye of the law it continued to belong to the father.

Patria potestas ceased normally only with the death of the father; but the father might voluntarily free the child by emancipation, and a daughter ceased to be under the father's potestas if upon her marriage she came under her husband's manus (*q.v.*), a corresponding power of husband over wife.

By classical times, the father's power of life and death had shrunk to that of light punishment, and sons could keep as their own what they earned as soldiers (*peculium castrense*). By Justinian's day (527–565), the rules of *peculium castrense* were extended to many sorts of professional earnings; and in other acquisitions, such as property inherited from the mother, the father's rights were reduced to a life interest.

patriarch, title used for some Old Testament leaders (Abraham, Isaac, Jacob, and Jacob's 12 sons) and, in the Christian church, a title given to bishops of important sees.

The biblical appellation patriarch appeared occasionally in the 4th century to designate prominent Christian bishops. By the end of the 5th century, however, in the course of growing ecclesiastical centralization, it acquired a specific sense. After the Council of Nicaea in 325, the church structure was patterned on the administrative divisions of the Roman Empire; thus, each civil province was headed by a metropolitan, or bishop of the metropolis (the civil capital of the province), while larger administrative units, called dioceses, were presided over by an exarch of the diocese, a title gradually replaced by patriarch. Some patriarchs exercised authority over several dioceses: the bishop of Rome over the entire West; the bishop of Alexandria over the dioceses of Egypt, Libya, and Pentapolis; and, after the Council of Chalcedon (451), the bishop of Constantinople over the dioceses of Pontus, Asia, and Thrace.

Controversy over the growth of major ecclesiastical centres contributed to the schism between East and West. Rome maintained that only apostolic sees, those originally established by apostles, had the right to become patriarchates. The East, however, always took for granted that primacies were based on such empirical factors as the economic and political importance of cities and countries. Constantinople, the new imperial capital and the ecclesiastical centre of the East, had no claims to apostolicity, but new jurisdictional rights were bestowed upon it at Chalcedon (451) for the explicit reason that it was "the residence of the emperor and the Senate."

Five patriarchates, collectively called the pentarchy (*q.v.*), were the first to be recognized by the legislation of the emperor Justinian (reigned 527–565), later confirmed by the Council in Trullo (692): Rome, Constantinople, Alexandria, Antioch, and Jerusalem—though, after the Muslim invasions of Egypt and Syria in 638–640, the bishops of Rome and Constantinople were alone in possessing any real power. Despite Constantinople's efforts to resist any proliferation of patriarchates, new centres emerged in the Slavic centres of Preslav (932), Trnovo (1234), Peć (1346), and Moscow (1589). At present there are nine Orthodox patriarchates: Constantinople, Alexandria, Antioch, Jerusalem, Moscow, Georgia, Serbia, Romania, and Bulgaria. Except in the title, there is no difference between a patriarch and any other head of an autocephalous (independent) church.

In Roman Catholicism, especially since the second Vatican Council, some effort has been made to restore the dignity of the Eastern-rite patriarchs as effective signs of collegiality, balancing Roman centralization.

patriarchy, hypothetical social system based on the absolute authority of the father or an elderly male over the family group. Inspired by the classical social Darwinism of the 19th century, the pioneering anthropologists Lewis Henry Morgan and Henry Maine envisioned cultures as having developed through evolutionary stages, one of which was patriarchy. Maine felt that all status or relationship in the earliest societies derived from a patriarchal kinship system and that all decisions of social consequence were the arbitrary judgments of a quasi-tyrannical patriarch. Sometimes patriarchy also includes in its meaning patria potestas, the system in which power to govern members of even the extended family rested in the hands of a father and his kin.

Although Morgan did undertake ethnographic work of nonliterate societies, Maine based his conclusions almost entirely on records of ancient Greece and Rome. Later anthropologists were skeptical of such evolutionary schemes, and ethnographers found absolute male authority to be rare even in societies with patrilineal descent systems. The word patriarchy, therefore, has fallen into disuse as a technical or categorical term.

Patrice Lumumba People's Friendship University, Russian UNIVERSITET DRUZHBY NARODOV IMENI PATRISA LUMUMBY, state institution of higher learning in Moscow, founded in 1960 "to give an education to people who had liberated themselves from colonialist oppression." It was named for the Congolese premier after his death in 1961. It draws students from developing nations throughout the world.

As at all Soviet universities, the students are fully financed by the government, including initial transportation to the Soviet Union and their return after graduation.

There are six faculties: engineering; agriculture; medicine; physics, mathematics, and general science; economics and international law; and history and philosophy. There is a strong emphasis on the first three subjects; only about 30 percent of the students are in the humanities. All courses are for six years, the first year being preparatory, during which the student must learn Russian, the language of instruction.

patrician, Latin PATRICIUS, plural PATRICII, member of a privileged citizen class in early Rome. Probably originating as leaders of the rudimentary Roman Senate, they came to monopolize the magistracies and priesthoods in the period before about 400 BC. Because their political influence was reduced by the plebeians, patricians at the end of the early republic retained exclusive control only of some old priesthoods, the office of *interrex,* or interim head of state, and perhaps that of *princeps senatus,* or senate leader. In the late republic (*i.e.,* to the 1st century BC) distinctions between patricians and plebeians lost political importance; some patricians became plebeians by adoption.

During the empire (after 27 BC), patrician rank was a prerequisite for ascent to the throne, and only the emperor could create patricians. Necessary for the continuation of ancient priesthoods, patricians had few privileges other than reduced military obligations. After Constantine's reign (306–337), *patricius* was a nonhereditary title of honour, ranked third after the emperor and consuls. By derivation, *patricius Romanorum* was the title of the patron of the Roman Catholic church, conferred by the pope on emperors from Charlemagne in the 9th century to Frederick I Barbarossa in the 12th. *Compare* plebeian.

Patrick, SAINT (fl. 5th century, Britain and Ireland; feast day March 17), patron saint and national apostle of Ireland, credited with bringing Christianity to Ireland and probably responsible in part for the Christianization of the Picts and Anglo-Saxons. He is known only from two short works, the *Confessio,* a spiritual autobiography, and his *Epistola,* a denunciation of British mistreatment of Irish Christians.

Life. He was born in Britain of a Romanized family. At the age of 16 he was torn by Irish raiders from the villa of his father, Calpurnius, a deacon and minor local official, and carried into slavery in Ireland, where, during six bleak years spent as a herdsman, he turned with fervour to his faith. Hearing at last in a dream that the ship in which he was to escape was ready, he fled his master and found passage to Britain. There he came near to starvation and suffered a second brief captivity before he was reunited with his family. Thereafter, he may have paid a short visit to the Continent.

The best known passage in the *Confessio,* his spiritual autobiography, tells of a dream, after his return to Britain, in which one Victoricus delivered him a letter headed "The Voice of the Irish." As he read it he seemed to hear a certain company of Irish beseeching him to walk once more among them. "Deeply moved," he says, "I could read no more." Nevertheless, because of the shortcomings of his education he was reluctant for a long time to respond to the call. Even on the eve of reembarkation for Ireland he was beset by doubts of his fitness for the task. Once in the field, however, his hesitations vanished. Utterly confident in the Lord, he journeyed far and wide, baptizing and confirming with untiring zeal. In diplomatic fashion he brought gifts to a kinglet here and a lawgiver there but accepted none from any. On at least one occasion he was cast into chains. On another, he addressed with lyrical pathos a last farewell to his converts who had been slain or kidnapped by the soldiers of Coroticus.

Careful to deal fairly with the heathen, he nevertheless lived in constant danger of martyrdom. The evocation of such incidents of what he called his "laborious episcopate" was his reply to a charge, to his great grief endorsed by his ecclesiastical superiors in Britain, that he had originally sought office for the sake of office. In point of fact, he was a most humble-minded man, pouring forth a continuous paean of thanks to his Maker for having chosen him as the instrument whereby multitudes who had worshipped "idols and unclean things" had become "the people of God."

The phenomenal success of Patrick's mission is not, however, the full measure of his personality. Since his writings have come to be better understood, it is increasingly recognized that, despite their occasional incoherence, they mirror a truth and a simplicity of the rarest quality. No diarist has ever bared his inmost soul to the same degree as did the patron saint of Ireland. As D.A. Binchy, the most austerely critical of Patrician (*i.e.,* of Patrick) scholars, has put it, "The moral and spiritual greatness of the man shines through every stumbling sentence of his 'rustic' Latin."

It is not possible to say with any assurance when Patrick was born. There are, however, a number of pointers to his missionary career having lain within the second half of the 5th century. In the Coroticus letter, his mention of the Franks as still heathen indicates that the letter must have been written between 451, the date generally accepted as that of the Franks' irruption into Gaul as far as the Somme River, and 496, when they were baptized en masse. Patrick, who speaks of himself as having evangelized heathen Ireland, is not to be confused with Palladius, sent by Pope Celestine in 431 as "first bishop to the Irish believers in Christ."

Legends. Before the end of the 7th century Patrick had become a legendary figure, and the legends have continued to grow. One of these would have it that he drove the snakes of Ireland into the sea to their destruction. Another, probably the most popular, is that of the shamrock, which has him explain the concept of the Holy Trinity, three Persons in one God, to an unbeliever by showing him the three-leaved plant with one stalk. Today Irishmen wear shamrocks, the national flower of Ireland, in their lapels on St. Patrick's Day, March 17. (T.O'R.)

Patrick, Lester B. and Frank A. (respectively b. Dec. 30, 1883, Drummondville, Que., Can.—d. June 1, 1960, Victoria, B.C.; b. Dec. 23, 1885, Ottawa—d. June 29, 1960, Vancouver, B.C.), Canadian brothers who as managers, owners, and league officials helped establish professional ice hockey in Canada and who aided the expansion of the National Hockey League (NHL) to the United States.

The brothers played hockey while attending McGill University (Montreal), Lester with the Montreal Amateur Athletic Association team (1901–02) and the amateur Montreal Wanderers (1905–07), both of which won Stanley Cups, and for the Brandon (Man.) team that played for but did not win the Stanley Cup (1903–05). Frank refereed in the Montreal senior league (1903–04), and the two joined the Renfrew Millionaires in the professional league that came to be the National Hockey Association (NHA; formed 1910).

In 1911 the Patrick family moved west to Victoria, where the brothers with their father, Joseph Frank Patrick, a lumberman, formed the Pacific Coast League. They built the first enclosed ice rinks at Vancouver and Victoria; at the time, the Vancouver rink was one of the largest buildings in Canada, seating 10,000. In that league the Patricks introduced many practices that later became standard: allowing the goalie to leave his feet; instituting blue lines in the mid-rink area, thus affecting the offside rule; adding assists to goals scored; and numbering uniform jerseys. Lester introduced the defenseman's practice of bringing the puck up the ice, not merely passing it up, thus changing the offense.

The Pacific League suffered in attendance during World War I, and in 1926 the Patricks sold their six teams and players to the National Hockey League, which used the pool of players to establish new teams and expand the game in the United States.

Lester assembled the New York Rangers and was their manager (1927–46); the team won Stanley Cups in 1928, 1930, and 1940. He developed the first farm team system in ice hockey and was responsible for many rule changes. In 1966 the Rangers instituted the Lester Patrick Trophy to be awarded for outstanding service to ice hockey in the United States.

Frank was manager and director of the NHL (1933–34) and coached for the Boston Bruins and the Montreal Canadiens before he retired in 1941.

Eric Whitehead's *The Patricks: Hockey's Royal Family* (1980) is an account of five generations of the Patrick family's activity in ice hockey.

patristic literature, body of literature that comprises those works, excluding the New Testament, written by Christians before the 8th century AD.

A brief treatment of patristic literature follows. For full treatment, *see* MACROPAEDIA: Christianity.

"Patristic" is derived from the Greek and Latin word *pater* (father) and refers to the works of the Church Fathers. Most patristic literature is in Greek or Latin, but much survives in Syriac and other Near Eastern languages.

The works of the Apostolic Fathers, a collection of short and unpretentious Greek writings largely concerned with Christian conduct, contain the earliest patristic literature. The oldest of these works, including the *Letter to the Church of Corinth,* by Clement of Rome, and possibly part of a manual of church order called the *Didachē,* stem from the last decades of the 1st century AD and antedate some books of the New Testament.

Accounts of martyrdoms are the most moving early patristic writings. The finest of them, the *Passion of Perpetua and Felicitas,* was written in Carthage in about 202 by the Christian noblewoman Perpetua as she awaited execution for her refusal to apostatize.

Apocryphal accounts of Christ's life and the careers of the Apostles flourished in the 2nd and 3rd centuries. Later Christian art drew on their romantic narratives to depict such things as the birth of Mary and the adventures of the apostle Peter.

By the middle of the 2nd century AD Christians wrote to justify their faith to the Roman government and to refute Gnostic ideas they considered heretical. The principal writer then was Justin Martyr, a Christian teacher put to death in Rome in about 165. Beginning with Justin, who wrote in Greek, Christians were increasingly sophisticated in their appropriation of the rhetorical and philosophical heritage of Greco-Roman culture. In this they relied on earlier Jewish literature written in Greek, particularly the works of Philo (*c.* 15 BC–*c.* AD 50), a philosopher who interpreted the Torah symbolically along Platonic lines.

Christian appropriation of Greek philosophy came to fruition in the writings of Origen (*c.* 185–*c.* 254), a Greek author from Alexandria, whose treatise, *On First Principles,* was the first coherent and systematic account of the main doctrines of Christian theology. Origen was the early church's greatest biblical scholar, and his allegorical method of interpretation dominated Christian exegesis until the Reformation.

The first important Latin Christian author, Tertullian of Carthage (*c.* 160–*c.* 225), set forth the main lines Latin theology would follow in writings of unexcelled stylistic brilliance.

The first Council of Nicaea, in 325, is the great watershed in patristic literature. In terms of Christian theology the council, the first convocation of Christian leaders theoretically from throughout the world, marks the beginning of an era, extending through the rest of the patristic period, during which general church councils sought to define Christian dogma ever more precisely. Socially and politically, the Council of Nicaea marks the point at which Christianity ceased to be the religion of a persecuted minority and became the Roman Empire's favoured religion.

The principal author at the time of the first Council of Nicaea, a Greek writer, Eusebius of Caesarea (*c.* 260–*c.* 340), associated himself with Constantine, the first Christian emperor.

Eusebius' *Ecclesiastical History*, published in its final edition around 323, is the first known history of the early church and its literature. Pioneering use of extensive documentation makes the *Ecclesiastical History* especially valuable.

For just over 100 years after Nicaea, patristic literature enjoyed its Golden Age. Theologians, most of them writing in Greek, worked out, after a long and bitter debate, what was to be the normative Christian doctrine of the Trinity. Chief among them were Athanasius (*c.* 293–373), the tenacious bishop of Alexandria, and the three Cappadocian Fathers, so called from their native province in Anatolia: Basil the Great (*c.* 330–379), his brother Gregory of Nyssa (*c.* 335–*c.* 394), and their friend Gregory of Nazianzus (*c.* 330–*c.* 389).

Athanasius and Basil contributed as authors to the development of Christian monasticism. Athanasius popularized it with his *Life of St. Antony*, the idealized biography of St. Anthony of Egypt, and Basil composed what was to become the rule of life for Eastern Orthodox monks.

Preachers and writers during this Golden Age achieved the highest standards of eloquence. Gregory of Nazianzus and John Chrysostom (*c.* 347–407) in Greek and Ambrose of Milan (*c.* 339–397) and Augustine of Hippo (354–430) in Latin were consummate orators, masters of the most respected and popular art form of their time. Ephraem of Nisibis (*c.* 306–373) composed superb Christian verse in Syriac. Jerome (*c.* 347–*c.* 420), the period's greatest man of letters, was largely responsible for the careful and eloquent Vulgate translation of the Bible from its original languages into Latin.

The most influential writer of the patristic period was Augustine of Hippo. His theological treatises pervasively shaped the common tradition of Roman Catholics and Protestants. His sustained meditation on God's grace, the *Confessions*, with its psychologically acute autobiography, is the patristic work most accessible to modern readers. His *City of God*, a treatise occasioned by the shattering news of the Visigothic sack of Rome in 410, initiated Christian philosophical reflection on history.

Two Greek theologians, Theodore of Mopsuestia (*c.* 350–*c.* 428) and Cyril of Alexandria (*c.* 375–444), set forth influential alternative approaches to the problem of how Christ could be both God and man. Theodore of Mopsuestia was the greatest biblical exegete after Origen, whose allegorism he rejected.

The isolation of cultural traditions and characteristically medieval concerns mark later patristic literature. Maximus the Confessor (*c.* 580–662), a Byzantine theologian, exemplifies typically Byzantine concerns with icons and with mystical contemplation. His contemporary Pope Gregory I (540–604), the last significant Latin patristic author, reluctantly assumed more immediately practical concerns. Gregory helped consolidate Benedictine monasticism and the Papacy, the two stable and enduring institutions in an otherwise chaotic time. The rise of Islām effectively closed the patristic era by ending what little cultural unity remained in the Mediterranean world.

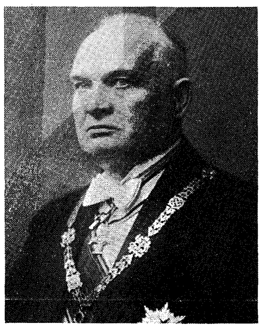
patron saint, saint to whose protection and intercession a person, a society, a church, or a place is dedicated. The choice is often made on the basis of some real or presumed relationship with the persons or places involved. St. Patrick, for example, is the patron saint of Ireland because he is credited with bringing Christianity to the Irish people. In some cultures national or local gods are the equivalent of patron saints; *e.g.*, in China K'uei Hsing is the patron of scholars because he reputedly passed his civil service examination with great distinction and will assist others to do the same.

patronage system (U.S.): *see* spoils system.

patronymic, name derived from that of a father or paternal ancestor, usually by the addition of a suffix or prefix meaning "son." Thus the Scottish name MacDonald originally meant "son of Donald." Usually the "son" affix is attached to a baptismal name, but it is also possible to attach it to the father's occupation (*e.g.*, Clerkson). Sometimes a patronymic is simply the father's given name (Thomas, Edward) or its genitive form (Edwards).

In some cultures the patronymic varies according to the sex of the child receiving it: in Russia, where everyone has a patronymic as well as a given name and surname, sons receive a patronymic ending in *-ovich* (*e.g.*, Ivanovich) and daughters a form ending in *-ovna* (*e.g.*, Ivanovna). A similar situation holds true in Norway.

Päts, Konstantin (b. Feb. 23 [Feb. 11, old style], 1874, Pärnu District, Estonia, Russian Empire—d. Jan. 18, 1956, Kalinin *oblast*, Russian S.F.S.R.), Estonian statesman who served as the last president of Estonia (1938–40) before its incorporation into the Soviet Union in 1940.



Päts, 1938

Of peasant stock, Päts was educated in the law but began a career in journalism in 1901, when he founded the Estonian-language newspaper *Teataja* ("Announcer"), which reflected Päts's socialistic leanings. In 1904 Päts became deputy mayor of Tallinn. During an Estonian rising in connection with the 1905 Russian Revolution, Päts, although he had called for restraint, was sentenced to death and had to flee Estonia. He was not able to return until 1910, at which time he served a brief prison term.

Active in the movement for Estonian independence after 1917, Päts became head of a provisional government when independence was declared in February 1918. Almost immediately, Päts was arrested by Estonia's German occupiers, but he resumed his post after the November 1918 armistice.

In 1921–22, 1923, and 1932–33 Päts served as *riigivanem* (equivalent to president and prime minister) of Estonia. After a new constitution providing for a stronger executive was approved in a 1933 referendum, Päts learned of a planned coup d'etat by the Fascist "Vap" movement, which had sponsored the constitution. He arrested the leaders of the movement and assumed dictatorial powers. Päts's authoritarian regime lasted until the Soviet Union occupied Estonia in June 1940. He was deported to the U.S.S.R. at the start of the occupation and died there.

Patsayev, Viktor Ivanovich (b. June 19, 1933, Aktyubinsk, Kazakh S.S.R.—d. June 29, 1971, in space, probably over Iran), Soviet cosmonaut, design engineer on the Soyuz 11 mission, in which he, mission commander Georgy T. Dobrovolsky, and flight engineer Vladislav N. Volkov remained in space a record 24 days and created the first manned orbital scientific station by docking their Soyuz 11 spacecraft with the unmanned Salyut station launched two months earlier. The three were found dead in their space capsule after it made a perfect landing in Kazakhstan. The accident was caused by decompression resulting from a leak in their capsule when a hatch was improperly closed. While in the space station, they had conducted meteorological and plant-growing experiments.

Pattani, also spelled PATANI, town and *changwat* (province) in the Southern region of Thailand, on the east coast of the Malay Peninsula. Pattani town, the provincial capital, located at the mouth of the Pattani River, has been an international trading port since the 16th century or earlier. Its port facilities, which also serve Yala province, export rubber and tin. Its airport has regular flights to other towns of southern Thailand.

Pattani was an independent Muslim city-state, ruling an area larger than the present province, until the 16th century when it became a vassal state of Siam (now Thailand). After 1800 it was divided into seven smaller units, which were incorporated as Siamese provinces in the early 20th century.

The province, one of Thailand's smallest, occupies an area of 749 sq mi (1,940 sq km) and has a 72-mi (116-km) coastline on the Gulf of Thailand. Salt production and fishing are important in the coastal towns of Yaring, Sai Buri, and Pattani. Pattani is drained by the Pattani and the Sai Buri rivers. Sandy ridges, remnants of old offshore sandbars, alternate with strips of clay soils. The ridges are the location of coconut groves and settlements, and the lowlands are filled lagoons ideal for rice and rubber cultivation. There are tin reserves. The population is mainly Muslim, and the culture of the area is oriented toward that of Malaysia, 65 mi south. Pop. (1980) town, 29,286; province, 418,932.

pattern glass, pressed glassware produced in sets of many pieces decorated with the same pattern. Manufactured in large quantities in the United States in 1840–80 by the larger glassworks, it was an offshoot of the U.S. invention (1820s) of mechanically pressed glass, which brought about a cheaper production. Pattern sets sometimes included a staggering number of pieces, ranging from sugar bowls to celery vases. More than 250 major patterns are known to have been made. Some popular patterns, known as camphor glass, combined the use of clear glass with an acid-finished design.

pattern poetry, verse in which the lines or typography are arranged to convey or extend the emotional content of the words. It is also known as *shaped, Cubist,* or *concrete* poetry. Of ancient (probably Eastern) origin, pattern poems are found in the Greek *Anthology* (*c.* 980), where one poem was recorded in the shape of an ax, another as an egg. Notable later examples are the wing-shaped "Easter Wings" of the 16th-century English Metaphysical poet George Herbert and his altar-shaped "The Altar."

In the 19th century, the French Symbolist poet Stéphane Mallarmé employed different type sizes in *Un Coup de dés* (1897; "A Throw of Dice"). The representative 20th-century French poet is Guillaume Apollinaire, whose *Calligrammes* (1918), inspired by the attempts of Cubist painters to represent all aspects of a subject simultaneously, are visual evocations as well as poems; in a poem about rain, the words fall in long, slanting lines. The U.S. poet e.e. cummings (1894–1962) is famous for his typographical eccentricities and was perhaps most successful in making these visual innovations meaningful elements of his poems. Some concrete poets have constructed tangible poems out of iron and other durable materials.

Patterson, Eleanor Medill, byname CISSY PATTERSON (b. Nov. 7, 1884, Chicago—d. July 24, 1948, Marlboro, Md., U.S.), a member of the McCormick-Patterson family of American newspaper publishers and herself the flamboyant editor and publisher of the *Washington Times-Herald.*

Hired by William Randolph Hearst as editor in chief of the *Washington Herald* in 1930, Patterson leased the paper and its evening counterpart, the *Washington Times,* from Hearst in 1937. The *Herald* under her sometimes eccentric editorship more than doubled its circulation. Learning that Eugene Meyer of the *Washington Post* wanted to buy the two Hearst papers, Patterson bought them herself, combining them into the *Washington Times-Herald.* The paper prospered during World War II but declined afterward.

Encouraged by her mother, Eleanor Patterson moved early toward a career as a socialite. She was married at age 19 to a Polish count, Joseph Gizycki, but the couple separated after a few years. As Eleanor M. Gizycka she wrote two novels, *Glass Houses* (1926) and *Fall Flight* (1928). She changed her name legally to Eleanor M. Patterson in 1930, the year in which she became editor of the *Herald.* She was an archconservative politically, a cast reflected by the *Times-Herald,* and she violently opposed President Franklin D. Roosevelt and his New Deal.

ally disturbed children. He won several Golden Gloves titles in 1951 and 1952 and was the Olympic Games middleweight champion in 1952. His first professional fight took place Sept. 12, 1952. When he won the heavyweight title he had lost only one professional fight, a disputed decision in favour of the clever and far more experienced Joey Maxim, a former 175-pound light-heavyweight champion.

Patterson succeeded retired champion Rocky Marciano by knocking out Archie Moore in five rounds in Chicago, Nov. 30, 1956. He lost the title to Ingemar Johansson of Sweden by a three-round knockout in New York City, June 26, 1959, and regained the championship by knocking out Johansson in five rounds in New York, June 20, 1960. He was subsequently knocked out in one round by Sonny Liston in a title bout in Chicago, Sept. 25, 1962. He later was defeated by Liston and Muhammad Ali in his attempts to recapture the world championship and by Jimmy Ellis, World Boxing Association heavyweight champion, in a match for that version of the disputed world title. He retired from the ring in 1972 and later ran an amateur boxing club and was athletic commissioner for the state of New York.

Patterson, John Henry (b. Dec. 13, 1844, near Dayton, Ohio, U.S.—d. May 7, 1922, near Philadelphia), American manufacturer who helped popularize the modern cash register by means of aggressive and innovative sales techniques.

Patterson began his career as a toll collector for the Miami & Erie Canal and then went into business selling coal with his brother. Convinced that petty pilfering by clerks was cheating him of profits, he bought three new machines called cash registers, invented in 1879 by a Dayton tavern owner, James Ritty. The store eventually showed a profit, and Patterson bought Ritty out and renamed the firm the National Cash Register Company, later to be known familiarly as NCR.

Because the cash register was new and not readily accepted by merchants, Patterson devised a number of mechanical improvements to make the machine easier to use and pioneered several marketing innovations to stimulate sales. He introduced the idea of exclusive territory for each of his salesmen, and he opened a school to train them, a first in marketing history. He also made extensive use of direct-mail advertising and paid generous commissions to his sales staff. To upgrade the quality of his product, he improved working conditions for his labourers at a time when such actions seemed almost unethical to his fellow manufacturers. When Patterson took over Ritty's operation he transformed the ugly slum factory into an attractive workplace and established an industrial welfare organization, with programs aimed at improving the health, education, and working conditions of the employees. In return for these benefits, however, he demanded absolute devotion and high productivity from his subordinates.

Patterson became nationally known when he spearheaded the relief work after a flood devastated Dayton in 1913 and raised $2,000,000 to fund a flood control and prevention plan.

Patterson, Joseph Medill (b. Jan. 6, 1879, Chicago—d. May 26, 1946, New York City), American journalist, coeditor and publisher—with his cousin Robert Rutherford McCormick—of the *Chicago Tribune* from 1914 to 1925; he subsequently became better-known as editor and publisher of the New York *Daily News,* the first successful tabloid newspaper in the United States.

A *Tribune* staff member from 1901, Patterson was an Illinois state legislator (1903–04) and Chicago commissioner of public works (1905–06). During World War I he served as a war correspondent in 1914–15 and, after the United States entered the war in 1917, as a combat officer. With McCormick he founded the New York *Daily News* (first published June 26, 1919), which, because of its sensationalism, soon attained a circulation of nearly 1,000,000, the largest among American tabloids. Relinquishing to McCormick his authority over the *Tribune,* Patterson became sole editor and publisher of the *Daily News* in 1925. A mild Socialist as a young man, he later became more conservative, as did the *Daily News;* the paper switched from support of President Franklin D. Roosevelt's policies to isolationist opposition.

Patti, Adelina, original name ADELA JUANA MARIA PATTI (b. Feb. 19, 1843, Madrid—d. Sept. 27, 1919, Craig-y-Nos Castle, Brecknockshire, Wales), Italian soprano, one of the great coloratura singers of the 19th century.

She went to the United States as a child and appeared in concerts in New York City from age seven. She made her operatic debut as Lucia in Gaetano Donizetti's *Lucia di Lammermoor* in New York City in 1859. Two years later she sang Amina in Vincenzo Belli-

ni's *La sonnambula* at Covent Garden, London, where she sang regularly until 1885. She sang many roles in the operas of Gioacchino Rossini, Bellini, Giacomo Meyerbeer, Charles Gounod, and others and also in several of the early operas of Giuseppe Verdi.

Her voice was considered small but was remarkable for its wide range, evenness of production, and purity of quality. She achieved her greatest successes in comedy, notably in the roles of Dinorah in Meyerbeer's *Dinorah,* Zerlina in Mozart's *Don Giovanni,* and Rosina in Rossini's *The Barber of Seville,* Rossini having arranged much of the music of this part for her. She had three marriages: in 1868 to Henri, marquis de Caux (divorced 1885); in 1886 to the tenor Ernesto Nicolini (d. 1898); and in 1899 to a Swedish baron, Rolf Cederström.

Patton, George S(mith) (b. Nov. 11, 1885, San Gabriel, Calif., U.S.—d. Dec. 21, 1945, Heidelberg, Ger.), U.S. Army officer who was an outstanding practitioner of mobile tank warfare in the European and Mediterranean theatres during World War II. His strict discipline, toughness, and self-sacrifice elicited exceptional pride within his ranks, and the general was colourfully referred to as "Old Blood-and-Guts" by his men.

A 1909 graduate of the U.S. Military Academy at West Point, N.Y., and a descendant of a Virginia family with a long military tradition, Patton became a keen student of the U.S. Civil War (1861–65), particularly of its great cavalry leaders, an interest that no doubt

contributed to the strategy of bold, highly mobile operations associated with his name. After serving with the U.S. Tank Corps in World War I, Patton became a vigorous proponent of tank warfare. Having taken part in the North African campaign (1942), he commanded the U.S. 7th Army in Sicily, employing his armour in a rapid drive that captured Palermo (1943).

The apogee of his career came with the dramatic sweep of his 3rd Army across northern France in the summer of 1944 in a campaign marked by great initiative, ruthless drive, and disregard of classic military rules. Patton's armoured units, operational since August 1, had by the end of the month captured Mayenne, Laval, Le Mans, Reims, and Châlons. In December his forces played a strategic role in defending Bastogne in the massive Battle of the Bulge. By the end of January 1945 Patton's forces had reached the German frontier; on March 1 they took Trier, and in the next 10 days they cleared the entire region north of the Moselle River, trapping thousands of Germans. They then joined the 7th Army in sweeping the Saar and the Palatinate, taking 100,000 prisoners.

Patton's military achievements caused authorities to overlook strong civilian criticism of some of his methods, including his widely reported striking of a hospitalized, shell-shocked soldier in August 1943. (Patton publicly apologized for the incident.) His public criticisms of the Allied postwar denazification policy in Germany led to his removal from the command of the 3rd Army in October 1945.

The controversial general died in a Heidelberg hospital after an automobile accident near Mannheim. His memoirs, *War As I Knew It,* appeared posthumously in 1947.

Patuākhāli, town, south-central Bangladesh. It is situated along the Patuākhāli River, a distributary of the Ariāl Khān. An important trading centre for rice, jute, oilseeds, sugarcane, and betel nuts, it is also a rice milling and match manufacturing centre. It is connected by road and river steamer with Barisāl. It has five colleges affiliated with the University of Dhākā.

The surrounding area is a floodplain drained by the Hāringhāta, Bishkhāli, and Burishwar rivers and forms part of the Sundarbans (*q.v.*). Rice, jute, sugarcane, coconuts, chilies, and tobacco are the chief crops; freshwater and saltwater fishes are abundant. Pop. (1981 prelim.) town, 45,818.

Patuca River, Spanish RÍO PATUCA, river in northeastern Honduras, formed southeast of Juticalpa by the merger of the Guayape and Guayambre rivers. It flows northeastward for approximately 200 miles (320 km), emerging from the highlands and crossing the Mosquito Coast to empty into the Caribbean Sea at Patuca Point. Near the river's mouth the Tom-Tom Creek branches to empty into Brus Lagoon. The course of the Patuca is interrupted by rapids in several places, most notably Portal del Infierno ("gate of hell"). Its navigable lower course is used to float logs cut from the dense tropical rain forests through which it flows, and it serves as the main transport and communications artery for the isolated regions around its lower course.

Pau, town, capital of Pyrénées-Atlantiques *département*, Aquitaine region, southwestern France. The capital of the former province of Béarn, Pau is a spa and winter sports centre. It stands on the edge of a plateau 130 feet (40 m) above the valley of the Pau Stream, which descends from the Pyrenees. The town's boulevard des Pyrénées, more than 1 mile (1.6 km) long, is situated high above the valley and offers a magnificent panoramic view of the mountains. A castle in the town, situated on a spur above the river, was the birthplace (1553) of Henry IV of France, who reigned from 1589 to 1610. It is now a national museum and contains a fine collection of the Gobelins tapestries. The house that was the birthplace (1763) of Marshal Jean Bernadotte, who became Charles XIV of Sweden (1818–44), is also a museum. Pau has shown considerable population growth because of recent industrialization (aeronautical equipment and shoes) and also because of its proximity to the natural gas and chemical-extraction complex at Lacq. The University of Pau and the Pays de l'Adour opened in 1970. Pop. (1982) 82,186.

GREECE

• **Paul** (b. Dec. 14, 1901, Athens—d. March 6, 1964, Athens), king of Greece (1947–64) who helped his country overcome Communist guerrilla forces after World War II.

The third son of King Constantine I of Greece, Paul left Greece with his father following Constantine's deposition in 1917. He refused the crown after the death of his brother, King Alexander (October 1920), but returned home in December 1920 upon Constantine's restoration to the throne. With the rise of republican feeling, however, he again left Greece (December 1923) and remained in exile until 1935, when his brother George was recalled as king. In 1938 Paul married his young cousin, the princess Frederika of Brunswick. He held officer's rank in the Greek Navy, Army, and Air Force and was a member of the army general staff at the outbreak of war with Italy (1940). In 1941 he escaped from occupied Greece and lived in Cairo and South Africa.

After the war Paul again returned home and ascended the throne upon the death of George (April 1, 1947). At that time Greece received U.S. economic assistance and help in putting down the Communist insurrection. Though professing aloofness from politics, he occasionally intervened in domestic issues.

PAPACY

• **Paul I,** SAINT (b. Rome—d. June 28, 767, Rome; feast day June 28), pope from 757 to 767.

Consecrated deacon by Pope St. Zacharias, he became a key member of the Curia under his brother Pope Stephen II (III), whom he was elected on April 26, 757, to succeed. He secured the support of the Frankish king Pepin the Short against the animosity of the Lombard king Desiderius and the Byzantine emperor Constantine V Copronymus.

In 763 Pepin mediated between Paul and Desiderius, who, allied with the Byzantines, had invaded the Papal States. Concurrently, Paul, heretofore loyal to Constantinople, vigorously protested Constantine's revival of Iconoclasm (destruction of images). The ensuing Iconoclastic persecution caused an expulsion of many Greek monks, for whom Paul provided refuge in Rome. He is noted for transporting the relics of many saints from the catacombs to Roman churches and for his building projects, including the church of SS. Peter and Paul.

• **Paul II,** original name PIETRO BARBO (b. Feb. 23, 1417, Venice—d. July 26, 1471, Rome), Italian pope from 1464 to 1471.

He was bishop of the Italian cities of Cervia and Vicenza before being made cardinal by Pope Eugenius IV in 1440. After services in the Curia under popes Nicholas V and Ca-

lixtus III, he became governor of Campania in 1456. Elected Pope Pius II's successor on Aug. 30, 1464, he immediately declared that "capitulations," or binding agreements that determined the subsequent conduct of elected prelates, could affect a new pope only as counsels, not as obligations, investing the papacy with an autocratic tone that was to persist throughout his pontificate.

Paul impaired his relations with King Louis XI of France by his repeated condemnations of the Pragmatic Sanction of Bourges—a pronouncement, issued by King Charles VII of France in 1438, that established the liberties of the French Church, particularly the election of the French king's nominee for successors to vacant prelacies.

He next turned his attention to the state of the Bohemian Church, which had been damaged by religious struggles with the Hussites (followers of the Bohemian religious reformer Jan Hus). Because the Council of Basel (1431–37) recognized the Hussites as a legitimate church released from papal censureship, Paul strove to abolish the Basel decree. He supported the Romanist (Catholic) party, which formed a confederacy against the king of Bohemia, George of Podebrady, a Hussite sympathizer. On Dec. 23, 1466, Paul excommunicated George and declared him deposed for refusing to suppress the Utraquists, an independent national church that branched off from the Hussites and that Rome did not recognize. Paul furthermore forbade all Catholics to continue their allegiance to George. In March 1468 he persuaded King Matthias I Corvinus of Hungary to declare war against George, who, concurrently, gained Louis's support. After Matthias conquered much of Moravia, Paul crowned him king of Bohemia in March 1469, a triumphant gesture of his crusade against the Hussites.

Seeing the advancing Turks as a major threat to Christendom, Paul in 1468 began fruitless negotiations with the Holy Roman emperor Frederick III to mount a crusade against them. He opposed the domineering policy of the Venetian government in Italian affairs and promulgated, with the Romans' consent, new statutes for Rome. In 1466 he initiated a severe prosecution against the Fraticelli (Franciscan extremists) with plans to exterminate them and their associates.

Suspecting that the Roman Academy and its founder, the Italian humanist Julius Pomponius Laetus, were opposing Christian ideals and endorsing a materialistic vision of life inspired by an admiration for the ancient world, Paul dissolved the academy and arrested its members in February 1468, subjecting one of its leading humanists, Bartolomeo Platina, to torture on additional charges of conspiracy. Thus, he incurred the enmity of the humanists, who saw him as an enemy of letters. He was, however, a patron of scholars and also a collector of antiquities and a restorer of monuments. He is responsible for founding the first printing presses at Rome, where he had built the celebrated Palace of St. Mark (now the Palazzo Venezia), his principal residence from 1466. Roberto Weiss's *Un umanista veneziano: Papa Paolo II* ("A Venetian Humanist: Pope Paul II") was published in 1958.

• **Paul III,** original name ALESSANDRO FARNESE (b. Feb. 29, 1468, Canino, Papal States—d. Nov. 10, 1549, Rome), Italian noble who was the last of the Renaissance popes (reigned 1534–49) and the first pope of the Counter-Reformation. The worldly Paul III was a notable patron of the arts and at the same time encouraged the beginning of the reform movement that was to affect deeply the Roman Catholic Church in the later 16th century. He called the Council of Trent in 1545.

Background and early years. Alessandro was the son of Pier Luigi Farnese and Giovannella Gaetani. In service to the papacy since the 12th century, the Farnese family had extended its possessions from a stronghold on Lake Bolsena south and westward to include most of the fiefs between Perugia, Orvieto, Sermoneta, and the sea. In 1417 Ranuccio Farnese (the Elder), one of the most celebrated *condottieri* (mercenary soldiers) of his time, had been made a Roman senator by Pope Martin V. Ranuccio's son Pier Luigi, by marriage with the Gaetani heiress, solidified the Farnese position in the Roman nobility. In 1489, Pier Luigi's daughter Giulia la Bella married Orsino Orsini, a relative of the Spanish cardinal Rodrigo Borgia (Borja), and became a favourite at the papal court. Her brother Bartolommeo became lord of Montalto; her other brother, Alessandro, was destined for the church.

Sensitive and talented, Alessandro Farnese was entrusted to the Humanist Pomponio Leto for his early education and then joined the Medici circle in Florence under Lorenzo the Magnificent. There he was associated with Giovanni de' Medici (the future Pope Leo X) and attended the University of Pisa.

Because of an obscure family quarrel, Alessandro's early sojourn in Rome was interrupted by a short prison term under Pope Innocent VIII. But his career was assured when Cardinal Rodrigo Borgia became his patron. On Rodrigo's election to the papacy (taking the name Alexander VI), he made Alessandro treasurer of the Roman Church and a year later, on Sept. 20, 1493, created him a cardinal deacon. Gossip traced Alessandro's rapid preferment to the intimacy between his sister Giulia and the Borgia pope, and Alessandro was referred to as the "petticoat cardinal."

Although a prelate, Alessandro did not become an ordained priest until 1519. Meanwhile, he conducted himself like a Renaissance nobleman. Of wide artistic tastes and philosophic interests, he increased his revenues with multiple benefices. He travelled on diplomatic missions, enjoyed the hunt, and delighted in majestic religious and secular ceremonies. Favoured also by Pope Leo X, he used his wealth to enhance his family position and constructed the famous Palazzo Farnese, on the Via Giulia in Rome. Moreover, despite his unfeigned personal piety, the Farnese cardinal kept a wellborn Roman mistress by whom he fathered four children—Pier Luigi, Paolo, Ranuccio, and Costanza. (Later, as Pope Paul III, he provoked serious charges of nepotism by using his papal influence to further the interests of his children and their families, going so far in one celebrated incident as to appoint two of his grandchildren, still in their teens, to the cardinalate.)
