In 1509 Pope Julius II invested Cardinal Alessandro Farnese with the bishopric of Parma. Selecting Bartolomeo Giudiccioni as his vicar general, the Cardinal took seriously the obligation of governing the diocese and decided to change his private way of life. In May 1512 he served as Julius' legate for the Fifth Lateran Council in Rome; then, having discontinued his liaison with his mistress in 1513, he put the reform decrees of that council into effect in Parma with a visitation in 1516 and, three years later, with a synod. In June 1519 he was ordained a priest and said his first mass on Christmas of that year. Thereafter, his private life was without reproach, and the Cardinal was identified with the reform party in the Roman Curia.

Achievements as pope. The Farnese cardinal's diplomatic skills made him an invaluable aid to the five pontiffs in whose election he participated—Pius III, Julius II, Leo X, Adrian VI, and Clement VII—before he himself emerged as the Roman pontiff on Oct. 13, 1534. At the age of 67, Pope Paul, though apparently frail, was a man of great charm and determination. He was described in diplomatic reports as shrewd and affable, deliberately slow of speech yet loquacious, expressing himself in an elegant Italian or Latin with learned allusions, and scrupulously refraining from tying himself down to a definite "yes" or "no" until the final settlement of an issue—but then able to act with swift, uncompromising dispatch.

Of medium height, spare of figure, with an aquiline nose, ruddy complexion, and aristocratic hands, Paul III was portrayed by Titian in 1543 at age 75 in the full vigour of his pontificate. Two later Titian portraits depict the ravages of age on the pontiff but reveal the depth of intelligence and strength that accompanied him to his last breath at 82.

The pontiff kept himself in good health by frequent excursions in Rome and the countryside, supervising urban projects and fortifications. He encouraged agriculture and provided for new food supplies. His coronation was accompanied by tournaments and pageants, signalling the end of the austerity imposed by the sack of Rome in 1527. In 1536 he authorized the revival of the carnival and rearranged the main thoroughfare in Rome for the visit of the Emperor Charles V, restoring the panoply of traditional ceremonies for the reception of princes and ambassadors. His lavish policies brought prosperity to Rome and the Papal States.

Despite charges of paganism levelled against his pontificate for its secular extravagances—even astrologers were admitted to the papal court—Pope Paul was determined to reform the church. Aware, however, of the setback suffered by Pope Adrian VI's precipitate reform policy a decade earlier, he proceeded, in the face of great internal opposition, with a slow but deliberate call for conversion of the Roman clergy and curia, as well as a reorganization of the papal offices. Immediately upon his election he announced his intention to hold a council and summoned the papal ambassadors Girolamo Aleandro and Pietro Paolo Vergerio from Venice and Vienna, respectively, for consultation about the dangerous state of the church in the north. He then dispatched Vergerio to Austria and Germany on a two-year sojourn to enlist prelates and princes in the project of holding a council in Mantua or Turin. The Protestants for years had been clamouring for such an assembly on German soil, free of Roman domination. The papacy, however, had feared the calling of a general council would compromise its authority. Paul, however, proceeded with preparations for the council even after it was rejected by Martin Luther and the Protestant leaders.

In a series of consistories, or consultative assemblies, he created cardinals of proved virtue throughout Europe. He also encouraged the foundation of new religious orders and congregations, such as the Theatines, Somaschi, Barnabites, and the Ursuline nuns. Particularly important was his confirmation of the new Jesuit order, which was to provide the papacy with one of its principal instruments in promoting the Counter-Reformation.

Pope Paul's greatest problems were caused by his relations with Emperor Charles V and the French king Francis I, whom he tried to persuade to cease their inveterate wars and turn their forces against the Ottoman Turks, who menaced the coasts of Italy as well as the outposts of Christendom in the East. He encouraged the Emperor to suppress the Lutheran Schmalkaldic League, urged the French king to eliminate the Huguenots, and employed tortuous diplomatic skill to avoid siding with either monarch. In 1538 he journeyed to Nice in an attempt to bring them together. That same year, he excommunicated the English king Henry VIII, who had declared himself head of the English Church. (An earlier sentence of excommunication under Clement VII had been suspended.) Using the military skill of Pier Luigi (his son by his former mistress) and the diplomacy of his grandson Cardinal Alessandro, Paul asserted papal control over central Italy, skillfully avoiding encirclement by both the imperial and French forces.

The Council of Trent. In May 1536 Pope Paul published a bull of convocation for his proposed council to be held in Mantua. He also authorized a select group of cardinals to draw up a report on the abuses within the church. Guided by Cardinal Gasparo Contarini, this group denounced the ordination of poorly prepared priests, the selection of incompetent bishops, the accumulation of benefices, and the decadence of the religious orders, preaching, and the care of souls. The report, however, fell into Protestant hands and was used by Luther in a violent attack on the Roman Church and the papacy. Nevertheless, the Pope pursued his plans to hold the council, scheduled to open on May 23, 1537, at Mantua. With infinite patience, Paul sought to overcome the opposition of Emperor, kings, prelates, and princes, proroguing and postponing the council's opening again and again over the course of nine years, but finally succeeding in having it inaugurated by his legate, Cardinal Giovanni del Monte, in Trent on Dec. 13, 1545.

In deference to the clamouring of the Protestants, the Emperor insisted that the council confine itself mainly to dealing with discipline and reform. Nevertheless, the Pope's decision that doctrinal matters be given precedence prevailed, and, in its early sessions, the Council of Trent hammered out decrees on the canon of the Scriptures, original sin, justification, and the sacraments, as well as on reform. Fears of the plague and the menace of an attack by armed Protestant forces induced the Pope to accept the council's transfer to Bologna in February 1548. But the Emperor forbade the Spanish and German prelates to go to Bologna, and the Pope had to suspend the Council on Sept. 17, 1549. Nevertheless, this first phase of the Council of Trent had achieved a substantial step forward, leading to a thorough reform of the Church's teaching and discipline.

Throughout his pontificate, Pope Paul frequently visited trouble spots in the Papal States and beyond. He was in Civitavecchia in 1535 and 1537; visited Lucca and Piacenza on his way to Nice in 1538; appeared in Perugia to pacify the city after his forces broke the power of the Colonna family in 1540; and in 1543 visited Bologna on his way to Busseto to meet the Emperor.

Patronage of the arts. As a patron of the arts, Pope Paul restored the University of Rome, increased the subsidies and importance of the Vatican Library, and showed favour to theologians and canonists but did not neglect the fine arts. He cajoled Michelangelo into finishing the fresco "The Last Judgment" in the Sistine Chapel, decorating the Pauline Chapel, and completing the plans for the construction of the new St. Peter's Basilica. He used Antonio da Sangallo the Younger and a host of architects to renew the fortifications of Rome and the Papal States, continued the construction of the Sala Regia (Royal Hall) in the Vatican, and ordered the reconstruction of the buildings on the Capitoline Hill.

In the midst of grave family, political, and military setbacks, the Pope visited the Quirinal Palace in Rome in early November 1549 and was taken with a raging fever. Clear-minded to the end, he received the last sacraments and died on November 10, in his 82nd year. On his deathbed he is reported to have repented of his nepotism.

Whatever the faults of his early career and the political intrigues of his pontificate, Pope Paul III was remembered by contemporaries as "good hearted, obliging and supremely intelligent . . . worthy to be described as magnanimous." He led the church out of the decadent splendour of the Renaissance into the austere rejuvenation of the post-Reformation epoch. His grandiose tomb in St. Peter's by Michelangelo's pupil Guglielmo della Porta befits the place he occupies in the church's history. (F.X.M.)

• **Paul IV,** original name GIAN PIETRO CARAFA (b. June 28, 1476, Carpriglio, Abruzzi—d. Aug. 18, 1559, Rome), Italian pope from 1555 to 1559, whose anti-Spanish policy renewed the war between France and the Habsburgs.

Of noble birth, he owed his ecclesiastical advancement to the influence of his uncle Cardinal Oliviero Carafa. As bishop of Chieti, Carafa served Pope Leo X as envoy to England and Spain. He resigned his benefices and, with St. Cajetan of Thiene (Gaetano da Thiene), founded the order of the Theatines (Congregation of Clerics Regular) in 1524 to promote clerical reform through asceticism and apostolic work. Having advised Leo's successors in matters of heresy and reform, he was appointed to Pope Paul III's commission for ecclesiastical reform, was made cardinal in 1536, and was responsible for a reorganization of the Roman Inquisition.

Despite his violent antipathies, austerity, uncompromising reformism, and exalted concept of papal authority, Carafa was elected pope

on May 23, 1555, through the influence of Cardinal Alessandro Farnese. Even the veto of the Holy Roman emperor Charles V was ignored. When Paul's excessive violence in orthodoxy and reform was carried over into politics, his pontificate was destined to be strife ridden. He succumbed to the counsels of his nephews, whom he elevated, and to his hatred of the Habsburgs and of the Spaniards, whom he attempted to drive from Naples by allying with France in December 1555. Thus, he provoked war against Charles and King Philip II of Spain. The Spanish victory in August 1557 at Saint-Quentin, Fr., and the advance upon Rome by the Duke of Alba forced Paul to come to terms with Spain; peace was made on Sept. 12, 1557. He continued his animosity toward Spain and the Habsburgs, however, by refusing to recognize the abdication of Charles and the election of his brother Ferdinand I (1558) as successor on grounds that the imperial transaction was effected without papal approval.

Paul's handling of the Protestant question was as disastrous as his politics. He denounced as a pact with heresy the Peace of Augsburg, the first permanent legal basis for the existence of Lutheranism and Catholicism in Germany. In England he ruined Cardinal Reginald Pole, archbishop of Canterbury, who had infuriated Paul by trying to prevent the conflict between France and the Habsburgs. In April 1557 Paul deprived Pole of his authority and in the following June, after England's declaration of war on France, summoned him to Rome on protests of heresy. Queen Mary I of England intervened, saving Pole from the fate suffered by his friend Cardinal Giovanni Morone, whom Paul imprisoned on illegitimate charges of unorthodoxy. He facilitated the ultimate victory of Protestantism in England by insisting upon the restitution of monastic lands that had been sold and by requiring Elizabeth I to submit her claims to the English throne to him.

An enemy to conciliar methods, Paul did not reassemble the Council of Trent (which had been suspended since 1552), preferring instead to work through commissions or congregations. But without a council he stopped many ecclesiastical abuses in Rome, disciplined vagrant clergy, and introduced firmer asceticism in the papal court.

Under him, the Roman Inquisition, established in 1542, launched a reign of terror. Following the trend in the Roman Catholic Church that wrongly suspected Jews of influencing the Reformation to some degree, Paul in 1555 established the ghetto at Rome. He enforced perpetual wearing of the Jewish badge and drastic separation of Jews from Christians. The antagonisms he aroused proved fatal to his reforming cause. G.M. Monti's *Ricerche su Papa Paolo IV Carafa* ("Researches on Pope Paul IV Carafa") was published in 1923.

• **Paul V,** original name CAMILLO BORGHESE (b. Sept. 17, 1552, Rome—d. Jan. 28, 1621, Rome), Italian pope from 1605 to 1621.

A distinguished canon lawyer, he was papal envoy to Spain for Pope Clement VIII, who made him cardinal in 1596. He became vicar of Rome in 1603 and on May 16, 1605, was elected as Pope Leo XI's successor at a time when the Kingdom of Naples and the Venetian Republic were violating ecclesiastical rights.

One of his first acts was to excommunicate the recalcitrant minister of Naples for violating the *privilegium fori—i.e.,* the right of ecclesiastics to be judged in criminal cases not by civil courts but by church courts. In 1606 a conflict erupted between Paul and Venice over papal jurisdiction and ecclesiastical immunity within the republic, where the celebrated theologian Paolo Sarpi encouraged resistance to papal censures. The situation became critical when Paul's interdict against Venice (May 1606) caused firmer defiance, led chiefly by Sarpi. Fear of Venice's breaking with Rome

Paul V, portrait bust by Gian Lorenzo Bernini, *c.* 1618; in the Borghese Gallery, Rome

Alinari—Art Resource/EB Inc.

and the risk of civil war in Italy induced the neighbouring states to intervene. Paul was prepared to appeal to arms, but a compromise was reached on April 21, 1607, mainly through France's mediation. Paul lifted the interdict and excommunicated Sarpi, against whom a murderous attack was made in the following October. Sarpi accused the Curia of instigating the assault, which Paul reprobated. He realized that the effect of interdicts was dead, and they were not used by the papacy against a sovereign state again.

Earlier (Sept. 22, 1606), Paul had expressly forbidden the Roman Catholics of England to take the new oath of allegiance imposed on them by King James I. His contention with Venice, however, made him politically cautious, and he endeavoured to maintain peace between the Habsburgs and France. He considered another crusade against the Turks, though without success. He particularly feared an open breach of the Peace of Augsburg, the first permanent legal basis for the coexistence of Lutheranism and Catholicism in Germany. Thus, when in 1618 hostility between German Catholics and Protestants caused fighting that developed into the Thirty Years' War, Paul gave no support to the Catholic powers.

In doctrinal matters, he was surprisingly undogmatic. He encouraged missions, notably those in Latin America, and confirmed many new congregations and brotherhoods, including St. Philip Neri's Oratorians (approved 1613), a congregation of secular priests. To preserve papal documents he founded the privy Vatican archives. In 1612 he authorized a new version of the *Rituale Romanum,* one of the Roman rite's liturgical books, which he promulgated on June 17, 1614.

Paul was guilty, however, of nepotism and is responsible for his family's inordinate wealth. He especially favoured his nephew Marcantonio Borghese, whom he created prince of Vivaro. His excessive fondness for display, which wasted funds needed for more crucial purposes, made him a spectacular patron of the arts and of building, including the chapel in the Basilica of Santa Maria Maggiore, Rome, where he is buried.

• **Paul VI,** original name GIOVANNI BATTISTA MONTINI (b. Sept. 26, 1897, Concesio, Italy—d. Aug. 6, 1978, Castel Gandolfo), Italian pope of the Roman Catholic church (reigned

Paul VI
AP/Wide World Photos

1963–78) during a period including most of the second Vatican Council (1962–65) and the immediate postconciliar era, in which he issued directives and guidance to a changing Roman Catholic church. His pontificate was confronted with the problems and uncertainties of a church facing a new role in the contemporary world.

Early life and career. The son of a middle-class lawyer—who was also a journalist and local political figure—and of a mother belonging to the same social background, Montini was in his early years educated mainly at home because of frail health. Later he studied in Brescia. Ordained priest on May 29, 1920, he was sent by his bishop to Rome for higher studies and was eventually recruited for the Vatican diplomatic service. His first assignment, in May 1923, was to the staff of the apostolic nunciature (papal ambassador's post) in Warsaw, but persistent ill health brought him back to Rome before the end of that same year. He then pursued special studies at the Ecclesiastical Academy, the training school for future Vatican diplomats, and at the same time resumed work at the Vatican Secretariat of State, where he remained in posts of increasing importance for more than 30 years.

In 1939 Montini was appointed papal undersecretary of state and later, in 1944, acting secretary for ordinary (or nondiplomatic) affairs. He declined an invitation to be elevated to the Sacred College of Cardinals in 1953. In the beginning of November 1954, Pope Pius XII appointed him archbishop of Milan, and Pope John XXIII named him cardinal in 1958. He was elected pope on June 21, 1963, choosing to be known as Paul VI.

Vatican II and Paul VI's pontificate. The Montini pontificate began in the period following the difficult first session of the second Vatican Council, in which the new pope had played an important, though not spectacular, part. His lengthy association with university students in the stormy atmosphere of the early days of the Fascist regime in Italy, in combination with the generally philosophical bent of his mind—developed by a long-standing habit of extensive and reflective reading—enabled him to bring to the perplexing problems of the times an academic understanding, coupled with the knowledge derived from long years of practical diplomatic experience. Paul VI guided the three remaining sessions of the second Vatican Council, often developing points he had first espoused as cardinal archbishop of Milan. His chief concern was that the Roman Catholic church in the 20th century should be a faithful witness to the tradition of the past, except when tradition was obviously anachronistic.

Upon the completion of the council (Dec. 8, 1965), Paul VI was confronted with the formidable task of implementing its decisions, which affected practically every facet of church life. He approached this task with a sense of the difficulty involved in making changes in centuries-old structures and practices—changes rendered necessary by many rapid transformations in the social, psychological, and political milieu of the 20th century. Paul VI's approach was consistently one of careful assessment of each concrete situation, with a sharp awareness of the many varied complications that he believed could not be ignored.

This prevalently philosophical attitude was often construed by his critics as timidity, indecision, and uncertainty. Nonetheless, many of Paul VI's decisions in these crucial years called for courage. In July 1968, he published his encyclical *Humanae Vitae* ("Of Human Life"), which reaffirmed the stand of several of his predecessors on the long-smoldering controversy over artificial means of birth prevention, which he opposed. In many sectors this encyclical provoked adverse reactions that may be described as the most violent attacks on the authority of papal teaching in modern times. Similarly, his firm stand on the retention of priestly celibacy (*Sacerdotalis Caelibatus,* June 1967) evoked much harsh criticism. Paul VI later likened the large numbers of priests leaving the ministry to a "crown of thorns." He also was disturbed by the growing numbers of religious men and women asking for release from vows or who were abandoning out of hand their religious vows.

From the very outset of his years as pope, Paul VI gave clear evidence of the importance he attached to the study and the solution of social problems and to their impact on world peace. Social questions had already been prominent in his far-reaching pastoral program in Milan (1954–63). During those years he had traveled extensively in the Americas and in Africa, centring his attention mainly on concern for workers and for the poor. Such problems dominated his first encyclical letter, *Ecclesiam Suam* ("His Church"), Aug. 6, 1964, and later became the insistent theme of his celebrated *Populorum Progressio* ("Progress of the Peoples"), March 26, 1967. This encyclical was such a pointed plea for social justice that in some conservative circles the pope was accused of Marxism.

Apostolic journeys. In an address to the council fathers at the end of the first session of the second Vatican Council, the then Cardinal Montini formulated a question that may be called the theme of his pastoral service as pontiff: "Church of Christ, what say you of yourself?" In an effort to answer this fundamental question, Paul VI undertook a series of apostolic journeys that were unparalleled occasions for a pope to set foot on every continent. His first journey was a pilgrimage to the Holy Land (January 1964), highlighted by his historic meeting with the Greek Orthodox patriarch of Constantinople, Athenagoras, in Jerusalem. At the end of that same year, he went to India, the first pope to visit Asia. The following year (Oct. 4, 1965) he traveled to the headquarters of the United Nations in New York City, where he delivered a moving plea for peace to the General Assembly in special session. In 1967 he undertook short visits to Fátima (Portugal) and to Istanbul and Ephesus (Turkey), a journey that had special ecumenical significance: a second meeting with Athenagoras in the patriarch's own episcopal city (Constantinople). In August 1968 the pope went to Bogotá, and he appeared before the International Labour Organisation and the World Council of Churches in Geneva, in June 1969. The following month he was in Uganda, East Africa. In the autumn of 1970, he undertook the longest papal journey in modern history: 10 days spent in visits to Tehrān, East Pakistan, the Philippines, Western Samoa, Australia, Indonesia, Hong Kong, and Ceylon, each stop bringing Paul VI into personal contact with different peoples of the world. His arrival in Manila almost ended in tragedy when an attempt was made on his life within minutes of his descent from the plane, but with no serious injury.

The themes treated by Paul VI on these trips were basically the same: world peace, social justice, world hunger, illiteracy, the brotherhood of man under God, and international cooperation.

Social and ecumenical interests. On Jan. 6, 1971, in the Clementine Hall in the Vatican, Paul VI conferred the Pope John XXIII Peace Prize on the Albanian-born Mother Mary Teresa Bojaxhiu, who had spent most of her life in India, where she had founded a special religious congregation of women dedicated to the alleviation of the countless ills of the poorest classes in the country. Paul VI declared on this occasion that the award was intended to centre attention on how even a humble individual without means can further world peace without fanfare, simply by proving in day-to-day action that "every man is my brother." Here, as in other instances, Paul's aim was to confront the world at large with the inescapable problems of justice and peace while at the same time proving conclusively that even these apparently insoluble problems can and must be settled with realistic courage and individual perseverance.

Paul VI's human concern found further expression in his efforts to lessen the long-standing tensions between the church of Rome and other churches and even with those professing no religion at all. He sought out closer understanding with numerous religious leaders throughout the world, both Christian and non-Christian, placing more emphasis on those aspects that unite the churches than on those that divide. To show that mutual acquaintance is at the very foundation of any plans or hopes for unity, Pope Paul met with prominent religious leaders from various communities in Great Britain, the United States, and the Soviet Union, as well as other countries. Paul VI also set up a special secretariat for nonbelievers, stressing the need of understanding and endeavouring to solve the problems posed by atheism.

Under his guidance the Roman Catholic church drastically revised its legislation governing marriages between its own members and those who profess other faiths, expressing a firm desire to diminish the threat of human tragedy following possible clashes of individual consciences. For this reason Paul VI's *motu proprio* (a type of papal document) was welcomed and praised for its understanding of human problems and its desire to find a satisfactory solution to the problem of mixed marriages without demanding of either side any renunciation of basic principles of conscience.

In the rise of modern ecumenism, Paul VI saw excellent opportunities to encourage world brotherhood, which, he hoped, might enable all men to continue their efforts for human well-being in their pursuit of happiness in unity of faith in God. On May 15, 1971, commemorating the 80th anniversary of Pope Leo XIII's encyclical *Rerum Novarum* on the reform of the social order, Pope Paul issued a forceful apostolic letter, "Octogesima Adveniens" with particular insistence on the necessity of involvement of all men in the solution of the problems of justice and peace. (E.L.H.)

BIBLIOGRAPHY. J.L. Gonzalez and T. Perez, *Paul VI* (1964), is a biography essential to an understanding of the man; substantial extracts from his discourses and other public pronouncements are included. James F. Andrews (ed.), *Paul VI: Critical Appraisals* (1970), is a collection of essays, some strongly disapproving of Paul's position on controversial issues. A more balanced view of his pontificate is presented by Peter Hebblethwaite, *The Year of Three Popes* (1979).

RUSSIA

• **Paul,** Russian in full PAVEL PETROVICH (b. Oct. 1 [Sept. 20, Old Style], 1754, St. Petersburg [now Leningrad], Russia—d. March 23 [March 11], 1801, St. Petersburg), emperor of Russia from 1796 to 1801.

Son of Peter III (reigned 1762) and Catherine II the Great (reigned 1762–96), Paul was reared by his father's aunt, the empress Elizabeth (reigned 1741–61). After 1760 he was tutored by Catherine's close adviser, the learned diplomat Nikita Ivanovich Panin, but the boy never developed good relations with his mother, who wrested the imperial crown from her mentally feeble husband in 1762 and, afterward, consistently refused to allow Paul to participate actively in government affairs.

Having married Sophia Dorothea of Württemberg (Russian name Maria Fyodorovna) in 1776 shortly after his first wife, Wilhelmina of Darmstadt (Russian name Nataliya Alekseyevna), died, Paul and his wife were settled by Catherine on an estate at Gatchina (1783), where Paul, removed from the centre of government at St. Petersburg, held his own small court and engaged himself in managing his estate, drilling his private army corps, and contemplating government reforms.

Despite Catherine's apparent intention to name Paul's son Alexander her heir, Paul succeeded her when she died (Nov. 17 [Nov. 6], 1796) and immediately repealed the decree issued by Peter I the Great in 1722 that had given each monarch the right to choose his successor; in its place Paul established in 1797 a definite order of succession within the male line of the Romanov family. Paul also, in an effort to strengthen the autocracy, reversed many of Catherine's policies; he reestablished centralized administrative agencies she had abolished in 1775, increased bureaucratic control in local government, and sought to impose limits on the authority of the nobles. In the process he provoked the hostility of the nobles, and, when he introduced harsh disciplinary measures in the army and displayed a marked preference for his Gatchina troops, the military, particularly the prestigious guards units, also turned against him.

Paul, detail of a portrait attributed to J. Voille, *c.* 1800; in the collection of Mrs. Merriweather Post, Hillwood, Washington, D.C.
By courtesy of Hillwood, Washington, D.C.

Confidence in his ability dropped even among his trusted supporters because of a number of actions. He demonstrated an inconsistent policy toward the peasantry and rapidly shifted from a peaceful foreign policy (1796) to involvement in the second coalition against Napoleon (1798) to an anti-British policy (1800). By the end of 1800, he had maneuvered Russia into the disadvantageous position of being officially at war with France, unofficially at war with Great Britain, without diplomatic relations with Austria, and on the verge of sending an army through the unmapped khanates in Central Asia to invade British-controlled India.

As a result of his inconsistent policies, as well as his tyrannical and capricious manner of implementing them, a group of highly placed civil and military officials, led by Count Peter von Pahlen, governor-general of St. Petersburg, and General Leonty Leontyevich, Count von Bennigsen, gained the approval of Alexander, the heir to the throne, to depose his father. On March 23 (March 11), 1801, they penetrated the Mikhaylovsky Palace and assassinated Paul in his bedchamber.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Paul KARAGEORGEVIĆ, PRINCE, Serbo-Croatian KNEZ (Prince) PAVLE KARAĐORĐEVIĆ (b. April 27, 1893, St. Petersburg [now Leningrad], Russia—d. Sept. 14, 1976, Paris, Fr.), regent of Yugoslavia in the period leading into World War II.

When Yugoslavia's king Alexander I was assassinated (Oct. 9, 1934), Paul was appointed regent for his 11-year-old nephew Peter II. Although Paul's sympathies lay with the British-French entente, he was forced to submit to Hitler's demands and align his country with the Axis powers. On March 27, 1941, two days after signing a treaty with Germany, Paul was deposed by a conspiracy led by General Dušan Simović and other air force officers. Paul fled to Greece, where he was captured by British forces after the war. After internment in Kenya he was released, and he settled in Paris.

Paul OF AEGINA, Latin PAULUS AEGINETA (b. *c.* 625, Aegina, Greece—d. *c.* 690), Alexandrian physician and surgeon, the last major ancient Greek medical encyclopaedist, who wrote the *Epitomēs iatrikēs biblio hepta,* better known by its Latin title, *Epitomae medicae libri septem* ("Medical Compendium in Seven Books"), containing nearly everything known about the medical arts in the West in his time.

Based largely on the works of such earlier Greek physicians as Galen, Oribasius, and Aëtius, the *Epitome* greatly influenced the medical practice of the Arabs, who considered Paul among the most authoritative of Greek medical writers. The Persian master physician ar-Rāzī (Rhazes) drew extensively from the work in writing his *Kitāb al-Manṣūrī* ("Book to al-Manṣūr") and Abū al-Qāsim, one of Islām's foremost surgeons, borrowed heavily from the *Epitome*'s sixth, or surgical, book in compiling the 30th chapter ("On Surgery") of his *at-Taṣrīf* ("The Method"). Thus Paul's work exercised a lasting influence on Western medieval medicine when the Arabic works were adopted as primary references in medieval Europe.

Besides his descriptions of lithotomy (surgical removal of bladder stones), trephination (removal of a disc of bone from the skull), tonsillotomy (removal of part of the tonsil), paracentesis (puncture of a body cavity in order to drain fluid), and amputation of the breast, Paul also devoted much attention in the *Epitome* to pediatrics and obstetrics. He dealt extensively with apoplexy and epilepsy, distinguished 62 types of pulse associated with various diseases, and rendered one of the first known descriptions of lead poisoning.

Paul OF SAMOSATA (fl. 3rd century), heretical bishop of Antioch in Syria and proponent of a kind of dynamic monarchian doctrine on the nature of Jesus Christ (*see* Monarchianism). The only indisputably contemporary document concerning him is a letter written by his ecclesiastical opponents, according to which he was a worldly cleric of humble origin who became bishop of Antioch in 260.

Paul held that it was a man who was born of Mary, through whom God spoke his Word (Logos). Jesus was a man who became divine, rather than God become man. A similar speculative Christology was found among the primitive Ebionites of Judaea; in Theodotus and Artemon of Rome (both of whom were excommunicated); and perhaps in other early Christian writers (and suggested by phrases in the New Testament, such as Acts 2:36). The biblical scholar Lucian of Antioch and his school were influenced by Paul. The 7th-century Paulicians of Armenia may have claimed to continue his traditions, hence their name.

Between 263 and 268 at least three church councils were held at Antioch to debate Paul's orthodoxy. The third condemned his doctrine and deposed him. But Paul enjoyed the patronage of Zenobia, queen of Palmyra, to whom Antioch was then subject, and it was not until late in 272, when the emperor Aurelian defeated Zenobia and brought Antioch under Roman imperial rule again, that the actual deposition was carried out.

Paul OF THE CROSS, SAINT, Italian SAN PAOLO DELLA CROCE, original name PAOLO FRANCESCO DANEI (b. Jan. 3, 1694, Ovada, Republic of Genoa [Italy]—d. Oct. 18, 1775, Rome; canonized 1867; feast day October 19), founder of the order of missionary priests known as the Passionists.

In 1720 Paul dedicated his life to God and began to experience visions, in the last of which the Virgin Mary appeared to him. He was inspired by this vision to found a congregation devoted to the suffering of Christ on the cross, and his rule for the new order was approved in 1741 by Pope Benedict XIV and confirmed in 1769 by Clement XIV. Paul subsequently founded the Passionist Nuns at Corneto (modern Tarquinia); the order was approved by Clement XIV in 1770. By the time of his death, Paul had established 12 monasteries in Italy, and since then his institute has spread throughout the world.

Paul OF THEBES, SAINT, also called PAUL THE HERMIT (b. *c.* 230, near Thebes, Egypt—d. *c.* 341, Theban desert; feast day January 15), ascetic who is traditionally regarded as the first Christian hermit.

According to St. Jerome, his biographer, Paul fled to the Theban desert during the persecution of Christians (249–251) under the Roman emperor Decius. Thereafter, he lived a life of prayer and penitence in a cave, dying at the reputed age of 113. Jerome considered Paul to be the first Christian hermit, an honour in modern times generally accorded to St. Anthony of Egypt. It is said that Anthony visited Paul when the latter was 113 years old and later buried him, wrapped in the cloak given to Anthony by Athanasius, bishop of Alexandria. In art Paul is often represented with a palm tree, symbolizing the source of his sustenance, or with two lions, who allegedly dug his grave.

Paul OF VENICE, Italian PAOLO VENETO, or PAOLO DI VENEZIA, Latin PAULUS VENETUS, original name PAOLO NICOLETTI (b. 1372, Udine, Patriarchate of Aquileia [Italy]—d.

June 15, 1429, Padua, Venetian Republic), Italian Augustinian philosopher and theologian who gained recognition as an educator and author of works on logic.

Influenced by study at Oxford and at Padua, where he also lectured (1408–15), Paul became Venetian ambassador to Poland (1413), but difficulties with the Venetian authorities prompted him to sever his ties with Venice. While teaching in Bologna (1424) and Siena (1422, 1427), where he became rector, he introduced the logic of William of Ockham. His principal works include *Logica parva* (1473), *Logica magna* (1481), *Summa totius philosophiae naturalis* (1496), and several discussions on Aristotle. The first two selections are known as *Logica duplex*, and they were used as a comprehensive textbook during the 15th and 16th centuries.

Paul THE APOSTLE, SAINT, original name SAUL OF TARSUS (b. AD 10?, Tarsus in Cilicia [now in Turkey]—d. 67?, Rome), 1st-century Jew who, after being a bitter enemy of the Christian church, became its leading missionary and possibly its greatest theologian. His extensive travels and his vision of a universal church were responsible for the speed with which Christianity became a world religion. More than half of the Acts of the Apostles deals with his career, and this, together with the letters written by him or in his name, comprises one-third of the New Testament.

A brief treatment of Saint Paul the Apostle follows. For a full treatment, *see* MACROPAEDIA: Paul, the Apostle.

Paul, a Roman citizen whose formal education must have been strictly Jewish, was trained as a rabbi and learned the trade of tentmaking. Although he never met Jesus, he regarded him as a threat to Pharisaic Judaism and persecuted his followers. Converted through a vision he experienced on the road to Damascus, he accepted his call to be the apostle to the Gentiles. After spending time in Arabia and in Damascus, he visited Peter and James in Jerusalem and eventually went with Barnabas to Antioch, where the idea of a planned mission first arose. Paul and Barnabas went to Jerusalem, consulted with the leaders of the Christians there, and reached agreement on future missionary policy. When Peter later visited Antioch, Paul insisted on disregarding the law that forbade Jews to eat with Gentiles.

Paul then began a series of three missionary journeys that took him to cities throughout Asia Minor and Greece. He maintained contact with the churches that he established by means of letters that taught, corrected, encouraged, and sometimes chided the young Christian communities. Paul paid his last visit to Corinth in AD 57 and then went to Jerusalem, where he was arrested. After being imprisoned at Caesarea for two years, he appealed to the emperor. He arrived in Rome in AD 60 and was kept in custody awaiting trial, during which time he wrote several letters.

Paul THE DEACON, Latin PAULUS DIACONUS (b. *c.* 720, Cividale del Friuli, Lombardy [Italy]—d. *c.* 799, Montecassino, Benevento), Lombard historian and poet, whose *Historia Langobardorum* ("History of the Lombards") is the principal source of information about his people.

Born to a rich and noble family of Friuli, northeast of Venice, Paul spent many years at the Lombard court in Pavia, serving as councillor under King Desiderius. After the fall of the Lombard kingdom to Charlemagne, Paul and his brother were involved in an anti-Frankish plot; their property was confiscated, and his brother was carried off as a prisoner to France. Paul took refuge in Benevento in southern Italy at the court of Duke Arichis II, who had married Desiderius' daughter Adalberga, once Paul's pupil. Several years later, when Charlemagne was in Rome, Paul sent verses to him begging for pardon and for the release of his brother. Charlemagne responded by freeing Paul's brother but insisted that Paul become a member of his court at Aachen, where he took part in the Frankish king's palace school, along with the scholars Alcuin and Einhard, meeting with the king for learned discussions.

In 786 Paul returned to Italy with Charlemagne, settling at the abbey of Montecassino, where he spent the rest of his life and wrote his history. Based on written sources and on oral tradition, which would otherwise have been lost, it covers the history of the Lombards to 744. His other works include a history of the bishops of Metz, a collection of homilies for the ecclesiastical year, a commentary on the Rule of St. Benedict, and another history—*Historia Romana*.

Paul THE HERMIT, SAINT: *see* Paul of Thebes, Saint.

Paul, Acts of, one of the earliest of a series of pseudepigraphal (noncanonical) New Testament writings known collectively as the Apocryphal Acts. Probably written about AD 160–180, the *Acts of Paul* is an account of the Apostle Paul's travels and teachings. It includes, among others, an episode reminiscent of the Greek fable of Androcles and the lion, in which Paul escapes from the wild beasts in the arena at Ephesus by recognizing a lion he had baptized earlier.

The *Acts of Paul* was first mentioned by Tertullian (AD 160–230), who found the book heretical because it encouraged women to preach and baptize. Tertullian related that the book had been written by a presbyter of a church in Asia who claimed to have written "out of love of Paul," and who was expelled from his church office. Despite the seemingly anti-Pauline endorsement of female ministry, the author did conform to doctrinal orthodoxy regarding continence and the Resurrection by establishing a close relationship between sexual purity and salvation. The author opposed the moral laxity of heretical Gnostic sects and attacked their denial of Christ's Incarnation and Resurrection.

Little was known of the actual contents of the *Acts of Paul* until the publication in 1904 of a 6th-century Coptic manuscript indicating that the complete apocryphon comprised three different texts: the *Acts of Paul and Thecla;* a letter from the Corinthians to Paul and his reply, commonly styled *III Corinthians;* and the *Martyrdom of Paul.* Each of these had previously been discovered as a separate writing in a number of manuscripts and in a variety of publications. The subsequent publication in 1936 of a substantial Greek fragment corroborated the theory that these texts share a common authorship and originally constituted a single work, the *Acts of Paul.*

Paul, Alice (b. Jan. 11, 1885, Moorestown, N.J., U.S.—d. July 9, 1977, Moorestown), American woman suffrage leader who introduced the first equal rights amendment campaign.

While doing graduate work in England in about 1908, Paul joined the British suffragettes, participating in militant actions and receiving three jail sentences. Returning to the United States, she advocated the use of militant tactics to publicize the need for a federal woman suffrage amendment to the U.S. Constitution. As chairman of the Congressional Union for Woman Suffrage (founded in 1913), later the National Woman's Party, Paul organized marches, White House protests, and rallies. After the suffrage amendment was ratified in 1920, she urged the enactment of a federal equal rights amendment to the Constitution. She wrote the "Lucretia Mott" amendment in 1923.

In 1938 Paul organized the World Party for Equal Rights for Women, known as the World Women's Party. She also successfully lobbied for references to sex equality in the preamble to the United Nations charter and in the 1964 U.S. Civil Rights Act.

Paul, Jean: *see* Jean Paul.

Paul, Lewis (d. 1759, London, Eng.), English inventor who devised the first power spinning machine, in cooperation with John Wyatt.

Paul was the son of a Huguenot refugee, at whose death he became a ward of the Earl of Shaftesbury. He began working with Wyatt about 1730, and they patented their machine in 1738. The idea was evidently Paul's, and the skilled Wyatt translated it into working machinery. The spinning machine operated by drawing cotton or wool through pairs of successively faster rollers. This spinning machine was eventually superseded by Richard Arkwright's water frame. Paul also patented a carding machine in 1748.

Paul, Wolfgang (b. Aug. 10, 1913, Lorenzkirch, Ger.), German physicist who shared one-half of the Nobel Prize for Physics in 1989 with the German physicist Hans G. Dehmelt. (The other half of the prize was awarded to the American physicist Norman F. Ramsey.) Paul received his share of the prize for his development of the Paul trap—an electromagnetic device that captures ions (electrically charged atoms) and holds them long enough for their properties to be accurately measured.

Paul studied at technological institutes in Munich and Berlin and received a doctoral degree in physics from the Technical University in Berlin in 1939. He became a lecturer at the University of Göttingen in 1944 and was a full professor there from 1950. From 1952 he also taught at the University of Bonn.

The Paul trap, which he developed in the 1950s, used a radio-frequency current to maintain an alternating electric field that isolates and confines charged particles and atoms in a small space. The Paul trap allowed physicists to study atomic properties and test physical theories with high degrees of precision and became an important tool in modern spectroscopy. Paul also invented a way of separating ions of different masses and storing them in the Paul trap, using a principle that was subsequently widely applied in modern spectrometers.

Paul-Boncour, Joseph (b. Aug. 4, 1873, Saint-Aignan, Fr.—d. March 28, 1972, Paris), French leftist politician who served as minister of labour, of war, and of foreign affairs and who for four years was France's permanent representative to the League of Nations.

Paul-Boncour
H. Roger-Viollet—Harlingue

After receiving a degree in law from the University of Paris, Paul-Boncour practiced law, organized the legal council of the Bourses du Travail (syndicalist workers' associations), and from 1898 to 1902 was private secretary to Premier Pierre Waldeck-Rousseau. He was elected deputy from his native district in 1909 and served as minister of labour in 1911. He lost his seat in the Chamber in 1914 but was returned to the National Assembly after World War I as a Socialist. In 1931, however, he resigned from the Socialist Party and formed a new group, the Union Socialiste Républicaine, composed of independents. That same year he was elected senator and served until the establishment of Marshal Philippe Pétain's Vichy government in 1940.

Paul-Boncour was permanent delegate to the League of Nations from 1932 to 1936, minister of war in the 1932 Cabinet of Édouard Herriot, premier from December 1932 to January 1933, and minister of foreign affairs from December 1932 to January 1934, from January to June 1936, and in March 1938. In July 1940 he voted against granting constitutional powers to Marshal Pétain and recommended continuation of the war against Germany from Algiers. A member of the Consultative Assembly in 1944, he led the French delegation at San Francisco and signed the United Nations Charter on behalf of France. He was a senator from 1946 to 1948.

Paul-Boncour's books *Le Féderalisme économique* (1900; "Economic Federalism") and *Les Syndicats de fonctionnaires* (1906; "Unions of Civil Servants") showed his interest in trade unionism. He is also the author of *Art et démocratie* (1912; "Art and Democracy") and *Entre deux guerres: souvenirs sur la III^e République* (1946; *Recollections of the Third Republic,* 1958).

Paula (Malta): *see* Paola.

Paulding, James Kirke (b. Aug. 22, 1778, Dutchess County, N.Y., U.S.—d. April 6, 1860, Hyde Park, N.Y.), dramatist, novelist, and public official chiefly remembered for his early advocacy and use of native American material in literature.

At 18 he went to New York City, where he formed a lasting friendship with the Irving brothers. This association aroused his enthusiasm for literature, and he, with William and Washington Irving, founded the *Salmagundi* (1807–08), a periodical consisting mainly of light satires on local subjects. The outbreak of hostilities between England and America encouraged the assertion of Paulding's nationalism. He satirized England's conduct toward America during the war in *The Diverting History of John Bull and Brother Jonathan* (1812) and *The Lay of the Scottish Fiddle: A Tale of Havre de Grace* (1813), the latter a burlesque of Sir Walter Scott. The same spirit of nationalism found expression in two later satires also directed at the British: *A Sketch of Old England: by a New England Man* (1822) and *John Bull in America* (1825).

The advantages and hardships of western migration are the theme of "The Backwoodsman" (1818), a poem written to call the American author home in his search of literary themes. Novels such as *Koningsmarke, the Long Finne, a Story of the New World* (1823), *Westward Ho!* (1832), and *The Old Continental, or, the Price of Liberty* (1846) represent Paulding's attempts to employ the American scene in fiction. His popular play, *The Lion of the West* (first performed 1831; first published 1954), introduced frontier humour to the stage by depicting a character resembling Davy Crockett and helped during the 1830s to contribute to the growing legend of Crockett. His *Life of Washington* (1835) illustrates Paulding's Americanism. Plain, even at times vulgar in style, he yet possessed a playful irony that he shared with the New York writers of his day. He held several public posts in New York and from 1838 to 1841 served as secretary of the navy. His literary work, however, overshadows his routine labours as a government official.

Pauli, Wolfgang (b. April 25, 1900, Vienna—d. Dec. 15, 1958, Zürich), Austrian-born U.S. winner of the Nobel Prize for Physics in 1945 for his discovery (1925) of the Pauli exclusion principle, which states that in an atom no two electrons can have the same energy. This principle clearly relates the quantum theory to the observed properties of atoms.

When he was 20, Pauli wrote a 200-page encyclopaedia article on the theory of relativity. He was appointed a lecturer at the University of Hamburg in 1923, and the following year he proposed that a fourth quantum number, which may take on the numerical values $+1/2$ or $-1/2$, was necessary to specify electron energy states. It was later found that the two values represent the two possible directions of spin for fermions. In 1925 he introduced his exclusion principle, which immediately made clear the reason for the structure of the periodic table of the elements.

In 1928 Pauli became professor of theoretical physics at the Federal Institute of Technology, Zürich. Under his direction the institution became a great centre of research in theoretical physics during the years preceding World War II. In the late 1920s it was observed that when a beta particle (electron) is emitted from an atomic nucleus, there is generally some energy and momentum missing, a grave violation of the laws of conservation. Rather than allow these laws to be discarded, Pauli proposed in 1931 that the missing energy and momentum is carried away from the nucleus by some particle (later named the neutrino by Enrico Fermi) that is uncharged and has little or no mass and had gone unnoticed because it interacts with matter so seldom that it is nearly impossible to detect. The neutrino was finally observed in 1956.

In 1940 Pauli was appointed to the chair of theoretical physics at the Institute for Advanced Study, Princeton, N.J., and in 1946 he became a naturalized citizen of the United States. Following World War II he returned to Zürich.

Pauli exclusion principle, assertion that no two electrons in an atom can be at the same time in the same state or configuration, proposed (1925) by the Austrian physicist Wolfgang Pauli to account for the observed patterns of light emission from atoms. The exclusion principle subsequently has been generalized to include a whole class of particles of which the electron is only one member.

Subatomic particles fall into two classes depending upon their statistical behaviour. Those particles to which the Pauli exclusion principle applies are called fermions. When in a closed system, such as an atom for electrons or a nucleus for protons and neutrons, fermions are distributed so that a given state is occupied by only one at a time.

Particles obeying the exclusion principle have a characteristic value of spin, or intrinsic angular momentum; their spin is always some odd whole-number multiple of one-half. In the modern view of atoms, the space surrounding the dense nucleus may be thought of as consisting of orbitals, or regions, each of which comprises only two distinct states. The Pauli exclusion principle indicates that, if one of these states is occupied by an electron of spin one-half, the other may be occupied only by an electron of opposite spin, or spin negative one-half. An orbital occupied by a pair of electrons of opposite spin is filled: no more electrons may enter it until one of the pair vacates the orbital. An alternative version of the exclusion principle as applied to atomic electrons states that no two electrons can have the same values of all four quantum numbers.

Paulician, member of a dualistic Christian sect that originated in Armenia in the mid-7th century. It was influenced most directly by the dualism of Marcionism, a Gnostic movement in early Christianity, and of Manichaeism, a Gnostic religion founded in the 3rd century by the Persian prophet Mani. The identity of the Paul after whom the Paulicians are called is disputed.

The fundamental doctrine of the Paulicians was that there are two principles, an evil God and a good God; the former is the creator and ruler of this world, the latter of the world to come. From this they deduced that Jesus was not truly the son of Mary, because the good God could not have taken flesh and become man. They especially honoured the Gospel According to Luke and the Letters of St. Paul, rejecting the Old Testament and the Letters of St. Peter. They rejected also the sacraments, the worship, and the hierarchy of the established church.

The founder of the Paulicians seems to have been an Armenian, Constantine, who took the additional name of Silvanus (Silas; one of St. Paul's companions). He gave a more distinctively Christian character to the Manichaeism that at the time was prevalent in the Asian provinces of the Byzantine Empire. The sect seems to have started a widespread political and military rebellion within the empire shortly after its appearance. Between 668 and 698 Constantine III and Justinian II sent two expeditions to repress it. Constantine (Silvanus) was stoned to death, and his successor, Simeon (Titus), was burned alive.

In the early 9th century Paulicianism was revived. It expanded into Cilicia and Asia Minor under Sergius (Tychicus), who made it strong enough to survive the persecution and massacre instigated by the emperor Michael I and the empress Theodora. The number and power of the Paulicians were greatest under Karbeas and Chrysocheir, the leaders in the third quarter of the 9th century. An expedition sent by Basil I in 872 broke their military power, but they survived in Asia at least until the Crusades. After the 9th century their importance lay chiefly in Thrace, where many Paulicians had been forcibly located to serve as a frontier force against the Bulgarians.

Paulician doctrines were disseminated among the Macedonians, Bulgarians, and Greeks, especially among the peasants, and it seems that they contributed to the development of the doctrines and practices of the Bogomils, another neo-Manichaean sect, who first appeared in Macedonia in the early 10th century.

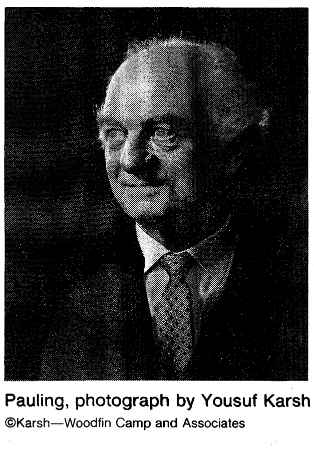
Pauling, Linus (Carl) (b. Feb. 28, 1901, Portland, Ore., U.S.), U.S. chemist who applied quantum mechanics to the study of molecular structures, particularly in connection with chemical bonding. Pauling received two Nobel Prizes, one for Chemistry in 1954 and another for Peace in 1962 (the latter in recognition of his efforts on behalf of the in-



Pauling, photograph by Yousuf Karsh

ternational control of nuclear weapons and his campaigns against nuclear testing). In 1972 he received the International Lenin Peace Prize.

Education. Pauling was the son of Herman William Pauling, a pharmacist, and Lucy Isabelle (Darling). He received his B.S. in chemical engineering at Oregon State Agricultural College (now Oregon State University), Corvallis, in 1922, then became a graduate assistant at California Institute of Technology, Pasadena, where he took his Ph.D. in physical chemistry in 1925. For two years he was a postdoctoral fellow in Europe, working in the laboratories of such noted scientists as Arnold Sommerfeld in Munich, Niels Bohr in Copenhagen, Erwin Schrödinger in Zürich, and Sir William Henry Bragg in London. He returned to California Institute of Technology as assistant professor of chemistry in 1927, becoming full professor in 1931 and serving as director of the Gates and Crellin Laboratories of Chemistry between 1936 and 1958.

Scientific achievements. Pauling's chemical work dealt with the many aspects of molecular structure, ranging from simple molecules to proteins. He was among the first to apply the principles of quantum mechanics to the structure of molecules and effectively utilized X-ray diffraction (the alteration of the straight course of X-rays by the interference of an atom or group of atoms), electron diffraction (interference with the course of electrons by atoms), magnetic effects, and the heat involved in forming chemical compounds for the calculation of interatomic distances and the angles between chemical bonds. He was successful in relating the distances and angles between chemical bonds to molecular characteristics and to interaction between molecules.

In order to account for the equivalency of the four bonds around the carbon atom, he introduced the concept of hybrid orbitals, in which electron orbits are moved from their original positions by mutual repulsion. Pauling also recognized the presence of hybrid orbitals in the coordination of ions or groups of ions in a definite geometric arrangement about a central ion. His theory of directed (positive and negative) valence (the capacity of an atom to combine with other atoms) was an outgrowth of his early work, as was the concept of the partial ionic character of covalent bonds—*i.e.,* atoms sharing electrons. His empirical concept of electronegativity, the power of attraction for electrons in a covalent bond, was useful in further clarification of these problems. In the case of compounds the molecules of which cannot be represented unambiguously by a single structure, he introduced the concept of resonance hybrids whereby the true structure of the molecule is regarded as an intermediate state between two or more depictable structures. The resonance theory came under heavy but unsuccessful attack in the U.S.S.R. in 1951 when doctrinaire scientists of the Communist Party argued that it conflicted with dialectical materialist principles. The ideas on bonding were developed serially in his numerous journal articles during his early career and were consolidated in his book, *The Nature of the Chemical Bond, and the Structure of Molecules and Crystals* (1939), which grew out of lectures he gave in 1937 and 1938. The textbook proved to be one of the most influential of the century.

In 1934 Pauling began to apply his knowledge of molecular structure to the complex molecules of living tissues, particularly in connection with proteins. His studies of the magnetic susceptibility (the ease with which something can be magnetized) of the hemoglobin (the red protein in the red cells of the blood) molecule during oxygenation inaugurated a succession of studies that led to a theory of native proteins (active proteins as found in living organisms), denatured proteins (ones that through heat or chemical action have broken some of their bonds), and coagulated (solidified) proteins. He became interested in proteins involved in immunological reactions and in 1940, with a German-born biologist, Max Delbrück, developed a concept of molecular complementarity in antibody-antigen reactions (in which the production of antibodies is stimulated in an organism when foreign substances called antigens are introduced). He recognized the importance of hydrogen bonding in protein structure and in interactions between macromolecules (extremely large molecules usually built from repeating groups of smaller molecules). His work with a U.S. chemist, Robert B. Corey, on the structure of amino acids and polypeptides (the chief components of proteins) led him to recognize that certain proteins have helical structures.

Late in the 1940s Pauling became interested in sickle-cell anemia when he learned that the red blood corpuscles show their abnormal crescent shape only in venous blood. Intuitively, he reasoned that the cause of the cell deformity must lie in a genetic defect associated with hemoglobin formation. His studies showed that the sickling effect was nullified by the presence of oxygen in the arterial blood.

Pauling also developed a molecular model for the explanation of anesthesia that was made public in 1961, introduced ideas toward the understanding of memory processes, and in 1965 postulated a theory of the atomic nucleus that had certain advantages over other models. His scientific career has been characterized by the application of intuitive guesses aided by a phenomenal memory of chemical facts. Pauling refers to this as the stochastic method (from the Greek "apt to divine the truth by conjecture").

Campaign for nuclear weapons disarmament. Following the development of nuclear weapons, Pauling became deeply concerned about the possible hazards of exposure to radiation associated with weapons testing. He expressed his view in his book *No More War!* (1958). In January 1958 he brought to the United Nations a petition signed by 11,021 scientists from all over the world urging an end to nuclear weapons tests. In 1963 he left the California Institute of Technology to become a staff member of the Center for the Study of Democratic Institutions at Santa Barbara, where he largely devoted himself to the study of problems of peace and war. No official reason was given for the award of the Peace Prize for 1962 to Pauling in 1963, but it is widely assumed that he received it for his efforts in behalf of the test ban treaty that was concluded in the same year. His pacifist views estranged him from many scientists with whom he had been closely associated during the years of World War II, when he had served as a civilian with the Office of Scientific Research and Development. Though he was equally opposed to nuclear testing by the United States and the Soviet Union, his loyalty to the U.S. was questioned in some conservative political circles.

In 1969 he resigned a position he had held for two years with the University of California, Santa Barbara, in protest against the educational policies of the Governor of California. He joined the chemistry department of Stanford University in California, where he was named professor emeritus in 1974. In addition to winning two Nobel Prizes, Pauling was widely honoured in scientific and pacifist circles. He held guest appointments in many other universities, both at home and abroad. His success as a scientist was based on his capacity for quick insight into new problems, his ability to recognize interrelationships, and the courage to put forward unorthodox ideas. While his concepts were not always correct, they always stimulated discussion and investigation. (A.J.I.)

BIBLIOGRAPHY. Pauling's scientific work is stressed by J.H. Sturdivant in A. Rich and N. Davidson (eds.), *Structural Chemistry and Molecular Biology,* pp. 3–9 (1968). This commemorative volume prepared for Pauling's 65th birthday also has a complete bibliography of his scientific papers and his books. For his Nobel Awards, see *Le prix Nobel en 1954,* pp. 29–32, 66–67 (1955), and the address "Modern Structural Chemistry," pp. 91–99; and *Le prix Nobel en 1963,* pp. 70–82, 113–114 (1964), and the address "Science and Peace," pp. 296–312.

Paulinus, SAINT (b. 584?, Rome—d. 644, Rochester, Kent, Eng.; feast day October 10), Italian missionary who converted Northumbria to Christianity, became the first bishop of York, and was later made archbishop of Rochester.

In 601 Paulinus was sent with SS. Mellitus (later first bishop of London) and Justus (later first bishop of Rochester) to England by Pope St. Gregory I the Great to assist Archbishop St. Augustine of Canterbury in his mission of converting England to Christianity. Paulinus was consecrated bishop at Kent (625) by Justus (then fourth archbishop of Canterbury) and escorted the daughter of King Aethelberht (Ethelbert) of Kent to the Northumbrian king Edwin. Paulinus converted and baptized Edwin (627), who made him first bishop of York, after which Paulinus' missions spread throughout Northumbria. When in 632 Edwin was slain by the Anglo-Saxon kings Caedwalla and Penda, Paulinus fled to Kent, where he became bishop of Rochester. He became archbishop in 634, when he received the pallium (*i.e.,* symbol of metropolitan jurisdiction) from Pope Honorius I.

Paulinus OF NOLA, SAINT, byname of MEROPIUS PONTIUS ANICIUS PAULINUS (b. AD 353, Burdigala, Gaul—d. June 22, 431, Nola, Italy; feast day June 22), bishop of Nola and one of the most important Christian Latin poets of his time.

Paulinus became successively a Roman senator, consul, and governor of Campania, a region of southern Italy. Returning to Aquitaine he married and in 389 retired with his wife to Spain. The death of their only child, in 392, influenced them to sell their possessions in Gaul and Spain. In 395 Paulinus was ordained priest and with his wife settled at Nola to live an ascetic life devoted to charity.

Paulinus' act of renunciation caused his old master, the Latin poet and rhetorician Ausonius, to write reproaches in verse, to which Paulinus replied in poetical epistles. Paulinus' style generally echoes that of such classical authors as Virgil, Horace, and Ovid. His poems (395–407) on the feast day of St. Felix of Nola are particularly charming and are regarded as the chief source of Felix' life. Paulinus also promoted the saint's cult and built a basilica at Nola dedicated to him.

Some 50 of his extant letters correspond with famous contemporaries, including SS. Augustine and Jerome and the celebrated ascetic Sulpicius Severus. Paulinus' prose style is often rhetorical and exuberant: he could describe in dignified language his cold reception by Pope St. Siricius, or satirize the ignorance of those who could not understand the life of renunciation. About 409 Paulinus was consecrated bishop of Nola. P. Fabre's *Essai sur la chronologie de l'oeuvre de S. Paulin de Nole* (1948; "Essay on the Chronology of the Works of St. Paulinus of Nola") was followed by his *S. Paulin de Nole et l'amitié chrétienne* (1949; "St. Paulinus of Nola and Christian Friendship").

Paullus Macedonicus, Lucius Aemilius, Paullus also spelled PAULUS (b. *c.* 229 BC—d. 160), Roman general whose victory over the Macedonians at Pydna ended the Third Macedonian War (171–168 BC).

Paullus' father, a consul of the same name, had been killed fighting the Carthaginians at Cannae in 216. Praetor in 191 and consul in 182, Paullus campaigned against the Lusitanians in Spain (191–189) and the Ingauni in Liguria (181). As consul again in 168, he decisively defeated the Macedonian king Perseus at Pydna (June 22). Paullus carried out the settlement with Macedonia and Greece, and, on orders from the Senate, he sacked the cities of Epirus. He was censor in 164. Paullus was the father of Scipio Aemilianus.

Paulo Afonso, city, northeastern Bahia *estado* ("state"), northeastern Brazil, on the São Francisco River, at the site of the Paulo Afonso Falls and Paulo Afonso National Park. Made the seat of a municipality in 1958, Paulo Afonso is the transportation and commercial centre for its agricultural hinterland. It is accessible by highway from Salvador, the state capital, about 310 miles (500 km) south, and from neighbouring communities in Bahia, Alagoas, and Pernambuco *estados.* The airport has flights to Recife and Salvador. Pop. (1980 prelim.) 62,066.

Paulo Afonso Falls, Portuguese CACHOEIRA DE PAULO AFONSO, series of rapids and three cataracts in northeastern Brazil on the São Francisco River along the Bahia-Alagoas border. Lying 190 miles (305 km) from the river's mouth, the falls have a total height of 275

feet (84 m) and a width of less than 60 feet (18 m). With an average water discharge of 100,000 cubic feet (3,000 cubic m) per second, the falls are the site of a large hydroelectric station. The falls form the central feature of Paulo Afonso National Park.

Paulos (Greek personal name): *see under* Paul.

Paulownia Sun, Order of the, Japanese TOKWA DAIJUSHO, exclusive Japanese order, founded in 1888 by Emperor Meiji and awarded for outstanding civil or military merit. The order, awarded to males only, is seldom bestowed on anyone below the rank of admiral, general, or ambassador. Actually, this order, consisting of one class, is the highest grade of another Japanese order, the Order of the Rising Sun.

The badge, suspended from a green paulownia flower, consists of a white enamel cross between the arms of which are the green leaves and mauve flowers of the paulownia tree, incorporated into the imperial Japanese emblem. Superimposed on the cross is a red enamel sun with rays of white and gold. The centre medallion is a polished garnet. *See also* Rising Sun, Order of the.

Paulus (Latin personal name): *see under* Paul, except as below.

Paulus, Friedrich von (b. Sept. 23, 1890, Breitenau, Ger. [now in Austria]—d. Feb. 1, 1957, Dresden, E.Ger.), German field marshal on the Eastern Front, whose capture at Stalingrad (now Volgograd) in early 1943 with his entire army became one of the turning points of World War II and contributed substantially to Germany's defeat.

After serving in World War I and as a staff officer early in World War II, Paulus became deputy chief of the German General Staff (1940) and helped draft plans for the invasion of the Soviet Union. As commander of the 6th Army from early 1942, he led the drive on Stalingrad. Surrounded in the city by a Soviet counteroffensive beginning Nov. 19, 1942, the 6th Army surrendered on Feb. 2, 1943. The Stalingrad disaster put an end to Germany's offensive role in the Soviet Union. A tremendous blow to morale, it also deprived Germany of about 300,000 irreplaceable trained men. Captured by Soviet forces, Paulus agitated against Adolf Hitler among German prisoners of war and later testified at the International Military Tribunal at Nürnberg. After his release in 1953, he settled in East Germany.

Paulus Helie, also spelled PAULUS ELIAE, or PAULUS ELIESEN: *see* Helgesen, Paul.

Paulus Macedonicus, Lucius Aemilius: *see* Paullus Macedonicus, Lucius Aemilius.

Paumotu (French Polynesia): *see* Tuamotu Archipelago.

pauraque, also spelled PARAUQUE, also called CUEJO (*Nyctidromus albicollis*), nocturnal bird of brushlands from southern Texas to northern Argentina. It is a relative of the nightjar (*q.v.*), belonging to the family Caprimulgidae. The pauraque is about 30 cm (about 12 inches) long, with rounded wings and a longish tail. It is mottled brown with a bold white bar on each wing; in the male the outer tail feathers are white.

pauropod, any member of the class Pauropoda (phylum Arthropoda), a group of small, terrestrial invertebrates distributed worldwide. The approximately 380 known species are found under dead leaves, stones, and rotten wood. They feed chiefly on fungi and decaying organic matter. Pauropods range in length from 0.5 to 2 mm (0.02 to 0.08 inch). The pauropod head is tiny, with large, branched antennae; deep-set mandibles; and two pairs of maxillae (accessory jaws). There is also a pair of vibration-sensitive organs (pseudoculi) instead of eyes. The body consists of 11 partially fused segments from which project nine pairs of legs, the first pair reduced and five jointed. Respiration occurs at the body surface in pauropods. Their reproductive system is equally simple; the sexes are separate.

Pausanias (d. probably between 470 and 465 BC, Sparta [Greece]), Spartan commander during the Greco-Persian Wars who was accused of treasonous dealings with the enemy.

A member of the Agiad royal family, Pausanias was the son of King Cleombrotus I and nephew of King Leonidas. He became regent for Leonidas' son after the father was killed at Thermopylae (480). Pausanias commanded the allied Greek army that defeated the Persians at Plataea (479), and he led the Greeks in the capture of Byzantium (478).

While Pausanias was at Byzantium, his arrogance and his adoption of Persian clothing and manners offended the allies and raised suspicions of disloyalty. Recalled to Sparta, he was tried and acquitted of the charge of treason but was not restored to his command. When the Athenians separated from the Spartans to form the Delian League, Pausanias returned to Byzantium privately and held the city until expelled by the Athenians (probably in 477). Later, suspected of plotting to seize power in Sparta by instigating a helot uprising, he took refuge in the Temple of Athena of the Brazen House to escape arrest. The Spartans walled in the sanctuary and starved him to death.

Although Herodotus doubted that Pausanias had colluded with the Persians, Thucydides, writing years after the events, was certain of his guilt. It is conceivable that the Spartans had made Pausanias a scapegoat.

Pausanias (fl. AD 143–176; b. Lydia), Greek traveler and geographer whose *Description of Greece* is an invaluable guide to ancient ruins.

Before visiting Greece, Pausanias had traveled widely in Asia Minor, Syria, Palestine, Egypt, Macedonia, Epirus (now in Greece and Albania), and parts of Italy. His *Description* takes the form of a tour of Greece starting from Attica. It is divided into 10 books; the first book seems to have been completed after 143, but before 161. No event after 176 is mentioned in the work.

His account of each important city begins with a sketch of its history; his descriptive narration follows a topographical order. He gives a few glimpses into the daily life, ceremonial rites, and superstitious customs of the inhabitants and frequently introduces legend and folklore.

Works of art are his major concern: inspired by the ancient glories of Greece, Pausanias is most at home in describing the religious art and architecture of Olympia and Delphi. At Athens he is intrigued by pictures, portraits, and inscriptions recording the laws of Solon; on the Acropolis, the great bronze statue of Athena; and, outside the city, the monuments of famous men and of Athenians fallen in battle. The accuracy of his descriptions has been proved by the remains of buildings in all parts of Greece.

The topographical part of his work shows his fondness for the wonders of nature: the signs that herald the approach of an earthquake; the tides; the icebound seas of the north; and the noonday sun, which at the summer solstice casts no shadow at Syene (Aswān), Egypt.

The famed anthropologist and classical scholar Sir James Frazer said of Pausanias: "without him the ruins of Greece would for the most part be a labyrinth without a clue, a riddle without an answer."

Paustovsky, Konstantin Georgiyevich (b. May 31 [May 19, Old Style], 1892, Moscow, Russia [now in Russian S.F.S.R.]—d. July 14, 1968, Moscow), Soviet fiction writer best known for his short stories, which carried the pre-Revolutionary romantic tradition into the Soviet period.

A descendant of Ukrainian Cossacks, Paustovsky attended school in Kiev, St. Petersburg (now Leningrad), and Odessa. Before he began to write, he worked at various jobs; he also traveled a good deal, both in the Soviet Union and abroad.

He wrote novels, novellas, short stories, and historical and biographical fiction. The short novels *Kara-Bugaz* (1932) and *Kolkhida* (1934) brought him wide popularity. His works reveal a lyrical interest in nature and an intense curiosity about people; he has been described as one of the best craftsmen among the writers of the 1920s and '30s. His main work, *Rasskaz zhizni* (1946–62; *The Story of a Life*), published in several volumes, is an autobiographical cycle of reminiscences.

Because of his age and prestige, Paustovsky was able in the 1950s and '60s to act as defender and protector of other Soviet writers who had been subjected to various degrees of official criticism.

pavane (probably from Italian *padovana,* "Paduan"), majestic processional dance of the 16th- and 17th-century European aristocracy. Until about 1650 the pavane opened ceremonial balls and was used as a display of elegant dress. Adapted from the basse danse, an earlier court dance, the pavane presumably traveled from Italy to France and England by way of Spain; in southern Spain it was performed in churches on solemn occasions.

Pavane, "The Dance in the Garden" illumination from the *Roman de la rose*, Toulouse, early 16th century; in the British Library (Harley MS 4425, fol. 14v)
Reproduced by permission of the British Library

The pavane's basic movement, to music in $\frac{2}{2}$ or $\frac{4}{4}$ time, consisted of forward and backward steps; the dancers rose onto the balls of their feet and swayed from side to side. A column of couples circled the ballroom, and the dancers occasionally sang. By about 1600, livelier steps like the *fleuret* (a brief lift of each foot before a step) made the dance less pompous. The pavane was customarily followed by its afterdance, the vigorous galliard. The *passamezzo* was a livelier Italian contemporary of the pavane.

The paired dances, pavane and galliard, were a forerunner of the instrumental dance suites of the 17th century, and pavanes appear in a few early suites—*e.g.*, the *padouanas* in some suites of Johann Hermann Schein. Later composers occasionally used the pavane as an instrumental piece; *e.g.*, Fauré (*Pavane for Orchestra*) and Ravel (*Pavane for a Dead Princess*).

Pavao (Serbo-Croatian personal name): *see under* Paul.

Pavarotti, Luciano (b. Oct. 12, 1935, Modena, Italy), Italian operatic lyric tenor, noted for his mastery of the highest notes of a tenor's range.

Pavarotti graduated from a teaching institute in Modena (1955) and then taught elementary school for two years. He studied opera privately, mostly in Mantua. After winning the Concorso Internationale, a singing competition, he made his professional operatic debut in Reggio Emilia, Italy, in 1961. He then played in opera houses throughout Europe and Australia. In 1968 he made his debut at the Metropolitan Opera House, New York City, and from 1971 was a regular performer there. Pavarotti became known to a wider public than opera connoisseurs; his concerts, recordings, and television appearances—which provided ample opportunity to display his ebullient personality—gained him a wide popular following.

He is considered one of the finest *bel canto* opera singers of recent times. Even in the highest register, his voice is noted for its purity of tone. His most notable operatic roles include the duke in *Rigoletto*, Tonio in *La Fille du Régiment* (with its demanding sequence of high C's), Arturo in *I Puritani*, and Radamès in *Aida*.

Pavel (Russian personal name): *see under* Paul.

Pavelić, Ante (b. July 14, 1889, Bradina, Bosnia—d. Dec. 28, 1959, Madrid), Croatian fascist leader and revolutionist who headed a Croatian state subservient to Germany and Italy during World War II.

As a practicing lawyer in Zagreb, Pavelić entered the nationalist Croatian Party of Rights. In 1920 he was elected city and county alderman at Zagreb. From 1927 to 1929 he was a representative in the Yugoslav Skupština (parliament), in which he vigorously opposed centralization of the country. When King Alexander assumed dictatorial power (1929), Pavelić fled to Italy and organized a group of Croatian terrorists known as the Ustaše (*q.v.*). They achieved their greatest success in organizing the assassination of King Alexander in Marseille on Oct. 9, 1934.

After the conquest of Yugoslavia by Axis forces in April 1941, Pavelić was installed as head (*poglavnik*) of the Independent State of Croatia, which included Bosnia and part of Dalmatia. Under the Ustaše regime, whose slogan was "Za dom Spremni" ("Ready for the Fatherland"), a brutal program of oppression was conducted against the Orthodox Serbs and the Jews. With the defeat of his German sponsors in May 1945, Pavelić left Croatia and went into hiding in Austria and Italy, finally escaping to Argentina in 1948. He survived an assassination attempt in 1957 but soon fled to Paraguay; he later settled in Spain.

pavement, in civil engineering, durable surfacing of a road, airstrip, or similar area. The primary function of a pavement is to transmit loads to the sub-base and underlying soil. Modern flexible pavements contain sand and gravel or crushed stone compacted with a binder of bituminous material, such as asphalt, tar, or asphaltic oil. Such a pavement has enough plasticity to absorb shock. Rigid pavements are made of concrete, composed of coarse and fine aggregate and portland cement, and usually reinforced with steel rod or mesh.

Pavese, Cesare (b. Sept. 9, 1908, Santo Stefano Belbo, Italy—d. Aug. 27, 1950, Turin), Italian poet, critic, novelist, and translator, who introduced many modern U.S. and English writers to Italy.

Pavese
Arnoldo Mondadori Editore

Born in a small town in which his father, an official, owned property, he moved with his family to Turin, where he attended high school and the university. Denied an outlet for his creative powers by Fascist control of literature, Pavese translated many 20th-century U.S. writers in the 1930s and '40s: Sherwood Anderson, Gertrude Stein, John Steinbeck, John Dos Passos, Ernest Hemingway, and William Faulkner; a 19th-century writer who influenced him profoundly, Herman Melville (one of his first translations was of *Moby Dick*); and the Irish novelist James Joyce. He also published criticism, posthumously collected in *La letteratura americana e altri saggi* (1951; *American Literature, Essays and Opinions,* 1970). His work probably did more to foster the reading and appreciation of U.S. writers in Italy than that of any other single man.

A founder and, until his death, an editor of the publishing house of Einaudi, Pavese also edited the anti-Fascist review *La Cultura.* His work led to his arrest and imprisonment by the government in 1935, an experience later recalled in "Il carcere" (published in *Prima che il gallo canti,* 1949; in *The Political Prisoner,* 1955) and the novella *Il compagno* (1947; *The Comrade,* 1959). His first volume of lyric poetry, *Lavorare stanca* (1936; *Hard Labor,* 1976), followed his release from prison. An initial novella, *Paesi tuoi* (1941; *The Harvesters,* 1961), recalled, as many of his works do, the sacred places of childhood. Between 1943 and 1945 he lived with partisans of the anti-Fascist Resistance in the hills of Piedmont.

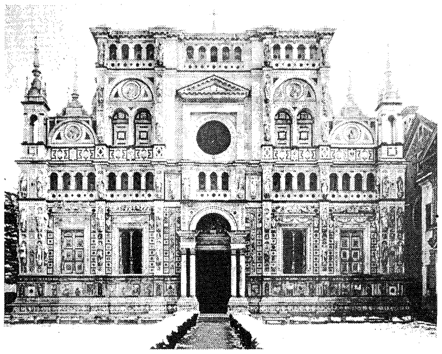
The bulk of Pavese's work, mostly short stories and novellas, appeared between the end of the war and his death. Partly through the influence of Melville, Pavese became preoccupied with myth, symbol, and archetype. One of his most striking books is *Dialoghi con Leucò* (1947; *Dialogues with Leucò,* 1965), poetically written conversations about the human condition. The novel considered his best, *La luna e i falò* (1950; *The Moon and the Bonfires,* 1950), is a bleak, yet compassionate story of a hero who tries to find himself by visiting the place in which he grew up. Several other works are notable, especially *La bella estate* (1949; in *The Political Prisoner,* 1955). Shortly after receiving the Strega Prize for it, Pavese committed suicide in a hotel room.

A Pavese Prize for literature was established in 1957, and some of Pavese's most significant work was published after his death, notably a volume of love lyrics that is thought to contain his best poetry, *Verrà la morte e avrà i tuoi occhi* (1951; "Death Will Stare at Me out of Your Eyes"); the story collection *Notte di festa* (1953; *Festival Night and Other Stories,* 1964); and the striking chronicle of his inner life, *Il mestiere de vivere, diario 1935–1950* (1952; London, *This Business of Living,* New York, *The Burning Brand: Diaries 1935–1950,* both 1961).

Many collections of Pavese's work have appeared, including *Racconti* (1960; *Told in Confidence and Other Stories,* 1971), a collection of much of his best fiction; *Poesie edite e inedite* (1962), edited by Italo Calvino; and *Lettere* (1966), which covers the period from 1924 to 1950. A poetry collection in English, *A Mania for Solitude, Selected Poems 1930–1950,* was published in 1969.

Pavia, Latin TICINUM, city, capital of Pavia province, Lombardia (Lombardy) region, northern Italy, on the left bank of the Ticino River, above its junction with the Po, 20 mi (32 km) south of Milan, with which it is connected by the Naviglio di Pavia (Pavia Canal).

Pavia originated as Ticinum, a settlement of the Papiria tribe, which was conquered by Rome *c.* 220 BC and later became a key point in the Roman defense of upper Italy. Pillaged by the barbarians Attila in AD 452 and Odoacer in 476, it later became an important centre of Gothic resistance against the Byzan-



The Certosa di Pavia, a Carthusian monastery completed in the 17th century, north of Pavia, Italy
SCALA—Art Resource/EB Inc.

tine Empire. From the 6th century, under the Lombards, it was a leading city of Italy, even after it fell to the Franks in 774. After a series of wars with Milan from the 11th to the 13th century, it was finally subdued by the viscounts of Milan and the Visconti of Brittany in the 14th century and became the political centre of Italy under Gian Galeazzo II Visconti, who founded the University of Pavia. The park of the Visconti Castle north of Pavia was the scene in 1525 of the defeat and capture of the French king Francis I by the Holy Roman emperor Charles V, aided by the Pavians and by Swiss militia; this battle demonstrated the superiority of firearms over cold steel and revolutionized military tactics. During the 18th century, Pavia was occupied by the Austrians, French, and Spaniards. It was one of the leading cities of Venetian Lombardy in the campaigns of the Risorgimento (movement for Italian political union) and was joined to the Kingdom of Italy in 1859.

The city still retains the ancient plan of the Roman *castrum* (fortified place), with main crossroads and a network of streets for *centuriae* (companies of soldiers). At its centre is the cathedral with its vast cupola; begun in 1488 by Cristoforo Rocchi and completed in 1898 according to his still extant model, the building has the form of a Latin cross. Among numerous other churches the most notable are S. Michele (1155, on the remains of a 7th-century foundation), the ancient Lombard cathedral where the medieval "kings of Italy" were crowned; S. Pietro in Ciel d'Oro (consecrated 1132), mentioned by the writers Dante, Petrarch, and Boccaccio, with a marble tomb (1362) containing the bones of St. Augustine of Hippo; S. Teodoro (12th century), decorated with 13th-century frescoes; and the Gothic churches of the Carmine (14th century) and S. Francesco (begun 1288). Secular buildings include the 12th- and 16th-century Broletto, or town hall; the Visconti Castle (1360–65) containing valuable artistic collections; and beautiful cloisters and palaces, one of which (Palazzo Malaspina) houses the Pinacoteca (art gallery). North of Pavia on the extreme boundary of the park of the Visconti is the Certosa di Pavia, a Carthusian monastery, the most celebrated religious monument in Lombardy; it was begun in 1396 by Bernardo da Venezia and continued by other notable artists in a transitional style between Gothic and Renaissance.

The University of Pavia, founded in 1361, is linked with the ancient law school, which dates back to 825. The colleges of Ghislieri and Borromeo, founded in the 16th century by Pope Pius V and St. Charles Borromeo, with the addition of the Cairoli, Castiglioni-Brugnatelli, Fraccaro, and Afro-Asiatic colleges, made Pavia the Oxford of Italy. It is particularly noted for the study of law, science, medicine, and surgery and has a central library of more than 400,000 volumes and 1,500 manuscripts.

A centre of communications, agriculture, and industry, the city manufactures sewing machines and has mechanical-engineering, ferrous-metalworking, chemical, and textile industries. Pop. (1983 est.) mun., 84,644; province 510,946.

Pavia, Battle of (Feb. 24, 1525), the decisive military engagement of the war in Italy between Francis I of France and the Habsburg emperor Charles V, in which the French army of 28,000 was virtually annihilated and Francis himself, commanding the French army, was taken prisoner. Francis was sent to Madrid, where, the following year, he concluded peace and surrendered French claims to Italy.

The French army had been besieging the city of Pavia, 20 miles (30 kilometres) south of Milan, when the 23,000-man Habsburg army under Fernando Francisco de Avalos, marchese di Pescara, arrived to aid the 6,000-man garrison and lift the siege. A hasty French attack was on the point of encircling Pescara when 1,500 Spanish arquebusiers opened fire on the rear of the French cavalry and riddled the ranks of the French and their allied Swiss infantry. The French attacks thereafter, made by German and Swiss mercenary infantry, were routed. The Spanish counterattack, supported by the Pavia garrison, which joined in the battle, completely swept the French from the field, destroying Francis' army as a fighting force in the process. Spanish hegemony in Italy dates from this battle.

Pavía y Lacy, Manuel (b. July 6, 1814, Granada, Spain—d. Oct. 22, 1896, Madrid), Spanish general whose defeat in the Spanish Revolution of 1868 helped bring about the deposition of Queen Isabella II.

Pavía was encouraged to enter the military by his father, an infantry colonel, and eventually was admitted to the elite Guards regiment. When Isabella became queen in 1833, he fought for her against her uncle Don Carlos in the First Carlist War (1833–39) and in 1840 he was made marqués de Novaliches. He emigrated to France in 1841 and on his return in 1843 took part in the overthrow of the government of Gen. Baldomero Espartero.

Pavía was named minister of war (1847) in the cabinet of the conservative Gen. Ramón Narváez. Afterward he was captain general of Catalonia, where he attempted to stimulate economic development and also conducted military operations against Carlist rebels. In 1853 he reluctantly accepted the post of captain general of the Philippines, where in the following year he crushed the revolt of José Cuesta.

In the revolution that deposed Isabella, Pavía attempted to halt the rebel army of Gen. Francisco Serrano y Domínguez by seizing a strategic bridge at Alcolea. His forces were repulsed at the bridge, and he was badly wounded. His defeat (Sept. 28, 1868) opened the way to Madrid, and the following day the Queen fled into exile.

Pavía emigrated at the accession of Amadeus as king of Spain (December 1870) but returned after the collapse of the First Republic and the restoration of Alfonso XII (December 1874). Pavía then regained his honours.

Pavía y Rodríguez de Alburquerque, Manuel (b. Aug. 2, 1827, Cádiz, Spain—d. Jan. 4, 1895, Madrid), Spanish general whose coup d'etat ended Spain's First Republic (1873–74).

In 1865 Pavía joined the staff of Gen. Juan Prim, whom he supported in the unsuccessful uprisings of 1866 and, after two years in exile, in the successful revolution of 1868 that deposed Isabella II (1833–68). After the abdication of Amadeus (February 1873) and the proclamation of the First Republic, Pavía suppressed insurrection in the south of Spain and restored the authority of the central government. On three occasions during 1873 he served as captain general of Madrid.

Pavía supported Pres. Emilio Castelar y Ripoll from September 1873 to Jan. 3, 1874, when Castelar was defeated in the Cortes (National Assembly) and was forced to resign. Castelar had governed firmly and had the confidence of the army. Believing the return to power of more radical republicans would harm both the nation and the army, especially his own artillery corps, Pavía forcibly dissolved the Assembly and summoned Gen. Francisco Serrano y Domínguez to form a new government. During Serrano's year of rule the First Republic existed in name only.

After the restoration of Alfonso XII (December 1874), Pavía was elected to the Cortes (1876). He was captain general of Catalonia (1880–81) and of New Castile (1885–86).

Pavie, Auguste (-Jean-Marie) (b. 1847, Dinan, Fr.—d. 1925, Thourie), French explorer and diplomat, who is best known for his explorations of the Upper Mekong Valley and for having almost single-handedly brought the kingdoms of Laos under French control.

Pavie went to Cochinchina (now part of southern Vietnam) as a sergeant in the marines in 1869 and subsequently worked in the Post and Telegraphic Department, directing construction of telegraph lines between Phnom Penh, the Cambodian capital, and Bangkok, the capital of Siam, in 1879 and another between Phnom Penh and Saigon (now Ho Chi Minh City) in 1882. While working on the telegraph lines, he travelled throughout Siam, Cambodia, and Vietnam and gained an intimate knowledge of each country's customs and languages. The French government hoped to gain control of the Lao states of the Mekong River Valley and accredited Pavie to the Siamese government as vice consul in Luang Prabang (Louangphrabang; the former royal capital of Laos) in 1886. During the next five years he travelled throughout northern Laos, winning for France the friendship of local rulers and chiefs and frustrating Siamese attempts to bring order to the region, which was beset by marauding bands of Chinese freebooters (Ho or Haw).

From 1891 to 1893 Pavie served as consul general in Bangkok and helped bring about the Franco-Siamese Conflict of 1893. Arguing that the Lao states intermittently had been vassals of Vietnam (though much longer dominated by Siam), and that France by taking control of Vietnam now succeeded to Vietnam's rights in Laos, Pavie justified military movements into the Lao states, thus provoking the crisis as a result of which all Lao states east of the Mekong River came under a French protectorate.

Before returning to France, Pavie conducted an expedition, defining Laos' borders with China, and with Upper Burma, which the British had annexed in 1886. He wrote *Mission Pavie: Indochine 1879–1895* (Paris, 1898–1919) and *À la conquête des coeurs* (1921).

pavilion, light temporary or semipermanent structure used in gardens and pleasure grounds. Although there are many variations, the basic type is a large, light, airy garden

Garden pavilion, Versailles, Fr.
Edwin Smith

room with a high-peaked roof resembling a canopy. It was originally erected, like the modern canvas marquee, for special occasions such as fetes, garden banquets, and balls, but it became more permanent, and by the late 17th century the word was used for any garden building designed for use on special occasions.

Although many ornamental garden pavilions survive in old gardens, the modern use of the name is usually limited to buildings on sports grounds with accommodations for changing clothes and storing equipment. "Pavilion" has also been used in reference to a tent, a summer residence, a dance hall, a bandstand, an annex or structure connected to a larger building, and to one of several buildings making up a complex.

pavillon chinois (musical instrument): *see* jingling Johnny.

Pavle (Serbo-Croatian personal name): *see under* Paul.

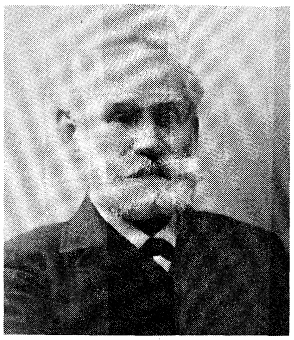
Pavlodar, *oblast* (administrative region), northern Kazakh Soviet Socialist Republic, with an area of 49,250 sq mi (127,500 sq km) along the middle course of the Irtysh River on the southern edge of the West Siberian Plain. Its lands consist mainly of flat steppe, which turns into semidesert in the southwest. The climate is continental and dry. Pavlodar, the capital, and Ekibastuz form a rapidly growing industrial complex based on power generated from the large, though low-grade, Ekibastuz coal deposits; there is also gold mining at Maykain and salt production from the salt lakes. Bozshakol is the site of a major copper deposit. The *oblast* is an important grain producer—mainly wheat and millet—and sheep and cattle also are raised. In 1981 nearly 60 percent of the population was urban. The most numerous nationalities are Russians, Kazakhs, Ukrainians, and Germans. The Irtysh-Karaganda Canal starts near the new town of Yermak (founded 1961), the site of a large power station and a ferro-alloying plant; there is navigation on the Irtysh. Pop. (1983 est.) 867,000.

Pavlodar, city and administrative centre of Pavlodar *oblast* (region), Kazakh Soviet Socialist Republic, and a port on the Irtysh River. The oldest *oblast* centre in northern Kazakhstan, it was founded in 1720 as Koryakovsky outpost on the Russian Irtysh fortified line, near salt lakes. It became the town of Pavlodar in 1861, but, although it did a substantial trade in salt and agricultural produce, its population was only about 8,000 in 1897. Since then and particularly since the mid-1960s, it has grown considerably to become a major industrial centre, with tractor, aluminum, and chemical plants. An oil refinery was completed in 1978. The city has industrial and teacher-training institutes. Pop. (1983 est.) 302,000.

Pavlograd, city, Dnepropetrovsk *oblast* (administrative region), Ukrainian Soviet Socialist Republic. A minor trading centre before the October Revolution (1917) and incorporated in 1797, it is now a major railway junction and centre of the west Donets Coal Basin. Its varied industrial base includes the manufacture of machinery for the chemical industry and for foundries and the production of bricks. There is a linen mill, and consumer industries include the processing of foodstuffs and production of clothes and furniture. Pop. (1983 est.) 115,000.

Pavlov, Ivan Petrovich (b. Sept. 26 [Sept. 14, old style], 1849, Ryazan, Russia—d. Feb. 27, 1936, Leningrad), Russian physiologist known chiefly for his development of the concept of the conditioned reflex. In a now classic experiment, he trained a hungry dog to salivate at the sound of a bell, which was previously associated with the sight of food. He developed a similar conceptual approach, emphasizing the importance of conditioning, in his pioneering studies relating human behaviour to the nervous system. He was awarded the Nobel Prize for Physiology in 1904 for his work on digestive secretions.

Life. Pavlov was the first son of the village priest and the grandson of the village sexton, and he spent his youth in his native village (Ryazan) in central Russia. He attended a church school and theological seminary, where



Pavlov
By courtesy of the Nobelstiftelsen, Stockholm

his seminary teachers impressed him by their devotion to imparting knowledge. In 1870 he abandoned his theological studies to enter the University of St. Petersburg (Leningrad), where he studied chemistry and physiology. After receiving the M.D. at the Imperial Medical Academy in St. Petersburg (graduating in 1879 and completing his dissertation in 1883), he studied during 1884–86 in Germany under the direction of the cardiovascular physiologist Carl Ludwig (in Leipzig), and the gastrointestinal physiologist Rudolf Heidenhain (in Breslau).

Having worked with Ludwig, Pavlov's first independent research was on the physiology of the circulatory system. From 1888 to 1890, in the laboratory of Botkin in St. Petersburg, he investigated cardiac physiology and the regulation of blood pressure.

He became so skillful a surgeon that he was able to introduce a catheter into the femoral artery of a dog almost painlessly without anesthesia and to record the influence on blood pressure of various pharmacological and emotional stimuli. By careful dissection of the fine cardiac nerves he was able to demonstrate the control of the strength of the heartbeat by nerves leaving the cardiac plexus; by stimulating the severed ends of the cervical nerves, he showed the effects of the right and left vagal nerves on the heart.

Pavlov married an attractive pedagogical student in 1881, a friend of the author Fyodor Dostoyevsky, but he was so impoverished that at first they had to live separately. He attributed much of his eventual success to his wife, a domestic, religious, and literary woman, who devoted her life to his comfort and work. In 1890 he became professor of physiology in the Imperial Medical Academy, where he remained until his resignation in 1924. At the newly founded Institute of Experimental Medicine, he initiated precise surgical procedures for animals, with strict attention to their postoperative care and facilities for the maintenance of their health.

During the years 1890–1900 especially, and to a lesser extent until about 1930, Pavlov studied the secretory activity of digestion. While working with Heidenhain, he had devised an operation to prepare a miniature stomach, or pouch; he isolated the stomach from ingested foods, while preserving its vagal nerve supply. The surgical procedure enabled him to study the gastrointestinal secretions in a normal animal over its life-span. This work culminated in his book *Lectures on the Work of the Digestive Glands* in 1897.

Laws of conditioned reflex. By observing irregularities of secretions in normal unanesthetized animals, Pavlov was led to formulate the laws of the conditioned reflex, a subject that occupied his attention from about 1898 until 1930. He used the salivary secretion as a quantitative measure of the psychical, or subjective, activity of the animal, in order to emphasize the advantage of objective, physiological measures of mental phenomena and higher nervous activity. He sought analogies between the conditional (commonly though incorrectly translated as "conditioned") reflex and the spinal reflex.

According to the physiologist Sir Charles Sherrington, the spinal reflex is composed of integrated actions of the nervous system involving such complex components as the excitation and inhibition of many nerves, induction (*i.e.,* the increase or decrease of inhibition brought on by previous excitation), and the irradiation of nerve impulses to many nerve centres. To these components, Pavlov added cortical and subcortical influences, the mosaic action of the brain, the effect of sleep on the spread of inhibition, and the origin of neurotic disturbances principally through a collision, or conflict, between cortical excitation and inhibition.

Beginning about 1930, Pavlov tried to apply his laws to the explanation of human psychoses. He assumed that the excessive inhibition characteristic of a psychotic person was a protective mechanism—shutting out the external world—in that it excluded injurious stimuli that had previously caused extreme excitation. In Russia this idea became the basis for treating psychiatric patients in quiet and nonstimulating external surroundings. During this period Pavlov announced the important principle of the language function in the human as based on long chains of conditioned reflexes involving words. The function of language involves not only words, he held, but an elaboration of generalizations not possible in animals lower than the human.

Opposition to Communism. Pavlov's relationships with the Communists and the Soviet government were unique not only for the Soviet Union but also for the history of science. Although he was never a politician, he spoke fearlessly for what he considered the truth. In 1922, during the distressing conditions in the aftermath of the Revolution, he requested permission from Lenin to transfer his laboratory abroad. Lenin denied this request, saying that Russia needed scientists such as Pavlov and that Pavlov should have the same food rations as an honoured Communist. Although it was a period of famine, Pavlov refused: "I will not accept these privileges unless you give them to every one of my collaborators!" In spite of many honours granted him by Soviet officials, he upbraided them openly. After returning from his first visit to the United States in 1923 (the second was in 1929), he publicly denounced Communism, stated that the basis for international Marxism was false, and said that, "For the kind of social experiment that you are making, I would not sacrifice a frog's hind legs!" In 1924, when the sons of priests were expelled from the Military Medical Academy in Leningrad (the former Imperial Medical Academy), he resigned his Chair of Physiology announcing "I also am the son of a priest, and if you expel the others I will go too!" In 1927, distressed that his was the only negative vote in the Academy of Sciences against the newly recommended "red professors," he wrote to Stalin, protesting that "On account of what you are doing to the Russian intelligentsia—demoralizing, annihilating, depraving them—I am ashamed to be called a Russian!" In the late 1920s, as an anti-Communist gesture, he refused N.I. Bukharin, the Communist commissar of education, admission to his laboratory, though the laboratory was supported by government funds administered by Bukharin.

During the last two years of his life, Pavlov gradually ceased these excoriations and even stated that he hoped to see the success of the government at the helm of his country. This change of heart may have been a result of increased government support of science and of his own feelings of patriotism when war with Japan seemed imminent. He was never a Communist, however, nor was he responsible for the technique of brainwashing that has sometimes been ascribed to him.

In personal habits Pavlov was extremely punctual, never missing an appointment, it was claimed, and arriving on time in the laboratory even when there was revolutionary activity on the streets. To a collaborator, who explained his 10-minute delay as a result of the shooting, Pavlov exclaimed, "What difference does a Revolution make when you have experiments to do in the laboratory!" He was a bold, vehement nonconformist both in science and in his personal life; he fiercely took up the cudgel for what he believed regardless of the force of his opposition. Although Pavlov held to scientific agnosticism, he considered true religion beneficial; he said that he envied no one anything except his wife her devout religious faith.

Assessment. Pavlov's method of studying the normal, healthy animal in natural conditions made possible his contributions to science. He was able to formulate the idea of the conditioned reflex because of his ability to reduce a complex situation to the simple terms of an experiment. Recognizing that in so doing he omitted the subjective component, he insisted that it was not possible to deal with mental phenomena scientifically except by reducing them to measurable physiological quantities.

Although Pavlov's work laid the basis for the scientific analysis of behaviour, and notwithstanding his stature as a scientist and physiologist, his work was subject to certain limitations. Philosophically, while recognizing the preeminence of the subjective and its independence of scientific methods, he did not, in his enthusiasm for science, clarify or define this separation. Clinically, he accepted uncritically psychiatric views concerning schizophrenia and paranoia, and he adopted such neural concepts as induction and irradiation as valid for higher mental activity. Many psychiatrists now consider his explanations too limited, and some neurophysiologists have taken greater interest in other developments, such as electrophysiology and biochemistry. In contrast to Sherrington, he has had few prominent students outside Russia. His method of working with the normal, healthy, unanesthetized animal over its entire life has not been generally accepted in physiology. (W.H.G.)

BIBLIOGRAPHY. Boris P. Babkin, *Pavlov: A Biography* (1949), based on personal and professional knowledge of the author, one of Pavlov's oldest pupils, is the most complete and reliable account until World War I. In dealing with Pavlov's later life Babkin depends upon a Russian monograph by A.A. Savich, another colleague, and the memoirs of his widow. I.P. Pavlov, *Lectures on Conditioned Reflexes,* 2 vol., trans. by W.H. Gantt (1929–41), contains a biographical sketch, including personality characteristics, dealing mainly with his career after the Soviet Revolution, based on the translator's six years of professional association with Pavlov. Discussions of Pavlov's scientific achievements and independent attitude to government bureaucracy also by W.H. Gantt are "Physiology Since Pavlov," *New Republic,* 105:728–731 (1941); "Pavlov Through Red-Colored Glasses," *Contemp. Psychol.,* 2:273–274 (1957); and "Ivan Petrovich Pavlov," *Recent Adv. Biol. Psychiat.,* vol. 4 (1962). Gantt's *Russian Medicine* (1937), shows the relation of Pavlov to prominent Russian figures in medicine. See also Gantt's *Pavlovian Approach to Psychopathology* (1970).

Pavlova, Anna (Pavlovna) (b. Feb. 12 [Jan. 31, old style], 1881, St. Petersburg, Russia—d. Jan. 23, 1931, The Hague), Russian ballerina, the most celebrated dancer of her time. She studied at the Imperial School of Ballet at the Mariinsky Theatre from 1891, joined the Imperial Ballet in 1899, and became a prima ballerina in 1906. In 1909 she went to Paris on the historic tour of the Ballets Russes. After 1913 she danced independently with her own company throughout the world.

Early life and the Imperial Ballet. The place and time of Pavlova's birth could hardly have

Anna Pavlova
Culver Pictures

been better for a child with an innate talent for dancing. Tsarist Russia maintained magnificent imperial schools for the performing arts. Entry was by examination, and, although Pavlova's mother was poor—her father had died when she was two years old—the child was accepted for training at the Imperial School of Ballet at the Mariinsky Theatre (now the Kirov State Theatre) in St. Petersburg in 1891.

Following ballet tradition, Pavlova learned her art from teachers who were themselves great dancers. She graduated to the Imperial Ballet in 1899 and rose steadily through the grades to become prima ballerina in 1906. By this time she had already danced *Giselle* with considerable success.

Almost immediately, in 1907, the pattern of her life began to emerge. That year, with a few other dancers, she went on a tour to Riga, Stockholm, Copenhagen, Berlin, and Prague. She was acclaimed, and another tour took place in 1908. In 1909 the impresario Sergey Diaghilev staged a historic season of Russian ballet in Paris, and Pavlova appeared briefly with the company there and later in London. But her experience of touring with a small group had given her a taste for independence, and she never became part of Diaghilev's closely knit Ballets Russes. Her destiny was not, as was theirs, to innovate but simply to show the beauties of classical ballet throughout the world. While she was still taking leave from the Mariinsky Theatre, she danced in New York City and London in 1910 with Mikhail Mordkin.

International acclaim. Once she left the Imperial Ballet in 1913, however, her frontiers were extended. For the rest of her life, with various partners (including Laurent Novikov and Pierre Vladimirov) and companies, she was a wandering missionary for her art, giving a vast number of people their introduction to ballet. Whatever the limitations of the rest of the company, which inevitably was largely a well-trained, dedicated band of young disciples, Pavlova's own performances left those who watched them with a lasting memory of disciplined grace, poetic movement, and incarnate magic. Her quality was, above all, the powerful and elusive one of true glamour.

Pavlova's independent tours, which began in 1914, took her to remote parts of the world. These tours were managed by her husband, Victor Dandré. The repertoire of Anna Pavlova's company was largely conventional. They danced excerpts or adaptations of Mariinsky successes such as *Don Quixote, La Fille mal gardée, The Fairy Doll,* or *Giselle,* of which she was an outstanding interpreter. The most famous numbers, however, were the succession of ephemeral solos, endowed by her with an inimitable enchantment: *The Dragonfly, Californian Poppy, Gavotte,* and *Christmas* are names that lingered in the hearts of her audiences, together with her single choreographic endeavour, *Autumn Leaves* (1918).

Pavlova's enthusiasm for ethnic dances was reflected in her programs. Polish, Russian, and Mexican dances were performed. Her visits to India and Japan led her to a serious study of their dance techniques. She compiled these studies into *Oriental Impressions,* collaborating on the Indian scenes with Uday Shankar, later to become one of the greatest performers of Indian dance, and in this way playing an important part in the renaissance of the dance in India.

Since she was the company's raison d'être, the source of its public appeal, and, therefore, its financial stability, Pavlova's burden was extreme. It was hardly surprising, therefore, that, by the end of her life, her technique was faltering, and she was relying increasingly on her unique qualities of personality.

Pavlova's personal life was undramatic apart from occasional professional headlines, as when, in 1911, she quarrelled with Mordkin. She kept her marriage secret for some time, and there were no children; her maternal instincts spent themselves on her company and on a home for Russian refugee orphans, which she founded in Paris in 1920. She loved birds and animals, and her home in London, Ivy House, Hampstead, became famous for the ornamental lake with swans, beside which she was photographed and filmed, recalling her most famous solo, *The Dying Swan,* which the choreographer Michel Fokine had created for her in 1905. These film sequences are among the few extant of her and are included in a compilation called *The Immortal Swan,* together with some extracts from her solos filmed one afternoon in Hollywood, in 1924, by the actor Douglas Fairbanks, Sr. (K.S.W.)

Franks (ed.), *Pavlova* (1956), a symposium contributed by people who knew Pavlova, compiled for the 25th anniversary of her death; Cyril W. Beaumont, *Anna Pavlova* (1932); Valerian Svetlov, *Anna Pavlova* (1930); and Paul D. Magriel (ed.), *Pavlova* (1947); Oleg Kerensky, *Anna Pavlova* (1973); and Andre Oliveroff, *Flight of the Swan* (1932, reprinted 1979).

Pavlovian conditioning, also called CLASSICAL CONDITIONING, a type of conditioned learning which occurs because of the subject's instinctive responses, as opposed to operant conditioning, which is contingent on the willful actions of the subject. *See* conditioning; Pavlov, Ivan Petrovich.

Pavlovo, city and administrative centre of Pavlovo *rayon* (district), Gorky *oblast* (region), western Russian Soviet Federated Socialist

Republic, on the Oka River. Its metalworking industries are continuations of what was a long handicraft tradition in metal goods, though now the industry produces buses and tractor and automobile parts as well. The city has a technical college devoted to the metalworking industry. Pop. (1983 est.) 70,000.

Pavlovsk, city, Leningrad *oblast* (administrative region), northwestern Russian Soviet Federated Socialist Republic. Founded in 1777 as Pavlovskoye, it became a city and was renamed Pavlovsk in 1796. The site, on the Slavyanka River, was a gift from Catherine II the Great to her son and heir, Paul. She commissioned the Scottish architect Charles Cameron to design the palace and park, most of which was built between 1782 and 1786. Later, other architects made changes and additions to Cameron's original scheme. The main building is the Great Palace, a domed, rectangular structure, surrounded by 1,500 ac (600 ha) of park.

The palace and grounds became a museum after World War I but were extensively damaged by the German occupation of 1941–44. Restoration of the palace and the park began in 1946 and was completed in 1973. Pop. (1970) 20,969.

Pavlovsky Posad, city, Moscow *oblast* (administrative region), western Russian Soviet Federated Socialist Republic, on the Klyazma River. It grew from a monastic village and, in the 18th century, was a centre of peasant silk weaving. In 1844 it became an industrial centre (*posad*) with other villages and had nine silk and three paper factories, employing 2,000 workers. It now has cotton, woollen, clothing, and ceramic industries. Pop. (1983 est.) 71,000.

Pavón, Battle of (Sept. 17, 1861), military clash at Pavón in the Sante Fe province of Argentina between the forces of the Argentine Confederation, commanded by Justo José de Urquiza, and those of Buenos Aires province, led by the governor, Bartolomé Mitre. Mitre's victory there marked the end of decades of internal armed conflict in Argentina.

Following the defeat of Mitre's Buenos Aires army at the Battle of Cepeda in 1859, Buenos Aires was constrained to join the confederation. But Mitre's forces won in a subsequent confrontation at Pavón, though not decisively, and Urquiza concluded that he now had little chance of success in his bid for national leadership. Thus a new national government was set up, with the capital again at Buenos Aires (it had been moved to Paraná, in Entre Ríos province, in 1853, when Buenos Aires had seceded from the confederation), and Mitre became provisional president. When the congress that was elected under the new government convened in May 1862, Mitre was chosen president for a six-year term.

Pawcatuck River, river rising in Worden Pond and Great Swamp, South Kingstown, R.I., U.S. It flows generally southwestward, emptying into Little Narragansett Bay after a course of about 30 mi (50 km). The river passes Shannock, Carolina, Bradford, Potter Hill, and Westerly and forms part of the boundary between Rhode Island and Connecticut. Several dams on the river supply power for manufacturing plants. The name is derived from an Algonkian Indian word that probably means "open divided stream."

Pawhuska, city, seat (1907) of Osage County, northeastern Oklahoma, U.S. It was settled in 1872 and named for an Osage chief, Paw-Hiu-Skah (White Hair), and the first buildings were those of the Indian Agency (established 1873). Cattle and oil (discovered in 1897) provide the basis of the economy, which is augmented by cotton ginning and light manufacturing, including oil-field equipment and clothing. Pawhuska is the tribal capital of the Osage Nation and the site of the Osage Tribal Museum. In 1909 the Rev. John Mitchell organized in the city what is claimed to be the first Boy Scout troop in the U.S. Inc. 1906. Pop. (1980) 4,771.

Pawla (Malta): *see* Paola.

Pawlikowska-Jasnorzewska, Maria (b. Nov. 20, 1893, Krakau, Austria-Hungary—d. July 9, 1945, Manchester), one of the finest Polish poets.

As a daughter of the well-known painter Wojciech Kossak, she grew up in an artistic and intellectual milieu. Her first collection of poems, *Niebieskie migdały* (1922; "Idle Dreams"), was warmly acclaimed by the poets of the Skamander group. Up to 1939 she published a dozen more small volumes of her lyric poetry—including *Pocałunki* (1926; "Kisses") and *Surowy Jedwab* (1932; "Raw Silk")—in which she dealt with such subject matter as the loves, the disenchantments, and the carefree life of a sophisticated modern woman.

During World War II she emigrated to France and later to England, where, lamenting her exile, she expressed her feelings in *Róża i lasy płonące* (1940; "A Rose and Burning Forests") and in *Gołąb ofiarny* (1941; "The Sacrificial Dove").

Pawlowska, Eliza (Polish writer): *see* Orzeszkowa, Eliza.

pawnbroking, business of advancing loans to customers who have pledged household goods or personal effects as security on the loans. The trade of the pawnbroker is one of the oldest known to mankind; it existed in China 2,000 to 3,000 years ago.

Pawnbroking in the West may be traced to three different institutions of the Middle Ages: private pawnbrokers, public pawnshops, and *montes pietatis.* Usury laws in most countries prohibited the taking of interest, and private pawnbrokers were usually persons exempt from these laws by religion or regulation—Jews, for example. Their sometimes exorbitant interest rates, however, caused social unrest, which made public authorities aware of the need for alternative facilities for consumption loans. As early as 1198, Freising, a town in Bavaria, set up a municipal bank that accepted pledges and made loans against moderate interest charges. Such public pawnshops enjoyed only a comparatively short existence; their moderate charges did not cover the risks incurred in this type of business.

The church also recognized the need for institutions to make lawful loans to indigent debtors; the Order of Friars Minor (Franciscans) in Italy in 1462 were the first to establish *montes pietatis* (*mons* denoted any form of capital accumulation), which were charitable funds for the granting of interest-free loans secured by pledges to the poor. The money was obtained from gifts or bequests. Later, in order to prevent the premature exhaustion of funds, *montes pietatis* were compelled to charge interest and to sell by auction any pledges that became forfeit.

In the 18th century many states reverted to public pawnshops as a means of preventing exploitation of the poor. These suffered a decline toward the end of the 18th century because limitation of interest was thought to represent restriction, and the use of public funds seemed to stand for state monopoly. Most states returned again to a system of public pawnshops, however, after finding that complete freedom in pawning was harmful to debtors. In the 20th century, the public pawnshop predominated in the majority of countries on the European continent, sometimes alone, sometimes side by side with private pawnbrokers. Public pawnshops were never established in the United States.

The importance of pawnbroking has declined in the 20th century. Social policies have helped to mitigate the financial needs resulting from temporary interruptions in earnings; operating expenses of pawnshops have risen; and installment credit and personal loans from banks have become widely available.

Articles are alphabetized word by word, not letter by letter

Pawnee, North American Plains Indian people of Caddoan linguistic stock who lived on the Platte River, Nebraska, from before the 16th century to the latter part of the 19th. In the 19th century the Pawnee tribe was composed of relatively independent bands: the Kitkehahki, Chaui, Pitahauerat, and Skidi. Each of these was divided into villages, the basic social unit of the Pawnee people.

An earthlodge in the Pawnee village on the Loup Fork, Nebraska; photograph by William Jackson, 1871

By courtesy of the Smithsonian Institution, Washington, D.C.

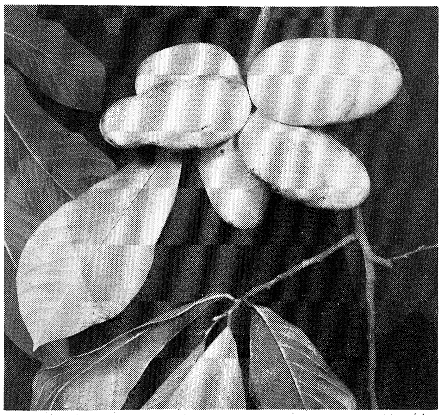
They lived in large, dome-shaped, earth-covered lodges but used skin tepees on buffalo hunts. The women raised corn (maize), squash, and beans. They had developed the art of pottery making, but it declined after the introduction of horses, which they first obtained in the 17th and 18th centuries from Spanish settlements in the southwest.

Class distinctions favoured chiefs, priests, and shamans. Each chief of a village or band had in his keeping a sacred bundle. Shamans had special powers to treat illness and to ward off enemy raids and food shortages. Priests were trained in the performance of rituals and sacred songs. Along with shamanistic and hunt societies, the Pawnee also had military societies.

The religion of the Pawnee was quite elaborate. They believed some of the stars to be gods and performed rituals to entreat their presence, but they also used astronomy in practical affairs (*e.g.,* to determine when to plant corn). Corn was regarded as a symbolic mother through whom the sun god bestowed his blessing. Other important deities were Tirawa, the supreme power, and the morning and evening stars. For a time Pawnee religion included the sacrifice of a captive adolescent girl to the morning star, but this practice was ended in the 19th century.

Relations between the Pawnee and whites were peaceful, and many served as scouts in the armies of the frontier. They ceded most of their lands in Nebraska to the U.S. government by treaties in 1833, 1848, and 1857. In 1876 their last Nebraska holdings were given up, and they were moved to Oklahoma, where they remained. More than 2,300 Pawnee were reported living on or near their Oklahoma reservation in the late 20th century.

pawpaw, also spelled PAPAW (*Asimina triloba*), deciduous tree or shrub of the custard-apple family, Annonaceae (order Magnoliales), native to the United States from the Atlantic coast north to New York state and west to Michigan and Kansas. It can grow to 12 m (40 feet) tall with pointed, broadly oblong, drooping leaves up to 30 cm (12 inches) long. The malodorous, purple five-centimetre (two-inch) flowers appear in spring before the leaves. The edible, 8- to 18-centimetre (3- to 7-inch) long fruits resemble stubby bananas; the skin turns black as the fruit ripens. They vary, depending on the variety, in size, time of ripening, and flavour. Some persons may develop a skin reaction after handling pawpaw fruits. The other seven species of *Asimina*, which are shrubby North American plants, include *A. speciosa* and *A. angustifolia*.



Cluster of unripened fruit of pawpaw (*Asimina triloba*)
John H. Gerard

The name pawpaw is also sometimes applied to the papaya (*q.v.; Carica*).

Pawtucket, city, Providence county, Rhode Island, U.S., on the Blackstone River (there bridged and known locally as the Pawtucket, or the Seekonk), just northeast of Providence and adjoining the city of Central Falls. In the heart of the business district, the river plunges 50 feet (15 m) over a mass of rocks; the city's name is from an Algonquian word for "at the falls." First settlement on the site was made in 1671 by Joseph Jencks, Jr. His smithy, destroyed in 1676 during King Philip's (Indian) War, was rebuilt, and soon the village became a centre for ironmongers. In 1790 Samuel Slater built the first successful water-powered cotton mill in North America, which has been restored and designated a national historic landmark. Highly industrialized, Pawtucket has an industrial economy.

The river has been continually improved by the federal government since 1867; there is a 16-foot (5-metre) channel all the way to Narragansett Bay. Pawtucket town (inc. 1828), east of the river, was originally in Massachusetts and was transferred to Rhode Island and reincorporated in 1862; part of North Providence, west of the river, was annexed to Pawtucket in 1874, and the expanded town was incorporated as a city in 1885. Pop. (1988 est.) city, 74,435; Pawtucket–Woonsocket–Attleboro PMSA, 324,800; Providence–Pawtucket–Fall River CMSA, 1,125,400.

Pax, in Roman religion, personification of peace, probably recognized as a deity for the first time by the emperor Augustus, in whose reign much was made of the establishment of political calm. An altar of Pax Augusta (the Ara Pacis) was dedicated in 9 BC and a great temple of Pax completed by the emperor Vespasian in AD 75.

Pax Romana (Latin: "Roman Peace"), a state of comparative tranquillity throughout the Mediterranean world from the reign of Augustus (27 BC–AD 14) to that of Marcus Aurelius (AD 161–180). Augustus laid the foundation for this period of concord, which also extended to North Africa and Persia. The empire protected and governed individual provinces, permitting each to make and administer its own laws while accepting Roman taxation and military control.

Paxinou, Katina, original name KATINA CONSTANTOPOULOS (b. *c.* 1900, Piraeus, Athens, Greece—d. Feb. 22, 1973, Athens), internationally recognized Greek actress known for her tragic roles in both modern and classic drama. With her second husband, the Greek actor-producer Alexis Minotis, she produced revivals of classic plays in ancient outdoor Greek theatres and translated modern plays into Greek, most notably those of the American playwright Eugene O'Neill.

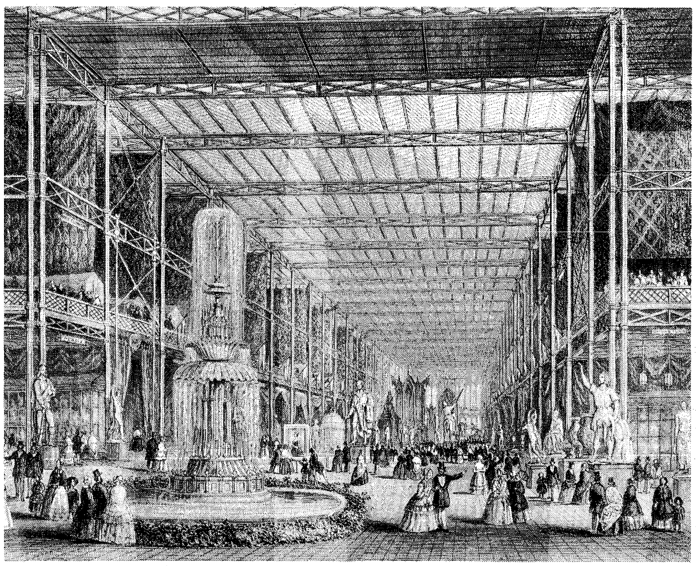
Paxinou was trained in Switzerland as an opera singer; her first professional appearance was in Dimitri Mitropoulos' opera *Sister Beatrice* at Athens in 1920. Four years later she made her debut in a dramatic role in *La Femme nue*. By 1930, when she established an association with Minotis to direct the company of the newly formed National Theatre of Athens, she had abandoned singing roles entirely. Tours of the United States, Germany, and England followed, culminating in her acclaimed London debut in the title role of Sophocles' *Electra* (1939). The war years restricted her activities to the United States, where she continued her stage appearances and made her film debut as Pilar in the screen version of Ernest Hemingway's *For Whom the Bell Tolls* (1943), receiving an Academy Award as best supporting actress.

After the war Paxinou returned to Athens to assist the Greek National Theatre in reviving the classical Greek tragedies, performing in the ancient theatre of Herodes Atticus at Athens and the partially reconstructed theatre at Epidaurus. In addition to her performance in *Electra*, Paxinou was acclaimed for her roles in *Oedipus Rex, Agamemnon, The Bacchae, Medea, Hecuba,* and *Hippolytus*. Her talents were not restricted to classical roles, however; her portrayals of the Henrik Ibsen characters Mrs. Alving in *Ghosts* and Hedda Gabler were considered outstanding. Her company's repertoire also included works by William Shakespeare, O'Neill, and the Spanish dramatist Federico García Lorca. Paxinou's film credits include highly respected performances in *Mourning Becomes Electra* (1947), *The Miracle* (1959), and *Rocco and His Brothers* (1960).

Paxos, Modern Greek PAXOÍ, island, Kérkira *nomós* (department), the smallest of the seven major Ionian Islands of Greece, 8 miles (19 km) southwest of Párga on the coast of Epirus. A hilly mass of limestone covered with olive groves, Paxos rises to about 750 feet (230 m). Gáïos on the east coast is the chief village and port. Papandi, the bishop's residence, stands near the centre with several quaint churches and belfries. Tourism is increasingly a source of revenue. Pop. (1981) 2,247.

Paxton, Sir Joseph (b. Aug. 3, 1801, near Woburn, Bedfordshire, Eng.—d. June 8, 1865, Sydenham, near London), English landscape gardener and designer of hothouses, who was the architect of the Crystal Palace for the Great Exhibition of 1851 in London.

He was originally a gardener employed by the Duke of Devonshire, whose friend, factotum, and adviser he became. From 1826 he was superintendent of the gardens at Chatsworth, the duke's Derbyshire estate; he built in iron and glass the famous conservatory there (1840) and the lily house for the duke's rare *Victoria regia* (1850). Also in 1850, after a cumbersome design had been officially accepted by the Great Exhibition's organizers, Paxton's inspired plan for a building of prefabricated elements of sheet glass and iron was substituted. His design, based on his earlier glass structures, covered four times the area of St. Peter's, Rome, and the grandeur of its conception was a challenge to mid-19th-century technology. Although it was built within six months and he was knighted for his efforts (1851), it was not until later that the structure was seen as a revolution in style. In 1852–54 its components were moved to Sydenham Hill in Upper Norwood, where they remained (reerected in a different form from the original) until destroyed by fire in 1936.



"Interior of the Great Exhibition," the Crystal Palace designed by Sir Joseph Paxton, 1850–51
By courtesy of National Monuments Record, London

Paxton was a member of Parliament for Coventry from 1854 until his death. During the period of his glass structures, he also designed many houses in eclectic styles and laid out a number of public parks.

Paxton Boys uprising, attack by Pennsylvania frontiersmen upon an Indian settlement that occurred in December 1763 during the Pontiac Indian uprising. About 57 drunken rangers from Paxton, Pa., slaughtered 20 innocent and defenseless Conestoga Indians near Lancaster, Pa. Governor John Penn thereupon issued proclamations ordering the local magistrates to arrest and try those men involved in the massacre. Since the residents of that frontier area were sympathetic to the actions of the Paxton Boys, however, no prosecutions were undertaken.

Besides revealing the prevailing bias of frontiersmen against Indians, the Paxton Boys uprising also took on a political tone. Residents of the Pennsylvania backcountry were already embittered over the eastern counties' disproportionate control over the colony's legislature and the failure of the eastern-dominated legislature to provide adequate appropriations for defense of the frontier. Consequently, sparked by the events surrounding the Paxton Boys massacre, about 600 armed frontiersmen marched on Philadelphia in January 1764 to vent their anger against the provincial assembly. A delegation of prominent Philadelphians, including Benjamin Franklin, met the protesters and restrained them from entering the city by promising them that the legislature would provide a thorough hearing of their complaints. The assembly offered no redress for the protesters' main grievances, though, and the colony's Proprietary Party publicized the incident to their advantage in their campaign during the election of 1764.

Payao (Thailand): *see* Phayao.

Payen, Anselme (b. Jan. 6, 1795, Paris, Fr.—d. May 12, 1871, Paris), French chemist who made important contributions to industrial chemistry and discovered cellulose, a basic constituent of plant cells.

Payen, the son of an industrialist, was put in charge of a borax refining plant in 1815. He broke the Dutch monopoly on borax—most of which was mined in the Dutch East Indies—by discovering a process for producing borax from boric acid. In 1820 he turned his efforts to refining beet sugar. Two years later he introduced the use of activated charcoal to remove coloured impurities from beet sugar. In 1833 he discovered and isolated diastase, the first enzyme (organic catalyst) to be obtained in concentrated form. He then pursued the extensive analysis of wood and its components that culminated in the discovery of cellulose. He became professor of industrial and agricultural chemistry in 1835 at the Central School of Arts and Manufactures, Paris. Among his other contributions were studies of starch and bitumen, and the discovery of pectin and dextrin.

Payette River, river formed by confluence of the North and South forks in Boise National Forest, Boise county, southwestern Idaho, U.S., flowing south and then west past Emmett to join the Snake River near Payette on the Oregon border after a course of about 70 miles (110 km). Black Canyon Dam and Reservoir on the Payette and the Cascade Dam and Reservoir on the North Fork are part of the Payette division of the Boise Irrigation Project.

payments, balance of, systematic record of all economic transactions between residents of one country and residents of other countries (including the governments). The transactions are presented in the form of double-entry bookkeeping.

There can be no surplus or deficit in a country's balance of payments as a whole (as distinguished from its balance of trade) because every payment must have its offsetting receipt.

The balance of payments of Japan, for example, records the various ways in which yen are made available to foreigners through Japanese purchases of foreign goods, expenditures of Japanese tourists abroad, donations, loans, etc. These expenditures are shown on the debit side of the balance. The receipts side indicates the various uses to which foreigners put their yen, such as purchases of Japanese goods, interest on Japanese loans, etc. If foreigners do not spend all the yen made available to them, the balance of payments will show on the credit side an increase of foreign-held yen balances, foreign purchases of Japanese securities, gold exports from Japan, or some similar item. *See also* international payment.

Payne, Humfry (Gilbert Garth) (b. Feb. 19, 1902, Wendover, Buckinghamshire, Eng.—d. May 9, 1936, Athens, Greece), English archaeologist noted for the publication *Necrocorinthia* (1931), in which a vast body of important information on archaic vase painting and other arts practiced at Corinth was gathered and classified.

Payne was educated at Christ Church, Oxford, where he studied classics and took two first-class honours. He continued his education by working as a research scholar in Mediterranean archaeology (1924–26). He became a senior scholar at Christ Church (1926–31) and worked as an assistant at the Ashmolean Museum from 1926 to 1928.

Appointed director of the British School of Archaeology at Athens in 1929, Payne published *Necrocorinthia* and *Archaic Marble Sculpture from the Acropolis* (1936; with photographs by Gerard Mackworth Young). Another excellent work, *Perachora,* on the archaic site located near Corinth, was written chiefly by Payne, but it was published after his death. He was buried in Mycenae.

Payne, John Howard (b. June 9, 1791, New York, N.Y., U.S.—d. April 9, 1852, Tunis, Tun.), American-born playwright and actor, who followed the techniques and themes of the European Romantic blank-verse dramatists.

A precocious actor and writer, Payne wrote his first play, *Julia, or, The Wanderer,* when he was 15. Its success caused him to be sent to Union College, Schenectady, N.Y., but family finances forced him to leave two years later. At 18 he made his first stage appearance in John Home's *Douglas,* but he encountered much opposition from established actors, and in 1813, at the height of the War of 1812, he sailed for England. At first interned as an enemy national, he was later released and triumphed at Drury Lane in *Douglas,* repeating his success in other European capitals. In Paris Payne met the actor Talma, who introduced him to French drama, from which many of his more than 60 plays were adapted; and Washington Irving, with whom he was to collaborate on two of his best plays.

The play considered Payne's finest, *Brutus: or, The Fall of Tarquin,* was produced at Drury Lane on Dec. 3, 1818. *Brutus* persisted for 70 years, serving as a vehicle for three of the greatest tragedians of the 19th century: Edwin Booth, Edwin Forrest, and Edmund Kean. Other important plays were *Clari: or, The Maid of Milan,* which included Payne's famous song "Home, Sweet Home"; *Charles the Second* (1824), written with Irving; and *Thérèse* (1821), a French adaptation. Because of weak copyright laws, Payne received little return from his successful plays, and in 1842 he accepted a consular post in Tunis.

Payne, Peter, Czech PETRA PAYNA (b. *c.* 1380, Hough-on-the-Hill, Lincolnshire, Eng.—d. *c.* 1455, Prague, Czech.), English theologian, diplomat, and follower of the early religious Reformer John Wycliffe; he was a leading figure in securing Bohemia for the Hussites.

At about the time Payne was principal of St. Edmund Hall, Oxford (1410–12), he joined the Lollards, and when the influential Lollard soldier Sir John Oldcastle was indicted in 1413, Payne felt it prudent to flee to Bohemia. There he supported the Utraquist Hussites. He became a central figure in the consistory that governed the Hussite church and was entrusted with several diplomatic missions. At the Council of Basel in 1433 he spoke out against state seizure of church property. Taken prisoner at the Battle of Lipany, in 1434, he was soon freed and took part in peace negotiations. With the return of the anti-Hussite king Sigismund to Bohemia, the Hussites were temporarily proscribed, and Payne was expelled from Prague. He was imprisoned for two years in Austria, then ransomed by fellow Hussites to return to Bohemia and participate in unification of the scattered Hussite church. Respected by all factions, he sought in vain to reconcile the extreme Taborites with the elected archbishop, Jan Rokycana. By 1448, when Payne went back to Prague, Rokycana's party was firmly established. Though he never learned Czech, Payne served the Hussites also through his theological works.

Pays Basque (France): *see* Basque Country (France).

Pays de la Loire, *région de programme* (planning region), encompassing the western French *départements* of Mayenne, Sarthe, Maine-et-Loire, Vendée, and Loire-Atlantique. The capital is Nantes. The region has an area of 12,386 square miles (32,082 square km) and is bounded by the *départements* of Morbihan, Ille-et-Vilaine, Manche, and Calvados to the north, Eure-et-Loire to the northeast, Loir-et-Cher and Indre-et-Loire to the east, and Vienne, Deux-Sèvres, and Charente to the south. The Bay of Biscay lies to the west. The Massif Armoricain extends into Mayenne and Loire Atlantique and the northern fringes of Vendée and Maine-et-Loire. Sarthe and eastern Maine-et-Loire belong to the Paris Basin. The massif of Vendée rises in the south. The Loire River flows east to west. An oceanic climate prevails.

The population remained static between 1851 and 1946, in distinction to the general trend of rural population loss in France during this period; it has subsequently increased at a rate approaching the national average. Demographic recovery has favoured the Loire Valley between Saumur and Saint-Nazaire, and the agglomerations of Angers and Nantes. Emigration has depleted the population of inland Vendée, northern Maine-et-Loire, and Mayenne and Sarthe outside Laval and Le Mans. The rural population density is relatively high, with the result that farms in general are small.

Soils tend to be acid and heavy; lime and fertilizers are widely used. Viticulture is concentrated in Maine-et-Loire around the towns of Souzay-Champigny, Brissac-Quincé, and Quarts-de-Chaume. Animal husbandry dominates agriculture. The region is a leading producer of milk, beef, and pork. Ducks are raised along the Atlantic coast. Fishing ports include Pornic and Le Croisic in Loire-Atlantique, and Les Sables-d'Olonne in Vendée.

Iron is mined at Segré in Maine-et-Loire and Rougé in Loire-Atlantique; Gétigné in Loire-Atlantique produces uranium. Manufactures are diverse and include ships, automobiles, and textiles. Pop. (1988 est.) 3,057,600.

Paysandú, city, western Uruguay, on the Uruguay River. The city was founded in 1772 by a priest, Policarpo Sandú, and 12 families of Christianized Indians, who translated the Spanish word *padre* ("father") into the Guaraní Indian word *pay,* from which stems the name Paysandú. Now Uruguay's third largest city, Paysandú has a relatively varied economy, with tanneries, textile factories, flour mills, distilleries, breweries, and meat-processing plants. A branch of the Faculty of Agriculture of the National University and a government-owned television station are located in Paysandú. The port is active, since cargo destined for northwestern Uruguay must be transferred at Paysandú from oceangoing ships to the shallow-draft vessels that ply the upper Uruguay. A bridge was built between Colón, Argentina, and Paysandú in 1970. Paysandú is linked also by rail, highway, and air services to Montevideo. Pop. (1985 prelim.) 75,200.

The cathedral at Paysandú, Uruguay
Walter Aguiar—EB Inc.

Payton, Walter (Jerry) (b. July 25, 1954, Columbia, Miss.), American professional football player who was regarded as the best yardage gainer in history.

Payton played football in high school and at Jackson State University, Miss., from which he graduated in 1975. He was drafted by the National Football League (NFL) Chicago Bears in 1975. Payton played with the Bears until his retirement after the 1987 season, filling the position of halfback for most of that time. In his 12 years as a professional football player, Payton was perhaps the greatest running back in the history of the game. He set the records for total career rushing yardage (16,726 yards), most combined career yards gained (rushing and pass receiving; 21,803 yards), most seasons with 1,000 or more yards rushing (10), most yards gained in a single game (275 yards), most games with 100 or more yards gained in a career (77), and most career touchdowns earned by rushing (110). Besides being football's all-time leading rusher, Payton was a capable blocker, pass receiver, and passer. He was an exceptionally durable, injury-free player and started in more than 130 consecutive games in his career.

Paz, Manuel de Godoy, príncipe de la (prince of): *see* Godoy, Manuel de.

Paz, Octavio (b. March 31, 1914, Mexico City), Mexican poet, writer, and diplomat, recognized as one of the major literary figures in Latin America after World War II.

Paz's family was ruined financially by the Mexican Civil War, and Octavio grew up in straitened circumstances. He was educated at a Roman Catholic school and at the University of Mexico. He turned to writing and published his first book of poetry, *Luna silvestre* ("Forest Moon"), in 1933 at age 19. Paz visited Spain in 1937, where he identified strongly with the Republican cause in the Spanish Civil War. He wrote his reflections on that experience in *Bajo tu clara sombra y otros poemas* ("Beneath Your Clear Shadow and Other Poems"), which, published in Spain in 1937, identified him as a young writer of real promise. Before returning home he visited Paris, where Surrealism exerted a profound influence on him.

Back in Mexico, Paz founded and edited several important literary reviews, including *Taller* (1939; "Workshop") and *El hijo pródigo* (1943; "The Prodigal Son"). He edited another review of literature and politics, *Plural*, in the 1970s. His major poetic publications include *No pasaran!* (1937; "They Shall Not Pass!"), *Libertad bajo palabra* (1949; "Freedom Under Parole"), *¿Águila o sol?* (1951; *Eagle or Sun?*), and *Piedra de sol* (1957; *The Sun Stone*). In the same period, he produced prose volumes of essays and literary criticism, including *El laberinto de la soledad* (1950; *The Labyrinth of Solitude*), an influential essay in which he analyzes the character, history, and culture of Mexico; and *El arco y la lira* (1956; *The Bow and the Lyre*) and *Las peras del olmo* (1957; "The Pears of the Elm"), which are studies of contemporary Spanish American poetry.

Paz entered Mexico's diplomatic corps in 1946 and served in a variety of assignments, including one as Mexico's ambassador to India from 1962 to 1968; in the latter year he resigned in protest over Mexico's brutal treatment of student radicals that year.

His poetry after 1962 includes *Blanco* (1967), *Ladera este* (1971; "East Slope"), and *Hijos del aire* (1981; *Airborn*). *Early Poems, 1935–55* was published in 1973 and *Selected Poems* in 1979. His later prose works include *Conjunciones y disyunciones* (1970; *Conjunctions and Disjunctions*) and *El mono gramático* (1974; *The Monkey Grammarian*).

Paz was influenced in turn by Marxism, Surrealism, Existentialism, Buddhism, and Hinduism. In the poetry of his maturity, he used a rich flow of Surrealistic imagery in dealing with metaphysical questions. His most prominent theme was man's ability to overcome his existential solitude through erotic love and artistic creativity.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Paz Estenssoro, Víctor (b. Oct. 2, 1907, Tarija, Bolivia), Bolivian statesman, founder and principal leader of the left-wing Bolivian political party National Revolutionary Movement (MNR), who served three times as president of Bolivia (1952–56, 1960–64, and from 1985). His first administration marked the beginning of a process of revolutionary social, economic, and political change in Bolivia.

Paz Estenssoro began his career as professor of economics at the University of San Andrés in La Paz. He was economic adviser to President Germán Busch (1937–39) and in 1939 was elected to the Chamber of Deputies. In 1941 he and others established the MNR; when it seized power in 1952, Paz Estenssoro became president. During his administration the right to vote was extended to Indians, and the three largest tin companies in the country were expropriated by the government. Most fundamental of all, an agrarian-reform law began the process of transferring the arable land of the central plateau to the Indians.

During 1956–60, Paz Estenssoro served as ambassador to the United Kingdom. He again became the MNR candidate for president in 1960 and won a decisive victory. During his second administration, his government reached an agreement with the U.S. government, the Inter-American Development Bank, and West German industrialists providing for a reorganization of the tin industry.

In the election of 1964, about 70 percent of the eligible voters cast their ballots for Paz Estenssoro. Nevertheless, he was overthrown by a military coup d'état in early November 1964 and went into exile in Peru. He remained in Lima as a professor of economics at the university until August 1971, when he returned to Bolivia as an adviser to the government led by the right-wing president Hugo Banzer Suárez.

Paz Estenssoro ran unsuccessfully for the presidency in 1979, and he ran again as the MNR's candidate in July 1985. He finished second to Banzer in the popular vote, in which no candidate gained a majority. On Aug. 5, 1985, Congress elected Paz Estenssoro president, and he was installed the next day. He immediately reduced government subsidies of consumer goods, devalued the peso, and streamlined state enterprises. These policies ended the hyperinflation that had imperiled Bolivia's economy.

Pazardzhik, also spelled PAZARDJIK, or PAZARDŽIK, town, west-central Bulgaria. It lies along the upper Maritsa River, between the Rhodope Mountains to the south and the Sredna Mountains to the north. It is a rail junction and an industrial centre, specializing in textiles, rubber, furniture, engineering, and the processing of agricultural produce.

The National Museum in Pazardzhik has artifacts dating the settlement from 2000 BC. The present town was founded by Russian Tatars, was under Turkish rule from the 15th to the 19th century, and until 1934 was called Tatar Pazardzhik. The Church of the Virgin Mary, which is half buried in the ground, contains masterpieces of Bulgarian carvings. Pop. (1986 est.) 77,378.

Pazyryk, Scythian burial site in a dry valley opening on the Bolshoy Ulagan River valley in the Kazakh Soviet Socialist Republic. The site, consisting of five large and nine smaller burial mounds and dating from about the 5th to the 3rd century BC, was excavated in 1929 and 1947–49. It is perhaps the richest source of information about the customs and artifacts of the Scythians before their westward migrations into western Asia and Europe. The site and its significance are described in S.I. Rudenko's *Frozen Tombs of Siberia: The Pazyryk Burials of Iron Age Horsemen* (1970).

PBI test (medicine): *see* protein-bound iodine test.

p'Bitek, Okot (b. 1931, Gulu, Uganda—d. July 19, 1982, Kampala), Ugandan poet, novelist, and social anthropologist whose three verse collections—*Song of Lawino* (1966), *Song of Ocol* (1970), and *Two Songs* (1971)—are considered to be among the best African poetry in print.

As a youth p'Bitek had varied interests; he published a novel in the Acholi language, wrote an opera, and played on Uganda's association football (soccer) team. He was educated at the University of Bristol in England (certificate in education), University College of Wales at Aberystwyth (bachelor of law), and the Institute of Social Anthropology at Oxford (degree in social anthropology). From 1964 to 1966 he taught at Makerere University in Kampala, Uganda.

His first collection of poetry, *Song of Lawino*, addresses the issue of the conflict of cultures. It is the lament of a nonliterate woman over the strange ways of her university-educated husband, whose new ways are incompatible with traditional African concepts of manhood. This book p'Bitek followed with *Song of Ocol*, which is the husband's response. A third volume, *Two Songs*, includes *Song of a Prisoner* and *Song of Malaya*.

After serving as director of Uganda's National Theatre and National Cultural Centre (1966–68), p'Bitek accepted a position as senior research fellow and lecturer at University College, Nairobi, Kenya (1971–78). He was also a visiting lecturer or writer-in-residence at several universities. From 1978 to 1982 he taught at the University of Ife in Nigeria.

In addition to writing poetry, p'Bitek produced several books on Acholi culture. Some of his essays are collected in *Africa's Cultural Revolution* (1975). *The Horn of My Love* (1974) contains Acholi poetry in both Acholi and English, and *Hare and Hornbill* (1978) is a collection of Acholi folktales that p'Bitek compiled and translated.

PCB (chemistry): *see* polychlorinated biphenyl.

PCF (political party): *see* French Communist Party.

PCI (political party): *see* Italian Communist Party.

PCP, abbreviation of PHENCYCLIDINE, byname ANGEL DUST, hallucenogenic drug with anesthetic properties, having the chemical name 1-(1-phencyclohexyl) piperidine. PCP was first developed in 1956 by Parke Davis Laboratories of Detroit for use as an anesthetic. In the early 1960s, however, clinical tests on humans revealed side effects ranging from distorted self-perception to severe disorientation and unpredictable, psychotic behaviour. The drug was never marketed for human use, although it is in use in veterinary medicine. Because PCP is relatively easy and inexpensive to manufacture, an illicit drug trade sprang up during the mid-1960s, and violence related to the use of PCP—including suicide and homicide—grew to alarming proportions in the mid- to late 1970s.

As with other hallucinogenic drugs, PCP does not cause physical dependence. In low doses, it produces toxic effects similar to those of LSD, although violent and psychotic behaviour seem to be more characteristic of PCP. The PCP user exhibits emotional instability, excited intoxication, lack of coordination, high blood pressure, and increased deep-tendon muscle reflexes, and is often impervious to pain. At high doses, PCP is highly toxic and can cause convulsions and coma.

The drug is typically smoked, mixed in powdered form with a leafy substance such as parsley, mint, tobacco, or marijuana; it may also be dissolved in a liquid and sprayed onto the leaves. Rarely, it is injected.

The effects of PCP depend on the susceptibility of the user and other variables such as mood, dosage, and setting. Effects are evident one to two hours after ingestion and generally last four to six hours. Among chronic users, the reappearance of symptoms such as disorientation and visual, memory, and speech disorders has been noted.

Pe-har, popular Tibetan divinity, the chief of the Five Great Kings. *See* Five Great Kings.

pea, any of several species, comprising hundreds of varieties, of herbaceous annual plants belonging to the family Leguminosae, grown virtually worldwide for their edible seeds. *Pisum sativum* is the common garden pea of the Western world. While their origins have not been definitely determined, it is known that these legumes are one of the oldest of cultivated crops; fossil remains have been found in Swiss lake villages. Wild peas grew in medieval Britain. Peas in the United States were introduced in early colonial times. Common garden peas in a monastery garden in Austria in the mid-1800s were used by the monk Gregor Mendel in his pioneering studies of the nature of heredity.

The pea plant is a hardy, leafy annual with hollow trailing or climbing stems of up to 1.8 metres (6 feet) in length, ending in tendrils that facilitate climbing. Each leaf has three pairs of leaflets. The reddish-purple, pink, or white flowers, growing two to three per stalk, are butterfly shaped. The fruit is a many-seeded pod that grows to 10 centimetres (4 inches) long, splitting in half when ripe. Inside the pod, 5 to 10 seeds are attached by short stalks. The seeds are green, yellow, white, or variegiated. Widely grown varieties include dwarf, half-dwarf, trailing, smooth-seeded, wrinkled-seeded, black-eyed, and sugar. The pods of sugar peas are customarily picked before the seeds reach maturity and are eaten raw or cooked like green beans.

Pea (*Pisum sativum*)
Walter Chandoha

In the home garden, peas should be planted in fertile, well-drained soil in an unshaded spot. The cool part of the growing season favours growth and development. The most common diseases that affect peas are root rot, powdery mildew, and several viral diseases. In the United States, peas are grown in the winter and early spring in parts of the Southwest and southern California. The commercial production in the United States centres in the northern tier of states, especially the Great Lakes states and the Pacific Northwest. Washington and Idaho produce dry, edible peas used in soup. Dried peas are sometimes ground into flour. Some of the dried-pea crop is exported. Asia and the U.S.S.R. lead in the world's dried-pea production. Europe and the North American continent produce the majority of the fresh pea crop for table use. Canning and freezing processes vary according to variety, plant size, shape and size of the pods, and period of maturation.

pea crab (*Pinnotheres*), any of a genus of crabs (order Decapoda of the class Crustacea) living in certain bivalved mollusks as a commensal (*i.e.,* on or in another animal host but not deriving nourishment from it). Females of *Pinnotheres ostreum,* also known as the oyster crab, are found in oysters of the Atlantic coastal waters of North America and are especially abundant in oysters of Chesapeake Bay. The body of the female is pinkish white and up to 2 centimetres (about 0.75 inch) across. An irregular stripe runs from front to back across the carapace, or back. Males, seldom seen, are smaller, dark brown, and usually free-swimming. The female pea crab holds her eggs with the back legs until they hatch. The larvae leave their mollusk home and swim before settling in another mollusk shell.

Pea crab (*Pinnotheres pisum*) in opened shell
Jane Burton—Bruce Coleman Ltd.

P. maculatus, with a range similar to that of *P. ostreum,* is found in the shells of scallops, clams, and mussels. *P. pisum,* found in European coastal waters, lives in mussel and cockle shells.

pea picker's disease: *see* leptospirosis.

Pea Ridge, Battle of (March 7–8, 1862), also called BATTLE OF ELKHORN TAVERN, bitterly fought U.S. Civil War clash in Arkansas, during which 11,000 Union troops under Gen. Samuel Curtis defeated 16,000 attacking Confederate troops led by generals Earl Van Dorn, Sterling Price, and Ben McCulloch. Following a fierce opening assault from the rear that almost overwhelmed Curtis' forces, the outnumbered Union troops rallied. After a desperate struggle with severe losses on both sides, Union forces counterattacked on March 8. The Confederates were forced to retreat, thus thwarting their hopes of regaining control of Arkansas.

Peabody, city, Essex County, northeastern Massachusetts, U.S., 15 mi (24 km) northeast of Boston. Originally part of Salem, it became part of Danvers in 1752 and was separately incorporated as the town of South Danvers in 1855. In 1868 it was renamed to honour the philanthropist George Peabody (1795–1869), who was born there. Glassmaking began there as early as 1638, and tanneries were established before the American Revolution. One of the nation's major leather-processing centres, it also produces chemicals, fabricated metals, and wood products. Inc. city, 1916. Pop. (1980) 45,976.

Peabody, Elizabeth Palmer (b. May 16, 1804, Billerica, Mass., U.S.—d. Jan. 3, 1894, Jamaica Plain, Mass.), U.S. educator and participant in the Transcendental movement, who opened the first English-language kindergarten in the U.S.

She was educated at a small private school by her mother, as were her sisters Sophia (who married the writer Nathaniel Hawthorne) and Mary (who married the educator Horace Mann). Peabody started her own school in Boston in 1820. From 1825 to 1834 she was secretary to William Ellery Channing, the early leader of Unitarianism in the United States; she then began an association with Bronson Alcott in his Temple School, of which she wrote in *Record of a School* (1835). After two years with the school, she became involved in adult education in Boston, where she lectured in history.

In 1839 Peabody opened her West Street bookstore, which became a sort of club for the intellectual community of Boston; the early planners of the Brook Farm experiment in communal living met there. On her own printing press she published translations by Margaret Fuller and three of Nathaniel Hawthorne's earliest books. For two years she published and wrote articles for *The Dial,* the critical literary monthly and organ of the Transcendental movement; she also wrote for other periodicals.

Peabody's kindergarten, opened in 1860, marked the American adoption of what until then had been primarily a German institution, inspired chiefly by the work of Friedrich Froebel. She went to Europe in 1867 to study Froebel's methods and brought several experienced German kindergarten teachers back with her. She devoted herself thereafter to organizing public and private kindergartens and to lecturing and writing in the field. As editor of the *Kindergarten Messenger* (1873–77) she played a major role in gaining acceptance for kindergarten as a part of regular public schooling. Her numerous books included *Kindergarten Culture* (1870), *The Kindergartner in Italy* (1872), and *Letters to Kindergartners* (1886).

Peabody, George (b. Feb. 18, 1795, Peabody, Mass.—d. Nov. 4, 1869, London), U.S.-born merchant and financier whose banking operations in England helped establish U.S. credit abroad.

When his brother's Newburyport, Mass., dry goods store burned down in 1811, Peabody went to Georgetown in Washington, D.C., to work in a wholesale dry-goods warehouse. By 1814, he had become a partner in the business, which relocated in Baltimore. By 1829 he was the senior partner of a business with branches in Philadelphia and New York City.

He made several business trips to purchase goods in England. On one trip, he negotiated an $8,000,000 loan for the near-bankrupt state of Maryland, accepting no commission on the transaction. In 1837 he moved to London permanently and established a merchant banking house that specialized in foreign exchange.

Peabody amassed a fortune of $20,000,000 and spent most of it on philanthropic works. His Baltimore institute provided a library, art gallery, and music academy. He also funded a historical museum and library in Peabody, Mass., a natural-history museum at Yale University, and a museum of archaeology at Harvard University; and he contributed to many other colleges and historical societies. His Peabody Education Fund was endowed with $3,500,000 to promote education of Southern children of all races.

In 1862 he gave $2,500,000 for the construction of apartment settlements for London's working people. He refused to accept a baronetcy from Queen Victoria. In 1868 the name of his birthplace (also his hometown) was changed to Peabody in his honour. The following year a statue of him was erected in London.

peace, disturbing the (law): *see* disturbing the peace.

peace, justice of the: *see* justice of the peace.

Peace Corps, U.S. government agency of volunteers, created by the Peace Corps Act of 1961. (From 1971 to 1982 it was a subagency of an independent agency called ACTION.)

The purpose of the Peace Corps is to assist other countries in their development efforts by providing skilled workers in the fields of education, agriculture, health, trade, technology, and community development. Peace Corps volunteers are assigned to specific projects on the basis of their skills, education, and experience. Once abroad, the volunteer is expected to function for two years as a good neighbour in the host country, to speak its language, and to live on a level comparable to that of his counterparts there.

The Peace Corps grew from 900 volunteers serving 16 countries in 1961 to more than 10,000 volunteers in 52 countries in 1966. By the early 1980s, however, the corps had been asked to leave a number of countries.

In the 1970s the Peace Corps began to place greater emphasis on the recruitment of skilled craftsmen, facilitated by a new policy of accepting volunteers with families. Efforts were also made toward closer consultation with the host countries in designing programs.

Overseas volunteer services similar to the Peace Corps are maintained by several European countries, including France, Germany, and Great Britain. These services, which are not always entirely publicly funded, usually involve one or two years of service by young volunteers in various types of development projects.

Peace Democrat (U.S. history): *see* Copperhead.

Peace Mission, predominantly black 20th-century religious cult in the United States, founded and led by Father Divine (1878/80–1965), who was regarded, or worshiped, by his followers as God, Dean of the Universe, and Harnesser of Atomic Energy.

According to most accounts, Father Divine was born George Baker and reared in Savannah, Ga., during the post-Reconstruction period, when black messiahs flourished in an atmosphere of misery and degradation. He received indelible impressions from his immersion in primitive mysticism and the Holiness and Pentecostal movements.

The transition from George Baker to Major J. Devine to Father Divine essentially was completed when he set up his first "heaven" in Sayville, Long Island, in 1919. Legal entanglements forced him to relocate in Manhattan (Harlem) and Philadelphia, but the cult continued to grow and spread through many cities of the northern and western United States.

Heaven, according to Father Divine, is symbolized by separation of sexes and union of all races in a communion composed of a multicourse feast. He also preached total racial integration, that all things and persons are to be forsaken for the Father, and that heaven is on earth. Although he owned almost nothing directly, a cult of between 500,000 and 2,000,000 followers provided him free access to a fortune worth at least $1,500,000.

Father Divine supported blacks in businesses that became successful and that fulfilled basic needs. The key to Father Divine's success was the devotion of competent disciples. In the late 20th century, this cohesion diminished and the movement dwindled.

Peace of ———: *see under* substantive word (*e.g.*, God, Peace of).

peace pipe: *see* sacred pipe.

Peace River, river in northern British Columbia and Alberta, Canada, forming the southwestern branch of the Mackenzie River system. From headstreams (the Finlay and the Parsnip) in the Canadian Rockies of British Columbia, the Peace flows northeastward across the Alberta prairies, receiving its major tributaries (the Smoky and the Wabasca) before joining the Slave River in Wood Buffalo National Park near the Lake Claire–Lake Athabasca complex. The river's total course (from the head of the Finlay) is 1,195 miles (1,923 km).

The river, named for Peace Point, Alta., where the Cree and Beaver Indians settled their territorial dispute, became an important fur-trade route after it was explored by Sir Alexander Mackenzie (1792–93). Farming, the valley's economic mainstay during the early decades of the 20th century, is now supplemented by lumber, coal, petroleum, and natural gas. In 1968 the W.A.C. Bennett Dam (600 feet [190 m] high and 1.25 miles [2 km] long) near Hudson Hope, B.C., was completed, creating Williston Lake and providing

The Peace River at Taylor Flats, B.C.

the valley with hydroelectric power and flood control. The Peace is navigable from the town of Peace River, Alta., to the Slave, except for a stretch of falls near Fort Vermilion.

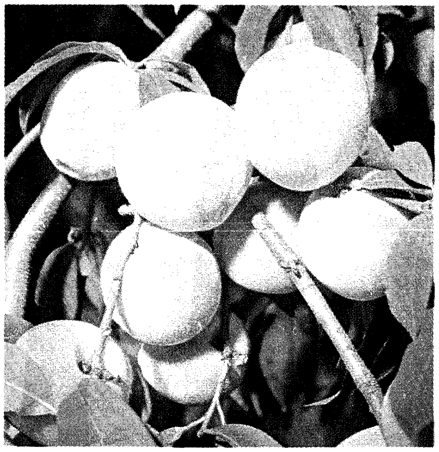
Peacekeeper missile, also called MX, U.S. intercontinental ballistic missile (ICBM) that entered service in 1986.

Under development from 1971, the MX (for "missile experimental") evolved into a 71-foot (22-metre) ICBM with a "bus," or fourth stage, located in its front end that carried 10 or 12 independently targetable thermonuclear warheads. This endowed each missile with several times the firepower of the two- or three-warhead Minuteman III, which it was designed to replace. In addition, the MX's extremely accurate guidance—an inertial system capable of being updated in flight by signals from navigation satellites—gave its 300-kiloton warheads greater potential to destroy reinforced missile silos and command bunkers in the Soviet Union. The MX had a range of approximately 7,000 miles (11,000 km).

In order to be able to evade attack by Soviet ICBMs, which lagged behind U.S. ICBMs in accuracy but were far more powerful, several types of bases for the MX were proposed. These included launching by air from huge transport jets, "deep basing" in silos located more than 1,000 feet (305 m) underground, shuttling the missiles continuously on trucks or rail cars among "multiple protective shelters," and grouping silos close together in a "dense pack," so that incoming nuclear warheads would destroy or deflect one another. All of these modes proved to be prohibitively expensive, and none was politically popular; in 1983 it was decided to place the missiles in Minuteman III silos. Although plans called for 100 Peacekeepers, only 50 were authorized for deployment at Warren Air Force Base, Wyoming.

peach (*Prunus persica*), fruit tree of the rose family (Rosaceae), grown throughout the warmer temperate regions of both the Northern and Southern hemispheres.

Small to medium-sized, the tree seldom reaches 6.5 m (21 feet) in height. Under cultivation, however, it is usually kept between 3 and 4 m (10 and 13 feet) by pruning. Leaves are glossy green, lance-shaped, and long pointed; they usually have glands at their bases that secrete a fluid that attracts ants and



Peach (*Prunus persica*)
Grant Heilman—EB Inc.

other insects. The flowers, borne in the leaf axils, are arranged singly or in groups of two or three at nodes along the shoots of the previous season's growth. The five petals, usually pink but occasionally white, five sepals, and three whorls of stamens are borne on the outer rim of the short tube that forms the base of the flower. The pistil consists of a single carpel with a relatively long style and an enlarged basal portion, the ovary, which becomes the fruit.

The peach develops from a single ovary that ripens into a fleshy, juicy exterior, making up the edible part of the fruit, and a hard interior, called the stone or pit. Of the two ovules in the ovary, usually only one becomes fertilized and develops into a seed, which is enclosed within the stone. This frequently results in one half of the fruit being slightly larger than the other, the two halves forming the slight longitudinal cleft typical of drupe fruits. The flesh may be white, yellow, or red. Varieties may be freestone types, which have stones that separate easily from the ripe flesh, or clingstones, which have flesh that adheres firmly to the stone.

Widely eaten fresh, often with cream, as a dessert fruit, the peach is also baked in pies and cobblers. Canned peaches are a staple commodity in many regions.

The peach probably originated in China, then spread westward through Asia to the Mediterranean countries and later to other parts of Europe. The Spanish explorers brought the peach to the New World, and as early as 1600 the fruit was found in Mexico. Large-scale commercial peach growing did not begin until the 19th century, in the U.S. Early plantings were seedling peaches, inevitably variable, often of poor quality. The practice of budding superior strains onto hardy seedling rootstocks, which came later in the century, led to the development of large commercial orchards.

The peach does well on various soil types ranging from coarse-textured sand or gravelly loams and shales to silt loam, but in general it grows best on well-drained sandy or gravelly loams. On most soils the peach responds well to nitrogen-rich fertilizers or manures, without which satisfactory growth cannot be obtained.

Most peach varieties produce more fruits than can be maintained and developed to full size. Some shedding of fruitlets takes place naturally, about a month to six weeks after full bloom, but the number remaining may have to be reduced further by hand thinning.

Peach trees are relatively short-lived as compared with some other fruit trees. In some regions orchards are replanted after 8 to 10 years, while in others trees may produce satisfactorily for 20 to 25 years or more, depending upon their resistance to diseases, pests, and winter damage.

Worldwide, the peach is the third most important of the deciduous-tree fruits, ranking after the apple and the pear. The U.S., where the peach ranks second to the apple, produces about a fifth of the world's supply. Italy is second, with about one-sixth the world supply. The Soviet Union, France, China, Spain, Greece, Argentina, Japan, Turkey, Mexico, South Africa, and Australia also produce substantial crops.

Peach, Charles William (b. Sept. 30, 1800, Wansford, Northamptonshire, Eng.—d. Feb. 28, 1886, Edinburgh), English naturalist and geologist who made valuable contributions to the knowledge of marine invertebrates and of fossil plants and fish.

While in the revenue coast guard (1824–45) in Norfolk, his attention was attracted to seaweeds and other marine organisms, and he began to collect them. In Cornwall, Peach found fossils in some of the older rocks previously regarded as unfossiliferous. This discovery proved the presence of Bala beds (Ordovician strata, 430,000,000 to 500,000,000 years old) nearby. In 1841 he wrote a paper entitled "On the Fossil Organic Remains Found on the Southeast Coast of Cornwall," and in 1843 he gave an account of his discovery of fish remains in the Devonian slates (345,000,000 to 395,000,000 years old) near Polperro, Cornwall.

Peach was appointed to a position with customs at Fowey, Cornwall, in 1845, and four years later he went to Scotland. He studied the Old Red Sandstone (Devonian strata), the boulder clay of Caithness, and the Carboniferous plants (280,000,000 to 345,000,000 years old) of Scotland. During a stay at Durness, Sutherland, in 1854, he found the first fossils in the Cambrian limestone (500,000,000 to 570,000,000 years old). He also identified many new species of sponges, coelenterates, and mollusks.

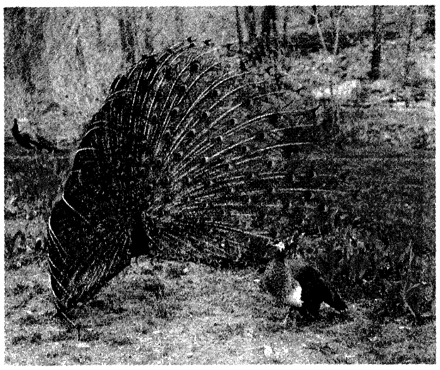
Peacham, Henry (b. *c.* 1576, North Nimms, Hertfordshire, Eng.—d. *c.* 1643), English author best known for his *The Compleat Gentleman* (1622), important in the tradition of courtesy books. Numerous in the late Renaissance, courtesy books dealt with the education, ideals, and conduct befitting a gentleman or lady of the court.

Peacham was educated at Cambridge and was successively schoolmaster, travelling tutor, and author. Of his time as master of the free school at Wymondham, Norfolk, he wrote "whiles that it was free, Myselfe, the Maister, lost my libertie." He wrote on a variety of themes and also published some of his pen-and-ink drawings, but his chief work remained *The Compleat Gentleman.* It was a full expression of his theories on education, and its table of contents exhibits the wide range of his interests: cosmography, geometry, poetry, music, sculpture, drawing, painting, heraldry. Samuel Johnson drew the heraldic definitions for his *Dictionary* from the 1661 edition.

peachblow glass, U.S. art glass made in the latter part of the 19th century by factories such as the Mount Washington Glass Works of New Bedford, Mass., and the New England Glass Company of East Cambridge, Mass. The name is derived from a Chinese porcelain glaze called "peach-bloom." Peachblow is made with either a shiny or a mat finish. Its colours range from bluish white or cream to violet red or pink. The glass is sometimes made with a milk-white lining.

peacock, any of several resplendent birds of the family Phasianidae (order Galliformes). Strictly, the male is a peacock, and the female is a peahen; both are peafowl. Two species of



Peacock (*Pavo cristatus*) displaying before peahen
Norman Tomalin—Bruce Coleman Inc.

Pavo are the blue, or Indian, peacock (*P. cristatus*), of India and Sri Lanka (Ceylon), and the green, or Javanese, peacock (*P. muticus*), from Burma to Java. The Congo peacock (*Afropavo congensis*) was discovered in 1936 after a search that began in 1913 with the finding of a single feather.

In both species of *Pavo,* the male has a 75-centimetre (30-inch) body and 150-centimetre (60-inch) train in which each feather is tipped with an iridescent "eye," ringed with blue and bronze. In display the cock elevates the tail, which lies under the train, thus elevating the train and bringing it forward, as he struts and quivers, audibly rattling the quills.

The blue peacock's body is mostly metallic blue green. The green peacock, with train much like that of the blue, has a green-and-bronze body. Hens of both species are green and brown and almost as big as the male but lack the train and the head ornament. In the wild, both species live in open lowland forests, flocking by day and roosting high in trees. The male forms a harem of one to five hens, each of which lays four to eight whitish eggs in a depression in the ground.

As ornamental birds, peacocks must be kept apart from other fowl, because of their bad disposition. Blue peacocks, though native to hot steamy lands, can survive northern winters; green peacocks, however, cannot tolerate much cold.

The Congo peacock is the only large phasianid in Africa. The cock is mainly blue and green, with a short rounded tail; the hen is reddish and green, with brown topknot.

Peacock, Thomas Love (b. Oct. 18, 1785, Weymouth, Dorset, Eng.—d. Jan. 23, 1866, Lower Halliford, Middlesex), English author who satirized the intellectual tendencies of his

Peacock, oil painting by H. Wallis, 1858; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

day in novels in which conversation predominates over character or plot. His best verse is interspersed in his novels.

Peacock met Shelley in 1812, and the two became such close friends that Shelley made Peacock executor of his will. Peacock spent several months near the Shelleys at Great Marlow in 1817, a period of great importance to his development as a writer. The ideas that lie behind many of the witty dialogues in his books probably found their origin in the conversation of Shelley and his friends. Peacock's essay *The Four Ages of Poetry* (1820) provoked Shelley's famous "Defence of Poetry" (written 1821, pub. 1840).

Peacock considered his novels to be "comic romances." *Headlong Hall* (1816), the first of his seven novels, already sets the pattern of all of them: characters seated at table, eating and drinking, and embarking on learned and philosophical discussions in which many common opinions of the day are criticized.

In his best-known work, *Nightmare Abbey* (1818), romantic melancholy is satirized, with the characters Scythrop drawn from Shelley, Mr. Flosky from Coleridge, and Mr. Cypress from Byron.

Peacock worked most of his life for the East India Company, the last 20 years as its chief examiner.

peacock pine: *see* Japanese cedar.

Peacock Throne, famous golden throne stolen from India by the Persians in 1739. Thereafter lost, it (and its reproductions) remained the symbol of the Persian, or Iranian, monarchy.

The original throne, built for the Mughal emperor Shāh Jahān in the early 17th century, was reportedly one of the most splendorous thrones ever made. It was ascended by silver steps and stood on golden feet set with jewels; and it was backed by representations of two open peacocks' tails, gilded, enamelled, and inset with diamonds, rubies, and other stones. The throne was seized along with other plunder when the Iranian conqueror Nāder Shāh captured Delhi in 1739. Before leaving India, he had a divan made in the same style and brought both Peacock Thrones back to Iran, only to lose both in warfare with the Kurds, who apparently dismantled them and distributed the precious stones and metals. Later Peacock Thrones or divans (probably reproductions) were made for subsequent *shāh*s, notably Fath 'Alī Shāh (reigned 1797–1834). The dazzling chairlike throne used by the two Pahlavi *shāh*s at their coronations (1926, 1941) was a reproduction dating from the Qājār dynasty.

peacock tree: *see* royal poinciana.

peacock worm (*Sabella*), any of a genus of segmented marine worms of the class Polychaeta (phylum Annelida). This type of fanworm (*q.v.*) lives in a tube about 30 to 40 centimetres (12 to 16 inches) long that is open at one end and constructed of mud particles cemented together by mucus. All but the top few centimetres of the tube is buried in the substratum. The front end of the worm has a fan of striped feathery tentacles, used for feeding and respiration, that protrudes from the tube into the overlying seawater. Inorganic and organic particles suspended in the water are trapped in mucus secreted by the tentacles. They are then transported down the tentacles by beating cilia and used either for tube building or passed into the mouth as food. Peacock worms rapidly withdraw their tentacles into the safety of the tube when predators approach. These worms are found both in the intertidal zone and in shallow subtidal areas.

Peak District, hill area in the county of Derbyshire, England, forming the southern end of the Pennines, the upland "spine" of England. The northern half is dominated by high gritstone moorlands, rising to Kinder Scout 2,088 ft (636 m). The limestone central plateau is cut through by scenic dales, notably those of the Rivers Wye and Dove. The Peak District National Park was formed in 1950–51, and its area of 542 sq mi (1,404 sq km) includes parts of Cheshire, Derbyshire, Staffordshire, and South Yorkshire.

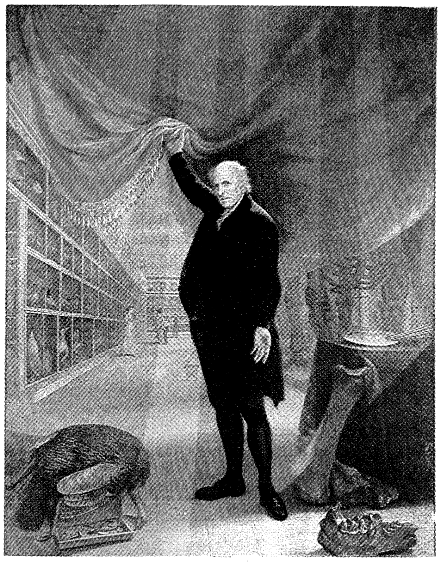
Peak Downs, fertile region of northeast central Queensland, Australia, comprising rolling scrub- and grass-covered country studded with peaks of volcanic rock. Bounded by the Rivers Belyando (west) and Nogoa (east) and drained by the Mackenzie River system, the Downs were once the source of gold and copper. Cattle, sheep, and grains are now produced there, and the region is also a source of timber and coal. Visited in 1844–45 and named for the Peak Range, whose granite summits rise above 2,000 ft (600 m), by the explorer Ludwig Leichhardt, the area was pioneered by pastoralists in 1854. Principal settlements include Clermont, Blair Athol, Emerald, and Springsure.

Peake, Mervyn (b. July 9, 1911, Kuling, Kiangsi Province, China—d. Nov. 17, 1968, Burcot, Oxfordshire, Eng.), English novelist, poet, painter, playwright, and illustrator, best known for the bizarre Titus Groan trilogy of novels and for his illustrations of his novels and of children's stories.

Educated in China and in Kent, Peake went to art school and trained as a painter, but he was stricken with a progressive illness that made him increasingly helpless until his death.

His Titus Groan novels—consisting of *Titus Groan* (1946), *Gormenghast* (1950), and *Titus Alone* (1959)—display a gallery of eccentric and freakish characters in an idiosyncratic Gothic setting. Peake's drawings and paintings, particularly his illustrations for the novels and for children's books, are only a little less known, and his poem *The Glassblowers* (1950) won a literary prize, together with *Gormenghast*. Peake also wrote a play, *The Wit to Woo* (performed 1957).

Peale, Charles Willson (b. April 15, 1741, Queen Annes County, Md., U.S.—d. Feb. 22, 1827, Philadelphia), U.S. painter best remembered for his portraits of the leading figures of the American Revolution and as the founder of the first major U.S. museum.



"The Artist in His Museum," oil painting by Charles Willson Peale, 1822; in the Pennsylvania Academy of the Fine Arts, Philadelphia

By courtesy of the Pennsylvania Academy of the Fine Arts, Philadelphia

Peale—who was a saddler, watchmaker, and silversmith—began his art career by exchanging a saddle for a few painting lessons from John Hesselius. He was also advised and influenced by John Singleton Copley. In 1766 a group of Maryland patrons sent him to London, where he studied for three years with Benjamin West. Peale's ideas were firmly democratic, and it is recorded that he even refused to take off his hat when the coach of King George III passed by.

On his return to America, Peale immediately became the fashionable portrait painter of the middle Colonies. He moved to Philadelphia in 1775, entered wholeheartedly into the Revolutionary movement, and served with the city militia in the Trenton–Princeton campaign. From 1779 to 1780 he represented the "Furious Whig" party in the Pennsylvania assembly, an activity that damaged his professional career. He opened a portrait gallery of Revolutionary heroes in 1782 and in 1786 founded an institution intended for the study of natural law and display of natural history and technological objects. Known as the Peale Museum, it grew to vast proportions and was widely imitated by other museums of the period and later by P.T. Barnum. Located in Independence Hall, the museum was a mélange of Peale's paintings, curious gadgets, and stuffed animals. Its most celebrated exhibit was the first complete skeleton of an American mastodon, unearthed in 1801 on a New York farm. Peale, who had accompanied the expedition, chronicled the excavation in his painting "Exhuming the Mastodon" (1806; Peale Museum, Baltimore).

In his long life, Peale painted about 1,100 portraits, including ones of Washington, Franklin, Jefferson, and John Adams. Crisply outlined and firmly modelled, they paralleled the Neoclassical style developed in France by J.-L. David. His seven life portraits of Washington were repeated many times by himself and other painters of his family. Peale was also a master of *trompe l'oeil* painting; his "The Staircase Group" (1795; Philadelphia Museum of Art), a life-sized double portrait of his sons Raphaelle and Titian, intentionally framed in a real door jamb and with a projecting bottom step, is said to have deceived George Washington into doffing his hat to the boys' images. Peale's brother James (1749–1831) and his sons Raphaelle (1774–1825), Rembrandt (1778–1860), Rubens (1784–1865), and Titian (1799–1881) were also painters.

Peale, Rembrandt (b. Feb. 22, 1778, Bucks County, Pa.—d. Oct. 3, 1860, Philadelphia), U.S. painter, writer, and portraitist of prominent figures in Europe and the post-Revolutionary U.S.

One of the sons of Charles Willson Peale, he studied first with his father, whose sculpturesque Neoclassical style is reflected in "Thomas Jefferson" (1805; New York Historical Society)—Rembrandt Peale's acknowledged masterpiece and the best existing portrait of Jefferson. Peale continued his training at the Royal Academy in London. Between 1808 and 1810 he went to Paris, where his work was admired by Jacques-Louis David, and he was offered the post of court painter to Napoleon.

Apparently because of unfavourable criticism, he ceased to paint for several years, and, following his father's example, he opened a museum and portrait gallery in Baltimore, where he also established the first illuminating-gas works. He sold his museum in 1822; it is now known as the Peale Museum and is devoted to local history.

When he took up painting again he was ambitious to rise above portraiture, so he turned to formal subject pieces. "The Court of Death" (1820; Detroit Institute of Arts) was the culmination of this series. Peale exhibited this painting throughout the country, earning over $8,000 during the first year.

With equal vigour he promoted his portrait of George Washington (1823; Pennsylvania Academy of the Fine Arts, Philadelphia), seeking to replace the popular accepted likeness of Washington, Gilbert Stuart's "Athenaeum" head (1796), with his own work. He had painted Washington from life in 1795, and of this later likeness he painted 76 replicas. Peale's painting and writing—*Notes on Italy* (1831), *Portfolio of an Artist* (1839)—occupied him for the remainder of his life.

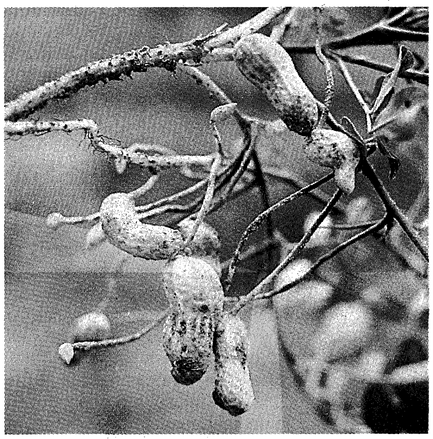
Peano, Giuseppe (b. Aug. 27, 1858, Cuneo, Sardinia—d. April 20, 1932, Turin, Italy), Italian mathematician and a founder of symbolic logic whose interests centred on the foundations of mathematics and on the development of a formal logical language.

He became a lecturer of infinitesimal calculus at the University of Turin in 1884 and professor in 1890. He also held the post of professor at the Accademia Militare, Turin, from 1886 to 1901. His *Formulaire de mathematiques* (Italian *Formulario Mathematico;* "Mathematical Formulary"), published 1894 to 1908 with collaborators, was intended to develop mathematics in its entirety from its fundamental postulates using Peano's logic notation. This work, and others, profoundly changed the outlook of mathematicians and was a major influence upon later efforts to restructure mathematics, notably the program by the French mathematicians whose works appear under the pseudonym Nicolas Bourbaki. Part of Peano's logic notation was adopted by Bertrand Russell and Alfred North Whitehead in their *Principia Mathematica*, 3 vol. (1910–13).

Peano's *Calcolo differenziale e principii di calcolo integrale* (1884; "Differential Calculus and Principles of Integral Calculus") and *Lezioni di analisi infinitesimale*, 2 vol. (1893; "Lessons of Infinitesimal Analysis") are two of the most important works on the development of the general theory of functions since the work of the French mathematician Augustin Cauchy (died 1857). In *Applicazioni geometriche del calcolo infinitesimale* (1887; "Geometrical Applications of Infinitesimal Calculus") Peano introduced the basic elements of geometric calculus and gave new definitions for the length of an arc and for the area of a curved surface. *Calcolo geometrico* (1888; "Geometric Calculus") contains his first work on mathematical logic.

Peano is also known as the creator of *Latino sine Flexione,* later called *Interlingua,* an artificial language. Based upon a synthesis of the vocabulary from Latin, French, German, and English, with a greatly simplified grammar, *Interlingua* was intended for use as an international auxiliary language. Peano compiled a *Vocabulario de interlingua* (1915) and was for a time president of the Academia pro Interlingua.

peanut, also called GROUNDNUT, EARTHNUT, or GOOBER, the pod, or legume, of *Arachis hypogaea* (family Fabaceae), which has the peculiar habit of ripening underground. (Despite its several common names, it is not a true nut.)



Peanut (*Arachis hypogaea*)
G. Tomsich—Photo Researchers

It is a concentrated food; pound for pound, peanuts have more protein, minerals, and vitamins than beef liver; more fat than heavy cream; and more food energy (calories) than sugar. The plant is an annual, ranging from an erect or bunch form 450–600 millimetres (18–24 inches) high, with short branches, to a spreading, or runner, form 300–450 mm high with branches up to 600 mm long that lie close to the soil. The stems and branches are sturdy and hairy; leaves are pinnately compound with two pairs of leaflets. The flowers are borne in the axils of the leaves; what appears to be a flower stalk is a slender calyx up to 40 mm long; the golden-yellow petals are about 10 mm across. The pods are most commonly 25–50 mm long, with two or three seeds, oblong, roughly cylindrical with rounded ends, contracted between the seeds, and have a thin, netted, spongy shell. The seeds vary from oblong to nearly round; seed coat colours range from whitish to dark purple, but mahogany red, rose, and salmon predominate.

After pollination and the withering of the flower, an unusual stalklike structure called a peg is thrust from the base of the flower toward the soil. In the pointed tip of this slender, sturdy peg the fertilized ovules are carried downward until the tip is well below the soil surface. Only then does the tip start to develop into the characteristic pod. The pegs sometimes reach down 100 mm or more before their tips can develop fruits. The fruits appear to function as roots to some degree, absorbing mineral nutrients directly from the soil. The pods may not develop properly unless the soil in which they lie is well supplied with available calcium, regardless of the nutrients available to the roots.

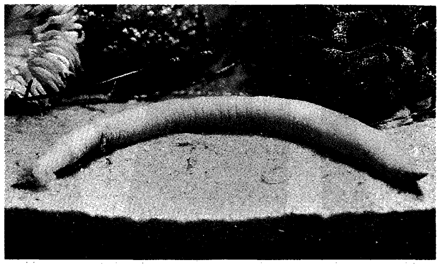
Native to tropical South America, the peanut was at an early time introduced into the Old World tropics. India, China, West Africa, and the U.S. have become the largest commercial producers of peanuts.

Peanut growing requires at least five months of warm weather with rainfall (or irrigation equivalent) of 600 mm or more during the growing season. In Asia the peanut is grown under irrigation. The best soils are well-drained sandy loams underlain by deep, friable loam subsoils. At harvest the entire plant, except the deeper roots, is removed from the soil. The nuts are best cured by allowing the harvested plants to wilt for a day, then placing them for four to six weeks in stacks built around a sturdy stake driven upright into the soil. The pods are placed toward the inside of each stack to protect them from weather.

The peanut is grown mainly for its edible oil, except in the U.S., where it is produced for grinding into peanut butter (half the harvested crop); for roasted, salted nuts; and for use in candy and bakery products. A small percentage of the U.S. crop is crushed for oil. In the southern U.S. the peanut is used extensively as feed for livestock. The tops of the plants, after the pods are removed, usually are fed as hay, although the entire plant may be so used. The development of some 300 derivative products from peanuts—including flour, soaps, and plastics—stems mainly from research conducted in the early 20th century by George Washington Carver (*q.v.*).

Peanuts, comic strip drawn and authored by Charles Schulz (*q.v.*).

peanutworm, also called SIPUNCULID, any member of the invertebrate phylum Sipuncula, a group of elongated, often spindle-shaped, unsegmented marine worms. The head usually has one or more rings of tentacles. Peanutworms vary in length from a few to 300 millimetres (1 inch) or more in length. Though rare, they may be locally common on seabeds throughout the oceans of the world. Peanut-

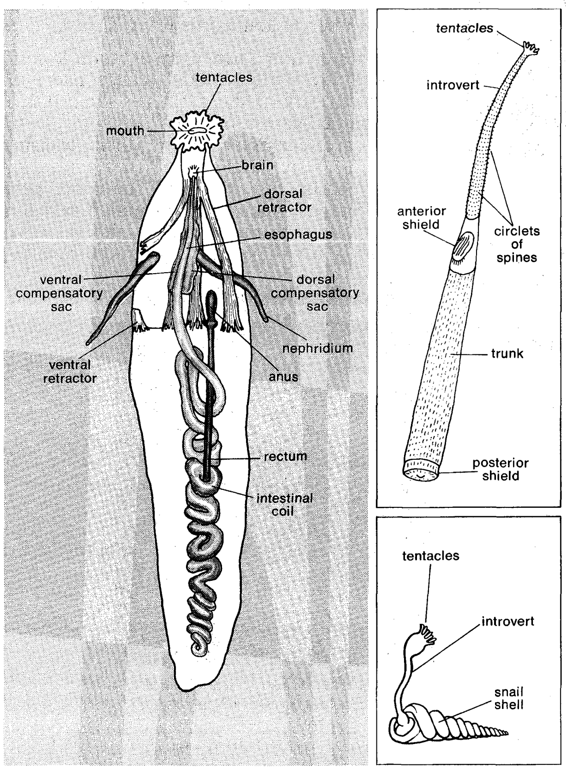


Peanutworm
Bucky Reeves—The National Audubon Society Collection/Photo Researchers

worms are bottom-dwelling (benthic) animals; most burrow in the mud or sand between tide levels or in oozes of the deepest ocean trenches. Some species have other habitats and live in discarded mollusk shells, in sponge siphons, in corals, among the twisted tubes of encrusting polychaetes (marine annelid worms), and even in tangled roots of marine plants.

Life cycle. Externally the sexes are alike and separate, with one exception. Gametes (mature germ cells) are shed into the body cavity and collect in nephridia (excretory organs) that become modified as egg- and sperm-storage organs; they are emitted into the sea from nephridiopores. Fertilization takes place outside the body. The trochophore (free-swimming) larva, which results from spiral cleavage of the zygote (the cell formed by two gametes), undergoes metamorphosis to its characteristic shape.

Form and function. Peanutworms consist of a muscular trunk, cylindrical to globular in shape, and a slender, anterior introvert (retractable proboscis) that is muscular, highly extensible, and capable of being withdrawn



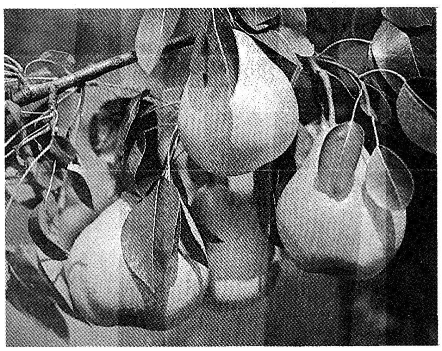
Principal parts of peanutworms
(Left) *Sipunculus nudus*, (top) *Aspidosiphon*, and (bottom) *Phascolion*
From *Invertebrate Zoology* by Paul A. Meglitsch. Copyright © 1967 by Oxford University Press, Inc. Reprinted by permission

into the trunk by retractor muscles. Hooks or spines are often present toward the tip of the introvert, while glandular pores and papillae are scattered over both trunk and introvert. Within the body cavity (coelom) a long alimentary canal spirals backward from the mouth to the posterior region of the trunk, then forward to the dorsal anus near the anterior end of the trunk. A contractile vessel, or compensatory sac associated with the esophagus, extends forward to the tentacles. Fluid passes to extended tentacles, returning to the vessel as they contract; both this and coelomic fluid contain blood cells with hemerythrin. One or two nephridia discharge to the exterior. Gonads develop at the base of the ventral retractor muscles.

Classification. The affinities of the peanutworms are obscure. Their development, like that of spoonworms (echiuroids), resembles that of annelids in that spiral cleavage and a trochophore larva occur. They differ from annelids, however, in their unsegmented bodies and absence of setae. They differ from spoonworms by the absence of setae, anterior anus, absence of anal vesicles, and presence of tentacles surrounding the mouth at the tip of the introvert. Fossils from the Middle Cambrian have been considered to be sipunculan.

pear, any of several species of *Pyrus,* especially *Pyrus communis,* of the rose family (Rosaceae), one of the most important fruit trees of the world, cultivated in all temperate-zone countries of both hemispheres.

The pear tree is broad-headed and up to 13 metres (about 43 feet) high at maturity;



Pear (*Pyrus communis*)
Grant Heilman—EB Inc.

it is taller and more upright than the apple tree. The roundish to oval, leathery leaves, somewhat wedge-shaped at their bases, appear about the same time as the flowers, which are 25 millimetres (one inch) wide and usually white. The pear flower, similar to that of the apple, differs in that the bases of the five styles are separated.

Pears are generally sweeter and of softer texture than apples. The fruit is distinguished by the presence of hard cells in the flesh, the so-called grit, or stone cells, which are absent in apples. In general, pear fruits are elongate, being narrow at the stem end and broader at the opposite end, although some types are apple-shaped.

The common pear, probably of European origin, has been cultivated since long before the Christian era. Thousands of varieties have been bred and named since ancient times in Europe alone. The pear was introduced into the New World by British and other Europeans as soon as the colonies were established. Also at an early date, Spanish missionaries carried the fruit to Mexico and California.

The pear is propagated by budding or grafting onto a rootstock. Many are grafted on seedling pears, usually of *Pyrus communis* origin. In Europe the main rootstock used is quince, which produces a dwarfed tree that fruits at an earlier age than most of the trees on pear rootstocks.

Pear trees are relatively long lived (50 to 75 years) and may reach considerable size unless carefully trained and pruned. Within four to seven years of setting out, the tree begins to bear satisfactorily; at age 20 to 25 it should yield 25 to 45 bushels of fruit.

The pear is commercially the second most important of the world's deciduous fruit trees, exceeded only by the apple. In the U.S., however, the pear ranks third, after the apple and peach.

In most pear-growing countries of the world outside Asia, by far the most widely grown pear variety is Williams' Bon Chrêtien, known in America as Bartlett. In the U.S. and Canada, varieties such as Beurre Bosc, Beurre d'Anjou, and Winter Nelis are grown. A highly popular variety in England and The Netherlands is Conference and in Italy, after Williams', are Curato, Coscia, and Passe Crassane, the last named being also popular in France. The pear often acclaimed as having the finest flavour and texture is Doyenne du Comice, first produced in France in 1849. In Asiatic countries the pear crop comprises primarily local varieties of native species.

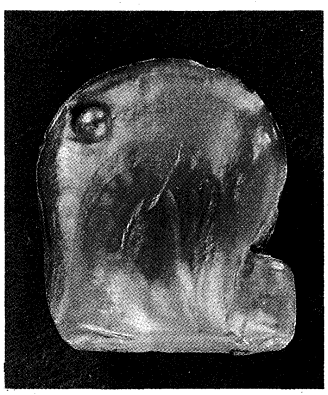
Italy is the world's leading pear producer, followed by China and the U.S. Other countries producing sizable quantities are France, Japan, Spain, Germany, Turkey, Australia, Bulgaria, and South Africa.

In the U.S., Canada, New Zealand, South Africa, and Australia, a large percentage of the crop is used for canning. In Europe, canning is secondary to the use of pears for desserts and for perry.

Pearic languages, small group of languages spoken mainly in Kampuchea (Cambodia), classified as Mon-Khmer languages in the Austro-Asiatic phylum. Included are Chong, Pear, Samre, Saoch, and possibly Angrak, located in the Poŭthĭsăt, Kâmpôt, and Siĕmréab provinces, in Kampuchea, and in Trat Province, Thailand. The languages are sometimes subgrouped with the Khmer language but are generally considered distinct, with a large number of loanwords from Khmer.

pearl, concretion formed by a mollusk consisting of the same material (called nacre or mother-of-pearl) as the mollusk's shell. It is a highly valued gemstone (*q.v.*).

Pearls are characterized by their translucence and lustre and by a delicate play of surface colour called orient. The more perfect its shape (spherical or droplike) and the deeper its lustre, the greater is the value of the pearl. Only those pearls produced by mol-



Blister pearl attached to the shell of an Oriental pearl oyster (*Pinctada martensii Dunker*)
By courtesy of The American Museum of Natural History, New York

lusks whose shells are lined with mother-of-pearl (*e.g.,* certain species of both saltwater oysters and freshwater clams) are really fine pearls; pearls from other mollusks are reddish or whitish, porcellaneous, or lacking in pearly lustre. Jewellers commonly refer to saltwater pearls as Oriental pearls and to those produced by freshwater mollusks as freshwater pearls.

The chief component of the nacre that constitutes the pearl is aragonite ($CaCO_3$). Nacre also contains a small amount of conchiolin, a hornlike organic substance (albuminoid) that is the main consituent of the mollusk's outer shell. The shell-secreting cells of the mollusk are located in the mantle, or epithelium, of its body; when a foreign particle penetrates the mantle, the cells attach to the particle and build up more or less concentric layers of pearl around it. Irregularly shaped pearls called baroque pearls are those that have grown in muscular tissue; pearls that grow adjacent to the shell are often flat on one side and are called blister pearls.

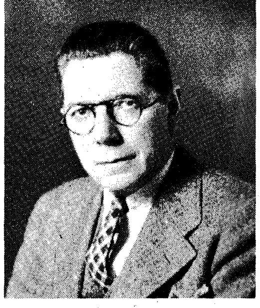
The colour of pearls varies with the mollusk and its environment. It ranges from black to white, with the rose of Indian pearls esteemed most. Other colours are cream, gray, blue, yellow, lavender, green, and mauve. All occur in delicate shades. The surface of a pearl is rough to the touch. Pearls come in a wide range of sizes. Those weighing less than 1/4 grain (1 pearl grain = 50 milligrams = 1/4 carat) are called seed pearls. The largest naturally occurring pearls are the baroque pearls; one such pearl is known to have weighed 1,860 grains.

The finest Oriental pearls are produced by the *mohar,* a variety of the *Pinctada martensii* species of saltwater mollusk. Found in the Persian Gulf, with the richest harvest taken from the waters off the great bight that curves from the peninsula of Oman to that of Qatar, the pearls come from depths of 8 to 20 fathoms (48 to 120 feet). Other notable sources of fine-quality pearls include the Gulf of Mannar between South India and Sri Lanka; the waters off Celebes, Indonesia; and the islands of the South Pacific. In the Americas, the Gulf of California, the Gulf of Mexico, and the waters of the Pacific coast of Mexico have yielded dark-hued pearls with a metallic sheen as well as white pearls of good quality.

Freshwater mussels in the temperate zone of the Northern hemisphere have produced pearls of great value, as for example those from the Mississippi River. Pearling is a carefully fostered industry in central Europe, and the forest streams of Bavaria, in particular, are the source of choice pearls. Freshwater pearling in China has been known from before 1000 BC. In all pearl fisheries, however, production has declined significantly since the widespread introduction of cultured pearls (*see* cultured pearl.

Pearl, Raymond (b. June 3, 1879, Farmington, N.H., U.S.—d. Nov. 17, 1940, Hershey, Pa.), U.S. zoologist, one of the founders of biometry, the application of statistics to biology and medicine.

As an instructor at the University of Michigan, where he had earned a Ph.D. in zoology (1902), Pearl recognized the advantages to be gained from applying standard statistical pro-



Pearl

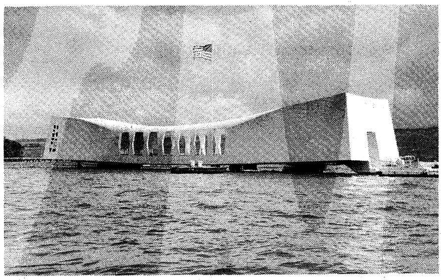
cedures to biological problems. He served as head of the biology department at the Maine Agricultural Experimental Station (1907–18) and as chief of the statistical division of the U.S. Food Administration (1917–19). He was then invited to organize the department of medical statistics and biometry at Johns Hopkins University. Pearl founded the *Quarterly Review of Biology* (1926) and *Human Biology* (1929) and was the author of more than 700 articles and books, including *Introduction to Medical Biometry and Statistics* (1923), which became a prototype for such college texts.

Pearl Harbor, naval base and headquarters of the U.S. Pacific Fleet, Honolulu county, southern Oahu Island, Hawaii, U.S. In U.S. history the name recalls the Japanese surprise air attack on Dec. 7, 1941, that temporarily crippled the U.S. Fleet and resulted in the United States' entry into World War II. (*See*



USS *Arizona* National Memorial in Pearl Harbor, Oahu, Hawaii
Charles Giugno

Pearl Harbor Attack.) Pearl Harbor centres on a cloverleaf-shaped, artificially improved harbour on the southern coast of Oahu, 6 miles (10 km) west of Honolulu. The harbour is virtually surrounded (west to east) by the cities of Ewa, Waipahu, Pearl City, Aiea, and Honolulu. It has 10 square miles (26 square km) of navigable water and hundreds of anchorages and covers a land area of more than 10,000 acres (4,000 hectares). Its four lochs are formed by the Waipio and Pearl City peninsulas and Ford Island. Pearl Harbor Entrance (channel) connects its virtually landlocked bay with the Pacific Ocean.

Pearl Harbor was called Wai Momi ("pearl waters") by the Hawaiians because of the pearl oysters that once grew there. In 1840 Lieutenant Charles Wilkes of the U.S. Navy made the first geodetic survey and urged the dredging of the coral-bar entrance to the harbour. About 30 years later, Colonel John McAllister Schofield further recommended that the United States secure harbour rights. A subsequent treaty (1887) granted the United States the exclusive use of the harbour as a coaling and repair station, but work was not begun until after 1898, when the Spanish-American War indicated its strategic value as a Pacific base. A naval station was established after 1908, and a drydock was completed in 1919.

During the Pearl Harbor Attack in 1941 the USS *Arizona* sank with a loss of more than 1,100 men; a white concrete and steel structure now spans the hull of the sunken ship, which was dedicated as a national memorial on May 30, 1962. Present facilities at Pearl Harbor include a naval shipyard, supply centre, and submarine base. The naval supply centre is on Pearl City Peninsula. Pearl Harbor Entrance is bounded on the east by Hickam Air Force Base and on the west by a naval reservation. During the Korean and Vietnam wars the harbour complex was a staging area for forces and equipment bound for the combat zones.

Pearl Harbor Attack (Dec. 7, 1941), surprise aerial attack on the U.S. naval base at Pearl Harbor on Oahu Island, Hawaii, by the Japanese that precipitated the entry of the United States into World War II. The attack climaxed a decade of worsening relations between the United States and an increasingly expansionist and militaristic Japan. Japan's invasion of China in 1937, its subsequent alliance with the Axis powers (Germany and Italy) in 1940, and its occupation of French Indochina in July 1941 prompted the United States to respond that same month by freezing Japanese assets in the United States and declaring an embargo on petroleum shipments and other vital war materials to Japan. By late 1941 the United States had severed practically all commercial and financial relations with Japan. Though Japan continued to negotiate with the United States up to the day of the Pearl Harbor attack, the government of Prime Minister Tōjō Hideki decided on war.

Admiral Yamamoto Isoroku, the commander in chief of Japan's Combined Fleet, had planned the attack against the U.S. Pacific Fleet with great care. Once the U.S. fleet was out of action, the way for the unhindered Japanese conquest of all of Southeast Asia, the Indonesian Archipelago, and the South Pacific would be open. On November 26 a Japanese fleet, under Vice Admiral Nagumo Chuichi and including 6 aircraft carriers, 2 battleships, 3 cruisers, and 11 destroyers, sailed to a point some 275 miles (440 km) north of Hawaii. From there, a total of about 360 planes was launched.

The first Japanese dive bomber appeared over Pearl Harbor at 7:55 AM (local time). It was followed by a first wave of nearly 200 aircraft, including torpedo planes, bombers, and fighters. The reconnaissance at Pearl Harbor had been lax; a U.S. Army private who noticed this large flight of planes on his radar screen was told to ignore them, since a flight of B-17s from the United States was expected at that time. The anchored ships in the harbour made perfect targets for the Japanese bombers, and since it was Sunday morning (a time chosen by the Japanese for maximum surprise) they were not fully manned. Similarly, the U.S. military aircraft were lined up on the airfields of the Naval Air Station on Ford Island and adjoining Wheeler and Hickam Fields to guard against sabotage, and very few became airborne. Most of the damage to the battleships was inflicted in the first 30 minutes of the assault. The *Arizona* was completely destroyed and the *Oklahoma* capsized. The *California, Nevada,* and *West Virginia* sank in shallow water. Three other battleships, three cruisers, three destroyers, and other vessels were also damaged. More than 180 aircraft were destroyed. U.S. military casualties totaled more than 3,400, including more than 2,300 killed. The Japanese lost from 29 to 60 planes, five midget submarines, perhaps one or two fleet submarines, and fewer than 100 men.

The Pearl Harbor Attack severely crippled U.S. naval and air strength in the Pacific. However, the three aircraft carriers attached to the Pacific Fleet were not at Pearl Harbor at the time and thus escaped. Of the eight battleships, all but the *Arizona* and *Oklahoma* were eventually repaired and returned to service, and the Japanese failed to destroy the important oil storage facilities on the island. The "date which will live in infamy," as U.S. President Franklin Roosevelt termed it, unified the U.S. public and swept away any earlier support for neutrality. On December 8 Congress declared war on Japan with only one dissenting vote (Representative Jeannette Rankin of Montana, who had also voted against U.S. entry into World War I).

The extent of the disaster and the unpreparedness of the U.S. military provoked considerable criticism. Admiral Husband Kimmel and General Walter Short, the Navy and Army commanders on Oahu, were relieved of duty, and official investigations were begun at once. Some historians and others went so far as to accuse President Roosevelt of having invited the attack (or at least done nothing to stop it) in order to bring the United States into the war against the Axis. However, later investigations indicated that, while U.S. officials had been aware that an attack by Japan was probable, they had no knowledge of the time or place at which it would occur.

Pearl Islands, Spanish ARCHIPIÉLAGO DE LAS PERLAS, archipelago, in the Gulf of Panama, about 50 miles (80 km) southeast of Panama City, consisting of 183 islands, of which 39 are sizable. The most important islands include the mountainous del Rey Island on which the principal town, San Miguel, is located; San José; Pedro González; and Saboga. The islands are visited by fishermen in search of the fishes that abound in the local waters. Pop. (1980) 2,942.

Pearl River, river in the southern United States, rising in east-central Mississippi and flowing southwestward, through Jackson, the capital of the state, then generally southward into Louisiana, past Bogalusa, and emptying into Mississippi Sound on the Gulf of Mexico. West of Picayune, Miss., the river divides into two streams: the East Pearl, which enters the sound near Grand Island, and the West Pearl, which parallels the East Pearl several miles to the west. Approximately 411 miles (661 km) long, the Pearl and its tributaries (Yockanookany and Strong rivers and the Bogue Chitto) drain about 7,600 square miles (19,700 square km). Locks on the West Pearl (1953) provide a 7-foot (2-metre) channel from the mouth to Bogalusa (58 miles [93 km] upstream). Chief river cities are Columbia, Monticello, and Jackson, all in Mississippi, and Bogalusa, in Louisiana. The Ross Barnett Reservoir north of Jackson provides water, flood and pollution control, and recreation facilities. The lower course of the Pearl and the East Pearl form the boundary between Mississippi and Louisiana. Honey Island Swamp, lying in the mid-delta area southwest of Picayune, is noted for its wildlife and fishing.

Pearl River Delta, Chinese (Wade–Giles) CHU CHIANG SAN-CHIAO-CHOU, (Pinyin) ZHU JIANG SANJIAOZHOU, also called CANTON DELTA, extensive low-lying area formed by the junction of the Hsi, Pei, Tung, and Pearl (Chu) rivers in south Kwangtung province, China. It covers an area of 2,900 square miles (7,500 square km) and stretches from the city of Canton (north) to the Portuguese overseas territory of Macau (south). The delta is a maze of streams and canals between small rice paddies that, because of the 12-month growing season, commonly support three rice crops annually. It is one of the most crowded areas of China. Fishing, silk weaving, and the raising of hogs and poultry supplement the farm-crop income.

pearlfish, also called FIERASFER, or CUCUMBER FISH, any of about 27 species of slim, eel-shaped marine fishes of the family Carapidae noted for living in the bodies of sea cucumbers, pearl oysters, starfishes, and other invertebrates. Pearlfishes are primarily tropical and are found around the world, mainly in shallow water. They are elongated, scaleless, and often transparent. The long dorsal and anal fins meet at the tip of the long, pointed tail. Most pearlfishes are about 15 cm (6 inches) or less in length. They penetrate sea cucumbers by way of the anus of the host, in some instances apparently feeding on its reproductive and respiratory organs.

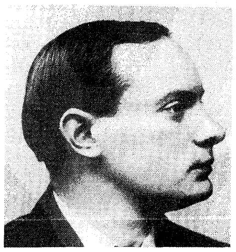
pearlstone (natural glass): *see* perlite.

Pears, Sir Peter (Neville Luard) (b. June 22, 1910, Farnham, Surrey, Eng.—d. April 3, 1986, Aldeburgh, Suffolk), British tenor, a singer of outstanding skill and subtlety who was closely associated with the works of Sir Benjamin Britten. He received a knighthood in 1977.

Pears studied at Oxford, at the Royal College of Music, and then with Elena Gerhardt and Dawson Freer. In 1936 he met Britten, and in 1938 he gave the first of many song recitals with Britten as accompanist. The two men became lifelong companions. In 1942 Pears made his opera debut in London in Jacques Offenbach's *Tales of Hoffman.* He then joined the Sadler's Wells Opera, where he created the title role in Britten's *Peter Grimes* (1945). In 1946 Pears helped Britten found the English Opera Group, and in 1947 they were instrumental in founding the Aldeburgh Festival.

Pears sang in the first performances of all of Britten's operas, including *Albert Herring, Billy Budd, Owen Wingrave,* and *Death in Venice.* He also performed notably in Wolfgang Amadeus Mozart's *Die Zauberflöte,* Bedřich Smetana's *The Bartered Bride,* and much of the Italian operatic repertory as well as in the song cycles of Robert Schumann and Franz Schubert and the Passions of J.S. Bach.

Pearse, Patrick Henry, Patrick also spelled in Irish PÁDRAIC (b. Nov. 10, 1879, Dublin—d. May 3, 1916, Dublin), leader of Irish nationalism and Irish poet and educator. He



Pearse
BBC Hulton Picture Library

was the first president of the provisional government of the Irish Republic proclaimed in Dublin on Easter Monday, April 24, 1916, and was commander in chief of the Irish forces in the anti-British uprising that began on the same day.

The son of an English sculptor and his Irish wife, Pearse became a director of the Gaelic League (founded 1893 for the preservation of the Irish language) and edited (1903–09) its weekly newspaper, *An Claidheamh Soluis* ("The Sword of Light"). To promote further the Irish language as a weapon against British domination, he published tales from old Irish manuscripts and a collection (1914) of his own poems in the modern Irish idiom. He founded St. Enda's College, near Dublin (1908), as a bilingual institution with its teaching based on Irish traditions and culture.

On the formation (November 1913) of the Irish Volunteers as a counterforce against the Ulster Volunteers (militant supporters of the Anglo-Irish union), Pearse became a member of their provisional committee, and he contributed poems and articles to their newspaper, *The Irish Volunteer.* In July 1914 he was made a member of the supreme council of the Irish Republican Brotherhood (IRB). After the Irish Volunteers split (September 1914), he became a leader of the more extreme Nationalist section, which opposed any support for Great Britain in World War I. He came to believe that the blood of martyrs would be required to liberate Ireland, and on that theme he delivered a famous oration at the burial (August 1915) of Jeremiah O'Donovan, known as O'Donovan Rossa, a veteran of Sinn Féin.

As an IRB supreme council member, Pearse helped to plan (January 1916) the Easter Rising. On Easter Monday he proclaimed the provisional government of the Irish Republic from the steps of Dublin General Post Office. On April 29, when the revolt was crushed, he surrendered to the British. After a court-martial, he was shot by a firing squad. More than any other man, Pearse was responsible for establishing the republican tradition in Ireland.

Pearse's *Collected Works* appeared in 1917–22 (3 vol.) and again in 1924 (5 vol.), and his *Political Writings and Speeches* in 1952. *Patrick H. Pearse,* Desmond Ryan's English translation of Louis N. Le Roux's *Vie de Patrice Pearse,* was published in 1932.

Pearson, Drew, byname of ANDREW RUSSELL PEARSON (b. Dec. 3, 1897, Evanston, Ill., U.S.—d. Sept. 1, 1969, Rockville, Md.), one of the most influential newspaper columnists in the United States.

Pearson was the son of a Quaker professor who became governor of the U.S. Virgin Islands. He was educated at Phillips Exeter Academy and attended Swarthmore College, where he was elected to Phi Beta Kappa and graduated in 1919. After traveling in postwar Europe, he taught industrial geography for three years at the University of Pennsylvania, quit teaching, and settled on a career in journalism. He combined reporting and lecturing on his travels with interviews and covered numerous major international events, including anti-foreigner strikes in China in 1925 and the Geneva Naval Conference of 1927. He was on the staff of the *United States Daily* from 1926 to 1933 and wrote for the Baltimore *Sun* from 1929 to 1932. Pearson and Robert S. Allen, another Washington, D.C., reporter, wrote a book, *Washington Merry-Go-Round* (1931), a gossipy treatment of the scene in the U.S. capital. He and Allen were fired for writing the irreverent book, but its success brought them an invitation to write a column with the same name for syndication. The column first appeared in 1932, setting a style for many similar columns by other writers. Pearson and Allen went their separate ways in 1942, Allen to do a column of his own, while Pearson continued "Washington Merry-Go-Round."

As his reputation grew Pearson visited and interviewed many world leaders, among them Premier Nikita S. Khrushchev of the Soviet Union. In 1947 he hired as a reporter Jack Anderson, who became his partner in 1965 and inherited the column on Pearson's death. Among Pearson's books was *Will Khrushchev Bury Us?* (1962). He began to keep an informal diary in 1949 and continued it until his death. Portions were published in 1974 as *Drew Pearson's Diaries: 1949–1959.*

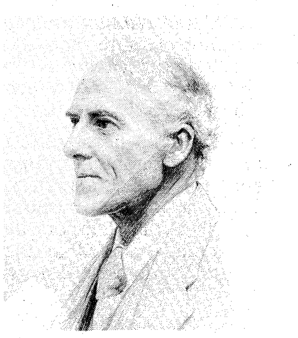
Pearson, Hesketh (b. Feb. 20, 1887, Hawford, Worcestershire, Eng.—d. April 9, 1964, London), English actor, director, and biographer.

After attending the Bedford Grammar School, he took his first job in a shipping office. In 1911 Pearson turned to the theatre, but his acting career was interrupted by World War I; he joined the army and fought as a private in Mesopotamia and Persia from 1914 to 1918. Pearson then returned to the stage as both actor and director. It was not until 1921 that he began his career as a writer, with *Modern Men and Mummies* (1921), which contained amusing portraits of his prominent contemporaries in the theatre.

Pearson's output largely consisted of lively and popular biographies of famous literary and artistic figures. Among such works are *Doctor Darwin* (1930); *Gilbert and Sullivan* (1935); *A Life of Shakespeare* (1942); *G.B.S: A Full-Length Portrait* (1942); *Conan Doyle: His Life and Art* (1943); *The Life of Oscar Wilde* (1946); *The Man Whistler* (1952); and *Henry of Navarre* (1963). A posthumous autobiography, *Hesketh Pearson, by Himself,* appeared in 1965.

Pearson, Karl (b. March 27, 1857, London—d. April 27, 1936, London), English mathematician, one of the founders of modern statistics.

Part of Pearson's multifaceted nature is revealed by his three-year law practice begun in 1881, his radical political activities in London, and the publication of two literary works by him—*The New Werther* (1880) and *The Trinity: A Nineteenth Century Passion-Play* (1882). In 1884 he was appointed professor of applied mathematics and mechanics at University College, London, where he taught, until his retirement in 1933, as Gresham professor of geometry (1891), head of the department of applied mathematics (1907), and Galton professor of eugenics (1911). Pearson's lectures as professor of geometry evolved into *The Grammar of Science* (1892), his most widely read book and a classic in the philosophy of science.

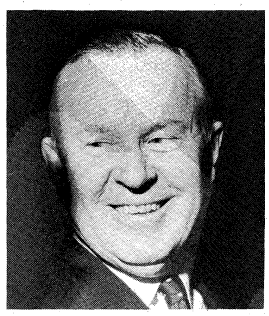


Karl Pearson, pencil drawing by F.A. de Biden Footner, 1924
By courtesy of Professor D.V. Lindley; photograph, J.R. Freeman & Co. Ltd.

Stimulated by the evolutionary writings of Francis Galton and a personal friendship with Walter F.R. Weldon, Pearson became immersed in the problem of applying statistics to biological problems of heredity and evolution. The methods he developed are essential to every serious application of statistics. From 1893 to 1912 he wrote a series of 18 papers entitled *Mathematical Contributions to the Theory of Evolution,* which contained much of his most valuable work, including the chi-square test of statistical significance. He was a cofounder (with Galton and Weldon), editor of (1901–36), and major contributor to the statistical journal *Biometrika.* He was also editor of *The Annals of Eugenics* (1925–36).

Pearson's other works include *The Chances of Death and Other Studies in Evolution* (1897); *The Life, Letters and Labours of Francis Galton* (1914, 1930); *Tables for Statisticians and Biometricians* (1914, 1931); *Tables of the Incomplete Gamma Function* (1922); and *Tables of the Incomplete Beta Function* (1934).

Pearson, Lester B(owles) (b. April 23, 1897, Toronto—d. Dec. 27, 1972, Ottawa), politician, diplomat, and prime minister of Canada, who was prominent as a mediator in international disputes in 1963–68.



Lester Pearson, 1963
Canadian Press

Pearson served in World War I (1914–18) and lectured in history at the University of Toronto (1924–28), after studying there and at the University of Oxford. He joined the Canadian foreign service in 1928 and became first secretary in the Department of External Affairs. He served on two royal commissions (1931) and as counselor of the Canadian high commissioner's office in London (1935).

Recalled to Canada in 1941, Pearson then served as ambassador to the United States in 1945–46. He headed the Canadian delegation at the United Nations from 1948 to 1956, and he was president of the United Nations General Assembly in 1952–53. In 1948 he became secretary of state for external affairs in the Liberal government of Louis Saint Laurent and entered Parliament for Algoma East. He represented Canada at the founding of the North Atlantic Treaty Organization (NATO) in 1949, and in 1951 he was chairman of that organization. In 1957 he received the Nobel Prize for Peace for his efforts to solve the Suez crisis of 1956. Pearson succeeded Saint Laurent as leader of the Liberal Party in 1958 and became prime minister in 1963; he resigned as prime minister in 1968 and retired from politics.

Pearson, Weetman Dickinson: *see* Cowdray of Midhurst, Weetman Dickinson Pearson, 1st Viscount.

Peary, Robert Edwin (b. May 6, 1856, Cresson, Pa., U.S.—d. Feb. 20, 1920, Washington, D.C.), U.S. Arctic explorer usually credited with leading the first expedition to reach the North Pole (1909).

Peary entered the U.S. Navy in 1881 and pursued a naval career until his retirement, with leaves of absence granted for Arctic exploration. In 1886, with his black American associate Matthew Henson, he traveled inland from Disko Bay over the Greenland ice sheet for 100 miles (161 km), reaching a point 7,500 feet (2,287.5 m) above sea level. In 1891 Peary returned to Greenland with seven companions, including his wife and Frederick A. Cook, who in 1909 would claim to have reached the North Pole before Peary. On this expedition Peary sledged 1,300 miles (2,100 km) to northeastern Greenland, discovered Independence Fjord, and found evidence of Greenland's being an island. He also studied the "Arctic Highlanders," an isolated Eskimo tribe who helped him greatly on later expeditions.

During his expedition of 1893–94 he again sledged to northeastern Greenland—this time in his first attempt to reach the North Pole. On summer trips in 1895 and 1896 he was mainly occupied in transporting masses of meteoric iron from Greenland to the United States. Between 1898 and 1902 he reconnoitred routes to the pole from Etah, in Inglefield Land, northwestern Greenland, and from Fort Conger, Ellesmere Island, in the Canadian Northwest Territories. On a second attempt to reach the pole he was provided with a ship built to his specifications, the *Roosevelt,* which he sailed to Cape Sheridan, Ellesmere Island, in 1905. But the sledging season was unsuccessful owing to adverse weather and ice conditions, and his party reached only 87°06′ N. Peary returned to Ellesmere in 1908 for his third attempt and early the following March left Cape Columbia on his successful journey to the pole. On the last stage of the trek he was accompanied by Henson and four Eskimo. Peary and his companions purportedly reached the North Pole on April 6, 1909. Peary returned to civilization only to discover that his former colleague, Cook, was claiming to have reached the North Pole independently in April 1908. Cook's claim, though subsequently discredited, marred Peary's enjoyment of his triumph. In 1911 Peary retired from the navy with the rank of rear admiral. His published works include *Northward over the "Great Ice"* (1898), *The North Pole* (1910), and *Secrets of Polar Travel* (1917).

Peary's claim to have reached the North Pole was almost universally accepted, but in the 1980s the examination of his 1908–09 expedition diary and other newly released documents cast doubt on whether he had actually reached the pole. Through a combination of navigational mistakes and record-keeping errors, Peary may actually have advanced only to a point 30–60 miles (50–100 km) short of the pole. The truth remains uncertain.

Peary Land, region, northern Greenland, extending about 200 miles (320 km) east and west along the Arctic Ocean, between Victoria Fjord and the Greenland Sea. One of the northernmost land regions of the world, ending at Cape Morris Jesup, it is Greenland's largest ice-free part, with a generally mountainous surface rising to 6,398 feet (1,950 m). The coastline is deeply indented by fjords. Although the region is without human habitation, its vegetation supports herds of muskoxen. It was partially explored in 1892, 1895, and 1900 by Robert E. Peary, the American Arctic explorer.

Peasant Party: *see* Bulgarian Agrarian National Union.

peasant, any member of a class of persons who till the soil as small landowners or as agricultural labourers. The term peasant originally referred to small-scale agriculturalists in Europe in historic times, but many other societies, both past and present, have had a peasant class.

The peasant economy generally has a relatively simple technology and a division of labour by age and sex. The basic unit of production is the family or household. One distinguishing characteristic of peasant agriculture is self-sufficiency. Peasant families consume a substantial part of what they produce, and while some of their output may be sold in the market, their total production is generally not much larger than what is needed for the maintenance of the family. Both productivity per worker and yields per unit of land are low.

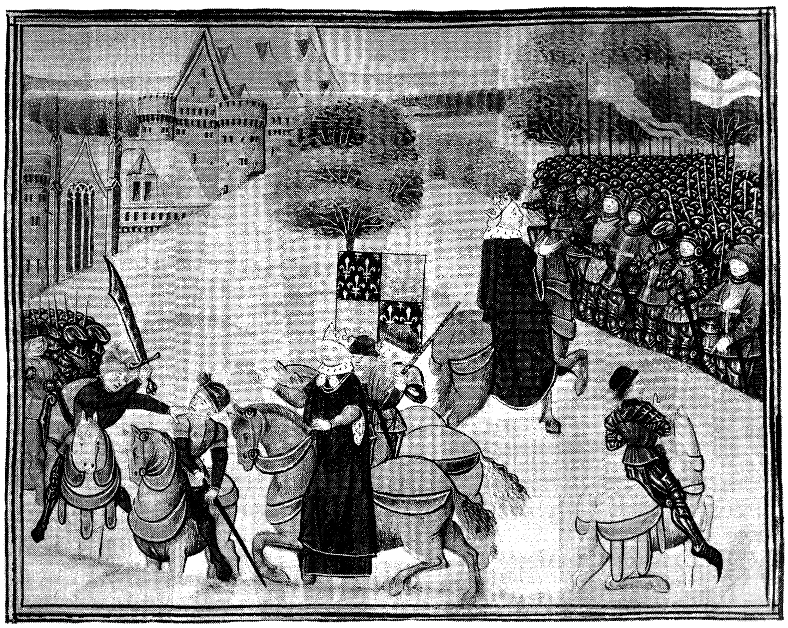
Peasants as a class have tended to disappear as a society industrializes. This is due to the mechanization of farming, the resulting consolidation of farming plots into larger units, and the accompanying emigration of rural dwellers to the cities and other sites of industrial employment. The small-scale agriculture associated with peasant labour is simply too inefficient to be economically viable in developed countries.

Peasants' Revolt, also called WAT TYLER'S REBELLION (1381), first great popular rebellion in English history. Its immediate cause was the imposition of the unpopular poll tax of 1381, which brought to a head the economic discontent that had been growing since the middle of the century. The rebellion drew support from several sources and included well-to-do artisans and villeins as well as the destitute. Probably the main grievance of the agricultural labourers and urban working classes was the Statute of Labourers (1351), which attempted to fix maximum wages during the labour shortage following the Black Death.

The uprising was centred in the southeastern counties and East Anglia, with minor disturbances in other areas. It began in Essex in May, taking the government of the young king Richard II by surprise. In June rebels from Essex and Kent marched toward London. On the 13th the Kentish men, under Wat Tyler (*q.v.*), entered London, where they massacred some Flemish merchants and razed the palace of the king's uncle, the unpopular John of Gaunt, Duke of Lancaster. The government was compelled to negotiate. On the 14th Richard met the men of Essex outside London at Mile End, where he promised cheap land, free trade, and the abolition of serfdom and forced labour. During the king's absence, the Kentish rebels in the city forced the surrender of the Tower of London; the chancellor, Archbishop Simon of Sudbury, and the treasurer, Sir Robert Hales, both of whom were held responsible for the poll tax, were beheaded.

The king met Tyler and the Kentishmen at Smithfield on the following day. Tyler was treacherously cut down in Richard's presence by the enraged mayor of London. The king, with great presence of mind, appealed to the rebels as their sovereign and, after promising reforms, persuaded them to disperse. The crisis in London was over, but in the provinces the rebellion reached its climax in the following weeks. It was finally ended when the rebels in East Anglia under John Litster were crushed by the militant bishop of Norwich, Henry le Despenser, on about June 25.

The rebellion lasted less than a month and



The death of Wat Tyler (left) and Richard II addressing the peasants (right), miniature from a manuscript of Jean Froissart's *Chronicles*, 15th century; in the British Library failed completely as a social revolution. The king's promises at Mile End and Smithfield were promptly forgotten, and manorial discontent continued to find expression in local riots. It succeeded, however, as a protest against the taxation of poorer classes insofar as it prevented further levying of the poll tax.

Pease, Edward Reynolds (b. Dec. 23, 1857, Henbury Hill, Dorset, Eng.—d. Jan. 5, 1955, Limpsfield, Surrey), English writer, one of the founders of the Fabian Society.

Born to a prosperous family, Pease left a business career and joined with Frank Podmore, a spiritualist and socialist writer, to found the Fabian Society in London in January 1884. It was named for the Roman consul Fabius Cunctator, known for his strategy of cautious gradualism in the war against Hannibal. The Fabians sought a gradualist approach to socialism in Britain. Early members included such leading intellectuals as George Bernard Shaw, Beatrice and Sidney Webb, and Graham Wallas. Following the notions of William Morris, the socialist who stressed craftsmanship, Pease left the business world and became a cabinetmaker. In 1890 the society hired Pease as a nominally paid part-time secretary. The following year the position became full-time and was held by Pease until 1913, when he became honorary secretary until 1938. In 1900 he helped form the Labour Representation Committee that became the Labour Party in 1906, serving as the representative of the influential Fabian Society for 14 years.

Pease wrote *The Case for Municipal Drink Trade* (1904) and *The History of the Fabian Society* (1916; rev. ed., 1925).

peat, organic fuel consisting of a light, spongy material formed chiefly in temperate humid environments by the accumulation and partial decomposition of vegetable remains under conditions of deficient drainage. Vast beds occur in Europe, North America, and northern Asia, but they are worked only where coal is deficient.

Dried peat burns readily with a smoky flame and a characteristic odour. The ash is powdery and light, except in certain varieties that have a high content of sand and other inorganic matter. Peat is used for domestic heating purposes and forms a fuel suitable for boiler firing in either briquetted or pulverized form; it also has been used in gas producers. In Ireland millions of tons of peat are consumed annually; the Soviet Union, Sweden, Germany, and Denmark also produce and use considerable quantities, and peat is used locally in England and Scotland.

Peat is usually hand-cut, although progress has been made in the excavation and spreading of peat by mechanical methods. Peat is cut by spade in the form of blocks, which are spread out to dry (peat in its natural state contains 90 to 95 percent water); when dry, these blocks weigh from three-quarters of a pound to two pounds each. In one method of mechanized winning, a dredger or excavator digs the peat from the drained bog and delivers it to a macerator, which extrudes the peat pulp through a rectangular opening; the pulp is then cut into blocks, which are spread to dry. Maceration promotes drying and tends to yield more uniform shrinkage and a denser and tougher fuel. Hydraulic excavating can also be used, particularly in bogs that contain roots and tree trunks. The peat is washed down by a high-pressure water jet, and the pulp runs to a sump. There, after slight maceration, it is pumped to a draining ground in a layer about 9 inches (230 mm) thick, which after partial drying is cut up and then dried.

Peat deposition is the first step in the formation of coal. The humid climate of the Carboniferous period (360 to 286 million years ago), which favoured the growth of huge tropical seed ferns and giant nonflowering trees, created the vast swamp areas that comprise the coal beds of today. As the plants died and fell into the boggy waters, which excluded oxygen and killed bacteria, they partially decomposed but did not rot away. The vegetation was changed into peat, some of which was brown and spongy, some black and compact, depending on the degree of decomposition. The sea advanced and withdrew over such deposits, and new sediments were laid down. Under pressure the peat dried and hardened to become low-grade coal, or lignite; further pressure and time created bituminous coal; and even more extreme pressures created anthracite.

peat moss, also called BOG MOSS, or SPHAGNUM MOSS, any of more than 160 species of plants of the subclass Sphagnidae, constituting the order Sphagnales, comprising the family Sphagnaceae, which contains one genus, *Sphagnum*. The pale green to deep red plants,

Peat moss (*Sphagnum flexuosum*)

K.G. Preston-Mafham—The Natural History Photographic Agency

up to 30 cm (about 12 inches) tall, form dense clumps around ponds, in swamps and bogs, on moist, acid cliffs, and on lakeshores from tropical to subpolar regions. The veinless leaves and stem cortex contain many interconnected, enlarged dead cells, with external openings through which water can enter; the plants hold up to 20 times their weight in water.

Each spherical brown sporangium, or spore case, shrinks as it dries, creating internal pressure that casts off the lid (operculum) and shoots the spores as far as 10 cm from the plant. The metabolic processes of growing peat moss cause an increase in the acidity of the surrounding water, thus reducing bacterial action and preventing decay. The plants also contain sphagnol, a phenolic compound with antiseptic properties.

Peat moss forms several types of bogs in northern areas. Compression and chemical breakdown of dead plants and other vegetable debris cause formation of the organic substance known as peat, which is harvested and dried for use as fuel. Dried peat moss has been used for surgical dressings, diapers, lamp wicks, bedding, and stable litter. It is commonly employed as a packing material by florists and shippers of live aquatic animals, and as a seedbed cover and soil additive by gardeners who value its ability to increase soil moisture, porosity, and acidity. Peat mosses are valuable in erosion control, and properly drained peat bogs provide useful agricultural land.

Some botanists believe peat mosses constitute a class; others consider them to be a subclass or order.

peat sampler, device for collecting uncontaminated samples of sediment from various kinds of deposits containing fossil pollen and other organic remains. Several instruments have been developed to retrieve controlled samples, and, although they are termed peat samplers, they are used to study many kinds of deposits other than peat. In general, peat samplers consist of closed sections of tubing that are forced into a sedimentary deposit to a required depth and then opened, filled, and withdrawn with the core sample.

pebble chopper, also called PEBBLE TOOL, primordial cutting tool, the oldest type of tool made by forerunners of modern man. The tool consists of a rounded stone struck a number of blows with a similar stone used as a pounder, which created a serrated crest that served as a chopping blade. The tool could be used as a crude hunting knife, to grub roots, and for other purposes.

pebble mosaic, type of mosaic work that uses natural pebbles arranged to form decorative or pictorial patterns. It was used only for pavements and was the earliest type of mosaic in all areas of the eastern Mediterranean, appearing in Asia Minor in excavated floors from the 8th and 7th centuries BC.

The first pebble mosaics had rough geometric designs, but artists in Greece by the 5th century BC had achieved a degree of technical proficiency that allowed them to create designs and figures with delicacy and considerable detail, as in a series of black-and-white mosaic floors depicting mythological scenes at Olynthus in northern Greece (*c.* 400 BC). Most pebble mosaics were made simply with dark and light patterns, but a few were multicoloured, such as the magnificent floors from the late 4th century BC found at Pella in Macedonia, which show monumental figures of people and animals rendered with impressive naturalism and grace. Pebble mosaics persisted as the major form of mosaic decoration until about the 3rd century BC, when they began to be replaced with mosaics of cut stone cubes, or tesserae. The later pebble mosaics, including those at Pella, were increasingly supplemented

Bellerophon, mounted on Pegasus, fighting the chimera, detail of a Greek pebble mosaic from Olynthus, Greece, *c.* 400 BC

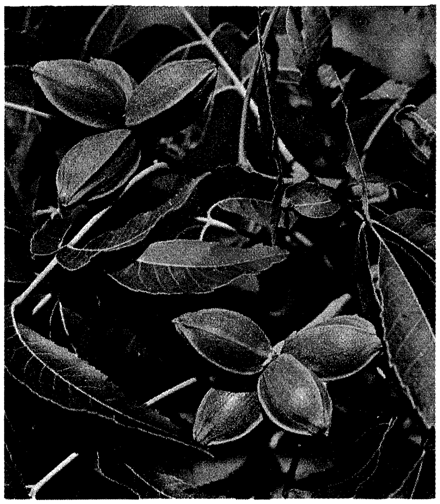
with stone tesserae chosen for colour intensity and with lead or terra-cotta strips for delineation of detail.

Peć, formerly IPEK, Latin PESCIUM, most populous town in the autonomous *pokrajina* (province) of Kosovo, republic of Serbia, Yugoslavia. Lying on a small tributary of the Beli Drim River, between the North Albanian Alps (Prokletije) and the Mokra Mountain Range, Peć is the terminus of a rail line from Niš. A majority of its inhabitants is Albanian. The town, with mosques, narrow streets, and old Turkish houses, has an Oriental character. It serves as a local market centre for agricultural produce; industries are leatherworking, food processing, and handicrafts.

Peć was especially important as a religious centre and was from *c.* 1253 to 1766, with brief interruptions, the chief see of the Orthodox Church of Serbia. The patriarchal monastery, repeatedly ravaged and restored, consists of four churches with fine frescoes, library, and treasury. About 12 mi (19 km) south of Peć is Dečani Monastery (1327–35), which has more than 1,000 frescoes and represents one of the finest extant examples of Serbian architecture and ornamentation. Pop. (1981 prelim.) mun., 111,067.

Pecalongan (Indonesia): *see* Pekalongan.

pecan (*Carya illinoensis*), nut of the walnut family (Juglandaceae), native to temperate North America. The tree occasionally reaches a height of about 50 metres (160 feet) and a trunk diameter of 2 m. It has a deeply furrowed bark and compound leaves with 9–17 finely toothed leaflets, arranged in feather fashion. The male flowers form hanging catkins; the female flowers are arranged in tight clusters at the ends of the shoots. At maturity the fleshy hulls of the short-clustered fruits dry, split along suture lines, and separate into four approximately equal sections, thus gradually freeing the nuts. The nuts have brown, mottled shells, varying greatly in thickness; size varies from 100 to 500 per kilogram (45 to 225 per pound) and shape from long and cylindrical with pointed apex to short and roundish



Pecan (*Carya illinoensis*)
Grant Heilman—EB Inc.

Rich and distinctive in flavour and texture, the pecan has one of the highest fat contents of any vegetable product and a caloric value close to that of butter. Its production is the basis of a considerable industry in the southeastern United States. The pecan may be eaten raw, sweetened or salted. It is widely used in pastries, such as coffee cakes, and often in conjunction with chocolate. In the southeastern United States the pecan pie, consisting of pecans baked in a clear custard, and the pecan praline candy are traditional sweets.

Native pecan trees occur in the United States (near the Rio Grande in Texas, and in Nebraska, Iowa, Indiana, and occasionally Alabama). Limited cultivation of grafted varieties had begun in Louisiana by 1847; some important varieties were introduced before 1890. Georgia, Alabama, and Mississippi are today the most important producers of grafted pecan nuts. The pecan has been introduced into many countries; it is cultivated to a limited extent in Australia and South Africa.

peccary, also called JAVELIN, or JAVELINA, New World counterpart of the swine, forming the family Tayassuidae (order Artiodactyla). The name javelin, or javelina, derives from their spearlike upper canines.

Resembling small pigs with small, erect ears and almost no tails, peccaries reach a length of 75–90 centimetres (30–35 inches) and a weight of 15–30 kilograms (33–66 pounds). They are hunted for their hides and meat; although ferocious when molested, they are sometimes tamed by South American Indians.

Collared peccary (*Dicotyles tajacu*)
Jen and Des Bartlett—Bruce Coleman Inc.

Peccaries differ from true pigs (family Suidae) in certain skeletal and dental features. They also have a scent gland under the skin that opens on the ridge of the back and gives off a strong, musky odour; this gland is the source of the tale that they have two navels, one above and one below. Peccaries are found from Texas to Patagonia. They feed on a variety of plants, small animals, and carrion. They have a barklike alarm call and when disturbed make a rattling sound by chattering their teeth. Litters usually consist of two young, born after a five-month gestation period.

There are two species. The collared peccary (*Dicotyles,* or *Tayassu, tajacu*) is dark gray with a white band across the chest and lives in deserts and forests in bands of about 5 to 25 individuals. The white-lipped peccary (*Tayassu pecari*) is slightly larger and darker, with a white area around the mouth. Found in wet, tropical forests, it lives in herds of 50 to more than 100 individuals.

Pecci, Vincenzo Gioacchino (pope): *see* Leo XIII *under* Leo (Papacy).

Pech Morena (India): *see* Morena.

Pechenegs, Byzantine PATZINAKOI, Latin BISSENI, Hungarian BESENYO, nomadic Turkic people who occupied the steppes north of the Black Sea (6th–12th century) and by the 10th century were in control of the lands between the Don and lower Danube rivers (after having driven the Hungarians out); thus they had become a serious menace to Byzantium. Originally inhabiting the area between the Rivers Volga and Yaik (Ural), the Pechenegs were attacked by the Khazars and the Oghuz (*c.* 889). They moved westward (especially as the Khazar state declined and could no longer impede the migration), driving the Hungarians into the Carpathian Basin and attacking Russian territory.

Kept at bay by the Russians and the Hungarians, the Pechenegs repeatedly invaded Thrace (10th century); they increased the frequency and intensity of their raids (11th century) after Byzantium conquered Bulgaria (1018) and became an immediate neighbour of the Pechenegs. In 1090–91 the Pechenegs advanced to the gates of Constantinople, where Emperor Alexius I with the aid of the Kumans annihilated their army and effectively destroyed Pecheneg power. Important Pecheneg settlements were later established in Hungary, probably after their defeat by Byzantium. The main source on Pecheneg history is the *De administrando imperii* of the Byzantine emperor Constantine VII Prophyrogenitus.

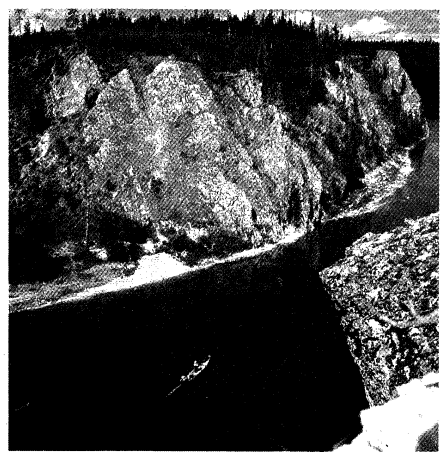
Pechenga, formerly (1919–44) PETSAMO, town, Murmansk *oblast* (administrative region), northwestern Russian Soviet Federated Socialist Republic, at the head of Pechenga Bay on the Barents Sea coast. Dating from the 16th century, the town was in northern Finland between 1919 and 1940 and was the terminus of the Arctic Highway from the Gulf of Bothnia. It is linked by rail to Murmansk, but its port functions, especially for the adjacent copper- and nickel-mining area, have largely been usurped by its outport of Liinakhamari. Pop. (latest census) 3,500.

Pechiney, French state-owned, multinational holding company formed in December 1971 as Pechiney Ugine Kuhlmann SA after the merger of Pechiney SA, an aluminum producer established in 1855, and Société Ugine Kuhlmann, a chemical company established in 1889. The combination is a major world producer of aluminum and a leading European copper fabricator. In 1982 the French government nationalized the company, and its name was shortened to the present one in 1983. Headquarters are in Paris.

One of the company's founders, A.R. Pechiney (1833–1916), pioneered in aluminum production by introducing the Sante-Claire Deville process at a plant in Salindres, Gard, Fr. However, he at first failed to foresee the potential value and marketability of the lightweight metal in its pure form. When in the mid-1880s Paul-Louis-Toussaint Héroult, who had been experimenting in ways to extract aluminum through electrolysis, sought Pechiney's advice on how next to proceed, Pechiney convinced him to abandon the project and instead concentrate on the development of aluminum alloys, particularly the copper-rich aluminum bronze.

The company now specializes in processing nonferrous metals and chemicals. In addition to aluminum and copper products, it produces stainless steel, ferroalloys, carbon products, rare metals, dyes, organic and inorganic chemicals, various metallurgical products, drugs, and electric products related to metal production. Pechiney operates facilities in the United States, Australia, India, Brazil, Malaysia, and a number of European countries.

Pechora River, also spelled PEČORA, river in the Russian Soviet Federated Socialist Republic. Rising in the northern Urals near Mt. Koyp, it flows 1,124 mi (1,809 km), first south in a narrow, deep valley, then west and north across an extensive, level basin to enter the Barents Sea by a delta. It drains an area of 124,500 sq mi (322,000 sq km). Freeze-up extends from early November to early May. Navigation is possible as far as Ust-Unya;



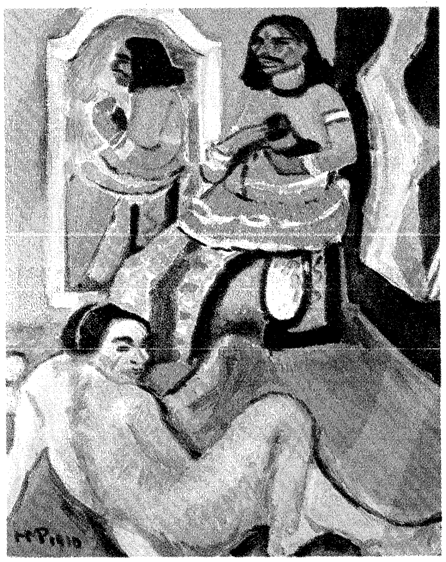
The Pechora River, Russian S.F.S.R., along its upper course
Syndication International Ltd., London

there is much timber rafting. In its basin are large deposits of coal, petroleum, and natural gas.

Pechora Sea, also spelled PEČORA, Russian PECHORSKOYE MORE, sea lying to the north of European Russian Soviet Federated Socialist Republic, between Kolguyev Island to the west and the Yugorsky Peninsula to the east. To the north is Novaya Zemlya. The Pechora Sea is, in effect, a southeastern extension of the Barents Sea. Its average depth is 20 feet (6 m), but it reaches a maximum depth of 690 feet (210 m). In the southern part of the sea run the eastward-flowing Kolguyev Current and its extension, the Novaya Zemlya, the flow of which is interrupted by the inflow of the Pechora River.

The Pechora Sea is blocked by floating ice from November until June. Cod, seals, and other marine life are exploited. The main port is Naryan-Mar on the Pechora River, an important exporter of timber.

Pechstein, Max (b. Dec. 31, 1881, Zwickau, Ger.—d. June 29, 1955, Berlin), painter and printmaker who was a leading member of the group of German Expressionist artists known as Die Brücke. He is best known for his paintings of nudes and landscapes.



"Indian and Woman," oil painting by Max Pechstein, 1910; in the collection of Morton D. May
By courtesy of Morton D. May

In 1906, when Pechstein joined Die Brücke, he was painting in the style of the Impressionists. But his association with the members of Die Brücke and exposure to the works of Matisse led Pechstein to use vigorous brushstrokes and jarring combinations of unmixed colours, as in his "Indian and Woman" (1910).

In 1910 Pechstein joined the Neue Sezession (New Secession), an association of artists in Berlin. His works of this period have simpler compositions and more sombre colours. In 1914 he traveled to Palau in the western Pacific, where he painted exotic subjects in a deliberately primitive manner.

Back in Europe, he designed stained glass and mosaics and took a teaching position at the Berlin Academy. He was forced to resign when the Nazis declared his work "decadent" but regained his post after World War II. His late work, however, lost much of the vigour of his earlier styles.

peck, unit of capacity in the U.S. Customary and British Imperial systems of measurement. In the United States the peck is used only for dry measure and is equal to 8 dry quarts, or 537.6 cubic inches (8.811 l). In Great Britain the peck may be used for either liquid or dry measure and is equal to 8 quarts (2 imperial gallons), or 554.84 cubic inches (9.094 l). The peck has been in use since the early 14th century, when it was introduced as a measure for flour. The term referred to varying quantities, however, until the modern units were defined in the 19th century.

Peck, (Eldred) Gregory (b. April 5, 1916, La Jolla, Calif., U.S.), American motion-picture actor.

Peck gave up training in medicine to pursue his interests in the acting profession in the early 1940s. His first stage performance in *The Morning Star*, a 1942 Broadway production, was well received, and he appeared in several other stage productions before his first film roles in *Days of Glory* and *The Keys of the Kingdom* (both 1944). Peck rapidly acquired a reputation for capable, conscientious acting with his performances in such films as *Spellbound* (1945), *Duel in the Sun* (1946), *The Yearling* (1946), *Gentleman's Agreement* (1947), and *Twelve O'Clock High* (1949). His portrayal of the weary, cynical title character of *The Gunfighter* (1950), however, established him as an actor of formidable skill. The Academy of Motion Picture Arts and Sciences awarded him an Oscar for his performance as the humane southern lawyer in *To Kill a Mockingbird* (1962).

His other films include *Roman Holiday* (1953), *The Big Country* (1958), *The Guns of Navarone* (1961), *Behold a Pale Horse* (1964), *Arabesque* (1966), *The Omen* (1976), *MacArthur* (1977), and *The Sea Wolves* (1981). Peck frequently played a likeable, honest man of measured speech who showed high moral qualities when put to the test. *Gregory Peck*, a biography by Michael Freedland, was published in 1980.

Peckham, Rufus Wheeler (b. Nov. 8, 1838, Albany, N.Y., U.S.—d. Oct. 24, 1909, Altamont, N.Y.), associate justice of the U.S. Supreme Court from 1896 to 1909.

Peckham was educated in Albany and Philadelphia and was admitted to the bar in 1859, after which he practiced law in Albany. In 1883 he was appointed a justice of the New York State Supreme Court, and in 1886 he became a member of the Court of Appeals of New York, the highest court in the state. He was nominated to the U.S. Supreme Court by President Grover Cleveland after the nomination of his brother, Wheeler Hazard Peckham, had failed Senate confirmation. Rufus took office in January 1896.

Peckham was basically a conservative justice who was noted for his careful and lucidly reasoned opinions. He is best known for the majority opinion he wrote in *Lochner* v. *New York* (1905), a case in which a baker had contracted with his employees for longer than a 10-hour working day in defiance of a state law setting 10 hours a day as the legal maximum. Peckham wrote that the Fourteenth Amendment prohibited the states from curtailing a man's liberty to make his own economic arrangements with his employees. This decision drew a stinging rebuke from Justice Oliver Wendell Holmes, Jr., in a memorable dissent. By the 1930s Holmes's opinion had become the prevailing interpretation of the Fourteenth Amendment, and legislation such as maximum-hours laws was held to be constitutional.

Peckinpah, Sam, byname of DAVID SAMUEL PECKINPAH (b. Feb. 21, 1925, Fresno, Calif., U.S.—d. Dec. 28, 1984, Inglewood, Calif.), American motion-picture director and screenwriter known for spectacular, violent westerns.

Peckinpah began his career in television, writing for and directing such western programs as "Gunsmoke," "The Westerner," and "The Rifleman." He made his debut as a film director with *The Deadly Companions* (1961). *Ride the High Country* (1962) and *Major Dundee* (1965) set the formulas for which he became famous: magnificent landscapes, embittered characters drifting in a West that has lost its code of honour, and—most notably—gruesome, realistically choreographed gunplay. *The Wild Bunch* (1969), considered his finest film, and *Pat Garrett and Billy the Kid* (1973) were especially bloody Peckinpah productions. The violence spilled over into such nonwesterns as *Straw Dogs* (1971), *The Getaway* (1972), and *Cross of Iron* (1977).

The Ballad of Cable Hogue (1970) and *Junior Bonner* (1972), plaintive evocations of the modern West, showed another side of Peckinpah.

Pecos, city, seat (1883) of Reeves County, southwestern Texas, U.S. It is situated in the Pecos River Valley, 77 miles (124 km) southwest of Odessa. It began in 1881 as a station on the Texas and Pacific Railway and as a cow town at the intersection of old cattle and wagon trails. It developed as a livestock distribution and service centre and is credited with holding the first Texas rodeo in 1883 (now held annually in July).

The city's West of the Pecos Museum depicts frontier life in the West. In the 1940s its commercial activities became more diversified when underground water was pumped for irrigation, oil and natural gas were tapped, and sulfur was processed. Farming (especially cotton, cantaloupes, and vegetables), cattle ranching, oil and gas production, and tourism are now major economic factors. Large automotive (tire) proving grounds are nearby. Inc. 1903. Pop. (1984 est.) 13,105.

Pecos Bill, in American folklore, cowboy hero of the Pecos River region of Texas who was an exaggerated personification of Western stamina and values; his vivid exploits are analogous to those of the legendary giant lumberjack Paul Bunyan of the North Woods.

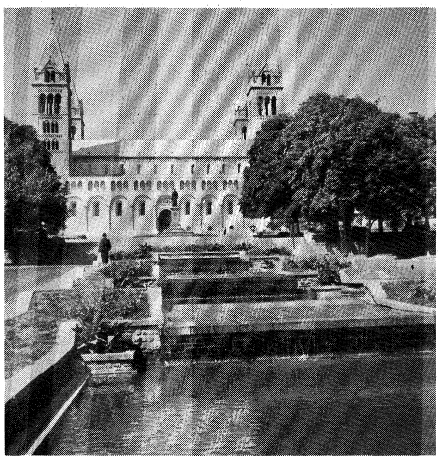
Created by journalists, primarily Edward O'Reilly in *Century* magazine, the Pecos Bill character was based on little authentic oral tradition and no historical prototype. He is said to have been born in Texas about 1832 and raised by coyotes after his parents lost him near the Pecos River. As a man he rode a mountain lion and used a rattlesnake as a lasso, besting the toughest of cowboys. He died, according to one tradition, after washing down a meal of barbed wire with a drink of nitroglycerin. Although Pecos Bill stories were read primarily by nonfrontier Americans, they were adopted by cowboys of Australia and the Argentine.

Pecos River, river in the southwestern United States, rising in Mora County, north-central New Mexico, in the Sangre de Cristo Mountains, and flowing about 735 miles (1,183 km) through eastern New Mexico and western Texas. It drains about 38,300 square miles (99,200 square km) before emptying into the Rio Grande at the Amistad National Recreation Area. After leaving the mountains, the Pecos flows over desertlike land, and its channel is dry much of the year. Near Roswell, N.M., the river widens into a basin, which closes somewhat to a broad, shallow valley at the Texas–New Mexico border. In the last 125 miles (201 km) of its course, the river has cut a narrow canyon more than 1,000 feet (300 m) deep. Dams controlling the river and providing water for irrigation include: Alamogordo Dam (1937), Avalon Dam (1907), McMillan Dam (1908), part of the Carlsbad Reclamation Project, and Red Bluff Dam (1936). Santa Rosa, Fort Sumner, Roswell, and Carlsbad, N.M., and Pecos, Texas, are important towns on or near the river.

Pécs, German FÜNFKIRCHEN, medieval Latin QUINQUE ECCLESIAE ("Five Churches"), capital of Baranya *megye* (county), southwestern

Hungary. It lies at the southern foot of the wooded Mecsek Mountains, 135 miles (220 km) south-southwest of Budapest. It is one of several city-county administrative units in Hungary. The site was occupied by the Roman town of Sopianae, the capital of the province of Southern Pannonia, which succeeded an Illyrian and Celtic settlement. In 1009 Stephen I, the first king of Hungary, made the town a bishopric. The name Pécs first appeared in the late 11th century. The town has a large main square with a well-preserved mosque (Ghazi Kassim Pasha), which is now a Roman Catholic church. The town's cathedral, which was founded in 1009 on the site of an old Roman church, was extensively renovated and restored in the 1960s.

Pécs is an old-established trade and handicrafts town, and during the 14th and 15th



Cathedral at Pécs, Hung.
Salmer—Plessner International

centuries it was also a great centre of humanist studies. It was occupied by the Turks from 1543 to 1686. The earliest university in Hungary, the University of Pécs, founded in 1367 by Louis I, was abolished by the Turks but was reopened in 1922. The Medical University of Pécs (1951) is also situated in the town. In the 18th century, German immigrant miners came to work the local coal seams, and there remains in Pécs one of the few German minorities in Hungary. In 1780 the city received a free royal charter. The Pécs–Komló coalfield, which supplies coking coal to Dunaújváros, formed the basis for the rapid development of the city in the 19th and 20th centuries.

Pécs's industries include engineering, furniture, tobacco, china, brewing, and leatherworking. An oil refinery in Pécs is supplied by pipeline from the Soviet Union. The Zsolnay factory, producing ceramic ware (majolica), is one of the best-known sites in Pécs. In the vicinity are extensive vineyards dating from Roman times. The town has good road and rail connections with Dunaújváros, Budapest, and other cities. The marked rise in Pécs' population in the 20th century was the result of an influx of Hungarian peasants from the countryside. Pop. (1989 est.) 183,000.

pectin, any of a group of water-soluble carbohydrate substances that are found in the cell walls and intercellular tissues of certain plants. In the fruits of plants, pectin helps keep the walls of adjacent cells joined together. Immature fruits contain the precursor substance protopectin, which is converted to pectin and becomes more water-soluble as ripening proceeds. At this stage the pectin helps ripening fruits to remain firm and retain their shape. As a fruit becomes overripe, the pectin in it is broken down to simple sugars that are completely water-soluble. As a result, the overripe fruit becomes soft and begins to lose its shape.

Because of its ability to form a thick gel-like solution, pectin is used commercially in the preparation of jellies, jams, and marmalades. Its thickening properties also make it useful in the confectionery, pharmaceutical, and textile industries. Pectic substances consist of an associated group of polysaccharides that are extractable with hot water or with aqueous solutions of dilute acids. The chief sources of commercial pectin are the peels of citrus fruits, and to a lesser extent apple pomace (residue from cider presses). Very small amounts of pectin suffice in the presence of fruit acids and sugar to form a jelly.

pectoralis muscle, any of the muscles that connect the front walls of the chest with the bones of the upper arm and shoulder. There are two such muscles on each side of the sternum (breastbone) in the human body: pectoralis major and pectoralis minor.

The pectoralis major, the larger and more superficial, originates at the clavicle (collarbone), the sternum, the ribs, and a tendinous extension of the external oblique abdominal muscle. The pectoralis major extends across the upper part of the chest and is attached to a ridge at the rear of the humerus (the bone of the upper arm). Its major actions are adduction, or depression, of the arm (in opposition to the action of the deltoideus muscle) and rotation of the arm forward about the axis of the body. When the raised arms are fixed (as in mountain climbing), it assists the latissimus dorsi and teres major muscles in pulling the trunk up. The pectoralis minor lies, for the most part, beneath the pectoralis major, arising from the middle ribs and inserting into (attaching to) the scapula (shoulder blade). It aids in drawing the shoulder forward and downward (in opposition to the trapezius muscle).

For a depiction of the pectoralis muscles in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

pectus excavatum, a chest deformity caused by depression of the breastbone, or sternum. Pectus excavatum is generally not noticeable at birth but becomes more evident with age unless surgically corrected. In most instances the abnormality is due to a shortened central tendon of the diaphragm, the muscular partition between the chest and the abdominal cavity. It may also result from displacement of the heart to the left of mid-chest or from excessive pulling downward by the diaphragm. Corrective surgery is best performed in early childhood. The heart and lungs are most affected by pectus excavatum. The heart is displaced to the left, there is more pressure on the heart, and the respiratory movements of the lungs are impaired. The effects include breathlessness upon exertion, pain around the heart, and dizziness.

pedal harp, musical instrument in which pedals control a mechanism raising the pitch of given strings by a semitone (single action) or by both a semitone and a whole tone (double action). The modern double-action pedal harp, the standard orchestral harp, covers six and a half octaves (three below and three and a half above middle C). Along the neck, or harmonic curve, are two sets of rotating brass disks; concealed inside the forepillar and in the deep metal plates running along both sides of the neck is a mechanism operated by seven pedals, one for each group of strings of a given pitch name. Depression of the pedal to the first notch shortens the appropriate strings by a semitone, to the second notch, by a whole tone. The shortening is effected by the rotating disks, which grip the string at the proper point. The harp is normally tuned diatonically (to a seven-note octave) in C♭; depressing all pedals to the first notch puts it into C, to the second notch, into C♯. Playing the pedal harp demands skilled coordination between the hands, which pluck the strings with the fleshy part of the fingertips, and the feet, which, with the pedals, select the necessary pitch changes for the strings.

Pedal harps were developed in the 18th century in response to changing musical styles demanding a full chromatic (12-note) octave. In the 17th century, small hooks were placed on the harp neck near each string; when turned, a hook shortened the string by a semitone. Besides interrupting the harpist's playing, however, the hooks pulled the strings out of plane and sometimes out of tune. In 1720 Celestin Hochbrucker, a Bavarian, attached the hooks to a series of levers in the forepillar (which thenceforth became hollow), controlled by seven pedals.

In about 1750 the Parisian harp-maker Georges Cousineau replaced the hooks by metal plates that gripped the strings while leaving them in plane. Cousineau also expanded the chromatic capability of the harp by building instruments with 14 pedals; although unwieldy, the second seven raised the strings an additional semitone. In 1792 the Parisian maker Sébastien Érard substituted rotating disks for the metal plates. In 1810 he produced a double action by adding a second set of disks controlled by the same pedals, thus virtually establishing the modern harp capable of playing in all major and minor keys.

pedal point, also called PEDAL TONE, in music, a sustained note, ordinarily in the bass, over which changing harmonies are played. The name may derive from the low tones sustained by organ pedals, although a pedal point can occur in the middle voices or the soprano. Pedal points are usually important notes in a key (normally the tonic and dominant; in the key of C, the notes C and G). Fugue No. 2 in J.S. Bach's *The Well-Tempered Clavier,* Book I, ends with a pedal point on the tonic. In the sonata-allegro form used in symphonies and sonatas, pedal points on the dominant often appear in the retransition (the passage preceding the recapitulation of the principal themes in the tonic key). This persistent dominant tone leads the listener to anticipate the eventual return to the tonic. An example occurs in the first movement of Mozart's *Symphony No. 41 in C Major* (*Jupiter*).

Pedal points are special instances of the use of drone (*q.v.*) and are occasionally called bourdons. François Couperin and Jean-Philippe Rameau utilized them in a number of pieces for the harpsichord.

Pedersen, Charles J(ohn) (b. Oct. 3, 1904, Pusan, Korea—d. Oct. 26, 1989, Salem, N.J., U.S.), American chemist who, along with Jean-Marie Lehn and Donald J. Cram, was awarded the 1987 Nobel Prize for Chemistry for his synthesis of the crown ethers—a group of organic compounds that would selectively react with other atoms and molecules much as do the molecules in living organisms.

Born to a Norwegian father and a Korean mother, Pedersen went in the early 1920s to the United States to study chemical engineering at the University of Dayton in Ohio, where he took his bachelor's degree. He received a master's degree in organic chemistry at the Massachusetts Institute of Technology and in 1927 went to work for E.I. du Pont de Nemours & Co. as a research chemist. He worked there for the next 42 years.

In the 1960s Pedersen synthesized a group of compounds that he named crown ethers for their structure—a loose, flexible ring of carbon atoms punctuated at regular intervals with oxygen atoms. By varying the size of the rings, he found that crown ethers would bind the ions of certain metal elements at the centre of the "crown." His discoveries were expanded upon by Lehn and Cram, and the result was the laboratory synthesis of molecules that could selectively react with other molecules in much the same way that enzymes and other natural biological molecules do.

Pedersen, Christiern (b. *c.* 1480, Helsingør, Den.—d. Jan. 16, 1554, Helsingør), Danish humanist who was among the first to rediscover Denmark's national literary and historical heritage and to encourage the development of a vernacular style in Danish literature.

Pedersen studied at Greifswald and took orders in 1505. In 1508 he went to Paris and there produced the first edition (now lost) of Saxo Grammaticus' *Gesta Danorum,* under the title *Historia danica* (1514). He also edited Peder Laale's proverbs and published a Latin–Danish lexicon. Returning to Denmark, he supported the Reformation and became secretary to Christian II, following him into exile in 1525. In Holland he translated, from the Vulgate, part of the New Testament (1529) and the Psalms (1531) into Danish and also adapted some of Luther's tracts. In 1532 he set up as a printer at Malmö, publishing Danish versions of French romances and the legends of Charlemagne. He had a share in the Danish translation of the Bible published in 1550, which was based on Luther's translation and which marked an important stage in the development of Danish literature as well as in the progress of the Reformation.

Pedersen, Holger (b. April 7, 1867, Gelballe, Den.—d. Oct. 25, 1953, Copenhagen), Danish linguist of exceptional accomplishment, especially in comparative Celtic grammar.

After receiving his doctorate in 1897, Pedersen proceeded, as professor at the University of Copenhagen, to enrich language science with an enormous number of books and articles of high originality. Trained in the exacting methodology of the Neogrammarian school of linguistics, he went far beyond its limits to become a participant in, or a critic of, most succeeding schools of linguistic thought, and he also anticipated some new trends. His Celtic researches appeared in many papers, in his monumental *Vergleichende Grammatik der keltischen Sprachen,* 2 vol. (1909–13; "Comparative Grammar of the Celtic Languages"), and in the *Concise Comparative Celtic Grammar* (1937), done in collaboration with H.

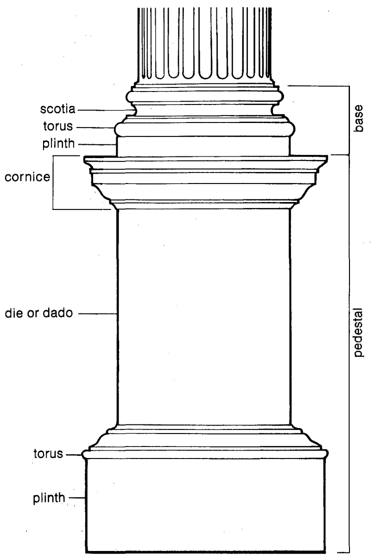
Lewis. About 30 books by Pedersen in Danish, English, French, and German offer authoritative treatments of Albanian, Armenian, Russian, and Indo-European dialects; Lithuanian, Hittite, Tocharian, Czech, and Turkish phonology; the relationship of Indo-European to the Semitic and Finno-Ugric languages; and the origin of runes. A work on the history of linguistic science was reissued under a new title, *The Discovery of Language,* in 1962.

pedestal, in Classical architecture, support or base for a column, statue, vase, or obelisk. Such a pedestal may be square, octagonal, or circular. The name is also given to the vertical members that divide the sections of a balustrade. A single pedestal may also support a group of columns, or colonnade. A pedestal is divided into three parts, from bottom to top: the plinth (or foot), the die (or dado), and the cornice (cap, cap mold, or surbase).



Corinthian pedestal
From John Fleming, Hugh Honour, Nikolaus Pevsner, *The Penguin Dictionary of Architecture,* copyright © John Fleming, Hugh Honour, Nikolaus Pevsner, 1966, 1972; Penguin Books Ltd.

The pedestal was first employed by the architects of ancient Rome to make a single column look more imposing; it was also featured in triumphal arches. In Renaissance Italy, architectural theorists decreed that the pedestal was an integral part of the order (*see* order) of the column and entablature and inseparable from it. At the same time, specific rules were established concerning the proportional height of pedestal to column: the higher the column is, the higher the pedestal must be.

pedestal rock: *see* perched rock.

Pedi, also called TRANSVAAL SOTHO, NORTHERN SOTHO, or BAPEDI, a Bantu-speaking people inhabiting the northeastern Transvaal, South Africa, and comprising the major group of the Northern Sotho ethnolinguistic cluster of peoples, who numbered about 2,370,000 in the late 20th century. Their territory, which is known as Bopedi, is located between the Olifants and Steelpoort rivers. Lebowa, a nonindependent Black State, is their officially designated "homeland," demarcated from the Bopedi area.

The ancestors of the Pedi are thought to have settled in the present region about 500 years ago after having migrated from Central Africa. After an initial period of peaceful settlement the Pedi empire arose, built on a number of military conflicts with neighbouring peoples. Pedi fortunes peaked during the rule of the king Thulare in the early 19th century, but the Pedi were subsequently defeated by the forces of Mzilikazi, the eventual founder of the Ndebele (Matabele) people. The Pedi recovered and successfully resisted Afrikaner encroachments on their territory in the 1850s, '60s, and '70s, but in 1879 the British completely crushed the Pedi. The British divided the Pedi country into two parts under different rulers in 1896, thus occasioning conflicts between rival Pedi leaders.

The Pedi area was designated for their exclusive settlement and use as part of the Natives' Land Act of 1913 and the Natives' Trust and Lands Act of 1936. Rainfall in the Pedi area is fairly low, but corn (maize), wheat, sorghum, millet, and beans are grown. A considerable variety of livestock is raised, including cattle, goats, sheep, fowl, and pigs. Pedi have been recruited to a great extent for labour elsewhere in the Republic of South Africa.

The basic Pedi social and living unit is the *kgoro,* which is a semicircular residential cluster of dwellings sheltering an extended family that is established around a group of related males but that may also include other people. The important son of a chief often establishes *kgoros.* The Pedi chief (*kgosi*) is the overall executive and judicial authority. In modern South Africa, however, the traditional chief must balance his traditional functions with the European-based legal system.

pediatrics, medical specialty dealing with the development and care of children and with the diagnosis and treatment of childhood diseases. The first important review of childhood illness, an anonymous European work called *The Children's Practice,* dates from the 12th century. The specialized focus of pediatrics did not begin to emerge in Europe until the 18th century. The first specialized children's hospitals, such as the London Foundling Hospital, established in 1745, were opened at this time. These hospitals later became major centres for training in pediatrics, which began to be taught as a separate discipline in medical schools by the middle of the 19th century.

The major focus of early pediatrics was the treatment of infectious diseases that affected children. Thomas Sydenham in Britain had led the way with the first accurate descriptions of measles, scarlet fever, and other diseases in the 17th century. Clinical studies of childhood diseases proliferated throughout the 18th and 19th centuries, culminating in one of the first modern textbooks of pediatrics, published by Frédéric Rilliet and Antoine Barthez in France in 1838–43, but there was little that could be done to cure these diseases until the end of the 19th century. As childhood diseases came under control through the combined efforts of pediatricians, immunologists, and public-health workers, the focus of pediatrics began to change, and early in the 20th century the first well-child clinics were established to monitor and study the normal growth and development of children. By the mid-20th century, the use of antibiotics and vaccines had all but eliminated most serious infectious diseases of childhood in the developed world, and infant and child mortality had fallen to the lowest levels ever. In the last half of the century, pediatrics again expanded its boundaries to incorporate the study of behavioral and social as well as specifically medical aspects of child health. *See also* childhood diseases and disorders.

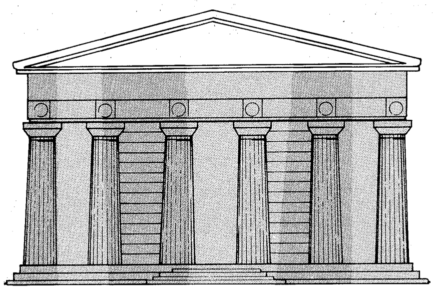
pedicab, three-wheeled vehicle with a hooded carriage body balanced on two of the wheels. The body may be placed in front or in back of the driver, who propels the vehicle by pedaling. Pedicabs are the successors to rickshas (*q.v.*) and have been widely used in East and Southeast Asia. The pedicab has been adapted for specialized uses; one example is a pedicab school bus.

Pedieos River, also spelled PEDIEAS, Greek PEDIAÍOS, Turkish PEDIYAS, river in central and eastern Cyprus. It rises in the Troödos range and flows in a northeasterly direction toward Nicosia, where it takes an easterly turn through the part of the central lowlands called the Mesaoria Plain toward Famagusta Bay. Although the longest (about 60 miles [100 km]) in Cyprus, the river is not navigable. Formerly emptying into the bay near the ancient city of Salamis, it now drains into irrigation reservoirs near Akhyritou and Kouklia, west of Famagusta.

pedigree, a record of ancestry or purity of breed. Studbooks (listings of pedigrees for horses, dogs, etc.) and herdbooks (records for cattle, swine, sheep, etc.) are maintained by governmental or private record associations or breed organizations in many countries.

In human genetics, pedigree diagrams are utilized to trace the inheritance of a specific trait, abnormality, or disease. A male is represented by a square or the symbol ♂, a female by a circle or the symbol ♀. Mating is shown by a horizontal line (marriage line) connecting a male symbol and a female symbol; offspring symbols are connected in a row (sibship line) beneath the mated pair. The offspring symbols appear from left to right in the order of birth and are connected to the marriage line by a vertical line. Possession of the character under study is shown by a solid or blackened symbol, and absence is shown by an open or clear symbol. Multiple births are designated by joining the individual symbols to the same point on the sibship line. Siblings not shown as individual symbols are indicated by a number within a large symbol for each sex.

pediment, in architecture, triangular gable crowning a portice (area, with a roof supported by columns, leading to the entrance of a building); or a similar form used decoratively over a doorway or window. The pediment



Pediment of a Greek temple

was the crowning feature of the Greek temple front. The triangular wall surface of the pediment, called the tympanum, rested on an entablature (a composite band of horizontal moldings) carried over the columns. The tympanum was often decorated with sculpture, as in the Parthenon (Athens, 447–432 BC), and was always crowned by a raking, or slanted, cornice.

The Romans adapted the pediment as a purely decorative form to finish doors, windows, and especially niches. Their pediments frequently appeared in a series consisting of alternating triangular and segmentally curved shapes, a motif revived by High Renaissance Italian designers; particularly fine examples are the window pediments of the piano nobile (floor above the ground floor) of the Palazzo Farnese (Rome, begun in 1517), built by Antonio da Sangallo the Younger.

Following a late Roman precedent, in which the line of the raking cornice is broken before it reaches the apex, the designers of the Baroque period developed many varieties of fantastic broken, scrolled, and reverse-curved pediments, an example of which can be seen on the Church of San Andrea al Quirinale (Rome, 1658–70) by Gian Lorenzo Bernini.

In some cases the designers even reversed the direction of the form so that the high points of a broken pediment faced toward the outside of the composition rather than toward the centre; and in the elaborate Churrigueresque, or late Renaissance, architecture of Spain, small sections of pediment were used as decorative motifs.

pediment, in geology, any relatively flat surface of bedrock (exposed or veneered with alluvial soil or gravel) that occurs at the base of a mountain or as a plain having no associated mountain. Pediments, sometimes mistaken for groups of merged alluvial fans, are most conspicuous in basin-and-range-type desert areas throughout the world.

The angle of a pediment's slope is generally from 0.5° to 7°. Its form is slightly concave, and it is typically found at the base of hills in arid regions where rainfall is spasmodic and intense for brief periods of time. There is frequently a sharp break of slope between the pediment and the steeper hillside above it. Water passes across the pediment by laminar sheet flow, but if this is disturbed, the flow becomes turbulent and gullies develop.

Though features characteristic of pediments attain their fullest development in arid regions, beveled bedrock surfaces also occur in humid areas. In the tropics, for example, the surfaces tend to be mantled with soils and obscured by vegetation. Many tropical towns sited on pediments (which offer easier building sites than the steep hillsides above or the river marshes below) show severe gullying where the water flow has been concentrated between walls and buildings.

Pediyas River (Cyprus): *see* Pedieos River.

pedo- (combining form, "child"): *see under* paedo-, except as below.

pedodontics, also spelled PAEDODONTICS, dental specialty that deals with the care of children's teeth. The pedodontist is extensively concerned with prevention, which includes instruction in proper diet, use of fluoride, and practice of oral hygiene. The pedodontist's routine practice deals basically with caries (tooth decay) but includes influencing tooth alignment. Lengthy treatment may be required to correct incipient abnormalities in tooth position. Braces or other correctional devices may be used. The pedodontist needs patience and a basic knowledge of children's behavioral patterns, as well as a knowledge of the effects on the mouth of physical and mental diseases. In the United States a two-year postgraduate course leads to a certificate in pedodontics.

pedology, scientific discipline concerned with all aspects of soils, including their physical and chemical properties, the role of organisms in soil production and in relation to soil character, the description and mapping of soil units, and the origin and formation of soils. Accordingly, pedology embraces several subdisciplines, namely, soil chemistry, soil physics, and soil microbiology. Each employs a sophisticated array of methods and laboratory equipment not unlike that used in studies of the physics, chemistry, or microbiology of nonsoils systems. Sampling, description, and mapping of soils is considerably simpler, however. A soil auger is used to obtain core samples in places where no subsurface exposure can be found, and the soil units are defined, delineated, and mapped in a manner similar to procedures in stratigraphy. Such soils studies, in fact, overlap the concerns of the stratigrapher and the geologist, both of whom may treat the soils layers as strata of the Quaternary period (from 1.6 million years ago to the present).

pedophilia, also spelled PAEDOPHILIA, psychosexual disorder in which an adult's arousal and sexual gratification occur primarily through sexual contact with prepubescent children. The typical pedophile is unable to find satisfaction in an adult sexual relationship and may have low self-esteem, seeing sexual activity with a child as less threatening than that with an adult. Most pedophiles are men; the condition is extremely rare in women.

Frequently the sexual encounter stops short of intercourse, the pedophile obtaining sexual gratification through fondling the child and sometimes through genital display alone. Reactions of the child victim can range from fright, particularly if force or violence is involved, to bewilderment or passive enjoyment. Although some children seem more upset by previous parental warnings than by an actual encounter, the sexual encounter can often be quite traumatic to them, especially if there is associated violence. There is also evidence that children who have been sexually victimized are more likely to be troubled adults. Studies have determined that boys who were sexually abused are more likely to become adult sex offenders. Sexually abused girls more frequently respond by self-destructive behaviours such as substance abuse or prostitution.

Legally, pedophilia is considered in most Western nations to be one of the most serious of sexual offenses. In general, the younger the child and the greater the disparity in age between pedophile and victim, the more severe the penalty. Most severe penalties are usually reserved for pederasty, sexual contacts between adult males and young boys. More than half of those arrested for pedophilia are friends, relatives, or acquaintances of the child.

Pedrarias Dávila: *see* Arias Dávila, Pedro.

Pedrell, Felipe (b. Feb. 19, 1841, Tortosa, Spain—d. Aug. 19, 1922, Barcelona), Spanish composer and musical scholar who devoted his life to the development of a Spanish school of music founded on both national folk songs and Spanish masterpieces of the past.

When Pedrell was a choirboy, his imagination was first fired by contact with early Spanish church music. Largely self-taught, he composed several operas, mostly on national subjects. The first, *El último Abencerraje,* founded on a text by Chateaubriand, was produced in an Italian version in Barcelona in 1874. In 1891 he published his manifesto *Por nuestra música,* which attracted much attention; misunderstood as favouring Wagnerian reforms, it advocated a Spanish opera with musical roots in the Spanish folk song. He published an invaluable four-volume collection of folk songs, the *Cancionero musical popular español.* In the eight-volume *Hispaniae schola musica sacra,* Pedrell edited, for the first time, a vast quantity of early Spanish church, stage, and organ music, including the keyboard works of Antonio de Cabezón and the complete works of Tomás Luis de Victoria. At the same time, he was working on an operatic trilogy, the first part of which, *Los Pirineos* ("The Pyrenees"; to a Catalan libretto), was produced in an Italian version in 1902. The second part, *La Celestina,* though it contained some of his finest music, remained unperformed. As a composer, Pedrell was to a certain extent hampered by technical shortcomings. His influence on later Spanish composers, however, was incalculable, and his pupils included Manuel de Falla, Isaac Albéniz, and Enrique Granados. His editions of early Spanish music laid the foundations of Spanish musicology.

Pedro (Portuguese or Spanish personal name): *see under* Peter, except as below.

Pedro I (b. Oct. 12, 1798, Lisbon, Port.—d. Sept. 24, 1834, Lisbon), founder of the Brazilian empire and first emperor of Brazil, from Dec. 1, 1822, to April 7, 1831, also reckoned as King Pedro (Peter) IV of Portugal.

Generally known as Dom Pedro, he was the son of King John VI of Portugal. When Napoleon conquered Portugal in 1807, Pedro accompanied the royal family in its flight to Brazil. He remained there as regent when King John returned to Portugal in 1821.

Pedro surrounded himself with ministers who counseled independence. When the Portuguese Cortês (Parliament), preferring colonial status for Brazil, demanded that Pedro return to Lisbon to "complete his political education," he issued a declaration of Brazilian independence on Sept. 7, 1822. Within three months he was crowned emperor.

Pedro's initial popularity waned, and in 1823, when the Brazilian Assembly was preparing a liberal constitution, he dissolved that body and exiled the radical leader José Bonifácio de Andrada e Silva. On March 25, 1824, however, Pedro accepted another liberal constitution drafted by the Council of State.

Although adoption of that charter may have saved Pedro from deposition, it did not reestablish his popularity. His autocratic manner, his lack of enthusiasm for parliamentary government, and his continuing interest in Portuguese affairs antagonized his subjects, as did the failure of his military forces in a war with Argentina over what is now Uruguay. Strong opposition in the Brazilian Parliament and a series of local uprisings induced him to abdicate in 1831 in favour of his son Dom Pedro II, who was then five years old. Pedro I then returned to Portugal.

On the death of King John VI (March 10, 1826), Pedro I had become titular king of Portugal as Pedro IV. Two months later, still in Brazil, he issued a parliamentary charter for Portugal and conditionally abdicated the Portuguese throne in favour of his daughter Maria da Glória, the future Queen Maria II. He died in Portugal while attempting to secure his daughter's claim against that of his brother, the regent Miguel.

Pedro II, original name DOM PEDRO DE ALCÂNTARA (b. Dec. 2, 1825, Rio de Janeiro, Braz.—d. Dec. 5, 1891, Paris, Fr.), second and last emperor of Brazil (1831–89), whose benevolent and popular reign lasted nearly 50 years.

On April 7, 1831, when he was five years old, his father, Pedro I (Pedro, or Peter, IV of Portugal), abdicated in his favour; and for nine years Brazil was governed by a regency. Pedro was declared of age on July 23, 1840, and crowned emperor on July 18, 1841. Although the disturbances in the provinces that had plagued the regency continued for the next five years, the young emperor's intellectual curiosity and profound concern for his subjects soon became apparent. He considered himself the arbiter of Brazil's political life, and he used the power granted him by the constitution to regulate the antagonistic groups that sought to dominate the country. The first Brazilian monarch to be born in Brazil, Pedro guarded his country's sovereignty in disputes with Great Britain and the United States. He led Brazil into the War of the Triple Alliance against Paraguay (1864–70), gaining new territory and prestige for Brazil.

The rule of Pedro II, a calm, serious, and intelligent man, brought stability and progress to the troubled economy. He encouraged coffee production instead of sugar, and under his guidance Brazil made significant gains in railroad, telegraph, and cable construction. As a result of his leadership, he enjoyed almost unqualified support for 40 years.

During Pedro's 49-year reign, he presided over 36 different cabinets, most of which received and merited public support, as Pedro was generally served by excellent councillors and ministers. By astutely alternating support for the Liberal and Conservative parties, he ensured that both enjoyed a roughly equal amount of time in power, and he provided orderly, nonviolent transitions between them. Both parties, however, represented the landholding oligarchy, and, as a result, issues that affected other sectors of Brazilian society were often hedged.

Thus, despite Pedro's generally benign and progressive leadership, by the end of his reign his support had crumbled. The crucial issue was the abolition of slavery. Personally opposed to slavery (he had freed his own slaves in 1840), Pedro felt that abolition in the agriculturally based Brazilian economy would have to occur gradually so as not to upset the landowners. When complete emancipation was at last decreed (1888), 700,000 slaves were freed, and no provision was made for compensation to the owners. Pedro also had strained relations with the Roman Catholic church after 1872 because of his opposition to the anti-Masonic laws passed by the church. In addition, the emperor, who represented the colonial countryside and landed classes, found himself removed from increasingly powerful elements in society, particularly the emerging urban middle class and the military. These and other factors combined to bring about his downfall. On Nov. 15, 1889, a military coup forced him to abdicate. The royal family went into exile in Europe. His remains and those of his wife were returned to Brazil in 1920 and placed in a chapel in the city of Petropolis, named in his honour.

Pedro HISPANO: *see* John XXI *under* John (Papacy).

Pedro, Dom: *see* Coimbra, Pedro, 1º duque de.

Pedro Juan Caballero, town, eastern Paraguay, founded in 1899. It lies in the Amambay Mountains at 2,296 feet (700 m) above sea level, opposite Ponte Porã, Braz. Pedro Juan Caballero is the region's largest town and principal trade centre. The hinterland is utilized primarily for cattle ranching and coffee growing. In the town are a government delegation, a radio station, a commerce school, a teachers college, and a school maintained by North American priests. The town is accessible by highway from Concepción and by the Brazilian railroad that terminates in Ponte Porã. Pop. (1985 est.) 37,688.

Pedrolino, French PIERROT, stock character of the Italian commedia dell'arte, a simple-minded and honest servant, usually a young and personable valet. One of the comic servants, or *zanni,* Pedrolino functioned in the commedia as an unsuccessful lover and a victim of the pranks of his fellow comedians. His costume consisted of a white jacket with a neck ruff and large buttons down the front, loose trousers, and a hat with a wide, floppy brim. Unlike most of the other stock characters, he played without a mask, his face whitened with powder.

Pedrolino became tremendously popular in later French pantomimes as the naive and appealing Pierrot. For 20 years at the Théâtre des Funambules, the great French mime Jean-Gaspard Deburau (1796–1846) played Pierrot as the pathetic, white-robed lover eternally mooning over the beautiful Columbine. The clown hero of Ruggero Leoncavallo's opera *I pagliacci* (1892) was a later use of a Pierrot-like figure.

Pedrolino, detail from "Actors of the Comédie-Italienne," oil painting by Nicolas Lancret, 18th century; in the Louvre, Paris
Giraudon—Art Resource/EB Inc.

Pee Dee River, river rising as the Yadkin River in the Blue Ridge Mountains in northwestern North Carolina, U.S. Flowing northeast past Wilkesboro and Elkin, then southeast past Badin, it becomes the Pee Dee (named for the Pedee Indians) after a course of about 200 miles (320 km). As the Pee Dee, it continues for 230 miles (370 km), generally southeast into South Carolina, past Cheraw, being joined by the Little Pee Dee approximately 20 miles (32 km) before emptying into Winyah Bay near Georgetown. As the Yadkin, the river is dammed to form High Rock and Badin lakes (by the Uwharrie National Forest) and, as the Pee Dee, to form Tillery and Blewett Falls lakes. The lower Pee Dee is navigable for 90 miles (145 km).

Peebles, royal burgh (1367) and seat of the district of Tweeddale (*q.v.*), Borders region, Scotland, at the junction of Eddleston Water with the River Tweed. Peebles grew up under the shelter of the royal castle, which was a favourite residence of the Scottish kings when they hunted in nearby Ettrick Forest.

The modern town is an agricultural centre and has large mills producing tweed and knitwear. Portions of the town walls still exist. The old market cross still stands, but little survives of Crosskirk, erected in 1261 to contain a supposed relic of the True Cross. Pop. (1981) 6,692.

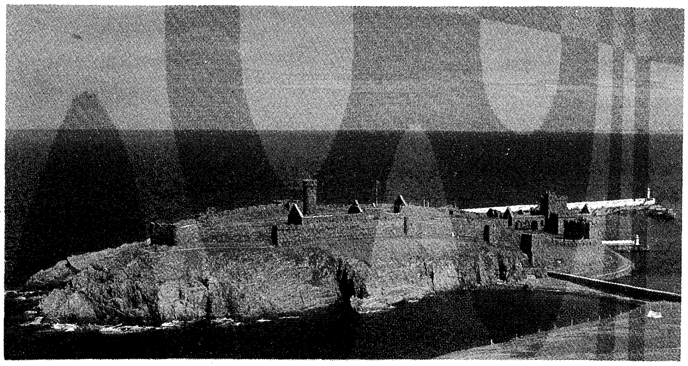
Peeblesshire, also called PEEBLES, or TWEEDDALE, former county and historic region of southeastern Scotland that formed a triangle between the counties of Midlothian (north and northeast), Selkirkshire (east and southeast), Dumfriesshire (south), and Lanarkshire (west). It had an area of 347 square miles (900 square km). Since the reorganization of 1975, it constitutes the district of Tweeddale (*q.v.*), of Borders region.

Occupation of Peeblesshire in the early Iron Age is indicated by the remains of numerous hill forts around the burgh of Peebles, and there are standing stones near the confluence of Lyne Water and the Tweed. The Romans left traces of their military rule in the camp at Lyne, locally known as Randal's Walls. In medieval times a series of peels (fortified towers) were erected; the best preserved is that of Neidpath Castle, a 15th-century stronghold of the Frasers just outside the royal burgh of Peebles.

The former county is closely associated with the legend of Merlin and has provided background and other material for Sir Walter Scott, James Hogg, and other writers.

Peekskill, city, Westchester county, southeastern New York, U.S., on the east bank of the Hudson River, 41 miles (66 km) north of New York City. Its name derives from Jan Peek, a Dutchman who established a trading post in 1654 at the point where a *kil* (Dutch for "creek") joins the Hudson. An early river port and agricultural-trade centre, it was attacked and burned by the British during the American Revolutionary War. Manufactures now include yeast, gin, electrical items, and stationery. Important emery mines are nearby. The city is also a tourist base for nearby Palisades recreational areas. Inc. village, 1839; city, 1940. Pop. (1988 est.) 19,528.

Peel, town on the west coast of the Isle of Man, one of the British Isles, on Peel Bay at the mouth of the River Neb, which forms the harbour. On the west side of the river mouth is Patrick's Isle, connected with the main island by a causeway; it is occupied by the ruined



Ruins of the castle at the entrance to Peel harbour, Isle of Man
Colour Library International

keep and guardroom of an ancient castle (the name Peel is Celtic for "fort"). Nearby are the remains of the cathedral of St. German. There are also ruins of the bishop's palace, palace of the lords of Man, and an ancient round tower. St. Patrick is said to have founded the first church on Man and a small chapel dedicated to him probably dates from the 8th or 10th century. Peel has a long-established fishing industry and is a seaside resort. Pop. (1981) 3,688.

Peel, Lady (entertainer): *see* Lillie, Beatrice.

Peel, Sir Robert, 2nd Baronet (b. Feb. 5, 1788, Bury, Lancashire, Eng.—d. July 2, 1850, London), British prime minister (1834–35, 1841–46) and founder of the Conservative Party, who was responsible for the repeal (1846) of the Corn Laws that had restricted imports.

Peel, detail of an oil painting by John Linnell, 1838; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

Early political career. He was the eldest son of a wealthy cotton manufacturer, Robert Peel (1750–1830), who was made a baronet by William Pitt the Younger. The younger Robert was educated at Harrow and at Oxford, and, with his father's money, a parliamentary seat was found for him as soon as he came of age, in 1809.

As an able young government supporter, Peel received appointment as undersecretary for war and colonies in 1810. Two years later he accepted the difficult post of chief secretary for Ireland. There he made his reputation as an able and incorruptible administrator and at the end of his Irish secretaryship was marked out for early promotion. He had also distinguished himself as the ablest of the "Protestant" party that resisted the admittance of Roman Catholics to Parliament, and in 1817 he gained the coveted honour of election as member of Parliament for Oxford University. Though declining immediate office after his return from Ireland, he was made chairman, in 1819, of the important currency commission that brought about a return to the gold standard.

In the 1822 ministerial reconstruction pursued by Robert Banks Jenkinson, 2nd earl of Liverpool, Peel accepted the post of secretary of state for the home department and a seat in the Cabinet. His first task was to meet the long-standing demands in Parliament for a radical reform of the criminal laws. He then proceeded to a comprehensive reorganization of the criminal code. Between 1825 and 1830 he effected its fundamental consolidation and reform, covering three-quarters of all criminal offenses. Rising crime statistics convinced him that legal reform should be accompanied by improved methods of crime prevention. In 1829 he carried through the Metropolitan Police Act, which set up the first disciplined police force for the Greater London area. As a result of Peel's efforts, the London police force became known as Bobby's boys and later simply bobbies.

When George Canning succeeded Liverpool as prime minister in 1827, Peel resigned on the issue of Roman Catholic emancipation. He returned to office under Arthur Wellesley, 1st duke of Wellington, early in 1828 as home secretary and leader of the House of Commons. Differences with Wellington led to the resignation of several followers of Canning after only four months in office, thus considerably weakening the government. This was followed by the Catholic crisis of 1828–29 that grew out of the renewal of the Irish movement for emancipation in 1823 with the formation of the Catholic Association. Its growing strength culminated in the victory of Daniel O'Connell, the Irish "Liberator," at a by-election for County Clare in 1828. Convinced that further resistance was useless, Peel proffered his resignation and urged the Prime Minister to make a final settlement of the Catholic question. Faced with severe opposition from the King and the Anglican Church, Wellington persuaded Peel, in 1829, to remain in office and assist in carrying through the policy of concession to the Catholics on which they now both agreed. Peel was bitterly attacked for his sudden change of heart and lost his seat for Oxford. Wellington's declaration against parliamentary reform in November 1830 finally brought about the fall of his weak and unpopular government.

Prime minister and Conservative leader. In the reform crisis following Wellington's fall, Peel's position was difficult and ambiguous. Though not opposed to moderate parliamentary reform, he was shocked by the sweeping measure introduced by the ministry of Charles Grey, 2nd Earl Grey, in March 1831. But, on the other hand, he made no effort to conciliate the ultra-Tories, and his refusal to form a new ministry with Wellington and pass a Tory reform bill in 1832 further weakened his standing with his former followers. Yet he was already looking to the growth of conservative opinion in the country, and his moderation in the first reformed Parliament (1833–34) did much to restore his political stature. The premature dismissal of the ministry of William Lamb, 2nd Viscount Melbourne, in November 1834 and Peel's appointment as prime minister gave him an impossible task because he did not possess, and the Conservative Party lacked the organization and men necessary to procure, a majority in the House of Commons (even though the general election of 1835 added considerably to their numbers). Nevertheless, his Tamworth Manifesto was an epoch-making statement of the new Conservative reform principles, and for the first time the party came under his acknowledged leadership. In April 1835, defeated by a combination of Whigs, radicals, and Irish nationalists, he resigned his office. During the next six years, aided by his astute and cautious tactics, the Conservative Party steadily increased in numbers and confidence. Following the general election of 1841, in which he gained a majority of more than 70 in the House of Commons, Peel formed an administration that was one of the most memorable of the century.

Peel was faced with war in China and Afghanistan, strained relations with France and the United States, severe commercial distress at home, agitation by the workingmen's reform movement of the Chartists and the Anti-Corn Law League, O'Connell's campaign for the repeal of the union of Ireland and Great Britain, and a five-year accumulation of budgetary deficits. His policy aimed at peace and security abroad, a reduction in the cost of living for the working classes, and encouragement to trade and industry. On the controversial issue of the Corn Laws, to which the landed interest in his party was very sensitive, he brought forward as one of his first measures a new bill drastically reducing the scale of protective duties. In the same year, the bold reintroduction of the income tax (originally instituted during the Napoleonic Wars) established the internal revenue on a sound footing and enabled him to make sweeping reductions of duties on food and raw materials entering the country. The Bank Charter Act of 1844, establishing a tight connection between note issue and gold reserves, completed the foundations of the Victorian banking and currency system. The success of these measures encouraged Peel to launch a second great free-trade budget in 1845. The income tax was renewed, and there was another even more massive round of tariff reductions.

With the return of prosperity, Chartism died down and the Anti-Corn Law League turned to more constitutional methods of agitation. Abroad, a firm but conciliatory policy led to better relations with France. The boundary disputes with the United States were settled by the mission of Alexander Baring, 1st Baron Ashburton, in 1842 and the Oregon treaty of 1846. The same combination of firmness and conciliation was followed in Ireland. Once the threatening campaign for repeal of the union was brought to a halt in 1843 with O'Connell's trial for conspiracy, Peel turned to more constructive measures. A commission was set up to inquire into the relations between landlord and tenant, and a wide scheme for Irish university education was passed into law in 1845.

The liberality of Peel's Irish policy, especially the greatly increased grant to the Catholic seminary of Maynooth, aroused strong Protestant feeling in England, severely straining relations with his own party. The potato disease in 1845, bringing with it the certainty of widespread famine in Ireland, completed the breach. Peel had already come to the conviction that the Corn Laws would have to be abolished sooner or later. His decision in the autumn of 1845 that a relief program for Ireland must be accompanied by the repeal of the Corn Laws split his Cabinet and led to his resignation. But, when Lord John Russell failed to form a free-trade ministry in December 1845, Peel returned to office. After savage parliamentary debates the repeal of the Corn Laws was finally carried through in June 1846. Peel believed that the attempt to preserve the Corn Laws in the changed social and political conditions of Britain would imperil the rule of the aristocracy. Nevertheless, a majority of his party voted against him, and a smaller number joined the opposition to bring about his defeat and resignation later the same month. For the rest of his career he dedicated himself to the support of free-trade principles and the maintenance of Russell's Whig ministry as the only safeguard against a protectionist government. He died in 1850 as a result of a riding accident.

Assessment. A proud, shy person, Peel was by nature quick-tempered, courageous, stubborn, and often autocratic. With a first-class intellect, an exact memory, and great capacity for work, he was a superb administrator and an outstanding parliamentary debater. Though he has an unchallenged place as founder of the modern Conservative Party, his political outlook was formed in the pre-reform era. He regarded ministers of the crown as servants of the state rather than as mouthpieces for sectional or party views. By insisting on fundamental changes in the national interest, he did much to preserve the continuity of aristocratic parliamentary government in an age of rapid industrial change, social distress, and class conflict. More than any other, he was the architect of the mid-Victorian age of stability and prosperity that he did not live to see.

Peel Commission, in full, ROYAL COMMISSION OF INQUIRY TO PALESTINE, group headed by Lord Robert Peel, appointed in 1936 by the British government to investigate the causes of unrest among Palestinian Arabs and Jews.

Discontent in Palestine dated back to 1920 when the British government was given a mandate to control Palestine; this mandate, intended to implement the Balfour Declaration of 1917, provided for both the establishment of a Jewish national home in Palestine and the preservation of the rights of non-Jewish Palestinian communities. Palestinian Arabs, desiring political autonomy and resenting the continued Jewish immigration into Palestine, disapproved the mandate, and by 1936 their dissatisfaction grew into open rebellion.

The Peel Commission published its report in July 1937. The report admitted that the mandate was unworkable because Jewish and Arab objectives in Palestine were incompatible, and it proposed that Palestine be partitioned into three zones: an Arab state, a Jewish state, and a neutral territory containing the Holy Places. Although the British government initially accepted these proposals, by 1938 it recognized that such partitioning would be infeasible and ultimately rejected the commission's report.

Peel River, river in northern Yukon Territory and northwestern Mackenzie District of the Northwest Territories, Canada, the northernmost tributary of the Mackenzie River. From its major headstream, the Ogilvie River, in the mountains of central Yukon Territory, the river flows generally northeastward for 425 mi (684 km) to join the Mackenzie near Fort McPherson, a fur-trading post and the only significant riverine settlement at the northern end of the Peel River Game Reserve. Its upper course through Peel Plateau is characterized by canyons as deep as 1,000 ft (300 m); its lower valley, much of which consists of nature preserve and game sanctuary, is wide, with braided channels, gravel bars, and small wooded islands. The river was named for Sir Robert Peel, the British statesman.

Peele, George (b. 1556, London—d. 1596), British dramatist, who experimented in many forms of theatrical art: pastoral, history, melodrama, tragedy, folk play, and pageant.

Peele began his varied literary career while at Oxford by translating into English a play of Euripides. In 1581 he moved to London but returned to Oxford in 1583 as a technical director for Christ Church's presentation of two spectacular plays by William Gager.

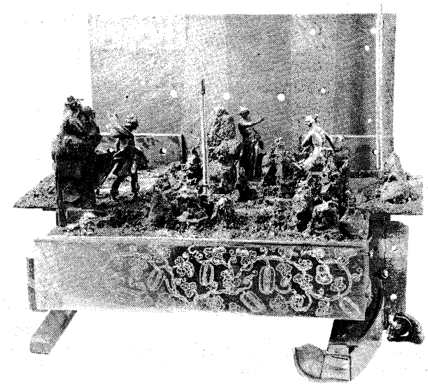
About this time Peele had joined a group of Oxonians living just outside the London city wall and had begun to experiment with poetry in various metres. From this association with the so-called university wits came two mythological pastoral plays: *The Arraignment of Paris* (1584) and *The Hunting of Cupid* (1591). He then produced a series of pageants for the city.

The Arraignment of Paris was produced for the courtiers, but the rest of Peele's life was devoted to writing for the popular stage. Of the many playhouse dramas he must have had a hand in, only four can be certainly ascribed to him: *The Battle of Alcazar* (1594), *The Old Wives' Tale* (1595), *Edward I* (1593), and *The Love of King David and Fair Bethsabe* (1599). In addition, Peele turned out commemorative poems to supplement a meagre income.

Peenemünde, village, Mecklenburg-West Pomerania *Land* (state), northeastern Germany, at the northwestern end of Usedom Island in the estuarine mouth of the Peene River on the Baltic Sea coast. It was mentioned as a fishing village in 1282. During World War II it was the site of the chief German research and testing facility for rockets and missiles (the so-called V-weapons), which were eventually used against England during the Blitz. Although the site was known to the Allies, it was not bombed until August 1943 by the Royal Air Force. It was captured by Soviet troops in April 1945. Pop. (1981 est.) 600.

peep, also called STINT, any of about a dozen species of small sandpipers. Some are also called oxbirds or oxeyes. *See* sandpiper.

peep show, children's toy and scientific curiosity, usually consisting of a box with an eyehole, through which the viewer sees a miniature scene or stage setting, painted or constructed in perspective. Peep shows of an earlier time are often the only accurate representation of the stage design and scenery of the period.



Model of a peep show representing the discovery of Diana by Actaeon, by Christoph Margraf, 1596; in the Kunsthistorisches Museum, Vienna
By courtesy of the Kunsthistorisches Museum, Vienna

The earliest known peep shows are the perspective views said to have been painted in transparent colours on glass and lighted from behind for various effects, from sunshine to moonlight, by Leon Battista Alberti in 1437. Later models (some preserved in the Kunsthistorisches Museum in Vienna) have designs that are apparently patterned on Renaissance court masques and pageants, such as that of the discovery of Diana by Actaeon, with fully modelled figures set against a background painted in careful perspective.

In the 17th century, peep shows in their cabinets were often exhibited in the streets by itinerant showmen, and the device became a popular children's toy. Some, equipped with movable scenery and wooden or cardboard figures, developed into the juvenile theatres of the 19th century (*see* toy theatre). The peep show was also the precursor of many types of optical toys, including the stereoscope and the magic lantern.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

peeping tom, person who derives sexual satisfaction from watching from hiding places as others disrobe or engage in sexual acts. The term derives from the legendary Peeping Tom, a prying tailor who was struck blind (in some accounts, struck dead) for opening his window and watching Lady Godiva as she rode naked through Coventry to demonstrate against heavy taxes on the town. Though Godiva's ride supposedly took place in the 11th century and was recorded as early as the 13th, the legend of Peeping Tom was not added to the story until about the 17th century. *See also* voyeurism.

peewee (bird): *see* pewee.

Pegasus, in Greek mythology, a winged horse that sprang from the blood of the Gorgon Medusa as she was beheaded by the hero Perseus (*q.v.*). With Athena's (or Poseidon's) help, another Greek hero, Bellerophon, captured Pegasus and rode him first in his fight with the Chimera (*q.v.*) and later while he was taking vengeance on Stheneboea (Anteia), who had falsely accused Bellerophon. Subsequently Bellerophon attempted to fly with Pegasus to heaven but was unseated and killed, the winged horse becoming a constellation and the servant of Zeus. Pegasus' story became a favourite theme in Greek art and literature, and in late antiquity Pegasus' soaring flight was interpreted as an allegory of the soul's immortality; in modern times it has been regarded as a symbol of poetic inspiration.

Pegasus, any of a series of three U.S. scientific satellites launched in 1965. These spacecraft were named for the winged horse in Greek mythology because of their prominent winglike structure. This "wing," which spanned 96 feet (29 metres), was specially designed to record the depth and frequency with which it was pierced by micrometeoroids. The information was used to design the outer shell of the manned Apollo spacecraft to prevent penetration of such high-speed particles of space dust. The data also enabled engineers to develop space suits that would shield astronauts from micrometeoroids when working outside their craft. The Pegasus ranks among the largest U.S. spacecraft ever built, with its center section extending 71 ft (21.6 m) in length.

Peggy Guggenheim Collection (Venice): *see* Guggenheim Collection.

Pegler, (James) Westbrook (b. Aug. 2, 1894, Minneapolis, Minn., U.S.—d. June 24, 1969, Tucson, Ariz.), U.S. conservative columnist whose continual crusades, combined with an acerbic, original style, attracted nationwide attention. In the column "As Pegler Sees It," introduced by William Randolph Hearst's King Features Syndicate in 1944, Pegler attacked the Supreme Court, the Newspaper Guild, the wealthy, the U.S. tax system, unions, and many national figures, among others. In 1954 Pegler was sued by the subject of one such attack, the author Quentin Reynolds, in a famous libel trial. Reynolds won $200,000 in punitive damages, then a record award in such a trial. In an effort to rein in the free-swinging columnist, the Syndicate began to edit his material, and he discontinued the column in 1962.

Pegler was the son of a star reporter from Minneapolis and Chicago, and he was still attending a Chicago high school when he started working for United Press (UP). Six years later, in 1916, after holding jobs in UP bureaus in Des Moines, St. Louis, and Dallas, Pegler was assigned to the agency's London bureau. After serving in the U.S. Navy in 1918 and 1919, he wrote and edited sports material for United News (1919–25) and the *Chicago Tribune* (1925–33). Beginning in 1933, he wrote a syndicated column, "Fair Enough," for the *New York World-Telegram.* In 1941 he received a Pulitzer Prize for exposing labour racketeering.

pegmatite, almost any wholly crystalline igneous or metamorphic rock that is at least in part very coarse grained, the major constituents of which include minerals typically found in ordinary igneous rocks and in which extreme textural variations, especially in grain size, are characteristic. Giant crystals, with dimensions measured in metres, occur in some pegmatites, but the average grain size of all such rocks is only 8 to 10 cm (3 to 4 inches).

Most bodies of pegmatite are tabular, podlike (cigar-shaped), or irregular in form and range in size from single crystals of feldspar to dikes (tabular bodies injected in fissures) many tens of metres thick and more than a kilometre long; many are intimately associated with masses of fine-grained aplite. Pegmatites occur in all parts of the world and are most abundant in rocks of relatively great geologic age. Some are segregations within much larger bodies of intrusive igneous rocks, others are distributed in the rocks that surround such bodies, and still others are not recognizably associated with igneous rocks.

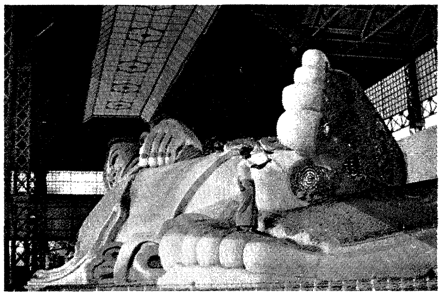
Granitic and syenitic pegmatite deposits are the chief source of commercial feldspar, sheet mica, and beryllium, tantalum–niobium, and lithium minerals. They also yield significant quantities of gem minerals, mica, molybdenite, cassiterite, tungsten minerals, rare-earth minerals, and certain types of kaolin, either directly or as the sources of placer deposits. Economic lode concentrations generally occur in zoned pegmatite bodies (*i.e.,* those within which two or more different rock types are systematically disposed).

Pegmatites are little different from the common igneous rocks in major elements of bulk composition, and they range from acid to basic (silica-rich to silica-poor); granitic and syenitic types are most abundant. Quartz and alkali feldspars are the essential constituents; the most common varietal and accessory minerals are muscovite, biotite, apatite, garnet, and tourmaline. Many granitic pegmatites contain unusual concentrations of the less-abundant elements. Ore minerals, chiefly sulfides and oxides, are widespread in pegmatites but rarely are abundant.

Pegolotti, Francesco Balducci (fl. 1315–40, Florence [Italy]), Florentine mercantile agent best known as the author of the *Pratica della mercatura* ("Practice of Marketing"), which provides an excellent picture of trade and travel in his day.

Pegolotti was a commercial agent in the service of the mercantile house of the wealthy and powerful Bardi family of Florence, and he visited Antwerp, Brabant (now in Belgium), in about 1315–17, London in 1317, and Cyprus in 1324–27. He again visited Cyprus in 1335, obtaining trading privileges for the Florentines from Little Armenia (now in Turkey). Compiled between 1335 and 1343, the *Pratica* begins with a kind of glossary of foreign terms then in use for all kinds of taxes or payments on merchandise as well as entries for "every kind of place where goods might be bought or sold in cities." The work next describes some of the chief trade routes of the 14th century and many of the principal markets then known to Italian merchants; the imports, exports, and business customs of important commercial regions; and the comparative value of the leading moneys, weights, and measures. There is one manuscript of the *Pratica* in the Riccardian Library, Florence. The most interesting sections of the work appeared in English translation in Sir Henry Yule's *Cathay and the Way Thither* (vol. 2, 1866).

Pegu, Burmese BAGO, port city, southern Myanmar (Burma), on the Pegu River, 47 miles (76 km) northeast of Yangon (Rangoon).



Reclining Buddha, Pegu, Myanmar (Burma)
Slim Aarons—Photo Researchers/EB Inc.

Pegu was the capital of the Mon kingdom and is surrounded by the ruins of its old wall and moat, which formed a square, with 1.5-mile (2.4-kilometre) sides. On the Yangon–Mandalay railway, it is the start of a branch line southeast along the Gulf of Martaban, an inlet of the Bay of Bengal, and has extensive road links in all directions. Pegu is a major rice- and timber-collecting centre and has numerous rice mills and sawmills.

Of its many pagodas, the ancient Shwemawdaw ("Golden Shrine"), 288 feet (88 m) high, is the most venerable. Said to contain two hairs of Gautama Buddha, it is of Mon origin and was severely damaged by an earthquake in 1930, but restoration was completed in 1954. The Shwethalyaung, a colossal reclining statue of Buddha (181 feet [55 m] long), is to the west of the modern town and is reputedly one of the most lifelike of all the reclining Buddha figures; allegedly built in 994, it was lost when Pegu was destroyed in 1757 but was rediscovered under a cover of jungle growth in 1881. From the nearby Kalyani Sima ("Hall of Ordination"), founded by the Mon king Dhammazedi (1472–92), spread one of the greatest reform movements in Myanmar Buddhist history. Its story is related in 10 stone inscriptions erected by the king close to the Sima. The Mahazedi, Shwegugale, and Kyaikpien are other notable pagodas.

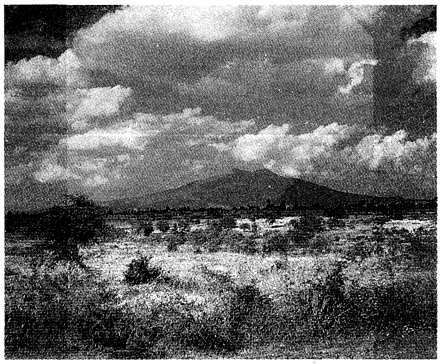
Pegu city is said to have been founded in 573 by Mon emigrants from Thaton to the southeast, but the most likely date of its foundation as the capital of a Mon kingdom is 825. The earliest record of the kingdom shortly before 850 was by the Arab geographer Ibn Khurradādhbih, who called it Ramaññadesa (the Rmen, or Mon, land). In 1057, when the Burman king Anawrahta of Pagan conquered the kingdom, he depopulated it by transporting 30,000 Mon to Pagan. Pegu was little heard of until Pagan fell to the Mongols in 1287. When the Mons recovered their independence, Pegu became the capital of their new kingdom in 1369. It functioned as a port, easily accessible from all parts of the alluvial plain. It was also a centre of Buddhist culture.

When in 1539 the Mon kingdom fell to the Burman Toungoo dynasty, Pegu was made the capital of a united kingdom until 1599 and again from 1613 to 1634. It was used in the 16th century as a base for the invasion of Siam. Many Europeans visited it, including the Venetian trader Cesare Federici (1569) and the English merchant Ralph Fitch (1587–88), whose description detailed its magnificence.

After the Burmans moved their capital to Ava in 1635, Pegu became a provincial capital, but a Mon revolt in 1740 restored it as the capital of their short-lived kingdom. When in 1757 the Burman king Alaungpaya invaded the Mon land, wiping out the last vestiges of independence, he destroyed Pegu but left the religious buildings intact. The British annexed the Pegu area in 1852, and in 1862, when the province of British Burma was created, the capital was moved from Pegu to Rangoon. Because of Alaungpaya's wars and the flight of the Mon people, the area was again virtually depopulated. The British later developed that area into the main rice-growing and exporting region of Burma.

Pegu is located between the forested Pegu Mountains (west) and the Sittang River (east). The area has a major irrigation scheme; rice is practically the only crop and is exported through Yangon. The Pegu Sittang Canal, which crosses the area, is navigable for nearly 40 miles (nearly 65 km) with locks. Pop. (1983) 150,447.

Pegu Mountains, Burmese BAGO YOMA, mountain range of south-central Myanmar (Burma), extending 270 miles (435 km) north–south between the Irrawaddy and Sittang rivers and ending in a ridge at Yangon (Rangoon). The range averages about 2,000 feet (600 m) in elevation, reaching its highest point in the north at Popa Hill (4,984 feet [1,519 m]), an extinct volcano. Teak and other tropical hardwoods are extracted in the eastern Pegu Mountains. Ethnic minorities (hill tribes) practice shifting cultivation in these mountains, growing upland rice, corn (maize), and millet. During the 1960s the Pegu Mountains were a refuge for communist insurgents.



Popa Hill, in the Pegu Mountains, Myanmar
Joe Cummings

Péguy, Charles (b. Jan. 7, 1873, Orléans, Fr.—d. Sept. 5, 1914, near Valleroy), French poet and philosopher who combined Christianity, socialism, and patriotism into a deeply personal faith that he carried into action.

Péguy was born to poverty. His mother, widowed when he was an infant, mended chairs for a living. He attended the *lycée* at Orléans on a scholarship and in 1894 entered the

École Normale Supérieure in Paris, intending to teach philosophy. In 1895 he turned to socialism, convinced it was the sole means by which poverty and destitution in the modern world could be overcome. He also abandoned the conventional practice of Roman Catholicism, though he retained to the end of his life a fervent religious faith. At this time he wrote his first version of *Jeanne d'Arc* (1897), a dramatic trilogy that formed a declaration and affirmation of his religious and socialist principles. Péguy was then caught up in the Dreyfus affair; he threw himself unreservedly into the battle to establish Dreyfus' innocence and helped to bring many of his fellow socialists onto the same side.

Besides running a bookstore that was a centre of pro-Dreyfus agitation, Péguy in 1900 began publishing the influential journal *Cahiers de la Quinzaine* ("Fortnightly Notebooks"), which, though never reaching a wide public, exercised a profound influence on French intellectual life for the next 15 years. Many leading French writers, including Anatole France, Henri Bergson, Jean Jaurès, and Romain Rolland, contributed work to it.

Péguy published several collections of his essays in the years before World War I, but the most important works of his maturity are his poems. Chief among them is *Le Mystère de la charité de Jeanne d'Arc* (1910), a mystical meditation that enlarges upon some of the scenes in the *Jeanne d'Arc* of 1897; *Mystère des Saints Innocents* (1912); and the culmination of the meditative and devotional outpouring of his final years, *Eve* (1913), a statuesque poem of 4,000 alexandrines in which Péguy views the human condition in the perspective of the Christian revelation.

When World War I broke out, he went to the front as a lieutenant, dying in the first Battle of the Marne. More information can be found in Y. Servais's *Charles Péguy: the Pursuit of Salvation* (1953) and Marjorie Villiers's *Charles Péguy, A Study in Integrity* (1965).

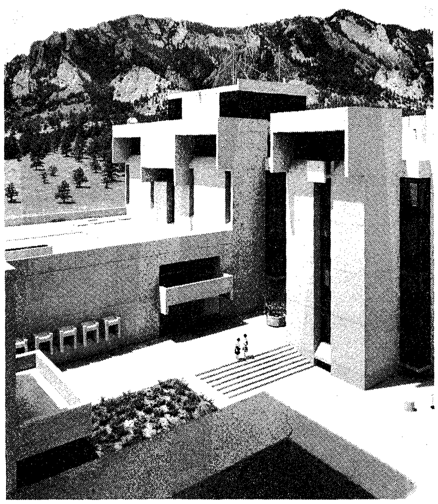
Pehlevi alphabet: *see* Pahlavi alphabet.

Pehowa, city, north-central Haryāna state, northwestern India. It lies along the Saraswati River. It is an important pilgrimage centre housing the Pirthudakeshwar (Pirthuveshwar) temples built by the Marāṭhās in honour of the goddess Sarasvatī. The name is derived from the Sanskrit name Pṛthūdaka ("Pool of Pṛthu"; the son of the legendary Raja Vena). Excavations have revealed inscriptions dating to the 9th century AD. Pop. (1981) 17,279.

Pei, I(eoh) M(ing) (b. April 26, 1917, Canton), Chinese-born American architect noted for his large but elegantly designed urban buildings and complexes.

Pei went to the United States in 1935, enrolling initially at the University of Pennsylvania, Philadelphia, and then transferring to the Massachusetts Institute of Technology, Cambridge, as a student of architectural engineering. He graduated in 1939 and, unable to return to China because of the outbreak of World War II, carried out various architectural contracts in Boston, New York City, and Los Angeles. During World War II he worked with a unit of the National Defense Research Committee. From 1945 to 1948 he was an assistant professor at the Graduate School of Design of Harvard University.

In 1948 Pei joined the firm of Webb & Knapp, New York City, as director of the architectural division. Working closely with the real estate developer William Zeckendorf, head of the firm, Pei created such urban projects as the Mile High Center in Denver, Colo. (1955), the Hyde Park Redevelopment in Chicago (1959), and the Place Ville-Marie in Montreal (1965).



National Center for Atmospheric Research by I.M. Pei, completed 1967, Boulder, Colo.
© Ezra Stoller (ESTO)

Pei formed his own architectural firm, I.M. Pei & Associates (later I.M. Pei and Partners), in 1955. Among the notable early designs of the firm were the Luce Memorial Chapel, Taiwan; the National Center for Atmospheric Research, Boulder, Colo., which, located near mountains, mimicked the broken silhouettes of the surrounding peaks; and the Everson Museum of Art, Syracuse, N.Y., which was actually four buildings joined by bridges. For the Federal Aviation Agency, Pei designed a type of pentagonal control tower that was installed in many American airports.

On the basis of a 1960 design competition Pei was selected to design the multiairline terminal at John F. Kennedy International Airport, New York City. In 1964 he was also selected to design the John F. Kennedy Memorial Library at Harvard University. Pei's innovative East Building of the National Gallery of Art, Washington, D.C. (1978), is an elegant triangular composition that was hailed as one of his finest achievements. In addition to designing public buildings, Pei was active in urban renewal planning. He was chosen to design the New York City Convention Center, the Gateway office complex in Singapore, and the Dallas Symphony Hall. Other works include the John Hancock Tower in Boston (1973), Indiana University Museum (1979), the west wing of the Boston Museum of Fine Arts (1980), Nestlé Corporate Headquarters (1981), El Paso Tower (1981), the Beijing Fragrant Hill Hotel (1982), and a controversial glass pyramid for one of the courtyards in the Louvre Museum in Paris.

In general, Pei's designs represent an extension of and elaboration on the rectangular forms and irregular silhouettes of the prevailing International Style. He is notable, however, for his bold and skillful arrangements of groups of geometric shapes and for his dramatic use of richly contrasted materials, spaces, and surfaces.

Pei, Mario (Andrew) (b. Feb. 16, 1901, Rome—d. March 2, 1978, Glen Ridge, N.J., U.S.), Italian-born American linguist whose many works helped to provide the general public with a popular understanding of linguistics and philology.

Pei immigrated to the United States with his parents when he was seven years old. By the time he was out of high school he knew not only English and his native Italian but also Latin, Greek, and French. Over the years he became fluent in five languages, capable of speaking some 30 others, and acquainted with the structure of at least 100 of the world's 3,000 spoken languages.

As a graduate student at Columbia University, New York City, he learned such early languages as Sanskrit, Old Church Slavonic, and Old French. He joined the Columbia faculty in 1937 and from 1952 to 1970 was professor of Romance philology. Besides compiling the companion popular sellers *The Story of Language* (1949) and *The Story of English* (1952; revised 1967 as *The Story of the English Language*), he published a large number of both technical and popular works, including *A Dictionary of Linguistics* (edited with Frank Gaynor, 1954), *Languages for War and Peace* (1943), a guide to seven key world tongues and 30 minor languages, and *Weasel Words: Saying What You Don't Mean* (1978).

Pei River, Wade–Giles romanization PEI CHIANG, Pei also spelled PAI, or PEH, Pinyin BEI JIANG, English NORTH RIVER, river in central Kwangtung Province, southeastern China. It is formed by the union of two smaller rivers, the Wu and the Chen, at Shao-kuan, in northern Kwangtung Province. The Pei River flows about 220 miles (350 km) south to join the Hsi (West) River, west of Canton. For centuries the Pei has played an important role in the transport system between North and South China.

Pei-hai, Pinyin BEIHAI, also called PAK-HOI, city and port in the Chuang Autonomous Region of Kwangsi, China. The city was in Kwangtung Province until 1965, when it became part of Kwangsi. It is on the shore of a small peninsula on the eastern side of Ch'inchou Bay on the Gulf of Tonkin, immediately south of the delta of the Nan-liu River, about 12½ miles (20 km) south of Ho-p'u.

Pei-hai was opened to foreign trade in 1876. Despite its poor harbour, badly exposed to northerly winds and impeded by sandbanks, Pei-hai became a moderately important port and the principal outlet for the trade of southern and western Kwangsi. Later the opening to trade of Wu-chou on the Hsi River and of Meng-tzu on the Red River in Yunnan Province robbed Pei-hai of much of its importance, and it became no more than a minor port, much of its foreign trade being in the hands of French trading companies. Pei-hai enjoyed a revival after 1937, when the Sino-Japanese War (1937–45) began, but in 1940 it was itself occupied by the Japanese.

Since 1949 Pei-hai has flourished as one of the most important fishing ports of southern China. Although much of the fishing fleet was destroyed during World War II, after 1945 the fishing industry was rapidly rehabilitated. After 1949 Pei-hai developed a shipbuilding industry for small craft and also began to manufacture cables, sails, and nets; a canning industry was established, and there are plants making such various fish products as fish-liver oil, dried fish, and glue. As the nearest Chinese port to Vietnam, Pei-hai traditionally had strong trading links with the Vietnamese port of Haiphong. In 1984 it became one of 14 Chinese coastal cities opened to Western trade and investment. Pop. (1985 est.) city centre, 115,700; city, 171,600.

Pei-p'iao, Pinyin BEIPIAO, mining town, western Liaoning Province, China. Located northwest of the Ta-ling Stream and east of the Ta-ch'ing Mountains, it is the site of a coal combine. The vertical shafts, which extend nearly 3,280 feet (1,000 m), are among the deepest mines in China. They produce coking coal from a southwestern extension of the Fu-hsin basin. Pop. (mid-1970s est.) 100,000–300,000.

Pei Wei DYNASTY: *see* Wei dynasty.

peine forte et dure (French: "strong and hard punishment"), in English law, punishment that was inflicted upon those who were accused of a felony and stood silent, refusing to plead either guilty or not guilty, or upon those who challenged more than 20 prospective jurors. By the Statute of Westminster, 1275, the *peine* was usually to imprison and starve until submission, but in 1406 pressing to death by heavy weights was added to this. An individual who chose to stand mute under the threat of *peine forte et dure* often did so to ensure that his goods and estates would be inherited by his family; if he entered a plea and was subsequently tried and convicted, his goods would pass directly to the crown. In treason cases *peine forte et dure* was not applicable, because standing mute in such cases meant a plea of guilty.

Peine forte et dure was abolished in 1772, when "standing mute" was made equivalent to conviction. By an act of 1827 a plea of "not guilty" was to be entered against any prisoner refusing to plead, and that has since remained the rule in English law. *Peine forte et dure* was rarely used in the American colonies. The few instances of its use helped to prompt the constitutional prohibition against cruel and unusual punishments.

Peipus, Battle of Lake, also called BATTLE OF LAKE CHUDSKOYE (April 5, 1242), encounter in which Alexander Nevsky of Novgorod was victorious over the invading Teutonic Knights. In 1239 the Livonian Knights (Order of the Brothers of the Sword) began a military campaign in northwestern Russia to expand their territory and convert the Russians to Roman Catholicism. Interrupted by the Mongol invasion of Poland and Silesia (1241), the campaign was resumed by the Teutonic Knights (with whom the Livonian Knights were affiliated). In 1241 the Knights captured Pskov, then proceeded against Novgorod in March 1242. But Nevsky led an army against them. Recovering all the territory seized by the Knights, he engaged them in battle on the frozen Lake Peipus (Chudskoye Ozero), known as the "battle on the ice." His victory forced the grand master of the Knights to relinquish all claims to the Russian lands that he had conquered and substantially reduced the Teutonic threat to northwestern Russia.

Peipus, Lake, Russian CHUDSKOYE OZERO, Estonian PEIPSI JÄRV, lake forming part of the boundary between the Estonian Soviet Socialist Republic and Pskov *oblast* (administrative region) of the Russian Soviet Federated Socialist Republic. It is connected by the narrow Tyoploye Ozero (lake) to a southern extension, Lake Pskov. Lake Peipus has an area of 1,400 sq mi (3,600 sq km), although this varies. The lake bottom, reaching a depth of about 50 ft (15 m), consists of gray mud; only in the south is it sandy. The banks are predominantly low-lying. The lake, which is frozen for six months of the year, forms the headwaters of the Narva River. In 1242 the Russians under Alexander Nevsky defeated the Germanic Teutonic Knights on the frozen Lake Peipus.

Peirce, Benjamin (b. April 4, 1809, Salem, Mass., U.S.—d. Oct. 6, 1880, Cambridge, Mass.), American mathematician, astronomer, and educator who computed the general perturbations of the planets Uranus and Neptune.

Peirce graduated from Harvard College in 1829 and accepted a teaching position with George Bancroft at his Round Hill School in Northampton, Mass. Two years later he was asked to join the faculty at Harvard as a tutor in mathematics. Much of Peirce's reputation was based on two of his early works. The first was his solution to a mathematical problem proposed in the journal *Mathematical Diary* in which he proved that there is no odd perfect number with fewer than four distinct prime factors; the second was his commentary and revision of Nathaniel Bowditch's translation of the first four volumes of the Marquis de Laplace's *Traité de mécanique céleste* ("Treatise on Celestial Mechanics").

In 1833 Peirce received his M.A. from Harvard and was named university professor of astronomy and mathematics. During the next decade he wrote a series of textbooks and monographs dealing with trigonometry, algebra, geometry, astronomy, and navigation, as well as *An Elementary Treatise on Sound* (1836), based on the work of physicist J.F.W. Herschel. Peirce was instrumental in establishing the Harvard Observatory, and in 1842 he became Harvard's Perkins professor of mathematics and astronomy, a position he held until his death. In this capacity he helped determine the orbit of the newly discovered planet Neptune and calculated the perturbations produced between its own orbit and those of Uranus and other planets.

Considered the leading American mathematician of his day, Peirce was named to a five-man committee by the American Academy of Arts and Sciences in 1847 to plan and organize what was to be the Smithsonian Institution. From 1849 to 1867 Peirce served as consulting astronomer to the newly created *American Ephemeris and Nautical Almanac,* and in 1852 he began a long association with the U.S. Coast Survey. Starting as director of longitude determinations, he eventually became superintendent of the Survey (1867–74) and oversaw the production of the first geodetic map of the country independent of local surveys. Peirce also served, in 1863, as one of the 50 incorporators of the National Academy of Science. His best work is *Linear Associative Algebra* (1870), a study of possible systems of multiple algebras.

Peirce, Charles Sanders (b. Sept. 10, 1839, Cambridge, Mass., U.S.—d. April 19, 1914, near Milford, Pa.), American scientist, logi-

Charles Sanders Peirce, 1891

cian, and philosopher who is noted for his work on the logic of relations and on Pragmatism as a method of research.

Life. Peirce was one of four sons of Sarah Mills and Benjamin Peirce, who was Perkins professor of astronomy and mathematics at Harvard University. After graduating from Harvard College in 1859 and spending one year with field parties of the U.S. Coast and Geodetic Survey, Peirce entered the Lawrence Scientific School of Harvard University, from which, in 1863, he graduated summa cum laude in chemistry. Meanwhile, he had reentered the Survey in 1861 as a computing aide to his father, who had undertaken the task of determining, from observations of lunar occultations of the Pleiades, the longitudes of American survey points with respect to European ones. Much of his early astronomical work for the Survey was done in the Harvard College Observatory, in whose *Annals* (1878) his *Photometric Researches* (concerning a more precise determination of the shape of the Milky Way Galaxy) appeared.

In 1871 his father obtained an appropriation to initiate a geodetic connection between the surveys of the Atlantic and Pacific coasts. This cross-continental triangulation lent urgency to the need for a gravimetric survey of North America directed toward a more precise determination of the Earth's ellipticity, a project that Charles was to supervise. In pursuit of this project, Peirce contributed to the theory and practice of pendulum swinging as a means of measuring the force of gravity. The need to make accurate measurements of lengths in his pendulum researches, in turn, led him to make a pioneer determination of the length of the metre in terms of a wavelength of light (1877–79). Between 1873 and 1886 Peirce conducted pendulum experiments at about 20 stations in Europe and the United States and (through deputies) at several other places, including Grinnell Land in the Canadian Arctic.

Though his experimental and theoretical work on gravity determinations had won international recognition for both him and the Survey, he was in frequent disagreement with its administrators from 1885 onward. The amount of time he took for the careful preparation of reports was ascribed to procrastination. His "Report on Gravity at the Smithsonian, Ann Arbor, Madison, and Cornell" (written 1889) was never published, because of differences concerning its form and content. He finally resigned as of the end of 1891, and, from then until his death in 1914, he had no regular employment or income. For some years he was a consulting chemical engineer, mathematician, and inventor.

Peirce was elected a fellow of the American Academy of Arts and Sciences in 1867 and a member of the National Academy of Sciences in 1877. He presented 34 papers before the latter from 1878 to 1911, nearly a third of them in logic (others were in mathematics, physics, geodesy, spectroscopy, and experimental psychology). He was elected a member of the London Mathematical Society in 1880.

Work in logic. Though Peirce's career was in physical science, his ambitions were in logic. By the age of 31, he had published a number of technical papers in that field, besides papers and reviews in chemistry, philology, the philosophy of history and of religion, and the history of philosophy. He had also given two series of Harvard University lectures and one of Lowell Institute lectures, all in logic. Though Peirce aspired to a university chair of logical research, no such chair existed, and none was created for him: the day of logic had not yet come. His nearest approach to this ambition occurred at Johns Hopkins University, where he held a lectureship in logic from 1879 to 1884 while retaining his position in the Survey.

Logic in its widest sense he identified with semiotics, the general theory of signs. He laboured over the distinction between two kinds of action: sign action, or semiosis, and dynamic, or mechanical, action. His major work, unfinished, was to have been entitled *A System of Logic, Considered as Semiotic.*

Though he made eminent contributions to deductive, or mathematical, logic, he was a student primarily of "the logic of science"—*i.e.,* of induction and of what he called "retroduction," or "abduction," the forming and accepting on probation of a hypothesis to explain surprising facts. His lifelong ambition was to establish abduction and induction firmly and permanently along with deduction in the very conception of logic—each of them clearly distinguished from the other two, yet positively related to them. It was for the sake of logic that Peirce so diversified his scientific researches, for he felt that the logician should ideally have an insider's acquaintance with the methods and reasonings of all the sciences.

Work in philosophy. Peirce's Pragmatism was first elaborated in a series of "Illustrations of the Logic of Science" in the *Popular Science Monthly* in 1877–78. The scientific method, he argued, is one of several ways of fixing beliefs. Beliefs are essentially habits of action. It is characteristic of the method of science that it makes its ideas clear in terms first of the sensible effects of their objects, and second of habits of action adjusted to those effects. Here, for example, is how the mineralogist makes the idea of hardness clear: the sensible effect of x being harder than y is that x will scratch y and not be scratched by it; and believing that x is harder than y means habitually using x to scratch y (as in dividing a sheet of glass) and keeping x away from y when y is to remain unscratched. By the same method Peirce tried to give equal clarity to the much more complex, difficult, and important idea of probability. In his Harvard lectures of 1903, he identified Pragmatism more narrowly with the logic of abduction. Even his evolutionary metaphysics of 1891–93 was a higher order working hypothesis by which the special sciences might be guided in forming their lower order hypotheses; thus, his more metaphysical writings, with their emphases on chance and continuity, were but further illustrations of the logic of science.

When Pragmatism became a popular movement in the early 1900s, Peirce was dissatisfied both with all of the forms of Pragmatism then current and with his own original exposition of it, and his last productive years were devoted in large part to its radical revision and systematic completion and to the proof of the principle of what he by then had come to call "pragmaticism."

His "one contribution to philosophy," he thought, was his "new list of categories" analogous to Kant's a priori forms of the understanding, which he reduced from 12 to 3: Quality, Relation, and Representation. In later writings he sometimes called them Quality, Reaction, and Mediation; and finally, Firstness, Secondness, and Thirdness. At first he called them concepts; later, irreducible elements of concepts—the univalent, bivalent, and trivalent elements. They appear in that order, for example, in his division of the modalities into possibility, actuality, and necessity; in his division of signs into icons, indexes, and symbols; in the division of symbols into terms, propositions, and arguments; and in his division of arguments into abductions, inductions, and deductions. The primary function of the new list was to give systematic support to this last division.

Peirce was twice married: first in 1862 to Harriet Melusina Fay, who left him in 1876, and second in 1883 to Juliette Pourtalai (*née* Froissy). There were no children of either marriage. For the last 26 years of his life, he and Juliette lived on a farm on the Delaware River near Milford, Pa. He called himself a bucolic logician, a recluse for logic's sake. He lived his last years in serious illness and in abject poverty relieved only by aid from such friends as William James.

Significance. Peirce is now recognized as the most original and the most versatile intellect that the Americas have so far produced. The recognition was slow in coming, however, and much of his work is still known only to specialists, each grasping a small part of it, severed from its connections with the rest. Even his Pragmatism is viewed in relation to that of other Pragmatists rather than to other parts of his own work. A philosopher will know him also for his evolutionary metaphysics (theory of basic reality) of chance and continuity. A mathematician may know him for his contributions to linear algebra. A logician will know him as one of the creators of the algebra of logic—including the logic of relations; quantification theory (on the usages of "every . . . ", "no . . . ", and "some . . . "); and three-valued logic, which admits a third truth value between true and false—and may know him also for his two systems of logical graphs, which he called entitative and existential. A psychologist may discover in him the first modern psychologist in the United States. A worker in semiotics will know him as co-founder of that science. A philologist may encounter him as an authority on the pronunciation of Elizabethan English. A computer scientist may find in one of his letters the first known sketch of the design and theory of an electric switching-circuit computer. But all of this, and much besides, lay beyond the scope of his professional career.

BIBLIOGRAPHY. *The Peirce papers. Collected Papers,* ed. by Charles Hartshorne, Paul Weiss, and Arthur W. Burks, 8 vol. (1931–58), with a bibliography of Peirce's writings in vol. 8, pp. 249–330. The Peirce papers in the Houghton Library at Harvard University are listed and described by Richard S. Robin in his *Annotated Catalogue of the Papers of Charles S. Peirce* (1967), and in "The Peirce Papers: A Supplementary Catalogue," *Transactions of the Charles S. Peirce Society,* 7:35–57 (1971). Peirce's mathematical writings appear in *Studies in the Scientific and Mathematical Philosophy of Charles S. Peirce,* ed. by Carolyn Eisele and Richard M. Martin (1979).

Studies. Studies in the Philosophy of Charles Sanders Peirce (1952), was edited by Philip P. Wiener and Frederic H. Young. The *Second Series,* ed. by Edward C. Moore and Richard S. Robin (1964), contains a supplement to Burks's bibliography of Peirce's own writings (pp. 477–485) and also a bibliography of writings about Peirce (pp. 486–514). There are further supplements in *Transactions . . . ,* 2:51–59 (1966). Carolyn Eisele and Victor F. Lenzen have published numerous studies of Peirce's work in the sciences, mathematics, and in the history of science (see the bibliographies mentioned above). Of the many books on Peirce's philosophy, the one that makes most use of unpublished materials and has greatest biographical value is Murray G. Murphy, *The Development of Peirce's Philosophy* (1961).

Peiresc, Nicolas-Claude Fabri de (b. Dec. 1, 1580, Belgentier, Fr.—d. June 24, 1637, Aix-en-Provence), French antiquary, Humanist, and influential patron of learning who discovered the Orion Nebula (1610) and was among the first to emphasize the study of coins for historical research.

Peiresc, engraving by J. Lubin
By courtesy of the trustees of the British Museum; photograph, R.B. Fleming

Travels in Italy (1599–1602), studies at Padua, and acquaintance there with Galileo stimulated Peiresc's antiquarian and astronomical interests. A senator at the Parlement of Aix from 1605, he corresponded with the Flemish painter Peter Paul Rubens and many of the noted scholars of the day. Peiresc was first to verify William Harvey's discovery of the circulation of blood, and Sir Isaac Newton made use of his work on optics. He encouraged the legal studies of the Dutch jurist Hugo Grotius, on whose writings much of international law is based, and was largely responsible for the publication of a well-known political satire of the time, *Argenis,* by the Scottish poet John Barclay (1621). No published works by Peiresc are known, but the records of his correspondence indicate the catholicity of his interests.

Peirithous (Greek mythology): *see* Pirithous.

Peisistratus, also spelled PISISTRATUS (b. early 6th century BC—d. 527 BC), tyrant of ancient Athens whose unification of Attica and consolidation and rapid improvement of Athens' prosperity helped to make possible the city's later preeminence in Greece.

Rise to power. In 594 Peisistratus' mother's relative, the reformer Solon, had improved the economic position of the Athenian lower classes, but the Solonian reorganization of the constitution had not eliminated bitter aristocratic contentions for control of the archonship, the chief executive post. As Peisistratus reached manhood, the two major vying factions were called the Plain, led by Lycurgus, and the Coast, led by Megacles.

During a war with the city of Megara about 565, Peisistratus gained military fame by taking the Megarian harbour. He organized his own faction, named the Hillsmen, a group that included noble families from his own district, the eastern part of Attica, and also a very considerable part of the growing population of the city of Athens. At one point Peisistratus slashed himself and the mules of his chariot and made a dramatic entrance into the agora (marketplace) to show how his enemies had wounded him. The people voted him use of a bodyguard of citizens armed with clubs, with the aid of which he seized the Acropolis and held power briefly in 560/559. To increase his support he contracted a short-lived marriage with the daughter of Megacles and again acquired temporary power in Athens (probably 556–555), but Lycurgus and Megacles united to force him out.

For several years Peisistratus was an exile in northern Greece. He laid a solid base for his return, exploiting the silver and gold mines of Mt. Pangaeum and gaining the support of conservatives in Thebes, Argos, Naxos, and elsewhere. In 546 he went to Eretria on the island of Euboea, with the force provided by his own funds and by his friends, and from this base invaded Attica. At Pallene, near Mt. Hymettus, he launched a surprise attack on the Athenian army in the heat of midday, while his enemies were gambling or sleeping. After a complete victory, Peisistratus became master of Athens for the third time and remained in power until his death in 527. His sons Hippias and Hipparchus succeeded him.

The occasional modern efforts to interpret the factions involved in the rise of Peisistratus as representing simply different economic interests or purely geographical blocs seem misconceived, nor can one hope to penetrate the legends about Peisistratus to discern his personality. His career down to 546 shows persistence, dexterity, and diplomatic ability; once master, he followed a program that pleased the city population especially but that also appealed to the rural majority.

Tyrant of Athens. Peisistratus was master of Athens by the use of force, so in Greek terms he was a *tyrannos.* He maintained a mercenary bodyguard, composed in part of Scythian archers; he may have disarmed the citizens; and he certainly placed hostages from major families in safekeeping on the island of Naxos. Yet he preserved the constitutional forms of government and made them operate more efficiently. Some aristocrats cooperated and were permitted to hold the yearly post of archon; others went into exile. Once Peisistratus, accused of homicide, appeared before the court on the day of the trial, but his accuser dared not press the charge.

His internal policies appear to have been designed to increase the unity and majesty of the Athenian state. Since religion was closely interwoven with the structure of the Greek polis, or city-state, many of his steps were religious reforms. He brought the great shrine of Demeter at Eleusis under state control and constructed the first major Hall of the Mysteries (Telesterion) for the annual rites of initiation into the cult. Many local cults of Attica were either moved to the city or had branch shrines there. Artemis, for instance, continued to be worshiped at Brauron, but now there was also a shrine to Artemis on the Acropolis. Above all, Athena now became the main deity to be revered by all Athenian citizens. Peisistratus constructed an entry gate (Propylaea) on the Acropolis and perhaps built an old Parthenon under the temple that now stands on the crest of the Acropolis. Many sculptured fragments of limestone from Peisistratid buildings have been found on the Acropolis, and the foundations of a major, unfinished temple can still be seen.

Festivals and literature also flourished in Peisistratid times. The tyrant enhanced the glory of the Panathenaea, a yearly festival to Athena, by accentuating the Great Panathenaea (every four years) with athletic contests and prizes for bards who recited the Homeric epics. After the cult of Dionysus was placed under state sponsorship, prizes were awarded at the yearly Dionysia for the singing of dithyrambs and, from 534, for the performance of tragedies. Poets such as Anacreon lived at the court of Peisistratus and his sons, who also encouraged the collection of oracles and supported the famous soothsayer Onomacritus.

Contribution to the growth of Athens. At this time Athens itself was becoming a city, rather than an agglomeration of villages. Peisistratus improved its water supply by building an aqueduct that fed the Enneakrounos fountain on the edge of the agora. He also beautified and systematized the marketplace itself; 6th-century markers of its borders have been found in agora excavations. Just outside the city, on the banks of the Ilissus stream, he began a temple to Olympian Zeus, but this was not finished until the reign of the Roman emperor Hadrian.

In the countryside, Solon had encouraged the growing of olive trees and vines to produce cash crops; Peisistratus made loans to small farmers for tools and equipment. In a few cases the estates of exiled aristocrats appear to have been broken up, but the major force in reducing aristocratic control over rural Attica seems to have been the regularization of government. Peisistratus instituted a system of traveling judges to provide state trials of rural cases on the spot; he himself made inspection tours.

This extensive cultural and political activity was financed by Peisistratus' revenues from the mines of Mount Pangaeum and from internal sources. The silver mines of Laurium were state property, and dues were exacted from the growing trade at Athenian harbours. Peisistratus instituted a tax, probably of 10 percent, on agricultural production. On one tour of inspection, according to a famous story, he saw a farmer digging in a field of stones and asked what his income was. When the farmer replied, "Just so many aches and pains; and of these aches and pains Peisistratus ought to take his 10 percent," the tyrant remitted all taxes to the frank farmer.

Athenian industry and commerce expanded tremendously in the latter half of the 6th century; the main contribution of Peisistratid rule to these developments was probably the guarantee of internal tranquility and the protection of foreign immigrants.

Externally, the tyrant pursued a policy of peace, probably because he dared not allow the Athenian citizenry to bear arms in a major war. But at this time the Greek world was also in a temporary state of balance. In the Aegean, Peisistratus helped such friends as Lygdamis of Naxos to become local tyrants. He purified the sacred island of Delos by removing the old graves near its temple of Apollo. His main efforts, however, were concentrated in gaining control of the Hellespont, through which came the exported grain of south Russia. To this end he secured command of Sigeum and installed a younger son, Hegesistratus, as its ruler. More important, he encouraged the Athenian Miltiades to lead a private venture that gained mastery over the Chersonesus.

On the death of Peisistratus, Athens was still much less important politically and militarily than was Sparta. Commercially, states such as Miletus, Corinth, and Aegina were at least as active, and the contemporary tyrant Polycrates of Samos was as important a patron of the arts and letters. Nonetheless, the religious and patriotic unification of Athens had made great progress during Peisistratus' calm, even rule. As Aristotle reports, it became a common saying that the tyranny of Peisistratus had been the age of Cronus, the golden age.

(C.G.St.)

BIBLIOGRAPHY. The main ancient sources are Herodotus, bk. 1, ch. 59–64; and Aristotle, *Constitution of Athens*, ch. 13–17. N.G.L. Hammond, *A History of Greece to 322 B.C.*, 2nd ed., ch. 6 and 8 (1967), cites other minor sources and gives the political development. On the constitutional side, see C. Hignett, *A History of the Athenian Constitution to the End of the Fifth Century B.C.*, ch. 5 (1952). A. Andrewes, *The Greek Tyrants* (1956), thoughtfully compares Peisistratus with other Greek tyrants.

Pekalongan, also spelled PECALONGAN, *kotamadya* (municipality) and *kabupaten* (regency), Jawa Tengah *provinsi* ("province"), central Java, Indonesia, situated on the northern coastal plain. The city, capital of the regency, has a fort (1753) and a small harbour and is the main distributing centre for the area, exporting tea, rubber, and sugar, which is locally refined. The city is a main centre of batik production, textiles forming an important cottage industry. Pekalongan regency, with an area of 2,176 square miles (5,636 square km), was granted to the Dutch East India Company by the Susuhunan of Mataram. The very fertile river valleys and coastal plain support crops that produce sugar, rice, kapok, cinchona, indigo, and corn (maize). Pop. (1980) city, 132,558; regency, 651,709.

pekan (mammal): *see* fisher.

Pekanbaru, *kotamadya* (municipality) and capital of Riau *provinsi* ("province"), central Sumatra, Indonesia. It is a port on the Siak Stream, located about 100 miles (160 km) upstream from the Strait of Malacca. It is a collection centre for agricultural produce from the hinterland, including rubber, tea, and coffee, together with petroleum, bauxite, and gold. Household industry includes wood carving, metalwork, basket weaving, and textile production. The city has an airport, and roads link it with Parit, Dumai, Bangkinang, Payakumbuh, and Taluk. The Grand Mosque of Shaykh Burhanuddin and Riau University (founded 1962) are located in Pekanbaru. Pop. (1980) 186,262.

Pekea nut: *see* souari nut.

Pekin, city, seat of Tazewell county, central Illinois, U.S., on the Illinois River (bridged) just south of Peoria. The first settler was Jacob Tharp in 1824; the town was laid out in 1829 and was named Pekin by Mrs. Nathan Cromwell, wife of a founder, on the false assumption that it was directly opposite Peking, China, on the other side of the Earth. (Many of the older city streets are named for Mrs. Cromwell's friends—Ann Eliza, Cynthiana, Henrietta, Matilda). Pekin's first schoolhouse (Snell School) was fortified during the Black Hawk War (1832) as Fort Doolittle. Pekin for many years remained a rough river port. Abraham Lincoln argued many cases in its courthouse. The city was the birthplace and home of U.S. Senator Everett M. Dirksen, who is buried there.

A shipping centre for grain, cattle, and coal, Pekin is served by several railroads and is on the Illinois Waterway. Manufactures include corn (maize) products, alcohol, liquor, malt, steel tanks, barrels, burial vaults, and copper, brass, iron, and aluminum castings. The Spring Lake Conservation Area is nearby. Inc. 1839. Pop. (1986 est.) 32,950.

Peking, Wade–Giles romanization PEI-CHING, Pinyin BEIJING, city, capital of Peking *shih* (municipality) and of the People's Republic of China. Peking is located in northeastern China at the northern end of the triangular North China Plain, about 100 miles (160 km) inland from the Gulf of Chihli of the Yellow Sea. With but few interruptions, the city has been China's capital almost continuously since AD 1272, when the Mongol ruler Kublai Khan established his political base there. In 1420 it was made the official capital city of the Ming dynasty (1368–1644), under the name of Peking ("Northern Capital"). The city has thus constituted an integral part of the country's history over the past eight centuries.

A brief treatment of Peking follows. For full treatment, *see* MACROPAEDIA: Peking.

The municipality of Peking is almost surrounded by Hopeh province and is bordered at two points by Tientsin municipality. Peking's lowland (elevation 100–130 feet [30–40 m]) site is bounded on the north by the fringe of the Mongolian Plateau and on the northeast by the Yen Mountains; a concave arc of lowland, termed the Bay of Peking by geologists, circles Peking from the northeast to the southwest. This embayment opens onto the great plain to the south and east.

Standing at the southern convergence of important mountain passes, Peking is a natural gateway on the long-distance land-communication route between the North China Plain and the northern ranges, plains, and plateaus. Because of its strategic position, Peking has been for more than 700 years an important terminus of the trade routes leading to and from the vast Central Asian hinterland.

Since the early 15th century, the city of Peking and its surrounding territories have been organized as a metropolitan district of enormous size. The present metropolitan area was established in 1959 and consists of four urban and six suburban *ch'u* (districts) surrounded by nine annexed *hsien* (counties). It may be divided into three concentric zones, based on urban functions. The central zone, including the formerly walled city, is mainly occupied by old palaces, government buildings, commercial districts, and old residential areas. The second zone, the near suburb, provides sites for new factories, schools, government buildings, and workers' dormitories; its outer fringe is agricultural. The third zone, the far suburb, constitutes the majority of the municipality's land area and functions as the economic base, supplying resources to the urban population of the other zones.

Peking's climate is of the continental monsoon type that occurs in the temperate zone. Winters are long, cold, and dry, influenced by Siberian air from the Mongolian Plateau; temperatures are lowest in January, with a mean of 24° F (−4° C). In summer the warm and humid air from the southwest often penetrates into North China, bringing most of the area's annual precipitation of 25 inches (635 mm). July is the warmest month, with a mean temperature of 79° F (26° C).

During the 1950s and 1960s, Peking became one of the nation's principal industrial centres. Primary activities include the production of steel, machines (chiefly for construction, transportation, mining, and farming), precision instruments, textiles, and petrochemicals and electrical engineering. The traditional handicrafts industry continues to be strong, producing rugs and carpets, porcelain and chinaware, jade and ivory sculpture, and other goods.

Many service industries, operated mainly by government agencies, have greatly expanded. Tourism is promoted by the China International Travel Service and by the Overseas Chinese Tourist Service, both based in Peking, and by a growing number of hotels and hostels. The People's Bank of China, whose head office is located in Peking's inner city, plays a key role in the country's nationwide and centralized system of banking. This bank functions as the agent of the national treasury, centralizing the financial resources of the government and the major sectors of China's economy. Working in cooperation with the People's Bank, and under its supervision, are the People's Construction Bank, which finances basic construction; the Agricultural Bank of China, which handles agricultural investment; and the Bank of China, which specializes in foreign trade and exchange.

Peking has striven for a high degree of self-sufficiency in secondary food supplies, such as vegetables, fruits, fish, and poultry. Vegetables are grown in a belt around the central city. Many state farms and communes have planted orchards on reclaimed land.

Peking lacks the compact central business district that characterizes most cities in the Western world. The historical market areas of the city were located to the southwest and southeast of the Imperial Palace, and the East and West markets are still major shopping centres. Since 1949 a number of multistory department stores have been erected; the Peking Department Store is the largest in China. In addition, there are many traditional bazaars that have developed distinctive reputations over many years.

Peking city proper essentially consists of two old walled cities, the northern inner city (or "Tatar City," lying approximately on the site of the Mongol city of Ta-tu) and the southern, outer city (or "Chinese City," added during the Ming dynasty). Within the inner city is the former Imperial City, which in turn contains the moated "Forbidden City," where the Imperial Palaces (now a museum) are located.

The symmetrical, rectangular layout of the inner city about a single straight north–south line is striking. All the city walls, important city gates, main avenues and streets, religious buildings, and daily shopping markets are arranged in relation to this central axis; few cities in the world can rival Peking in the regularity and harmony of its plan. Peking also has a high proportion of recreational land.

Peking represents, better than any other existing city, the heritage of Chinese architectural achievement. Care has been taken throughout the centuries to preserve the traditional sites, even while modernizing parts of the city. Since 1949, the greatest change in appearance has been the demolition of the old city walls and the extension of the city's streets immediately outside the old walls.

Among the historical and religious structures in Peking, the Temple of Heaven (T'ien T'an) is unique, both for its unusual geometric layout, which embodies the age-old belief that heaven is round and the Earth square, and because it represents the supreme level of Chinese architectural enterprise. Other important sites include the Temple of the Imperial Ancestors (now the People's Cultural Park) on the east side of the axis, which is balanced by the Altar of Earth and Harvests (now the Chungshan Park) on the west. Perhaps the most imposing structure built since 1949 in the heart of the city is the two-block-long Great Hall of the People. In its grand auditorium the National People's Congress (the supreme organ of state power) holds its sessions.

Peking's position as a centre of higher education has been firmly established since 1949. A scientific and educational district has emerged, containing the prestigious Peking (1898) and Ch'ing-hua universities. Also within this district are other institutions for ideological training, for music and medical education, and for training in specialized technical fields. The Chinese Academy of Sciences, China's highest research institute, is located there as well. Peking also offers a number of foreign-language institutions.

As the cultural focus of China for several centuries, Peking possesses what are probably the finest cultural institutions in the nation, including libraries (such as the Peking Library, containing imperial collections), museums (the Palace Museum and the Museum of Chinese History), and theatres. Peking is also the chief publishing and media centre in China.

Intracity transport is provided by a network of buses and trolleys, but bicycles constitute the bulk of street traffic. Highways, which have regular bus service, are the chief links with nearby communities. Peking is the railroad and airline centre of China. It is linked by direct express trains with several large urban centres and also occasionally with foreign cities such as Moscow; P'yŏngyang, N.Kor.; Ulaanbaatar, Mongolia; and Hanoi, Vietnam. A dozen major highways radiate from Peking, along which regular bus services run. Its international airport is located 14 miles (23 km) from the city. Area city, 1,763 square miles (4,567 square km); metropolitan area, 6,500 square miles. Pop. (1988 est.) city, 5,468,540; mun. 9,926,000.

Peking duck, one of the most celebrated dishes of Pekingese, or Mandarin Chinese, cuisine. In its classic form, the dish calls for a specific breed of duck, the Imperial Peking, that is force-fed and housed in a small cage so that inactivity will ensure tender meat. The neck and head are left intact as the bird is killed and dressed, and, after the entrails are removed, the lower opening is sewed shut. Air is forced between the skin and flesh to puff out the skin so that the fat will be rendered out during roasting and the skin, the choicest part of the dish, will be very crisp. The inflated bird is painted with a sweet solution, hung up to dry for several hours, then roasted suspended in a cylindrical clay oven.

Peking duck is served in three courses. The skin is accompanied by hoisin sauce (a commercially prepared, reddish brown sweet and spicy sauce), scallions cut into brushes, and thin wheat-flour pancakes or steamed wheat-flour "lotus buns," all of which are eaten together as a sandwich. The meat of the duck is cut up and served with vegetables as a second course, and a soup of the duck's bones with celery cabbage follows. Because it must be roasted in a special oven, Peking duck is primarily restaurant fare.

Peking man, extinct hominid of the species *Homo erectus,* known from fossils found at Chou-k'ou-tien (Zhoukoudian) cave near Peking. Peking man was identified as a new fossil human by Davidson Black in 1927 on the basis of a single tooth. Later excavations yielded 14 skullcaps, several mandibles, facial bones and limb bones, and the teeth of about 40 individuals. These Chou-k'ou-tien hominid fossils are dated to the Middle Pleistocene, (about 900,000 to 130,000 years ago), although a more exact date has not been determined. Before being assigned to *Homo erectus,* they were variously classified as *Pithecanthropus* and *Sinanthropus.*

Peking man is characterized by a cranial capacity averaging 1,075 cubic cm (range 850–1,300 cubic cm, overlapping the range of modern man, whose average is 1,350 cubic cm), a skull flat in profile but with a small forehead, a sagittal ridge on top of the head for attachment of powerful jaw muscles, very thick skull bones, heavy browridges, an occipital torus, a large palate, and a large, chinless jaw. The teeth are essentially human, though the canines and molars are quite large, and the enamel of the molars is often wrinkled. The limb bones are indistinguishable from those of modern man. Core tools, primitive flaked tools, worked-bone tools, charred animal bones, and the remains of hearths found in association with these human bones show Peking man had a well-developed communal culture, practiced hunting, and used fire domestically. Peking man postdates Java man and is considered more advanced in having a larger cranial capacity, a forehead, and nonoverlapping canines.

The original fossils were under study at the Peking Union Medical College in 1941, when, with Japanese invasion imminent, an attempt was made to smuggle them out of China and to the United States. The bones disappeared and have never been recovered, leaving only plaster casts for study. Renewed excavation in the caves, beginning in 1958, brought new specimens to light.

Peking Man (1975) by Harry L. Shapiro describes the original finding of the fossils, discusses their significance, and reconstructs the circumstances under which they vanished.

Peking opera: *see* ching-hsi.

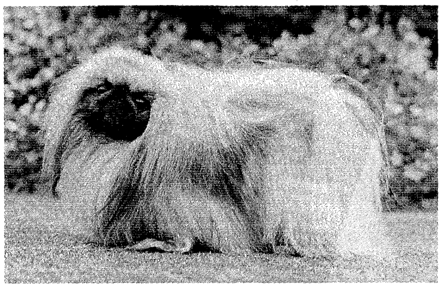
Peking University, Chinese (Wade–Giles) PEI-CHING TA-HSÜEH, (Pinyin) BEIJING DAXUE, byname PEI-TA, or BEIDA, in Peking, one of the oldest and most important institutions of higher learning in China. It originated as the Capital College, which was founded in 1898 by the emperor Kuang-hsü as part of his short-lived program to modernize and reform China's institutions. This school languished after the empress dowager Tz'u-hsi's coup d'état of the same year. After the overthrow of the Ch'ing dynasty in 1911, the school was renamed Peking University. It was subsequently reinvigorated, and by 1920 it had become a centre for the most progressive currents among China's intelligentsia and students. During the 1920s two founders of the Chinese Communist Party, Li Dazhao and Chen Duziu, were on the university's faculty, and the young Mao Zedong began studying Marxism in 1918 under their influence, while he worked in the university's library. The noted writer Lu Hsün lectured on Chinese literature at Peking University in the 1920s.

Student demonstrations at the university in 1919 marked the start of the influential May Fourth Movement. During the Japanese invasion of China (1937–45), the university was temporarily relocated to K'un-ming in Yunnan province. In 1952 the university was reorganized and merged with Yen-ch'ing (Yanjing) University, which had been founded by American Methodist missionaries in 1922. Peking University relocated to Yen-ch'ing's more spacious campus, on the northwestern outskirts of Peking. The first disturbances of the Cultural Revolution began at Peking University in 1966. Education there ceased from 1966 to 1970 and did not regain a firm basis until after the end of the Cultural Revolution in 1976. Peking University has since reasserted its position as the foremost nontechnical university in China. Students who score the highest in nationwide competitive examinations are admitted to it. The university has about 25 academic departments and several research institutes. It also has the largest university library in China. All Peking University students live in dormitories and receive a government stipend for food. Tuition, books, equipment, and medical care are free.

Peking Zoological Garden, also called PEKING ZOO, zoological garden on the western outskirts of Peking, founded in 1906 by the empress dowager Tz'u-hsi. The zoo is managed by the Peking Office of Parks and Forestry, financed with government funds, and noted for its collection of rare Asian species.

The Peking Zoo served chiefly as an experimental farm from 1911 to 1949, when the Chinese Communists took control of Peking. The Communist government renovated the 56-ha (138-ac) zoo and reopened it to the public shortly thereafter. In 1952 an elephant house was built, and since that time a large carnivore enclosure, a primate house, and an aquatic animal house have been added. The zoo's collection has grown to more than 4,000 specimens of about 485 species. Among the rare primates in the collection are snub-nosed monkeys and white-headed langurs. It also includes unusual ungulates such as the kiang (a wild ass), the white-lipped deer, and the little-known takin (a heavily built, mountain-dwelling, hoofed mammal). The very rare white-eared pheasant was kept from extinction by the work of the Peking Zoo, and the zoo was the first to breed the giant panda. A large collection of fishes featuring unusual varieties of goldfish is also maintained by the zoo.

Pekingese, breed of toy dog developed in ancient China, where it was held sacred and was kept as a palace dog by members of the Imperial family. It was introduced to the West by English forces that looted the Imperial Palace at Peking in 1860. The Pekingese has been



Pekingese
Sally Anne Thompson—EB Inc.

known, both in the Orient and in the West, as the "lion dog"—presumably because of its appearance, although it is also acclaimed as having a lionlike independence and courage. It stands about 6 to 9 inches (15 to 23 centimetres) and weighs up to about 14 pounds (6.5 kilograms). The celebrated "sleeve dogs" are very small Pekingese once carried by Chinese royalty in the sleeves of their robes. A long-haired dog, the Pekingese has a full mane and heavily haired thighs, forelegs, tail, and toes. Its head is broad and flat, with hanging ears and a short, wrinkled muzzle. The coat may be solid or variegated in colour, but there is always a black mask across the face.

Peko, in Estonian religion, an agricultural deity who aided the growth of grain, especially barley. Peko was represented by a wax image that was kept buried in the grain in the granary and brought out in early spring for a ritual of agricultural increase. An entire village might participate in such a ceremony, for which the food and beer were furnished in common. After the ceremonial feast, leftovers would be distributed among the poor, and the men would engage in ritual wrestling or fence jumping to determine who would be the host for Peko in the following year. The first one to get a bleeding wound would take Peko home and store him in his granary. The word Peko itself is thought to derive from the name of the Swedish deity Beyggvir, in turn deriving from *bjugg* ("barley"), which in its earliest form was *beggwu.*

pelage, hairy, woolly, or furry coat of a mammal, distinguished from the underlying bare skin. The pelage is significant in several respects: as insulation; as a guard against injury; and, in its coloration and pattern, as a species adornment for mutual recognition among species members, concealment from enemies, or, in the case of many males, as a sexual allurement to promote courtship and mating. *Compare* plumage.

Pelagia OF ANTIOCH, SAINT (d. *c.* 311, Antioch, Syria; feast day June 9), 15-year-old Christian virgin who, probably during the persecution of Christians by the Roman emperor Diocletian, threw herself from a housetop to save her chastity and died instantly. Her authenticity was endorsed and praised by St. Ambrose and St. John Chrysostom who celebrated her martyrdom in a homily.

The memory of this historical Pelagia influenced two legends of fictitious Pelagias—Pelagia the Penitent (or Margarito) and Pelagia Margaret of Tarsus. Pelagia the Penitent was a prostitute of Antioch who experienced sudden conversion to Christianity and then lived her remaining life in a cave at Jerusalem, disguised as a man. Pelagia of Tarsus, for refusing to marry Diocletian, was roasted to death. Both legends are associated with that of St. Margaret of Antioch.

Pelagianism, also called PELAGIAN HERESY, a 5th-century Christian heresy taught by Pelagius (*q.v.*) and his followers that stressed the essential goodness of human nature and the freedom of the human will. Pelagius was concerned about the slack moral standards among Christians, and he hoped to improve their conduct by his teachings. Rejecting the arguments of those who claimed that they sinned because of human weakness, he insisted that God made human beings free to choose between good and evil and that sin is a voluntary act committed by a person against God's law. Celestius, a disciple of Pelagius, denied the church's doctrine of original sin and the necessity of infant Baptism.

Pelagianism was opposed by Augustine, bishop of Hippo, who asserted that human beings could not attain righteousness by their own efforts and were totally dependent upon the grace of God. Condemned by two councils of African bishops in 416, and again at Carthage in 418, Pelagius and Celestius were finally excommunicated in 418; Pelagius' later fate is unknown.

The controversy, however, was not over. Julian of Eclanum continued to assert the Pelagian view and engaged Augustine in literary polemic until the latter's death in 430. Julian himself was finally condemned, with the rest of the Pelagian party, at the Council of Ephesus in 431. Another heresy, known as Semi-Pelagianism (*q.v.*), flourished in southern Gaul until it was finally condemned at the second Council of Orange in 529.

Pelagianism, Semi-: *see* Semi-Pelagianism.

pelagic zone, ecological realm that includes the entire ocean water column. Of all the inhabited Earth environments, the pelagic zone has the largest volume, 1,370,000,000 cubic kilometres (330,000,000 cubic miles), and the greatest vertical range, 11,000 metres (36,000 feet). Pelagic life is found throughout the water column, although the numbers of individuals and species decrease with increasing depth. The regional and vertical distributions of pelagic life are governed by the abundance of nutrients and dissolved oxygen; the presence or absence of sunlight, water temperature, salinity, and pressure; and the presence of continental or submarine topographic barriers.

Pelagic life consists of three categories. The phytoplankton, which constitute the food base of all marine animals, are microscopic organisms that inhabit only the sunlit uppermost oceanic layer, using sunlight to photosynthetically combine carbon dioxide and dissolved nutrient salts. Zooplankton are the marine animals that rely mainly upon water motion for transport, although some forms such as jellyfish are feeble swimmers. Zooplankton subsist on phytoplankton and smaller zooplankton and are dominated in their numbers by small crustacean copepods and euphasiids. Nekton, the free swimmers, are dominated by the bony and cartilaginous fishes, molluscans, and decapods, with rarer mammals and reptiles.

Pelagie Islands, Italian ISOLE PELAGIE, group of islands in the Mediterranean Sea between Malta and Tunisia, south of Sicily; administratively they form the commune of Lampedusa in Agrigento province, Sicily, Italy. The group consists of the islands of Lampedusa (*q.v.*) and Linosa and the Isolotto (islet) Lampione, standing on the eastern edge of the submarine platform of the east coast of Tunisia. Pop. (1981 prelim.) Lampedusa and Linosa mun., 4,495.

Pelagius (b. *c.* 354, probably Britain—d. after 418, possibly Palestine), monk and theologian whose heterodox theological system known as Pelagianism (*q.v.*) emphasized the primacy of human effort in spiritual salvation.

Coming to Rome *c.* 380, Pelagius, though not a priest, became a highly regarded spiritual director for both clergy and laymen. The rigorous asceticism of his adherents acted as a reproach to the spiritual sloth of many Roman Christians, whose moral standards greatly distressed him. He blamed Rome's moral laxity on the doctrine of divine grace that he heard a bishop cite from the *Confessions* of Saint Augustine, who in his prayer for continence beseeched God to grant whatever grace the divine will determined. Pelagius attacked this teaching on the grounds that it imperilled the entire moral law and soon gained a considerable following at Rome. Henceforth his closest collaborator was a lawyer named Celestius.

After the fall of Rome to the Visigoth chieftain Alaric in 410, Pelagius and Celestius went to Africa. There they encountered the hostile criticism of Augustine, who published several denunciatory letters concerning their doctrine, particularly Pelagius' insistence on man's basically good moral nature and on man's own responsibility for voluntarily choosing Christian asceticism for his spiritual advancement.

Pelagius left for Palestine *c.* 412. There, although accused of heresy at the synod of Jerusalem in 415, he succeeded in clearing himself and avoiding censure. In response to further attacks from Augustine and the Latin biblical scholar Jerome, Pelagius wrote *De libero arbitrio* ("On Free Will") in 416, which resulted in the condemnation of his teaching by two African councils. In 417 Pope Innocent I endorsed the condemnations and excommunicated Pelagius and Celestius. Innocent's successor, Zosimus, at first pronounced him innocent on the basis of Pelagius' *Libellus fidei* ("Brief Statement of Faith"), but after renewed investigation at the council of Carthage in 418, Zosimus confirmed the council's nine canons condemning Pelagius. Nothing more is known of Pelagius after this date.

Pelagius I (b. Rome—d. March 4, 561, Rome), pope from 556 to 561. His ecclesiastical roles under popes St. Agapetus I, St. Silverius, and Vigilius were highly important in the history of the church.

As a deacon, Pelagius accompanied Agapetus to Constantinople to help him dissuade the Byzantine emperor Justinian I from attempting the reconquest of Italy. Before he died at Constantinople, Agapetus appointed Pelagius nuncio. When the Byzantine empress Theodora, Justinian's wife, apparently effected the deposition and banishment in March 537 of Agapetus' successor, Silverius, Pelagius returned to Rome. After the deacon Vigilius was made pope, Pelagius went to Constantinople, where he counselled Justinian, returning to Rome as imperial representative.

In the church, a massive complication, subsequently called the "Three Chapters Controversy," arose in reaction to Justinian's edict of 544 against certain Nestorian writings (*see* Nestorians). When Vigilius was summoned to Constantlnople in 545 to ratify the edict, Pelagius served as defender of Rome when it was captured in 546 by the Ostrogothic king Totila, whom he courageously persuaded to spare the Romans. Since the Goths had been warring with the Byzantines in Italy, Totila sent Pelagius on an unsuccessful mission to Constantinople to negotiate a settlement with Justinian.

Pelagius remained in Constantinople with Vigilius, whom he accompanied to Rome and back to Constantinople in 552, where they refused to attend the council of 553 to settle the "Three Chapters Controversy." The council condemned the Nestorian writings and their authors. When, however, Vigilius decided, in 554, to sanction Justinian's edict and the council's condemnation, Pelagius withdrew his support of the Pope, for which he was excommunicated. To Justinian, Pelagius wrote letters against Vigilius, the Byzantine emperor, and to the Council of Constantinople. Imprisoned, he was not released until the death in 555 of Vigilius, whom he formally condemned in his *In defensione trium capitulorum* ("In Defense of the Three Chapters"). Pelagius was reconciled with Justinian and was elected, through imperial insistence, to succeed Vigilius in 555, being consecrated at Rome on April 16, 556.

Italy, however, was in chaos. The West had not accepted the decrees of the Council of Constantinople, and a schism immediately erupted that continued until 610. One of Pelagius' most urgent problems was to rebuild Rome, a task made easier because Justinian in 554 had promulgated his Pragmatic Sanction, confirming and increasing the pope's temporal power. In effect, Pelagius was the official protector of the civil population. By making his new rights resolute and by organizing the temporal government of papal sovereignty, Pelagius began the foundation of the papacy's political power. With the Eastern emperors no longer papal opponents, his role as spiritual head of the church shifted to the danger of barbarian invasion and the protection of the Italian peoples.

Pelagius was unable to prevent the bishops of Milan and Istria from schism because as pope he reversed his opinion and upheld the Council of Constantinople. His aim was church unification, and his power was set by the imperial government. Pelagius' pontificate illustrates the enormous difficulties of his time. Editions of his writings appeared in 1932 and 1956.

Pelagius II (b. Rome—d. Feb. 7, 590, Rome), pope from 579 to 590.

Of Gothic descent, he was consecrated as Pope Benedict I's successor on Nov. 26, 579, without imperial confirmation. His pontificate was continually troubled by the Lombards who were besieging Rome and threatening the Italian peoples, for whom the papacy was responsible.

Pelagius sent the deacon Gregory (later Pope St. Gregory I the Great) as nuncio to Constantinople for aid from the Byzantine emperor Tiberius II. Involved in wars with Persia, Tiberius was unable to help, and for the first time in papal history Pelagius appealed to the Catholic Franks. In a letter (580) to the Frankish bishop of Auxerre he declared it was the Franks' duty as Christians to defend Rome and Italy against the "deathly race" of the Lombards. Gregory persuaded Tiberius to approve Pelagius' unprecedented appeal and to grant the Franks subsidies. Halted in their advance, the Lombards took up a defensive position; but, when the Franks withdrew, the Lombards threatened again, and Pelagius made an appeal to Tiberius' successor, Maurice. The imperial representative in Italy, Exarch Smaragdus of Ravenna, finally negotiated peace in 585.

In the meantime, Pelagius tried unsuccessfully to end the long-standing schism in northern Italy, where certain bishops had broken with Rome over the "Three Chapters Controversy," a complicated dispute among the papacy, Justinian, and the Council (553) of Constantinople over the censuring of Nestorian writings. Despite Pelagius' efforts, the schism continued until 610.

Although relationships between Rome and Maurice were good, a dispute arose over St. John IV the Faster, bishop of Constantinople. Pelagius protested when John assumed the title—traditional at Constantinople since the 5th century—of ecumenical patriarch, which seemed to make him Pelagius' equal, if not his superior. Maurice supported John, and thus began a titular controversy between the Byzantine and Western churches, sharpened by Pelagius' refusal to accept the decrees of a Constantinopolitan council endorsed by John.

Pelagius was responsible for building projects in Rome, including a basilica adjacent to San Lorenzo fuori le Mura. He died in a plague that struck Rome after a disastrous flood.

Pelasgi, also called PELASGIANS, the people who occupied Greece before the 12th century BC. The name was used only by ancient Greeks. The Pelasgi were mentioned as a specific people by several Greek authors, including Homer, Herodotus, and Thucydides, and were said to have inhabited various areas, such as Thrace, Argos, Crete, and Chalcidice. In the 5th century BC the surviving villages apparently preserved a common non-Greek language.

It is uncertain whether any ancient people actually called themselves Pelasgi. In later Greek usage their name was applied to all "aboriginal" Aegean populations.

Pelavicino, Oberto, Pelavicino also spelled PALLAVICINO (b. 1197, Polesine, near Cremona, Lombardy—d. May 8, 1269, Gisalecchio, near Pontremoli, Tuscany), leader of the Ghibelline (imperial) party in northern Italy and powerful supporter of the Holy Roman emperor Frederick II and his sons.

As a member of a great feudal family of Lombardy, Pelavicino fought at Frederick's side in 1238 against Brescia, near Milan, and the following year became imperial vicar (deputy of the emperor) in Lunigiana and Pontremoli, near Genoa. He acted as Frederick's representative in several north Italian cities, serving as *podestà* (chief magistrate) of Reggio in 1246 and at Cremona in 1249 and after 1249 as imperial vicar over the area from Pavia to Tuscany.

After Frederick's death (1250), he served in 1253 as imperial vicar in Lombardy for Frederick's son Conrad IV and, after Conrad's death (1254), took advantage of political turmoil to become lord of Pavia, Cremona, and Piacenza, allying himself with the Veronese tyrant Ezzelino da Romano against the Guelfs (supporters of the pope). In 1258 he quarrelled with Ezzelino over the possession of Brescia. Transferring his allegiance to Conrad's younger brother, King Manfred, he made an alliance with Azzo d'Este of Ferrara that contributed to Ezzelino's defeat by Guelf forces in 1259. The following year the Della Torre family, lords of Milan, made Oberto captain general for five years, with nominal control over several neighbouring cities. The invasion of Charles of Anjou's Guelf army in 1264–65 drove him out of Milan, and he died four years later, his power greatly diminished by the Ghibelline defeat.

Pelayo (d. *c.* 737), founder of the Christian kingdom of Asturias in northern Spain, which survived through the period of Moorish hegemony to become the spearhead of the Christian Reconquistá in the later Middle Ages.

Pelayo's historical personality is overshadowed by legend. As far as can be ascertained, he was a page, or possibly a member of the royal bodyguard, of the Visigothic king Roderick, and may have been of royal blood. He survived the defeat (711) of the Visigoths by the Moors at the Battle of Guadalete near Medina Sidonia and reached his native Asturias, where he led a revolt of Asturians and Visigothic refugees against the Moorish governor Munuza. He was captured and sent to Córdoba as a hostage but escaped (717) and again assumed leadership of the Asturian rebellion. The rebels, though driven into the uplands of the Picos de Europa, were able to survive massive attacks by Moorish armies, especially at the Battle of Monte Auseba, and, eventually, Pelayo—accepted as their ruler (*c.* 718–*c.* 737)—was able to set up a tiny kingdom with its capital at Cangas de Onís. The stories and relics of Pelayo associated with the nearby shrine of Covadonga belong to legend rather than to fact; it was, however, in this legendary guise that he became an important symbol of Christian resistance in medieval Spanish history and literature.

Articles are alphabetized word by word, not letter by letter

Pelé, byname of EDSON ARANTES DO NASCIMENTO (b. Oct. 23, 1940, Três Corações, Braz.), association football (soccer) player, in his time probably the most famous and possibly the best paid athlete in the world. In competition for the World Cup (Jules Rimet Trophy) he led the Brazilian national team to three victories (1958, 1962, and 1970) and permanent possession of the trophy.

Pelé
A.F.P.—Pictorial Parade/EB Inc.

After playing for a minor league club at Bauru, São Paulo state, Pelé (whose nickname apparently is without significance) was rejected by major league teams in the city of São Paulo. In 1956, however, he joined the Santos Football Club, which, with Pelé at inside left forward, won several South American clubs' cups and, in 1962, its first world club championship. On Nov. 20, 1969, in his 909th first-class match, he scored his 1,000th goal. A medium-sized man (5 feet 8 inches, 160 pounds), he combined kicking power and accuracy with a remarkable ability to anticipate other players' moves. Sometimes called "Pérola Negra" ("Black Pearl"), he became a Brazilian national hero.

Pelé announced his retirement in 1974 but in 1975 agreed to sign a three-year, $7,000,000 contract with the New York Cosmos of the North American Soccer League (NASL) and to promote the game in the United States. He retired after leading the Cosmos to the league championship in 1977.

Pelé was the 1978 recipient of the International Peace Award, and in 1980 he was named Athlete of the Century. In addition to his accomplishments in sports, he published several best-selling autobiographies, starred in several successful documentary and semi-documentary films, and composed numerous musical pieces, including the entire soundtrack for the film *Pelé* (1977).

pelecaniform, order (Pelecaniformes) of relatively large, aquatic birds that share the common characteristic of webbing between all four toes. The three suborders are the Phaethontes, (including the tropic bird; *q.v.*) the Fregatae (the frigate bird; *q.v.*) and the Pelecani (including the pelican, booby, gannet, cormorant, and snakebird (*qq.v.*).

A brief treatment of pelecaniforms follows. For full treatment, *see* MACROPAEDIA: Birds.

The three species of tropic birds, confined to the tropics, are the most pelagic (free-flying over open ocean) of the pelecaniforms. They range far out to sea in search of small fish and squid, which they detect while hovering over the sea, then plunging into a powerful dive to capture prey just below the surface of the water. Their courtship display is conducted in midair. The birds fly around in a group and then a pair leaves the group and flies together. The nuptial display often ends with one or both birds flying to the nest site located on open ground under the shelter of a bush or rock where a single egg is laid.

Frigate birds are also found solely in the tropics. They can be distinguished by their long powerful wings, deeply forked tail, and long, hooked beak. Frigate birds use their mastery of flight to advantage in pursuing other seabirds, which they harry until the seabirds disgorge their prey. The frigate birds then catch the food in the air or retrieve it from the surface. They also catch their own prey, particularly flying fish, which they catch in midair. They also snatch fish, and possibly squid, from the surface without alighting.

Courtship behaviour of the frigate bird includes a display in which the male, while leaning back and extending his wings, inflates his scarlet throat (gular) sac, vibrates his wings, and claps his bill. This display is also used in individual recognition. As with the tropic birds, a single egg is laid. Five living species of frigate bird are known.

Pelicans are found in both freshwater and marine habitats from the tropics to the temperate zones. These large, buoyant birds tend to fish while swimming, thrusting their large beaks and long necks below the surface to scoop up fish, which they store in their distensible throat pouches. Their buoyancy is due to pneumatic bone structure and water-repellent plumage. Groups of pelicans will cooperate to herd fish into the shallows. The brown pelican (*Pelecanus occidentalis*) of the Pacific coast of Central and South America, unlike the other species, is known to forage some distance offshore, plummeting into the water to seize its prey. Pelicans build nests on the ground, large but untidy constructions of twigs, grass, algae, and feathers. They lay one to three eggs. Incubation and feeding of the young are shared between the male and female.

Boobies are found from the tropics to the temperate zones in marine habitats. Both gannets and boobies are strong fliers, capturing prey by diving from great heights to spear fish underwater. The blue-footed booby (*Sula nebouxii*) exhibits cooperation when hunting in a group. Boobies are colonial nesters. Their courtship display consists of raising the head and tail and partially lifting the wings. Most boobies lay their eggs in small depressions on open ground, although some species nest on cliff ledges. Gannets and boobies lay one or two eggs.

The cormorants and snakebirds (also called darters, or anhingas) are long-necked, underwater swimmers who pursue and lie in wait for prey below the surface of the water. Snakebirds are found in freshwater habitats from the tropics to the temperate zones. The cormorants inhabit both freshwater and marine environments and are dispersed from the Equator to the polar regions. While cormorants pursue fish and sometimes mollusks on their underwater dives, snakebirds lie in wait underwater and stab passing fish. The cormorants can engage in cooperative fishing activity. Adaptations for diving in these species include the closed external nostrils. Both cormorants and snakebirds are colonial nesters; male courtship display consists of raising the head and tail and lifting and waving their wings. The clutch consists of two to five eggs.

While few external features unite the pelecaniforms, certain anatomical features are common to species with similar habits. For example, the more aerial species have pneumatized skeletons. Those types that dive from great heights, such as boobies, tropic birds, and brown pelicans, have air sacs under the skin, forming a spongy, protective mattress that aids in buoyancy. In cormorants and snakebirds the large contour feathers are wettable and trap little air. This keeps buoyancy low and enables them to submerge.

Because most pelecaniform birds nest in exposed situations they are subject to overheating and commonly protect their young by shading them with their wings. A common method of cooling is by rapid panting of the throat pouch (absent in tropic birds) to maximize evaporative cooling. The water required for evaporation comes from food and seawater, the excess salt being secreted by nasal salt glands. In most seabirds the salt flows out through the nostrils, but in boobies and cormorants, where the nostrils are closed, the solution trickles down from the end of the bill. In all species, both parents share the feeding and incubating of the young.

Pelée, Mount, French MONTAGNE PELÉE, active volcanic mountain on the Caribbean island of Martinique, French West Indies. Situated 15 mi (24 km) northwest of Fort-de-France, it is 4,583 ft (1,397 m) high. The Pelée (French: Bald) massif consists of volcanic ash and lavas. A gently sloping cone, it is scored with ravines and supports luxuriant forests. Minor eruptions occurred in 1792 and 1851, but on May 8, 1902, it violently destroyed the port of Saint-Pierre, killing approximately 30,000 people, 15 percent of the island's population. So dramatic was this event that the name of the mountain has been adopted as typifying that particular kind of eruption, the pelean-type eruption of ash, gas, and nuée ardente ("flaming cloud"). A minor eruption occurred in 1929.

Pelee Island, island, in Lake Erie, southern Ontario, Canada. It lies near the Ohio boundary, a few miles south of Point Pelee National Park and has an area of 18 sq mi (47 sq km). Originally leased from the Indians by Thomas McKee in 1788, it was acquired in 1823 by William McCormick. Viticulture was practiced until 1855, when John Scudder drained marshes for raising vegetables and tobacco. Soybeans later became the leading crop. Middle Island, a rock off its southern coast, is the southernmost point of Canada. Pop. (1981) 247.

Peletier, Jacques, byname JACQUES PELETIER DU MANS (of Le Mans) (b. 1517, Le Mans, Fr.—d. 1582, Paris), French poet and critic whose knowledge and love of Greek and Latin poetry influenced the group of French poetry reformers known as La Pléiade. In the preface to his translation of Horace's *Ars Poetica* (1545) and in his *Art poétique française* (1555), he put forward his own program for the reform of French poetry. He insisted that poets must imitate the classics if French literature was to rise to great heights. In addition to lyric poetry, Peletier wrote major works on mathematics and spelling reform.

Peleus, in Greek mythology, king of the Myrmidons of Thessaly; he was most famous as the husband of Thetis (a sea nymph) and the father of the hero Achilles, whom he survived. When he and his brother Telamon were banished from Aegina, the kingdom of their father Aeacus', he went to Phthia to be purified by his uncle King Eurytion, whose daughter Antigone he married, receiving a third of Eurytion's kingdom. During the Calydonian boar hunt he accidentally killed Eurytion. He then went to Iolcos to be purified by King Acastus, whose wife Astydameia made advances to him. When he refused her, she told Antigone that he wanted to marry her daughter, causing Antigone to hang herself. Peleus later won the sea nymph Thetis by capture, and all the gods except Eris came to the wedding. But after Thetis bore Achilles to him, she returned to the depths of the sea, later fetching Peleus to dwell with her.

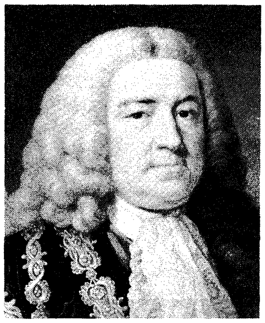
Pelham, Henry (b. 1696—d. March 6, 1754, London), prime minister of Great Britain from 1743 to 1754. A somewhat colourless politician, he worked for peace abroad and introduced important financial reforms.

First elected to Parliament in 1717, Pelham



Pelham, detail of a portrait by John Shackleton, *c.* 1752; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

became a supporter of Robert Walpole (prime minister 1730–42), who helped him obtain appointments as lord of the Treasury (1721), secretary for war (1724), and paymaster to the forces (1730). After Walpole resigned under pressure from the House of Commons in 1742, Pelham became prime minister and chancellor of the exchequer in a ministry that included his brother Thomas Pelham-Holles, duke of Newcastle, and John Carteret, a favourite of King George II.

Carteret's attempts to involve England more deeply in conflict with France and Prussia (War of the Austrian Succession, 1740–48) caused Pelham to dismiss him in 1744, shortly after Carteret had been created Earl Granville. When George II continued to push for the return of Granville, Pelham retaliated by calling for a mass resignation of the ministers on Feb. 11, 1746—the first such action in English history. Since Granville was unable to form a new ministry, Pelham returned to office three days later, bringing into his ministry William Pitt (later earl of Chatham), whom the King disliked. Subsequently, Pelham's only serious political opposition came from Frederick Louis, prince of Wales, who unsuccessfully endeavoured to depict his father, George II, as a captive of the Pelhams. In 1748 Pelham signed the Treaty of Aix-la-Chapelle, which ended the War of the Austrian Succession, which he had seen as a severe financial drain on the country. After the war he accomplished a major reduction of the military establishment and of government expenses, and he reduced the land tax and consolidated the national debt. The subject is treated in John W. Wilkes, *A Whig in Power* (1964).

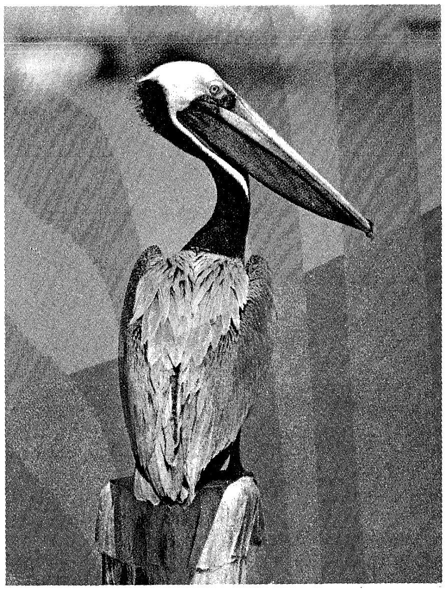
Pelham-Holles, Thomas: *see* Newcastle (under Lyme), Thomas Pelham-Holles, 1st duke of.

Pelias, in Greek mythology, a king of Iolcos in Thessaly who imposed on his half-nephew Jason the task of bearing off the Golden Fleece. According to Homer, Pelias and Neleus were twin sons of Tyro (daughter of Salmoneus, founder of Salmonia in Elis) by the sea god Poseidon, who came to her disguised as the river god Enipeus, whom she loved. The twins were exposed at birth but were found and raised by a horse herder. Later, Pelias seized the throne and exiled Neleus.

Later legend relates that on Jason's return with the fleece, his wife Medea, the enchantress, took revenge on Pelias by persuading his daughters, except for Alcestis, to cut up and boil their father in the mistaken belief that he would thereby recover his youth.

pelican (*Pelecanus*), any of seven or eight species of water birds constituting the family Pelecanidae (order Pelecaniformes), distinguished by their large, elastic throat pouches. Pelicans inhabit lakes, rivers, and sea coasts in many parts of the world. With some species reaching a length of 180 centimetres (70 inches), having a wingspan of 3 metres (10 feet), and weighing up to 13 kilograms (30 pounds), they are among the largest of living birds. Pelicans eat fish, which they catch by using the extensible throat pouch as a dip-net. The pouch is not used to store the fish, which are swallowed immediately. One to four bluish-white eggs are commonly laid in a stick nest and hatch in about a month. The young live on regurgitated food obtained by thrusting their bills down the parent's gullet. They mature at three to four years. Though ungainly on land, pelicans are impressive in flight. They usually travel in small flocks, soaring overhead and often beating their wings in unison. The sexes are similar in appearance, but males are larger.

Best known are the two species called white pelicans: *Pelecanus erythrorhynchos* of the New World, the North American white pelican, and *P. onocrotalus* of the Old World, the European white pelican. The smaller, 107–137-cm brown pelican (*P. occidentalis*) of the New World is a coastal species listed as endangered by the U.S. Fish and Wildlife Service. Its U.S. populations declined drastically as a result of DDT and related pesticides—which interfere with calcium metabolism, thus causing weak shells that tend to break during incubation—but breeding improved after DDT was banned.



Brown pelican (*Pelecanus occidentalis*)
Norman Tomalin—Bruce Coleman Inc.

Pelicans usually breed in colonies on islands; there may be many small colonies on a single island. The gregarious North American white pelican breeds on islands in lakes in north central and western North America; all pairs in any colony at any given time are in the same stage of the reproductive cycle. It is migratory, as are some other species. The brown pelican breeds along the tropical and subtropical shores of both the Atlantic and Pacific coasts.

Pelindaba, site of South Africa's first nuclear research reactor, south central Transvaal, South Africa. It is located about 20 mi (32 km) west of Pretoria, on former farmland near the man-made lake called Hartbeespoort. The reactor, Safari I, was inaugurated there in 1965. The National Nuclear Research Centre, located at Pelindaba, undertakes applied nuclear research, and the reactor serves as a source of neutron radiation and radioactive isotopes. Enriched uranium is also produced at adjoining Valindaba.

Pelion, Mount, Modern Greek ÓROS PÍLION, mountain range on the Magnesia peninsula of southeastern Thessaly, Greece, rising to 5,417 ft (1,651 m). Mt. Pelion (5,075 ft), just northeast of Vólos, has a wooded western flank overlooking a gulf whose ancient ports were Iolcus and Pagasae. In Greek mythology it was the home of Centaurs. The ship "Argo" of the Argonauts allegedly was built of wood from its trees.

Pélissier, Aimable-Jean-Jacques, DUC DE (duke of) MALAKOFF (b. Nov. 16, 1794, Maromme, Fr.—d. May 22, 1864, Algiers), French general who distinguished himself in the conquest of Algeria and was the last French commander in chief in the Crimean War.

Pélissier, engraving
H. Roger-Viollet

Educated at the military schools of La Flèche and Saint-Cyr, Pélissier was commissioned as an artillery second lieutenant in 1815. In 1823 he served in the Spanish campaign to suppress the revolution against Ferdinand VI, and in 1828–29 he fought against the Turks in the Peloponnese. After his first brief service in Algeria in 1830, he returned there in 1839 to take part in the campaign against the patriot emir of Mascara, Abdelkader. He fought with distinction, being promoted to general in 1846, and served as military commander of the coastal province of Oran from 1848 to 1851. During the 1852 coup d'etat of Napoleon III, he was interim governor of Algeria. Subsequently, he played a leading role in the subjugation of the tribes of southern Algeria.

In January 1855 Pélissier was given command of an army corps in the Crimea. He defeated a Russian attack on the Traktir Ridge on August 16 and captured the fort of Malakhov and the city of Sevastopol on September 8. Four days later he was made marshal of France, and in July 1858 he was created duc de Malakoff. From March 1858 to April 1859 Pélissier was French ambassador to London. He was governor of Algeria from 1860 until his death.

Pella, ancient capital of King Archelaus of Macedonia at the end of the 5th century BC and birthplace of Alexander the Great. Originally known as Bounomos, the city developed rapidly under Philip II, but after the defeat of the last Macedonian king by the Romans (167 BC) it became a small provincial town.

The site of Pella, in northern Greece, about 24 miles northwest of Thessaloníki, has long been known. Excavations by the Greek Archaeological Service begun in 1957 have revealed the rectangular grid plan of the town and large, well-built houses with colonnaded courts and rooms with mosaic floors portraying scenes of lion hunts and of Dionysus riding a panther.

pellagra, nutritional disorder caused in large part by a deficiency of niacin, a member of the vitamin B complex, and characterized by skin lesions and by gastrointestinal and neurological disturbances—the so-called classical three Ds of pellagra: dermatitis, diarrhea, and dementia.

The skin lesions are the most characteristic and usually the earliest symptoms. They result from an abnormal sensitization of the skin to sunlight and tend to occur symmetrically on the exposed surfaces of the arms, legs, and neck. They may look at first like a severe sunburn, later becoming reddish brown, rough, and scaly.

Gastrointestinal symptoms usually consist of alternate constipation and diarrhea, with an accompanying inflammation of the mouth and the tongue, and fissuring and dry scaling of the lips and corners of the mouth.

Neurological signs appear later in most cases, when the skin and alimentary manifestations are prominent. The dementia, or mental aberrations, may include general nervousness, confusion, depression, apathy, and delirium. In humans, pellagra is seldom a deficiency of niacin alone; response to niacin therapy tends to be partial, whereas the therapeutic administration of multivitamins commonly brings swift recovery. Mild or suspected instances of niacin deficiency can be effectively treated with a well-balanced diet alone.

The breakthrough in the understanding of pellagra took place in 1937, when it was shown that the disorder known as black tongue in dogs could be cured by the administration of niacin (also called nicotinic acid) or the amide of niacin (nicotinic acid amide or nicotinamide). Pellagra is now seldom encountered in countries in which the population generally eats a well-balanced diet, but it still occurs widely where the diet is high in starchy foods and low in essential amino acids and vitamins. Corn (maize), for example, is low in both niacin and tryptophan, the latter being an amino acid that is converted to niacin in the body. Such foods as milk and eggs, although low in niacin, will protect the body from pellagra because their proteins contain sufficient tryptophan for the synthesis of niacin. Pellagra can also be a side effect of chronic alcoholism. Symptoms closely resembling those of pellagra are seen in Hartnup disease (*q.v.*).

Pellegrini, Carlo, pseudonym APE (b. March 1839, Capua, Kingdom of Naples—d. Jan. 22, 1889, London), caricaturist notable for his portraits of prominent Englishmen appearing in *Vanity Fair.*

As a young man he was a part of Neapolitan society, whose members he caricatured in a good-natured way. Following an unhappy love affair and the death of a sister, he went to England in 1864 and turned his hand to cartooning. His first effort—a cartoon of Benjamin Disraeli—appeared in the British literary magazine *Vanity Fair* in 1869, shortly before he adopted the signature "Ape." His second, of William Gladstone, appeared a week later. One of the best known is of the writer Thomas Carlyle, which appeared in 1870. His portraits were gently humorous, in keeping with his genial disposition.

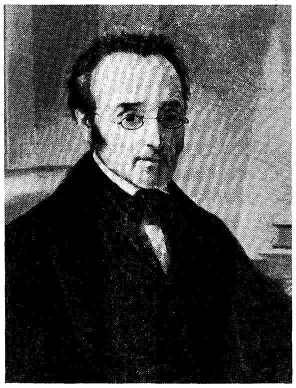
Pellegrino PELLIGRINI, also called PELEGRINO DA BOLOGNA (Italian painter): *see* Tibaldi, Pellegrino.

Pelletier, Pierre-Joseph (b. March 22, 1788, Paris, Fr.—d. July 19, 1842, Paris), French chemist who helped found the chemistry of alkaloids.

Pelletier was professor at and, from 1832, director of the School of Pharmacy, Paris. In 1817, in collaboration with the chemist Joseph-Bienaimé Caventou, he isolated chlorophyll, the green pigment in plants that is essential to the process of photosynthesis. His interests soon turned to a new class of vegetable bases now called alkaloids, and he isolated emetine. With Caventou he continued his search for alkaloids, and in 1820 they discovered brucine, cinchonine, colchicine, quinine, strychnine, and veratrine. Some of these compounds soon found medicinal uses. Such applications marked the beginning of the gradual shift away from the use of crude plant extracts and toward the use of natural and synthetic compounds found in nature or formulated by the chemist.

In 1823 Pelletier published analyses of several alkaloids, thus providing a basis for alkaloid chemistry. He also did important studies of other compounds, including caffeine, piperine, and picrotoxin.

Pellico, Silvio (b. June 25, 1789, Saluzzo, Kingdom of Sardinia [now in Italy]—d. Jan. 31, 1854, Turin), Italian patriot, dramatist, and author of *Le mie prigioni* (1832; *My Prisons*), memoirs of his sufferings as a political prisoner, which inspired widespread sympa-



Pellico, detail of an oil painting by Luigi Norfini
SCALA—Art Resource/EB Inc.

thy for the Italian nationalist movement, the Risorgimento.

Educated at Turin, Pellico spent four years in France, returning to Italy in 1809 to begin his career as a poet and playwright. His romantic tragedy *Francesca da Rimini* (published 1818) was a success on its first performance (1815) and was followed by several others. He had already become one of the circle of Romantic revolutionary writers including Vincenzo Monti, Ugo Foscolo, Giovanni Berchet, and Alessandro Manzoni, and in 1818 he collaborated in founding a liberal and patriotic newspaper, *Il Conciliatore,* of which he became editor. After its suppression by the Austrian police (1819), he joined the Carbonari and, in October 1820, was arrested for treason. In 1822 he was sentenced to death, but the sentence was commuted to life imprisonment, of which he served eight years in prisons in Milan, Venice, and the infamous Spielberg (Spilberk) fortress (used as a political prison by the Habsburgs) in Brunn. From 1838 he lived with his wife in Turin. Of his plays, poetry, and prose works, *Le mie prigioni* is still widely read and translated for its simple, direct style, spiritual revelation, and Christian piety.

Pelloutier, Fernand (b. Oct. 1, 1867, Paris, Fr.—d. March 13, 1901, Paris), a leading organizer and theoretician of the French labour movement who deeply influenced the philosophy and methods of anarcho-syndicalist labour unionism.

As a young journalist in the town of Saint-Nazaire, Pelloutier became a member of the Parti Ouvrier, the largest Marxist Socialist party in France at the time; but he left it in 1892 after the party's leader repudiated the idea of the general strike as romantic and impractical. Disillusioned by leftist party politics, he turned to anarchism and in 1895 became secretary of the Fédération des Bourses du Travail, an institution combining the functions of workers' clubs, employment exchanges, and local labour-union federations. He criticized orthodox Marxists for relying upon the apparatus of the state, a bourgeois institution, as a means of changing society and asserted that the state would be replaced by a "voluntary and free association of producers." This association would be based upon the Bourses du Travail. Through them, Pelloutier believed, the workers would evolve communistic forms of production and create "a socialist state within the bourgeois state."

Pelloutier was a gifted organizer as well as a theoretician, and under his guidance the bourses grew in number until he claimed more than 250,000 members throughout France. In 1900 he founded the Office Nationale de la Statistique et de la Placement, for the purpose of getting satisfactory employment for workers and reducing job competition.

In his *Histoire des bourses du travail* (1902), Pelloutier defined the theory and practice of anarcho-syndicalism.

Pelloux, Luigi (Girolamo) (b. March 1, 1839, La Roche, Savoy [now in France]—d. Oct. 26, 1924, Bordighera, Italy), Italian general and prime minister (1898–1900) who brought his country to the brink of crisis by adopting an extremely repressive domestic policy.

After graduation from the military academy at Turin (1857), Pelloux fought in several battles against Austria, distinguishing himself as a brave and capable leader. He rose through the ranks and as major commanded the artillery that first breached Rome's Porta Pia, thus allowing the occupation of the city (1870), which the troops of a uniting Italy made the country's capital.

In 1880 Pelloux began his political career in the House of Deputies. Promoted to general in 1885, he was minister of war in three cabinets (1891–92, 1892–93, 1896–97). In 1896 he was made a senator. When disturbances broke out in Bari, where he was commander of the army corps, he recognized that the unrest arose from extreme economic need and refused to declare martial law, thus gaining the favour of the leftists. Similar outbursts in other Italian cities, however, led to the downfall of the government.

Invited to form a government (June 1898), Pelloux began correcting the excesses of the previous administration. Soon, however, his training as an army officer asserted itself, and he introduced a repressive bill that would have greatly curtailed civil liberties (February 1899). To avoid defeat on his foreign policy, which featured an unsuccessful military expedition to China, Pelloux resigned (March 1899) and formed a second, more conservative government.

Although the country was now quite calm, Pelloux attempted to make his earlier bill more repressive, thus finally uniting the left in opposition against him. Pelloux prorogued the chamber and tried to have the bill passed by royal decree.

When the decree was ruled void by the Court of Cassation (February 1900), Pelloux had to resubmit his bill to a thoroughly hostile chamber. Forced to resign on June 18, 1900, he was given command of an army corps at Turin (1900–02).

Pelly River, stream in central Yukon Territory, Canada, one of the main headstreams of the Yukon River. It was named in 1840 by Robert Campbell for Sir John Henry Pelly, governor of the Hudson's Bay Company. Rising in the Mackenzie Mountains near the southeastern boundary of the territory, the river flows westward, receiving its two major tributaries, Ross and Macmillan rivers, before joining the upper course of the Yukon at Fort Selkirk. The Pelly, 378 miles (608 km) in length, is navigable for small boats for more than 200 miles (320 km), to Hoole Canyon, except in the shallows of Bradens Canyon.

Pelopidas (d. 364 BC, Cynoscephalae, Thessaly [now in Greece]), Theban statesman and general responsible, with his friend Epaminondas, for the brief period (371–362) of Theban hegemony in mainland Greece.

In 385 Pelopidas served in a Theban contingent sent to support the Spartans at Mantineia, where he was seriously wounded but was saved by Epaminondas. Upon the seizure of the Theban citadel by the Spartans (382), Pelopidas fled to Athens and took the lead in a conspiracy to liberate Thebes. In 379 his party surprised and killed their chief political opponents and, by arousing the Theban people, were able to force the Spartan garrison to surrender. In this and subsequent years he was elected boeotarch, or chief magistrate, of Thebes. Pelopidas was the leader of the Sacred Band, a selected infantry body of 300, which routed a large Spartan force at Tegyra (near Orchomenus, Boeotia) in 375 and distinguished itself in the defeat of Sparta at the decisive battle of Leuctra (371).

In 369, in response to a petition of the Thessalians, an army under Pelopidas checked the ambitions of Alexander, tyrant of Pherae, and drove the forces of the king of Macedonia out of Thessaly. Later Pelopidas was seized by Alexander, and two expeditions from Thebes were needed to win his release. Finally Pelopidas defeated Alexander at Cynoscephalae (364) but was killed in the combat.

Peloponnese, also called PELOPONNESUS, Modern Greek PELOPÓNNISOS, peninsula of 8,278 square miles (21,439 square km), a large, mountainous body of land jutting southward into the Mediterranean that since antiquity has been a major region of Greece, joined to the rest of mainland Greece by the Isthmus of Corinth. The name, which is derived from Pelopos Nisos (Island of Pelops, a legendary hero), does not appear in Homer, who preferred to apply the name of Argos, a Mycenaean city-state, to the whole peninsula. The Mycenaean civilization flourished in the 2nd millennium BC at such centres as Mycenae, Tiryns, and Pylos. The city-state of Sparta was long the major rival of Athens for political and economic dominion over Greece during the classical period, from about the 5th century BC until the Roman conquest in the 2nd century. Under the Byzantine Empire the Peloponnese suffered repeated incursions by warrior tribes from the north. In the 13th century AD it was taken by the Franks, who held it for two centuries until it reverted to the last Byzantine emperors. It was conquered by the Turks in 1460. By the 14th century the Peloponnese was known as the Morea (Mulberry), first applied to Elis, a northwestern mulberry-growing district, and it was the site of the Despotate of Morea. Patras (Pátrai), the major city in modern times, located in the northern Peloponnese, has continued to gain commercial importance since the War of Greek Independence (1821–29). Highways link all the major regions of the Peloponnese, and there is an independent railway network that serves all the districts except Laconia.

Peloponnesian League, also called SPARTAN ALLIANCE, military coalition of Greek city-states led by Sparta, formed in the 6th century BC. League policy, usually decisions on questions of war, peace, or alliance, was determined by federal congresses, summoned by the Spartans when they thought fit; each member state had one vote. The league was a major force in Greek affairs, forming the nucleus of resistance to the Persian invasions (480–479) and fighting against Athens in the Peloponnesian War (431–404). Spartan power declined after the defeat at Leuctra (371), and the league disintegrated in 366–365 BC.

Peloponnesian War (431–404 BC), war fought between the two leading city-states in ancient Greece, Athens and Sparta. Each stood at the head of alliances that, between them, included nearly every Greek city-state. The fighting engulfed virtually the entire Greek world, and it was properly regarded by Thucydides, whose contemporary account of it is considered to be among the world's finest works of history, as the most momentous war up to that time.

A brief treatment of the Peloponnesian War follows. For full treatment, *see* MACROPAEDIA: Greek and Roman Civilizations, Ancient.

The Athenian alliance was, in fact, an empire that included most of the island and coastal states around the northern and eastern shores of the Aegean Sea. Sparta was leader of an alliance of independent states that included most of the major land powers of the Peloponnese and central Greece, as well as the sea power Corinth. Thus, the Athenians had the stronger navy and the Spartans the stronger army. Further, the Athenians were better prepared financially than their enemies, owing to the large war chest they had amassed from the regular tribute they received from their empire.

Athens and Sparta had fought each other before the outbreak of the Great Peloponnesian War (in what is sometimes called the First Peloponnesian War) but had agreed to a truce, called the Thirty Years' Treaty, in 445. In the following years their respective blocs observed an uneasy peace. The events that led to renewed hostilities began in 433, when Athens allied itself with Corcyra, a strategically important colony of Corinth. Fighting ensued, and the Athenians then took steps that explicitly violated the Thirty Years' Treaty. Sparta and its allies accused Athens of aggression and threatened war.

On the advice of Pericles, its most influential leader, Athens refused to back down. Diplomatic efforts to resolve the dispute failed. Finally, in the spring of 431, a Spartan ally, Thebes, attacked an Athenian ally, Plataea, and open war began.

The years of fighting that followed can be divided into two periods, separated by a truce of six years. The first period lasted 10 years and began with the Spartans, under Archidamus, leading an army into Attica, the region around Athens. Pericles declined to engage the superior allied forces and instead urged the Athenians to keep to their city and make full use of their naval superiority by harassing their enemies' coasts and shipping. Within a few months, however, Pericles fell victim to a terrible plague that raged through the crowded city, killing a large part of its army as well as many civilians. Thucydides survived an attack of the plague and left a vivid account of its impact on Athenian morale. In the meantime (430–429), the Spartans attacked Athenian bases in western Greece but were repulsed. The Spartans also suffered reverses at sea. In 428 they tried to aid the island state of Lesbos, a tributary of Athens that was planning to revolt. But the revolt was headed off by the Athenians, who won control of the chief city, Mytilene. Urged on by the demagogue Cleon, the Athenians voted to massacre the men of Mytilene and enslave everyone else, but they relented the next day and killed only the leaders of the revolt. Spartan initiatives during the plague years were all unsuccessful except for the capture of the strategic city Plataea in 427.

In the next few years the Athenians took the offensive. They attacked the Sicilian city Syracuse and campaigned in western Greece and the Peloponnese itself. In 425 the picture was bleak for Sparta, which began to sue for peace. But led by Brasidas, hero of the Battle of Delium, a Spartan force gained important successes in Chalcidice in 424, encouraging Athenian subject states to revolt. In a decisive battle at Amphipolis in 422, both Brasidas and the Athenian leader Cleon were killed. This set the stage for Cleon's rival Nicias to persuade the Athenians to accept the Spartans' offer of peace.

The so-called Peace of Nicias began in 421 and lasted six years. It was a period in which diplomatic maneuvers gradually gave way to small-scale military operations as each city tried to win smaller states over to its side. The uncertain peace was finally shattered when, in 415, the Athenians launched a massive assault against Sicily. The next 11 years made up the war's second period of fighting. The decisive event was the catastrophe suffered by the Athenians in Sicily. Aided by a force of Spartans, Syracuse was able to break an Athenian blockade. Even after gaining reinforcements in 413, the Athenian army was defeated again. Soon afterward the navy was also beaten, and the Athenians were utterly destroyed as they tried to retreat.

By 411 Athens itself was in political turmoil. Democracy was overthrown by the oligarchical party, which was in turn replaced by the more moderate regime of the Five Thousand. At the end of 411 the rebuilt Athenian navy, fresh from several victories, acted to restore democratic rule. However, the democratic leaders refused Spartan peace offerings, and the war continued at sea with the Spartan and Athenian fleets trading costly victories. The end came in 405 when the Athenian navy was destroyed at Aegospotami by the Spartan fleet under Lysander, who had received much aid from the Persians. The next year, starved by an impenetrable blockade, Athens capitulated. Athens' defeat was perhaps the worst casualty in a war that crippled Greek military strength, and thus the most culturally advanced Greek state was brought into final eclipse.

Pelops, legendary founder of the Pelopid dynasty at Mycenae in the Greek Peloponnese, which was probably named for him. Pelops was a grandson of Zeus, the king of the gods. According to many accounts, his father, Tantalus, cooked and served Pelops to the gods at a banquet. Only Demeter, bereaved over the loss of her daughter, failed to recognize him and partook. When the body was ordered by the gods to be restored, the shoulder, Demeter's portion, was missing; the goddess provided a replacement of ivory.

According to Pindar, however, the sea god Poseidon loved Pelops and took him up to heaven; the ghastly feast was merely malicious gossip to account for his disappearance. Pelops, however, had to return to mortal life because his father had abused the favour of heaven by feeding mere mortals with nectar and ambrosia, of which only gods partook. Later, according to Pindar, Pelops strove for the hand of Hippodamia, daughter of King Oenomaus of Pisa in Elis. Oenomaus, who had an incestuous love for his daughter, had previously killed 13 suitors. He challenged Pelops to a chariot chase, with Hippodamia the prize of victory and death the price of defeat. Though Oenomaus' team and chariot were the gift of his father, the god Ares, Pelops' chariot was from Poseidon. Pelops won the bride and killed Oenomaus.

In more hostile versions, Pelops bribed Oenomaus' charioteer, Myrtilus, to remove the linchpins from Oenomaus' chariot. After his victory, for reasons that are given differently in different sources, he threw Myrtilus into the sea that afterward was called the Myrtoan. Myrtilus—or Oenomaus—was said to have uttered the curse that dogged the Pelopid house of Atreus. Preparations for the chariot race are depicted in the east pediment of the Temple of Zeus at Olympia. *See also* Atreus.

pelota (Spanish: "ball"), also called PILOTA, or PELOTE BASQUE, any of a number of glove, racket, or bat court games requiring a rubber-cored ball. These games arose from the old French game known as *jeux de paume.* Varieties of this game are played in many parts of the world.

The variations of pelota can be classified as either *jeux directs*—games in which the players face each other and the pelota is hit freely between opponents—or *jeux indirects*—games in which the ball is hit off a wall. The second class has many variations, including barehand (*main nue*), the most popular. Pelota courts include the one-walled *place libre,* the two- or three-walled *fronton,* and the small, covered court, called the *trinquet.* The surfaces of these courts range from dirt to highly polished cement.

In Spain and elsewhere, pelota is a professional game on which spectators wager. Most popular is the difficult and fast variation of *remonte,* a 35-point game that requires two players on each side and is played with a special *chistera,* a curved glove with a chestnut or ash frame. The *fronton* version of pelota, popular in Spain, Mexico, the Philippines, and parts of the United States, is called jai alai.

Pelota was popular among all social classes by the 16th century but decreased in popularity by the middle of the 18th century, except among the Basques. By the end of the 19th century, the game had spread worldwide. It is widely used as a medium for gambling; amateur play revived at the beginning of the 20th century.

Pelota was played as a demonstration sport in the Olympic Games in 1924. The Federación Internacional de Pelota Vasca, which organizes the world championships, the first of which was played in 1952, was founded in 1925. *See also* jai alai.

Pelotas, coastal city, southeastern Rio Grande do Sul *estado* ("state"), southern Brazil, on the left bank of the Canal de São Gonçalo, the river that connects the Mirim Lagoon with the dos Patos Lagoon. Founded in 1780 as São Francisco de Paula, it was raised to town status and renamed in 1830; it became a city in 1835. Located at 23 feet (7 m) above sea level, it serves with the port of Rio Grande (25 miles [40 km] southeast) as a transfer point for ocean vessels that cannot cross the shallow dos Patos to Pôrto Alegre fully loaded. It is also the chief port for the cattle-ranching area of southern Rio Grande do Sul. Pelotas is Brazil's largest producer of *xarque* (jerked beef) and has meat-packing plants, flour and rice mills, tanneries, and other factories. It is the site of the Sul Riograndense, Rural do Sul, and Católica de Pelotas universities (all established in 1960) and the Universidade Federal de Pelotas (1883). It is easily accessible by road, railway, and air. Pop. (1980 prelim.) 197,092.

Pelotas River, Portuguese RIO PELOTAS, also called ALTO URUGUAI RIVER, river in southern Brazil, rising on the western slope of the Serra do Mar at Alto do Bispo in Santa Catarina state, on the Atlantic coast. It arches northwestward across the uplands for approximately 280 miles (450 km) before receiving the Canoas River and becoming the Uruguay River (*q.v.*) near Marcelino Ramos. It forms much of the border between Santa Catarina and Rio Grande do Sul states and is used for navigation. Heavy snows and rains in the winter cause flooding.

Peltier, Jean-Charles-Athanase (b. Feb. 22, 1785, Ham, Fr.—d. Oct. 27, 1845, Paris), French physicist who discovered (1834) that at the junction of two dissimilar metals, an electric current will produce heat or cold, depending on the direction of current flow. The effect, known by his name, is used in devices for measuring temperature and, with the discovery of new conducting materials, in refrigeration units.

Peltier, detail of a lithograph by Maurin
Giraudon—Art Resource/EB Inc.

A clockmaker, Peltier retired when he was 30 years old to devote his time to scientific investigations. In 1840 he introduced the concept of electrostatic induction, a method of charging a conductor by closely juxtaposing another charged object to attract all charges of one sign and then grounding the conductor to bleed off the other group of charges, leaving a net charge behind. He wrote numerous papers on atmospheric electricity, waterspouts, the boiling point at high elevations, and related phenomena.

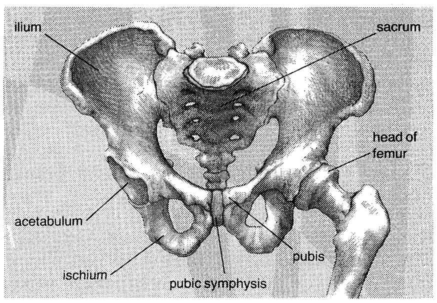
Peltier effect, the cooling of one junction and the heating of the other when electric current is maintained in a circuit of material consisting of two dissimilar conductors; the effect is even stronger in circuits containing dissimilar semiconductors. In a circuit consisting of a battery joined by two pieces of copper wire to a length of bismuth wire, a temperature rise occurs at the junction where the current passes from copper to bismuth, and a temperature drop occurs at the junction where the current passes from bismuth to copper. Discovered (1834) by the French physicist Jean-Charles-Athanase Peltier, this effect was used in the 1960s to produce commercial thermoelectric refrigerators.

Pelucón (member of a Chilean political group): *see* Pipiolo and Pelucón.

Péluse, Gaspard Monge, comte de (count of): *see* Monge, Gaspard.

Pelusium, Greek PELOUSION, ancient Egyptian city on the most easterly mouth of the Nile (long since silted up). It was probably called by the Egyptians Sa'inu and also Per-Amon (House of Amon), whence perhaps the modern name of the site, Tell Farama. It is situated about 20 miles (32 km) southeast of Port Said, in the Sinai Peninsula. The city is referred to in the Bible (Ezekiel 30:15) as "the stronghold of Egypt" (the name being given in the King James Version as Sin, transliterated from the Hebrew). In the 26th and later Egyptian dynasties, Pelusium was the main frontier fortress against Palestine and was a customs post for Asiatic goods. In 525 BC the Persians, under Cambyses II, defeated the Saite pharaoh Psamtik III there. During the periods of Egyptian independence from Persia (28th–29th dynasty) it was a vital defensive centre. In Roman times it was a station on the route to the Red Sea. The site's ruins date from the Roman period.

pelvic girdle, also called BONY PELVIS, in human anatomy, basin-shaped complex of bones that connects the trunk and legs, supports and balances the trunk, and contains and supports the intestines, urinary bladder, and internal



Front view of female pelvic girdle

sex organs. The pelvic girdle consists of paired hipbones, connected in front at the pubic symphysis and behind by the sacrum; each is made up of three bones—the blade-shaped ilium, above and to either side, which accounts for the width of the hips; the ischium, behind and below, on which the weight falls in sitting; and the pubis, in front. All three unite in early adulthood at a triangular suture in the acetabulum, the cup-shaped socket that forms the hip joint with the head of the femur (thighbone). The ring made by the pelvic girdle functions as the birth canal in females. The pelvis provides attachment for muscles that balance and support the trunk and move the legs, hips, and trunk. In the infant the pelvis is narrow and nonsupportive. As the child begins walking, the pelvis broadens and tilts, the sacrum descends deeper into its articulation with the ilia, and the lumbar curve develops.

In the semierect apes, the centre of gravity falls near the shoulder, and the abdominal organs depend from the vertebral column. The ilium is elongated and somewhat spoon-shaped, and the pelvis is oriented horizontally. In a human being, when standing erect, the centre of gravity falls over the centre of the body, and the weight is transmitted via the pelvis from the backbone to the thighbone, knee, and foot. Morphological differences from apes include the following: the ilium is broadened backward in a fan shape, developing a deep sciatic notch posteriorly; a strut of bone, the arcuate eminence, has developed on the ilium diagonal from the hip joint (concerned with lateral balance in upright posture); the anterior superior iliac spine, on the upper front edge of the iliac blade, is closer to the hip joint; and the ischium is shorter. The pelvis of *Australopithecus africanus*, which lived more than 2,000,000 years ago, is clearly hominid. *Homo erectus* and all later fossil hominids, including Neanderthal man, had fully modern pelvises.

Sex differences in the pelvis are marked and reflect the necessity in the female of providing an adequate birth canal for a large-headed fetus. In comparison with the male pelvis, the female basin is broader and shallower; the birth canal rounded and capacious; the sciatic notch wide and U-shaped; the pubic symphysis short, with the pubic bones forming a broad angle with each other; the sacrum short, broad, and only moderately curved; the coccyx movable; and the acetabula farther apart. These differences reach their adult proportions only at puberty. Wear patterns on the pubic symphyses may be used to estimate age at death in males and females.

pelvic inflammatory disease (PID), general, acute inflammation of the pelvic cavity in women, caused by a bacterial infection of the uterus, the Fallopian tubes, or other structures in the upper reproductive tract. Such bacterial infections can be sexually transmitted and often occur secondary to infection with chlamydia or gonorrhea. Women who use oral contraceptives are somewhat more likely to contract PID. The infective bacteria can also gain entry to the uterus after childbirth or through use of an intrauterine device (IUD). The symptoms of PID are similar to and may be mistaken for those of gonorrhea. They include pain in the abdomen and lower pelvis, chills, nausea, fever, and a thick and peculiarly odorous vaginal discharge. Treatment of PID consists of intensive antibiotic therapy to fight the infection, along with bed rest, pain-killing medications, and abstention from sexual intercourse until the infection disappears.

Pematangsiantar, city, Sumatera Utara *propinsi* (North Sumatra province), Sumatra, Indonesia. It lies about 50 miles (80 km) southeast of Medan, the provincial capital, with which it is connected by a major road and railway. The second most populous city in the province, after Medan, Pematangsiantar is inhabited mainly by Batak; there are also Chinese and Indians who are mostly traders, merchants, and businessmen. Located in the midst of rubber and palm plantations, it is a centre of trade and transshipment for rubber, tobacco, tea, natural fibres, palm oil, and rice. Industries include food processing, soap and oil production, and rice milling. Wood carving, gold and silver filigree work, handloom weaving, and plaiting are among the crafts. The Universitas H.K.B.P. Nomensen (private) is located in Pematangsiantar. There is also the Simalungun Museum and a zoo. Pop. (1980) 150,376.

Pemba Island, Arabic JAZĪRAT AL-KHUḌRAH, island in the Indian Ocean, lying 35 miles (56 km) off the coast of East Africa, opposite the port of Tanga, Tanzania. The island embraces 380 square miles (984 square km) and is 42 miles (67 km) long and 14 miles (22 km) wide. As the Arabic name, which means Green Island, suggests, it is more fertile than its sister island, Zanzibar, which lies 30 miles (48 km) to the southwest. Pemba is the world's leading producer of cloves. As in Zanzibar, the population and culture of the island have been greatly influenced by infusions of peoples from mainland Africa, the Middle East, and the Indian subcontinent. The administrative headquarters is at Wete on the western side of the island. Pop. (1978 prelim.) 205,870.

Pemberton, John Clifford (b. Aug. 10, 1814, Philadelphia—d. July 13, 1881, Penllyn, Pa.), Confederate general during the American Civil War, remembered for his tenacious but ultimately unsuccessful defense of Vicksburg.

Pemberton grew up and was educated in

Philadelphia, entered West Point in 1833, and graduated four years later. He fought in the Mexican War and was cited for bravery while participating in many of the crucial battles of 1846 and 1847.

Upon the outbreak of the American Civil War, Pemberton resigned his commission on April 24, 1861, and went to Richmond to offer his services to the Confederacy. Made a lieutenant colonel on April 28, 1861, Pemberton began organizing the cavalry and artillery in Virginia. On May 8 he was promoted to colonel and on June 17 to brigadier general; on Feb. 13, 1862, he became a major general in command of South Carolina, Georgia, and Florida. In October 1862 Pemberton was made lieutenant general and given command over Mississippi, Tennessee, and eastern Louisiana.

Ordered by President Jefferson Davis to hold Vicksburg at all costs, Pemberton conducted a stubborn defense despite his lack of adequate food, ammunition, and manpower. General Ulysses S. Grant laid siege on both land and water, and by early July 1863 the Confederate defenders were suffering from starvation and exhaustion. On July 4 Pemberton accepted Grant's terms for unconditional surrender. Shortly thereafter he resigned his commission as lieutenant general and served out the balance of the war as an ordnance inspector with the rank of colonel.

After Appomattox, Pemberton retired to a farm near Warrenton, Va. In 1876 he moved to Philadelphia.

Pembroke, Welsh PENFRO, town, seat of South Pembrokeshire district, Dyfed county, Wales, comprising the localities of Pembroke and Pembroke Dock on the south shore of the Milford Haven inlet.

The older locality, Pembroke, incorporated in 1090 by royal charter, was a walled town built along a narrow limestone ridge, at the west end of which the castle, dominating the Haven, was the seat of the earls of Pembroke in the 12th and 13th centuries. St. Mary's Church was founded in 1260, and nearby are the ruins of a Benedictine priory established in 1098: its church was fully restored in 1882. Pembroke is now mainly a small market town and tourist centre. Pembroke Dock grew up around a naval dockyard that opened in 1814 (closed 1926). Pop. (1981) 15,576.

Pembroke, EARLS OF, titled English nobility of several creations, most notably in the families FitzGilbert, Marshal, and Herbert, grouped below chronologically and indicated by the symbol •.

• Pembroke, Richard FitzGilbert, 2nd Earl of, byname RICHARD STRONGBOW, also called RICHARD DE CLARE (b. *c.* 1130—d. April 20, 1176, Dublin, Ire.), Anglo-Norman lord whose invasion of Ireland in 1170 initiated the opening phase of the English conquest.

The son of Gilbert FitzGilbert, 1st Earl of Pembroke, he succeeded to his father's estates in southern Wales in 1148/49. Pembroke had evidently lost these lands by 1168; it was probably in that year that he agreed to aid Dermot MacMurrough, king of Leinster, who had been expelled from his kingdom by Roderic (Rory O'Connor), high king of Ireland. King Henry II of England (reigned 1154–89) granted Pembroke permission to invade Ireland, and on Aug. 23, 1170, the earl landed near Waterford. Waterford and Dublin quickly fell to the Normans. After the death of MacMurrough in May 1171, Pembroke was besieged in Dublin by Roderic, but in September his forces broke out and routed Roderic's army. In order to prevent Pembroke from setting himself up as an independent ruler, Henry II had him acknowledge royal authority over his conquests in Leinster. Pembroke helped the king suppress a rebellion in Normandy in 1173–74, and in return Henry granted him custody of Wexford, Waterford, and Dublin. By the time Pembroke died, all Ireland had been committed to his care, but within Ireland his supremacy was recognized only in Leinster.

His son Gilbert de Striguil (or Strigoil) died unmarried, certainly before 1189, and as a minor was never styled earl. The earldom passed with Richard's daughter Isabel (d. 1220) to her husband William Marshal, the 1st Earl of Pembroke in the Marshal line.

• Pembroke, William Marshal, 1st Earl of, also called WILLIAM THE MARSHAL (b. *c.* 1146—d. May 14, 1219, Caversham, Berkshire, Eng.), marshal and then regent of England who served four English monarchs as a royal adviser and agent and as a warrior of outstanding prowess.

Marshal's father, John (FitzGilbert) the Marshal (d. 1165), fought for the empress Matilda (widow of the German emperor Henry V and daughter of Henry I of England) in her unsuccessful struggle to gain the throne of her cousin King Stephen (reigned 1135–54). After proving his bravery in warfare and in tournaments, Marshal became a guardian (1170) to Prince Henry, eldest son of King Henry II (reigned 1154–89). In 1187, four years after the prince's death, Marshal reentered Henry II's service and fought beside him in France until the king died in 1189.

Upon the accession of Henry's third son, Richard I the Lion-Heart (reigned 1189–99), Marshal married Isabel, the heiress of Richard FitzGilbert (or de Clare), Earl of Pembroke, thereby acquiring vast estates in England, Normandy, Wales, and Ireland. Richard set forth on a crusade in 1190, leaving William Longchamp in charge of the kingdom. In the following year Pembroke joined the opposition that drove Longchamp into exile. While Richard was held captive in Germany (1192–94), Pembroke struggled to prevent the king's brother, John, from seizing power in England.

Upon the death of Richard I in 1199, Pembroke helped John succeed peacefully to the throne; he was formally recognized as Earl of Pembroke. By 1213 he had become the king's closest adviser, and he remained loyal to John during the disputes with the barons that led to the signing of the charter of liberties known as Magna Carta (June 1215). John died during the ensuing civil war with the barons, who had invited Louis of France (later King Louis VIII) to be their king. Designated *rector regis et regni* ("governor of the king and of the kingdom") for John's son, King Henry III, Pembroke defeated the English barons and French invaders and in September 1217 concluded a treaty with Louis that wisely granted amnesty to the rebellious barons.

BIBLIOGRAPHY. Biographies include Sidney Painter, *William Marshal* (1933, reprinted 1982); and Georges Duby, *William Marshal, the Flower of Chivalry* (1985).

• Pembroke, Jasper Tudor, Earl of: *see* Bedford, Jasper Tudor, Duke of.

• Pembroke, William Herbert, 1st Earl of, BARON HERBERT OF CARDIFF, also called (until 1551) SIR WILLIAM HERBERT (b. *c.* 1506—d. March 17, 1570, Hampton Court, near London, Eng.), the Earl of Pembroke of the second Herbert creation, a leading figure in the reigns of Edward VI, Mary I, and Elizabeth I of England. His father, Sir Richard Herbert, was an illegitimate son of William, the 1st Earl of Pembroke of the first creation. Sir William's first wife, Anne Parr, was a sister of Catherine Parr, who married Henry VIII in 1543.

In January 1544 Sir William was granted the rich estates formerly belonging to Wilton Abbey. Appointed a governor to the young king Edward VI, Sir William helped to suppress the rebellion in Wiltshire, Devon, and Cornwall in 1549. In October 1551 he was created Baron Herbert of Cardiff and Earl of Pembroke. After Edward VI's death he did homage to Lady Jane Grey but withdrew his allegiance in time to attend the proclamation of Mary I in London. Mary made him a privy councillor, and he led her troops against the rebel Sir Thomas Wyat early in 1554.

On the accession of Queen Elizabeth I, Pembroke continued as a member of the privy council, and, from 1568 until his death, he served as steward of the royal household. Imprisoned in September 1569 for having favoured a proposed marriage between Mary Stuart and Thomas Howard, 4th Duke of Norfolk, he was released shortly afterward. He was succeeded by his son Henry, the 2nd earl (*c.* 1538–1601).

Pembroke, Mary Herbert, Countess of, *née* MARY SIDNEY (b. Oct. 27, 1561, near Bewdley, Worcestershire, Eng.—d. Sept. 25, 1621, London), patroness of the arts and scholarship and a notable translator. She was the sister of Sir Philip Sidney, who dedicated to her his *Arcadia.* After his death she published it and completed his verse translation of the Psalms.

In 1575 Queen Elizabeth I invited Mary to court, promising "a speciall care" of her. Two years later Mary wed Henry Herbert, 2nd Earl of Pembroke, and lived mainly at Wilton House, near Salisbury, Wiltshire. Their sons, William and Philip, were the "incomparable pair of brethren" to whom William Shakespeare's First Folio (1623) was dedicated.

Among those who praised her for her patronage of poetry was Edmund Spenser, who dedicated his *Ruines of Time* to her, and Michael Drayton, Samuel Daniel, and John Davies. A lutanist, she inspired Thomas Morley's dedication of *Canzonets* (1593); and, in his dedication to her of *Pilgrimage to Paradise* (1592), Nicholas Breton likened her to the Duchess of Urbino, patroness in an earlier time to Baldassare Castiglione. Lady Pembroke ranked after the queen as the most admired of Elizabethan *femmes savantes.*

Lady Pembroke translated Robert Garnier's tragedy *Marc-Antoine* and Philippe Duplessis-Mornay's *Discours de la vie et de la mort* (both 1592) and elegantly rendered Petrarch's *Trionfo della morte* into terza rima.

Pembroke table, light, drop-leaf table designed for occasional use, probably deriving its name from Henry Herbert, 9th Earl of Pembroke (1693–1751), a noted connoisseur and amateur architect. The table has two drawers and flaps on either side that can be raised by brackets on hinges (known as "elbows") to increase its size. Usually provided with casters (it was often used for bedside meals), the legs of the common English versions, as illustrated by Thomas Sheraton and others, are X-shaped.

Pembroke table, satinwood painted in grisaille, English, 1792; in the Victoria and Albert Museum, London

By courtesy of the Board of Trustees of the Victoria and Albert Museum, London

In the United States a distinctive type of support, shaped like a lyre, became popular toward the end of the century. It is also known as a flap and elbow table.

Pembrokeshire, also called PEMBROKE, Welsh PENFRO, former county and historic region of south Wales, once bounded on the northeast by Cardiganshire, on the east by Carmarthenshire, on the south by Bristol Channel, and on the west and northwest by St. Bride's Bay and Cardigan Bay of St. George's Channel. It covered an area of 614 square miles (1,590 square km). With the reorganization of 1974, Pembrokeshire became a part of Dyfed county.

The outstanding feature of the early history of Pembrokeshire is its importance in Megalithic times. The northwestern section of the region (including the southern slopes of the Prescelly Hills) is especially rich in Megalithic remains—dolmens, alignments, standing stones, and stone circles.

In ancient times Pembrokeshire was known to the Welsh as Dyfed. In 877 Dyfed fell nominally under the sway of the princes of south Wales, but the coast towns fell prey to Scandinavian pirates; a large number of Scandinavian place-names are found along the coast. With the building of Pembroke Castle (1090), the Normans began to spread over southern Dyfed. Flemish settlers were established in the region during the 12th century, and, as a result, the south was better populated than the north and maintained a closer contact with the affairs of the English; the south was also the Norman stronghold and has long been famous for its medieval castles. The earldom of Pembroke was formally established as a shire by Henry VIII in 1536, and English law was imposed from 1542.

Pembrokeshire, South (Wales): *see* South Pembrokeshire.

pemphigus, a group of diseases characterized by the development of large water blisters on otherwise normal-appearing skin or mucous surfaces. The blisters may first appear on skin surfaces prone to frictional contact, such as the groin, armpits, and palms, or may erupt generally over the body. Microscopically, the condition is characterized by a degeneration of the intercellular bridges of the cells of the epidermis, the outermost nonvascular layer of the skin, resulting in a separation and destruction of skin cells. The clefts and splits within the degenerating skin layer form blisters filled with a serumlike fluid containing fragments of dead cells. These blisters eventually burst, leaving denuded and eroded skin areas.

There are several clinical variants of pemphigus. The most common form of pemphigus is pemphigus vulgaris; others are pemphigus erythematosus and pemphigus foliaceus. In pemphigus vulgaris, cell destruction occurs just above the base of the epidermis, whereas in pemphigus erythematosus and pemphigus foliaceus, usually more benign types, this process occurs higher up within the epidermis.

Pemphigus was formerly fatal within a few months or years of onset because of secondary bacterial infection of the blisters and the loss of body fluids and proteins through denuded skin areas. The disease can now be relieved with the administration of corticoids or other suitable hormones. The cause of pemphigus has not yet been established, but evidence thus far suggests a virus.

pen, tool for writing or drawing with a coloured fluid, such as ink. The earliest ancestor of the pen probably was the brush used for writing by the Chinese by the 1st millennium BC. The early Egyptians employed thick reeds for penlike implements about 300 BC. A specific allusion to the quill pen occurs in the 7th-century writings of St. Isodore of Seville, but such pens made of bird feathers were probably in use at an even earlier date. They provided a degree of writing ease and control never realized before and were used in Europe until the mid-19th century, when metallic pens and pen nibs (writing points) largely supplanted them. Such devices were known in classical times but little used (a bronze pen was found in the ruins of Pompeii). John Mitchell of Birmingham, Eng., is credited with having introduced the machine-made steel pen point in 1828. Two years later the English inventor James Perry sought to produce more flexible steel points by cutting a centre hole at the top of a central slit and then making additional slits on either side.

The inconvenience of having to continually dip a pen to replenish its ink supply stimulated the development of the fountain pen, a type of pen in which ink is held in a reservoir and passes to the writing point through capillary channels. The first practical version of the fountain pen was produced in 1884 by the American inventor L.E. Waterman.

Ball-point pens date from the late 19th century. Commercial models appeared in 1895, but the first satisfactory model was patented by Lazlo Biro, a Hungarian living in Argentina. His ball-point pen, commonly called the "biro," became popular in Great Britain during the late 1930s, and by the mid-1940s pens of this type were widely used throughout much of the world. The writing tip of a ball-point pen consists of a metal ball, housed in a socket, that rotates freely and rolls quick-drying ink onto the writing surface. The ball is constantly bathed in ink from a reservoir, one end of which is open and attached to the writing tip.

Soft-tip pens that use points made of porous materials became commercially available during the 1960s. In such pens a synthetic polymer of controlled porosity transfers ink from the reservoir to the writing surface. These fibre-tipped pens can be used for lettering and drawing as well as for writing and may be employed on surfaces such as plastic and glass.

PEN, International, international organization of writers. The original PEN was founded in London in 1921 by the English novelist John Galsworthy, and it has since grown to include writers worldwide. The name PEN is an acronym standing for "poets, playwrights, editors, essayists, and novelists." International PEN promotes international intellectual exchanges and goodwill among writers. It promotes freedom of expression for all writers regardless of their nationality, race, or religion, or of the political system under which they live. PEN is especially active in defending and supporting writers who are being harassed, persecuted, or oppressed by their government. The organization also bestows literary awards, sponsors translations of works written in obscure or neglected languages, holds conferences on current politico-literary topics, and publishes pamphlets and newsletters. To become a member of PEN an author must usually have published at least two books, one of which shows considerable literary distinction. PEN is headquartered in London, and there are more than 80 PEN Centres (branch organizations) situated in a total of about 60 countries worldwide.

Pen-ch'i (China): *see* Pen-hsi.

pen drawing, artwork executed wholly or in part with pen and ink, usually on paper. Pen drawing is fundamentally a linear method of making images. In pure pen drawing in which the artist wishes to supplement his outlines with tonal suggestions of three-dimensional form, modeling must necessarily be effected by the close juxtaposition of a series of strokes forming areas of hatching or cross-hatching. Many pen studies, however, are produced with the substitution of tonal washes (layers of colour spread over a broad surface) laid onto the drawing with a brush, in which case the outlines or other important definitions of the figures or landscape are established by the pen lines. *See* wash drawing.

Inks of various types used in pen studies contribute additional diversity to the final effects. Historically, three types of ink were most frequently used. One was black carbon ink, made from extremely fine particles of the soot of burnt oils or resins in a solution of glue or gum arabic. The finest type of black carbon ink was known as Chinese ink and was the prototype of the modern black India ink. A brown ink popular with the old masters because of its warm, luminous colour qualities was known as bistre. It was prepared by boiling wood soot to obtain a liquid, transparent brown extract. The third important ink was an iron gall, or chemical, ink. Its principal ingredients were iron sulfate, the extract of gall nuts, and a gum arabic solution. It was, in fact, the common writing ink for centuries and was employed for most early drawings. Its colour when first applied to the paper is bluish black, but it rapidly turns blackish and, over the years, a dull brown.

Pens are the oldest and most popular of all the drawing media of the Western artist, in part because of the variety of linear effects provided by the three basic types of pens and their adaptability to the changing styles of draftsmanship over many centuries. These three basic types are quill pens, cut from the wing feathers of fowls and birds; reed pens, formed and trimmed from stems of bamboo-like grasses; and metal pens, fabricated from various metals, especially fine steel. The outstanding master of the reed pen, the Dutch artist Rembrandt, used it often in combination with the quill pen and washes to produce the richly suggestive atmospheric illusionism of his works. The reed pen never had the widespread popularity of quill or metal pens, but for special effects it has served artists admirably; for example, the 19th-century Dutch artist Vincent van Gogh in his last years used it in his drawings to produce the blunt, powerful strokes that were counterparts of the heavy brush strokes typical of many of his canvases.

Until the acceptance of the modern steel pen,

"View of Arles," reed pen drawing by Vincent van Gogh, 1888–89; in the Museum Boymans-van Beuningen, Rotterdam most Western master draftsmen used quill pens. During the Middle Ages the quill pen was used for the fine delineations of images in manuscripts; its nibs, which can be sharpened to extreme fineness, permit the craftsman to create small linear figures or ornamental decorations on the pages or along the borders of the parchment leaves. This characteristic, combined with the flexibility of the quill point, which responds to pressure for varying the widths of lines or forming accents, made it adaptable to the diverse personal styles of draftsmen from the 15th to the end of the 19th century.

The development of excellent steel pens by the Englishman James Perry in the 1830s and the mass production by stamping pens from steel blanks led to the metal pen's supplanting the quill. Nevertheless, artists only reluctantly adopted the steel pen, and most drawings in pen and ink done before the 20th century were still produced with quills. The steel pen is now used for drawing almost exclusively and is available in many shapes, sizes, and degrees of stiffness or flexibility. It has become standard studio equipment of the illustrator, cartoonist, and designer. Pen drawings by such outstanding painters and sculptors as Pablo Picasso, Henri Matisse, and Henry Moore demonstrate the virtue of the steel pen in producing the sharp linear definitions generally preferred by modern masters.

Pen-hsi, also spelled PEN-CH'I, Pinyin BENXI, or BENQI, city in Liaoning *sheng* (province), China. It is situated some 45 miles (70 km) southeast of Shen-yang (Mukden) on the T'ai-tzu River.

From the time of the Liao dynasty (907–1125) it was the centre of a small-scale iron industry, and coal began to be mined in the late 18th century. The startling modern growth of Pen-hsi began with the establishment in 1905 of the Pen-hsi Coal Mining Company with joint Chinese and Japanese capital. In 1911 the company began iron smelting and changed its name to the Pen-hsi Coal and Iron Company. It was efficiently managed and remained important but gradually became dominated by Japanese interests.

After the establishment of the Japanese puppet state of Manchukuo (formerly Chinese Manchuria) in 1932 and the formulation of the Manchurian Industrial Development Plan in 1936, the Manchukuo government developed Pen-hsi's iron and steel production. Much of the iron from Pen-hsi had low phosphorus and sulfur content and was in demand for the munitions industry. The city's works also began to produce special steels for the Japanese navy.

In 1945–46 the occupying Soviet forces dismantled most of the equipment, but the plant was restored by 1950, and during the early 1950s much new equipment was installed by Soviet technicians. By 1957 Pen-hsi's iron production had reached the World War II level, and new local sources of ore were being exploited. The iron industry is closely integrated with the large iron and steel complex at An-shan, to which much of Pen-hsi's pig iron production is transported. Since 1958 the steel output of Pen-hsi has been greatly increased. Pen-hsi also has large cement, chemical, and nonferrous alloy manufacturing industries. It also has thermal power stations. It is connected by rail with Shen-yang, An-shan, and Lü-ta. Pop. (1988 est.) 725,600.

penal colony, distant or overseas settlement established for punishing criminals by forced labour and isolation from society. Although a score of nations in Europe and Latin America transported their criminals to widely scattered penal colonies, such colonies were developed mostly by the English, French, and Russians. England shipped criminals to America until the American Revolution and to Australia into the middle of the 19th century. France established penal colonies in Africa, New Caledonia, and French Guiana (of which those in the latter, including Devil's Island, were still operating during World War II). French Guiana epitomized the worst features of penal colonies: harsh punishments and the underfeeding of prisoners assigned to hard labour were routine. The Siberian colonies maintained by the Soviet Union were initially organized under the tsars but were most widely employed from the Russian Revolution through the Stalin era. Governments have since turned to alternative means of crime control, and most penal colonies have been abolished. *See also* exile and banishment.

Penal Laws, laws passed against Roman Catholics in Britain and Ireland after the Reformation that penalized the practice of the Roman Catholic religion and imposed civil disabilities on Catholics. Various acts passed in the 16th and 17th centuries prescribed fines and imprisonment for participation in Catholic worship and severe penalties, including death, for Catholic priests who practiced their ministry in Britain or Ireland. Other laws barred Catholics from voting, holding public office, owning land, bringing religious items from Rome into Britain, publishing or selling Catholic primers, or teaching.

Sporadically enforced in the 17th century and largely ignored in the 18th, the Penal Laws were almost completely nullified by the Roman Catholic Relief Act (1791), the Catholic Emancipation Act (1829), the Roman Catholic Charities Act (1832), and the Roman Catholic Relief Act (1926). *See* Catholic Emancipation.

penal science: *see* penology.

Penang, also called PENANG ISLAND, Malay PINANG, or PULAU PINANG, island of Malaysia, lying off the northwest coast of peninsular Malaya, from which it is separated by a strait whose smallest width is 2.5 miles (4 km). Its area is about 113 square miles (293 square km). Penang Island is roughly oval, with a granitic, mountainous interior (highest point 2,428 feet [740 m]) and narrow coastal plains, most extensive in the northeast, where Malaysia's chief port, George Town, uses the sheltered harbourage of the strait. Long one of Asia's busiest shipping centres, Penang in the late 20th century became Malaysia's prime tourist centre, with luxury and tourist resort hotels mainly on the north coast at Batu Feringgi.

The island's strategic location in the northern part of the Strait of Malacca led Captain Francis Light of Britain's East India Company to found a British colony there in 1786. The British occupation was made legal in 1791 by a treaty with the sultan of Kedah; the adjacent mainland area was added in 1800. In 1826 Penang combined with Malacca and Singapore to form the Straits Settlements (*q.v.*). In the beginning, the island (called Prince of Wales Island until after 1867) was virtually uninhabited and had excellent shelter and water for sailing vessels plying the India-China run. It quickly attracted a cosmopolitan population of Chinese, Indians, Sumatrans, and Burmans and rapidly surpassed any other trading post in western Malaya. From the mid-19th century Penang became a market and point of transit for the valuable tin and rubber of the mainland. Although the countryside contined to be Malay, Malay influence, tradition, and economic life almost disappeared from the urban and port areas, where Penang became predominantly Chinese by race and European in manner and economic outlook. In 1948 the island became part of the Federation of Malaya, later Malaysia.

The island's rural population grows rice, vegetables, and fruit. During the alternating seasons of northeast and southwest winds, the incidence of rain is affected by the "shadow" of the hilly interior. In George Town the rainfall averages 105 inches (2,700 mm) annually with maxima in October and May, no month having less than 3 inches (76 mm). Mean monthly temperatures at the coast are 80° F (27° C). A coast road encircles the island. From the mainland the island can be reached either by ferry or by a modern bridge, some 5.2 miles (8.4 km) in length, connecting Perai on the mainland to Glugo. There is an international airport in the southeast corner of Penang near the town of Bayan Lepas. Pop. (1980 prelim.) 467,042.

Penates, formally DI PENATES, household gods of the Romans and other Latin peoples. In the narrow sense, they were gods of the *penus* ("storeroom"), but by extension their protection reached the entire household. They are associated with other deities of the house, such as Vesta, and the name was sometimes used interchangeably with that of the Lares, any of various tutelary deities. The Penates are all or some specific group of deities with household connections, but their number and precise identity were a puzzle even to the ancients.

The Penates were worshiped privately as protectors of the individual household and also publicly as protectors of the Roman state. Each house had a shrine with images of them that were worshiped at the family meal and on special occasions. Offerings were of portions of the regular meal or of special cakes, wine, honey, incense, and, more rarely, a blood sacrifice. The state as a whole worshiped the Penates Publici. This state cult occupied a significant role as a focal point of Roman patriotism and nationalism.

pencil, slender rod of a solid marking substance, such as graphite, enclosed in a cylinder of wood, metal, or plastic; used as an implement for writing, drawing, or marking. In 1565 the German-Swiss naturalist Conrad Gesner first described a writing instrument in which graphite, then thought to be a type of lead, was inserted into a wooden holder. Gesner was the first to describe graphite as a separate mineral, and in 1779 the Swedish chemist Carl Wilhelm Scheele showed it to be a form of carbon. The name graphite is from the Greek *graphein,* "to write." The modern lead pencil became possible when an unusually pure deposit of graphite was discovered in 1564 in Borrowdale, Cumberland, Eng.

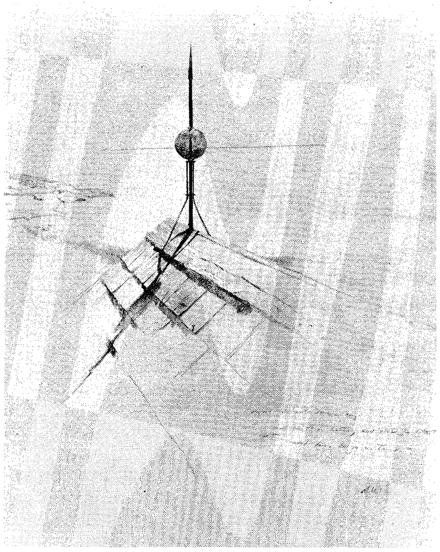
The hardness of writing pencils, which is related to the proportion of clay (used as a binder) to graphite in the lead, is usually designated by numbers from one, the softest, to four, the hardest. Artists' drawing pencils range in a hardness designation generally given from 8B, the softest, to F, the hardest. The designation of the hardness of drafting pencils ranges from HB, the softest, to 10H, the hardest.

The darkness of a pencil mark depends on the number of small particles of graphite deposited by the pencil. The particles are equally black regardless of the hardness of the lead; only the size and number of particles determine the apparent degree of blackness of the pencil mark. The degree of hardness of a lead is a measure of how much the lead resists abrasion by the fibres of the paper.

pencil cedar: *see* eastern red cedar.

pencil drawing, drawing executed with an instrument composed of graphite enclosed in a wood casing and intended either as a sketch for a more elaborate work in another medium, an exercise in visual expression, or a finished work. The cylindrical graphite pencil, because of its usefulness in easily producing linear gray-black strokes, became the successor of the older, metallic drawing stylus, with which late medieval and Renaissance artists and tradesmen sketched or wrote on paper, parchment, or wood.

Although graphite was mined in the 16th century, the use by artists of pieces of natural graphite, inserted in a *porte-crayon* ("pen-



"Lightning Rod," pencil on white paper by Andrew Wyeth; in a private collection

cil holder"), is not known before the 17th century. Then minor graphite details were included in sketches, notably in landscape renderings by Dutch artists. During that century and most of the 18th, graphite was used to make preliminary sketch lines for drawings to be completed in other media, but drawings completely finished with graphite were rare.

Although pencil drawings were much less commonly produced by artists of those centuries than sketches in chalks, charcoal, and pen and ink, the use of graphite gradually increased among painters, miniaturists, architects, and designers. By the late 18th century, an ancestor of the modern pencil was constructed in the form of a rod of natural graphite fitted into a hollow cylinder of wood. Not until 1795, however, did the French inventor Nicolas-Jacques Conté devise a method of producing pencil rods from mixtures of graphite and clays, a true prototype of the modern graphite pencil. Conté's technical improvement made possible the production of fine pencils the strokes of which could be controlled, varying from type to type in softness and hardness, darkness and lightness. These excellent quality graphite pencils encouraged wider use by 19th-century artists, and pencil drawing became commonly used for studies and preliminary sketches. The graphite pencil could be used on almost any type of drawing surface, a fact that helped make it indispensable in the artist's studio.

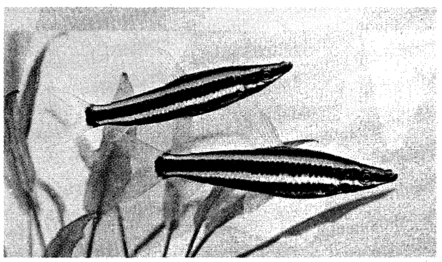
Although graphite pencils provided a substantial range of light-dark effects and the opportunity for tonal modeling, the greatest masters of pencil drawing always kept the elements of a simple linearism or limited shading that were appropriate to pencil drawing. This concept of pencil drawing contrasted with that sometimes employed in the 18th and 19th centuries in which extensive tonal modeling of three-dimensional forms and elaborate effects of light and shade were produced by artists and miniaturists by rubbing the soft graphite particles with a stump, a tightly rolled piece of soft paper or chamois.

The preciseness and clarity associated with the use of a moderately hard graphite pencil were developed in the highly selective draftsmanship of the 19th-century French Neoclassicist Jean-Auguste-Dominique Ingres. His figure sketches and portrait studies were the epitome of pencil drawing in which lucid contours and limited shading combined to create a spirit of elegance and restraint. Many artists throughout Europe accepted this manner, including such German draftsmen as Adrian Ludwig Richter, who preferred the hardest of pencils and sharpest of points to produce wirelike delineations of figures and landscapes. Softer and darker graphite pencils offered appropriate effects to artists whose tastes required more freedom and spontaneity. The sketches of the Romantic artist Eugène Delacroix, created swiftly and filled with flamboyant and undetailed strokes, had a suggestiveness of dramatic figures and compositions. Vincent van Gogh chose a broad carpenter's pencil for powerful, blunt strokes.

One of the most sensitive users of the graphite pencil in the 19th century was the French artist Edgar Degas. A master pastelist and draftsman with coloured chalks and charcoal, Degas created pencil drawings of warmth and charm that were quite unlike the cool, classic works of Ingres or the highly animated, sometimes violent sketches of Delacroix. Degas, with high selectivity, combined graciously fluid outlines with soft, limpid tonal shadings.

Artists of the 20th century continue to use the graphite pencil as a device for autonomous artworks as well as for sketching and for making preliminary rehearsals of conceptions later carried out in painting or sculpture—*e.g.*, Henri Matisse, Amedeo Modigliani, Pablo Picasso, and others whose taste for basically linear conceptions is revealed in their graphic works.

pencil fish, any of several slender South American fishes belonging to three groups of



Pencil fish (*Anostomus anostomus*)
Gene Wolfsheimer

characins, treated by some authorities as three separate families and by others as a single family, Characidae. Pencil fish pick animal food from the bottom or from plant surfaces. Most species inhabit slow-moving water and all live in fresh water. Some habitually swim at an angle, tail down, others horizontally, and still others tail up.

The larger pencil fish grow to somewhat over 20 cm (8 inches) long and include well-known aquarium fishes as *Anostomus anostomus* (family Anostomidae) and various species of *Hemiodus* (family Hemiodontidae). Several species of pygmy pencil fish belong to the genus *Nannostomus* (family Lebiasinidae) and reach a length of 2.5 to 4 cm (1 to 2 inches). *N. eques, N. beckfordi,* and *N. marginatus* are common aquarium species.

Pend Oreille Lake, lake in Kaniksu National Forest, northwestern Idaho, U.S. The largest lake in Idaho, it is about 40 miles (65 km) long and 4 miles (6.5 km) wide and covers an area of 125 square miles (325 square km); it is about 2,500 feet (760 m) deep and is noted for the highly prized Kamloops rainbow trout. The lake (the name of which is derived from the French name [Pend d'Oreille] for the Kalispel Indians, who wore ear pendants) receives the Clark Fork River, which becomes the Pend Oreille River when it leaves the lake.

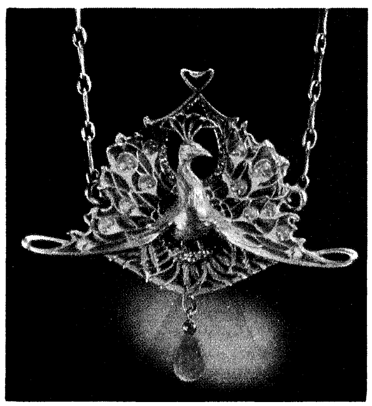
Penda (d. Nov. 15, 654), Anglo-Saxon king of Mercia from about 632 until 654, who made Mercia one of the most powerful kingdoms in England and temporarily delayed the rise of Northumbria.

In 628 Penda defeated a West Saxon people known as the Hwicce at the Battle of Cirencester (in present-day Gloucestershire) and annexed their territory. He and King Cadwallon of Gwynedd (in northern Wales) invaded Northumbria in 632 and defeated and killed the Northumbrian king Edwin. That victory carried Penda into the Mercian kingship, but in 633 he was forced to recognize Northumbrian overlordship. Penda did not recover his independence until 641, when his army killed King Oswald of Northumbria. He then proceeded to extend his power over an area corresponding to modern Cheshire, Shropshire, and Hereford and Worcester. His son Peada had been made subking of Middle Anglia by 653. East Anglia was subjugated, and King Cenwalh was driven from Wessex for three years (645–648). In 654 Penda invaded Northumbria with forces drawn from many kingdoms, but he was slain by the Northumbrian king Oswin at the Battle of the Winwaed near Leeds (in present-day Yorkshire). Although Penda was a pagan, he allowed Peada to introduce Christianity into Middle Anglia.

pendant, also spelled PENDENT, in architecture, sculpted ornament or elongated boss terminating the fan, or pendant, vaulting, associated with late English Gothic architecture of the Perpendicular period (15th century). Such devices are also to be found hanging from the framing of open timber roofs of this as well as the earlier Decorated period.

In stone ceilings the use of pendant vaulting was a solution to the difficulty of adapting fan vaulting to church naves built much wider than previously. Strong transverse arches were made to span the area, and these in turn supported the elongated voussoirs, ending in pendants. Intermediate rib and panel vaults spring from the pendants. Examples include Oxford's cathedral (1480–1500) and divinity schools (1480–83). In Henry VII's chapel (1503–19), Westminster, London, the pendant vaulting is supported by hidden arches above the ceiling. This type of fan vaulting was also a feature of the Flamboyant period (14th to early 16th century) in France.

pendant, in jewelry, ornament suspended from a bracelet, earring, or, especially, a necklace. Pendants are derived from the primitive practice of wearing amulets or talismans around the neck. The practice dates from the Stone Age, when pendants consisted of such objects as teeth, stones, and shells.



Art Nouveau pendant by L. Gautrait, *c.* 1900; in the Schmuckmuseum, Pforzheim, Ger.
By courtesy of the Schmuckmuseum, Pforzheim, Ger.

The pharaohs of ancient Egypt wore pendants that were sometimes of huge dimensions, usually bearing commemorative or auspicious scenes in which the sovereign is being deified. Other pendants were in the shape of flies, winged scarabs, vultures, the eye of the god Horus, falcons, and sacred serpents. An exquisite example of an early gold pendant is that of two hornets clasped together, found in Mycenae and dating from the 17th century BC (Archaeological Museum, Iráklion, Crete). Etruscan pendants were decorated with spindles and cylinders, figured, or in the shape of human heads. Greek and Hellenistic pendants usually formed the entire necklace. Pendants in the shape of a bulla (*q.v.*) are frequent in Roman necklaces, but there are also examples of cameos (*q.v.*), intaglios, and gold coins mounted as pendants.

During the Middle Ages, characteristic jewels were the reliquary, or devotional, pendant and the cross, chased or enamelled with religious subjects and often set in an architectural frame. One of the most famous early pendant reliquaries, which belonged to Charlemagne (cathedral treasury, Reims, Fr.), contained relics of the True Cross and the crown of thorns under a sapphire set with gold. In the 14th century it was customary for noblemen to wear necklaces with pendants bearing heraldic subjects; pendants worn by women generally depicted sentimental subjects.

Toward the beginning of the 16th century, pendants became decorative rather than religious objects. The Renaissance artists created numerous beautiful crosses and figured pendants modelled in high relief and depicting numerous subjects, such as mermaids, tritons, animals and ships, and mythological and religious scenes. Often, the irregular shapes of baroque pearls (*q.v.*) were exploited and adapted for the bodies of human beings or animals, whose faces and limbs were modelled in gold and enamelled.

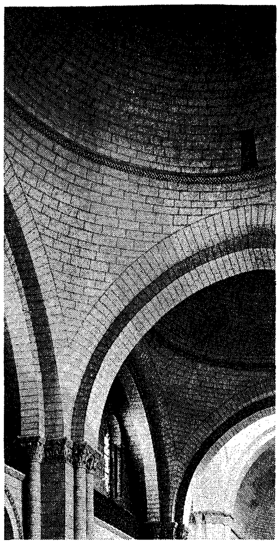
In the Baroque period there was a return in pendants to engraved figures and intaglio and cameo cutting, framed in geometric decorative designs containing gems and, later, in ribbons and floral designs done mainly in diamonds, rubies, emeralds, and pearls. Such pendants continued to be popular until the end of the 18th century.

The Empire style attached no great importance to pendants, and most of the rare examples consist of cameo medallions. In the 19th century the Art Nouveau (*q.v.*) school created pendants with a lovely aesthetic line in which the most common motifs were women's figures and profiles, butterflies, peacocks, insects, and flowers.

Pendéli Óros (Greece): *see* Pentelicus, Mount.

pendentive, in architecture, a triangular segment of a spherical surface, filling in the upper corners of a room, in order to form, at the top, a circular support for a dome. The problem of supporting a dome over an enclosed square or polygonal space assumed growing importance to the Roman builders of the late empire. It remained for the Byzantine architects, however, to recognize the possibilities of the pendentive and fully develop it. One of the earliest examples of the use of the pendentive is also one of the largest—that of Hagia Sophia (completed AD 537) at Istanbul.

In the Romanesque period pendentives occur commonly in western Europe in the domed churches of the Aquitaine in France, as in Saint-Front at Perigueux (begun 1120) and the cathedral of Saint-Pierre at Angoulême (1105–28), but they occur only occasionally in Italian churches. During the Renaissance and the Baroque the preference for domed churches, especially in Catholic Europe and



Romanesque pendentives supporting domes in the nave of the cathedral of Saint-Pierre at Angoulême, Fr., 1105–28
Archives Photographiques

Latin America, gave great importance to the pendentive. As a result of Byzantine influence, pendentives are frequent in Islāmic architecture. They are often decorated with stalactite work or sometimes, as in Iran, with delicate ribbing.

A vaulting form in which the curve of the pendentive and dome is continuous, without a break, is known as a pendentive dome. *See also* dome; squinch.

Penderecki, Krzysztof (b. Nov. 23, 1933, Debica, Poland), outstanding Polish composer of his generation whose novel and masterful treatment of orchestration won worldwide acclaim.

Penderecki
CAF, Warsaw

Penderecki studied composition at the Superior School of Music in Kraków (graduated 1958), subsequently becoming a professor there. He first drew attention in 1959 at the third Warsaw Festival of Contemporary Music, where his *Strophes* for soprano, speaker, and ten instruments was performed. The following year was marked by the performances of both *Anaklasis,* which premiered at the Donaueschingen Festival, and the *Threnody for the Victims of Hiroshima* for 52 strings. The *Threnody* illustrates Penderecki's skilled and refined treatment of instruments, making use of quarter-tone clusters (close groupings of notes a quarter step apart), glissandi (slides), whistling harmonics (faint, eerie tones produced by partial string vibrations), and other extraordinary effects. Penderecki received the UNESCO Award and the Polish Minister of Culture Prize in 1961 for his innovative composition. The techniques used in *Threnody* were extended to his vocal work *Dimensions in Time* (1961) and his operas *The Devils of Loudun* (1968) and *Paradise Lost* (1978).

Penderecki's *Psalms of David* (1958) and *Stabat Mater* (1962) reflect a simple, linear trend (letting interwoven melodic lines predominate and determine harmonies) in his composition. The *Stabat Mater* combines traditional and experimental elements and led to his other well-known masterpiece, the *Passion According to St. Luke* (1963–66). In form, the latter work resembles a Baroque passion, such as those by J.S. Bach, and Penderecki makes use of traditional forms such as the passacaglia (a variation form), a chantlike freedom of metre, and a twelve-tone row (ordering of the 12 notes of the chromatic scale) based on the motif B♭-A-C-B (in German notation, B-A-C-H) in homage to Bach.

Penderecki's 1962 *Canon* for 52 strings made use of polyphonic techniques (based on interwoven melodies) known to Renaissance composers. On the other hand, he also made some use of aleatory (chance music) freedoms, percussive vocal articulation, nontraditional musical notation, and other devices that stamped him as a leader of the European avant-garde. Later works include *Utrenja* (in two parts, 1969–71; *Morning Prayer*), a cello concerto (1972), *Magnificat* (1973–74), *Rajutracony* (1976–78; *Paradise Lost*), *De Profundis* (1977), and a violin concerto (1977).

Pendergast, Thomas J(oseph) (b. July 22, 1872, St. Joseph, Mo., U.S.—d. Jan. 26, 1945, Kansas City, Mo.), U.S. politician who created a powerful political machine in Missouri. Critics of Pres. Harry S. Truman frequently linked his name with Pendergast, a former associate.

Pendergast went to Kansas City in 1893, where he learned the rudiments of municipal politics from precinct captains and where, by 1916, he had become political boss of Kansas City's Democrats, a position he held for almost 25 uninterrupted years. His political machine dominated state as well as city politics and had strong influence in Democratic national conventions. Political foes labelled him a ruthless leader of a corrupt political machine that had made Kansas City a hotbed of vice and crime.

Pendergast was toppled not by his political opponents but by the U.S. government, which found him guilty of evading payment of income taxes on $443,550. This sum allegedly included a $315,000 bribe he had received from some fire-insurance companies for favouring their side in a rate-increase dispute. Pendergast was sentenced to federal prison in May 1939 and served a year and a day.

Pendle, district (borough), county of Lancashire, England. It lies on the eastern boundary of the county and takes its name from Pendle Hill, 1,831 ft (707 m) high, famous for its association with Lancashire witches in the 17th century. In the early 18th century woollen textiles were an important domestic industry, but they were replaced by cotton by the end of the century, when the Leeds and Liverpool Canal gave easy transport of the raw cotton from Liverpool. More recently industrial diversification has added engineering—including Rolls-Royce at Barnoldswick—and the manufacture of furniture, carpets, and plastics. Much of the area is rural, and agriculture is also important. The district has an area of 65 sq mi (168 sq km). Pop. (1983 est.) 85,200.

Pendleton, city, northeastern Oregon, U.S., on the Umatilla River, adjacent to the Umatilla Indian Reservation. On the Oregon Trail, it was founded in 1869 by G.W. Bailey as the seat of Umatilla County and named for George Hunt Pendleton. It became a wheat and cattle centre after the arrival of the railroad in 1889. Industries include food processing and lumber and woollen mills. It is headquarters for Umatilla National Forest and the site of an Oregon State University agricultural experiment station and of Blue Mountain Community College (1962). The Pendleton Round-Up (rodeo) has been held annually in September since 1910. Inc. 1880. Pop. (1980) 14,521.

Pendleton, Edmund (b. Sept. 9, 1721, Caroline County, Virginia—d. Oct. 26, 1803, Caroline County, Va., U.S.), Virginia patriot during the American Revolution.

Pendleton's father and grandfather died the year of his birth, and the young man grew up without paternal care. Apprenticed at the age of 14 to the clerk of the Caroline County court, Pendleton acquired a legal education, and in 1741 he was admitted to the bar.

In 1751 Pendleton became a justice of the peace, and the following year he was elected to the House of Burgesses. A conservative, he clashed repeatedly with Patrick Henry (whom Pendleton considered a demagogue) over Henry's radical opposition to the Stamp Act and other divisive issues between Britain and the American colonies. Pendleton did charge that Parliament had exceeded its authority in passing the Stamp Act, and he soon emerged as a leader among the patriots.

Selected in 1773 as a member of Virginia's Committee of Correspondence, Pendleton represented the colony at the first Continental Congress in 1774. In 1775 he served as president of the Virginia Committee of Public Safety, which acted as a temporary government during the critical period just prior to independence. At the Virginia convention of 1776, Pendleton drew up the instructions to Virginia's representatives in Congress, directing them to propose a declaration of independence. He later helped revise the laws of Virginia and helped draft the state's first constitution.

Under the new constitution, Pendleton served as first speaker of Virginia's House of Delegates. In 1779 he became president of the supreme court of appeals, but except for trips to Richmond in order to preside, he spent much of the remainder of his life at his estate, "Edmunsbury," in Caroline County. He nonetheless exerted influence over national affairs by corresponding regularly with his friends in Congress, especially James Madison. Elected president of Virginia's ratifying convention in 1788, Pendleton vigorously supported acceptance of the new federal Constitution. He thereafter refused several positions in the national government offered by his long-time friend George Washington and spent his final years at his Virginia estate.

Pendleton, George (Hunt) (b. July 29, 1825, Cincinnati, Ohio, U.S.—d. Nov. 24, 1889, Brussels), American lawyer and legislator, an advocate of civil service reform and sponsor of the Pendleton Civil Service Act (1883), which created the modern civil service system.

Admitted to the bar in 1847, Pendleton, a Democrat, practiced law in Cincinnati and in 1853 was elected to the state senate. As a member of the U.S. House of Representatives (1857–65), he opposed suspension of *habeas corpus* and other extraordinary measures taken by Pres. Abraham Lincoln during the Civil War. In 1864 he was the Democratic vice-presidential nominee, sharing the ticket with the former Union Army general George B. McClellan. The Democrats, who made peace their primary issue, were soundly defeated.

After the war Pendleton was a Greenbacker and a principal advocate of the Ohio Idea, a proposal for redeeming certain Civil War bonds in paper currency (greenbacks) instead of in gold. On this issue he alienated Eastern Democrats, who in turn deprived him of the 1868 Democratic presidential nomination. As a U.S. senator from Ohio (1879–85), he sponsored the Pendleton Civil Service Act (1883), which provided for a federal civil service commission and a corps of professional civil servants recruited by means of competitive examinations. Appointed minister to Germany by Pres. Grover Cleveland in 1885, Pendleton served abroad until his death.

Pendleton Civil Service Act (Jan. 16, 1883), landmark U.S. legislation establishing the tradition and mechanism of permanent federal employment based on merit rather than on political party affiliation (the spoils system).

Widespread public demand for civil service reform was stirred after the Civil War by mounting incompetence, graft, corruption, and theft in federal departments and agencies. After Pres. James A. Garfield was assassinated in 1881 by a disappointed office seeker, civil service reform became a leading issue in the midterm elections of 1882. In January 1883, Congress passed a comprehensive civil service bill sponsored by Sen. George H. Pendleton of Ohio, providing for the open selection of government employees—to be administered by a Civil Service Commission—and guaranteeing the right of citizens to compete for federal appointment without regard to politics, religion, race, or national origin. Only about 10 percent of the positions in the federal government were covered by the new law, but nearly every president after Chester A. Arthur, who signed the bill into law, broadened its scope. By 1980 more than 90 percent of federal employees were protected by the act.

Pendred's syndrome, hereditary metabolic condition that is characterized by deafness and defective incorporation of iodine into thyroid hormone, resulting in goitre or enlargement of the thyroid gland. Pendred's syndrome is a major cause of congenital deafness. It does not produce symptoms of hypothyroidism (deficiency of thyroid activity) in most patients, nor does the condition affect life expectancy.

pendulum, body suspended from a fixed point so that it can swing back and forth under the influence of gravity. Pendulums are used to regulate the movement of clocks because the interval of time for each complete oscillation, called the period, is constant. The scientist Galileo first noted (*c.* 1583) the constancy of a pendulum's period by comparing the movement of a swinging lamp in a Pisa cathedral with his pulse rate. The Dutch mathematician and scientist Christiaan Huygens invented a clock controlled by the motion of a pendulum in 1656. The priority of invention of the pendulum clock has been ascribed to Galileo by some authorities and to Huygens by others, but Huygens solved the essential problem of making the period of a pendulum truly constant by devising a pivot that caused the suspended body, or bob, to swing along the arc of a cycloid rather than that of a circle.

A simple pendulum consists of a bob suspended at the end of a thread that is so light as to be considered massless. The period of such a device can be made longer by increasing its length, as measured from the point of suspension to the middle of the bob. A change in the mass of the bob, however, does not affect the period, provided the length is not thereby affected. The period, on the other hand, is influenced by the position of the pendulum in relation to the Earth. Because the strength of the Earth's gravitational field is not uniform everywhere, a given pendulum swings faster, and thus has a shorter period, at low altitudes and at the Earth's Poles than it does at high altitudes and at the Equator.

There are various other kinds of pendulums. A compound pendulum has an extended mass, like a swinging bar, and is free to oscillate about a horizontal axis. A special reversible compound pendulum called Kater's pendulum is designed to measure the value of g, the acceleration of gravity.

Another type is the Schuler pendulum. When the Schuler pendulum is vertically suspended, it remains aligned to the local vertical even if the point from which it is suspended is accelerated parallel to the Earth's surface. This principle of the Schuler pendulum is applied in some inertial guidance systems to maintain a correct internal vertical reference, even during rapid acceleration.

A spherical pendulum is one that is suspended from a pivot mounting, which enables it to swing in any of an infinite number of vertical planes through the point of suspension. In effect, the plane of the pendulum's oscillation rotates freely. A simple version of the spherical pendulum, the Foucault pendulum (*q.v.*), is used to show that the Earth rotates on its axis. *See also* ballistic pendulum.

Penedo, port city, Alagoas state, northeastern Brazil, on the north bank of the lower São Francisco River, bordering Sergipe state, 25 mi (40 km) above its mouth on the Atlantic Ocean. Founded in the 16th century during the Portuguese conquest, it has developed a thriving trade in hides, rice, and cotton. There is light industrial development, including cotton spinning, weaving, vegetable-oil processing, and rice husking. Pop. (1980 prelim.) 27,064.

Penelope, in Greek mythology, a daughter of Icarius of Sparta and the nymph Periboea and wife of the hero Odysseus. In the *Odyssey* is told the story of how, during her husband's long absence after the Trojan War, many chieftains of Ithaca and nearby islands became her suitors. To spare herself their importunities she insisted that they wait until she had woven a shroud for Laertes, father of Odysseus. Every night for three years, until one of her maids revealed the secret, she undid the piece that she had woven by day in order to delay the date at which she would have to forsake her lost husband by remarrying. She was finally relieved by the arrival of Odysseus. According to later writers, after the death of Odysseus, Penelope married Telegonus, son of Odysseus and the sorceress Circe.

peneplain, gently undulating, almost featureless plain that, in principle, would be produced by fluvial erosion that would, in the course of geologic time, reduce the land almost to baselevel (sea level), leaving so little gradient that essentially no more erosion could occur. The peneplain concept was named in 1889 by William M. Davis, who believed it to be the final stage of his geomorphic cycle of landform evolution.

There has been much debate on the peneplain theory. The lack of present-day peneplains tends to discredit it, but some attribute this lack to geologically recent diastrophism, or uplifting, of the Earth's crust. Other geomorphologists question whether the Earth's crust has ever remained stable long enough for peneplanation to occur.

Criteria considered by its proponents to be evidence for the theory are (1) the accordant summits, or remnants of an uplifted, dissected peneplain; (2) the occurrence of uniform truncation of strata of varying erosional resistance;

and (3) the presence of remnants of a mantle of residual soil formed on the peneplain. Opponents of the theory hold that even if some examples do represent almost flat plains (which they consider unlikely), they were not necessarily formed by fluvial erosion within the confines of a geomorphic cycle.

Peneus River (Greece): *see* Piniós River.

Peng Dehuai, Wade-Giles P'ENG TE-HUAI (b. *c.* 1898, Hsiangt'an, Hunan province, China—d. Nov. 29, 1974, Peking), military leader, one of the greatest in Chinese communist history, and minister of national defense of China from 1954 until 1959, when he was removed for criticizing the military and economic policies of Mao Zedong.

Peng was a military commander under Chiang Kai-shek but broke with him in 1927 when Chiang attempted to rid the Nationalist Party (Kuomintang) of leftist elements. In 1928 Peng became a communist and soon afterward became involved in guerrilla activity, leading a series of peasant uprisings. He became a senior military commander under Mao and participated in the Long March (1934–35), the communist retreat of 6,000 miles (9,650 km) from southeast to northwest China.

Peng was the second-ranking man in the communists' military hierarchy from the outbreak of the Sino-Japanese War in 1937 to 1954. He led Chinese forces in the Korean War and signed the armistice at P'anmunjŏm on July 27, 1953. In 1954 he became minister of national defense and a member of the Politburo of the Chinese Communist Party. In 1959, however, he criticized as impractical the policies of Mao's Great Leap Forward, which emphasized ideological purity over professional expertise in both the military forces and the economy. Peng was deprived of office and membership in the party and disappeared from view. Peng was posthumously "rehabilitated" in December 1978 under the post-Mao regime.

Penghu Islands, Chinese (Wade-Giles) P'ENG-HU CH'ÜN-TAO, or P'ENG-HU LIEH-TAO, or (Pinyin) PENGHU QUNDAO, or PENGHU LIEDAO, also called PESCADORES, archipelago and *hsien* (county) of Taiwan, consisting of about 64 small islands, approximately 30 miles (50 km) west of the coast of Taiwan, from which it is separated by the Penghu Channel. Of volcanic origin, many of the islands consist of weathered basalt, and they are surrounded by coral reefs. The islands are low-lying, most rising only about 100–130 feet (30–40 m) above sea level. The highest peak is about 157 feet (48 m). The islands have a warm climate, being situated in the path of the Kuroshio (Japan Current), and the annual temperature range is from 61° to 82° F (16° to 28° C). The rainfall is roughly 35 inches (900 mm) annually, nearly all of which falls between June and September. For the rest of the year there is a shortage of water, and there are no rivers. In winter the islands are swept by severe winds. The largest islands are Penghu (25 square miles [64 square km]), on which more than half of the population lives, Pai-sha, Yü-weng, and Pa-chao. Penghu and Pai-sha are linked by a causeway. The total area of the entire group and of the county is 49 square miles (127 square km).

Women mending fishnets, Ma-kung, Penghu Islands, Taiwan

George Holton—Photo Researchers/EB Inc.

About half of the islands are cultivated, but the soils are poor and the climate harsh; the main crops—sweet potatoes, peanuts (groundnuts), corn (maize), and millet—are those associated with poor hill country in southern China. A large part of the population are fishermen, and the European name Pescadores ("Fishermen") was given to the islands by the Portuguese in the 16th century.

The islands were probably known to the Chinese (under the name Liu-chiu) as early as the 7th century AD. Their name first appears as P'eng-hu (or P'ing-hu) in Chinese sources of the 12th century, and it was at this time that they were probably first settled by Chinese fishermen from Fukien or Chekiang provinces on the mainland. At the beginning of the Ming dynasty (1368–1644), the Chinese government built a fort on Penghu, established a civil government there, and imposed taxes on the fisheries. In 1388, however, the entire population was transported to the mainland. Penghu was then abandoned and became a lair for pirates. Only in the reign of the Ming emperor Wan-li (1572–1620) did Chinese settlers again begin to colonize the islands, first establishing fisheries and then in 1625 military colonies. Meanwhile, between 1622 and 1624, the islands had been occupied by the Dutch. At the end of the Ming dynasty, many Fukienese settlers came to the islands to escape the fighting in southeast China, mostly from Chang-chou and Ch'üan-chou. By 1683 there were said to be some 6,000 inhabitants on the islands, who were formally placed under the control of the civil authorities in Taiwan. In 1721 the islands became the base for government punitive action against Chu I-kuei, a rebel on Taiwan.

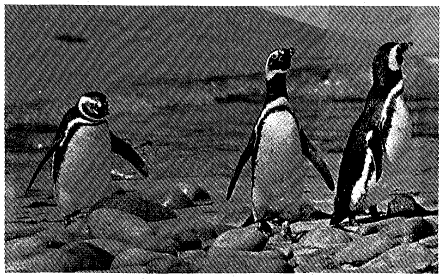
In the 19th century, when the Western powers began to have designs on Taiwan, the islands again became an important strategic area. They were occupied by the French in 1884–85, and, after the Sino-Japanese War of 1894–95, they were ceded to Japan, together with Taiwan. Returned to China in 1945, the islands were made a *chen* (township) under Taiwan and, in 1950, became a *hsien* of Taiwan province.

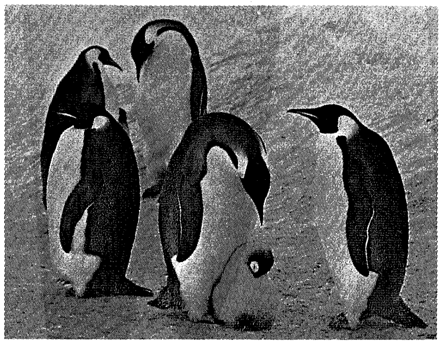
Since 1949 the islands have been under the control of the government of the Republic of China on Taiwan; a Chinese Nationalist naval base, Ma-kung (now the county seat), was established on Penghu. In addition to the fishing industry, the working of the islands' phosphate deposits have also provided income. Pop. (1989 est.) 97,327.

penguin, any member of Sphenisciformes, an order of flightless marine birds containing one family, Spheniscidae.

A brief treatment of penguins follows. For full treatment, *see* MACROPAEDIA: Birds.

Of all birds, penguins are the most fully adapted to water and extreme cold. Penguins are flightless and clumsy on land but at home in the water. They breed on islands in the subantarctic and on cool coasts of Africa, Australia, New Zealand, and South America. Only the Adélie penguin (*Pygoscelis adeliae*) and the emperor penguin (*Aptenodytes forsteri*) reach Antarctica itself; the Galápagos penguin (*Spheniscus mendiculus*) is confined to the tropics off South America.





(Top) Magellan penguins (*Spheniscus magellanicus*) and (bottom) emperor penguins (*Aptenodytes forsteri*)

(Top) Peter Johnson from Natural History Photographic Agency—EB Inc., (bottom) Michael C.T. Smith from The National Audubon Society Collection/Photo Researchers—EB Inc.

The Adélie, the best-known penguin, has, like the others, a dark back and a white belly. The species differ mainly in head pattern and in size, from 40 cm (16 inches) in the little blue, or fairy, penguin (*Eudyptula minor*) to almost 120 cm (4 feet) in the emperor penguin. Sexes are alike in size and plumage. At sea for weeks at a time, flocks of penguins feed on fish, squid, and crustaceans. In turn, penguins are the prey of leopard seals and killer whales. Some species migrate long distances inland to ancestral nesting colonies. The eggs, usually one or two, are incubated in turns by both parents, one remaining on the nest while the other goes off to feed. Young penguins are fed by regurgitation and are often tended in crèches, or "kindergartens."

Penibético Mountain System, Spanish SISTEMA PENIBÉTICO, also called CORDILLERA PENIBÉTICA, or BAETIC CORDILLERA, mountain system comprising the Andalusian mountains of southern Spain, of which the northern range runs about 360 miles (580 km) from Cape Trafalgar to Cape Nao. The central and southern ranges, the Penibético proper, extend a shorter distance from Estepona to Cape Gata. Separating the two systems is a complex series of structures, traceable in longitudinal corridors and high basins for 180 miles (290 km) between Antequera and Baza and again between Lorca and the Guadalentín Valley. To the south, in the Penibaetic proper, the interior mountains include the Sierra Nevada, with the highest peak of the Iberian Peninsula, Mount Mulhacén, 11,411 feet (3,478 m).

penicillin, one of the first and still one of the most widely used antibiotic agents, derived from the *Penicillium* mold. Alexander Fleming (later Sir Alexander Fleming) in 1928 first observed that colonies of *Staphylococcus aureus* (the pus-producing bacterium) failed to grow in those areas of a culture that had been accidentally contaminated by the green mold *Penicillium notatum.* He isolated the mold, grew it in a fluid medium, and found that it produced a substance capable of killing many of the common bacteria that infect humans. Other researchers created an injectable agent for therapeutic use in 1940.

The several kinds of penicillin synthesized by various species of the mold *Penicillium* may be divided into two classes: biosynthetic penicillins (those formed during the process of mold fermentation) and semisynthetic penicillins (those in which the structure of a chemical substance—6-aminopenicillanic acid—found in all penicillins is altered in various ways). Because it is possible to change the characteristics of the antibiotic, different types of penicillin are produced for different therapeutic purposes. Benzylpenicillin, or penicillin G, is the only naturally occurring penicillin that is still used clinically. Because of its poor stability in acid, much of penicillin G is broken down as it passes through the stomach; as a result of this characteristic, it must be given by intramuscular injection, which limits its usefulness. Some of the semisynthetic penicillins are more acid-stable and so may be given as oral medication.

All penicillins work in the same way, namely, by inhibiting the bacterial enzymes responsible for cell-wall synthesis and activating other enzymes to break down the organisms' protective walls; therefore, they are not effective against microorganisms that do not produce cell walls.

Some strains of previously susceptible bacteria have developed a specific resistance to penicillin; these bacteria either produce penicillinases, enzymes that disrupt the internal structure of penicillin and thus destroy the antimicrobial action of the drug, or they lack cell-wall receptors for penicillin, greatly reducing the drug's ability to enter bacterial cells.

Among the bacteria sensitive to penicillin are those that cause throat infections, pneumonia, spinal meningitis, gas gangrene, diphtheria, syphilis, and gonorrhea. The chief side effects of penicillin are allergic or hypersensitivity reactions, including skin rashes, hives, swelling, and anaphylaxis, or allergic shock. Milder symptoms may be treated with corticosteroids but usually are prevented by switching to alternative medications; anaphylactic shock, which can occur in previously sensitized individuals within seconds or minutes, may require immediate administration of epinephrine to end the life-threatening process.

Penicillium, genus of blue or green mold fungi (division Mycota) of the form-class Deuteromycetes (Fungi Imperfecti). Those species for which the sexual phase is known are

placed in the Eurotiales. Found on foodstuffs, leather, and fabrics, they are of economic importance in the production of antibiotics (penicillin, *q.v.*), organic acids, and cheeses.

Peninsular Campaign (April 4–July 1, 1862), in the American Civil War, large-scale but unsuccessful Union effort to capture the Confederate capital at Richmond, Va., by way of the peninsula formed by the York and the James rivers. Following the engagement between the ironclads *Monitor* and *Merrimack* at nearby Hampton Roads (March 9), Federal supplies and 100,000 troops were disembarked at Fort Monroe under Major General George B. McClellan. The first phase of the campaign, during which the North reached the town of White House, within striking distance of Richmond, concluded with the indecisive Battle of Seven Pines (May 31–June 1), in which Confederate General Joseph E. Johnston was seriously wounded and field command passed to Robert E. Lee. A second phase was characterized by three weeks of inactivity. The final phase ended triumphantly for the Confederate forces of General Lee, who forced the withdrawal of the Federal Army of the Potomac after the Seven Days' Battles (*q.v.;* June 25–July 1).

Peninsular War (1808–14), Spanish GUERRA DE LA INDEPENDENCIA ("War of Independence"), that part of the Napoleonic Wars fought in the Iberian Peninsula, where the French were opposed by British, Spanish, and Portuguese forces. Napoleon's peninsula struggle contributed considerably to his eventual downfall; but until 1813 the conflict in Spain and Portugal, though costly, exercised only an indirect effect upon the progress of French affairs in central and eastern Europe. The war in the Peninsula did interest the British, because their army made no other important contribution to the war on the continent between 1793 and 1814; the war, too, made the fortunes of the British commander Arthur Wellesley, afterward Duke of Wellington.

Napoleon's pact with Russia at Tilsit (July 7, 1807) left him free to turn his attention toward Britain and toward Sweden and Portugal, the two powers that remained allied or friendly to Britain. Russia, it was decided, would deal with Sweden, while Napoleon, allied to Spain since 1796, summoned (July 19) the Portuguese "to close their ports to the British and declare war on Britain." His intention was to complete the Continental System designed to make economic war against Britain, for there was no other means to bring it to seek peace than by striking at its trade. When the Portuguese proved dilatory, Napoleon ordered General Andoche Junot, with a force of 30,000, to march through Spain to Portugal (October–November 1807). The Portuguese royal family fled, sailing to Brazil, and Junot arrived in Lisbon on November 30. The French army that conquered Portugal, however, also occupied parts of northern Spain; and Napoleon, whose intentions were now becoming clear, claimed all of Portugal and certain provinces of northern Spain. Unable to organize government resistance, the Spanish minister Godoy persuaded his king, Charles IV, to imitate the Portuguese royal family and escape to South America. The journey from Madrid was halted at Aranjuez, where a revolt organized by the "Fernandista" faction (March 17, 1808) procured the dismissal of Godoy and the abdication of Charles IV in favour of his son Ferdinand VII. Napoleon, taking advantage of the situation, sent in General Joachim Murat to occupy Madrid and, by a mixture of threats and promises, induced both Charles and Ferdinand to proceed to Bayonne for conferences. There, on May 5, 1808, Napoleon forced Ferdinand to abdicate in favour of Charles and Charles in favour of himself. In exchange, Napoleon promised that Spain should remain Roman Catholic and independent, under a ruler whom he would name. He chose his brother Joseph Bonaparte. On May 2, however, the people of Madrid had already risen against the invader, and the war for Spanish independence had begun.

The rebellion in Madrid began the movement that ultimately proved fatal to Napoleon's power. Although the Madrid revolt was ruthlessly suppressed by the French, provincial insurrections took place thoroughout Spain, and the Spaniards showed great capacity for guerrilla warfare. The French were repulsed from Valencia, and General Pierre Dupont, who had advanced into Andalusia, was compelled to retreat and ultimately to capitulate with all his army at Bailén (July 23). The Spaniards now advanced upon the capital and expelled Joseph Bonaparte (August).

The French counterattack, leading to the recapture of Madrid (December 1808), forced the junta to retreat southward to Seville. In January 1810 General Nicolas de Dieu Soult began the conquest of Andalusia, and, with the fall of Seville in the same month, the central junta fled to Càdiz. Only the obstinate resistance of Wellington in Portugal, the continuous activity of the guerrillas, and dissensions among the French saved the peninsula from final submission. Indeed, the British forces, which had first landed in Portugal on Aug. 1, 1808, quickly achieved some successes, conquering Lisbon and forcing the evacuation of the French from Portugal (Convention of Cintra, Aug. 30, 1808). In 1809 the French returned to Portugal, briefly holding Oporto and Lisbon; but Wellington, with some difficulties, was able to outflank them and lead a force toward Madrid. His victory at the Battle of Talavera (July 27–28, 1809) was short-lived, nevertheless, and he was compelled to retreat to central Portugal, where he fortified himself within the country around Lisbon, now again under British rule. His celebrated "lines of Torres Vedras" were defensive works designed to resist any army that Napoleon could send against them.

For the next two years the battles and campaigns in various parts of Spain and Portugal, though numerous, were inconclusive. They did, however, wear down the resources of the French, in both men (now numbering more than 200,000) and matériel; and, when Napoleon in 1811–12 directed his whole attention toward Russia, not only were the depleted peninsular armies not reinforced but as many as 30,000 men were withdrawn for the Grand Army marching east.

Thus, from his base in Portugal, which he had successfully defended, Wellington in 1812 began his gradual advance into Spain. His defeat of Marshal Jean-Baptiste Jourdan at the Battle of Vitoria on June 21, 1813, finally decided the issue in the peninsula. Joseph Bonaparte withdrew from Spain, and Wellington fought his way across the Pyrenees into France (August 1813). Napoleon, after his crushing defeat at Leipzig (Oct. 16–19, 1813), recognized the impossibility of retaining his hold on Spain and released Ferdinand, who had been detained by the French at Valençay since his abdication in 1808. In March 1814 Ferdinand VII returned to Spain and the throne.

penis, the copulatory organ of the male of higher vertebrates that in mammals usually also provides the channel by which urine leaves the body. The corresponding structure in lower invertebrates is often called the cirrus.

The human penis is anatomically divided into two continuous areas—the body, or external portion, and the root. The root of the penis begins directly below the bulbourethral glands with a long cylindrical body of tissue known as the corpus spongiosum (or corpus cavernosum urethrae). This tissue extends through the body of the penis to the tip, where it expands into a mushroom-shaped structure called the glans penis. Running through the centre of the corpus spongiosum is the urethra, a common passage for semen and urine; the urethra ends in a slitlike opening at the tip of the glans penis. Beginning alongside of the bulbourethral glands are a pair of long cylindrical bodies called the corpora cavernosa penis. These continue through the body of the penis, occupying the sides and upper portion directly above the corpus spongiosum; they terminate immediately before the glans penis.

The corpora cavernosa consist of empty spaces divided by partitions of tissue. The tissue consists of muscle, collagen (a fibrous protein), and elastic fibre. The corpora cavernosa are termed erectile tissue (*see* erection), because during sexual excitation, their fibrous tissue is expanded by blood that flows into and fills their empty spaces. The blood is temporarily trapped in the penis by the constriction of blood vessels that would normally allow it to flow out. The penis becomes enlarged, hardened, and erect as a result of this increased blood pressure. The corpus spongiosum is also considered erectile tissue. This area, however, does not become as enlarged as the other two during erection, for it contains more fibrous tissue and less space; unlike the corpora cavernosa, the corpus spongiosum has a constant blood flow during erection.

The corpora cavernosa and corpus spongiosum are enclosed by a circular layer of elastic tissue. This in turn is covered by a thin layer of skin. The skin, which is slightly darker in colour than the rest of the body, is loose and folded while the penis is in a flaccid state. At the beginning of the glans penis, a circular fold of skin, commonly called the foreskin (or prepuce), extends forward to cover the glans. Frequently at birth or during early childhood, the foreskin is removed by an operation called circumcision.

For a depiction of the penis in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

penis bone: *see* baculum.

penitential book, any of the manuals used by priests of the Western Church, especially during the early Middle Ages, in administering ecclesiastical penance. (The name penance is applied to both a sacramental rite and acts performed in satisfaction for sins.) Penitentials contained (1) detailed lists of sins that the priest was to consider in assisting an individual penitent with his examination of conscience and confession during the rite and (2) corresponding penances or acts that were to be assigned to the penitent.

The first penitential books appeared in Ireland and Wales, and the earliest extant compilations are probably those associated with St. David and various Welsh synods of the 6th century, though the *Canons of St. Patrick* (*c.* 450) are occasionally, and somewhat loosely, spoken of as the first penitential. These and later Celtic penitentials were brought to the continent of Europe by missionary monks at an early date. Their introduction met with the opposition of ecclesiastics who favoured the older, traditional public penance, but there is considerable documentary evidence that penitential books were in use among the Franks by the late 6th century, in Italy by the late 8th century, and among the Spanish Visigoths by the early 9th century. Recognition that errors had crept into the penitential books and that they had imposed arbitrary penances, combined with the proscription of local councils and bishops, led to the decline in influence of these books. The ultimate effect of the penitentials and of the reaction against them was the official codification of disciplinary and penitential canons or laws.

Besides their importance in the history of theology and canon law, the penitentials are of value to the philologist as source material for comparative studies of Latin, Anglo-Saxon, Old Irish, and Icelandic forms; to the social historian for the vivid, often revolting picture they present of the manners and morals of barbarous peoples just coming under the influence of Christianity; and to the student of jurisprudence for the information they afford about the early history of the *wergild* (blood money), which defined in monetary terms the value of a man's life and was the basis for a system of compensation for wrongs by money payment.

Penkovsky, Oleg Vladimirovich (b. April 23, 1919, Ordzhonikidze, Russia—d. May 1963, U.S.S.R.), colonel in the Soviet army intelligence directorate (GRU) and deputy chief of the foreign section of the State Committee for the Coordination of Scientific Research (1960–62), who was convicted of spying for the United Kingdom and the United States.

Penkovsky became an intelligence officer after attending the Military Diplomatic Academy (1949–53) and served primarily in Moscow except while he was assistant military attaché in Ankara, Tur. (1955–56). In April 1961, through Greville M. Wynne, a British businessman, he offered his services to British intelligence. Between April 1961 and August 1962 Penkovsky passed more than 5,000 photographs of classified military, political, and economic documents to British and U.S. intelligence forces. He was arrested on Oct. 22, 1962, and executed for high treason soon after his trial. In 1965 his journal, *The Penkovskiy Papers,* was published in the United States.

Penn, Arthur (Hiller) (b. Sept. 27, 1922, Philadelphia), U.S. motion-picture director whose films are noted for their critical examination of the American social fabric, often exposing the darker undercurrents of American society.

Penn became interested in theatre during his stint in the Army (1943–46), and after World War II he attended Black Mountain College in North Carolina and studied literature at the universities of Perugia and Florence in Italy. When he returned to the United States he studied at the Actors Studio in Los Angeles. Penn received his early training as a director during what is known as the golden age of television; from 1953 he wrote dramas and directed plays for such noted television series as "Philco Playhouse" and "Playhouse 90." He also gained a solid reputation as a theatrical director. His Broadway plays included *Two for the Seesaw* (1958); *The Miracle Worker* (1959), a successful adaptation of the play that he originally directed for television; *Toys in the Attic* (1960); *All the Way Home* (1960); and *An Evening With Mike Nichols and Elaine May* (1960–61).

Penn's first movie was *The Left-Handed Gun* (1958), a psychological view of Billy the Kid that is vastly different from his image in popular mythology. In 1962 Penn directed the screen version of *The Miracle Worker,* a commercial and artistic success that brought him the first of three Academy Award nominations for best director. His next two films, *Mickey One* (1965) and *The Chase* (1966), dealt with the ambiguous heroism of the outsider in society. *Bonnie and Clyde* (1967), which used graphic violence as a mode of social criticism, brought him international acclaim. It was followed by *Alice's Restaurant* (1969), a rather wistful paean to the youth counterculture of the time, and by the revisionist western *Little Big Man* (1970), a directorial tour de force that parodied the conventional Hollywood western and depicted American frontier policy as brutal, racist, and at times outright genocidal. His later films included *Night Moves* (1975), *The Missouri Breaks* (1976), *Altered States* (1980), and *Four Friends* (1981).

Penn, Irving (b. June 16, 1917, Plainfield, N.J., U.S.), U.S. photographer, influential for his incisive portraits and his innovations in colour photography.

His early ambition was to be a painter. But at the age of 26 he took a job designing photographic covers for the fashion magazine *Vogue.* He soon developed a photographic style characterized by bold graphic design and brilliant contrast.

During his career, Penn photographed a large number of celebrities, sparring with each sitter to reveal his personality to the camera. In his early portraiture, he often used props to draw

Irving Penn, 1960
Alexander Liberman

out the subject's personality. He also made a memorable series of portraits of the Indians of Cuzco, Peru, and a series of portraits, collectively called *Small Trades,* of labourers formally posed in their work clothes and holding the tools of their trade. Three hundred of his pictures were published in *Moments Preserved* (1960). His other books include *Worlds in a Small Room* (1974), *Inventive Paris Clothes, 1909–1939* (1975), and *Flowers* (1980).

Penn is especially known for his innovations in colour photography. He often achieved very large-grained colour through extreme enlargement and applied such romantic effects as image diffusion and soft focus to such unlikely subjects as industrial equipment.

Penn, William (b. Oct. 14, 1644, London—d. July 30, 1718, Buckinghamshire, England), English Quaker leader and advocate of reli-

William Penn, pastel portrait by Francis Place; in the Historical Society of Pennsylvania
By courtesy of the Historical Society of Pennsylvania

gious freedom who oversaw the founding of the American Commonwealth of Pennsylvania as a refuge for Quakers and other Nonconformists and religious minorities of Europe. He twice visited the colony (1682–84, 1699–1701).

Early life and education. William was the son of Adm. Sir William Penn, who could serve only as a distant model during the child's first dozen years because he was almost always at sea. Young William's mother, Margaret (*née* Jasper) van der Schuren Penn, was a childless widow when the elder Penn married her in 1644. In addition to William, the firstborn, their children included Margaret, born in 1652, and Richard, in 1656. The Penns lived in London until, shortly after William's serious bout with smallpox at the age of three, they moved into the Essex countryside near the village of Chigwell, the seat of a renowned grammar school. From his 6th to his 12th year, young Penn pored over Greek and Latin 8 to 10 hours a day, laying the foundations of his classical education. The strong sense of the past that was thus engendered may have contributed to the feeling of security in his young life.

This stable world was shaken by Admiral Penn's naval defeat in the West Indies in 1655 and brief imprisonment in the Tower of London. This caused the family to move back to London and then, because of continuing political uncertainty, to Ireland the following year. It was while he was thus uprooted in early adolescence, William Penn later recalled, that "the Lord first appeared unto me . . . about the 12th Year of my Age, Anno 1656," a divine encounter probably fostered by the Puritan influence of Chigwell. In Ireland he heard Thomas Loe, a Quaker itinerant, preach to his family at the Admiral's invitation, an experience that apparently intensified his religious feelings.

Four years were spent in Ireland, with tutors tending to Penn's education. He was now in closer association than ever with his land-bound father. At the restoration of the Stuart dynasty in 1660, the Admiral was knighted and named a commissioner of the navy. William, who was academically well prepared, the same year entered Oxford, where he demonstrated his piety by rejecting the Anglican formalism of the university. He was fined for refusing to attend chapel and dismissed in his second year. Admiral Penn was outraged by this conduct. Determined to thwart his son's religiosity, he sent the 18-year-old on a grand tour of the Continent and to the Protestant college at Saumur, in France, to complete his studies. The Admiral's purpose was to prepare the young man for high public office, but William devoted most of two years to the study of theology at Saumur. Summoned back to England, he entered Lincoln's Inn and spent a year reading law before his studies were cut short in early 1666 by the London plague.

His limited legal knowledge was put to use in managing the family estate in Ireland. Barely 21, he accepted his father's decision that he follow this worldly course, but then he crossed paths again with Thomas Loe. At a meeting in Cork, Penn heard Loe preach on the text "There is a Faith that overcomes the World, and there is a Faith that is overcome by the World." He committed himself from that moment to the Quakers, religious radicals who were reviled by respectable society and subject to official persecution.

Quaker leadership and political activism. Bent on converting a reluctant world to righteousness, the first Quakers would stop at nothing to preach the Truth. Penn joined the sect in this spirit and was imprisoned four times for publicly stating his beliefs in word and print. He published 42 books and pamphlets in the seven years immediately following his conversion, including the famous *No Cross No Crown* in 1669, a defense of his beliefs written in the Tower of London. Penn's willingness to withstand the harshness of his confinements, when he might have used his father's position to obtain release, as well as his missionary efforts on the Continent, convinced other Quakers of his commitment. He was on the way to a position of leadership at a time when the nature of the movement was changing.

In reaction to official persecution, George Fox, the founder of the Society of Friends, was imposing discipline on his people to control the excesses of radical Quakers and, thus, to give the government less provocation. Penn's contribution to the transformation of the society was a tireless advocacy of liberty of conscience, the fundamental principle of his social thought and action. This liberty could be realized only through an official policy of tolerating dissent; but to seek toleration was to admit, implicitly, that there might be many truths. Both Fox and Penn were accommodating "a Faith that overcomes the World" to the necessity of social survival.

Penn's move from zeal to moderation reflected not only a pragmatic temperament but also a change in his personal life. Though his academic training was extensive, Penn's theorizing was almost always a response to particular problems. His views on toleration were expressed not in a philosophical treatise but in a number of timely tracts. An example is "The People's Ancient and Just Liberties Asserted, in the Trial of William Penn and William Meade" (1670), a vindication of the independence of the jury, which Penn defended in a court case that stands as a landmark in English legal history. In his own life, the death of Admiral Penn in 1670, of his brother Richard in 1673, and of four of his eight children in infancy after his marriage to Gulielma Springett in 1672 were sorrowful and sobering experiences. Penn reached middle age more mellow than millenarian, content to work within the system. Inevitably, this led to political action.

Again the Quaker leader turned to his pen, and he began lobbying as well. He not only presented his case to men of influence but also prevailed upon fellow Quakers to compile a record of persecutions (institutionalized in the Meeting for Sufferings) and lay petitions before Parliament. His entrance into politics coincided with the emergence of the Whigs, whose advocacy of legislative power and religious toleration was naturally appealing to him. His *England's Great Interest in the Choice of this New Parliament* (1679) was one of the first clear statements of Whig policy. Among his personal acquaintances, however, were Tory leaders, the King (Charles II), and the King's brother, the Duke of York (later James II).

Founding and governorship of Pennsylvania. Within the Society of Friends there was resentment of the worldly militance Penn represented; older Quakers stymied his strategy. Nor did Penn's foray into politics serve him well when the Whigs faded before a Tory resurgence. Frustrated in England, Penn turned toward America as a means of institutionalizing his political and religious principles. Friends had been preaching across the Atlantic since 1655. By 1674 two Quakers had come into possession of West New Jersey, only to engage in a conflict over ownership that Penn was asked to mediate. Convinced of the virtue of single proprietorship, he applied to the crown for a grant of land in the New World, drew upon his connections with men of rank, and received Pennsylvania through a charter that named him the supreme governor.

Penn did not lay full claim to this privilege. Torn between the advice of Whigs and liberal Quakers, who advocated a vigorous popular legislature to offset executive power, and the need to lure politically conservative financial backing, he drew a frame of government that limited republicanism. Power was concentrated in the governor and his council, but he also guaranteed liberty of conscience and promised that the freemen could alter the system if they so chose. The response to this gesture was a political fray in Pennsylvania that was wilder than Penn could have imagined—the consequence of the Quakers' quest for legislative power.

The turbulence in Pennsylvania caught the attention of English officials, who were already suspicious of such Quaker peculiarities as pacifism and the refusal to take oaths. As proprietor, Penn divided his energies between the demands of provincial Quakers and the threats of the home government. Because the latter were more crucial to the autonomy of his colony, he was forced to spend most of his time in England, living in Pennsylvania less than four years.

Penn's first visit (1682–84) was cut short by a boundary controversy with Maryland, which he settled advantageously after a hasty return to London. Simultaneously, James II took the throne and began to accelerate the absolutist policies of his older brother. Penn was personally sympathetic to James, persuaded by his professions favouring toleration and fearful that Pennsylvania's independence would be sacrificed to the Dominion of New England. Penn thus became implicated in a reign abruptly terminated by revolution. Ironically, the establishment of parliamentary ascendancy and religious toleration by statute in 1689 was coincident with Penn's alienation from the government. Pennsylvania was briefly brought under royal rule (1692–94), primarily because Quakers would not cooperate in the colonial war effort.

By the mid-1690s, when Penn emerged from hiding and began rebuilding his political alliances, he found both the King and Parliament intent on strengthening the crown's colonial policy and, concomitantly, undermining the autonomy of the chartered and proprietary colonies. Penn, who led the fight against passage of the Navigation Act of 1696 that embodied the new imperial designs, emerged as spokesman for the continued independence of these colonies. His own was commercially and strategically the most important and, therefore, the most visible and open to attack.

Final years. The provincial Quakers, who were indifferent to Penn's situation, continued to hammer away at executive power, even after he granted the Pennsylvania assembly preeminence in the Charter of Privileges, the climax of his second visit (1699–1701) to the colony. Discouraged by this lack of gratitude, shocked by the discovery that his personal steward had defrauded him of thousands of pounds, and disappointed by the un-Quakerly behaviour of his eldest son, William Penn, Jr., he initiated negotiations in 1702 to sell the "holy experiment" (while simultaneously defending it). On the verge of concluding an agreement of sale in 1712, Penn suffered a crippling stroke, lingering on pathetically until his death six years later. The province, in trusteeship because of his indebtedness, passed to Hannah Callowhill Penn, whom Penn had married in 1696, two years after the death of his first wife. In the 18th century, Pennsylvania was distinguished by its unicameral legislature and its cultural diversity, late testimony to Penn's principles of republicanism and toleration. (J.E.I./Ed.)

BIBLIOGRAPHY. Mary Maples and Richard S. Dunn (eds.), *The Papers of William Penn* (1981–), is a projected five-volume work; Catherine O. Peare's readable *William Penn: A Biography* (1957), includes a bibliography of his writings; Joseph E. Illick, *William Penn the Politician: His Relations with the English Government* (1965), contains a short bibliographical essay on Penn biographies; Mary Maples Dunn, *William Penn: Politics and Conscience* (1967), examines the Quaker leader's ideas. Melvin B. Endy Jr., *William Penn and Early Quakerism* (1973), studies his religious thought; and Harry Emerson Wildes, *William Penn* (1974), includes a bibliography of Penn's writings and of Penn biographies.

Penn, Sir William (b. April 23, 1621, Bristol, Gloucestershire, Eng.—d. Sept. 16, 1670, London), British admiral and father of William Penn, the founder of Pennsylvania.

In his youth he served at sea, and in the English Civil War he fought for Parliament, being appointed rear admiral of the Irish seas in 1647. He was arrested in 1648 on suspicion of corresponding with Charles I but was soon released. He fought in the First Anglo-Dutch War (1652–54) as vice admiral and then as general of the fleet. After secretly offering in 1654 to deliver the fleet to the exiled Charles II, he commanded the expedition sent by Oliver Cromwell to the West Indies, which captured Jamaica (May 1655) but failed to take Hispaniola. On his return he was briefly imprisoned, for reasons that are uncertain.

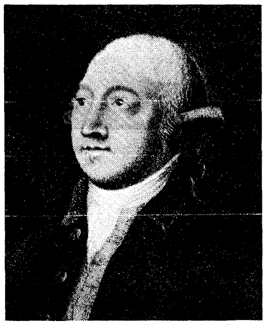
Retiring to his estate in Munster in Ireland, he engaged in secret communication with the Royalists. At the Restoration (1660) he was knighted and appointed a commissioner for the navy. In the Second Dutch War (1665–67) he served as captain of the fleet with the Duke of York (afterward James II). Penn was the author of a code of naval tactics that was the basis of the "Duke of York's Sailing and Fighting Instructions," long the orthodox tactical guide of the navy.

Pennacook, Algonquian-speaking American Indians whose villages were located in what are now southern and central New Hampshire, northeastern Massachusetts, and southern Maine. Like other New England Algonquian tribes, they depended on hunting, fishing, and the cultivation of corn (maize). They were semisedentary, moving seasonally in response to changing food resources.

Smallpox and other causes reduced the Pennacook population from an estimated 2,000 in 1600 to 1,250 in 1674. The treachery of the whites subsequently caused the Pennacook to flee their territory, most removing to Canada and eventually settling at Saint-François-du-Lac. The remainder moved westward and eventually settled at Schaghticoke, Rensselaer County, N.Y.

Pennant, Thomas (b. June 14, 1726, Downing, Flintshire, Wales—d. Dec. 16, 1798, Downing), Welsh naturalist and traveler, one of the foremost zoologists of his time.

Pennant was a landowner of independent means. His books were valued for their highly readable treatment of the existing knowledge of natural history. His volume on *British Zoology* (1766) stimulated zoological research,



Pennant, detail from a lithograph
BBC Houlton Picture Library

particularly in ornithology, in Great Britain, and his *History of Quadrupeds* (1781) and *Arctic Zoology,* 2 vol. (1784–85), were also widely read. His travel books presented valuable information on the local customs, natural history, and antiquities of Scotland, Wales, England, and the European continent.

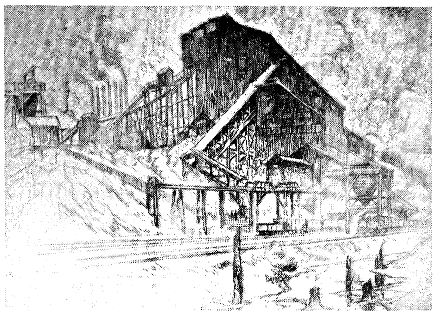
Pennant's cat, also called PENNANT'S MARTEN: *see* fisher.

Pennel, John (Thomas) (b. July 25, 1940, Memphis, Tenn., U.S.), American pole-vaulter who was the first to jump more than 17 feet (5.18 m) and was a world-record holder (1963, 1966, 1969).

At Coral Gables (Florida) High School, from which he graduated in 1958, he divided his extracurricular time between vaulting and playing sousaphone in the band. He competed for Northeast Louisiana State College (later Northeast Louisiana University, Monroe) from 1959 through 1963. His 1963 world record was set with a vault of 5.20 m (17 feet ¾ inches). At the 1964 Olympic Games at Tokyo he competed despite a back injury and placed eleventh. He won the pole vault at the Amateur Athletic Union meet in 1965 and regained the world record in 1966 with a vault of 5.34 m. In the 1968 Olympic Games at Mexico City, he placed only fifth. In 1969 he made his highest vault, 5.44 m, and held the world record once more until the following year, when Wolfgang Nordwig of East Germany vaulted 5.45 m. A succession of injuries ended Pennel's vaulting career.

Pennell, Joseph (b. July 4, 1857, Philadelphia—d. April 23, 1926, Brooklyn, N.Y., U.S.), American etcher, lithographer, and writer who was one of the major book illustrators of his time.

Pennell, after attending the Pennsylvania Academy of the Fine Arts, went to Europe



"Things that Tower—Coal Collieries," drypoint by Joseph Pennell; in the Metropolitan Museum of Art, New York City
By courtesy of the Metropolitan Museum of Art, New York, gift of David Keppel, 1917

in 1884 and made his home in London. He produced numerous books (many of them in collaboration with his wife, Elizabeth Robins Pennell), but his chief distinction is as an original etcher and lithographer and as an illustrator. During his lifetime Pennell produced more than 900 etchings and mezzotints and more than 600 lithographs, on architectural and landscape subjects ranging from the Panama Canal and Yosemite National Park to the factories of England and the temples of Greece. His publications include several books on drawing and printmaking, and his famous biography of his friend J.M. Whistler, written with Mrs. Pennell (1908). Pennell moved back to the United States during World War I.

Penner River, also called NORTHERN PENNER RIVER, river rising on the Deccan Plateau 7 miles (11 km) west-southwest of Chik Ballāpur, Karnātaka (formerly Mysore) state, southern India. It flows north into Andhra Pradesh state and turns east-southeast toward the Coromandel Coast, emptying into the Bay of Bengal near Nellore, about 350 miles (560 km) from its source. The river is seasonal, becoming a torrent after the rains and a thin stream during dry periods.

Penney, J(ames) C(ash) (b. Sept. 16, 1875, Hamilton, Mo., U.S.—d. Feb. 12, 1971, New York City), merchant who established one of the largest chains of department stores in the United States.

Penney's first job was clerking in a general store for a salary of $2.27 per month. For medical reasons he moved to Colorado in 1897 and was soon hired by local dry-goods merchants Guy Johnson and T.M. Callahan. The company opened another store in Kemmerer, Wyo., in 1902, and young Penney became a one-third partner for an investment of $500 and a promissory note for $1,500. Five years later Penney bought out his partners' shares and launched the beginning of the J.C. Penney Co.

As each new store opened, Penney offered a profit-sharing plan to its manager. Even in 1927, when the company ceased operating as a partnership and sold its stock publicly, managers were given stock in the company, and eventually all employees were included in profit-sharing plans.

Offering a wide variety of relatively inexpensive general merchandise, J.C. Penney stores appeared in every state in the United States. Before his death in 1971 at the age of 95, Penney saw his company grow from a frontier-town dry-goods store to the second largest nonfood merchandiser in the country, behind Sears, Roebuck and Co. Annual sales had reached $4,000,000,000 produced by 1,660 different stores.

Penney (of East Hundred), William (George) Penney, Baron (b. June 24, 1909, Gibraltar), English nuclear physicist who led Britain's development of the atomic bomb.

Penney studied physics at the Imperial College of Science and Technology of the University of London (B.S. 1929, Ph.D. 1931) and at the University of Cambridge (Ph.D. 1935). He taught at the Imperial College from 1936 to 1945. Penney was engaged in research for the Ministry of Home Security and the Admiralty during World War II and was principal scientific officer of the department of scientific and industrial research in 1944–45 at the Los Alamos Scientific Laboratory, New Mexico, where he helped develop the American atomic bomb. In 1946 he was appointed chief superintendent of armaments research for the British Ministry of Supply, and in this capacity he supervised Britain's development of its own atomic bomb. He directed the successful first test of that weapon in 1952. He was knighted that same year. Penney was director of atomic-weapons research and development at Aldermaston, Berkshire, from 1953 to 1959, and he served as chairman of the U.K. Atomic Energy Authority from 1964 until 1967. In 1967 he was created a life peer.

Penney Company, in full J.C. PENNEY COMPANY, INC., U.S. retail company founded in 1902 by James Cash Penney (1875–1971) and today engaged in marketing apparel, home and automotive products, drugstore merchandise, and insurance. The firm serves consumers principally through stores, including catalog operations, in the United States and Puerto Rico. The company was called J.C. Penney Stores Company from 1913 to 1924, when it was reincorporated as J.C. Penney Co. Its present name was adopted in 1968. It is headquartered in Dallas, Texas.

On April 14, 1902, founder Penney and two partners opened the Golden Rule dry goods store in the small town of Kemmerer, Wyo., in a coal-mining and sheep-raising area. In the following two years they opened stores in two other Wyoming frontier towns. In 1907 Penney bought out his original partners and took on new ones, beginning with Earl Corder Sams (president of the company, 1914–46). By the time the firm was incorporated on Jan. 17, 1913, as the J.C. Penney Stores, there were 34 stores in the American West. In the following year the company's headquarters were moved to New York City. By 1929 J.C. Penney had become a public corporation listed on the New York Stock Exchange and had increased its number of stores to 1,392.

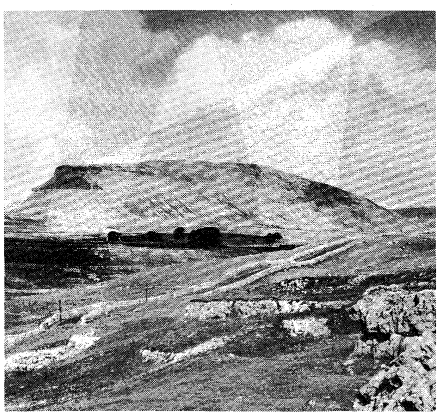
Penney retired in 1946, taking the title of honorary chairman, but until 1958 his conservative policies remained influential. (For many years any employee known to use tobacco or liquor, even privately, was discharged.) In 1958 the firm's traditional policy of strict cash-and-carry gave way to credit selling, and the emphasis on apparel and notions was broadened to include a more complete range of hard and soft goods and more fashionable merchandise. In 1962 the firm entered the catalog field, the first *Penney Catalog* being issued the following year. In 1966 it acquired two insurance companies. Overseas operations began in 1968–69, when it acquired Sarma, SA, a Belgian retail chain; and in 1971 it inaugurated stores in Italy under the name J.C. Penney, SpA. In 1988 the firm relocated its headquarters from New York City to Dallas.

Pennine Alps, Italian ALPI PENNINE, French ALPES PENNINES, segment of the Central Alps along the Italian-Swiss border, bounded by the Great St. Bernard Pass and the Mont Blanc group (southwest), by the Upper Rhône

The village of Courmayeur in the Pennine Alps, Italy
J. Alex Langley—DPI

Valley (north), by Simplon Pass and the Lepontine Alps (*qq.v.;* northeast), and by the Dora Baltea River valley (south). The highest point is Dufour Peak (*q.v.;* 15,203 feet [4,634 m]) in the Monte Rosa group; other important peaks include the Matterhorn and the Weisshorn. Most of the glaciers lie on the north slopes, including the well-known Gorner Glacier near Zermatt, Switz. Mountain climbing has long been the main activity of the region. The Swiss portion of the range is sometimes called the Walliser Alpen (German) or Alpes du Valais (French).

Pennines, major upland mass forming a relief "backbone," or "spine," in the north of England, extending southward from Northum-



Pen-y-Ghent in the northern section of the Pennines
Kenneth Scowen, F.I.I.P., F.R.P.S.

berland into Derbyshire. The uplands have a short, steep western slope and dip gently eastward. They are surrounded on the east, west, and south by the Vale of York, the Lancashire and Cheshire plains, and the valley of the River Trent, respectively. On the north, the Tyne Gap and Eden Valley separate the Pennines from the Cheviots and the Lake District mountains.

The Pennine system is often wrongly called a chain, but it is hardly even a range. Its hills are broken up into numerous short ranges by valleys (often called dales) cut back into them in every direction. The Pennines, in fact, form a north and south watershed that determines the course of all the larger rivers in northern England. The Pennines are divided into two main sections by a gap formed by the Rivers Aire (flowing east) and Ribble (flowing west). The northern section of the Pennines is broader and generally higher than the southern. The highest points in the northern section are Cross Fell (2,930 feet [893 m]), Whernside (2,419 feet [737 m]), Ingleborough (2,373 feet [723 m]), and Pen-y-Ghent (2,273 feet [693 m]). In the southern section, heights of more than 2,000 feet (600 m) are rare, apart from Kinder Scout (2,088 feet [636 m]), part of the Peak District of Derbyshire.

The geological structure of the Pennines consists of carboniferous limestone and Millstone Grit with some local shales. On the drier areas, heather moor predominates, while the wet, peaty areas are covered mostly with cotton grass. The summits of the hills are rounded or nearly flat, but geological structures and glacial action have helped to produce fine scenery in the dales. Water action has developed remarkable underground caverns and watercourses in the limestone of the Pennines. Among these caverns and chasms are Ingleborough Cave near Clapham, Gaping Gill (more than 350 feet [107 m] deep), and Rowten Pot (365 feet [111 m]). The stream draining Malham Tarn (brook) disappears below ground and reappears at the foot of the cliffs at Malham Cove. A notable underground watercourse in Derbyshire is the River Wye, which disappears into Plunge Hole and then traverses Poole's Hole, near Buxton. There are few lakes in the Pennines, but reservoirs in Millstone Grit areas supply the manufacturing regions of West Yorkshire and Lancashire with water.

The economy of the Pennines is based mainly on sheep farming and the quarrying of limestone. The valleys contain numerous small market towns, among them Hawes, Muker, and Grassington. Tourism has become an important element in the economy, helped by the designation of the Peak District, Yorkshire Dales, and Northumberland national parks. The Pennine Way, a footpath running along the hills of the Pennines from end to end for 250 miles (400 km), was opened in 1965.

There are numerous prehistoric remains, such as the great circle of stones at Arbor Low Hill. Hadrian's Wall, an ancient Roman defensive line against the peoples of what was, in large part, to become Scotland, extends east-west along the northern edge of the Pennines.

Pennington (England): *see* Lymington and Pennington.

Pennisetum, genus of the grass family (Poaceae), containing about 80 species of annual and perennial plants, native to tropical and subtropical areas. Kikuyu grass (*P. clandestinum*), a perennial sod-forming species, is

Feathertop (*Pennisetum villosum*)
Hartmut Noeller—Peter Arnold

grown for pasturage in Central America. Several varieties of feathertop (*P. villosum*) and fountaintop, or fountain grass (*P. setaceum,* formerly *P. ruppelii*), both native to Ethiopia, are cultivated in North America as ornamentals for their arching form and feathery, coloured flower clusters.

Pearl millet (*P. glaucum*), an annual species, which bears a cattaillike flower cluster, is cultivated in tropical areas for its edible grain. Napier grass, or elephant grass (*P. purpureum*), a tall African perennial, is cultivated for forage in Central American pastures.

Pennsylvania, officially COMMONWEALTH OF PENNSYLVANIA, constituent state of the United States of America, one of the Middle Atlantic states, located in the eastern United States. The state is bounded on the north by Lake Erie and the state of New York, on the east by New York and New Jersey, on the south by Delaware, Maryland, and West Virginia, and on the west by the Panhandle of West Virginia and by Ohio. The state capital is Harrisburg.

A brief treatment of Pennsylvania follows. For full treatment, *see* MACROPAEDIA: United States of America: *Pennsylvania.*

Four major Indian groups occupied Pennsylvania at the time of European arrival: the Delaware, or Lenni Lenape; the Susquehanna; the Shawnee; and various segments of the Iroquois League. Swedes (1643), Dutch (1647), and others were the first European settlers. The English seized control of the region in 1664, and in 1681 King Charles II of England signed a charter giving the region to William Penn. Under Penn's guidance a Quaker colony was established in 1682, based on government by popular will and religious tolerance.

In the century that followed, the Indians increasingly resisted the expansion of European settlements. Much of the fighting during the French and Indian War (1754–63) took place in Pennsylvania.

By the eve of the U.S. War of Independence, Pennsylvania had become a keystone state geographically and a centre of military, economic, and political activity. The first (1774) and second (1775–76) Continental Congresses met in Philadelphia, the Declaration of Independence was signed there, and the city temporarily became the capital of the confederation (1783–89) and of the fledgling United States.

When the American Civil War broke out in 1861, Pennsylvania once again became a centre of military activity, and at Gettysburg the Union Army won one of the most decisive victories of the war. The end of the war brought a period of great economic, industrial, and population growth, consolidating Pennsylvania's position as a major commercial power.

The Allegheny Front (escarpment) and Allegheny Mountains form a northeast-to-southwest diagonal across the centre of the state, while to the north and west a rugged plateau region falls almost at the lakefront into the Lake Erie Lowland. In the southeast are the fertile Coastal Plains around Philadelphia and the Piedmont, one of the state's most productive agricultural regions. The eastern part of the state is drained by the Delaware River and its tributaries and the western part is drained by the Ohio River system. The Susquehanna River, wide, shallow, and meandering, drains the largest part of the state.

Pennsylvania has a continental climate that is characterized by wide fluctuations in seasonal temperatures, with prevailing winds from the west. Annual rainfall averages some 39 inches (991 mm), and average temperatures in the north range from about 69° F (21° C) in July to about 25° F (−4° C) in January. In more southerly parts of the state, averages are several degrees higher.

The major ethnic groups constituting the population are the English, Germans, Scots-

Irish, French, Welsh, Cornish, and Irish, who settled in colonial times, and Italians and Slavic peoples, who immigrated primarily in the 20th century. Pennsylvania is also noted for its large religious populations of Quakers, Amish, Mennonites, Moravians, Schwenckfelders, and Dunkards. The state population has been growing very slowly, well below the national average. In this largely urban state, the greatest population density is found in Philadelphia, Delaware, and Allegheny counties, the latter including Pittsburgh.

Pennsylvania is one of the nation's most prosperous states, with both its past and present prosperity based on fertile farmland, commercial forestland, seemingly inexhaustible supplies of coal, many navigable waterways, and an economically strategic location. Pennsylvania still has a sizable farm population, and about one-third of the land is under cultivation. The major agricultural products are dairy and poultry products, meat animals, mushrooms, corn (maize), hay, apples, and grapes. It is one of the largest producers of coal in the nation, and it has small deposits of natural gas, iron ore, limestone, silver and gold, copper, cobalt, zinc, and salt. Pennsylvania's foremost industry was steel, but food processing, chemicals, machinery, and electrical and electronic equipment surpass it in terms of value added by manufacture. The state continues to produce much of the nation's specialty steel. The state's manufacturing industries are well diversified, and Pennsylvania ranks high in the nation in manufacturing employment.

The state's three major ports, Philadelphia, Pittsburgh, and Erie, are supplemented by others along the Delaware, the Susquehanna, and the channelized Inland Waterway System. Pennsylvania's highway system is one of the largest in the nation. The railway system links the state's major industrial centres and provides an important economic link for the Middle Atlantic region. The most important of the state's international airports are at Philadelphia and Pittsburgh.

Pennsylvania has an active cultural life, centred in Philadelphia and Pittsburgh. The Philadelphia Orchestra and the Pittsburgh Symphony Orchestra are two of the nation's major orchestras. The Curtis Institute of Music, founded in 1924, is one of the world's leading conservatories. The religious music of the Moravians is displayed at the Bach Choir's Bach Festival in Bethlehem. A great diversity of museums includes the Philadelphia Museum of Art. There is an active theatrical community, and a number of prominent 20th-century writers originated in Pennsylvania. Educational opportunities are plentiful. Philadelphia is a major centre of medical education, and Pittsburgh is a centre of scientific study. Area 45,308 square miles (117,348 square km). Pop. (1990 est.) 11,827,000.

Pennsylvania, University of, private university located in Philadelphia, founded in 1740 as a charity school. Largely through the efforts of Benjamin Franklin and other leading Philadelphians, it became an academy in 1753, with Franklin as president of the first board of trustees. Two years later it was chartered as the College and Academy of Philadelphia. With the foundation in 1765 of the first medical school in North America, the institution became in fact a university, but it was not so called until 1779, when for a time it received state support. Since 1791 it has been a privately endowed and controlled institution, although it continues to receive state aid.

University institutes include the Wistar Institute of Anatomy and Biology (the first anatomical institute in America devoted entirely to research, 1892) and the Henry Phipps Institute of Genetics and Community Diseases (1910). The University Museum (archaeology and ethnology) is a teaching and research organization.

Pennsylvania Academy of the Fine Arts, in Philadelphia, oldest art academy and museum in the United States, founded 1805. Specializing in American painting and sculpture of the 18th to the 20th century, the Academy's Art Museum was built between 1872 and 1876 according to designs by the architect Frank Furness (1839–1912). The building's architectural style is high Victorian. For its centennial year (1976), which coincided with the U.S. Bicentennial, the museum underwent a complete renovation.

The museum's collections of 19th- and 20th-century American landscape and genre paintings include pieces by such artists as Mary Cassatt, Thomas Eakins, Charles Willson Peale, and Andrew Wyeth. A 9,000-volume library of art history focuses primarily on American painting and sculpture.

Pennsylvania Avenue, major thoroughfare of Washington, D.C. It runs for 7 miles (11 km) in a northwesterly direction from the District of Columbia-Maryland line over the Anacostia River (John Philip Sousa Bridge) and through Washington's well-known central section lined with government buildings between the Capitol and the White House. It continues past George Washington University to end in Georgetown just west of Rock Creek. Pennsylvania Avenue is the traditional route of presidential inaugural and other major parades.

Pennsylvania Dutch (from German *Deutsch,* or *Deitsch,* "German"), 17th- and 18th-century German settlers in Pennsylvania and their descendants. They now live largely in Lehigh, Berks, Lebanon, Lancaster, and York counties. Some groups still speak a German dialect, known as Pennsylvania Dutch or Pennsylvania German (*Pennsylfawnish Deitsch*), and much larger numbers retain such elements of their traditional culture as a special cookery (*e.g.,* shoofly pie, a pie of molasses and dough crumbs) and distinctive decorative motifs, including geometric hex signs painted on barns and floral patterns stenciled on furniture and housewares. Most Pennsylvania Dutch are thoroughly assimilated and live lives scarcely different from the life of other Americans. Some groups, notably the Amish, however, wear plain, old-style garb, drive horse-drawn buggies, and live according to relatively strict religious principles.

The liberal and tolerant principles of William Penn's government in colonial Pennsylvania attracted a large flow of immigrants from the Rhine country of Germany. The immigration began with the Mennonite Francis Daniel Pastorius, who came to Pennsylvania with some German Quakers in 1683 and founded Germantown, the pioneer German settlement. The early German settlers were for the most part members of the smaller sects who came and settled as groups—Mennonites, Amish, Dunkers, or German Baptists, Schwenckfelders, and Moravians. After 1727 the immigrants were mostly members of the larger Lutheran and Reformed churches. Their farming skills made their region of settlement a rich agricultural area. By the time of the American Revolution they numbered about 100,000, more than a third of Pennsylvania's population.

Pennsylvania Railroad Company, byname PENNSY, largest of the trunkline railroads that connected the East Coast of the United States with the interior. It was chartered in 1846 by the Pennsylvania legislature to build a line between Harrisburg and Pittsburgh. Its first passenger train ran in 1848 between Philadelphia and Pittsburgh.

Through buying the Pittsburgh, Fort Wayne and Chicago Railway, the railroad reached Chicago in 1856. After the American Civil War the railroad expanded to St. Louis, Mo., and Cincinnati, Ohio, in the west and to New York City, Washington, D.C., and Norfolk, Va., in the south and east, ultimately becoming a 10,000-mile (16,000-kilometre) system. In 1910, with the completion of a tunnel under the Hudson River, it became the only railroad to enter New York City from the south. It also acquired control of the Long Island Railroad Company.

Throughout most of its history the Pennsylvania was a prosperous railroad, losing money for the first time in 1946. It suffered from the disadvantage that its route to Chicago had to cross the Appalachians, with grades of greater than 0.5 percent. Its chief competitor, the New York Central, had a water-level route to Chicago. In February 1968 the two railroads, together with the New York, New Haven and Hartford, merged to form the Penn Central Transportation Company. The new corporation also had a number of subsidiaries in real estate, oil refining, and a variety of other industries.

Penn Central encountered serious management and financial difficulties, however, and was forced into bankruptcy in June 1970. Its passenger services were taken over by the federally established National Railway Passenger Corporation (Amtrak) in 1971. The Penn Central continued to lose money, and, when efforts at reorganization failed, the assets of the railroad were acquired by Consolidated Rail Corporation (Conrail) in April 1976. Operation of the New York-Washington route was later transferred to Amtrak. The Penn Central Corporation continued in business as a diversified corporation not connected with the railroad industry.

Pennsylvania system, penal method based on the principle that solitary confinement fosters penitence and encourages reformation. The idea was advocated by the Philadelphia Society for Alleviating the Miseries of Public Prisons, whose most active members were Quakers. In 1829 the Eastern State Penitentiary, on Cherry Hill in Philadelphia, applied this so-called separate philosophy. Prisoners were kept in solitary confinement in cells 16 feet high, nearly 12 feet long, and 7.5 feet wide (4.9 by 3.7 by 2.3 m). An exercise yard, completely enclosed to prevent contact among prisoners, was attached to each cell. Prisoners saw no one except institution officers and an occasional visitor. Solitary penitence, however, was soon modified to include the performance of work such as shoemaking or weaving. The Pennsylvania system spread until it predominated in European prisons. Critics in the United States argued that it was too costly and had deleterious effects on the minds of the prisoners. The Pennsylvania system was superseded in the United States by the Auburn system.

Pennsylvanian period, in North America, interval of geologic time roughly equivalent to what is internationally designated the Late Carboniferous epoch (320 to 286 million years ago). Because the rocks that originated during this span of time are widespread in the state of Pennsylvania, U.S., some American geologists favour the term over Late Carboniferous, which was first adopted in Europe. *See* Carboniferous period.

Penny Post, private postal service created by the London merchant William Dockwra in 1680. All letters and packets up to one pound in weight were delivered for one penny (1 *d*). The packets were also insured up to £10. Dockwra's system consisted of several hundred receiving offices from which an hourly collection was made; the letters were taken to six central sorting offices. There were 4 deliveries per day in the greater part of London and 6 or 8 in the business centres.

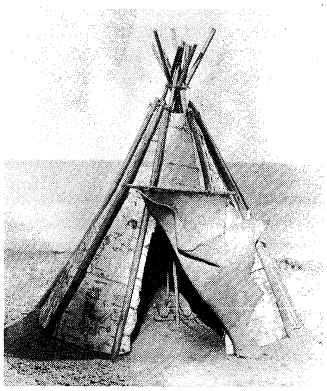
There was also a daily delivery, for which an additional penny was charged, to places 10 to 15 miles (16 to 24 kilometres) outside of London. In 1683 the Penny Post was taken over by the government-operated General Post Office, and Dockwra was forced to pay damages for having encroached on the crown's monopoly of the mail service which had been effected by Charles I in 1635.

pennycress, any plant of the genus *Thlaspi*, of the mustard family (Brassicaceae), named and sometimes grown for its round seedpods.

Pennycress (*Thlaspi rotundifolium*)
A.J. Huxley—EB Inc.

Most of the 60 species are Eurasian, but a few are native to North and South America, mostly in mountain areas. Common pennycress, or field pennycress (*T. arvense*), has spikelike clusters of penny-shaped, notched pods topped by small, white, four-petalled flowers.

Penobscot, Algonkian-speaking Indians who lived on both sides of the Penobscot Bay and throughout the Penobscot River Basin in what is now Maine, U.S. They were members of the Abnaki (*q.v.*) confederacy. Penobscot subsistence was based on hunting, fishing, and collecting, with seasonal movements following



Tepee-shaped wigwam of the Penobscot Indians of Maine
By courtesy of the American Museum of Natural History, New York

food resources. In winter small family groups lived in hunting camps within separate family territories, rights to which were inherited through the male line; larger camps and villages were inhabited during the summer. The office of tribal chief embodied little power, the individual acting generally as a tribal representative in ceremonies or in dealings with outsiders and sometimes adjudicating disputes.

Europeans first encountered the Penobscot early in the 16th century; a French mission was established among them in 1688. The Penobscot assisted the French against the English in all the wars on the New England frontier until 1749, when they made peace with the English. As a result they did not remove to Canada with the other groups of the Abnaki confederacy, and they remain in their old territory to the present. The Penobscot and the Passamaquoddy (*q.v.*) send to the Maine state legislature a representative who has no seat or vote and is permitted to speak only on tribal affairs.

Penobscot River, river in Maine, U.S., formed by several headstreams draining numerous lakes that were initially created by melting glaciers; it is the state's longest river, about 350 mi (560 km) in length. Its western and eastern branches join at Medway and run in a southeasterly direction to empty into the Atlantic via Penobscot Bay near Bucksport. The river's major tributary is the Mattawamkeag; Bangor, 23 mi from the ocean, is the head of navigation. Once an important source of salmon, the river with its hydropower facilities has become economically important to the lumbering and pulp and paper industries. The bay extends 35 mi inland and is 27 mi wide; it includes many islands and sheltered harbours, and tourism is significant.

Navigated by English voyagers in 1603, and in 1604 by Samuel de Champlain, the river was named after the Penobscot Indians. Its valley became a bloody battleground for the French and British between 1673 and 1759 and between the British and Americans until 1815.

penology, also called PENAL SCIENCE, that part or division of criminology which concerns itself with the philosophy and practice of society in its efforts to repress criminal activities. As the term signifies (from Latin *poena*, "pain," or "suffering"), penology has stood in the past and, for the most part, still stands for the policy of inflicting punishment on the offender as a consequence of his wrongdoing; but it may reasonably be extended to cover other policies, not punitive in character, such as probation, medical treatment, and education, aimed at the cure or rehabilitation of the offender; and this is, in fact, the accepted present sense of the term.

The principal aims of penal science are: to bring to light the ethical bases of punishment, along with the motives and purposes of society in inflicting it; to make a comparative study of penal laws and procedures through history and between nations; and, finally, to evaluate the social consequences of the policies in force at a given time. Thus conceived, penology represents a grouping of studies, some of which, dealing with the aims and the moral or social justifications of punishment, date from a remote past, while others, having to do with the wider social implications of the system, have scarcely yet made a beginning.

Modern penology dates from the publication of Cesare Beccaria's pamphlet on *Crimes and Punishments* in 1764. This represented a school of doctrine, born of the new humanitarian impulse of the 18th century, with which Jean-Jacques Rousseau, Voltaire, and Montesquieu in France and Jeremy Bentham in England were associated. This, which came afterwards to be known as the classical school, assumed every criminal act to be a deliberate choice determined by a calculation of the prospective pleasures and pains of the act contemplated. All that was needed to overcome the criminal purpose was to provide for each and every crime a penalty adequate to overbalance its assumed advantages. Excessive penalties, such as death, were unnecessary and therefore unjust.

The classical school was followed, a generation later, by the neoclassical school of the revolutionary period in France, which modified Beccaria's rigorous doctrine by insisting on the recognition of varying degrees of moral, and therefore of legal, responsibility, as in the case of children and the insane, as well as of mitigating circumstances in general. The doctrine of the "individualization of punishment"—that is to say, of the punishment of the individual rather than of the crime committed by him, which is of commanding importance in present day penology—is only a development of this fundamental principle of the neoclassical school.

This normal historical development of penology was interrupted during the last quarter of the 19th century by the widespread acceptance of the theory of crime and its treatment promulgated by Cesare Lombroso and his disciples. This, at first known as the Italian, or continental, school of criminology, was later named the positive school, so-called because it pursued the positive methods of modern science. Its fundamental doctrine was that the criminal was doomed by his inherited traits to a criminal career and was therefore a wholly irresponsible actor. Society must, of course, protect itself against him, but to punish him as if he were a free moral agent was as irrational as it was unethical.

Although the enthusiasm for the doctrines of the positive school waned and the alleged facts on which they were based were largely discredited, it nevertheless left a valuable legacy of influence. To it must be given much of the credit for the present active tendency to make the mental study of the criminal an essential part of his diagnosis, a fact which has given the psychologist and, particularly, the psychiatrist a leading place in the development of modern penological theory. From studies such as these, criminologists discovered that there was no single formula that accounted for all violators of the penal code, while the policy of the individualization of punishment took on the form of individualization of treatment.

Indeed, the emphasis turned to research—research into the factors, whether individual or social, which determine criminal activities and research into the resources of the community for making such disposition of the offender as will effectually protect the former without destroying the latter.

Penrith, city, east central New South Wales, Australia, on the Nepean River, a section of the Hawkesbury River. Founded in 1815, it was known as Evan and Castlereagh before being renamed after Penrith in Cumberland, England. It was declared a municipality in 1871 and a city in 1959. A suburb of Sydney (30 mi [48 km] east), to which it is linked by rail and the Great Western Highway, Penrith is also a resort and agricultural centre (dairying, fruits, poultry, vegetables, and beef). Its industries include the manufacture of aluminum foil, concrete and building materials, plastics, textiles, pharmaceutical products, and engineering and electrical products. Pop. (1981) 108,720.

Penrith, locality, Eden district, county of Cumbria, England. It is situated on a main route to Scotland, at the foot of Penrith Beacon (937 ft [286 m]) overlooking the mountains of the scenic region known as the Lake District.

Penrith Castle was built in the 14th century as a defense against the Scottish raids and was dismantled during the mid-17th-century English Civil War. The parish Church of St. Andrew, of Norman foundation, has a 13th-century tower, but the body of the building is 18th century.

The town, on the edge of the Lake District National Park, is now a tourist and agricultural centre, with a weekly livestock market. Places of interest include the Giant's Grave (ancient hogsback stones and cross shafts) in the churchyard and the Gloucester Arms (associated with Richard III of England [reigned 1483–85]). The ruins of Brougham Castle, with a 12th-century keep, stand on the site of a Roman fort, $1\frac{1}{2}$ mi (2.5 km) to the southeast. Pop. (1981 prelim.) 12,205.

Penrose, Boies (b. Nov. 1, 1860, Philadelphia—d. Dec. 31, 1921, Washington, D.C.), U.S. legislator and longtime party boss of Pennsylvania. He served as U.S. senator from Pennsylvania from 1897 to 1921.

Penrose was admitted to the Pennsylvania bar in 1883, began to practice law in Philadelphia, and soon became interested in government and politics. He was elected as a Republican to the state legislature in 1884 and to the state senate in 1887. In that year he also published *The City Government of Philadelphia,* a study prepared in collaboration with law partner Edward P. Allinson, which advocated certain municipal reforms. The politics of reform did not long hold his interest, however, as he became associated with state party boss Matthew S. Quay. In 1895 Penrose ran unsuccessfully for the Republican nomination for mayor of Philadelphia. Two years later he was elected to the U.S. Senate and was successively reelected until his death.

Succeeding Quay as Republican boss of Pennsylvania in 1904, Penrose thereafter maintained a firm grip on state affairs that was broken only temporarily in 1912, when Progressives, led by former Pres. Theodore Roosevelt on the national level, succeeded in challenging his authority. In a dispute over campaign funds, Roosevelt and others stepped up their attacks, characterizing Penrose as the archetypal political boss whose corrupting influence stood in the way of clean, honest government. Although never charged with bribery or otherwise profiting financially from his role in politics (he was independently wealthy), Penrose was undisputedly the chief power broker in Pennsylvania in the first decades of the century and used that power without reservation. In the Senate he rose to the post of chairman of the Finance Committee in 1911. He opposed virtually all measures the Progressives brought forth during this period, including prohibition and women's suffrage.

Penrose, Roger (b. Aug. 8, 1931, Colchester, Essex, Eng.), British mathematician and relativist who in the 1960s calculated many of the basic features of black holes.

In 1969, with Stephen Hawking, Penrose proved that all matter within a black hole collapses to a singularity, a geometrical point in space where mass is compressed to infinite density and zero volume. Penrose also developed a method of mapping the regions of space–time surrounding a black hole. (Space–time is a four-dimensional continuum comprising three dimensions of space and one of time.) Such a map, called a Penrose diagram, allows one to visualize the effects of gravitation upon an entity approaching a black hole.

In the early years of his career Penrose held temporary posts at a number of universities in both England and America. From 1964 to 1973 he served as reader and eventually professor of applied mathematics at Birbeck College, London. From 1973 he held the Rouse-Ball Chair of mathematics at Oxford University. Penrose received the Adams Prize in 1966 and the Dannie Heineman Prize for Physics in 1971. He was elected to the Royal Society in 1972, and he shared the Royal Astronomical Society's Eddington Medal with Hawking in 1975.

Penryn, locality and English Channel port, Kerrier district, county of Cornwall, England. It lies at the head of the River Penryn's estuary. The town owed its development to the bishops of Exeter, who granted the first charter (1265). James I (reigned 1603–25) granted and renewed the charter of incorporation. Penryn is the principal English port for the shipment of granite, which is extensively quarried in the district. Pop. (1981 prelim.) 5,090.

Pensacola, city, seat (1821) of Escambia County, extreme northwestern Florida, U.S., on Pensacola Bay. A Spanish settlement was made on the bay coast in 1559 but was abandoned in 1661. The Spaniards formally took possession in 1698 and built Ft. San Carlos, but this was ravaged during the French–Spanish colonial fighting of 1719–20. After the British gained control following the Seven Years' War, Pensacola (a name derived from Pansfalaya, a local Indian tribe) became the capital of West Florida. During the Revolution it became a haven for Tories but in 1781 was taken by a Spanish force from New Orleans. In 1818 Gen. Andrew Jackson captured the city, accusing the Spanish of encouraging Indian raids against the U.S. After Florida was ceded to the U.S. in 1821, Pensacola acquired a federal navy yard. The city was seized by Confederates at the outbreak of the Civil War, but Ft. Pickens on Santa Rosa Island offshore remained in Federal hands; in 1862 the Confederates evacuated the city.

Lumbering and commercial fishing increased after the war, and industry developed. The navy yard became a naval air station in 1913, and the large aviation training school helped the city's economy. Pensacola's landlocked deepwater port, although important, suffers because of its proximity to Mobile, Ala. (61 mi [98 km] northwest). Tourism and chemical and wood industries are significant economic factors. Pensacola Junior College opened there in 1948, and the University of West Florida opened in 1967. The Fiesta of Five Flags, reflecting the city's checkered history, is an annual event in June. Gulf Islands National Seashore is to the south. Inc. 1822. Pop. (1980) city, 57,619; (1982 est.) metropolitan area (SMSA), 308,500.

pension, series of periodic money payments to a person who retires from employment because of age, disability, or the completion of an agreed span of service. The payments usually continue for the rest of the natural life of the recipient, and sometimes to a widow or other survivor. Military pensions have existed for many centuries; private pension plans originated in Europe during the 19th century.

Eligibility for and amounts of benefits are based on a variety of factors, including length of employment, age, earnings, and, in some cases, past contributions. Benefits are sometimes also arranged to complement payments from public social security programs. Although public and private pension plans have undergone parallel development in the United States and Britain, in other countries—*e.g.,* Italy and Sweden—the existence of social security programs paying generous retirement benefits has to some extent precluded significant development of private pension plans. In other cases, though, as in Germany, private programs have been widely adopted in spite of large social security benefits.

Pensions may be funded by making payments into a pension trust fund (or a pension foundation in some European countries) or by the purchase of annuities from insurance companies. In plans known as multi-employer plans, various employers contribute to one central trust fund administered by a joint board of trustees. Such plans are particularly common in The Netherlands and France and in industries in the United States.

The United States has recognized that many of its workers are ineligible for pension plans and has taken steps to extend eligibility to these workers. In 1962 U.S. Representative Eugene Keogh was instrumental in the passage of a bill that became the Self-Employed Individuals Tax Retirement Act. This legislation allowed self-employed individuals and their employees to be covered by qualified pension plans administered by the self-employed individual, thus extending to them some of the tax benefits that had been available to employees of corporations. Few people utilized the original Keogh Plan, causing Congress to remove certain restrictions on the Plan in 1968. Further liberalization of the Plan came about through the Employee Retirement Income Security Act of 1974, which created another form of tax-supported retirement savings plan, the Individual Retirement Account, or IRA.

IRA's are sponsored by banks, brokerage houses, and other financial institutions and are designed to allow participation by individuals not otherwise actively participating in a tax-supported retirement plan. In certain circumstances, a person eligible for IRA participation may also establish an IRA for an unemployed spouse (spousal IRA). Special plans known as rollover IRA's can be set up to receive pension funds even when an individual's employment with the employer sponsoring a pension plan is severed. These funds, if reinvested in the individual's rollover IRA within a specified period of time, are allowed to continue to increase untaxed until their distribution at or after the individual's retirement.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

---

pensionary, Dutch PENSIONARIS, powerful political office in the Dutch Republic (United Provinces; 1579–1795). Pensionaries, originally the secretaries and legal advisers of the town corporations, were first appointed in the 15th century. They were members of the town delegations in the provincial States (assemblies). The pensionaries of the provinces of Holland and Zeeland were particularly influential and, by the end of the 16th century, virtually dominated certain city governments.

In Holland the nobility had its own pensionary who served as chairman of the States. This land advocate, as he was then known, held a position of national power in the period 1586–1618, when Johan van Oldenbarnevelt, a former pensionary of Rotterdam, dominated the domestic and foreign policy of the republic. His power came not from his office but from the fact that he was the leader of the ruling oligarchy of Holland, the preponderant province. With the fall of Oldenbarnevelt in 1618, the office, renamed councillor pensionary (*raadpensionaris*) in 1619, declined as that of the stadholder increased in power. In 1653, during the first stadholderless period (1650–72), the office again became ascendant with the appointment of Johan de Witt, the pensionary of Dordricht from 1650. No succeeding grand pensionary equalled his power and prestige.

The office of councillor pensionary (including the less important equivalent in Zeeland) was abolished with the fall of the republic in 1795. The title was briefly revived in 1805 but referred to a newly created national office.

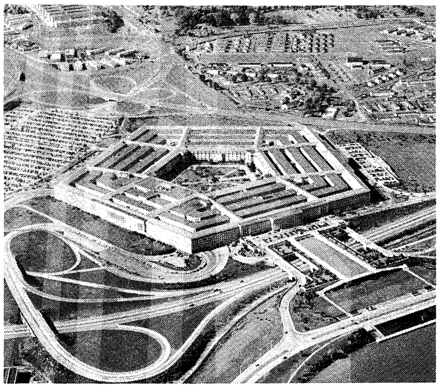
Penstemon, the beard-tongue genus of the figwort family (Scrophulariales; *q.v.*), containing about 250 species of plants native to North America, particularly the western United States. The flowers are usually large and showy, tubular, bilaterally symmetrical, and have four fertile stamens and one sterile stamen (staminode). Many species and varieties are popular in home gardens. The colourful flowers are white, yellow, blue, purple, or scarlet.

Pentaceratops, genus of five-horned, large herbivorous dinosaurs found as fossils in Late Cretaceous rocks of North America and possibly eastern Asia (the Cretaceous period began 144,000,000 years ago and lasted 77,600,000 years); it was a relative of the more familiar *Triceratops.* Especially well known from the Kirtland Shale of New Mexico, *Pentaceratops* had one horn on its snout, one above each eye, and one on each side of the large, bony neck frill. The frill served as an attachment area for powerful muscles that aided in chewing and controlling movements of the head. It also protected vulnerable areas from attack by predators.

The forelimbs of Pentaceratops were shorter than the hind limbs, a circumstance indicating that these horned dinosaurs descended from bipedal dinosaurs and had reverted to a quadrupedal mode of locomotion. The back had a characteristically arched appearance caused by the unequal development of the limbs.

pentaerythritol tetranitrate (explosive): *see* PETN.

Pentagon, large five-sided building in Arlington county, Va., near Washington, D.C., that serves as headquarters of the U.S. Department of Defense, including all three services—Army,



The Pentagon, Arlington County, Va.
Ewing Galloway

Navy, and Air Force. Designed by George Edwin Bergstrom, it was built in 1941–43 to bring under one roof the U.S. War Department offices then housed in widely scattered buildings. On its completion it was the world's largest office building, covering 34 acres (14 hectares; including a 5-acre [2-hectare] central court) and offering 3,700,000 square feet (343,730 square m) of usable floor space for as many as 25,000 persons, military and civilian. Built of structural steel and reinforced concrete with some limestone facing, the structure has five floors, excluding the mezzanine and the basement. The building consists of five concentric pentagons, or "rings," with 10 spokelike corridors connecting the whole. A huge concourse within it provides a shopping centre for Pentagon workers, and beneath this concourse are bus and taxi terminals. Parking areas adjacent to the building can accommodate as many as 10,000 cars, and a heliport for the Pentagon was added in 1956.

Pentagon Papers, papers that contain a history of the U.S. role in Indochina from World War II until May 1968 and that were commissioned in 1967 by U.S. Secretary of Defense Robert S. McNamara. They were turned over (without authorization) to *The New York Times* by Daniel Ellsberg, a senior research associate at the Massachusetts Institute of Technology's Center for International Studies.

The 47-volume history, consisting of approximately 3,000 pages of narrative and 4,000 pages of appended documents, took 18 months to complete. Ellsberg, who worked on the project, had been an ardent early supporter of the U.S. role in Indochina but, by the project's end, had become seriously opposed to U.S. involvement. He felt compelled to reveal the nature of U.S. participation and leaked major portions of the papers to the press.

On June 13, 1971, *The New York Times* began publishing a series of articles based on the study, which was classified as "top secret" by the federal government. After the third daily installment appeared in the *Times,* the U.S. Department of Justice obtained in U.S. District Court a temporary restraining order against further publication of the classified material, contending that further public dissemination of the material would cause "immediate and irreparable harm" to U.S. national-defense interests.

The *Times*—joined by *The Washington Post,* which also was in possession of the documents—fought the order through the courts for the next 15 days, during which time publication of the series was suspended. On June 30, 1971, in what is regarded as one of the most significant prior-restraint cases in history, the U.S. Supreme Court, in a 6–3 decision, freed the newspapers to resume publishing the material. The court held that the government had failed to justify restraint of publication.

The Pentagon Papers revealed that the Harry S. Truman administration gave military aid to France in its colonial war against the communist-led Viet Minh, thus directly involving the United States in Vietnam; that in 1954 President Dwight D. Eisenhower decided to prevent a communist takeover of South Vietnam and to undermine the new communist regime of North Vietnam; that President John F. Kennedy transformed the policy of "limited-risk gamble" that he had inherited into a policy of "broad commitment"; that President Lyndon B. Johnson intensified covert warfare against North Vietnam and began planning to wage overt war in 1964, a full year before the depth of U.S. involvement was publicly revealed; and that Johnson ordered the bombing of North Vietnam in 1965 despite the judgment of the U.S. intelligence community that it would not cause the North Vietnamese to cease their support of the Viet Cong insurgency in South Vietnam.

The release of the Pentagon Papers stirred nationwide and, indeed, international controversy because it occurred after a decade of growing dissent over the legal and moral justification of intensifying U.S. actions in Vietnam. The disclosures and their continued publication despite top-secret classification were embarrassing to the administration of President Richard M. Nixon, who was preparing to seek reelection in 1972. So distressing were these revelations that Nixon authorized unlawful efforts to discredit Ellsberg, efforts that came to light during the investigation of the Watergate Scandal (*q.v.*).

The papers were subsequently published in book form as *The Pentagon Papers* (1971).

pentameter, line of verse containing five metrical feet. In English verse, in which pentameter has been the predominant metre since the 16th century, the preferred foot is the iamb—*i.e.,* an unstressed syllable followed by a stressed one, represented in scansion as ∪ ′.

Geoffrey Chaucer employed iambic pentameter in his *Canterbury Tales* as early as the 14th century, although without the regularity that is found later in the heroic couplets of John Dryden and Alexander Pope. Most English sonnets have been written in iambic pentameter, as in this example:

∪ ′ ∪ ′ ∪ ′ ∪ ′ ∪ ′
So long | as men | can breathe | or eyes | can see,
∪ ′ ∪ ′ ∪ ′ ∪ ′ ∪ ′
So long | lives this | and this | gives life | to thee.
(Shakespeare, Sonnet 18)

Shakespeare also used pentameter in his blank-verse tragedies.

pentarchy, in early Byzantine Christianity, the proposed government of universal Christendom by five patriarchal sees, under the auspices of a single universal empire. Formulated in the legislation of the emperor Justinian I (527–565), especially in his *Novella* 131, the theory received formal ecclesiastical sanction at the Council in Trullo (692), which ranked the five sees as Rome, Constantinople, Alexandria, Antioch, and Jerusalem.

Since the end of the 4th century, the five patriarchates were indeed the most prominent centres of the universal Christian church, enjoying a de facto primacy based on such empirical factors as the economic and political importance of their cities and countries. The church of Constantinople, the "New Rome," for example, occupied second rank because it was the capital of the empire.

According to the views of Roman bishops, however, only apostolic sees, churches actually founded by apostles, were eligible for primacy; this view thus excluded any patriarchal role for Constantinople. In fact, the popes always opposed the idea of pentarchy, gradually developing and affirming a universal ecclesiastical structure centred on Rome as the see of Peter. Byzantine imperial and conciliar legislation practically ignored the Roman view, limiting itself to the token recognition of Rome as the first patriarchal see. The tensions created by the opposing theories contributed to the schism between East and West.

The pentarchy lost its practical significance with the christological disputes of the 5th and 6th centuries, which separated the see of Alexandria from imperial Christendom, and after the Muslim domination of the Orthodox patriarchates of Alexandria, Antioch, and Jerusalem in the 7th century. The patriarch of Constantinople remained the only real primate of Eastern Christianity, and new influential ecclesiastical centres in Bulgaria, Serbia, and Russia, with new and powerful patriarchates, eventually began to compete with Constantinople and overshadow the ancient patriarchates of the East.

pentastomid, any of about 70 species of tiny parasites belonging to the Pentastomida, usually considered a class. Pentastomids are considered to lie between annelids and arthropods in evolutionary development. They range from a few millimetres to 14 cm (about 6 inches) in length and lack respiratory, circulatory, and excretory organs.

Pentastomids live in the respiratory systems of vertebrate hosts. Although they are mostly tropical or subtropical, those with homoiothermic (warm-blooded) hosts may also be found in cold regions. Reptiles are the most common victims of pentastomid infestation. *Porocephalus* is parasitic in snakes and rodents. *Lingulata* species parasitize various mammals, including dogs. A few species are of medical interest because they infest human hosts.

Pentateuch, the first five books of the Old Testament. *See* Torah.

pentathlon, athletic contest entailing five distinct types of competition. In the ancient Greek Olympics, the pentathlon included a race the length of the stadium (about 180 or 200 yards [165 or 183 m]), the long jump, discus throw, javelin throw, and a wrestling match between the two athletes who performed best in the previous four events. This Greek pentathlon was adapted for modern track-and-field competition by setting the sprint distance at 200 m and by substituting a 1,500-metre run for the wrestling match. The event was included in the Olympic Games from 1912 through 1924.

The modern, or military, pentathlon, based on the skills needed by a battlefield courier, was first included in the Olympic Games of 1912, and it has been a team event since 1952. It is not a women's event in the Olympics. The modern pentathlon is a five-day contest involving five events; competition includes a 600-metre equestrian steeplechase on a horse selected by lot, a series of épée fencing matches, pistol shooting at standing silhouette targets, a 300-metre freestyle swim, and a 4,000-metre cross-country run. The modern pentathlon is governed by the Union Internationale du Pentathlon Moderne et Biathlon. Each nation may enter a three-member team. Scoring is on a point basis; the individual and team winners are determined by total scores from the five events. From 1964 to 1980, individual women competed in an Olympic athletics event known as the pentathlon, which included shot put, high jump, 80-metre hurdles, 200-metre dash, and long jump (*see also* heptathlon). *See also* Olympic Games.

pentatonic scale, also called FIVE-NOTE SCALE, or FIVE-TONE SCALE, musical scale containing five different tones. It is thought that the pentatonic scale represents an early stage of musical development, because it is found, in different forms, in most of the world's music. The most widely known form is anhemitonic (without semitones; *e.g.,* c–d–f–g–a–c′), the hemitonic form (with semitones; *e.g.,* c–e–f–g–b–c′) occurring less frequently.

Pentatonic scales may have been used in ancient times to tune the Greek kithara (lyre), and some early Gregorian chant incorporated pentatonic melodies. A variety of pentatonic scales occur in the music of American Indians, black Africa, and Asia (*e.g.,* the Javanese five-tone *slendro*), as well as in many European folk melodies. In Western art music, 20th-century composers such as Claude Debussy have used pentatonicism for special effects.

Pentecost (island, Vanuatu): *see* Pentecôte.

Pentecost (from Greek *pentecostē,* "50th day"), also called WHITSUNDAY, major festival in the Christian church, celebrated on the Sunday that falls on the 50th day after Easter. It commemorates the descent of the Holy Spirit on the disciples, which occurred on the Jewish Pentecost, after the death, Resurrection, and Ascension of Jesus Christ (Acts of the Apostles, chapter 2), and it marks the beginning of the Christian church's mission to the world.

The Jewish feast was primarily a thanksgiving for the firstfruits of the wheat harvest, but the rabbis associated it with remembrance of the Law given by God for the Hebrews to Moses on Mount Sinai. The church's transformation of the Jewish feast to a Christian festival was thus related to the belief that the gift of the Holy Spirit to the followers of Jesus was the firstfruits of a new dispensation that fulfilled and succeeded the old dispensation of the Law.

When the festival was first celebrated in the Christian church is not known, but it was mentioned in a work from the Eastern church, the *Epistola Apostolorum,* in the 2nd century. In the 3rd century it was mentioned by Origen, theologian and head of the catechetical school in Alexandria, and by Tertullian, Christian priest and writer of Carthage.

In the early church, Christians often referred to the entire 50-day period following Easter as Pentecost. Baptism was administered both at the beginning (Easter) and end (the day of Pentecost) of the season. Eventually, Pentecost became a more popular time for baptism than Easter in northern Europe, and in England the feast was commonly called White Sunday (Whitsunday) for the special white garments worn by the newly baptized. In *The First Prayer Book of Edward VI* (1549), the feast was officially called Whitsunday, and this name has continued in the Anglican churches.

Pentecost (Judaism): *see* Shabuoth.

Pentecostal Assemblies of the World, Inc., Protestant denomination organized in the United States in 1916 after many members withdrew from the Assemblies of God during the Jesus Only controversy, a movement that denied the standard Pentecostal belief in the Trinity—Father, Son, and Holy Spirit. Originally an interracial church, it was divided by the splitting off of the whites into the Pentecostal Church, Inc., in 1924. This church merged with the Pentecostal Assemblies of Jesus Christ in 1945 to form the United Pentecostal Church, Inc. The Pentecostal Assemblies of the World, Inc., baptizes in the name of Jesus rather than in the name of the Trinity. In organization it resembles Methodism. Headquarters are in Indianapolis, Ind.

Pentecostal Church of God of America, Inc., Protestant denomination organized in Chicago in 1919 as the Pentecostal Assemblies of the U.S.A. by a group of ministers who had earlier refused affiliation in the General Council of the Assemblies of God (1914); the present name was adopted in 1922. Citing the *Statement of Fundamental Truths* issued by a subsequent Council as a regression to the conventional ecclesiasticism from which many Pentecostals had just recently emerged, the new group demonstrated its independence by establishing rather liberal policies on ordination, church membership, and the issue of divorce and remarriage of the clergy.

Though not very active in the area of foreign missions, the Pentecostal Church of God has conducted an extensive ministry among the American Indians. Headquarters and a publishing house are located in Joplin, Mo.

Pentecostal Fellowship of North America (PFNA), cooperative organization established in Chicago in 1948 by eight Pentecostal denominations for the purpose of "inter-denominational Pentecostal cooperation and fellowship." Several Canadian and U.S. Pentecostal bodies are members of the organization. It is governed by a 13-member Board of Administration and a 5-member Executive Committee.

Pentecostal Holiness Church, Inc., Protestant denomination organized in Falcon, N.C., in 1911 by the merger of the Fire-Baptized Holiness Church (organized in 1898 by several Pentecostal associations) and the Pentecostal Holiness Church (organized in 1900). A third group, the Tabernacle Pentecostal Church, joined the consolidation in 1915.

Unlike most other Pentecostal churches, the denomination permits candidates for baptism to "have the right of choice between the various modes as practised by the several evangelical denominations." It even permits the baptism of infants. In matters of polity, it is decidedly less democratic than other Pentecostal bodies. Reflecting the Methodist Episcopal heritage of its Holiness constituents, the denomination is divided into conferences: general, annual, district, and missionary.

The General Board of Education oversees the operations of three church-related institutions of higher learning: Emmanuel College, a fully accredited academy and junior college in Franklin Springs, Ga., close to the denominational headquarters; Holmes Theological Seminary in Greenville, S.C.; and Southwestern Pentecostal Holiness College in Oklahoma City, Okla., which Oral Roberts, a faith healer and evangelist, helped to establish. *See* Holiness movement.

Pentecostalism, charismatic religious movement that gave rise to a number of Protestant churches in the United States in the 19th and 20th centuries and that is characterized by the belief that all Christians should seek a postconversion religious experience called the baptism with the Holy Spirit. This experience corresponds to the first outpouring or descent of the Holy Spirit upon the 12 disciples of Christ assembled in Jerusalem on the day of Pentecost, as recorded in Acts 1:12–2:4, and it is accompanied by the same sign: the gift of glossolalia, or "speaking in tongues" (*see* tongues, gift of). Pentecostals also hold that a Spirit-baptized believer may receive at least one of the other supernatural gifts that were known to have been in existence in the early church—the ability to prophesy, to heal, or to interpret what is said when someone speaks in unknown tongues. Beyond these unique distinctions, Pentecostal churches reflect those patterns of faith and practice characteristic of the Fundamentalist–Holiness branches of Protestantism that also originated in 19th-century America, with their emphases of biblical literalism, conversion, and moral rigour (*see also* Fundamentalism; Holiness movement). Despite a common belief in certain doctrines, such as baptism of the Spirit, speaking in tongues, and healing, Pentecostals have not united in a single denomination.

The sources of Pentecostalism's appeal. The initial success of the Pentecostal movement during the early decades of the 20th century, as well as its widespread appeal since then, had its roots in the post-Civil War period. That period was a time of mounting indifference to the claims of the biblical faith. Denominations that had been noted for their revivalistic fervour suddenly changed; they became subdued. Emotional modes of religious expression—enthusiastic congregational singing, spontaneous testimonies, prayer in unison, and extemporaneous sermons on simple biblical themes by lay preachers—gave way to ordered, formal worship services that were conducted by "reverends" who had been trained in homiletics (preaching skills) and influenced by higher biblical criticism. Lecture centres and elegantly appointed sanctuaries had replaced camp-meeting sites and crude frame tabernacles.

As the large popular denominations became transformed into churches of the upper-middle class, people of limited means began to feel more and more out of place. They yearned to return to a "heart religion" that would satisfy not only their craving for religious certainty but also their emotional, psychological, and physical needs. The newly emerging Holiness and Pentecostal movements fulfilled these needs for churchgoers and nonchurchgoers alike. Moreover, Pentecostal churches continued to minister to all levels of society, especially to the economically and culturally neglected and socially isolated.

Another probable source of Pentecostalism's appeal is the emphasis placed on the doctrine of healing. From the very beginning of the Pentecostal revival, its evangelists—Mrs. Mary B. Woodworth-Etter, Charles Price, Aimee Semple McPherson, and, more recently, Oral Roberts—have taught that deliverance from sickness was provided for in Christ's atonement and is, therefore, the privilege of all who have the requisite faith. This effort to minister to the physical needs of people most likely has been responsible for winning many followers to Pentecostalism.

Modern origins. The roots of the modern Pentecostal movements are traceable to a number of charismatic outgrowths of the 19th-century Holiness revival that developed in various parts of the United States. Perhaps the most far-reaching of these movements was the one that originated around the turn of the 20th century at a small religious school called Bethel Bible College in Topeka, Kan. The director of the institution, Charles Fox Parham, one of many ministers who had been influenced by the Holiness movement, believed that what he saw as a complacent, prosperity-ridden, and coldly formalistic church of the era needed to be revived and that such a revival could only be achieved by another outpouring of the Holy Spirit. He therefore instructed his students, many of whom already held ministerial credentials with Methodist, Friends, or Holiness churches, to pray, fast, study the Scriptures, and await an endowment of Pentecostal blessing and power that would be very much like the events recounted in the book of Acts.

On Jan. 1, 1901, the first of Parham's many students to experience a Spirit baptism began speaking in an unknown tongue. Henceforth, most Pentecostals usually declared that glossolalia was the "initial evidence" that one had been truly Spirit-baptized. These recurrences of Pentecost also had prophetic overtones that Parham and his students interpreted as meaning that they must be living in the last days. Imbued with this sense of urgency, they set out to evangelize the American Southwest before the end came. Their efforts were so successful that by 1905, according to Parham, approximately 25,000 persons in Texas alone had embraced Pentecostal faith and practice. The embryonic charismatic movement was at first significant only regionally: in the tri-state region of Kansas, Missouri, and Texas and in Alabama and western Florida. The national and international expansion occurred as a consequence of what is recorded as the Azusa Street revival of 1906.

The Apostolic Faith Gospel Mission at 312 Azusa Street in the industrial section of Los Angeles was unpretentious. Its leader, William Seymour, a one-eyed black former Holiness preacher, had been exposed to Pentecostal teaching at a Bible school that Charles Parham had established in Houston, Texas. Under his guidance, the old frame building, which formerly had housed a Methodist congregation, became a Pentecostal mecca (or pilgrimage centre). From April 1906 onward, rich and poor, blacks and whites, native Americans and those from abroad, and seekers and skeptics flocked to the Azusa Street Mission to receive spiritual help.

Spiritually energized and convinced that they had been charismatically endowed, scores of men and women spread out to tell of their experiences, extolling the reality and purposiveness of speaking in tongues. Soon storefront missions, modest tabernacles located in sparsely populated rural areas, and upper-story lofts in squalid urban neighbourhoods housing lively groups of Pentecostal believers sprang up in many parts of the world. These congregations represented the effects of a novel revival that was known variously as the Latter Rain, Apostolic Faith, or Pentecostal movement.

At first, the ultimate in organizational development among Pentecostal Christians was an amorphous sort of "spiritual union." Little if any thought was given to forming a separate "Pentecostal" branch of the Christian church. Despite the fact that scores of members of the historic Protestant churches embraced the teachings and practices of healing, prophesying, and speaking in tongues, they initially had no intention of withdrawing from their own churches to form another denomination. They merely wanted to be agents of reform and revival, helping to rid their churches of formalism in worship, modernism in belief, and worldliness in practice and striving to transform them into vibrant, spirit-filled communities similar to those described in the New Testament book of Acts. They fully expected the "showers of blessing," the prophetically promised Latter Rain of which they had received a few droplets, to fall copiously upon their respective denominations, which would make them wholly Pentecostal.

But the triumphant conquest of the Protestant religious world by Pentecostal ideas during those early years never materialized. In fact, the embryonic movement became the object of rather widespread opposition. Pastors who endorsed Pentecostal practices were relieved of their pulpits by their churches; missionaries who were sympathetic toward the charismatic movement were notified by their mission boards that their financial support was being stopped; and parishioners who practiced speaking in tongues found their names being stricken from membership rolls. Resolutions were passed and anathemas (rigorous ecclesiastical denouncements) were pronounced against those exhibiting Pentecostal practices. Those who desired to retain their charismatic religious way of life found it increasingly difficult to do so within the institutional framework of conventional Protestantism, with the result that many holding such views withdrew from their churches to form new and distinctly Pentecostal groups.

At the outset, most Pentecostals shunned anything reminiscent of the religious bodies they had left. They were particularly wary of the multiplication of, or the concentration of power in, administrative bureaus. They were unwilling to subject themselves to external ecclesiastical control or to be bound by common practices in matters of faith or polity. The result of such fears was a heterogeneity that was totally ineffectual. What became viewed as false doctrines spread unchecked; self-styled evangelists preyed on congregations that found it difficult to discriminate between sincere and insincere preachers; and financial accounts and records went unaudited. Leading Pentecostals, recognizing that the problems created by unbridled individualism and autonomy far surpassed the evils of organization and bureaucracy, attempted to establish a denomination that was unmistakably charismatic. A unitive Pentecostal movement, however, never developed. Some groups favoured ardour, spontaneity, legalism, and independence; others preferred order, ritual, tolerance, and hierarchical control.

Pentecostal denominations are widespread throughout the United States and are found in many other countries, notably Mexico, Chile, and other Latin-American countries, Sweden, Norway, Great Britain, South Africa, and the Soviet Union. Forty or more identifiable groups in America practice glossolalia; in addition, there are hundreds of obscure "storefront" congregations that cannot be included in any reliable computation. Pentecostal churches abound also in remote mountain and other rural areas, and it is mainly among these that the pronounced emotional manifestations are found. The larger bodies are organized in the Pentecostal World Conference, an international fellowship headquartered in Wales.

Pentecôte, also called PENTECOST, formerly ARAGH, or RAGA, island of Vanuatu, in the southwestern Pacific Ocean, 60 miles (100 km) southeast of Espiritu Santo. Volcanic in origin, it occupies 169 square miles (438 square km) and has a central mountain ridge that rises to 3,107 feet (947 m). Many permanent streams flow down the eastern slopes into fertile valleys, where copra and coffee are cultivated. Pentecôte is known for its land divers—men who construct towers up to 80 feet (24 m) tall of bush timber and vines from which they dive headfirst to within inches of the ground. The divers are suspended only by vines, short and springy enough to break their fall, attached to the tower and to their ankles. Precise planning allows them to survive these plunges. The island has one hospital and an airstrip. Pop. (1987 est.) 11,780.

Pentelicus, Mount, also called PENTELIKON, Modern Greek PENDÉLI ÓROS, historically BRILESSOS, or BRILETTOS, mountain range enclosing the Attic plain on its northeast but within the *nomós* (department) of Attikí. The chief summit, about 10 miles (16 km) northeast of Athens, is Kokkinarás (3,638 feet [1,109 m]), which yields white Pentelic marble on its north slope. In classical times the peak had 25 quarries on the south slope at elevations between 2,500 and 3,300 feet (760 and 1000 m). These provided excellent marble for most of the buildings and sculptures of Athens in the 5th and 4th centuries BC. At the summit was a sanctuary to the goddess Athena. In the 1960s a ban was imposed on quarrying on the south slope to avoid scarring the landscape.

Penthièvre, Louis-Joseph, duc de (duke of): *see* Vendôme, Louis-Joseph, duc de.

Penthoraceae, family of a single genus (*Penthorum*) of perennial herbs, in the order Saxifragales, native to eastern Asia and eastern North America. All three species in the genus have underground stems, toothed leaves, and one-sided flower clusters borne at the branch tips. The ditch, or Virginian, stonecrop (*Penthorum sedoides*) grows to about 0.6 m (2 feet) tall. It has pale, greenish yellow flowers and pale green leaves that turn bright orange as they mature. Ditch stonecrop is planted as an ornamental at the edges of pools or in shallow water.

penthouse, enclosed area on top of a building. Such a structure may house the top of an elevator shaft, air-conditioning equipment, or the stairs leading to the roof; it can also provide living or working accommodations. Usually a penthouse is set back from the vertical face of a building, thus providing open spaces or terraces on one or more sides; but in recent practice architects and rental agents have referred to the top floor of any building, regardless of setbacks, as a penthouse.

Although the word now denotes a luxurious and expensive apartment, commanding a panoramic view, historically a penthouse was a mere lean-to, or shed, or other small structure attached to a comparatively large building. In medieval times a penthouse, or pentice, was important in siege craft, being the temporary structure that protected besieging forces as they prepared for an attack on the enemy.

Penticton, city, southern British Columbia, Canada, between Skaha and Okanagan lakes, 245 miles (394 km) east of Vancouver. First settled in 1865, its name was derived from a Salish Indian word, *phthauntauc* (*pen-hik-ton*), meaning "place to stay forever." Centred in an apple-, peach-, and apricot-growing area, the city's economy depends on tourism, fruit canning and packing, lumber products, construction, transport and storage, and livestock raising. The Dominion Radio Astrophysical Observatory, Okanagan Game Farm, and the Copper Mountain Ghost Town are nearby. Penticton became a district municipality in 1908 and was incorporated as a city in 1948. Pop. (1986) 23,588.

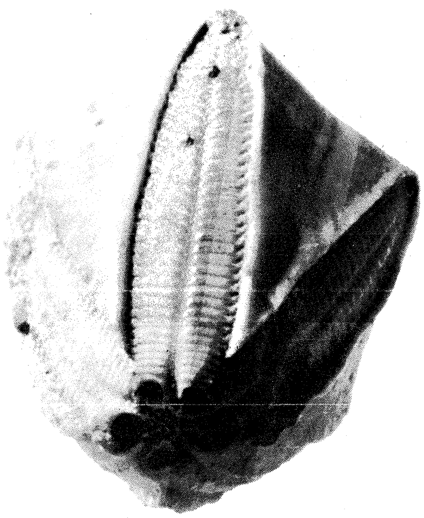
pentimento (from Italian *pentirsi:* "to repent"), in art, the reappearance in an oil painting of original elements of drawing or painting that the artist tried to obliterate by overpainting. If the covering pigment becomes transparent, as may happen over the years, the ghostly remains of earlier marks may show through. Pentimenti most commonly occur owing to slight repositionings by the artist of the outlines of figures or of their clothing. Many signs of such "repentances," or pentimenti, are found among the thinly painted Dutch panels of the 17th century. One of the most famous examples is a double hat brim in Rembrandt's "Flora" (*c.* 1665).

pentlandite, a nickel and iron sulfide mineral, the chief source of nickel. It is nearly always found with pyrrhotite and similar minerals in silica-poor rocks such as those at Bushveld, S.Af.; Bodø, Nor.; and Sudbury, Ont. It has also been found in meteorites. Pentlandite forms crystals that have isometric symmetry. For chemical formula and detailed physical properties, *see* sulfide mineral (table).

pentode, electronic vacuum tube with five electrodes. Besides the cathode, anode, and control grid of the triode (*q.v.*) and the added screen grid of the tetrode (*q.v.*), there is still another grid (suppressor grid) placed between screen grid and plate and maintained at cathode potential. Thus any electrons emitted from the plate surface by secondary emission are repelled back to the plate. The pentode can be used for almost all purposes for which vacuum tubes are used, including amplification, mixing, oscillation, and pulse generation, and in circuits for timing, control, and counting.

pentosuria, inborn error of carbohydrate metabolism, characterized by the excessive urinary excretion of the sugar xylitol. It is caused by a defect in the enzyme xylitol dehydrogenase, by which xylitol is normally metabolized. No disabilities are incurred, and no dietary or other measures are necessary. Reducing properties of the urine of affected individuals may lead to confusion with, and unnecessary treatment for, diabetes mellitus, which is not related to pentosuria. Pentosuria has been observed almost exclusively in persons of Jewish descent.

Pentremites, extinct genus of stemmed, immobile echinoderms (forms related to the



Pentremites pyriformis, collected from the Paint Creek Formation at Floraville, Ill.
By courtesy of the Buffalo Museum of Science, Buffalo, N.Y.

starfish) abundant as marine fossils in Mississippian and Pennsylvanian rocks (345,000,000 to 280,000,000 years old), especially in the midcontinent region of North America. The genus is mainly restricted to the Mississippian Period; more than 80 Mississippian species are known. Specimens are frequently well preserved, allowing detailed anatomical and evolutionary studies to be made.

penumbra (from Latin *paene*, "almost"; *umbra*, "shadow"), in astronomy, the outer part of a conical shadow, cast by a celestial body, where the light from the Sun is partially blocked—as compared to the umbra (*q.v.*), the shadow's darkest, central part, where the light is totally excluded. The definition of the term may be extended to include the partial shadow of any large source of light or electromagnetic radiation. An observer in the penumbra sees the Sun (or other light source) partially obscured. The term also is used for the outer portion of a sunspot.

Penutian languages, major grouping (phylum or superstock) of American Indian languages, spoken along the west coast of North America from British Columbia to central California and central New Mexico. The phylum consists of 15 language families with about 20 languages; the families are Wintun (two languages), Miwok-Costanoan (perhaps five Miwokan languages, plus three extinct Costanoan languages), Sahaptian (two languages), Yakonan (two extinct languages), Yokutsan (three languages), and Maiduan (four languages)—plus Klamath-Modoc, Cayuse (extinct), Molale (extinct), Coos, Takelma (extinct), Kalapuya, Chinook (not to be confused with Chinook jargon, a trade language or lingua franca), Tsimshian, and Zuni, each a family consisting of a single language. All but four of the surviving familes are spoken by fewer than 150 persons.

Major languages in the phylum are Zuni, spoken in New Mexico; Tsimshian, spoken in British Columbia; and the Sahaptian dialects (Klikitat, Umatilla, Wallawalla, Warm Springs, and Yakima), spoken in north central Oregon.

The Penutian languages are sometimes grouped into a yet larger stock, called either Penutian or Macro-Penutian, that includes several Meso-American Indian languages. The Totonacan, Huave, and Mixe-Zoque language families are often included, and some scholars suggest the inclusion of the large Mayan language family. The American linguist Benjamin L. Whorf proposed to include not only Mixe-Zoque, Huave, Totonacan, and Mayan (including Huastec) but also Uto-Aztecan, another major North and Meso-American language family. This grouping has not been generally accepted.

The Penutian languages tend toward the use of formal or inflecting suffixes and changes in the stems of words. In this respect they resemble European languages.

Penwith, district, county of Cornwall, extreme southwestern England. It is a promontory occupying an area of 117 sq mi (303 sq km) at the westernmost tip of England, bordered by St. George's Channel on the north and the English Channel on the south. Penwith has contrasting landscapes. As in much of Cornwall, the physiography alternates between moorlands of igneous-based (granite) intrusives and sedimentary-based valleys, such as the Hayle Valley. Land's End peninsula on the west includes windswept moorlands 600 to 800 ft (185 to 245 m) high, with bold and rugged cliffs along its northern shore that descend on the south into protected coves and headlands with rich vegetation. Plants normally associated with the subtropics (such as hydrangeas, camellias, and orange trees) thrive in sheltered valleys because of the maritime climate, greatly influenced by the North Atlantic Drift. Dairy cattle are grazed throughout the district, and pigs, beef cattle, poultry, early season vegetables, and some fruits thrive in the fertile Hayle Valley in eastern Penwith. The larger coastal resorts of Penzance (the district seat), St. Ives, and Land's End are popular with artists and adventure seekers; the villages of the district have retained an unspoiled appearance.

The village of Pendeen at the northwestern tip of Penwith district is the site of a small tin mine still operating in the 1980s, exemplifying an industry that was an economic mainstay until the late 19th century of both the district and the county. Pilchard and mackerel are caught offshore by fishermen operating out of Newlyn. Assorted prehistoric remains, including cromlechs (stone circles) dating from 2000–1600 BC, are found in the moorlands. Pop. (1984 est.) 54,700.

Penza, *oblast* (administrative region), western Russian Soviet Federated Socialist Republic, occupying an area of 16,680 sq mi (43,200 sq km) across the western flank of the Volga Upland, which falls gently to the Oka–Don Plain in the extreme west. The *oblast* lies in the zone of forest-steppe. About one-fifth of its surface is in pine or oak forest, mostly in the Sura Basin, but natural vegetation has been widely plowed up, resulting in severe soil erosion. Agriculture, the major economic activity, is dominated by grain, especially winter rye and spring wheat. Hemp, sugar beets, and sunflowers are also grown. Engineering, the main industry, is concentrated in Penza city, the *oblast* headquarters, and Kuznetsk; the other cities are small and are mainly concerned with processing food and agricultural products. Timber working is important in the surviving forest areas, and paper is made. Pop. (1984 est.) 1,499,000.

Penza, city and administrative centre of Penza *oblast* (region), western Russian Soviet Federated Socialist Republic, at the confluence of the Penza and Sura rivers. The city was founded in 1666 as a major fortress; after 1684 it formed the western end of the Syzran defensive line. It was frequently attacked by the Crimean Tatars, suffering especially in their last assault of 1717. With the settlement of the surrounding lands, Penza became an important agricultural centre. Grain was sent to Moscow, first by the Sura River and, after the 1870s, by rail. The processing of farm products is still a significant economic factor, but it has been surpassed in importance by industries producing machinery, diesel engines, compressors, calculating machines, and bicycles; there are also watchmaking, papermaking, and timber-working industries. The city's tree-lined streets have spread from the hill, on which the fortress originally stood, onto the level Sura floodplain. Penza has teacher-training, polytechnic, engineering, and agricultural institutes, an observatory, and several industrial-research institutions. Pop. (1984 est.) 522,000.

Penzance, parish, Penwith district, county of Cornwall, England, and the country's most westerly town. It overlooks Mounts Bay where the English Channel meets the Atlantic Ocean, and has a remarkably equable climate, allowing many subtropical plants to flourish. Early vegetables and flowers are raised locally and also in the offshore Scilly Islands, with which it is linked by sea and air services. Newlyn, nearby, is a small fishing port, much frequented by artists. The occasional pirate raids Penzance experienced during the 17th century, due to its location on a sheltered bay on England's southwest tip, made it the location for the Gilbert and Sullivan operetta, "The Pirates of Penzance." The chief modern function of Penzance is as a tourist centre and local service centre for Penwith district. Pop. (1981) 19,210.

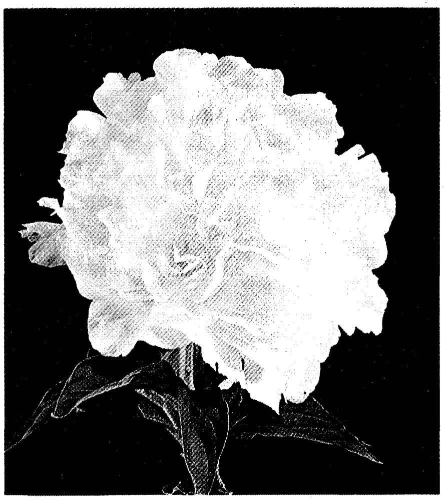
Penzias, Arno (Allan) (b. April 26, 1933, Munich, Ger.), German-American astrophysicist who won a Nobel Prize for a discovery that supported the "big bang" theory of creation.

Educated at City College of New York in New York City and Columbia University, where he received his doctorate in 1962, Penzias joined Bell Telephone Laboratories in Holmdel, N.J. In collaboration with Robert Wilson he began monitoring radio emissions from a ring of gas encircling the Milky Way Galaxy. Unexpectedly, the two scientists detected a uniform background static that suggested a residual thermal energy throughout the universe of about 3 K, which most scientists now agree is the residual background radiation stemming from the primordial explosion billions of years ago from which the universe was created (*see* big-bang model). For this work Penzias and Wilson shared half of the 1978 Nobel Prize for Physics. In 1976 Penzias became director of the Bell Radio Research Laboratory and in 1981 vice-president of research at Bell Laboratories.

peonage, form of involuntary servitude, the origins of which have been traced as far back as the Spanish conquest of Mexico, when the conquerors were able to force the poor, especially the Indians, to work for Spanish planters and mine operators. In both the English and Spanish languages, the word peon became synonymous with labourer but was restricted in the United States to those workers compelled by contract to pay their creditors in labour. Although the Thirteenth Amendment to the Constitution and congressional legislation after the American Civil War prohibited any such involuntary servitude in the United States, the former slaveholding states of the South devised certain legislation to make labour compulsory. Under these state laws, employers could induce or deceive men into signing contracts for labour to pay their debts or to avoid fines that might be imposed by the courts.

Another form of peonage exists when prisoners sentenced to hard labour are farmed out to either private or governmental labour camps.

peony, any of the flowering plants in the genus *Paeonia* (family Paeoniaceae) known for their large, showy blossoms. All but two species are native to Europe and Asia; *P. browni* and *P. californica* are found along the Pacific coastal mountains of North America.



Peony (*Paeonia*)
Gilbert H. Wild & Son, Inc.

There are two distinct groups of peonies: the herbaceous and the tree, or moutan, peonies. The herbaceous peonies are perennials that grow to a height of almost 1 m (about 3 feet) and have large, glossy, much-divided leaves borne on annual stems produced by fleshy rootstocks. In late spring and early summer they produce large single and double flowers of white, pink, rose, and deep-crimson colour. The fragrant Chinese *P. lactiflora* and the European common peony (*P. officinalis*) have given rise to most of the familiar garden peonies. *P. lactiflora* has provided hundreds of cultivated varieties, including the Japanese types, with one or two rows of petals surrounding a cluster of partially formed petals in the centre (petaloid stamens).

The tree peonies have developed from the wild Chinese species *P. suffruticosa.* They are shrubby, with permanent woody stems. The plants sometimes attain a height of 1.2 to 1.8 m (about 4 to 6 feet); they begin flowering in late spring. The blossoms vary in colour from white to lilac, violet, and red. Tree peonies require a hot, dry summer season for best growth, and they can be grafted in late summer or autumn on the roots of herbaceous peonies. A race of hybrids, developed by crossing the tree peony with the yellow Chinese *P. lutea,* has both single and double flowers, sometimes tinged with red. Many varieties have been grafted onto supportive rootstock and so cannot be readily propagated by simple division. Peonies are seldom grown from seeds except in breeding programs to find new varieties; the seed takes about two years to germinate.

Peoria, city, seat of Peoria county, central Illinois, U.S., on the Illinois River where it widens to form Peoria Lake. With Peoria Heights, West Peoria, Bartonville, Bellevue, East Peoria, Creve Coeur, and Pekin, Peoria forms an urbanized industrial complex.

Named for one of the five Indian tribes in the Illinois Confederacy, Peoria represents one of the state's oldest settled locations. The French under Robert Cavelier, sieur de La Salle, built Fort-Crèvecoeur on the bluffs, opposite the present city in 1680, but it was plundered and deserted later that same year. There were later settlements around Peoria Lake by the French, Indians, and later colonists. After 1813 the location was known as Fort Clark, named for the American Revolutionary War general George Rogers Clark; but when Peoria county was formed in 1825, the community, chosen as the county seat, reverted to the French–Indian name of Peoria. There, on Oct. 16, 1854, Abraham Lincoln denounced slavery in rebuttal to a speech by Stephen A. Douglas.

A major port on the Illinois Waterway, Peoria is a trading and shipping centre for a large agricultural area (corn [maize] and livestock). Highly industrialized, its manufactures include earth-moving equipment, trailers, steel, wire, paper products, and chemicals. The Caterpillar Tractor Company, the city's largest employer, has its international headquarters there. Distilling and brewing are also major industries. The U.S. Department of Agriculture's Northern Regional Research Laboratory (completed 1940) is located there. Educational institutions include Bradley University (established as Bradley Polytechnic Institute in 1897) and Illinois Central College, in East Peoria (1966). Peoria's cultural and recreational activities focus on Lakeview Park, which contains the Lakeview Center for the Arts and Sciences, Lakeview Planetarium, Peoria Players Theater, and Lakeview Swimming Pool and Ice Skating Rink. Jubilee College State Park and Historic Site is 14 miles (23 km) west. Inc. town, 1835; city, 1845. Pop. (1988 est.) city, 108,841; Peoria MSA, 340,400.

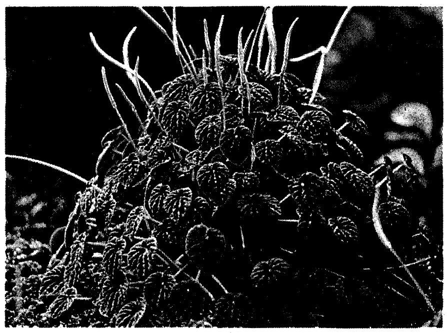
Pepe, Guglielmo (b. Feb. 13, 1783, Squillace, Calabria, Kingdom of the Two Sicilies [now in Italy]—d. Aug. 8, 1855, Turin, Piedmont), Neapolitan soldier prominent in the Italian Risorgimento and author of valuable eyewitness accounts.

After briefly attending a military academy, Pepe enlisted at 16 in the republican army formed in Naples as a result of the French Revolution. He was wounded and taken prisoner by the royalists, but his life was spared because of his youth. In 1800 he fought under Napoleon at Marengo and continued in French service for several years, commanding a brigade in Spain in 1811–13. After the Bourbon restoration in Naples, Pepe accepted a commission in the royal army and helped suppress brigands in Calabria; but, when revolution broke out in 1820, he took command of the republican army. Failure of the revolution sent him into exile, mainly in England, where he spent the next several years writing of his experiences, including *A Narrative of the Political and Military Events Which Took Place at Naples in 1820 and 1821* (1821). His memoirs appeared in 1846, but in 1848, following the major revolution of that year, he was once more back in Naples. Sent north to aid in the war against Austria, he was recalled to Naples but instead joined in the defense of Venice. After the city's surrender he went to Paris; but, after Louis-Napoléon's coup d'état (1851), Pepe moved to Turin. His *Casi d'Italia negli anni 1847, 1848, 1849* (*Narrative of Scenes and Events in Italy, from 1847 to 1849*) was published in 1850.

Pepel, town, Atlantic seaport, western Sierra Leone, on Pepel Island, near the mouth of the Sierra Leone River (an estuary formed by the Rokel River and Port Loko Creek). Beginning in 1933 it exported iron ore brought by rail from the Sierra Leone Development Company's mines at Marampa, 41 miles (66 km) east-northeast. Until iron-ore mining was suspended in 1975, Pepel, the nation's only iron-ore port, had an annual turnover of 2–3 million tons of ore. Only Pepel and the port of Freetown have docking facilities. The local Temne population is also engaged in fishing and rice farming. Pop. (1984 est.) 6,469.

peperite, subsurface rock containing fragments ejected by an underground volcanic explosion (*see* tuff).

Peperomia, genus of the pepper family (Piperaceae), comprising more than 500 species of tropical and subtropical fleshy herbs, annuals as well as perennials. Some are epiphytic (growing on the branches of trees). The leaves,



Peperomia (*Peperomia*)
F.K. Anderson—EB Inc.

sometimes attractively coloured with veins or spots, are oval, thick, fleshy, and smooth-edged. The thick, red stalk of the leaf is in some species fixed to the interior of the leaf. Flowers are minute and densely packed on a slender spike, which is likely to be curved.

A few species, particularly *P. argyreia* (sometimes called *P. sandersii*), are popular houseplants because of their attractive foliage. *P. argyreia,* native to Brazil, grows about 10 to 15 cm (4 to 6 inches) tall. Dark red leafstalks support alternate leaves, which are up to 10 cm (4 inches) long and 7.5 cm (3 inches) wide. The leaves are handsomely marked with broad, creamy bands parallel to the veins.

P. obtusifolia (sometimes *P. magnoliifolia*), another popular cultivated species, is also native to the tropics. It lies close to the soil and has wrinkled, reddish stems. The minute flowers are red. The leaves, about 7.5 to 12.5 cm (3 to 5 inches) long, have small notches near the tip and are red along the margins. The young leaves and stems of *P. vividispica* are used as food in Central and South America.

Pepi, also spelled PHIOS, PHIOPS, MERIRE, or MERYRE, name of Egyptian kings, grouped below chronologically and indicated by the symbol •.

• **Pepi I,** third king of the 6th dynasty (*c.* 2325–*c.* 2150 BC) of ancient Egypt, whose reign saw the spread of trade and conquest and a growth in the influence of powerful provincials from Upper Egypt.

Pepi was the son of Teti, founder of the 6th dynasty. Before succeeding his father, Pepi had to cope with a usurper whose early success forced Pepi to seek the aid of Upper Egyptian potentates to gain control of the kingdom. Two of Pepi's chief queens were sisters of his vizier, one of the Upper Egyptian potentates; they each bore a son who succeeded to the throne.

Pepi I initiated a policy of intensive penetration of Nubia, south of the First Nile Cataract. Inscriptions record journeys southward early in his reign. Fragments of vessels bearing the king's name were excavated at Kerma, though some scholars believe that the vessels were brought there later. Uni, another Upper Egyptian and a close confidant of the king, recruited troops from Nubia as well as from Egypt in preparation for raids against rebellious Bedouins of the northeastern frontier.

Extensive trade with Lebanon is attested by numerous vessels made during Pepi's reign and found at Byblos. An Upper Egyptian biography mentions frequent journeys to Punt, on the Somali coast of eastern Africa. Pepi's courtiers also led quarrying expeditions to various parts of Egypt, and remains of a temple of the king have been found deep in the Nile delta. Pepi's pyramid complex was built at Ṣaqqārah, southwest of Cairo; its name, MeneferPepi, eventually became attached to Memphis, the capital of Egypt.

• **Pepi II** NEFERKARE, fifth king of the 6th dynasty (*c.* 2325–*c.* 2150 BC) of ancient Egypt, during whose extensive reign the government became weakened because of internal and external troubles. Late Egyptian tradition indicates that Pepi II acceded at the age of six and, in accord with king lists of the New Kingdom, credits him with a 94-year reign. Contemporary texts record his 62nd and 65th years.

Pepi II was a son of Pepi I and was born late in his father's reign. While still very young he succeeded his half-brother Merenre, who died at an early age. His mother served as coregent for a number of years, and the old group of officials serving the royal family maintained the kingdom's stability. Expeditions of trade and conquest to lower Nubia and Punt (the Somali coast of Africa), however, met with resistance, and the signs of external trouble are unmistakable.

Internally, the vizierate passed from the family that had served Pepi's predecessors and descended through a number of other officials. The excessive devotion of resources to funerary endowments drained the country's resources. Furthermore, powerful provincial nobles drew talent away from the capital. Biographies of the era reveal that Pepi had more interest in duties toward the dead than concern for the kingdom. Finally, because of the unusually long reign of the king, Egypt had a senile ruler when it needed vigorous leadership. Those of his children who survived Pepi had brief, ephemeral reigns and failed to cope with the political and economic crises that arose as the 6th dynasty ended.

Pepi's pyramid complex at Ṣaqqārah, across the Nile from Cairo, was among the largest of the 5th and 6th dynasties. Structural weakness, aggravated by an earthquake, later required that a girdle wall be built around the pyramid.

Pepin, also spelled PEPPIN, name of rulers grouped below by country or dynasty and indicated by the symbol •.

Foreign-language equivalents:

French	Pépin
German	Pippin
Italian	Pipino

AQUITAINE

• **Pepin I** (d. Dec. 13, 838), Carolingian king of Aquitaine, the second son of the emperor Louis I the Pious.

He was granted Aquitaine in July 814 and was recognized as king in 817, though it was clear that he was to remain subordinate to his elder brother Lothair, the heir to the imperial title. It was Pepin who in 830 started the revolt of Louis I's elder three sons against their father, but in February 831 he became reconciled with Louis. Rebelling again in 832, he was then deposed from his kingship by Louis but could still exploit separatist feeling in Aquitaine and took part in renewed rebellion against Louis in 833. He finally repented in 834 and helped to restore the emperor's authority. Aquitaine was then given back to him, with Anjou in addition. He probably died insane.

• **Pepin II** (d. after AD 864, Senlis, Fr.), Carolingian king of Aquitaine.

The son of Pepin I of Aquitaine, he gained the throne about 845, after defeating the emperor Charles II the Bald in 844. War soon broke out again, however, and Charles slowly advanced through Aquitaine. Pepin took refuge with Sancho, duke of the Gascons, but in 852 was handed over to Charles, tonsured, and relegated to a monastery. Escaping in 854, he renewed the struggle, but in 859 the Aquitanians began to abandon him. Thereafter he became a wanderer, sometimes joining Viking raiders, with a band of whom he attacked Toulouse in 864. Captured soon afterward, he died during imprisonment at Senlis.

CAROLINGIAN DYNASTY

• **Pepin I,** byname PEPIN OF LANDEN, or PEPIN THE ELDER, French PÉPIN DE LANDEN, or PÉPIN LE VIEUX (d. *c.* 640), councillor of the Merovingian king Chlotar II and mayor of the palace in Austrasia.

Through the marriage of his daughter Begga with Ansegisel, son of Arnulf (d. 641; bishop of Metz), Pepin was the founder of the Carolingian dynasty. Deprived of his mayoralty at the accession (629) of Dagobert I, he regained power in Austrasia after that king's death (January 639) but did not long survive to enjoy it.

• **Pepin II,** byname PEPIN OF HERSTAL, French PÉPIN D'HÉRISTAL (d. Dec. 16, 714, Jupille, near Liège [now in Belgium]), ruler of the Franks (687–714), the first of the great Carolingian mayors of the palace.

The son of Begga and Ansegisel, who were, respectively, the daughter of Pepin I and the son of Bishop Arnulf of Metz, Pepin established himself as mayor of the palace in Austrasia after the death of Dagobert II in 679 and defended its autonomy against Theodoric III of Neustria and Ebroïn, Theodoric's mayor of the palace. Defeated by Ebroïn in 680 at Lucofao (near Laon), Pepin gained his revenge on the Neustrians in 687 at Tertry (near Péronne) and became sole effective ruler of the Franks. He nevertheless retained Theodoric III on the throne and after his death replaced him with three successive Merovingian kings. After several years of warfare Pepin defeated the Frisians on his northeastern border (689) and married his son Grimoald to Theodelind, daughter of the Frisian chief Radbod. He also forced the Alemanni to recognize Frankish authority again and encouraged Christian missionaries in Alemannia and Bavaria. Charles Martel was his son.

• **Pepin III,** byname PEPIN THE SHORT, French PÉPIN LE BREF, German PIPPIN DER KURZE (b. *c.* 714—d. Sept. 24, 768, Saint-Denis, Neustria [now in France]), the first king of the Frankish Carolingian dynasty and the father of Charlemagne. A son of Charles Martel, Pepin became sole de facto ruler of the Franks in 747 and then, on the deposition of Childeric III in 751, king of the Franks. He was the first Frankish king to be anointed—first by St. Boniface and later (754) by Pope Stephen II.

Background and kingship. For years the Merovingian kings had been unable to prevent power from slipping from their hands into those of the counts and other magnates. The kings were gradually eclipsed by the mayors of the palace, whose status developed from that of officer of the household to regent or viceroy. Among the mayors, a rich family descended from Pepin of Landen (Pepin I) held a position of especial importance. When Charles Martel, the scion of that family, died in 741, he left two sons: the elder, Carloman, mayor of Austrasia, Alemannia, and Thuringia, and Pepin III, mayor of Neustria, Burgundy, and Provence. No king had ruled over all the Franks since 737, but to maintain the fiction of Merovingian sovereignty, the two mayors gave the crown to Childeric III in 743.

Charles had had a third son, however—Grifo, who had been born to him by a Bavarian woman of high rank, probably his mistress. In 741, when his two brothers were declared mayors of the Franks, Grifo rebelled. He led a number of revolts in subsequent years and was several times imprisoned. In 753 he was killed amid the Alpine passes on his way to join the Lombards, at this time enemies of the Franks as well as of the papacy.

Numerous other rebellions broke out. In 742 men of the Aquitaine and Alemannia were in revolt; in 743 Odilo, duke of Bavaria, led his men into battle; in 744 the Saxons rebelled, in 745 Aquitaine, and in 746 Alemannia, both the latter for the second time.

In 747, when Carloman decided to enter monastic life at Rome, a step he had been considering for years, Pepin became sole ruler of the Franks. But Pepin was ambitious to govern his people as king, not merely as mayor. Like his father, he had courage and resolution; unlike his father, he had a strong desire to unite the papacy with the Frankish realm. In 750 he sent two envoys to Pope Zacharias with a letter asking: "Is it wise to have kings who hold no power of control?" The pope answered: "It is better to have a king able to govern. By apostolic authority I bid that you be crowned King of the Franks." Childeric III was deposed and sent to a monastery, and Pepin was anointed as king at Soissons in November 751 by Archbishop Boniface and other prelates.

Pepin and Pope Stephen II. The pope was in need of aid. Aistulf, king of the Lombards, had seized Ravenna with its lands, known as the exarchate. Soon, Lombard troops marched south, surrounded Rome, and prepared to lay siege to its walls. So matters stood when in 752 Zacharias died and Stephen II became pope. In November 753 Pope Stephen made his way over the stormy mountain passes to Frankish territory. He remained in France until the summer of 754, staying at the abbey of Saint-Denis, Paris. There he himself anointed Pepin and his sons, Charles and Carloman, as king and heirs of the crown.

The pope returned to Italy accompanied by Pepin and his army. A fierce battle was fought in the Alps against Aistulf and the Lombards. The Lombard king fled back to his capital, Pavia; Pepin and his men plundered the land around Pavia until Aistulf promised to restore to papal possession Ravenna and all the Roman properties claimed by the pope.

Aistulf broke his word. Again and again Pope Stephen wrote to Pepin of his difficulties. In

756 the Frankish king once more entered Italy. Aistulf was once more constrained to make promises, but the same year he died—of a fall from his horse—and in April 757 a new king, Desiderius, became ruler of the Lombards. That year Stephen II also died, and Paul I was elected pope. He, too, constantly wrote to Pepin asking for help.

But the King of the Franks had other concerns. He had to put down revolts in Saxony in 748 and 753 and a rising in Bavaria in 749. He was continually marching against rebellious Aquitaine. In 768 Pepin died at Saint-Denis, on his way back from one of his Aquitainian expeditions.

Pepin is remembered not only as the first of the Carolingians but also as a strong supporter of the Roman Church. The papal claims to territory in Italy originated with Pepin's campaigns against Aistulf and the latter's pledge to return the Roman territories. His letters also show him calling for archbishoprics in Frankish territory, promoting synods of clergy and layfolk, and as deeply interested in theology. (E.S.D.)

ITALY

• **Pepin** (d. July 8, 810, Milan), king of Italy (781–810) and second son of the Frankish emperor Charlemagne.

Given the title of king of Italy in 781, Pepin took part in campaigns against Duke Tassilo III of Bavaria from 787 and led an army against the Avars in 796. His Venetian campaign (809–810) enabled Charlemagne later to come to favourable terms with the Byzantine Empire. As early as 806 Charlemagne, in planning the division of his lands, had decided that on his death Pepin should inherit Italy, Bavaria, and the territory of the Alemanni, but Pepin predeceased his father by four years.

Pepin, Donation of (754), promise made by the Carolingian Frankish king Pepin III the Short to win for Pope Stephen II (III) lands in Italy that had been conquered by the Lombards; it was later (756) embodied in a document that became the origin of papal rule over central Italy, which lasted until the 19th century. Pepin had, with papal agreement, deposed the last Merovingian ruler of the Franks and had then been elected king himself. He received the Pope at Quierzy-sur-Oise (near Laon, Fr.), made the donation, and was subsequently anointed as king by the Pope. Fulfilling his promise, Pepin fought two campaigns (754 and 756) in Italy, wresting from the Lombard king Aistulf former Byzantine territory, which he then awarded to the Pope. Pepin's donation was confirmed and extended by his successor, Charlemagne, in 774 and justified by the claim that it was based on a grant supposed to have been originally made to the papacy by Constantine I, the first Christian Roman emperor, in the 4th century AD (the Donation of Constantine).

pepino hill (from Spanish *pepino,* "cucumber"), also called HUM (Serbo-Croatian: "hill"), or HAYSTACK HILL, conical hill of residual limestone in a deeply eroded karst region. Pepino hills generally form on relatively flat-lying limestones that are jointed in large rectangles. In an alternating wet and dry climate, high areas become increasingly hard and resistant while low areas are subjected to greater erosion and solution. In some places, such as the Kwangsi area of China, pepino hills may have almost vertical sides and may be riddled with caves. Pepino hills develop to greater heights in regions having subtropical or equatorial rainfall and are then generally called mogotes (Spanish: "hillocks").

peplos, also spelled PEPLUS, garment worn by Greek women during the early Archaic, Classical, and Hellenistic periods (*i.e.,* up to about AD 300). It consisted of a large, rectangular piece of material folded vertically and hung from the shoulders, with a broad overfold. During the early periods, it was belted around the waist, usually beneath the overfold; if the overfold was long, however, the belt was sometimes placed on top of it, as seen in many statues of Athena.

In Hellenistic times the overfold was belted below the bust. To allow for growing, young girls wore peploses with long overfolds. When worn with other types of dress, the peplos was the outermost garment. Initially, it was made of wool or linen; later, cotton and silk were also used.

The goddess Eirene wearing a peplos, Roman copy of a Greek sculpture by Cephisodotus the Elder of Athens, marble, 4th century BC; in the Metropolitan Museum of Art, New York City

Pepo, Bencivieni di (painter): *see* Cimabue.

Pepoli FAMILY, family that played an important role in the political and economic life of 13th- and 14th-century Bologna.

The Pepoli, wealthy bankers, were leaders of the Guelf (papal) party and helped expel the Ghibelline (imperial) Lambertazzi from the city in 1274. Romeo de' Pepoli ruled the city for several years, but an insurrection forced him to flee with his family, and he died in exile in 1321. His son Taddeo, who had received a doctorate in law from the University of Bologna, followed his father into banishment, but after six years he returned to Bologna and in 1337 was acclaimed lord of the city, assuming the title of "keeper of peace and justice." Pope Benedict XII later recognized him as papal vicar.

After Taddeo's death, his sons were forced to yield Bologna to the growing power of the Visconti of Milan, and the city fell under the rule of Archbishop Giovanni Visconti in 1352. Unable to recover their political position, the Pepoli became soldiers, scholars, literary men, and jurists. In the 19th century the family was active in the Risorgimento, the movement for Italy's unification.

pepper (*Piper nigrum*): *see* black pepper.

pepper, also called GARDEN PEPPER (*Capsicum*), any of a great number of plants of the nightshade family, Solanaceae, notably *Capsicum annuum, C. frutescens,* and *C. boccatum,* extensively cultivated throughout tropical Asia and equatorial America for their edible, pungent fruits. Peppers, which have been found in prehistoric remains in Peru, were widely grown in Central and South America in pre-Columbian times. Pepper seeds were carried to Spain in 1493 and from there spread rapidly throughout Europe.

The genus *Capsicum* comprises all the varied forms of fleshy-fruited peppers grown as herbaceous annuals—the red, green, and yellow peppers rich in vitamins A and C that are used in seasoning and as a vegetable food. Hot peppers, used as relishes, pickled, or ground into a fine powder for use as spices, derive their pungency from the compound capsaicin, a substance characterized by acrid vapours and burning taste, that is located in the internal partitions of the fruit. First isolated in 1876, capsaicin stimulates gastric secretions and, if used in excess, causes inflammation.

In addition to the cherry (Cerasiforme group) and red cluster (Fasciculatum), these hot varieties, which are red when mature, include the tabasco (Conoides), which is commonly ground and mixed with vinegar to produce a hot sauce, and the long "hot" chili and cayenne (Longum), often called capsicums. Cayenne pepper, said to have originated in Cayenne in French Guiana, is one of the spices derived from these peppers and is produced in many parts of the world.

The mild bell or sweet peppers (Grossum) have larger, variously coloured but generally bell-shaped, furrowed, puffy fruits that are used in salads and in cooked dishes. These varieties are harvested when bright green in colour—before the appearance of red or yellow pigment—about 60–80 days after transplanting.

The term "pimiento," from the Spanish for "pepper," is applied to certain mild pepper varieties possessing distinctive flavour but lacking in pungency; these include the European paprikas, which include the paprika (*q.v.*) of commerce, a powdered red condiment that was known in Hungary by the late 16th century. "Pimiento," often pronounced the same as "pimento," should not be confused with the latter, which is allspice.

Pepper plants are treated as tender summer annuals outside their native habitat. They are propagated by planting seed directly in the

Red peppers (*Capsicum annuum*) from which paprika is made

G.R. Roberts

field or by transplanting seedlings started in greenhouses or hotbeds after six to ten weeks.

pepper coral (marine animal): *see* millepore.

pepper tree (*Schinus molle*), small ornamental tree, of the cashew family (Anacardiaceae), native to tropical America and cultivated in warm subtropical regions. The long leaves

Pepper tree (*Schinus molle*)
Thase Daniel

have storage cells that contain a volatile oil. The small white flowers are borne in clusters at the ends of the branches. Each small, pealike fruit has a hard kernel surrounding one seed. The fruits are used in beverages and medicines because of their hot taste and aroma. Pepper tree is a host plant for scale insects that damage orange trees.

peppered moth (*Biston betularia*), a European moth of the family Geometridae (order Lepidoptera), having speckled black-and-white wings. It is of significance in exemplifying natural selection through industrial melanism.

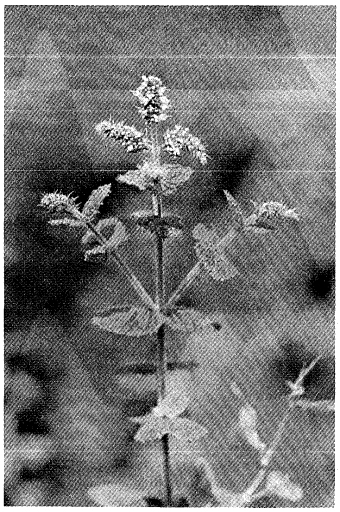
The peppered moth had originally been white-coloured, but a dark (melanic) form of the peppered moth, first noticed in Manchester, Eng., in 1848, had outnumbered the usual light-coloured moth by 99 to 1 by 1898. The explanation of this phenomenon is that the dark moth, which originally was a chance mutation, was rendered less conspicuous to bird predators than the light moth against tree trunks which had become covered with black soot owing to the air pollution caused by nearby industries. The difference is genetic and of interest as a striking example of rapid evolutionary change in a localized area.

peppergrass, also called PEPPERWORT, any of about 100 species of herbs constituting the genus *Lepidium*, of the mustard family (Brassicaceae), distributed throughout the world. Many, such as *L. perfoliatum*, are lawn and field weeds, but some are useful salad plants. Most species have long taproots, broad basal leaves differing from the narrow leaves on the flowering stalks, and spikelike clusters of small, greenish or whitish, four-petalled flowers. Each seed is in a flat, round pod. Gar-

Peppergrass (*Lepidium perfoliatum*)
F.K. Anderson—EB Inc.

den cress (*q.v.; L. sativum*), a North African annual, is sometimes cultivated for its piquant basal leaves. Virginia peppergrass (*L. virginicum*), spread throughout North America, sometimes is known as canary grass because its seed stalks are fed to cage birds. Its leaves are used in salads. Lentejilla, or little lentil (*L. intermedium*), native to Europe but long naturalized in Mexico, is used as a folk medicine. Pepperwort, or field pepper (*L. campestre*), a widespread weed, is native in Europe and naturalized in North America. It has hairy, arrow-like stem leaves and once was marketed as a poison antidote under the name of mithridate pepperwort.

peppermint (*Mentha piperita*), strongly aromatic perennial herb, source of a widely used flavouring. It has stalked, smooth, dark-green leaves and blunt, oblong clusters of pinkish-lavender flowers, which are dried and used to flavour candy, desserts, beverages, salads, and other foods. Peppermint has a strong,



Peppermint (*Mentha piperita*)
Shunji Watari—EB Inc.

sweetish odour, and a warm, pungent taste with a cooling aftertaste. Indigenous to Europe and Asia, it has been naturalized in North America and is found near streams and in other wet sites. It is cultivated in Europe, Asia, and North America for its essential oil. Natural hybridization among wild species has yielded many varieties of peppermint, but only two, the black and the white, are recognized by growers. The former has purplish and the latter green stems. Black peppermint, also called English peppermint or mitcham mint, is extensively grown in the United States. The white variety is less hardy and less productive, but its oil is considered more delicate in odour and obtains a higher price.

Oil of peppermint, a volatile essential oil distilled with steam from the herb, is widely used for flavouring confectionery, chewing gum, dentifrices, and medicines. Pure oil of peppermint is nearly colourless. It consists principally of menthol (*q.v.*) and menthone. Menthol, also called mint camphor or peppermint camphor, has long been used medicinally as a soothing balm. Oil of Japanese mint (*Mentha arvensis* variety *piperascens*) is very different from peppermint oil but is also a rich source of menthol. The name Japanese peppermint is sometimes used for this plant, but it is not a true peppermint.

Pepperell, Sir William, BARONET, Pepperell also spelled PEPPERELL (b. June 27, 1696, Kittery, Mass.—d. July 6, 1759, Kittery), colonial American merchant, politician, and soldier who in 1745 commanded land

Pepperrell, detail of a portrait by Peter Pelham after a painting by John Smibert; in the collection of the Massachusetts Historical Society

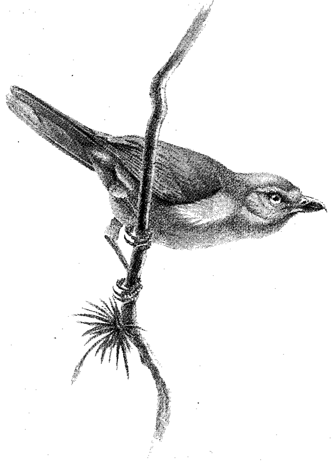
forces that, with a British fleet, captured the French fortress of Louisbourg (in present-day Nova Scotia). For this exploit in King George's War, he was created a baronet (1746), the first man born in one of the 13 colonies to be so honoured. He was also given the rank of lieutenant general in the British Army. For a brief period (1756–57), he was acting governor of Massachusetts.

Pepperrell became prosperous as an associate in his father's mercantile firm and in real estate investments. He served as a member of the Massachusetts General Court and of the Governor's Council and as chief justice of the Court of Common Pleas. His one son predeceased him, and the baronetcy became extinct upon his death.

peppershrike, family name CYCLARHIDAE, either of two species of stout-billed tropical American songbirds (order Passeriformes). (They are included by some authorities in the vireo family, Vireonidae.) Both peppershrikes are olive green above and yellow and white below; they are about 15 centimetres (6 inches) in length. The bill is high and termi-



Peppershrike (*Cyclarhis nigrirostris*)
Painting by H. Jon Janosik

nally hooked. Peppershrikes are found in open woodland from southern Mexico to Argentina and Paraguay. They feed on large insects and some fruit, taken as they move about in foliage. Their song is a sweet warble, repeated frequently.

pepperwort (plant): *see* peppergrass.

Peppin (personal name): *see under* Pepin.

PepsiCo, Inc., American conglomerate producing various products and services, including beverages, food, sporting goods, cargo transportation, and building construction. The company of the current name was formed in 1965, in the merger of Pepsi-Cola Company and Frito-Lay, Inc. After its merger PepsiCo began further diversification.

The Pepsi-Cola Company had a checkered career, running through several different ownerships from 1902 to 1941. The first beverage of the name was created by Caleb D. Bradham (1866–1934), a pharmacist in New Bern, N.C., who gave it its name in 1898 and incorporated the Pepsi-Cola Company in 1902. After moderate prosperity for many years, the company fell on hard times and was reorganized and reincorporated in 1922 as The Pepsi-Cola Company. In the following year, however, this effort went bankrupt; and, after a few months of ownership under a holding company, the trademark and assets were sold in 1923 to a newly formed Pepsi-Cola Corporation, again reformed in 1928 as National Pepsi-Cola Corporation.

When this "National" company went bankrupt in 1931, the trademark and assets were picked up by Charles G. Guth (1876–1948), the real founder of modern Pepsi-Cola. He established a new Pepsi-Cola Company, had a chemist reformulate a better drink, set up new bottling operations, and began merchandising a spectacularly successful 12-ounce bottle of Pepsi-Cola for five cents. Guth concurrently had been president of Loft, Incorporated, a candy manufacturer and soda-fountain chain (founded in 1919), but, in a proxy war in 1935–36, lost control of the company. Then, because he had used Loft money, personnel, and facilities to build up his separate Pepsi-Cola operations, the new Loft management brought suit in court in 1937–38, won the case, and won ownership of Pepsi-Cola. Finally, on June 30, 1941, Pepsi-Cola Company was merged into Loft, and the name Loft, Incorporated, was simultaneously changed to Pepsi-Cola Company.

In the immediate postwar years, Pepsi-Cola's business again slumped, but in 1949 Alfred N. Steele (1901–59), a former vice president of Coca-Cola Company, was hired and, in the next year, was made chief executive officer. His emphasis on giant advertising and sales promotions increased Pepsi-Cola's net earnings elevenfold in the course of the 1950s. (After his death in 1959, his wife, the actress Joan Crawford, became an active director of the company.) In the next decades, the conglomerate mergers and acquisitions began. After the merger of Pepsi-Cola Company and Frito-Lay, Inc., the company acquired several other companies, Pizza Hut, Inc. (1977); Taco Bell Inc. (1978); Seven-Up International (1986); and Kentucky Fried Chicken Corp. (1986).

Company headquarters of Pepsi-Cola and PepsiCo underwent several moves, from New Bern, N.C. (1902–23), to Richmond, Va. (1923–31), Baltimore, Md. (1931–35), New York City (1935–70), and Purchase, N.Y. (from 1970).

pepsin, the powerful enzyme in gastric juice that digests proteins such as those in meat, eggs, seeds, or dairy products.

Pepsin was first recognized in 1836 by the German physiologist Theodor Schwann. Nearly a century later, in 1930, it was crystallized and its protein nature established by John H. Northrop of the Rockefeller Institute for Medical Research.

Glands in the mucous-membrane lining of the stomach make and store an inactive protein called pepsinogen. Impulses from the vagus nerve and the hormonal secretions of gastrin and secretin stimulate the release of pepsinogen into the stomach, where it is mixed with hydrochloric acid and rapidly converted to the active enzyme pepsin. The digestive power of pepsin is greatest at the acidity of normal gastric juice (pH 1.5–2.5). In the intestine the gastric acids are neutralized (pH 7), and pepsin is no longer effective.

In the digestive tract pepsin effects only partial degradation of proteins into smaller units called peptides, which then either are absorbed from the intestine into the bloodstream or are broken down further by pancreatic enzymes.

Small amounts of pepsin pass from the stomach into the bloodstream, where it breaks down some of the larger, or still partially undigested, fragments of protein that may have been absorbed by the small intestine.

Pepsin is prepared commercially from swine stomachs. Crude pepsin is used in the leather industry to remove hair and residual tissue from animal hides prior to their being tanned. It is also used in the recovery of silver from discarded photographic films by digesting the gelatin layer that holds the silver compound.

peptic ulcer, sharply circumscribed, punched-out defect or erosion of tissue in the lining of the stomach or duodenum, produced by the corrosive and digestive action of acid gastric juice. Gastric (stomach) ulcers appear to be caused by failure of the normal mechanisms for protection of the stomach wall: the mucous cells may not secrete an adequate protective layer of mucus; or gastric acid, though normal or even below normal in quantity, may not be adequately buffered and diluted by swallowed food and by regurgitated intestinal contents. Duodenal ulcers, on the other hand, usually occur in the presence of greater than normal amounts of gastric juice with a high acid concentration. Peptic ulcers occasionally occur in the lower portion of the esophagus, as a result of repeated regurgitation of gastric contents.

Peptic ulcer occurs in 10 to 15 percent of the world's population; men are affected more frequently than women, and, except in Japan, duodenal ulcers are more common than gastric ones. The causes are not completely understood, although many factors have been implicated, including nervous tension, ingestion of certain drugs (such as salicylates and corticoid), and hormonal factors.

The symptoms of gastric and duodenal ulcer are similar, consisting of gnawing, burning, aching, hungerlike pain in the mid-upper abdomen, occurring from one to three hours after meals and several hours after retiring. Characteristically, this pain is relieved by ingestion of materials such as food, milk, and baking soda, which dilute and neutralize acid.

Complicating conditions may occur secondarily to peptic ulcer: obstruction of the stomach outlet, caused by inflammation or scar formation, may cause vomiting; bleeding may occur, leading to weakness and anemia; and the intestinal wall may perforate, causing severe localized abdominal pain and peritonitis.

During the late 1970s and '80s a variety of drugs were developed that both promoted the healing of peptic ulcers and prevented their recurrence. These drugs achieved their effect by reducing the secretion of acid gastric juice, neutralizing acid, directly protecting ulcers from the acid, or helping to promote mucosal secretion. When complications occur, or when the ulcer fails to heal with drug treatment, surgery may be necessary; a major portion of the stomach is often removed to decrease acid production and thus prevent recurrence.

peptide, any organic substance of which the molecules are structurally like those of proteins, but smaller. The class of peptides includes many hormones, antibiotics, and other compounds that participate in the metabolic functions of living organisms. Peptide molecules are composed of two or more amino acids joined through amide formation involving the carboxyl group of each amino acid and the amino group of the next. The chemical bond between the carbon and nitrogen atoms of each amide group is called a peptide bond. Some or all of the peptide bonds, which connect the consecutive triplets of atoms in the chain regarded as the backbone of the molecule, can be broken by partial or complete hydrolysis of the compound. This reaction, producing smaller peptides and finally the individual amino acids, is commonly used in studies of the composition and structure of peptides and proteins.

The number of amino-acid molecules present in a peptide is indicated by a prefix: a dipeptide contains two amino acids; an octapeptide, eight; an oligopeptide, a few; a polypeptide, many. The distinction between a polypeptide and a protein is imprecise and largely academic; some authorities have adopted, as an upper limit on the molecular weight of a polypeptide, 10,000 (that of a peptide composed of about 100 amino acids).

Pepusch, John Christopher, German JOHANN CHRISTOPH PEPUSCH (b. 1667, Berlin [Germany]—d. July 20, 1752, London, Eng.), composer who was an important musical figure in England in the years before G.F. Handel.

After studying theory and organ music, Pepusch at age 14 obtained a position at the Prussian court; he remained there until 1697. He traveled to the Netherlands, and in 1700 he settled in England. In 1712 he became music director to the Duke of Chandos. He took a doctorate in music from the University of Oxford in 1713. About this time he became music director at Lincoln's Inn Fields Theatre, for which he wrote several masques and arranged the tunes and composed the overtures for John Gay's *Beggar's Opera* (1728) and its sequel *Polly* (unperformed until 1777). In 1737 he became organist at the Charterhouse. He was in demand as a teacher; William Boyce was among his pupils. He also collected a magnificent library of music books and scores. Deeply interested in music of the Renaissance and of ancient Greece and Rome, he had a strong influence on the early development of musical antiquarianism in England; one consequence was the publication of Boyce's anthology *Cathedral Music* (of 16th- and 17th-century England). Pepusch helped form the Academy of Ancient Music, which performed works by 16th-century composers, and he edited some works of Arcangelo Corelli. His compositions include cantatas, concerti, and chamber music.

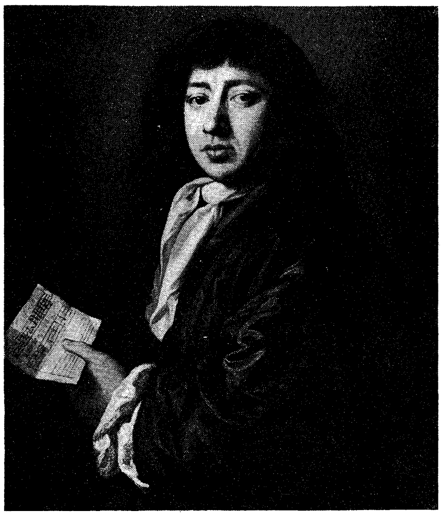
Pepys, Samuel (b. Feb. 23, 1633, London, Eng.—d. May 26, 1703, London), English diarist and naval administrator, celebrated for his *Diary* (first published in 1825), which gives a fascinating picture of the official and upper-class life of Restoration London from Jan. 1, 1660, to May 31, 1669.

Life. Pepys was the son of a working tailor who had come to London from Huntingdonshire, in which county, and in Cambridgeshire, his family had lived for centuries as monastic reeves, rent collectors, farmers, and, more recently, small gentry. His mother, Margaret Kite, was the sister of a Whitechapel butcher. But, though of humble parentage, Pepys rose to be one of the most important men of his day, becoming England's earliest secretary of the Admiralty and serving in his time as member of Parliament, president of the Royal Society (in which office he placed his imprimatur on the title page of England's greatest scientific work, Sir Isaac Newton's *Philosophiae Naturalis Principia Mathematica*), master of Trinity House and of the Clothworkers' Company, and a baron of the Cinque Ports. He was the trusted confidant both of Charles II, from whom he took down in shorthand the account of his escape after the Battle of Worcester, and of James II, whose will he witnessed before the royal flight in 1688. The friends of his old age included Sir Christopher Wren, Sir Isaac Newton, John Evelyn, Sir Godfrey Kneller, John Dryden, and almost every great scholar of the age.

Early career. Samuel Pepys (pronounced peeps) was sent, after early schooling at Huntingdon, to St. Paul's School, London. In 1650 he was entered at Trinity Hall, Cambridge, but instead went as a sizar to Magdalene College, obtaining a scholarship on the foundation. In March 1653 he took his B.A. degree and in 1660 that of M.A. Little is known of his university career save that he was once admonished for being "scandalously overserved with drink." In later years he became a great benefactor of his college, to which he left his famous library of books and manuscripts. He was also once offered—but refused—the provostship of King's College, Cambridge.

In December 1655 he married a penniless beauty of 15, Elizabeth Marchant de Saint-Michel, daughter of a French Huguenot refugee. At this time he was employed as factotum in the Whitehall lodgings of his cousin Adm. Edward Montagu, later 1st earl of Sandwich, who was high in the lord protector Cromwell's favour. In his diary Pepys recalls this humble beginning, when his young wife "used to make coal fires and wash my foul clothes with her own hand for me, poor wretch! in our little room at Lord Sandwich's; for which I ought forever to love and admire her, and do." While there, on March 26, 1658, he underwent a serious abdominal operation, thereafter always celebrating the anniversary of his escape by a dinner—"This being my solemn feast for my cutting of the stone."

In 1659 Pepys accompanied Montagu on a voyage to the Sound. About the same time he was appointed to a clerkship of £50 per annum in the office of George Downing, one of the tellers of the Exchequer, after whom Downing Street was later named. It was while working in Downing's office and living in a small house in Axe Yard that on Jan. 1, 1660, he began his diary. A few months later he sailed, as his cousin's secretary, with the fleet



Pepys, oil painting by John Hayls, 1666; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

that brought back Charles II from exile. Appointed, through Montagu's interest at court, clerk of the acts of the navy at a salary of £350 per annum and given an official residence in the navy office in Seething Lane, he became in the next few years a justice of the peace, a commissioner for and, later, treasurer of, Tangier, and surveyor of naval victualling. When he entered upon his functions, he was ignorant of almost everything that belonged to them. His chief use of his position was to enjoy his newfound importance and the convivial companionship of his colleagues, admirals Sir William Batten and Sir William Penn. But early in 1662 there came a change. The colleagues whose bacchanalian habits and social position had made them so attractive began to prove irksome, and their insistence on their superior experience and status galled Pepys's pride. In his isolation, he sought for ways by which he could show himself their equal. He had not far to look, for his fellow officers were anything but attentive to business. "So to the office," Pepys wrote, "where I do begin to be exact in my duty there and exacting my privileges and shall continue to do so." He had found his vocation.

Naval administration. It was not in Pepys's nature to do things by halves. Having resolved to do his duty, he set out to equip himself for its performance. In the summer of 1662 he occupied his leisure moments by learning the multiplication table, listening to lectures on shipbuilding, and studying the prices of naval stores: "into Thames Street, beyond the Bridge, and there enquired among the shops the price of tar and oil, and do find great content in it, and hope to save the King money by this practise." At the same time, he began his habit of making careful entries of all contracts and memoranda in large vellum books—beautifully ruled by Elizabeth Pepys and her maids—and of keeping copies of his official letters.

The qualities of industry and devotion to duty that Pepys brought to the service of the Royal Navy became realized during the Second Dutch War of 1665–67—years in which he remained at his post throughout the Plague and saved the navy office in the Great Fire of London. Before trouble with his eyesight caused him to discontinue his diary in 1669—an event followed by the death of his wife—these qualities had won him the trust of the King and his brother James, the duke of York, the lord high admiral. In 1673, in the middle of the Third Dutch War, when York's unpopular conversion to Catholicism forced him to resign his office, Pepys was appointed secretary to the new commission of Admiralty and, as such, administrative head of the navy. In order to represent it in Parliament—before whom he had conducted a masterly defense of his office some years before—he became member first for Castle Rising and, later, for Harwich. For the next six years he was engaged in stamping out the corruption that had paralyzed the activities of the navy. His greatest achievement was carrying through Parliament a program that, by laying down 30 new ships of the line, restored the balance of sea power, upset by the gigantic building programs of France and the Netherlands. In his work both at the Admiralty and in Parliament, Pepys's unbending passion for efficiency and honesty (combined with a certain childlike insistence on his own virtue and capacity for being always in the right) made for him powerful and bitter enemies. One of these was Lord Shaftesbury, who in 1678 endeavoured to strike at the succession and at the Catholic successor, the Duke of York, by implicating Pepys in the mysterious murder of the London magistrate Sir Edmund Berry Godfrey, the crime on which the full credulity of the populace in the Popish Plot depended. When Pepys produced an unanswerable alibi, his enemies endeavoured to fasten Godfrey's murder on him indirectly by accusing his confidential clerk, Samuel Atkins. Despite the third-degree methods employed against him, Pepys also proved an alibi for Atkins, who would otherwise almost certainly have perished. Six months later, his enemies brought into England a picturesque scoundrel and blackmailer called John Scott, who had begun his life of crime in what today is Long Island, New York, and whom Pepys had endeavoured to have arrested at the time of Godfrey's death on account of his mysterious activities disguised as a Jesuit. Pepys was flung into the Tower on an absurd charge of treason brought against him by Scott and supported by the Exclusionists in Parliament, as also on a minor and equally unjust charge of popery, brought against him by a dismissed butler whom he had caught in bed with his favourite maid. Had not Charles II almost immediately dissolved Parliament and prevented a new one from meeting for a further year and a half, Pepys would have paid the penalty for his loyalty, efficiency, and incorruptibility with his life. He employed his respite with such energy that by the time Parliament met again he had completely blasted the reputation of his accuser by collecting circumstantial details of his infamies from almost every country.

In 1683, when the King felt strong enough to ignore his opponents, Pepys was taken back into the public service. He had accompanied the Duke of York in the previous year on a voyage to Scotland, and he now sailed as adviser to the Earl of Dartmouth to evacuate the English garrison of Tangier—a voyage that he described in a further journal.

On his return, in the spring of 1684, he was recalled by Charles II to his old post. Entitled secretary of the affairs of the Admiralty of England and remunerated by a salary of £500 per annum, he combined the modern offices of first lord and secretary of the Admiralty, both administering the service and answering for it in Parliament. For the next four and a half years, including the whole of James II's reign, Pepys was one of the greatest men in England, controlling the largest spending department of state. With his habitual courage and industry, he set himself to rebuild the naval edifice that the inefficiency and corruption of his enemies had shattered, securing in 1686 the appointment of a special commission "for the Recovery of the Navy." When, at the beginning of 1689, after James II had been driven from the country, Pepys retired, he had created a navy strong enough to maintain a long ascendancy in the world's seas. Hitherto there had been brief spells when the emergence of naval geniuses like Sir Francis Drake and Robert Blake had given England a temporary advantage over its maritime neighbours, but for long periods the English "sovereignty of the seas" had been an idle boast. When Pepys became associated with the navy in 1660, the line of battle had consisted of 30 battleships of a total burden of approximately 25,000 tons and carrying 1,730 guns. When he laid down his office, he left a battle line of 59 ships of a total burden of 66,000 tons and carrying 4,492 guns. Not only had he doubled the navy's fighting strength, but he had given it what it had never possessed before and what it never again lost—a great administrative tradition of order, discipline, and service.

"To your praises," declared the orator of Oxford University, "the whole ocean bears witness; truly, sir, you have encompassed Britain with wooden walls." Pepys's last 14 years, despite attempts by his political adversaries to molest him, were spent in honourable retirement in his riverside house in York Buildings, amassing and arranging the library that he ultimately left to Magdalene College, Cambridge, corresponding with scholars and artists, and collecting material for a history of the navy that he never lived to complete, though he published a prelude to it in 1690, describing his recent work at the Admiralty, entitled *Memoires relating to the State of the Royal Navy of England for ten years determined December 1688.* He died at the Clapham home of his former servant and lifelong friend William Hewer. His fellow diarist John Evelyn wrote of him: "He was universally belov'd, hospitable, generous, learned in many things, skilled in music, a very greate cherisher of learned men of whom he had the conversation."

The diary. The diary by which Pepys is chiefly known was kept between his 27th and 36th years. Written in Thomas Shelton's system of shorthand, or tachygraphy, with the names in longhand, it extends to 1,250,000 words, filling six quarto volumes in the Pepys Library. It is far more than an ordinary record of its writer's thoughts and actions; it is a supreme work of art, revealing on every page the capacity for selecting the small, as well as the large, essential that conveys the sense of life; and it is probably, after the Bible and James Boswell's *Life of Samuel Johnson,* the best bedside book in the English language. One can open it on any page and lose oneself in the life of Charles II's London, and of this vigorous, curious, hardworking, pleasure-loving man. Pepys wanted to find out about everything because he found everything interesting. He never seemed to have a dull moment; he could not, indeed, understand dullness. One of the more comical entries in his diary refers to a country cousin, named Stankes, who came to stay with him in London. Pepys had been looking forward to showing him the sights of the town—

> But Lord! what a stir Stankes makes, with his being crowded in the streets, and wearied in walking in London, and would not be wooed by my wife and Ashwell to go to a play, nor to White Hall, or to see the lions, though he was carried in a coach. I never could have thought there had been upon earth a man so little curious in the world as he is.

Pepys possessed the journalist's gift of summing up a scene or person in a few brilliant, arresting words. He makes us see what he sees in a flash: his Aunt James, "a poor, religious, well-meaning, good soul, talking of nothing but God Almighty, and that with so much innocence that mightily pleased me"; and his sister Pall, "a pretty, good-bodied woman and not over thick, as I thought she would have been, but full of freckles and not handsome in the face." He could describe with wonderful vividness a great scene: as, for example, the day General George Monck's soldiers unexpectedly marched into a sullen City and proclaimed there should be a free Parliament—"And Bow bells and all the bells in all the churches as we went home were a-ringing; it was past imagination, both the greatness and suddenness of it." He described, too, the Restoration and coronation; the horrors of the Plague; and the Fire of London, writing down his account—so strong was the artist in him—even as his home and its treasures were being threatened with destruction:

> We saw the fire as only one entire arch of fire from this to the other side of the bridge, and in a bow up the hill for an arch of above a mile long: it made me weep to see it. The churches, houses, and all on fire and flaming at once; and a horrid noise the flames made, and the cracking of houses at their ruine.

Above all, Pepys possessed the artist's gift of being able to select the vital moment. He makes his readers share the very life of his time: "I staid up till the bell-man came by with his bell just under my window as I was writing of this very line, and cried, 'Past one of the clock, and a cold, and frosty, windy morning.' " He tells of the guttering candle, "which makes me write thus slobberingly"; of his new watch—"But Lord! to see how much of my old folly and childishness hangs on me still that I cannot forebear carrying my watch in my hand in the coach all the afternoon and seeing what o'clock it is one hundred times"; of being awakened in the night—

> About 3 o'clock this morning I waked with the noise of the rain, having never in my life heard a more violent shower; and then the cat was locked in the chamber and kept a great mewing and leapt upon the bed, which made me I could not sleep a great while.

Pepys excluded nothing from his journal that seemed to him essential, however much it told against himself. He not only recorded his major infidelities and weaknesses; he put down all those little meannesses of thought and conduct of which all men are guilty but few admit, even to themselves. He is frank about his vanity—as, for example, in his account of the day he went to church for the first time in his new periwig: "I found that my coming in a perriwig did not prove so strange to the world as I was afeared it would, for I thought that all the church would presently have cast their eyes upon me, but I found no such thing"; about his meannesses over money, his jealousies, and his injustices—"Home and found all well, only myself somewhat vexed at my wife's neglect in leaving her scarfe, waistcoat and night dressings in the coach today; though I confess she did give them to me to look after." For he possessed in a unique degree the quality of complete honesty. He is both Everyman and the recording angel; his diary paints not only his own infirmities but the frailty of all mankind.

After the successful publication of John Evelyn's diary in 1818, Pepys's diary was transcribed—with great accuracy—by John Smith, later rector of Baldock, Hertfordshire.

A number of volumes of Pepys' correspondence have also been published. (Ar.Br.)

Pequot, any member of a group of Algonquian-speaking Indians who lived in the Thames valley in what is now Connecticut, U.S.; in the 1600s their population was estimated to be 2,200. Their subsistence was based on the cultivation of maize (corn), hunting, and fishing.

The Mohegan and the Pequot were jointly ruled by the Pequot chief Sassacus until a rebellion of the subchief Uncas that resulted in Mohegan independence. From 1620 the Pequot and British settlers had lived side by side in mutual helpfulness and peaceful trade. Gradually, however, Pequot resentment swelled against new colonists who pushed their way westward frequently in a high-handed manner. The Pequot were especially fearful of British territorial intrusion because they were already squeezed into the region between Narragansett Bay and the Connecticut River. The tribe had also stirred the ire of the British by limiting its trade to the Dutch.

Several incidents had taken place between the Pequots and the settlers before the summer of 1636, when a Boston trader was murdered, presumably by a Pequot, on Block Island. A punitive expedition that was sent by Massachusetts authorities to destroy native villages and crops only succeeded in arousing the tribe to make a more determined defense of its homeland. Puritan clergymen encouraged violence against the Pequots, whom they regarded as infidels, and the British settlers agreed to take up arms.

In a short but vicious war, fought under Captain John Mason with the aid of Mohegans and Narragansets, the main Pequot fort at Mystic, Conn., was surprised and burned, and between 500 and 600 inhabitants were burned alive or slaughtered. Defeated, some Pequot decided to separate into small bands and abandon the area; many who fled were killed or captured by other Indians or the English; many were sold into slavery in New England or the West Indies, and the Mohegan obtained control of Pequot lands. Those who surrendered were distributed among other tribes, but received such harsh treatment that in 1655 they were placed under the direct control of the colonial government and resettled on the Mystic River. Their numbers declined rapidly, and in the late 20th century there were approximately 200 members of the tribe.

Per-Month (town, Egypt): *see* Hermonthis.

Per Ramessu, also called PI RAMESSE, biblical RAAMSES, modern QANTÎR, KHATÂ'NA, or TALL AD-DABA'A, ancient Egyptian capital in the 15th, 19th, and 20th dynasties. Situated in the northeastern delta about 62 miles (100 km) northeast of Cairo, the city lay in ancient times on the Bubastite branch of the Nile.

Probably founded in the Old Kingdom, the city was overrun by Palestinian peoples in about 1700 BC and became the Hyksos capital about 1530 BC. Sacked by the victorious pharaoh Ahmose about 1521 BC, it remained obscure until the advent of the 19th dynasty, whose home was nearby. Sometime during this period the Hebrews settled in this area.

Seti I (1290–79 BC) built a palace on the site and started a faience-manufacturing industry. His successor, Ramses II, decided to move his capital there to utilize the military potential of the site. Early in his reign large temples, residences, storehouses, docks, and military facilities were built (whence the biblical name "treasure cities" stemmed, Exodus 1:11). The city was divided into four quarters, each dedicated to a deity; Amon and Wadjit were the Egyptian gods, Seth and Astarte the Asiatic, as Ramses strove to bind the religions of Syria and Egypt. In the centre of the city, the cult of the king himself was dominant. The city was not only the royal residence but also the administrative capital, as various government bureaucracies were moved here. A rich agricultural and riverine hinterland provided food and recreation for the populace. Oriented toward Egypt's empire in Syria-Palestine, the city began to decline after the loss of the Asiatic territory in the mid-20th dynasty. Toward the end of that dynasty, the town of Tanis, 15 miles (24 km) to the north, superseded Per Ramessu. The final blow was the transfer of the royal residence to Tanis in the 21st dynasty. It was the large-scale plunder and reuse of the stone of Per Ramessu that led to great confusion over the location of the Ramesside capital. Excavations started in the 1940s by Egyptian archaeologists and carried forward by an Austrian expedition since 1975 have firmly located Ramses II's capital here and also have elucidated the Hyksos period of the city.

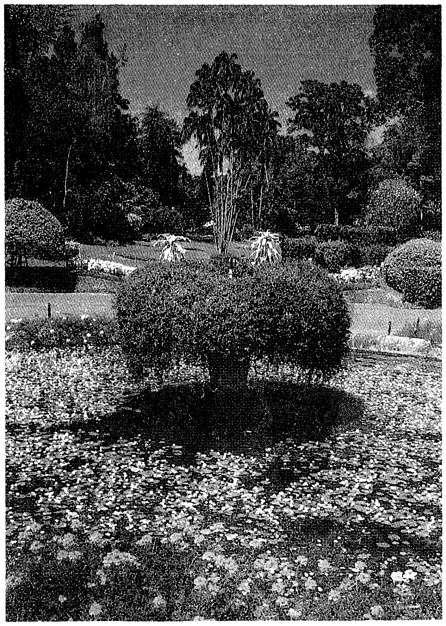
Peradeniya Botanic Gardens, botanical garden in Peradeniya, near Kandy, Sri Lanka, noted for its rich and varied collections of tropical woody plants. Occupying 59 hectares (146 acres), it has about 4,000 species of plants. The most important specimens of the garden include palms, some of which are planted in impressive avenues. Significant, too, are the collections of orchids, gymnosperms, and flowering trees.

The gardens were founded in 1821 primarily to introduce coffee trees and various other tropical plants of economic importance to the region. Even after it took on a more botanical emphasis in the 1840s, the garden remained a centre for horticultural activities.



Peradeniya Botanic Gardens, in Peradeniya, Sri Lanka
Robert Harding Picture Library

Under the directorship of the botanist George H.K. Thwaites, the garden played a pivotal role in establishing the country's flourishing tea industry in the late 1870s. Thwaites also brought in and cultivated the Brazilian rubber tree, which became a crop producer vital to the nation's economy. The botanical collection has developed into one of the finest in the region.

Perak, traditional region, northwestern West Malaysia (Malaya), bordering Thailand to the north and fronting the Strait of Malacca to the west. Its area includes a large portion of West Malaysia's west-coast plains and centres upon the Perak River, which flows north to south between the Keledang Range to the east and the Bintang Range to the west; both of these mountain ranges lie east of the west-coast plains. The name Perak means "tin."

Chiefly because of its deposits of tin, the region was subject to many foreign and domestic incursions. Malacca fell to the Portuguese in 1511, and it was then that Perak began to emerge as an independent state. The region was particularly harassed by the Achinese, who managed to capture four sultans of Perak and thousands of their subjects between 1575 and 1675 and who were effectively the overlords of Perak. Several Dutch attempts to control tin exports resulted in a 1765 treaty with the sultan of Perak, but the most serious threat to the state was actually from its Bugis neighbours to the south. British influence, which began with an 1818 trade treaty, was extended in 1826, when the Dindings coastal strip and Pangkor Island offshore were ceded to them as bases for pirate suppression. In the Pangkor Engagement (1874), the chiefs accepted a British resident, and Perak became one of the Federated Malay States (1896). The Dindings and Pangkor were returned in 1935 to Perak, which joined the Federation of Malaya after World War II.

Tin mining is still carried on in the region, particularly in Kinta Valley (*q.v.*). Much of the region remains jungle, and the Keledang and Bintang ranges are roadless and sparsely inhabited; there is, however, a good network of roads supported by the Malayan Railway along the foothills of these ranges.

Lake Chenderoh in north-central Perak is the site of a hydroelectric dam on the Perak River that supplies power to the valley. Rubber production, paddy (rice) farming, coconut plantations, and fishing are also important. Tobacco is grown as an off-season cash crop in paddy areas. Iron is mined, and there are coal deposits in the region.

Perak, Tun (d. 1498), *bendahara* (chief minister) of Malacca (now Melaka), who was kingmaker and the effective ruler of that important East Indies trade centre from 1456 until his death in 1498.

A leader in the Malay defeat of a Siamese invasion in 1445–46, Tun Perak was made *bendahara* by Sultan Muzaffar Shah in 1456, when he again led Malacca's forces in a decisive defeat of the Siamese. He proceeded with an aggressive foreign policy that resulted in a loose empire taking in the whole southern half of the Malay Peninsula and a portion of the east coast of Sumatra. Muzaffar Shah died about 1459, and the next three sultans, Mansur Shah, Ala'ud'din, and Mahmud Shah, who were all related to Tun Perak, apparently owed their positions to his influence.

Perak War (*c.* 1874–76), rebellion against the British by a group of dissident Malay chiefs that culminated in the assassination in 1875 of James Birch, the first British resident (adviser) in Perak. Although they succeeded in eliminating Birch, the Malay leaders failed in their ultimate objective—the curbing of British economic and political influence in the area.

Birch arrived in Perak in November 1874 to take up the post of resident (*i.e.,* official British adviser to the sultan), which had been created as part of the Pangkor Engagement, a treaty between the British government and the Malay chiefs. Birch hoped through his influence to have Raja Abdullah accepted as sultan in Upper Perak and to modernize the traditional administrative system, under which government had been based on personal relationships between the sultan and the chiefs. Because of rapid and revolutionary administrative change, especially concerning revenue collection and slavery, the resident soon alienated Abdullah and most local chiefs.

At a meeting in July 1875, the sultan organized a movement to kill Birch and end foreign influence in Perak. When Birch was in Upper Perak posting new tax proclamations, one of the chiefs, Maharaja Lela, and his men assassinated him. An attack on the residency itself failed to materialize. Subsequent British military action crushed weak Malay resistance; the plotters were arrested by mid-1876 and were later tried. Abdullah was deposed as sultan, and the rebel chiefs were severely punished. Subsequent British residents attempted to work through Malay rulers and to avoid drastic changes in traditional institutions.

Peralta, Pedro de (b. *c.* 1584, Spain—d. 1666, Madrid), Spanish colonial official and founder of Santa Fe, N. M.

Peralta arrived in Mexico City during the winter of 1608–09 following his university studies in Spain. In March 1609 the viceroy of Mexico appointed him to the post of governor of New Mexico; and, from April to October of that year, Peralta organized an expedition to that province. He evidently reached the colony's San Gabriel settlement by the following spring. He then founded another settlement at Santa Fe.

Peralta's authority as governor of New Mexico was challenged by the Franciscan missionaries. In 1612 one of the missionaries, Fray Isidrio de Ordoñez, declared Peralta a "schismatic heretic" and proclaimed that he was excommunicated. A short time thereafter, Peralta was arrested and was imprisoned for almost a year, until he sent word of his situation to the viceroy, who forthwith ordered his release.

Peralta continued to serve the Spanish monarchy in the Americas even after he no longer acted as governor of New Mexico. He became lieutenant commander of the Pacific seaport of Acapulco, and he was appointed alcalde of Mexico City's royal warehouse, 1621–22. In 1637 he traveled to Caracas, Venezuela, where he married and entered a commercial enterprise. From 1644 to 1652 he served as auditor and, later, treasurer of the royal treasury in Caracas. He returned to Spain in the latter year, after sustaining injuries from residents who resented his attempts to collect debts owed to the monarchy. He resigned his commission in 1654 and lived in retirement in Madrid until his death.

Peranakan, in Indonesia, a native-born person of mixed Indonesian and foreign ancestry. There are several kinds of Peranakans in Indonesia, namely Peranakan Chinese, Peranakan Arabs, Peranakan Dutch, and Peranakan Indians. The Peranakan Chinese form the largest and the most important group, and for this reason many scholars use Peranakan to refer to the Chinese group.

Until the end of the 19th century, immigration of Chinese was limited because of difficulties in transportation. Most of those who reached Java, mainly from the southern provinces of China, married indigenous women, usually nominal Muslims or non-Muslims.

In time they formed a stable Peranakan Chinese community. Peranakans partly adopted the indigenous way of life and generally spoke the local native tongue rather than Chinese. Along the northern coast of Java, where most of the Chinese lived, a combination of Bazaar Malay and Hokkien dialect was used as a common language, and this language was later known as Bahasa Melaju Tionghoa (Chinese Malay). The Peranakan Chinese community was firmly established by the mid-19th century and had become self-contained with a decline in intermarriage. New immigrants continued to be rapidly assimilated into the Peranakan community because there was no mass immigration.

In the early 20th century a great increase in the number of Chinese immigrants (including women) in Java, the dynamics of Chinese nationalism, and the development of Chinese medium schools contributed to the shaping of a Totok (an Indonesian term for foreign-born people) Chinese community. Unlike the Peranakan Chinese, Totok Chinese were born in China, still spoke a Chinese dialect or Mandarin, and were frequently strongly China-oriented.

Despite the rapid growth of the Totok community, they were overwhelmingly outnumbered by the Peranakan Chinese. In 1930, for example, Indonesia-born Chinese constituted more than 79 percent of all the Chinese in Java, and about 53 percent of the total were at least third generation. But they were by no means a homogeneous political group. Before World War II there were three political streams in the Peranakan Chinese community—the Sin Po group, which was China-oriented; the Chung Hwa Hui, which was Dutch East Indies-oriented; and the Partai Tionghoa Indonesia, which was Indonesia-oriented. These three groups were dissolved during the Japanese occupation (1942–45).

Percé, city, seat of Pabok *municipalité régionale de comté* (regional county), Bas-Saint-

Laurent-Gaspésie region, eastern Quebec province, Canada, on the Gulf of St. Lawrence, at the east end of the Gaspé Peninsula. First visited in 1659 by Bishop François Laval, it has been the site of a Roman Catholic mission since 1670. Percé is now a fishing port and summer resort. Offshore, but connected by a sandbar at low tide, is famed Rocher-Percé (Pierced Rock)—a rocky island 290 feet (88 m) high that is pierced by a 60-foot-(18-metre-) high arch; it and another nearby tourist attraction, Bonaventure Island, are bird sanctuaries. Pop. (1981) 4,839.

perception, the process whereby sensory stimulation is translated into organized or meaningful experience.

A brief treatment of perception follows. For full treatment, *see* MACROPAEDIA: Perception, Human.

The perceptual process is not directly observable, but relations can be found between the various types of stimulation and their associated experiences or percepts. Empirical demonstration of the difference between sensation and perception has been a classical problem, largely because of a lack of agreement about the definition of the two terms. A common distinction is that sensations are simple sensory experiences while percepts are complex constructions of simple elements that have been joined through association. Another distinction is that perceiving is subject to the influence of learning. Percepts have also been characterized as relating to external objects while sensations are more subjective and are internally localized experiences. An anatomical distinction identifies sensation with neural events occurring near the sense organ, while percepts happen at the level of the brain.

Experimental evidence suggests that percepts follow a measurable, developmental time course, and may even change with time or yield more than one percept. Such devices as the tachistoscope, which permit the duration of visual stimuli to be precisely controlled, have indicated that in human beings there is a brief period (100 to 200 milliseconds at most) during which a percept is highly vulnerable to disruption.

Theorists have been divided as to whether perceptual organization is primarily innate or learned. Research has suggested that some basic visual functions, such as pattern and depth perception, are innate, but that visual experience is important to perceptual development.

Structuralist theory states that percepts are structured or synthesized from sensations. To study this concept, Edward Bradford Titchener devised a means of taking percepts apart to reveal their constitutional elements. Through the use of a device that moves the image source along with the eye, it was discovered that stabilized images seem to disappear and that some movement in retinal image is needed to maintain perception over extended periods of time.

Gestalt theorists Max Wertheimer, Kurt Koffka, and Wolfgang Köhler rejected the assumption that perceptual organization was the product of learned relationships. They agreed that simple sensations could comprise organized percepts, but they maintained that percepts were basic to experience and that the human experience is of organized wholes (Gestalten) rather than collections of elements. The mind tends to fill in small gaps in a figure in order to perceive a logical whole. Not only do patterns have properties that are not inherent in the elements themselves, but, according to the principle of Prägnanz, the perceived pattern will be as good as prevailing conditions permit. A good configuration is inferred to have such properties as simplicity, stability, regularity, symmetry, continuity, and unity.

Gestalt theory states that the ground (background) of a figure provides a great deal of perceptual information. The apparent brightness of a stimulus, for example, depends on the surrounding stimulation as well as the figure's own luminance.

Perceptual processes may become fatigued by prolonged visual exposure to an image. Figural aftereffects refer to changes in the perceived shape or location of a figure following its inspection. Most objects tend to appear stable despite continually changing stimulus features. Perceptual constancy prevails, given the appropriate contextual cues, enabling an observer to match an object as it is perceived with the object as it is understood to exist.

Perceptual functioning varies among cultures, among individuals, and even within the same individual. Perceptions may be influenced by expectancies, needs, unconscious ideas, values, and conflicts; people have a tendency to impose order and meaning upon their experiences. *See also* movement perception; space perception; time perception.

perceptual constancy, also called OBJECT CONSTANCY, or CONSTANCY PHENOMENON, the tendency of animals and man to see familiar objects as having standard shape, size, colour, or location regardless of changes in the angle of perspective, distance, or lighting. The impression tends to conform to the object as it is or is assumed to be, rather than to the actual stimulus. Perceptual constancy is responsible for the ability to identify objects under various conditions, which seem to be "taken into account" during a process of mental reconstitution of the known image. For example, snow appears white in the low illumination of moonlight, as well as in sunlight 800,000 times as bright. Perceptual constancy is reduced by limited experience with the object and by decreasing the number of environmental cues that aid in identification of the object.

perceptual learning, the effects of past experience on sensory perceptions.

A brief treatment of perceptual learning follows. For full treatment, *see* MACROPAEDIA: Perception, Human.

An organism's readiness to learn is of primary importance to its survival, and this readiness depends largely on its perceptual skills. Perceptual skills are intimately involved in producing more effective responses to stimuli.

Historically, perceptual learning has been the subject of vigorous debate. Although early Gestalt psychologists denied that learning modifies perceiving, that this occurs is now almost universally accepted. Research continues to examine the extent of modification and how modification occurs. There are two main schools of thought: discovery and enrichment. The discovery theory holds that learning makes one aware of stimuli one had previously overlooked. Enrichment refers to one's increased awareness and heightened response capabilities in the light of a learning experience. It is very possible that discovery and enrichment may simply describe different aspects of perceptual learning.

One aspect of the enrichment thesis holds that learning determines how one interprets common spatial relationships. For example, one learns to assume that a plate remains circular even though it may appear elliptical when viewed from certain angles. In fact, say theorists, these kinds of assumptions are essential in reducing ambiguity for mature perceiving.

In the laboratory, perceptual learning has been tested and measured by observing the effects of practice on perceptual abilities. Subjects are given various auditory, olfactory, and visual acuity tests. With practice, subjects improve their scores, indicating that perceptual abilities are not immutable but are modifiable by learning. Researchers have also discovered through studies with newborn animals and with laboratory subjects adjusting to prism-distorted vision that active, exploratory interaction with the environment greatly enhances perceptual learning.

In studies of animal behaviour, the term perceptual learning is sometimes used to refer to those instances in which an animal learns to identify a complex set of stimuli that can be used to guide subsequent behaviour. Examples of such perceptual learning include imitation and observational learning, song learning in birds, and imprinting in birds and mammals. *See* learning.

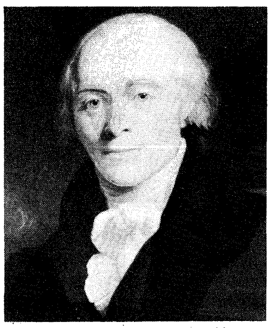
Perceval, hero of Arthurian romance, distinguished by his quality of childlike (often uncouth) innocence, which protected him from worldly temptation and set him apart from other knights in Arthur's fellowship. This quality also links his story with the primitive folktale theme of a great fool or simple hero. In Chrétien de Troyes's poem *Le Conte du Graal* (12th century), Perceval's great adventure was a visit to the castle of the wounded Fisher King, where he saw a mysterious dish (or grail) but, having previously been scolded for asking too many questions, failed to ask the question that would have healed the Fisher King. Afterward, he set off in search of the Grail and gradually learned the true meaning of chivalry and its close connection with the teachings of the church. In later elaborations of the Grail theme, the pure knight Sir Galahad displaced him as Grail hero, though Perceval continued to play an important part in the quest.

The story of Perceval's spiritual development from simpleton to Grail keeper received its finest treatment in Wolfram von Eschenbach's great 13th-century epic, *Parzival.* This poem was the basis of Wagner's last opera, *Parsifal* (1882).

Perceval, John: *see* Egmont, John Perceval, 2nd earl of.

Perceval, Spencer (b. Nov. 1, 1762, London—d. May 11, 1812, London), lawyer, politician, and British prime minister from 1809 until his assassination in 1812.

The second son of the 2nd Earl of Egmont, Perceval was educated at Harrow and at Trinity College, Cambridge; he was called to the bar by Lincoln's Inn in 1786 and became a king's counsel in 1796. In the same year he entered Parliament, where his rise to power was facilitated through his contacts with William Pitt the Younger. On the formation of the government of Henry Addington (1801–04), which succeeded that of Pitt, he was appointed solicitor general. From 1802 and through Pitt's second administration (1804–06) he was attorney general.

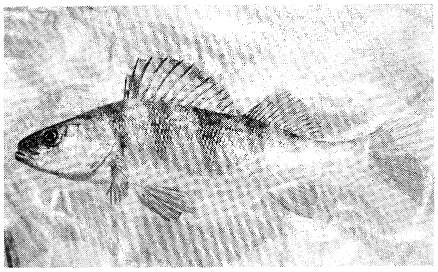


Spencer Perceval, detail of an oil painting by G.F. Joseph, 1812; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

When King George III dismissed William Grenville's ministry in March 1807, Perceval, an ardent opponent of Catholic emancipation, became chancellor of the Exchequer and chancellor of the duchy of Lancaster under the 3rd Duke of Portland, whom he succeeded as prime minister on Oct. 4, 1809. His administration was marked by strong opposition to the tolerant views that had ruined his predecessors; and he is one of the few English statesmen of the period notorious for his extreme religious intolerance. He was a man of a cold, ungenial nature. Perceval was shot and killed in the House of Commons by John Bellingham, a deranged man who had vainly applied to him for redress of a personal complaint against the government.

perch, either of two species of fish, the common and the yellow perch (*Perca fluviatilis* and *P. flavescens,* sometimes considered as single species, *P. fluviatilis*) of the family Percidae (order Perciformes). The name also is widely, and sometimes confusingly, applied to a variety of other fishes.



Yellow perch (*Perca flavescens*)
L.M. Chace from The National Audubon Society Collection/Photo Researchers—EB Inc.

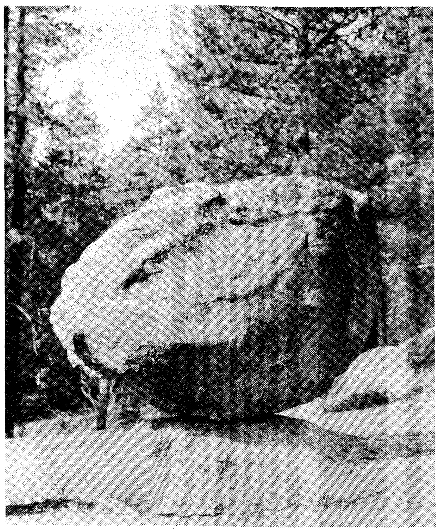
The common and yellow perches are found, respectively, in the fresh waters of Eurasia and North America. Both are well-known and popular as both food and sport fishes. They have two dorsal fins, the first spiny and the second soft-rayed.

Perches are carnivores and inhabit quiet ponds, lakes, streams, and rivers. They spawn in spring, the female at that time laying strings of eggs in the shallows among water plants, branches, and the like. The common, or European, perch is greenish with dark, vertical bars on the sides and reddish or orange colouring in the lower fins. It grows to a maximum weight of about 3 kg (6 pounds), rarely more. The yellow perch, native to eastern North America and introduced on the Pacific coast, is similar to the European perch but yellower in colour. It grows to about 40 cm (15 inches) and 1 kg (2.2 pounds).

Other perchlike and perch-named fishes include the pikeperch (*q.v.*), also of the family Percidae; the surfperch (*q.v.*); and the white perch, a relative of the sea bass (*q.v.*).

Perche, region of northern France on the border of Normandie, mainly in the east of the Orne *département,* with extensions into neighbouring *départements.* Formerly a county, it was united to the French crown in 1525. It is largely hilly country, the Perche Hills having summits as high as 1,000 feet (300 m). Perche is a district of pastoral farming and dairying, famous for its breed of draft horses (Percherons). Mortagne-au-Perche and Nogent-le-Rotrou, the chief market towns, were at different times capitals of Perche county.

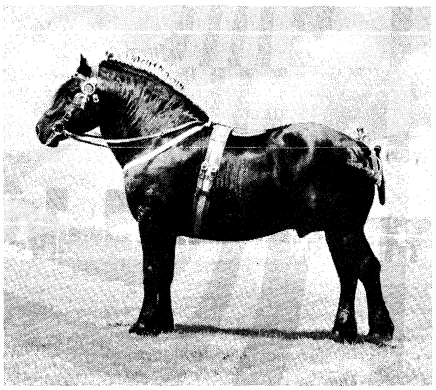
perched rock, also called MUSHROOM ROCK, or PEDESTAL ROCK, boulder balanced on a pinnacle rock, another boulder, or in some other precarious position. Some perched rocks form in place, as where rainwash (and in some cases wind) has removed fine material from around the boulder. Others may be transported by tectonic forces (involved in deformation of the Earth's crust) or by ice (such as erratics, or glacier transports) and let down to an unsettled position. Perched rocks commonly have



Glacial erratic perched on low pedestal of massive granite, Tulare County, California
By courtesy of the U.S. Geological Survey, Washington, D.C.

a hard capping, such as ferruginous duricrust, and they often show crumbling or exudation around their sides.

Percheron, heavy draft-horse breed that originated in the Perche region of France. The breed probably stems from the Flemish "great horse" of the Middle Ages; modified by Oriental blood to develop a coach-horse type, it was changed again in the 19th century by introduction of draft-type blood to produce animals for heavy farm work. Although a few Percherons were imported earlier, they did not



Percheron
Sally Anne Thompson—EB Inc.

become popular draft animals in the United States until after 1851. Before mechanization revolutionized farming, Percherons were widespread and influenced American agriculture more than any other draft breed.

Percherons average 16 to 17 hands (64 to 68 inches, or 163 to 173 cm) high and weigh 1,900 to 2,100 pounds (860 to 950 kg). The head is fairly small and clean cut, the neck long, and the body well muscled. Common colours are black and gray. Percherons are agile and energetic for their size and display a mild disposition. The Percheron Horse Association of America and its predecessor organizations date from 1902.

perching bird: *see* passeriform.

perching duck, any of the species of the tribe Cairinini, family Anatidae (order Anseriformes), waterfowl that typically inhabit wet woodlands, nest in holes in trees, and perch on branches by means of their long-clawed toes. The tribe is widely represented, especially in the tropics. Perching ducks are closely akin to dabbling ducks, which they resemble in feeding habits and, in some species, courtship behaviour; in other respects they are like shelducks. Some possess a bony knob at the wing bend, and most forms show white wing patches and black wing linings. Drakes are larger than hens and, on the whole, more brightly patterned—sometimes in metallic colours.

Best known among the perching ducks are: the North American wood duck (*Aix sponsa*), or Carolina duck, and its Asian relative, the mandarin duck (*A. galericulata*), both exceptionally colourful; and the Muscovy duck (*Cairina moschata*), of Mexico to Peru and Uruguay. The smallest of waterfowl are the little-known perching ducks of tropical forests, the so-called pygmy geese (*Nettapus* species).

perchloroethylene: *see* tetrachloroethylene.

Percier, Charles; and Fontaine, Pierre (-François-Léonard) (respectively b. Aug. 22, 1764, Paris—d. Sept. 5, 1838, Paris; b. Sept. 20, 1762, Pontoise, Fr.—d. Oct. 10, 1853, Paris), pair of French architects and interior designers who carried out many building and decorative projects during the reign of Napoleon I and helped create the influential Empire style (*q.v.*) of interior decoration.

Percier and Fontaine became acquainted with each other while both were studying architecture in Paris. Percier won the Prix de Rome in 1786 and spent the following years studying in Rome with Fontaine, who became his lifelong friend. They returned to Paris in 1790 and set up their own practice; their work eventually attracted the attention of Josephine Bonaparte, Napoleon's wife, and she engaged them to renovate her Château de Malmaison (1800–02). From then on the Bonapartes became their principal patrons.

In their subsequent decorative work Percier and Fontaine virtually invented the severe but elegant Neoclassical blend of Greco-Roman and Egyptian forms and motifs that became known as the Empire style. They redid interiors, walls, and ceilings and designed furniture, accessories, and ornament for the old royal palaces and the new residences of the Bonapartes. Much of their work was done on the Louvre and the Tuileries palaces; they designed the arcades of the rue de Rivoli and the rue de Castiglione along the Louvre and designed the Arc de Triomphe du Carrousel connecting the Louvre and Tuileries (1806–08). They also worked on the Château de Saint-Cloud and the Château de Fontainebleau.

Financing grew scarce in the later years of the Empire, and the return of the Bourbons in 1814 aborted several grandiose Napoleonic building projects and sent Percier into permanent retirement. Fontaine remained active, designing the sombre Neoclassical Chapelle Expiatoire (1815–26) in Paris and continuing to restore the Louvre-Tuileries complex under both Charles X and Louis-Philippe. He retired in 1848.

perciform, any member of the order Perciformes, a group of bony fishes with more than 6,000 species placed in about 150 families. The group includes some of the most important food and game fishes, such as the tunas, mackerels, marlins, perches, and sea basses.

A brief treatment of perciforms follows. For full treatment, *see* MACROPAEDIA: Fishes.

Most perciforms range from 30 to 250 cm (about 1 to 8 feet) in length, but the smallest species, the freshwater goby of the Philippines, measures barely half an inch in length. By contrast, among the largest perciforms are the bluefin tuna and the Indo-Pacific black marlin, which can reach 680 kg (1,500 pounds) in weight.

Perciforms are found all over the world. Among the Antarctic species, which comprise about three-fourths of all Antarctic fishes, the best known is the icefish, noted for its almost transparent appearance. The Indo-West Pacific fishes are also largely made up of perciforms, including the wrasse, goby, and damselfish. Freshwater perciforms include the cichlid, which is found in India, Africa, and North and South America, and the perch and sunfish families found in North America and Europe.

Since the earliest times, perciforms have been an important food source for humans. In Scotland, archaeologists have found evidence of the sea bream being eaten in shell mounds. Nile perches have been found as mummies in Egypt, wrapped up and buried with the dead. Goatfishes (Nullidae) were considered a valuable food by the ancient Romans; in Japan they are eaten raw as *sashimi* or dried in cakes as *kamaboko*. Isinglass, used to make jellies and to clarify wine and beer, is obtained from the drums and the threadfins. Leather is provided by the skin of the wolffish, and artificial pearls are made in Japan with guanin, found in the skin of the Japanese cutlass fish.

Some perciforms have strange habits. A group of blenny lays eggs in the cavity of a living sponge. The young of the black sea bass are mostly born female, but within five years many of them change into males. Eleven species of the sparids are hermaphroditic at some time or even throughout their lifetimes. Most perciform eggs are fertilized in the water, but some species have internal fertilization. Many species are very protective of their young.

Some perciforms form interesting relationships with other marine species. The cleaner fishes, a type of wrasse, remove parasites from inside the mouths of larger predator fishes. The saber-toothed blenny (*Aspidonotus taeniatus*) mimics the cleaner fish but takes a quick bite of fin instead of cleaning. Some fish survive by similar imitations: young tripletails (Lobotidae) turn on their sides and drift like dead leaves. Another blenny mimics a wrasse for both food and protection.

percussion, medical diagnostic procedure that entails striking the body directly or indirectly with short, sharp taps of a finger, or, rarely, a hammer. The procedure was first described in 1761 by the Austrian physician Leopold Auenbrugger von Auenbrugg. Although generally ignored by his contemporaries, it is now routinely employed. The sounds produced by the procedure are helpful in determining the size and position of various internal organs, in revealing the presence of fluid or air in the chest, and in aiding in the diagnosis of pneumonia or pulmonary tuberculosis.

percussion instrument, any musical instrument, among the oldest known, from which sound is produced mainly by striking. There are two main classes of percussion instruments: idiophones, which emit sound when their own substance vibrates (such as bells, cymbals, and castanets), and membranophones, which emit sound when an attached, stretched membrane vibrates (such as drums). Each group contains instruments of both definite and indefinite pitch; timpani, bells, and xylophones are tuned to definite pitches, while snare drums, triangles, clappers, rattles, and cymbals are of indefinite pitch. Both types serve chiefly to delineate rhythm, though the tunable instruments may also be used for melody. Percussion instruments form the third section of the Western orchestra.

A brief treatment of percussion instruments follows. For full treatment, *see* MACROPAEDIA: Musical Instruments.

Idiophones. In the early Stone Age man began to use noisemakers. Notched bones or gourds, which emitted a rasping sound when scraped with a stick, and rattles, which were either gourds filled with pebbles or cords strung with shells, seeds, or teeth, were the first idiophones. Another primitive instrument was the slit-drum, a tree trunk hollowed out in a narrow lengthwise slit, laid over a pit in the ground, and either stamped on or beaten with sticks.

The earliest Greek idiophones were the *krotala* (clappers resembling castanets, made of wood or cane) and the *kymbala*, early cymbals (metal plates made slightly concave, so that only the edges strike each other). The ancient Greek and Roman chorus leaders used a foot-clapper as a timebeating instrument, known in Rome as the *scabellum*, and in Greece as the *kroupalon*. These instruments served a primarily ritual function and from the Stone Age to Greek and Roman times retained a magical significance. Bells were believed capable of warding off evil spirits. Clappers and cymbals were used by women who followed the cult of Dionysus and had a religious as well as a secular function. These ideas carried over into medieval times, when clappers and bells were used in Christian religious ceremonies. *Cymbala*, or bell chimes, may have been taken to Europe from Byzantium. They consisted of a stand with metal cups (hemispherical or tulip-shaped) tuned to the diatonic scale (as represented by the white notes of a modern keyboard) and were quite popular in the Middle Ages. As the bells used became larger these chimes developed into the carillon. This was activated mechanically by a rotating cylinder set with nails (not unlike the modern music box), which caused hammers to strike the bells, playing a tune. In northern Europe they were set in church towers and activated by the tower clock.

Other idiophones that served extra-musical purposes in medieval times were clappers ("bones" or tabulae), carried by lepers as a warning, and jingles (small bells), worn for their magical powers in tournaments and battles. The triangle (a small steel triangle with an open corner, struck with an iron rod) first appeared in the 15th century. It is of indefinite pitch, and has the property of picking up the harmonics (acoustical vibrations) of other instruments.

The rise in importance of instrumental music during the Renaissance had profound influence and effects on the uses of idiophones. Rather than merely being used as an accompaniment to songs or dances, or for their ritual or magical effects, their capacity for melody was gradually exploited. By the 16th century the carillon could be played by a keyboard, increasing its melodic function. The xylophone, an import from Indonesia, consisted of tuned wooden bars struck with hammers. The first xylophones were known as "straw fiddles" as the wooden bars rested on straw rolls.

Cymbals, castanets (small wooden clappers played in pairs), and triangles fell out of favour in the Renaissance, but with the rise in popularity of "Turkish music" (an imitation of Turkish Janissary bands) in the late 18th century, they came back into use, providing "local colour," particularly in opera and military music.

In the early 18th century the Glockenspiel, a development of the carillon, came into favour. In this instrument the bells were replaced by bronze bars. The bell lyre, a portable version, was used in military bands. The celesta, a modern form of Glockenspiel with a keyboard, makes use of metal bars under which hang tuned wooden resonators.

More recently developed, and in common use in today's orchestras, are tubular bells. These are graduated steel tubes suspended from a frame, struck with rawhide hammers. Modern instruments consist of two rows of bells, forming a chromatic scale (all 12 notes of the octave), whereas earlier examples had one row, encompassing a diatonic scale.

A less common idiophone is the Chinese gong (tam-tam), a hammered bronze disk of indeterminate pitch, struck by a hammer. This was imported to Europe about the time of the French Revolution (late 18th century) and is often used in theatrical music. More obscure is the glass harmonica, developed from musical glasses of different sizes that contained water and emitted a pitch when the rims were rubbed by the players' fingers. These attracted the attention of Benjamin Franklin, who in 1763 invented the glass harmonica, enabling the performer to play chords on what had previously been a monophonic (single-voiced) instrument. Both Ludwig van Beethoven and Wolfgang Amadeus Mozart wrote pieces for this instrument, but it was abandoned when it was found that continuous friction of the sensitive fingertips on the glass caused severe nervous disorders.

With the exception of the glass harmonica, most of the instruments mentioned are still used in modern orchestras. The xylophone and its relatives the marimba and vibraphone are popular with jazz musicians. The marimba, a South American adaptation, is a larger version of the xylophone, with tuned metal resonators beneath its bars. The vibraphone uses graduated metal bars, under which are metal resonators that open and close using an electric motor, giving it a unique vibrato effect.

Membranophones. The history and development of membranophones naturally runs parallel to that of idiophones. The earliest drums were struck by hand and later by sticks, the change coming roughly with the change from snake or lizard skin to the use of large animal skins for the membrane. Tubular drums were originally sections of tree trunks, with a skin stretched over the top. Smaller portable drums were developed, made from gourds, clay vessels, or wood. Another type of early drum was the frame drum, a hoop over which was stretched a single skin or two parallel skins. The tympanon, an ancient Greek drum, was of this type.

In the early Middle Ages drums were not in common use in western Europe. In the 12th century the tabor, a small two-headed drum that was fastened to the left arm and played in conjunction with a small pipe, appeared. The tabor often has a snare, consisting of gut strings that create a rasping sound when the drum is beaten. Other instruments of the time were the naker or nacaire (small kettledrums, always in pairs), and the tambourine, a small one-sided frame drum with jingles set into the frame. These were generally used for beating time, an accompaniment to singing and dancing.

By the mid-15th century the kettledrum had grown, now consisting of a large copper caldron with a calf-skin head, and was used in military and ceremonial music (usually with trumpets). The tabor developed into the snare, or side, drum, so-called because it hung at the drummer's side, and was also used by the military. The tenor drum is a large, deeper, unsnared side drum. In the early 17th century kettledrums began to be used in the orchestra in pairs, tuned to the keynote of the piece and a fourth below. Modern kettledrums, or timpani, have a range of approximately five notes and can be tuned according to the tension of the head, either by T-shaped screws or pedals. The bass drum, usually about 34 inches across, was first used in "Turkish music," and is still a member of the modern orchestra.

The most striking development in 20th century Western music has been the expanded use of all types of percussion instruments. As they were previously used for rhythmic impetus, or for melody, they are now exploited for their extreme variety of tone colour, or timbre (the distinctive sound unique to each instrument). Western composers' fascination with Eastern music has led to the use of Asian and African instruments (such as wood blocks, temple blocks, wood and glass chimes, and the slit-drum). The Latin American influence is felt largely in jazz with the use of marimbas and bongo drums. Many avant-garde composers experiment with creating different timbres within an existing framework, such as stroking the edge of a cymbal with a bow or a saw.

Percy FAMILY, English family renowned in history and ballad for its role in medieval, Tudor, and Stuart times.

The family was founded by William de Percy (*c.* 1030–96), a follower of William I the Conqueror, who bestowed on him a great fief in Yorkshire and Lincolnshire. His grandson William (d. 1175) was the last of the house in the direct line, leaving two daughters and coheiresses, Maud, who died childless, and Agnes. Agnes de Percy married Josceline de Louvain, and from this marriage descended the second house of Percy (which name it assumed), until its own extinction in the male line five centuries later (1670).

A descendant of the union of Agnes and Josceline, Henry de Percy (1273–1314) was one of Edward I's most active agents in the subjugation of Scotland until the success of Robert de Bruce made him withdraw into England. Summoned to Parliament as a baron in the time of Edward I, he later, as one of the lords ordainer, supported the baronial opposition to the personal rule of Edward II. Hitherto the family had been mainly connected with Yorkshire, but Henry gave its fortunes a new direction by his purchase of lands in Northumberland. Henceforth the Percys, now the greatest landowners in Northumberland, became the principal guardians of the northeastern border against the Scots, and successive members of the family served regularly as wardens of the Scottish Marches.

Henry de Percy (1341–1408), marshal of England, was created Earl of Northumberland at Richard II's coronation in 1377. He served Richard in numerous capacities but after 1398 supported the Duke of Hereford (afterward Henry IV) and took a prominent part in Richard's abdication. His son, Sir Henry Percy, known as Hotspur, figures prominently in William Shakespeare's history play *1 Henry IV.* Hotspur was killed at the Battle of Shrewsbury (1403) fighting Henry IV; and his father, Northumberland, after being attainted in 1406 for plotting against Henry IV, was slain at Bramham Moore (Feb. 19, 1408). The Percys were Lancastrians and Henry (1393–1455), 2nd Earl of Northumberland and Hotspur's son, was slain at the first battle of St. Albans fighting for Henry VI; while Henry (1421–61), the 3rd earl, fell at the Battle of Towton (1461). The earldom was then briefly given to John Neville but returned to the Percys in 1470 when Henry (*c.* 1449–89), son of the 3rd earl, was restored as the 4th earl by Edward IV. The 4th earl acquiesced in the accession of Richard III and submitted to Henry VII, with whom he found favour. Henry (1478–1527), the 5th earl, known as the Magnificent, was prominent in the early years of Henry VIII. The earldom lapsed in 1537 on the death of Henry (*c.* 1502–37), the 6th earl, whose brother was attainted for his role in the revolt known as the Pilgrimage of Grace (1536).

The earldom of Northumberland was restored to the Percy family in 1557 and continued in the male line until 1670. Thomas (1528–72), the 7th earl, was beheaded for his part in the northern rebellion (1569) which aimed to release Mary Stuart and give toleration to Roman Catholics. Henry (*c.* 1532–85), the 8th earl, also suspected of pro-Catholic plotting, was imprisoned in the Tower of London, where he was found shot in 1585. Henry (1564–1632), the 9th earl, was imprisoned in the Tower from 1605 to 1621 on suspicion of complicity in the Gunpowder Plot, because his cousin, Thomas Percy, was one of the chief conspirators. Algernon (1602–68), the 10th earl, was opposed to the trial of Charles I and took no part in affairs under the Commonwealth and urged moderation after the Restoration. On the death of his son, Joceline (1644–70), the 11th earl, the male line of the Percys of Northumberland became extinct.

Percy, Sir Henry, byname HOTSPUR (b. May 20, 1364—d. July 21, 1403, near Shrewsbury, Shropshire, Eng.), English rebel who led the most serious of the uprisings against King Henry IV (reigned 1399–1413). His fame rests to a large extent on his inclusion as a major character in William Shakespeare's *Henry IV.*

The eldest son of Henry Percy, 1st Earl of Northumberland, he was nicknamed Hotspur by his Scottish enemies in recognition of the diligence with which he patrolled the border between England and Scotland. He was captured and held for ransom by Scottish invaders in 1388–89, and in 1399 he and his father played a crucial part in helping Henry Bolingbroke (afterward King Henry IV) overthrow King Richard II. Henry IV rewarded Hotspur with lands and offices in northern England and Wales, but the Percys would not be content until they dominated the king. Their stunning victory over the Scots at Homildon (Humbledon) Hill in Durham, in September 1402, contrasted with Henry's fruitless attempts to suppress the Welsh rebel Owen Glendower. Nevertheless, Henry refused to allow Hotspur to ransom the Scottish captives, and he delayed in paying the expenses of Hotspur's border warfare. Hence in 1403 Hotspur and Northumberland decided to depose the king. Hotspur raised a rebellion in Cheshire in July, but Henry intercepted him near Shrewsbury before he could join forces with his father. In the ensuing battle Hotspur was killed.

Percy, Lucy: *see* Carlisle, Lucy Hay, Countess of.

Percy, Thomas: *see* Northumberland, Thomas Percy, 7th Earl of; Worcester, Thomas Percy, Earl of.

Percy, Thomas (b. April 13, 1729, Bridgnorth, Shropshire, Eng.—d. Sept. 30, 1811, Dromore, County Down, Ire.), English antiquarian and bishop whose collection of ballads, *Reliques of Ancient English Poetry* (1765), awakened widespread interest in English and Scottish traditional songs.

The basis of Percy's collection was a tattered 15th-century manuscript of ballads (known as the Percy folio) found in the house of a friend when it was about to be used to light a fire. To this nucleus Percy added many other ballads, songs, and romances, supplied by his friends who, at his request, rummaged in libraries, attics, and warehouses for old manuscripts. Publication of the *Reliques* inaugurated the "ballad revival," a flood of collections of ancient songs, that proved a source of inspiration to the Romantic poets.

Percy was educated at Christ Church, Oxford, and held livings in Northamptonshire, at Easton Maudit (1753) and Wilby (1756). The *Reliques,* dedicated to the Countess of Northumberland, gained him her patronage, and after editing *The Household Book of the Earl of Northumberland in 1512* (1768), a pioneer work of its kind, he became the earl's chaplain and secretary. In 1778 he acquired the deanery of Carlisle and in 1782 the Irish bishopric of Dromore. Percy's geniality and scholarly interests made him many friends, including Samuel Johnson, who encouraged him to edit the *Reliques* and praised his "minute accuracy of enquiry." Percy's translations from Chinese, Hebrew, Spanish, and Icelandic and his first English version of the

Icelandic *Edda* (from Latin, in *Northern Antiquities,* 1770) show his linguistic ability. Above all, his voluminous correspondence confirms his determined pursuit of factual accuracy and places in context the work for which he is principally remembered. His correspondence, edited by Cleanth Brooks in seven volumes, was published 1946–77.

Percy, Walker (b. May 28, 1916, Birmingham, Ala., U.S.—d. May 10, 1990, Covington, La.), American novelist who wrote of the New South transformed by industry and technology.

Orphaned in late childhood, Percy and his brothers went to live with his father's cousin, a bachelor and lawyer, in Greenville, Miss. Percy studied at the University of North Carolina (B.A., 1937) and Columbia University (M.D., 1941) and, while working as a pathologist at Bellevue Hospital, New York City, contracted tuberculosis, compelling him to rest at an upstate New York sanatorium. While recovering, he read widely, was attracted to the works of European existentialists, and decided on a career in writing. He also converted to Roman Catholicism.

During the 1950s, Percy wrote articles for philosophical, literary, and psychiatric journals, and not until 1961 was his first novel published, *The Moviegoer,* which won a National Book Award and which introduced Percy's concept of "Malaise," a disease of despair born of the rootless modern world. Other fiction included *The Last Gentleman* (1966), *Love in the Ruins: The Adventures of a Bad Catholic at a Time near the End of the World* (1971), *Lancelot* (1977), *The Second Coming* (1980), and *The Thanatos Syndrome* (1987). He also wrote such nonfiction as *The Message in the Bottle* (1975), a sophisticated philosophical treatment of semantics.

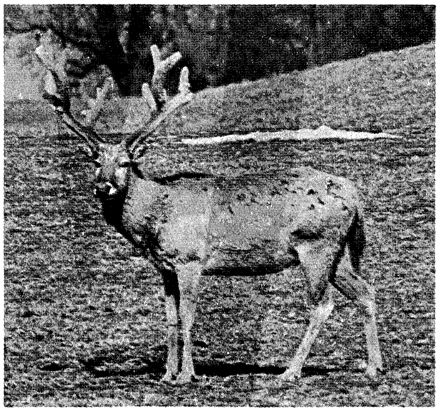
Perdiccas (b. *c.* 365 BC—d. 321), general under Alexander the Great who became regent of the Macedonian empire after Alexander's death (323).

Perdiccas served with distinction in Alexander's campaigns and, upon Alexander's death, led the aristocratic party that supported the claim of the unborn child of Roxana, Alexander's widow, to the succession. After a compromise under which a division of the powers of regency was arranged, Perdiccas exercised a wide authority in Asia as "supreme general" and soon began to act as if he meant to make himself king. This move was resisted by the regional governors, Ptolemy in Egypt, Antigonus in Phrygia, and by Perdiccas' colleagues in the regency, Craterus and Antipater.

In 322 Perdiccas conquered Cappadocia and installed as satrap (provincial governor) his most reliable and efficient subordinate, Eumenes of Cardia. Antigonus fled to Europe, where he persuaded Antipater and Craterus that Perdiccas must be destroyed. Leaving Eumenes to hold Asia Minor against Craterus and Antigonus, Perdiccas marched against Ptolemy, but when he failed to cross the Nile he was murdered by mutinous officers.

Père David's deer (*Elaphurus davidianus*), large, rare Asian deer, family Cervidae (order



Père David's deer (*Elaphurus davidianus*)
P. Morris—W.C.I.

Artiodactyla). The only member of its genus, it is unknown in nature within historic times. Presumably native to northern China, it is now found only in zoos, private animal collections, and game reserves.

The deer is about 1.1 metres (43 inches) tall at the shoulder and is characterized by heavy legs, broad hooves, relatively small ears, and a long, bushy tail. The coat is reddish brown in summer and uniformly grayish brown in winter. The male has long antlers that fork shortly above the base, the front prong branching once and the rear prong extending backward, unbranched.

The only known population of this deer in the 19th century was the herd kept for the emperor of China in a game park near Peking. Observations of the deer were made in 1865 by a French missionary, Armand David, and specimens were classified the following year by the French naturalist Henri Milne-Edwards. From 1869 to 1890, several Père David's deer were brought to European zoos. Most of the Chinese herd died in a flood in 1895, and the remaining deer were killed during the Boxer Rebellion (1900). A breeding population was then established at Woburn Abbey, in England, under the care of the duke of Bedford. The deer bred well in captivity and now survive in zoos and game parks around the world.

Peréal, Jean: *see* Perréal, Jean.

Pereda, José María de (b. Feb. 6, 1833, near Santander, Spain—d. March 1, 1906, Santander), Spanish writer, the acknowledged leader of the modern Spanish regional novelists. Born of a family noted for its fervent Catholicism and its traditionalism, Pereda looked an authentic hidalgo. An older brother provided him with an income that allowed him to become a writer. His first literary effort was the *Escenas montañesas* (1864), starkly realistic sketches of the fisherfolk of Santander and the peasants of the Montaña. There followed other sketches and early novels of pronounced controversial spirit, such as *El buey suelto* (1878; "The Unfettered Ox"); *Don Gonzalo González de la Gonzalera* (1879), a satire on the revolution of 1868 and a eulogy of the old patriarchal system of government; and *De tal palo tal astilla* (1880; "As the Wood, So the Chips"), a protest by a rigid Catholic against the liberal religious tendencies advocated by his friend Benito Pérez Galdós. With the exception of *Pedro Sánchez* (1883) and *La Montálvez* (1888), all his novels have a Montaña background.

Pereda's best work, one of the finest Spanish novels of the 19th century, was *Sotileza* (1884), an epic of the Santander fisherfolk, exemplified by the portrait of the haughty, enigmatic female fisher Sotileza, and a genuine novel of customs.

In his virile realism, tinged with human sympathy, Pereda is thoroughly Castilian. He had the gift of creating human characters, particularly of the humbler variety, and, with his mastery of rich and flexible language, he excels, above all, as a painter of nature, in all its aspects.

Peredvizhniki (Russian: The Wanderers), group of Russian painters who in the second half of the 19th century rejected the restrictive and foreign-inspired classicism of the Russian Academy to form a new realist and nationalist art that would serve the common man. Believing that art should be useful, a vehicle for expressing humanitarian and social ideals, they produced realistic portrayals of inspiring or pathetic subjects from Russian middle-class and peasant life in a literal, easily understood style. Forming a Society of Wandering Exhibitions in 1870, they organized mobile exhibitions of their works in an effort to bring serious art to the people.

The most prominent Russian artists of the 1870s and 1880s, including Ivan Kramskoy,

"The Boyarin Morozova," oil painting by Vasily Surikov, one of the Peredvizhniki, 1887; in the State Tretyakov Gallery, Moscow
Novosti Press Agency

Ilya Repin, Vasily Surikov, Vasily Perov, and Vasily Vereshchagin, belonged to this group. The movement dominated Russian art for nearly 30 years and was the model for the Socialist Realism of the Soviet Union.

Peregrinatio Etheriae, English PILGRIMAGE OF ETHERIA, an anonymous and incomplete account of a western European nun's travels in the Middle East, written for her colleagues at home, near the end of the 4th century. It gives important information about religious life and the observances of the church year in the localities visited, which included the chief holy places of the Old and New Testaments in Egypt, Palestine, and Syria. There is a detailed description of the daily and annual liturgical activities in Jerusalem.

Discovered in 1884 in an 11th-century Latin manuscript at Arezzo, Italy, the account was published in 1887. It was at first attributed to Silvia, a sister of Rufinus (died *c.* 410), a Christian priest, writer, and translator from northern Italy. Later it was determined that the author was probably a Spanish nun called Etheria (Aetheria, Egeria, Eucheria). According to internal evidence, the account was written between 363 and 540, but most scholars agree that the most likely date was the last years of the 4th century.

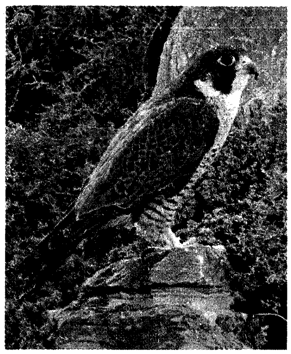
peregrine falcon, also called DUCK HAWK (*Falco peregrinus*), bird of prey of the family Falconidae, which occurs worldwide but has become rare throughout almost all of its range.

Bluish gray above with underparts white to yellowish with black barring, peregrines range from about 33 to 48 centimetres (13 to 19 inches) long. They are strong and fast. They fly high and dive at tremendous speeds, striking with clenched talons and killing by impact. The prey includes ducks and shorebirds. Peregrines inhabit rocky open country near water where birds are plentiful. The usual nest is a mere scrape on a ledge, high on a cliff. The clutch is two to four reddish brown eggs. The young fledge in five or six weeks.

The chief cause of the peregrine falcon's decline has been the buildup of chlorinated hydrocarbons (which are used in such pesticides as DDT) in the bird's food sources. The chemicals become concentrated in the peregrine's tissues and interfere with reproduction, particularly by causing the thinning of eggshells and the resultant loss of eggs. Habitat destruction has also played a role in the falcon's population decline.

The American peregrine falcon (*F. p. anatum*), which once bred from Hudson Bay to the southern United States, is listed as endangered in the *Red Data Book.* It is extinct in the eastern United States and eastern boreal Canada. The Alaskan peregrine is also classified as endangered, and several other subspecies worldwide are listed as threatened or vulnerable.

Peregrine falcons can be bred in captivity, and programs have been instituted to release captive-bred peregrines into areas where the bird has become extinct. The ultimate success of such programs, however, may depend on



Peregrine falcon (*Falco peregrinus*)
Kenneth W. Fink—Root Resources

the elimination of chlorinated hydrocarbons from the peregrine falcon's food chain.

Peregrinus: *see* Vincent of Lérins, Saint.

Peregrinus PROTEUS (b. AD 100, Parium, Mysia, Anatolia—d. 165), Greek Cynic philosopher remembered for his spectacular suicide—he cremated himself on the flames of the Olympic Games in 165.

Suspected of murdering his father, Peregrinus was forced to flee to Palestine, but his influence in the Christian community there led to his arrest. On his release he left Palestine and became estranged from the Christians. He then went to Egypt, where he became a pupil of the Cynic philosopher Agathobulus. Peregrinus next went to Rome but was expelled by the prefect for insulting the emperor Antoninus Pius. After leaving Rome he went to Greece, where he was at first well received, but he compromised his popularity by disparaging the public benefactor Herodes Atticus. He then announced his intention of cremating himself and finally did so on a funeral pyre during the Olympic Games in the presence of many spectators, among whom was Lucian.

Lucian's account of Peregrinus in the letter "On the Death of Peregrinus" depicts him as an opportunist and exhibitionist, but not all ancient authors agreed. Modern scholars tend to think of Peregrinus as sincere, however abnormal, in his enthusiasms.

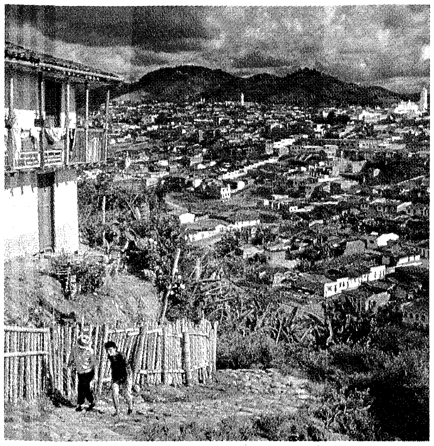
Peregrinus of Maricourt, Peter, French PIERRE PÈLERIN DE MARICOURT, Latin PETRUS PEREGRINUS DE MAHARNCURIA ("Peter the Pilgrim from Maricourt") (fl. 13th century), French crusader and scholar who wrote the first extant treatise describing the properties of magnets.

Almost nothing is known about Peregrinus' life, except that he wrote his famous treatise while serving as an engineer in the army of Charles of Anjou that was besieging Lucera (in Italy) in August 1269 in a "crusade" sanctioned by the pope. Peregrinus's abilities as an experimenter and technician were highly praised by his contemporary Roger Bacon.

Peregrinus' letter on the magnet, *Epistola Petri Peregrini de Maricourt ad Sygerum de Foucaucourt, Militem, De Magnete* ("Letter on the Magnet of Peter Peregrinus of Maricourt to Sygerus of Foucaucourt, Soldier"), commonly known by its short title, *Epistola de magnete,* consists of two parts: the first treats the properties of the lodestone (magnetite, a magnetic iron oxide mineral), and the second describes several instruments that utilize the properties of magnets. In the first part, Peregrinus provides the first extant written account of the polarity of magnets (he was the first to use the word "pole" in this regard), and he provides methods for determining the north and south poles of a magnet. He describes the effects magnets have upon one another, showing that like poles repel each other and unlike poles attract each other. In the second part of his treatise he treats the practical applications of magnets, describing the floating compass as an instrument in common use and proposing a new pivoted compass in some detail.

In his treatise Peregrinus brought together all existing contemporary knowledge of magnets, added his own fundamental observations, and organized the whole into a body of knowledge that formed the basis of the science of magnetism. The *Epistola* is widely regarded as one of the great works of medieval experimental research and a precursor of modern scientific methodology.

Pereira, city, capital of Risaralda *departamento,* west-central Colombia. It lies in the western foothills of the Cordillera Central above the Cauca Valley. It was founded in 1863 on the former site of Cartago by Remigio Antonio Cañarte and named after Francisco Pereira Gamba, who donated lands for the enterprise. Pereira is a centre for coffee and cattle and has some light manufacturing, mainly textiles. A fishing and hunting preserve and a ski resort are nearby. The controversial bronze statue "The Naked Bolivar" (1963), by Rodrigo Arenas Betancourt, stands in its own plaza. The Cathedral of Our Lady of the Poor (1890) and the Technical University of Pereira



Pereira, Colom.
Carl Frank—Photo Researchers/EB Inc.

(1958) are architectural landmarks. Road and rail connect Pereira with Cali and Armenia, and there is an airport. Pop. (1985) 233,271.

Pereira, Nuno Álvares, Nuno Álvares also spelled NUN ÁLVAREZ, original name of BLESSED NUNO DE SANTA MARIA (b. June 24, 1360, Bonjardim, Port.—d. April 1, 1431, Lisbon), outstanding Portuguese military leader, known also as the Holy Constable, whose victory over Castilian forces in the historic Battle of Aljubarrota (Aug. 14, 1385) assured his nation's independence.

Pereira distinguished himself in battle at the age of 13, fighting against the Castilians in their invasion of 1373. On the death of Ferdinand I of Portugal (October 1383), Pereira came forward as a supporter of John of Aviz, the illegitimate son of Ferdinand's father Peter I, against the claims of Ferdinand's daughter Beatriz, whose marriage to John I of Castile posed a threat to Portugal's independence. In January 1384 John I invaded Portugal. Despite the fact that most of his family favoured Castile, Pereira continued to support John of Aviz (later John I, king of Portugal) and defeated the Castilians in the Battle of Atoleiros (April 6, 1384). Further brilliant and heroic actions as a field commander won him appointment to the office of constable of the kingdom in 1385.

Although the Castilians had withdrawn in 1384, they invaded again the following year and moved on Lisbon. To block their advance, Pereira engaged the Castilians at Aljubarrota, where he skillfully prepared the defensive position and displayed courageous and resolute leadership of his greatly outnumbered army in winning a decisive victory. He continued to fight against the Castilians until the final peace of Oct. 30, 1411. He gave all his support to the expedition that captured Portugal's first African possession, Ceuta in northern Morocco, from the Moors in 1415.

John I of Portugal heaped honours on Pereira, giving him titles and extensive lands and properties. Pereira's daughter Beatriz married John I's legitimated son Afonso and thus became ancestor of the house of Bragança, which in 1640 became the ruling house of Portugal. Pereira, who had had a Carmelite house built in Lisbon in fulfillment of a vow, entered it himself as Friar Nuno de Santa Maria in 1423. He was beatified by Pope Benedict XV on Jan. 23, 1918.

Perejasław Agreement: *see* Pereyaslav Agreement.

Perelman, S(idney) J(oseph) (b. Feb. 1, 1904, Brooklyn, N.Y., U.S.—d. Oct. 17, 1979, New York, N.Y.), American humorist who was a master of wordplay in books, movies, plays, and essays.

In 1925 Perelman graduated from Brown University, where he edited the school humour magazine. He began writing for the early, frenetic Marx Brothers films and helped turn out the screenplays for such classics as *Monkey Business* (1931) and *Horse Feathers* (1932). He also regularly contributed essays for *The New Yorker* magazine under such absurd titles as *Beat Me, Post-Impressionist Daddy; No Starch in the Dhoti;* and *Methinks He Doth Protein Too Much.* Perelman collaborated on the theatrical comedies *All Good Americans* (1934) and *One Touch of Venus* (1943), and for his collaboration on the film *Around the World in 80 Days* he shared an Academy Award for best screenwriter for 1956. His magazine pieces were collected in a long series of books, including *Strictly from Hunger* (1937), *Westward Ha!, or, Around the World in Eighty Clichés* (1948), *The Swiss Family Perelman* (1950), and *The Road to Miltown, or, Under the Spreading Atrophy* (1957).

Perelman's humour was characterized by an exquisite sense of cliché and mimicry combined with a varied vocabulary to create effects of comic nihilism and literary parody. The perennial objects of his satire were cultural affectations and what he felt to be the ridiculousness of modern life.

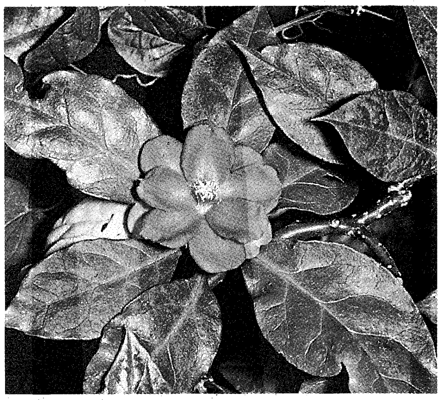
Peres, Shimon, original name SHIMON PERSKI (b. Aug. 16, 1923, Wołożyn, Pol.), Israeli statesman and member (from 1959) of the Knesset (Israeli parliament) who served as prime minister of Israel from 1984 to 1986.

Peres immigrated with his family to Palestine in 1934. While working on a kibbutz, he became involved in politics, and in 1947 he joined the Haganah movement, a Jewish defense organization, under the direction of David Ben-Gurion, who soon became his political mentor. When Israel achieved independence in May 1948, Prime Minister Ben-Gurion appointed Peres, then only 25, head of Israel's navy. In 1952 he was appointed deputy director general of the Defense Ministry, later serving as general director (1953–59) and deputy defense minister (1959–65), during which period he stepped up state weapons production, initiated a nuclear-research program, and established overseas military alliances, most notably with France. Peres resigned in 1965 in order to join Ben-Gurion in founding a new party, Rafi, in opposition to the succeeding prime minister, Levi Eshkol.

The Rafi Party was unsuccessful, however, and in 1967 Peres initiated merger negotiations between the Mapai (Ben-Gurion's former party) and the Ahdut Avodah, a more leftist workers' party, that resulted in the establishment of the Israel Labour Party, of which he became deputy secretary-general. He became defense minister in the Labour Cabinet of Yitzhak Rabin in 1974.

In 1977 Peres became head of the Labour Party and, as such, was twice defeated by Menachem Begin as a candidate for prime minister (1977, 1981) before winning access to the post after the indecisive elections of 1984. In September 1984 Peres and Yitzhak Shamir, head of the Likud party, formed a power-sharing agreement, with Peres as prime minister for the first half of a 50-month term and Shamir as deputy prime minister and foreign minister; the roles were reversed for the second 25-month period. Under Peres' moderate and conciliatory leadership, Israel withdrew its forces in 1985 from their controversial incursion into Lebanon, and the government engineered a comprehensive austerity program drastically reducing the soaring inflation rates that had bedeviled the economy. After similarly indecisive elections in 1988, the Labour and Likud parties formed another coalition government with Peres as finance minister and Shamir as prime minister; this coalition lasted only until 1990, when Likud was able to form a government without Labour support.

Pereskia, genus of about 20 species of trees, shrubs, and vines, family Cactaceae, native to the West Indies, Mexico, and Central and South America, especially coastal areas. Leafy cactus (*P. aculeata*), also known as Barbados, or West Indian, gooseberry, is cultivated extensively for hedges, lumber, and its edible fruit. It has large leaves, unique among cacti.



Pereskia
Werner W. Schulz

P. pititache, the native Mexican species, is treelike, growing to 12 m (about 40 feet) tall.

Peresvetov, Ivan Semenovich (b. Lithuania, fl. 16th century, Russia), early Russian progressive social critic.

Peresvetov was born to a family of the lower nobility in the Grand Duchy of Lithuania and served in the Polish Lithuanian army during the 1520s and 1530s. He arrived in Russia in 1538 or 1539.

In 1549 he presented his *Two Books* (*Dve Knigi*) to Tsar Ivan IV the Terrible. These works were ostensibly an account of the Ottoman conquest of Constantinople by Sultan Mehmed II but actually provided a covert, allegorical denunciation of the privileges still enjoyed by the boyars. Peresvetov's support of the demands of the military class over that of the boyars presumably found favor with Ivan IV, who had to overcome boyar direction of the government to establish himself as the first tsar. Peresvetov advocated strong, autocratic rule coupled with a well-organized army and administration. His advocacy of promotion based on merit and military service was too radical for his time, however, as was his call for the abolition of all indenture.

Peresvetov wrote in an energetic folk Russian that contrasted sharply with the Church Slavonic style of the period.

Peretz, Isaac Leib, also spelled YITSKHEK LEYB PERETS, Leib also spelled LOEB, or LÖB (b. May 18, 1852, or May 20, 1851, Zamość, Pol., Russian Empire—d. April 3, 1915, Warsaw), prolific writer of poems, short stories, drama, humorous sketches, and satire who was instrumental in raising the standard of Yiddish literature to a high level.

Peretz began writing in Hebrew but soon turned to Yiddish. For his tales of Ḥasidic lore, which he introduced into literature (*e.g.,* the *Silent Souls* series), he drew his material from the lives of impoverished Jews of eastern Europe. Critical of their humility and resignation, he urged them to consider their temporal needs while retaining the spiritual grandeur for which he esteemed them. In his drama *Die Goldene Kaite* (1909; "The Golden Chain"), Peretz stressed the timeless chain of Jewish culture. To encourage Jews toward a wider knowledge of secular subjects, Peretz for several years wrote articles on physics, chemistry, economics, and other subjects for *Yiddishe Bibliothek,* which he also edited.

The Peretz home in Warsaw was a gathering place for young Jewish writers, who called him the "father of modern Yiddish literature." During the last 10 years of his life, Peretz became the recognized leader of the Yiddishist movement, whose aim—in opposition to the Zionists—was to create a complete cultural and national life for Jewry within the Diaspora with Yiddish as its language.

Pereyaslav Agreement, Pereyaslav also spelled PEREJASŁAW (Jan. 18 [Jan. 8, Old Style], 1654), act undertaken by the *rada* (council) of the Cossack army in the Ukraine to submit the Ukraine to Russian rule, and the acceptance of this act by emissaries of the Russian tsar Alexis; the agreement precipitated a war between Poland and Russia (1654–67).

The hetman of the Zaporozhian Cossacks, Bohdan Khmelnitsky, had been leading a revolt against Polish rule in the Ukraine since 1648. In 1651, in the face of a growing threat from Poland and forsaken by his Tatar allies, Khmelnitsky asked the tsar to incorporate the Ukraine as an autonomous duchy under Russian protection. The Russians, however, were reluctant to enter into such an agreement, and it was not until October 1653 that a Russian *zemsky sobor* ("assembly of the land") approved the request and Alexis sent a delegation, headed by V.V. Buturlin, to the Cossacks.

Only after the Cossacks had suffered a disastrous military defeat (December 1653), however, did the *rada* receive the Muscovite delegation at Pereyaslav and formally submit to "the tsar's hand." Two months later (March 1654), the details of the union were negotiated in Moscow. The Cossacks were granted a large degree of autonomy, and they, as well as other social groups in the Ukraine, retained all the rights and privileges they had enjoyed under Polish rule. But the unification of the Ukraine with Russia was unacceptable to Poland; a Russo-Polish war (Thirteen Years' War) broke out and ended with the division of the Ukraine between Poland and Russia. *See also* Andrusovo, Truce of.

Pereyaslav-Khmelnitsky, also spelled PEREIASLAV-KHMELNITSKII, or PEREJASLAV-CHMEL'NICKIJ, formerly (until 1943) PEREYASLAV, or PEREIASLAV, city, Kiev *oblast* (province), Ukrainian Soviet Socialist Republic. Pereyaslav-Khmelnitsky has existed since the 10th century, when it was known as Pereyaslav-Russky. It was a border stronghold of the Kievan state but was overrun by Mongol Tatars in 1239. In the 17th century it played a part in Bohdan Khmelnitsky's uprising against Polish domination of the Ukraine. In 1654 Khmelnitsky convened a council at Pereyaslav that submitted the Ukraine to Russian rule. Modern Pereyaslav was occupied by German forces during both world wars.

Archaeological excavations in Pereyaslav-Khmelnitsky have uncovered artifacts and building foundations dating from as early as the 10th century. The modern city has food-processing and clothing industries. Pop. (1974 est.) 24,600.

Pérez, Antonio (b. 1534, Madrid—d. Nov. 3, 1611, Paris), Spanish courtier who was secretary to Philip II of Spain, and later became a fugitive from Philip's court.

Pérez was an illegitimate son of Gonzalo Pérez, secretary of Philip's predecessor, the emperor Charles V. Charming and well-connected, Pérez quickly rose in Philip's service, becoming the king's secretary (1568) and secretary of several of the royal councils.

The upstart secretary was hated by many of the grandees and by his rivals in the Spanish civil service. The king's favour was unstable, and to safeguard himself, Pérez intrigued with all parties: with Philip II's half-brother Don Juan of Austria and his secretary, Juan de Escobedo, against the king; with the king against Don Juan; perhaps even with the Netherlands rebels against both. When Don Juan, then governor-general of the Netherlands, sent Escobedo to Spain in 1577 to plead for his plan to invade England and liberate and marry Mary Stuart, queen of Scots, Pérez feared the exposure of his own intrigues. He persuaded the suspicious king that Escobedo was Don Juan's evil genius and was plotting treason. The king gave his consent to the murder of Escobedo, and Pérez organized his assassination on March 31, 1578.

Philip II never forgave Pérez for having forced his hand. On July 28, 1579, he had Pérez and the Princess of Eboli arrested. Pérez remained in prison for 11 years, but all efforts to extract a full confession and incriminating documents from him failed. In April 1590 he escaped from Madrid to Aragon and placed himself under the protection of the Aragonese courts. Now, for the first time, he accused the king of the murder of Escobedo. Philip thereupon tried to have Pérez handed over to the Inquisition, but the populace of Saragossa twice rioted (May and September 1591) and prevented this move. Philip considered it rebellion and sent a Castilian army into Aragon (October 1591).

Pérez fled to France in November. He spent the remainder of his life at the courts of France and England, carrying on his polemic against Philip II and contributing to the "black legend" about the king. After Philip II's death (1598), Pérez lost what little influence he had had. He failed to obtain a pardon from Philip III and died in exile. His *Relaciones,* of which there are many editions, was published in 1598.

Pérez (Rodríguez), Carlos Andrés (b. Oct. 27, 1922, Rubio, Venezuela), president of Venezuela from 1974 to 1979 and from 1989.

Pérez began his political life as a member of the liberal political party Democratic Action, led by Rómulo Betancourt. When Betancourt took power as president of the junta that overthrew President Isaías Medina Angarita in 1945, Pérez followed as his secretary. A right-wing coup drove Pérez and other party leaders into exile until 1958, when the dictatorship of Marcos Pérez Jiménez was overthrown. Pérez served in the Chamber of Deputies (1959–64 and 1969–72), was minister of the interior (1962–63), and occupied important party posts. Betancourt supported his candidacy in the presidential elections in 1973, which Pérez won by a wide margin. The most important issues facing his administration concerned Venezuela's petroleum production, in particular the question of foreign ownership and how to invest the enormous proceeds received by the government. In 1976 Venezuela nationalized the entire oil industry, while maintaining foreign technical and managerial personnel to ensure efficient operation. Pérez also ordered a production slowdown to conserve resources, passed measures designed to stimulate small business and agriculture, and channeled petroleum income into hydroelectric projects, education programs, and steel mills. While preserving friendly relations with the United States, he underscored his policy of autonomy from it by supporting Panama's demand for control of the Panama Canal and reestablishing diplomatic relations with Cuba (broken in 1961).

As a former president, Pérez was barred by law from seeking reelection for 10 years. Upon that period's termination in 1988, Pérez was again elected to the presidency as the Democratic Action Party's candidate.

Pérez, Manuel Benítez: *see* Cordobés, El.

Pérez de Ayala, Ramón (b. Aug. 9, 1880, Oviedo, Spain—d. Aug. 5, 1962, Madrid), Spanish novelist, poet, and critic who excelled in philosophical satire and the novel of ideas.

Pérez de Ayala studied law at Oviedo University and philosophy and literature at the

University of Madrid. During World War I he covered France, Italy, England, South America, and the United States as a correspondent for the Buenos Aires periodical *La prensa.* He was Spanish ambassador to England (1931–36) and voluntarily exiled himself to South America because of the Spanish Civil War (1936–39). He was elected to the Spanish Academy in 1928.

After writing a volume of poetry, *La paz del sendero* (1903; "The Peace of the Path"), he produced a series of four largely autobiographical novels: *Tinieblas en las cumbres* (1907; "Darkness at the Top"), describing an adolescent's erotic awakening; *AMDG* (1910; *i.e.,* the Jesuit motto "Ad Majorem Dei Gloriam," or "To the Greater Glory of God"), a bitter satire about the author's unhappy education at a Jesuit school; *La pata de la raposa* (1912; *The Fox's Paw*); and *Troteras y danzaderas* (1913; "Trotters and Dancers"), a novel about literary and Bohemian life in Madrid.

Pérez de Ayala's later novels, which are considereed to be his finest works, show a greater mastery of characterization and novelistic technique. *Belarmino y Apolonio* (1921; *Belarmino and Apolonio*) is a symbolic portrayal of the conflict between faith and doubt. *Luna de miel, luna de hiel* (1923; *Moons of Honey and Gall*) and its sequel, *Los trabajos de Urbano y Simona* (1923; "The Labours of Urbano and Simona"), treat the contrast between idealistic innocence and the realities of mature romantic love. In *Tigre Juan* (1926; *Tiger Juan*) and its sequel, *El curandero de su honra* (1926; "The [Quack] Healer of His Honour"), Pérez de Ayala continued to create characters of a universal nature and gave free expression to his delightful and wry humour. Pérez de Ayala also wrote poetry, short stories, and essays.

Pérez de Cuellar, Javier (b. Jan. 19, 1920, Lima, Peru), Peruvian diplomat and fifth secretary-general of the United Nations (UN), from 1982.

After attending the Catholic University in Lima, Pérez de Cuellar joined the foreign ministry in 1940 and the diplomatic service in 1944. After serving in embassies in France, the United Kingdom, Bolivia, and Brazil, he returned in 1961 to the Ministry of Foreign Affairs, where he remained until 1969 (except for a two-year term, 1964–66, as ambassador to Switzerland). After serving as Peru's first ambassador to the Soviet Union (1969–71), he was made Peru's permanent representative to the UN, a post that he held until becoming secretary-general on Jan. 1, 1982, succeeding Kurt Waldheim in that post.

Pérez de Cuellar repeatedly advocated the use of the UN Security Council for keeping the peace and serving as a forum for negotiations. He was reelected to another five-year term as secretary-general in 1986. In August 1988 Pérez de Cuellar personally negotiated the cease-fire that ended active hostilities in the Iran–Iraq War.

Pérez de Cuellar was a skilled, careful diplomat. He was the author of *Manual de Derecho Diplomático* (1964; "Manual of Diplomatic Law").

Pérez de Guzmán, Alonso: *see* Medina-Sidonia, Alonso Pérez de Guzmán, duque de.

Pérez de Guzmán, Fernán (b. *c.* 1378—d. *c.* 1460), Spanish poet, moralist, and historian, author of the first important work of history and historiography in Spanish. His historical portraits of his contemporaries earned him the title of the "Spanish Plutarch."

A member of a distinguished family, Pérez de Guzmán devoted himself to letters after being imprisoned by Alvaro de Luna, a counselor to King John II of Castile. Although his poetry went through many editions, it is not as a poet that he is chiefly remembered. His fame rests on his *Mar de historias* (1512; "Sea of Histories"), a collection of biographies of emperors, philosophers, and saints, and primarily on the third part of this collection, which contains historical portraits of 33 prominent men and one woman from the reigns of Henry III to John II (the period 1390 to 1454). He knew many of the people he described, and, although the portraits are based on rhetorical models, the prose is clear and economical, capturing each personality in a few pages.

Equally important is the preface to the third part of the *Mar,* in which Pérez de Guzmán provided the first examination in Spanish of the theory of history and the responsibility of the historian, concerning himself with the problems of historical accuracy, the proper prose for a historian, and the problem of fame as a moral force in history.

Pérez de Hita, Ginés (b. 1544, Mula, Murcia, Spain—d. 1619), Spanish writer, author of *Historia de los bandos de los Zegríes y Abencerraves . . .* (1595–1619), usually referred to as *Guerras civiles de Granada* ("The Civil Wars of Granada"). The book is considered the first Spanish historical novel and the last important collection of Moorish border ballads, the latter punctuating the book's narrative.

Pérez de Hita fought in the suppression of the revolt of the Moors in the Alpajurras mountains (1568–71), an event that is reflected in the second part of his *Guerras.* The first part deals with Moorish life in Granada before the Christian conquest of that city in 1492. The first part's portrait of the chivalrous Moorish family of the Abencerrages established the stereotype of the romantic Moor in European literature, a type imitated in Madeleine de Scudéry's *Almahide* (1660), Marie-Madeleine de La Fayette's *Zaÿde* (1670), François Chateaubriand's *Aventures du dernier Abencérage* (1826), and Washington Irving's *Chronicle of the Conquest of Granada* (1829).

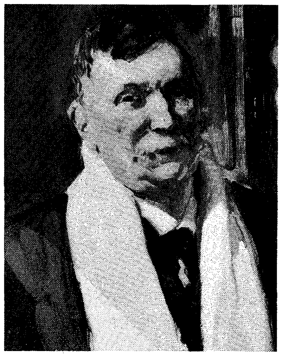
Pérez Esquivel, Adolfo (b. Nov. 26, 1931, Buenos Aires, Arg.), Argentine sculptor and architect who became a champion of human rights and nonviolent reform in Latin America. His work as secretary-general of Peace and Justice (Paz y Justicia), an ecumenical organization established in 1974 to coordinate human-rights activities throughout Latin America, brought him the Nobel Prize for Peace in 1980.

Pérez Esquivel, son of a fisherman, was already well known as a sculptor when he was appointed to a professorship at the Argentine National School of Fine Arts in 1968. He resigned his chair upon being chosen to lead Peace and Justice in 1974. His outspoken advocacy placed him in a precarious situation, for in denouncing the terrorism of both the left and the right that had brought Argentina to the brink of civil war, he brought upon himself the enmity of both sides. He spoke on behalf of the *desaparecidos,* the thousands of people who had simply disappeared during the Argentine military junta's campaign against extremists. He was himself arrested in 1977 and held without charge for 14 months, during which time he was tortured.

Pérez Galdós, Benito (b. May 10, 1843, Las Palmas, Canary Islands, Spain—d. Jan. 4, 1920, Madrid), writer who is regarded as the greatest Spanish novelist since Miguel de Cervantes. His enormous output of short novels chronicling the history and society of 19th-century Spain earned him comparison with such realist writers as Honoré de Balzac and Charles Dickens.

Born into a middle-class family, Pérez Galdós went to Madrid in 1862 to study law but soon abandoned his studies and took up journalism. After the success of his first novel, *La fontana de oro* (1870; "The Fountain of Gold"), he began a series of novels retelling Spain's history from the Battle of Trafalgar (1805) to the restoration of the Bourbons in Spain (1874). The entire cycle of 46 novels would come to be known as the *Episodios nacionales* (1873–1912). In these works Galdós perfected a unique type of historical fiction that was based on meticulous research using memoirs, old newspaper articles, and eyewitness accounts. The resulting novels are vivid, realistic, and accurate accounts of historical events as they must have appeared to those participating in them. The Napoleonic occupation of Spain and the struggles between liberals and absolutists preceding the death of Ferdinand VII 1833 are respectively treated in the first two series of 10 novels each, all of them composed in the 1870s.

In the 1880s and '90s Pérez Galdós wrote a long series of novels dealing with contemporary Spain, beginning with *Doña Perfecta* (1876). Known as the *Novelas españolas contemporáneas,* these books were written at the height of the author's literary maturity and include some of his finest works, notably *La desheredada* (1881; *The Disinherited Lady*) and his masterpiece, the four-volume novel *Fortunata y Jacinta* (1886–87), a study of two unhappily married women from different social classes. Pérez Galdós' earlier novels in the series show a reforming liberal zeal and an intransigent opposition to Spain's ubiquitous and powerful clergy, but after the 1880s he displayed a newly tolerant acceptance of Spain's idiosyncracies and a greater sympathy for his country. He demonstrates a phenomenal knowledge of Madrid, of which he showed himself the supreme chronicler. He also displays a deep understanding of madness and abnormal psychological states. Pérez Galdós gradually came to admit more elements of spirituality into his work, eventually accepting them as an integral part of reality, as evident in the important late novels *Nazarín* (1895) and *Misericordia* (1897; *Compassion*).



Pérez Galdós, detail of an oil painting by Joaquín Sorolla y Bastida

By courtesy of the Hispanic Society of America

Financial difficulties prompted Pérez Galdós in 1898 to begin a third series of novels (covering the Carlist wars of the 1830s) in the *Episodios nacionales,* and he eventually went on to write a fourth series (covering the period from 1845 to 1868) and begin a fifth, so that by 1912 he had brought his history of Spain down to 1877 and retold events of which he himself had been a witness. The books of the fifth series, however, and his last works showed a decline in mental powers compounded by the blindness that overtook him in 1912.

Pérez Galdós also wrote plays, some of which were immensely popular, but their success was largely owing to the political views presented in them rather than to their artistic value.

Pérez Jiménez, Marcos (b. April 25, 1914, Michelena, Venezuela), professional soldier and president of Venezuela whose regime was marked by extravagance, corruption, police oppression, and mounting unemployment.

Pérez Jiménez, 1955

By courtesy of the Library of Congress, Washington, D.C.

A graduate of the Venezuelan Military Academy, Pérez Jiménez began his political career in 1944, participating in the coups d'état of October 1945 and November 1948. After the second coup he served as a member of the military junta that ruled Venezuela. In December 1952 he became provisional president by designation of the armed forces—an appointment confirmed by the constituent assembly of 1953, which, under his control, elected him to a five-year presidential term (1953–58).

Financed by income from oil royalties, Pérez Jiménez began a vast program of public works, including the construction of highways, hotels, office buildings, factories, and dams. Pérez Jiménez and his associates received a commission from every project. The ubiquitous secret police, the closing of the university, the silencing of the press, rampant inflation, and the jailing of five priests led the church to ally itself with the opposition parties, the dissatisfied workers, and younger military men who felt excluded from the rewards of the administration. After being forced out of office in January 1958, Pérez Jiménez fled to the U.S., reportedly taking with him approximately $200,000,000.

In 1963 Pérez Jiménez was extradited by the U.S. to stand trial for embezzlement of government funds. After serving five years in jail, he was released and went to Spain in August 1968. Elected to the Senate in 1969 *in absentia,* his election was annulled on the grounds that he was not a registered voter in Venezuela. In March 1972 in Madrid he announced his candidacy for president in the forthcoming elections. He returned once more to Caracas in May 1972, but his visit prompted riots in the city, and he returned to Spain.

perfect gas, also called IDEAL GAS, a gas that conforms, in physical behaviour, to a particular, idealized relation between pressure, volume, and temperature called the general gas law. This law is a generalization containing both Boyle's law and Charles's law as special cases and states that for a specified quantity of gas, the product of the volume v and pressure p is proportional to the absolute temperature t; *i.e.,* in equation form, $pv = kt$, in which k is a constant. Such a relation for a substance is called its equation of state and is sufficient to describe its gross behaviour.

The general gas law can be derived from the kinetic theory of gases and relies on the assumptions that (1) the gas consists of a large number of molecules, which are in random motion and obey Newton's laws of motion; (2) the volume of the molecules is negligibly small compared to the volume occupied by the gas; and (3) no forces act on the molecules except during elastic collisions of negligible duration.

Although no gas has these properties, the behaviour of real gases is described quite closely by the general gas law at sufficiently high temperatures and low pressures, when relatively large distances between molecules and their high speeds overcome any interaction. A gas does not obey the equation when conditions are such that the gas, or any of the component gases in a mixture, is near its condensation point.

The general gas law may be written in a form applicable to any gas, according to Avogadro's law (*q.v.*), if the constant specifying the quantity of gas is expressed in terms of the number of molecules of gas. This is done by using as the mass unit the gram-mole; *i.e.,* the molecular weight expressed in grams. The equation of state of n gram-moles of a perfect gas can then be written as $pv/t = nR$, in which R is called the universal gas constant. This constant has been measured for various gases under nearly ideal conditions of high temperatures and low pressures, and it is found to have the same value for all gases: $R = 8.314$ joules per gram-mole-kelvin.

Perfectionist (religious group): *see* Oneida Community.

performance, in law, act of doing that which is required by a contract. The effect of successful performance is to discharge the person bound to do the act from any future contractual liability.

Each party to the contract is bound to perform promises according to the stipulated terms. In case of any controversy as to the meaning of a promise, the courts have usually decided that a person must perform it as the other party reasonably understood it to be. Thus, a preference for the rights of the one who is to receive the benefit of the promise is established.

Attempts to establish hard and fast rules about reasonable interpretations of promises are now discouraged. Although at one time a person would be held to the literal meaning of the contract provisions stating a promise, the requirement now is to perform the true meaning and intent of the contract, which may not correspond with the fine print.

perfume, fragrant product that results from the artful blending of certain odoriferous substances in appropriate proportions. The word is derived from the Latin *per fumum,* meaning "through smoke." The art of perfumery was apparently known to the ancient Chinese, Hindus, Egyptians, Israelites, Carthaginians, Arabs, Greeks, and Romans. References to perfumery materials and even perfume formulas are found in the Bible.

Raw materials used in perfumery include natural products, of plant or animal origin, and synthetic materials. Essential oils (*q.v.*) are most often obtained from plant materials by steam distillation. Certain delicate oils may be obtained by solvent extraction, a process also employed to extract waxes and perfume oil, yielding—by removal of the solvent—a solid substance called a concrete. Treatment of the concrete with a second substance, usually alcohol, leaves the waxes undissolved and provides the concentrated flower oil called an absolute. In the extraction method called enfleurage, petals are placed between layers of purified animal fat, which become saturated with flower oil, and alcohol is then used to obtain the absolute. The expression method, used to recover citrus oils from fruit peels, ranges from a traditional procedure of pressing with sponges to mechanical maceration. Individual compounds used in perfumery may be isolated from the essential oils, usually by distillation, and may sometimes be reprocessed to obtain still other perfumery chemicals.

Certain animal secretions contain odoriferous substances that increase the lasting qualities of perfumes. Such substances and some of their constituents act as fixatives, preventing more volatile perfume ingredients from evaporating too rapidly. They are usually employed in the form of alcoholic solutions. The animal products include ambergris from the sperm whale, castor (also called castoreum) from the beaver, civet from the civet cat, and musk from the musk deer.

Odour characteristics ranging from floral effects to odours unknown in nature are available with the use of synthetic, aromatic materials.

Fine perfumes may contain more than 100 ingredients. Each perfume is composed of a top note, the refreshing, volatile odour perceived immediately; a middle note, or modifier, providing full, solid character; and a base note, also called an end note or basic note, which is the most persistent. Perfumes can generally be classified according to one or more identifiable dominant odours. The floral group blends such odours as jasmine, rose, lily of the valley, and gardenia. The spicy blends feature such aromas as carnation, clove, cinnamon, and nutmeg. The woody group is characterized by such odours as vetiver (derived from an aromatic grass called vetiver, or khuskhus), sandalwood, and cedarwood. The mossy family is dominated by an aroma of oak moss. The group known as the Orientals combines woody, mossy, and spicy notes with such sweet odours as vanilla or balsam and is usually accentuated by such animal odours as musk or civet. The herbal group is characterized by such odours as clover and sweet grass. The leather–tobacco group features the aromas of leather, tobacco, and the smokiness of birch tar. The aldehydic group is dominated by odours of aldehydes, usually having a fruity character. Fragrances designed for men are generally classified as citrus, spice, leather, lavender, fern, or woody.

Perfumes are usually alcoholic solutions. The solutions, generally known as perfumes but also called extraits, extracts, or handkerchief perfumes, contain about 10–25 percent perfume concentrates. The terms toilet water and cologne are commonly used interchangeably; such products contain about 2–6 percent perfume concentrate. Originally, eau de cologne was a mixture of citrus oils from such fruits as lemons and oranges, combined with such substances as lavender and neroli (orange-flower oil); toilet waters were less concentrated forms of other types of perfume. Aftershave lotions and splash colognes usually contain about 0.5–2 percent perfume oil. Recent developments include aerosol sprays and highly concentrated bath oils, sometimes called skin perfumes.

Perfumes employed to scent soaps, talcums, face powders, deodorants and antiperspirants, and other cosmetic products must be formulated to avoid being changed or becoming unstable in the new medium. They must also be formulated so as to avoid unacceptable alterations in the colour or consistency of the product.

Industrial perfumes are employed to cover up undesirable odours, as in paints and cleaning materials, or to impart a distinctive odour, as in the addition of leather odours to plastics used for furniture coverings and the addition of bread odours to wrapping papers used for breads.

perfume bottle, a vessel made to hold scent. The earliest example is Egyptian and dates to around 1000 BC. The Egyptians used scents lavishly, especially in religious rites; as a result, when they invented glass, it was largely used for perfume vessels. The fashion for perfume spread to Greece, where containers, most often terra-cotta or glass, were made in a variety of shapes and forms such as sandalled feet, birds, animals, and human heads. The Romans, who thought perfumes were aphrodisiacs, used not only molded glass bottles but also blown glass, after its invention at the end of the 1st century BC by Syrian glassmakers. The fashion for perfume declined somewhat with the beginning of Christianity, coinciding with the deterioration of glassmaking.

By the 12th century Philippe-Auguste of France had passed a statute forming the first guild of *parfumeurs,* and by the 13th century Venetian glassmaking had become well established. In the 16th, 17th, and particularly the 18th centuries, the scent bottle assumed varied and elaborate forms: they were made in gold, silver, copper, glass, porcelain, enamel, or any combination of these materials; 18th-century porcelain perfume bottles were shaped like cats, birds, clowns, and the like; and the varied subject matter of painted enamel bottles included pastoral scenes, chinoiseries, fruits, and flowers.

By the 19th century classical designs, such as those created by the English pottery ware maker Josiah Wedgwood, came into fashion; but the crafts connected with perfume bottles had deteriorated. In the 1920s, however, René Lalique, a leading French jeweller, revived interest in the bottles with his production of

molded glass examples, characterized by iced surfaces and elaborate relief patterns.

Perga, Greek PERGE, modern MURTINA, or MURTANA, ancient city of Pamphylia, (in modern Antalya *il* [province], Turkey). It was a centre of native culture and was a seat of the worship of "Queen" Artemis, a purely Anatolian nature goddess.

In Perga the apostles Paul and Barnabas began their first mission in Anatolia (Acts of the Apostles 13:13). A difficult mountain route into Phrygia began at Perga, and Alexander the Great used it for his invasion of the interior. Long the chief city of the district of Pamphylia Secunda, Perga was superseded in Byzantine times by its port, Attaleia, which became a metropolis in 1084. The most notable remains at Perga include a theatre, a stadium, two basilicas, and the agora. Pop. (latest census) 491.

Pergamino, city of northern Buenos Aires province, Argentina. Located within the Pampa, it is about 135 mi (220 km) northwest of the ciy of Buenos Aires. It was first mentioned in 1626 as an unpopulated spot where a group of Spaniards lost some parchment documents (*pergaminos*). It was settled and became a municipality in 1784.

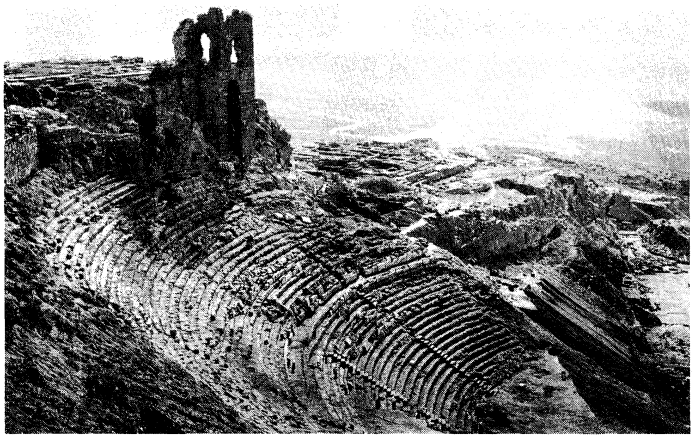
Located at the hub of rail and road networks, the city has developed a diverse economy, including the processing and distribution of agricultural produce and the manufacture of furniture, metals, and textiles. A local museum depicts the history of agriculture in the Pampa. Pop. (1980) 68,989.

Pergamum, Greek PERGAMON, ancient Greek city in Mysia, situated 16 miles from the Aegean Sea on a lofty isolated hill on the northern side of the broad valley of the Caicus (modern Bakir) River. The site is occupied by the modern town of Bergama, in the *il* (province) of Izmir, Turkey. Pergamum existed at least from the 5th century BC, but it became important only in the Hellenistic Age (323–330 BC), when it served as the residence of the Attalid dynasty. Their fortress and palace stood on the peak of the hill, while the town itself occupied the lower slopes. Under the Roman Empire the city was situated on the plain below.

It had formal autonomy under the Attalids, who, however, interfered in most aspects of civic government. Initially they ruled Pergamum as vassals of the Seleucid Kingdom, but Eumenes I declared himself independent of Antiochus I (263 BC); when he died in 241 he was succeeded by his nephew Attalus I, who defeated the Galatians and assumed the royal title; the dynasty received its name from him. The original Attalid territory around Pergamum (Mysia) was greatly expanded by 188 BC with the addition of Lydia (excluding most Greek coastal cities), part of Phrygia, Lycaonia, and Pisidia (from 183 BC), all former Seleucid territories. This expansion was accomplished as the result of Eumenes II's alliance with Rome in its conflict with the Seleucid Antiochus III.

When Eumenes' son and second successor, Attalus III, died without an heir, he bequeathed the kingdom to Rome (133). Rome accepted it and set up the province of Asia (129), which included Ionia and the territory of Pergamum, but left the other regions to neighbouring kings, who were clients of Rome. The kingdom of Pergamum yielded much wealth, especially in agricultural surpluses and silver, first to the Attalid rulers and later to Rome.

The Attalids made the city of Pergamum one of the most important and beautiful of all Greek cities in the Hellenistic Age; it is one of the most outstanding examples of city planning in that period. They built a library excelled only by that at Alexandria. The kings after Attalus I collected many works of art from Greece to adorn the city's temples and courtyards, supplementing the many works of sculpture, painting, and decoration commissioned from resident artists. In Roman times its population was an estimated 200,000. Excavations that were begun in 1878 under the auspices of the Berlin Museum, besides unearthing many artistic treasures, have enabled archaeologists to reconstruct the plan of the most important areas of the Hellenistic city. Its monuments included a theatre; the temple to Athena Nicephorus; and the great altar of Zeus with its richly decorated frieze, a masterpiece of Hellenistic art. A part of the altar and its surviving reliefs, restored and mounted, now stands in the Pergamon Museum in Berlin.



The Greek theatre and part of the terrace in the upper city, Pergamum
By courtesy of Staatliche Museen Preussischer Kulturbesitz, Antikenabteilung, Berlin—Art Resource/EB Inc.

The civic structures of the lower city included a large marketplace, a gymnasium, and temples of Hera and Demeter. Roman remains include an amphitheatre, a theatre, and a racetrack. The early Attalids erected the first structures of the upper (royal) city, but the later kings Eumenes II and Attalus III, by their extensive building and rebuilding, were chiefly responsible for the city's great architectural and artistic reputation. After the fall of Rome, Pergamum was ruled by the Byzantines until it passed into Ottoman hands early in the 14th century.

pergola, garden walk or terrace, roofed with an open framework over which plants are trained. Its purpose is to provide a foundation on which climbing plants can be seen to ad-

vantage and to give shade. It was known in ancient Egypt and was a common feature of early Renaissance gardens in Italy and subsequently throughout Europe.

Pergolas have always been popular in hot climates, and in Mediterranean countries they are frequently covered with vines or ivy. In more northerly countries, where shade is less attractive, they are less common; but they had a marked revival during the Arts and Crafts movement in Great Britain in the early 20th century for the purpose of growing wisteria and were prominent features at the William Randolph Hearst castle at San Simeon, Calif.

Pergolesi, Giovanni Battista (b. Jan. 4, 1710, Jesi, Italy—d. March 16, 1736, Pozzuoli), Italian composer whose intermezzo *La serva padrona* ("The Maid Turned Mistress") was one of the most celebrated stage works of the 18th century.

His family name was Draghi, but, having moved to Jesi from Pergola, the family was called Pergolesi, meaning "of Pergola." From 1726 he attended the Conservatorio dei Poveri at Naples, where he earned a high reputation as a violinist. In 1732 he was appointed *maestro di cappella* to the prince of Stigliano at Naples and produced a Neapolitan opera buffa, *Lo frate 'nnammorato*, and a mass (probably his *Mass in F*). Both were well-received. In 1733, his opera seria *Il prigionier superbo* was produced. But it was the comic intermezzo *La serva padrona,* inserted between the acts of *Il prigionier superbo*, that achieved success. In 1734 Pergolesi was appointed deputy *maestro di cappella* of Naples, and in May he went to Rome to direct the performance of his *Mass in F.* His subsequent operas met with only occasional success. His health began to fail, and in 1736 he left Naples for the Capuchin monastery at Pozzuoli, near Naples, where he finished his last work, the celebrated *Stabat Mater.* He died in extreme poverty at age 26 and was buried at the cathedral at Pozzuoli.

When Pergolesi died, his fame had scarcely spread beyond Rome and Naples, but later in the century it grew enormously. The success of *La serva padrona* was largely posthumous, and it reached its peak after its performance in Paris in 1752. There it led to *la guerre des bouffons* ("the war of the buffoons"), with musical forgers vying to produce spurious works of Pergolesi, leaving some uncertainty about the authenticity of works attributed to him. Some of the works attributed to Pergolesi by Igor Stravinsky in arrangements he made for his ballet *Pulcinella* (1920) are among those of doubtful authenticity.

Pergolesi's serious style is best-illustrated in his *Stabat Mater* and in his masses, which demonstrate his ability to handle large choral and instrumental forces. His gift of comic characterization is best-shown in the classic *La serva padrona.*

Perhimpunan Indonesia, English INDONESIAN UNION, an Indonesian students' organization in The Netherlands, formed in the early 1920s, which provided a source of intellectual leadership for the Indonesian nationalist movement. This association originated in 1908 as the Indische Vereeniging (Indies Association), which changed its name to the Indonesische Vereeniging (Indonesian Association) in 1922 as Indonesian nationalism developed. It became known as the Perhimpunan Indonesia in 1924 and was the vanguard of the Indonesian nationalist movement, advocating national independence from the Dutch.

The Perhimpunan Indonesia was the first political organization to use the term Indonesia in its name. It was influenced by socialist ideas and by Gandhi's principle of nonviolent civil disobedience. When the members of this association returned to Indonesia, they were active in study clubs and eventually in political parties. Two prominent figures were Raden Sutomo and Mohammad Hatta.

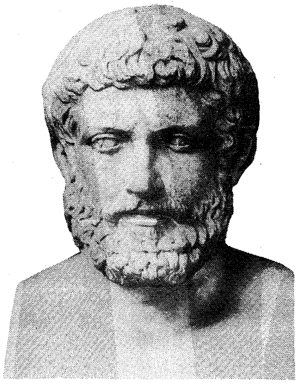
Peri, Jacopo, byname IL ZAZZERINO (b. Aug. 20, 1561, Rome—d. Aug. 12, 1633, Florence), Italian composer noted for his contribution to the development of dramatic vocal style in early Baroque opera.

Under the early sponsorship of the Florentine Cristofano Malvezzi, Peri had published by 1583 both an instrumental work and a madrigal. After early posts as an organist and singer, he was employed in 1588 by the Medici court and, after 1600, was also associated with the court at Mantua. Contemporary testimonials mention his skill as a singer and chitarrone player.

In collaboration with Ottavio Rinuccini, Peri is best-known for composing what was probably the first opera, *Dafne* (1598), and also, in collaboration with Giulio Caccini and Rinuccini, the first opera for which complete music still exists, *Euridice* (1600). The impetus for this new style of dramatic singing, quite different from the traditional Renaissance texture of complex polyphony, was cultivated in Peri's probable association with the Camerata, a group of Florentine poets, musicians, and literati, including Giovanni Bardi and Vincenzo Galilei, who sought to re-create the simplicity of ancient Greek dramatic productions.

periaktos (Greek: "revolving"), plural PERIAKTOI, ancient theatrical device by which a scene or change of scene was indicated. It was described by Vitruvius in his *De architectura* (*c.* 14 BC) as a revolving triangular prism made of wood, bearing on each of its three sides a different pictured scene. While one scene was presented to the audience, the other two could be changed. Although it was once thought to be a feature of Greek classical drama, it is now believed that it did not originate until the Hellenistic age. The periaktos was revived, notably for the Italian theatre in about 1500 and for the 17th-century English stage.

Periander (d. *c.* 588 BC), second tyrant of Corinth (*c.* 628–588), a firm and effective ruler who exploited his city's commercial and cultural potential. Much of the ancient Greek representation of Periander as a cruel despot



Periander, marble bust in the Vatican Museum, Rome
The Mansell Collection

probably derives from the Corinthian nobility, with whom he dealt harshly.

Periander was the son of Cypselus, the founder of the Cypselid dynasty of Corinth. To promote and protect Corinthian trade, Periander established colonies at Potidaea in Chalcidice and at Apollonia in Illyria. He conquered Epidaurus and annexed Corcyra. The *diolkos* ("portage way") across the Isthmus of Corinth was perhaps built during his reign. It appears that the commercial prosperity of Periander's Corinth became so great that the tolls on goods entering its ports accounted for almost all government revenues. Periander cultivated friendly relations with Thrasybulus, tyrant of Miletus, and maintained ties with the kings of Lydia and Egypt. In the cultural sphere he was a patron of art and of literature; by his invitation the poet Arion came to the city from Lesbos. Sometimes reckoned as one of the Seven Wise Men of Greece, Periander was the supposed author of a collection of maxims in 2,000 verses.

periarteritis nodosa (vascular disease): *see* polyarteritis nodosa.

Peribsen, Egyptian king of the 2nd dynasty (*c.* 2775–*c.* 2650 BC), who promoted the cult of the god Seth over that of Horus, the god favoured by his predecessors. His tomb was located in Seth's district in Upper Egypt, at Abydos. According to some scholars, Peribsen's ascendancy was accompanied by a violent reaction against the supporters of Horus, but the supremacy of Horus was restored after his death.

pericarditis, inflammation of the pericardium, the membranous sac that encloses the heart. Acute pericarditis may be associated with any of a number of diseases and conditions, including myocardial infarction (death of a section of heart muscle), uremia (abnormally high levels of urea and other nitrogenous waste products in the blood), allergic disorders, and infections. The pericardial infection may be syphilis, rheumatic heart disease, tuberculosis, or some other bacterial infection. It may be viral or protozoal; the protozoal organism that causes amebic dysentery, for example, may escape from a liver abscess and invade the pericardium. The infection, finally, may be fungal—infection, for example, with *Histoplasma capsulatum.*

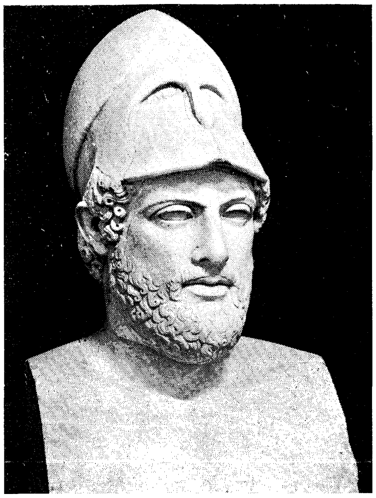
A person with infectious pericarditis experiences pain over the heart, neck, and shoulder. The pain is sometimes increased during breathing and is relieved by leaning forward. Lying down may accentuate the pain, which may radiate to the left arm, the shoulder, and the neck. The affected person may experience difficulty in breathing and may be weak, anxious, and depressed. His skin may be pale or bluish, and he may be feverish and delirious. The tracings of the heart's electrical activity are characteristic, and X rays may show accumulation of fluid in the pericardial sac. A rapid increase of pericardial fluid, called cardiac tamponade, may cause shock. Treatment involves slowly draining the fluid and combating the underlying infection. Acute pericarditis may result in the formation of scar tissue that contracts around the heart and interferes with its operation. This condition, called chronic constrictive pericarditis, is corrected by surgical removal of the pericardium.

periclase, magnesium oxide mineral (MgO) that occurs as colourless to grayish, glassy, rounded grains in marble and in some dolomitic limestones, where it formed by the metamorphosis of dolomite at high temperatures. Rocks containing periclase have been identified at Monte Somma and Predazzo, Italy; Nordmark and Långban, Swed.; and Crestmore, Calif. Periclase may be a major component of the mantle of the Earth. For detailed physical properties, *see* oxide mineral (table).

Pericles (b. *c.* 495 BC, Athens—d. 429, Athens), Athenian statesman largely responsible for the full development, in the later 5th century BC, of both the Athenian democracy and the Athenian empire, making Athens the political and cultural focus of Greece. His achievements included the construction of the Acropolis, begun in 447.

Background and education. Knowledge of the life of Pericles derives largely from two sources. The historian Thucydides admired him profoundly and refused to criticize him.

His account suffers from the fact that, 40 years younger, he had no firsthand knowledge of Pericles' early career; it suffers also from his approach, which concentrates exclusively on Pericles' intellectual capacity and his war leadership, omitting biographical details, which Thucydides thought irrelevant to his theme. The gaps are partly filled by the Greek writer Plutarch, who, 500 years later, began writing the life of Pericles to illustrate a man of unchallengeable virtue and greatness at grips with the fickleness of the mob and finished rather puzzled by the picture he found in his sources of Pericles' responsibility for a needless war. These sources are not all ascertainable, but they certainly preserve an invaluable amount of fact and contemporary gossip, which is sometimes nearly as useful.



Pericles, detail of a marble herm; in the Vatican Museum
Anderson—Alinari from Art Resource/EB Inc.

Pericles was born into the first generation able to use the new weapon of the popular vote against the old power of family politics. His father, Xanthippus, a typical member of this generation, almost certainly of an old family, began his political career by a dynastic marriage into the controversial family of the Alcmaeonids. He soon left their political camp, probably on the question of relations with Persia, and took the then new path of legal prosecution as a political weapon.

Perhaps outbid in his search for popular support, Xanthippus was ostracized in 484 BC, though he returned in 480 to command the Athenian force at Mycale in 479, probably dying soon after. From him Pericles may have inherited a leaning toward the people, along with landed property at Cholargus, just north of Athens, which put him high, though not quite at the highest level, on the Athenian pyramid of wealth.

His Alcmaeonid mother, Agariste, provided him with relationships of sharply diminishing political value and her family curse, a religious defilement that was occasionally used against him by his enemies. A few days before Pericles' birth, according to the Greek historian Herodotus, Agariste dreamed she bore a lion. The symbolism, although ambiguous, is most likely to be unfavourable. That Pericles' skull was of unusual shape seems well attested, but one can hardly speculate about the possible psychological consequences.

The only name associated with his early education is that of the musical theorist Damon, whose influence, it is said, was not just confined to music. The arrival of the Sophist philosophers in Athens occurred during his middle life, and he seems to have taken full advantage of the society of Zeno and particularly Anaxagoras, from whom he is said to have learned impassivity in the face of trouble and insult and skepticism about alleged divine phenomena.

The first known date in his life is 472 BC, when he paid for the production of the playwright Aeschylus' Persian trilogy. Nothing further is known until 463, when he unsuccessfully prosecuted Cimon, the leading general and statesman of the day, on a charge of having neglected a chance to conquer Macedonia; this implies that Pericles advocated an aggressive policy of expansion for Athens. Only rumour associates him directly with the political convulsion of the next two years, which drove Cimon into exile, swung Athens away from its alignment with Sparta, and decisively strengthened the democratic elements in the Athenian constitution; but he probably did support the democratic leader Ephialtes in this period, and his introduction of pay for juries, unfortunately undatable, is a logical consequence of Ephialtes' reforms.

Rise to democratic leadership. That Pericles immediately succeeded the assassinated Ephialtes as head of the democratic party in 461 is an ancient oversimplification; there were other men of considerable weight in Athens in the next 15 years. The outbreak of war among the Greek states in 459 put a premium on military talent, and Pericles' only recorded campaign in the next few years was a naval expedition in the Corinthian Gulf in 454, in which Athens defeated Achaea but failed to win more important objectives. Politically he is credited with some kind of rapprochement with Cimon, who is said to have been recalled and allowed to resume the war with Persia, much preferred to fighting other Greeks, but the date of Cimon's recall is uncertain, and the rumours are hard to disentangle.

In 451 or 450 Pericles carried a law confining Athenian citizenship to those of Athenian parentage on both sides. No source provides any background to this proposal; it is not even clear whether it was retrospective. A correct assessment is vital for understanding Pericles, but explanations vary considerably; some argue that Pericles was merely forging a low-level political weapon for use against Cimon, who had a foreign mother. The upper classes certainly had no prejudice against foreign marriages; the lower classes may well have had more, and, on the whole, it is possible to view Pericles here as championing exclusivist tendencies against immigrants who might break down the fabric of Athenian society.

One hundred years later, an orator argued for firm distinctions of status on the ground that the law provided even the poorest Athenian girl with a dowry in the form of her citizenship. The law also may have passed because of a general wish to restrict access to the benefits of office and public distributions, but there was never any disposition on the part of Athenians to restrict economic opportunities for foreigners—who served in the fleet, worked on public buildings, and had freedom of trade and investment, with the crucial, but normal, exception of land and houses. To speak of this legislation as a move toward creating a "master race" is thus partly misleading, but the demagogic nature of the law seems clear.

Cimon died after 451, during his last campaign against Persia. The policy of war with Persia was abandoned and a formal peace probably made. The Persian War, begun as an ill-considered gesture in 499, could be considered ultimately successful. The city of Athens, however, was physically still much as it had been left by the Persian sack of 480, and its gods were inadequately housed.

Restoring Athens' preeminence. Hostilities among the Greek states had also come to an end in the Five Years' Truce of 451. Pericles now embarked on a policy designed to secure Athens' cultural and political leadership in Greece. It had already dominated the alliance that had continued the Persian War after Sparta's withdrawal in 478, a leadership strengthened by the transfer of the alliance's considerable treasury from Delos to Athens in 454. If peace with Persia did not end the alliance, it may have ended the annual tribute paid to that treasury.

Whether to regain this tribute, or simply to assert Athenian leadership, Pericles summoned a conference of all Greek states to consider the questions of rebuilding the Greek temples destroyed by the Persians, the payment of sacrifices due to the gods for salvation, and the freedom of the seas. Sparta would not cooperate, but Pericles continued on the narrower basis of the Athenian alliance. Tribute was to continue, and Athens would draw heavily on the reserves of the alliance for a magnificent building program centred on the Acropolis. In 447 work started on the temple later known as the Parthenon and on the gold and ivory statue of Athena (by Phidias), which it was to house; the Acropolis project was to include, among other things, a temple to Victory and the Propylaea (started 437), the entrance gateway, far grander and more expensive than any previous Greek secular building.

There was domestic criticism, however. Thucydides, son of Melesias (not the historian) and a relative of Cimon, who had inherited some of his political support, denounced both the extravagance of the project and the immorality of using allied funds to finance it. Pericles argued that the allies were paying for their defense, and, if that was assured, Athens did not have to account for how the money was actually spent. The argument ended in ostracism in 443; Thucydides went into exile for 10 years, leaving Pericles unchallenged. It cannot be determined whether the glamour of the project had completely caught Athenian imagination or whether Pericles was now simply thought to be indispensable. Plutarch attributed to Pericles a desire to stimulate economic activity and employment in Athens, but these motives may be anachronistic and in actuality may not have influenced the voters very much.

Revolts within the empire. There was also some initial allied resentment at the continuation of tribute, and some scattered revolts. Pericles met the situation in part by extending a network of Athenian settlements throughout what may now be called the empire, thus strengthening Athenian control and providing new land for the growing Athenian population. In establishing one of these, Pericles engaged in his most admired campaign, the expulsion of barbarians from the Thracian Chersonese (Gallipoli). A more serious crisis came in 447 or 446, however, when the cities of Boeotia, under Athenian control since 458, beat a small Athenian army and successfully revolted. Euboea, crucial to Athenian control of the sea and food supplies, and Megara soon followed suit. The strategic importance of Megara was immediately demonstrated by the appearance, for the first time in 12 years, of a Spartan army north of the Isthmus in Attica. Pericles thought and acted swiftly. The details were never fully known, but, possibly by bribery and certainly by negotiation, it was arranged that Athens would give up its mainland possessions and confine itself to a largely maritime empire. The Spartan army retired, Euboea was quickly reduced, and the arrangement was ratified by the Thirty Years' Peace (winter 446–445). For Athens, the essential loss was that of Megara, which meant that a Spartan army could appear in Attica at any time. That Pericles doubted the stability of the settlement and saw the need to develop an alternative basic strategy for Athens is shown by his immediate construction of a third Long Wall to improve the defenses of Athens and the port of Piraeus. Henceforth, in effect, Athens could be turned into an island at will.

Political and military achievements. There was a break in tensions for the moment. After Thucydides' ostracism, Pericles had little domestic opposition. His position rested on his continual reelection to the generalship and on his prestige, based, according to the historian Thucydides, on his manifest intelligence and incorruptibility. From his youthful demagogy, he had moved to a more middle ground in politics, and there are traces in his later life of his being outflanked by more radical spokesmen. Athens was, Thucydides says, in name a democracy but, in fact, governed by its first man. Though Athenian democracy never gave more than severely limited powers to the executive, the assembly gave Pericles what he wanted. Thucydides, obsessed with the power of intellect, takes little note of the need of a statesman to work hard, and it is Plutarch who provided the glimpses of a man who took no interest in his own estates, who was never seen on any road but that to the public offices, and who was only recalled to have gone to one social occasion, which he left early.

This picture is softened somewhat by what is known of his personal life. The identity of his wife, however, though certainly of wealth and high birth, is unknown. He married her in his late 20s but, as they were incompatible, divorced her some 10 years later. Close to 50, he took Aspasia of Miletus into his house. By his own law, marriage was impossible, and, after the death of his two legitimate sons, their son Pericles had to be legitimated. Although Aspasia is clouded by scandal and legend, it is easy to believe she possessed great charm and intelligence. There is no reason to doubt that she was free and of good birth in her own city with its great intellectual traditions. It is clear that her own behaviour and Pericles' attitude toward her were surprising phenomena in Athens, where upper class women were kept secluded. That Pericles was known to kiss her on leaving for and returning from work gave rise to speculation about her influence on him and, thus, on Athenian politics.

As the building program continued, Pericles demonstrated Athenian superiority in other ways. In 443 a Panhellenic colony was founded under Athenian auspices at Thurii, in southern Italy, but did not form a continuing centre of Athenian influence in the west, as may have been hoped. At an unknown date, Pericles took a fleet into the Black Sea to demonstrate Athenian power and secure the grain route from the Tauric Chersonese (the Crimean Peninsula in the modern Ukrainian S.S.R.). As the buildings on the Acropolis rose, celebrations of the festival of the Panathenaea grew more and more elaborate, and much was done to enhance the splendour of the Mysteries of Eleusis, symbolic, among other things, of the Athenian claim to have brought corn and civilization to mankind.

Pericles' last major campaign was the one interruption in these years. In 440, Samos, one of Athens' principal allies with a substantial fleet of its own, revolted, and, despite a victory by Pericles against superior numbers, the revolt nearly succeeded. The campaign to recover Samos, although long and costly, was ultimately successful, and it became a model against which later Athenian generals measured their achievements.

The drift toward war. There had been a serious possibility that Sparta and its allies might intervene on this occasion, but they did not, and the Thirty Years' Peace was upheld until the end of the 430s. Tension grew as the decade progressed, particularly with regard to Corinth, Sparta's ally, whose interests conflicted more obviously with those of Athens. By 433 the situation was serious enough for Athens' finances to be put on a war basis, and, thereafter, the drift to war continued.

Pericles' policy was one of firmness, coupled with careful manipulation of the diplomatic position to keep Athens technically in the right. The firmness was a puzzle to contemporaries, particularly his determination to enforce decrees excluding Megarian trade from the Athenian Empire. Was he, it was asked, influenced by some private grievance of Aspasia? Was he trying to divert attention from personal attacks on himself and friends by making war? Thucydides tells just enough to make his own interpretation plausible, that Megara was a small matter in itself but crucial as a symbol of Athenian determination to maintain its position. Consideration of Megara's strategic importance, which Thucydides consistently undervalues, may suggest further the possibility that the Megarian decrees were not the immediate cause of the war but the first blow in a war Pericles thought inevitable and that began in spring 431.

Pericles' main strategic ideas are clear. He was an admiral rather than a general, and Athens' naval resources were immeasurably superior to its land power. He would evacuate the Athenian countryside, bring the population into the Long Walls, decline battle with the Spartan army, and rely on the fleet to assure Athenian food supplies and secure the empire on whose resources the expensive naval policy depended. Expenditure on building had been counterbalanced by annual savings from the tribute, and enough capital had been reserved, he thought, for a long war, though expenditure turned out heavier than he could have calculated. This is essentially Thucydides' analysis, though he failed to explain what end to the war, other than a stalemate, Pericles wanted or expected. There are some indications that Periclean strategy included more aggressive elements, such as the recovery of Megara, which would have considerably improved Athens' position.

Weakness of Pericles' strategy. This strategy, however, had marked political weaknesses. The Athenian population had deep roots in the countryside, and great firmness was required to bring them to abandon their land to Spartan ravages without a fight. The middle-class army suffered in morale, and the living conditions of the lower classes, though they were allowed activity in the fleet, deteriorated in the overcrowded city. The overcrowding had an unforeseeable consequence in a plague, which in the second summer of the war took a quarter of the population. No obvious success counterbalanced the discomforts of war, and Pericles was deposed from office and fined. He was soon reelected, but he took no new initiatives before his death in autumn 429.

After the first campaigning season of the war, he had delivered the funeral speech over the fallen, which Thucydides reports at length. They had fallen, he said, in preserving a way of life that he described in detail. Athenian life often fell short of this Periclean ideal, but he conceived it with clarity and made it generally recognized. He conceived his Athens as "an education to Greece." If the last speech attributed to him by Thucydides is any guide, he cannot be accused of ignoring that the realities of power that made the Periclean age possible might also bring it down.

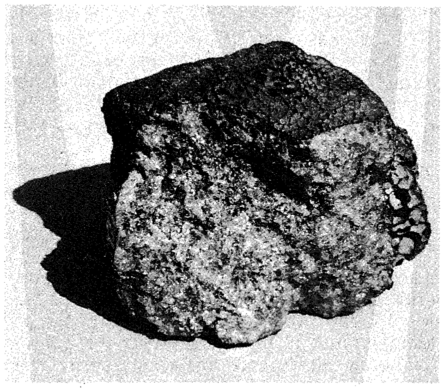
Modern works. A.R. Burn, *Pericles and Athens* (1949), brief but good historical treatment with a critical bibliography; V. Ehrenberg, *Sophocles and Pericles* (1954), detailed discussion of aspects of the intellectual background; C.M. Bowra, *Periclean Athens* (1971), a full picture of the period and its culture; J.K. Davies, *Athenian Propertied Families*, pp. 455–460 (1971), only on family and property, but with scholarly bibliography; R. Meiggs, *The Athenian Empire* (1972), a detailed, scholarly survey.

peridot, also called PRECIOUS OLIVINE, gem-quality, transparent green olivine in the forsterite–fayalite series (*q.v.*). Gem-quality olivine has been valued for centuries; the deposit on Jazīrat Zabarjad (Saint Johns Island),



Peridot from Jazīrat Zabarjad, Egypt, in the Red Sea

By courtesy of the American Museum of Natural History, New York City; photograph, Emil Javorsky—EB Inc.

Egypt, in the Red Sea that is mentioned by Pliny in his *Natural History* (AD 70) still produces fine gems. Very large crystals are found in the Mogok district of Burma; peridots from the United States are seldom larger than two carats. Yellow-green peridot has been called chrysolite (Greek: "golden stone"); this term, used for various unrelated minerals, has become less common for the gemstone. Peridot is generally faceted with a step cut.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

---

peridotite, a coarse-grained, dark-coloured, heavy, intrusive igneous rock that contains at least 10 percent olivine, other iron- and magnesia-rich minerals (generally pyroxenes), and not more than 10 percent feldspar. It occurs in four main geologic environments: (1) interlayered with iron-, lime-, and magnesia-rich rocks in the lower parts of tabular-layered igneous complexes or masses; (2) in alpine-type mountain belts as irregular, olivine-rich masses, with or without related gabbro; (3) in volcanic pipes (funnels, more or less oval in cross section, that become narrower with increasing depth) as kimberlite; and (4) as dikes (tabular bodies injected in fissures) and irregular masses with rocks exceptionally rich in potash and soda. The layered complexes are believed to have been formed in place by selective crystallization and crystal settling from a previously intruded fluid or magma; the remaining types seem to have ranged from fluid magmas to semisolid crystal mushes at the time of emplacement. *See also* dunite; kimberlite.

Peridotite is the ultimate source of all chromium ore and naturally occurring diamonds, and of nearly all chrysotile asbestos. It is one of the main host rocks of talc deposits and platinum metals and formerly was a major source of magnesite. Fresh dunite is used in parts of glass furnaces. Nearly all peridotite is more or less altered to serpentine and is cut by many irregular shear surfaces; in warm, humid climates peridotite and serpentine have weathered to soils and related deposits that, though now worked on a relatively small scale, are enormous potential sources of iron, nickel, cobalt, and chromium.

Perier, Casimir(-Pierre) (b. Oct. 21, 1777, Grenoble, Fr.—d. May 16, 1832, Paris), French banker and statesman who exercised a decisive influence on the political orientation of the reign of King Louis-Philippe.

Perier was the son of a manufacturer and financier. After service with the staff of the French army in Italy (1798–1801), he returned to France and together with his brother, Antoine-Scipion, founded a new bank. By 1814 he was one of the most important bankers in Paris. In 1817 he opposed the government's policy of relying on foreign banks to finance France's war indemnity. Elected to the Chamber of Deputies in 1817, he sat with the moderate opposition of the left.

After the Revolution of July 1830 that overthrew Charles X and made Louis-Philippe king of the French, Perier was elected president of the Chamber of Deputies. On March 13, 1831, he became president of the council of ministers (premier) and minister of the interior. He set himself to restore order: the National Guard was brought into action against demonstrators in Paris; and later the army put down the silkworkers' insurrection in Lyon (November–December 1831). In foreign affairs he pursued an active policy: a naval squadron was dispatched to Lisbon to force the Portuguese government to compensate French merchants for damages (July 1831); he sent an army to defend Belgium against the Dutch (August 1831); and he ordered the occupation of the Adriatic port of Ancona to check Austrian predominance in the Papal States (February 1832). He had to face continual attacks from both left and right, and his authoritarian manner sometimes alienated Louis-Philippe also. He died of cholera.

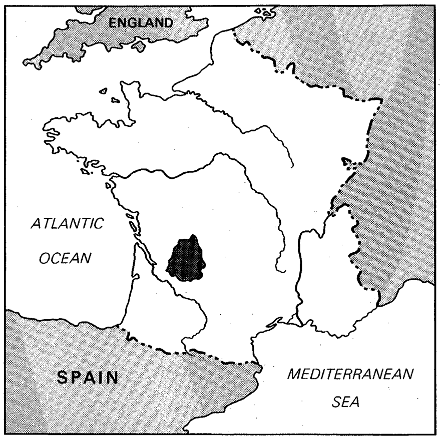
periglaciology, study of the large areas of the Earth that were adjacent to but not covered by ice during the glacial periods. Modern representatives of these areas are the sub-Arctic tundra and permafrost regions located in the Northern Hemisphere. All of the conditions derived from such a paleoenvironment can be observed in the geologic record preserved in many areas now free of ice.

Pérignon, Dominique-Catherine, marquis de (b. May 31, 1754, Grenade, Fr.—d. Dec. 25, 1818, Paris), general and marshal of France, active during the Revolutionary and Napoleonic wars.

A retired officer of the royal army, Pérignon resumed active service in 1792. Operations against the Spaniards won him the rank of general and, in 1794, command of the Army of the Eastern Pyrenees. As ambassador to Madrid he negotiated the Spanish alliance (1796). While fighting in Italy (1799) he was wounded and taken prisoner by the Russians for 18 months, returning to France to become a senator (1801) and a marshal (1804). He was appointed governor general of Parma (1806) and commander in chief at Naples (1808) and became a count of the empire in 1811. After Napoleon's abdication he rallied to Louis XVIII, was made a peer and later a commanding officer at Toulouse (1815) and Paris (1816), and was created marquis in 1817.

Périgord, historic and cultural region encompassing the southern French *département* of Dordogne and part of Lot-et-Garonne and roughly coextensive with the former county of Périgord. The area was originally inhabited by the Gallic tribe of the Petrocorii, or Petragorici, whose capital became Périgueux. The counts of Périgord later played a part in the troubled affairs of Aquitaine, and, beginning in 1259, control of Périgord was disputed by the French and the English. In 1470 the area was transferred to the House of Albret and subsequently was inherited by the crown of Navarre, whereupon Henry IV united it with the French crown (1607). Under the *ancien régime,* Périgord was included in the province of Guyenne and the *intendance,* or *généralité,* of Bordeaux.

Physiographically Périgord is an upland region on the southwestern flanks of the Massif Central, drained westward by the Lot, Dordogne, and other tributaries of the Garonne.



The county of Périgord *c.* 1035

From W. Shepherd, *Historical Atlas,* Harper & Row, Publishers (Barnes & Noble Books), New York; revision Copyright © 1964 by Barnes & Noble, Inc.

The traditional farmstead has two stories linked by an outdoor stairway; houses are often flanked by towers. Architectural features include balconies on the ground floor, oversize portals, carved lintels, and stone arcades. The rural population has been depleted by emigration.

There are numerous immigrants from Alsace and Brittany; repatriates from Algeria settled in Périgord between 1962 and 1964. Roman Catholicism predominates, although there is a sizable Protestant enclave in Bergerac. Three dialects of Occitan are widely spoken in the countryside.

Regional cuisine features truffles, which are unearthed among oak trees by trained pigs and dogs between November and March, and fine pâtés de foie gras. Geese are penned in November and force-fed corn (maize) cooked with fat and salt; geese and ducks are slaughtered by Christmas for foie gras. The wings and thighs are seasoned and canned. Wild boars are occasionally raised for pâté. Phylloxera has destroyed most of the region's vines, though Pécharmant, which is produced outside Bergerac, is a notable dark wine with a slightly earthy flavour.

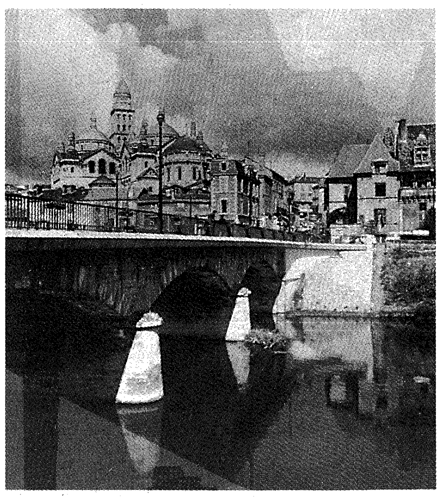
Perigordian industry, tool tradition of prehistoric men in Upper Paleolithic Europe that followed the Mousterian industry, was contemporary in part with the Aurignacian, and was succeeded by the Solutrean. Perigordian tools included denticulate (toothed) tools of the type used earlier in the Mousterian tradition and stone knives with one sharp edge and one flat edge, much like modern metal knives. Other Upper Paleolithic tool types are also found in Perigordian culture, including scrapers, borers, burins (woodworking tools rather like chisels), and composite tools; bone implements are relatively uncommon.

The Perigordian has two main stages. The earlier stage, called Châtelperronian, is concentrated in the Périgord region of France but is believed to have originated in southwestern Asia; it is distinguished from contemporary stone tool culture complexes by the presence of curved-backed knives (knives sharpened both on the cutting edge and the back). The later stage is called Gravettian and is found in France, Italy, and Russia (there termed Eastern Gravettian). Gravettian people in the west hunted horses to the near exclusion of the reindeer and bison that other contemporaries hunted; in Russia Gravettians concentrated on mammoths. Both appear to have hunted communally, using stampedes and pitfalls to kill large numbers of animals at one time. Gravettians in the east used large mammoth bones as part of the building material for winter houses; mammoth fat was used to keep fires burning. Gravettian peoples made rather crude, fat "Venus" figurines, used red ochre as pigment, and fashioned jewelry out of shells, animal teeth, and ivory.

Périgueux, town, *département* of Dordogne, Aquitaine region, southwestern France. An episcopal see, it lies on the right bank of the Isle River, east-northeast of Bordeaux and southwest of Paris. Originally settled by a Gaulish tribe, the Petrocorii, the town fell to the Romans, who called it Vesuna after a local spring, the Vésone, that became their tutelary deity.

The modern town developed from two nuclei, the Cité and Puy-Saint-Front, which vied with one another until they united in 1251. The Cité, in the southwestern part of the town, occupies the site of Vesuna, subsequently reduced by the barbarians to a small encampment, called the Civitas Petrocorium, from which the names Cité and Périgueux are derived. Puy-Saint-Front, on the east, grew between the 5th and 13th centuries around an abbey sanctuary containing the body of St. Front, the Apostle of Périgord, and the first bishop of Périgueux. The contemporary city spreads west and northwest of Puy-Saint-Front.

Périgueux struggled against the English throughout the Hundred Years' War (1337–1453) and suffered severely under Protestant occupation (1575–81) during the 16th-century Wars of Religion. Given amnesty by Louis XIV in 1654 for its part in the Fronde (a series of civil disturbances, 1648–53), the town then experienced an era of peace. At the time of the French Revolution at the end of the 18th century, it continued as the capital of a *département,* covering the same area as the medieval province of Périgord Blanc. From



Périgueux on the Isle River, Fr., with the domes and bell tower of the cathedral of Saint-Front in the background

CAP—Vloo, Paris

the July Monarchy (1830) onward many improvements were made, and the town received new impetus under the Second Empire (1852–70) and the Third Republic (1870–1940).

A chief point of cultural interest is the cathedral of Saint-Front, built in the 12th century on the ruins of the abbey, which burned in 1120. One of the largest in southwestern France, it is built in the shape of a Greek cross, topped by five lofty domes and numerous colonnaded turrets. A Romanesque bell tower and cloisters of the 12th, 13th, and 16th centuries adjoin it on the south. Successive restorations, the last ending in 1901, have altered its original character. The Périgord Museum displays prehistoric and archaeological artifacts of the area, as well as secular and religious art. In the Cité is the 12th-century church of Saint-Étienne, which was the cathedral until 1669. Evidences of early occupation are an arena of the 3rd century AD, a boundary wall of the Roman *civitas* on which is built the Château Barrière (12th–15th century), and the Tour de Vésone, believed to be part of a temple to the goddess Vesuna.

Now one of the most attractive towns in southwestern France, Périgueux is a road and rail junction with connections northeast to Limoges and southwest to Bordeaux. The nearest airport is to the east at Bassilac. Internationally known for its pâté de foie gras, truffles, and wine, Périgueux is also an important hog market. Industries include canneries and plants producing hardware, cutlery, chemicals, textiles, and leather goods. Pop. (1982) 32,632.

Perijá, Mountains of, Spanish SERRANÍA DE PERIJÁ, also called SIERRA DE PERIJÁ, mountain chain, the northward extension of the Andean Cordillera Oriental, forming part of the border between Colombia and Venezuela. The range extends for 190 miles (306 km) from the vicinity of Ocaña, Norte de Santander department, Colombia, northward to the Guajira Peninsula. Its crest line rises to 12,300 feet (3,750 m) above sea level. Included in the range are the Motilones, Valledupar, and Oca mountains. To the west, across the César River, lies the higher Sierra Nevada de Santa Marta, while to the east stretches the Maracaibo Lowland of Venezuela.

perilla oil, drying oil obtained from the seeds of Asiatic mint plants of the genus *Perilla.* Perilla oil is used along with synthetic resins in the production of varnishes. Perilla oil dries in less time than linseed oil and on drying forms a film that is harder and yellows more than that formed by linseed oil. The paint and varnish industry accounts for the largest

Perilla frutescens, the seeds of which are the source of perilla oil
W.H. Hodge

usage. Perilla oil also is important in the manufacture of printing inks and linoleum. In the Orient perilla oil is used as an edible oil.

Perilla has been cultivated in China, Korea, Japan, and northern India and is becoming increasingly important. The seeds contain 35 to 45 percent oil.

Perim Island, Arabic BARĪM, island in el-Mandeb Strait off the coast of Yemen (Aden), to which it belongs. A rocky volcanic island, lying just off the southwestern tip of the Arabian Peninsula, Perim is 5 square miles (13 square km) in area and rises as high as 214 feet (65 m). It has a harbour on the southwestern shore, and an airfield is in the north. Perim was visited by the Portuguese in 1513 and occupied by the French in 1738. The British occupied the island in 1799, but scarcity of water forced them to decamp to Aden; they returned in 1857 and established a coaling station. Perim's population expanded greatly thereafter but declined after the coaling station was abandoned in 1936. The island was incorporated into the British colony of Aden in 1937 and became part of independent Yemen (Aden) in 1967.

period, in geology, the basic unit of the geological time scale; during these spans of time specific systems of rocks were formed. Originally, the sequential nature of defining periods was a relative one, originating from the superposition of corresponding stratigraphic sequences and the evidence derived from paleontological studies. With the advent of radiometric dating methods, absolute ages for various periods can be determined.

period, in music, unit of melodic organization made up of several related consecutive phrases. Often the period has two phrases, typically of 8 or, in some cases, 16 measures each. The first phrase, called the antecedent, ends on a semi- or half-cadence and thus avoids any sense of finality; the second comes to a full cadential stop on the tonic, unless a modulation has occurred, in which case the full cadence confirms the new key.

Periodic structure is primarily a function of homophonic and especially diatonic music, in which the kind of sectionalization associated with the musical period operates at all structural levels. Polyphonic and monophonic textures, on the other hand, thrive on nonperiodicity, or aperiodicity, precisely because the resulting lack of clearly defined intersections generates the continuous flow of melodic energy that is the essence of music thus conceived.

periodic law, in chemistry, the generalization that there is a recurring pattern in the properties of the elements when they are arranged in order of increasing atomic number—*i.e.,* the total number of protons in the atomic nucleus. The periods (horizontal rows) of the periodic table illustrate these relationships.

A brief treatment of periodic law follows. For full treatment, *see* MACROPAEDIA: Chemical Elements. The article also contains a full-colour periodic table.

The elements, arranged in order of their increasing atomic numbers, are divided into seven periods reflecting periodicities in electronic structure and in chemical and physical properties. There are three short periods of 2, 8, and 8 elements; three long periods of 18, 18, and 32 elements, all of which are known; and a further long period predicted to contain 32 elements with atomic numbers from 87 to 118 (successful efforts to prepare elements with atomic numbers as high as 110 had been claimed by the late 1980s).

The progression of elements along a period represents a systematic occupation by electrons of orbitals, or electron shells. A period is completed when all the electron orbitals within a given energy level are filled.

The formulation of the periodic table began during the 1860s, when the Russian chemist Dmitry I. Mendeleyev undertook a detailed investigation of the relationship between the properties of the elements. In 1869, on the basis of an extensive correlation of the properties and the atomic weights of the elements, he proposed the periodic law and devised a tabular arrangement of the elements to show the observed relationships. Lothar Meyer, a German chemist, developed a similar classification of the elements independently of Mendeleyev at about the same time.

Mendeleyev's periodic table made it possible to observe many types of chemical relations hitherto studied only in isolation. It was not, however, widely accepted at first. The new classification system had gaps, but Mendeleyev predicted that they would be filled by elements not yet discovered. The validity of his predictions became apparent with the discovery of three new elements within the next 20 years. During the 1920s it was recognized that the order of elements in the periodic table is that of their atomic numbers. In subsequent years considerable progress was made in explaining the periodic law in terms of the electronic structure of atoms. This clarification greatly increased the value of the law.

periodic motion, in physics, motion repeated in equal intervals of time, the time of each interval being called the period. Periodic motion is performed, for example, by a rocking chair, a bouncing ball, a vibrating tuning fork, a swing in motion, the Earth in its orbit about the Sun, and a water wave. In each case the interval of time for a repetition, or cycle, of the motion is called a period.

In simple harmonic motion (*see* simple harmonic motion), the period is the time required to complete one vibration. One period therefore equals the reciprocal of the frequency, or 1/frequency; *e.g.,* a hummingbird's wing that beats with a frequency of 50 per second has a period of 0.02 second.

When a point moves around a circle with uniform speed, its projection on any line taken as the diameter (*i.e.,* the intersection of a line drawn through the point perpendicular to the diameter) will execute simple harmonic motion. Although the point is moving with constant speed, the projection point will accelerate or decelerate according to whether it is moving toward the centre of the circle or away from it. If the ratio of its displacement distance from the centre to the acceleration is denoted by c, then the period T of a simple harmonic motion is equal to 2π times the square root of c—*i.e.,* $T = 2\pi\sqrt{c}$.

Waves that can be represented by harmonic waves—*i.e.,* sine curves—are periodic. If the wave is propagated with a velocity v and has a wavelength λ, then the period (T) is equal to wavelength divided by velocity, or $T = \lambda/v$. Because frequency (f) is the reciprocal of the period—*i.e.,* $f = 1/T$—this equation may be written $f = v/\lambda$.

periodontal membrane, also called PERIODONTAL LIGAMENT, fleshy tissue between tooth and tooth socket that holds the tooth in place, attaches it to the adjacent teeth, and enables it to resist the stresses of chewing. It develops from the follicular sac that surrounds the embryonic tooth during growth.

The periodontal membrane contains blood vessels and sensory nerve endings for pain, touch, and proprioceptive sensation (sensation arising from stimuli within rather than outside the body), the latter providing the central nervous system with the feedback information necessary for coordinated muscle activity in complex activities such as mastication and swallowing.

periodontics, dental specialty concerned with the prevention, diagnosis, and treatment of functional and structural diseases of the periodontal membrane and related tissues that surround and support the teeth. Degeneration or inflammation of these tissues can be caused by various systemic or local diseases or by poor oral hygiene. In some cases the cause is not established. Most commonly, periodontic diseases are caused by hardened bacteria, called bacterial plaque, which adheres to teeth and destroys periodontal tissue. The most prevalent periodontal disease is periodontitis, inflammation of the periodontium.

periodontitis, inflammation of the soft tissues around the teeth, characterized by swollen, tender gums and eventual loss of teeth. Periodontitis begins with the deposition of bacterial plaque on the teeth below the gum line, irritating and eroding the neighbouring tissues. At this state, the condition is reversible, but left untreated the inflamed margin of the gum begins to recede, exposing the roots of the teeth; eventually the alveolar bone that anchors the teeth becomes involved, loosening the teeth to the point where they may fall out. Removal of all plaque deposits and affected soft tissues can arrest but not reverse alveolar deterioration.

Although the precipitating cause of periodontitis is poor dental hygiene leading to plaque deposition, an inherent susceptibility to osteoporosis and degeneration of connective tissues may also play a role in the more severe consequences of the disease. Familial juvenile periodontitis, an inherited condition resulting in tooth loss in early adulthood, is an extreme manifestation of this systemic susceptibility.

periosteum, dense fibrous membrane covering the surfaces of bones, consisting of an outer, fibrous layer and an inner, cellular layer. The outer layer is composed mostly of collagen and contains nerve fibres that cause pain when the tissue is damaged. It also contains many blood vessels, branches of which penetrate the bone to supply the osteocytes, or bone cells. These branches pass into the bone along channels known as Volkmann's canals to the vessels in the haversian canals, which traverse the length of the bone. Fibres from the inner layer also penetrate the underlying bone, serving, with the blood vessels, to bind the periosteum to the bone.

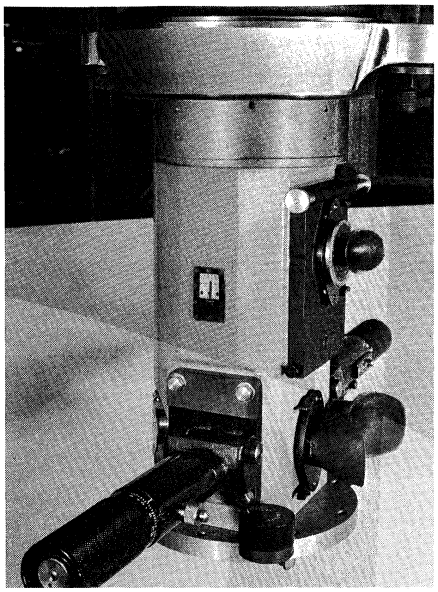
The inner layer of the periosteum contains osteoblasts (bone-producing cells) and is most prominent in fetal life and early childhood, when bone formation is at its peak. In adulthood these cells are less evident, but they retain their functional capacities and are vital to the constant remodeling of bone that goes on throughout life. In the event of bone injury they proliferate greatly to produce new bone in the repair process. Following an injury such as a fracture, the periosteal vessels bleed around the traumatized area and a clot forms around the fragments of bone. Within 48 hours the osteoblasts multiply and the inner layer of the periosteum expands to become many cell layers thick. The cells then begin to differentiate and lay down new bone between the ends of the fracture.

The periosteum covers all surfaces of the bone except for those capped with cartilage, as in the joints, and sites for attachment of ligaments and tendons. Fibrous cartilage often takes the place of the periosteum along grooves where tendons exert pressure against the bone. The periosteum on the inner surface of the skull is also modified to some extent as it joins the membrane protecting the brain, the dura mater.

peripeteia (Greek: "reversal"), the turning point in a drama after which the plot moves steadily to its denouement. It is discussed by Aristotle in the *Poetics* as the shift of the tragic protagonist's fortune from good to bad, which is essential to the plot of a tragedy. It is often an ironic twist, as in Sophocles' *Oedipus Rex* when a messenger brings Oedipus news about his parents that he thinks will cheer him, but the news, instead, slowly brings about the awful recognition that leads to Oedipus' catastrophe. The term is also used to refer to the hero's shift from bad fortune to good in a comedy.

periscope, optical instrument used in land and sea warfare, submarine navigation, and elsewhere to enable an observer to see his surroundings while remaining under cover, behind armour, or submerged.

A periscope includes two mirrors or reflecting prisms to change the direction of the light coming from the scene observed: the first deflects it down through a vertical tube, the second diverts it horizontally so that the scene can be viewed conveniently. Frequently there is a telescopic optical system that provides magnification, gives as wide an arc of vision as possible, and includes a crossline or reticle pattern to establish the line of sight to the object under observation. There may also be devices for estimating the range and course of the target in military applications and for photographing through the periscope.



Periscope, eyepiece box and observer's station; handles control rotation about the axis, twist grips provide control of the line-of-sight elevation

By courtesy of Kollmorgen Corp., Northampton, Mass.

The simplest type of periscope consists of a tube at the ends of which are two mirrors, parallel to each other but at 45° to the axis of the tube. This device produces no magnification and does not give a crossline image. The arc of vision is limited by the simple geometry of the tube: the longer or narrower the tube, the smaller the field of view. Periscopes of this type were widely used in World War II in tanks and other armoured vehicles as observation devices for the driver, gunner, and commander. When fitted with a small, auxiliary gunsight telescope, the tank periscope can also be used in pointing and firing the guns. By employing tubes of rectangular cross section, wide, horizontal fields of view can be obtained.

perissodactyl, member of the mammalian order Perissodactyla, made up of 15 species of herbivorous hoofed mammals divided into 3 families: the horses, asses, and zebras (Equidae), the rhinoceroses (Rhinocerotidae), and the tapirs (Tapiridae). Members of the order are characterized by an odd number of toes on the hind foot, as distinguished from the even-toed ungulates of the Artiodactyla (*e.g.,* cattle, swine).

A brief treatment of perissodactyls follows. For full treatment, *see* MACROPAEDIA: Mammals.

Living perissodactyls are remnants of a large and varied group that flourished in the Tertiary Period (2,500,000 to 65,000,000 years ago). Eight entire families known from the fossil record are extinct, in addition to numerous species from the three families still extant. The fossil history of the order is well-known, especially in the case of Equidae, making their development of great scientific interest and a significant force shaping evolutionary thought. The perissodactyls are large, ranging from the 600-pound (270-kilogram) tapir to the 4,500-pound (2,040-kilogram) rhinoceros. All perissodactyls feed by grazing or browsing, and their teeth have evolved specialized forms adapted to grinding. Various living species have seen their numbers reduced by hunting and human expansion; many are presently protected in game reserves and national parks.

Horses, asses, and zebras adapted to a variety of environments, although not forests or other areas of dense vegetation. They are a highly specialized running form, subsisting almost entirely on grasses. Two races of wild horse (*Equus caballus*), one gray (the tarpan) and one reddish brown (*E. c. przewalskii*), were once widely distributed throughout northern Eurasia. The tarpan became extinct in the Ukraine in the mid-19th century, while Przewalski's horse, thought to have disappeared as a truly wild animal before 1950, may still exist in the remote semidesert lands near the Mongolian–Chinese border. The domestic horse, a descendant of the wild horse, is found throughout the world.

Three species of zebra are found on the African continent, ranging from mountainous terrain to sparsely wooded savanna. Originally very numerous, their numbers have also been severely reduced (one variety now numbers perhaps 100 animals) primarily by competition from domestic livestock for meagre pastureland. A large proportion of zebras are to be found in reserves or enjoying legal protection.

The true ass (*Equus asinus*), found in arid North Africa, is the ancestor of the modern donkey. It is probable that truly wild asses no longer exist, the strain having been diluted by interbreeding with escaped or released domestic donkeys. All races of the half-asses (*E. hemionus*) that are not extinct are rare. The species, which includes the onager, one of which stands only 1 m (3 feet) tall at the shoulder, ranges from Syria through Central Asia to Mongolia.

There are two living species of rhinoceros found in Africa and three in Asia. As with the *Equus* family, all species have been severely reduced in number, some presently being close to extinction, and many are protected in reserves and parks. All are characterized by very large size, extremely thick and mainly hairless hides, and one or, in the case of the Indian rhinoceros, two horns. The African species are the black, or prehensile-lipped, rhinoceros and the white, or square-lipped, rhinoceros. The black rhinoceros, ranging from southern Africa to as far north as the Côte d'Ivoire, is a selective browser and can apparently survive without free water by devouring succulent plants. Its numbers have been reduced mainly by poachers seeking the horns. The much larger white rhinoceros is mainly a grazing animal whose numbers have been reduced to the approximately 1,700 confined to the game reserves of Zululand and an additional population in Zaire.

Less than 1,000 members of the three Asian rhinoceroses survive today in widely separated pockets. The Sumatran rhinoceros, the smallest of the family, standing 1 to 1.5 m (3 to 5 feet) at the shoulder, is thought to number between 100 and 170. Only 25 to 60 Javan rhinoceroses survive, confined to a single reserve in western Java. The most numerous species, the Indian, or one-horned, rhinoceros, is threatened by hunting and by expanding human populations.

The tapirs are rounded, semiamphibious, piglike creatures that inhabit forests and woodlands, subsist by browsing, and are characterized by a trunklike snout and a coat of short, bristly hair. One Asian species (*Tapirus indicus*), the largest tapir, is found in Sumatra and the Malay peninsula, while three species, the mountain (*T. pinchaque*), Baird's (*T. bairdii*), and the Brazilian (*T. terrestris*), range throughout Middle and South America. The mountain tapir is the smallest and most primitive species and is found in Colombia and Ecuador at altitudes up to 15,000 feet. Baird's tapir, the largest, extends from Mexico to coastal Ecuador. Its shyness and difficulty in adjusting to human settlement have greatly reduced its range and numbers.

All ungulates, including the perissodactyls, were probably derived from the order Condylarthra, unspecialized tapir-sized mammals, and emerged 55,000,000 to 40,000,000 years ago, during the Eocene. The earliest horses (formerly *Eohippus*, now known as *Hyracotherium*) were browsing, forest-dwelling creatures, sometimes no larger than a fox terrier, that appeared in Europe and North America. *Pliohippus*, the line from which modern horses are descended, developed in North America during the Pleistocene and then spread throughout most of the world. One group of animals (*e.g.*, *Homogalax*) was the common ancestor of both the tapirs and rhinoceroses. After the separation of the families, some rhinoceros ancestors developed massive horns, and one, *Baluchitherium*, grew to stand 5.5 metres (18 feet) at the shoulder.

The perissodactyls as a rule avoid human contact and play little rôle in the affairs of man. The exceptions, of course, are the equines, particularly the horse and ass, whose importance in the history of mankind as pack, draft, and riding animals, as well as occasionally as food, is very great indeed.

peristalsis, involuntary movements of the longitudinal and circular muscles, primarily in the digestive tract but occasionally in other hollow tubes of the body, that occur in progressive wavelike contractions. Peristaltic waves occur in the esophagus, stomach, and intestines. The waves can be short, local reflexes or long, continuous contractions that travel the whole length of the organ, depending upon their location and what initiates their action.

In the esophagus, peristaltic waves begin at the upper portion of the tube and travel the whole length, pushing food ahead of the wave into the stomach. Particles of food left behind in the esophagus initiate secondary peristaltic waves that remove leftover substances. One wave travels the full length of the tube in about nine seconds. The peristaltic-wave contractions in the esophagus of humans are weak compared with those of most other mammals. In cud-chewing animals, such as cows, reverse peristalsis can occur so that the food is brought back from the stomach to the mouth for rechewing.

When the stomach is filled, peristaltic waves are diminished. The presence of fat in a meal can completely stop these movements for a short period until it is diluted with gastric juices or removed from the stomach. Peristaltic waves start as weak contractions at the beginning of the stomach and progressively become stronger as they near the distal stomach regions. The waves help to mix the stomach contents and propel food to the small intestine. Usually, two to three waves are present at one time in different regions of the stomach, and about three waves occur each minute.

In the small intestine, local stimulation of the intestinal smooth muscle by the presence of food particles causes contractions that tend to travel from the stimulated point in both directions. Under normal circumstances, the progress of the contractions in an oral direction is quickly inhibited, while the contractions travelling away from the mouth tend to persist. If the intestine is paralyzed by applying such drugs as nicotine or cocaine to the intestinal wall, the contractions initiated by local stimulations travel equally well in both directions. Ordinarily, peristaltic waves appear in the small intestine at irregular intervals and travel for varying distances; some travel only a few inches, others a few feet. They serve to expose food to the intestinal wall for absorption and to move it forward.

In the large intestine (or colon), the peristaltic wave, or mass movement, is continuous and progressive; it advances steadily toward the anal end of the tract, pushing waste material in front of the wave. When these movements are vigorous enough to pass fecal masses into the rectum, they are followed by the desire to defecate. If feces are passed to the rectum and not evacuated from the body, they are returned to the last segment of the colon for longer storage by reverse peristaltic waves. Peristaltic waves are particularly important in helping to remove gas from the large intestine and in controlling bacterial growth by mechanically acting as a cleansing agent that dislodges and removes potential colonies of bacteria.

peristerite, iridescent gemstone in the plagioclase (*q.v.*) series of feldspar minerals. The name (from Greek *peristera,* "pigeon") refers to the resemblance of fine specimens such as those from Ontario and Quebec to the commonly iridescent feathers of a pigeon's neck. In peristerite—usually a form of one of the sodium-rich varieties of plagioclase albite or oligoclase—the sodium aluminosilicate and calcium aluminosilicate that make up the mineral separate and form intergrowths of submicroscopic but distinct crystals of the two compounds. The iridescence probably arises from diffusion of light by adjoining areas of different optical properties, or from reflection and diffraction of the separating crystals of the two different substances.

peritoneum, large membrane in the abdominal cavity that connects and supports internal organs. It is composed of many folds that pass between or around the various organs. Two folds are of primary concern: the omentum, which hangs in front of the stomach and intestines; and the mesentery, which attaches the small intestine and much of the large intestine to the posterior abdominal cavity.

The omentum and mesentery contain blood vessels, nerves, lymph nodes, varying amounts of fat, elastic fibres for stretching, and collagen fibres for strength. The omentum is thinner than the mesentery and is lacy in appearance. It contains large quantities of fat that serve to keep the organs warm. The mesentery is fan-shaped and well supplied with blood vessels that radiate to the intestines.

The functions of these membranes are to prevent friction between closely packed organs by secreting serum that acts as a lubricant, to help hold the abdominal organs in their proper positions, to separate and unite organs, and to guard as a barrier against infection.

peritonitis, inflammation of the peritoneum, the membrane that lines the abdominal wall and then folds in to enclose the abdominal organs. The condition is marked by an accumulation of serum, fibrin, cells, and pus in the peritoneal cavity (between the two folds of the peritoneal membrane) and by abdominal pain and distension, vomiting, and fever.

Peritonitis may be acute or chronic, generalized or localized. Acute peritonitis is usually secondary to an inflammatory process elsewhere in the body and may be caused by a variety of agents, such as a bacterial invasion from an infected body structure, or blood or other body fluids from a ruptured organ. A perforated gastrointestinal tract, notably a ruptured appendix, is a common primary cause of peritonitis. Control of the source of inflammation is followed either by remission of the peritoneal inflammation, by the formation of adhesions sealing the two sides of the peritoneal cavity, or by localized abcesses in the peritoneum, which must then be drained. Antibiotic therapy has greatly decreased the incidence of the latter complication.

peritonsillar abscess (disease): *see* quinsy.

peritrich, any ciliated vase-shaped protozoan of the order Peritrichida (more than 1,000 species), found in both fresh and salt water. Usually nonmotile (sessile), they attach themselves to underwater objects, but a few genera, such as *Telotrochidium,* are free-swimming. In most peritrichs a posterior disk, the scopula, secretes a contractile stalk for attachment. Some primitive forms, such as the genus *Scyphidia,* attach directly to an object with the adhesive secreted by the scopula. Peritrichida, lacking uniform ciliation, have conspicuous rows of cilia (short hairlike processes) around the mouth, and there is a posterior ring of cilia in the free-swimming migratory adults and larvae. Reproduction by longitudinal fission differs from the usual ciliate transverse fission. Some sessile genera (for example, *Vorticella*) are solitary; others (*e.g., Zoothamnium*) form branching colonies. Peritrichs are coming to serve a useful role in ecological studies as pollution indicators.

Peritrich (*Zoothamnium* colony)
J.M. Langham

periwig: *see* peruke.

periwinkle, in botany, any of various plants of the genus *Vinca* of the dogbane family (Apocynaceae). The name periwinkle is possibly taken from *pervinka*, the Russian name of the flower, which in turn is derived from *pervi*, "first," as it is one of the first flowers of spring. The lesser periwinkle (*V. Minor*), with lilac-blue flowers, 2 centimetres ($^{3}/_{4}$ inch) across, an evergreen, trailing perennial, is native to Europe and is found in the British Isles. Introduced into North America, it is now widespread over much of the eastern continent. The similar greater periwinkle (*V. major*), with purplish-blue flowers, $2^{1}/_{2}$ to 5 cm across, native to continental Europe, has become naturalized in England.

periwinkle, in zoology, any small marine snail belonging to the family Littorinidae. Peri-

Periwinkles (*Littorina*)
Jane Burton—Bruce Coleman Ltd.

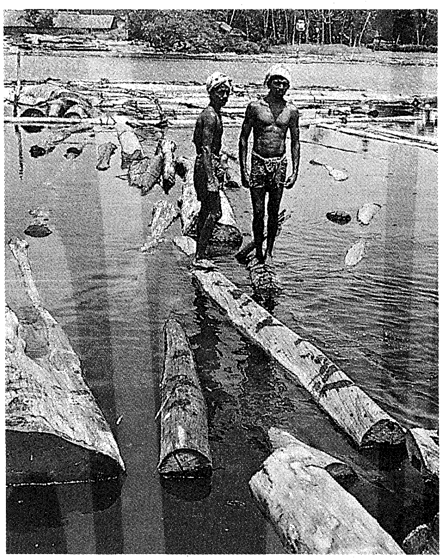
winkles are widely distributed shore (littoral) snails, chiefly herbivorous, usually found on rocks, stones, or pilings between high- and low-tide marks; a few are found on mud flats, and some tropical forms are found on the prop roots or mangrove trees. Of the approximately 80 species in the world, 10 are known from the western Atlantic. The common periwinkle, *Littorina littorea*, is the largest, most common and widespread of the northern species. It may reach a length of 4 centimetres (1 1/2 inches), is usually dark gray, and has a solid spiral (turbinate) shell that readily withstands the buffeting of waves. Widespread along the rocky shores of northern Europe, the common periwinkle was introduced into North America at Halifax, Nova Scotia, in about 1857 and has spread as far south as Maryland. It is very common on the rocky shores of New England and also occurs on shallow muddy bottoms, along the banks of tidal estuaries, and among the roots and blades of marsh grass where the water is only moderately salty.

The breeding habits of periwinkles are quite variable. *Littorina saxatilis*, which lives high up on rocks and is often out of water for long periods of time, holds its eggs in a brood sac until the young are fully developed, at which time they emerge as tiny crawling replicas of the adult.

All species in the Littorinidae are important as a favourite food of many shore birds, particulary ducks.

Certain other marine snails, such as the common northern lacuna (*Lacuna vincta*), are sometimes called periwinkles. In many sections of the southern United States, the term periwinkle, or pennywinkle, is applied to any small freshwater snail.

Periyār, river and lake in southern Kerala state, southwestern India. The river, 140 mi (225 km) long, rises in the Western Ghāts range near the border with Tamil Nādu state and flows north to Periyār Lake in Kottayam



Logging on the Periyār River, Kerala, India
Gilbert Leroy—C.I.R.I.

district. The lake, 12 sq mi (31 sq km) in area, is an artificial reservoir created by damming the river. It lies at an altitude of 2,800 ft (850 m), is ringed by mountain peaks, and is surrounded by a wildlife sanctuary. A tunnel carries water from the lake eastward through the mountains to the Vaigai River in Tamil Nādu, where it is used for irrigation.

From the lake the Periyār River flows in a generally northwest direction through the mountains and onto the coastal plain, past Alwaye, emptying into the Arabian Sea at Parūr. Further development of the river during the late 20th century included construction of a hydroelectric project and another irrigation dam.

Periyār Wild Life Sanctuary, wildlife preserve in Idukkī district, Kerala state, southern India. The sanctuary is noted for herds of elephants, sometimes numbering 50 members. In addition, bonnet monkey, nilgai, langur, porcupine, sloth bear, tiger, leopard, Asian elephant, barking deer, gray jungle fowl, kingfisher, the great Indian hornbill, and the southern grackle are found in the preserve. Extending over an area of 297 sq mi (770 sq km), the sanctuary encompasses Periyār Lake, formed in the early 1900s by impounding the Periyār River, and is located near the Kerala–Tamil Nādu border about 73 mi (118 km) south of Ernākulam and 170 mi northeast of Trivandrum. At an altitude of about 4,600 ft (1,600 m), the hilly topography has produced a lakeshore varied by numerous creeks, bays, and promontories. The vegetal cover is tropical evergreen and deciduous, with patches of dense forest including jackfruit, teak, and kokam trees. Most of the grassland is now planted with eucalyptus.

perjury, willful, knowing, and corrupt giving under oath of false testimony regarded as material to the issue or point of inquiry. All elements of the crime are essential for conviction. Criminal intent is required; a person who makes a false statement and then later corrects himself has not committed perjury. The testimony must be material to the issue of inquiry, since perjury on a point not material can be no more than a misdemeanour and may not be punished at all.

The giving of false testimony under oath distinguishes perjury from criminal contempt. The latter is an obstruction of the administration of justice, usually in violation of an order of the court. Some perjuries that have the effect of obstructing the adjudication of a case may be given increased punishment for that reason. Generally, however, punishment is directed less against the effect of the perjury than against the disregard of the oath itself. Thus, a man who perjures himself numerous times during the adjudication of one case may be convicted of only a single perjury, though his punishment may be increased.

One who knows of another's perjury and does not make his information known to authorities may be convicted of a separate offense of subornation of perjury. This offense covers anyone who is implicated in the perjury.

Perkin, Sir William Henry (b. March 12, 1838, London—d. July 14, 1907, Sudbury, near Harrow, Middlesex, Eng.), British chemist who discovered aniline dyes.

In 1853 Perkin entered the Royal College of Chemistry, London, where he studied under August Wilhelm von Hofmann. While Perkin was working as Hofmann's laboratory assistant, he undertook the synthesis of quinine. He obtained instead a bluish substance with excellent dyeing properties that later became known as aniline purple, Tyrian purple, or mauve. In 1856 he obtained a patent for manufacturing the dye, and the next year, with the aid of his father and his brother Thomas, he set up an aniline manufacturing plant near Harrow.

In 1858 he and B.F. Duppa synthesized glycine in the first laboratory preparation of an amino acid. They synthesized tartaric acid in 1860. After Graebe and Liebermann announced their synthesis of the red dye alizarin, Perkin developed a cheaper procedure, obtained a patent for his process, and held a monopoly on its manufacture for several years. In 1867 he discovered a chemical process for preparing unsaturated acids. The following year he used this process, which became known as the Perkin reaction, to synthesize coumarin, the first artificial perfume. He also investigated other dyes, salicyl alcohol, and flavourings. About 1874 he abandoned manufacturing and devoted himself to research, not only studying chemical processes but also investigating the optical rotation of various substances. He was knighted in 1906, the 50th anniversary of his discovery of mauve.

Perkins, Frances, original name FANNIE CORALIE PERKINS (b. April 10, 1882, Boston—d. May 14, 1965, New York City), U.S. secretary of labor during the presidency of Franklin D. Roosevelt. Besides being the first woman to be appointed to a Cabinet post, she also served one of the longest terms of any Roosevelt appointee (1933–45).

Perkins' appointment met with some resistance from business and political leaders, and even organized labour greeted her selection coolly. She was regarded as a social reformer, and indeed she had spent most of her life in that capacity. After graduating from Mount Holyoke College (South Hadley, Mass.) in 1902, she taught school and performed church-related social work. For a short time she assisted Jane Addams at Hull House in Chicago, but she soon left for Philadelphia, where she worked with immigrant girls. She did graduate work at the University of Pennsylvania before transferring to Columbia University, where in 1910 she received a master's degree in social economics.

During the next two decades, Perkins dedicated herself to social reform in New York. As executive secretary (1910–12) of the Consumers' League of New York, she lobbied successfully for improved wages and working conditions, especially for women and children. From 1912 to 1917 she held an equivalent position with the New York Committee on Safety, where she became acquainted with Roosevelt while lobbying for a limitation of the workweek for women to 54 hours.

After serving as director of the New York Council of Organization for War Service, Perkins was appointed to the New York State Industrial Commission and later to the Industrial Board. She became chairman of the board in 1926, and in 1929 Roosevelt (then governor of New York) made her state industrial commissioner. With the onset of the Great Depression, Perkins became a prominent advocate for unemployment compensation and governmental involvement in the economy.

As secretary of labor under Roosevelt, Perkins pushed for a minimum wage and maximum workweek, a limit on employment of children under 16, creation of the Civilian Conservation Corps, and unemployment compensation—all of which were enacted. She helped draft the Social Security Act and supervised the Fair Labor Standards Act (1938). When the focus of labour activity shifted in the late 1930s from government to unions, Perkins played a less visible role. Her most important work was now the building up of the Department of Labor, particularly the strengthening of the Bureau of Labor Statistics.

Two months after Roosevelt's death, Perkins resigned from the Cabinet, but she remained in government as a U.S. Civil Service commissioner until 1953. From then until her death, she lectured on the problems of labour and industry. *The Roosevelt I Knew,* a record of her association with the president, was published in 1946.

Perkins, George Walbridge (b. Jan. 31, 1862, Chicago—d. June 18, 1920, Stamford, Conn., U.S.), U.S. insurance executive and financier who organized the health insurance agency system and the corporate structures of several large companies. He also served as chairman of Theodore Roosevelt's Progressive Party, organizing Roosevelt's 1912 presidential campaign.

When Perkins became an office boy for the New York Life Insurance Company in 1877, the company gave charge of territories to general agents who then hired their own salesmen. The salesmen had no company loyalty and often made exaggerated claims for a policy to get the premium. By 1892 Perkins was third vice president in charge of all agencies. Instead of contracting with general agents, he hired local salesmen directly and made them permanent employees. In 1896 he developed a new system of employee benefits based on number of years on the job and policies sold.

In 1900 he was chairman of the Palisades Interstate Park Commission. The following year he became a partner in the banking firm of J.P. Morgan & Company, in which capacity he reorganized corporations such as International Harvester, International Mercantile Marine, and United States Steel. He set up plans for employees of these companies to purchase stock at less than market value and established sick pay and old-age pensions.

In 1910 he retired from business to promote his views about the need for cooperation in business. His published speeches include *National Action and Industrial Growth* (1914), *The Sherman Law* (1915), and *Profit Sharing* (1919).

Perkins, Jacob (b. July 9, 1766, Newburyport, Mass.—d. July 30, 1849, London), American inventor who produced successful innovations in many fields.

In about 1790 Perkins built a machine to cut and head nails in one operation, but the plant he opened to exploit it was ruined by an extended lawsuit over the invention. He subsequently devised a method of bank-note engraving that made counterfeiting extremely difficult. Failing to attract American interest in the process, Perkins and his partner set up a factory in England and in 1819 began printing notes for local banks; after 1840 the factory was also authorized to print Britain's first penny postage stamps.

Perkins also experimented with high-pressure steam boilers and in 1823 devised means to attain working steam pressure of 800–1400 psi. He built a Woolf-type steam engine (1827), designed an improved paddle wheel (1829), and invented a means for the free circulation of water in boilers (1831), which led to the design of modern water-tube boilers. He was awarded a medal by the Society for the Encouragement of the Arts for his method of ventilating ships' holds.

Pērkons (Latvian: "Thunderer"), Lithuanian PERKŪNAS, Old Prussian PERKUNIS, sky deity of Baltic religion, renowned as the guardian of law and order and as a fertility god; the oak, as the tree most often struck by lightning, is sacred to him. Pērkons is related in functions and image to the Slavic Perun, Germanic Thor, and Greek Zeus.

Often depicted as a vigorous, bearded man holding an ax, Pērkons rides across the sky striking fire with his two-wheeled chariot and bringing rain to farmers. In the spring his lightning purifies the earth and stimulates plant growth. Pērkons also directs his thunderbolts against evil spirits and unjust men and even disciplines the gods. Lithuanian legend recounts that when Mēnuo, the moon god and husband of Saule, goddess of the Sun, committed adultery, Perkūnas punished his infidelity by cutting him to pieces.

According to ancient tradition, thunderbolts—"bullets of Pērkons," found buried in the ground as flint or bronze celts—or any object or person struck by lightning could be used by mortals as protection against devils or as cures for toothache, fever, and fright. Probably the most popular of all Baltic gods, Perkūnas is often referred to in Lithuanian as *dievaitis,* an archaic diminutive of *dievas* ("god").

Perlas, Archipiélago de las (Panama): *see* Pearl Islands.

Perlepe (Yugoslavia): *see* Prilep.

Perlis, state (*negeri*), northwestern West Malaysia (Malaya), wedged between Thailand and northwestern Kedah State, with a short coastline on the Andaman Sea (southwest). The smallest (307 sq mi [795 sq km]) and most northerly of the Malayan states, it was part of Kedah until 1821. Given sultanate status by Thailand in 1841, Perlis became one of the Unfederated Malay States under British protection when Thai suzerainty ended (1909). After temporary annexation by Thailand in 1943, it again became a British protectorate in 1945 and later joined the Federation of Malaya.

Mainly occupying a closely cultivated and densely settled plain, formed by short streams (from a steep northeastern range) that combine to form the Sungai (River) Perlis, it is one of the country's most productive paddy-(rice-) growing regions. Regular crops of dry paddy are sown, as the coarse alluvium and erratic streams present problems of water shortage for wet farming. A 20,000 ac (8,100 ha) sugar plantation and refinery are located at Chuping. Rubber and coconuts are minor crops. Kuala Perlis and Sanglang are small fishing villages with houses built on stilts over water. While Malay paddy farmers are an overwhelming majority, some Chinese are engaged in tin mining in the underground caves and crevices of the northern limestone hills (which also are the basis of a cement factory that began production in 1975); they live in small mining settlements such as Kaki Bukit.

Because of its size, Perlis is not divided into administrative districts. Kangar, the state capital, is a dispersed, open settlement, and the sultan resides at nearby Arau. Roads link the main villages, including Bukit Keteri, Simpang Ampat, and Beseri. At Padang Besar ("big field"), a port of entry, the Malayan Railway crosses into Thailand. Bukit Tengku Lembu is the site of a Neolithic burial ground. Pop. (1982 est.) 150,322.

perlite, also called PEARLSTONE, a natural glass with concentric cracks such that the rock breaks into small, pearl-like bodies. It is formed by rapid cooling of viscous lava or magma. Perlite has a waxy to pearly lustre and is commonly gray or greenish but may be brown, blue, or red.

Some perlites are of intrusive origin (dikes), but others constitute major portions of lava flows. These glassy rocks may grade into nearly completely crystalline volcanic types. Like obsidian, they may contain large crystals (phenocrysts) of quartz, alkali feldspar, plagioclase feldspar, and, in some cases, biotite or hornblende; where phenocrysts are abundant the rock passes into vitrophyre.

A rhyolite (*q.v.*), perlite has chemical composition, index of refraction, and specific gravity similar to those of obsidian (*q.v.*). Its water content, however, is considerably higher (generally 3 to 4 percent); much of it is absorbed, subsequent to consolidation, from the sea or wet sediments into which the perlite was intruded.

Devitrification, or conversion of the glass to a microscopically fine crystalline aggregate, is usually initiated spontaneously along cracks or at the surfaces of phenocrysts and crystalline bodies (spherulites). Some minutely crystalline rocks show well-developed perlitic structure and undoubtedly represent completely devitrified perlite. The localization of spherulites along curved and concentric bands in certain glass-free rocks suggests a devitrified perlite with spherulitic growth along the perlitic cracks.

Before about 1950 perlite was virtually unknown in commerce. Since then, however, great deposits have been worked in New Mexico, Nevada, California, and other western states; production outside the United States has increased very slowly, the chief producers being the Soviet Union and Greece. When crushed perlite is rapidly heated, the contained water is converted to steam; tiny bubbles are formed within the softened rock, and the perlite is thus expanded up to 20 times its original volume. Because of its very low density, heat-treated perlite is a substitute for sand in lightweight wall plaster and concrete aggregate. The porous nature of perlite makes the material ideal for heat and sound insulation; other uses include lightweight ceramic products, filters, and fillers.

Perlman, Itzhak (b. Aug. 31, 1945, Tel Aviv, Israel), Israeli-born violinist known for a brilliant virtuoso technique. His refinement of detail led many critics to regard him as one of the finest performers of the major violin repertoire of his time.

At the age of four Perlman was a victim of polio, which left his legs paralyzed. His first public concert was in Tel Aviv, at the age of 10. In 1958 he went to the Juilliard School in New York City to study with Ivan Galamian and Dorothy DeLay. He made his Carnegie Hall debut in 1963 and won the Leventritt Prize a year later, which brought him immediate engagements with major American orchestras. He returned to Israel in 1965 for a successful tour and made his London debut in 1968 but continued to reside in New York City. Thereafter he gave international concert tours, taught and played in numerous major music festivals, and recorded most of the standard violin works.

Perm, *oblast* (administrative region), western Russian Soviet Federated Socialist Republic, occupying an area of 62,000 sq mi (160,600 sq km) on the western flank of the central Urals, extending from the crestline in the east across the broad basin of the middle Kama to the Verkhne (Upper) Kama upland in the west. The northwestern corner is occupied by the Komi-Permyak autonomous *okrug* (area). Almost the entire *oblast* is thickly forested, with swampy forest, or taiga, of spruce, fir, pine, and birch. Extensive floodplain meadows line the rivers. In 1982, 75 percent of the population was urban, reflecting Perm's position as part of the Urals industrial area. It is exceptionally rich in minerals, notably salt and potassium along the Kama; these are the basis of the chemical industry of Berezniki, Solikamsk, and Perm city, the administrative centre. Petroleum is extracted along the Kama, in the Sylva and Iren valleys, and in the south and is refined in Perm and Krasnokamsk. Chusovoy and Lysva have metallurgical plants, and most cities have engineering industries. Coal is mined in the Kizel area. The forests supply paper, pulp, and other timber-working industries. Agriculture has a minor role, except for intensive market gardening around the cities. There are several large power stations, notably the Kama hydroelectric plants. Pop. (1984 est.) 3,027,000.

Perm, formerly (1940–57) MOLOTOV, city and administrative centre of Perm *oblast* (region), western Russian Soviet Federated Socialist Republic, on both banks of the Kama River. In 1723 a copper-smelting works was founded at the village of Yegoshikha (founded 1568), at the junction of the Yegoshikha and Kama rivers. In 1780 the settlement of Yegoshikha became the town of Perm, although another town, Perm Velikaya (Perm the Great; now Cherdyn), had existed 150 mi (240 km) upstream since the 14th century. The city grew in commercial importance through its position on the navigable Kama and on the Great Siberian Highway, established in 1783, and, later, on the Trans-Siberian Railroad, which was completed to Yekaterinburg (now Sverdlovsk) in 1878. Modern Perm is still a major focus of communications and is also one of the chief industrial centres of the Urals region. It has large-scale engineering industries, a major oil refinery, and a large chemical industry, making fertilizers and dyes. The city's institutions of higher education include A.M. Gorky University, founded in 1918. There are several theatres, a notable art gallery, and a school of ballet. Perm gives its name to the Permian Period (from 286 to 245 million years ago), which was first identified in geologic strata in the locality. Pop. (1989 prelim.) 1,091,000.

permafrost, permanently frozen earth, with a temperature below 0° C (32° F) continuously for two or more years. Permafrost is estimated to underlie 20 percent of the Earth's land surface and reaches depths of 1,525 m (5,000 feet) in northern Siberia. It occurs in 85 percent of Alaska, 50 percent of the Soviet Union, and Canada, and probably all of Antarctica. The position of the southern boundary of permafrost in the Northern Hemisphere corresponds approximately to the position of the line connecting points whose mean annual air temperature is 0° C.

A brief treatment of permafrost follows. For full treatment, *see* MACROPAEDIA: Ice and Ice Formations.

Permafrost is overlain by a surface layer which is subject to thawing during the warmer seasons of the year. This zone of seasonal freezing and thawing is termed the active layer, and the maximum depth of thaw penetration delimits the top of the permafrost (permafrost table). The depth to which soil is thawed will vary on an annual basis according to the vagaries of summer temperature. Hence a layer may occur above the permafrost table which may be subject to thaw only in certain years. Such a layer has been termed the pereletok, or supra-permafrost layer. Sporadic bodies of permafrost are often buried by perennially thawed ground that is itself overlain by the seasonally frozen active layer. Such unfrozen layers, as well as islands of thawed ground surrounded by permafrost, are called taliks.

Permafrost is essentially the product of a negative heat balance at the ground surface. Where mean annual ground-surface temperatures are below 0° C, summer thaw depths will be exceeded by winter freezing depths, resulting in permafrost growth. If the condition is maintained, the progressive downward extension of the permafrost will ultimately be counterbalanced by the geothermal heat flow from the Earth's interior. The resultant equilibrium depth will determine the permafrost's base. Thus, the lower the mean surface temperature, the greater the depth at which the equilibrium position will lie.

Although permafrost may exist without any ice content, it is usually associated with the presence of ground ice. Ice occurs in many forms and variable amounts in ground permafrost and often exceeds all other materials in quantity. It is present as crystals of diverse size and shape, as grains, films, veins and lenses, and as large masses. Annual surface-temperature fluctuations affect the ice in the uppermost part of the permafrost where it lies within about 10–20 m (30–65 feet) of the surface. Rapid cooling in the winter may cause thermal contraction cracks to propagate down from the permafrost table and also up to the surface. These become infilled by snow and hoarfrost or by fine mineral particles. Repeated cracking and ice growth results in the growth of ice wedges in vertical section and polygons in horizontal form, two of the most widespread geomorphic features associated with permafrost. Complex stress forces operating within permafrost layers may produce such surface features as mud spots, frost blisters, ice mounds, and pingos. Pingos, which are hills composed largely of ice, originate in swampy lowlands and may attain heights exceeding 200 feet (60 m) and diameters of several hundred feet.

Most authorities recognize a geographic subdivision of permafrost into two zones, continuous and discontinuous, with some recognizing an outer fringe to the latter that is called a sporadic zone. Within the continuous zone, permafrost everywhere underlies the ground surface and is usually continuous in depth down to its lower limit. Within the discontinuous zone, the lateral continuity of the permafrost is broken to create alternating frozen and talik areas. As the sporadic zone is approached, the amount and thickness of the residual permafrost decreases. Beyond the main permafrost belt, limited areas of permafrost are present where elevation reduces the mean annual temperature regime, with the permafrost lying as cores to the mountain massifs. Permafrost is essentially continuous in polar regions, becomes increasingly discontinuous at lower latitudes, and occurs only sporadically towards its geographic limits.

Permafrost and the geomorphic processes associated with it have a significant effect on the development and distribution of plant and animal life where it occurs. Its practical importance to human affairs is that it presents special problems in essentially all engineering projects. The buildup of ground ice is a response to a long and complex thermal history, and its preservation is dependent upon the insulatory properties of the overlying active layer. Because of this factor, land use in permafrost environments must take account of the special geomorphic sensitivity of the terrain. Where permafrost occurs, waste disposal, mining activities, well drilling, and road, airstrip, and building construction all pose critical problems. The delicate thermal balance within the active layer must be maintained; otherwise, extensive permafrost degradation may be induced and cause a loss in the weight-bearing strength of the permafrost.

An interesting aspect of permafrost is the preservation in it of the carcasses of extinct Ice Age mammals; one or two almost complete, frozen mammoths dating from at least 10,000 years ago have been reported from Siberia.

Permalloy, trademark of the Western Electric Company for nickel-iron alloys having much higher magnetic permeability than iron alone. It is widely used for fabricating the thin pieces that are laminated to form transformer cores. The proportion of nickel may range from 35 to 90 percent, depending on the properties desired, and is about 78 percent for low-power transformers. Hipernik (trademark of the Westinghouse Electric Company) is an alloy of 50 percent nickel useful for high-power transformers. Heating Permalloy containing 5 percent molybdenum in pure hydrogen yields Supermalloy, with even higher permeability.

permeability, capacity of a porous material for transmitting a fluid; it is expressed as the velocity with which a fluid of specified viscosity, under the influence of a given pressure, passes through a sample having a certain cross section and thickness. Permeability is largely dependent on the size and shape of the pores in the substance and, in granular materials such as sedimentary rocks, by the size, shape, and packing arrangement of the grains.

The standard unit of permeability is the darcy, equivalent to the passage of one cubic centimetre of fluid (having a viscosity of one centipoise) per second through a sample one square centimetre in cross-sectional area under a pressure of one atmosphere per centimetre of thickness.

permeability, magnetic: *see* magnetic permeability.

Permeke, Constant (b. July 31, 1886, Antwerp, Belg.—d. Jan. 4, 1952, Ostend), painter and sculptor who was significant in the development of Expressionism in Belgium.

Permeke studied at art academies in Bruges and Ghent. He came to know fellow Belgian artists Frits van den Berghe and Gustave and Léon de Smet and from 1909 to 1912 joined them at a popular artists' colony at Laethem-Saint-Martin, Belg. In England during World War I, Permeke composed some of his most profound paintings. His thick brushwork, sombre, earthy colours, and depictions of massive human figures helped usher Belgian painting into a new era. Although his subjects and themes were grounded in the Flemish tradition—farmers, fishermen, and everyday life—Permeke's personal vision gave powerful expression to the ordinary, as in "The Oarsmen" (1921). In 1935 he began sculpting torsos and nudes that were marked by the same solid, weighty, and often brutal style.

Permian Basin, also called WEST TEXAS BASIN, large sedimentary basin in western Texas and southeastern New Mexico that is noted for its rich petroleum and natural-gas deposits. It originated as a marine basin bordered by extensive deltas during the Permian and Triassic periods (between 286 and 208 million years ago). The Permian Basin consists of three connected but distinct areas of subsidence, which are, from east to west, the Midland Basin, Central Basin, and Delaware Basin. These smaller basins are separated from one another by platforms, areas of relatively thin sedimentary strata. Great subsidence during the Permian Period, coupled with limited access to the ocean, resulted in the deposition of salts (from which evaporite minerals later precipitated) in the basins and the formation of large barrier reefs that abounded with diverse marine fauna around them. The occurrence of large quantities of oil and natural gas in the Permian Basin is attributable to subsurface remnants of Permian reefs; these reefs were rich in plant and animal remains that developed into petroleum and collected in the porous formations. Numerous oil fields also occur in the geologic remnants of the lagoonal deposits that formed behind the reefs.

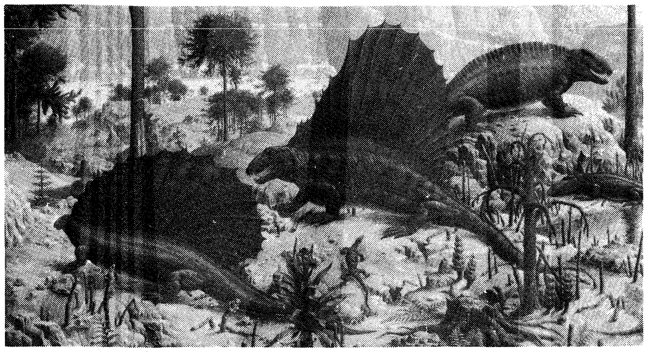
Permian languages: *see* Permic languages.

Permian Period, interval of geologic time from 286 to 245 million years ago. The Permian is the last of the six periods of the Paleozoic Era; it follows the Carboniferous and precedes the Triassic of the subsequent Mesozoic Era. The Permian is often divided into the Early Permian Epoch (286 to 258 million years ago) and the Late Permian Epoch (258 to 245 million years ago). The rocks that originated during the period make up the Permian System.

A brief treatment of the Permian Period follows. For full treatment, *see* MACROPAEDIA: Geochronology.

The Permian was named by the early British geologist Sir Roderick I. Murchison in 1841 after the Perm region of the Russian Urals, whose rocks became a standard reference for the Permian System. The rocks of the system are characterized by an abundance of red land-laid sediments and evaporites (salts formed by a sequence of chemical precipitation in an acid environment).

Massive movements of crustal plates continued from the preceding Carboniferous Period into the Permian. The northern hemispheric continent of Laurasia (composed essentially of present-day North America, Greenland, Europe, and Asia) became linked to the southern hemispheric landmass of Gondwana



Landscape of characteristic Permian animals and plants, detail of the mural "The Age of Reptiles" by Rudolph F. Zallinger; in the Peabody Museum of Natural History, Yale University

Peabody Museum of Natural History, Yale University, New Haven, Conn.

(composed of what is now South America, Africa, India, Australia, and Antarctica), forming one single supercontinent by the mid-Permian. This immense assembly of landmasses, known as Pangaea, stretched across all the climatic temperature zones virtually uninterrupted from pole to pole. The extensive glaciation that had begun in the Carboniferous continued into the Permian, mainly in the southern portion of Gondwana that was located around the south paleopole. Hot, dry conditions prevailed almost everywhere else on Pangaea, and by the Late Permian deserts became widespread in several tropical and subtropical areas on the supercontinent.

Laurasia and Gondwana remained separated at their eastern extent by the Tethys Sea, and the rest of the Earth's surface was covered by a vast ocean known as Panthalassa. Orogenies (mountain-building episodes) associated with the formation of Pangaea by the collision of these continents continued into the Permian, further forming the Appalachian mountain chain of North America and the Hercynian mountain chains of Europe and Asia.

In eastern Europe the stable Russian Platform in the east flanked a deep-sea trough, the Ural Geosyncline, which was compressed, folded, and uplifted to form the Ural Mountains when the Angaran segment of western Siberia collided with eastern Laurasia.

In western Europe continental and restricted basin deposits, such as red sandstone, conglomerate, shale, dolomitic limestone, and evaporites, predominated. Permian deposits are widespread in North America, particularly in Texas, New Mexico, Nevada, and Utah, where marine and continental deposits accumulated in great thicknesses. North American Permian deposits are principally sandstones, shales, limestones, and evaporites. Deposits of limestone, sandstone, shale, cherts, and basalt pillow lavas were also formed in the shallow and deepwater environments of the Tethys Sea. The Permian deposits on the landmasses that made up Gondwana exhibit similar characteristics; they contain tillites (consolidated sedimentary rocks formed by the lithification of glacial till) and sediments deposited by glacial meltwater, as well as sandstones, shales, and coal. This rock sequence indicates that the world climate in the Permian became milder through alternating warm and cool stages. Late Permian deposits in Pangaea are characterized by dune sands, evaporites, and red beds (*e.g.,* shale and sandstone of reddish colour), indicating the onset of desert conditions at the close of the period.

Economically important mineral deposits of Permian age consist of evaporite minerals (such as halite, sylvite, and gypsum), coal, petroleum, and copper ore. Significant evaporite deposits of rock salt and potash minerals are found in the southwestern United States, the Soviet Union, Poland, The Netherlands, Denmark, and England. Important Permian coals are found in northern Siberia, China, Korea, India, Australia, and southern Africa. Permian rocks also hold significant oil and natural-gas deposits in the southwestern United States (western Texas, Oklahoma, and New Mexico) and in the Soviet Union.

The fossil record indicates that life evolved from the preceding Carboniferous into the Permian as a continuation of established faunas. The marine invertebrates, mainly brachiopods, ammonoids, bryozoans, bivalves, and foraminiferans, evolved into several lineages during the period. The rapid evolutionary rate of the ammonoids and fusulinid foraminiferans make them extremely useful for geologic dating in the Permian. Marine and freshwater fish lineages and the amphibians thrived in the Permian. Of the vertebrates, the reptiles evolved into three markedly distinct groups: the cotylosaurs, the pelycosaurs, and the therapsids (mammallike reptiles). Land plants evolved from the Carboniferous ferns and seed ferns to the conifers and adapted to drier and well-drained land conditions. An abrupt change occurred in Gondwana with the widespread development of the Glossopteris flora, which were tongue ferns adapted to the colder climates of the Southern Hemisphere.

Toward the close of the Permian, however, many forms of life suffered mass extinction. In Gondwana the Glossopteris flora disappeared, but the coniferous flora of the Northern Hemisphere survived into the Triassic. Many animal groups did not survive the Permian. Trilobites and fusulinids became extinct, and the brachiopods, ammonoids, and bryozoans were severely reduced. Uncertainty still exists over the events that led to these extinctions at the close of the period.

Permic languages, also called PERMYAK, or PERMIAN, division of the Finno-Ugric branch of the Uralic language family, consisting of the Udmurt (Votyak) and Komi (Zyryan) languages. The Permic languages are spoken along the northern and western reaches of the Ural Mountains in the Soviet Union in and around the Udmurt A.S.S.R. and the Komi A.S.S.R. Udmurt has little dialectal variation, but Komi has many distinctive dialects divided into three major groups: Northern (Zyryan) Komi, Western (Permyak) Komi, and Eastern (Yazva) Komi. Komi has two literary languages, one based on Zyryan and the other on Permyak.

Both Udmurt and Komi have flourishing literatures that have developed primarily since the second half of the 19th century, although written records of Komi exist from the 14th century. The Permic languages are of note for their contrast of voiced and voiceless consonants (voiceless *p* contrasts with voiced *b*) generally lacking in the Uralic languages. *See also* Finno-Ugric languages.

permission to elect (English royal church prerogative): *see* congé d'élire.

permit, marine fish, a species of pompano (*q.v.*).

permittivity, a universal electric constant appearing in the mathematical formulation of two fundamental phenomena, the existence of a physical force between two separated electric charges (*see* Coulomb force), and the modification of the properties of an electric field attending the introduction into it of a dielectric (*see* displacement, electric). Permittivity is a generalized, or large-scale, description of electric behaviour that does not specify detailed features on the atomic dimension.

The permittivity of an insulating, or dielectric, material is commonly symbolized by the Greek letter epsilon, ε; the permittivity of a vacuum, or free space, is symbolized ε_0; and their ratio $\varepsilon/\varepsilon_0$, called the dielectric constant (*q.v.*), is symbolized by the Greek letter kappa, κ.

In the rationalized metre-kilogram-second (mks) and SI systems, the magnitude of the permittivity of a vacuum ε_0 is 8.854×10^{-12}. Its units and those of permittivity ε are square coulombs per newton square metre. In the mks system, permittivity ε and the dimensionless dielectric constant κ are formally distinct and related by the permittivity of free space ε_0; $\varepsilon = \kappa\varepsilon_0$. The magnitude and units of the permittivity of free space in the mks system are a necessary consequence of the laws of physics and of the decision to make the practical electrical units in use, such as volt and ampere, compatible with the mechanical units, such as metre and kilogram. In the centimetre-gram-second (cgs) system, the value of the permittivity of free space ε_0 is chosen arbitrarily to be one. Thus, the permittivity ε and the dielectric constant κ in the cgs system are identical; both of them are dimensionless numbers.

Permon, Laure (French author): *see* Junot, Laure.

permutations and combinations, different ways in which a subset of objects can be selected from a given set of objects, with or without regard to the order in which the objects are selected, respectively. The development of the theory of permutations and combinations, and of procedures for counting the numbers of them possible in a given situation, played an important part in the development of probability theory in the 17th century. This is because probability theory evolved from the consideration of the possible outcomes of gambling situations such as playing cards and rolling dice, and these outcomes can frequently be expressed in terms of permutations and combinations.

To illustrate permutations and combinations, consider five distinguishable objects, such as the letters A, B, C, D, and E, and look at all the different ways in which two of these five objects can be selected. If both the letters selected and the order of selection are considered, then the following 20 outcomes are possible:

AB	BA	AC	CA	AD
DA	AE	EA	BC	CB
BD	DB	BE	EB	CD
DC	CE	EC	DE	ED

Each of these 20 different possible selections is called a permutation. In particular, they are called the permutations of five objects taken two at a time, and the number of such permutations possible is denoted by the symbol ${}_5P_2$. In general, if there are n objects available from which to select, and permutations are to be formed using k of the objects at a time, the number of different permutations possible is denoted by the symbol ${}_nP_k$. A formula for evaluation ${}_nP_k$ is

$${}_nP_k = \frac{n!}{(n-k)!},$$

where the symbol ! indicates that all the consecutive positive integers from 1 up to and including the preceding quantity—n or $(n-k)$—are to be multiplied together. For example, using this formula, the number of permutations of five objects taken two at a time is

$$ {}_5P_2 = \frac{5!}{(5-2)!} = \frac{5!}{3!} = \frac{(1)(2)(3)(4)(5)}{(1)(2)(3)} = \frac{120}{6} = 20. $$

Suppose now that only the letters selected are important, not their order of selection. In this case AB and BA, for example, are really a single selection. In fact, if the order in which the two letters are selected is unimportant, then there are only 10 different possible results. These 10 different possible selections, in which only the letters selected are important and not the order in which they are selected, are called "combinations" of five objects taken two at a time, and the number of such combinations possible is denoted by the symbol ${}_5C_2$. In general, if there are n objects available from which to select, and combinations are to be formed using k of the objects at a time, the number of different combinations possible is denoted by the symbol ${}_nC_k$:

$$ {}_nC_k = \frac{n!}{(k)!\,(n-k)!}. $$

For example, the number of combinations of five objects taken two at a time is

$$ {}_5C_2 = \frac{5!}{(2)!\,(5-2)!} = \frac{5!}{(2)!\,(3)!} = \frac{(1)(2)(3)(4)(5)}{(1)(2)(1)(2)(3)} = \frac{120}{12} = 10. $$

The formulas for ${}_nP_k$ and ${}_nC_k$ are called counting formulas since they can be used to count the number of possible permutations or combinations in a given situation without having to list them all.

Permyak languages: *see* Permic languages.

Pernambuco, *estado* ("state") of northeastern Brazil, situated near the eastern tip of the South American coastline's bulge into the Atlantic. It is bounded on the east by the Atlantic Ocean, on the south by the states of Alagoas and Bahia, on the west by Piauí, and on the north by Ceará and Paraíba. The area of the state is 37,947 square miles (98,282 square km). The state capital is Recife.

Although Cristóvão Jacques founded a trading post on the mainland near the Iguaraçú River in 1526, the first permanent settlement of Pernambuco was at Olinda in 1535 by Duarte Coelho, who had been granted a captaincy extending from the mouth of the São Francisco River northward to that of the Iguaraçú.

During the Dutch occupation (1630–54), a well-planned town was built where present-day Recife is located. This became, under the name Mauritzstad, the administrative capital. Pernambuco was ably governed by the Dutch and prospered with the production of sugar in the plantations located in the rich alluvial soil along the coast. Portuguese rule replaced that of the Dutch in Pernambuco in 1654.

In the early 18th century a bitter rivalry developed between Olinda, the administrative capital of the captaincy and residence of the rich aristocratic plantation owners, and Recife, inhabited by traders, ship chandlers, and warehouse workers, mostly Portuguese. Recife continued to prosper, however, while Olinda declined, and in 1823 Recife was elevated to the category of city (*cidade*). In 1827 it was made the capital of the *província.*

In 1817 Pernambuco was the scene of a local armed rebellion against Portuguese rule. Pernambuco remained for years a hotbed of republicanism and revolutionary agitation. It was the site of unsuccessful insurrections against Portuguese rule in 1821–22, 1824, 1831, and 1848. Pernambuco became a state of the Brazilian Republic in 1891.

Pernambuco's Atlantic coastline, which extends approximately 116 miles (187 km) from south to north, is relatively short when compared to the state's east–west extent of 447 miles (720 km). The coastal zone is comparatively narrow and is separated from the high inland plateau by an intermediate zone formed by the terraces and slopes between the two. The coastal zone is low, well-wooded, and fertile and has a hot, humid climate, relieved to some extent by the southeast trade winds. The middle zone, called the *agreste* region, has a drier climate and lighter vegetation. The inland plateau is called the *sertão;* it is high, stony, and dry and frequently is devastated by prolonged droughts (*sêcas*). The climate of the *sertão* is characterized by hot days and cool nights. For the state as a whole there are two clearly defined seasons, rainy from March to July and dry for the remainder.

The rivers of the state include a number of small plateau streams (dry for much of the year) flowing southward to the São Francisco River and several large streams in the eastern part flowing eastward to the Atlantic. The largest of the coastal rivers are the Goiana, which drains a rich agricultural region in the northeast part of the state; the Capibaribe and the Beberibe, which flow eastward to the Atlantic at Recife; the Ipojuca, which reaches the coast south of Recife; the Sirinhaém; and the Una. A large tributary of the Una—the Jacuípe River—forms part of the boundary with Alagoas.

Beginning in the 16th century and continuing through the colonial period, large numbers of black slaves were brought by the Portuguese from Africa to work the sugar plantations in Pernambuco. Thus the population of the state includes a high percentage of blacks and mulattoes, especially in the coastal region. The majority of Pernambuco's population lives within 200 miles (322 km) or less of the coast. Living conditions in general are better in the coastal region than they are in the interior, as are public health and education. Higher education is available in Recife at the Federal University of Pernambuco, the Catholic University of Pernambuco, and the Rural University of Pernambuco.

Agriculture is the leading activity in Pernambuco, although grazing, commerce, manufacturing, and mining also contribute to the economy. Since the 16th century the coastal plain has been devoted to the production of sugarcane, largely for export abroad and to other areas of the state and nation. Tropical and semitropical fruits (bananas, oranges, coconuts) and food crops (sweet potatoes, corn [maize], cassava, rice) are also grown commercially in the coastal zone. The principal crops of the *agreste* region are cotton, coffee, beans, cassava, onions, tomatoes, corn, and tobacco. Livestock raising is the chief activity in the *sertão,* but in areas of adequate rainfall or irrigation, cotton, sisal, castor beans, and food crops are also produced. Pernambuco's large herds of cattle and goats are the source of meat, hides, skins, and leather.

The traditional manufactures are refined sugar, cotton cloth, and cigars. Sugar processing continues to be the major industry, although there is today a broad range of other industries, such as steel manufacture and the processing of nonferrous metals.

Pernambuco's port of Recife is one of the country's most important because of its location on the South American coastline's bulge into the Atlantic. The railways of the area converge on the port, as does the system of surfaced roads. Recife also is the site of an international airport.

The state's cultural life and institutions also are concentrated in Recife, and Olinda, a national monument, is of considerable touristic interest because of the old colonial churches and houses located in that city. Pop. (1988 est.) 7,105,000.

pernicious anemia, also called ADDISON'S ANEMIA, severe, slow-developing disease, characterized by a deficiency of red blood cells and often white cells and platelets in the circulation, by associated jaundice from the accelerated destruction of red cells in the bone marrow, by a lack of gastric juice (achylia gastrica), and by progressive gastrointestinal and neurologic problems.

Pernicious anemia is caused by a deficiency of vitamin B_{12}. This deficiency in turn is usually due to the underproduction of a substance called intrinsic factor, which is made by parietal cells in the stomach fundus and is necessary for the absorption of vitamin B_{12} from food. The lack of vitamin B_{12} leads to a disordered production of deoxyribonucleic acid (DNA). In the bone marrow, red-cell production becomes abnormal—the nuclei remain immature, while the surrounding cytoplasm matures normally, eventually becoming overabundant and containing much hemoglobin. Such cells, called megaloblasts, are for the most part destroyed in the bone marrow without being freed to the circulation. Some megaloblasts mature to become large red cells, called macrocytes; these reach the circulation but function abnormally and have a reduced life span. A deficiency of white blood cells (leukopenia) and of platelets (thrombocytopenia) also develops in the circulation.

Pernicious anemia may develop as a result of cancer or of surgical removal of the stomach; in many cases, however, the reason for the atrophy of the parietal cells of the stomach fundus, which is the most common cause of pernicious anemia, is not known, although an autoimmune mechanism has been suggested. Most patients display antibodies against the parietal cells; more than 50 percent also show antibodies against intrinsic factor. These latter antibodies probably bind to the intrinsic factor molecules, preventing them from combining with the vitamin B_{12} and being absorbed by the intestine.

Pernicious anemia affects males and females equally, is uncommon under age 35, and is more common in persons with blood group A and in blue-eyed, bulky-framed, light-skinned northern Europeans. Symptoms and signs include waxy pallor; fatigue; weakness; shortness of breath; jaundice; smooth, shiny tongue; deficiency of constituents of gastric juice; and progressive neurological problems, such as a loss of sensation in fingers and toes, stiffness, incoordination, apathy, and irritability. The administration of vitamin B_{12} by injection produces quick improvement in the anemia; the neurological damage is seldom fully reversible.

Pernik, formerly (1949–62) DIMITROVO, town, west-central Bulgaria. The town is located on the banks of the Struma River, 19 miles (30 km) southwest of Sofia. Originally a Bulgarian fortress whose function it was to contain the assaults of the Byzantine armies, Pernik was for five centuries (1396–1878) under Turkish rule. Pernik was originally a small agricultural village; from 1891 on, however, it was a centre of Bulgarian industrial growth because of the mining of considerable quantities of coal in the area. It is a leading industrial town in Bulgaria in terms of the tonnage of goods produced and in the proportion of its working population employed in industry. The town's cultural centre, the Georgi Dimitrov Palace of Culture, is one of the finest in Bulgaria. The town also has a mining school, a large sports complex with a stadium, a national theatre, a symphony orchestra, a museum, and an attractive park (Municipal Gardens). Pop. (1981 est.) town, 93,483; (1982 est.) *okrüg*, 175,042.

pernio: *see* chilblains.

Pernov (Estonian S.S.R.): *see* Pärnu.

Perobolinggo (Indonesia): *see* Probolinggo.

peromelia, congenital absence or malformation of the extremities, of rare occurrence until the thalidomide tragedy in the early 1960s. Peromelia is caused by errors in the formation and development of the limb bud from about the fourth to the eighth week of intrauterine life.

In amelia, one of the rarest of malformations of the extremities, limbs are completely absent. Ectromelia is the absence of one or more extremities. In phocomelia ("seal extremity") the upper part of the limb is extremely underdeveloped or missing, and the lower part is attached directly to the trunk, resembling the flipper of a seal. Hemimelia is a condition in which the upper part of the limb is well formed but the lower part is rudimentary or absent. Sirenomelia ("mermaid extremity") is a severe abnormality in which the legs are fused to a greater or lesser degree and contain malformed bones, the anal and urinary orifices are absent, and the genitals and parts of the intestinal and urinary tracts malformed.

Treatment of major limb malformations involves the fitting of prostheses and special training in their use. Surgery is used with success in relieving minor malformations.

Perón, Eva (Duarte de), *née* MARÍA EVA DUARTE, byname EVITA (b. May 7, 1919, Los Toldos, Arg.—d. July 26, 1952, Buenos Aires), second wife of Argentine president Juan Perón, who, during her husband's first term as president (1946–52), became a powerful though unofficial political leader, revered by the lower economic classes.

One of five illegitimate children of Juan Duarte and Juana Ibarguren, Eva Duarte married Col. Juan Perón, a widower, in 1945 after an undistinguished career as a stage and radio actress. She participated in her husband's 1945–46 presidential campaign, winning the adulation of the masses, whom she addressed as *los descamisados* (Spanish: "the shirtless ones").

Although she never held any government post, Evita acted as de facto minister of health and labour, awarding generous wage increases to the unions, who responded with political support for Perón. After cutting off government subsidies to the traditional *Sociedad de Beneficencia* (Spanish: "Aid Society"), thereby making more enemies among the traditional elite, she replaced it with her own Eva Perón Foundation, which was supported by "voluntary" union and business contributions plus a substantial cut of the national lottery and other funds. These resources were used to establish thousands of hospitals, schools, orphanages, homes for the aged, and other charitable institutions. Evita was largely responsible for the passage of the women's suffrage law and formed the Peronista Feminist Party in 1949. She also introduced compulsory religious education into all Argentine schools. In 1951, although she knew herself to be dying of cancer, she obtained the nomination for vice president, but the Army forced her to withdraw her candidacy.

After her death, Evita remained a formidable figure in Argentine politics. Her working-class followers tried unsuccessfully to have her canonized, and her enemies, in an effort to exorcise her as a national symbol of Peronism, stole her body in 1955 after Perón was overthrown and secreted it in Italy for 16 years. In 1971 the military government, bowing to Peronist demands, turned over her remains to her exiled widower in Madrid. After Juan Perón died in office in 1974, Isabel Perón, hoping to gain favour among the populace, repatriated the remains and installed them next to the deceased leader in a crypt in the presidential palace. Two years later a new military junta hostile to Peronism removed the bodies; Evita's remains were finally interred in the Duarte family crypt in Recoleta cemetery.

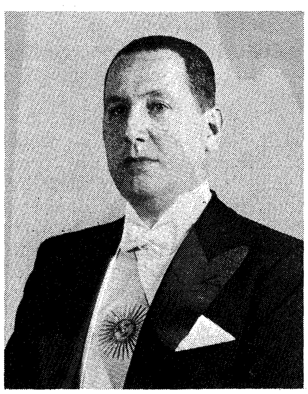
Perón, Isabel (Martínez de), *née* MARÍA ESTRELA MARTÍNEZ CARTAS (b. Feb. 4, 1931, La Rioja, Arg.), president of Argentina 1974–76, third wife of Pres. Juan Perón.

She was born to a lower-middle-class family, acquired the name Isabel (her saint's name) on her Roman Catholic confirmation, and adopted the name when she became a dancer. She met Perón in either 1955 or 1956 and, giving up her career in show business, became his personal secretary, accompanying him in exile to Madrid, where they were married in 1961. She visited Argentina several times in the 1960s and early 1970s, building support for Perón. When Perón finally returned to Argentina to run for president in 1973, Isabel was chosen as his running mate on the suggestion of Perón's close adviser José López Rega. Perón's illness several times elevated her to the position of acting president, and when he died on July 1, 1974, she succeeded him in office.

Her regime inherited problems of inflation, labour unrest, and political violence. She attempted to solve the problems by appointing new Cabinet ministers, printing money to pay foreign debts, and imposing a state of siege in November 1974 as the country was on the brink of anarchy. The controversy surrounding her social welfare minister López Rega, who was forced into exile for graft and terrorist activities, did not help her situation. Moderate military officers urged her to resign, but she stubbornly refused; the economic and political situation continued to worsen, and on March 24, 1976, she was seized by Air Force officers and held under house arrest for five years. In 1981 she was convicted of corrupt practices, but she was paroled in the summer of that year and went into exile in Spain. Pardoned in late 1983, she submitted her "irrevocable" resignation as head of the Partido Justicialista, the Peronist party, from her home in Madrid in 1985.

Perón, Juan (Domingo) (b. Oct. 8, 1895, Buenos Aires province, Argentina—d. July 1, 1974, Buenos Aires), army colonel who became president of Argentina (1946–55, 1973–74), founder and leader of the Peronista movement.

Early life and career. Born in 1895 in a town on the Pampas of the province of Buenos Aires, Perón had a typical Argentine inheritance. He was a creole—a descendant of families that have been settled in Argentina for several generations—yet he also had non-Spanish European ancestors (Italian and French) as do most Argentines, for they live in a land dominated by immigrants and their descendants.



Juan Perón, 1954
By courtesy of the OAS (Columbus Memorial Library)

His early career was in many ways typical of the upwardly mobile, lower-middle-class, male youth. He entered military school at 16 and made somewhat better than average progress through the officer ranks. But he had superior attributes. A strongly built six-foot-tall youth, Perón was the champion fencer of the army and a fine skier and boxer. He served in Italy during the late 1930s as a military attaché and observed the successes of the Fascists and Nazis. He had a bent for history and political philosophy and published in those fields.

In 1943 he joined a clique of military plotters that overthrew the ineffective civilian government of Argentina, a government that had failed to solve the pressing problems of social and economic justice for a people ideologically split by the issues of World War II.

The military regimes of the following three years came increasingly under the influence of Perón, who had shrewdly requested for himself only the minor post of secretary of labour and social welfare. By 1945 he had also become vice president and minister of war. Clearly, he was bidding for undisputed power, based on the support of the underprivileged labourers (the *descamisados,* or "shirtless ones") and on his popularity and authority in the army.

Marriage to Eva Duarte. In early October 1945, Perón was ousted from his positions by a coup of constitutionally minded civilians and officers. But his beautiful and dynamic mistress, Eva Duarte, and associates in the labour unions rallied the workers of greater Buenos Aires, and Perón was released from custody on Oct. 17, 1945. That night, from the balcony of the presidential palace, he addressed 300,000 people, and his address was broadcast to the nation on radio. He promised to lead the people to victory in the pending presidential election and to build with them a strong and just nation. A few days later he married Eva, or Evita, as she was popularly called, who would help him rule Argentina in the years ahead.

After a campaign marked by repression of the liberal opposition by the federal police and by strong-arm squads, Perón was elected president in February 1946 with 56 percent of the popular vote.

Perón set Argentina on a course of industrialization and state intervention in the economy, calculated to provide greater economic and social benefits for the working class. He also adopted a strong anti-United States and anti-British position, preaching the virtues of his Third Position—between Communism and capitalism—both domestically and in international relations. He extended Argentina's influence widely in Latin America and particularly sought to establish its political and ideological hegemony over South America.

If he did not structurally revolutionize Argentina, he did reshape the nation. Basing his government on a foggy doctrine he called Justicialismo, the President showered needed benefits upon the labourers, in the form of wage increases and fringe benefits. He nationalized the railroads and other utilities and financed public works on a large scale. The funds for those costly innovations—and for the graft that early began to corrode his regime—came from the foreign exchange accumulated by Argentine exports during World War II and from the profits of the state agency that set the prices for agricultural products. Perón dictated the political life of the nation by his command of the armed forces. He severely restricted and in some areas eliminated constitutional liberties.

Dictator in exile. Reelected by a somewhat larger margin in 1951, Perón modified some of his policies. But he was overthrown and fled to Paraguay on Sept. 19, 1955, after an army–navy revolt led by democratically inspired officers who reflected growing popular discontent with inflation, corruption, demagoguery, and oppression.

Perón finally settled in Madrid. There in 1961 he married for the third time (his first wife had died of cancer, as had Evita in 1952); his new wife was the former María Estela (called Isabel) Martínez, an Argentine dancer whom he met in 1956. In Spain, Perón worked to ensure, if not his return to Argentina, at least the eventual assumption of power by the millions of Peronist followers, whose memory of his regime improved with time and with the incapacity of the Argentine governments following Perón's decade of power.

In election after election the Peronists emerged as a large, indigestible mass in the Argentine body politic. Neither the civilian nor the military regimes that precariously ruled in Argentina after 1955 were able to solve the relatively rich nation's condition of "dynamic stagnation," in part because they refused to give political office to the Peronists.

The military regime of General Alejandro Lanusse, which took power in March 1971, proclaimed its intention to restore constitutional democracy by the end of 1973 and allowed the reestablishment of political parties, including the Peronist party. Upon invitation from the military government, Perón returned to Argentina for a short time in November 1972. In the elections of March 1973, Peronist candidates captured the presidency and majorities in the legislature, and, in June, Perón was welcomed back to Argentina with wild excitement. In October, in a special election, he was elected president and, at his insistence, his wife—whom the Argentines disliked and resented—became vice president.

A legacy of turmoil. While in exile Perón had wooed the left-wing Peronists and had supported the most belligerent labour unions. Once returned to power, however, he formed close links with the armed forces and other previously opposition right-wing groups. When he died in 1974, he left to his widow and successor as president an untenable situation. Isabel Perón failed to obtain the firm support of any power group, not even the labour unions. Terrorist activity and political violence increased. On March 24, 1976, the armed forces took power, removed Isabel Perón from office, and set up a military junta. (T.F.McG./Ed.)

BIBLIOGRAPHY. Robert J. Alexander, *Juan Domingo Peron* (1979); and Joseph A. Page, *Perón* (1983), are biographies. Analyses of the development of Peronism and its effect on Argentina may be found in Guido Di Tella, *Argentina Under Perón, 1973–76: The Nation's Experience with a Labour-based Government* (1983); and Frederick C. Turner and José Enrique Miguens (eds.), *Juan Perón and the Reshaping of Argentina* (1983).

Peronist, member of the JUSTICIALIST NATIONALIST MOVEMENT, Spanish PERONISTA, or MOVIMIENTO NACIONALISTA JUSTICIALISTA, in Argentine politics, a supporter of Juan Perón, or an adherent of the populist and nationalistic policies that Perón espoused. Peronism has played an important part in Argentina's history from the mid-1940s. The movement arose as the personal following of Colonel Juan Perón, who, after participating in a successful military coup in 1943, became Argentina's minister of labour. In this position he enacted various social measures to help the country's growing class of urban industrial workers. Perón was elected to the presidency in 1946 with the strong support of these workers and their labour unions; he also gained the support of many lower-middle-class citizens and of the nation's industrialists. After Perón was overthrown and exiled in 1955 by the military, the leaderless Peronist movement was weakened by factional conflicts, since it was composed of many divergent elements, from left-wing trade unionists to right-wing authoritarian nationalists. The movement remained the main civilian contender for power in Argentina, however.

Under the new name of the Justicialist Nationalist Movement, the Peronists swept back into power in 1973 when the military permitted the first general elections in 10 years. Perón returned from exile and became president. But deep dissension between right-wing and left-wing Peronists erupted into terrorism and violence after Perón's death in 1974, and the military overthrew Perón's widow and successor as president, Isabel, in 1976. The Peronists lost the presidential election of 1983, but in 1989 their candidate, Carlos Saúl Menem, was elected to the presidency.

Pérotin, Latin PEROTINUS (d. 1238?, Paris?), French composer of sacred polyphonic music, who is believed to have introduced the composition of polyphony in four parts into Western music.

Nothing is known of Pérotin's life, and his identity is not clearly established. He worked probably at the Cathedral of Notre-Dame in Paris, and his compositions are considered to belong to the Notre-Dame, or Parisian, school, of which he and Léonin are the only members known by name.

Pérotin's four-part works were revolutionary, since religious music of the 12th century was almost entirely in the form of two-part organum (polyphony in which a plainchant melody is sung against another line of music). In Pérotin's organa the liturgical chant of the tenor is heard against not one voice but two or three voices that provide highly decorative vocalizations. He is known to have composed two four-part works, "Viderunt" and "Sederunt"; another four-part composition, "Mors," is believed to be his. He also enlarged upon the *Magnus liber organi,* a collection of organa by his predecessor, Léonin, and made innovations in the use of rhythm. "Viderunt" and "Sederunt," musical creations comparable in scope to the cathedrals of Gothic architecture, have both been recorded in modern performance.

perovskite, calcium titanate mineral (formulated $CaTiO_3$) found as brilliant black cubes in many basic igneous rocks, in their associated pegmatites, and in metamorphic contact zones. It also occurs in chlorite or talc schists. For detailed physical properties, *see* oxide mineral (table).

peroxide, any of a class of chemical compounds in which two oxygen atoms are linked together by a single covalent bond. Several organic and inorganic peroxides are useful as bleaching agents, as initiators of polymerization reactions, and in the preparation of hydrogen peroxide (*q.v.*) and other oxygen compounds. The negatively charged peroxide ion (O_2^{2-}) is present in inorganic compounds that may be regarded as salts of the very weak acid hydrogen peroxide; examples are sodium peroxide (Na_2O_2), a bleaching agent, and barium peroxide (BaO_2), formerly used as a source of hydrogen peroxide.

Two categories of peroxides exist in which one or both of the oxygen atoms are covalently linked to atoms other than hydrogen. One category is represented by cumene hydroperoxide, an organic compound used as a polymerization initiator and as a source of phenol and acetone, and peroxysulfuric acid, an inorganic compound used as an oxidizing agent. The other category includes di-*tert*-butyl peroxide and ammonium peroxydisulfate, both used as initiators.

peroxy acid, also called PERACID, any of a class of chemical compounds in which the atomic group $-O-O-H$ replaces the $-O-H$ group of an oxy acid (a compound in which a hydrogen atom is attached to an oxygen atom by a covalent bond that is easily broken, producing an anion and a hydrogen ion). Examples of peroxy acids are peroxyacetic acid ($CH_3CO-OOH$, related to acetic acid, CH_3CO-OH) and peroxysulfuric acid ($HOSO_2-OOH$, or H_2SO_5, analogous to sulfuric acid, $HOSO_2-OH$, or H_2SO_4).

Peroxy acids usually are prepared by reaction of the oxy acid with hydrogen peroxide; small amounts of sulfuric or other strong acids often are used to accelerate the reaction of weak oxy acids. The peroxy acids are used primarily as oxidizing agents; they readily add oxygen to alkenes to give epoxides and are used to convert ketones to esters and amines to nitro compounds, amine oxides, or nitroso compounds.

perpetual calendar, type of dating system that makes it possible to find the correct day of the week for any date over a wide range of years. Aspects of the perpetual calendar can be found in the Jewish religious and the Julian calendars, and some form of it has appeared in proposed calendar reforms. The 19th-century French philosopher Auguste Comte, for example, proposed a calendar of 13 months of 28 days each, with an extra day (Year Day) inserted between December 28 and January 1 each year and with an additional leap-year day periodically. More recently, reformers promoted the World Calendar, consisting of 12 months divided into 30 and 31 days, with an annual "year-end" day and a periodic leap-year day.

To find the day of the week for any Gregorian or Julian date in the perpetual calendar provided in the Table, first find the proper dominical letter (one of the letters A through G) for the year in the upper Table. Leap years have two dominical letters, the first applicable to dates in January and February, the second to dates in the remaining months. Then find the same dominical letter in the lower table, in whichever column it appears opposite the month in question. The days then fall as given in the lowest section of the column.

perpetual motion, the action of a device that, once set in motion, would continue in motion forever, with no additional energy required to maintain it. Such devices are impossible on grounds stated by the first and second laws of thermodynamics.

A brief treatment of perpetual motion follows. For full treatment, *see* MACROPAEDIA: Energy, Concept of.

Perpetual motion, although impossible to produce, has fascinated both inventors and the general public for hundreds of years. The enormous appeal of perpetual motion resides in the promise of a virtually free and limitless source of power. That perpetual-motion machines cannot work because they violate the laws of thermodynamics has not discouraged inventors and hucksters from attempting to break, circumvent, or ignore those laws, and the history of such attempts is long and colourful.

Basically there are three kinds of perpetual-motion devices. The first kind includes those devices that purport to deliver more energy from a falling or turning body than is required to restore those devices to their original state. The most common of these, and the oldest, is the overbalanced wheel. In a typical version, flexible arms are attached to the outer rim of a vertically mounted wheel. An inclined trough is arranged to transfer rolling weights from folded arms on one side of the wheel to fully extended arms on the other. The implicit assumption is that the weights exert more downward force at the ends of extended arms than is required to raise them on the other side, where they are kept closer to the axis of rotation by the folding of the arms. This assumption violates the first law of thermodynamics, also called the law of

conservation of energy, which states that the total energy of a system is always constant. The first such device was suggested by Vilard de Honnecourt, a 13th-century French architect, and actual devices were built by Edward Somerset, 2nd marquis of Worcester (1601–67), and Jean Ernest Elie Bessler, known as Orffyreus (1680–1745). Both machines gave impressive demonstrations by virtue of their ability to operate for long periods of time, but they could not run indefinitely.

Another unsuccessful attempt to create perpetual motion by violating the first law of thermodynamics was the closed-cycle water mill, such as one proposed by the English physician Robert Fludd in 1618. Fludd erred in thinking that the energy created by water passing over a mill wheel would exceed the energy required to get the water back up again by means of an Archimedes screw.

Perpetual motion machines of the second kind attempt to violate the second law of thermodynamics—namely, that some energy is always lost in converting heat into work. One of the more notable failures in this category was the ammonia-filled "zeromotor" developed in the 1880s by John Gamgee in Washington, D.C.

Perpetual motion machines of the third kind are those associated with a continuous motion that would supposedly be possible if hindrances like mechanical friction and electrical resistivity could be eliminated. In fact, such forces can be greatly reduced, but they can never be completely eliminated without expending additional energy. A prime example is the superconductive metals, whose electrical resistance disappears completely at low temperature, usually somewhere around 20 K. Unfortunately, the energy required to maintain the low temperature exceeds the work that results from the superconductive flow.

Other types of perpetual motion machines have been proposed based on misunderstandings of the nature of certain energy sources. An example is the self-winding clock that derives energy from changes in the temperature or pressure of the atmosphere. It depends upon the energy delivered to the Earth by the Sun and is not, therefore, a perpetual motion machine.

Scientific and governmental sanctioning bodies have looked askance at perpetual motion claims for many years. Since 1775 the French Academy of Science has refused to correspond with anyone claiming to have invented a perpetual motion machine. The British and U.S. patent offices have long refused to expend time or energy on such claims.

Perpignan, city, capital of Pyrénées-Orientales *département*, Languedoc-Roussillon region, southern France, on the Têt River, 8 mi (13 km) west of the Mediterranean Sea, and 19 mi (31 km) north of the Spanish frontier. Formerly a stronghold town, and once the capital of the old province of Roussillon, it is today a flourishing market centre for the wines, fruit, and vegetables of the rich plain in which it is located. The town walls were dismantled toward the end of the 19th century, but the picturesque Castillet—a 14th- and 15th-century crenellated fort that defended the principal gate—still stands and is now a museum. Nearby are the ancient Loge de Mer, which housed the maritime tribunal, and the 14th- and 15th-century cathedral of Saint-Jean. In the south of the town, the bastions of the great 17th- and 18th-century citadel surround the partially restored medieval palace of the kings of Majorca. Paintings by Catalan primitive artists and by Hyacinthe Rigaud, a native of Perpignan, are in the Rigaud Museum.

After serving as the capital of the counts of Roussillon, Perpignan in 1172 passed to the House of Aragon. James I of Aragon divided his realm between his sons, leaving Roussillon and Majorca to the younger, James, the first of three hereditary kings of Majorca who made the city their capital (1276–1344). Perpignan was heavily fortified during and after the struggle between France and Spain for the province of Roussillon. It became French in 1659, by the Treaty of the Pyrenees. Perpignan has been a city of refuge in the 20th century—after 1936, for refugees from the Spanish Civil War, and for returning North African emigrants after 1960. Pop. (1982) 107,812.

Perrault, Charles (b. Jan. 12, 1628, Paris—d. May 15/16, 1703, Paris), French poet, prose writer, and storyteller, a leading member of the Académie Française, who played a prominent part in a literary controversy known as the "quarrel of the ancients and the moderns." He is best remembered for his collection of fairy stories for children, *Contes de ma mère l'oye* (1697; *Tales of Mother Goose*).

A lawyer by training, Perrault first worked as an official in charge of royal buildings. He began to win a literary reputation in about 1660 with some light verse and love poetry and spent the rest of his life in promoting the study of literature and the arts. In 1671 he was elected to the Académie Française, which soon was sharply divided by the so-called quarrel between the ancients and the moderns. Perrault supported the modern view that as civilization progresses, literature evolves with it and that therefore ancient literature is inevitably more

Charles Perrault, detail of an oil painting by an unknown French artist, 17th century; in the Musée National de Versailles et des Trianons, Versailles, Fr.

Cliche Musees Nationaux, Paris

coarse and barbarous than modern literature. His poem *Le Siècle de Louis le Grand* (1687; "The Age of Louis the Great") set such modern writers as Molière and François de Malherbe above the classical authors of Greece and Rome. His chief opponent in this controversy was Nicolas Boileau-Despréaux, who on the whole had the better of the argument. Nevertheless, Perrault's stand was a landmark in the eventually successful revolt against the confines of the prevailing tradition.

Perrault's charming fairy stories in *Mother Goose* were written to amuse his children. They include "Little Red Riding Hood," "The Sleeping Beauty," "Puss in Boots," and "Bluebeard," modern versions of half-forgotten folk tales, which Perrault retold in a style that is simple and free from affectation.

Perrault, Claude (b. Sept. 25, 1613, Paris, Fr.—d. Oct. 9, 1688, Paris), French physician and amateur architect who, together with Louis Le Vau, Charles Le Brun, and François d'Orbay, designed the eastern facade of the Louvre.

Perrault's training was in mathematics and medicine, and he was a practicing physician. He was elected a member of the newly founded Academy of Sciences in 1666, and in 1673 he produced a renowned French annotated translation of Vitruvius' architectural treatise. Claude's brother, Charles, was assistant to J.-B. Colbert, the superintendent of works under Louis XIV, and Charles saw to it that Claude, who had little practical experience, was appointed to the three-man commission responsible for the rebuilding of the Louvre.

Claude collaborated in the final design of the Colonnade, a massive row of paired columns that rises above the unadorned first story and dominates the majestic east facade of the Louvre. Perrault claimed responsibility for this design, but it is now thought that he collaborated on it with Le Vau and d'Orbay and helped solve the engineering problems associated with the Colonnade's construction. Perrault was probably the designer of the Paris Observatory, which still stands.

Perrault's foremost scientific pursuit was as a director of a team that performed dissections on various animals; his death is attributed to a disease contracted while dissecting a camel.

Perrault, Pierre (b. 1611?, Paris, Fr.—d. 1680, Paris), French hydrologist whose investigation of the origin of springs was instrumental in establishing the science of hydrology on a quantitative basis. He showed conclusively that precipitation was more than adequate to sustain the flow of rivers; thus he refuted theories traceable as far back as the writings of Plato and Aristotle that invoked some variety of subterranean condensation or return flow of seawater to account for the discharge of water in springs and rivers.

Perrault was not a scientist by profession but had been, in succession, a lawyer, a government administrator, and a writer. In his most significant scientific work, *De l'origine des fontaines* (1674; *On the Origin of Springs*), he presented a study of a substantial section of the Seine River, beginning at its source, northwest of the city of Dijon. His numerical estimates demonstrated that the annual river runoff was only one-sixth of the amount of water falling as rain or snow over the drainage basin in a year.

Perréal, Jean, Perréal also spelled PERÉAL, also called JOHANNES PARISIENSUS, or JEAN DE PARIS (b. *c.* 1460, Paris?, Fr.—d. June/July, 1530, Paris/Lyon), painter, architect, and sculptor, the most important portrait painter in France at the beginning of the 16th century.

Perréal was a court painter to the Bourbons and later worked for Charles VIII, Louis XII, and Francis I of France. He traveled to Italy several times between 1492 and 1530 and in 1514 visited London, where he painted a portrait of the princess Mary Tudor. Perréal designed tombs, medals, and public ceremonials. A painting of Charles VIII of France and a miniature, "Pierre Sala," are probably the most important works now attributed to him. Perréal was a superb craftsman who in his portraits grafted a French elegance of design and presentation onto conventional Flemish realism.

Perrers, Alice, also called ALICE DE WINDSOR (d. 1400), mistress of King Edward III of England. She exercised great influence at the aging monarch's court from about 1369 until 1376.

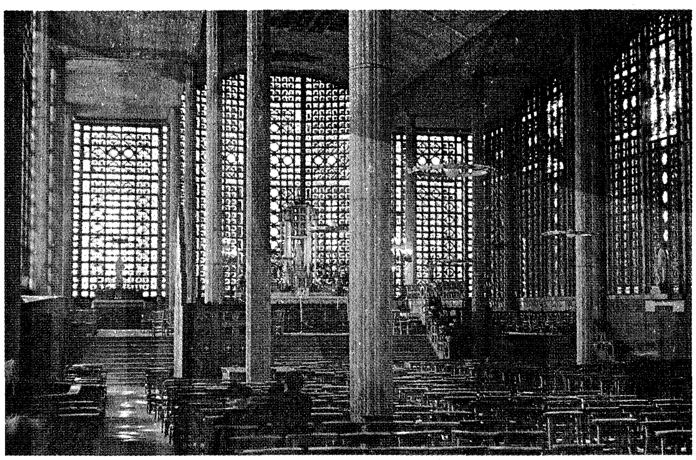
She belonged probably to the Hertfordshire family of Perrers, although it is also stated that she was of more humble birth. Before 1366 she had entered the service of Edward's queen, Philippa, and she appears later as the wife of Sir William de Windsor, deputy of Ireland (d. 1384). Her intimacy with the king began about 1366, and during the next few years she received from him several grants of land and gifts of jewels.

Not content with the great influence that she obtained over Edward III, Alice interfered in the proceedings of the courts of law to secure sentences in favour of her friends or of those who had purchased her favour—actions which induced the Parliament of 1376 to forbid all women from practicing in the law courts. Alice was banished, but John of Gaunt, Duke of Lancaster, allowed her to return to court after the death of Edward the Black Prince in June 1376; and the Parliament of 1377 reversed the sentence against her. Again attempting to pervert the course of justice, she was tried by the peers and banished after the death of Edward III in June 1377; but this sentence was annulled two years later, and Alice regained some influence at court. Her time, however, was mainly spent in lawsuits.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Perret, Auguste (b. Feb. 12, 1874, near Brussels, Belg.—d. Feb. 25, 1954, Paris, Fr.), French architect notable for his pioneering contributions to the vocabulary of reinforced-concrete construction.

He was the son of Claude-Marie Perret, a stonemason who, after 1881, had a flourishing business as a building contractor in Paris. Auguste studied architecture at the École des Beaux-Arts, Paris, but left before receiving his diploma to enter his father's business. With his brothers, Gustave and Claude, he built (1903) at 25 rue Franklin, Paris, what was probably the first apartment block designed for reinforced-concrete construction. His garage on the rue de Ponthieu (1905) demonstrates how light and open an interior can be when the use of reinforced concrete has minimized the need for structural supports. Through its exposed frame, the garage exhibits Perret's concern for structural honesty. A visible framework was also a notable characteristic of the interior of his Paris Théâtre des Champs-Élysées (1913). He used thin shell roof vaulting for his warehouses in Casablanca (1915) and elegant concrete arches for a clothing factory in Paris (1919). Publicity resulting from Perret's Church of Notre-Dame at Le Raincy (1922–23), near Paris, probably fully established the novel and progressive character of his ideas and the immense structural possibilities of reinforced concrete.



Church of Notre-Dame, Le Raincy, Fr., by Auguste and Gustave Perret, 1923, with stained glass by Maurice Denis

GEKS

Among Perret's many notable buildings of the 1920s and 1930s was the École Normale de Musique in Paris (1929), considered by many to be an acoustical masterpiece. After World War II he was appointed chief architect for the reconstruction of Le Havre. Notable Perret buildings there are the Hôtel de Ville and the church of St. Joseph, both designed in 1950 and completed before his death. By that time his ideals were in sharp conflict with those of many of the younger architects who were less interested in the expression of structural systems than in the variety of spatial and sculptural effects made possible by reinforced concrete.

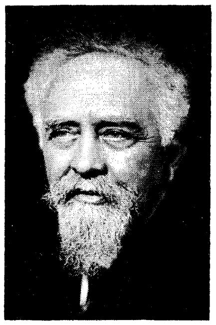
Perrin, Ami (d. 1561), Swiss opponent of the religious Reformer John Calvin at Geneva and leader of the anti-Calvinist Libertines.

A member of a prominent Genevese family, Perrin was associated with the city's anti-Savoyard party (Eidguenots) and commanded a company outfitted against the Duke of Savoy in 1529. Between 1544 and 1555 he stood as one of the most powerful figures in Geneva, serving many times as the city's intercantonal and foreign emissary.

Perrin early embraced the Reformation and championed the cause of Geneva's seminal Reformer, Guillaume Farel. Consequently, he opposed the growth of the Calvinist theocracy, siding with and eventually leading an established party of moderation, the Libertines. In May 1555 an armed rising of his Libertines was resisted by the city's government, and he was condemned to death. He managed to escape to Bern, where, with a few supporters (Fugitifs), he continued a futile opposition in exile.

Perrin, Claude: *see* Victor-Perrin, Claude.

Perrin, Jean(-Baptiste) (b. Sept. 30, 1870, Lille, Fr.—d. April, 17, 1942, New York City), French physicist who studied the Brownian motion of minute particles suspended in liquids and thereby confirmed the atomic nature of matter. For this achievement he was



Jean Perrin
H. Roger-Viollet

honoured with the Nobel Prize for Physics in 1926.

Educated at the École Normale Supérieure, Paris, Perrin joined the faculty of the University of Paris (1898) where he became professor of physical chemistry (1910–40). In 1895 he established that cathode rays are negatively charged particles (electrons). Around 1908 he addressed himself to determining the way in which colloidal particles remained suspended in a liquid in defiance of gravity. Through observations of the manner of sedimentation of these particles, he confirmed Einstein's equation concerning the phenomenon, and was also able to estimate the size of atoms and molecules as well as their quantity in a given volume.

Perrine, Charles Dillon (b. July 28, 1867, Steubenville, Ohio, U.S.—d. June 21, 1951, Villa General Mitre, Arg.), U.S. astronomer who discovered the sixth and seventh moons of Jupiter in 1904 and 1905, respectively. In 1904 he published a calculation of the solar parallax (a measure of the Earth-Sun distance) based on observations of the minor planet Eros during one of its close approaches to the Earth.

Perrine worked at the Lick Observatory in California from 1893 to 1909 and then until his retirement in 1936 was director of the Argentine National Observatory in Córdoba. His work included counts of extragalactic nebulae and the discovery of 13 comets.

Perron, (Charles) Edgar du (b. Nov. 2, 1899, Meester Cornelis, Java—d. May 14, 1940, Bergen, Neth.), writer and critic, cofounder with Menno ter Braak of the influential Dutch literary journal *Forum* (1932–35), which aimed to replace superficial elegance of literary style with greater sincerity of literary content. The *Forum* writers resisted National Socialism and the German occupation of The Netherlands.

The son of a Dutch East Indian planter, du Perron went to Europe in 1921 and lived on the Left Bank in Paris, an experience that provided the background of his novel *Een voorbereiding* (1927; "A Preparation"). Cosmopolitan in outlook, he did much to counteract Dutch provincialism by publicizing the works of the French writers André Gide and André Malraux. He translated into Dutch Malraux's *La Condition humaine*, which had been dedicated to him. His collected essays, *De smalle mens* (1934), deal with the precarious position of the individual in the face of the collective attitudes of left and right. His poems, collected in *Parlando* (1941), are characterized by everyday words and a conversational tone. Shortly before World War II, du Perron spent a few more years in the Dutch East Indies collecting materials for *De man van Lebak* (1937), a critical biography of the great Dutch novelist Multatuli.

Perronet, Jean(-Rodolphe) (b. Oct. 8, 1708, Suresnes, Fr.—d. Feb. 27, 1794, Paris), French civil engineer renowned for his stone-arch bridges, especially the Pont de la Concorde, Paris.

The son of an army officer, Perronet entered the newly formed Corps des Ponts et Chaussées (Bridges and Highways Corps) and so distinguished himself that on the founding, in 1747, of the École des Ponts et Chaussées, the world's first engineering school, he was appointed director.

During construction of a bridge at Mantes in 1763, Perronet made the discovery that the horizontal thrust of a series of elliptical arches was passed along to the abutments at the ends of the bridge. Armed with this knowledge, he carried the stone-arch bridge to its ultimate design form with extremely flat arches that were supported during construction by timbering (falsework) and mounted on very slender piers, which widened the waterway for navigation and reduced scour from the current.

The result was also aesthetically pleasing; Perronet's Pont de Neuilly has been called the most graceful stone bridge ever built. He was 80 years old when he began the Pont de la Concorde, originally called the Pont Louis XV, in 1787. Despite the outbreak of the French Revolution, he kept the work going, completing it in 1791. His memoirs, published in 1782, give a complete account of his career to that date.

Perrot, Sir John (b. *c.* 1527, Harroldston, Pembrokeshire, Wales—d. September 1592, London), lord deputy of Ireland from 1584 to 1588, who established an English colony in Munster in southwestern Ireland.

Perrot was reputed to be the son of King Henry VIII of England and Mary Berkley, who later married Thomas Perrot of Pembrokeshire. Knighted in 1547, he was appointed president of Munster by Queen Elizabeth I in 1570. After suppressing the Munster rebellion of James (Fitzmaurice) Fitzgerald, he pardoned the rebels and returned to England (1573). In 1584 he was sent back to Ireland as lord deputy. He confiscated vast lands in Munster for plantation by English settlers, but the colonization was poorly organized and ex-

Sir John Perrot, engraving by U. Green, 1584

ecuted. He did succeed, however, in bringing the native landowners of Connaught under English law by having them pay the crown a fixed money rent. In return, they avoided losing lands to plantations.

Meanwhile, Perrot's tolerance toward Roman Catholics and his plan to convert St. Patrick's Cathedral in Dublin into a university had earned him the enmity of Adam Loftus, Anglican archbishop of Dublin. In 1588 Loftus had Perrot recalled to England on trumped-up charges of treasonable negotiations with Spain. Perrot was found guilty, but he died in prison before he could be executed.

Perrot, Jules (Joseph) (b. Aug. 18, 1810, Lyon—d. Aug. 24, 1892, Paramé, Fr.), French virtuoso dancer and choreographer whose mas-

Jules Perrot, engraving after a drawing

terpieces of Romantic ballet include *Pas de Quatre* (1845), composed for four of the 19th century's leading ballerinas and frequently revived in the 20th century; Perrot is usually credited with choreographing Giselle's dances in *Giselle* (1841).

He studied with Auguste Vestris and Salvatore Viganò, two of the principal exponents of expressive ballet (as opposed to pure or formal ballet). He made his debut in 1830 at the Paris Opéra, where, despite the period's prejudice against male dancers, he was highly applauded for both his classical and his mime dancing. A combination of knee trouble and the professional jealousy of his partner Marie Taglioni led to his resignation in 1835. He then toured Europe (1835–40) as a dancer and choreographer and in Naples was joined by the young ballerina Carlotta Grisi, whom he trained and later married. Perrot again danced in Paris in 1840, but only Grisi was hired to perform at the Opéra. Since he frequently arranged her solos, his choreography is now believed to include that of her title role in *Giselle,* still considered a consummate challenge to a ballerina's artistry; Jean Coralli, however, received all official credit for choreographing Giselle.

From 1842 to 1848 Perrot worked in London, making it an important ballet centre by choreographing such ballets as *Ondine* (1843), *Esmeralda* (1844), and the *Pas de Quatre,* staged for Marie Taglioni, Carlotta Grisi, Lucile Grahn, and Fanny Cerrito. In 1848 Perrot became premier danseur at the Imperial Theatre in St. Petersburg, where he created eight more ballets and revived many others. Some of his ballets, such as *Esmeralda* and *Giselle,* remained in the Russian repertoire long after his departure from St. Petersburg (1859) and eventually became part of the post-Revolution Soviet ballet. On his return to France, Perrot attempted to revive his major works but was unsuccessful, since technical virtuosity had become more popular in western Europe than the expressive and dramatic elements that characterized his ballets.

Perrot, Nicolas (b. *c.* 1644, France—d. Aug. 13, 1717, Lower Canada), French fur trader, North American colonial official, and explorer.

Perrot immigrated to New France (Canada) as a youth, and his services there under the Jesuits and Sulpicians enabled him to learn Indian languages and native cultures. He entered the fur trade about 1663, working in the Great Lakes region, and in 1668 he was among the first French traders who dealt with the Algonkin tribes around Green Bay. Governor Frontenac sent Perrot in 1670 as interpreter on an expedition that claimed the Upper Mississippi area for France in June 1671. He returned to New France that autumn, married, and settled on an estate at Bancour. For the next 12 years, he evidently worked his lands but also engaged in some fur trading, as he was awarded a license for that purpose in 1674.

In 1683 Governor Le Fevre La Barre authorized Perrot to undertake a Great Lakes trading expedition, and the next year, the governor directed him to obtain the support of western tribes in his campaign against the Iroquois. In 1685 Perrot was made commandant of the Green Bay region, and, with his commission, he journeyed to the junction of the Wisconsin and Mississippi rivers, where he built Ft. St. Nicolas. In 1686 he constructed Ft. St. Antoine on Lake Pepin and initiated trade with the Sioux and other local tribes. The following year, Perrot was ordered to assist another campaign against the Iroquois. He ousted British fur-tradering expeditions from the Great Lakes region, and, on May 8, 1689, he officially renewed France's claim to the Upper Mississippi.

Perrot continued to work among the western tribes until 1696, when all trading licenses were revoked. He then returned to Lower Canada. Perrot subsequently worked as an interpreter and served in the militia, although he devoted his final years to writing his memoirs.

Perry, Bliss (b. Nov. 25, 1860, Williamstown, Mass., U.S.—d. Feb. 13, 1954, Exeter, N.H.), U.S. scholar and editor, especially noted for his work in American literature.

Perry was educated at Williams College, Williamstown, and the universities of Berlin and Strassburg (then in Germany). He taught at Williams (1886–93), Princeton University (1893–1900), and Harvard University (1907–30) and was Harvard lecturer at the University of Paris (1909–10). From 1899 to 1909 he edited *The Atlantic Monthly.* The French government awarded him the Legion of Honour. He edited many volumes, including the works of Edmund Burke, Sir Walter Scott, and Ralph Waldo Emerson, and was general editor (1905–09) of the Cambridge edition of the major American poets. He wrote a number of books, including works on Walt Whitman, John Greenleaf Whittier, Thomas Carlyle, Emerson, and others, as well as novels, short fiction, essays, an autobiography, studies of poetry, and collections of fiction and essays.

Perry, Matthew C(albraith) (b. April 10, 1794, South Kingston, R.I., U.S.—d. March 4, 1858, New York City), U.S. naval officer who headed an expedition that forced Japan in 1853–54 to enter into trade and diplomatic relations with the West after more than two centuries of isolation. Through his efforts the United States became an equal power with Britain, France, and Russia in the economic exploitation of East Asia.

Earlier, Perry had served as commanding officer (1837–40) of the first U.S. steamship, the "Fulton"; led a naval squadron to Africa to help suppress the slave trade (1843); and successfully commanded naval forces during the Mexican War (1846–48). In March 1852 Pres. Millard Fillmore placed Perry—who was called by his honorary rank of commodore—in charge of a naval expedition to induce the Japanese government to establish diplomatic relations with the United States. After studying the situation, Perry concluded that Japan's traditional policy of isolation would be altered only if superior naval forces were displayed and if Japanese officials were approached with a "resolute attitude." With two frigates and two sailing vessels, he entered the fortified harbour of Uraga on July 8, 1853—an act widely publicized throughout the world. Calling himself an "admiral," he refused to obey Japanese orders to leave and sent word that if the government did not delegate a suitable person to receive the documents in his possession, he would deliver them by force if necessary. The Japanese defenses were inadequate to resist him, and after a few days of diplomatic sparring they accepted his letter from the President of the United States requesting a treaty.

In the interim, the Japanese, who were aware of China's recent defeat by the technologically superior Western powers in the Opium War (1839–42), decided to agree to Perry's terms as a way of stalling for time while they improved their defenses. In February 1854 he reappeared in Edo (modern Tokyo) Bay—this time with nine ships—and on March 31 concluded the first treaty between the two countries. The pact assured better treatment of shipwrecked seamen, permitted U.S. ships to obtain fuel and supplies at two minor ports, arranged for a U.S. consul to reside at Shimoda, and opened the way for further U.S. trading privileges. Perry's success demonstrated the inability of the Shogun, Japan's hereditary military dictator, to enforce his country's traditional isolationist policy; the Japanese were soon forced to sign similar treaties with other Western nations. These events contributed to the collapse of the shogunate and ultimately to the modernization of Japan.

Matthew Perry, detail of a Japanese watercolour, *c.* 1853; in Norfolk Museum of Arts and Sciences, Virginia
Collection Norfolk Museum of Arts and Sciences, Virginia

Considered thereafter an authority on the Far East, Perry stressed the danger of British and Russian expansion and urged a more active U.S. role in the Orient. He specifically recommended the acquisition of island bases in the Pacific to assure U.S. military and commercial superiority in the area, but the government was not ready to act on these proposals for roughly half a century.

Perry, Oliver Hazard (b. Aug. 20, 1785, South Kingston, R.I., U.S.—d. Aug. 23, 1819, at sea), U.S. naval officer who became a national hero when he defeated a British squadron in the Battle of Lake Erie in the War of 1812.

Appointed a midshipman at 14, Perry served in both the West Indies and the Mediterranean until February 1813, when he was sent to Erie, Pa., to complete the building of a U.S. squadron to challenge British control of the Great Lakes.

Oliver Hazard Perry, detail from a portrait by an unknown artist
By courtesy of the U.S. Navy

By early autumn he had assembled a fleet of 10 small vessels and was ready to engage the enemy. When the battle was joined on September 10, Perry's fleet was greatly superior in short-range firepower but only slightly superior at long range; a light wind prevented him from closing in quickly on the six British warships commanded by R.H. Barclay. When Perry's flagship, the "Lawrence," was disabled, he transferred to the "Niagara," winning the battle within the next 15 minutes by sailing directly into the British line, firing broadside. In his official report of the British surrender he said, "We have met the enemy and they are ours."

Perry's successful action at Lake Erie helped ensure U.S. control of the Northwest; it also raised him to a position of national eminence and earned him promotion to the rank of captain. He commanded the "Java" in the Mediterranean (1816–17) and a small U.S. fleet sent to the South Atlantic (1819) to bring under control certain vessels that were preying on U.S. shipping out of Buenos Aires and Venezuela. On the return trip he contracted yellow fever and died.

Perry, Ralph Barton (b. July 3, 1876, Poultney, Vt., U.S.—d. Jan. 22, 1957, Cambridge, Mass.), U.S. educator and philosopher noted as the founder of the school of new Realism in American Pragmatic philosophy.

Educated at a private school in Philadelphia and at Princeton (A.B., 1896) and Harvard (M.A., 1897; Ph.D., 1899), Perry began a teaching career that spanned nearly half a century when, in 1899, he became a philosophy instructor at Williams College in Williamstown, Mass.; he then taught philosophy briefly at Smith College in Northampton, Mass. In 1902 he went to Harvard in the same role and remained there until his retirement in 1946. By 1913 he had become a full professor and in 1930 was made Edgar Pierce professor of philosophy. After his retirement from Harvard, he was Gifford lecturer at the University of Glasgow (1946–48).

Heavily influenced by William James, Perry was founder of the school of new Realism, which sought to refine and develop James's pragmatism. He edited James's works and wrote a biography—*The Thought and Character of William James*—that earned him a Pulitzer Prize (1936). Among his other books are *The Approach to Philosophy* (1905), *The Present Conflict of Ideals* (1918), *General Theory of Value* (1926), *Shall Not Perish From the Earth* (1940), *Puritanism and Democracy* (1944), *One World in the Making* (1945), *The Citizen Decides* (1951), and *Realms of Value* (1954).

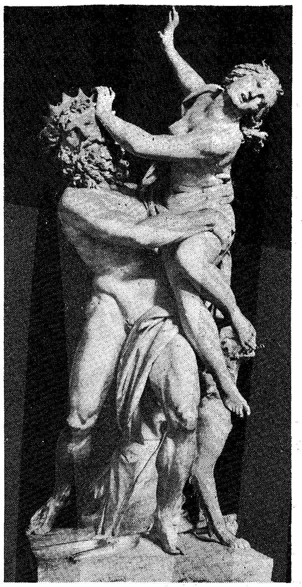
Perry, W(illiam) J(ames) (b. 1868—d. 1949), British geographer and anthropologist noted for his diffusionist theory of cultural development. Perry believed that Egypt of 4000 BC was the original and sole source of agriculture, pottery, basketry, domestic animals, houses, and towns and that these then spread throughout the world. He explained all cultural differences and similarities by migrations and additions, losses, and combinations of complexes of cultural traits, views that are considered naive by contemporary anthropologists.

Perry Convention (Japanese history): *see* Kanagawa, Treaty of.

Perryville, Battle of (Oct. 8, 1862), in the American Civil War, engagement of Union and Confederate troops as Gen. Braxton Bragg was leading the Confederates in an advance on Louisville, Ky., from Chattanooga, Tenn. Union troops, under Gen. Don Carlos Buell, were marching from Louisville when they unexpectedly encountered the Confederate Army. A bloody but indecisive battle ensued at Perryville, near Danville, Ky. Bragg's forces, though, held the field and continued to control the area until forced to withdraw three months later following the Battle of Stones River.

Perse, Saint-John: *see* Saint-John Perse.

Persephone, Latin PROSERPINA, or PROSERPINE, in Greek religion, daughter of Zeus, the chief god, and Demeter, the goddess of agriculture; she was the wife of Hades, king of the underworld. In the Homeric "Hymn to Demeter," the story is told of how Persephone was gathering flowers in the Vale of Nysa when she was seized by Hades and removed to the underworld. Upon learning of the abduction, her mother, Demeter, in her misery, became unconcerned with the harvest or the fruitfulness of the Earth, so that widespread famine ensued. Zeus therefore intervened,



Persephone abducted by Hades, marble sculpture by Gian Lorenzo Bernini, 1621–22; in the Borghese Gallery, Rome

Anderson—Alinari from Art Resource/EB Inc.

commanding Hades to release Persephone to her mother. Because Persephone had eaten a single pomegranate seed in the underworld, she could not be completely freed but had to remain one-third of the year with Hades, spending the other two-thirds with her mother.

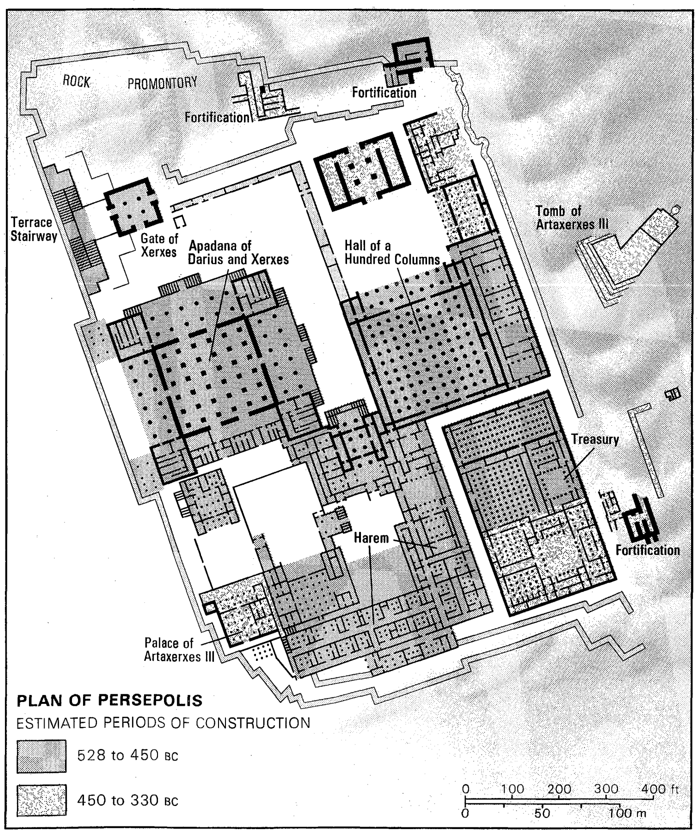
One of the variants of the name Persephone is Persephassa, which suggests that she was originally a pre-Hellenic goddess of the dead and that her connection with Demeter came later, when she was identified with Kore (Core; Greek: Maiden), the young grain goddess and daughter of Demeter. The story that Persephone/Kore spent four months of each year in the underworld was no doubt meant to account for the barren appearance of Greek fields in full summer (after harvest), before their revival in the autumn rains, when they are plowed and sown.

Persephone also appears in the Orphic myth of Zagreus, her son by Zeus, who, as a child, was torn apart by Titans.

Persepolis, Old Persian PARSA, modern TAKHT-E JAMSHĪD, or TAKHT-I JAMSHĪD (Persian: Throne of Jamshīd), an ancient capital of the Achaemenian kings of Iran (Persia), located about 32 miles (51 kilometres) northeast of Shīrāz in the *ostān* (province) of Fars, southwest Iran, near the confluence of the small river Pulvār (Rūdkhāneh-ye Sīvand) with the Rūd-e Kor.

Though archaeologists have discovered evidence of prehistoric settlement, inscriptions indicate that the construction of the city began under Darius I the Great (reigned 522–486 BC), who, as a member of a new branch of the royal house, made Persepolis the capital of Persia proper, replacing Pasargadae, the burial place of Cyrus the Great. Built in a remote and mountainous region, Persepolis was an inconvenient royal residence and was visited mainly in the spring. Effective administration of the Achaemenian Empire was carried on from Susa, Babylon, or Ecbatana. This accounts for the fact that the Greeks were not acquainted with Persepolis until Alexander the Great's invasion of Asia. In 330 BC Alexander plundered the city and burned the palace of Xerxes, probably to symbolize the end of his Panhellenic war of revenge. In 316 BC Persepolis was still the capital of Persis as a province of the Macedonian Empire. The city gradually declined in the Seleucid period and after, its ruins attesting its ancient glory. In the 3rd century AD the nearby city of Istakhr became the centre of the Sāsānian Empire.

The site is marked by a large terrace with



City of Persepolis

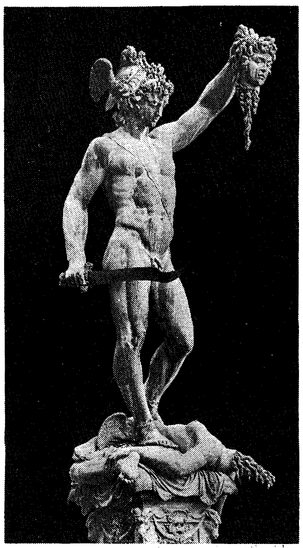
Adapted from *Westermann Grosser Atlas zur Weltgeschichte,* Georg Westermann Verlag, Braunschweig its east side leaning on Kūh-e Raḥmat (the Mount of Mercy). The other three sides are formed by a retaining wall, varying in height with the slope of the ground from 13 to 41 feet (4 to 12 metres); on the west side a magnificent double stair in two flights of 111 easy stone steps leads to the top. On this terrace are the ruins of a number of colossal buildings, all constructed of a dark gray stone, often polished to the consistency of marble, from the adjacent mountain. The stones, of great size, cut with the utmost precision, were laid without mortar, and many of them are still in place. Especially striking are the huge columns, 13 of which still stand in Darius the Great's audience hall, known as the apadana, the name given to a similar hall built by Darius at Susa. There are two more columns still standing in the entrance hall of the Gate of Xerxes, and a third has been assembled there from its broken pieces.

In 1933 two sets of gold and silver plates recording in the three forms of cuneiform, Ancient Persian, Elamite, and Babylonian, the boundaries of the Persian Empire were discovered in the foundations of Darius' hall of audience. A number of inscriptions, cut in stone, of Darius I, Xerxes I, and Artaxerxes III indicate to which monarch the various buildings are to be attributed. The oldest of these on the south retaining wall gives Darius' famous prayer for his people: "God protect this country from foe, famine and falsehood." There are numerous reliefs of Persian, Median, and Elamite officials, and 23 scenes separated by cypress trees depict representatives from the remote parts of the empire who, led by a Persian or a Mede, made appropriate offerings to the king at the national festival of the vernal equinox.

Behind Takht-e Jamshīd are three sepulchres hewn out of the mountainside; the facades, of which one is incomplete, are richly ornamented with reliefs. About eight miles north by northeast, on the opposite side of the Pulvār, rises a perpendicular wall of rock in which four similar tombs are cut at a considerable height from the bottom of the valley. This place is called Naqsh-e Rostam (the Picture of Rostam) from the Sāsānian carvings below the tombs, which were thought to represent the mythical hero Rostam. That the occupants of these seven tombs were Achaemenian kings might be inferred from the sculptures, and one of those at Naqsh-e Rostam is expressly declared in its inscriptions to be the tomb of Darius I, son of Hystaspes, whose grave, according to the Greek historian Ctesias, was in a cliff face that could be reached only by means of an apparatus of ropes. An inscription beside the entrance to Darius' tomb describes his character and states that God had given him two special qualities, wisdom and activity. The three other tombs at Naqsh-e Rostam, besides that of Darius I, are probably those of Xerxes I, Artaxerxes I, and Darius II. Xerxes II, who preceded Darius II, reigned for a very short time and could not have obtained so splendid a monument; still less could Sogdianus (Secydianus), who usurped his brother's throne and reigned for less than a year. The two completed graves behind Takht-e Jamshīd probably belong to Artaxerxes II and Artaxerxes III. The unfinished one might be that of Arses, who reigned at the longest two years, but is more likely that of Darius III, last of the Achaemenian line, who was overthrown by Alexander the Great. (R.N.S.)

BIBLIOGRAPHY. A. Sami, *Persepolis,* 6th ed. (Eng. trans. 1970); D.N. Wilber, *Persepolis: The Archaeology of Parsa Seat of the Persian Kings* (1969), with full bibliography of works on Persepolis.

Perseus, in Greek mythology, the slayer of the Gorgon Medusa and the rescuer of Andromeda from a sea monster. Perseus was the son of Zeus and Danaë, the daughter of Acrisius of Argos. As an infant he was cast into the sea in a chest with his mother by Acrisius, to whom it had been prophesied that he would be killed by his grandson. After Perseus had grown up on the island of Seriphus, where



"Perseus," bronze sculpture by Benvenuto Cellini, 1545–54; in the Loggia dei Lanzi, Florence
Alinari—Art Resource/EB Inc.

the chest had grounded, King Polydectes of Seriphus, desiring Danaë, tricked Perseus into promising to obtain the head of Medusa, the only mortal among the Gorgon (*q.v.*).

Aided by Hermes and Athena, Perseus pressed the Graiae, sisters of the Gorgons, into helping him by seizing the one eye and one tooth that the sisters shared and not returning them until they provided him with winged sandals (which enabled him to fly), the helmet of Hades (which conferred invisibility), a curved sword, or sickle, to decapitate Medusa, and a bag in which to conceal the head. (According to another version, the Graiae merely directed him to the Stygian Nymphs, who told him where to find the Gorgons and gave him the bag, sandals, and helmet; Hermes gave him the sword.) Because the gaze of Medusa turned all who looked at her to stone, Perseus guided himself by her reflection in a shield given him by Athena and beheaded Medusa as she slept. He then returned to Seriphus and rescued his mother by turning Polydectes and his supporters to stone at the sight of Medusa's head.

A further deed attributed to Perseus was his rescue of the Ethiopian princess Andromeda when he was on his way home with Medusa's head. Andromeda's mother, Cassiopeia, had claimed to be more beautiful than the sea nymphs, or Nereid (*q.v.*); so Poseidon had punished Ethiopia by flooding it and plaguing it with a sea monster. An oracle informed Andromeda's father, King Cepheus, that the ills would cease if he exposed Andromeda to the monster, which he did. Perseus, passing by, saw the princess and fell in love with her. He turned the monster to stone by showing it Medusa's head and afterward married Andromeda.

Later Perseus gave the Gorgon's head to Athena, who placed it on her shield, and gave his other accoutrements to Hermes. He accompanied his mother back to her native Argos, where he accidentally struck her father, Acrisius, dead when throwing the discus, thus fulfilling the prophecy that he would kill his grandfather. He consequently left Argos and founded Mycenae as his capital, becoming the ancestor of the Perseids, including Heracles.

The Perseus legend was a favourite subject in painting and sculpture, both ancient and Renaissance. Sigmund Freud reinterpreted the Gorgon's head in terms of castration, and the English novelist Iris Murdoch used it for modern symbolism in *A Severed Head* (1961).

Perseus (b. *c.* 212 BC—d. *c.* 165, Alba Fucens, near Rome), the last king of Macedonia (179–168), whose attempts to dominate Greece brought on the final defeat of Macedonia by the Romans, leading to annexation of the region.

The elder son of King Philip V of Macedonia, Perseus commanded troops in his father's wars against Rome (199) and Aetolia (189). After three years of intriguing against his brother Demetrius, accusing him of coveting the succession, Perseus in 181 persuaded the King to have Demetrius executed. On succeeding to the throne, he extended his influence in Thrace and Illyria but made special efforts to win over the Greek world. To this end he resumed control of the Delphic Amphictyony, established excellent relations with Rhodes, and encouraged revolution in Aetolia and Thessaly. After subduing a revolt in Dolopia, he aroused widespread alarm in Greece by visiting Delphi with his army. Eumenes II of Pergamum incited Rome against Perseus' allegedly aggressive designs, thus precipitating the Third Macedonian War (171–168). Perseus held off the Romans for three years but in 168 lost the support of Genthius of Illyria, thus exposing his western flank. A Roman army forced him to fight at Pydna (in southern Macedonia), where he was defeated by Lucius Aemilius Paulus. He spent the rest of his life in captivity.

Pershing, John J(oseph), byname BLACK JACK (b. Sept. 13, 1860, Laclede, Mo., U.S.—d. July 15, 1948, Washington, D.C.), U.S. Army general who commanded the American Expeditionary Force (AEF) in Europe during World War I.

Pershing, 1917
By courtesy of the Library of Congress, Washington, D.C.

Graduating from the U.S. Military Academy at West Point, N.Y., in 1886, Pershing served in several Indian wars, in the Spanish-American War (1898), as brigadier general in the Philippine Islands (1906–13), and as commander of a punitive raid against the Mexican revolutionary Pancho Villa (1916). He also was a military instructor at the University of Nebraska, Lincoln, and at West Point.

After the United States declared war on Germany (April 1917), Pres. Woodrow Wilson selected Pershing to command the American troops being sent to Europe. In June he submitted a "General Organization Report" recommending an army of 1,000,000 men by 1918 and 3,000,000 by 1919. Though early U.S. planning had not included such a large force, Pershing's recommendations prevailed.

Pershing was determined to maintain the integrity of the AEF as an independent army, despite pressure from the Allied high command to use U.S. troops as replacement units in European divisions, many of which were exhausted from the setbacks of 1917. Pershing largely resisted these pressures, although during the March–June 1918 German offensive threatening Paris, he was finally persuaded to release his troops temporarily to inter-Allied commander Marshal Ferdinand Foch.

Pershing's army never became entirely self-sufficient, but it conducted two significant operations. In September 1918 the AEF assaulted the Saint-Mihiel salient successfully. Then, at Foch's request, later that month Pershing quickly regrouped his forces for the Meuse-Argonne offensive, despite his original plans to advance toward Metz. Though incomplete preparations and inexperience slowed the operations, the inter-Allied offensive in France destroyed German resistance in early October and led to the Armistice the next month.

Pershing was criticized for operational and logistic errors, but his creation of the AEF was a remarkable achievement; he returned home with a sound reputation and in 1919 was given the rank of general of the armies of the United States. Pershing's nickname, Black Jack, derived from his service with a black regiment early in his career; it came to signify his stern bearing and rigid discipline. Eschewing politics, Pershing remained in the army and served as chief of staff from 1921 until his retirement three years later.

Pershing's memoirs were published as *My Experiences in the World War,* 2 vol. (1931).

Persia, the kingdom of Iran in southwestern Asia. The term was used for centuries, chiefly in the West, and originated from a region of southern Iran formerly known as Persis, alternatively as Pārs, or Parsa, modern Fārs. Parsa was the name of an Indo-European nomadic people who migrated into the region about 1000 BC. The first mention of the Parsa occurs in the annals of Shalmanesar III, an Assyrian king, in 844. During the rule of the Persian Achaemenid dynasty (559–330 BC) the ancient Greeks first encountered the inhabitants of Persis on the Iranian Plateau, when the Achaemenid kingdom was expanding. The use of the name was gradually extended by the ancient Greeks and other Western peoples to apply to the whole Iranian Plateau. The people of Iran have always called their country Iran, "Land of the Aryans."

In 1935 the government of Iran requested that the name Iran be used instead of Persia.

Persian (cat): *see* longhair.

Persian deer, fallow deer (*q.v.; Dama mesopotamica*) of western Asia. The maral, an Asiatic red deer, also is often called Persian deer.

Persian Gulf, also called ARABIAN GULF, Arabic BAḤR FĀRIS, Persian KHALĪJ-E FĀRS, shallow marginal sea of the Indian Ocean covering a surface area of 92,500 square miles (240,000 square km) between the Arabian Peninsula and southwestern Iran.

A brief treatment of the Persian Gulf follows. For full treatment, *see* MACROPAEDIA: Asia.

The Persian Gulf extends 615 miles (990 km) from the al-ʿArab River (mouth of the Tigris and Euphrates rivers) in the northwest to its outlets, the Strait of Hormuz and the Gulf of Oman, on the southeast; its width ranges from 35 to 210 miles (55 to 340 km). The gulf contains the island state of Bahrain and is bordered by Iran to the north and east, the United Arab Emirates and Oman to the south, Saudi Arabia and Qatar to the west, and Kuwait and Iraq to the northwest.

The seafloor is very shallow, rarely deeper than 300 feet (90 m), although depths exceeding 360 feet are found near its outlet and at isolated localities in its southeastern part. The deepest waters occur along the Iranian coast, while a broad shallow area, averaging less than 120 feet deep, borders the Arabian coast. The small freshwater inflow into the gulf is mostly from the Tigris–Euphrates–Kārūn rivers; there are some ephemeral streams on the Iranian coast south of Būshehr, but virtually no fresh water flows into the gulf on its southwest side. This condition, together with high water temperatures, results in evaporation in excess of freshwater inflow and high salinity.

The economy of the Persian Gulf region is dominated by the production of petroleum. The gulf and surrounding countries produce nearly one-fourth of the world's total petroleum and have more than one-half of the world's proved reserves. Large commercial-fishing industries have also developed on the gulf coasts in Kuwait, Qatar, and Bahrain.

Persian language, also called FĀRSĪ, member of the Iranian branch of the Indo-Iranian language family; it is the official language of Iran. Written in Arabic characters, modern Persian also has many Arabic loanwords and an extensive literature.

Old Persian, spoken until approximately the 3rd century BC, is attested by numerous inscriptions written in cuneiform, most notable of which is the great monument of Darius I at Bīsitūn, Iran. The inscriptions at Bīsitūn were generally trilingual—in Old Persian, Elamite, and Akkadian.

Middle Persian, spoken from the 3rd century BC to the 9th century AD, is represented by numerous epigraphic texts of Sāsānian kings, written in Aramaic script; there is also a varied literature in Middle Persian embracing both the Zoroastrian and the Manichaean religious traditions. Pahlavi was the name of the official Middle Persian language of the Sāsānian Empire.

Modern Persian grammar is in many ways much simpler than its ancestral forms, having lost most of the inflectional systems of the older varieties of Persian. Other than markers to indicate that nouns and pronouns are direct objects, Modern Persian has no system of case inflections. Possession is shown by addition of a special suffix (called the *ezāfeh*) to the possessed noun. Verbs retain a set of personal endings related to those of other Indo-European languages, but a series of prefixes and infixes (word elements inserted within a word), as well as auxiliary verbs, are used instead of a single complex inflectional system to mark tense, mood, voice, and the negative.

Persian literature, body of writings in Modern Persian (Fārsī), the form of the Persian language written with the Arabic alphabet and with many Arabic loanwords, that emerged by the 9th century, especially in northeast Iran, and became established as the literary form of the Persian language in Iran and northern India.

A brief treatment of Persian literature follows. For full treatment, see MACROPAEDIA: Islāmic Arts.

After the Arab conquest of Iran in the 7th century, Islām replaced orthodox Zoroastrianism and its related heterodoxies as the dominant religion and also eclipsed the minority religions, Buddhism, Nestorian Christianity, and Manichaeism (all of which had some discernible influence on later literary subject matter and imagery), and Arabic became the language of law and culture. In the 9th century, however, the Persian political revival was accompanied by the emergence of a Persian literary medium, expecially in northeast Iran, where the dialect known as Modern, or New, Persian began to be used for literary expression and so became established as the literary form of the Persian language in Iran and in northern India. Mid-20th-century research, by study of an indigenous spoken dialect preserved among the Iranian people and of the learned language of Arabic (with its greater vocabulary), has revealed examples of the early form of this language. The first writings in Modern Persian were in verse, the medium of praise and pleasure, and Arabic elements were few. As prose translations from Arabic began to be made, rhetorical refinements based on Arab literary conventions and more Arabic words and literary devices were introduced.

The earliest major genres of Persian poetry were the panegyric and elegy, both written in the form of the qasida (a formal ode), and their first great exponent was Rūdakī, who flourished under the Sāmānid Naṣr II (913–943). Another form soon to develop was the shorter lyric, or ghazel (ghazal), used for bacchic odes and later for love poetry. Both the qasida and the ghazel were monorhymed. The introduction of the rhyming couplet, *maṡnavī,* effected the release from the limitations of monorhyme and led to the composition of epic and long didactic poems. Like the robāʿī, or quatrain, the *maṡnavī* was a purely Persian development; and the robāʿī, unlike most other poetic forms, was unknown in Arabic.

The foundations of Persian prose, as of poetry, were laid in the time of the Sāmānid dynasty. In 963 Balʿami, vizier of al-Manṣūr I, published an abridged translation of the famous annals of aṭ-Ṭabarī. About the same time, a band of theologians from Transoxania made a Persian version of aṭ-Ṭabarī's other great work, his commentary on the Qurʾān, thus demonstrating that Persian also was suitable for sacred texts. Al-Manṣūr I also commissioned the first Persian book on medicine, the pharmacopoeia of Abū Manṣūr Muvaffaq of Herat. The application of Persian to philosophy and science, which involved the coining of an extensive and subtle technical vocabulary, ranks among the outstanding achievements of Avicenna, whose formative years were passed at the Sāmānid court.

Persian lynx: *see* caracal.

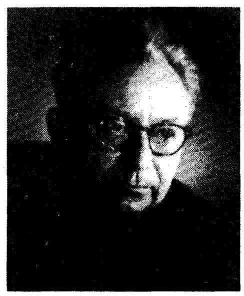
Persian melon: *see* muskmelon.

Persian Royal Road, ancient road running from Susa, the ancient capital of Persia, across Anatolia to the Aegean Sea, a distance of more than 1,500 miles (2,400 km). Royal messengers, who, according to the Greek historian Herodotus, were stopped by "neither snow, nor rain, nor heat, nor gloom of night," traversed the entire road in nine days, thanks to a system of relays. Normal travel time was about three months. Alexander the Great made use of the Royal Road in his invasion and conquest of the Persian Empire.

Persian Wars: *see* Greco-Persian Wars.

Persian wheel (in irrigation): *see* sakia.

Persichetti, Vincent (b. June 6, 1915, Philadelphia—d. Aug. 14, 1987, Philadelphia), American composer noted for his succinct polyphonic style (based on interwoven melodic lines), forceful rhythms, and generally diatonic (moving stepwise; not atonal or highly chromatic) melodies.



Persichetti

By courtesy of the Juilliard School, New York; photograph, Clarence E. Premo

Persichetti began piano lessons at the age of 5, studied theory at 8, and produced his first two works at 14. Among his later teachers were the composer Roy Harris and the conductor Fritz Reiner, the latter at the Curtis Institute in Philadelphia. In 1942 Persichetti began teaching at the Philadelphia Conservatory, and from 1947 he taught at the Juilliard School in New York City. He also was music editor for the Elkan-Vogel Company in Philadelphia.

Among his many published works are several for band and various chamber combinations and the highly regarded *Piano Quintet* (1955). He also wrote nine symphonies and many piano concerti, as well as songs, solo sonatas (including one for harpsichord), ballet music, and a large group of serenades. Skilled in the composition of simple, elegant pieces as well as more complex and virtuosic works, Persichetti was credited with having produced a distinctive blend of Classical, Romantic, and Modernist elements.

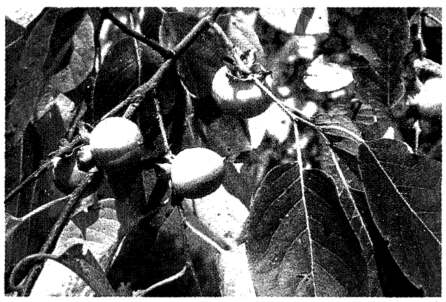
He wrote the book *Twentieth-Century Harmony: Creative Aspects and Practice* (1961).

Persigny, Jean-Gilbert-Victor Fialin, duc de (duke of) (b. Jan. 11, 1808, Saint-Germain-Lespinasse, Fr.—d. Jan. 12, 1872, Nice), French statesman, an ardent Bonapartist, who helped pave the way for Louis-Napoléon's rise to power as the emperor Napoleon III.

Of a petty noble family, he served in the hussars from 1825 to 1831, when he was dismissed for participation in a political rebellion. Thereafter he devoted himself to the restoration of the empire and to the cause of Louis-Napoléon Bonaparte: he played an active part in the latter's attempted coups in 1836 and 1840 and in his eventual election to the presidency in 1848. He was then appointed aide-de-camp to Louis-Napoléon and was simultaneously deputy for Loire (1849–51), enjoying an important backstairs influence.

As minister of the interior (1852–54) he accelerated the proclamation of the empire and worked energetically to organize a Bonapartist party; as French ambassador in London (1855–58 and 1859–60) he sought to strengthen Anglo-French relations. He was minister of the interior again (1860–63), but his conduct at the elections in 1863 gave rise to criticism, and he was dismissed. Napoleon III gave him the ducal title (1863) and was grateful to him but now looked upon his views as being too extreme and disregarded the advice that Persigny, frustrated by inactivity, continued to send. Gradually their relations deteriorated, particularly as Persigny and the empress Eugénie were bitter enemies. Persigny's *Mémoires* appeared in 1896.

persimmon, tree of the genus *Diospyros* (family Ebenaceae) and its globular, edible fruit. The Oriental persimmon (*D. kaki*), an important and extensively grown fruit in China and Japan, where it is known as *kaki,* was introduced into France and other Mediterranean



American persimmon (*Diospyros virginiana*)
H.R. Hungerford

countries in the 19th century and grown to a limited extent there. Introduced into the United States a little later, it is now grown commercially on a small scale in California and in the Gulf states, mainly in home gardens. The fruit, 5 to 8 cm (2 to 3 inches) or more in diameter, yellow to red in colour, somewhat resembles a tomato in appearance and contains vitamin A, with lesser amounts of vitamin C. Except for such varieties as Fuyu, the fruit tends to be highly astringent until soft-ripe or, as in Japan, until treated with certain gases. The trees will tolerate temperatures to about −18° C (0° F).

The native American persimmon (*D. virginiana*) is a small tree, occasionally up to 10 m (33 feet) in height, and grows from the Gulf states north to central Pennsylvania and central Illinois. The fruit is 3 to 5 cm (1 to 2 inches) in diameter, usually rather flattened, and dark red to maroon in colour. Most fruits contain several rather large, flattened seeds. It is generally considered more flavourful in its softened state than the Oriental species. Considerable quantities are gathered from the wild. A number of superior kinds have been named and propagated to a limited extent but are not grown commercially. Persimmons are eaten fresh as a dessert fruit, often with sugar or liqueur, stewed, or cooked as jam.

Persis, Persian PARSA, ancient country in the southwestern part of Iran, roughly coextensive with the modern *ostān* (province) of Fārs. Its name was derived from the Iranian tribe of the Parsua (Parsuash; Parsumash; Persians), who settled there in the 7th century BC. Herodotus lists the leading Persian tribes as the Pasargadae, to which the Achaemenians, the royal family of Persia, belonged; the Maraphii; and the Maspii. It was these three that Cyrus II the Great assembled to approve his plans for his revolt against Astyages, his Median overlord, in 550 BC.

The inhabitants of Persis were considered to be the rulers of the Achaemenian Empire and were exempt from taxation. As the homeland of the Achaemenian dynasty, Persis was closely associated with the monarchy. Cyrus built his capital at Pasargadae, and about 30 miles (48 km) to the southwest Darius I founded his new capital of Parsa, known to the Greeks as Persepolis, the Persian City.

The history of Persis after the fall of the Achaemenian Empire in 330 BC is obscure. Lying apart from the main strategic and economic highways of Iran, it preserved its ancient culture, language, and religion under the Seleucids and enjoyed considerable autonomy during the Parthian period. In the 3rd century AD its rulers, heirs of the Achaemenian tradition, founded the Sāsānian Empire.

Persius, in full AULUS PERSIUS FLACCUS (b. AD 34, Volaterrae [now in Italy]—d. 62, Campania), Stoic poet whose Latin satires reached a higher moral tone than those of other classical Latin poets (excepting Juvenal).

A pupil and friend of the Stoic philosopher Lucius Annaeus Cornutus and a fellow student of the poet Lucan, who admired all he wrote, Persius discovered his vocation as a satirist through reading the 10th book of Lucilius. He wrote painstakingly, and his book of satires was still incomplete at his premature death. The book, edited by his friends Cornutus and Caesius Bassus, was an immediate success. The six satires, amounting to 650 lines, are in hexameters; but what appears as a prologue, in which Persius (an extremely wealthy man) ironically asserts that he writes to earn his bread, not because he is inspired, is in choliambics. The first satire censures literary tastes of the day, reflecting the decadence of national morals. The remaining books are philosophical discussions on themes often treated by Seneca, such as what may rightly be asked of the gods, the necessity of self-knowledge for public men, and the Stoic doctrine of freedom.

Persius is said to have been gentle in disposition, girlishly modest, good-looking, and devoted to his mother, sister, and aunt. To his mother and sister he left a considerable fortune.

persona, in literature, the person who is understood to be speaking (or thinking or writing) a particular work. The persona is almost invariably distinct from the author; it is the voice chosen by the author for a particular artistic purpose. The persona may be a character in the work in question or merely an unnamed narrator; but, insofar as the manner and style of expression in the work exhibit taste, prejudice, emotion, or other characteristics of a human personality, the work may be said to be in the voice of a persona.

The term derives from the Latin *persona,* meaning an actor's mask, and is thus etymologically related to the term *dramatis personae,* designating the characters in a drama.

persona, in psychology, the personality that an individual projects to others, as differentiated from the authentic self. The term, coined by Carl Jung, is derived from the Latin *persona,* referring to the masks worn by Etruscan mimes. According to Jung, the persona enables an individual to interrelate with the world around him by reflecting the role in life that the individual is playing. In this way one can arrive at a compromise between one's innate psychological constitution and society. Thus the persona enables the individual to adapt to society's demands.

personal income tax, a tax imposed by public authorities on the incomes of individuals or family units. *See* income tax.

personal-liberty laws, pre-U.S. Civil War laws passed by Northern state governments to counteract the provisions of the Fugitive Slave Acts and to protect escaped slaves and free blacks settled in the North.

Contravening the Fugitive Slave Act of 1793, which did not provide for trial by jury, Indiana (1824) and Connecticut (1828) enacted laws making jury trials possible upon appeal. In 1840 Vermont and New York granted fugitives the right of jury trial and provided them with attorneys. After 1842, when the Supreme Court ruled that enforcement of the Fugitive Slave Act was a federal function, some Northern state governments passed laws forbidding state authorities to cooperate in the capture and return of fugitives. In the reaction to the Fugitive Slave Act contained in the Compromise of 1850, most Northern states provided further guarantees of jury trial, authorized severe punishment for illegal seizure and perjury against alleged fugitives, and forbade state authorities to recognize claims to fugitives. These laws were among the many assaults on states' rights cited as a justification for secession by South Carolina in 1860.

personal property (law): *see* real and personal property.

personalism, a school of philosophy, usually idealist, which asserts that the real is the personal, *i.e.,* that the basic features of personality—consciousness, free self-determination, directedness toward ends, self-identity through time, and value retentiveness—make it the pattern of all reality. In the theistic form that it has often assumed, personalism has sometimes become specifically Christian, holding that not merely the person but the highest individual instance of personhood—Jesus Christ—is the pattern.

Personalism is thus in the tradition of the *cogito, ergo sum* ("I think, therefore I am") of René Descartes in holding that, in the subjective flow of lived-through experience, one makes more direct soundings of the real than in anything arriving through the tortuous paths of perceptual processes. The word *person* comes from the Latin *persona,* which referred to the mask worn by an actor and thus to his role. Eventually, it came to mean the dignity of a man among men. The person is thus supreme both in reality (as substance) and in value (as dignity).

There are various kinds of personalism. Though most personalists are idealists, believing that reality is either of, in, or for consciousness, there are also realistic personalists, who hold that the natural order, though created by God, is not as such spiritual; and, again, though most personalists are theists, there are also atheistic personalists. Among the idealists there are absolutistic personalists (*see* absolute idealism), panpsychistic personalists (*see* panpsychism), ethical personalists, and personal idealists, for whom reality comprises a society of finite persons or an ultimate person, God.

Though elements of personalistic thought can be discerned in many of the greatest philosophers of the Western tradition and even in the Orient—as, for example, in Rāmānuja, a 12th-century Hindu theist—Gottfried Wilhelm Leibniz, a famous 17th–18th-century German philosopher and mathematician, is usually singled out as the founder of the movement and George Berkeley, the 18th-century Anglo-Irish churchman and epistemologist, as another of its seminal sources.

Personalism has been strongly represented in France, usually under the name of spiritualism. Inspired by Maine de Biran, an 18th–19th-century thinker who had taken as primordial the inner experience of acting against a resisting world, Félix Ravaisson-Mollien, a 19th-century philosopher and archaeologist, drew a radical distinction between the spatial world of static necessary law and the world of living individuals, spontaneous, active, and developing. This led in turn to the personalism of Henri Bergson, a 19th–20th-century intuitionist, who stressed duration as a nonspatial experience in which subjective states both present and past intimately interpenetrate to form the free life of the spiritual person and who posited the élan vital as a cosmic force expressing this life philosophy.

Personalism in the United States matured among 19th–20th-century philosophers of religion, often of the Methodist Church, several of whom had studied in Germany under Rudolf Hermann Lotze, an erudite metaphysician and graduate in medicine. George Holmes Howison, for example, stressed the autonomy of the free moral person to the point of making him uncreated and eternal and hence free from an infinite person. Borden Parker Bowne, who made Boston University the citadel of personalism, was explicitly theistic, holding that men are creatures of God with many dimensions—moral, religious, emotional, logical—each worthy of consideration in its own right and each reflecting the rationality of the creator. Nature, too, for him, displays the energy and rational purpose of a God who is immanent in it as well as transcendent over it.

Through Bowne's disciples Edgar Brightman and Ralph Tyler Flewelling and many others, personalism was influential through the mid-20th century, and its impact upon existentialism and phenomenology has perpetuated its spirit and many of its insights.

personalismo, in Latin America, the practice of glorifying a single leader, with the resulting subordination of the interests of political parties and ideologies and of constitutional government.

Latin-American political parties have often been constituted by the personal following of a leader rather than by adherents of certain political beliefs or proponents of certain issues. Thus the popular term for such parties or their members has been often derived from their leaders—*e.g.,* Peronistas (the followers of Juan Perón, Argentine president in 1946–55, 1973–74) or Fidelistas (the followers of Fidel Castro, Cuban leader who came to power in 1959). The archetypical demagogue and focus of *personalismo* in Mexico was General Antonio López de Santa Anna, who dominated Mexican political life between 1821 and 1855. The Dominican Republic and Ecuador in particular have suffered from *personalismo,* but the phenomenon has been rather pervasive throughout Latin-American history.

Personalismo is related to the phenomenon in Latin America called *caudillismo,* by which a government is controlled by dictatorial leaders (caudillos). During and immediately after the Latin-American independence movement in the early 19th century, politically unstable conditions led to the widespread emergence of such leaders; thus the period is often referred to as the "age of the caudillos." The flamboyant leader of the independence movement, Simón Bolívar, was the first such ruler (of Gran Colombia, his ephemeral political creation). Although some nations, such as Argentina and Chile, developed more regular forms of constitutional government in the latter 19th century, *caudillismo* remained into the 20th century a common feature of Latin-American states and prevailed in such countries as Argentina, during Perón's regime—as a form of political bossism—and in others as outright and brutal military dictatorship, as with the regime of Juan Vicente Gómez in Venezuela (ruled 1908–35). The latter was a ruler in the Venezuelan tradition, following the pattern of such dictators as José Antonio Páez, who controlled the country in 1830–46 and again in 1860–63. Among other well-known caudillos of the 19th century were Juan Manuel de Rosas of Argentina, Francisco Solano López of Paraguay, and Andrés Santa Cruz of Bolivia. In such countries as Argentina and Mexico, during periods of weak central government, regional caudillos operated in their own localities in much the same way as did those on a national scale.

personality, the characteristic way in which a particular individual thinks, feels, and behaves. Personality embraces a person's moods, attitudes, and opinions and is most clearly expressed in his interactions with other people. Personality is those behavioral characteristics, both inherent and acquired, that distinguish each individual and are observable in his relations to the environment and to the social group.

A brief treatment of personality and its measurement follows. For full treatment, *see* MACROPAEDIA: Personality.

Personality theories. Theories of personality have been offered in an attempt to understand how a given person is similar to others, how he is different, and what organizes a particular set of similarities and differences into an overall pattern. The ancient Greeks used their ideas about physiology to account for differences and similarities in temperament. They believed emotional and physical health depended on a balance of four fluids, called humours. Each humour was identified with a personality trait: blood with enthusiasm, black bile with melancholy, yellow bile (choler) with anger, and phlegm with apathy. Each mood or disposition was seen as a result of a combination of these fluids.

In the 20th century, the German psychiatrist Ernst Kretschmer developed a personality-classification scheme based on three basic bodily structures (somatotypes) and their accompanying psychological characteristics. However, this and other "constitutional" theories of personality have been found to have only limited validity, if any at all.

The most influential personality theory of the modern era has been Sigmund Freud's psychoanalytic one. Freud concentrated on understanding the forces at work in a personality and the internal structures which channel and direct them. In Freud's view, the human personality has three components: the id, the ego, and the superego. The id is the original structure of the personality and contains primitive, inherited drives or instincts; these biologically mediated factors supply the driving force, or psychic energy, to the personality through the id. The id is associated with the inborn tendency of a person to satisfy his drives and thus release tension, or, in other words, to achieve pleasure and avoid pain. In infancy and childhood the ego develops from the id so that the individual can interact realistically with the objective world in his quest to satisfy his instinctual needs. The ego controls the higher intellectual, logical, and perceptual functions involved in the control of behaviour. The chief expression of the ego is realistic, logical thinking. The superego was theorized by Freud to represent the person's adoption of social and moral values. The conscience is part of the superego. Freud theorized that the overall orientation of the human personality is directed toward satisfying a person's inborn drives or instincts. The individual personality structure develops out of the struggle between drives (which originate in the id) and the processes to control and at the same time satisfy these drives (which processes are centred in the ego).

Freud's psychoanalytic concepts have had a profound influence on personality theory in the 20th century. He turned scientific attention from mere descriptions of personality "types" to an interest in how people become what they are. Psychoanalysis was especially influential in its insistence that personality is affected by both biological and psychosocial forces that operate principally within the family, and in its claim that the major foundations of individual personality are laid early in life. Psychoanalytic theory has provided a workable preliminary framework for much personality research involving motivations and development.

Those of Freud's followers who broke away to found psychotherapeutic schools of their own failed to develop followings comparable to Freud's. Like Freud, Carl Jung (*q.v.*) emphasized unconscious motives. He separated himself from Freud's emphasis on sexuality, however, and formulated a typal theory that distinguished people according to whether they were extroverted (outward-looking) or introverted (inward-looking). Jung also posited a storehouse of inherited racial memories called the "collective unconscious." An individual personality is a persona (mask) drawn from this repository. For Alfred Adler (*q.v.*), the motive force of personality was a "drive to power" which led individuals to compensate for feelings of inferiority. Freud's personality theories were further refined by Erik H. Erikson (*q.v.*), who integrated biological, psychological, and social factors into a comprehensive theory of personality development and change covering the full span of the human lifetime.

Contemporary personality studies generally tend to be empirical and based on experiments and, perforce, have a narrower scope than the sweeping theories of psychoanalysis. One major area of study is personality traits; traits refer to persistent (though not unvarying) behaviours or behaviour patterns that imply a disposition to respond in a particular, predictable way. Pyschological traits are more or less stable over time and across different situations, and they contribute much to the consistency of a person's behaviour. Traits are the product of both genetic predisposition and experience.

There is considerable evidence to suggest that personality is actively shaped by external influences, chiefly the other members of one's family and the larger sociocultural context common to all members of a family. But there has also been an accumulation of experimental evidence suggesting that genetic factors play a prominent role in the formation of personality. Systematic observations of human infants have shown clearly observable differences in their activity, passivity, fussiness, cuddliness, and responsiveness. It appears that these patterns, which can be considered expressions of personality, are at least partially genetically determined. In general, evidence is emerging that personality traits such as sociability, impulsiveness, altruism, aggression, and truthfulness have at least some inherited biological basis.

Measurement. Contemporary academic investigation of personality makes little attempt to sustain a consistent, generally applicable view of personality, preferring an eclectic use of existing theories to assemble masses of heterogenous data, which are then scrutinized for patterns. The measurement or assessment of personality is an attempt to define human characteristics, measure them objectively, and relate them to social behaviour. Following the example of intelligence testing, tests have been devised that allow for the measurement of specific "factors" of the personality such as sociability or introversion, which can be viewed as dimensions of traits. Despite the problems which have plagued this approach, the intellectual inclination it embodies—its attention to empirical, quantitative data collection and distrust of general-theory building—appears well-rooted.

The most common techniques for measuring and assessing personality are interviews, behavioral observation, and personality tests.

In an interview the individual under assessment "tells his story" to the interviewer and answers questions about himself. In clinical (diagnostic) interviews the aim is not only to collect information about a person but to be able to use it toward making an appropriate referral or designing a psychotherapeutic program for that individual. Shortcomings to the interview technique include interviewer bias and changed subject behaviour to match the perceived expectations of the interviewer.

Behavioral observation techniques attempt to assess the individual's behaviour without the distorting lenses of one's self-image and experimenter expectation. An individual may be observed in a natural or simulated setting and the frequency of a certain behaviour noted. The collection of biographical information from indirect sources such as medical records or relatives may also be useful for personality assessment.

Personality tests tend to be of two main types, personality inventories and projective tests. Personality inventories usually consist of a large number of questions to which the subject must respond true or false—*e.g.,* "I am afraid to be alone," "I consider myself a happy person." Such tests are easy to administer and score, produce objective results, and allow the comparison of profiles from individual to individual. Probably the most widely used test of this type is the Minnesota Multiphasic Personality Inventory. The respondent receives a score for each of nine clinical subscales, for instance, depression, schizophrenia, and paranoia. The higher the score on any of the scales, the more likely the person is to have that mental disorder. Another well-known personality inventory is the California Psychological Inventory.

Projective tests present the examinee with an ambiguous stimulus and ask him to comment on it. Such tests are called projective because the subject is thought to project his personality onto the stimulus. One of the more well known of these is the Rorschach test, in which a person must make verbal associations to a series of 10 inkblots. The subject's responses are scored according to location of the percept (association) in the inkblot; the kind of stimulus characteristic (*e.g.,* form or colour) emphasized; content of the percept; perception of movement; and number of percepts. Another is the Thematic Apperception Test, which requires the subject to invent and tell a story about a series of ambiguous drawings that are shown to him. *See also* developmental psychology; humanistic psychology.

personality disorder, also called CHARACTER DISORDER, mental disorder that is marked by deeply ingrained and lasting patterns of inflexible, maladaptive, or antisocial behaviour. A personality disorder is an accentuation of one or more personality traits to the point that the trait significantly impairs an individual's social or occupational functioning. Personality disorders are not, strictly speaking, illnesses, since they need not involve the disruption of emotional, intellectual, or perceptual functioning. In many cases, an individual with a personality disorder does not seek psychiatric treatment for such unless he is pressured to by his relations or by a court.

There are many different types of personality disorders; they are classified according to the particular personality traits that are accentuated. Persons who have a paranoid personality disorder show a pervasive and unjustified mistrust and suspiciousness of others. They may be secretive or aggressive and are excessively sensitive to implied slights or criticism. Persons with schizoid personality disorder appear aloof, withdrawn, unresponsive, humourless, and dull and are solitary to an abnormal degree. Persons with explosive personality disorder exhibit extreme emotional instability characterized by explosive outbursts of rage upon minor provocation. Persons with histrionic personality disorder persistently display overly dramatic, highly excitable, and intensely expressed behaviour, *i.e.,* histrionics. Persons with dependent personality disorder lack energy and initiative and passively let others assume responsibility for major aspects of their lives. Persons with passive-aggressive personality disorder express their hostility through such indirect means as stubbornness, procrastination, inefficiency, and forgetfulness.

One of the most important disorders is the antisocial, sociopathic, or psychopathic personality disorder. This disorder is chiefly characterized by a personal history of chronic and continuous antisocial behaviour in which the rights of others are violated. Poor or nonexistent job performance is another major indicator. Persons with antisocial personality disorder make up a significant portion of the criminal and delinquent elements of society. Besides persistent criminality, the symptoms may also include sexual promiscuity or sexual aggression and drug addiction or alcoholism. Sociopaths generally accept their behaviour as natural, feel no guilt when they hurt others, see little reason for or possibility of change, and resist therapy.

The causes of personality disorders are unknown, though there is undoubtedly a hereditary element involved. Personality traits are, by definition, virtually permanent, and so personality disorders are only partially amenable to treatment, if at all. The most effective treatment combines various behavioral and psychotherapeutic therapies. Medication may be helpful in alleviating periodic anxiety, depression, emotional instability, or paranoid tendencies in some cases.

personification, figure of speech in which human characteristics are attributed to an abstract quality, animal, or inanimate object. An example is "The Moon doth with delight / Look round her when the heavens are bare" (Wordsworth, "Ode: Intimations of Immortality from Recollections of Early Childhood," 1807). Personification has been used in European poetry since Homer and is particularly common in allegory; for example, the medieval morality play *Everyman* (*c.* 1500) and the Christian prose allegory *Pilgrim's Progress* (1678) by John Bunyan contain characters such as Death, Fellowship, Knowledge, Giant Despair, Sloth, Hypocrisy, and Piety. Personification became almost an automatic mannerism in 18th-century Neoclassical poetry, as exemplified by these lines from Thomas Gray's "Elegy Written in a Country Church Yard":

> Here rests his head upon the lap of earth
> A youth to Fortune and to Fame unknown:
> Fair science frowned not on his humble birth,
> And Melancholy marked him for her own.

personnel administration, the management of the people in working organizations. It is also frequently called personnel management, industrial relations, employee relations, and manpower management. It represents a major subsystem in the general management system, in which it refers to the management of human resources, as distinguished from financial or material resources. The term may be used to refer to selected specific functions or activities assigned to specialized personnel officers or departments. It is also used to identify the entire scope of management policies and programs in the recruitment, allocation, leadership, and direction of manpower.

Personnel administration begins with the definition of the required quantities of particular personal capabilities. Thereafter, people must be found, recruited, selected, trained or retrained, negotiated with, counseled, led, directed, committed, rewarded, transferred, promoted, and finally released or retired. In many of these relations, managers deal with their associates as individuals (the field takes its name in part from this type of relationship). In some working organizations, however, employees are represented by unions, and managers bargain with these associations. Such collective-bargaining relationships are generally described as labour relations.

Current practice shows wide variation in the range of responsibilities assigned to personnel or industrial-relations departments. Major areas of personnel department responsibilities include: (1) organizing—devising and revising organizational structures of authority and functional responsibility and facilitating two-way, reciprocal, vertical, and horizontal communication; (2) planning—forecasting personnel requirements in terms of numbers and special qualifications, scheduling inputs, and anticipating the need for appropriate managerial policies and programs; (3) staffing, or manning—analyzing jobs, developing job descriptions and specifications, appraising and maintaining an inventory of available capabilities, recruiting, selecting, placing, transferring, demoting, promoting, and thus assuring qualified manpower when and where it is needed; (4) training and development—assisting team members in their continuing personal growth, from pre-employment, preparatory job training to executive development programs; (5) collective bargaining—negotiating agreements and following through in day-to-day administration; (6) rewarding—providing financial and nonfinancial incentives for individual commitment and contribution; (7) general administration—developing appropriate styles and patterns of leadership throughout the organization; (8) audit, review, and research—evaluating current performance and procedures in order to facilitate control and improve future practice.

Individual personnel departments may be assigned varying degrees of responsibility in a few, many, or all of these areas. In areas assigned to them, personnel departments exercise various levels of authority. Some officers and departments create policies and make major decisions and determinations. Some study and recommend policies and create and direct appropriate programs. The personnel vice president may be a member of the executive cabinet; he may be expected to assume leadership in and responsibility for all manpower management policy and programs. Other personnel departments are essentially "staff" or advisory; their activities are restricted to recommending, consulting, and providing such specified technical and professional services as are requested by operating managers. Among the most common examples, the personnel staff (when, as, and if requested and authorized by operating managers) analyzes jobs and prepares job specifications, visits sources of potential employees, conducts preliminary screening interviews, administers tests, supervises rating or appraisal programs, counsels employees, conducts training and development programs, negotiates agreements, monitors grievance settlements, maintains safety and accident control programs, administers employee benefits and services, prepares forecasts of future manpower requirements, recommends changes in organizational structures, supervises formal in-house communication, conducts employee attitude and morale surveys, and supplies other related services, sometimes including public relations.

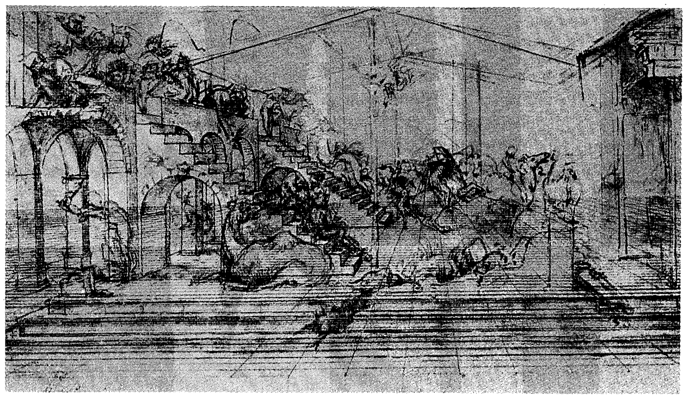
Persons, Robert: *see* Parsons, Robert.

perspective, method of graphically depicting three-dimensional objects and spatial relationships on a two-dimensional plane or on a plane that is shallower than the original (for example, in flat relief). Perceptual methods of representing space and volume, which render them as seen at a particular time and from a fixed position and which are characteristic of Chinese and most Western painting since the Renaissance, are in contrast to conceptual methods. The pictures of young children and primitives (untrained artists), many of the paintings of cultures such as ancient Egypt and Crete, India, Islām, and pre-Renaissance Europe, as well as the paintings of many modern artists, depict objects and surroundings independently of one another, as they are known to be rather than as they are seen to be, and from the views that best present their most characteristic features; in many Egyptian and Cretan paintings, for example, the head and legs of a figure are shown in profile, while the eye and torso are shown frontally. This system produces not the illusion of depth but the sense that objects and their surroundings have been compressed within a shallow space behind the picture plane.

In Western art, illusions of perceptual volume and space are generally created by use of the linear perspectival system, based on the observations that objects appear to the eye to shrink and parallel lines and planes to converge to infinitely distant vanishing points as they recede in space from the viewer. Parallel lines in spatial recession will appear to converge on a single vanishing point, called one-point perspective. Perceptual space and volume may be simulated on the picture plane by variations on this basic principle, differing according to the number and location of the vanishing points. Instead of one-point (or central) perspective, the artist may use, for instance, angular (or oblique) perspective, which employs two vanishing points.

Another kind of system—parallel perspective combined with a viewpoint from above—is traditional in Chinese painting. When buildings rather than natural contours are painted and it is necessary to show the parallel horizontal lines of the construction, parallel lines are drawn parallel instead of converging, as in linear perspective. Often foliage is used to crop these lines before they extend far enough to cause a building to appear warped.

The early European artist used a perspective that was an individual interpretation of what he saw rather than a fixed mechanical method. At the beginning of the Italian Renaissance, early in the 15th century, the mathematical laws of perspective were discovered by the architect Filippo Brunelleschi, who worked out some of the fundamental principles, including the concept of the vanishing point, which had been known to the Greeks and Romans but had been lost. These principles were applied in painting by Masaccio (for example, in his "Trinity" fresco in Sta. Maria Novella, Florence; *c.* 1427), who within a short period brought about an entirely new approach in painting. A style was soon developed using configurations of architectural exteriors and interiors as the background for religious paintings, which thereby acquired the illusion of great spatial depth. In his seminal *Della pittura* (1436; *On Painting*, 1956), Leon Battista Alberti codified, especially for painters, much of the practical work on the subject that had been carried out by earlier artists; he formulated, for example, the idea that "vision makes a triangle, and from this it is clear that a very distant quantity seems no larger than a point."



Linear perspective study for "The Adoration of the Magi," silverpoint, pen, and bistre heightened with white on prepared ground by Leonardo da Vinci, *c.* 1481; in the Uffizi, Florence
Alinari—Art Resource/EB Inc.

Linear perspective dominated Western painting until the end of the 19th century, when Paul Cézanne flattened the conventional Renaissance picture space. Linear perspective also plays an important part in presentations of ideas for works by architects, engineers, landscape architects, and industrial designers, furnishing an opportunity to view the finished product before it is begun. Differing in principle from linear perspective and used by both Chinese and European painters, aerial perspective (*q.v.*) is a method of creating the illusion of depth by a modulation of colour and tone.

perspective scenery, in theatre, scenery and the scene design technique that represents 3-dimensional space on a flat surface, so as to create an illusion of reality and an impression of distance. Developed during the Italian Renaissance by Baldassarre Peruzzi and his student Sebastiano Serlio, perspective scenery applied the newly mastered science of optical perspective and brought the craft of illusion to the Italian stage. An initial motivation may have been to allow theatre to move from outdoors into closed rooms, where perspective painting could make small spaces appear larger.

Influenced by the perspective painting of Renaissance artists, particularly Florentine artist Filippo Brunelleschi, who formalized principles of perspective, and by the 15th-century revival of Vitruvius' writings on architecture, Peruzzi applied the laws of perspective to scene design. His work provided a basis for Sebastiano Serlio's *De Archittetura* (1545), which outlined methods of constructing perspective scenery and the raked, or angled, stage—from which the terms upstage and downstage derive. Angle perspective, which created an illusory, offstage vanishing point where painted vistas disappeared, was an 18th-century refinement of the Renaissance techniques of perspective scenery.

Perspex (acrylic plastic): *see* Lucite.

perspiration, in most mammals, water given off by the intact skin, either as vapour by simple evaporation from the epidermis (insensible perspiration) or as sweat, a form of cooling in which liquid actively secreted from sweat glands (*q.v.*) evaporates from the body surface. Sweat glands, although found in the majority of mammals, constitute the primary means of heat dissipation only in certain hoofed animals (orders Artiodactyla and Perissodactyla) and in primates, including man. Their secretion is largely water (usually about 99 percent), with small amounts of dissolved salts and amino acids.

When the body temperature rises, the sympathetic nervous system stimulates the eccrine sweat glands to secrete water to the skin surface, where it cools the body by evaporation. Thus, eccrine sweat is an important mechanism for temperature control. In extreme conditions, human beings may excrete several litres of such sweat in an hour.

Human eccrine sweat is essentially a dilute sodium chloride solution with trace amounts of other plasma electrolytes. In some cases a reddish pigment may also be present. In a person unused to heavy sweating, the loss of sodium chloride during a period of heavy labour or high temperatures may be great (*see* sodium deficiency), but the efficiency of the gland increases with use, and in acclimatized persons the salt loss is decreased.

The apocrine sweat glands, associated with the presence of hair in human beings (as on the scalp, the armpit, and the genital region), continuously secrete a concentrated fatty sweat into the gland tube. Emotional stress stimulates contraction of the gland, expelling its contents. Skin bacteria break down the fats into unsaturated fatty acids that possess a pungent odour.

persuasion, the process by which a person's attitudes or behaviour are, without duress, influenced by communications from other people. One's attitudes and behaviour are affected by other factors (for example, verbal threats, physical coercion, one's physiological states). Not all communication is intended to be persuasive; some of it has such purposes as informing or entertaining. Persuasion often involves manipulating other people, and for this reason many find the exercise distasteful. Others might argue that without some degree of social control and mutual accommodation, the human community becomes disordered and that persuasion indeed gains moral accept-ability when the alternatives are considered. To paraphrase Winston Churchill's evaluation of democracy as a form of government, persuasion is the worst method of social control except for all the others.

In European universities of the Middle Ages, persuasion was one of the basic liberal arts to be mastered by any educated man; and, from the days of imperial Rome through the Reformation, it was raised to a fine art by preachers who used the spoken word to move men to virtue and the Holy Land. In the modern era, persuasion, in the form of advertising, supports a major industry; only education and the military command a greater share of the gross national product.

The process of persuasion can be conveniently analyzed in a preliminary way by distinguishing verbal communication (as cause, or stimulus) from the associated changes in attitudes (as effect, or response).

Analysis has led to the delineation of a series of successive steps that a person undergoes in being persuaded. The communication first is presented; the person pays attention to it, and he comprehends its contents (including the basic conclusion being urged and perhaps also the evidence offered in its support). For persuasion to be effected, the individual must yield to, or agree with, the point being urged; and, unless only the most immediate impact is of interest, he must retain this new position until opportunity arises to act on it. Finally, if the fruits of the persuasive process are to be reaped, he must carry out the behaviour implied by his new attitudinal position; *e.g.*, he enlists in the army or becomes a Buddhist monk or begins to eat cornflakes for breakfast.

Some, but by no means all, theorists emphasize a similarity between education and persuasion. They hold that persuasion closely resembles the learning of new information through informative communication. Thus, since repetition in communication will modify learning, they infer that it will have persuasive impact as well; that, for example, principles of verbal learning and conditioning are widely and profitably applied by persuaders (as in the judicious repetition of television advertisements). The learning approach tends to emphasize attention, comprehension, and retention of the message.

One's reaction to persuasive communication depends in part on the message and to a considerable extent on the way in which the receiver perceives or interprets it. Words in a newspaper advertisement may take on different persuasive qualities if they are printed in red instead of in black. Perceptual theorists regard persuasion as altering the person's perception of any object of his attitudes. Perceptual approaches also rest on evidence that the receiver's preconceptions are at least as important as the message content in determining what will be understood. The approach stresses attention and comprehension.

While learning and perceptual theorists may stress objective intellectual steps involved in the process of being persuaded, another, functional, approach emphasizes more subjective motivational aspects. It views humans as essentially ego-defensive—that is, as organisms with beliefs that function to satisfy conscious and unconscious personal needs and that may have little to do with the objects toward which those attitudes and actions are directed. Functional theorists say, for example, that ethnic prejudice and other forms of social hostility derive more from individual personality structure than from information about the nature of these groups.

Other theories view the person confronted with persuasive communication as being in the harassed role of trying to find some reasonable compromise among many conflicting forces acting on him—*e.g.*, his own desires, his information, and the social pressures put upon him, including this new communication. Those (frequently called congruity, balance, consistency, or dissonance theorists) who stress this conflict-resolution model focus on how people weigh these forces in adjusting their attitudes. Some theorists who take this point of departure stress the intellectual aspects of persuasion, while others emphasize emotional considerations.

Each of the approaches considered above tends to neglect one or more steps in the process of being persuaded and thus serves to supplement rather than supplant the others. Another, more eclectic and inclusive approach, growing out of information-processing theory, is oriented to a consideration of all of the options implied by the communication aspects of source, message, channel (or medium), receiver, and destination (behaviour to be influenced); and each option is appraised for its persuasive efficacy in terms of presentation, attention, comprehension, yielding, retention, and overt behaviour.

Perth, capital, Western Australia, situated on Melville and Perth waters, on the estuary of the Swan River, 12 miles (19 km) above its mouth, which forms the inner harbour of Fremantle. The city, fifth largest in the nation, is the centre of a metropolitan area in which about three-fourths of the state's population is concentrated. In the early 19th century, the British, suspicious of French and U.S. interest in the Australian west coast, decided to expand settlement and to claim the entire continent. In 1827 Captain (later Sir) James Stirling arrived to choose a townsite. The following year, Captain Sir Charles Fremantle took possession of the area, and in 1829 a colony, with private financial backing, was declared. It was named after the county of Perth in Scotland, birthplace of Sir George Murray, then secretary of state for the colonies. Proclaimed a city in 1856, it was linked to Adelaide (in South Australia) by telegraph in 1877 and received strong impetus for growth from the discovery (1890) of gold at Coolgardie-Kalgoorlie (374 miles [602 km] east), from the opening of an improved Fremantle harbour (1901), and from the completion of the transcontinental railway in 1917. It became a lord mayoralty in 1929.

Perth and the Swan River estuary, Western Australia
R. Archibald—Shostal/EB Inc.

Perth is a major industrial centre, with heavy industries concentrated in the suburban zones of Kwinana, Fremantle (*qq.v.*), and Welshpool. Diversified manufactures include paint, plaster, printed materials, sheet metal, cement, rubber, tractors, steel, aluminum, and nickel; there are also petroleum refineries and food-processing plants.

The city has a moderate climate for eight months of the year, but January and February are quite hot, and both June and July are cool and damp. The city is accessible via several highways, the transcontinental railway, the port of Fremantle, and the international airport. It was the site of the Commonwealth and Empire Games in 1962. Perth has Anglican and Roman Catholic cathedrals and two universities: the University of Western Australia (1911) and Murdoch University (1975). Many Italian immigrants live in northern Perth and in Fremantle. Pop. (1986) urban centre, 895,710; (1987 est.) Perth Statistical Division, 1,083,400.

Perth, town, seat of Lanark county, southeastern Ontario, Canada, on the Tay River, 45 miles (70 km) southwest of Ottawa. Named after the town in Scotland, it was founded in 1816 by Scottish immigrants who were later joined by British-Canadian veterans of the War of 1812. The town became an important commercial and administrative centre after the construction of the Tay Canal in the 1830s linked it with Montreal and Ottawa (via the Rideau Canal and Ottawa River). The canal is now used only by pleasure craft. Located in the centre of the Rideau Lakes region, Perth also serves as a summer resort. Inc. village, 1850. Pop. (1986) 5,673.

Perth, city, royal burgh, and seat of the administrative authority of Perth and Kinross district, Tayside region, Scotland, on the right bank of the River Tay. The name is probably Celtic. Following the conversion of the Britons to Christianity and the dedication of the first church to St. John the Baptist, Perth also became known as St. John's Town; both names were used until the 17th century.

Perth was well established by the 12th century, a burgh in 1106 and a royal burgh in 1210. Until about 1452 it served as the capital of Scotland and was therefore both a frequent royal residence and a centre of government. During the Scottish Wars of Independence, Perth was taken by Edward I of England, who strengthened its fortifications in 1298. It was retaken by Robert de Bruce in 1313 during the fourth of the town's seven sieges. The English held it again from 1335 to 1339. Perth was a Jacobite city during the Scottish uprisings of 1715 and 1745, and the insurgent James, the Old Pretender, was proclaimed king at its market cross.

Few buildings remain from this eventful past, apart from the Church of St. John the Baptist, which was built about 1440. The Salutation Hotel, built in 1699, is said to be the oldest hotel building in Scotland. The town's friaries have disappeared, as have the castle, palace, and fortress. Notable modern public buildings include St. Ninian's Episcopal Cathedral (1850–90) and Perth prison, originally erected in 1812 to house French prisoners of the Napoleonic Wars.

During the European Middle Ages, Perth was a significant river port at the head of the Tay estuary, but it gradually declined. Fertilizers are still imported in quantity, and seed

potatoes are exported. Perth has long been a centre for dyeing industries, whisky blending and distilling, and the manufacture of twine, jute, and glass. Although the city has always maintained a wide range of industries, it is primarily the centre for its agricultural hinterland. Its livestock sales are famous in Great Britain. Pop. (1981) 43,009.

Perth Amboy, city and port of entry, Middlesex county, central New Jersey, U.S., at the mouth of the Raritan River, on Raritan Bay at the southern end of Arthur Kill (channel), there bridged to Tottenville, Staten Island, N.Y. Settled in the late 17th century, it was the capital of the East Jersey colony from 1686 to 1702, and, after East and West Jersey were united to form New Jersey province, it served with Burlington from about 1738 to 1790 as the alternate provincial capital. The last royal governor of the colony was Benjamin Franklin's son William. Perth Amboy was occupied by the British in 1776–77 and was later evacuated when General George Washington seized northern New Jersey. Industry is now well diversified and includes oil refining, electrolytic copper refining, shipbuilding, and the manufacture of chemicals, paint, and ceramics. The city's original name, Amboy, is of Indian origin. Later, Perth was added in honour of an early proprietor, the Earl of Perth. Perth Amboy is usually regarded as the place where the first black person (Thomas Mundt Peterson) voted (March 31, 1870) in the United States. Inc. 1718. Pop. (1988 est.) 38,205.

Perth and Kinross, district, Tayside region, north-central Scotland; created by the reorganization of 1975, it includes the former county of Kinross and most of the former county of Perth. The district has an area of 2,021 square miles (5,235 square km). Perth is the seat of the district authority.

The Highland Boundary Fault runs across Perth from northeast to southwest, forming a rough boundary between lowland Perth in the southeast and The Grampians in the northwest. Highland Perth, a plateau about 3,000 feet (915 m) high, rises to Ben More (3,852 feet [1,174 m]), Ben Lawers (3,984 feet [1,214 m]), and Schiehallion (3,547 feet [1,081 m]); it is much dissected by intensely glaciated valleys often occupied by glacial ribbon lakes (*e.g.,* Lochs Rannock, Tummel, Tay, and Earn). Much of lowland Perth lies within the central valley of Scotland; it includes the Ochil and Sidlaw hills (1,500–2,000 feet [450 to 600 m]), and the vale of Strathmore, which forms a drift-covered, lowland corridor.

Perth's fertile lowlands produce good crops of wheat, sugar beets, and fodder, as well as high-quality seed potatoes. Fruits, particularly raspberries, are intensively cultivated on the low, fertile, riverine lands called carses. Sheep farming predominates on the hills and beef cattle on the foothills. The rivers and lochs abound with salmon and trout. The Forestry Commission controls large acreages of woodland, including Rannock Forest. There is a forestry school at Pitlochry. The Tummel-Garry Hydro-Electric Scheme of 10 power stations is the largest in Scotland; others include the Breadalbane and Lawers schemes.

Industries include widespread whisky distilling in Pitlochry, Aberfeldy, and Perth. Pop. (1987 est.) 123,607.

Perthes, Jacques Boucher (de Crèvecoeur) de (French archaeologist): *see* Boucher (de Crèvecoeur) de Perthes, Jacques.

perthite, any member of a class of alkali feldspars in which tiny crystals of sodium-rich feldspar (albite; $NaAlSi_3O_8$) are intimately intergrown with, but distinct from, tiny crystals of potassium-rich feldspar (orthoclase or, less commonly, microcline; $KAlSi_3O_8$). Slow cooling of a homogeneous, molten mixture of sodium and potassium feldspar induces instabilities and results in the separation of tiny crystals of the two phases. In perthite, they sometimes may be seen by the unaided eye; in microperthite, however, they are distinguishable only microscopically, and in cryptoperthite the crystals are so small that the separation can be detected only by X-ray diffraction. Perthite was originally thought to be a single mineral, described at a locality near Perth, Ontario, from which its name is derived.

Perthshire, also called PERTH, former county and historic region, north-central Scotland. It was bounded north by the counties of Inverness-shire and Aberdeenshire, east by Angus (formerly Forfarshire), and southeast by Clackmannanshire and Stirlingshire; and its area was 2,493 square miles (6,457 square km). Since the reorganization of 1975 the region that made up Perthshire lies mostly in Perth and Kinross district of Tayside (*q.v.*) region, with the remainder in Stirling district of Central region.

In AD 83 the Roman general Gnaeus Julius Agricola explored the lands beyond the Firth of Forth and in the following year penetrated to the Grampians. The growing lawlessness of the southern Picts and their frequent raids in the more settled country in the south later compelled the attention of the Roman emperor Severus. But though he led a strong army to the shores of the Moray Firth, he was unable to subdue the tribesmen. There were several Roman forts in the county, such as those at Bochastle, Dalginross, Bertha, Fendoch, and Gourdie, as well as a legionary fortress at Inchtuthil; along the Earn there were many signal stations.

When the Romans finally withdrew from Britain, the Picts established their capital first at Abernethy and then at Forteviot. Abernethy was the centre of the Celtic church after the conversion of the natives by St. Ninian, Palladius (deacon of the Roman church), and other missionaries in the 5th and 6th centuries. On the burning of Forteviot by the Norsemen in the 8th century, the seat of Pictish government was removed to Scone. In the latter half of the 9th century, Dunkeld—to which Kenneth I MacAlpin had brought some of the relics of St. Columba from Iona—became the scene of monastic activity.

The Danes periodically harried the land but suffered a crushing defeat at Luncarty in 961. In 1054 Macbeth was defeated at Dunsinane by Siward, Earl of Northumbria, who had invaded Scotland in the interest of his kinsman, Duncan's son, who, on the death of the usurper three years later, ascended the throne as Malcolm III. With Malcolm's accession the Celtic rule of the monarch of Scone came to an end. The royal burgh of Perth (*q.v.*) became the capital of Scotland at the beginning of the 12th century and remained the capital until 1452; from that time the history of the county is merged in that of the county town, with the exception of such isolated incidents as the removal of the coronation stone from Scone to Westminster in 1296, the defeat of Robert de Bruce at Methven in 1306, and the Battle of Dupplin Moor (*q.v.*) in 1332.

Doune Castle, belonging to Thomas Randolph, Earl of Moray, was built in the 14th century and was a royal palace. It was restored in 1883. Blair Castle, home of the Duke of Atholl, is in Scottish baronial style, with a 13th-century tower.

Among non-Roman archaeological remains are the hill fort on Dunsinane; the ship barrow of the Vikings at Rattray; weems (or earth houses) in the parishes of Monzie, Alyth, and Bendochy; standing stones near Pitlochry; and an extraordinary assemblage of sculptured stones now housed in the museum at Meigle.

Pertinax, Publius Helvius (b. Aug. 1, 126, Liguria [now in Italy]—d. March 28, 193), Roman emperor from January to March 193.

The son of a freed slave, Pertinax taught school, then entered the army, commanding units in Syria, in Britain, and on the Danube

Pertinax, detail of marble bust; in the Vatican Museum, Rome

Anderson—Mansell from Art Resource/EB Inc.

and the Rhine. He earned distinction during the great invasion by German tribes in 169. Given senatorial rank and command of a legion, he was soon promoted to the consular commands of Moesia, Dacia, and Syria, but under the emperor Commodus (reigned 180–192) he fell from favour, together with the future emperor Septimius Severus, during the ascendancy of the praetorian prefect Perennis. In the last years of Commodus' life, Pertinax became prefect of the city of Rome, while Severus commanded the armies of the upper Danube. When Commodus was murdered on Dec. 31, 192, the Senate met before dawn and proclaimed Pertinax (then senior marshal of the empire) emperor. He tried to enforce unpopular economies in both civilian and military expenditure and was murdered by a small group of soldiers after less than three months in power. When Severus became emperor later in the year, he decreed divine honours for the slain ruler and took the name Pertinax.

perturbation, in astronomy, deviation in the motion of a celestial object caused either by the gravitational force of a passing object or by a collision with it. For example, predicting the Earth's orbit around the Sun would be rather straightforward were it not for the slight perturbations in its orbital motion caused by the gravitational influence of the other planets. The search for a 10th planet continues because some astronomers believe that the known outer planets are being gravitationally perturbed by something beyond Pluto.

perturbation, in mathematics, method for solving a problem by comparing it with a similar one for which the solution is known. Usually the solution found in this way is only approximate.

Perturbation is used to find the roots of an algebraic equation that differs slightly from one for which the roots are known. Other examples occur in differential equations. In a physical situation, an unknown quantity is required to satisfy a given differential equation and certain auxiliary conditions that define the values of the unknown quantity at specified times or positions. If the equation or auxiliary conditions are varied slightly, the solution to the problem will also vary slightly.

The process of iteration is one way in which a solution of a perturbed equation can be obtained. Let D represent an operation, such as differentiation, performed on a function, and let $D + \varepsilon P$ represent a new operation differing slightly from the first, in which ε represents a small constant. Then, if f is a solution of the common type of problem $Df = cf$, in which c is a constant, the perturbed problem is that of determining a function g such that $(D + \varepsilon P)g = cg$. This last equation can also be written as $(D - c)g = -\varepsilon Pg$. Then the function g_1 that satisfies the equation $(D - c)g_1 = -\varepsilon Pf$ is called a first approximation to g. The function g_2 that satisfies the equation $(D - c)g_2 = -\varepsilon Pg_1$ is called a second approximation to g, and so on, with the nth approximation g_n satisfying $(D - c)g_n = -\varepsilon Pg_{n-1}$. If the sequence $g_1, g_2, g_3, \ldots, g_n, \ldots$ converges to a specific function, that function will be the required solution of the problem. The largest value of ε for which the sequence converges is called the radius of convergence of the solution.

Another perturbation method is to assume that there is a solution to the perturbed equation of the form $f + \varepsilon g_1 + \varepsilon^2 g_2 + \ldots$ etc., in which the $g_1, g_2, \ldots$ etc., are unknown, and then to substitute this series into the equation, resulting in a collection of equations to solve corresponding to each power of ε.

pertussis: *see* whooping cough.

Peru, officially REPUBLIC OF PERU, Spanish REPÚBLICA DEL PERÚ, third largest nation in South America, covering an area of 496,225 square miles (1,285,216 square km). Its capital is Lima. The country lies between latitudes 0° and 19° S (about 1,325 miles [2,132 km] from northwest to southeast) and longitudes 68° and 82° W (about 570 miles [917 km] at its widest extent from west to east); it is bounded on the northwest by Ecuador, on the northeast by Colombia, on the east by Brazil and Bolivia, on the south by Chile, and on the west by the Pacific Ocean. The population in 1990 was estimated at 22,332,000.

A brief summary of Peru follows. For full treatment, *see* MACROPAEDIA: Peru.

Peru

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. Peru can be divided into three geographical regions from west to east: the Costa (coast), the Sierra (highlands), and the Montaña, or *selva* (the vast, forested eastern plains). The Costa is a long narrow belt of arid lowlands, rising to about 1,500 feet (460 m) above sea level, and contains most of the chief cities of Peru. The Sierra consists of the Andean mountain ranges of the Cordillera Occidental ("western range"), Cordillera Central, and Cordillera Oriental ("eastern range"), which have average elevations of between 9,000 and 19,000 feet (2,750 and 5,800 m). Mount Huascarán (22,205 feet [6,768 m]), in the west-central part of the country, is the highest point in Peru. The Sierra region varies in width from about 60 miles (95 km) in the north to 200 miles (320 km) in the south. The Montaña is a humid lowland region less than 3,000 feet (915 m) above sea level and consists principally of the tropical rain forests of the Amazon basin. The Amazon's chief headstreams in Peru are the Marañón and Ucayali rivers. Lake Titicaca in the south, with an area of 3,200 square miles (8,288 square km), lies at an elevation of 12,500 feet (3,810 m) and is the world's highest navigable body of water. Peru is subject to considerable seismic activity; the last volcanic eruption was recorded in 1869, but earthquakes are more frequent.

The climatic regions of Peru are diverse and are defined by elevation or by the blockage of weather patterns by the Andes. Average annual temperatures vary from 66° to 72° F (19° to 22° C) on the coast, to 34° to 57° F (1° to 14° C) in the Andes, and to 75° to 95° F (24° to 35° C) in the eastern forests. Precipitation is heaviest in the east (75 to 125 inches [1,900 to 3,175 mm]) and very low (about 2 inches [50 mm]) in the arid western coasts. The snow line varies from 14,700 to 16,400 feet (4,480 to 5,000 m).

The western coastal region has sparse vegetation (cactus and algarroba); the vegetation of the Sierra consists of perennial shrubs, cacti, pepper trees, and tall grasses; and the Montaña is characterized by wild rubber, mahogany, cinchona, cocoa, vanilla, and curare trees and is the most densely vegetated region of Peru. Peru is famous for its camellike species—the llama, the alpaca, the wild vicuña, and the guanaco—all grazing animals of the highlands; in the Amazon basin are found the parrot, monkey, sloth, jaguar, capybara, and alligator. Piranha are found in the streams.

Peru has extraordinarily rich mineral resources, including gold, silver, copper, iron ore, phosphates, and manganese. The northern desert, the Amazon basin, and the narrow continental shelf have large petroleum and natural-gas deposits. Peru's exploitable hydroelectric potential is great.

The people. Quechua Indians are the largest ethnic group in Peru, encompassing almost half of the total population; mestizos and whites are the other major ethnic groups. There are minority populations of blacks and Asians (particularly Japanese). Both the Spanish and Quechua languages have official status; Aymara is spoken by a large segment of the Indian population. About 70 percent of the people speak Spanish. More than nine-tenths of the people are Roman Catholic.

The population density is moderate, and the large-scale migration to coastal urban areas has restricted the development of second- and third-order urban centres. Lima, the capital, has the largest population, followed by Arequipa and Callao. About 70 percent of the population is urban.

Two-fifths of Peru's population is younger than 15 years of age. The extraordinarily high birth rate maintained by Peru's young population applies great pressure on all of the nation's existing resources and reduces gains made in social or economic areas. In an effort to reduce this high population growth, measures were introduced in 1976 to bring greater numbers of women into the labour force. Both general and infant mortality rates are high, especially in rural areas. Life expectancy is a relatively low 58 years for men and 62 years for women.

The economy. Peru has a developing mixed economy largely based on manufacturing, services, agriculture, and mining. The petroleum industry and most other industries were nationalized between the late 1960s and early 1970s, and the government's insistence that workers participate in management has discouraged investment by foreign firms. Unemployment and underemployment are widespread. The gross national product (GNP) has not grown as rapidly as the population, and the GNP per capita is about average for a developing country.

Agriculture accounts for approximately one-tenth of the GNP and employs more than one-third of the work force. Subsistence farming predominates in the Andes mountains; farms, located in the irrigated valleys, or oases, along the coast have generally high yields and tend to raise crops for export. Only 3 percent of the country's total land area is arable; Peru is not agriculturally self-sufficient. Droughts are frequent and irrigation is inadequate. The land-reform law of 1969, which expropriated 25,900,000 acres (10,500,000 hectares), has benefited only a limited number of peasants. Smallholdings have been consolidated into cooperative farms. Sugarcane, cotton, coffee, potatoes, corn (maize), rice, and plantains are major crops. Coca is primarily cultivated for cocaine, which is smuggled to Colombia and from there to the United States and Europe. Sheep, llamas, alpacas, and vicuñas are raised for wool.

Prior to 1972 Peru had been the world's leading fishing nation, with anchovies the main catch. The El Niño (a severe, irregularly occuring variation in weather patterns) of that year, however, caused great damage to the fishing grounds, and the catch plummeted, although Peru remained among the world leaders. Through conservation measures, the fishing industry gradually recovered.

Mining accounts for approximately one-tenth of the GNP and employs about 2 percent of the work force. The government controls most mining through the Empresa Minera del Perú, Empresa Minera del Centro del Perú, and Petróleos del Perú; marketing is controlled by the Minero Perú Comercial.

Peru is an important producer of petroleum, and the value of petroleum exports is roughly comparable to that of copper. A pipeline across the Andes links oil fields in the northeastern jungles to the coast. Rich deposits of uranium have been discovered north of Lake Titicaca. Peru is a leading producer of iron, zinc, copper, bismuth, lead, and silver. Minerals regularly account for almost two-thirds of the total value of the country's exports.

Industries are heavily concentrated around Lima and neighbouring Callao. Manufacturing accounts for approximately one-third of the GNP and employs more than one-tenth of the work force. Major manufactures include cement, textiles, steel, televisions, processed foods, refined petroleum, tires, and motor vehicles.

Production of electricity is controlled by the government. Electricity is chiefly generated from waterpower and reaches only about one-fourth of the population.

All but one-tenth of Peru's roads are unpaved. Public railways were nationalized in 1972. Callao is the largest of the country's numerous ports and is the site of Peru's most important international airport.

Exports include mineral products, agricultural products, fish products, and petroleum; imports consist of foodstuffs, consumer goods, and component parts for Peruvian industries. The United States, Japan, and Germany are Peru's major trading partners.

Taxes on exports have been prohibitively high and are being reduced in favour of higher indirect taxes. Quotas on imports have been replaced by higher tariffs. Low world prices for commodities on which the country depended for foreign-exchange earnings made it increasingly difficult for Peru to meet debt repayments in the 1980s. Loans from the International Monetary Fund were restricted after the country drastically reduced its payment schedule for foreign loans. In 1987 Peru nationalized the nation's financial system.

Government and social conditions. Civilian government was fully restored in 1980, following more than a decade of military rule. The constitution, promulgated in 1979, vests executive power in the president, directly elected to a five-year term. The president governs with the assistance of a Council of Ministers, appointed by the president. Legislative power is held by the bicameral Congress, composed of the 180-member Chamber of Deputies and the 60-member Senate, members of which are directly elected to five-year terms. Senators are elected on a regional basis, while deputies are elected by a system of proportional representation. The major political party is the centrist Alianza Popular Revolucionaria Americana (APRA). The judicial system is headed by the Supreme Court and includes higher courts and the courts of first instance.

Peru's social-welfare system provides cash benefits or medical care for sickness, maternity, and disability and pensions for old age, invalidism, disability, and loss of support. Conditions of employment are guaranteed by labour laws. Infectious diseases such as typhoid, tuberculosis, gastrointestinal diseases, whooping cough, malaria, and influenza are widespread despite government programs to bring them under control. Dietary deficiency is most serious among children. Medical facilities are inadequate in the rural areas. Most housing, both urban and rural, lacks water and sewerage. Squatter settlements on the outskirts of cities and inner-city tenements house the growing population of urban poor.

Peru's relatively high literacy rate is comparable to most South American countries. Education is compulsory, where possible, and free for children between the ages of 6 and 15. Adult-literacy programs and technical education have high government priority. Peru has more than 30 universities, including the oldest in South America, the National University of San Marcos in Lima (founded 1551).

Peru's press is one of the oldest on the continent; its first newspaper was founded in 1791. Censorship laws introduced during military rule have been repealed, effectively restoring freedom of the press. Radio and television facilities are either fully or partially owned by the government.

Cultural life. The ancient culture of Peru is best known not only in its Spanish–Inca cities but also in the remains of Machu Picchu, a "lost city" of the Incas on an 8,000-foot-(2,450-kilometre-) high mountain 50 miles (80 km) from Cuzco. Peruvian folk culture is rich in elements from pre-Hispanic and mestizo traditions.

The ancient Peruvians were great builders, adapting their architecture to the landscape. The oldest colonial work is the Cathedral of Lima, and the most important is the Convent and Church of San Francisco of Lima.

Peru's most prominent writers since the late 19th century include César Vallejo, José María Argüedas, and Mario Vargas Llosa. Valle-Riestra's *Ollanta* and Vincente Stea's *Sinfonía autóctona* (*Aboriginal Symphony*) were the major musical works of 19th-century Peru. Painting reached its zenith with the famous Cuzco school during the 17th and 18th centuries.

History. Human habitation in Peru dates back to at least 8000 BC. Several advanced cultures developed in different parts of Peru by the middle of the 13th century AD. About AD 1438 the Incas set out on a 50-year period of conquest, ultimately controlling present-day Peru, Bolivia, Chile, Ecuador, and northern Argentina.

The Spanish explorer Francisco Pizarro landed in Peru in 1527. Returning in 1532 with a small army, he conquered the Inca empire and in the next year killed Atahuallpa, the Inca king.

Spain consolidated its control over Peru, and it remained under Spanish domination for almost 300 years. During the independence movements of the early 19th century, Peru remained loyal to the Spanish crown. Peruvian independence came about as a virtual by-product of the successes of other Spanish colonies in their wars of independence. Following the Argentine liberator General José de San Martín's capture of Lima in 1821, Peru's independence was proclaimed.

In 1836 General Andrés Santa Cruz united Peru with Bolivia to create the Peru-Bolivia confederation, which, however, was broken up in 1839 following a military defeat at the hands of Chile. From 1844 to 1862 General Ramón Castilla ruled Peru, providing much-needed political stability. Castilla helped develop public education, abolished slavery, and strengthened the military. In the 1870s the Civilian Party was formed; it successfully wrested control of the country from the military but was unable to cope with a severe economic depression. Peru's economic dislocation was aggravated by the effects of an unsuccessful war with Chile (1879–84). Rising public debt led to the formation of the Peruvian Corporation (1889), established by the country's creditors to help in economic recovery.

In 1895 the Democratic Party was formed and elected Nicolás de Piérola president. After a period of orderly political and economic development, Augusto Leguía y Salcedo of the Civilian Party won a single term as president (1908–12). Leguía was elected again in 1919 and embarked on a U.S.-financed public-works program. Although he was re-elected, his popularity was declining, and in 1930 a military coup ousted Leguía. Colonel Luis Sánchez Cerro, leader of the coup, was elected president in 1931 but was assassinated in 1933. His successor, General Oscar Benavides, restored confidence in the economy. Manuel Prado was elected to the presidency in 1939 and immediately aligned Peru with U.S. policies during World War II.

Following the war, General Manuel Odría seized control of the government (1948) and remained in power until 1956. Prado was elected to his second term as president that same year. He was succeeded by Fernando Belaúnde Terry in 1963. Belaúnde initiated more effective agricultural land use, organized community development projects, and tried to eradicate illiteracy.

A military junta seized power in 1969. It nationalized many foreign commercial holdings and encouraged expropriation of landed estates by the peasants. In August 1975 another military coup replaced the ruling junta and paved the way for a return to civilian rule in 1980. The popularly elected civilian governments in the 1980s and '90s, however, were beset with skyrocketing inflation and unemployment, a gigantic foreign debt, and violence by guerrilla groups using terrorist tactics, such as the neo-Maoist Shining Path (Sendero Luminoso) and the Tupac Amaru Revolutionary Movement. Drug trafficking and widespread coca farming also hampered economic reform.

Peru, city, seat (1834) of Miami county, north-central Indiana, U.S. The city lies on the Wabash River near its juncture with the Mississinewa, midway between South Bend (70 miles [110 km] north) and Indianapolis. Founded in 1826 as Miamisport on the site of a Miami Indian village and apparently renamed for the South American country, Peru is now a transportation, industrial, and agricultural trading centre. Manufactures include electrical and heating equipment; plastics; and paper, wood, and fabricated metal products. Pioneer, circus, and Indian relics are displayed in the Miami County Historical and Puterbaugh museums. Songwriter Cole Porter was born in Peru and is buried there. The annual Circus City Festival commemorates Peru's former fame as one of the nation's foremost circus winter quarters. Grissom Air Force Base and the Mississinewa Reservoir are nearby. Inc. town, 1848; city, 1867. Pop. (1988 est.) 13,030.

Peru, Viceroyalty of, Spanish VIRREINATO DE PERU, the second of the four viceroyalties that Spain created to govern its domains in the Americas. Established in 1543, the viceroyalty initially included all of South America under Spanish control except for the coast of what is now Venezuela. It later lost jurisdiction (with the creation of the Viceroyalty of New Granada in 1739) over the areas that now constitute the nations of Colombia, Ecuador, Panama, and Venezuela and, later still (with the establishment of the Viceroyalty of the Río de la Plata in 1776), over what is now Argentina, Uruguay, Paraguay, and much of Bolivia.

Until nearly the end of the colonial era, Peru was considered the most valuable Spanish possession in the Americas. It produced vast quantities of silver bullion for shipment to Europe, especially from the mines at Potosí. Thriving on the labour of enslaved Indians, an exploitative society of mine operators and merchant princes lived in splendour in the coastal city of Lima. Access to easy wealth, however, was one of the major contributing factors to political instability in the region. Geography was another; Lima's position along the western coast of South America limited effective communication with Spain. And the rigours of the terrain—especially the Andes Mountains—made Peru very difficult to govern.

From 1569 to 1581, the Viceroyalty of Peru received some much-needed stable leadership from the viceroy Francisco de Toledo. Considered the best of Peru's viceroys, Toledo revamped the administration, granted certain rights of autonomy to the Indians, and modernized mining operations. His successors—most notably the Marqués de Montes Claros (1607–15), Francisco de Borja y Aragón, Prince de Esquilache (1615–21), Don Pedro Antonio Fernández de Castro, 10th Count de Lemos (1667–72), and Melchor Portocarrero Lasso de la Vega, Count de la Monclova (1689–1705)—were for the most part impressive men and capable administrators.

By the late 18th century, however, the Viceroyalty of Peru was badly in need of reform. Exploitation of the Indians had led in 1780 to the brief but bloody rebellion of José Gabriel Condorcanqui (or Tupac Amaru, as he wished to call himself, after his Inca ancestor). This revolt spread throughout Peru, and, although Tupac was captured and executed in 1781, the Indians continued to wage war against the Spaniards until 1783, causing the disruption of the viceroyalty's economic life. The area was unable to mount a vigorous defense when General José de San Martín entered Lima and declared Peru's independence from Spain in July 1821. Then, on Dec. 9, 1824, the Spanish royal army—despite an advantage in manpower and arms—lost the Battle of Ayacucho to a revolutionary army under Antonio José de Sucre. The viceroy of Peru and his generals were taken prisoner, and what was left of the territory that had been the Viceroyalty of Peru became part of the independent nations of Peru and Chile.

Peru–Chile Trench, also called ATACAMA TRENCH, submarine trench in the eastern Pacific Ocean, about 100 miles (160 km) off the coast of Peru and Chile. It reaches a maximum depth of 26,457 feet (8,064 m) below sea level in Richards Deep and is 3,666 miles (5,899 km) long; its mean width is 40 miles (64 km) and it covers an expanse of some 228,000 square miles (590,000 square km). It lies offshore from an area of active volcanism. The trench sediments are alternate layers of turbidites and oceanic deposits, mainly clays, volcanic ash, and siliceous oozes, with some carbonates and, possibly, primary dolomites.

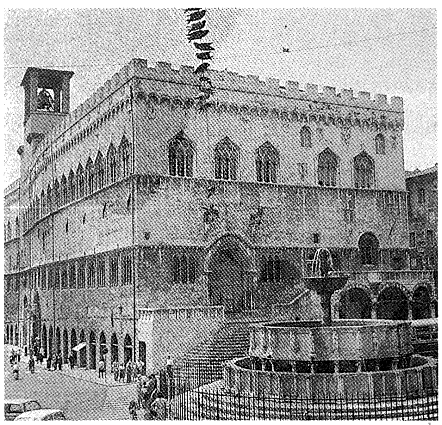
Studies of these sediments indicate the presence of metals initially disseminated in newly erupted underwater volcanic rocks.

Peru Current, also called HUMBOLDT CURRENT, cold-water current of the southeast Pacific Ocean, with a width of about 900 km (550 mi). Relatively slow and shallow, it transports only 350,000,000–700,000,000 cu ft (10,000,000–20,000,000 cu m) of water per second. It is an eastern boundary current similar to the California Current of the North Pacific. The West Wind Drift flows east toward South America south of latitude 40° S, and while most of it continues through the Drake Passage around the southern tip of South America to the Atlantic, a shallow stream turns north to parallel the continent as far as latitude 4° S, where it turns west to join the Pacific South Equatorial Current.

As it is a cold current, except at times of the phenomenon known as El Niño Current (*q.v.*), the Peru Current brings fog to the nearby coast but also helps to keep the coast one of the most intensely arid areas in the world. The cold flow is intensified by upwelling of deep water caused by the combined effects of the drag of surface winds of the Southeast Trades and the Earth's rotation. Upwelling brings abundant nutrients close to the surface, and the beneficial effects of sunlight, which allow for rich plankton growth, make the waters off Peru, Chile, and Ecuador one of the world's greatest fishing grounds for anchovies and the larger fish (*e.g.,* tuna) that feed upon them. Another economic benefit is the guano, used for fertilizer, deposited by the flocks of birds that feed on the anchovies.

The current's alternative name is taken from that of the German scientist Alexander von Humboldt, who in 1802 took measurements that showed the coldness of the flow in relation to the air above it and the sea around it.

Perugia, Latin PERUSIA, city, seat of an archbishopric and capital of Perugia province and Umbria region, in central Italy, north of Rome; it lies on an irregular cluster of hills overlooking the Umbrian and central



Palazzo dei Priori, Perugia, Italy
Mildred Bernhaut—Photo Researchers

Tiber valleys and Lake Trasimeno. Founded by the Umbrians, it became one of the 12 strongholds of the Etruscan Confederation and belonged to Rome from 310 BC. In AD 592 it became a Lombard duchy; subsequently, it was embroiled in many petty conflicts with neighbouring towns in which it usually took the Guelf, or pro-papal, side. The condottiere Braccio Fortebraccio captured it in 1416, and later the rival Oddi and Baglioni families fought there for power before the town became a papal possession in 1540.

Perugia was the centre of the great Umbrian school of painting, which reached its height in the 15th century. It played an active part in the Italian Risorgimento in 1859 and in the following year became part of united Italy.

There are considerable remains of Etruscan walls with three gateways, as well as the Etruscan nucleus of the well-preserved medieval city enclosed by 13th-century walls, and, on the outskirts, the Etruscan *hypogea* (underground burial chambers) of San Manno and of the Volumnii (2nd century BC). In the centre of the city the magnificent Piazza Quattro Novembre contains the Palazzo dei Priori, or Palazzo Comunale (1293–97; extended 1443), housing the National Gallery of Umbria's remarkable collection of paintings and sculpture; the cathedral of S. Lorenzo (1345–1430), in which is the supposed white onyx espousal ring of the Virgin; and the splendid Maggiore Fountain (1278) by Fra Bevignate. Other landmarks include the Collegio del Cambio (1452–57), with a dazzling series of frescoes by Pietro Perugino and his pupils. Particularly notable among the many fine churches are S. Angelo (5th and 6th centuries; on a circular plan); S. Domenico (1305; rebuilt 1632), containing the monumental tomb of Pope Benedict XI; S. Pietro (originally 10th century, often remodelled); S. Severo (15th–18th centuries), with a fresco by Raphael; and S. Bernardino (1457–61). In the former convent of S. Domenico are the state archives and the Etrusco-Roman museum, with an important archaeological collection. The former convent of the Olivetans is the central seat of the university (founded 1307), and the Palazzo Gallenga is the seat of the Italian university for foreigners.

Perugia is an agricultural trade centre noted for its chocolate; its chief economic activities are the food, textile, machine, and pharmaceutical industries. Pop. (1983 est.) mun., 143,089.

Perugia, Lake of (Italy): *see* Trasimeno, Lake.

Perugia, University of, Italian UNIVERSITÀ DEGLI STUDI DI PERUGIA, coeducational state institution of higher learning at Perugia, Italy. The university was founded in 1200 by a group of students seceding from the University of Bologna. It was recognized by Pope Clement V in 1308 as a *studium generale,* a place of study accepting scholars from all over Europe and conferring a generally recognized degree. After the annexation of the papal territories by the Kingdom of Italy in 1860, the university became autonomous. Among its modern faculties are law, medicine, letters and philosophy, political science, economics, veterinary medicine, agriculture, pharmacy, and the physical and biological sciences.

Perugino, byname of PIETRO DI CRISTOFORO VANNUCCI (b. *c.* 1450, Città della Pieve, near Perugia, Romagna—d. February/March 1523, Fontignano, near Perugia), Italian early Renaissance painter of the Umbria school, the teacher of Raphael. His work (*e.g.,* "Giving of the Keys to St. Peter," 1481–82, a fresco in the Sistine Chapel, Rome) anticipated High Renaissance ideals in its compositional clarity, sense of spaciousness, and economy of formal elements.

Early work. Nothing is known for certain of Perugino's early training, but he may have been a pupil of Fiorenzo di Lorenzo (*c.* 1440–1525), a minor painter in Perugia, and of the renowned Umbrian Piero della Francesca (*c.* 1420–92) in Arezzo, in which case he would have been a fellow pupil of one of his most famous contemporaries, Luca Signorelli. The two men were acquainted, and an occasional influence from Signorelli is visible in Perugino's work, notably in the direction of an increased hardness of drawing (*e.g.,* "Crucifixion and Saints," *c.* 1480–1500; Uffizi, Florence). In Florence, where he is first recorded in 1472, he almost certainly worked in the shop

"Vision of St. Bernard," wood panel by Perugino, *c.* 1491–94; in the Alte Pinakothek, Munich
By courtesy of the Alte Pinakothek, Munich

of the important painter and sculptor Andrea del Verrocchio, where the young Leonardo da Vinci was apprenticed.

The first certain work by Perugino is a "Saint Sebastian," at Cerqueto, near Perugia. This fresco, or mural painted on plaster with water-dissolved pigments, dates from 1478 and is typical of Perugino's style. He must have attained a considerable reputation by this time, since he probably worked for Pope Sixtus IV in Rome, 1478–79, on frescoes now lost. Sixtus IV also employed him to paint a number of the frescoes in the Sistine Chapel in the Vatican Palace. Completed between 1481 and 1482, three narrative scenes behind the altar were destroyed by Michelangelo in 1535–36 in order to use the space for his fresco of the "Last Judgment." Of the scenes completely by Perugino's own hand, only the fresco "Giving of the Keys to St. Peter" has survived. The simple and lucid arrangement of the composition reveals the centre of narrative action, unlike the frescoes in the same series by the Florentine painter Sandro Botticelli, which, in comparison, appear overcrowded and confused in their narrative focus. After completing his work in the Sistine Chapel, Perugino returned to Florence, where he was commissioned to work in the Palazzo della Signoria. In 1491 he was invited to sit on the committee concerned with finishing the Florence cathedral.

Mature work. From approximately 1490 to 1500 Perugino was at his most productive and at the artistic summit of his career. Among the finest of his works executed during this time are the "Vision of St. Bernard," the "Madonna and Saints," the "Pietà," and the fresco of the "Crucifixion" for the Florentine convent of Sta. Maria Maddalena dei Pazzi. These works are characterized by ample sculpturesque figures gracefully posed in simple Renaissance architectural settings, which act as a frame to the images and the narrative. The harmonious space is tightly controlled in the foreground and middle ground, while the background effect is conversely one of infinite space. During this period he painted his best known portrait, a likeness of "Francesco delle Opere." Perugino must have been well acquainted with the late 15th-century portraiture of Flanders, since the influence of the Flemish painter Hans Memling is unmistakable.

Commissioned by the guild of bankers of Perugia, Perugino painted a fresco cycle in their Sala dell'Udienza that is believed to have been completed during or shortly after 1500, the date that appears opposite Perugino's self-portrait in one of the scenes. The importance of these frescoes lies less in their artistic merit than in the fact that the young Raphael, Perugino's pupil around 1500, probably was an assistant learning the technique of fresco painting. An allegorical figure of Fortitude from this series is often attributed to Raphael.

Late work. After 1500, Perugino's art began to decline, and he frequently repeated his earlier compositions in a routine manner. Giorgio Vasari, a 16th-century biographer and artist, wrote that the critical Florentines began to lampoon him, and Perugino replied that they had once praised his work, and, if he now gave the same designs, they had no right to blame him. It is certainly true that the "Combat of Love and Chastity" (Louvre, Paris) was commissioned in 1503 by Isabella d'Este and was delivered only in 1505, after a great many letters had passed between all concerned, at which time Isabella expressed herself as satisfied but only moderately so. In fact, Perugino left Florence about 1505 and began to work principally for the less critical public of Umbria.

In 1508 he made a temporary comeback by painting roundels on the ceiling of the Stanza dell'Incendio in the Vatican. The commission for the frescoes on the walls of the room went to his pupil Raphael, who, in the few years after leaving Perugino's studio, proved himself the greater artist.

One of Perugino's last commissions was the completion in 1521 of some frescoes in S. Severo, Perugia, which had been begun by Raphael. He was still painting in February or March 1523 when he died of the plague. The fresco of the "Nativity," in the National Gallery, London, comes from Fontignano and is generally supposed to be Perugino's last work. (P.J.Mu.)

MAJOR WORKS. "St. Sebastian" (1478; Cerqueto, Italy); "Giving of the Keys to St. Peter" (1481–82; Vatican, Sistine Chapel); "Crucifixion" (*c.* 1485; National Gallery, Washington, D.C.); "Vision of St. Bernard" (*c.* 1491–94; Alte Pinakothek, Munich); "Adoration of the Child, Crucifixion, and Saints" (1491; Villa Torlonia, formerly Albani, Rome); "Madonna and Saints" (1493; Uffizi, Florence); "Madonna and Saints" (1493; Kunsthistorisches Museum, Vienna); "Crucifixion" (1493–96; convent of Sta. Maria Maddalena dei Pazzi, Florence); "Francesco delle Opere" (1494; Uffizi); "Pietà" (*c.* 1494–95; Uffizi); "Virgin in Glory with Saints" (*c.* 1495–96; Pinacoteca Nazionale, Bologna, Italy); "Agony in the Garden" (1495; Galleria Palatina, Florence); Altarpiece (1497; church of Sta. Maria Nuova, Fano, Italy); "Ascension" (1496–98; Musée Municipal des Beaux-Arts, Lyon), panels belonging to this painting in museums at Nantes and Rouen in France; "Annunciation" (1498; church of Sta. Maria Nuova); "Archangel Michael, the Virgin Adoring the Child, Archangel Raphael with Tobias" (*c.* 1499; National Gallery, London); "Biagio Milanesi" (1500; Uffizi); "The Monk Baldassare" (1500; Uffizi); "Prophets, Heroes, Sibyls, and Sages, the Transfiguration and the Adoration of the Shepherds" (*c.* 1497–1500; Sala dell'Udienza, Collegio del Cambio, Perugia, Italy); "St. Sebastian" (1500–08; Hermitage, Leningrad); "Resurrection" (*c.* 1501; Vatican Gallery); "Adoration of the Shepherds" (1501; Galleria Nazionale dell'Umbria, Perugia); "Crucifixion and Saints" (1502–06; church of S. Agostino, Siena, Italy); "Marriage of the Virgin" (1503–04; Musée de l'Hôtel de Ville, Caen, Fr.); "Combat of Love and Chastity" (1505; Louvre, Paris); "Deposition" (1505–07; Uffizi); "Assumption" (1506; Uffizi); "Ascension" (*c.* 1509; Cathedral, Sansepolcro, Italy); Altarpiece (before 1517; Galleria Nazionale dell'Umbria); "Adoration of the Magi" (1521; church of Sta. Maria delle Lacrime, Trevi, Italy); "Nativity" (1522; National Gallery, London).

BIBLIOGRAPHY. The most complete documentation on Perugino is in Fiorenzo Canuti, *Il Perugino,* 2 vol. (1931); but there is a useful modern monograph by E. Camesasca, *Tutta la pittura del Perugino* (1959). See also the lengthy article by Francesco Santi in the *Encyclopedia of World Art,* vol. 11, col. 265–271 (1966); and Frederick Hartt, *A History of Italian Renaissance Art* (1969).

peruke, also called PERIWIG, man's wig, especially the type popular from the 17th to the early 19th century. It was made of long hair, often with curls on the sides, and drawn back on the nape of the neck.

Use of the word peruke probably became widespread in the 16th century, when the

Back view of a squared peruke worn by an effigy of William II, 1725; in the Victoria and Albert Museum, London

wearing of wigs became popular. Toward the end of the 16th century and the beginning of the 17th, the peruke was no longer worn as an adornment or to correct nature's defects but rather as a distinctive feature of costume, especially after Louis XIII of France set the fashion in 1624. *See also* wig.

Perun, the thunder-god of the ancient pagan Slavs, a fructifier, purifier, and overseer of right and order. His actions are perceived by the senses: seen in the thunderbolt, heard in the rattle of stones or the bellow of the bull or the bleat of the he-goat (thunder), and felt in the touch of an ax blade. The word for Thursday (Thor's day) in the Polabian language was *peründan.* Polish *piorun* and Slovak *parom* denote "thunder" or "lightning."

The "Lightning-god" and his cult among the Slavs is attested by the Byzantine historian Procopius in the 6th century. In the *Primary Russian Chronicle,* compiled *c.* 1111, Perun is mentioned as having been invoked in the treaties of 945 and 971, and his name is the first in the list of gods of St. Vladimir's pantheon of 980. He was worshipped in oak groves by western Slavs, who called him Prone, which name appears in Helmold's *Chronica Slavorum* (*c.* 1172). Porenut, Perun's son, is mentioned by the Danish historian Saxo Grammaticus in the early 13th century.

In the Christian period the worship of Perun was gradually transferred to St. Elijah (Russian Iliya), but in folk beliefs, his fructifying, life-stimulating, and purifying functions are still performed by his vehicles: the ax, the bull, the he-goat, the dove, and the cuckoo. Sacrifices and communal feasts on July 20 in honour of Perun or Iliya continued in Russia until modern times.

Perusia (Italy): *see* Perugia.

Perutz, Max Ferdinand (b. May 19, 1914, Vienna), Austrian-born British biochemist, co-recipient of the 1962 Nobel Prize for Chemistry for his X-ray diffraction analysis of the structure of hemoglobin, the protein that transports oxygen from the lungs to the tissues via blood cells.

Perutz was educated at the University of Vienna and at the University of Cambridge, where he received his Ph.D. in 1940. While at Cambridge he began research at the Cavendish Laboratory (1937), taking the first X-ray diffraction pictures of hemoglobin crystals and working with the most powerful tool for examining the structure of hemoglobin—X-ray crystallography.

In 1947, along with the British biochemist John C. Kendrew—with whom he was later to share the Nobel Prize—Perutz founded the Medical Research Council Unit for Molecular Biology at Cambridge. There the two men continued their investigation of hemoproteins, Kendrew specializing in the molecular structure of myoglobin (muscular hemoglobin), Perutz concentrating on the hemoglobin molecule itself. By 1959 Perutz had shown that hemoglobin was composed of four separate polypeptide chains that formed a tetrahedral structure, with four heme groups near the molecule's surface. Perutz subsequently showed that in oxygenated hemoglobin the four chains are rearranged, a discovery that led to the full determination of the molecular mechanism of respiratory transport by hemoglobin. Perutz served as director of the Unit for Molecular Biology from its inception until 1962. From 1962 until his retirement in 1979, he served as chairman of the Medical Research Council molecular biology laboratory (at the School of Clinical Medicine, Cambridge).

Perutz also investigated the flow of glaciers, making a crystallographic study of the transformation of snow into glacial ice (1938). Measuring for the first time the velocity distribution of a glacier, he proved that the fastest flow occurs at the surface and the slowest near the bed of the glacier.

Peruvian–Bolivian Confederation, transitory union of Peru and Bolivia (1836–39). Bolivia's dictator, Andrés Santa Cruz, conquered Peru after helping to quell an army rebellion against Peruvian president Luís José de Orbegoso in 1835. Santa Cruz then divided Peru into a northern and a southern part, with Orbegoso as president in the north and Gen. Ramón Herrera in the south. These states were then joined to Bolivia, of which Gen. José Miguel de Velasco was made president. Santa Cruz assumed the office of "protector" of the confederation, a lifetime and hereditary office. Since he had already proved himself an able administrator in Bolivia, influential Peruvians welcomed his rule.

Great Britain, France, and the United States recognized the confederation, but its South American neighbours feared and opposed the powerful new state. In 1836 fighting broke out between the confederation and Chile, whose relations with independent Peru had already been strained by economic problems centring on rivalry between their ports of Callao (near Lima) and Valparaíso, Chile. In 1837 Santa Cruz's forces defeated an Argentine army sent to topple him.

The Chileans, joined by Peruvians opposed to Santa Cruz, persisted in their fight until, under the command of Gen. Manuel Bulnes, they finally defeated the forces of the confederation at the Battle of Yungay (department of Ancash, Peru) on Jan. 20, 1839. This defeat caused the immediate dissolution of the confederation; Santa Cruz went into exile. Agustín Gamarra assumed the presidency of Peru and tried to subjugate Bolivia to Peru; this attempt ended abruptly with his death on the battlefield in 1841. Both Peru and Bolivia then entered a period of internal conflict and disorder.

Peruzzi FAMILY, leading family of medieval Italian financiers whose bankruptcy in the 14th century contributed to the economic depression of the late Middle Ages.

An old Florentine family belonging to the "popular" (democratic) party, the Peruzzi contributed 10 gonfaloniers (chief executives) and 54 priors (members of the governing body) to the republic. Coming to prominence as bankers *c.* 1275, the Peruzzi soon had branches in most of the important centres of Europe and were second in importance only to the Bardi company. The Florentine chronicler Giovanni Villani was a Peruzzi partner. At the beginning of the Hundred Years' War between England and France, they were especially active in Naples, Paris, and London. Beginning in the 1330s, the Peruzzi made large loans to Edward III of England, first in concert with the Bardi company, later by themselves, financing his wars in Scotland and France in return for grants of wool, money, and assignment of customs and taxes. Loans in 1338–39 for the mounting expenses of Edward's wars exhausted both Peruzzi and Bardi resources. From 1342 to 1345 members of both companies were arrested for bankruptcy and released only on renunciation of all claims to interest, and the English crown canceled massive debts to the Peruzzi. At the same time, the king of Naples defaulted on his debts to the two companies, and the king of France exiled them and confiscated their goods.

The disasters abroad brought on panic at home, resulting in 1342 in a movement by the Bardi and Peruzzi and other great banking companies to set up Walter of Brienne, duke of Athens, as ruler of Florence, hoping to control his foreign and financial policies to save their firms from bankruptcy. In 1343, disappointed in their hopes, the bankers ousted the soldier of fortune. When a revolution put the *popolo minuto* (lesser guilds and merchants) in power, the Peruzzi company's bankruptcy followed, heralding a great economic crisis.

Peruzzi, Baldassarre (Tommaso) (b. 1481, Siena?, Republic of Siena [now in Italy]—d. Jan. 6, 1536, Rome), Sienese architect and painter, one of the earliest artists to attempt illusionist architectural painting (*quadratura*), the extension of real architecture into imaginary space.

A contemporary of Raphael and Donato Bramante, Peruzzi began his career as a painter of frescoes in the Cappella San Giovanni in

"Head of the Goddess Ceres," oil painting by Baldassarre Peruzzi; in the Galleria Nazionale, Rome
Photo SASKIA, North Amherst, Mass.

Siena Cathedral. His first architectural work was the Villa Farnesina in Rome (1509–21), and he also assisted in the fresco decoration of this palace. On Raphael's death, in 1520, Peruzzi was appointed one of the architects for St. Peter's in Rome. Among the many edifices attributed to him, the most significant is probably the Palazzo Massimo alle Colonne (*c.* 1535) in Rome.

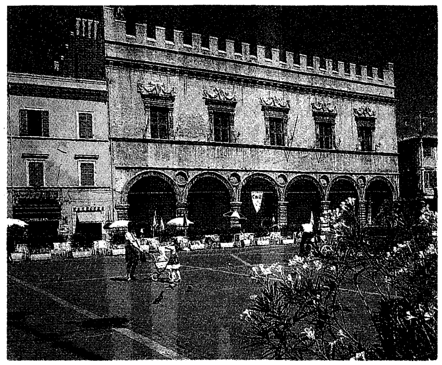
Pervomaysk, also spelled PERVOMAISK, or PERVOMAJSK, city, Nikolayev *oblast* (province), Ukrainian Soviet Socialist Republic, at the confluence of the Sinyukha and Yuzhny Bug rivers. The city, formerly known as Olviopol, was incorporated in 1773 and renamed, literally, First of May, after the international (Communist) holiday, in 1919. The city is divided by the rivers into three separate parts. It is now an industrial centre, with machine, engineering, food, and furniture industries. Pop. (1987 est.) 79,000.

Pervomaysk, also spelled PERVOMAISK, or PERVOMAJSK, mining town, Voroshilovgrad *oblast* (province), Ukrainian Soviet Socialist Republic, on the Donets Coal Basin. The town, the name of which means First of May, after the international (Communist) holiday, was incorporated in 1938, before which it was known as Petromaryevka. Besides mining, Pervomaysk has electrical-engineering and light industries. Pop. (1974 est.) 45,400.

Pervouralsk, city, Sverdlovsk *oblast* (province), western Russian Soviet Federated Socialist Republic, located on the upper Chusovaya River and on the railway from Sverdlovsk to Perm. Founded in 1732 as an ironworks, the modern city of Pervouralsk has several large steel-pipe factories. It also produces mining machinery, pipes, chemicals, clothing, and foodstuffs. Iron ore containing vanadium is mined in the vicinity. Pop. (1989 prelim.) 142,000.

Pesaḥ, also spelled PESACH (Judaism): *see* Passover.

Pesaro, Latin PISAURUM, city, capital of Pesaro e Urbino *provincia,* Marche *regione,* northern Italy, a seaport on the Adriatic Sea at the mouth of the Foglia (Pisaurum) River. Destroyed by Witigis the Ostrogoth in 536, the town was rebuilt and fortified by the Byzantine general Belisarius and was one of the five cities of the Maritime Pentapolis under the exarchate of Ravenna. Later disputed between the popes and the Holy Roman emperors, Pesaro came into the hands of the Malatesta family of Rimini about 1285. It was sold in 1445 to the Sforza family, and in 1512, through the influence of Pope Julius II, it went to the pope's nephew Francesco Maria I della Rovere, duke di Urbino. It reverted to the Papal States in 1631. A main point at the Adriatic end of the so-called Gothic line in World War II, Pesaro suffered heavily in the Allied advance of 1944, but many of its old buildings escaped with minor damage. Notable landmarks include the fortress of Rocca Constanza (built 1474–1505 for Constanzo Sforza); the Palazzo Ducale (1450–1510); the cathedral, with a 14th-century facade; and the nearby Villa Imperiale, built (1469–72) for Alessandro Sforza and noted for its fine stucco ceilings, wall paintings, and pavements of majolica plates. A new palace, begun in 1530 by Girolamo Genga and his son for Eleonora Gonzaga, was never completed.



The Palazzo Ducale, Pesaro, Italy, 1450–1510
Shostal/Superstock

The civic museums house the picture gallery and the museum of majolica, with the richest collection in Italy. (Pesaro has been famous for its majolica since 1462.) The Oliveriano Archaeological Museum is important for students of Italian antiquities. The composer Gioacchino Antonio Rossini, a native of Pesaro, left his fortune to found a music school there.

Pesaro is a pleasant seaside resort and serves a rich agricultural area; its industries include sulfur refining, boatbuilding, and the manufacture of motorcycles. Pop. (1988 est.) mun., 90,375.

Pescadores: *see* Penghu Islands.

Pescara, Latin ATERNUM, city, capital of Pescara *provincia,* Abruzzi *regione,* central Italy, on the Adriatic Sea at the mouth of the Pescara River, east-northeast of Rome.

Government palace and the Pescara River in Pescara, Italy
Marzari—SCALA from Art Resource/EB Inc.

The Roman Aternum, the city was almost destroyed in the barbarian invasions and arose again in the early European Middle Ages as Piscaria (*i.e.,* "abounding with fish"). The scene of much fighting throughout its history, it suffered heavy damage in World War II. Since 1927, Castellammare Adriatico, on the north bank of the river, has been part of Pescara. The birthplace (1863) of the poet Gabriele D'Annunzio has been preserved.

Pescara is a seaside resort and tourist centre that lies on the railway and main road from Bologna to Bari and Brindisi. Fishing and electrical, mechanical, textile, and food-processing industries are economically important, and there are naval shipyards. Pop. (1988 est.) mun., 130,525.

Pescara, Fernando Francesco de Avalos, marchese di (marquess of) (b. 1490, Naples [Italy]—d. Dec. 2, 1525, Milan), Italian leader of the forces of Holy Roman emperor Charles V against the French king Francis I.

A pupil of the soldier of fortune Prospero Colonna, Pescara commanded Spanish forces in Italy in the struggles from 1512 to 1525 between the French on one side and the Spanish and Germans on the other. In 1512 he was wounded at Ravenna, became a prisoner of the French, and was released on the promise not to fight against them again, a promise that was to be broken many times. In subsequent engagements he defeated the Venetians at Vicenza, occupied Padua in 1514, and, once more fighting against the French, took Milan in 1521 and Genoa in 1522. After Prospero Colonna's death in 1523, Pescara became virtual commander of Charles V's troops in Italy, winning a victory at Romagnano (northwest of Milan) in 1524 and, the following year, his greatest battle, at Pavia (south of Milan). There, by a combination of patience and tact, he successfully led his unpaid, ill-fed, and demoralized troops against the French.

After the victory Girolamo Morone, the Milanese chancellor, tried to enlist Pescara in a plot to ally Italy with France against Charles V, offering him the crown of Naples. Pescara at first appeared to give the plan serious consideration—to learn details of the conspiracy, he later claimed. But on Oct. 14, 1525, he arrested Morone, marched on Milan, and forced the Milanese to swear allegiance to the emperor, demanding the surrender of the citadels of Milan and Cremona (southeast of Milan). The duke of Milan, Francesco Sforza, refused, whereupon Pescara besieged the Castello Sforzesco. He died, however, before the duke yielded, and on his deathbed he recommended clemency for Morone.

Pescennius Niger Justus, Gaius: *see* Niger, Pescennius.

Peschiera del Garda, formerly PESCHIERA SUL GARDA, port village, Verona *provincia,* Veneto *regione,* northern Italy. Situated on the southeast end of Garda Lake at the efflux of the Mincio River, Peschiera lies about 14 miles (23 km) west of Verona. It is a rail junction. The village also has a fish hatchery. During Austrian rule, Peschiera was one of the four fortified towns, the site of the northwest fortress of the Quadrilateral. Pop. (1988 est.) mun., 8,729.

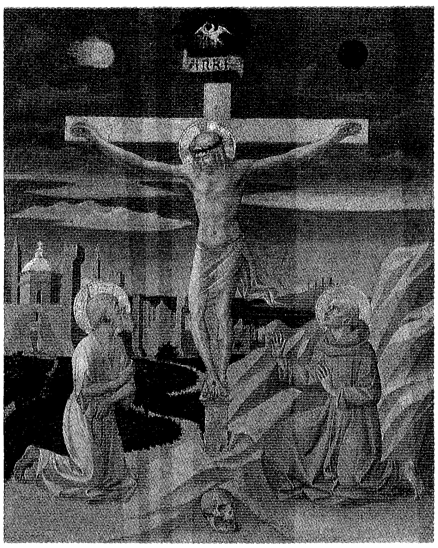
Pescia, town, Pistoia *provincia,* Toscana *regione,* central Italy, at the base of the Etruscan Apennines and at the western end of the Nievole River. Its cathedral is notable for an ancient tower, and in the 14th-century Church of St. Francis is a picture of St. Francis of Assisi, painted in 1235 by Bonaventura Berlinghieri. There are also several notable paintings in the civic museum.

The town has diverse industries, particularly paper manufacture, which dates from the 15th century. An important distribution centre for local produce, Pescia has an agricultural school and is a busy market in asparagus and flowers. Pop. (1988 est.) mun., 18,089.

Pescium (Yugoslavia): *see* Peć.

Pesellino, original name FRANCESCO DI STEFANO, also called GIUOCHI (b. 1422, Florence [Italy]—d. July 29, 1457, Florence), Italian artist of the early Renaissance who excelled in the execution of small-scale paintings.

Pesellino was raised by his grandfather, the painter Giuliano il Pesello, and worked as his assistant until Giuliano's death. He then became associated with Fra Filippo Lippi. In 1453 he went into partnership with Piero di Lorenzo di Pratese, and during this period he began, for the Church of the Trinità at Pistoia, the altarpiece now in the National Gallery, London. It was left unfinished at his death.



"The Crucifixion with Saint Jerome and Saint Francis," tempera on wood by Pesellino, probably *c.* 1440–45; in the National Gallery of Art, Washington, D.C.

By courtesy of the National Gallery of Art, Washington; Samuel H. Kress Collection

Pesellino is famous for his *cassone* pictures, which were intended for the decoration of marriage chests and in which he illustrated old legends or tales in tapestry-like designs. Several of these are in the Gardner Museum, Boston. A number of works by Pesellino may be seen in the National Gallery of Art, Washington, D.C.; the Metropolitan Museum of Art, New York City; and the Museum of Art of Toledo, Ohio.

peshaṭ (Hebrew: "spread out"), in Jewish hermeneutics, the simple, obvious, literal meaning of a biblical text. In the interpretation of the Halakha (the "Proper Way"; *i.e.,* the Oral Law that was essentially an interpretation of the Written Law), *peshaṭ* was preferred. Other interpretive principles, however, could be used simultaneously in any given text: *remez* (meaning "hint," in reference to typological or allegorical interpretations), *derash* (meaning "search," in reference to biblical study according to the *middot,* or rules), and *sod* (meaning "secret," or mystical interpretation). The first letters (PRDS) of these four words were first used in medieval Spain as an acronym forming the word PaRaDiSe to designate a theory of four basic interpretive principles: literal, philosophical, inferred, and mystical.

Depending on the needs or preferences of a particular historical period, one of the four principles generally gained a dominant position. During the early scribal and rabbinical period (*c.* 4th century BC–*c.* 2nd century AD), *peshaṭ* was preferred. Later, in the Talmudic period (*c.* 3rd–6th century AD), the inferred sense (*derash*) was viewed as more adequately communicating the intent of the divine author of the text—*i.e.,* making the text more relevant by seeking in it ethical and religious implications. Both *remez* and *sod,* which allowed for greater speculation, became favourite interpretive methods of the Kabbalists, Jewish mystics who flourished in Europe and Palestine during the Middle Ages and the early modern period.

Peshāwar, city, central North-West Frontier province, Pakistan. The city (capital of the province) lies just west of the Bāra River, a tributary of the Kābul River, near the Khyber Pass. The Shāhjī-kī Dhērī mounds, situated to the east, cover ruins of the largest Buddhist stupa in the subcontinent (2nd century AD), which attest the lengthy association of the town with Buddha and the religion founded about him. Once the capital of the ancient Buddhist kingdom of Gandhāra, the city was known variously as Paraṣawara and Puruṣapura (town, or abode, of Puruṣa). Also called Begrām, the present name, Peshāwar (*pēsh āwar,* "frontier town"), is ascribed to Akbar, the Mughal emperor of India (1556–1605). A great historic centre of transit-caravan trade with Afghanistan and Central Asia, Peshāwar is today connected by the Grand Trunk Road and rail with Lahore, Rāwalpindi, Hyderābād, and Karāchi and by air with Rāwalpindi, Chitrāl, and Kābul, Afg.

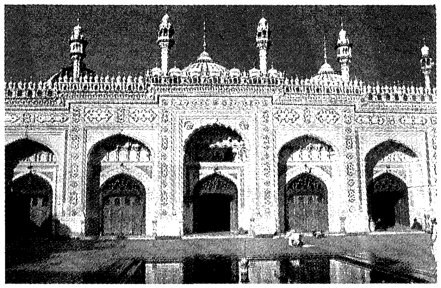
Industries include textile and sugar mills, fruit canning, and the manufacture of *chappal*s (sandals), shoes, leatherwork, glazed pottery, wax and embroidery work, copper utensils, *lungī*s (loincloths), turbans, carpets, ornamental woodwork and furniture, ivory work, knives, and small arms. The ancient Qiṣṣah (Kissa) Khwānī Bāzār ("Street of Storytellers") is the meeting place for foreign merchants who deal in dried fruits, woolen products, rugs, carpets, *pūstīn*s (sheepskin coats), karakul (lambskin) caps, and Chitrālī cloaks.

Peshāwar's historic buildings include Bālā Ḥissār, a fort built by the Sikhs on the ruins of the state residence of the Durrānīs, which was destroyed by them after the battle of Nowshera; Gor Khatri, once a Buddhist monastery and later a sacred Hindu temple, which stands on an eminence in the east and affords a panoramic view of the entire city; the pure white mosque of Mahābat Khān (1630), a remarkable monument of Mughal architecture; Victoria memorial hall; and Government House. There are many parks, and the Chowk Yadgar and the town hall are other places of social and public assembly. Coffeehouses also are popular. Gardens and suburbs are outside the old city wall.

Constituted a municipality in 1867, the city has three hospitals, a museum (with a large collection of Gandhāran Buddhist relics), an agricultural college, and the University of Peshāwar (founded 1950), with several constituent and affiliated colleges.

The surrounding region consists of highly irrigated plains, part of a huge basin drained and irrigated by the Kābul River, and a tract covered by low hills at Cherāt in the southeast. The chief crops are wheat, corn (maize), sugarcane, barley, cotton, and fruit (apples, pears, peaches, pomegranates, and quinces). The inhabitants are mostly Pashtuns.

References to the Peshāwar area occur in early Sanskrit literature and the writings of the classical historians Strabo and Arrian and the geographer Ptolemy. The Vale of Peshāwar was annexed by the Greco-Bactrian king Eucratides (2nd century BC), and Kaniṣka made Puruṣapura the capital of his Kushān (Kuṣāna) empire (1st century AD). Buddhism was still dominant in the 5th century AD when Fa-hsien, the Chinese Buddhist monk and traveler, passed through the area. Captured by the Muslims in AD 988, it was by the 16th century in the possession of the Afghans, who were nominally dependent on the Mughals. Sikh authority was firmly established by 1834, and the area was under British control from 1849 to 1947. Pop. (1981) town, 566,248; metropolitan area, 1,084,347.



Mahābat Khān Mosque, Peshāwar, Pak.

Frederic Ohringer from the Nancy Palmer Agency—EB Inc.

Peshitta (Syriac: "simple," or "common"), Syriac version of the Bible, the accepted Bible of Syrian Christian churches from the end of the 3rd century AD. The name Peshitta was first employed by Moses bar Kepha in the 9th century to suggest (as does the name of the Latin Vulgate) that the text was in common use. The name also may have been employed in contradistinction to the more complex Syro-Hexaplar version.

Of the vernacular versions of the Bible, the Old Testament Peshitta is second only to the Greek Septuagint in antiquity, dating from probably the 1st and 2nd centuries AD. The earliest parts in Old Syriac are thought to have been translated from Hebrew or Aramaic texts by Jewish Christians at Edessa, although the Old Testament Peshitta was later revised according to Greek textual principles. The earliest extant versions of the New Testament Peshitta date to the 5th century AD and exclude The Second Letter of Peter, The Second Letter of John, the Third Letter of John, The Letter of Jude, and The Revelation to John, which were not canonical in the Syrian church.

Peshtigo, city, Marinette county, northeastern Wisconsin, U.S. It is situated on the Peshtigo River, 49 miles (79 km) north-northeast of Green Bay. On Oct. 8, 1871, the date of the more famous but less deadly Chicago fire, winds whipped Wisconsin forest fires that had been burning for several days, destroying 1,200,000 acres (500,000 hectares); in a few hours Peshtigo was burned to the ground, with 1,152 known deaths. A monument commemorating those who died is in Peshtigo Fire Cemetery. Peshtigo is a manufacturing community; its chief products are lumber, paper and paper products, and boats. Dairying supplements the economy. Inc. 1903. Pop. (1986 est.) 2,930.

peshwa, the office of chief minister among the Marāthā people of India. The peshwa, also known as the *mukhya pradhan,* originally headed the advisory council of the raja Śivājī (reigned *c.* 1659–80). After Śivājī's death, the council broke up and the office lost its primacy, but it was revived when Śivājī's grandson Shāhū appointed Bālājī Visvanāth Bhat, a Chitpavan Brahman, as peshwa in 1714. Bālājī's son Bājī Rāo I secured the hereditary succession to the peshwaship.

From Shāhū's death, in 1749, the peshwa Bālājī Bājī Rāo was the virtual ruler of Mahārāshtra. He hoped to succeed the Mughals in Delhi, but, after a disastrous defeat of his army at Pānīpat (1761), he became the head of a confederacy of himself and four northern chiefs. Succession disputes from 1772 weakened the peshwa's authority. Defeat by Holkars—the Marāthā rulers of Indore—led Bājī Rāo II to seek British protection by the Treaty of Bassein (1802). Bājī Rāo was deposed after attacking the British in 1818; he died in 1853.

Pesne, Antoine (b. May 23, 1683, Paris, Fr.—d. Aug. 5, 1757, Berlin, Prussia [Germany]), French-born Rococo painter of historical subjects and portraits who was the most important artist in Prussia in the first half of the 18th century.

His father, the painter Thomas Pesne, and his maternal great-uncle, Charles de La Fosse, were probably his first teachers. While studying in Paris, he was influenced by the leading French portraitists, Hyacinthe Rigaud and Nicolas de Largillière. In Rome and Naples and particularly in Venice, where he studied with Andrea Celesti, Pesne developed a marked talent as a colourist.

In 1707 Pesne's full-length portrait of the Prussian ambassador to Venice, Baron von Knyphausen, attracted the attention of Frederick I of Prussia, who appointed him court portraitist. When Frederick II came of age, Pesne was able to give full scope to his colouristic gifts in mythological and allegorical ceiling paintings and murals, executed for the interiors of the palaces of Rheinsberg, Charlottenburg, Berlin, Potsdam, and Sanssouci. He continued to paint portraits, some of which achieve by their brushwork and brilliant colouring an almost impressionistic effect anticipating Pierre-Auguste Renoir. Of special interest are the various representations, in the style of Antoine Watteau, of Italian and French dancers and actresses whom Frederick II engaged for the Berlin Opera. These portraits are often cited for their perceptive characterizations.

peso, the monetary unit of several Latin-American countries and the Philippines; it is divided into 100 centavos. The peso was introduced into Spain by the monarchs Ferdinand and Isabella, who reformed the Spanish coinage system in 1497; it did not come into common use, though, until the time of Charles I (the emperor Charles V).

Originally divided into eight reales, the peso subsequently became the basis of the silver coinage of the Spanish empire after the monetary reform of 1772–86. In the Americas it was called "piece of eight," or "Spanish milled dollar," and was, in fact, equivalent to the U.S. silver dollar. It was retained as the basic coin by most of the Spanish colonies in the Americas when they gained their independence. When these countries adopted the decimal system for their coinage, a local name was in several cases substituted for the term peso. Thus it was renamed sol in Peru, bolivar in Venezuela, sucre in Ecuador, colón in El Salvador and Costa Rica, balboa in Panama, lempira in Honduras, quetzal in Guatemala, córdoba in Nicaragua, and boliviano in Bolivia. Other countries, such as Argentina, Chile, Colombia, Cuba, Mexico, and Uruguay, continued to use the term peso. Even where the name was officially changed, peso often continued to be used in popular speech. Spain first adopted the peseta as a monetary unit in 1859 and, except briefly from 1864 to 1868, has retained the peseta as the basic unit.

Pessac, town, southwestern suburb of Bordeaux, Gironde *département,* southwestern France. It was the site of a Gallo-Roman villa of the patrician Pesus. Located in the Graves vineyard district, it is noted for its red wines (Haut-Brion, Pape Clément). The 17th-century château of Haut-Brion, with its famous vineyard, is located there. It is also the site of a housing project designed by Le Corbusier. Pessac has some diversified manufacturing. Pop. (1982) 49,019.

Pessanha, Camilo (b. Sept. 7, 1867, Coimbra, Port.—d. 1926, Macao), Portuguese poet whose work is the representative in Portuguese poetry of Symbolism in its purest and most genuine form and the chief precursor of Modernist poetry.

After studying law at the university at Coimbra in 1891, Pessanha became a high-school teacher in the Portuguese colony of Macao in China. Pessanha began to practice various Oriental customs, including the opium habit, and learned Cantonese, from which he translated some elegies, *Oito Elegias Chinesas* ("Eight Chinese Elegies"). He also collected Chinese objets d'art, which he bequeathed to the Machado de Castro Museum in Coimbra. His writings on China, in particular the *Introdução a um Estudo sobre a Civilização Chinesa* and the *Elegias,* were collected in *China* (1943).

Although he had begun to write verse in Coimbra, Pessanha was virtually unknown until 1916, when his innovative Symbolist poetry was published in the progressive review *Centauro.* Later collected in *Clépsidra* (1920), it became a breviary for the Modernist poets. Pessanha is one of the most lyrical of Portuguese poets.

Pessoa, Fernando Antônio Nogueira (b. June 13, 1888, Lisbon, Port.—d. Nov. 30, 1935, Lisbon), poet whose part in Modernism gave Portuguese literature European significance.

From the age of seven Pessoa lived in Durban, S.Af., where his stepfather was Portuguese consul. He became fluent in English and wrote his early verse in English. In 1905 he returned to Lisbon, where he remained, working as a commercial translator while contributing to avant-garde reviews, especially *Orpheu* (1915), the organ of the Modernist movement, of which Pessoa was a leading aesthetician. He began publishing books of English poetry in 1918, but it was not until 1934 that his first book in Portuguese, *Mensagem,* appeared. It attracted little attention. Fame came after his death in 1935, when his extraordinarily rich dream world, peopled with alter egos whose poetry he produced along with his own, became generally known. Though the works of the imaginary poets differ in outlook and style from the work done under Pessoa's own name, taken together they express different personalities that he felt to exist within himself. The most important of his works are *Poesias de Fernando Pessoa* (1942), *Poesias de Álvaro de Campos* (1944), *Poemas de Alberto Caeiro* (1946), and *Odes de Ricardo Reis* (1946).

Included among English translations of some of his work are *Selected Poems,* 2nd ed. (1982), edited by Jonathan Griffin, and *Always Astonished: Selected Prose* (1988), edited by Edwin Honig.

Pest, *megye* (county), north-central Hungary, extending southward from the Budapest area to near the Tisza River and with an area of 2,469 square miles (6,394 square km). The *megye* is very much oriented toward Budapest, the national capital and *megye* seat, which is a county in its own right. Pest is by far the most populous and industrialized *megye* in Hungary.

The principal industrial centres of the *megye* have varied industries, including a cement factory at Vác, a prefabricated-house factory at Dunakeszi, and food canneries at Cegléd and Nagykőrös. Százhalombatta is a rapidly developing industrial centre with a power station and oil refinery based on a pipeline from the Soviet Union. Szentendre, founded by Serbs, has many Baroque buildings, several museums, and an artists' colony. The Danube Bend is a popular resort area with Visegrád at its centre. Visegrád has a medieval fortress and ruins of a Renaissance castle. In Gödöllő there is an agricultural university.

Market garden vegetables, fruits, pigs, and poultry are the main farm products, and there is a high crop value yield per acre and per

capita, especially in sugar peas and tomatoes. Pop. (1983 est.) 983,000.

pest, any organism judged as a threat to human beings or to their interests. When early man hunted animals and foraged for food, he shared the natural resources with other organisms in the community. As human culture developed and population rose, people made ever-increasing demands on these resources. One result of changing the environment has been a great increase in the number of species that are now recognized as competitors of humans. These competitors are usually referred to as pests. The definition of pest is, of course, subjective. An ecologist would not necessarily consider several leaf-eating caterpillars on a plant as pests, whereas a gardener who cultivated the plant might very well do so. And only one bat, rat, or mouse is enough to qualify as a household pest.

Natural communities have always contained organisms that were economically significant; locusts, for example, have plagued humans throughout history, and grain from Stone Age locations has been found infected with bunt and ergot diseases. Most species that became pests, however, did so because of environmental modification, occasionally from natural causes but usually from human activities.

In order to appreciate some of the methods devised to combat pests, one should consider how advancing technology has increased the number of harmful insect species. The change from natural vegetation to large areas of single-crop (monoculture) agriculture has three consequences. First, given a more uniform food source, some plant-eating species increase to large populations. Second, the uniform plant cover is easily invaded by attacking pests. Third, the introduction of new crops over large areas results in the transfer of previously harmless insects from scattered native plants to the new and abundant sources of food. Cultural practices such as fertilization, irrigation, and the use of modern harvesting equipment (which often leaves large amounts of plant litter in the field) enhance still further the ability of pest species to increase rapidly. In addition, the elimination of species that compete with or prey upon pests—an unintended effect in some pest control programs—has also exacerbated certain pest problems. Also, the ease with which people and goods can be transported around the world has resulted in the introduction of exotic pests in many places.

Pests are found throughout the animal kingdom. Microorganisms such as fungi, bacteria, and viruses are here considered with the pests even though they are usually thought of as agents of disease. Most animal pests are invertebrates, among them protozoa, flatworms, nematodes, snails, slugs, insects, and mites. Among the vertebrates, rabbits, elk, deer, and many kinds of rodents are sometimes injurious to crops.

Insects are also serious pests because some of them play an essential role in the transmission of disease. Each year millions of lives, particularly in the tropics, are threatened by insect-borne diseases. Malaria and yellow fever are transmitted by mosquitoes, plague by fleas, typhus by the human louse, sleeping sickness by tsetse flies, Chagas' disease by blood-sucking bugs, and leishmaniasis by sandflies. Other diseases may be spread by insects accidentally as a result of their habits.

Pest control began to receive attention in the 18th century, and it has become increasingly important since then. As control programs were developed, they tended to fall primarily into two somewhat mutually exclusive categories: chemical and biological. Physical or mechanical methods, including sticky barriers, heat killing (for storage pests), and flooding (for ground pests), were also developed. Because of their limited utility and short-term effectiveness, they have been superseded largely by chemical and biological methods.

The chemical, or pesticide, approach probably began with the use of poisonous plant compounds—ground tobacco was used in France to kill aphids about 1763. Other natural products such as nicotine, rotenone, petroleum, kerosene, creosote, and turpentine were used in the 19th century. Inorganic compounds such as Paris green, lime sulfur, Bordeaux mixture, hydrogen cyanide, and lead arsenate were also introduced in the 1800s.

With the appearance of the synthetic organic compounds during World War II, a dramatic change occurred in pest control. Some organic compounds, such as the dinitrophenols, had been used earlier, but the discovery of the insecticidal properties of DDT (dichloro-diphenyl-trichloroethane) and of BHC (benzene hexachloride) made the concept of pest-free crops possible. Research in the 1930s on plant hormones and related compounds led to the development of the selective herbicide 2,4-D (2,4-dichlorophenoxyacetic acid), and this became commercially available about the same time as DDT. Following the appearance of these new synthetic organic compounds, a whole new series of pesticides—insecticides, fungicides, herbicides, and plant growth regulators—was introduced.

Although the ancient Chinese used predacious ants to control foliage-feeding insects, the control of pests by biological means appears to have been initiated in the Western world with the importation of the Indian Mynah bird into Mauritius in 1762 to control the red locust. Control of bedbugs by predatory agents was recommended in 1776. A number of other projects in biological control were carried out in the 1800s, but the modern era in this phase of pest control began in 1888 with the importation into California of the vedalia beetle (*Rodolia cardinalis*) to control the cottony-cushion scale (*Icerya purchasi*). This beetle, imported from Australia, saved the citrus-fruit industry.

The use of plants resistant to insects was suggested about 1788 as a means of controlling the Hessian fly, a pest of wheat. The classic example of this approach was the control of phylloxera, aphid-like insects that atacked the root stocks of the European wine grape and almost ruined the European wine industry. The solution lay in grafting the European wine grape onto resistant American stocks. The effort, about 1900, to control the lantana shrub in Hawaii by introducing an insect appears to have been the first attempt to control weeds biologically. The use of microorganisms to destroy insect pests began in the late 1800s and early 1900s.

With the appearance of the synthetic organic insecticides, however, emphasis was placed on chemical control, and biological means fell into neglect. The extensive use of powerful chemical agents soon resulted in a number of serious ecological problems. Consequently, current pest control practice minimizes the use of pesticides and combines them with biological methods in an approach called integrated control. The integrated control of an insect that attacks crops may, for example, involve the breeding of pest-resistant crop varieties; the development of crop culture methods that inhibit pest proliferation; the release of organisms that are predators or parasites of the pest species; the placement of traps baited with the pest's own sex attractants (pheromones); the disruption of the pest's reproduction by the release of sterilized pests; and, often as a last resort, the application of chemical insecticides. Other important tools of modern pest control or importation and quarantine regulations, which are designed to prevent the introduction of exotic pests.

Pestalozzi, Johann Heinrich (b. Jan. 12, 1746, Zürich—d. Feb. 17, 1827, Brugg, Switz.), Swiss educational reformer, who advocated education of the poor and emphasized teaching methods designed to strengthen the student's own abilities. Pestalozzi's method became widely accepted, and most of his principles have been absorbed into modern elementary education.

Pestalozzi's pedagogical doctrines stressed that instructions should proceed from the familiar to the new, incorporate the performance of concrete arts and the experience of actual emotional responses, and be paced to follow the gradual unfolding of the child's development. His ideas flow from the same stream of thought that includes Johann Friedrich Herbart, Maria Montessori, John Dewey, and more recently Jean Piaget and advocates of the language experience approach such as R.V. Allen.

Pestalozzi, lithograph after a drawing by G.A. Hippius, 1818; in the Pestalozzianum, Zürich
By courtesy of the Bibliotheque Nationale Suisse

Pestalozzi's curriculum, which was modelled after Jean-Jacques Rousseau's plan in *Émile,* emphasized group rather than individual recitation and focussed on such participatory activities as drawing, writing, singing, physical exercise, model making, collecting, map making, and field trips. Among his ideas, considered radically innovative at the time, were making allowances for individual differences, grouping students by ability rather than age, and encouraging formal teacher training as part of a scientific approach to education.

Pestalozzi was influenced by the political conditions of his country and by the educational ideas of Rousseau; as a young man he abandoned the study of theology to go "back to Nature." In 1769 he took up agriculture on neglected land near the River Aare—the Neuhof. When this enterprise collapsed in 1774, he took poor children into his house, having them work by spinning and weaving and learn simultaneously to become self-supporting. This project also failed materially, although Pestalozzi had gained valuable experience. He also took an active interest in Swiss politics.

As practical realization of his ideas was denied him, he turned to writing. *Die Abendstunde eines Linsiedlers* (1780; "The Evening Hour of a Hermit") outlines his fundamental theory that education must be "according to nature" and that security in the home is the foundation of man's happiness. His novel *Lienhard und Gertrud* (1781–87; *Leonard and Gertrude,* 1801), written for "the people," was a literary success as the first realistic representation of rural life in German. It describes how an ideal woman exposes corrupt practices and, by her well-ordered homelife, sets a model for the village school and the larger community.

The important role of the mother in early education is a recurrent theme in Pestalozzi's writings.

For 30 years Pestalozzi lived in isolation on his Neuhof estate, writing profusely on educational, political, and economic topics, indicating ways of improving the lot of the poor. His proposals were ignored by his own countrymen, and he became increasingly despondent. He would have accepted the post of educational adviser anywhere in Europe had it been forthcoming. His main philosophical treatise, *Meine Nachforschungen über den Gang der Natur in der Entwicklung des Menschengeschlechts* (1797; "My Inquiries into the Course of Nature in the Development of Mankind"), reflects his personal disappointment but expresses his firm belief in the resources of human nature and his conviction that people are responsible for their moral and intellectual state. Thus, Pestalozzi was convinced, education should develop the individual's faculties to think for himself.

Pestalozzi's chance to act came after the French Revolution, when he was more than 50 years old. The French-imposed Helvetic Republic in Switzerland invited him to organize higher education, but he preferred to begin at the beginning. He collected scores of destitute war orphans and cared for them almost single-handedly, attempting to create a family atmosphere and to restore their moral qualities. These few exhausting months in Stans (1799) were, according to Pestalozzi's own account, the happiest days of his life.

From 1800 to 1804 he directed an educational establishment in Burgdorf and from 1805 until 1825 a boarding school at Yverdon, near Neuchâtel. Both schools relied for funds on fee-paying pupils, though some poor children were taken in, and these institutes served as experimental bases for proving his method in its three branches—intellectual, moral, and physical, the latter including vocational and civic training. They also were to finance his life's "dream," an industrial (*i.e.,* poor) school. The Yverdon Institute became world famous, drawing pupils from all over Europe as well as many foreign visitors. Some visiting educators—*e.g.,* Friedrich Froebel, J.F. Herbart, and Carl Ritter—were so impressed that they stayed on to study the method and later introduced it into their own teaching.

While dedicated assistants carried on the teaching, Pestalozzi remained the institute's heart and soul and continued to work out his method. *Wie Gertrud ihre Kinder lehrt* (1801; *How Gertrude Teaches Her Children*) contains the main principles of intellectual education: that the child's innate faculties should be evolved and that he should learn how to think, proceeding gradually from observation to comprehension to the formation of clear ideas. Although the teaching method is treated in greater detail, Pestalozzi considered moral education preeminent.

The family spirit prevailing at Yverdon was shattered in later years by a progressively severe dispute among the teachers for first place by Pestalozzi's side. The longed-for poor school, established by means of the proceeds from publication of his collected works, existed for only two years. To Pestalozzi's great distress, the Yverdon Institute lost its fame and its pupils. His efforts at reconciliation were in vain. With a few pupils he retreated to Neuhof in 1825, sad but convinced that his ideas would prevail in the end. His *Schwanengesang* (1826; "Swan Song") culminated in the maxim "Life itself educates."

Pestalozzi was an impressive personality, highly esteemed by his contemporaries. His concept of education embraced politics, economics, and philosophy, and the influence of his "method" was immense. (K.Si./Ed.)

BIBLIOGRAPHY. Kate Silber, *Pestalozzi: The Man and His Work,* 4th ed. (1976), containing a select bibliography of texts and literature, is the major comprehensive account of Pestalozzi's life and personality and interpretation of his writings; a more modest but extremely useful study is Robert B. Downe's *Heinrich Pestalozzi, Father of Modern Pedagogy* (1975). An analysis of Pestalozzi's educational ideas and methods is presented in Michael Heafford, *Pestalozzi: His Thought and Its Relevance Today* (1967); and Gerald Lee Gutek, *Pestalozzi and Education* (1968).

Pestel, Pavel Ivanovich (b. July 5 [June 24, Old Style], 1793, Moscow, Russia—d. July 25 [July 13], 1826, St. Petersburg), Russian military officer and a radical leader of the Decembrist revolutionaries.

The son of a government official, Pestel attended school in Dresden, Saxony, from 1805 to 1809. He entered the elite Corps of Pages in St. Petersburg in 1810 and, upon graduation in 1811, was commissioned as an ensign in the Lithuanian Regiment of Guards. After fighting in the Napoleonic Wars, he returned to St. Petersburg with a sense of Russia's backwardness in comparison with western and central Europe. In 1816 Pestel joined the Union of Salvation to discuss ideas for Russian reforms and the institution of a constitutional monarchy. In 1818 he organized a branch of the Union of Welfare at Tulchin, and in 1821 he organized the more radical Southern Society of Decembrists. His plan for the socioeconomic and political transformation of Russia, titled *Russkaya Pravda* (1824; "Russian Truth"), called for the execution of the imperial family, the emancipation of the serfs, the replacement of the tsarist autocracy by a republican form of government, and the allotment of land to the freed serfs.

During the succession crisis following the death of Alexander I and on the day before the Decembrists' planned uprising took place in St. Petersburg, Pestel was arrested in Tulchin (Dec. 25 [Dec. 13, Old Style], 1825), having been betrayed by an officer newly recruited into the Southern Society. He was executed a few months later in Petropavlovsk fortress with four other Decembrists.

pesticide, any toxic substance used to kill animals or plants that cause economic damage to crop or ornamental plants or are hazardous to the health of domestic animals or humans. All pesticides interfere with normal metabolic processes in the pest organism and often are classified according to the type of organism they are intended to control. *See* herbicide; insecticide; fungicide; fumigant.

pet, any animal kept by human beings as a source of companionship and pleasure.

While a pet is generally kept for the pleasure that it can give to its owner, often, especially with horses, dogs, and cats, as well as with some other animals, this pleasure appears to be mutual. Thus, pet keeping can be described as a symbiotic relationship, one that benefits both animals and human beings. As the keeping of pets has been practiced from prehistoric times to the present and as pets are found in nearly every culture and society, pet keeping apparently satisfies a deep, universal human need.

The history of pets is intertwined with the process of animal domestication, and it is likely that the dog, as the first domesticated species, was also the first pet. Perhaps the initial steps toward domestication were taken largely through the widespread human practice of making pets of captured young wild animals. Eventually, a working relationship developed between the dogs and their human captors. The dog was swifter, had stronger jaws, and was better at tracking prey; therefore, it could be of great use in hunting and guarding duties. From human beings, on the other hand, the dogs were assured of a constant supply of food as well as warmth from the fire. There is indirect evidence that the dog may have been domesticated and kept as a pet since Paleolithic times, as can be surmised from the paintings and carvings that archaeologists have found in ancient campsites and tombs. In Mesopotamia, dogs that look remarkably like the present-day mastiff were shown participating in a lion hunt. Domestic pets were often depicted in the scenes of family life in ancient Egypt; hunting dogs of the greyhound or saluki type accompany their master to the chase, and lap dogs frequently sit under the chair of their master or mistress.

Next to the dog, horses and cats are the animals most intimately associated with human beings. Surprisingly, both these animal groups were domesticated rather late in human history. There is no evidence that horses were domesticated in Paleolithic or Mesolithic times, but by about 2000 BC horses used in chariot battles were an established phenomenon throughout the Middle East. It seems that riding astride horses was a practice developed a few centuries later (*see* horsemanship). The cat, too, does not seem to have been domesticated as a pet until the New Kingdom period (about the 16th century BC) in Egypt. This is all the more strange as the ancient Egyptians had tamed many types of animals, such as lions, hyenas, monkeys, the Nile goose, and dogs, since the Old Kingdom period. But once cats were finally domesticated, their popularity was enormous. Gradually, the cat became one of the most universally worshiped animals.

As has been noted, the primary bond distinguishing a pet-and-owner relationship is affection. As useful as many of these animals are, what differentiates a pet from other economically useful livestock is the degree of contact between the animals and human beings. Often, this relationship has been unabashedly sentimentalized in myth, art, and literature. The affection between Alexander the Great and his favourite horse, Bucephalus, has become legendary, while in the modern age the popularity of such canine motion-picture stars as Rin Tin Tin and Lassie is further evidence of the importance placed on the relationship between owner and pet.

The pet-and-owner relationship, however, is not only founded on companionship; since the earliest period of domestication, pets have fulfilled practical, economic ends. Catching other animals to feed their human masters is one of the most fundamental uses of pets, and not only dogs have served in this capacity but cats, hyenas, and lions have also been used for hunting. The aristocratic, rather arcane sport of falconry made use of the natural talent of hawks to aid in hunting game birds. Pets have also been used for the purpose of guarding—either other livestock, the home or territory of their owners, or the owners themselves. Any pet that has a sharp sense of smell or hearing and that makes a loud noise when aroused can be used as a guard, although dogs are the best-known examples. It is thought that the Nile goose, a favourite household pet of the ancient Egyptians, may have served such a purpose. The herding and guarding of livestock is another practical use of pets, in particular the dog. Over the centuries, many specialized breeds of dog have been developed to suit this purpose.

Often, pets have been used as a source of food when other sources become scarce. This has been the case with dogs throughout their history of domestication in both the Old World and the New World. Guinea pigs, domesticated as pets in the New World, also assured a stable food supply.

Pets have also been used to eliminate animal pests. The rat-catching ability of cats is celebrated in fairy tales such as "Puss 'n Boots" and "Dick Whittington," as is the snake-catching talent of the mongoose in Rudyard Kipling's "Rikki-tikki-tavi."

Finally, pets themselves have become a self-perpetuating industry, bred for a variety of purposes, including their value as breeding animals. Pets that are bred for aesthetic purposes may have full-fledged show careers. Other pets may be bred for racing or other competitive sports, around which sizable industries have been built.

Animals kept as pets can be classified according to the type of premises or habitat they usually occupy. Dogs, cats, and birds such as canaries and parakeets are kept as household pets. Other birds, such as jays, magpies, and members of the crow family, are kept in aviaries. When kept as pets, reptiles and amphibians frequently require special conditions of heat and moisture. For this reason, they are best kept in glassed enclosures called vivaria. The most common vivarium pets are snakes, lizards, turtles, frogs, and toads. Many people keep fish as aquarium pets. Fishes constitute a completely separate section of the pet world, and an international industry exists for catching, breeding, transporting, and supplying stock. Hutch, or cage, pets can be kept indoors or outdoors under protected conditions. These pets include rabbits, guinea pigs, rats, mice, hamsters, gerbils, and, recently, chinchillas. Paddock pets are those that must be stabled outdoors and include such animals as horses, ponies, donkeys, and mules. Several kinds of insects are also kept as pets. These include walking-stick insects (kept in simple containers at room temperature) and ants (kept in artificial nests).

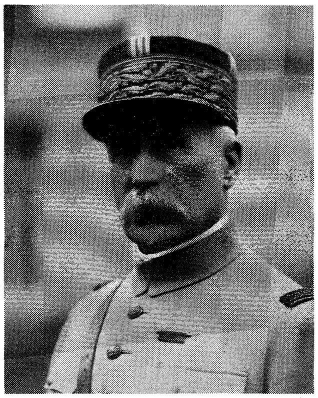
Of increasing concern is the sale of exotic pets (*e.g.,* jaguars, alligators, ocelots, monkeys, apes, kinkajous, etc.). Rarely are the owners of such pets able to provide the basic nutritional or habitat needs of these animals; most of the animals soon die or are sent to a zoo. Furthermore, in order to obtain the young, which are considered most desirable as pets, many adults of the wild species are killed, seriously depleting populations already endangered. Several countries have passed laws to prohibit the importation of endangered species as pets, but an active black market flourishes.

Petaḥ Tiqwa, city, west-central Israel, on the Plain of Sharon, east-northeast of Tel Aviv-Yafo and part of that city's metropolitan area. Situated in the valley of Achor near the Yarqon River, the city takes its name (meaning "Door of Hope") from the biblical allusion in Hosea 2:15: ". . . and make the valley of Achor a door of hope." Petaḥ Tiqwa was the first village (founded 1878) in the modern Jewish settlement of Palestine and is known as Em ha-Moshavot (Hebrew: "Mother of Villages"). Because the village was founded in a swampy, malarial area, the first years of settlement were unstable and dangerous. Settlers first planted eucalyptus trees for drainage, then turned to truck and citrus farming; the first orange groves in modern Palestine were also planted in the village. With the growth of Tel Aviv, much of the agricultural land was converted to suburban residential and industrial use. Petaḥ Tiqwa was incorporated as a city in 1939. Industries include the production of canned fruits, oils and soaps, textiles, and agricultural machinery.

About 5 miles (8 km) east-northeast of Petaḥ Tiqwa is the tell (mound) of Aphek, an ancient Canaanite city, mentioned in Egyptian texts as early as the 18th century BC. In the Bible, Aphek was the site of the rout of the Israelites by the Philistines (I Samuel 4). Later Herod the Great, king of Judaea, built the city of Antipatris on the site (*c.* 20 BC). Pop. (1988 est.) 132,100.

Pétain, (Henri-)Philippe (b. April 24, 1856, Cauchy-à-la-Tour, Fr.—d. July 23, 1951, Île d'Yeu), French general who was a national hero for his victory at the Battle of Verdun in World War I but was discredited as chief of state of the French government at Vichy in World War II. He died under sentence in a prison fortress.

Born into a family of farmers in northern France, Pétain, after attending the local village school and a religious secondary school, was admitted to Saint-Cyr, France's principal military academy. As a young second lieutenant in an Alpine regiment, sharing the rough outdoor life of his men, he came to understand the ordinary soldier. The extraordinary popularity he was later to enjoy with the rank and file in World War I is believed to have had its origin there.



Pétain
EB Inc.

His advancement until the outbreak of World War I in 1914—he was 58 when he finally became a general—was slow because as a professor at the War College he had propounded tactical theories opposed to those held by the high command. While the latter favoured the offensive at all costs, Pétain held that a well-organized defensive was sometimes called for and that before any attack the commander must be sure of the superiority of his fire power.

After successively commanding a brigade, a corps, and an army, Pétain in 1916 was charged with stopping the German attack on the fortress city of Verdun. Though the situation was practically hopeless, he masterfully reorganized both the front and the transport systems, made prudent use of the artillery, and was able to inspire in his troops a heroism that became historic. He became a popular hero, and, when serious mutinies erupted in the French army following the ill-considered offensives of General Robert-Georges Nivelle, then French commander in chief, Pétain was named his successor.

He reestablished discipline with a minimum of repression by personally explaining his intentions to the soldiers and improving their living conditions. Under him the French armies participated in the victorious offensive of 1918, led by Marshal Ferdinand Foch, generalissimo of the Allied armies. Pétain was made a marshal of France in November 1918 and was subsequently appointed to the highest military offices (vice president of the Supreme War Council and inspector general of the army).

Following the German attack of May 1940 in World War II, Paul Reynaud, who was then head of the government, named Pétain vice premier, and on June 16, at the age of 84, Marshal Pétain was asked to form a new ministry. Seeing the French army defeated, the "hero of Verdun" asked for an armistice. After it was concluded, the Chamber of Deputies and the Senate, meeting in Vichy, conferred upon him almost absolute powers as "chief of state."

With the German army occupying two-thirds of the country, Pétain believed he could repair the ruin caused by the invasion and obtain the release of the numerous prisoners of war only by cooperating with the Germans. In the southern part of France, left free by the armistice agreement, he set up a paternalistic regime the motto of which was "Work, Family, and Fatherland." Reactionary by temperament and education, he allowed his government to promulgate a law dissolving the Masonic lodges and excluding Jews from certain professions.

He was, however, opposed to the policy of close Franco-German collaboration advocated by his vice premier Pierre Laval, whom he dismissed in December 1940, replacing him with Admiral François Darlan. Pétain then attempted to practice a foreign policy of neutrality and delay. He secretly sent an emissary to London, met with the Spanish dictator Francisco Franco, whom he urged to refuse free passage of Adolf Hitler's army to North Africa, and maintained a cordial relationship with Admiral William Leahy, the U.S. ambassador to Vichy until 1942.

When, in April 1942, the Germans forced Pétain to take Laval back as premier, he himself withdrew into a purely nominal role. Yet he balked at resigning, convinced that, if he did, Hitler would place all of France directly under German rule. After Allied landings in November 1942 in North Africa, Pétain secretly ordered Admiral Darlan, then in Algeria, to merge the French forces in Africa with those of the Allies. But, at the same time, he published official messages protesting the landing. His double-dealing was to prove his undoing.

In August 1944, after the liberation of Paris by General Charles de Gaulle, Pétain dispatched an emissary to arrange for a peaceful transfer of power. De Gaulle refused to receive the envoy. At the end of August the Germans transferred Pétain from Vichy to Germany. Brought to trial in France for his behaviour after 1940, he was condemned to death in August 1945. His sentence was immediately commuted to solitary confinement for life. He was imprisoned in a fortress on the Île d'Yeu off the Atlantic coast, where he died at the age of 95. (G.Bl.)

BIBLIOGRAPHY. An early, brief biographical survey is found in B.H. Liddell Hart, *Reputations, Ten Years After* (1928, reprinted 1968). Stephen Ryan, *Pétain the Soldier* (1969), focuses on Pétain's career during World War I. Richard Griffiths, *Marshal Pétain* (1970; also published as *Pétain: A Biography of Marshal Philippe Pétain of Vichy,* 1972); and Herbert R. Lottman, *Pétain, Hero or Traitor: The Untold Story* (1985), are balanced and complete biographies. For analysis of Pétain's later years, see Robert Aron, *The Vichy Regime, 1940–44* (1958, reissued 1969); Janet Flanner, *Pétain: The Old Man of France* (1944); and Sisley Huddleston, *Pétain, Patriot or Traitor?* (1951). Petaling Jaya, city, West Malaysia (Malaya), about 7 miles (11 km) southwest of Kuala Lumpur, the national capital. Established (1953) originally as a satellite settlement for squatters of Kuala Lumpur, Petaling Jaya is among the most industrialized and prosperous cities in Malaysia. Local industries include the processing of food, rubber, and wood and the manufacture of paper, chemicals, pharmaceuticals, fertilizers, and beverages. A vocational institute provides training in automobile engineering, refrigeration, welding, and electronics. There is also a film production studio and a teaching hospital. Cultural resources include the Malaysian branch of the Royal Asiatic Society, the national archives of Malaysia, and the Cooperative College of Malaysia, founded 1956. Pop. (1980) 207,805.

Petaluma, city, Sonoma County, western California, U.S., at the head of navigation on the Petaluma River, 38 mi (61 km) north of San Francisco. Founded in 1852, it derived its name from the Rancho Petaluma (Miwok Indian *pe'ta*, "flat"; *lu'ma*, "back"). The poultry and egg industry, dairying, and wine making are foremost commercial activities, supplemented by light manufactures (notably processing machinery and fishing tackle). Nearby is the Petaluma Adobe State Historical Park (the restored home of Mexican general Mariano Guadalupe Vallejo, built about 1836). Inc. town, 1858; city, 1884. Pop. (1980) 33,834.

Petar (Serbo-Croatian, Montenegrin, etc., personal name): *see under* Peter.

Petare, city, northwestern Miranda state, in the central highlands of northern Venezuela. Formerly a commercial centre in a fertile agricultural area producing coffee, cacao, and sugarcane, the city has become a residential suburb of the national capital and a part of the Caracas metropolitan area. Cardboard is manufactured in the city. Expressways lead from Petare to downtown Caracas, approximately 10 mi (16 km) to the west-northwest. Pop. (1981 est.) 334,800.

petasos, also spelled PETASUS, wide-brimmed hat with a conical crown worn in ancient Greece. The petasos worn by men had a rather low crown, while that worn by women had a tall one.

Man wearing a petasos, terra-cotta sculpture from Tanagra, Greece, early 5th century BC; in the British Museum
By courtesy of the trustees of the British Museum

A hat used for travelling, the petasos was made of felt or straw and had a chin strap, so that when not in use it could be hung down the back. The winged hat of the god Hermes was also called a petasos.

Petchabun (Thailand): *see* Phetchabun.

Petchaburi (Thailand): *see* Phetchaburi.

Petén, department, northern Guatemala, bounded on the north and west by Mexico and on the east by Belize. The department's 13,843 sq mi (35,854 sq km) make up over one-third of the national territory. Petén is a low limestone plateau, varying in altitude between 500 and 700 ft (150 and 210 m) above sea level at the base of the Yucatán Peninsula. Except for areas of savanna vegetation, the region is covered by dense tropical rain forests. Few rivers penetrate Petén, for most of the heavy rainfall is drained underground.

Because of its vegetation and unsuitability for agriculture, Petén long has been isolated. The centre of the Mayan Old Empire, it contains ruins of many Mayan cities, most notably Tikal, where in the 1970s the government established a large park with tourist facilities, and Uaxactún (*qq.v.*). The Maya Itzá Indians, whose centre was around Lake Petén Itzá, were not subdued by the Spanish until 1697. The major resources of Petén lie in its forests, which yield mahogany, tropical cedar, rubber, and chicle. Some oil has been found in the area. Sugarcane, cacao, fruits, and grains are cultivated around Flores (*q.v.*), the departmental capital, which lies on Lake Petén Itzá. Thousands of people have migrated from the overworked lands to the south and through slash-and-burn agriculture have attempted to turn the forests into farmland. Flores is accessible by highway from Belize; other roads radiate to the Mexican border and to navigable rivers. The first road connecting the central part of the country with northern Petén was completed in 1970, but much transportation in Petén is by air. Pop. (1982 est.) 102,803.

Petén Itzá, Lake, Spanish LAGO PETÉN ITZÁ, central Petén department, northern Guatemala, 160 mi (260 km) northeast of Guatemala City. A depression in the low limestone plateau at an elevation of 262 ft (80 m) above sea level, it measures about 22 mi from east to west and 10 mi from north to south and is 165 ft deep; its area is 40 sq mi (100 sq km). It has no visible outlet, because its drainage is underground. Once the stronghold of the Maya Itzá Indians, who were not conquered by the Spanish until 1697, the shores of the lake are now dotted with modern towns: Flores, the departmental capital, which lies on an island in the southwestern portion of the lake; San Benito, in the southwest; and San Andrés, on the northwestern shore. Much of the surrounding land is covered by dense tropical rain forest, but there is some cultivation of cacao, sugarcane, grains, and tropical fruits around Flores.

BRITTANY

• Peter I, also called PETER OF DREUX, byname PETER MAUCLERC, French PIERRE DE DREUX, or PIERRE MAUCLERC (b. 1190—d. 1250, at sea en route to France), duke or count of Brittany from 1213 to 1237, French prince of the Capetian dynasty, founder of a line of French dukes of Brittany who ruled until the mid-14th century.

Married by his cousin King Philip II Augustus of France to Alix, heiress to Brittany, Peter did homage for the province in 1213 and assumed the title of duke, though he was considered merely a count by the French. He energetically asserted his authority over the Breton lands, annexing new fiefs to the ducal domain, granting privileges to the towns, and regularizing the administration.

As guardian for his son, John I the Red, after Alix's death in 1221, Peter attempted to build up his own power against the day of his son's majority; he extorted concessions from the French regency in 1227 by means of rebellion. He transferred his allegiance from the French to the English king from 1229 until 1234, despite the fact that his predecessor, Arthur I, had been murdered by the English. But when John came of age (1237), Peter had to renounce Brittany and henceforth was merely count of Braine.

Called Mauclerc (Bad Clerk) either because his early training for the church was abortive or because he quarreled continually with the episcopate, Peter spent much of his life under excommunication and was persuaded to go on a crusade (1239–40) in penance. In 1248 he went to Egypt on another crusade. Wounded in battle, he died on his way home.

• Peter II (d. Sept. 22, 1457, Nantes, Fr.), duke of Brittany (from 1450), son of John V (or VI) and brother of his predecessor Francis I. He made an important innovation in limiting the right of asylum in churches and monasteries, enabling him to pursue his enemies at will. To preserve the family line, he adhered to the testament of Francis I and made his uncle Arthur, constable de Richemont (*q.v.*), his successor, as Arthur III.

CONSTANTINOPLE

• Peter, also called PETER OF COURTENAY, French PIERRE DE COURTENAY (d. 1219?), briefly Latin emperor of Constantinople from 1217 to 1219.

The son of Peter of Courtenay (d. 1183) and a grandson of the French king Louis VI, he obtained the counties of Auxerre and Tonnerre by his first marriage. He later married Yolande (d. 1219), sister of Baldwin I and Henry of Flanders, first and second Latin emperors of Constantinople; she brought him the marquessate of Nevers.

Chosen successor to Henry of Flanders when Henry died without sons in 1216, Peter was consecrated emperor in S. Lorenzo Fuori le Mura, Rome, by Pope Honorius III on April 9, 1217. Accompanied by an army and a papal legate, he subsequently embarked at Brindisi on ships furnished by the Venetians, for whom he tried to conquer Durazzo from Theodore Ducas, Greek despot of Epirus. Failing in that enterprise, Peter set out overland toward Thessalonica. In the mountains near Elbasan he was taken by Theodore and died, probably by assassination, after an imprisonment of at least two years.

MONTENEGRO

• Peter I, Montenegrin in full PETAR PETROVIĆ NJEGOŠ (b. *c.* 1747, Njegoš, Montenegro—d. Oct. 30 [Oct. 18, old style], 1830, Cetinje), the great *vladika*, or prince-bishop, of Montenegro from 1782 to 1830, who won full independence of his country from the Turks.

As successor to his saintly but inept uncle Sava, Peter became the reigning prince in theocratic Montenegro in 1782 and was consecrated bishop two years later. To cement relations with Russia, always a potential ally against the Turks, he visited Russia that same year. On his return he found his land was being overrun by the forces of the Pasha of Scutari. Uniting his warlike clans, he drove the invaders out. War with the Turks flared up periodically, sometimes with, and sometimes without, a powerful ally such as Russia or Austria. In 1796 a second invasion by the Pasha of Scutari led to a series of brilliant victories over the Turks, with Peter leading his men. The Pasha was captured and beheaded, and by a treaty in 1799 Sultan Selim III was forced to recognize the independence of Montenegro. New territories were added, including Brda, recently settled by Serbs from Hercegovina, which was to double the size of Montenegro during Peter's reign.

During the Napoleonic Wars, Montenegro became involved in the struggle between the Great Powers. When by the Treaty of Pressburg with Austria (1804) the French took over Dalmatia, Peter allied himself first with the Russians until 1807 and then with the British in 1813 to maintain Montenegrin occupation of the town and Gulf of Kotor. After the French left in 1813, the territory was annexed by Peter (October 1813), and Kotor became his capital for a year. At the Congress of Vienna (1815), however, the land was returned to Austria. In Peter's last years as ruler he was involved in more wars with the Turks (1819 and 1821) and in settling blood feuds among his mountaineers; his efforts further enhanced his reputation as a just prince.

• **Peter II,** Montenegrin in full PETAR PETROVIĆ NJEGOŠ (b. Nov. 13 [Nov. 1, old style], 1813, Njegoš, Montenegro—d. Oct. 31 [Oct. 19, O.S.], 1851, Cetinje), the *vladika* or prince-bishop of Montenegro from 1830 to 1851, renowned as an enlightened ruler, an intrepid warrior, and especially as a poet. His principal works were "The Ray of the Microcosm," "The False Tsar Stephen the Small," and "The Mountain Garland."

On succeeding his uncle Peter I, he took the title of Peter II rather than his own Christian name of Rado. As part of the tradition of theocratic Montenegro, Peter was consecrated bishop in 1833 (the practice was discontinued by his successor). While maintaining his lands in wars against the traditional enemy, the Turks, Peter II conducted reforms that were financed in part by an annual subsidy from Tsar Nicholas I of Russia. Schools were founded, and the first printing press was installed at Cetinje, the capital. Peter strengthened his government by eliminating the office of civil governor, which had been held on a hereditary basis by the Radonić family, and by transferring the power of local chieftains to a senate of 12 leading chiefs, meeting in Cetinje under his supervision.

NAPLES

• **Peter I:** *see* Peter III (Spain: Aragon).

PORTUGAL

• **Peter I,** byname PETER THE JUST, or THE CRUEL, Portuguese PEDRO O JUSTICEIRO, or O CRUEL (b. April 8, 1320, Coimbra, Port.—d. Jan. 18, 1367), king of Portugal from 1357 to 1367.

The son of Afonso IV and his consort Beatriz of Castile, Peter was married in 1336 to Constanza of Castile; but she died in 1345, and Peter is chiefly remembered for his tragic amour with Inês de Castro (*q.v.*), whose death he savagely avenged after his accession to the throne. Even so, some of his acts, designed to curb abuses and to enhance the royal power, were of great importance: he reformed the administration of justice (1361) and did much to make the Portuguese church a national one by insisting on the *beneplácito régio*, that is, the royal approbation of all papal bulls or letters before they could be published in the kingdom.

Although before he became king of Portugal he had advanced a claim to the Castilian throne (1354), he later helped Castile against Aragon (1358 and 1360). From 1363, however, he pursued a neutral policy. On his death he was succeeded by his son Ferdinand I.

Articles are alphabetized word by word, not letter by letter

• **Peter II** (b. April 26, 1648, Lisbon—d. Dec. 9, 1706, Lisbon), king of Portugal whose reign as prince regent (1668–83) and as king (1683–1706) was marked by the consolidation of royal absolutism and the reduction of the significance of the Cortes (National Assembly); at the same time he encouraged economic development and guided his nation through a troubled period in Europe.

After the death of his father, John IV, in 1656, Peter's feebleminded and profligate elder brother Afonso VI brought Portugal to a very low condition. In November 1667 Afonso was sent into confinement in the Azores, and Peter became regent. Shortly thereafter, his brother's marriage (1666) to Marie Françoise Elisabeth of Savoy-Nemours was annulled, and Peter married her. He quickly made peace with Spain (Feb. 13, 1668), forgoing advantages that might have been expected from the Portuguese victories of 1663–65. When Afonso died on Sept. 12, 1683, Peter became king.

In the last years of the 17th century, the goldfields of Brazil provided Peter with great wealth and enabled him to govern without seeking revenue from the Cortes, which was not convoked after 1697. To stimulate Portuguese industry and commerce, Peter concluded the Methuen Treaty (1703) with England, which agreed to reduce customs duties on Portuguese wines in return for favourable treatment of English woollen goods. The treaty largely resulted from Peter's having finally adhered (May 1703) to the Anglo-Austrian side in the War of the Spanish Succession, though at first he had allied himself with France. Peter died in the midst of the war, leaving his throne to John V, his son by his second wife, Maria Sophia of Palatinate-Neuburg, whom he had married in 1687, four years after the death of his first wife.

• **Peter III** (b. July 5, 1717, Lisbon—d. May 25, 1786, Ajuda, Port.), king consort of Portugal from 1777, with Queen Maria I. The younger son of John V of Portugal, he was married in July 1760 to the daughter of his elder brother, King Joseph. When she became queen as Maria I (February 1777), Peter became nominally king. He devoted himself entirely to religious practices.

• **Peter IV:** *see* Pedro I.

• **Peter V** (b. Sept. 16, 1837, Lisbon—d. Nov. 11, 1861, Lisbon), king of Portugal who conscientiously and intelligently devoted himself to the problems of his country during his short reign (1853–61).

Peter succeeded his mother, Maria II, on Nov. 15, 1853; and while his father, Ferdinand II of Saxe-Coburg-Gotha, acted as regent for two years, Peter travelled (1854–55) to the more industrialized European nations.

He wished to convert the Duque de Saldanha's Regeneration movement into a two-party system and inclined toward the liberalism of the Duque de Loulé (his mother's uncle). He carefully studied internal problems, from the railways to military organization, and left the politicians in no doubt as to his views. He personally patronized the foundation of the Curso Superior de Letras, the forerunner of the University of Lisbon. In the spring of 1858 he married Stephanie of Hohenzollern-Sigmaringen and never recovered from her death in the following year.

Epidemics of cholera and yellow fever recurred in Portugal, and he worked assiduously to provide relief. In October 1861 he fell ill with typhoid fever, and he and a younger brother died in November. He was succeeded by his second brother, Louis (Luís).

RUSSIA

• **Peter I,** Russian in full PYOTR ALEKSEYEVICH, byname PETER THE GREAT, Russian PYOTR VELIKY (b. June 9 [May 30, old style], 1672, Moscow—d. Feb. 8 [Jan. 28, O.S.], 1725, St. Petersburg), tsar of Russia, who reigned jointly with his half-brother Ivan V (1682–96) and alone thereafter (1696–1725) and who in 1721 was proclaimed emperor (*imperator*). He was one of the most outstanding rulers and reformers in Russian history.

A brief account of the life and works of Peter I follows; for a full biography, *see* MACROPAEDIA: Peter the Great.

Peter—the son of Tsar Alexis by his second wife, Natalia Kirillovna Naryshkina, who had been reared in an atmosphere open to progressive influences from the West—was a healthy, lively, and inquisitive child. He loved military games and enjoyed carpentry, joinery, blacksmithing, and printing. At the age of 17 a marriage was arranged with the beautiful Eudoxia but within a decade she was relegated to a convent. After becoming sole ruler in 1696, Peter's most far-reaching accomplishment was to draw Russia further into the European sphere. After touring western Europe himself (1697–98), he transferred the capital to St. Petersburg on the Baltic coast, introduced Western technology, and completely overhauled the Russian government and military system, further increasing the power of the monarchy at the expense of the nobles and the Orthodox Church.

Peter pursued foreign policies aimed at giving Russia access to the Baltic and Black Seas, engaging in a war with Ottoman Turkey (1695–96) and in the Great Northern War with Sweden (1700–21). His campaign against Persia in 1722–23 secured the southern and western shores of the Caspian Sea for Russia. At his death, Russia was a far more secure and advanced nation than it had been before his reign.

• **Peter II,** Russian in full PYOTR ALEKSEYEVICH (b. Oct. 23 [Oct. 12, old style], 1715, St. Petersburg—d. Jan. 29 [Jan. 18, O.S.], 1730, Moscow), emperor of Russia from 1727 to 1730. Grandson of Peter I the Great (ruled 1682–1725), Peter II was named heir to the Russian throne by Catherine I (ruled 1725–27) and was crowned at the age of 11 (May 18 [May 7, O.S.], 1727).

Because Catherine had named the Supreme Privy Council to act as regent for the youth, Aleksandr D. Menshikov, who had been a close adviser to both Peter I and Catherine I and had become the most prominent member of the council, dominated the first months of Peter's reign. Menshikov installed the young emperor in his own household and arranged for his daughter and Peter to become betrothed. Peter, however, did not welcome the domineering kindness of his guardian and turned to the Dolgorukys, an old aristocratic family. In September 1727 the Dolgoruky family arrested Menshikov, exiled him to Siberia, and replaced him as the dominant political figures in Russia. They subsequently moved Peter's capital from St. Petersburg (now Leningrad) to Moscow (1728) and prepared for Peter's marriage to Princess Yekaterina Alekseyevna Dolgorukaya (1729). On the day set for the wedding, however, Peter II died of smallpox.

• **Peter III,** Russian in full PYOTR FYODOROVICH, original name KARL PETER ULRICH, HERZOG (duke) VON HOLSTEIN-GOTTORP (b. Feb. 21 [Feb. 10, old style], 1728, Kiel, Holstein-Gottorp—d. July 18 [July 7, O.S.], 1762, Ropsha, near St. Petersburg), emperor of Russia from Jan. 5, 1762 (Dec. 25, 1761, O.S.), to July 9 (June 28, O.S.), 1762.

Son of Anna, one of Peter I the Great's daughters, and Charles Frederick, duke of Holstein-Gottorp, the young duke was brought to Russia by his aunt Elizabeth shortly after she became empress of Russia (Dec. 5–6, 1741). Renamed Peter (Pyotr Fyodorovich), he was received into the Russian Orthodox Church (Nov. 18 [Nov. 7, O.S.], 1742) and proclaimed the heir to the Russian throne. On Aug. 21, 1745, he married Sophie Frederike Auguste, a princess from Anhalt-Zerbst, in Germany, who took the name Catherine (Yekaterina Alekseyevna).

Peter, who was mentally feeble and extremely pro-Prussian, not only alienated the affections of his wife soon after their marriage but also failed to gain the favour of politically powerful court cliques. His popularity diminished further after he succeeded Elizabeth and, reversing her foreign policy, made peace with Prussia and withdrew from the Seven Years' War (1756–63), formed an alliance with Prussia, and prepared to engage Russia in a war against Denmark to help his native Holstein gain control of Schleswig. Even when he relieved the gentry of their obligation to serve the state (March 1, 1762), he did not gain supporters. When he offended the Russian Orthodox Church by trying to force it to adopt Lutheran religious practices and also alienated the imperial guards by making their service requirements more severe and threatening to disband them, Catherine, who suspected that he was planning to divorce her, conspired with her lover Grigory Grigoryevich Orlov and other members of the guard to overthrow him.

Peter III, detail of an engraving by Johann Stenglin after a painting by G.C. Grooth; in the collection of Mrs. Merriweather Post, Hillwood, Washington, D.C.

By courtesy of Hillwood; Washington, D.C.

On July 9 (June 28, O.S.), 1762, Catherine, with the approval of the guard, the senate, and the church, became Catherine II, empress of Russia. Peter, who was at his residence at Oranienbaum, near St. Petersburg, formally abdicated on July 10 (June 29, O.S.); he was arrested and taken to the village of Ropsha, where, while in the custody of one of the conspirators, Aleksey Grigoryevich Orlov, he was killed.

Serbia

Sicily

• **Peter I:** *see* Peter III (Spain: Aragon).

Spain: Aragon

• **Peter I** (b. *c.* 1068–74—d. Sept. 28, 1104), king of Aragon from June 1094. The son of Sancho Ramírez, the third in order of the historic kings of Aragon, Peter belonged to times anterior to the authentic written history of his kingdom; and little is known of him save that he conquered Huesca (1096) and Barbastro (1100) from the Moors of Saragossa. He was twice married but left no children and was succeeded by his brother Alfonso I.

• **Peter II,** byname PETER THE CATHOLIC, Spanish PEDRO EL CATÓLICO (b. 1174—d. Sept. 12, 1213, Muret, Fr.), king of Aragon from 1196 to 1213, the eldest son and successor of Alfonso II.

Peter married (1204) Mary, lady of Montpellier, and thus greatly extended Aragonese power in southern France. Despite the violent objections of his subjects, he had himself crowned by Pope Innocent III in Rome and declared his kingdom a feudatory of the Holy See (1204). Peter, with other Spanish kings, took a prominent part in the victory over the Moors at Las Navas de Tolosa (July 16, 1212); but he then went to support his brother-in-law Raymond VI of Toulouse against the crusader Simon de Montfort in Languedoc. There he was killed in the Battle of Muret. His son James I succeeded him.

• **Peter III,** byname PETER THE GREAT, Spanish PEDRO EL GRANDE (b. 1239—d. Nov. 11, 1285, Villafranca del Panades, Catalonia), king of Aragon from July 1276, on the death of his father, James I, and king of Sicily (as Peter I) from 1282.

In 1262 he had married Constance, heiress of Manfred, the Hohenstaufen king of Sicily; and after the revolt of the Sicilians in 1282 he invaded the island and was proclaimed king at Palermo, despite strong Guelph and papal opposition (*see* Sicilian Vespers). His Sicilian enterprise was unpopular in Aragon, where an association of nobles and some municipalities, the Unión Aragonesa, forced him to grant a privilege not only confirming the Aragonese *fueros* (legal rights) but diminishing some of the crown's rights. In 1285 Philip III of France invaded Aragon to dethrone Peter but was disastrously defeated. Peter, however, soon died. His great stature and physical strength were famous. Among his children were Alfonso III of Aragon, James I of Sicily (II of Aragon), and Frederick III of Sicily.

• **Peter IV,** byname PETER THE CEREMONIOUS, or THE CRUEL, Spanish PEDRO EL CEREMONIOSO, or EL CRUEL, or EL DEL PUÑAL (He of the Dagger) (b. Sept. 5, 1319, or Sept. 15, 1317, Balaguer, Catalonia—d. Jan. 5, 1387, Barcelona), king of Aragon from January 1336, son of Alfonso IV.

Peter was the most cultivated of Spanish 14th-century kings but was also an inveterate political intriguer whose ability to dissemble was notorious. Through his voluminous correspondence, the workings of his mind are far better known than those of any contemporary Spanish ruler. Having picked a quarrel with James III of Majorca, he reincorporated the possessions of the Majorcan crown, namely the Balearic Islands and Roussillon, by force into his own dominions (1343–44). He next crushed the long-standing pretensions of the Aragonese nobles by defeating the armies of the Unión Aragonesa at Epila (1348), thereafter displaying the extreme vindictiveness that he always showed when his authority was challenged. Peter had to contend with revolt in Sardinia throughout his reign; but he succeeded, by political and military means, in preparing the future reunion of Sicily to the Aragonese crown and was recognized by the Catalan Almogávares as duke of Athens and Neopatras in 1380.

The chief event of his reign, however, was the intermittent war (1356–66) against King Peter of Castile. Urged on by France and by his own ambitions, Peter IV underwrote Henry of Trastámara's claims to the Castilian throne in exchange for a promised cession of one-sixth of Castile. The war was disastrous to Aragon, which was saved only by the intervention of the mercenary companies brought from France by Bertrand du Guesclin. Although the mercenaries succeeded in briefly installing Henry of Trastámara on the Castilian throne, Henry failed to honour any of his promises to Peter, and after 1369 Charles V of France took no trouble to conceal that he preferred his alliance with Castile to that with Aragon. As a result, Peter now pursued a complicatedly neutral approach to the Hundred Years' War, with some bias in favour of the English. His last years were clouded by a quarrel with his heir, the future John I, who let himself become the tool of French intrigues against Aragonese neutrality.

Spain: Castile

• **Peter,** byname PETER THE CRUEL, or THE JUST, Spanish PEDRO EL CRUEL, or EL JUSTICIERO (b. Aug. 30, 1334, Burgos, Castile—d. March 23, 1369, Montiel, Fr.), celebrated king of Castile and Leon from 1350 to 1369, charged by his contemporary enemies with monstrous cruelty but viewed by later writers as a strong executor of justice.

He succeeded his father, Alfonso XI, at the age of 15, and John II of France saw the chance to force Castile into a military alliance against England. The alliance was concluded (1352), and Peter was forced to marry (1353) Blanche, daughter of Pierre, duc de Bourbon, though he was already passionately in love with the beautiful María de Padilla—who was to remain his mistress, and perhaps his legal wife, until her death (1361). He abandoned Blanche immediately after the marriage. This act ruptured the Franco-Castilian alliance.

At home Peter was at once confronted by a row of bastard half brothers, led by Henry of Trastámara (later Henry II), who, to win support for his undefined ambitions, proclaimed himself defender of the magnates' privileges against the growing power of the crown. After leading several revolts which Peter crushed with energy, Henry, who failed to win any popular sympathy, escaped to France (1356) and offered to serve the French crown against his brother. From 1356 to 1366 Peter was engaged in a bitter war with Aragon, whose king, Peter IV, supported Henry's cause. During the war Peter won many successes against Aragon while Trastamaran propaganda failed to undermine Castilian loyalty toward him. In 1365, therefore, the French king Charles V, Pope Urban V, and Peter IV—to save Aragon from being overrun—paid veteran French mercenaries, led by Bertrand du Guesclin, to go to Spain and overthrow Peter, replacing him by Henry. Peter fled to Gascony and requested English help under the Anglo-Castilian alliance, concluded on June 22, 1362. The Trastamarans and their French allies were routed at Nájera (April 3, 1367) by Edward the Black Prince, and Peter resumed his reign.

Charles V sent Henry back to Spain with more French troops and a long civil war ensued. Eventually Peter was defeated at Montiel and assassinated there by his brother's own hand.

Yugoslavia

• **Peter I** (b. July 11 [June 29, old style], 1844, Belgrade—d. Aug. 16, 1921, Topčider, near Belgrade), king of Serbia from 1903, the first strictly constitutional monarch of his country. In 1918 he became the first king of the Kingdom of Serbs, Croats, and Slovenes (later called Yugoslavia).

Born the third son of the reigning prince Alexander Karageorgević (1842–58), Peter became heir to the throne on the death of his brother Svetozar (1847). After his father was forced to abdicate (1858), Peter lived in exile for the next 45 years. Educated in France, mainly at military schools, such as the prestigious Saint-Cyr, he served as a lieutenant in the French Army during the Franco-German War and was decorated with the Cross of the Legion of Honour for heroism. When the Serbs of Hercegovina revolted against the Turks in 1875, Peter organized a party of volunteers to assist them. Afterward he became an honorary senator in Montenegro (1883) and improved his dynastic ties by marrying Zorka, the first child of Prince Nicholas of Montenegro (1883).

In 1903 the Serbian king Alexander Obrenović (1889–1903) was assassinated, ending the Obrenović dynasty, and Peter was elected king of Serbia. His reputation as a liberal (he translated John Stuart Mill's essay *On Liberty* into Serbian in 1868) and his strong advocacy of constitutional government helped improve the political situation at home and win recognition abroad. Incapacitated by age and poor health, Peter named his heir, Prince Alexander, to be regent on June 24, 1914. During World War I, after the defeat of Serbia by the Central Powers (Germany and Austria) in 1915, he took part in the retreat to the Adriatic, being carried in a litter. At the end of World War I he returned to Belgrade, where he was proclaimed king of the Serbs, Croats, and Slovenes (Dec. 1, 1918).

• **Peter II,** Serbo-Croatian in full PETAR KARAĐORĐEVIĆ (b. Sept. 6, 1923, Belgrade—d. Nov. 3, 1970, Los Angeles), the last king of Yugoslavia.

The son of Alexander I, who was assassinated during a visit to France on Oct. 9, 1934, Peter became titular king at 11, but the actual rule was in the hands of a regent, his uncle Prince Paul. After Paul was deposed by a coup of officers led by Gen. Dušan Simović on March 27, 1941, Peter ruled for a few weeks until Axis troops invaded. He then fled into exile in London, where he led an émigré government. In 1944 he married Princess Alexandra of Greece, and, after the Yugoslav monarchy was abolished by Tito in 1945, he settled in the U.S. He wrote *A King's Heritage* (1955) and worked in public relations in New York.

Peter (b. Volhynia Grand Duchy of Lithuania—d. 1326, Moscow), Russian Orthodox metropolitan of Kiev and Moscow (1308–26) and the first metropolitan to reside in Moscow.

Until Peter's tenure as metropolitan, the centre of the Russian Orthodox Church had for many years been in Kiev, the ancient capital of Rus, with a brief interlude in Vladimir. When Peter became metropolitan, he, like his predecessors, lived in no fixed place but rather travelled throughout Russia to promote unity among rival principalities.

His allegiance leaned toward Moscow and its prince, Ivan, whom he believed capable of liberating Russia from Mongol oppression. Ivan began to turn his obscure principality into a religious centre by building a cathedral to the archangel Michael and, following Peter's suggestion, a cathedral dedicated to the Assumption. Under Ivan's and Peter's influence, Moscow became the religious capital of Russia; and its position as the permanent home of the metropolitan was strengthened by Peter's direction that he be buried in the Cathedral of the Assumption there.

Peter CHRYSOLOGUS, SAINT (b. *c.* 400/406, Imola, near Ravenna—d. *c.* 450, Imola; feast day July 30), archbishop of Ravenna, whose orthodox discourses earned him the status of doctor of the church. The title Chrysologus (Golden Orator) was added to his name at a later date, probably to create a Western counterpart to the Eastern patriarch St. John Chrysostom.

About 433 he became archbishop of Ravenna, where, with the aid of Galla Placidia, the mother of the Roman emperor Valentinian III, he promoted the construction of church buildings. He was a close friend of Pope St. Leo I the Great and was highly respected by the Western and Eastern churches for his orthodoxy. In 448 when the Eastern monk Eutyches was condemned for founding Eutychianism, an extreme form of Monophysitism teaching that Christ's nature was only human and not also divine, he appealed to Peter, whose reply withheld judgment but instructed Eutyches to be obedient to Leo.

Many of Peter's homilies survive, including the letter to Eutyches. In the standard collection of 176 sermons made in the 8th century, however, several are not authentic. His short sermons stress the fundamental Christian doctrines and the duties of Christian life in keeping with the needs and ideals of the times. Peter was declared a doctor of the church by Pope Benedict XIII in 1729. G. Gann's *Saint Peter Chrysologus: Selected Sermons* appeared in 1953.

Peter CLAVER, SAINT, Spanish SAN PEDRO CLAVER (b. 1581, Verdu, Spain—d. Sept. 4, 1654, Cartagena, Colom.; canonized 1888; feast day September 9), Jesuit missionary to South America who, in dedicating his life to the aid of Negro slaves, earned the title of apostle of the Negroes.

Peter entered the Society of Jesus in 1602 and eight years later was sent to Cartagena, where he was ordained in 1616. The miserable condition of the slaves aboard ship and in the pens of Cartagena, South America's chief slave market, caused Peter to declare himself "the slave of the Negroes forever." Accompanied by interpreters and carrying food and medicines, he boarded every incoming slave ship and visited the pens, where he nursed the sick and taught religion. Despite strong official opposition, Peter persevered for 38 years, baptizing an estimated 300,000 slaves. He was canonized by Pope Leo XIII, who in 1896 proclaimed him patron of all Roman Catholic missions to Negroes. Arnold Lunn's *Saint in the Slave Trade* appeared in 1935.

Peter DES RIVAUX (b. *c.* 1190, Poitou, Fr.—d. 1262), one of the Poitevin administrators who dominated the government of young King Henry III of England from 1232 to 1234; Peter failed in his efforts to create an all-powerful central administration.

His father (or uncle), Peter des Roches (bishop of Winchester, 1205–38), became tutor to Henry upon the King's accession. Peter des Rivaux served as a king's clerk from 1218 to 1223 but was exiled from England when Henry threw off Peter des Roches's tutelage in 1227. Returning to England under Henry's protection in 1230, Peter des Rivaux was appointed treasurer of the household in June 1232.

After Henry stripped the powerful Hubert de Burgh, the last of the great justiciars, of his authority (July–November 1232), Peter des Rivaux took over the machinery of government. He immediately initiated a drastic overhaul of the financial and administrative system. These innovations, if fully executed, would have made Henry the richest and most powerful monarch in Europe, but the English barons, led by Edmund Rich, archbishop of Canterbury, forced Henry to dismiss Peter des Rivaux and the other Poitevins in 1234. Peter served as baron of the exchequer again in 1253 and keeper of the wardrobe in 1257–58, but he never regained his former power.

Peter DES ROCHES (d. June 1238, Farnham, Hampshire, Eng.), Poitevin diplomat, soldier, and administrator, one of the ablest statesmen of his time, who enjoyed a brilliant but checkered career, largely in England in the service of kings John and Henry III.

As bishop of Winchester from 1205 to 1238, he organized and added to the financial resources of his see. He held ecclesiastical appointments in Touraine and Poitou and afterward went to England, where King John influenced his election to the see of Winchester. He remained in England and retained his see throughout the interdict (1208–13), filling several administrative and military roles. He became chief justiciar in 1214 but was unpopular and was replaced in June 1215. He supported John loyally during the war with the barons and was one of his executors. Peter crowned Henry III and was his tutor until 1227. As the most influential Poitevin in the country, he headed that group of alien officials and soldiers who suffered political defeat at the hands of the justiciar, Hubert de Burgh, in 1223–24. He accompanied the emperor Frederick II's crusade (1228–29) and reached Jerusalem. In 1230 he helped to reconcile Frederick with the Pope and in 1231 negotiated a truce between Henry III and the French. On his return to England in 1231, he influenced Henry III to promote his son (or nephew) Peter des Rivaux to numerous posts and brought about Hubert's fall in 1232. The administrative methods he advocated, however, led to baronial opposition in 1233, and in 1234 Henry III dismissed Peter des Roches from favour and Peter des Rivaux from office.

Peter LOMBARD, French PIERRE LOMBARD, Latin PETRUS LOMBARDUS (b. *c.* 1100, Novara, Lombardy—d. Aug. 21/22, 1160, Paris), bishop of Paris whose *Four Books of Sentences* (*Sententiarum libri IV*) was the standard theological text of the Middle Ages.

After early schooling at Bologna, he went to France to study at Reims and then at Paris. From 1136 to 1150 he taught theology in the school of Notre Dame, Paris, where in 1144–45 he became a canon—*i.e.,* staff clergyman. Lombard was present at the Council of Reims (1148) that assembled to examine the writings of the French theologian Gilbert de La Porrée. In June 1159 he was consecrated bishop of Paris and died the following year.

Although he wrote sermons, letters, and commentaries on Holy Scripture, Lombard's *Four Books of Sentences* (1148–51) established his reputation and subsequent fame, earning him the title of *magister sententiarum* ("master of the sentences"). The *Sentences,* a collection of teachings of the Church Fathers and opinions of medieval masters arranged as a systematic treatise, marked the culmination of a long tradition of theological pedagogy, and until the 16th century it was the official textbook in the universities. Hundreds of scholars wrote commentaries on it, including the celebrated philosopher St. Thomas Aquinas.

Book I of the *Sentences* discusses God, the Trinity, divine guidance, evil, predestination; Book II, angels, demons, the Fall of man, grace, sin; Book III, the Incarnation of Jesus Christ, the redemption of sins, virtues, the Ten Commandments; Book IV, the sacraments and the four last things—death, judgment, hell, and heaven. While Lombard showed originality in choosing and arranging his texts, in utilizing different currents of thought, and in avoiding extremes, of special importance to medieval theologians was his clarification of the theology of the sacraments. He asserted that there are seven sacraments and that a sacrament is not merely a "visible sign of invisible grace" (after Augustine of Hippo) but also the "cause of the grace it signifies." In ethical matters, he decreed that a man's actions are judged good or bad according to their cause and intention, except those acts that are evil by nature.

Lombard's teachings were opposed during his lifetime and after his death. Later theologians rejected a number of his views, but he was never regarded as unorthodox, and efforts to have his works condemned were unsuccessful. The fourth Lateran Council (1215) approved his teaching on the Trinity and prefaced a profession of faith with the words, "We believe with Peter Lombard . . . ." His collected works are in J.-P. Migne, *Patrologia Latina,* vol. 191–192. The best edition of the *Four Books of Sentences* (no English translation) is considered to be that of the Franciscans of the College of St. Bonaventura (near Florence), *Libri quattuor sententiarum* (2 vol., 1916). E.F. Rogers' *Peter Lombard and the Sacramental System* appeared in 1917.

Peter MARTYR, name commonly used in English for (1) St. Peter Martyr, who was killed in 1252 by the Cathari, a heretical Christian sect; (2) Peter Martyr d'Anghiera, who was an Italian historian; and (3) Peter Martyr Vermigli, who was one of the greatest Italian Reformers and a leading exponent of the Reformed doctrine of the sacraments.

Peter MARTYR D'ANGHIERA, Italian PIETRO MARTIRE D'ANGHIERA, Spanish PEDRO MÁRTIR DE ANGHIERA (b. Feb. 2, 1457, Arona, Milan—d. October 1526, Granada, Spain), chaplain to the court of King Ferdinand II of Aragon and Queen Isabella I of Castile, and historian of Spanish explorations, who became a member of Emperor Charles V's Council of the Indies (1518). He collected unidentified documents from the various discoverers, including Christopher Columbus, and wrote *De Orbe Novo* (published 1530; "On the New World"), in which the first European reference to India rubber appears in the description of an Aztec game. His collection of 812 letters is valuable source material for the period.

Peter MARTYR, SAINT, also called PETER OF VERONA, Italian SAN PIETRO MARTIRE or SAN PIETRO DA VERONA (b. 1205?, Verona—d. April 6, 1252, near Milan; canonized 1253; feast day April 29), inquisitor, vigorous preacher, and religious founder who, for his militant reformation, was assassinated by the neo-Manichaean sect, the Cathari (heretical Christians who held unorthodox views on the nature of good and evil).

Peter's parents were members of the Cathari, and there was some family opposition to Peter's studying at the University of Bologna. There he befriended Dominic (Domingo de Guzmán), whose religious order, the Order of Friars Preachers, he entered about 1221.

Peter gained his initial reputation as preacher in Lombardy, where eventually he was forbidden to preach because of spurious moral charges made against him. After receiving what he regarded as divine inspiration, he resumed his evangelization with such fervour that Pope Gregory IX appointed him general inquisitor about 1232. In this capacity he preached against the Cathari throughout northern and central Italy, and his success provoked powerful enemies among them

According to a 14th-century work ascribed to Peter of Todi, who was prior general of the Servite order from 1314 to 1344, Peter Martyr helped the Seven Holy Founders to establish the Servites in Florence during the 1240s. Peter himself influenced and founded various confraternities to combat heresies. He served as prior of the Italian Dominican centres of Asti in 1240, of Piacenza in 1241, and of Como in 1251, the year that Pope Innocent IV named him papal inquisitor.

While returning to Milan from a preaching mission at Como, Peter and his companion, the friar Dominic, were attacked by Cathari, who bludgeoned Peter with an ax. According to pious tradition, he wrote on the ground *Credo in Deum* ("I believe in God") with his own blood before being fatally stabbed in the heart. Dominic died a few days later. Peter was buried in the church of Sant' Eustorgio, Milan. He was subsequently named patron of inquisitors. In 1952 appeared two biographies (in Italian), by R. Francisco and by G. Ederle.

Peter NOLASCO, SAINT, French SAINT PIERRE NOLASQUE (b. *c.* 1182, probably Barcelona—d. Dec. 25?, 1249/56, Barcelona; canonized 1628; feast day January 28), founder of the order of Our Lady of Ransom (Mercedarians, or Nolascans), a religious institute originally designed to ransom Christian captives from the Moors; today, the Mercedarians, whose numbers have declined, are engaged mostly in hospital work.

Peter dedicated himself to helping the poor. In Spain, where the Moors held many Christian slaves gained from struggles between the Moorish and the Christian kingdoms there, he ransomed them with funds from his inheritance and from contributions. Between 1218 and 1234, he founded his order at Barcelona. Peter is said to have gone twice to Africa to redeem Christian slaves there. He resigned his offices of master general and ransomer some years before his death.

When his cause for canonization was being considered in Rome, there was presented a notarial act, the *documento de los sellos* ("document of the seals"), declaring that the Blessed Virgin Mary came to Peter and instructed him to found his order. The *documento* has since been proved to be a forgery. P.N. Pérez' *San Pedro Nolasco, fundador de la orden de la Merced* appeared in 1915.

Peter OF ALCÁNTARA, SAINT, Spanish SAN PEDRO DE ALCÁNTARA, original name PEDRO GARAVITO (b. 1499, Alcántara, Spain—d. Oct. 18, 1562, Arenas; canonized 1669; feast day October 18), Franciscan mystic who founded an austere form of Franciscan life known as the Alcantarines or Discalced (*i.e.*, barefooted) Friars Minor. He is the patron saint of Brazil.

Of noble birth, he entered the Franciscan Order at Alcántara in 1515 and was ordained priest in 1524. As a friar, Peter emphasized the penitential aspects of the life of St. Francis of Assisi, founder of the Franciscans. He then wrote special instructions for his disciples and in Spain and Portugal founded convents that were unique for their isolation and discomfort. From his first friary at El Pedroso, Spain, his friars spread to Italy, Germany, and France.

Peter had spirited correspondence with SS. Francis Borgia, Louis of Granada, and especially with the mystical writer Teresa of Avila, whom he aided in her reform of the Carmelite nuns and whose autobiography is one of the best sources on his life. Peter's *Tratado de la oración y meditación* (*Treatise on Prayer and Meditation*) has been translated into numerous languages (Eng. trans., 1926).

Peter OF CANDIA: *see* Alexander (V) *under* Alexander (Papacy).

Peter OF CASTELNAU, French PIERRE DE CASTELNAU (b. Château-Neuf, Montpellier, Fr.—d. Jan. 14, 1208, near Saint-Gilles, Fr.), Cistercian martyr, apostolic legate, and inquisitor against the Albigenses, most particularly the Cathari (heretical Christians who held unorthodox views on the nature of good and evil), whose assassination led to the Albigensian Crusade.

Peter became an archdeacon in 1199 and in 1202 joined the Cistercian order. In 1207 Pope Innocent III appointed Peter as apostolic legate and inquisitor to lead an expedition against the Albigenses and particularly to obtain the recantation of Count Raymond VI (*q.v.*) of Toulouse, who was allowing the heresy to spread throughout his domain. Having urged him from 1205 to stamp out the heretics, Peter now excommunicated Raymond, placing the Languedoc region under interdict, which aroused grave opposition. Peter's campaign on behalf of Innocent ended in disaster. He was assassinated, supposedly at Raymond's instigation, and in response to this act Innocent launched the Albigensian Crusade, a holy war in which Toulouse was ravaged and its inhabitants, Cathar and non-Cathar alike, were massacred. Peter's relics were enshrined in the church of Saint-Gilles. He is venerated as a martyr in the dioceses of the Midi, in France.

Peter OF MONTBOISSIER, BLESSED: *see* Peter the Venerable.

Peter OF VERONA, SAINT: *see* Peter Martyr, Saint.

Peter THE APOSTLE, SAINT, original name SIMEON, or SIMŌN (d. *c.* AD 64, Rome), disciple of Jesus Christ, recognized in the early Christian Church as the leader of the disciples and by the Roman Catholic Church as the first of its unbroken succession of popes. Peter, a fisherman, was called to be a disciple of Jesus at the beginning of his ministery. He received from Jesus the name Cephas (*i.e.*, Rock, hence Peter, from the Latin *petra*).

St. Peter, detail of a tempera painting on wood by Nardo di Cione, second half of the 14th century; in the Yale University Art Gallery

The man and his position among the disciples. The sources of information concerning the life of Peter are limited to the New Testament: the four Gospels, Acts, the letters of Paul, and the two letters that bear the name of Peter. He probably was known originally by the Hebrew name Simeon or the Greek form of that name, Simōn. The former appears only twice in the New Testament; the latter, 49 times. At solemn moments (Gospel According to John 21:15) he was called "Simon, son of John." The Gospel According to John prefers Simon (17 times) or the compound, rarely found elsewhere, of Simon Peter. Though Paul has a distinct preference (8 times out of 10) for the Greek transliteration Kēphas (Latinized as Cephas) of the Aramaic name or title Kepha, meaning "rock," the Gospels and Acts use the Greek translation Petros approximately 150 times. From the Synoptic Gospels (Gospel According to Matthew 8:14) and Paul (First Letter of Paul to the Corinthians 9:5), there is indirect evidence that Peter was the son of John and was married. His family originally came from Bethsaida (John 1:44), but during the period of Jesus' ministry he lived in Capernaum, at the northwest end of the Sea of Galilee, where he and his brother Andrew were in partnership as fishermen with James and John, the sons of Zebedee (Gospel According to Luke 5:10).

Much can be learned about Peter from the New Testament—either explicitly from the statements made by and about Peter or indirectly from his actions and reactions as revealed in a number of episodes in which he figures prominently. He was at times vacillating and unsure, as in his relations with the church of Antioch when he at first ate with the Gentiles and later refused to do so (Letter of Paul to the Galatians 2:11–14); he could also be resolute (Acts of the Apostles 4:10; 5:1–10). Occasionally he is depicted as rash and hasty (Luke 22:33, etc.) or irritable and capable of great anger (John 18:10). Often he is pictured as gentle but firm and, as in his professions of love to Jesus, capable of great loyalty and love (John 21:15–17).

The New Testament reports that Peter was unlearned in the sense that he was untrained in the Mosaic Law (Acts 4:13), and it is doubtful that he knew Greek. He apparently learned slowly and erred time and time again, but later, when entrusted with responsibility, he demonstrated that he was mature and capable.

The Gospels agree that Peter was called to be a disciple of Jesus at the beginning of his ministry, but when and where the event took place is recorded differently in the several Gospels. Luke (5:1–11) scarcely mentions James and John and omits Andrew while emphasizing the call of Peter. Matthew (4:18–22) and Mark (Gospel According to Mark 1:16–20) note the call of the four men and—with Luke—agree that the event took place at the Sea of Galilee. The Gospel According to John places the call in Judaea (1:28) and states that Andrew—who had been a follower of John the Baptist (1:35) and had heard John indicate that Jesus was the Lamb of God—left John and introduced Peter to "the Messiah," who at that time gave him the name (or title) Cephas (*i.e.*, Peter, or Rock).

The Synoptic Gospels (Matthew, Mark, and Luke) are probably correct in recording that the call to Peter was extended in Galilee when Jesus first began his work in that area. The Gospel According to John is here, as elsewhere, perhaps more theologically than historically motivated; the author of John wishes to stress that Peter recognized Jesus' Messiahship from the beginning and that Jesus had seen Simon as the rock from their first meeting.

The Synoptic Gospels largely agree in the amount of emphasis each gives to the leadership of Peter among the Twelve Apostles, but there are differences also. For example, in one case Matthew and Luke note that Peter was the speaker in questioning Jesus about a parable, but Mark has attributed these words to the group of disciples (see Matt. 15:15; Luke 8:45; and Mark 7:17). With differing degrees of emphasis, the Synoptic Gospels agree that Peter served as spokesman, the outstanding member of the group, and enjoyed a certain precedence over the other disciples. Whenever the disciples are listed, Peter is invariably mentioned first (Matt. 10:2–4; Mark 3:16–19; Luke 6:14–16; Acts 1:13; *cf.* only Gal. 2:9). Although it is not certain whether or not this priority is due primarily to reading back into the Gospel narrative Peter's importance in the apostolic church, his forceful personality was surely a factor.

Those not belonging to the immediate followers of Jesus also recognized the authority of Peter, such as when the collectors of the temple tax approached him for information (Matt. 17:24). Again, with characteristic quickness he sought a clarification from Jesus on behalf of the disciples concerning the meaning of a parable (Matt. 15:15) or of a saying (Matt. 18:21). As both an individual and representative of the Twelve Apostles, he made a plea for personal preference in the Kingdom of Heaven as a reward for faithful service (Matt. 19:27, 28).

On several occasions Peter alone is mentioned by name, and others are indicated as merely accompanying him (Mark 1:36; Luke 8:45). Even when the three disciples closest to Jesus (the "pillars"—Peter, James, and John) figure in a particular incident, it is frequently Peter alone who is named. When the three are named, Peter's name invariably appears first (as in Matt. 17:1, 26:37). It was his home in Capernaum that Jesus visited, when he cured Peter's mother-in-law (Matt. 8:14); it was Peter's boat that Jesus used when he instructed the crowd (Luke 5:3). It was Peter who possessed remarkable insight and displayed his depth of faith in the confession of Christ as the Son of God (Matt. 16:15–18; Mark 8:29; Luke 9:20); and it was Peter who rebuked and in turn was rebuked by Jesus when the Master prophesied that he would suffer and die (Mark 8:32, 33). It was also Peter who manifested the momentary weakness of even the strongest in the denial of his Lord (Matt. 26:69–75; Mark 14:66–72; Luke 22:54–61). Later, however, with greater maturity, he discovered strength and, as he was charged by Jesus (Luke 22:31, 32), effected the strengthening of others. Finally, Peter, who survived his denial, was permitted to be the first witness of the Resurrection (Luke 24:34).

In the Fourth Gospel, the prominence of Peter is challenged in the person of John, the "Beloved Disciple." Though Peter receives mention in John 37 times (out of a total of 109 times in the four Gospels), one-third of the references are found in the appendix (chapter 21), and he appears in only 9 incidents. The Gospel According to John attempts to show the close relationship between John and Jesus while still reserving to Peter the role of representative and spokesman. The fact that Peter is emphasized in John and charged by Jesus to "tend my sheep" and "feed my lambs" (John 21:15,16) at the same time that the role of the disciples as a whole is being deemphasized attests to the prestige of Peter in the apostolic church. But throughout the Fourth Gospel Peter shares his prominence with John (13:24; 18:15; 19:26, 27, etc.). Among the purposes of chapter 21 in emphasizing Peter may well be an attempt to restore the disciple who denied his Lord to the position he enjoyed in the Synoptic Gospels.

Incidents important in interpretations of Peter. Out of the many incidents in which Peter figures prominently in the Gospels, three should be separately considered; for each is important, contains problems of interpretation, and is controversial.

In Mark (8:29) and Luke (9:20), to a question of Jesus concerning his essential identity, about which he pressed the disciples for an opinion, Peter answered for them all that Jesus is the "Messiah" or "God's Messiah." In adjuring them to be silent, Jesus rejected the response as perhaps too partial, too political. In the Matthean version (16:13), expanding upon the narrative in Mark, Peter answered for himself and presumably for the other disciples, "You are the Christ, the Son of the living God." A new dimension of understanding was thus reached, and this heightened awareness of Jesus' divinity was approved by Jesus and occasioned Peter's "ordination."

In what may be a grouping of Petrine material (Matt. 16:18, 19)—the confession, naming, and receiving of authority—Jesus gave to Simon the title of Cephas, or Peter (Rock). Though in the past some authorities have considered that the term rock refers to Jesus himself or to Peter's faith, the consensus of the great majority of scholars today is that the most obvious and traditional understanding should be construed, namely, that rock refers to the person of Peter. In John the title was granted at what may have been their first meeting (1:42). Thus *when* the name was given is open to question, but *that* the name was given by Jesus to Peter seems fairly certain. Matthew continues that upon this rock—that is, upon Peter—the church will be built. The word church in the 1st-century Gospel According to Matthew is to be understood as referring to the community of the faithful rather than to a definite ecclesiastical organization.

The authenticity of the uniquely Matthean material (Matt. 16:16–19) of this narrative has been and is widely discussed and has been challenged on the bases (1) that verses 16–19 are found only in Matthew, or (2) that the inclusion of the word church suggests a level of organization acquired only at a later period. Though these and other arguments against authenticity are given most careful consideration, the general consensus is that at some time—and more likely at the end of his career—these words were spoken by Jesus.

If Peter's confession demonstrates his faith and insight, his denial that he knew Jesus demonstrates a weakness of will (even if momentary), capability of inaction, and a tendency toward vacillation, but not a loss of faith. Prior to the denial, out of his deep love for Jesus and his overestimation of his own capabilities, he had sought to overrule Jesus' prophecy of his denial and declared that, even if the other disciples deserted Jesus, he would suffer death rather than disown his Lord (Matt. 26:33–35; Mark 14:29–31; Luke 22:31–34; John 13:37–38). As the drama unfolded, Peter fled when Jesus was arrested but did find his way to the palace of the high priest where Jesus had been taken. When confronted in the courtyard with the danger of admitting association with Jesus, he chose to deny (Matt. 26:69–75; Mark 14:66–72; Luke 22:54–61; John 18:15–18, 25–27). The degree of his shame and the depth of his love were revealed when he later realized that the prophecy had been fulfilled, and he wept bitterly (Matt. 26:75; Mark 14:72).

The fact of Peter's denial did not destroy the love and trust that Jesus felt for him. It was to Peter—who had confessed the Sonship of Jesus (Matt. 16:16), who had been commissioned earlier to "lend strength" to his brothers (Luke 22:32), who had hesitated in his resolution at one crucial point (Mark 14:66–72), and who on the morning of the Resurrection "ran to the tomb" (Luke 24:12)—that the Resurrected Christ first appeared. The earliest report of Peter's priority as a witness to the Resurrection is found in the letters of Paul (I Cor. 15:5), and this most probably is the intent of Luke (24:34). The initial appearance to Peter in Galilee may have been included in the original ending of Mark.

The silence concerning this important matter of priority in Matthew and John is remarkable. It may be, however, that Matt. 14:27, 28 represents a misplaced post-Resurrection narrative, and John 21 may contain an echo of the tradition preserved by Paul (I Cor. 15:5). Whether or not Jesus appeared *first* to Peter after the Resurrection, he was a witness, which Peter declared to be a criterion of apostleship (Acts 1:22).

The position of Peter in the Apostolic Church. Given the information supplied by the Gospels, it is not unexpected that Peter should emerge immediately after Jesus' death as the leader of the earliest church. For approximately 15 years after the Resurrection, the figure of Peter dominated the community. He presided over the appointment of Matthias as an Apostle (Acts 1:23–26) to take the place of Judas, who had betrayed Christ and later died. It was Peter who first "raised his voice" and preached at Pentecost, the day when the church came into being (Acts 1:14–39). It was Peter who served as an advocate for the Apostles before the Jewish religious court in Jerusalem (Acts 4:5–22). And it was he who exercised the role of judge in the disciplining of those who erred within the church (Acts 5:1–10).

Peter led the Twelve Apostles in extending the church "here and there among them all" (Acts 9:32). He went first to the Samaritans

(Acts 8:4–17), "who received the Holy Spirit"; in Samaria he encountered the magician and faith healer Simon Magus; then he went to Lydda, in the plain of Sharon (Acts 9:32–35), where he healed the paralyzed Aeneas; and then at the Mediterranean coastal town of Joppa (Acts 9:36–43) he effected the cure of Tabitha (Dorcas) in the name of Christ.

He went farther north on the Mediterranean coast to Caesarea (Acts 10:1–11:18), where, through the conversion of Cornelius, "a centurion of what was known as the Italian Cohort" (Acts 10:1), Peter introduced Gentiles into the church. According to Jewish requirements, a Gentile convert must first become a Jew through the rite of circumcision and be acceptable as a proselyte. In accepting Cornelius and the others—who may have had some informal connection with the synagogue (Acts 10:1)—and ordering "them to be baptized in the name of Jesus Christ" (Acts 10:48) without submission to the prior rite of circumcision, Peter introduced an innovation that insured the opposition of the Jewish Christians and others. This independent course set by Peter with the blessing of "the Spirit" (Acts 10:10–15) was possibly a factor in Herod's beheading of James (the brother of John) and in the arrest of Peter (Acts 12:2, 3). In prison (*c.* AD 44) Peter was visited by an "angel of the Lord. . . . And the chains fell off his hands," and he made his escape (Acts 12:1–8). He went immediately to "the house of Mary, the mother of John whose other name was Mark" (Acts 12:12). After asking them to report his escape "to James and to the brethren," he "went to another place" (Acts 12:17).

At this point the unchallenged leadership of Peter in Jerusalem came to an end. It is not at all clear where Peter went, but it is not probable that the words to another place refer to a different home in the same general area that would provide temporary refuge.

The later work of Peter is not covered in Acts, perhaps because the author of Luke–Acts had planned a third book that would have included such a discussion, but the book was never written or was written and later lost. Perhaps the events would have included unedifying material such as the internal jealousy within the church alluded to in the *First Letter of Clement* 4–6, or perhaps the author died before completion of his work. Whatever momentary glimpses into the period of the later ministry of Peter remain can only be noted in a discussion of his relationship with the two other outstanding Apostles of the time, James and Paul.

Peter was the most prominent figure in the Jerusalem Church up to the time of his departure from Jerusalem after his imprisonment by King Herod and his subsequent release in the New Testament account (Acts 12:1–17). For example, Paul went up to Jerusalem to consult with Peter three years after he had been converted and remained with him for two weeks (Gal. 1:18, 19). When Peter left Jerusalem, however, it appears clear to many New Testament scholars (although unconvincing to others) that he assumed a missionary role while the actual leadership of the church devolved upon James, "the brother of the Lord." This sequence of authority is suggested by Peter's obedience to the wishes of "certain persons who came from James" and hence his ceasing to eat with Gentile Christians at Antioch (Gal. 2:11–14); by a final "summing up" of decisions made in the so-called apostolic Council of Jerusalem (Acts 15:7) by James; and later, when Peter made his departure from the home of the mother of John whose other name was Mark, by the word of explanation or "report" of his whereabouts left primarily for James (Acts 12:17).

Paul first met with Peter at Jerusalem three years after his conversion. In the record of this meeting the name of Cephas (Peter) precedes that of James, although Galatians notes that in another meeting 14 years later the name of James precedes that of Cephas (Gal. 2:9). Paul also emphasized an incident involving himself and Peter at Antioch. Apparently, Paul had achieved some success in the difficult matter of welding the Jewish and Gentile Christians of Antioch into one congregation. The Jewish Christians saw the sharing of food with Gentiles as quite alien to their tradition. In the absence of Paul, Peter, perhaps in his capacity as missionary, visited Antioch and ate with the united group. Later, "certain persons came from James" and opposed the united congregation's custom of eating together. In apparent deference to James, Peter "drew back and began to hold aloof," and the Jewish Christians did likewise. The unity of the group had been destroyed. When Paul returned, he upbraided Peter for what he may have considered Peter's vacillation or perhaps even purposeful disruption (Gal. 2:11–14). This incident may have occasioned the Jerusalem Council (AD 49 or 50), in which it was settled that hereafter Paul should be "entrusted with the gospel to the uncircumcised" (Gal. 2:7) and Peter "for the mission to the circumcised" (Gal. 2:8).

In passing, Paul refers to a party of Cephas (Peter) in I Corinthians 1:12 that suggests that a group in the church of Corinth was especially devoted to Peter (leading some to assume a residence of Peter in Corinth) and in I Corinthians 9:5 to Peter as carrying on missionary activity accompanied by his wife. A missionary journey to Asia Minor may be suggested in the First Letter of Peter 1:1.

Tradition of Peter in Rome. The problems surrounding the residence, martyrdom, and burial of Peter are among the most complicated of all those encountered in the study of the New Testament and the early church. The absence of any reference in Acts or Romans to a residence of Peter in Rome gives pause but is not conclusive. If Peter did write I Peter, the mention of "Babylon" in 5:13 is fairly reliable evidence that Peter resided at some time in the capital city. If Peter was not the author of the first epistle that bears his name, the presence of this cryptic reference witnesses at least to a tradition of the late 1st or early 2nd century. "Babylon" is a cryptic term indicating Rome, and it is the understanding utilized in Revelation 14:8; 16:19; 17:5, 6 and in the works of various Jewish seers.

It may be said that by the end of the 1st century there existed a tradition that Peter had lived in Rome. Further early evidence for the tradition is found in the *Letter to the Romans* by Ignatius, the early 2nd-century bishop of Antioch. It is probable that the tradition of a 25-year episcopate of Peter in Rome is not earlier than the beginning or the middle of the 3rd century. The claims that the church of Rome was founded by Peter or that he served as its first bishop are in dispute and rest on evidence that is not earlier than the middle or late 2nd century.

Words of John 21:18, 19 clearly allude to the death of Peter and are cast into the literary form of prophecy. The author of this chapter is aware of a tradition concerning the martyrdom of Peter when the Apostle was an old man. And there is a possible reference here to crucifixion as the manner of his death. But as to when or where the death took place there is not so much as a hint.

The strongest evidence to support the thesis that Peter was martyred in Rome is to be found in the *Letter to the Corinthians* (*c.* AD 96; 5:1–6:4) of Clement of Rome:

> Peter, who by reason of wicked jealousy, not only once or twice but frequently endured suffering and thus, bearing his witness, went to the glorious place which he merited (5:4). . . . To these men [Peter and Paul] who lived such holy lives there was joined a great multitude of the elect who by reason of rivalry were victims of many outrages and tortures and who became outstanding examples among us (6:1).

These sources, plus the suggestions and implications of later works, combine to lead many scholars to accept Rome as the location of the martyrdom and the reign of Nero as the time.

As part of the general question of Peter's residence and martyrdom in Rome, debated since the appearance of the *Defensor pacis* of Marsilius of Padua (*c.* 1275–*c.* 1342), the particular question of where Peter was buried has been argued. There is not the slightest hint at a solution in the New Testament. The earliest evidence (*c.* AD 200) is found in a fragment of a work by Gaius (or Caius) witnessing to a tradition at least a generation earlier (*c.* AD 165) that the "trophy" (*i.e., tropaion,* or monument) of Peter was located at the Vatican. Though difficult to interpret, the use of the word trophy indicates that in this period the Vatican area was associated with either the tomb of the Apostle or simply a monument erected in the area of Peter's victory (*i.e.,* his martyrdom).

Some scholars find support for a tradition that the Apostle was buried "Ad Catacumbas" ("at the catacombs" of San Sebastiano) on the Via Appia in an inscription of Damasus (pope, 366–384), composed in such ambiguous terms that it was certain to foster such misinterpretations as are found in the letter of Gregory the Great to Empress Constantina and the notice of Cornelius in the *Liber Pontificalis.* Apart from the aforementioned, later literary tradition is unanimous in indicating the Vatican Hill as the place of burial. See *Peristephanon,* XII, of Prudentius, various notices in the *Liber Pontificalis,* and *The Salzburg Itinerary.* Liturgical sources such as the *Depositio Martyrum, Martyrologium Hieronymianum,* though interesting, add nothing to the literary evidence.

Excavations were begun in the late 19th century in order to substantiate the theory that the burial of Peter and Paul was "Ad Catacumbas." After a half century of investigation, it now seems reasonable to concede that a cult of the Apostles existed there about AD 260, though Christian influence may have been exerted as early as AD 200. None of the excavations, however, in all of the areas indicated at various times as the resting place of the apostolic relics, have produced any evidence whatsoever that the bodies of Peter and Paul were either buried there originally or brought there at a later time after earlier burials elsewhere.

In the early 4th century, the emperor Constantine (died AD 337) with considerable difficulty erected a basilica on the Vatican Hill. The difficulty of the task, combined with the comparative ease with which this great church might have been built on level ground only a slight distance to the south, may support the contention that the Emperor was convinced that the relics of Peter rested beneath the small Aedicula (shrine for a small statue) over which he had erected the basilica. The task before the excavators was to determine whether or not the belief of Constantine accorded with the facts or was based merely upon a misunderstanding.

The excavation of this site, which lies far beneath the high altar of the present Church of St. Peter, was begun in 1939. The problems encountered in excavation and interpretation of what has been discovered are extremely complex. There are some scholars who are convinced that a box found in one of the fairly late sidewalls of the Aedicula contains fragments of the remains of the Apostle, fragments which at an earlier time may have rested in the earth beneath the Aedicula. Others are most definitely not convinced. If a grave of the Apostle did exist in the area of the base of the Aedicula, nothing identifiable of that grave remains today. Furthermore, the remains discovered in the box that until comparatively recently rested in the sidewall do not lead necessarily to a more positive conclusion. Archaeological investigation has not solved with any great degree of certainty the question of the location of the tomb of Peter. If it was not in the area of the Aedicula, perhaps the grave rested elsewhere in the immediate vicinity, or perhaps the body was never recovered for burial at all.

The feast of St. Peter. Five festivals in the calendar of the Roman Catholic Church involve honour paid to Peter. And in each, the name of Paul is also associated. First chronologically, on January 18 is celebrated the festival of the "Cathedra Petri" at Rome, and on February 22 at Antioch. June 29 marks the festival of Peter and Paul, ranking among the 12 most important celebrations of the Roman Catholic Church. The escape of Peter from his chains is noted in the feast of August 1. Last, the dedications of the basilicas of Peter and Paul, commemorating their construction by the emperor Constantine, are celebrated in the festival of November 18.

Peter THE HERMIT, French PIERRE L'ERMITE (b. *c.* 1050, probably Amiens, Fr.—d. July 8, 1115, Neufmoustier, near Huy, Flanders), ascetic, monastic founder, considered one of the chief stimulators in the launching of the First Crusade.

Peter reputedly visited the Holy Land *c.* 1093. When Pope Urban II proclaimed the Crusade at the Council of Clermont in November 1095, Peter began his preaching, travelling from Berry (in central France) across Champagne and down the Meuse Valley to Cologne, and thence (May 1096) leading his enthusiastic followers across Europe to Constantinople. On August 5–6 the crusaders advanced to Nicomedia (modern Izmir, Tur.). Unable to maintain discipline, Peter soon returned to Constantinople to seek help from the Byzantine emperor, Alexius I. In his absence most of his army was annihilated (October 21) by the Turks. He waited in Constantinople until the princely expeditions from western Europe were finally assembled there (May 1097) and accompanied them southeastward across Anatolia. In Antioch he became discouraged by the hardships attending the crusaders' siege in October and was dissuaded only with difficulty from abandoning the enterprise (January 1098).

At last having reached Jerusalem, Peter was appointed almoner of the Christian army in spring 1099. He preached a sermon on the Mount of Olives shortly before the storming of Jerusalem in July, and he conducted processions there in August. He returned to Europe in 1100, becoming prior of the Augustinian monastery of Neufmoustier, at Huy, which he founded, and died there. Y. Le Febvre's *Pierre l'Ermite et la croisade* appeared in 1946.

Peter THE JUST: *see* Peter I *under* Peter (Portugal); Peter *under* Peter (Spain: Castile).

Peter THE VENERABLE, also called BLESSED PETER OF MONTBOISSIER, French PIERRE LE VÉNÉRABLE, or BIENHEUREUX PIERRE DE MONTBOISSIER (b. *c.* 1092, Montboissier, Auvergne, Arles—d. Dec. 25, 1156, Cluny, Burgundy), outstanding French abbot of Cluny whose spiritual, intellectual, and financial reforms restored Cluny to its high place among the religious establishments of Europe.

Peter joined Bernard of Clairvaux in supporting Pope Innocent II, thereby weakening the position of the antipope, Anacletus II. After Peter Abelard's teachings had been condemned at the Council of Sens (1140), Peter received him at Cluny and reconciled him with Bernard and with the Pope. He also tried to convert the Crusades into nonviolent missionary ventures; ordered the first Latin translation of the Qur'ān so that it might be refuted; and was papal ambassador to Aquitaine, Italy, and England. He wrote hymns and poems in addition to theological tracts and left about 200 letters of considerable historiographical interest. Although Peter has not been canonized, his cult received papal approval in 1862.

Peter, Apocalypse of, also called REVELATION TO PETER, pseudepigraphal (noncanonical and unauthentic) Christian writing dating from the first half of the 2nd century AD. The unknown author, who claimed to be Peter the Apostle, relied on the canonical Gospels and on Revelation to John to construct a conversation between himself and Jesus regarding events at the end of the world. Unlike Revelation to John, however, the *Apocalypse of Peter* dwells on eternal rewards and punishments. The graphic account of the torments to be borne by sinful men was apparently borrowed from Orphic and Pythagorean religious texts, thereby introducing pagan ideas of heaven and hell into Christian literature. The most complete extant version (in Ethiopic) was discovered in 1910.

Peter, Gospel of, pseudepigraphal (noncanonical and unauthentic) Christian writing of the mid-2nd century AD, the extant portion of which covers the condemnation, Crucifixion, and Resurrection of Jesus. Because the work reflects the view that Christ's body had only the appearance of reality, Serapion, bishop of Antioch *c.* AD 190, believed it was written by a member of the heretical Docetist sect. Modern scholars are more inclined to attribute it to a Syrian Christian Gnostic because the Gospel does not view the Crucifixion as an act of atonement. But it lacks the mythological or cosmological speculations characteristic of most Gnostic sects. Possibly to convince non-Christians of the truth of the Resurrection, the *Gospel of Peter* goes beyond the canonical Gospels in claiming that Roman soldiers and Jewish officials witnessed the event.

Peter, Hugh, Peter also spelled PETERS (b. 1598, Fowey, Cornwall, Eng.—d. Oct. 16, 1660, London), English Independent minister, army preacher, and propagandist during the Civil War and Commonwealth.

Educated at Trinity College, Cambridge, he was ordained a priest in the Anglican Church in 1623. He went to London in 1626 and was appointed preacher at St. Sepulchre's, but his unorthodox views led to the suspension of his preaching license in 1627. He was in Holland from 1628 to 1635; he returned to England and then sailed to Massachusetts, where he succeeded Roger Williams as preacher at Salem in December 1636. He played a leading part in the colony's affairs and helped in the founding of Connecticut. Peter returned to England in 1641 as an agent for Massachusetts, but after the Irish Insurrection (October 1641) he went to Ireland as chaplain to a company of adventurers under Alexander, Lord Forbes, which fought against the Irish rebels (June–September 1642). As chaplain to the New Model Army, Peter preached during the campaigns of 1645 and 1646.

He accompanied Oliver Cromwell to Ireland in 1649 and was present at the fall of Wexford. Appointed chaplain to the Council of State (1650), he preached at Whitehall continually during the Commonwealth and Protectorate, but his protests against the Dutch War (1652–54) brought him a reprimand from Parliament. He also advocated reform of the universities, banking, and poor relief.

During the later years of the Protectorate, his part in civil and military affairs was less prominent. At the Restoration in 1660 he was specially exempted from the Act of Indemnity and at his trial in October 1660 was found guilty of abetting the execution of Charles I. He was executed at Charing Cross.

Peter's works included sermons, accounts of battles and sieges, and tracts on legal, economic, and social reforms. See R.A. Stearns, *The Strenuous Puritan* (1954).

Peter, letters of, two New Testament writings attributed to the foremost of Jesus' 12 Apostles but perhaps written during the early 2nd century.

The first letter, addressed to persecuted Christians living in five regions of Asia Minor, exhorts the readers to emulate the suffering Christ in their distress, remembering that after his Passion and death Jesus rose from the dead and is now in glory. The Christians are urged to repay evil with goodness and to love one another and are cautioned to safeguard their reputation as good citizens of high morality, thereby removing all doubt about the injustice of their sufferings. The question of authorship has not been solved to the satisfaction of scholars. Whereas the fluent Greek style and certain historical references seem to argue against Petrine authorship, the description of a primitive church organization, for example, seems to indicate an early composition, with the actual writing perhaps done by a secretary of or spokesman for Peter.

The second letter is principally concerned with the Second Coming of Christ. The author attributes the apparent delay to God's patience in allowing time for universal redemption and notes that in the sight of God 1,000 years are like one day. The writer also warns against false teachers, whose conduct is as immoral as their words are deceptive. They, and those who follow them, says the writer, will be destroyed in a great conflagration that will precede "new heavens and a new earth in which righteousness dwells" (3:13). Though the author explicitly identifies himself as Peter, numerous textual difficulties created doubts as early as the 3rd century about the actual authorship, which have been reinforced by subsequent scholarship.

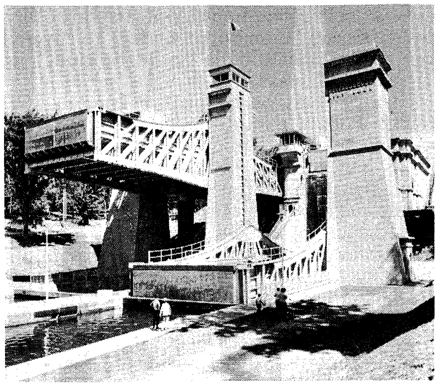
Peter Damian, SAINT, Italian SAN PIER DAMIANI (b. 1007, Ravenna [Italy]—d. Feb. 22, 1072, Faenza; feast day February 23), cardinal and doctor of the church, an original leader and a most forceful figure in the 11th-century reform movement.

Educated at the Italian universities of Ravenna, Faenza, and Parma, he abandoned his teaching career (1035) to enter the hermitage of Fonte Avellana in the Apennines, where he was chosen prior in 1043. Peter's zeal for reform, particularly his advocacy of clerical celibacy and his attacks on simony (the buying or selling of church office), attracted attention. Created cardinal in 1057, he served Popes Stephen IX (X), Nicholas II, and Alexander II, whom he defended during the schism of the antipope Honorius II. Even in semiretirement at Fonte Avellana (after 1067), he was active in the cause of reform. He died after reconciling Ravenna with Alexander, who excommunicated Henry, archbishop of Ravenna. He was declared a doctor of the church in 1828.

A conservative in political and theological controversies, he often used strong language, thus reminding his contemporaries of St. Jerome. As an apostle of voluntary poverty, he may be considered a forerunner of St. Francis of Assisi. His prolific works are collected in J.P. Migne's *Patrologia Latina* (vol. 144–145, 1853). *Selected Writings on the Spiritual Life,* translated and with an introduction by P. McNulty, was published in 1959.

Peter the Great Bay, Russian ZALIV PETRA VELIKOGO, inlet, Sea of Japan, northwestern Pacific Ocean, in the Maritime Territory of the Soviet Union. Extending 115 miles (185 km) from the mouth of the Tumen River (on the Soviet-Chinese border) northeast across to Cape Povorotny, the bay is 55 miles (88 km) long. In the north, the port of Vladivostok is situated on the Muravyov-Amursky Peninsula between Amur and Ussuri bays. The town of Posyet is on Posyeta Bay (southwest). The functioning of these harbours is severely limited by the freezing of the bay from early December to mid-April. Formerly (from 1855) known as Victoria Bay, the inlet was renamed (1859) to honour Peter I the Great.

Peterborough, city, seat of Peterborough county, southeastern Ontario, Canada, on the Otonabee River, 70 miles (115 km) east-northeast of Toronto. In 1821 Adam Scott founded a sawmill and gristmill at the site, which became known as Scott's Plains. In 1825 almost 2,000 Irish immigrants settled there, and the town and county were renamed for the group's director, Peter Robinson. Peterborough became a commercial and manufacturing centre of the surrounding area and a tourist centre for the Kawartha Lakes region. Canalization of the Otonabee as part of the Trent Canal system provided a direct link with Lake Ontario and Georgian Bay by means of the world's highest hydraulic lift lock (1904), 65 feet (20



Lift lock on the canalized Otonabee River at Peterborough, Ont.
Shostal—EB Inc.

m). Manufactures include electrical appliances and machinery, boats and marine equipment, hardware, lumber, watches, and food products. The city is the site of Trent University (founded 1963) and of Sir Sandford Fleming College of Applied Arts and Technology. Inc. 1905. Pop. (1986) 61,049.

Peterborough, city ("district"), county of Cambridgeshire, England. The city stands on the River Nen, which is navigable for small vessels to and from the North Sea. It lies on the margin, or "shoreline," of the Fens, a low-lying area of peat and silt, which was for many centuries intermediate between land and sea but which was drained and reclaimed between the 17th and 19th century. Today the Fens is an area of great fertility and massive agricultural output, and a number of the region's products are processed in Peterborough's factories.

The flat city site is dominated by St. Peter's Cathedral, a structure begun in 1118 and consecrated in 1238. It is in part a good example of Late Norman style; but it was added to in virtually every succeeding architectural period, and the total effect is discordant. The cathedral contains the Hedda Stone, an Anglo-Saxon sculpture some 1,200 years old, and the tomb of Catherine of Aragon, Henry VIII's first wife. Apart from the cathedral, gatehouses, and the Church of St. John (1407), there are few buildings of interest.

The draining of the Fens, the coming of the railway, and the development of some of England's largest brickworks on the south bank of the Nen contributed to Peterborough's 19th-century growth. In the mid-20th century its designation as an expanded town has led to further substantial growth. Situated on the main London–Edinburgh railway at a point of junction with cross-country routes, it is a choice location, particularly for warehousing and distributing trades.

Under the expanded town plan, the formerly concentrated city has been surrounded by a ring of dispersed suburban communities, linked by fast motor routes. The district stretches 20 miles (32 km) from east to west, and some 8 miles (13 km) from north to south. Pop. (1981) city, 115,544; (1986 est.) district, 148,200.

Peterborough, also spelled PETERBORO, town ("township"), Hillsborough county, southern New Hampshire, U.S., at the confluence of the Contoocook and Nubanusit rivers. The site, granted in 1737 and named after Charles Mordaunt, 3rd Earl of Peterborough, was permanently settled in 1749 and incorporated in 1760. The town became famous after the establishment of the MacDowell Colony there by Marian Nevins, the wife of composer Edward MacDowell, following his death in 1908. The colony attracted numerous composers and writers, including Stephen Vincent Benét, Willa Cather, and Thornton Wilder. Tourism and some light manufacturing (textiles, baskets) are the economic mainstays. The Sharon Arts Center in the town is run by the League of New Hampshire Arts and Crafts. Popular summer and winter resorts are at nearby Miller and Greenfield state parks; Temple and Crotched mountains have ski slopes. Pop. (1986 est.) 5,190.

Peterborough, Soke of, former administrative county (1884–1965) within Northamptonshire, Eng. From 1965 to 1974 it was part of Huntingdon, and it is now part of Cambridgeshire.

The Soke of Peterborough stretched from Market Deeping, Lincolnshire, in the north to Peterborough in the south and comprised the rural districts of Barnack and Peterborough as well as the city of Peterborough. The part of the Soke north of the River Nene is known as the Liberty of Peterborough, an area originally under the jurisdiction of the abbot of the monastery.

Peterhead, most easterly town in Scotland, burgh, fishing port, and seat of the Banff and Buchan district of Grampian region. Founded in 1593, Peterhead developed as a port and functioned briefly as a fashionable 18th-century spa. By the early 19th century it had become the chief British whaling centre. Fishing for herring later assumed primary importance but declined in favour of whitefish to supply local fish-processing plants. Food processing and light engineering were the town's main industries until the 1970s, when exploitation of the North Sea oil fields revived the town. Pop. (1981) 17,085.

Peterhof (Russian S.F.S.R.): *see* Petrodvorets.

Peterloo Massacre (Aug. 16, 1819), in English history, the brutal dispersal by cavalry of a radical meeting held on St. Peter's Fields in Manchester. The "massacre" (likened to Waterloo) attests to the profound fears of the privileged classes of the imminence of violent Jacobin revolution in England in the years after the Napoleonic Wars. To radicals and reformers Peterloo came to symbolize Tory callousness and tyranny.

The August meeting was the culmination of a series of political rallies held in 1819, a year of industrial depression and high food prices. Presided over by the radical leader Henry Hunt, the meeting was intended to be a great demonstration of discontent, and its political object was parliamentary reform. About 60,000 persons attended the rally, including a high proportion of women and children. None was armed, and their behaviour was wholly peaceable. The magistrates, who had been nervous before the event, were alarmed by the size and mood of the crowd, and ordered the Manchester yeomenry to arrest the speakers immediately after the meeting had begun. The untrained yeomenry did not confine themselves to seizing the leaders but, wielding sabres, made a general attack on the crowd. The chairman of the bench of magistrates thereupon ordered the 15th Hussars and the Cheshire Volunteers to join the attack; in ten minutes the place was cleared except for bodies. The numbers of killed and wounded were disputed; probably about 500 people were injured and 11 killed. Hunt and the other radical leaders were arrested, tried, and convicted—Hunt being sent to prison for two years.

Petermann Ranges, low mountains extending for 200 miles (320 km) from east-central Western Australia southeast to the southwest corner of Northern Territory. A continuation of the granite and gneiss formations in the Musgrave Ranges to the southeast, the Petermanns rise to a height of 3,800 feet (1,158 m). Visited (1874) by Ernest Giles, the mountains were named after August Petermann, a German geographer. The eastern section lies within the Petermann Reserve. To the east is the Ayers Rock–Mount Olga National Park.

Peters, Carl (b. Sept. 27, 1856, Neuhaus an der Elbe, Hanover [Germany]—d. Sept. 10, 1918, Bad Harzburg, Ger.), German explorer who advanced the establishment of the German East African protectorate of Tanganyika, now a part of Tanzania.

Carl Peters, oil painting by Herbert Sidney, 1912
Historia-Photo

After visiting London to study British principles of colonization, Peters founded the Society for German Colonization in 1884 and later that year, in the Usambara Mountains area of present-day northeastern Tanzania, made a number of contracts with chiefs who surrendered their territories to him. He later helped to extend the German sphere of influence and established the German East Africa Company, which obtained an imperial charter in 1885. He reached Uganda in 1890 and concluded a treaty with the king, but without the support of the German government. This treaty was declared void, for an agreement had been reached between Germany and Great Britain by which Uganda was left in the British sphere. He became imperial high commissioner for Kilimanjaro in 1891 but was deprived of his commission in 1897 for misuse of official power in his treatment of the Africans. From 1899 to 1901 he explored regions along the Zambezi River with a view to commercial exploitation and described his discovery of ancient cities and gold mines in *Im Goldland des Altertums* (1902; *The Eldorado of the Ancients*). He also published *Die deutsche Emin-Pascha Expedition* (1891; *New Light on Dark Africa*), among other works.

Peters, Curtis Arnoux: *see* Arno, Peter.

Peters, Hugh: *see* Peter, Hugh.

Peters, Lenrie (b. 1932, Bathurst, Gambia [now Banjul, The Gambia]), physician, novelist, and one of western Africa's most important poets.

Peters was educated at Bathurst, Freetown (Sierra Leone), and at Trinity College, Cambridge, where he earned a medical degree in 1959, with further studies in surgery. He broadcast on several British Broadcasting Corporation programs (and chaired its *Africa Forum*) before returning to Gambia.

His novel *The Second Round* (1965) is semi-autobiographical in its story of the disillusionment and alienation of a young doctor returning from England to Freetown after completing his medical studies and finding his home unsettled and unsettling, the people there having rejected all traditional values without substituting anything positive. The doctor drifts among acquaintances for a time but finally seeks some meaning by working in an isolated up-country hospital.

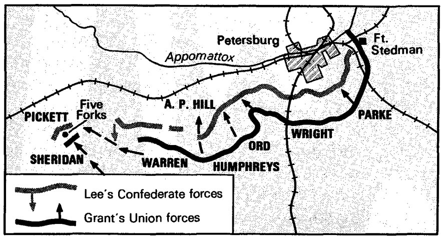
Peters' poetry (*Poems*, 1964; *Satellites*, 1967; and in several anthologies) is less pessimistic, characterized by a hope that good will prevail and by a sense of discovery. Some of his poems, however, tell of an estrangement similar to that in *The Second Round*. In style he usually follows European conventions, although he concentrates upon African themes and images.

Petersburg, city, seat (1839) of Menard county, central Illinois, U.S., on the Sangamon River. The area was settled about 1820, and in 1826 a plat for Petersburg (named for Peter Lukins, who owned land on the site) was surveyed by Abraham Lincoln. In a hillside cemetery near the city, which is on the Lincoln Heritage Trail, is the grave of Lincoln's fiancée, Ann Rutledge, whose headstone is inscribed with an epitaph written by the poet and novelist Edgar Lee Masters, a native son. The boyhood home of Masters, who is buried in the same cemetery, is maintained as a museum. The county courthouse has a display of Lincoln papers. Lincoln's New Salem Historic Site is just to the south. The city's economy is basically agricultural, with corn (maize), wheat, and soybeans being the chief crops. Inc. 1841. Pop. (1986 est.) 2,390.

Petersburg, city, in, but independent of, Dinwiddie and Prince George counties, southeast Virginia, U.S., on the Appomattox River (bridged), adjacent to Colonial Heights and Hopewell, 23 miles (37 km) south of Richmond. In 1645 Fort Henry was built at the falls of the Appomattox, the site of the present city. The name (earlier, Peter's Point and Peter's Town) reputedly honours Major Peter Jones, who became commander of the fort in 1675. In 1733 Colonel William Byrd II surveyed the site, but it was not until 1748 that an act of the colonial legislature established the town. During the American Revolution it was captured by British troops under William Phillips and Benedict Arnold (April 25, 1781). On May 20, Lord Cornwallis arrived with his army to prepare for the campaign that was to end with his surrender at Yorktown. In 1784 the towns of Petersburg, Blandford, Pocahontas, and Ravenscroft were combined and incorporated as Petersburg. It was the scene of bitter fighting in the American Civil War.

The city's manufactures include cigarettes, textiles, chemicals, luggage, and furniture. It is the seat of Richard Bland College (1961) and Virginia State University (1882). Historic sites include Petersburg National Battlefield (scene of the "Battle of the Crater"), Old Blandford Church (1737) and Cemetery (with 30,000 Confederate graves), and Center Hill Mansion Museum (1823). Fort Lee, with its Quartermaster Museum, is nearby. Inc. city, 1850. Pop. (1988 est.) city, 41,944; Richmond–Petersburg MSA, 844,300.

Petersburg Campaign (1864–65), series of military operations in southern Virginia during the final months of the American Civil War, culminating in the defeat of the South. Petersburg, an important rail centre 23 miles (37 km) south of Richmond, was a strategic point for the defense of the Confederate capital. In June 1864 the Union army began a siege of the two cities, with both sides rapidly constructing fortifications 35 miles (56 km) long. In a series of battles that summer, Union losses were heavy, but, by the end of August, General Ulysses S. Grant had crossed the Petersburg–Weldon Railroad; he captured Fort Harrison on September 29. By year's end, however, General Robert E. Lee still held Richmond and Petersburg. But mostly due to mismanagement and inefficiency, Southern railroads had broken down or been destroyed. Thus the Confederates were ill-fed to the point of physical exhaustion, and the lack of draft animals and cavalry mounts nearly immobilized the troops. Hunger, exposure, and the apparent hopelessness of further resistance led to increasing desertion, especially among recent conscripts. In March 1865 the Confederates were driven back at the Battle of Fort Stedman, leaving Lee with 50,000 troops as opposed to Grant's 120,000. Soon after, Grant crushed a main Southern force under General George E. Pickett and General Fitzhugh Lee at the Battle of Five Forks (April 1);



The Petersburg Campaign, Union attacks on April 1–2, 1865
From *A Dictionary of Battles* by David Eggenberger, Copyright © 1967 by David Eggenberger, reprinted with permission of the publisher, Thomas Y. Crowell Company Inc.

the next day the defenders were driven back within the Petersburg inner defenses. Lee immediately informed President Jefferson Davis that the two cities could no longer be held, and the evacuation was carried out that night. After Lee's plan to join with General Joseph E. Johnston was thwarted, he surrendered to General Grant on April 9 at Appomattox Court House.

Petersfield, Louise-Renée de Kéroualle, Baroness: *see* Portsmouth, Louise-Renée de Kéroualle, Duchess of.

Peterson, Oscar (b. Aug. 15, 1925, Montreal, Can.), Canadian jazz pianist best known for his dazzling solo technique.

After playing with a popular Canadian orchestra, Peterson went to the United States in 1949, where he appeared in one of jazz promoter Norman Granz's concerts at Carnegie Hall. He toured with Granz's Jazz at the Philharmonic group throughout the 1950s, leading a trio with Ray Brown (bass) and Irving Ashby (guitar), later succeeded by Barney Kessel and Herb Ellis. In the late 1950s, after Ellis left the trio, Peterson substituted a drummer (Ed Thigpen) for the guitarist and continued to develop his own personal style in the tradition of swing and bebop (having been at first influenced by Art Tatum and Earl Hines, among others). In the mid-1960s Louis Hayes replaced Thigpen, and Sam Jones replaced Ray Brown.

Peterson gained a wide audience after making several extensive European tours and recording with such jazz greats as Billie Holiday, Roy Eldridge, Dizzy Gillespie, Count Basie, and Ella Fitzgerald. He also won acclaim through his solo performances and recordings. Peterson received three Grammy Awards (1974, 1975, and 1977) and the Order of Canada service medal, and he was frequently named number one jazz pianist in numerous critics' and readers' polls. He was author of *Jazz Exercises and Pieces* (1965) and *Oscar Peterson New Piano Solos* (1965).

Peterson, Roger Tory (b. Aug. 28, 1908, Jamestown, N.Y., U.S.), American ornithologist, author, conservationist, and wildlife artist whose field books on birds, beginning with *A Field Guide to the Birds* (1934), did much in the United States and Europe to stimulate public interest in bird study.

The "Peterson Field Guide Series" includes Peterson's own books on birds of western North America (1954), eastern and central North America (1980), Britain and Europe (with British ornithologists Guy Mountfort and P.A.D. Hollum; 1954), and Mexico (1973), as well as his own volume on the wild flowers of eastern North America (with

Margaret McHenney; 1968). The series also includes a number of guides by other authors.

Peterson started drawing birds while in high school. He studied at the Art Student's League, New York (1927–29), and the National Academy of Design, New York (1929–31). In painting for the field guides, he stressed those features of each species that would aid the reader in identifying it in the field. In addition to the field guides, he wrote many popular books of a more general nature, among them *Birds Over America* (1948), *Wildlife in Color* (1951), *Wild America* (1955), *The Birds* (1963), and *The World of Birds* (with James Fisher; 1964). He received many awards, including the Brewster Medal of the American Ornithologists' Union (1944), the New York Zoological Society Gold Medal (1961), the World Wildlife Fund Gold Medal (1972), the Linné Gold Medal from the Royal Swedish Academy of Sciences (1976), and the U.S. Medal of Freedom (1980).

Peterson was an officer of many ornithological and conservation organizations, including the American Ornithologists' Union, National Audubon Society, and International Committee for Bird Preservation.

Petersson, Lars: *see* Petri, Laurentius.

Petersson, Olof: *see* Petri, Olaus.

Petherick, John (b. 1813, Glamorgan, Wales—d. July 15, 1882, London), British trader and explorer who investigated the western tributaries of the Nile River and made zoological and ethnological discoveries in the Sudan and Central Africa. He was the first European to encounter the Azande of northeastern Congo (now Zaire).

Petherick went to Africa in 1845 on a fruitless search for coal deposits in the interior of Egypt and the Sudan and remained in the Sudan as a trader. He later transferred his energies to the investigation of the tributaries of the Nile that run through the southern Sudan, notably the Baḥr-al-Ghazāl (Gazelle River). In 1853 he reached the borders of the Azande nation. Following the publication of his accounts of his travels, *Egypt, the Soudan and Central Africa* (1861), the Royal Geographical Society appointed him to meet John H. Speke and James A. Grant on their return from discovering the source of the Nile, but while carrying out further investigations in the Azande country, Petherick misjudged Speke's arrival and missed him.

Pethick-Lawrence (of Peaslake), Frederick William Pethick-Lawrence, Baron, original name FREDERICK WILLIAM LAWRENCE (b. Dec. 28, 1871, London—d. Sept. 10, 1961, London), British politician who was a leader of the woman suffrage movement in Great Britain during the first two decades of the 20th century; he later served (1945–47) as secretary of state for India and Burma.

In 1901 Lawrence married Emmeline Pethick, a fellow social worker in the East End of London, and added her family name to his own. Together they assailed their nation's prosecution of the South African War (1899–1902) and then became leaders in the agitation for woman suffrage. Pethick-Lawrence spent nearly all his considerable inheritance paying suffragettes' fines; and in 1912, after a demonstration in London, he served a few months in jail.

A Socialist and Labour Party member, he defeated Winston Churchill, at that time a Liberal, in the 1923 election to the House of Commons from West Leicester. In Ramsay MacDonald's second Labour ministry (1929–31) he was financial secretary to the Treasury. As secretary of state for India and Burma (August 1945–April 1947) in the Labour government of Clement Richard (afterward 1st Earl) Attlee, he was unable to reconcile Jawaharlal Nehru and Mohammed Ali Jinnah, respectively leaders of the Hindus and Muslims in India. He was created a baron in 1945. His autobiography, *Fate Has Been Kind,* was published in 1943 and *Pethick-Lawrence,* by Vera Mary Brittain, in 1963.

Pethick-Lawrence's two marriages were childless, and the barony became extinct upon his death.

Pétion, Alexandre Sabès (b. April 2, 1770, Port-au-Prince, Haiti—d. March 29, 1818, Port-au-Prince), Haitian liberator and president remembered by the Haitian people for his liberal rule and by South Americans for his support of Simón Bolívar during the struggle for independence from Spain.

The son of a wealthy French colonist and a mulatto, Pétion served in the French Colonial Army before the French Revolution and then joined the revolutionary troops of Toussaint-Louverture and, later, those of the mulatto general André Rigaud. Fleeing to France after Toussaint defeated Rigaud, who had set up a mulatto state in the southern provinces, Pétion returned in 1802 with the French Army sent to reconquer the colony but then became one of the first Haitian officers to revolt against France. In 1806 he was a leader in the revolt against the rule of Jean-Jacques Dessalines, who had played a principal role in 1803 in ousting the French. When, after Dessalines' death, Henry Christophe set up a separate state in northern Haiti, Pétion was elected president of southern Haiti in 1807. He was re-elected in 1811 and made president for life in 1816.

Influenced by ideals of French liberalism, Pétion divided the large plantations into small lots, giving one to each of his soldiers. Freed from the burden of producing a surplus for the plantation owners, the people produced only enough for their own needs, and the resulting slowdown in the economy led to galloping inflation. Pétion's regime was also marked by continual struggles with Christophe and with dissident generals in his own country.

Pétion de Villeneuve, Jérôme (b. Jan. 3, 1756, Chartres, Fr.—d. 1794, near Saint-Émilion), politician of the French Revolution who was at first a close associate, and later a bitter enemy, of the Jacobin leader Robespierre.

The son of a lawyer of Chartres, Pétion practiced as an advocate before accepting a seat with the bourgeois Third Estate at the States General of 1789. When the Third Estate obtained control of the States General (which became the National Assembly) and set about abolishing France's feudal institutions, Pétion and Robespierre led the small minority of deputies who pressed for enfranchisement of the lower classes and other far-reaching democratic reforms. The National Assembly dissolved itself on Sept. 30, 1791, and in November Pétion was elected mayor of Paris. Without breaking with Robespierre, he formed ties with the Girondins, the moderate bourgeois-democrats who opposed Robespierre in the newly formed Legislative Assembly.

When the Girondins organized a popular demonstration against King Louis XVI in Paris on June 20, 1792, Pétion made only half-hearted efforts to preserve order. Louis retaliated by suspending him from office on July 12, but the Legislative Assembly reinstated the mayor on August 3. Nevertheless, during the Paris insurrection that overthrew the monarchy on August 10, Pétion avoided committing himself to the Revolutionary cause.

In September 1792, Pétion was elected the first president of the National Convention, which succeeded the Legislative Assembly. Jealous of Robespierre's preeminence among the Montagnards (as the Jacobins of the Convention were called), Pétion joined the Girondins, and on June 2, 1793, he, together with 28 other Girondin leaders, was expelled from the Convention in a Montagnard coup d'état. Escaping arrest, Pétion made his way to the vicinity of Saint-Émilion, where he and another prominent Girondin, François Buzot, committed suicide. Their bodies were discovered on June 18, 1794.

Pétionville, eastern suburb of Port-au-Prince, Ouest *département,* southern Haiti, on the cool northern hills of the Massif de la Selle. Named for Alexandre Sabès Pétion, who fought in Haiti's wars for independence in the early 19th century and was later president of the southern kingdom, it is primarily a residential and resort area. It is linked to Port-au-Prince, the national capital, by a winding toll road, the proceeds of which were intended to finance Duvalierville, a model city, now defunct. Pop. (1982 prelim.) 35,333.

Petipa, Marius (b. March 11, 1819, Marseille—d. July 14 [July 1, old style], 1910, Gurzuf, Russia), dancer and choreographer who worked for nearly 60 years at the Mariinsky Theatre in St. Petersburg and had a profound influence on modern classical Russian ballet. He directed many of the greatest artists in Russian ballet and developed ballets that retain an important position in Soviet dance repertoire.

Petipa, 1869
Novosti Press Agency

Petipa and his brother Lucien (later principal dancer at the Paris Opéra) received their early training from their father, Jean, a ballet master long active in Brussels. After Marius' debut in Nantes, Fr., in 1838, he danced in Belgium, France, and the United States (he appeared in New York in 1839) before accepting an engagement in Spain, where he gathered material for ballets later produced in Russia. He established a reputation as a talented pantomime artist and one of the outstanding dancers of his day.

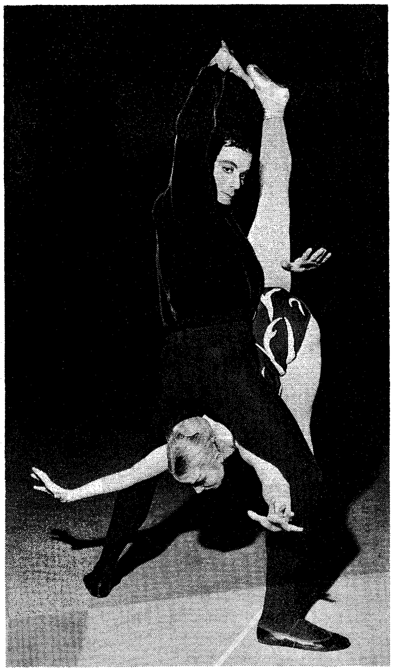
He made his initial appearance at the St. Petersburg Mariinsky Theatre in 1847 in *Paquita* and staged his first original ballet, *Un Mariage sous la régence* ("A Regency Marriage") there in 1858. For his wife, the ballerina Mariya Surovshchikova, he created *Le Marché des innocents* (1859; "The Children's March"). His first outstanding success was *La fille du pharaon* (1862; "The Pharaoh's Daughter"). Later, after becoming choreographer in 1862 and chief choreographer in 1869, he produced more than 60 ballets, working from carefully detailed plans that became the basis of modern classical ballet in Russia. He collaborated with Tchaikovsky on *The Nutcracker* (*Casse Noisette,* choreographed by his assistant Lev Ivanov) and *The Sleeping Beauty* and presented versions of *Swan Lake, Raymonda,* and *Giselle* that have been revived frequently. Among other major ballets are his *Don Quixote* (1869), *La Bayadère* (1877), and *Le Corsaire* (1899). After the death of his first wife, Petipa married another dancer, Lyubov Leonidovna.

Petit, Roland (b. Jan. 13, 1924, Villemomble, Fr.), French dancer and choreographer whose dramatic ballets combined fantasy with elements of contemporary realism.

Trained at the Paris Opéra Ballet school, he joined the company in 1940 but left in 1944 to create and perform his own works at the Théâtre Sarah Bernhardt, in Paris. In 1945 Petit was instrumental in creating Les Ballets des Champs-Elysées, where he remained as principal dancer, ballet master, and choreographer until 1947. In 1948 he formed the Ballets de Paris de Roland Petit (1948–50, 1953–54, 1955, and 1958), which made several tours of Europe and the United States Dancers who rose to prominence in his companies include Jean Babilée, Colette Marchand, Leslie Caron, and Renée ("Zizi") Jeanmaire, whom he married in 1954.

His choreography was often angular or acrobatic and was considered theatrical in its use of mime dance, occasional singing, and props such as cigarettes and telephones. His works included the realistic ballet *Les Forains* (1945; "The Strolling Players"), a study of indigent circus performers; the imaginative creation *La Croqueuse de diamants* (1950; "The Diamond Cruncher"), whose heroine eats the gems her associates steal; and *L'Oeuf à la coque* (1949; "The Soft-Boiled Egg"), in which the leading female dancer hatches from an egg in hell. *Carmen* (1949) was one of Petit's most popular ballets; the choreography was passionate and erotic, and Jeanmaire became famous for her interpretation of the title role. *Le Jeune Homme et la mort* (1946; "The Young Man and Death") and *Les Demoiselles de la nuit* (1948; "The Ladies of the Night") were among his other popular ballets.

Petit staged several music hall revues for his wife and choreographed the dances for the films *Hans Christian Andersen* (1952), *The Glass Slipper* (1955), *Daddy Long Legs* (1955),



Petit and Danielle Jossy in *Maldoror*
Serge Lido

Anything Goes (1956), and others. The ballet film *Black Tights* (1962) consisted of Petit's works *La Croqueuse de diamants, Cyrano de Bergerac, A Merry Mourning* (originally presented in 1953 as *Deuil en 24 heures,* "A 24-Hour Mourning"), and *Carmen.* Petit also staged several of his ballets for Sadler's Wells Ballet (now the Royal Ballet), for the Royal Danish Ballet, and for other troupes. From 1970 to 1975 he owned and operated the Casino de Paris, producing revues starring Jeanmaire. In 1973 he became director of the Ballet de Marseille. He choreographed a modern version of *Coppélia* in 1975 and a new *Phantom of the Opera* for the Paris Opéra Ballet in 1980.

petit jury, also called TRIAL JURY, COMMON JURY, or TRAVERSE JURY, a group chosen from the citizenry of a district to try a question of fact. It is the standard jury used in civil and criminal trials—at the request of either party to a civil action and only at the defendant's request in a criminal action. It is distinguished from the grand jury (*q.v.*), which formulates accusations, whereas the petit jury tests the accuracy of such accusations by standards of proof.

Generally, the petit jury's function is to deliberate questions of fact, questions of law being left to the trial judge; however, the distinction is often blurred. The petit jury has less discretion than is often imagined. The trial judge supervises it, rules on what evidence it may view and on what laws are applicable, and sometimes directs its verdict. If the judge deems that the jury has grossly ignored the weight of the evidence, he or she can set aside their verdict.

Although petit juries in England and the United States have historically contained 12 members, there is no uniform number. Numerical requirements for a valid verdict vary (*e.g.,* unanimity in the U.S., a majority in Scotland and Italy, two-thirds in Portugal), as do subject areas of operation. In the United States, for example, juvenile defendants may not request a jury, and in England juries have been eliminated from civil cases. Outside England and the United States the petit jury is declining. In nations having civil rather than common law, the jury, where found, is used only for criminal trials. Germany and France have a mixed tribunal of judges and jurors, and Japan abolished its petit jury in 1943 after a brief experimental period for civil cases.

Scholars disagree on the time and place of the trial jury's birth. Some suggest that King Alfred the Great of England initiated the institution in the 9th century. Others trace it to the Norman Conquest of England (1066). The petit jury emerged as a distinct form when the Articles of Visitation in England (1194) separated accusatory and trial juries—the grand and petit juries of today.

The future of the petit jury is uncertain. Even in England and the United States it is hotly debated. Proponents argue that the trial jury is a bulwark against tyranny, being drawn from the populace at large. Detractors insist the system is inconvenient and clumsy and that modern legal complexities are beyond the competence of most petit jurors. Court backlogs continue to underscore the need for greater efficiency in the administration of justice. *See also* voir dire.

petit mal (French: "little sickness"), type of epilepsy characterized by episodes of brief unresponsiveness. They generally last less than 15 seconds each and usually occur many times in a day—sometimes several hundred times. No involuntary movement or falling occurs (as in grand mal). After the short interruption of consciousness, the individual is mentally clear and able to continue what he was doing before. Petit mal occurs mainly in children and does not appear initially after age 20; it tends to disappear before or during early adult life. Each short absence is accompanied by an electroencephalogram pattern in which "spike and wave" discharges recur three times a second. At times petit mal can be nearly continuous, and the person may continue his activities in a clouded, partially responsive state for minutes or hours. *See also* epilepsy.

petit point, form of canvas embroidery similar to cross-stitch embroidery (*q.v.*), but even finer because of its small scale. The squareness and regularity of the outlines of the forms represented is less apparent at ordinary viewing distance. The stitch used—also called petit point or tent stitch—is worked either in diagonal or horizontal rows across the intersection of the canvas threads. The thread is carried back from stitch to stitch in a uniform

Petit point embroidered box, English, *c.* 1670; in the Royal Scottish Museum, Edinburgh
By courtesy of the Royal Scottish Museum, Edinburgh; photograph, Tom Scott

manner to ensure that the pull of the thread at the front is consistent.

Petit point was widely used in France in the 17th and early 18th centuries, particularly for pole screens and upholstery covering.

Petit porcelain, French hard-paste porcelain produced by Jacob Petit (b. 1796). Petit worked at the porcelain factory at Sèvres as a painter. With his brother Mardochée he bought a porcelain factory in Fontainebleau

Petit porcelain tea jar from Jacob Petit's factory at Fontainebleau, Fr., *c.* 1840; in the Victoria and Albert Museum, London
By courtesy of the Victoria and Albert Museum, London

in 1830, finally settling in Paris in 1863. The wares he made were of a purely ornamental character; *e.g.,* vases, statuettes, clocks. The high-quality porcelain may have been fired in Limoges. The usual colours are pale pink, light green, mauve, black, and gold. The shapes are idiosyncratic interpretations of the 18th-century rocaille style typical of the taste of the Louis-Philippe period for Rococo. Impressed or in blue, the mark for Petit porcelain is JP.

Petit-Quevilly, Le, town, southwest suburb of Rouen, Seine-Maritime *département,* Haute-Normandie region, northern France, on the Seine River. The name Quevilly comes from the Latin Quevillicium—in ancient French Chivilly, or Chevilli—meaning "a row of spikes" that enclosed a park where the Norman dukes once hunted. It was designated "Petit" in 1030 to distinguish it from Le Grand-Quevilly. Historic buildings include the Chapel of Saint-Julien, formerly part of the leprosarium founded by Henry II of England in 1183. Louis IX (St. Louis) was baptized in the chapel, which is decorated with 12th- and 13th-century paintings. Pop. (1982) 22,861.

Petit-Saint-Bernard, Col du (France–Italy): *see* Little Saint Bernard Pass.

petition, written instrument directed to some individual, official, legislative body, or court in order to redress a grievance or to request the granting of a favour. Petitions are also used to collect signatures to enable a candidate to get on a ballot or to put an issue before the electorate. They are also used to pressure representatives and deputies to vote in a certain way.

Most governments allow citizens to petition in some form for redress of grievances, and, indeed, in many countries it is an established right. The history of its growth has been wide and varied. In England the right of petitioning the crown was recognized indirectly as early as Magna Carta (1215) and reaffirmed in the Bill of Rights of 1689. At first, petitions to the crown appear to have been for the redress of private and local grievances. Moreover, in Parliament many statutes were drawn up from the petitions from the House of Commons to the crown and the latter's answers. Although the right to petition Parliament itself is not mentioned in the Bill of Rights, it is a convention of the constitution. In modern times the presentation of public petitions plays little effective part in parliamentary affairs because most fail to conform to very strict tests of technical validity.

In the United States the right to petition was recognized during the American Revolution and formalized in the First Amendment of the Constitution. Now both Congress and the various state legislatures have well-defined procedures for receiving and acting upon materials of this kind. Although the rules are not as stringent as those in England, individual officials often have wide discretion in interpreting the validity of petitions.

In France the petitions of the people and the National Assembly played a significant role throughout the Revolution.

petition of ———: *see under* substantive word (*e.g.,* right, petition of).

Petitot, Jean (b. July 12, 1607, Geneva, Switz.—d. April 3, 1691, Vevey), Swiss painter who was the first great miniature portraitist in enamel.

The son of sculptor Faulle Petitot, he was apprenticed to a Swiss jeweler from 1622 to 1626. About 1633 he went to France, where he probably became the pupil of Jean and Henri Toutin, the originators of the art of painting miniature portraits in enamel. By 1637 Petitot had arrived in England, where he was patronized by Charles I and his court. Only a few miniatures are known from this period, and all are copies of portraits by the court painter Sir Anthony Van Dyck (1599–1641).

Portrait of an unknown lady, painted enamel miniature by Jean Petitot; in the Musée Condé, Chantilly, Fr.

Giraudon—Art Resource/EB Inc.

Petitot had high expectations of his stay in England, but, after the outbreak of the first of the English Civil Wars, he returned to France. For many years he enjoyed the patronage of Louis XIV (1638–1715) and his courtiers. He executed many portraits of the king, his family, and the most celebrated figures in the king's entourage; most were based upon paintings by fashionable artists. Petitot worked in partnership with Jacques Bordier until the latter's death in 1684. When the Edict of Nantes, a document of religious freedom, was revoked in 1685, Petitot, as a Protestant, was imprisoned. Worn out by fever and old age, he signed a recantation and was freed. In 1687 he was allowed to return to Geneva and was received back into the Reformed Church.

Although priority in the discovery of the art of painting enamel miniature portraits belongs to the Toutins, it was Petitot who raised the art to a level never surpassed. While relying primarily on original portraits by others, he was able to preserve to a remarkable degree the character of the work he was transforming into a small, jewellike roundel. The most important collections of his works are in the Victoria and Albert Museum, London, and the Louvre, Paris. His style, much imitated in his own time, provoked a vast number of 18th- and 19th-century copies or imitations.

His son Jean-Louis Petitot (1653–after 1699) painted portrait enamels in a style closely resembling that of his father.

Petlyura, Symon Vasilyevich (b. May 17 [May 5, Old Style], 1879, Poltava, Ukraine, Russian Empire [now in Ukrainian S.S.R.]—d. May 26, 1926, Paris, Fr.), Socialist leader of the Ukraine's unsuccessful fight for independence after the Russian revolutions of 1917.

One of the founders of the Ukrainian Social-Democratic Workers' Party in 1905, Petlyura published two socialist weekly newspapers before the onset of World War I, when he became an officer in the Russian army (1914). After the imperial government of Russia was overthrown by the February Revolution (1917), he joined the Ukrainian Central Rada ("council"), which proclaimed the Ukraine to be an autonomous republic (June 1917); and in July he was appointed minister of war of the newly formed government.

Soon thereafter, however, the Germans occupied the Ukraine and established a puppet government. When the Germans withdrew at the end of the war, he assumed a leading role in the Ukraine's movement for independence, heading the five-member directorate of the Rada, becoming ataman ("commander in chief") of the Ukrainian army, and seizing power from the German regime.

Petlyura's government then had to confront hostile Soviet Russian armies as well as forces of the anti-Bolshevik White Russians. When the White armies, which had occupied the Ukraine and replaced Petlyura's government at the end of 1918, withdrew in the autumn of 1919, the Ukraine fell under Soviet authority.

To overthrow the Soviet regime, Petlyura concluded a treaty of alliance with Józef Piłsudski, head of the Polish state, in April 1920 and supported the Poles in their war against Soviet Russia (Russo-Polish War of 1919–20). Although the Poles repulsed the Soviet army, they were unable to secure independence for the Ukraine when they concluded the Treaty of Riga with the Bolsheviks (March 18, 1921).

The Ukraine subsequently remained under Soviet control, and Petlyura, after spending some months in Warsaw, moved with his government to Paris, where, several years later, he was fatally shot by Shalom Shvartsbard, in revenge for the deaths of Jews during pogroms staged by members of Petlyura's army.

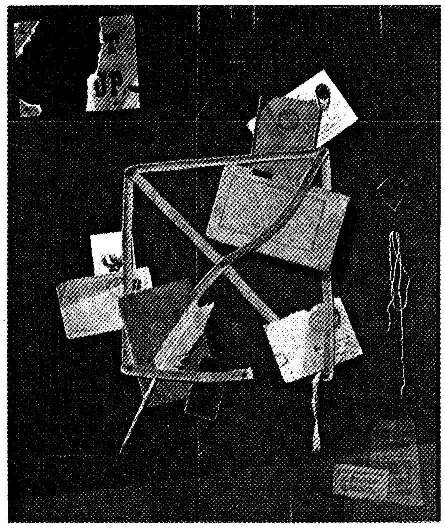
PETN, abbreviation of PENTAERYTHRITOL TETRANITRATE, a highly explosive organic compound belonging to the same chemical family as nitroglycerin—*i.e.,* the nitric acid esters of polyalcohols.

PETN was introduced as an explosive after World War I. It is used by itself in detonators and detonating fuses (Primacord) and in a mixture, called pentolite, with an equal amount of trinitrotoluene (TNT), developed during World War II, in grenades and projectiles.

PETN is a colourless, crystalline material that is generally stored and shipped as a mixture with water. It is less sensitive than nitroglycerin but is easily detonated. Valued for its shattering force and efficiency, PETN is the least stable of the common military explosives but retains its properties in storage for longer periods than nitroglycerin or cellulose nitrate (nitrocellulose) does. PETN is also used in medicine as a heart stimulant.

Peto, John Frederick (b. May 21, 1854, Philadelphia, Pa., U.S.—d. Nov. 23, 1907, Island Heights, N.J.), American still-life painter who, though influenced by the style and subject matter of the better-known trompe l'oeil ("fool-the-eye") still-life painter William Harnett, developed a distinctive mode of expression.

Biographical information on Peto is meagre, and few of his works were signed or dated. He may have been a student at the Philadelphia Academy of Fine Arts. From 1879 to 1886



"Old Time Letter Rack," oil on canvas by John Frederick Peto, 1894; in the Museum of Modern Art, New York City

By courtesy of the Museum of Modern Art, New York, gift of Nelson A. Rockefeller

he contributed irregularly to academy exhibitions. He knew Harnett, and possibly they were close friends. Peto and Harnett painted many of the same subjects—money, books, violins, and guns. A favourite subject of both, but particularly of Peto, was the letter rack in which a group of tapes tacked to a vertical surface held letters and other objects. Such pictures were done both early and late in Peto's career, the late ones, such as "Old Reminiscences," being stronger in abstract composition. Characteristically, Peto chose common, everyday objects as his subjects.

From 1875 to 1889 Peto worked in Philadelphia and, from 1889 to his death, in the village of Island Heights. Most of his works date from the second period. Because he was unknown and away from the world of art, his works were often represented as Harnett's. His works differ from Harnett's, however, in their softer, more luminous colour and gentler, almost poetic atmosphere.

Petőfi, Sándor (b. Jan. 1, 1823, Kiskőrös, Hung.—d. probably 1856, Siberia), one of the greatest Hungarian poets and a revolutionary who symbolized the Hungarian desire for freedom.

Petőfi had an eventful youth; he studied at eight different schools, joined for a short time a group of strolling players, and enlisted as a private soldier, but because of ill health was soon dismissed from the army. He traveled extensively in Hungary, mostly on foot. As a schoolboy he displayed a keen interest in the stage and in literature, and his first poem was published in 1842. After years of vicissitudes, in 1844, on the recommendation of Mihály Vörösmarty, then the leading Hungarian poet, he became an assistant editor of the literary periodical *Pesti Divatlap*. His first volume of poetry, *Versek,* appeared in the same year and made him famous at once, though the tone of his poems scandalized many. In 1847 he married Julia Szendrey, who inspired his best love poems.

Petőfi played a leading role in the literary life of the period preceding the outbreak of the Hungarian Revolution of 1848. After 1847, together with Mór Jókai, he edited the magazine *Életképek*. A fervent partisan of the French Revolution, he castigated the social conditions of his country, attacking the privileges of the nobles and the monarchy. Politically he was an extreme radical and an inspired agitator, but he was lacking in experience and failed to obtain a seat in the Diet. His poems glowed with political passion, and one of them, "Talpra magyar" ("Rise, Hungarian"), written on the eve of the revolution, became its anthem. During the revolution he became the aide-de-camp of General Jozef Bem, then head of the Transylvanian army, who had great affection for the somewhat unsoldierly but enthusiastic poet. Petőfi disappeared during the Battle of Segesvár, July 31, 1849. Though for many years his death at Segesvár had been assumed, in the late 1980s Soviet investigators found archives that revealed that he was one of some 1,800 Hungarian prisoners of war who were marched to Siberia. It is believed that he died of tuberculosis in 1856.

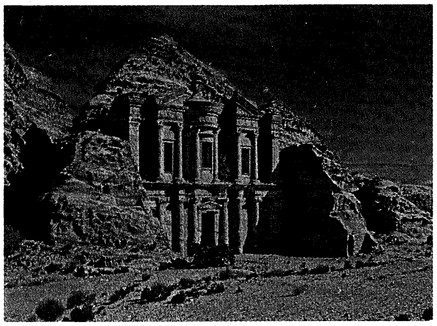
Petőfi's poetry is characterized by realism, humour, and descriptive power and imbued with a peculiar vigour. He introduced a direct, unpretentious style and a clear, unornamented construction adapted from national folk songs. This simplicity was the more arresting as it was used to reveal subtle emotions and political or philosophical ideas. Of his epic poems the *János vitéz* (1845), an entrancing fairy tale, is the most popular. Petőfi's popularity has never diminished in Hungary.

A critical edition of Petőfi's works by B. Varjas Béla was published in six volumes, 1948–56.

Petoskey, resort city, seat (1853) of Emmet county, northwestern Michigan, U.S., on Little Traverse Bay of Lake Michigan, 67 miles (108 km) northeast of Traverse City. Settled in 1852 and named for the Ottawa chief Pet-o-sega, it was the site of St. Francis Solanus Indian Mission (1859), which still stands. Originally a lumber town, it has turned to tourism and small manufacturing. Fine ski areas are nearby. The local beaches and gravel pits are searched by rock hounds for colourful and unusual fossilized stones, one of which—the Petoskey Stone—was adopted in 1965 as the official state stone. North Central Michigan (junior) College (1958) is located in the city. Inc. village, 1879; city, 1896. Pop. (1986 est.) 6,160.

Pëtr (Russian personal name): *see under* Peter.

Petra, Arabic BAṬRĀ, ancient city, centre of an Arab kingdom in Hellenistic and Roman times; its ruins are in southwest Jordan. The city was built on a terrace, pierced from east to west by the Wadi Mūsā (the Valley of Moses)—one of the places where, according to tradition, the Israelite leader Moses struck a rock and water gushed forth. The valley is enclosed by sandstone cliffs veined with shades of red and purple varying to pale yellow; and for this reason Petra is often called the "rose-red city."



The Nabataean rock-cut monument of ad-Dayr at Petra
Brian Brake—Rapho/Photo Researchers—EB Inc.

The Greek name Petra ("Rock") probably replaced the biblical name Sela. The site is usually approached from the east by a narrow gorge known as the Sik (or Siq; Wadi as-Sīk). Remains from the Paleolithic and the Neolithic periods have been discovered at Petra, and "Edomites" are known to have occupied the area in about 1200 BC; but little is known about the site up to about 312 BC, when the Nabataeans, an Arab tribe, occupied it and made it the capital of their kingdom. Under their rule, the city prospered as a centre of the spice trade.

When the Nabataeans were defeated by the Romans in AD 106, Petra became part of the Roman province of Arabia but continued to flourish until changing trade routes caused its gradual commercial decline. After an earthquake (not the first) damaged the city in AD 551, significant habitation seems to have ceased. The Islāmic invasion occurred in the 7th century, and a Crusader outpost is evidence of activity there in the 12th century. After the Crusades, the city disappeared from history until it was rediscovered by the Swiss traveler Johann Ludwig Burckhardt in 1812.

Excavations from 1958 on behalf of the British School of Archaeology in Jerusalem and the American School of Oriental Research added greatly to knowledge of Petra. Ad-Dayr ("The Monastery"; *c.* 3rd century AD) is one of Petra's best-known rock-cut monuments; it is an unfinished tomb facade that during Byzantine times was used as a church. The most noteworthy features of Petra are the tombs, many of which have elaborate facades and are now used as dwellings.

Petracha (Siamese king): *see* Phetracha.

Petralona skull, hominid fossil dating from possibly 70,000 years ago found in a cave near Thessaloníki, in eastern Greece, by two Greek archaeologists in 1960. The skull was found attached to a stalactitic column. The jaw was missing, but the cranium was almost complete.

The skull has a large brow and a slanting forehead, and, from the structure of the face, the jaw is estimated to have been larger than the known Neanderthal man. Nevertheless, the skull is considered to belong to an early Neanderthal type that is comparable to that of Kabwe man (found in Africa) and also related to certain European equivalents.

Petrarch, Italian in full FRANCESCO PETRARCA (b. July 20, 1304, Arezzo, Tuscany [Italy]—d. July 18/19, 1374, Arqua, near Padua, Carrara), Italian scholar, poet, and Humanist whose poems addressed to Laura, an idealized beloved, contributed to the Renaissance flowering of lyric poetry. Petrarch's inquiring mind and love of classical authors led him to travel, visiting men of learning and searching monastic libraries for classical manuscripts. He was regarded as the greatest scholar of his age.

Education and early poems. Petrarch's father, a lawyer, had been obliged to leave Florence in 1302 and had moved to Arezzo, where Petrarch was born. The family eventually moved to Avignon (1312), in the Provence region of southern France, the home of the exiled papal court, at which an Italian lawyer might hope to find employment. Petrarch's first studies were at Carpentras, Fr., and at his father's insistence he was sent to study law at Montpellier, Fr. (1316). From there he returned to Italy with his younger brother Gherardo to continue these studies at Bologna (1320). But already he was developing what, in a later letter, he described as "an unquenchable thirst for literature."

Petrarch's earliest surviving poems, on the death of his mother, date from the Montpellier and Bologna period, though like all Petrarch's work they were heavily revised later. Meanwhile, his knowledge and love of the classical authors increasing, he made his acquaintance with the new vernacular poetry that was being written. After his father's death, in 1326, Petrarch was free to abandon his law studies and pursue his own interests. Returning to Avignon, he took minor ecclesiastical orders and entered the household of the influential cardinal Giovanni Colonna. Petrarch enjoyed

Petrarch, portrait miniature within the illuminated initial *a* from *De remediis utriusque fortunae* by Petrarch, completed 1366; in the Biblioteca Nazionale Marciana, Venice (Cod. Marc. Lat. VI, 86)
By courtesy of the Biblioteca Nazionale, Venice

life in Avignon, and there is a famous description of him and his brother as dandies in its polished courtly world; but he was also making a name there for his scholarship and the elegance of his culture.

As well as a love of literature, Petrarch also had during his early youth a deep religious faith, a love of virtue, and an unusually deep perception of the transitory nature of human affairs. There now followed the reaction—a period of dissipation—which also coincided with the beginning of his famous chaste love for a woman known now only as Laura. Vain attempts have been made to identify her, but Petrarch himself kept silent about everything concerning her civil status, as though he thought it unimportant. He first saw her in the Church of St. Clare at Avignon on April 6, 1327, and loved her, although she was outside his reach, almost until his death. From this love there springs the work for which he is most celebrated, the Italian poems (*Rime*), which he affected to despise as mere trifles in the vulgar tongue but which he collected and revised throughout his life.

Classical studies and career (1330–40). He spent the summer of 1330 at Lombez, Fr., the bishop of which was an old friend from Bologna, Giacomo Colonna. In 1335 he received a canonry there but continued to reside at Avignon in the service of the Cardinal, with whom he stayed until 1337. Quite apart from his love for Laura, this period was an important one for Petrarch. These were years of ambition and unremitting study (notably in the field of classical Latin). They were also years of travel. In 1333 his journeying took him through France, Flanders, Brabant, and the Rhineland, where he visited men of learning and searched monastic libraries for "lost" classical manuscripts (in Liège he discovered copies of two speeches by Cicero). In Paris he was given a copy of the *Confessions* of St. Augustine by a friend and spiritual confidant, the Augustinian monk Dionigi of Sansepolcro, and he was to use this more and more as the breviary of his spiritual life.

These experiences bring Petrarch's mission as a stubborn advocate of the continuity between classical culture and the Christian message more sharply into focus. By making a synthesis of the two seemingly conflicting ideals—regarding the one as the rich promise and the other as its divine fulfillment—he can claim to be the founder and great representative of the movement known as European Humanism. He rejected the sterile argumentation and endless dialectical subtleties to which medieval Scholasticism had become prey and turned back for values and illumination to the moral weight of the classical world. In 1337 he visited Rome for the first time, to be stirred among its ruins by the evident grandeur of its past. On returning to Avignon he sought a refuge from its corrupt life—the papacy at this time was wholly absorbed in secular matters—and a few miles to the east found his "fair transalpine solitude" of Vaucluse, which was afterward to become a much-loved place of retreat.

The chronology of Petrarch's writings is somewhat complicated by his habit of revising, often extensively. By the time he discovered Vaucluse, however, he had written a good many of the individual poems that he was to include in the *Epistolae metricae* (66 "letters" in Latin hexameter verses) and some of the vernacular *Rime* inspired by his love for Laura. At Vaucluse he began to work on *Africa,* an epic poem on the subject of the Second Punic War. He also began work on *De viris illustribus,* intended as a series of biographies of heroes from Roman history (later modified to include famous men of all time, beginning with Adam, as Petrarch's desire to emphasize the continuity among ideals of the Old Testament, of the classical world, and of Christianity increased).

Moral and literary evolution (1340–46). Meanwhile, his reputation as a scholar was spreading; in September 1340 he received invitations from Paris and Rome to be crowned as poet. He had perhaps sought out this honour, partly from ambition but mainly in order that the rebirth of the cult of poetry after more than 1,000 years might be fittingly celebrated. He had no hesitation in choosing Rome, and accordingly he was crowned on the Capitoline Hill on April 8, 1341, afterward placing his laurel wreath on the tomb of the Apostle in St. Peter's Basilica: again, the symbolic gesture linking the classical tradition with the Christian message.

From Rome he went to Parma and the nearby solitude of Selvapiana, returning to Avignon in the autumn of 1343. It is generally believed that he went through some kind of moral crisis at this time, rooted in his inability to make his life conform to his religious faith and possibly heightened by his brother's decision to enter a Carthusian monastery. At any rate, this is a common reading of the *Secretum meum* (1342–43). It is an autobiographical treatise consisting of three dialogues between Petrarch and St. Augustine in the presence of Truth. In it he maintains hope that, even amidst worldly preoccupations and error, even while absorbed in himself and his own affairs, a man might still find a way to God. Thus, Petrarch's spiritual "problem" found a coherent solution, one that can be said to express the Petrarchan vision and the Humanist's religious and moral outlook.

It was therefore an evolution—both moral and literary—rather than a "crisis" that made Petrarch decide his love for Laura was love for the creature rather than for the Creator and therefore wrong—proof of his attachment to the world. It was an evolution in his thinking that led him to break through the barriers of his too-exclusive admiration for antiquity and to admit other authoritative voices. It was now, for example, that *De viris* was enlarged to include material from sacred as well as secular history, while in the *De vita solitaria* (1346) he developed the theoretical basis and description of the "solitary life" whereby man enjoys the consolations of nature and study together with those of prayer.

Break with his past (1346–53). The events of the next few years are fundamental to his biography, both as a man and as a writer. In the first place, he became enthusiastic for the efforts of Cola di Rienzo to revive the Roman republic and restore popular government in Rome—a sympathy that divided him still more sharply from the Avignon court and in 1346 even led to the loss of Cardinal Colonna's friendship. The Plague of 1348, known as the Black Death, saw many friends fall victim, including Laura, who died on April 6, the anniversary of Petrarch's first seeing her. Finally, in the jubilee year of 1350 he made a pilgrimage to Rome and later assigned to this year his renunciation of sensual pleasures.

These are the landmarks of Petrarch's career, but the time in between was filled with diplomatic missions, study, and immense literary activity. In Verona in 1345 he made his great discovery of the letters of Cicero to Atticus, Brutus, and Quintus, which allowed him to penetrate the surface of the great orator and see the man himself. The letters spurred him on to write epistles to the ancient authors whom he loved and to make a collection of his own letters that he had scattered among his friends. These great collections record not only Petrarch's genius for friendship but also all those shifts in attitude by which he left behind the Middle Ages and prepared for the Renaissance. Toward the end of 1345 he returned again to the peace of Vaucluse and spent two years there, chiefly revising *De vita solitaria* but also developing the theme of solitude in a specifically monastic context, in *De otio religioso.* Between November 1347 and his pilgrimage to Rome in 1350 he was also in Verona, Parma, and Padua. Much of the time was spent in advancing his career in the church; the manoeuvring and animosities this involved resulted in an intense longing for the peace of Vaucluse; not even a visit from his lifelong friend the poet Boccaccio, who offered him a chair to be established under his guidance in the University of Florence, could deflect him. He left Rome in May 1351 for Vaucluse.

Here he worked on a new plan for the *Rime.* The project was divided into two parts: the *Rime in vita di Laura* ("Poems During Laura's Life") and the *Rime in morte di Laura* ("Poems After Laura's Death"), which he now selected and arranged to illustrate the story of his own spiritual growth. The choice of poems was further governed by an exquisite aesthetic taste and by a preference for an approximately chronological arrangement, from the description of his falling in love to his final invocation to the Virgin; from his "youthful errors" to his realization that "all worldly pleasure is a fleeting dream"; from his love for this world to his final trust in God. The theme of his *Canzoniere* (as the poems are usually known) therefore goes beyond the apparent subject matter, his love for Laura. For the first time in the history of the new poetry, lyrics are held together in a marvellous new tapestry, possessing its own unity. By selecting all that was most polished and at the same time most vigorous in the lyric tradition of the preceding two centuries and filtering it through his new appreciation of the classics, he not only bequeathed to humanity the most limpid and yet passionate, precise yet suggestive, expression of love and grief, of the ecstasies and sorrows of man, but also created with his marvellous sensibility the form and language of the modern lyric, to provide a common stock for lyric poets of the whole of Europe.

He also continued work on the *Metricae,* begun in 1350; he embarked on a polemic against the conservative enemies of his new conception of education, which rejected the prevailing Aristotelianism of the schools and restored the spiritual worth of classical writers—the new studies to be called *litterae humanae,* "humane letters." He also began work on his poem *Trionfi,* a more generalized version of the story of the human soul in its progress from earthly passion toward fulfillment in God.

Later years (1353–74). But the death of his closest friends, dislike of the newly elected pope, Innocent VI, increasingly bitter relations with the Avignon court, all finally determined Petrarch to leave Provence. He found rooms in Milan and stayed there for most of the next eight years. During these eight years he also completed the first proper edition of the *Rime,* continued assiduously with the *Familiares,* worked on the *Trionfi,* and set in order many of his earlier writings.

Early in 1361 he went to Padua, hoping to escape the Plague. He remained there until September 1362, when, again a fugitive from the Black Death, he sought shelter in Venice. He was given a house, and in return Petrarch promised to bequeath all his books to the republic. He was joined by his daughter Francesca, and the tranquil happiness of her little family gave him great pleasure. He was visited by his dearest and most famous friends (including the great chancellor Benintendi de' Ravegnani and Boccaccio, who presented him with a long-desired Latin translation of Homer's poems); he was invited to play an honourable part in the life and politics of the city; he worked peacefully but with great concentration at the definitive versions of his various writings. Nevertheless, after receiving an insult from four young men who followed the Arab "naturalist" interpretation of Aristotle's work, Petrarch was induced to move back to Padua in 1367. He remained there until his death, dividing his time from 1370 between Padua and Arquà, in the neighbouring Euganean hills, where he had a little house. There he wrote the defense of his Humanism against the critical attack from Venice, *De sui ipsius et multorum ignorantia.* He was still in great demand as a diplomat; in 1370 he was called to Rome by Urban V, and he set off eager to see the fulfillment of his great dream of a new Roman papacy, but at Ferrara he was seized by a stroke. Yet he did not stop working; in addition to revision he composed more minor works and added new sections to his *Posteritati,* an autobiographical letter to posterity that was to have formed the conclusion to his *Seniles*; he also composed the final sections of the *Trionfi.* Petrarch died in 1374 while working in his study at Arquà and was found the next morning, his head resting on a manuscript of Virgil.

The hallmark of Petrarch's thought was a deep consciousness of the past as the nutriment of the present. His abiding achievement was to recognize that, if there is a Providence that guides the world, then it has set man at the centre. Petrarch provided a theoretical basis for the enrichment of man's life. But, even more important, the Humanist attitudes of the Italian 15th century that led into the Renaissance would not have been possible without him. (J.H.W./Ed.)

MAJOR WORKS. The chronology of Petrarch's works is difficult to ascertain because the poet habitually and heavily revised everything he wrote. His collected works (*Opera*) were published in 1554 and 1581. *Epistolae metricae* (he worked on the collection in three phases: 1350, 1357, and 1363; ed. by D. Rossetti, *Poesie minori del Petrarca,* 1831); *Africa* (begun 1338 or 1339; published posthumously 1396; critical edition by N. Festa, 1926); *De viris illustribus* (begun 1338–39; revised 1341–43, and again 1351–53; later replanned with the title *Quorundam virorum illustrium epithoma,* preface by Petrarch, completed by his disciple Lombardo della Seta; ed. by L. Razzolini, 1874–79); *Secretum meum* (1342–43, revised 1353–58; ed. by E. Carrara in *Prose,* 1955); *De vita solitaria* (1346 and later—one addition of 1371; ed. by G. Martellotti in *Prose,* 1955); *De otio religioso* (1347, revised and enlarged 1357; ed. by G. Rotondi, 1958); *Familiarium rerum libri xxiv* (arrangement of the letters begun 1351–53, i–viii; 1359–60, ix–xix; 1363–64, xx–xxiii; 1366, xxiv; critical edition by V. Rossi and U. Bosco, 1933–42); *De remediis utriusque fortunae* (begun 1354; published 1366; Petrarch probably returned to it later); *Senilium rerum libri* (after 1361 to 1374); *Posteritati* (first draft before 1367; additions 1370–72; ed. by E. Carrara and P.G. Ricci in *Prose,* 1955); *De sui ipsius et multorum ignorantia* (written 1367, published 1371; ed. by L.M. Cappelli, 1906).

Sapegno in vol. 2 of the Cecchi-Sapegno *Storia della letteratura italiana* (1965), with copious bibliography; Aldo Scaglione, *Francis Petrarch, Six Centuries Later* (1975), essays; and Stephen Minta, *Petrarch and Petrarchism: The English and French Traditions* (1980), commentaries on and selections of poets writing in the Petrarchan tradition.

Petrassi, Goffredo (b. July 16, 1904, Zagarolo, near Rome), one of the foremost Italian composers of the 20th century.

After completing his musical studies he was appointed to the faculty of St. Cecilia Academy in Rome as professor of composition; in 1956 he taught composition classes at the Berkshire Music Center in Tanglewood, Mass., and throughout his career he toured widely as a conductor. Petrassi composed in a variety of styles. His early music shows the influence of Casella and Hindemith; his later, that of Stravinsky and Schoenberg. Choral composition, as in *Coro di morti* (1940–41), the cantata *Noche oscura* (1950–51), and *Orationes Christi* (1974–75), played a major role in his development. In his later compositions he displayed an interest in twelve-tone procedures, and several of his eight concerti for orchestra (1931–72) feature liberal doses of atonality. Petrassi's other works include operas, ballets, chamber and keyboard music, and songs.

Petre, Sir Edward, 2ND BARONET, byname FATHER PETRE (b. 1631, London—d. May 15, 1699, Watten, Flanders), English Jesuit, favourite of King James II of Great Britain.

Educated in France, he entered the Society of Jesus in 1652 and took orders in 1671,

Petre, engraving

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

when he returned to England. In 1679 he succeeded to the family baronetcy and estates and was appointed vice provincial of the English Jesuits but was imprisoned for suspected complicity in the Popish Plot (an alleged conspiracy to massacre Protestants, murder the King, and burn London). Released in 1680 by the influence of James (then duke of York), he was later blamed for the King's more extreme policies. James made Petre clerk to the closet (1686) and a member of the Privy Council (1687), but the King was unsuccessful in his attempt to persuade the Pope to make Petre a cardinal. Late in 1688 Petre fled abroad.

petrel, any of a number of seabirds of the order Procellariiformes, particularly certain members of the family Procellariidae, which also includes the fulmars and the shearwaters. Members of the family Hydrobatidae are increasingly called storm petrels; those of the Pelecanoididae are usually called diving petrels (*see* diving petrel; storm petrel).

Among the procellariid petrels, some two dozen species of the genera *Pterodroma* and *Bulweria* are called gadfly petrels because their flight is more fluttering than that of the related shearwaters (*see* shearwater). Certain heavy-bodied petrels are known as fulmars, and one, *Macronectes giganteus,* is called both giant fulmar and giant petrel (*see* fulmar).

Gadfly petrels nest in loose colonies on islands in the tropical and subtropical regions of the major oceans. A single egg (rarely two) is laid on the soil surface or in a burrow or crevice. The chick is tended by both parents and deserted about a week before it is fully fledged; it completes its development on stored fat. During the nonbreeding season, these birds roam the open ocean, feeding on squid and small fish. Most gadfly petrels are dark above and light beneath, with long wings and short, wedge-shaped tails. Because they are quite similar in appearance, the species are difficult to distinguish.

Some of the better known gadfly petrels are the endangered Bermuda petrel, or cahow (*Pterodroma cahow,* sometimes considered a race of *P. hasitata*); the dark-rumped petrel, also called the Hawaiian petrel (*P. phaeopygia*), another endangered species, now concentrated almost entirely on the island of Maui; the phoenix petrel (*P. alba*), which breeds on several tropical archipelagos; and the black-capped petrel, or diablotin (*P. hasitata*), formerly found throughout the West Indies but now known only in Haiti. Several other species, including the Chatham Island (or magenta) petrel, the Galápagos dark-rumped petrel, and the Réunion petrel, are also on the endangered list.

Several other procellariids are also called petrels. Among them are the pintado petrel, or Cape pigeon (*Daption capensis*), a sub-Antarctic species about 40 centimetres (16 inches) long, marked with bold patches of black and white. The snow petrel (*Pagodroma nivea*), 35 cm, a pure white species, and the Antarctic petrel (*Thalassoica antarctica*), 42 cm, a brown-and-white-pied species, are rarely seen outside Antarctic waters.

Petri, Laurentius, Swedish LARS PETERSSON (b. 1499, Örebro, Swed.—d. Oct. 26, 1573, Uppsala), Lutheran churchman, a leader of the Protestant Reformation in Sweden and the first Protestant archbishop of Uppsala (1531–73).

His influence was very great, although he was less dynamic and forceful than his brother Olaus. The Swedish Bible of 1541, for which he was principally responsible, was as important for Swedish life and literature as Luther's German translation was for the German-speaking peoples. His *kyrkoordning* (church order) of 1571 defined the practice of the church, particularly its relation to government. It went far toward establishing the independence of the church from the crown, which has been characteristic of most of the history of the Swedish Lutheran Church.

Petri, Olaus, Swedish OLOF PETERSSON (b. Jan. 6?, 1493, Örebro, Swed.—d. April 19, 1552, Stockholm), Lutheran churchman who, with his brother Laurentius, played a decisive role in the reformation of the Swedish church.

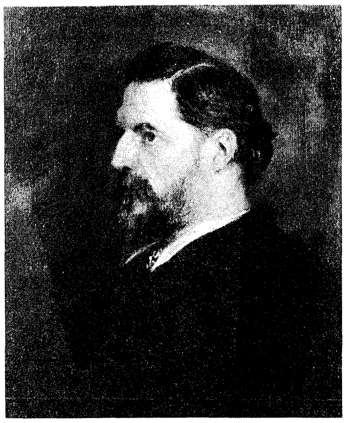
He studied at Wittenberg (1516–18) and absorbed the reformed teaching of Martin Luther and Philipp Melanchthon. When Gustavus Vasa was crowned king in 1523, Olaus had already attracted attention and criticism by his preaching. The Roman Catholic hierarchy was hostile to the King, who became a supporter of the reformed teaching. During the reign of Gustavus Vasa, Olaus rose in prominence and served briefly as chancellor (1531). Later, because he opposed the autocratic policy of the King, he fell from favour and was condemned to death in 1540, the sentence being remitted for a heavy fine. He regained favour, however, and was appointed pastor of Storkyrkan (the Cathedral of St. Nicholas) in Stockholm. Olaus provided most of the literature for the Swedish Reformation movement, including a Swedish New Testament, hymnbook, church manual, the Swedish liturgy, and many homiletical and polemical writings. His *Chronicle* is an important historical document.

Petrie, Sir (William Matthew) Flinders (b. June 3, 1853, Charlton, near Greenwich, London—d. July 28, 1942, Jerusalem), British archaeologist and Egyptologist who made valuable contributions to the techniques and methods of field excavation and invented a sequence dating method that made possible the reconstruction of history from the remains of ancient cultures. He was knighted in 1923.

Petrie was named for his maternal grandfather, Matthew Flinders, British navigator, pioneer hydrographer, and explorer of Australia and Tasmania. A frail child, Petrie was privately educated, early developing archaeological and ethnological interests, particularly in the area of ancient weights and measures, and in Egyptology.

At the age of 24, Petrie wrote *Inductive Metrology, or the Recovery of Ancient Measures from the Monuments,* a work that represented a new approach to archaeological study. Fieldwork done at various locations in Britain, including Stonehenge, enabled him to determine by mathematical computations the unit of measurement for the construction of the monument. His *Stonehenge: Plans, Description, and Theories* was published in 1880, and in that same year he began the surveys and excavation of the Great Pyramid at Giza, which initiated his four decades of exploration in the Middle East.

During the 1884 excavation of the Temple of Tanis, Petrie discovered fragments of a colossal statue of Ramses II. In 1885 and 1886, at Naukratis and Daphnae in the Nile delta, he uncovered painted pottery by which he proved that those sites had been trading colonies for the ancient Greeks. It was this discovery that caused him to believe that history could be



Petrie, detail of an oil painting by G.F. Watts; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

reconstructed by a comparison of potsherds (pottery fragments) at various levels of an excavation.

He first applied his principle of sequence dating in Palestine, at Tel Ḫasi, south of Jerusalem. In 1890, in a period of only six weeks, the indefatigable excavator found a series of occupations for which he supplied tentative dates of habitation. His work at the hill site marked the second stratigraphic study in archaeological history—the first was carried out at Troy by Heinrich Schliemann. The excavations of these two men marked the beginning of the examination of successive levels of a site, rather than the previously practiced method of haphazard digging, which had produced only a jumble of unrelated artifacts. Most of Petrie's contemporaries in archaeology questioned his hypothesis that chronology could be established by potsherds, whether painted or undecorated. But, with the progressive sophistication of the science of archaeology, examination and classification of broken pottery became, as it is now, routine procedure.

He made other important discoveries in the Fayyūm region of Egypt. At Gurob he found numerous papyri and Aegean pottery that substantiated dates of ancient Greek civilizations, including the Mycenaean. At the Pyramid of Hawara he searched through the tomb of Pharaoh Amenemhet III to discover how grave robbers could have found the tomb's opening and made their way through the labyrinth surrounding the two sarcophagi (stone coffins) that they emptied. He concluded that they must have been given the master plan by an informer. At al-Fayyūm also he made a rich find of 12th-dynasty jewelry (housed at the Metropolitan Museum in New York City since 1919). He was delighted by his discovery of the earliest-known Egyptian reference to Israel on the stela (a stone slab monument) of Merneptah, pharaoh of ancient Egypt from 1213 to 1204 BC.

In 1892 Petrie was made Edwards professor of Egyptology at University College, London, and he served in the position until 1933, when he became professor emeritus. In 1894 he founded the Egyptian Research Account, which in 1905 became the British School of Archaeology.

Petrie added to the knowledge of the pyramid builders during his exploration of the necropolis of Abydos, holy city of the cult of Osiris, god of the dead. At Tell el-Amarna he excavated the city of Akhenaten, or Amenhotep IV, ruler of Egypt from 1353 to 1336 BC, revealing the now-famous painted pavement and other artistic wonders of the Amarna age (14th century BC). Three thousand graves found by Petrie at Naqādah, northeast of Thebes, were identified as those of primitive ancient Egyptians.

In 1904 Petrie published *Methods and Aims in Archaeology,* the definitive work of his time, in which he lucidly defined the goals and methodology of his profession along with the more practical aspects of archaeology—details of excavation, including the use of cameras in the field. With uncommon insight, he noted that research results were dependent on the personality of the archaeologist, who, in addition to possessing broad knowledge, had to have insatiable curiosity. His own abundance of that characteristic was never questioned.

Inscriptions Petrie found on the Sinai Peninsula represented an intermediate stage (not later than 1500 BC) of written communication between Egyptian hieroglyphics and the Semitic alphabet. Although he wrote *The Formation of the Alphabet* (1912), language was not Petrie's forte, and he depended on a sixth sense for free translation of inscriptions and for establishing dates through the study of the forms of hieroglyphs.

Under the auspices of the American School of Research, he excavated in Palestine from 1927 until 1938, when he was 85. In those years, again at Tel Ḫasi, he uncovered the ruins of 10 cities. His scientific methods provided the guidelines for all subsequent Palestinian excavations. He died at Jerusalem at the age of 89. (G.J.P.)

BIBLIOGRAPHY. W.F. Albright, *History, Archaeology, and Christian Humanism* (1964), in the course of discussing specific contributions to archaeology, evaluates Petrie's work in the development of archaeological method. C.W. Ceram, *Gods, Graves, and Scholars,* 2nd ed. rev. and enlarged (1967, reprinted 1986; originally published in German, 1949), considers Petrie the outstanding interpreter of discoveries.

Petrified Forest National Park, national park in eastern Arizona, U.S., 18 miles (29 km) east of Holbrook. Established as a national monument in 1906 and as a national park in 1962, it occupies an area of 146 square miles (378 square km). The park features extensive exhibits of petrified wood in several "forest" areas. The park includes the inaccessible Black Forest in the Painted Desert (*q.v.*), a badlands region of colourful wind-eroded hills near the north entrance, where Pilot Rock (6,235 feet [1,900 m]), the park's highest point, is located. Other sections (Blue Mesa, Jasper, Crystal, and Rainbow forests) of the park are mostly filled with fossilized leaves, plants, and broken logs. Other features include petroglyphs (such as Newspaper Rock) and ancient Indian Pueblo ruins, notably the Puerco Indian Ruin (just south of the Painted Desert) and the Rainbow Forest Museum near the south entrance.

The park's elevation, which ranges from 5,300 feet (1,600 m) to Pilot Rock's 6,235 feet (1,900 m), and annual precipitation, which is less than 10 inches (250 mm), are the primary factors in determining the type of plant and animal life. Many of the plants are small and

inconspicuous, but they include some that blossom in spring—yuccas, mariposa lilies, and cacti—and others that provide summer flowers—asters, rabbit brush, and sunflowers. Wildlife includes coyotes, bobcats, antelopes, rattlesnakes, lizards, and a variety of birds, notably the horned lark, rock wren, and phoebe.

petrified wood, fossil formed by the invasion of minerals into cavities between and within cells of natural wood, usually by silica (silicon dioxide, SiO_2) or calcite (calcium carbonate, $CaCO_3$). The petrified forests of the western United States are silicified wood, the tree

tissues having been replaced by chalcedony (cryptocrystalline quartz). Often this replacement is so accurate that the internal structure as well as the external shape is faithfully represented; sometimes even the cell structure may be determined.

Petrillo, James C(aesar) (b. March 16, 1892, Chicago—d. Oct. 23, 1984, Chicago), American labour leader who served as president of the American Federation of Musicians (AFM) from 1940 to 1958.

Petrillo grew up on Chicago's west side and, after a brief period as a trumpet player and band leader, became active in an independent musicians' union and served as its president for three years. Defeated for reelection, he joined the local chapter of the American Federation of Musicians in Chicago in 1918. In

1922 he became president of the Chicago local. Active in Democratic political circles, Petrillo used a position on Chicago's Park Board to initiate free summer concerts in Grant Park—a practice that has continued since 1936.

In 1940 Petrillo was elected national president of the AFM; and from that date until his retirement in 1958 he fought on many different fronts to protect his membership from changes wrought by technological change in the entertainment and recording industry.

Petrine theory, the basis of Roman Catholic doctrine on papal primacy, resting partly on Christ's bestowing the "keys of the Kingdom" on Peter (the first pope, according to Catholic tradition), and partly on Christ's words: "And I tell you, you are Peter [Greek: *Petros*], and on this rock [Greek: *petra*] I will build my church" (Matt. 16:18). *See also* pope.

Petrobrás, abbreviation of PETRÓLEO BRASILEIRO SA, Brazilian, largely government-owned monopoly formed on Oct. 3, 1953, to prospect and extract crude oil, natural gas, and related hydrocarbons; to refine domestic and imported petroleum; and to transport oil and gas and their derivatives. The largest joint-stock, limited-liability company in Brazil, it is an operating company, whereas the National Petroleum Council (Conselho Nacional do Petróleo), a government agency, establishes policies and oversees the overall development of the petrochemical industry. Headquarters are in Rio de Janeiro.

Although largely devoted to developing petroleum sources in Brazil, on land and offshore, Petrobrás also has interests in oil fields in such areas as the Middle East, North Africa, and Colombia. A subsidiary, Interbrás (Petrobrás Comércio Internacional SA) is an export-import company trading in a variety of products, such as foods, fertilizers, metals, tractors, clothing, and textiles. Other subsidiaries and associated companies produce or develop fertilizers, minerals, and other industrial products.

petrochemical, any of a large group of chemicals (as distinct from fuels) derived from petroleum and natural gas and used for a variety of commercial purposes. Petrochemical production is highly automated, typically using large-scale continuous processes. The largest outlets for petrochemical raw materials are the manufacture of plastics, fibres, synthetic rubbers, detergents, fertilizers, insecticides, and solvents; such diverse industries as automobile, aviation, textile, explosives, and paint manufacturing, food processing, agriculture, and construction use petrochemicals.

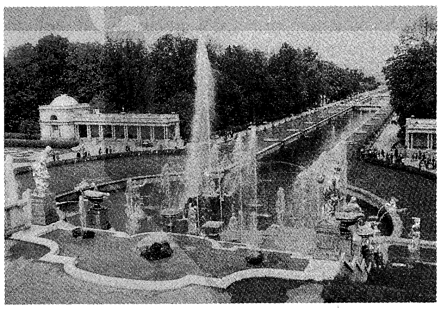
The petrochemical industry received its chief impetus in 1913 from the development of the thermal cracking process by which crude petroleum was refined. The process yielded gaseous by-products that were at first used only as illuminating gas or as fuel, but were found useful as chemical raw materials in the 1920s and 1930s. The introduction of catalytic cracking in 1937 and increased supplies of natural gas brought further expansion of the industry.

Hydrocarbons produced by petroleum refining methods are converted by polymerization to plastics, synthetic rubbers, and synthetic fibres of superior hardness, flexibility, or strength.

Ethylene and propylene, produced by thermal cracking since 1913, provide raw materials for many chemicals. From ethylene are manufactured ethylene glycol, used in polyester fibres and resins and in antifreezes; ethyl alcohol, a solvent and chemical reagent; polyethylene, for film and plastics; styrene, for resins, synthetic rubber, plastics, and polyesters; ethylene dichloride, for vinyl chloride, used in plastics and fibres; and ethyl chloride, for tetraethyllead, an anti-knock additive in gasoline. Propylene is processed into isopropyl alcohol, used as a solvent and convertible to acetone, also a solvent; acrylonitrile, for acrylics, resins, and synthetic rubber; cumene, for phenol, used in resins, adhesives, plastics, and detergents and convertible to the components of nylon-6,6; polypropylene, for plastics, fibres, and film; propylene oxide, for propylene glycol and polyurethane; epichlorohydrin for glycerol and epoxy resins; and polyisoprene for synthetic rubber. From the butanes and butylenes come butadiene, for synthetic rubber and plastics; isobutylene, for synthetic rubber; and polybutene, for oil additives, sealants, caulking compounds, and adhesives.

The aromatic compounds benzene, toluene, the xylenes, and naphthalene yield a variety of products. Benzene is processed into alkylbenzenes, used in surfactants, and cyclohexane, from which nylon is manufactured; toluene is used for solvents, gasoline, and explosives; xylene for solvents and gasoline; naphthalene for insecticides. Chemicals derived from methane, a major constituent of natural gas, include carbon black, a pigment and strengthening agent for rubber; methyl alcohol for formaldehyde, synthetic resins, and solvents; chloromethanes, for refrigerants, solvents, aerosol propellants, and cleaning fluids; and acetylene, for vinyl acetate, used in adhesives, water-based paints, textiles, and paper manufacturing.

Petrodvorets, also spelled PETRODVOREC, formerly (until 1944) PETERHOF, Russian PETERGOF, city, Leningrad *oblast* (administrative region), northwestern Russian Soviet Federated Socialist Republic, on the southern shore of the Gulf of Finland, 18 mi (29 km) southwest of the city of Leningrad. Peter I the Great founded Peterhof in 1709 as a country estate. After visiting the French court in 1717, he decided to make Peterhof into an imperial residence that would rival Versailles. The Baroque Grand Palace (completed 1721) was designed by Domenico Trezzini and the palace's gardens by Alexandre Le Blond; Bartolomeo Rastrelli enlarged the structure in 1752. Peterhof subsequently became the most lavish and popular of the Russian royal summer residences. Nicholas II spent much time in Peterhof and the last tsarevich (heir apparent of a Russian tsar) in the Romanov line, Aleksey Nikolayevich, was born there in 1904.



The Grand Cascade in the gardens of the Baroque Grand Palace, Petrodvorets, Russian S.F.S.R.
Valerie J. Edessis—EB Inc.

The modern city of Petrodvorets is a rail terminus, port, and resort centre. The products of the surrounding agricultural area consist of lumber, dairy cattle, pigs, vegetables, and potatoes. Industries in the city include watch factories and lapidary works. Many workers commute to Leningrad by way of a suburban train line. The Grand Palace (now a museum); the 39 mi of canals that connect the intricate system of fountains, as well as pavilions, small palaces, and gardens; and the noted statue of Samson Rending the Lion's Jaws (sculpted by Mikhail Kozlovsky in 1802) are today part of the 2,500-ac (1,000-ha) area known as the Palace-Museums and Parks of the City of Petrodvorets. Pop. (1983 est.) 76,000.

Petrofina SA, major Belgian petroleum conglomerate, engaged in the exploration for and production of crude oil, oil refining, and petrochemical production. Headquarters are in Brussels.

The company was organized in 1920 as the Compagnie Financière Belge des Pétroles, with its initial interest in the development of Romanian oil fields and of Belgian interests in Africa. It assumed its present name in 1957.

Until 1962 the company's main efforts were directed toward petroleum distribution and refining, and to establishing associated companies in the United States and Canada. Since 1962 Petrofina has shown increasing interest in manufacturing petrochemicals, and the company has become one of the world's largest ethylene producers. It also produces polypropylene, polystyrene, and related products. Other products include paints and varnishes, fatty acids, emulsifiers and detergents, plastics, and materials for road construction. The company has petrochemical manufacturing facilities in Belgium and the United States.

As an integrated petroleum company, Petrofina engages in exploration, production of crude oil, refining, and distribution. Its exploration activities have become concentrated primarily in the North Sea and North America. It has refineries in Europe, America, and Angola, and sells much of its petroleum output through its own retail outlets.

Petrograd (Russian S.F.S.R.): *see* Leningrad.

Petrokrepost, formerly (until 1611) ORESHEK, (1611–1702) NOTEBURG, and (1702–1944) SHLISSELBURG, town, Leningrad *oblast* (administrative region), northwestern Russian Soviet Federated Socialist Republic, on the Neva River where it flows out of Lake Ladoga, east of Leningrad city. Founded as Oreshek in 1323 by the Republic of Novgorod, it was captured in the early 17th century by the Swedes, who built the fortress of Noteburg. Taken by Peter I the Great in 1702, it was renamed Shlisselburg and became a key fortress protecting St. Petersburg. Later used as a prison, Shlisselburg again played a fortress role in the defense of Leningrad in World War II. Renamed Petrokrepost in 1944, it is a shipbuilding and repair centre on the White Sea–Baltic Canal. Pop. (latest census) 7,100.

Petróleo Brasileiro SA (Brazilian company): *see* Petrobrás.

Petróleos de Venezuela, SA, state-owned Venezuelan company created through the nationalization of the petroleum industry on Jan. 1, 1976. It earns the largest share of Venezuela's foreign exchange, and its revenues support about three-fourths of the national budget. Headquarters are in Caracas.

By 1971 Venezuela had begun to take steps to curb the control and influence of the foreign concessionaires who, since their arrival soon after World War I, had been exploiting the nation's oil fields. The state barred the sale of additional concessions, nationalized concessions already sold but not yet exploited, and set a timetable for expropriation of ongoing operations.

Since the nationalization of the industry, Petróleos de Venezuela has been engaged in the exploration, refining, and marketing of oil, petrochemicals, and natural gas, including the export of petroleum and petroleum products. The company is also responsible for supervising and planning the controlled use of Venezuela's proven oil reserves. A member of the Organization of Petroleum Exporting Countries, the company tends to be a voice of moderation within that group.

Petróleos Mexicanos, byname PEMEX, state-owned Mexican company, a producer, refiner, and distributor of oil, natural gas, and petroleum derivatives. Pemex is the largest Latin-American oil company. Headquarters are in Mexico City.

Commercial production of crude oil in Mexico began in 1901 at Ebano, near Tampico, and, during the first quarter of the 20th century, Mexico produced nearly one-fourth of the world's oil annually. The development of huge oil fields in Texas and the Middle East and the rapid exhaustion of some of Mexico's oil reservoirs, however, diminished Mexico's share of total world production. Following prolonged controversy, the government expropriated all foreign oil interests in 1938 and set up Pemex to manage the consolidated industry.

Since its formation, Pemex has carried on a vigorous exploration program, sinking hundreds of exploration and development wells per year. Under Mexican president José López Portillo, Pemex in the 1970s began the exploitation of huge, newly discovered oil reserves in Tabasco and Chiapas states. His government's ambitious expansion of Pemex's extraction and processing capabilities led to the tripling of Mexico's crude oil production in the years from 1976 to 1982.

The company is an integrated petroleum company, engaging in oil and gas exploration, production, refining, transportation, storage, distribution, and sales. Most of the production comes from the state of Veracruz and the rest from Tabasco, which also produces almost half the country's natural gas. Additional large reserves have been exploited in the Gulf of Mexico. The company has been a major world exporter of fossil fuel since Mexico became self-sufficient in crude oil in 1974.

petroleum, complex mixture of hydrocarbons that occurs in the Earth in liquid, gaseous, or solid forms; the term is usually restricted to the liquid form, commonly called crude oil. Both liquid and gaseous phases of petroleum occur naturally underground and, taken together, constitute the most important of the primary fossil fuels.

A brief treatment of petroleum follows. For full treatment, *see* MACROPAEDIA: Fuels, Fossil; Industries, Extraction and Processing. For statistical data on production, reserves, and trade, *see* MICROPAEDIA: mining (table).

Petroleum was known to many ancient peoples through surface seepages. Excavations in Iran, Iraq, and elsewhere show that bitumen, or asphalt, a form of petroleum, was used to caulk ships, to build roads, and for other purposes. Europeans of the age of exploration found similar seepages of the black liquid in the Americas and in Indonesia.

The first important modern use of petroleum was as an illuminating fuel to replace whale oil in lamps. The first well drilled specifically for oil was that of E.L. Drake at Titusville, Pa., in 1859; within a few decades oil drilling was widespread in the United States, Europe, the Middle East, and East Asia. The development of the automobile gave petroleum a new and swiftly expanding role as the primary source of gasoline. Petroleum also is the source of kerosene, gas oil, lubricating oil, and residual fuel oil. It is refined and processed into numerous other products, such as solvents, paints, asphalt, plastics, synthetic rubber, fibres, soaps and cleansing agents, waxes and jellies, medicines, explosives, and fertilizers.

Petroleum is derived from aquatic plants and animals that lived and died hundreds of millions of years ago. Their remains mixed with mud and sand in layered deposits that, over the millennia, were geologically transformed into sedimentary rock. Gradual decomposition of the organic matter contributed to the production of petroleum in the rock structures. Since the Paleozoic era (from about 570 million to 245 million years ago), the organic matter has been slowly moving from the original compacting clays to more porous and permeable rocks, such as sandstones and siltstones, where it finally became entrapped. Such entrapped accumulations of oil are called pools. A series of pools within a common reservoir rock structure or a series of pools in separate but neighbouring reservoir rock formations is commonly referred to as an oil field. A group of oil fields in similar geologic environments is known as a petroleum province.

Crude petroleum, pumped from the Earth through drilled wells, is costly to locate, recover, and process, but it is the world's largest energy source, accounting for approximately 39 percent of all energy consumed. The Middle East, the Soviet Union, and the United States are the world's leading petroleum producers; the United States is the largest consumer, and the Soviet Union is second.

Crude oils vary considerably in their compositions, but the major components are hydrocarbons (compounds of hydrogen and carbon). Despite the variations in the molecular structure of the compounds, most crude oils contain from 82 to 87 percent carbon by weight and from 12 to 15 percent hydrogen. Most crude oils contain a mixture of three series of compounds—paraffin, naphthene, and aromatic. The paraffin series is the broadest, extending from methane, which forms natural gas, through the liquids that are refined into ordinary gasoline, to crystalline waxes. The naphthene series ranges from volatile liquids to tarry asphalts. The chief member of the aromatic series is benzene. Petroleums also vary in their physical properties, such as volatility, colour, and specific gravity.

Almost all crude oil comes from beneath the Earth's surface, but a few petroleum lakes, or tar pits, are known (a good example is the La Brea Tar Pits in Los Angeles). The extraction of petroleum and natural gas from the Earth involves three basic steps: prospecting, drilling, and recovery. About four-fifths of the world's proved petroleum reserves in land areas have now been developed, and development of offshore deposits has assumed increasing importance since 1960.

In oil exploration, geologic techniques can determine only the existence of rock formations that are favourable for oil deposits, not whether oil is actually there. Drilling is the only sure way to ascertain the presence of oil. With modern rotary equipment, wells can be drilled to depths of more than 7,600 m (25,000 feet). Once oil is found, it may be recovered (brought to the surface) by various methods. Underground pressure created by natural gas or water within the reservoir can force the oil up; if the natural pressure is not great enough, it can be raised by artificially injecting water or steam into the reservoir through a well. Enhanced recovery processes may be utilized to increase production. These processes involve injecting such substances as carbon dioxide, polymers, and solvents into a reservoir to reduce oil viscosity and capillarity. Thermal recovery methods are frequently used to enhance the production of heavy crude oils, whose extraction is impeded by viscous resistance to flow at reservoir temperatures.

Petroleum is transported to refineries by pipelines, which can often carry more than 500,000 barrels per day, or by oceangoing tankers. The basic refinery process is distillation, which separates the crude oil into fractions of differing volatility. After the distillation, other physical methods are employed to separate the mixtures, including absorption, stripping, solvent extraction, and crystallization.

After physical separation into such constituents as gasoline, kerosene, and lubricating oils, selected petroleum fractions may be subjected to chemical conversion processes, such as cracking and reforming. In the most general terms, cracking breaks the large molecules of hard-to-use heavy oils into the smaller molecules that form their lighter, more valuable fractions. Reforming changes the structure of a molecule without breaking it to pieces; the process is widely used to raise the octane number of gasolines obtained by distillation of paraffinic crude oils. Both cracking and reforming can be brought about by simply heating the petroleum fraction to high temperatures (thermal processes) or by bringing them into contact with certain reagents (catalytic processes).

petroleum engineering, field of engineering that involves the optimized development and exploitation of crude oil and natural gas fields, as well as the technical analysis and forecasting of these fields' future performance. In general, petroleum engineers are not involved in the exploration for new fields, but they may contribute to a joint effort of geologists, geophysicists, and engineers in such endeavours. Petroleum engineers are responsible for the development and production of oil reservoirs after discovery.

A brief treatment of petroleum engineering follows. For full treatment, *see* MACROPAEDIA: Engineering; Industries, Extraction and Processing.

Petroleum engineering as a discipline may be said to have started with the drilling of the first oil well in Titusville, Pa., in 1859. For many years the United States, relying more on petroleum than other industrialized nations, contributed the most to the development of this profession. The first college department of petroleum engineering in the United States was established in 1914, and many more petroleum engineering programs began in the 1920s and '30s. By the mid-1980s more than two dozen colleges offered degrees in petroleum engineering in the United States, and similar programs existed in other oil-producing countries.

The first topics of concern to the original colleges were the areas of operations and machinery. As progress in petroleum recovery was made, more importance was placed on ways to maximize the amount of oil recovered from a given reservoir; such topics of study as reservoir characterization, reservoir behaviour, and mathematical simulation using computers began to be emphasized. Major areas of current attention and future importance are tied to computer simulation of drilling, fluid flow in pipe and reservoir rocks, and recovery processes.

There are many areas of specialization in petroleum engineering. The drilling of exploratory wells requires engineers to design, plan, and supervise drilling operations. After a new reservoir has been discovered, drilling engineers are responsible for drilling development wells and preparing them for production. Engineering efforts during this stage concentrate on keeping drilling costs to a minimum while ensuring that the completed well is capable of efficient production of oil and gas from the reservoir.

After wells are completed and ready for production, production engineers design the equipment needed to pump fluids to the surface; to separate oil, gas, and water; and to store or transport the oil and gas. Production engineers are responsible for the efficient operation of producing wells and for the redesign of any well equipment or surface facilities.

Another type of petroleum engineer specialist is called a log analyst, whose reponsibilities include evaluating data gathered on wells immediately after drilling. The log analyst determines reservoir properties such as thickness, areal extent, and the saturations of oil, gas, and water. These parameters are needed for calculating the amount of oil and gas in the reservoir.

Reservoir engineers are responsible for the overall recovery of petroleum from a reservoir. They study the reservoir's past behaviour in order to forecast the future and ultimate recovery. The reservoir engineer determines if the use of secondary recovery or enhanced oil recovery techniques would be profitable.

All petroleum engineers, regardless of their area of specialization, must do economic evaluations to determine which of several options or choices will yield optimum results. These conclusions are then presented to company management. The analytical methods used by petroleum engineers are similar to most other types of engineering, the major difference being that the petroleum reservoir exists far underground—frequently several thousand to 20,000 feet deep. This remoteness means that most petroleum-engineering calculations are based on indirect and imperfect measurements of underground phenomena.

Equipment and analytical procedures have been developed for measuring properties of the reservoir rock and fluids, flow rates and pressures, downhole pump operation, and wellbore measurements while drilling. All these and other data are analyzed to assist the petroleum engineer. Computers have assumed increased importance in analyzing data.

Petroleum Exporting Countries, Organization of (OPEC), multinational organization established to coordinate the petroleum policies of its members and to provide the member states with technical and economic aid. The organization was established in September 1960 and formally constituted in January 1961 by Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela. Members admitted since OPEC was founded include Qatar (1961), Indonesia and Libya (1962), Abu Dhabi (1967; membership transferred to the United Arab Emirates in 1974), Algeria (1969), Nigeria (1971), Ecuador (1973), and Gabon (1975). The headquarters of OPEC, initially in Geneva, were moved to Vienna in 1965. Policy is formulated at conferences of delegates from member countries, which meet at least twice a year. Conference decisions are made on the principle of unanimity.

OPEC decisions began to be of major importance in the world oil market at its 35th conference in Vienna in September–October 1973, when it raised oil prices by 70 percent. The dominant Middle Eastern members of OPEC used succeeding price increases as a political weapon aimed at Western nations in retaliation for their support of Israel against its Arab neighbours in the so-called Yom Kippur War of October 1973. Prices were accordingly raised another 130 percent at the Tehrān conference of December 1973, and a temporary embargo was placed on oil shipments to the United States and The Netherlands at the same time. Other price increases followed in 1975, 1977, 1979, and 1980, which ultimately raised the price of a barrel of crude oil from US $3.00 in 1973 to $30.00 in 1980.

The oil price increases brought a great upsurge in the government revenues of the OPEC countries. They spent part of these revenues on the development of their economies and also invested large sums in the industrialized countries, particularly the United States. A significant amount was also placed with U.S. banks to finance loans to developed and developing countries. Other sums went to the European currency market. OPEC also established the OPEC Fund for International Development in 1976 to aid developing countries.

By the early 1980s, however, the influence of OPEC on world oil prices was declining; Western industrialized countries were responding to increased oil prices by exploiting alternative sources of energy (most notably coal and nuclear energy), by locating and drilling more of their own oil resources, by turning to other emerging oil-exporting countries to meet their fossil-fuel needs (particularly Mexico and the Soviet Union), and by encouraging conservation programs to decrease their overall demands for energy. These efforts by the West significantly reduced dependence on OPEC oil and by 1982 had forced the OPEC countries to lower prices and cut back production. Decreasing Western demand for OPEC oil was a severe blow to the organization's unity, which had already been damaged by internal conflicts and by the Iraq–Iran war that had broken out in 1980.

The member countries of OPEC differ in their oil endowment, as well as in their economic and political interests. Four of the members—Kuwait, Qatar, Saudi Arabia, and the United Arab Emirates—have very large oil reserves in relation to their populations. They are also financially strong and can thus afford more flexibility in adjusting their output to serve long-term interests. Saudi Arabia, having the largest reserves, has traditionally played a decisive role in determining prices, although its influence has diminished.

OPEC has a Board of Governors, appointed by the member countries, with a chairman elected by the conference. There is a secretariat for administration and research, located in Vienna.

petroleum jelly, also called PETROLATUM, translucent, yellowish to amber or white, unctuous substance having almost no odour or taste, derived from petroleum and used principally in medicine and pharmacy as a protective dressing and as a substitute for fats in ointments and cosmetics. It is also used in many types of polishes and in lubricating greases, rust preventives, and modeling clay.

Petrolatum is obtained by dewaxing heavy lubricating-oil stocks. It has a melting-point range from 38° to 54° C (100° to 130° F). Chemically, petrolatum is a mixture of hydrocarbons, chiefly of the paraffin series.

petroleum trap, subsurface reservoir of petroleum. The oil is always accompanied by water and often by natural gas; all are confined in porous rock, usually such sedimentary rocks as sands, sandstones, arkoses, and fissured limestones and dolomites. The natural gas, being lightest, occupies the top of the trap and is underlain by the oil and then the water. A layer of impervious rock, called the roof rock, prevents the upward or lateral escape of the petroleum. That part of the trap actually occupied by the oil and gas is called the petroleum reservoir.

Many systems have been proposed for the classification of traps; one simple system divides them into structural traps, stratigraphic traps, and combinations of the two. A structural trap has a concave (viewed from below) roof caused by the local deformation (by faulting or folding) of the reservoir rock and the impervious roof rock. In this case, the intersection of the oil–water contact with the roof rock determines the edges of the reservoir. In a stratigraphic trap, variations in the rock strata themselves (*e.g.,* a change in the local porosity and permeability of the reservoir rock, a change in the kinds of rocks laid down, or a termination of the reservoir rock) play the important role. The stratigraphic variations associated with the reservoir rocks are the main influence on the areal extent of the reservoirs in these traps. A complete gradation between the two varieties is possible.

The oil and gas pool will rise to the top of the trap if the underlying water is stationary, and the resulting oil–water contact will be level. When the water is moving, however, the pool is displaced down the trap's side in the direction of flow because of hydrodynamic pressure. In some traps the pool may be displaced great distances or may even be completely flushed out. *See also* salt dome.

petroleum wax, any wax obtained from petroleum, including paraffin wax, microcrystalline wax, and petroleum jelly (*qq.v.*). By comparison, animal and vegetable waxes are generally higher in cost, of varying chemical constitution, and of uncertain availability and have thus been largely displaced by petroleum waxes.

Petrolina, city, southwestern Pernambuco *estado* ("state"), northeastern Brazil. It lies on the left (north) bank of the São Francisco River, just across from Juàzeiro, in Bahia state, with which it is linked by ferry and railroad bridge (completed in 1951). Petrolina is the southern terminus of a railroad running northwestward for approximately 100 miles (160 km) to Paulistana, in Piauí state. The principal goods shipped from Petrolina are cotton, textiles, chemicals, perfume, tobacco, and sugar. The city is also accessible by highway and by air. Pop. (1980 prelim.) 73,436.

petrology, scientific study of rocks that deals with their composition, texture, and structure; their occurrence and distribution; and their origin in relation to physicochemical conditions and geologic processes. It is concerned with all three major types of rocks—igneous, metamorphic, and sedimentary. Petrology includes the subdisciplines of experimental petrology and petrography. Experimental petrology involves the laboratory synthesis of rocks for the purpose of ascertaining the physical and chemical conditions under which rock formation occurs. Petrography is the study of rocks in thin section by means of a petrographic microscope (*i.e.,* an instrument that employs polarized light that vibrates in a single plane). Petrography is primarily concerned with the systematic classification and precise description of rocks.

Petrology relies heavily on the principles and methods of mineralogy because most rocks consist of minerals and are formed under the same conditions. Also essential to petrological research is the careful mapping and sampling of rock units, which provide data on regional gradations of rock types and on associations unavailable by other means.

Petronius Arbiter, Gaius, original name TITUS PETRONIUS NIGER (d. AD 66), reputed author of the *Satyricon,* a literary portrait of Roman society of the 1st century AD.

Life. The most complete and the most authentic account of Petronius' life appears in Tacitus' *Annals,* an account that may be supplemented, with caution, from other sources. It is probable that Petronius' correct name was Titus Petronius Niger. From his high position in Roman society, it may be assumed that he was wealthy; he belonged to a noble family and was therefore, by Roman standards, a man from whom solid achievements might have been expected. Tacitus' account, however, shows that he belonged to a class of pleasure-seekers attacked by the Stoic philosopher Seneca, men who "turned night into day"; where others won reputation by effort, Petronius did so by idleness. On the rare occasions, however, when he was appointed to official positions, he showed himself energetic and fully equal to public responsibilities. He served as governor of the Asian province of Bithynia and later in his career, probably in AD 62 or 63, held the high office of consul, or first magistrate of Rome.

After his term as consul, Petronius was received by Nero into his most intimate circle as his "director of elegance" (*arbiter elegantiae*), whose word on all matters of taste was law. It is from this title that the epithet "Arbiter" was attached to his name. Petronius' association with Nero fell within the emperor's later years, when he had embarked on a career of reckless extravagance that shocked public opinion almost more than the actual crimes of which he was guilty. What Petronius thought of his imperial patron may be indicated by his treatment of the rich vulgarian Trimalchio in the *Satyricon.* Trimalchio is a composite figure, but there are detailed correspondences between him and Nero that cannot, given the contemporary nature of the work, be accidental and that strongly suggest that Petronius was sneering at the emperor.

Tacitus records that Nero's friendship ultimately brought on Petronius the enmity of the commander of the emperor's guard, Tigellinus, who in AD 66 denounced him as having been implicated in a conspiracy of the previous year to assassinate Nero and place a rival on the imperial throne. Petronius, though innocent, was arrested at Cumae in southern Italy; he did not wait for the inevitable sentence but made his own preparations for death. Slitting his veins and then bandaging them again in order to delay his death, he passed the remaining hours of his life conversing with his friends on trivial topics, listening to light music and poetry, rewarding or punishing his slaves, feasting, and finally sleeping "so that his death, though forced upon him, should seem natural."

The Satyricon. The *Satyricon,* or *Satyricon liber* ("Book of Satyrlike Adventures"), is a comic, picaresque novel that is related to several ancient literary genres. In style it ranges between the highly realistic and the self-consciously literary, and its form is episodic. It relates the wanderings and escapades of a disreputable trio of adventurers, the narrator Encolpius ("Embracer"), his friend Ascyltos ("Scot-free"), and the boy Giton ("Neighbour"). The surviving portions of the *Satyricon* (parts of Books XV and XVI) probably represent about one-tenth of the complete work, which was evidently very long. The loose narrative framework encloses a number of independent tales, a classic instance being the famous "Widow of Ephesus" (*Satyricon,* ch. 111–112). Other features, however, recall the "Menippean" satire; these features include the mixture of prose and verse in which the work is composed; and the digressions in which the author airs his own views on various topics having no connection with the plot.

The longest and the best episode in the surviving portions of the *Satyricon* is the *Cena Trimalchionis,* or "Banquet of Trimalchio" (ch. 26–78). This is a description of a dinner party given by Trimalchio, an immensely rich and vulgar freedman (former slave), to a group of friends and hangers-on. This episode's length appears disproportionate even to the presumed original size of the *Satyricon,* and it has little or no apparent connection with the plot. The scene is a Greco-Roman town in Campania, and the guests, mostly freedmen like their host, are drawn from what corresponded to the petit bourgeois class. Trimalchio is the quintessence of the parvenu, a figure familiar enough in ancient satirical literature, but especially so in the 1st century AD, when freedmen as a class were at their most influential.

Two features distinguish Petronius' "Banquet" from other ancient examples: its extraordinary realism and the figure of Trimalchio. It is obvious that the table talk of the guests in the "Banquet" is based on the author's personal observation of provincial societies. The speakers are beautifully and exactly characterized and their dialogue, quite apart from the invaluable evidence for colloquial Latin afforded by the vulgarisms and solecisms in which it abounds, is a humorous masterpiece. Trimalchio himself, with his vast wealth, his tasteless ostentation, his affectation of culture, his superstition, and his maudlin lapses into his natural vulgarity, is more than a typical satirist's figure. As depicted by Petronius he is one of the great comic figures of literature and is fit company for Shakespeare's Falstaff. The development of character for its own sake was hardly known in ancient literature: the emphasis was always on the typical, and the classical rules laid down that character was secondary to more important considerations such as plot. Petronius, in his treatment of Trimalchio, transcended this almost universal limitation in a way that irresistibly recalls Dickens, and much else in the "Banquet" is Dickensian—its exuberance, its boisterous humour (rare in ancient literature, where wit predominates), and its loving profusion of detail.

The rest of the *Satyricon* is hardly to be compared to the "Banquet." Insofar as any moral attitude at all is perceptible in the work as a whole, it is a trivial and debased brand of hedonism. The aim of the *Satyricon* was evidently above all to entertain by portraying certain aspects of contemporary society, and when considered as such, the book is of immense value: superficial details of the speech, behaviour, appearance, and surroundings of the characters are exactly observed and vividly communicated. The wealth of specific allusions to persons and events of Nero's time shows that the work was aimed at a contemporary audience, and certain features suggest that the audience in fact consisted of Nero and his courtiers. The realistic descriptions of low life recall the emperor's relish for slumming expeditions; and the combination of literary sophistication with polished obscenity is consistent with the wish to titillate the jaded palates of a debauched court.

If Petronius' book has a message, it is aesthetic rather than moral. The emphasis throughout the account of Trimalchio's dinner party is on the contrast between taste and tastelessness. Stylistically, too, the *Satyricon* is what Tacitus' account of the author would lead one to expect. The language of the narrative and the educated speakers is pure, easy, and elegant, and the wit of the best comic passages is brilliant; but the general impression, even when allowance is made for the fragmentary state of the text, is that of a book written quickly and somewhat carelessly by a writer who would not take the necessary trouble to discipline his astonishing powers of invention. In his book, as in his life, Petronius achieved fame by indolence. (E.J.Ke./Ed.)

MAJOR WORKS. The *Satyricon* (1st century AD; *The Satyricon of Titus Petronius Arbiter,* "Loeb Series," 1913; "Penguin Classics Series," 1965, the former with both Latin text and English translation, and the latter in English translation), containing the episode of the "Cena Trimalchionis" (*Dinner at Trimalchio's,* 1925 and 1950) and the anecdote known as the *Widow of Ephesus.* The Martin S. Smith edition, *Cena Trimalchionis* (*i.e., Satyricon,* 1976), includes a bibliography of scholarship from 1909.

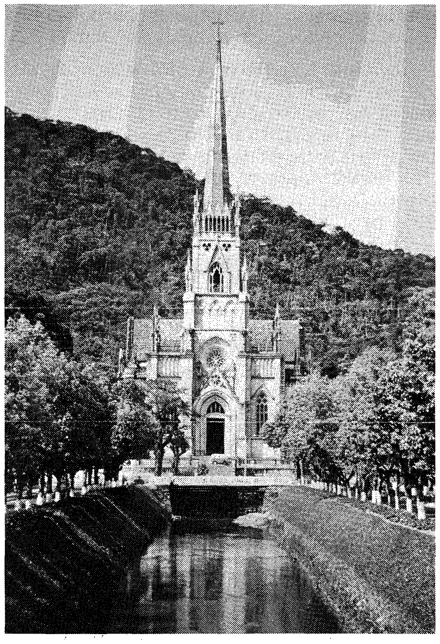
BIBLIOGRAPHY. Discussion of the problems of identification and authorship, with bibliographies of the older literature, is in J.P. Sullivan, *The Satyricon of Petronius: A Literary Study* (1968); and P.G. Walsh, *The Roman Novel* (1970). A biographical reconstruction is G. Bagnani's *Arbiter of Elegance: A Study of the Life and Works of C. Petronius* (1954).

Petronius Maximus: *see* Maximus, Petronius.

Petropavlovsk, city and capital of Severo (North) Kazakhstan *oblast* (province), Kazakh Soviet Socialist Republic. It lies along the Ishim River in the centre of the Ishim Steppe. The second oldest *oblast* centre in northern Kazakhstan after Pavlodar, it was founded as a Russian fort in 1752 and soon became an important centre of trade between Russia and Central Asia and the Kazakh steppes. The Trans-Siberian Railroad reached Petropavlovsk in 1896, and by 1917 the population was nearly 50,000. Petropavlovsk now has some notable industrial undertakings and accounts for about nine-tenths of the industrial output of the *oblast.* It is also important as the junction of the Trans-Siberian and Trans-Kazakhstan railroads. The city has a theatre, a television station, and a teacher-training institute. Pop. (1987 est.) 233,000.

Petropavlovsk-Kamchatsky, also spelled PETROPAVLOVSK-KAMČATSKIJ, port and administrative centre of Kamchatka *oblast* (province), far eastern Russian Soviet Federated Socialist Republic. It lies along the landlocked Avachinskaya Gulf, on the Pacific coast of the Kamchatka Peninsula. The city was founded in 1740 during V.J. Bering's Second Kamchatka Expedition. In 1854, during the Crimean War, an Anglo-French attack on Petropavlovsk was repulsed. The modern city is a fishing centre and has fish-processing, can-making, net-making, and ship-repairing industries. Pop. (1987 est.) 252,000.

Petrópolis, city, north of the city of Rio de Janeiro, in Rio de Janeiro *estado* ("state"), Brazil. It is situated in a valley at 2,667 feet (813 m) above sea level, in the Órgãos Mountains. The city was founded in 1845 by



The cathedral at Petrópolis, Braz.
Walter Aguiar—EB Inc.

Bavarian immigrants under the sponsorship of Dom Pedro II, the Brazilian emperor for whom it was named. The emperor was attracted by the site's relatively cool climate and held court there during the warmer months. His possessions, along with those of Dom Pedro I and João VI of Portugal, remain in the ornate royal palace, now the Museum of the Empire. Petrópolis served as the state capital from 1894 until 1903. A treaty with Bolivia was signed there in 1903 for an exchange of lands and a Brazilian commitment to construct the Madeira–Mamoré Railway. The city has diversified industries and is the seat of the Catholic University of Petrópolis (1961). Pop. (1980) 150,249.

Petros PHILARGOS (antipope): *see* Alexander (V) (Papacy).

Petroşani, city, Hunedoara *judeţ* (county), west-central Romania, situated on a tributary of the Jiu River. Founded in the 17th century, it is the principal city and cultural centre for the upper Jiu Valley coalfield. It has a theatre and a museum of mining. The city is the headquarters for a group of nearby mining centres, including Lupeni, Petrila, Vulcan, and the new town of Uricani at the foot of Mount Retezat. Output from the area averages several million tons of low-grade bituminous coal annually. Petroşani manufactures coal by-products and is the site of a state mining institute. Jules Verne, the fiction writer, wrote about Petroşani and its environs in his book *Le Château des Carpates,* after his visit to Romania in 1892. Highways and a railway connection extend through Petroşani. Pop. (1982 est.) 44,268.

Petrosyan, Tigran V(artanovich), Petrosyan also spelled PETROSIAN (b. June 17, 1929, Tbilisi, Georgian S.S.R.—death reported Aug. 14, 1984, Moscow), Soviet Chess master who won the world championship from Mikhail Botvinnik in 1963, defended it successfully against Boris Spassky in 1966, and was defeated by Spassky in 1969. Petrosyan's play, subtle and tirelessly patient, was designed to weaken an opponent's position gradually rather than to crush it at a single blow. Against masters of comparable strength he played a great many drawn games.

Petrosyan was made a Chess master in 1947. He was educated at Yerevan Teachers' College in the Armenian S.S.R. and continued postgraduate study in philosophy there after becoming world Chess champion. He received a number of decorations for his achievements, and he remained an active member in the Presidium of the Chess Federation of the U.S.S.R. In 1968 Petrosyan published *Chess and Philosophy.*

Petrović, George, Serbo-Croatian ĐORĐE PETROVIĆ: *see* Karageorge.

Petrozavodsk, city and capital of the Karelian Autonomous Soviet Socialist Republic, northwestern Russian S.F.S.R., situated on the western shore of Lake Onega, south of the Shuya River outflow. The city was founded in 1703 by Peter I the Great as an ironworks to supply ordnance to his new capital of St. Petersburg. Its modern industries include engineering and timber working. The many scientific and educational establishments include a university, a teacher-training institute, and a branch of the Academy of Sciences of the U.S.S.R. Pop. (1983 est.) 247,000.

Petrucci, Ottaviano dei (b. 1466, Fossombrone, near Ancona, Papal States—d. 1539, Venice), Italian music printer whose collection of chansons, *Harmonice Musices Odhecaton A* (1501), was the first polyphonic music printed from movable type.

Petrucci went to Venice in 1490, holding music printing monopolies there from 1498 to 1511 and later at Fossombrone. In 1536, at the request of the Venetian Senate, he returned to Venice. His 61 music publications contain masses, motets, chansons, and *frottole* by the foremost composers of the 15th and early 16th centuries, among them Josquin des Prez, Jean d'Okeghem, and Loyset Compère. He also published the first book of printed lute music, Francesco Spinaccino's *Intabolatura de Lauto* (1507).

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Petrucci, Pandolfo (b. *c.* 1452, Siena, Republic of Siena—d. May 21, 1512, San Quirico d'Orcia), Italian merchant and politician who succeeded in gaining supreme power over Siena. Although an absolute and tyrannical ruler, he did a great deal to augment the artistic splendour of his native city.

Exiled from Siena as a partisan of the Nove (New Ones), Petrucci returned in 1487 and began to take advantage of the struggles among various political factions. Having married Aurella Borghese, daughter of one of the most powerful men in the city, Petrucci entered public office, acquiring so much authority and wealth that he became the actual despot of Siena with the title of *signore* (lord). Petrucci's ambition, however, alienated even Niccolò Borghese, whom Petrucci later assassinated (July 1500). This crime frightened his adversaries, leaving him in complete control.

As head of state, Petrucci consolidated his power by surrounding himself with supporters whose loyalty was guaranteed by the income they received from certain public lands. Yet the authoritarian and arbitrary Petrucci stopped the sale of public offices, secured economic advantages for the city, reformed the monetary system, and protected arts and letters.

Involved in the political struggle between France and Spain on the Italian peninsula, Petrucci was implicated in a plot against the powerful Cesare Borgia. He fled from Siena in January 1503 but was returned in March through the intervention of Louis XII of France. After the death of Cesare in 1507, Petrucci became more powerful than ever. By secret accords he allied with the Spanish and Pope Julius II against the French shortly before his death.

Petrus (Latin personal name): *see under* Peter, except as below.

Petrus AUREOLI, Aureoli also spelled AUREOLUS, English PETER AUREOL, French PIERRE AURIOL, ORIOL, or D'ORIOL (b. *c.* 1280, near Gourdon, Guyenne—d. 1322, Aix-en-Provence/Avignon, Provence), French churchman, philosopher, and critical thinker, called *Doctor facundus* ("eloquent teacher"), who was important as a forerunner to William of Ockham.

Petrus may have become a Franciscan at Gourdon before 1300; he was in Paris (1304) to study, possibly under John Duns Scotus. He became lector at Bologna (1312), Toulouse (1314–15), and Paris (1316–18). Provincial of his order for Aquitaine *c.* 1320, he was nominated archbishop of Aix-en-Provence and consecrated in 1321 by Pope John XXII, to whom he had dedicated *c.* 1316 his *Commentariorum in primum librum sententiarum,* 2 vol. (1596–1605; "Commentary on the First Book of Sentences").

Criticizing Duns Scotus' and St. Thomas Aquinas' theory of knowledge, Petrus promoted an individualistic empiricism (emphasizing the part played by experience in knowledge against that played by reasoning), supported by a doctrine of universals, or general words that can be applied to more than one particular thing; this doctrine is partly Nominalistic (denying the reality of universal essences) and partly conceptualistic (acknowledging universals as existing only in the mind). According to Petrus, knowledge is appearance of objects: man knows what exists by direct impressions, more or less clearly, but without intermediaries; forms, essences, and universals are fictions. Although some of his philosophical theories are individual, he generally conforms to the dictum subsequently known as "Ockham's razor"—*i.e.,* that entities are not to be multiplied beyond necessity. Essentially, Petrus anticipated the Nominalism that Ockham developed more fully.

Petrus' works include *Tractatus de paupertate* (1311; "Treatise on Poverty"), the unfinished *Tractatus de principiis naturae,* 4 vol. ("Treatise on the Principles of Nature"), and *Tractatus de conceptione beatae Mariae Virginis* (1314/15; "Treatise on the Conception of the Blessed Mary the Virgin"). In 1319 he wrote his popular *Compendium . . . totius Scripturae* ("Compendium . . . of the Whole Scripture").

Petrus DE VINEA: *see* Pietro della Vigna.

Petrus HISPANUS: *see* John XXI *under* John (Papacy).

Pétrus Ky, also called TRUONG VINH KY, or JEAN-BAPTISTE PÉTRUS (b. Dec. 6, 1837, Vinh Long province, Vietnam—d. Sept. 1, 1898), Vietnamese scholar whose literary works served as a bridge between his civilization and that of the West. He helped popularize the romanized script of the Vietnamese language, Quoc-ngu.

Pétrus Ky was born into a Roman Catholic family, and in 1848 he attended a mission college in Cambodia; three years later he studied at the Catholic college in Penang (now Pinang, Malaysia), established by French missionaries, and decided to enter the priesthood. Having studied French, Latin, and Greek, Pétrus Ky was designated by the missionaries as their most competent interpreter, and so his future was redirected. In 1863 he went with the statesman Phan Thanh Gian as an interpreter on a diplomatic mission to France. Pétrus Ky saw the great cultural differences between the Vietnamese and the French, and he stayed in Europe until 1865, visiting England, Spain, Italy, and Egypt, while compiling a Vietnamese–French dictionary.

In 1867–74 Pétrus Ky taught Oriental languages in Saigon and wrote prolifically in the French-sponsored Vietnamese language newspaper *Gia-Dinh Bao.* In 1876 he visited northern Vietnam (Tonkin in French usage) and prepared a confidential report on political conditions there, urging a French advance into this still uncolonized region. In 1886 Gov. Gen. Paul Bert designated Pétrus Ky as the teacher of French to the emperor Dong Kanh at the court of Hue.

Pétrus Ky assumed responsibility for translating not only the French language but also Western attitudes and philosophies for the Vietnamese. He was a prolific writer on many diverse subjects; among his publications are *Thanh suy bi tho'i phu* (1883; "Whims of Destiny"), *Phong hoa dieu hanh* (1885; "Morals and Deeds"), *Grammaire de la langue annamite* (1867; "Grammar of the Vietnamese Language"), *Petit cours de géographie de la Basse-Cochinchine* (1875; "Handbook of the Geography of Lower Cochinchina"), *Cours d'histoire annamite* (1875–77; "Course of Vietnamese History"), and *Histoire d'Annam* ("History of Vietnam"), the first significant history of Vietnam written in a European language and following European historiographic models.

Petsamo (Russian S.F.S.R.): *see* Pechenga.

Pettazzoni, Raffaele (b. Feb. 3, 1883, Persiceto, Italy—d. Dec. 8, 1959, Rome), Italian historian of religions and educator, a founder and president (1950–59) of the International Association for the Study of History of Religions. His original comparative method is shown in many works, among them his studies *Dio, formazione e sviluppo del monoteismo nella storia delle religioni* (1922; "God, the Formation and Development of Monotheism in the History of Religions"), *La confessione dei peccati,* 3 vol. (1929–35; "The Confession of Sins"), and *L'essere supremo nelle religioni primitive* (1957; "The Supreme Being in Primitive Religions").

petticoat, in modern usage, an underskirt worn by women. The *petycote* (probably derived from the Old French *petite cote,* "little coat") appeared in literature in the 15th century in reference to a kind of padded waistcoat, or undercoat, worn for warmth over the shirt by men. The petticoat developed as a piece of women's apparel—a skirt worn under an overgown—at the end of the Middle Ages. By the beginning of the 16th century, the overgown had an inverted V opening, and the petticoat, now visible, was brocaded or embroidered.

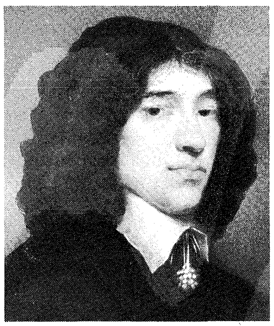
In the 17th century the outer skirt was looped up prominently, showing the petticoat underneath, and in the 18th century the petticoat figured prominently with the inverted V opening of the popular polonaise. In the early 19th century, women wore many petticoats, bound together, to show the great fullness of the skirt. By the 1850s, however, these voluminous petticoats had been abandoned for the more comfortable crinoline (*q.v.*). In about 1900, when skirts became less full, the petticoat was visible only when a woman lifted her dress—as when crossing the street. Thereafter, petticoats became increasingly less important and were worn only as undergarments.

Pettit, Bob, byname of ROBERT E. LEE PETTIT (b. Dec. 2, 1932, Baton Rouge, La., U.S.), American professional basketball player, first to score 20,000 points in the National Basketball Association (NBA). A graceful 6-foot 9-inch athlete, he was considered to be the first really agile player of extraordinary height in professional basketball.

After graduating from Louisiana State University, Baton Rouge, Pettit played NBA basketball for 11 seasons (1954–65) with the Milwaukee (after 1954–55, the St. Louis) Hawks. In each season but his last, he led the Hawks in scoring and rebounding. Twice (1955–56 and 1958–59) he was the NBA scoring champion and was voted the league's most valuable player. On Nov. 22, 1961, he set an NBA single-game record by scoring 19 free throws without missing. In 792 NBA regular season games, Pettit scored 20,880 points (average 26.4 points a game) and captured 12,851 rebounds. He retired in 1965 and was elected to the Basketball Hall of Fame in 1970.

Petty, Sir William (b. May 26, 1623, Romsey, Hampshire, Eng.—d. Dec. 16, 1687, London), English political economist and statistician whose main contribution to political economy, *Treatise of Taxes and Contributions* (1662), considered the role of the state in the economy and touched on the labour theory of value.

As a young man, Petty abandoned a life at sea to take up the study of medicine at the universities of Leiden, Paris, and Oxford. He was successively a physician, professor of



William Petty, detail of a portrait attributed to Isaac Fuller, *c.* 1649–51; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

anatomy at Oxford, professor of music in London, inventor, surveyor and landowner in Ireland, and member of Parliament.

A protagonist of the empirical scientific doctrines of the newly established Royal Society, of which he was a founder, Petty was one of the originators of political arithmetic, which he defined as the art of reasoning by figures upon things relating to government. His *Essays in Political Arithmetick and Political Survey or Anatomy of Ireland* (1672) presented population estimates and rough calculations of social income. His ideas on monetary theory and policy were developed in *Verbum Sapienti* (1665) and in *Quantulumcunque Concerning Money, 1682* (1695).

His most significant work, however, is his *Treatise on Taxes.* Petty favoured giving free rein to the natural forces of individual self-interest. Unlike liberals after Adam Smith, however, Petty considered the maintenance of a high level of employment by monetary and fiscal policies and by public works to be a duty of the state. In the *Treatise,* he also argued that the labour necessary for production was the main determinant of exchange value.

petty morrel (plant): *see* spikenard.

petunia, flowering plant whose showy, trumpet-shaped flowers make it immensely popular for summer beds and window boxes. It is a genus of the nightshade family (Solanaceae), originating in South America, and it is related to the deadly nightshade, potato, and tobacco plants.

The genus *Petunia* comprises many species, but the common garden petunia, *P. hybrida,* is a cross of two species native to Argentina—*P. axillaris* and *P. violacea.* The innumerable varieties of *P. hybrida* fall into two types: the compact, erect type, reaching 6 to 10 inches (15 to 25 centimetres) and adapted for summer garden beds, and the sprawling, long-stemmed balcony petunia, which grows to about 18 in. and is often potted in hanging baskets and window boxes. Flowers are funnel-shaped; are crisped, fringed, or ruffled; and are of spectacular hue, ranging from pure white to deep crimson or purple and often speckled or veined in contrasting colours. There are single- and double-bloom varieties. Leaves are soft, flabby, and covered with fine, sticky hairs.

Although technically a perennial, the petunia is most often grown as an annual. They do well in almost any ordinary garden soil in any temperate locale, provided they are well watered and well drained. They grow poorly in shade. Flowers bloom profusely from early summer until frost.

Pétursson, Hallgrímur (b. 1614, Hólar, Ice.—d. Oct. 27, 1674, Ferstikla), poet, one of the greatest religious poets of Iceland.

Though he came from a good family, Hallgrímur lived an errant life; as a boy he ran away to Copenhagen and became a blacksmith's apprentice. Through the influence of Bishop Brynjólfur Sveinsson he was later enrolled in the Danish Frúar Skóli ("Our Lady's School"), where he received a Latin humanist education. In 1636 he was entrusted with the re-Christianizing of a party of Icelanders who had been held captive by Algerian pirates for nine years. Among them was a 38-year-old woman, Gudridur Símonardóttir, who bore a child by Hallgrímur and later married him. Returning to Iceland, Hallgrímur worked as a labourer and a fisherman but eventually became a parson at Saurbær (1651–69). He contracted leprosy and out of this misery produced his *Passiusálmar* (1666; *The Passion Hymns of Iceland*), which ranks among the best religious poetry of the world. In each hymn the poet merges his personal suffering with that of Jesus. The effect of the Passion Hymns in bolstering the morale of a desperate people was attested to by the immediate widespread popularity of the hymns. First printed in 1666 and for the 64th time in 1957, they remain the most cherished devotional songs of the Icelanders. The Hallgrímskirkja, a memorial church built in the poet's honour at Saurbær, is one of the largest and finest churches in Iceland.

Petworth, parish, Chichester district, county of West Sussex, England. The parish adjoins the great park of Petworth House (now owned by the National Trust). The mansion itself was largely rebuilt (1688–96) by Charles Seymour, the 6th duke of Somerset, and contains a noted art collection; its deer park was landscaped in the 18th century by Lancelot ("Capability") Brown. Pop. (1971) 2,506.

Peugeot SA, major French automotive manufacturer and holding company, incorporated in France in 1896 as Société Anonyme des Automobiles Peugeot. The company merged with another large French automobile producer, Citroën SA, in 1976, the combination assuming the name Peugeot–Citroën SA. The present name was adopted in 1979. Headquarters are in Paris.

Peugeot was founded in 1890 by Armand Peugeot (1849–1915), one of a large family of industrialists and engineers. The first Peugeot automobile had been designed in a family-owned shop set up in 1885 to build velocipedes and quadricycles.

In 1914 Citroën's founder, André Citroën, formed his own company to produce munitions during World War I. The company proved so successful that by the end of the war Citroën was able to buy out the Mors Company, an automobile manufacturer for which Citroën had previously served as president. In the 1920s the company, which was established as Citroën SA in 1924, emerged as a major producer of low-priced, mass-produced cars. By 1933 it had built 90 percent of the taxicabs operating in Paris.

During the Great Depression, Citroën fell into financial trouble and was sold to the Michelin Tire Company in 1936. During the 1960s Citroën was merged with several other automakers. In 1975, to avert another potential bankruptcy, the French government funded Citroën's sale to a group that included Peugeot, which increased its holdings in the company the following year.

In 1978–79 Peugeot acquired the European car- and truck-making units and related finance operations of Chrysler Corporation of the United States, changing the names of these Peugeot subsidiaries to Talbot. In addition to manufacturing cars and trucks, Peugeot is a major producer of bicycles and motorcycles. The holding company owns and operates several bank and finance companies throughout Europe.

Peul (people): *see* Fulani.

Peutinger Table, copy of a Roman map, made in 1265 by a monk of Colmar (Alsace) on 12 sheets of parchment. Eleven of the sheets are now in the Nationalbibliothek in Vienna. The dimensions are 268 by 13⅓ inches (6.82 by 0.34 metres). The copy was found by Conradus Celtis in 1494 and was bequeathed by him to his friend Konrad Peutinger (1465–1547) of Augsburg.

The shape of the map, an elongated rectangle, causes a grave deformation of the Roman world, the distances from north to south being compressed and those from east to west being unduly extended. The map is in six colours—black, red, green, yellow, blue, and rose. Opinions have differed as to how closely the lost original depended on Roman itineraries and world maps. The table depicts an area beyond the frontiers of the Roman Empire to the east. *See also* itinerarium.

Pevensey, locality, Wealden district, county of East Sussex, England. Once an English Channel port, it now lies a mile inland along a narrow waterway; from the 13th century on, silting of the waterway brought about Pevensey's economic decline. The remains of the walls and towers of a Roman fort, Anderida

Ruins of the castle at Pevensey, in East Sussex
A.F. Kersting

(*c.* 250), rank among the best extant examples of Roman building in England. After the Norman Conquest (1066) a castle was built within the Roman walls. Pop. (1981) 2,668.

Pevensey, Spencer Compton, Viscount: *see* Wilmington, Spencer Compton, Earl of.

Pevsner, Antoine (b. Jan. 18, 1886, Oryol, Russia—d. April 12, 1962, Paris), Russian-born French sculptor and painter who—like his brother, Naum Gabo (*q.v.*)—advanced the Constructivist style, which employs such materials as metal, glass, and wire and eschews mass in favour of space intervals and a sense of movement.

Pevsner studied art in Kiev, went to Paris in 1911 and 1913, and in 1915 joined his brother Naum in Oslo, where they experimented in art that was "capable of utilizing emptiness and liberating us from the compact mass." The brothers returned to Russia after the Russian Revolution of 1917, and Pevsner became a professor at Moscow's school of fine arts. In 1920 they issued the "Realist Manifesto" of Constructivism, championing their form of art, which they exhibited that year. In 1923 Pevsner left Russia and settled in Paris. A naturalized Frenchman by 1930, he was cofounder and later honorary president of the Réalités Nouvelles group of exhibiting artists.

Pevsner produced primarily sculpture after 1923. His early sculptures used zinc, brass, copper, and celluloid, but later he relied mainly on parallel arrays of bronze wire soldered together to form plates. These plates are joined together to form intricate and convoluted shapes using both straight and curved lines. Pevsner was the finest Constructivist sculptor, and he succeeded in infusing that somewhat impersonal geometric style with his own feeling for form.

Pevsner, Naum Neemia: *see* Gabo, Naum.

pew, originally a raised and enclosed place in a church designed for an ecclesiastical dignitary or officer; the meaning was later extended to include special seating in the body of the church for distinguished laity and, finally, to include all church seating. In its early stages, the pew was meant for standing in and was close in conception to a pulpit; but in its second phase of development, it became an elaborate wooden structure, shut off from the main body of the nave, with seats, prayer benches, and other accessories. Such pews were owned by individuals or institutions and appeared both in wills and in legal actions.

In its final and more generalized context, a pew consisted of a long, backed, oak or pine bench with a fixed kneeling board. The upright ends were squared off or terminated in a finial or other carved ornament. The use of this type of seating in modern churches is almost universal.

Pew, J(ohn) Howard and Joseph N(ewton), Jr. (respectively b. Jan. 27, 1882, Bradford, Pa., U.S.—d. Nov. 27, 1971, Ardmore, Pa; b. Nov. 12, 1886, Pittsburgh—d. Apr. 9, 1963, Philadelphia), American industrialist brothers who expanded the Sun Oil Company (which their father had founded) by introducing new refining, marketing, and distribution techniques.

The Sun Oil Company was founded by Joseph Newton Pew, Sr. (1848–1912). Beginning in 1886, Pew, Sr., piped and refined oil in Pennsylvania and Ohio. When oil was discovered near Beaumont, Texas, in 1901, he bought some wells and built a pipeline to the tidewater area of the nearby Neches River, whence the oil could be shipped to his huge new refinery at Marcus Hook, Pa., for processing. He consolidated his oil-producing holdings in Ohio, Illinois, West Virginia, and Texas in the new Sun Oil Company and was its president from 1901 until his death.

His son, J. Howard Pew, joined the company in 1901, was president in 1912–47, and thereafter was a director. He developed a way of making lubricants out of asphaltic Texas oil. Under his leadership, Sun was the first (in 1927) to use pipes heated with mercury vapour rather than with fire to separate lubricants and the first (in 1937) to use Eugene Houdry's catalytic-cracking process, instead of thermal cracking, to make its gasoline.

Joseph N. Pew, Jr., joined the company in 1908 and became vice president four years later upon his father's death. He persuaded the company to lay gasoline pipelines from the Marcus Hook refinery to distribution points in Ohio, New York, and New Jersey. He then negotiated with 1,000 landholders in four states for permission to cross their property.

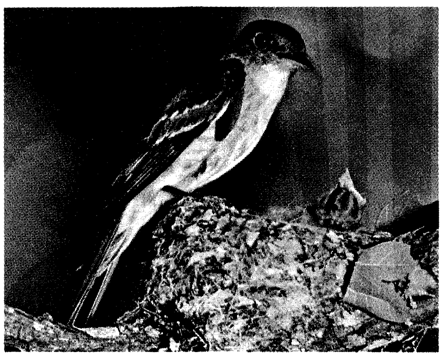
In 1916 the brothers founded a shipbuilding company that produced oil tankers for Sun and its competitors. Sun's shipyard used welding instead of riveting to build ships, thereby saving substantially on the amount of steel required per ship.

During World War II, Sun pioneered in developing and refining aviation fuels and lubricants. In 1942 the company also adapted the Houdry process to the production of synthetic rubber.

In 1933–34 Joseph, Jr., went to Washington to fight the New Deal petroleum code, which he believed would lead to price-fixing. The experience was the beginning of his involvement with the Republican Party. Besides contributing large sums of money to the party, he purchased trade publications and magazines, like *Farm Journal,* to sway the public to his way of thinking. He also wielded considerable influence in shaping several Republican Party platforms.

The Sun Oil Company became the Sun Company, Inc., in 1971, the year of J. Howard Pew's death.

pewee, also spelled PEEWEE, any of eight species of birds of the genus *Contopus* (family Tyrannidae); it is named for its call, which is monotonously repeated from an open perch. In North America a sad, clear "pee-oo-wee" announces the presence of the eastern wood pewee (*C. virens*), while a blurry "peeurrr" is the call of the western wood pewee (*C. sordidulus*). Some authorities consider the western form to be a race of *C. virens*. Both forms are plain birds, about 14 cm (6 inches) long, that resemble the eastern phoebe; the two forms differ from the eastern phoebe, however, in being browner and more slender and in having two distinct whitish wing bars.



Eastern wood pewee (*Contopus virens*)
Thase Daniel

Wood pewees winter chiefly in northern South America. Other pewees are found in Central and South America.

pewter, tin-based alloy used as a material from which domestic utensils were fashioned. The use of pewter dates back at least 2,000 years to Roman times. Ancient pewter contained about 70 percent tin and 30 percent lead. Such pewter, also called black metal, darkened greatly with age, and the lead readily leached out in contact with acidic foods.

Pewter with little or no lead is of finer quality, and alloys that include antimony and bismuth are more durable and brighter of sheen. Modern pewter is about 91 percent tin, 7.5 percent antimony, and 1.5 percent copper; the absence of lead makes it safe to use for dishes and drinking vessels. The surface of modern pewter is bluish-white with either a crisp, bright finish or a soft, satin sheen. It resists tarnish, retaining its colour and finish indefinitely.

Pewter work is usually cast, then further finished by hammering, turning on a lathe, burnishing, and sometimes engraving. Some items, such as snuffboxes, were constructed from separate pewter pieces and then soldered together. Some modern pewter work is formed by stamping presses. Most pewter alloys are quite ductile and easily worked. Cold-working does not cause the metal to harden sufficiently to require annealing.

Manufacture of pewter ware developed in various European countries from the 14th century. Pewter was widely used for dishes, church vessels, and decorative items. Being a common alloy, pewter has been primarily utilitarian and only secondarily ornamental, being used where the precious metals were too expensive. Pewter work often emulated designs in silver, and some unscrupulous pewterers even endeavoured from time to time to pass off pewter as silver or something almost like silver. Most pewter work was unornamented, but some items (usually for display only) were painted, enameled, gilded, and even inlaid with other metals, such as brass.

Peyer's patch, any of the nodules of lymphatic cells that aggregate to form bundles or patches and occur usually only in the lowest portion (ileum) of the small intestine; they are named for the 17th-century Swiss anatomist Hans Conrad Peyer.

Peyer's patches are round or oval and are located in the mucous membrane lining of the intestine. They can be seen by the naked eye as elongated thickened areas, and their surface is free of the projections (villi) and depressions (Lieberkühn glands) that characterize the intestinal wall. Usually there are only 30 to 40 patches in each individual. In young adults, however, they may be more numerous, and as an individual ages they tend to become less prominent. Their function is not known exactly; they may serve an immunological function like that of peripheral lymph nodes.

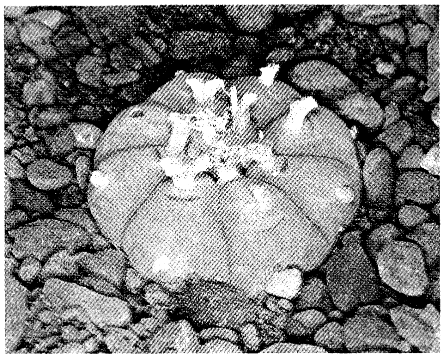
In typhoid fever, these patches may become sites of inflammation, in which case they may develop into ulcerations, hemorrhages, or perforations.

peyote, also called MESCAL-BUTTON, two species of the cactus genus *Lophophora,* family Cactaceae, native to North America, almost exclusively to Mexico.

Peyote, well known for its hallucinogenic effects, contains at least 28 alkaloids, the principal one of which is mescaline (*q.v.*). Peyote figures prominently in old religious rituals of certain North American Indian peoples and in the ritual of the Native American Church (*q.v.*). The sale, use, or possession of dried mescal buttons or live plants is prohibited by law in some places.

Peyote is found only on limestone soils of the Chihuahuan desert of southern Texas and northern Mexico. Averaging about eight centimetres (three inches) wide and five centimetres (two inches) tall, the body of the peyote cactus is spineless, soft, and in most cases, blue green in colour.

The more common species, *L. williamsii,* has pink to white flowers in summer, the fruit ripening the following year. *L. diffusa,* more



Peyote (*Lophophora williamsii*)
Dennis E. Anderson

primitive, grows in a small area in central Mexico. Its flowers are white to yellow, and the body is yellow green.

peyotism: *see* Native American Church.

Pezza, Michele: *see* Diavolo, Fra.

Pfaff, Johann Friedrich (b. Dec. 22, 1765, Stuttgart, Württemberg—d. April 21, 1825, Halle, Saxony), German mathematician who proposed the first general method of integrating partial differential equations of the first order.

Pfaff was professor of mathematics at the University of Helmstedt from 1788 until 1810, when he was appointed professor of mathematics at the University of Halle. He made notable contributions to calculus, the theory of series, and the solution of differential equations. He completed his work on the general method of partial differential equation integration in 1814–15. The term Pfaffian problem was originated in his honour. Among his published works are *Disquisitiones analyticae* (1797; "Analytic Works") and *Observationes ad Euleri institutiones calculi integralis* ("Observations of Eulerian Methods of the Integral Calculus").

Pfälzer Wald (Germany): *see* Haardt Mountains.

Pfeffer, Wilhelm (Friedrich Philipp) (b. March 9, 1845, Grebenstein, near Kassel, Ger.—d. Jan. 31, 1920, Leipzig), German botanist whose work on osmotic pressure made him a pioneer in the study of plant physiology.

After earning his Ph.D. from the University of Göttingen in 1865 Pfeffer continued his studies at the universities of Marburg and Bonn. He then held teaching positions at Bonn (1873), Basel (1877), Tübingen (1878), and Leipzig (1877), where he remained until his death. Pfeffer's work on cell metabolism led to his work in 1877 in devising a semi-

Pfeffer
Archiv fur Kunst und Geschichte, Berlin

permeable membrane that he used to study osmosis. He developed a method for measuring osmotic pressure and showed that pressure depended on the size of the molecules too large to pass through the membrane. Pfeffer was then able to measure the size of giant molecules. His findings were published in *Osmotische Untersuchungen, Studien sur Zellmechanik* (1877; "Osmotic Research Studies on Cell Mechanics"). His best publication is *Pflanzenphysiologie. Ein Handbuch des Stoffwechsels und Kraftwechsels in der Pflanze* (1881; *The Physiology of Plants; A Treatise upon the Metabolism and Sources of Energy in Plants,* 1900–06), which was for long a standard handbook.

Pfefferkorn, Johannes (Joseph) (b. 1469, Nürnberg?—d. 1522/23, Cologne), German controversialist—a Christianized Jew—and opponent of Jewish literature, whose dispute with the Humanist and Hebraist Johannes Reuchlin (*q.v.*) was a European *cause célèbre* in the early 16th century.

Pfefferkorn began a campaign to rid Germany of Jewish writings that were suspected of being subversive of Christianity. The Dominicans of Cologne supported him, and in 1509 he succeeded in persuading Emperor Maximilian I to issue a mandate permitting the confiscation and destruction of Hebrew books. Strong protests, however, forced the Emperor to seek the advice of theologians and scholars, including Reuchlin. Reuchlin's defense of many Jewish writings provoked fanatical recriminations from Pfefferkorn, resulting in a war of pamphlets and culminating in a widespread controversy between conservative scholars and the Humanists, who often caricatured Pfefferkorn in their popular writings.

Pfitzner, Hans (Erich) (b. May 5, 1869, Moscow—d. May 22, 1949, Salzburg, Austria), German composer who upheld traditional ideals during the post-Wagnerian era.

Pfitzner was a pupil at Frankfurt of Iwan Knorr. Between 1892 and 1934 he held posts as teacher and conductor in several German towns, including Strassburg, where he was director of the conservatory and of the opera. His operas include *Der arme Heinrich* (Mainz, 1895), *Die Rose vom Liebesgarten* (Eberfeld, 1901), and *Palestrina* (Munich, 1917), the last being his best known work. His works were widely played in Germany but made little impression in other countries.

PFNA: *see* Pentecostal Fellowship of North America.

Pforzheim, city, Baden-Württemberg *Land* (state), southwestern Germany, on the northern edge of the Schwarzwald (Black Forest), where the Nagold and Würm rivers join the Enz, on the French border. Originally the site of a Roman settlement (Porta Hercyniae), it was chartered *c.* 1195. The city was at times the residence of the margraves of Baden-Baden and Baden-Durlach. The Humanist Johann Reuchlin was born there (1455), and its medieval Latin school was famous. The city was sacked during the Thirty Years' War (1618–48) and the War of the Grand Alliance (1689–97) and was virtually destroyed during World War II. It has been rebuilt with broad thoroughfares and open spaces along the rivers. Notable buildings include the castle-church of St. Michael (13th–15th century), the Franciscan Barfüsserkirche ("church of barefoot friars"; 13th century), and the modern Reuchlin House (containing both history and jewelry museums). Pforzheim has been the centre of the German jewelry and watch industry since the 18th century and has schools for precious metalworking and watchmaking. Other manufactures include machinery, electrical equipment, and paper. Pop. (1989 est.) 108,887.

Pfyffer, Ludwig, byname KING OF THE SWISS, German SCHWEIZERKÖNIG (b. 1524—d. March 17, 1594, Luzern, Switz.), Swiss military leader, spokesman for Roman Catholic interests in the cantons, and probably the most important Swiss political figure in the latter half of the 16th century.

For many years an active and intrepid warrior in the service of France, Pfyffer won fame by safely leading the royal family of Charles IX from Meaux to Paris while under Huguenot attack (1567). Elected chief magistrate for Luzern in 1571—which office he continued to occupy until his death—he made that city the centre of Catholic Counter-Reformation activity in Switzerland. His Golden (or Borromean) League (1586)—the alliance of the seven Catholic cantons for furtherance of religious interests—nearly led to the destruction of the Swiss Confederation and precipitated the division of the canton of Appenzell along religious lines. Pfyffer established close relations with the Holy League of Philip II of Spain and Henri, duc de Guise, and concluded a Swiss alliance with Spain (1587) against the accession of Henry of Navarre (Henry IV) to the French throne. He also acquired a substantial fortune from foreign pensions and as a supplier of mercenaries to the pope.

PGR: *see* psychogalvanic reflex.

pH, quantitative measure of the acidity or basicity of aqueous or other liquid solutions. The term, widely used in chemistry, biology, and agronomy, translates the values of the concentration of the hydrogen ion—which ordinarily ranges between about 1 and 10^{-14} gram-equivalents per litre—into numbers between 0 and 14. In pure water, which is neutral (neither acidic nor alkaline), the concentration of the hydrogen ion is 10^{-7} gram-equivalents per litre, which corresponds to a pH of 7. A solution with a pH less than 7 is considered acidic; a solution with a pH greater than 7 is considered basic, or alkaline.

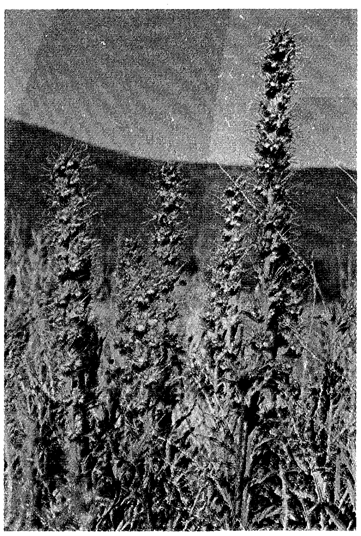
The measurement was originally used by the Danish biochemist S.P.L. Sørensen to represent the hydrogen ion concentration, expressed in equivalents per litre, of an aqueous solution: $pH = -\log[H^+]$ (in expressions of this kind, enclosure of a chemical symbol within square brackets denotes that the concentration of the symbolized species is the quantity being considered).

Because of uncertainty about the physical significance of the hydrogen ion concentration, the definition of the pH is an operational one—*i.e.*, it is based on a method of measurement. The U.S. National Bureau of Standards has defined pH values in terms of the electromotive force existing between certain standard electrodes in specified solutions.

In agriculture, the pH is probably the most important single property of the moisture associated with a soil, since that indication reveals what crops will grow readily in the soil and what adjustments must be made to adapt it for growing any other crops. Acidic soils are often considered infertile, and so they are for most conventional agricultural crops, although conifers and many species of shrub will not thrive in alkaline soil. Acidic soil can be "sweetened" or neutralized by treating it with lime. As soil acidity increases so does the solubility of aluminum and manganese in the soil, and many plants (including agricultural crops) will tolerate only slight quantities of those metals. Acid content of soil is heightened by the decomposition of organic material by microbial action, by fertilizer salts that hydrolyze or nitrify, by oxidation of sulfur compounds when salt marshes are drained for use as farmland, and by other causes.

The pH is usually measured with a pH-meter, which translates into pH readings the difference in electromotive force (electrical potential or voltage) between suitable electrodes placed in the solution to be tested. Fundamentally, a pH meter consists of a voltmeter attached to a pH-responsive electrode and a reference (unvarying) electrode. The pH-responsive electrode is usually glass, and the reference is usually a mercury-mercurous chloride (calomel) electrode, although a silver-silver chloride electrode is sometimes used. When the two electrodes are immersed in a solution, they act as a battery. The glass electrode develops an electric potential (charge) that is directly related to the hydrogen-ion activity in the solution, and the voltmeter measures the potential difference between the glass and reference electrodes. The meter may have either a digital or analogue (scale and deflected needle) readout. Digital readouts have the advantage of exactness, while analogue readouts give better indications of rates of change. Battery-powered portable pH-meters are widely used for field tests of the pH of soils; such tests may also be performed, less accurately, by mixing indicator dyes in soil suspensions and matching the resulting colours against a colour chart calibrated in pH.

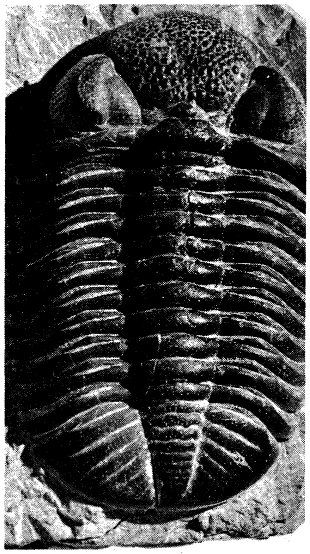
Phacelia, genus of about 200 species of blue- or white-flowering herbs, native to North America and Andean South America and including several species of garden flowers. It belongs to the family Hydrophyllaceae.



Phacelia
F.K. Anderson—EB Inc.

P. campanularia, native to dry slopes of southern California, bears blue, five-lobed blooms in loose sprays over the dark-green, toothed, oval leaves, on plants about 23 centimetres (9 inches) tall. From similar areas the closely related California bluebell, or wild Canterbury bell (*P. whitlavia*), has urn-shaped blooms.

Phacops, genus of trilobites (an extinct group of aquatic arthropods) found as fossils in



Phacops rana milleri, collected in Sylvania, Ohio
By courtesy of the Buffalo Museum of Science, Buffalo, N.Y.

Silurian and Devonian rocks (between 345,000,000 and 430,000,000 years old) in Europe and North America. *Phacops* is a common and easily recognizable form, with its rounded rather than angular outline, globose head region, and large compound eyes. A common form is the species *Phacops rana.*

Phaedo, also spelled PHAEDON (b. *c.* 417 BC, Elis, in the Peloponnesus), philosopher, founder of a Socratic school of philosophy at Elis on the Peloponnese, and author of works on dialectics and ethics.

Born of an aristocratic family, Phaedo was made a prisoner in the war with Sparta (400–399 BC) and was sold as a slave. Bought and freed by an Athenian who was a friend of Socrates, Phaedo became Socrates' disciple. Plato named one of his dialogues after him. After Socrates' death, Phaedo returned to Elis and established his school.

Many dialogues were attributed to Phaedo, but only the *Zopyrus* and *Simon* have survived.

Phaedrus (b. *c.* 15 BC, Thrace—d. *c.* AD 50, Italy), Roman fabulist, the first writer to Latinize whole books of fables, producing free versions in iambic metre of Greek prose fables then circulating under the name of Aesop.

A slave by birth, Phaedrus went to Italy early in life, became a freedman in the emperor Augustus' household, and received the usual education in Greek and Latin authors.

The poets Ennius, Lucilius, and Horace had introduced fables into their poems, but Phaedrus considered himself a genuine, pioneering artist whose poems, combining charm with a serious didactic purpose, were assured of immortality. He also prided himself on his brevity. The fables of Phaedrus include such favourites as "The Fox and the Sour Grapes," "The Wolf and the Lamb," "The Lion's Share," "The Two Wallets," and "The Pearl in the Dung-Heap." His work became extremely popular in the Middle Ages. Numerous prose and poetic versions of his tales appeared in Europe and Britain. A collection called *Romulus,* was the basis of most of them; Phaedrus' identity having been lost, some scholars assumed that Romulus was the author.

In the early 18th century a manuscript was discovered at Parma that contained 64 fables of Phaedrus, of which 30 were new. Another manuscript was later found in the Vatican and published in 1831. Later research identified 30 more fables as written in the iambics of Phaedrus.

Phaenias (Greek philosopher): *see* Phanias.

Phaeophyta, division or phylum of algae the members of which are commonly known as brown algae (*q.v.*).

Phaestus, Greek PHAESTOS, ancient city on the western end of the southern plain of Crete, about 3½ miles (5.6 kilometres) from the sea. The site was occupied from the 4th millennium BC, and its importance grew in the Early and Middle Bronze ages (*c.* 3000–*c.* 1600 BC). In the latter period its palace was first built and later remodelled. In the Late Bronze Age, about 1400, it was destroyed in the same earthquake that destroyed Knossos and other sites on Crete. It was reoccupied in the final phase of the Late Bronze Age (13th century BC) and was widely known in classical and Hellenistic times (*c.* 6th–1st centuries BC) until neighbouring Gortyn eclipsed it under the Roman Empire.

Phaethon (Greek: Shining, or Radiant), in Greek mythology, the son of Helios, the sun god, and a woman or nymph variously identified as Clymene, Prote, or Rhode. Taunted with illegitimacy, Phaethon appealed to his father, who swore to prove his paternity by giving him whatever he wanted. Phaethon asked to be allowed to drive the chariot of the sun through the heavens for a single day. Helios, bound by his oath, had to let him make the attempt. Phaethon set off but was entirely unable to control the horses of the sun chariot, which came too near to the earth and began to scorch it. To prevent further damage, Zeus hurled a thunderbolt at Phaethon, who fell to the earth at the mouth of the Eridanus, a river later identified as the Po.

phaeton, open, four-wheeled, doorless carriage, popular in the 18th and 19th centuries. It contained one or two seats, usually had a folding, or falling, top, and was owner-driven (*i.e.,* it had no outside driver's seat). The most spectacular phaeton was the English four-wheeled high-flyer, the body of which consisted of a light seat for two, resting atop two sets of springs and reached by ladder.

Much more reasonably constructed and graceful phaetons were the mail and the spider phaetons. The mail phaeton, used chiefly to convey passengers with luggage and as a travelling and posting carriage, was so named because it was constructed with mail-springs originally designed for mail coaches. The spi-

Phaeton, *c.* 1770; in the Science Museum, London

der phaeton, of U.S. origin, was a light vehicle made for gentlemen drivers. The Stanhope and Tilbury phaetons were also fashionable carriages, both used at horse shows. Double phaetons had two seats, and extension-top phaetons resembled better surreys and simpler cabriolets.

Phag-mo-gru FAMILY, Tibetan family that in the 14th century liberated Tibet from Mongol control. The Phag-mo-gru had begun to extend its power over the surrounding countryside in the 13th century at a time when the country was being governed by a series of lamas from the Sa-skya monastery, residing at the Mongol (Yüan) court in China. The death of the emperor Kublai Khan in 1294 marked the beginning of the decline of Mongol power; the Phag-mo-gru, under its great leader Byang-chub rgyal-mtshan (1302–64), moved in and soon began to actively dispute the Sa-skya Lama's authority. By 1358 Byang-chub rgyal-mtshan had liberated all of central Tibet, eradicating Mongol control over the country. Byang-chub rgyal-mtshan and the Phag-mo-gru leaders who succeeded him assumed the title of Gong-ma, restored the Tibetan ethos as the ruling ideology, and divided the nation into districts governed by centrally appointed officials. During the next 100 years in which the Phag-mo-gru was dominant, a semblance of central authority was reestablished in the country. In the middle of the 15th century, however, the Phag-mo-gru rule was gradually usurped by the powerful Rin-spung family, who had previously been ministers to the Gong-ma.

phage (virus): *see* bacteriophage.

phagocytosis, process by which living cells (phagocytes) ingest or engulf other cells or particles. The phagocytic cell may be a free-living one-celled organism, such as an amoeba, or one of the body cells, such as a leukocyte (white blood cell). The particles commonly phagocytized by leukocytes include bacteria, dead tissue cells, protozoa, various dust particles, pigments, and other minute foreign bodies. In the simpler forms of animal life, such as amoebae and sponges, phagocytosis is a means of feeding; in higher animals phagocytosis is chiefly a defensive reaction against infection and invasion of the body by foreign substances (antigens).

In humans and in vertebrates generally, the most effective phagocytic cells are the macrophages (large phagocytic cells) and the granular leukocytes, or granulocytes (small phagocytic cells). The macrophages occur especially in the liver, spleen, and lymph nodes, in which their function is to free the blood and lymph of bacteria and other particles. Macrophages are also found in all tissues as wandering amoeboid cells, and the monocyte, a precursor of the macrophage, is found in the blood. The smaller granulocytes are white blood cells, chiefly neutrophils, that are carried along by the circulating blood until they reach an area of infected tissue, where they pass through the blood vessel wall and lodge in that tissue. Both macrophages and granulocytes are drawn toward an area of infection or inflammation by means of substances given off by the bacteria and the infected tissue, or by a chemical interaction between the bacteria and complement, which is a blood plasma protein.

Before phagocytosis is accomplished, the phagocyte and the particle must adhere to each other, and whether this is possible depends largely on the chemical nature of the surface of the particle. Ordinary proteins from the blood can form a surface film on less virulent bacteria to which leukocytes adhere, and phagocytosis follows. Virulent bacteria are ingested with more difficulty. Leukocytes, instead of adhering to them, succeed only in pushing them away. If, however, the leukocytes succeed in pushing them against a firm surface, such as the lining of a blood vessel, the bacteria may not be able to slip away and are ingested. This process is known as surface phagocytosis. Other virulent bacteria may not be phagocytized until their surfaces are coated with special antibodies formed by the body in response to the presence of that particular kind of bacterium. Such antibodies are of great importance in establishing immunity to diseases.

The manner in which a phagocytic cell ingests a particle varies somewhat with the size of the particle. Small particles, such as bacteria or minute grains of charcoal, seem to be ingested in an instant. At one moment they appear through the microscope to be adherent to the surface of the phagocyte; at the next moment they are inside it. Larger objects, such as clumps of bacteria or tissue cells, are phagocytized by a more prolonged response of the leukocyte. The cell flows around the object until it has been completely engulfed.

The results of phagocytosis are digestion and destruction of the particle by means of enzymes inside the phagocyte. The engulfed object is contained within a membrane-bound vacuole. Poisons contained in ingested bacteria cannot harm the phagocyte so long as the bacteria remain in the vacuole; phagocytic enzymes are secreted into the vacuole in which digestion takes place. If the particle is indigestible, however, as is a grain of carbon, it eventually may be ejected by the phagocyte.

'Phags-pa (b. 1235—d. 1280), Tibetan scholar-monk who set up a Buddhist theocracy in Tibet.

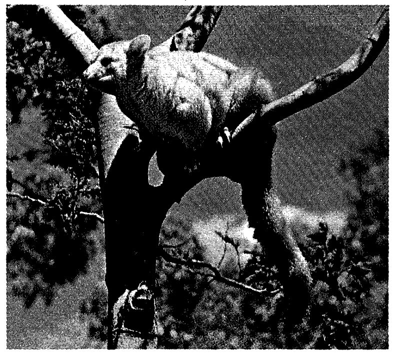
'Phags-pa was a member of the Sa-skya-pa school of Buddhism, which was based at the Sa-skya monastery and which was noted for its emphasis on scholarship. After the Mongols had established suzerainty over his country, 'Phags-pa accompanied his uncle, the Sa-skya lama, on a visit to Mongolia in 1247. 'Phags-pa later succeeded his uncle as lama and came to have great influence with Kublai Khan, founder (1279) of the Yüan dynasty of China, to whom he became adviser. With Kublai he worked out the relation of Tibet to China as a personal bond between the lama as priest and the emperor as patron (*yon-mchod*). He also developed with Kublai the "dual principle" of the parity of power and dignity of church and state in political matters. 'Phags-pa also invented an alphabet for the Mongol language.

phala (Sanskrit: "fruit"), in Indian philosophy, the fruit or consequence of a particular action (*karma*). The almost universally held conviction among Indian philosophers that this life is but one in a chain of lives and that social class and personal character are the result of deeds in a previous life underlies the significance of both *phala* and *karma*. The moral energy of man's past deeds is conserved and automatically fructifies in the circumstances of a future life. *See also* karma.

Phalaborwa, also spelled PALABORA, mining town, northeastern Transvaal, South Africa, located east of the Drakensberg mountains and north of the Olifants River near Kruger National Park. It is built on top of an old black African mining centre of iron and copper ore; traces of their workings and clay smelting ovens have been found in the nearby granite hills. A name of tribal origin, Phalaborwa ("Better than the South") means the area was healthier than fever-ridden areas to the south. Copper mining by Europeans was first undertaken there in 1904 but was soon suspended because of the high cost of transport. The discovery of phosphates there led to the formation of the Phosphate Development Corporation (Foskor) in 1951 and the establishment of the town of Phalaborwa in 1957. Phosphate deposits now mined there supply South Africa's requirements. Copper and iron ore are extracted once again, and uranium is recovered as a by-product. Pop. (1984 est.) mun., 12,000.

phalanger, any of several species of Australasian marsupial mammals of the family Phalangeridae. They are called possums in Australia and Tasmania. The cuscus (*q.v.*) belongs to this family.

Phalangers are tree-dwelling animals: the clawless innermost hind digit and, sometimes, the first and second digits of the forefoot are opposable, making it possible for the animal to grasp branches. The second and third digits of the hind foot are united. The tail is long and often prehensile. The pouch opens forward; there are usually two to four teats. The first incisor tooth is long and stout; the side teeth are tiny. The coat is often woolly, and many species are striped. Total length ranges from 12 to 120 centimetres (5 to 47 inches).



Golden brush-tailed possum (*Trichosurus*)
Warren Garst—Tom Stack and Associates

Phalangers are native to the forests of Australia, Tasmania, New Guinea, and islands west to Celebes and east to the Solomons. All are herbivorous, feeding on fruits, leaves, and blossoms. Some species also eat insects and small vertebrates. Phalangers are active chiefly at night. Most bear their young—usually two or three—in tree hollows and unused birds' nests; a few build leafy nests of their own.

Several species are endangered: they are the prey of snakes and cats or have been trapped for their fur, though in Australia they are now protected. The brush-tailed possum (*Trichosurus vulpecula*) is the most widely distributed Australian and Tasmanian marsupial. It looks rather like a squirrel.

Ring-tailed possums—the 17 species of the genus *Pseudocheirus*—usually carry their tails in a circle at the tip. The three dormouse possums, or mundardas (*Cercartetus*), and the three pygmy possums (*Eudromicia*) store fat in the tail and become torpid at times. Striped phalangers, also called striped possums (*Dactylonax palpator* and the three species of *Dactylopsila*), are chiefly New Guinean; they have the fourth digit of the front foot elongated to serve as a probe for grubs in rotten wood. The long-snouted phalanger, or honey possum (*Tarsipes spenserae*), has an extended muzzle and only 22 teeth—the fewest among marsupials. It uses its bristle-tipped tongue to take nectar from flowers. Several phalanger species are arboreal gliders who use flaps of skin along their flanks as sails with which to ride from tree to tree. *See* glider.

phalanx, tactical formation consisting of heavily armed infantry standing shoulder to shoulder in files normally eight men deep. The use of the formation, developed by the ancient Greeks and maintained throughout their history, apparently spread throughout Greece during the 7th century BC. The Greek hoplite (heavy-armed infantryman) who manned the phalanx was equipped with a round shield, a heavy corselet of leather and metal, greaves (shin armour), an 8- to 21-foot pike for thrusting, and a 2-foot double-edged sword. The pikes formed a barrier to cavalry attack, although the phalanx was somewhat vulnerable to archers, either mounted or on foot.

Since the phalanx held in solid ranks and was divided only into the centre and wings, there was generally little need for an officer corps; the whole line advanced in step to the sound of the flute. The Spartans, however, did train officers to manoeuvre the phalanx.

Phalaris (d. *c.* 554 BC), tyrant of Acragas (modern Agrigento), Sicily, notorious for his cruelty. He is alleged to have roasted his victims alive in a bronze bull, their shrieks representing the animal's bellowing. A statue of a bull of some kind seems to have existed, but the facts surrounding its use have been embellished. For example, the supposed designer of the bull, Perilaus, or Perillus, was said to have been the first man executed in it.

After assuming the responsibility for building the temple of Zeus Atabyrios, in the citadel at Acragas, Phalaris armed his workers and seized power. Under his rule Acragas seems to have prospered and to have expanded its territory. The splendid layout of the city probably belongs to his time. Eventually Phalaris was overthrown by Telemachus, the ancestor of Theron (tyrant 488–472). It is said that the deposed tyrant was burned to death in his own bronze bull.

Contrary to the legends that stress the cruelty of Phalaris, he was represented by the sophists of the Roman Empire as a humane and cultured man. The famous 148 *Letters of Phalaris* were proved by the great English Classical scholar Richard Bentley, in his *Dissertation on the Letters of Phalaris* (1699), to have been written much later by a sophist or rhetorician, possibly Adrianus of Tyre (died *c.* AD 193).

phalarope (Greek: "coot-foot"), any of three species of shorebirds that constitute the family Phalaropodidae (order Charadriiformes). They are lightly built, slim-necked birds, about 20 to 25 centimetres (8 to 10 inches) long, and have

Wilson's phalarope (*Steganopus tricolor*)
Alice B. Kessler

lobed toes, adapted to swimming. Phalaropes are noted among birds for complete reversal of sex roles. Females, larger and more brightly coloured than males, fight for nesting territories and do the courting; males undertake all nesting duties and lead the young southward in autumn after the females have departed.

Phalaropes are marked with red and soft gray in summer; in winter they are gray and white. Two species that breed around the Arctic Circle are the red phalarope (*Phalaropus fulicarius*), called gray phalarope in Britain, and the northern phalarope (*Lobipes lobatus*), called red-necked phalarope in Britain. Both species winter on tropical oceans, where they are known as sea snipe. Wilson's phalarope (*Steganopus tricolor*) breeds in interior western North America and migrates chiefly to the Argentine pampas.

phallicism, worship of the generative principle as symbolized by the sexual organs or the act of sexual intercourse. Although religious activities that involve sexuality or the symbolism of the male or female sexual organs are sometimes called phallic cults, there is no evidence that any cult is preeminently phallic.

The most important forms of sexual rituals are those in which intercourse is believed to promote fertility, those that release a flood of creative energy by breaking boundaries and by returning a culture to the state of primeval and powerful chaos (*e.g.,* the orgy during New Year festivals), or those in which sexual intercourse symbolizes the bringing together of opposites (*e.g.,* alchemy or Tantrism, a Hindu esoteric meditation system).

In other traditions objects of adoration are representations of the sexual organs (*e.g.,* the phallus borne in Dionysiac processions in Greece and Rome; the male *liṅga* and female *yoni* in India) or deities with prominent genitals (*e.g.,* Priapus in Greece). In these instances, the powers of creativity that the sexual organ represents, rather than the organ itself, are worshipped.

Phalodi, town, Rājasthān state, northwestern India. Located in the Great Indian (Thar) Desert, Phalodi is an old caravan centre, believed to have been founded in the 15th century. Architectural monuments include a fort and palaces. The town is connected by road and rail with Jodhpur and is a trade centre for camels, sheep, hides, and salt. Local manufactures include metal utensils, camel's-hair mats, and pottery. Just north lies the Phalodi salt source, a large saline depression of the desert. Camels are bred nearby. Pop. (1981) 28,539.

Phan Boi Chau, also called PHAN GIAI SAN, PHAN SAO NAM, PHAN THI HAN, or HAI THU, original name PHAN VAN SAN (b. 1867, Nghe An province, northern Vietnam—d. Sept. 29, 1940, Hue), dominant personality of early Vietnamese resistance movements, whose impassioned writings and tireless schemes for independence earned him the reverence of his people as one of Vietnam's greatest patriots.

Phan Boi Chau was the son of a poor scholar, who stressed education and preparation for the mandarin examinations, the only means to success in the traditional bureaucracy. By the time he received his doctorate in 1900 Phan Boi Chau had become a firm nationalist.

In 1903 he wrote *Luu cau huyet le tan thu* ("Ryukyu's Bitter Tears"), an allegory equating Japan's bitterness at the loss of the Ryukyu Islands with the Vietnamese loss of independence. With fellow revolutionaries he formed the Duy Tan Hoi (Reformation Society; *see* Duy Tan) in 1904 and secured the active support of Prince Cuong De (*q.v.*), thus presenting to the people an alliance of royalty and resistance.

In 1905 Phan Boi Chau moved his resistance movement to Japan, and in 1906 he met the Chinese revolutionary Sun Yat-sen. His plans to place Cuong De on the throne of Vietnam resulted in a meeting in 1906 with the Prince and the Vietnamese reformer Phan Chau Trinh (*q.v.*). A Franco-Japanese understanding forced Phan Boi Chau, the Vietnamese students he had brought to Japan, and Cuong De to leave Japan in 1908–09. By 1912 Phan Boi Chau had reluctantly given up his monarchist scheme. He reorganized the resistance movement in Canton, China, under the name Viet Nam Quang Phuc Hoi (Vietnam Restoration Society). The organization launched a plan to assassinate the French governor general of Indochina, but the plan failed. Phan Boi Chau was imprisoned in Canton from 1914 to 1917; during his confinement he wrote *Nguc trung thu* ("Prison Notes"), a short autobiography.

Upon his release, Phan Boi Chau studied Marxist doctrine and resumed his resistance to the French. In June 1925 he was seized and taken to Hanoi, but hundreds of Vietnamese protested against his arrest. The French pardoned him and offered him a civil service position that he refused.

Phan Boi Chau lived out his later years in quiet retirement at Hue, under French surveillance. He wrote a second autobiography, replete with directives for future revolutionaries, and several volumes of poetry. Among his notable works are *Viet Nam vong quoc su* (1906; "History of the Loss of Vietnam"), renowned as Vietnam's first revolutionary history book, and *Hau Tran dat su* ("Strange Story of the Latter Tran"), a historical novel with political implications.

Phan Chau Trinh, also spelled PHAN CHU TRINH (b. 1872, Tay Loc, Quang Nam province, Vietnam—d. March 24, 1926, Saigon), nationalist leader and reformer who played a vital role in the movement for Vietnamese independence and who was the leading proponent of a reformist program that joined the aims of expelling the French and of restructuring Vietnamese society.

Trained in military skills by his father, Phan Chau Trinh fought in 1885 against French forces that were searching for the fugitive rebel king Ham Nghi, the symbol of the resistance. In an encounter with the French, his father was killed, possibly by a member of a nationalist–royalist organization who thought him a traitor. Thereafter, Phan Chau Trinh would not associate with any plans to oppose the French that involved a monarchist symbol.

Phan Chau Trinh resumed his education in 1887, studying the Chinese classics in preparation for the mandarin examinations, which he passed in 1900. By 1906 he had come to view the mandarin bureaucracy and the Vietnamese monarchy as symbols of a backwardness that would forever prevent technological progress and the development of an autonomous state. That year he went to Japan, where he discussed plans for overthrowing the French regime with another Vietnamese nationalist, Phan Boi Chau (*q.v.*). Phan Chau Trinh argued for the gradual development of an autonomous state by laying firm foundations in economic and industrial development. His primary goal was modernization, from which he believed a Vietnamese democratic republic would follow.

Returning to Vietnam, Phan Chau Trinh started small business enterprises and spread propaganda encouraging the development of local industries and a modern education for all Vietnamese. Gaining a large following, he tried to persuade the French to undertake major reforms, and he urged replacing the mandarin civil service system with vocational schools and commercial firms. He asked wealthy Vietnamese to develop national commerce through personal investments.

Greatly influenced by the writings of Jean-Jacques Rousseau and Montesquieu, Phan Chau Trinh began by appealing in vain to French colonialists in terms of their own revolutionary tradition. In 1908 he was seized in Hanoi during a series of arrests of anticolonialist agitators. He maintained a silent protest through a hunger strike while awaiting trial at Hue. After a trial in a joint mandarin and French court, he was sentenced in May 1908 to life imprisonment on Poulo Condore (now Con Son). He was pardoned and released in 1911, however, apparently to work with the colonial regime for modernization. Subsidized by the French, he went to Paris; he was again imprisoned early in World War I, this time for draft evasion and pro-German leanings. He was released in 1915 but received no more subsidies from the French. Phan Chau Trinh returned to Vietnam in 1924 and died of tuberculosis in 1926. He was mourned by Vietnamese of all classes in a national funeral ceremony that lasted a week.

BIBLIOGRAPHY. An excellent critical assessment of Phan Chau Trinh's writings and his influence on Vietnam's historical development is given in David G. Marr, *Vietnamese Anticolonialism, 1885–1925* (1971).

Phan Dinh Phung (b. 1847, Ha Tinh province, Vietnam—d. Dec. 28, 1895, Nghe Tinh province), Vietnamese government official who opposed French expansion in Vietnam and became a leader of the nationalist resistance movement.

Phan was a mandarin at the court of the Vietnamese emperor Tu Duc. After Tu Duc's death in 1883, Phan opposed the succession of the emperor's nephew Ham Nghi. Ham Nghi ascended the throne in 1884, however, and Phan was condemned to death by his enemies at the court; the sentence was later commuted to banishment. Ham Nghi became the youthful figurehead leader of an unsuccessful rebellion against the French in 1885.

By 1894 Phan led another rebellion that failed because of inadequate support. Phan and his fellow revolutionaries were forced to retreat to the mountains of Nghe Tinh province. In July 1895 the French sent 3,000 troops to Nghe Tinh, but Phan's resistance movement held out for several months. At the end of the year, Phan died of dysentery, and the remainder of his followers were caught and executed.

Phan Khoi (b. 1888?, Quang Nam province, Annam [now in Vietnam]—d. 1958, Hanoi, North Vietnam), intellectual leader who inspired a North Vietnamese variety of the Chinese Hundred Flowers Campaign, in which scholars were permitted to criticize the communist regime, but for which he himself was ultimately persecuted by the Communist Party of Vietnam.

Phan Khoi was a dedicated nationalist who in his youth followed the patriot Phan Chau Trinh in working for social and political reforms in Vietnam. When Vietnam was divided in 1954, Phan Khoi chose to remain under the communist government in the north, becoming North Vietnam's most illustrious intellectual. He was the editor of *Nhan Van* ("Humanism") and *Giai Pham Mua Xuan* ("Beautiful Flowers of the Spring"), two radical literary reviews that took advantage of the liberalizing proclamation of Mao Zedong, of China, to offer stringent criticisms of the Hanoi regime. Phan Khoi accused the Communist Party of corruption, attacked alleged anti-intellectualism of the Vietnam People's Army, and voiced other complaints.

"Art is a private sphere," he wrote, "Politics should not encroach upon it." The criticisms, however, were more than the government could endure. The liberalization policy ended, and Phan Khoi was imprisoned on charges of "deviationism."

Phan Thanh Gian, also spelled PHAN THANG GIANG (b. 1796, Ben Tre province, Cochinchina [now in Vietnam]—d. Aug. 4, 1867, Vinh Long), Vietnamese government official and diplomat whose conservatism and strict adherence to the political and ethical tenets of Confucianism may have contributed to the French conquest of Vietnam.

The son of a low-ranking administrative employee, Phan Thanh Gian was outstanding in state examinations and won a doctoral degree—the first awarded in Cochinchina (southern Vietnam)—and a position close to Emperor Minh Mang. At the imperial court he progressed rapidly through the scholarly ranks, becoming a mandarin of the second order and a counselor of the emperor. Following Confucian principles strictly, he informed his sovereign of errors and shortcomings in imperial edicts and practices, thus incurring imperial displeasure. Minh Mang deprived him of his titles and demoted him to fight as a common soldier in the region of Quang Nam, in central Vietnam.

On the battlefield, Phan Thanh Gian marched in the front lines and provided an example of courage and discipline. His behaviour won him the respect and admiration of officers as well as his fellows, and Minh Mang recalled him to court. Under succeeding rulers he was named to the highest governmental positions.

When the Vietnamese sovereigns began the active persecution of Christian missionaries, France invaded southern Vietnam and by 1862 had captured Saigon (now Ho Chi Minh City), Bien Hoa, and Vinh Long. By treaty Phan Thanh Gian ceded Gia Dinh and Dinh Thong (present-day My Tho), in the hope that the French would stay out of the remainder of Vietnam. The French thus controlled the richest parts of southern Vietnam, its three easternmost provinces.

In 1863 Phan Thanh Gian proposed a treaty by which France would halt colonization efforts in Vietnam and return the three provinces in exchange for commercial settlements and land around Saigon, My Tho, and Mui Vung Tau (Cap Saint-Jacques), the promise of yearly tribute, and the provision that all of southern Vietnam would be declared a French protectorate. The terms were approved by France, and, although the emperor Tu Duc reneged on some points and added modifications that favoured the Vietnamese, the treaty was signed in 1864. The following year, however, France declared that it would respect only the terms of the original treaty. Phan Thanh Gian was dismayed, feeling that he had failed and had betrayed his people. He feared the influence of Western civilization and distrusted European technology. When the French seized lands that were under his personal protection in 1867, he committed suicide in protest of the use of force by the French in a cause for which they lacked any moral justification.

Phan Thiet, seaport, southern Vietnam. On the South China Sea, it is at the head of a broad crescent bay, 112 miles (180 km) east-northeast of Ho Chi Minh City (formerly Saigon). Originally a fishing village, it had resort facilities under the French colonial administration. It is one of Vietnam's most important fishing ports and centres for fish processing and marketing; it is also headquarters of the Vietnamese fishing cooperatives. There is a considerable brick- and tile-making industry. An important activity is the manufacture of *nuoc mam,* the national condiment derived from certain types of fermented fish. There are hospitals and a commercial airport located there. Pop. (latest est.) 76,652.

Phanariote, member of one of the principal Greek families of the Phanar, the Greek quarter of Constantinople (Istanbul), who, as administrators in the civil bureaucracy, exercised great influence in the Ottoman Empire in the 18th century. Some members of these families, which had acquired great wealth and influence during the 17th century, abandoned their traditional careers in commerce to enter the bureaucracy of the Ottoman Empire. From 1669 until 1821 Phanariotes served as dragomans (interpreters who also acted as foreign-affairs advisers) to the Sublime Porte (the Ottoman government) and to foreign embassies. They were also appointed hospodars (rulers) of the Danubian principalities, Moldavia and Walachia, which were vassal states of the Ottoman Empire during the period 1711–1821, which is, therefore, known as the Phanariote period in Romanian history. Phanariotes also dominated the administration of the Eastern Orthodox church and frequently intervened in the selection of prelates, including the patriarch of Constantinople. Leading Phanariote families were the Argyropoulos, Cantacuzino, Mavrokordátos, and Ypsilantis.

Phanerozoic Eon, the span of geologic time extending about 570 million years from the end of the Proterozoic Eon to the present. The Phanerozoic, the eon of visible life, is divided into three major spans of time largely on the basis of characteristic assemblages of life-forms: the Paleozoic, Mesozoic, and Cenozoic eras. Although life clearly originated at some time, probably quite early, in the Proterozoic Eon, not until the Phanerozoic did a rapid expansion and evolution of forms occur and fill the various ecological niches available. The key to this great Phanerozoic expansion appears to lie in the development of plants able to carry out the photosynthetic process and thus release free oxygen into the atmosphere. Before this time, the Earth's atmosphere contained negligible amounts of free oxygen, and animals, in which energy transfers involving the process of respiration are critical, were unable to develop. During the Phanerozoic, the Earth gradually assumed its present configuration and physical features through such processes as continental drift, mountain building, and continental glaciation. Thus, although the Phanerozoic Eon represents only about the last one-eighth of time since the Earth's crust formed, its importance far exceeds its relatively short duration.

Phang Xi Pang (peak, Vietnam): *see* Fan Si Pan.

Phangnga, town, southern Thailand, on the hilly western side of the Malay Peninsula. It lies on the coastal road and is a centre for mining, trade, and tourism inspired by the mountain caves and coastal scenery. The surrounding area has a coastline on the Indian Ocean and embraces a number of offshore islands. Tin and tungsten are mined in the region, and rubber, fruit, and rice are produced. Pop. (1986 est.) 8,897.

Phanias, also spelled PHAENIAS, or PHAINIAS (fl. *c.* 300 BC), Greek philosopher of Eresus on the island of Lesbos, a pupil of Aristotle and a friend of Theophrastus, whom he joined in the Peripatetic school. He is mentioned as the author of works on logic, in which he probably followed Aristotle's doctrine; he also wrote, as Theophrastus did, on botany; and there are remains of works by him on poets, on the Socratic philosophers, and on history. His *Prytaneis of Eresus* was a history in which events in the Greek world in general were included, the chronology being determined by the series of the successive magistrates of his native place. In his *Tyrants of Sicily* he seems to have dealt with Western history against a pan-Hellenic background.

phantom midge (subfamily Chaoboridae), any of a group of insects (order Diptera) similar in appearance to the mosquito. The common name is derived from the fact that the larvae are almost transparent. Their antennae are modified into grasping organs. The larvae, found in pools, often destroy mosquito larvae. The adults do not bite.

Phao Sriyanond (b. March 1, 1910, Siam [now Thailand]—d. Nov. 21, 1960, Geneva, Switz.), director general of the Thai government's national police, who as one of a powerful triumvirate, with Luang Phibunsongkhram and Sarit Thanarat, built a formidable armed force in an unsuccessful attempt to assert his individual authority.

Phao, of Thai-Burmese ancestry, joined in the coup of 1947 that restored Phibunsongkhram to power; he held various ministries in the new regime and was given command of the national police force. In a purge of Thailand's Communists in 1952–53 he directed a harsh anti-Chinese policy. His reputation was marred by charges of widespread corruption among police officials, who were accused of smuggling opium and profiteering in national commercial enterprises, and by the mysterious deaths of the regime's political opponents. In the early 1950s Phao and Sarit became more powerful than Phibunsongkhram, and the rivalry between Phao and Sarit led in 1957 to a bloodless coup that forced Phao and Phibun into exile.

pharaoh (from Egyptian *per ʿaa,* "great house"), originally, the royal palace in ancient Egypt; the word came to be used as a synonym for the Egyptian king under the New Kingdom (starting in the 18th dynasty, 1539–1292 BC), and by the 22nd dynasty (*c.* 945–*c.* 730 BC) it had been adopted as an epithet of respect. The term has since evolved into a generic name for all ancient Egyptian kings, although it was never formally the king's title. In official documents, the full title of the Egyptian king consisted of five names, each preceded by one of the following titles: Horus; Two Ladies; Golden Horus; King of Upper and Lower Egypt and Lord of the Double Land; and Son of Re and Lord of the Diadems. The last name was given him at birth, the others at coronation.

The Egyptians believed their pharaoh to be a god, identifying him with the sky god Horus and with the sun gods Re, Amon, and Aton. Even after death the pharaoh remained divine, becoming transformed into Osiris, the father of Horus and god of the dead, and passing on his sacred powers and position to the new pharaoh, his son. The pharaoh's divine status was believed to endow him with magical powers: his uraeus (the snake on his crown) spat flames at his enemies, he was able to trample thousands of the enemy on the battlefield, and he was all-powerful, knowing everything and controlling nature and fertility.

As a divine ruler, the pharaoh was the preserver of the god-given order, called *ma'at.* He owned a large portion of Egypt's land and directed its use, was responsible for his people's economic and spiritual welfare, and dispensed justice to his subjects. His will was supreme, and he governed by royal decree. To govern fairly, though, the pharaoh had to delegate responsibility; his chief assistant was the vizier, who, among other duties, was chief justice, head of the treasury, and overseer of all records. Below this central authority, the royal will of the pharaoh was administered through the nomes, or provinces, into which Upper and Lower Egypt were divided.

Since he was considered a god, the pharaoh lived apart from other men, and his subjects subscribed to rituals that exalted him as a divine king. All those approaching him, for example, had to prostrate themselves on the ground. When the pharaoh died, Egyptian funerary rituals were performed that were thought to guarantee that he survive in the afterlife as a god, apart from other men.

Evidence suggests, however, that the Egyptians knew that their divine ruler was only a human being, if a supreme one; they judged him according to his deeds, criticizing pharaohs, plotting against them, and deposing or murdering ineffectual ones. Each succeeding pharaoh, however, ascended the throne under the aegis of the rituals and traditions that recognized him as divine ruler.

Pharisee, member of a Jewish religious party that flourished in Palestine during the latter part of the Second Temple period (515 BC–AD 70). Their insistence on the binding force of oral tradition ("the unwritten Torah") still remains a basic tenet of Jewish theological thought. When the Mishna (the first constituent part of the Talmud) was compiled about AD 200, it incorporated the teachings of the Pharisees on Jewish law.

The Pharisees (Hebrew: Perushim) emerged as a distinct group shortly after the Maccabaean revolt, around 165–160 BC; they were, it is generally believed, spiritual descendants of the Hasideans (*q.v.*). The Pharisees emerged as a party of laymen and scribes in contradistinction to the Sadducees, *i.e.,* the party of the high priesthood that had traditionally provided the sole leadership of the Jewish people. The basic difference that led to the split between the Pharisees and the Sadducees lay in their respective attitudes toward the Torah (the first five books of the Old Testament) and the problem of finding in it answers to questions and bases for decisions about contemporary legal and religious matters arising under circumstances far different from those of the time of Moses. In their response to this problem, the Sadducees, on the one hand, refused to accept any precept as binding unless it was based directly on the Torah, *i.e.,* the Written Law. The Pharisees, on the other hand, believed that the Law that God gave to Moses was twofold, consisting of the Written Law and the Oral Law, *i.e.,* the teachings of the prophets and the oral traditions of the Jewish people. Whereas the priestly Sadducees taught that the written Torah was the only source of revelation, the Pharisees admitted the principle of evolution in the Law; men must use their reason in interpreting the Torah and applying it to contemporary problems. Rather than blindly follow the letter of the Law even if it conflicted with reason or conscience, the Pharisees harmonized the teachings of the Torah with their own ideas or found their own ideas suggested or implied in it. They interpreted the Law according to its spirit; when in the course of time a law had been outgrown or superseded by changing conditions, they gave it a new and more acceptable meaning, seeking scriptural support for their actions through a ramified system of hermeneutics. It was due to this progressive tendency of the Pharisees that their interpretation of the Torah continued to develop and has remained a living force in Judaism.

The Pharisees were not primarily a political party but a society of scholars and pietists. They enjoyed a large popular following, and in the New Testament they appear as spokesmen for the majority of the population. Around 100 BC a long struggle ensued as the Pharisees tried to democratize the Jewish religion and remove it from the control of the Temple priests. The Pharisees asserted that God could and should be worshiped even away from the Temple and outside Jerusalem. To the Pharisees, worship consisted not in bloody sacrifices—the practice of the Temple priests—but in prayer and in the study of God's law. Hence the Pharisees fostered the synagogue as an institution of religious worship, outside and separate from the Temple. The synagogue may thus be considered a Pharasaic institution since the Pharisees developed it, raised it to high eminence, and gave it a central place in Jewish religious life.

The active period of Pharasaism, the most influential movement in the development of Orthodox Judaism, extended well into the 2nd and 3rd centuries AD. The Pharisees preserved and transmitted Judaism through the flexibility they gave to Jewish scriptural interpretation in the face of changing historical circumstances. The efforts they devoted to education also had a seminal importance in subsequent Jewish history; after the destruction of the Second Temple and the fall of Jerusalem in AD 70, it was the synagogue and the schools of the Pharisees that continued to function and to promote Judaism in the long centuries following the Diaspora.

pharmaceutical, substance used in the diagnosis, treatment, or prevention of disease and for restoring, correcting, or modifying organic functions.

A brief treatment of pharmaceuticals follows. For full treatment, *see* MACROPAEDIA: Industries, Chemical Process.

Records of medicinal plants and minerals date to ancient Chinese, Hindu, and Mediterranean civilizations. Ancient Greek physicians such as Galen used a variety of drugs in their profession. During the 16th century AD, after Western medicine began to recover from its long sleep during the Dark and Middle Ages, pharmaceutical practice began to develop rapidly. In 1546 the first pharmacopoeia (list of drugs and their preparation) appeared in Germany, and the profession of pharmacy is considered to have begun in 1617 with the founding of the Society of Apothecaries in London. Among the earliest modern pharmaceuticals were the anesthetics; morphine was first used in 1806, ether in 1842, chloroform in 1847, and cocaine in 1860. Other substances isolated in the 19th century included strychnine (1817), quinine (1820), and nicotine (1828). Joseph Lister first used phenol (carbolic acid) to prevent infection in 1865.

Pharmaceuticals are generally classified by chemical group, by the way they work in the body (pharmacological effect), and by therapeutic use. Alkaloids were the first pure pharmaceuticals derived from natural substances (plants); they include quinine, nicotine, cocaine, atropine, and morphine. Drugs of animal origin include glandular extracts containing hormones, such as insulin for use in treating diabetes.

Antibiotics, vaccines, human blood-plasma fractions, and steroid hormones are other important pharmaceuticals manufactured from natural substances. Vitamins, which were formerly obtained from natural sources, are now often made in the laboratory.

In the preparation of dosages, many pharmaceuticals are ground to varying degrees of fineness. Many medicinal substances are added to water, alcohol, or another solvent so that they can be used in solution form. These may include spirits, elixirs, and tinctures. Ointments are one of many semisolid preparations, which also include creams, pastes, and jellies. Solid pharmaceuticals include pills, tablets, lozenges, and suppositories. In this form the compounds are more stable, with less risk of chemical reaction, and the dosage is easier to determine. Storage and packaging also is made simpler, and solid forms are more efficient to produce.

pharmacology, branch of medicine that deals with the interaction of drugs with the systems and processes of living animals, in particular, the mechanisms of drug action as well as the therapeutic and other uses of the drug.

The first Western pharmacological treatise, a listing of herbal plants used in classical medicine, was made in the 1st century AD by the Greek physician Dioscorides. The medical discipline of pharmacology derives from the medieval apothecaries, who both prepared and prescribed drugs. In the early 19th century a split developed between apothecaries who treated patients and those whose interest was primarily in the preparation of medicinal compounds; the latter formed the basis of the developing specialty of pharmacology. A truly scientific pharmacology developed only after advances in chemistry and biology in the late 18th century enabled drugs to be standardized and purified. By the early 19th century, French and German chemists had isolated many active substances—morphine, strychnine, atropine, quinine, and many others—from their crude plant sources. Pharmacology was firmly established in the later 19th century by the German Oswald Schmeiderberg (1838–1921). He defined its purpose, wrote a textbook of pharmacology, helped to found the first pharmacological journal, and, most importantly, headed a school at Strasbourg that became the nucleus from which independent departments of pharmacology were established in universities throughout the world. In the 20th century, and particularly in the years since World War II, pharmacological research has developed a vast array of new drugs, including antibiotics, such as penicillin, and many hormonal drugs, such as insulin and cortisone. Pharmacology is presently involved in the development of more effective versions of these and a vast array of other drugs through chemical synthesis in the laboratory. Pharmacology also seeks more efficient and effective ways of administering drugs through clinical research on large numbers of patients.

During the early 20th century, pharmacologists became aware that a relation exists between the chemical structure of a compound and the effects it produces in the body. Since that time, increasing emphasis has been placed on this aspect of pharmacology, and studies routinely describe the changes in drug action resulting from small changes in the chemical structure of the drug. Because most medical compounds are organic chemicals, pharmacologists who engage in such studies must necessarily have an understanding of organic chemistry.

Important basic pharmacological research is carried out in the research laboratories of pharmaceutical and chemical companies. After 1930 this area of pharmacological research underwent a vast and rapid expansion, particularly in the United States and Europe.

The work of pharmacologists in industry deals also with the exhaustive tests that must be made before promising new drugs can be introduced into medical use. Detailed observations of a drug's effects on all systems and organs of laboratory animals are necessary before the physician can accurately predict both the effects of the drug on patients and their potential toxicity to humans in general. The pharmacologist does not himself test the effects of drugs in patients; this is done only after exhaustive tests on animals and is usually conducted by physicians to determine the clinical effectiveness of new drugs. Constant testing is also required for the routine control and standardization of drug products and their potency and purity.

pharmacopoeia, also spelled PHARMACOPEIA, a book published by a government, or otherwise under official sanction, to provide standards of identity, quality, and strength for the medicinals representing the best practice and teaching of medicine. The primary function of a pharmacopoeia is to describe each drug on the selected list and to specify methods for determining its identity, quality, and strength. The provisions of the pharmacopoeia are binding upon all who produce drugs and who dispense them.

The task of compiling most pharmacopoeias is carried out by experts in the professions of medicine, chemistry, and pharmacy at the request of the agency undertaking the compilation. Most programs are financed from government funds, but the *British Pharmacopoeia* and the *United States Pharmacopeia* are written by private, nonprofit organizations with the sanction of their respective governments. The proceeds of their sale support the revision. Most countries not having a national pharmacopoeia have adopted one of another nation (or nations) or, in some cases, the international pharmacopoeia.

The *Pharmacopoea Internationalis* was put forward by the World Health Organization in 1951 as a recommendation aimed at minimizing or eliminating variations among national pharmacopoeial standards.

pharmacy, the science that deals with the collection, preparation, and standardization of drugs and medicines. Pharmacists prepare and dispense the medications prescribed by physicians, dentists, and veterinarians.

A brief treatment of pharmacy follows. For full treatment, *see* MACROPAEDIA: Medicine.

References to pharmacy have been found throughout history. Special groups of physician-priests in ancient Egypt prepared remedies in the temples, and in Greece and Rome and sometimes in Europe (during the Middle Ages), the role of the pharmacist was filled by an herbalist, who supplied the physician with the raw materials for the medicines.

The Philadelphia College of Pharmacy and Science, founded in 1821, was the first college of pharmacy in the United States. Similar schools were soon organized in Europe, but universities began to include pharmacy courses in their curricula. The course of instruction for pharmacy was increased from four to five years in 1960; it includes two years of basic training in the arts and sciences, followed by advanced and specialized courses and some business classes. In the United States, pharmacy graduates must be examined and licensed by the state government.

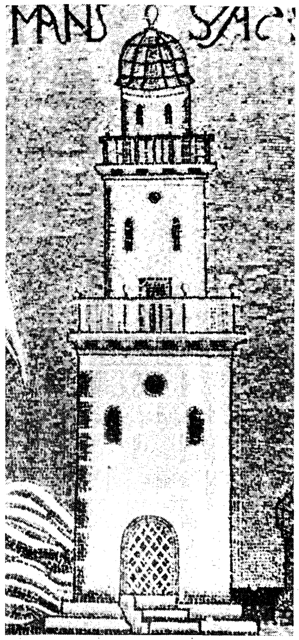
The growth of the pharmaceutical industry has meant that pharmacists themselves are no longer required to prepare many of the prescriptions called for by the physician. They do continue to have responsibility for formulating, storing, and providing correct dosages of the prescribed medicines.

The laws of the pharmaceutical industry are based on the national pharmacopoeia, a treatise that outlines the purity and dosages of numerous medicinal products. Most countries have their own treatise, but an international pharmacopoeia was published beginning in the 1950s by the World Health Organization (WHO) of the United Nations. A number of organizations specialize in pharmacy. Among them are the Pharmaceutical Society of Great Britain and the American Pharmaceutical Association, both founded in the mid-19th century.

Pharnabazus (fl. late 5th and early 4th centuries BC), Persian soldier and statesman who was the hereditary satrap (provincial governor) of Dascylium under Darius II and Artaxerxes II. Pharnabazus was an outstanding military and naval commander in Persia's wars against Athens and Sparta. In the war with Athens, beginning in 413 BC, he supported Spartan operations in the Hellespont. When war broke out with Sparta in 400 BC, he persuaded Artaxerxes to organize a naval counterstroke, and in 394 the Persian navy, jointly commanded by Pharnabazus and the Athenian admiral Conon, completely destroyed the Spartan fleet off Cnidus and gained the mastery of the Aegean. When in 388 the revival of Athenian imperialist ambitions led Artaxerxes to enter into an alliance with Sparta, Pharnabazus, as the chief opponent of Sparta, was recalled with honour from his command. In 385 and 373 he commanded unsuccessful invasions of Egypt.

Pharos OF ALEXANDRIA, one of the Seven Wonders of the World and the most famous lighthouse in antiquity. It was a technological triumph and is the archetype of all lighthouses since. Built by Sostratus of Cnidus for Ptolemy II of Egypt in about 280 BC on the island of Pharos in the harbour of Alexandria, it is said to have been more than 440 feet (135 m) high. The lighthouse was built in three stages, all sloping slightly inward; the lowest was square, the next octagonal, and the top cylindrical. A broad spiral ramp led to the top, where a fire burned at night.

The lighthouse was surmounted by a huge statue, probably representing either Alexander the Great or Ptolemy I Soter in the form of the sun god Helios. Though it was well-known earlier, the Pharos does not appear in any list of wonders until the 6th century AD (the earliest list gives the walls of Babylon instead). In the Middle Ages the Arabs replaced the beacon with a small mosque. The Pharos was still standing in the 12th century, although by 1477 the Mamlūk sultan Qā'it Bāy was able to build a fort from its ruins.



Pharos of Alexandria, Egypt, detail of a mosaic in St. Mark's church, Venice, late 13th century

Douglas B. Hague

Pharsalus, Battle of (48 BC), the decisive engagement in the ancient Roman civil war between Julius Caesar and Pompey. After Caesar had been defeated by Pompey at Dyrrhachium in 48 BC, both armies departed and again made contact somewhere near what is today Fârsala, Greece. After several days of maneuvering, Pompey finally offered Caesar battle (August 9 by the uncorrected Roman calendar; June 6, Julian). Caesar had approximately 22,000 men; Pompey possibly had as many as 45,000.

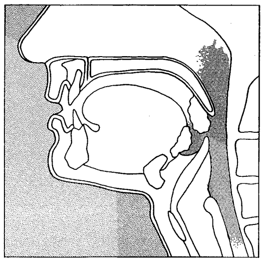
Pompey massed the main force of his cavalry on his left infantry wing, hoping to outflank and overpower Caesar's right wing, which was made up of a mixed band of cavalry and infantry. Caesar, however, foresaw the defeat of his right wing and had stationed behind it about 2,000 of his best legionnaires. In the ensuing battle, Pompey's cavalry drove back Caesar's cavalry, only to find itself faced by the advancing corps of select men using their *pila* as stabbing spears rather than as javelins. Confused by the unusual infantry attack, Pompey's cavalry turned and fled. The victorious legionnaires then began to outflank the left wing of Pompey's infantry; at the same time, Caesar's third division, which had been held in reserve, was ordered to attack. Pompey's legions broke, and he himself fled to Larissa. About 24,000 of Pompey's troops surrendered; the rest were dead or in flight. When Caesar, whose casualties were less than 250, surveyed the stricken field and Pompey's dead supporters he exclaimed, "They would have it so" ("Hoc voluerunt").

pharyngitis, inflammation and infection of the pharynx (throat), usually as a result of infections with bacteria or viruses. A streptococcal infection of the throat may be a complication arising from a common cold. Many viral infections closely mimic the symptoms of a streptococcal infection. The symptoms of pharyngitis caused by streptococci are generally redness and swelling of the throat, a pustulant fluid on the tonsils or discharged from the mouth, extreme soreness of the throat that is felt during swallowing, swelling of lymph nodes, and a slight fever; sometimes in children there are abdominal pain, nausea, headache, and irritability. Within approximately three days the fever leaves; the other symptoms may persist for another two to three days. Treatment is with antibiotics.

Viral pharyngitis infections also occur. They can produce raised whitish to yellow lesions in the pharynx that are surrounded by reddened tissue. They cause fever, headache, and sore throat that lasts for 4 to 14 days. Lymphatic tissue in the pharynx may also become involved.

A number of other infectious diseases may cause pharyngitis, including tuberculosis, syphilis, diphtheria, and meningitis.

pharynx (Greek: "throat"), a cone-shaped passageway leading from the oral and nasal cavities in the head to the esophagus and larynx. The pharynx chamber serves both respiratory and digestive functions. Thick fibres of muscle and connective tissue attach the pharynx to the base of the skull and surrounding structures. Both circular and longitudinal muscles occur in the walls of this organ; the circular muscles form constrictions that help push food to the esophagus and prevent air



Pharynx
Drawing by Charles Joslin

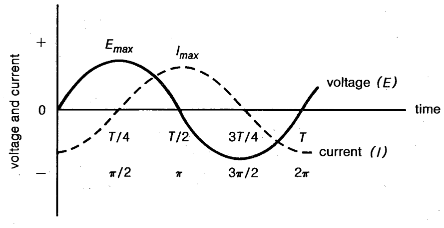
from being swallowed, while the longitudinal fibres lift the walls of the pharynx during swallowing.

The pharynx consists of three main divisions. The anterior portion is the nasal pharynx, the back section of the nasal cavity. The nasal pharynx connects to the second region, the oral pharynx, by means of a passage called an isthmus. The oral pharynx begins at the back of the mouth cavity and continues down the throat to the epiglottis, a flap of tissue that covers the air passage to the lungs and that channels food to the esophagus. Triangular-shaped recesses in the walls of this region house the palatine tonsils (*see* tonsils), two masses of lymphatic tissue prone to infection. The isthmus connecting the oral and nasal regions is extremely beneficial in humans. It allows them to breathe through either the nose or the mouth and, when medically necessary, allows food to be passed to the esophagus by nasal tubes. The third region is the laryngeal pharynx, which begins at the epiglottis and leads down to the esophagus. Its function is to regulate the passage of air to the lungs and food to the esophagus.

Two small tubes (eustachian tubes) connect the middle ears to the pharynx and allow air pressure on the eardrum to be equalized. Head colds sometimes inflame these tubes, causing earaches and hearing difficulties. Other medical afflictions associated with the pharynx include tonsillitis, cancer, and various types of throat paralyses caused by polio, diphtheria, rabies, or nervous-system injuries. *See also* swallowing.

phase, in astronomy, any of the varying appearances of a celestial body as different amounts of its disk are seen (from the Earth, ordinarily) to be illuminated by the Sun. The Moon displays four main phases: new, first quarter, full, and last quarter. Earth, as seen from the Moon, shows the same phases in opposite order; *e.g.,* Earth is full when the Moon is new. Planets more distant than the Earth from the Sun display only full or gibbous (more than half but not entirely full) phases to an observer on the Earth; *i.e.,* they are always seen with more than half of their apparent disks in sunlight. Mercury and Venus, closer to the Sun than Earth is, show full cycles of phases like the Moon's.

phase, in mechanics, the fraction of a period (*i.e.,* the time required to complete a full cycle) that a point completes after last passing through the reference, or zero, position. For example, the reference position for the hands



Phase

of a clock is at the numeral 12, and the minute hand has a period of one hour. At a quarter past the hour the minute hand has a phase of one-quarter period, having passed through a phase angle of 90°, or $\pi/2$ radians. In this example the motion of the minute hand is a uniform circular motion, but the concept of phase also applies to simple harmonic motion such as that experienced by waves and vibrating bodies.

If the position y of a point or particle changes according to a simple harmonic law, then it will change in time t according to the product of the amplitude, or maximum displacement, r, of the particle and a sine or cosine function composed of its angular speed, symbolized by the Greek letter omega (ω), the time t, and what is called the epoch angle, symbolized by the Greek letter epsilon (ε): $y = r \sin(\omega t + \varepsilon)$. The angle $(\omega t + \varepsilon)$ is called the phase angle at time t, which at zero time is equal to ε. Phase itself is a fractional value—the ratio of elapsed time t to the period T, or t/T—and is equal to the ratio of the phase angle to the angle of the complete cycle, 360°, or 2π radians. Thus, phase for uniform circular or harmonic motion has the value $(\omega t + \varepsilon)/2\pi$. Applying this expression to the example of the moving minute hand cited above, ε is zero (zero phase angle at zero time), angular speed is 2π radians per hour, and time t is ¼ hour, giving a phase of ¼.

When comparing the phases of two or more periodic motions, such as waves, the motions are said to be in phase when corresponding points reach maximum or minimum displacements simultaneously. If the crests of two waves pass the same point or line at the same time, then they are in phase for that position; however, if the crest of one and the trough of the other pass at the same time, the phase angles differ by 180°, or π radians, and the waves are said to be of opposite phase. Two periodic motions represented by the equations $y_1 = r_1 \sin(\omega_1 t + \varepsilon_1)$ and $y_2 = r_2 \sin(\omega_2 t + \varepsilon_2)$ have a phase-angle difference $(\omega_2 t + \varepsilon_2) - (\omega_1 t + \varepsilon_1)$, or $(\omega_2 - \omega_1)t + (\varepsilon_2 - \varepsilon_1)$. At zero time, or if the angular speeds ω_1 and ω_2 are identical, the phase-angle difference is $(\varepsilon_2 - \varepsilon_1)$ and the phase difference is $(\varepsilon_2 - \varepsilon_1)/2\pi$.

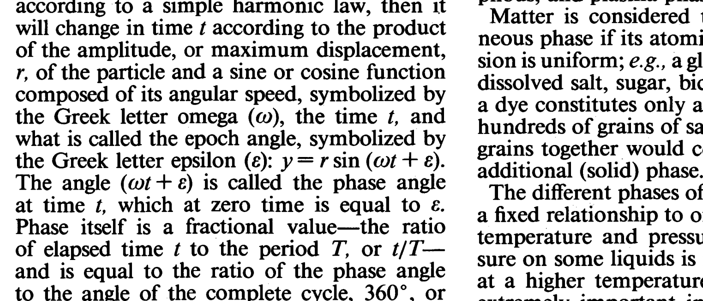
The measurement of phase difference is of central importance in alternating-current technology. In the diagram, two waves represent the voltage (E) and the current (I) in an alternating-current (ac) circuit with pure inductance. The difference in phase angle $(\varepsilon_E - \varepsilon_I)$ is 90°, and the phase difference is 90°/360° = ¼; the current is said to lag one-quarter cycle in phase. This lag may also be seen from the diagram: the voltage has already completed one-quarter cycle by the time the current has reached zero. In ac power transmission, the terms multiphase and polyphase are applied to currents that are out of phase with one another. In a two-phase system, there are two currents with a phase difference of 90°; in a three-phase system, the currents differ in phase by 120°.

phase, in thermodynamics, chemically and physically uniform or homogeneous quantity of matter that can be separated mechanically from a nonhomogeneous mixture and that may consist of a single substance or of a mixture of substances. The three fundamental phases of matter are solid, liquid, and gas (vapour), but others are considered to exist, including crystalline, colloidal, glassy, amorphous, and plasma phases.

Matter is considered to form one homogeneous phase if its atomic or molecular dispersion is uniform; *e.g.,* a glass of water containing dissolved salt, sugar, bicarbonate of soda, and a dye constitutes only a single liquid phase. If hundreds of grains of sand were added, all the grains together would constitute only a single additional (solid) phase.

The different phases of a pure substance bear a fixed relationship to one another in terms of temperature and pressure. Thus, if the pressure on some liquids is raised, they will freeze at a higher temperature. This relationship is extremely important in industrial as well as scientific work (*see* phase diagram).

phase diagram, graph showing the limiting conditions for solid, liquid, and gaseous phases of a single substance or of a mixture of substances while undergoing changes in pressure and temperature or in some other combination of variables, such as solubility and temperature. The Figure shows a typical phase diagram for a one-component system (*i.e.,* one consisting of a single pure substance), the curves having been obtained from measurements made at various pressures and temperatures. At any point in the areas separated by the curves, the pressure and temperature allow only one phase (solid, liquid, or gas) to exist,



Phase equilibria for the solid, liquid, and vapour states of a substance and changes in temperature and pressure, up to the points on the curves, will not alter this phase. At any point on the curves, the temperature and pressure allow two phases to exist in equilibrium: solid–liquid, solid–vapour, or liquid–vapour. For example, the line drawn for the variation with temperature of vapour pressure for the liquid is the boundary between liquid and vapour; only vapour can exist on the low-pressure, high-temperature side of the line, while the substance must be liquid on the high-pressure, low-temperature side; liquid and vapour exist together at temperatures and pressures corresponding to points on the line; at the place where this line vanishes, called the critical point, the liquid and its vapour become indistinguishable. Along the line between liquid and solid, the melting temperatures for different pressures can be found. The junction of the three curves, called the triple point, represents the unique conditions under which all three phases exist in equilibrium together. A phase diagram for two components usually shows melting curves on a temperature–composition diagram.

Phase diagrams are specific for each substance and mixture. Complex mixtures may require three-dimensional phase diagrams, which can be represented in two dimensions through use of perspective. Phase diagrams are widely used in studies of mineral equilibria in connection with the conditions of formation of rocks and minerals within the Earth. They also are invaluable when designing industrial equipment and seeking optimum conditions for manufacturing processes, and in determining the purity of substances.

phase rule, law relating variables of a system in thermodynamic equilibrium, deduced by the U.S. physicist J. Willard Gibbs in his papers on thermodynamics (1875–78). Systems in thermodynamic equilibrium are generally considered to be isolated from their environment in some kind of closed container, but many geological systems can be considered to obey the phase rule. The variables are: the number of phases P (forms of matter; *i.e.,* solid, liquid, and gas not necessarily of a single chemical component), the number of chemical components C (pure compounds or elements), and the number of degrees of freedom F of intensive variables, such as temperature, pressure, and percentage composition. The phase rule states that $F = C - P + 2$. Thus, for a one-component system with one phase, the number of degrees of freedom is two, and any temperature and pressure, within limits, can be attained. With one component and two phases—liquid and vapour, for example—only one degree of freedom exists, and there is one pressure for each temperature. For one component and three phases (*e.g.,* ice floating in water with water vapour above it, in a closed container), there is no degree of freedom, and temperature and pressure are both fixed at what is called the triple point (*see* phase diagram).

In multicomponent systems the number of components to be counted may be less than the total number if some are in chemical equilibrium with one another. For example, a monomer (simple molecule) in equilibrium with its dimer (two molecules chemically bonded) would count as a single component.

Phasi, Isaac ben Jacob al-: *see* Alfasi, Isaac ben Jacob.

Phasianidae, the pheasant family, a bird family (order Galliformes) that includes among its members the jungle fowl, partridge, peacock, pheasant, and quail (*qq.v.*).

Phat Song (Vietnamese philosopher): *see* Huynh Phu So.

Phatthalung, also spelled PHATALUNG, or PHETTALUNG, *changwat* (province), in the Southern region of Thailand. Phatthalung town, the provincial capital, lies on the Bangkok–Singapore rail line. The province, with an area of 1,322 sq mi (3,425 sq km), occupies a fertile plain planted largely in rice and coconuts. Fishing is a major activity on Thale (lake or lagoon) Luang. Pop. (1980) town, 19,611; (1982 est.) province, 418,405.

Phaulkon, Constantine (b. 1647, Cephalonia, Greece—d. June 5, 1688, Ayutthaya, Siam), Greek adventurer who became one of the most audacious and prominent figures in the history of 17th-century European relations with Southeast Asia.

Phaulkon signed on an English merchant ship in Greece at 12 years of age and sailed to Siam. He learned Siamese quickly, and this ability—combined with his knowledge of Portuguese, Malay, French, and English—rendered him invaluable as an interpreter, in which capacity he served with the English East India Company in the years 1670–78. He cultivated a friendship with King Narai and offered his services to the Siamese court. He rose quickly to become acting minister of finance and foreign affairs (*phrakhlang*), and by 1685, as virtual prime minister, he took the leading role in shaping Narai's foreign policy.

In collaboration with French Roman Catholic missionaries, Phaulkon schemed to establish French power in Siam. He encouraged diplomatic exchanges between Narai and King Louis XIV. His ambitions and his rapid rise to power were viewed with suspicion by Siamese court officials, and they became alarmed when a major French expedition in 1687 was allowed to occupy the city of Bangkok. In 1688 King Narai became seriously ill and was unable to protect Phaulkon. With France threatening to seize the country, a court faction led by Phetracha, Narai's foster brother, obtained Phaulkon's arrest and execution. This episode demonstrated to the Siamese the dangers of close alliance with a single European power, and Siamese foreign policy thereafter was much more cautious. Indeed, the architects of Siamese foreign policy in the 19th century carefully studied the Phaulkon affair.

Phaulkon–Tachard conspiracy (1685–88), in Siamese history, an unsuccessful attempt to establish French control over Thailand (Siam), an attempt in which Constantine Phaulkon, a high-level royal adviser to Thailand's King Narai, cooperated with Gui Tachard, a French Jesuit missionary.

A Greek by birth, Phaulkon had worked with the British East India Company in Java, and then entered the service of the Siamese king, rising to the position of virtual prime minister. Tachard, who arrived at Ayutthaya, the Siamese capital, in 1685, hoped to convert the Thais to Christianity and to extend French influence, and he enlisted Phaulkon's aid for these purposes.

After negotiations between the two men, a treaty was drafted in December 1685, granting France numerous trading privileges and allowing troops to be stationed in the town of Singora (Songkhla). The French king, Louis XIV, presented additional demands, however, and in 1687 sent an armed French expedition to Thailand to secure acceptance of his terms, which included French garrisons at the strategic cities of Bangkok and Mergui. Narai became suspicious of French designs, and to placate him Phaulkon engaged the French garrison troops as mercenaries in the service of Thailand. The final treaty was then ratified by Narai, who hoped that closer relations with France would help to balance the strong Dutch economic influence in Ayutthaya.

In March 1688 King Narai became seriously ill. Phaulkon, isolated without the King's support, was overthrown and executed by an anti-French faction at the Siamese court led by Narai's foster brother Phetracha (Bedraja); the French garrisons were expelled from the country.

The effect of the Phaulkon–Tachard conspiracy was to reverse a policy of openness to foreigners encouraged by previous Siamese kings. When Phetracha succeeded Narai, he took steps to discourage European settlers and to limit foreign influence in Siam.

Phayao, also spelled PAYAO, town and *changwat* (province) in the Northern region of Thailand. The provincial capital, Phayao town, lies on a scenic mountain lake that empties into the Nam Mae (river) Ing, a Mekong tributary. The town was the capital of a principality in the 13th and 14th centuries. It is on the main road between Lampang and Chiang Rai. The province, with an area of 2,446 sq mi (6,335 sq km), was created in 1977 from several southern districts of Chiang Rai province, in extreme northern Thailand on the Laotian border. Phayao province is a mountainous region on the watershed between the Mekong and Chao Phraya river systems. Pop. (1980) town, 21,853; province, 418,228.

Phayre, Sir Arthur Purves (b. May 7, 1812, Shrewsbury, Shropshire, Eng.—d. Dec. 14, 1885, Bray, County Wicklow, Ire.), British commissioner in Burma, who made a novel attempt to spread European education through traditional Burmese institutions.

Educated at the Shrewsbury School in England, Phayre joined the army in India in 1828. He was an army officer in Moulmein in the province of Tenasserim, Burma; in 1846 he was appointed assistant to the commissioner of the province. In 1849 he was made commissioner of Arakan, where he learned to speak fluent Burmese.

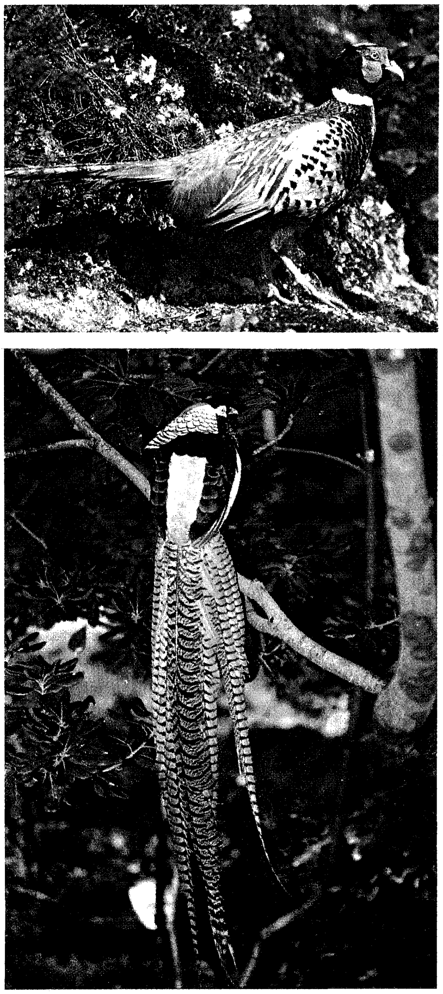
After the Second Anglo-Burmese War (1852), Phayre became commissioner of Pegu and played a major role in the relations between the government of India and the new king Mindon. He served as interpreter for the Burmese mission to Calcutta in 1854 and the following year headed a return mission to the Burmese capital, Amarapura. Although no treaty was signed, Phayre and the Burmese king came to an understanding that prevented the outbreak of further war. In 1862, when Phayre was made commissioner for the entire province of British Burma (including Arakan, Tenasserim, and Pegu), he concluded a commercial treaty with Mindon to facilitate trade between Lower and Upper Burma and to establish a British representative at the capital. Five years later Phayre left Burma; after serving for a few years (1874–78) as governor of Mauritius, he retired to Bray and was knighted (1878).

Phayre was a renowned scholar of Burmese culture and history; he wrote the first standard *History of Burma* (1883). His effort to introduce modern education into Burma using Buddhist monastic schools as a foundation was ultimately unsuccessful.

Phazania (Africa): *see* Fezzan.

pheasant, any bird of the family Phasianidae (order Galliformes) that is larger than a quail or partridge. Most pheasants—some 50 species in about 16 genera of the subfamily Phasianinae—are long-tailed birds of open woodlands and fields, where they feed in small flocks. All have hoarse calls and a variety of other notes. The males of most species are strikingly coloured. A male pheasant—pugnacious in breeding season—has one or more leg spurs and may have fleshy ornaments on the face. Courting males sometimes fight to the death in the presence of hens, who seem utterly indifferent to the commotion.

Centre of distribution of pheasants is China to Malaysia. Several species have been naturalized elsewhere, and many are prized as



(Top) common pheasant (*Phasianus colchicus*) and (bottom) Lady Amherst's ruffed pheasant (*Chrysolophus amherstiae*)

(Top) H. Reinhard—Bruce Coleman Inc., (bottom) K.W. Fink—Bruce Coleman Inc.

ornamentals in zoos and private collections. Some species have been brought to the verge of extinction by hunting.

The common pheasant (*Phasianus colchicus*) has 20–30 races ranging across Asia. Birds naturalized elsewhere are mixtures of races, with the gray-rumped ringneck (or Chinese) strain usually dominating.

The pheasant prefers grain fields near brushy cover. The male, about 90 centimetres (35 inches) long, with streaming, narrow, cross-barred tail, has a brown back and coppery breast, purplish-green neck, and two small ear tufts; his entire body is speckled and barred. He collects a harem of about three brownish, relatively short-tailed hens. The grassy nest contains about 10 eggs, which hatch in three to four weeks.

The green pheasant, or *kiji* (*P. versicolor*), of Japan, is mainly metallic green. It is sensitive to earth tremors unfelt by man and calls in concert when a quake impends.

The argus pheasants, of southeastern Asia, carry long feathers covered with "eyes." Two distinct types are known: the crested argus, or ocellated pheasants (*Rheinardia*), and the great argus (*Argusianus*). The great argus of Malaya, Sumatra, and Borneo (*A. argus*) can attain a length of 2 metres (6½ feet). During display the large "eyes" seem to revolve as the bird quivers.

Ornamental pheasants have been kept for centuries and are represented in collections throughout the world. Best known ornamentals in the west are two species of ruffed pheasants: Lady Amherst's (*Chrysolophus amherstiae*) and the golden pheasant (*C. pictus*).

Several pheasants are of exceptional coloration. Such are the monals, or Impeyan pheasants, of south central Asia. The male Himalayan Impeyan (*Lophophorus impejanus*) has metallic green head and throat, coppery nape and neck, green-gold mantle, purplish wings, white back, orangish tail, and black underparts; the hen is streaked brown. The Chinese monal (*L. lhuysii*), now found only in western China, is an endangered species.

The male tragopans, or horned pheasants (*Tragopan* species), of Asia also, are among the world's most colourful birds. They show a bright apron of flesh under the bill during courtship and short fleshy horns. The white-spotted plumage may be mainly red, yellow, or gray.

pheasant's-eye (*Adonis annua*), annual herbaceous plant of the buttercup family (Ranunculaceae) native to Eurasia and grown in garden borders and as cut flowers. It is 20 to 40 centimetres (8 to 16 inches) tall and is noted for its small, red flowers with prominent dark centres.

Pheidias: *see* Phidias.

Pheidon (fl. probably early 7th century BC), king of Argos, Argolis, who made his city an important power in the Peloponnese.

Herodotus implies that Pheidon flourished about 600 BC, but at this time Corinth and Sicyon, not the Argives, were in the ascendance. Although some later writers assigned Pheidon to the 8th century BC, most modern scholars place him in the early 7th century. He was said to have been the 10th successor to Temenus, the founder of Argos, and ruler of the whole Argolid peninsula in the northeast Peloponnese. Pheidon united this region (the "lot of Temenus"), marched across the Peloponnese, and seized Olympia (perhaps in 672 or 668).

The system of standard measures instituted by Pheidon remained in effect in the Peloponnese long after his death; it was also employed in Athens before the reforms of Solon (6th century BC). The statement of the 4th-century Greek historian Ephorus that Pheidon was the first to coin silver money cannot be correct, for the beginning of coinage in mainland Greece is now generally ascribed to the late 7th century. In general the King used his royal power more effectively than was usual in an age when the aristocracy was in control. The Argive recovery that he instigated did not last long against the alliance of Sparta and Elis, and the northeastern cities were soon independent under their own tyrants.

Phek, town, administrative headquarters of Phek district, Nāgāland state, northeastern India, 75 mi (121 km) east of Kohīma town. It was a subdivisional headquarters before the bifurcation of Kohīma district in 1973. It is a rural town whose inhabitants practice shifting cultivation. Weaving is the important cottage industry. Phek district (about 770 sq mi [2,000 sq km]) is in the southeastern part of the state and extends over most of the southern hilly region. It is bounded by Manipur state on the south, Burma on the east, Zonheboto and Tuensang districts on the north, and Kohīma district on the west. Phek district is hilly and rugged with north–south-aligned ranges defined by narrow valleys. The Naga Hills form the eastern frontier and are cut by the Tizu River, which drains eastward. The natural vegetation ranges from tropical evergreen to temperate evergreen. Agriculture is the principal occupation; oranges, grapes, and mangoes are grown. Cottage industries include weaving, dyeing, cane working and woodworking, blacksmithing, pottery making, and timber seasoning. The people belong to different ethnic groups of Mongolian descent; they are referred to as Kirāts in the Hindu epic the *Mahābhārata*. They live in villages on the crests of hills and along roads traversing the valleys. Pop. (1981) town, 13,609; district, 70,618.

phellem (botany): *see* cork.

Phelps, William Lyon (b. Jan. 2, 1865, New Haven, Conn., U.S.—d. Aug. 21, 1943, New Haven), U.S. scholar and critic who did much to popularize the teaching of contemporary literature.

Phelps attended Yale (B.A. 1887, Ph.D. 1891) and Harvard (M.A. 1891), taught at Harvard for a year, and then returned to Yale, where he was for 41 years a member of the English department and Lampson professor from 1901 until his retirement in 1933. For years his students voted him Yale's most inspiring professor. In 1895 he taught the first U.S. college course in the modern novel. Both in this course and in his *Essays on Russian Novelists* (1911), Phelps was influential in introducing Russian novelists to U.S. readers. He was a popular lecturer and critic, and his literary essays in *Scribner's Magazine* and other periodicals and his syndicated newspaper column, "A Daily Thought," brought him an audience estimated in the millions. His *Autobiography with Letters* was published in 1939.

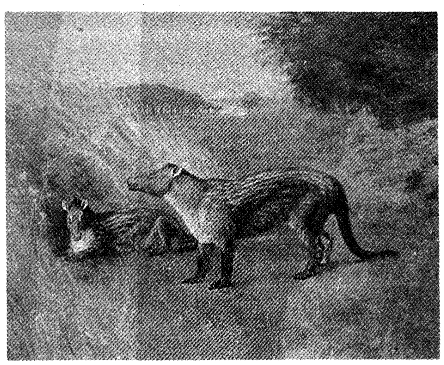
Phenacodus, extinct genus of primitive mammals known from fossils in early Eocene deposits (the Eocene Epoch began 54,000,000 years ago and lasted 16,000,000 years).

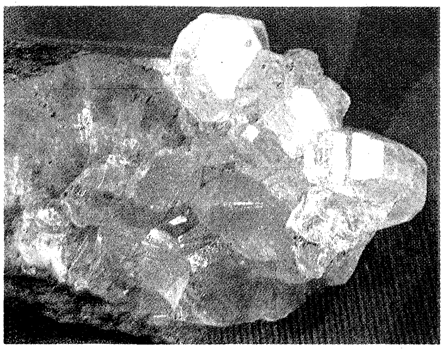


Phenacodus, restoration painting by Charles R. Knight, 1898

By courtesy of the American Museum of Natural History, New York

Though too late in time to have been the ancestral form from which the hoofed mammals evolved, *Phenacodus* represents a late-surviving form that retained many of the primitive traits that a common ancestor must have possessed. In structure and dentition, *Phenacodus* appears to be intermediate between the early carnivores and the early herbivores. Though the canine teeth are large and well developed, the cheek teeth were at least partly adapted to a plant diet.

phenakite, rare mineral, beryllium silicate, $BeSiO_4$, used as a gemstone. Phenakite has long been known from the emerald and chrysoberyl mine on the Takovaya River,



Phenakite on feldspar from Minas Gerais state, Brazil

near Sverdlovsk, in the Urals, U.S.S.R., where large crystals occur in mica schist. It also occurs in the granite of the Ilmen Mountains in the Urals and of the Pikes Peak region in Colorado. Other notable localities include Kragerø, Nor., and San Miguel de Piricicaba, Braz. For detailed physical properties, *see* silicate mineral (table).

For gem purposes the stone is brilliant cut; *i.e.,* with numerous facets. It is often colourless and glassy but may be wine yellow, pale rose, or brown. Its indices of refraction are higher than those of quartz, beryl, or topaz; it is consequently rather brilliant and may sometimes be mistaken for diamond. Nevertheless, it is not in general use, and fine examples are seldom seen outside private or museum collections.

phenazocine, synthetic narcotic drug and the first analgesic of a new structural type introduced in the 1960s. Phenazocine belongs to the benzomorphan series, a group of organic compounds with similarities to both morphine and the narcotic antagonists. Investigated during a search for a potent, nonaddicting analgesic, phenazocine is about four times as potent as morphine, and addiction appears to develop more slowly than does addiction to morphine.

Phenazocine, administered by intramuscular injection in the form of the hydrobromide salt, is available in solution and sometimes marketed under the trade name Prinadol.

phenbenzamine, also called DIMETHYLAMINOETHYLBENZANILIDE, the first specific antihistaminic drug to be used therapeutically to counteract the histamine reaction, as it occurs in allergies. Antergan was the trade name for the drug. Introduced in France in 1942, phenbenzamine has been replaced by newer, more effective, and less toxic drugs.

phencyclidine (drug): *see* PCP.

phenelzine, synthetic drug of the monoamine-oxidase inhibitor type, used to treat mental depression. Like other monoamine-oxidase inhibitor drugs, phenelzine prevents the enzymatic breakdown of norepinephrine, the brain-neurotransmitter substance concerned with emotional stimulation. Phenelzine is administered orally. The onset of action is delayed, the effects of the drug developing slowly over the first two weeks of therapy. As with other monoamine-oxidase inhibitor drugs, liver damage is a possible side effect.

Phenix City, city, Lee and Russell counties, seat (1935) of Russell County, eastern Alabama, U.S., and a port on the Chattahoochee River, opposite Columbus, Ga. Incorporated in 1883 as Brownville, it was renamed in 1889 for the old Phoenix Mills in Columbus. In 1923 it annexed Girard (settled 1820, inc. 1890). Manufactures include paperboard, bricks, and textiles. The last Civil War battle east of the Mississippi was fought there (April 16, 1865). Nearby in Georgia is Ft. Benning (a military reservation), and the remains of Ft. Mitchell (erected in 1813 during the Creek War) are south of Phenix City. In the early 1950s Phenix City had the reputation of being a "sin city." After the assassination of anti-vice crusader Albert L. Patterson (a nominee for district attorney) in 1954, there was a successful movement to clean up the community led by his son, John, who became the governor of Alabama (1959–63). Pop. (1980) 26,928.

phenobarbital, barbiturate drug that became available in 1912, used in medicine as a sedative, hypnotic, and anticonvulsant. *See* barbiturate.

phenol, any of a family of organic compounds characterized by a hydroxyl (OH) group attached to a carbon atom, which forms part of the benzene ring or any ring of carbon atoms that comprise what is called the aromatic series. Besides serving as the generic name for the entire family, the term phenol is also the specific name for its simplest member, monohydroxybenzene (C_6H_5OH), commonly known as carbolic acid.

A brief treatment of phenols follows. For full treatment, *see* MACROPAEDIA: Chemical Compounds.

Phenols are similar to alcohols but form stronger bonds with hydrogen. Thus, they are more soluble in water than are alcohols and have higher boiling points. Most phenols are acidic.

Phenols occur either as colourless liquids or white solids at room temperature. Many phenols have a sharp, spicy odour, but monohydroxybenzene smells bland and sweetish. It is, however, highly toxic and caustic.

So-called natural monohydroxybenzene can be made from wood tar or from the destructive distillation of coal. It can also be obtained from petroleum and from the organic matter of plants. Other phenols of truly natural origin are found in essential oils, which are derived from seeds or leaves of plants. Coal tar has been a prime source of synthetic phenols, but today most varieties are produced by methods using benzene as a starting material.

Because of their acidity, phenols react with strong bases to form alkali-metal salts known as phenoxides, phenolates, or phenates. The most important reaction of monohydroxybenzene is its condensation (which produces water as a side effect) with formaldehyde. This forms synthetic polymers, called phenol-formaldehyde (phenolic) resins, that are widely used in making plastics. In dilute solutions, monohydroxybenzene combats itching of the skin. Owing to its irritating effect, however, it has largely been discontinued as a medicinal antiseptic. Members of the phenol series with higher molecular weight, and derivatives of monohydroxybenzene, have supplanted it as an industrial antiseptic (*e.g.,* for germicidal cleaning) as well. Chlorophenols are used in various products, including fungicides, bacteriocides, and herbicides. Alkylphenols are used in synthetic detergents and to produce oxygen inhibitors.

phenol coefficient, number representing the disinfectant quality of an antiseptic or germicide in relation to that of phenol, which is used as a standard. The phenol coefficient of a chemical is found by adding microorganisms to several samples of various concentrations of the chemical and to samples of phenol for a known period of time. The action of the chemicals is stopped before samples are removed from each solution and added to a suitable liquid growth medium. The sample in which no visible microbial growth occurs is considered the end-point sample for the chemical. An end-point concentration is recorded for phenol as well. A ratio is then determined by comparing the concentrations of the two end-point samples.

phenol–formaldehyde resin (plastic): *see* Bakelite.

phenolphthalein, an organic compound of the phthalein family widely employed as an acid–base indicator and as a laxative.

The colourless form of phenolphthalein that exists in acidic solution is converted by alkali to an anionic form (with a negative charge) that also is colourless. Further alkali produces the bluish-red form, which is a doubly charged anion. In very strongly alkaline solutions, formation of the triply-charged anion disrupts the chromophoric (colour-producing) system; this anion is colourless.

Phenolphthalein, which is closely related to the triphenylmethane dyes, was discovered in 1871 by the German chemist Adolf von Baeyer, who prepared it by fusing phenol and phthalic anhydride in the presence of sulfuric acid or zinc chloride, the procedure still employed.

phenolsulfonphthalein test, also called PSP TEST, clinical procedure for the estimation of overall blood flow through the kidney. A specific dose of the PSP dye is injected intravenously, and its recovery in the urine is measured at successive time intervals. The recovery value at 15 minutes after injection (normally about 35 percent) is the most significant diagnostically, since even a damaged kidney may be able to remove the PSP dye from circulation after a longer time. PSP excretion is decreased in most chronic kidney diseases and may be increased in some liver disorders. *See also* kidney function test.

phenomenalism, a philosophical theory of perception and the external world. Its essential tenet is that propositions about material objects are reducible to propositions about actual and possible sensations, or sense data, or appearances. According to the phenomenalists, a material object is not a mysterious something "behind" the appearances that men experience in sensation. If it were, the material world would be unknowable; indeed, the term matter itself would be unintelligible unless it somehow could be defined by reference to sense experiences. In speaking about a material object, then, reference must be made to a very large group or system of many different possibilities of sensation. Whether actualized or not, these possibilities continue during a certain period of time. When the object is observed, some of these possibilities are actualized, though not all of them. So long as the material object is unobserved, none of them is actualized. In this way, the phenomenalist claims, an "empirical cash value" can be given to the concept of matter by analyzing it in terms of sensations.

Some philosophers have raised the objection against phenomenalism that, if these hypothetical propositions play such an important role in the phenomenalist analysis—analyzing all material-object expressions in terms of actual and possible sense experiences—it nonetheless remains difficult to avoid using material-object expressions in "if . . . then" clauses, which would render any analysis circular. A second and even more important objection is that it is very difficult to believe that categorical propositions about material objects (*e.g.,* "There is a fire in the next room") can be analyzed without remainder into sets of hypotheticals or "if . . . then" clauses; *i.e.,* that a statement about what there actually is can be reduced to a set of statements about what there would be if certain (nonexistent) conditions were to be fulfilled.

phenomenology, a school of philosophy that arose at the turn of the 20th century with the work of Edmund Husserl. Its primary objective has been to take a fresh approach to concretely experienced phenomena through the direct investigation of the data of consciousness—without theories about their causal explanation and as free as possible from unexamined presuppositions—and to attempt to describe them as faithfully as possible. By carefully exploring examples, one can thus fathom the essential structures and relationships of phenomena.

A brief treatment of phenomenology follows. For full treatment, *see* MACROPAEDIA: Philosophical Schools and Doctrines, Western.

Phenomenology developed gradually through many reformulations by Husserl, but its central features may be enumerated as follows: The first step in the phenomenological method is the so-called phenomenological reduction, or epoche, by which is meant the description of mental acts in a way that is free of theories and presuppositions, either about those acts themselves or about the existence of objects in the world. In contrast to the psychologist, the phenomenologist disregards the causes, consequences, and physical accompaniments of mental acts. Objects, however, do not disappear altogether in such a process; for Husserl inherited from the German philosopher of psychology Franz Brentano the doctrine that every mental act is intentional, that it is "of" or "about" an object. The object need not actually exist; one can believe in dragons or see pink rats whether or not such things exist in the conventional sense. The object may also be an "irreal" one, such as a number. The description of mental acts thus involves a description of their objects, but only as phenomena and without assuming their existence.

The second step in phenomenological analysis is the eidetic reduction, through which by reflecting on a particular act (*e.g.,* seeing a tree) and by imaginatively varying certain of its features, the essence, or eidos, not merely of this particular act but of any comparable one (*e.g.,* of seeing as such) may be intuited. Any object of vision must, for example, have colour, extension, and shape. Eidetic reduction may be used in examining not only sensory perception and its objects but also mathematical objects, as well as values, moods, and desires.

Finally, the phenomenological view takes into account the process by which objects are constituted or built up in the cognition of them. Seeing a tree entails a diversity of visual experiences as the tree is seen at different times, from different angles, and at different distances, yet what is seen continues to be apprehended as a single persistent object.

In his earlier writings, Husserl did not seriously doubt that objects exist independently of mental acts. The reduction is simply a device for focusing on them as phenomena. Later, however, he introduced the problematic notion of a transcendental phenomenological reduction, by which is discovered the transcendental ego, which is distinct from the phenomenal ego of ordinary awareness. At this stage Husserl moves away from his earlier realism toward a form of Kantian idealism, in which objects are regarded as not merely accessible to the ego but rather that their perceived nature is constituted by and dependent upon it. Husserl continually grappled with the problems thus presented for the common belief—itself a phenomenon—that objects exist independently of one's consciousness of them and that there are several distinct selves of equal status (intersubjectivity). In doing so, he came to regard the world as existing not for a single ego, but for a community of egos; in this light, the task of phenomenology is thus to reflect upon and describe this communal experience and its essential structures. Husserl's early concern with scientific knowledge gives way to the idea of the *Lebenswelt* ("life-world"), the world of lived experience, from which the world of science is seen ultimately to derive.

While the interpretation and value of Husserl's doctrines are controversial, his influence has been extensive and diverse, particularly, but not exclusively, in continental Europe. He has influenced not only philosophers but also psychologists and sociologists. His existentialist followers—notably Martin Heidegger, Jean-Paul Sartre, and Maurice Merleau-Ponty—have called themselves phenomenologists, while discarding such Husserlian features of phenomenology as the view of philosophy as a rigorous science, the concern with epistemology, the epoche, and the transcendental ego. They are in general less concerned with cognition than with action, though Husserl's seminal notion of the *Lebenswelt* brings him closer to them.

phenomenon, in philosophy, any object, fact, or occurrence perceived or observed. In general, phenomena are the objects of the senses (*e.g.,* sights and sounds) as contrasted with what is apprehended by the intellect. The Greek verb *phainesthai* ("to seem," or "to appear") does not indicate whether the thing perceived is other than what it appears to be. Thus in Aristotle's ethics "the apparent good" is what seems good to a man, whether or not it really is good. Later Greek philosophers distinguished observed facts (phenomena) from theories devised to explain them. This usage, widely adopted in the 17th century by scientists who sought to explain phenomena of natural science (*e.g.,* magnetism), is still current.

In modern philosophy the word is sometimes used for what is immediately apprehended by the senses before any judgment is made; it has, however, never become a technical term, many philosophers preferring sense-datum or some such expression—though they commonly accept the cognate forms phenomenalism and phenomenology. In English translations of Immanuel Kant, "phenomenon" is often used to translate *Erscheinung* ("appearance"), Kant's term for the immediate object of sensory intuition, the bare datum that becomes an object only when interpreted through the categories of substance and cause. Kant contrasted it to the noumenon, or thing-in-itself, to which the categories do not apply.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

phenothiazine, widely used anthelmintic (worming agent) in veterinary medicine. Phenothiazine is an organic compound effective against a broad range of parasites in cattle, horses, poultry, sheep, and swine. A highly toxic drug, it is not recommended for human use and is not effective in dogs or cats. Many antianxiety drugs, including chlorpromazine and trifluoperazine, are derivatives of phenothiazine.

phenotype, all the observable characteristics of an organism, such as shape, size, colour, and behaviour, that result from the interaction of its genotype (total genetic inheritance) with the environment. The common type of a group of physically similar organisms is sometimes also known as the phenotype. Environmental conditions may favour the expression of certain potentials common to all the individuals. The phenotype may change constantly throughout the life of an individual because of environmental changes and the physiological and morphological changes associated with aging.

Different biological and physical backgrounds influence development of inherited traits (as size, for example, is affected by available food supply) and alter expression by similar genotypes (for example, twins maturing in dissimilar families). All inherited possibilities in the genotype are not expressed in the phenotype, because some are the result of latent, recessive, or inhibited genes. *See also* genotype.

phenylalanine, an amino acid present in the mixture obtained upon hydrolysis of common proteins. Human hemoglobin (the oxygen-carrying pigment of red blood cells) is one of the richest sources of phenylalanine, yielding 9.6 percent by weight. First isolated in 1881 from lupine seedlings, phenylalanine is one of several essential amino acids for fowls and mammals; *i.e.,* they cannot synthesize it and require dietary sources. Microorganisms synthesize it from glucose and pyruvic acid (products of the breakdown of carbohydrates).

phenylketonuria (PKU), also called PHENYLPYRUVIC OLIGOPHRENIA, hereditary inability of the body to normally metabolize the amino acid phenylalanine. Phenylalanine is normally converted in the human body to tyrosine, another amino acid, by a specific organic catalyst, or enzyme, called phenylalanine hydroxylase. This enzyme is not active in individuals who have phenylketonuria. As a result of this metabolic block, a high level of phenylalanine is observed in blood plasma, cerebrospinal fluid, and urine. Abnormal products of phenylalanine breakdown can also be detected in the urine. In the tissues, the excess amino acid and its abnormal metabolites interfere with various metabolic processes. The central nervous system, notably, is affected; impairment of some facet of nerve cell function manifests itself by mental retardation, epileptic seizures, and abnormal brain wave patterns, but the mechanism of injury is not known. The first behavioral signs of nerve cell damage are usually evident in an affected child from four to six months old. The retention of phenylalanine in body tissues also inhibits the course of tyrosine metabolism and leads specifically to a decrease in the formation of a product of tyrosine—melanin, the pigment found in the skin, hair, and eye. This may explain why persons with phenylketonuria generally have blond hair, blue eyes, and a fair skin.

Phenylketonuria is transmitted by an autosomal recessive gene. Statistically, two unaffected carriers of the trait can expect a 25 percent chance of having a child who is phenylketonuric, a 50 percent chance of having a child who is unaffected but is a carrier, and a 25 percent chance of having a completely normal child. Reliable tests are available to detect carriers of phenylketonuria, as well as infants who have the disorder. Approximately one in 10,000 newborn infants will show abnormally high plasma phenylalanine levels; out of these, about two-thirds will have the classic form of phenylketonuria, which, if untreated, will cause severe mental retardation. In the treatment of phenylketonuria, a lifelong diet low in phenylalanine is effective in controlling the body level of this amino acid.

phenylpyruvic oligophrenia (metabolic disorder): *see* phenylketonuria.

phenylthiocarbamide tasting, also called PTC TASTING, a genetically controlled ability to taste phenylthiocarbamide (PTC) and a number of related substances, all of which have some antithyroid activity. PTC-tasting ability is a simple genetic trait governed by a pair of alleles, dominant *T* for tasting and recessive *t* for nontasting. Persons with genotypes *TT* and *Tt* are tasters, and persons with genotype *tt* are nontasters; there appears to be hormonal mediation of the tasting ability, however, since women are more often taste sensitive in this regard than are men. It has been suggested that PTC tasting may be related to the genetically determined level of dithiotyrosine in the saliva.

PTC-tasting ability is not particularly useful, it would seem, since PTC does not occur in food, but some substances related to PTC do occur in food items. As for the utility of being able to taste PTC, it appears that nontasters of PTC may have a higher than average rate of goitre, a disease of the thyroid gland sometimes associated with lack of iodine; since PTC and related compounds contain iodine, there may be a selective advantage of some kind for tasters or nontasters in different environments. It has also been suggested that tasters may have more food aversions than nontasters, a disadvantage in situations of food scarcity.

The chief reason for interest in tasting ability, however, is that the frequency of tasters varies from population to population and from race to race. Difference in PTC-taster frequency is of use to the physical anthropologist in the determination of relationships between population groupings.

pheochromocytoma, also called CHROMAFFINOMA, tumour, most often nonmalignant, that causes abnormally high blood pressure because of hypersecretion of the hormones epinephrine and norepinephrine. Usually the tumour is in the medullary cells of the adrenal gland but may occur elsewhere; *e.g.,* in the chromaffin tissues of the ganglions of the nervous system.

The hypertension may be persistent or paroxysmal (periodic). Patients with persistent hypertension usually are afflicted with a constant headache, are thin and nervous, and have high blood sugar and an elevated basal metabolic rate. In paroxysmal attacks of hypertension, which last from one-half to three-quarters of an hour, the headache is much more intense and is accompanied by sweating, pallor, and tremor. Surgical removal of the tumour is the most effective treatment of the disorder. Pheochromocytoma is an uncommon cause of hypertension, perhaps causing only one out of every 1,000 cases of that disorder.

Pherecydes OF SYROS (fl. *c.* 550 BC), Greek mythographer and cosmogonist traditionally associated with the Seven Wise Men of Greece (especially Thales).

Pherecydes is credited with originating metempsychosis, a doctrine that holds the human soul to be immortal, passing into another body, either human or animal, after death. He is also known as the author of *Heptamychos,* a work, extant in fragments only, describing the origin of the world. Pherecydes was characterized by Aristotle as a theologian who mixed philosophy and myth. Tradition says that he was the teacher of Pythagoras. He is not to be confused with Pherecydes of Athens, a genealogist who lived about a century later.

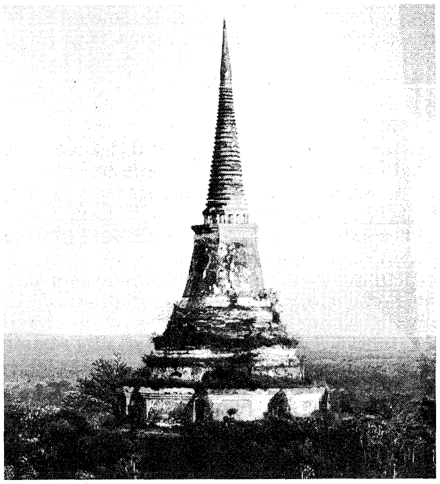
Pherenice (queens and princesses of Egypt): *see under* Berenice.

pheromone, any endogenous chemical secreted in minute amounts by an organism in order to elicit a particular reaction from another organism of the same species. Pheromones are widespread among insects and vertebrates but are unknown among birds. The chemicals may be secreted by special glands or incorporated in other substances, such as urine. They may be shed freely into the environment or deposited in carefully chosen locations. Pheromones are also used by some fungi, slime molds, and algae as attractants in reproduction; organisms of complementary reproductive cell types grow or move toward each other.

Pheromones are widely used to promote aggregation. Among social insects such as termites and ants, several different pheromones may transmit the various messages needed to coordinate the complex activities of a colony. Some ants lay scent pheromones along a trail leading to a food source so that other members of the colony can find the food. Pheromones are also used to signal the presence of danger. A wounded minnow has been shown to release a chemical from specialized epidermal cells that elicits a dispersal response from the school. Pheromones play a role in sexual attraction and copulatory behaviour, and they have been shown to influence the sexual development of many mammals as well as of insects such as termites and grasshoppers. Such pheromones tend to last relatively longer and extend farther distances than alarm pheromones. Aspects of vertebrate parent-young responses are often elicited by chemical stimuli. Entomologists use particular sex-attractant pheromones to lure and trap harmful insects.

Pheromones may be involved in human sexual response. In testing human vaginal secretions, scientists have identified fatty acids identical to several that are presumed to act as sex pheromones in other primates. The human female's sensitivity to musklike odours is greatest around the time of ovulation, which some researchers interpret as proof of the ancestral presence of a musky pheromone in the male.

Phetchaburi, also called PETCHABURI, or PHET BURI, town, south-central Thailand, located in the northern portion of the Malay Peninsula. It lies 65 miles (105 km) southwest of Bangkok. Phetchaburi is located near the mouth of the Phet Buri River and lies along the southern railway and highway. Before the sea route around the Malay Peninsula was developed, the town was on an overland trade route from Europe and India to continental Southeast Asia. Near the town are the ruins of old Brahmin and Buddhist temples and caves; Khao Luang cave is a Buddhist shrine. Both King Mongkut and his son, Chulalongkorn, built palaces in Phetchaburi. Haad Chao Samran, a popular beach, is nearby. Rice is grown on irrigated land in the surrounding area, and there are coconut, melon, and palm-sugar plantations. Pop. (1985 est.) town, 33,984.



Stupa, Phetchaburi, Thailand
Rene Burri—Magnum

Phetracha, also spelled BEDRAJA, or PETRACHA, also called P'RA P'ETRAJA (b. 1633?—d. 1703, Ayutthaya, Siam [now Thailand]), king of Siam (1688–1703) whose policies reduced European trade and influence in Siam and helped preserve its independence.

Phetracha was the foster brother of King Narai, whose patronage helped him rise to become head of the Elephant Department and a leading general in the kingdom. He led the coup that toppled the Greek adventurer Constantine Phaulkon from ministerial office and expelled a French expeditionary force from Siam in 1688. In that year he seized the throne himself and determined to drastically reduce foreign power and influence. To this end he persecuted Christians and harassed western traders, while encouraging Asian traders who were more easily controlled.

Phetracha's 15-year reign was frequently interrupted by revolts. Although he reorganized his country's civil and military administration, these achievements were overshadowed by the authoritarianism with which he ruled and by the intemperance, cruelty, and depravity that reportedly characterized his military ventures. His equally tyrannical son, King Sua, "Tiger," succeeded him.

Phetsarath Ratanavongsa, Prince (b. Jan. 19, 1890, Luang Prabang, Laos—d. 1959, Vientiane), Lao nationalist and political leader, who is regarded as the founder of Lao independence.

Phetsarath was the eldest son of Viceroy Boun Khong of the Kingdom of Luang Prabang and the elder brother to Souvanna Phouma and Souphanouvong. He studied in Saigon and in France, and on his return to Laos in 1913 joined the civil service of Luang Prabang under the French Protectorate. By 1919 he had become head of the indigenous branch of the civil service, and for the next two decades he worked to unify Laos by creating a bureaucracy that would transcend the principalities and provinces into which it had been divided by the French.

Following the Franco-Thai Indochina War of 1940–41, the French ceded additional provinces (including Vientiane) to the Luang Prabang kingdom and granted executive powers to a Lao cabinet in which Viceroy Phetsarath served as premier. When the Japanese surrendered at the end of World War II, Phetsarath sought to prevent the return of the French and proclaimed the unification of Laos as a single, independent kingdom. When King Sisavangvong dismissed him from office, he joined the opposition Lao Issara (Free Laos) government in Vientiane, and on the French reoccupation of Laos in 1946 he fled to Thailand. Phetsarath took the lead in forming the Free Laos government-in-exile and became its head in December 1946.

As the French began making concessions to Lao nationalism, Phetsarath's brothers withdrew their support from him and his government-in-exile. Souphanouvong joined with the Viet Minh to form the Communist Pathet Lao and continue armed opposition, and Souvanna Phouma decided to cooperate with the French and participate in French-sponsored Lao governments. Phetsarath refused to return to Laos until assured that efforts would be made to end civil war that had developed between rightist and leftist factions; but his hopes for such a reconciliation soon were dashed after his return to Laos in 1956. Phetsarath's autobiography, *Iron Man of Laos,* was published in 1978.

Phettalung (Thailand): *see* Phatthalung.

Phialia (ancient city): *see* Phigalia.

Phibunsongkhram, Luang, also called PIBUL SONGGRAM, original name PLAEK KHITTASANGKHA (b. July 14, 1897, near Bangkok—d. June 12, 1964, Tokyo), field marshal and premier of Thailand in 1938–44 and 1948–57 and associated with the rise of authoritarian military governments in Thailand.

He was educated at the royal military academy, and in 1914 he entered the Siamese artillery corps. In 1924–27 he took advanced military training in France, where he became involved with Thai students who were plotting the overthrow of the absolute monarchy. On returning to Bangkok, he served as a major on the army general staff, and in 1928 he received the title by which he was known thereafter, Luang Phibunsongkhram, which he later took as his family name.

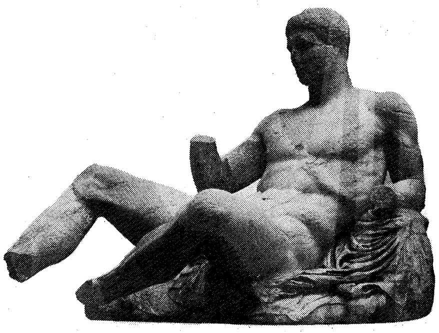
After helping organize the bloodless revolution of 1932 that forced King Prajadhipok to grant a constitution, Phibunsongkhram rose rapidly in the new, military-dominated government and came to public prominence by suppressing the 1933 rebellion of Prince Boworadet. In 1934 he became minister of defense and worked both to strengthen the army and to popularize military values in the fashion of contemporary Italy and Germany. On becoming premier in December 1938, he worked to mobilize the country (whose name he changed from Siam to Thailand in 1939), espousing ultranationalist and irredentist views. After the fall of France he provoked war with French Indochina (1940–41) to regain territories in Laos and Cambodia lost by treaty at the beginning of the century. Already pro-Japanese, when Japan invaded Thailand on Dec. 8, 1941, he quickly concluded an alliance with Japan and declared war on the United States and Great Britain on Jan. 25,

Phibunsongkhram, 1957
Popperfoto

1942. As field marshal during the war he promoted such modern habits as wearing shoes and hats and exhorted the Thai to follow their "Leader" in a highly authoritarian fashion. Though technically an ally of Japan, Thailand increasingly was treated as an occupied state. A strong, anti-Japanese Free Thai Movement developed, and, when the war began to turn against Japan, Phibunsongkhram's government collapsed (July 1944) and a civilian government took power, controlled from behind the scenes by Pridi Phanomyong.

Postwar civilian governments lacked sufficient public support to maintain public order and economic stability, and they were discredited by the suspicious death of King Ananda Mahidol in 1946. The army seized the government in 1947, and Phibunsongkhram returned as premier in 1948. Almost immediately he commenced efforts to contain the spread of communism in Thailand. He suppressed the economic development of Chinese immigrants in Thailand in an attempt to restrict those who were members of the Chinese Communist Party, and he cooperated with the British-Malay campaigns against communist guerrillas in Thailand-Malaya border areas. During the Korean War he supported UN action by dispatching an expeditionary force of 4,000 troops. In 1954 he further allied Thailand to the West in the Cold War by helping establish the Southeast Asia Treaty Organization (SEATO), with its headquarters in Bangkok. After a brief experiment with democracy in 1956–57, when political parties were allowed and free speech encouraged, he was ousted by military colleagues who had tired of the corruption and inefficiency of his government. He then fled to Tokyo, where he lived until his death.

Phidias, also spelled PHEIDIAS (fl. *c.* 490–430 BC), Athenian sculptor, the artistic director of the construction of the Parthenon, who created its most important religious images and supervised and probably designed its overall



"Heracles," marble statue produced in the workshop of Phidias, from the eastern pediment of the Parthenon, the Acropolis, Athens, *c.* 5th century BC; in the British Museum
By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

sculptural decoration. It is said of Phidias that he alone had seen the exact image of the gods and that he revealed it to man. He established forever general conceptions of Zeus and Athena.

Little is known about Phidias' life. When Pericles rose to power in 449, he initiated a great building program in Athens and placed Phidias in charge of all artistic undertakings. Among works for which Phidias is famous are three monuments to Athena on the Athenian Acropolis (the Athena Promachos, the Lemnian Athena, and the colossal Athena Parthenos for the Parthenon) and the colossal seated Zeus for the Temple of Zeus at Olympia; none of these survives in the original.

The first of Phidias' monuments to Athena, the bronze Athena Promachos, was one of his earliest works. It was placed on the Athenian Acropolis in about 456. According to the preserved inscription, it measured about 30 feet (9 m) high. At the time, it was the largest statue yet erected in Athens.

The so-called Lemnian Athena was dedicated as an offering by Athenian colonists who were sent to Lemnos between 451 and 448. A head of Athena in Bologna and two statues of Athena in Dresden are thought to be copies, in marble, of Phidias' original work in bronze.

The colossal statue of the Athena Parthenos, which Phidias made for the Parthenon, was completed and dedicated in 438. The original work was made of gold and ivory and stood some 38 feet (12 m) high. The goddess stood erect, wearing a tunic, aegis, and helmet and holding a Nike (goddess of victory) in her extended right hand and a spear in her left. A decorated shield and a serpent were by her side. Several copies have been identified from this description; among them are the Varakion, a Roman copy of about AD 130 (now in the National Archaeological Museum of Athens), and a Hellenistic copy, from about 160 BC, made for the main hall of the royal library at Pergamum (now in the Staatliche Museen Preussischer Kulturbesitz in Berlin).

The ancient writers considered Phidias' Zeus, completed about 430, for the Temple of Zeus at Olympia to be his masterpiece; this colossal statue is now considered to be one of the Seven Wonders of the Ancient World. Zeus was seated on a throne, holding a Nike in his right hand and a sceptre in his left. His flesh was of ivory, his drapery of gold. The throneback rose above his head. Everything surrounding the figure, including the statues and paintings (by Panaenos), was richly decorated. The Olympian Zeus was about seven times life size (or 42 feet [13 m]) and occupied the full height of the temple.

Phidias' last years remain a mystery. Pericles' enemies accused Phidias of stealing gold from the statue of the Athena Parthenos in 432, but he was able to disprove the charge. They then accused him of impiety (for including portraits of Pericles and himself on the shield of Athena on the Athena Parthenos), and he was thrown into prison. Until recently, it was thought that Phidias died in prison shortly thereafter; now it is believed that he was exiled to Elis, where he worked on the Olympian Zeus. A "workroom," thought to be Phidias', has been found in Olympia. It contains a number of terra-cotta molds believed to have been used for the drapery of the Olympian Zeus.

Phidias and his assistants were also responsible for the marble sculptures that adorned the Parthenon. Most of these remains (the Elgin Marbles) are now in the British Museum. Several of these sculptures have been attributed to Phidias, but none with certainty.

From these works one can gain some idea of Phidias' style. Even when movement is represented in some of his reliefs, a monumental quality is imparted. Though the construction of the human body is perfectly understood, its rendering is restrained and harmonized. In other words, Phidias may be called the initiator of the idealistic, classical style that distinguishes Greek art in the later 5th and the 4th centuries.

Philadelphia (Jordan): *see* Amman.

Philadelphia, city, seat (1833) of Neshoba county, east-central Mississippi, U.S., and headquarters of the Choctaw Indian Agency, 80 miles (130 km) east-northeast of Jackson. It was settled on an old Indian site, Aloon Looanshaw, following the Treaty of Dancing Rabbit Creek (1830) and named for Philadelphia, Pa. The Indian Agency was established in 1918, and the majority of the state's few thousand Choctaw (*q.v.*) live in the vicinity. A large Indian school is in the city. In 1964 the city received national attention when three civil-rights workers, murdered during a voter-registration drive, were found buried nearby. The city is an agricultural-trade centre (cattle, cotton, corn) with some light manufactures (textiles, electric motors, lumber products). The Choctaw Indian Fair is an annual summer event. Inc. 1904. Pop. (1986 est.) 7,010.

Philadelphia, city and port, coextensive with Philadelphia county, southeastern Pennsylvania, U.S. Situated at the confluence of the Delaware and Schuylkill rivers, it is the largest city in the state of Pennsylvania. From its founding in 1681 as a Quaker settlement, through its central roles in the American Revolution, the early federal government, and the Industrial Revolution, to the 20th century, Philadelphia has been an intellectual, economic, and humanitarian centre.

A brief treatment of Philadelphia follows. For full treatment, *see* MACROPAEDIA: Philadelphia.

Much of Philadelphia occupies the fertile Atlantic Coastal Plain, but in the city's western extremity the hills of the Piedmont plateau reach elevations of about 440 feet (134 m). Its continental climate is characterized by hot, humid summers and mild winters.

Philadelphia's harbour, one of the largest freshwater ports in the world, is the major element in the official agglomeration of Delaware River ports known as Ameriport, collectively one of the busiest shipping centres in the world. The area is a centre for research, and the development of new technologies and products has stimulated the growth of its industries. Apparel, food and food products, printing and publishing, and electrical machinery are leading manufacturing industries, and employment in nonmanufacturing and service industries is substantial. The city is also a major banking centre, and it has the oldest stock exchange (1790) in the United States, as well as three other exchange services.

The gridiron of streets in central Philadelphia, which is known as Center City, follows the original plan of the city's founder, William Penn. Penn Square, midway between the two rivers and occupied by City Hall, marks the centre, and four shady and fountained squares—Logan, Franklin, Washington, and Rittenhouse—dot the quadrants. Benjamin Franklin Parkway offers a splendid vista as it cuts northwestward from near Penn Square to the shaded and elegant Fairmount Park, the nation's largest landscaped municipal park. Southwark, Society Hill, and the Independence Hall area, located southeast and east of City Hall, are the city's oldest sections and contain some of its finest old houses, taverns, and churches. Independence National Historical Park houses Independence Hall, where the Declaration of Independence and the Constitution were signed and the historic Liberty Bell is displayed. Nearby, Carpenters' Hall was the site of the meeting of the First Continental Congress. Elfreth's Alley, just west of the Delaware River, is the oldest continuously inhabited street in the country. Throughout these areas and elsewhere, two- and three-story red-brick buildings fronting directly on the sidewalks and containing impressive examples of colonial design outside and inside are characteristic of the domestic architecture. The areas of Philadelphia north, south, and west of the city centre contain many distinctive ethnic or racial sections. The Germantown section in the northwest was settled by Germans in Penn's time; black and Puerto Rican communities are located in North Philadelphia; Italian and other European sections are located in South Philadelphia. In the late 20th century Asians (Chinese, Filipinos, Koreans, and Indians) settled in West and South Philadelphia.

Philadelphia has a vigorous cultural life, with its many prominent museums, galleries, orchestras, and theatres. The world-renowned Philadelphia Museum of Art, which houses priceless collections of art from the Western Middle Ages onward and from the Orient, heads a great diversity of museums. The Philadelphia Orchestra and the Walnut Street Theatre, the oldest playhouse in active use in the English-speaking world, are representative of the rich musical and theatrical traditions of the city. Philadelphia is a centre for medical education, and the University of Pennsylvania heads an array of universities and colleges.

Local transportation is provided by buses, subways, streetcars, and trolley cars, and both the Delaware and the Schuylkill are bridged at several points. Philadelphia is well served by roads, railways, and waterways, and there are two airports, one international, making it an important transportation centre of the Atlantic Seaboard. Area city, 136 square miles (352 square km); metropolitan area, 5,351 square miles (13,859 square km). Pop. (1988 est.) city, 1,657,285; Philadelphia-Wilmington-Trenton metropolitan area (CMSA), 5,963,300.

Philadelphia Centennial Exposition (1876), international trade fair, the first exposition of its kind in the United States, held in celebration of the 100th anniversary of the Declaration of Independence.

Ten years in the planning, the Centennial Exposition cost more than $11 million and covered more than 450 acres (180 hectares) of Philadelphia's Fairmount Park. President Ulysses S. Grant opened the exposition on May 10, 1876, and for the next six months more than 10,000,000 people viewed the works of 30,000 exhibitors.

Unquestionably the focal point of the exposition was Machinery Hall, where viewers marveled at the working models of steam engines and dynamos and celebrated the advent of the United States as an internationally important industrial power. Although some critics were offended by the ornate and grandiose symptoms of the "Gilded Age" and by the wild confusion of architectural styles found among the more than 200 buildings, the Centennial Exposition gave a decided boost to the American spirit and signaled the coming of age of a modern nation.

Philadelphia Inquirer, The, morning daily newspaper published in Philadelphia, long one of the most influential dailies in the eastern United States.

It was founded in 1847 as the *Pennsylvania Inquirer* but adopted "Philadelphia" into its name about 1860. When the American Civil War began, it voiced strong support for the North, and it was frequently delivered to Union troops in the field. The *Inquirer* was involved in circulation wars through the latter half of the 19th century and the early years of the 20th. It survived by giving its readers broad coverage of the news and by constantly modernizing its plant and equipment. In 1863 the *Inquirer* became one of the first daily newspapers to use a web-fed rotary press that could print on both sides of the paper at once.

There were several changes of ownership in the early 20th century, but the *Inquirer* largely retained its character as an aggressive paper. Moses L. Annenberg bought it in 1936 and managed within four years to boost its Sunday circulation to more than 1,000,000 copies. The paper stayed in his family's hands after his death in 1942. It was acquired in 1969 by John S. Knight, along with the afternoon tabloid *Philadelphia Daily News.* Both newspapers were included in the merger of the Knight and Ridder groups in 1974; each one, however, maintained editorial independence.

Philadelphia Zoological Gardens, first zoo in the United States, opened in Philadelphia in 1874 with an animal inventory of several hundred native and exotic specimens. It was begun and continues to be operated by the Zoological Society of Philadelphia, founded in 1859. After the American Civil War had ended in 1865, a 42-acre (17-hectare) site was selected in Fairmount Park, an architect was sent to study the London Zoo, and the collection was begun. The Philadelphia Zoo developed the first zoo laboratory (1901) and the first children's zoo (1938) in the United States. It was the first zoo to formulate specific diets for its animals (1930s), and one of these, monkey cake, is still used today by many zoos. Modern developments include an elaborate hummingbird exhibit (1970) and a reptile house (1972) with naturally planted displays. Also during the 1970s, three major outdoor exhibits were constructed: Wolf Wood, Bear Country, and the multispecies African Plains. The Philadelphia Zoo maintains excellent cat and waterfowl collections and is famous for the longevity records of its animals. It has about 2,000 specimens representing more than 500 species.

Philadelphus, genus of deciduous shrubs of the family Hydrangeaceae, including the popular garden forms commonly known as mock orange (from its characteristic orange-blossom fragrance) and sweet syringa. *Philadelphus,* comprising about 75 species, is native to northern Asia and Japan, the western United States, the southern Atlantic coast of the United States, and Mexico. These decorative and fragrant shrubs bloom in the late spring and grow unusually well in dry soils.

Various species of *Philadelphus* have opposite entire or toothed leaves, a solid, white pith, and often a flaky bark. The flowers are showy and usually white-petaled, with clumps of bright yellow stamens. Some species are not more than 1.2 m (4 feet) high, while others may attain a height of 4.6 m (15 feet).

The very fragrant common mock orange, *P. coronarius,* is a shrub up to 3 m (10 feet) high with clusters of creamy-white flowers; certain varieties, however, may possess golden flowers. *P. microphyllus,* a smaller shrub, has solitary 2.5-centimetre- (1-inch-) wide flowers with a pineapple scent. *P. lemoinei,* a hybrid of *P. coronarius* and *P. microphyllus,* has given rise to a number of horticultural varieties with large and fragrant flowers.

Philae, Arabic JAZĪRAT FĪLAH, island in the Nile River just above the First Cataract and the old Aswān Dam and 7 miles (11 km) south-southwest of Aswān city, in Aswān *muḥāfaẓāh* (governorate), Egypt. Its ancient Egyptian name was P-aaleq; the Coptic-derived name Pilak ("End," or "Remote Place") probably refers to its marking the boundary with Nubia. The conventional name is Greek, but locally it is known as Qasr Anas al-Wujūd, after a hero of *The Thousand and One Nights.* Before its gradual submergence in the reservoir created by the old Aswān Dam in 1902 and 1907, the alluvium-covered granite rock of Philae, measuring 1,500 by 480 feet (460 by 150 m), had always been above the highest Nile floodings. Accordingly, it attracted a number of ancient temple and shrine builders, earning the still current name of Jazīrat al-Birba ("Temple Island").

From early Egyptian times the island was sacred to the goddess Isis; the earliest structures known are those of Taharqa (reigned 689–664 BC), the Cushite 25th-dynasty pharaoh. The Saites (664–525 BC) built the earliest-known temple, found dismantled and reused in the Ptolemaic structures. Nectanebo II (Nekhtharehbe [reigned 360–343 BC]), last pharaoh of the 30th dynasty and last independent native ruler of Egypt prior to 1952, added the present colonnade. The complex of structures of the Temple of Isis was completed by Ptolemy II Philadelphus (reigned 285–246 BC) and his successor, Ptolemy III Euergetes (fl. 246–221 BC). Its decorations, dating from the period of the later Ptolemies and the Roman emperors Augustus and Tiberius (27 BC to AD 37), were, however, never completed. The Roman emperor Hadrian (reigned AD 117–138) added a kiosk west of the complex and a gate to the east. Other small temples or shrines dedicated to Egyptian deities include a temple to Imhotep and one to Hathor and chapels to Osiris, Horus, and Nephthys.

The Temple of Isis continued to flourish during Roman times and was not closed until the reign of Justinian I (AD 527–565), even though since 378 there had been an edict of Theodosius I banning worship of Osiris and Isis. The priests of Isis had obtained great powers in Upper Egypt, probably because they held gold mines at Wadi Alaki and controlled the terminus of the caravan route at Kubban. Their influence in Nubia remained strong long after Egypt became Christian, since the Nobadae and Blemmye tribes continued to worship Isis. By lending the goddess's image for annual rites, the Roman and Byzantine rulers of Egypt maintained a measure of control over these tribes, which continually threatened and harassed Egypt proper. Late in Justinian's reign the Temple of Isis was converted into a church, and two other Coptic churches were built in the still-prosperous town.

All these structures were thoroughly explored and reinforced (1895–96) before being partially flooded behind the old Aswān Dam. In 1907 a careful inspection revealed that salts were damaging paints on the decorations. When the temples reemerged after 1970 with the completion of the High Dam upstream, it was found that considerable damage had been done to the shrines. A decision was therefore made to remove them to higher ground on the nearby island of Agilkia. The island was leveled to resemble the original Philae, and the temples were rebuilt in 1980, returning them to some measure of their original beauty.

Philagathus, Johannes: *see* John XVI (or XVII) *under* John (Papacy).

philanthropic foundation, a nongovernmental, nonprofit organization, with assets provided by donors and managed by its own officials, and with income expended for socially useful purposes. Foundation, endowment, and charitable trust are terms used interchangeably to designate these organizations, which can be traced far back in history. They existed in the ancient civilizations of the Middle East, Greece, and Rome. Plato's Academy (*c.* 387 BC), for example, was established with an endowment that helped to sustain its existence for some 900 years. The medieval Christian church set up and administered trusts for benevolent purposes. The Islāmic world, despite its differing religious, political, and social concepts, developed an equivalent to the foundation, entitled the waqf, as early as the 7th century AD. Merchants in 17th- and 18th-century western Europe founded similar organizations for worthy causes.

These early philanthropic forms were usually small and for local and palliative purposes. Although there are still many small foundations, the late 19th and the 20th centuries witnessed the creation of the distinctive large modern ones. Having broad purposes and great freedom of action, including the ability by many to conduct programs worldwide, such foundations are variously categorized as: community, which have support from many donors and are located in a specific community or region; corporation-sponsored, which have increased dramatically in number, size, scope, and importance since World War II; operating, which carry out projects with their own staff; and independent, which are established by individuals and families. Most of the larger and best-known foundations in the United States and other countries have been of the last type.

James Smithson and George Peabody provided funds for the establishment in the United States of the Smithsonian Institution (1846) and the Peabody Education Fund (1867), respectively. At the turn of the century, Andrew Carnegie and John D. Rockefeller inaugurated the first of their many philanthropies. Carnegie's giving exceeded $350,000,000, with much of it used for the establishment of such foundations as The Carnegie Foundation for the Advancement of Teaching (1905) and the Carnegie Corporation of New York (1911). Rockefeller established the General Education Board (1902) and The Rockefeller Foundation (1913), and four generations of Rockefellers have given well over $1,000,000,000 for these entities and other philanthropic purposes.

Other American foundations of considerable size and impact were the Russell Sage Foundation (1907), The Commonwealth Fund (1918), and the John Simon Guggenheim Memorial Foundation (1925). The Ford Foundation (1936), with multibillion-dollar assets, is the largest foundation in the world. Its annual grants of millions of dollars support activities in the United States, Asia, Latin America, and Africa. Other American foundations with assets in excess of $1,000,000,000 and supporting a broad range of activities include the W.K. Kellogg Foundation (1930), The Robert Wood Johnson Foundation (1936), The Pew Memorial Trust (1948), and the John D. and Catherine T. MacArthur Foundation (1970).

Outside the United States some of the wealthiest foundations include the Wellcome Trust, England (1936); Nuffield Foundation, England (1943); Juan March Foundation, Spain (1955); Calouste Gulbenkian Foundation, Portugal (1956); Alfried Krupp von Bohlen und Halbach Foundation, West Germany (1967); J.W. McConnell Family Foundation, Canada (1967); and the Toyota Foundation, Japan (1974).

The large modern foundations have expended most of their funds for activities in the fields of education, social welfare, science, health, religion, conservation, international relations, and public policy. Some foundations have been reluctant to publicize their activities. Others, especially the larger ones, provide reports on their operations and, in recent years, have been instrumental in establishing such informational and archival organizations as The Foundation Center, U.S. (1956), the Foundation Library Center of Japan (1985), and the European Foundation Centre, Belgium (1989). (J.C.Ki.)

BIBLIOGRAPHY. Frank Emerson Andrews, *Philanthropic Foundations* (1956), is outdated but informative. Harold M. Keele and Joseph C. Kiger (eds.), *Foundations* (1984), focuses on the history of these American institutions. Up-to-date coverage is provided in Joseph C. Kiger (ed.), *International Encyclopedia of Foundations* (1990).

Philanthropinum, late 18th-century school founded in Dessau, Ger., by the educator Johann Bernhard Basedow. Aiming to foster in its students a humanitarian worldview and awareness of the community of interest among men, it taught rich and poor boys together regardless of religious or class distinctions. The school had many enthusiastic supporters, among them the philosophers Immanuel Kant, Gotthold Ephraim Lessing, and Moses Mendelssohn, and its influence spread to neighbouring countries, particularly Switzerland.

Basedow believed in state rather than religious control of education and in a pragmatic approach to teaching. He stressed modern rather than classical languages, teaching them through conversation and games. Scientific subjects such as natural history, anatomy, and physics and practical ones such as carpentry were emphasized. Physical education was an important part of the curriculum. Further, in an age when many schools were noted for their harsh discipline, Basedow held that school could be so pleasant and absorbing that punishment would be virtually unnecessary.

Philaret, also spelled FILARET, original name FYODOR NIKITICH ROMANOV (b. *c.* 1554/55—d. Oct. 22 [Oct. 12, Old Style], 1633, Moscow, Russia [now in Russian S.F.S.R.]), Russian Orthodox patriarch of Moscow and father of the first Romanov tsar.

During the reign (1584–98) of his cousin, Tsar Fyodor I, Philaret served in the military campaign against the Swedes in 1590 and later (1593–94) conducted diplomatic negotiations with them. After Fyodor's death, Philaret was banished to a monastery by Boris Godunov (reigned 1598–1605). On Godunov's sudden death in 1605 and the subsequent shift of power to the first False Dmitry, Philaret was released and made metropolitan, or archbishop, of Rostov. In 1610 he was imprisoned by the Poles while attempting to arrange the accession of Prince Władysław of Poland to the Russian throne, but he was freed in 1619 after the election of his son Michael as tsar. Philaret was made patriarch of Moscow in the same year.

Exercising both ecclesiastical and political rule in Russia, Philaret reformed the church administration, instituted a program of establishing a divinity college in each diocese, and established libraries to upgrade theological scholarship. In a Moscow synod he decreed that all Latin Christians coming into the Russian Orthodox church would require rebaptism. His ecclesiastical policy strove to minimize the influence of the Roman Catholic church among Russian and Polish bishops. In addition to further developing the Russian liturgical books, Philaret also sponsored social legislation to stabilize the peasant farmers, reformed the tax structure, and reorganized the military.

Philaret, also spelled FILARET, original name VASILY MIKHAYLOVICH DROZDOV (b. Jan. 6, 1783 [Dec. 26, 1782, Old Style], Kolomna, near Moscow, Russia [now in Russian S.F.S.R.]—d. Dec. 1 [Nov. 19], 1867, Moscow), Russian Orthodox biblical theologian and metropolitan, or archbishop, of Moscow whose scholarship, oratory, and administrative ability made him the leading Russian churchman of the 19th century.

Upon his graduation from the Trinity Monastery, near Moscow, in 1803, Philaret was appointed as a teacher there and, in 1806, as a monastery preacher. In 1808 he took monastic vows and also was named professor of philosophy and theology, and subsequently rector, at St. Petersburg's Theological Academy. Rising rapidly in his church career, he became a member of the Holy Synod in 1818 after serving with numerous ecclesiastical-reform commissions, was named archbishop of Tver (modern Kalinin) in 1819, and in 1821 was transferred to Moscow. An activist, Philaret quickly established himself as a power in church and state. Considered as charismatic by the Russian Orthodox, he served as the final authority in theological and legal questions, his decisions eventually being published in 1905 with the title "Views and Comments."

By 1858, having overcome extended opposition, Philaret successfully directed the translation of the Bible into modern Russian. His chief theological work was the "Christian Catechism of the Orthodox Catholic Eastern Greco-Russian Church," treating the 4th-century Nicene Creed, the theology of prayer, and the Mosaic Law. First published in 1823, Philaret's "Catechism" was subjected to several revisions to expunge its Lutheran influences, but after 1839 it exercised widespread influence on 19th-century Russian theology.

Philaretus (Dutch philosopher): *see* Geulincx, Arnold.

Philargos, Petros: *see* Alexander (V) *under* Alexander (Papacy).

Philastre, Paul-Louis-Félix (b. Feb. 7, 1837, Brussels, Belg.—d. Sept. 11, 1902, Buyat-Beayeau, Fr.), French administrator and diplomat who, in the formative years of colonialism in French Indochina, played a crucial role in mitigating relations between the European colonialists and the French administration, on the one hand, and the indigenous population and its royal court at Hue, in central Vietnam. He was considered generally sympathetic to the Vietnamese.

Philastre graduated from France's naval school in 1857 and signed onto the *Avalanche,* bound for China. He arrived in Cochinchina (now in southern Vietnam) in 1861 and was named inspector of indigenous affairs in January 1863 at My Tho, a Mekong River delta village. Two years after being made chief of native law (June 1868), he grew ill and returned to France. During the Franco-German War and the Paris Commune, Philastre commanded an artillery regiment in the defense of Paris. He returned to Saigon in 1873, working under Admiral Marie-Jules Dupré.

An avid imperialist, Dupré had been seeking official recognition from the Vietnamese emperor Tu Duc of French holdings in three western provinces formally ceded to France in an 1862 treaty that Tu Duc had reneged upon. Meanwhile, in the summer of 1873 the profiteering trader Jean Dupuis, eager to secure northern Vietnam for trade with China, attacked Hanoi. Dupré then sent an expedition north under Francis Garnier, ostensibly to suppress Dupuis's bold move. Garnier, however, with Dupré's approval, joined forces with the trader and laid claim to Hanoi. But Dupré had meanwhile received word from France officially condemning the whole affair, and he commissioned Philastre as ambassador to try to win concessions from Tu Duc.

Philastre was poorly received at Hue by Tu Duc, who asked him to go north to resolve matters with the French forces there. At Hanoi, feeling that the Vietnamese had been wronged, he acted against Dupré's implicit directives and, presenting himself as Dupré's representative, ordered a cease-fire. Arriving shortly after Garnier had been killed in battle, Philastre was able to assert his authority. He laid the foundations of the treaty of 1874, under which Tu Duc at last bowed to the French conquest of the south. So impressed were the Vietnamese by Philastre's honesty and sincerity that they agreed to terms in the treaty that exceeded what the French had asked. Thereafter he served as representative of the protectorate of Cambodia (1876) and as chargé d'affaires at Hue (1877–79). He returned to France in 1880 and taught mathematics at Cannes and Nice (1882–94).

Briefly discredited because of his countercoup in the Dupuis–Garnier affair, which delayed French expansion into the north of Indochina for a decade, Philastre won the acclaim of later French writers for his honesty and for the respect he showed for the people and traditions of Vietnam. His most important scholarly achievement was the translation into French of the Vietnamese legal code and its commentaries. The erudite work was published as *Le Code annamite* ("The Annamite Code") in two volumes in Paris in 1876.

philately, also called STAMP COLLECTING, the hobby of collecting and studying postage stamps. The term philately was coined in 1864 by a Frenchman, Georges Herpin, who invented it from the Greek *philos,* "love," *a,* "negative," *telein,* "to tax"; the postage stamp permitted the letter to come free of charge to the recipient, rendering it untaxed.

There have been several claimants to the invention of the adhesive postage stamp, but the first recorded sale of such stamps took place on May 1, 1840, in England, followed soon after by the earliest reference to stamp collecting, an advertisement in *The Times* of London in 1841 placed by "a young lady, being desirous of covering her dressing-room with cancelled postage stamps."

The first lists of stamps were issued in 1861 by Oscar Berger-Levrault in Strasbourg and Alfred Potiquet in Paris. In England, Frederick Booty, J.E. Gray, and Mount Brown all issued catalogs in 1862; Brown's third edition (1866) listed 2,400 varieties, inclusive of what is now termed postal stationery or envelopes, wrappers, and letter sheets, as well as many local issues. The standard modern catalogs (*e.g.,* Yvert and Tellier in France, Michel's in Germany, Gibbons' in Great Britain, and Scott or Minkus in the United States) exclude this latter material, and yet the total number of listings, including minor varieties, reaches more than 100,000.

Because of the sheer bulk, not to mention the prohibitive expense, of a general collection embracing the stamps of all nations and all periods, most collectors turn to limited fields. They may collect only the stamps of one country, for example, or of one continent or one period. Others specialize in collections of certain kinds of stamps; some collect only one issue and study it thoroughly, and others may collect only revenue stamps or postal stationery. Those interested purely in stamp designs may collect art or religion on stamps, or flowers, fish, bridges, etc.; this sort of collecting is called topical, or thematic.

The collection of postal markings, both on stamped and pre-stamp covers, is a form of specialization; collecting of precancelled stamps is another. Meters (machines that print a postal frank on the envelope) have given rise to yet another specialized form. Telegraph stamps or Christmas seals are also collected by some specialists.

Many famous collections of the past have been dispersed and absorbed by others; some have been sold at auction, bringing total prices of several million dollars. The unique one-cent British Guiana magenta of 1856 was sold by private negotiation for a price reputed to be more than $50,000. In 1970 it was sold again at auction for $280,000.

One of the outstanding collections in Europe—especially rich in British and colonial issues—was formed principally by King George V, a famed philatelist, and passed on to those who succeeded him as the British monarch. The Thomas K. Tapling collection, bequeathed to the British Museum, may well be the finest in public hands. The Smithsonian Institution collection at Washington, D.C., stresses U.S. stamps. The postal museums of many European capitals have outstanding collections, such as those at Berlin, at The Hague, and at Stockholm; the last received the Hans Lagerlof (New York) collection.

Clubs or societies of collectors are to be found in most cities of the world, with national and international societies to bind them together. Many of the prominent national societies, such as the Royal Philatelic Society of London and the American Philatelic Society, were formed in the 19th century. The International Philatelic Federation was formed in 1926. Many specialist societies have also sprung up, notably since 1945. One of the most important activities of stamp clubs is the holding of exhibitions, including sales, from time to time. International, national, and regional societies hold regular exhibitions, offering valuable awards to outstanding collections.

Philbrick, Herbert Arthur (b. May 11, 1915, Rye Beach, N.H., U.S.), U.S. counterintelligence agent for the Federal Bureau of Investigation (FBI) against the Communist Party of the United States during the 1940s.

Philbrick studied engineering at Lincoln Technical Institute of Northeastern University in Boston, and in 1938 he became an advertising salesman. Through a sales call, he became interested in the Massachusetts Youth Council and later helped to set up a subsidiary organization in Cambridge. Gradually he came to realize that the organization was controlled and used for propaganda by the Communist Party. He took his suspicions to the FBI and was asked by them to act as an undercover agent. He did so for nine years, reporting on activities that violated the Smith Act and other laws. On April 6, 1949, he broke cover to testify against 12 Communist leaders who had been indicted in part on evidence he had provided. All 12 were found guilty, and Philbrick became a public figure. In 1952 he published a record of his undercover work called *I Led Three Lives,* which became a best-seller and was the basis for a popular television series of the same name.

Philby, H(arry) Saint John (Bridger) (b. April 3, 1885, Saint Johns, Badula, Ceylon [now Sri Lanka]—d. Sept. 30, 1960, Beirut), British explorer and Arabist, the first European to cross the Rubʿ al-Khali, or Empty Quarter, of Arabia from east to west.

Philby was educated at Trinity College, Cambridge, and joined the Indian Civil Service in 1907. In 1917, as political officer of the Mesopotamian Expeditionary force, he was dispatched on a diplomatic mission to ʿAbd al-ʿAzīz ibn Saʿūd. After meeting with the future king of Saudi Arabia, he crossed the desert from al-ʿUqayr to Jidda—an exploit recorded in his book, *Heart of Arabia* (1922). Philby succeeded T.E. Lawrence as chief British representative in Transjordan (1921–24) but resigned to establish a business in Arabia. He was an unofficial adviser of Ibn Saʿūd and converted to Islām in 1930.

After an unsuccessful foray into politics in England in 1939 and a brief incarceration there in 1940 because of his antiwar views, Philby returned to Arabia in 1945. Ten years later he was expelled because of his public criticism of the inefficiency and extravagance of the oil-enriched Saʿūdi regime. Philby made important contributions based on his Arabian explorations to the fields of archaeology, cartography, and linguistics. His son, Kim Philby, became a Soviet agent within the British intelligence service.

Philby, Kim, byname of HAROLD ADRIAN RUSSELL PHILBY (b. Jan. 1, 1912, Ambāla, India—d. May 11, 1988, Moscow), British intelligence officer until 1951 and the most successful Soviet double agent of the Cold War period.

While a student at the University of Cambridge, Philby became a Communist and in 1933 a Soviet agent. He worked as a journalist until 1940, when Guy Burgess, a British secret agent who was himself a Soviet double agent, recruited Philby into the MI-6 section of the British intelligence service. By the end of World War II, Philby had become head of counterespionage operations for MI-6, in which post he was responsible for combating Soviet subversion in western Europe. In 1949 he was sent to Washington to serve as chief MI-6 officer there and as the top liaison officer between the British and U.S. intelligence services. While holding this highly sensitive post, he revealed to the U.S.S.R. an Allied plan to send armed anti-Communist bands into Albania in 1950, thereby assuring their defeat; warned two Soviet double agents in the British diplomatic service, Burgess and Donald MacLean, that they were under suspicion (the two men consequently escaped to the Soviet Union in 1951); and transmitted detailed information about MI-6 and the Central Intelligence Agency to the Soviets.

After Burgess' and MacLean's defection, suspicion fell on Philby, and he was relieved of his intelligence duties in 1951 and dismissed from MI-6 in 1955. Thereafter he worked as a journalist in Beirut until fleeing to the Soviet Union in 1963. There he settled in Moscow and eventually reached the rank of colonel in the KGB, the Soviet intelligence service. Philby published a book, *My Silent War* (1968), detailing his exploits.

Philby seems to have been a lifelong and committed Communist whose primary devotion lay toward the Soviet Union rather than his native country. He was apparently responsible for the deaths of many Western agents whose activities he betrayed to the Soviets during the 1940s and early '50s.

Philemon (b. *c.* 368 BC, Syracuse, Sicily [now in Italy]—d. *c.* 264 BC), poet of the Athenian New Comedy, elder contemporary and successful rival of Menander.

As a playwright Philemon was noted for his neatly contrived plots, vivid description, dramatic surprises, and platitudinous moralizing. By 328 he was producing plays in Athens, where he eventually became a citizen; he also worked in Alexandria for a time. Of 97 comedies by him, some 60 titles survive in Greek fragments and Latin adaptations.

Philemon, Letter of Paul to, brief New Testament letter written by Paul the Apostle to a wealthy Christian of Colossae, Asia Minor, on behalf of Onesimus, Philemon's former slave. Paul, writing from prison, expresses affection for the newly converted Onesimus and asks that he be received in the same spirit that would mark Paul's own arrival, even though Onesimus may be guilty of previous failings. While passing no judgment on slavery itself, Paul exhorts Philemon to manifest true Christian love that removes barriers between slaves and free men. The letter was probably composed in Rome about AD 61.

Philemon and Baucis, in Greek mythology, a pious Phrygian couple who hospitably received Zeus and Hermes when their richer neighbours turned away the two gods, who were disguised as wayfarers. As a reward, they were saved from a flood that drowned the rest of the country; their cottage was turned into a temple, and at their own request they became priest and priestess of it. Long after, they were granted their wish to die at the same moment, being turned into trees. Similar stories occur in the *Märchen* ("fairy tales") of the Grimm brothers.

Philepittidae, bird family, order Passeriformes, consisting of the asities and false sunbirds, four species of small birds confined to the forests of Madagascar.

Members range in size from 9 to 16.5 centimetres (3.5 to 6.5 inches) long. The two species of asities (*Philepitta*) are plump, stout-legged pitta-like birds that browse foliage for berries and other fruit. The false sunbirds (*Neodrepanis*) are smaller and have weak legs and longer down-curved bills with which they dip into flowers for nectar and small insects. They were formerly classified with the sunbirds (family Nectariniidae). All members have bare skin, or wattles, around the eyes.

The Philepittidae is currently placed in the suboscine suborder Tyranni, but certain anatomical features suggest that they are more closely allied to families in the suborder Eurylaimi.

Philetaerus (b. *c.* 343 BC, Tios, in Paphlagonia, a region of northern Anatolia—d. 263 BC), founder (reigned 282–263) of the Attalid dynasty, a line of rulers of a powerful kingdom of Pergamum, in northwest Asia Minor, in the 3rd and 2nd centuries BC.

Philetaerus initiated the policies that made Pergamum a leading centre of Greek civilization in the East. He served under Antigonus I Monophthalmus, successor to Alexander the Great in Phrygia, in northern Anatolia, until 302, when he deserted to Antigonus' rival, Lysimachus, ruler of Thrace. Lysimachus made him guardian of the fortress of Pergamum with its treasure of some 9,000 talents. In 282 Philetaerus transferred his allegiance to Seleucus I, the successor to Alexander the Great in Syria, who allowed him a far larger measure of independence than he had hitherto enjoyed.

The territory Philetaerus controlled was as yet quite small—no more than Pergamum and its environs—and it was largely of necessity that he curried favour with the first Seleucid kings. His gifts to the temples at Delphi, Greece, and on the island of Delos, in the Aegean Sea, secured for his family some prestige outside of Anatolia. When, after the death of Seleucus I in 280, the Seleucid grip on Asia Minor slackened, Philetaerus found a chance to increase the area under his control. Before his death in 263 he had abandoned the Seleucids in favour of a tie with Egypt.

Philetaerus was reportedly a eunuch; he adopted one of his nephews, Eumenes, as his heir and successor.

Philetas OF **Cos,** Philetas also spelled PHILITAS (b. *c.* 330 BC—d. *c.* 270 BC), Greek poet and grammarian from the Aegean island of Cos, regarded as the founder of the Hellenistic school of poetry, which flourished in Alexandria after *c.* 323 BC. He is reputed to have been the tutor of Ptolemy II and the poet Theocritus. The Roman poets Propertius and Ovid mention him as their model, but only fragments of his work have survived. His most important poem appears to have been the *Demeter,* an elegy narrating the wanderings of the goddess of the Earth, Demeter. He also compiled a dictionary of rare words from Homer, the Greek dialects, and other sources.

Philidor, André, original family name DANICAN, byname L'AÎNÉ (b. *c.* 1647—d. Aug. 11, 1730, Dreux, Fr.), musician and composer, an outstanding member of a large and important family of musicians long connected with the French court.

The first recorded representatives of the family were Michel Danican (died *c.* 1659), upon whom the nickname Philidor (the name of a famous Italian musician) was bestowed by Louis XIII as a complimentary reference to his skill, and André's father Jean (died 1679), who, like Michel, played various instruments in the Grande Écurie, the king's band. André and his brothers, Jacques, called "le Cadet" (died 1708), and Alexandre, whose birth and death dates are unknown, also played in the royal band. André distinguished himself as a performer in Louis XIV's chamber and chapel and composed several divertissements, or opéra ballets, for royal entertainment, as well as marches, fanfares, and similar music. Further, as keeper of the royal music library from 1684, he collected hundreds of volumes of dances, operas, sacred music, songs, marches, and other music from the time of Henry III onward; a large part of this invaluable collection survives.

André and Jacques each had children who carried on the family tradition, the most important being André's son François-André Philidor (*q.v.*), noted as a composer and Chess player. Another son of André, Michel, whose birth and death dates are unknown, a drummer in the Grande Écurie, is said to have worked with the instrument builder Jean Hotteterre (*q.v.*) in the invention of the oboe.

Philidor, François-André, original name FRANÇOIS-ANDRÉ DANICAN (b. Sept. 7, 1726, Dreux, Fr.—d. Aug. 24, 1795, London), French composer whose operas were successful and widely known in his day and who was a famous and remarkable Chess player. The last member of a large and prominent musical family, François-André was thoroughly trained in music, but at age 18 he turned entirely to Chess competition throughout Europe. He was particularly well received in England, where he published a book on Chess and eventually received a pension from the London Chess Club. In 1754 he returned to Paris and set about composing highly popular operas, such as *Sancho Pança dans son isle* (1762) and *Tom Jones* (1765), as well as other dramatic and sacred music. He continued playing Chess and composing for the remainder of his life, travelling regularly to London.

Philikí Etaireía (Greek: Friendly Brotherhood), Greek revolutionary secret society founded by merchants in Odessa in 1814 to overthrow Ottoman rule in southeastern Europe and to establish an independent Greek state. The society's claim of Russian support and the romance of its commitment (each member swore "irreconcilable hatred against the tyrants of my country") brought thousands into its ranks. Though some recruits believed that the society was secretly directed by the Russian emperor's foreign secretary—the Greek Ioánnis, Count Kapodístrias—it was Alexander Ypsilantis, an officer in the Russian Army, who accepted the leadership in 1820. Having planned uprisings in the Danubian principalities as well as in the Peloponnese and the Greek islands, Ypsilantis launched the revolt in the spring of 1821. The Romanian peasants did not join his forces, however; the Russian emperor Alexander I repudiated him, and the Turks quickly defeated him. The venture resulted primarily in bringing an end to the rule of the Greek Phanariotes in Moldavia and Walachia.

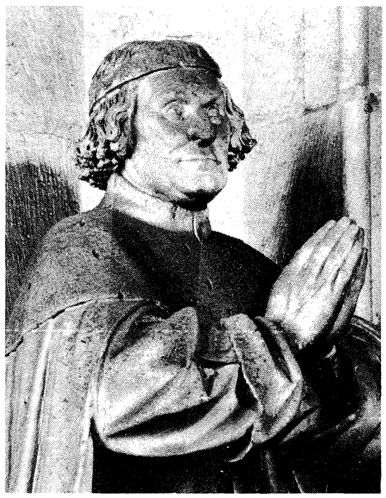
BURGUNDY

• **Philip I,** also called PHILIP OF ROUVRES, French PHILIPPE DE ROUVRES (b. 1345, Rouvres, Burgundy—d. November 1361, Rouvres), last Capetian duke of Burgundy (1349–61) and count of Boulogne and Artois.

Son of Philip of Burgundy, he inherited the duchy upon the death of his grandfather, Eudes IV, and inherited the countships upon the death of his grandmother, Joan of France. His mother, Joan of Boulogne, who subsequently married the king of France, John II, ruled Philip's lands during his minority, but after her death in 1360 he was declared of age. Though he married at the age of 12, he died without heirs, and his domains were dismembered. King John granted the duchy of Burgundy to his own son, Philip II the Bold (1363).

• **Philip II,** byname PHILIP THE BOLD, French PHILIPPE LE HARDI (b. Jan. 17, 1342, Pontoise, Fr.—d. April 27, 1404, Halle, Brabant), duke of Burgundy (1363–1404) and the youngest son of the French king John II the Good.



Philip II, detail of a sculpture by Claus Sluter, 14th century; portal of the Chartreuse de Champmol, Dijon
Lauros—Giraudon from Art Resource/EB Inc.

One of the most powerful men of his day in France, he was for a time regent for his nephew Charles VI; and when Charles went insane, he became virtual ruler of France.

John II's grant of the duchy of Burgundy to Philip in September 1363 did not become effective until June 1364, when the new king, Philip's brother Charles V, confirmed it. Philip and Charles supported each other's policies. The duke's marriage (June 1369) to Margaret of Flanders was arranged by Charles to prevent her from marrying an English prince. In 1384, Philip and his wife inherited Flanders, Artois, Rethel, Nevers, Franche-Comté, and some lands in Champagne. By purchase and skillful alliance he also secured several holdings in the Netherlands. In 1386 his domains had become so extensive that he arranged separate administrations at Lille and Dijon for his northern and southern territories.

During the minority of their nephew Charles VI, Philip and his brothers shared the government of France and the spoils of power. Philip did not hesitate to involve the government in the furtherance of his own aims, which, because of the location of his domain, were shaped by the necessity of friendly relations with Germany and England. In November 1388, Charles rejected the tutelage of his uncles; but, when Charles became insane in 1392, Philip regained his preeminence and imposed his own policies on the French government: an alliance with England (1396) and (in relation to the papal Western Schism) the withdrawal (1398) of support for the Avignon pope Benedict XIII, since Philip's Flemish subjects adhered to the Roman pope Boniface IX. He furthermore diverted huge sums from the royal treasury, thus coming into conflict with his chief rival for power, Charles VI's brother Louis, duke d'Orléans.

Philip was a patron of the arts. He collected illuminated books and manuscripts, purchased jewelry and precious cloth, and encouraged painters. He fell heavily into debt, chiefly from financing his son John's crusade against the Ottoman Turks (1396).

• **Philip III,** byname PHILIP THE GOOD, French PHILIPPE LE BON (b. July 31, 1396, Dijon, Burgundy [now in France]—d. June 15, 1467, Bruges [now Brugge, Belg.]), the most important of the Valois dukes of Burgundy (reigned 1419–67) and the true founder of the Burgundian state that rivaled France in the 15th century.

Philip was the son of John the Fearless and Margaret of Bavaria. When he became duke of Burgundy at the age of 23, his first aim was

Philip III, detail of a portrait attributed to Rogier van der Weyden; in the Louvre, Paris
Cliche des Musees Nationaux, Paris

to extricate himself as expeditiously as possible from the French affairs in which his father, Duke John, had been embroiled and that had led to his assassination in 1419. Holding the dauphin Charles (later Charles VII of France) answerable for his father's murder, Philip signed the Treaty of Troyes with King Henry V of England in 1420, a treaty in which the queen of France, Isabella of Bavaria, conferred succession to the French crown on Henry and partitioned France among England, Burgundy, and her disinherited son, the dauphin Charles.

Philip paid little attention to potential conquests in France and preferred to remain uncommitted there. He maintained his alliance with England, apart from a break in 1435–39, when he tried but failed to conquer Calais, but seldom gave England serious help against France. On the other hand, especially after 1435, when he acknowledged Charles as king of France and accepted his disavowal of the murder of John the Fearless, he did his best to be on reasonably good terms with the king of France. His real interests lay not in France but in the development of his own territories.

Behind an impressive, if bizarre, facade of courtly splendour and chivalrous festivity, Duke Philip the Good was an aggressive opportunist who, especially in the first half of his ducal reign, concentrated on the task of attacking and swallowing up his smaller neighbours. Namur was purchased in 1421; Hainaut fell to Burgundian arms in 1427; the rich duchy of Brabant was taken over in 1430; and the combined counties of Holland and Zeeland were conquered in a long series of personally led and bitterly contested campaigns between 1424 and 1433. The crowning achievement of Philip's policy of territorial expansion was his conquest of the duchy of Luxembourg in 1443.

It was under Philip that the richness and extravagance of court life in the European Middle Ages reached its apogee. Philip, whose personal tastes in clothes were relatively simple, loved to surround himself with all the pomp and pageantry that the age could command. In 1430 he founded a new order of chivalry, a Burgundian version of the British Order of the Garter, called the Toison d'Or, or Golden Fleece, membership of which was limited to 24 noblemen of proven valour and wide renown. Court was held at Brussels or Bruges, in Brabant and Flanders, respectively; or at Hesdin or Lille, in northeastern France; or at some other centre.

The best artists of the day were employed by Philip to paint his banners and pennons, to decorate his palaces and carriages, and to illuminate what was probably the finest collection of picture books ever put together. The artist Jan van Eyck accompanied a ducal embassy to Portugal to paint the king's daughter Isabella, so that Philip could see her likeness before committing himself to marrying her. Sculptors worked on tombs at Philip's command, and exquisite tapestries were embroidered under his personal supervision. A host of musicians, jewelers, goldsmiths, and other craftsmen and artists were employed at his court. The bawdy stories exchanged by Philip and his courtiers after dinner were collected into *Les Cent Nouvelles Nouvelles,* or "The Hundred New Short Stories."

Some of the more elaborate banquets, notably the Feast of the Pheasant in 1454, at Lille, were open to the public, who could admire the endless array of model ships and towers, pies with people inside them, peacocks, swans, and eagles (mock or real), and other paraphernalia that accompanied the various dishes. Other entertainment was held from time to time in the form of tournaments or passages of arms, and Duke Philip's courtiers roamed about Europe issuing challenges and doing battle with their colleagues from other lands.

Duke Philip was tall, handsome, and bony in figure; his face was long and lean, with a high forehead, prominent nose, and bushy eyebrows. Excellent in health, he enjoyed hunting, tennis, archery, and jousting in his youth, but he turned in his later years to making clogs, repairing broken glasses, and soldering broken knives. His many bastard children caused the bishop of Tournai (himself a bastard) to criticize him for what the ecclesiastic called "the weakness of the flesh." Some were brought up at court; others went into the church. His mistresses were kept out of affairs of state, and it was mere geographic convenience and economy that caused him to maintain several at once in the different towns where he held court. Self-assured and flamboyant almost to the end, he died, possibly of pneumonia, at Bruges in 1467. (R.Va.)

BIBLIOGRAPHY. Otto Cartellieri, *The Court of Burgundy* (1929, reprinted 1972), is a comprehensive study of Philip's reign. Richard Vaughan, *Philip the Good: The Apogee of Burgundy* (1970), offers a broad political biography, with characterization of the period in general, and includes a comprehensive bibliography.

• **Philip IV:** *see* Philip I (Spain).

FRANCE

• **Philip I** (b. 1052—d. July 29/30, 1108, Melun, Fr.), king of France (1059/60–1108) who came to the throne at a time when the Capetian monarchy was extremely weak but who succeeded in enlarging the royal treasury by a policy of devious alliances, the sale of his neutrality in the quarrels of powerful vassals, and the practice of simony on a huge scale.

Philip was the elder son of Henry I of France by his second wife, Anne of Kiev. Crowned at Reims in May 1059, he became sole king on his father's death in 1060. Two years after he came of age in 1066, he obtained the county of Gâtinais as the price of his neutrality in a family struggle over Anjou and thereby linked the royal possessions in Sens with those around Paris, Melun, and Orléans. His major efforts, however, were directed toward Normandy, in which from 1076 he supported Robert II Curthose, its ineffectual duke, first against Robert's father, King William I of England, then against Robert's brother, William II. Philip's true goal was to prevent emergence of a rival power in Normandy, for he was willing to abandon Robert whenever it seemed possible he might become dangerous.

Because of his firm determination to retain control over all appointments to ecclesiastical posts, which he blatantly sold, Philip was eventually drawn into conflict with the papacy. This conflict was exacerbated by his matrimonial affairs; his scandalous "marriage" with Bertrada de Montfort, wife of a vassal, brought him repeated excommunication. By 1104, when the struggle with the papacy was finally ended, Louis VI, Philip's son by his legitimate wife, Bertha, had taken over the administration of the kingdom, Philip having been rendered inactive by his extreme obesity.

• **Philip II,** byname PHILIP AUGUSTUS, French PHILIPPE AUGUSTE (b. Aug. 21, 1165, Paris, Fr.—d. July 14, 1223, Mantes), the first of the great Capetian kings of medieval France (reigned 1179–1223), who gradually reconquered the French territories held by the kings

Philip II, seal of majesty, showing the king crowned and enthroned, from a document of 1180
Archives Photographiques, Paris

of England and also furthered the royal domains northward into Flanders and southward into Languedoc. He was a major figure in the Third Crusade to the Holy Land in 1191.

Early life and kingship. Philip was the son of Louis VII of France and Adela of Champagne. In order to be associated as king with his father, who had fallen mortally ill, he was crowned at Reims on Nov. 1, 1179. His uncles of the House of Champagne—Henry I, count of Champagne; Guillaume, archbishop of Reims; and Thibaut V, count of Blois and Chartres—hoped to use the youthful king to control France. To escape from their tutelage, Philip, on April 28, 1180, married Isabella, the daughter of Baldwin V of Hainaut and the niece (through her mother) of Philip of Alsace, the count of Flanders, who promised to give the King the territory of Artois as her dowry.

When Henry II of England arrived in Normandy, perhaps with the intention of responding to an appeal by the House of Champagne, Philip II entered into negotiations with him and, at Gisors on June 28, 1180, renewed an understanding that Louis VII had reached with him in 1177. As a result, the House of Champagne was politically isolated, and Philip II was making all decisions for himself and acting as he saw fit when his father died, on Sept. 18, 1180, leaving him sole king in name as well as in fact.

When the Count of Flanders allied himself with the Champagne faction, there followed a serious revolt against the King. In the Peace of Boves, in July 1185 (confirmed by the Treaty of Gisors in May 1186), the King and the Count of Flanders composed their differences (which had been chiefly over possession of Vermandois, in Picardy), so that the disputed territory was partitioned, Amiens and numerous other places passing to the King and the remainder, with the county of Vermandois proper, being left provisionally to Philip of Alsace. Thenceforward the King was free to run against Henry II of England.

Territorial expansion. Henry's French possessions—the so-called Angevin Empire, consisting of Normandy, Maine, Anjou, and Touraine, with Aquitaine in the hands of his son, the future Richard I the Lion-Heart of England, and Brittany ruled by another son, Geoffrey (died 1186)—all were a constant menace to the French royal domain. Furthermore, there were long-standing disputes over the Vexin (between Normandy and the Île-de-France), Berry, and Auvergne.

Philip II launched an attack on Berry in the summer of 1187 but then in June made a truce with Henry, which left Issoudun in his hands and also granted him Fréteval, in Vendômois. Though the truce was for two years, Philip found grounds for resuming hostilities in the summer of 1188. He skillfully exploited the estrangement between Henry and Richard, and Richard did homage to him voluntarily at Bonmoulins in November 1188. Finally, by the Treaty of Azay-le-Rideau, or of Colombières (July 4, 1189), Henry was forced to renew his own homage, to confirm the cession of Issoudun, with Graçay also, to Philip, and to renounce his claim to suzerainty over Auvergne. Henry died two days later.

Richard, who succeeded Henry as king of England, had already undertaken to go on crusade (the Third Crusade) against Saladin in the Holy Land, and Philip now did likewise. Before his departure, he made the so-called Testament of 1190 to provide for the government of his kingdom in his absence. On his way to Palestine, he met Richard in Sicily, where they promptly found themselves at variance, though they made a treaty at Messina in March 1191. Arriving in Palestine, they cooperated against the Muslims at Acre, until Philip fell ill and made his illness a pretext for returning to France, quite determined to settle the succession to Flanders (Philip of Alsace had just died on the crusade) while Richard was still absent. Thus, by the end of 1191, Philip II was back in France.

In spite of promises he had made in the Holy Land, Philip at once prepared to attack the Plantagenet possessions in France. Informed of this, Richard also left the crusade but was taken prisoner while on his way back by the duke of Austria, Leopold V of Babenberg. Philip did everything he could to prolong his rival's captivity, but Richard was at last set free (1194) and went to war against Philip. The French king suffered a number of defeats (from that at Fréteval in July 1194 to that at Courcelles in September 1198) in a series of campaigns that were occasionally punctuated by negotiations. It was fortuitous for Philip, however, when Richard was killed in April 1199.

Richard's brother John was by no means as formidable a fighter. Moreover, his right to Richard's succession could be contested by Arthur of Brittany, whose father had been senior to John. To secure the succession, therefore, John came to terms with Philip: by the Treaty of Le Goulet (May 22, 1200), in return for Philip's recognition of him as Richard's heir, he ceded Évreux and the Norman Vexin to Philip; agreed that Issoudun and Graçay should be the dowry of his niece Blanche of Castile, who was to marry the future Louis VIII (Philip's son by Isabella of Hainaut); and renounced any claim to suzerainty over Berry and Auvergne.

Shortly afterward, however, John entered into conflict with the Lusignan family of Poitou (in Aquitaine), who appealed to Philip as overlord. When he was summoned to appear before the royal court as a vassal of the French crown, John did not present himself, and Philip, in April 1202, pronounced John's French fiefs forfeit and undertook to carry out the sentence himself. He invaded Normandy, overran the northeast, and laid siege to Arques, while Arthur of Brittany, the son of Geoffrey, who died some years before, campaigned against John's supporters in Poitou; but John, marching south from Maine, captured Arthur at Mirebeau (August 1). In fury, Philip abandoned the siege of Arques and marched southwestward to Tours, ravaging John's territory on his way before returning to Paris. Guillaume des Roches, the powerful seneschal of Anjou, who had taken John's side, came to terms with Philip in March 1203.

Resuming operations against Normandy, Philip occupied the towns around the great fortress of Château-Gaillard, to which he laid siege in September 1203, having overruled Pope Innocent III's attempts to mediate. John, who is reported to have murdered Arthur of Brittany in April, retired to England in December, and Château-Gaillard fell to Philip in March 1204. Rouen, the Norman capital, surrendered in June, after 40 days' resistance.

After his conquest of Normandy, Philip subdued Maine, Touraine, Anjou, and most of Poitou with less difficulty (1204–05), though the castles of Loches and Chinon held out for a year. He sought to secure his conquests by lavishing privileges on the towns and on the religious houses but otherwise left the local barons in power. Unrest, however, was endemic in Poitou, and in June 1206 John landed at La Rochelle. After a campaign in the south, he turned north toward the Loire. At Thouars in October 1206, he and Philip made a two-year truce, leaving John in possession of the reconquered Poitevin lands. In the following year, however, Philip invaded Poitou again; and, after a further campaign in 1208, only the south and part of the west of Poitou remained loyal to John (with Saintonge, Guyenne, and Gascony).

Philip next hoped to exploit the dispute between John and Pope Innocent III. While Innocent was threatening to declare John unfit to reign (1212), plans were being made for a French landing in England and for the accession of Philip's son Louis to the English throne. The plans had to be dropped when John made his submission to the Pope (1213). Throwing himself into schemes for revenge, John formed a coalition against France: the Holy Roman emperor Otto IV, the Count of Flanders (Ferrand, or Ferdinand, of Portugal), and the Count of Boulogne (Raynald, or Renaud, of Dammartin) were to invade the Capetian territory from the northeast while John attacked from the west, with the help of his Poitevin barons.

John landed at La Rochelle in February 1214 and advanced into Anjou but was put to flight by Louis at La Roche-aux-Moines on July 2; his confederates were completely defeated by Philip in the decisive Battle of Bouvines on July 27. The Anglo-Angevin power in France and the coalition had both been broken in one month. Thus Philip, who, in 1213, had transferred Brittany to his cousin Peter of Dreux, was left without any significant opposition to his rule in France.

It was not only at the Plantagenets' expense that Philip enlarged the royal domain. His claim to Artois through his first marriage and his gains by the settlement of 1185–86 have been mentioned above, and he subsequently proceeded, step by step, to acquire the rest of Vermandois and Valois. His insistence on his suzerainty over vacant fiefs and on his tutelage over minors and heiresses was particularly effective with regard to Flanders, where two successive Flemish counts, Philip of Alsace (died 1191) and Baldwin IX (died *c.* 1205) had left no male issue.

Though he did not personally take part in the crusade proclaimed by Pope Innocent III against a Cathari religious sect in Languedoc, Philip allowed his vassals and knights to carry it out. Simon de Montfort's capture of Béziers and Carcassonne (1209) and his victory at Muret over Raymond VI of Toulouse and Peter II of Aragon (1213) prepared the way for the eventual annexation of eastern Languedoc to the royal domain six years after Philip's death and for the union of northern and southern France under Capetian rule.

Internal affairs. Several years before he tried to take advantage of the papacy's quarrel with John of England, Philip had himself been in dispute with Rome. After the death (1190) of Isabella of Hainaut, he had married Ingeborg, sister of the Danish king Canute IV, on Aug. 14, 1193, and on the next day, for a private reason, had resolved to separate from her. Having procured the annulment of his marriage by an assembly of bishops in November 1193, he took a Tirolese lady, Agnes, daughter of Bertold IV of Meran, as his wife in June 1196. Denmark, meanwhile, had complained to Rome about the repudiation of Ingeborg, and Pope Celestine III had countermanded it in 1195; but Celestine died (1198) before he could resort to coercion against Philip. The next pope, Innocent III, was sterner: in January 1200 he imposed an interdict on France. Philip, therefore, in September 1200, had to submit, pretending to be reconciled with Ingeborg. In fact, he refused to cohabit with her and kept her in semicaptivity until 1213, when he accepted her beside him—not as his wife but at least as his queen. Agnes had died in 1201, after bearing two children to Philip: Marie, countess of Namur (1211) and duchess of Brabant (1213), by successive marriages; and Philip, called Hurepel, count of Clermont.

Throughout his reign, Philip kept a close watch over the French nobility, which he brought effectively to heel. He maintained excellent relations with the French clergy, leaving the canons of the cathedral chapters free to elect their bishops and favouring the monastic orders. He knew, too, how to win the support of the towns, granting privileges and liberties to merchants and frequently aiding their struggles to free themselves from the seignorial authority of the nobles. In return, the communes helped financially and militarily. Most of all, Philip gave his attention to Paris, not only fortifying it with a great rampart but also having its streets and thoroughfares put in order. For the countryside, he multiplied the number of *villes neuves* ("new towns"), or enfranchised communities.

The Capetian monarchy's hold on the huge royal domain as well as on the kingdom as a whole was considerably strengthened by Philip's institution of a new class of administrative officers, the royal *baillis* and the seneschals for the provinces, who were appointed by the king to supervise the conduct of the local *prévôts* ("provosts"), to give justice in his name, to collect the revenues of the domain for him, and to call up the armed forces, in addition to other duties.

Conclusion. Philip II died on July 14, 1223. Knowing his own strength, he was the first of the Capetians not to have his eldest son crowned and associated with him during his lifetime; in fact, his conquests and strong government made him the richest and most powerful king in Europe and prepared the way for France's greatness in the 13th century.

(M.Pa.)

BIBLIOGRAPHY. Concise outlines of the reign of Philip II can be found in *The Cambridge Medieval History,* vol. 6, ch. 9 (1929, reprinted 1968); and Brian Tierney and Sidney Painter, *Western Europe in the Middle Ages, 300–1475,* 4th ed., ch. 15 (1983). The relationship of Philip to Capetian policy and the development of the monarchy is explored by Robert Fawtier, *The Capetian Kings of France: Monarchy and Nation, 987–1328* (1960, reprinted 1982; originally published in French, 1942); and Ch. Petit-Dutaillis, *The Feudal Monarchy in France and England: From the Tenth to the Thirteenth Century* (1936, reprinted 1983; originally published in French, 1933).

• **Philip III,** byname PHILIP THE BOLD, French PHILIPPE LE HARDI (b. April 3, 1245, Poissy, Fr.—d. Oct. 5, 1285, Perpignan), king of France (1270–85), in whose reign the power of the monarchy was enlarged and the royal domain extended, though his foreign policy and military ventures were largely unsuccessful.

Philip, the second son of Louis IX of France (Saint Louis), became heir to the throne on the death of his elder brother Louis (1260). Accompanying his father's crusade against Tunis in 1270, he was in Africa when Louis IX died. He was anointed king at Reims in 1271.

Philip continued his father's highly successful administration by keeping in office his able and experienced household clerks. Mathieu de Vendôme, abbot of Saint-Denis, whom Louis IX had left as regent in France, remained in control of the government. The death in 1271 of Alphonse of Poitiers and his wife, heiress of Toulouse, enabled Philip early in his reign to annex their vast holdings to the royal demesne. Nevertheless, in 1279 he was obliged to cede the county of Agenais to Edward I of England. The marriage in 1284 of Philip's son, the future Philip IV, to Joan, the heiress of the crown of Navarre and the countships of Champagne and Brie, brought these important areas also under Capetian control. In addition Philip over the years made numerous small territorial acquisitions.

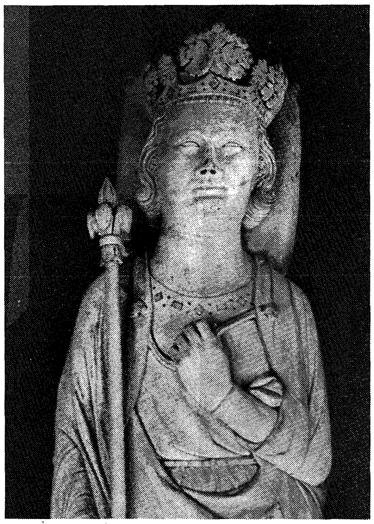
Philip was less successful militarily. In 1276 he declared war to support the claims of his nephews as heirs in Castile but soon abandoned the venture. In 1284, at the instigation of Pope Martin IV, Philip launched a campaign against Peter III of Aragon, as part of the War of the Sicilian Vespers, in which the Aragonese opposed the Angevin rulers of Sicily. Philip crossed the Pyrenees with his army in May 1285, but the atrocities perpetrated by his forces provoked a guerrilla uprising. After a meaningless victory at Gerona and the destruction of his fleet at Las Hormigas, Philip was forced to retreat. He died of fever on the way home.

• **Philip IV,** byname PHILIP THE FAIR, French PHILIPPE LE BEL (b. 1268, Fontainebleau, Fr.—d. Nov. 29, 1314, Fontainebleau), king of France from 1285 to 1314 (and of Navarre, as Philip I, from 1284 to 1305, ruling jointly with his wife, Joan I of Navarre). His long struggle with the Roman papacy ended with



Philip IV, detail of the statue from his tomb, 14th century; in the abbey church at Saint-Denis, Fr.

Archives Photographiques, Paris

the transfer of the Curia to Avignon, Fr. (beginning the so-called Babylonian Captivity, 1309–78). He also secured French royal power by wars on barons and neighbours and by restriction of feudal usages. His three sons were successively kings of France: Louis X, Philip V, and Charles IV.

Early years. Born at Fontainebleau while his grandfather was still ruling, Philip, the second son of Philip III the Bold and grandson of St. Louis (Louis IX), was not yet three when his mother, Isabella of Aragon, died on her return from the crusade on which Louis IX had perished. The motherless Philip and his three brothers saw little of their father, who, stricken by Isabella's death, threw himself into campaigning and administrative affairs. His troubled childhood and the series of blows he suffered explain in some measure the conflicting elements in his adult personality. In 1274 his father married Marie de Brabant, a beautiful and cultivated woman, and, with her arrival at court, intrigue began to flourish. In the same year, the two-year-old Joan, heiress of Champagne and Navarre, was welcomed as a refugee. Reared with the royal children, she would, when she was 12, become the bride of Philip the Fair.

In 1276 Philip's older brother, Louis, died, and the shock of this event, which suddenly made Philip heir of the kingdom, was compounded by persistent rumours of poisoning and suspicions that Philip's stepmother intended to see Isabella's remaining sons destroyed. Vague allegations were circulated that Louis's death was linked with certain unspecified "unnatural acts" of his father. These rumours, never satisfactorily put to rest, together with the unexpected change in Philip's fortunes, apparently served to arouse in him feelings of insecurity and mistrust.

Consequently, Philip turned elsewhere in search of a model for his own conduct. He found it in Louis IX, whose memory was increasingly venerated as the number of miracles attributed to him mounted. Reports of Louis's exacting standards of rulership and his saintly virtues were reinforced by the precepts of the religious advisers who surrounded the adolescent Philip. A more self-confident person might have been able to discriminate realistically among the sometimes artificially exaggerated stories and the utopian ideals. Philip, however, became convinced that it was his God-given duty to attain the lofty goals of his grandfather.

When Philip was 16, he was knighted and married to Joan of Navarre. In 1285 he accompanied his father to the south on a campaign to install Philip's brother Charles on the throne of Aragon. He had no sympathy with the enterprise, however, which was backed by his stepmother and aimed against the King of Aragon, his late mother's brother. When his father died in October 1285, Philip immediately abandoned the venture.

Wars with England and Flanders. In the first years of Philip's reign the Aragonese affair was settled, and Philip intensified his predecessors' efforts to reform and rationalize the administration of the realm. He dispatched investigators to inquire into the conduct of royal officials and into infringements upon royal prerogatives. Philip persisted in seeking such reforms, which strengthened the monarchy's position but angered the nobles, townsmen, and ecclesiastics who had profited from the laxer policies of earlier kings.

War with England began in 1294, initiating a 10-year period of conflict that severely strained Philip's resources. There had been some naval clashes, but full-scale war might well have been avoided had not Philip, perhaps in a fit of youthful bravado, decided to demonstrate his power over England's mighty Edward I, his vassal, for control of the duchy of Gascony. Philip's victories in 1297 may have satisfied his ambitions, but they brought no territorial gain, for the many lands that Philip had seized were returned. Nevertheless, the war was significant. First, the peace treaty of 1303 stipulated that Philip's daughter Isabella should marry the future Edward II of England—an alliance that resulted in years of peace between the two kingdoms. Second, during the war, Philip's vassal Guy of Dampierre, count of Flanders, had allied himself with Edward I, a move that Philip considered to be base treachery and that resulted in a breach between the two that persisted until long after Philip's death.

Before the peace, but after fighting with England had ceased, Philip made a move to crush the Flemings, only to see a host of his nobles fall at Courtrai in 1302. This stunning defeat was redeemed two years later at Mons-en-Pévèle, where Philip showed exceptional personal courage. Finally, in 1305, Philip forced Flanders to accept a harsh peace treaty that exacted heavy reparations and humiliating penalties.

In financing the prolonged effort against Flanders, Philip had held assemblies and had bartered privileges and promises of reform for support in the war. Most important, in abandoning the property taxes that earlier had been levied for defense, he enforced the principle that all must fight to defend France but might purchase exemption if they wished. This successful policy was later employed as a regular wartime expedient by the French monarchy.

Conflict with the papacy. Philip's rupture with Boniface VIII can be considered a third consequence of the English war. Because the hostilities interfered with papal plans for a crusade, Boniface intervened aggressively and sometimes tactlessly to promote peace. In February 1296 he issued the bull *Clericis Laicos*, prohibiting lay taxation of clergy without papal approval. Both Edward I and Philip, affronted by this threat to their authority and their treasuries, responded with retaliatory measures, forcing Boniface to retreat and, in July 1297, to proclaim the legitimacy of clerical taxation without the pope's permission when the ruler attested its necessity.

To mollify Philip, Boniface supported him against the Flemings and canonized Philip's grandfather Louis IX in 1297. The Pope's position in France was even weaker than he realized, for, at least as early as 1297, his enemies had spread charges against him, such as that he questioned the immortality of the soul or that he had plotted the death of his predecessor on the papal throne. Philip, for his part, had not rejected these stories out of hand.

New grounds for dispute developed in 1301, when Philip arrested Bernard Saisset, bishop of Pamiers, as a suspected traitor. Boniface, his confidence buoyed after the triumphant papal jubilee of 1300, determined not only to force Philip to send Saisset to Rome, but also to launch a frontal attack on the king's authority. In December 1301 Boniface suspended Philip's right to tax ecclesiastics and summoned the French clergy to Rome to discuss the King's governance and the state of the French Church. Saisset was permitted to go to Rome, but Boniface's other measures encountered immediate resistance. Philip had a papal bull burned and ceremoniously invoked curses on any of his sons who dared subordinate the kingdom to any power other than God's.

In April 1302 he rallied public support in a large assembly. Undaunted by his humiliating defeat by the Flemings at Courtrai and by Boniface's declaration of the universal supremacy of the Roman pontiff in the bull *Unam Sanctam*, Philip held additional assemblies in the spring of 1303. He issued his own grand ordinance of reform that included remedies for administrative weaknesses enumerated by the Pope. Then, in response to appeals by his ministers Guillaume de Nogaret and Guillaume de Plaisians, Philip pledged to see Boniface judged for the heretical words and criminal and immoral deeds with which he had been charged.

Boniface's plans to issue a personal sentence of excommunication against Philip were forestalled when Nogaret appeared in Anagni and seized Boniface on Sept. 7, 1303. Nogaret probably intended to press Boniface to submit to conciliar judgment, but his plans were frustrated when troops, rallied by Boniface's Italian enemies, turned to violence and pillage. Two days later townsmen of Anagni freed the Pope, whose death the following month saved him from having to appear before a council to answer Philip's charges. Accusations against Boniface's memory, however, proved a useful negotiating device in dealing with his successor, Benedict XI, and even more so with Clement V, the Gascon-born pope who pleased Philip by transferring the papal curia from Rome to Avignon, a city near Philip's realm. Charges against Boniface were pressed until 1311, when Clement declared Philip's zeal praiseworthy and nullified all the offensive bulls that Boniface had issued after November 1301.

The years of peace between 1304 and 1313 allowed Philip not only to pursue his posthumous vendetta against Boniface but also to formulate plans to establish himself as the undisputed champion of orthodoxy. Before 1304 Philip had given thought to the moral implications of his deeds, taking steps to indemnify those harmed by coinage changes and advancing approved justifications of other wartime measures. After 1304 his scrupulousness became more apparent. He secured bulls from Pope Clement that absolved him from future crusading vows, annulled any obligation to return sums wrongfully taken from ecclesiastics for his wars, and—after lengthy negotiation—declared the Flemings subject to ecclesiastical sanctions if they failed to observe the peace treaty of 1305. In 1306 reformation of the coinage, long advocated by the church, was begun, and in later years Philip sought his subjects' advice concerning monetary policy. Philip's intensified preoccupation with questions of conscience and morals may have been prompted by the death in April 1305 of Queen Joan, a determined woman of scholarly inclinations and a devotee of St. Louis. Philip never married again, and in the months after his wife's death he considered abdicating and assuming the kingship of the Holy Land as head of a consolidated crusading order.

Persecution of the Jews and Knights Templars. Philip soon found more practical ways of venting his grief and proving his dedication to God, while also advancing the material interests of a realm that was impoverished by long years of warfare. In 1306 he expelled all Jews from France, seizing their property and confiscating the monies owed to them. Philip's devotion to St. Louis was witnessed that same year by elaborate ceremonies in his honour, and Louis's anti-Semitic proclivities might have inspired Philip to act against the Jews, whose usefulness as a source of regular revenue had in any case been exhausted by his earlier repeated impositions.

Similarly mixed motivations influenced Philip to attack the Knights Templars, the wealthy, powerful, independent crusading order that had long acted as the French monarchy's financial agent. Philip's newfound interest in uniting the crusading orders made him mistrustful of the Templars' opposition to such plans. Thus, he was receptive to charges of heresy and sodomy presented against them in 1305. His tentative overtures to Clement V were fruitless, but, with the support of Nogaret and his own Dominican confessor—who was also the papal inquisitor in France—Philip decided in September 1307 to seize all Knights Templars in France and to exhort his fellow rulers to follow his lead.

At first dubious and reluctant, Clement V eventually supported Philip; he had been told of outraged anti-Templars appeals voiced in a large assembly of Philip's subjects, and he had heard damning confessions from the mouths of representatives of the order, many of whom had been tortured. Far-flung tribunals had gathered enough materials to cast doubts on the Templars' dedication, and, although not condemned as heretical, the order was quashed and its property assigned to the Knights Hospitallers. Whatever Philip's reasons for launching his attack against the order, his action brought him substantial financial gain despite Clement V's repeated attempts to protect the Templars' interests.

During the interwar years Philip asserted his independence of the Holy Roman Empire in diplomatic exchanges with imperial princes and the emperors themselves. He also fortified his eastern border by arranging marriages for his sons that extended French influence over the county of Burgundy and by exerting his authority over the city of Lyon. Less successful were his attempts to implement his dream of gaining control of the empire. He failed to have his brother Charles elected emperor in 1308, nor did he succeed on behalf of his second son Philip in 1313.

Last years. This disappointment presaged the troubles of Philip's last year as king. In June 1313 his fortunes had reached a high point. Having knighted his sons, taken the crusader's cross, and issued coinage-reform ordinances, he witnessed the triumphal departure of his sons against the Flemings, who had been excommunicated for their failure to observe the treaty of 1305. When the Flemings capitulated and accepted a truce, Philip magnanimously ordered the return of money collected for the army. After these successes and demonstrations of royal grace, 1314 brought only troubles. Philip's stubborn resolve to defend morality and the faith was shown when, with royal acquiescence, the grand master of the Templars, Jacques de Molay, was burned at the stake after retracting his earlier confession. Far graver were the public trial and execution of two young squires convicted of adultery with Philip's daughters-in-law.

The death of Clement V was another blow, but an even greater one was the Flemings' fresh uprising. With his subjects' agreement, Philip mounted another campaign, but the negotiation of a truce caused difficulties. There were rumours of treason involving one of Philip's ministers and insistent demands for the restitution of all money collected for the war. Philip, who needed the funds, delayed, and a coordinated movement of opposition developed. Nobles in northern and eastern France presented their grievances to the King, who by early November was lying ill at Poissy, St. Louis's birthplace, recovering from a minor stroke. Having regained strength, he travelled to his own birthplace, Fontainebleau, and there, a day before his death, he halted collection of his last tax and provided for a crusading expedition to be conducted in his name.

Assessment. Philip was aloof, sternly reserved, and physically striking—tall, fine-featured, and blond—hence his name, "the Fair." Frankly enjoying the trappings of monarchy, he built and maintained the palaces befitting his estate, but his chief concern was for the dignity of his office. He believed that he and his kingdom were guarded by God and chosen as special defenders of the Catholic faith. He valued the curative powers that he believed God's grace had given him. Proud of his orthodoxy and inspired by a priestly sense of mission, he was receptive to accusations of sin and heresy levelled against others, and he prosecuted ruthlessly those charged with such failings.

A visionary idealist, he also possessed a fundamental sense of the possible and the necessary, and those of his grandiose schemes that exceeded the bounds of practicality were abandoned. As authoritarian and determined as he sometimes appeared, he lacked the firmness and independence of judgment that a surer sense of confidence in himself might have afforded him. He often turned for guidance to the intelligent and able ministers whom he promoted and protected, and he solicited the support of his subjects, who were called together with unprecedented frequence to endorse and sometimes to help construct royal policy. Such consultation may have been politically expedient, but, like the expressions of reassurance obtained from spiritual authorities, it also served to convince Philip of the legitimacy of his actions.

Philip was, by all accounts, an impressive ruler. Some Italian writers detested him and his line, but most contemporaries acknowledged his piety and good intentions, although many of them disapproved of his wars, his taxes, and his influential advisers. In the later years of the 14th century, when memory of these sources of complaint had faded, his reign was considered a golden age of freedom from burdensome and unjust taxation. Historians of recent times have differed in their judgments, and nationalistic and ecclesiastical biases have affected many assessments. It now seems possible to conclude, however, that the most striking accomplishments of his reign bear the ultimate impress of the complex personality of a scrupulous, suspicious, rigorous, visionary, determined man who fervently believed himself called by God to act as judge of the morals and welfare of his subjects.

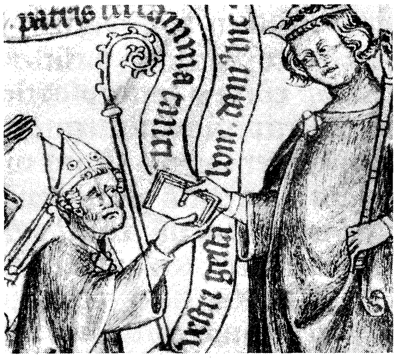
Philip V, byname PHILIP THE TALL, French PHILIPPE LE LONG (b. *c.* 1293—d. Jan. 3, 1322), king of France (from 1316) and king of Navarre (as Philip II, from 1314), who largely succeeded in restoring the royal power to what it had been under his father, Philip IV.



Philip V, detail of a Latin manuscript, early 14th century; in the Bibliothèque Nationale, Paris (MS. Latin 5286)

Philip was the second son of Philip IV, who made him count of Poitiers in 1311. When his elder brother, King Louis X, died in 1316, leaving an infant daughter Joan by his adulterous first wife, and a pregnant widow, Philip won recognition as regent for the unborn child and then, upon its death in November 1316, five days after birth, declared himself king. Anointed at Reims in January 1317, Philip quickly moved to consolidate his position, and on February 2 an assembly of barons, prelates, Parisian bourgeois, and doctors of the University of Paris recognized him as king, enunciating the principle that Joan, as a woman, could not succeed to the throne of France.

Anxious to ensure peace and order as a means to the prosperity of the kingdom, Philip established a system of local militias under officers responsible to the crown; he also increased the efficiency of government machinery at all levels and checked the abuses of local officials. He was succeeded by his brother, Charles IV.

Philip VI, byname PHILIP OF VALOIS, French PHILIPPE DE VALOIS (b. 1293—d. Aug. 22, 1350, near Paris), first French king of the Valois dynasty. Reigning at the outbreak of

Philip VI, detail from a French manuscript, 14th century; in the Bibliothèque Nationale, Paris (MS. Fr. 18437)

the Hundred Years' War (1337–1453), he had no means of imposing on his country the measures necessary for the maintenance of his monarchical power, though he continued the efforts of the 13th-century Capetians toward the centralization of the administration in Paris. To raise taxes for war, he was obliged to make concessions to the nobility, the clergy, and the bourgeoisie; hence his reign witnessed the important development of the political power of the estates. The bourgeoisie, profiting from the king's power, proved grateful and loyal; among the clergy and nobility, however, a movement for reform of finances took root.

The elder son of Charles of Valois, Philip was first cousin to the brothers Louis X, Philip V, and Charles IV, the last Capetian kings of the direct line. On the death of Charles IV in 1328, Philip, in the face of opposition from the partisans of the claim of Edward III of England, assumed the regency until the end of the pregnancy of Charles IV's widow. When the widow produced a daughter, who therefore could not succeed to the throne, Philip became king and was crowned at Reims in May 1328.

After the outbreak of a revolt in Flanders in August of that year, the count of Flanders appealed to Philip, whose knights butchered thousands of rebellious Flemings at the Battle of Cassel. When shortly thereafter Robert of Artois, who had helped Philip to win the crown, claimed the countship of Artois against a member of the royal family, Philip was forced to institute judicial proceedings against Robert, who became his bitter enemy. In 1334 Robert went to England and began to foment trouble between Edward III and Philip, hastening the deterioration of Anglo-French relations, which in 1337 led to the outbreak of the Hundred Years' War. Military operations were at first restricted. In 1340, however, France suffered a grave defeat in the naval Battle of Sluys. Meanwhile, the internal situation had worsened, as a result of resentment over the preponderant influence of the nominees of the powerful Duke of Burgundy in the king's council. A serious crisis resulted in 1343 and forced Philip to summon to Paris the estates of the kingdom, which took some measures to appease public opinion and to relieve the burdens of administration. France's devastating defeat by the English at Crécy (1346) gave rise to another crisis. To conciliate opponents, the government was obliged to entrust finances to three abbots. A new meeting of the estates in November 1347 again forced the King to recast his council. The spread of the Black Death in 1348 and 1349, however, overshadowed all political questions. When Philip died, he left France divided by war and plague, although by purchase he had made some important additions to the territory of the kingdom.

GERMANY/HOLY ROMAN EMPIRE

• **Philip,** also called PHILIP OF SWABIA, German PHILIPP VON SCHWABEN (b. 1178—d. June 21, 1208, Bamberg, Ger.), German Hohenstaufen king whose rivalry for the crown involved him in a decade of warfare with the Welf Otto IV.

The youngest son of the Holy Roman emperor Frederick I Barbarossa, Philip was destined for the church. After being provost of the cathedral at Aachen, he was, in 1190 or 1191, elected bishop of Würzburg. Shortly after the death of his brother Frederick (1191), however, he abandoned his ecclesiastical career. Another brother, the Holy Roman emperor Henry VI, made him duke of Tuscany in 1195 and duke of Swabia in 1196. In May 1197 he married Irene, daughter of the Byzantine emperor Isaac II Angelus.

Philip, sculpture, *c.* 1207; in the St. Ulrich Museum, Regensburg, Ger.

By courtesy of the St. Ulrich Museum; photograph, Foto Marburg—Art Resource/EB Inc.

At Henry VI's death in September 1197, his son, the future emperor Frederick II, was less than three years old, and the German princes were unwilling to accept him as king. The princes favourable to the Hohenstaufens elected Philip German king in March 1198. The opposing party, led by Archbishop Adolf of Cologne, elected Otto, a son of Henry the Lion of Brunswick of the rival Welf dynasty, king in June of that year. Otto was crowned at Aachen, the proper place for the ceremony, by Archbishop Adolf. Philip's coronation, by another prelate, did not take place until September 1198 at Mainz.

In the ensuing civil war the Hohenstaufen cause prospered at first. In 1201, however, Pope Innocent III recognized Otto as king and excommunicated Philip. Philip's fortunes were only restored in 1204, by a series of defections from Otto's side, culminating in that of Adolf of Cologne himself. In June 1205, Adolf crowned Philip at Aachen.

The city of Cologne, which, notwithstanding its archbishop, had sided with Otto, was captured in January 1207, and Otto's cause seemed lost. Late in 1207, however, when Philip offered to give Otto one of his daughters in marriage and to enfeoff him with either the duchy of Swabia or the kingdom of Arles, Otto, buoyed by hopes of financial, if not military, support from the kings of England and Denmark, rejected the offer. Nevertheless, a truce was arranged that lasted until June of the following year.

In 1208 Pope Innocent III recognized Philip as king and promised to crown him emperor. Philip, who had mobilized his army at Bamberg in order to move against Otto, was waiting for the truce to expire when he was murdered by Otto of Wittelsbach, count Palatine of Bavaria, to whom he had refused to give one of his daughters in marriage. Eventually his daughters were married: Beatrix the Elder to his old rival Otto, Cunigunda to King Wenceslas of Bohemia, and Beatrix the Younger to Ferdinand III of Castile.

A brave man, Philip was praised by contemporaries for his mildness and generosity. The diversion of the Fourth Crusade to Constantinople is assumed by some authorities to have been prompted by him in the interests of his brother-in-law, the Byzantine emperor Alexius IV Angelus.

HESSE

• **Philip,** byname PHILIP THE MAGNANIMOUS, German PHILIPP DER GROSSMÜTIGE (b. Nov. 13, 1504, Marburg, Hesse [Germany]—d. March 31, 1567, Kassel), landgrave (*Landgraf*) of Hesse (1509–67), one of the great figures of German Protestantism, who championed the independence of German princes against the Holy Roman emperor Charles V.

Early years. Philip was the son of Landgrave William II, a cultivated, austere man and an experienced soldier. He died when Philip was barely five years old. Philip's mother, Duchess Anna of Mecklenburg, was a passionate, energetic, and ambitious woman; her relations with her son, however, were cool and were impaired by her second marriage in 1519 and by Philip's conversion to the doctrines of Martin Luther. As a victim of political forces he spent a gloomy youth, attaching himself increasingly to his older sister Elizabeth, later duchess of Saxony; throughout his life no one was closer to him than she.

In March 1518 the emperor Maximilian I declared Philip to be of age. While assuming the government in name, he retained his parents' capable counselors, mostly lawyers by training, who imbued the young man with his parents' single-minded devotion to the welfare of the state. Philip eventually developed into a self-reliant politician. From his youth, he characteristically thought in terms of the territorial state, an attitude that was to determine his future relations with the Habsburg emperors. He ruled his territory in the spirit of an early enlightened despotism.

Philip, detail of a portrait by Hans Krell, 1525; in the Wartburg Sammlungen, Eisenach, Ger.

The landgraviate of Hesse had suffered greatly during his mother's regency, but Philip succeeded in bringing order to the confused administration of the state and, through skillful management of alliances, in freeing Hesse from its isolation in foreign affairs. In 1523 Philip, fighting alongside the powerful electors of the Palatinate and of Trier, defeated the rebellious imperial knight Franz von Sickingen. This victory also crushed the remaining opposition of the Hessian nobility and undoubtedly strengthened the young man's self-confidence.

Two years later, in fact, he scored his first personal triumph when he suppressed the peasant revolt in the neighbouring imperial abbeys of Fulda and Hersfeld. He then advanced into Thuringia and, allied with the elector of Saxony and the dukes of Brunswick-Wolfenbüttel and Saxony, defeated Thomas Müntzer, a popular preacher from Mühlhausen/Thüringen, at a battle near Frankenhausen in May 1525. By this victory Philip saved the central German principalities from destruction.

Conversion to Protestantism. During these years, while the first storm of the Reformation was sweeping through Germany, Luther's teachings gained a firm hold in many Hessian localities and at the landgrave's court. It was not until the summer of 1524, however, after making a detailed study of the Bible, the writings of the Church Fathers, and the history of the church, that Philip himself joined Luther. At the same time, orthodox Roman Catholic princes of southern Germany were uniting to make common cause against the ecclesiastical innovations. After the defeat of the peasants this alliance was aimed to bring down the middle and northern German princes as well, in order "to eradicate the damned Lutheran sect, the source of this revolt."

Philip was deeply convinced that the religious question was at the same time a political one, and he was the first to recognize that freedom for the new faith would be secured only if Protestant sovereigns and towns united for defense. In May 1526 he won over the elector John of Saxony for a defensive alliance, which other northern and eastern German princes then joined. Henceforward, he strove to unite the Protestant estates into a powerful alliance, which would render them unassailable and thus allow them to build their state churches.

Only when the decree of August 1526 of the imperial Diet of Speyer seemed to provide a legal basis for it and when a Hessian "synod" (part church council, part provincial diet) at Homberg had publicly discussed the religious question did Philip carry through the Reformation in his state. The Homberg deliberations led to the *Reformatio ecclesiarum Hassiae,* unique for its democratic-presbyterian church constitution and the ecclesiastical discipline of the congregations. On Luther's advice this reform, conceived by the former Franciscan Franz Lambert, was not carried out; instead Hesse became Protestant on the model provided by the electorate of Saxony.

Philip, however, continued to favour the teachings of the southern German and Swiss reformers and consequently resolved to mediate between the Lutherans and the Zwinglians, adherents of the Swiss reformer Huldrych Zwingli. Within one year, 1527, Philip secularized all the monasteries. The new state-church organization was now methodically built up. In order to ensure a new generation of clergy and officials, the landgrave took the educational system in hand and founded the first Protestant university in 1527 at Marburg. On former monastic and church estates, he set up four hospitals for the insane, the first "psychiatric" hospitals known to medical history. Church and school were subordinated to the "common good."

There arose the Protestant authoritarian state, which considered itself a taskmaster responsible for the religious and moral life of its subjects and dictated their beliefs. Like all his fellow princes, Philip was intolerant, but, in contrast to most, he respected the individual's freedom of conscience by permitting dissenters to emigrate. He soon showed this attitude in his dealings with the Anabaptists: his purpose was not to punish them as the imperial laws dictated but to convert them by clemency and instruction in doctrine; in this work Martin Bucer, the reformer from Strasbourg, was his helper. They introduced into Hesse in 1539 the rite of confirmation, which became a model for Protestant churches.

Leadership of the Protestant states. His agile and fertile mind, infectious energy, and fearlessness rapidly made Philip the leader of the Protestant estates. He continued to strive for a great Protestant alliance, for he clearly recognized that the situation of the Protestants would deteriorate if the Roman Catholic emperor Charles V were to triumph in the struggle for European predominance. The way to change and reform began in 1529, when the second imperial Diet of Speyer repealed the first imperial Diet's decree of 1526. A group of princes and towns led by Philip protested (hence Protestants) against the repeal on the epoch-making grounds that in questions of faith each imperial estate would have to justify itself before God alone.

Moreover, the landgrave saw with growing apprehension that doctrinal differences between Protestants endangered the development of an all-embracing Protestant defensive alliance. His attempt at the Colloquy of Marburg, in October 1529, to bring about a theological settlement in personal discussion with the reformers, headed by Luther and Zwingli, essentially failed over the question of the Eucharist. Thus, the ambitious plans he shared with Zwingli for a European alliance against the Roman Catholic house of Habsburg remained only a dream.

Despite everything, Philip managed in 1531 to unite 6 princes and 10 towns in the Schmalkaldic League, which was to serve as a defensive alliance. Although it had serious organizational shortcomings, the league gradually became the centre of Protestant politics. At the same time, it became a rallying point for the enemies of the house of Habsburg as well as for those Roman Catholic princes who were fearful for their independence. The league, of which the landgrave was the driving spirit, became, moreover, a factor in European politics. Philip reached the peak of his career in 1534, when he executed a campaign to restore Duke Ulrich of Württemberg, who had been driven from his state by the Habsburgs. As a result of his success, Württemberg was opened up to the Reformation, and Austria's power in southern Germany was broken.

Decline. It was Philip's tragedy that he destroyed his own leading position a few years later by his extremely provocative marital transactions. In addition to his marriage to the duchess Christina of Saxony in 1523, he contracted a second marriage with Margarete von der Saale, a maid of honour of his sister Elizabeth. As a bigamist he fell under the judgment of the Holy Roman emperor, with whom he now tried to come to terms, but, while Philip and the Schmalkaldic League remained inactive and the other Protestant princes indulged in petty disputes, the emperor Charles V prepared to settle the religious problem once and for all by force of arms. In the summer of 1546 he attacked. The league's unwieldy organization, long deplored by Philip, now took its toll. Mistakes of leadership, lack of finance, and ultimately the attack by the Protestant duke Maurice of Saxony on the territory of his cousin the elector John Frederick of Saxony hastened the collapse.

After the capture of the Elector, Philip submitted himself to the mercy of the Emperor in June 1547. Deceived by Charles, he, too, was led away a prisoner. His long imprisonment in the Netherlands deeply affected his mental powers of resistance. In order to gain his freedom, he accepted the so-called Augsburg Interim, by which the Emperor attempted to restore the unity of the Catholic faith without interference from the princes. Philip, however, failed in his attempt to gain his freedom, for the Hessian population resisted conversion to Catholicism. Only after his son-in-law, Maurice of Saxony, and Philip's eldest son, William, in alliance with other German princes and Henry II of France, unexpectedly rose against the Emperor in March 1552 were he and John Frederick released.

Aged and ailing, but also wiser, the Landgrave returned to his homeland. After the victory over the Emperor, the adherents of the Confession of Augsburg—the official Lutheran doctrine—succeeded in gaining a position of legal equality with the Catholics in the empire, in accordance with the Peace of Augsburg of 1555. In this respect Philip, who was far ahead of his time, expressed genuine tolerance for all Christian denominations. He continued to pursue his old plans for a Protestant union and strove on behalf of his embattled co-religionists in France and the Netherlands, but in his later years he cautiously remained in the background of the political stage. He devoted all his strength to the rebuilding of his state, which had been ravaged by war and by its occupation by foreign troops. By the time of his death in 1567, his contemporaries were already referring to the warm-hearted and generous sovereign as the Magnanimous.

(W.He.)

BIBLIOGRAPHY. A bibliography of literature on Philip is given in K.E. Demandt, *Schrifttum zur Geschichte und geschichtlichen Landeskunde von Hessen,* vol. 1, pp. 203–212 (1965). General information is found in *The New Cambridge Modern History,* vol. 2, ch. 3 and 6 (1958). Philip's political correspondence is preserved in the Hessisches Staatsarchiv Marburg and has been calendared in F. Kuech and W. Heinemeyer (eds.), *Politisches Archiv des Landgrafen Philipp,* 4 vol. (1904–59). Valuable individual research is contained in the publications issued in 1904 to honour Philip: *Festschrift zum Gedächtnis Philipps des Grossmütigen,* published by the Verein für hessische Geschichte und Landeskunde (1904); *Philipp der Grossmütige,* published by the Historischen Verein für das Grossherzogtum Hessen (1904); and C.A. von Drach and G. Koennecke, *Die Bildnisse Philipps des Grossmütigen* (1905).

JUDAEA

• **Philip** (b. 20 BC—d. AD 34), son of Herod I the Great; he ruled ably as tetrarch over the former northeastern quarter of his father's kingdom of Judaea.

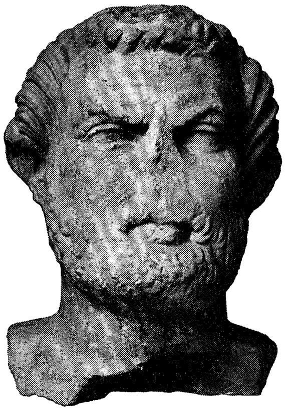
When the Roman emperor Augustus adjusted Herod's will, Philip was assigned to the region east of the Sea of Galilee, in modern northern Israel, Lebanon, and southern Syria. In AD 6, he may have joined in charging his half brother with misgoverning Judaea, but with little benefit to himself, for Judaea then became a Roman province.

Of his father's inheritance his was the poorest share, but he ruled it well. Because he had few Jewish subjects, he pursued a policy of Hellenization. His coins bore the Emperor's image, and he rebuilt a town, Beth-saida (on the northern shore of the Sea of Galilee), renaming it Julias in honour of the Emperor's daughter. Near the source of the Jordan he founded another town and allowed it a large degree of self-government, on the Greek pattern.

Philip was less extravagant a ruler than any of his brothers. He avoided prolonged trips to Rome, instead travelling extensively in his territory and devoting his time to his subjects. Late in his reign he married Salome, the daughter of Herodias, who was her mother's tool in securing from Herod Antipas the execution of John the Baptist.

MACEDONIA

• **Philip II,** byname PHILIP OF MACEDON (b. 382 BC—d. 336, Asia Minor), 18th king of Macedonia (359–336 BC), who restored internal peace to his country and then, by 339, had gained domination over all Greece by military and diplomatic means, thus laying the foundations for its expansion under his son Alexander III the Great.



Bust, tentatively identified as Philip II of Macedonia, middle of the 4th century BC; in the Ny Carlsberg Glyptotek, Copenhagen

Early life and accession. Philip was a son of Amyntas III. In his boyhood he saw the Macedonian kingdom disintegrating while his elder brothers Alexander II and Perdiccas III, who each reigned for a few years, strove unsuccessfully against insubordination of their regional vassal princes, intervention of the strong Greek city Thebes, and invasion by the Illyrians of the northwest frontier.

Philip himself spent some time as a hostage at Thebes, the leading city (with Athens) of this decade (370–360 BC), where the great Epaminondas, the most inventive tactician of all Greek generals until then, was in charge of the best army in Greece. These were probably the most formative years of Philip's education. When he returned to Macedonia his brother Perdiccas soon found him ready for a command.

Philip came to the throne suddenly and unexpectedly in 359, when Perdiccas was killed meeting an Illyrian invasion. The Illyrians prepared to close in; the Paeonians were raiding from the north, and two claimants to the throne were supported by foreign powers. In this crisis Philip showed a good sense of priorities by buying off his dangerous neighbours and, with a treaty, ceding Amphipolis to Athens. He used the time gained in military preparations. The army that later conquered Persia was developed all through his reign, but the decisive innovations in arms—the *sarissa,* a pike nearly half as long again as the spear of the Greeks—tactics, and training belong probably to this first year.

Macedonian expansion. In 358 he invaded Paeonia, and then he defeated the Illyrians decisively, in a battle that already suggests a master of war. The next year his marriage with Olympias, the Molossian princess of Epirus (the mother of Alexander the Great), helped to stabilize his western frontier. Now he ventured to antagonize Athens by recapturing Amphipolis, the strategic key securing the eastern frontier and giving access into Thrace; and in 356 he took the west Thracian Crenides (renamed by him Philippi), a place newly founded to exploit new finds of silver and gold in Mount Pangaeum. These successes frightened his neighbours into forming a coalition against him, which was joined by Athens; but it achieved nothing.

The 10-year "war for Amphipolis" with Athens showed that the Athenians, with all their naval power, were quite unable to damage the continental and military power of Macedonia or even to save their own allies from Philip's attacks. Meanwhile he twice penetrated deeply into Thrace. And in the south a Thessaly divided against itself gave him an entry into Greece. These same 10 years saw central Greece immersed in the Sacred War to liberate Delphi from its occupation by the Phocians, enabling Philip to intervene as the ally of Thebes and the Thessalian League of city states. His only great defeat in the field came in Thessaly in 353, owing (it seems) to overconfidence and failure of reconnaissance. The next year he retrieved it with a spectacular victory, which forced the Athenians to occupy Thermopylae and bar his path to the south.

Presidency of the Thessalian League. Characteristically, Philip declined the trial of strength, prepared to wait for six years until he could gain Thermopylae by negotiation and without striking a blow. Meanwhile his Thessalian victory earned him election as president (*archōn*) of the Thessalian League (probably 352), a position unique for a foreigner in a Greek confederation and one that was to bind Thessaly to the kings of Macedonia for 150 years and more.

Philip's capture of Olynthus and annexation of Chalcidice in 348, enslaving the Olynthians and other of the Chalcidians, was disquieting to many. The Greeks themselves occasionally were brutal to small cities, but Olynthus was a large city. Philip's enemies could affect a high moral tone and contempt for a barbarous Macedonian, but even his friends might have wondered whether he ought to be allowed into the heart of Greece with an army. Yet there were many ways in which he could serve them. Particularly, he could finish the Sacred War, which the Thessalians, Thebans, and others still could not finish for themselves. Athens could not prevent this now and had reason to fear that Philip's next campaign in Thrace (346) might challenge its own control of the sea route to southern Russia, its main source for imported corn. Significantly, however, it was Philip, and not Athens, who made the first overtures for peace, though all the military initiatives lay in his own hand. His plans for the future, in Greece and farther afield, included Athens as a willing ally, not as a defeated enemy.

Even before the peace with Athens was ratified (346), the Athenian publicist Isocrates was inviting Philip to reconcile the four leading cities of Greece and to lead a united Greek alliance in a war of expansion against Persia. A step in this direction was Philip's intervention now to end the Sacred War, in recognition of which he was admitted to membership of the Delphic Amphictyony—an association of neighbouring states. The votes of the Thessalians and their clients gave him a control of its council, which could be used on occasion for political and diplomatic ends.

He lost no opportunity in the next years (346–343) of penetrating Greece without war, by winning and buying friends among the politicians of the smaller cities and intervening occasionally with subsidies or a force of mercenaries in their local disturbances. This policy made him some enemies, too, and it played into the hands of the great orator Demosthenes and others at Athens. Demosthenes saw Philip now as a bar to Athenian greatness and a threat to its freedom and existence; he talked tirelessly to warn the Athenians of the danger and to convince the Greeks in general that it was their danger too. Philip in these years conciliated Athens in small ways even under provocation, but he came to see that Demosthenes and the anti-Macedonians were beyond conciliation (343–342). Meanwhile, he reasserted his suzerainty over the neighbouring Illyrians, tightened his grip on Thessaly, and in 342 began the series of campaigns in Thrace that enabled him in two years to annex great parts of it as a province, and finally to demonstrate his power against the Scythians settled on the southern banks of the Danube Delta. The events in Thrace caused two of his Greek allies, the cities of Perinthus (later called Heraclea, present-day Marmaraereğlisi) and Byzantium, to review their position, and his coercion of them led to the two great sieges that showed the development of his artillery and allied arms, of which his son Alexander was to make greater use in Asia.

The declaration of war by Athens in 340 enabled him to raise the two sieges without undue loss of face, though he had failed to establish a threat to the Athenian corn route to southern Russia. Athens was to be intimidated now by invasion of its territory through central Greece, where the key position was held by Thebes, his ally hitherto, but of late a dissatisfied and recalcitrant one. His services to it in the Sacred War had been more than offset by his new position as its successful rival for leadership in and through the Amphictyony, and his moves toward hegemony in Greece could be seen in Thebes as encroachments.

Victory of Chaeronea. When Philip swept south with his army in November 339, he hoped to rush the Thebans into honouring their alliance and letting him through into Attica. The Thebans listened instead to Demosthenes and to their own instinct of self-preservation. The Greek alliance became something formidable with the accession of Thebes, and Philip was forced, as a contemporary orator put it with only a mild exaggeration, "to stake his all on the issue of one short day." Chaeronea was a famous victory, gained by decisive blows of Philip's cavalry. His real skill as a general can be seen, though dimly, in a manoeuvre of controlled retreat aimed at dislocating the advancing Greeks and creating gaps for the cavalry to strike. By winning this battle he had won the war.

In the various peace treaties with the Greek states, Thebes had to admit a Macedonian garrison, and its democratic constitution was replaced by a pro-Macedonian government; but Athens suffered neither invasion of its territory nor interference with its democracy and was not disarmed by dismantling of the walls or surrender of the navy. For Philip, Athens was the one Greek state from which he needed not neutrality or unwilling alliance but active cooperation. All past experience had shown that wars against Persia succeeded only when the Persians were denied the use of the Aegean, and for this the great Athenian navy was the first need.

In Greece (outside Thessaly), Philip could have had no illusions about his own unpopularity, except among those of the well-to-do who were attracted by his court and his patronage; some cities also (especially the neighbours of Sparta) were glad to lean on Macedonia for support against an ancient enemy. Philip intended to involve all the Greeks with the Persian war. So Isocrates had advised him eight years before; but on the details of the ways and means he had no advice to offer. Philip himself organized the Greeks now to keep the peace with him and with each other and to support him in the Persian war overseas. In the constitutional details of his settlement of Greece he may well have had the help of Aristotle, free from his recent duties as tutor of the young Alexander.

The League of Corinth. Philip's so-called League of Corinth, established in 337, was an organization designed to preserve and perpetuate a general peace (*koinē eirēnē*), inaugurated when the delegates of all the states of Greece (except Sparta) and the islands swore to abide by it and to recognize Philip as president (*hēgemōn*) for this purpose. The general peace was a political innovation of the Greeks themselves, used several times in the past 50 years in attempts to stabilize affairs while promoting this or that hegemony. The peace had never lasted long because the leading Greek states had neither the power nor the mutual trust to create an effective organization for collective action against aggressors.

Philip designed a council of representatives from all the states (*synedrion*), which was empowered to deliberate and decide on action to be taken in the event of the peace being broken or threatened. After the decisions were made, their execution lay with Philip as *hēgemōn.* The states were under obligation to supply troops or ships to the *hēgemōn* on demand, by quotas corresponding to their voting power on the council. Though neither Philip nor Macedonia had representatives on the council, it was the knowledge that the *hēgemōn* had the power of Macedonia in his hand that made this organization effective. As it happened, Corinth, where the inaugural meeting was held, was one of only three Greek cities with a Macedonian garrison, a fact the significance of which can have been lost on nobody.

Last years. Philip was wise, no doubt, to build on the foundation of the earlier practice of the Greeks themselves and also to refrain from organizing them in any permanent alliance that would have recalled too much the unpalatable experiences of the past. He was not, however, a Greek politician or even a Greek, but king of the Macedonians; and he cannot possibly have seen the settlement of Greece—as most modern historians have seen it—as the culmination of his life's work. For him it culminated nothing and was not even an end in itself but only a means. Chaeronea had brought the Greeks to order, and his plans required that they should stay in order now. The *synedrion* at Corinth heard his program for a Persian war and duly acclaimed it early in 337. Early the next year an advance force of the Macedonian army crossed to Asia Minor. Philip would lead the grand army into Asia presently, and the Greeks would be with him.

This meteor fizzled out. The subtle, pliant, patient, calculating diplomatist, master of timing in politics and war, ended his life in a tale of irresponsible incompetence. The historian Theopompus, who saw Philip at close quarters, made much of his vices, his love of drink and debauchery, and his wild extravagance with money. Allowance made for this notably faultfinding and puritanical writer, Philip's character did contain some real ambiguities, extending into his domestic life. His "political marriages" were mostly opportune symbols of goodwill toward princes or groups worth conciliating, but his last marriage, in 338, to the Macedonian Cleopatra, led to a final break with Olympias, his queen, who left the country accompanied by the crown prince Alexander. Though Olympias was unpopular at court and though Cleopatra's connections were powerful and important, it was not "politic" to put the succession in jeopardy. Philip showed that he had never intended this result, by taking trouble to be reconciled with Alexander. The tradition that makes him infatuated with Cleopatra is probably right. If so, he misjudged fatally the amount of harm that could be done by marrying her.

With the preparations far advanced for the crossing into Asia, at the grand celebration of his daughter Cleopatra's marriage to Alexander of Epirus (brother of Olympias), Philip was assassinated by Pausanias, a young Macedonian noble with a bitter grievance against the young queen's uncle Attalus and against Philip for denying him justice. This was the official explanation, and Pausanias himself could add nothing to it; he was killed on the spot. Suspicion fell on Olympias and Alexander, those with most to gain from Philip's death, and many modern interpreters have followed it. Aristotle, however, clearly did not believe it. In his *Politics* a few years later he used this incident as an example of a monarch murdered for private and personal motives—which would have been a puerile indiscretion if either he or the world in general had ever taken the canard seriously.

Assessment. So ended, unworthily, the first of the great Macedonians. Everything known about him comes from Greek sources, which concentrate on his impact upon the Greeks and their history. Yet even more impressive, in view of Macedonia's troubled and undistinguished past, would be the full story of his unification and expansion of his own kingdom; his control of its regional princes, nobles, and gentry and their retainers, to form a great Macedonian people, symbolized by the finest army the world had seen; and his continuing attrition by warfare and diplomacy, which in some 20 years reduced much of the Balkan peninsula to subservience.

The apparently untidy record of his campaigns into Illyria or Thrace and of his interventions with diplomacy or arms (or both) in Thessaly, Euboea, and the Peloponnese, which might suggest that repetition is a sign of incompetence, seem better interpreted as the work of a strategist operating always on several fronts, often preferring diplomacy to war, limited objectives to the grandiose, the smaller risks to the greatest; especially never forgetting that there is always another day. His decisive day at Chaeronea came, in a sense, because his true policy in Greece had failed, thanks partly to Demosthenes. But probably to take control of Greece without a Chaeronea was a real impossibility at this date (or indeed later).

Though Philip certainly wanted to be acceptable in Greece and did attract many important Greeks to his court, his philhellenism has been overrated: Olynthus and other Greek cities knew better. Though he cultivated the Athenians for reasons of high policy, there is no evidence that he ever in his life set foot in Athens, a remarkable piece of insouciance at every level. Pella, his capital, had long been a resort or refuge of great men of letters, and under Philip the connection with Plato's Academy was preserved, Theopompus was entertained, and Isocrates was invited; the leading actors of the Athenian stage appeared in Macedonia, too. Aristotle, whose father had been physician to Amyntas, Philip's father, spent three or four important years as Alexander's tutor.

Philip presumably was at home with these people, but tradition says nothing of him as a man of letters himself or as an intellectual, though as an orator he could impress a party of Athenians that included Demosthenes and Aeschines and other professionals. His charm was great; he was by nature convivial, hospitable, and a bon viveur. Undoubtedly he drank too much and too often, with the saving grace that he was known to listen to home truths even when drunk. As a commander in the field he was unwearying, and in action he fought like a lion; in the end he was really disfigured with old wounds. He was a general perhaps not of genius but of a very high order, with the tactical skill to coordinate the cavalry and infantry arms which were largely of his own creating. Making and training over the years a great army, he was paradoxically sparing and even cautious in using it.

If he had survived to invade Asia, it would not have been to overthrow the Persian Empire. He might have established a Macedonian empire in Asia, perhaps, but it would have been a Mediterranean empire in character. The Greeks would have benefitted by colonization, but the problem of Greek freedom would have remained, with the political domination of the higher culture by the lower. Philip was aware of the problem, and the League of Corinth, with its facade of freedom, was his answer. It did not deceive the Greeks or satisfy them; but no later Macedonian king could improve on it. Philip had made Macedonia, and now Macedonia and its kings made world history. (G.T.G.)

Wust, *Philipp II von Makedonien und Griechenland in den Jahren von 346 bis 338* (1938, reprinted 1973), an excellent analysis of Philip's later years. George Cawkwell, *Philip of Macedon* (1978), is a balanced, well-researched biography.

• **Philip V** (b. 238 BC—d. 179, Amphipolis, Macedonia), king of Macedonia from 221 to 179, whose attempt to extend Macedonian influence throughout Greece resulted in his defeat by Rome. His career is significant mainly as an episode in Rome's expansion. The son of Demetrius II and his wife Phthia (Chryseis), the young prince was adopted, after his father's death in 229, by his half-cousin Antigonus Doson, who took the throne. Philip succeeded upon Antigonus' death (summer 221) and soon won renown by supporting the Hellenic League in its war against Sparta, Aetolia, and Elis (220–217). In 215 Philip, allied with Hannibal, the Carthaginian general who was invading Italy (Second Punic War), attacked the Roman client states in Illyria and initiated 10 years of inconclusive warfare against Rome (First Macedonian War). The Romans countered his moves by an alliance with the Greek cities of the Aetolian League, but Philip effectively aided his allies. When the Romans withdrew in 207, he forced an independent settlement upon Aetolia (206) and concluded the war with Rome on favourable terms (Peace of Phoenice, 205).

Philip then turned to the east. He plotted against Rhodes and in 203–202 conspired with Antiochus III of Syria to plunder the possessions of the Egyptian king Ptolemy V. But the people of Rhodes and Pergamum defeated Philip at sea off Chios (201) and so exaggerated reports of his aggression that Rome decided to declare war (Second Macedonian War, 200–196). The Roman campaigns in Macedonia (199) and Thessaly (198) shook Philip's position in Greece, and in 197 the Romans decisively defeated him at Cynoscephalae in Thessaly.

The terms of the peace confined Philip to Macedonia; he had to surrender 1,000 talents indemnity and most of his fleet and deposit hostages, including his younger son, Demetrius, at Rome. Until 189 Philip aided Rome against her enemies on the Greek peninsula. As a reward his tribute was remitted and his son restored (190).

Philip devoted the last decade of his life to consolidating his kingdom. He reorganized finances, transplanted populations, reopened mines, and issued central and local currencies. Neighbouring states constantly and successfully accused him at Rome, however. Becoming convinced that Rome intended to destroy him, he extended his authority into the Balkans in three campaigns (184, 183, 181). In 179, while pursuing a scheme for directing the Bastarnae against the Dardanians, Philip died. He had been a fine soldier and a popular king whose plans for expansion lacked consistent aims and achieved only temporary success. F.W. Walbank's *Philip V of Macedonia* (1940) is the standard biography.

Navarre

• **Philip I–II:** *see* Philip IV–V (France).

Papacy

• **Philip** (fl. 8th century, Italy), antipope in July 768. Temporal rulers coveted the papal throne following the death (767) of Pope St. Paul I, and Toto, duke of Nepi, had his brother Constantine II, a layman, elected pope. The Lombard king Desiderius then sent troops to Rome, killing Toto and deposing Constantine. Backed by some Romans, the Lombards, in 768, secretly set Philip up as pope. Philip had been a monk in the monastery of St. Vito. He was ejected, however, and Stephen III (IV) was elected pope on Aug. 1, 768, at which time Philip retired to his monastery.

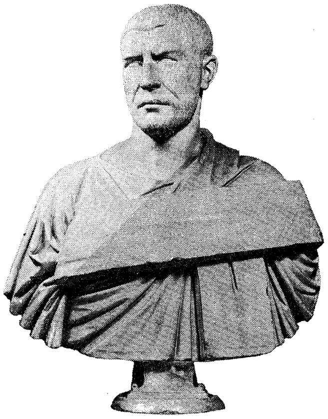
Roman Empire

• **Philip,** byname PHILIP THE ARABIAN, Latin in full MARCUS JULIUS PHILIPPUS (d. 249), Roman emperor from 244 to 249.

A member of a distinguished equestrian family of Arab descent, he was praetorian prefect



Philip, marble bust in the Vatican Museum
The Mansell Collection

when the emperor Gordian III was killed in a mutiny (perhaps with Philip's connivance). Philip became emperor and quickly concluded a peace ending a war with Persia. After undertaking a series of campaigns against the Goths and other tribes on the Danube, he returned to Rome to celebrate in 248 the 1,000th anniversary of the founding of the city. Philip then faced a series of revolts by provincial army commanders, the last of whom, Decius, killed and succeeded him in the autumn of 249.

Christian writers of the 4th century and later regarded Philip as the first Christian emperor; whether he was or not is unclear, but it is certain he did not adopt Christianity openly.

Spain

• **Philip I,** byname PHILIP THE HANDSOME, Spanish FELIPE EL HERMOSO (b. July 22, 1478, Bruges—d. Sept. 25, 1506, Burgos, Spain), king of Castile for less than a month before his death and the founder of the Habsburg dynasty in Spain.

Philip was the son of the future Holy Roman emperor Maximilian I of Habsburg and Mary of Burgundy. At his mother's death (1482) he succeeded to her Netherlands dominions, with Maximilian acting as regent for him during his minority. When Philip became of age, his interest in the Netherlands was soon subordinated to his hopes for the Spanish succession. In 1496 Philip was married to Joan the Mad, daughter of Ferdinand II the Catholic of Aragon and Isabella I the Catholic of Castile; Joan later inherited the crown of Castile. From January 1502 to March 1503 Philip and Joan lived in Spain and received homage as prospective heirs to the kingdoms of Aragon and Castile. Isabella died in 1504, leaving the crown of Castile to Joan. Philip was recognized as king consort. Because Joan was in the Netherlands at the time, Ferdinand, in accordance with Isabella's will, acted as regent.

Philip soon began to oppose his father-in-law, who was unwilling to give up his control of Castile, and in early 1506 sailed to Spain to claim his wife's inheritance. On his voyage his ships had to take shelter in England, where King Henry VII forced him to agree to two treaties, the first of which secured English support for Philip's Castilian rights. The second (April 30, 1506), the *Intercursus Malus*, was a trade agreement disadvantageous to the Netherlands. In Castile, Philip, backed by the nobility, soon raised a strong army. He negotiated Ferdinand's withdrawal on June 27, 1506. By that time Joan's mental condition had deteriorated further, and Philip assumed sole control. He was in the process of organizing his administration when he was stricken with a fever and died. His son Charles I of Spain (the Holy Roman emperor Charles V) became king of Aragon and Castile on Ferdinand's death in 1516, thus firmly establishing the dynasty that was to govern Spain for nearly two centuries.

• **Philip II** (b. May 21, 1527, Valladolid, Spain—d. Sept. 13, 1598, El Escorial, Spain), king of Spain (1556–98) and king of Portugal (as Philip I, 1580–98), champion of the Roman Catholic Counter-Reformation. During his reign the Spanish Empire attained its greatest power, extent, and influence, though he failed to suppress the revolt of the Netherlands (beginning in 1566) and lost the "Invincible Armada" in the attempted invasion of England (1588).

Early life and marriages. Philip was the son of the Holy Roman emperor Charles V and Isabella of Portugal. From time to time, the Emperor wrote Philip secret memoranda, impressing on him the high duties to which God had called him and warning him against trusting any of his advisers too much. Philip, a very dutiful son, took this advice to heart. From 1543 Charles conferred on his son the regency of Spain whenever he himself was abroad. From 1548 until 1551, Philip travelled in Italy, Germany, and the Netherlands, but his great reserve and his inability to speak fluently any language except Castilian made him unpopular with the German and Flemish nobility.

Philip contracted four marriages. The first was with his cousin Maria of Portugal in 1543. She died in 1545, giving birth to the ill-fated Don Carlos. In 1554 Philip married Mary I of England and became joint sovereign of England until Mary's death, without issue, in 1558. Philip's third marriage, with Elizabeth of Valois, daughter of Henry II of France, in 1559, was the result of the Peace of Cateau-Cambrésis (1559), which, for a generation, ended the open wars between Spain and France. Elizabeth bore Philip two daughters, Isabella Clara Eugenia (1566–1633) and Catherine Micaela (1567–97). Elizabeth died in 1568, and in 1570 Philip married Anna of Austria, daughter of his first cousin the emperor Maximilian II. She died in 1580, her only surviving son being the later Philip III.

King of Spain. Philip had received the Duchy of Milan from Charles V in 1540 and the kingdoms of Naples and Sicily in 1554 on the occasion of his marriage to Mary of England. On Oct. 25, 1555, Charles resigned the Netherlands in Philip's favour and, on Jan. 16, 1556, the kingdoms of Spain and the Spanish overseas empire. Shortly afterward Philip also received the Franche-Comté. The Habsburg dominions in Germany and the imperial title went to his uncle Ferdinand I. At this time Philip was in the Netherlands. After the victory over the French at St. Quentin (1557), the sight of the battlefield gave him a permanent distaste for war, though he did not shrink from it when he judged it necessary.

Philip II, detail of an oil painting by Titian; in the Corsini Gallery, Rome
Alinari—Art Resource/EB Inc.

After his return to Spain from the Netherlands in 1559 Philip never again left the Iberian Peninsula. From Madrid he ruled his empire through his personal control of official appointments and all forms of patronage. Philip's subjects outside Castile, thus, never saw him, and they gradually turned not only against his ministers but also against him. This happened particularly in the Netherlands, in Granada, and in Aragon.

Method of government. By sheer hard work Philip tried to overcome the defects of this system. His methods have become famous. All work was done on paper, on the basis of *consultas* (that is, memoranda, reports, and advice presented him by his ministers). In Madrid, or in the gloomy magnificence of his monastic palace of El Escorial, which he built (1563–84) on the slopes of the Sierra de Guadarrama, the King worked alone in his small office, giving his decisions or, as often, deferring them. Nothing is known of his order of work, but all his contemporaries agreed that his methods dangerously, and sometimes fatally, slowed down a system of government already notorious for its dilatoriness. Painstaking and conscientious, Philip's craving for ever more information hid an inability to distinguish between the important and the trivial and a temperamental unwillingness to make decisions.

This was coupled with an almost pathological suspicion of even his most able and faithful servants. Margaret of Austria, duchess of Parma; the Duke of Alba; Don John of Austria; Antonio Pérez; and Alessandro Farnese—to name only the most distinguished—suffered disgrace. "His smile and his dagger were very close," wrote his official court historian, Cabrera de Córdoba. It was no exaggeration, for, in the case of Juan de Escobedo, the secretary of Don John of Austria, Philip even consented to murder. As a result, Philip's court became notorious for the bitterness of its faction fights. The atmosphere of the Spanish court did much to poison the whole Spanish system of government, and this played no small part in causing the rebellions of the Netherlanders (1568–1609), of the Moriscos of Granada (1568–70), and of the Aragonese (1591–92).

Yet the "black legend" that, in Protestant countries, represented Philip II as a monster of bigotry, ambition, lust, and cruelty is certainly false. Philip's spare and elegant appearance is known from the famous portraits by Titian and by Anthonis Mor (Sir Anthony More). He was a lover of books and pictures, and Spain's literary Golden Age began in his reign. An affectionate father to his daughters, he lived an austere and dedicated life. "You may assure His Holiness," Philip wrote to his ambassador in Rome, in 1566, "that rather than suffer the least damage to religion and the service of God, I would lose all my states and an hundred lives, if I had them; for I do not propose nor desire to be the ruler of heretics." This remark may be regarded as the motto of his reign. To accomplish the task set him by God of preserving his subjects in the true Catholic religion, Philip felt in duty bound to use his royal powers, if need be, to the point of the most ruthless political tyranny, as he did in the Netherlands. Even the popes found it sometimes difficult to distinguish between Philip's views as to what was the service of God and what the service of the Spanish monarchy.

Foreign policy. For the first 20 years of his reign, Philip sought to preserve peace with his neighbours in western Europe. He was fighting a major naval war with the Ottoman Empire in the Mediterranean and, from 1568, he was faced with rebellion and war in the Netherlands. From the late 1570s, his policy gradually changed. The death (August 1578) without heirs of his nephew, King Sebastian of Portugal, opened up the prospect of Philip's succession to Portugal. He had to conquer (1580) by force what he regarded as his just, hereditary rights, but the rest of Europe was alarmed at this growth in Spanish power.

Both England and France gave increasing support to the rebellious provinces of the Netherlands. Gradually, in the 1580s, Philip became convinced that the Catholic religion in western Europe, and his own authority in the Netherlands, could be saved only by open intervention against England and France. To this end he fitted out the Armada that, with the help of the Spanish Army in the Netherlands, was intended to conquer England (1588). He sent money and troops to support the League, the ultra-Catholic party in France, against Henry of Navarre and the Huguenots. He even claimed the throne of France for his daughter, Isabella Clara Eugenia, after the murder of Henry III in 1589. Again, even his Catholic allies found it difficult to distinguish between Philip's championship of the Catholic Church and the interests of Spain.

All these plans failed. Henry of Navarre became a Catholic (1593) and Philip had to accept (Peace of Vervins, 1598) his succession as Henry IV of France. England and the northern Netherlands remained Protestant and unconquered. Yet Philip's reign as a whole was not a failure. He had defeated the great Ottoman offensive in the Mediterranean at the Battle of Lepanto (1571). In the Iberian Peninsula he had completed the work of unification begun by the "Catholic Kings," Ferdinand and Isabella. Most important of all, in his own eyes, he had won great victories for the Catholic Church. If England, Scotland, and the northern Netherlands were lost, the southern Netherlands (modern Belgium) had been preserved. In Spain and Italy he had prevented the spread of heresy, and his intervention in France was one of the factors that forced Henry IV to become a Catholic.

When Philip II died of cancer at El Escorial in 1598, Spain was still at the height of its power; it took almost 50 years before it was clear that the Counter-Reformation would make no further major conquests.

(H.G.K.)

BIBLIOGRAPHY. The fullest account of Philip II's life was written in the early 17th century by his official court historian, L. Cabrera de Córdoba, *Felipe Segundo, rey de España,* 4 vol. (1876–77). Cabrera was very well informed, especially about life and personalities at Philip's court. His work has proved indispensable to all later biographers. The best full-scale modern political biography is R.B. Merriman, *The Rise of the Spanish Empire in the Old World and the New,* vol. 4 (1934). G. Mattingly, *The Defeat of the Spanish Armada* (1959), is distinguished both by its impeccable scholarship and by the brilliance of its writing. An attempt to assess Philip II's aims and methods in the light of modern research is an article by H.G. Koenigsberger, "The Statecraft of Philip II," in *European Studies Review,* 1:1–21 (1971).

•**Philip III** (b. April 14, 1578, Madrid—d. March 31, 1621, Madrid), king of Spain and of Portugal (as Philip II) whose reign (1598–1621) was characterized by a successful peaceful foreign policy in western Europe and internally by the expulsion of the Moriscos (Christians of Moorish ancestry) and government by the King's favourites.

Philip III, detail of a portrait by Diego Velázquez; in the Prado, Madrid

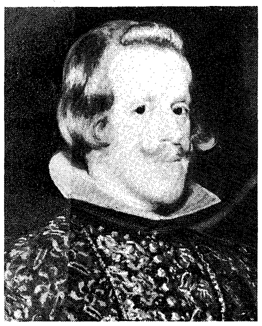
Philip was the son of Philip II of Spain by his fourth consort, his Habsburg cousin Anna of Austria. Though pious, benevolent, and highly virtuous in private conduct, Philip, after he became king (Sept. 13, 1598), showed himself to be indolent and indifferent to his responsibilities. His father revealed his disappointment when he remarked that his son was unfit to govern the kingdoms God had given him and would instead be governed by them. In April 1599 the new king married his Habsburg cousin the Austrian archduchess Margaret.

From the beginning, Philip placed affairs entirely in the hands of a favourite, Francisco Gómez de Sandoval y Rojas, marqués de Denia, later the duke of Lerma—the first in a line of royal favourites who governed 17th-century Spain. Philip's government continued a policy of hostility to the Turks, and in Italy it faced the rivalry of the Republic of Venice and the Duchy of Savoy. In the rest of western Europe, however, a Spanish policy of conciliation ruled. Peace in the West enabled the government to deal with the internal problem of the Moriscos; and on April 9, 1609, the decision was made for their expulsion, which caused serious economic and demographic difficulties in certain areas. The peace was brought to an end by the outbreak (1618) of the Thirty Years' War, in which Philip gave his unconditional support to the Holy Roman emperor Ferdinand II and the Catholic German princes.

Remote from his subjects, Philip spent huge sums on court entertainments and neglected Spain's growing economic problems, which were to reach crisis proportions in the following reign. Having resided in Valladolid in the first years of his reign, he eventually fixed his court in Madrid. After a visit to Portugal (1619), he suffered the first attack of an illness that two years later brought about his death.

• **Philip IV** (b. April 8, 1605, Valladolid, Spain—d. Sept. 17, 1665, Madrid), king of Spain (1621–65) and of Portugal (1621–40), during the decline of Spain as a great world power.

He succeeded his father, Philip III of Spain, in 1621, and, for the first 22 years of his



Philip IV, detail of a portrait by Diego Velázquez; in the National Gallery, London

reign, Philip's *valido*, or chief minister, was the Conde-Duque de Olivares, who took the spread of the Thirty Years' War as an opportunity not only for resuming hostilities against the Dutch at the end of the Twelve Years' Truce of 1609 (1621) but also for an ambitious attempt to restore Spanish hegemony in Europe, in close alliance with the imperial branch of the Habsburg dynasty. The Spanish armies won some conspicuous victories—for instance, the capture of Breda from the Dutch (1626) and the defeat of the Swedes and Weimarians at Nördlingen (1634)—but France declared open war in 1635, and Spain's early successes were offset, from 1640, by the separatist rebellions of Catalonia and of Portugal (Portugal becoming independent in 1640 under John IV of the House of Bragança).

Philip dismissed Olivares in 1643 and replaced him with Don Luis Méndez de Haro, who remained in office until his death in 1661. Thereafter the King had no *valido*, but frequently relied on the advice of a nun and mystic, María de Ágreda, who corresponded with him on both spiritual matters and affairs of state. By the end of his reign Spain, weakened by military reverses and economic and social distress, had become a second-class power.

Philip's first wife was Elizabeth (Spanish, Isabel), daughter of Henry IV of France; after her death in 1644, he married Maria Anna (Mariana), daughter of the Holy Roman emperor Ferdinand III. A poet and patron of the arts, Philip was the friend and patron of the painter Velázquez, many of whose works portray Philip and members of his court.

• **Philip V**, also called (until 1700) PHILIPPE, DUC (duke) D'ANJOU (b. Dec. 19, 1683, Versailles, Fr.—d. July 9, 1746, Madrid), king of Spain from 1700 (except for a brief period from January to August 1724) and founder of the Bourbon dynasty in Spain. During his reign Spain regained much of its former influence in international affairs.

Philip was a son of the dauphin Louis (son of Louis XIV of France) and of Marie Anne, daughter of Ferdinand, elector of Bavaria. Philip's whole career was influenced by the fact that he was a grandson of Louis XIV of France and a great grandson of Philip IV, king of Spain. Philip held the title of duc d'Anjou until 1700, when he emerged as a person of political importance. In that year Charles II, the last Habsburg king of Spain, who died without issue, left Philip all his possessions (Spain, Spanish America, the Spanish Netherlands, and parts of Italy). The refusal of Louis XIV to exclude Philip from the line of succession to the French throne resulted in the War of the Spanish Succession. The Treaty of Utrecht, signed in 1713, deprived Philip of the Spanish Netherlands and of the Italian possessions of the Spanish Habsburgs, but left him the throne of Spain and Spanish America.

During the first 13 years of Philip's reign France had a dominant influence on the Spanish court, and the French ambassador had a place on the inmost council of state. After the death of his first wife (María Luisa of Savoy) in 1714, Philip came under the influence of his second wife, Princess Isabella Farnese, who was the niece and stepdaughter of the duke of Parma. Because of Isabella's desire to secure territories in Italy for her sons, Spain became embroiled in conflict with Austria, Great Britain, France, and the United Provinces but managed to secure the succession of Philip and Isabella's oldest son, Don Carlos (later Charles III of Spain), to the duchy of Parma. Philip abdicated from the Spanish throne in January 1724 in favour of his oldest son, Luis, but was persuaded to become king again after Luis died of smallpox in August 1724. Philip's reign is noted primarily for the governmental and economic reforms instituted by his French and Italian advisers.

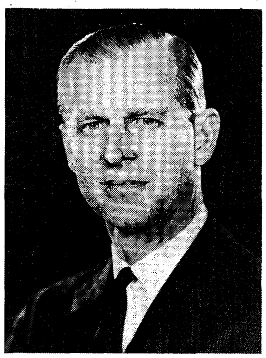
Philip V, detail of a portrait by Louis-Michel Van Loo; in the Prado, Madrid

By courtesy of the Museo del Prado, Madrid

Philip had few intimate friends; his chief interests were religion, hunting, and music. During the last years of his reign he often lapsed into periods of insanity, and his wife largely controlled public affairs.

Philip, DUKE OF EDINBURGH, in full PRINCE PHILIP, DUKE OF EDINBURGH, EARL OF MERIONETH AND BARON GREENWICH, also called PHILIP MOUNTBATTEN, original name PHILIP, PRINCE OF GREECE AND DENMARK (b. June 10, 1921, Corfu, Greece), husband of Queen Elizabeth II of the United Kingdom.

Philip's father was Prince Andrew of Greece and Denmark (1882–1944), a younger son of King George I of the Hellenes (originally Prince William of Denmark). His mother was Princess Alice (1885–1969), who was the eldest daughter of Louis Alexander Mountbatten, 1st marquess of Milford Haven, and Princess Victoria of Hesse and by Rhine, granddaughter of Queen Victoria. Reared chiefly in Great Britain, Philip was educated at Gordonstoun School, near Elgin, Moray, and at the Royal Naval College, Dartmouth.



Prince Philip, 1962

Camera Press

From January 1940 to the end of World War II, he served with the Royal Navy in combat in the Mediterranean and the Pacific.

On Feb. 28, 1947, Philip became a British subject, renouncing his right to the Greek and Danish thrones and taking his mother's surname, Mountbatten. (His father's family name had been Schleswig-Holstein-Sonderburg-Glücksburg.) His marriage to his distant cousin Princess Elizabeth took place in Westminster Abbey on Nov. 20, 1947. On the eve of his wedding he was designated a royal highness and was created a Knight of the Garter, Baron Greenwich, earl of Merioneth, and duke of Edinburgh. He continued on active service with the Royal Navy, commanding the frigate "Magpie," until Elizabeth's accession on Feb. 6, 1952, from which time he shared her official and public life.

In 1957 she conferred on him the dignity of prince of the United Kingdom, and in 1960 his surname was legally combined with the name of her family as Mountbatten-Windsor as a surname for lesser branches of the royal family.

Philip THE APOSTLE, SAINT (b. Bethsaida of Galilee—d. traditionally Hierapolis; fl. 1st century; Western feast day May 1, Eastern feast day November 14), one of the Twelve Apostles. Mentioned only by name in the Apostle lists of the Synoptic Gospels, he is a frequent character in the Gospel According to John, according to which (1:43–51) he came from Bethsaida, answered Jesus' call ("Follow me"), and was instrumental in the call of St. Nathanael (probably St. Bartholomew the Apostle), whom he brought to Jesus.

At the time of his call, Philip seemingly belonged to a group influenced by St. John the Baptist. He participated in the miracle of the loaves and fishes (John 6:5–9), accounting for his symbol in medieval art of loaves. With St. Andrew the Apostle, he brought word to Jesus that certain Greeks had asked to see him (John 12:21–22). In John 14:8–9, Philip asked Jesus to reveal the Father, receiving the answer, "Have I been with you so long, and yet you do not know me, Philip? He who has seen me has seen the Father."

Nothing more is known about him from the New Testament. In later legends he was often confused with St. Philip the Evangelist (Philip the Deacon), one of the seven deacons of the early church (Acts 6:5). His apostolate was supposedly in the territory of Scythia, an ancient Eurasian area. He died of natural causes according to one tradition but, according to another, of crucifixion, accounting for his other medieval symbol of a tall cross. The *Acts of Philip* are apocryphal and probably date from the 3rd/4th century.

Philip THE ARABIAN: *see* Philip *under* Philip (Roman Empire).

Philip THE BOLD: *see* Philip II *under* Philip (Burgundy); Philip III *under* Philip (France).

Philip THE EVANGELIST, SAINT, also called PHILIP THE DEACON (b. Caesarea? Palestine [now in Israel]; fl. 1st century; feast day June 6), in the early Christian church, one of the seven deacons appointed to tend the Christians of Jerusalem, thereby enabling the Apostles to freely conduct their missions. His energetic preaching, however, earned him the title of Philip the Evangelist and led him to minister successfully in Samaria, in Palestine, where he converted, among others, the famous magician Simon Magus (Acts 8:9–13). Later, on the road from Jerusalem to Gaza, he instructed and baptized a court official from Ethiopia.

Philip's missionary journey ended at Caesarea (Acts 8), where he raised his four daughters, reputed to be prophets, and where, about AD 58, he entertained the Apostle St. Paul and his companions on their last journey to Jerusalem (Acts 21:8). According to Greek tradition, he became bishop of Tralles (modern Aydin, Tur.).

Philip, John (b. April 14, 1775, Kirkcaldy, Fife, Scot.—d. Aug. 27, 1851, Hankey, Cape Colony [now in South Africa]), controversial Scottish missionary in South Africa who championed the rights of the Africans against the European settlers.

In 1818, at the invitation of the London Missionary Society, Philip left his congregation in Aberdeen, where he had served since 1804, to investigate the conditions at mission stations in South Africa. His findings led to a condemnation of the colonists for their harsh treatment of the Hottentots. Subsequently appointed the first superintendent for the missions of the society, Philip devoted the rest of his life to promoting the cause of the Africans. He was unpopular among the settlers and ignored by local authorities, but he aroused philanthropic sentiment in Britain with his lecture tour in 1826 and his *Researches in South Africa* (1828). Supported by influential friends, Philip secured the enactment by the British government of an ordinance bestowing equal rights for all the native peoples in South Africa in 1828. Philip hoped to create a series of native states to the north and east of Cape Colony, but in the end colonial expansion prevailed.

To Philip's admirers, he was a high-minded, far-sighted humanitarian who did much to promote the welfare of the Africans. His many white detractors in South Africa saw him as an arbitrary mischief-maker who used false evidence and political intrigue to gain his ends.

Philip Morris Companies Inc., American holding company founded in 1985, the owner of several major American companies, notably Philip Morris Inc., the General Foods Corporation, and Kraft, Inc., with diversified interests in food products. Headquarters are in New York City.

The ancestor of the present company was incorporated in 1919 as Philip Morris & Company, Ltd. Inc., acquiring the assets of a New York corporation of the same name. Throughout the 1930s, '40s, and '50s it expanded its interests in tobacco processing and marketing and became a principal maker of cigarettes. Although Philip Morris' namesake cigarette brand has been eclipsed by later brands, the company continues to receive more than three-fifths of its revenues from the sale of tobacco products. Major cigarette brands sold in the United States and abroad include Marlboro, Benson and Hedges, Parliament, Virginia Slims, and Merit. Cigarettes are sold throughout the world through distributors, retailers, and vending-machine chains.

Philip Morris obtained controlling interest in the Miller Brewing Company in 1969. In 1978 Philip Morris acquired the international cigarette business of the Liggett Group Inc. (formerly Liggett & Myers) and the Seven-Up Company, a soft-drink maker; unable to expand its soft-drink market, it sold Seven-Up in 1986. In order to reduce its dependence on the faltering tobacco market, in 1985 the company bought the General Foods Corporation (*q.v.*), carrier of such well-known food products as Maxwell House coffee and Birds Eye frozen dinners. In 1988 Philip Morris acquired Kraft, Inc. (*q.v.*), a large maker of cheeses and grocery products. Philip Morris thus became one of the world's largest corporate producers of consumer goods. Other corporate properties include Philip Morris Industrial, which manufactures adhesives and other specialty chemical products.

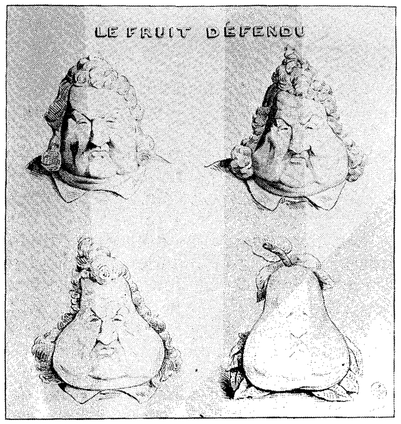
Philipe, Gérard (b. Dec. 4, 1922, Cannes, Fr.—d. Nov. 25, 1959, Paris), one of France's most popular and versatile actors, whose brilliant performances on both stage and screen established his international reputation.

Philipe attended Conservatory of Dramatic Art in Paris and made his debut in Nice at the age of 19. Consequently, he was invited to Paris, where he played Angel in *Sodome et Gomorrhe* (1943), a performance that made him an overnight star. His stage notoriety led to film offers, and within five years his screen appearances created an international furor. Two of his earliest film roles—as the obsessed prince in *L'Idiot* (1946; adapted from Fyodor Dostoyevsky's novel) and as the soulful 17-year-old tragically in love with an older woman in Claude Autant-Lara's *Le Diable au corps* (1946; *Devil in the Flesh*)—fixed the dual image that came to be associated with Philipe throughout his career. In the former role, his portrayal of the tormented hero revealed his intelligence and innovative talent; in the latter, his good looks and latent sensuality attracted a following that saw him as a "pin-up." Other films, which brought him into contact with such great directors of the period as René Claire, Max Ophüls, and Luis Buñuel, include *La Beauté du diable* (1949; *Beauty and the Devil*), *La Ronde* (1950), *Fanfan la tulipe* (1951), *Les Belles de nuit* (1952; *Night Beauties*), and *Grandes Manoeuvres* (1955; *Summer Manoeuvres*).

Film stardom did not diminish Philipe's enthusiasm for the stage. In 1951 he joined the Théâtre National Populaire to portray *Le Cid* and continued to work there until his death. He created particularly memorable roles in *Caligula* (1945; by Albert Camus), *Prinz Friedrich von Homburg* (1951), *Lorenzaccio* (1952; by Alfred de Musset), *Ruy Blas* (1954), and *Richard II* (1954). He also appeared in the first French production of Bertolt Brecht's *Mother Courage and Her Children* (1951). With the company of the Théâtre he toured onstage in the Soviet Union, the United States, and Canada. He was president of the French actors' union at the time of his death.

Philipon, Charles (b. April 19, 1806, Lyon, Fr.—d. Jan. 25, 1862, Paris), French caricaturist, lithographer, and liberal journalist who made caricatures a regular journalistic feature.

Philipon settled in Paris in 1823, took to lithography, and began to draw caricatures for a living. He was an excellent draftsman with a fertile and irrepressible sense of satire.



"La Poire," caricature of Louis-Philippe by Charles Philipon, about 1830–35; in the Musée Carnavalet, Paris

Giraudon—Art Resource/EB Inc.

Moreover, he had vigorous political opinions, an enterprising spirit, and boundless energy. In 1830 he published a journal of political satire, *La Caricature.* The career of the journal was brief and turbulent; after an avalanche of legal actions, it was suppressed in 1835. Meanwhile, in 1832, Philipon had produced a daily paper (with a new caricature every day) called *Le Charivari.* Ten years later *Le Charivari* was to become godfather to *Punch,* subtitled *The London Charivari.* In 1838 *La Caricature* made a cautious and short-lived reappearance under the title of *La Caricature Provisoire.* His next publication of importance, *Le Journal pour Rire* ("The Journal for Laughing"; later *Le Journal Amusant*), appeared in 1848 in the form of large newspaper sheets filled with woodcuts. Besides these journals, Philipon issued many occasional publications, such as *Le Musée Philipon, Les Robert Macaires, Les Physiologies,* and numerous political brochures.

As an artist, his best-known invention was a drawing that depicted the gradual transformation of Louis-Philippe into the shape of a pear. *La Poire* became the common symbol of the king, and all Philipon's artists used it in their caricatures. They were a notable group: he was able to attract and inspire the best talents in France. Honoré Daumier and Gustave Doré were the most famous, but there were also Paul Gavarni, Grandville (J.-I.-I. Gérard), Henri Monnier, and Auguste Raffet. His effect on caricature in France was considerable and decisive, as was his influence on the development of lithography as an artistic and commercial medium.

Philipp (German personal name): *see under* Philip.

Philipp, Isidor (b. Sept. 2, 1863, Budapest—d. Feb. 20, 1958, Paris), French pianist who had a long, highly successful tenure at the Paris Conservatoire.

He was brought to Paris as an infant. As a piano student of Georges Mathias at the Conservatoire, he won the first prize in 1883. After study with Saint-Saëns and Stephen Heller, he began a brief solo concert career, making his London debut in 1890. From 1893 to 1934 he was professor of piano at the Conservatoire, where he taught many notable students, including Albert Schweitzer. He lived in America from 1941 to 1955, teaching privately, mainly in New York. At the age of 91 he played the demanding piano part of the Franck violin sonata at his farewell concert. His influence was mainly as a teacher, and he published several books of technical exercises for the piano.

Philippa OF HAINAUT (b. *c.* 1314—d. Aug. 15, 1369, Windsor, Berkshire, Eng.), queen consort of King Edward III of England (ruled 1327–77); her popularity helped Edward maintain peace in England during his long reign.

Philippa's father was William the Good, count of Hainaut (in modern Belgium) and Holland, and her mother, Jeanne de Valois, was the granddaughter of King Philip III of France. She was married to Edward in October 1327, nine months after he ascended the throne. Accompanying him on his expeditions to Scotland (1333) and Flanders (1338–40), she won universal respect for her gentleness and compassion. In 1347 she interceded and saved the lives of six burghers of Calais, Fr., whom Edward had threatened to execute. Unlike earlier foreign queens of England, she did not alienate the English barons by bringing large numbers of her countrymen to the royal court.

She was patron to the Hainauter chronicler Jean Froissart, who served as her secretary from 1361 until her death. Queen's College, Oxford University, was founded by her chaplain and named after her. Philippa bore Edward five daughters and seven sons; five of their sons were prominent in 14th-century politics.

Philippe (French personal name): *see under* Philip, except as below.

Philippe ÉGALITÉ: *see* Orléans, Louis-Philippe-Joseph, duc d'.

Philippe, Charles-Louis (b. Aug. 4, 1874, Cérilly, Fr.—d. Dec. 21, 1909, Paris), writer of novels that describe from personal experience the sufferings of the poor.

Philippe was the son of a shoemaker; he was ambitious to become an army officer but was

Charles-Louis Philippe
Harlingue—H. Roger-Viollet

refused entry to the École Polytechnique in 1894 because of his slight physique. He finally found employment in the Paris municipal service as a shop inspector.

His novels either describe the Paris poor or are set in his native province of Bourbonnais. Of the first group, the most notable is *Bubu de Montparnasse* (1901; Eng. trans., 1952), which tells the story of a young prostitute's relationship with her procurer and with a young intellectual who tries to save her. The novels of rural poverty include *La Mère et l'enfant* (1900), in which the author tenderly recalls his own childhood; *Le Père perdrix* (1902; title page 1903), the story of an old blacksmith, reduced by illness to indigence, and of a young engineer who loses his job because of his independent outlook; and the unfinished *Charles Blanchard* (1913), an evocation of the unhappy childhood of the author's father. Philippe's novels are distinguished by pity for the social outcast and by his power to depict the misery of poverty.

Philippeville (Algeria): *see* Skikda.

Philippi, modern FÍLIPPOI, hill town in the department (*nomós*) of Kavála, Greece, overlooking the coastal plain and the bay at Neapolis (Kavála). Philip II of Macedon fortified this old Thasian settlement in 356 BC to control neighbouring gold mines.

In 42 BC Philippi was the site of the decisive Roman battle in which Mark Antony and Octavian (later the emperor Augustus) defeated Brutus and Cassius, the leading assassins of Julius Caesar. Brutus and Cassius, whose forces roughly equalled those of their opponents, lay astride the Via Egnatia to the west of Philippi, their position being partly protected by a marsh. Antony made a successful attack on the camp of Cassius, who, not knowing that Brutus' forces had successfully assailed Octavian's camp, committed suicide. About three weeks later, on October 23, Brutus, against his better judgment, fought a second action in which he was routed; despairing of restoring the republican cause, he too took his own life. After the battle a colony for Roman veterans was started at Philippi, and this was later reinforced by Augustus.

The Letter of Paul to the Philippians was addressed to Christian converts in Philippi whom he had visited in his second and third missionary journeys. Many ruins, especially of the imperial epoch, are spread over the site. Pop. (1981) 728.

Philippi, city, seat (1843) of Barbour County, northeastern West Virginia, U.S., on the Tygart Valley River, 13 mi (21 km) south of Grafton. Settled in 1780, it was early called Anglin's Ford and Booths Ferry until it was chartered in 1844 and named for Philip Pendleton Barbour, associate justice (1836–41) of the U.S. Supreme Court. It is known primarily as the site of an important early Civil War battle, fought June 3, 1861, and locally called the "Philippi Races" because of the speed of the retreat of the Confederate forces under Col. George A. Porterfield when routed by the Federal forces under Col. B.F. Kelley. A marker at the site on Broaddus Hill, now the campus of Alderson-Broaddus College (1871; Baptist), describes it as the "First Land Battle between North and South." A covered bridge, spanning the Tygart and used by both sides during the battle, was reinforced in 1937 and is believed to be the nation's only covered two-lane bridge in current use. Tygart Lake State Park is just to the north. Coal mines, gas and oil wells, timber, and mixed farming are the economic mainstays. Inc. city, 1905. Pop. (1980) 3,194.

Philippians, Letter of Paul to the, New Testament letter written by Paul the Apostle, while he was in prison (probably at Rome about AD 62), and addressed to the Christian congregation he had established in Macedonia. Apprehensive that his execution was close at hand, yet hoping somehow to visit the Philippians again, Paul explains that he was imprisoned for preaching the gospel of Christ. Though he welcomes death for Jesus' sake, he is equally concerned to continue his apostolate. Paul exhorts his readers to remain steadfast in their faith and to imitate the humility of Christ, who "emptied himself" and "became obedient unto death, even death on a cross" (2:7–8). Exegetes generally believe that this much-quoted passage was taken from an early Christian hymn. Paul further urges the Philippians to work out their "own salvation with fear and trembling" (2:12), words often cited by theologians in discussing the role of free will in gaining personal salvation.

Philippicus Bardanes, original name VARDAN (b. Armenia—d. after 713), Byzantine emperor whose brief reign (711–713) was marked by his quarrels with the papacy and his ineffectiveness in defending the empire from Bulgar and Arab invaders.

Philippicus was the son of the patrician Nicephorus of Pergamum (modern Bergama, western Turkey). His original name, Vardan, may have been derived from that of his mother. Emperor Tiberius III Apsimar (ruled 698–705) exiled Vardan to the Ionian island of Cephalonia for his pretensions to the throne, but in 711, Tiberius' rival, Justinian II, recalled him and sent him to Cherson (in the Crimea) to suppress a revolt. Instead, he made common cause with Cherson and was proclaimed emperor under the Greek name of Philippicus. He sailed to Constantinople, gained the throne, and had Justinian and his family killed.

Philippicus was an advocate of the Monothelite heresy, the belief in a single will of Christ. Even before entering Constantinople, he had ordered the picture of the Third Council of Constantinople (which had condemned Monothelitism in 680) to be removed from the palace and the names of those the council had condemned restored. Patriarch Cyrus refused to support the new policy and was deposed and replaced by the more compliant deacon John early in 712. Pope Constantine therefore refused to recognize the new emperor.

In foreign policy, Philippicus' reign was disastrous. The Bulgarians besieged Constantinople in 712, and in 712–713 the Arabs captured several cities. On June 3, 713, military conspirators overthrew and blinded Philippicus and installed his chief secretary, Artemius, as Anastasius II (mainly at the instigation of the Senate and people).

Philippine Independent Church, Spanish IGLESIA FILIPINA INDEPENDIENTE, also called AGLIPAYAN CHURCH, independent church organized in 1902 after the Philippine revolution of 1896–98 as a protest against the Spanish clergy's control of the Roman Catholic Church. Co-founders of the church were Isabelo de los Reyes y Florentino, author, labour leader, and senator, who was imprisoned during the revolution for his criticism of Spanish clergy and government officials in the Philippines, and Gregorio Aglipay y Labayán, a Philippine Roman Catholic priest who was excommunicated in 1899 for his activities on behalf of the revolution. Aglipay accepted de los Reyes' request that he serve as supreme bishop of the new church in 1903, a position he held until his death in 1940.

The church continued to follow Roman Catholic forms of worship, but for many years doctrine was strongly influenced by Unitarianism. A schism developed in 1946, and a unitarian faction left the church. Under Isabelo de los Reyes, Jr., elected bishop in 1946, the church adopted in 1947 a new declaration of faith and articles of religion that were Trinitarian. The Protestant Episcopal Church in the United States consecrated three bishops of the Philippine Independent Church in 1948, and the two churches entered into a close association. In 1961 the church was accepted into full communion with the Church of England and the Old Catholic churches.

In 1970 membership was 1,437,000.

Philippine Insurrection, a war between the United States and Filipino revolutionaries from 1899 to 1902; the insurrection may be seen as a continuation of the Philippine Revolution against Spanish rule. The Treaty of Paris (1898) transferred Philippine sovereignty from Spain to the United States but was not recognized by Filipino leaders, whose troops were in actual control of the entire archipelago except the capital city of Manila. Although an end to the insurrection was declared in 1902, sporadic fighting continued for several years thereafter.

Commo. George Dewey defeated the Spanish fleet in Manila Bay on the morning of May 1, 1898, but could not occupy Manila until ground troops arrived three months later. On August 13 Manila fell after a bloodless "battle." Spanish Governor Fermín Jáudenes had secretly arranged a surrender after a mock show of resistance to salvage his honour. With American troops in possession of the city and Filipino insurgents controlling the rest of the country, conflict was inevitable.

The war began with shooting on the outskirts of Manila on the night of February 4, 1899. Throughout the spring of 1899, American troops pushed north into the central Luzon Plain, and by the end of that year the Filipino general Emilio Aguinaldo retreated into the inaccessible northern mountains. The period of conventional battles ended, but insurgent leaders in many provinces continued bitter guerrilla warfare.

Fighting flared with increased bitterness on the island of Samar in 1901. Gen. Jacob F. Smith, enraged by a guerrilla massacre of U.S. troops, launched a retaliatory campaign of such indiscriminate ferocity that he was court-martialled and forced to retire.

After 1902 the American civil government regarded the remaining guerrillas as mere bandits, though the fighting continued. About 1,000 guerrillas under Simeón Ola were not defeated until late 1903, and in Batangas province, south of Manila, troops commanded by Macario Sakay resisted capture until as late as 1906.

The last organized resistance to U.S. power took place on Samar from 1904 to 1906. There, the rebels' tactic of burning pacified villages contributed to their own defeat. The United States gained an undisputed control of the Philippines and retained possession of the islands until 1946.

Philippine languages, about 70 to 75 aboriginal languages of the Philippine Islands. They belong to the Indonesian branch of the Austronesian family and are subdivided into two main subgroups—the central (or Mesophilippine) division and the northern (or Cordilleran) division—with a number of other member languages forming smaller groups or remaining unclassified.

The most important languages in the central division are Tagalog (a standardized form of which, Pilipino, is the official national language) and Cebuano. The most important in the northern division is Ilocano.

Philippine Revolution (1896–98), Filipino independence struggle that, after more than 300 years of Spanish colonial rule, exposed the weakness of Spanish administration but failed to evict Spaniards from the islands. The Spanish–American War brought Spain's rule in the Philippines to a close in 1898 but precipitated the Philippine Insurrection, a bloody war between Filipino revolutionaries and the U.S. Army.

Numerous quasi-religious uprisings had punctuated the long era of Spanish sovereignty over the Philippines, but none possessed sufficient coordination to oust the Europeans. During the 19th century, however, an educated Filipino middle class emerged and with it a desire for Philippine independence. Opposition before 1872 was primarily confined to the Filipino clergy, who resented the Spanish monopoly of power within the Roman Catholic Church in the islands. In that year the abortive Cavite Mutiny, a brief uprising against the Spanish, served as an excuse for renewed Spanish repression. The martyrdom of three Filipino priests—José Burgos, Mariano Gómez, and Jacinto Zamora—for allegedly conspiring with the rebels at Cavite sparked a wave of anti-Spanish sentiment.

Reform-minded Filipinos took refuge in Europe, where they carried on a literary campaign known as the Propaganda Movement. Dr. José Rizal quickly emerged as the leading Propagandist. His novel *Noli me tângere* (1886; *The Social Cancer,* 1912) exposed the corruption of Manila Spanish society and stimulated the movement for independence.

By 1892 it became obvious that Spain was unwilling to reform its colonial government. Andres Bonifacio, a self-educated warehouse clerk, organized a secret revolutionary society, the Katipunan, in Manila. Membership grew to an estimated 100,000 by August 1896, when the Spaniards discovered its existence. Bonifacio immediately issued a call for armed rebellion. The Spanish then arrested Rizal, who had advocated reform but never condoned the revolution. Rizal's public execution, on Dec. 30, 1896, so enraged and united Filipinos as to make permanent retention of power by Spain clearly impossible.

In March 1897 leadership of the revolution passed to a young general, Emilio Aguinaldo, who had Bonifacio shot for alleged sedition. Aguinaldo proved incapable of militarily defeating the Spanish troops, who were augmented by Filipino mercenaries. In the later months of 1897, Aguinaldo's revolutionary army was pushed into the mountains southeast of Manila.

On Dec. 15, 1897, the pact of Biak-na-Bato was proclaimed. Though its precise terms have been a matter of impassioned debate ever since, the pact brought a temporary end to the Philippine Revolution. Aguinaldo and other revolutionary leaders accepted exile in Hong Kong and 400,000 pesos, plus Spanish promises of substantial governmental reforms, in return for laying down their arms. Neither side executed the terms of the pact in good faith. Aguinaldo used the money to purchase arms in Hong Kong, and the Spanish reneged on the promised reforms.

After the U.S. Navy commodore George Dewey annihilated the Spanish fleet in Manila Bay on May 1, 1898, Aguinaldo immediately returned to the Philippines. He began the revolution anew, this time against the United States, which had assumed title to the Philippines as a result of the Spanish defeat. Aguinaldo was captured in 1901 and subsequently appealed to Filipinos to cease fighting and accept U.S. sovereignty.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Philippine Sea, section of the western North Pacific, lying east and north of the Philippines. The floor of this portion of the ocean is formed into a structural basin by a series of geologic folds and faults that protrude above the surface in the form of bordering island arcs. The Philippine islands of Luzon, Samar, and Mindanao are on the southwest; Palau, Yap, and Ulithi (of the Carolines) on the southeast; the Marianas, including Guam, Saipan, and Tinian, on the east; the Bonin and Volcano islands (Iwo Jima) on the northeast; the Japanese islands of Honshu, Shikoku, and Kyushu on the north; the Ryukyu Islands (Okinawa) on the northwest; and Taiwan (Formosa) in the extreme west. They surround an area measuring 1,800 mi (2,900 km) north–south by 1,500 mi east–west and occupying a total surface area of 40,000 sq mi (1,000,000 sq km), about 3 percent of the entire Pacific region. The basin, with a general depth of 19,700 ft (6,000 m), plunges to its greatest depths in trenches to the east of the island arcs. The deepest is the 34,578-ft Philippine Trench. Numerous seamounts rise from the basin floor, some of which are volcanic; their peaks, often flat (called tablemounts, or guyots), are capped with coral. The warm Pacific North Equatorial Current flows westward across the southern part of the sea. On meeting the Philippines, the current divides; part swings north near Luzon to form the Kuroshio (*q.v.*), of which some will return to the sea as the Kuroshio Countercurrent, and part swings south as the Pacific Equatorial Countercurrent. These currents, together with areas near reefs, ridges, and seamounts, are the sites of fishing grounds. Hurricanes and typhoons, which become particularly strong in September, originate in the sea.

Philippine Sea, Battle of the (June 19–21, 1944), naval battle of World War II between the Japanese Combined Fleet and the U.S. 5th Fleet. It accompanied the U.S. landing on Saipan and was known as "the greatest carrier battle of the war," ending in a complete U.S. victory.

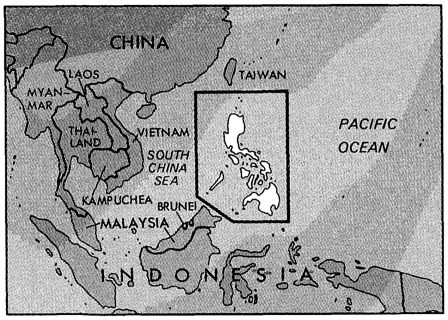
It began on the morning of June 19, when Adm. Ozawa Jisaburo, determined on a showdown with the U.S. invaders, sent 430 planes in four waves against ships under the command of Adm. Raymond Spruance. The result for the Japanese was a disaster: in the first day of the battle the Japanese lost more than 300 planes and two regular carriers; and, as their fleet retired northward toward safe harbour at Okinawa, it lost another carrier and nearly 100 more planes. During the two days of battle, U.S. losses totalled 130 aircraft and some damage to ships.

The poor showing by the Japanese has been attributed to many factors, but two may be singled out for special mention: men and matériel. Some Japanese pilots went into action with as little as three months of training, whereas many U.S. pilots had spent two full years in training. Japanese planes were highly manoeuvrable and had a longer range than U.S. planes, but they were inferior in several respects, particularly in their inadequate armour protection and lack of self-sealing fuel tanks. U.S. submarines also played an important but less publicized role in providing U.S. commanders with intelligence of enemy movements and in sinking Japanese ships.

Philippine Trade Act of 1946: *see* Bell Trade Act.

Philippine Trench, also called PHILIPPINE DEEP, MINDANAO TRENCH, or MINDANAO DEEP, submarine trench in the floor of the Philippine Sea of the western North Pacific Ocean bordering the east coast of the island of Mindanao. The abyss, which reaches the second greatest depth known in any ocean, was first plumbed in 1927 by the German ship "Emden." The reading obtained at that time was the first indication of the actual near-record depth. In 1945 the USS "Cape Johnson" recorded a sounding of 34,440 ft (10,497 m), slightly exceeded by the 34,578-ft sounding originally made by the Danish "Galathea" in 1951. Later soundings reported to exceed these have been found to be instrumentation errors.

Philippines, officially REPUBLIC OF THE PHILIPPINES, Pilipino REPUBLIKA NG PILIPINAS, archipelago of about 7,100 islands and islets lying about 500 miles (800 km) off the southeastern coast of Asia, covering a land area of about 115,800 square miles (300,000 square km). The capital is Manila. The country spans about 1,150 miles (1,850 km) from south to north at its longest extent and about 700 miles (1,125 km) from west to east at its widest extent; surrounded by the Pacific



Philippines

Ocean, it is bounded by the Philippine Sea to the east, the Celebes Sea to the south, the Sulu Sea to the southwest, and the South China Sea to the west. The two principal islands of the Philippines are Luzon in the north, occupying 40,420 square miles (104,688 square km), and Mindanao in the south, occupying 36,537 square miles (94,630 square km). The Visayan group of islands in the central Philippines include Panay, Negros, Cebu, Leyte, and Samar; Mindoro is situated directly south of Luzon, and Palawan is isolated in the west. The population in 1990 was estimated at 61,483,000.

A brief treatment of the Philippines follows. For full treatment, *see* MACROPAEDIA: Philippines.

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. The Philippine topography is varied, with inactive volcanoes and mountain ranges the conspicuous features of most of the larger islands. Many islands have narrow and often-interrupted coastal plains and river systems that generally trend northward. Large lakes on Luzon and Mindanao are of volcanic origin except Laguna de Bay, the country's largest lake (356 square miles [922 square km]), southeast of Manila; it was probably once an arm of Manila Bay. Northern Luzon has rugged north–south-trending mountain ranges (including the Sierra Madre in the east and the Cordillera Central in the west) separated by the fertile Cagayan River valley. A merger of these mountain systems in central Luzon separates the Cagayan valley from the 150-by-50-mile (240-by-80-kilometre) densely populated, agriculturally productive central plain of Luzon to the south. Manila is located at the southern end of this plain on the natural harbour provided by Manila Bay. The convoluted peninsular arm of southeastern Luzon is occupied by isolated volcanoes and irregular masses of mountains and hills. Irregularly shaped Mindanao has a complex topography including five major mountain systems and a number of sizable gulfs, bays, and peninsulas giving the island an extremely long coastline. Mount Apo, at 9,692 feet (2,954 m) the highest peak in the Philippines, overlooks Davao, Mindanao's largest city.

The Philippines have a maritime tropical climate with temperature variations being almost entirely a result of elevation. Manila has an average annual temperature of 81° F (27° C). The archipelago is well-watered, with the western Philippines having a distinct dry season. Typhoons frequently strike the more northerly eastern coast. More than one-third of the country is forested. There are many valuable hardwoods, such as lauan (Philippine mahogany), as well as many softwoods, including pine. Native plants and animals include some 800 species of orchid and at least 56 species of bat.

The Philippines is rich in mineral resources. Deposits of gold, silver, iron ore, copper, lead, chromite, nickel, manganese, and limestone occur in commercial quantities. Limited petroleum reserves are located off the island of Palawan.

The people. The people of the Philippines (who are called Filipinos) are predominantly of a Malay stock frequently admixed with Chinese and sometimes with American or Spanish ethnic groups. Pilipino, a language based on Tagalog (the language spoken around Manila by almost one-third of the country's total population), and English are both official languages. There are scores of other languages, the main groups of which are the Cebuano (spoken by approximately one-fourth of the total population), Ilocano, Hiligaynon, and Bicol.

More than four-fifths of the population is Roman Catholic, and a sizable minority is Muslim. Some of the population belongs to the Philippine Independent Church (Aglipayan) and others are mainline Protestant.

Population density in the Philippines is relatively high. Nearly two-fifths are younger than 15 years of age. Family-planning programs have been concentrated especially in rural areas. Overall life expectancy has increased to almost 64 years. Heavy migration from rural to urban areas has caused overcrowding, particularly in metropolitan Manila; about two-fifths of the country's population is urban. Emigration and immigration generally balance each other, although many of the emigrants include highly skilled workers.

The economy. The economy of the Philippines is largely based on agriculture, light industries, and services. A market economy predominates, though intervention by the government was increased in the late 20th century. Prices have tended to rise more rapidly than purchasing power, and wages are among the lowest in East Asia. The gross national product (GNP) per capita, which has a negative real growth rate, is similar to that of other developing countries.

Agriculture accounts for approximately one-fourth of the gross domestic product (GDP) and employs more than two-fifths of the work force, many of them tenant farmers. More than one-fourth of the land is arable; irrigation is insufficient, and the government and various international agencies have sponsored programs to expand the land under irrigation. However, the country has not attained agricultural self-sufficiency.

Rice is the leading staple, though corn (maize) predominates in some islands. Various hybrid strains of rice have been introduced and greater amounts of fertilizer are now used, but yields are far from optimum. The Philippines is a leading producer of coconuts, exported mainly as coconut oil as well as whole and as copra. Sugarcane, bananas, and pineapples are also widely grown and have supplanted traditional abaca (Manila hemp) and tobacco as sources of foreign exchange.

The Philippines' forests are being depleted by widespread illegal cutting and patterns of shifting cultivation that still persist. Large quantities of high-quality timber and veneers are exported to Japan, the United Kingdom, and the United States. Mining accounts for only a small percentage of the GDP, but copper, gold, and iron ore are sources of foreign exchange. Manufacturing accounts for approximately one-fourth of the GDP and employs about one-tenth of the work force. Major manufactures include processed foods, beverages, petroleum products, textiles, and footwear. The government has encouraged the development of labour-intensive industries, including the assembly of electrical and electronic equipment. Only one-seventh of the country's roads are paved. There are international airports at Manila and near Cebu on Mactan Island. The country's most important port is Manila. The transportation infrastructure, however, is poorly developed and has been a major obstacle to increasing agricultural output. Exports include electrical and electronic equipment and components, coconut products, clothing, fruits and vegetables, and sugar and sugar products. Mineral fuels, capital goods, cereals, and chemicals are imported. The balance of trade is frequently unfavourable. The United States and Japan are the Philippines' leading trading partners. Remittances from Filipinos working abroad are an important source of foreign exchange. The government's budgetary expenditures have traditionally exceeded revenues, and the external public debt has increased sharply since 1980.

Government and social conditions. The Philippine constitution of 1987 (which replaced the Constitution of 1973, as amended in 1981 and 1984) vests executive power in the president, the head of state, who is directly elected to a single six-year term. The president appoints the Cabinet, which is responsible for the day-to-day administration of the country. Legislative power is vested in the bicameral Congress of the Philippines, consisting of a 250-member House of Representatives and a 24-member Senate. House members are elected from districts, although a number of them are appointed, and senators are elected at large. The judicial system is headed by a politically independent Supreme Court. A martial-law ban on political parties was lifted in 1978, and since the mid-1980s partisan political activity has been vigorous. Outlawed political organizations operating in the country include a group seeking autonomy for Muslim Filipinos and a communist-led insurgency.

Health-care facilities and personnel are concentrated in Manila; the city has some 15 times as many physicians as the outlying rural areas. Malnutrition is widespread, and the demand for health care continues to outstrip available resources. A serious housing shortage exists, and some squatter communities (especially around Manila) lack elementary facilities for health and sanitation.

The literacy rate is high relative to Southeast Asian countries. Six years of elementary education is officially compulsory and free in public schools, and enrollment is almost universal. Many large universities, mostly established in the early 20th century, are concentrated in Manila. Freedom of the press is guaranteed by the constitution. Newspapers are published in Pilipino, English, and many of the country's vernacular dialects. There are numerous radio and television stations in operation in the Philippines.

Cultural life. The Philippines has been strongly influenced by centuries of rule by Spain and a half-century of rule by the United States, but strong Southeast Asian moorings have remained. Many Filipino songs and dances of the Spanish period have been preserved or reinterpreted. Ensembles such as Bayanihan have made these traditional performances known to a worldwide audience. A rich folkloric tradition preserves legends and myths of the origin of the world and tales associated with the Spanish conquest. Distinctive regional wood carvings attract nationwide attention.

History. Chinese traders are known to have visited and resided on the islands from about

AD 1000, but the influence of both China and India on the Philippines was of little importance. At the beginning of the 15th century Filipinos were primarily shifting cultivators, hunters, and fishermen having animistic beliefs. Islām was introduced later in the same century (particularly in the area of Mindanao) followed by Ferdinand Magellan's European discovery of the Philippines in 1521. The late 16th-century, militarily enforced Spanish colonization of much of the northern and central Philippines led to the nominal conversion of all the inhabitants to Roman Catholicism. The Moros, as the Spanish called the Muslims of Mindanao and the Sulu Archipelago farther southwest, were never completely subdued by the Spanish.

Central government in Manila retained a medieval, autocratic cast into the 19th century; the city also dominated the islands as an oppressive ecclesiastical centre and as a commercial centre serving as an entrepôt for Chinese silks and Mexican silver. By the 1830s Manila was open to foreign markets. The European demand for sugar and abaca led to intensive growth of commercial agriculture. In the late 19th-century, sons of wealthy landholders returned from European schools to the Philippines imbued with nationalistic ideals that led to an 1896 insurrection that was put down by Spanish troops.

The islands were ceded to the United States after the Spanish-American War of 1898, but an independence movement within the Philippines was not subdued until 1906. The juxtaposition of U.S. democracy and imperialistic rule over the Filipinos was sufficiently jarring to most Americans that, from the beginning, the training of Filipinos for self-government and ultimate independence was an essential rationalization for U.S. hegemony.

The Commonwealth of the Philippines was established in 1935 in an attempt to prepare the country for political and economic independence, but this effort was delayed by World War II and the subsequent Japanese invasion and occupation. The Republic of the Philippines was proclaimed on July 4, 1946, with a government patterned on that of the United States and with Manuel Roxas as the first president.

In 1965 Ferdinand E. Marcos was elected president, and in 1969 he became the first Philippine president to be reelected. In 1972 Marcos declared martial law, a state of affairs that was formally ended in 1981, although Marcos continued to rule by decree. The assassination of opposition leader Benigno S. Aquino, Jr., in 1983 became the focal point of mounting opposition to Marcos' rule. In a presidential election held in February 1986, Marcos was declared the official winner over opposition candidate Corazon Aquino, Benigno's widow, but the apparent fraudulence of Marcos' electoral victory precipitated a revolt that drove him from power. Aquino took over as president immediately after Marcos' departure.

Philippus (Latin personal name): *see under* Philip.

Philips, Ambrose (b. Oct. 9, 1674, Shrewsbury, Shropshire, Eng.—d. June 1/2, 1749, London), English poet and playwright.

Philips was educated at John's College, Cambridge. His first and best-known poems were collected in *Pastorals* and were probably written while he was a fellow at Cambridge, although they were not published until 1710. For *Pastorals,* Philips won immediate praise from leading men of letters, including Sir Richard Steele, Joseph Addison, and even Alexander Pope (who later attacked Philips in his satires). His adulatory verses ("Dimpley damsel, sweetly smiling") won Philips the nickname "Namby-Pamby." *The Distrest Mother* (1712), his adaptation of Jean Racine's *Andromaque,* was a success.

Philips, Peter (b. 1561—d. 1628, Brussels), English composer of madrigals, motets, and keyboard music of considerable reputation in his lifetime.

He was a Roman Catholic, and in 1582 he left England for Italy, where he became organist of the English College in Rome. In 1585 he entered the service of Lord Thomas Paget, with whom he traveled extensively. After Paget's death in 1590 Philips went to Antwerp. In 1597 he moved to Brussels, becoming organist of the royal chapel of the archduke Albert of Austria. In 1593 he was accused by the Dutch authorities of planning the murder of Queen Elizabeth I, but after imprisonment and trial he was released. He probably took holy orders, for in 1610 he was appointed to a canonry.

Philips published volumes of his own madrigals, to Italian texts, in 1596, 1598, and 1603. Eight volumes of his church music were published between 1612 and 1633. A posthumously published volume of masses is lost. Many of his compositions appeared in contemporary collections, including Thomas Morley's *First Book of Consort Lessons* (1599) and the *Fitzwilliam Virginal Book,* which contains 19 keyboard pieces by him. Philips' style reveals Italian and Dutch as well as English traits; J.P. Sweelinck was a powerful influence, and his firm polyphonic passages are at times reminiscent of William Byrd.

Philips' Gloeilampenfabrieken NV, English PHILIPS' INCANDESCENT LAMP WORKS, Dutch manufacturer specializing in the production of electrical and electronic equipment and household appliances. Headquarters are in Eindhoven, The Netherlands.

The company traces its origins to the formation of Philips and Company in 1891. It became a partnership in 1899 and was incorporated under its present name in 1912. In 1939 the company's noncontinental assets were transferred to two trusts: the British Trust in Great Britain and the American Trust in the United States. An affiliate of the American Trust is North American Philips Corporation, a major U.S. defense contractor.

The company manufactures electrical and electronic products and systems in several major product areas: lighting and batteries, with research emphasis on providing the same amount of light using less energy; home electronics—televisions, radios, and audio and video recorders; home appliances and personal care products; professional products, including telecommunications, computer systems, and office equipment; and industrial supplies. Other miscellaneous activities of the company include the manufacture of musical instruments, furniture, and sporting goods. The company also has affiliates engaged in musical recording and motion picture production in Europe and the United States. Philips has manufacturing and marketing subsidiaries throughout the world.

Philistine, one of a people of Aegean origin who settled on the southern coast of Palestine in the 12th century BC, about the time of the arrival of the Israelites. According to biblical tradition (Deuteronomy 2:23; Jeremiah 47:4), the Philistines came from Caphtor (possibly Crete). They are mentioned in Egyptian records as *prst,* one of the Sea Peoples that invaded Egypt in about 1190 BC after ravaging Anatolia, Cyprus, and Syria. Repulsed by the Egyptians, they occupied the coastal plain of Palestine from Joppa (modern Tel Aviv–Yafo) to the Gaza Strip. The area contained the five cities (the Pentapolis) of the Philistine confederacy (Gaza, Ashkelon [Ascalon], Ashdod, Gath, and Ekron) and was known as Philistia, or the Land of the Philistines. It was from this designation that the whole of the country was later called Palestine by the Greeks.

The Philistines expanded into neighbouring areas and soon came into conflict with the Israelites, a struggle represented by the Samson saga (Judges 14–16). With their superior arms and military organization the Philistines were able (*c.* 1050) to occupy part of the Judaean hill country. They were finally defeated by the Israelite king David (10th century), and thereafter their history was that of individual cities rather than of a people.

In the early part of the 7th century, Gaza, Ashkelon, Ekron, Ashdod, and probably Gath were vassals of the Assyrian rulers; but during the second half of that century the cities became Egyptian vassals. With the conquests of the Babylonian king Nebuchadrezzar II (605–562) in Syria and Palestine, the Philistine cities became part of the Neo-Babylonian Empire. In later times they came under the control of Persia, Greece, and Rome.

There are no documents in the Philistine language, which was probably replaced by Canaanite, Aramaic, and, later, Greek. Nor is much known of the Philistine religion, since all their gods mentioned in biblical and other sources have Semitic names and were probably borrowed from the conquered Canaanites. Until their defeat by David, the Philistine cities were ruled by *seranim,* "lords," who acted in council for the common good of the nation. After their defeat, the *seranim* were replaced by kings.

The Philistines long held a monopoly on smithing iron, a skill probably acquired in Anatolia. At sites occupied by the Philistines at an early period, a distinctive type of pottery, a variety of the 13th-century Mycenaean styles, has been found.

Philistus (b. *c.* 430 BC, Syracuse, Sicily [now in Italy]—d. 356), Greek historian of Sicily during the reigns of Dionysius I and II.

Philistus helped Dionysius I to seize power in 405 and then became his right-hand man and commander of the citadel. He was later exiled (386/385) for unknown reasons but was recalled after 20 years by Dionysius II at the time of Plato's first visit to his court. Philistus held high command first in the Adriatic and later at home in the civil war and died on active service.

During his exile, spent mostly in Epirus, he began his history, which ultimately totaled 13 books, seven on Sicilian affairs before 405, four on the reign of Dionysius I, and two on the early years of Dionysius II (367–363). It was continued by the Syracusan Athanas. His history clearly became a standard work, used by Ephorus in his Sicilian sections and also by Timaeus and Plutarch, writers who disliked his pro-monarchical viewpoint.

Philitas OF COS: *see* Philetas of Cos.

Phillip, Arthur (b. Oct. 11, 1738, London—d. Aug. 31, 1814, Bath, Somerset, Eng.), British admiral whose convict settlement established at Sydney in 1788 was the first permanent European colony on the Australian continent.

Arthur Phillip, detail from an oil painting by F. Wheatley, 1786; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Phillip joined the British Navy in 1755, retired in 1763 to farm for 13 years in England, then served with the Portuguese Navy against Spain (1776) and with the British Navy against France (1778). In 1786 he was assigned the duty of founding a British convict settlement in New South Wales, and the following year he set sail with 11 ships.

As the first governor of New South Wales, Phillip struggled with rebellious convicts and troops and—until the middle of 1790—with the threat of famine; but he successfully created a permanent community. Despite his conciliatory policy toward the native Aborigines, he failed to establish peace between the settlers and the natives. He returned to England in 1792 because of poor health, but he saw further action at sea (1796–98) and was promoted to admiral in 1814.

Phillip Island, island astride the entrance to Western Port (bay) on the south coast of Victoria, Australia, southeast of Melbourne. About 14 mi (23 km) long and 6 mi at its widest, the island occupies 40 sq mi (100 sq km) and rises to 360 ft (110 m). Visited in 1798 by the English explorer George Bass, it was originally called Snapper Island and then Grant Island, after Lieut. James Grant, who landed there in 1801, and renamed in honour of Capt. Arthur Phillip, first governor of New South Wales. Sealers and whalers were in residence by 1802. It was proclaimed a shire in 1928. The island, the main town of which is Cowes, supports stock grazing and chicory cultivation and is a growing resort and retirement centre. It is the site of a koala bear sanctuary, seal, muttonbird, and fairy penguin rookeries, and a geological formation known as the Giant's Pipe Organ. The island is bridged to San Remo, on the east (mainland) shore of Western Port. Pop. (1981) 2,832.

Phillips, Stephen (b. July 28, 1864, Summertown, Oxfordshire, Eng.—d. Dec. 9, 1915, Deal, Kent), English actor and poet who was briefly successful as a playwright.

Phililips was educated at Trinity College

Stephen Phillips, watercolour by Percy Anderson, 1902; in the National Portrait Gallery, London

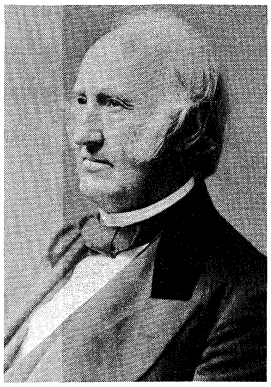
School, Stratford-upon-Avon, and at King's School, Peterborough. He joined F.R. Benson's company in 1885. His first collection of poetry, *Poems* (1897), was followed by several verse dramas, including *Herod* (1901), *Ulysses* (1902), and *Nero* (1906). Phillips was compared to Shakespeare for *Paolo and Francesca* (1900), but his reputation soon declined and he died in poverty.

Phillips, Wendell (b. Nov. 29, 1811, Boston—d. Feb. 2, 1884, Boston), Abolitionist crusader whose oratorical eloquence helped fire the antislavery cause during the period leading up to the U.S. Civil War.

After opening a law office in Boston, Phillips,



Wendell Phillips

By courtesy of the Library of Congress, Washington, D.C.

a wealthy Harvard Law School graduate, sacrificed social status and a prospective political career in order to join the antislavery movement. He became a close associate of the Abolitionist leader William Lloyd Garrison and began lecturing for antislavery societies, writing pamphlets and editorials for Garrison's *Liberator*, and contributing financially to the Abolition Movement.

His reputation as an orator was established at Faneuil Hall, Boston (Dec. 8, 1837), at a meeting called to protest the murder of Abolitionist Elijah Lovejoy at Alton, Ill., the previous month. When Phillips spontaneously delivered a stirring and passionate denunciation of the mob action against the martyred editor, he was recognized as one of the most brilliant orators of his day.

As a reform crusader, Phillips allied himself with Garrison in refusing to link Abolition with political action; together they condemned the federal Constitution for its compromises over slavery and advocated national disunion rather than continued association with the slave states. During the Civil War (1861–65) he assailed Pres. Abraham Lincoln's reluctance to uproot slavery at once, and after the Emancipation Proclamation (January 1863) he threw his support to full civil liberties for freedmen. In 1865 he became president of the American Anti-slavery Society after Garrison resigned.

After the Civil War, Phillips also devoted himself to temperance, women's rights, universal suffrage, and the Greenback Party (a minor political movement). He was an unsuccessful Massachusetts gubernatorial candidate of the Labor Reform and Prohibition parties in 1870. He continued to lecture on the lyceum circuits until the 1880s.

Phillips Academy, also called PHILLIPS ANDOVER ACADEMY, or ANDOVER, private, coeducational college-preparatory school (grades 9–12) in Andover, Mass., U.S.

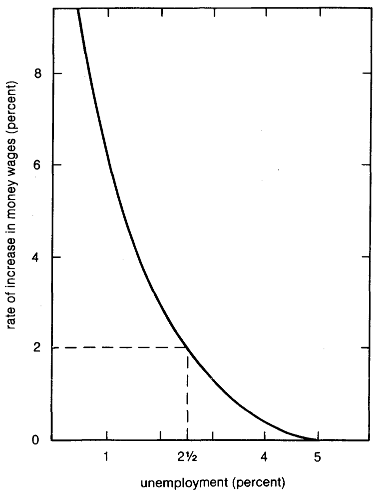
Founded as a boarding school for boys in 1778 by Samuel Phillips, then lieutenant governor of Massachusetts, it is the oldest incorporated academy in the United States. Sons of some of America's most influential families have enrolled at Andover, including Washingtons and Lees from Virginia, and Lowells from Massachusetts. In 1973 Andover merged with adjoining Abbott Academy for girls, established in 1829 as the first incorporated New England school for girls.

Phillips Collection, museum containing an outstanding small collection of late 19th- and 20th-century American and European painting and sculpture that was founded in 1918 by Duncan Phillips. It is housed in Phillips' residence (built 1897) in Washington, D.C.

The museum sponsors concerts, docent programs, gallery talks, guided tours, lectures, organized educational programs, radio programs, and temporary and permanent exhibits. It also publishes books and catalogs.

Phillips curve, graphic representation of the economic relationship between the rate of unemployment (or the rate of change of unemployment) and the rate of change of money wages. It indicates that wages tend to rise faster when unemployment is low. In his original article (1958), A.W. Phillips plotted the unemployment rates and the rates of change of money wages for the U.K. from 1861 to 1957. He found that, except for the years of unusually large and rapid increases in import prices, the rate of change in money wages could be explained by the level of unemployment. As traditional economic theory would predict, in times with low rates of unemployment employers are more likely to bid wages up in an effort to lure the higher quality employees away from their competitors. When unemployment rates are high, such bidding is unnecessary and the rate of change in money wages is lower.

The main implication of the Phillips curve is that, because a particular level of unemployment implies a particular rate of wage increase, the aims of low unemployment and



Phillips curve

From *Economica* (1958)

a low rate of inflation may be inconsistent. In recent years, however, the relation between unemployment and inflation has been too unstable, most observers would argue, to make much use of the Phillips curve concept. In particular, the situation in the early 1970s, with both relatively high unemployment and extremely high wage increases in most countries, represented a point well off the Phillips curve.

Phillips Exeter Academy, also called EXETER, private, coeducational college-preparatory school (grades 9–12) in Exeter, N.H., U.S. It was founded as a boys' school in 1781 by John Phillips, a local merchant and uncle of Samuel Phillips, the founder three years earlier of Phillips Academy in Andover, Mass.

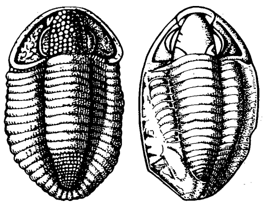
Exeter's curriculum emphasizes group discussion led by the instructor in a Socratic manner, an instructional method called the Harkness Plan after philanthropist Edward S. Harkness, who richly endowed the school in 1931. Exeter has gained a national reputation for faculty participation in decision making and freedom of speech, and in 1953 an Exeter Study Commission under the direction of William Saltonstall issued a report that led to a national reexamination of the role of secondary education. The school began admitting girls in 1970.

Phillips Petroleum Company, major U.S. petroleum company. Headquarters are in Bartlesville, Okla.

The company was incorporated in 1917 to acquire the Oklahoma and Kansas oil-producing properties of Frank and L.E. Phillips. The acquisition of a refinery in 1927 led to its development as an integrated oil company, so that it is now engaged in every phase of the petroleum industry, including exploration and development, transportation, refining and processing, and marketing and distribution. Phillips has important oil and gas holdings in the North Sea, Nigeria, and Indonesia, and owns its own refineries, pipelines, tankers, and tank cars.

The company markets its products primarily in the Midwest, under the trade name of Phillips 66, and abroad. It markets gasoline for automobiles and aviation, oils and greases, kerosene, and liquefied gas. It also produces petrochemicals, synthetic fibres, plastics, and agricultural chemicals. It has subsidiaries in North and South America, Europe, Africa, Australia, and the Far East.

Phillipsia, genus of trilobites (an extinct group of aquatic arthropods) uncommonly found as fossils in Carboniferous and Permian rocks (360,000,000 to 245,000,000 years old) in Europe, North America, and the Far



Phillipsia

East. One of the last known trilobite genera, *Phillipsia* is characterized by a relatively large head region and a large posterior region. Some forms are characterized by an unusual development of small surface nodes.

phillipsite, hydrated calcium, sodium, and potassium aluminosilicate mineral in the zeolite family $(Ca,Na_2,K_2)_3Al_6Si_{10}O_{32} \cdot 12H_2O$. It typically is found as brittle white crystals filling cavities and fissures in basalt and in phonolite lava, occurring near Rome; on Sicily; in Victoria, Australia; and in Germany. Phillipsite's molecular structure is a framework containing rings of four or eight linked silicate or aluminate tetrahedra (each consisting of four oxygen atoms arranged at the points of a triangular pyramid about a central silicon or aluminum atom); the openness of this structure and the presence of the aluminum atoms (each of which contributes a negatively charged site) give phillipsite cation-exchange properties (dissolved sodium, potassium, calcium, and magnesium readily replacing one another in the structure), making phillipsite useful in water softeners. For detailed physical properties, *see* zeolite (table). *Compare* harmotome.

Phillpotts, Eden (b. Nov. 4, 1862, Mount Abu, Rājasthān, India—d. Dec. 29, 1960, Broad Clyst, near Exeter, Devon, Eng.), British novelist, poet, and dramatist especially noted for novels evoking their Devon setting in a manner reminiscent of the style of Thomas Hardy.

Phillpotts was educated at Plymouth and for 10 years was a clerk in an insurance office. He then studied for the stage and later decided to become a writer. He produced more than 100 novels, many of them about rural Devon life. Among his more important works are the novels *Children of the Mist* (1898), *Sons of the Morning* (1900), and *Widecombe Fair* (1913); the autobiographical studies of boyhood and adolescence, *The Human Boy* (1899) and *The Waters of the Walla* (1950); the plays *The Farmer's Wife* (1917) and *Yellow Sands* (with his daughter Adelaide, 1926); and the poetry collections *The Iscariot* (1912), *Brother Beast* (1928), and *The Enchanted Wood* (1948). He also wrote *One Thing and Another* (1954), a collection of poems and essays.

Phillpotts, Henry (b. May 6, 1778, Bridgwater, Somersetshire, Eng.—d. Sept. 18, 1869, Torquay, Devonshire), Church of England bishop of Exeter (from 1830), who represented the conservative High Church wing of the Oxford Movement and emphasized litur-

gical forms of worship, episcopal government, monastic life, and early Christian doctrine as normative of orthodoxy. His unsuccessful attempt to block (1847–51) the pastoral appointment of George C. Gorham because of his Calvinistic view of Baptism gave rise to one of the most publicized ecclesiastical lawsuits in the 19th century and agitated High Church feeling against Parliament's intervention in religious questions. He actively supported Tory politics, opposing social reform and religious toleration.

Philo JUDAEUS, also called PHILO OF ALEXANDRIA (b. 15–10 BC, Alexandria—d. AD 45–50, Alexandria), Greek-speaking Jewish philosopher, the most important representative of Hellenistic Judaism. His writings provide the clearest view of this development of Judaism in the Diaspora. As the first to attempt to synthesize revealed faith and philosophic reason, he occupies a unique position in the history of philosophy. He is also regarded by Christians as a forerunner of Christian theology.

Life and background. Little is known of the life of Philo. Josephus, the historian of the Jews who also lived in the 1st century, says that Philo's family surpassed all others in the nobility of its lineage. His father had apparently played a prominent role in Palestine before moving to Alexandria. Philo's brother Alexander Lysimachus, who was a general tax administrator in charge of customs in Alexandria, was the richest man in the city and indeed must have been one of the richest men in the Hellenistic world, because Josephus says that he gave a huge loan to the wife of the Jewish king Agrippa I and that he contributed the gold and silver with which nine huge gates of the Temple in Jerusalem were overlaid. Alexander was also extremely influential in Roman imperial circles, being an old friend of the emperor Claudius and having acted as guardian for the Emperor's mother.

Philo was born between 15 and 10 BC. The community of Alexandria, to judge from the language of the Jewish papyri and inscriptions, had for nearly three centuries been almost exclusively Greek-speaking and indeed regarded the Septuagint (the 3rd-century-BC translation of the Hebrew Bible into Greek) as divinely inspired. During the century and a half before Philo's birth, Alexandria had been the home of a number of Jewish writers whose works exist now only in fragments. These men were often influenced by the Greek culture in which they lived and wrote apologies for Judaism.

The Alexandrian Jews were eager to enroll their children of secondary school age in Greek gymnasiums, institutions with religious associations dedicated to the liberal arts and athletics; in them, Jews were certainly called upon to make compromises with their traditions. It may be assumed that Philo was a product of such an education: he mentions a wide range of Greek writers, especially the epic and dramatic poets; he was intimately acquainted with the techniques of the Greek rhetorical schools; and he praises the gymnasium. Philo's education, like that which he ascribes to Moses, most probably consisted of arithmetic, geometry, astronomy, harmonics, philosophy, grammar, rhetoric, and logic.

Like the cultured Greeks of his day, Philo often attended the theatre, though it had distinctly religious connotations, and he noted the different effects of the same music on various members of the audience and the enthusiasm of the audience for a tragedy of Euripides. He was a keen observer of boxing contests and attended chariot races as well. He also mentions the frequency with which he attended costly suppers with their lavish entertainment.

Philo says nothing of his own Jewish education. The only mention of Jewish education in his work indicates how relatively weak it must have been, because he speaks only of Jewish schools that met on the Sabbath for lectures on ethics. That he was far from the Palestinian Hellenizers and that he regarded himself as an observant Jew is clear, however, from his statement that one should not omit the observance of any of the Jewish customs that have been divinely ordained. Philo is critical both of those who took the Bible too literally and thus encountered theological difficulties, particularly anthropomorphisms (*i.e.,* describing God in terms of human characteristics), and those who went to excesses in their allegorical interpretation of the laws, with the resulting conclusion, anticipating Paul's antinomianism, that because the ceremonial laws were only a parable, they need no longer be obeyed. Philo says nothing of his own religious practices, except that he made a festival pilgrimage to Jerusalem, though he nowhere indicates whether he made more than one such visit.

In the eyes of the Palestinian rabbis the Alexandrian Jews were particularly known for their cleverness in posing puzzles and for their sharp replies. As the largest repository of Jewish law apart from the Talmud before the Middle Ages, Philo's work is of special importance to those who wish to discern the relationship of Palestine and the Diaspora in the realm of law (*halakah*) and ritual observance. Philo's exposition of the law may represent either an academic discussion giving an ideal description of Jewish law or the actual practice in the Jewish courts in Egypt. On the whole, Philo is in accord with the prevailing Palestinian point of view; nonetheless he differs from it in numerous details and is often dependent upon Greek and Roman law.

That Philo experienced some sort of identity crisis is indicated by a passage in his *On the Special Laws.* In this work, he describes his longing to escape from worldly cares to the contemplative life, his joy at having succeeded in doing so (perhaps with the Egyptian Jewish ascetic sect of the Therapeutae described in his treatise *On the Contemplative Life*), and his renewed pain at being forced once again to participate in civic turmoil. Philo appears to have been dissatisfied with his life in the bustling metropolis of Alexandria: He praises the Essenes—a Jewish sect who lived in monastic communities in the Dead Sea area—for avoiding large cities because of the iniquities that had become inveterate among city dwellers, for living an agricultural life, and for disdaining wealth.

The one identifiable event in Philo's life occurred in the year 39 or 40, when, after a pogrom against the Jews in Alexandria, he headed an embassy to the emperor Caligula asking him to reassert Jewish rights granted by the Ptolemies (rulers of Egypt) and confirmed by the emperor Augustus. Philo was prepared to answer the charge of disloyalty levelled against the Jews by the notorious anti-Semite Apion, a Greek grammarian, when the Emperor cut him short. Thereupon Philo told his fellow delegates not to be discouraged because God would punish Caligula, who, shortly thereafter, was indeed assassinated.

Works. Philo's genuine works may be classified into three groups:

1. Scriptural essays and homilies based on specific verses or topics of the Pentateuch (the first five books of the Bible), especially Genesis. The most important of the 25 extant treatises in this group are *Allegories of the Laws,* a commentary on Genesis, and *On the Special Laws,* an exposition of the laws in the Pentateuch.

2. General philosophical and religious essays. These include *That Every Good Man Is Free,* proving the Stoic paradox that only the wise man is free; *On the Eternity of the World,* perhaps not genuine, proving, particularly in opposition to the Stoics, that the world is uncreated and indestructible; *On Providence,* extant in Armenian, a dialogue between Philo, who argues that God is providential in his concern for the world, and Alexander, presumably Philo's nephew Tiberius Julius Alexander, who raises doubts; and *On Alexander,* extant in Armenian, concerning the irrational souls of animals.

3. Essays on contemporary subjects. These include *On the Contemplative Life,* a eulogy of the Therapeutae sect; the fragmentary *Hypothetica* ("Suppositions"), actually a defense of the Jews against anti-Semitic charges to which Josephus' treatise *Against Apion* bears many similarities; *Against Flaccus,* on the crimes of Aulus Avillius Flaccus, the Roman governor of Egypt, against the Alexandrian Jews and on his punishment; and *On the Embassy to Gaius,* an attack on the Emperor Caligula (*i.e.,* Gaius) for his hostility toward the Alexandrian Jews and an account of the unsuccessful embassy to the Emperor headed by Philo.

A number of works ascribed to Philo are almost certainly spurious. Most important of these is *Biblical Antiquities,* an imaginative reconstruction of Jewish history from Adam to the death of Saul, the first king of Israel.

Philo's works are rambling, having little sense of form; repetitious; artificially rhetorical; and almost devoid of a sense of humour. His style is generally involved, allusive, strongly tinged with mysticism, and often obscure; this may be a result of a deliberate attempt on his part to discourage all but the initiated few.

Originality of his thought. The key influences on Philo's philosophy were Plato, Aristotle, the Neo-Pythagoreans, the Cynics, and the Stoics. Philo's basic philosophic outlook is Platonic, so much so that Jerome and other Church Fathers quote the apparently widespread saying: "Either Plato philonizes or Philo platonizes." Philo's reverence for Plato, particularly for the *Symposium* and the *Timaeus,* is such that he never took open issue with him, as he did with the Stoics and other philosophers. But Philo is hardly a plagiarist; he made modifications in Plato's theories. To Aristotle he was indebted primarily in matters of cosmology and ethics. To the Neo-Pythagoreans, who had grown in importance during the century before Philo, he was particularly indebted for his views on the mystic significance of numbers, especially the number seven, and the scheme of a peculiar, self-disciplined way of life as a preparation for immortality. The Cynics, with their diatribes, influenced him in the form of his sermons. Though Philo more often employed the terminology of the Stoics than that of any other school, he was critical of their thoughts.

In the past, scholars attempted to diminish Philo's importance as a theological thinker and to present him merely as a preacher, but in the mid-20th century H.A. Wolfson, an American scholar, demonstrated Philo's originality as a thinker. In particular, Philo was the first to show the difference between the knowability of God's existence and the unknowability of his essence. Again, in his view of God, Philo was original in insisting on an individual Providence able to suspend the laws of nature in contrast to the prevailing Greek philosophical view of a universal Providence who is himself subject to the unchanging laws of nature. As a Creator, God made use of assistants: hence the plural "Let us make man" in Genesis, chapter 1. Philo did not reject the Platonic view of a preexistent matter but insisted that this matter too was created. Similarly, Philo reconciled his Jewish theology with Plato's theory of Ideas in an original way: he posited the Ideas as God's eternal thoughts, which God then created as real beings before he created the world.

Philo saw the cosmos as a great chain of being presided over by the Logos, a term going back to pre-Socratic philosophy, which is the mediator between God and the world, though at one point he identifies the Logos as a second God. Philo departed from Plato principally in using the term Logos for the Idea of Ideas and for the Ideas as a whole and in his statement that the Logos is the place of the intelligible world. In anticipation of Christian doctrine he called the Logos the first-begotten Son of God, the man of God, the image of God, and second to God.

Philo was also novel in his exposition of the mystic love of God that God has implanted in man and through which man becomes Godlike. According to some scholars, Philo used the terminology of the pagan religions and mystery cults, including the term *enthousiasmos* ("having God within one"), merely because it was part of the common speech of the day; but there is nothing inherently contradictory in Judaism in the combination of mysticism and legalism in the same thinker. The influence of the mystic notions of Platonism, especially of the *Symposium,* and of the popular mystery cults on Philo's attempt to present Judaism as the one true mystery is hardly superficial; indeed, Philo is a major source of knowledge of the doctrines of these mystery cults, notably that of rebirth. Perhaps, through his mystic presentation of Judaism, Philo hoped to enable Judaism in the Diaspora to compete with the mystery religions in its proselyting efforts, as well as in its attempts to hold on to its adherents. That he was essentially in the mainstream of Judaism, however, is indicated by his respect for the literal interpretation of the Bible, his denunciation of the extreme allegorists, and his failure to mention any specific rites of initiation for proselytes, as well as the lack of evidence that he was himself a devotee of a particular mystery cult.

The purpose of what Philo called mystic "sober intoxication" was to lead one out of the material into the eternal world. Like Plato, Philo regarded the body as the prison house of the soul, and in his dualism of body and soul, as in his description of the flight from the self, the contrast between God and the world, and the yearning for a direct experience of God, he anticipated much of Gnosticism, a dualistic religion that became important in the 2nd century BC. But unlike all the Greek philosophers, with the exception of the Epicureans, who believed in limited freedom of will, Philo held that man is completely free to act against all the laws of his own nature.

In his ethical theory Philo described two virtues, under the heading of justice, that are otherwise unknown in Greek philosophic literature—religious faith and humanity. Again, for him repentance was a virtue, whereas for other Greek philosophers it was a weakness. Perfect happiness comes, however, not through men's own efforts to achieve virtue but only through the grace of God.

In his political theory Philo often said that the best form of government is democracy; but for him democracy was far from mob rule, which he denounced as the worst of polities, perhaps because he saw the Alexandrian mob in action. For Philo democracy meant not a particular form of government but due order under any form of government in which all men are equal before the law. From this point of view, the Mosaic constitution, which embodies the best elements of all forms of government, is the ideal. Indeed, the ultimate goal of history is that the whole world be a single state under a democratic constitution.

Philoctetes, Greek legendary hero who played a decisive part in the final stages of the Trojan War.

He (or his father, Poeas) had been bequeathed the bow and arrows of the Greek hero Heracles in return for lighting his funeral pyre; Philoctetes thus became a notable archer. En route to Troy he was incapacitated by a snakebite and was left behind. After a seer revealed that Troy could be taken only with the aid of Heracles' bow and arrows, the Greek warriors Odysseus and Diomedes went to Philoctetes and persuaded him to accompany them to Troy. There he was healed of his wound and killed Paris (son of Priam, king of Troy), by which action he paved the way for the city's fall. He subsequently returned home but later wandered as a colonist to southern Italy, where he ultimately died in battle.

The theme of this story was used by the ancient Greek writer Sophocles in his *Philoctetes.*

Philodemus (b. *c.* 110 BC, Gadara, Syria—d. *c.* 35 BC, Herculaneum, Campania), Greek poet and Epicurean philosopher who did much to spread Epicureanism to Rome.

After studying under the Epicurean Zeno of Sidon at Athens, he moved to Rome *c.* 75 BC and became the mentor of the Roman aristocrat Lucius Calpurnius Piso, who invited Philodemus to live in his villa at Herculaneum, near Naples. In the ruins of that villa were found fragments of Philodemus' writings. He was known for his theory of art, which contradicted classical doctrines of aesthetics. His fame rests largely, however, on his love epigrams in the Palatine Anthology, allusions to which are found in works by the later Roman poets Virgil, Ovid, and Horace.

Philodendron, genus of mostly climbing herbs, commonly called philodendron, comprising about 200 species in the arum family (Araceae), native to tropical America, some of which are popular indoor foliage plants in colder areas and landscape plants in warmer climates.

The leaves are often large and smooth-margined to variously lobed and cut. The inflorescence, uncommonly produced in cultivation indoors, is a leaflike cone or spathe, green to white or reddish, which surrounds a central stout spadix bearing inconspicuous flowers. Identification is complicated by differences in leaf size and shape between the young and mature plants and by the large number of cultivated varieties that exist. The mature phase occurs only under ideal conditions and in some cases only when vertical support is provided.

Many forms of philodendron are available in cultivation, foremost among them being the common heart-leaf philodendron (*Philodendron scandens oxycardium*); the velvet-leaf philodendron (*P. scandens micans*) has small bronzy-green velvety leaves with reddish undersides. Of moderate size is the fiddle-leaf, or horsehead, philodendron (*P. bipenniflorium*), with fiddle-shaped, large, glossy green leaves up to 15–25 centimetres (6–10 inches) wide and 45 cm long. Larger types include the spade-leaf philodendron (*P. domesticum* or *P. hastatum*), with triangular leaves up to 60 cm long, and the selloum philodendron (*P. selloum*), with deeply cut leaves up to one metre (three feet) long, both of which are striking plants that require considerable indoor space.

Philokalia (Greek: "Love of the Good, the Beautiful"), prose anthology of Greek Christian monastic texts that was part of a movement for spiritual renewal in Eastern monasticism and Orthodox devotional life in general. Compiled by the Greek monk Nikodimos and by Makarios, the bishop of Corinth, the *Philokalia* was first published in Venice in 1782 and gathered the unpublished writings of all major Hesychasts (hermits) of the Christian East, from Evagrius Ponticus to Gregory Palamas.

The *Philokalia* is concerned with "inner asceticism," not merely outward obedience to one's superior or the practice of physical austerities. Inner asceticism means, above all, daily recollection of death and judgment, together with perpetual remembrance of God as omnipresent and omnipotent, and ceaseless prayer. It is through this compilation that the tradition of the "prayer of the mind," or Jesus prayer, uttered in a particular bodily position with a special way of breathing, became better known and gained new followers among Orthodox as well as Western Christians.

The *Philokalia* had great success in the Slavic countries, especially Russia, and a Church Slavonic version appeared in 1793 in St. Petersburg under the title of *Dobrotoliubie.* It was translated by the starets (spiritual leader) Paissy Velitchkovsky, who introduced a neo-Hesychast spiritual renewal into Russian and Moldavian monasticism. Whereas in Greece the *Philokalia* apparently had little influence outside certain schools of monasticism (although attempts were made to reach a wider public with new editions in 1867 and 1957), the Church Slavonic version became, through the influence of the startsy, one of the favourite spiritual books of all classes of Russian laity during the 19th century. In 1877 Theophan Zatvornik (Theophane the Recluse), the former bishop of Tambov, compiled a Russian version in five volumes.

Philolaus (fl. *c.* 475 BC), philosopher of the Pythagorean school, named after the Greek thinker Pythagoras (fl. *c.* 530 BC).

Philolaus was born either at Tarentum or, according to the 3rd-century-AD Greek historian Diogenes Laërtius, at Croton, in southern Italy. When, after the death of Pythagoras, dissension was prevalent in Italian cities, Philolaus, according to some accounts, fled first to Lucania and then to Thebes, in Greece. He later returned to Italy, where he may have been a teacher of the Greek thinker Archytas.

Philolaus was a student of the celebrated number theory of Pythagoras, who stressed the importance of numerical groupings. He was particularly interested in the properties inherent in the decad, the sum of the first four numbers. Speusippus, the successor of Plato as head of the Greek Academy, is reported to have reproduced the doctrine of the first four numbers from a book by Philolaus. Only fragments of his works survive, however, and the belief that Philolaus was the first systematizer of Pythagoreanism is widely disputed.

philology, a term now rarely used but once applied to the study of language and literature. Nowadays a distinction is usually made between literary and linguistic scholarship, and the term philology, where used, means the study of language—*i.e.,* linguistics (*q.v.*). It survives in the titles of a few learned journals that date to the 19th century. Comparative philology was a former name for what is now called comparative linguistics (*q.v.*).

Philombe, René, pseudonym of PHILIPPE-LOUIS OMBEDE (b. 1930, Ngaoundéré, Cameroon), African novelist, poet, playwright, essayist, and journalist. The *Cameroon Tribune* called him "one of the most influential personalities in the new wave of creative writing in Cameroon."

Philombe, a cultural and political activist from his teens, became a policeman in 1949. He unionized the police and became their union secretary in Douala. In the mid-1950s, after he was permanently crippled by spinal disease, he began writing seriously. His *Lettres de ma cambuse* (1964; *Tales from my Hut,* 1977), which he had written in 1957, won the Prix Mottard of the Académie Française. His other published works include *Sola, ma chérie* (1966; "Sola, My Darling"), a novel about seemingly unjust marriage customs; *Un Sorcier blanc à Zangali* (1970; "A White Sorcerer in Zangali"), a novel about the effect of a missionary's clash with the colonial administration in a small village; *Choc anti-choc* (1978), "a novel made of poems"; and *Africapolis* (1978), a tragedy. The latter two are both thinly veiled allegories of life under a malevolent dictatorship.

In 1960 Philombe was a co-founder of the National Association of Cameroonian Poets and Writers, and he remained its permanent general secretary. Many of his patriotic literary activities earned him long periods in prison, in spite of his infirmities. In 1981 he was once again released under house arrest, but all of his manuscripts were retained.

Philopoemen (b. *c.* 252 BC, Megalopolis, Arcadia—d. 182, Messene, Messenia), general of the Achaean League notable for his restoration of Achaean military efficiency.

He was trained to a career of arms by the Academic philosophers Ecdelus and Demophanes. After spending some 10 years as a mercenary leader in Crete, he returned to Achaea and was elected federal cavalry commander for 210/209, when his reorganized cavalry defeated the Aetolians on the Elean frontier. As general of the confederation for 208/207 he introduced heavier Macedonian armour and phalanx tactics and crushed the Spartans under Machanidas at Mantineia (207). General again in 206/205 and 201/200, he expelled Nabis of Sparta from Messene and routed him at Tegea. In a fourth generalship (193/192) he failed against Nabis by sea but almost annihilated his army near Gythium. The Roman general Flamininus prevented his taking Sparta, but on Nabis' assassination (192) Philopoemen incorporated it in the confederation. Henceforth he dominated Achaean policy, but, when Messene rebelled, he was taken in a skirmish and given poison (182). Plutarch relates his life.

Philoponus, John, also called JOHN THE GRAMMARIAN, Greek JOANNES PHILOPONUS, or JOANNES GRAMMATICUS (fl. 6th century), Greek Christian philosopher, theologian, and literary scholar whose writings expressed an independent Christian synthesis of classical Hellenistic thought, which in translation contributed to Syriac and Arabic cultures and to medieval Western thought. As a theologian, he proposed certain esoteric views on the Christian doctrine of the Trinity and the nature of Christ.

A native of Alexandria, Egypt, and a student there of the celebrated Aristotelian commentator Ammonius Hermiae, Philoponus interpreted Aristotle critically in the light of Neoplatonic Idealism and Christian theology; thus, he identified Aristotle's concept of the first cause with the Christian notion of a personal God. Arguing for the Christian doctrine of creation, he composed a treatise, now lost, "On the Eternity of the World," contradicting the 5th-century Neoplatonist Proclus.

Possibly Philoponus' Christianization of Aristotelian doctrine allowed the Alexandrian academy to continue despite criticism from the church. Among his notable commentaries are those on Aristotle's *Metaphysics,* the logical treatises of the *Organon,* the tract on *Physics,* the three books of *De anima* ("On the Soul"), and *De generatione animalium* ("On the Generation of Animals"). In philosophical theology Philoponus produced his major work, *Diaitētēs ē peri henōseōs* ("Mediator, or Concerning Union"), in which he discusses the Trinity and Christology. Because he held that every nature necessarily is individualized, he concluded that in Christ only one nature was possible, the divine. Although such a theological position appeared to be heretical Monophysitism, Philoponus approximated the orthodox teaching by explaining that though Christ's humanity was devoid of personhood, it was not dissolved by its fundamental union with the divinity. Claiming that his Christology was traditional, he criticized the doctrinal statements of Pope Leo I (440–461) and the Council of Chalcedon (451), and in 681 he was censured by the third Council of Constantinople for his alleged Monophysitism.

In order to defend the Christian dogma of personal immortality, Philoponus broke with the common Aristotelian and Stoic interpretation of a single universal mind operative in all men and taught that each person possesses an individual intellect. Among his other original contributions to Western thought was his development of Aristotle's kinetic theory of motion (the principle that nothing moves unless it is moved by an external force), by affirming that velocity is directly proportional to the excess of force to resistance. Philoponus' two treatises on grammar were later revised in lexicon form and received wide recognition during the Middle Ages.

Philosophe, any of the literary men, scientists, and thinkers of 18th-century France who were united, in spite of divergent personal views, in their conviction of the supremacy and efficacy of human reason. Inspired by the philosophic thought of René Descartes, the Skepticism of the Libertins, or freethinkers, and the popularization of science by Bernard de Fontenelle, they expressed support for social, economic, and political reforms, occasioned by sectarian dissensions within the church, the weakening of the absolute monarchy, and the ruinous wars that had occurred toward the end of Louis XIV's reign. In the early part of the 18th century, the movement was dominated by Voltaire and Montesquieu, but that restrained phase became more volatile in the second half of the century. Diderot, Rousseau, Georges-Louis Leclerc de Buffon, Étienne Bonnot de Condillac, Anne-Robert-Jacques Turgot, and the Marquis de Condorcet were among the Philosophes who devoted their energies to compiling the *Encyclopédie,* one of the great intellectual achievements of the century.

philosophical anthropology, discipline that seeks to unify the several empirical investigations of human nature in an effort to understand individuals as both creatures of their environment and creators of their own values.

A brief treatment of philosophical anthropology follows. For a full treatment, *see* MACROPAEDIA: Philosophical Anthropology.

Philosophical anthropology emerged as an academic discipline in Germany in the 1920s, after a time of increasing specialization in the human sciences. Scholars such as Helmuth Plessner, Max Scheler, and, earlier, Wilhelm Dilthey were concerned that the analysis of human nature through one narrow discipline (*e.g.,* psychoanalysis, physical anthropology) would result in as many limited and deterministic views of humanity as there were empirical disciplines. Marxists, for example, saw economic forces as the only determinant of the human condition, while Freudians identified subconscious forces in that role. Philosophical anthropologists argued that human nature is complex and dynamic and is able constantly to rediscover and re-create itself within the confines of its biology and culture.

Although established in reaction to scientific specialization, philosophical anthropology had its intellectual roots in the British Empirical philosophers—especially Francis Bacon, John Locke, and David Hume—and the great naturalists Carolus Linnaeus, the Comte de Buffon, and Charles Darwin. In their studies of human nature, these men assumed no causal connections or final design in the phenomena they observed and admitted only those facts that could be proved by experience. Plessner and Scheler built on the Phenomenology of Edmund Husserl in an effort to begin scientific inquiry into human nature with the intuitive, personal consciousness of experience. Other philosophical anthropologists have borrowed from Existentialism.

Philosophical Radical, adherent of the Utilitarian political philosophy that stemmed from the 18th- and 19th-century English jurist Jeremy Bentham and culminated in the doctrine of the 19th-century English philosopher John Stuart Mill. Bentham believed that "Nature has placed mankind under the governance of two masters, pain and pleasure" and that actions should be judged morally right or wrong according to whether or not they tend to maximize pleasure and minimize pain among those affected by them. He explored the implications of this principle for legal and other social institutions. Bentham's theory was developed and refined by Mill, who held that actions are right in proportion as they tend to promote the greatest happiness of the greatest number. Other Philosophical Radicals included the economists James Mill and David Ricardo, the jurist John Austin, and the historian George Grote. They favoured economic and political liberalism and, although primarily theorists, they aimed at and achieved considerable practical influence.

philosophy (from Greek, by way of Latin, *philosophia,* "love of wisdom"), the critical examination of the grounds for fundamental beliefs and an analysis of the basic concepts employed in the expression of such beliefs. Philosophical inquiry is a central element in the intellectual history of civilization.

The subject of philosophy is treated in a number of articles in the MACROPAEDIA. For treatments of the major systems of Chinese philosophy, *see* Buddhism, The Buddha and; Confucius and Confucianism; Taoism. *See also* the biography of Chu Hsi. For treatment of Japanese philosophical systems, *see* Buddhism, The Buddha and; Shintō. The philosophical traditions of the Indian subcontinent are treated historically in the article Indian Philosophy. For further treatment of particular Indian systems, *see* Buddhism, The Buddha and; Hinduism; Jainism; Sikhism. For historical treatment of Western philosophy, *see* Philosophy, The History of Western. Major systems are treated individually under the title Philosophical Schools and Doctrines, Western. *See also* Aristotelianism, Aristotle and; Augustine; Christianity: *Christian Thought and Doctrine;* Cartesianism, Descartes and; Hegelianism, Hegel and; Hume; Islām: *Islāmic Philosophy;* Judaism: *Jewish Philosophy;* Kantianism, Kant and; Locke; Marxism, Marx and; Mill, J.S.; Nietzsche; Platonism, Plato and; Socrates. For treatment of particular branches of philosophical inquiry, *see* Aesthetics; Epistemology; Ethics; Ideology; Logic, The History and Kinds of; Metaphysics; Mind, Philosophy of; Philosophical Anthropology; Philosophies of the Branches of Knowledge.

For a description of the place of philosophy in the circle of learning and for a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, *see* PROPAEDIA: Part Ten, Division V.

Philostorgius (b. *c.* AD 368, Borissus, Cappadocia—d. *c.* 433, probably Constantinople), Byzantine historian, partisan of Arianism, a Christian heresy asserting the inferiority of Christ to God the Father. His church history, preserved in part, was the most extensive collection of Arian source texts assembled in a single work and furnished valuable data on the history, personalities, and intellectual milieu of theological controversy in the early church.

Philostorgius was the son of a staunch Arian and from the age of 20 studied in Constantinople and became a follower of Eunomius of Cyzicus, a leading exponent of extreme Arianism. This branch of the heresy stressed an absolute monotheism: only the Father is perfect God; the Son, Christ, is created.

Between 425 and 433 (during the reign of Emperor Theodosius II), Philostorgius wrote his church history in 12 books, after visiting Arian communities throughout the Eastern empire. The work, covering the period 300 to 425, was intended to continue the monumental *Ecclesiastical History* by the 4th-century chronicler Eusebius of Caesarea. In reality it constituted an apology for the radical Arian school. Beyond fragmentary references by Byzantine historians from the 9th to the 13th century, it has survived only in a summary and commentary in the *Bibliotheca* ("The Library," or annotated bibliography) of Photius, the 9th-century scholarly patriarch of Constantinople. Although he acclaimed Philostorgius' style and diction, Photius charged him with obscurity and bias, particularly in his laudatory treatment of Eunomius and other Arian spokesmen and in his condemnation of orthodox theologians and emperors. Philostorgius refrained from attacking directly the celebrated orthodox leaders Gregory Nazianzene and Basil of Caesarea; he admitted the cogency of some of their refutations of heterodox Trinitarian theology but chided them for their criticism of his mentor, Eunomius. The *History* appealed to the cultured Greek because of its Arian emphasis on the rational intelligibility of Christian revelation. It also depicts the Arian response to the pagan accusation that Christianity influenced the political misfortunes of the Greco-Roman empire and civilization. Philostorgius countered that the lamentable collapse of classical culture into barbarism verified Christian apocalyptic teaching, or the predictions and signs portending the end of the world and the Second Coming of Christ.

Byzantine chronicles mention an apology for Christianity, written against the 3rd-century Neoplatonist Porphyry, but this tract has been lost. An English translation of *The Ecclesiastical History of Philostorgius as Epitomized by Photius* was done by E. Walford (1851). A critical edition of the Greek text was compiled by Joseph Bidez in the series *Die Griechischen christlichen Schriftsteller der ersten drei Jahrhunderte,* vol. 21 (1913; "The Greek Christian Writers").

Philostratus, any of at least three members of a family of ancient Greek writers. They are often confused with one another, and the attribution of certain works among them is controversial.

Flavius Philostratus (b. *c.* AD 170—d. *c.* 245), called "the Athenian," studied at Athens and some time after 202 entered the circle of the philosophical Syrian empress of Rome, Julia Domna. On her death he settled in Tyre. He wrote the *Gymnasticus* (a treatise dealing with athletic contests); a life of the Pythagorean philosopher Apollonius of Tyana; *Bioi sophiston* (*Lives of the Sophists*), treating both the Classical Sophists of the 5th century BC and later philosophers and rhetoricians; a discourse on nature and law; and the epistles ("Love Letters"), of which one forms the basis of Ben Jonson's "Drink to Me Only with Thine Eyes."

Philostratus (b. *c.* AD 190), called "the Lemnian," son-in-law of Flavius Philostratus, was the author of a letter to Aspasius of Ravenna and of the first series of the *Imagines* in two books, discussing 65 real or imaginary paintings on mythological themes in a portico at Naples. They are an important source for the knowledge of Hellenistic art and roused the enthusiasm of Goethe.

Philostratus, called "the Younger," grandson of Philostratus the Lemnian, wrote a second series of *Imagines* in the 3rd century AD.

Philotheus Kokkinos (b. *c.* 1300, Salonika, Greece—d. 1379, Constantinople), theologian, monk, and patriarch of Constantinople, a leader of the Byzantine monastic and religious revival in the 14th century. His numerous theological, liturgical, and canonical works received wide circulation not only in Byzantium but throughout the Slavic Orthodox world.

Born of a Jewish mother, Philotheus became a monk and then abbot of the Great Laura on Mt. Athos, Greece, where he became a leading advocate of Hesychasm (a form of contemplative prayer) and a close friend of the theologian Gregory Palamas. In 1347 Philotheus was named bishop of Heraclea, near Constantinople, but spent most of his time at the imperial capital.

A protégé of the emperor John VI Cantacuzenus, Philotheus was appointed patriarch of Constantinople in November 1353. He was deposed by John V Palaeologus in 1354 and then restored by Callistus I. After he was reappointed patriarch in 1364, Philotheus opposed the efforts of John V to negotiate with the popes Urban V and Gregory XI. Asserting his patriarchal authority, he fostered the Hesychast cause by canonizing Gregory Palamas and acclaiming him a doctor of the Greek Orthodox Church at the synod of 1368.

Through an independent ecclesiastical policy, moreover, Philotheus consolidated the Orthodox Serbs, Bulgarians, and Russians with the Greek patriarchate. Concomitantly, he implemented his theory of Constantinople's patriarchal supremacy over the entire Eastern church. In 1367 he agreed to hold a Union Council with the Western church, but the idea was rejected by Pope Urban VI. Philotheus actively intervened in the political and ecclesiastical affairs of Russia, consolidating administrative functions under a single metropolitan of Kiev and all Russia (who actually resided in Moscow).

Philoxenus OF MABBUG, Syriac AKHSĒNĀYĀ (b. *c.* 440, Tahal, Beth-Garmaï [near modern Kirkūk, Iraq]—d. *c.* 523, Gangra, Paphlagonia [near modern Samsun, Turkey]), Syrian bishop, theologian, and classical author. He was a leader of the Jacobite Monophysite church, a heterodox group teaching a single, divine nature in Christ, subsuming his humanity. He also contributed significantly to the Syriac literary heritage, particularly with the Philoxenian New Testament based on the original Greek text.

A student at the school of Edessa, now Urfa, Tur., Philoxenus rejected the Nestorian doctrine of Christ that posited in him an autonomous human nature conjoined to the divinity simply by a moral bond. Instead, Philoxenus emphasized the dynamic hegemony of Christ's divinity over his humanity. Because of his zeal in expounding the Monophysite cause, he was expelled from Edessa by the Orthodox patriarch of Antioch. But with the support of Peter the Fuller, Monophysite patriarch of Antioch, Philoxenus was named bishop of Hierapolis (Mabbug), near modern Aleppo, Syria, in 485.

Investigated by Flavian II, orthodox successor to Peter the Fuller, Philoxenus was condemned as a heretic by Macedonius, patriarch of Constantinople. Supported, however, by the new emperor, Anastasius I, Philoxenus undertook a campaign to replace Orthodox bishops with Monophysite churchmen. At the accession of the Orthodox emperor Justin I in 518, Philoxenus was exiled to Philippopolis, now Plovdiv, Bulg., where he continued his polemical and ascetical writings during the rigours of captivity. It is possible he died violently.

Philoxenus collaborated in a Syriac version of the New Testament in about 508 with Polycarp of Hierapolis, his chorepiscopus ("auxiliary bishop"). Together with the celebrated Peshitta, an early Syriac Bible text, the Philoxenian New Testament, as it is called, served as the principal scriptural source for Syriac Christianity for two centuries. *The Discourses of Philoxenus,* 2 vol. (1894), a collection of 13 of Philoxenus' addresses on the Christian life, were edited and translated by Sir Ernest Alfred Thompson Wallis Budge.

Phios, also spelled PHIOPS (Egyptian kings): *see* Pepi.

Phitsanulok, town, north-central Thailand. Phitsanulok lies along the Nan River and the Bangkok–Chiengmai railroad. It is also served by an airport and by a major highway to Sukhothai (west) and Khon Kaen (east). The commercial centre in the southern part of town deals in rice, cotton, and tobacco. The old walled city dates to the 13th century, and from 1350 to 1767 it was second in size and importance to the national capital of Phra Nakhon Si Ayutthaya. The temple complex Wat Phra Si Rattana Mahathat houses the Phra Buddha Jinaraj, an early bronze figure famed for its beauty. Modern buildings in Phitsanulok include a 15-story hotel. Rice is the main crop grown in the surrounding agricultural area. Pop. (1985 est.) town, 76,008.

Phiz: *see* Browne, Hablot Knight.

phlebitis, inflammation of the wall of a vein. Phlebitis may result from the infection of tissues adjacent to the vein, or it may result from trauma or from a surgical operation or childbirth. A long period of bed rest and an attendant lack of blood circulation may also cause phlebitis. Varicose veins, obesity, and atherosclerosis are other predisposing factors. In many cases the cause of phlebitis is not known.

Phlebitis can last for years, and if it continues for a long time, the inner lining of the inflamed vein becomes irritated to the point that various elements in the blood are deposited there, forming a blood clot. This condition is known as thrombophlebitis (*q.v.*).

Phlebitis usually occurs in one of the superficial veins of the lower leg. The condition is more serious when it occurs in a more deeply situated blood vessel, since if a blood clot develops there and then breaks away and begins to circulate in the bloodstream, it can cause a serious circulatory obstruction. The indications of phlebitis include localized pain, swelling, redness, and heat over the inflamed vein. Examination may reveal a tender, cordlike mass under the skin at the site. If phlebitis affects a superficial vein, the condition is relatively innocuous and can be treated by analgesics and bed rest until the inflammation disappears, at which time mild exercise should be taken. In severe or serious cases of phlebitis, anticoagulants are administered to prevent the formation of blood clots.

phlebothrombosis, formation of a blood clot in a vein that is not inflamed. Inactivity, such as bed rest during convalescence, can lead to the condition, which frequently progresses to thrombophlebitis (*q.v.*), in which the clot adherent to the wall of the vein is accompanied by inflammation of the vessel.

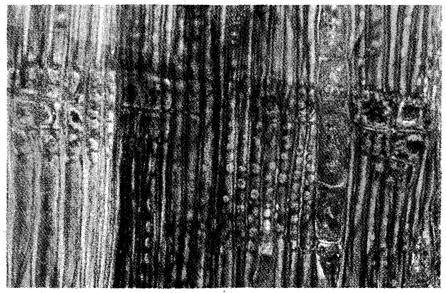
phlebotomus fever: *see* pappataci fever.

phlegmasia alba dolens (medicine): *see* milk leg.

Phlipon, Jeanne-Marie: *see* Roland (de La Platière), Jeanne-Marie.

phloem, also called BAST, tissues in plants that conduct foods made in the leaves to all other parts of the plant. Phloem is composed of various specialized cells called sieve tubes, companion cells, phloem fibres, and phloem parenchyma cells. Primary phloem is formed by the apical meristems (zones of new cell production) of root and shoot tips; it may be either protophloem, the cells of which are matured before elongation (during growth) of the area in which it lies, or metaphloem, the cells of which mature after elongation. Sieve tubes of protophloem are unable to stretch with the elongating tissues and are torn and destroyed as the plant ages. The other cell types in the phloem may be converted to fibres. The later maturing metaphloem is not destroyed and may function during the rest of the plant's life in plants such as palms but is replaced by secondary phloem in plants that have a cambium.

Sieve tubes, which are columns of sievetube cells having perforated, sievelike areas in their lateral or end walls, provide the channels in which food substances travel. Phloem parenchyma cells, called transfer cells and border parenchyma cells, are located near the finest branches and terminations of sieve tubes



Longitudinal section through xylem (pink) and phloem (blue green); small circles within the phloem are the sieve areas of the sieve cells, and the dark red areas in the phloem are phloem parenchyma cells

J.M. Langham

in leaf veinlets, where they also function in the transport of foods. Phloem fibres are flexible long cells that make up the soft fibres (*e.g.,* flax and hemp) of commerce.

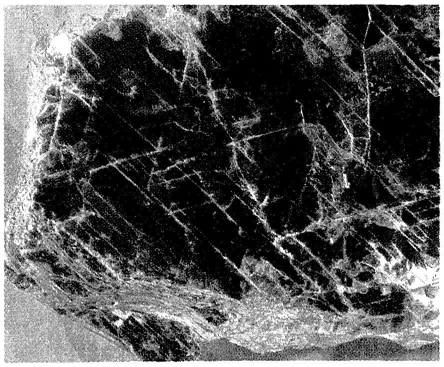
phlogiston, in early chemical theory, hypothetical principle of fire, of which every combustible substance was in part composed. In this view, the phenomena of burning, now called oxidation, was caused by the liberation of phlogiston, with the dephlogisticated substance left as an ash or residue.

Johann Joachim Becher in 1669 set forth his view that substances contained three kinds of earth, which he called the vitrifiable, the mercurial, and the combustible. He supposed that, when a substance burned, combustible earth (Latin *terra pinguis,* meaning "fat earth") was liberated. Thus, wood was a combination of phlogiston and wood ashes. To this hypothetical substance Georg Ernst Stahl, at about the beginning of the 18th century, applied the name phlogiston (from Greek, meaning "burned"). Stahl believed that the corrosion of metals in air (*e.g.,* the rusting of iron) was also a form of combustion, so that when a metal was converted to its calx, or metallic ash (its oxide, in modern terms), phlogiston was lost. Therefore, metals were composed of calx and phlogiston. The function of air was merely to carry away the liberated phlogiston.

The major objection to the theory, that the ash of organic substances weighed less than the original while the calx was heavier than the metal, was of little significance to Stahl, who thought of phlogiston as an immaterial "principle" rather than as an actual substance. As chemistry advanced, phlogiston was considered a true substance, and much effort was expended in accounting for the weight changes observed. When hydrogen, very light in weight and extremely flammable, was discovered, some thought it was pure phlogiston.

The phlogiston theory was discredited by Antoine Lavoisier between 1770 and 1790. He studied the gain or loss of weight when tin, lead, phosphorus, and sulfur underwent reactions of oxidation or reduction (deoxidation); and he showed that the newly discovered element oxygen was always involved. Although a number of chemists—notably Joseph Priestley, one of the discoverers of oxygen—tried to retain some form of the phlogiston theory, by 1800 practically every chemist recognized the correctness of Lavoisier's oxygen theory.

phlogopite, also called BROWN MICA, basic aluminosilicate of potassium, magnesium, and iron that is a member of the common mica group. Varieties that contain only small amounts of iron are economically important as electrical insulators. Phlogopite occurs typically as a metamorphic product (*e.g.*, in crystalline metamorphosed limestones), and it also



Phlogopite mica from Warwick, N.Y.
By courtesy of the Field Museum of Natural History, Chicago; photograph, John H. Gerard—EB Inc.

occurs in ultrabasic igneous rocks. Phlogopite forms a chemical substitution series with biotite, from which it is arbitrarily distinguished by a magnesium-to-iron ratio greater than 2:1. For detailed physical properties, *see* mica (table).

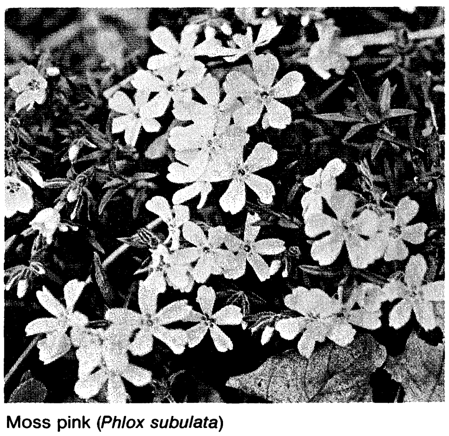
The name phlogopite also denotes an iron-free compound regarded as making up a large part of the mineral. Its chemical composition is $K_2Mg_6(Si_6Al_2O_{20})(OH)_4$.

Phlórina (Greece): *see* Flórina.

Phlox, genus of about 65 species of plants belonging to the family Polemoniaceae, admired both in gardens and in the wilds for their clustered heads of flowers. All species but one from northeastern Asia are native to North America. Phlox is herbaceous, usually with oval or linear leaves; it has heads of massed tubular flowers with five flaring lobes.

Summer phlox (*P. paniculata*) sometimes reaches more than 1½ m (5 feet) high, on straight, stiff stems topped by reddish purple to white, fragrant, large, flat flower heads. It grows in rich, moist soils. Annual phlox (*P. drummondii*) is a 45-centimetre (1½-foot), branching plant with usually reddish purple blooms. It has given rise to many cultivated forms with petals of two colours and starlike shape. Blue phlox (*P. divaricata*) is a spring-flowering woodland perennial growing to 45 cm, with blue to white flower clusters. Perennial phlox (*P. pilosa*), about the same height, bears red-purple flowers on hairy plants in summer in upland woods and prairies of central North America.

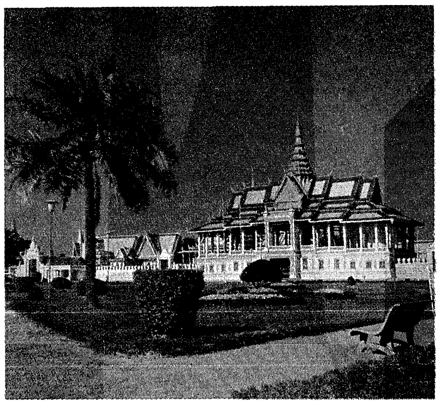
Moss pink, or creeping phlox (*P. subulata*), a low, evergreen mat covered in early spring with blue, purple, pink, or white massed blooms, is native to sandy soil and rocky ledges in eastern North America. Moss pinks, often grown as garden perennials, creep along the soil, branching freely.



Moss pink (*Phlox subulata*)
Russ Kinne—Photo Researchers/EB Inc.

Phnom Penh, Khmer PHNUM PÉNH, also spelled PNOM PENH, or PHOM PENH, capital and chief city of Kampuchea (Cambodia). It lies at the confluence of the Basăk (Bassac), Sab, and Mekong river systems, in the south-central part of the country.

Phnom Penh was founded in 1434 to succeed Angkor Thom as the capital of the Khmer nation but was abandoned several times before being reestablished in 1865 by King Norodom. The city formerly functioned as a processing centre, with textiles, pharmaceuticals, machine manufacturing, and rice milling. Its chief assets, however, were cultural. Institutions of higher learning included the National University of Phnom Penh (founded in 1956 as the Royal Khmer University), with schools of engineering, fine arts, technology, and agricultural sciences, the latter at Chamcar Daung, a suburb. Also located at Phnom Penh were the Royal University of Agronomic Sciences and the Agricultural School of Prek Leap.



The Royal Palace at Phnom Penh, Kampuchea
M. Mattson—Shostal/EB Inc.

The picturesque city of Phnom Penh was built around the royal palace and Preah Morokot Pagoda, the latter known for its floor of silver tiles. The royal palace compound included the royal palace (1919), the Royal Palace Museum, and the Veal Mien (Royal Plain), on which the national congress met twice a year. The Jayavarman VII Art Museum had a display of Khmer jewels, and the National Museum displayed Khmer art and historical documents. The European quarter, in the northern sector of the city, stood at the foot of the high Phnom Penh (Penh Hill), atop which was a pagoda housing the ashes of the legendary Lady Penh, whose discovery of a bronze Buddha there inspired the settlement bearing her name. Phnom Penh's other educational institutions included the independent Buddhist University and institutes for Buddhist and Pāli studies. A world-renowned attraction was the Royal Ballet, until modern times restricted to performances before Cambodian royalty. Its authentically bejeweled dancing girls gave mimed versions of ancient Buddhist and Hindu legends. There was also a national theatre.

When the Khmer Rouge came to power in Cambodia in 1975, they forcibly evacuated the entire population of Phnom Penh and drove its residents into the countryside. The city remained virtually deserted until Vietnamese forces invaded Kampuchea and overthrew the Khmer Rouge in 1979. Phnom Penh was gradually repopulated in the following years. Because of the virtual extermination of Kampuchea's educated class by the Khmer Rouge, the city's educational institutions face a long and difficult period of recovery.

Although situated 180 miles (290 km) from the sea, Phnom Penh is a major port of the Mekong River valley, since it is linked to the South China Sea via Vietnam by the Hau Giang channel of the Mekong Delta. The city trades in dried fish, corn (maize), cotton, and pepper. Four national highway routes and three rail lines converge on the city, linking it with other parts of Kampuchea, with the seaport at Kâmpóng Saôm (formerly Sihanoukville), and with neighbouring Thailand, Vietnam, and Laos. The international airport in nearby Pochentong has flights to Bangkok, Ho Chi Minh City (formerly Saigon), and Hong Kong and to Siĕmréab (Siem Reap), location of ancient Khmer ruins. Pop. (1988 est.) 750,000.

phobia, an extreme, irrational fear of a specific object or situation. A phobia is classified as a type of anxiety disorder, since anxiety is the chief symptom experienced by the sufferer. Phobias are thought to be learned emotional responses. It is generally held that phobias occur when fear produced by an original threatening situation is transferred to other similar situations, with the original fear often repressed or forgotten. An excessive, unreasoning fear of water, for example, may be based on a forgotten childhood experience of almost drowning. The person accordingly tries to avoid that situation in the future, a response that, while reducing anxiety in the short term, reinforces the person's association of the situation with the onset of anxiety.

Behaviour therapy is often successful in overcoming phobias. In such therapy, the phobic person is gradually exposed to the anxiety-provoking object or situation in a controlled manner until he eventually ceases to feel anxiety, having realized that his fearful expectations of the situation remain unfulfilled. In this way, the strong associative links between the feared situation, the person's experience of anxiety, and his subsequent avoidance of that situation are broken and are replaced by a less maladaptive set of responses. Psychotherapy may also be useful in the treatment of phobias.

Although psychiatrists classify phobias as a single type of anxiety disorder, hundreds of words have been coined to specify the nature of the fear by prefixing "phobia" with the Greek word for the object feared. Among the more common examples are acrophobia, fear of high places; claustrophobia, fear of closed places; nyctophobia, fear of the dark; ochlophobia, fear of crowds; xenophobia, fear of strangers; and zoophobia, fear of animals. Agoraphobia, the fear of being in open or public places, is a particularly crippling illness which may prevent its victims from even leaving home. School phobia may afflict schoolchildren who are overly attached to a parent. *See also* anxiety.

Phobos, the inner of the two satellites of Mars. It was discovered by the American astronomer Asaph Hall in 1877. A small, irregular, heavily cratered body about 27 × 22 × 19 km (17 × 14 × 12 miles) across, Phobos circles Mars every 7.65 hours at a distance of 9,378 km (5,814 miles) in a nearly circular orbit that lies only 1° from Mars's equatorial plane. Since the satellite's orbital period is less than the spin period of Mars (24 hours 37 minutes), Phobos moves from west to east in the Martian sky. The surface is covered with a gray, very dark regolith whose reflectance is only about 6 percent, or about one-half that of the lunar surface. These facts and the satellite's low mean density (two grams per cubic centimetre) are consistent with a carbonaceous composition, suggesting that Phobos may be a captured asteroid-like object. Remarkable linear grooves, typically 100 m (328 feet) wide and 20 m (66 feet) deep, cover much of the surface. There is strong evidence that they are associated with the formation of the largest crater on Phobos; this structure, known as Stickney, measures about 10 km (6 mi) across. Precise observations of Phobos' position over the past century suggest that Mars's tides are slowly pulling the satellite toward the planet. If such is the case, Mars will have only one satellite—Deimos—in perhaps 1,000,000,000 years.

An internationally built Mars probe sponsored by the Soviet Union was scheduled to pass within 50 m (164 ft) of Phobos in 1988, using laser and charged-particle beams to analyze surface material.

Phocaea, modern FOÇA, ancient Ionian city on the northern promontory of the Gulf of Smyrna, Anatolia (now the İzmir Körfezi, Turkey); it was the mother city of several Greek colonies. The Phocaeans arrived in Anatolia perhaps as late as the 10th century BC and, lacking arable land, established colonies in the Dardanelles at Lampsacus, on the Black Sea at Amisus (Samsun), and in the Crimea. In the Mediterranean they colonized as far west as Massilia (Marseille) and Emporion (Ampurias in northeastern Spain). When Phocaea was besieged by the Persians about 545 BC, most of the citizens chose emigration rather than submission. In 190 BC, allied with the Seleucids against Rome and Pergamum, the Phocaeans so savagely repelled the Roman forces that the praetor Lucius Aemilius Regillus was obliged to withdraw his men and entreat the citizens not to take the war so seriously; his infuriated troops took advantage of the truce to sack the city. After participating in an uprising against Roman rule in 132 BC, Phocaea was sentenced to destruction but was reprieved through the intercession of its colony Massilia.

Modern Foça is located in an olive- and tobacco-growing region of İzmir *il* (province); it is 70 km (45 mi) from the industrial metropolis of İzmir. Tourists are attracted to ruins of the ancient city and to a commercial resort village. Pop. (1981 prelim.) 6,150.

Phocas (d. 610), Thracian centurion who was Byzantine emperor from 602 to 610.

Following an army rebellion against the emperor Maurice in 602, Phocas was sent to Constantinople as spokesman. There he took advantage of revolts in the capital to get himself chosen emperor in place of Maurice, who, together with his son, was executed. Phocas enjoyed good relations with Rome, his recognition of the primacy of the pope in matters of religion winning him praise from Pope Gregory I. Having made peace with the Avars (604) by agreeing to pay them an increased annual tribute, he had to face the avenging forces of Maurice's ally, Khosrow II, under whom the Persians moved into Asia Minor, reaching the Bosporus by 608. Phocas' persecution of a Christian sect, the Monophysites, and of the Jews brought him the hatred of the Eastern provinces, and in the capital he grew increasingly tyrannical. Fear of the Persians, together with general discontent, led to an appeal to the exarch of Carthage, who in 610 sent an expedition under his son Heraclius; the latter had Phocas executed and was himself proclaimed emperor on Oct. 5, 610. A column honouring Phocas still stands in the Roman Forum.

Phocion (b. *c.* 402 BC—d. 318), Athenian statesman and general, virtual ruler of Athens between 322 and 318. Formidable in the defense of his city, he nevertheless urged Athens to accommodate itself to the Macedonian Empire.

Phocion was a pupil of Plato and in later life a close friend of the Platonic philosopher Xenocrates. After serving Persia as a mercenary, he was drawn into Athens' efforts to remain independent of Macedonia. In 348 his tactical skills saved an Athenian force sent to crush allies of Philip II in Euboea. He helped

Anderson—Art Resource/EB Inc.

Megara (343) and Byzantium (340) defend themselves against Philip, but from about this time he regarded the Macedonians as unstoppable and cultivated diplomatic relations with them in order to avoid outright conquest. Following the death of Alexander the Great in 323, he advised against the Lamian War, though he led the defense against a Macedonian raid into Athenian territory. Sent to sue for peace the next year, he managed to reduce his city's indemnities but was forced to accept the occupation of Athens' port, Piraeus.

Phocion ruled Athens as Macedonia's agent with great moderation and personal honesty. In the power struggle after the death of the regent in 319, however, he was deposed, convicted of treason, and executed by Athenians hoping to restore democracy. Shortly afterward the Athenians decreed a public burial and a statue in his honour.

Articles are alphabetized word by word, not letter by letter

Phocis, Modern Greek FOKÍS, district of ancient central Greece, extending northward from the Gulf of Corinth over the range of Mt. Parnassus to the Locrian Mountains, which formed the northern frontier. In the fertile Cephissus River valley, between the two mountain ranges, lay most of the Phocian settlements: Amphicleia (or Amphicaea), Tithorea, Elatea, Hyampolis, Abae, and Daulis. A mountain spur running south from Mt. Parnassus to the Gulf separated the city of Crisa and its port, Cyrrha, on the Crisaean plain from the port city of Anticyra.

Its early history is obscure; Phocis was mainly pastoral, and the population was thought to be of the Aeolians, one of the earliest Greek-speaking peoples in the peninsula. Before the 6th century BC, however, Boeotians from the east and Thessalians from the north encroached on their territory. Traditionally, the Phocians controlled the sanctuary of Delphi; pilgrims landing at Cyrrha on their way to the sacred oracle were tolled heavily on the road through Crisa. Galled by this impiety, a coalition of Greek states in about 590 BC proclaimed a sacred war, destroyed Crisa, and put the sanctuary under the control of a council administered jointly by neighbouring communities. The irresolute conduct of the Phocians contributed to the Greek defeat by Persia at Thermopylae (480); at Plataea they were on the Persian side. In 449 or 448 the Spartans expelled the Phocians from Delphi but with the help of their new ally, Athens, they soon recaptured it. When Athenian land power declined, Phocis wavered again and became an ally of Sparta in the Peloponnesian War (431–404 BC).

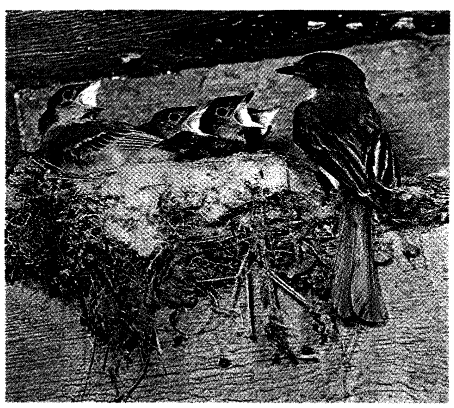
In the 4th century Phocis was constantly endangered by Boeotian aggression. During the Corinthian War (395–387) Phocis helped Sparta to invade Boeotia, but afterward it submitted to the growing power of Boeotia's principal city, Thebes. Phocians took part in the Theban Epaminondas' campaigns in the Peloponnese (370–366) but not in the successful campaign of Mantineia (362). In return for this negligence the Thebans secured a penal decree against them (for religious offenses). The Phocians retaliated by seizing Delphi, which they looted to finance mercenaries for an invasion of Boeotia and Thessaly; they were driven out of Delphi by Philip II of Macedon, who split their towns into villages and exacted an indemnity (346). During the 3rd century Phocis passed under the control of Macedonia; it was annexed to the Aetolian League in 196.

Ancient Phocis corresponds to the southeastern portions of present Fthiótis and Fokís *nomoi* (departments), whose capitals are Lamía and Amphissa (*qq.v.*), respectively. The agriculture of the area includes wheat, olives, and grapes; livestock are also important. Bauxite is mined in the Parnassian range, and there is an aluminum-reducing plant at Aspra Spítia, near ancient Anticyra. The small port of Itéa, near the site of Cyrrha, serves tourists on their way to Delphi.

Phocus, in Greek mythology, the son of Aeacus, king of Aegina, and the Nereid Psamathe, who had assumed the likeness of a seal (Greek *phoce*) in trying to escape Aeacus' embraces. Peleus and Telamon, Aeacus' legitimate sons, resented Phocus' superior athletic prowess. At the instigation of their mother, Endeis, they plotted his death, drawing lots to decide which should destroy him. The lot fell on Telamon, who murdered Phocus, feigning an accident. Aeacus, however, discovered the truth and banished both his sons.

Phoebe, in Greek mythology, a Titan, daughter of Uranus and Gaea. By Coeus she was the mother of Leto and grandmother of Apollo and Artemis. She was also the mother of Asteria and Hecate. Her epithet was Gold-Crowned, but her name, like Apollo's forename Phoebus, signified brightness. In later mythology she was identified with the moon as were Artemis and her Roman counterpart Diana. *See also* Selene.

phoebe, any of three species of New World birds of the family Tyrannidae (order Passer-



Eastern phoebe (*Sayornis phoebe*)
John Hennessy—The National Audubon Society Collection/Photo Researchers

iformes). In North America the best known species is the eastern phoebe (*Sayornis phoebe*), 18 centimetres (7 1/2 inches) long, plain brownish gray above and paler below. Its call is a brisk "fee-bee" uttered over and over. It makes a mossy nest, strengthened with mud, on a ledge, often under a bridge. In the open country of western North America is Say's phoebe (*S. saya*), a slightly larger bird with buff-hued underparts. The most widely distributed is the black phoebe (*S. nigricans*), occurring from the southwestern United States to Argentina; it is dark above, with a contrasting white belly. All phoebes have the habit of twitching their tails when perching.

Phoebe, outermost known satellite of Saturn. About 220 kilometres (136 miles) in diameter, the satellite has a mean distance from Saturn of about 12,952,000 km (8,030,240 mi). The orbit is significantly eccentric, retrograde, and steeply inclined to the plane of Saturn's rings and regular satellites. Thus it seems possible that Phoebe may be a captured object similar to an asteroid, rather than a primordial satellite of Saturn.

Phoebus (Greek god): *see* Apollo.

Phoenicia, ancient region corresponding to modern Lebanon with adjoining parts of modern Syria and Israel. The chief cities (excluding colonies) were Gebal (Greek: Byblos, modern Jubayl); Sidon (modern Ṣaydā); Tsor (Greek: Tyros, modern Tyre, Arabic: Ṣūr); and Berot (Greek: Berytos, modern Beirut).

It is not certain what the Phoenicians called themselves in their own language; it appears to have been Kena'ani (Akkadian: Kinahna), "Canaanites." In Hebrew the word *kena'ani* has the secondary meaning of "merchant," a term that well characterizes the Phoenicians. The Phoenicians probably arrived in the area about 3000 BC. Nothing is known of their original homeland, though some traditions place it in the region of the Persian Gulf.

At Byblos, commercial and religious connections with Egypt are attested from the Egyptian 4th dynasty (*c.* 2613–*c.* 2494); extensive trade was certainly carried on by the 16th century, and the Egyptians soon established suzerainty over much of Phoenicia. The 14th century, however, was one of much political unrest, and Egypt eventually lost its hold over the area. Beginning in the 9th century, the independence of Phoenicia was increasingly threatened by the advance of Assyria, the kings of which several times exacted tribute and took control of parts or all of Phoenicia. In 538 Phoenicia passed under the rule of the Persians. The country was later taken by Alexander the Great and in 64 BC was incorporated into the Roman province of Syria; Aradus, Sidon, and Tyre, however, retained self-government. The oldest form of Phoenician government seems to have been kingship—limited by the power of the wealthy merchant families. Federation of the cities on a large scale never seems to have occurred.

The Phoenicians were well known to their contemporaries as sea-traders and colonizers, and by the 2nd millennium they had already extended their influence along the coast of the Levant by a series of settlements, including Joppa (Jaffa, modern Yafo), Dor, Acre, and Ugarit. Colonization of areas in North Africa (*e.g.,* Carthage), Anatolia, and Cyprus also occurred at an early date. Several smaller Phoenician settlements were planted as stepping stones along the route to Spain and its mineral wealth. Phoenician exports included cedar and pine wood, fine linen from Tyre, Byblos, and Berytos, cloths dyed with the famous Tyrian purple (made from the snail *Murex*), embroideries from Sidon, wine, metalwork and glass, glazed faience, salt, and dried fish. In addition, the Phoenicians conducted an important transit trade.

Phoenician glass vessels from Camirus (left) and from Tharros (right) inlaid with threads of different colours; in the British Museum

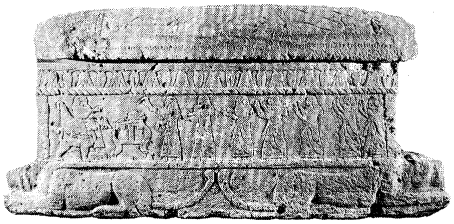
In the artistic products of Phoenicia, Egyptian motifs and ideas were mingled with those of Mesopotamia, the Aegean, and Syria. Though little survives of Phoenician sculpture in the round, relief sculpture is much more abundant. The earliest major work of Phoenician sculpture to survive was found at Byblos; it was the limestone sarcophagus of Ahiram, king of Byblos at the end of the 11th century.



Carved limestone sarcophagus of Ahiram bearing a Phoenician inscription, 11th century BC; in the Musée National, Beirut
By courtesy of the National Museum of Lebanon, Beirut

Ivory and wood carving became Phoenician specialties, and Phoenician goldsmiths' and metalsmiths' work was also well known. Glassblowing was probably invented in the coastal area of Phoenicia in the 1st century or earlier.

Although the Phoenicians used cuneiform (Mesopotamian writing), they also produced a script of their own. The Phoenician alphabetic script of 22 letters was used at Byblos as early as the 15th century. This method of writing, later adopted by the Greeks, is the ancestor of the modern Western alphabet. It was the Phoenicians' most remarkable and distinctive contribution to arts and civilization.

The religion of the Phoenicians was inspired by the powers and processes of nature. Many of the gods they worshipped, however, were localized and are now known only under their local names. A pantheon was presided over by the father of the gods, El; Asherah of the Sea was his wife and their mother. Of his family, the goddess Astarte (Ashtart) was the principal figure.

Phoenician alphabet, writing system that developed out of the North Semitic alphabet and was spread over the Mediterranean area by Phoenician traders. It is the probable ancestor of the Greek alphabet and, hence, of all Western alphabets. The earliest Phoenician inscription that has survived is the Ahiram epitaph at Byblos in Phoenicia, dating from the 11th century BC and written in the North Semitic alphabet. The Phoenician alphabet gradually developed from this North Semitic prototype and was in use until about the 1st century BC in Phoenicia proper. Phoenician colonial scripts, variants of the mainland Phoenician alphabet, are classified as Cypro-Phoenician (10th–2nd centuries BC) and Sardinian (*c.* 9th century BC) varieties. A third variety of the colonial Phoenician script evolved into the Punic and neo-Punic alphabets of Carthage, which continued to be written until about the 3rd century AD. Punic was a monumental script and neo-Punic a cursive form.

The Phoenician alphabet in all its variants changed from its North Semitic ancestor only in external form—the shapes of the letters varied a little in mainland Phoenician and a good deal in Punic and neo-Punic. The alphabet remained, however, essentially a Semitic alphabet of 22 letters, written from right to left, with only consonants represented and phonetic values unchanged from the North Semitic script. *See also* Semitic alphabet, North.

Phoenician language, Semitic language of the Northern Central (often called Northwestern) group, spoken in ancient times on the coast of Syria and Palestine in Tyre, Sidon, Byblos, and neighbouring towns, and in other areas of the Mediterranean colonized by Phoenicians. Phoenician is very close to Hebrew and Moabite, with which it forms a Canaanite subgroup of the Northern Central Semitic languages. The earliest Phoenician inscription deciphered dates probably from the 11th century BC; the latest inscription from Phoenicia proper is from the 1st century BC, when the language was already being superseded by Aramaic.

In addition to being used in Phoenicia, the language spread to many of its colonies. In one, the North African city of Carthage, a later stage of the language, known as Punic, became the language of the Carthaginian Empire. Punic was influenced throughout its history by the language of the Berbers and continued to be used by North African peasants until the 6th century AD.

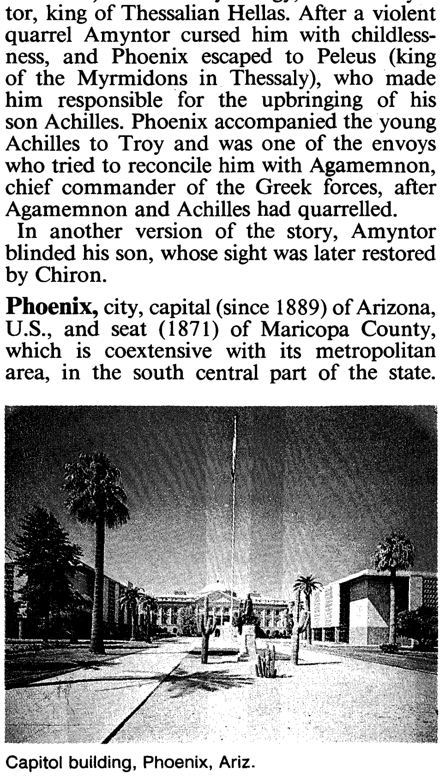
Phoenician words are found in Greek and Latin classical literature as well as in Egyptian, Akkadian, and Hebrew writings. The language is written with a 22-character alphabet that does not indicate vowels.

Phoeniculidae (bird family): *see* wood hoopoe.

Phoenix, in Greek mythology, son of Amyntor, king of Thessalian Hellas. After a violent quarrel Amyntor cursed him with childlessness, and Phoenix escaped to Peleus (king of the Myrmidons in Thessaly), who made him responsible for the upbringing of his son Achilles. Phoenix accompanied the young Achilles to Troy and was one of the envoys who tried to reconcile him with Agamemnon, chief commander of the Greek forces, after Agamemnon and Achilles had quarrelled.

In another version of the story, Amyntor blinded his son, whose sight was later restored by Chiron.

Phoenix, city, capital (since 1889) of Arizona, U.S., and seat (1871) of Maricopa County, which is coextensive with its metropolitan area, in the south central part of the state.



Capitol building, Phoenix, Ariz.
Markow Photography

On the Salt River, it occupies a semiarid, saucer-shaped valley, surrounded by mountains and green irrigated fields, west and south of the Tonto National Forest. In 1867 Jack Swilling visited the area and organized an irrigation company; canals and harvests followed, and a village was founded. An associate of Swilling, Darrel Duppa, was impressed by evidences of a prehistoric culture, the Hohokam. Like the legendary phoenix that, consumed by fire, arose from its own ashes, so, Duppa predicted, would the Salt River city be born from the ancient Indian ruins.

Phoenix developed as the commercial focus of the extensive Salt River irrigation projects, fed from the Roosevelt and other dams. Diversified manufacturing (almost nonexistent before 1940) has become the chief source of income, augmented by agriculture, mining, timbering, tourism, and military airfields and test stations. The city experienced rapid growth after World War II and expanded widely in area (248 sq mi [643 sq km]); it embraces the Desert Botanical Gardens and Papago Park. The original State Capitol building is constructed of native tufa in neoclassic style. Phoenix Civic Plaza is a six-square-block convention centre. Educational institutions include Phoenix College (1920), Grand Canyon College (1949), American Graduate School of International Management, Thunderbird Campus (1946), Southwestern College (1960), DeVry Institute of Technology (1967), and Maricopa Technical Community College (1968). Arizona State University is at nearby Tempe. Annual events are the Copper Bowl parade and football game, the World's Championship Rodeo, and the Arizona State Fair. The city is the home of many professional sports teams. Inc. 1881. Pop. (1970) city, 581,562; metropolitan area (SMSA), 967,-522; (1980) city, 789,704; metropolitan area (SMSA), 1,508,030.

phoenix, in ancient Egypt and in classical antiquity, a fabulous bird associated with the worship of the sun. The Egyptian phoenix was said to be as large as an eagle, with brilliant scarlet and gold plumage and a melodious cry. Only one phoenix existed at any time, and it was very long-lived—no ancient authority gave it a life span of less than 500 years. As its end approached, the phoenix fashioned a nest of aromatic boughs and spices, set it on fire, and was consumed in the flames. From the pyre miraculously sprang a new phoenix, which, after embalming its father's ashes in an egg of myrrh, flew with the ashes to Heliopolis ("City of the Sun") in Egypt, where it deposited them on the altar in the temple of the Egyptian god of the sun, Re. A variant of the story made the dying phoenix fly to Heliopolis and immolate itself in the altar fire, from which the young phoenix then rose.

The *bennu,* a heron, was traditionally associated with sun worship in Egypt, appearing on monuments as a symbol of the rising sun and of the life after death. But despite the common religious associations, the phoenix as described in literature did not at all resemble a heron in appearance, and its home was not in Egypt but nearer the rising sun (normally in Arabia or India, where spices for the nest and egg were plentiful). Probably the phoenix story originated in the Orient and was assimilated to Egyptian sun worship by the priests of Heliopolis. The adaptation of the myth to an Egyptian environment helped to bring about the connection between the phoenix and the palm tree (also called *phoinix* in Greek), which was long associated with sun worship in Egypt.

The Egyptians associated the phoenix with immortality, and that symbolism had a widespread appeal in late antiquity. The phoenix was compared to undying Rome, and it appears on the coinage of the late Roman Empire as a symbol of the Eternal City. It was also widely interpreted as an allegory of resurrection and life after death—ideas which also appealed to emergent Christianity.

In Islamic mythology the phoenix was identified with the *'anqā'* (Persian *sīmorgh*), a huge, mysterious bird (probably a heron) that was originally created by God with all perfections but had thereafter become a plague and was killed.

Phoenix Islands, group of uninhabited coral atolls, part of Kiribati, in the west central Pacific Ocean, 1,650 mi (2,650 km) southwest of Hawaii. The group comprises Phoenix (Rawaki), Sydney (Manra), McKean, Gardner (Nikumaroro), Birnie, Hull (Orona), Kanton (Canton), and Enderbury atolls. They have a total land area of about 11 sq mi (28 sq km). All are low, sandy atolls that were discovered in the 19th century by U.S. whaling ships. Several also were worked for their limited supplies of guano. The islands, annexed by Britain in 1889, were joined to the Gilbert and Ellice Islands Colony in 1937. Settlement of Sydney, Gardner, and Hull islands by Gilbertese colonists in 1938 proved infeasible over time because of inconsistent rainfall. The entire populaiton was moved to the Solomon Islands in 1958 and 1963. After 1939 Kanton and Enderbury were under joint U.S.–British administration for use as stops on transpacific airline flights. Starting in 1970, the United States used Kanton Atoll for missile tracking. All of the Phoenix Islands became part of independent Kiribati in 1979.

Phoenix Park murders (May 6, 1882), assassination by stabbing, in Dublin, of the chief secretary of Ireland, Lord Frederick Cavendish, and his under secretary, T.H. Burke. The Chief Secretary had arrived in Dublin only that day and was walking in the city's Phoenix Park in the evening when set upon by members of a nationalist secret society, the Invincibles.

The event occurred just after Charles Stewart Parnell, leader of the Irish Home Rule party in the British House of Commons, was released from Kilmainham jail, Dublin, where he had been confined for his violent speeches against the Land Act (1881), which he considered insufficient land-reform legislation. The result of the assassinations was a revulsion against terrorism. Parnell, who had just compromised with the British government over the land question, was consequently able to subordinate the Irish National League, a nationalist organization, to the more moderate Home Rule Party in Parliament.

Phoenixville, borough, Chester County, southeastern Pennsylvania, U.S., on the Schuylkill River between French and Pickering creeks, 28 mi (45 km) west of Philadelphia. The site was originally settled in 1720 by the Rev. Francis Buckwalter, a German refugee, and the town was founded (1731) by his followers. It marked the most westerly point reached by the British in Pennsylvania during the U.S. War of Independence. The steel industry dates from around 1785 beginning with Benjamin Longstreth's unsuccessful iron forge. Other forges, including Lewis Wernwag's Phoenix Iron Works (1813), which gave the borough its name, were established. In 1856 John Griffen, superintendent of the Phoenix Iron Works, turned out the first Griffen gun (a light cannon), later used by the Federal Army during the Civil War. Steel remains economically important. Light manufactures include textiles, paper and rubber products, abrasives, and chemicals. Phoenixville is the seat of Valley Forge Christian College. Inc. 1849. Pop. (1980) 14,165.

Phom Penh (Kampuchea): *see* Phnom Penh.

phon, unit of loudness level. The loudness level of a sound is a subjective, rather than an objective, measure. To measure loudness, the volume of a 1,000-hertz reference tone is adjusted until it is perceived by listeners to be equally as loud as the sound being measured. The loudness level, in phons, of the measured sound is then equal to the sound-pressure level, in decibels, of the adjusted reference sound above the standard reference level, which is the minimum audible threshold. A variation of one phon in the loudness level of a sound is approximately the smallest change in sound-pressure level detectable by the human ear under normal listening conditions.

phoneme, in linguistics, smallest unit of speech distinguishing one word (or word element) from another, as the sound *p* in "tap," which separates that word from "tab," "tag," and "tan." A phoneme may have more than one variant, called allophones (*q.v.*), which function as a single sound; for example, the *p* of "pat," "spat," and "tap" differ slightly phonetically, but that difference, determined by context, has no significance in English. In some languages, where the variant sounds of *p* can change meaning, they are classified as separate phonemes—*e.g.,* in Thai the aspirated *p* (pronounced with an accompanying puff of air) and unaspirated *p* are distinguished. Phonemes are based on spoken language and may be recorded with special symbols, like those of the International Phonetic Alphabet (*q.v.*). In transcription, linguists conventionally place symbols for phonemes between slash marks: /p/. The term phoneme is usually restricted to vowels and consonants, but some linguists extend its application to cover phonologically relevant differences of pitch, stress, and rhythm. Nowadays the phoneme has a less central place in phonological theory than it used to have, especially in American linguistics. Many linguists regard the phoneme as a set of simultaneous distinctive features, rather than as an unanalyzable unit.

phonemics, in linguistics, the study of the phonemes and phonemic system of a language. For linguists who analyze phonological systems wholly in terms of the phoneme, phonemics is coextensive with phonology (*q.v.*).

phonetics, the study of how speech sounds are made (articulatory phonetics), the acoustic properties of speech sounds (acoustic phonetics), and how speech sounds are organized in language (linguistic phonetics).

The first phoneticians were Indian scholars who, 2,300 years ago, tried to preserve the correct pronunciation of their Sanskrit holy texts so that the sacred sounds were not modified in transmission. The classical Greeks are credited with being the first to develop a writing system based on a phonetic alphabet. Some works of articulatory phonetics were produced in the 17th century. Modern phonetics began with the publication in 1867 of *Visible Speech* by Alexander Melville Bell; this book introduced a notation for writing down speech sounds with sufficient precision to permit thorough investigation of human phonological activity.

The modern emphasis in phonetics is toward developing a system of classification that can permit all human speech sounds to be compared. Linguists Noam Chomsky and Morris Halle have put forward a checklist of 30 properties that they maintain can be used to specify every different significant speech sound. Another concern of phonetics is the investigation of the mental processes by which speech is perceived. Some experiments have suggested that people understand speech elements less by identifying their acoustic properties than by identifying the motor activity used in making the utterances; this theory is supported by the observation that people have difficulty hearing the differences between sounds that they themselves are unable to produce in pronunciation.

Phôngsali, formerly PHONG SALY, town, extreme northern Laos. It lies in the northern tip of Laos, between Yunnan province, China, and northern Vietnam. The mountainous surrounding area was a trouble spot for the colonial French, who fought Chinese bandits there during World War I. The area in 1962 became a refuge for Pathet Lao insurgents, who used the Ou River valley to launch attacks on the former royal capital, Luang Prabang (now Louangphrabang), 125 miles (200 km) south of Phôngsali. The river valleys of the area are occupied by valley Lao, who raise rice and corn (maize). Phôngsali town is a small market centre that is served by the port of Hat Sa on the Ou River and is linked by road to Chiang-ch'eng, China. Pop. (latest est.) town, 3,000.

phonocardiography, diagnostic technique that creates a graphic record, or phonocardiogram, of the sounds and murmurs produced by the heart and associated great vessels. The phonocardiogram is obtained either by acoustic pickup with a chest microphone or with a miniature sensor in the tip of a small tubular instrument that is introduced into one of the heart chambers. The phonocardiogram usually supplements the information obtained by listening to body sounds with a stethoscope (auscultation) and is of special diagnostic value when performed simultaneously with measurement of the electrical properties of the heart (electrocardiography) and pulse rate.

Phonofilm, system used in the 1920s to provide sound synchronized with motion pictures. A sound track was photographically recorded on the film by a beam of light modulated by the sound waves. The sound was reproduced during projection by directing a beam of light through the sound track onto a photocell, the response of which was electronically amplified.

phonograph, also called RECORD PLAYER, instrument for reproducing sounds by means of the vibration of a stylus, or needle, following a groove on a rotating disc or cylinder. Though experimental mechanisms of this type appeared as early as 1857, the invention of the phonograph is generally credited to the United States inventor Thomas Edison (1877).

All modern phonographs have certain components in common: a turntable that spins the record; a stylus that tracks a groove in the record; a pickup that converts the mechanical movements of the stylus into electrical impulses; an amplifier that intensifies these electrical impulses; and a loudspeaker that converts the amplified signals back into sound. Some phonographs are also equipped with a record changer. A phonograph capable of undistorted reproduction of sound is one component of what is known as a high-fidelity sound system (*q.v.*). *See also* sound recording.

phonolite, any member of a group of extrusive igneous rocks (lavas) that are rich in nepheline and potash feldspar. The typical phonolite is a fine-grained, compact igneous rock that splits into thin, tough plates which make a ringing sound when struck by a hammer, hence the rock's name.

The most important constituent of phonolite is alkali feldspar, either sanidine or anorthoclase, which forms not only the bulk of the groundmass (matrix) but most of the large crystals (phenocrysts) in porphyritic varieties. Nepheline rarely appears in large crystals but may occur either interstitially or in well-formed microphenocrysts. The principal dark-coloured mineral is pyroxene: aegirine or titaniferous augite. Pyroxene phenocrysts occur as well-formed crystals; in the groundmass, pyroxene occurs characteristically as slender needles, often abundant enough to colour the rock green. An alkaline amphibole nearly always occurs as phenocrysts; barkevikite, riebeckite, or arfvedsonite are typical. Feldspathoids other than nepheline may be present as accessory minerals; the most common are noselites, sodalite, and leucite. Glass has been reported occasionally, but only in small amounts.

Most phonolites are of Tertiary or Recent age and therefore formed within about the last 66 million years; but excellent examples occur at several localities in the Carboniferous strata of Scotland and Brazil, which means that they are at least 286 million years old. Tertiary or Recent phonolites are common in Europe, as in Auvergne, France; the Eifel plateau and the Laacher See, Germany; Czechoslovakia; and the Mediterranean area (chiefly in Italy). They also occur at Cripple Creek, Colorado, and the Black Hills, South Dakota; Devil's Tower, Wyoming, is variously described as tinguaite or phonolite, depending on whether it is considered a volcanic plug or a flow.

Leucite phonolites are perhaps best known from the vicinity of Naples. Apachite, from the Apache Mountains, Texas, is an amphibole phonolite. Kenyite, from Mount Kenya, in east Africa, is rich in olivine. The phonolite of Olbrück, Ger., a rather popular local building stone, is said to contain about 15 percent noselite and 8 percent leucite. Phonolite trachytes occur on St. Helena and a number of other volcanic islands.

phonology, study of the sound patterns that occur within languages. Some linguists include phonetics, the study of the production and description of speech sounds, within the study of phonology. Diachronic (historical) phonology examines and constructs theories about the changes and modifications in speech sounds and sound systems over a period of time. For example, it is concerned with the process by which the English words "sea" and "see," once pronounced with different vowel sounds (as indicated by the spelling), have come to be pronounced alike today. Synchronic (descriptive) phonology investigates sounds at a single stage in the development of a language, to discover the sound patterns that can occur. For example, in English, *nt* and *dm* can appear within or at the end of words ("rent," "admit") but not at the beginning.

phonon, in solid-state physics, quantum of lattice vibrational energy. In analogy to a photon (a quantum of light), the phonon can be viewed as a wave packet with particle-like properties. Its behaviour characteristics determine or affect various properties of solids. The concept of the phonon is, for example, particularly useful in the theory of the thermal conductivity of insulators. It has been found that ionic crystals are better thermal insulators than metals. In such a crystal, so-called anharmonic forces exist that cause different phonons to interact with one another. This interaction in turn enables the phonons to transmit heat energy to the crystal as a whole, resulting in the establishment of a smooth temperature variation throughout the solid.

Phonons also provide a basis for understanding the property of superconductivity in certain metals. In most metallic solids phonons, along with impurities, scatter individual electrons. Under certain conditions, however, the interaction between phonons and electrons has quite a different effect and leads to an interaction between the electrons themselves. This action couples together electrons with energies near the Fermi level. At temperatures near absolute zero (−273.15° C), its effects are sufficient to cause these electrons to move as a coherent group through the medium. Thus, after an electric current has been set up, phonons must produce a change in the motion of the entire group of coupled electrons rather than simply scatter individual electrons. Because the relatively weak, thermally excited phonons are not able to do so, they move through the lattice without scattering. As a consequence, a current set up in the material persists indefinitely, and the metal becomes a superconductor of zero resistance.

phorate, generically, a powerful pesticide effective against insects, mites, and nematodes. It is a systemic insecticide that acts by inhibiting cholinesterases, enzymes involved in transmitting nerve impulses. Chemically, it is an organophosphate, *O,O*-diethyl *S*-(ethylthio)methyl phosphorodithioate. Like all organophosphates, it is related to the nerve gases and is among the most toxic of all pesticides to vertebrates, including humans.

As a systemic, phorate is taken up by the roots of plants and translocated to the parts above ground, where it is concentrated in new leaves and fruits and kills sucking pests that consume sufficient plant sap containing the chemical.

Because of its persistence in soil it is most useful in controlling soil-dwelling nematodes (microscopic roundworms that suck plant roots and transmit disease thereby). It is not recommended for use by the homeowner because it is extremely toxic and persistent.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

phoresy, transportation of a minute parasite, such as a mite or a feather louse (Mallophaga), by a larger, more mobile parasite (*e.g.,* a hippoboscid fly) of the same host, enabling the smaller parasite to colonize new host individuals. Feather lice accomplish phoresy by clinging to the body hairs of blood-sucking flies.

Phormion (d. *c.* 428 BC), brilliant Athenian admiral who won several engagements before and during the Peloponnesian War.

Phormion was one of the generals leading reinforcements to the Athenian siege of Samos in 440. He assisted the Acarnanians and Amphilochians against Ambracia, which resulted in an alliance with Acarnania that was useful to Athens. In 432–431 he headed the siege of Potidaea and was sent with 20 ships to block the entrance to the Gulf of Corinth. There in the summer of 429 he won two brilliant victories. In the first, he defeated 47 Peloponnesian ships that were advancing to reinforce the Spartan Cnemus' campaign in Acarnania; in the second battle, he routed Cnemus' 77-vessel fleet.

phormium (*Phormium tenax*), Portuguese FORMIO, a plant of the family agave (Agavaceae), and its fibre, belonging to the leaf fibre (*q.v.*) group. The plant is native to New Zealand, where the fibre, sometimes called New Zealand "hemp," or "flax," has been used since ancient times for cordage, fabrics, and baskets. It has been grown in southern Ireland, mainly as an ornamental plant, since 1798 and was later introduced to parts of Europe; commercial plantings were started in St. Helena, the Azores, Australia, southern Africa, and Japan. In the 1930s cultivation was established in the South American countries of Brazil, Chile, and Argentina.

The plant is composed of about 8 to 12 shoots growing from a central rootstock. Each shoot bears at least five dark green, lance-shaped leaves arranged in fanlike form. The leaves, tapering to a point from a base about 2 inches (5 cm) wide, are about 3 to 14 feet (0.9 to 4.2 m) long, with smooth, hard outer surfaces and undersides marked with a middle rib. The flower stalk grows from the plant centre to a height of 12 to 15 feet (3.6 to 4.5 m) and bears bunches of yellow flowers, each about 1.5 inches (3.8 cm) long. The numerous black seeds are flat and shiny.

Crops are adaptable to various soils but grow best in well-drained, loose, moderately rich soil and in temperate climates with moderate rainfall. Plants are propagated from shoots of mature roots (rhizomes) or sometimes from seed and are spaced 4 to 6 feet (1.2 to 1.8 metres) apart. The first leaves are ready for harvesting four to six years after planting, and additional leaves can be taken at intervals of one to four years thereafter. At each harvest three to four outer leaves are taken from each shoot. They are cut off by hand, 6 to 8 inches (15 to 20 centimetres) above the point at which they grow from the stalk, since lower cutting would free the red-coloured plant juice, staining the fibre.

In commercial processing the leaves, sorted according to quality and length, are subjected to machine decortication, a crushing and scraping process that frees the fibre. The fibre strands are then washed and sun-dried to promote bleaching and bring out lustre. Phormium, creamy white when carefully processed, is flexible, with fair strength and good lustre, and is resistant to damage in saltwater. It is used in twines and ropes and also made into bagging fabrics and such items as mats and shoe soles.

phoronid (marine invertebrate): *see* horseshoe worm.

phosgene, also called CARBONYL CHLORIDE, a colourless, chemically reactive, highly toxic gas having an odour like that of musty hay, used in making organic chemicals, dyestuffs, polycarbonate resins, and isocyanates for making polyurethane resins. It first came into prominence during World War I, when it was used, either alone or mixed with chlorine, against troops. Inhalation causes severe lung injury, the full effects appearing several hours after exposure.

First prepared in 1811, phosgene is manufactured by the reaction of carbon monoxide and chlorine in the presence of a catalyst. It can be formed by the thermal decomposition of chlorinated hydrocarbons; *e.g.,* when carbon tetrachloride (*q.v.*) is used as a fire extinguisher. Gaseous phosgene, which has a density about three and one-half times that of air, liquefies at a temperature of 8.2° C (46.8° F); it is usually stored and transported as the liquid under pressure in steel cylinders or as a solution in toluene. With water, phosgene reacts to form carbon dioxide and hydrochloric acid.

phosphate, any of numerous chemical compounds related to phosphoric acid (H_3PO_4). One group of these derivatives is composed of salts containing the phosphate ion (PO_4^{3-}), the hydrogen phosphate ion (HPO_4^{2-}), or the dihydrogen phosphate ion ($H_2PO_4^-$), and positively charged ions such as those of sodium or calcium; a second group is composed of esters, in which the hydrogen atoms of phosphoric acid have been replaced by organic combining groups such as ethyl (C_2H_5) or phenyl (C_6H_5).

phosphate mineral, any of a group of naturally occurring inorganic salts of phosphoric acid, $H_3(PO_4)$. More than 200 species of phosphate minerals are recognized, and structurally they all have isolated (PO_4) tetrahedral units. Phosphates can be grouped as: (1) primary phosphates that have crystallized from a liquid; (2) secondary phosphates formed by the alteration of primary phosphates; and (3) rock phosphates formed at low temperatures from phosphorus-bearing organic material.

Primary phosphates usually crystallize from aqueous fluids derived from the late stages of crystallization. Particularly common in granitic pegmatites are the primary phosphates apatite [$Ca_5(F,Cl,OH)(PO_4)_3$], triphylite [$LiFePO_4$], lithiophilite [$LiMnPO_4$], and the rare-earth phosphates monazite [$(LaCe)(PO_4)$] and xenotime [$Y(PO_4)$]. Primary phosphates commonly occur in ultrabasic rocks (*i.e.,* those very low in silica), including carbonatites and nepheline syenites. Metamorphic apatite occurs in calc-silicate rocks and impure limestones.

Secondary phosphates are extremely varied, forming at low temperatures, in the presence of water, and under variable oxidation states. Both di- and tri-valent oxidation states of iron and manganese are usually present, producing brilliant colours. Two common species are strengite [$Fe(PO_4)(H_2O)_2$] and vivianite [$Fe_3(PO_4)(H_2O)_8$].

Rock phosphates develop from bones, shells, and diatoms, but are poorly characterized because of their fine grain-size. Deposits of such phosphates do, however, occur on a wide-scale basis.

For individual phosphate minerals and their properties, *see* Table, pages 396–397. For additional information, *see also* the separate entry for each of the varieties listed therein.

phosphate rock: *see* phosphorite.

phosphine (PH_3), also called HYDROGEN PHOSPHIDE, a colourless, flammable, extremely toxic gas, with a disagreeable, garlic-like odour. Phosphine is formed by the action of a strong base or hot water on white phosphorus or by the reaction of water with calcium phosphide (Ca_3P_2). Phosphine is structurally similar to ammonia (NH_3), but phosphine is a much poorer solvent than ammonia and is much less soluble in water.

Organic compounds with bonds between phosphorus and carbon or hydrogen are named as derivatives of phosphine; in primary, secondary, and tertiary phosphines, one, two, and three hydrogen atoms have been replaced by organic combining groups. Thus methylphosphine (CH_3PH_2) is a primary phosphine, in which the methyl group (CH_3) takes the place of one of the hydrogen atoms of phosphine itself. The metal salts are called phosphides, and the protonated forms (compounds to which a hydrogen ion has been added) are called phosphonium compounds. The organic derivatives of phosphine are usually made by substitution reactions using the readily available phosphorus trichloride (PCl_3).

phosphofructokinase, enzyme that is important in regulating the process of fermentation, by which one molecule of the simple sugar glucose is broken down to two molecules of pyruvic acid. The enzyme, one of a class called transferases, catalyzes one of several specific reactions involved in this breakdown—the formation of fructose-1,6-diphosphate and adenosine diphosphate (ADP) from fructose-6-phosphate and adenosine triphosphate (ATP); its activity is sensitive to the ATP/ADP ratio in the cell.

phospholipid, also called PHOSPHATIDE, any member of a large class of fatlike, phosphorus-containing substances that play important structural and metabolic roles in living cells. The phospholipids, with the sphingolipids, the glycolipids, and the lipoproteins, are called compound lipids, as distinguished from the simple lipids (fats and waxes) and from other fat-soluble cell components, mostly isoprenoids and steroids. The term phosphoglyceride is used by some as a synonym for phospholipid and by others to denote a subgroup of phospholipids.

In general, phospholipids are composed of a phosphate group, two alcohols, and one or two fatty acids. On one end of the molecule are the phosphate group and one alcohol; this end is polar, *i.e.,* has an electric charge, and is attracted to water (hydrophilic). The other end, which consists of the fatty acids, is neutral; it is hydrophobic and water-insoluble but is fat-soluble. This amphipathic nature (containing both hydrophobic and hydrophilic groups) makes phospholipids important in membranes; they form a two-layer structure with the polar head facing out on each surface to interact with water, and with the neutral "tails" driven inward and pointing toward one another. This structural arrangement of membranes is nearly impermeable to ions and most polar molecules. Proteins embedded in the phospholipid matrix transport many substances across the membrane.

Lecithin (*q.v.;* phosphatidyl choline) and the cephalins (phosphatidyl ethanolamine and phosphatidyl serine) are groups of phospholipids of widespread occurrence in plants and animals; lecithin is the most abundant, but is rare in microorganisms.

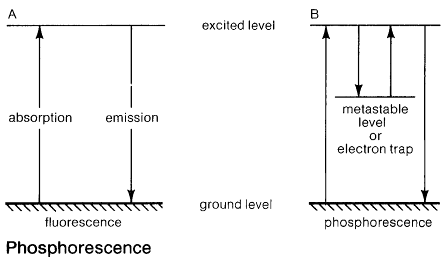
Other phospholipids include plasmalogens, present in brain and heart and apparently of limited occurrence in nonanimal tissues; phosphoinositides, present in brain; and cardiolipin, initially isolated from heart.

phosphor, solid material that emits light, or luminesces, when exposed to radiation such as ultraviolet light or an electron beam. Hundreds of thousands of phosphors have been synthesized, each one having its own characteristic colour of emission and period of time during which light is emitted after excitation ceases. When certain phosphors luminesce from electron excitation, the process is called electroluminescence (*q.v.*), and these phosphors are used in the production of radar and television screens. Phosphors excited by ultraviolet, visible, and infrared radiation are used principally in the so-called fluorescent lamps commonly employed for general illumination.

phosphor bronze, alloy of copper and tin that contains a trace of phosphorus. *See* bronze.

phosphorescence, emission of light from a substance exposed to radiation and persisting as an afterglow after the exciting radiation has been removed. Unlike fluorescence, in which the absorbed light is spontaneously emitted about 10^{-8} second after excitation, phosphorescence requires additional excitation to produce radiation and may last from about 10^{-3} second to days or years, depending on the circumstances.

To understand the difference between phosphorescence and fluorescence it is helpful to refer to the energy level diagrams in the Figure, in which the relative distance of a line, or level, above a base line (the ground level) denotes the energy of an electron occupying that level. In A, representing fluorescence, an electron is raised from the ground level to an excited level by a light photon or other radiation. Transition of the electron back to the ground level can occur spontaneously with radiation of the same energy as that which was absorbed. According to electromagnetic theory, the return is almost coincident, occurring within 10^{-8} second or so. The case for phosphorescence is illustrated in the Figure by B. There, interposed between the ground level and the excited level, is a level of intermediate energy, called a metastable level, or electron trap, because a transition between the metastable level and other levels is forbidden (highly improbable). Once an electron has fallen from the excited level to the metastable level (by radiation or by energy transfer to the system), it remains there until it makes a forbidden transition or until it is further excited



Phosphorescence

back to the transition level. This excitation may come about through thermal agitation of the neighbouring atoms or molecules (called thermoluminescence) or through optical (*e.g.*, infrared) stimulation. The time spent in the metastable level, or electron trap, determines the length of time that phosphorescence persists.

phosphorescence, marine: *see* marine phosphorescence.

phosphoric acid (H_3PO_4), also called ORTHOPHOSPHORIC ACID, the most important oxygen acid of phosphorus, used to make phosphate salts for fertilizers. It is also used in dental cements, in the preparation of albumin derivatives, and in the sugar and textile industries. It serves as an acidic, fruitlike flavouring in food products.

Pure phosphoric acid is a crystalline solid (melting point 42.35° C, or 108.2° F); in less concentrated form it is a colourless syrupy liquid. The crude acid is prepared from phosphate rock, while acid of higher purity is made from white phosphorus.

Phosphoric acid forms three classes of salts corresponding to replacement of one, two, or three hydrogen atoms. Among the important phosphate salts are: sodium dihydrogen phosphate (NaH_2PO_4), used for control of hydrogen ion concentration (acidity) of solutions; disodium hydrogen phosphate (Na_2HPO_4), used in water treatment as a precipitant for polyvalent metals; trisodium phosphate (Na_3PO_4), used in soaps and detergents; calcium dihydrogen phosphate or calcium superphosphate ($Ca[H_2PO_4]_2$), a major fertilizer ingredient; calcium monohydrogen phosphate ($CaHPO_4$), used as a conditioning agent for salts and sugars.

Phosphoric acid molecules interact under suitable conditions, often at high temperatures, to form larger molecules (usually with loss of water). Thus, diphosphoric, or pyrophosphoric, acid ($H_4P_2O_7$) is formed from two molecules of phosphoric acid, less one molecule of water. It is the simplest of a homologous series of long chain molecules called polyphosphoric acids, with the general formula $H(HPO_3)_nOH$, in which $n = 2, 3, 4, \ldots$. Metaphosphoric acids, $(HPO_3)_n$, in which $n = 3, 4, 5, \ldots$, are another class of polymeric phosphoric acids. The known metaphosphoric acids are characterized by cyclic molecular structures. The term metaphosphoric acid is used also to refer to a viscous, sticky substance that is a mixture of both long chain and ring forms of $(HPO_3)_n$. The various polymeric forms of phosphoric acid are also prepared by hydration of phosphorus oxides.

phosphorite, also called PHOSPHATE ROCK, rock with a high concentration of phosphates in nodular or compact masses. The phosphates may be derived from a variety of sources, including marine invertebrates that secrete shells of calcium phosphate, and the bones and excrement of vertebrates.

A brief treatment of phosphorite follows. For full treatment, *see* MACROPAEDIA: Minerals and Rocks.

For statistical data on mine production of ore, refining of metal, reserves (or production capacity), and trade worldwide and for major national industries, *see* mining (table).

The thickest deposits of phosphorite form in areas of geosynclinal subsidence, where phosphorite is associated with carbonaceous shale and chert. The phosphorite is usually carbonaceous and pelletal, and it is mixed with skeletal matter and phosphatic shells. Deposits may be up to one metre (about 3 feet) thick. Phosphorites also form on stable areas associated with sandstone or shale. These deposits are not carbonaceous but do contain nodules and phosphatized shells. Typical phosphorite beds contain about 30 percent phosphorous pentoxide (P_2O_5) and constitute the primary source of raw materials for most of world's production of phosphate fertilizers. Significant deposits of phosphorites in the United States include the Phosphoria Formation in Idaho and the Monterey Formation in California. Major deposits also occur in the Sechura Desert in Peru. Alteration of phosphorites tends to leach carbonates and sulfides and increase the percentage of phosphorus pentoxide. The Phosphoria Formation, for example, contains about 34 percent phosphorus pentox-

autunite $Ca(UO_2)_2(PO_4)_2 \cdot$ 10–12H_2O	lemon yellow to sulfur yellow; greenish yellow to pale green	vitreous to pearly	2–2½	3.1–3.2	thin tabular crystals; flaky aggregates; crusts	one perfect, micalike cleavage	α = 1.553 β = 1.575 γ = 1.577	tetragonal $I\frac{4}{m}mm$	fluoresces yellowish green under ultraviolet light
brushite $CaHPO_4 \cdot 2H_2O$	colourless to pale yellow	vitreous or pearly	2½	2.3	transparent to translucent efflorescences or minute crystals	two perfect cleavages	α = 1.539 β = 1.546 γ = 1.551	monoclinic A2	piezoelectric
collophane (massive apatite)	grayish white; yellowish; brown	weakly vitreous to dull	3–4	2.5–2.9	cryptocrystalline massive; hornlike concretions and nodules		n = 1.59–1.61		
lazulite $MgAl_2(PO_4)_2(OH)_2$	azure blue or sky blue; bluish white, bluish green; deep blue	vitreous	5½–6	3.1–3.4	crystals; compact masses; grains	two cleavages; uneven to splintery fracture	lazul scorz α = 1.604–1.639 β = 1.626–1.670 γ = 1.637–1.680	monoclinic $P\frac{2_1}{n}$	forms solid solution series with scorzalite in which Fe replaces Mg in the crystal structure
monazite (Ce, La)PO_4	yellowish brown or reddish brown to brown	usually resinous or waxy; sometimes vitreous or adamantine	5–5½	4.6–5.4; usually 5.0–5.2	translucent, small, flattened crystals	one distinct cleavage	α = 1.79–1.80 β = 1.79–1.80 γ = 1.84–1.85	monoclinic $P\frac{2_1}{n}$	moderately paramagnetic
pyromorphite $Pb_5(PO_4)_3Cl$	olive green; yellow; gray; brown to orange	resinous to subadamantine	3½–4	7.0	barrel-shaped prisms; globular, kidney-shaped, or grape-like masses	uneven to subconchoidal fracture	ϵ = 2.030–2.031 ω = 2.041–2.144	hexagonal $C\frac{6_3}{m}$	forms solid solution series with mimetite in which As replaces P in the crystal structure
torbernite $Cu(UO_2)_2(PO_4)_2 \cdot$ 8–12H_2O	various shades of green	vitreous to subadamantine	2–2½	3.2	tabular crystals; micalike masses	one perfect, platy cleavage	ϵ = 1.582 ω = 1.592	tetragonal $I\frac{4}{m}mm$	water content depends on temperature and humidity

ide near the surface compared to only about 28 percent at depth.

Phosphoros (mythology): *see* Lucifer.

phosphorous acid (H_3PO_3), also called ORTHOPHOSPHOROUS ACID, one of several oxygen acids of phosphorus, used as reducing agent in chemical analysis. It is a white or yellowish crystalline substance (melting point about 73° C, or 163° F) with a garlic-like taste. An unstable compound that readily absorbs moisture, it is converted to phosphoric acid (H_3PO_4) in the presence of oxygen or when heated above 180° C (360° F). Phosphorous acid (H_3PO_3) forms salts called phosphites, also used as reducing agents. Phosphorous acid is prepared by dissolving tetraphosphorus hexoxide (P_4O_6) or phosphorus trichloride (PCl_3) in water.

phosphorus (P), nonmetallic chemical element of the nitrogen family (Group Va of the periodic table).

Properties, occurrence, and uses. Ordinarily a colourless, semitransparent, soft, waxy solid that glows in the dark, it takes fire spontaneously upon exposure to air and forms dense white fumes of the oxide. Phosphorus was first prepared in elemental form in 1669 by a German alchemist, Hennig Brand, from a residue of evaporated urine.

Phosphorus is present in the fluids within cells of living tissues as the phosphate ion, PO_4^{3-}, one of the most important mineral constituents for cellular activity. The genes, which direct heredity and other cellular functions and are found in the nucleus of each cell, are molecules of DNA (deoxyribonucleic acid), which all contain phosphorus. Cells store the energy obtained from nutrients in molecules of adenosine triphosphate (ATP). Calcium phosphate is the principal inorganic constituent of teeth and bones.

Not found free in nature except in a few meteorites, phosphorus occurs in compounds that are widely distributed in many rocks, minerals, plants, and animals. Ranking 12th in abundance among the elements in the Earth's crust, phosphorus composes approximately 0.12 percent of the crust in the form of minerals such as apatite, wavellite, and vivianite; it always occurs as the phosphate ion. The chief commercial source is phosphorite, or phosphate rock, an impure massive form of carbonate-bearing apatite.

Elemental phosphorus is prepared industrially in electric furnaces in which phosphate rock, coke, and silica pebble are continuously charged and heated until they are chemically converted into phosphorus vapour, carbon monoxide gas, and a calcium silicate slag. The stream of gas is cooled to condense the phosphorus to the liquid and eventually to the solid form, which is stored under water to prevent spontaneous ignition.

The element has about 10 forms (allotropes) that occur within three major categories: white, red, and black. White phosphorus has two allotropes: the alpha form, which is stable at ordinary temperatures, has a cubic crystal structure; the beta form, which is stable below −78° C (−108° F), has a hexagonal crystal structure. White phosphorus is poisonous. Exposure to sunlight or to heat converts white phosphorus to red, which neither phosphoresces nor spontaneously burns in air. Black phosphorus, which is flaky like graphite, is made by subjecting white phosphorus to high pressures, it is chemically the least reactive form, and white is by far the most reactive. White phosphorus has been used for military purposes as a source of smoke and to fill incendiary shells and grenades. Red phosphorus is used in preparing the striking surface for safety matches.

All naturally occurring phosphorus is the stable isotope, phosphorus-31. Radioactive phosphorus-32 has a half-life of 14.3 days; it is a useful tracer in studies of the life cycles of plants and animals.

Principal compounds. Phosphorus is used almost entirely in the form of compounds, usually in the oxidation states of +3, +5, and −3. Unlike nitrogen and various other members of the family, phosphorus tends to exhibit a preference for the +5 state, however.

Of considerable economic significance is phosphine, or hydrogen phosphide, PH_3. This gaseous compound is produced either by the action of a strong base (or hot water) on white

triphylite $LiFePO_4$	bluish or greenish gray (triphylite); clove brown, honey yellow, or salmon (lithiophilite)	vitreous to subresinous	4–5	3.3–3.6 not varying linearly with composition	transparent to translucent cleavable or compact massive	one perfect cleavage	triph lith $\alpha = 1.694–1.669$ $\beta = 1.695–1.673$ $\gamma = 1.700–1.682$	orthorhombic Pmnb	forms solid solution series with lithiophilite in which Mn replaces Fe in the molecular structure; structure similar to olivine
triplite $(Mn, Fe, Mg, Ca)_2PO_4(F, OH)$	dark brown; flesh red; salmon pink	vitreous to resinous	5–5½	3.5–3.9	massive	one good cleavage	$\alpha = 1.643–1.696$ $\beta = 1.647–1.704$ $\gamma = 1.668–1.713$	monoclinic $I\frac{2}{m}$	
turquoise $CuAl_6(PO_4)_4(OH)_8 \cdot 4H_2O$	blue to various shades of green; greenish to yellowish gray	waxy	5–6	2.6–2.8	opaque, dense, cryptocrystalline to fine granular massive	one perfect and one good cleavage	$\alpha = 1.61$ $\beta = 1.62$ $\gamma = 1.65$	triclinic $P\bar{1}$	forms solid solution series with chalcosiderite in which Fe replaces Al in the molecular structure
variscite $AlPO_4 \cdot 2H_2O$	yellowish green, pale to emerald green, bluish green or colourless (variscite); peach-blossom red, carmine, violet (strengite)	vitreous to faintly waxy	3½–4½	2.2–2.5	fine-grained, round or grape-like aggregates, nodules, veins, or crusts	one good cleavage	varis stren $\alpha = 1.563–1.707$ $\beta = 1.588–1.719$ $\gamma = 1.594–1.741$	orthorhombic Pcab	forms solid solution series with strengite in which Fe replaces Al in the molecular structure; both variscite and strengite have monoclinic forms
vivianite $Fe_3(PO_4)_2 \cdot 8H_2O$	colourless when fresh, darkening to deep blue or bluish black	vitreous	1½–2	2.7	rounded prismatic crystals; kidney-shaped, tubelike, or globular masses; concretions	one perfect cleavage	$\alpha = 1.579–1.616$ $\beta = 1.602–1.656$ $\gamma = 1.629–1.675$	monoclinic $C\frac{2}{m}$	
wavellite $Al_3(PO_4)_2(OH)_3 \cdot 5H_2O$	greenish white; green to yellow	vitreous	3½–4	2.4	translucent, hemispherical, or globular aggregates	one perfect and one good cleavage	$\alpha = 1.520–1.535$ $\beta = 1.526–1.543$ $\gamma = 1.545–1.561$	orthorhombic Pcmm	
xenotime YPO_4	yellowish brown to reddish brown; flesh red, grayish white, pale yellow, or greenish	vitreous	4–5	4.4–5.1	small prismatic crystals; coarse radial aggregates; rosettes	uneven to splintery fracture	$\epsilon = 1.816–1.827$ $\omega = 1.721–1.720$	tetragonal $I\frac{4}{a}md$	moderately paramagnetic; similar in appearance and identical in form and structure to zircon, but softer

phosphorus or by the hydrolysis of a metal phosphide. Phosphine is primarily employed as a starting material in the synthesis of various organic phosphorus compounds and as a doping agent for solid-state electronics components.

Among the most commercially important phosphorus compounds are the oxides and acids. Much of the industrially produced white phosphorus is burned to form phosphorus pentoxide, or phosphorus(V) oxide, P_4O_{10}. Sometimes called phosphoric anhydride, or diphosphorus pentoxide, this compound can be obtained in the from of a soft white powder or colourless crystalline solid. It is widely used in chemical analysis as a dehydrating agent and in organic synthesis as a condensing agent. Large quantities are treated with water to make orthophosphoric acid (H_3PO_4), commonly called phosphoric acid (*q.v.*), which has diverse industrial applications, including the production of phosphates, salts that contain the phosphate ion (PO_4^{3-}), the hydrogen phosphate ion (HPO_4^{2-}), or the dihydrogen phosphate ion ($H_2PO_4^-$). Such salts are used as leavening agents in baking, as abrasives in toothpaste, and sometimes as additives to detergents. Another salt, prepared by the action of phosphoric acid on phosphate rock, is calcium dihydrogen phosphate, or superphosphate, $Ca(H_2PO_4)_2$, the most widely used phosphate fertilizer.

With the halogen elements phosphorus forms varous halides, which are used to synthesize organic phosphorus chemicals. Phosphorus reacts with sulfur to form several sulfides that are utilized in the manufacture of organic chemicals and matches. It reacts with many metals and metalloids to form phosphides.

Phosphorus atoms can bond directly with carbon atoms, yielding a large number of organic phosphorus compounds. These are found in many important biological processes. The phosphoglycerides, for example, are required for fermentation. The adenosine phosphates are essential in photosynthesis and for muscle action. Industrially important organic phosphorus compounds include plasticizers and gasoline additives. Certain highly toxic forms are employed in insecticides of the parathion type. Poisonous organic derivatives of phosphorus have been used as nerve gas, a key weapon of chemical warfare.

atomic number	15
atomic weight	30.9738
melting point (white)	44.1° C (111.4° F)
boiling point (white)	280° C (536° F)
density (white)	1.82 g/cc at 20° C (68° F)
oxidation states	−3, +3, +5
electron configuration	2-8-5 or $1s^2 2s^2 2p^6 3s^2 3p^3$

phosphorus cycle, circulation of phosphorus in various forms through nature. Of all the elements recycled in the biosphere, phosphorus is the scarcest and therefore the one most limiting in any given ecological system. It is indispensable to life, being intimately involved in energy transfer and in the passage of genetic information in the deoxyribonucleic acid (DNA) of all cells.

Much of the phosphorus on Earth is tied up in rock and sedimentary deposits, from which it is released by weathering, leaching, and mining. Some of it passes through freshwater and terrestrial ecosystems via plants, grazers, predators, and parasites, to be returned to those ecosystems by death and decay. Much of it, however, is deposited in the sea, in shallow sediments, where it circulates readily, or in ocean deeps, whence it wells up only occasionally. Phosphorus is brought back to the land through fish harvests and through collection of guano deposited by seabirds. Although there are seasonal pulses of availability, there appears to be a steady loss of phosphorus to the ocean deeps.

Because of its high reactivity, phosphorus exists in combined form with other elements. Microorganisms produce acids that form soluble phosphate from insoluble phosphorus compounds. The phosphates are utilized by algae and terrestrial green plants, which in turn pass into the bodies of animal consumers. Upon death and decay of organisms, phosphates are released for recycling.

Because of the steady diversion of phosphorus into the oceans, the element must be added (in fertilizers) to soils to maintain fertility and agricultural productivity.

phosphorus deficiency, condition in which an organism does not receive an adequate supply of phosphorus, a mineral vitally important to the normal metabolism of numerous compounds and (in solution) an acid that, with sulfur, must be neutralized by the base-forming ions of sodium, potassium, calcium, and magnesium. About 70 percent of retained phosphorus combines with calcium in bone and tooth structure, while nitrogen combines with most of the remaining 30 percent to metabolize fats and carbohydrates. Phosphorus is the principal element in the structure of the nucleus and cytoplasm of all tissue cells. In addition, this mineral probably has the power to regulate hydrogen ion concentration and vitamin absorption in living tissues. It is also a universally distributed component of skeletal, nerve, and muscle tissues. A reduced concentration of phosphate in the blood serum is a disorder known as hypophosphatemia (*q.v.*).

Deficiencies relating to the ratio of phosphorus to calcium may cause bone diseases such as rickets in children and osteoporosis or osteomalacia in adults. Sometimes an improper ratio causes bone fragility and tetany (severe muscle spasms in fingers and toes).

Dietary sources of phosphorus include milk products, egg yolk, fresh foods, legumes, nuts, and whole grains.

phosphorylation, in chemistry, the addition of a phosphoryl group (PO_3^{2-}) to an organic compound. The process by which much of the energy in foods is conserved and made available to the cell is called oxidative phosphorylation (*see* cellular respiration). The process by which green plants convert light energy to chemical energy is called photophosphorylation (*see* photosynthesis).

Phothisan, also spelled PHOTISARATH, or PHOTHISARA (b. 1501—d. 1547), ruler (1520–47) of the Lao kingdom of Lan Xang whose territorial expansion embroiled Laos in the warfare that swept mainland Southeast Asia in the latter half of the 16th century.

Phothisan was a pious Buddhist who worked to undermine animism and Brahmanic religious practices and promote Buddhism. He resided much of the time not in the capital at Luang Prabang but in Vientiane, which was located farther south and maintained better communications with the major states of the region. Phothisan married a princess from Chiang Mai (now in northern Thailand), and when his father-in-law, the ruler of Chiang Mai, died in 1546 without male issue, Phothisan had his own son Setthathirat I placed on the Chiang Mai throne. When Phothisan died in the following year, after a fatal accident while hunting wild elephants, Setthathirat succeeded him and joined together the two kingdoms—which were soon embroiled in Siamese-Burmese wars that devastated much of the region over the next half-century.

Photian Schism, a 9th-century-AD controversy between Eastern and Western Christianity that was precipitated by the opposition of the Roman pope to the appointment by the Byzantine emperor Michael III of the lay scholar Photius to the patriarchate of Constantinople. The controversy also involved Eastern and Western ecclesiastical jurisdictional rights in the Bulgarian church, as well as a doctrinal dispute over the *Filioque* ("and from the Son") clause that had been added to the Nicene Creed by the Latin church.

photic zone, surface layer of the ocean that receives sunlight. The uppermost 80 m (260 feet) or more of the ocean, which is sufficiently illuminated to permit photosynthesis by phytoplankton and plants, is called the euphotic zone. Sunlight insufficient for photosynthesis illuminates the disphotic zone, which extends from the base of the euphotic zone to depths of about 200 m (650 feet). The thicknesses of the photic and euphotic zones vary with the intensity of sunlight as a function of season and latitude and with the degree of water turbidity. The bottommost, or aphotic, zone is the region of perpetual darkness that lies beneath the photic zone and includes most of the ocean waters.

Photius, SAINT (b. *c.* 820, Constantinople [now Istanbul]—d. Feb. 6, 891?, Bordi, Armenia; canonized 10th century?; feast day February 6), patriarch of Constantinople (858–867 and 877–886), defender of the autonomous traditions of his church against Rome and leading figure of the 9th-century Byzantine renascence.

Photius, lead seal; in the Dumbarton Oaks Research Library and Collection, Washington, D.C.

By courtesy of the Dumbarton Oaks Research Library and Collection, Washington, D.C.

Background and early career. Photius was related through his father to Tarasius, a civil servant who was patriarch from 784 to 806, and through his mother to the empress Theodora and her brother Bardas, who was a power behind the throne from 842 to 866. The circle to which both families belonged had strained relations with some army officers, who wished to reduce the expense of government by an educated civil service, and with monks who distrusted the worldly wisdom of bureaucrats. In controversies that had arisen over the place of pictures (icons) in Christian worship, the learned civil servants resisted the iconoclasts (the destroyers of sacred images), who had support in the army. When the icons were restored in 787, however, and again after renewed controversy in 843, the civil servants were lenient with the former iconoclasts, whereas the monks, especially the Studites of the monastery of St. John of the Stoudion, would have purged them, as dangerous heretics, from all important positions.

The parents of Photius were condemned to exile by an iconoclast council early in his childhood and took him with them. In the first years of the regency of Theodora (842–856), after his parents had died, Photius became a distinguished teacher. A circle gathered around him for regular readings in classical and Christian prose literature, including medical and scientific works. On the basis of notes taken at these readings, which continued after he left the schools for the civil service, he composed his *Myriobiblon* or *Bibliotheca* (*Bibliothēkē*), a digest of Greek prose literature, with more than 270 articles. This work was begun on a diplomatic mission in the Muslim world and most probably completed during his temporary retirement from public life after 867.

Patriarch of Constantinople. He became first secretary of state, probably before 855, and in 858 he was promoted through all the ecclesiastical orders to be made patriarch of Constantinople on Christmas Day, replacing the austere Ignatius, who had fallen out with Bardas. The deposition of Ignatius offended not only the Studites and other monks, who objected to the promotion of a civil servant, but also Pope Nicholas I, who did not understand the role of laymen educated in theology and in Byzantine civilization. Photius offended him further by refusing to restore dioceses transferred from the Roman to the Byzantine patriarchate during the iconoclastic controversy. The importance of these dioceses had been increased by the conversion to Christianity of leading chiefs among the Slavonic nations (the Moravians, Croats, and Bulgarians); jurisdictionally they might belong to either the Roman or the Byzantine patriarchate.

As conflicts developed among Roman, German, and Byzantine missions, Photius wrote a circular letter to the other Eastern patriarchs complaining of theological, liturgical, and other innovations by Latin missionaries in Bulgaria. At a council in Constantinople in 867, he condemned and excommunicated Nicholas I, who had refused to recognize him as the lawful patriarch—thus bringing about the Photian Schism—and in letters to other bishops had represented him as a persistent adversary of the West.

By this time, however, the fall of Bardas had weakened the position of Photius. When he protested against the murder of the emperor Michael III by Basil the Macedonian, he was deposed, in the autumn of 867, and Ignatius was restored. Pope Adrian II, who had just succeeded Nicholas I at Rome, now envisioned a settlement of the differences between Rome and Constantinople. The terms proposed by his legates to a council in Constantinople in 869–870, however, were unacceptable to many Byzantine ecclesiastics. Ignatius himself in 870 consecrated bishops for Bulgaria. Without help from the friends of Photius, however, he could neither reach a satisfactory settlement of tensions between East and West nor solve the internal problems of the Byzantine Orthodox Church.

Photius returned to the court before 876 as tutor to the princes of the imperial family, and at the death of Ignatius in 877 or 878 he also returned to the patriarchate. Though some of the monks resented his return, as they had objected to his first promotion, he now won support from Rome, since Pope John VIII was in need of Byzantine naval assistance against the Moors, who were harrying the Italian coastline. The Pope sent legates to a new council at the church of Hagia Sophia in Constantinople in 879–880. In the resulting settlement, Bulgaria was assigned to the Roman patriarchate, but the continued presence of Greek bishops secured its cultural links with the East. Bulgaria soon became a centre from which the Byzantine liturgy in the language of the Macedonian Slavs spread to other Slavonic-speaking lands.

The filioque controversy. Rome did not press its claims to Greek dioceses in Italy and Greece under the jurisdiction of Constantinople, and the Roman legates consented to the Byzantine demand to condemn Western additions to the Nicene Creed, without explicit mention of the contentious use of the word *filioque* (Latin: "and the Son"), whereby the Holy Spirit was said by some to proceed from the Father "and the Son." This interpolation had been introduced into the Nicene Creed in Spain and had spread among the Franks, but it was not yet in use in Rome. Photius' Latin was limited, and on the *filioque* controversy his information was inadequate, though he showed more understanding of the question in his later work on *The Mystagogia of the Holy Spirit,* completed in or after his second patriarchate.

The settlement between Rome and Constantinople was once thought to have been obtained by fraud and repudiated by Pope John VIII, but most likely it was accepted by the Pope. John VIII was murdered in 882, and his successor, whose position was irregular, was probably not recognized at Constantinople. Photius was in communion not only with John but also with Adrian III (884–885) and with Stephen V in 886. In that year he resigned the patriarchate on the accession to the throne of his pupil the emperor Leo VI. The Pope suspected that the resignation of Photius had been forced upon him to make way for another pupil, Prince Stephen, but if he was more than 80 years old it may well have been voluntary. He died on February 6, perhaps 891, but the year is not certain. (Ge.E.)

BIBLIOGRAPHY. Francis Dvornik, *The Photian Schism: History and Legend* (1948, reprinted 1970), supersedes the older view of the contribution of Photius to the schism between the Eastern and Western Churches that is summarized by J. Ruinaut in *Le Schisme de Photius* (1910); and by Louis Bréhier, "The Greek Church: Its Relations with the West up to 1054" and "Attempts at Reunion of the Greek and Latin Churches," vol. 4, pp. 246–273, 594–626, *The Cambridge Medieval History* (1923). Informative articles by F. Dvornik, "Constantinople and Rome," and H. Gregoire, "The Amorians and Macedonians, 842–1025," appear in vol. 4, pt. 2, pp. 431–472, 105–192, *The Cambridge Medieval History,* new ed. (1966), with useful bibliographies. See Cyril Mango (ed. and trans.), *The Homilies of Photius* (1958). Other works of his are still most easily accessible in J.P. Migne (ed.), *Patrologiae Graeco-Latina,* vol. 101–104 (1866) with the *Myriobiblon* or *Bibliotheca* filling vol. 103. Of the older books, J.B. Bury, *A History of the Eastern Roman Empire from the Fall of Irene to the Accession of Basil I., A.D. 802–867* (1912); and J.M. Hussey, *Church and Learning in the Byzantine Empire, 867–1185* (1937), especially the chapter on "Learning Under the Macedonians in the Ninth and Tenth Centuries," pp. 22–36, may still be used with profit.

photo-ionization, the interaction of electromagnetic radiation with matter resulting in the dissociation of that matter into electrically charged particles. The simplest example, the photoelectric effect (*q.v.*), occurs when light shines on a piece of metal, causing the ejection of electrons. Another category of photo-ionization involves the disruption of covalent chemical bonds, producing positively and negatively charged fragments; such a reaction is often called the primary process of a photochemical reaction (*q.v.*).

Photo-Secession Group, the first important group of U.S. photographers that worked to get photography accepted as an art form. Led by Alfred Stieglitz (1864–1946), the group also included Edward Steichen (1879–1973), Clarence H. White (1871–1925), Gertrude Käsebier (1852–1934), and Alvin Langdon Coburn (1882–1966). These photographers broke away from the Camera Club of New York in 1902 and pursued techniques of manipulating negatives and printing paper to approximate the effects of drawings, etchings, and oil paintings.

The Photo-Secession Group actively promoted its ideas. Stieglitz edited and published the important quarterly *Camera Work* and opened the Little Gallery (also known as the Photo-Secession Gallery and "291" from its address on Fifth Avenue), providing the group with a place to exhibit their work. In 1910 the Photo-Secession sponsored an international show of more than 500 photographs by its members or photographers whose aims were similar to its own. The show, occupying more than half of the exhibition space at the Albright-Knox Art Gallery in Buffalo, was a sensation and significantly advanced the acceptance of photography as an art form.

By 1910, however, the members of the Photo-Secession had become divided. Some continued to manipulate their negatives and prints to achieve nonphotographic effects, while others came to feel that such manipulation destroyed tone and texture and was inappropriate to photography. Torn by this division, the group soon dissolved.

photocathode, an element of a photoelectric cell (*q.v.*) that emits electrons when struck by light, making possible the flow of electric current through the device. A substance often used for photocathodes is a partially oxidized silver–cesium alloy.

photocell: *see* photoelectric cell.

photochemical equivalence law, fundamental principle relating to chemical reactions induced by light, which states that for every quantum of radiation that is absorbed, one molecule of the substance reacts. A quantum is a unit of electromagnetic radiation with energy equal to the product of a constant (Planck's constant, h) and the frequency of the radiation, symbolized by the Greek letter nu (ν). In chemistry, the quantitative measure of substances is expressed in terms of gram moles, one gram mole comprising 6.0225×10^{23} (Avogadro's number) molecules. Thus, the photochemical equivalence law is restated as: for every mole of a substance that reacts 6.0225×10^{23} quanta of light are absorbed.

The photochemical equivalence law applies to the part of a light-induced reaction that is referred to as the primary process; that is, the initial chemical change that results directly from the absorption of light. In most photochemical reactions the primary process is usually followed by so-called secondary processes that are normal interactions between reactants not requiring absorption of light. As a result such reactions do not appear to obey the one quantum–one molecule reactant relationship. The law is further restricted to conventional photochemical processes using light sources with moderate intensities; high-intensity light sources such as those used in flash photolysis and in laser experiments are known to cause so-called biphotonic processes; *i.e.,* the absorption by a molecule of a substance of two photons of light.

The photochemical equivalence law is also sometimes called the Stark–Einstein law after the German-born physicists Johannes Stark and Albert Einstein, who independently formulated the law between 1908 and 1913.

photochemical reaction, any type of chemical process initiated by the absorption of visible, ultraviolet, or infrared radiation. The most important photochemical process for living systems is photosynthesis, the production by green plants of carbohydrates from carbon dioxide and water. Vision in animals depends on photochemical reactions that occur in the eye, and reactions of this kind are involved in photography, bleaching of laundry and tanning of the skin by sunlight, and in numerous processes used in the chemical industry.

A brief treatment of photochemical reactions follows. For full treatment, *see* MACROPAEDIA: Chemical Reactions.

For a photochemical process to occur, energy in the form of visible, infrared, or ultraviolet radiation must be absorbed by a substance.

Primary photochemical processes are those that occur as an immediate consequence of this absorption. Secondary processes are those subsequent changes that follow the primary processes. The core of photochemical theory is derived mainly from the principles of quantum mechanics and of atomic and molecular physics.

Photochemical reactions often convert light energy into chemical energy very efficiently. This is a consequence of the fact that when an atom or molecule absorbs light energy it gains much more energy than it ever could by other methods such as heating. An example of this type of photochemical process is photosynthesis. Another important photochemically based natural phenomenon is the production of ozone in the upper atmosphere. Ozone, which filters out most of the harmful ultraviolet radiation from the Sun, is produced when sunlight breaks the bonds of some oxygen molecules, allowing atomic oxygen to combine with oxygen molecules to yield ozone.

Photography employs another type of photochemical process. Grains of silver chloride or silver bromide in photographic film absorb minute amounts of light when the camera shutter opens, thereby converting bound silver to metallic silver. Conventional chemical action (development of the film) then amplifies the photochemical action of light alone.

Types of photochemical effects. Light energy may trigger a reaction that, once started, can proceed spontaneously. A mixture of hydrogen and chlorine gases, for example, will not react if kept in darkness, but they will react explosively if violet or ultraviolet light reaches the mixture.

Light may boost a reaction that might otherwise proceed at an imperceptibly slow rate. Certain types of molecular rearrangements that alter molecular geometry result from this kind of photochemical process.

Absorbed light may convert reacting molecules to an energy state higher than their initial state. The absorbed energy is converted into potential energy and is stored. Most photochemical processes occurring in biological systems are of this type.

Light energy may be stored as chemical energy and later released as electrical energy. This principle is utilized in solar batteries.

Energy considerations. Fundamental to all quantitative interpretations of photochemical processes is the quantum-mechanical principle that energy exists in discrete packets, or quanta. Furthermore, the energy of each quantum of electromagnetic radiation, known as a photon is related to the frequency with which its waves propagate. This relationship is expressed by the equation $E = h\nu$, where E is the energy (in ergs) of the photon, ν is the frequency of the radiation (in cycles per second), and h is Planck's constant, which has the value 6.625×10^{-27} erg-sec.

A photochemical process begins when an atom or molecule absorbs a photon. The absorber, initially in a relatively low energy state, achieves an excited state, usually because one electron from a state of low energy has been boosted to a state of higher energy. An electron, however, can absorb only a photon whose energy corresponds to the allowed quantum jump for that particular electron. The energy of the photon also corresponds to a characteristic absorption line or band of the absorbing species.

The absorber, excited by a photon, may then undergo any of several different primary photochemical steps. The absorber may emit a photon as the excited electron settles back into a lower energy state. This phenomenon is called luminescence. In some instances the absorber may return to its lower energy state if it collides with a second substance that carries off the excitation energy. This is called nonradiative decay. The absorber, however, may react in several other ways. It may undergo photoionization or photodissociation. In the former case, the excited electron is, in a sense, promoted out of the atom or molecule, leaving behind a charged particle, or ion. In the latter case, the excited electron ceases to participate in a chemical bond (though it remains associated with one atom or group of atoms), thereby enabling the molecule to split, or dissociate. Or an absorber may undergo an internal rearrangement of its atoms to form a stereoisomer, for example.

photocollography (printing): *see* collotype.

photocomposition, also called PHOTOTYPESETTING, or FILMSETTING, method of assembling or setting type by photographing characters on film from which printing plates are made. The characters are developed as photographic positives on film or light-sensitive paper from a negative master containing all the characters; the film, carrying the completed text, is then used for making a plate for letterpress, gravure, or lithographic printing by a photomechanical process.

Some photocomposing machines automatically select and position the negative of the desired characters in rapid succession so that their images are projected on a roll of film, which is exposed at high speed. Varying the projection scale produces different type sizes. In other machines the characters are generated by computer and electronically created on the film. A typewriter-like keyboard controls the operation in either case.

Typesetting by photography was proposed as early as 1866. The Hungarian engineer Eugene Porzolt designed the first photocomposing machine in 1894, but machines such as the Fotosetter did not become available commercially until the 1950s. By the 1960s, such machines were being combined with digital computers, which prepared tapes and controlled machines in high-speed operations. Present-day photocomposition machines use computers to make end-of-line (hyphenation and justification) and page design decisions automatically, thereby producing copy faster and cheaper than units that require operators to make end-of-line decisions. *See also* computerized typesetting.

photoconductivity, that portion of the ability of a material to allow an electric current to flow in it that is affected by exposure to light, frequently used to detect and measure the amount of light.

Many crystals, including those made from the chemical elements silicon and germanium, are poor current conductors because their electrons are unable to move freely within the material when an electrical voltage is applied. Light directed on such materials is absorbed by some electrons, however, freeing them to pass more easily from one atom to the next when a voltage is applied. In contrast, good conductors such as metals have an abundance of free, current-carrying electrons.

When photoconductive materials are removed from the light, the freed electrons return to their more tightly bound state. The time required for the return to normal conductivity varies widely from one type of crystal to another. *See* photoelectric effect.

photocopying machine, also called PHOTOCOPIER, any device for producing copies of text or graphic material by the use of light, heat, chemicals, or electrostatic charges. The need for a process other than wet photographic reproduction for copying documents stimulated the invention of various techniques, notably the diffusion-transfer and dye-line processes, during the early 1950s. In the diffusion-transfer process a master copy is made on a translucent sheet, which is placed on light-sensitized negative paper and exposed to light. The negative is then placed in contact with a sheet of positive transfer paper and fed into a developer. When the two sheets are peeled apart, the image is transferred to the positive paper. The dye-line process also requires a translucent original but only one sheet of sensitized paper. This process uses ammonia fumes rather than liquid to develop the image, obviating problems of paper shrinkage.

Another photocopying method that became available in the early 1950s uses the heat of infrared light. In this process, sometimes called thermography, sensitized copy paper is placed in contact with the original and both are exposed to infrared rays. The original absorbs the rays in areas darkened by print or by the lines and shades of an illustration, and thereby transfers the impressions to the surface of the copy paper.

The method most widely used by modern office photocopiers is called xerography (from the Greek words meaning "dry writing"). Although developed by the U.S. physicist Chester F. Carlson in 1937, the process did not become available for commercial use until 1950. Xerography, which involves the application of electrostatic charges and heat, is extremely versatile and can be employed to produce copies of all kinds of written, printed, and graphic matter. The basis of the process is photoconductivity, an increase in the ability of certain substances to allow an electric current to flow through them when struck by light. The chemical element selenium, for example, is a poor electrical conductor, but when light is absorbed by some of its electrons and a voltage is applied, these electrons are able to pass more freely from one atom to another. When the light is removed, their mobility falls. Xerography typically uses an aluminum drum coated with a layer of selenium. Light passed through the document to be copied, or reflected from its surface, reaches the selenium surface, onto which negatively charged particles of ink (*i.e.*, the toner) are sprayed, forming an image of the document on the drum. A sheet of copy paper is passed close to the drum, and a positive electric charge under the sheet attracts the negatively charged ink particles, resulting in the transfer of the image to the copy paper. Heat is then momentarily applied to fuse the ink particles to the paper. The copy paper itself originally provided the treated surface, but the substitution of the selenium-coated drum permitted the use of ordinary paper. Other improvements were introduced, making it possible to print on both sides of the paper, sort and collate, automatically produce a predetermined number of copies, and enlarge or reduce the image reproduced from the original. Xerographic machines capable of duplicating coloured materials became available in the 1970s.

The development of fast and efficient photocopying machines has benefitted business and government tremendously. It has, however, created copyright problems and stimulated changes in existing copyright laws and regulations in the United States and elsewhere.

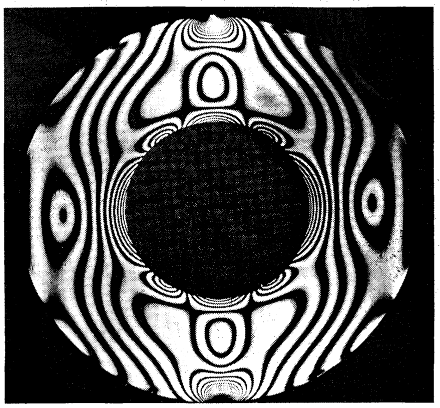
photodisintegration, also called PHOTOTRANSMUTATION, in physics, nuclear reaction in which the absorption of high-energy electromagnetic radiation (a gamma-ray photon) causes the absorbing nucleus to change to another species by ejecting a subatomic particle, such as a proton, neutron, or alpha particle. For example, magnesium-25, upon absorbing a photon of sufficient energy, emits a proton and becomes sodium-24. Photodisintegration differs from the nuclear reaction photofission, in which a nucleus, upon absorbing a photon, splits into two fragments of nearly equal mass.

photodynamism, conversion of certain substances in the skin of animals into other substances by the action of light. The resultant compounds may be beneficial (*e.g.,* vitamin D), but in some cases they produce disorders of the skin. The original compound may be present in normal skin; it may be derived from certain foods; it may result from an inherited biochemical defect; or it may be a combination of the preceding.

photoelasticity, the property of some transparent materials, such as glass or plastic, while under stress, to become doubly refracting (*i.e.,* a ray of light will split into two rays at entry). When photoelastic materials are subjected to pressure, internal strains develop that can be



Photoelastic stress pattern of a ring in diametral compression

observed in polarized light; *i.e.,* light vibrating normally in two planes, which has had one plane of vibration removed by passing through a substance called a polarizer. Two polarizers that are crossed ordinarily do not transmit light, but if a stressed material is placed between them and if the principal axis of the stress is not parallel to this plane of polarization, some light will be transmitted in the form of coloured fringes. Stresses in opaque mechanical structures can be analyzed by making models in plastic and studying the fringe pattern under polarized light, which may be either white (a mixture of all wavelengths) or a single wavelength. A photoelastic model under stress is shown in the photograph. *See* double refraction.

photoelectric cell, also called ELECTRIC EYE, PHOTOCELL, or PHOTOTUBE, an electron tube with a photosensitive cathode that emits electrons when illuminated and an anode for collecting the emitted electrons. Various cathode materials are sensitive to specific spectral regions, such as ultraviolet, infrared, or visible light. The voltage between the anode and cathode causes no current in darkness because no electrons are emitted, but illumination excites electrons that are attracted to the anode, producing current proportional to the intensity of the illumination. These tubes are used in control systems, where interrupting a beam of light opens a circuit, actuating a relay that, in turn, supplies power to a mechanism that brings about the desired operation, such as the opening of a door. The tubes are also used in photometry and in spectroscopy.

photoelectric effect, phenomenon in which charge particles are released from a material when it absorbs radiant energy. The photoelectric effect commonly is thought of as the ejection of electrons from the surface of a metal plate when light falls on it. In the broad sense, however, the phenomenon can take place when the radiant energy is in the region of visible or ultraviolet light, X-rays, or gamma rays; when the material is a solid, liquid, or gas; and when the particles released are electrons or ions (charged atoms or molecules).

Discovery and early work. The photoelectric effect was discovered in 1887 by a German physicist, Heinrich Rudolf Hertz, who observed that ultraviolet light changes the lowest voltage at which sparking takes place between given metallic electrodes. At the close of the 19th century, it was established that a cathode ray (produced by an electric discharge in a rarefied-gas atmosphere) consists of discrete particles, called electrons, each bearing an elementary negative charge. In 1900 Philipp Edward Anton Lenard, a German physicist, studying the electrical charges liberated from a metal surface when it was illuminated, concluded that these charges were identical to the electrons observed in cathode rays. It was further discovered that the current (given the name photoelectric because it was caused by light rays), made up of electrons released from the metal, is proportional to the intensity of the light causing it for any fixed wavelength of light that is used. In 1902 it was proved that the maximum kinetic energy of an electron in the photoelectric effect is independent of the intensity of the light ray and depends on its frequency.

The observations that (1) the number of electrons released in the photoelectric effect is proportional to the intensity of the light and that (2) the frequency, or wavelength, of light determines the maximum kinetic energy of the electrons indicated a kind of interaction between light and matter that could not be explained in terms of classical physics. The search for an explanation led in 1905 to Albert Einstein's fundamental theory that light, long thought to be wavelike, can be regarded alternatively as composed of discrete particles (now called photons), equivalent to energy quanta.

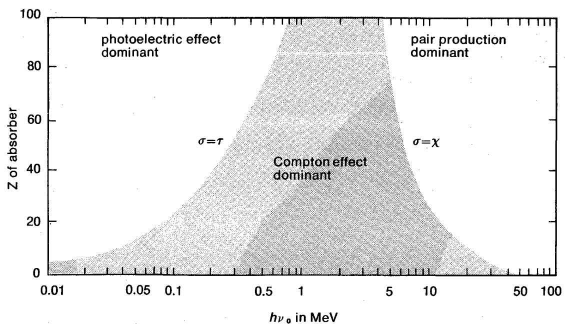
In explaining the photoelectric effect, Einstein assumed that a photon could penetrate matter, where it would collide with an atom. Since all atoms have electrons, an electron would be ejected from the atom by the energy of the photon, with great velocity. The kinetic energy of the electron, as it moved through the atoms of the matter, would be diminished at each encounter. Should it reach the surface of the material, the kinetic energy of the electron would be further reduced as the electron overcame and escaped the attraction of the surface atoms. This loss in kinetic energy is called the work function, symbolized by omega (ω). According to Einstein, each light quantum consists of an amount of energy equal to the product of Planck's universal constant (h) and the frequency of the light (indicated by the Greek nu, ν). Einstein's theory of the photoelectric effect postulates that the maximum kinetic energy of the electrons ejected from a material is equal to the frequency of the incident light times Planck's constant, less the work function. The resulting photoelectric equation of Einstein can be expressed by $E_k = h\nu - \omega$, in which E_k is the maximum kinetic energy of the ejected electron, h is a constant, later shown to be numerically the same as Planck's constant, ν is the frequency of the incident light, and ω is the work function.

The kinetic energy of an emitted electron can be measured by placing it in an electric field and measuring the potential or voltage difference (indicated as V) required to reduce its velocity to zero. This energy is equal to the product of the potential difference and an electron's charge, which is always a constant and is indicated by e; thus, $E_k = eV$.

The validity of the Einstein relationship was examined by many investigators and found to be correct but not complete. In particular, it failed to account for the fact that the emitted electron's energy is influenced by the temperature of the solid. The remedy to this defect was first formulated in 1931 by a British mathematician, Ralph Howard Fowler, who, on the assumption that all electrons with energies greater than the work function would escape, established a relationship between the photoelectric current and the temperature: the current is proportional to the product of the square of the temperature and a function of the incident photon's energy. The equation is $I = \alpha AT^2\varphi(x)$, in which I is the photoelectric current, α and A are constants, and $\varphi(x)$ is an exponential series, whose numerical values have been tabulated; the dimensionless value x equals the kinetic energy of the emitted electrons divided by the product of the temperature and the Boltzmann constant of the kinetic theory: $x = (h\nu - \omega)/kT$; in which x is the argument of the exponential series, h is Planck's constant, ν is the frequency of the incident radiation, ω is the work function of the material, k is Boltzmann's constant, and T is temperature.

Originally, most investigations of photoemission centred on the emissive properties of solid metals that are good conductors of electricity. Gradually, with the recognition of the effects of volume and surface impurities, there evolved an interest in the photoelectric emission from insulators, which are nonconductors, and from semiconductors, which conduct electricity only under certain circumstances. The energy distribution of electrons in insulators and semiconductors is different from that of metals. As a consequence, the photoelectric yield (number of electrons emitted for each incident quantum of radiation) versus energy of the incident photon can be different for materials having the same work function.

The photoelectric effect in semiconductors can be understood only in terms of quantum mechanics. It is possible to think of solids as



Locus of equal atomic cross sections for Compton and photoelectric interactions ($\sigma = \tau$) and for Compton and pair-production interactions ($\sigma = \chi$); the incident photon energy is $h\nu_0$, and Z is the atomic number of the atoms in the absorber

From S. Flugge (ed.), *Encyclopedia of Physics,* vol. 34, Berlin-Göttingen-Heidelberg: Springer 1958, in L. Marton, *Methods of Experimental Physics;* Academic Press Inc.

being composed of tiny crystals, each of which has an orderly array of atoms in three dimensions called a lattice structure. Every electron in the lattice, whether bound to an atom or unbound, has a definite energy, called its energy state. Energy states are influenced by the lattice structure of the crystal. Electrons can change to a higher energy state by absorbing heat or electromagnetic energy. According to the laws of quantum mechanics, only specific discrete energy states may exist, and these are grouped together in energy bands, with the regions between them called forbidden bands. The band of highest energy that is occupied when the crystal is at absolute zero temperature is the valence band. If this band contains states that are unoccupied, it is called a conduction band and the crystal is a metal. If all the states are occupied, the crystal is either an insulator or a semiconductor, depending on whether or not electrons from the valence band can be transferred to the next unoccupied band, which then becomes a conduction band. In a semiconductor the input of energy, in the form of light, can raise a valence electron into the conduction band. Electrons can also be supplied to a semiconductor by atoms having energy levels in the forbidden gap, called impurity atoms. In an insulator the forbidden gap is too large to be bridged easily.

Photoconductivity. Many materials exhibit a marked change in electrical conductivity when irradiated. Usually the conductivity increases, although a few instances of the opposite reaction are known. In highly conductive substances, such as metals, the change in conductivity is insignificant. It is most important in semiconductors.

In a semiconductor there are a certain number of "free" electrons occupying energy levels in the conduction band and a certain number of positively charged "holes" left in the valence band by the free electrons that entered the conduction band because of the natural vibrations of atoms. During irradiation of the substance, the generation of free charge carriers (electrons and holes) increases, producing an increased conductivity, continuing until the carriers generated by the photon absorption can no longer move through the material. The electronic processes can be manifold, depending upon the band structure of the material, the imperfections in the material, and other factors. One of the most important factors in determining photosensitivity (*i.e.,* the change in conductivity per photon absorbed) is the free-carrier lifetime, which must be finite because recombination or neutralization takes place between negatively charged electrons and positively charged holes, and there are thus fewer electrons available for the conduction process. This lifetime can vary from 10^{-2} second to 10^{-12} second, not only from substance to substance but also in a single substance having varying degrees of imperfections or impurities.

Another important factor determining photosensitivity is the light absorption characteristic of the photoconductors. When the photon energy is greater than the forbidden energy gap of the solid, each photon creates a free pair—a free electron and a free hole. If the photon energy is much larger than the band gap (as, for instance, the photon energy of X-rays), the absorption of a single photon can give rise to many free pairs.

Photovoltaic effect. The photovoltaic effect consists in the generation of an electromotive force as a consequence of the absorption of radiation; that is to say, a current will flow across the junction of two dissimilar materials when light falls upon it. The primary effect is photo-ionization; *i.e.,* the production of equal numbers of positive and negative charges. One or both charges can then migrate to a region in which charge separation can occur. This charge separation happens normally at a potential barrier between two layers of the solid material.

For a large photovoltaic effect, the change of potential at the barrier should be large and the distance over which the carrier has to move should be small. This effect implies an abrupt change in some property of the material, including an abrupt change of the conductivity. The response time of the photovoltaic effect is relatively short, although not so instantaneous as photoemission. An important characteristic of the photovoltaic effect is its relatively high efficiency as a device to convert the energy of radiation to electrical current.

Other photoelectric effects. Photoemissive phenomena are well known for the higher energy ranges in the X-ray and gamma regions because such penetrating radiation can release photoelectrons from inner atomic shells. If a vacancy is produced in an inner shell because of the removal of an electron through the photoelectric process, the vacancy will be filled by an electron from a less tightly bound state; the resulting excess energy may cause the simultaneous emission from the atom of a second electron, called an Auger electron, from another less tightly bound state. This is the Auger effect, which is generally, but not exclusively, observed at higher energies. A given inner vacancy can be followed by a great number of different Auger transitions. This fact, coupled with the development of high-resolution spectroscopy and improved methods for the study of low-energy electrons, makes the Auger effect an important tool in the exploration of many nuclear processes such as capture and internal conversion. Also, the knowledge of the energies and intensities of Auger electrons gives information about transition probabilities, both in atoms and in molecules. Conversely, Auger spectroscopic lines with precisely known energies can be used for the energy calibration of conversion electrons—electrons that are ejected from their shells when a nucleus loses its excitation energy.

One other significant photoemissive process is the Compton effect, which relates the directions taken by a photon and an electron after they collide. In the collision between a higher energy photon and an electron initially at rest, the photon will share some of its energy and momentum with the electron, and the photon and electron will take off in divergent paths. The laws for the conservation of energy and momentum show that kinetic energy of the electron is strongly dependent on the energy of the photon, whereas the Compton shift in wavelength of the photon is independent of the energy. The Compton shift of wavelength between the incident and scattered photon, which represents an increase in wavelength before and after collision, is equal to the product of two terms: the first term is the ratio Planck's constant to the rest mass of an electron (according to relativity, a body has the least mass when at rest relative to the observer) times the velocity of light; the second term is the difference between 1 and the cosine of the angle that the scattered photon makes with the path of the incident photon. In equation form, $\Delta\lambda = (h/m_0c)(1 - \cos\theta)$, in which $\Delta\lambda$ represents the shift in wavelength, h is Planck's constant, m_0 is the rest mass of the electron, c is the velocity of light, and θ is the scattering angle of the photon. The term h/m_0c that corresponds to a 90° scattering angle of the photon is called the Compton wavelength for all electrons. It is a fundamental atomic unit of length having a numerical value of 2.4262×10^{-10} centimetre.

Atoms, electrons, and nuclei can interact with electromagnetic radiation in many possible ways. Whereas at low energies the photoelectric effect dominates, and at very high energies pair production (the conversion of a photon into an electron and a positron) is prevalent, there exists a broad range of energies in which the attenuation of radiation depends almost exclusively on Compton scattering (see figure).

Applications. The many technological variants of photoemissive devices take advantage of a response that is linear with light intensity, coupled with an extremely short response time. A photoemissive device (photodiode) can be coupled with a suitable amplifying system, its sensitivity thus extended to the detection of single photons. The best known amplifying system, the photomultiplier, consists of a suitable set of secondary emitters built into the same container. Photodiodes and photomultipliers are being applied in a growing number of fields such as the control of industrial products and of manufacturing processes, the measurement of light intensities, scintillation counters, facsimile transmission, spectral analysis, and many others.

Photodiodes and photomultipliers integrate the light falling over the surface of the photoemitter to give the total amount received. Image converters, image intensifiers, television camera tubes, and image storage tubes take advantage of the point-by-point emission of the photocathode. In the first two examples, an optical image incident on a semitransparent photocathode is used to transform the light image into an "electron image." The electrons released by each element of the photoemitter are focussed by an electron-optical device onto a fluorescent screen, reconverting it in the process again into an optical image. This process can be carried out in a single step or in several steps, amplifying the image at each step. In the most common type of television camera tubes, the first step, as with the image converter, is to transfer an electron image from the photocathode onto a thin insulating target, where, through emission of secondary electrons, a pattern of positive charges results. An independent electron beam scans the target, is influenced by the charges residing on its surface, and conveys the information to a secondary electron multiplier. The amplified signal goes to the external circuit.

Photoconductors, too, have been widely used, mostly in the form of thin film devices, for storage tubes, television pickup tubes, display devices, radiation-controlled variable resistances, electronic switches, image amplifiers, X-ray intensifiers, and, for electrophotography. As radiation detectors, photoconductors offer an extension of the spectral range to lower incident photon energies than obtainable with photoemitters. Infrared detectors have been described, such as indium-antimony detectors, that have a lower energy limit of 0.15 electron volt. Special detectors for the infrared are commercially available with a low energy limit corresponding to 0.030–0.040 electron volt. Silicon detectors are widely used for X-ray and gamma-ray detection and spectral analysis.

Photovoltaic devices have been used extensively as photographic light meters and similar devices and have gained prominence as energy conversion devices, mainly because of their high efficiency in the visible region of the spectrum. Solar-cell arrays have been developed that can provide the necessary power for the operation of many electrical devices.

photoengraving, any of several processes for producing printing plates by photographic means. In general, a plate coated with a photosensitive substance is exposed to an image, usually on film; the plate is then treated in various ways, depending upon whether it is to be used in a relief (letterpress) or an intaglio (gravure) printing process.

A brief treatment of photoengraving follows. For full treatment, *see* MACROPAEDIA: Printing, Typography, and Photoengraving.

In relief printing the printing areas of the plate are defined by cutting away the nonprinting areas to a lower depth; ink is uniformly distributed (usually by a roller) on the raised surface only and is then transferred to paper. With intaglio plates, on the contrary, it is the nonprinting areas that are raised; the printing areas are cut or etched away with acid. The whole plate is washed with ink, which is then wiped off the top surface, leaving the incised areas filled with ink to be transferred, under pressure, to paper.

Although early 19th-century experiments with photographically prepared printing plates and chemically etched letterpress printing surfaces were contemporary with the first developments in photography, the commercial development of photoengraving did not start until the 1850s, after the introduction of the wet-collodion process. This process, still widespread until the 1930s, uses a plate coated with a light-sensitive solution of collodion to capture a negative image for transfer to the printing plate.

A major difficulty was that of producing tones intermediate between black and white by letterpress printing. In the second half of the 19th century various kinds of halftone screens were invented that solved the problem and ensured the rapid growth of photoengraving. Light falling on a surface coated with a photosensitive substance was made to pass first through a patterned screen (usually glass ruled with a uniform grid of lines, either the lines themselves or the squares between them being opaque), as well as through a transparent film carrying the image (*e.g.*, a photographic transparency). The screen broke the image into a pattern of dots of various sizes, the size of any given dot being dependent on the amount of light transmitted by the image at that point. Thus, when the plate was developed—usually by washing away the unexposed coating—the surface was left covered with dots of varying size corresponding to the varying tones of the image. The exposed, hardened coating acted as a resist during the subsequent etching of the plate by acid. This process can be applied whether a plate is being prepared for relief or intaglio printing. For relief printing, a halftone screen with opaque lines and a negative transparency are used. The areas of large dots (which take more ink than small ones) will print as the dark areas of the image. Intaglio printing using this process, known as photogravure, was invented in 1878. A transparent positive is used with a screen of opaque squares, producing a plate of tiny cells etched to varying depths, the deepest (which hold the most ink) representing the dark areas on the image. Because the cell pattern breaks up fine lines, photogravure is not ideal for printing type, but it is very useful for continuous tone copy like photographs and drawings and is used in printing periodicals and other commercial work needing very long press runs. It is generally done by rotary printing (known therefore as rotogravure) from copper cylinders, which are often plated with chromium to make it longer wearing.

A related process, line intaglio, or copperplate gravure, in which the images are composed exclusively of lines of varying width and depth, is used extensively in the printing of bank notes, stamps, securities, and the like. The characteristic sharpness and variety of the lines make it hard to reproduce them by any photographic or other means.

An important technical difficulty in photoengraving can occur at the etching stage, from the tendency of acid to act equally in all directions and not merely downward, thus broadening lines and undercutting and weakening halftone dots. This was overcome initially by coating the sidewalls of the etched areas with an acid-resist, sometimes repeatedly, but later by the discovery of various compounds that control the lateral action of the chemicals used to etch magnesium, copper, and zinc.

photofission, in physics, splitting of an atomic nucleus into two fragments of nearly equal mass upon absorption of electromagnetic radiation. It most commonly occurs in heavy nuclei, as in those of uranium or thorium, upon their bombardment by high-energy gamma rays. *Compare* photodisintegration.

photogram, shadowlike photographic image made by placing opaque, translucent, or transparent objects between light-sensitive paper or film and a light source; exposing the assemblage to light; and developing the latent image on the paper. The artistic potential of the photogram was extensively exploited during the 1920s.

The Swiss photographer Christian Schad, Hungarian-born painter-photographer László Moholy-Nagy, and U.S. expatriate Surrealist Man Ray were the medium's chief proponents. Ray, whose photograms are known as rayographs, applied the contact-exposure technique to motion-picture making as well.

photogrammetry, technique that uses photographs for mapmaking and surveying. As early as 1851 the French inventor Aimé Laussedat perceived the possibilities of the application of the newly invented camera to mapping, but it was not until 50 years later that the technique was successfully employed. In the decade before World War I terrestrial photogrammetry, as it came to be known later, was widely used; during the war the much more effective technique of aerial photogrammetry was introduced. Although aerial photogrammetry was used primarily for military purposes until the end of World War II, thereafter, peacetime uses expanded enormously. Photography is today the principal method of making maps, especially of inaccessible areas, and is also heavily used in ecological studies and in forestry, among other uses.

From the air, large areas can be photographed quickly using special cameras, and blind areas, hidden from terrestrial cameras, are minimized. Each photograph is scaled, using marked and known ground reference points; thus, a mosaic can be constructed that may include thousands of photographs. Plotting machines and computers are used to overcome complications.

Instruments used in photogrammetry have become very sophisticated. Developments in the second half of the 20th century include satellite photography, very large scale photographs, automatic visual scanning, high-quality colour photographs, use of films sensitive to radiations beyond the visible spectrum, and numerical photogrammetry.

photographic emulsion, nuclear: *see* nuclear photographic emulsion.

photography, method of recording the permanent image of an object by the action of light, or related radiation, on a sensitive material. The word, derived from the Greek *photos* ("light") and *graphien* ("to draw"), was first used by Sir John F.W. Herschel in 1839.

A brief account of photography follows. For full treatment, *see* MACROPAEDIA: Photography.

Louis-Jacques-Mandé Daguerre announced the first commercially successful photographic process, the daguerreotype, in 1839. A year later William Henry Fox Talbot described his negative–positive calotype process, which became the forerunner of modern photographic processes. This was followed by the wet collodion process in 1851 and by dry plates in 1871. Flexible films were introduced in 1889 by George Eastman. Since then, the light sensitivity (speed) of films has been greatly improved, and the quality of film emulsions has become so fine that prints many times larger than the size of the film can be made. Colour photography, expensive and complicated in the 19th century, has been so refined that it is nearly as easy as black-and-white photography. Technical improvements in the camera have transformed it from a bulky, cumbersome apparatus to a compact, sophisticated device that is often small enough to fit in a pocket.

The development of photography has had a profound effect on society. At first its main use was in portraiture and in showing people the sights of the world. In the 1850s and 1860s, Roger Fenton and Mathew B. Brady pioneered war photography and founded photo-journalism, which has become pervasive in modern mass media. Professional photography now covers an enormous range of activities. Portraiture consists mainly of photography and pictures of the newsworthy. Social photography records people at parties, weddings, and other celebrations. Publicity, fashion, and advertising photography has become highly sophisticated, as has industrial and architectural photography. Pictures taken for their own sake, rather than to display a particular subject, are used in magazines, books and calendars and increasingly as decorative art. The use of posters and prints for wall decoration has increased, as has the interest in "fine prints" especially monochrome ones. Photography is also used for scientific and technical research. It has made a direct contribution to work in virtually every discipline, and its ability to record invisible radiation and photographs in uninhabitable situations has provided pictures of many phenomena that would otherwise have gone unseen.

To make a photograph it is first necessary to form an image on a light-sensitive plate or film in a camera by means of a system of lenses in the camera. The plate or film may be of cellulose acetate, glass, or other transparent material coated with an emulsion of a halide (or salt) of silver, such as silver bromide or silver chloride. After exposure to light for a certain time period, the film is removed from the camera and placed in a chemical developer solution that yields, fine, black silver particles. The particles cluster where light was strongest on the film, producing a reverse, or negative, image of the light and shadow of the object photographed. The particles are chemically fixed on the negative by washing in a fixer, which is frequently a solution of sodium thiosulfate called hypo. Other chemicals dissolve the unexposed silver salts, which are then washed out with water.

An accurate positive image, or photograph, is made on special sensitized paper by placing the finished negative over the paper and exposing it to light. The lightest portions of the negative transmit the most light, and darker portions screen out more light, so that the negative image is reversed on the print. This positive image is fixed and washed in a process similar to the one used to produce the negative. In instant-print photography the processing chemicals are included in the film or camera, and the pictures are processed immediately upon their removal from the camera. Film intended to produce slides can be processed to bypass the negative stage. Such "reversal" films are commonly used to produce colour transparencies and, rarely, black-and-white ones.

Colour photography is accomplished by two basic methods. In the additive processes, now seldom used, the subject is photographically separated into its blue, green, and red components (three-colour process), and negative images are used to combine blue, green, and red light to reproduce the subject with the same proportions of colours as in the original. In subtractive processes, positives are made in colours complementary (yellow, magenta, and cyan) to negative images photographed by blue, green, and red light; the three positive layers superimposed on each other reproduce the colours present in the original subject.

Infrared photography is used to record the image of an object by using film sensitive to invisible infrared radiation instead of to ordinary light. Hot objects emit infrared rays and may be photographed in the dark, showing details of temperature distribution over the survace. Distant objects may be photographed with improved clarity because infrared light is not scattered as much by atmospheric haze as is ordinary light. The technique is widely used in astronomy; nebulae and stars that are invisible because of haze may be photographed by infrared photography. It has been applied to detect irregularities in treated and dyed textiles; to decipher old or altered documents; in aerial photography to observe pollution in streams and lakes and to detect diseased trees in forests; and by the military to distinguish painted camouflage from foliage, chlorophyll being transparent to infrared radiation.

Ultraviolet photography is a method of making a photograph of an object illuminated with ultraviolet rather than ordinary visible light. In the direct method, a plate or film sensitive to ultraviolet light is exposed to the ultraviolet rays reflected off the object. In the fluorescence method, and ultraviolet light induces fluorescence, or the production of visible light, in the object, and this fluorescent light provides the illumination for the photograph.

Ultraviolet photography, with its capability of detecting characteristic fluorescences, serves as a tool for identifying paintings, ceramics, grades of paper, and erasures in documents. Because of the excessive scattering of the short wavelengths of ultraviolet by the atmosphere, ultraviolet photography is not adapted to landscape photography; such photos appear blurred and show no shadows.

photoluminescence, emission of light from a substance as a result of absorption of electromagnetic radiation; such a substance is called a phosphor (*q.v.*), and the emitted light usually has a longer wavelength than the incident radiation.

photolysis, chemical process by which molecules are broken down into smaller units through the absorption of light.

The best known example of a photolytic process is the experimental technique known as flash photolysis, employed in the study of short-lived chemical intermediates formed in many photochemical reactions. The technique, developed by the English chemists R.G.W. Norrish and George Porter in 1949, consists of subjecting a gas or liquid to an intense burst of light lasting a few microseconds or milliseconds, followed by a second, ordinarily less intense flash. The first flash dissociates the absorbing compound into short-lived molecular fragments and the second flash provides a means for their identification by spectrophotometry (*q.v.*). The method is a valuable tool for the identification of transient chemical intermediates and hence for the study of mechanisms of fast chemical reactions.

photometer, device that measures the strength of electromagnetic radiation in the range from ultraviolet to infrared and including the visible spectrum. Such devices are generally transducers that convert an electric current into a mechanical indication, *e.g.*, a pointer moving across a dial. The source of the current may be a selenium cell, which generates a current when light falls on it, or it may be a permanent source, such as a battery, in which case the current passes through a cadmium sulfide cell whose resistance varies with the amount of light falling on it.

Photometers are made in many forms for various applications. They may be used directly, as in photography or in measuring glare, colour variation, reflectance, or other qualities, or they may be incorporated into such devices as densitometers, spectrographs, and telescopes.

photometry, in astronomy, the measurement of the brightness of stars and other celestial objects (nebulae, galaxies, planets, etc.). Such measurements can yield large amounts of information on structure, temperature, distance, age, etc.

A brief treatment of astronomical photometry follows. For full treatment, *see* MACROPAEDIA: Analysis and Measurement, Physical and Chemical.

The earliest observations of the apparent brightness of the stars were made by Greek astronomers. The system used by Hipparchus about 130 BC divided the stars into classes called magnitudes; the brightest were described as being of first magnitude, the next class were second magnitude, and so on in equal steps down to the faintest stars visible to the unaided eye, which were said to be of sixth magnitude. The application of the telescope to astronomy in the 17th century led to the discovery of many fainter stars, and the scale was extended downward to seventh, eighth, etc., magnitudes.

In the early 19th century it was established by experimenters that the apparently equal steps in brightness were in fact steps of constant ratio in the light energy received and that a difference in brightness of five magnitudes was roughly equivalent to a ratio of 100. In 1856 N. Pogson suggested that this ratio should be used to define the scale of magnitude, so that a brightness difference of one magnitude was a ratio of 2.5188 in intensity and a five-magnitude difference was a ratio of $(2.5188)^5$, or precisely 100. Steps in brightness of less than a magnitude were denoted by using decimal fractions. The zero point on the scale was chosen to cause the minimum change for the large number of stars traditionally established as of sixth magnitude, with the result that several of the brightest stars proved to have magnitudes less than 0 (*i.e.*, negative values).

The introduction of photography provided the first nonsubjective means of measuring the brightness of stars. The fact that photographic plates are sensitive to violet and ultraviolet radiation, rather than to the green and yellow wavelengths to which the eye is most sensitive, led to the establishment of two separate magnitude scales, the visual and the photographic. The difference between the magnitudes given by the two scales for a given star was later termed the colour index and was recognized to be a measure of the temperature of the star's surface.

Observations in the 19th century, especially by E. Pickering at Harvard, revealed that while the majority of stars are of unchanging brightness, five classes of variable stars could be identified. The most spectacular of these are the novae, stars that suddenly brighten by 10 or more magnitudes before fading slowly back into obscurity. Three types of stars show regular changes in brightness; The simplest are the eclipsing binaries, pairs of stars rotating about one another that are seen from Earth regularly to occult one another. Second are the long-period variables, the best known being Mira Ceti, which fluctuates between second and ninth magnitude in a cycle of 332 days. The third group, called the Cepheid variables after delta Cephei, the best known example, fluctuate faster but over a narrower range. The fifth class of unsteady stars, the irregular variables, show small changes in brightness, with no discernible pattern; Betelgeuse is a first-magnitude example. The Cepheid variables are the most important of these five groups because their periods of variation are related to their absolute brightness; they can thus be used to measure distances to clusters or galaxies in which they are observed.

Since the 1940s astronomical photometry has been vastly extended in sensitivity and wavelength range, especially by the use of photoelectric rather than photographic detectors. The faintest stars now observed have magnitudes around 24. Magnitudes are now measured not only in the visible but also in the ultraviolet and infrared.

The dominant photometric classification system, the UBV system introduced in the early 1950s by H.L. Johnson and W.W. Morgan, uses three wave bands, one in the ultraviolet, one in the blue, and the other in the dominant visual range. More elaborate systems can use many more measurements, usually by dividing the visible and ultraviolet regions into narrower slices or by extension of the range into the infrared. Routine accuracy of measurement is now of the order of 0.01 magnitude, and the principal experimental difficulty in much modern work is that the sky itself is luminous, due principally to photochemical reactions in the upper atmosphere. The limit of observations is now about 1/1,000 of the sky brightness in visible light and approaches 1/1,000,000 of the sky brightness in the infrared.

Photometric work is always a compromise between the time taken for an observation and its complexity. A small number of broad-band measurements can be done quickly, but as more colours are used for a set of magnitude determinations for a star, more can be deduced about the nature of that star. The simplest measurement is that of effective temperature, while data over a wider range allow the observer to separate giant from dwarf stars, to assess whether a star is metal-rich or deficient, to determine the surface gravity, and to estimate the effect of interstellar dust on a star's radiation.

photomicrography, photography of objects under a microscope. Such opaque objects as metal and stone may be ground smooth, etched chemically to show their structure, and photographed by reflected light with a metallurgical microscope.

Biological materials may be killed, dyed so that their structure can be seen, and mounted on glass slides for photographing by transmitted light using ordinary light microscopes; or, by using ultraviolet, infrared, electron, or X-ray microscopes, sharp photographs can be made of living, unstained specimens. Cinephotomicrography, taking motion pictures of magnified objects, is useful in studying organism growth, colloidal movement, and chemical reactions.

photomontage, composite photographic image made either by pasting together individual prints or parts of prints, by successively exposing individual images onto a single paper, or by exposing the component images simultaneously through superimposed negatives. In the 1880s the juxtaposition of separate images

Study for a composition picture by Henry Peach Robinson, *c.* 1860

Gernsheim Collection, Humanities Research Center, The University of Texas at Austin through successive exposures became fashionable in the "combination print," especially in the form of the contrived group portrait. The subjective, fragmented, potentially absurd qualities of this juxtaposition were exploited by Dadaist and Futurist artists of the early 20th century.

The photomontages of George Grosz and John Heartfield from this period are among the major examples of the form. Photomontage was also used extensively in the Pop art movement of the 1960s and 1970s. A technically sophisticated form of photomontage was developed by the U.S. photographer Jerry Uelsmann.

photomultiplier tube, electron multiplier tube that utilizes the multiplication of electrons by secondary emission to measure low light intensities. It is useful in television camera tubes, in astronomy to measure intensity of faint stars, and in nuclear studies to detect and measure minute flashes of light. The tube utilizes a photosensitive cathode, that is, a cathode that emits electrons when light strikes it, followed by a series of additional electrodes, or dynodes, each at a successively higher positive potential so that it will attract electrons given off by the previous dynode.

The first dynode is made to emit several electrons by each electron striking it; similarly, each electron from the first dynode causes the second dynode to emit several electrons, leading to an increase, or multiplication, of electrons at each dynode until the final dynode is reached. Total amplification may reach 1,000,000, with nine dynodes customarily employed.

photon, also called LIGHT QUANTUM, minute energy packet of electromagnetic radiation. The concept originated (1905) in Einstein's explanation of the photoelectric effect, in which he proposed the existence of discrete energy packets during the transmission of light. Earlier (1900), the German physicist Max Planck had prepared the way for the concept by explaining that heat radiation is emitted and absorbed in distinct units, or quanta. The concept came into general use after the U.S. physicist Arthur H. Compton demonstrated (1923) the corpuscular nature of X-rays. The term photon (from Greek *phōs, phōtos,* "light"), however, was not used until 1926. The energy of a photon depends on radiation frequency; there are photons of all energies from high-energy gamma- and X-rays, through visible light, to low-energy infrared and radio waves. All photons travel at the speed of light. Considered among the subatomic particles, photons are bosons, having no electric charge or rest mass and one unit of spin; they are field particles that are thought to be the carriers of the electromagnetic field.

photoperiodism, the functional or behavioral response of an organism to changes of duration in daily, seasonal, or yearly cycles of light and darkness. Photoperiodic reactions can be reasonably predicted, but temperature, nutrition, and other environmental factors also modify an organism's response.

A brief treatment of photoperiodism follows. For full treatment, *see* MACROPAEDIA: Behaviour, Animal.

In animals, the regular activities of migration, reproduction, and the changing of coats or plumage can be induced out of season by artificially altering daylight. Birds, for example, have migrated north in the winter after having been exposed to reversed seasonal lighting in laboratories. The manipulation of a specific stimulating period of darkness, which is required by each species for every phase of the migratory process, is an important factor in photoperiodism.

When stimulated by light, an animal's pituitary gland will release hormones that affect reproduction. Thus, the mating season of a species can be made to occur at an unusual time by manipulating daylight. Long periods of light followed by short periods will induce mating behaviour in species that normally breed in autumn (*e.g.,* goats and sheep), while spring breeders (*e.g.,* mink) will start the reproductive process when daylight is increased. Application of photoperiodism is common in the poultry industry, as daylight affects egg-laying, mating, and body weight of the fowl.

photophore, light-emitting organ present in fireflies and certain other bioluminescent animals. Photophores are glandular in origin and produce light by a chemical reaction. Photophores vary in size and form but often contain such structures as lenses, reflecting layers, and filters in addition to the light-producing material. *See also* bioluminescence.

Consult the INDEX *first*

photoprotein, in biochemistry, any of several proteins that give off light upon combination with oxygen, hydrogen peroxide, or other oxidizing agents. Unlike the oxidation of luciferin, the production of light by a photoprotein requires no catalyst. Such a system occurs in *Aequorea*, a luminescent jellyfish, in which the single organic chemical aequorin requires calcium or strontium ions for luminescence to occur. *See also* bioluminescence.

photoreception, any of the biological responses of organisms to stimulation by light.
