## ABSTRACT

A Breit-Wigner analysis of plutonium-240 is folded into a Maxwellian velocity distribution to obtain total, scattering, radiative capture, and a portion of the fission cross sections versus neutron energy from 0.0253 to 120 ev and for plutonium-240 temperatures of 0.0253 to 0.2 ev.

## ACKNOWLEDGMENTS

This paper is directly based on parameters evaluated by neutron nuclear spectroscopists. We are grateful to the Brookhaven Compilation Group, especially to Mrs. Sophie Moore and Dr. Murray Goldberg. We appreciate a private communication from Dr. Bowen R. Leonard, Jr., of the Hanford Works.

## I. METHOD

This work follows the methods of Devaney, Goldstein, Fagan, and Devaney.<sup>1</sup> Briefly put, this calculation yields the cross sections expected from plutonium- $^{240}$  in thermal Maxwellian motion, assuming negligible reactive interference. That a Maxwellian velocity distribution is a useful approximation follows from the fact that the Debye temperature of plutonium, which lies between 170 and  $180^{\circ}\text{K}$ ,<sup>2</sup> is well below the temperatures considered here (0.0253 ev is  $294^{\circ}\text{K}$ ).

The cross sections presented here are those actually measurable or useable in the laboratory, namely, the reaction rate per nucleus divided by the laboratory neutron velocity; see the discussion in Devaney and Fagan (IA-2144).<sup>1</sup> Multilevel interference formulas were judged unnecessary, the ratio of widths to spacing being about 0.01; see the discussion for tungsten in Devaney, Devaney, and Coward (IA-2289).<sup>1</sup>

## II. SOURCES OF DATA

The 1st level parameters were obtained from Pattenden and Rainey<sup>3</sup> with the exception of the fission width which came from Leonard and Odegaard.<sup>4</sup> The neutron width of the 10th resonance (116.0 ev) was taken from Simpson and Fluharty,<sup>5</sup> and the remaining fission widths are an out and out guess by one author (J.D.). The rest of the level parameters are taken from the Brookhaven Compilation of Hughes, Magurno, and Brussel,<sup>6</sup> with the radiation width taken as 34 mv when not specifically given. We list below the level parameters used (laboratory system):

To account for contributions of resonances outside the energy range considered in this study we have added to the capture cross section  $1/v$  terms of strength (at 0.0253 ev) 6.1865 barns. The radius parameter,  $R = 10$  fermis, was chosen as large as the senior author's conscience would permit. However, experiment and this calculation disagree by a factor of thirty! in the total cross section from  $E_n = 12$  to 19 ev, and similarly from  $E_n = 22$  to 36 ev.<sup>3,6</sup> No reasonable value for  $R$  can cure this discrepancy; either the theory is markedly incomplete, or the experimental values are wildly high in these valleys. Nor is this the only discrepancy, for as noted by many authors, the fission width of the first resonance appears to give too high a thermal fission cross-section when compared with direct thermal measurements (unless one postulates large destructive interference). Consequently, we do not place great confidence in the cross-sections reported here. They are simply the best we can do at this time.

A comparison of our values with experiment at thermal (0.0253 ev energy and temperature) follows (all quantities in barns):

Quantity:	Total Cross Section, $\sigma_T$	Radiative Capture Cross Section, $\sigma_\gamma$	Fission Cross Section, $\sigma_F$

### III. RESULTS

The results of the calculation are presented in tables, each of which gives the total, scattering, fission, and radiative capture cross section as a function of energy for one temperature. Of course, only the first two or three tabulated figures are significant and the last two figures give the exponent; thus, for example, 1.0576678 02 is read 106. and 9.3158847-01 is read 0.93. The fission cross section above 2 ev is pure guesswork.
