USER'S MANUAL FOR LASL SHOCK HUGONIOT DATA FILE

by

Martha S. Hoyt

ABSTRACT

Tape, photostore, and Common File System access instructions for the equation-of-state file HUGDATA are given. The data format is described, and an example shows how to extract data on specific materials for use as code input.

I. INTRODUCTION

The LASL Data Center for Dynamic Material Properties is collecting and publishing dynamic material property data generated at Los Alamos Scientific Laboratory over the last twenty-five years. Stanley P. Marsh has collected data on the single-shocked state (the Hugoniot locus) of many materials in the 10- to 50-GPa pressure range, and they are being published by the University of California Press. The collection is titled "LASL Shock Hugoniot Data."

The data also are available from tape, photostore, and Common File System files. This report describes the data format and how the data on specific materials may be extracted.

II. THE FILE

The file HUGDATA contains tables of Hugoniot data on 486 materials. Each line in the file corresponds to a punched card. For each material, the data are given as follows

Card 1	Column 10	0 - no fit requested for handbook 1 - linear fit requested for handbook
Card 2		Material name including formatting characters
Card 3		Material name continued or blank
Card 4	Columns 1-6	Longitudinal velocity (F6.2)
	Columns 7-12	Shear velocity (F6.2)
		Blank if no velocities given

Card 5 Reference (14I5) or blank
 Card 6 and following are data cards
 Columns 1-14 Description
 Columns 17-18 Experimental method (I2)
 Columns 20-29 ρ_o (E10.3)
 Columns 30-39 Data not used in this handbook
 Columns 40-45 \bar{v}_s (F6.3)
 Columns 46-51 U_p (F6.3)
 Columns 52-72 Data not used in this handbook
 End-of-data card 99 in Columns 15-18
 End-of-all-data card 9999 in Columns 15-18

III. FILE ACCESS

HUGDATA is an unclassified file written to photostore, the Common File System (CFS), and tape from Machine U, a CDC 7600. Photostore access is:

```
XPOR T14KER GET HUGDATA, HP
```

CFS access is:

```
MASS GET /DATACTR/HUGDATA
```

The file is also on tapes BG039 and CH086 for LASL and tape MH001 for LLL. These are seven-track, 800-bpi, odd-parity tapes. They are written with the ADT utility (UR-401) using the 2R option; that is, there are two copies of the file on each tape. The tapes must be read using the utility RDFILES (UR-402). The execute line is:

```
RDFILES BG039 HUGDATA END
```

IV. HOW TO EXTRACT A PARTICULAR MATERIAL FROM THE DATA FILE

Particular materials may be extracted from the data file and put on a new file that can be used as input to a processing code. The Appendix lists all the materials, including formatting characters, in the order in which they appear in the file. Use TRIX AC to find the name of the desired material and the end of data on that material. All other lines in the file can be deleted. Example:

Let us make a file called TAPE1 that will contain:

```
Argon, solid
Lithium-6 Deuteride,  $\rho_o = 0.74$ 
Phenolic Refrasil, multiple-warp
```

Find the materials in the Appendix. Note the order in which they appear and the formatting characters, such as *,), and (. Then use TRIX AC, as shown on Page 3, to establish the file TAPE1, to locate the title card and end of each material, and to delete unwanted lines.

```
