M. G. Silbert

FISSION CROSS SECTION OF  $^{238}\text{Pu}$  FROM PERSIMMON,  
TABULAR PRESENTATION

by

M. G. Silbert

ABSTRACT

Values for the neutron-induced fission cross section of  $^{238}\text{Pu}$  from 18 eV to 3 MeV are presented in tabular form.

I. INTRODUCTION

This report is a tabular presentation of the neutron-induced fission cross section of  $^{238}\text{Pu}$  between 18 eV and 3 MeV, as measured in the Persimmon nuclear explosion by LASL groups P-3 and W-8. A description of the experimental arrangement and preliminary results have been presented in LASL report LA-4108-MS. A formal paper will be published in the near future by M. G. Silbert (LASL), A. Moat (AWRE, Aldermaston), and T. E. Young (Idaho Nuclear Corp.). Reference should be made to the above reports for experimental details.

Table I lists the neutron energy in electron volts, the fission cross section in barns, and the fractional uncertainty (standard deviation) of the cross section. The uncertainty is a quadratic combination of the random uncertainty at each point and a systematic uncertainty of 5.3% applicable to

all points. The cross section is a weighted average from detectors at  $55^\circ$  and at  $80^\circ$  to the neutron beam. The time channels chosen for Table I were 1.0 microseconds below  $10^5$  eV, 0.5 microseconds from  $1 \times 10^5$  to  $9 \times 10^5$  eV, and 0.2 microseconds from  $9 \times 10^5$  eV to  $3 \times 10^6$  eV.

Table II is a high resolution presentation of the cross section between  $10^3$  and  $10^5$  eV, a region in which intermediate structure is evident. The time channels are 0.2 microseconds. Table II was derived from the high resolution (drum camera) recordings from the two detectors, whereas from  $10^3$  to  $10^5$  eV Table I was derived from an average of high resolution and low resolution (streak camera) recordings from the two detectors. The integrals of the cross section from  $10^3$  to  $10^5$  eV in Tables I and II agree to within 2%.

TABLE I
