All LAMS reports are informal documents, usually prepared for a special purpose and primarily prepared for use within the Laboratory rather than for general distribution. This report has not been edited, reviewed, or verified for accuracy. All LAMS reports express the views of the authors as of the time they were written and do not necessarily reflect the opinions of the Los Alamos Scientific Laboratory or the final opinion of the authors on the subject.

ABSTRACT

This report describes various computational techniques employed to describe the equation of state of normal hydrogen data. Using the following functional form, the differences between the observed and calculated values are in general within 5%:

$$\text{Pressure} = P_1 V^{P_2} [1 - (P_3/V)^{P_4}] + P_5 T / (V - P_6 + P_7/V)$$

where P_1, P_2, \dots, P_7 are the resulting parameters, V = volume, T = temperature.

1. Introduction

In the fall of 1959, the Statistical Section of the Theoretical Division assisted in fitting a multiple regression surface to smoothed hydrogen data. The result of this endeavor appeared in LAMS-2357.* There were several reasons to continue the work: 1) foremost, raw data rather than smoothed data should be used; 2) the surface fit in LAMS-2357 was divided into several regions; the divisions were for the convenience of the equations, rather than natural data divisions; 3) since there were divisions, discontinuities existed at the boundaries of the divisions; and 4) the results were not as good as desired.

2. Representation of Data

The raw data represent an amalgamation of information from some six different sources (see Table 1). There are 4 values or variables involved: temperature (T) in $^{\circ}\text{K}$, pressure (P) in atm., volume (V) in cc/m, and compressibility (Z). It should be noted that $Z = f(T, V)$. It should also be noted that at various times different combinations of the variables were used in attempting to solve the problem.

* Sherman, Vogel, Moore, Schuch, and Goldman, Los Alamos Scientific Laboratory Report, LAMS-2357, September 25, 1959.

3. Two-Dimensional Approach

The approach used primarily was the so-called two-dimensional (2-D) approach, suggested by W. E. Keller of Group CMF-9 of this Laboratory. The isotherm runs illustrate the technique. Suppose we hold temperature fixed; then there are several data points for this temperature. Then fit (in two-dimensions) some function, say $Z = A P + B P^2 + C P^3$ where A, B, and C are constants determined by a least squares fit. Since this can be done for several temperatures, we may write $Z = A(T) P + B(T) P^2 + C(T) P^3$. Now if a "nice" functional relation can be found for A(T), B(T), and C(T) in terms of T, the problem is solved, for an ensuing function $Z = f(P, T)$ follows.

4. Results of the Two-Dimensional Approach

A. Isotherm Runs. In 2-D, the results were quite good for the various temperatures. The expression $Z = e^{a(T)} P^2 + b(T) P + c(T) P^2 + d(T) P^3 + f(T) P^4$ fits the data extremely well. Unfortunately, the coefficients a(T), b(T), c(T), d(T), and f(T) were not well behaved. Thus, an attempt to extend this into 3-D was rather unsuccessful, resulting in some errors of magnitude of 25%.

B. Isochore Runs. Again, the 2-D fits were rather good. In fact, they were better than the isotherm runs. (It should be noted that the T,P surface is much better to work with than the Z,P surface). The equation used here for the 2-D runs was $P = A(V) + B(V) T + C(V) T^2$. Here the coefficients A(V), B(V), and C(V)

were quite well behaved, allowing a smoother transition into 3-D.

The evolving equation is as follows:

$$\begin{aligned} \text{Pressure} = & P_1 + P_2/V + P_3/V^2 + P_4/V^3 + P_5/V^4 + P_6T + P_7T/V \\ & + P_8T/V^2 + P_9T/V^3 + P_{10}T/V^4 + P_{11}T^2 + P_{12}T^2/V \\ & + P_{13}T^2/V^2 + P_{14}T^2/V^3 + P_{15}T^2/V^4, \end{aligned} \quad (1)$$

where P_1, P_2, \dots, P_{15} are the resulting parameters.

It should be noted that this equation is very similar to that used in LAMS-2357. The fundamental difference in approach is the division of data. Here the data have been divided into 2 classes: class 1 = GAS plus FLUID, class 2 = LIQUID. Obviously, this represents a "logical" data division. Further, the program was rewritten to minimize the percentage of error. Table 2 shows the percentage deviation of equation (1). Also IBM Listing 1 enumerates the fitted values.

5. Boulder Equation

From a writeup by R. D. Goodwin, CEL, National Bureau of Standards, Boulder, Colorado, entitled Approximate Wide-Range Equation of State for Hydrogen, the following parameters were determined by the method of least squares:

$$\text{Pressure} = P_1 V^{P_2} [1 - (P_3/V)^{P_4}] + P_5 T / (V - P_6 + P_7/V), \quad (2)$$

where P_1, P_2, \dots, P_7 are the resulting parameters.

Again, the data were divided into the forementioned two groups. The results for the GAS-FLUID data were very gratifying; maximum error was less than 5%. See Table 2 for an exact percentage deviation for these data. Also see IBM Listing 2 for a point-by-point enumeration of the results. Unfortunately, this function does not seem to fit LIQUID data alone. A further run was made fitting ALL data (see Listing 3 and Table 2). It should be noted that the expression does fit all data relatively well; the large percentage errors here are attributed to the liquid area. For the present, this represents the best run.

6. Explanation of Table 3 and the IBM Listings

Table 3 enumerates the parameter values to which the least squares equations converged for the three runs made. A brief explanation of the IBM listings follows: The final values and standard deviations of the parameters are given on the 5th page of Listing 1 and the 3rd pages of Listings 2 and 3. Then the data points, the corresponding points on the fitted curve, the deviations between fitted and actual dependent variables, etc. are listed. The first independent variable is the volume, the second, the temperature. For a more detailed explanation of the listings and the computational least squares iterative procedure, refer to LA-2367, The

Solution of the General Least Squares Problem with Special Reference to High-Speed Computers, October 15, 1959, by R. H. Moore and R. K. Zeigler of this Laboratory.

7. Summary

The Boulder equation does an adequate over-all job, and does particularly well for the bulk of the data, namely the GAS-FLUID data. It should be noted that most of the points with maximum deviation were near the "critical point".

TABLE 1
DATA SOURCE LIST

The following were the data sources used for this work. References are for Normal Hydrogen.

2 IND REC FUNCTION

THIS PROBLEM CONTAINS 411 DATA POINTS, 2 INDEPENDENT VARIABLE(S), AND 15 PARAMETER(S) (< 0 OF THEM HELD CONSTANT).
 THE WEIGHTED VARIANCE IS 6.3765333E-04 AND THE UNWEIGHTED SUM OF SQUARES OF THE DEVIATIONS IS 2.4006791E 03.

TPZ FIT USING BOULDER EQUATION

THIS PROBLEM CONTAINS 411 DATA POINTS, 2 INDEPENDENT VARIABLE(S), AND 7 PARAMETER(S) (1 OF THEM HELD CONSTANT).

THE WEIGHTED VARIANCE IS 2.1776194E-04 AND THE UNWEIGHTED SUM OF SQUARES OF THE DEVIATIONS IS 5.9058115E 02.

TP2 FIT USING BOULDER EQUATION

THIS PROBLEM CONTAINS 499 DATA POINTS, 2 INDEPENDENT VARIABLE(S), AND 7 PARAMETER(S) (1 OF THEM HELD CONSTANT).
 THE WEIGHTED VARIANCE IS 5.6456198E-04 AND THE UNWEIGHTED SUM OF SQUARES OF THE DEVIATIONS IS 1.6238074E 03.
