APPENDIX A.	LIST OF REQUESTERS	329

I. INTRODUCTION

1

This report is a working document of the U. S. Nuclear Data Committee. It contains a list of cross-section and related measurements important to the U. S. nuclear energy programs. These requests have originated from various Atomic Energy Commission agencies and contractors, Department of Defense laboratories and contractors, National Aeronautics and Space Administration laboratories and contractors, and other interested groups. Requests have also been received from the Advisory Committee on Reactor Physics (ACRP), the United States Nuclear Data Committee (USNDC), the Defense Nuclear Agency (DNA), and others.

Each request which appears in this compilation has been reviewed by subcommittees of the USNDC. In addition, those requests designated as DRDT and DNA have been reviewed by the ACRP; those designated as DCTR were reviewed by an ad-hoc Committee on Controlled Thermonuclear Research; those designated as DNA were reviewed by individuals designated by the DNA; etc.

Requesters' comments have often been edited to conserve space, hopefully without compromising the intended meaning. Status comments are the responsibility of the working subcommittees of the USNDC although editing was often required before inclusion in the final document. In compiling the status comments, the USNDC assumes that the requester has consulted the published literature and the National Neutron Cross Section Center files for available data listed in CINDA documents which are kept current and are available in all AEC depository libraries. Most references to such published literature have therefore been omitted.

This version* of the request list was produced by computer printout. The computer program was written by Myron L. Stein specifically for the MANIAC at Los Alamos. The present printout is unrevised and contains slight notation problems which may be confusing. The MANIAC printer allows only a few Greek characters but it does allow overprinting; therefore Roman letters with a bar over the top are chosen to denote many of the common Greek symbols; for example, $\bar{\alpha}$ is Greek α , $\bar{\beta}$ is Greek β , $\bar{\gamma}$ is Greek γ , etc. Throughout the tables, capital σ is used for σ due to the obvious similarity between the two.

It should be noted that this reaction list was originally set up to handle neutron interactions but, at a later date, the list was amended to include other incident particles. Therefore, a channel description such as "Elastic" and "Total" always refers to incident neutrons. If a particle other than a neutron is in the incident channel, the specific particle appears under "REACTION" for each request listed.

*Future request compilations will be the responsibility of the National Neutron Cross Section Center at Brookhaven National Laboratory.

Reaction types are, for the most part, in standard notation. These requests are invariably for microscopic data, and dependence on the incident neutron energy is implied. If the request is for the measurement of a cross section as a function of angle or exit particle energy as well as incident energy, this information is given in the column labeled "REACTION TYPE-VARIABLE."

All requests are ordered by Z, A, and then by reaction type according to an ordering scheme which resembles that chosen for ENDF/B. For example, retrievals are easily made on cross sections, angular distributions, energy spectra, etc. The main body of the requests contains requests for nucleon induced reactions and scattering for energies up to 20 MeV (Table 1). Photon-induced requests are in Table 2 and medium energy requests in Table 3. All of the reaction indices are completely described and defined as prefixes to each of these tables.

ACKNOWLEDGMENTS

The editors of this compilation would like to acknowledge the work of Dr. Myron L. Stein who handled all of the computer programming and operations, and to Mrs. Jane Rasmussen, who keypunched the majority of the requests. Mrs. Juanita Gammel has conscientiously and patiently prepared the input and edited the output for this final version. To all of these people, we express our sincere appreciation.

II. PROCEDURES FOR SUBMITTING REQUESTS

Requests for measurements of nuclear data should be transmitted through the appropriate channels to the U. S. Nuclear Data Committee at which time they will be reviewed by the various USNDC subcommittees. All requests should be completely specified and transmitted in the appropriate format, including the requester's comments regarding the importance and application of the request. They should then be submitted in the following manner:

- A. Fission reactor requests should be transmitted to the Advisory Committee on Reactor Physics which will review and set the priority for each such entry. The present chairman is:

Dr. W. H. Hannum, Chief
Division of Reactor Development & Technology
Reactor Physics Branch
U. S. Atomic Energy Commission
Washington, D. C. 20545

- B. DOD requests should be transmitted to the Radiation Physics Division of the Defense Nuclear Agency. The present contact is:

Capt. Dean Kaul, Radiation Transport Project Officer
 HQ, Defense Nuclear Agency, Attn: RARP
 Department of Defense
 Washington, D. C. 20305

- C. Other requests should be transmitted to:

Dr. George A. Kolstad, Assistant Director for Physics & Mathematics Programs
 Division of Physical Research
 U. S. Atomic Energy Commission
 Washington, D. C. 20545

III. PRIORITY ASSIGNMENTS

The exact meaning of "priority" is difficult to assess but the following definitions,^{*} which closely resemble those used by both EANDC and the EACRP, have been adopted by the USNDC:

PRIORITY I. Nuclear data which satisfy the criteria of Priority II and which have been selected for maximum practicable attention taking into account the urgency of nuclear energy program requirements.**

* The priority has been left blank on all requests for fusion reactor data. These fall under the organization listing of the Division of Controlled Thermonuclear Research (DCTR), AEC, Washington.

** For example, the EACRP assigns its highest priorities for reactor measurements as follows:
 The highest priority should be given to requests for nuclear data for reactors to be built in the near future if:

these data are still necessary to predict the different reactor properties after all information from integral experiments and operating reactors has been used; or

information on an important reactor parameter is in principle attainable through mathematical calculations from nuclear data only; or

these data are needed for materials required in reactor physics measurements.

- PRIORITY II. Nuclear data that will be required during the next few years in the applied nuclear energy programs (for example, in data needed to make the best use of reactor fuel and construction materials such as neutron moderators, absorbers, and radiation shields, space and bio-medical applications; data required for better understanding of some significant aspect of reactor behavior).
- PRIORITY III. Nuclear data of more general interest and data required to fill out the body of information needed for nuclear technology.

IV. SCREENING REQUESTS

All fission reactor requests in this report were reviewed by the ACRP; all fusion reactor requests were reviewed by an Ad Hoc Committee for CTR; and the entire list of requests was reviewed by the following members and Subcommittee members of the USNDC in the Fall of 1972:

Standards

R. S. Caswell, NBS, Chrm.
 W. W. Havens, Jr., Col.
 W. P. Poenitz, ANL
 L. Stewart, LASL
 B. R. Leonard, Jr., BNW

Elastic and Inelastic Scattering

A. B. Smith, ANL, Chrm.
 J. C. Hopkins, LASL
 H. Goldstein, Col.
 F. G. J. Perey, ORNL

Gamma-ray Production

H. E. Jackson, ANL, Chrm.
 H. T. Motz, LASL
 R. E. Chrien, BNL
 J. K. Dickens, ORNL
 V. J. Orphan, IRT

Total Capture Cross Sections

R. L. Macklin, ORNL, Chrm.
 R. C. Block, RPI
 M. P. Fricke, SAI
 W. P. Poenitz, ANL
 J. B. Czirr, LLL

Fission

M. S. Moore, LASL, Chrm.
 C. D. Bowman, NBS
 G. De Saussure, ORNL
 R. W. Hockenbury, RPI
 E. Melkonian, Col.
 J. A. Grundl, NBS

Resonance Parameters, Resonance Integrals, and Total Cross Sections

R. C. Block, RPI, Chrm.
 A. D. Carlson, NBS
 J. A. Farrell, LASL
 W. W. Havens, Jr., Col.
 M. H. Kalos, NYU
 O. D. Simpson, ANC

Fast Neutron Reactions

H. Alter, AI, Chrm.
 D. W. Barr, LASL
 D. E. Gardner, LLL
 J. L. Brownlee, LLL
 G. W. Butler, LASL

V. TABLES WITH DESCRIPTIVE INFORMATION

Preceding Tables 1, 2, and 3 will be the dictionary describing the quantities in the table which follows. The entire request list is contained in these three tables which are described as:

Table 1 contains the measurement requests for low-energy incident particles, that is, neutrons, protons, deuterons, tritons, and ^3He , ^4He , and ^6Li particles;

Table 2 contains the measurement requests for photons incident; and

Table 3 contains the medium-energy measurement requests for incident charged particles.

The requests which have been deleted from the last publication of the request list (NCSAC 35) have been compiled by hand for inclusion in Table 4. One line retrievals sorted on organization are to be found in Table 5. Each organization comprises a subset of Table 5 with names and organizational addresses given on each title page. A word of explanation is necessary since the one-line computer printout may appear to include erroneous requests. In making a search of this nature, only the first line of the particular request is retrieved even though the first requester (A-1 card and request) may not belong to that particular organization. Therefore, when a request appears in Table 5 without the correct organizational listing, one should take that request number and refer back to the main document in order to determine the energy range, priority, and accuracy associated with that specific request.

THIS PAGE LEFT BLANK INTENTIONALLY

TABLE 1. LOW ENERGY REQUESTS FOR INCIDENT NUCLEONS

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
<u>A. NEUTRONS INCIDENT</u>		
Total		Sum of all partial cross sections
Elastic	$\sigma(\theta_n)$	Cross section for the scattering of the incident particle with the center-of-mass energy unchanged
Elas + 1st	$\sigma(\theta_n)$	Elastic plus first excited state cross section
Elas + In	$\sigma(\theta_n)$	Elastic plus "some" inelastic cross section
Tot n Scat	$\sigma(\theta_n)$	All emitted neutrons including elastic
Emission	$\sigma(\theta_{n'})$ $\sigma(E_{n'})$ $\sigma(\theta_{n'}, E_{n'})$ $\sigma(55^\circ, E_{n'})$ $\sigma(90^\circ, E_{n'})$	All emitted neutrons except elastic, that is: Emission = $\sigma_{n,n'} + 2\sigma_{n,2n} + 3\sigma_{n,3n} + \bar{v}\sigma_{n,f} + \text{etc.}$
Inelastic	$\sigma(\theta_{n'})$ $\sigma(E_{n'})$ $\sigma(\theta_{n'}, E_{n'})$	Total inelastic scattering cross section
$\sigma_{n,n'}$	Isom State	Inelastic scattering to an isomeric state
$\sigma_{n,n'}$	1st State	Inelastic scattering to the first excited state
$\sigma_{n,n'}$	2nd State	Inelastic scattering to the second excited state
$\sigma_{n,n'p}$		Reaction cross section for the emission of n and p

TABLE 1. (cont.)

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
$\sigma_{n,n'd}$		Reaction cross section for the emission of n and d
$\sigma_{n,n't}$	$\sigma(\theta_n,)$	Reaction cross section for the emission of n and t
$\sigma_{n,n'3\bar{a}}$		Cross section for the $^{12}\text{C}(n,n'3\alpha)$ reaction
$\sigma_{n,2n}$		Total cross section for the (n,2n) reaction
$\sigma_{n,2n}$	Isom State	Partial (n,2n) cross section to an isomeric state
$\sigma_{n,2n}$	Act	Activation cross section for the (n,2n) reaction
$\sigma_{n,3n}$		Total (n,3n) cross section
$\sigma_{n,3n}$	Act	Activation cross section for the (n,3n) reaction
$\sigma_{n,4n}$		Total (n,4n) cross section
$\sigma_{n,g}^-$		$(\sigma_{n,\gamma})$ Total radiative capture cross section
$\sigma_{n,g}^-$	Act	Activation cross section for the (n, γ) reaction
$\sigma_{n,g}^- \text{ wrt}$	$\sigma_{n,f}^{\text{Pu}^{239}}$	Relative measurement with respect to Pu^{239} fission
$\sigma_{n,p}$		Total (n,p) cross section
$\sigma_{n,p}$	Act	Activation cross section for the (n,p) reaction
$(n,p)\text{Li}^9$	$\bar{b} \rightarrow \text{Be}^{9*} \rightarrow n$	The $\text{Be}^9(n,p)\text{Li}^9$ reaction which β decays to an excited state in Be^9 , which then emits a neutron
$(n,p)\text{N}^{17}$	$\bar{b} \rightarrow \text{O}^{17*} \rightarrow n$	The $\text{O}^{17}(n,p)\text{N}^{17}$ reaction which β decays to an excited state in O^{17} which then emits a neutron
$\sigma_{n,d}$		Total (n,d) cross section
$\sigma_{n,t}$		Total (n,t) cross section

TABLE 1. (cont.)

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
Tot \bar{a} Prod		Total α production cross section; for example, for B^{10} , this would be $\sigma_{n,\alpha_0} + \sigma_{n,\alpha_1} + 2\sigma_{n,t2\alpha} + 2\sigma_{n,2n} + 2\sigma_{n,n'd}$
$\sigma_{n,\bar{a}}$		Total (n, α) cross section
$\sigma_{n,\bar{a}}$	Act	Activation cross section for the (n, α) reaction
$\sigma_{n,\bar{a}}$ Ratio	wrt B^{10}	Measurement of the Li^6 (n, α) relative to B^{10}
$\sigma_{n,\bar{a}}$	1st	The B^{10} (n, $\alpha_1\gamma$) cross section (separate α_0 and α_1)
$\sigma_{n,\bar{a}g}$	$E_g^- = 480$ keV	The B^{10} (n, $\alpha_1\gamma$) cross section (detect the 480-keV γ)
Tot \bar{g} Prod	$\sigma(\theta_g^-)$ $\sigma(E_g^-)$ $\sigma(\theta_g^-, E_g^-)$ $\sigma(55^\circ, E_g^-)$ $\sigma(90^\circ, E_g^-)$	Total γ -ray production cross section, including all processes such as inelastic, radiative capture, (n,p), (n, α), (n,2n), (n,f), etc.
$\sigma_{n,n'}(\bar{g}'s)$	$\sigma(\theta_g^-)$	A specific γ (or γ 's) which is uniquely identified with inelastic scattering
$\sigma_{n,n'}(\bar{g}_1)$	$\sigma(\theta_g^-)$	A discrete γ -ray associated with the deexcitation of the first excited state of the target. In most cases of interest, the excitation and deexcitation cross sections are identical.

TABLE 1. (cont.)

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
Absorption		Usually specified as $\sigma_{n,\gamma} + \sigma_{n,f}$ but here includes $\sigma_{n,p} + \sigma_{n,d}$
$\sigma_{\text{abs}} - \sigma_{n,f}$	no n exit	$\sigma_{n,p} + \sigma_{n,d} + \text{etc.}$
Destruct	of target	All cross sections in which the target is consumed
$\sigma_{n,f}$		Cross section for all processes accompanied by fission
$\sigma_{n,f}$ Ratio	wrt H, B ¹⁰	The fission cross section ratio to hydrogen scattering or B ¹⁰ as the reference standard
Fis Ratio	wrt U ²³⁵	Ratio measurements of fission cross section relative to U ²³⁵
Fis Ratio	wrt Pu ²³⁹	Ratio measurements of fission cross section relative to Pu ²³⁹
$\sigma_{n,f} + \sigma_{n,g}$	at 77° K	Absorption cross section averaged over a spectrum represented by a Maxwellian with temperature 77° K
Eta		Number of neutrons per nonelastic collision
Alpha		Ratio of the capture to fission cross section
Nu Bar		Average number of fission neutrons emitted per fission
Nu Bar	Prompt	Average number of prompt fission neutrons per fission
Nu Bar	Delayed	Average number of delayed fission neutrons per fission
Fis. Spect	$P(E_n,)$	Energy spectrum of the fission neutrons produced by fission
Cap Spect	$P(E_g-)$	Energy spectrum of the γ 's produced in radiative capture
Prompt n Y	$P(E_n,)$	Energy spectrum of the prompt neutrons
Delayd n Y	$P(E_n,)$	Energy spectrum of the delayed neutrons

TABLE 1. (cont.)

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
Fis n Y	$P(E_n)$	Energy spectrum of the fission neutrons (prompt plus delayed)
Tot f Y		Total fission yield
Prompt f Y		Prompt fission yield
Delayd f Y		Delayed fission yield
Fis \bar{g} Y	$P(E_g^-)$	Fission gamma spectrum (total)
Prompt \bar{g} Y	$P(E_g^-)$	Prompt gamma spectrum
Delayd \bar{g} Y	$P(E_g^-)$	Delayed gamma spectrum
Delayd \bar{g} Y	$P(E_g^-, T^{1/2})$	Time dependent delayed gamma spectrum
Fis Prod Y	of Xe^{135}	Average number of Xe^{135} produced per fission
Fis Prod Y	of Cs^{137}	Average number of Cs^{137} produced per fission
Fis Prod Y	of Nd^{147}	Average number of Nd^{147} produced per fission
Fis Prod Y	of Sm^{149}	Average number of Sm^{149} produced per fission
Polariz	$P(\theta_n)$	Vector polarization produced in neutron elastic scattering
Res Par		All resonance parameters
Res Int		Resonance Integral
Res Int	Capture	Resonance radiative capture integral
J, π		Spin and parity
\bar{G}		Total level width

TABLE 1. (cont.)

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
\bar{G}_n		Neutron level width
\bar{G}_f		Fission level width
\bar{G}_g		Radiative capture level width
\bar{G}_p		Proton level width
\bar{G}_a		Alpha level width
\bar{G}_n and \bar{G}_g		Neutron and radiative capture widths
\bar{G}_f and \bar{G}_n		Fission and neutron widths
\bar{G}_g and \bar{G}_f		Radiative capture and fission widths
<u>B. PROTONS INCIDENT</u>		
$\sigma_{p,n}$		Cross section for the (p,n) reaction
$\sigma_{p,\bar{a}}$		Cross section for the (p, α) reaction
$\sigma_{p,n'p}$		Cross section for the (p,n'p) reaction
(p,p')Li ⁶	d + \bar{a}	Li ⁶ (p,p')Li ^{6*} reaction which decays via (d + α)
(p,d)Be ⁸	2 \bar{a} decay	Be ⁹ (p,d)Be ⁸ reaction which decays via 2 α

TABLE 1. (cont.)

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
<u>C. DEUTERONS INCIDENT</u>		
$\sigma_{d,n}$		Cross section for the (d,n) reaction
$\sigma_{d,n}$	$\text{He}^3 + \bar{a}$	$\text{Li}^6(d,n)\text{Be}^7$ reaction which decays via $(\text{He}^3 + \alpha)$
$\sigma_{d,p}$		Cross section for the (d,p) reaction
$\sigma_{d,p}$	$t + \bar{a}$	$\text{Li}^6(d,p)\text{Li}^7$ reaction which decays via $(t + \alpha)$
$\sigma_{d,n'p}$		Cross section for the (d,n'p) reaction
$\sigma_{d,a}$		Cross section for the (d, α) reaction
$(d,d')\text{Li}^{6*}$	$d + \bar{a}$	$\text{Li}^6(d,d')\text{Li}^{6*}$ reaction which decays via $(d + \alpha)$
<u>D. TRITONS INCIDENT</u>		
t,d		Cross section for the (t,d) reaction
$t,2n$		Cross section for the (t,2n) reaction
$(t,p)\text{Li}^8$	$\bar{b}^- \rightarrow 2\bar{a}$	$\text{Li}^6(t,p)\text{Li}^8$ reaction which β^- decays to Be^8 and then 2α 's are emitted
$(t,n)\text{Be}^8$	$2\bar{a}$ decay	$\text{Li}^6(t,n)\text{Be}^8$ reaction where 2α 's are emitted promptly

TABLE 1. (cont.)

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
<u>E. He's INCIDENT</u>		
${}^3\text{He}, p$		Cross section for the (${}^3\text{He}, p$) reaction
$({}^3\text{He}, p)$	$2\bar{a}$ decay	$\text{Li}^6({}^3\text{He}, p)$ reaction which leads to the emission of 2α 's
$({}^3\text{He}, d)$		Cross section for the (${}^3\text{He}, d$) reaction
$({}^3\text{He}, n)\text{B}^8$	$\bar{b}^+ \rightarrow 2\bar{a}$	$\text{Li}^6({}^3\text{He}, n)\text{B}^8$ reaction which β^+ decays to Be^8 and then 2α 's are emitted
<u>F. α's INCIDENT</u>		
$\sigma_{\bar{a}, n}^-$		Cross section for the (α, n) reaction
$\sigma_{\bar{a}, p}^-$		Cross section for the (α, p) reaction
$(\bar{a}, \bar{a}')\text{Li}^{6*}$	$d + \bar{a}$	$\text{Li}^6(\alpha, \alpha')\text{Li}^{6*}$ reaction which decays by $(d + \alpha)$
<u>G. Li^6 PARTICLES INCIDENT</u>		
${}^6\text{Li} + {}^6\text{Li} \rightarrow$	${}^7\text{Be} + {}^4\text{He} + n$	Cross section for the production of Be^7 , α , and n

TABLE 3. MEDIUM ENERGY REQUESTS

<u>Reaction</u>	<u>Variables Allowed</u>	<u>Definition</u>
Tot p Reac		Total reaction cross section for incident protons
$\sigma_{p,x}$	$\sigma(E_x)$	Cross section for the emission of a charged-particle, x, where x is one of many charged particles allowed
σ_{p, Li^6}		Cross section for Li^6 production due to incident protons
$\sigma_{p,A=19}$		Cross section for the production of mass 19 particles
$\sigma_{p,kny}$	$\sigma(\theta_n, E_n)$	Angle and energy dependence of the neutrons produced by protons incident, k is the neutron multiplicity, and y is the remaining particle or particles
$\sigma_{p,kpy}$	$\sigma(\theta_p, E_p)$	Angle and energy dependence of the protons produced by protons incident, k is the proton multiplicity, and y is the remaining particle or particles
$\sigma_{\alpha,kny}^-$	$\sigma(\theta_n, E_n)$	Angle and energy dependence of the neutrons produced by α 's incident, k is the neutron multiplicity, and y is the remaining particle or particles
$\sigma_{\alpha,k\pi^\pm y}^-$	$\sigma(\theta_\pi, E_\pi)$	Angle and energy dependence of the pions produced by α 's incident, k is the pion multiplicity, and y is the remaining particle or particles
$\sigma_{\alpha,x}^-$	$\sigma(E_x)$	Cross section for the emission of a charged particle, x, where x is one of many charged particles allowed
