FISSION CROSS SECTION OF ^{243}Cm
FROM THE UNDERGROUND NUCLEAR EXPLOSION, PHYSICS-8

Table of Values

by

M. G. Silbert

ABSTRACT

The neutron-induced fission cross section of ^{243}Cm was measured from 15 eV to 3 MeV in a time-of-flight experiment which used the intense, single-pulse neutron source provided by the underground nuclear explosion Physics-8 and a 240-m, evacuated flight path. The cross section reported here has been channelized into $1\ \mu\text{s}$ bins. Typical uncertainties for each data point are $\pm 10\%$ nonsystematic and $\pm 10\%$ systematic.

A number of neutron time-of-flight cross-section measurements were carried out during the Physics-8 underground nuclear explosion. These measurements were made on an elaborate experimental tower situated at ground level above the explosive, which was buried at a depth of 240 m. This report presents the fission cross section measured for ^{243}Cm over the neutron energy range 15 eV to 3 MeV. This nuclide is of special interest as its fission cross section was heretofore known only poorly and in limited energy regions.

Experimental techniques employed for cross-section measurement using a nuclear explosion source have been described in detail elsewhere.¹ To summarize, a thin sample of ^{243}Cm in a well-collimated neutron beam was viewed by silicon semiconductor detectors which responded to the emitted fission fragments. Similar detectors and thin samples of ^6LiF or ^{235}U provided a measurement of the neutron flux. To furnish a background signal, detectors viewed a bare sample backing at a different position in the neutron beam.

The 210- μg Cm sample was deposited on 4- μm -thick stainless steel; it contained 89% ^{243}Cm , 11% ^{244}Cm , and traces of $^{242},^{245},^{246}\text{Cm}$, and $^{239},^{240}\text{Pu}$. The sample was prepared and assayed at the Lawrence Livermore Laboratory.

The fission cross section presented in Table I derives from a single detector oriented at 90° to the neutron beam. The ^{243}Cm cross section has been normalized to the areas (14.0 and 23.7 b-eV, respectively) of the fission resonances at 22.85 and 34.99 eV in ^{244}Cm . These areas were measured by Moore and Keyworth² simultaneously with the present measurement and were visible in the ^{243}Cm signal. Table I lists the values of neutron energy E, fission cross section S, and nonsystematic fractional uncertainty (standard deviation) DS/S. In addition to the listed uncertainties, there is a systematic uncertainty of $\pm 10\%$ in the cross section which is dominated by the normalization error.

A formal report of this measurement, to include an analysis of the resonance structure in the region 15 to 80 eV, is being prepared.³

ACKNOWLEDGMENTS

I am indebted to many people who were involved in the complex measurements made with the underground explosion source. Special thanks are extended to R. W. Lougheed, J. E. Evans, and R. W. Hoff of the Lawrence Livermore Laboratory of the University of California, who prepared and assayed

the ^{243}Cm sample. I thank P. A. Seeger for data reduction and G. A. Keyworth and M. S. Moore for valuable discussions. R. R. Fullwood and J. H. McNally were responsible for the initial stages of this measurement.
