# Capture Cross Section of $^{238}\text{Pu}$ from Persimmon. Tabulation of Values

by

M. G. Silbert

CAPTURE CROSS SECTION OF  $^{238}\text{Pu}$  FROM PERSIMMON, TABULATION OF VALUES

by

M. G. Silbert

ABSTRACT

The capture cross section of  $^{238}\text{Pu}$ , measured on the Persimmon nuclear explosion experiment, is presented in tabular form over the energy region from 18 eV to 200 keV.

---

The neutron cross-section measurements carried out in conjunction with the Persimmon nuclear explosion included thin and thick samples of  $^{238}\text{Pu}$ . Fission fragment detectors at the thin sample measured the fission cross section of  $^{238}\text{Pu}$ . Moxon-Rae (M-R) gamma-ray detectors at the thick sample measured the gamma-ray output, which was proportional to a sum of the fission and capture cross sections of  $^{238}\text{Pu}$ . Subtraction of the fission contribution from the M-R signal yielded a measurement of the neutron radiative capture cross section.

Reference 1 is a formal report of the measurements and includes experimental details. Table I below presents the cross section in point-wise form, each point representing a time (neutron energy) channel in the time-of-flight experiment. Table I lists the neutron energy, E, in electron volts, the capture cross section, S, in barns, and the fractional uncertainty (standard deviation) of the cross section.

REFERENCE
