THE ENCYCLOPEDIA AMERICANA

Municipal Accounting may be termed a by-product of increasing municipal activity. This began with what is commonly known as the industrial revolution. The establishment of the factory system, the abandoning of home production or the "domestic system," the drift of population away from country estates and agricultural employment, the increased need for making provision for the health, comfort, convenience, and for the social order of crowded settlements and fast growing cities have forced on local government activities which have made its officers responsible agents for great business corporations. Within a few decades the small trading towns on the coast and inland lines of transportation in England and continental Europe had grown from mere villages, or a collection of villages, to the proportions of cities; and the proper administration of government came to involve expenditures of millions where before only hundreds or thousands of public revenues were required. In the borough or the town the officer had immediate contact with every detail of public expense and his own experience was sufficient guide to administrative control. Increase in municipal functions forced him to rely on employees and agents, and he soon came to be dependent on them for a knowledge of details; an understanding of the financial transactions of the larger community could be had only through a well devised system of accounts.

Accounting is a method of collecting, classifying and co-ordinating the financial data pertaining to an enterprise, public or private. As a method of collection, accountancy attempts to make a complete record of financial transactions; as a method of classification it aims to assign accurately each financial fact to an administrative department or category to which it properly belongs; as a means of final co-ordination its object is to finally bring all the data to a single subject of account into form for a complete understanding of related details. Thus by process of original record and restatement, not only does a system of accounts give a complete history of the business as a whole but also a chronological, as well as summarized, statement of transactions pertaining to each administrative interest; and, through final summaries, exact knowledge may be brought to the attention of the administrator of every relation that is important in the management of affairs. Judged, therefore, both from its methods and from its results, accountancy has come to be a true science of financial record — a science which is fundamental to controlling judgment, both with respect to past operation, and as pertaining to provisions to be made for the future, in enterprises that are too large for the personal contact of a single head.

In the development of methods which will properly record financial transactions and reduce these records to reliable statistical statements, accounting has followed all the transformations of business itself. With each advance in complexity, and with each widening of the scope of enterprise the adoption of an improved system of records which will insure authentic results have been imperative. Private concerns have been able to survive under such conditions only that those in control may have a complete mastery over details. When intelligent direction has become impossible the private institution has failed and its business has passed to its competitors. Scientific accounting methods were first worked out in private life as a matter of survival. The public corporation, however, has not been subject to this law. Peace and social order must be preserved at any cost; public health must be protected; public convenience has commanded service of the government as the only institution which could properly represent the public welfare. The government could not die and the corporation, empowered with governing activities, has been allowed to pass on from generation to generation inheriting methods which were inaugurated under conditions that required little or no provision made for authentic record of official conduct.

Analogy with private business may still further illustrate present conditions of municipal accounts. From primitive to modern accounting there have been three steps, namely: A system of partial accounting and two systems of com-

plete accounting. The two systems of complete accounting are commonly known as "Single Entry" and "Double Entry." Of these two last named, Single Entry is the more primitive. Single entry accounts attempt to make a complete record of transactions, but in classification the financial data are finally co-ordinated around proprietary interests only. Single entry accounts attempt to state proprietary assets and proprietary liabilities, but do not record anything with respect to current business operation. In these, under the single entry system, profits are arrived at through balancing off appraised valuation of assets against liabilities. No attempt is made to show current operations and no account is taken of earnings and expense. With the introduction of highly complicated and highly centralized industrial and commercial organization, under corporate control, most of the administrative problems came to be centred in operation — hence the necessity for the introduction of other accounts for the purposes of final classification. To provide such information the "Double Entry" system was devised. Under such an accounting plan not only may the cost of each article of product be determined, as a guide to estimating profit in price making on each particular sale, but the results in net earning of the gross business may be accurately determined from the books without inventory and valuation of assets and the closing of accounts representing proprietary assets and liabilities.

The public corporation and enterprises conducted by the government have been less fortunate in the development of methods which would show expenses (or cost of administration), revenue (or current income), transactions with respect to corporate properties, and liabilities outstanding. Municipal accounting has developed not as a condition necessary to survival but in response to a public demand for municipal reform. This movement first began in Europe and has reached its highest development in Great Britain where scientific accountancy had become first established as a necessary means of administrative control over large private undertakings. For public protection, the established methods of accounting were first applied to joint stock companies. Among the first Acts directed toward this end were those following railway speculation in the fourth and fifth decades of the century just closed. The abuses which had grown out of this character of promotion and the failures which had followed the absence of a strict financial control were the reasons for the enactment of the Companies Clauses Consolidation Act (8 Vict., c. 16). Under the provisions of this Act, auditors were to be appointed by the stockholders of corporations at their regular meeting, and these auditors were empowered to employ accountants to assist them in making special reports or in confirming the reports prepared by the officers themselves for the information of stockholders. The reports of auditors so appointed were to include a certificate as to the correctness of the balance sheet, in which was to be set forth the capital stock and credit liabilities, the accounts due to the company and the properties of every description. They were also to give a "distinct view of the profit and loss which shall have arisen in the transactions of the Company in the course of the preceding half year." It was further provided that no dividends should be declared except out of profits and that dividends should never be apportioned to stockholders when this would result in the impairment of capital resources. Gradually statutory provisions requiring appointment of auditors either by the stockholders of companies at their regular meetings or by the Board of Trade were extended to include public gasworks, public waterworks, commercial banking companies, savings banks, university and college estates, judicial trustees, county officers, etc. In the movement toward political reform a Local Government Board was finally created (1871) which would force upon all of the County Councils, Municipal Corporations, and Town Councils (except those of the larger cities) a uniform system of accounts, complete audits of account, and reports to the government of the financial operation as well as financial condition of local governing bodies. The same spirit of reform and the same necessity for providing a system which would furnish exact knowledge of details and summaries of results as a means of better administrative direction and control, induced the larger municipalities to employ professional accountants to instal improved systems of financial record and to audit their accounts periodically.

As it was in Great Britain that modern industry first found its highest development, so it was there that accountancy was first raised to the plane and dignity of a profession. The "Companies' Acts" and supplementary legislation requiring the appointment of independent auditors contributed much to the development of the science by making its requirements general in the management of large affairs. Instead of leaving the science to be slowly evolved by a process of natural selection of methods, the several Acts of Parliament, making audits and reports compulsory, immediately brought the talents of thousands to the task of specialization in this field. When the Local Government Board was organized, in 1871, the London Institute of Chartered Accountants (a chartered body of professional accountants) had already been in existence nearly twenty years and similar professional bodies had been organized among the accountants of Scotland and Ireland. The application of accounting methods to English municipal governments, therefore, was a comparatively easy task. The public corporation had grown too large for the effective use of partial and primitive systems of financial record; these had long since failed to serve the public administrative need. When English accountants were asked to turn their talent to municipal work they had simply to apply the principles and methods of scientific accounting to which they had long been accustomed (in the classification of financial data of gas companies, water companies, railways, and the large industrial and commercial corporations, making such changes only as were made necessary by the public character of the enterprise.

Theretofore municipal accounts had been little more than cash book entries and treasury statements; the efforts of local communities had been directed toward holding the officers of government to strict account in the handling of public funds. The first efforts toward reform were for the protection of the taxpayer against fraud and misappropriation. To this end a strict account of receipts and disbursements had

been required and the accounts and reports of municipalities were little more than detailed or classified statements of the public treasury. When, however, municipal functions had become multiplied and municipal activities had grown too complex to allow of an intelligent grasp of details by those in control, the futility of the cash book system became apparent. From the best records that might be made and the best summaries deducible from records of the flow of cash no notion might be had of the real problems of administration. What the officer would know and what the taxpayer was primarily interested in as a matter of strict economy was the current cost of government and the current revenue provisions to meet this cost. It was also necessary to have a complete accounting for the various properties belonging to the city (other than cash) and a complete statement of credit obligations. None of these results could be obtained from a record of receipts and disbursements. The municipalities had been using a system of partial account only, and the larger problems of financial administration which confronted them demanded not only a system of complete financial account but also one which would show both municipal operative results and transactions pertaining to municipal assets and liabilities — that is, a complete double entry system.

Applying the principles and the methods to which they were accustomed in the analysis of financial data and final summarization of accounts for the railway and other large private corporations accountants found that the categories necessary to show costs of administration were almost identical with what they had been accustomed to set up as the expense account of private undertakings; and in lieu of earnings in private accounts a statement must be made of current revenues accruing to meet expense incurred. The net result of these two classes of accounts would show revenue surplus and revenue deficit of the municipality for the year, or other period stated, instead of net earnings. In other words, these two classes of accounts exhibit the true financial results of municipal operation for the year, but none of the data collected in either class had any reference to cash receipts or cash disbursements. Under the double entry system, when an expense was incurred it was at once set up in its proper classification both as an expense and as a current liability of the city. The cash payment when finally made had no reference to the expense but simply operated to reduce amount of current liabilities and to correspondingly decrease the cash assets of the treasurer. On the other hand, revenues were spread upon the books as soon as they accrued and became payable; of these a double entry was made, first in a proper revenue account, and second as a current asset. Payment of revenue into the treasury or cash received did not in any manner affect the revenue account but operated to reduce an assets receivable account and to increase the amount of cash in the treasury.

While modern systems of accounting take no notice of the flow of cash as a means of showing the results of operation in net earnings or in revenue surplus or revenue deficit, receipts and disbursements become an important exhibit in those accounts intended to portray financial condition. These accounts are those ultimately collected in the balance sheet and are sometimes referred to as proprietary accounts to distinguish them from those designed to show results from operation. Municipal properties and municipal liabilities can be affected in only four ways: (1) They may be increased or decreased by cash transactions; (2) they may be increased or decreased by credit transactions; .(3) assets may be decreased by depreciation and liabilities may be increased by reserves set up to cover depreciation; and (4) assets may be decreased by loss of property or the liabilities may be increased by reserves set up to cover loss. To give a true picture, therefore, of transactions pertaining to proprietary assets and liabilities and as a means of holding officers to strict account, summaries must be shown representing present financial condition, and exhibits must be made which will properly set out the transactions of cash and credit, as well as the reserves or provision made to cover depreciation or loss, through which the changes in proprietary accounts have been affected. It is as a means of illuminating the cash assets account and of giving assurance as to the correctness of cash balances represented, only, that exhibits of receipts and disbursements are important.

Under the English system of municipal accounting the assets and liabilities or the accounts which are finally stated and summarized in the balance sheet are again divided into two classes, viz.: (1) Those showing current and contingent assets and liabilities and (2) those which show transactions and the final result of transactions pertaining to the permanent properties and the funded debt of municipalities. The latter of these two classes is set up in their reports as capital accounts. A statement of cash receipts and disbursements (or of transactions of the municipal treasury) with respect to these two classes of properties and liabilities is also distinguished. Cash receipts and disbursements which pertain to or affect current assets and liabilities are called ordinary, while those which pertain to or affect capital accounts are denominated extraordinary. These terms, however, pertain to no other class of accounts than cash and have no real significance in exhibits other than detailed or classified statements of receipts and disbursements.

In America, accounting ideals long languished and financial records were retained in innocent simplicity and primitive confusion long after the science had become well established in England and Scotland. During the period that accountancy was being erected on the high plane of a profession in Europe, commerce and industry were on the Western Continent first beginning to feel the need for a method which would insure integrity of summaries of financial results. Till the middle of the 19th century America was a highly individualistic agricultural community. The American farmer needed no accounts other than a simple statement of cash receipts and payment and a memorandum of credit obligations. Before 1830 the bank was about the only enterprise of large capital and its transactions were treated as cash. In 1820 the city population of the United States was only 4.93 per cent and there were only 13 cities having a population over 8,000. The census of 1850 showed an urban population of only 12.49 per cent; at this time the American Transportation Company was about the only concern

whose volume of business and breadth of organization demanded a modern method of account. And it has been in the railway service that most of the American accountants have received their training.

After the Civil War, industrial and commercial enterprises came to take so prominent a place in our national life that the current of population set strongly toward the city and a process of centralization was begun similar to that felt by Great Britain about a century before. In 1900, about one half of our population was found by the census takers in large cities, and, in the most highly industrial portion, namely, the North Atlantic Division, only 31.8 per cent remained in rural employment. The sudden development of the municipalities, the hopeless chaos in municipal administration, the known mal-practice in public office, and the abortive attempts on the part of honest officials to locate responsibilities as well as protect themselves against the suspicion of corruption which the public had come to entertain toward all those connected with local government (as a result of the peculations of the few and of the organized political plunder to which the public treasury was subject) have within the last two decades raised up a universal demand for municipal reform which has brought the combined intelligence of honest citizenship to the solution of the means necessary to its accomplishment. In America, as in England and in continental Europe, attention was first called to attacks on the public treasury and to the subversion of public funds to private use. As a means of protecting the taxpayer against the misapplication of cash received, the first step toward reform was the creation and election of independent treasury officials and the publication of detailed treasury reports. These have served as a protection against fraudulent inroads on the treasury, but have done much to confuse ideals of municipal accounting with statements of receipts and disbursements.

The need for a system of complete accounting in American municipalities as a first premise to municipal reform has in recent years been enlarged on by many, but by none has it been more forcefully expressed than by Nathan Matthews, Jr., of Boston, who was elected mayor of that city in 1891. Boston at that time was better equipped, perhaps, than any other American city for furnishing the kind of data needed for an intelligent administration, yet Mr. Matthews in his first report calls the attention of the people to their helplessness in the following language:

> Called to the chief magistracy of the city without previous service in the government and believing that the first duty of a public officer charged with the disbursement of millions of dollars of public moneys was to search the printed reports of the city government for accounts that would show the cost from year to year, of equipping and of maintaining the various departments of municipal service, I was amazed to discover that practically there was none. I have in consequence been obliged to devote an inordinate amount of time to the work of securing this information and of arranging it in convenient form for use, the time thus spent amounting to several hours per day for weeks at a stretch.

In this statement Mayor Matthews brought into strong contrast the cash account system and the needs of the administration for authentic statements and summaries of accounts which will show "the costs from year to year of equipping and of maintaining the various departments of municipal service" as well as the revenue provisions made by government for meeting this expense.

In many departments of our large cities even memoranda of account were found to be almost entirely lacking. The Comptroller of Chicago in his report (1897) points to the confusion in the Special Assessment Bureau as follows,

> Too severe criticism cannot be made upon the lack of system prevalent and the absolute neglect to post the books of accounts in the Special Assessment Bureau of the Department of Public Works in past administrations. It was discovered by this administration soon after it came into office that the books of account of that Bureau were more than five years unposted.

As late as 1901 the Fassett Commission investigating the accounting methods of the cities of the State of New York reported

> That the system of accounting in the several cities is more unintelligible and chaotic even than the laws under which the cities themselves are administered. . . . We believe that there can be no wise legislation with reference to the government of cities unless it be possible for the officers of the State, and especially for the Legislature and the Governor, to be able at all times to know with definiteness and certainty the facts relative to the general condition of municipal administration in each of the cities, and more particularly the exact financial situation in each and all of them.

The general awakening in America has not been without results. The city of Boston under the revised ordinance of 1898 empowered the City Auditor with the approval of the Mayor to designate expert accountants to examine the books and departments periodically. In a number of the States a movement has been inaugurated to create a board, or officer, of central control over municipalities and local governing bodies with powers similar to those enjoyed by the Local Government Board of Great Britain. The State of Ohio has recently enacted a complete Municipal Code which applies to the principal cities and towns of the State, giving them uniformity of administrative organization and which provides for a system of accounts that will show revenue and expense. The same law enacted a State Auditor or Comptroller of Municipal Accounts, with power to prescribe forms and to require reports which will insure accounting results. Other States have introduced uniformity in accounts for county and town organizations. Generally speaking, however, American municipalities and local governing bodies are still attempting to work out their administrative problems from the cash book and even in States where the law requires a statement of revenue and expenses, attempts are made to reach such a result through supplementary schedules, still making the treasury statement of receipts and disbursements the principal feature of their system. American municipal accounting officers have not yet risen to the dignity of professional accountants; few of them have such a knowledge of the principles and methods of accounting that they appreciate the futility of the cash book system. Even in cities like New York and Boston the cash book system is still retained. Their reports show little else than the flow of cash as exhibited in summaries of receipts and disbursements. Neither the officers of American cities in responsible positions, nor the taxpayers have any means of determining from such a system current expenses or annual cost of administration; no accurate statement may be made of revenue accruing to cover costs; there is no intelligent guide in making appropriations and no means of

ascertaining revenue surplus or revenue deficit; budgetary estimates as a basis for taxation, and statements of revenue and expenses as a guide to administration, are rendered impossible except through such process of rough approximation as that described by Mr. Matthews in his report to the citizens of Boston.

Chicago was the first large American city to adopt a system of accounts adequate to meet administrative needs. As shown in a paper recently read before the Detroit Conference of the National Municipal League (April 1903),

> Within fifty years Chicago had grown from a village to a municipality of two millions; it had begun with a small town organization, as its population and territorial jurisdiction had spread over the surrounding prairies and swamps, primitive local governments had been incorporated by consolidation rather than by process of readjustment and reorganization. . . . The City of Chicago had finally come to include more than twenty separate taxing jurisdictions, over which it had little control and between which there was no well defined method of co-operation for common ends; the financial side of the administration had become unmanageable and the government in all its activities was crippled. Recognition of this situation on the part both of citizens and of officers of administration was the first step towards reform. Citizen activity and discontent were in evidence on every side.

The Mayor and Council were alive both to the public demand and to the probable results of public censure in case their own incumbency was not relieved from suspicions which were sure to follow. As a result, Haskins and Sells, public accountants, were employed to devise and instal a complete system of accounts which would meet the administrative needs of the city. The general features of the new system adopted as a result of this employment closely follow that in use by the English municipalities. In each department and office is kept a complete record (or original entries) of all financial transactions pertaining thereto. These are finally collected in the Comptroller's office, and co-ordinated in final summaries of revenues and expense (or operative results) and assets and liabilities (or statements of financial condition). The important administrative features of this system are represented in detail in the report of the Comptroller for the year 1902, as follows: (1) Uniformity of accounting methods in all departments; (2) Concentration of accounting in the Comptroller's office; (3) Collection of all revenue by the City Collector; (4) Daily remittances; (5) Monthly reports to the Comptroller and monthly balances between the Comptroller and all departments; (6) Financial reports published monthly by the Comptroller; (7) The organization of an Audit Bureau and a methodical plan of auditing by officers and employes retained especially for that purpose independent of all departments; (8) Accrument of all revenues on the general books of the city where they stand as evidence of obligations due to the city until paid; (9) Approval of all contracts and requisitions for supplies by the Comptroller to prevent departments from incurring liabilities in excess of appropriations; (10) The issuance of all fiscal stationery, forms, and receipts, consecutively numbered by the Comptroller and holding the departments responsible for their use or cancellation; (11) The use of graduated stubs or coupon receipts for the collection of money; (12) The establishment of a complete chain of accounting from the inception of revenue and expense throughout the various branches of the city to the Comptroller's office, where all of the auditing is finally concentrated.

The administrative results of such a system are also set out in the same report. The installation was so managed so as not to interfere with the current business of the city; the work was simplified in such a manner that clerks of ordinary ability might perform the duties required; instead of making necessary an increased clerical force the annual administrative expense was reduced over $72,000; beside, the new system had "improved the efficiency of individual employees and promoted an intelligent and interested direction of their efforts by departmental heads." Another result of bringing revenues accrued prominently before the administration. There was an increase in cash collections of nearly $500,000 in miscellaneous revenues alone. It may be further noticed that in the report above referred to only a brief summary is made of cash receipts and disbursements, the books of the treasury and the audited voucher system of account being considered an adequate protection against official infidelity. The body of the Comptroller's report is devoted (1) to classified summaries and detailed exhibits of revenue and expense; and (2) to classified balance sheet summaries and detailed exhibits of municipal assets and liabilities.

Prominent among the many American societies which have taken a serious interest in municipal accounting reform, is the National Municipal League. This society was organized in 1894, and is composed of members and representatives of local reform organizations. In 1899 the League appointed a special committee to further the interest of uniform municipal accounting and statistics. The first task to which the committee put itself was to work out a classification of administrative interests and purposes which might serve as a basis for accounts and statistics. This classification was published in 1900, and formed a part of the "Municipal Program" of the League. The main interest of the committee being one of bringing the present accounts and reports of municipalities into such uniformity as would form a common basis for comparison, the classification and schedules adopted were applied by the committee to treasury accounts — or cash receipts and disbursements — only. As these schedules have been recognized and adopted by a large number of American municipalities and have been made the basis for the statement of treasury accounts a general outline is here set up.

RECEIPTS AND EXPENDITURES.

I. General Government.
- 1. Mayor — Office.
  - (a) Salary of Mayor.
  - (b) Other expenses of city executive.
- 2. Legislative.
  - (a) City Council.
  - (b) City Clerk.
- 3. Law Department.
- 4. Finance Department.
- 5. Bureau of Elections.
- 6. Public Printing.
- 7. Buildings not in other departments.
- 8. Registration.
- 9. Other general.

II. Protection of Life, Health and Property.
- 1. Police.
- 2. Fire Department.
- 3. Courts.
- 4. Jails, prisons and reformatories.
- 5. Health Department.
- 6. Cemeteries.
- 7. Building Department.

8. Militia and armories.
9. Miscellaneous.

III. PUBLIC CHARITY.
1. Hospitals.
2. Insane.
3. Houses for aged, deaf, dumb, blind, etc.
4. Almshouses and workhouses.
5. Lodging-houses.
6. Outdoor relief.
7. Miscellaneous.

IV. PUBLIC WORKS.
1. Administrative expenses.
2. Opening and grading streets.
3. Street paving.
4. Sidewalks.
5. Street cleaning.
6. Street sprinkling.
7. Street lighting.
8. Garbage collection and disposal.
9. Snow removal.
10. Sewers and sewage disposal.
11. Bridges.
12. Miscellaneous.

V. PUBLIC INDUSTRIES.
1. Waterworks.
2. Gasworks.
3. Electric light plants.
4. City real estate.
5. Markets.
6. Docks and wharves.
7. Transit subways.
8. Subways for pipes and wires.
9. Miscellaneous.

VI. PUBLIC EDUCATION, RECREATION AND ART
1. Schools.
2. Libraries.
3. Museums and art galleries.
4. Parks (*a*)
(*b*) Playgrounds.
(*c*) Gymnasia.
5. Baths.
6. Celebrations.
7. Miscellaneous.

VII. TRUST FUNDS.

VIII. MISCELLANEOUS.

IX. TAXATION.
1. Real property.
(*a*) Lands.
(*b*) Buildings.
2. Personal property.
3. Poll taxes.
4. Liquor licenses.
5. Franchise tax.
6. Receipts from franchise rights.
7. Special assessments.
(*a*) Street opening.
(*b*) Street paving.
(*c*) Sidewalks.
(*d*) Sewers.
(*e*) Other purposes.
8. Miscellaneous.

X. PUBLIC DEBT.
1. Interest.
2. Sinking fund.

XI. TOTALS OF RECEIPTS AND EXPENDITURES (TO THIS POINT).

XII. CASH BALANCES AT BEGINNING AND END OF FISCAL YEAR, RESPECTIVELY.

XIII. GRAND TOTALS OF BOTH SIDES OF THE ACCOUNT (BALANCED).

Having worked out a general classification of subjects of administrative interests, and having successfully applied these to the treasury accounts of American municipalities, the committee, under instructions from the National Municipal League, undertook to apply its schedules to the other controlling accounts and to report on a complete system of municipal accounting and statistics. For this purpose the double entry system was adopted and the detailed accounts were divided into two general classes, namely, (1) Operative Accounts, showing cost of municipal administration and municipal revenues accrued to meet the current expenses incurred, and (2) Proprietary Accounts, showing assets and liabilities. Thus, in general, they follow the plan adopted by the English municipalities and applied to this such a classification as a basis for co-ordination of financial items and details as are suited to American conditions. Recognizing the separate and independent organization of the office of Comptroller and the office of Treasurer under American municipal charters, separate outlines for reports by these two officers are planned, the report of the Comptroller to show all of the controlling accounts arranged in such manner as to exhibit a complete resumé of operations and financial conditions, the report of the Treasurer to exhibit the flow of cash and balances of cash on hand.

The awakened deep interest in municipal accounting is one of the most hopeful promises of permanent reform in municipal administration.

E. ALLEN FROST,
Formerly Deputy City Comptroller, Chicago.

Municipal Art Societies, organizations in the various large cities of the United States, devoted to the promotion of municipal art, and the making of the city beautiful. Among these organizations are the Municipal Art Societies of New York, Chicago, Cincinnati and Baltimore; the American Park and Out-Door Association; the Fairmount Park Association, etc. See ART, AMERICAN; PARK.

Municipal Debt. See DEBT; FINANCE, *Municipal.*

Municipal Government. Cities are centres of influence for good or ill. In industry, commerce, science, culture, thought, they lead the world and largely determine its destiny. If city populations are corrupt, immoral, illiterate, depraved, the whole nation is contaminated. If their government is a failure, the state is endangered, both because the cities have such a large proportion of the population and because the character of the whole country is so largely influenced by city conditions. New York city has a population greater than the 13 colonies when they broke away from Great Britain. Its wealth is 20 fold that of the United States when the Constitution was drafted. Its present annual expenditures are one fourth of those of the Federal government. Its net debt is one third of the national indebtedness, including the bonds still outstanding for the Civil War, and 30 fold the debt of New York State.

Growth of Cities.— Population is concentrating at a rapid rate. In 1900, there were 62 cities in the United States that had a population greater than New York in 1800. During the 19th century, the percentage of the population living in cities over 8,000 increased from 3.97 to 33.1. The number of such cities grew from 6 to 545, and their combined population from 210,873 to 24,992,199 — 118 fold; while the remainder of the country, including all towns below 8,000, grew from 5,097,610 to 50,485,268 — less than 10 fold.

The drift cityward is not confined to the United States. Every progressive country of the Eastern and Western hemispheres bears witness to the universal trend. In England and Wales, two thirds of the people live in cities over 8,000. In Prussia, Belgium and Holland the ratio is higher than in the United States; and in several other European and South American countries the proportion is nearly as large. The causes of urban growth are principally economic. The great improve-

ments in manufacture, mining, agriculture and transportation have made it possible for a larger and larger proportion of the population to turn to pursuits other than the extractive industries. Wants have multiplied with increasing wealth, and for their satisfaction, new industries have sprung up. Since nearly all industries outside of agriculture can be conducted better in populous centres than in rural localities, they have located in cities, and there the people connected with industry and commerce have concentrated. Others have been drawn cityward by social advantages — theatres, operas, libraries, schools, etc., for the cities are the centres of culture, art and science, as well as trade and industry.

Congestion of Population.— This increasing concentration signifies not merely the union of millions under one municipal government but, what is far more important, a congestion of population which has never been equaled. The steady reduction in the space allotted to each person and the piling of house upon house have brought within the confines of a single city block a larger number of persons than the whole population of some cities. According to the last census there were in the Eighth Assembly District of New York 72,125 persons. If the whole city were as densely populated, it would contain every man, woman and child in the United States, the Territories, all of the islands recently acquired and also Mexico and Canada — all of North America. Foreign cities do not have usually as many persons per unit of ground area as American cities; their buildings are not so high. London's densest quarter does not contain one half as many persons per square mile as the lower East Side of New York city. But there is great congestion and squalor in London, nevertheless.

From this congestion, the ceaseless contact of person with person, the great density, most of the problems of municipal government spring. Expensive health departments are not needed in the country; the individual protects himself against disease. Street paving and cleaning are simple problems. Each person looks after his own water supply, transportation, lighting, etc. Public service corporations cannot exist without thickly settled centres, and franchise questions do not perplex frontier districts. Home rule is not discussed. Even the village has a very simple form of government. In the city everything is changed. Elaborate health, fire, police, water supply and transportation systems are necessary. The citizen comes into too close and too constant contact with his fellows to be permitted to do as he pleases. There must be new laws, more administrative departments and a different form of government throughout. New problems arise, such as housing, home rule, public ownership and civil service — all of which, in ultimate analysis, find their origin in the great density of population.

City v. Country.— Although cities have existed ever since the dawn of authentic history, and although they have held at times absolute sway over the rest of humanity, the modern city is the outgrowth of the last century or of the last 150 years at the most. Down to the foundation of the Roman Empire, the city occupied the centre of the stage, dominating the country. During the Middle Ages, the country got the upper hand and kept it until the modern industrial era caused people to seek the towns and increased urban wealth and power in the commercial world by leaps and bounds. At the dawn of this era, wherever there was any sort of representative government, the rural communities controlled it, for the towns were small and not influential. As they grew in population and wealth, they naturally demanded a larger share in national affairs and more local autonomy. The country districts naturally were reluctant to grant either; and as they controlled the law-making power and the machinery for changing the constitution, they had their way. In England, the landed gentry and the "rotten boroughs" fought off all serious inroads into their power until the Reform Acts of 1832–5 were passed, and then a readjustment was achieved only through a revolution, although a peaceable one. On the Continent, the growing towns did not secure their fair share of influence until later. In certain countries they have not yet obtained it, and in the United States there are as extreme instances of high-handed domination of municipal affairs by country districts as existed in the 19th century anywhere. Of course, since cities grow so much more rapidly than the country, any system which apportions political power justly for the moment, must soon become obsolete. It is not this incidental injustice to which I refer, but to the deliberate refusal to give cities their fair representation in State affairs and to the constant intermeddling in matters which are purely local.

Rural Domination in the United States.— Only a few instances need be cited. In Connecticut, the State has been so gerrymandered that seven per cent of the population — rural districts — elect a majority to the House of Representatives. The 11 large manufacturing towns, containing one half of the population of the State, have 22 votes as compared with 233 votes held by the other half, the rural half of the State. No reapportionment in the House has been made since 1876, nor in the Senate since 1827. Even the moderate changes suggested by the constitutional convention of 1902, which still kept control in the hands of a few decaying, "rotten" rural districts, failed of adoption. In Rhode Island it is the same, and it is suggestive to note that these two commonwealths, among the oldest and most Puritanical of the original thirteen, are the most corrupt, depraved and debauched in political matters. This can not continue forever. The cities may not obtain the full share to which their population would entitle them, but they will compel the country to yield in the long run. The justice and equity of their demands must be recognized.

Home Rule for Cities.— The other half of the problem of the relation of city and State concerns the intrusion of the State into purely local matters, and here again history shows that this interference has been carried at times to the farthest extreme. The dispute between the king and the rural gentry was going on when the towns began to increase in wealth and population. The country had secured some degree of local autonomy, and its representatives had gotten some control over the law-making

authority. They objected to granting the towns a distinct local government, or, where this was done, insisted that the central government should have constant supervision. On the Continent, the general trend was to give the cities residuary powers, that is, to permit them to do anything which was not prohibited, but through the enactment of such laws, their powers were considerably curtailed. England started with frequent central interference in local matters, usually legislative and judicial, resulting in misgovernment, corruption and decreased efficiency in central administration. The report of the Commission on Municipal Corporations for 1835, reads like a description of recent American conditions. The Continent started with greater liberty, subject to administrative supervision, which was adopted in England in 1834 and since has been extended and substituted for legislative interference, which worked so badly. Thus, insular and continental Europe have been approaching the same goal, that is, a general grant of power and form of government, with local autonomy, subject to central administrative control, such as the approval of municipal loans and certain ordinances by the Local Government Board, the audit of accounts by the same authority and the inspection of police departments by the inspectors of the Secretary of State.

State Interference in the United States.— The experience of the United States shows the same tendency; and although no State has gone so far as England, France or Prussia, a beginning has been made. A brief outline must suffice. The first city charters, whether from the English crown, the colonial authorities or the early State legislatures, defined in few words the powers, duties and form of government. Particular attention was paid to financial powers and methods of selecting officials. The authority granting the charter frequently controlled these with a strong hand. For example, annual acts authorizing New York city to assess taxes were necessary down to 1874. The mayor was appointed by the governor until 1821. Up to the middle of the century, ordinances remained in force only for a limited time (three months to three years) unless approved by the colonial or State authorities. Boston did not receive a city charter until 1822. As the cities increased in size and wealth, a more elaborate system of government was necessary, and the States undertook to regulate in detail every minor as well as every major point. These provisions needed alteration from time to time, and the only recourse was to special acts of the legislature, which grew rapidly in number and scope. The distrust of city governments, due to the corruption and inefficiency so prevalent after the middle of the century, was a contributing cause, for the restriction of functions and the removal of discretionary power was thought to be a method of remedying the prevalent evils. Even the reformers themselves fled to the State capitols for legislation in preference to fighting out the battle locally.

Special Legislation.— Wherever these conditions existed, there appeared a mass of special legislation. In the 10 years from 1880 to 1889, the Fassett Legislative Committee reported that 1,284 acts were passed by the New York State legislature affecting the government of cities; nearly one half related to the three cities now combined in Greater New York. Other States show equally bad conditions. Legislatures have constantly interfered to the extent of abolishing or creating offices, altering salaries, ordering streets to be paved, forcing the city to pay claims which were groundless, compelling the construction of unnecessary buildings, etc. The evils of State interference are important. Responsibility cannot be fixed; or if it is traced to the State legislature, this body cannot be reached, for only a small proportion of its members is elected in the city concerned. Indifference is encouraged, and city affairs are left to those who make profit from governmental prerogatives. Due consideration cannot be given to local matters, and State legislators are not sufficiently acquainted with the needs of localities, other than their own, to act intelligently. Questions are decided by log-rolling and personal favor, or a city's interests are made the football of State politics. No continuity is possible in municipal policy. The State, too, suffers, for matters of general interest often are sidetracked to let pass some little bill in which a constituent of Senator —— is personally (and often financially) interested. These injurious effects have been recognized for many years, and various remedies have been tried or suggested. The one most frequently adopted is the enactment of constitutional provisions prohibiting special legislation upon municipal matters. This method by itself has not been effective, for the courts have so interpreted "special legislation" and "municipal matters" that State interference has often continued uninterrupted. (*Vide* court decisions in Ohio prior to 1902.) The difficulty has been that each locality has peculiar needs and that no charter which goes into great detail will suit all cities; neither will it continue to be satisfactory without amendment for any length of time. Further, the State must have some sort of control over local governments; they cannot be permitted to become wholly independent; the State must supervise all matters other than those of mere local interest. But the field of local affairs has not clearly been delimited, and as long as this is the case there must be confusion and bad administration.

Administrative Control.— The best results have been attained where there is a general act of incorporation for all cities (or all cities of the same general size), or if there be a charter for each city, where it is general in character, the minor details being left to the city to determine, and to be altered locally as conditions change. There should be central *administrative* supervision instead of legislative interference, and although great progress has not been made in this direction in the United States, it has been tried sufficiently to show clearly that it would be as successful here as it has been in Europe. Such a system would improve the character of our laws by enabling legislators to give more attention to State matters, would fix responsibility for inefficiency, would arouse interest in local affairs by placing the fate of the city in its own hands, would tend to separate State from local politics and leave each to be settled upon its own merits, and would refer administrative questions to administrative departments with their staff of experts and abundant experience whereby to reach a wise decision. Just where the line is to be drawn between local and

State matters is a difficult problem, and there is a strong tendency toward the centralization of certain functions, such as education and poor relief. But so far as these matters have been transferred to the State with beneficial results, it has been where there is no important local benefit, where there is not a great diversity of opinion among localities, where there is unity as to the methods to be adopted, and where the function is general and not limited to a few localities. Until these stages are reached, the State should control, but not administer, and the extent of this control should vary with the State's interest. In no case is it pardonable for the State regularly to appoint local officers. If the function is a local function and if the expense is borne locally, the State should not interfere, except possibly to remove an officer who has been proved to be guilty of malfeasance, or to appoint when a locality refuses to perform the duties imposed by the State. The trouble has been that the municipality is an agent of the State and also the means of satisfying local needs. Hence, it is necessary to determine whether a function is local or State, or partly local and partly State, and to frame the proper system of supervision or control accordingly. This brings us to a consideration of the scope of municipal activity as recognized by practice.

Municipal Functions.— From the legal standpoint, the municipality in Great Britain and America can do only what it is authorized to do by the central government, and grants of powers are strictly construed. In Prussia and France, and quite generally upon the continent of Europe, the municipalities have residuary powers. In law the difference is not so great as one might expect from the divergence in theory, and when comparison is made between actual operations, instead of the powers which *may* be exercised, England and Germany stand side by side. In these two countries, the local governments have a greater range of activities than in ony other countries in the world. Beginning with the protection of life and property, the function most generally performed by municipal governments, it is found that in all progressive countries, there are well equipped police, fire, health and judicial departments. These are not universally under the complete control of the municipal authorities, for in some cities, generally national capitals (for example, London, Paris, Berlin, and Vienna), the police force is wholly administered by the central government. In several American cities (for example, St. Louis, Baltimore, and Boston), the police authorities are appointed by the State. In practically all countries except the United States, the central governments supervise local police administration on the ground that the preservation of life and property is not of mere local interest but concerns the whole country. The same is true of the local judiciary, and to a less extent of fire and health, State supervision in the latter cases being much less extensive than in police and judicial administration.

The care of the dependent and delinquent classes is a recognized governmental function in all progressive countries, but the extent of municipal activity varies greatly. In Great Britain, the poor-law authorities are entirely independent of the town governments. Generally in the United States, especially in the smaller cities, poor-relief is granted by the county authorities, and subsidies to private institutions are made by most of the large cities. In France, Germany and the other principal countries of Europe, the cities generally have control, subject to supervision by the central governments. Everywhere municipal activity is supplemented by private and ecclesiastical charity, especially in the case of homes for dependent children and hospitals. German cities show the greatest amount of municipal action in this direction and English cities the least. The insane, owing to the comparatively small number in each locality and the economy of large asylums, are generally cared for by other than municipal authorities — State, department, or provincial authorities, as the case may be. For persons who are near the border line between dependence and self-support, there are many instances of municipal lodging-houses, either free or charging a small fee, and labor bureaus to provide employment for the unemployed. These are far more common in Europe than in the United States. A few cities have gone so far as to establish schemes for employment insurance and to rent land in small allotments to the poorer classes for truck farms.

Educational facilities are also generally under municipal control, but central supervision is usually more thorough and far-reaching than in the case of charity administration. Since the recent act in England abolishing the school boards was passed, elementary education almost everywhere is a municipal function. Secondary education is more generally left to private or church management, except in the United States where it has been municipalized, or in Germany where it belongs frequently to higher governmental authorities. As one goes higher and higher in educational work, the activity of city governments decreases. In recent years, the broadening conception of education has introduced trade schools, but there are few of these under municipal control in the United States, while in Europe they are very common, although in the smaller countries particularly, the central government often contributes to their support. Public libraries are more common in America than elsewhere. In Europe there are fewer private donations. The public treasury bears most of the burden, and there is hardly a town of importance that does not have a municipal library. On the Continent they are mostly scholars' libraries which are not frequented by the general public, as is so generally the case in the United States. Municipal museums of art and science are more common in Europe and are visited by large numbers. Theatres and opera houses are also frequently maintained by foreign cities, but of course they are not free like museums and libraries. The prices charged, however, are often very low. American cities sometimes provide concerts for the public in the parks, but there is no instance to my knowledge of a municipal theatre or opera house in the United States.

In the matter of parks, American cities, as a rule, excel all others, but Paris is the most favored city of all. Including the large parks of Versailles and Fountainebleau, there are nearly 200,000 acres within a short distance of the city, and 20,000 acres can be reached in an afternoon excursion. In foreign cities, one

more frequently finds parks under private or national control than in the United States, and this is particularly true of botanical and zoological gardens, which are parks in many ways. The movement for small parks and playgrounds in densely populated districts is growing rapidly. German cities lead, but American and British cities have been more active in recent years. Municipalities have also provided facilities for football, baseball, polo, ice skating, tennis, horse racing, cricket, bicycling, bowling, target shooting, lacrosse, dancing, bull fighting and the many other forms of amusement peculiar to each country. There are also instances of recreation piers, music pavilions, school gymnasiums, race tracks, etc., administered by cities. Public baths — plunge, spray, shower, tub and sometimes Russian, Turkish and medicinal as well as river and harbor baths — have been maintained by municipalities for decades, but the great increase has come within the last 20 years. Great Britain and Germany head the list, the United States consorting with Russia, Italy, and Austria at the foot. It is to be recalled, however, that the need, great as it is, for public baths in the United States, is relatively less than in Europe where so few bath-rooms are to be found in private houses and apartments. The first municipal indoor bath in New York city was opened about two years ago.

Other instances of the democratization of city governments are to be seen in the reconstruction of slum districts, the condemnation of old rookeries, the laying out of new streets and the rebuilding of the remaining areas. Here again European cities have gone farthest. The gigantic schemes undertaken by Glasgow, Birmingham, London, and Paris show what excellent results can be accomplished, and in many instances the increased value of the land has paid a large portion (in a few cases, all) of the cost of the scheme. American cities, because of their limited powers in this regard, have not been able to carry out such large schemes or finance them so successfully. Usually a portion of the expense of laying out new streets or widening old ones is assessed upon the property benefited, and the city is recouped in part. The care of bridges and streets — paving, cleaning and repairing — is almost everywhere a municipal function, and tolls are rapidly being abolished on bridges as they disappeared from roads earlier. Sewerage systems, which have come to be considered indispensable in progressive American towns, are not so common in Europe, especially outside of the large cities, and a number of these (St. Petersburg and Moscow, for example), do not have anything that approaches a system. Conditions in the smaller cities and in the less progressive countries are most primitive. Garbage and refuse disposal is still less a municipal function, but as in the case of sewage, no progressive city of any size is considered up-to-date which does not do something either directly or indirectly. Many cities do not undertake to perform the work by direct labor, but let the contract to a private corporation. The tendency, however, is toward day labor rather than the contract system.

Industrial Functions.— The functions over which there is most debate as to the propriety of municipal action, are those which may be termed industrial functions, that is, those in which the municipality acts less as a governmental and more as a private corporation. The oldest instance is the ownership of real estate. Many of the European cities own large estates (Berlin possesses nearly 40 square miles and Vienna receives upward of $2,000,000 annually), and in some instances the income constitutes a large proportion of the total revenue — 40, 50 or 60 per cent. American cities have squandered their patrimony and now own little. New York city owned 1,500 acres on Manhattan Island as late as 1844, but soon sold it for little. Markets, cemeteries and abattoirs are usually under municipal control in Europe and not infrequently in the United States. The object is not so much profit as the protection of the health and well-being of the city. For the same reason waterworks have been operated by municipalities for generations, and the number is constantly on the increase. Municipal operation is almost universal in Germany, and exists probably in fully one half of the cities of France which have plants. In Great Britain and the United States, about two thirds of the cities over 10,000 population have municipal systems, and the supply is better and more abundant than in other countries. The municipalization of lighting plants has not been carried so far. It is advocated on economic grounds and for reasons of political expediency rather than because of the direct effect upon the health and well-being of a community. Here again Germany leads, municipal gas plants existing in four fifths of the larger towns. Great Britain is a close second; one half of the cities over 50,000 and over one third of all the towns having gasworks at all operate their own plants. In other countries private operation holds sway, although there are many instances of municipal operation. The United States has only 20 municipal plants, and in a few other instances they are jointly owned or there are also private companies.

Electric lighting is a later development than gas, and the greater extent of municipal operation reflects the strong tendency in this direction. Towns have often been able to build their own plants without buying out a private company at exorbitant prices, which was frequently necessary in the case of gas lighting, where grants were made to private companies before municipal operation was generally considered as a wise course to pursue. Municipal operation is most common in Great Britain, where only one third of the undertakings are in private hands. In Prussia about one half of the more important cities have municipal plants. Outside of Germany there are many municipal plants scattered throughout Europe, but the number of private companies is very much larger. There are many in the United States also, the number being 278 in 1902, but in nearly one third of these places there were also private companies. The proportion is larger among small towns, where electricity has only recently been introduced, than among the large cities.

The municipalization of transportation facilities, other than streets and bridges, is a still more recent movement. Harbor improvements, docks and quays are quite commonly under municipal administration, but sometimes the central government has jurisdiction. There are a few instances of municipal ferries. Street railways have also been municipalized, there being

instances of municipal ownership without municipal operation and also complete municipal management. The former was the earlier form and until recently was generally adopted by British cities, but now it is giving way to public operation, and the mileage of municipal undertakings considerably exceeds that belonging to companies. In other countries municipalization has not gone so far, the number of instances being small but on the increase. Nearly every country has a few instances of public ownership or operation, except the United States, where there is only one of little importance in Grand Junction, Colo. Two American cities, New York and Boston, own rapid transit subways, and their example will probably be followed in other directions.

Another important function in central and western Europe is the municipal pawn shop (see MONT DE PIÉTE) in nearly all of the larger and many of the smaller cities, except in Great Britain, where no steps have yet been taken in this direction. In the United States, it is also left to private action, subject to regulation through laws and ordinances. Municipal savings banks are a natural outgrowth of municipal pawn shops. They are very numerous in Germany, where there are no postal savings banks, probably aggregating 1,500 in number. In France, Austria and Italy they are almost as numerous, but are more scattered in the other continental countries. Great Britain and the United States have none. A number of Russian cities have commercial banks, receiving deposits, giving credit, and in other ways doing a genuine banking business. This course has not been followed elsewhere so far as I can learn.

There are sporadic instances of other functions performed by city governments. Many cities virtually insure their own buildings by refusing to take out policies in private companies, but a few have gone further and have insured the property belonging to private individuals. Many English towns maintain laundries where the poor may bring their clothes, wash, iron and dry them for a small fee. Municipal telephones are becoming common in Europe. Tenements and single houses have been erected by many British towns for the working classes, replacing unsanitary dwellings. Certain cities manage restaurants, own interurban steam railroads, irrigation systems, stone quarries, brick yards, cold storage warehouses, oyster beds, fisheries, printing plants, lotteries, newspapers, undertaking establishments, etc.

Trend of Municipal Activity:— If one were to compare present with past municipal activity, he would find that great changes have been made. Certain functions have been lopped off and many new ones added. International affairs, for example, are now administered by the central governments; the prevention of fires is no longer an individual matter but dealt with collectively through city administrations. Upon the whole, there has been a great increase, for the new functions are far more numerous and comprehensive than those which have ceased to be municipal. The general trend is toward (1) the transfer to other authorities of functions of general as distinguished from local interest, which tend to increase as the country becomes more thickly settled; (2) the centralization of matters in the administration of which uniformity is possible and essential, and economy by consolidation important; (3) the multiplication of regulations dealing with the relations of man to man, because the individual cannot protect himself and because he should not be allowed either to impose upon the less fortunate or to remedy any injustice in his own way; (4) the increase of constructive action as distinguished from repressive measures, which is made possible by the concentration of population and has become necessary because of the conditions which great density has produced; (5) the taking over from private hands of functions which have become monopolistic and yet are of such vital concern to the whole city as to demand collective rather than individual management. In no country has there developed a fixed rule for determining whether a function should be undertaken by the municipality. None is feasible, for local conditions must decide, and these vary so greatly that it is folly to insist that municipalities shall or shall not adopt a certain course, because it apparently conflicts with some *à priori* definition of "natural rights" or a preconceived idea of the proper sphere of government.

Governmental Organization.— Having considered what is the position of the city in law and practice, its governmental organization demands attention. As in all governments, provision is made for expression of the popular will and the execution of its edicts. In practice an official may have something to do with each, and this often leads to confusion and misgovernment, for where the choice of an administrative officer is determined by his personal opinion upon matters which do not come directly under his jurisdiction, the results cannot but be disastrous. Yet, such will be the case as long as the sphere of the city is not clearly delimited and there is no adequate means for the enactment of laws which represent the will of the city, as is the case in most American cities at the present time. The first steps in the expression of the popular will are the organization of parties, the making of nominations and the election of officials. These subjects are discussed elsewhere and need not be elaborated here, except to note that the conditions of city life make necessary the adoption of methods in urban different from those in rural districts, as for example, personal registration in cities and proxy registration in the country.

The Council.— The number and character of offices to be filled are also quite different in cities. There is always a local legislative body of some sort, except in a few instances where the city is administered by higher authorities, as in Washington, D. C., where the citizens do not vote at all. These legislative bodies vary greatly in every respect. In some cities, there are two chambers; in others, only one. The consensus of opinion in Europe favors a unicameral council. There are not many truly bicameral legislatures, and where two bodies do exist, it usually will be found that one is more of a consulting body for the administrative officials than a legislature. A number of American cities have two bodies, but experience does not approve the plan. New York city has a board of estimate and apportionment and a board of aldermen, but the latter has proved so unsatisfac-

tory that its powers have been reduced until it is only the shadow of its former self.

This tendency is almost universal in the United States, and what functions the State legislature has not assumed have frequently been transferred to the administrative departments and to the mayor, who has come to be the central figure. There are exceptions, however, and the city which most nearly resembles foreign cities with their important local legislatures is Chicago, where the council is unicameral and possessed of considerable power, even in administration as well as legislation. It is suggestive to note that Chicago has probably escaped with as little special legislation as any city and that it is organized under a general State law, which is a simple, brief, condensed statement of municipal organization and powers. Where there is a council of any importance, by whatever name it may be called, it usually is empowered, subject to such statutory limitations as exist, to regulate its own organization and procedure, to enact local ordinances, to issue franchises, to control the public property, to levy taxes, to borrow money, to apportion expenditures, and less generally to appoint and remove the chief administrative officials (council committees in England), to act as a judicial body, and ex-officio to perform many minor duties. The number of members of the council varies greatly, European bodies being generally larger than American. The London County Council has 137 members, the Budapest Council 400, the New York Board of Estimate and Apportionment only 8, Chicago 70. The term of office ranges generally from one to four years, but in certain instances as high as six and nine years (not in United States). In some countries, the whole council retires at once; in others only one half, one third or one fifth go out at the same time. Where the council committees have close oversight over administrative functions, some continuity is very essential. Of course, it often happens, especially in European countries, but not infrequently in the United States, that an efficient councillor is re-elected for several times — a custom that produces very beneficial results. The systems of representation are also various. America, England, and Germany have followed the district plan, each ward electing not more than one member at a time. In other continental countries, the council is elected on a general ticket, or each district elects a considerable number of members. Minority or proportional representation is often provided for under the general ticket plan, either by cumulative or limited voting. In Prussia, Austria, Japan and some other countries, the voters are divided into three classes, the total of the taxes paid by the voters in each class being one third of the total amount collected. Each class elects one third of the municipal council, from which it is evident that the large taxpayers have a much greater influence than the small taxpayers. The qualifications for members of the council are generally less stringent in the United States than those of voters, for an alderman need not live in the district from which he is elected, although in practice, it is seldom that he does not. In foreign countries and in a number of American cities, they are more stringent, the holding of property or the payment of a tax being a prerequisite. Obligatory unpaid service is common abroad, but some sort of a salary, although as low as $1 per session, is usually paid in American cities, and compulsory service has ceased to obtain.

The Mayor.— In the United States both legislative and administrative functions are possessed by the mayor. He very frequently, although not universally, has the veto power and sometimes presides over the council and appoints the committees. His principal powers are executive, however, and as the head of the administrative service he exercises powers that make him by far the most important person in the city government. He usually appoints and frequently may remove at will the principal officials, except the few that are elected, and consequently determines to a great extent what their policies shall be. The tendency is toward an increase of these powers; in fact, that has been the trend since the first of the 19th century. As the council has declined, the mayor has grown stronger. The method of selection, with a few exceptions, is by popular vote. Salaries range from $15,000 in New York down to small amounts in the less important cities. There are very few over $5,000 per year. Terms of office vary from one to five years, the usual length being two years in the larger cities, with one year becoming more common as the size of the city decreases. In practice, a re-election is not uncommon, but it is rarely that a man serves more than two terms.

The situation is entirely different in England. The office of mayor is one of honor and dignity but possessed of few powers. He is a member and presiding officer of the council, but has no veto power and appoints no officials except when he happens to be a member of a committee, but even then he has no more power than any other member. He is appointed by the council annually and very frequently does not succeed himself. His heavy expenses for social functions are only partially reimbursed by appropriations voted for this purpose, and hence only well-to-do men can afford to accept the honor. The one official who most nearly resembles the American mayor is the town clerk, but he is appointed by the council, receives a large salary (for England), has a permanent tenure, and does not appoint the administrative officials. Whatever of unity and harmony there is he produces, and it is his duty to keep in touch with everything. But the real administrative work of the departments is conducted by superintendents selected and directed by the committees of the council, among whom the activities of the city have been apportioned. These committees must, of course, do as commanded by the whole council, but they have great freedom and they are the administrative heads of the city, as well as part and parcel of the legislative body. It is evident that the English system contains no official who can be compared with the mayor in the United States.

In France, the *maire* more nearly resembles his American contemporary. He is a member of the council and its presiding officer, but has no veto. He prepares the provisional budget and has full power over the administration. He appoints most of the salaried officials, and may remove them. He controls the property of the city, directs public works, supervises expenditures, etc. As agent of the central government

he has charge of the police and oversees the faithful execution of the national laws. He is elected, as in England, by the council, but is responsible to the central government rather than to the city. His term of office is four years.

The Prussian *bürgermeister* is not a member of the elective council, but of the board of magistrates — a sort of executive council which initiates legislation and perfects local ordinances. He does not directly appoint the other administrative officials, but he has considerable influence in this direction, being the head of the board of magistrates, which directs and controls all departments. Tenure of office is very long; the appointment is ordinarily for 12 years and sometimes for life. Burgomasters have professional training for administration, a life occupation, and are well paid considering the salaries usually given in Germany. Promotions from a small to a larger city are common.

Administrative Departments.— From this brief outline it is evident that the administrative service in France and the United States generally, is under a single head — the mayor; in Germany, under a special body — the magistrates; and in England, under the council committees. All are elected or appointed by the council and hence more or less subject to its control, except the American mayor who is elected by the people and hence wholly independent. In the United States certain of the department heads are commonly elected, such as the board of education, comptroller and treasurer (finance), assessors and sometimes others. In some cities, the council elects a considerable number; in others the appointments of the mayor must be confirmed by the council; but the trend is toward few elective officers and unrestricted power in the hands of the mayor of appointment and removal. Foreign experience points in the same direction, for the French *maire*, the English council committees and the Prussian magistrates appoint without confirmation of the council. The power of removal is not much considered abroad, for the salaried officials are experts and hold office continuously. The number of departments and the allotment of functions vary greatly from city to city. In Europe these matters are generally left to the convenience of each town; in the United States the charter often fixes them arbitrarily. The relative merits of a single head or a board of commissioners have long been discussed. The drift in the United States is toward a single head, although schools, parks, police and public works are still generally managed by boards. In England the board system is practically universal, but the council committees usually leave to the salaried and permanent head all questions save those of general policy — a very wise course. In Germany the joint committees of councilmen and magistrates are mainly advisory bodies, much more so than the committees in England. In France the single commission system is universal. Thus, the United States is the only country that clings to boards of salaried administrative officials as department heads, and here they are on the wane. Subordinate officials are invariably appointed by the heads of the departments, who have much more discretion in Europe than America where civil service rules are being widely introduced and extended. In New York city, for example, all of the city positions are included in the classified service, except the most important, those of a confidential or fiduciary character, and those requiring only manual labor. Even the last named are subject to certain examinations. In England, no such system exists in the municipal service. The spoils idea has not gotten a foothold, and it has not been necessary, therefore, to tie the hands of city officials with civil service rules. German and French cities have competitive examinations, but these are merely means to sift out the unfit, to ascertain the half dozen or dozen applicants best fitted for the position. Considerable freedom is permitted in the final choice. The public opposition to spoils is a far greater restraining force than civil service regulations.

The Municipal Problem.— Much as Americans dislike to admit it, there is no escape from the fact that European cities generally are better governed than those in the United States; there is greater efficiency, and much less dishonesty and corruption abroad. This is so well recognized that we have a distinct "municipal problem," peculiar to American cities and unknown beyond the Atlantic, having a voluminous literature of its own. In a word, the problem is: How may honesty and efficiency be secured and retained in municipal affairs? The solutions that have been suggested are many. In the first place, governmental organization has been criticized, and it has been urged that new charters should be secured. This has seemed so reasonable that charter tinkering has been the favorite occupation of the reformers in every city, but no deep and far-reaching regeneration has followed. Every known system has been tried, without achieving the desired result. Doubtless the best system helps to secure honesty and efficiency, and the highest results cannot be attained without it, but it is not the most important element. The cities with the best charters have not been the best governed. Another factor, which has been noted by many, is State interference in local matters. This has contributed to the difficulty of the situation undoubtedly, and there is the experience of England to prove that when local affairs are left to the municipality to administer and State affairs to the central government, the efficiency of each is greatly increased. But the few American cities that have been free from State interference are not so much better than the rest as to show that here is the solution of the problem. The foreign elements in our populations have also come in for a share of the blame. It is pointed out that whereas in many American cities the proportion of foreign born persons ranges from 30 to 40 per cent, in foreign cities the number of persons born outside of the country in which they reside very seldom exceeds 5 per cent and usually ranges from 2 to 4 per cent. The fact that the foreigners who throng our cities are ignorant of our institutions and unfitted for the duties of citizenship in a democracy is made the basis for an appeal for restricted suffrage and immigration as a means of purifying politics. But if this is the fundamental difficulty, why is it that those cities where the people are almost wholly of Anglo-Saxon descent, are as badly governed as any? It must be admitted, however, that the mixture of races with conflicting ideas upon

all questions makes it almost impossible to bring them to agree upon the issue in an election and to get an expression of opinion upon one issue. To tell what is the result of an election under such conditions is impossible. The policy of imposing upon a city a statute which is directly contrary to the will of the people adds to the confusion and forces the voters to consider the iniquity of such measures and to disregard the question of municipal honesty and efficiency, often apparently opposing an administration which gives them both efficiency and honesty. There are still other students of municipal government who urge proportional representation, direct legislation, ballot reform, nominations by the people, the organization of *local* political parties, or restriction of suffrage to taxpayers, etc., as the principal means of reform. Of late public operation of municipal monopolies has received much attention, and when one considers the great amount of corruption due to bribery of city officials connected with the granting of franchises, he is almost forced to the conclusion that municipalization would be preferable, even with all the "graft" which might follow.

Admitting that all these factors may contribute something and that no one contributes all, is it probable that together they furnish the explanation and point the way to relief? Is there no other important factor? I cannot but believe that the fundamental difficulty lies deeper. It is very suggestive to note that the epochs of high tide in municipal corruption almost invariably and with exactness coincide with the periods of greatest dishonesty and swindling in private finance. The lid has recently been taken off of business and politics, and the stench arising from each has been equally nauseating. In the period of gigantic corruption in business, following the Civil War, honesty seemed a lost virtue in many quarters. This was coincident with the reign of the Tweed Ring in New York, the Gas Ring in Philadelphia, etc. And if other illustrations are needed, continue the excursion prior to the Civil War; the same coincidence will appear. It is foolishness to expect that men have one conscience for business and another for politics, which are put on and off as occasion requires. The same standards and the same practices, if analyzed carefully, will be found to obtain in business and in politics. Reformers have urged that municipal administration is business not government and should be conducted as business. That is exactly the position of the corruptionist. Municipal administration *is* business; it has been business; it is conducted upon the same principles as business; and as long as it is and as long as business is corrupt, government will be corrupt. What are wanted are a regenerated civic consciousness, higher standards of honesty and morality, and genuine personal integrity. Other factors will aid in the realization of the ideal city, but cannot go far and any advance will be only transitory, unless individual standards are improved.

Municipal League, National. See MUNICIPAL ACCOUNTING.

Municipal Ownership, a term which in its broadest sense might be applied to a city's owning any business, but which in general usage is referred merely to the city's ownership of such public utilities as are natural monopolies. Natural monopolies have been defined as those industries which from some inherent quality inevitably tend to become monopolies; the most important of such industries in municipalities are waterworks, lighting plants, and street-railways. The question of public ownership of these utilities is a recent one, and is the result of the rapid growth of cities, and the increasing need of having water, light and transportation, supplied with efficiency and cheapness to all citizens.

Arguments For and Against Municipal Ownership.—The reasons advanced in favor of municipal ownership are as follows: (1) An increase of the city government's functions is desirable because it makes the public affairs of more importance to the individual citizen, so that he gives them more time and attention and the government of the city does not fall into the hands of a few; also because increased importance and dignity of public services will attract better and more efficient men to the service. (2) The large monopolies which own public franchises are the principal cause of corruption in municipal government, through their attempts to gain and keep franchises, and enlarge their privileges without regard to the public welfare, and to give their functions and privileges to the municipality direct would remove a corrupting influence. (3) A city can float bonds at a lower rate of interest than a private company, and can lower the cost of supply by not seeking to make large profits on watered stock, but by merely paying expenses and interest on bonds. (4) If profit beyond this be made it can be used for lowering the general tax rate, or rates to private consumers can be reduced. (5) Without too greatly increasing costs the city may afford to pay higher wages for shorter hours to employees, and improve the standard of the condition of labor. The argument is further advanced that in the great majority of cases in which municipal ownership has been tried, the results have been very favorable, and that the cases of municipal mismanagement are more than matched by the cases of mismanagement of private industries. Among the most notable and successful examples of municipal ownership is that of the street-railways in Glasgow, Scotland, where the city assumed the operation of all street-railway lines in 1894; in that year the fares were reduced, the mileage was rapidly extended and electricity was substituted for horse-power; the financial success of the city's enterprise is thus briefly summed up in the 1902 report of the department: receipts, $3,052,000; expenses, including allowance for

deterioration, $2,015,000; balance, $1,037,000, half of which is credited to the general reserve fund. Another set of statistics indicating advantage in municipal ownership, relate to the gas-plants owned by cities in the United States. In 1901 the average price of gas in private enterprises was $1.04 per 1,000 feet, in public plants $0.92 per 1,000 feet, the public plants having less than half as great an average output; in the same year the public plants made a gross profit of 29.9 cents per 1,000 feet, showing that cheaper rates did not involve failure to meet expenses. The reasons advanced against municipal ownership are as follows: (1) The political corruption of American city governments would involve inefficient officers appointed for political reasons, and consequent mismanagement. (2) If city officials are dishonest in their dealings with corporations, there is no reason to suppose they would be more honorable in their management of public industries and funds. (3) In the desire of the officials to win popular favor, rates to consumers may be reduced below what the city can really afford, and the industry thus made a public burden; or (4) a mistake on the other side may be made with the idea of reducing the general tax rate, and those who are consumers be really taxed for the benefit of those who are not. (5) Municipal management will not be progressive in testing new methods and developing new territory, being fearful of running the risk of failure and heavy expenses which such experiments involve. Opponents of municipal ownership also argue that the cheapness claimed for city operation of industries is more apparent than real; in proof of which they call attention to the fact that in many cities which have undertaken the management of municipal enterprises no provision is made in the accounts for deterioration and wear and tear of machinery and plant, or if such provision is made it is not equal to what many experts have declared sufficient, and that this item of expense will ultimately become a burden to the community. They also cite the case of the gas works of Philadelphia (the largest American city to own its gas plant) where public operation was inefficient and expensive, and a return was made to private management; and claim that this might occur in any city, especially in any large city.

Statistics of Municipal Ownership.— The first publicly owned waterworks in the United States were those of Winchester, Va., built "before 1800"; in 1890, 42.9 per cent of all waterworks in the United States were under municipal ownership; in 1902, 51 per cent were under municipal ownership; in larger cities of over 30,000 inhabitants 88 out of 135 plants were owned by the city; and the proportion of privately owned plants was largest in cities of 5,000 to 30,000 inhabitants. In 1900, of 981 cities of the United States reporting, 21 owned their gas plants (this including Philadelphia, whose plant is leased to a private company till 1927); no city larger than Philadelphia had attempted public ownership; the larger cities with public gas plants are Richmond, Va., Wheeling, W. Va., and Duluth, Wis. In Germany, however, 41 out of 54 of the larger cities own their gas plants, and the smaller cities show a still larger proportion of municipal ownership; municipal plants are also common in Holland, Sweden and Switzerland. Electric lighting plants have come somewhat more generally under municipal ownership in the United States, but few large cities have entered this field; in 1900, out of 135 cities of over 30,000 population only four owned their electric plants; but the proportion is much larger in the smaller cities and towns; of 579 cities of from 3,000 to 5,000 population, 111 reported public ownership of electric lighting plant, and 18 joint ownership. The public ownership of street-railways has made no advance in the United States; in Great Britain many large cities have gained control of their street-railways; prominent among them are Glasgow, Plymouth, Blackpool, Liverpool, Sheffield, Hull, Southampton, Huddersfield and Belfast. On the Continent municipal ownership of street-railways is rare, but increasing. Only one city of the United States owns its street-railways, Grand Junction, Col.; the cable road across Brooklyn Bridge was at one time owned and operated by the city, but was later given over to private management. New York city owns its docks, other cities have municipal boards which have supervision and control of docks, though privately owned, and Boston and a few other cities own the ferries. The question of municipal ownership of local telephone lines has also been considered, and a few municipal telephones are found in Great Britain.

It should be remembered, however, that the total progress of municipal ownership cannot be measured entirely by the proportion of cities owning important industries. Advance has been made along other lines, as for instance the increase of general and special State legislation authorizing the erection and purchase of waterworks and lighting plants, and providing for extra taxation or bond issues for establishing municipal plants; in the cities, too, there has been a growing tendency to limit the franchises in regard to time, with the idea of making municipal ownership possible in the near future. Many public men are giving serious consideration to the subject and the mayors of several important cities have been elected on a municipal ownership platform, or have openly favored it, among them may be mentioned the mayors (in 1902) of Toledo, Denver, Cleveland, and Columbus; in the election of 1901, in Saint Louis both parties had a plank favoring municipal ownership. In Chicago, an attempt to extend the franchise of street-railways for 50 years was defeated; and the question of municipal ownership of gas and electric plants, and street-railways referred to the people in the aldermanic election of 1902; the result of the vote is interesting as showing the state of public opinion in one of our largest American cities:— of the 213,859 votes cast

{ 170,824 favored city ownership of street railways.
{ 161,365 favored city ownership of gas plant.
{ 157,740 favored city ownership of electric light plant.

Munjistin, an orange coloring matter, closely allied to purpurin and to alizarin, which occurs in munjeet (East Indian madder), and has the formula $C_{14}H_5(OH)_2O_2.COOH$. It dissolves in boiling alcohol, separating again, upon cooling, in the form of brilliant golden plates. Munjistin gives an orange yellow color when used as a dye with aluminum mordants, and with iron mordants it gives a brownish purple, its colors being fairly permanent.

Munkacsy, moon'kä-chē, **Michael,** Hungarian painter: b. Munkacs, Bereg County, Hungary, 10 Oct. 1846; d. Endenich, near Bonn, 1 May 1900. His real name was Lieb, but he is known only under the assumed name derived from that of his birthplace. Beginning life as a carpenter, he met a strolling portrait painter in Gyula, who was so much struck by the artisan's interest in art that he gave him painting lessons. Munkacsy proceeded to paint portraits and genre pictures, taking his subjects from common country life. One of these early canvases, 'A Country Idyll,' was purchased by the Art Union of Pesth. He eventually put himself under the instruction of the battle-painter Franz Adam at Munich. He made rapid progress and the Hungarian government awarded him the first prize for genre paintings thrice in succession, and he was thus enabled to take up his residence at Düsseldorf and to study under Knaus and Vautier. The first great picture he painted was 'The Last Day of a Condemned Man,' exhibited in the Paris Salon in 1870. This was followed in 1871 by 'Wartime' (an episode in the Hungarian war). The succeeding year he made Paris his home and his pictures began to attract growing attention. He painted many small genres of singular power and character, such as 'Going to School'; 'The Kitchen Politician'; 'The Butter Woman'; 'The Pawn Shop' (1874); 'The Workshop' (1875); but as his strength and mastery of his art grew he rose to loftier subjects, religious and historical. In 1877 he painted 'Milton in his Blindness Dictating Paradise Lost,' to which was awarded the gold medal at the Paris Exposition. It is now in the Lenox Library, New York. Great as was the sensation created by this picture, a historic genre of remarkable coloring in gray and black and of profound insight and power of characterization, an even deeper impression was produced by his 'Christ Before Pilate' (1882), which some critics consider the greatest religious picture of its century. This vast canvas is startling in its freshness of conception, its living action, the mingled grandeur and pathos which the artist has infused into his treatment of the central figure, as well as its masterly composition and technique. It has been exhibited in all quarters of the civilized world and was bought by John Wanamaker of Philadelphia for $120,000. It was followed by his dramatic 'Christ on Calvary,' the religious intensity of which is heightened by the accurate fidelity to differing national types with which the spectators of the Crucifixion are portrayed; a piece of realism whose suggestiveness is obvious. In 1886, he produced 'The Last Moments of Mozart,' now in the collection of General Russell Alger, Detroit, Mich. The present owner paid $50,000 for this pathetic picture, in which the composer is listening to his still uncompleted requiem, sung at his bedside by his favorite singers, the night before his death. The last three years of his life this painter suffered from mental alienation and closed his days in a sanitarium.

Mun'kar. See MOHAMMEDANISM.

Munkit'trick, Richard Kendall, American author and editor: b. Manchester, England, 5 March 1853. He was educated in American academies and was one of the editors of the humorous journal 'Puck' 1881–9. Since 1901 he has been editor of 'Judge.' He has published 'Farming' (1891); 'The Moon Prince and Other Nabobs' (1893); 'New Jersey Arabian Nights' (1893); 'The Acrobatic Muse' (1896); 'The Slambangaree' (1898).

Munn, Charles Clark, American novelist: b. Southington, Conn., 1848. His boyhood was spent on a farm which he left at 17 and for 30 years was engaged as a commercial traveler. He is the author of several popular novels, including: 'Pocket Island' (1900); 'Uncle Terry: a Story of the Maine Coast' (1900); 'Rockhaven' (1902).

Munn, Orson Desaix, American publisher: b. Monson, Hampden County, Mass., 11 June 1824. He was educated at the academy in Monson, was a clerk and country store-keeper there until 1846, and then bought the 'Scientific American,' which he has published since that date. He is also head of Munn & Company, patent solicitors.

Muñoz, Juan Bautista, hoo-ān' bä-oo-tēs'-tä mū-ñōth', Spanish historian: b. near Valencia, Spain, 1745; d. Madrid, Spain, 1799. He was graduated from the University of Valencia and was appointed in 1779 historiographer of the Indies and was instructed by the king to write a history of America. This work was published under the title 'Historia del Nuevo Mundo' in 1793 and though completed only to 1500 is highly valued. Of his manuscripts many are now in the Academy of History at Madrid but, unfortunately, many others are scattered.

Munro, mŭn-rō, **Neil,** Scottish novelist: b. Inveray, Scotland, 3 June 1864. He has published 'The Lost Pibroch: Celtic Tales and Sketches' (1896); 'John Splendid,' a Highland romance (1898); 'Gilian the Dreamer' (1899); 'Doom Castle' (1901); 'The Shoes of Fortune' (1901).

Munroe, mŭn-rō', **Charles Edward,** American chemist and expert on explosives: b. Cambridge, Mass., 24 May 1849. He was graduated at Harvard in 1871; was assistant in chemistry there for three years; professor of chemistry United States Naval Academy 1874–86; chemist to United States Naval Torpedo Station 1886–92; and since the last date professor of chemistry and dean of Columbian University, Washington, D. C. He was a special agent on chemical industries for the United States Census of 1900; is president of the American Chemical Society; received the decoration of the Order of the Medjidje from the Sultan of Turkey, 1901; has invented a smokeless powder; and is the author of various monographs on chemistry, notably of explosives.

Munroe, Charles Kirk, American writer for boys: b. Appleton, Wis., 15 Dec. 1856. He was educated at Harvard and was editor of 'Harper's Round Table' 1879–82. For many years

he has made Florida his home. Among his numerous works are: 'The Flamingo Feather' (1887); 'Wakulla' (1888); 'Campmates'; 'Canoemates'; 'Raftmates'; 'Rick Dale'; 'Dorymates'; 'The White Conquerors'; 'Big Cypress'; 'At War with Pontiac'; 'Life of Mrs. Stowe' (with her son); 'Copper Princess' (1898); 'Forward March' (1899); 'Under the Great Bear' (1900), etc.

Munroe, Robert, Scottish archæologist: b. Ross-shire 21 July 1835. He was educated at the University of Edinburgh and was a physician at Kilmarnock till 1886 when he turned his whole attention to archæological researches. He is a member of many learned societies at home and abroad and has published 'Ancient Scottish Lake Dwellings' (1882); 'The Lake Dwellings of Europe' (1890); 'Rambles and Studies in Bosnia, Herzegovina and Dalmatia' (1895); 'Prehistoric Problems' (1897); 'Prehistoric Scotland and its Place in European Civilization' (1899).

Mun'see Indians, an American tribe of the Delaware family, originally one of the three great divisions of that race. They were sometimes called the Wolf tribe of the Delawares. They resided along the Delaware River, and in New York, Pennsylvania, and New Jersey. During the Revolution many of the Munsees removed to Canada, where at Thames, Ontario, in 1903, there were about 100 survivors. At Green Bay, Wis., is another tribal remnant of several hundred. See DELAWARE INDIANS.

Mun'sell, Joel, American printer: b. Northfield, Mass., 14 April 1808; d. Albany, N. Y., 15 Jan. 1880. He established himself in Albany in 1827, and was publisher and editor of the 'New York State Mechanic' from 1841 to 1843. At various times he was the publisher of the 'Unionist,' the Albany *Daily State Register, Morning Express* and *Statesman,* and other journals. Munsell made a close study of the art of printing, in its history and application, and his collection of works on the subject, the largest in America, was in part purchased by the State for the New York State library. He contributed papers to the 'Transactions' of the Albany Institute, of which he was a founder, and published: 'Outlines of the History of Printing' (1839); 'Annals of Albany' (1849–59); 'Every-Day Book of History and Chronology' (1856); 'Chronology of Paper and Paper-Making' (1857, enlarged 1870); and 'Manual of the 1st Lutheran Church of Albany, 1670–1870' (1871).

Munsey, mŭn'sĭ or -zĭ, **Frank Andrew,** American publisher: b. Mercer, Maine, 21 Aug. 1854. After receiving a common school education, he began his business career in a country store, and then became manager of a telegraph office in Augusta, Maine. He went to New York in 1882 and started 'The Golden Argosy,' a juvenile weekly which he afterward changed into a monthly for adults under the style of 'The Argosy.' 'Munsey's Weekly' appeared in 1890, and after issuing this for one year he transformed it also into a monthly calling it 'Munsey's Magazine. He also founded 'The Junior Munsey' and 'The Puritan.' He might be said to be the pioneer in the publication of cheap illustrated publications. He also controls the New York *Daily News,* the Boston *Journal* and the Washington *Times.* He is a popular member of many clubs in New York city and elsewhere, and is the author of several books for boys: 'Afloat in a Great City' (1887); 'The Boy Broker' (1888); 'A Tragedy of Errors' (1889); 'Under Fire' (1890); and 'Derringforth' (1894).

Mun'son, James Eugene, American inventor: b. Paris, N. Y., 12 May 1825. He was educated at Amherst College and in 1857 removed to New York, where he was court stenographer for 30 years. He invented the "Munson System" of shorthand, a machine for operating the typewriter by telegraph, and a type-setting machine. He published: 'The Complete Phonographer' (1866); 'Dictionary of Practical Phonography' (1875); 'A Shorter Course in Munson Phonography' (1900); etc.

Mun'ster, Ireland, the southwest and largest of the four provinces of that country, bounded on the north by Connaught, on the east by Leinster, and on the west and south by the Atlantic Ocean. It has an area of 9,521 square miles and is divided into the counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford. Pop. (1901) 1,076,188.

Münster, mün'stĕr, Prussia, the capital of Westphalia, a town and episcopal see, in a plain on the Aa, at the junction of several railways and on the Dortmund-Ems canal, 78 miles northeast of Cologne. The site of its mediæval ramparts has been converted into promenades. The principal edifices are the cathedral, the church of St. Lambert, the Rathaus, exchange, museum, theatre, the Pauline Library, several educational, benevolent, and charitable institutions, etc. The manufactures include woolen, linen, and cotton goods, leather, sugar, starch, etc. Münster originated in a monastery around which a settlement arose in the 12th century; it was long governed by martial bishops. The most notable event in its long history occurred in 1532–5 when the city fell into the hands of the Anabaptists (q.v.). Pop. (1900) 63,776.

Münsterberg, mün'ster-bĕrg, **Hugo,** German-American psychologist: b. Dantzic, Germany, 1 June 1863. He graduated at the Dantzic Gymnasium in 1882, and pursued post-graduate studies in physiology, philosophy, natural sciences and medicine until 1887. He received the degree of Ph.D. at Leipsic in 1885 and that of M.D. at Heidelberg in 1887. After this he was instructor and assistant professor of psychology in the University of Freiburg at Baden, Germany. In 1892 he came to America and accepted the professorship of experimental psychology at Harvard University, Cambridge, Mass., where he has remained ever since. His studies in psychology have chiefly been devoted to its physiological aspects. He is a member of the Psychological Association and was elected its president in 1898; also a member of the American Academy of Arts and Sciences. Most of his works are in the German language: 'Die Willenshandlung' (1888); 'Gedankenübertragung' (1889); 'Der Ursprung der Sittlichkeit' (1889); 'Beiträge zur Experimentellen Psychologie' (1889–93); 'Aufgaben und Methoden der Psychologie' (1891); 'Psychology and

Life' (1899); 'Grundzüge der Psychologie' (1900); and 'American Traits' (1902). He has also been a large contributor of psychological and philosophical articles to the 'Psychological Review' and many other magazines and periodicals.

Munt'jac, a small East Indian deer representing the genus *Cervulus,* which resembles the musk-deer in many points, especially in having long sharp upper canine teeth, or tusks, which are effective weapons. These little deer, only 20 to 22 inches in height, inhabit hilly jungles, and have lyrate, single-pronged antlers, mounted upon remarkably tall pedicels. Several species are known, of which the most familiar is the Kakar or barking-deer (*C. muntjac*) of Indian sportsmen, whose loud resonant cries may be heard at a surprising distance, and which is a favorite not only because it exercises skill in its pursuit, but gives excellent venison. Consult Kinloch, 'Large Game Shooting' (1885).

Münzer, münt'sĕr, **Thomas,** German religious fanatic: b. Stolberg about 1490; d. Frankenhausen 15 May 1525. He preached at Zwickau in 1520, and at Prague in 1521, promulgated his doctrines at Allstedt in Thuringia in 1523, and excited the people to revolt against the authorities. In Mühlhausen (1524) he gained the unqualified support of the populace, deposed the city council and appointed a new one, suffered the monasteries and houses of the wealthy to be sacked, and proclaimed a community of goods. He was now joined by another fanatic named Pfeifer, with his troop of rapacious followers, and this circumstance with the news that 40,000 peasants had assembled in Franconia, and plundered and burned 150 castles of the nobles and 23 monasteries, inflamed his zeal, and he joined in what was termed the «Peasants' War,» intending to exterminate «the godless princes and priests.» Leaving Pfeifer governor in Mühlhausen, he proceeded to Frankenhausen, and rekindled the ardor of the townspeople. The dukes of Saxony, Philip, and Brunswick, and other rulers sent a force against the insurgents; Münzer was totally defeated after an obstinate struggle, was taken and executed. See PEASANTS' WAR.

Munzinger, moont'sĭng-ĕr, **Werner,** Swiss explorer: b. Olten, Switzerland, 4 April 1832; d. Africa 14 Nov. 1875. He engaged in mercantile life and later became British and then French consul at Massowah in Egyptian Abyssinia. He explored a large part of northeastern Africa and wrote much concerning his travels. Among his works are: 'Ostafrikanische Studien' (1864); 'Vocabulaire de la Langue Tigré' (1865); etc.

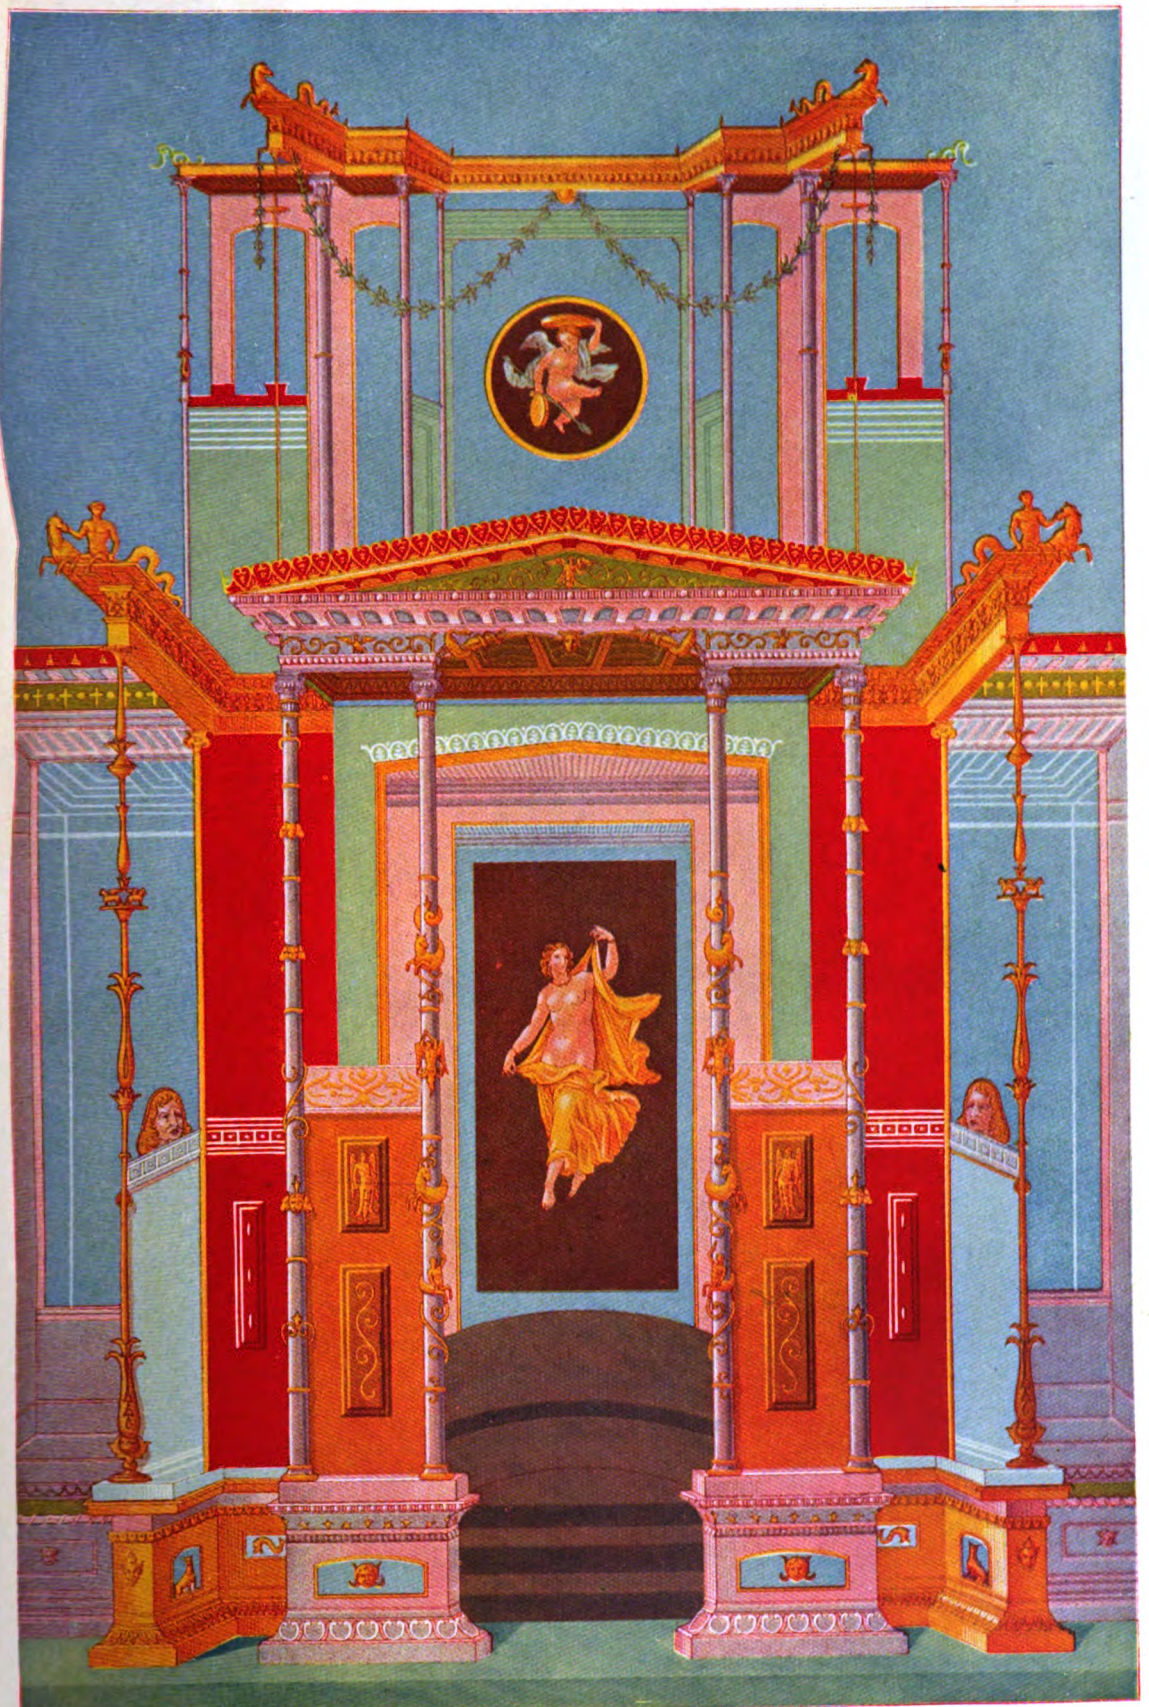
Muradabad, moo-rä-dä-bäd'. See MORADABAD, INDIA.

Muræ'na, an eel or moray of the family *Murænidæ.* (See MORAY.) There can be little doubt that the *muræna* of the Roman feasts often translated «lamprey,» was one of the true eels. It was held in the highest esteem. Pliny tells of the enormous sums of money and the great care which were spent on the cultivation of the muræna. The artificial fish-pond of Lucullus was said to have been sold for about $200,000; and one Hirrius is said to have furnished Cæsar with 6,000 murænas alone for a regal entertainment given to the people. We are also told that these fishes were kept as pets by both sexes of the Roman nobility. See MULLET.

Mural Circle, in astronomy, an instrument formerly employed in observatories to measure the zenith distances of stars. The mural circle is now superseded by the transit instrument.

Mural Decoration. Mural decoration includes, besides wall painting, the facing of the walls with marble, arranged in patterns or carved in relief, as well as the use of tiles, mosaic, decorative plaster, sgraffito, fresco, and stenciling; also of such wall coverings as tapestry, painted hangings, printed papers and cloths. The history of mural decoration takes us back to the earliest times. In early Egypt the wall surfaces were covered with conventional figures, or vertical stripes and zigzags, cut in slightly below the surface. These early patterns, as well as the human figures and hieroglyphics of later and more elaborate work, were carefully colored. Painting of patterns and human subjects on the uncarved flat surface was also used: but always in flat color, without gradation, and therefore wholly conventional in character. In Babylonia and Assyria, wall surfaces were frequently covered with alabaster slabs, carved in low relief, and with enameled and colored bricks. In Greece, the wall surfaces which formed the background of reliefs were frequently highly colored and much of the detail was brought out in contrasting tones. The Etruscans had a system of wall painting, and their tombs dating back to the 8th century still show examples of their work, but is of but little comparative merit. The principal specimens remaining of Roman wall-painting are to be found in Pompeii. There is also a good example in the so-called House of Livia, on the Palatine Hill in Rome. The early Christians, who held their religious services in the catacombs, were accustomed, from the 1st to the 9th century, to decorate the walls, and we have wall pictures of the 4th century still remaining. Byzantine architecture is especially noted for its mosaic wall decoration, as found, for example, in Santa Sophia, Constantinople, and Saint Mark's, Venice. Romanesque examples are found in the Cathedral of Monreale, Sicily, the church of San Clemente, Rome, and San Miniato, near Florence. Gothic church architecture depends more for its decoration on its stained glass than upon wall painting or mosaic, although in Italian Gothic art examples of colored mural decoration are numerous. Under the influence of the Renaissance wall paintings were numerous and beautiful, especially in Florence and Sienna; and soon the palaces of Rome surpassed even those, the work being generally in fresco. Later work, especially after the introduction of oil painting, grew to have somewhat of the nature of easel pictures. There are good examples of this later Renaissance style in the Doges' palace in Venice, and in the Italian churches, and it reappears in the modern work of the Pantheon and the Hotel de Ville, Paris. In America, the wall paintings at the Boston public library and the Library of Congress, besides some recent work in New York city, are worthy of attention.

The names of the painters who have left us wall decorations as products of their work give us a key to the progress of mural painting.



GRÆCO-ROMAN MURAL DECORATION

From the time when Giotto gave life to a dead art to the time of Puvis de Chavannes is a period of 500 years. Following Giotto came the Florentines, such as Orcagna, Masaccio, Benozzo, Gozzoli, Lippi, and Ghirlandajo, and the Umbrians and Siennese, such as Lorenzetti, Signorelli, Perugino, Pinturicchio, and Raphael. This great period of mural painting culminates in the work of Michelangelo in the Sistine Chapel. Later came the Venetians Titian, Paul Veronese and Tintoretto; but their work was generally on canvas, stretched on frames. From the period of the Renaissance to the last part of the 19th century there was little notable mural decoration, but since then there have come Hippolyte, Flandrin, Puvis de Chavannes, and Baudry, in France; La Farge, Abbey, Blashfield, Walker, Vedder, Mowbray, Cox, Simmons, Blum, Reid, Turner, and Sargent, in America, have been carrying out wall decorations in a manner that speaks encouragingly for the 20th century. Among the more celebrated and important pieces of mural painting are La Farge's 'Ascension of Christ' in the church of the Ascension, New York, and his decoration of Trinity Church in Boston; Simmons' paintings in the criminal court building, New York; Blashfield's in the Congressional Library at Washington; and the magnificent pictures by Sargent in Sargent Hall, Boston public library.

Mosaic.— For external pictorial decoration mosaic is the best medium. It is made generally of small glass tesseræ, which can be colored freely, and even gilded by the insertion of leaf gold, producing permanent metallic lustre in backgrounds and ornaments. Mosaic may be used on a large scale with stone, brick, or terra-cotta, and either polished or left with a dull finish. Mosaics may be of marble or of glazed tiles; but the term when used without qualification refers to work done with very small tesseræ as stated above.

Fresco.— The name "fresco" means painted in water-color upon fresh plaster, and this was the great medium of the Renaissance men. Encaustic means that heat is applied in fixing the color. Encaustic was used especially by the Greeks and Romans, but little is known of the exact process. The only example of the Pompeian decoration that has been brought to America is that in the Metropolitan Art Museum in New York, taken from the Boscoreale Villa, near Pompeii, buried in the eruption of Mount Vesuvius in 79 A.D. These were unearthed in 1901, and the entire plaster walls of one room and sections from other parts of the villa were brought late in the year 1903.

FRANK A. BOURNE,
Architect, Boston, Mass.

Murat, Joachim, zhō-ä-kēm mü-rä, French marshal and some-time king of Italy: b. Bastide, Lot, France, 25 March 1771; d. Pizzo, Calabria, Italy, 13 Oct. 1815. He was the son of a prosperous innkeeper of La-Bastide-Fortunière, near Cahors, France, and had a remarkable career. While studying for the priesthood at Toulouse he enlisted in a cavalry regiment but was soon dismissed for insubordination. He served in the constitutional guard of Louis XVI.; then entered the 12th regiment of mounted chasseurs and rose by his zealous Jacobinism to the rank of lieutenant-colonel. He attached himself to Napoleon in 1795, and followed him to Italy and to Egypt. In these campaigns he frequently distinguished himself, and in 1799 Napoleon appointed him general of division. He clung close to the great leader and returned to France with him from the disastrous Egyptian campaign. At a time when everything depended on prompt action he rendered Napoleon most valuable service by dispersing the Council of Five Hundred at Saint Cloud, on the memorable 18th Brumaire. In gratitude and as a reward Napoleon entrusted him with the command of the Consular Guard, and shortly after (20 Jan. 1800) gave him his youngest sister, Caroline, in marriage.

Murat had command of the cavalry at the battle of Marengo and expelled the Neapolitans from the Papal States. In 1803 he was made a member of the *Corps Legislatif*, and in 1804 was the governor of Paris. On the establishment of the Empire Murat became one of the popular idols, and was showered with honors. He was made marshal of the empire, grand-admiral, and prince of the imperial house. His services in the campaign of 1805 against Austria, in which he entered Vienna at the head of the army, were rewarded in 1806 with the grand-duchy of Cleves and Berg. He participated in the battles of Austerlitz, Jena, Eylau and Friedland. In the war of 1806 with Prussia, and of 1807 with Russia, he commanded the cavalry, and in 1808 he commanded the French army which occupied Madrid, and quelled the insurrection there in May. He expected to receive the crown of Spain, as Charles IV. had invested him with royal authority; but Napoleon, who destined Spain for his brother Joseph, placed him on the throne of Naples 15 July 1808. He then took the title of "Joachim Napoleon." Ferdinand IV. (q.v.), however, continued to rule in Sicily under English protection. Murat proved a beneficent king and instituted some reforms, but he was, after all, but the tool of Napoleon. He shared the hardships and reverses in the disastrous Russian campaign of 1812, and returned to Naples discouraged and discontented. In 1813 he again fought for Napoleon, whose cause he deserted after the battle of Leipsic. He entered into a treaty with England and Austria in 1814 which guaranteed him his throne on condition that he would join the coalition against Napoleon. He took up arms again in 1815 for Napoleon; but being defeated by Generals Neipperg and Bianchi he was forced to leave Italy, and took refuge in Toulon. After the overthrow of Napoleon he escaped to Corsica, and set sail for the Neapolitan territory with a view to recover his kingdom. He foolhardily landed at Pizzo on 8 October, but was immediately captured, tried by court-martial, condemned and shot.

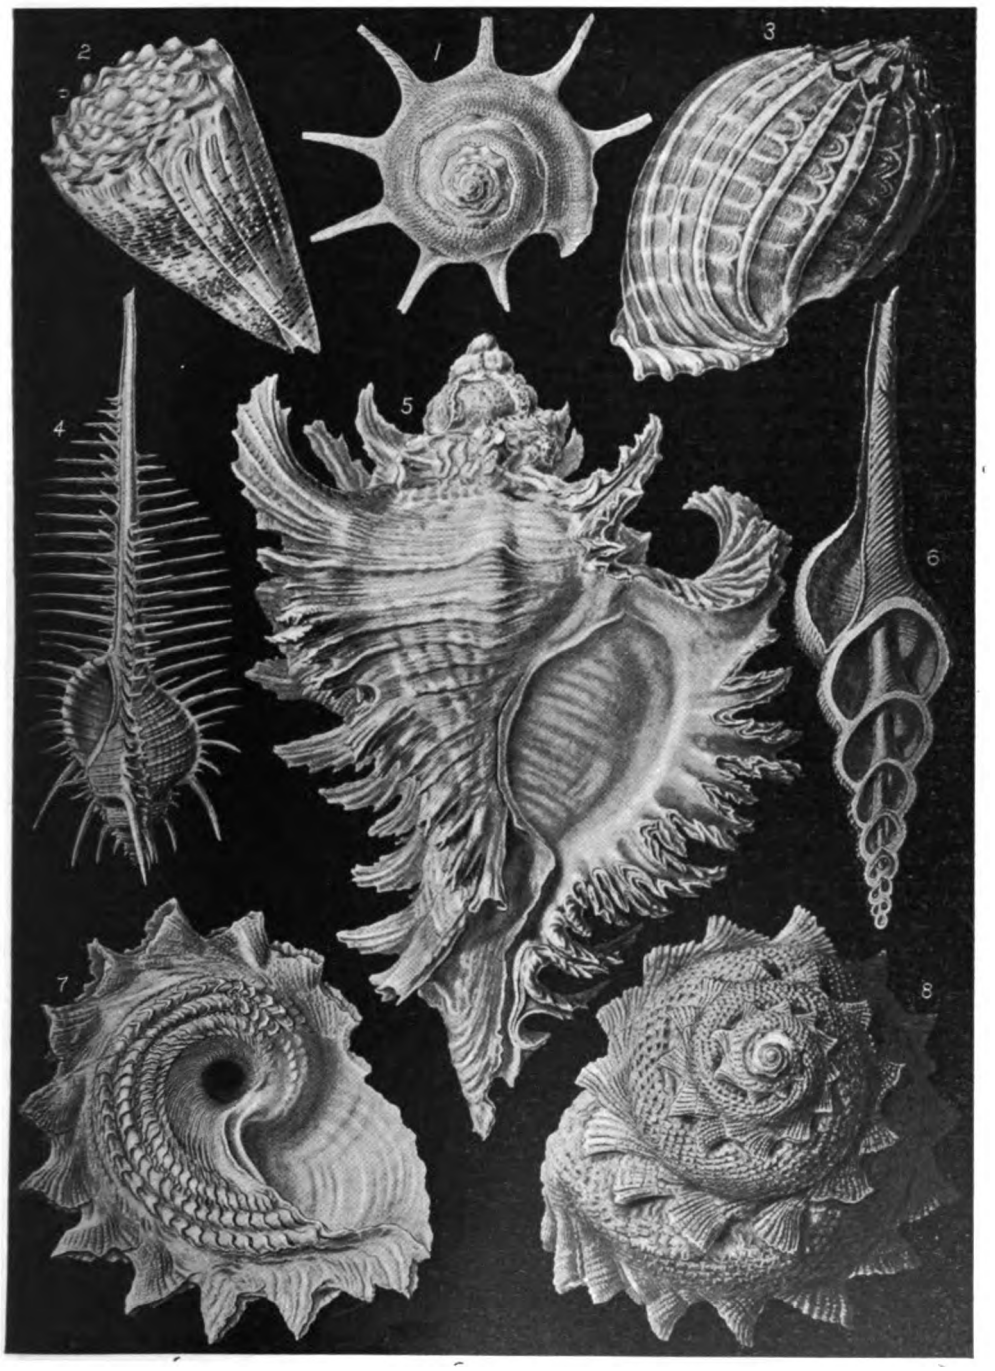
Murat, Napoleon Achille, French American author: b. Paris 21 Jan. 1801; d. Wasceissa, Leon County, Fla., 15 April 1847. He was the son of Joachim Murat, king of Naples, and before his father's overthrow bore the title of Prince of the Two Sicilies. When his father lost the throne he sought refuge in Austria, where he received his education. In 1821 he came to the United States, and after an extended tour through the country bought a large estate and settled near Tallahassee, Fla., where he devoted himself to farming and literary work; he also gave largely to and was active in philanthropic enterprises. He became a United States citizen, and in 1824 was made alderman of the city of Tallahassee, in 1825 mayor, and in 1826 postmaster. He accompanied Lafayette during most of his visit to the United States, and at that time was introduced to Catharina Dudley, a grandniece of Washington, whom he afterward married. He refused many offers of political advancement, and lived quietly on his estate. In 1828 he published in the Paris 'Revue Trimestrielle' a series of letters on political parties in the United States, which were later published as 'Lettres d'un Citoyen des Etats Unis à ses Amis d'Europe'; in 1838 he published 'Esquisses morales et politiques sur les Etats Unis d'Amérique'; and 'Exposition des Principes du Gouvernement républicain tel qu'il a été perfectionné en Amérique' (Exposition of the Principles of Republican Government as Perfected in America). This latter work was very popular among those of republican sympathies in Europe, was translated into several different languages, and passed through over 50 editions.

Murat, Napoléon Lucien Charles, nä-pō-lā-ôn lü-sē-ôn shärl, Prince of Ponte Corvo, French politician, second son of Joachim Murat: b. Milan 16 May 1803; d. Paris 10 April 1878. He left Italy for Austria with his mother in 1815; started for the United States in 1824, but was shipwrecked on the Spanish coast, and held prisoner for a time; arrived in Boston in 1825; and in 1827 married an heiress of Bordentown, N. J., Georgina Fraser, who was soon afterward reduced to school teaching for her living. Murat returned to Paris in 1848, sat in the Constitutional Assembly and in the Legislative Assembly (1849), was minister to Turin (1849–50), had his debts paid and received a pension of $30,000 a year under Napoleon III., and in 1859–60 made a feeble claim to the crown of Naples, but received no support from France. His vote in the Senate, where he sat from 1852 to 1870, for the temporal power of the Pope, alienated from him the French Freemasons, whose grand-master he had formerly been. He retired to private life after the revolution of 4 Sept. 1870.

Muravieff, moo-rä-vē-ĕf', Russian noble family, originally settled in the grand-duchy of Moscow, but in 1488 receiving from Ivan Vassilievitch holdings in Novgorod. Its chief members are: Nikolai Jerofeyevitch, d. Montpellier 1770, governor of Livonia, and author of the first Russian algebra. Mikhail Nikititch, b. Smolensk 25 Oct. 1757; d. Saint Petersburg 29 July 1807; was chosen tutor to the grand-dukes Alexander and Konstantin in 1785, rector of the University of Moscow (1796), and secretary of state to the ministry of public instruction (1801); and wrote a manual of ethics, which is classic in Russia (1810, 1815). Nikolai Nikolaievitch, son of the governor of Livonia: b. Riga 1768; d. Moscow 1 Sept. 1840; was educated at Strasburg; entered the navy 1788; was captured in 1790; was transferred to the army in 1796; and from 1797 to 1823, with the exception of service against Napoleon in 1812–14, he was at the head of a private military school near Moscow, which was bought by the government in 1816. His son, Alexander Nikolaievitch, b. 1792; d. Moscow 1864; was sent to Siberia for his part in the conspiracy of 1825; was pardoned; served in the Crimean war; and as governor of Nijni Novgorod did much for the abolition of serfdom. Another son, Nikolai Nikolaievitch, b. Saint Petersburg 1793; d. there 4 Nov. 1866; entered the army at 17; served in the Caucasus; was sent to Khiva 1819; distinguished himself in the war with Turkey, 1828–9, and in the Polish campaign, 1831; in 1832 treated with Mehemet Ali; was disgraced and retired in 1838, but reinstated in 1848; and in 1855 commanded the army in the Caucasus. He wrote a valuable book about his travels in Khiva (1822), and on the campaign in the Caucasus in 1855 (1876). His brother, Mikhail Nikolaievitch, b. 1795; d. Syrez, near Luga, 10 Sept. 1866; became major general in 1830; was military governor of Grodno; was a member of the Council of State, 1850–62; opposed the emancipation of the serfs; used such cruelty in putting down a student rising in 1861 that he was forced to resign; but in 1863 was sent to Wilna as governor-general, and won from the Poles the name of the Hanger or Executioner by his pitiless severity; and in 1866 was president of the commission which examined Karakasoff, who attempted to assassinate Alexander II. His memoirs were published by his grandson, Mikhail Nikolaievitch, b. 7 April 1845; d. 8 June 1900; ambassador to Berlin (1885), to Copenhagen (1893); and from 1897 to his death foreign minister. He did much to solve the Cretan question, published the invitation to the Hague Peace Conference (1898), and forwarded Russia's interests in China. Another Nikolai Nikolaievitch, Count Muravieff Amursky, b. Saint Petersburg 1809; d. Paris 19 Nov. 1881; fought in the war with Turkey, 1828–9; became governor-general of Eastern Siberia in 1847; in 1858 concluded the treaty of Aigun with China, by which Amur was ceded to Russia, and thus won the title Amursky; and in 1859 arranged a treaty with Japan at Yeddo. The last 20 years of his life were spent in Paris. The Muravieff-Apostol branch of the family, so called because of its intermarriage with that of Apostol, a Cossack hetman, is most prominently represented by Ivan (1769–1851), who translated Aristophanes, Horace, Sheridan, etc., into Russian; and by his son Sergei (1796–1826), who took part in the conspiracy of 1825 and was executed in Saint Petersburg.

Murchison, mẽr'kĭ-sŏn, Sir **Roderick Impey,** Scottish geologist: b. Tarradale, Ross, Scotland, 19 Feb. 1792; d. London 22 Oct. 1871. He was educated at the military college in Great Marlow and at the University of Edinburgh;

MUREX.



1. Calcar triumphans. 2. Conus imperalis. 3. Harpa ventricosa. 4. Murex tenuispinus. 5. Murex inflatus. 6. Fusus longicauda. 7, 8. Australium imperiale.

entered the army in 1807 and served under Wellington in the Peninsular campaign, but retired from the army with the rank of captain of dragoons in 1815. He then took up the study of science and spent years in scientific investigations, particularly in that of geology. In 1825 he became a member of the Geological Society of London, of which he was president in 1831–2 and in 1842–3. His investigations extended through France, England and Wales and he reclassified the Palæozoic rocks giving to his new system the name Silurian in 1835. In 1841 he was commissioned by Emperor Nicholas to make a geological survey of Russia and was engaged in that work until 1844 making discoveries which enabled him to present to the scientific world the Permian system. He was one of the founders of the British Association for the Advancement of Science and presided over it in 1846. He was several times elected president of the Royal Geographical Society and from 1862 until his death was continuously re-elected. In 1855 he was appointed director of the British Geological Survey. He published: 'Geology of Cheltenham' (1834); 'The Silurian System' (1839); 'Geology of Russia in Europe and in the Ural Mountains' (1845); 'Geological Atlas of Europe' (1856); etc. See Geikie, 'Memoir of Sir Frederick Murchison' (1875).

Murchisonite, a flesh-red variety of the mineral orthoclase, which exhibits golden-yellow reflections when viewed from certain directions. It occurs at Dawlish and Exeter, England, and is named for its discoverer, Sir Roderick I. Murchison.

Murcia, mėr'shĭ-ą (Sp. moor'thē-ä), Spain, the capital of the ancient kingdom and modern province of same name, 30 miles northwest of Cartagena, on the Segura, which divides the town into two unequal portions, connected by a handsome bridge. The city is surrounded by a brick wall, and is entered by three principal gates. The streets are generally broad, straight, and well paved. Among the public buildings the most important is the cathedral, its principal façade a fine combination of Corinthian and composite architecture. It was begun in 1353. In the plaza stands the capacious episcopal palace, built in 1752, one of the finest edifices of its class in Spain; and in close proximity to it the colleges of St. Fulgentius and St. Isidore, which form one range of building. The bishop takes his title from Cartagena, from which town the see was transferred. The other public edifices and institutions consist of the college of St. Leander, which is an academy of music connected with the cathedral; the hospital of St. John, with which is connected a hospital for convalescents; a house of refuge, a foundling hospital, the town-house, an institute for advanced education, a school of design, an ecclesiastical seminary, several nunneries, a bull-ring, and a good botanical garden. There are manufactures of coarse cloths and baize of different colors; of silk-stuffs, especially taffeta and plush; linens, hats, gloves, saltpeter; also silk spinning-mills, dye-works, potteries, tanneries, soap-works, and about thirty flour-mills. Considerable commerce is carried on in silks and other manufactures, as well as in grain, etc. Pop. (1900) 111,693.

Murder. See Homicide.

Murdoch, mėr'dŏk, **James Edward,** American actor: b. Philadelphia, Pa., 25 June 1811; d. Cincinnati, Ohio, 19 May 1893. He made his dėbut as an actor in Philadelphia in 1829, playing Frederick in 'The Lover's Vow,' and in 1838 appeared in New York as Benedick in 'Much Ado About Nothing.' He played Pythias to Edwin Forrest's Damon and in 1842 retired from the stage to study. He reappeared in New York in 1845 as Hamlet and for 15 years played with great success in the United States and England. During the Civil War he devoted himself to caring for the wounded soldiers and in giving entertainments for their benefit. His best roles were Hamlet, Mercutio, Benedick, and Claude Melnotte, in which he had few equals. He published with William Russell: 'Orthophony' (1845); and 'The Stage' (1885).

Murdock, Harold, American banker: b. Boston, Mass., 1862. He was educated at the Boston Latin School, entered the banking business and is president of the National Exchange Bank of Boston. He wrote: 'The Reconstruction of Europe: a Sketch of the Diplomatic and Military History of Continental Europe from the Rise to the Fall of the Second Empire' (1889).

Murdock, William, Scottish inventor: b. Bellow Mill, near Old Cumnock, 21 Aug. 1754; d. Sycamore Hill, near Soho, 15 Nov. 1839. He went in 1777 to Birmingham, where he obtained employment in the famous engineering establishment of Boulton & Watt, at Soho, near that town. A demand for Watt's pumping-engines came from the Cornish mines, and Murdock was soon sent thither to superintend the erection and fitting of these engines. In 1800 he was made manager of the works of Boulton & Watt, being afterward admitted as a partner. He retired in 1830. His invention of coal-gas lighting remains his most conspicuous achievement. He began in 1792 his experiments regarding the illuminating properties of gases produced by distilling wood, peat, and coal. In 1800 he had an experimental gas apparatus in operation at Soho, and in 1803 the Boulton and Watt foundry was regularly lighted by that means. In February 1808, Murdock read before the Royal Society a paper detailing his investigations. Gas-lighting fell into the hands of promoters, and in 1809 Murdock was compelled to publish a vindication of his claims in 'Letter to a Member of Parliament.' It has been asserted that he invented the steam locomotive, but the three engines he made came to nothing.

Mu'rex, a genus of gasteropod mollusks typical of the family *Muricidæ,* resembling the whelk; shell spiral, rough, with three or more ranges of spines simple or branched. Murices are remarkable for the beauty and variety of their spines. They were in high esteem from the earliest ages on account of the purple dye that some of them yielded. See Purple Shell.

Mu'rexide, in chemistry, the hydrogen-ammonium salt of a hypothetical acid called «purpuric acid,» the acid itself not being known in the free state. Murexide has the chemical formula $C_8H_4N_5O_6(NH_4)$, and about 1855 it was largely used as a dye. The colors that it gives are fast so far as light is concerned, and are quite brilliant; but they tarnish quickly when exposed to sulphur dioxid gas, and hence are more or less fugitive in houses where coal gas is

burned. As a dye, murexide has now been replaced by the coal-tar colors (q.v.). It may be prepared by evaporating a mixture of uric acid and nitric acid to dryness, and moistening the reddish residue with ammonia. The beautiful purple red of murexide is at once developed. (This reaction is used as a test for uric acid, in urinary analysis.) Murexide dissolves in water to a beautiful purple solution, the color changing to blue upon the addition of potash. The commercial supply of murexide, when it was used as a dye, was prepared from uric acid; the uric acid required being obtained from guano, in which it exists in considerable quantities. A dye similar to murexide, and perhaps identical with it, was obtained by the ancients from a gland of the murex, or "purple-fish"; whence the name "murexide."

Murfree, mėr'frē, **Mary Noailles** ("CHARLES EGBERT CRADDOCK"), American novelist: b. Murfreesboro, Tenn., 24 Jan. 1850. Her early years were spent in Murfreesboro to which after some years in Saint Louis she returned in 1890, and her careful studies of life in the mountains of Tennessee, where her summers have usually been passed, are reflected in nearly all of her books. Her earliest short story appeared in the 'Atlantic Monthly' in 1878, and was followed by others over the signature "Charles Egbert Craddock." Until her identity was revealed in 1885 they were supposed to be the work of a masculine writer. She has published: 'In the Tennessee Mountains' (1884); 'Where the Battle was Fought' (1884); 'The Prophet of the Great Smoky Mountains' (1885); 'Down the Ravine' (1885); 'In the Clouds' (1886); 'The Story of Keedon Bluffs' (1887); 'The Despot of Broomsedge Cove' (1888); 'His Vanished Star' (1894); 'The Phantoms of the Footbridge' (1895); 'The Mystery of Witchface Mountain' (1895); 'The Juggler' (1897); 'The Young Mountaineers' (1897); 'The Bushwhackers' (1899); 'The Story of Old Fort Loudon' (1899); 'The Champion' (1902); 'A Sceptre of Power' (1903).

Murfreesboro, mėr'frēz-bŭr-ō, Tenn., city, county-seat of Rutherford County; on the Nashville, C. & St. L. railroad; about 33 miles southeast of Nashville. The first settlement was made in 1811 and in 1817 it was incorporated. It was the capital of the State from 1819 to 1826. It is in an agricultural section in which cotton is one of the principal products. The city has a number of manufacturing establishments, chief of which are flour and lumber mills, tanneries, cotton gins, cotton compresses, machine-shops, red cedar ware factories, and carriage factories. On the site of the Stone River battlefield, near the city, is a National cemetery which contains the graves of 6,150 soldiers, 2,333 of unknown dead. (See STONE RIVER, BATTLE OF.) It is the birthplace of the author, Mary Noailles Murfree (q.v.). Pop. (1890) 3,739; (1900) 3,999.

Murger, Henri, ŏn-rē mür-zhār, French poet and novelist: b. Paris 24 March 1822; d. there 28 Jan. 1861. He entered a lawyer's office, but left it, and was for a time secretary to the Russian Count Tolstoi. Of his career in 1838–48 almost nothing is known. He was a member of an informal club or clique of unconventional and impecunious young artists and authors, which was named "Bohemia," and the associates "Bohemians"—a name famous in general literary history. He contributed a great mass of "copy" to numerous periodicals, and at last made a reputation by his 'Scènes de la Vie de Bohème' in which he appears as Rodolphe (1848). He then found sufficient to do, wrote dramas for the Luxembourg Theatre, and articles for the 'Revue des Deux Mondes.' Other works are: 'Scènes de la Vie de Jeunesse' (1851); 'Le Pays Latin' (1852); 'Le Dernier Rendezvous' (1852); and 'Les Buveurs d'Eau' (1854). Many of his lyrics are very beautiful, and his prose works, especially his masterpiece, are characterized by rare humor and pathos. Consult the appreciation in Saintsbury's 'Essays on French Novelists' (1891).

Murghab, moor-gāb', a river of Central Asia, which rises on the northern frontier of Afghanistan, in the Paropamisus Mountains, and after a northwestward course of nearly 400 miles, loses itself in the desert sands surrounding the oasis of Merv.

Mu'riacite. Same as ANHYDRITE (q.v.).

Muriat'ic Acid. See HYDROCHLORIC ACID.

Murichi, or **Morichi,** a South American palm of the genus *Mauritia* (*M. flexuosa*), also known as ita-palm; it is nearly related to the *buriti* (q.v.) or wine-palm. These palms reach a height of 100 to 150 feet, and grow along the Orinoco River, forming great forests near its mouth. It furnishes to the Indians of that region almost everything; and during much of the year, when the lowlands adjacent to the river are flooded, they dwell among its branches, like monkeys, for want of dry land upon which to rest or travel. "At the time of the inundations," says Humboldt, "the tufts of the fan-leaved murichi present the appearance of a forest issuing from the bosom of the waters. The navigator, traversing at night the branches of the Orinoco delta, sees with surprise the crowns of these palms lighted up by large fires. These are the habitations of the Guaranis suspended from the trunks of the trees. These people stretch mats in the air, fill them with earth, and on this bed of wet clay light what fires they require for household purposes. For ages they have owed their liberty and political independence to the treacherous and miry nature of their soil, which they traverse in seasons of drought, and over which they alone know how to pass in safety; to their isolation in the delta of the Orinoco, and to their living in the trees." Consult: Von Humboldt, 'Voyage aux Régions Equinoxiales,' Vol. VIII., p. 363 (1807–27).

Mu'ridæ, the family of mice and rats (qq.v.).

Murillo, mū-rĭl'ō (Sp. moo-rēl'yō), **Bartolomé Estéban,** bär-tō'lō-mā ās-tā'bän, Spanish painter; b. Seville, end of December 1617; d. there 3 April 1682. He began his art education under Juan del Castillo, and in 1642 sought wider experience in Madrid, where his townsman Velasquez was enjoying a brilliant career. By the latter he was dissuaded from a contemplated visit to Rome and secured facilities for studying in the Royal Galleries and in the Escorial. Here he placed himstlf for three years under the inspiration of Ribera, Titian, Rubens, Vandyke and Velasquez himself. In 1645 he returned to Seville where he undertook to paint 11 separate pictures for the cloister of Saint

Francis in illustration of Franciscan history. These works proved the foundation of his renown. The principal pieces of this series are 'Saint James Distributing Alms' (now in the Academy Fernando, Madrid); the so-called 'Angel Piece' (in the Louvre); 'The Death of Saint Clara' (in the Dresden Gallery). These strike the note of the early Seville school, being warm in tone, and exhibit Murillo as drawing his types of beauty from the lower orders of the Spanish people. Of even more transparent coloring are his 'Saints Leander and Isidore' in the sacristy of the Cathedral at Madrid; 'The Birth of Mary' (in the Louvre); and the 'Vision of Saint Anthony' (in Seville Cathedral, 1656); both of these latter belong to the middle period of his artistic development. In 1665 he began his four pictures for the Church of Santa Maria pa Blanca, among them being his 'Church Triumphant'; 'The Immaculate Conception' (in the Louvre); and 'The Foundation of the Church of Santa Maria Maggiore at Rome' (in the Madrid Academy). In 1668 he painted his 'Madonna Hovering in the Clouds Surrounded by Eight Saints of Seville' (in the chapter house of Seville cathedral); and about 1670 his 'Holy Family with Elizabeth and The Infant Baptist' (in the Louvre). His most brilliant period was between 1670 and 1680; and in 1674 he had completed the eight vast pictures illustrating the 'Corporal Works of Mercy.' These were intended for the church of the Caridad Hospital, and are remarkable for splendor of coloring and strength of design; the faces are lifelike in expression and the composition and perspective faultless. His 'Saint Elizabeth of Hungary Nursing the Sick' (in the Madrid Museum) belongs to this period. In 1676 he executed 20 pictures for the Capuchin monastery at Seville, 17 of which are now in the local museum. It was at this time he painted the famous 'Immaculate Conception' which Maréchal Soult took to France and sold to the nation for 615,000 francs. It is now in the Louvre, and is the work by which this painter is most popularly known. While Murillo was engaged at Cadiz in painting 'The Betrothal of Saint Catherine' for the high altar of the Capuchin church, he fell from the scaffolding and died as the result of his injuries. The work was completed by his pupil Osorio with no particular success.

Murillo has left about 400 pictures, including his devotional paintings and the many representations of the 'Immaculate Conception,' one of his favorite and characteristic subjects. His most important work in the United States is the altar-piece in the Cathedral of Saint Peter's at Cincinnati. He was the greatest of Spanish religious painters because his Madonnas are real Spanish women and only raised by the magic of his brush into sainthood or apotheosis. But he was a great genre painter also. He knew the gypsies and beggars of Spain as well as he knew the saints. He could paint landscape and portrait, flowers and fruit, maidens and children of that Seville which he loved so well and never left for France or Italy. Unswayed by the influence of the dazzling schools of Tuscany or Flanders he has confined himself to Spanish faces, to Spanish atmosphere and scenery, and has realized a manner and color of his own. If he has sacrificed in this way anything of vigor or variety he has gained far more in originality, sincerity, verisimilitude, and an individuality which is truly national.

Consult: Tubino, 'Murillo, su epoca, su vida, sus quadros' (1864); Curtis, 'Velasquez and Murillo' (1881); Lefort, 'Murillo et ses élèves' (1892).

Mur'muru Palm. See ASTROCARYUM.

Murner, moor'nĕr, **Thomas,** German satirist and opponent of the Reformation: b. Strasburg 24 Dec. 1475; d. about 1536. He studied at the principal universities of Europe, devoting himself particularly to theology and philosophy, and early gained a reputation for ability, marred however by a quarrelsome disposition. He led an unsteady life, preaching for some time at Frankfort-on-the-Main and other places, but incurring generally the displeasure of his congregations by the coarse personalities of his sermons, and was successively expelled from Freiburg, Treves, and Venice. He became one of the most virulent opponents of the Reformation. Some of his writings against the Reformation were burned by order of the diet of Worms; and he was compelled to flee to Switzerland, whence he was in time likewise expelled. The latter part of his history is not known. In 1506 he had been crowned as poet laureate by the emperor Maximilian; and his 'Narrenbeschwörung' (1512), of which his 'Der Schelmenzunft' (1512) may be regarded as a continuation, is one of the most remarkable imitations of Sebastian Brant's celebrated satirical poem entitled 'Narrenschiff.' He wrote 'Chartiludium logice,' etc. (1507), and other Latin works; prepared a German version of Virgil and other translations; and was also regarded as the editor of 'Eulenspiegel.' But he is chiefly remembered by his writings against Luther and the Reformation. His most celebrated satirical work is entitled 'Von dem grossen Lutherischen Narren' (1522; new ed., 1848). Consult: Lappenburg, 'Murners Eulenspiegel' (1854); Goedeke, 'Murners Narrenbeschwörung' (1879); Kawerau, 'Thomas Murner und die Kirche des Mittelalters' (1890).

Mur'phey, Archibald De Bow, American jurist: b. Caswell County, N. C., 1777; d. Hillsboro, N. C., 3 Feb. 1832. He was graduated from the University of North Carolina in 1799 and was for the three succeeding years professor of ancient languages there. He studied law and was admitted to the bar in 1802 and established a large practice. He was a member of the State senate in 1812–18 and proved himself an able legislator, advocating internal improvements and working earnestly to enlarge and improve the educational system of the State. In 1818 he was a judge of the superior court and in 1819–20 was a justice of the supreme court of North Carolina. He published: 'Memoir of Improvements Contemplated, and the Resources and Finances of the State' (1819); 'Reports of Cases in the Supreme Court of North Carolina in 1804–13 and 1818–19' (1821–6); etc.

Mur'phy, Arthur, British dramatist: b. Clooniquin, near Elphin, County Roscommon, Ireland, 27 Dec. 1727; d. 18 June 1805. He was educated at the Roman Catholic College of St. Omer, France, and was subsequently employed in a London banking house. In 1758 appeared

his first drama 'The Upholsterer,' a farce, directed against politicians, which proved very successful, followed by 'The Orphan of China'; 'The Way to Keep Him'; 'All in the Wrong'; 'The Citizen'; 'The Old Maid'; 'Three Weeks after Marriage'; 'Zenobia'; 'The Grecian Daughter'; etc. At various times in his life he engaged in political controversies, and edited journals opposing Mr. Fox, the first Lord Holland, and Wilkes' 'North Briton.' His plays are his best performances, and some of them, including 'The Way to Keep Him' and 'Three Weeks after Marriage,' long kept the stage.

Murphy, Charles Francis, American politician: b. New York 20 June 1858. He received a public-school education, in 1900 became a member and treasurer of the board of commissioners for docks and ferries, in 1892–1901 was chairman of the Tammany Hall Democracy, and in 1902 became its chief.

Murphy, Francis, American temperance evangelist: b. Wexford, Ireland, 24 April 1836. During the Civil War he served in the Union army. In 1870, at Portland, Maine, he began the organization of temperance reform clubs, which were established in all parts of the State, and of which he was the first president. He made his headquarters in Pittsburg, Pa., where, after his first address, in 1876, the pledge was signed by 45,000 people; and before long the signatures secured throughout the United States in response to his endeavors numbered as many as 10,000,000. His labors were also carried into England with noteworthy results. During the Spanish-American War he served as chaplain in the United States army. He still devotes himself to his evangelistic work.

Murphy, Franklin, American manufacturer and politician: b. Jersey City, N. J., 3 Jan. 1846. He entered Newark Academy, but at 16 enlisted in the army and served throughout the Civil War, being promoted to the rank of 1st lieutenant; he was engaged in the battles of Antietam, Chancellorsville, Gettysburg, and others of importance. At the close of the war he established at Newark a varnish manufacturing business which has grown into a large establishment of wide reputation. He began his political career as member of the common council at Newark, and was also member of the State legislature for six years. In 1892 he became chairman of the Republican State Committee in which capacity he conducted two successful gubernatorial campaigns. In 1902 he was elected governor of New Jersey by 17,000 majority. He is also a member of the Republican National committee.

Murphy, Henry Cruse, American politician and historian: b. Brooklyn, N. Y., 5 July 1810; d. there 1 Dec. 1882. He was graduated at Columbia in 1830, studied law, was admitted to the bar in Brooklyn, became city attorney there, and in 1842 was elected mayor. In 1843 he was elected to Congress; was a delegate to the New York Constitutional Convention in 1846; and in 1847 re-entered Congress. From 1857 to 1861 he served as United States minister to Holland. He became well known as a journalist, being for some time editor of the Brooklyn *Eagle;* and through the publication of his studies in the colonial history of New York valuable documents were brought to light. He translated from the Dutch De Vries' 'Voyages from Holland to America, 1632 to 1644' (1853), and his other publications include: 'Henry Hudson in Holland: Origin and Objects of the Voyage which Led to the Discovery of the Hudson River' (1859); 'Jacob Steendam, Noch Vasater' (1861); 'Anthology of the New Netherlands' (1865); and 'The Voyage of Verrazzano' (1875).

Murphy, John Francis, American painter: b. Oswego, N. Y., 11 Dec. 1853. He came to New York in 1875 and educated himself in art, giving especial attention to landscape painting. His first picture to appear in the National Academy of Design was exhibited in 1876, and since 1887 he has been a National Academician. His painting 'Tints of a Vanished Past' gained the Haligarten prize (1885). In 1887 he was awarded the Webb prize by the Society of American Artists of which he is a member.

Murphy, Nathan O., American politician: b. Jefferson, Maine, 14 Oct. 1849. He was educated in the public schools; was a teacher in Wisconsin, 1866–9; removed to Arizona about 1870; engaged in mining, law practice, and railroad construction; was governor of the Territory in 1892 and in 1898–1902; and in 1893 was elected territorial delegate to Congress by the Republican vote.

Murphysboro, mûr'fĭz-bŭr-ō, Ill., city, county-seat of Jackson County; on the Big Muddy River, and on the Mobile & O., the St. Louis V., and the Illinois C. R.R.'s; about 140 miles south of Springfield. It is situated in an agricultural section, and nearby are coal-fields, timber, and building stone. The chief industrial establishments are foundries, machine-shops, flour and lumber mills, and brick and tile yards. There is a large trade in farm and dairy products, coal, and lumber. Pop. (1890) 3,880; (1900) 6,463.

Mur'rain, loosely, any widely prevailing and contagious disease among domestic animals. The term is applied to various specific disorders in different localities, but more particularly to the epizootic diseases, especially those of cattle. Still more strictly it is limited to the plague commonly known as the foot-and-mouth disease (aphthous fever), which attacks cattle and other animals, causing loss of appetite, febrile disturbance, lameness, vesicular eruptions on the feet and in the mouth, etc., with frequent complications. See ANTHRAX; CATTLE-PLAGUE; RINDERPEST; TEXAS FEVER.

Murray, mŭr'ā, **Alexander,** American naval officer: b. Chestertown, Md., 1765; d. Philadelphia 6 Oct. 1821. In 1776 he received a commission in the then half-organized navy, and while waiting for sea duty entered the army, serving (1776–7) as lieutenant and captain in the 1st Maryland regiment, and participating in the actions and operations near New York. Toward the end of 1777 he was given command of the Revenge with letters of marque; was captured by the British, exchanged, served with distinction on the Trumbull; was again captured and exchanged; then took command of a privateer, and served later on the Alliance. In 1798, on the reorganization of the navy, he was appointed captain and during the difficulties with France commanded the Montezuma. Transferred to the Constellation, he

served in the Mediterranean during the war with Tripoli, in which he initiated actual hostilities by attacking a flotilla of the enemy. After that war he was mainly engaged in shore duty until his death.

Murray, Alexander, Scottish linguist: b. Dunkitterick, Kirkcudbrightshire, 22 Oct. 1775; d. Edinburgh 15 April 1813. With little but self-acquired education he learned not only English, but Continental and Oriental languages, Latin, Greek, and Hebrew. After studying at the University of Edinburgh he settled as pastor (1808) at Urr, and four years later became professor of Oriental languages at Edinburgh. He edited Bruce's 'Travels' (1805), and his works include 'Outlines of Oriental Philology' (1812) and 'History of the European Languages,' the latter published after his death, with a slight autobiography and a memoir (1823).

Murray, David, American educator and author: b. Delhi, N. Y., 15 Oct. 1829. He was graduated from Union College in 1852 and in 1863–73 he was professor in Rutgers College. In 1873–9 he was adviser to the Imperial minister of education in Japan and in 1880 became secretary of the New York Board of Regents. He has published: 'Story of Japan' (1894); 'History of Education in New Jersey'; 'History of Delaware County, N. Y.'; etc.

Murray, David Christie, English novelist: b. West Bromwich, Staffordshire, England, 13 April 1847. He was educated privately and his first journalistic work was done on the Birmingham press. He removed to London in 1873 where he wrote for the *Daily News* and for the *World,* and in the Russo-Turkish war he was special correspondent for the *Times.* His first novel 'A Life's Atonement' was published in 1879 and he has since devoted himself to chiefly fiction. Among his numerous and popular novels are: 'Way of the World' (1884); 'The Weaker Vessel' (1888); 'A Rising Star' (1894); 'This Little World' (1897); 'Despair's Last Journey' (1901); etc.

Murray, George Henry, Canadian politician: b. Grand Narrows, Nova Scotia, 7 June 1861. He was educated in Grand Narrows and in Boston University and was admitted to the bar in 1883. He was appointed to the legislative council of Nova Scotia in 1889 and in 1896 became premier and provincial secretary of Nova Scotia under a Liberal administration. He was elected to the Dominion Parliament in 1897.

Murray, Grenville ("EUSTACE CLARE"), English journalist: b. 1824; d. Passy, France, 20 Dec. 1881. He was in the diplomatic service from 1851 to 1868, but was generally in discord with his superiors or with British residents. From 1869 he lived in France, where he was Paris correspondent of the *Pall Mall Gazette* and the *Daily News,* and an early contributor to the 'Cornhill.' He was one of the ablest journalists of his time. A voluminous writer, among his works were: 'The Roving Englishman,' chapters of travel (1854); 'Embassies and Foreign Courts' (1855); 'The Member for Paris' (1871); 'Young Brown' (1874); 'Turkey' (1877); 'The Russians of To-day' (1878); 'Under the Lens: Social Photographs' (1885).

Murray, James, Scottish soldier: b. about 1725; d. 1794. He was a son of the fourth Lord Elibank, and about 1740 entered the army; came with his regiment to America in 1757; at the siege of Louisburg (1758) commanded a brigade; and in the battle on the Heights of Abraham (13 Sept. 1759) led the left wing of the army under Wolfe. In 1760 he held Quebec against superior numbers of the French, in the same year served with Amherst in the reduction of Montreal, and was made governor of Quebec. From 1763 to 1766 he was governor of Canada; in 1774 became governor of Minorca; was compelled to surrender Fort Saint Philip to the French, in 1782, after a heavy siege, and upon returning to England was court-martialed and acquitted. In 1783 he was made a full general in the British army. Consult: Parkman, 'Montcalm and Wolfe' (1884, 1898).

Murray, James Augustus Henry, Scottish philologist and lexicographer: b. Denholm, near Hawick, Roxburghshire, 1837. He was graduated B.A. of London University, from 1855 till 1858 was an assistant master in Hawick Grammar-school, becoming in the latter year master of Hawick Academy, for a few years was foreign correspondent to the Oriental Bank in London, and from 1870 till his removal to Oxford in 1885 a master at Mill Hill School. He was president of the Philological Society in 1878–80 and 1882–4. Since 1879 Dr. Murray has been general editor of the 'New English Dictionary on Historical Principles,' the great work issued under the auspices of the Philological Society from the Clarendon Press, Oxford. Other works by him are: 'A Week among the Antiquities of Orkney' (1861), 'Dialects of the Southern Counties of Scotland' (1873), 'Synopsis of Paley's *Horæ Paulinæ*' (1872), 'The Romance and Prophecies of Thomas of Ercildoune' (1875), the article 'English Language' in the 'Encyclopædia Britannica' (9th ed.), and many papers on the archæology, natural history, geology and language of the border counties of Scotland. In 1884 he was awarded a civil list pension of £270 per annum.

Murray, or **Moray, James Stuart,** EARL OF. See STUART, JAMES.

Murray, John, American clergyman, founder of American Universalism: b. Alton, Hampshire, England, 10 Dec. 1741; d. Boston, Mass., 3 Sept. 1815. He was brought up in Ireland, where he joined the Methodist congregation and did some preaching, but in 1760 went to England, came under the influence of James Relly, and was excommunicated by Whitefield. He came to America in 1770; preached in Newport, Boston and Portsmouth his peculiar doctrines, which agree with modern Universalism only in the belief of universal salvation, but otherwise held to the dogma of the Trinity, of a personal devil, and of the incarnation; and at the outbreak of the Revolution was chaplain of a Rhode Island brigade for a short time, during which his resignation was demanded by the orthodox chaplains in the army. He formed a Universalist church in Gloucester, and in 1783 recovered property belonging to his parishioners which had been seized by the parish authorities, who acted on the ground that the Universalists had no corporate existence; the success of this suit was

a distinct advance in congregational freedom in New England. At his death he was in charge of the Universalist Society of Boston. He wrote 'Letters and Sketches' (1812), and an 'Autobiography,' continued and edited by his wife (1816).

Murray, John, English publisher: b. London 27 Nov. 1778; d. there 27 June 1843. He began business in 1799, early attained success, and became the friend of, as well as publisher for, some of the chief writers of the day, including Byron, Moore, Rogers, Campbell, Crabbe, Washington Irving, George Borrow, and Benjamin Disraeli. He started the 'Quarterly Review' in February 1809 in opposition to the Whig 'Edinburgh Review,' of which Gifford, S. T. Coleridge, and Lockhart were editors, and Scott and Southey contributors. By 1817 the 'Quarterly' was a great success. In 1824 Murray was involved in the controversy with Moore regarding the destruction of Byron's 'Memoirs'; and in 1826 undertook the publication of the *Representative,* a daily newspaper, which, after running six months was discontinued at a loss of $130,000. Consult: Moore, 'Life of Byron' (1830); and Smiles, 'A Publisher and his Friends' (1891).

Murray, Sir **John,** Canadian scientist: b. Coburg, Ontario, 3 March 1841. He was educated at Edinburgh University. In 1867 he accompanied for biological purposes an expedition to Spitzbergen and Greenland, and in 1872 was appointed one of the scientific staff of the Challenger expedition. From 1876 till 1882 he was chief assistant-editor of the scientific reports published in connection with that voyage, and in the latter year became editor-in-chief. He also accompanied several other scientific exploring expeditions in various parts of the world. Besides editing the Challenger reports a large number of papers on geographical, oceanographical, and biological subjects. He has received many honors from learned bodies, including the Royal Society's royal medal, the Founder's medal of the Royal Geographical Society, and the Cuvier prize of the Institute of France.

Murray, John Clark, Canadian educator: b. Paisley, Scotland, 19 March 1836. He was educated in the universities of Edinburgh and Göttingen and in 1862 accepted the chair of philosophy in Queen's University, Kingston, Canada. Since 1872 he has been professor of moral philosophy in M'Gill University, Montreal. He has published: 'Outlines of Sir W. Hamilton's Philosophy' (1870); 'The Ballads and Songs of Scotland' (1874); 'A Handbook of Psychology' (1885); 'An Introduction to Ethics' (1901); etc.

Murray, John O'Kane, American historian: b. Glenariffe, Ireland, 12 Dec. 1847; d. Chicago, Ill., 30 July 1885. He removed to the United States where he became a physician and author of some repute. His most important work was a 'Popular History of the Catholic Church in America' (1876) and among his other books are: 'The Catholic Heroes and Heroines of America' (1878); 'Lessons in English Literature' (1883); etc.

Murray, Lindley, American grammarian: b. Swatara, Lancaster County, Pa., 22 April 1745; d. Holgate, near York, England, 16 Feb. 1826. He was son of M. L. Murray (q.v.). He studied the law (1761–5) and practised as a barrister; but after the Revolution quitted the bar for commercial speculation, and having realized a fortune, went, in 1784, to England for reasons of health, and settled at Holgate, near York. His 'English Grammar' (1795) met with a truly enormous success, being almost universally introduced as a text-book in England and the United States, and for years was regarded as the standard authority. It passed through nearly 50 editions in its original form, and was abridged, enlarged, simplified, and otherwise edited. A corrected edition by the author was published in 1816, and his abridgment (1818) of this went through 150 editions, each of 10,000 copies. His work was far from accurate, however, and was soon superseded; but it freed a difficult subject from chaos. He wrote further educational and religious works, and an autobiography edited and continued by Frank (1826).

Murray, Mary Lindley, American heroine: b. Pennsylvania; d. New York 25 Dec. 1782 (O. S.). She is known through an incident of the Revolution. On 15 Sept. 1776 the British line of march passed her residence, "The Grange," a small country-seat at Murray Hill, New York. Putnam, having evacuated New York, was at the same time marching along the Bloomingdale road near the North River, intending to join Washington at Harlem Heights. Howe thought by marching across the island to cut off the American retreat. He was, however, invited, with his officers, to luncheon at "The Grange" by Mrs. Murray, accepted, and remained more than two hours, during which time Putnam escaped. A bronze tablet in commemoration was placed in the parked enclosure on Park Avenue below 37th Street on Evacuation day (25 Nov.) 1903.

Murray, William, Earl of Mansfield. See Mansfield, William Murray, Earl of.

Murray, William Henry Harrison, American writer: b. Guilford, Conn., 26 April 1840. He was graduated from Yale in 1862, entered the Congregational ministry the next year and held pastorates in Greenwich and Meriden, Conn. In 1868 he became pastor of Park Street Church, Boston, and from 1869 to 1873 delivered Sunday evening talks in Boston Music Hall to crowded houses. He resigned his charge in 1874 and later left the ministry. He has published 'The Perfect Horse' (1873); 'Adirondack Tales' (1877); 'How Deacon Tubner Kept New Year's' (1887); 'Adventures in the Wilderness'; 'Deacons'; 'Music Hall Sermons'; 'Sermons from Park Street Pulpit'; 'The Doom of Mamelons'; etc.

Murray, William Vans, American diplomat: b. Maryland about 1762; d. Cambridge, Md., 11 Dec. 1803. He received a classical education and after peace was declared in 1783 he went to London and studied law. He returned to the United States in 1785 and established a law practice in Maryland. In 1791–7 he served in Congress where he gained a reputation as a learned and skilful legislator and in 1797 was appointed by Washington minister to the Netherlands. He was envoy to France in 1800 and was chiefly instrumental in concluding the treaty between the United States and that country. He then returned to the ministry at The Hague

and remained there until 1801 when he retired from public life. He published, 'The Constitutions and Laws of the United States.'

Murray, the largest river of Australia, rising in the Australian Alps, its sources being partly in New South Wales, partly in Victoria. It flows for a long distance westward, forming the boundary between these two colonies, then passes into South Australia, where it takes a southern direction, and falls into the Indian Ocean at Encounter Bay, 39 miles southeast of Adelaide, after passing through a large shallow sheet of water called Lake Alexandrina. Its total length is about 1,300 miles. Its chief affluents are the Murrumbidgee and Darling. It is navigable by light draft steamers in the wet season, for the greater part of its course to Albury, 190 miles northeast of Melbourne.

Murray Bay, or **Malbaie,** Canada, a village of Charlevoix County, Quebec, on a bay of the Murray estuary, near the north bank of the Saint Lawrence River, 90 miles east of Quebec. It has lumber industries, and its dependent suburbs, Pointe à Pic and Cap à l'Aigle, at each end of the bay, are popular summer resorts, the surrounding country being very attractive and affording angling, rowing, bathing, and other facilities. Steamboats connect with Quebec. During the Revolutionary War, Murray Bay was a station for United States prisoners of war. Pop. (1901) 826.

Murre, mėr, or **Murrelet,** an auk (q.v.) of the genera *Uria, Cepphus,* and related groups; a guillemot. They are small, black-and-white, web-footed, diving, fish-eating birds, which abound on all rocky northern coasts, breeding on sea-fronting ledges, where each pair produces a single, large, pyriform, variously colored egg, which is not placed in a nest but incubated in turn by the parents, who lift it from the ground upon their webbed toes and warm it between their downy legs. Several diminutive and handsomely ornamented species of the coasts of the North Pacific are called murrelets. Consult: Baird, Brewer and Ridgway, 'North American Water-Birds' (1884); and the writings on arctic ornithology of Fielden, Nelson, Turner, Murdock, etc.

Mur'rine Vases are antique vessels, distinguished for costliness of material and beauty of execution. They were brought by Pompey from Asia to Rome, and bore an immense price. Some antiquarians have supposed them to have been made of a mineral of the class of sardonyx or agate, or of a kind of porcelain or glass.

Murrumbidgee, mŭr-ŭm-bĭd'jē, Australia, a large river of New South Wales, rising in the Gourock Range above Numeralla about 80 miles from the Pacific Ocean. It flows at first northward, but the greater part of its course is westerly; and after receiving the Lachlan from the north, near Nap Nap, it turns toward the south to join the Murray below Balranald. It flows through a fertile and picturesque district, but is navigable only in the wet season. Length about 1,300 miles.

Murshidabad, moor-shē-dā-bād', India, a town and administrative headquarters of a district of Bengal, 116 miles north of Calcutta, on the Bhaghirathi, a branch of the Ganges. It is a straggling collection chiefly of mud houses occupying an extensive area, but has several substantial brick buildings, chief of which are the beautiful Nawab's palace dating from 1837, the imambara and a Moslem mosque. Two miles south of the city is Motijihl or Pearl Lake and the site of the historic palace of Suraj-ud-Dowlah. On the opposite bank of the river connected by a ferry is Azimganj containing the old cemetery of the Nawabs, a mausoleum, mosque, etc. The city is noted for its ivory carving, its embroidery in gold and silver lace, silk weaving, and the manufacture of hookah pipes, and musical instruments. It is still a busy centre of trade but less so than during the 18th century when it was the capital of Bengal and a very populous city, the rise of Calcutta causing its decline. Pop. (1901) 15,168 with Azimganj 28,551.

Musa ibn Nosair, moo'sä ĭb'n nō-sīr', Arabian conqueror: b. Mecca, Arabia, about 660; d. Hedjaz, Arabia, 717. He conquered northern Africa in 699–709 and became its governor in 712. Jealous of the success of Tarik, whom he had sent to conquer Spain, he tried to wrest from Tarik his glory by his own brilliant conquests. This conduct brought upon him the displeasure of the caliph of Damascus who recalled him, stripped him of his honors and caused him to be killed. Other authorities state that he died in extreme poverty. See Burke's 'History of Spain,' Vol. I. (1895).

Musa (moo'sä) **Bay,** a bay formed by the western end of Fuga Island, Philippines (lying north of Luzon) and two small adjacent islands. Although it is well protected from the sea, it is resorted to for shelter only in cases of necessity, as the coral bottom makes anchorage insecure; it is, however, one of the cruising ports of the United States Navy among the outlying island groups of American possessions in the northern part of the Philippine Archipelago.

Musa'ceæ, the banana family, a group in the Order *Scitamineæ,* comprising the largest of herbaceous plants, generally destitute or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivaling palms in stateliness, the long sheathing bases of the leafstalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the mid-rib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a 3-valved capsule or fleshy. The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa,* being much used for food, while the fibres of the leaves are employed for cordage and for textile purposes (see BANANA; FIBRE).

Musæus, mū-sē'ŭs, in Greek mythology, a poet, seer, and priest, said to have been the son of Eumolpus and Selene, or, according to others, the son and pupil of Orpheus. He was the reputed author of a number of poems, oracles, purificatory verses, hymns, etc., of which we possess but a few fragments, and those of doubtful authenticity. A later Musæus, who flourished about the end of the 5th century A.D., was the author of a beautiful little poem in Greek, entitled 'Hero and Leander.' See HERO.

Musäus, moo-zā'oos, **Johann Karl August,** German author: b. Jena 29 March 1735; d. Weimar 28 Oct. 1787. He studied theology; was master of the pages at the Weimar court, and in 1770 became professor in the Weimar gymnasium. His writings, characterized by humor, simplicity, and kindly satire, include 'Der deutsche Grandison' (The German Grandison); 'Physiognomische Reisen'; 'German Popular Tales' (Volksmärchen der Deutschen), and a series of tales entitled 'Straussfedern' (Ostrich-feathers). Consult 'Life' by Müller (1867).

Mus'cæ Volitan'tes (literally, "floating flies"), in physiology, the name given to certain common phenomena of vision giving the appearance of motes or small bodies floating before the eyes. One class of these specks are a precursor of amaurosis; but another and more common class are quite harmless, and may be seen by anyone under proper conditions. A deranged stomach helps to give them greater prominence.

Mus'cardine. See SILKWORM.

Muscarin, a coal tar color introduced by Durand and Hugenin, and having the empirical formula $C_{18}H_{18}N_2O_2Cl$. It is a brownish violet powder, slightly soluble in cold water, but dissolving readily in hot water with the formation of a violet-blue solution. Powdered zinc decolorizes its aqueous solution, but the color returns upon exposure to air. Muscarin produces a blue color upon cotton that has been mordanted with tannin and tartar emetic.

Muscarine, an alkaloid having the chemical formula $C_5H_{15}NO_2$, and occurring in certain mushrooms, notably in the "fly agaric" (*Agaricus muscarius*). It is also formed in the putrefactive decay of flesh. It may be obtained in the form of deliquescent crystals which are without taste, and insoluble in ether, though readily soluble in water and in alcohol. Solutions of the alkaloid are strongly alkaline, and precipitate ferric and cupric salts in the form of hydrates. Muscarine is exceedingly poisonous. It contracts the pupil of the eye, slows the pulse by prolonging the diastolic state of the heart, and induces salivation, vomiting, intestinal spasms, and general muscular weakness, followed by death. The "fly agaric" takes its name from the fact that flies that alight upon it are killed, either by the muscarine or by another alkaloid, neurine, which the fungus also contains.

Muscat, mŭs-kăt', **Muskat,** or **Maskat,** Arabia, the capital of Oman, on the Gulf of Oman, commanding the entrance to the Persian Gulf. It is a fortified seaport of considerable commercial and strategical importance; the seat of the Imam or Sultan of Muscat; by arrangement has a British political resident; and since 1898 is used as a coaling station by France. Its appearance by no means corresponds with its wealth and importance. Large buildings are few, and the sultan's palace (a plain edifice), the governor's house, and a few minarets, alone rise above the mass of flat-roofed huts or houses. The streets are extremely narrow and its situation at the foot of high cliffs, and nearly surrounded by bare rocks, renders it one of the hottest places in the world. A sufficient supply of water is obtained from wells about 40 feet deep. About three miles distant is the town of Mattrah with docks for building and repairing shipping. As it stands in an open plain, exposed to the sea-breeze, it is cooler than Muscat, so that many of the wealthier merchants of the latter place have their dwellings at Mattrah, and spend only the hours of business in the neighboring city. The combined population of Muscat, Mattrah, and intervening villages, has been variously estimated at 25,000 and at 60,000.

Muscat was occupied by the Portuguese under Albuquerque in 1507. In 1651 it fell again under a Mohammedan ruler. In the latter half of the 18th century it attained, under a ruler who bore the religious title of Imam, considerable importance as a seaport. In 1808 Seid Saïd succeeded to the sovereignty, having assassinated his cousin Bedr. His sovereignty embraced also a stretch on the east coast of Africa, extending from the neighborhood of Cape Delgado northward as far as the equator. In like manner a large portion of the coast of the Persian Gulf acknowledged his sway, so that, including Omán and the African islands Zanzibar, Monfia or Mafia, and Pemba, the coasts ruled by him, for the most part only commercially, could not have had an extent of less than 3,000 miles. In 1840 Seid Saïd removed the court and seat of government from Muscat to Zanzibar, and in 1856 died on the return voyage from a visit paid to the former place. His son Mejed succeeded him as Sultan of Zanzibar and ruler of the African territory, and another son acquired Muscat. Seyyid Toorkee became ruler of Muscat in 1871, and on his death in 1888 a son succeeded him.

Mus'catel, a name given to French and Italian wines, white or red.

Muscatine, mŭs-ka-tēn', Iowa, city, county-seat of Muscatine County; on the Mississippi River, and on the Iowa C., the Chicago, R. I. & P., and the Burlington, C. R. & N. R.R.'s; about 25 miles below Davenport and 140 miles east by south of Des Moines. It is at a bend in the river where the waters change from a westward to a southward current. As usual along the west bank of the Mississippi, the city is on high bluffs which command an extended view of the river. It was first settled in 1833, and in 1839 was incorporated. It is situated in a fertile agricultural region in which there is considerable wood land. Muscatine Island, just below the city, is noted for its watermelons. The chief industries of the city are connected with the manufacturing of foundry and machine-shop products, oatmeal, flour, pickles, brick, tile, boxes, buttons, packing cases, wagons, carriages, pottery, rolling-mill products, canned goods, lead works, and lumber. It has considerable trade in its manufactured articles, farm and dairy products, hogs, lumber, and fruit.

Muscatine has good public and parish schools and several private schools. It has the public Musser Library. It has also several charitable institutions. The government is vested in a mayor, who holds office two years, and a council. The school board, police judge, treasurer, assessor, and wharf master are chosen at a popular election by the people. The waterworks are owned and operated by the city. Pop. (1890) 11,454; (1900) 14,073.

Muschelkalk, mûsh'ĕl-kălk, a German name, signifying shell lime, applied to geological beds of middle Triassic or New Red Sandstone period, occurring in the Alps, in northwestern Germany, Alsace and Lorraine, Swabia, Franconia, Hesse, Thuringia and upper Silesia. The name is due to the many fossil remains of Cephalopods, Encrinites, and Mollusks in general found in the limestone mass of these beds. The Muschelkalk is divided into lower, middle and upper.

Muscle-reading, a form of observation whereby one who is specially trained may, by careful study of muscular movements, interpret many thoughts that are in the minds of others. This is possible because many thoughts are expressed in some manner of muscular action. Thus a person who is told to think steadily, bearing in mind a certain number, unconsciously says that number over and over to himself, making thereby very minute muscular movements of the lips. These can be seen and read by a skilled person, and thus is explained the common trick of many so-called clairvoyants. This tendency of motor expression of mental images is very pronounced in some people. They involuntarily go toward or away from a hidden object, and a blindfold person can often find these objects by carefully noting the degree of muscular resistance or acquiescence in their search for such objects. This parlor trick takes much practice, a quick sense, and much concentration, but does not involve any «thought-transference,» or «mind-reading.» Some people become very skilful in this type of observation, and all may acquire a certain amount of skill by careful watching. Much of the so-called intuition of women is in reality muscle-reading. They are on the lookout for certain forms of muscular reaction, and can thus guess at what is going on in the minds of others. Their constant contact with small children, who characteristically show what they are thinking about, through their muscles of expression, is a school of experience for them. (See EMOTIONS.) Consult: Jastrow, 'American Journal of Psychology,' Vol. IV., p. 398; Preyer, 'Die Erklärung des Gedankenlesens' (1886); and 'Fact and Fancy in Psychology' (1900).

SMITH ELY JELLIFFE, M.D.,
Editor 'Journal of Nervous and Mental Disease.'

Muscle-sensation, a loose and vague phrase, otherwise muscle-sense, to express the sum of sensations that come from the joints, skin, muscles, and tendons in the act of making muscular movements. It is also applied to a generalized dull sensation which results from the stimulation of a muscle, either from electrical discharge, or from fatigue following the long-continued stimulation of either a voluntary or involuntary muscle. The perceptions of muscular sense are usually grouped under (1) those of posture; (2) those of passive movement; (3) those of active movement; (4) those of resistance to movement. The muscle-sense is of much importance in imparting information concerning the relative position of the different members of the body, and its loss in this particular (asterognosis) constitutes a valuable symptom in the diagnosis of certain nerve disorders. The muscle-sense is all-important in maintaining bodily equilibrium. Each joint in the body possesses a varying degree of delicacy in this function of equilibrium. Thus the shoulder-joint is considered to be 40 times as delicate in this respect as the joints of the fingers. Angle of bending and speed of movement are both important in the interpretation of these joint-sensations. Muscle-sense in all its bearings has close relations to accuracy and skill in all limb-movements, as seen in marksmanship, ball-playing, billiards, golf, etc., in all sports and games requiring delicate muscular adaptations.

SMITH ELY JELLIFFE, M.D.,
Editor 'Journal of Nervous and Mental Disease.'

Muscles. The organs called muscles are made up of a collection of muscle-cells, which have for their function the accomplishment of bodily movements. These movements may be gross, as in walking, or very minute, such as take place in the contracting movements of the arteries or veins; they may be voluntary, called into action by willed impulses from the brain, or they may be involuntary and brought about by different stimuli from some part of the central nervous system. The muscular movements necessary in writing are illustrative of the voluntary type; the heart-beat, of the involuntary variety. In point of evolutionary development the involuntary movements may be said to have preceded the voluntary, and hence in regard to complexity of structure the involuntary muscle-cells are simpler than the muscle-cells that perform voluntary movements, and to these two types of cells students of minute anatomy have given the names of unstriped or involuntary muscle, and striped or voluntary muscle. The muscular tissue of the heart is of intermediary character. It is a striped involuntary muscle. Muscle-tissue, like protoplasm, is strongly contractile, but unlike ordinary protoplasm, which can contract in all directions, muscle-substance can contract in only one direction. The simplest type of muscle-substance is seen in many lower animals. In these the muscle-cells are elongated spindles with sharpened ends and with a single elliptical to rod-shaped nucleus, situated about the middle of the fibre. They show a faint longitudinal striation, vary in length from 40 to 500 microns (1-600, 1-50 of an inch) in length, and 3 to 8 microns (1-8000, 1-3000 inch) in diameter. These muscle-cells in man correspond to the unstriped muscle-cells, are bound together in bundles, or flattened plates by an intercellular cement-substance, and are found more particularly in the walls of the intestine, the trachea, bronchi, blood-vessels, bladder, ureter, uterus, in many of the organs of the body, and in glandular structures. They have a rich blood-supply, and a nervous network of sensory terminal filaments, as well as fibres from the sympathetic nervous system. The pains of an intestinal colic, of a gall-stone, of childbirth, are all due to forcible contractions of these involuntary muscle-cells in the respective organs. The more prominent muscles of the body, such as those that move the various bones, the muscles proper, and such as are eaten as roast beef, are of the striped variety. These are a modification of the simple spindle-cells. In man they orig-

inate in the mesoderm (q.v.); muscle-substance commences to form in the interior of some of the cells; these elongate, many nuclei are formed, and the final result is a bundle of much elongated cylindrical cells 12 cm. (2 inches) long and from 10 to 100 microns (1-2500 to 1-250 inch) broad. Each cell is covered by a special sheath, the sarcolemma, and within is made up of very intricate and minutely structured protoplasm, the most striking feature of which is its banded or striated appearance; hence the name striated. Just within the sarcolemma a number of flattened elliptical muscle-nuclei are found. In insects striped muscle-tissue can be studied to best advantage. Occasionally branched forms of striated muscle are found. Blood-vessels are numerous in striped muscle, and lymphatics and nerves are also abundant. Special types of nerve-endings, muscle-plates, are characteristic of voluntary muscle.

Heart-muscle differs from ordinary striped muscle by having shorter oblong cells, which are branched. There is no sarcolemma, and the cells contain but one or two nuclei, which are situated in the centre of the muscle-substance. Blood-vessels, lymphatics, and nerves are plentiful in the heart muscle.

Groups of these muscle-cells, with connective tissues, tendons, and fat, make up the gross muscles of the human body. The voluntary muscles are all attached to bony structures; the involuntary muscles are found in the softer parts. Contraction and expansion are the expressions of their functions, each set of muscles being provided with antagonists, and it is characteristic that in response to pleasure-giving stimuli movements of expansion result, whereas under painful stimuli contraction is marked. Modern psychological theories have been founded on this fundamental principle, emotional states being interpreted as being founded on visceral muscular activities. The forms of external stimuli that can cause muscular action are usually classed as mechanial, chemical, thermal, and electrical. Excess of stimulus brings about a condition of fatigue in muscle. This is accompanied by diminished muscular power, by pain or discomfort, by diminished reflex excitability, and by vague symptoms in the body indicative of some perversion of metabolism.

Muscles are classified in various ways; according to structure or according to their function, or by their positions and situations in the body. For example, some muscles are attached to bones, which they move after the fashion of levers. Such muscles are said to arise or take origin from definite points of bones, and are generally inserted into bones by tendinous prolongations of the muscular substance. The insertion is the moving point, and the origin the fixed point of the muscle. The tendons of muscles vary in length and breadth. They represent inelastic bands of fibrous tissue, the fibres of which insensibly merge into and become continuous with their attached muscular fibres. When the tendinous fibres of muscles become greatly broadened out, so as to form fibrous webs or membranes, which separate or enclose muscles, or which afford extensive surfaces for their attachments, the term aponeuroses is then applied to them. Such aponeurotic expansions are seen in the terminations of the muscles of the abdominal wall, in the scalp, and in other situations. The limit or extent of the action of a muscle is determined by the length of its fibres, whilst its degree of force or strength depends on the number of the fibres. Other muscles are not attached to bones as levers, but on the contrary surround and enclose cavities, which they limit or expand as required. Such hollow muscles are exemplified in the heart and uterus, in the muscular fibres of blood-vessels, in the muscles of the digestive tract, in the iris of the eye, etc.

The nature, mode, and effects of muscular action may be briefly considered in connection with the present subject. The muscles which have the most active functions are those most abundantly nourished. Every action on the part of a living being results in the production of a certain amount of waste material, evinced by perceptible differences in the chemical composition of the tissue. And when it is remembered that the nervous and vascular supply of muscle is also concerned in muscular work and waste, the entire question is seen to assume aspects of a very intricate and complicated nature. Increased exercise of muscles — as seen in gymnastic exercises, or in the exercise of certain trades (for example, the arms of the blacksmith and the lower limbs of the ballet-dancer) — demanding increased nutrition, results in the increased growth of the muscle, and in the formation of new tissue. This result, it is evident, can take place only when the nutrition of the tissue keeps pace with, or slightly outstrips its waste and wear.

The property of contractility distinctive of muscular tissue, and through which its functions are manifested, is generally, though not always or invariably, brought into action through the stimulus of the nervous system, or more widely speaking, through stimuli conveyed to the muscular fibres through the nerves. The subject of the various kinds of muscular actions involves both physiological and mechanical considerations. The voluntary muscles thus constitute moving powers for the bones as levers; and in the living body examples of the three kinds of levers which mechanical science distinguishes are found. In the familiar action of the biceps muscle, which flexes or bends the fore upon the upper arm, is seen an instance of a lever of the third kind, in which the power (represented by the insertion of the muscle on the radius or bone of the fore-arm) is placed between the fulcrum (at the elbow-joint) and the weight (in the hand). The lever of the second order may be illustrated by the raising of the body upon the toes, as in the act of making a step forward in walking. Here the weight (represented by the body pressing on the ankle) is placed between the fulcrum (formed by the fixed toes) and the power represented by the muscles of the calf). The head moving on the spine illustrates a lever of the first order; the fulcrum being represented by the atlas vertebræ, the power by the muscles of the neck, and the weight by the heavier portion of the skull situated in front of the spine. See ANATOMY.

SMITH ELY JELLIFFE, M.D.,
Editor 'Journal of Nervous and Mental Disease.'

Muscles, Diseases of. Very little is known of the diseases of muscles themselves. Muscle-tissue, in common with other types of

tissue, undergoes certain forms of degeneration, fatty, mucoid, gelatinous, calcareous, etc., but of the diseases of the muscular tissues themselves there are few well-defined types. The reason for this lack of definite information bearing on diseases of the muscles is largely due to the close relationship that the nervous system bears to the muscular system. This renders it almost impossible to distinguish between a disease of the muscle and a disease of the nerve which is distributed to that muscle. Thus, at the present time, it is held that many of the forms of muscular atrophy and some of the forms of muscular dystrophy are forms of the diseases of the nervous mechanism of the muscle rather than disease of the muscle itself. In former times these were classed as diseases of muscle.

Myositis, simple inflammation of the voluntary muscles, is a form of acute or subacute inflammation in the muscle, due probably to some infectious organism. It is characterized by stiffness of the muscles and with swelling in the muscle-substance. It is usually progressive, the muscles of the body becoming stiff, hard, and fragile, and undergoing fatty degeneration. Myositis is probably a very rare affection, and it is not yet known whether it is a primary or a secondary condition. Ordinary muscular spasms or muscular cramps are in reality localized neuralgias in the muscle, and should be considered as of nervous rather than muscular origin. Lumbago is one of the conspicuous examples of a neuromuscular affection. Myoclonia or Friedrich's disease, and myotonia, or Thomsen's disease, are two forms of disease affecting the muscular system that have certain alliances with hysterical affections, and although regarded by many as of purely muscular origin, there are many reasons for believing that these diseases are of the neuromuscular type. In myotonia the disease usually comes on in childhood; the muscles become stiff, and the children are noted for being clumsy in their movements. The contractions, as in the hand, for instance, commence very slowly and are performed almost automatically, and when the patient desires to loosen his grasp of an object the muscular response is slow, the contraction often persists, or the patient may be scarcely able to open his hand. In much the same manner walking is affected; the patient starts with difficulty; one leg seems to be stiff and halts; but after a few moments of limbering up, as it were, the patient may be able to walk more or less briskly. The disease is chronic, and is possibly of hysterical nature. No treatment is known.

Myoclonia occurs chiefly in patients of bad nervous condition, and consists in clonic contractions of the muscles of the extremities. These contractions somewhat resemble chorea. Associated muscle-groups seem to be involved in myoclonia, whereas in chorea the contractions are extremely irregular. The disease is probably most closely associated with the convulsive tics and is probably due to some affection of the motor cortex. Treatment seems unavailing.

Myositis ossificans is a very rare chronic affection of muscles, during which the muscles become harder and harder, and finally develop bone-like transformations, so that the patient becomes like the ossified man of the circus. As a matter of fact most of these cases drift into museums and circuses. Very little is known as to the cause of the disease, and treatment is unavailing. See NEUROMUSCULAR DISEASES.

Muscogee, mŭs-kō'gē, Ind. Ter., town in the Creek Nation territory; on the Missouri, Kansas & Texas railroad; about 120 miles east by north of Oklahoma. It is in the midst of a fertile agricultural region where some attention is given to cultivating wheat and considerable attention to raising cattle. Its chief trade is in wheat and live-stock. It is the seat of the Henry Kendall College, founded in 1894 under the auspices of the Presbyterians. In 1903 there were in attendance over 200 pupils. The courses lead to the degrees of A.B., B.S., and B.L. Muscogee is the headquarters of the Government Indian Agent. Pop. (1900) 4,254.

Muscogees. See MUSKHOGEAN INDIANS.

Muscovite, or **Common Mica,** a native silicate of aluminum, potassium and hydrogen, occurring in crystals that belong to the monoclinic system, though usually hexagonal or rhombic in general form, and distinguished by the facility with which it may be split into thin laminæ. Muscovite also occurs in massive forms, and in scaly aggregates. It occurs in various colors, and has a lustre that is vitreous or pearly. It is transparent or translucent, with a hardness of from 2 to 2.5, and a specific gravity of from 2.8 to 3. It is a very common mineral, and is an essential constituent of granite, gneiss, and numerous other rocks. The transparent varieties, when obtainable in considerable size, are used for the manufacture of gas-burner chimneys, for covering the windows of stoves and the "peep-holes" of furnaces, and for other purposes where transparency must be combined with infusibility and with a considerable power of resisting the prolonged action of heat. Considerable quantities of it are mined in Bengal and in Switzerland, and fine deposits occur in many parts of the United States. Perfectly transparent plates a yard in diameter are sometimes found at Grafton, N. H., and similar specimens also occur in the western part of North Carolina. Pulverized muscovite is employed in the preparation of certain kinds of paint, and in the manufacture of insulating material for use about electric machinery. Muscovite is not affected by acids, but decomposes upon being fused with the alkaline carbonates. The name "muscovite" is derived from the older popular name "muscovy-glass," which is supposed to refer to the fact that the Russians used it for window-panes. See MICA.

Mus'covy Duck, or **Musk-duck.** See DUCK.

Mus'cular Christianity, a phrase originating with Charles Kingsley (q.v.), to denote robust, healthy, religious feeling which encourages and takes an active part in the harmless and healthy amusements of life, as opposed to a puritanical, ascetic, or contemplative form of religion.

Muscular System, Development of. Two main forms of muscle-tissue (see MUSCLES) exist in the human body, the striated muscle-tissue, which makes up the muscles of the bony framework of the body, and is under control of the brain, and the unstriated muscle-tissue, which is under the control of the sympathetic nervous system. (See NERVOUS SYSTEM.) The

heart-muscle is regarded as an intermediate form, resembling striated muscle-tissue, but in its development more nearly allied to the more primitive unstriated muscle-tissue. Non-striated muscle-tissue is formed by a direct transition of certain cells in the middle germinal layers (see EMBRYOLOGY) or mesenchyme. At first these muscle-fibres are irregularly distributed, but later they are collected into small bundles or into layers, and become associated with the individual organs with which they functionate. Striped muscular tissue develops from the same layer, but the details of development, as is the case in the histogenesis of the heart-muscle, are extremely complicated. The cells at first develop a mesh-like structure or reticulum. This reticulum develops small disks, which later become small columns of muscular tissue. The columns at first develop at the periphery of the cell, and gradually fill in around the nucleus, which in the heart-muscle lies in the centre of the cell, whereas in the muscles of the skeleton the nucleus is pushed to one side, or disappears, new nuclei appearing just beneath the sarcolemma-sheath. The skeletal muscles develop in regular order from the different segments (somites) of the mesoderm. In the early stages the distribution is very symmetrical, but later it becomes extremely ununiform by reason of the irregular welding of different segments of the bony skeleton. There remains, however, a regular association of the muscular myotomes and their embryonic nerve supply, and the homologies of structure may be traced by the nerve-supply, although the muscles themselves may have shifted from their original position. This is a question of highly technical nature, but has many practical bearings in modern medicine. Thus the great broad muscle of the back, the latissimus dorsi, which arises from the seventh and eighth cervical segments, but later migrates and is fastened all the way down the spine as far as the crest of the hip-bone, is supplied by a nerve which also develops from the seventh and eighth cervical nerves. The developmental history of each skeletal muscle can thus be traced by means of its nerve-supply. The whole process is one of extreme intricacy and should be studied in special monographs.

Evolution of Muscular Tissue.— As in the development of the muscular system in man there has been a gradual evolution of the plan of muscular arrangement, so in the animal series there has been a gradual development of a muscular system from the very simplest types of contractile protoplasm. Even in plants definite movements may occur which may be very slow or very rapid. Yet no muscular tissue proper has ever been found in plants. Many of the lowest plants, the *Algæ,* are motile and are provided with vibratory cilia, but these minute hairs, although capable of rapid motion, cannot be regarded as muscular organs. In the contracting protoplasm of the lowest animals, the rhizopods, although movements take place, yet there is no muscle-tissue. Nor is muscle-tissue found in the next higher group, the *Infusoria,* although very actively moving forms are known, for example, the familiar microscopic animal *Paramecium.* The bell-animalcules, *Vorticella, Stentor,* etc., have stalks that coil and uncoil with great rapidity, but they contain no muscle-tissue proper. They do, however, contain what are termed myronemes, and spironemes, which are longitudinally striated and may functionate as muscular organs. In another genus of infusorians (*Bursaria*) there is a contractile band about the body of the animal. It has been regarded as a true sphincter muscle. It has not the structure of the developed unstriped muscle-cell. In the closely allied sponges (*Porifera*) certain elongated cells with rod-shaped nuclei are found, and may be considered the ancestral forms of the unstriped muscle-cell, although it is not until the group of the *Cœlenterates* is reached that true unstriped muscular tissue is present in its more advanced forms. In many of the hydroids a form of external neuromuscular cell is found. This is a type of cell half nerve, half muscle, but not resembling true muscular tissue. In the jellyfishes of this order both neuromuscular tissue and true unstriped muscle-fibres are found. In the sea-anemones unstriped muscle is abundant. It is mostly developed, however, from the external layers of the body, and thus embryologically is not comparable to the muscle-tissue that in practically all the animals higher than the cœlenterates is formed in the middle germinal layers of the developing animal. In one of the higher cœlenterates, the common water-hydra, some muscle-cells are found imbedded in the deeper tissues of the body, thus foreshadowing the higher type of muscular tissue. In the next great family of animals, the *Echinodermata,* to which the sea-urchins, starfishes, and sea-cucumbers belong, unstriped muscular tissue is common, but no evidence of striated or striped muscle is yet present. In the worms the muscular tissue is unstriped and abundant. In the mollusks, the foot of the soft clam, the muscle of the oyster, are made up of unstriped muscle fibres. A higher order, the *Arthropods* or *Crustaceans,* including the crabs, lobsters, etc., contains a well-developed muscular system which is made up of striated muscle, practically the first appearance of this type of muscle in the animal kingdom. In these animals, moreover, there is a type of development of the muscles that anticipates the regular segmented type, metameres or myomeres, of higher animals.

From the crustaceans onward both types of muscle-tissue are found. In the low vertebrates, *selachians* and *fishes,* typical heart-muscle cells, striated and with central-lying nuclei, are found. Consult McMurrich, 'Development of the Human Body,' with full bibliography (1902). See ANATOMY.

SMITH ELY JELLIFFE, M. D.,
Editor 'Journal of Nervous and Mental Disease.'

Mus'culus, Wolfgang, German scholar and Protestant theologian: b. Dieuze, Lorraine, 1497; d. Bern 30 Aug. 1563. He entered the Benedictine abbey of Lutzelstein and was ordained priest. He was converted to the Protestant faith by Luther's writings, withdrew from his order in 1527, and in 1531 became pastor of a church at Augsburg. In 1536 he assisted at the Wittenberg assembly, and in 1540 was appointed by the Augsburg senatus a delegate to the ecclesiastical conferences at Worms and Ratisbon. He subsequently became professor of theology at Bern. Among his works are 'Commentarii in Genesin' (1557); and an edition of Polybius.

Muses, goddesses of the liberal arts and sciences; originally nymphs of inspiring fountains. Different accounts are given of their origin. There is also a great difference in their names and attributes. The most celebrated are the daughters of Zeus and Mnemosyne. According to Homer they lived upon Olympus. At first three Muses only were known: Meletē (meditation), Mnēmē (memory, for the immortalizing of great deeds), and Aoidē (song, for the accompaniment of story). Four Muses are sometimes mentioned as the daughters of Zeus and Plusia, namely, Meletē, Aoidē, Archē, and Thelxinoē. At other times they are said to have been seven, at others eight in number. Nine Muses are also enumerated as the daughters of Pierus, king of Emathia; but these are usually held to be different from the nine Muses who ultimately came to be generally recognized in Greece; and although the genuine Muses are sometimes called Pieridæ, they are said to have derived the epithet not from Pierus but the district of Pieria. The names finally recognized as those of the Muses were Clio, Euterpe, Thalia, Melpomene, Terpsichore, Erato, Polyhymnia, Urania, and Calliope. Among the adventures of the Muses their three contests with the Sirens, with the daughters of Pierus, and with the bard Thamyris, in all of which they were victorious, are particularly famous. The customary occupation of the Muses was singing and dancing. Separate attributes were not till a comparatively late period assigned to the individual Muses. Calliope became the Muse of epic poetry. She was the most distinguished among the Muses, the protectress of kings, whom she endowed with eloquence and song. Clio became the Muse of history; Euterpe of lyric poetry and music, particularly of wind-instruments; Thalia of comedy; Melpomene of tragedy; Urania of astronomy; Erato of lyric and erotic poetry; Polyhymnia of the sublime hymn; and Terpsichore of the dance. They are commonly represented as beautiful virgins, adorned with wreaths of palm leaves, laurel, roses, or the feathers of the Sirens. They dance in a circle, together with Apollo, who in later times was styled Musagētēs, or leader of the Muses. Their worship extended from Greece to Italy. In Rome they had a separate temple, and a grove was sacred to them. The swan, the nightingale, and the grasshopper were also sacred to them.

Museum of Art, Metropolitan. See ART, METROPOLITAN MUSEUM OF.

Museums are institutions for the preservation, study and display of natural objects, or of those made by man, while as a sequence of study comes the publication of information thus derived. The word museum originally signified merely a grove or other locality sacred to the Muses, but with the development of the museum the word has undergone a parallel course of evolution until it has come to have its present meaning. The next use of the term was for an institution devoted to the study of philosophy, literature and art, but not including the preservation and display of objects; in this sense it was applied to the famous Museum of Ptolemy Soter at Alexandria. While this was in the nature of a university, there is some reason to believe that collections of plants and animals were attached to the institution, so that it may be regarded as the prototype of the more modern botanical and zoological garden. In the modern sense public museums are of comparatively recent establishment, and as educational factors, of later date than art galleries and libraries, although like these having their beginnings in the gratification of the desires of private individuals. The origin of the art museum is to be found in the collections of statuary, paintings and other works of art, made by kings, nobles and men of wealth; the germs of the modern museum of natural history were the cabinets of miscellaneous curiosities brought together by students, merchants, or men of leisure. Many of these collections subsequently developed into important public museums, the most striking example, and the one most frequently cited, being the British Museum (q.v.), which was the final outgrowth of the cabinet and library of Sir Hans Sloane. In the United States the Museum of Comparative Zoology, at Cambridge, Mass., has grown from the collections made by Louis Agassiz (q.v.) for his own use, until it has become one of the most important museums in this country. Even the United States National Museum, if not the direct outgrowth of a private collection, was indirectly due to the labors of individuals, for its nucleus is to be found in the specimens gathered by the National Institution (later the National Institute), a body organized with the avowed purpose of directing the bequest of James Smithson (q.v.) and engaging in pursuits in accordance with its terms.

The lineal successors of the cabinets of private collectors were the museums of scientific societies where specimens were gathered for purposes of study and display, and while these still exist they have largely given place to museums supported by the state or municipality. Private collections are more numerous than ever, but these are rarely formed with any intention of displaying their contents to the public, although there are some notable exceptions, as in the museum of the Hon. Walter Rothschild at Tring. Ultimately, however, a large proportion of these private collections find their way to public museums through the liberality of their owners.

Another step toward the establishment of public museums was the formation of collections of objects of more or less popular interest and their exhibition to the public on the payment of a fee. Notable examples of these abroad were those of Sir Ashton Lever and Charles Bullock, which flourished in London during the latter portion of the 18th century and first part of the 19th. It is interesting to note that one of the earliest cabinets formed in the United States, that of Mr. Arnold, of Norwalk, Conn., was sold to Sir Ashton Lever, while later on the "Leverian Museum" was sold and its specimens scattered among the great museums of Europe.

Early American Museums.—In this country the principal recent museums of this character were the Boston Museum and Barnum's Museum in New York, in both of which the idea of amusement predominated, the first named being a rather incongruous introduction to a theatre. Both, however, contained some really valuable specimens of natural history and Barnum was among the first to exhibit living fishes. Of a very much earlier date, and more scientific in their aims were the museums conducted by Charles and Rembrandt Peale in Baltimore

and Philadelphia, the latter of which was established in 1785 and from 1822 to 1828 installed in Independence Hall. The modern "dime museum" with its exhibit of "freaks" is a survival of this phase of museum development, and the catalogues of some celebrated old collections will show that they comprised many very similar objects, as well as those of real value from a naturalist's standpoint.

Government Museums.—The final step in the establishment of public museums, the transferral of collections from private to governmental ownership, may be said to date from the founding of the British Museum in 1753. At first admission was by ticket and limited to 30 persons per day; in 1810 the museum was made accessible to the public for three days a week, and not until 1879 was it open to the public daily. The United States National Museum was only formally created in 1876, although so early as 1846 the government possessed collections which were in the custody of the Smithsonian Institution. Exploration has done so much for museums that it may almost be included among the causes that have led to their formation. The colonization of America brought to Europe many examples of new plants and animals, while the Dutch East India voyages did the same for southern Asia, and is is surprising to see how large a number of species from these regions was described by Linnæus and others so early as 1760.

In more recent times the Wilkes Exploring Expedition of 1838–42 and the government surveys for a route for the Pacific railroad had a very decided influence on the origin and growth of the United States National Museum, and there is scarcely an institution that has not been benefited in a similar way. It is but a step from expeditions in which scientific results were subordinate to practical ends to those undertaken solely for scientific purposes, and the systematic exploration of our western Territories for fossils by Yale, Princeton, and other universities, and by such institutions as the American Museum of Natural History and the Carnegie Museum, has become a matter of almost daily news. Another most important factor in the development of museums has been national or international exhibitions. These have had a direct effect in bringing together collections illustrative of natural or industrial resources, and a more indirect influence in stimulating methods of arranging and displaying such material. The London Exhibition of 1851 led to the establishment of the South Kensington (now Victoria and Albert) Museum, and the ethnological museum of the Trocadero was one of the outcomes of the Paris Exposition of 1889. Our own Centennial Exhibition was the direct cause of the erection of a building for the United States National Museum and of the founding of the Pennsylvania Museum of Art, while from the Chicago Exposition came the Field Columbian Museum and the Philadelphia Commercial Museum. Other causes play minor parts in influencing the lines of growth of museums both small and great. Thus the extensive colonial possessions of Great Britain have been largely instrumental in making the vertebrate collections of the British Museum the greatest in the world, while the museum at Leyden is not far behind owing to the former extensive commerce of Holland. In the United States the large deposits of fossil vertebrates in the West, their general accessibility, the imposing appearance of many of the specimens, and the important results to be derived from their study have given a great impetus to the formation of palæontological collections, while special attention has been given to the preparation and exhibition of this class of material. The display of fossil vertebrates in the American Museum of Natural History is unrivaled, and other notable exhibits are to be found in the Museum of Yale University, and in the Carnegie, Field Columbian, and United States National Museums.

Popular Display of Specimens.—What may be termed the popularizing of museums has but recently taken place, and while the display of objects has always been regarded as one of the functions of museums, it is a branch which has received particular attention only during the past 25 years. Originally the larger part of the specimens of birds and mammals were placed on exhibition, but it became evident that this meant the injury or even loss of many, and that the public cared little for large monotonous series of stuffed animals. At present the number of objects on exhibition is relatively small compared with those in the reserve or study series, and there is a very general effort to display at least a part of the specimens amid their natural surroundings. The influence of the private collector has probably had much to do in bringing about this change, and the British Museum, under the administration of Dr. Günther was the first of the great museums to introduce groups of birds, with their natural surroundings, as a part of its exhibition series. These were largely added to under the directorship of Sir William Flower, who took great interest in the problem of rendering museums attractive and instructive, while, following this example, the American Museum of Natural History took the lead in this direction in the United States. To the museum of Leyden, Holland, however, belongs the credit of having before this departed from the tradition that mammals must be stuffed in stiff and formal attitudes and caused some to be mounted that bore some resemblance of life. Change in the character of the exhibits has been accompanied by equal changes in the matter of labeling and to some extent in the publications issued by museums, so that from being merely storehouses of material for the benefit of a few they have become great schools of instruction for the many.

Classification.— Museums may be grouped or classified by their contents, or according to the purposes for which they were established. Following the first method Dr. Goode has divided them into museums of art, history, anthropology, natural history, technology, and commerce. A museum may be established for any of these great subjects as a whole or for one of the many branches into which they may be subdivided. Thus a museum of natural history may comprehend both animals and plants, or one or the other of these primary divisions; it may include the animals of a single continent, a single geographical region or be restricted to those of one locality; it may be devoted to some large group, as mammals, birds, or insects, to some minor division, as birds of prey, butterflies, etc., and may or may not include fossil species. Technology may be greatly subdivided, and while the favorite and more striking subjects are shipbuilding and railroads, there are also museums

of hygiene and textile fabrics, while the United States National Museum contains collections illustrating the development of electrical apparatus. And technology may trespass on art in the matter of ornament, or, like art, be included in a historical collection illustrating the progress of mankind or of one nation.

According to the purposes for which they are founded Dr. Goode distinguishes national museums; local, provincial, or city museums; college and school museums; professional or class museums; and museums or cabinets for special research owned by societies or individuals. This scheme of classification is open to the objection that it confuses purpose with ownership or administration, since, for example, national and municipal museums are not merely for the display of objects found within their boundaries, but for those belonging to the nation or city.

College and school museums have for their immediate purpose the formation of collections that shall aid students in understanding various problems connected with science, technology or art, but they are usually extended beyond this and become more or less general in their character. This has been the case with the museums of Harvard and Yale universities and is notably true of many foreign museums, such as that of the Royal University of Prussia, which is the national museum. The professional museum is for the illustration of some special occupation or line of research such as mining, medicine, or even psychology, which has a museum at Florence founded by Mantegazza. The largest institution of this kind is the Museum of the Royal College of Surgeons, London, which has developed from the private collection of John Hunter.

Modern European Museums.— Europe naturally has the greatest number of governmental museums, the capital of almost every state claiming at least one museum of natural history and an art gallery, and often anthropological and technological collections as well. Paris, with some 30 museums, probably leads in the matter of national collections, while Berlin and Vienna have respectively about 20 and 15 museums. Turkey forms a notable exception to the above statement, for Friedlander's Directory contains no mention of a Turkish museum, although a commercial museum has been established at Constantinople. Great Britain has the largest number of local museums, those devoted to the preservation and display of objects illustrating the natural history and archæology of the immediate vicinity, and, as a whole, these are better administered than those of other countries, great care being devoted to labeling, arranging and otherwise making the collections interesting and instructive to the public.

Modern American Museums.— Including collections of all kinds, there are, according to a list prepared by Dr. A. G. Mayer, 343 museums in the United States, divided according to subjects as follows:

Natural history	233
Science and fine arts	13
Fine arts	34
Industrial arts	6
History	20
Art, history, archæology and ethnology	26

Many of these are, of course, extremely small and it is unfortunately only too probable that many of them are poorly supported and badly cared for, since it often happens that a college may receive an important gift of material without provision for its subsequent care. Omitting the smaller "cabinets" 176 of these museums are attached to schools or colleges, 31 are controlled by societies, 16 are private or municipal institutions and 29 have been established by the Federal government or by States. A very considerable portion of these State museums, however, are connected with agricultural colleges or geological surveys and are limited in their scope, so that the number of institutions adequately representing the resources of the respective States is very small. The State Museum of New York stands first among these, and that of Ohio is important, while the mining industries of various States are well represented.

The Museum of Comparative Zoology, Harvard University, holds the first place among college museums. It is not confined to zoology, as its name might imply, but covers the entire field of natural history. The mineralogical collection dates back to 1793 and is probably the oldest of its kind in America, while the botanical section includes the Gray Herbarium. The nucleus of the Museum of Comparative Zoology was the private cabinet of Louis Agassiz, which was purchased by subscription for $12,000 in 1852. In 1858 an allowance was made for the maintenance of the museum and in 1859 the State of Massachusetts assumed an interest in the institution, at the same time appropriating $100,000 for its increase; $71,000 was also raised by private subscription. In 1876 the State assigned its rights to Harvard College and since that time the museum has been maintained by the university, although the great increase in its collection has been principally due to the liberality of Alexander Agassiz, who has expended over $1,000,000 for that purpose. An important museum of anatomy is attached to the Harvard Medical School. The Museum of Yale University contains the Marsh collection of fossil vertebrates, comprising many types, as well as the largest collection extant of fossil footprints, while brachiopods and sponges are well represented. In other departments are a fine series of modern corals and many rare archæological specimens. The Museum of Princeton University possesses large and important collections of fossil mammals from Patagonia and our western States, a good collection of North American birds and many examples of ancient and modern art. The Museum of Archæology, University of Pennsylvania, has the best collection of Babylonian antiquities in America and is also particularly strong in American archæology; also attached to the university is the Wistar Institute of Anatomy. To Amherst College belongs the Appleton Cabinet of fossil footprints, containing the specimens described by Prof. E. Hitchcock, and the University of Kansas is rich in Cretaceous vertebrates and large North American mammals. On the Pacific coast Stanford University and the University of California both have museums; at present these are working collections, but both have art collections apart from these.

The most important, as well as oldest museums under the control of scientific societies are those of the Academy of Natural Sciences, Philadelphia, and the Boston Society of Natural

History; the first dating from 1812, the latter from 1831, although it was the successor of the Linnæan Society, founded in 1814. Each contains large collections of birds comprising many types of species described by our earlier ornithologists, such as Wilson, Bonaparte, Cassin and Lawrence. The Academy has the largest collection of mollusks in America, and one of the largest in the world, including many types of Tryon, Say and Pilsbry. These two institutions may be looked upon as the predecessors of public, scientifically arranged museums in the United States, the majority of our museums being of very recent origin.

While city or municipal museums are not numerous in this country yet the class includes some of the larger, more important museums in the United States. Most of these have been founded by private citizens but have subsequently received support from city governments either by grants of money, the allotment of land, or the construction of buildings. Chief among them and the largest municipal museum of natural history in the world, is the American Museum of Natural History, New York, incorporated in 1869 as the result of the efforts of the leading members of the New York Lyceum of Natural History whose collections had been destroyed by fire. Other noteworthy museums of this class are the Field Columbian Museum of Chicago, the Carnegie Museum, Pittsburg, and the Milwaukee Museum.

In this category, too, are to be found all the art museums in the United States, not one having been established by the National Government, or that of any State. Local museums are practically lacking in the United States; for most of the smaller museums, even, make the attempt to cover the same ground as the larger institutions when they could achieve much better results by confining their attention to the immediate vicinity. In conclusion it may be said that while public museums are not so numerous in the United States as might be expected from the size, resources and wealth of the country, the last 25 years has not only witnessed a great increase in their number but in the growth and educational efficiency of those already established. For detailed information as to museums and their administration, cases, labels and the arrangement of exhibts, consult 'Museums Association, Report of Proceedings, etc.,' London (1890 to 1900); since that date 'Journal of the Museums Association'; consult Flower for the history of museums, their objects, etc.; 'Essays on Museums and Other Subjects Connected with Natural History' (1898). For the history of the Smithsonian Institution, United States National Museum, classification and administration of museums, 'A Memorial of George Brown Goode.' Report of the United States National Museum for 1897, Part II., Washington, D. C. (1901) 'An Account of the United States National Museum'; Report of the United States National Museum for 1896, pp. 287–327, Washington, D. C. (1898). A brief history of the United States National Museum is contained in the 'Report of the United States National Museum' for the year ending 30 June 1901, pp. 1–47, Washington, D. C. (1903); The American Museum of Natural History is described under the title of 'The Making of a Museum,' by L. P. Gratacap, in the 'Architectural Record' for 1900, pp. 375–402.

A work in three volumes on 'Museums, their History and their Use, with a Bibliography and List of Museums in the United Kingdom,' by Dr. D. Murray, has just been published by James Maclehose & Sons, Glasgow.

FREDERIC A. LUCAS,
Curator U. S. National Museum.

Mush, moosh, Asiatic Turkey, the chief town of the Mush sanjak, vilayet of Bitlis, 79 miles south of Erzerum, near the Kara-su, the eastern affluent of the Euphrates. It is built on a plateau 4,800 feet above sea-level, rising on the south side of a mountain-girt and fertile plain. It is a dirty town, peopled by Turks and Armenian Christians. It has Gregorian and Roman Catholic bishops and an American Protestant mission and schools. A thriving trade is carried on in the tobacco, grape vine, wheat, and other agricultural products of the adjacent plain. Mush is mentioned by Xenophon and Moses of Khorene, and came into prominence in 1894, owing to the massacre of Armenians at Sasun in the neighborhood. Pop. about 20,000.

Mush'room, a popular term loosely applied to many species of higher fungi, especially such as have a cap (pileus) upon an erect stalk. Primarily, the mushroom is *Agaricus campestris* (see FUNGI), the only species cultivated upon a commercial scale. Though more than 700 species of mushrooms have been proved edible within the last half century, and though many others will doubtless be proved harmless, the novice should be cautious in trying new species. Each unfamiliar kind should be subjected to rigid examination first by smell, and malodorous ones discarded; then by taste, a small piece being nibbled but not swallowed. If no ill results follow in the course of several hours, a small piece may be swallowed. If no evil effects follow, but the flavor raw is unpleasant, cooked morsels may be cautiously tried, and results noted. Each individual must decide what species agree with him, because some systems will not endure kinds innocuous to others. Nervous fear of fancied bad symptoms must be controlled, or real illness may be induced by the imagination.

Several species are popularly reputed virulent which do not produce any marked effect upon the health for several hours, and which are widely feared as deadly. Since the two commonest of these (*Amanita muscaria* and *A. phalloides*) are often mistaken for the common mushroom, the novice should never gather any toadstools in the woods under the impression that they are the proper mushroom, which grows in pastures, lawns, etc., and not in shady places. Further, all species with yellow or white gills should be avoided until known to be edible. The common mushroom has pink gills when young, and purplish-brown or black gills when mature.

Several of the thousand species of the genus *Agaricus* are valued for food, but the common mushroom (*A. campestris*) is the most important. It is occasionally found in open and grassy glades; never in the deep forest, but most frequently in old pastures and lawns, especially in autumn, but often when conditions are favorable during the summer. It grows about three

inches tall, has a fleshy cap about three inches broad, generally white, sometimes reddish or brownish above and pink beneath. Its stem does not rise from a cup-like base as does that of *Amanita phalloides*. It is generally gathered in the "button" stage, that is, before the cap has expanded. Among its near relatives the best known is probably the horse mushroom (*A. arvensis*) which is much larger, whiter above, lighter below, the gills being white when young, but otherwise resembling the common species. Other prized edible relatives are: *A. silvicolus*, smooth, yellowish-white, with a long stem growing in the woods; *A. rodmani*, white, short and thick-stemmed, found in hard ground, as in city streets; and *A. fabaceus*, reddish-brown and long-stemmed, with an almond flavor and odor, which grows in greenhouses and on compost heaps. This species has been successfully cultivated.

Success in mushroom growing seems to depend more upon the individual grower than upon the method, since two growers may each succeed equally with very different methods. The essentials seem to be decaying organic matter in abundance, uniform but not excessive moisture, and equable rather low temperature. The most popular places for cultivating this plant are caves, abandoned mines, and quarries, cellars, pits and similar places, where the temperature is naturally suitable or may be artificially controlled. The beds are usually made by spreading a layer of well rotted manure and loam over a firmly packed deep layer of fresh horse-manure. After the violent heat of fermentation has passed and the temperature has fallen to or below 90° F., the mushroom "spawn" is planted. This spawn consists of the mycelium of the fungus in bricks (English) or flakes (French) made of equal parts of horse and cow manure and loam; it is a commercial article and its manufacture constitutes a business distinct from mushroom growing. After sowing, the bed is kept moist by mulching with straw or covering with mats which are replaced in about ten days with a layer of loam about two inches deep. In America the mushroom is rarely cultivated out of doors; in Europe it often is, the temperature and moisture there being more favorable. It is frequently found growing wild as in the vicinity of Petrolea, Ontario, Canada, in sufficient quantities to make commercial shipments profitable.

Besides the species already mentioned, several common American species are among the most desirable edible fungi. *Coprinus comatus*, the horse-tail or shaggy-mane mushroom, grows sometimes six inches tall, has a nearly cylindrical white shaggy cap with often black scales, and white gills when young, but these turn black and liquefy with age. It is commonly found in lawns, waste places, rubbish heaps, etc., from midsummer until the coming of frost, especially after showers. *C. atramentarius*, the ink-cap, resembles the preceding in general appearance and places of growth. *C. micaceus*, the glistening coprinus, is a brownish species smaller than the preceding. It grows upon decaying wood. *Lepiota procera*, the parasol mushroom, and *L. naucina*, the smooth lepiota, grow in lawns, pastures and occasionally in gardens. They have white spores and a ring on the stems, to which the gills are usually not attached. *Cantharellus cibarius*, the chantrelle, grows about three inches tall, measures nearly as much across the cap, has an irregular top-shaped yellow or orange cap, and has much-branched gills. It grows upon the ground in woods. *Marasmius oreades*, the fairy ring, or champignon, is a small cream-colored or reddish species, which tends to grow in circles upon lawns and pastures. It is rather tough and solid, but is valued for its nutty flavor and its drying qualities. Its gills are alternately long and short. *Lactarius deliciosus* has an orange cap, an orange milky juice, and with age shows greenish tints where bruised. Several other related species are highly valued by epicures, for example, *L. volemus*, with a white sweet juice and orange cap; *L. corrugis*, a darker species, even dark brown. *Boletus edulis*, the edible pore-mushroom, has a yellowish or brownish cap, with convex tubes which change with age from white to greenish yellow. It is commonest in chestnut, pine, and oak woods during autumn. *Fistulina hepatica*, the liver-fungus, grows upon decaying wood, is stemless and of irregular form, red, succulent and fibrous. It is often called beefsteak-fungus on account of its edible qualities. *Morchella esculenta* and several relatives, popularly known as morels, are of various colors, but usually grayish or yellowish. The top somewhat resembles honeycomb, which makes them easily recognized. They delight in potash and are common where the land has been burned over or wood-ashes have been thrown; also in orchards and woods. *Lycoperdon giganteum* and other species of puff-balls, which are common in pastures, are considered among the best edible fungi if used while still white. They are more or less globular in form. The species mentioned sometimes attains a diameter of several feet.

Mushrooms are often said to be equal to meat in nutritive qualities, but these statements are not warranted by analysis, which show that fresh mushrooms contain about 88 per cent of water, 3.5 per cent of protein, 6.0 per cent of nitrogen-free extract, and generally less than one per cent each of fat, fibre and ash. The protein content is therefore less than one fifth that of porterhouse steak, less than one third that of dressed codfish, and but little more than one-fourth that of hens' eggs. Indeed, according to analyses, they seem to be inferior to most vegetables. Their chief value is therefore in their flavors, which vary with individual species as much as among higher plants. They are eaten by various animals (see FUNGUS-EATERS).

Music is the science of combining tones in melodic, rhythmic, and harmonic order, so as to excite the emotions or appeal to the intellect. For untold ages it was purely emotional. With its development as a science, in the Middle Ages, it appealed almost entirely to the intellect, this species of music culminating shortly,

before 1600. At the present time that music is considered best which appeals both to mind and emotion. It is the combination and equipoise of these two factors which causes Beethoven to be considered one of the chief masters, and the music of Wagner, with all its intensity of passion, to appeal to the mental processes by its peculiar treatment of *Leit-motiven.*

Spencer and Huxley suggest imitations of nature (bird-songs, etc.) as a possible commencement of emotional music. Palæolithic man had his music, even instrumental music, as may be deduced from a primitive flute of reindeer's horn, found in a cave which was inhabited during the Stone Age. Many pre-historic horns of metal have been unearthed among the relics of the Bronze Age.

From two or three notes the scale (q.v.) grew into various intricate and widely differing forms. The five-toned (pentatonic) scale is the most primitive now in use among civilized nations. It was chiefly employed by the Chinese, even 4,000 years ago, but is also used in some hymns ('There is a Happy Land' and in many Scottish songs, such as 'Ye Banks and Braes,' or 'Auld Lang Syne').

About 600 B.C. Pythagoras (see PYTHAGORAS) established the proportions of the intervals, and Music, always an artificial and a human product, was given a natural foundation. (See MODE; INTERVAL.) It may be doubted whether harmony existed at all in the ancient world. It is absolutely certain that the Chinese, who were well advanced in the art in ancient days, and who formulated many acoustical principles before the time of Pythagoras, used melody without supporting harmonies. It is possible that the Greeks had a crude accompaniment of drone bass to some of their songs. The Scriptural music, loud and ecstatic, and of an improvisational character, is a blind alley and does not lead to modern development of any kind. The music of both the old and new Testaments was orally transmitted and is not to be traced. Ancient Rome copied the Greek music but without fully understanding it. Rome conquered Greece but could not assimilate its culture, and in the first centuries of our era the musical art was retrogressing. The influence of the Christian Church stayed the decadence and gave a new direction to the art. Ambrose (about 340–398) and Gregory (540–604), stemmed the tide of decay and rescued some part of the ancient systems or modes. The power of music in the early Christian ritual is not only shown by the praises of the Fathers of the Church, but by the fact that the Emperor Julian in 361 endeavored to found a musical conservatory in Alexandria to educate boys to sing in the pagan rites as his adversaries were singing in the Christian churches. The Roman influence now extended the Gregorian chants all over the civilized world. Boethius (475–524) had written a treatise on the Roman system which became the misty text-book of the earliest days (See BOETHIUS). In 790 Pope Adrian sent singing teachers into France with missals illustrating the Gregorian modes. An antiphonarium was left at St. Gallen which still exists and proves the earnestness of the musical mission. The music of this early period, however, is still very vague to us, since no practical notation existed. The musicians of this epoch sometimes employed alphabetical letters as notes (which could be deciphered) but more frequently a system of lines, curves, dots and dashes, called the *Neumes,* which were only to aid the memory of one who had learned the song orally, but meant nothing definite to anyone who had not thus studied it.

A step forward was made by a monk named Hucbald, in St. Amands, who improved the notation somewhat by using a staff (it is very doubtful if he invented it) and by writing certain rules regarding the union of different parts in music simultaneously. The reform seems, at first, to be a very great one, meaning nothing less than the birth of part-music, the evolution of a new science; but, when one knows that these parts were simply consecutive fifths or fourths, or other equally harsh progressions, one can only marvel that the men of the middle ages bore it so patiently. The new system was called the *Organum,* since it was often played upon the great wind instrument which had disappeared when Rome went down, and reappeared in Europe in the reigns of King Pepin and the Emperor Charlemagne.

A much greater reformer than Hucbald came upon the scene about 1000 A.D. Guido, an excellent monk of Arezzo, founded the system of sight-reading, by establishing a vocal scale on the syllables still in use. He found that the hymn to St. John (patron saint of singers) rose step by step from C to the following words,

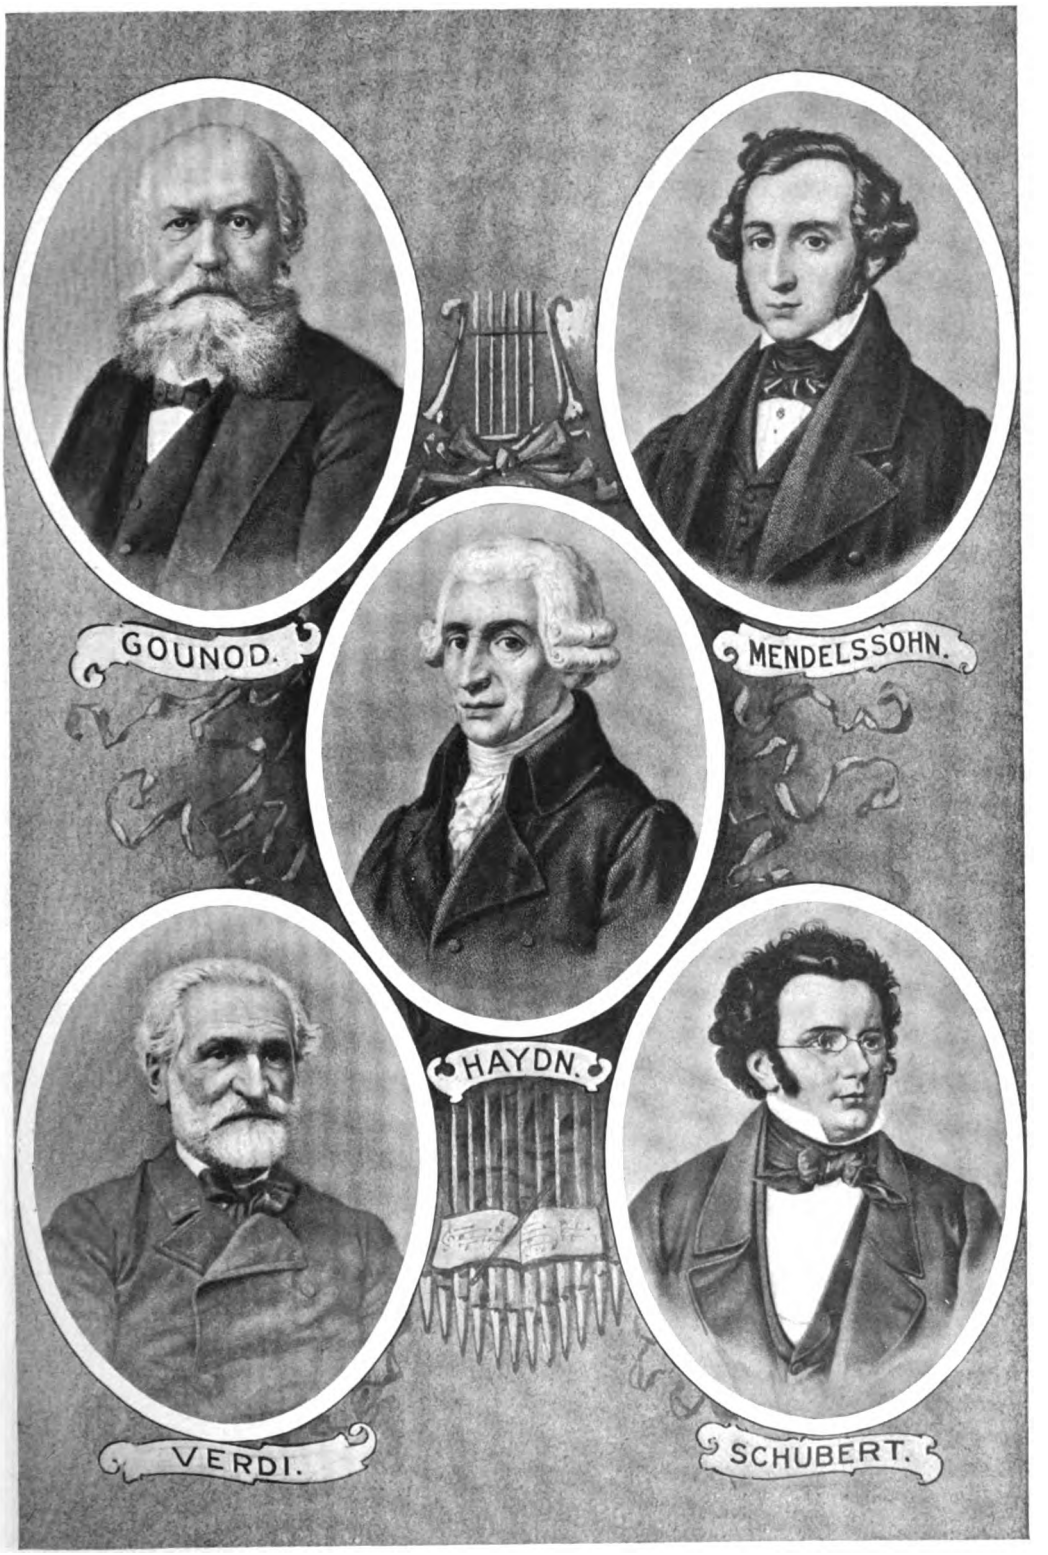
(C) UT queant laxis,
(D) REsonare fibris,
(E) MIra gestorum
(F) FAmuli tuorum.
(G) SOLve polluti
(A) LAbii reatum,
Sancte Johannes.

causing his choir-boys to memorize the syllables from the melody of their chief hymn, he soon taught them intervals by this simple means, and his treatise "De ignoto cantu" was the first practical mode of singing "an unknown song" (that is, a song unknown before to the singer), in short, the birth of sight-singing. It must be confessed, however, that Guido's claims to this tremendous discovery have been contested, and that every point connected with the rise of the science of music is more or less wrapped in vagueness and doubt.

We come to somewhat firmer ground a little later when notes of definite length are introduced. Franco of Cologne may be credited with the first clear treatise upon such a system (he calls it "Ars Cantus Mensurabilis") in the first half of the 13th century.

And now there came a recession from the evil-sounding fourths and fifths that had existed in the 10th century, and from some equally harsh progressions that were countenanced long after this. The troubadours in France and the minnesingers in Germany had brought forth secular music that broke many of the old rules yet sounded infinitely better than the more "regular" music. The musical canons of the ecclesiastics began to broaden. Marchettus of Padua and Jean de Muris, both in the middle of the 14th century, began to urge new progressions, and the consecutive fifths were tabooed, only to reappear copiously in the most modern works of the 20th century.

It will be impossible in an outline sketch to give all the attempts that were made in evolving the new science, from the 11th to the 14th centuries. Suffice it to say that out of these efforts there grew the first real school of compo-



sition, and instead of its having birth in Rome, it was born in the Netherlands and in Flanders. Yet the Flemish school at once gave its services to the Church, and many of its greatest representatives in its earliest stages went to Rome as servants of the Catholic cause. The Flemish School may be called the true beginning of the science of music, since now, for the first time, a race of composers existed who worked according to definite rules in the production of intricate counterpoint, and were able to impart their knowledge to their pupils. William Dufay was the first of this race of composers. His epoch is mistakenly given in many histories as falling in the 14th century, but the researches of F. X. Haberl have proved that he was born shortly after 1400. He died 27 Nov. 1474. The chief of his contemporaries were Hobrecht, Eloy, Brasart and Binchois, who have, however, left little more than their names, and even of Dufay very little music is extant.

The first great teacher of the school was John Ockeghem, or Ockenheim (about 1430–1513), and among his pupils was the first great composer of that time, practically the first great contrapuntist that the world had ever possessed,—Josquin Des Pres,—whose music Martin Luther delighted in. Des Pres was born about 1440 and died either in 1515 or 1521. Other pupils of Ockeghem were De la Rue, Brumel and Agricola. All the music of the foregoing composers was purely intellectual, but with Des Pres we find the first glimmerings of emotion mingled with the musical mathematics, and he taught that dissonances could be used to express passionate feeling.

The greatest figure in the Flemish school, however, is Orlando Di Lasso (1520–94), who composed works which are beautiful even to modern ears. The Flemish school ended with this culmination. It had existed about two centuries and in that time it had brought forth the science of composition and some 300 composers.

There was, however, another country which helped greatly in this result. The first musical dictionary ever written, by John Tinctor (1476), gives the credit of the invention of counterpoint to the English, and a manuscript of a canon for six voices, in the British Museum, would seem to show that there were very skilful composers in England as early as the 13th century. This canon ("Sumer is icumen in") ascribed by some to John of Reading, in 1250, by others to a much earlier date, is a surprisingly advanced work for its epoch. A mysterious figure looms up as an English contemporary of Dufay, in John Dunstable, but of the music of this Englishman (who died about 1458) very little is known, only a few fragments remaining.

Contemporaneous with the later Flemish writers one finds a few Italian composers forming a school of their own. The first of the old Italian school was Costanza Festa, a Florentine, who died in 1545. But the one great master in this field was Palestrina (born probably in 1524—there is much doubt about the date of birth,—and died 1594), who was without doubt the greatest composer up to that time. He combined the Flemish ingenuity with a lofty dignity and sometimes (as in his 'Improperia') with emotional power.

The year 1594 was an epoch year in music. The Flemish school ended in that year, with Di Lasso's death; the Italian school lost its chief master in Palestrina; a revulsion against the intellectuality of music took place,—and the first opera was written.

We pause here, therefore, to sum up a few other points in musical evolution that had preceded this important date.

Although the chief scientific music of the world had been ecclesiastical up to this point, the troubadours in France, and the minnesingers in Germany, had turned the attention of cultured minds to the beauties of secular singing. Instrumental music was as yet a Cinderella among the arts. The strolling jongleurs and wandering minstrels amused the people, and sometimes the nobility, with displays of skill upon various instruments, combined with juggling tricks. They were generally under the ban of the law and led a very precarious existence.

One of the trouvères of France,—Adam de la Halle,—in the latter half of the 13th century, had written a musical play, entitled 'Robin et Marion,' which was the precursor of light opera. It is the earliest popular work of which we have any record, but it was written by ear, and not by any teachable rules. Venice, partly through the efforts of Flemings, partly through Italian influence, had become a centre of organ-playing. Adrian Willaert (1480–1562), a Fleming, had become organist of St. Mark's in Venice and drew many pupils thither, among them Di Rore, Zarlino, and Andrea Gabrieli. The last-named taught his nephew, Giovanni Gabrieli, who became one of the noblest composers of the Venetian school. He was born in 1557 and died in 1613. Zarlino taught many German pupils, and through the Venetian school of organ-playing, Germany for the first time came in close musical touch with Italy. Zarlino taught Scheidt, Praetorius and Schiedemann, while the elder Gabrieli had Hans Leo Hassler as a pupil. Zarlino and Willaert were the first to agitate for a tempering of the musical scale (see TEMPERAMENT), but its establishment came much later through the wisdom of Bach.

Claudio Merulo (1533–1604) established the organ toccata, probably the earliest form of technical instrumental display in the modern sense. One other form of scientific secular music had arisen, thanks to the Netherlanders; the madrigal, an unaccompanied vocal composition displaying the most intricate counterpoint had come into vogue, and Willaert and Di Lasso had achieved triumphs in this school. Luca Marenzio (1556–99) had also done good work in this field. But the most charming madrigal composers were to be found in England, where this style of singing met with especial favor. It is customary to vaunt the glory of the Elizabethan poets, but if the tremendous name of Shakespeare be eliminated, the excellence of the contrapuntists at this time rivals that of their literary brethren. Tallis, Weelkes, Wilbye, Morley, Farrant, Byrd, Bull, Ford, etc., may well be cited as balancing Beaumont, Fletcher, Massinger, Marlowe, Jonson etc.

Music-printing (see PRINTING) had also been established, in 1502, by Petrucci of Fossombrone, and caused the compositions of all these men to spread from country to country with great rapidity.

The change from the old school of pure counterpoint to a more emotional style, from intricate choral works to solos both vocal and

instrumental, had its first practical demonstration in 1594 (some place the date two years later), by the composition and performance of the first opera, entitled 'Daphne.' The work was the outcome of the efforts of a coterie of cultivated amateurs who began their meetings in Florence, and endeavored to bring into music something of what they supposed it to have possessed in ancient Greece. The men who were active in this movement, which caused the renascence of music, were Giovanni Bardi (Count Vernio), Vincenzo Galilei, Strozzi, Mei, Rinuccini, Caccini, and Peri. Their first opera met with great success, but their second,—'Euridice' — was an epoch-making work, since it contained in embryo an entirely new mode of musical treatment. Counterpoint was replaced by monody, and recitative allowed musical declamation to take the place of intricate tonal construction. The libretto was the work of Rinuccini, while the music was written by Peri and Caccini in two versions, that of the former being the better.

The new school spread quickly to all countries, only in France its progress was checked by the power of Lulli, who devoted himself chiefly to ballet-music. The latter was largely introduced into Molière's plays and obtained the favor of Louis XIV., who sometimes appeared himself in the dances.

The opera was not the only form of the period of phenomenal musical activity which marked the closing of the 16th century and the beginning of the 17th. The oratorio also had its beginning in this wonderful era. Filippo Neri (1515–95), who has since been canonized by the church, was an enthusiast in the matter of good church music and at his church in Rome he frequently had spiritual meetings, apart from the regular services, in which he portrayed Scriptural subjects in the shape of musical plays. His friend Palestrina often assisted in this pious work, and may have had a hand in the development of the great sacred form. As these entertainment did not take place in the body of the church, but in the Oratory (Oratorio), the origin of the name of this form will readily be seen.

But the real establishment of the form came with Emilio del Cavaliere (1550–98), who wrote a large work in the new style, entitled 'L'Anima e Corpo.' This was first performed in 1600, probably in the church where Neri had labored, and was given upon a stage, with costume and action, exactly as if it were an opera. Although both Neri and Cavaliere were dead, such minute directions were left regarding the mode of presenting the work that one may presume that the intentions of the composer were thoroughly carried out. This first oratorio was so entirely in the new school of monody and declamation that one may doubt as to whether the establishment of opera is not in a large degree to be credited to Del Cavaliere.

Besides the opera and oratorio, instrumental forms were established at this time as well. Dancing is the mother of instrumental form. The dances of Spain had gradually made their way into France and exerted a strong influence upon classical music. In an effort to obtain contrasts several of these were joined together in one large composition, which was at first called a partita, but afterward became a suite.

Free instrumental forms also sprang from the organ toccatas already alluded to. Frescobaldi (1588–1653) was to Rome what Willaert had been to Venice half a century before. Frescobaldi has been called the father of true organ-playing. He improved the toccata and called it *sonata* (a sounding-piece,— that is, an instrumental piece), to distinguish it from the *cantata,* — the singing piece. Corelli (1653–1713) gave to the old sonata a form, which, although much less important than the later, classical shape, had yet within itself the elements of the noble form. Its first movement was a large three-division shape, exposition, development and recapitulation; and this led to the *Sonata-Allegro,* the first movement-form of the classical symphonies and sonatas, the form of many noble overtures.

Amid all these remarkable advances the fugue remained rigid and lifeless, a survival of the old intellectual problem-music. As yet the fugue was little more than a canon, a continuous imitation of a given melody. It waited its liberator — Bach.

During the century which followed we find Italy combining contrapuntal skill with the less educated enthusiasm which marked the early operas, and such men as Monteverde (1568–1643) and eventually Alessandro Scarlatti (1659–1725) make of the new school something far better than its founders had dreamed of. Stradella, Carissimi, Lotti, and Rossi added to the advance of the great new school which was to cause Italy to be just called the "Mother of Music." The school was established in England too by Henry Purcell (1658–95), who even introduced the Italian musical signs and expression-marks into his native country. Purcell, who was the greatest musical genius that England ever produced, founded his own English operas upon the Italian models, but his works had characteristics entirely their own and extend all the way from the melody of 'Lilliburlero' (the revolutionary song of 1688) to the loftiest anthems and brightest operas.

In France the great Lulli (1633–87) was bringing forth the most dainty and graceful ballets. In Germany Reinhard Keiser (1673–1739) began the 18th century by endeavoring to form a German school of opera, but the Italian operas soon resumed their sway.

In Germany, also, the effect of the numerous students who had gone down to Venice in the 16th century and the beginning of the 17th, was beginning to make itself felt. Luther's influence had established the chorale as a sturdy root whence much sacred music was to grow. Perhaps the three men who most helped the growth of Germany's sacred music in its earliest post-Lutheran stages were the "three Ss,"— Schutz (1585–1672), Scheidt (1587–1654), and Schein (1586–1630), who not only helped Italian music in the Fatherland, but elevated the style of organ-playing far above anything that Italy had done. Musical settings of the Passion began to appear in Germany, and the oratorio took a nobler path than in Italy, even before the appearance of Bach and Handel. To Germany also was due the new arrangement of part music, which took the melody out of the tenor voice, where it had always been in the Flemish and old Italian music, and placed it in the soprano, a change due to the chorale-singing of the 16th and 17th centuries.

Out of the great musical epoch at the beginning of the 17th century there came also a radical change of notation. The notation of Franco of Cologne had been improved by the invention of many additional rhythms and the employment of smaller notes. In the music of Palestrina and of Orlando di Lasso, that is to say up to 1594, one finds some half-dozen tonalities (keys) employed, and notes and rests down to 16ths. But one does not yet discover a rational division of music into measures. This great advance came shortly after 1600, with the new monody, the declamatory music of the early operas, and with this came also, for the first time, the use of terms of tempo and of expression. Even the grouping of notes was invented in the latter part of the 17th century, so that this epoch saw the establishment of the greater part of our present notation system. Music of the better class, printed after 1700, is without any very important difference from that printed to-day.

And now the procession of the tone-masters who are prized by the modern world begins. Bach (1685–1750) and Handel (1685–1759) were so exactly contemporaneous that many speak of them as if they had been the Siamese twins of music. Yet their influence was very divergent. Bach leaned toward the old school of pure counterpoint; Handel was impelled toward modern dramatic effects. They faced different ways. Handel led toward orchestral experiments and was more directly melodic than Bach. We owe to him the noblest form of oratorio, which, by the way, he did not attempt seriously until past his fiftieth year.

To Bach we owe debts far more varied and even greater. He reconciled the old diatonic style of composition with the newer more modulatory school; by his great organ works and his clavichord fugues he founded modern technique; he was the father of the best school of organ-playing; he composed the greatest mass (that in B minor) which the world possesses, and also the noblest Passion music; and he was absolutely the inventor of freedom of modulation. Before his time, by what was called "mean temperament," it was possible to modulate into some three or four major and minor keys. Bach in 1722 gave to the world the first book of his "Well-tempered Clavichord," the composer's declaration of independence—"We hold that all keys are created free and equal!" (See TEMPERAMENT.) In 1740 he wrote the second book, riveting the great reform.

Opera in the meantime had lost its opening splendor. Intoxicated by the success of the new style of music the composers began to believe that poetry was a secondary matter in the wedding of the arts, and in allowing their music to pursue an independent path all dramatic purport was soon lost. A reformer was needed and he soon came. Gluck (1714–87) began a crusade against the meaningless character of many of the beautiful melodies of the Italian Opera. In 1776 his opera of 'Orpheus' (which still holds the stage) began the dramatic school of operatic music. Beethoven followed in this path, and Mozart managed to reconcile melodic grace and dramatic content.

In carrying this sketch to its conclusion we must now trace three intertwining paths—piano music, orchestral music, and operatic and other vocal music. Naturally we shall be able to allude only to epoch-making composers.

In 1709 Cristofori, an Italian, invented the pianoforte. The instrument was at first neglected. Bach thought it fit only for rondos. Mozart used the spinet, as did Haydn. It was Beethoven who first turned the tide toward the new instrument. Instrumental technique grew up in the train of the new invention. Domenico Scarlatti (1683–1757) led toward a piano style while writing for the spinet. In 1752 Philipp Em. Bach published the first valuable book of technique, which could be applied to the piano, to the clavichord, or the spinet.

The classical piano sonata grew gradually from a combination of the ideas of the suite and of the first movement of the old sonata as established by Corelli. Haydn first established it, Mozart improved it, and Beethoven brought it to its culmination. The symphony was but a larger form of sonata, for orchestra, and the same process of evolution took place. Seldom has a form reached its zenith more quickly; from the first symphony, composed by Haydn (in three movements and for eight instruments only) in 1769, to the tremendous ninth symphony of Beethoven, composed in 1824, is but 55 years, yet these years contain all that is pertinent to the birth, growth and climax of every form of sonata,—in which we include classical chamber music, string quartettes, quintettes, etc., and orchestral works such as symphonies and concertos.

Just as there was a most significant musical epoch from about 1590 to 1620, so we find the "classical period" from about 1775 to 1825 to present not only a marvelous amount of creative energy, but a change in the musical taste of the world, a transformation of the scope and style of music. Only the opera went on its uninterrupted path. Yet here, too, there were some changes.

Beethoven (1770–1827) was an instrumental, an orchestral composer, par excellence. His one opera, 'Fidelio,' great art-work though it was, exerted no especial influence upon any school of composition. Mozart (1756–91) improved the style of the Italians in opera, but did not actually strike out a new path. His 'Don Giovanni,' for a long time the masterpiece of the world in the operatic form, was but a culmination of what Italy had already attempted. Rossini (1792–1868) with a pernicious habit of creating the most beautiful melodies whether they fitted the text or not, set back the hands of the clock of musical progress, as far as opera was concerned, for a good half-century.

The first ringing note of the newer and truer school of dramatic opera was heard when Von Weber (1786–1826) in 1820 completed his 'Freischütz,' an opera built upon the sure foundation of the folk-song, dramatic and thoroughly wedding its poetry and music.

The sacred forms, during the classical epoch, did not change materially. Beethoven wrote a most intricate mass, but it was only an echo of Bach with his great polyphonic B minor mass. Mozart composed, almost upon his death-bed, a noble requiem, but it was only an addition of operatic flavor to the requiems that had preceded. Cherubini (1760–1842) wrote a couple of requiems that were as great as any of the school—but were not in any sense innovations.

Piano and orchestral works advanced the most in the classical half-century. The vastest

piano-work existing today is probably Beethoven's B flat sonata, Op. 106.

The orchestra, in the modern sense, had its birth in the classical half-century. Bach and Handel made only outline sketches of their orchestral works, leaving much for modern commentators to fill in. But when Haydn came to England, in 1791, he directed a complete orchestra and he published complete orchestral scores, an epoch in the history of orchestral development. Mozart had, however, before this time, written a large number of symphonies in complete score, many of which were published at a later period. Although the modern orchestra and the full score had their origin in this remarkable epoch, the art of conducting came later. Mendelssohn and Berlioz may be named as the first really great conductors in the modern definition of the word. The use of the baton in conducting only became established after 1800.

One other important evolution must be added to the work of the 50 years which form such a golden epoch of musical creation. The songs of Europe, such as had any real worth, were almost altogether folk-songs, melodies which grew up as the briar rose by the way-side of art, not the careful product of great composers, but the spontaneous voice of the people. The songs of the composers were generally dull and artificial things, made so, perhaps, by the fact that the poets were not concerning themselves with short and lyrical forms. But when Goethe and Heine, in Germany, began writing beautiful lyrical poems, the song-composer was sure to follow soon. Franz Schubert (1797–1828) was the genius who evolved the 'Lied,' the artistic song which, however short, was yet a complete and perfect whole; as a tiny Meissonier painting is as perfect in its way as the largest canvas. Schubert added glorious works to the symphonic repertoire, his piano-works practically founded the "Minuet-form," yet he thought vocally, and his most spontaneous and most important works we consider to be his 'Lieder,' which songs began a new school. There are, however, a few authorities who consider Schubert greatest in his orchestral works and influence.

We may now follow the three distinct musical paths,—Vocal forms (including opera), piano music and orchestral music,—each by itself, to the present time. Continuing the song development, we find Schumann (1810–56), and Robert Franz (1815–92) following in the footsteps of Schubert and bringing the miniature vocal form to perfection. The operatic form took a wide deviation.

The work of Rossini was baleful only in the fact that it paid no heed to the wedding of words and music in dramatic unity. In light operas Rossini was a model, and his 'Barber of Seville' is a masterpiece. Once and once only, he proved that he could write a truly dramatic opera, and produced 'William Tell.' Donizetti (1797–1848), Bellini (1802–35), etc., followed his lead and wrote charmingly, but untruthfully. France compromised and united prettiness and some degree of dramatic feeling in the works of Gounod (1818–93), and of Ambroise Thomas (1811–96). The real reform, however, in this mesalliance of Poetry and Music was made by Richard Wagner (1813–83).

Wagner's combat and triumph have been too recent to require detail here. We need only state that his theories of opera, or "music-drama" as he preferred to call it, were,—

1. The abolition of a set form (that is, ending as one began), and the use of any shape that the poem suggested.

2. Absolute unity of the entire work. No division into songs, duets, choruses, with applause between and sometimes even encores. Continuity from beginning to end.

3. The music is always to interpret the poetry. Its entire character is to be dictated by the words: "Music is Truth." "In the wedding of the arts Poetry is the man, Music the woman"; "Poetry must lead, Music must follow"; "Music is the handmaid of Poetry"; are a few of Wagner's apothegms.

4. Abolition of mere tune and the substitution of a melodic recitative, called the "Melos."

5. Absolute freedom of modulation. Not necessarily a fixed tonality to any work or part of it. "Swimming in a sea of tone."

6. Excellence of libretto. No book is fit to be used for the text of an opera unless it would make a successful drama by itself.

7. A constant use of the Leit-motif (a musical figure expressing a definite meaning) by which the orchestra speaks a language that can be comprehended, somewhat like the chorus used to do in the old Greek tragedies. (See LEIT-MOTIF.)

These are not all of the theories that Wagner evolved, but they are the most important. They did not spring into being at once. One sees a few of them in 'Tannhäuser,' more in 'Lohengrin,' but the fulness of his reforms is first revealed in 'Tristan und Isolde.'

Wagner's work has influenced all the modern opera composers. Verdi (1813–1901) had begun his career in Italy almost upon the lines of his predecessors. Thanks to his genius he soon began to carve out a better vein for himself. In his 'Aida' he began to lead Italy to a much finer and truer school of opera than it had ever possessed. In 'Otello' and 'Falstaff' while carefully discarding the "Leit-motif" he seems to arrive at almost all the other Wagnerian conclusions, although his Italian personality prevents any great resemblance in results. In France, Bizet (1838–75), the best of French operatic composers, was starting upon a similar path with 'Carmen' when death interruped his career. America has as yet produced no standard operas, although Paine's 'Azara' and Chadwick's 'Judith' are worthy to become permanent additions to the repertoire.

Tracing the piano path from the time of Beethoven, we find three great "Cs" in technical writing—Czerny (1791–1857), Clementi (1752–1832), and Cramer (1771–1858). These led to a modern technique and this bore fruit in two different directions. Liszt (1811–86) became the king of the piano and brought its technical power to a point that had never been suspected before his time. Chopin (1809–49) came as the poet of the piano and gave to the instrument its most beautiful phases of expression. A host of piano composers have sprung up in every civilized country, Russia furnishing a great number.

In connection with the rise of technique we may speak of the advance in other branches of music. Italy had great singing schools in the 18th century, and some of the most famous vocal teachers. Nicolo Porpora (1686–1766) was the most eminent of these, and had as pupils some of the most renowned singers of his day, among them Farinelli (Carlo Broschi) who was reputed to be unrivaled in flexibility and in power. Pistocchi was another of the famous teachers of this epoch and his most famous pupil,—Senesino,—disputed the palm even with

Farinelli, in England in Handel's time. Vocal technique could scarcely go further than it advanced in the 18th century, although the 19th furnished such singers as Catalani, Malibran, Mario, Rubini, Lablache, Jenny Lind, and later such artists as Jean De Reszke, Adelina Patti, and, in the dramatic school, Materna, Tietjens, etc.

In violin technique the chief advance was begun in the 17th century, when Corelli (1653–1713) was the most prominent teacher of Italy. At about this time, too, the golden period of violin making began and the Amatis, Stradivarius and the Guarnerii made the name of Cremona famous all over the world. The king of all violinists, speaking entirely from the standpoint of virtuosity, was Paganini (1784–1840) who advanced technique so far that even to-day the greatest living violinists are unable to conquer all of the difficulties which he left as a legacy to the world. Since his time the sceptre has passed to Joachim (1831—), who held it for many years, but now, in his old age, sees it contended for by a host of advanced players. Paganini influenced violin music toward mere virtuosity, while such players as Joachim, Wilhelmj, or Wieniawski combine musical feeling with technique in their work.

Orchestral development has been absolutely phenomenal since Beethoven made his developments in tone-coloring. Berlioz (1803–69) was the first to advance upon the great pioneer's work and achieved remarkable results by his various experiments with new combinations. Wagner carried the art of orchestration still higher in his operas, and since his death a whole host of great tone-colorists have arisen. Russia has contributed very much to this advance, and it is not an absurd prophecy to predict that the Slav may attain the orchestral supremacy of the world in the near future. Tschaikowsky (1840–93) appears to be the greatest genius in this field that Russia has yet produced.

France has done much in recent times in this direction both in purely orchestral works and in combination with voices in cantatas and operas. César Franck (1822–90) led the reform in that country and, thanks chiefly to him, a race of very modern music-thinkers has arisen in France. Massenet, Saint Saens, D'Indy, Charpentier, Chaminade, and many others are writing in various fields of music, almost all tending to develop the orchestral side in some way. There is much freedom of form in the neo-Gallic school.

Italy has done very little in this direction, Sgambati being her only symphonist of prominence, but the neo-Italians, Mascagni, Puccini, Leoncavallo, etc., are laying great stress upon their orchestral work in opera.

Germany has developed chiefly along the Wagnerian lines, not an unmixed blessing when applied to purely orchestral work. After Beethoven there came a degree of dulness in orchestral matters. Mendelssohn (1809–47) developed the symphony along the classical lines, but while one must pay cordial tribute to the symmetry, skill, and melodic character of Mendelssohn's work, he was not of the stuff of which epoch men are made.

It was Schumann who made the first remonstrance against following too slavishly the classical paths, and through him the Romantic school and the freer mode of sonata treatment had its birth.

There are many who desire us to believe that the sonata form and all classical orchestral forms have had their day, but the great work of Brahms (1833–97) in symphony and sonata stands as a refutation to this dictum.

Nevertheless the modern tendency is toward greater freedom than ever before, both in form and in harmonic combinations. Liszt began this movement, and the time will come when it will be seen that his orchestral works were scarcely less influential than his piano compositions. He has led toward great brilliancy of tone-coloring, and, in his 'Poèmes Symphoniques,' to freedom of form and to intense dramatic expression. In England, Edward William Elgar (1857) has broken the bonds of Handelian tradition in oratorio by his Wagnerian orchestral, solo, and choral treatment of 'The Dream of Gerontius' and other sacred cantatas. Richard Strauss (1864—) has led the orchestra into the most difficult paths that it has ever trodden. He is not only the greatest master of orchestration at the present time, but he has endeavored to extend the boundaries of orchestral expression, using metaphysical subjects freely and pushing programme-music (instrumental music which gives definite pictures) to the extreme limit.

America has brought forth a school of orchestral writers of which John K. Paine (1839—), George W. Chadwick (1854), and E. A. MacDowell (1861—), are the foremost, while Horatio Parker (1863—) has brought the American oratorio to a much higher standard than it has ever before occupied.

What the future may bring is difficult to prophesy. Music has changed so constantly and so entirely, from epoch to epoch, that it is folly to imagine that there will be no further changes. In 1722 Rameau, the French composer, declared that music had been worn utterly threadbare, that all the possibilities of tonal expression had been exhausted! Yet almost all the great composers came after that time!

We cannot believe that the world will ever recede from the great orchestral virtuosity it has attained, but we may imagine that a return may be made, if not to form, at least to melodic beauty. A combination of attractive melody with rich and impressive harmony, a perfect balance of the intellectual and the emotional sides of the art,— these may be characteristics of the Music of the Future.

Music-box. See MUSICAL INSTRUMENTS, MECHANICAL.

Musical Drama. See DRAMA; MUSIC.

Musical Festival, a series of performances with large choral and orchestral auxiliaries usually held in large cities yearly or bi-yearly. The first known of these festivals was the great Handel Commemoration (1784-7). Festival performances of Handel's oratorios were given in Berlin and other continental cities. In the United States the better known entertainments of this kind are the Cincinnati Musical Festival and the Worcester, Mass., Festival. See ORATORIO.

Musical Instruments, Mechanical. From the earliest times men were able to produce harmonious musical tones by automatic or mechanical means. The hanging gardens of Babylonia were fitted with various wind harps, which produced a soothing melody in a minor key. The inventive Greeks had many instruments which could produce harmony in a limited scale through the action of the wind (Æolian harps) or by water dropping upon differently tuned vessels. But it was not until the development of the harpsichord into the now common pianoforte that rapid strides were made in this industry. The patient workmen of Switzerland first constructed music-boxes in the middle of the 18th century by fitting minute plugs on a brass or metal cylinder, so arranged that they would strike separate bars of steel and vibrate them, thus producing the proper musical tones to form harmony. This same principle is still in use, although some of these German and Swiss music-boxes are quite elaborate and can play intricate compositions. The motive power is usually a spring, which, when wound up, causes the cylinder to revolve and the pins to strike the tone bars and vibrate them.

During the last decade of the 19th century and the beginning of the 20th, wonderful improvements have been made. The tediousness of learning to play the piano properly may have been the incentive for this activity, for it is now possible to attach to any ordinary piano a simple apparatus which will play perfectly any composition which the human hands could produce, rivaling in technique, expression and brilliancy the efforts of the most celebrated piano performers of the world to-day. Many American firms are now engaged in the manufacture of these attachments for the piano. In 1880 the first really successful mechanical player was invented and called the "æolian." This name has clung to all the succeeding inventions along this line. The first æolian was applied to the melodeon, a flat reed instrument operated by a bellows, which forced wind through the reeds, downward, thus producing harmonious sound. As the melodeon and organ each require no delicacy in the touch to produce music, this first æolian was a comparatively simple piece of mechanism. The basic principle was the perforation of a roll of tough, strong paper, the perforations allowing air to pass through them as desired, this stream of released air in turn operating a felt-tipped finger, which pressed down upon the organ's key, or opened a valve. The size of this perforation in the paper gauged the length of time which elapsed before the finger was released and the sound emanating from that particular key stopped.

The operator of one of these attachments for the organ sat before the instrument, as in ordinary playing, and pumped with his feet on a bellows. This bellows not only filled the air chamber of the organ with air, but also operated the wind motor of the æolian. As the motor pumped air into the attachment, it was held in a chamber ready to be emitted when the perforated paper passed over the holes in the roof of the chamber. As a note was wanted, a perforation made in the paper over the corresponding hole released a current of air, which tripped a "pneumatic" (vibrating disk), opening a valve which sounded the note. Tempo was given to the music and controlled by means of a stop which regulated the speed of the motor, and the rubato was formed by the ordinary crescendo swell. The different sets of reeds in the instrument were brought into play in the regular manner, by the pulling forth of stops. The performer not having to bother with the purely mechanical act of personally pressing down the keys, this being done by the automatic action of the attachment, he was left free to more perfectly render the expression the composer intended for his work.

This attachment proved so successful on the ordinary melodeon that it was desired to obviate the inevitable "brassy" effect which seems a part

of all flat-reed instruments, such as the common organ or melodeon. This was done by enclosing the different sets of reeds in tiny chambers of resonant woods, the air entering these chambers and being forced upward, instead of downward, as before. The result was a peculiarly round, full tone, which has become known as the "vocalion" system. The attachment was then applied to the pipe organ with fine effect. This æolian is (1904) made in large numbers by a New York corporation, which occupies a large building for the display of the attachment, so great has this business become. In this building is a pipe organ costing $35,000, with the latest æolian attachment, where song recitals are held, the control of the operator over the instumentation being absolutely perfect.

The latest application of the æolian principle is to the piano. Inasmuch as this required an acute delicacy of touch in fingering the instrument named, in order to meet the demands of a critical musical public, the production of a capable attachment was a problem of much difficulty in the solving. In 1898, this difficulty was met by the same company which had made possible the æolian, the attachment being called the "pianola." The paper roll and wind motor were used in the pianola, as in the æolian, but the pneumatic vibrators were made most sensitive, so that they vibrated with the rapidity and delicacy of the human fingers, giving a "touch" to the playing not excelled by Joseffy himself. In fact, it is impossible to tell whether the piano is being operated by an expert pianist or by the pianola, if the instrument be not seen.

These striking pneumatics are operated by both high and low pressure bellows, by the same action of pumping with the feet. By means of a small lever, the touch can be modulated from the softest pianissimo to the heaviest fortissimo. The mechanism is enclosed in an ornamental case, placed in front of the piano, with the felt-tipped steel fingers in position over the keys of the instrument. There are three tiny levers in front of the pianola, one controlling touch (as described), another tempo (or the speed at which the paper shall proceed from the roller) and the third operating the sostenuto, or loud pedal. This makes a fingering mechanism, as delicate and perfect as a watch, completely under the control of a human player, who can exhibit as much if not more artistic impulse than if compelled to use his hands to produce the touch.

The instant appreciation of the lovers of good music is shown by the fact that both the æolian and pianola are now sold in immense quantities all over the world. Their cost varies from $250 to many thousands. A late improvement is the making of a piano with the pianola attachment enclosed in the case of the piano, so that the instrument can be played by the hands, if desired. By releasing a spring, the pianola is made operative and proceeds to play any tune placed upon the roll. This instrument costs $850. An æolian for the pipe organ, which will play on both manuals of the organ from the same roll of paper, costs, in a size suitable for private homes, about $3,500.

All the various attachments for producing mechanical playing on the organ and piano have as their basis this principle of the perforated paper roll. They all took their form from the original æolian, and are known by various names, such as the "angelus," "pianotone," "pianograph," etc. This method of making automatic players for musical instruments is also applied to some few other instruments aside from the organ and piano. The most ingenious is, perhaps, the automatic banjo, or "encore," as its makers call it. In appearance this unique affair looks like an ordinary banjo, standing upright in a glass-covered cabinet. On each side of the strings near the bridge are claw-like "pickers," which catch the strings as would the human fingers. Above, along the frets, are several small disks over the strings, which are compressed on the strings to produce the tone variation desired, as by the fingering of the human hand. Inside the cabinet is an electric motor which rotates a roll of perforated paper, which releases the picks and disks as needed to produce the peculiar tone effects of the banjo. The rapidity of action demanded for the proper playing of negro melodies and such like music, common to this instrument, makes the invention one of much interest. It is in common use in many places in America, where music is desired to attract guests. A variation of this same idea is also seen in the automatic chimes of bells, where electrically moved perforated paper sets the bells in a cabinet jingling in more or less perfect tone.

Perhaps the best known automatic musical instrument in America is the hand organ, worked by a spring motor or by turning a crank. Thousands of such instruments are to be seen in every town and city. They are now made in this country principally, America having almost entirely taken away this trade from Italy and Switzerland. In the small hand organ, the system used in the ordinary music-box is employed, though many of the best and largest have adopted the perforated paper idea. Some of these latter have attachments that will play on a bass drum, a snare drum, cymbals, piano keys and reeds — all at once!

In some of the music halls of America are to be found huge automatic "orchestrions," which have several pipes like a pipe organ, as well as piano strings, cymbals, a drum, etc. These are limited to a few tunes only and are operated by powerful motors driven by steam or electricity. Their mechanism is intricate and they are continually getting out of order. The principle on which they are operated is largely that of the music-box, the paper roll not being used in them to any great extent. The "calliope" of the circus may justly be classed in this same automatic category, as it is sometimes played by use of the paper roll. In the calliope, the power is given by a steam engine, which also sends its steam into pipes of varying length and size, which, when emitted by pressing down a key, or valve, produces a hideous sound approaching music, which is heard a long distance — its chief recommendation.

One of the most useful and successful of the separate musical automatons of this class is an instrument invented and manufactured solely in America. It is called the "Regina" music-box and is made by the hundreds in New Jersey. Its principle of operation is a combination in effective form of both the perforated paper idea and the Swiss music-box construction. A zinc disk about eighteen inches in diameter has perforations around its circumference, the disk

revolving at the centre about a spindle, the rotation being effected by a spring motor. Underneath this disk is a chromatically arranged series of steel vibrators, each representing a definite tone. As the metal disk revolves, the vibrator is struck which corresponds to the note desired, the hole in the disk releasing a tiny hammer bar as it passes. The elongation of the hole causes a longer pulsation of the vibrator, producing long or short tones, as desired. There is practically no attempt made to give delicacy of touch, as in the pianola, but the music produced is much superior to the ordinary music-box, and the construction is simpler, cheaper and less liable to get out of order. Some forms of the regina are quite elaborate in construction as to case, the price ranging from $20 to above $500. The disks each contain perforations for one tune and cost little. They are almost indestructible, a manifest advantage over the perishable paper roll of the pianola or the wax record roll of the phonograph. Reginas of the largest size have sounding boards which enhance the tone vibrations.

Other late American inventions in the mechanical musical instrument line are numerous, though not in general use. Ever since Benjamin Franklin's musical glasses, which he called a "harmonica," attempts have been constantly made to play upon glasses, filled to different degrees with water to vary the tone, by mechanical means instead of using the moistened fingers. This has been practically solved. Wet chamois-covered fingers are automatically revolved around the rims of the glasses by the action of a perforated paper roll, as in the pianola. The result is almost equal to the work of human fingers and does nicely as a public entertainer. The "jewsharp," mouth organ and similar small instruments are also played automatically in like manner. In fact, the invention of the perforated disk, or roll of paper, opened up the field of successful operation in this line to a limitless extent and each day sees new methods of adapting it to all kinds of instruments.

One class of automatics not heretofore touched upon is the "nickel-in-the-slot" machine, with musical attachments. These machines are placed in the waiting-rooms of railway stations and ferries and in other public places, where one can put the mechanism into operation by inserting a penny or nickel into a slot. This releases a lever, which in turn operates a spring motor. The music is produced by the music-box method or by the disk of metal — like the regina.

There remain for consideration in this article the various forms of the phonograph, which was originated by Thomas A. Edison (q.v.) principally as a preservator of the human voice in speaking. It has come to be generally used as a mechanical musical instrument, as well. With the attachment of a long megaphone horn to increase the volume of sound, the songs of all the noted singers, the orchestrations of prominent bands, the instrumental and vocal solos and choruses of church choirs, etc., are so presented that they can be readily heard in a large hall. The several companies making these instruments in America employ the services of the best singers and instrumentalists to sing and play into their machines, the tones being perfectly recorded upon the sensitive wax rolls. These original, or master, records are then in turn put upon a deliverer, which sends forth the sound into a score of waiting machines, to be again and yet again recorded. The phonograph has found a deserved place in thousands of American homes. For full details of the construction of the phonograph, see article PHONOGRAPH. Also see PIANO, ORGAN, MUSIC, HARMONY, and kindred articles in this work.

PUTNAM DREW.

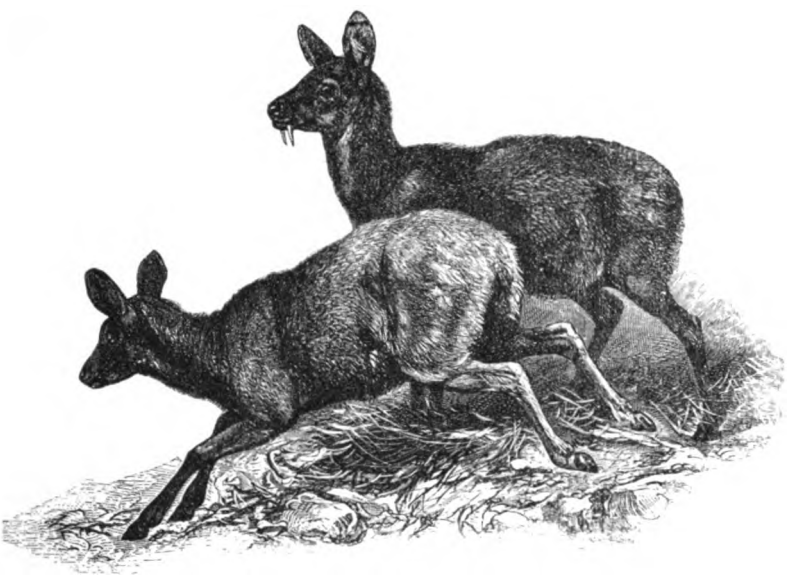
Musical Sand, beaches which emit musical tone or other sound when the sands are pressed under foot or struck together in a bag. They occur throughout the world, notably in the peninsula of Sinai, on the great musical mountain of Jebel Nagous; near Colberg in Pomerania; on the East Prussian coast; in the United States, where there are such sonorous beaches on the Atlantic, on the Wisconsin River (near Kilbourn City, Wis.), on the Mississippi (opposite Carondelet), and on the Pacific coast; in Hawaii, where there are "Barking Sands" in the southwest coast of Kauai; in Africa (Liberia and West Griqualand); in Botany Bay, New South Wales; and in Brown's River Bay, Tasmania. The sound is a mere squeak unless the sand is very dry; then it is musical. Hence the common explanation that the sound is due to the "rubbing together of millions of clean sand-grains very uniform in size" is less likely than the hypothesis that it is caused by the oscillation of the particles which are prevented by elastic air-cushions from actual contract.

Mu'sick, John Roy, American author: b. Saint Louis County, Mo., 28 Feb. 1849; d. Omaha, Neb., 14 April 1901. He was graduated at the Northern Missouri State Normal School in 1874, admitted to the bar in 1877, and until 1882 practised law at Kirksville, Mo., and elsewhere. Afterward journalism and authorship became his chief occupations. In 1878 he published in 'Potter's American Monthly' his first story, 'Justice Courts,' and among his later works may be mentioned: 'The Banker of Bedford'; 'History Series of Missouri'; 'Calamity Row'; 'Brother Against Brother'; 'The Mysterious Mr. Howard'; 'Hawaii'; 'Our New Possessions'; 'The War with Spain'; 'Cuba Libre'; and 12 'Columbian Novels,' dealing with the history of the United States. In these novels were passages which some newspapers described as plagiarisms from Dickens and Saint-Pierre, and in consequence Musick was made the object of much criticism.

Musin, mü-zăn, **Ovide,** Belgian violinist: b. near Liège, Belgium, 1854. He studied at the Liège Conservatory and won a first prize for violin playing when only 11. He played with signal success in various European capitals after 1870 and in 1883 made his appearance in New York at a Symphony concert in October of that year. He subsequently married the American soprano singer, Annie Louise Tanner, with whom he has made successive concert tours.

Musk, or **Muscovy, Duck.** See DUCK.

Musk-deer, a small deer-like animal (*Moschus moschiferus*) of the sub-family *Moschinæ*, differing from typical deer in the absence of antlers in either sex, in having only one lachrymal orifice, in the presence of a gall-



1

2

1. Musk Deer.

2. Musk Ox.

bladder, and, in the male, of the musk-bearing glands to which the animal owes its name. Other peculiarities are the smooth brain, long tusks (canines) of the upper jaw, and the character of the feet, where the «false hoofs» come to the ground. These and other characters led Flower to declare it «an undeveloped deer,»— a representative of an ancient type.

The musk-deer is of small size, about 20 inches tall, grayish, marked with obscure stripes on the fore quarters and neck, thick-legged and ungraceful in form, but agile in movement. The species is confined to the highlands of Tibet and northward, where they frequent the pine-woods, going to the heights above them in summer. They dwell alone, or in family parties, are timid and secretive, feeding rarely except at night, and then subsisting partly on roots dug with their great teeth.

The males alone yield the musk secretion, which is furnished by a glandular sac or pouch situated on the abdomen, and averaging the size of a hen's egg. The secretion is resinous and unctuous, and becomes granular and of a dark color when dried. About 190 grains is stated to be the average quantity obtained from a single animal. When the musk-sac is first opened the odor is said by Tavernier to be so powerful that it causes the mucous membrane of the nose to bleed. The bag or «pod» is cut out by the hunters, and its orifices are tied, nevertheless the contents are often found much adulterated. The substance also reaches the market in a granular form, having been scraped off rocks where it has been deposited by the animal. The best comes by way of India and China, and is known as Tongking musk; a poorer quality comes from Siberia. Formerly musk had some value in medicine, but now is used almost wholly by perfumers; and the demand is so great that the animals are now comparatively rare, and the price of musk-pods has greatly advanced over former rates.

A somewhat similar secretion is possessed by many other mammals and reptiles, and in some cases, as of the muskrats (q.v.), is very strong, especially in the mating-season. The biological significance of it, no doubt, is sexual attraction. A similar odor belongs to certain plants. Consult Flower and Lydekker, 'Mammals' (1902).

Musk-ox, a singular ruminant (*Ovibos moschatus*), now confined to the Arctic regions of North America, but once circumpolar, and in Pleistocene times an inhabitant of all Europe and in America as far south as Kentucky. In general appearance it much resembles a large hairy sheep. Its body is clothed in long, brownish hair, with a warm undercoat of wool, very thick and tufted on the neck and shoulders, and elsewhere long and flowing, so that it hangs down almost to the feet. A lighter saddle-shaped patch marks the middle of the back. The tail is short and invisible. The legs are short and strong, and the hoofs of unequal size and shape, the outer being much broader than the inner one. The horns are broad at the base, covering the forehead and crown, much as do those of the Cape buffalo, then curve downward between the eye and the ear and then upward and backward. The average size of the male is that of a small domestic ox. This animal seems intermediate in structure between oxen and sheep, having part of its characteristics bovine and the other part caprine. A thorough exposition of its anatomy by Dr. Lönnberg may be found in the 'Proceedings' of the Zoological Society of London for 1900. The musky odor which belongs to them is not emitted by any special gland, but seems a general emanation, and is not very strong.

In habits these animals are gregarious, each herd numbering from 20 to 30 members. They migrate in winter from the most northern and exposed places to those farther south, or where food is more accessible, and are constantly hunted by the Esquimos as an important source of food. To this is added much destruction by fur-traders, whalers, and explorers, and their numbers are much diminished. Their present winter range is rarely south of the Barren Grounds (q.v.), between Hudson Bay and Great Slave Lake. Their food consists of moss, lichens, herbage and twigs of the dwarf willows and birches which grow in parts of their country. They are extremely wary, and their hunting requires great skill and endurance. Their flesh is good, their hides very useful and from their wool might be woven an admirable cloth could it be obtained in sufficient quantity. Consult books by Arctic explorers and Grinnell, Wister and Whitney, 'Bison, Musk-Ox and Sheep' (1903).

Musk Plant, a popular name for several unrelated plants. The species most cultivated in the United States is *Mimulus moschatus,* of the natural order *Scrophulariaceæ* and a native of the Western States. It is very popular in cool greenhouses and window gardens and, being hardy, in damp, shady places out of doors. In Europe, the name is most applied to *Erodium moschatum* of the natural order *Geraniaceæ,* a native of the Mediterranean region, growing in gardens from annually sown seeds. The name is applied in the West Indies to *Guarea grandifolia,* which is also known as musk wood, and to *Trichilia moschata,* also called musk tree. This last popular name is also applied to a Tasmanian tree (*Olearia argophylla*). An East Indian plant (*Euryangium sumbul*) is probably best known in the markets as musk root. Its starchy roots are used as a substitute for musk in perfumery.

Musk-shrew. See MUSKRAT.

Musk-turtle, or **Stinkpot.** See BOX-TURTLE.

Musk-wood, a tree (*Guarea grandifolia*) of the tropical American order *Meliaceæ,* so called in the West Indies because the bark smells so strongly of musk that it may be used as a perfume. Although the tree attains timber size the wood contains a bitter resinous substance which unfits it for many purposes. The bark of several trees of this genus is used as an emetic and purgative.

Several other trees and plants give a musky odor, such as the musk-plant, one of the monkey-flowers (*Mimulus*); the grape-hyacinth; the musk-mallow or musk-okra; the starchy root of the Asiatic *Euryangium sumbul,* which is used to adulterate true musk; the Tasmanian musk-tree (*Olearia argophylla*) and others.

Muskegon, mŭs-kē'gŏn, Mich., city, county-seat of Muskegon County; at the mouth of the Muskegon River, on Muskegon Lake, and on

the Grand Rapids & I., the Toledo, S. & M., and branches of the Pere M. R.R.'s; about 95 miles northwest of Lansing, and 38 miles northwest of Grand Rapids. Lake Muskegon, upon which the city is situated, is connected with Lake Michigan by a channel 200 feet wide and of sufficient depth for large vessels. This gives the city an excellent harbor for lake steamers, which connect it directly with all the important lake ports. The harbor is clear of ice all the year.

Muskegon was first settled in 1834, although a temporary trading post was established here in 1812. It was incorporated as a village in 1861 and chartered as a city in 1869. The chief manufactures are furniture, curtain rollers, refrigerators, flour, beer, knit-goods, paper, pianos, iron products, chemical engines, tin-plate products, electric cranes, leather, and cutlery. It has a large trade in lumber, the manufactures of the city, fruit, celery, vegetables, and farm products. The city has been greatly favored by the numerous donations of one of its own citizens. He has presented a public library, a gymnasium, a manual training school, an endowed hospital, and a square upon which has been erected a soldiers' monument, and several bronze statues. The government is vested in a mayor, who holds office one year, and a council. The waterworks are owned and operated by the city. Pop. (1890) 22,702; (1900) 20,818.

Musket, a small hand-gun with which infantry soldiers were formerly armed. When first introduced, early in the 16th century, it was discharged by means of a lighted match, and was so heavy that it had to be laid across a staff to be fired. To make use of it the soldier required to carry a slow-burning match with him which was apt to be extinguished in wet weather. The wheel-lock followed, the chief feature of which was a wheel made to revolve by means of a spring, and to cause sparks by friction against a flint. The next improvement was the flint-lock proper (about 1625), in which sparks were produced by one impact of a piece of flint on the steel above the priming powder. Musketeers were soon introduced into all armies, and in the beginning of the 17th century infantry consisted of pikemen and musketeers, and all changes in regard to the relative proportion of the two arms were always in favor of the latter. The flint-lock musket was introduced into the British army toward the end of the 17th century, and was the British musket of the days of the Peninsular war and Waterloo, known familiarly as "Brown Bess." It was superseded by the percussion musket in 1842, this musket being in turn superseded by the rifle. See ARMS AND ARMOR; FIRE ARMS; RIFLE.

Musketoon', a short, thick musket, used in the 18th century but now obsolete; the bore was the thirty-eighth part of its length; it carried 5 ounces of iron or 7½ of lead, which was discharged by an equal quantity of powder.

Mus'ketry, the science and art of shooting with small-arms, especially with the musket or rifle. In connection with the British army there is a musketry school, where officers and non-commissioned officers of infantry and cavalry are trained in musketry.

Muskhogean (mŭsk-hō-gē'ạn) **Stock.** See CREEKS.

Mus'kellunge, Maskinonge, etc., the great pike (*Lucius nobilior*) of the lakes of the interior of North America. See PIKE.

Muskingum, mŭs-kĭng'gŭm, a river of eastern Ohio with a course of about 120 miles wholly within the State. It is formed by the junction of the Tuscarawas and the Walhonding at Coshocton in the county of the same name, and it flows in a general southeast direction through a beautiful and fertile valley to Marietta, where it joins the Ohio. The chief towns on its banks are Zanesville, McConnellsville, and Marietta. It is navigable for 90 miles to Dresden.

Muskingum College, in New Concord, Ohio, founded, under the auspices of the United Presbyterian Church, in 1837. In 1903 there were connected with the institution 15 professors and instructors, and about 300 pupils. There were about 4,000 volumes in the library; the buildings, grounds, and furnishings were valued at $40,000; the productive funds were nearly $50,000. The annual income, which includes tuitions, interest from productive fund, fees, etc., amounted to about $12,000. The courses lead to the degrees of A.B. and B.S.

Musk'melon, or **Cantaloupe.** See MELONS.

Muskogi Indians. See CREEKS.

Muskoka, mŭs-kō'ka, Can., a county of Ontario, bordering on Georgian Bay, the name also being borne by a beautiful lake and river, and comprehensively applied to the extensive region lying between Georgian Bay on the west, Lake Nipissing on the north, Ottawa River on the east, and Lake Simcoe on the south. The capital of the county is Bracebridge on the Grand Trunk Railroad, pop. (1901) 2,479. The region with between 800 and 1,000 lakes and smaller bodies of water, chief of which are Muskoka, Rosseau, and Joseph lakes, all abounding in fish; several rivers and picturesque waterfalls, notably High Falls and South Falls on the Muskoka River and Bridal Veil Falls on the Shadow River, and extensive forests filled with game, is a paradise for sportsmen which is become more widely known and visited every year. During the summer steamboats ply on the principal lakes connecting with the Grank Trunk and Canadian Pacific R.R.'s.

Muskrat, or **Musquash,** an aquatic rodent (*Fiber zibethicus*) numerous throughout North America, and yielding a valuable fur. It is a member of the rat family (*Muridæ*), and is, in effect, a gigantic vole or meadow-mouse, with a tail flattened sideways into a powerful swimming instrument, and fringed with stiff hairs; the hind feet are set obliquely to the leg; the ears are very small and buried in fur, the muzzle is blunt and furry; the palms and soles are naked and fringed with hairs. The average total length is about 21 inches, of which the tail is more than a third, measuring as long as the body without the head. The color varies above from almost black to pale brown; sides of head and body chestnut-brown; under-fur bluish gray; feet dark brown; tail black. Those of the Rocky Mountain region are smaller and paler than eastern ones. The musky odor of these animals is due to a thick fluid secreted in

two small glands near the generative organs, which imparts a taint to the flesh that makes it unpalatable to most persons.

These animals reside along small streams, and in swampy places generally, being most abundant around Chesapeake Bay and in the marshy lakes of the upper Mississippi region and northward to Hudson Bay. Where the banks have some elevation they form extensive burrows, which have entrances below the surface of the water, and gradually ascend till they terminate in a chamber above the level of high water. These burrows are most frequently made under the roots of trees, or in other situations of difficult access. The excavations are of great injury to artificial embankments along canals and rivers, by permitting the water to undermine and to make large breaches in them, and in some parts of the country they do serious damage to canal embankments and river-dikes. When, however, these animals inhabit low and marshy situations, they construct conical houses usually surrounded by water, not unlike those of the beaver but smaller, composed of reeds, etc., mixed with clay. These houses have subterranean passages leading to them, and are inhabited by many individuals during the winter; but in the warm weather they desert them entirely, and dwell in pairs in a bank-burrow while they rear their young. The houses contain a large, smooth-walled chamber, above the waterline; and when frozen are sufficiently solid to form a protection against all but the largest carnivora; but they are usually destroyed and swept away in the spring floods, so that a new house is erected every season.

The muskrat feeds mainly upon aquatic vegetation, especially the rootstocks and basal parts of stems, and is especially fond of the pond-lily. These it brings to the shore to eat, almost always during the night, for it is essentially nocturnal, although often seen abroad in the daytime. It is very fond of mussels, and brings great quantities of these ashore, always, when possible, at the same place, so that piles of their shells accumulate to indicate favorite feeding-spots. In summer the muskrats feed on shore-herbage somewhat, and frequently go some distance to get a meal of growing corn, garden vegetables or fallen fruit. They are accused also of occasional fish-catching, and are unwelcome in waters devoted to fish-culture. Because of the commercial value of its fur and of its destructiveness in some places, or for amusement, the muskrat is incessantly persecuted by man, as well as preyed upon by many natural enemies — minks, wolverines, foxes, wildcats, badgers, wolves, birds of prey, water-moccasins, snapping-turtles, pikes and others, which capture many young and some adults. Nevertheless they are so secretive and so prolific, and have found so many advantages in the civilized parts of the country, that they survive even in the most thickly settled districts, and are likely to maintain their numbers indefinitely. They produce from three to nine young at a birth, and often breed two or three times a year.

The fur of the muskrat is dense and soft, but inferior to that of the beaver. It was formerly little esteemed, but during the last century has come more and more into use, beginning with a demand early in the 19th century for making "beaver" hats. When this industry was ended by the introduction of silk hats the demand diminished, but revived again, until, about 1870, London was receiving about 4,000,000 skins annually, besides some 500,000 consumed in America and 1,500,000 sent to Germany, principally Leipsic. The price then began to fall, but the product amounted in 1903 to about 5,500,000 pelts. The best "No. 1 black" skins averaged in London, in 1903, about 30 cents.

"Muskrat fur," according to a recent authority, "is used more extensively in Europe than in America, the Russians and Germans being especially large consumers. It is employed in making gloves, collars, caps, capes, muffs, trimmings, linings, etc., and is made up either natural, plucked, plucked and pointed, or plucked and dyed black or various shades of brown. Large quantities are used as linings for overcoats and long wraps, from 40 to 60 being necessary for each garment. Sometimes the under parts are used separately for this purpose, the natural white color being quite effective. The skins of young animals are especially suited for linings. The unplucked skins are frequently dyed to imitate mink, and sold as 'Alaska mink,' 'water mink,' or 'black mink.'"

Muskrats are taken by shooting, spearing in winter (through their houses, or through the ice), or, most numerously, by trapping. Ordinary steel traps are used, placed under the water inside a broken house, or in a runway or landing place, baited with an apple, or bit of parsnip, and often scented with musk or an aromatic oil, and fastened by a heavy chain so arranged, if possible, as to lead the animal to drown itself in its struggles. In certain districts, as along Chesapeake Bay, men make a regular business of trapping muskrats in winter; and even own, or rent, large spaces of marshland for that purpose.

The books of Audubon, Godman, Hearne, Richardson, Merriam and all general writers on American mammals should be consulted; also Stone and Cram's 'American Animals' (1902); Herrick, 'Mammals of Minnesota' (1892); and the files of the 'American Naturalist' and of 'Forest and Stream.'

Muskrat, Indian, a name among the British residents in India for a shrew (*Crocidura cærulea*), about the size of the common rat, which comes into houses at night hunting for cockroaches and similar insects, and makes its presence known by occasional shrieks. This animal emits a peculiarly strong and penetrating odor of musk, which clings to everything the little beast touches, and arises from two large musk-glands beneath the skin of the side of the body a short distance behind the forelimbs. Consult Blanford, 'Mammalia of British India' (1888).

Mus'lim, or **Moslem.** See MOHAMMEDANISM.

Muslin, a fine cotton fabric. The name is said to be derived from the city of Mosul in Mesopotamia. The texture of muslin is usually plain, but sometimes adorned with figured patterns. The manufacture of muslin was introduced into Europe from India about the end of the 17th century, and it is now largely carried on both in Great Britain and in France.

Mus'quash, a name in the Canadian Northwest for the local muskrat (q.v.).

Mussel-pecker, a bird, the oyster-catcher (q.v.).

Musselburgh, mŭs'l-bŭr-ō, Scotland, a town and seaport of Midlothian, 6 miles east of Edinburgh, on the Firth of Forth, at the mouth of the Esk, which divides it into two parts, Musselburgh proper and Fisherrow. It has noted golf-links, a bridge of Roman origin, and a curious old tolbooth built in 1590, out of materials from the celebrated Chapel of Loretto. The chief manufactures are leather, paper, and fishing-nets by machinery. There is a fishing population of about 1,100. The battle of Pinkie, in 1547, was fought in the vicinity. Pop. (1901) 11,704.

Mussels, Fresh-water. See FRESH-WATER MUSSELS.

Mussels, Marine. The marine mussels belong to a family (*Mytilidæ*) of bivalve mollusks which have the anterior retractor muscles very small, the posterior large, and the two valves of the shell equal and covered by a thick horny layer. Numerous species occur in all seas and, because of the comparative delicacy of their flesh, and their habit of forming immense beds, many are of commercial importance. Foremost in this respect is the edible mussel (*Mytilus edulis*) which has a smooth, dark-colored, wedge-shaped shell with the umbos or beaks exactly at the hinge end. This species is circumpolar in its distribution, and on our Atlantic coast extends southward to North Carolina. Wherever rocky reefs, piles, or other suitable objects for attachment occur at low water, combined with currents for bringing food, this mollusk multiplies into extensive colonies. In Europe it is valued much more highly than in this country, where it is chiefly used for bait, although considerable quantities are canned in New York. Besides the fisheries on natural beds this mussel is regularly cultivated in France by methods akin to those used in European oyster culture. The genus *Modiola,* containing the so-called horse-mussels, is distinguished by the more oblong shell inflated toward the hinge end, from which the umbos, though close, are quite distinct. The best known one (*M. modiolus*) is a large species distinguished by the nearly unribbed surface and the coarse hairy epidermis. It has nearly the distribution of the *Mytilus,* and abounds in the north on rocky shores at low water and below to a considerable depth. *Modiola plicatula* is distinctly ribbed and has a thinner epidermis. This is an American species which ranges from Nova Scotia to Georgia and is extremely abundant at low water on the mud-flats of the New Jersey coast, where it is doubtless effective in the upbuilding of sedimentary areas. These two species are less valued for food than the *Mytilus,* but are largely utilized in certain localities as fertilizers. Consult: Goode, 'Fishery Industries of the United States' Sec. I (1884); Cooke, 'Mollusca' (1895).

Musset, Louis Charles Alfred de, loo-ē shärl äl-frā dė mü-sā, French poet, novelist, and dramatist: b. Paris 11 Dec. 1810; d. there 2 May 1857. After trying various professions and being dissatisfied with them all he, about 1830, gave himself up wholly to literature, and in that year published poems, 'Contes d'Espagne et d'Italie.' In 1831 appeared a new collection entitled 'Poésies Diverses,' and in 1833 a third, bearing the general title 'Un Spectacle dans un Fauteuil,' in which the chief pieces are a comedy of a light and delicate grace called 'A quoi Revent les jeunes Filles,' and a poem, 'Namouna,' written after the manner of Byron. His 'Confession d'un Enfant du Siècle' (1836) is a gloomy autobiographic novel, containing the analysis of a diseased state of mind, all the phases of which the author had studied in himself, and which had already revealed itself in some of his earlier poems. The same settled melancholy also distinguishes his 'Rolla,' 'Une bonne fortune,' 'Lucie,' 'Les Nuits,' 'Une Lettre à Lamartine,' 'Stances à Madame Malibran,' 'L'Espoir en Dieu,' and other poems, written some before and some after the 'Confession' published in the 'Revue des Deux Mondes.' The prose tales he contributed to the same periodical are full of grace and feeling. The same qualities are found in his comedies and *proverbes* (short dramatic pieces), published in 1840. One of these short pieces 'Un Caprice,' was performed at the Théâtre Français in 1847, and although not composed in accordance with the customs of the stage, succeeded by the truth of the characters and the charm of the dialogue. De Musset was made librarian of the department of the interior in 1838, of which post he was afterward deprived, and of the department of public instruction in 1855. In 1852 he was admitted a member of the French Academy. Among his dramatic works perhaps the best is 'Les Caprices de Marianne,' a classic of the Théâtre Français repertory. He has been ranked after Hugo and Lamartine as the third French poet of the 19th century. Consult biographies by Paul de Musset (1877; Eng. trans. by H. W. Preston 1887), and Barine (1893).

Mus'sey, Reuben Dimond, American surgeon: b. Pelham, N. H., 23 June 1780; d. Boston 21 June 1866. He was graduated at Dartmouth in 1803; studied medicine at the University of Pennsylvania; practised in Salem, Mass.; taught in the Dartmouth medical school 1814–20 and 1822–38, at Bowdoin 1833–5, at Ohio Medical College 1837–50, and at Miami Medical College, which he founded, 1851–8; and spent the last eight years of his life in practice in Boston. He was a famous operator, the first to remove the shoulder blade, or to tie both carotid arteries, and successful in his operations for stone, for removing ovarian tumor, for strangulated hernia, and in subcutaneous deligation in varicocele. Mussey wrote 'Health: Its Friends and Its Foes' (1862).

Must, the juice of the grape, which by fermentation is converted into wine. In the wine countries this unfermented sweet must is distinguished from the sour must or unripe wine of a year old.

Mus'tang. See BRONCO.

Mus'tard, a genus of annual, biennial and perennial herbs (*Brassica*) of the natural order *Cruciferæ.* The species, of which about 100 have been described, are characterized by yellow four-petaled flowers, linear or oblong pods containing one row of seeds. All are noted for their more or less biting flavor for which some are valued as esculents. In a generic sense, cabbage, kale, cauliflower, turnip, and other vege-

tables are mustards, but specifically the name is restricted to a few species of which the following are the most important: Black mustard (*B. nigra*) so called from its dark brown seeds, white mustard (*B. alba*) the seeds of which are yellowish, Indian mustard (*B. ramosa*), and *B. arvensis*. These are all cultivated for their seeds which when ground constitute the popular condiment, mustard. Sometimes flour and turmeric are added to the mustard to dilute and color it. The young plants are often eaten like spinach or as a salad. They may be easily obtained from seed sown in any garden soil.

Mustard Oil. See OIL OF MUSTARD.

Mustil'idæ. See FUR-BEARING ANIMALS.

Mut, moot, in Egyptian mythology, a goddess of heaven and queen of earth, the wife of Ammon and the mother of Chons. Her name signifies "mother."

Muta Nzige, moo'tā nzē'gā, Africa, the local name for a lake discovered by Stanley in 1876, explored by him in 1889, and renamed the Albert Edward Nyanza (q.v.).

Mutanabbi, moo-tä-näb'bē (Arabic, "the alleged prophet"), Arabian poet: d. Kufa, Asiatic Turkey, 965 A.D. He published a 'Divan,' or collection of verse, a German translation of which exists ('Motenebb der grösste arabische Dichter' 1824).

Muta'tion Theory, a hypothesis of organic evolution which accounts for development by sudden changes or "leaps" rather than by slow and successive degrees; sometimes styled saltatorial evolution. It is illustrated by "Sports" (q.v.),—sudden aberrations from the normal, more familiar in botany than in zoology, but often occurring there. This mode of evolution has always been regarded as effective to some degree, but its general application was urged by Prof. Hugo De Vries in a work 'Die Mutationstheorie,' published in 1901.

Muther, moo'tĕr, **Richard,** German art historian: b. Ohrdruf, Germany, 25 Feb. 1860. He was educated in the University of Heidelberg and the conservatory at Munich and devoted his attention to the history of art in which subject he has been professor at the University of Breslau since 1895. He has published: 'Anton Graff' (1881); 'Gothic and Early Renaissance Illustrations of German Books' (1884); 'Meisterholzschnitte aus den Jahrhunderten' (1887); 'The History of Modern Painting' (1893); 'A Century of French Painting' (1901); 'Geschichte der englischen Malerei' (1902); etc.

Mutineers of the Bounty, The, a work published in 1870 by Lady Diana Belcher. It is an account of a unique settlement on a South Sea island. In 1789 H. M. S. Bounty, Lieutenant Bligh commanding, while sailing in the South Seas was captured by mutineers, and the commander with 18 of the crew were set adrift in the cutter. The ship sailed to Tahiti. There dissensions arose among the mutineers. Half of them sailed away, and all trace of them was lost for many years. Some 20 years later, a British vessel happened accidentally to stop at Pitcairn's Island. The officers were amazed to meet young men who spoke excellent English, and to find a prosperous and happy Christian community, largely descendants of the mutineers. It was learned that the Bounty sailed directly from Tahiti to Pitcairn's Island, where the mutineers made a settlement. One of them, John Adams, remembering his early Christian training, established the principles of the Christian religion firmly in this peculiar community, which, maintaining its essential characteristics, still occupies Pitcairn and Norfolk Islands.

Mutiny (Fr. *mutin,* refractory, stubborn; *mutiner,* to rise in arms). Two hundred years ago the word mutiny was often used in describing insurrection or sedition in civil society; but it is now applied exclusively to certain offenses by sailors and soldiers. Properly it is the act of numbers in resistance of authority; but by statutes, certain acts of individuals are declared to be mutiny. The act of Congress of 3 March 1835 defines mutiny or revolt in the following language:

> If any one or more of the crew of any American ship or vessel on the high seas, or on any other waters within the maritime and admiralty jurisdiction of the United States, shall unlawfully, wilfully, and with force or by fraud, threats, or other intimidations, usurp the command of such ship or vessel from the master or other lawful commanding officer thereof; or deprive him of his authority and command on board thereof; or resist or prevent him in the free and lawful exercise thereof; or transfer such authority and command to any other person not legally entitled thereto; every such person so offending, his aiders and abettors, shall be deemed guilty of a revolt or mutiny and felony.

The same statute provides for endeavors and conspiracies to excite mutiny. In construction of the act it has been held that mere disobedience of orders by one or two of the seamen, without any attempt to excite a general resistance or disobedience, and insolent conduct or language toward the master or violence to his person, if unaccompanied by other acts showing an intention to subvert his authority as master, are not sufficient to constitute the offense of endeavoring to excite mutiny. An indictment for this crime, it is said, must set forth a confederacy of at least two of the men to refuse to do further duty, and to resist the lawful commands of the officers. The offense of making a revolt was by the act of April, 1790, punishable by death. By the act of 1835, it is punished by fine not exceeding $2,000, and by imprisonment and confinement at hard labor for not more than 10 years, according to the nature nnd aggravation of the offense; while attempts to excite a mutiny are punishable by fine not exceeding $1,000, or by imprisonment not exceeding five years, or by both. Mutinous conduct in the army and navy is provided for by the acts of 10 April 1806 and of 23 April 1800. By the former, "any officer or soldier who shall begin, excite, cause, or join in any mutiny or sedition, in any troop or company in the service of the United States, or in any party, post, detachment, or guard, shall suffer death, or such other punishment as by a court martial shall be inflicted." Under the latter, "if any person in the navy shall make, or attempt to make, any mutinous assembly, he shall, on conviction thereof by a court martial, suffer death." The law of mutiny in Great Britain is similar to the United States statute.

Mu'toscope, a mechanical apparatus for exhibiting instantaneous pictures of moving objects taken by the kinetograph or similar instrument. Photographic prints from the series of

pictures thus obtained are mounted in consecutive order around a cylinder standing out like the leaves of a book. When this cylinder is slowly revolved, the picture cards being held back by a stop, and allowed to snap past the eye one by one, as one thumbs the leaves of a book, an apparently moving picture is the result, and it is difficult to realize that the picture is not endowed with life.

Mutsuhito, moot'soo-shtō, emperor of Japan: b. Kioto 3 Nov. 1852. He was son of the Mikado Komeïtenno, whom he succeeded 3 Feb. 1867. The fall of the shogun in 1868 gave him more power than his ancestors had enjoyed for many centuries. The empire became a constitutional monarchy in 1889, when the Salic law became effective; European influence has steadily grown, but whether because of or in spite of the Mikado is unknown. The principal events of his reign are the Chino-Japanese war (1895), Japanese intervention in China (1900), the Anglo-Japanese *entente* (1902), and the still unsettled contest between Japan and Russia over their respective positions in Korea and Manchuria. The Mikado's heir, Harunomiya, is his son by a concubine or second wife; the queen is Haruko, daughter of a noble, and Mutsuhito's wife since 9 Feb. 1869.

Mutton-bird, a sailors' name for the shearwater (q.v.).

Mutton-fish, a local name for various fishes noted for their fatness, especially the eel-pout (q.v.).

Mut'tra, India, the chief town of a district of the United Provinces, on the Jamna, 36 miles northwest of Agra. It is an old Hindu city, and is identified by some with the Methora mentioned by Arrian. It is regarded as the birthplace of Krishna, and is a great centre of Hindu devotion, being resorted to by large numbers of pilgrims. It has numerous temples, mosques, bathing ghats, a museum, and the 17th century observatory of the Hindu astronomer Jey Singh. Pop. (1901) 59,574.

Muyscas, mū-ē'skä. See CHIBCHAS.

Muzaffar-ed-Din, moo-zä-fėr'ĕd-dēn', Shah of Persia: b. Teheran 25 March 1853. He was governor of Azerbaijan; succeeded his father, Nasr-ed-Din (q.v.), 1 May 1896; was largely influenced by European civilization and politically by France and Russia; and visited Europe several times; in 1900 was attacked by an anarchist named Salson in Paris; and in 1902 again visited western Europe and England. His heir is Muhammed Ali Mirzi, b. 21 June 1872.

Muzaffarpur, mŭz-ăf-ạr-poor', India, the chief town of a district in Bengal, on the Little Gandak River, 38 miles by rail northeast of Patna. It has broad well-kept streets, fine public buildings, two large temples, large bazaars, and carries on a considerable trade, chiefly in saltpeter and indigo. Pop. (1901) 45,617.

Můzáková, Johana. See SVETLA, KAROLINA.

Muziano, Girolamo, jē-rō-lä'mō moot-sē-ä'nō, commonly known as BRESSANO, Italian painter: b. Aquafredda, near Brescia, 1528; d. Rome 27 April 1592. He was a pupil of Romanino (see ROMANINO GIROLAMO) and of Titian at Venice, and subsequently imitated Michelangelo. He was a skilful mannerist who could paint in any style while possessing none of his own. Among his most successful pictures are: 'The Taking Down from the Cross,' in the Borghese Gallery, Rome; 'The Gift of the Apostolic Keys,' in the Vatican. There are also some frescoes of his still to be seen in the Vatican.

Muz'zey, Artemas Bowers, American Unitarian clergyman: b. Lexington, Mass., 2 Sept. 1802; d. Cambridge, Mass., 21 April 1892. He was graduated at Harvard University in 1824, and from Harvard Divinity School in 1828, and entering the Unitarian ministry held pastorates in Framingham, Cambridgeport, and Newburyport, Mass., and Concord, N. H. He was active in educational and political matters, and in 1865 retired from ministerial duties. Among his numerous publications are: 'The Young Man's Friend' (1836); 'Man, a Soul' (1842); 'The Higher Education' (1871); 'Personal Recollections of Rev. Dr. Channing' (1874–5); 'Immortality in the Light of Scripture and Science' (1876); 'Education of Old Age' (1884).

My'all Wood, the hard violet-scented wood of the Australian *Acacia homalophylla,* much used for making whip handles and tobacco pipes.

Mycale, mīk'ạ-lē, Asia Minor, the classical name of the modern Samsun, a mountain of south Ionia, with the promontory of Cape Santa Maria opposite the island of Samos as its seaward termination. In its vicinity the Persian army and navy under Tigranes were defeated by the Greeks, under Leotychides, king of Sparta, and Xanthippus, in September 479 B.C. But few of the vanquished survived the contest, the Greeks burning the Persian fleet and camp.

Mycenæ, mī-sē'nē, Greece, an ancient city of Argolis in the Peloponnesus, six miles northeast of Argos, built on a steep hill dominating the passes to Corinth. Its ruins since Schliemann's excavations in 1876 have yielded an abundance of archæological treasures of the greatest value and interest, illustrating and revealing the distinctive Mycenæan period of civilization, which preceded the culminating era of Hellenic culture. Mycenæ is said to have been founded by Perseus, and before the commencement of the Trojan war was the residence of Agamemnon, in whose reign it was regarded as the leading city in Greece; it was also the scene of the domestic tragedies of Atreus (q.v.). It declined in importance after the invasion of the Dorians, but its cyclopean walls, citadel, and other features, chief of which are the Lion's Gate, and the vaulted building of megalithic architecture called the Treasury of Atreus (q.v.), stood through succeeding centuries, and still stand, as monuments of its ancient grandeur and importance. Consult: Schuchhardt-Sellers, 'Schliemann's Excavations' (1891); Hall, 'The Oldest Civilization of Greece' (1901); Tsountas and Manatt, 'The Mycenæan Age' (1897).

Mycose, or **Trehalose,** a substance resembling sugar, and classified with the sugars, which occurs in ergot of rye, in trehala manna, and in certain fungi. It has the chemical formula $C_{12}H_{22}O_{11}.H_2O$, crystallizes in rhombs, gives up its water of crystallization at 212° F., and melts at 228° F. It dissolves readily in water, and is sweet to the taste, but it does not reduce Fehling's solution. Acids slowly convert it into dextrose.

Myeli'tis (from Greek *μυελός*; marrow), an inflammation attended with more or less softening of the substance of the spinal cord. It may be acute or chronic. Some of the maladies formerly ascribed to chronic myelitis are now known to be due to chronic induration and thickening (sclerosis). The most common causes of myelitis are: irritation of the cord by fractured, dislocated, or diseased vertebræ, by the pressure of a tumor, or by hemorrhage into its substance. The disease is aggravated by intemperate habits. It begins usually with pain or other uncomfortable sensations in the spine or extremities, and fatigue, followed by an uncertain gait, paralysis, and very frequently death. If the inflammation involves the upper part of the cord above the origin of the respiratory nerves, respiration is interfered with and death results from asphyxia. If the inflammation exists lower down, in addition to the loss of motor power in the extremities the bladder and rectum may be paralyzed, the evacuations are discharged involuntarily, and death occurs from exhaustion. The tendency of the inflammation is to spread.

Myer, mī'ėr, **Albert James,** American meteorologist: b. Newburg, N. Y., 20 Sept. 1827; d. Buffalo, N. Y., 24 Aug. 1880. He was graduated from Hobart College in 1847 and from the Buffalo Medical College in 1851 and in 1854 became a surgeon in the United States army. While on duty in Texas he devised a signal system consisting of flags by day and torches at night, so simple yet so ingenious that it has been adopted by the armies of the world. He was in command of the signal corps in 1858–60 and in the latter year was commissioned major and appointed chief signal officer of the army. He served in the Civil War in 1861–3 and then took charge of the signal office at Washington and introduced his system at West Point. He was promoted brigadier-general in 1865 and soon afterward retired from the army. He was engaged in the preparation of his book on the signal system and in meteorological investigations at Buffalo until 1870 when he was appointed to take charge of the meteorological observations under the government. The work of the weather bureau was soon recognized as important and was widely extended under General Myer's direction, 300 stations being established before his death. He was United States delegate to the International Congress of Meteorologists at Vienna in 1873 and in 1879 to that held at Rome. He published 'A Manual of Signals for the United States Army and Navy' (1868).

Myers, mī'ėrz, **Ernest James,** English poet, brother of F. W. H. (q.v.): b. Keswick, Cumberland, 1844. He was called to the bar in 1874, but has never practised. He has published: 'The Puritans' (1869); 'Poems' (1877); 'Defence of Rome and Other Poems' (1880); 'Judgment of Prometheus and Other Poems' (1886); etc.; besides translating the odes of Pindar (2d ed. 1884).

Myers, Frederic William Henry, English author: b. Duffield, Derbyshire, 6 Feb. 1843; d. Rome, Italy, 17 Jan. 1901. He was educated at Cambridge, was classical lecturer there at Trinity in 1865–9, and was school inspector from 1872 until his death. In 1882 he assisted in founding a Society for Psychical Research, of which at the time of his death he was president. He was best known as an essayist of much interest, but had also done some work in verse. Among his publications are: 'St. Paul' (1867; new ed. 1879), a poem; 'Wordsworth' (1880), in 'English Men of Letters'; 'Renewal of Youth, and Other Poems' (1882); 'Essays, Modern and Classical' (1883); 'Phantasms of the Living' (with Gurney and Podmore, 1886); 'Science and a Future Life' (1893); and the massive 'Human Personality and its Survival of Bodily Death' (1901).

Myers, Mordecai, American soldier and official: b. Newport, R. I., 1776; d. Schenectady, N. Y., 20 Jan. 1871. On the breaking out of the War of 1812 he enlisted and became a major in the 30th infantry. For a time he was a merchant in Richmond, Va., when he removed to New York. His later life was passed in Schenectady, N. Y., where he served for two years as mayor and for six years in the legislature as member for that district. He held a prominent place in the Masonic fraternity, having been elected grand master and grand high priest of Royal Arch Masons of the State of New York.

Myers, Philip Van Ness, American historian: b. Tribes Hill, N. Y., 10 Aug. 1846. He was graduated from Williams College in 1871 and studied at Yale in 1873–4. He then traveled for three years in Europe and South America, and in 1879–90 was president of Farmers' College, Ohio. He was professor of history and political economy at the University of Cincinnati in 1890–1900, and has published: 'Life and Nature Under the Tropics' (1871); 'Mediæval and Modern History' (1889); 'History of Greece' (1897); 'The Middle Ages' (1902); etc.

Myers, Theodore Walter, American banker: b. New York 11 Jan. 1844. On the breaking out of the Civil War he was appointed captain of the Third regiment, Sickles' brigade; and later was captain of the Ninth regiment, New York National Guard, being connected with the City Guard for many years. In 1864 he entered Wall Street, became a member of the Stock Exchange, and after being associated with various firms, in 1884 organized the bank of Theodore W. Myers & Company. In 1887 he was appointed park commissioner and treasurer of the department. In 1888–91 he served as city comptroller, with such success as to be renominated and re-elected by both Republicans and Democrats for term of 1891–3. During his term of office he negotiated a loan of $14,000,000 for the city at the surprisingly low rate of 2½ per cent.

Myg'ale, the technical and book-name of a species of trap-door spider (*Mygale avicularia*) which has been known to catch small birds and kill them. It is a native of Surinam, Brazil, and adjoining regions. It is the largest of all the spiders, being very stout, with thick, hairy legs. It builds its nest in trees. Similar species are brought into our ports in bunches of bananas. The fact that the bird-spider will actually kill birds and suck their blood was asserted by Madam Merian in 1705. Her statements were received with doubt, but long after were verified by Bates. The specimen he observed on the Amazon River was nearly two inches in length, the legs expanding seven inches. He

saw the monster on a tree-trunk beneath a deep crevice in the tree, across which was stretched a dense white web. "The lower part of the web was broken, and two small finches were entangled in the pieces; one was quite dead, the other was still living and was smeared with the filthy liquor or saliva exuded by the monster." The natives call them *aranhas caranguejeiras,* or "crab-spiders." The hairs on the body and legs come off when touched, and "cause a peculiar and almost maddening irritation." This, Bates thinks, is not due to any poisonous quality residing in the hairs, but to their being short and hard, and thus getting into the fine creases of the skin.

Myia'sis, a condition caused by the larvæ of flies. House-flies may affect the skin of man by depositing eggs in wounds and on ulcerations, or may invade the external cavities of the body. The eggs hatch, and the maggots cause much local irritation and symptomatic fever; or in the case of the bot-fly (q.v.), penetrate the skin deeply and produce large abscesses. The maggots, as a rule, do not penetrate other tissues. The principal flies that infect wounds, etc., are the flesh-fly (blue-bottle), blow-fly, screw-worm fly, and house-fly (qq.v.). Internal myiasis may result from swallowing the eggs of flies, when the resulting larvæ are got rid of by vomiting or purgation. Consult Howard, 'The Insect Book' (1901).

Mylitta, mĭ-lĭt'ta, an Assyrian goddess, identified by the Greeks with Aphrodite. She was, as goddess of the moon, the female principle of generation.

My'lodon, a genus of extinct edentate mammals, of sloth-like structure and large proportions, the ground sloths, the remains of which occur along with those of the Megatherium and Megalonyx, in the recent or post-Tertiary deposits of South America. In size the *Mylodon robustus* — the most familiar species — attained a length, in some instances, of 11 feet. See MEGATHERIUM.

Myna. See MINA-BIRD.

Myo'pia, nearsightedness. See SIGHT, DEFECTS OF.

Myosin, a proteid substance, usually classed as a globulin (see GLOBULINS), which separates from muscle plasma after death, in the form of a clot, which is analogous to the clot of fibrin that is formed under similar circumstances in blood. It does not exist in the living muscle, being there represented by two other proteids called myosinogen and paramyosinogen, respectively. The stiffening of the muscles after death (technically known as the "rigor mortis") is due to the formation of the myosin clots in the cells of the muscles.

Myoso'tis. See MOUSE-EAR.

Myriap'oda, a group formerly recognized among the arthropodan animals, but now known to be unnatural and hence abandoned. It included the groups of *Chilopoda,* or centipedes, and the *Diplopoda,* millepeds or galley-worms. The features common to all are the elongate worm-like body consisting of a head, and behind this the trunk of numerous similar leg-bearing segments, not divided into thorax and abdomen. Closer analysis shows that the chilopods are somewhat closely related to the true insects, while the diplopods form a distinct group of doubtful position. In the chilopods the head bears a pair of groups of simple eyes, a pair of antennæ and three pairs of jaws (mandibles, maxillæ, labium), while the first pair of trunk appendages becomes connected with the head and serve as poison-jaws. The trunk-segments are all similar, and each bears a pair of legs, the number of segments ranging from 15 to 170 or more. The body-segments are flattened and the reproductive openings are at the hinder end of the body. Most of the chilopoda are carnivorous. The most noticeable members of the group are the centipedes (*Scolopendridæ*) of the tropics, some of which are nearly a foot in length and have considerable poison powers. See CENTIPEDES.

In the diplopoda the head bears but two pairs of jaws (mandibles and lower lip or gnathochilarium), while the trunk-segments are usually circular in section, and each, except a few near the head, bears *two* pairs of legs, an exception to the otherwise universal rule among arthropoda of a pair of legs to a somite. The range of segments is even greater than in the chilopods, there being 9 in *Pauropoda* and 200 in some *Polyzoindæ.* The reproductive organs lie ventral to the intestine, and the external openings are a little behind the head. The *Diplopoda* live mostly upon decaying vegetation. For protection they rely upon the very thick and hard walls of the bodies, and in some species upon peculiar stink glands which open on the sides of the body. See MILLEPED.

The Myriapods appear in the Devonian rocks and they are found in all parts of the world to-day. Most of the American species are described in Bollman's 'Myriapods of America' (United States National Museum, 1893).

Myricin, a substance formed by the combination of palmitic acid with an organic radical known as "myricyl." It has the chemical formula $C_{46}H_{92}O_2$, and occurs in beeswax, forming the chief portion of that part of the wax which is insoluble in alcohol. Myricin melts at 162° F., is readily saponified by alcoholic potash, and may be obtained in the form of feathery crystals by deposition from its solution in ether.

Myr'ioscope, a variation of the kaleidoscope (q.v.). A square box has a sight-hole in front, and at the rear are two plane mirrors which are arranged at a suitable angle. On horizontal rollers is a piece of embroidered silk or other ornate fabric, which is moved by means of a crank-handle on one of the rollers. This causes a pretty display when the ornamental figures are multiplied and thrown into geometrical apposition.

Myristic Acid, an organic acid occurring in the form of a glyceryl ether in nutmeg butter, from which it may be prepared by saponification and subsequent distillation at a pressure materially below that of the atmosphere. It has the chemical formula $C_{14}H_{28}O_2$, and is insoluble in water. It is very soluble in hot alcohol, however, from which it separates, upon cooling, in the form of lustrous laminæ, melting at 129° F. A number of compounds of myristic acid with the metals are known, as well as several ethers and other organic compounds.

Myrmidons, mėr'mĭ-dŏnz, a former people on the southern borders of Thessaly, who accompanied Achilles to the Trojan war. They were said to have received their name from Myrmidon, a son of Zeus and Eurymedusa. They are said to have emigrated into Thessaly under the leadership of Peleus.

Myrob'olans, the dried fruits of various species of East Indian trees, all having more or less astringent properties. They are imported into Britain for dyers and tanners, especially the latter. The trees are of the genus *Terminalia,* order *Combretaceæ,* the chief being the belleric myrobolan (*T. bellerica*), and the chebulic (*T. chebulica*).

My'ron, Greek sculptor: b. Eleutheræ, a seaport of Bœotia, about 450 B.C. He was, along with Phidias and Polycletus, a pupil of Ageladas, the founder of the Peloponnesian school of sculpture, and made his renown at Athens as a versatile and masterly worker in bronze, silver, and every other art material. He executed statues of gods, heroes, and especially of athletes, many of which were set up in the temples at Delphi and Olympia. The most celebrated among them was that of swift-runner Ladas, and the Discobolus, or hurler of the discus, a work of art highly admired by the Romans, as is proved by the many Italian copies of it made in marble, the finest of which is that now in the Lancelotti Palace, Rome. On medals, basins, and reliefs there are still extant copies of his Athenian work, 'Athene throwing Away the Flute,' etc. A marble copy of his 'Marsyas' is in the Lateran Museum at Rome, and one in bronze is to be seen in the British Museum. He was equally successful in the representation of animals. His 'Cow' in the market at Athens was the subject of many a laudatory epigram and was brought to Rome in the time of Cicero. Myron gave a somewhat exaggerated slenderness to the human form, which he modeled with exquisite beauty and anatomical accuracy, but was not a master of facial expression.

Myrrh, a popular name for a gum resin produced by *Balsamodendron myrrha,* variously referred to the natural orders *Burseraceæ* and *Amyridaceæ;* also for a garden plant *Myrrhis odorata* of the natural order *Umbelliferæ.* The resin is obtained from Arabia and adjacent Africa from a small, prickly, stunted, gray-barked tree which bears few small denticulate leaves, and smooth, brown, egg-shaped drupes as large as currants. The drops, granules, or tears which in commerce are brown, red, or yellow, are at first rather oily, yellowish, and soft, becoming brittle with age. They have a pleasing balsamic odor and lasting, bitter, aromatic taste. From earliest times they have been used for making incense and other perfumes and have been reputed useful in medicine, especially for cleansing the mouth and sweetening the breath.

Myrrh, the garden plant, is also known as sweet cicely, which has been cultivated for ages as a sweet herb for flavoring salads and culinary preparations. It is little grown in the United States except by people of rather recent European ancestry.

Myrta'ceæ, a natural order of trees and shrubs, the myrtle family, comprising about 70 genera and more than 2,000 species widely distributed in warm climates but sparingly in temperate. It is one of the most important families of economic plants. Some of the species, such as pomegranate (*Punica granatum*), guava (*Psidium spp.*), luma and ugni (*Myrtus*) yield important fruits; some such as cloves (*Eugenia sp.*), allspice (*Pimenta*), furnish highly valued spices; and still others, especially species of *Eucalyptus,* are leading timber trees of the world. The species are characterized by simple, entire leaves generally dotted with glands; perfect flowers in racemes or sometimes cymes, and various kinds of fruits. The order is variously limited, some authors including as sub-orders certain groups ranked as orders by other botanists. As extended, the order includes nearly 3,000 species. See MYRTLE.

Myrtle, a popular name for several unrelated plants of which the following are probably the best known: Grape myrtle (*Lagerstræmia indica*) of the natural order *Lythraceæ;* running myrtle (*Vinca spp.*) of the order *Apocynaceæ;* sand myrtle (*Leiophyllum, spp.*) of the *Ericaceæ.* When unqualified the name generally refers to various species of Myrtus of the natural order *Myrtaceæ.* The common myrtle (*M. communis*) is an evergreen shrub native of the Mediterranean region and western Asia, whence it has been introduced into gardens throughout the warmer temperate climates of the world for its foliage and flowers. It was used in Greek festivals as sacred to Venus and as the symbol of beauty and youth. Its aromatic leaves and berries were formerly used in medicine and its bark in tanning, uses still made of them to some extent in southern Europe. The small leaved myrtle (*M. microphylla*), the luma (*M. luma*), and the Chilian guava (*M. ugni*) yield edible fruits, for which they are planted in South America and to some extent in California.

Myrtle Tree. See BEECH.

Mysia, mĭsh'ĭ-ạ, Asia Minor, a name anciently applied to a district which varied greatly in extent at different periods. The name first occurs in the legend of Telephus, who became king of Mysia. Under the Persian empire Mysia was the name of the section between Lydia on the south and the range of Ida on the north. It was united with the region on the north and with Lydia in forming a single satrapy. After the overthrow of the Persian empire by Alexander the Great, Mysia fell to Lysimachus (311 B.C.). Subsequently it formed part of the Græco-Syrian kingdom, then of the kingdom of Pergamus, and finally, in 133 B.C., was bequeathed with the rest of the kingdom of Pergamus, by Attalus III. to the Romans, by whom it was made a part of the province of Mysia. When the divisions of Asia Minor were settled under Augustus, the name of Mysia was given to the whole of the northwestern district, bounded on the north by the Propontis (Sea of Marmora), east by Bithynia and Phrygia, south by Lydia, and west by the Ægean Sea. Under the later empire Mysia was erected into a separate proconsular province, and received the name of Hellespontus.

Mysore, mī-sōr', or **Maisur,** mī-soor', India, (1) the capital of the native state of the same name, 250 miles west by south of Madras, in a valley 2,450 feet above sea-level,

dominated on the southeast by Chamundi Hill 1,040 feet higher, with a temple on its summit. Modern enterprise on European methods has greatly improved the town. The streets are broad and regular, the houses intermingled with trees and temples, and there are several fine modern public buildings, including the British Residency. The fort built in European style, and separated from the town by a promenade, encloses the Maharaja's palace, and the dwellings of his officials. Pop. (1901) 68,151.

(2) The native state ruled by a maharajah, is bounded north by Bombay and Madras, east, south, and west, by Madras and Coorg, and has an area of 27,936 square miles. Coffee plantations and gold mines are the chief sources of its wealth. The principal commercial centre is Bangalore (q.v.), the capital is Mysore, described above. After being impoverished under native administration, the British took charge from 1831 until 1881, when the state was restored to a representative of the old dynasty, trained in a British school. The state is now one of the most conspicuous examples in its government and general prosperity, of the success of this method. Pop. (1901) 5,538,482.

Mysteries, in ancient history, were among the Greeks, and afterward also among the Romans, secret religious assemblies, in which no uninitiated person was permitted to take part. They originated at a very early period. They seem to have had a double object — first, that of handing down the traditions relating to the divinities in whose honor they were celebrated; and secondly, that of teaching and practising religious rites. The true value of the mysteries did not lie in dogmatic teaching, but in the moral improvement apparent in the votaries, in the comfort the rites gave in the present life, and the hopes they inspired for the world to come. The most important Greek mysteries were (1) the Eleusinian; (2) the Samothracian, which were celebrated in honor of the Cabiri in all the places where these divinities were worshipped. (3) The Dionysia, at Rome called Bacchanalia, which were celebrated in honor of Dionysus or Bacchus. These mysteries were of so licentious a character that they were first forbidden in Thebes, and afterward in all Greece, as prejudicial to the public peace and morals. This was likewise done in Italy by a decree of the Roman senate in 186 B.C. (See BACCHUS.) (4) The Orphic, consecrated to Dionysus Zagreus, the son of Zeus and Persephone. (See ORPHEUS.) See also MIRACLE PLAYS.

Mysteries of Udolpho, The, a famous romance by Mrs. Anne Radcliffe, published in 1795. Like the famous 'Castle of Otranto' of Horace Walpole, this story belongs to the school of lime-light fiction. Udolpho is a mediæval castle in the Apennines, where, during the 17th century, all sorts of dark dealings with the powers of evil are supposed to be carried on. Sheridan and Fox praised the book highly; the grave critic and poet-laureate Warton sat up all night to read it; Walter Scott thought that, even setting aside its breathless interest as a story, "its magnificence of landscape, and dignity of conception of character, secure it the palm"; while Mathias, the author of 'The Pursuits of Literature,' who knew more of Italian letters than any other man then in England, discourses on "the mighty magician of 'The Mysteries of Udolpho.'" It is marked by that "art of poetical landscape," which, according to Garnett, the author, "may almost be said to have introduced into the modern novel."

Mystery of Edwin Drood, The, an unfinished novel by Charles Dickens (q.v.), written in 1870. The story ceased at the sixth chapter and leaves a murder mystery unsolved.

Mystic Shrine, Ancient Arabic Order of Nobles of the, an order said to have been founded at Mecca. The American order is composed only of 33d degree Masons. The membership amounts to 68,000. See MASONIC FRATERNITY.

Mysticism, the theory of knowledge put forth by the mystics. This theory relates principally to the knowledge of God, and the capacity of the human soul to apprehend the existence and nature of the Supreme Being, independently of an external revelation or authoritative teaching. But mysticism was more than a merely intellectual movement; it implied the knowledge of God through the feelings and affections, so as to bring about a union between the human soul and God, in which the human soul should lose its own self-consciousness of God's existence. On this side mysticism seems sometimes to lapse into the pantheism of Spinoza.

Mysticism to some degree forms a part of every phase of experimental and devotional religion. We find traces of it in the first ages of Christianity. The Logos of Saint John is the manifestation of God to the human mind, which latter like a mirror (to use Saint Paul's metaphor) reflects "the light which lighteth every man that cometh into the world." Both Saint Peter and Saint Paul reveal themselves as mystics in this sense.

The first systematic mystics arose in Egypt. When the old mysticism of pagan cults had passed away, and the revival of a pseudo-Platonism had driven men to turn from dialectics or tradition to the intuitions of the individual soul for knowledge and illumination, monasticism and mysticism burst into flower, and every hermit cell became an oracle where the solitary looked into his own soul, saw God there, and spoke with Him face to face. In many cases mysticism was a reaction from slavish conformity to dogma, and the tediousness or bitterness of theological controversy. The earliest mystics, like the earliest monastics, arose in the centuries when the controversies on the Trinity, especially on the nature of the second and third persons of the Trinity, were being furiously carried on. This revolt was a claim made by the human mind for liberty and independence. The soul asserted the right, as it had the power, to know and apprehend God without the need of the Church's authoritative definition. This is the history of mystics in every religion and every age; the cast-iron formalism of Brahmanism met its defiance in the theories of Buddhism, and the Moslem literist who based everything on the sentences of the Koran drove some of the most devout and imaginative of the faithful into Sufistic mysticism. What Alexandrian mysticism was may be seen from the pseudo-Dionysian writings which exhibit an attempt to

combine Christianity and Platonism, with the object of raising the church in the minds of believers above the perturbations of ecclesiastical politics; and giving to the world a clear and independent insight into the profundities of religious truth without subjecting the soul to the tyranny or narrowness of dogma. From the writings of the pseudo-Dionysius, and the teaching of his predecessors which they embodied, mysticism was planted deep in the bosom of the Christian Church. The Alexandrian made a clear distinction between a cold rational and intellectual knowledge of God by intuition and feeling. No man he declares can have an absolute knowledge of God in thought, for God is infinite and the mind finite; human knowledge is relative; the human soul can reflect, be united with, and lost in God in the ecstasy of supreme devotion, and this dictum has been re-echoed by all the mystics from Saint Bernard to John Wesley.

Neo-Platonism.— The crucial point in all theories of knowledge is that at which Platonism, the doctrine of intuition, and Aristotelianism, the doctrine of reason, become confronted. When dialectic was introduced to define the nature of God (as in the early controversies of the Church), Neo-Platonism sprang to life with another solution. External causes, such as the breach in the barrier between Eastern nations and Europe wrought by the conquests of Alexander, as well as the triumph of Christianity over Greek and Roman religions, had necessitated this phase of religious and philosophical speculation. Moses, Plato, Zoroaster and Christ were brought into conjunction, and the result was the mysticism known as Neo-Platonism. Like all other forms of Christian mysticism it was a sort of esoteric Christianity. Its fundamental theory was that man the subject, and God the object, were by a subjective intuition, ecstasy, so to be united as to lose their separate identity.

Oriental Mysticism.— The mysticism of India must be considered under two heads, those of Brahmanism and Buddhism. Brahmanism is practically a polytheistic religion with an elaborate ritual, and a detailed ascetic code. (See HINDUISM.) The learned Brahmans, however, have a certain system of their own, which must be called esoteric Brahmanism. This is a form of mysticism, whose essence is pure contemplation. To the esoteric Brahman all religious exercises, all ceremonial observances, the frequenting of temples, even the giving of alms, are of no avail in bringing the soul nearer to God without contemplation which results in the absorption of the individual human soul in the universal soul. This conviction made a way for the propagation of Buddhism. The Buddhist believes neither in the existence of a human soul, nor of a God; but he is a mystic in that he places the source of salvation in the subjective mood of each individual. Hence his Four Great Truths, namely, (1) That misery always follows existence; (2) That all modes of existence always result from passion or desire; (3) That there is no escape from existence excepting by the destruction of passion or desire; (4) That this may be accomplished by following the fourfold way to Nirvana. These four stages or paths of which the first is an awakening to the hollowness of life and a recognition of their need for the guidance of the Enlightened One (Buddha). The second Path is reached by liberation from the passions of lust and revenge. He enters the third Path by becoming free from evil desires, doubt, ignorance, heresy and attaining good will toward all living beings. The fourth Path is Nirvana (q.v.) which, however, cannot be attained to in this life. (See BUDDHISM.)

Mohammedan Mysticism.— The mystical theology which grew up in the midst of Islam is called Sufism (q.v.), a system which is practically a sort of humanistic pantheism. According to Sufistic teachings nothing exists actually but God. Man is like a stream that flows from one source, the Deity. The soul of man is separated from God as wax is from honey, as the plant from its nourishing soil. Yet reunion is possible. The four degrees or paths of approach are (1) Shariat, ascetism; (2) Tarikat, yearning; (3) Hakikal, contemplation; (4) Soul union with God. The Sufis neglect all worship and ritual and in their poetry and romance earthly symbols are employed to express deep spiritual truths.

Christian Mysticism in Europe.— Scotus Erigena translated the Greek treatise of pseudo-Dionysius in the 9th century. The work was widely circulated, and made many disciples. Among the famous mystics of the Middle Ages were Saint Catharine of Sienna and Saint Brigitta, whose visions were all the outcome of the devout contemplation exemplified in the Egyptian monastics. As in Alexandria the vagaries of the mystic led him into revolt against the dogmas of the church, which denounced as heretical the teeming sects that came from mystical Gnostic and Manichæan ancestry, so was it with the Paulicians (q.v.) of the 7th century and the Cathari (q.v.) whose communities multiplied so widely in Europe. But it was not yet time for the mystics to act on the offensive. The first important occasion when the representatives of Christian dogma as implied in scholasticism, came into conflict was in the famous controversy between Saint Bernard of Clairvaux, and Peter Abélard. The charge made by Bernard was: «Peter Abélard makes void the whole Christian faith by attempting to comprehend the nature of God by human reason.» These words are an echo of the Alexandrian mystic whom we have already quoted. When Bernard and Abélard, in the 12th century, crossed swords on this question, and the mystic was supported and the scholastic condemned by the decree of Pope Innocent II., the controversies of Europe had taken that direction, which could only end in the uprising of a man like Luther. Bernard's mysticism was of a practical kind. He states there are three stages in the knowledge of God. By abstraction from earthly things, the mind is able to rise to the vision of the divine nature. Those, who by asceticism become dead to the body, are granted that ecstatic vision in which Saint Paul was caught up into heaven. The highest stage is when self-love is lost in love of God, and we ourselves are absorbed into the deity, «as the little drop of water falling into a vast measure of wine seems to lose its own nature entirely, and to partake of the taste and color of the wine.»

Scotus Erigena's translation of the writings of the pseudo-Dionysius made a profound impression in France. The Augustinian mon-

astery of St. Victor at Paris became a famous home of mysticism in the 12th and 13th centuries. The chief of the Victorines, as these mystics were called, were Hugo of Saint Victor (1096–1144), his pupil, Richard of Saint Victor, and Walter of Saint Victor. They all made war on scholasticism, saying that the objects of mystic contemplation are partly above reason and partly contrary to it. The crown was set to their system by Bonaventura (1221–74), who, in his 'Itinerarium mentis ad Deum' (The Mind's Guide Book in the Path of God), gives a detailed account of various stages in mystical perfection, intuition, ecstacy, and union with God.

Religious formalism and dogmatic literalism in the 12th and 13th centuries in Germany and the Netherlands were met by the protest of many mystical sects, including the Begherds and the Beguines. The Dominican and Franciscan orders founded in the 13th century were an outcome of a like longing to maintain and spread a more personal and emotional type of religious experience. There rose many female saints and visionaries, chief among whom was Elizabeth of Hungary. Joachim of Floris, an Italian mystic, published his prophetic gospel, in which he announced that the Kingdom of the Father and the Son had passed and the Kingdom of the Holy Spirit was to open upon the world in 1260. The doctrines of the New Spirit, a system of mystical pantheism founded on the writings of Erigena spread widely in the valley of the Rhine during the 14th century. But the greatest of European speculative mystics was Eckhart (1260–1329), summing up his teaching in the words, "The eye with which I see God is the same eye with which God sees me. My eye and God's eye are one; one vision; one recognition; one love." The followers of Eckhart formed themselves into the society known as the "Friends of God." Such was John Tauler of Strasburg. He was exceedingly eloquent as a preacher and the most influential religious teacher in Germany in his day. Tauler's 'Deutsche Theologie' was afterward published by Luther and exercised a great influence on the mind and life of that reformer. There were many Christian brotherhoods formed by mystics who took no monastic vows, the most famous of which was that at Deventer, the "Brethren of a Common Lot," of which Thomas à Kempis (1380–1471) was a member. Later German mystics were Thomas Munzer, in whom mysticism developed into the widest fanaticism, and ended in the atrocities of the Peasants' war. Mysticism in Jakob Boehme (1575–1624) lost some of its peculiar religious and emotional character and became more widely speculative — a philosophy or a theosophy, rather than a devotional school of religious thought.

Among post-Reformation mystics must be mentioned the devoted and ecstatic founder of the Discalced Carmelites, Santa Teresa (1515–82) and her ally Saint John of the Cross. Saint Francis de Sales (1567–1622) still exercises a powerful influence through his exquisitely tender and spiritual counsels. In the case of Madam Guyon (1648–1717) "quietism" and "passive prayer" were developed to their most extravagant manifestations; yet she had many disciples, and her religious notions were once approved of by Fénelon, though the more robust minded and acute Bossuet stoutly opposed them. In England the Cambridge Platonists of the 17th century must be called mystics, though not in the same sense as George Fox, founder of Quakerism, and William Law, translator of Jakob Boehme.

Present-day Forms of Mysticism.— Mysticism in modern times has grown up side by side with agnosticism and materialistic monism. It takes the form of theosophy, esoteric Buddhism, and there are some traces of a true mysticism in so-called Christian Science. These forms of mysticism have thousands of adherents, they form large organizations and have originated a large and growing literature of their own. A more philosophical form of mysticism is the doctrine of the Neo-Hegelians which first came to light in England, but has roused much interest in the United States and Germany. In literature we find traces of Neo-Platonism in Browning's theory of knowledge, while Emerson is a mystic who exhibits wide affinities with eastern as well as western schools of thought. See NEO-PLATONISM; PLOTINUS; PHILO JUDÆUS; PORPHYRY.

Consult: Vaughan, 'Hours with the Mystics'; Preger, 'Geschichte der Deutschen Mystiker'; Jundt, 'Histoire du Panthéisme Populaire.'

Mytens, mī'tĕnz, **Daniel,** Dutch painter: b. The Hague about 1590; d. Holland 1642. He went to London, England, and was welcomed at the court of James I.; he was appointed painter royal by Charles I. and was much favored by the king and aristocracy. Many of his portraits, which are bold and spirited in conception, broad in treatment, and of admirable color, are in Hampton Court. When Van Dyck came to England he gradually eclipsed in royal favor the glory of his predecessor, who returned to Holland.

Myth, a general name for certain kinds of folk-lore stories, historic tales, etc., differing from fable (q.v.) and from legend (q.v.). See MYTHOLOGY.

Myth'ical Islands, imaginary islands described in popular fable, romance, and song, supposed to have existed in all ages in the several oceans of the world. The lost Atlantis was first mentioned by Plato. The Islands of the Blessed were creations of the Greeks. The fairy isle of Avalon is a feature of Celtic mythology, as was also the mythical land of Saint Brendan.

Mytho, Mitho, or **Mito,** French Indo-China, a town of Cochin-China, on the northernmost branch of the Me-Kong delta, 58 miles by rail southwest of Saigon. Mytho is an important trading centre for the produce of Cambodia and Annam, and the railway from Saigon was the first built in the country. Pop. 30,000.

Mythol'ogy, from the Greek *muthos* or *mythus,* a tale or fable, and *logos,* a discourse. This is a collective name for the entire body of fables, legends, myths, and traditions, that arise in the earliest periods of a nation's existence and of its civilization, and which embody the convictions of the people among whom such fables arise as to their gods or other divine personages, their origin and early history, and the heroes connected with it. Such fabulous narratives seem to grow up naturally among all early peoples, and are found among the ruder races at the present day, but the mytholo-

gies which have been most studied, and the tales belonging to which are best known, are those of ancient Greece and Rome, Scandinavia, the Hindus, and ancient Egypt. Though speculations as to the origin of mythology have been put forth from a very early period, it is only in recent times, by the help of comparative philology, and by comparing together the myths of different peoples (comparative mythology), that any real advance has been made, and the study of mythology placed upon a scientific basis. The mythologies of Greece and India have been most fruitful for this purpose, and that of Greece in particular must always be largely drawn upon in any exposition of the results arrived at by modern investigators. Myths are of course believed in by the bulk of the people among whom they are current, and it is only when speculative and reflective spirits arise, and when science and philosophy have made some advances, that their truth is called in question.

Classification.— It is difficult to find a general theory which will explain the origin of all myths, for though we may admit that many, perhaps most, of them are physical in origin, it is impossible to deny that others may be pure fabrications, tales invented by early bards or minstrels to beguile a weary hour, while in others fragments of real history may be hidden. To decide what class any myth is to be referred to, we must trace it, if possible, back to its earliest and most rudimentary form, and then, by the aid of the science of language, we may be able to say whether it is physical in origin, or not; but as this will in many cases be impossible, there must remain a number of myths whose origin cannot be settled.

Greek.— Among the Greeks there was a method or system of interpretating myths and mythological deities, by which they are regarded as deifications of dead heroes and poetical exaggerations of real histories. This was the belief or philosophy of Euhemerus, a Greek philosopher, whose method or system has been called Euhemerism. By disciples of this school, Jupiter is said to have been an ancient ruler of Crete; Æolus (the god of the winds), a skilful mariner; Atlas, a great astronomer, and so on. The Euhemeristic school is not even yet extinct, and at the present day it includes some who find in the sacred Scriptures prototypes of mythological personages. Zeus, Apollo, Athene, Heracles, and the other divinities of ancient Greece, were believed by the bulk of the people to have a real existence, and the stories regarding them were looked on as true; but even in Greece in early times the absurdities and monstrosities of some of the myths led to attempts at explaining the stories in such a way as that they should not shock common sense or moral feeling. By some authors the stories that represent the gods as guilty of gross immorality, as impure, cruel, and deceitful, were flatly denied, and those authors in whose writings such stories are found were accused of having invented them themselves. Homer and Hesiod were severely censured by Xenophanes and Heraclitus on this account; and Plato would not endure the idea that the Homeric poems should be admitted into his ideal republic.

Hindu.— Prominent among the Hindu myths we find the sky god Dyaus (from *dyu*, to shine), whose name, however, always retained its meaning of sky, so that Dyaus had only an indistinct personality as a deity. Dyaus is the same as Zeus, and also the same as the *Ju* of the Roman Jupiter, the latter part of this name signifying simply father. The Hindu Varuna, a sky god, is conceivably the same as the Greek Ouranos, which word, besides being the name of a deity, had the ordinary signification of sky or heaven. The Vedic god Indra again, whose name is derived from *indu*, Sanskrit drop or sap, and therefore would mean the giver of rain, corresponds closely to Zeus in his attributes; like him, and like the Norse god Thor, he is the wielder of the thunderbolt. So the bright Vedic goddess Ushas, the dawn, is the Greek Eos, the dawn; while Ahana, another name for the dawn, is the Greek Athene.

Scandinavian.— The mythology of the North European people include folk-lore tales and the like of Denmark, Norway, Sweden and Iceland. Among the gods of the north are Thor, god of thunder, the strongest of gods and mortals, whose hammer, Miölnir, crushes the hardest objects, and Baldur, the youthful and beautiful god of eloquence. Niord is the god of winds, of sailors, of commerce, and of riches; his son Frei is the ruler of the sun, and on him depend rain and sunshine, plenty or dearth. Freya is the goddess of love. The mildest and most bountiful of the gods, she is a friend of sweet song, and loves to hear the prayers of mortals. Tyr, a son of Odin, the fearless god, who wounds by a look, is lofty as a fir, and brandishes the lightnings of battle. He is not properly the god of war, but rather of power and valor. His brother Braga is the god of wisdom and poetry. Braga's wife is Iduna, who preserves the apples of immortality, which she offers in vessels of gold to the heroes at their entrance into Valhalla. The Valkyrias or "choosers of the slain" are awful and beautiful beings, neither daughters of heaven nor of hell. Mounted on swift horses, they conducted the heroes to Valhalla. Another striking figure is Loki, as beautiful as he is malignant. By the giantess Angerbode he had Hela, the goddess of the lower regions, the wolf Fenrir, and the terrible serpent of Midgard, Jormungandur, which surrounds the whole earth. Hela rules in Niflheim. All who die of sickness and old age, and not in war, descend to her dark mansion. Other mythical personages were the Norns or fates, and Heimdall, who keeps watch on the bridge Bifröst. The popular belief was all would perish in a final crash of doom.

Indians and Savages.— Andrew Lang, the English student of mythology, declares that he finds a key to mythology in the study of the myths and mental habits of savage races. He maintains that "the savage and senseless element in mythology is for the most part a legacy from ancestors of the civilized races who were in an intellectual state not higher than that of Australians, Bushmen, American Indians, the lower races of South America, and other worse than barbaric peoples," and that the monstrous myths current in Greece, Egypt, and India were thus inherited. He points to the currency of such myths among savages at the present day, and to the fact that in general savages are eager to arrive at some explanation of the natural phenomena around them, and are quite satisfied with explanations that to civilized men may

seem even imbecile. When a phenomenon presents itself the savage requires an explanation, and that explanation he makes for himself or receives from tradition in the shape of a myth.

Bibliography.— Cox, 'Tales of Ancient Grimm,' 'Teutonic Mythology' (1889); Lang, 'Custom and Myth' (1884); Lang, 'Myth, Ritual and Religion' (1887); Lang, fairy books of various dates; Müller, 'Lectures on the Science of Language' (1897); and various works on Folk-lore.

Mytile'ne. See MITYLENE.

Myxœde'ma, a cretinoid state appearing in adult life, presenting many nutritive changes, and especially a solid œdema in the subcutaneous tissues. Its cause is a loss of function of the thyroid gland (q.v.), and a resulting diminution in the supply of its secretion to the blood. It is strictly a fibrosis of the thyroid. The disease was first described by Sir William Gull of London in 1893. A similar condition results from removal of the gland by operation. Women are the principal sufferers, furnishing 80 per cent of the cases. Myxœdema is found in cold climates, and probably most frequently in Europe; in certain districts it appears to be endemic. The onset of the disease is gradual, and the symptoms are loss of activity, sensitiveness to cold, falling of the hair, decay of teeth and nails, rough, dry skin, spongy gums, diminution of perspiration, yellow tint and swelling of the face, paleness of the mucous membrane, subnormal temperature, constipation, albuminuria, impairment of sight and hearing, headache, slow intellection, hallucinations and, in some cases, insanity. But the most noticeable symptom is the solid œdema, which develops principally in the loose subcutaneous tissues, appearing like a considerable swelling. The face, the back of the hands, and the upper limbs first present enlargement; but in time it involves the whole body. The thickening and enlargement of the face renders the patient unrecognizable.

Treatment consists in the administration of thyroid gland and of tonics. Grafting of a partial or entire thyroid gland taken from an animal into the subcutaneous tissue has been very successful. Internally a glycerine extract of sheep's thyroid is given, or a dry extract, or an emulsion may be made and used hypodermically. This treatment was first suggested by Murray, of Newcastle-upon-Tyne, in 1891. The remedy must be used cautiously, especially if cardiac or vascular disease exists. Thyroid may cause vomiting, diarrhœa, fever, profuse perspiration, headache, glandular swellings, and prostration. The dose should be graduated so as to avoid these symptoms of poisoning. After many months of treatment the disease disappears. The dose should then be diminished, but the patient must continue to take thyroid all her life, lest the myxœdema return. (See CRETINISM; THYROID GLAND.) Consult Gull, 'On a Cretinoid State Supervening in Adult Life in Women,' in Clinical Society's 'Transactions' (London, 1874); Gimlette, 'Myxœdema and the Thyroid Gland' (London, 1895); Murray, 'Diseases of the Thyroid Gland,' in 'Twentieth Century Practice,' Vol. IV. (New York, 1895).

N

N the fourteenth letter of the English and several other alphabets, is classed as a dental-nasal consonant: it is pronounced when a voiced sound is emitted through the nose while the tip of the tongue is in contact either with the front upper teeth or with the front of the palate: the position of the tongue, whether touching the teeth or the palate, distinguishes the n of one language from that of another: the n of English speech is produced by placing the point of the tongue against the palate just behind the gums. When n is followed by a guttural either the n and the guttural form one nasal sound, as in ring, or the n becomes distinctly nasal and the guttural retains its own sound-value, as in rink; but when the n and the guttural belong to different syllables, as in the words engage, include, concave, unkind, the n usually retains its pure sound; yet the rule has many exceptions recognized by orthoepists, who while they regard the n of syncarpy, syncretist, as pure, mark the n of syncope and many other words as nasal, equal to ng. In words ending with n preceded immediately by l or m, the n is silent: kiln, hymn; in the beginning of a word a consonant preceding n is silent: know, gneiss, mnemonic, pneumatic. In many words is seen an intrusive n, as in passenger, messenger, though the words from which these are formed, passage, message, have no n. The initial n of newt, nickname, and a few other words is the n of the indefinite article which became inseparably attached to ewt, ekename, etc.; conversely, by dropping the initial n the forms nadder, nauger, napron became adder, auger, apron.

N. D'Anvers, dăn'vẽrz. See BELL NANCY R.E.M.

N-Rays, a new form of radiation discovered by M. Blondlot. He uses the term N-rays to designate the new radiation, the name being suggested by the University of Nancy, where he conducted his experiments. One of the important properties of N-rays, is that they can be reflected and refracted while they have penetrative powers similar to Röntgen rays. They do not, however, affect a photographic plate and are, of course, invisible. But when a screen has been devised which will render them visible, it will then be possible to obtain perspective images of hidden bodies, such as a diseased bone, and this will give these rays as great an advantage over the X-rays as the photograph has over the old black-and-white silhouette. Another fact connected with N-rays has been discovered by Blondlot, and since confirmed by Reubens, which may prove to be of great importance in another field of application. This is the fact that these rays enhance the luminosity of a glowing solid or gas without increasing its temperature. The explanation of this effect has not yet been offered, but any means which will enable us to increase the luminosity of a body without increasing its temperature promises to be of great importance in solving the problem of an efficient light.

Naar, David, American journalist and politician: b. St. Thomas, W. I., 6 Nov. 1800; d. Trenton, N. J., 1880. He entered into mercantile business with his father and brothers in New York, later removed to Elizabeth, N. J., in 1844 was elected a member of the New Jersey Constitutional Convention, and was appointed in the same year by President Polk United States consul to St. Thomas. He returned in 1848 and was elected mayor of Elizabeth. In 1853 he removed to Trenton, N. J., where he took charge of the 'True American,' a journal which he soon raised to a position of influence. In 1864 he was elected State treasurer and retired from his paper in 1866.

Na'bal, in Biblical history, the name of an Israelite of the tribe of Judah. David, having afforded protection to Nabal and saved his flocks and herds, his property, and even his life when in danger, some time after sent to him to supply his troops with provisions. This Nabal refused; on which David, stung with the ingratitude of the man, vowed to take summary justice on the ungrateful Jew and exterminate his family; and taking with him 400 men, set out for the residence of the mercenary Hebrew. Abigail, Nabal's wife, hearing of her husband's conduct and David's resolve, collected such provisions as the army required, and, attended by a train of servants, set out to meet the approaching king. Her beautiful person, combined with the excuses she made for her husband's conduct, so softened the heart of David, that he accepted her gifts, averted his wrath, and Nabal having been "smitten by the Lord" a few days after, David married his widow.

Nabatæ'ans, năb-ạ-tē'ạnz, a Semitic race of people who from the 4th century B.C. to about 100 A.D. held a position of importance in Arabia and adjacent regions. They were ruled by kings; their capital was Petra (q.v.), and they carried on a great caravan trade. Their language was Aramaic.

Nabayugan, nä-bā-yoo'gän, a tribe of the Philippines living in the province of Cagayàn, Luzon, west of Malanec. They are a warlike, head-hunting people, of Malay origin, and apparently related to the Guinaanes.

Na'bob, The, a novel by Alphonse Daudet, published in 1877. This is one of the most highly finished of the author's works. It is a romance of manners and observation; and it

blends successfully many of the qualities of both the naturalist and the romantic schools.

Nabonassar, năb ō năs'ar, **Era of.** See BABYLONIA; NEBUCHADNEZZAR.

Nabonidus, nab-ō-nī'dŭs, or **Nabonadius** (Babyl. *Nebûna'id*), last king of Babylon (555-38 B.C.). He was elevated to the throne by his fellow conspirators in the murder of Prince Labossoracus (or Laborosoachard). Soon after his accession he concluded with Lydia and Egypt an offensive and defensive alliance against the Persians under Cyrus. He then greatly strengthened the defenses of his capital. It was not, however, until 539 B.C. that Cyrus, who had already defeated the impetuous Crœsus, marched upon Babylon. Nabonidus followed the traditional Oriental strategy in opposing his foe. He fought a battle within sight of Babylon, was utterly defeated, and then, while most of his army found safety within the great walls, he himself with a small force entered Borsippa, an important town southwest of Babylon; possibly hoping by this movement to force Cyrus to divide the Persian host. His stepson, Belshazzar (Bil-shar-uzur), familiar through the scriptural narrative in Daniel, and apparently co-sovereign, conducted the defense of Babylon. After the fall of the capital, Nabonidus surrendered, was kindly treated by Cyrus, and even made governor of the province of Carmania. Some of his inscriptions show that he was a personage of historical interest. See BELSHAZZAR; CYRUS.

Nabopolassar, nă-bō-pō-läs'sar, Babylonian king, founder of the New Babylonian empire. He was a Chaldæan, not of the kingly line, and erected an independent kingdom in Chaldæa in the second quarter of the 7th century B.C., thence extending his power to Babylon about 626. With his ally, Cyaxares of Media, he conquered Nineveh about 606, and died soon afterward, leaving the empire to Nebuchadnezzar, his son. Nabopolassar improved the irrigation of the country round Babylon and did much to beautify the city. Consult Rogers, 'History of Babylonia and Assyria' (1900).

Na'both, an Israelite, owner of a plot of ground in Jezreel, during the reign of Ahab, king of Israel, about 897 B.C. This plot lay on the eastern slope of the hill of Gilboa, and in addition to this he owned a vineyard. The palace of Ahab immediately adjoined this vineyard, which became an object of the king's desire and he offered to purchase it or give another in exchange for it. When Naboth refused to part with the "inheritance of his fathers," Ahab was bitterly disappointed, but his wife sent a warrant in Ahab's name, sealed it with his signet and caused Naboth to be apprehended, brought to Samaria, tried for blasphemy and treason on the testimony of two suborned witnesses, and stoned to death with his sons. Their mangled remains were devoured by the dogs and swine and the blood from their wounds ran down into the large tank or reservoir which still is seen on the slope of Samaria. This crime brought down the curse of Elijah upon the guilty couple (2 Kings ix. 2–26), which was fulfilled soon after in the fate of both. See AHAB, JEZEBEL.

Na'bu. See NEBO, MOUNT.

Nabua, nä'bwä, Philippines, a pueblo of the province of Ambos Camarines, island of Luzon, situated in the southern part of the province, on the Buhi River, 20 miles southeast of Nueva Cáceres. It is in a marshy region where rice is grown, and is connected with the neighboring towns by a good road. It is a military and telegraph station. Pop. 17,800.

Nabuco de Araujo, nä-boo'sō dā ä-row'-hoo, **José Tito,** Brazilian dramatist: b. Rio Janeiro, Brazil, 4 Jan. 1836. He served as provincial deputy in the magistracy and was for many years district attorney of Rio Janeiro, but resigned in 1879 and retired to private life. His work as a dramatist is well known in South American cities, where it has been successfully presented. He has published: 'O Filho do Acaso'; 'Biographia de Lamartine' (1877); 'Historia e Vida do General Gurjão' (1878); 'Poesias' (1879); etc.

Nabulus, nä-boo-loos', or **Nablus,** näb-loos', Palestine, the ancient Schechem, and one of the chief cities of Samaria, 30 miles north of Jerusalem, on the highest part of the fertile and fruitful pass between Mounts Ebal and Gerizim, leading from the Mediterranean to the Jordan. It is a busy trading and industrial centre, the seat of a governor, the see of a Greek bishop, and is visited by great numbers of pilgrims attracted by the tombs of Joshua and Joseph, Jacob's Well, and the Tree of the Sanctuary, three miles south on the road to Jerusalem. As a Canaanite city it was destroyed by Abimelech, a son of Gideon the judge. Rehoboam was crowned king of Israel here, and during the Greek occupation Justin Martyr was born here. It figured conspicuously during the crusades. It was the religious centre of the Samaritans (q.v.), whose descendants inhabit the southwest quarter of the town. Pop. est. 20,000.

Nachi (nä'chē) **Indians.** See CREEKS.

Nachtigal, näH'tē-gäl, **Gustav,** German explorer in Africa: b. Stendal 23 Feb. 1834; d. at sea near Cape Palmas 19 April 1885. He studied medicine; became a military surgeon; in 1861 went to Algiers; in 1863 became surgeon to the army of the Bey of Tunis; and in 1868 was sent with presents from the king of Prussia to Sultan Omar of Bornu in recognition of kindness shown to German explorers. His journey through Tibbu and Tibesti was over country hitherto untraversed by a European. He arrived at Kuka in 1870, thence explored Borku, Kanem, and the country south of Bornu, and on his way back to Cairo passed through Wadai. The years from 1875 to 1882 he spent in Germany arousing national interest in German colonization. He entered the consular service in 1882, becoming consul to Tunis, and in 1884 was German commissioner for the annexation of Togoland, Kamerun, and Lüderitzland. He died on his way back to Europe. Nachtigal's work marked a distinct era in the exploration of northern Africa, and even more notably in German colonial policy. He wrote 'Sahara und Sudan' (1879–89). His letters are collected in Berlin, 'Erinnerungen an Gustav Nachtigal' (1887). Consult also the life by Ruhle (1892).

Nacogdoches, năk-ō-dō'chĕz, Texas, city, county-seat of Nacogdoches County; on the Texas & N. O., the Houston, and the East & W. T. R.R.'s; about 120 miles north by west of Beaumont and 130 miles north by east of Hous-

ton. It is in a rich agricultural region, in which the chief products are cotton and tobacco. A government experiment station for testing the tobacco is located here. The industrial interests of the city, outside the government station, are connected chiefly with the preparation of cotton and tobacco for market.

Nacogdoches was first settled by Spaniards in the early part of the 18th century; it was first a mission, the headquarters for the converted Indians of the surrounding region. Pop. (1890) 1,138; (1900) 1,827.

Nacré. See MOTHER OF PEARL.

Nacrite, a class of white unctuous minerals possessing a pearly shining lustre. They are usually found with mica slate, and also occur native in granite, crystallizing in four-sided prisms. The constituents are usually alumina 28.844, silica 64.440, with varying portions of lime and the protoxides of iron and manganese. Nacrite is found in various localities, notably near Brunswick, Maine, and in some parts of Ireland.

Nadal', Ehrman Syme, American author: b. Lewisburg, W. Va., 13 Feb. 1843. He was graduated from Yale in 1864 and was a secretary of the United States legation at London, 1870–1 and 1877–84. He has published 'Impressions of London Social Life' (1875); 'Essays at Home and Elsewhere' (1882); 'Zweibach, or Notes of a Professional Exile' (1895).

Nadchés Indians. See CREEKS.

Na'den, Constance Caroline Woodhill, English poet: b. Edgbaston, Birmingham, 24 Jan. 1858; d. London 22 Oct. 1889. She studied at the Mason College, Birmingham, in 1881–7; became interested in sociological problems, and lectured with effect. She was an investigator of Spencer's system of philosophy, and became the advocate of a doctrine, taught also by Dr. R. Lewins, called 'Hylo-Idealism,' an attempt to furnish a metaphysical system reconciled with the science of modern times. She is chiefly remembered for her volumes of 'Songs and Sonnets of Springtime' (1881), and 'A Modern Apostle and Other Poems' (1887). The poems were commended for their promise by Gladstone in a review in the 'Speaker.'

Nadia, nā'dē ā, or **Nud'dea,** India, a town and district of Bengal: (1) the town, capital of the district, on the Bhagirathi River, 63 miles north of Calcutta, is a place of sanctity, the seat of native Sanskrit schools, and was the residence of the last independent Hindu king of Bengal in 1203. Pop. (1901) 14,105; (2) the district has an area of 2,982 square miles. The Ganges here known as the Padna skirts its northeastern boundary and from it branch the three "Nadia rivers," the Bhagirathi, Jalangi, and Matabhanga, which irrigate the district and are valuable thoroughfares for communication and trade. Pop. (1901) 1,667,990.

Na'dir, in astronomy, that point of the heavens which is diametrically opposite to the zenith, or point directly over our heads. The zenith and nadir are the two poles of the horizon; the zenith, nadir and centre of the earth are in one straight line.

Nadir Shah, nā'dēr shā, or **Tamasp Kuli Khan,** king of Persia: b. Khorasan 1688; d. Fethabad 19 June 1747. He was of Turkish blood and poor family; early showed his cunning by his attempts, while in the service of different governors of Khorasan to get this province for himself, but was unsuccessful. Putting himself at the head of a band of robbers he got possession of several strongholds in Khorasan; and in 1726 entered the service of Tamasp II., for whom he checked the Afghans and defeated the Turks, and from whom he received four provinces. When Tamasp was defeated at Hamadan by the Pasha of Bagdad and was forced to cede the provinces on the Arauxis to the Turks and to make a disgraceful peace, Nadir dethroned him, put his son Abbas III. in his place and took the regency upon himself. The lost provinces were won back from the Turks and in 1736 upon the death of Abbas Nadir came to the throne, invaded Afghanistan and conquered it, took most of India from the grand mogul Mohammed XIV., pillaged Delhi, and was everywhere so successful that his empire reached from the Indus and Oxus to the Euphrates and Caspian. He made peace with the Turks in 1746, but was assassinated by the officers of his guard, who were weary of his brutal cruelty. Consult Maynard, 'Nadir Shah' (1885).

Naegele, nā'gē-lē, **Charles Frederick,** American painter: b. Knoxville, Tenn., 8 May 1857. He studied figure and portrait painting under C. Myles Collier, William Sartain, and William M. Chase in New York. He has received many awards in competitive exhibitions and has painted portraits of Peter Cooper, Charles L. Tiffany, ex-Governor Roswell P. Flower, General Joseph D. Bryant, General Edwin A. McAlpin, John W. Gates, William Woodward Junior, Franklin V. Edson, and Waldo Hutchins.

Næ'nia, or **Nenia** (Latin), a funeral song among the ancients, sung generally by women. Nænia was also the goddess of lamentation.

Nævius, nē'vī-ŭs, **Gneius,** early Roman poet: b. probably in Campania between 274 and 264 B.C.; d. Utica, Africa, 204 B.C. or 202 B.C. He wrote in the old Saturnian verse an epic on the first Punic war; but was better known as a dramatic writer, particularly for his comedies. Most of his plays, of which the earliest was produced in 235 B.C., were translations or adaptations from the Greek. His attacks on the Metelli, of the Roman nobility, provoked their anger, and he was banished from the city, and retired to Utica. Fragments only of his works have come down to us. These have been edited by Klussmann, Vahlen, and most recently by Ribbeck ('Fragmenta Scænicorum Romanorum').

Næ'vus, a birth-mark or mother's mark. This disfigurement, which occurs most frequently on the head and trunk, but may also appear on the extremities, is essentially an enlargement of the minute veins, or venous capillaries, which are dilated, and anastomose or unite among themselves to form a vascular patch generally of a deep-red color. The lesion is confined to the upper layer of the true skin. No pulsations are observable in the nævus, but if the circulation in the neighborhood is obstructed in any way, turgescence is seen, and the color deepens. The familiar name of "mother's mark," or "longing mark," is applied

to nævus from a former belief that the lesion was the result of fear, fright, unnatural longing, or some such irritation acting upon the mother's constitution, and communicating its effects to the unborn child, in the shape of this mark. Nævus, apart from questions as to its exact cause, appears to be invariably congenital in its nature, and never to occur as a result of disease or accident. After birth it usually enlarges, and after attaining a certain size may remain to constitute a permanent lesion, or it may be absorbed with or without inflammatory action. Nævus has been treated in various ways, by excision with the knife, ligature, caustics, etc. The ligature has until recently been most commonly employed for its removal, threads being passed under the base of the nævus, and tied so as to produce strangulation of the vessels. Electropuncture and electrolysis are now much used, the latter being, where practicable, the best of all discovered means. In cases where a nævus is of limited extent, and does not produce disfigurement, or where from its situation it may not be seen at all in ordinary circumstances, the surgeon's advice generally is to let it alone. In subcutaneous nævus the lesion is more deeply seated. Subcutaneous nævus generally accompanies the more superficial form, but may bleed spontaneously, and weaken the patient unless removed.

Nafa, nä'fä, **Naba,** or **Nava,** Japan, the principal seaport town of the Liu-Kiu Islands, on Okinawa. It is on the west coast of the island, and carries on a considerable export trade in silk, cotton, and sugar. Pop. (1898) 35,453.

Naftia, näf'tē-ä, **Lago,** or **Lago dei Palici,** Sicily, a historic lakelet of volcanic origin, in an ancient crater over 900 feet in circumference, near Palagonia, in Catania. Its nauseating naphtha-like emanations are fatal to birds and small animals; its waters thick and greenish, and in a frequent state of ebullition from the underpressure of escaping carbonic acid gas. The lake was regarded with superstition by the ancients, and here the Siculi, the earliest known inhabitants, had a temple to two chthonic gods, the Palici of the Romans, which was the seat of the conspiracy and revolt against Rome 104 B.C.

Naga, nä'gä, Philippines, (1) a pueblo of the province of Cebú, situated on the east coast, 12 miles southwest of the town of Cebú. It is a port of call for steamers and coasting craft going to Cebú by the southern passage, and is on the east coast road. Pop. 15,100. (2) The former name of Nueva Cáceres (q.v.).

Nâga, in Hindu mythology, the name given various deified serpents, which are represented as the sons of the Muni Kasyapa and his wife Kadrii. Their king is Sesha, the sacred serpent of Vishnu.

Naga River, a river of southern Luzon, Philippines, rising in the mountains of the province of Albay, within four miles of the Pacific coast and flowing northwest to Bató Lake, on the boundary between Albay and Ambos Camarines. Passing through the lake, it continues its northwest course across Ambos Camarines, and empties into San Miguel Bay. Ten miles from its mouth is Nueva Cáceres, and about midway between this town and the bay the river makes a sweep in the shape of a horseshoe, turning toward the northeast. During its course it has three different names: from its source to Lake Bató it is called the Inaya; from the lake to Nueva Cáceres, Bicol or Vicol; and from Nueva Cáceres to its mouth, Naga. In the second part of its course it receives several important tributaries, is navigable for craft of some size, and forms the channel of trade in rice between Albay and Ambos Camarines. In the latter part of its course it receives the waters of Polanluna, which drains a large valley in the northwest of its province. It is navigable to Nueva Cáceres for vessels of 150 to 200 tons.

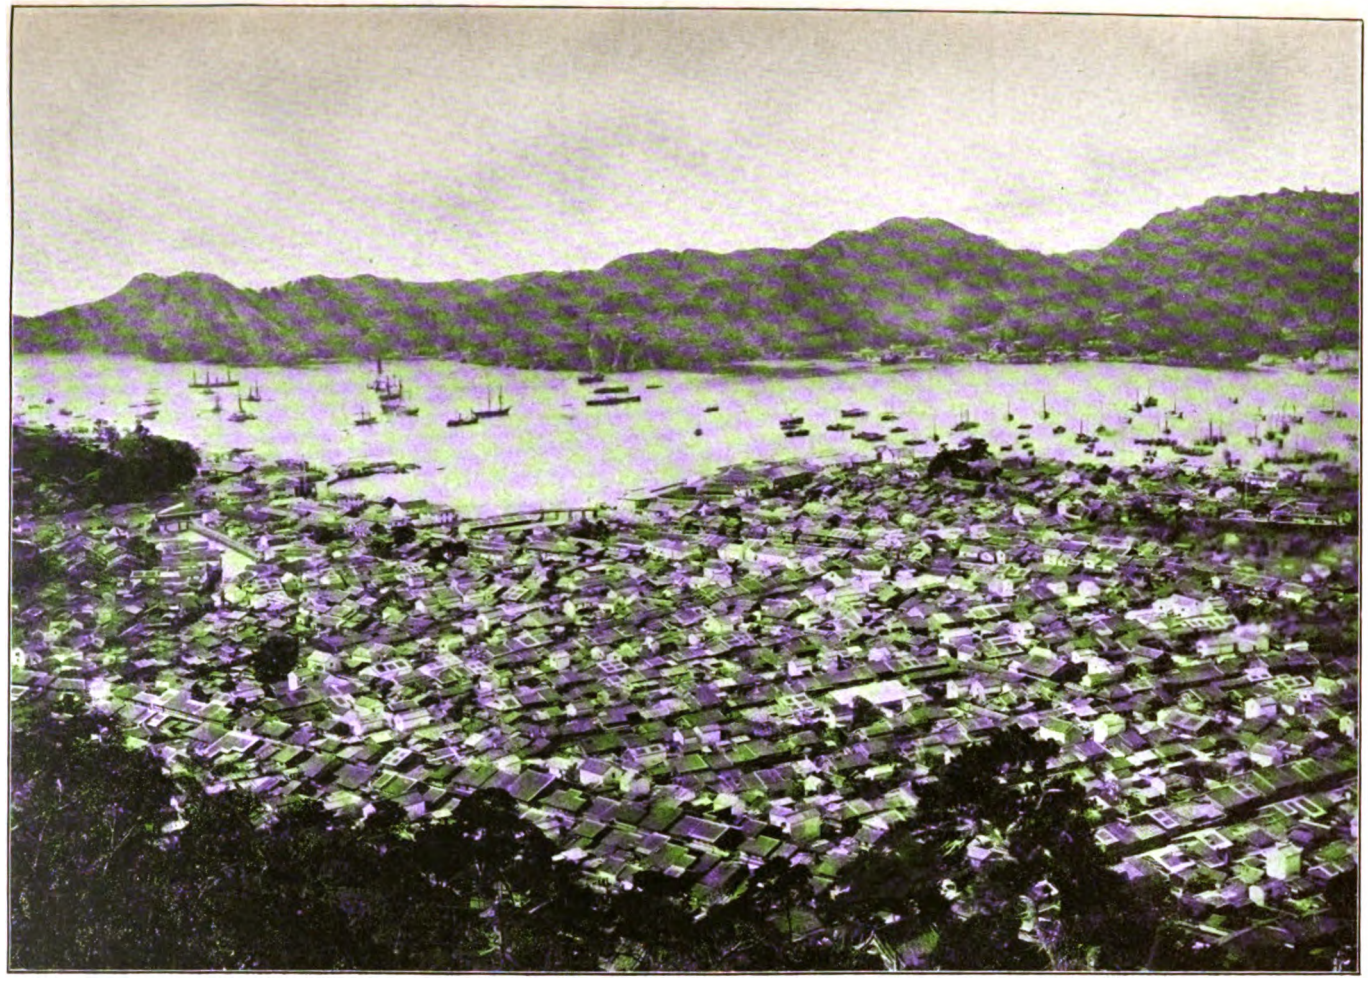
Nagano, nä'gä-nō, Japan, a city of Hondo, 96 miles northwest of Tokyo. It has an active trade in silks, woolens, and other textiles, and is a noted Buddhist pilgrim resort, visited for its celebrated Zenkoji Temple, dating from the 7th century. Pop. (1898) 31,320.

Nagar, näg'ăr or nŭg'ŭr. See BEDNUR.

Nagasaki, nä-gä-sä'kē, Japan, an important treaty port, and the chief town of a prefecture, on the southwest coast of the island of Kiusiu, beautifully situated on a peninsula at the extremity of a bay or harbor, enclosed by hills covered with luxuriant verdure. The streets are wide and clean, while each house has a garden attached. The climate is mild and healthful. An extensive system of modern waterworks has been installed. Previous to 1858 the only European nation allowed to trade here was the Dutch, which has maintained commercial relations with the town for more than 200 years. In that year Nagasaki was one of five Japanese ports opened to the British and Americans, as well as the Dutch; and in October 1869 seven other Japanese ports were opened to most of the European nations, besides the United States. Nagasaki has a splendid harbor, which has been greatly improved by extensive dredging and other operations, and the port at present is the third in Japan. It has a patent slip- and two large graving-docks. In the neighborhood are some of the most productive coal-mines of Japan, and coal is one of the chief articles of export. Other exports are cuttlefish, grain and provisions, rice, flour, shell-fish, paper, cotton (raw and yarn), etc. The imports comprise sugar, rice, raw cotton, oil-cake, kerosene, machinery, metals, coal, locomotives, tobacco, etc. The number of vessels entered in 1899 was 1,096, and the gross tonnage 1,784,770. Ship-building is an important industry and the engine works of Aka-no-ura is its chief industrial establishment. Pop. (1889) 44,921; (1899) 120,865.

Nagcarlán, năg-kăr-län', Philippines, a pueblo of the province of Laguna, Luzon, situated in the centre of the province between the headwaters of the Santa Cruz and the San Diego Rivers, 12 miles south of Santa Cruz. It is on the road between Majayjay and San Pablo. Pop. 13,000.

Nagel, nä'gĕl, **Albrecht Eduard,** German ophthalmologist: b. Dantzic, Germany, 14 June 1833; d. Tübingen, Germany, 24 July 1895. He studied medicine at Königsberg and Berlin and established a practice in Dantzic in 1856. In 1864 he was privat-docent at Tübingen and 1874 he became professor of ophthalmology there. He



VIEW OF HARBOR AND CITY OF NAGASAKI.

edited the 'Mittheilungen aus der ophthalmiatrischen Klinik in Tübingen' after 1880, and published: 'Das Sehen mit zwei Augen' (1861); 'Die Anomalien der Refraction und Accommodation des Auges' (1880); 'Die Vordbildung zum medicinischen Studium' (1890).

Nä-geli, nä'gĕ-lē, **Karl Wilhelm,** Swiss botanist: b. Kilchberg, near Zürich, 27 March 1817; d. Munich 10 May 1891. He studied in Zürich, Geneva, and Berlin; began (1842) the teaching of botany in Zurich; became extraordinary professor at the university there in 1848, full professor in 1852 at Freiburg, and at Zürich three years later. Afterward he held the professorship of botany at Munich. His most important work for science was in the physiology and morphology of plants. His writings deal chiefly with morphological and cytological subjects, and the transformation of species (see PROGRESSION, or PROGRESSIVE EVOLUTION) is fully treated in his 'Mechanisch-physiologische Theorie der Abstammungslehre' (1883).

Naglee, năg'lē, **Henry Morris,** American soldier: b. Philadelphia 15 Jan. 1815; d. San Francisco 5 March 1886. Entering the Union army early in the Civil War, he participated in the Peninsular campaign of 1862, and in the following year was appointed to the command of the Seventh army corps and of the District of Virginia. He retired from the army in 1864, and later went to California, where he cultivated a vineyard at San José, and gave his name to a well-known brandy.

Nagoya, nä-gō'yä, Japan, the chief town of Owari province, Hondo, near the head of Owari Bay, 92 miles by rail east of Kioto. It was formerly a city of great importance, being for a time the capital of the empire. It is still the fourth city in Japan in respect of population and an important centre for the production of pottery and fancy ware, silk and cotton goods, and other manufactures. The chief edifices are the 17th century castle of Owari with its valuable art collection, and the Higashi Hongwanji Buddhist temple. Pop. (1898) 244,145.

Nagpur, näg- or nŭg-poor', or **Nagpore,** India, a city, district, and division, of the Central Provinces. (1) The city, capital of the district and division, and also of the Central Provinces, 520 miles by rail east of Bombay, although at an elevation of 1,100 feet above sea-level, occupies an unhealthful situation on the banks of the Nag. The municipal limits include, besides the town proper, the native suburb of Sitabaldi, the European station of Sitabaldi, the small suburb of Takli, and a considerable area of land under cultivation. In the centre rises Sitabaldi Hill, crowned with the fort, which is garrisoned by a small detachment from the British regiment at Kamptee, 9 miles distant. There are some Hindu temples and mausolea built in the best style of Mahratta architecture, and several schools. The chief manufactures are cotton and woolen cloths. There is a trade in wheat and other grain, salt, country cloth, European piece and miscellaneous goods, silk, etc., and coal is obtained from a bed at a depth of 200 feet, which is estimated to contain 17,000,000 tons. Here, in 1817, a British force of 1,350 men defeated a Mahratta army of 18,000 men. Nagpur was formerly the seat of a line of rajahs, which became extinct in 1853, when their territory was annexed to the British dominions. Pop. (1901) 124,599. (2) The district of Nagpur has an area of 3,483 square miles; pop. (1901) 751,584; (3) the division of Nagpur, divided into five districts, has an area of 24,127 square miles; pop. (1901) 2,716,748.

Nagrandians, or **Maribois,** a Central American tribe of Indians, formerly occupying Nicaragua, near the present site of Leon.

Naguilian, nä-gē-lē'än, Philippines, a pueblo of the province of Unión, Luzon, situated on the Bauang (or Baoang) River, four miles from the mouth and 10 miles southeast of San Fernando. Pop. 10,400. A small town (pop. 2,200) in the province of Isabela, Luzon, has the same name.

Nagyagite, a telluride of lead and gold agreeing with the formula $PbAu_2TeS$. Besides these elements it often contains traces of copper, silver, sulphur and antimony. It is found native in foliated masses and is hence sometimes called "foliated tellurium." It crystallizes, but rarely, in dimetric forms and its specific gravity is 6.85 to 7.2. It melts easily under the blowpipe and burns with a blue flame. In color it is lead gray, and of a brilliant metallic lustre. It is found in Virginia, but derives its name from Nagyag, Transylvania, where it was first found.

Nahant, nȧ-hănt', Mass., town, in Essex County, on Massachusetts Bay. It is on a peninsula, which extends into the bay about four miles. The surface is uneven, the east coast rugged, in some places bold cliffs are along the shore; the west coast is low and more regular. There are two small villages in the town, one Nahant, the other Little Nahant. The whole peninsula is a residential section; many of the handsome dwellings are the summer homes of Boston men. Nahant is four miles from Lynn, the nearest railroad station, and about 10 miles northeast of Boston. Formerly it was part of Lynn, but in 1853 it was made a separate town. Pop. (1890) 880; (1900) 1,182.

Na'hi Indians. See CREEKS.

Nahr-el-Asi, när'ĕl-ä'sē. See ORONTES.

Nahua (nä'wä) **Indians,** a Central American collective name given to the Indian tribes which were the most powerful in Mexico at the time of the Spanish conquest. They had many pueblos, or towns, knew how to cultivate the ground, were skilled in gold and feather work and used hieroglyphics in writing. About 2,000,000 Indians of that region are now classed as Nahuas. They are sometimes called Aztecs. See AZTEC CONFEDERACY.

Nahuel-Huapi, nä-wäl' wä-pē', or **Tiger Lake,** Argentina, a lake on the boundary between the territories of Neuquen and Rio Negro, on the east slope of the Andes. It is 75 miles long, 10 miles broad, and has an area of 300 square miles, dotted with several islands. It is fed by numerous mountain torrents and is drained by the Limay affluent of the Rio Negro.

Na'hum, one of the 12 minor Hebrew prophets succeeding Zephaniah as the foreteller of Nineveh's destruction. He flourished about 606 B.C. He is said to belong to Elkosh, an unknown place. He announces the fall of Nineveh, as Jehovah's judgment on that sinful city, and his method of releasing his people in captivity there. The prophecy opens with a sub-

lime vision of God's coming to judge the nations. But he will save the righteous, while his enemies the Assyrians are utterly destroyed. The news of the tyrants' downfall will be welcomed by Israel. The capture of Nineveh by its foes (Medes and Chaldæans) is then described. The desolation of the city is a token of Israel's restoration. The fall of Thebes in Egypt (about 668 B.C.) is cited as an example of what is to happen to Assyria, in spite of its fortresses, its wealth and its armies. With a wide view of the working of Providence, an abstention from all moral or homiletic utterances, this powerful prophecy advances with majestic unity from its noble procemium to its close.

Naiada'ceæ, a small family of aquatic plants differing from the *Potamogetonaceæ* (q.v.) in having the flower diclinous, with one stamen and one ovary.

Nail, an elastic horny plate on the upper or dorsal surface of the end of a finger or toe, as in man and monkeys. Hoofs, claws, talons, sheath-horns, and the bills of birds are analogous. Nails and claws of all kinds are modifications of the epidermis, identical in formation and mode of growth. The root of the nail rests in a matrix which is a fold of the dermis, particularly rich in vascular papillæ from which the nail-cells are produced. The pink color of a healthy nail is due to the blood beneath. The little white area toward the root of a nail, called lunula from its crescentic shape, has less blood under it. When nails are destroyed new ones will be formed if the matrix is uninjured. Nails are a support and a defense to the ends of the fingers and toes, assist in picking up small objects, and if healthy and in good condition add comeliness to the parts to which they are attached. To most animals possessing them they are of great importance, giving a needed rigidity to fingers and toes, and adapting them to a great variety of necessary utilities, as firmly seizing and holding prey (perfected in the retractile apparatus of feline claws), scratching, digging, searching crevices for food, and as formidable weapons. In horses, cattle, and other ungulated animals, they enclose some or all the digits, and are called hoofs (q.v.). In the sloths the nails assume a large relative size, and are used as a chief means in arboreal progression. In the Amphibia — as in some toads, efts, etc.— the nails are represented in their simplest form, and appear as mere thickenings of the skin at the extremities of the digits.

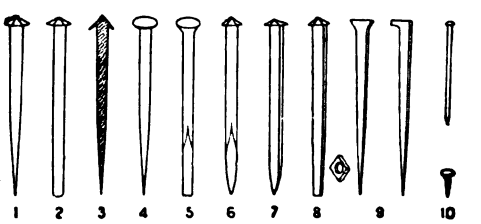
In man the nails appear about the fifth month of fœtal or embryonic life. After birth the nails of the hand grow at the rate of about one millimetre per week, those of the foot about one millimetre per month.

The health of the nails is affected, as is that of the skin, by local or general diseases. They may become thickened (hypertrophy) as the result of inflammation or a degeneration of nerves; diminished in size (atrophy) from traumatic influences; malformed as the result of disturbed function of the matrix; degenerated from faulty nutrition, and discolored in various diseases, the discoloration probably being in the tissues beneath. The nails are also subject to parasitic diseases. A hang-nail is a sliver of skin attached at one end; it should be cut off close to the point of attachment. The painful affection called ingrowing nail usually occurs in the great toe, not through alteration in the nail itself, but from constant pressure of the adjacent soft parts against its edge by a tight shoe. The irritation often results in the formation of an ulcer, extremely sensitive, and subject to continual aggravation from the imbedded nail.

Nails, headed spikes of metal, varying in size from those a little larger than ordinary pins to those several inches in length, and from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch in thickness. Up to the beginning of the 19th century they were made entirely by hand, and constituted a household industry in various countries, married women, and children of both sexes being employed in their production under exceedingly unsatisfactory conditions. In England Birmingham was the centre of the industry, at one time giving employment to over 60,000 persons, and requiring a weekly supply of 200 tons of nail-rods from the iron-works of that district. In the United States New England held a corresponding position, and is even to-day the centre of the industry in America, with Taunton, Mass., as the great tack-making centre of the world. Almost all of the nail output of England was consumed at home, and similar conditions obtained in the United States, France, and Germany.

Hand-made nails were known as wrought or forged nails, and were made from metal plates rolled to the required thickness, and then slit by slitting-rollers into nail-rods or split-rods of various sizes, corresponding to the required size and character of the nails to be forged, and were sold to the nail-makers in bundles. The hand-nailer's outfit consisted of a forge for heating the nail-rods, an anvil (a small cube of steel), a hammer resembling that of a file-cutter (the face being sloped toward the handle), and a few "swages" (stamps or dies for producing ornamental or stamped heads).

To make a nail, a nail-rod was heated on the forge, hammered on the anvil, and a portion of it the length of the required nail was cut off on a chisel attached to the anvil. The head was shaped by the bore, a piece of iron 10 or 12 inches in length, having a steel knob at each end perforated with a hole the size of the



Principal Forms of Nails.

shank of the nail, and countersunk to correspond with the kind of head required. Various forms of heads were produced by employing different kinds of bores. These forged or wrought nails included at least 300 different types, with at least 10 sizes in each type, representing a total of over 3,000 different names, all of which were perfectly understood by those who manufactured or used them. The retail terms — fourpenny, sixpenny, tenpenny, etc.— were not only indefinite in themselves, but

varied in different countries, and even in different localities of the same country. Therefore, they were generally designated by terms defining their use, as deck, scupper, pail, mop, hurdle, etc., or according to the forms of their heads, as clasp, rose, diamond, etc., or the shape of their points, as flat, sharp, spear, etc. Their thickness was expressed as fine, barbed, and strong, and their length in inches, generally in connection with the weight (expressed in pounds) of 1,000 of the nails referred to. Their principal forms are illustrated by the accompanying drawing, and their uses may be briefly stated as follows: (1) "Rose-sharp" and "fine-rose": the former used for coopering, fencing and other rough work employing hard wood; the latter, with broad spreading heads of greater holding power, used in pine and other soft woods. (2) "Flat-point rose": used in wood liable to split by the wedge-like action of sharp-pointed nails. They were driven with the edges of their flat points across the grain of the wood, and not only prevented splitting, but also held more firmly. (3) "Clasp" nails: commonly used by carpenters in deal and similar woods. The edges of their heads projected downward and, when driven below the surface of the wood, held tightly by clasping a portion of it together, and also allowed a plane to pass over them in finishing work. (4) "Clout" nails, with flat circular heads and round sharp-pointed shanks; used for nailing iron-work and other substances to wood. (5) "Counter-clout" nails, with countersinks under their heads, and chisel points: extensively used by wheelwrights and smiths. (6) "Fine-dog" and "strong-dog," with solid, slightly countersunk heads, round shanks and speared points: used for nailing down stout iron-work, in which the heads are not required to lie flush with the face of the metal. (7) "Kent-hurdle" and "Gate" nails, with broad thin rose heads, flat shanks and good spear-points: used for nailing together and clenching the oaken bars of hurdles, fences, and gates. (8) "Rose-clench" nails, with points cut square: used in nailing wood-sheathing, and the manufacture of packing-cases and boxes, in which the soft wood is liable to split unless bored before being nailed. The square heads of the nails punch out their own holes by driving a portion of the wood before them. The term "clench" was derived from the mode of their employment in boat-building, where they were clenched by hammering down or by riveting the end over a "rove" (a diamond-shaped metal plate), thus drawing the planks together firmly. (9) "Horseshoe" nails, with square or countersunk heads: made of the best refined iron, and capable of being drawn out fine without breaking in the hoof. (10) "Brads and tacks": a class of small very useful nails, employed for a variety of purposes too numerous to mention. The latter were sometimes made so small that 1,000 did not exceed 20 grains in weight.

The credit of inventing nail-making machinery appears to belong to the United States, which in 1786 granted a patent to Ezekiel Reed, of Bridgewater, Mass., for a "cut-nail" machine. About the beginning of the 19th century nail-making machines had been generally introduced in England, but the first English patent was granted to John Clifford in 1790. In making cut nails strips of metal of a breadth and thickness corresponding to the size and thickness of the required nail, and about a foot in length, are heated to a black heat and fed into the machine end first. A slicer cuts off the nail-blank, which in falling is clutched at the neck and held until a moving die strikes its upper end and forms the head; it is then liberated and passes out into the trough. In small nails the taper of the shanks and points is obtained by cutting the nail-blanks alternately, the metal strip (of uniform thickness) being turned over after each cut so that the points and heads are taken from the opposite sides of the blank; while in the larger nails the metal strip is rolled so that its cross section corresponds to the required taper. These machines turn out nails at a rate of 10 to 1,000 per minute, according to the size of the nails. Cast nails are produced by the ordinary process of molding in sand. They are relatively brittle, but are cheap, and are used for rough purposes, such as lathing and in the manufacture of stout boots and shoes. Wire nails were first made in France, hence sometimes called "French nails." They were used in the woodworking trades, and up to 1850 were made by hand. The wire was cut into the required lengths; a wire-blank was pinched in a vise, with a small portion projecting, which was flattened into a head by a few blows of the hammer. Subsequently machines were invented into which the wire was fed, and the cutting, heading, and pointing were performed automatically.

In the United States William Hersel, of New York, produced the first hand-made wire nails in 1850. Shortly afterward French machines were imported, but they were soon superseded by those of American make, which were awarded medals over those of French and German manufacturers at the Centennial Exhibition in 1876. The new industry, however, was of slow growth. Up to 1885 there were about 25 firms engaged in it, but since then these nails have been widely adopted in the manufacturing trades. They are now (1904) being produced by more than 80 plants in various parts of the United States, and are rapidly supplanting all the other forms of nails. With the exception of horseshoe nails, which to a large extent continue to be made by hand, from fine grades of wrought iron, all nails are now made of mild steel by machines. In the United States the production is in excess of the consumption, and American wire nails, especially, have been exported to European and other countries in increasing quantities for several years. The money value of the export of 1891 was but $420,697, while that of 1900 reached a total of $3,050,408. Consult: Smith, 'Treatise on Wire'; Swank, 'History and Manufacture of Iron in all Ages'; Reports of the Bureau of Statistics, United States Treasury Department.

W. Morey, Jr.,
Consulting Civil Engineer.

Nain Sing, Hindu explorer: b. Numaon; d. Morabad 1 Feb. 1882. He received from a military officer, Col. Montgomerie, instruction and stimulus for the work of exploration, which he afterward carried on in Central Asia, first in Cashmere and Ladak (1856–7), and later in Tibet, making a journey (1865–6) to Lhasa (q.v.),

which won him recognition from the Royal Geographical Society. This was followed by other important journeys, chief of which was that across the Tibetan plateau (1874–5), of which he was the first explorer. The 'Geographical Magazine' (1876) published an account of this journey, with a map.

Naini Tal, India, a town and district of the United Provinces: (1) the town, capital of the district, has a beautiful situation besides a lake, 6,409 feet above sea-level, between spurs of the Himalayas, 70 miles north of Bareilly. It is a popular health resort, the summer headquarters of the provincial government, and has a military convalescent hospital. A disastrous landslip here in 1880 destroyed 150 lives. Pop. (1901) 12,408. (2) The district has an area of 2,658 square miles; pop. (1901) 306,362.

Naipali (nī-pā'lē) **Language,** an Indian language spoken in Nepal. It resembles the Hindu. The literature of the language is very scanty.

Nairne, nārn, **Carolina Oliphant,** BARONESS, Scottish poet: b. Gask, Perthshire, 16 Aug. 1766; d. there 26 Oct. 1845. Her father was a staunch Jacobite, and named her after the young Pretender. In 1806 she was married to her cousin, William Murray Nairne, who in 1824 became Baron Nairne. Her poems were issued in 1846 as 'Lays from Strathearn,' and in 1869 Charles Rogers edited a volume entitled 'The Life and Songs of the Baroness Nairne,' of which a revised edition appeared in 1886. Among her poems are several of the most popular Scottish songs, such as 'The Land o' the Leal'; 'The Laird o' Cockpen'; 'Caller Herrin'; 'The Auld House'; 'Charles is my Darling.'

Nairs, nā'ērz, a Mohammedan caste in Malabar, who have peculiar marriage customs, polygamy and polyandry thriving side by side.

Naissant. See HERALDRY.

Nakshatra (Sanskrit, "celestial luminary" or "star"), in the Vedas simply means a star, but later was used of what in the mythological astronomy of India are called mansions of the moon, in which that planet periodically rests in its course through the heavens; these were small clusters of stars or asterisms, 27 or 28 in number. They were mythologically personified as the daughters of Daksha, and wives of the moon. Their introduction into the Hindu system has been variously accounted for. Consult: Thibaut on Hindu astronomy and astrology in Bühler, 'Grundriss der Indo-Arischen Philologie' (1899).

Nala, nā'la, in Hindu mythology, a legendary king of ancient India, whose love for Damayanti, the daughter of Bhima, king of Vidarbha, and the adventures arising therefrom, forms a celebrated episode of the 'Mahâbhârata,' as also of a separate poem, the 'Nalodaya,' attributed to Kalidasa.

Naltunne Tunne (näl-tŭ-nā' tŭ-nā') **Indians,** an American tribe of the Athapascan family, formerly residing on the Pacific coast south of Rogue River, Oregon. A few descendants of the race now live on the Siletz reservation, Oregon.

Namaland. See NAMAQUALAND.

Namangan, nä-män-gän', Russian Turkestan, a town of Ferghana, on the Sir-Daria, near the confluence of the Narin, about 50 miles northeast of Khokand. It is in a rich oasis, and is the trading centre for the surrounding nomadic tribes. Near it naphtha and coal are found. Pop. (1897) 62,000.

Namaqualand, nä-mä'kwä-land, or **Namaland, Great** and **Little,** southwest Africa, territorial divisions occupying an extensive region bordering on the west coast, and separated by the Orange River; Great Namaqualand belonging to Germany, being north of the river, and Little Namaqualand, belonging to Great Britain, on the south. (1) GREAT NAMAQUALAND extending along the west coast from the Orange River, lat. 28° 30' S., to Walfish Bay, lat. 23° S., and stretching inland from the west coast to the Kalahari Desert, has an estimated area of 100,000 square miles. It is mainly drained by the Oup, Borradaile, or Great Fish River, which, after a southerly course of about 450 miles, joins the Orange River. Along a coast-line of over 400 miles there is scarcely a running stream to be met with. There are several small bays in which safe anchorage may be had, such as Angra-Pequena, Sandwich Harbour, and Walfish Bay (q.v.) the latter with a small dependent territory belonging to Great Britain. The country is favorable for the rearing of cattle, which is the chief occupation. Copper ore appears to be in abundance in several localities, and in the vicinity of Kalahari Desert ivory and ostrich feathers are collected. The lion, giraffe, rhinoceros, and hippopotamus are still found in the north, although rapidly disappearing. The gemsbok, eland, and other large antelopes, now driven from Cape Colony, still find a refuge in the less frequented districts. The region is for the most part inhabited by the Namaquas, the principal existing tribe of the race generally known as Hottentots. The total number of Namaquas in Great and Little Namaqualand does not exceed 50,000; they lead a half-pastoral, half-predatory life, yielding allegiance to a number of petty chiefs. Polygamy is universal among them. They are gradually disappearing before the Griquas and other mixed races. The region has belonged to Germany since 1885, but little has been done toward its development. (See GERMAN SOUTHWEST AFRICA.) (2) LITTLE NAMAQUALAND, an electoral division of Cape Colony south of the Orange River, is a dry and barren region, but derives some importance from its copper mines. The chief mining station is Ookiep, 90 miles from Port Nolluth, with which it is connected by rail. Pop. 16,809, chiefly Namaquas and Griquas, and in the neighborhood of the mines, numerous Dutch farmers and English settlers.

Namas. See HOTTENTOTS.

Namaycush, the great lake-trout (q.v.).

Namby Pamby, a name bestowed upon Ambrose Philips (q.v.) (1671–1749).

Names of persons in the very earliest ages no doubt had some significance and meaning, but no record is handed down to us. The Old Testament names are almost all original, that is, given in the first instance to the individual bearing them, and either originated in some circumstance of birth or as an expression of some religious sentiment, thus — Jacob (supplanter), Isaac (laughter), Isaiah (salvation of Jehovah), etc. The names of women had equal signifi-

cance: Rachel (ewe), Hannah (favor), Deborah (bee), etc. In Old Testament times the name was often changed on the occasion of an important event in one's life, Abram becoming Abraham, Jacob becoming Israel, and so on. Neither the Hebrews, Egyptians, Assyrians, Babylonians, Persians, nor Greeks had surnames; and in the earliest period of their history the same may be said of the Romans. In course of time, however, every Roman citizen had three, the prænomen or personal name, which was placed first, and commonly written with one or two letters, for example C. for Gaius, Cn. for Gneius, M. for Marcus, Q. for Quintus, and so on. Then followed the nomen, the name of the gens or clan, as Cornelius, Julius, Fabius, from the Cornelian, Julian, and Fabian gentes. Lastly came the cognomen or family name, as Cicero, Cæsar, Scipio, etc. Conquerors were occasionally complimented by the addition of a fourth name or agnomen, commemorative of their conquests, as Coriolanus, Africanus, Germanicus, etc. While the earliest Greek names were expressive of some quality in high estimation, as Callimachus (excellent fighter), Apollodorus (gift of Apollo), the Roman names were less dignified and ambitious in their origin; thus Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, as Naso (long-nosed), Paulus (little), Crassus (fat), Cocles (one-eyed). Celtic and Teutonic names had often equal significance, as Gottfried (God's peace), Conrad (bold in counsel), Bertha (brightness), Ethel (noble), etc. Times of great public excitement have had a very considerable influence in modifying the fashion in names. Thus the English Puritans preferred Old Testament names and such as directly expressed religious sentiment. Among the Scottish Covenanters Old Testament names were also prevalent. At the French Revolution the names of the most famous Greek and Roman republican heroes were in general favor.

The principle of the modern system of personal nomenclature now adopted in most countries in Europe is to have one name for the individual (Christian or baptismal name) joined to a second name which is common to the family to which he belongs (surname). It is impossible to state with any degree of certainty when this system became general. No instance is known, we believe, of any Anglo-Saxon family bearing a surname from generation to generation. They were introduced by the Norman adventurers, but were for centuries confined to the upper classes. Surnames became general in Scotland about the 12th century. In some of the wilder districts of Wales they can hardly be said to have been adopted even yet. The principal sources from which surnames are derived are personal characteristics, rank, or profession, localities, animals, or natural objects, and patronymics. Thus from the first source, personal characteristics, we have Black, Brown, Grey, Green, Whyte; Little, Long, Short, Broadhead, Lightfoot, Cruickshank. From rank or profession we have King, Prince, Pope, Bishop, Abbot, Prior, Stewart or Stuart, Smith, Wright, Carpenter, Taylor, Baker or Baxter, Weaver or Webster, Falconer, Fletcher (arrow-maker), Glover, Bowman, Chapman or Marchant, Miller, Brewer or Brewster, Shepherd. From localities, animals, or natural objects, come Hill, Dale, Wood, Forest, Brookes or Burns, Grove, Shaw; Bird, Lyon, Hogg, Crabbe, Fox, Roebuck, Bull; Stone, Tree, Flint, Steele. From patronymics are derived Andrews, Anderson; Alexander, Sanderson, Sandison; James, Jameson, Jamieson; Jones, Johnson, Jonson, Jackson; Williams, Williamson, Wills, Wilson; Thom, Thomson; Roberts, Robertson, Robinson. Surnames in many other languages are derived from like sources; thus Black, Whyte, Brown, are with the Germans Schwartz, Weiss, Braun; with the French, Lenoir, Leblanc, Lebrun; the Gaelic prefix Mac, the Irish O', the Norman-French Fitz, the German affix -sohn or -son, the Scandinavian -sen, the Russian -vitch, are all equivalents of the English affix -son. The Hebrews, as already stated, had no surnames proper, nor had the Arabians; but to distinguish two men of the same name the former used the form Solomon ben David (Solomon son of David), and the latter Abraham ibn Esra (Abraham son of Esra). The Welsh used the word ap in the same way; Evan ap Richard (John son of Richard). In most nations the wife changes her surname on marriage to that of her husband; in Spain, however, she retains it, while the son may adopt either the paternal or maternal name. In Great Britain a man may now change his Christian name and surname without an act of Parliament, royal license, or even public advertisement; but there is no law to compel third parties to use the new name. In the United States names can only be changed by special act of State legislatures.

Nicknames of persons are most difficult to classify owing to the great variety of origins. Physical peculiarities, complimentary (as Strongitharm), derogatory, as Spindleshanks, Sheepshanks, Crookshanks, Heavisides, etc.; mental attributes, as Grave, Stern, Wise, Sage, Moody, Proud, Courteous (Curteis), on one hand, and on the other Blythe, Gay, Foolhardy, Jolly, Meek, etc.; nicknames from complexion and color of the hair, as Black, White, Brown and Browning, Ruddy, Readman, Hoare, Grey, etc.; nicknames from peculiarities of dress, Curtmantel, Shorthose, etc.; from social position, as Bastard, Lacklands, and so on; from the animal and vegetable kingdoms, from birds and fishes. Then compounds were made by applying a sobriquet to a Christian name, as Micklejohn, Littlejohn, Brownjohn; if he was a comely, well made fellow, he was Properjohn. These names appear again in Norman guise, as Grosjean, Petijean, Bonjean, from which comes Bunyan — so that when we speak of good John Bunyan we are (perhaps unconsciously) only translating the name of "the inspired tinker." See NATIONAL NICKNAMES.

Bibliography.— Barber, 'British Family Names' (1894); Bardsley, 'Dictionary of English and Welsh Surnames' (1901); Innes, 'Concerning Some Scotch Surnames' (1860); Yonge, 'History of Christian Names' (1863).

Namouna, nä-moo-nä', in Persian mythology, an ever young and beautiful enchantress, born long before any other created thing, yet still retaining all her youthful attractiveness.

Namur, nä'moor (Fr. nä-mür'), Belgium; (1) a city, capital of the province of the same name, at the confluence of the Sambre and Meuse, 35 miles southeast of Brussels. The

old fortifications have been razed since 1866 with the exception of the picturesque citadel dating from 1784, built upon steep rocks, high above the confluence of the rivers. A cordon of five large and four small modern forts now defend the town. The town is beautifully situated and well built, with spacious streets and several handsome squares. Frequent sieges and bombardments destroyed almost all its ancient buildings. Among those of more recent times are the cathedral dedicated to St. Aubin, one of the most handsome modern churches of Belgium; the church of St. Loup, the church of Notre Dame, the Hôtel de Ville, and the belfry tower. Namur is the seat of a bishop; it possesses a chamber of commerce, a royal athenæum, a public library, a museum, an agricultural society, normal and various other schools, and numerous benevolent institutions. Namur is famous for its cutlery, its leather-works, and its iron and brass foundries. The trade is greatly favored by the two navigable rivers. Steamers ply on the Meuse; and railways communicate with Brussels, Mons, and the French frontier. Namur dates from the 7th century, under the names of Namucum, Navinucum Castrum, and Namon. It was taken by Louis XIV. in 1692, and retaken by William III. of England in 1695. Pop. (1900) 32,333. (2) The province is bounded on the north by Brabant, northeast by Liège, east by Luxemburg, south and southwest by France, and west by Hainaut; greatest length, north to south 57 miles; greatest breadth, 37 miles; area, 1,413 square miles. The surface is greatly diversified, well watered by the Meuse, with its tributaries, the Lesse and the Sambre. About one half of the whole surface is cultivated. The chief vegetable productions are the ordinary cereals, oil-seeds, chicory, fruit, and medicinal and dye plants. In some places the vine is cultivated. The extensive forests furnish good timber and the prevailing carboniferous strata yield coal, iron, limestone, etc. The industry of the province, both manufacturing and commercial, is largely developed. Namur was an independent county as early as the 10th century. At the close of the 12th century it came into the possession of the counts of Hainaut, and early in the 13th century fell to Peter of Courtenay, emperor of Constantinople. It was sold by his son Baldwin to Guy of Dampierre, count of Flanders, with whose descendants it remained till 1420, when it was purchased by Philip the Good, Duke of Burgundy, for 132,000 gold ducats, and afterward shared the fate of the other Burgundian states. Pop. (1900) 346,512, nearly all of whom speak Walloon.

Nan-Chang-Fu, China, the chief town of the province of Kiang-si, 176 miles southeast of Hankow, on the Kan-Kiang, near its entrance into the Po-yang. It is noted for its porcelain industries. Pop. (est.) 150,000.

Nan-Che, China, a town in the province of Chekiang, 40 miles west of Yen-chow-fu, in a beautiful valley at the confluence of the Hwuy-chow with one of its affluents. It is neat and clean, about three miles in circuit, and carries on a considerable river trade with the towns above and below. Pop. (est.) 200,000.

Nan-Ning, China, a trading station and treaty port in the province of Kwang-tung, 300 miles southwest of Canton, at the limit of navigation on the Yu-Kiang. Pop. (est.) 40,000.

Nana, a novel by Emile Zola, one of the Rougon-Macquart series, which appeared in 1880. It is a study in heredity, the evil effects of which upon an individual and reflexively upon society are powerfully portrayed in the development of the leading character, Nana, a dissolute actress.

Nana Sahib, nä'nä sä'hīb, Mahratta leader of the Sepoy rebellion: b. near Cawnpore 1825; d. Nepal about 1859. His real name was Dhandu Panth, and he was the adopted son of the last Mahratta peshwa of Poona, whose great wealth he inherited, but whose annual pension of about $400,000 was not continued to him by the British government. He lived as a native prince, moving in European society, and when the Sepoy mutiny broke out he secretly encouraged it, but openly offered aid to the English. He marched on Delhi at the head of native troops; promised the English a safe conduct from Cawnpore, but shot or drowned all of them but four; and before leaving the city killed all Europeans, women and children included, that he found in the city, and threw their bodies into the famous well of Cawnpore. He fled to Nepal, was repeatedly defeated by the English, and was not heard of after 1859.

Nanaimo, na-nī'mō, Canada, a seaport town of British Columbia, on Departure Bay, on the east coast of Vancouver Island, opposite Vancouver town on the mainland, with which it has a daily steamer service. It derives its importance from the valuable coal-mines in the neighborhood, and large quantities are exported from its excellent harbor, and also by the Esquimalt and Nanaimo railroad, which connects with Victoria, 59 miles to the south. Nanaimo originated in a Hudson's Bay Company trading post established in 1833; it was incorporated in 1874 and is a thriving municipality. Pop. (1901) 6,130.

Nânak, nä'nāk, **Nânek,** or **Nânuk,** Hindu religious leader, founder of the sect of the Sikhs: b. Talwandy (now Nankana), in Lahore, 1469; d. Kirtipur 1538. A member of the warrior caste, he early associated with Kabir, leader of a monotheistic sect, and came under other mystical influences. He traveled to all the holy places of India, made the pilgrimage to Mecca and Medina, and as a result of his studies of Brahmanism and Islam wrote the 'Adi-Granth,' which frequently quotes Kabir, and in general is a mixture of the Vedas and the Koran. This gospel he preached through India; it became the national religion of the Sikhs and was proclaimed by Nânak's successors from Labona down to Govind Sinh, who died in 1708. The 'Adi-Granth' preaches the worship of one god, the equality of man, the duty of loving all men, and the need for frequent ablution. See SIKHS.

Nan'crede, Charles Beylard, American surgeon: b. Philadelphia 30 Dec. 1847. He was graduated at the medical school of the University of Pennsylvania in 1869; practised in Philadelphia for 20 years; in 1889 became physician, professor of surgery, and surgeon in the University Hospital, University of Michigan; served with distinguished bravery in the Santiago campaign in 1898; contributed to the 'International Cyclopædia of Surgery,' to the 'Cyclopædia of

Diseases of the Nose and Throat,' to Parkes, 'Treatise on Surgery,' etc.; and wrote 'Principles of Surgery' (1899).

Nancy (Fr. nôṅ-sē), France, the capital of ancient Lorraine, of the former department of Meurthe, and since 1872 of the department of Meurthe-et-Moselle, situated in a fertile plain, near the left bank of the Meurthe, 218 miles east of Paris, on the railway to Strasburg. It is divided into the old and the new town, and has extensive suburbs. The former is for the most part irregularly built, with streets narrow and winding; but has several fine public buildings. The new town has straight and spacious streets, intersecting each other at right angles, and traversed by tramways; the houses, almost without exception, are handsome. The Place Stanislas, surrounded by several fine public buildings, and communicating, by a triumphal arch, with the Place Carrière, has a fine statue of Stanislas Lesczynski, king of Poland, who passed the latter years of his life here as Duke of Lorraine, and bestowed upon the town many of its finest modern embellishments. There are statues also to Gen. Drouot, Thiers, and other notabilities. The Cours Léopold, occupying the highest part of the town, and finely planted, is the principal promenade; another is the Pépinière, a large planted area. Among the chief edifices are the cathedral, a modern structure in the Italian style; the church of St. Epvre, with a lofty tower and a fine portal, one of the finest specimens of modern Gothic in France; the church of the Cordeliers, built in 1484, and containing the tombs of several dukes of Lorraine; the 19th-century churches of St. Peter, St. Vincent, and St. Leon; Hôtel de Ville (17th century); ducal palace, an elegant specimen of flamboyant Gothic, with a fine porch (16th century); public library (88,000 volumes and 1,200 manuscripts); seven handsome gates or triumphal arches. Nancy is the see of a bishop, and the headquarters of the 20th army corps. At the head of its educational institutions is the celebrated university founded at Pont-à-Mousson in 1572 and removed to Nancy in 1768; it has faculties of law, philosophy, natural science, mathematics, medicine, and a school of pharmacy; Nancy also has a lyceum, a botanical garden, a school of forestry, a theological seminary, etc. The manufactures consist of broadcloth and other woolen stuffs; cottons and cotton yarn, hosiery, lace, all kinds of embroidery, stained paper, tobacco, etc. There are also ironworks, dye-works, breweries, and tanneries. The most memorable event in the annals of Nancy is the battle fought under its walls, when the Duke of Burgundy (Charles the Bold) was signally defeated and slain by René II., Duke of Lorraine. On 12 Aug. 1870 it surrendered to the Germans, by whom it was occupied until 1 Aug. 1873. The population was largely increased by the influx of Alsatians after the annexation of Alsace to Germany. Pop. (1872) 52,978; (1901) 102,463.

Nanda Devi, India, a peak of the main Himalayan Range, near the sources of the Ganges and the Brahmaputra, with a height of 25,656 feet.

Nandi, in Indian mythology, the goddess of joy and mirth.

Nan'du, a Brazilian name for the South American ostrich or rhea. See RHEA.

Nanek, or **Nanuk.** See NANAK.

Nanini, Giovanni Maria, jō-vän'nē mä-rē'ä nä-nē'nē, Italian composer: b. Vallerano, Italy, about 1540; d. Rome, Italy, 11 March 1607. He studied music in Rome and was appointed Maestro di Cappella there in 1571. In 1577 he became a member of the Pontifical Choir. His compositions are of great value, among them are: 'Hodie nobis Cœlorum Rex'; 'Cento cinquanta sette Contrappunti e Canoni'; etc.

Nankeen, or **Nanking Cloth,** a sort of cotton cloth, which takes its name from the city of Nanking, where it was originally manufactured. It was formerly imported extensively from China, but has generally been superseded by other fabrics. It is now imitated in most other countries where cotton goods are woven. The English manufactures have now so completely driven the Chinese from the market that large quantities are shipped from that country to Canton.

Nanking, nän-kĭng' (officially *Kiangning,* that is, Southern Capital), China, capital of the province of Kiang-su, and vice-regal headquarters for the three provinces of Kiang-su, Kiang-si, and Ngan-hwei, near the right bank of the Yang-tse-Kiang, 560 miles south by east of Peking. It is 18 miles in circumference, and is surrounded by a wall 40 feet high. The principal streets are of moderate width, clean, well paved, and lined with handsome stores; but the houses are, in general, mean, and only one story high. The part of the city occupied by the Manchus is separated by a wall from the Chinese town. There are extensive manufactures of fine satin and crape, and the cotton cloth which foreigners call nankeen derives its name from this city; paper and ink of fine quality, and beautiful artificial flowers of pith paper, are produced here. Nanking is celebrated also for its scholars and literary atmosphere, having many large libraries and book stores.

Nanking was the capital of the Chinese empire from 1368 to 1403; but when the seat of government was transferred to Peking it lost its importance and a great part of its population, about a third of its area being now unoccupied. The only remarkable remains of royalty are the sepulchral Ming statues situated near the walls. The famous porcelain tower of 9 stories, and 200 feet in height, completed in 1432, was destroyed during the Taiping rebellion. The city was held from the spring of 1853 to July 1864 by the Taipings, who made it their capital. At its capture by the rebels and recapture by the Imperialists it suffered severely. By the French treaty of 1858 Nanking was made a treaty port, but never attained any importance as such, owing to the vicinity of Chinkiang-fu. Pop. estimated at 140,000.

Nanna, nän'nä, in Scandinavian mythology, the wife of Balder. When the blind god slew her husband, she threw herself on his funeral pile and was burned to death. See MYTHOLOGY.

Nan'nacus, or **Nannakos,** according to a Greek legend, the king who predicted Deucalion's flood.

Nansen, Fridtjof, frēt'yŏf nän'sĕn, Norwegian Arctic explorer: b. Great Fröen, near Christiania, 10 Oct. 1861. He studied at Christiania University, and in 1882 made an Arctic voyage in a sealing vessel in order to have opportunities of studying animal life in the higher latitudes. On his return he was appointed curator of the Bergen Natural History Museum. In 1888 he crossed Greenland from sea to sea a little north of latitude 64°, an account of this journey being published in England in 1890, under the title 'Across Greenland.' He returned in 1889, and was appointed curator of the Museum of Comparative Anatomy in Christiania University. In 1893 he sailed on board a specially built steamer (the Fram) in the expectation that, entering the Polar ice in the neighborhood of the New Siberian Islands, he would be drifted by a current over the Pole and would come out on the east side of Greenland. This expectation was based on the fact that articles belonging to the Jeannette, an Arctic expedition vessel lost in 1881, had drifted in about three years from Bering Strait across the Polar regions to Greenland. After being carried to lat. 83° 59′, he left the Fram and crew, and with a single companion, Lieutenant Johansen, and with sledges, dogs, and kayaks, took the ice. In this way he reached a higher latitude than any previously attained, 86° 14′ (8 April 1895), and then turned southwestward to Franz Josef Land. There he spent the winter of 1895–6 and on 17 June 1896 fell in with members of the Jackson-Harmsworth expedition, with which he returned to Vardē. The Fram, under Captain Sverdrup, had reached lat. 85° 57′, and had been for four months fast in the ice. Nansen was received everywhere with the greatest enthusiasm, and medals and other honors were conferred upon him, including a professorship of zoology in Christiania University. In 1897 he published an account of his voyage, which appeared in English as 'Farthest North,' certainly the most interesting of all narratives of Arctic travel. A translation of a work by him on 'Eskimo Life' was published in 1893.

Nantel, nän-tĕl', **Guillaume,** Canadian journalist and politician: b. St. Jerome, P. Q., 4 Nov. 1862. He received his education at the seminary of Saint Thérèse de Bainville and was admitted to the bar in 1875. He was editor of the St. Jerome 'La Minerve' and of 'Le Nord,' and in 1882 was elected to the Canadian Parliament and was re-elected in 1886, '90, '92. From 1887–92 he edited 'La Presse' at Montreal, and in 1897 founded 'La Monde Canadien.' He was minister of public works in 1891–6 and is a director in large railroad concerns. He published: 'Notre Nord-ouest provincial' (1888).

Nantes, nänts (Fr. nänt), France, capital of the department of Loire-Inférieure, and an important commercial port, on the right bank of the Loire, where it receives both the Erdre and the Sèvre, 248 miles by rail west-southwest of Paris. The Loire here forms a number of islands, two of which are among the finest quarters of the town, and are connected by several bridges. The situation, on an important navigable river, within 40 miles of the ocean, is advantageous for commerce, and has been enhanced since 1891 by the construction of a ship-canal to Saint Nazaire at the mouth of the Loire. Nantes is so well placed, and so regularly, and in some parts so splendidly built, that it justly ranks as one of the finest towns in France. It has a number of elegant squares; and its quays, which line the banks of the rivers, extend nearly five miles. The notable public edifices are the cathedral, in the flamboyant style, dating from the 15th century; the handsome modern church of St. Nicholas in the Gothic style of the 13th century, with a tower 278 feet high; the celebrated ducal castle, an edifice of the 14th century, partly modernized in the 16th, flanked with massive round towers; the palace of justice or law-courts, a large and handsome building; the Hôtel de Ville; the exchange, restored and enlarged in 1891; the museum of natural history; and the new museum (1897); the large picture-gallery; public library of 102,000 volumes; chapter-house, and Hôtel Dieu or infirmary. Nantes is the see of a bishop; it has courts of first resort and commerce, a chamber of commerce and exchange, a college, diocesan seminary, and secondary ecclesiastical school; a secondary school of medicine, and a hydrographical school of the first class. The manufactures consist of blankets, serge, flannel, printed stuffs, canvas, ships' boilers and machinery, cordage, chemical products, glue, ship biscuits, etc.; there are also cotton-mills, sugar-refineries, iron-works, glass-works, bleach-fields. Sardines and preserved meats are important articles among its industrial products. The building-docks are of great extent. Nantes carries on a large foreign trade, vessels of 1,700 tons now being able to reach the town. The trade includes a variety of articles both for the home, the colonial, and the foreign markets. Before the conquest of Gaul by the Romans, Nantes was the capital of the Nannetes. In 445 it valiantly withstood a siege of 60 days by the Huns. During the 9th century it was thrice taken by the Normans, and almost entirely ruined. In 1118, when it had again become prosperous, an accidental fire reduced the greater part of it to ashes. During the English wars in France it suffered much, repeatedly falling into the hands of opposite parties. For a long time it formed one of the most valuable possessions of the dukes of Brittany, but in 1499 the heiress of the dukedom, Anne of Brittany, who was born here, having married Louis XII., it passed with the rest of her possessions to the crown of France. The most memorable event connected with the history of Nantes is the famous edict (see EDICT OF NANTES) issued here by Henry IV., 30 April 1598, securing the Protestants in the free exercise of their religion, and making them eligible to all civil and military employments. This edict was revoked by Louis XIV. in 1685. The *noyades* or drownings of the monster Carrier during the Revolution were perpetrated here. (See CARRIER.) Pop. (1901) 128,349.

Nantes, Edict of. See EDICT OF NANTES.

Nanteuil, Robert, French copperplate engraver: b. Rheims 1630; d. Paris 1678. His father-in-law, Nicolas Regnesson, was his first instructor and in 1647 he went to Paris and worked under the eye of Philippe de Champagne (q.v.). Louis XIV. appointed him designer and engraver to the king. He employed in his work a simple line which grew gradually

thicker at the shade point and died away toward the high light in faint and fainter stipple points, in this way he produced the fine color values which characterize his engravings. In his portraits, of which about 200 exist, he exhibits powerful modeling and life-like drawing. Some of these latter works are after the paintings of Lebrun, Du Chastel, and others. He also executed some excellent pastels. Consult Loriquet, 'Robert Nanteuil' (1886).

Nanticoke, năn'tĭ-kōk, Pa., borough, in Luzerne County; on the Susquehanna River, and on the Delaware, L. & W., the Central of N. J., and the Pennsylvania R.R.'s; about 80 miles north by east of Harrisburg. It was settled about the middle of the 19th century, and incorporated as a borough in 1874.

It is situated in an anthracite coal region, and has extensive water power which is utilized in manufacturing. The industry contributing most to the wealth of the town is coal mining. The chief manufacturing establishments of the city are mining and agricultural implement works, large hosiery mills, knitting factories, canning factory, flour and grist mills, lumber mills, and cigar factories. It has considerable trade in coal, and its own manufactures. The government is administered under the original charter which provides for a burgess, who holds office three years, and a council. Pop. (1890) 10,044; (1900) 12,116.

Nanticoke Indians, a former American tribe of the Algonquin family residing in Maryland. They were of very dark complexion and were notorious for their peculiar customs and ceremonies. The Iroquois made war upon them in 1678, and in 1722 only about 500 of them survived. Later they removed to southern New York, and afterward to Ohio, where they joined the Delawares.

Nantuck'et, Mass., town, county-seat of Nantucket County; embracing the islands of Nantucket, Tuckermuck, and Muskeget. It is about 25 miles from the mainland of the State and 100 miles southeast of Boston. On the north is Nantucket Sound, on the east and south the Atlantic Ocean, and on the west Muskeget Channel, which separates it from Martha's Vineyard. The main island, Nantucket, is about 15 miles long, and averages about two miles in width. The area of the whole town is about 60 square miles. The most populous part of the town is along the north shore of the largest island. There are several villages in the town, the largest, Nantucket, on Nantucket harbor, was founded in 1673. The first settlement was made in 1659, by a colony in charge of Thomas Macy, at the place called Madeget. Nantucket is a famous summer resort; the island is dotted with handsome summer villas. The residents claim that the climate is antagonistic to asthma, hay fever, and malaria.

At one time Nantucket was the headquarters of a great whaling industry, but the chief industries of the present (1904) are agriculture and fishing. A flourishing coastwise trade is carried on by a number of the islanders. Muskeget Park is one of the attractions. The town has a public library (the Athenæum), and the Coffin high school. At the "town meeting" the administrative officials are annually elected. Pop. (1890) 3,268; (1900) 3,006. Consult Hinchman, 'Early Settlers of Nantucket.'

Naoroji, now'rō-jē, **Dadabhai,** first Indian member of the English Parliament: b. Bombay 4 Sept. 1825. He is the son of a Parsi priest, and was educated in the Bombay school that developed into the Elphinstone School and College, where he was the first native professor of mathematics and natural philosophy (1854). In 1855 he went to England, where he has since, for the most part, resided. In 1867 he assisted in founding the East India Association; through his efforts in 1870 the civil service was opened to native Indians; and he accomplished much for the improvement of Indian finance and industries. He became prime minister to the Prince of Baroda in 1874; from 1875 to 1887 held important municipal and legislative positions; and in 1886 and 1893 was president of the Indian National Congress. For many years he was president of the London Indian Society. From 1892 to 1895, as a Liberal, he represented Central Finsbury in the House of Commons, and in the latter year was made a member of the royal commission formed to inquire into Indian expenditure, etc. He has written: 'England's Duties to India' (1867); 'The Wants and Means of India' (1870); articles collected in 1887; and 'Poverty and Un-British Rule in India' (1901).

Nap, or **Napoleon,** a card game played by two or more players, each of whom receives five cards. It is usually played for money, a fixed stake per trick being agreed on. When the player at the left of the dealer examines his cards he either declares to win one, two, three, four, or five tricks — the latter called "going nap"; or he "passes," that is, declines to play, being accordingly out of that game. If he declares any number of tricks less than five, the next player in order has an opportunity of declaring or passing, the one who declares the highest number of tricks being always the one who has to play. The first card played determines that trumps are to be of that suit for the game. Should the player declaring succeed in winning his number of tricks, he pockets a corresponding sum from each player, and the game recommences; should he fail, he has to pay to each player a sum corresponding to the number of tricks.

Napa, nä'pä, Cal., city, county-seat of Napa County; on the Napa River, and on the Southern Pacific railroad. It is in an agricultural region in which large quantities of fruit are raised; and in the vicinity is an extensive deposit of cement rock. It was settled in 1847 and in 1863 was incorporated. The city has excellent transportation facilities as the Napa River is navigable, thus making direct water communication with San Francisco and other cities. The chief manufactures are gloves, woolen goods, leather, shoes, and canned goods. There is a large trade in fruit, Portland cement (made at Napa Junction), and the manufactures of the city. The scenery around Napa is beautiful; some of the attractions are the petrified forests, the mineral springs, and the Napa Redwoods. It has the State Hospital for the Insane. Pop. (1890) 4,395; (1900) 4,036.

Napanee, Canada, a port of entry and the county-seat of Lennox County, 24 miles west of Kingston, on the bay of Quinté, at the outlet of the Napanee River. It is the terminus of the Quinté & Napanee railroad, and is on the Grand Trunk railway. It has mills, factories, and a considerable grain trade. Pop. (1901) 3,143.

Naperville, nā'pẽr-vĭl, Ill., city, in Du Page County; on the Du Page River, and on the Chicago, Burlington & Quincy railroad; about 28 miles west of Chicago. It was settled in 1830 and in 1857 was incorporated. It is in an agricultural region, and in the vicinity are stone quarries. It is chiefly a residential city, the seat of the Northwestern College, established in 1861 under the auspices of the Evangelical Association. It has good public and parish schools and the Nichols Library. Pop. (1890) 2,216; (1900) 2,629.

Naphtali, năf'ta-lī (Hebrew, "wrestler"), the 7th son of Jacob by Bilhah, Rachel's maid, one of the 12 patriarchs and eponymous founder of one of the 12 tribes of Israel. The territory of Naphtali lay to the northwest of the Sea of Galilee; of this tribe was Barak, the hero and deliverer of Israel in the days when Deborah, the wife of Lapidoth, judged Israel. This frontier tribe was exposed to the incursions of the adjoining heathen, and is specially mentioned in the Song of Deborah as among those who "jeoparded their lives under the death" in the battle against Jabin the Canaanite king. Tiglathpileser when he overran the north of Palestine carried off the whole population to Assyria, after which Naphtali disappears from history. The district became famous under the name of Galilee as the home of Jesus Christ and most of his apostles. Capernaum, Tiberias, Magdala and Chorazin lay within the ancient boundaries of the tribe of Naphtali.

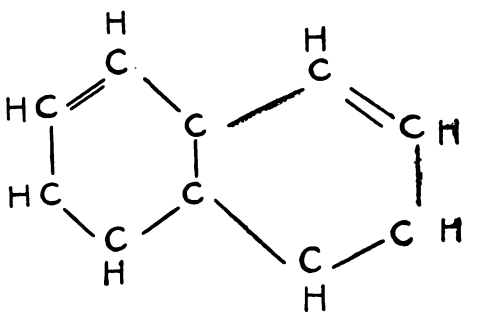
Naphtha, in chemistry, among the ancients, all inflammable liquids, especially the more fluid sorts of asphalt or bitumen; the word, which is of Persian origin and signifies "moist" being first used of Persian product and then applied more generally. In modern continental usage and among chemists the term is applied to any inflammable liquid product of organic decomposition. Thus mineral or native naphtha is only another name for kerosene or petroleum (q.v.). Commercially the word has still a third usage, for all the lighter products of petroleum distillation, namely the hydrocarbon spirits, as distinct from the safer and heavier hydrocarbon oils. Similar distillation products from coal-tar, peat, wood, india-rubber, bones, etc., are also called naphthas. These vary in density from 0.67 to 0.72, and in gravity from 90° to 60° Beaumé. American crude petroleum naphtha, which constitutes from 6 to 20 per cent of the crude petroleum, is refined into various grades, gasoline, benzine, and benzoline being the most important. Russian petroleum is only 5 or 6 per cent naphtha. Scotland produces a naphtha called shale-spirit, being 4 or 5 per cent of the crude shale oil, and rather heavier than most other naphthas, but not so heavy as the coal tar naphthas, which vary in specific gravity between .850 and .950. Caoutchine is another name for india-rubber naphtha. The uses of naphtha are various, the lighter grades being utilized as detergents in dyeing, clothes and glove cleaning; and the coal-tar naphthas are largely employed as solvents in making india-rubber goods. The Scotch shale-spirit is the most important component of a wood preservative. Naphtha in general, and gasoline in particular, are largely used for power producers in automobiles. Carburetting gas and the extraction of perfumes from flowers are two widely different uses of naphtha. The production of naphtha in the United States averages nearly 20,000,000 gallons annually. The figures for 1901 and 1902 are as follows:

NAPHTHA PRODUCTION IN THE UNITED STATES.

Year	Gallons	Value
1901	21,685,000	$1,742,000
1902	19,683,000	1,393,000

Naphtha-poisoning. See Petroleum-poisoning.

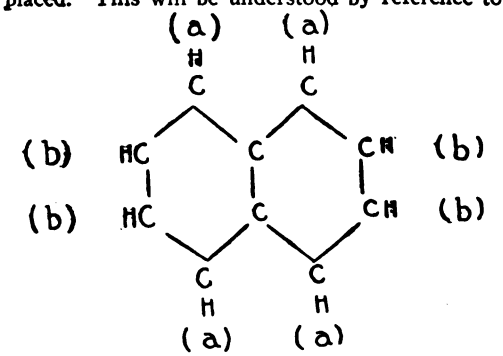
Naphthalene, or **Naphthalin,** a coal-tar product consisting of carbon and hydrogen, with the chemical composition $C_{10}H_8$, closely related to benzol. Its peculiar chemical composition may be represented by the graphic formula:



Naphthalene is prepared by the distillation of coal-tar at a temperature between 180° and 220° C. The residue crystallizes on cooling, is then compressed, warmed, after the addition of sulphuric acid, and either sublimated or distilled. Physically, naphthalene is a white solid, with brilliant, leafy crystals, melting at 80° C. to a colorless liquid, boiling at 218° C., combustible with a sooty flame and pitchy odor. It is insoluble in cold water, slightly soluble in water at a higher temperature, and easily soluble in the essences, in boiling alcohol, or in ether. Naphthalene forms various compounds, mostly by simple addition; the most important are the various sulphonic acids, such as $C_{10}H_7SO_3H + H_2O$, used in the manufacture of dyes. Mixed with camphor, to counteract its peculiar odor, naphthalene is used to keep moths and other insects from clothes. Consult Täuber and Norman, 'Die Derivate des Naphthalin welche für die Technik Interesse besitzen' (1896).

Naphthamein, năf-thăm'ẽ-ĭn, a coal-tar color, obtained by treating an aqueous solution of naphthylamine hydrochloride with ferric chloride, naphthamein then separating as an amorphous purple precipitate. Naphthamein is insoluble in water, alkalies, and dilute mineral acids, but it dissolves readily in acetic acid and in ether. When used as a dye, it gives colors ranging from a gray-violet to a gray-brown; but the dye is not fast, and fades upon exposure to light. Naphthamein is also known as "naphthalene violet," and its chemical formula has not yet been definitely determined.

Naph'thol, in chemistry, a substance derived from naphthalene in the same way that phenol is derived from benzene,—that is, by replacing one of the hydrogen atoms of the hydrocarbon by a molecule of hydroxyl, OH. The empirical formula for naphthalene being $C_{10}H_8$, the corresponding formula for naphthol therefore is $C_{10}H_7.OH$. In benzene the substitution can be made in only one way, because the molecule of that substance is chemically symmetrical, its hydrogen atoms being all similarly related to one another, and to the carbon atoms. In naphthalene, however, two essentially different kinds of substitution are possible, according to the position of the hydrogen atom that is replaced. This will be understood by reference to



the structural formula of naphthalene, as presented herewith. The hydrogen atoms in the positions marked "a" are more directly associated with the central pair of carbon atoms than are those in the positions marked "b"; and we must therefore admit that two chemically different naphthols are possible, according as the hydrogen that is replaced by hydroxyl is an "a" atom or a "b" atom. These two naphthols are in fact known, and to distinguish them from each other the prefixes "alpha" and "beta" are attached to the name. Thus "alpha-naphthol" is the compound obtained by replacing one of the "a" hydrogen atoms by OH, and "beta-naphthol" is the compound obtained by a similar replacement of a "b" atom. Both of the naphthols resemble ordinary phenol (or carbolic acid), and both are used as antiseptics, and also in the preparation of certain of the coal-tar colors. The naphthols exist in coal-tar, and may also be prepared by the action of sulphuric acid upon naphthalene, followed by treatment with sodium hydroxid; the actual details of the manufacture require considerable technical knowledge, however, and for them reference must be made to the advanced works on organic chemistry, and the chemistry of the coal-tar products. (See the references under COAL-TAR COLORS.) Alpha-naphthol crystallizes in short trimetric prisms, which melt at 201° F. and boil at 534° F. Beta-naphthol crystallizes in flat plates or tablets, melts at 253° F., and boils at 547° F. Both are slightly soluble in hot water, and both dissolve freely in alcohol, ether and benzene.

Naphthyl, a hydrocarbon radical $C_{10}H_7$, occurring in the compounds and derivatives of naphthalene. It is a merely hypothetical group as it appears only in compounds. If its existence be assumed, naphthalene ($C_{10}H_8$, or $C_{10}H_7.H$) is merely its hydrid; naphthol or naphthyl alcohol in the same way might be considered a hydrate of naphthyl, since its formula may be written $C_{10}H_7OH$. Dinaphthyl ($C_{20}H_{14}$) is a carbide formed by the action of heat upon napththalene; it is a solid and is fusible at 154° C.

Napier, nā'pĭ-ẽr, SIR **Charles,** British naval commander, cousin of Sir Charles James and Sir William Napier (q.v.): b. Merchiston Hall, Stirlingshire, 6 March 1786; d. Merchiston Hall, Hampshire, 6 Nov. 1860. At 13 he entered the navy as a volunteer, and in 1805 was promoted lieutenant. In 1807 he became commander, and from the gallantry displayed by him in 1809 in the pursuit of three French line-of-battle ships, was shortly after made post-captain. Debarred from active service by his promotion, he joined the British army in Portugal and took part in the battle of Busaco. In 1814 he was despatched to the United States, where he led an expedition against Baltimore. In 1829 he received the command of the Galatea, in which he was employed on the coast of Portugal and the Azores. Becoming acquainted with the Duke of Terceira and other constitutionalists, he accepted the command of their fleet, and by his defeat of the Miguelites in a naval engagement effected the relief of Oporto and the establishment of Donna Maria on the throne. For his services the Portuguese government created him Viscount da Capo San Vincent, and nominated him admiral-in-chief. He soon returned to England, and in 1839 was ordered to the Mediterranean, where, on the outbreak of the war between Mehemet Ali and the Porte, and the co-operation of Britain with Russia and Austria on behalf of the latter power, he performed some of his most gallant exploits, including the storming of Sidon and the capture of Acre. Having blockaded Alexandria, he concluded on his own responsibility a convention with Mehemet Ali, by which the latter and his family were guaranteed in the hereditary sovereignty of Egypt on resigning all claim to Syria. In 1841 he was elected member for Marylebone, and proved himself a warm advocate of liberal measures and naval reform. In 1847, while in command of the Channel fleet, he compelled the emperor of Morocco to grant compensation for the injuries inflicted by him on British commerce. On the commencement of the Russian war he was nominated to the command of the Baltic fleet, but in this capacity had few opportunities for striking a decisive blow, which at the time somewhat disappointed his country. Sir Charles Napier was an author as well as a commander and published 'The War in Portugal' (1836); 'The War in Syria' (1842); 'The Navy, its Past and Present State' (1851). Consult: Elers Napier, 'Life and Correspondence of Admiral Sir Charles Napier' (1862).

Napier, SIR **Charles James,** English soldier and administrator: b. London 10 Aug. 1782; d. Oaklands, near Portsmouth, Hampshire, 29 Aug. 1853. He entered the army as ensign in his 12th year and within four months was gazetted lieutenant. Having become captain in 1803, he accompanied his regiment to the Peninsula, and distinguished himself at Coruña, where he had the rank of major, and where, after receiving five wounds, he was taken prisoner. In 1810, when again at liberty, he returned to the Peninsula, and fought at Busaco. After obtaining the rank of colonel, and taking part in most of the leading events of the Peninsular campaigns, he re-

turned to England on the conclusion of the peace. He was in the United States during the War of 1812, and after his return took part in the storming of Cambrai in 1815. From 1822 to 1830 he was governor of the island of Cephalonia, where he pleased the inhabitants better than the authorities at home. In 1841 he sailed for the east to assume the chief command within the presidency of Bombay. He was shortly afterward called to Scinde, in consequence of the determination of Lord Ellenborough, then governor-general, to punish the Ameers for alleged misconduct during the Afghan war. This policy was ably carried out by Napier, first by the splendid victories of Meanee (17 Feb. 1843) and Hyderabad (24 March), and afterward by the administration of Scinde as a conquered province, of which Lord Ellenborough made him governor. He retired in 1841, but during the Sikh war of 1848–9 he sailed once more for the East as commander-in-chief of all the forces in India. Having taken a step which subjected him to an unceremonious rebuke from the Marquis of Dalhousie, the governor-general, he threw up his appointment and returned to England the next year. Consult: Bruce, 'Life of General Sir Charles Napier' (1885); Butler, 'Sir Charles Napier' (1890).

Napier, Henry Edward, English naval officer and author: b. 5 March 1789; d. 13 Oct. 1853. He was the youngest brother of Sir Charles James Napier (q.v.). He entered the British navy in 1806, served in the East Indies in 1808–11, became lieutenant in 1810, commanded the Goree and later the Rifleman in the Bay of Fundy, was placed on half-pay in 1815, and in 1830 was made captain on half-pay. In 1820 he was elected a fellow of the Royal Society. He published a valuable six-volume 'Florentine History' (1846–7), from the earliest authentic records to the time of Ferdinand III.

Napier, John, Scottish mathematician: b. Merchiston, near Edinburgh, 1550; d. there 4 April 1617. He was educated at St. Andrews, traveled on the Continent, returned to a life of proprietorship and leisurely study, and published in 1593 his 'Plaine Discovery of the Whole Revelation of Saint Iohn,' in the dedicatory letter of which he proceeded to give James VI. some advice. For a time he busied himself with devising instruments of war, such as burning-glasses for firing hostile vessels; a piece of artillery for destroying everything round the arc of a circle; and a round metal chariot, from which shot might be fired through small openings while the enemy became "abased and altogether uncertain." Sir Thomas Urquhart ('The Jewel' 1652) says that the artillery was tried on a Scottish plain with the slaughter of many sheep and cattle. His great work 'Mirifici Logarithmorum Canonis Descriptio' appeared in 1614. This explained the nature of logarithms (q.v.), then styled "artificial numbers," and supplied the table for their application. It astonished Europe, and deeply interested Kepler, who helped to extend the use of logarithms. With Henry Briggs Napier devised the new canon in which 0 represented the logarithm of unity and 10,000,000,000 that of the entire sine. His 'Mirifici Logarithmorum Canonis Constructio' (1619) explained the method of constructing the table; and the 'Rabdologiæ' (1617) was a description of enumeration by bone or ivory rods, which, known as "Napier's rods," were widely employed in Europe for assistance in multiplication, division, and the extraction of the square and cube root. Consult Mark Napier, 'Memoirs' (1834).

Napier, Robert Cornelis, Lord Napier of Magdala, English soldier: b. Ceylon 6 Dec. 1810; d. London 14 Jan. 1890. Educated at the Military College, Addiscombe, he entered the Bengal Engineers, and during the second Sikh war (1848) was present as chief engineer at the siege of Multan, and after its fall took part in the battle of Gujarat. When the Mutiny broke out in 1857 he was appointed chief of the staff to Sir James Outram, and in the second relief of Lucknow it was he who constructed the engineering works which enabled Sir Colin Campbell to capture the city. In the Chinese campaign of 1860 he was second in command, and in 1865 became commander-in-chief of the Bombay army. He commanded in 1868 the expeditionary force against King Theodore of Abyssinia, defeated the king's forces, released the English prisoners, and stormed the mountain fortress of Magdala (April 1868). For his services in this short but brilliant campaign he was rewarded with a peerage and a pension. Subsequently he was appointed commander-in-chief in India (1870), governor of Gibraltar (1876), and constable of the Tower (1887). At his death he was buried in St. Paul's with military honors. Consult Markham, 'History of the Abyssinian Expedition' (1869).

Napier, Sir William Francis Patrick, British soldier and author, brother of Sir Charles James Napier (q.v.): b. Castletown, Kildare, England, 17 Dec. 1785; d. Scinde House, Clapham, Surrey, 12 Feb. 1860. At 14 he entered the army, with his brothers Charles and George took a distinguished part in the Peninsular campaigns, receiving seven decorations for the share borne by him in as many principal actions, including Busaco, Salamanca, the Nivelle, and Orthez. Some years later he began his celebrated 'History of the War in the Peninsula and in the South of France from 1807 to 1814' (1828). It furnishes the best and most interesting record existing of the momentous transactions which it chronicles, though from its opposition to the prevailing politics of the day its merits were at first insufficiently appreciated. In 1841 he was advanced to the rank of major-general, was appointed lieutenant-governor of Guernsey the following year, and in 1848 created a K.C.B. Criticisms on his brother's proceedings in India called him forth as a champion on his behalf, and he produced successively the 'Conquest of Scinde' (1845); 'History of Sir Charles Napier's Administration of Scinde' (1851); and 'Life and Opinions of the Late Sir Charles Napier' (1857). He also wrote 'English Battles and Sieges in the Peninsula.' Consult 'Life' by Lord Aberdare (1864).

Napier of Magdala. See Napier, Robert Cornelis.

Napier's Rods, in mathematics a set of rods contrived by John Napier in 1617 for the purpose of facilitating the numerical operations of multiplication and division. They consist of pieces of bone, or ivory, in the shape of a parallelopipedon, about three inches long and three

tenths of an inch in width, the faces of each being divided into squares, which are again subdivided on 10 of the rods by diagonals into triangles, except the squares at the upper ends of the rods. See CALCULATING MACHINES.

Naples, nā'plz, Italy, the capital of the province of Naples, and previously of the former kingdom of the Two Sicilies (q.v.), the largest city and second seaport of the kingdom, situated on the celebrated Bay of Naples, 160 miles by rail southeast of Rome. Its site is of singular beauty, occupying an area about five miles long and three miles broad, on the north side of the nearly semicircular bay, partly along the shore and partly climbing the adjacent slopes. It is bounded on the one side by the picturesque heights of Posilipo, and on the other by the lofty, volcanic mass of Vesuvius (q.v.). The environs are densely peopled, among neighboring towns and villages being Portici, Resina, Castellamare, Casoria, Pozzuoli, etc., and the classic sites of Herculaneum and Pompeii (qq.v.) all connected by rail. The bay, 20 miles wide, and extending inward 10 miles, with a coast line of about 35 miles, has Cape Miseno as its northwest extremity, off which lie the islets of Procida and Ischia; Campanella Point forms the southeast extremity, with the beautiful isle of Capri lying beyond. The city is divided into two unequal parts by a steep ridge projecting from the height on which stands the castle of St. Elmo, and terminated by a rocky islet surmounted by the Castello dell' Ovo. The largest and most ancient part of Naples lies to the east of these heights. This now forms the business quarter and is intersected from north to south by the main street, the Via di Roma. The western and more modern part of the city, the fashionable quarter, has a superior situation, and commands magnificent views; the chief street in this quarter is the Corso Vittorio Emanuele, nearly three miles long. The streets are mostly well paved with lava or volcanic basalt, and the houses are large, lofty, and solidly built, and have flat roofs. Since the cholera epidemic of 1884 a plan of municipal improvement on an extensive scale has been carried out, including a new water supply, a modern sewerage system, the destruction of the narrow streets, alleys, and lanes, the former abodes of filth, misery, vice, and crime, and the building of new quarters, with wide thoroughfares and modern houses. There are few remains of ancient times, but there are five castles, dell' Ovo, Nuovo, del Carmine, Capuano, St. Elmo, the gates Porta del Carmine and Capuano, all of mediæval construction, and Virgil's tomb.

Among the chief public edifices is the cathedral, dating from 1272, a large Gothic building erected on the site of two temples dedicated to Neptune and Apollo. It is held in high veneration in consequence of possessing the relics of St. Januarius or Gennaro, including the phial of his blood which liquefies miraculously on certain occasions. Other edifices are the church De' Santi Apostoli, said to have been originally founded by Constantine the Great on the site of a temple of Mercury; the church of St. Paul, built in 1817–31 in imitation of the Pantheon at Rome; the Palazzo Reale (Royal Palace), a building of great size in the lower part of the town; the palace of Capo di Monte, situated on a height in the outskirts; the old palace, where the courts of justice now hold their sittings; the Palazzo dei Pubblici Studj, formerly occupied by the university, but now converted into the Museo Nazionale, a museum containing not only a valuable library of 275,000 volumes and many rare MSS., but also the older and more recent collections belonging to the crown, the Farnese collection of paintings and sculpture from Rome and Parma, and an unequaled collection of gems, bronzes, vases, etc., chiefly obtained from the excavations of Pompeii and Herculaneum. Naples has a university, dating from 1224, and attended by over 3,000 students; many other educational institutions, including the celebrated zoological station with marine aquarium and laboratory, and numerous hospitals and charitable foundations. The manufactures, which are numerous but individually unimportant, include macaroni, woolens and cottons, silks known as *gros de Naples,* glass, china, musical instruments, flowers and ornaments, perfumery, soap, chemicals, machinery, etc. The harbor accommodation has recently been extended, and the trade is important. The exports consist chiefly of bones, cream of tartar, hoops, linseed, hemp, wheat, figs, gloves, licorice, madder, coral, macaroni, oil, wine, wool, tallow, rags, and silk, raw, dyed, and manufactured. Naples is one of the most densely populated cities of Europe, and one of the features of the city is its unique population, which swarms incessantly in the thoroughfares, where throngs of sellers, buyers, and idlers intermingle with asses, mules, hand carts, and vehicles, dazzling the eye with their brilliant variety of costume, and the expressiveness of their frantic gestures and attitudes, while the ear is stunned by the shrill cries of the itinerant dealers, the songs of the improvisatore, and the high-pitched patois of the seething crowds. The Marinella, an open beach fronting the east part of the city, was formerly the abode of the lazzaroni, a class which has now lost its distinctive features, the term being now generally applied to the fishermen.

Naples was founded by a Greek colony from the town of Cumæ many centuries before Christ. It took the name of Neapolis ("New City") to distinguish it from a still older Greek city adjoining called Parthenope. It passed to the Romans in 290 B.C. In 536 A.D. it was taken by Belisarius, and was pillaged by Totila in 542. In 1130 the Norman Robert Guiscard united the south of Italy and the adjacent island of Sicily into one political unity, Naples being recognized as the metropolis. It was afterward successively under the sway of the emperors of Germany, and the kings of France and Spain. Under the latter it became the capital of an independent kingdom, but having been brought within the vortex of the French Revolution, was handed over by Napoleon, first to his brother Joseph, and then to his brother-in-law Murat. The Congress of Vienna having restored the legitimate sovereignty, Naples received back its former masters. After a long period of misrule they were ejected by Garibaldi in 1860, and Naples was then incorporated into the kingdom of Italy. Pop. (1901) 563,751.

Naples Yellow, or Neapolitan Yellow, a permanent orange-yellow pigment much used in oil painting and in glass and porcelain painting. It is prepared by fusing at a moderate heat, for

two hours, a mixture of chemically pure antimonis-tartrate of potash, lead nitrate and sodium-chloride. When cooled the common salt dissolves, leaving a fine yellow powder.

Napo, nā'pō, Ecuador, an affluent of the Amazon, which rises on the north side of Cotopaxi, and after a southeasterly course of about 800 miles, forming for a considerable distance the boundary between Colombia and Ecuador, joins the Amazon just beyond the eastern boundary, at Corocha, Peru. It is navigable nearly 500 miles for steamers; it flows through a region rich in mineral and vegetable wealth, but comparatively destitute of inhabitants.

Napoleon I., emperor of the French: b. Ajaccio, Corsica, 15 Aug. 1769; d. Longwood, Saint Helena, 5 May 1821. He was descended from the Italian family of Bonaparte (q.v.), of which the Corsican branch through him became the historic representative. Napoleon Bonaparte was the son of Charles Bonaparte, an advocate of some repute, and of Letitia Ramolino, whose family were Florentines. Of 13 children born to them, he was the fourth, and was the second son. At 10 he was sent to the military school of Brienne, where he remained till 1784. His school companions regarded him as taciturn and morose; but as he was a Corsican, speaking very little French, and poor as well as proud, his conduct is doubtless to be ascribed as much to his circumstances as to his temperament. Toward those who, like Bourrienne, showed him sympathy, he was susceptible of strong and lasting attachments. From the annual report of the school it appears that he "distinguished himself in mathematics, was tolerably versed in history and geography, weak in Latin, general literature, and other accomplishments; of regular habits, well behaved and studious, and enjoying excellent health." His favorite author was Plutarch. In October 1784 he repaired to the military school at Paris to complete his studies for the army; and in September 1785 received his commission as second lieutenant in the artillery regiment of La Fère. Soon afterward he was promoted to be first lieutenant in the regiment of Grenoble, then stationed at Valence. While here he devoted some attention to literature, gaining a prize offered by the Lyons Academy. He had the intention of describing an excursion he made to Mont Cenis in the style of Sterne's 'Sentimental Journey,' then much in favor on the Continent; but a much more suitable task was a 'History of Corsica,' which he began and communicated to Paoli, then living in exile in London.

Meantime the Revolution was rapidly developing. Many of Napoleon's fellow officers at Valence openly took part with the royalists, but he chose the popular side, though in a quiet and undemonstrative way, as he had little liking for the turbulence of mobs. On 6 Feb. 1792 he became captain of artillery by seniority and, being in Paris the same year, he witnessed the insurrections of 20 June and 10 August. He was accompanied by his friend and biographer Bourrienne (q.v.), who relates that on one of these occasions, when Napoleon saw the mob break into the Tuileries and force the king to don the red cap, he exclaimed, "It is all over with that poor man! A few discharges of grape would have sent all those despicable wretches fleeing!" Soon after he left for Corsica, where Paoli then held the chief command. The excesses of the Septembrists and Terrorists, however, induced Paoli to break with the Convention and seek the assistance of England. This brought him into conflict with Napoleon, who adhered to the Convention, which so exasperated the Corsicans against him that after a few skirmishes he was driven from the island along with his whole family. He made a short stay at Marseilles, where he published a small pamphlet, 'Le Souper de Beaucaire,' Republican in sentiment, but not Jacobinical, as has been asserted. He then set out for Paris, where he spent a part of the summer of 1793; and in September of that year was sent, with the commission of lieutenant-colonel of artillery, to assist in the reduction of Toulon, then in the hands of the English. The place was captured 19 December entirely through his strategic genius; and in the following February he was made a brigadier-general of artillery. Later in the year he was sent to Genoa to examine the state of the defenses of that city and to ascertain the political disposition of its inhabitants.

In the beginning of 1795 he was again in Paris in search of employment, but in spite of his known abilities was not at first successful. In his letters to his brother Joseph, written about this time, he complains of poverty and ennui, and seems to have thought of offering his services to the Sultan of Turkey. On the 13th Vendémiaire IV. (5 Oct. 1795), when the sections of Paris had risen against the Convention, Napoleon, named by Barras (q.v.), was commander of the 5,000 troops provided for its defense. Although he had had but a night in which to make arrangements for the dispersion of the populace, when the National Guards, as the defenders of the sections were called, advanced to the number of 30,000 along the quays of the Seine, the Rue St. Honoré, and the other approaches to the Tuileries, they found every point securely guarded. To their feeble musketry fire Napoleon replied by murderous discharges of grape. In less than an hour of actual fighting victory was secured for the Convention, which recognized the value of the young victor's services by appointing him to the command of the Army of the Interior.

About this time he made the acquaintance of Josephine Beauharnais, to whom he proposed marriage and was accepted. The ceremony took place 9 March 1796, and less than a week afterward he had to depart to assume the command of the army of Italy, which for three or four years had been carrying on a desultory warfare against the Sardinians and the Austrians amid the defiles of the Alps and the Ligurian Apennines. His army consisted of only 40,000 men, and even those were badly fed and clothed, while the allies could oppose him with a much larger force. In the end of March he set out from Nice and came up with the allies at Montenotte, and inflicted on them a disastrous defeat (11 April). This victory separated the Sardinian from the Austrian army, and Napoleon, determined to crush them in detail, pursued the former and beat them at Millesimo (13th and 14th), and then fell on the latter at Dego (14th and 15th).

This opened up for him both the route to Turin and to Milan. Napoleon lost no time; the Sardinians, who were retiring upon Turin,

NAPOLEON BONAPARTE.

AFTER A PAINTING BY PAUL DELAROCHE.

were overtaken and beaten at Mondovi (22d), and compelled to sue for peace; and the Austrians, who were falling back on Milan, were signally defeated at the battle of Lodi (10 May). On the 15th he entered Milan, where heavy contributions were levied on the state, and the principal works of art were seized and sent to Paris. Naples, Modena, and Parma hastened to conclude a peace; the Pope was compelled to sign an armistice; and the whole of northern Italy was in the hands of the French. Mantua was the next object of attack. Wurmser, at the head of large Austrian reinforcements, advanced through the Tyrol to its defense; he was defeated at Castiglione 5 August and again at Bassano 8 September, which compelled him to take refuge behind the walls of Mantua. Not yet disheartened, Austria sent a third army in two divisions under Marshal Alvinczy and General Davidovich. This for a while held the French in check, but on 15 November a battle was begun at Arcole, which, after three days of hard fighting, gave the victory again to the French, and decided the result of the campaign. In January 1797, Alvinczy opened a fresh campaign by advancing at the head of 50,000 troops from Roveredo to the relief of Mantua, but was completely routed by Napoleon on the 14th at Rivoli; and on 2 February Wurmser was compelled by famine to surrender at Mantua. On the same day Napoleon put an end to the armistice with the Pope, and invaded the States of the Church, beat the papal troops on the Senio, and took in quick succession the towns of Faenza, Ancona, Loretto, and Tolentino. On the 19th the Pope was compelled to conclude a peace by which he surrendered Avignon, Bologna, Ferrara, and the Romagna to France. Napoleon next entered the Tyrol, driving before him the Archduke Charles, who had undertaken another invasion of Italy. An armistice was agreed upon, 7 April, and Austria gave territory and indemnity to France, receiving Venetia in return. This closed the great Italian campaigns, in which Napoleon, by ingenuity of plan, celerity of movement, and audacity in assault, far outgeneraled all his antagonists.

In December 1797 Napoleon returned to Paris; the enthusiasm of the Parisians was immense, and the festivals in his honor innumerable. About this time the Directory seems to have had the intention of invading England, and had brought an army together for that purpose. The command was conferred on Napoleon, who at first professed to favor the design, but who well knew its impracticability. It has been thought by many that this proposal was merely a feint to cover the real design of the Directory, namely, the invasion of Egypt, as a preliminary step to the conquest of British India. By 10 May 1798 an army of 36,000 men was collected and embarked at Toulon in a fleet commanded by Brueis (q.v.). A body of scientific and artistic explorers accompanied it. On 9 June the French landed at Malta, and the next day took possession of the island, in which they left a garrison. Ten days after the fleet resumed its voyage, reaching Alexandria on 1 July, and that city being taken, Napoleon and the army advanced on Cairo. Here they encountered a large body of Mamelukes, which, after a long and bloody struggle, known as the battle of the Pyramids, they repulsed. Many of the surrounding tribes thereupon submitted to the French, who thus for a while held a seeming possession of the whole of Egypt. Thinking himself secure in his conquest Napoleon immediately set about reorganizing the civil and military government of the country; but fortune was preparing for him a terrible reverse. The English admiral Nelson, who had long been in pursuit of his fleet, found it moored in the bay of Abukir, and, with the exception of four vessels which contrived to escape, utterly destroyed it.

All means of return to Europe for the French were thus cut off, and to add to their misfortunes the sultan declared war against them, and a short time after serious disturbances broke out in Cairo, which were only suppressed by horrible massacres. Napoleon resolved to meet the Turkish forces assembling in Syria. In February 1799 he crossed the desert with about 13,000 men; took El-Arish and Gaza, and stormed Jaffa, where a great number of Turkish prisoners were deliberately massacred. On the 17th he reached Acre, which was defended by a Turkish garrison under Djezzar Pasha, assisted by Sir Sydney Smith and a small body of English sailors and marines. After 60 days he gave up the siege and returned to Egypt, leaving the whole country on fire behind him. He reentered Cairo 14 June, having lost 4,000 men in the Syrian expedition. About the middle of July the sultan landed a force of 18,000 at Abukir, which Napoleon attacked and almost annihilated on the 25th. His position was far from agreeable, however; he had signally failed in the great objects of his expedition, and besides news had reached him of disaster to the French arms in Italy and of confusion in Paris. On 22 August he embarked in a frigate and 9 October landed at Fréjus, having narrowly escaped capture several times by the British Mediterranean cruisers. He arrived in Paris in time to take advantage of the political intrigues then rife. The credit of the government was wholly gone, and its authority over its generals impaired. A revolution in the government 18 June had not made new directors more competent than their predecessors. Another change became necessary. Napoleon secured the co-operation of Moreau and the other generals then in the capital, and abolished the Directory on the 18th and 19th Brumaire (9–10 November). A new constitution was then drawn up, chiefly by the Abbé Siéyès, under which Napoleon was made first consul. As, however, he had the power of appointing to all public offices, of proposing all public measures in peace and in war, and the entire command of all administrative affairs, both civil and military, he was virtually ruler of France.

From this time Napoleon's policy developed itself more distinctly; its objects were to establish order at home and to humiliate the enemies of the nation; but personal aggrandizement was an end scarcely less conspicuous. With sagacity, activity, and boldness he undertook to reform civil affairs. He recruited the national treasury by various expedients, repealed the more violent laws passed during the Revolution, such as punishment for matters of opinion, reopened the churches and suppressed the Vendean insurrection by a series of decided but conciliatory measures. But he was well aware that his genius was essentially military, and that his most

striking triumphs were those won on the battle-field. He offered Austria, England, and Turkey, in theatrical phrases, terms of peace, which were rejected. He resolved to strike a blow first at Austria by a renewal of the glories of his former Italian campaign. An army of 36,000 men was concentrated with unparalleled rapidity and secrecy on the shores of the Lake of Geneva. On 13 May 1800 he began his daring march across the Great Saint Bernard, and almost before the Austrian General Melas was aware, had entered Milan (2 June). After several unimportant skirmishes he encountered the Austrians at Marengo (14 June), where he achieved another brilliant victory, which put all the Piedmontese fortresses, for the second time, in possession of the French.

Having established provisional government at Milan, Turin, and Genoa, he returned to Paris 3 July. As his general, Moreau, had defeated the Archduke John in the decisive battle of Hohenlinden (3 December), Austria was reduced to sue for peace, and on 9 Feb. 1801 signed the treaty of Lunéville, which was mainly based on that of Campo Formio. Treaties were subsequently concluded with Spain, Naples, the Pope, Bavaria, Portugal, Russia, Turkey, and finally, 27 March 1802, the Peace of Amiens. Thus it seemed as if a universal cessation of hostilities were about to mark the history of Europe, and allow Napoleon the opportunity to crush the insurrection of the blacks in San Domingo. An army was sent out under Leclerc, some 20,000 of which were swept away by disease or the sword; the blacks were provoked by brutal cruelties to still more fearful massacres, in which about 60,000 whites perished. Toussaint l'Ouverture, an able and courageous negro who had made himself the leader of his unfortunate countrymen, was seized during a truce and carried to France, where he died in prison.

But the great occupation of Napoleon was the improvement of the interior affairs of the nation. A general amnesty allowed all the *émigrés* to return home; the Legion of Honor, a new order of knighthood, was established. Considerable attention was paid to such departments of education as tended to promote efficiency in the public service. Mathematics and physical science were encouraged at the expense of philosophy, ethics, and social and political science. All prefects of departments and all mayors of cities were appointed by Napoleon, so that not a vestige of provincial or municipal freedom remained. On 2 Aug. 1802, Napoleon was proclaimed by a decree of the senate consul for life, a step confirmed by a plebiscite of 3,000,000 votes. A *senatus consultum* issued some days after, reconstructing the electoral bodies and reducing the tribunate to 50 members, showed, however, that Napoleon was not yet satisfied with the authority he was clothed with, and many persons saw in the movement a step toward still more absolute power. It is to this period that the greatest of his services to France belongs. He assembled the first lawyers in the nation, under the presidency of Cambacérès, to draw up a code of civil laws. (See CODE, *Code Napoléon.*)

Meanwhile the state of Europe was beginning to look serious. Disturbances in Switzerland in the early part of 1802 induced Napoleon to resort to an armed mediation in its affairs; in August of the same year Elba was incorporated with France, Piedmont 11 September, and Parma in October. England regarded these proceedings as an infringement of the treaty of Amiens, and as remonstrances were ineffectual, there was in a short time a resumption of hostilities. On 18 May 1803, England declared war against France, having laid an embargo on all French ships in British ports. France retaliated by a decree that all Englishmen found on her territory should be detained as prisoners of war; and General Mortier was sent to occupy Hanover, as belonging to Great Britain. While these events were taking place a conspiracy for the overthrow of the first consul and the re-establishment of the Bourbons was discovered and thwarted. Napoleon pretended to see an accomplice of the conspirators in the Duc d'Enghien, and caused him to be arrested in neutral territory, brought to Vincennes and, after a mock trial, shot. Napoleon now seems to have thought it necessary that he should assume the imperial dignity. An appeal was made to the nation, and upward of 3,000,000 votes were given in favor of conferring on him the title and prerogatives of emperor, while less than 3,000 were against it. On 18 May 1804 Napoleon assumed the imperial title; and in order that due solemnity should not be wanting, he requested Pius VII. to perform the ceremony of his coronation. The Pope assented and went to Paris 2 December. He was only allowed to perform part of the ceremony, however, as Napoleon snatched the crown from the pontiff's hands and placed it on his own head, performing a like office for his consort Josephine. On 26 May 1805 he was also crowned king of Italy in the Cathedral of Milan; and Eugène Beauharnais, his stepson, was appointed viceroy. He created a nobility with sounding titles; surrounded himself by a brilliant court; established all the etiquette of royalty; and introduced many practices marked by ostentation and parade.

Meanwhile the Northern powers listened to the solicitations of England, and united in a coalition against the new emperor. Russia, Austria, and Sweden all joined in the charges of aggrandizement laid against Napoleon by the English government; but Prussia, tempted by him with the promise of Hanover, could not be brought to enter the coalition. The emperor abandoned his design of making a descent on England, broke up the camp at Boulogne, and concentrating his widely scattered forces at Mainz, September 1805, he marched at once across Bavaria at the head of 180,000 men, and compelled the Austrian general Mack to capitulate at Ulm, with 23,000 men (20 October). On 13 November he had reached Schönbrunn, near Vienna, where he received news of the victory of Nelson at Trafalgar, over the united fleets of France and Spain. Entering the Austrian capital, he made rapid preparations to meet the combined armies of Russia and Austria, then concentrating on the plains of Olmütz. On 2 December the three armies, each commanded by an emperor, met at Austerlitz. The struggle was desperate and long but at last victory was won by Napoleon. The rout of the allies was complete. The Austrian emperor instantly sued for peace, giving up to France all his Italian and Adriatic territories. The Russian emperor retired behind his own frontiers, and Hanover was handed over

to Prussia. As the king of Naples had received English and Russian troops into his dominions, Napoleon construed this act into one of direct hostility. In February 1806 a French army occupied the continental part of the Neapolitan States, of which Joseph Bonaparte was declared king on the deposition of their former sovereign. The Batavian republic was transformed into a kingdom dependent on France and given to another brother of the emperor, Louis, who took the title of King of Holland. Various districts in Germany and Italy were erected by the conqueror into dukedoms and bestowed on his most successful generals.

But the most important change of all was the formation of the Confederation of the Rhine on 12 July, and the dissolution of the old German empire. On the death of the English minister, Pitt, and the accession of Fox, negotiations were entered into for the cessation of hostilities between France and England, and as propositions were entertained toward the restoration of Hanover, the eyes of the Prussians were at once opened, and war, however hazardous, was determined on and was declared on 8 October, the emperor being already at Bamberg directing the movements of his troops, who had remained in Germany. On the 14th Napoleon met the enemy at Jena, and inflicted on them a severe defeat; while his general, Davout, added on the same day to the French triumph by the brilliant victory of Auerstädt. On the 27th Napoleon entered the Prussian capital. After garrisoning all the important fortresses and reducing such towns as made a show of resistance, he issued the celebrated Berlin decree (see CONTINENTAL SYSTEM), directed against English commerce. This policy nearly ruined the commerce of France and the other European nations, while it increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be obtained from the colonies save through her, and the continental merchants engaged in an extensive smuggling trade with the British, which it was impossible to prevent.

After the capture of Berlin Napoleon marched north against the Russians, who were advancing to assist the Prussians. He called on the Poles to rise, but was answered with little enthusiasm. At Pultusk 28 Dec. 1806, and at Eylau 8 Feb. 1807 he met with severe checks, and retired on the line of the Vistula; in the course of a few months, however, having received heavy reinforcements, he once more took the offensive. On 14 June was fought the battle of Friedland, which was so disastrous to the Russian arms that Alexander was compelled to sue for an armistice. The Peace of Tilsit was concluded 7–9 July, and by it the king of Prussia received back half of his dominions, and Russia undertook to close her ports against British vessels. The duchy of Warsaw was erected into a kingdom and given to the king of Saxony; out of the Prussian territories west of the Elbe the kingdom of Westphalia was formed and bestowed on Jerome, Napoleon's youngest brother; and Russia obtained a part of Prussian Poland, and by secret articles was allowed to take Finland from Sweden. Soon after the Peace of Tilsit was signed Napoleon entered into a war against Portugal, as that nation had refused to respect the Berlin decree, and Junot was sent to occupy Lisbon (30 Nov. 1807). The Pope refusing to carry out the continental blockade and to recognize Joseph Bonaparte as king of Naples, Rome was occupied 2 Feb. 1808. The administrative affairs of Spain having fallen into inextricable confusion, Napoleon sent into that kingdom an army under Murat, who with difficulty took possession of the capital and by the treaty of Bayonne Charles IV. resigned the Spanish crown, which was given to Joseph Bonaparte, Murat receiving the vacant sovereignty of Naples.

The great body of the Spanish people rose against this summary disposal of the national crown, and England assisted them with immense supplies. Thus began the Peninsular war (q.v.), which lasted seven years. The Spaniards were at first successful; a French squadron was captured by the English at Cadiz, 14 June; Gen. Dupont surrendered at Baylen, 22 July, with 18,000 men; Junot was defeated 21 August by Sir Arthur Wellesley at Vimeira. But Napoleon rushed to the scene of action in October at the head of 180,000 men, and entered Madrid in spite of all resistance by the Spaniards, 2 December. The British troops which had advanced to the aid of the Spaniards were driven back on Coruña, where they made a successful stand, but lost their general, Sir John Moore, 16 Jan. 1809. In the meantime Austria, alarmed at the aggressive policy of Napoleon, who had seized Tuscany and the States of the Church, and determined to profit by his absence in Spain, again declared war, and got together an effective army under the Archduke Charles. Napoleon hurried into Bavaria, encountered the archduke at Eckmühl (22 April), and completely defeated him; on 13 May he again entered Vienna. Reorganizing his shattered army, Charles likewise advanced toward Vienna on the opposite bank of the Danube. The French seized the island of Lobau, threw a bridge across the river, and attacked the enemy at Aspern and Essling on the 21st and 22d, but were repulsed and thrown back on the island, which they proceeded to fortify, awaiting the arrival of Eugène with the army of Italy. On 5 July they debouched on the left bank of the Danube, and on the 6th the Austrians were crushed at Wagram. This enabled Napoleon to dictate his own terms of peace, which were agreed to on 14 October at Schönbrunn. On the preceding day an unsuccessful attempt was made to assassinate him by a young German enthusiast named Staaps. Whether the subsequent marriage with the daughter of the Austrian emperor was in course of negotiation at Schönbrunn is doubtful, but soon after his return to Paris Napoleon informed Josephine of his determination to divorce her. He seems to have arrived at the conclusion that he could only put an end to the machinations of the old legitimate dynasties by intermarriage. Josephine, too, had borne him no children, and he was ambitious of perpetuating his power in his family. On 16 December an act of divorce was passed by the commissioners of the senate, and by proxy 11 March (formally 2 April) 1810 he was married to the Archduchess Maria Louisa. The fruit of this union was a son, Napoleon François Charles Joseph, born 23 March 1811, and proclaimed in his cradle king of Rome. (See REICHSTADT, DUKE OF.)

The years 1810–11 were the period of Napoleon's greatest power. On the north he had annexed Holland, Friesland, Oldenburg, Bremen,

and all the coast-line as far as Hamburg, and on the south Rome and the southern papal provinces. His empire thus extended from the frontiers of Denmark to those of Naples, with Paris, Rome, and Amsterdam as its first, second, and third capitals, and it was divided into 130 provinces, having a total population of 42,000,000. He may also be said to have exercised almost unlimited control in Spain, the Italian kingdoms, Switzerland, and the Confederation of the Rhine (q.v.). But now the tide began to turn. Russia found it impossible to carry out the continental blockade without permanent injury to her great landowners; Sweden, which had accepted Bernadotte, one of Napoleon's generals, as king, was in a like predicament. The Berlin decree was frequently evaded, which involved Russia particularly in fresh complications, and in view of the war now inevitable, that nation formed an alliance with Sweden. In May 1812 Napoleon declared war against Russia, and determined, in spite of the dissuasion of his most prudent generals, to invade the country. On 16 May Napoleon was in Dresden making arrangements for the great Russian campaign. The army he organized for it has been estimated at from 640,000 to 680,000 men, inclusive of Prussian, Austrian, German, Polish, and Swiss auxiliaries. An army of 300,000 Russians, under Barclay de Tolly and Bagration, assembled on the banks of the Niemen to oppose him. On 24 June he crossed that river at Kovno, and the Russians retired step by step before him, deliberately wasting the country, carrying off all supplies, and avoiding as far as possible general engagements. The French, however, pushed rapidly forward, overtook and routed the rear guard of Barclay's army at Ostrovno, 25 July, and on the 28th occupied Vitebsk. On 16 August the Russians made a stand at Smolensk against an advanced division of the French army, and when the latter entered the city on the 18th it was in ruins.

Both the opposing armies now took up their march toward Moscow. Kutusoff, who had succeeded Barclay, resolved to dispute the passage of the Borodino. An obstinate battle ensued 7 September, which cost the French nearly 30,000 men, and their opponents about double that number. On the 15th Napoleon entered Moscow, which had been deserted by its inhabitants, and which was nearly destroyed by a fire that began on the same night and lasted five days. The baffled French were compelled to seek shelter in the desolate surrounding country. Napoleon vainly attempted to negotiate with Alexander; it was impossible to pursue the Russians farther; nothing remained but retreat. The French army was now reduced below 120,000 men. For some time the weather was favorable, but the winter set in earlier than usual, and with extraordinary severity.

The line of retreat, too, led through the very districts which had been wasted on the advance. Swarms of mounted Cossacks incessantly harassed the French, now sadly demoralized by cold, famine, disease, and fatigue. When the invaders left Smolensk (14 November) they numbered only 40,000 fighting men, and when they had fought their way over the Berezina (27th) there remained but 25,000. At Smorgoni Napoleon quitted the army (5 December), leaving Murat in command.

Napoleon reached his capital on the 18th and immediately ordered a fresh conscription, still determined on prosecuting the war. But the spirit of Europe was now fairly roused; kings, ecclesiastics, and people rose unanimously against the devastator of the Continent, the terror of whose name had been destroyed by his disastrous reverse. A sixth coalition, consisting of Prussia, Russia, England, Sweden, and Spain was formed, which early in 1813 sent its forces toward the Elbe. Napoleon had still an army of 350,000 in Germany. For some months he was everywhere victorious. On 2 May he defeated the allies at Lützen, and on the 21st at Bautzen. He reached Breslau 1 June, and on the 4th concluded a six weeks' armistice, which gave the allies time to reorganize and concentrate their forces and, what was of equal consequence, to gain over Austria. The campaign was reopened 16 August. The allies advanced on Dresden, where Napoleon had his headquarters. The battle which ensued (see DRESDEN, BATTLE OF) 26-7 August was another dearly bought victory for the French, who were now so outnumbered that their chief was compelled to fall back on Leipsic. There he was completely hemmed in, and in the great "Battle of the Nations" (Völkerschlacht), as this battle of Leipsic is called, fought 16–19 October, he was completely defeated. The retreat across the Rhine was almost as disastrous as that from Moscow.

On Napoleon's arrival at Paris, 9 November, he succeeded in obtaining from the senate, in spite of the opposition in the legislative body and the prevalent discontent of the people, a decree for a conscription of 300,000 men. With a fertility of resource and a genius for combination almost miraculous, he was able to enter on another campaign, which was this time to be conducted in France. From January to March he confronted the combined hosts of the allies, inflicting defeat after defeat on them. But numbers were against him; a new and formidable enemy, Wellington, was rapidly advancing on the capital from the south. On 30 March the allies, after a severe engagement, captured the fortifications of Paris, and on the 31st Alexander and Wellington entered the city amid the acclamations of the people.

On 6 April Napoleon abdicated at Fontainebleau in favor of his son. He was allowed the sovereignty of the island of Elba, with the title of emperor, and a revenue of 6,000,000 francs. After bidding his army adieu he departed for his new abode, landing from the British frigate. Undaunted at Ferrajo 4 May, and Louis XVIII. was restored. After a residence of ten months, most of which was spent in intriguing with the Republicans and his own adherents, he made his escape from the island, and landed at Fréjus 1 March 1815, with an escort of 1,000 of his old guard. As soon as his arrival was known Ney and a large part of the army joined him, and he made a triumphal march on Paris, which he reached on the 20th. Louis was driven from his throne without a shot having been fired. The allies were startled at the astounding event. Their armies once more marched toward the French frontier. Napoleon, hastily reorganizing the government on a rather more liberal basis than that of the empire, and having made vain attempts to open negotiations for peace, advanced to meet them. On 15 June he crossed the Sambre at the head of 130,000 men to attack the

English and Prussians under Wellington and Blücher. On the 16th he defeated Blücher at Ligny, while at Quatre-Bras the English were held in check by Ney. The Prussians made an orderly and leisurely retreat, pursued by a division of the French army under Grouchy.

In order to preserve his communication with the Prussians, Wellington fell back upon Waterloo, where he was attacked by Napoleon on the 18th. The British held their ground obstinately during the greater part of the day, and in the evening, when Blücher, who had outmaneuvered Grouchy, came up, the French were completely crushed, and Napoleon's power forever broken. The retreat was a disorderly flight. The allies marched without opposition on Paris. On the 22d Napoleon again abdicated in favor of his son; but being threatened by Fouché, who had assumed the direction of the government, and seeing no hope of escape from France, he surrendered at Rochefort to Captain Maitland of the British warship Bellerophon, claiming the hospitality and protection of the British government. Captain Maitland was instructed to detain him as a prisoner, and then transfer him to the Northumberland, which was to convey him to the island of St. Helena, where he was to be confined for the rest of his life, according to a convention signed at Paris 20 August, between Great Britain, Austria, Russia, and Prussia. He landed there 16 October. In July 1816 Sir Hudson Lowe was sent out as governor of the island. From the very first Napoleon seems to have quarreled with that officer, and he appealed to the sympathy of the world through reports of the ill treatment he was subjected to. The governor had no power to remedy the chief causes of the prisoner's complaint. In September 1818 Napoleon's health began to fail. He refused medicine, would not ride, toward the end of 1820 grew worse, and died at last of cancer of the stomach. On 8 May 1821 he was buried on the island; but in 1840, in accordance with his own wishes, his remains were removed to Paris, and there, under the dome of the Hôtel des Invalides, they found their final resting-place. Consult: Thiers, 'History of the French Revolution' (1823–7) and 'History of the Consulate and Empire' (1845–61); Scott, 'Life of Napoleon' (1827); Bignon, 'Histoire de France sous Napoléon' (1829–50); Thibaudeau, 'Le Consulat et l'Empire' (1834–5); Lanfrey, 'History of Napoleon' (1869–75); Jung, 'Bonaparte et son Temps' (1880–1); Ropes, 'The First Napoleon' (1885) and 'Campaign of Waterloo' (1893); Fournier, 'Napoleon I., eine Biographie' (1886–9); Sargent, 'Napoleon Bonaparte's First Campaign' (1894) and 'Campaign of Marengo' (1897). For the relations of Napoleon with the United States, Adams' 'History of the United States 1801–17' (1889–91) should be consulted. The 'Correspondance de l'Empereur Napoléon I.' (1858–70) is a main source of original documentary history. Of works of a more personal character, dealing with the life of Napoleon from various points of view, among the more important are those of Bourrienne, Talleyrand, Metternich, Rémusat, Marbot, Montholon, Pasquier, Ségur, Las Casas, O'Meara, Sachet, Masséna, Marmont, and Roederer. As recent writings of another sort bearing on Napoleon's personal history, those of Levy and Masson deserve particular notice. The work of Rose, 'Life of Napoleon I.' (1901) is the latest complete biography in English. Channing's essay on Napoleon, and Emerson's chapter in 'Representative Men,' as well as Carlyle's pictures in 'Heroes,' are still worthy of attention.

Napoleon II., son of Napoleon I. See REICHSTADT, DUKE OF.

Napoleon III. (CHARLES LOUIS NAPOLEON BONAPARTE), emperor of the French: b. Paris 20 April 1808; d. Chiselhurst, England, 9 Jan. 1873. He was the son of Louis Bonaparte (q.v.), king of Holland. He was taken by his mother, Queen Hortense, to Switzerland in 1816, was educated at the gymnasium of Augsburg and the military school at Thun, joined the unsuccessful Italian revolt against papal rule in Romagna, and by a conspiracy at Strasburg on 30 Oct. 1836 was declared emperor. He was arrested and sent without trial to the United States, returned to Switzerland in 1837, lived in London in 1838–40, and on 6 Aug. 1840 landed at Boulogne for a fresh attempt against Louis Philippe. This time he was imprisoned in the fortress of Ham, under a life sentence; but he contrived his escape 25 May 1846. During this time he had leisure for the exercise of his literary abilities, and the result was the works: 'Aux Mânes de l'Empereur'; 'Fragments Historiques'; 'Analyse de la Question des Sucres'; 'Réponse à M. de Lamartine'; 'Extinction du Paupérisme'; besides contributions to the 'Dictionnaire de la Conversation,' and several articles to democratic newspapers. On the outbreak of the revolution of 1848 he hastened from England to Paris, and in a letter to the provisional government declared that he came to serve under the republican flag (28 Feb. 1848). On the day following he issued another letter announcing that as the government deemed his presence in Paris dangerous he would immediately quit the country. He accordingly returned to London, where he served as a special constable on the occasion of the great Chartist demonstration of April (1848). In the election of September he was put forward by Paris and three other departments. He returned to Paris and on 26 September took his seat.

He at once commenced through his zealous associates his candidature for the presidency. On the day of the election, 10 December, it was found that out of 7,500,000 votes Louis Napoleon had obtained 5,434,226. On the 20th the prince-president, as he was now called, took the oath of allegiance to the republic. For a time the greatest harmony seemed to be re-established; the president selected his ministers from the ranks of the various political parties, and strove to gain a majority in the assembly by the adoption of a strictly conservative policy. On 2 Dec. 1849 was formed a new ministry, the members of which were merely tools of the president. It was evident that a crisis was approaching. At last on 2 Dec. 1851 it came. Paris was overawed by the army; there was needless butchery in the streets; reports of approval by Paris of this course were sent to the provinces. The empire was re-established in Louis Napoleon by a vote of 8,000,000 to 640,000. On 29 Jan. 1853 the new sovereign married Eugénie Marie de Montijo, Countess de Teba. In 1854, Napoleon, in conjunction with England, entered the Crimean war in the interest of Turkey against Russia — a war which was carried on by all

the parties with great vigor, until a peace was concluded, 30 March 1856, the terms of which were the neutralization of the Black Sea, the abandonment by Russia of her protectorate of the Danubian principalities, and a re-arrangement of frontier territory between Russia and Turkey, to the advantage of the latter power. (See CRIMEA, *History.*) About the beginning of the year 1859 it was evident that another European war was imminent. Northern Italy was groaning under the Austrian yoke; Sardinia demanded a separate government for Lombardy and Venetia, which Austria refused to grant. War was declared between that country and Sardinia about the end of April, and Napoleon took up arms in favor of his Italian ally, Victor Emmanuel. The two allied sovereigns took the field in person. Montebello, Magenta, Marignano, and Solferino were brilliant victories for the allies. By the terms of the Peace of Villafranca, Austria ceded Lombardy to Italy, and the provinces of Savoy and Nice were given to France.

A second distant expedition was undertaken, but had not a like success. Toward the end of 1861 France, England, and Spain agreed to despatch a joint expedition to Mexico for the purpose of exacting redress of injuries of long continuance inflicted on the subjects of the respective allies, and the enforcement of pecuniary claims, which were obstinately contested by the Mexican government. The extravagant demands of M. de Soligny induced the English and Spaniards to believe that Napoleon had some ulterior object in view, and they withdrew from further intervention (April 1862). The French army continued the quarrel alone. On 10 June General Bazaine led his troops into the Mexican capital amid many demonstrations of enthusiasm. An imperial form of government was initiated, and Maximilian (q.v.), archduke of Austria, was placed at its head with the title of emperor. Maximilian's death caused Napoleon's policy to be viewed with suspicion in France. The emperor opened the Suez Canal, entertained Europe at the World's Exposition, rebuilt and greatly beautified Paris. But France lost slowly in prestige, and there was a decline of administrative integrity.

On the conclusion of the Austro-Prussian war of 1866 Napoleon, jealous of the growing power of Prussia, demanded a reconstruction of frontier, claiming, by way of compensation for his non-intervention in the quarrel, Prussian territory on the Saar, a claim peremptorily refused. The ill-feeling between the two nations was increased in 1867, when the king of Holland signified his intention to cede Luxemburg to France. The cession was strongly resisted by Prussia, and at the London conference (7–11 May) the neutralization of the duchy was agreed to by treaty under the guarantee of the Great Powers. It could no longer be concealed, however, that a rupture between France and Prussia was imminent, and in 1870, on the Spanish crown being offered to Leopold of Hohenzollern, Napoleon demanded that the king of Prussia should compel that prince to refuse it. Notwithstanding the subsequent renunciation of the crown by Leopold war was declared by France (19 July). (See FRANCO-GERMAN WAR.) On the 28th Napoleon set out to take the chief command. After Sedan, he had a personal interview with King William, who assigned to him Wilhelmshöhe, near Cassel, as a place of residence during his captivity. One of the immediate consequences of this disaster was a revolution in Paris. Gambetta, Jules Favre, and several other members of the Corps Législatif, proclaimed a republic and the dethronement of the emperor (4 September). The empress and her son secretly quitted Paris and repaired to England, where they took up their residence at Camden House, Chiselhurst. Here they were rejoined by the emperor, when he regained his freedom in March 1871, and here he remained till his death.

Napoleon III. was rather a student and littérateur than a statesman. He was not an efficient administrator, and was most unfortunate in his advisers and subordinates. At the time of the Franco-German war he appears to have been quite deceived as to the military strength of France and its readiness for the conflict. Besides the literary works already mentioned, Napoleon III. is the author of an uncompleted 'History of Julius Cæsar' (1865–6), and various productions collected and published in 1854–69 and 1873. Consult: Gottschalk (1871); von Sybel (1873); and Jerrold (1877) for biography; also Hugo, 'Histoire d'un Crime' (1877), and various standard histories of modern Europe.

Napoleon, Eugène Louis Jean Joseph, ē-zhăn loo-ē zhŏn zhō-zĕf, Prince Imperial of France: b. in the Tuileries, Paris, France, 16 March 1856; d. South Africa 1 June 1879. He fought for the Imperial arms in the Franco-German war of 1870–1; but when disaster seemed imminent was sent to join his mother in England, whither she had fled. He was proclaimed Napoleon IV. by his adherents in 1874. In 1879 he joined a British expedition against the Zulus in South Africa and was killed in ambush.

Napoleon, Joseph Charles Paul, PRINCE, a son of Jerome Bonaparte. See BONAPARTE, JEROME.

Napoleon, Ohio, village, county-seat of Henry County; on the Maumee River and the Miami & Erie Canal, and on the Lima Northern and the Wabash & Detroit R.R.'s; about 38 miles southwest of Toledo. Its chief manufactures are flour and dairy products. It has considerable trade in farm and dairy products and live-stock. The village owns and operates the electric-light plant and the waterworks. Pop. (1890) 2,764; (1900) 3,639.

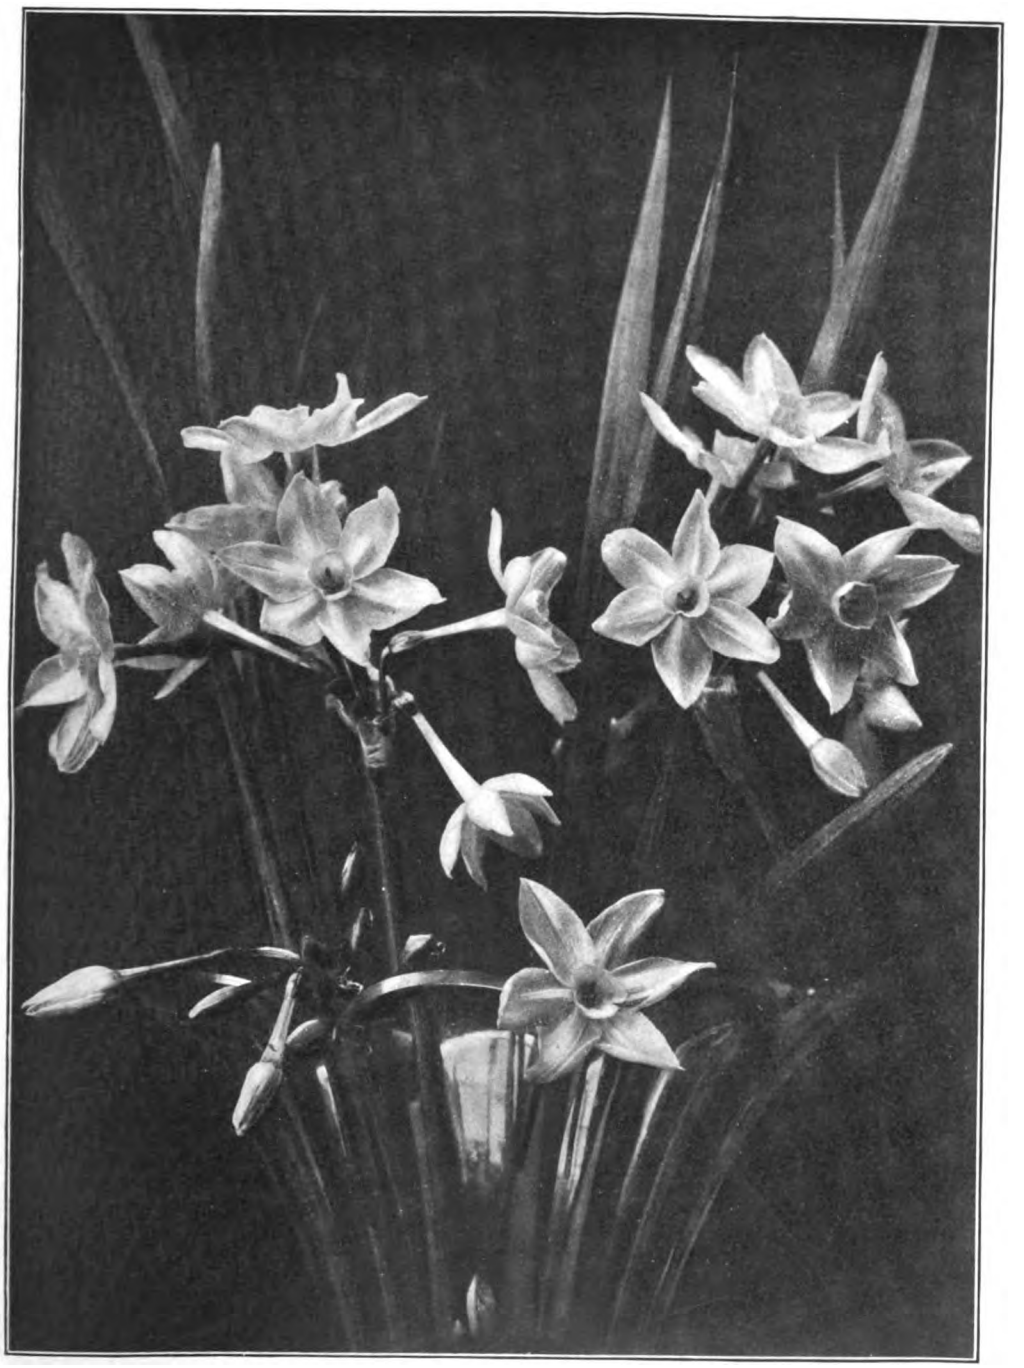
Napoleon, a piece of French money valued at $4 or 20 francs. See LOUIS D'OR.

Napoleon Gun. See ARTILLERY.

Napoleon le Petit, lė pė-tē ("Napoleon the Little"), the title of Victor Hugo's savage satire on Louis Napoleon (Brussels, 1852).

Napoleon's Tomb, the burial-place of Napoleon Bonaparte under the dome of the Invalides in Paris. It has the form of a circular crypt 20 feet deep and 36 in diameter, open at the top. The tomb was designed by Visconti, and on the walls are 10 marble reliefs by Simart. Napoleon's remains were brought here in 1840 from Saint Helena.

Naquatez (nä'kwä-tĕz) **Indians.** See CREEKS.



NARCISSUS.

Naquinoneis, nä-kwē-nō'nēz. See CHIQUITOS.

Nara, nä'rä, Japan, the capital of a prefecture, and from 709–784 the capital of the country, on the island of Hondo, 26 miles by rail southeast of Osaka. It has some manufactures of toys, fans, art objects, etc., but its chief interest is archæological and historical, illustrated in the Shoso-in Museum with its splendid collection of antiquities, and in the shrines and temples dating from the imperial period, one of which contains a celebrated Daibutsu (q.v.), or gigantic statue of Buddha. Pop. (1898) 30,600.

Nar'aka, or **Nuruk,** in Hindu mythology, a term equivalent to the English word hell. In Naraka there are 28 divisions, in which sinners of as many different classes are confined and subjected to tortures corresponding to the gravity of their offenses.

Narbada, när-bä'dä. See NERBUDDA.

Narbonne, när-bŏn, France, the chief town of an arrondissement in the department of Aude, in a beautiful hill-girt plain, eight miles from the Mediterranean and 36 miles by rail east of Carcassonne. Boulevards occupy the site of the mediæval ramparts removed since 1865. The town, traversed by the Robine Canal, has dark and winding streets lined with ill-built houses, and is generally unattractive. It is, however, of historical interest as the Roman Narbo Martius, their earliest colony (118 B.C.) beyond the Alps. It flourished under Tiberius, its schools for a long time rivaling those of Rome. About 309 A.D. it became the capital of Gallia Narbonensis, and had its capitol, forum, theatre, aqueducts, triumphal arches, etc., of which there are few remains owing to the vandalism of Francis I. in using them as building materials. In 412 it was taken by the Visigoths, in 719 by the Saracens, from whom it was recovered by Pepin in 759, to fall a century later to the Northmen. During the 11th and 12th centuries it was a prosperous manufacturing city, but subsequently deteriorated owing to the silting of its harbor. The principal edifices are the Romanesque church of St. Paul (1229); the quondam cathedral of St. Just (1272–1332), only the fine Gothic choir of which, 131 feet high, has been completed; and the former archbishop's palace, now the city hall, in which are a good museum, a library, and a picture gallery. The white heather honey of Narbonne maintains its ancient celebrity; the wine is chiefly used for blending purposes, its production being now carefully supervised by the œnological station founded in 1894. Pop. (1901) 28,900.

Narcissus, när-sĭs'ŭs, in Greek mythology, the son of the river god Cephissus. Narcissus was of surpassing beauty, but excessively vain and inaccessible to the feeling of love. Echo pined away to a mere voice because her love for him found no return. Nemesis determined to punish him for his coldness of heart, and caused him to drink at a certain fountain, wherein he saw his own image, and was seized with a passion for himself of which he pined away. The gods transformed him into the flower which still bears his name. See ECHO; MYTHOLOGY.

Narcissus, a genus of plants of the order *Amaryllidaceæ* (q.v.). The species, numbering from 16 to about 50, according to different authors, have bulbous roots, narrow grass-like leaves, and generally white or yellow flowers borne singly or in small clusters and protruding from a dry spathe at the summit of a leafless scape. Because of their hardiness, ease of cultivation, habit of blooming in early spring, beauty and fragrance, many of the species and their numerous hybrids and varieties have been general garden favorites for centuries. A few produce their blossoms in the autumn (for example, *N. serotinus, N. elegans,* and *N. viridiflorus*); but they are rarely cultivated. Some are useful for winter forcing, especially the polyanthus narcissus (*N. tazetta*), with its popular forms the "paper white" and the "Chinese sacred lily." In general, the garden species succeed best in well drained garden soil of medium texture and richness. The bulbs should be planted in autumn about five inches deep and three inches apart, and should not be disturbed until they appear to be failing, perhaps after three years. Then when the foliage has died down the clumps may be dug, the bulbs divided, cleaned, and stored in a cool dry place until planting time. Among the most popular species are the poet's narcissus (*N. poeticus*), also known as pheasant's eye, the jonquil (*N. jonquilla*), and *N. tazetta* mentioned above. The Lent lily (*N. pseudo-narcissus*), or daffodil, is also one of the most widespread and hardy. See DAFFODIL.

Narco'sis, or Narcotism (Greek, "stupor"), insensibility more or less profound, the result of absorption by the blood, and subsequent action on the brain, of certain drugs in poisonous amount, or of certain excretory elements, as in uræmia.

Narcot'ics (from Greek ναρκοῦν, to benumb), substances which have the property of stupefying. In small (medicinal) doses they either quiet undue irritability of the nervous system, producing sleep and relieving pain or spasm, or they excite or stimulate the normal irritability. Opium and alcohol, for example, are sometimes used as "bracers." Narcotics are too frequently used for slight ailments or fancied ones. For the repeated or habitual use of small doses is dangerous, as it is apt to excite a craving for and the use of larger or poisonous doses (see POISONS). Poisonous doses produce stupor, coma, and sometimes convulsions and death. Those narcotics which produce sleep are termed hypnotics (q.v.) or soporifics. Those which are used to alleviate pain are anodynes or analgesics (q.v.). Though the effects of most of the narcotics resemble more or less those of opium each narcotic affects the system in a peculiar way. Belladonna, for example, dries the throat, dims the vision, dilates the pupils of the eyes (opium contracts them), and produces delirium. Some narcotics produce constipation, others do not. Some act principally upon the brain, others on the alimentary canal or bronchial tubes. The principal narcotics are opium (with its alkaloids, such as morphia, codeine, and thebaia, and preparations of it — paregoric, laudanum, etc.), belladonna, camphor, hyoscyamus or henbane, caffeine, chloral hydrate, alcohol, Indian hemp, hops, bromide of potassium, and stramonium. There is also a group of chemical organic compounds which are narcotics, such as paraldehyde, sulphonal, and trional. Nar-

cotics should be used with extreme caution, as the susceptibility to their poisonous effects varies in different persons. Of late years the market has been flooded with so-called pain-cures, carminatives, cordials, soothing-syrups, etc., warranted to be harmless, but which are in fact narcotics, in mixtures more or less agreeable to the taste, but none the less liable to do harm. Children are more susceptible to the influence of narcotics tnan adults, hence the risk of giving them to children is greater. See ANÆSTHETICS: NICOTINE: TOBACCO.

Nar'cotine, an alkaloid which occurs in opium, has the chemical formula $C_{22}H_{23}NO_7$, and acts as a narcotic poison. It may be prepared as follows: Opium is exhausted with dilute hydrochloric acid, and the alkaloidal bases that the extract contains are precipitated by the addition of caustic potash. The precipitated bases are then re-dissolved, and the solution is treated with oxalic acid to precipitate the papaverine that it contains, after which the filtered solution is treated with ammonia to throw down the narcotine. The precipitate so obatined is purified by re-crystallization from alcohol. Narcotine was the first alkaloid obtained from opium, of which it constitutes from 1 to 8 per cent by weight. It is almost insoluble in cold water, moderately soluble in alcohol and in ether, and readily soluble in chloroform. It crystallizes in trimetric prisms, or in radiating needle-like forms, which melt at 349° F. Aqueous solutions of the alkaloid are neutral, and solutions in other menstrua are but feebly alkaline. Narcotine (unlike the other alkaloids that opium contains) appears to exist in opium in the free state, and not in the form of a salt. Its salts do not crystallize readily, and are decomposed when their solutions are evaporated, with separation of free narcotine.

Nard, a plant, spikenard. See ARALIA.

Nares, närz, SIR **George Strong,** English Arctic explorer: b. Danestown, near Aberdeen, Scotland, 1831. He was educated at the Royal Naval College and entered the navy in 1845. He accompanied the Arctic expedition of 1852–4 and in 1872–4 commanded the Challenger. In 1875–6 he was at the head of the North Polar Expedition and obtained valuable scientific information, after which he was assigned to the command of a survey of the South Pacific. He was created vice-admiral in 1892, but has retired from active service. He wrote: 'Seamanship' (1862); 'Voyage to the Polar Sea' (1878); etc.

Narghile, när'gĭ-lē, or **Nargileh,** a Turkish tobacco-pipe, the chief feature of which is that when used the smoke is made to pass through water. It is otherwise called a hookah, and is commonly known as a water-pipe.

Nariño, nä-rē'ño, **Antonio,** Colombian politician: b. Bogota, Colombia, 1765; d. Leiva, Colombia, 13 Dec. 1823. He was educated in the college of San Bartolome in Bogota and entered the magistracy. His writings of a revolutionary character brought him into trouble and in 1795 after a tedious trial he was transported to Spain under sentence of ten years' penal servitude. Escaping in 1797 he returned to his own country but was again imprisoned and not released until the revolution of 1810, when he joined the patriot army. He was elected president in 1811 and later dictator. Civil war breaking out Nariño defeated the federalists and then resigning his dictatorship marched against the royalist forces in the south. His success was followed by defeat at Pasto in 1814 when he was captured and sent a prisoner to Spain. He was held a prisoner until 1820 when he returned to his own country. In 1821 he was elected senator, but declined the vice-presidency in 1822 and ill health compelled him to retire soon after his appointment as commander-in-chief in 1823.

Narragansett (năr-ą-găn'sĕt) **Indians,** an American tribe formerly occupying the territory now comprised in the State of Rhode Island and the eastern part of Long Island. Shortly after the arrival of the pilgrims they manifested symptoms of hostility; and as an expression of sentiment Canonicus, their chief, sent to Plymouth a bundle of arrows wrapped in the skin of a rattlesnake; to which Bradford, the governor, replied with the same skin filled with powder and shot. This significant retort secured, if not the good-will, at least the peaceableness of the sagacious chief. In the Pequot war they aided the colonists, but not unanimously. In the winter of 1675, during King Philip's war, that chief having taken refuge with the tribe, the colonists, apprehending that they would join his cause, made a secret attack upon their principal fort, killing about 1,000 warriors, destroying all their provisions, and exposing those who escaped to cold and famine, of which very many died. The Narragansetts from this time waged incessant war with the whites. They have now entirely disappeared as a race, although some of their descendants of mixed blood are to be found in one or two localities in Rhode Island.

Narragan'sett Bay, an inlet of the Atlantic Ocean, extending into the State of Rhode Island about 28 miles. At its entrance, from Sakonnet Point to Point Judith, the bay is about 18 miles wide. One of its channels, on the east, is called Sakonnet River, and the chief arms of the bay are on the east Mount Hope Bay, on the west, Greenwich Bay. The principal rivers which enter the bay are, at its head, Providence River, from the east Taunton, from the west Pawtuxet. The largest island in the bay is Rhode Island, and others are Conanicut, Prudence, and Hog. Several places of importance are on the shores of the bay, chief of which are Providence at the mouth of the Providence River, Newport on Rhode Island, and Fall River, at the mouth of the Taunton.

Narragansett Bay is of great importance to the State, as it gives a longer shore-line and more opportunities for commerce and transportation. The first explorers of the northeast coast of the United States mention this bay.

Narragansett Pier, R. I., a famous summer resort, in Washington County; on Narragansett Bay, and on the Narragansett Pier Railroad; about 10 miles from Newport and 28 miles from Providence. The railroad was built in 1876 and extends from Kingston Station to the "The Pier," a distance of about 12 miles. A steamer plies daily during the season between Newport and "The Pier." The chief attractions are the climate and the scenery. Narragansett Heights, about three miles distant, are about 400 feet above sea-level. The colored rocks nearby and

the long beach are attractive. There are a number of fine hotels, handsome cottages, and excellent bathing houses and pavilions. The place was settled in 1675, and the same year an engagement took place nearby between the colonists and the Narragansett Indians. Gen. Winslow, who commanded the colonists, about 1,000 in all, captured 600 Indians and killed 300. The loss of the whites was about 150 wounded and 85 killed. The pier, from which the place takes its name, was built in 1815. Pop. (1890) 1,408; (1900) 1,523.

Narrenschiff, när'ĕn-shĭf, **Das** ("The Ship of Fools"), Sebastian Brant's celebrated work (1494). See BRANT, SEBASTIAN.

Narrows, The, a narrow part of New York Bay, a channel which connects Upper New York Bay with Lower New York Bay, and separates Long Island and Staten Island. At the south entrance of The Narrows are two forts, Fort Hamilton on Long Island and Fort Wadsworth on Staten Island. See NEW YORK BAY.

Narses, när'sēz, Byzantine general: b. Armenia 472; d. Rome 568. He was a slave and a eunuch, when he entered the imperial household in Constantinople, of which he soon became chamberlain. His ability soon advanced him to the office of treasurer to Justinian, who sent him to Italy in 538 to keep an eye on Belisarius. In 551 Narses became commander-in-chief in Italy, speedily drove thence the Franks and Goths, re-established Byzantine control, but in spite of his able administration was removed by Justinian's successor, Justin II. Legend says that he was insulted by the Empress Sophia upon his dismissal, and that he thereupon went over to the Lombards. He was equally famous as general and statesman. Consult: Hodgkin, 'Italy and Her Invaders' (1885–95, Vols. IV. and V.); Bury, 'Later Roman Empire' (Vol. I., 1889).

Nar'thex (Greek, a reed, hence any oblong figure), the term used in ecclesiastical architecture to designate the westernmost division of an ancient Greek Church, running like a cloister from the north to the south wall. It was separated from the nave proper by a screen or railing, beyond which catechumens and those under Church censure or penance were not permitted to advance. It had three door-ways, one on the west as well as one in the northern and southern walls. The western was the principal entrance and was known as "the beautiful" or "royal gate." The doors leading through the screen into the nave were named according to the classes who used them, "the priests' gate," "the men's gate," etc. The narthex was also used for funerals and public meetings; baptism was celebrated there and the font, which had formerly been in a building adjoining the church, was also placed in the narthex. Consult: Bingham, 'Christian Antiquities'; Siegel, 'Christliche Alterthümer'; Walcott, 'Sacred Archæology.'

Naruszewicz, nä-roo-shä'vĭch, **Adam Stanislaw,** Polish historian and poet: b. Pinsk, Lithuania, 20 Oct. 1733; d. Janow, Galicia, 8 July 1796. He became a Jesuit in 1748; taught in the Jesuit schools in Wilna and Warsaw; and after the suppression of the Order became bishop of Smolensk, and later of Lutsk. His poetry, consisting of translations, odes, fables, epigrams, satires, and idylls, was published in 1778. In prose, he translated Tacitus, wrote a biography of Chodkiewicz (1781), composed a history of Crimea (1787), and on the suggestion of his patron, King Stanislaus Augustus Poniatowski, wrote his greatest work, a history of Poland down to 1386 (1780–6), which, because of its style and its protest against the abuses of a monarchy or an aristocracy, won him the name of the Polish Tacitus.

Narvacan, när-vä-kän', a pueblo of the province of Ilocos Sur, Luzon, situated 13 miles southeast of Vigan, the provincial capital. It is on the main road and one of the most important towns of the province, being next the capital in population. Pop. 16,500.

Narvaez, när-vä-ĕth', **Pánfilo de,** Spanish soldier in America: b. Valladolid about 1470; d. near mouth of Mississippi River November 1528. He came to America about 1498, settled first in Santo Domingo and then in Cuba, where from 1512 until his death he was under Velasquez in the command of an auxiliary force in the conquest of the island. The disobedience of Cortés in Mexico, whither he had been sent by Velasquez led the latter to send Narvaez in 1520 to supersede and punish Cortés. This expedition was entirely unsuccessful. Narvaez landed at Vera Cruz in April; was defeated in May at Cempoala by the army of Cortés; lost one eye in the battle; and was deserted by the remnant of his army, which joined Cortés. He was captured, but soon released; returned to Spain, where he was appointed governor of Florida in 1526; and sailing from Cuba in March of 1528, landed at Apalachee Bay, lost half his men on the march inland, retreated to the shore, where he found that his ships had been destroyed, and having built boats, sailed westward along the coast, only to be shipwrecked with all but four of his men.

Narvaez, Ramon Maria, DUKE OF VALENCIA, Spanish general and statesman: b. Loja, Andalusia, 4 Aug. 1800; d. Madrid 23 April 1868. He entered the army in 1815; lived in retirement from 1823 to 1834; in 1836 defeated the Carlist leader, Gomez; and in 1838, after clearing La Mancha of brigands, was made captain-general of Old Castile. He led an insurrection against Espartero, his old chief, but was beaten and fled to France, where he joined the party of Maria Christina. He returned to Madrid in July 1843; Espartero left the country; and from May 1844 to February 1846, and from October 1847 to January 1851 Narvaez was prime minister, in recognition of his services to Maria Christina. He held the same post in 1856–7 and 1864–5, being minister to Paris and Vienna in the intervals. During the military rising of 22 June 1866 Narvaez commanded the loyal soldiery, and in July succeeded the defeated O'Donnell as ministry president and minister of war. A liberal in early life he became more and more conservative and spent his last years in attempting to keep Isabella on the throne.

Nar'whal, a large porpoise which inhabits the Arctic Ocean. It belongs to the family *Delphinidæ* and was named *Monodon monoceros* by Linnæus. Its most striking characteristic is the possession of a very long, straight, spirally-grooved tusk, which projects forward from the left side of the upper jaw in line with

the axis of the body. When full-grown the narwhal has a length of about 16 feet. The head is rounded, the back has a very low ridge instead of a fin, and the pectoral fins are short and broad. The color of the body is gray above, and white below, everywhere mottled and spotted with gray and black. The young are darker colored, while old individuals are often nearly white throughout. The vertebral formula is as follows: Cervicals, 7; dorsals, 11; lumbars, 6; caudals, 26; total, 50. The cervical vertebræ, unlike those of other porpoises, except the beluga or white whale, are all free. The skull is depressed, with a broad rostrum.

The massive tusk or maxillary tooth of the narwhal is developed only in the male, and with rare exceptions, only on the left side of the jaw. Normally, the corresponding tusk or tooth of the right side remains concealed in the maxillary bone during life. In females neither tusk is visible. All other teeth are wanting in adults of both sexes. Occasionally, both tusks are developed in males and in females as well. About 16 such heads have been preserved, including one from Prince Regent Inlet in the National Museum, Washington. The largest narwhal tusks are about 8 feet long, with a girth of about 9 inches at the base. They are hollow for a considerable proportion of their length.

The tusk is a secondary sexual character like the antlers of the stag, the spurs and comb of the cock, etc. It has been suggested that the narwhal makes use of the tusk to break the ice, to transfix its prey, or in combat, but these ideas lack confirmation.

When first introduced into Europe, the true origin of the tusks not being known, they were supposed to be the horns of the mythical unicorn. For a considerable time they were highly prized on account of their reputed medicinal properties, and are still made use of in China as a drug.

Narwhals occur in large herds, or schools, among the ice of the Arctic Ocean, northward of lat. 65° N. They migrate to higher latitudes as the ice recedes and return in the fall. Very rarely individuals stray southward along the coast of Europe as far as Scotland.

The narwhal resembles the beluga or white whale in many important characters, not shared by other porpoises, and forms with it a separate sub-family, the *Delphinapterinæ*.

F. W. True,
Curator U. S. National Museum.

Nasals. See Phonetics; Speech.

Nasby, năz'bĭ, **Petroleum V.** See Locke, David Ross.

Nascent State, in chemistry, the state or the peculiar reactionary power possessed by an element at the instant of liberation from a compound or combination in which it has previously existed. At the moment an element is liberated from a compound of which it has been a constituent it acquires a higher power of chemical reaction than it displays some time after its liberation. One theory of the nascent state of an element is that the molecules at the instant of liberation are separate and independent; and that an appreciable length of time is required for their final arrangement; and that while they are in this free state, they possess an extraordinary power of reaction, which power is otherwise exerted and expended in the act of molecular arrangement. For instance, it has been advanced by some chemists and physicists that hydrogen in a nascent state is made up of single atoms, while hydrogen in a gaseous state is composed of molecules, each molecule containing two atoms. Thus many substances will combine with nascent hydrogen which utterly refuse gaseous hydrogen.

Nascopi, nä-skō'pē, or **Nascapee, Indians,** a Labrador tribe, the most easterly known branch of the Algonquian family. They formerly occupied the interior table-land extending from Lake Mistassini to the Atlantic Ocean.

Nase'berry, the fruit of *Sapota achras,* one of the finest West India fruits. The bark of the tree has astringent and febrifugal properties. See Sapotaceæ.

Naseby, nāz'bĭ, England, a village of Northamptonshire, 12 miles northwest of Northampton (pop. 700), near which, on 14 June 1645, Fairfax and Cromwell commanding the Parliamentary troops, defeated Charles I. and his army, taking 5,000 prisoners and capturing the royal cannon and baggage. Since 1823 the battlefield is marked by an obelisk on Naseby ridge (648 feet).

Nash, Abner, American politician: b. Prince Edward County, Va., 8 Aug. 1716; d. Philadelphia, Pa., 2 Dec. 1786. He studied law and removed to New Berne, N. C., where he practised successfully and in 1774 he was a member of the first provincial congress of North Carolina. He served as member of the council which framed the State constitution in 1776 and was speaker of the senate in 1779. He was governor of the State from 1779–81 and in 1782–6 sat in the Continental Congress.

Nash, Francis, American soldier: b. Prince Edward County, Va., 10 May 1720; d. Germantown, Pa., 7 Oct. 1777. He was a brother of Abner Nash (q.v.), and early removed to North Carolina where he was clerk of the superior court of Orange county. He served under the crown with a captain's commission but resigned and was a member of the provincial congress which met in 1775 when he was appointed lieutenant-colonel in the Continental army. In 1777 he was commissioned brigadier-general by the Continental Congress and at once joined Washington, under whom he commanded a brigade and was mortally wounded at the battle of Germantown.

Nash, George Kilbon, American politician: b. York Township, Medina County, Ohio, 14 Aug. 1842. He was educated at the Western Reserve University and at Oberlin College, studied law and was admitted to the bar. He was editor of the 'Ohio State Journal for over a year and in 1879–82 was prosecuting attorney of Franklin County, Ohio. He established a law practice in Columbus in 1883–5. In 1900 he was elected governor of Ohio, and in 1902 he was re-elected.

Nash, Henry Sylvester, American theologian: b. Ohio 1854. He entered the Protestant Episcopal ministry in 1881, and since 1884 has been professor of the literature and interpretation of the New Testament at the Episcopal Theological School, Cambridge, Mass. He has written: 'The Genesis of the Social Conscience' (1896); 'Ethics and Revelation' (1898); 'His-

tory of the Higher Criticism of the New Testament' (1900).

Nash, Sir **John,** English architect: b. London 1752; d. East Cowes Castle, Isle of Wight, 13 May 1835. He studied and practised architecture under Sir Robert Taylor; then retired from business until 1793; and upon his re-entry into the profession gained much royal and noble patronage. He laid out Regent's Park, and the street leading up to the Park, now called Regent Street; remodeled Buckingham Palace; and altered the Brighton Pavilion. He was particularly fond of single façades, of projecting colonnades, and of a plentiful use of plaster and stucco. The use of cast-iron girders was principally introduced by Nash, who patented several varieties. Personally he was an estimable man, but unpopular because of George IV.'s display of favoritism toward him.

Nash, Richard, called Beau Nash, English leader of fashion: b. Swansea, Wales, 18 Oct. 1674; d. 3 Feb. 1762. He studied at Jesus College, Oxford, was for a time in the army, but finding military discipline not to his liking, entered at the Inner Temple. In 1705 his skill in gaming took him to Bath, which in 1703 had become a much frequented watering-place. He determined to improve the provincial character of the spa, and soon became a self-appointed but arbitrary master of ceremonies. He was known as the "King of Bath" and his rule was celebrated in prose and verse. His code included the prohibition of swords within his realm, a restriction which tended toward that consideration for the public peace which was then growing in England. His vanity grew with his power; he appeared in a monstrous cream-colored beaver and invariably journeyed by post-chariot with three span of grays, footmen, and outriders. About 1758 he withdrew from a reign which seems to have been in its way skilful and judicious. Goldsmith wrote his life (1762).

Nash, or **Nashe, Thomas,** English satirist and dramatist: b. Lowestoft, Suffolk, 1567; d. 1601. He studied at Cambridge in 1586, spent some time on the Continent, and before 1588 came to London. In 1589 he published his 'Anatomie of Absurditie.' In the literary warfare carried on between the Puritans and bishops Nash took an active part in behalf of the latter. Under the pseudonym "Pasquil," he published the tracts, 'A Countercuffe Given to Martin Junior' (1589) and 'Pasquil's Apologie' (1590). In 1592 he issued his powerful satire on contemporary society, 'Pierce Pennilesse his Supplication to the Divell.' His 'Christes Teares over Jerusalem' (1593) followed in repentant mood, and he affected to dismiss satire, in which, he said, he had "prodigally conspired against good houres." His notable work of picaresque fiction, 'The Unfortunate Traveller, or the Life of Jack Wilton' (1594) to a certain extent anticipated Defoe. Involved in a paper war with Gabriel Harvey, who had boasted of having put him to silence, he thereupon published 'Have with you to Saffron-Walden, or Gabriel Harvey's Hunt is Up' (1596), brimming with scorn. Nash also wrote plays, in whole or in part. He completed, unsatisfactorily (1594) Marlowe's 'Dido.' His 'Summers' Last Will and Testament' (1593), comedy, was first published in 1600. A play 'The Isle of Dogs,' led to his imprisonment for attacks contained in it. He died having, as one epitaph put it, "never in his life paid shoemaker or tailor." Nash's personality was somewhat unique in Elizabethan literature. His prose was vigorous, and his verses were at times those of a poet. His works were edited by Grosart (1883–4).

Nashua, năsh'ū-a, N. H., city, one of the county-seats of Hillsboro County; on the Nashua River, and on several branches of the Boston & Maine railroad; about 33 miles south by east of Concord and 38 miles northwest of Boston. The first settlement was made in 1655 and in 1673 it was incorporated by Massachusetts as Dunstable township. In 1746 it was reincorporated by Massachusetts, and in 1836 it adopted the name Nashua. It received its city charter in 1853. It is an important manufacturing city; the water power is obtained from the Nashua River by means of a canal three miles long, 60 feet wide and eight feet deep. The chief manufactures are cotton goods, paper, shoes, iron and steel products, edge tools, hardware, saddlery, refrigerators, registers, sash, doors, and blinds, ice cream freezers, stationary engines, caskets, and furniture. It has a United States fish hatchery, city and county buildings, and several fine church buildings, Saint Francis Xavier (R. C.) is the largest. There are excellent public and parish schools, and two academies. The original charter of 1853, still in use, provides for a mayor, who holds office two years, and a council. The school board is chosen by popular vote. Pop. (1890) 19,311; (1900) 23,898.

Nashville, Ill., city, county-seat of Washington County; on the Illinois S. and the Louisville & N. R.R.'s; about 110 miles south by east of Springfield. It is in an agricultural region, in which there are large coal fields. The chief manufactures are flour, dairy products, and agricultural and mining implements. Coal mining and cattle raising contribute to the industrial wealth of the city. Pop. (1890) 2,084; (1900) 2,184.

Nashville, Tenn., capital of Tennessee, the second largest city in the State, and county-seat of Davidson County; 186 miles southwest of Louisville, Ky., and 234 miles northeast of Memphis. Nashville is on the Cumberland River, and the Nashville, C. & St. L., Louisville & N. and Tennessee C. R.R.'s.

Topography.— The city has an area of about 12 square miles and is regularly laid out on gradually rising ground, sloping back from the river to an elevation of 560 feet above the sea. The streets are wide and well paved, about 175 miles of thoroughfare being covered with macadam and about 20 miles paved with granite, brick and bitulithic pavement. Around the city in every direction are the green hills of Middle Tennessee where there is much commercial timber and mineral wealth. The soil in the vicinity produces every fruit and vegetable not absolutely confined to the tropics. The average rainfall for 31 years has been 48.82 inches; the average winter temperature 39 degrees; and summer temperature 79; mean temperature for the year 59.

Government.— Nashville is governed under a charter of 1883, revised in 1901, by a mayor elected every two years, and a unicameral coun-

cil, which confirms the mayor's nominations of Park Commissioners, Civil Service Commissioners, Members of the Board of Health and of the Board of Education. The city attorney, comptroller, treasurer, tax assessor, city judge and board of public works are elected by the people. The city expends annually $1,000,000 for maintenance; the principal items being $200,000 for schools; $167,000 for interest on debt; $95,000 for police department and $60,000 for waterworks. The waterworks are owned by the city; the system which comprises 85 miles of mains cost over $2,000,000. The electric lighting plant is also owned by the municipality. Over $1,000,000 has been expended in recent years on a new and improved sewer system. The street railways operate over 85 miles of track, all converging at a central transfer station.

Buildings.— Prominent among the noticeable structures are the State Capitol, costing $1,500,000; United States Government Building; Davidson County Court House; the City Hall; Tennessee School for the Blind; Tennessee Industrial School; the State Penitentiary; the Parthenon; City Hospital; Confederate Soldiers' Home; Vendome Theatre; the new Union Depot; and the various churches and educational institutions.

Education.— There is no city in the South as prominent in educational interests as Nashville. Here is the seat of the Vanderbilt University; the University of Nashville; Peabody School for Teachers; Medical and Dental Departments of the University of Tennessee, the rest of which is located at Knoxville; Ward Seminary; Belmont College; Boscobel College; Watkins Institute; St. Cecilia Academy; Fisk University; Roger Williams University; Walden University. The State Library contains 40,000 volumes. The Carnegie Library cost $100,000 and has a fine and rapidly increasing number of volumes. The Tennessee Historical Society has a large and valuable library, many rare manuscripts, portraits, etc. The public schools are of the highest rank, and embrace, in addition to the ordinary studies ranging into the high school education, departments of industrial education, stenography, typewriting, bookkeeping.

Parks and Cemeteries.— In the park surrounding the State Capitol building is the tomb of James K. Polk (q.v.) and an equestrian statue of Andrew Jackson. The Hermitage, the former home of Jackson, is 10 miles east of the city. To the north is the National Cemetery where are buried 16,643 soldiers who fell in the Civil War. A Centennial Park has been made on the grounds of the Tennessee Centennial Exposition of 1897, and the former history building is now a museum and art gallery. In the park is a fine monument honoring James Robertson, the founder of Nashville. Watkins Park is to the west. Shelby Park, to the east of the city, is a natural shaded tract with a river frontage. Glendale Park, to the south, is a place of unrivaled beauty. There is also here Mount Olivet Cemetery, with the beautiful Confederate soldiers' monument, and the Cumberland Driving Park.

Manufactures.— The industries of Nashville, which are more extensive than any other city in the State, have an aggregate capital of $13,173,000, with an annual output valued at $18,470,000. The manufactures include flour, grist-mill products, lumber and timber products, fertilizers, cotton goods, clothing, harness, saddlery, soap, stoves, ranges, hollow ware, coffins, shoes, candles, tobacco, wagons, carriages, and confectionery. There is a large export trade and extensive wholesale traffic in dry goods, boots and shoes, groceries and drugs. The wholesale trade in 1902 was estimated at over $60,000,000. Almost at the doors of Nashville, and tapped by every line of railroad entering the city, are apparently inexhaustible fields of coal of the highest grade. The bountifulness of the supply is attested by the fact that during the prolonged anthracite coal strike, when coal was selling at almost prohibitive prices in every other section of the country, there was absolutely no advance in the price of coal in Nashville.

History.— The city was settled in 1780 by a band of pioneers under the leadership of James Robertson. It was named in honor of Gov. Abner Nash of North Carolina and was called Nashborough until 1784. During the early years of its existence Nashville was repeatedly attacked by the Cherokees and other Indian tribes. It was chartered as a city in 1806; was the seat of the State legislature in 1812–15, and became the permanent State capital in 1843. The Federal army occupied the city in 1862 and around the city in 1864 was fought one of the great battles of the Civil War. (See NASHVILLE, BATTLE OF.) In 1896, the State celebrated the centennial of Tennessee's admittance into the Union, and a great industrial exposition was held here the following year.

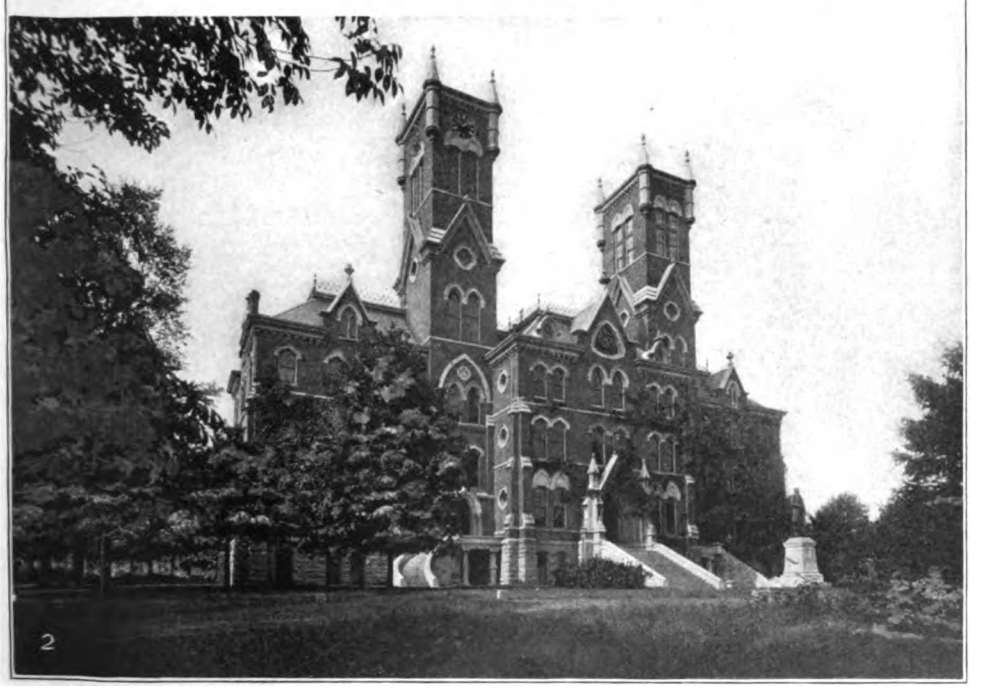
Population.— Nashville in 1830 had a population of 5,566; (1850) 10,165; (1860) 16,988; (1870) 25,865; (1880) 43,350; (1890) 76,168; (1900) 80,865; the last total includes 3,037 persons of foreign birth and 30,044 of negro descent.

R. A. HALLEY,
Retail Merchants Association, Nashville, Tenn.

Nash'ville, the name of a Confederate privateer that left Charleston in 1861 on a cruise to England and captured booty to the amount of $3,000,000. In March 1863 she was sunk by a Federal ironclad at the mouth of the Savannah River.

Nashville, Campaign and Battle of. When Gen. Sherman's picked army of 62,000 left Atlanta 15 Nov. 1864 for the March to the Sea (q.v.) the Confederate army under Hood, strengthened by Forrest's cavalry, was on the Tennessee River in the vicinity of Tuscumbia and Decatur, with S. D. Lee's corps across the river and in advance of Florence. Active preparations were making for a move on Nashville with the Ohio as a possible objective. Gen. Thomas had been sent to Nashville six weeks before to organize a force to resist Hood. Toward the last of October the Twenty-third corps, Schofield's, and the Fourth, D. S. Stanley's, were ordered to Thomas, who sent them under Gen. Schofield to Pulaski, with orders to delay Hood as long as possible to allow of the needed concentration and organization at Nashville. This infantry force at Pulaski aggregated 18,000 effectives, one division of the Twenty-third corps being detached, and was further strengthened by four brigades of cavalry under Gen. James H. Wilson. Forrest's force of Confederate cavalry was four times

NASHVILLE, TENN.



1. **Jackson Monument.** 2. Vanderbilt University, Science Hall.

Wilson's. Gen. Sherman thus describes the force with Gen. Thomas at Nashville at the time of Hood's advance on Pulaski: "Gen. Thomas was at Nashville with Wilson's dismounted cavalry, and a mass of new troops and quartermaster's employees amply sufficient to defend the place." Of the sound men sent back to Thomas by Gen. Sherman when he was fitting out a perfect army for the March to the Sea, he lost 15,000 from expiration of service, or from furloughs previously granted, within a week after Hood's advance from Florence. In place of these 15,000 Thomas received 12,000 newly enlisted recruits. To secure Chattanooga Sherman telegraphed Gen. Steedman, who held the place with a small force, "You must organize and systematize the hospitals and men sent back to Chattanooga"; and to a suggestion that he might make use of some of the convalescents he was receiving from Atlanta he replied: "So far, all such detachments reported from the front are with furloughs and are awaiting transportation home."

Under such conditions Gen. Thomas was working most energetically at Nashville to organize an army to meet Hood, while Gen. Schofield, with his inferior force, was holding against him with the utmost stubbornness to gain time for Thomas.

Hood was baffled in his attempt to intercept Gen. Schofield at Pulaski and Columbia, Schofield reaching the latter place, forming solidly before Hood, who arrived 27 November, and holding him there to the limits of possibility. Again, by skilful work, Schofield reached Franklin in advance of Hood, marching his troops at night within rifle-shot of the enemy's lines at Spring Hill. Here Hood threw his army *en masse* upon Schofield, who had taken position around the town. The attack was delivered at 4 P.M., and lasted into the night. It was one of the most desperate assaults of the Confederates on any field, and most depressing for them in its results, five general officers being killed, six wounded, and one captured. (See FRANKLIN, BATTLE OF.) The night of the 30th Schofield withdrew to Nashville, and the morning of 1 December Thomas' army was united.

A part of A. J. Smith's veteran division arrived at Nashville during the battle of Franklin, but not in time to be sent to Gen. Schofield. The rest of his division, and Gen. Steedman's division from Chattanooga also arrived 1 December.

Hood advanced the day after the battle of Franklin and established his lines in front of Nashville 2 December. Not until Hood appeared before Columbia with the entire army that had confronted the three armies under Sherman, re-enforced with Forrest's 10,000 cavalry, and the fact appeared that Schofield was fighting a gallant, almost desperate game to hold him back while Thomas was working energetically to organize his forces, did the authorities at Washington and City Point realize that Thomas had been left with wholly inadequate means. In reply to a telegram from Gen. Grant in which he was directed not to "let Forrest get off without punishment," Gen. Thomas, 24 November, thus stated his real condition.

> Your despatch of 4 P.M. yesterday just received. Hood's entire army is in front of Columbia, and so greatly outnumbers mine at this time that I am compelled to act on the defensive. None of General Smith's troops have arrived yet, although they embarked at Saint Louis on Tuesday last. The transportation of Generals Hatch's and Grierson's cavalry was ordered by General Washburn I am told, to be turned in at Memphis, which has crippled the only cavalry I had at this time. All of my cavalry was dismounted to furnish horses to Kilpatrick's division, which went with General Sherman. My dismounted cavalry is now detained at Louisville, awaiting arms and horses. Horses are arriving slowly, and arms have been detained somewhere en route for more than a month. General Grierson has been delayed by conflicting orders in Kansas, and from Memphis, and it is impossible to say when he will reach here. Since being placed in charge of affairs in Tennessee, I have lost nearly fifteen thousand men discharged by expiration of service and permitted to go home to vote. My gain is probably twelve thousand perfectly raw troops. Therefore, as the enemy so greatly outnumbers me, both in infantry and cavalry, I am compelled for the present to act on the defensive. The moment I can get my cavalry, I will march against Hood, and if Forrest can be reached he shall be punished.

This created a feeling at Washington and City Point approaching a panic. It was feared that Hood might avoid Thomas, cross the Cumberland, and carry out President Davis' plan to have him push on to the Ohio. This fear was redoubled when the necessity appeared for Schofield to retire from Franklin. It was not so clearly seen that his stubborn holding against Hood had saved the situation which Sherman created. Instead of leaving Thomas, who up to that time had never lost a movement or a battle, to deal with Hood as his full knowledge of the situation might suggest, it was insisted that he should at once attack. The straits of the situation were recognized at City Point, and the day after Schofield's arrival Grant telegraphed: "Arm and put in your trenches your quartermaster's employees, citizens, etc." The fourth day Thomas was peremptorily ordered to attack. He calmly went on with his energetic preparations to deal a final blow to Hood. His despatches, clearly showing his situation and his active work, were ridiculed by Stanton and Halleck, and Grant repeated his orders to attack, and next directed Halleck to relieve him, first with Schofield, and next with Logan, and Grant himself started to take general direction, although Thomas had explained that while he had the troops ready to attack, a sleet-storm had covered the country with a sheet of ice upon which neither men nor horses could move, but that the moment it melted he would attack. When Logan reached Louisville he was met with the news of an overwhelming victory.

The two-days' battle, 15 and 16 December, was remarkable for its perfection of plan, and for the fact that in its progress to the end this plan was closely followed.

The Confederate main and advanced lines were intrenched on bold hills about two miles from the city. Their advanced salient was established within three eighths of a mile of the Union centre. The Union lines extended from the river above the city to the river below it. The Confederate lines were compact between the Murfreesboro railroad at their right and the Hillsborough turnpike, which ran south from the centre of the city, across the Union centre. Thus the Confederate lines covered less than half of the Union position. Cheatham's corps was on the right, Lee's corps formed the centre, and Stewart's corps the left.

More than half the inner line was held by quartermasters' employees under Q. M. G. Donaldson, and the rest of that line by new troops

under Gen. J. F. Miller. Gen. A. J. Smith's corps held the right of the advanced Union line, Gen. T. J. Wood's line the centre, and Gen. Schofield the left. Gen. Steedman's division was in echelon to the front on the left. The night before the battle Gen. Schofield's corps was moved to the left and front of Wood's line, and prepared to take prominent part in turning the Confederate left. The morning of the 15th fog veiled the rapid formation of Union forces in front of their works.

The battle began at 8 o'clock by a successful attack by Gen. Steedman's division upon the earthworks commanding the extreme left. This attracted the enemy's attention to that quarter. About 10 o'clock Smith's corps moved against Hood's left, and Wilson's cavalry corps of 9,000 horsemen and 3,500 dismounted men swung off in its wide circuit against the left and rear of the Confederate works, one division extending to the river below the city, and forcing back Hood's cavalry reserve under Gen. Chalmers. Forrest's main body had been sent to attack Murfreesboro. Smith's corps moved obliquely against the Confederate left flank and took it in reverse. Schofield, by a wide detour, penetrated still further to the rear. At the same time Wood assaulted in front. Wilson's troopers carried earthworks, captured 27 guns, and swept squarely into the rear of the Confederate left. These movements compelled its withdrawal for two miles. The next afternoon the same tactics were continued by Smith, Schofield, and Wilson, while Wood on the Union centre, and Steedman on the left, pushed forward to Hood's new line. This had been reformed with Cheatham on the left, Stewart in the centre, and Lee on the right. The Union lines began the attack upon Hood's position at 3 o'clock with an unsuccessful assault by two brigades from Wood and one from Steedman upon the Confederate right. Soon after 4 o'clock Smith and Wood's corps on the front, with Schofield operating on their right and against the Confederate left flank, attacked in force, soon carrying the entire line. This attack and its results Gen. Hood thus described in his official report: "The position gained by the enemy being such as to enfilade our line caused in a few moments our entire line to give way, and our troops to retreat down the pike in the direction of Franklin, most of them, I regret to say, in great confusion, all efforts to reform them being fruitless." Here 54 guns in position were captured. There was immediate and hot pursuit for 9 days, led by Wilson's cavalry, when the remnant of Hood's forces crossed the Tennessee, having suffered a loss during his campaign of over 13,500 prisoners and 72 guns, and here the Union pursuit ended. Over 2,000 deserters came into the Union lines.

The result vindicated Thomas' insisting upon waiting for the remounting of his cavalry, since Wilson with his troopers formed an essential and controlling element in the battle and in a pursuit which were designed to disintegrate an army.

The records do not show the number of men with which Hood reached Tupelo. He claims that there were 18,500 left there after 3,000 were furloughed. He further says that of 14,000 that left Tupelo to join Gen. J. E. Johnston in North Carolina 9,000 deserted. Gen. Johnston's reports show that when Hood's forces reached him they numbered 3,953 officers and men. Thus, after Nashville, Hood's splendid force of Confederate fighters did not again appear as an army on the theatre of war.

Even this complete victory, defeating the contemplated advance of the Confederate army to the Ohio, did not fully allay the panic at Washington lest Sherman's movement to the sea should prove to have left the Central West without sufficient protection, and while every possible effort in pursuit was being put forth in horrible weather, Gen. Halleck thus telegraphed Thomas:

> Permit me, General, to urge the vast importance of a hot pursuit of Hood's army. Every possible sacrifice should be made, and your men for a few days will submit to any hardships and privations to accomplish the great result. If you can capture or destroy Hood's army General Sherman can entirely crush out the rebel military force in all the Southern States. He begins a new campaign about the first of January, which will have the most important results if Hood's army can now be used up. A most vigorous pursuit on your part is, therefore, of vital importance to General Sherman's plans. No sacrifice must be spared to obtain so important a result.

Gen. Thomas, nagged beyond endurance, put an end to this style of despatches by the following reply:

> Your despatch of 12 M., this day, is received. General Hood's army is being pursued as rapidly and as vigorously as it is possible for one army to pursue another. We can not control the elements, and you must remember that, to resist Hood's advance into Tennessee, I had to reorganize and almost thoroughly equip the force now under my command. I fought the battle of the 15th and 16th instant with the troops but partially equipped; and, notwithstanding the inclemency of the weather and the partial equipment, have been enabled to drive the enemy beyond Duck River, crossing two streams with my troops, and driving the enemy from position to position without the aid of pontoons, and with but little transportation to bring up supplies of provisions and ammunition. I am doing all in my power to crush Hood's army, and, if it be possible, will destroy it. But pursuing an enemy through an exhausted country, over mud roads completely sogged with heavy rains, is no child's play, and can not be accomplished as quickly as thought of. I hope, in urging me to push the enemy, the department remembers that General Sherman took with him the complete organization of the Military Division of the Mississippi, well equipped in every respect, as regards ammunition, supplies, and transportation, leaving me only two corps, partially stripped of their transportation to accommodate the force taken with him, to oppose the advance into Tennessee of that army which had resisted the advance of the army of the Military Division of the Mississippi on Atlanta, from the commencement of the campaign till its close, and which is now, in addition, aided by Forrest's cavalry. Although my progress may appear slow, I feel assured that Hood's army can be driven from Tennessee, and eventually driven to the wall by the force under my command. But too much must not be expected of troops which have to be reorganized, especially when they have the task of destroying a force, in a winter's campaign, which was able to make an obstinate resistance to twice its numbers in spring and summer. In conclusion, I can safely state that this army is willing to submit to any sacrifice to crush Hood's army, or to strike any other blow which may contribute to the destruction of the rebellion.

This changed the tone of despatches from Washington and City Point. Grant and Stanton sent congratulations, and Grant, in his official report, after setting forth his impatience and apprehensions that Hood would go north, said of Thomas: "But his final defeat of Hood was so complete, that it will be accepted as a vindication of that distinguished officer's judgment."

H. V. Boynton.

Nashville, University of, in Nashville, Tenn., a coeducational institution founded in 1785 by the State of North Carolina as Davidson Academy. In 1806 after Tennessee had been

JAMES NASMYTH,

INVENTOR OF THE STEAM HAMMER AND STEAM PILE DRIVER.

founded, the name was changed to Cumberland College, and in 1826 to the University of Nashville. The school was closed during the Civil War. The trustees of the university and of the Peabody Fund united in 1875 in establishing a normal school for the training of teachers. Montgomery Bell Academy and Winthrop model school constitute the preparatory department, and the other departments are collegiate and medical. The courses of study lead to the degrees of A.B., B.S., and B.L. In 1902 there were connected with the school 35 professors and instructors and about 900 students. In the preparatory department there were 325 pupils. The library contained over 20,000 volumes, and the grounds, buildings and furnishings were valued at $205,000; the productive fund was about $106,500; and the annual income about $80,000.

Nashville Convention, in American history, a convention of delegates from the Southern States held at Nashville, Tenn., in June 1850, called to consider the slavery question and the encroachments of Northern abolitionists. The Wilmot Proviso and the Missouri Compromise were disapproved, but resolutions of open resistance advanced by Texas, South Carolina and Mississippi were voted down. The convention which was never generally popular, met again in November, and again moderate resolutions were adopted.

Nasik, nä'sĭk, or **Nassick,** India: (1) the capital of a district of Bombay on the Godavari, 31 miles from its source, and 100 miles northeast of Bombay. It is the headquarters of Brahmanism in the Deccan and one of the most sacred of Hindu pilgrim resorts; the banks of the river here are crowded with temples and shrines. Nasik is the Nasica of Ptolemy and was anciently a Mahratta capital. It has noted manufactures of brass and copper work, paper, cotton, etc. Pop. (1901) 21,500. (2) The district has an area of 5,940 square miles; pop. (1901) 819,575.

Nasmyth, nā'smĭth, **Alexander,** Scottish painter: b. Edinburgh 9 Sept. 1758; d. there 10 April 1840. He chose portrait painting as his specialty; became Allan Ramsay's pupil and subsequent assistant and accompanied that artist to London. He returned to Edinburgh (1779); and traveled in Italy (1782), where he devoted himself to landscape and historical painting. Among his works is the famous portrait of Burns in the London National Gallery, the large 'River Scene' owned by the Society of Arts; 'The Port of Leith' (1824); and 'The Lawn Market' (1824); in 1822 he published 16 scenes described by Sir Walter Scott. His landscapes are finely composed and very impressive, though he is inferior as a painter to his son Patrick (q.v.). The Nasmyths were an artistic race and between 1829 and 1866 no less than six woman painters of the family exhibited in London.

Nasmyth, James, Scottish engineer: b. Edinburgh 19 Aug. 1808; d. South Kensington, 7 May 1890. He was the son of Alexander Nasmyth (q.v.), the Scottish landscape painter. After study at Edinburgh University, he went to London in 1829, offered his services to Maudsley, founder of a well known engineering firm, and was appointed assistant in his private workshop. There he remained till 1831, when he returned to Edinburgh, and constructed a set of engineering tools with which he began business in 1834 at Manchester. Here he was so successful that he had soon to erect a large new workshop at Patricroft near Manchester, where he became famous as a machine constructor and inventor. Chief among his inventions was the steam-hammer, designed in 1839, and in 1842 patented in an improved form. The first hammer was constructed from a view of Nasmyth's sketches by Schneider at Creuzot, in France, about 1841; but the first British one was erected by Nasmyth at Patricroft in 1843. Among Nasmyth's further inventions are a nut-shaping machine, a hydraulic punching-machine, and a flexible shaft for driving small drills. In 1856 he retired from the firm of Nasmyth, Gaskell & Co., which he had founded, and devoted himself to the study of astronomy. He was the first to observe the mottled appearance of the sun's surface known as "willow-leaves" or "rice grains" (1860). He is the author of 'Remarks on Tools and Machinery' in Baker's 'Elements of Mechanism' (1858); 'The Moon Considered as a Planet, a World, and a Satellite' (1874), with James Carpenter; and an autobiography edited by Dr. S. Smiles (1883).

Nasmyth, Patrick Milner, Scottish painter: b. Edinburgh 7 Jan. 1787; d. Lambeth, London, 17 Aug. 1831. He studied under his father and developed a great talent for landscape, though he labored under the difficulties of ill health, and a crippled right hand which necessitated the use of the left in painting. He came to London in his 20th year and made his reputation by his first picture exhibited at the Royal Academy 'A View of Loch Katrine' (1809). He invariably painted *en plein air,* and in his last sickness was raised on his bed that he might watch through the window the violent thunderstorm that was raging outside and in the progress of which he expired. His pictures are highly valued and his 'View in Surrey' sold (1892) for £2,625 ($13,125).

Naso, nä'sō. See OVID.

Na'son, Elias, American biographer: b. Wrentham, Mass., 21 April 1811; d. North Billerica, Mass., 17 June 1887. He was graduated from Brown University in 1835, engaged in teaching and was ordained a Congregationalist minister in 1852. He was the author of: 'Life of Governor Andrew' (1868); 'Life of Charles Sumner' (1874); 'Lives of Moody and Sankey' (1877); 'Originality' (1882); and many other works.

Nason, Emma Huntington, American poet: b. Hallowell, Maine, 6 Aug. 1845. She was graduated from the Maine Wesleyan Seminary and Female College in 1865 and was married to C. H. Nason of Augusta, Maine, where she has since resided. She has published 'White Sails' (1888), and 'The Tower, with Legends and Lyrics' (1895).

Nasqa, näs-hä'. See NASS INDIANS.

Nasr-ed-Deen, näs'r-ĕd-dēn', Shah of Persia: b. 24 April 1831; d. 1 May 1896. He was not the eldest son but the ability and influence of his mother induced his father, Mohammed Mirza, to proclaim him his heir and he succeeded to the throne in 1848. His accession was disputed by the reformer El Bab, but the new

shah crushed the opposition mercilessly and became the ablest ruler that Persia had had in many years. He studied European methods of warfare and proved himself a master of finance. He crushed the insurrections which broke out in various provinces and by his occupation of Herat in 1856 provoked a war with Great Britain which was concluded in 1857. In 1873-8 and in 1889 he visited Western Europe and endeavored to establish more friendly relations with England, soon, however, returning to his friendship with Russia. He favored progress and western civilization in so far as it did not conflict with his despotic rule, and under his reign the telegraph through Persia connecting Europe and India was built. He was assassinated in 1896.

Nass (näs) **Indians**, or **Nasqa**, or **Nishgar**, a general name for several tribes residing on the Nass River, British Columbia. They live in seven villages and number perhaps 1,000. They have not decreased in numbers in recent years and are steadily improving in morals and intelligence.

Nassau, näs'sow, **Joan Mauritz van**, COUNT OF NASSAU-SIEGEN, Dutch general and statesman: b. Delft, Holland, 17 June 1604; d. Cleves, Prussia, 20 Dec. 1679. He was governor-general of the Dutch possessions in Brazil in 1637–44 and had a brilliant and prosperous administration. He defeated the Spanish and Portuguese and upon his return to Holland was made lieutenant-general of cavalry; in 1647 he was governor of Cleves and in 1665 commanded the army of the Netherlands. He became governor of Utrecht in 1674.

Nassau, Germany, a former independent duchy, now as Wiesbaden, forming a district of the Prussian province of Hesse-Nassau (q.v.). The chief town is Wiesbaden (q.v.). The family of Nassau, the elder branch of which reigned till 1866, dates from the 10th century. The younger branch inherited in 1544 the principality of Orange (q.v.), and as the princes of Orange took an important place in European history. The reigning Duke of Nassau sided against Prussia in 1866, and his duchy was incorporated with Prussia (see PRUSSIA: GERMANY). On the extinction of the male line of the Orange branch by the death of William III. of Holland, in 1890, the Duke of Nassau became Grand-Duke of Luxemburg.

Nassau, näs'â, the capital of the Bahama Islands (q.v.), situated on the north coast of New Providence, the largest island of the group. The town is built on a steep hill, is well laid out, and has fine government and other public buildings, and handsome residences. The climate is mild and healthful, and Nassau is a popular winter health resort for Americans and West Indians. There is a good harbor, and an active general trade is carried on. The United States is represented by a consular agent. Pop. 10,000.

Nassau, Fort, N. J., a former fort on the Delaware River, near the present site of Gloucester, N. J. The fort was built by Capt. Jacobus May, in 1831.

Nasse, näs'sĕ, **Erwin**, German political economist: b. Bonn 2 Dec. 1829; d. there 4 Jan. 1890. He was educated in Bonn and became prominent as an economist. In 1869–79 he served in the Prussian Lower House and in 1889 became a member of the House of Peers. He founded and was president of the Verein für Socialpolitik. He published: 'Ueber das preussische Steuersystem' (1861); 'Ueber die mittelalterliche Feldgemeinschaft in England' (1869); 'Agrarische Zustände in England' (1884); etc.

Nassick. See NASIK.

Nast, Thomas, American caricaturist: b. Landau, Bavaria, 27 Sept. 1840; d. Guayaquil, Ecuador, 7 Dec. 1902. His mother brought him to this country in 1846. He was employed as doorkeeper in Bryant's Art Gallery, Broadway and 13th Street, New York, where he spent his spare time copying the paintings. For six months he studied in a drawing class, then became a draughtsman for 'Frank Leslie's.' In 1860 he was sent to England to draw for the 'Illustrated News' the Heenan-Sayers prize fight; in 1861 drew sketches of the Italian campaign; in 1862 joined the 'Harper's Weekly' staff and by his clever cartoons soon became famous. But with his purely political and personal caricatures dating from 1871–3, when he attacked the Tweed Ring in New York city, drew the money-bag head of Tweed and the first Tammany tiger, and largely contributed to the defeat of the Ring, he came to new fame and power. He bitterly opposed Greeley in 1872, Tilden in 1876, and Hancock in 1880, urging against each of these nominees his inevitable connection with Tammany Hall. In 1884 he attacked the Republican candidate for the only time, but with unusual bitterness. He left 'Harper's Weekly' in 1887, and in 1894 became a member of the staff of the *Pall Mall Gazette*. In May 1902 he was appointed United States consul at Guyaquil, where he died of yellow fever. For several years he published 'Nast's Almanac,' with his own illustrations to text by various authors. Nast did some oil-painting, especially of scenes in the Civil War. He was a great caricaturist, as realistic as the French masters in his groups and as dignified as Tenniel in his single figure cartoons.

Nastur'tium, the Indian cress (*Tropæolium majus*), an American climbing annual with pungent fruits and showy orange flowers; or *T. minus*, a smaller species. See TROPÆOLIUM; CRESS.

Na'sua. See COATI.

Nat Turner's Rebellion, in American history, a term applied to a negro insurrection at Southampton, Va., in 1831. The rebellion was led by Nat Turner, a negro slave, who believed himself chosen by God to free the colored race. At an appointed time he set out with several hundred followers going from house to house with the intention of killing all white persons. Before the authorities dispersed the rebels 55 persons were killed. After hiding for some weeks in the Dismal Swamp, Turner was captured and hanged.

Nata, nä'tä, in Mexican mythology, the name of a former legendary prophet, who resembled the Noah of Biblical times.

Natal, nȧ'tăl', Africa, a British colony on the southeast coast, bordering on the Indian

Ocean, and bounded by Portuguese East Africa, the Transvaal, and Orange River colonies, Basutoland, and Cape Colony. Including Zululand, annexed in 1897, it has an estimated area of 35,019 square miles. In January 1903 the former Transvaal districts of Vryheid, Utrecht, and part of Wakkerstroom were transferred to Natal.

Topography.— The chief natural boundary on the land side is formed by the Drakensberg Mountains, separating it from the Orange River Colony and Basutoland. The Tugela River separates the colony proper from the Zulu country; on the southwest the Umzimkulu and Umtamvuna partly separate it from Cape Colony. The 400 miles of coast-line contains the mouths of numerous streams, but is destitute of creeks and bays, having only one sheltered anchorage at Port Natal (on which stands the seaport Durban), a fine circular bay completely landlocked, capacious enough to contain whole fleets, and deep enough within to float the largest vessels. The surface is finely diversified, rising by successive terraces from the shore toward the lofty mountains on its western frontiers. The chief summits are Champagne Castle, 10,357 feet; Mont aux Sources, about 10,000 feet; and Giant's Castle, 9,657 feet. From the main chain numerous transverse branches proceed nearly at right angles, and form a series of minor watersheds, separating the different streams. The mountains descend very gradually on the west, and may be regarded as the abutments of a very elevated table-land, but they present precipitous fronts to the east, and are so broken by chasms and ravines that they were at one time regarded as impassable.

Hydrography.— The colony has a great advantage over most of the districts of South Africa in its abundance of perennial streams, though these are all too shallow to be navigable, while many flow through precipitous ravines and rocky gorges. The most important rivers are the Tugela, which has a course of about 150 miles, its tributary, the Buffalo, or Umzinyati, being also a considerable stream; the Umvoti, Umgeni, and Umkomanzi, farther to the south; and the Umzimkulu, which partly separates Natal from Cape Colony.

Geology and Mineral Resources.— The prevailing stratified rocks are sandstone and slate, often thrown into confusion and pierced by igneous rocks, particularly basalt, greenstone, and porphyry, which assume the form both of continuous ridges and isolated hills, and often cover extensive areas. The mineral productions are principally coal, iron-stone, limestone, and marble. Coal is worked and is used on the railways, and the iron-stone is also being utilized. There are rich gold-fields in Zululand.

Climate.— The climate on the whole is extremely salubrious. On the coast the range of temperature is from 47° to 88°, giving an average in summer of 76° and in winter of about 55°; in the interior, at the town of Pietermaritzburg, the mean temperature of July, the coldest month, is 55°; of February, the hottest, 80½°; and of the whole year, 67°. During the rainy season (October to March) thunder showers are of almost daily occurrence. Long droughts are almost unknown.

Vegetation.— Under such a climate, and with a soil of considerable fertility, vegetation is obviously vigorous. Timber-trees everywhere exist in sufficient numbers for the wants of the colony, and on the western frontiers as well as elsewhere form considerable forests, for the most part unencumbered by the underwood which prevails in Cape Colony.

Fauna.— The wild animals include the leopard, hyena, tiger-cat, antelopes, jackal, ant-bear, and porcupine. The hippopotamus has still his haunts in several of the rivers, and there are numbers of small crocodiles; while snakes, some of them venomous, are also plentiful. The birds comprise the vulture, several varieties of eagle, and the secretary-bird, etc.

Agriculture.— In the level districts of the interior, wheat, barley, oats, beans, and vegetables of almost every description have been largely and successfully grown; but the chief crop everywhere is maize, of which even two good crops can be raised in the year. In many parts the vine thrives well, various fruits are cultivated, and could be produced in unlimited quantities. In the coast districts, where the climate is tropical, the sugarcane is cultivated with success. In similar localities tobacco, arrowroot, ginger, bananas, pine-apples, etc., also grow well. Tea has begun to be cultivated with good prospects, and coffee is also grown to a small extent.

Commerce, etc.—In 1901 the total value of exports amounted to about $23,000,000, wool being by far the largest, others being gold, sugar, coal; the imports were valued at about $48,000,000, mostly manufactured goods. The railways, which belong to the government, have a length of over 600 miles, and extend into the Orange River Colony and Transvaal.

Government.— Natal has since 1893 been under a governor, a legislative council, and a legislative assembly. The governor represents the king, and is appointed by the home government. He appoints an executive of not more than six ministers, and with their advice nominates the members of the legislative council, a body consisting of 12 persons. The legislative assembly consists of 39 elected members, the electors having the right of voting in virtue of a small property qualification. The assembly is elected for a term of four years, but may be dissolved before the end of this period. All bills must receive the governor's assent before they become law. For administrative purposes the colony is divided into counties, of which that of Pietermaritzburg is so named from containing the capital, situated about 54 miles inland. The only seaport, and the largest town, is Durban, on Port Natal. There are somewhat special regulations for Zululand, which at present bears the designation of a "province." Education is well attended to, there being government high and primary schools, many aided private schools, and schools for Kaffir and coolie children.

History.— Natal owes its name to having been discovered on Christmas Day, 1497, by Vasco da Gama. In 1823 a small English settlement was formed on Port Natal. Subsequently large numbers of discontented Boers from the Cape Colony entered the country as settlers. A treacherous massacre of part of the Boers by Dingaan, chief of the Zulus, in 1838, led to hostilities, in which Dingaan was ultimately driven beyond the frontiers. In 1839 the Boers pro-

claimed themselves an independent republic, also declaring their determination to establish diplomatic relations with European powers. The establishment of a hostile settlement at the only port between Algoa and Delagoa bays, and at a valuable entrance from the coast to the interior of South Africa, was so obviously incompatible with British interests that a force was despatched from the Cape, and after some fighting the Boers submitted, except a discontented section, who retired beyond the Drakensberg range. The territory was proclaimed British in 1843. It formed an integral part of the Cape Colony until 1856, when it was erected into a separate colony. Its prosperity has been affected by the Kaffir troubles, as well as by the British complications with the Transvaal Boers; and in 1899–1900 it suffered severely in the South African war (q.v.). Pop. (1901) 925,118, including 786,912 Kaffirs, 74,385 Asiatics, and 63,821 Europeans; the newly transferred Transvaal districts, already mentioned, give an additional 58,000, comprising 50,000 Kaffirs and 8,000 Europeans.

Natal, Brazil, the principal seaport and capital of the state of Rio Grande do Norte, at the mouth of the river of that name, on the Atlantic, 150 miles north of Pernambuco. Notwithstanding the sand-bars at the entrance to the harbor, considerable export trade is carried on chiefly of cotton, sugar, rubber, etc., about $1,000,000 annually. The United States is represented by a consular agent. Natal was originally called CIDADE DOS REIS. Pop. 10,000.

Natalie, năt'a-lē, a queen of Servia: b. 14 May 1859. She is a daughter of Pierre Ivanovitch Keschko, a Russian officer, and married Prince Milan, afterward king of Servia, in 1875. The marriage turned out unhappily, and the union was broken in 1888, when Milan obtained a divorce. The king abdicated in the following year, and Natalie, returning to Belgrade, the Servian capital, resided there for a time with her son, King Alexander, enjoying the favor of the people; but in 1891, at the request of the National Assembly, left the country on account of political interests. Becoming reconciled to Milan in 1893, she resumed her former relations with the royal family; and returning to Belgrade in 1895, she was greeted by the people with every token of popularity. Her residence has since been chiefly in Biarritz, France; and after the assassination of King Alexander (1903) the political authorities at Belgrade decreed that she should not again enter the Servian kingdom.

Natato'res, an obsolete group of birds, the swimmers, artificially allied by Illiger on their likeness in pursuing an aquatic life, but structurally having relationships with several natural orders. Similar illogical groupings in the same by-gone but once popular classification were *Clamatores,* the screamers; *Scansores,* the climbers; *Cursores,* the runners; etc.

Natchez, năch'ĕz, Miss., city, county-seat of Adams County; on the Mississippi River, and on the Yazoo & M. V. and the New Orleans & N. R.R.'s; about 90 miles in direct line southwest of Jackson and 65 miles below Vicksburg. It has steamer connection with all the Mississippi River ports. The city is on a bluff about 200 feet above the river. On this bluff was located the first settlement, by Bienville, who built here Fort Rosalie in 1716. The place was destroyed and many of the inhabitants murdered, in 1729, by the Natchez Indians. The fort came into possession of the English in 1763, when the name was changed to Fort Parmure. In 1779 the Spaniard took possession, and in 1798 the Unite States became undisputed owner of lands east of the Mississippi, which included Natchez and much of the adjacent territory. From 1798 to 1820 Natchez was the capital of Mississippi; in 1803 it was incorporated as a city. During the Civil War the city suffered considerable loss of property and damage to its industries and commerce. In 1862 Commodore Porter shelled the city, and in 1863 Federal troops took possession and retained control until peace was declared. The country surrounding Natchez is chiefly devoted to agriculture; cotton is the principal product. The principal industries of the city are connected with the manufacturing and shipping of cotton products. It has ice factories, planing mills, foundries, machine-shops, and furniture factories. Natchez has a large trade in cotton, shipping each year thousands of bales. Considerable rice and sugarcane are shipped from this port. On a bluff just outside the city limits is a National cemetery, which contains 3,159 graves, 2,780 of unknown dead. The city has Memorial Park, Temple Opera House, a court-house, the city public buildings, Institute Hall, several excellent hotels, and a large number of handsome residences. It is the seat of Stanton College and Natchez Institute, and has good public and parish schools, and the Fisk Library. There are two orphanages and a number of private schools. The government, in accordance with the charter of 1877, is vested in a mayor, who holds office two years, and a council. The school board are elected by the council. Pop. (1890) 10,101; (1900) 12,210.

Natchez Indians. See CREEKS.

Natchez, nä-chāz, **Les,** a romance by Chateaubriand, published in 1825–6, many years after the author first planned it. The work was written during his exile in England, long after his journeyings in America, of which country it contains his views as well as setting forth his psychological speculations and philosophy of life. It is pervaded by the elements of that romanticism with which, through this and other works, the name of Chateaubriand (q.v.) is associated.

Natchitoches, năch-ĭ-tŏch'ĕz, an American Indian tribe formerly living along the banks of the Red River, in Louisiana. They were driven from their homes by the Natchez and united with the Caddoes in 1731.

Natchitoches, năk-ĭ-tŏsh', La., town, parish seat of Natchitoches Parish; on a short stream which flows into the Red River, and on the Texas & Pacific railroad; about 150 miles in direct line northwest of Baton Rouge, the capital of the State. The town is on the site of what was once a French trading post established in 1714. It is situated in an agricultural region in which the chief products are sugarcane and cotton. Considerable attention is given to stock-raising. The principal industries of the town are connected with the shipment of the agricultural products and live-stock. It is the seat of the State Normal School and of Saint Mary's Academy (R. C.); and it has a high school, public

and parish elementary schools. Pop. (1890) 1,820; (1900) 2,388.

Na'than, Hebrew prophet in the time of David and Solomon. He was probably much younger than David, and lived late into the reign of Solomon. He was in his time the latest direct descendant and representative of the schools of the prophets under Samuel. Saint Jerome mentions a Jewish tradition which identifies him with the eighth son of Jesse, but there is no ground for this supposition. His earliest appearance in the history of David is as the King's counsellor, first advising the building of the temple and then after a vision announcing that the time had not yet come (about 1010 B.C.). His power, eloquence and tact as a prophet are shown by his exquisite apologue of the ewe lamb which brought David to a sense of his guilt in the case of Bathsheba (1000 B.C.). On the birth of Solomon the prophet named the child Jedidah, "beloved of the Lord," and was entrusted with his education. When the end of David's reign approached Nathan advocated the succession to Solomon, counseled Bathsheba to secure it, and rebuking the indifference of the King, obtained his presence and assistance at the inauguration of his successor (977 B.C.). Nathan's sons occupied high posts in the new court, Nabud being "the King's friend" and principal officer or chamberlain, while Azariah was over the "twelve officers which provided victuals for the King and his household." It was in accordance with the counsels and suggestions of this prophet that David, the year after his son's accession, crowned the work of his life, as poet, musician, and promoter of a rich temple ritual, by introducing into public worship an orchestra of Levites. Eccles. ix. 14–16, a passage attributed to Solomon, is evidently an imitation of 2 Sam. xii. 1–4, which shows how the influence of Nathan was perpetuated in the literature of succeeding ages. He left two works behind him, a life of Solomon and a life of David. He died about 935 B.C., and his grave is still pointed out at Halhul, five miles north of the ancient Hebron.

Nathan the Wise, a dramatic poem by Gotthold Ephraim Lessing, published in 1779. It expresses Lessing's ideal of the theatre as the pulpit of humanity and is concerned with the search for truth under all creeds, the protest of natural kinship against the artificial distinctions and divisions of mankind on religious grounds, and the elevation of brotherly love to the highest place in the Divine favor. The scene is in Jerusalem and the plot turns upon the fortunes of a certain Christian knight in wooing for his bride Recha, the supposed child of the Jew Nathan. Moses Mendelssohn, the friend of Lessing, is portrayed in the character of Nathan. Consult translation of 'Nathan the Wise,' by Ellen Frothingham (1868).

Nathan'ael, one of the earliest believers in and follower of Christ. He was a native of Cana in Galilee, and attached himself to Jesus on becoming convinced of the Messiahship of the son of Mary by his miraculous insight and power of reading the heart (Saint John i. 46–49). On the hypothesis that he was one of the twelve he has been identified with Bartholomew, but on insufficient grounds. There is a tradition that Nathanael was the bridegroom at the marriage at Caana, and Epiphanius implies that he was one of the two disciples whom Jesus overtook on the way to Emmaus.

Nat'ica, a genus of sea-snails, forming the type of the family *Naticidæ*. The shell is globose in form, the spiral portion being minute and indistinctly marked; smooth and porcelain-like, and its aperture of large size and semicircular form. The animal appears large in proportion to the shell, the foot especially being extensive. The mantle-lobes partly conceal the shell, and an operculum is always present. Most of the genera of this family are marine, and the white, chalky *N. heros* is a familiar species all along the eastern coast of the United States, and lays its eggs in a collar-shaped mass of glutinous material mixed with sand which often excites the curiosity of the stroller by the seaside. This shell is the one most frequently chosen by our hermit-crabs. Consult Arnold, 'The Sea-Beach at Ebb Tide' (1901).

Natick, nā'tĭk, Mass., town in Middlesex County; on the Charles River, and on the Boston & Albany railroad. The head of Cochituate Lake, one of the sources of the water supply of Boston, is in the northwest part of the town. The place was founded by John Eliot (q.v.), and from 1651 to the time of the founder's death, it was used chiefly as a home for converted Indians. In 1781 it was incorporated as a town. The chief manufactures are shirts, men's clothing, boots, shoes, edge tools, boxes, baseballs, and supplies for athletic games. A monument in honor of John Eliot is in one of the public parks and a soldiers' monument in another park. Some of the educational institutions are the Morse Institute, the Walnut Hill High School for young women, and the Bacon Public Library. Pop. (1890) 9,118; (1900) 9,488. Consult: Hurd, 'History of Middlesex County, Mass.'; Bacon, 'History of Natick.'

Nation, either a people inhabiting a certain extent of territory and united by common political institutions; or an aggregation of persons of the same ethnological family and speaking the same or cognate language. See GOVERNMENT.

National Academy of Design. See ACADEMY OF DESIGN, NATIONAL.

National Academy of Sciences. See ACADEMY OF SCIENCES, THE NATIONAL.

National Airs. See NATIONAL SONGS.

National Arts Club, organized in New York city, to promote acquaintance among art workers and art lovers, to provide proper exhibition facilities, and to encourage the publication of works on art. The club holds monthly exhibitions.

National Assembly. See ASSEMBLY, NATIONAL.

National Association for the Promotion of Social Science, a British institution designed to promote the increased cultivation of physical science and the facilitating of friendly intercourse among its followers. In addition, however, to the subjects relating to this branch of knowledge, a series of highly important questions bearing vitally on the well-being and prosperity of the country have largely engaged public attention of late years. They comprehend

the science of social economy in all its branches, as regards public health and morality, education, crime, with its causes, prevention, and punishment, the mutual relations of employer and employed, and generally all those phases and laws which result from the social compact and develop themselves proportionately with the advancement of civilization and refinement. The project of establishing an association which should be specially devoted to the investigation and discussion of these topics was first suggested to Lord Brougham in the end of 1856. The first meeting was held at Birmingham in 1857, and meetings were subsequently held in London, Edinburgh, Glasgow, Dublin, Manchester, Liverpool, Newcastle, Aberdeen, Bristol, and other important towns. Many valuable and interesting papers were read at the meetings of the society, which published annually a volume of Transactions containing the most important reports, addresses, and papers.

National Association of Democratic Clubs, The, an organization formed 4 July 1888, of 21 local clubs; which had increased in 1903, to over 10,000 clubs, with a membership of 1,200,000. The headquarters of the association are in New York city.

National Banking System. See BANKS AND BANKING; FINANCE.

National Banks. See BANKS AND BANKING.

National Board of Health, The, a Federal body, instituted by Act of Congress, 3 March 1879, to consist of 11 members; one army surgeon, one navy surgeon, one medical officer of the marine hospital service, one officer of the Department of Justice, and seven physicians from civil life.

National Cemeteries are burial grounds, instituted by Act of Congress, for the interment of United States soldiers who have fallen in battle, and whose graves become, accordingly, a sacred national charge. These graves, 316,236 in number, are distributed in 72 special, or "National," cemeteries, and in 320 of the local cemeteries of the country. The names of 175,764 (more than one half) of the dead have been preserved and attached to the graves. Of the rest it is only known that they died fighting in the Federal armies; their graves marked with the sad inscription, "Unknown United States Soldier." Of the whole number, less than one-fifth now repose in their original graves; 257,520, or more than four-fifths, have been removed from the rude trenches of the battlefields, or from their roadside graves. The largest National cemetery in the country is at Vicksburg, Miss. About 17,000 are interred here. Near by is the cemetery at Natchez, where 3,200 are buried. In the immediate vicinity are the cemeteries of Port Hudson, Baton Rouge and Alexandria. A National cemetery that is very little known is Jefferson Barracks, located about 18 miles below Saint Louis, Mo. Over 11,800 are buried here, and the cemetery is one of the grandest sites in the world. It is about 300 feet above the Mississippi, on the west bank, and commands a view in all directions over the bottom lands. This cemetery is remarkably well kept, although it does not contain as many trees as one feels ought to be there. The National cemetery on the Custer battlefield in Dakota is perhaps the strangest burying-place in all the world. It is a most barren spot, containing an enormous marble shaft, with 414 graves grouped around it. The strange thing about this cemetery is that all those sleeping there were killed on the same day. It is not generally known, but the United States maintains a National cemetery at the City of Mexico. The 6,184 buried there are the victims of the Mexican war. For a complete list of National cemeteries see MILITARY POSTS, U. S.

National Christian League for the Promotion of Social Purity, an American organization with headquarters in New York, founded for the purpose its name implies. The league has established a home in New York for self-supporting women, and has organized an auxiliary known as the Social Culture Club.

National Civic Federation, The, an American organization, founded 16 Dec. 1901; the outgrowth of a number of local conventions representing capital and labor. It is entirely non-partisan in principle, considering such topics as imperialism, trusts, tariff, taxation, etc., with a view of obtaining the clearest understanding of them. The federation is controlled by an executive committee of 30 members and meets annually, or at such other times and in such localities as may be deemed advisable. Its membership consists of men from all parts of the country, including a large number prominent in the various occupations of life. The by-laws of the federation provide the following standing committees: Foreign Relations, Insular Affairs, Banking and Currency, Industrial Combinations, Interstate and Foreign Commerce, Consular and Diplomatic Service, Military and Naval Affairs, Labor, Education, Immigration, Municipal Government, Taxation, Civil Service, Indian Affairs, and the Negro Question. See INDUSTRIAL COMMISSION.

National Conference of Charities and Correction, an American association composed of State boards of public charities and various charity organizations. The National conference is held each year in some city determined upon at a preceding meeting. At these conferences papers are read and general subjects embraced under charity and correction are discussed.

National Convention, in France, a legislative body constituted in the hall of the Tuileries, 17 September, and formally opened 21 Sept. 1792. This convention continued till a new constitution was organized, and the executive directory was installed at the Little Luxembourg, 1 Nov. 1795. The Chartists in England formed a National Convention in 1839. In the United States a National Convention is the meeting once in four years of a political party assembled to select a presidential ticket. See ELECTIONS.

National Covenant, a league formed by Scotch Presbyterians in 1638. See COVENANT.

National Debt. See DEBT, NATIONAL.

National Divorce Reform League. See MARRIAGE AND DIVORCE.

National Education, Systems of. See EDUCATION IN THE UNITED STATES; EDUCATIONAL ORGANIZATION AND ADMINISTRATION.

National Educational Association, an organization of teachers and educators in the United States, formed "to elevate the character and advance the interests of the profession of teaching and to promote the cause of popular education." It was established in 1857 as the National Teachers' Association, and assumed the present name in 1870. Meetings have been held annually in the different States and in Canada, at which important educational questions have been discussed; and the 'Proceedings' (published annually) contain papers of great educational value and interest. Before 1870 all discussions were held before the whole association as a body, but since then various departments have been organized for the consideration of special topics, including normal school and kindergarten departments, and the national council of education, this latter, consisting of 60 members elected from the association, has published several important reports. A permanent endowment of about $90,000 has been secured; the active members of the association in 1903, numbered 2,800, and the associate members attending the annual meetings have averaged 10,000 for the past few years.

National Expansion is the acquisition of territory, whether by conquest, seizure, or purchase. Since the treaty of peace with Great Britain in 1783 the United States has expanded in area about five-fold. By the peace protocol signed by representatives of Spain and the United States, 12 Aug. 1898, it was provided that Porto Rico and other Spanish islands in the West Indies and an island in the Ladrones should be ceded to the United States, and that the latter should "occupy and hold the city, harbor, and bay of Manila pending the conclusion of a treaty of peace, which shall determine the control, disposition, and government of the Philippines." By this treaty the Philippine Islands were ceded to the United States, the latter paying Spain $20,000,000. Subsequently the United States bought two other islands in the vicinity for $100,000. See ANNEXATION; COLONIES AND COLONIZATION.

National Farmers' Alliance. See FARMERS' ALLIANCE.

National Gallery, The, the British national picture gallery; a collection of paintings, in Trafalgar Square, London. It originated in a collection formed by Mr. Angerstein, consisting of 38 pictures, 29 by old masters and 9 by British painters, and purchased with public funds in 1824 for $280,000 as the nucleus of a national gallery. Since that time the collection has been greatly enlarged by purchases out of funds provided by Parliament, as well as by bequests and gifts. Of the latter the most munificent has been that of Mr. Vernon in 1847, a collection of 157 works of English painters. Another highly valuable section is that of the pictures and drawings by Turner bequeathed to the nation at his death in 1851. In 1871 a valuable prize was secured by the purchase for $375,000 of Sir Robert Peel's collection, consisting of 77 paintings and 18 drawings. In 1885 Parliament voted $350,000 for the purchase of a single picture, the 'Ansidei Raphael,' together with $87,500 for another, Van Dyck's 'Charles I. on Horseback.' The National Gallery now comprises fully 1,200 pictures, and though specially strong in examples of the British school of painting, foreign masters are fully represented. The various early and late Italian schools are extensively illustrated; there are good examples of the chief representatives of Italian art, as Raphael, Correggio, Paul Veronese. There are a few good examples of Murillo and Velasquez and the Spanish school; and the great Dutch and Flemish painters, Rembrandt, Rubens, Van Dyck, etc., are well represented.

National Grange. See GRANGERS.

National Guard. See MILITIA.

National Hymns. A national hymn as usually understood is the official song rendered on ceremonial occasions, fêtes, and other public gatherings. It is sometimes an air (without words) that is recognized by the government, a march played by bands and orchestras to stimulate patriotism and loyalty to the ruler. While the oldest of national hymns now extant date back less than five centuries, lines breathing the spirit of patriotism were written by Horace and other poets of ancient times. The national song is intimately related with, and probably grew out of, the folk-song. Words and music should convey something of the national temper, should voice the aspiration of a people, and express to some extent the ideas that a nation stands for. Love of fatherland and pride in one's country are the keynotes of many national anthems. In some of them religious feeling is blended with patriotic sentiment. The tune as well as the lyric should be by a native composer. In Europe the writers of national hymns have usually been enlisted in the service of institutionalism. Their productions have been often inspired by devotion to church and state, also by love of home. Considering the lack of poetical merit in most national songs, their influence has been very great. Wars and revolutions have sometimes called them into being, and in these especially the note of freedom is emphasized.

Austria.— The Austrian national hymn, 'Gott erhalte unsern Kaiser,' was written in 1797 by Laurence L. Haschka (1749–1827); music by Joseph Haydn (1732–1809). A stanza is quoted:

God preserve our Franz in glory, Franz our Emp'ror good and great!
High in wisdom, famed in story, we his praises celebrate;
Love of subjects young and hoary bind his crown of regal state,
God preserve our Franz in glory, Franz our Emp'ror good and great!

Hungary. Among the patriotic songs of Hungary the one most frequently heard is 'Isten áld meg a Magyart' (Lord, bless the Hungarian), which is wed to a striking melody. The renowned 'Rákótzy March' has even greater power over Hungarians. Bohemia, now included in the Austrian empire, has two well-known national songs, the 'War-song of the Hussites' (dating back to about 1460) and 'My Fatherland,' composed centuries ago. The names of author and composer are forgotten. The first stanza of this favorite national ditty is:

Where is my house? Where is my home?
Streams among the meadows creeping,

Brooks from rock to rock are leaping,
Everywhere bloom spring and flowers,
Within this paradise of ours;
There, 'tis there, the beauteous land!
Bohemia, my fatherland!

Belgium.— The Belgian national hymn is 'La Brabançonne' (the Song of the Brabantines); music by François van Campenhout (1780–1848). The words were written by Jenneval, a French comedian, who was playing in a theatre of Brussels when the rising took place which resulted in Belgium's independence from Dutch rule in 1830. The refrain plays on the word "orange," referring to the reigning house of Orange in the Netherlands. The first stanza is appended:

Who would have thought the arbitrary
And scheming despot would bring force?
Against us comes a sanguinary
Princeling, with shrapnel in his course.
'Tis done, o'er Belgians comes a change.
No more with Nassau shameful pact shall be.
The grape-shot's shattered the orange
Upon the tree of liberty.

Three other versions of 'La Brabançonne' were written — that by Lonlay in 1848, another by Campenhout, and one by Hymans in 1852 — relating to the political situation in those years.

France.— 'La Marseillaise' (first known as the 'War Song of the Army of the Rhine' and then as the 'Song of the Marseillais') is the greatest of all national hymns. It was composed in one night (24 April 1792) by a young artillery officer, Rouget de Lisle (1760–1836). Although the authorship of the air is in dispute, it has generally been considered his composition. It has also been attributed to Holtzmann and to Dalayzac (a noted French composer). The song gave articulate expression in the spirit of the Revolution and has been the inspiration of French armies on many a battlefield. The keynote of the 'Marseillaise' is in the final stanza (the sixth):

Oh love of fatherland supernal,
Our avenging arms direct, sustain!
Oh Liberty, divine, eternal,
Fight by thy champions' side amain!
Beneath our gallant banner gory,
May victory hasten at thy call,
And thine opponents, as they fall,
Behold thy triumph and our glory!

The national hymn of the Second Empire (1852–70) was 'Partant pour la Syrie'; words by A. de Laborde and music by Queen Hortense.

Great Britain.— The British national hymn, 'God Save the King,' was composed in 1739 by Henry Carey (1692–1743), who was partly indebted to others for the words. He borrowed and re-wrote the air from the French. The music has been adopted for the national hymns of the United States, Switzerland, Prussia, and other German states. The Welsh national song, 'Hen Wlad Fy Nhadan' (Land of my Fathers), was written by Evan James; melody by James James. The first stanza, as translated by Eben Vardd, is as follows:

The land of my fathers, the land of my choice,
The land in which poets and minstrels rejoice;
The land whose stern warriors were true to the core,
While bleeding for freedom of yore.

Among the patriotic songs of various parts of the British Empire are 'The Song of Australia' (words by Mrs. C. J. Carleton and music by Carl Linger) and Canada's 'Maple-leaf Forever' (music by A. Muir).

Germany.— Germany's national hymn, 'Die Wacht am Rhein' (The Watch on the Rhine), was written in 1840 by Max Schneckenburger (1819–49). The air, composed in 1854 by Carl Wilhelm (1815–75), was little known until the Franco-Prussian war (1870–1), when this stirring lyric sprang into sudden popularity.

A national song very popular among Germans is 'Deutschland über Alles,' written in 1841 by August H. Hoffmann (1798–1874), generally known as Hoffmann von Fallersleben. It is sung to the music of the Austrian national hymn. The first stanza of 'Das Lied der Deutschen' is thus translated:

German Empire over all things, over all things in the world,
When for safety and defiance its proud banner is unfurled,
From the Maas unto the Memel, from the Etsch to sea waves curled —
German Empire over all things, over all things in the world!

Prussia.— The Prussian national hymn is 'Heil dir im Siegerkranz' (Hail to thee laurel-crowned), written in 1790 by Heinrich Harries (1762–1802). It is sung to the tune of 'God Save the King.' A general favorite is 'Preussenlied' (Song of the Prussians), written in 1830 by Bernhard Thiersch (1794–1855); melody composed in 1839 by H. A. Neithardt (1793–1861). The Bavarian hymn is 'Heil unserm König, Heil' (Hail to our monarch, hail).

Switzerland.— The Swiss national hymn, 'Dem Vaterland' (My Fatherland), by J. R. Wyss (1781–1830), is sung to Carey's music. The first stanza of this inspiring lyric is:

Call'st thou, my Fatherland?
See us with heart and hand
Vowed to thee, all!
Helvetia, hail to thee!
True still thy sons shall be,
Like them Saint James did see
Leap at war's call!

Netherlands.— Holland has two national songs that are often sung on public occasions — 'Wilhelmus van Nassouwe' (dating back to 1583) and 'Wien Neerlandsch Bloed.' The latter hymn, by H. C. Tollens (1778–1856), begins:

Let him in whom old Dutch blood flows,
Untainted, free and strong;
Whose heart for Prince and country glows,
Now join us in our song;
Let him with us lift up his voice,
And sing in patriot band,
The song at which all hearts rejoice,
For Prince and Fatherland!

The writer of the Boer national hymn is not known. The music is attributed to the Dutch composer, Richard Holl. There are three stanzas, of which the first runs as follows:

Know'st thou a race, of freemen bred,
Who broke the tyrant's might;
Who burst their bonds and fought and bled
For freedom and for right?
Come, burghers! Raise the flag on high
That led to victory;
The hour of bondage has gone by —
Free men, free men are we!

There are two stanzas in the national hymn of the Orange Free State; words by H. A. L. Hammelsberg and music by W. F. G. Nicolai.

Denmark.— The Danish national hymn, 'Kong Christian stod ved höjen mast' (King Christian stood beside the mast), was written by Johannes Evald (1743–81); music by Johan Hartmann (d. 1793), a German who settled in Copenhagen in 1768. Longfellow's version of this spirited poem is well known.

Norway.— The Norwegian national hymn is 'Sang for Norge' (Song for Norway), written in 1859 by Björnstjerne Björnson. Three

stanzas of this admirable lyric have been translated by Rasmus B. Anderson. The first is:

Yes, we love with fond devotion
Norway's mountain domes,
Rising, storm-lashed, o'er the ocean,
With their thousand homes;
Love our country, while we're bending
Thoughts to fathers grand,
And to saga-night that's sending
Dreams upon our land.

Another patriotic song is Anker Minding's 'Sönner af Norge' (Sons of Norway), set to music by H. A. Bjerregaard (1792–1842).

Sweden.— The Swedish national hymn is 'Fosterjorden' (Land of my Birth), by Richard Dybeck (1811–77); melody from Jemtland (a province in western Sweden) arranged by J. N. Ahlstrom. C. T. Hanson's translation is:

Oh, ancient beloved Northland of my birth,
The happiest of nations though lowly,
I greet thee, most beauteous land upon earth,
Thy green hills, thy sun, thy heaven blue and holy.

The thought of thee brings back the days that are gone,
The same in thy royal beauty ever,
O'er all lands and seas thy sweet name is borne,
Oh, I would live among thy hills forever!

Russia.— The national hymn of Finland, 'Värt Land' (Our Land), by J. L. Runeberg (1804–77), is one of marked beauty; music by F. Pacius. The Russian national hymn, 'Bozhe Zaria Chrany' (God preserve the Tzar), written by Joukowsky, is a prayer. The air by Alexis Lvoff dates from 1830, when Nicholas I. ordered it sung as the national anthem. The revolt of 1830 produced the stirring battle song by Albert Sowinski, 'Poland's not yet dead in slavery,' which has been called the Polish national hymn.

Rumania and Servia.— The Balkan states have national songs that are highly characteristic of these liberty-loving peoples. That of Montenegro is 'Onward! Onward!' Servia has two: 'Rise, Servians'; and 'God in His Goodness,' set to music by D. Jenko. In 1861 the Rumanian government offered a prize for the best national hymn, which was won by V. Alexandri's stanzas, 'Long live the king'; music by E. A. Hübsch.

Turkey.— Turkey has no national hymn. Each sultan has an imperial air composed in his honor. That of Abdul Hamid, 'Hamidie,' was written by Hadji Emin Bey; music by Redgeb Pacha. There are several Ottoman war songs full of national feeling.

Greece.— The Greek national hymn is the war song, 'Sons of Greece, come, arise,' which dates back to the days of the Greek struggle for independence (1821–9). Byron translated it.

Italy.— The only national air of Italy is Gabetti's 'Marcia Reale Italiana' (Royal Italian March), played on all official occasions. The famed Garibaldi's 'Hymn' is a martial strain, and the other patriotic songs are sectional.

Spain.— The Spanish national air is the fine 'Hymne de Riejo,' by Huerta (1803–80).

Portugal.— Portugal's national hymn is the 'Hymno Constitucional,' written about 1861 by Dom Pedro I., emperor of Brazil. Upon the accession of Don Carlos I. (21 Dec. 1889), a new national air was composed by H. M. Jurior.

United States.— The national anthem of the United States is the 'Star Spangled Banner,' written in 1814 by Francis S. Key. The melody is that of an old drinking song. Other patriotic songs that divide honors with it are: 'Hail, Columbia' (1798), by Joseph Hopkinson (1770–1842), sung to music composed by Fyles in 1788; and S. F. Smith's 'America,' written in 1832 to fit the air of 'God Save the King.'

Mexico.— The Mexican national hymn, 'Mexicanos, al grito de guerra' (Mexicans, at the cry of war), was written by F. G. Bocanegra; air composed in 1853 by James Nunó.

South and Central America.— The national hymns of other countries of Spanish America are: Costa Rica — 'De la Patria,' by M. M. Gutierrez; Guatemala — words by P. Molina and air by R. Alvarez; Honduras — music by L. Campos; Nicaragua — air by Blas Villatas; Salvador — words by J. J. Canas and music by J. Aberle; Argentina — air by V. Lopez; Brazil — words by Medeiros e Albuquerque and music by L. Miquez; Chile — air by Carnicer; Bolivia — words by J. I. de Sanjines and music by B. Vincenti; Uruguay — music by D. I. Deballi; Venezuela — words by V. Salias and music by J. Sandaeta.

Oriental.— The airs that do duty as national hymns in Persia, Burma, and other Oriental countries are not very elaborate. That of Japan consists of four lines:

Let Mikado's empire stand
Till a thousand years, ten thousand years shall roll,
Till the sand in the brooklets grow to stone,
And the moss these pebbles emeralds make.

The Japanese have borrowed G. F. Root's 'Battle Cry of Freedom.' Some Mohammedan countries of Africa have sultans' hymns. The national air of Liberia is by Olmstead Luca.

National Law. See INTERNATIONAL LAW.

National Legislative Assembly, in French history, when the nobility and clergy summoned with the Tiers Etat ("Third Estate") to the States-General declined to sit with the Commons, these declaring, on 17 June 1789, that they represented 96 per cent of the nation, assumed the name of the National Legislative Assembly, though the name Constituent Assembly is more frequently employed. The second assembly convened from 1 Oct. 1791 to 21 Sept. 1792, and was followed by the National Convention. Its composition was democratic.

National Museum. See UNITED STATES NATIONAL MUSEUM.

National Nicknames, the collective name of a people or nation, usually originating with the people themselves. John Bull was first given to the people of Great Britain by John Arbuthnot in his 'Law is a Bottomless Pit.' He also gave the name Nicholas Frog to the Dutch and Jean Crapaud (toad) to the French people. John Chinaman is a popular name for the Chinese, Taffy for the Welsh; Jean Baptiste for the French Canadians, and Ivan Ivanovitch for the Russians.

In the United States the two popular national names are Brother Jonathan and Uncle Sam. The former was first used. Gen. Washington, on assuming command of the New England Revolutionary forces, was in great straits for arms and war material. The governor of Connecticut, Jonathan Trumbull, was a man of excellent judgment and an esteemed friend of Washington. In the emergency, Washington

said, "We must consult Brother Jonathan." This expression was repeated on other difficult occasions, and became a convenient name for the whole people. The name Uncle Sam is an extension of the letters U. S. (United States), printed or stamped on the government property. It was first used in Troy, N. Y., in 1812, when certain goods purchased for the government and branded U. S., were officially inspected by Samuel Wilson, whose nickname was "Uncle Sam." The coincidence of initials suggested the application of this nickname to the government.

National Parks and Reservations, large tracts of public lands in the United States, reserved from settlement or residence, and which are retained, maintained, and improved by the Federal Government. These public parks include the Casa Grande Park in Arizona, 480 acres; the Yellowstone National Park in Montana and Wyoming, 2,142,720 acres; the Sequoia Park in California, 250 square miles; the Hot Springs Reservation, 912 acres; Yosemite National Park, in California, 1,512 square miles; General Grant Park in California, 4 square miles; and others. A detailed description of these National parks will be found under their respective titles. For a list of United States military reservations see MILITARY POSTS, UNITED STATES.

National Portrait Gallery, British, an institution that owes its origin to the zealous and enlightened efforts of Earl Stanhope. A board of trustees was appointed late in 1856, and by the end of the following year 23 portraits had been secured — some of them purchases and others gifts. The difficulty of the trustees is to guard against improper admissions in the way of donation, and therefore no donation can be accepted unless approved of by at least three-fourths of the trustees present at a meeting. At present the National Portrait Gallery contains over 1,000 portraits, under the varieties of paintings, busts, medallions, etc. Its treasures were for a time accommodated in the Bethnal Green Museum, but a new building, erected for it mainly by private munificence (funds being provided by W. H. Alexander), beside the National Gallery, was opened in 1896. The arrangement is chronological.

National Provident Union, an American fraternal society founded in 1883. In 1903 it had 54 sub-councils and 3,117 members. Its headquarters are in Brooklyn, N. Y. During 1902 it disbursed $100,892 in benefits.

National Republican Party, in American history, the name taken by those who deserted the old Democratic-Republican party after the defeat of Adams by Jackson in 1828. Clay was defeated. In 1835 the party, reinforced by other elements, took the name of Whig. See WHIG PARTY.

National Road. See ROADS AND ROADWAYS.

National Soldiers' Homes. See SOLDIERS' HOMES.

National Songs, popular melodies or tunes with accompanying words, peculiar to a particular nation or people. These songs are sung and the melodies played on state or public occasions, and are frequently utilized in war as battle songs. In the United States, 'The Star Spangled Banner,' 'Yankee Doodle,' 'Hail Columbia,' 'America,' 'John Brown's Body,' and 'Dixie' are popular national songs. It is generally conceded that 'Yankee Doodle' is the true national American air, notwithstanding the more recent rival claims of 'Hail Columbia' and 'The Star Spangled Banner,' neither of which have high intrinsic merit or have taken any great popular hold. More like a hymn is the song 'America,' which is sung to the tune of 'God Save the King.' The origin of 'Yankee Doodle' is obscure and disputed. The most probable account ascribes to the tune an English origin, and the words to Dr. Schuckburgh, an army surgeon, about 1755, soon after which, during the American Revolution, it came extensively into vogue.

The origin of the British national anthem has been a subject of controversy since the end of the 18th century, and is still involved in obscurity. 'God Save the King' was first printed in the 'Harmonia Anglicana' of 1742, without name of author or composer, varying slightly from the present version; and in 1745, during the Scottish rebellion, it became widely known, versions of it being sung nightly at Drury Lane and Covent Garden theatres with great applause. Of the numerous claims to its parentage, the view supported by most, and by several eminent writers, attributes it, both words and music, to Henry Carey, about 1740. The evidence for this is given in Chappell's 'Popular Music of the Olden Time,' and Chrysander's 'Jahrbücher,' Vol. I. But W. H. Cummings, who thoroughly beat out the subject in a series of papers in the 'Musical Times' in 1878, entitled to the greatest weight, considers this evidence unreliable; and he arrives at the conclusion that the music has been adopted (but when, and by whom, we shall probably never know) from an "Ayre" by Dr. John Bull, found (without words) in a collection of music by him once in the hands of Dr. Kitchener, afterward of Richard Clark, the original of which seems to have disappeared.

The hymn was translated into German by Heinrich Harries, a Holstein clergyman, and sung to the original air at a birthday celebration in honor of the king of Denmark in 1790; and an adaptation from these words, made in 1793 by Dr. B. G. Schumacher, beginning "Heil dir im Siegerkranz," has ever since been in use as the Prussian national hymn. It called forth the admiration of Beethoven and Haydn, and moved the latter to compose the Austrian national hymn, which was first sung on the Emperor Franz's birthday in 1797. The words now used, beginning, "Gott erhalte Franz den Kaiser," are by Baron Zedlitz; the original words were by Hauschka. The Hungarians have two national hymns — the 'Szózat' ('The Appeal'), beginning, "Be true to the land of thy birth," written by Vörösmarty (1800–55), the creator of Hungarian poetry of the Romantic school, and composed by Benjamin Egressy, an actor and eminent composer of sacred music; and the 'Magyar Hymnusz,' written by Kölcsey and composed by Francis Erkel. The Rákóczy march, by an unknown composer, dates from the end of the 17th century. The simple and dignified Russian national anthem dates from 1830, and is the work of General Alexis Lwoff (1799–1870). Of the Danish national hymn, 'Kong Christian,' the words are by Ewald and the music by Johann Ernst Hartmann (1726–91). There are several claimants to the honor of

being the Norwegian national hymn, of which may be mentioned 'Sönner af Norge,' written about the beginning of the 19th century, music by C. Blom; and the modern 'Ja, vi elsker dette Landet' ('Yes, we love this land'), words by Björnson, music by R. Nordraak. The Swedish hymn, 'King Karl, the Young Hero,' was written by Esaias Tegnér (1782–1846). The Dutch national hymn, 'Wien Neerlandsch Bloed,' was written by Henrik Tollens (1780–1856), and was composed by J. W. Wilms. 'La Brabanconne,' the Belgian revolutionary song of 1830, was written by Jenneval, a Brussels actor, and composed by Campenhout. The 'Marseillaise' (q.v.) of the French was written and composed in 1792 by Claude Joseph Rouget de Lisle (1760–1836), and received its name from being sung by the volunteers from Marseilles who took part in the movements in Paris in that year. Various doubts have been thrown on De Lisle's authorship of the tune, but these were finally disposed of by a pamphlet written by his nephew in 1865. The Portuguese 'Hymno Constitucional' was composed by Dom Pedro I., emperor of Brazil.

National Union, an American fraternal and beneficial organization, incorporated in 1881, under the laws of Ohio. In 1903 there were 875 councils and 63,000 members in the Order. Over $150,000,000 in insurance is carried by the members, and over $15,000,000 has been paid out in death benefits. The headquarters of the Order are located at Toledo, Ohio.

National University, The, a proposed great institution of learning to be located at Washington, D. C. For over 100 years there has been discussion of this subject. The establishment of such a university was first conceived by George Washington about 1790, when the shares he received from the Potomac Company had proved so valuable. He wished to appropriate this stock toward the founding of such an institution, but this stock, and that accruing from the James River Company left by his will for such purposes, were, however, divided between two charity schools, one on the James (see WASHINGTON AND LEE UNIVERSITY), and one on the Potomac. Washington strongly disapproved of foreign education for the American youth.

A national university, known as the Carnegie Institute, was incorporated 4 Jan. 1902 in Washington, D. C., by John Hay, Secretary of State; Edwin D. White, Justice of the Supreme Court; D. C. Gilman, ex-president of Johns Hopkins University; Charles D. Walcott, superintendent of the Geological Survey; John S. Billings, ex-Surgeon-General of the Navy, and Carroll D. Wright, Commissioner of Labor. The aims of the university are: (1) To increase the efficiency of the universities and other institutions of learning throughout the country by utilizing and adding to their existing facilities, and by aiding teachers in the various institutions for experimental and other work in these institutions as far as may be advisable. (2) To discover the exceptional man in every department of study, whenever and wherever found, and enable him by financial aid to make the work for which he seems specially designed his life work. (3) To promote original research, paying great attention thereto, as being one of the chief purposes of this institution. (4) To increase the facilities for higher education. (5) To enable such students as may find Washington the best point for their special studies to avail themselves of such advantages as may be open to them in the museums, libraries, laboratories, observatory, meteorological, piscicultural, and forestry schools and kindred institutions of the several departments of the government. (6) To ensure the prompt publication and distribution of the results of scientific investigation, a field considered to be highly important.

The board of trustees elected by the corporators of the institution included the President of the United States, the president of the United States Senate, the speaker of the House of Representatives, the secretary of the Smithsonian Institution, the president of the National Academy of Sciences, and 20 other leading citizens of the United States. The establishment of the National University was made possible by the gift, for this purpose, of $10,000,000 by Andrew Carnegie (q.v.). In 1903 no actual steps had as yet been taken toward the construction of university buildings.

National Workshops. See ATELIERS NATIONAUX.

Nationalism, a system of socialism having its origin in Edward Bellamy's novel of social reform, 'Looking Backward.' In 1889 a party of Bellamy's admirers in Boston organized the first Nationalistic Association, and in 1901 the movement had spread so rapidly that nearly 200 similar clubs had been organized. In certain localities, particularly in California, these clubs took an active interest in politics. The movement also spread to England, where the Nationalization Society was organized in 1890. Bellamy's scheme involved government control of production and distribution. Consult Bellamy, 'Looking Backward' (1887).

Nationalists, in British politics, a term applied to the Irish political party whose programme includes the more or less complete separation of Ireland from Great Britain.

Nationality, in the United States is determined by the Federal law. The Constitution established no rules regarding the acquisition or loss of American nationality, which is therefore governed by the subsidiary or common law of the land. See FOURTEENTH AMENDMENT; GOVERNMENT; NATURALIZATION.

Nations, Battle of the ("Völkerschlacht"), in the Napoleonic wars, the battle fought at Leipsic 16–19 Oct. 1813, in which Napoleon, with about 190,000 men, was defeated by the allies numbering from 200,000 to over 300,000 at different stages of the conflict. The French loss is estimated at 40,000 killed and wounded, and 30,000 prisoners; that of the allies at 54,000 killed and wounded. The liberation of Germany is practically dated from this event.

Nations, Law of. See INTERNATIONAL LAW.

Native Bear, the Australian koala (q.v.).

Native Companion, an Australian name for a large local crane (*Grus australasiana*) peculiar to that island-continent.

Nativ'ity, in astrology, the theme or figure of the heavens, and particularly of the 12 houses, at the moment when a person is born, supposed to indicate his future destinies, and

synonymous with horoscope. See HOROSCOPE; ASTROLOGY.

Nato'lia, or **Anato'lia,** the modern name for Asia Minor (q.v.).

Natorp, nä'tôrp, **Paul Gerhard,** German scholar: b. Düsseldorf, Germany, 24 Jan. 1854. He was educated in Berlin, Bonn, and Strasburg and accepted a professorship in Marburg in 1885. He wrote: 'Descartes' Erkenntnisstheorie' (1882); 'Platos Staat' (1895); 'Platos Ideenlehre' (1903); etc.

Natrocal'cite. See GAY-LUSSITE.

Nat'rolite (from "natron," native carbonate of sodium), a native hydrous silicate of sodium and aluminum, having the chemical formula $Na_2Al_2Si_3O_{10} + 2H_2O$, and crystallizing in slender prismatic forms belonging to the orthorhombic system. It is transparent to translucent, and usually white (or nearly so), with a vitreous lustre, a hardness of from 5 to 5.5, and a specific gravity of from 2.20 to 2.25. It occurs in cavities in basaltic rocks, and in seams in granite, gneiss and syenite. It occurs in many parts of Europe, and fine crystals are found in southern Norway. In the United States the mineral occurs in Connecticut, New Jersey, and Arkansas, and also in the Lake Superior region. It is likewise found in Nova Scotia. Natrolite takes a good polish, and has been used as a gem stone.

Na'tron, a carbonate of soda or mineral alkali, $Na_2CO_3 10H_2O$. It is produced from the ashes of several species of marine plants, and is also obtained by evaporating the waters from some mineral springs. It occurs in nature, but only in solution, and is generally found in an impure state, being mixed with other sodium salts, such as the sulphate and chloride. The soda lakes of Egypt have supplied great quantities of this substance for many centuries; it was used by the ancient Egyptians as an important ingredient in their embalming fluids. A similar but impure hydrogen sodium carbonate is found deposited by evaporation on the shores of the Caspian and Black seas, also on the banks of alkali lakes and springs in California, particularly in the neighborhood of San Bernardino.

Natter, Heinrich, Austrian sculptor: b. Graun, Tyrol, 16 March 1846; d. Vienna 13 April 1892. He was five years apprentice to a sculptor in Meran and subsequently was taught drawing at Augsburg by Johann Geyer, a famous painter of humorous genre. Subsequently he studied with great profit under Max Widumann (q.v.), the sculptor, in the Munich academy. Weak health compelled him to travel and he visited Riva on Lago de Garda, and Venice, until the war of 1866 called him to active military service. He afterward took up his residence at Munich, where he made his reputation by his portrait busts, sepulchral statues, a colossal statue of the god 'Odin' (1873) and the head of a 'Sleeping Satyr.' A career of wider activity opened for him after his settlement in Vienna, where, besides numerous bust portraits and monuments he executed the statue of Zwingli for Zürich; the statue of Haydn for Vienna; the portrait statue of Laube and Dingelstedt for the municipal theatre of that city; and the statue of Walter von der Vogelweide for Bolzano (1889). His statue of Andreas Hofer, which is his masterpiece, was unveiled after the sculptor's death on a height near Innsbruck. A poetic delicacy of conception and a certain life-like expression, oftener found in painting than in sculpture, are the characteristic features of his work. His literary remains were published by L. Speidel, under the title 'Kleine Schriften' (1893).

Nat'terjack, an Old World toad (*Bufo calamita*), light-brown in color, spotted with patches of a darker hue. It does not leap or crawl like the common toad, but rather runs, whence it has the name of walking or running toad. It has a deep and hollow voice, audible at a great distance, and is often found in dry situations.

Nattier, Jean Marc, zhŏn märk nä-tē-ā, French painter: b. Paris 1685; d. 1766. He was the pupil of Jean Jouvenet, won the Academy prize in 1700 and became professor of the Academy in 1752. His fame as a portrait painter was increased by the visit he paid to Antwerp in 1715 to paint likenesses of Peter the Great and his wife Katharine I.; he also painted the portraits of many of their suite. So great was his skill in portraying the fine ladies of his day that he has done as much to immortalize such faces as those of Marie Lesczynska, Henriette de France, Madame Adelaide, Madame de Chateauroux, Madame de Flavacourt, and many others of the court of Louis XV., as Rigaud (see RIGAUD, HYACINTHE) had done for Bossuet, for Louis XIV., his courtiers, and other leading men of the period.

Natty Bumppo, the central figure in Cooper's (see COOPER, J. F.) stories: 'The Pioneers' (1823), in which he appears as "Leatherstocking," a name lent to the series as the 'Leatherstocking Tales'; 'The Last of the Mohicans' (1826), in which he is known as "Hawk-eye" and "Le Longue Carabine" ("The Long Rifle"); and 'The Pathfinder' (1840) and 'The Deerslayer' (1841), in which his respective sobriquets furnish the titles of the volumes. Lounsbury ('Life' of Cooper 1884) has called him "one of the few original characters, perhaps the only great original character, that American fiction has added to the literature of the world."

Natuna (nä too'nä) **Islands,** East Indies, a chain of islands in the South China Sea, extending northwest from Cape Api, Borneo, and belonging to the Dutch. The principal islands are Great and South Natuna islands, and Stokong. The aggregate area is estimated at over 800 square miles. The islands are mountainous and densely forested; the chief products are cocoanuts, fish, rice, and maize. Pop. 9,000, mostly Malay fishermen.

Natural (in music). See MUSIC.

Natural Bridges are formation tunnels eaten through rocks by streams, etc. There are many of these natural curiosities in the United States. The one in Virginia is the most celebrated. The arch is 60 feet spring, depth 200 feet, crown 40 feet thick. In Walker County, Ala., is a natural bridge in which the stone is so stratified as to resemble masonry. In Trinity County, Cal., a small river runs for 3,000 feet through an arch of 80 feet span and 20 feet high. In Berkshire County, Mass., the Hudson brook flows for 30 rods under an arch of white

marble. At the village of Natural Bridge, N. Y., the Indian River flows through a series of arches.

Natural Gas. See GAS, NATURAL.

Natural History, in its widest sense, that department of knowledge which comprehends the sciences of zoology and botany, chemistry, natural philosophy or physics, geology, palæontology, and mineralogy. It is now, however, commonly used to denote collectively the sciences of botany and zoology, and it is sometimes restricted to denote the science of zoology alone.

Natural History of Selborne, The, a celebrated work by Gilbert White (q.v.), published in 1789. Its material consists of White's letters to Daines Barrington and Thomas Pennant (qq.v.), in which the writer describes outdoor life in the little Hampshire village which his works made famous and interesting alike to students of nature and to lovers of good books, among which the 'Natural History' ranks as a unique classic of science and of letters.

Natural Law. See LAW, NATURAL.

Natural Philosophy. See PHYSICS.

Natural Rights. See LAW, NATURAL.

Natural Selection, the doctrine advanced by Charles Darwin and almost coincidentally by Alfred Russel Wallace (q.v.), to account for the divergence of animal forms and their gradual separation into distinct species and groups, by a process akin to the selective mating practised by men in rearing and perpetuating breeds of domestic animals. It forms the basis of Darwin's hypothesis of organic development by descent, and depends upon the fact that variations constantly appear in animals, and may in some degree be perpetuated. These variations may be minute fluctuations on either side of a mean, a little more of one character and a little less of another; or they may be sudden steps of considerable magnitude; in other words, they may be continuous or discontinuous. They may visibly affect only one character at a time, or they may affect many parts of the organism at once, as if there were a general movement to a new position of organic equilibrium.

(2) Living creatures are involved in a manifold and intricate struggle for existence, varying greatly in its form and in its intensity, and due to a variety of causes. It is necessitated especially by two facts: first, that two parents usually produce many more than a pair of offspring, and that the population tends to outrun the means of subsistence; and, secondly, that organisms are at the best only relatively well adapted to the external conditions of their life, which moreover are variable. The "struggle" may be for food or foothold, for mates or property, for self-preservation or for the welfare of the young, including much more than an internecine scramble around the platter which contains the necessaries of life; the phrase is applicable as regards relative length of life, vigor or constitution, success in having offspring, and so on.

(3) In this struggle for existence the relatively less fit organisms are weeded out or eliminated, and sometimes only a small proportion of those born survive to become adults or reproductive. But it must be clearly understood that elimination does not necessarily involve sudden death or no offspring; it may simply involve, in the first instance, a slightly shorter, less successful life, or a smaller, less vigorous family. Yet whether the eliminative process be gentle or severe, the result is the same — that the relatively more fit variants tend to survive; and since many variations are demonstrably transmissible from generation to generation, and may, through the pairing of similar or suitable mates, or in other ways, gradually increase in amount, the eliminative or selective process works toward the establishment of new adaptations and new species.

The three steps in the argument are thus: (1) The occurrence of transmissible germinal variations is a fact of life; (2) the struggle for existence is a fact of life; and (3) the elimination of the relatively less fit is a fact of life. The result has been, and is, the rise and progress of new adaptations, new varieties, new species, new types.

A formidable objection to the selection theory, first clearly stated by Prof. Fleeming Jenkin, is that variations of small amount and sparse occurrence would tend to be swamped out by intercrossing. In human or "artificial" selection, the breeder takes measures to prevent this by pairing similar or suitable forms, but what in nature corresponds to this action of the breeder? Various suggestions have been made in answer to this objection. Thus Weismann says: "The necessary variations from which transformations arise must in all cases be exhibited, over and over again, by many individuals," and in his ingenious theory of Germinal Selection he has suggested the internal mechanism by which this result may come about.

But the answer at present most relied on is that worked out by Romanes, Gulick, and others — the theory of isolation (q.v.). The theory of isolation emphasizes the great variety of ways in which, in the ordinary course of nature, the range of intercrossing may be restricted, for example, by geographical barriers, by differences in habit, by psychical likes and dislikes, and by those remarkable reproductive variations which cause mutual sterility between two sections of a species living on a common area.

We have given a statement of the theory of natural selection very much as it might have been given in 1859, when Charles Darwin and Alfred Russel Wallace enriched biology by their independent exposition of the selection idea; but since then our knowledge of the nature and origin of variations has greatly increased, the analysis of the various modes of inheritance has become much more precise, the difficulty of proving any instance of the transmission of "an acquired character" or direct somatic modification is generally acknowledged, and we have recognized the value of a second directive factor in evolution, namely, isolation. It may be said that the theory of natural selection is now being subjected to more severe and more dispassionate criticism than it had to encounter in the early Darwinian days, when the validity of the general evolution idea was the central subject of discussion.

Thus there is a demand for some serious attempt to measure the intensity of the struggle for existence in typical cases, and for evidence that the absence of a particular variation in certain members of a stock does really determine their elimination. In other words, evolutionists have awakened to the necessity of testing natural selection in relation to actual cases.

Lastly it should be noted that the doctrines of Lamarck, which were that use-and-disuse, inheritance of acquired characters, and other factors were more potent than natural selection, have been revived and strengthened by a school of naturalists who insist that they must at least be held to have had an important share in the phenomena of biology.

Bibliography.—Darwin, 'Origin of Species' (6th edition, 1882); 'Descent of Man' and other works; Wallace, 'Natural Selection' (1869; revised edition 1891) 'Darwinism' (1889); Huxley, 'Lectures on Evolution' and other works; Gray, 'Darwiniana' (1876); Weismann, 'Essays upon Heredity' (1892) and other works; Romanes, 'Darwin and After Darwin' (1892–5); Osborn, 'From the Greeks to Darwin' (1894), and the writings of Allen, Bates, Bateson, Beddard, Belt, Brooks, Cope, Forbes, Gadow, Haeckel, Hyatt, Lankester, Morgan, Packard, Poulton, Semper, and modern zoologists generally. See DARWINIAN THEORY; EVOLUTION.

Natural Theology, that knowledge of God's existence and nature which mankind learn from observation of the world of nature. Biblical theology is the knowledge of God's nature and operations derived from revelation; and revelation is impossible unless we first postulate a personal God. Thus natural theology is the foundation of any system which professes to give an account of the Supreme Being as well as of man's origin and destiny.

Method of Natural Theology.—The first proposition postulated in this department of speculation is that every effect requires a cause (q.v.). One of the self-contradictions of Lucretius is contained in his axiom *ex nihilo nihil fit* ("nothing can come from nothing"), after pronouncing which he proceeds in his attempt to prove that the order and uniformity of nature proceeds from nothing, that is, random disorder, the fortuitous concourse of atoms. Unless it is admitted that certain events and phenomena are invariably connected as cause and effect, there can be no science of Natural Theology, which is based upon the assumption that causation is a fact, the truth of which is accepted among the intuitive beliefs of the human mind.

How far a Science.—As Natural Theology claims for its domain the physical, intellectual and moral nature of man as well as the world of nature in the midst of which he is set, it starts out by saying with Natural Science that the present constitution of things had a beginning. Plants and animals did not always exist on this planet. The questions arise, Whence did they come? How came man here? The theory that species as it exists at present was the original form of organic life on the earth, has now been abandoned, and two other theories have come in sight, (1) That animals and plants have been produced by forces eternally and necessarily inherent in matter (see NATURALISM). (2) That nature is the product of a personal being, acting with deliberate design. In the history of recent speculation we come upon a suspensive judgment in this question; on the other hand Positivists (see POSITIVISM) have ruled it out from the field of human speculation. Suspensive reasoners do not profess to know because they declare the matter unknowable. This is agnosticism (q.v.) and its adherents style themselves agnostics.. On the other hand, observers of nature have remarked in the works of nature an analogy with and a resemblance to the works, contrivances and methods of human artificers. They have accordingly reached a belief in a transcendently great and powerful maker who has originated all things. The existence of man as an individual person has been taken as testimony to the existence of an infinite and eternal being as the one supreme God. It has also been averred that anti-intuitionalists destroy the basis of all knowledge and science and that a physicist who denies causation sweeps away the foundation on which his system is reared.

Main Arguments.—(1) It is claimed that the idea of God's existence is innate in every human being and is as necessary a fact of consciousness as his own personal identity. In the most rudimentary and debased tribes is found this sense of a Supernatural Power. Lubbock and others deny to some degraded races this innate idea; it is sometimes added that deaf-mutes are in the same mental condition. It does not, however, follow because an idea has not been expressed in language that it is therefore not present in the mind. The mind may not have been explored by the subject; the readiness with which belief in the supernatural is accepted by savages and children is one reason for the belief that the response they make to communications on this subject springs from previous divinations of the consciousness in realizing itself. If this idea is not innate it is certain that the faculties of the human mind are such that the study of nature, man, and the obligations of life bring each individual face to face with the notion of God. Descartes, Leibnitz and others aver that the capacity of the human mind to entertain the conception of a being perfect and omnipotent, proves the existence of a reality which corresponds to such a conception; but their argument has not satisfied metaphysicians such as Reid and Stewart and, through the metaphysical subtilities involved in it, must be laid aside as a popular argument. (1) The study of nature and of history, that is, of man as a physical intellectual and moral being, furnishes material for arguments from design, teleological arguments as they are sometimes called (see TELEOLOGY). This is the simplest and most obvious form of argument to be put forth in Natural Theology and has been put forth in all ages. Socrates constantly stated it; Cicero enforced it among his Roman followers. Although on the first publication of Darwin's and Wallace's theory of evolution it lost its place of importance in Apologetics, it has recently been revived and stated with renewed force. The laws of Natural Selection and Survival of the Fittest must have had a law-giver, and the discovery of additional links in the chain of causation does not necessarily destroy its continuity. The Hebrew writers constantly refer to the power and goodness of Jehovah as evidences both in the works of nature, the events of history and the faculties of mankind. Saint Paul begins his Epistle to the Romans with this argument against the degraded paganism of Rome; the Fathers have enforced it over and over again. Paley's 'Natural Theology' has been a most important statement of the argument from design which has been enlarged in its application by Chalmers, Tulloch, McCosh and Agassiz. The argument from design can of course only prove the existence of a creator of

the world. Man alone is conscious of a Creator, who, however, need not be the self-existent God, but once grant that man has a maker, and it would at once follow that a supreme self-existent God exists who is the First Cause. Consult: Xenophon, 'Memorabilia'; Plato, 'Laws X.'; Cicero, 'De Natura Deorum'; Descartes, 'Principia Philosophiæ'; Leibnitz, 'Theodice'; Paley, 'Natural Theology'; Chalmers, 'Natural Theology'; McCosh and Dickie, 'Typical Forms in Nature'; Tulloch, 'Theism'; Chadbourne, 'Final Causes'; Harris, 'Philosophical Basis of Theism.'

Natural Tones are tones produced by the natural alteration of nodal points in wind instruments by pressure only. See HARMONICS.

Nat'uralism, the theory that in the operations of nature a blind force acts in accordance with necessary law. In ancient Greek philosophy naturalism was taught by Leucippus and by Epicurus in their atomic theory of the universe. The most famous exposition of this doctrine is to be found in the 'De Rerum Natura' or 'Nature' of Lucretius (q.v.) the Latin poet contemporary with Cicero. In modern times it has been advocated by D'Holbach, in his 'Système de la Nature'; Robinet in his 'Traité de la Nature,' and it sometimes seems as if Herbert Spencer, in his 'First Principles,' taught it; though in the latter days of his life he wavered and vacillated very much in his ideas of causation. In theology naturalism is opposed to Theism, in that it implies the non-existence of a personal God as Creator and Controller of the universe. See NATURAL THEOLOGY.

Naturalism (in Literature). See REALISM AND NATURALISM.

Naturalists, American Society of, an association numbering 230 active members, organized in 1883, for the purpose of bringing together persons interested in topics of natural history.

Naturalization Laws, acts placing foreign born persons in the same legal position as natural-born citizens. The conditions under and the manner in which an alien may be admitted to become a citizen of the United States are prescribed by the U. S. Revised Statutes.

Declaration of Intentions.—The alien must declare upon oath before a circuit or district court of the United States or a district or supreme court of the Territories, or a court of record of any of the States having common law jurisdiction and a seal and clerk, two years at least prior to his admission, that it is, *bona fide,* his intention to become a citizen of the United States, and to renounce forever all allegiance and fidelity to any foreign prince or State, and particularly to the one of which he may be at the time a citizen or subject.

Oath on Application for Admission.— He must at the time of his application to be admitted declare on oath, before some one of the courts above specified, "that he will support the Constitution of the United States, and that he absolutely and entirely renounces and adjures all allegiance and fidelity to every foreign prince, potentate, state, or sovereignty, and particularly. by name, to the prince, potentate, state, or sovereignty of which he was before a citizen or subject," which proceedings must be recorded by the clerk of the court.

Conditions for Citizenship.— If it shall appear to the satisfaction of the court to which the alien has applied that he has made a declaration to become a citizen two years before applying for final papers, and has resided continuously within the United States for at least five years, and within the State or Territory where such court is at the time held one year at least; and that during that time "he has behaved as a man of good moral character, attached to the principles of the Constitution of the United States, and well disposed to the good order and happiness of the same," he will be admitted to citizenship.

Titles of Nobility.— If the applicant has borne any hereditary title or order of nobility he must make an express renunciation of the same at the time of his application.

Soldiers.—Any alien of the age of 21 years and upward who has been in the armies of the United States, and has been honorably discharged therefrom, may become a citizen on his petition, without any previous declaration of intention, provided that he has resided in the United States at least one year previous to his application, and is of good moral character. (It is judicially decided that residence of one year in a particular State is not requisite.)

Minors.—Any alien under the age of 21 years who has resided in the United States three years next preceding his arriving at that age, and who has continued to reside therein to the time he may make application to be admitted a citizen thereof, may, after he arrives at the age of 21 years, and after he has resided five years within the United States, including the three years of his minority, be admitted a citizen; but he must make a declaration on oath and prove to the satisfaction of the court that for two years next preceding it has been his *bona fide* intention to become a citizen.

Children of Naturalized Citizens.—The children of persons who have been duly naturalized, being under the age of 21 years at the time of the naturalization of their parents, shall, if dwelling in the United States, be considered as citizens thereof.

Citizens' Children who are Born Abroad.— The children of persons who now are or have been citizens of the United States are, though born out of the limits and jurisdiction of the United States, considered as citizens thereof.

Chinese.—The naturalization of Chinamen is expressly prohibited by the Laws of 1882.

Protection Abroad to Naturalized Citizens.— The Revised Statutes of the United States declare that "all naturalized citizens of the United States while in foreign countries are entitled to and shall receive from this Government the same protection of persons and property which is accorded to native-born citizens."

The Right of Suffrage.—The right to vote comes from the State, and is a State gift. Naturalization is a Federal right and is a gift of the Union, not of any one State. In nearly one half of the Union aliens (who have declared intentions) vote and have the right to vote equally with naturalized or native-born citizens. In the other half only actual citizens may vote. The Federal naturalization laws apply to the whole Union alike, and provide that no alien may be naturalized until after five years' residence. Even after five years' resi-

dence and due naturalization he is not entitled to vote unless the laws of the State confer the privilege upon him, and he may vote in several States six months after landing, if he has declared his intention, under United States law, to become a citizen.

In Other Countries.— In France a foreigner who has obtained permission to become domiciled in France is entitled to letters of declaration of naturalization after three years' residence. Also, by the French Naturalization Act, 1889, a foreigner who has resided in France for 10 years may at once be naturalized without preliminary ceremony. In Germany naturalization can be conferred only by the higher administrative authorities; the applicant must show that he is at liberty, under the laws of his native country, to change his nationality, or, if he is a minor, that his father or guardian has given him the requisite permission, that he is leading a respectable life, that he is domiciled in Germany, and that he has the means of livelihood. In all countries a married woman is held to be a citizen of the state of which her husband is for the time being a subject, and the naturalization of a father carries with it that of his children in minority. In countries where military service is compulsory naturalization in fraud of this either is prohibited or renders the offender liable to imprisonment, if he returns, and forfeiture of all property subsequently acquired in his native country. Certain privileges of British nationality may be acquired by the issue to an alien of letters of denization granted by the crown; and for this no previous residence is required.

Nature Printing, a modern process for obtaining impressions from leaves, fibres, lace, etc. In one method the object, such as a fern frond, is placed between a steel plate and one of heated lead and subjected to a strong pressure, forming an exact intaglio copy in the lead from which impressions are taken.

Nature-study, an educational means of putting the child into direct contact and sympathy with its own life. Education has been largely unrelated to the daily life. The child has lived in one world and has gone to school in another world, and to church in still another. The child lives in a certain environment. The phenomena and objects and portent of this environment should be elucidated to the child to the end that his life may be made meaningful and resourceful at the same time that the intellectual powers are developed and strengthened. In other words, any subject, however common, is capable of being put into pedagogic form and being made the means of training the mind. This is the natural development, as it is natural for the plant to draw its sustenance from the soil and air about it rather than from the soil and air of some other region. The best primary educational means are those that begin with the subjects with which the child lives day by day.

The subjects with which a child lives are «natural» subjects; hence the term «nature-study.» Nature-study has to do with the things and events of the child's customary environment. The term itself is not wholly a fortunate one, since it would seem, in the common use of the word to indicate a «study» or a piece of «work» or a subject for a school «period,» as if it were co-ordinate with geography and writing and English. Nature-study is not merely a subject to be taught: it stands for an attitude toward education and toward living. It stands for open-mindedness and sympathy toward common things and ordinary conditions rather than a mere acquirement of extraneous things. Nature-study teaches in terms of the pupil's life,— the weather, the plants, the animals, the fields, the streets, the affairs of the home and the school and the hamlet or the ward. «Using the common things and events as educational means» is a phrase that expresses the main idea that underlies the term nature-study.

Yet, there is another and vital conception in the nature-study idea: we are to teach by means of the common things for the purpose of putting the pupil into a sympathetic attitude toward his life and environment, not merely to impart knowledge of the things and phenomena themselves. Sympathy is the keynote of nature-study. In this it differs from the traditional teaching of science, and in this it is adapted to the young mind. The customary teaching of science may not open the mind to any sense of loving relationship to its own environment. It may be wholly extrinsic and exotic. Science-teaching has often become as dogmatic and as devoid of the breath of life as mere philosophy or history were in the years just passing. The pupil may not be so near to life and to his own problems when dissecting a necturus as when studying the history of Rome. Both are out of place and out of touch with mere children: they are subjects for later years. «Science,» as commonly taught, is a subject for maturing and mature minds, not for beginners. Nature-study accepts the child's outlook on the world and uses it as a means of developing the child. Gradually, nature-study leads to the science point of view, preparing for the instruction in the advanced grades.

It is not to be supposed, however, that nature-study is unscientific. On the contrary, it should follow the laws of the development of the child's mind, and therefore be eminently scientific. But it is scientific only in itself, and not in the sense that it teaches science, as the word «science» is commonly interpreted in the schools. Science-teaching has for its main purpose the discovery of truth. Its spirit is investigational. It would make investigators. Yet, as a matter of fact, it is as good science to put the child first of all into a correct attitude toward nature as later to develop his research instincts.

It is to be regretted that much of the teaching that passes as nature-study seems to have no permanent pedagogical value. This is almost necessarily the case, since the nature-study movement is new as a matter of practice, however old it may be as a matter of theory and principle. It is in large measure a revolt from the formal and «dry» science-teaching, and its method is therefore essentially personal and informal. We are now in the experimental era. Perhaps no one yet knows how nature-study may best be handled in the schools. It is certain, however, that it should deal with actual things and phenomena. Its underlying method is observation,— the child actually to see the thing for himself, to know it intimately from first-hand contact. As a pedagogical method, the teaching of nature-study does not deal with abstractions, nor mere sentimentalism, nor primarily with poetry or

nature-study literature. It asks, What is the thing? What does it do, or how does it live, or why is it here? What relation does it bear to the conditions in which it is found?

The term nature-study is of common-school origin. It is very modern. It seems to have come into use in this country between 1884 and 1890. It grew out of "object teaching" and "elementary science" and "natural history." It is not equivalent to the teaching of zoology and botany, as classified sciences. It cares little for zoology and botany and geology, but everything for animals and plants and the out-of-doors. It is in large measure a return to the ideals of Rousseau, Froebel, Pestalozzi, and others, combined with a reaction from the unfree and over-nice laboratory methods into which we have fallen in the schools. Nature-study is an emancipation. Although nature-study is specially a common-school movement, its spirit is nevertheless of universal application, and, consciously or unconsciously, it is coming to dominate the point of view in all good nature-teaching anywhere,— in the actual study of the object in its natural setting.

The nature-study idea is one of the movements that are democratizing education. The Greek and mediæval ideals are adapted to the few and the special rather than to the many. We have believed that some few subjects alone are profitable as educational means; these subjects are the ones that are most capable of being put into books. But a subject that cannot be put in a book is nevertheless capable of being made the means of training a mind,— and among these subjects are those that make the most direct and personal appeal to children and youth. It is not to be supposed that the older subjects are to be banished from the schools, but only that new ones are to be added. We are just now perplexed as to how to handle the many subjects that are coming into the schools. The truth is, however, that all subjects with which men engage and in which they are interested are to be taught, both as a means of intensifying the hold on life and of enlarging the spiritual horizon. We have made the mistake of thinking that some subjects lead to "culture" and that others do not. All subjects should lead to that end. How to adapt and use all these many subjects in the schools is not the purpose of this article to inquire: this must be worked out with patience and forethought in the time that is just ahead of us.

We have reason to expect a gratifying secondary result of the nature-study idea in the movement that it must set up toward the country. There is still a strong tendency to remove to the city. The attraction to the city is both financial and social, chiefly financial. It is time that we set other ideals than money. The person that understands soils and plants and animals and fields should be able to develop the resources of the country and to make a comfortable living from the land; and the mind that is sympathetic with nature does not need to go to the city for entertainment. Our educational systems and points of view are chiefly such as help the city man rather than the country man.

While it is not the purpose to enter into a discussion of the methods of teaching nature-study, attention should be called to some of the most important dangers. (1) There is danger of giving relatively too much attention to mere subject-matter or fact. Nowhere should the acquiring of mere information be the end of an educational process, and least of all in nature-study, for the very essence of nature-study is spirit, sympathy, enthusiasm, attitude toward life. It is these results that the youth gets naturally when he associates in a perfectly free and natural way with objects in the wild. Science-teaching has often fallen short of its goal in the elementary schools — and even in the colleges and universities — by insisting so much on the subject-matter as to forget the pupil. In standing so rigidly for the letter, we have missed the spirit. (2) A second danger is making the instruction too long and too laborious. A child's mind cannot be held to a subject profitably for any great length of time. As soon as the child becomes weary of giving attention, the danger-point is reached; for thereafter there is loss in the spirit and enthusiasm, however much may be gained in dry subject-matter. Even in high schools and colleges we make mistakes in demanding too long-continued application to one subject. Short, sharp, enthusiastic exercises, with pith and point, of five to ten minutes' duration, are efficient and sufficient for most purposes, particularly with beginners. (3) A third danger is the practice of merely telling or explaining. Set the child to work, and let the work be within the child's own realm. Pollen, lichens, capsules, lymphatics, integuments — these are not within the child's range: they smack of the museum and the text-book. Yet it appears to be the commonest thing to put mere children at the subject of cross-fertilization: they should first be put, perhaps, at flowers and insects. In every schoolroom might be hung with profit the motto, "Teaching, not telling." (4) A fourth point is the danger of adhering too closely to the book habit We are gradually growing out of the book slavery even in arithmetic and grammar and history. This means a distinct rise in the abilities of the teacher. Of all subjects that should not be taught by the book, nature-study is chief. Its very essence is freedom from tradition and "method." Nature-study books are most useful as sources of fact and inspiration, but not as class texts. The good teacher of nature-study must greatly modify the old idea of "recitations." President Eliot writes: "Arithmetic is a very cheap subject to teach; so are spelling and the old-fashioned geography. As to teaching history in the old-fashioned way, anybody could do that who could hear a lesson recited. To teach nature-studies, geometry, literature, physiography, and the modern sort of history requires well-informed and skilful teachers, and these cost more than the lesson-hearers did." (5) Finally, we must come into contact with the actual things, not with museums and collections. Museums are little better than books unless they are made to be very secondary means. The museum has now become a laboratory. The living museum must come more and more into vogue — living birds, living plants, living insects. The ideal laboratory is the out-of-doors itself; but for practical school purposes this must be supplemented. The most workable living laboratory of any dimensions is the school-garden. The true school-garden is a laboratory plat; time is coming when such a laboratory will be as much a part of a good school equipment as

blackboards and charts and books now are. It will be like an additional room to the school building. Aside from the real school-garden, every school premises should be embellished and improved as a matter of neighborhood and civic pride; for one cannot expect the child to rise above the conditions in which it is placed. All these dangers cannot be overcome by any "system" or "method"; they must be solved one by one, place by place, each teacher for himself. Whenever nature-study comes to be rigidly graded and dressed and ordered, the breath of life will be crushed from it. It is significant that everywhere mere "method" is giving way to individualism.

In time, the methods of teaching nature-study will crystallize and consolidate about a few central points. The movement itself is well under way. It will persist because it is vital and fundamental. It will add new value and significance to all the accustomed work of the schools; for it is **not** revolutionary, but evolutionary. It stands for naturalness, resourcefulness, and quickened interest in the common and essential things of life. It is strange that such a movement is necessary. It would seem to be the natural, and almost the inevitable, thing that the education of the child should be such as to place it in intimate relation with the objects and events with which it lives. It is a fact, however, that our teaching has been largely exotic to the child; that it has begun by taking the child away from its natural environment; that it has concerned itself with the subject-matter rather than with the child.

The literature of nature-study is of three groups: that dealing with the underlying pedagogical conceptions, a group that is yet small and undeveloped; that setting forth courses and methods, a group that comprises a large number of books and leaflets; that of the "nature writers," appealing to the general public, and now very voluminous. Probably no recent development of literature is so marked as the writing about "nature"; and this tendency is a good criterion of the enlargement of our sympathies and of our growing interest in realities. All publishers of educational books issue nature-study guides and texts, and the number is rapidly increasing; it is therefore impossible to give a list here. Some of the American writers in the educational field, aside from specialists in the various departments, are W. S. Jackman, C. F. Hodge, Mrs. L. L. W. Wilson, F. O. Payne, O. P. Jenkins, V. L. Kellogg, D. Lange, C. B. Scott, C. A. McMurray, A. C. Boyden.

L. H. BAILEY,
Director College of Agriculture, Cornell University.

Nature Worship, a religious belief in which the powers of nature are personified and worshipped. It found its highest and most beautiful expression in the mythology of ancient Greece. In the classification of religions with regard to the estimation in which the Deity is held, Lubbock makes nature worship the second stage, atheism (the absence of definite ideas on the subject) being the first. See MYTHOLOGY.

Naucratis, nâ'kră-tĭs, Egypt, an ancient Greek colony, the remains of which are near Nebireh, 50 miles by rail southeast of Alexandria. It existed as early as the beginning of the 7th century B.C., and was approached by a navigable canal in the western part of the Delta, near the Canopic branch of the Nile. Its chief period of splendor was during the reign of Amasis II., 570–520 B.C., under whom it was recognized as the official capital of the Greeks in Egypt. Its site was rediscovered in 1884 by Professor Flinders Petrie. Subsequent excavations have uncovered the remains of buildings described by Herodotus, the Hellenium, temples to Apollo, Aphrodite, the Dioscuri, etc., and there have been valuable finds of early Greek pottery and other archæological treasures. Consult Petrie, 'Naucratis' (1886).

Naucydes, nâ-sī'dēz, Greek sculptor. He flourished in the first quarter of the 4th century B.C. His birthplace was Argos and he was the pupil of the Elder Polycletus of the Peloponnesian school of sculpture. He carved a chryselephantine statue of Hebe for the temple of Hecate at Argos; a bronze statue of Hecate; a Hermes; several statues of Victory; a portrait of the poetess Erinna; 'Phryxus Sacrificing the Ram' (for the acropolis at Athens); and a Discobolus. The younger Polycletus was his pupil.

Naugatuck, Conn., town and borough in New Haven County; on the Naugatuck River, and on a division of the New York, N. H. & H. railroad; about 28 miles south by west of Hartford and 15 miles northwest of New Haven. In 1844 it was incorporated as a town, and as a borough in 1893. The chief manufactures are rubber goods, paper boxes, knit goods, machine-shop products, and cigars. It has considerable trade in farm products, especially tobacco. It is well supplied with schools; it has besides the public and parish elementary schools, the Whittemore High School, the Salem School, Sacred Heart Academy (R. C.), and the Whittemore Memorial Library. The government is vested in a board of warden and burgesses, who hold office one year, and who appoint all the administrative officials except the board of education, the members of which are chosen by popular vote. Pop. (1890) 6,218; (1900) 10,541.

Naugatuck, nâ'ga-tŭk, a river in Connecticut, has its rise in the northern part of Litchfield County, and flows south, about 60 miles, and enters Housatonic River at Derby. It flows through a mountainous part of the State, and supplies water power to many mills and factories. Waterbury (q.v.) is the chief city on its banks.

Naulette, nō-lĕt', a large cavern in Belgium, near Dinant. Here, in 1866, was found the lower jaw of a human, together with the bones of the elephant and rhinoceros. The human remains were assigned to the Monsterian epoch.

Nauma'chia, or **Naumachy** (from the Greek *naus,* a ship, and *machē,* a fight), among the Romans a public spectacle, representing a naval action. Cæsar was the first who exhibited a spectacle of this sort, which soon became the favorite amusement of the Roman people. Buildings were erected by the emperors, specially adapted for the purpose. They resembled the amphitheatres, and like them were at first built of wood. Domitian erected one of stone. A *naumachia,* built by Augustus, was 1,800 feet long and 200 wide, and was capable of contain-

ing 50 ships with three banks of oars, besides many small vessels. They were suddenly laid under water by means of subterranean canals, so that the ships were raised at once from the dry floor before the eyes of the spectators. These sea-fights were exhibited with the same splendor and reckless disregard of human life which characterized the gladiatorial combats. Titus exhibited a sea-fight in which 3,000 men were engaged, and ships almost equal in number to two real fleets were shown in combat by Domitian.

Naumann, Johann Friedrich, yō'hän frēd'rĭH now'män, German ornithologist: b. Ziebigk, Germany, 14 Feb. 1780; d. there 15 Aug. 1857. He studied with his father, who was an ornithologist, and became professor and inspector at the ornithological museum of the Duke of Anhalt-Köthen. His most valuable contribution to the science of ornithology is the 'Naturgeschichte der Vögel Deutschlands' ('Natural History of the Birds of Germany'), published in 1822–4; he prepared the illustrations for this work, making the plates for more than 500 copper engravings. He also wrote 'Taxidermie' (1815); 'Ueber den Haushalt der nördlichen Seevögel Europas' (1824); and, with Buhle, 'Die Eier der Vögel Deutschlands und der benachbarten Länder' (1819–28). A statue of him was erected at Köthen in 1880, and the German Ornithological Society named its official organ in his honor 'Naumannia.'

Naumann, Johann Gottlieb, yō'hän gŏt'lēb, German composer: b. Blasewitz, near Dresden, 17 April 1741; d. Dresden 23 Oct. 1801. Thanks to the interest of a rich Swedish amateur, Weeström, he was taken to Italy when 16, and there studied under Tartini. He became court composer at Dresden in 1765, and kapellmeister in 1774, a post to which he returned in 1786, after six years in Stockholm. His music, including operas, oratorios, and symphonies, was essentially Italian in style and is no longer popular. Consult the biography by Nestler (1901).

Naumann, Karl Friedrich, son of J. G. Naumann (q.v.), German mineralogist: b. Dresden 30 May 1797; d. there 26 Nov. 1873. He was educated at Freiburg, Jena and Leipsic, and in 1821 made a scientific tour in Norway. He was an instructor in the University of Jena in 1823, and professor at Leipsic in 1826. From 1826 to 1842 he was professor of crystallography at Freiburg, and from 1842 till shortly before his death held a professorship at Leipsic. Among his works are: 'Anfangsgründe der Krystallographie' (2d. ed. 1854); 'Elemente der Mineralogie' (12th ed. 1885).

Nau'mannite, in mineralogy, is the name given to a native selenide of silver and lead found in the Harz Mountains and so called from K. F. Naumann (q.v.). This mineral contains about 26 per cent of selenium, 65 per cent of silver, and 6 per cent of lead; in some samples a great part of the silver is replaced by lead. Specific gravity about 8.0. Color and streak iron-black.

Naumburg, nowm'boorg, or **Naumburg-on-the-Saale,** zä'lĕ, Germany, a town of the Prussian province of Saxony, on the Saale, near the junction of the Unstrut, 28 miles southwest of Halle. Its chief edifice is the restored cathedral, which has four lofty towers, one the gift of William II., erected in 1894. The town has some manufactures and a considerable wine trade. It became an episcopal see in 1029. In the 15th and 16th centuries, several treaties were concluded at Naumburg, and the town was of great strategical importance during the Thirty Years' war and the wars of 1806 and 1813. Pop. (1900) 23,817.

Naupactus, nâ-păk'tŭs. See LEPANTO.

Nauplia, nâ'plĭ-ạ, Greece, a fortified seaport town, capital of a nomarchy, at the north extremity of the Gulf of Argos, 25 miles by rail south of Corinth. It was occupied by the Venetians in the 13th century and was taken by the Turks in 1540. From 1824 to 1835 it was the capital of Greece, but declined in importance after the removal of the court to Athens. Pop. (1889) 10,879.

Nauplius, nâ'plĭ-ŭs, in Greek mythology, the son of Neptune and father of Palamedes. He is said to have revenged the death of his son by deceiving the Greeks by false beacons, as they returned from Troy, and causing their vessels to be wrecked. See MYTHOLOGY.

Nauplius. See LARVA.

Nausea (Latin, from Greek *ναυσία*, seasickness), a sensation of sickness and distress, of which the leading characteristic is squeamishness of the stomach. The disturbance, however, extends to the entire system. In severe cases languor affects every part; the pulse is small; the skin moist and pale; the flow of saliva increases; and if vomiting does not immediately accompany the sensation, the apprehension of it is painfully present. The causes of nausea are many: blows upon sensitive parts, mental shocks, hysteria, pregnancy, irritation or tumors of the abdominal or the pelvic viscera may produce it, as may also the early stage of zymotic disease, or epilepsy, diseases of the brain, etc. See VOMITING.

Naushon, nâ-shŏn', the largest of the Elizabeth Islands (q.v.), off the southeast coast of Massachusetts.

Nautch, nâch, in India, a dance performed by the dancing girls attached to the temples, called Nautch girls or Nautchee, who are brought up and trained to all the arts and allurements of their profession. It is probably a survival of the ancient custom of sacred prostitution. They move with slow, undulatory movements of the body, while the feet are but little used.

Nautical Surveying. See HYDROGRAPHY; SURVEYING.

Nau'tilus, a marine cuttlefish of the genus *Nautilus* and family *Nautilidæ*, a few living species of which are the only survivors of the order or superorder *Tetra branchiata*, which, including both the nautiloid forms and the ammonites (q.v.) is divided into no less than 22 extinct families, so abundant were they in past ages. The nautiloids began in the Cambrian, became greatly differentiated and abundant in the Silurian and Carboniferous, and by the close of the Palæozoic Age had become almost

entirely extinct. The more complex ammonites, on the other hand, reached their full development only during the Mesozoic Age. The shell of the pearly or chamboid nautilus, described below, is typical of the armature of the group. It is at first simple, but as the animal grows becomes coiled in a flat spiral and divided by internal transverse septa into a succession of chambers, the last one of which is occupied by the animal. This process is continued until about 36 chambers have been formed, all but the last filled with gas which gives a certain buoyancy, but does not enable the animal to come to the surface. Externally the shell is porcellaneous; internally is a layer of mother-of-pearl. The septa are perforated by an opening, through which a fleshy cord or siphuncle passes from the posterior end of the animal to the apical or first chamber of the spire. Among other anatomical peculiarities the animal has four gills and four kidneys, calcareous instead of horny beaks, a funnel composed of two lobes instead of one tube, small stalked eyes, and no ink bag. Quite unique are the tentacles, which number about 90. On each side of the head are a hood tentacle, two ocular tentacles, and 17 brachial tentacles, and around the mouth four groups of 12 or 13 labial tentacles.

The best-known species is *Nautilus pompilius* which, with two others, inhabits the Indian Ocean and tropical parts of the South Pacific. They live exclusively on or near the bottom in relatively deep waters, are gregarious, more or less migratory, and nocturnal. Although fond of any animal matter, they feed chiefly on prawns. In swimming they dart quickly backward for short distances, with the tentacles either radiating or held together and stiffly projecting from the mouth of the shell; but they are inactive and rest most of the time on the bottom. Little is known of their breeding, which is supposed to take place in deep holes. The eggs are very large; including the capsule they measure nearly 1½ by ¾ inches. They are attached singly by the base, and the capsule is irregularly folded and fenestrated longitudinally in a most peculiar manner. This species is very abundant in about 60 fathoms of water in the Philippines, and large numbers are captured by the fishermen in bamboo fish traps or baskets constructed on the principle of the lobster pots in use on the New England coast and baited with any kind of animal offal. The shells are somewhat used in the arts, but the flesh is little esteemed for food, as is that of the native species by the Fiji Islanders. Consult: Willey, 'Zoological Results,' Part VI. (Cambridge, 1902), and Lacaze-Duthier, 'Arch. Zoologie Experimentale' (1892).

The "paper nautilus" is a very different animal, for which see ARGONAUT.

J. PERCY MOORE,
University of Pennsylvania.

Nautilus, in hydraulic engineering, a diving-bell requiring no suspension. Water admitted through the cock into pipes flows into the exterior chambers, causing the apparatus to sink. The workmen enter through an aperture at the top, closed by an air-tight cover, and can in still water move the machine in any required direction by stepping on the ground and pushing. Air is condensed in a reservoir at the surface to a degree somewhat greater than the condensation due to the depth, and passes through a pipe into the chambers rendering the machine specifically lighter than water, and enabling it to lift stones or other objects below. A gauge indicates the amount of lifting power attained as the air is admitted.

Nautilus Propeller, in marine engineering, a water-jet propeller on the reaction principle. Water is forced by a turbine driven from the engine, through two nozzles, one on each side of the vessel, and directed fore or aft. See NAVAL ARCHITECTURE.

Nauvoo, nâ-voo', Ill., city in Hancock County; on the Mississippi River; about 30 miles below Burlington, Ia. It is situated in an agricultural and fruit growing region in which grapes and berries are the chief products. The principal industries are connected with the manufacturing of wine and the shipping of wine and fruits. It is the seat of Saint Mary's Academy (R. C.).

Nauvoo was founded by the Mormons (q.v.) in 1840, and in 1846 it had a population of 15,000. It had mills, factories, stores, schools, etc. Its most conspicuous building was a temple built of white limestone, 130 feet long and 90 feet wide. The temple was not completed when the Mormons were expelled in 1846; in 1848 it was partially destroyed by fire, and in 1850 it was further ruined by a tornado. A company of French Socialists, called Icarians, took possession of Nauvoo in 1850 and remained until 1857. The "Nauvoo Legion," a Mormon military organization, which embraced all the boys and men between the ages of 16 and 50, was founded here in 1840, and in 1857 was reorganized in Utah. At the last muster, in 1870, it had a membership of 13,000. Pop. (1890) 1,208; (1900) 1,321.

Nava, nä'vä, a seaport of Japan. See NAFA.

Navajo Indians. The meaning of the word Navajo is indefinite; said by Benavides (1630) to signify "great planted fields"; it is probably not from the Spanish *navája,* "knife," as has been supposed. An important tribe of the Athapascan or Tinne stock of Indians, now on a reservation of about 9,442,240 acres in northeastern Arizona, northwestern New Mexico, and southeastern Utah. Population estimated at 16,000. There is no evidence that the Navajos were seen by the Spanish explorers of the Southwest in the 16th century, although the latter passed through their present territory in 1540, 1583, and 1598; it is therefore believed that at this early period they were an insignificant agricultural tribe, but gradually increased in population largely through the adoption of natives of both allied and other stocks during succeeding years. Their territory is entirely within the arid region and their lands are chiefly desert; but in the cañons and about the bases of the mesas that abound in their territory, horticulture is practised through deep planting in the sandy soil, while in the valley of the Rio San Juan, which is the largest stream in their country, farming is carried on to a greater extent. Agriculture, however, forms but a meager part of the Navajo's subsistence, his livelihood being gained principally from the flocks and herds, of which, in 1902, there were 380,000 sheep and 67,000 goats, the former of which, besides fur-

nishing the chief food supply, netted $150,000 in wool and blankets. These blankets, which have become celebrated, are woven by the women on simple looms and in pleasing and sometimes intricate designs of various colors. Formerly native dyes of rare delicacy of tone were employed, but in recent years these have given way to glaring aniline colors, and the decorative patterns have also been largely modified to meet the demands of the white man, so that as specimens of aboriginal handiwork very few of the Navajo blankets now woven are comparable with those formerly made. The Navajos also weave belts, garters, and saddle-girths, and make a few excellent baskets, mostly for ceremonial use. Some of the men are expert silversmiths.

Although more closely related in language to the Apaches than to any other tribe, the Navajos are greatly mixed, embodying elements of Pueblo, Shoshonean, Yuman, and even of Spanish blood; hence there is perhaps a greater variety in their physical features than among most Indian tribes.

The typical Navajo dwelling is a conical framework of logs or sticks covered with brush, bark, or grass, and earth, with a smoke-hole at the apex and a doorway in one side. Rude shelters with open fronts are erected for use in summer. If a person dies in a house the latter is believed to become haunted and is henceforth tabooed.

Dr. Washington Matthews, U. S. A., who has studied the inner life of the tribe, discovered the existence of 51 clans, grouped into about a dozen phratries, which latter, however, are probably not homogeneous organizations as among some Indians. A Navajo belongs to the clan of his mother, and a man may not marry a woman belonging to his own clan; or, as a rule, one of his own phratry. Their religion is elaborate and complicated. They have a great many ceremonies, most of which are performed for healing the sick, but others are conducted to insure success in planting, harvesting, building, war, nubility, marriage, travel, etc., and for bringing rain. Sacrifice, elaborate dry paintings with sand and pigments, masquerade, dancing, prayer, and song are the elements of the ceremonies, the gods being personated by the masked performers. No supreme god is recognized; there was no great creator of the world, the latter have existed, in the Navajo belief, at the time of their origin as a people. There are many beneficent gods as well as malevolent gods or genii, and devils.

Almost from the beginning of the 17th century the Navajos were enemies of the sedentary tribes and of the Spanish colonists, and although they were never so predatory and warlike as their Apache cousins, the Spanish villages and Pueblo settlements suffered almost continuously from their raids up to the time of the conquest of New Mexico by American forces in 1846, followed by the establishment of military posts throughout the Southwest. Treaties were made with the tribe in 1846, 1848, and 1849, but they were of no avail in keeping in check their depredations, which continued at intervals until 1858, expeditions meanwhile being led against them. In the year last named the Navajos killed a negro servant at Fort Defiance, as a direct result of which it became necessary to wage warfare against the Indians from August until December, during which 50 Navajos were killed and a large number of sheep and other stock lost. Another treaty was signed, but during 1860 the depredations continued, and another expedition was led against them, but without success. In April the natives boldy attacked Fort Defiance, but were repulsed. In the winter of 1860–1 an active campaign was made against them, and although practically their only loss was in sheep, they were compelled to sue for peace in February 1861, when an armistice of a year was agreed to, during which the troops were withdrawn. In a dispute over a horserace at Fort Fauntleroy (near the present Fort Wingate), New Mexico, a dozen Navajos were brutally killed. Emboldened by the withdrawal of the troops on account of the Civil War, the Indians resumed their raids, which they continued almost uninterruptedly until 1863, when Col. Christopher ("Kit") Carson began operations against them and a plan was formulated to transfer the Navajos from their old haunts to Fort Sumner, at the Bosque Redondo, on the Pecos River, in eastern New Mexico. It was determined that all who refused to go after 20 July would be regarded as hostile and be treated accordingly, yet by the close of the year only 200 prisoners were at Fort Sumner or on the way thither. Early in 1864 Carson made a campaign to the Cañon de Chelly, in the heart of the Navajo country in northeastern Arizona, where he killed 23 and captured over 200 of the Indians. This taught the latter a lesson, so that by the close of 1864 more than 7,000 of the tribe were held as prisoners at the Bosque Redondo; these were increased to 8,491 in 1865, but it was supposed that this number did not represent more than half of the tribe. The experiment, however, proved a failure, so that after the death of about a thousand of the Indians, the escape of others, and an expenditure of about a million dollars in their support in a region ill-adapted to their progress, the remainder, numbering 7,304, were removed to their old country in July 1868, an appropriation of $422,000 having been made in that year to give them a new start. Since that time the Navajos have been peaceable and industrious. They make good laborers and are slowly developing agricultural pursuits. In 1902 they had 8,000 acres under cultivation, which yielded 1,200 bushels of wheat, 700 bushels of oats, etc., and 3,000 bushels of corn. They earned in addition a quarter of a million dollars by the product of their labor, and besides the sheep and goats above mentioned owned 47,260 horses, mules, and burros, and 8,000 cattle. There are 189 Navajo children in two government reservation schools, the support of which cost about $28,000 in 1902. There are also 4 sectarian missions and 2 mission schools on or near the reservation. Ethnology, 1901); Matthews, 'A Two-faced Navajo Blanket' ('American Anthropologist,' Vol. II., pp. 638–42, 1900); Hrdlicka, 'Observations on the Navajo' ('American Anthropologist,' Vol. II., pp. 339–45, 1900); Hollister, 'The Navajo and his Blanket' (1903).

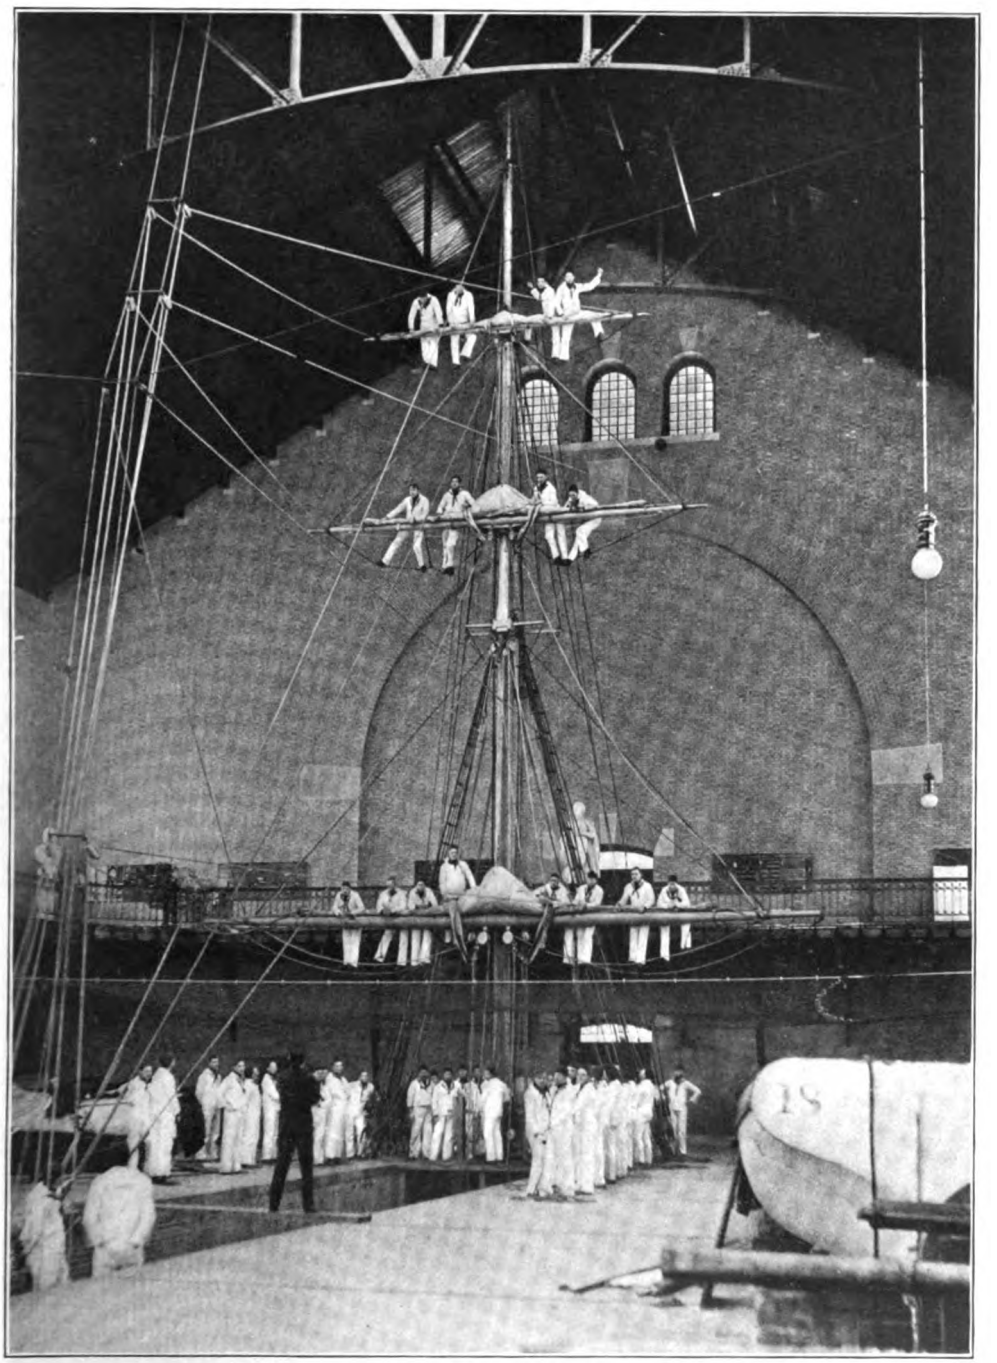
F. W. Hodge,
Smithsonian Institution, Washington, D. C.

Naval Academy, United States, the most important naval school in America, established at Annapolis, Md., in 1845, by a special act of the Congress. The origin of this technical educational institution was due primarily to the efforts of George Bancroft, secretary of the navy. The Academy was opened 10 Oct. 1845, with Commander Franklin Buchanan as superintendent. For a time during the Civil War the school was removed from Annapolis to Newport, R. I. The Bureau of Navigation of the Navy Department has direct supervision of the Academy.

Admission of Students.—There are received at the Academy, one naval cadet for each member or delegate of the United States House of Representatives, one for the District of Columbia, and 10 at large. The appointment of cadets at large and for the District of Columbia is made by the President. The Secretary of the Navy, as soon after 5 March in each year as possible, must notify in writing each member and delegate of the House of Representatives of any vacancy that may exist in his district. The nomination of a candidate to fill the vacancy is made, on the recommendation of the member or delegate, by the secretary. Candidates must be actual residents of the districts from which they are nominated. The course of naval cadets is six years, the last two of which are spent at sea. Candidates at the time of their examination for admission must be not under 15 nor over 20 years of age and physically sound, well formed, and of robust constitution. They enter the Academy immediately after passing the prescribed examinations, and are required to sign articles binding themselves to serve in the United States navy eight years (including the time of probation at the Naval Academy), unless sooner discharged. The pay of a naval cadet is $500 a year, beginning at the date of admission. At the end of the third year the new first class is separated into two divisions, namely, the Line Division and the Engineer Division, the numbers of these divisions being proportioned to the vacancies that have occurred in the several corps during the preceding year. At the end of the six years' course appointments to fill vacancies in the line and in the Marine Corps are made from the Line Division, and to fill vacancies in the Engineer Corps from the Engineer Division. If, after making assignments as above, there should still be vacancies in one branch and surplus graduates in the other, the vacancies in the former may be filled by assignment to it of surplus graduates from the latter. At least 15 appointments from such graduates are made each year. Surplus graduates who do not receive appointments are given a certificate of graduation, an honorable discharge, and one year's sea pay.

The Course of Study.—When a cadet graduates he must be a seaman, an engineer, a true marine engineer, well acquainted with steam, electricity and ordnance, and a navigator and surveyor, and he must have a fair knowledge of his own language with some acquaintance with French and Spanish. To achieve this in four years he must be well grounded in the rudiments; he must have good health, and he must work hard. The course must be progressive and the instructors competent and in sufficient numbers to be able to instruct — not merely to examine and hear lessons. Even then the work of studying would be too hard for the average youth were it not for the fact that much of the practical work is good out-of-door exercise and the hard brain work is well balanced with plenty of physical exercise and healthy amusement. The instruction for the fourth class, that is for the first year, completes the study of algebra and geometry and includes trigonometry and descriptive geometry. In English it includes rhetoric and something of the art of writing English and Andrews' 'Manual of the Constitution.' French and Spanish and mechanical drawing are begun. It is a necessity for a naval officer to be able to read a drawing and to make a good working sketch. The naval architect, the marine engineer, and the ordnance engineer has each his special methods in drawing, with which the cadet must become familiar. Accordingly he starts drawing with the beginning of his course. All his professional work during this year is practical and is given him during the drill period. The academic year opens on 1 October and closes about 1 June; then comes the practice cruise, which is devoted almost entirely to practice professional work with some little study of the theory of professional subjects. The cruise ends about 1 September when the cadets have a month's leave to visit their homes. Academic life begins again on 1 October. During the third-class year the cadets complete their studies in the mathematical department. They have trigonometry, descriptive geometry, conic sections, differential and integral calculus. In English they study naval history. They continue the study of French and Spanish, and mechanical drawing, and take up the study of elementary physics and chemistry. Their practical work is continued during the drill period and on the practice cruise at the end of the academic year.

Second Class Men.—After the month's leave they take up their life at the Academy as second-class men, and now begin to take up the study of professional subjects. In the department of mechanics they study integral calculus, mechanics and hydro-mechanics. They continue the study of physics and chemistry and begin the study of electricity and magnetism. They continue mechanical drawing and lay the foundation for engineering in studying the principles of mechanism and mechanical processes, with marine engines and boilers. They study theoretical seamanship and the drill regulations for infantry and artillery. The practical work continues during the drill period and has advanced progressively so that the cadets are well prepared for the professional subjects of this and the following year. This is their last practice cruise, and by far the most important one, as they are now carefully instructed in their duties as officers. They are required to perform the work of officers at sea in handling the ship and managing the motive power, both steam and sail. They must work hard at practical navigation with instruments and charts. They visit the great shipyards of the country, listen to lectures and take notes, with the ships and engines under construction as object lessons. In their last year as first-class men all their studies are professional. They have seamanship and naval tactics, ordnance and gunnery, navigation, compass deviations and surveying, boilers, engineering materials, designing and naval construction, and elec-



APPARATUS FOR INDOOR TRAINING IN HANDLING A FULL-RIGGED SHIP. I.

trical engineering. The practical work goes hand in hand with the theoretical during the drill period. The first class are the officers of the cadet battalion and under supervision perform much of the work of officers.

Sea Service.—At the end of their first-class year the cadets are graduated and are ordered to sea. Here they nominally continue their course for two years, being examined at the completion of that time and commissioned as ensigns. Actually their work as officers begins after leaving the Academy, and under the present necessity for more officers they perform the duties of even higher grades than that of ensign. In fact they perform the duties of commissioned officers without the rank or pay or right to pension or retirement in case of injury or illness in line of duty.

Athletics.— To discuss the training of cadets at the Naval Academy without mentioning athletics would be to leave out a most important factor in their character training. Boating, football, baseball, fencing, track athletics, and gymnasium work are all encouraged. The various competitive games are a source of amusement to all and of healthy exercise to many. Courage and skill are gained and self-denial must be practised by those who train for the various sports, and athletics furnishes one of the most important aids in training a youth to become an officer.

Academy Buildings.— In 1895 was commenced a new and improved plan of construction and reorganization of the school buildings at Annapolis. The new buildings are largely due to the efforts of two men — the superintendent at that time, Capt. Philip H. Cooper, now rear-admiral, and Col. R. M. Thompson, who graduated in 1868 and was in 1895 a member of the Board of Visitors. The board recommended the rebuilding of the Naval Academy and the energy of these two men pressed the scheme upon the government. The department was induced to order a board to consider and recommend a comprehensive plan for all the necessary buildings, and Colonel Thompson persuaded the New York architect, Ernest Flagg, to consult with the board and with Captain Cooper. A beautiful set of plans resulted, recommended by the board and approved by the department. But the Spanish War interfered and it was not till 1898 that an appropriation became available and the cornerstone of the new armory was laid by Rear-Admiral F. V. McNair, who had succeeded Captain Cooper as superintendent. The plan as viewed from the sea front shows the cadet quarters extending 729 feet, flanked on one side by the armory and on the other by the boat house. These buildings are at right angles to the direction of the cadet quarters, are 428 feet long and similar in appearance. They are connected by colonnades with the quarters. This gives from the sea a harmonious group of buildings extending in a northeast and southwest direction for 1,278 feet with the high roof of the main building of the cadet quarters as a centre. Thirteen hundred feet in a northwest direction, with the main line of buildings parallel to and facing the first group is the academic building with the chemistry and marine engineering buildings on either flank and with the high roof of the academic building in the centre and balancing the group to the southeast. Between these two groups, facing the Severn River and forming the west side of the rectangle, is the auditorium and chapel, with the superintendent's house and the administration building on either side. The fourth side of the rectangle is formed by the basin. From the steps of this basin and facing the auditorium is the best view. On either hand is a handsome group of buildings with the dome of the auditorium as the centre. The new buildings involved an outlay of over $8,000,000.

Naval Apprentice. See NAVAL SERVICE.

Naval Architects and Marine Engineers, The Society of, an American society with over 500 members incorporated in New York State, and with headquarters in New York city. The society holds annual meetings and seeks to advance the art of shipbuilding.

Naval Architecture. The existence of naval architecture as an art is probably contemporaneous with the existence of man, but its development into a science is confined almost wholly to the 19th century and accompanied the advance in all mechanical sciences during that period. During the 18th century, and even earlier, some Continental mathematicians had devoted attention to the subject and developed various theorems concerning floating bodies which were likewise applicable to ships. Throughout this period the French were the acknowledged leaders in the development of knowledge relating to such matters. So much was this the case that it seems to have been not unusual for other countries to reproduce the models of French men-of-war, thereby admitting the excellence of the French type and paying deserved tribute to the labors of the naval architects of that country.

Perhaps the most notable attempt, however, to place naval architecture upon a logical and scientific basis, prior to 1800, was that of the famous Swedish naval architect, Chapman (1721–1808), who, during his long career, achieved special eminence in his profession and wrote a number of treatises relating to various features of naval architecture. One hundred years ago each nation, and, indeed, each master builder, carefully guarded as valuable secrets the methods and theories pertaining to the science of naval architecture, which had been deduced from experience or which had been handed down by those who had conducted previous investigations. This state of affairs, indeed, extended well into the 19th century, but with the rapid development of iron shipbuilding, which started about the middle of that century, came a rapid advance in naval architecture and dissemination of knowledge upon the subject, until, to-day, in the leading shipbuilding countries of the world will be found schools devoted to this subject; and the products of the naval architect's skill differ only in comparatively minor respects, whether turned out from British, European, American, or Japanese shipyards.

The primary object of the vast majority of all ships is to-day, as throughout the past, *transportation,* and the problem is only affected in its details in order to conform to the requirements of the articles carried, be they men, merchandise, or, in the case of men-of-war, armor, armament and other appliances for rendering

the vessel efficient as a fighting machine. The foregoing statement is quite as true of the humble 10-knot collier, which will carry in coal twice the weight of her hull, machinery, and outfit, as of the trans-oceanic passenger liner which carries a comparatively small amount of cargo but a large quantity of bunker coal to enable it to make a high speed, and provides luxurious accommodations for numerous passengers. It is true also of the man-of-war, which carries a proportionately large crew and a fair amount of cargo in the shape of consumable stores, coal and ammunition, besides a heavy weight of armor, armament and ammunition, and the necessary military adjuncts required by the special service upon which employed. Considering, then, all ships as bearers of burdens, there are two essential characteristics which they must show: They must be able to go from point to point at an appropriate speed and with all reasonable safety for ship, cargo and crew. Ability to keep the sea under all the usual conditions of its intended service is indispensable for every ship, and we will now consider briefly the detailed factors entering into the problem.

Buoyancy.—When a ship is entirely waterborne, the weight of water which it displaces is exactly equal to the weight of the ship itself and everything contained in it. To float at all, the volume of the enveloping surface of the ship must be greater than the volume of water which equals in weight the displacement of the ship. Clearly, for safety, there must be a margin, or reserve of buoyancy, in the ship over and above the buoyancy equal to its weight. The percentage of reserve buoyancy varies widely according to the type of vessel, passing from approximately zero in the case of diving, or submarine, boats (when in condition to dive), to as much as 100 per cent or more in the case of passenger vessels with large deck areas and high sides. In certain types of men-of-war, notably the large cruiser class, the percentage of reserve buoyancy is also very high. In the case of men-of-war, the reserve buoyancy is practically fixed by the design; but, in the case of merchant vessels, and particularly cargo carriers, which are subject to overloading, the reserve buoyancy is now practically determined by the marine insurance companies. The business of insuring ships and their cargoes is a large and important one, but is carried on by a comparatively small number of very powerful companies or associations, and these companies, for their own protection, have a well-equipped, scientific and technical staff and have prescribed conditions affecting the safety, or seaworthiness, of ships, which must be complied with in order to obtain insurance at a reasonable rate. In England, the Board of Trade, which is the department of the government charged with authority over matters relating to shipping, has acted in conjunction with the large insurance companies in laying down requirements for reserve buoyancy, these authorities being still further assisted by representatives of the national associations of naval architects. The actual amount of reserve buoyancy required varies somewhat with the size and type of vessel, and likewise with the character of the service, the maximum amount being required for vessels engaged in winter service in the North Atlantic Ocean. Speaking broadly, the objects aimed at in the load-line requirements are to obtain the greatest possible carrying capacity, compatible with safety of the vessel under all conditions of weather, after making provision for minor casualties which might still further reduce the reserve of buoyancy.

Structural Strength.—Buoyancy, however, is not the only requirement for seaworthiness of a ship. It is essential that the ship should be strong enough to withstand the stresses due to the action of the waves. In this direction, also, the insurance companies have taken a prominent position, and laid down minimum requirements acceptable for merchant vessels. Strength is obtained not only by the use of the best materials but by the disposition of the material used in such manner as to best accomplish the desired results. The methods used in determining the strength of ships are very similar to those used in determining the strength of other structures, such as bridges, but there is an essential difference due to the fact that it is practically impossible to determine the maximum load to which a ship may be subjected. It is comparatively easy to calculate the strength of the hull structure, knowing the disposition of the weights and buoyancy of the vessel. The stresses upon each part of the vessel's structure, when floating in still water, may be determined with accuracy; but the maximum stress will occur, not in still water, but among waves, and while we know that, whatever the motion of the sea, the buoyancy of the submerged portions of a ship must equal the total weight of the vessel and its contents (subject to minor corrections, due to the dynamic effect of the motions of the ship itself), it is obviously impossible to foresee the possible combinations and contours of waves to whose action the ship may be subjected and the consequent distribution of buoyant forces and structural stresses. Hence, the naval architect, in determining the structural requirements of a ship so far as they affect its strength, must be guided largely by experience. If he provides strength equal or superior to that of ships of the same type and not very dissimilar in size, which have shown no weakness in service, he has reasonable assurance that he is safe. But, when dealing with vessels of a novel type or size beyond precedent, the skill and judgment of the designer are taxed to the utmost to accurately estimate in advance and provide against the maximum stresses that may occur in service. In this respect, also, the accumulated experience of the marine insurance societies has been of great value in determining adequate strength associated with weight of structure which is not excessive, and which will permit a maximum development of carrying and other desirable qualities. The natural tendency of such societies, however, is to make sure of adequate strength, necessarily giving to weight and cost merely secondary consideration; so that whenever a novel type of ship is put forward, there is apt to be a period of discussion and unsettlement. The builders and owners naturally desire to provide only the minimum strength necessary, in their judgment, for complete seaworthiness, while, from the point of view of the insurer, if any error is made it should be positively on the side of excessive strength. As the results of experience accumulate, these questions adjust them-

Mqu

selves, but with the rapid development in the size of ships, and the variations in types which have been witnessed during the last quarter of the 19th century, shipbuilders and the insurance societies have not been entirely in accord on such questions.

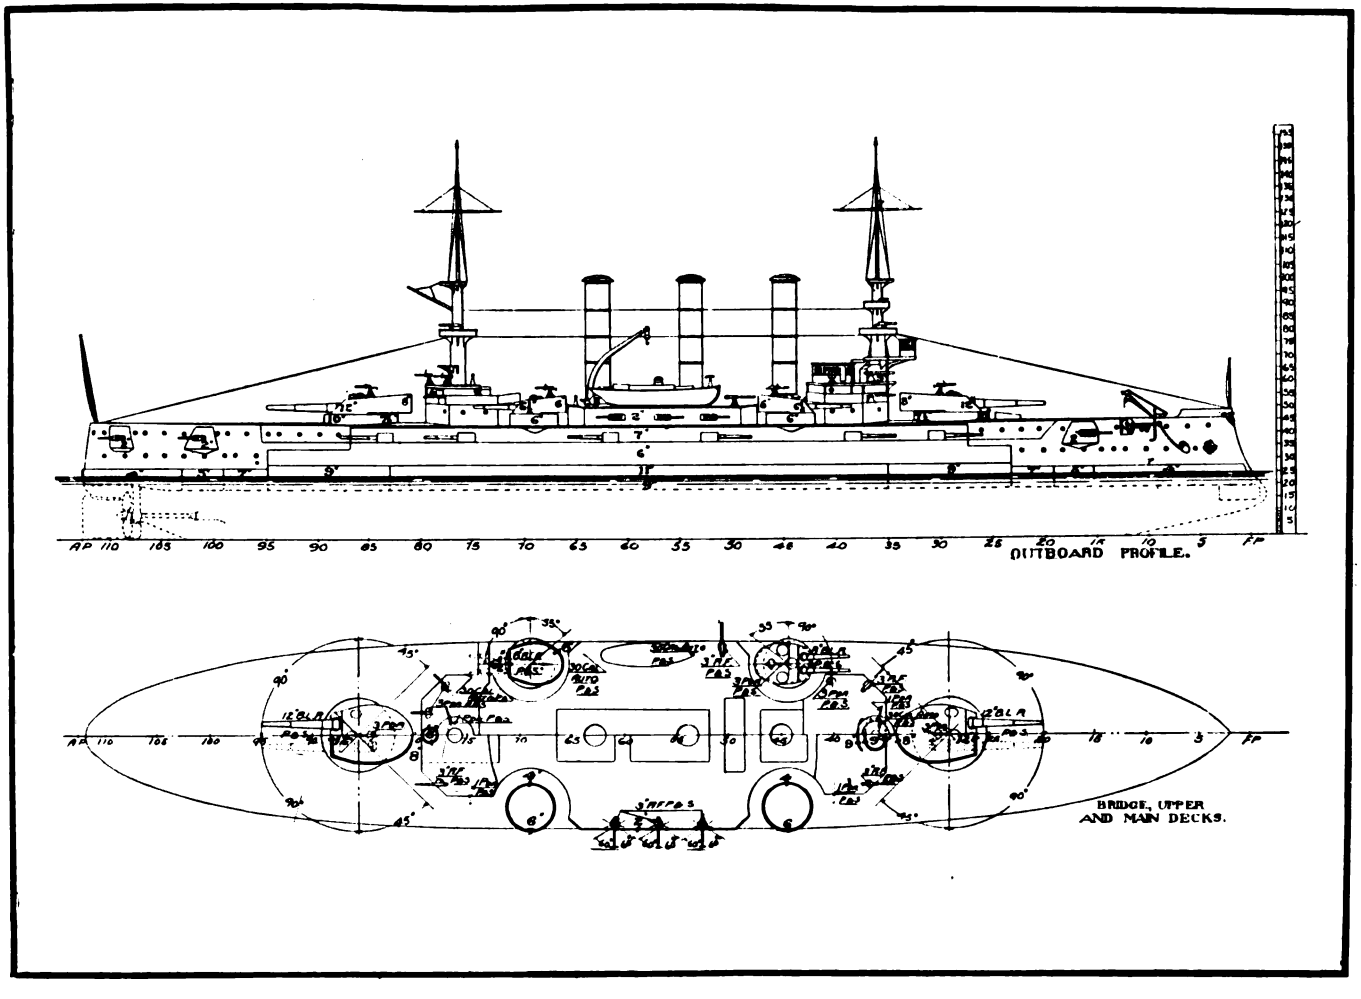
Stability.—In addition to the elements of adequate buoyancy and strength, there must be considered an equally important factor in the seaworthiness of the vessel,—namely, *stability.* This quality is all-important in rendering the vessel safe and enabling it to resist the capsizing effect of wind and waves. The stability problems which must be solved by the naval architect are practically peculiar to his profession. Sailing vessels, to avoid capsizing, must be handled with skill, and sail must be reduced in ample time to avoid the disastrous consequences of undue wind pressure. Steamers of the present day carry practically no sail, and are liable to be capsized by the sea only. But with them, too, there is room for skill in handling with reference to the direction of the waves, etc. It is the duty of the naval architect to provide a vessel, in either case, which, when handled with ordinary skill, will be stable under all probable conditions of wind and weather. The general features of the problem of stability are comparatively simple, and may be readily understood by considering a ship floating in still water. Under these conditions, the whole weight of the ship may be regarded as concentrated and acting downward through its centre of gravity. The upward forces of buoyancy may also be regarded as concentrated into a single upward pull through an imaginary point called the metacentre. With the ship at rest, the downward pull through the centre of gravity must be exactly equal to the upward pull through the metacentre. Evidently, if the metacentre is directly below the centre of gravity, there will be unstable equilibrium, since any slight accidental deflection of the centre of gravity would result in further deflection, the forces of buoyancy and gravity acting as an upsetting couple; if, however, the centre of gravity is below the metacentre, the resultant of the downward pull through the centre of gravity and the upward pull through the metacentre produces a righting moment tending to return the ship to the upright position. The name "metacentre" is supposed to have originated from the Greek word "meta," meaning "limit" or "goal" beyond which the centre of gravity cannot pass. Possibly it would have been more logical if the metacentre had been called the centre of buoyancy, thereby causing the nomenclature of the centre of buoyant forces to correspond more exactly to that of the centre of gravity. But in naval architecture, the centre of buoyancy is the name given to the centre of gravity of the volume of water displaced by the immersed portion of the ship. The line of action of the resultant upward forces of buoyancy must obviously pass through the centre of buoyancy, and it therefore follows that the centre of buoyancy and the metacentre are always found in one vertical line. The metacentre is not a fixed point but rises and falls as the ship inclines, owing to the varying shape and proportions of the immersed portion of the hull, and in every ship there is finally found an angle of inclination at which the metacentre is found directly below the centre of gravity. For inclinations greater than this, there is a tendency for the ship to capsize instead of right itself. The inclination at which this occurs is called the capsizing angle, and the angular range through which the vessel can be inclined without capsizing is called the "range of stability." Generally speaking, the less the freeboard (or height of side above water), the smaller the range of stability. In practice, the range of stability necessary for safety is affected somewhat by the initial metacentric height, or the distance between the centre of gravity and the metacentre when the ship is upright. The greater this distance, the greater the effort required to heel the ship, and hence the range of stability may be made less with safety. In practice, with any type of ship the range of stability can seldom be safely made less than 50°, and, in the majority of cases, should be much more. It is frequently over 100° for vessels of high freeboard. For safety alone, it is not always necessary that, initially, when in the upright position, the metacentre should be above the centre of gravity. If the metacentre is slightly below the centre of gravity, the vessel will heel over a few degrees to one side or the other until it reaches an inclination at which the metacentre rises above the centre of gravity and the vessel becomes stable again; if the freeboard of the vessel is high and the range of stability is great, such a vessel may be perfectly safe. Several of the large trans-Atlantic liners are purposely designed with comparatively small initial metacentric height, as such a condition permits the vessel to respond less quickly to wave action, and causes easy and slow rolling.

Rolling.—Closely associated with the question of stability is the question of rolling in a seaway. When a vessel is floating in disturbed water the effect is to change the relative location of the centre of buoyancy so that the metacentre shifts to one side or the other of a vertical line through the centre of gravity, causing a tendency to heel or roll the vessel until the metacentre again becomes immediately above the centre of gravity. Moreover, by this time the vessel has acquired certain angular velocity so that it swings beyond the position of equilibrium. An analysis of the theory of the rolling of ships at sea would be too complicated to be instructive in an article of this character, but, as in the case of stability, there are certain broad, underlying principles. These would be comparatively simple if in a floating body of ship-shape form the metacentre were fixed. In the case of a floating circular cylinder, such a condition does exist, the metacentre being fixed and remaining always at the centre of the cylinder. In such a case, the motion of a ship rolling is very closely analogous to what it would be if the vessel were suspended on pivots at the height of the metacentre. In such an imaginary case, in conformity with the well-known principles covering the motion of compound pendulums, the closer the metacentre is to the centre of gravity, the longer the period of oscillation, and the further the metacentre from the centre of gravity, the shorter the period of oscillation. In actual ships floating in water, however, the question is complicated by the varying position of the metacentre and the resistance of the water, which, in the absence of new disturbing causes, rapidly brings rolling ships to

rest. But the fact remains that vessels of large metacentric height are inclined to roll very quickly, while those of small metacentric height are sluggish in their rolling motion. When floating among waves which are large as compared with the vessel, the vessel of great metacentric height tends to float like a board, keeping its deck fairly parallel to the surface of the water; while the vessel of small metacentric height will at times be found rolling toward the wave crest instead of away from it,—a very undesirable condition with low free-board vessels. In practice, vessels vary widely in their periods of oscillation. For a large vessel, perhaps the shortest period met with in practice would be that of a low-freeboard monitor, which, on account of its large metacentric height, may make a single roll from extreme inclination in one direction to the extreme in the other in from 2½ to 3 seconds, while a large vessel of small metacentric height may take as much as 20 seconds to the single roll. While rolling through small angles, say under 10°, the motion of a vessel is practically isochronous, that is to say, the period or time of completing a roll varies but little with the angle. This ceases to be true when vessels reach large angles of roll, say 30° or more. If there did not exist a retardation of roll in heavy rolling there would be grave danger of vessels, otherwise perfectly safe and seaworthy, being capsized by an accumulation of roll, every passing wave adding a little to the amplitude of roll,—well illustrated by the fact that with properly-timed impulses comparatively small forces will give large oscillations to a swinging weight. In actual practice, the skilled seaman can do much to limit excessive rolling by shaping the course of the vessel so as to produce complete lack of synchronism between the period of the ship and that of the waves. The naval architect, however, in the original design of the vessel utilizes the resistance of the water and provides "bilge" or "rolling keels," which aid materially in preventing heavy rolling. Bilge keels are projections at the bilge of the ship, approximately from one foot to three feet in depth, and extending usually for about half the length of the vessel and so situated when practicable as to offer maximum resistance to rolling. When properly fitted, bilge keels will often reduce the maximum angle of rolling, under adverse conditions, to less than half what it would be without them.

Speed and Resistance of Ships.—It has already been pointed out that an essential characteristic of all ships is mobility. The speed of a ship is a simple, concrete fact, readily appreciated by anyone and comparable with the speed of other ships; therefore, in many cases, it is considered the most conspicuous and important quality of a ship, whether man-of-war or passenger steamer. The keen interest taken by the general public in the speed records of passenger steamers engaged in trans-oceanic service fully illustrates this fact. The present accepted methods of determining the power necessary to drive a given ship at a given speed, and, conversely, the form of ship best adapted to be driven by a given power, are of comparatively recent development and largely due to the late William Froude, who, through an elaborate series of experiments, established the truth of the fundamental laws upon which are based the present theories of the resistance of ships. The resistance of a given ship, moving at a given speed, is made up of three main factors: first, the skin friction of the water on the surface of the ship. This is dependent only upon the surface exposed and the speed of the ship. It varies slightly with variation of form, due to this variation affecting the velocity of the water over the hull, but this variation is too slight to be taken account of in practice. The second element of resistance is what is called "wave-making resistance," due to the fact that a ship in moving through water produces waves and the force required to produce these waves proportionately reduces the power available for propulsion and thus, in effect, increases the resistance to the motion of the ship. The third element is what is called "eddy making," due to eddies of the water behind square corners of the hull and attachments, such as stern-post, propeller strut, etc. The eddy-making resistance is, however, comparatively small. The skin frictional resistance of a ship can be readily calculated with sufficient accuracy from the results of experiments upon the friction of plane surfaces drawn through water at known speeds. Mr. Froude demonstrated that the remaining resistances (wave and eddy making) of a full-sized ship could be estimated with great accuracy from a careful determination of similar resistances experienced by a small model of a ship when towed at a speed corresponding to the desired speed of the ship, the corresponding speeds of model and ship being in the ratio of the square roots of their linear dimensions. For a ship 500 feet in length, and a small model 20 feet long, the ratio of linear dimensions is 25; so that the actual speed of the model corresponding to 20 knots for the ship, would be $20 \div \sqrt{25}$, or 4 knots. By model experiments, also, it is comparatively easy to investigate the general effect of changes in shape and dimensions of vessels without having recourse to experiments with full-sized ships. The principles applied in passing from models to full-sized ships were also applied by Mr. Froude in passing from one full-sized ship to another,—being quite applicable if the two ships are similar, and applicable with fair approximation if the two ships are reasonably similar in proportions and shape.

Model Basins.—Experimental model basins are now found in nearly all shipbuilding countries. That of the United States is located at Washington. It is about 500 feet long, and, at its maximum section, the water is about 42 feet wide and 14 feet deep. Wooden models 20 feet long, made by special machinery, are used in this experimental work, the model being towed back and forth through the water by an electrically-actuated carriage which spans the basin. When erected in 1899, this was the largest experimental basin in the world. Later experimental basins built in Germany, however, are somewhat longer but not so deep or wide. From data obtained with models towed in the experimental basin, the effective horse-power, as it is called, necessary to tow the full-sized ship without engines, is determined with great accuracy. It is therefore necessary to establish, from actual trials, the relationship between this effective horse-power and the indicated horse-power which the ship's engines must exert.



UNITED STATES BATTLESHIP CONNECTICUT.

Length over all, 456 ft. 4 in. Length on load water line, 450 ft. Breadth, extreme, 76 ft. 10 in. Mean draft to load water line, 24 ft. 6 in. Maximum draft at full load, 26 ft. 9 in. Mqu

This ratio depends upon the friction of machinery, efficiency of propellers, and to some extent upon the shape of the stern of the ship, and other minor factors; it is found, in practice, that it ranges from .50 to .60, although there is seldom reason why it should not be made as great as .55, a lower value being usually due to mistakes in design of hull, unsuitable propellers, or some such cause. The tabulated data obtained from experiments with models in the experimental basin, supplemented by progressive trial data taken under actual seagoing conditions, from the full-sized ships, have in recent years greatly aided the naval architect and the engineer in their design work, and the profession at large is under many obligations to the late William Froude and to his eminent successors in this work, among the most conspicuous of whom are R. E. Froude, in charge of the British Admiralty Experimental Tank at Haslar, and Naval Constructor Taylor, U. S. N., in charge of the U. S. Naval Experimental Tank at Washington, D. C., the writings of both of whom are generally recognized as valuable contributions to the literature of naval architecture.

Materials Used in Shipbuilding.—As the development of naval architecture has been largely influenced by the materials used in ship construction, brief allusion to these materials seems appropriate. The material used in the construction of ships underwent, broadly speaking, two changes during the 19th century: a change from wood to iron, which dates approximately from about the middle of the century, and a change from iron to mild steel, which dates from about 1880. Wood is still used as material for shipbuilding, many coasting vessels, for instance, in the United States and elsewhere being still built of wood; but the number and importance of wooden ships, as compared with those of iron and steel is diminishing yearly, and, at the present date, it may be said that the only structural material of importance for the construction of ocean-going ships is steel. Open-hearth steel, suitable for shipbuilding purposes, with an ultimate tensile strength of about 60,000 pounds to the square inch and an elongation in an 8-inch specimen of from 20 to 25 per cent before rupture, was introduced between 1870 and 1880. It was practically unknown in the United States in 1880. The contractor for the first steel vessels of the new Navy, which were contracted for in 1883, had to make special arrangements for the domestic manufacture of the steel needed in his work, and had to pay for it at that time about 7½ cents per pound. The growth of the manufacture of this material in the United States since that date, however, has been astonishing, mild steel of nearly the same characteristics as that used for ships being used in large quantities for bridges, houses, and other structures, so that, about 1900, its price had fallen as low as 1½ cents per pound, as compared with 7½ cents per pound some 15 years earlier. The qualities of the steel used in shipbuilding vary little in the different shipbuilding countries, being prescribed, as a rule, for merchant ships, by the marine insurance societies. For men-of-war, a somewhat higher grade of material is prescribed, and the inspection is rather more rigid. Coincident with the development of iron and steel as materials for shipbuilding, there began to develop an increase in the size of ships, due to the greater strength of the material of construction, and probably also to the fact that the use of steam instead of sails for propulsion, made it possible to increase the propulsive steam power of the large ships when it would not have been possible to add correspondingly to their sail area. The tendency towards an increase in size has been very marked since 1885, until now ships have reached sizes and dimensions limited only by the draft of water and the docking and wharf facilities available in the ports to which they trade.

The present state of development of naval architecture is probably best illustrated by examining the characteristics of some of the most recent products of shipbuilding skill in this country as exemplified in the principal characteristics of the United States battleship Connecticut and the trans-Pacific liner Minnesota, which are representative of our latest American designs of men-of-war and merchantmen. Commercially, it is found that the large steamer will carry freight or passengers cheaper at the same speed, or faster for the same cost, than the small steamer. The large man-of-war, on the other hand, is able to carry a much greater weight of armor and armament and can maintain a higher sustained sea speed than is practicable in a vessel of small displacement. See WARSHIPS.

Naval Cadet. See NAVAL ACADEMY, UNITED STATES; NAVAL SERVICE.

Naval Construction. See NAVAL ARCHITECTURE.

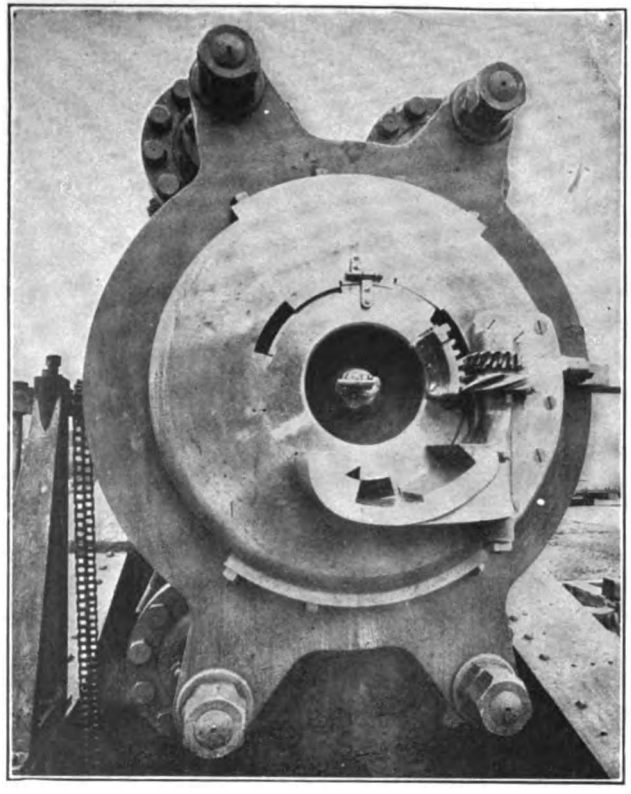
Naval Constructors are officers of the United States Navy, detailed to look after the designing, building, and repairing of warships. At every navy yard there is generally a naval constructor on duty. These officers are chosen from Naval Academy graduates and are prepared for their work by special education at technical schools. In 1902 there were 21 constructors and 20 assistants.

Naval Fleet. In times of war almost every known type of vessel is brought into action and comprises a part of the naval fleet. A squadron is usually a group of vessels of the same general build and character, as for instance a battleship with a force of cruisers, under the general command of an admiral. A fleet may include several commanders and all classes of vessels. These may be battleships, cruisers, monitors, torpedo-boats, destroyers, gunboats, submarines, tugs, colliers, transports, hospital ships, repair ships, distilling vessels, and refrigerating ships. Some of the last named craft are almost indispensable to a well equipped war fleet. A repair ship is an important adjunct and is fitted up like a machine shop, carrying spare plates, tools, and extra portions of machinery. She has forges, punching machines, etc., for repairing damages, and carries a crew composed to a large extent of machinists and iron shipwrights. The hospital ship is fitted with wards, operating rooms, modern appliances

for surgical operations, and for caring for the sick and carrying a large corps of trained nurses. In the United States navy this ship is painted white and flies the Red Cross flag, so that the foe may know her mission is sacred. She is absolutely unarmed. Most important, however, of these auxiliaries is the collier. A collier carries nothing but coal, everything being sacrificed to make room for bunkers and the machinery to take in and eject coal most expeditiously. The refrigerating ship carries an ice manufactory on board and immense cold-storage rooms for carrying fresh food. See NAVY OF THE UNITED STATES, THE.

Naval Guns. Gunpowder cannon for naval purposes appear to have been first used in the Orient. Old Japanese paintings of the 13th century depict naval combats between Chinese and Japanese fleets, the vessels being enveloped in the smoke from cannon. Among the Europeans, cannon began to be used at sea in the latter part of the 14th century. At first, galleys carried one gun, mounted in the bow and called a "corsiere"; later, sailing vessels carried small bombards mounted on the upper decks, which fired stone shot over the rails. Early in the 15th century, gun-ports were invented by the French, resulting in an increase of the number of guns carried, and before the end of the century, ships carrying as many as 60 guns each had been built by both the English and the French. From specimens still extant, it appears that these cannon were either constructed of wrought-iron or made of cast-brass; that they were sometimes of considerable length, and that some of them were breech-loaders. The guns of the Mary Rose, sunk in action with the French off Spithead, in 1545, were recovered in 1836. Some of them are of cast-brass, while the others are wrought-iron breech-loaders from 8 feet 6 inches to 11 feet in length, and from 5 to 8 inches in calibre. In loading these guns, the breech-piece was removed and the powder-charge placed in its forward end; the shot was inserted in the gun, and the breech-piece was replaced and held in position by a wedge from the rear. The difficulty of effectually closing the breech, however, appears to have caused a general abandonment of breech-loaders about the earlier part of the 17th century, and a reversion to muzzle-loaders made of cast iron and brass; inducing simple, rapid, and cheap methods of construction, which were steadily adhered to, during the following three hundred years. In the matter of projectiles, stone shot were gradually superseded by those of cast iron, while even rifling appears to have been attempted to obtain power and accuracy of aim. A rifle gun bearing the date of 1547 is one of the curiosities in the Woolwich arsenal, England. It is rifled with six grooves of a uniform twist of one turn in 26 inches. The extent of the use of guns at sea about the close of the 16th century is shown by the record of the armament of the "Invincible Armada." It was composed of about 140 ships, carrying a total of about 3,000 guns, most of which were small — 4, 6, and 10-pounders. A few of the larger vessels, however, were better armed. The largest ship, the San Lorenzo, carried a total of 50 guns, varying in size from 4 to 60-pounders; while the Triumph, the largest vessel of the opposing English fleet, carried a total of 68 guns of about the same size. During the 17th century, the size and gun-power of individual ships was greatly increased. In 1737, the first English three-decker, the Royal Sovereign, carrying 150 guns, was built. Up to the beginning of the 18th century, the tendency in gun construction was to produce long guns of small calibre, under the impression that the range increased with the length of the gun. The advantages of the larger calibre in close engagements, however, were gradually recognized, and resulted in the production of the "carronades," which were the most effective naval guns of that period. (See ORDNANCE.) The entire battery of the Victory, Nelson's famous flag-ship at the battle of Trafalgar, amounting to a total of 102 guns, was composed of carronades varying in size from 32 to 68-pounders. They were mounted on wooden truck carriages, and were given elevation by handspikes applied under the breech, a quoin or a wedge-shaped piece of wood being pushed in to hold the breech up in position. They were trained by handspikes with the aid of side-tackles, and their recoil was limited by a stout rope called the breeching, the ends of which were secured to the sides of the ship. At this time the slow match was commonly used for firing, and sighting was effected by looking along the exterior, or "line of metal" of the gun. Flint-locks were first applied to naval guns about 1780. The advantage of their use was appreciated in the sea-fight off Dominica, 12 April 1782, when the English fleet under Rodney defeated the French fleet under Comte de Grasse. In this action, Rodney's flag-ship, the Duke, carried guns fitted with flint-locks, and rendered such efficient service that they were applied to all guns and continued in general use up to about 1840, when they were superseded by percussion locks. Percussion locks were first introduced about 1828, when they were fitted to the guns of the United States frigate Vandalia, but their general use in the United States navy commenced about 1842, about 10 years later than their adoption by the French; while the English adhered to the flint-locks up to 1845. Improvements in sighting appear to have been first made by the English about the beginning of the 19th century. Fixed-sights were adopted by them in 1802, but they were superseded by the movable rear-sight invented by the French, some time later. About this time the Bomford "columbiads" were introduced and were found to be very effective as naval guns, and were followed in 1822 by the "Paixhans guns" which were quickly introduced in all navies. They were of considerable length, had long and narrow powder chambers, and fired solid shot and explosive shell at high velocities. Their introduction practically compelled the adoption of armor for ships. (See ORDNANCE.)

The creation of armored ships initiated the struggle for supremacy between guns and armor, which has continued up to the present time with unabated vigor, and caused the development of the high power rifled guns. The first of these were cast-iron muzzle-loading rifles and were used by the French and the English in the Crimean war. They showed such marked superiority over the smoothbores, that rifled guns were generally adopted by the various European countries, and persistent efforts were made, especially by Krupp in Germany, to perfect a breech-loading type. (See ORDNANCE.) In the United States, greater attention was paid to the



CLOSED.

OPEN.

BREECH MECHANISM OF TWELVE-INCH BREECH LOADING RIFLE.

production of a better class of high power smoothbores. The "Dahlgren" guns were brought out in 1856, and were unquestionably the best naval guns at that time, comparing favorably with the rifles of contemporary European make. They were followed by the "Rodman" guns, also smoothbores, which were superseded by the built-up wrought-iron and steel rifles, only when the demand for stronger material to resist the greater pressures developed, forced the rejection of cast-iron for that purpose. (See ORDNANCE.) The introduction of rifled guns was slow, and was attended by pecuniary and other difficulties. The "Parrott" rifles, built to meet the exigencies of the Civil War, were not capable of further development, and although used to some extent on ships, were not considered satisfactory for naval purposes. The lack of funds for the construction of modern guns on the lines developed by foreign private concerns, together with the desires of all countries to utilize in some way the large number of smoothbores in their possession at that time, compelled the adoption of makeshift methods to convert smoothbores into rifles, and postponed the development of truly modern gun construction until 1885. (See ORDNANCE.)

The greatest progress, however, has been made since 1898. This is best illustrated by the accompanying drawings showing the development of the 6-inch gun, from 1883 to 1901. The old gun 30 calibres in length, delivered its 100 pound projectile, with a muzzle velocity of 2,000 feet per second, while the velocity given by the latest type is 2,900 feet per second. This increase is due to its larger powder chamber, bigger charge, and the slow combustion of the powder and sustained acceleration of the projectile in its longer bore of 50 calibres. It will also be noted, that in spite of the great increase in length and weight, the new gun is of simpler construction, consisting of only six separate pieces, as against twelve pieces in the older form; while greater transverse strength is obtained by the substitution of a long jacket and a few long hoops for the large number of short hoops formerly employed. Modern naval guns are "built-up" steel rifles, capable of firing solid shot, or explosive armor-piercing shells, at high velocities and with great powers of penetration. (See ORDNANCE.)

The following table gives the weights and dimensions of the latest guns of the United States Navy; also the character, velocity, and the powers of penetration of the projectiles, and will serve to represent naval guns in general:

All of them are breech-loaders, and are equipped with rapid-firing breech mechanisms up

to and including those of 8-inch calibre. (See ORDNANCE.) In their design a maximum of efficiency with a minimum of weight is obtained, while the calibre selected is controlled to a great extent by the conditions of their service. The largest guns ever placed on board ship were the Armstrong 110-guns, of the English battleships, Sanspareil, Benbow, and Victoria. They were of 16.25-inch calibre. Many 13.5-inch guns are still used in the English and French navies, and some 13-inch guns in the naval service of the United States, but guns exceeding 12 inches in calibre are not being made for any naval service at the present time. In addition to these larger types, naval armaments include the various forms of rapid-fire and machine guns of smaller calibre, and greater speed of fire, but their precise value as naval weapons is a matter of some controversy. The rifling of naval guns is of the poly-groove type (see ORDNANCE); their projectiles are either of the capped or uncapped variety (see PROJECTILES); and they are fired by electric, percussion, combination, or friction primers. The electric, or the percussion primer, consists of a small copper tube about one and one-half inches in length, with an enlarged head. The electrical contact with the firing circuit is by means of a small projecting wire, while the percussion contact with the powder-charge is a small cap in the head of the primer. The combination primer consists of a small metallic shell somewhat like that of a centre-fire cartridge, containing the priming composition, and fitted with a cap that is insulated from the shell. This cap, if struck, will explode and ignite the powder-charge, or it may be worked by an electric contact; in which case, the current passing through the cap, heats to incandescence the bridge of fine platinum wire connecting the cap with the shell, and thus ignites the composition which explodes the powder-charge in the gun.

The methods of construction, and systems of loading applied to naval guns, are similar to those generally employed in the production and operation of the larger types of ordnance. In the United States navy, all of the guns are equipped with the "interrupted or slotted screw" breech mechanism, improved by the "Welin" patent breech-plug, the rights for which were purchased from the Vickers-Maxim firm, at a cost of several hundred thousand dollars. In this plug, the screw-threads are cut in steps of varying radius in the several sectors, instead of uniform radius with alternate blank and threaded sectors, as in the older form. By this method the amount of the plug cut away is reduced, also the depth of the plug, and consequently the distance it has to be pushed in before it is fully inserted. In all guns up to and including those of 7-inch calibre, the breech is opened with a horizontal lever, one sweep of which unlocks the threads, withdraws the plug, and swings it clear of the breech. (See illustration of breech mechanism of new 6-inch rapid-fire gun.) In the 8-inch rifle and all larger calibres, the breech is opened with a crank, as the plug is too heavy and the swing too great to be operated by a lever. The time consumed in opening and closing the breech, however, is but a small fraction of that required to serve the gun, its loading and pointing are the operations that take the most time.

In the 12-inch gun, the continued turning of the crank rotates and unlocks the plug, withdraws it, and swings it around to the right side of the breech. To open or close the breech requires seven and one-half turns of the crank, easily performed in less than five seconds. The mechanism of the 8-inch gun is practically the same, but being lighter is handled more quickly.

Mounts and Carriages for Modern Naval Guns.— The first important step in the development of modern gun mounting, was the employment of hydraulic cylinders to check the recoil. Very large guns requiring power for their operation, are mounted in turrets or barbettes, and their carriages, until within the last few years, were built on the system originally installed on the English ship Thunderer, in 1877. This type of mounting as used on the first modern armored ships of the United States Navy, consists of a steel slide pivoted to the turret at its forward end, and supported by a hydraulic ram at the rear. This slide carries a movable saddle to which the gun is secured by steel straps, the forward part of the saddle being attached to the piston rod of a hydraulic cylinder secured between the slide rails. Shallow grooves, decreasing in width toward the rear, are cut in the walls of the cylinder. When the gun recoils, the water is forced from the rear side of the piston through the grooves to the front side, absorbing the energy of the recoil and stopping the gun after it had recoiled a distance of about four calibres. A pipe conveys water from a pumping system below the recoil cylinder, entering by an automatic valve which closes when the pressure in the cylinder exceeds the pressure in the hydraulic system. When the gun recoils this valve closes, but opens as soon as the recoil is checked, so that the water pressure returns the gun to battery at once. For loading, the slide is dropped, usually to the position of extreme elevation; a three-storied ammunition car, carrying the projectile in the upper compartment, and half the powder-charge in each of the others, is hoisted in line with the breech by a hydraulic cylinder actuating a wire-rope purchase, and the three parts of the load are pushed into the gun successively, by a hydraulic rammer. The turrets are turned by either steam or electric motors situated on the deck below the turret floor, which operate a pinion geared into a rack fixed to the turret. Since 1880 greater progress has been made in gun-mountings than even in the guns themselves. The first small rapid-fire guns were mounted on tripods, or cone stands, and had no recoil; the shock of the discharge being absorbed by the elasticity of the supports; but, as these guns increased in size and power, it became necessary to allow them recoil, and to do this without greatly reducing their speed of fire, the "cradle" mount was devised This form of mount, now used for all naval guns, consists of a frame or sleeve mounted on trunnions, in which the gun is so fitted that it can slide back and forth. The recoil is checked by hydraulic cylinders, and the gun is returned to the firing position by the expansion of springs compressed by the force of the recoil. As the trunnions are on the sleeve and not on the gun, elevation or depression is given by turning the whole combination of gun, sleeve, recoil cylinders, and counter-recoil springs, around the axis of the trunnions. "Cradle mounts" are also known as "balanced spring return mounts," a designation derived from the fact that in them,

2. Six-inch rapid-fire, breech loading rifle.

the sleeve is balanced at its centre of gravity which coincides with the position of the axis of the trunnions, instead of being supported by a pivot in front and a ram at the rear, as in the older form. All of the guns in the United States Navy, from the 3-inch to the 8-inch calibres, inclusive, recoil in the oscillating sleeve. The recoil of the 8-inch gun is 24 inches, of the 7-inch 21 inches, of the 6-inch 15 inches, and of the 5-inch 11.5 inches. Guns of and below the 7-inch calibre, are mounted on pedestal mounts, turn on ball bearings, and are balanced (at the centre of gravity) in their sleeves. They are worked by the hand and can be elevated or depressed with great ease. In the case of the 6-inch and 7-inch guns, the gun pointer stands on a platform attached to the sleeve and turning with the gun. He is, therefore, unaffected by the recoil and is able to keep the gun steadily upon the target. His position, with his hands on the traversing and elevating hand-wheels, and with his eye at the telescopic sight, is shown clearly in the photograph of the 6-inch gun. All guns above the 3-inch calibre are fitted with telescopic sights, also with open day and night sights, and with electric and percussion firing gear. The recoil of the 12-inch gun, is taken up by four hydraulic cylinders placed symmetrically around the gun, but attached to the sleeve or non-recoiling part. The pistons are attached to a yoke on the breech of the gun. In the 12-inch guns of the Maine and her class, and for the monitors, the recoil is 33 inches. Each recoil cylinder contains a series of heavy triple springs, about 1 ton in weight, which are put into them under an initial tension sufficient to prevent any movement of the gun when the ship rolls, or when it is elevated to its maximum limit. Upon discharge, these springs are still farther compressed by the force of the recoil, and in expanding exert sufficient force to return the gun to the firing position as soon as the recoil is checked. As this force is sufficient to return the gun to battery at extreme elevation, it exceeds the force necessary to return the gun at level. This excess of energy is counteracted by a hydraulic buffer, or counter-recoil check, fitted into the front end of each cylinder, which prevents the gun from being run out violently, and brings it to rest gradually, as it runs out.

The increased speed of fire of modern naval guns is chiefly due to the improved gun-mounts and breech mechanisms described in the foregoing text. The consequent enormous increase in the power of battleships is clearly illustrated by the above table, which gives a comparison of the total energy of fire of the United States battleship Oregon in 1898, with that of the Georgia launched in 1903. The Georgia is a larger vessel; but while the increase in displacement is 40 per cent, the increase in energy of fire is about 340 per cent. This increase, however, is due as much to the greater muzzle energy developed by the new guns as to their increased speed of fire.

The rates of fire given in the table may appear to be very low, but they represent practical and not ideal values. Rates of fire as high as 8 aimed shots per minute, from a 6-inch gun, all of which struck a target 15 feet high, at a range of 1,500 yards, are of record, but the conditions under which they were attained were undoubtedly ideal. Under actual battle conditions, even the rate of 3.5 rounds per minute given in the table, could be maintained for a few minutes only, as the heating up of the gun alone, would necessitate a rest. In this connection, the «life» or period of effective use of modern guns may be considered briefly, with advantage. Various explanations have been offered for the erosive effects of the escaping powder-gas on the surface of the bore. Some authorities claim that it is of a chemical nature, while others are of the opinion that it is a mechanical action of a scouring character. It is true that a great deal of the injurious effects of gas erosion has been partially eliminated by the use of effectual gas-checks, but what appears to be the principal attendant cause — the high temperature of combustion of the powder-charge — still remains, and indicates the proper direction in which experiments should be made to overcome those effects completely. Large charges of brown powder erode the bore very rapidly. Smokeless powder containing a large percentage of nitroglycerine, such as «cordite,» exerts an erosive action, so rapid that a gun is practically worthless after firing 70 or 80 rounds. On the other hand, the use of pure guncotton smokeless powder, such as used at present by the United States, France, and Russia, in which the temperature of combustion is not only lower than that of nitroglycerine, but is even lower than that of ordinary gunpowder, shows a decrease of erosive action to a marked degree. In a 3-inch gun, tested at the Indian Head proving grounds, 450 rounds were fired without impairing its accuracy.

It is undoubtedly true that the heating of the gun in rapid firing, in addition to the high temperature of combustion, increases the wear, especially in those of the smaller calibres — 6-pounder and the 3-inch class. In the case of the gun just mentioned, at the end of 450 rounds

of slow firing it was practically as good as new, but it was completely destroyed, by the wearing away of its rifling, in one hour, by firing it at the rate of two rounds per minute.

Bibliography.— Specific information on naval guns, may be obtained from the following named publications: Annual Reports of the Office of Naval Intelligence; Annual Reports of the Chief of the Bureau of Ordnance, U. S. Navy Department; Ingersoll, 'Text-Book on Ordnance and Gunnery'; Proceedings of the United States Naval Institute; The Naval Pocket-Book; Brassey, 'Naval Annual'; 'Engineering' (London, current); 'Scientific American' (New York, current).

Consulting Civil Engineer.

Naval Institute, United States, an organization founded in 1873 at Annapolis, Md., by the officers of the Naval Academy. It issues quarterly 'Proceedings' on naval affairs. Each year the Institute offers a life membership, a gold medal, and a prize of $100 for the best essay or paper of interest to the naval service. The present membership includes two thirds of all the officers of the navy.

Naval Law. See LAW, MILITARY.

Naval Maneuvers. See ARMY AND NAVY MANEUVERS.

Naval Militia, armed organizations instituted by many of the States, under an act of Congress, forming a part of the State militia. The duty of the naval militia in time of war is to man the coast and harbor defense vessels, thus leaving free the regular force to carry on offensive operations at sea. Historically the first step may be said to have been taken by the introduction by Senator Whitthorne of a bill in the United States Senate on 17 Feb. 1887, "To create a naval reserve of auxiliary cruisers, officers, and men from the mercantile marine of the United States." This measure did not become a law, but as a result the Navy Department in 1887 prepared a plan of organization for a naval militia force based on a battery of 18 petty officers and men as a unit. The legislature of Massachusetts passed an act, which was approved 17 May 1888, establishing "a naval battalion to be attached to the volunteer militia." This was really the pioneer measure in the United States, but the organization under it was not completed till 25 March 1890. The State of Pennsylvania, under an act approved 26 April 1889, made provision for the establishment of not less than four companies, "to constitute a battalion to be known as the Naval Battalion of the National Guard of Pennsylvania." On the same day the legislature of Rhode Island "established a naval battalion to be attached to the Rhode Island Militia." The legislature of New York passed an act, approved 14 June 1889, to establish a State Naval Militia of three battalions of naval reserve artillery and a naval reserve torpedo corps to consist of not less than four companies to a battalion.

In 1890 little was done except in the way of perfecting the organizations in States which had passed laws. The Massachusetts Naval Battalion drilled on board the receiving ship Wabash and the New York battalion on board the receiving ship Minnesota. The year 1891 was, however, a most important one. On 2 March 1891, Congress appropriated $25,000 for arms and equipments for the Naval Militia, and in June the department issued regulations governing the disbursement of the fund pro rata, one allotment being paid on 1 July and a reserve allotted on 1 October. On 31 March 1891, an act was approved in California for a naval battalion. The governor of North Carolina granted permission for the formation of a battalion of naval artillery, to consist of not less than two batteries, as a part of the National Guard. No law was passed directly authorizing the establishment of a Naval Militia. In the same way the Galveston Artillery Company was ordered by the governor of Texas enrolled as a "battery for seacoast defense," and was recognized by the department as a Naval Militia force in Texas.

In 1893 the following States passed laws relating to the Naval Militia: North Carolina, Michigan, Illinois, Connecticut, and Georgia. In the regulations of the department governing the distribution of the annual appropriation for 1893 "only uniformed petty officers and enlisted men" were hereafter to be considered in making the apportionment, one half of the allotment due any State to be withheld until the governor shall inform the department officially "that a proper naval uniform has been adopted and issued to its Naval Militia." Notice was also given that all arms and equipment issued by the department should remain the property of the United States and should be receipted for and annually accounted for on blank forms furnished by the department.

The following table shows the number of officers, petty officers, and enlisted men in each State and in the District of Columbia on 1 Jan. 1901, as certified to by the governor of the State and by the brigadier-general commanding the District of Columbia militia:

STATE	Officers	Petty officers and enlisted men
California	36	380
Connecticut	20	185
District of Columbia	10	162
Florida	4	48
Georgia	17	111
Illinois	56	575
Louisiana	23	327
Maine	3	46
Maryland	18	221
Massachusetts	39	497
Michigan	17	183
New Jersey	32	322
New York	57	585
North Carolina	27	219
Ohio	22	234
Oregon	9	115
Pennsylvania	9	64
Rhode Island	12	181
South Carolina	24	224
Total	435	4,679

All matters relating to the naval militia come under the cognizance of the assistant secretary of the navy. The Navy Department transacts all its business with the naval militia through the governors and adjutants-general of the States.

The following table shows the allotment of appropriations to each State, in conformity with the regulations of the Navy Department:

State	Allotment
California	$4,846.90
Connecticut	2,359.68
District of Columbia	2,066.31
Florida	612.24
Georgia	1,415.81
Illinois	7,334.12
Louisiana	4,170.88
Maine	586.73
Maryland	2,818.85
Massachusetts	6,339.23
Michigan	2,334.17
New Jersey	4,107.11
New York	7,461.67
North Carolina	2,793.34
Ohio	2,984.67
Oregon	1,466.83
Pennsylvania	816.32
Rhode Island	2,308.66
South Carolina	2,857.12
Total	$59,680.64

Naval Observatory, The United States, is the youngest among the great astronomical institutions of the nation, but it has developed in a remarkably brief time into one fit to rank with Greenwich and Pulkowa. We hear less of it, however, than we do of many of the private institutions in this country, for its object is not the further discovery of the unknown, but the development and application of the known. Of course, the former is the more brilliant object, but it would undoubtedly incur an expense to the government greater than the value of the discoveries. When a discovery is made, if it is of any importance, it has to be followed up and elaborated upon before it can be made useful to mankind. Here comes the hard work which the world does not see and here the great majority of astronomers fail.

Recently great changes have occurred in the scientific staff of the institution by the retirement of the older professors, notably Doctors Newcomb and Hall, and the succession to their responsibilities of a younger staff, comprising Profs. Skinner, See, Updegraff, Eichelberger, Littell, and Prof. Harshman, Director of the 'Nautical Almanac.' It is remarkable that although in scientific achievement this country has led the way since its incipiency, it eked out the first 60 years of its existence, and attained some mighty marine achievements, practically without so indispensable an institution as a naval observatory. We depended on Greenwich, Pulkowa, and Paris, and on college observatories here almost entirely until 1842.

The Observatory was originally established in 1807, but little progress was made, and in 1832, the small building 16 feet square used for the purpose, contained but a single instrument. In that year a $25,000 appropriation was secured and a new building erected. Berlin, Paris, Greenwich, and Vienna presented some 200 rare volumes of the highest standard as a nucleus for an astronomical library. This branch has grown from that to one numbering 22,000 volumes and pamphlets, and stands to-day second to Pulkowa only. The institution grew rapidly, and in 1874 installed the largest telescope then in existence, the famous 26-inch equatorial. It was set in place just in time to observe the transit of Venus, which occurs but once in a lifetime.

Naval Order of the United States, an association composed of a General Commandery and commanderies in the States of Massachusetts, Pennsylvania, New York, and Illinois, and in the District of Columbia. The General Commandery meets triennially on 5 October, and the State Commanderies meet annually in November. The parent commandery, that of Massachusetts, was organized at Boston on 4 July 1890. The General Commandery was established three years later, on 19 June 1893. The members of the order are officers and the descendants of officers who served in the navy and marine corps in any war or in any battle in which the said naval forces of the United States have participated. The membership clause provides for two classes of members: First, veteran officers and their male descendants, and, second, enlisted men who have received the United States naval medal of honor for bravery in the face of the enemy.

Naval Reserve. See NAVAL MILITIA.

Naval Schools, institutions for the training of naval officers. In the United States the Naval Academy at Annapolis, Md., is the most important school of this character. In Great Britain the chief naval school is the Royal Naval College at Greenwich, an institution fully equipped for the teaching of all branches of theoretical and practical knowledge connected with the profession of a naval officer, including mathematics, physics, mechanics, chemistry, fortification, navigation, surveying, marine engineering, drawing, etc. For a detailed description of the Annapolis school see the article NAVAL ACADEMY, UNITED STATES; see also NAVAL SERVICE.

Naval Service, The. For a period of ten years after the close of the Civil War the officers of the navy met with many difficulties in keeping up the well-earned reputation of our naval vessels, because of the very inferior class of men composing the crews. The percentage of Americans in the service was small, and it was no unusual circumstance to have the powder division of a ship made up almost entirely of foreigners, who could neither understand nor speak the English language. This was because the division was generally composed of bandsmen, mostly Italians, and servants, who were usually French or Japanese. The intelligent officers of our navy could not be content with this anomalous condition of affairs, and constantly suggested improvements, many of which were from time to time adopted; but the betterment of our enlisted force was very gradual, and not until toward the dawn of the 20th century were the present high standards reached.

It must be remembered that the work of the navy differs from that of all other callings, by reason of the fact that nothing counts except results. In battle or in target practice, the shot that does not hit is absolutely wasted. The engine that cannot develop the speed for which it was designed may prevent a warship from performing the mission upon which she is sent. The officers who do not show efficiency and patriotism are not suitable representatives of their country in foreign harbors. The commander of a fleet or vessel who in time of emergency is wanting in diplomatic ability lacks

one of the essentials of a naval leader. In peace or in war, nothing but perfect discipline and the highest efficiency will suffice, and it is for this reason that the navy cannot content itself with indifferent work. It does not require a war to bring naval weakness to the attention of the country.

The whole aim and purpose of every man in the navy should be to cultivate strong and lasting friendships among his fellows, to influence men to be fearless in the discharge of their duty, and to do everything that will produce efficiency at all times. There is something in the naval life that helps to bring out the best a man has in him. The sea has a tendency to make all men feel their nothingness, and it is not surprising that where men have in common shared triumphs, endured perils, seen the wonders of the deep, and at times felt the presence of a stronger controlling power, they become bound by ties which make them love each other like brothers.

The new navy, as it has been called, means not only great engines and machines of war, and floating fortresses, but it means the proper training of young men for the profession of fighting upon the sea. While the early establishment of the Naval Academy had a wondrous effect upon the efficiency of the American navy, there had been felt for half a century a need for a preparatory system to properly fit young men for service in the enlisted force. It was about 1870 that the success of the apprentice system in some of the European navies became so marked as to indicate an effective solution of the problem of the education of sailors. So impressed was Secretary Robeson with the desirability of this system that in April 1875 he issued a circular directing that the education of boys for the navy should comprise only the elements of an English education, alternating with practical seamanship and other professional occupations designed to make of them sailors in the navy. In accordance with this idea, the two frigates Minnesota and Constitution and the sloops Portsmouth and Saratoga were commissioned as school and training ships. To-day the qualifications for admission as apprentices are almost identical with those of 1875, except that the limit of age at time of entrance has been raised, being now 14 to 18 years. Each boy must satisfy the recruiting officer that he is of robust frame, intelligent, of perfectly sound and healthy constitution, and that he is able to read and write. In special cases, where the boy shows general intelligence and is otherwise qualified, he may be enlisted even though his reading and writing are imperfect. Boys are enlisted on the receiving ships at the navy yards and are sent as soon after enlistment as practicable to one of the training stations maintained for their education.

In 1880 the people of Newport ceded Woonachasset, or Coaster's Harbor Island, to the State of Rhode Island, and in March 1881 the State ceded title and jurisdiction over the island to the United States, for use as a training station. In August of the following year Congress accepted "the cession by the State of Rhode Island to the United States of said island for use as a naval training station." The old ship New Hampshire was taken to Coaster's Harbor Island in 1881, was housed in, heated by steam, lighted by electricity, and fitted out for comfortably accommodating 500 apprentices. They slept in hammocks, assisted in keeping the ship clean, and in various ways were gradually accustomed to a nautical life. The daily routine began at 5:30, when reveille was sounded and hammocks were lashed and stowed. After an early breakfast the boys washed their clothes, scrubbed decks, and bathed. About six hours each day were occupied with studies and drills. Tattoo was sounded at 9 o'clock, when all boys were required to be in their hammocks.

As time has gone on, various changes have been made in the training of apprentices, but the results of the adoption of the apprentice system have been very satisfactory, and in recent years another training station has been established in San Francisco harbor, and another on the Great Lakes is contemplated. Three departments of instruction are maintained, namely, seamanship, gunnery, and English. The apprentice remains at the training station for at least six months, during which time, even with the very limited number of instructors, the average boy learns more about his future profession than the average landsman on a man-of-war does in a three years' cruise. Several line officers are attached to the training station, and supervise the discipline and instruction. Warrant officers give technical instruction in their specialties, and a chaplain looks after the moral training of the boys. Twice each year the boys are drafted to the training ships, which make summer cruises to Europe and winter cruises to the West Indies. Only half of the crews are changed at a time, and each apprentice remains on board for a year. This duty at sea is supposed to transform the boys into deep-water sailors. Their former instruction is continued, but the boys acquire, through their sea duty, development of physique, knowledge of sailing ships, perfect fearlessness, and activity in the performance of their duties. After the completion of their terms on the training ships, the apprentices are transferred to regular men-of-war, where their education is still continued; and when they have shown a proper aptitude they are sent to the Washington navy yard for a six months' course of instruction in gunnery. A limited number of them are afterward sent to Newport for an equal length of time, to be given a practical working knowledge of electricity and torpedoes. They then graduate into the service as seamen-gunners, and are insured petty officers' positions with much better pay.

The importance of the apprentice system, together with the thorough means taken to secure the best possible results at Annapolis, cannot be overestimated when it is considered that there must be assigned to every modern warship a large complement of highly trained and educated officers, as well as a skilled and resourceful crew. There must be among the enlisted force a large percentage of men who receive high pay and who are accorded respect and consideration. The average pay of men on board a warship is twice that received by troops in barracks or in camp. The opportunity for professional advancement is greater on shipboard than on shore. The man who possesses technical skill, application of purpose, and power of resource, will be certain of quick promotion and increased pay. The call for petty officers is always urgent, and nearly all commanding officers are willing to give high-class men ad-

vancement every six months, and in some cases at shorter intervals. Some of the warrant machinists now in the navy, receiving $1,500 per annum, secured their appointments in less than two years from the time they entered the naval service.

In 1901 Congress passed a law providing that a limited number of warrant officers having six years' service as such, and who could pass the examination prescribed by the Department, might secure commissions in the naval service. The opportunity presents itself, therefore, for an apprentice boy to rise, through the various positions in the enlisted force, to the line of the navy and eventually to become the commander of a fleet. A career in the navy gives every officer an opportunity to specialize along lines in which he may possess particular ability. The opportunity also presents itself, through travel and observation, to acquaint himself with the strength and weakness of other nations, to acquire their languages, and to read their literature. Moreover, service in the navy does not unfit either the enlisted man or the commissioned officer for a business career. There are now in civil life thousands of business and professional men who have served on American men-of-war.

Turning now to another viewpoint, it should be said that patriotism, love of the flag, and pride of country are in themselves sufficient to inspire a man to succeed in the American naval service. The War of the Revolution, the War of 1812, the Mexican war, the great Civil War, and the late Spanish-American war, all join in telling the story of the American navy. Immediately upon entering the service in any capacity, one feels instinctively the pride and glory of the history of our flag on the seas. He becomes a participant, in thought at least, in the victories of the past, and pride and patriotism find an abiding place in his heart. And as science in warfare advances, the man behind the gun, the man on the deck, or the man in the engine room, feels that he too is making advances no less important to him than the march of science and invention to the service and the country.

It was through the necessities of the Civil War that the impetus came for naval construction and the beginning of the evolution of the modern war vessel. A new era dawned for the Navy in 1883, when the Atlanta, Boston, Chicago, and Dolphin were laid down and became a nucleus for our present navy. Since then ships have been added on improved plans and with improved machinery. "A duel between guns and armor," as Rear-Admiral Melville has aptly termed it, has been constantly going on; and as fast as a ship is built and armored on plans far surpassing the preceding one, valuable improvements are suggested and adopted for her successor which render her relatively out of date. The latest American cruiser is a marvel. In speed, ability to keep the sea, and striking power, she is the equal of anything that floats. When we to-day compare our navy with those of foreign nations, it must be confessed that the comparison is a pleasing one from the standpoint of the United States; especially when we remember that comparatively few years ago our navy, in the modern sense of the term, did not exist. To-day the United States and Germany appear to be of equal strength, considered numerically; but when we look at the offensive and defensive power of the battleships which we now have under construction, it must be admitted that, in spite of the large building programme which Germany has in hand, the fighting strength of our navy is to-day a little greater than that of Germany.

With one of the best navies in the world, America demands the best men to man her ships,— men of character and sterling worth; and to such men the navy offers golden opportunities. And what is demanded of them in return? The first thing a recruit learns upon joining a naval vessel is the necessity of implicit obedience. The enlisted man who tries to do his duty suffers very little from the yoke of discipline. In fact, it is a protection to the man disposed to do his duty, since severe measures are only taken against those inclined to disobey established rules and regulations. Great changes have been wrought during the last thirty years, and therefore the new navy offers quite a different career from that which presented itself in the past, and one from which no American citizen need shrink. The naval man of the new age must keep all his senses on the alert; his ear must be trained to detect any variation in the rhythmic beat of the pistons and propellers; his eye must note any leakage of water or vapor or any change in conditions; his touch must be sensitive to the temperature of the working parts; and even his tongue must be a monitor in helping to maintain the freshness of the water in the boilers. The old organization passed away with the old ships, and, as President Roosevelt has said, "the naval officer of the future must be a fighting engineer." Therefore a career in the navy, for the majority of those who are connected with the service, must be along mechanical lines. The naval conflicts of the future will doubtless be short, sharp, and decisive. Men of intelligence, quickness, alertness, and resource, rather than of great brawn and muscle, are needed on the forecastle as well as in the cabin and ward-room; below decks as well as in the conning tower; in the lowest position as well as in the most exalted office. And every man, performing fearlessly the duty assigned him, will remember that wherever he goes there floats over him the flag of "Old Glory" that must at all times and forever be honored, revered and loved.

GEORGE DEWEY,
Admiral of the Navy.

December 7, 1903.

Naval Signals. See SIGNALS, NAVAL.

Naval Squadron. See NAVAL FLEET.

Naval Stores, or **Ship Stores,** a general term used in commerce and in the merchant marine, for certain products of the pine tree, including spirits of turpentine, resins, pitch, tar, etc. The term is a misnomer in these days of steel and iron ships, as nine tenths of the product are used in other industries rather than in shipping. The name naval stores is derived from the consumption in early days of large quantities of pitch and tar in ship yards and on board of vessels. Nine tenths of the naval stores used throughout the world come from the long-leafed pine belt of the Southern States. The pine belt includes a vast territory commencing in North Carolina, near the Virginia State line, and extending southward to

Florida, along the Atlantic Coast line. The belt is from 5 to 100 miles wide and includes the States of North Carolina, South Carolina, Georgia, Alabama, Mississippi, and Louisiana. The territory embraces about 130,000 square miles. The other tenth of the world's supply comes from France and Austria.

Turpentine.— Spirits of turpentine is derived from the sap of the long-leafed pine and in its crude state is of a fine white color. Upon exposure to the air it becomes dry, hard, and brittle, thus forming resin. From 200 acres of pine trees there is obtained the first year about 280 barrels of crude turpentine, or dip; and 70 barrels of what is known as scrape. This distilled will give 2,000 gallons of spirits of turpentine and 260 barrels of resin. In the fourth and last year of the sap flow this output is reduced to 1,000 gallons of turpentine and 110 barrels of resin. In the days of the Civil War turpentine sold at $1.75 to $1.90 a gallon, as against the normal price of 28 or 30 cents; and inferior resin sold as high as $4 a barrel, the normal price being about $1.90. These Civil War prices boomed the industry in France for several years. (See TURPENTINE.)

Pitch.— The ordinary pitch of commerce is derived from a dry distillation of resin, and is largely used in calking wooden ships. (See TAR.)

Tar.— The variety of tar known as wood tar which is made from the pine sap (see TAR) is produced almost entirely in North Carolina. A cord of pine wood will produce 40 gallons. Wilmington, N. C., is the headquarters for the world's supply of tar and crude turpentine.

Statistics.— The city of Savannah, Ga., is the largest market in the world for naval stores. The output in the United States amounts to $10,000,000 annually. In 1900, the pine belt of the Southern States produced 340,000 casks or 17,000,000 gallons of spirits of turpentine, and 1,400,000 barrels of resin. The exports in a single year amount to over 250,000 casks. To produce these so-called naval stores 2,300,000 acres of pine forests are worked annually, and over 800,000 acres of virgin forest are invaded every year. The one great detriment to the industry is fire, and it has been estimated the annual loss from fire in the pineries will amount to $1,000,000. In South Carolina alone the turpentine industry employs over 7,000 workmen. There are 290 stills in the State, with a capital invested of $1,454,800, and an annual production valued at nearly $3,000,000.

Naval Tactics. See TACTICS, NAVAL.

Naval Veterans, National Association of, a patriotic society founded by delegates from the various associations of naval veterans throughout the Union at a meeting held in the city of New York, in January 1887. The object of the National Association is:

> To cherish the memory and associations of the war of the late rebellion, to perpetuate the glorious names and deeds of our navy, to strengthen the ties of fraternal fellowship and sympathy, to advance the best interests of this association, and to extend all possible relief to the widows and orphans of members; to foster the cultivation of naval science; to encourage the building of an efficient navy and national defenses; to enforce unqualified allegiance to the general government; to protect the rights and liberties of American citizenship, and to maintain national honor, dignity, union, and independence.

Any officer, appointed or enlisted man who has served in the United States Navy, United States Marine Corps, or United States Revenue Marine Service during any portion of the time between 12 April 1861 and 25 Aug. 1865, who has not borne arms against the United States, or been convicted of any infamous crime, and who has been honorably discharged or resigned by an honorable acceptance of resignation, is eligible to membership in this association. There are 39 local associations under the national charter, a paid membership of over 7,500, and 3,000 contributing members.

Naval War College. See NAVY OF THE UNITED STATES.

Navarino, nä-vä-rē'nō, or **Pylos,** pī'lŏs, Greece, a seaport town on Navarino Bay, on the southwest coast of the Morea. Its official name is Pylos, ancient Pylos, the city of Nestor, now called Palæokastro and Palæo-Navarino, being at the north extremity of the bay. The Bay of Navarino was the scene of a great sea-fight between the Athenians under Cleon and the Spartans, 425 B.C. From 1492 to 1821, the town was in the possession of the Turks, when it was taken by the Greeks. The Turks recaptured it in 1825, and retained it until on 20 Oct. 1827 in Navarino Bay the Turkish and Egyptian navy of 89 ships was annihilated by 24 ships of the combined British, French, and Russian fleets under Sir Edward Codrington, the British admiral. Pop. (est.) 3,000.

Navarre, nạ-vär', Spain, a northern province, formerly, with a portion of the department of Basses-Pyrénées, France, constituting the ancient kingdom of Navarre. The province has an area of 4,046 square miles; the surface generally is mountainous and bleak, but in the valleys, and along the river banks, the soil is fertile, producing wheat, maize, barley, and oats. The principal rivers are the Aragon, Arga, Ebro, and Bidassoa. The mineral wealth comprises iron, copper, and rock salt. The chief towns are Pamplona, the capital, Tudela, Olite, and Estella. Pop. of province (1897) 302,978. Navarre was inhabited at an early period by the Vascones, who were expelled by the Romans. It was seized by the Visigoths in 470, invaded by the Saracens early in the 8th century, and fell under the sway of Charlemagne in 778. It became an independent state in 855. In 1035 Navarre was divided into three kingdoms — Navarre, Aragon, and Castile. The first two became united in 1076, and again separated in 1134. In 1285, it became an appanage of France, but recovered its independence in 1328. Ferdinand conquered it in 1512. The estates of Navarre took the oath of allegiance to him in 1513, and it was incorporated with Castile in 1515. After this act of spoliation, there remained nothing of the ancient kingdom of Navarre beyond a small territory on the north side of the Pyrenees, which was subsequently united to the crown of France by Henry IV. of Bourbon, king of Navarre, whose mother, Jeanne d'Albret, was granddaughter of Queen Catherine; and hence the history of Navarre ends with his accession to the French throne, in 1589, the French monarchs, however, until Charles X., being called also King of Navarre.

Navarrete, Juan Fernandez, hoo-ān' fĕr-nän'dĕth nä-vär-rā'tā, Spanish painter: b. Logroño about 1526; d. Toledo 1579. He was

known as 'El Mudo,' the mute, being deaf and dumb. He imitated the monk painter of the Milanese school, Fra Vicente; he then devoted himself almost entirely to the study of Titian, whose style and coloring he reproduced so successfully that he became known as the "Spanish Titian." Philip II. appointed him his court painter and much of this artist's best work was done in decorating the Escorial. Titian's influence is evident in a 'Birth of Christ'; a 'Holy Family'; and a 'Scourging of Christ' in the Escorial (1571–5), which have exercised a profound influence on the development of technique in Spanish painting.

Navarro, Madame. See ANDERSON, MARY ANTOINETTE.

Navarro, Pedro, pā'drō nä-vär'rō, Spanish general: b. Spain 1446; d. Naples, Italy, 1528. He was engaged with Gonsalvo de Cordova in the Naples campaign of 1500 and made such skilful use of mines as to influence largely the outcome of the war. For this service he was created Count of Alvetto and given command of a naval expedition against the Moors. He was taken prisoner by the French in 1512 and despairing of being ransomed he joined the French army. In an attack upon Naples he was again captured and died soon after.

Navas de Tolosa, Las, läs nä'väs dā tō-lō'sā, Spain, a village of Jaen province, 38 miles by rail north of Jaen, which owes its celebrity to the defeat near here of the Moorish army under Mohammed ibn Abdallah 16 July 1212, by the Spanish troops commanded by Alfonso VIII., assisted by an army of French and English crusaders. In the vicinity also, a battle was fought between the Spanish and French in 1812.

Navassa, nä-vä'sä, West Indies, a small island off the southwest coast of Haiti; about two miles long and one and one-half miles wide; altitude, 300 feet. High bold cliffs border nearly all the shore. In 1857, Peter Duncan, an American, discovered on this island a deposit of guano estimated to amount to 1,000,000 tons. According to an act of Congress, passed 18 Aug. 1856 relative to the discovery of guano deposits on unclaimed islands, it was decided that the island of Navassa should be considered "as appertaining to the United States." In 1889 trouble arose among the workmen on the island, and one man was killed in "the Navassa Riot." The murderer was tried by the courts under jurisdiction of the United States, and finally sentenced to be hanged. The question of jurisdiction was the only point in the case which caused delay; the sentence, in 1891, was commuted to imprisonment for life.

Nave, in Gothic architecture, that part of an ecclesiastical edifice to the west of the choir, and in which the congregation assemble; the part of a church between the aisles. See ARCHITECTURE.

Navesink (năv'ĕ-sĭnk) **Highlands,** a low range of hills, in Monmouth County, New Jersey, south of Sandy Hook, and at the mouth of Navesink River. Mount Mitchell, the highest point, is nearly 300 feet above sea-level. On an elevation, 195 feet, stands a lighthouse with two towers 100 feet apart and 53 feet in height. In each tower is a fixed white light. The Highlands are an important landmark to ships approaching "The Narrows," and the region in this part of New Jersey is a favorite resort for residents of New York.

Na'vew, or Naphew. See TURNIP.

Navic'ular Disease. See HORSE, DISEASES OF THE.

Navidad, La, lä nä-vē-däd', the name of a fort built by Columbus in 1493 on the coast of Haiti, and which was the first Spanish settlement in the New World. Here he left a company of between 30 and 40 men, but on his return in November of the same year found they had all been killed by the Indians and the fort destroyed. See COLUMBUS.

Navies of the World. The following summary gives the naval strength of the leading nations of the world as reported in 1901:

Argentine Republic.— Coast defense armorclad, 4; armored cruisers, 5; 2d-class cruisers, 3; smaller cruisers and gunboats, 7; torpedo destroyers, 4; torpedo boats, 1st-class 12, 2d-class 10.

Austria-Hungary.— Battleships, 2d-class, 6, 3d-class, 2; port-defense ships, 7; cruisers (armored), 2, 2d-class, 3, 3d-class, 8; gunboats, etc., 12; torpedo boats, 1st-class, 32; 2d-class, 31, 3d-class, 8.

Brazil.— Battleships, 4; coast defense vessels, 6; cruisers, 2d-class, 3, 3d-class, 2; torpedo boats, 1st-class, 8, 3d-class, 6; smaller cruisers and gunboats, 12.

British Empire.— Battleships, 1st-class, 20, 2d-class, 24, 3d-class, 11; armored cruisers, 2d-rate, 9; protected cruisers, 1st-class, 21, 2d-class, 45, 3d-class, 34; torpedo gunboats, etc., 33; torpedo destroyers, 80; torpedo boats, 1st-class, 11, 2d-class, 71; torpedo ships, 2. Vessels of small fighting value: Battleships, 4th-class and coast defense, 21; obsolete cruisers, 4th-class, 28; miscellaneous vessels, 89; torpedo boats, 3d-class, 95. Under construction and projected: Battleships, 16 armored cruisers, 1st-rate, 14; protected cruisers, 3d-class, 9; torpedo destroyers, 28; miscellaneous vessels, 6.

Chile.— Armorclad, 5; 2d-class cruisers, 2; 3d-class, 2; gun vessels and gunboats, 11; torpedo destroyers, 4; torpedo boats, 1st-class, 15, 2d-class, 4.

China.— Swift cruisers, 2; small cruisers, 3; torpedo destroyers, 3; torpedo gun vessel, 1; torpedo boat, 1; and several other vessels.

Colombia.— River gunboat, 1; other small vessels, 2.

Costa Rica.— Gunboat, 1; torpedo boat, 1.

Denmark.— Coast defense armorclads, 5; torpedo ship, 1; 3d-class cruisers and gun vessels, 6; gunboats, 7; torpedo boats, 1st-class, 14, 2d-class, 20.

Ecuador.— Torpedo launch, 1; transport, 1.

France.—Battleships, 6; armored cruisers, 5; torpedo destroyers, 28; torpedo boats, 112; submarine boats, 26. Under construction and projected (1902): Battleships, 22; armored cruisers, 19; destroyers, 24; torpedo boats, 151; submarine boats, 12.

German Empire.— Battleships, 2d-class, 8, 3d-class, 8; coast defense ships, 19; cruisers, 2d-class, 8, 3d-class, 5; torpedo gunboats, 8; torpedo boats, 1st-class, 35, 2d and 3d-class, 103. Under construction and projected: Battleships,

46; coast defense ships, 8; cruisers, 2d-class, 22; 3d-class, 48; torpedo boats, 114.

Greece.— Armored vessels, 5; torpedo boats, 17; unprotected vessels: corvettes, 2; cruisers, 2; gunboats, 12; revenue vessels, 3; also a steel yacht, an iron transport, and miscellaneous craft.

Haiti.— Cruisers, 3d-class, 6; sloops, 2; and a gun vessel.

Italy.— Battleships, 2d-class, 5; large armored cruisers, 3; small armored cruisers, 3; battleships. 3d-class, 9; protected cruisers, 1st-class, 2, 2d-class, 5, 3d-class, 8; torpedo gunboats, 15; torpedo destroyer, 1; torpedo boats, 1st-class, 11, 2d-class, 100, 3d-class, 71; submarine torpedo boats, 1. Under construction: Battleships, 1st-class, 3; small armored cruisers, 3; protected cruisers, 3d-class, 1; torpedo gunboats, 2; torpedo destroyers, 4; torpedo boats, 2d-class, 1.

Japan.— Battleships, 1st-class, 3; armored coast defense vessels, 5; armored cruisers, 7; protected cruisers, 13; smaller cruisers, 5; gun vessels, 10; torpedo boats, 1st-class, 29, 2d-class, 24, 3d-class, 4; destroyers, 12. Under construction or projected: Battleships, 1st-class, 3.

Mexico.—Despatch vessels, 2; unarmored gun vessels, 2; and a steel training cruiser. Under construction and projected (1902): Gunboats, 4; torpedo boats, 1st-class, 5.

Morocco.— An iron screw ship and a smaller vessel.

Netherlands.— Old ironclad turret ships, 2; unprotected cruisers, 6; old flat-bottomed gunboats, 30; and a number of coast defense monitors. Under construction and projected: Torpedo boats, 1st-class, 13, 2d-class, 15, 3d-class, 25; and 4 other 3d-class boats.

Norway.— Armorclad, 2; monitors, 4; unarmored gun vessels, 3; gunboats of various kinds, 28; torpedo boats, 27.

Panama.—Two small steamers.

Paraguay.— One small ocean steamer, and 2 small river steamers.

Persia.— One screw steamship and one river steamer.

Peru.— One cruiser, a screw steamer, and 10 small vessels.

Portugal.— Protected cruisers, 5; cruisers, 3d-class, 6; old armored vessel, 1; torpedo boats, 1st-class, 15, smaller grade, 30; gunboats of various kinds, 26. Under construction: Miscellaneous vessels, 8.

Rumania.— Protected cruisers, 1; gunboats, 7; coast guard vessels, 6; torpedo boats, 1st-class, 6, 2d-class, 2; training ship, 1; screw despatch vessel, 1; projected: Armored vessels, 2.

Russia.— Battleships, 1st-class, 3, 2d-class, 10, 3d-class, 1; coast defense vessels, 12; armored cruisers, 10, 2d-class, 3, 3d-class, 1; gunboats and miscellaneous, 30. Under construction and projected (1902): Battleships, 1st-class, 5, 2d-class, 9; coast defense vessels, 1; armored cruisers, 2, 2d-class, 3, 3d-class, 4; gunboats and miscellaneous vessels, 10.

Santo Domingo.— Small gunboats, 3.

Servia.— Steamer used in the military service, 1.

Siam.— Cruisers, 2; gunboats, 4; training ship, 1; torpedo store ship, 1; transports, 3; despatch boats, 4; yachts, 5.

Spain.— Battleships. 1st-class, 1; coast defense ships, 2; armored cruisers, 1st-class, 3; protected cruisers, 1st-class, 1; cruisers, 2d-class, 5, 3d-class, 4; gunboats, etc., 60; torpedo boats, 1st-class, 20, 2d-class, 3, 3d-class, 4. Under construction: Cruisers 2d-class, 2, 3d-class, 1; gunboats, 1; torpedo boats, 4.

Sweden.— Armored coast defense turret ships, 1st-class, 10, 2d-class, 4, 3d-class, 9; steam corvettes, 3; torpedo cruisers, 5; gunboats and despatch vessels, 13; torpedo boats, 26; miscellaneous, 13.

Turkey.— Coast defense ships, 12; cruisers, 2d-class, 2, 3d-class, 4; gunboats, etc., 6; torpedo boats, 1st-class, 19, 3d-class, 7.

United States.— Battleships, 1st-class, 9, 2d-class, 1; coast defense ships, 19; armored ram, 1; armored cruisers, 2; protected cruisers, 15; unprotected cruisers, 3; dynamite vessel, 1; gunboats, 17; torpedo boats, 24. Under construction: Battleships, 1st-class, 10; armored cruisers, 6; protected cruisers, 9; gunboat, 1; monitors, 4; torpedo boat destroyers, 18; torpedo boats, 15; submarine torpedo boats, 7.

Venezuela.— Steamers, 3; sailing vessels, 2; and a number of small gunboats.

See also NAVAL ARCHITECTURE; NAVY, HISTORY OF; NAVY OF THE UNITED STATES, THE; NAVAL SERVICE, THE.

Navigable Rivers. See RIVER.

Navigation, The Science of Modern. At sea, with no land in sight, there are two methods available to the navigator for finding where his vessel is, — by "dead reckoning," and by "observation" of the heavenly bodies.

Dead reckoning consists in applying to the last accurately determined position of the vessel the "run" that has since been made good, and regarding the position thus obtained as the most probable one at the instant under consideration. The positions regarded as accurately determined and upon which future dead reckoning is based are such as are obtained from terrestrial objects before losing the land, or by astronomical observations; each time there is a new determination of position it affords a new basis, or "departure," for the dead reckoning. If a vessel known to be in lat. 45° 0′ N., and lon. 25° 0′ W., steers thence to the northward and eastward until, according to the best methods of reckoning course and distance, she has arrived at a point 45 minutes farther north and 30 minutes farther east, the position by dead reckoning is 45° 45′ N., 24° 30′ W. Tables computed ready to hand for the navigator's use give, at a glance, the distance to north or south and to east or west corresponding to each distance on each course; for instance, if the vessel runs 30 miles to the east-northeast, the equivalent is shown to be 11.5 miles north and 27.7 miles east.

The unit of distance used at sea is the nautical mile, or "knot," of 6,080 feet, which is about 1 1-7 land or statute miles; this is practically equal to one minute of latitude over all the earth, hence its adoption affords great facility in computations; the exact length of a minute of latitude of course varies by a few feet, at different distances from the equator. on account of the earth's flattening at the poles, but this mean value answers closely enough for navigating purposes. and when the ship makes a knot or "northing" or "southing" the navigator may consider that he has made a minute of latitude wherever he may be, and for 60 of

them, a degree. Not so, however, with longitude, for the distance between meridians, and subsequently the length of a degree or a minute of longitude, grows less as we approach the poles; at the equator the minute of longitude and minute of latitude are equal; but as one travels north or south from the equator conditions change; if a man were standing upon the North Pole he might, by a whirl upon the heel, make the circuit of all the earth's longitudes, while it would take a journey of about 25,000 miles to accomplish the same thing at the equator; for intermediate latitudes, there is an intermediate relation of the minute of longitude to the knot, a knot being, for example, 1.1 minutes of longitude at the 30th parallel and two minutes at the 60th. All of these different values are tabulated in navigation books, in convenient form, so that this unaccommodating feature of the longitude is not such a bugbear to the seafarer after all.

The dead reckoning obviously depends for its accuracy upon the correctness with which the mariner knows, first, the course, or direction in which the vessel has moved, and, secondly, the distance run; and it is the course and distance "over the ground" that should be considered, for a knowledge of the ship's progress through the water will not suffice for exact results if the water itself has been in motion. From this it may be understood that errors are always to be expected in dead reckoning, due to inaccuracies in estimating the course and the distance sailed, and to the effect of the unknown movement of the sea itself, that is, the "current."

To obtain the course, or direction, sailed, the compass is the sole source of knowledge. It may be considered that this is quite sufficient, and so it is when thoroughly understood; but the compass is not the simple and obedient servant of the mariner that it is ordinarily credited with being. "True as the needle to the pole" may be outrageously false, and usually is. The pole that the free magnetic needle seeks is the earth's magnetic pole, situated in Arctic North America, not the geographical one to which we are accustomed to refer; hence the needle points at an angle from the true north which depends upon the relative directions of the two poles at the position of the observer. This inaccuracy amounts to about 9 degrees at New York, about 15 degrees at London, and attains a value of upward of 30 degrees on a voyage between the two places; at some points in the region of the magnetic pole the error is very large, and, as may readily be conceived, in localities between the magnetic and geographical poles the "north" end of the needle points due south. The error caused by this discrepancy in the indication of the needle is called the "variation," or "declination," of the compass; its value has been determined, by observations, for all the navigable waters of the globe, and the results are accessible to the mariner, who makes allowance for the false pointing of his compass according to the position in which he finds himself; he must be careful, however, to employ the value corresponding not only to the proper place but also to the proper time; for the magnetic pole has a slow motion which is constantly creating differences in the values of the variation, so that in the course of a few years a material alteration takes place in this error in each locality.

This false pointing due to variation is only one of the untruths of the needle; there is another and a more obscure one that the navigator must guard against. In every vessel in which iron or steel is used to any material extent for construction or equipment, or in which these metals are carried in the cargo, there is exerted upon the compass needle a magnetic effect independent of that of the earth, and the needle, instead of seeking the magnetic pole, takes up a position that is dependent upon the combined influence of the magnetic force of the earth and that of the ship. This error is called the "deviation" of the compass, and it exerts a different influence and therefore produces a different deflection of the needle, on every different heading of the ship, in every different locality, and on every different angle of inclination from the vertical, or "heel," of the ship; in other words, it is different at Yokohama from what it is at Singapore — different when the ship heads northeast from what it is when she heads southeast, different when she heels to starboard on one slope of a wave from what it is when she heels to port on the other slope. It is not at all unusual for the deviation to amount to as much as 45 degrees, and it may reach a very much higher value. To overcome this error due to the ship's own attraction of the needle, it is customary to "compensate" the compass,— that is, to place near the needle artificial deflectors which will oppose to each of the various magnetic forces of the ship an equal corrective force, and thus neutralize the disturbance under all the various circumstances that may arise. Such of the ship's metal as has actually attained the properties of a magnet is corrected by small bar magnets; to such as exerts a magnetic effect through "induction" only (that is, the temporary influence of the earth's magnetism), non-magnetic masses of iron are opposed which are capable of acquiring an equal amount of temporary magnetism under identical conditions with that of the ship; and so for each of the disturbing elements. By the compensation of a compass it is possible to reduce the deviation to a very small amount, and such residual as there may be is then determined and allowed for.

But even with the compass thoroughly understood there are other errors that may occur in the reckoning of the course; the helmsman may be inexpert or the sea heavy, and in consequence the ship may not always head as desired; she may go off sidewise, or, to use the nautical expression, "make leeway," to an unknown degree; and an ocean current for which it is impossible to make accurate allowance may produce errors of both course and distance.

The distance run is the second essential element of the dead reckoning. It is ascertained by various methods. In the early days of navigation it used to be determined by tossing a piece of wood overboard from the forward part of the vessel and then having a man walk aft, keeping abreast of it as it was left behind by the vessel; the time it took the man to traverse a known distance on the deck afforded a basis for calculating the speed.

This method was replaced by one still in use on many vessels — "heaving the log." A "chip," or piece of wood of appropriate shape

is tossed overboard astern, being arranged to float in an upright position and thus present a flat surface not easily drawn through the water; to it is attached a marked line; the chip remains stationary while the line is paid out from a reel; the distance that the chip is left astern in a given time (usually indicated by a sand-glass) shows the speed of the vessel, the marks of the line being so placed as to give the result directly in knots.

The most modern method of determining speed is by the "patent log"; a small screw-shaped "rotator" is kept towing astern at the end of a long plaited line; as the vessel moves through the water the little screw rotates, the principle involved being the same as that upon which the big screw-propeller drives the ship; each turn of the rotator is transmitted through the tow-line to the shaft of a registering apparatus, and the distance run at any moment may be read from the register as one tells time by the clock. Some navigators dispense with all instruments and reckon distance by the revolutions of the engine — a successful method if they have a sufficiently extensive acquaintance with their vessels to know the number of revolutions required to drive the vessel a distance of one knot through the water under all the different conditions that may be encountered.

Absolute accuracy of results in the recording of distance is seldom attainable, notwithstanding the superior means of determination that exist in these later days; so that the distance, like the kindred term of the problem, the course, can never be relied upon implicitly, and the navigator must look for a means to obtain, from time to time, a fresh "departure" by which he may start anew his dead reckoning. For this purpose observations of the celestial bodies are made.

For the taking and working of astronomical sights there are required a sextant, a chronometer and a nautical almanac. The sextant is a light, handy instrument by means of which the angle between two objects may be measured. It carries two mirrors, of which one is capable of motion about a pivot, and the other is fixed. There is a telescope through which the observer looks directly toward one of the objects — in the case of a sea observation, the horizon; the movable mirror is then placed in such a position that a ray of light from the second object (the sun, or other heavenly body) is reflected to the fixed mirror and thence, through the telescope, to the eye of the observer. When the one object, seen directly, and the other, seen by reflection, appear to the observer to be in coincidence, the measure is made, and it only remains to read the amount of the angle from a graduated scale over which an index travels to mark the position of the movable mirror on its pivot; and so nice is the graduation and so effective the method of reading that angles may be measured to the nearest ten seconds, or to $\frac{1}{360}$ part of a degree. This accurate instrument is the descendant of a primitive one, used by early navigators, in which the measure was made by a plumb-bob — a very rough guide, especially on board a vessel tossing with the sea.

An instrument of equal importance in navigation is the chronometer, which is nothing more nor less than a time-piece in which every known device is employed to insure absolute uniformity of running. It is hung in "gimbals," or swinging rings, so that it may remain level as the ship rolls and pitches; and it is kept in a damp-proof, dust-proof and shock-proof case, and treated with the utmost tenderness, being especially guarded from changes of temperature. It is not expected that the chronometer shall always show absolutely the correct time of the standard meridian, but the requirement demanded is that its gain or loss shall be precisely the same from day to day; the latter condition being fulfilled, the navigator may ascertain, before leaving port, the "error" of his instrument, or the amount it varies from the true time at a certain place on a certain day, and the "rate," or amount of change in each 24 hours; and with this information it is a simple matter to determine the error in the indication on any future day, providing the actual rate agrees with the predicted one. Good chronometers, properly cared for, run with wonderful uniformity, and few gain or lose as much as three seconds a day. The evenness of their going is such that navigators may count upon the longitude based upon their indications being correct within a couple of minutes, even after a long voyage; and when it is considered that four seconds of error in the chronometer makes an error of a minute in the longitude, the accuracy with which the performance must agree with the prediction may be realized. In view of the importance of the chronometer in the determination of position, the better equipped vessels carry three or more of these instruments, instead of putting unlimited faith in a single one; for in every piece of mechanism there is a chance, however remote, of misbehavior somewhere, and with several instruments available for comparison any departure from a normal rate on the part of one is quickly revealed by the others. It is probable that a further safeguard will soon be afforded, for when the wireless telegraph comes into general use a signal may be sent out each day at Greenwich noon or some other definite instant of time, thus enabling the error of the chronometer to be determined daily at sea with as complete accuracy as it may now be determined ashore.

The finding of the ship's position by astronomical methods is not possible without a knowledge of the time, this element having a direct bearing upon the longitude. Hence no great degree of accuracy in navigation was attainable until the invention of a time-keeper that could be counted upon for an even performance under the conditions existing on shipboard. In 1714, the Parliament of Queen Anne offered a reward for the production of such an instrument, the amount to vary with the degree of success achieved. John Harrison, an Englishman who had devoted his life to the perfection of the chronometer, finally offered an instrument which, in 1758, was placed for trial aboard a naval vessel making a voyage to Jamaica and return; on arrival home, after an absence of five months, the error of its indication was found to amount to only 1 minute 5 seconds, or about 16 minutes of longitude, and the inventor was awarded the highest prize that had been offered, $100,000.

There is published annually, by the government of each of the more important maritime nations, a "Nautical Almanac," in which are given tables by which the positions of the sun,

moon, planets and all fixed stars of material magnitude may be found for any instant throughout the year. The navigator who is supplied with this book, together with a sextant by which he may measure the angular height, or "altitude," of any visible body above his horizon, and a chronometer rated to the exact time of a standard meridian (such as that of Greenwich), has at hand all the means necessary for finding the vessel's position by means of the celestial bodies.

Suppose that a bird is flying through the air on a known course and in such manner that its position above the earth may be determined for any given instant of time; and suppose that at a certain moment an observer with a sextant and watch measures the altitude of the bird — that is, its angular height above the horizon — and simultaneously records the time. Now take as a centre the point on the earth vertically below the bird, this point being known from the position as given by the time; and from that centre draw a series of circles. If we consider any one of those circles it may be seen that from every point of its circumference the bird will appear at the same angular distance above the horizon at the given instant; further, there will be one circle whose circumference contains our observer, and from every point of that circumference the altitude of the bird will be that which he measured. It is therefore clear that the observation has resulted in locating the observer upon one of a series of points which lie upon a certain circumference; but it has not defined the particular point. If, however, there is another bird flying in a known track, or if the observer waits while the first bird changes position somewhat, he may observe a second altitude and draw another circle that also takes in his position; then he will know that he is at one of the two points where those circles intersect, for if he is at the same time on both circles these are the only places at which the condition is fulfilled.

At sea, the sun, moon and stars take the places of the birds with which we have just been dealing, and our spheroidal-shaped globe that of the plane surface upon which we considered the observer to be standing. The altitude of a celestial body is measured with the sextant and the time is simultaneously noted by the chronometer; the chronometer correction being applied, the navigator knows the exact instant at which the observation was taken, which, from the information given in the Nautical Almanac, defines the position of the observed body with relation to the earth, taking account both of the daily rotation of the earth about its axis and of its annual revolution about the sun; and, having located the body, a circumference may be determined which will, like that in the case of the bird, take in all positions at which the observed altitude is possible; so also may a second circumference be determined either by a second celestial body or by the same body at a later time, and the intersection of the two circles will give the position of the ship, due allowance being of course made in case there has been a change of position between the two sights.

Practically, it is never necessary to deduce the whole circle, for the circumference may be very large, taking in perhaps half the globe; the navigator need only work out an arc a few miles in length, for the vessel's position is always known within narrow limits from the dead reckoning; for a similar reason, there is never any question in the navigator's mind as to which of the two intersections represents the true position. The computation is not a difficult one, being facilitated, like many other operations in navigation, by tables. When the body observed is on the meridian the problem assumes a particularly simple form, and hence it is an invariable rule, if the weather is clear, to take an observation of the sun when it attains its maximum altitude at noon, and to work up the day's run to that time and begin anew the dead reckoning. Any heavenly body may be used for obtaining position, providing it shows with sufficient clearness to be observed through the sextant, and providing also that the horizon is in sight. Sights of the sun are more generally used than those of other heavenly bodies; indeed, there are some navigators that seldom employ others; such sights have some advantage in simplicity of working, and may usually be taken with a more distinct horizon and consequently greater accuracy; but in the fast-moving modern steamers it is almost imperative to find the position more frequently than is possible by using the sun alone, and so the stars and planets (and occasionally the moon) are called into service.

When clouds and fog prevent the taking of observations, the mariner has no recourse but to rely upon the dead reckoning; but his reliance, in such a case, is not implicit, and the cautious captain — and how few are not cautious, with their heavy responsibility for life and property? — makes due allowance, in approaching the land, for possible inaccuracies in the supposed position.

Thus far, the methods of the navigator in the open ocean have alone been considered; but there is another branch of his art that remains to be touched upon — "piloting," where the land is in sight, and where courses are shaped and positions found from terrestrial objects. The first requisite for this work is a nautical chart, which shows the features of the land and water with a completeness of detail that the landsman would scarcely dream of. Upon it are represented, in proper position, the shore-line and the prominent characteristics of the land,— mountains, towns, lighthouses, windmills, conspicuous trees and houses, sand beaches, bluffs, rocks, islets — everything that could possibly be recognized by a person on a passing vessel and utilized for locating position. The water is also depicted, and nearly all that is above and below it — buoys, light-ships, and all floating objects of a permanent nature; the depth of water at frequent intervals, especially over shoals, reefs, and dangers; the character of the bottom in different regions, whether mud, sand, coral, or other substance; the direction and velocity of tidal and other currents that may be expected; and much useful information besides. By this chart, the ship may be guided in safety among the dangers that beset her near the land. When any object is in view which is portrayed upon the chart, the navigator may observe, by sighting over the compass, the "bearing," or direction, in which it lies; if a line is drawn upon the chart through this object in the observed

direction by the aid of the compass circles placed here and there, it is known that the ship's position on the chart is somewhere upon that line; then, if a second line is similarly drawn through another visible object, the exact location of the ship must be at the intersection of the two. Various other methods of a like nature afford the means for plotting the position of the vessel.

If, as in foggy weather or on an unlighted coast, there is nothing in sight by which the ship may be located, soundings may be taken, and the depth of water and character of bottom compared with those shown on the chart, thus giving a fair approximation to the position. In certain places, the nature of the bottom is more favorable for navigation by soundings than in others; thus the formation of the ocean bed to seaward of New York is such that in thick weather vessels may, with care, run well in toward the entrance of the harbor with no guide but the depth. Soundings may be made by direct measurement with a marked line lowered to the bottom by a heavy "lead" which serves as a sinker, but the method involves stopping the vessel to get an "up and down cast" when the depth is considerable; this disadvantage is obviated by the employment of a patent sounding-machine, the most useful of all modern inventions for the aid of the navigator, in which the depth is determined from the pressure exerted by the weight of water above the lead; this device registers as accurately when trailing astern as when suspended vertically, so that soundings may be taken with the vessel going at regular speed.

In piloting, the navigator receives assistance from all sorts of artificial marks that are maintained for the purpose by the various governments, and the ingenuity displayed in some of these is characteristic of the age in which we live. There are all sorts of buoys — spar buoys and can buoys; buoys that ring bells as they roll with the sea, and those that blow whistles by the air compressed as they rise and fall upon the waves; buoys that are lighted by electricity and those that are lighted by gas, the latter burning night and day, without renewal, for months, and sometimes automatically eclipsing their lights at definite intervals to make them distinctive. Then there are all sorts of lighthouses showing all sorts of lights — fixed, revolving, flashing, intermittent, white, red, green; and some possess one characteristic in directions whence the approach is clear, and another characteristic on bearings where they shine over dangers. There are also the lightships to give warning of dangers at a distance from the shore, like that on the Diamond Shoals, 14 miles from the dreaded Hatteras, maintained in one of the most boisterous spots of the ocean, which, besides showing other lights, throws a search-light beam vertically toward the heavens to mark the mariner's way. Moreover, since lights are of small avail in foggy weather, nearly every lighthouse and lightship has its fog signal — a siren, a steam trumpet, a bell, or sometimes a gun; and each of these is sounded according to some precise characteristic by which it may be recognized and distinguished.

GEORGE WOOD LOGAN,
Lieutenant, United States Navy.

Navigation Act, an important act passed by the British parliament in 1651 for the protection of British shipping and commerce. In relation to early American conditions the act provided that all colonial trade should be carried on in ships built and owned in England in the colonies (a provision which stimulated colonial shipbuilding), and that, in the case of many specified goods, trade should be with England only. The act was largely rendered inoperative by colonial smuggling. The efforts at last made to enforce the rule were among the chief causes of the Revolution.

Navigation Laws, as adopted by the United States in 1792–3, have been in operation since that date with few changes or revisions. The laws contain the following provisions: No vessel, unless entirely built in this country and wholly owned and officered by Americans, is considered an American vessel having the right to be protected by the American flag. No foreign vessel is permitted to engage in the American coasting trade, the same extending from Atlantic to Pacific ports. American vessels are no longer considered as such if even a part-owner (with a few exceptions) resides abroad for a short time. Transfer of an American vessel to foreigners prohibits it from ever again sailing under the American flag. If an American vessel makes any repairs in a foreign port, duty must be paid on the value of all such repairs on her return to this country. The repairing of foreign vessels in our ports, with foreign materials, is placed under restriction. A tax of six cents per ton of their burden, called a tonnage tax, is imposed on all vessels (except fishing and pleasure vessels) engaged in trade to ports not in North or Central America and a few other specified places, the maximum aggregate tax in any one year not exceeding 30 cents. Foreign vessels pay the same tax, but if one of the officers of an American vessel is a foreigner, it is forced to pay an additional tax of 50 cents. Materials for the construction of vessels for foreign trade may be imported free of duty, but the duty must be paid if the vessel engages for more than two months a year in the coasting trade. American vessels may unload at any port of delivery in the customs district, but foreign vessels can only discharge their cargoes at a port of entry, which is a certain designated port in each customs district in the United States. Exceptions are made when they are laden with coal, salt, or similar merchandise in bulk. See ADMIRALTY LAWS; LAW, MARITIME.

Naville, Edouard Henri, ĕd-oo-ār ŏn-rē nā-vēl, Swiss Egyptologist: b. Geneva 14 June 1844. He was educated at the University of Geneva, at King's College, London, at Bonn, and at Paris; went to Egypt in 1869, and there made important discoveries; was appointed editor of the 'Book of the Dead' by the London Congress of Orientalists in 1875, and in 1886 published 'Das Aegyptische Todtenbuch der 18. bis 20. Dynastie'; and in 1891 became professor of Egyptology at Geneva. He contributed volumes on the store city of Pithom (1885), on Goshen (1887), on Osorkou II.'s festival hall (1892), etc., to the 'Memoirs' of the Egypt Exploration Fund.

Navy, History of the. From a period earlier than authentic history, the Greeks began to exhibit a spirit of naval enterprise, and as long as their independence remained the various states into which both the mainland and the islands of Greece, as well as their Asiatic colonies were divided, rivaled each other in planting colonies and pushing their commerce in all directions. These states had also their armaments, and fought fiercely with one another, as well as with their foreign foes. The Athenians, Corinthians, Rhodians, even single cities like Chalcis and Megara, became renowned for their naval strength, and naval battles play a conspicuous part in the history of Greece. In the Persian invasions of Greece the size and power of the Persian fleets also forms a notable circumstance, and the great battle of Salamis (480 B.C.), in which Themistocles defeated the fleet of Xerxes, was the turning-point of the last Persian invasion. The smallness of the Greek galleys, and the superior size and number of those of the enemy, render this battle remarkable. The details of the tactics employed in it, and even the position of the rival fleets, are still matters of critical disputation.

But centuries before the rise of any naval power in Greece, Phœnicia (q.v.) had, certainly as early as 1100 B.C., a powerful fleet to protect its commerce and colonies through the Mediterranean from the attacks of pirates.

Among the Phœnician colonies arose one which in enterprise, ambition, and power eclipsed the parent state. Carthage, the rival of Rome, rose to her high rank among the nations of antiquity purely in virtue of her naval commerce. In her long struggle with Rome it was mainly the wealth acquired by commerce which enabled her to maintain the conflict. The Carthaginians also stimulated the Romans to enter upon naval enterprise. A Carthaginian vessel which had been cast on the coast of Italy furnished the model for their first fleet, which consisted of 100 quinqueremes and 20 triremes. This fleet is said to have been built in 60 days. Duilius, who commanded it, wisely distrusting the seamanship of his improvised sailors, contrived a means of approximating his first contest with the Carthaginians as nearly as possible to a land fight. By the use of grappling irons peculiarly contrived the Roman vessels were firmly attached to those of the enemy, and a struggle ensued, in which superior force and determination alone could influence the result. Thus the first great naval battle of Rome, fought off the Lipari Islands, 260 B.C., by the fleet of Duilius against a Carthaginian fleet of superior size under a leader named Hannibal, resulted in a complete victory, which was celebrated by a triumph at Rome.

The Ancient Galley, the war-ship of the Greeks, was a narrow vessel about 100 feet in length. It was admirably fitted to move rapidly in smooth water, and the numerous rowers gave great impetus to the attack of the beak, which was its principal means of aggression. The bow curved inward, forming a circular beak, which was faced with iron; or else it receded suddenly, having a single sharp point like a ploughshare, projecting at the surface of the water, and intended to open the side of an antagonist. Frequently the beak was formed to represent a lion, tiger, or other ravenous beast calculated to inspire terror. It was always surmounted by the national emblem; thus an owl stood on the prow of an Athenian galley; a cock on a Phœnician or Carthaginian; and the eagle on a Roman. Here or at the stern were also placed the ensigns and standards, and trumpeters standing beside them sounding their shrill blasts to inspire courage at the moment of onset. From the bow to the stern there extended a flooring or deck, which served as a battle-field for the mailed and heavy-armed soldiers. The stern was covered with a circular shed or pavilion, richly carved and decorated with streamers and trophies. Under this was placed the *tutela,* representing some patron deity, to which sacrifices and prayers were offered, and which was held so sacred as to furnish a sanctuary to whoever took refuge there. From this elevated station, too, the commander surveyed the fight and directed the efforts of his followers. There were two distinct classes of officers and men in each galley. The commander of the soldiers was supreme, and under him the pilot, who took his station abaft, at the side of the steersman, directed all necessary evolutions and maneuvers. The pilot was assisted in the command of the sailors by his mate, and by the boatswain or encourager of the rowers; whilst a musician marked the measure of the stroke, and by the harmony of his voice and instrument inspirited the rowers when weary with toil. The rowers were frequently, as in modern times, malefactors chained to the oar. Javelins and arrows were discharged in showers from the deck, or from turrets at the bow and stern. As a protection from these a curtain of hides was used, from behind which the soldiers discharged their missiles in return, and thrust with long spears used only at sea. In the centre were engines from which rocks were projected of size sufficient to sink a ship; and masses of iron called dolphins were projected from the mast-heads to break the bottom of the enemy's vessel. But the chief means of offense was the attack of the beak, and to make it with advantage it was generally desired to gain the wind. Combustibles were also cast from ship to ship, and peculiar devices due to the ingenuity of the particular commanders adopted on special occasions. The line of battle was usually triangular, the admiral's ship being at the angle in advance, and the line of storeships forming the base. Before encountering it was usual for the admiral to pass in a small boat throughout his fleet, haranguing his followers, and urging them to do their duty. Thus inspirited a shout of anticipated triumph would pass from ship to ship, and when the gilded shield was at length displayed as a signal for battle, the shrill trumpets sent forth their blasts, and the combatants rushed to the encounter, rending the air with shouts and war songs. The battle won, the victors returned to port, towing their prizes, their ships being decorated with fragments of the wrecks, themselves crowned with laurel, and singing pæans to Apollo. The richest of the spoils was reserved as an oblation to the gods, and broken or sometimes entire galleys were placed in the precincts of the temples. Little change was made by the Romans in their mode of warfare down to the time of the fall of the empire. The emperors of Constantinpole had still a fleet of galleys propelled by rowers.

Navies of the Middle Ages.—On the fall of the Roman empire naval enterprise declined, but only for a brief period. The honor of reviving it is disputed by the French and the Italians. To the latter chiefly belongs the honor of leading the way in the development of modern European commerce, but for the growth of naval armaments we must look also to the north of Europe. Charlemagne had a considerable fleet both on the Mediterranean and the ocean; but already in his time, and even in that of his predecessors, the settled states of Europe had begun to become subject to the piratical excursions of Northmen and Danes, which were afterward directed so persistently against England, and continued for several centuries to disturb its government. In the meantime the Italian republics of Venice and Genoa began to restore the commerce of the Mediterranean, and to open up communications with India by the Red Sea and the Persian Gulf. The Pisans and Florentines followed, and in the time of the crusades the chief naval armaments of the Christians were supplied by the Italian cities. The successors of Charlemagne did not follow his example in maintaining a regular fleet, yet Saint Louis was able to transport his own army to Africa, and to defend his coast against the English, but Philip le Bel had recourse to the Genoese against the English. The great naval battles of these times were fought among the Italian republics, or by them against the Turks, with whom they alternately traded and made war. After the epoch of the crusades we have a period which in one aspect of its development might be called the epoch of commerce and especially of mercantile navigation. The honor of leading the way in this new epoch belongs to the Portuguese. They were followed by the Spanish, the English, the Dutch, the French, and ultimately by all the other nations of Europe, according to their means and opportunities. The Spanish navy reached its highest power in the time of Charles V. and Philip II. Francis I. attempted the revival of the French marine and it was vigorously undertaken by Richelieu. The administration of Colbert revived both the mercantile and national navy, and the latter attained its chief strength and highest glory in the reign of Louis XIV., when it opposed, and sometimes not unsuccessfully, the united navies of England and Holland. The navy of Holland became powerful almost from the time of the national independence, and contended with success alternately against the fleets of England and France. Some of the most hotly contested naval battles on record have been fought between the English and Dutch fleets.

Cannon are said to have been first used in naval warfare by the Venetians against the Genoese in 1370, a considerable time after their invention.

The Battle of Lepanto.—The famous battle of Lepanto, which was fought between the Christian powers and the Turks 7 Oct. 1571, may be considered as representative of the first stage of the transition from the earlier mode of warfare. The Christian fleet was collected in the port of Messina in September 1571. It was contributed by the powers who had joined in the Holy League. The Spanish fleet consisted of 77 Spanish, 6 Maltese, and 3 Savoyard galleys under Don John of Austria, who commanded the joint fleet; there were 12 papal galleys, under Marc Antonio Colonna; and 108 Venetian galleys, and 6 galeazzi under Sebastian Veniero. The Turkish fleet, consisting of 300 vessels, under Capudan-pasha, Musinsade Ali, lay in the Gulf of Lepanto. Though the Turks were more numerous, the Christians were better armed and equipped. Their soldiers wore coats of mail and helmets, and were provided with firearms. The Turks defended themselves with leathern shields, and had bows and arrows in place of guns. The prows of the Christian galleys were less open and better defended than those of the Turks. The admirals, according to ancient custom, led the van. Both parties moved to the assault, but the wind changing at the moment favored the Christians. The admirals' galleys closed after a brief cannonade, and grappled each other. The Spaniards boarded three times, and were thrice driven back. A reinforcement of 200 men enabled them to return again to the assault with decisive effect, and an indiscriminate slaughter of the Turks took place. The head of Ali was exhibited on a pole to his followers. The battle after this only waxed fiercer, and the Turks fought with the courage of despair. So intense did the struggle become that the galley slaves in both fleets joined in the contest; but while the galley slaves of the Christians, who consisted of criminals, fought on their own side in hope of earning a pardon, those of the Turks, who were Christian slaves, rose against their masters. Over 15,000 Christians are said to have been relieved from servitude by the victory. The Turks lost besides 224 ships and 30,000 men.

Modern Navies.—The improvements determined by the use of artillery were chiefly an increase in the size and offensive strength of the ships, and a relative diminution in the number of men. Oars were abandoned for sails. Battles were fought and ships maneuvered by the sailors, and the marines or organized body of soldiers became a mere auxiliary force, available as sharpshooters and for land engagements. Two leading qualities now stood forth as the most important object to be attained in the construction and equipment of vessels for war—strength of offensive armament and speed and facility of maneuvering. These qualities did not now first acquire importance, but they gained in relative importance at the expense of a previously preponderating element of equipment, namely, the number of fighting men available for assault at close quarters. Two classes of vessels, according to the preponderance of one or other of these qualities, thus came to constitute the chief strength of modern fleets. The ship of the line, or first-class war-vessel, carried the strength of offensive equipment to the utmost limit practicable without sacrificing seagoing qualities. The frigate, only excelled in strength by a line-of-battle ship, was built and rigged with every artistic appliance to secure speed. Even line-of-battle ships were sometimes made too heavy for effective service, and facility of movement could not be altogether neglected with impunity; but the great point in a first-class vessel was the weight of broadside, and a hundred or more guns on three decks were commonly carried. In a pitched battle it was the line-of-battle ships that bore the brunt of the fight and decided the day. The frigates scoured

the seas on special missions, escaped from the enemy's line-of-battle ships by speed, destroyed his privateers, and protected the commerce of their own state. During all the great European wars these were the leading types of vessels employed. The tactics of naval warfare during this period, allowance being made for the different means of offense, did not differ materially from the ancient methods. To gain the wind of an adversary, to break his line and to engage him at close quarters with superior force, were still the main objects to be pursued. But a change took place when steam was introduced as a means of propulsion, and iron as a material for the construction of vessels. Vessels clad in iron armor now came to supersede the oak-built ship of the former epoch. More recently improvements made in the size, range, and destructive power of projectiles have effected a new revolution, or succession of revolutions, in the science of naval armaments, and the broadside has given way to a small number of powerful guns. The struggle between these new developments of offensive and defensive force still goes on. Iron clad and steel clad ships have superseded the wooden walls, and the introduction of gunboats, torpedo boats, submarines, torpedo destroyers and other craft have made naval warfare a new and peculiar science, totally different from the naval warfare of the past.

Navy League of the United States, The, an organization formed in 1902 for the purpose of upbuilding the American navy. In 1903 the association began the publication of a monthly bulletin, 'The Navy League Journal.' The League has a large and growing membership and promises to exceed that of similar organizations in Europe. The German Navy League has now, at the end of its fifth year, 626,201 members. The British Navy League, with sections in all the British provinces, has nearly as many members, and is becoming a great power in Great Britain. The French Navy League, with a former president of the republic as its president, has the support of the most influential people of France.

Navy Maneuvers. See ARMY AND NAVY MANEUVERS.

Navy Register, a Government publication issued annually by the United States Navy Department. It gives a complete list of the officers of the navy and the marine corps in order of their rank, lists of retired officers, resignations, dismissals, deaths, ships in service and other important naval information.

Navy Yard, a water-frontage usually including wharves and dry docks used by the government for building and repairing warships, keeping naval stores, etc. In Great Britain the term dockyard is generally used. On the continent the word arsenal is frequently employed. In England the royal dockyards are at Chatham, Sheerness, Portsmouth, Devonport, and Pembroke, besides the Deptford and the Woolwich store yards. There are also royal dockyards at Haulbowline in Cork Harbor, at the Cape of Good Hope, Gibraltar, Malta, Halifax, Bermuda, Antiqua, Jamaica, Sierra Leone, Trincomalee, Singapore, Hong Kong, Esquimalt (Vancouver's Island), Fernando Po, Sidney, and Shanghai. The greatest naval centres of France are Cherbourg, Brest, Lorient, Rochefort, Toulon, and Bizerta in Tunis. Germany has three ports of war, Kiel, Dantzic, and Wilhelmshafen. Trieste and Pola are the Austrian naval harbors. Russia has Cronstadt and Sebastopol at home, and Vladivostok in the Amur territory. In the United States the principal navy yards are located as follows: New York (Brooklyn, N. Y.); Mare Island, Cal.; Norfolk (Portsmouth, Va.); Portsmouth, N. H. (Kittery, Me.); Boston (Charlestown, Mass.); League Island (Philadelphia); Washington, D. C.; and Pensacola, Fla. Besides the navy yards there are several naval stations, the important ones being at Boston, Mass.; Newport, R. I.; Indian Head, Md.; Norfolk, Va.; Bremerton, Wash.; Port Royal, S. C.; Portsmouth, N. H.; Philadelphia, Pa.; Cavite, Philippines; San Juan, Porto Rico; Tutuila, Samoa; Guam, Ladrones; Havana, Cuba; Honolulu, Hawaii; Sitka, Alaska; and Yokohama, Japan. In the early history of the United States navy, nearly all the vessels were built and equipped at the navy yards. The six wooden frigates used in the Civil War were there constructed, but the modern steel warships have been built chiefly by contract, by private builders, so that the navy yards now are used mainly for repairs.

Navy of the United States, The. The American navy came into existence in 1775 after the close investment of Boston by Washington had cut off all supplies to the British troops, save such as might arrive by water. To intercept these, some small vessels were armed and manned by New England seamen, first under the auspices of Rhode Island and Connecticut, and afterward by authority of the Congress which organized a Naval Committee with John Adams at its head. These little craft not only deprived the enemy of succor, but captured enough prizes to furnish the colonial army with war material, without which it could not have continued hostilities.

Early History.— In 1776, the navy had 31 cruisers mounting 586 guns, and no less than 136 privateers mounting 1,360 guns had also been fitted out. Including the flotilla on Lake Champlain, the government war vessels in service during the Revolution numbered in all 64, carrying a total of 1,242 guns. This force captured 196 vessels worth about $6,000,000, and the privateer auxiliaries, numbering 792, mounting over 13,000 guns, took 600 British ships, valued at $18,000,000. Insurance on British bottoms rose from two to fifteen per cent. This unprecedented destruction of British commerce, and the fact that the Colonies were literally supporting their forces from captured British goods, were among the strongest arguments which led to peace.

The Hancock, Randolph, Raleigh and other cruisers authorized by Congress were excellent ships, and the Alliance and Confederacy built toward the close of the war had no superiors afloat. They were mainly armed with 4- to 18-pounder guns. Progress, however, stopped when

independence was achieved, and the vessels were sold and men discharged. In 1794, a law re-establishing the navy under the secretary of war was enacted and six frigates authorized. Of these, three were constructed, the Constitution, 44 guns, 1,576 tons; Constellation, 36 guns, 1,265 tons; and United States, 44 guns, 1,576 tons. The Constitution is still afloat. Three were abandoned and the material sold. Under the pressure of French spoliations, however, the navy was increased and at the beginning of the quasi-war with France in 1798 it aggregated 22 ships with 456 guns and 3,484 men. This little force during the two and a half years of hostilities captured 84 French armed vessels mounting over 500 guns. The military discipline of the navy here begins: the American officers, largely recruited from merchantmen, learned from the commanders of the British war vessels in the West Indies, the traditions and customs of the older service. Then also came in the carronade or short gun, with little penetrating but great smashing power. At the end of the French war, another reduction of the navy took place. The theory that ships and guns could be called into existence when needed, as easily as log cabins, even at that early day, had become well rooted. Accordingly after cutting our force down to 15 vessels, we deemed it wise to present the Dey of Algiers with 26 barrels of silver dollars and the fine frigate Crescent to induce him to let our commerce alone. Tripoli in her turn, being thus encouraged, demanded special blackmail. Thereupon the navy once more rejuvenated, not merely destroyed the Barbary pirates, but emerged from the war in 1805, a sea power hereafter to be taken into account in the world's diplomacy. It was during these campaigns that disciplinary routine was so highly perfected by Commodore Edward Preble that it has remained with little substantial alteration to the present day. It was then also for the first time that the American navy was accorded all the formal honors of a national service by the war-ships of other countries.

War of 1812.— When the War of 1812 with Great Britain began, the navy had 17 ships aggregating 15,300 tons and carrying 442 guns and 5,025 men. It had no yards, no docks, no adequate means of any sort for repair or refitting. The British navy, fresh from the victories of Trafalgar and the Nile, had over seven times this force on the North American station alone. Within seven months the United States ships had reduced three British frigates to wrecks and taken 500 merchantmen — a result which astounded the world. The Constellation 55 guns destroyed the Guerrière in 40 minutes and the Java in one hour and 55 minutes, and the United States 54 guns dismantled the Macedonian 29, in about an hour and a half. The subsequent sloop actions were almost equally decisive. The noteworthy fact of these duels was the destructive character of the American fire — which literally tore the British ships to pieces and converted their decks into slaughter-houses. Three prominent factors contributed to success.

1. The United States ships, and especially the frigates were larger — 12 feet longer — and at the same time more easily maneuvered than any which had ever before been built. The sloops-of-war outclassed those of foreign navies at every point.

2. The frigates concentrated the power of a ship of the line. They mounted long 24-pounders in broadside— an innovation startling for the times. To the Guerrière's 32 long 18's and 16 short 32's the Constitution opposed 30 long 24's and 24 short 32's. When she fought the Java she had increased the number of her long 24's to 32, so that while decreasing the number of her short guns to 22, she had augmented their size to 24-pounders. That gave the combination of low power, heavy smashing projectiles with relatively high power penetrating projectiles which characterized the navy armament for many a year afterward.

3. The American gunners aimed their guns. They had been taught, as their fathers from the backwoods who had harried the Hessians had been taught, to fire at targets; to use their long cannon as they used their long fowling pieces and to send round shot into hulls at the water line, just as they were accustomed with their rifle bullets to bring down ducks on the wing. The British system then involved no gun pointing. The carronades had no sights and were laid level — point blank — with a range of about 500 yards. They were fired with the same hope of hitting something which King George's grenadiers or those of his serene Highness of Waldeck cherished when they presented fire-lock and pulled the trigger in one motion. So long as shot cut up sails and rigging and so impaired motive power the desired end was attained. The bull-dog Briton could then lay his ship close aboard the enemy and finish the fight with boarders and cutlasses. But the handy American ships kept out of point blank range. Their long 24's enabled them to do this and at the same time deliberately to drill holes in the British water line, while occasionally anticipating the yet distant shell fire by sending slow heavy balls against the wooden sides and annihilating whole gun's crews with the resulting shower of splinters. That is how the Wasp cut up the Frolic in 43 minutes and the Hornet demolished the Peacock in just 11 — while incidentally demonstrating the superior advantages of firing on the down roll of the ship in order to convert the adversary into a sieve, instead of on the up roll which merely clipped his wings.

In the war of 1812, the regular navy numbering but 23 vessels carrying in all but 556 guns, captured 254 of the enemy's craft. The value of the prizes taken by the navy and the privateers jointly was over $45,000,000. The cost of British marine insurance became almost prohibitive, 13 guineas per £100 was paid to insure vessels crossing the Irish Channel. So great was the injury to British commerce that in June, 1813, flour in Great Britain was $58 per barrel and lumber $72 per 1,000 feet. Before the war was over, the English were building ships on the "exact lines" of the American 44-gun frigates, and cutting down some of their most famous line-of-battle ships to compete with them. After peace had been secured, the permanent establishment of the navy was fixed at 12 ships of the line, 14 first class frigates, 3 second class frigates, 6 sloops-of-war and a proportionate number of smaller vessels. The more famous craft built between 1814 and 1825 were the 74-gun ships Washington, Franklin, Columbus, Ohio and Delaware, which were armed with 12 eight-inch and 70 32-pounder guns. For a time, the

North Carolina with 102 guns in three tiers of port-holes on her towering sides was regarded as the most powerful war-ship afloat. Meanwhile the possibilities of steam war vessels were looming up. Robert Fulton had built the Demologos in 1813, which not only was propelled by a midships paddle wheel — but had a queer collection of innovations, notably a battery of long 32-pounders supplemented by a 100-pounder submarine gun, and apparatus for discharging steam into an enemy's hull. She was accidentally blown up in 1829 and was succeeded by the wooden steam battery Fulton the Second, built in 1837 which, however, proved a failure. Four years later, the Mississippi and Missouri, side wheel steamers, were constructed and they were followed in 1847 by the Susquehanna and Powhatan — all excellent and serviceable vessels. The value of having the motive power beneath the water line had, however, already attracted attention to the screw propeller. In 1844, the Princeton, designed by Captain John Ericsson, the first screw steam war vessel ever built, was launched. She carried two long 225-pounder built-up guns, capable of piercing 4½ inches of wrought iron, and the first of their type. She was broken up in 1849 — but was in service long enough fully to demonstrate the naval importance of screw propulsion. The engineer corps of the navy (amalgamated with the line in 1899) was organized by act of 31 Aug. 1842, and in 1845 the United States Naval Academy (q.v.) was established at Annapolis.

The Civil War.—The screw steam war vessel was now fully developed and those of our navy were as graceful as yachts and the most formidable of their class. Between 1856 and 1859, we built the Niagara, Colorado, Merrimac, Wabash, Minnesota and Roanoke frigates and the Brooklyn, Lancaster, Hartford, Richmond, Pensacola, Pawnee, Michigan, Narragansett, Dacotah, Iroquois, Wyoming and Seminole sloops, some of which still survive. Meanwhile the Dahlgren shell gun began to replace the older type of smooth bore. When the Civil War broke out the navy, however, had become much reduced. Of the 90 vessels on the list, 42 were in commission and the rest unserviceable. The sailing ships still carried the ancient 32-pounders and 8-inch shell guns and only the steamers were provided with Dahlgrens — but these were regarded as monsters, their caliber having increased to 11 inches. It went to 15 and even 20 inches before the war closed — but the guns were very short, powder charges small and initial velocities seldom rose above 1,200 feet per second. These pounding weapons — true to the old principle — were supplemented by rifles mainly of the Parrott type, which lingered long after they had been proved about as dangerous to friend as to foe. When the war opened, the navy had 1,457 officers and 7,600 seamen — when it closed the officers numbered 7,500 and the seamen 51,500 — 208 additional vessels were built and 418 purchased. The total number of Confederate or British vessels captured or destroyed was 1,504, valued at $31,000,000, and the net proceeds of property seized on the blockade which was efficiently maintained over more than 3,000 miles of coast was $20,501,927. The cost of the navy throughout the Civil War was about $314,000,000, equal to only 9.3 per cent of the government expenditure for the whole period of four years and four months. The total number of ships of all classes in the navy in December 1864 was 671.

The great naval development of the Civil War was the Monitor, a raft-like vessel 172 feet long over all, of 41½ feet beam and 11⅓ feet depth, of hold plated with five layers of 1 inch iron on her hull and 8 layers on her single steam rotated turret wherein were installed two 11-inch Dahlgren guns. She revolutionized marine warfare and made the wooden steam frigate about as archaic as the Roman trireme. To a limited extent also (especially in the Confederate iron clads Virginia and Tennessee and the Federal so called "tin-clads" of the Mississippi) the armored casemate was subjected to test — but it is only of comparatively late years and following the great improvements in armor that the casemate has assumed a really important place in naval construction.

Reorganization.— After the Civil War, the navy as usual was rapidly reduced — the total number of vessels in commission in the fall of 1866 being but 115. The monitors were laid up at League Island and gradually destroyed. Five which still survive, though practically useless, were permitted a brief harbor service during the Spanish War. Two, however, of the more formidable class, the Miantonomah and the Monadnock, made long voyages respectively to Europe and around Cape Horn — thus for the first time demonstrating the sea-going capacity of low freeboard turret ships and dooming to final extinction the wooden man-of-war. Gradually but steadily the depletion of the navy list continued and vessel after vessel was sold. Many were broken up under the law decreeing destruction if needed repairs should be found to cost more than 20 per cent of the value — and finally in 1881, so far as ships went, the country was little better than defenseless. In July of that year we had as the steam navy, 13 so called first rates (all of wood of from 2,840 to 3,173 tons measurement) of which one, the Tennessee, was at sea and four were ancient craft still on the stocks and never launched; 20 second rates (929 to 2,300 tons, all wooden but one) and most of these old-fashioned and unserviceable; 27 third rates (410 to 918 tons), again all wooden but four, and some of the Civil War monitors. The rest of the navy was made up of wooden sailing ships, two of which had served in the War of 1812, including some that became all but worn out decades earlier while chasing pirates in the West Indies and slavers on the African coast. The one sea-going flagship Tennessee (plus "repairs") in ten years of active service gradually cost $3,800,000 and was ultimately sold for $34,555. Numerous other vessels built in the interval since the Civil War had meanwhile gone almost immediately from shipyard to scrap heap. "It is often the subject of wonder," says the secretary of the navy in his report for 1887, "what has become of the $70,000,000 spent upon war vessels since the close of the war in view of the fact that there is now no navy." The existing armament was as antiquated as the ships themselves. It consisted principally of 9-inch smooth bore and 8-inch rifle guns, all muzzle loading, and the latter had been economically concocted from old 11-inch Dahlgrens by inserting a wrought iron rifled tube in the bore. The only breech loaders in

the service were those which had been "converted" from the miserable 100 and 60-pounder Parrott rifles. This deterioration of the navy, however, extended no further than to the ships, and, at times, to the Navy Department. Throughout all that long period of corruption and decay the discipline of the service never wavered, the attainments of the naval officers constantly advanced, drills and target practice were as scrupulously maintained on wretched wooden craft which the poorest foreign iron clad could send to the bottom with ease, as if they had been held on the most powerful of battleships, and although we had, at most, only 55 antiquated ships, every one of them too slow to run away from and too weak to fight with a war vessel of the modern build and equipment, none the less all were ready to do their best — inadequate as it was — instantly and at all times. The ships of the United States Navy have often become weak in numbers and bad in construction, but the men who handle them have never retrograded. In quality the personnel of the United States Navy has always been the best.

It was in 1881 that Secretary Hunt appointed an advisory board to determine the requirements of a new navy. It recommended 21 armored vessels besides 70 unarmored, together with rams, and most significant of all declared that the material of construction should be steel. That was the knell of the iron navy — although as a matter of fact, iron had never fully replaced wood. Meanwhile there was not a plant in the United States capable of making forgings for guns of more than 6-inch caliber — nor one able to make armor plate or torpedoes or machine guns. In May 1887 contracts were signed with the Bethlehem Iron Company for gun forgings and armor plates and in the same year the now great naval gun factory in the Washington Navy Yard was begun.

The Modern Navy.—The first vessels of the new steel fleet were the Dolphin (1884) and the Atlanta, Boston, and Chicago (1885). The increase after 1888 was rapid, the outbreak of the Spanish War of 1898 finding the navy equipped with 77 vessels, including several coast line battleships such as the Iowa, Indiana and Oregon, and the powerful armored cruisers New York and Brooklyn. The war developed the remarkable preparedness of the navy, which practically annihilated that of Spain in a campaign of 110 days. The chief naval event apart from the battles of Santiago and Manila was the famous rush of the Oregon from San Francisco to Jupiter Inlet, Fla., around Cape Horn, a distance of some 14,000 miles in 68 days, which she accomplished without accident, arriving in condition for immediate service.

The navy of the present day is summarized below:

Battleships.—These are distinguished by the arrangement of their turrets and caliber of guns therein. The largest vessels are those of the Louisiana class. They measure 16,000 tons displacement and are about 450 feet in length. The fastest ships — 19 knots per hour — are those of the Georgia class. The chief innovation in turret arrangement is that in which smaller turrets are directly superposed upon larger ones, the large turret having two very heavy guns and the upper or superposed turret, two guns of lighter weight. There has been much controversy over this construction. The classification is as follows:

(*a*) Two Turrets, 12″ guns, Maine, Missouri, Ohio, Texas.
(*b*) Two Turrets, 13″ guns, Alabama, Illinois, Wisconsin.
(*c*) Two Turrets, 13″ guns, and two turrets with 8″ guns superposed, Kentucky, Kearsarge.
(*d*) Two Turrets, 12″ guns, and two turrets with 8″ guns superposed, and two additional 8″ turrets, Virginia, Rhode Island, Georgia, Nebraska and New Jersey.
(*e*) Two Turrets, 12″ guns and four turrets with 8″ guns, Louisiana, Minnesota, Mississippi, Kansas, Iowa, Vermont, Connecticut, and Idaho.
(*f*) Two Turrets, 13″ guns, and four turrets with 8″ guns, Indiana, Massachusetts, Oregon.

Armored Cruisers.— The largest of these vessels are of 14,500 tons displacement, 502 feet long and are capable of steaming 22 knots per hour. They have armored turrets and are classified as follows:

(*a*) Four armored turrets with 8″ guns, Brooklyn.
(*b*) Two armored turrets with 8″ guns, Colorado, California, New York, Pennsylvania, South Dakota, West Virginia.
(*c*) Two armored turrets with 10″ guns, Tennessee, Washington.

There are four single turret harbor defense monitors: Arkansas, Florida, Nevada and Wyoming each carrying two 12-inch and four 4-inch guns, and six double turret monitors, Amphitrite, Monadnock, Miantonomah, Monterey, Puritan and Terror. The last named group — excepting the Monterey — have iron hulls and steel turrets. The Monterey has two 12-inch and two 10-inch guns. Of other vessels the numbers are as follows: Protected cruisers (unarmored steel vessels) 23, unprotected cruisers 3, gunboats 13, light draft gunboats 3, unarmored composite vessels (gunboats) 8; besides iron and wooden craft and small gunboats under 500 tons displacement, tugs, etc.

As compared with other navies, that of the United States stands as follows, all vessels authorized (1904) and building being considered. Battleship strength: Great Britain, first; France, second; Germany, third; Russia, fourth; United States, fifth; Italy, sixth, and Japan seventh. Armored cruiser strength: Great Britain, first; France, second; United States, third; Russia, fourth; Germany, fifth; Italy, sixth; and Japan, seventh.

Guns.—All forgings for naval guns are made of open hearth steel containing nickel. The use of nickel in steel for gun forgings while only of recent development has been found to impart very desirable qualities which vary greatly according to the amount of nickel contained. In general the presence of 3.25 per cent of nickel increases the tensile strength and elastic limit without causing a corresponding reduction in elongation and contraction of area; and the elastic limit is also increased relatively to the tensile strength. This condition indicates toughness. Crystallization after forging is also avoided; and a fine granular or amorphous condition results. This steel is more sensitive to temper, and it is in tempered steel that the improved qualities are most apparent. As shown by the ballistic tests of armor plate, the presence of nickel also materially increases the resistance to shock. Guns are classified into (1) main battery guns, (2) secondary battery guns, (3) field guns and (4) small arms. Main battery guns are either (1) heavy caliber and turret guns, which include 13-inch, 12-inch, 10-inch,

and 8-inch, or, (2) intermediate caliber guns which are of the ordinary rapid fire types, represented by the new 7-inch, the 6-inch, the 5-inch and 4-inch guns. All guns of a caliber less than 4 inches are secondary battery or light-caliber guns. All guns of the main battery and a large part of the secondary are of the built up type, the heavy gun having a steel tube jacket, jacket hoops, locking hoops and chase hoops; the last, in recent designs, being carried to the muzzle. The newer types of naval guns are designed for a muzzle velocity of about 3,000 F. S., which represents a more than quadrupling of the muzzle energy with the same weight of projectile, achieved since 1879, when the maximum muzzle velocity was about 1,450 F. S. The term "high power gun" is applied to all having a muzzle velocity of over 2,500 F. S. The interrupted screw and conical spiral thread systems of breech closure are used for all guns of and above 3 inches in caliber. For handling the larger guns hydraulic and electric power are used: and, in the newer vessels, electric power exclusively. Large guns are fired by electricity. The 12-inch gun throws a projectile weighing 850 pounds and is capable at 2,000 yards of penetrating a thickness of 21 inches of either Krupp or Harvey armor. The 7-inch gun throws a projectile of 165 pounds and at the same range will penetrate about 9.7 inches.

The projectiles for large guns are pointed armor-piercing shells of the best quality of steel fitted with a soft steel cap at the extremity and common shell of forged steel and cast iron. Smokeless powder is solely used except for filling shell and ignition purposes. The smokeless powders are all nitro-substitution products and their chief characteristic is that very nearly their entire bulk turns into gas. The present development of naval guns is in the direction of increasing accurate and quick control. Modern 6-inch guns are being fired from ships eight or ten times per minute at targets about the size of the ship, and a mile distant and hitting the target at every shot. The weight of the 6-inch gun with all its turning parts is about 25,000 pounds, and this is directed by one man. There is also a tendency to increase the weight and length of guns, that of the 6-inch gun having augmented from 11,000 to 16,000 to 18,000 pounds. So also the strength of gun metal is increasing. In the large guns it is now equal to a strain of about 50,000 pounds per square inch —and in smaller guns runs as high as 75,000 pounds.

Submarine Torpedoes are of the Whitehead type, driven by a screw propeller actuated by compressed air and controlled by the gyroscope. With an air pressure of 1,500 pounds per square inch, a speed of 30 knots per hour for 1,200 yards has been attained and, with increased pressure and superheating devices, a speed of 35 knots is apparently possible. The desirability of underwater torpedo tubes in ships is in controversy. The great weight of naval opinion is in favor of them. Torpedoes are certainly effective at ranges of 2,000 yards and under, and war vessels unprovided with them lack a weapon of offense, the absence of which is demoralizing to the crews and distinctly disadvantageous.

Armor.—Two kinds of face-hardened steel armor are used in the navy, the Harvey and the Krupp, the former being employed for plates under five inches in thickness. In both, the face of the plate is hardened to a certain depth, leaving the back of tough steel to serve as a support. Wood backing is obsolescent. Krupp plates are used for the main side-belt armor, turrets, conning tower, casemate and intermediate battery protection of battleships. Harvey plates down to 3 inches in thickness are employed for side armor plates, bulkheads, etc. For sighting hoods and other light structures, homogeneous nickel steel is chosen. For the purpose of design it is assumed that Krupp armor will keep out projectiles of a caliber equal to its thickness at moderate fighting ranges; but this in practice is greatly modified by the soft capped projectile which gives an increased penetrating efficiency of about 20 per cent at normal impact. As between guns and armor the gun is ahead. At present 12-inch guns using 850 to 1,000 pound projectiles are mounted in turrets clothed with 12-inch armor. These turrets can be penetrated at any distance at which the projectile is likely to hit, unless the impact is very oblique. Similarly the 6- or 7-inch guns of ships can penetrate the best 6- and 7-inch armor.

Boilers and Engines.— Two kinds of boiler are employed in the large vessels, namely, the steel cylindrical Scotch or water tank and the tubulous or water tube boiler. The principal types of water tube boiler adopted for the battleships are the Babcock & Wilcox and Niclausse. For torpedo boats and destroyers the Mosher, Normand, Seabury and Thorneycroft water tube generators are used. Engines are usually of the two-screw-vertical triple-expansion type.

Navy Organization.—The President of the United States is the commander-in-chief of the navy. Its affairs are administered by the Navy Department, of which the secretary of the navy is the head. The assistant secretary of the navy performs such duties as may be assigned him by the secretary, the most important being the supervision of naval stations in insular possessions, the Marine Corps, War College, building of ships in navy yards and fitting of vessels for sea. The navy is governed by the Articles for the Government of the United States Navy, and statutes of Congress, orders of the President and secretary and a code called Regulations for the Government of the Navy of the United States, last published 1900.

The business of the Navy Department is distributed as the secretary deems expedient among eight bureaus. The Bureau of Yards and Docks controls docks and buildings in Navy Yards. The Bureau of Equipment provides coal, all equipments of ships and electrical appliances afloat, and supervises the Hydrographic Office and distribution of charts therefrom, the Naval Observatory, Nautical Almanac and Compass offices. The Bureau of Navigation promulgates orders, regulates details of officers and enlistment of men, supervises the Naval Academy and all naval educational institutions, the Naval Home, keeps the service records and looks after discipline. The Bureau of Ordnance has charge of armor and armament of all kinds and mechanism thereto pertaining, besides governing the Torpedo Station, naval proving grounds and shore magazines. The Bureau of Construction and Repair designs, builds and repairs ships and supervises docking them. The Bureau of Steam Engineering designs, builds and repairs steam

machinery. The Bureau of Supplies and Accounts buys provisions, clothing, small and contingent stores and keeps the accounts of officers and men. The Bureau of Medicine and Surgery looks after the health of the force and controls all laboratories, naval hospitals and dispensaries. The office of the Judge-Advocate General of the Navy is independent of the bureaus and takes charge of courts-martial and courts of inquiry, examines claims against the Department and attends generally to its legal work.

There is a loose sort of co-ordination between the bureaus, and the chiefs form a quasi-cabinet for the secretary. He is not bound by their advice and sometimes disregards it. Chiefs of Bureaus are naval officers nominated by the President and confirmed by the Senate to their office, the term of which is four years. They hold the rank of rear-admiral during incumbency, as does the Judge-Advocate General that of captain in the navy or colonel in the marine corps. The policy of the navy for the last half century has been against permanent officials in the bureaus. It has required officers of all grades to perform short tours of duty in them, so that there has always been an excellent understanding of needs and capacities between the administration and the fleet.

At the present time (1904) a proposition for a general staff to submit plans and policy to the secretary, and then under his authority to direct their execution, thus co-ordinating the work of the bureaus and ensuring permanent and systematic control of the military by the civil power is under discussion. There are already certain permanent boards of naval officers which take part in the administration. The General Board, presided over by the Admiral of the Navy, considers questions of naval policy and strategy and advises the secretary. The Board of Inspection and Survey inspects and reports on the efficiency of ships in commission. The Lighthouse Board controls the lighthouse establishment. For the distribution of navy yards and naval stations see NAVY YARDS. The navy provides vessels and officers for the Commission of Fish and Fisheries and for the nautical schools of Massachusetts and New York. It also maintains naval attachés at the United States embassies and legations at London, Paris, St. Petersburg, Berlin, Rome, Vienna, Tokyo and Peking. Jointly with the Treasury Department it manages the lighthouses and provides officers for their inspection.

Personnel.—Officers are commissioned or warranted. Commissioned officers belong either to the "line" or to the "staff." The grades of line officers and the number allowed by law in each grade are admiral 1, rear admirals 18, captains 70, commanders 112, lieutenant-commanders 170, lieutenants 300, lieutenants, junior grade, 75, ensigns and midshipmen, indefinite. The staff officers include the Medical Corps, consisting of 15 medical directors, 15 medical inspectors, 56 surgeons, 55 passed assistant surgeons, and 53 assistant surgeons; the Pay Corps of 13 pay directors, 14 pay inspectors, 40 paymasters, 30 passed assistant paymasters and assistant paymasters indefinite. The chaplains of various grades number 24; the professors of mathematics 12, naval constructors 43, civil engineers 24, and admiral's secretary 1. All line officers, excepting a few yearly appointed from the warrant officers, are graduated from the United States Naval Academy (q.v.). Promotion up to rear admiral is by seniority only — subject to physical and professional examination at each step. The office of admiral is personal and expires with the individual holder. The staff officers are promoted by seniority in their several corps. The warrant officers include boatswains, gunners, and carpenters, in each of which corps there are two grades, chief sailmakers, warrant machinists, pharmacists and mates. The great majority are appointed from the enlisted force. Chief warrant officers rank with but after ensigns. Promotion in the warrant grades is by seniority.

Enlisted Men.— Only citizens of the United States can be enlisted. At the present time (1904) they form 90.7 per cent of the enlisted force, 79.8 per cent being native born. The total enlisted force is 27,245 men. The recruit must be able to write and speak English, have no physical disabilities, nor be a deserter or a minor under 14 years of age. The age limits vary with the rating — thus on first enlistment, a landsman must be between 18 and 25, unless he has a mechanical trade, when he can enlist up to 35, which is for all ratings the maximum. The enlistment term is four years — no enlistments for special service are allowed. Re-enlistment requires proof of creditable discharge. Enlisted men are classified into chief petty officers, petty officers of the first, second and third classes, and seamen of the first, second and third classes. They are again classified into the seaman branch, artificer branch, special branch and messmen branch. The seaman branch includes such petty officers as boatswains' mates, gun captains, and the like, and ordinary seamen, landsmen, together with the three classes of naval apprentices. The artificer branch includes all the machinists, electricians, carpenters, firemen and coal passers, the special branch, the stewards, hospital attendants and musicians, and the messmen branch, the cooks, stewards and mess attendants. Petty officers are appointed by captains of ships from the enlisted force. Two years' service at sea is required for rating as ordinary seaman and four years for seaman. Gun pointers are selected for merit and any one is eligible who shows the necessary natural aptitude. Those who become expert receive as high as $10 per month in addition to their regular pay.

Apprentices are enlisted between the ages of 16 and 17 with the consent of parents or guardians and must engage to serve until 21. They are instructed in the rudiments at the training station at Newport, R. I., and at San Francisco, Cal., for six months and then go to the training ships for a year's cruise at sea, after which they are promoted from the third class to the second, and assigned to the fleet. One year later they are rated in the first class and are eligible for petty office. Their instruction is continued during their apprenticeship and they have other special privileges.

Pay.—The pay of the commissioned officers of the line at sea or on shore duty beyond sea is as follows: Admiral, $13,500; rear-admirals, first nine, $7,500; second nine, $5,500; captains, $3,500; commanders, $3,000; lieutenant commanders, $2,500; lieutenants, $1,800; junior

lieutenants, $1,500, and ensigns, $1,400. Officers of the medical and pay corps receive the pay of their corresponding grades. All salaries (excepting that of the Admiral) are reduced 15 per cent during shore duty in the United States. All grades below rear-admiral are entitled to longevity increase of 10 per cent for every five years' service, until 40 per cent of the full yearly pay of the grade is reached. Midshipmen receive $500 per year at the Naval Academy and $950 per year with the fleet. The maximum pay of chaplains is $2,800, of professors of mathematics and engineers $3,500, and of naval constructors $4,200. All warrant officers except mates, whose pay ($900) is stationary, receive $1,200 during the first three years after appointment, increasing after 12 years to $1,800. The pay of chief petty officers is from $70 to $50, other petty officers from $65 to $30, and seamen from $35 to $9 per month. There are various special allowances and rewards for particular service — for which see the yearly Naval Register. Retirement of officers is compulsory at age of 62, also for disability and under certain conditions under Act of 3 May 1899. It is voluntary after 40 years' service and above the grade of lieutenant commander. Retired officers (according to the law under which they retire) receive either three fourths or one half the sea pay of their grade on the active list or one half their leave pay. Enlisted men can retire after thirty years' service and attaining age 50 unless physically disqualified for duty. They receive three fourths of the pay in the rating they held when retired.

The Naval Home at Philadelphia (formerly called the Naval Asylum), built in 1832, provides a retreat for old officers and sailors.

Naval Education.—The educational institutions of the navy are the Naval Academy (q.v.) at Annapolis, Md., the War College at Newport, R. I., and the apprentice training stations at Newport and San Francisco. The Naval Academy founded by Secretary George Bancroft in 1845 as a school for midshipmen studying for promotion, is now the foremost naval college in the world. All of the line officers of the navy with a very few exceptions are its graduates. The students are midshipmen. They are appointed by the secretary of the navy on nomination of Senators and members of Congress and by the President. One midshipman is allowed at the Academy for every member or delegate of the House of Representatives, one for the District of Columbia, two for each State upon recommendation by Senators, and 15 appointed by the President. The course is four years at the Academy, eight months of each year being devoted to study at Annapolis and the remainder to cruises in the practice ships. This is followed by two years at sea prior to promotion to ensign. Candidates must be physically sound, not less than 5 feet 2 inches in height and between the ages of 16 and 20, and must pass a rigid entrance examination, which includes geometry, history and advanced geography. The course covers thorough technical education in gunnery, navigation, marine engineering, languages, law and all other branches required by a naval officer. The standard of efficiency demanded is at least 66⅔ per cent, from which no diminution is allowed. The proportion of graduates to freshmen has been hitherto about 44 per cent. The faculty is mainly composed of graduate naval officers. The new buildings of the Academy now (1904) approaching completion are to cost nearly $12,000,000 and form the most magnificent educational structures in the world. The War College, founded by Rear Admiral Stephen Bleecker Luce, U. S. N., in 1883, is established at Newport, R. I. It is not a school, but a place for discussion of naval problems by officers of all grades, forming committees in attendance usually during the summer months. It specially considers matters of strategy, planning of campaigns, etc.

The Marine Corps was established by the Continental Congress in November 1775. It is a part of the Navy and has participated in all its actions. Its grades and pay correspond to those of the Army. It has 1 major-general (commandant), 5 colonels, 50 lieutenant colonels, 10 majors, 55 captains, 55 1st lieutenants and 57 2d lieutenants. Retirement is compulsory at age 64 or for disability, and is voluntary at 30 or 40 years under different laws. Officers are very commonly appointed 2d lieutenants directly from civil life, although many have been selected from graduates of the Naval Academy.

Naval Policy.—It is the policy of the United States, not to have the largest navy, but one which shall be fully adequate for the maintenance of its peace and in every particular of the highest attainable efficiency. At the present time (1904) our naval armament is below the minimum for the work demanded of it. A battleship requires about forty months to build and it takes six years to produce a competent naval officer. So also it takes time to train men to handle the complicated mechanism which is essential to the modern war vessel. The training facilities of the country and the means for obtaining the enlisted force are inadequate. A Naval Reserve is necessary from which to draw men at once in case of need. A Naval Militia (q.v.) co-ordinated with the regular service is also of great value, especially for harbor and coast defense. Several States have established such militia, but its development has been greatly retarded by lack of proper national encouragement and support. The distribution of our naval force in time of peace is in two fleets and four separate squadrons. The North Atlantic fleet includes the east coast of the United States and West Indies, and is divided into the Battleship, the Caribbean and the Coast squadrons. The Asiatic fleet covers the east Asiatic coast and the Philippines and is divided into the Northern and Southern squadrons; the European Squadron, the South Atlantic Squadron which cruises on the east coast of South America, the Pacific Squadron, which ranges over the whole west coast of both continents, and the Training Squadron. See also NAVAL ARCHITECTURE; NAVY, HISTORY OF; NAVAL SERVICE, THE; NAVIES OF THE WORLD.

Bibliography.— For histories of the navy consult: Cooper's (1839); Maclay's (1895–9); Spears' (1897); also Aldrich's 'History of the Marine Corps.' A great deal of information will also be found in Hammersley's 'Naval Encyclopedia' (1881) and subsequent editions. Niles' 'Register and American State Papers' may also be consulted. The 'Official Records of the U. S. and Confederate Navies during the War of the Rebellion' contain all reports and like

matter, and are published by the Navy Department. Consult also file of the 'Army and Navy Journal' 1863 to date. For current progress, the yearly reports of the secretary of the navy and of the Bureaus — the publications of the Office of Naval Intelligence and of the United States Naval Institute are indispensable. For the Naval Academy, consult the history of that institution by Park Benjamin, and the yearly 'Registers' obtainable from the superintendent, which give all qualifications for entrance, course, etc. Information as to apprentices, enlistments, etc., are published by the Bureau of Navigation. Fullam and Ward's 'Text Book of Ordnance and Gunnery,' and Beig's 'Steam Boilers,' contain full data relative to their subjects. For government and organization consult 'Regulations for the Government of the Navy' (1900), and for Personnel and Stations, the current 'Navy Register.' For construction of ships consult 'Proceedings of the Institute of Naval Architects and Marine Engineers.

Revised by ROBERT M. THOMPSON,
President Naval Academy Alumni Association.

Nawanagar, nạ-wā-nạ-gär'. See NOWANAGAR.

Naxos, năk'sŏs, or **Naxia,** näk-sē'ä, Greece, an island of the Ægean Archipelago, the largest of the Cyclades, lying east of Paros; length, 18 miles; breadth, 12; area, 170 square miles. It is hilly, beautiful, and extremely productive, yielding fruit, wine, oil, silk, wheat, and barley, while the higher grounds afford pasturage for cattle. Cheese, honey, and wax are exported, as well as wine, oil, fruit, and grain. There are prehistoric quarries of granite, marble, and serpentine; and emery exists in abundance, being exported in large quantities. The chief town or village is Naxos (pop. 2,000), near the northwestern part of the island, on a small bay with a harbor and insecure roadstead. In ancient times Naxos was celebrated for its wine, and played a prominent part in the legends of Dionysus or Bacchus, who is said to have found Ariadne here after she was deserted by Theseus. It was anciently inhabited by Ionians who had emigrated from Athens. Pop. (1889) 15,572.

Naylor, nā'lôr, **James Ball,** American novelist: b. Pennsville, Ohio, 4 Oct. 1860. He was graduated from Starling Medical College, Columbus, Ohio, in 1886, and has since practised medicine and engaged in literary work. He has published: 'Current Coins' (1893); 'Ralph Marlowe' (1901); 'The Sign of the Prophet' (1901); 'In the Days of St. Clair' (1902); etc.

Nazaræans, năz-ạ-rē'ạnz, a Jewish sect mentioned by Epiphanius. The term is probably derived from *Netsir,* a branch, that is, a branch of the true stock. They professed to revert to a patriarchal form of religion and thus to supersede Mosaic Judaism, canonized the 12 patriarchs, but did not exclude Moses and Aaron from their list of saints. According to them the law given to Moses was lost and the extant Pentateuch corrupt. While rejecting the sacrifice of animals and eating no flesh, they kept the Sabbath and the Jewish festivals. They were found in Galaaditis, Basanitis and other regions east of the Jordan.

Nazarene, năz-ạ-rēn', a designation of Jesus Christ. It appears in two forms in the Greek, *Nazarenos,* and *Nazoraios,* both derived from Nazareth. Though this designation occurs 19 times in the New Testament the authorized version only twice renders it "Nazarene" (Matt. ii. 24; Acts xxiv. 5), elsewhere by the words "of Nazareth." The demoniac uses it in addressing Jesus in the synagogue at Capernaum (Mark i. 24; Luke iv. 34); the people to Bartimæus (Mark x. 47; Luke xviii. 37); the soldiers who apprehended Jesus (John xviii. 5–7); the servants at his trial (Matt. xxvi. 71; Mark xiv. 67); Pilate in the superscription (John xix. 19); the disciples on their way to Emmaus (Luke xxiv. 19); Saint Peter (Acts ii. 22; iii. 6; iv. 10); the false witness against Stephen (Acts iv. 14); the ascended Jesus (Acts xxii. 8); and Saint Paul (Acts xxvi. 9). At first it was applied to Jesus as naturally indicating his birthplace. The Galileans were not highly esteemed; their dialect was debased; the population had become degraded through admixture with the heathen; they were seditious, hence the accusation against Saint Paul as "ringleader of the Nazarenes." Nazareth was a small, obscure town of Galilee, hence Nazarene became a term of reproach and is still used by Arabs as a general designation for Christians; and the Indian Mutiny is said to have been encouraged by a pretended ancient prophecy that the Nazarenes should be expelled from Hindustan after dominating it for 100 years. See NAZARETH.

Nazarenes, nickname of a certain school of German painters who both in coloring and technique professed to reproduce the method and style of Italian painters of the 14th and 15th centuries, Giotto, Fiesole, Perugino. The leaders in this movement were Overbeck, Schadow, Veit, Schnorr and Carolsfeld, who founded at Rome "The Congregation of the Brothers of Saint Isidore." Schnorr and Schadow later on left the brotherhood. A similar movement in England was initiated by the Pre-Raphaelites (q.v.).

Nazarenes. See EBIONITES.

Nazareth, năz'ạ-rĕth (ancient NASSRA, that is, "flower"; modern EN-NASIRAH, ĕn nä-sē'ra), Palestine, a city noted for being the home of Jesus Christ. It is about 20 miles in direct line from the Mediterranean Sea, 15 miles from the Sea of Galilee, and 70 miles north of Bethlehem (q.v.). The distance to Bethlehem by the usual route is 110 miles. The city is built in the form of an amphitheatre, in a valley which is 1,115 feet above the level of the sea, and surrounded by hills. On the south is the plain on which the Nazarenes threshed their wheat, and farther away is the plain of Esdraelon. From the summit of the hills which surround the city a fine view of the surrounding country may be obtained. The Nazareth of the time of Jesus extended farther up toward the summit of the hills (Luke iv.). The place was the home of Mary, the mother of Jesus, and of Joseph, the husband of Mary. The city is not mentioned in the Old Testament; but it is referred to several times in the New Testament (Luke i. 26; John i. 46, and other places). The streets are narrow, but well paved, the houses are principally of stone. The house in which Jesus lived was held in esteem in the early ages of Christianity, but when the place came into possession

of the Moslems, Christians who approached the village were in great danger. At the time of the crusades (q.v.) the place was ornamented and kept in good order, but again in 1291 the Moslems gained possession and the village declined. The Franciscan Fathers erected a church and monastery in Nazareth in 1300, but they were expelled in 1362. They returned in 1468, but were obliged to leave in 1542, and returned in 1620. They are now in Nazareth and under their auspices the Church of the Annunciation, and several other churches and chapels have been built. The Fathers give hospitality to all travelers who visit the place. The pilgrim house is called "Our Lady of America," as it was erected by the contributions of Roman Catholic Americans. The house in which the Holy Family lived is said to be now in Loretto (q.v.), in Italy. Some of the points of interest are the Church of the Annunciation, the fountain of the Virgin, the workshop of Saint Joseph, the church of the schismatic Greeks, church of the United Greeks, and the *mensa Christa* (table of Christ). Tradition relates of the last mentioned, that it is the rock upon which Jesus Christ took a repast with his disciples. Saint Francis of Assisi visited Nazareth in 1219; and Saint Louis, king of France, and his wife, visited it on 25 May 1251. The Franciscan Fathers have a school for boys, and the Ladies of Nazareth a school for girls. There is one hospital in charge of Brothers of Saint John of God, a school for boys under the Brothers of the Christian Schools, and a free dispensary and home for the aged in charge of Sisters. The population is estimated to be about 10,000; in 1897, by accurate report there were 2,400 Roman Catholics (including three rites), 2,000 schismatic Greeks, 100 Protestants, and 1,500 Moslems. Consult: De Hamme (translated by Rotthier) 'Ancient and Modern Palestine'; De Vogue, 'Les Eglises de la Terre-Sainte'; Roger, 'La Terre-Sainte'; De Hamme, 'Guide-Indicateur des Sanctuaires et Lieux historiques de la Terre-Sainte'; Stanley, 'Sinai and Palestine'; Smith, 'Historical Geography of the Holy Land'; Guerin, 'Galilee.'

Nazareth, Ky., in Nelson County; on the Louisville & Nashville railroad; two and one half miles from Bardstown (q.v.) and 39 miles south by east of Louisville. It is the seat of the mother house of the Sisters of Charity in Kentucky, an order whose members follow the rule of Saint Vincent de Paul, and who extend their work through 54 branch houses in several States. The area of Nazareth is 6,000 acres, encircled by woodlands beyond which rise the famous Kentucky Knobs. One of the sisters is postmaster of the government office and the long distance telephone supplies the need of quick means of communication with patrons. The convent building has a frontage of 1,000 feet, and is surrounded by well-kept lawns, adorned with shrubs and flowers, and a park of 100 acres. It has an art gallery which contains some valuable works of the great masters and some creditable work from the teachers and students. Two fine groups of bronze, life size, are near the entrance. The library contains about 6,000 volumes and is well furnished. The laboratory is supplied with up-to-date philosophical and chemical apparatus. The museum, a hall 80 by 75 feet, contains collections of historical souvenirs, shells, fossils, corals, minerals, stuffed birds and animals, botanical specimens, herbaria, fungi, and more than 100 specimens of wood from native trees, so arranged and classified as to show the bark and the grain of the wood. The exhibition hall, 165 by 75 feet, has a seating capacity of 2,500. The church, French Gothic, a gem of beauty, is gracefully arched, handsomely furnished, and perfect in all its appointments.

The founders of Nazareth were Right Rev. J. B. M. David of Bardstown and Catherine Spalding. Mother Catherine Spalding's mother was an elder; thus the first superior was a representative of two of the most prominent families of Kentucky. The convent was founded in 1812; the school in 1814; branch houses were established in Bardstown in 1818, and at Saint Vincent's, Union County, Ky., in 1820. Under the title, "Nazareth Literary and Benevolent Institution," the convent was chartered by the Legislature of Kentucky in 1829. The Sisters, following their vocation, having done heroic service when opportunities presented themselves. They gave personal service and all the aid in their power during the cholera epidemic in 1832 and 1833; they served in taking care of the soldiers during the Civil War; in 1878, 12 sisters died at their post attending to yellow fever patients, but their places were soon filled, for when volunteers were called for, every Sister offered herself. They have done work in Louisville during various visitations of smallpox and other contagious diseases. Out of the cholera of 1833 grew their first orphan asylum, Saint Vincent's, in Louisville.

Some of the most distinguished men of the country have been their patrons: Henry Clay, who sent his daughter, granddaughter and great-granddaughter to Nazareth; Judge Benjamin Winchester, John J. Crittenden, Judge John Rowan, Zachary Taylor, Jefferson Davis, George D. Prentice, Governor Charles Wickliffe, and many others. Some of the noted pupils of the school were Sarah Knox Taylor, daughter of President Zachary Taylor; Mary Anderson, Mrs. Charlotte McIlvain Moore, Mrs. James Meline, Mary Irwin, and a host of others.

The Sisters now number 820; they have houses in Kentucky, Tennessee, Arkansas, Mississippi, Ohio, Massachusetts, Maryland, and Virginia. They have 16 academies, 54 parish schools, six hospitals and infirmaries, five orphanages, and three homes. They have in their schools 16,300 pupils; in their hospitals 800 patients, and in their orphanages 550 children.

Nazareth, Pa., borough in Northampton County; on the Delaware, Lackawanna & Western railroad; about five miles north by west of Easton and 100 miles northeast of Harrisburg. It is near large anthracite coal fields and has considerable manufacturing. The chief industrial establishments are cigar factories, paper and hosiery mills, lumber and planing mills, carriage works, foundry, machine shops, lace factory, guitar factory, creamery, and large brick and coal yards. There is considerable trade in manufactures and coal. Pop. (1890) 1,318; (1900) 2,304.

Naz'arite. See NAZIRITE.

Naz'arites, a sect of Christians in Hungary, numbering about 80,000. They profess to

go back to the New Testament for their belief and practice; reject Sunday as a holy day of rest, though for convenience adopt it as the day of public worship, which any man of good standing in the church can hold, as they have no separated and ordained ministry. They observe Baptism and the Lord's Supper as sacraments, but refuse to take an oath or to serve in war. When a Nazarite is drawn in the conscription a substitute is provided either by his relations or the parish to which he belongs. The sect found an entrance into Hungary through two journeyman locksmiths, Denkel and Kropacsek of Szegedin in 1839; the locksmith Henesei became its Apostle and it rapidly grew from 50,000 members to its present number. The simple social life, charity and peacefulness of this sect puts them on a level with the followers of George Fox in English-speaking countries.

Nazirite, an Israelite who bound himself or herself to the service of Jehovah by a special vow, the obligations of which are stated in Numbers vi. 1–21. The word is derived from a Hebrew root meaning separation, and is sometimes translated in the Greek version of the Septuagint by a word that means sanctified or consecrated. The principal stipulations of the vow bound the Nazirite to abstinence from wine or strong drink and from the eating of grapes, and forbade him to cut or shave off the hair of his head, or to touch a dead body. The duration of this vow according to the Jewish canons could not be less than 30 days; though some took the vow for life. Samson, Samuel and John Baptist are mentioned in Scripture as perpetual Nazirites, of which there were two classes, those who were permitted to diminish their hair when it became too heavy, if they were willing to bring the three appointed sacrifices (Num. vi. 10–12); and those who were forbidden to diminish their hair, but could touch a dead body, as Samson did the jaw-bone of an ass, without being defiled.

The institution of Naziritism was intended to typify the separation and restraint of a holy life. The growth of the hair indicated the virility of heroic virtue; the flowing locks symbolized childlike simplicity, power, beauty, liberty and the unchecked employment of human faculties in the service of God. Maimonides speaks of the dignity of the Nazirites as being equal to that of the high-priest; according to Eusebius the historian (Hist. Eccles. ii. 23), Nazirites were the only Israelites, excepting the high-priests, who were permited to enter the Holy of Holies. Parents could dedicate their prospective children to the life of a Nazirite. No community life or separation from the engagements and enjoyments of domestic or social life was entailed by the vow, whose special object appears to have been to set forth symbolically among the people, in the person of separated devotees, useful and impressive lessons of submission to the law of holiness. Consult: Michaelis, 'Law of Moses'; Bähr, 'Symbolik des Mosaici Cultus'; Driver, 'The Books of Joel and Amos' (in the Cambridge Bible for Schools and Colleges 1897).

Neæra, nẹ-ē'rā, in Greek mythology, a name given to various nymphs; also a maiden mentioned by Horace.

Neagh, nā (local, nā'ăH), **Lough,** Ireland, in the province of Ulster, is the largest lake of the United Kingdom. It is situated about 12 miles west of Belfast, is 48 feet above sea-level, 16 miles long, has an average breadth of ten miles, a maximum depth of 102 feet, and an area of 98,255 acres. It is well stocked with trout, char, pullen, and other lake fish. It receives the waters of the Upper Ban, Blackwater, and Callan, and is drained into the North Channel by the Lower Bann. The Lough is connected by canals with Belfast, Newry, and the Tyrone coal field.

Neagle, nā'gl, **John,** American painter: b. Boston, Mass., 4 Nov. 1796; d. 1865. He was practically a self-taught artist although after his marriage with the daughter of Thomas Sully he received instruction and encouragement from that painter, and applying himself to portrait painting he rapidly grew in favor wth connoisseurs and was made director of the Pennsylvania Academy (1830), and in 1835 first president of the Artists' Fund Society of Philadelphia. Many of his most important works are at Philadelphia, where his parents had settled shortly after his birth. The full-length of 'Patrick Lyon at the Forge' (1826); and the portraits of Rev. Joseph Pilmore, Henry Clay, and George Washington are strong in drawing, harmonious in coloring and strikingly characteristic.

Neal, nēl, **Daniel,** English non-conformist clergyman and historian of the Puritans: b. London 14 Dec. 1678; d. Bath 4 April 1743. He studied at the Merchant Taylors' School, at a Dissenters' theological school in Little Britain, in Utrecht for two years and in Leyden for one; was assistant and then pastor of a congregation which met first in Aldersgate Street and later in Jewin Street; and wrote 'History of New England' (1720), which won him the honorary degree of M.A. from Harvard, and the great 'History of the Puritans' begun by John Evans but practically the work throughout of Neal (1732–8). The latter book won him a high reputation with the non-conformists, but is not free from bias. It brings the history of English Dissent down to 1689. Consult the 'Life of Neal' by Toulmin (1793).

Neal, David Dalhoff, American painter: b. Lowell, Mass., 20 Oct. 1838. He began his studies at the Munich Royal Academy, where he gained the Great Medal. He has painted many historical-romantic pictures and among them 'Mary Stuart and Riccio'; 'Oliver Cromwell Visits John Milton'; 'Nuns at Prayer'; 'In the Crypt'; 'Retour du Chasse'; etc. Among his portraits may be mentioned those of Adolph Sutro; Rev. Mark Hopkins; Judge Hoffman of California; D. O. Mills; Whitelaw Reid; etc.

Neal, John, American author: b. Portland, Maine, 25 Aug. 1793; d. there 21 June 1876. He had little schooling; was a clerk in Boston; removed to Baltimore in 1816, began to practise law and write fiction. He contributed largely to British periodicals, lived in England 1823–7, being secretary to Bentham part of that time, and was the first successful American author abroad. He was (1838) one of the earliest speakers in behalf of woman's suffrage, was attracted successively by phrenology, mesmerism,

and spiritualism, and probably introduced gymnastics into America. Neal was the patron and guide of several younger writers, notably Edgar Allan Poe. Under the name Jehu O'Cataract he wrote a bombastic poem 'Battle of Niagara' (1818). His novels include 'Randolph' (1823), in which he drew the portrait of William Pinckney so freely as to rouse Edward C. Pinckney to challenge the author; 'Brother Jonathan' (1825); and 'Rachel Dyer' (1828). He wrote the most of 'Paul Allen's American Revolution,' and much else with "marvelous rapidity." Consult his 'Wandering Recollections of a Somewhat Busy Life' (1869).

Neal, Joseph Clay, American journalist: b. Greenland, N. H., 3 Feb. 1803; d. Philadelphia, Pa., 18 July 1847. He edited the 'Pennsylvanian' in 1831–44 and later established the 'Saturday Gazette.' He wrote: 'Charcoal Sketches' (1837); 'Peter Ploddy and other Oddities' (1844); etc.

Neale, Edward Vansittart, English reformer: b. Bath, England, 1810; d. 1892. He was educated at Oxford, and became a Christian Socialist. He founded the first co-operative store in London and was instrumental in the establishment of numerous co-operative societies, mills, etc.; and visited America in 1875 in the interests of his work. He published: 'The Characteristic Features of Some of the Principal Systems of Socialism' (1851); 'The Mythical Element in Christianity' (1873); etc.

Neale, John Mason, English clergyman and hymn-writer: b. London 24 Jan. 1818; d. East Grinstead, Sussex. He was graduated from Trinity College, Cambridge, in 1840; became fellow and tutor of Downing College in that year; and from 1846 until his death was warden of Sackville College, East Grinstead. His ecclesiastical views were those of the most advanced wing of the High Church party. In 1839 he was a founder of the Cambridge Camden Society, later the Ecclesiological Society, and in 1854 established at Rotherfield the sisterhood of St. Margaret, transferred in 1856 to East Grinstead. In rebuilding Sackville College chapel in 1850 he added ornaments denounced by Gilbert, bishop of Chichester, who inhibited him from officiating in the diocese, but the inhibition was removed in 1863. Neale is said to have known 20 languages. His greatest work was in hymnology. As a translator of Latin and Greek Christian hymns he has perhaps never been equaled. Fully one eighth of 'Hymns Ancient and Modern' (1878) is by him. Chief among his renderings are 'Mediæval Hymns and Sequences' (1851); 'The Rhythm of Bernard of Morlaix' (1858), and 'Hymns of the Eastern Church' (1863). From the 'Rhythm' have been adapted the familiar 'The World is Very Evil,' 'Brief Life is here our Portion,' 'For thee, O dear, dear Country,' and 'Jerusalem the Golden.' He wrote also an important 'History of the Holy Eastern Church' (1847–51). In 1884 a selection from his writings was published. Consult: Julian, 'Dictionary of Hymnology,' pp. 785–90 (1892).

Neander, Johann August Wilhelm, yō'hän ow'goost vĭl'hĕlm nā-än'dĕr, German theologian and church historian: b. Göttingen 17 Jan. 1789; d. Berlin 14 July 1850. A Jew, his name was originally David Mendel. Upon his profession of Christianity in 1806 he assumed the name Neander ("new man"). After study of theology at Göttingen, he became professor at Heidelberg in 1812, and in 1813 at Berlin. At Berlin he lectured until his death, largely on church history, but also on ethics, New Testament exegesis, and systematic theology. His lectures were notable, and his literary activity great. He was the founder of modern church history, and beyond doubt the chief in that field in the 19th century. His motto, "Pectus est quod theologum facit," illustrates his method. He viewed Christianity, not, like either Supernaturalists or Rationalists, as a scheme of doctrine, but as a divine force; and its history as the study of human history in terms of that force. His principal work is the 'General History of the Christian Religion and Church' ('Allgemeine Geschichte der christlichen Religion and Kirche') (1825–52), translated by Joseph Torrey (12th ed. 1881), and more widely circulated in England and the United States than in Germany. This survey is based on a most careful use of the sources, and is marked by rigorous analysis. Neander's style here, as elsewhere, is somewhat involved at times, but free from pretentiousness. Schaff terms Neander "a giant in learning and a saint in piety." He wrote further 'Julian the Apostate' (1812; Eng. trans. 1850); 'St. Bernard' (1813); 'Memorials of the Christian Life in the Early and Middle Ages' (1822; Eng. trans. by Ryland 1852); 'History of the Planting and Training of the Christian Church' (1832; Eng. trans. by Ryland 1842); 'The Life of Jesus Christ' (1837; Eng. trans. by McClintock and Blumenthal 1848); and other works. Consult: Schaff, 'St. Augustin, Melanchthon, and Neander' (1886); Wiegand, 'Life' (1890).

Neanderthal, Prussia, a valley or ravine near the village of Hochdal, between Düsseldorf and Elberfeld, which came into prominence in 1857 by the discovery in a limestone cave at a depth of 60 feet, of the remains of a prehistoric man, of a hitherto unknown type. The peculiar dolichocephalic formation of the skull induced several anthropologists to regard it as typical of a separate race of cave dwellers, while others explained the abnormality as caused by disease during the lifetime of the individual; it is now regarded as a representative of the most ancient of European dolichocephalous people, of whom various remains have been found subsequently in Bohemia, France, and England.

Neap-tides are those which happen when the moon is nearly at the second and fourth quarters. The neap-tides are low tides in respect to their opposites, the spring-tides. See TIDES.

Neapolis, nẹ-ăp'ō-lĭs, Macedonia, the town where Saint Paul, as mentioned Acts xvi. 9–11, commenced his evangelizing work in Europe. It was the port of Philippi eight miles to the west, and was situated on Kavala Bay, near the site of modern Kavala in Turkey.

Nearchus, nẹ-är'kŭs, officer of Alexander the Great. He was a native of Crete and went to Amphipolis in the reign of Philip at whose court he formed a friendship with Alexander. Under the latter he was made governor of Lycia and other provinces in Asia Minor in 330 B.C. and about 329 B.C. accompanied Alexander in the Indian campaigns. In 326–5 he

commanded the great fleet built by Alexander at Hydaspes and conducted it from the Indus to the Persian Gulf, discovering on his way the mouths of the Euphrates and the Tigris. Upon the division of the empire which followed Alexander's death, Nearchus was made governor of Lycia and Pamphilia by Antigonus. He wrote an account of his voyage, which has been preserved in Arrian's 'Indica.' See Plutarch, 'Vita Alexandri'; Vincent, 'Voyage of Nearchus to the Euphrates.'

Nearc'tic Region, one of the primary faunistic divisions of the Earth (see ZOOGEOGRAPHY) according to the widely accepted scheme of Sclater and Wallace. It embraces all North America, as far south as the highlands of Mexico carry northern climatic conditions. The differences between its fauna and that of the northern parts of the Old World (Palæarctic Province) are, however, not sufficient, in the view of many students, to justify so primal a distinction; and the later tendency is toward uniting the Nearctic and Palæarctic «regions» into one under the name Holarctic region, or Arctogæa.

Nearsightedness. See SIGHT, DEFECTS OF.

Neat's-foot Oil, an oil obtained from the feet of the common ox.

Nebo, nē'bō, Palestine, the biblical name of Jebel Neba, 2,643 feet high, a few miles east of the north end of the Dead Sea, the mountain of ancient Moab whence Moses viewed the Promised Land, and where he died (Deut. xxxii. 49; xxxiv. 1).

Nebo, or **Nabu,** in Babylonian mythology, an idol representing the planet Mercury. It was worshipped by the ancient Arabians, and among the Chaldæans and Assyrians from the fact that many compound proper names occur in the Scriptures of which this word forms a part; as, Nebuchadnezzar, Nebuzaradan, Nebushaszan, etc.

Nebraska, nē-brăs'ka (the «Tree Planter State» (admitted to the Union 1 March 1867), is bounded on the north by South Dakota, on the west by Colorado and Wyoming, on the south by Colorado and Kansas, on the east by Iowa, from which it is separated by the Missouri River. Capital, Lincoln; area, 76,840 square miles; population (1900) 1,066,300.

Topography.— The surface of Nebraska is a part of the great plain which slopes from the Rocky Mountains to the Missouri River. This slope is gradual but almost rapid. The western part of the State is called the foot-hill region, being the extreme extension of the Rocky Mountain uplift. Its eastern elevation is from 3,600 to 4,000 feet, and its western about 5,000 feet. North of the North Platte River a low mountain chain — Pine Ridge — extends east and west about 100 miles, some of its precipitous hills or peaks, of fantastic shapes, reaching a height of 4,500 feet. The part of the Bad Lands in Nebraska is included in this region. The surface slopes from Pine Ridge southward to the North Platte River. There is another chain of low mountain south of the North Platte River, called the Wild Cat Mountains, and in this range Wild Cat Mountain, in Banner County, rises to a height of 5,038 feet, the highest elevation in the State; and Gabe Rock and Big Horn Mountain, in the same county, are respectively 5,006 and 4,718 feet in height. East of the northern foot-hills are the Box Butte plains, with a gently undulating surface, about 500 square miles in area and 4,000 feet in elevation. The surface slopes gradually from north to south also. Thus the altitude at Benkelman, in the extreme southwest, is 2,968 feet; of the extreme southeast, at Rulo, 842 feet; of the extreme northwest, at Harrison, 4,849 feet; of the extreme northeast, at Dakota City, 1,102 feet. The altitude of Kimball, in the southwest part of the western projection of the State and about 100 miles south of Harrison, is 4,697 feet. The uniformity of the slope of the Platte Valley is remarkable. The altitude of Plattsmouth, at the mouth of the Platte River, is 968 feet; of Kearney, in the Platte River Valley, about midway across the State, 2,152 feet; and of Ogallala, near the western border and also in the Platte Valley, 3,211 feet — the difference between Plattsmouth and Kearney being 1,184 feet, and between Kearney and Ogallala 1,159 feet.

River Systems.— The river system is simple and in an undeveloped condition. The only large river, besides the Missouri, which forms the eastern border of the State, is its tributary, the Platte, which flows through the central part from east to west. Both the north fork and the south fork of this river rise in the heart of the Rocky Mountains, the first northwest, and the other southwest of Denver. They unite at the town of North Platte, 250 miles from the east boundary of the State. The other considerable streams are the Republican, the Niobrara, and the Loup Fork rivers. The Republican rises in eastern Colorado, and flows eastward in Nebraska and near its southern line for a distance of 216 miles, then southwestwardly in Kansas, entering the Kansas River at Junction City, Kan. The Niobrara River, whose entire length is about 460 miles, rises in the mountainous districts of southeastern Wyoming, and flowing eastward enters the Missouri River on the northern border of the State, 100 miles from its eastern line. Through about 200 miles of its course it flows rapidly in a deep and narrow cañon, and then in a broad and sandy channel, characteristic of the other principal rivers of Nebraska. The main branch of the Loup Fork rises in the northwest part of the State, and flowing southeastwardly enters the Platte River at Columbus, 75 miles west of the eastern boundary of the State. Notable features of the river system are that the principal streams run nearly parallel to one another, and are almost uniformly shallow, with low banks. In general, the surface of the land slopes away from the Platte River on the south, so that, regarded from that side, its bed is really a ridge rather than a valley. For example, the altitude of the southerly part of Franklin County is 1,845 feet, while that of the river, only 40 miles north, is about 2,150 feet. The sources of the Platte River are mountain streams fed by the snows of the Rocky Mountains. An inexhaustible bed of water underlies the surface of the whole State, and it percolates rapidly through the loose formation, so that wells yield a remarkably large flow. This subterranean sheet of water is fed partly by seepage from the Platte and other principal streams, but mainly by the rainfall, 90 per cent

of which is absorbed by the porous soil; while in the States east of the Missouri River 50 per cent of the rainfall commonly flows over the surface, and is either evaporated or finds it way to the sea. While there are many smaller streams of water in most parts of the State, tributary to the principal streams, yet these are not as numerous as in the more easterly States; but, on the other hand, in Nebraska, an unlimited supply of water, which is easily reached through the loose soil and drawn to the surface by windmills, underlies every farm; and in fact the States of the trans-Missouri plains have the best distributed water supply for ordinary purposes in the country.

Artesian Wells.— Artesian wells, most of them with a strong flow of water, are found in 35 counties, distributed throughout all parts of the State. They may be classed in four natural groups: the deep wells of the Carboniferous, located at Beatrice, Lincoln, and Omaha, and of a depth varying from 556 to 2,463 feet; those of the northeastern counties in the Dakota sandstone, 300 to 600 feet deep, a continuation of the great South Dakota basin, where the water flows with great force from below the Pierre shale when it is pierced; the shallow wells in glacial clays and sands, such as those at Cook; and other shallow wells not in the drift, as in Holt and Rock counties. The water from the artesian wells at Beatrice and Lincoln are very strongly impregnated with common salt, and at the latter place they are extensively used for bathing and medicinal purposes.

Climate and Rainfall.— The atmosphere of Nebraska is characterized by dryness and rarity, though these qualities are not extreme. This feature, together with the generally cloudless sky, makes the climate through most of the year exhilarating and very enjoyable. In the months of July, August, and September, the sun is very hot, and at times the south wind is oppressive; but this is the only disagreeable feature of the climate. The winters, in particular, are dry, and in general mild with prevailing brilliant sunshine. The highest average temperature of 52° F. is found in the extreme southeast part of the State at an elevation of about 900 feet; it is 2° less in the southwest part at an elevation of 3,000 feet. The mean annual temperature decreases toward the north at an average rate of 1° to each 40 miles in the eastern and southern parts, but in the northwest the decrease is less rapid. Along the northern boundary the average temperature is about 46°. January is the coldest month, with a mean temperature of about 27° below the yearly average. In the coldest days of winter the temperature falls to from 10° to 20° below zero, and rarely as low as 30° below zero. In the northwest part of the State, 40° below zero has been recorded twice in the last 28 years. July is the warmest month, with a temperature of about 26° above the yearly mean, and a range of mean temperature from 78° in the southeast to 72° in the northwest. In the hottest days of summer the temperature sometimes exceeds 100°. The last killing frost in spring occurs in the southeast during the last 10 days of April, but it appears gradually later to the northward and westward, occurring near 1 May in most of the agricultural section of the State, while in the highly elevated northwest the season is about two weeks later. Killing frosts come as a rule in the South Platte district during the first week in October, and from 5 to 10 days earlier in the central and northwestern parts of the State. The average length of the season between killing frosts is from 155 to 165 days in the southeast, from 145 to 150 in the northeast, central, and southwest, and from 130 to 135 in the northwest. The precipitation consists almost entirely of rain, the average snowfall being only about 20 inches, equal to two inches of water, or less than one tenth of the total precipitation. The precipitated moisture comes almost entirely from the Gulf of Mexico, and is brought by the prevailing southerly winds of summer. The annual precipitation slightly exceeds 30 inches in the southeastern part of the State, and decreases to the north and west somewhat irregularly but at an average rate of 1 inch from the southeast corner to the middle of the western border, where it is only 15 inches. The decrease northward along the eastern border is about 1 inch for 40 miles, or to 27 inches in the northeast corner. The decrease westward is 1 inch for each 50 miles along the northern border, or to 18 inches in the northwest corner. There is very little precipitation in the winter months, and it averages less than an inch of water for each month from November to February, inclusive. There is a slight increase in March, but the spring rains begin in April, when the fall is from 2 to 3 inches in most parts of the State. In May it is about 1 inch more, and in June and July reaches about the same amount. June is the month of heaviest rainfall, with an average of 5 inches in the southeast and slightly less than 3 inches in the southwest. There is a decided decrease in August, and still less again in September and October. The significant fact of the meteorology of Nebraska is that nearly 70 per cent of the rainfall occurs in the five crop-growing months — from April to August. This is why, with a relatively small annual rainfall, great crops of all the agricultural staples are produced.

Surface, Farming, Stock-raising, and Irrigation.— With the exception of parts of the extreme northwest counties and of what is known as the Sand Hill region, the soil of Nebraska is fertile; within the limits of sufficient rainfall it produces all crops peculiar to the latitude, and outside of that limit it produces the most nutritious grasses. Wherever in the arid region irrigation is supplied, the soil produces heavy crops. This fact is illustrated in the irrigated part of Scott's Bluff County, where the altitude is over 4,000 feet. The Bad Lands system of South Dakota reaches over into northwestern Nebraska, occupying a part of Dawes and Sioux counties. While most of the Bad Lands are worthless, yet even in them there are cañons and pockets with grass and water which make fine pasture for stock. The Sand Hill region comprises upward of 15,000 square miles, extending generally from the 98th meridian to the 102d meridian on the north border of the State. The other two boundary lines extend from the two points in question in irregular courses to the southeast and to the southwest, respectively, until they meet near the southern border of the State. The hills proper are in the northerly part of this region, and are formed of sand which drifts before the wind. They are constantly

changing their position. The winds from a prevailing direction carry the sand from the side of a hill, over its apex, lodging it on the opposite side, and in this way it slowly travels along the general course of the prevailing wind. This Sand Hill region is a great sponge for the absorption of water, which in turn breaks out in numerous springs, lakes, and streams. There are many pockets and valleys in these hills which are occupied by ranches and afford fine pasture and hay for stock, while the soil in a large part of the whole region is both fertile and arable. About 40,000 square miles, somewhat more than half of the State, is adapted to agriculture without irrigation, while the rest of the State is well adapted to grazing. The stock that is raised on the vast pasture lands of the western half is fattened by the abundant crops of corn and hay of the eastern part.

The irrigation system comprises canals aggregating about 2,500 miles in length and covering approximately 1,000,000 acres. Most of the running water in the arid portion of the State that is readily accessible has been utilized for irrigation purposes; but some of the streams, and notably the Niobrara River, which would cover a large area of very fertile lands, have not yet been put to use. If the system of water storage and distribution is established by the Federal government, as now contemplated, the resulting increase in the cultivable area and agricultural products of western Nebraska will be enormous.

Blue stem, grama, drop-seed, and wild wheat grass make up the common "prairie grass" which is general in the eastern third of the State. They continue also to the west, but in shorter form, and buffalo grass takes their place to a considerable extent. These grasses, and particularly the blue stem and grama, constitute the "bunch grass" of the more arid parts of the State, including the Sand Hills. The range of vegetable products is shown in the following table, compiled from careful estimates of the crops of 1903, by Prof. A. E. Davisson, of the School of Agriculture, University of Nebraska:

	Acreage	Total yield Bushels
Winter wheat	1,939,776	32,347,647
Spring wheat	439,612	5,781,788
Corn	5,964,048	205,853,660
Oats	1,958,721	62,229,904
Rye	343,067	5,634,382
Barley	113,717	3,118,240
Irish potatoes	68,472	5,523,757
Broom corn	2,047	Tons—725
Millet	132,370	331,612
Sorghum	128,598	457,478
Alfalfa	238,401	837,704
Timothy	243,696	465,571
Wild hay	1,842,216¼	2,728,907
Clover	54,635	95,612

	Number	Value
Sheep	3,264,659	$88,145,793
Horses and mules	2,223,396	8,893,584
Hogs	809,875	40,493,750
Cattle	328,066	1,148,231

A normal crop of corn produces about 250,000,000 bushels, and of wheat upward of 50,000,000 bushels. The yield of these two great staples will in time greatly exceed these amounts. Winter wheat has been found to be a reliable and prolific crop only within recent years; and it has lately been demonstrated that alfalfa will do well and yield above three tons to the acre, without irrigation, anywhere within the farming area of the State. These two facts or discoveries are of vast importance in estimating the future resources of Nebraska. The total number of farms in 1900 was 121,525; total acreage, 29,911,779. The total value of farms at the present time (1903) is upward of $900,000,000. The value of poultry produced each year is about $4,000,000; of milk, butter, and cheese, about $9,000,000; and of eggs, about $5,000,000. All of the principal fruits are raised successfully, and the production is rapidly increasing. The number of fruit trees was more than trebled between 1890 and 1900. The principal crops are apples, cherries, plums and grapes, but the production of peaches has rapidly increased in the last five years. All of the well-known forest trees of northern latitudes thrive in the eastern half of the State. The bull pine is found in considerable quantities in the high lands of the northwest and tends to spread out on the plains as well as along the streams eastward. Pines and other evergreens are being very successfully propagated in the Sand Hills.

Geology.— Geologically Nebraska is probably the most distinctly agricultural State in the Union; but though its rocks are undisturbed sediment and its geology is apt to be regarded as very simple, yet investigation shows it to be diversified and not without economic importance. The geological strata are so deeply buried that they are not exposed for study. They sag or dip toward the west and are hidden until the Rocky Mountains are reached, thus forming a deeply buried trough. The beds are covered by very distinct loose surface material known as bluff deposit or loess, glacial drift and sand hills. All of the southeastern half of the State is covered by loess, often 100 feet deep. This loess is a sandy loam of glacial origin, of a light yellow color and almost inexhaustible fertility. The northwestern half is largely covered by sand hills formed by the transportation and piling up of the disintegrated Tertiary rock by the wind. This sand hill covering is often 300 feet thick. The limestone of the coal measure or Carboniferous age — the oldest rock in the State — is exposed particularly along the streams in the southeastern counties. Though the carboniferous rock does not yield coal of commercial value yet its limestone produces lime, rubble, riprap, and is used for building, smelting and sugar refining; and this formation yields also flint for ballast and enormous amounts of excellent clay for brick, tile and terra-cotta. West of Lincoln, or about 40 miles from the eastern border, the carboniferous strata dip under the cretaceous rock, sinking to a depth of several thousand feet before coming to the surface again in the mountains. If its great mantle of fertile soil and sand could be lifted, cretaceous clays and shales would predominate over the surface of the State. They actually occur in widely scattered patches along the streams. The Dakota is the best known and most important layer of cretaceous rock, being the great water bearing bed. It is composed largely of rusty sands and beds of clay which appear from the south-central boundary to the northeast corner of the State. Besides producing unlimited quantities of excellent water, including the artesian flow, the Dakota layer furnishes superior clay of all colors for brick, a soft and ocherous stone

THE STATE CAPITOL, LINCOLN, NEBRASKA.

which is used for building, sand for building purposes and valuable gravel beds. Overlying the Dakota is the Benton cretaceous, in the main a white layer of chalk rock overlying black shale. It is found along the Republican and Niobrara rivers. The chalk rock is very soft when quarried and is easily cut into desired shapes for building for which it is used after it has hardened by exposure to the air. This rock promises to become a valuable industrial resource in the manufacture of hydraulic cement.

The Pierre formation overlies the Benton and covers about two thirds of the State, reaching a thickness of 4,000 to 5,000 feet. It is commonly called Pierre shale and is of no commercial value. Overlying the Pierre shale are the Tertiary beds, divided into a lower clayey layer, 800 to 1,000 feet thick, known as the Bad Lands (Oligocene), and an upper layer, 500 to 600 feet thick, known as the Butte sands (Arikaree Miocene). Where the surface is not too much broken the soil of the Bad Lands is inherently fertile, but in general they are of little commercial value. They contain, however, the most important and valuable geological fossils perhaps in the whole country. Scenically they are imposing to the degree of grandeur and will eventually attract large numbers of tourists.

In many places in the southwestern part of the State a still younger formation rests upon what is known as the magnesia or mortar beds (Ogallala). All other beds are still more recent and consist of unconsolidated materials. The eastern fifth of the State has a thin layer of glacial drift under the layer of loess, and it is composed of clay, gravel, sand, boulders of granite, green-stone, and more especially sink boulders of Sioux quartzite from Sioux Falls, S. D. The youngest deposit in the State is the alluvium along the streams, chiefly valuable on account of its great fertility and because it yields brick of a fair quality where good clays are wanting. Among the mineral resources of the State, either already developed or of probable utility, are ocher, peat, bituminous coal of the carboniferous formation, lignite coal of the cretaceous, diatomaceous earth, natural pumice or volcanic ash in extensive beds, enormous amounts of clay, limestone, sand, gravel, flint and material for the manufacture of hydraulic cement. Other well known and important minerals and metals are found, but not in such quantities and conditions as to be of economic value.

Manufactures.— The total capital engaged in manufacturing in 1900 was $71,982,127; number of wage-earners, 24,461; wages $11,570,688; value of products, $143,990,102. The leading manufacturing industry is slaughtering and meat-packing. The product of the eight packing establishments — situated at South Omaha — was $71,018,339. The output of only one or perhaps two packing centres — Chicago and Kansas City — equals that of South Omaha at the present time. Other leading manufactures are, flour and grist-mill products, $8,100,794; steam railway car shops, $2,624,461; printing and publishing, $2,553,051; butter, cheese and condensed meat, $2,253,893; malt liquors, $1,433,501. There are three beet sugar factories in the State, located respectively at Ames, Grand Island and Norfolk. In 1902 forty-seven counties engaged in beet-raising, the total acreage of 11,193 producing 102,858 tons, the average price being $5.00 per ton. The output of the three factories was 22,890,000 pounds of sugar. Nebraska soil is peculiarly adapted to beet-raising and under experienced cultivation produces an average of 15 tons to the acre. A net profit of from $25 to $35 an acre is commonly realized by the beet grower. The area adapted to beet-raising is so great and the soil so rich that the beet sugar industry, which is still in its infancy in the State, promises to grow to great proportions.

Railroads.— Considering the comparative newness of the State, Nebraska has a remarkably well developed railroad system, consisting of 5,757.92 miles. Four trunk lines traverse the State from east to west — the Chicago & Northwestern system on the north; the Union Pacific through the central part along the Platte river; and the Burlington & Missouri and the Chicago, Rock Island & Pacific through the South Platte section. The Chicago, St. Paul, Minneapolis & Omaha railroad — allied with the Chicago & Northwestern — runs along the eastern border of the State from Omaha to the north line, and the Missouri Pacific runs from Omaha southward along the eastern border with several branch lines into the interior of the South Platte section. Ramifications of the main lines cover the eastern half of the State like a net work, and all parts are well supplied with railway facilities. The principal railway centres are Lincoln and Omaha.

The mileage of the several railway systems in 1903 was as follows:

Burlington & Missouri	2,409.69
Union Pacific	947.40
Chicago, Rock Island & Pacific	245.58
Chicago & Northwestern	1,070.08
Missouri Pacific	356.34
Chicago, St. Paul, Minneapolis & Omaha	271.16
Kansas City & Omaha	193.08
Wilmuth & Sioux Falls	129.16
St. Joe & Grand Island	112.83
Kansas City, Wyandotte & Northwestern	20.10
Atchison, Topeka & Sante Fe	2.50
	5,757.92

Finances.— The total assessed valuation for 1903 was $188,458,379.44; the total tax levy, $1,523,316.38, consisting of the general fund, $1,135,721.69; school fund, $199,136.46; university fund, $188,458.23. The State has no bonded indebtedness. The floating interest-bearing indebtedness was $1,997,671.98, 1 June 1903.

Banks.— In September 1903, there were 127 National Banks with total resources of $44,751,-181.62; capital stock, $6,715,000; deposits, $28,-285,377.27; surplus, $1,656,950; undivided profits, $798,451.33. On 5 Sept. 1893 there were 496 State banks with a capital stock of $8,001,000; 113,829 depositors; total deposits, $37,690,305; surplus fund, $1,427,897; undivided profits, $1,566,284; dividends unpaid, $6,295; total resources, $49,539,593, of which $2,352,638 was cash; and $32,222,257 loans and discounts; total reserve, 36⅓ per cent of the deposits.

Education.— Devotion to the cause of popular education and an efficient system of schools characterize Nebraska as all of the prairie States. The percentage of illiteracy is 2.3 —lower than that of any other state except Iowa, which is the same, Kansas being next lowest. Following are data for the year ending 13 July 1902: There were in the 90 counties, 6,666 school districts; 6,813 school houses; 9,101

teachers were required; 9,629 different teachers were employed at an average monthly wage of $40.44; there were 375,340 children of school age — between 5 and 21 years — total enrolment, 290,543; average daily attendance 185,755; average length of term, 138 days; value of school district property, $10,281,548.36; amount paid for books and supplies $254,123.91; total teachers' wages, $2,828,048.94; total expenditures $4,435,338.45; cost of education per pupil (on enrolment), $15.27; cost of education per pupil (on average attendance) $23.87; total indebtedness $3,241,782.82; graded schools, 465; number of teachers in graded schools, 3,152; number of four year high school graduates, 1,135; number of three year high school graduates 521; private schools 221. The total resources of school districts for the same period were $4,566,333.69. Of this sum more than $3,000,000 was raised by state and school district taxation; the balance was derived from fines and licenses and interest on the permanent school fund. The State University, located at Lincoln — the principal higher educational institution — had a total attendance for the year ending June, 1903, of 2,560; and the total number of instructors, including professors, fellows, scholars and assistants, was 175. The income of the University for the same year was as follows:

From one mill state tax	$188,000
Annual interest on land leases, land sale contracts and investments of permanent endowment fund	50,000
Annual cash appropriations by the United States	40,000
Annual receipts from fees and all other sources	42,500
	$320,500

Under the increased valuation of property by the act of the legislature of 1903 it is expected that the income of the university from the one mill tax will be nearly doubled. The State university and the agricultural college are united or fused under one general management. The former received a land endowment from the general government of 45,426.08 acres and the latter 89,148.60 acres. Of these lands 43,250 acres have been deeded to purchasers, 64,250 acres are under contract of sale and 27,000 acres are under lease contract. By act of the legislature the leased lands, that is, all those remaining unsold, are withdrawn from sale. The agricultural college has a finely developed farm of 320 acres contiguous to the city of Lincoln; the campus on which most of the fifteen buildings are situated is in the heart of the city. The value of the farm, campus, buildings and equipment of the university is approximately $1,250,000. The permanent common school securities aggregate $5,072,223.79; permanent university securities, $101,050.97; agricultural college securities, $224,692.14. The total number of acres of lands acquired by the common schools was 2,795,532.65, of which 541,460.06 acres have been deeded, 340,527.23 acres are under contract for sale, 1,909,138.02 acres are under lease contract, 1,339 acres are vacant, and 3,067.84 acres are unclassified. The total interest-bearing value of the permanent school and university funds is $9,746,451.75; and it is estimated that the present value of the remaining lands under sale and lease contracts would swell this fund to $18,000,000. The State school tax must not be less than one half of one per cent nor more than one and a half per cent on the assessed valuation.

There is one State normal and training school, situated at Peru, in which 550 students were enrolled in 1901 and a second, to be located at Kearney, was provided for by the legislature of 1903. There are about 30 private seminaries, academies and colleges, and about 20 denominational private primary schools. The following give the usual college degrees: Bellevue College (Presbyterian), Bellevue; Cotner University, under the auspices of the Christian Church, at Lincoln; Union College (Seventh Day Adventist), Lincoln; Doane College, Crete (Congregational); Fremont Normal College, Fremont; Grand Island College (Baptist), Grand Island; Hastings College (Presbyterian), Hastings; Creighton University (Roman Catholic), Omaha; Nebraska Wesleyan University (Methodist), Lincoln; Nebraska Normal College, Wayne; York College (United Brethren), York. All of the Christian denominations and the Jewish denomination have organizations in the State. In 1900 the total number of church edifices was 2,315; of communicants, 278,334; of ministers, 1,928. The Roman Catholic denomination leads with 90,515 communicants, then the Methodist Episcopal, with 53,810; the Lutheran, 34,577; the Disciples of Christ, 19,560; Presbyterian, 17,650; Baptist, 16,500; Congregational, 14,601.

Charities.— The charitable and penal institutions are as follows: Nebraska Hospital for the Insane, at Lincoln; Asylum for the Incurable Insane at Hastings; Nebraska Soldiers and Sailors' Home at Grand Island; Soldiers and Sailors' Home, Milford; Home for the Friendless (children), Lincoln; State Industrial School (for boys) at Kearney; Girls Industrial School at Geneva; Nebraska Industrial Home (for women) at Milford; Nebraska Institution for Feeble Minded Youth at Beatrice; Institute for the Deaf and Dumb, at Omaha; Institute for the Blind at Nebraska City; State Penitentiary at Lincoln. The governor, commissioner of public lands and buildings and the state superintendent of public instruction constitute the State Board of Charities and Corrections. This board appoints four advisory secretaries, not more than two of whom shall belong to the same political party; and the board and these secretaries serve without compensation. The board appoints a chief clerk and determines his compensation. The officers and other employees of these institutions are appointed by the governor and so are subject to partisan selection and change with each State administration with the inevitable pernicious results. The approximate number in poor-houses in 1902 was 856, and 400 received partial outside relief. There are at present (November 1903) 273 prisoners in the State penitentiary, of whom 5 are women. The labor of 200 is leased to contractors within the penitentiary yards at 50 cents a day.

State Government.— In 1875 the present constitution of the State succeeded that adopted at the time of its admission. The legislature consists of a Senate of 33 members and a House of 100 members — the maximum number allowed by the constitution. Its sessions are biennial and the pay of members for each session is limited to 60 days. Members of both houses

are elected for two years. The executive department consists of governor, lieutenant-governor, secretary of state, auditor of public accounts, treasurer, superintendent of public instruction, attorney general and commissioner of public lands and buildings, who hold office for two years. There are three judges of the supreme court who hold their office for the term of six years. Owing to the practical difficulty of amending the State constitution other de facto officers have been provided for indirectly by creating various boards who are nominally assistants of the regular state officers. Thus there are at present nine supreme court commissioners who perform the same duties as the regular judges except that they have no power to enter judgments. There was formerly a board of railway commissioners created on the same plan, but it was abolished on the ground of uselessness by the legislature in 1901. There are 15 judicial districts which require 27 judges whose term of office is four years; and a county judge for each county whose term of office is two years. The governor, auditor and treasurer each receive a salary of $2,500 a year, and the secretary of state, attorney general, superintendent of public instruction and commissioner of public lands and buildings, $2,000. The lieutenant governor receives twice the compensation of a senator; and members of both houses of the legislature receive $5.00 a day during the session. Judges of the supreme and district courts each receive a salary of $2,500 a year. These salaries are fixed by the constitution. The several counties may adopt the township system, under which the county board of supervisors is composed of the supervisors from the several townships and municipalities, or the county commissioner system. Under the latter there are three commissioners in counties with not more than 125,000 inhabitants, and five commissioners in all other counties; but counties of not more than 125,000 inhabitants may by popular vote decide to have five commissioners. The term of office of county commissioners is three years. There are six congressional districts in the State.

Politics.— Nebraska was Democratic in politics from the time of its territorial organization under the famous Kansas-Nebraska bill (q.v.) until the latter part of the territorial period when it became Republican through immigration from the strongly Republican States to the eastward and the stimulus of the change to a Republican national administration. The Democrats opposed the admission of the State under the enabling act of 1864, partially to prevent the addition of Republican senators and representatives to the Federal Congress and partially because they believed the financial and political resources of the territory too small to justify or bear the burdens of State government. The Republicans pressed statehood because their leading politicians were ambitious to attain the resulting State and Federal offices and because their party needed additional votes in the Senate in the struggle against the faction led by President Andrew Johnson. Through the impetus and inertia of the issues and passions of the Civil War the State remained decisively Republican until 1890. At about that time the Farmers' Alliance (q.v.), an organization similar to the Granges of other agricultural States, determined to take an active part in politics. In the year named a Democratic governor was elected by a small plurality over the Independent or Farmers' Alliance candidate who in turn received a small number of votes more than the Republican candidate. The Republican candidates for Congress in all three of the districts were defeated by large majorities. This revolution against the Republican party was occasioned partly by revolt against its maladministration of the affairs of the State and partly by a growing anti-monopoly sentiment which insisted on control by the State of the railway corporations, which had never been seriously attempted, and the direct regulation of transportation rates. Even the Democratic governor had vetoed the maximum railway freight bill passed by the Fusionist legislature of 1891. This dereliction of the two old parties was chiefly responsible for the rise and dominant growth of Populism. The independent movement was precipitated at the time in question by the very low prices of farm produce, and rebellion against "ten cent corn" in particular. In the meantime, as a new and easier way of paying old debts grew more desirable, "free silver," as promulgated by W. J. Bryan (q.v.), became the all-powerful Populist shibboleth. In 1894 the Fusion candidate of the Democratic and Peoples' Independent parties was elected governor as also in 1896 and 1898. In 1900 the tide turned and the State has again become Republican by a small majority. A spirit of reprisal against the East for its tariff and other sectional impositions animated the free-silver movement to a greater degree than is generally supposed. The grievances which started the independent movement which overwhelmed Republicanism in Nebraska have been in no wise abated; but democracies do not make hay while the sun shines or prepare for war in times of peace, so that during the period of good crops, and of the good prices which have naturally followed the long period of business depression, Populist reformers have either become Republicans again or are inert, and the cause of reform waits. The Populist movement was at first excited and swift to an almost revolutionary degree, yet this was owing chiefly to the pinching conditions resulting from the accidental coincidence of general industrial depression and several seasons of short crops. Though extravagant in its manifestations, and at the first visionary in some of its objects, the movement was inherently rational and legitimate, and in its political effect salutary.

Population.— The white population was only nominal at the time of the organization of the Territory because it had been set apart as "Indian country," in which white settlement was proscribed. In 1855 the Territorial census showed a population of 4,494, and in 1856, 10,716. In 1860, by the Federal census it was 28,441; in 1870, 122,993; in 1880, 452,402. The peculiar incident of the development of Nebraska is that the railways preceded settlement and improvement, for the double reason that farm produce could not reach the sole far eastern market until the railways should come to carry it, and that the people in general lacked the faith in the productiveness of the country and the courage to test it which were furnished by the strong men at the head of the railway corporations. The total foreign born population in 1900 was 177,347, of which Germany furnished 65,506;

Sweden, 24,693; Bohemia, 16,138; Denmark, 12,531; Ireland, 11,127; England, 9,757; Canada, 8,010; Austria, 3,893; Norway, 2,883; Scotland, 2,773; Switzerland, 2,340; Italy, 752. There were 3,322 Indians and 6,269 negroes. Of the total population 564,592 were males and 501,708 females. In 1900 there were 21 cities with a population of over 2,500. Omaha had 102,555; Lincoln, 40,169; South Omaha, 26,001. The cities next in size are Beatrice, Grand Island, Nebraska City, Fremont, and Hastings, all of these running somewhat above 7,000. No proper comparison can be made of the population of the State and its cities in 1900 with that of 1890 on account of the palpable padding of the census in the latter year.

Following are the names of the 90 counties and their county-seats:

Adams, Hastings.	Jefferson, Fairbury.
Antelope, Neligh.	Johnson, Tecumseh.
Banner, Harrisburg.	Kearney, Minden.
Blaine, Brewster.	Keith, Ogallala.
Boone, Albion.	Keyapaha, Springview.
Box Butte, Alliance.	Kimball, Kimball.
Boyd, Butte.	Knox, Center.
Brown, Ainsworth.	Lancaster, Lincoln.
Buffalo, Kearney.	Lincoln, North Platte.
Burt, Tekamah.	Logan, Gandy.
Butler, David City.	Loup, Taylor.
Cass, Plattsmouth.	Madison, Madison.
Cedar, Hartington.	McPherson, Tryon.
Chase, Imperial.	Merrick, Central City.
Cherry, Valentine.	Nance, Fullerton.
Cheyenne, Sidney.	Nemaha, Auburn.
Clay, Clay Center.	Nuckolls, Nelson.
Colfax, Schuyler.	Otoe, Nebraska City.
Cuming, West Point.	Pawnee, Pawnee City.
Custer, Broken Bow.	Perkins, Grant.
Dakota, Dakota City.	Phelps, Holdrege.
Dawes, Chadron.	Pierce, Pierce.
Dawson, Lexington.	Platte, Columbus.
Deuel, Chappell.	Polk, Osceola.
Dixon, Ponca.	Red Willow, McCook.
Dodge, Fremont.	Richardson, Falls City.
Douglas, Omaha.	Rock, Bassett.
Dundy, Benkelman.	Saline, Wilber.
Fillmore, Geneva.	Sarpy, Papillion.
Franklin, Bloomington.	Saunders, Wahoo.
Frontier, Stockville.	Scott's Bluff, Gering.
Furnas, Beaver City.	Seward, Seward.
Gage, Beatrice.	Sheridan, Rushville.
Garfield, Burwell.	Sherman, Loup City.
Gosper, Elwood.	Sioux, Harrison.
Grant, Hyannis.	Stanton, Stanton.
Greeley, Greeley Center.	Thayer, Hebron.
Hall, Grand Island.	Thomas, Thedford.
Hamilton, Aurora.	Thurston, Pender.
Harlan, Alma.	Valley, Ord.
Hayes, Hayes Center.	Washington, Blair.
Hitchcock, Trenton.	Wayne, Wayne.
Holt, O'Neill.	Webster, Red Cloud.
Hooker, Mullen.	Wheeler, Bartlett.
Howard, Saint Paul.	York, York.

History.— Nebraska, the Indian name of the principal river of the State — commonly known by its French appellation, the Platte — and meaning shallow water, was applied before the organization of the territory to all that portion of the trans-Missouri plains lying approximately between the 38th and the 43d parallels of latitude — or between the watershed of the Platte River on the north and that of the Arkansas on the south. The country to which the name now applies is noted for the Nebraska or Platte Valley route to the Pacific Northwest and the California and Rocky Mountain gold fields over the great Oregon trail, which passed from its southeast border up to and along the Platte Valley; as the initial point of the first trans-continental railroad — the Union Pacific — which also passes along the Platte Valley; as being the subject of the third great compromise of the slavery question known as the Kansas-Nebraska bill (q.v.); as the first territory the acts of whose elective legislature were not required to be submitted to the national Congress for approval; and the only State admitted into the Union on condition of the acceptance by its legislature of a condition imposed by the Federal Congress which undertook to annul a provision of its own constitution.

With the exception of the famous Lewis-Clark expedition, which passed up the Missouri River, making several encampments on Nebraska soil, in 1804, the first explorers and settlers in the State came from Saint Louis, the seat of the western fur trade at the beginning of the 19th century. The Mallet brothers, Frenchmen from Saint Louis, crossed the eastern part of the State as early as 1739, and Colonel Zebulon Pike probably crossed its southern border on his great expedition in 1806. Crooks and McClellan, of Astor's American Fur Company, made the first authentic location on the present site of Bellevue in 1810, but remained less than a year.

Manuel Lisa, a Spaniard, and field manager for the Missouri Fur Company of Saint Louis, established a trading post, called Fort Lisa, about five miles below Council Bluff, where he lived a large part of each year until 1819. He may fairly be regarded as the first bona fide white settler of Nebraska. The military division of Major S. H. Long's famous expedition up the Platte Valley to the Rocky Mountains established the first military post in Nebraska in 1819, at Council Bluff, so named by Lewis and Clark because there they held a council with the Otoe and Missouri Indians. It was located about 25 miles above the present city of Council Bluffs, but on the opposite or Nebraska side of the river. The post was first called Camp Missouri and afterward Fort Atkinson, after General Atkinson, the commander of the troops of Long's expedition, and still later, Fort Calhoun. Long's scientific party camped about five miles below at Engineer Cantonment. Captain Bonneville passed through the State over the Oregon Trail in 1832, and Frémont on his exploring expedition in 1842.

Nebraska was included in Louisiana territory after the division of the Louisiana Purchase in 1804, the lower portion called the territory of Orleans comprising the present State of Louisiana. In 1812 the name was changed to Missouri territory, in 1819 the territory of Arkansas with the present boundaries of the State on the north and south but extending to the western boundary of the Louisiana Purchase, was organized. After the admission of Missouri as a State in 1821 the remainder of the Louisiana Purchase remained without political organization until 28 June 1834, when that part of it north and east of the Missouri River was attached to Michigan. On 30 June 1834 the remaining part of the Purchase was designated as "Indian country" by act of Congress and set apart exclusively for Indian occupancy. There was, therefore, no political organization and little or no white settlement within Nebraska until its territorial organization in 1854.

The politics of the territory at the outset was largely influenced and the official appointments dictated by the Southern pro-slavery element. The first two governors were from Southern States, and many of the other appoint-

ive officers were importations from the same section. The first governor of the Territory, Francis Burt, of South Carolina, took the oath of office at Bellevue, 16 Oct. 1854, and died from the effects of his long journey from South Carolina two days afterward. He was a member of the famous Nullification Convention of 1832 and voted for the resolutions there adopted. Bellevue was the principal settlement or town of the territory and Governor Burt intended to designate it as the capital by convening the first legislature there; but Secretary Thomas B. Cuming, who succeeded him as acting governor, called the first legislature to meet at Omaha 16 Jan. 1855, and that body located the capital there. This action aroused animosity between the North Platte and the South Platte sections of the territory which continued with great bitterness until the capital was finally removed to Lincoln, its present site, by act of the first State legislature, 14 June 1867. The legislature of 1857 passed an act to remove the capital from Omaha but it was defeated by the veto of the governor. The legislature of 1858 divided in a controversy over capital removal, the majority retiring to the village of Florence, and the minority remaining at Omaha, thus precluding any practical work for that session. W. A. Richardson, the chief lieutenant of Stephen A. Douglas in the struggle over the Kansas-Nebraska Bill, was governor of the territory during the year 1858. He resigned the office on account of the rupture between Douglas and President Buchanan over the question of the admission of Kansas as a State. On 5 March 1860, a proposition for the Territory to enter statehood was defeated by a popular vote of 2,094 to 2,372. Under authority of the enabling act of 19 April 1864, which was passed by Congress in response to the petition of the territorial legislature of that year, a constitutional convention was held 4 July 1864; but the proposal of statehood having been defeated at the same election at which the delegates to the convention were chosen (6 June) it adjourned without action by a vote of 37 to 5. Political parties were first formed in 1858, the division being almost wholly on the slavery question. The 6th legislature (1860) voted to abolish slavery in the Territory; but the act was vetoed by Governor Black. A similar act by the 7th legislature (1861) was passed over Governor Black's veto. This procedure was purely tactical, as there were only five or six slaves in the Territory and they were not increasing.

The 11th territorial legislature (1866) submitted a constitution to the people who approved it by the close vote of 3,938 to 3,838 on 2 June 1866, notwithstanding that it restricted the suffrage to white men. But the bill to admit the State into the Union under this constitution which was passed by Congress 27 July 1866, failed to become effective by the refusal of President Johnson to sign it. In January 1867, another bill admitting the State passed both houses of Congress; but ostensibly for the reason that it imposed an improper condition precedent — that it should not be effective until the legislature of the proposed State should declare that there should be no denial of the elective franchise or of any other right to any person by reason of race or color — this bill was vetoed by President Johnson, but it was passed over the veto, and the legislature, convened in special session on 20 February, accepted the condition. A great debate took place in Congress over the question of the constitutionality and expediency of imposing this condition, and many Republicans of national fame opposed it on both grounds. The adoption of the 15th amendment to the Constitution of the United States soon after set aside the issue and prevented a test by the courts of the constitutionality of the condition. David Butler, Republican, was declared elected governor over J. Sterling Morton, Democrat, at the election of 2 June 1866, by the slender majority of 109. The first State legislature, whose members were elected at the same time, convened on the following 4th of July and elected John M. Thayer and Thomas W. Tipton, Republicans, United States Senators over J. Sterling Morton and Andrew J. Poppleton, who were supported by the Democratic members.

Indian Occupancy.— That part of the Territory which was settled immediately after its organization was not relinquished by the Omaha, Missouri and Otoe Indians who occupied it until March 1854, two months before the organic act was passed. The Kansas tribe had ceded their lands in the southeastern part of the Territory in 1825, and the Otoe and Missouri tribes had ceded a strip lying east of that ceded by the Kansas, in 1833. The Pawnees ceded all their lands south of the Platte River in the south central part of what is now the State in 1833. In 1857 the Pawnees ceded the rest of their possessions north of the Platte. In 1861 the Arapaho and Cheyenne tribes ceded their lands lying in the southwest corner of the State, in 1875 the Sioux ceded their lands lying north of the Platte in the western part of the State, and in 1876 the Sioux, Cheyennes and Arapahoes relinquished all claims to the remaining Indian possessions which comprised a strip along the north border of the State, lying mostly west of the 101st meridian. While the Omaha, Otoe, Missouri, and Pawnee Indians were in the main peaceable from the beginning of territorial settlement the other tribes, and especially the Sioux and Cheyennes were warlike, and constant attacks were made upon settlers up to 1868. The depredations of the Indians were especially severe during the Civil War in 1863 and 1864, and again in 1867. There is one Indian reservation in the northeastern part of the State occupied by the Omahas and Winnebagoes, the former numbering about 1,200 and the latter 1,100. All the lands of the reservation have been allotted to the Indians in severalty, and they are all citizens of the State. The tendency of the Omahas is to increase slowly and of the Winnebagoes to decrease. The Federal government maintains a school at the Omaha and Winnebago agency, another at the Santee agency, and a boarding school for Indians at Genoa.

The original Territory of Nebraska, which comprised all of the Louisiana Purchase north of Kansas and west of the Missouri River, was reduced by the organization of the Territory of Colorado 28 Feb. 1861, which took away that portion of the present State of Colorado east of the Rocky Mountains; by the organization of the Territory of Dakota, 2 March 1861, taking away that part of the States of North Dakota and South Dakota lying west of the Missouri River, and by the organization of the Territory of Idaho, — 3 March 1863 — which included the remainder of the Purchase lying west of the Dakotas, leaving Nebraska in its present territorial form with

the exception of the addition, taken from Dakota in 1882, of a strip east of the Keyapaha River and west of the main channel of the Missouri River.

ALBERT WATKINS,
Editor 'Illustrated History of Nebraska.'

Nebraska, University of, The, at Lincoln, Neb., was founded by act of the legislature in 1869. Funds for the erection of the first building were provided by the sale of lots in the then new capital city of Lincoln. This first building, now called University Hall, was completed in 1871, the lumber and part of the brick being hauled from the Missouri River in wagons. The college of literature, science and the arts was opened 6 Sept. 1871, with a faculty of five professors and 90 students. The charter act contemplated six colleges, but an amendment in 1877 reduced the number to five, merging the State Agricultural College and the College of Practical Science into the Industrial College. The Board of Regents, originally 12 members, but now 6, constitute the governing body. The University comprises the graduate school (degrees, Master of Arts and Doctor of Philosophy); the College of Literature, Science and the Arts (degree, Bachelor of Arts); the Industrial College (degree, Bachelor of Science), which includes the School of Agriculture, the School of Mechanic Arts, and the School of Domestic Science; the College of Law (degree, Bachelor of Laws); the College of Medicine (degree, Doctor of Medicine); the School of Fine Arts; the School of Music; and the summer session. Each college and school has its faculty, charged with the instruction and the immediate management thereof. Law and medicine are not organized into departments. The other colleges are so organized, having the following departments: agriculture; animal husbandry; animal pathology; astronomy and meteorology; bibliography; botany; agricultural chemistry; general chemistry; education (pedagogy); civil engineering; mechanical engineering; electrical engineering; dairy husbandry; domestic science (household arts); mechanical drawing and machine design; elocution; English language; English literature; entomology and ornithology; forestry; geology (including palæontology and geography); Germanic language and literature; Greek language and literature; Roman language and literature; Romance languages; American history and jurisprudence; European history; horticulture; mathematics; military science and tactics; philosophy; physics; physical education; political economy and sociology; zoology. Nebraska students in the College of Literature, Science and the Arts and in the Industrial College pay no tuition. Non-resident students, also all students in the professional schools and in the schools of fine arts and music, pay small tuition fees. All departments are open to both sexes on equal terms. A tax of one mill per dollar on the assessment roll of the State, together with interest income from land sales and land leases are the chief sources of revenue. The University receives the benefit of the Morrill Acts for the maintenance of instruction in branches relating to agriculture and the mechanic arts, and of the Hatch Act, in aid of agricultural experimentation. The 10 buildings on the city campus, with their class rooms, laboratories, libraries and offices, house all the departments except the school of agriculture, the work of which is done mainly at the University farm, and the College of Medicine, in which the last two years' work is given at Omaha. There are five buildings at the farm. This consists of 320 acres, a little removed from the city campus. Here are located the departments of agriculture, animal husbandry, animal pathology, dairying, and horticulture. About 100 acres are laid out in experiment plats for field crops, fruit and vegetables. Herds of cattle, sheep and swine are owned, being used for experimentation as well as for instruction. Four new buildings were recently erected, an administration building and a physics laboratory on the city campus, a hall of agriculture, a dairy building, shops, and a horticulture laboratory at the farm. The libraries accessible to the students contain about 133,300 volumes, of which 55,000 are in the University library itself. Over 500 periodicals are received, and the University possesses a copious and well chosen museum, which is supplemented in several directions by departmental museums. During 1903 the enrolment at the University was as follows: Graduate School 123; College of Literature, Science and the Arts 1,047; Industrial College 673; College of Law 182; College of Medicine 138; School of Fine Arts 85, School of Music 333; Summer Session 254; grand total 2,835. From this 275 names have to be deducted on account of repetition, leaving an actual total of 2,560. Nearly half of these were women, there being women in each department. The University has 61 professors, 8 associate professors, 14 assistant professors, 17 adjunct professors, 35 instructors and lecturers, and 40 assistants.

E. BENJ. ANDREWS,
Chancellor, University of Nebraska.

Nebraska City, Neb., city, county-seat of Otoe County; on the Missouri River, and on the Missouri P. and the Burlington & M. R. R.R.'s; about 45 miles in direct line east by south of Lincoln, the capital of the State, and 40 miles below Omaha. It is in a fertile agricultural region. It is built on the site of old Fort Kearney (1848) and was laid out in 1855. It was incorporated in 1871 and chartered in 1891. The chief manufacturing establishments are flour and lumber mills, planing mills, a cannery, brick works, breweries, a distillery, starch factory, foundries, machine shops, and cereal mills; employing in all about 2,000 persons. It has large grain elevators, cold storage buildings, lumber yards, stock yards, and packing and provision house. It is the seat of the State Institute for the Blind and the Academy of the Annunciation. It has a public library, a government building, city and county buildings, a number of churches, a high school, and public and parish elementary schools.

The government is administered under the charter of 1891, which provides for a mayor, elected biennially, and a council of eight members, one half of whom are elected by wards and the other four at large. Pop. (1890) 11,941; (1900) 7,380.

of Lincoln by lines of electric railway. The University is a denominational institution of the Methodist Episcopal Church, organized in 1887 as the result of an effort to unify the educational interests of the denomination within the State. It consists of a College of Liberal Arts, an Academy with courses fitted to the college curriculum, a Normal School, a School of Expression, and a Conservatory of Music. It is coeducational, and its standards for degrees are those required by the college senate of the denomination for its first class institutions. Its first graduates were the class of 1890, which consisted of four members. Its present number of students is 700; its professors and instructors 40. Its college graduates number about 250; its library has 5,000 volumes; its buildings and grounds are valued at $150,000; its productive endowment is $50,000. Its present chancellor is DeWitt C. Huntington, D.D.

Nebuchadnezzar, nĕb″ü-kạd-nĕz′ạr (Nabu-Kudurriuzur, "Nebo protect my dominion"), the most illustrious monarch of the New Babylonian or Chaldæan kingdom, son of Nabopolassar (q.v.). In the life-time of his father he defeated as crown prince the Egyptian Pharaoh Necho at Carchemish 605 B.C., and ascended the throne as his father's successor 604 B.C. He at once began his career of conquest, subduing Syria, and laying Judah and its king, Jehoiakim, under tribute. In 598 he marched against Jerusalem and led away into captivity at Babylon Jehoiakin, the 18-year-old son of Jehoiakim, just as he had succeeded to the throne on his father's death. With the young king the most eminent rulers of the land were carried off, 10,023 in all, together with the costly spoils of the temple and royal palace. As Zedekiah who succeeded Jehoiakin in the latter's exile entered into a treaty with Egypt Nebuchadnezzar's army besieged and captured Jerusalem a second time, carrying off Zedekiah into captivity (586 B.C.). Nebuchadnezzar meanwhile had strongly established his headquarters at Ribla in Cœlo-Syria. The remaining inhabitants of Jerusalem were taken as captives to Babylon, and the Jewish capital absolutely destroyed. For the 13 years between 585 and 573 B.C., the city of Tyre was besieged by Nebuchadnezzar to no purpose; in 572 B.C. he invaded Egypt and conquered it from Syene to the frontiers of Ethiopia. Pharaoh Hophra was defeated and dethroned and from 565 to 586 B.C. a Babylonian army occupied Egypt. Besides his activity in these campaigns Nebuchadnezzar was tireless in efforts for the security of his realm, the welfare of his people, the adorning and fortification of his capital Babylon. He restored the ruined canal and cut another, the King's Canal. At Sippara he made a lake like Lake Mœris, ten miles in circumference, which received and distributed the overflowing waters of the Euphrates, and he founded the city of Teredon at the mouth of that river. He built the Median wall as a defense to his kingdom, and completed the vast ramparts which his father Nabopolassar had begun. He beautified the royal residence with palace and temple buildings, finished the tower of the seven planets at Borsippa, restored and decorated the royal palace of his father, and built a new palace on a height surrounded by hanging gardens for the pleasure of his Median wife Amytis. This great work is said to have been completed in 15 days. He died after a reign of 43 years, 561 B.C., deeply deplored by his subjects.

Neb′ula (in medicine). See LEUCOMA.

Nebulæ, The, in astronomy, a term derived from the Latin, signifying little clouds. The nebulæ may properly be divided into two distinct classes, the green and the white. Less than five per cent of the number in the catalogues make up the former class, but this disproportion is made up for in area by their greater size in many cases. The difference between the two classes is fundamental, and it is questionable even if they might not properly be designated by different names. The spectrum of the green nebulæ consists chiefly of green and blue lines with sometimes a very faint continuous spectrum,— their constitution is therefore obviously mainly gaseous. The spectrum of the white nebulæ is continuous, with, in one instance, evidence of very faintly marked bright and dark lines. Their nature is therefore uncertain, but probably they are made up largely of solid as well as gaseous matter. From their small proper motions it is not likely that any of the nebulæ are as near us as the nearer stars. The green nebulæ are distributed in and near the Milky Way; the white ones are located on either side, and are generally remote from it. In this respect they differ from the star clusters, which in other respects they somewhat resemble. While the Milky Way shines chiefly by the light of the countless stars that it contains, a portion of its light is also due to enormous areas of green nebulous matter, which serves as a luminous background to the stars themselves. Undoubtedly the finest telescopic object in the sidereal heavens is the great nebula in Orion, which belongs to this class. Its extension in a gigantic spiral fills a large part of the constellation, and is the largest nebula known outside of the Milky Way. Next to it in size and also in magnificence is 30 Doradus, in the larger Magellanic Cloud. This is also a spiral structure. The Argus and Trifid nebulæ are other fine specimens of this class. All these nebulæ are obviously connected with a large number of stars, and are possibly in process of dispersion from them. Frequently a single star will be connected with a nebular wisp. These objects are known as nebulous stars, and are evidently analogous to the larger formations.

There is a second division of the green nebulæ. These have the same spectrum, but owing to a slightly different division of the light usually present a somewhat bluish appearance. These are known as planetary nebulæ on account of their rounded well defined disks. The disks are generally somewhat diversified and contain sometimes one and sometimes two stellar nuclei. The largest and finest of the planetary nebulæ is known as the Owl nebula in Ursa major. It is so called because it was formerly supposed to resemble the face of an owl. For a few years it had two brilliant nuclei which corresponded with the two eyes. Later, first one and then the other of these disappeared, and now it has a single nucleus in its exact centre. If the planetary disk is too small to be distinguished as such, the formation is designated as a stellar nebulæ. When a *nova* or temporary star fades out, it is usually

converted into one of these bodies. If the central portion of a planetary nebula is comparatively dark, it is then called a ring nebula. The best known example of this class is the ring nebula in Lyra.

Practically all the large white nebulæ exhibit a spiral structure, but they differ from the green spirals in that they are double instead of single. This can best be understood if we imagine a pliable rod which we take hold of at one end and roll up into a single spiral like a clock spring. If we take the rod by the middle and twirl it as we might a cane, we shall have a double spiral, and indeed it looks as if it were by such a whirling action that spiral white nebulæ were constructed.

The largest and most brilliant white nebula in the heavens is the great nebula in Andromeda. It is the only nebula indeed that is conspicuous to the naked eye. The one best showing its spiral nature, however, is the Whirlpool nebula in Canes Venatici. Often, as is the case with both of these objects, a secondary nucleus terminates one of the spirals. Smaller nuclei frequently occur at intermediate positions upon both spirals. If the nebular hypothesis is correct, and the solar system condensed from a former large nebulous mass, it is likely to have been from an object such as one of these, only probably on a much smaller scale. Unlike the green nebulæ, the white ones are not associated with brilliant stars, but that they are sometimes connected with small ones is shown by the fact that in 1885 a small temporary star suddenly appeared close to the centre of the nucleus of the great nebula in Andromeda. While we have little evidence bearing upon the subject, it seems most likely that the white nebulæ are condensing at present upon numerous hot stellar nuclei located in their midst. What the size of these nuclei may be we have no knowledge, but it seems likely that they are generally small as compared to our sun.

A subdivision of the white nebulæ, containing by far the largest part of them consists of small faint elliptical bodies showing no detail. It is possible that if they were nearer to us, and were better seen, that they, too, would show a spiral structure. In closing this brief summary of our knowledge of the nebulæ, we must refer to one most unexpected property that some of them have exhibited — that of variability. Three variable nebulæ have appeared and disappeared in the constellation Taurus, but the best known example is that of the Trifid nebula, a large section of which, which was formerly dark, is now bright, and apparently a region which was formerly bright is now dark. This is probably due not to a shifting of the material itself, but to a change in its luminosity. The source of this luminosity is now generally believed to be electric, although it may be suggested that the unknown gas which all the green nebulæ contain in combination with hydrogen, and which is found nowhere else in the universe, may possess properties like radium, rendering the whole gaseous formation luminous until its original atomic structure is finally broken down.

WILLIAM H. PICKERING,
Astronomical Observatory, Harvard University.

Nebular Hypothesis, The. This term in astronomy has come to signify that process of formation of the solar system which was propounded first by Swedenborg, next by Kant, and finally by LaPlace. It is generally associated with the name LaPlace. Occasionally it is spoken of as Kant's hypothesis, but Swedenborg's name is seldom associated with it. According to this hypothesis in its modern form, the sun and its attendant planets and satellites originally existed as one vast gaseous mass of greater diameter than the orbit of Neptune. This mass contained also numberless small solid particles. Owing to gravitation it gradually condensed. By the principle of the conservation of energy, as the mass became smaller its temperature must necessarily have risen. At the same time by the relative action of the various currents existing in the original mass of gas a continuous rotation in one direction would have been set up. As it shrank in size, by the principle of the conservation of momentum, its velocity of rotation must necessarily have increased. Under these circumstances, as it continued to grow smaller and hotter, a portion of its substance, owing to centrifugal force, must sooner or later have been left behind, to revolve about it in a closed orbit.

If the structure of the outer portions was very uniform, a considerable mass of matter might be left at one time. If this were sufficiently large it would form a ring about the central body, like that which we now find surrounding the planet Saturn. If not sufficiently large, the bodies into which it would condense would revolve independently, like the belt of asteroids now surrounding the sun. If the outer portions of the original nebula were of irregular structure, an independent nebulous mass would be left behind. If this were small, it would condense into a comet, which is merely a cloud of meteors and gas resembling the original nebula, but if it were large enough to exert an appreciable gravitational effect of itself, it might condense into a separate star or planet.

It was originally supposed that a ring was always formed preparatory to condensation into a planet. This does not, however, seem necessary, and the whole nebulous mass may possibly have had a spiral structure with condensations occurring at intervals along its length, such as we see at present on a large scale in the great nebula in Andromeda and in Canes Venatici. Certain it is that nebulæ of this type are extremely common in the heavens, while ringed structures like the nebulæ in Lyra and Hydra are more rare. The process of contraction of the central mass of what was originally our nebula is still going on, and is indeed the source of the sun's heat at the present time. In order to produce the actual enormous output of solar energy, the sun's diameter must diminish at the rate of about 300 feet a year, a quantity too small for us to measure, however, even after the lapse of several centuries.

Two objections to the nebular hypothesis have been raised of late years. If the satellites are formed by the condensation of the mass of the planets, then when the planets shrink away from them, the satellites should revolve in their

orbits more slowly than the planets revolve on their axes. This is true of all the satellites save the innermost one of Mars, which makes rather more than three revolutions while the planet makes one. The generally accepted explanation of this anomaly is a slight retardation of the time of rotation of the planet due to a tide formally raised upon it by the sun. If the planet revolves more slowly than the satellites, than by tidal interaction between them, the velocity of the satellites will be increased, and at the same time the two will be drawn nearer together. Should these conditions continue, the satellites would ultimately fall upon the surface of the planet. Another suggestion is that the two satellites of Mars are asteroids captured by the planet at a time when the eccentricity of its orbit was much higher than it is at present. The second objection to the nebular hypothesis is a more serious one. If the planets originally had the form of rings, then by Kepler's third law the inner edge of the ring would have revolved faster than the outer one. When the ring was condensed to form a planet, the planet and its satellites would then have revolved in a retrograde direction. With the exception of Uranus and Neptune all the planets revolve direct, that is in the same direction as the sun.

To overcome this difficulty LaPlace suggested that the rings, owing to friction among their particles, revolved as one piece. This we now know could not have been the case. Kirkwood proposed that although the planets started with a retrograde rotation, yet if in a greatly diffused condition, tidal friction would soon cause them to present always the same face to the sun. This would be tantamount to a direct rotation, and subsequent condensation might accelerate the acquired velocity up to the present observed rate of speed. Faye suggested the idea that all the inner planets were formed inside of the nebula and before it had become much condensed; that Uranus and Neptune were formed later after the central condensation had occurred; and that this would account for the difference in the direction of the rotation. Trowbridge has pointed out that if the rings were much denser near their inner edge in the case of the inner planets that this would explain their direct rotation. Of course if the planets separated from the central mass as individual bodies, not as rings, they would then all have a direct rotation. There are two objections to all these suggestions. One is that they explain the rotation of Neptune in a different manner from that of the other planets, and the other is that they do not explain the rotation of Uranus at all. This planet, or rather its satellites, and therefore probably the planet itself, revolves in a plane very nearly at right angles to the plane of its orbit.

It was suggested by the writer (consult 'Astronomical Journal' 1901, No. 511) that although the planets were condensed from the rings or spirals of the nebula they would all undoubtedly revolve in a retrograde direction, yet the tidal action of the sun acting upon them would always tend to set up a rotation in the contrary direction. Now the effect of this would be, not as Kirkwood supposed, to neutralize the original retrograde rotation, by any means, but rather to cause the planet to gradually shift the plane of its rotation, as may readily be demonstrated from the theory of the gyroscope. In its earlier stages, or if the tidal force were small, the direction of the rotation would be retrograde. Later the plane of rotation would so change as to be perpendicular to the plane of the planet's orbit, and still later the plane of rotation would be completely reversed, the planet now having simply a direct rotation.

WILLIAM H. PICKERING,
Astronomical Observatory, Harvard University.

Necessita'rian, a name given any one who follows the philosophy or doctrine of necessity. Hobbes may be considered the founder of the English Necessitarians, and on the Continent it was developed by his contemporary Spinoza, and later by Leibnitz. Jonathan Edwards (1703–58), president of Princeton College, toward the close of his life published 'An Inquiry into the Freedom of the Will'; and Priestley (1733–1804) published his 'Doctrine of Philosophical Necessity Illustrated' in 1777.

Necessity, Fort, a former defensive work near Union, Fayette County, Pa.; built by Gen. Washington in 1754.

Neches, nĕch'ĕz, a river in Texas, which has its rise in Van Zandt County and flows southeast into Sabine Lake (q.v.). It traverses a fertile agricultural section of the State, and in its lower course passes through an oil region. Beaumont (q.v.) is on its bank a short distance from the mouth. The Neches is about 350 miles long.

Necho, nē'kō, or **Nekau,** Egyptian king, the Pharaoh-Nechoh of the Bible: b. last half of 7th century B.C.; d. 595 B.C. He was son of Psammetichus I., succeeded him in 609, attempted to hold Syria after the collapse of the Assyrian empire, and in this campaign killed at the battle of Megiddo King Josiah of Judah, whose son Jehoahaz was made king dependent on Necho. But the later campaign was less fortunate for the Egyptian king, who was defeated at Carchemish in 604 by Nebuchadnezzar, and thus lost possession of Syria. Necho's internal rule was vigorous; he built a canal from the Nile to the Red Sea and sent out Phœnician sailors to explore the African coast. This fleet is said to have circumnavigated the continent. Consult Budge, 'History of Egypt' (1902).

Neck, that part of the body in the higher animals which forms the juncture of the head with the trunk. In man the neck is formed mainly of the muscles passing from the skull to the thorax, and of the trachea and the œsophagus. There are also the cervical or neck vertebræ, in man numbering seven, the same number being nearly constant in all the *Mammalia.* The most notable exceptions are seen in the manatees and the two-toed sloth, having six neck-vertebræ; while in the three-toed sloth nine cervical segments exist. In long-necked birds as many as 25 cervical vertebræ may be present. In fishes no neck or cervical region is distinguishable. The ligamentous structures connected with the head and neck, and with the articulation of the skull upon the vertebral column, form a very complicated series; and in the lower animals especially — as in the horse or

elephant — there is a strong band of fibres, forming the ligamentum nuchæ, which suspends the head on the neck. In man, the head being balanced on the spinal column, this ligament is of comparatively small size, and it extends from the occipital protuberance at the back of the skull to the spine of the seventh or last cervical vertebra. The muscles of the neck are numerous, and are generally classified and described along with those of the head. The term neck is also used in anatomy to indicate any attenuated process or part of a bone which serves to unite or support parts of larger proportions; for example, the neck of the femur or thigh-bone, the neck of the humerus, of the radius, etc. See ANATOMY.

Neckar, nĕk'kär, Germany, an affluent of the Rhine, which rises in the Black Forest in Würtemberg, near one of the sources of the Danube, and flows through Baden into the Rhine at Mannheim, after a course, including windings, of about 240 miles. The area of its basin is 4,150 square miles. It is navigable for small boats from Heidelberg near its mouth, so far as Cannstadt, but the actual navigation of the river extends only to Heilbronn, up to which steamers ply.

Necker, Jacques, zhäk nā-kār (English, nĕk'ĕr), French minister of finance: b. Geneva, Switzerland, 30 Sept. 1732; d. Coppet, near Geneva, 9 April 1804. In 1750 he went to Paris to enter the banking-house of his uncle, M. Vernet, and having become partner in a banking business, soon acquired an immense fortune. After giving up his business he held the post of resident minister at Paris, representing his native town. Ambitious of literary distinction, he produced his 'Eloge de Colbert' (1773), which gained the prize of the French Academy. His 'Essai sur la Legislation et le Commerce des Grains' (1775) was violently attacked by the economists, owing to his expressing himself in favor of restrictions on the exportation of corn. In July 1777 he obtained the post of director-general of finances. Malversation, under the preceding reign, had caused a great deficit, to which the American war made additions. New taxes would have been unpopular, and Necker endeavored to meet the exigency by loans and reforms. But the partisans of Turgot found fault with his innovations. In 1781 he published his 'Compte rendu au Roi,' relative to his administration. This statement of the financial condition of the nation found favor with the people; but displeased the court, and Necker was dismissed in May 1781. He went to Switzerland, where he published his work 'Administration des Finances' (1784). The errors and prodigality of Calonne, who next had the management of the state finances, increased Necker's reputation: the latter returned to France in 1787, wrote against Calonne, who had accused him of being the author of the deficit, and was exiled in consequence. But in 1788 Necker was recalled as comptroller-general, he supported the convocation of the States-General, which was the wish of the nation, and the giving a double representation to the *tiers état.* When the court in a royal sitting, held on 23 June 1789, wished to annul the decision of the Third Estate, by which the National Assembly was constituted, Necker refused to appear in the sitting. On 11 July the advisers of the king succeeded in inducing him to give Necker his dismissal, and to order him to leave the kingdom. No sooner was his removal known than all Paris was in a ferment. The storming of the Bastille followed (14 July), and symptoms of popular violence became so alarming that the king found himself compelled to recall the banished minister. His first object was to restore tranquillity, and security of person and property. But as minister of finance he was obliged to propose measures unacceptable to the populace. His moderate opinions in regard to the administration of government did not keep pace with the wishes of those who dictated to the people. Under these circumstances he wrote to the Assembly, in September 1790, requesting his dismissal. His daughter, Madame de Staël, has given a somewhat too favorable view of his character as a statesman in her 'Considerations.' His ability, though considerable, was much overrated in his day. Among his other works are: 'De l'Importance des Opinions Religieuses' (1788); 'Réflexions présentées à la Nation Française' (1792); 'Du Pouvoir Exécutif dans les Grands Etats' (1792); 'De la Révolution Française' (1796); and 'Dernières Vues de Politique et de Finances' (1802). A collective edition of his works was published at Paris in 1820–2. Consult Nourrisson, 'Trois Révolutionaires: Turgot, Necker, et Bailly' (2d ed. 1886); Hermann, 'Zur Geschichte der Familie Necker' (1886).

Necker, Susanne Curchod de Nasse, French matron: b. Geneva, Switzerland, 1739; d. Coppet, Switzerland, 1794. She came of a French Protestant family and as a girl was noted for her beauty, wit, and wide knowledge which so attracted the historian Gibbon that he wished to marry her. In 1764 she married Jacques Necker (q.v.) and in Paris her house soon became frequented by the most distinguished men of the day, among them Buffon, Saint Lambert, and Marmontel. She educated her daughter, the famous Madame de Staël in this atmosphere and devoted much time to philanthropic work, founding the hospital named for her. She wrote: 'Reflexions sur le Divorce' (1794), and 'Mélanges' (published posthumously in 5 vols.). See D'Haussonville, 'Le Salon de Madame Necker' (1882).

Necker de Saussure, dĕ sō-sür, **Adrienne Albertine,** French author: b. Geneva, Switzerland, 1765; d. 1841. She was married to Jacques Necker, a cousin of Madame de Staël with whom she was intimate. She published: 'Notice of the Character of Madame de Staël' (1820); and 'Progressive Education' (2 vols. 1828–32).

Nec'romancer, The. See RAMIREZ, IGNACIO.

Nec'romancy (Greek *nekros,* dead, and *manteia,* divination), the divination of the future by questioning the dead, under the belief that the spirits or souls of the dead could be communicated with, and could give information regarding the future. This, like many superstitious rites, it is supposed, is of the highest antiquity. Mention is made of necromancy in the Old Testament: for instance, in Deuteronomy (xviii. 11), where it is forbidden. In the 28th chapter of the first book of Samuel the

witch of Endor is related to have raised up Samuel to gratify the desire of Saul. In many parts of Greece there were oracles of the dead, and necromany was practised in the temples by priests or other religious persons. It was also practised in Thessaly, notorious for magic and sorcery. From the first the practice was condemned by the Christian Church, and during the Middle Ages necromancers were persecuted in all ways, imprisoned, tortured, burned. See also MAGIC.

Nec'ronite (Greek, "a corpse"), a variety of feldspar occurring in granular limestone near Baltimore, Md. It is nearly white in color, and derives its name from the fact that it emits a fetid odor when struck.

Necrop'olis (Greek, "the city of the dead"), a term applied to the cemeteries in the vicinity of ancient cities. In classical antiquity the name is given to a suburb of Alexandria, where the corpses were received and embalmed. Here Cleopatra applied the asp to her breast.

Necro'sis (Greek, literally, "a state of death"), in pathology, the death of a circumscribed piece of tissue. In surgery, the term is specifically applied to the death of a bone, in part or in whole, but especially in mass. The part affected by necrosis, like a slough of the soft tissues, has no longer any organic connection with the body. This dead portion, especially when detached from the bone to which it belonged, is called the sequestrum. If the necrosis is confined to the superficial layers of the bone-substance, the operation of nature by which the dead layers are thrown off is called exfoliation. The line of demarcation is the boundary between the living tissue and the dead. If it is the whole of the outer case of the bone that suffers, the periosteum or investing membrane sometimes remains healthy, and deposits a lymph which rapidly ossifies and surrounds the diseased part with a healthy crust. The bones that most usually suffer from necrosis are those of the lower extremity, the tibia and femur; necrosis of the soft parts is called gangrene (q.v.).

Nectanebo I., nĕk-tā-nē'bō, king of Egypt: d. 364 B.C. The first king of the 30th dynasty he came to the throne in 382, formed an alliance with Evagoras of Cyprus against the Persians; successfully met a Persian invasion in 374; was conservative in religion and restored many old temples. The British Museum possesses his sarcophagus. This great general was succeeded by Teher or Taho, who was supplanted by NECTANEBO II. in 361, also a general and also an ally of the Greeks, with whose help he put down a pretender to the throne and for a time held the Persians off, only to succumb to them (343) after the defection of Mentor, one of his Greek generals. He left Egypt and fled to Ethiopia — or by a late and untrustworthy tradition to Macedonia where he seduced Queen Olympias and thus was the father of Alexander the Great. This story is evidently suggested by a longing for poetic justice to the king defeated by the Persians, who in turn were crushed by Alexander. Egypt was a Persian province from 343 to 332, when it came into the control of Macedonia.

Nec'tar, a sweet liquid secreted by a glandular surface structure in a plant called a *nectary;* and the name is extended by botanists to any aborted part of a flower in the place between the gynœcium and andrœcium (see FLOWER) where nectaries usually occur. Nectar varies in composition with the plant that produces it, but consists mainly of water, with sugar and grape-sugar, and various carbo-hydrates and proteids which make it nutritious and give it flavor and odor. Nectaries may occur in many places, and are of various forms. Those outside of flowers are most often found at or near the base of the petiole, or about stipules. Within flowers the nectar glands form a more or less continuous ring between the stamens and pistil; or the disk itself may secrete a sweetish fluid; or other parts, as the petals (for example, in aconite) may become nectaries. In many cases the secretion exudes directly from the surface and not from any definite pore or excretory opening.

Such structures belong mainly to seed-producing plants and serve the purpose of attracting insects whose visits are beneficial in effecting cross-pollination (see FLOWERS AND INSECTS) as they go from flower to flower in search of this delectable food, which bees, wasps, and others transform into honey. The nectaries on the outside of certain plants attract ants (q.v.) which protect the plant.

The terms nectar and nectary are derived from the name given by the Greek poets to the drink of the immortal gods on Mount Olympus. It was poured out by Hebe, the goddess of Youth, and conferred immortality. Homer describes it as resembling red wine. It was joined with ambrosia, the immortalizing food of the gods, and like it was of most delicious odor.

Nec'tarine, a smooth-skinned peach formerly regarded as a distinct species, which may be derived from the seed of a peach or from a peach bud by bud variation, and which, conversely, may produce a tree bearing peaches by either of the means mentioned. In all ways as an orchard fruit the nectarine is managed like the peach, but is far less popular. Commercial orchards of this tree are planted in California, the product being mainly dried or canned. Consult: Darwin, 'Animals and Plants under Domestication' (1868). See PEACH.

Nedjed, nĕd'jĕd, **Nejd,** or **Nejed,** Arabia, the general name signifying "elevated country," applied to the central Wahabi kingdom in great part covered by the heights of Jebel Toweyk. The capital is Riad (pop. 30,000), a centre of Mohammedan orthodoxy and fanaticism. A great part of the region is sandy desert interspersed with fertile spots inhabited by Bedouins. The more elevated districts with towns and villages inhabited by the settled population, feed immense droves of camels and the best breeds of Arab horses. The climate is healthful. Consult: Palgrave, 'Central and Eastern Arabia' (1865).

Needell', MRS. **John Hodder.** See NEEDELL, MARY ANNA LUPTON.

Needell, Mary Anna Lupton, English novelist: b. London 1830. She was a writer and student in early life and was then married to J. H. Needell of Allington, Dorsetshire. During her married life she suspended writing, but resumed it in 1881. Among her works are 'Ada

Gresham' (1851); 'Catharine Irving' (1853); 'Julian Karslake's Secret' (1881); 'The Story of Philip Methuen' (1886); 'Stephen Elliott's Daughter' (1891); 'Passing the Love of Woman' (1892); 'Unstable as Water' (1902). Several of these have been republished in this country.

Needfire. See FIRE.

Needham, nēd'am, **Charles Willis,** American college president: b. Castile, N. Y., 30 Sept. 1848. He was graduated from the Albany Law School and in 1874–90 practised law in Chicago where he assisted in founding the University of Chicago. In 1890 he removed to Washington where he has established a law practice and since 1897 has been connected with Columbian University of which he became president in 1902.

Needham, James George, American entomologist: b. Virginia, Ill., 18 March 1868. He was graduated in 1891 from Knox College, Galesburg, Ill., and from Johns Hopkins in 1893. He became professor of biology at Lake Forest University in 1898 and has had charge of the New York Entomological Field Station since its establishment in 1899. He has written 'Elementary Lessons in Geology' (1895); 'Outdoor Studies' (1898); etc.

Needham, John Turberville, English naturalist: b. London, England, 10 Sept. 1713; d. Brussels, Belgium, 30 Dec. 1781. He was a Roman Catholic priest and was in his later years director of the Academy of Sciences at Brussels. He published: 'New Microscopical Discoveries' (1745); 'Idée sommaire, ou Vue Générale du Système physique et métaphysique sur la Génération' (1780); etc.

Needle, a small steel instrument, sharp pointed at one end, and having an eye or hole through which is passed a thread in sewing and stitching. Needles were known to the ancients, who ascribed the invention of them to the goddess Bellona; but at first they consisted only of small spikes of wood or fish-bones. The Phrygians and Babylonians must have been acquainted with needles, as they were celebrated for their skill in embroidery. Needle-makers were incorporated at Nuremberg in 1370, and at Augsburg in 1406. The first needle-work in England is said to have been established in 1560.

There are about 22 processes in the present manufacture of needles. The first is the cutting of the coils of wire into two-needle lengths by a guillotine shearing machine. The wire is of the best crucible steel, and requires to be very carefully gauged to size. After being cut, the lengths of wire are raised to a dull red heat and placed in loose bundles inside iron rings to be straightened by rolling each bundle backward and forward on a face plate with a slightly curved bar, through which the rings project. The wires are next pointed at both ends. An arrangement is used by which the wires are withdrawn — one closely following another — from a hopper by a pulley revolving at right angles to the grindstone, the wires being held to the face of the pulley by an india-rubber band. In their passage between the pulley and the grindstone the wires (double-needle blanks) revolve on their axis and become pointed at one end, and the process is repeated for the pointing at the other end. The fine steel dust formerly so injurious to the health of the hand-grinders, is now drawn away from the operative by the suction of a strong current of air. The stamping of these two-length blanks in the middle by the hand-worked stamping machine, so as to produce the flat of the eyes and the mark for the holes, as well as the punching of the holes by a screw press, can now be accomplished by more expeditious machines. By the newer method, the wire blanks are automatically fed into a quick-running belt-driven machine, in which a punch and dies form the prints or flats for the eyes. Then two oval holes are punched through the two prints of each blank by a vertical belt-driven punching-machine. After being eyed the still double blanks — they are now rather double needles joined at the heads by thin fins — are "spitted" through their eyes on two wires flatted at one end to retain them. The burr made by the punch and die (stamping) is now removed by filing the spitted needles on both sides, and after being broken in two between the heads, which are then also smoothed by filing, a row of single needles is left on each spit.

The needles then undergo a tempering process. They are first hardened by being laid on a plate and raised to a red heat in a furnace, after which they are dipped in cold oil, kept cool by running off a portion as it gets warm, and replacing it by an equal quantity of cold oil. The needles, now hard and easily broken, are made less brittle by placing them on a continuous band of wire gauze, which travels slowly over gas flames. They are now rolled one by one under the finger on a smooth stone, and thus the bent ones are weeded out. In parcels of 50,000 they are next washed and scoured with soap to remove any of the oil used in tempering, which still adheres, and the eyes are afterward "blued" to soften them. In the case of needles of fine quality the eyes are gilt. By one method the eyes are polished by threading them loosely on wires carried by standards fixed to a tray or platform, which is moved rapidly with a reciprocating motion in a horizontal plane. In about one hour, with the assistance of a little fine emery and oil, the constant swinging of the needles on the wire smooths their eyes so as not to cut the thread. But the eyes of the best needles are hand-polished with fine emery on flax threads. The next step is to grind the heads and set the points by hand on a rapidly-revolving stone of fine texture. For the final polishing of the shanks, the needles are fed in a longitudinal direction, in rows one deep, between transverse leather-covered rollers, with holding rollers above them. Besides turning on their own axes, a lateral as well as a backward and forward motion is given to the rollers, which produces a high polish on the needles. The needles now require to be laid with their heads in one direction. A gun-metal disk revolving vertically takes up each needle by a groove in its periphery, and lets it fall on an inclined glass plate. Owing to the taper form of the pointed ends of the needles, they describe an arc in revolving so that those with the points in one direction roll to the right and the others fall round to the left. The finished needles, though intended to be of the same size, always differ to some extent in their lengths, so that those of exactly one size require to be separated

from other lengths by the sorting process in which gauges are used. Lastly, the needles are papered either by being spitted on cloth pasted to paper, or by being made up into small packets, in which case the bits of paper are cut and folded in a machine like that used for envelope-making.

Special kinds of needles are required for sewing canvas, for upholstering, in surgical operations, etc. Knitting needles are slender straight rods with rounded ends, and are used in pairs or sets of four or five. They vary in length and are made of wood, bone, or ivory, but chiefly of steel. Crochet needles have a hook at one end. Some needles are used in machinery. They are made of steel and are used for hosiery and stockinet work. Sewing-machine needles have a hook, eye, or barb at the pointed end, and are used with a single thread in making a single loop stitch both with eye and with barb. The best known sewing-machine needle is the one with the eye at the pointed end, having a long groove on one side and a short groove on the opposite. The needle used on leather is the wax-thread needle, and includes many shapes. Instead of an eye these needles are formed with hooks by which the thread is pulled through a hole made by an awl. The welting needle is a section of a circle in shape, used for putting welts on boots and shoes.

In the United States the manufacture of needles has become an important industry. The total output for 1901 amounted to 1,120,536 gross, the product being valued at $1,027,949.

Needle Gun. See FIRE-ARMS; ORDNANCE.

Needle-ore, the common name for Aikinite also called Aciculite and acicular bismuth. It is a sulphid of bismuth, lead and copper, and is found native in various localities. It has a dull metallic lustre and is of a blackish lead-gray color. It occurs in embedded acicular crystals of needle-like formation and hence derives its name.

Needle Peak, a mountain of the Panamint Range in the southeastern part of Inyo County in California. It takes its name from its peculiar sharp pointed summit. It is in a region which bears many marks of the Glacial period, the shape of the mountains, the large number of glacial lakes, the markings on the rocks, and the vegetation. Needle Peak is southwest and a short distance from "Death Valley."

Needlefish, a marine gar of the genus *Tylosurus* (see GAR), especially *T. notatus.*

Neefs, nāfs, more correctly, NEEFFS, **Pieter,** the Elder, Dutch painter: b. Antwerp about 1578; d. there between 1656 and 1661. He was a pupil of the painter of architectural views, Hendrik van Steenwijck (q.v.), began his career as a painter in the same department of art in 1605, and in 1609 was elected a member of St. Luke's Guild of painters in Antwerp. His paintings are numerous, and he is well represented in the Louvre at Paris, the Pinakothek at Munich, the Museum at Ghent, the Gallery at Dresden, and other European collections. They are mainly interiors of churches, the gloom of the building being lit up with torches or tapers and are remarkable for aërial and linear perspective. The technique is delicate and highly finished. He generally secured the services of some other artist to introduce figures in his views, among others Teniers, Francken and Van Thulden.

Neenah, nē'na, Wis., city in Winnebago County; on Lake Winnebago at its outlet, and on the Fox River; also on the Chicago, M. & St. P., the Wisconsin C., and the Chicago & N. R.R.'s; about 50 miles north by west from Milwaukee and 30 miles southwest of Green Bay. It is on an island upon which is also Menasha, the two cities being really one in commercial interests, but each having an independent municipal government. Neenah was settled in 1846 and in 1850 was incorporated as a village. In 1873 it received its city charter which was revised in 1883. The chief industrial establishments are stove works, flour and paper mills, foundries, machine shops, shoe factory, brick works, tobacco factories, and lumber mills. There is a large trade in manufactures, lumber and farm products. The city is well built and has many attractions for tourists. It is a favorite fishing resort. It has several parks, a commodious opera house, city buildings, several fine churches and school buildings. It has a fine public library. The waterworks are owned and operated by the city. Pop. (1890) 5,083; (1900); 5,954.

Neer, nār, **Aart van der,** Dutch painter: b. Amsterdam 1603; d. there 9 Nov. 1677. He became famous in his native city about 1640 and was particularly happy in moonlight effects among the canal scenery of Holland, as well as in winter landscapes, skaters on the ice, fires or conflagrations. These midnight scenes of raging flame are sometimes filled with figures, which give them a powerful dramatic effect. His pictures are found in most public galleries. He ended his days as an innkeeper.

Neerwinden, nār'vĭn-dĕn, Belgium, a village in the province of Liège, 16 miles from Louvain, which gives its name to two battles fought in the vicinity: (1) on 29 July 1693 when the French under the Marshal of Luxembourg gained a victory over the English and Dutch allies under William III. of Britain; (2) on 18 March 1793 when the French under Dumouriez were defeated by the Austrians under the Prince of Coburg.

Nees von Esenbeck, nās fŏn ā'zĕn-bek, **Christian Gottfried,** German botanist and natural philosopher: b. in the Odenwald 14 Feb. 1776; d. Breslau 16 March 1858. He was long a practising physician, but became professor of botany successively at Erlangen (1818), Bonn, (1819), Breslau (1831), and Berlin (1848–52). He displayed much originality of thought in his 'Naturphilosophie' (1841), forming Vol. I. of his uncompleted 'System der spekulativen Philosophie.' Among his other writings are: 'Handbuch der Botanik' (1820–1); 'Bryologia Germanica' (1823–31).

Neesima, nē'sĭ-ma, **Joseph Hardy,** Japanese educator: b. Tokyo, Japan, 14 Feb. 1843; d. Kioto, Japan, 23 Jan. 1890. He came to the United States to be educated and found a friend in Alpheus Hardy whose name he adopted. He studied at Amherst and continued his theological course at Andover and upon his return to Japan in 1874 was warmly received by his countrymen. He founded Dōshisha College at Kioto and was

its president. See his 'Life and Letters' edited by Arthur S. Hardy (1892).

Nef, John Ulric, American chemist: b. Herisau, Switzerland, 14 June 1862. He was graduated from Harvard University in 1884. In 1887–9 he was professor of chemistry in Purdue University, Lafayette, Ind., and in 1889–92 he was engaged at Clark University, South Atlanta, Ga. He became professor of chemistry in the University of Chicago in 1892 and since 1896 has been head professor of that department.

Neff, nĕf, **Felix,** Swiss philanthropist: b. Geneva 8 Oct. 1798; d. there 12 April 1829. He entered the army, rose to the grade of sergeant in the artillery, but at 21 devoted himself to the elevation of the people of the Fressinières valley, and in 1823 settled among them as pastor, teacher, engineer and farmer. His noble work transformed the degraded inhabitants of his great parish and speedily wore out his health so that shortly before his death he had to retire to Geneva.

Negapatam, nĕg-a-pa-tăm', India, a town and port of the Tanjore district, Madras. It has an active trade with Ceylon, the Straits Settlements, etc., and is the terminus of the South Indian Railway. It was an early settlement of the Portuguese; was taken by the Dutch in 1660, and by the British in 1781. Pop. (1901) 56,455.

Negative Quantity. See MATHEMATICS.

Negatives, Development and Treatment of. The principles of development of both photographic glass dry-plate and film negatives are the same. Glass plate or film negatives may be developed in a photographic dark-room or in special small portable dark-rooms or daylight developing machines. Photographic dry plates have spread upon the surface a film of a gelatine emulsion carrying and incorporated with it a certain amount of bromide of silver. The emulsion is flowed over the plate surface in a warm fluid condition, which solidifies when cooled into a film. Sensitized photographic films are prepared by the emulsion spread upon a transparent support resembling celluloid. When the prepared glass plate or sensitized film is exposed in the camera, the light acts upon the gelatino bromide of silver film in such a way, it is believed, as to convert the bromide of silver in the film into a sub-bromide which becomes thereafter susceptible to the action of a reducing agent known as the developer. The bromide of silver not acted upon by the light is not affected chemically by the developer. The chemical change which the developer induces in the bromide of silver, is a reduction of the light affected parts, to metallic silver. Anything which will effect this reduction is known as a developing agent. There are numerous new ones being added continually to the list. Most developers are derivatives from benzine, common ones being pyrogallol, known as «pyro,» quinol, amidol, metol, ortol, glycin, and eikonogen. While any of the developing agents alone would reduce the exposed silver bromide to metallic silver, in practice it is found best to combine the developing agent with an alkali, carbonate of soda, ammonia or carbonate of potash. The alkali is called the accelerator. To prevent rapid oxidization of the alkaline developer, sodium sulphite is added and preserves the developer prior to the mixture with it of an alkali, oxalic acid, as well as other acids of a similar character like sulphuric or sulphurous are added, which will keep the solution from discoloration. There are many different developing agents and many different formulæ for making developing solutions. These differ slightly from each other in their action, but the general method of use is the same. In compounding developers it is sometimes advisable to introduce potassium bromide, or ammonium bromide, particularly in the development of plates fully or somewhat over-exposed. They are known as restrainers and have the power of retarding the action of the developer, which is sometimes desirable. Instead of dissolving the bromide of potassium or ammonia in the developer, it is usual to prepare a weak solution of bromide in water about five grains to five or eight ounces of water and immerse the plate in this solution for three or four minutes, then remove and transfer the plate to the developing tray and pour upon it the normal developer. The preliminary bromide treatment checks the rapidity of development and prevents an overexposed plate from becoming flat or foggy.

In general to obtain the proper density in the film for most commercial plates, it has been found that four grains of pyrogallic acid, metol, ortol, glycin, pyro catechin, adurol, eikonogen, diogen, imogen, edinol, and other similar developer agents, to the ounce of water is about the right proportion. Bromide of potassium aids in increasing the density. In some cases where it is desired to secure thin quick printing negatives full of detail the percentage of pyrogallic acid can be reduced one-fourth.

The method of developing film or plates in a dark-room is as follows:

The sensitive dry plate must be removed from the original package in a dark room or a room illuminated only by a reddish orange colored light, also for inserting in the plate in the holder and development, both are done under the same condition. After removing the plate from the plate holder, or film from film spool, it is well to place them in clear water and allow them to soak for a few minutes. This insures the developing solution flowing evenly over the surface of the film, which is essential for even development. The plate or film strip is then placed in a tray of developing solution, previously prepared, or, in the case of glass plates, the solution may be poured over the plate in the tray. The developer at once begins its action and should be kept in motion by rocking the tray, or the film should be passed through and through the developer until development is complete. In about a minute after immersion, parts of the plate are seen to grow dark where the developer is changing to metallic silver the light affected silver bromide. The operator watches the progress of the change by holding his plate up to the colored light from time to time.

In about four or five minutes, with a normal developer, all the susceptible silver bromide has become metallic silver, forming the negative image of the object photographed. The silver is densest where the light has acted longest on the sensitive film; thinnest where there was the least light as in the shadows. When the film is fully developed so that no further details

appear in the shadows, the plate or film is rinsed in water to remove the developer, and is ready for the second chemical step, called "fixing."

The chemical commonly used for this process is hyposulphite of soda — "hypo" in the photographic vernacular. To prepare the fixing solution, about one ounce of "hypo" is dissolved in six ounces of water and the solution is poured into a separate tray in which the negative is immersed. The action of the solution on the negative is to dissolve away the unreduced silver in the plate or film, a process requiring about five minutes. As the action of the fixer proceeds, the milky color of plate or film is seen gradually to disappear. When all the soluble silver has been removed — indicated by the total disappearance of the whitish color — the negative is chemically complete and may be exposed to light with safety. The negative should now be removed from the "hypo," rinsed in clear water and placed in a bath of alum and water for a few minutes. Instead of alum a formaline solution may be used. These solutions toughen the gelatine so that it will not be readily marred or scratched in subsequent handling. The negative should then be washed thoroughly in water for about an hour to eliminate all the hypo and alum. If a glass negative, it may be immediately placed in a rack to dry and the drying hastened by placing the rack in a window or in front of an electric fan. In the case of film negatives, a short soaking in a glycerine solution is advisable. This is to prevent the contraction of the gelatine side of the film, in drying, from curling the film. After removal from the glycerine solution, the negative is dried without washing. Drying requires a number of hours under ordinary conditions. When dry it is advisable to wipe the back of film negatives with a soft cloth moistened in benzine to remove the glycerine, which is sticky.

Glass plate negatives are either developed one at a time or as many as will cover the bottom may be placed in the developing tray at once. Film may be developed in the entire strip of 2, 4, 6, 10 or 12 negatives, as the film cartridges are prepared; or they may be cut apart and each exposure handled separately. The cutting apart may be done at any time after development has proceeded sufficiently to show the dividing line between the exposures on the film strip. The temperature of both developing and fixing solutions should be between 60 and 70° F., as should the alum hardening bath. If the temperature of the solutions is materially higher, the gelatine emulsion softens unduly, although development is accelerated. If the solutions are below 60°, development is retarded.

Sometimes after development, negatives are found to be too "dense" to give good results in printing — that is, the metallic silver has formed too thick over the whole negative, or parts of it. This may be due to several causes, which are not in the province of this article to explain. "Dense" negatives may be improved by what is called reducing. This is done by immersing the negative, previously washed with care, in a weak bath of ferri-cyanide potassium, a small amount of hyposulphite of soda, and water. This solution gradually dissolves away the reduced metallic silver of the negative image. When enough has been removed to make the negative of proper density, the reduction is checked by washing, and the negative is dried in the usual way. Negatives may be reduced locally by applying the solution to the parts with a small brush. In place of ferricyanide of potassium, persulphate of ammonia without hypo can be used. The formula is as follows:

Persulphate of ammonia	15 grains
Water	1 ounce

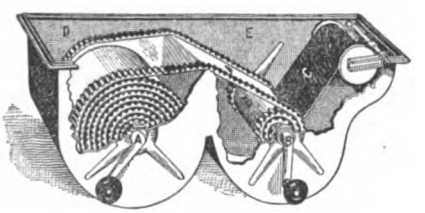
Make a fresh solution each time and add two drops of nitric acid. The salt readily dissolves. The negative if dry should be soaked for half an hour in water and then be immersed in the ammonia solution. Reduction occurs gradually, when sufficient wash the negative under the tap and immerse for ten minutes in ten per cent solution of sodium sulphite for two or three minutes, which checks the action. Then wash and dry.

Negatives are sometimes underdeveloped; owing to a very short exposure negatives can not be developed far enough and when fixed are too thin to give good prints, not enough metallic silver having been formed. Such negatives may be "intensified," which is a sort of re-development. A negative must be well washed to eliminate the hypo prior to the intensification process. There are different ways of accomplishing this with a variety of formulæ. A common way is to immerse the negative in a solution containing bi-chloride of mercury. This changes the dark negative image to a white color, the metallic silver in the film having been reduced to silver chloride by association with the mercuric chloride. The whitened or bleached negative is now transformed, after being well washed with water, by immersing in a bath of water and dilute ammonia or a solution of sodium sulphite and water, until the white color becomes brown or black. The action of the alkali changes the chloride to metallic silver again. The negative now possesses greater opacity in the high lights and will yield more vigorous and brilliant prints. The intensifying process may be repeated by washing the film carefully between each step. Negatives may be intensified locally by applying the chemical solutions to the desired parts.

How far to carry the development of glass plates or film is an important point in negative making. Some operators rely entirely on their judgment in the case of each negative, examining it by the dark-room light to see when the desired density has been attained. The uncertainty of results in thus trying to stop development at just the right point resulted in the introduction of what is known as the "factorial system" of development. This system is based on the theory that a certain definite relation exists between the total length of time required for development, and the time elapsing between immersing the plate in the developer and the first appearance of the image. Different developers have different factors according to their various actions. So, multiplying the time elapsing from immersion in developer to appearance of image, by the factor of the developer used, gives total length of development needed. The factor of any developer at a definite uniform temperature can be determined by experiments.

Underlying this "factorial system" is the theory that in every case the time of exposure of plate or film alone determines the final quality of the negative. The eminent authorities Alfred Watkins and Hurter and Driffield hold this view, which is being generally accepted. The gradation between light and shadow in the negative (not its general "density" or "thinness") really determines its printing quality; that what this scale of gradation or ratio of contrast is going to finally be, is fixed before the image makes its appearance in the developer. But, if the operator knows before development of over or under exposure, he may influence the contrast in his negative somewhat by altering his developer. In view of the above, time development is now recognized by many workers as the correct way of development, the length of time to elapse between the immersion of plate or film into the developer to the completion of development varying with solutions of different compositions and their temperatures.

The Kodak developing machine is based on the principles of time development. This machine is for film only. With it film is developed without a dark-room. Introduced in 1901 the Kodak developing machine became immediately popular with film workers and has become the favorite method of development. The advantages of machine development are many. No dark-room is needed; the operations are simpler and therefore more likely to be successful. The general results are better than by the older development method. With the Kodak developing machine the operator of course does not have to depend upon his own judgment as to when development should cease. He times development, thus being certain of his results. The chemicals to be used with the machine are prepared in powder form, only needing to be combined with water to form the proper solutions. The chemical principles of development in the Kodak developing machine and the dark-room are identical. The machine itself is a light-tight metal box containing a colored transparent apron. Its operation is as follows:



Kodak Developing Machine.

The spool of film is inserted in the machine so that the black paper, which protects the roll of film from light in the cartridge, will lead from the top, as shown in cut, the transparent apron (F) having first been wound onto arbor "A." The black paper is then pulled out and the end attached to arbor "B" by slipping under the wire guard. Arbor "B" is then turned to the right until the word "stop" printed on the black paper to mark the beginning of the film strip appears. The developer is then poured into compartment "E," the end of apron (F) is hooked onto arbor "B" and the top put on the machine. The operator then turns handle to the right until the time of development (four or five minutes) has expired. The film "G" winds up inside of apron, but with the face not touching it, thus allowing free action of the developer. The cover is then removed from machine, developer poured off and fixing solution poured in; the cover replaced and the handle turned again for about five minutes, when the fixing is complete. After fixing, the film is removed from machine by taking hold of either end of black paper and pulling out of machine, the film being taken hold of when it appears and pulled free from the black paper. Nothing remains to be done except to wash the film, harden it in the alum solution and pin up to dry. Film must always be developed in the entire strip when using the machine.

Developing Formulæ.

PYRO DEVELOPER.

1.

Pyrogallic acid	½ ounce
Sulphuric acid	20 minims
Pure water	32 ounces

2.

Sulphite of Soda (anhydrous)	3 ounces
Carbonate of Soda	2 "
Pure water	32 "

To develop take

Water	2 ounces
No. 1	1 ounce
No. 2	1 "

EIKONOGEN DEVELOPER.

1.

Eikonogen	1 ounce
Sulphite of Soda (crystals)	3 ounces
Water	60 "

2.

Carbonate of Potash	3 ounces
Water	30 "

To develop take

No. 1	2 ounces
No. 2	1 ounce
Water	2 ounces

METOL DEVELOPER.

A.

Distilled or boiled water	10 ounces
Anhydrous Sodium Sulphite	250 grains
Metol	50 "

B.

Distilled or boiled water	10 ounces
Potassium Carbonate C. P.	1 ounce

For normal developer take 3 parts of A and add 1 part of B.

For over-exposure take 3 parts of A, add ½ part of B, 4 parts of water, and 10 to 60 minims of a solution of Potassium Bromide, 1 to 10.

Carbonate of Soda can be substituted for Carbonate of Potash.

METOL-HYDRO DEVELOPER.

Make two solutions as follows, each will keep a long time:

1.

Metol	50 grains
Hydroquinone	40 "
Potassium Metabisulphite	½ ounce
Distilled water	10 ounces

2.

Sodium Carbonate (crystals)	2 ounces
Distilled water	10 "

For use mix equal parts. Bromide of Potassium should be added in small quantities in cases of great over-exposure.

EDINOL DEVELOPER.

Edinol	240 grains
Potassium Metabisulphite	120 "
Sodium Carbonate	800 "
Sodium Sulphite	400 "
Potassium Bromide	40 "
Water	10 ounces

For a developer put 1 part of above into 7 parts of water. Can be used for several negatives. Is of a light straw color.

FIXING SOLUTION.

Hyposulphite Soda	4 ounces
Water	16 "

ALUM BATH.

Saturated solution of alum allowed to settle and decant.

TO MAKE FARMER'S REDUCER.

Dissolve 1 ounce Ferri-Cyanide of Potassium in 9 ounces water, forming a 10 per cent solution. Add enough of this solution to fresh Hypo bath to make it a light straw color.

ANOTHER REDUCER.

Ferric Chloride	1 dram
Hydrochloric Acid	2 drams
Water to make 10 ounces.	

INTENSIFIER.

1.

Mercuric Chloride	1 dram
Ammonium Chloride	1 dram
Water	4 ounces

2.

Ammonia (.880)	1 dram
Water	4 ounces

Bleach in No. 1, wash well, and blacken in No. 2.

Eastman Kodak Company.

Negaunee, nĕ-gâ'nē, Mich., city in Marquette County; on the Duluth, S. S. & A., and the Chicago & N. R.R.'s; about 12 miles west by south of Marquette. It was settled in 1870 and in 1873 was chartered as a city. It is in the iron region of the State and has within the city limits several productive iron ore mines. The ridge (Iron Mountain) upon which Negaunee is located is over 1,000 feet above Lake Superior. The chief industries of the city are connected with the mining and shipping of iron ore. It has excellent public and parish schools. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 6,078; (1900) 6,935.

Negley, nĕg'lĭ, **James Scott,** American soldier: b. Liberty, Pa., 22 Dec. 1826; d. Plainfield, N. J., 8 Aug. 1901. He was educated at the Western University of Pennsylvania and served in the ranks through the Mexican War. At the outbreak of the Civil War he organized a brigade, was commissioned brigadier-general and joined the Army of the Ohio. He defeated the Confederates at Lavergne in 1862 and was promoted to the rank of major-general for gallant conduct at Stone River. Commercial and railway enterprises engaged his attention after the war and in 1869–73, 1875–7, and 1885–7 he was a member of Congress.

Neg'ligence, in law, there are recognized three degrees of negligence: *ordinary,* the want of ordinary care or diligence; *slight,* the want of great care or diligence; and *gross,* the want of slight care or diligence. The person charged with negligence must have been under an obligation to exercise care or diligence either assumed by contract or imposed by law. An alleged act of negligence must always be the proximate cause of the injury sustained; but any injury caused to a person by another who at the time is exercising due care is not actionable. The question of negligence is usually one for a jury, and the onus of proof rests on the plaintiff, except when the thing resulting from the negligence speaks for itself. A master is responsible for the negligence of his servants, but in no case can redress be had where contributory negligence on the part of the plaintiff is proved.

Nego'tiable Instrument, any note, bill, contract or document which can be endorsed and transferred to a third party. In addition to negotiable paper (q.v.), other written instruments considered negotiable are deeds, insurance policies, contracts, liens, judgments, etc.

Negotiable Paper, either promissory notes or bills of exchange, payable to the bearer or order. These are evidences of debt or money due and may be transferred to a third party by endorsement or delivery. The third party may sue for the amount in his own name. A sealed paper, unless issued by a corporation or State, is not usually deemed negotiable. The demand for payment of paper thus negotiated must be made when the note falls due, or to use the common phrase, at its maturity. But this is not at the expiration of the time when the note is made payable on the face of it. The law adds three whole days, which are called days of grace. At first, these were, as the name intimates, days of favor or mere indulgence; but usage, and now law, have converted them into an absolute right. In most of the States, statutes provide that all negotiable paper, not payable at sight or on demand, is entitled to three days of grace, unless it be expressly agreed otherwise. This is sometimes done, but not often; and the words used for this purpose are, simply, "without grace." One distinction is important. These days retain so much of their original character of mere indulgence, that if the last day of grace falls on Sunday, or on any holiday on which payment cannot be demanded, it is now due, and demand must be made, on the Saturday or other day preceding. But if paper without grace, or any payment not entitled to grace, falls due on Sunday, or any other legal holiday, the payer now gains a day, because payment cannot be demanded until Monday, or the day after the holiday.

Negri, nā'grē, **Ada,** Italian poet: b. Lodi, near Milan, 3 Feb. 1870. She became a schoolteacher at Motta-Visconti, on the Ticino, and in 1892 published a small volume of poems, 'Fatalità,' which in Italy aroused a general interest and by 1894 had passed through six editions. She received from the city of Florence an honorary stipend of $340 (1,700 lire) annually for a period of 10 years, and was appointed an instructor in literature at the Scuola Normale of Milan. His further work includes the volume 'Tempeste.' Much of her verse is an appeal for the working-classes. There is a German translation by Jahn of some of the poems. Consult: Heyse, 'Deutsche Rundschau' December 1894; Dornis, 'La Poesie italienne contemporaine' (1898).

Negritos, nā-grē'tōz, the negroid race inhabiting the Philippine Islands, the Andaman Islands, and the Malay Peninsula; in the Philippines they are called Aëtas or Itas. The negritos of the Philippines may be considered typical of their race; they are of small stature, seldom being more than four feet eight inches in height, with brachycephalic head form; their skin is dark, almost black, their hair short and woolly, and their features resemble those of the negroes, though the lips are not so thick. They are true savages, depending for their food upon hunting and wild roots; they do not build villages nor stable huts, but roam through the mountains in small bands of 50 or 60. They make baskets of a rude sort and their bows and arrows for hunting; tattooing is regularly practised among them.

They are found chiefly in the islands of Luzon, Panay, Palawan, Negros, Cebu, and Mindanao; and their number is estimated in the later United States reports as 30,000. Their origin and relationship to other races present many interesting ethnological questions which have not been satisfactorily settled; their geographical distribution, however, leaves little doubt that they were the original inhabitants of the Philippine Archipelago and at one time practically the sole possessors of the islands; they were probably driven back into the mountainous interior by invasions of primitive Malayans (see PHILIPPINE ISLANDS).

Negro, a name properly applied to the races inhabiting the continent of Africa, originally between lat. 10° N. and 20° S. The term does not include the inhabitants of Northern Africa, the Egyptians, Berbers, Nubians, Abyssinians and others. Neither do the Hottentots in South Africa belong to the negro race. The term negro, therefore, is not synonymous with African, and is not a national appellation, but denotes an ideal type constituted by certain physical characters, namely, black skin, woolly hair, flat nose, thick everted lips, and a prognathous form of skull.

Out of Africa, negroes are found in the United States, the West Indies, Brazil, Peru, the Cape Verde Islands, and Arabia. They are rare in Europe, Polynesia, and Australia. Negroes were nearly unknown to the Hebrews and the Homeric Greeks; the Egyptians, however, about 2300 B.C., became acquainted with negroes through the conquests of their rulers, and represented them on their monuments as early as 1600 B.C.; for nearly 35 centuries the type has remained unchanged in Egypt. Negroes were unknown to the Greeks until the 7th century B.C., their Ethiopians being merely any people darker than the Hellenic, like the Arabs, Egyptians, Libyans, or Carthaginians, none of which are negroes.

The negro race is divided naturally into two great divisions: (1) African negroes, (2) Papuans or Melanesians. There are four sub-divisions of African negroes, according to locality: (1) West Sudan and Guinea; (2) Central Sudan and Chad Basin; (3) East Sudan and Upper Nile; (4) South Africa. Authorities estimate their number at 130,000,000, with probably 20,000,000 full-blood or half-caste negroes, either slaves or descendants of slaves, chiefly in tropical or sub-tropical America, and enumerate the following as the chief anatomical and physiological points in which the negro differs most from his own congeners:

1. The abnormal length of the arm, sometimes reaching to the knee-pan.
2. Prognathism (Facial angle 70°, in Caucasian 82°).
3. Weight of brain, 35 ounces (in gorilla 20 ounces, average Caucasian (Europe or America) 45 ounces).
4. Full black eye, black iris, and yellowish sclerotic coat.
5. Short, flat, snub nose, broad at extremity, with dilated nostrils and concave ridge.
6. Thick, protruding lips, showing inner surface.
7. Very large zygomatic arches.
8. Exceedingly thick cranium, enabling him to use the head as a weapon of attack.
9. Weak lower limbs, terminating in a broad, flat foot, with low instep, projecting and somewhat prehensile great toe, and "lark heel."
10. Complexion deep brown, blackish, or even black, not due to any special pigment, but to the greater abundance of coloring matter in the Malpighian mucous membrane.
11. Short, black hair, distinctly woolly, not frizzly.
12. Thick epidermis, cool, soft, and velvety, mostly hairless, and emitting a peculiar odor described as hircine.
13. Frame of medium height, thrown somewhat out of the perpendicular by the shape of the pelvis, the spine, the backward projection of the head, and the whole anatomical structure.
14. The cranial sutures, which close much earlier in the Negro than in other races.

The native African negroes display considerable ingenuity in the manufacture of weapons, in the working of iron, in the weaving of mats, cloth, and baskets from dyed grasses, in the dressing of skins of animals, in the structure of their huts and household utensils, and in the various implements and objects of use in a barbarous state of society. Their religion consists in the worship of idols and fetishes, representing a supreme power which they all acknowledge; they believe also in good and evil spirits, in witchcraft, charms and spells, omens, lucky and unlucky days, etc.; they make fetishes of serpents, elephants' teeth, tigers' claws, and many similar objects, and reverence wooden images and sacred things, which they think have received a peculiar power from their divinities to drive away evil spirits, and protect them from danger, disease, and witchcraft. They make prayers and offerings to their idols, and have sacred songs, festivals, dances, ceremonies, and places; they sacrifice animals and sometimes human victims, especially during funeral obsequies; they have their priests and holy men, who are also magicians and doctors. They believe generally in an after life, without any distinct idea of retribution, and some tribes in the transmigration of the human soul into a gorilla, or other bird, beast, reptile, or fish. Being very fond of music, they have many ingeniously contrived musical instruments, generally of a noisy character; they have a keen sense of the ridiculous, and are of a cheerful disposition; though cruel to their enemies and prisoners, and setting little value on human life; they are naturally kind-hearted, hospitable to strangers, and communicative of their joys and sorrows; the females are remarkably affectionate as mothers and children, and as attendants on the sick, even to foreigners. They are less dirty in their persons and dwellings than most other barbarous races. For the history and development of the negro in America, see NEGRO IN AMERICA and NEGRO EDUCATION.

Negro Education. The negro race in America has grown from 20 native Africans imported into the country as chattel slaves in 1619, to 10,000,000 of free men, entitled under the Federal Constitution to all the rights, privileges and immunities of citizens of the United States, in 1904. The great task of educating these millions has been a phenomenal undertaking and the results have been still more phenomenal.

It was the general policy of the 16 slave-holding States of the South to prohibit by fine, imprisonment and whipping the giving of instruction to blacks, mulattoes or other descendants of African parentage, and this prohibition was extended in most of the slave States to "free persons of color" as well as to slaves.

But it has been the general policy of the slave system in all ages to keep the slaves in ignorance as the safest way to perpetuate itself. In this respect the American slave system followed the beaten path of history, and thus furnished the strongest argument for its own undoing. The ignorance of the slave is always the best safeguard of the system of slavery, but no such theory could long prevail in a democracy like ours. There were able and distinguished men among the slaveholders themselves who rebelled against the system and the theories by which it sought to perpetuate itself. Such Southern men as Thomas Jefferson, Henry Clay, Cassius M. Clay, and hundreds of others, never became reconciled to the system of slavery and the degradation of the slave.

The general character of the laws enacted on this subject by the slave States can be inferred from the following law, passed by the State of Georgia in 1829:

> If any slave, Negro, or free person of color, or any white person shall teach any slave, Negro or free person of color to read or write either written or printed characters, the said free person of color or slave shall be punished by a fine and whipping, at the discretion of the court; and if a white person so offend, he, she or they shall be punished with a fine not exceeding $500 and imprisonment in the common jail, at the discretion of the court.

There were no laws in the slave code more rigidly enforced than those prohibiting the giving or receiving instruction by the slaves or "free persons of color." And yet in nearly all the large cities of the Southern States — notably in Charleston, Savannah, and New Orleans — there were what were styled "clandestine schools," where such instruction was given. Those who maintained them and those who patronized them were constantly watched and often apprehended and "beaten with many stripes," but the good work went on in some sort until 1860, when the war that was to be "the beginning of the end" of the whole system of slavery, put a stop to all such effort for the time being.

There is no more heroic chapter in history than that which deals with the persistence with which the slaves and "free persons of color" in the slave States sought and secured a measure of intellectual and religious instruction; for they were prohibited from preaching or receiving religious instruction except by written permit and when at least five "white men of good reputation" were present at such gatherings. But there has never been a time in the history of mankind when repressive laws, however rigidly enforced, could shut out the light of knowledge or prevent communion with the Supreme Ruler of the universe by such as were determined to share these noblest of human enjoyments. True, only a few, a very few, of the blacks and "free people of color" were able to secure any appreciable mental instruction; but the fact that so many of them sought it diligently in defiance of fines and penalties is worthy of notice and goes far toward explaining the extraordinary manner in which this people crowded into every school that was opened to them after the war of the rebellion had swept away the slave system and placed all the children of the republic upon equality under the Federal Constitution. Nor was this yearning for mental instruction spasmodic; 34 years after the war all the school houses, of whatever sort, opened for these people are as crowded with anxious pupils as were the modest log school houses planted by New England men and women while the soldiers of the disbanded armies of the North and South were turning their faces homeward. A race so imbued with a love of knowledge, displayed in slavery and become the marvel of mankind in freedom, must have reserved for it some honorable place in our national life which God has not made plain to our understanding.

In the free States of the North very little more provision was made, as late as 1830, by the State for the education of the Negro population than by the slave States. There was no prohibition by the State against such instruction, but there was a very pronounced popular sentiment against it, when prosecuted by benevolent corporations and individuals. In 1833 the Connecticut legislature enacted the following black law, for the purpose of suppressing a "school for colored misses" which Miss Prudence Crandall had been forced to open in self-defense, at Canterbury:

> Whereas, attempts have been made to establish literary institutions in this State for the instruction of colored persons belonging to other States and countries, which would tend to the great increase of the colored population of the State, and therefore to the injury of the people; therefore,
>
> Be it enacted, etc., that no person shall set up or establish in this State any school, academy, or other literary institution for the instruction or education of colored persons, who are not inhabitants of this State, or harbor or board, for the purpose of attending or being taught or instructed in any such school, academy or literary institution, any colored person who is not an inhabitant of any town in this State, without the consent in writing, first obtained, of a majority of the civil authority, and also the selectmen of the town, in which such school, academy or institution is situated, etc.
>
> And each and every person who shall knowingly do any act forbidden as aforesaid, or shall be aided or assisting therein, shall for the first offense forfeit and pay to the treasurer of this State a fine of $100, and for the second offense $200, and so double for every offense of which he or she shall be convicted; and all informing officers are required to make due presentment of all breaches of this act.

The cause of this law was the acceptance by Miss Crandall of a young colored girl into her select school for young ladies. The parents of the white students insisted upon the dismissal of Miss Harris, the bone of contention, but Miss Crandall refused to do so, when the white students were withdrawn. Miss Cran-

dall then announced that she would open her school for "young ladies and little misses of color." The people of Canterbury protested against this course, and persecuted legally and otherwise Miss Crandall and her 20 pupils. When they found that they could not intimidate the brave woman the legislature was appealed to, and the law was enacted. Under it Miss Crandall was arrested and placed in the common jail. The case was tried three times in the inferior courts, and was argued on appeal before the court of errors 22 July 1834. The court reserved its decision and has not yet rendered it. The obnoxious law was repealed in 1838.

Schools established for the education of Negro youth were assaulted and wrecked in free States, but the good work steadily progressed. Private schools sprang up in all the Middle and New England States, Pennsylvania, New York, and Massachusetts leading in the work, their white citizens contributing largely to their support. There were many of these schools, some of them of splendid character, in Boston, Providence, New York, Philadelphia, Washington and Cincinnati. They were gradually absorbed into the public school system, and none of them now exist in an independent character, except the Institute for Colored Youth at Philadelphia, Lincoln University, in Chester County, and Avery Institute at Allegheny City, all in Pennsylvania.

In 1837 Richard Humphreys left $10,000 by will, with which the Institute for Colored Youth was started, 30 members of the Society of Friends forming themselves into an association for the purpose of carrying out the wishes and plans of Mr. Humphreys. A remarkable feature of the constitutions adopted by the trustees, in view of the present consideration of the subject by those concerned in Negro education, is the following preamble:

"We believe that the most successful method of elevating the moral and intellectual character of the descendants of Africa, as well as of improving their social condition, is to extend to them the benefits of a good education, and to instruct them in the knowledge of some useful trade or business, whereby they may be enabled to obtain a comfortable livelihood by their own industry; and through these means to prepare them for fulfilling the various duties of domestic and social life with reputation and fidelity as good citizens and freemen."

The measure of progress which has been made in public opinion and in the educational status of the Negro race in the Middle and New England States can easily be estimated by the fact that as recently as 1830 no Negro could matriculate in any of the colleges and other schools of this splendid group of States, and that now not one of them is closed against a black person, except Girard College at Philadelphia, whose founder made a perpetual discrimination against people of African descent in devising his benefaction; that Negro children stand on the same footing with white children in all public schools benefits; that the separate school system has broken down entirely in the New England States and is gradually breaking down in the Middle States, New Jersey and Pennsylvania being the only States in the latter group which still cling to the principle; and that in many of the public schools of both groups of States Negro teachers are employed and stand upon the same footing as white teachers. Indeed, Miss Maria L. Baldwin, an accomplished black woman, is principal of the Agassiz School, at Cambridge, Mass., and in the large corps of teachers under her, not one is a member of her own race.

All this is a very long stride from the condition of the public mind in the Middle and New England States when Negro children were not allowed to attend any public school or college and when a reputable white woman was persecuted, jailed and her property destroyed, in 1834, for accepting a young colored woman into her select school. This remarkable change in public sentiment argues well for the future of the Negro race and for the republic, which for more than a century has agonized over this race problem, and is still anxious about it in the 16 Southern States, where a large majority of the Negroes reside and will, in all probability, continue to reside for all time to come.

Dr. A. D. Mayo, one of the best authorities on educational matters in the United States, says that "it is still a favorite theory of a class of the representatives of the higher university and college education to proclaim the invariable legitimate descent of the secondary and even elementary schooling of the people always and everywhere from this fountain head," the Southern States, and that, "in one sense, this assertion is 'founded on fact.'" But, although most of the Southern States were committed to the theory of public education, the system of slavery stood in the way of the development of the theory. Popular education and slavery, like oil and water, will not mix. The educational energy of the South expanded rather along academic and collegiate than common school lines. The slave-holding aristocracy drew the social line against the poor whites as well as the slave blacks, and while dooming the latter to mental darkness by stringent laws, rigidly enforced, the same result was accomplished in the case of the former by the steady development of the old English theory of academy education, chartered for the most part by the State but supported almost wholly by their patrons, and therefore inaccessible to the children of the poor whites. It was due to this fact that so very large a percentage of the southern white population figured in the first census after the War of the Rebellion as illiterate and so figure to a large extent even to-day, 29 years after the beneficent operation of the public school system in all of the States of the South.

In the South, because of the existence of the slave system more than anything else, drifted away from the theory of public school education, prior to 1860, it has nobly rectified its mistake since 1870. Upon this point Dr. Mayo says, speaking of Virginia, which has always set the pace for her sister States of the South — and especially in the matter of education, under the leadership of Dr. W. H. Ruffner (from 1870 to 1882), who has been appropriately styled the Horace Mann of the South:

> But the condition of the educational destitution in which the State found itself in 1865, in the hour of its dire extremity, was the logical result of the narrow English policy it has pursued in this as in other directions; and in 1870 the cry went up, from the sea to the most distant recesses of the western mountains, for the establishment of the American people's common school.
>
> In nothing has the really superior class of Vir-

ginia more notably declared its soundness, persistence, and capacity to hold fast to a great idea than in the way in which it stood by the educational ideas of Jefferson through the one hundred turbulent years from the outbreak of the War of the Revolution to the inauguration of the people's common school in 1870.

As it was with Virginia, so it was with the other Southern States. A revival was begun in public or common school education in 1870, which is still in progress, such as swept over New England and the Middle States from 1830 to 1860. Broken in fortune and bowed with defeat in a great Civil War, the South pulled itself together as a giant rouses from slumber and shakes himself, and began to lay the basis of a new career and a new prosperity in a condition of freedom of all the people and in the widest diffusion of education among the citizens through the medium of the common schools. Perhaps no people in history ever showed a more superb public spirit and self-sacrifice under trying circumstances than the people of the South have displayed in the gradual building up of their public school system upon the ruins of the aristocratic academy system. The work had to be done from the ground up, from the organization of the working force to the building of the school houses and the marshaling of the young hosts. The work has required in the aggregate, perhaps, the raising by taxation of $514,922,268, $100,000,000 having been expended in maintaining the separate schools for the negro race. This must be regarded as a marvelous showing when the impoverished condition in which the war left the South in 1865 is considered. But it is a safe, if a time-honored saying, that "where there is a will there is a way." The Southern people found a way because they had a will to do it; and it is not too much to claim that the industrial prosperity which the South is now enjoying is intimately connected with the effort and money expended in popular education since 1870.

The total enrolment of the 16 Southern States and the District of Columbia for the year 1896–7 was 5,398,076, the number of Negro children being 1,460,084; the number of white children 3,937,992. The estimated number of children in the South from 5 to 18 years of age was 8,625,770, of which 2,816,340 or 32.65 per cent were children of the Negro race, and 5,809,430 or 67.35 per cent were white children. The number of Negro children enrolled was 51.84 per cent of the Negro population and 67.79 of the white population. When the relative social and material condition of the former is contrasted with that of the latter, it must be admitted that the children of the former slaves are treading closely upon the heels of the children of the former master class in the pursuit of knowledge as furnished in the public school system.

During the year 1896–7 it is estimated that $31,144,801 was expended in public school education in the 16 Southern States and the District of Columbia, of which, it is estimated, $6,575,000 was expended upon the Negro schools. Since 1870 it is estimated that $514,922,268 have been expended in the maintenance of the public school system of the Southern States, and that at least $100,000,000 have been expended for the maintenance of the separate public schools for Negroes.

The significance of the facts contained in the two foregoing paragraphs will be appreciated by Europeans as well as Americans. The fact that 2,816,340 children of former slaves were in regular attendance in the public schools of the late slave-holding States of the South during the year and that $6,575,000 was expended for their maintenance, gathered entirely from public taxation and funds for educational purposes controlled by the States, should be regarded as the strongest arguments that could be presented to Americans or to foreigners to prove that the race problem in the United States is in satisfactory process of solution. The people of the Southern States, the old slave-holding class, have not only accepted in good faith the educational burden placed upon them in the addition of 8,000,000 of people to their citizenship, but they have discharged that burden in a way that must command the admiration of the world. That my own people are discharging their part of the obligation is shown in the statistics of school attendance and in the further fact that it is estimated they have amassed since their emancipation $300,000,000 of taxable property. While this may seem small as a taxable value as compared to the aggregate of taxable values in the Southern States, it is large, indeed, when the poverty of the Negro race in 1865, with all the advantages and disadvantages of slave education and tradition to contend with, are considered. When a race starts empty-handed in the serious business of life, what it inclines to and amasses in a given period is valuable almost wholly as a criterion upon which to base a reasonable deduction as to its ultimate future. The Negro race is compelled to go forward in the social scale because it is surrounded by forces which will not permit it to go backward without crushing the life out of it, as they crushed the life out of the unassimilable aboriginal Indian races of North America. It is clear that the Negro race, in its desire for American education, possesses the prime element of assimilation into the warp and woof of American life, and if its desire for the Christian religion be added we have the three prime elements of homogeneous citizenship as defined by Prof. Aldrini, namely, habitat, language and religion.

It seems well to say this much, adduced from the statistics of common school education in the late slave States of the 16 Southern States and the District of Columbia, where the bulk of the Negro people reside, as a logical conclusion in a problematical situation, concerning which many wise men are disposed to indulge a pessimism which confuses them as well as those who have to deal immediately with the perplexing condition of affairs. The common school statistics of the Southern States leave no room for doubt as to the ultimate well-being of the Negroes residing in those States.

The extraordinary development of the public school system of the 16 Southern States and the District of Columbia has been hastily recorded since 1870. It is a record worthy of the proud people who made it,—people who have from the foundation of the republic been resourceful, courageous, self-reliant; rising always equal to any emergency presented in their new and trying circumstances, surrounded on every side, as they were, by a vast undeveloped territory, and by a hostile Indian population, and fatally handicapped by a system of African slavery, which proved a millstone about the

neck of the people until it was finally abolished, amid the smoke and flame and death of a hundred battles in 1865. There are none so niggardly as to deny to the Southern people the full measure of credit which they deserve for the splendid spirit with which they put aside their prejudices of more than two centuries against popular common school education on the one hand, and their equally prescriptive prejudice against the education of the Negro race under any circumstances on the other. Few if any people in the various history of mankind have so completely overcome two such prejudices. On this point Dr. Mayo says:

> Almost 100 years ago young Thomas Jefferson drew up a scheme for the education of the people of Virginia, which, had it been adopted, would have changed the history of that and of every southern State and the nation. He proposed to emancipate the slaves and fit them, by industrial training, for freedom; to establish a free school for every white child in every district of the colony; to support an academy for boys within a day's horseback ride of every man in the Old Dominion, and to crown all with a university, unsectarian in religion, elective in its curriculum, teaching everything necessary for a gentleman to know. This plan received the endorsement of many of the most eminent men of the day, and exalts the fame of Jefferson as an educator even higher than his reputation as a statesman.

All that Jefferson dreamed and outlined for the people of Virginia and of the South has been more than accomplished for both races in Virginia and in the South. The possibilities of a common school, collegiate and industrial education have been placed in easy reach of all the people, and the people are justifying the splendid faith of the Sage of Monticello by the earnestness with which they are taking advantage of the opportunities provided for them by the States and a munificent Christian philanthropy — a philanthropy which has given fully $40,000,000 of money and thousands of devoted men and women teachers to illuminate the mental darkness generated by the system of slavery. Surely no better monument than this philanthropy could be erected to perpetuate the memory of Horace Mann and Henry Barnard, in relighting the fires of popular education in the Middle and New England States, for without their labors and sacrifices in this cause that philanthropy would not have been possible.

But the public school system of the Southern States had to have other and more substantial foundation than was offered at the close of the War of the Rebellion, in 1865, by the academy and college system which had been fostered and developed as best adapted to a social condition whose cornerstone was the slave system. Without this foundation, firmly and wisely laid in the fateful years from 1865 to 1870, by the initiative of the Federal Government, magnificently sustained by the philanthropy and missionary consecration of the people of the New England and Middle States, the results which we have secured in the public school system of the South from 1870 to the present time would not have been possible. All the facts in the situation sustain this view.

It is creditable to the people of the New England and Middle States that they, who had been engaged for four years in a Titanic warfare with their brethren of the Southern States, should enter the Southern States in the person of their sons and daughters, and with a voluntary gift of $40,000,000, or more, to plant common schools and academies and colleges, in the devastation wrought by the Civil War, upon the sites where the slave auction block had stood for 250 years, thereby lifting the glorious torch of knowledge in the dense mental darkness with which the slave system had sought to hedge its power; nor is it less creditable that the Southern people accepted this assistance and builded upon it a public school system which promises to equal that in any of the other sections of the republic.

In anticipation of the condition of affairs that would arise when hostilities should cease, as early as the spring of 1865, before the war was over, an act was passed by Congress providing for the relief of the destitute of the South. The act was entitled "an act to establish a bureau for the relief of freedmen and refugees." On 20 May 1865, Major-General O. O. Howard was appointed commissioner of the Freedman's Bureau. General Howard,— who founded the institution which bears his name at Washington and gave it a princely endowment,—"gave," says the historian Williams, "great attention to the subject of education; and after planting schools for the freedmen throughout a greater portion of the South, in 1870, five years after the work was begun, he made a report. It was full of interest. In five years there were 4,239 schools established, 9,307 teachers employed, and 247,333 pupils instructed. In 1868 the average attendance was 89,396, but in 1870 it was 91,398, or 79¾ per cent of the total number enrolled. The emancipated people sustained 1,324 schools themselves, and owned 592 school buildings. The Freedman's Bureau furnished 654 buildings for school purposes."

In 1879, according to the same authority, "there were 74 high and normal schools, with 8,147 students, and 61 intermediate schools, with 1,750 students in attendance. In doing this great work,— for buildings, repairs, teachers, etc.,— $1,002,896.07 was expended. Of this sum the freedmen raised $200,000. This was conclusive proof that emancipation was no mistake."

Mr. Williams says further that it appears from the reports of the Freedman's Bureau that the earliest school for freedom was opened by the American Missionary Association, at Fortress Monroe, Va., September 1861, and before the close of the war Hampton and Norfolk were leading points where educational operations were conducted; but after the cessation of hostilities teachers were sent from the Northern States and schools for freedmen were opened in all parts of the South. During the five years of its operations the bureau made a total expenditure of $6,513,955.55. No money was ever more wisely or beneficently expended. While a goodly portion of it was expended in food and clothing, and the like, for the destitute freedmen, by far the most of it went into school houses and into the salaries of school teachers, and finally became the basis if not the inspiration of the public school system of the Southern States; it certainly did become the inspiration and the foundation of the 178 schools for secondary and higher education which exist to-day independently of the public school system or of State control, although many of them are recipients of State assistance.

While the Federal Government was planting these schools among the freedmen, the people of the Middle and New England States were

sending thousands of dollars into the South and sending an army of devoted men and women to back up and carry forward the educational work among the freed people. In the extent of it, it was and it continues to be the most striking example of Christian brotherhood and benevolence in the annals of mankind. Through the agency of the Federal Government and Northern philanthropy, schools for the freed people were planted everywhere, and grew and prospered, and continue to grow and prosper, as such schools never have done before.

After 30 years of effort there are 25,615 Afro-American teachers in the schools of the South, where there was hardly one when the work began; some 4,000 men have been prepared, in part or in whole, for the work of the Christian ministry, and a complete revolution has been effected in the mental and moral character of Afro-American preachers, a service which no one can estimate who is not intimately informed of the tremendous influence which these preachers exercise everywhere over the masses of their race; the professions of law and medicine have been so far supplied that one or more representatives are to be found in every large community of the South, as well as in the North and West, graduates for the most part of the schools of the South; and all over the South are men engaged in trade occupations whose intellects and characters were shaped for the battle of life by the New England pioneers who took up the work where their soldier brothers laid it down at the close of the war. But the influence of these teachers upon the character, the home life, of the thousands who are neither teaching, preaching nor engaged in professional or commercial pursuits, but are devoted to the making of domestic comfort and happiness for their husbands and children, in properly training the future citizens of the republic, was one of the most necessary and far-reaching that was exercised, and the one which to-day holds out the promise for the best results in the years to come.

It was these New England men and women who labored all over the South from 1865 to 1870 who made possible the splendid public school results. Their labors did not end in the field of primary education in 1870; they remained at their posts until they had prepared the 25,000 Negroes necessary to take their places. And even unto to-day hundreds of them are laboring in some one of the 169 schools of secondary and higher education maintained for the freed people.

In the inauguration and development of the educational work in the Southern States and the District of Columbia there have been other potential agencies than those already enumerated. It has been shown that the Federal Government, operating through the Freedman's Bureau, of which Major-General O. O. Howard was commissioner, between 1865 and 1870 established 4,239 schools, employing 9,307 teachers, with an enrolment of 247,333 pupils, at a total expense of $1,002,896.07, of which the freedmen themselves raised $200,000; that the American Missionary Association, founded in 1846, was among the first agencies to enter the southern educational work, as it has since been the most active and effective; and that the Southern States, from 1870, when they assumed control of the common school system, to 1896–7, spent in primary education, $514,922,268, of which at least $100,000,000 was devoted to the free education of the slaves. These enormous expenditures were largely supplemented by private benevolence, estimated at a total of $40,000,000, much of which went into primary school buildings and education, the buildings in most instances having been gradually relinquished to the States.

As the American Missionary Association was among the first to enter the southern school work, it is proper to give it a conspicuous place in this monograph. The extent of its operations in the southern field can be inferred from the 53d annual report of the executive committee. From this report it appears that the association has in the southern educational work of secondary and higher education 5 chartered institutions, 45 normal and graded schools, 26 common schools, being 76 schools, with 414 instructors and 12,428 pupils. The receipts for the current work for the year were $297,681.98; expenditures, $296,810.84. The total receipts for all purposes for the year were $370,963.44, of which $71,960.50 is credited to income from the Daniel Hand fund. The work of this association has been inestimable.

At the annual meeting of the American Missionary Association, at Providence, R. I., October 1888, it was announced that Daniel Hand, of Guilford, Conn., had given the association $1,000,894.25, in trust, to be known as the "Daniel Hand educational fund for colored people," the income of which shall be used for the purpose of educating needy and indigent colored people of African descent, residing, or who may hereafter reside, in the recent slave States of the United States." In addition to this princely gift Mr. Hand provided that his residuary estate, amounting to the sum of $500,000, should be devoted to the same purpose, to be disbursed through the association. Mr. Hand made his wealth in the South, where he settled in Augusta, Ga., in 1818, and he, therefore, had an intimate knowledge of the educational needs of the emancipated people. He was a man of devout nature.

But the fund which had the most influence upon the development of the primary and secondary education of the Southern States was that of $2,000,000 established by George Peabody, of Danvers, Mass. (the first gift of $1,000,000 being made 7 Feb. 1867, the second $1,000,000 being added 1 July 1869). In addition, $1,100,000 in bonds, endorsed by Mississippi, and $384,000 Florida bonds were given to the trustees appointed to administer the trust, but these bonds were ultimately repudiated by Mississippi and Florida, although both of them were beneficiaries of the trust,— Mississippi by $86,878 and Florida by $67,375, from 1868 to 1897. The general purposes of the trust, as Mr. Peabody stated it, in his letter to the 16 trustees designated by him, were that "the income thereof should be applied in your discretion for the promotion and encouragement of intellectual, moral or industrial education of the young of the more destitute portions of the southern and southwestern States of our union; my purpose being that the benefits intended shall be distributed among the entire population, without other distinction than their needs and the opportunities of usefulness to them."

The trustees of the Peabody fund, of which the Hon. Robert C. Winthrop was chairman, were particularly fortunate in securing as the first general agent Dr. B. Sears, then president of Brown University. Dr. Sears died 6 July 1880, and was succeeded 2 Feb. 1881, by Dr. Curry,— a southern man,— learned, eloquent, an indefatigable worker, and passionately devoted to the highest educational ideas and to the cause of southern education. As the representative of the Peabody fund and the Slater fund, he has done quite as much as Dr. Ruffner and Dr. Sears in shaping the southern educational movement.

From 1868 to 1897 the income of the fund amounted to $2,478,527.13, of which $248,562.25 was expended in maintaining the Normal College for whites at Nashville, Tenn., and $398,690.88 for scholarships at the same college. The remainder was expended in rendering aid to the needy public schools of the South and in stimulating normal and industrial education for both races.

In March 1882, John Fox Slater, of Norwich, Conn., created a trust fund of $1,000,000, stating that the "general object which I desire to have exclusively pursued is the uplifting of the lately emancipated population of the Southern States and their posterity by conferring on them the blessings of Christian education." He declared in the same relation: "The disabilities formerly suffered by these people and their singular patience and fidelity in the great crisis of the nation, establish a just claim on the sympathy and good will of humane and patriotic men. I cannot but feel the compassion that is due in view of their prevailing ignorance which exists by no fault of theirs."

"But it is not only for their own sakes," Mr. Slater said further, "but also for the safety of our common country, in which they have been invested with equal political rights, and I am desirous to aid in providing them with the means of such education as shall tend to make them good men and good citizens — education in which the instruction of the mind in the common branches of secular learning shall be associated with training in just notions of duty toward God and man in the light of the Holy Scriptures."

The fund is administered by a trustee board, and like the Peabody fund, composed of some of the most distinguished citizens of the republic. The Slater fund is used almost exclusively at the present time in promoting industrial education at a number of the largest institutions for colored people.

These princely donations by three private citizens, aggregating a fund of $4,000,000, have been supplemented by millions of dollars more from private citizens which have gone to the building up of the educational waste places of the South, to which all of the great church denominations have contributed, and still contribute, more or less as organized bodies. As the outgrowth of the benefactions and effort since 1865 there are now, according to Dr. Mayo, 169 schools of secondary and higher education in the Southern States maintained for the Negro people. They are fed constantly by the common schools. and all the agencies working together are fast reducing the ignorance bequeathed as a terrible legacy by the slave system to the Southern States. We shall search history in vain for a parallel to the munificence, the Christian charity and the personal sacrifice which the people of the great republic have contributed since 1865 to the education of the lately enslaved people of the Negro race.

It was natural and to have been expected, after the New England men and women who had graduated out of the white heat of the high educational enthusiasm created by Horace Mann, Henry Barnard, Dr. Sears, and others, from 1830 to 1860, had laid the foundation of the primary education among the emancipated people of the Southern States, that they would then turn their attention to the secondary and higher education of the same people. As fast as they prepared young men and women to take their places as school teachers (and at the present time there are more than 25,000 such teaching in the public schools of the South), these New England men and women retired from the field as public school teachers. They were actuated almost wholly by Christian missionary spirit.

But there was another and a splendid work for them to do in laying the foundation of the secondary and higher education as the necessary supplement of the primary educational work. At the present time there are 169 such schools in the 16 Southern States and the District of Columbia. Some of them are magnificent seats of learning; such, for example, as Howard University, at Washington; Atlanta University, at Atlanta; Fisk University, at Nashville; Wiley University, at Marshall, Texas, and the like, so that the Southern State which has no such school of higher learning is poor indeed. And these schools were founded, for the most part, and are maintained in the main by northern philanthropy — a philanthropy of which George Peabody, John F. Slater and Daniel Hand are the most striking examples. The fact that the income of these 169 schools in 1896–7 was $1,045,289, that $540,097 of it was derived from unclassified sources, that the several States and municipalities contributed $271,839, and that the students paid in tuition fees $141,262, shows that all the best forces of the republic — the State, the Christian philanthropist and the grateful beneficiary — are all working harmoniously together to prepare the children of the former slaves for the proper and high duties of citizenship. The public school system.— with 1,460,084 pupils enrolled of Negroes, in 1896–7, as against an enrolment of only 571,506 in 1876–7,— is a fixture and serves as a constant feeder of the 169 schools of higher learning. Thus the whole system, it will be seen, of primary, secondary and higher education, is in harmonious relationship and must grow stronger every year.

It should not be overlooked, however, that besides the splendid advantages offered the Negroes by these 169 schools of higher learning, all of the colleges and universities of the Northern and Western States are accessible to Negro students who prefer them, color distinctions not being recognized or tolerated in the management of these schools. The white colleges and universities of the Southern States, like the public school system, are conducted rigidly upon lines of race separation.

It was a natural development of the educational effort in the Southern States that when the schools of secondary and higher education

had become fixed facts a desire should have grown up for other institutions whose principal object should be the industrial education of such of the Negroes as desire that sort of education. Of late years industrial schools have sprung up all over the Southern States, and they are growing constantly in favor with the masses, because of their economic condition and the growing demand for skilled workmen in all avenues of industry. In the early days of the educational work of the Southern States little stress was laid upon the industrial training of the people. Mental and moral and religious training was considered the all-important thing. Perhaps it was, — to a people who had dwelt in mental, moral and religious darkness from 1620 to 1865. They needed the great light of mental, moral and religious truths as a firm and sure foundation upon which was to be built a structure of technical education, out of which should naturally grow the industrial and commercial rehabilitation of the people, without which there can be no character, no strength, no prosperity in an individual or a race. This principle was recognized by the 30 members of the Society of Friends, who established the Institute for Colored Youth at Philadelphia in 1837.

The Friends were very much in advance of their time, and a great many good people of both races have not caught up with their idea as yet. However, there has been a very great and satisfactory awakening all over the republic during the past decade, among all races of the population, as to the vital importance of technical education. The fact that 13,581 Negro students were receiving industrial training in schools of the South, in 1897, speaks volumes, as compared to the 2,108 who were receiving collegiate education, and the 2,410 who were receiving classical instruction, and the 1,311 who were taking the professional course in the same year; making a total of 5,829 taking the higher education, or 7,752 fewer than were taking the industrial course. Indeed, the growth of the industrial theory of education among Negroes in the past decade has not only been phenomenal, but it is by all odds the most encouraging fact in a situation not without its discouraging features.

It is a rare compliment to one of the wisest and best of the New England men who engaged in the southern educational work that his theory of industrial training has taken such a firm root in a rich soil. This good and wise man was General Samuel Chapman Armstrong. While other men and women were devoting themselves to the necessary work of founding schools of secondary and higher education for the freed people, General Armstrong in 1868 busied himself in founding and developing the Hampton Normal and Agricultural Institute at Hampton, Va., which, says the historian of the work, "beginning in 1868 with two teachers and 15 students in the old barracks left by the Civil War, the Hampton school has grown, until at the beginning of 1899 there were 1,000 students. Of these 135 are Indians, representing 10 States and Territories. Of the 80 officers, teachers and assistants, about one half are in the industrial departments. Instead of the old barracks there are now 55 buildings."

The Hampton Normal and Agricultural Institute is without doubt at the present time the centre of all that is best, wisest and most permanent in the educational development of the black man in the South. It is by far the largest and most important seat of learning in the country for the development of the Negro. It has a large property now valued at over $500,000 and has in constant operation all the industries by which the colored people find it necessary to make a living. Under wise supervision this institution is constantly growing, broadening and deepening its influence among the people. The work of the Hampton Institute has not only resulted in turning the attention of the Negro population to the importance of industrial education, but has had a marked influence in shaping the education of the white South in the same direction.

Out of the Hampton Institute grew the Tuskegee Normal and Industrial Institute, located at Tuskegee, Ala., in the black belt of the South. The Tuskegee Institute has grown from a log cabin to an institution possessing at the present time (1904) 62 buildings with 2,325 acres of land, 151 instructors and over 1,500 students. It gives instruction in about 36 different industries, in addition to giving training in academic and religious branches. A large number of graduates of Tuskegee are turned out every year and are at work in various portions of the South as teachers in class rooms, instructors in agricultural, mechanical and domestic pursuits. Quite a number of these graduates and students cultivate their own farms or man their own industrial establishments. The property owned by the Tuskegee Normal and Industrial Institute is valued at $700,000, and the buildings have been very largely built by the labor of the students themselves. One rather unique feature of the Tuskegee Normal and Industrial Institute is that the institution is wholly officered by members of the Negro race. Aside from Hampton, Tuskegee is one of the largest and most important centres of education in the South, especially in the direction of industrial development.

The work of the Hampton Institute and Tuskegee is not only proving itself valuable in showing the rank and file of the colored people how to lift themselves up, but it is equally important in winning the friendship and co-operation of the southern white people. The influence of the young men and women turned out from these two institutions, as well as from other institutions, is gradually softening the prejudice against the education of the Negro, and in many striking instances bringing about the active co-operation and help of the southern white man in the direction of elevating the Negro to a higher plane of living.

There have been many other schools than the Tuskegee Institute founded on the Hampton idea, and the number is increasing every year. Nearly all the Southern States are now maintaining industrial schools not only for the blacks but for the whites as well, for the education that is good and necessary for the black is equally so for the white boy.

From these facts and conclusions set forth, hastily withal, it will readily be seen that from the educational point of view the Negro race has, since 1865, taken full advantage of its splendid opportunities, and that the present

affords splendid promise that the future, which so many dread, will, in the providence of God, take care of itself. BOOKER T. WASHINGTON,
President Tuskegee Institute.

Negro Exodus, in American history, a term applied to the emigration of southern negroes to the West and Southwest in 1879 and 1880. During these years upward of 50,000 negroes, men, women, and children, moved to Kansas, and as many more were scattered among the other Western States. So many of the emigrants were penniless and destitute that a Freedmen's Relief Association was organized among the citizens of Kansas. The movement proved so disastrous that emigration ceased at the close of 1880. The negroes undoubtedly removed to the West to better their condition, but the charge was openly made that the movement originated with the Republican party, in order to ensure the election of Republican presidential electors in doubtful States.

Negro Free State. See LIBERIA.

Negro in America, The. In 1900 there were in the United States and its dependencies, 8,840,789 persons of negro descent. They were descendants of the slaves brought from Africa to America in the 15th, 16th, 17th, 18th, and 19th centuries. The demand for workmen in the mines and on the plantations of the Spanish West Indies was the primary incentive for opening the African slave trade to America. A small European slave trade from Africa had begun with the voyage of the Portuguese sailor, Antonio Gonzales, to the River of Gold in 1442. This stream was soon turned toward America when the Indians failed as workmen and the trade was encouraged by King Ferdinand and the Emperor Charles V. The Bull of Demarcation having debarred Spain from African possessions, she was compelled to secure her slaves through contract with the Portuguese and later with other trading nations. This contract for supplying the Spanish Indies with negroes became to be a great commercial prize and the zeal with which the Portuguese, Dutch, and English successively filled these contracts was the main means of transplanting this race.

Early Immigration.— The exact number of negroes brought to America will of course never be known. Dunbar estimates that nearly 900,000 came to America in the 16th century, 2,750,000 in the 17th, 7,000,000 in the 18th, and over 4,000,000 in the 19th, less than 15,000,000 in all. In the limits of the United States, the growth of the black population has been steady and has even since the cessation of the slave trade far outstripped that of any other of the original groups of Americans. In colonial times the slaves went mainly to the West Indies, and, although a few landed in Virginia as early as 1619, they were not brought to the continent in large numbers until England secured the Spanish contract in 1713. At that time there were perhaps 50,000 negroes in continental America; by 1727 this had reached 75,000, and the subsequent increase is estimated by Bancroft as follows:

1750	220,000
1754	260,000
1760	310,000
1770	462,000
1780	462,000

Exact statistics as given by the census reports beginning in 1790 show the following figures:

DATE	Total negroes	Per cent of increase	Per cent of increase of whites	Per cent of total population
1790.....	757,208	.....	.....	19.27
1800.....	1,002,037	32.33	35.76	18.88
1810.....	1,377,808	37.50	36.12	19.03
1820.....	1,771,656	28.59	34.12	18.39
1830.....	2,328,642	31.44	34.03	18.10
1840.....	2,873,648	23.40	34.72	16.84
1850.....	3,638,808	26.63	37.74	15.69
1860.....	4,441,830	22.07	37.69	14.13
1870.....	4,880,009	9.86	24.76	12.66
1880.....	6,580,793	34.85	29.22	13.12
1890.....	7,488,789	13.79	26.68	11.93
1900.....	8,840,789	18.1	21.4	11.6

The census of 1870 was defective and probably that of 1890, also, which would explain the chief irregularities in the rate of increase of negroes. The higher rate of increase of the whites is due to the large immigration.

History.— The history of the negro in America up until 1863 is largely the history of slavery (q.v.). And yet he was not altogether the passive victim of the system. In the earlier days, the tendency was to recognize him as a kind of feudal serf not essentially different from the white serfs. Consequently, when freed, the free black had in many cases the right to vote and intermarried with the white servant class. Gradually, however, a color caste arose which condemned a person of negro descent to civil and legal inferiority, no matter whether he was technically a slave or not. The negroes did not submit to slavery or caste restrictions wholly without a struggle. Before 1850, while the fire of African freedom still burned in the veins of the slaves, there was in all leadership or attempted leadership but the one motive of revolt and revenge,— typified in the terrible Maroons, the Danish blacks, and Cato of Stono, and veiling all the Americas in fear of insurrection. The liberalizing tendencies of the latter half of the 18th century brought, along with kindlier relations between black and white, thoughts of ultimate adjustment and assimilation. Such aspiration was especially voiced in the earnest songs of Phillis, in the martyrdom of Attucks, the fighting of Salem and Poor at Bunker Hill, the intellectual accomplishments of Banneker and Derham, and the political demands of the Cuffes. Stern financial and social stress after the Revolutionary War cooled much of the previous humanitarian ardor. The disappointment and impatience of the negroes at the persistence of slavery and serfdom voiced itself in two movements. The slaves in the South, aroused undoubtedly by vague rumors of the Haitian revolt, made three considerable attempts at insurrection,— in 1800 under Gabriel in Virginia, in 1822 under Vesey in Carolina, and in 1831 again in Virginia under Nat Turner. In the free States, on the other hand, a new and curious attempt at self-development was made. In Philadelphia and New York color-proscription led to a withdrawal of negro communicants from white churches and the formation of a peculiar socio-religious institution among the negroes known as the African Church,— an organiza-

tion still living and controlling in its various branches over a million of men.

Walker's wild appeal against the trend of the times showed how the world was changing after the coming of the cotton-gin. In 1830, slavery seemed hopelessly fastened on the South, and the slaves thoroughly cowed into submission. The free negroes of the North, inspired by the mulatto immigrants from the West Indies, began to change the basis of their demands; they recognized the slavery of slaves, but insisted that they themselves were freemen, and sought assimilation and amalgamation with the nation on the same terms with other men. Thus, Forten and Purvis of Philadelphia, Shad of Wilmington, Du Bois of New Haven, Barbadoes of Boston, and others strove singly and together as men, they said, not as slaves; as "people of color," not as "negroes." The trend of the times, however, refused them recognition save in individual and exceptional cases, considered them as one with all the despised blacks, and they soon found themselves striving to keep even rights they formerly had of voting and working and moving as freemen. On the other hand it was impossible to suppress wholly the upward struggles of the free negro or even of the exceptionally gifted slaves. When the war with England broke out, negroes fought in the ranks; they helped man the victorious ships in the struggle of 1812, and finally in the Civil War turned the scale of victory for the North at a critical point. The number of free negroes was as follows:

1790	59,466
1800	108,435
1810	186,446
1820	233,634
1830	319,599
1840	386,293
1850	434,495
1860	448,070
1870	4,880,009

Barred out of the labor market by slavery on the one hand and color prejudice on the other, these negroes were in a desperate condition; and even in the free States "black laws" curtailed their civil rights. Nevertheless they struggled bravely. In 1830, they held their first national convention in Philadelphia, and began to agitate for civil rights and education, and to discuss schemes of migration to Canada and elsewhere. As the abolition movement grew it received substantial aid from free negroes; it was in a negro church in Boston that the American Anti-Slavery Society was formed, and the first subscribers to Garrison's 'Liberator' came from a Philadelphia negro, James Forten. Led by Remond, Nell, Wells-Brown, and Douglass, a new period of self-assertion and self-development dawned. To be sure, ultimate freedom and assimilation was the ideal before the leaders, but the assertion of the manhood rights of the negro by himself was the main reliance, and John Brown's raid was the extreme of its logic. After the war and emancipation, the great form of Frederick Douglass, the greatest of American negro leaders, still led the host. Self-assertion, especially in political lines, was the main programme, and behind Douglass came Elliot, Bruce, and Langston, and the Reconstruction politicians, and, less conspicuous but of great social significance, Alexander Crummell and Bishop Daniel Payne.

Civil Rights.— As a slave, the negro could be (1) sold or given away by his legal owners, (2) seized for debt, (3) separated from his family, (4) could own no property, (5) had no right to vote, (6) could not hold office, (7) nor could he testify in a court of law save in suits for his own freedom. (8) He could not legally marry, (9) nor trade or make contracts. (10) He could not move about without permission, (11) could be punished corporally and even killed by the master in some cases, and (12) was not permitted to learn to read and write. Being thus legally deprived of all essential rights of manhood, he was utterly defenseless before the aggressions of the unscrupulous even in matters of life and limb. Free negroes in slave States like Virginia and North Carolina were disfranchised early in the 18th century; later their right to testify in courts was taken away, then the right to hold any office, and finally legal pressure was brought to bear in the shape of vagrancy laws and curtailment of economic freedom so as to force them into slavery or drive them from the State.

The free negroes of the North were very generally subject to codes of "Black Laws" which varied from State to State. Those of Ohio as adopted and amended in 1804, 1807, 1824, and later, prohibited negroes from settling in the State unless they could show a certificate of freedom and give bonds guaranteeing good behavior and self-support; a negro was disqualified from testifying in court trials where a white person was a party or to serve as a juryman in any case; his children were excluded from the public school; finally he could not vote. Some States had less rigorous laws and tended to alleviate the position of the blacks; others tended toward greater restrictions.

When the Civil War came despite disclaimer and compromise, the negro was the central issue. The first pressing question was the treatment of fugitive slaves; Butler confiscated them as "contraband of war," Fremont sought to free all slaves, and Halleck sought to catch and return them. Finally beginning at Port Royal, S. C., under Pierce and extending to Fortress Monroe, New Orleans, Vicksburg, Cairo and wherever these fugitives were massed, there grew up systems of controlled negro labor under the guardianship of government officials. General Banks, for instance, had 90,000 ex-slaves under him in Louisiana, with 50,000 laborers under his guidance and an annual budget of $100,000. He made out 4,000 pay rolls a year, registered the freedmen, inquired into and redressed all grievances, laid and collected taxes, and established a public school system. Colonel Eaton in Tennessee, General Saxton in South Carolina, and others had similar work in charge.

Meantime missionary and freedmen's aid societies began sending money, clothes, and teachers south, and there was a demand that the government take hold of this work, unify it and help make easier the transition of 4,000,000 persons from slavery to freedom. This was the genesis of the Freedmen's bureau. This "Bureau of Refugees, Freedmen and Abandoned Lands" was established as a part of the War Department by the Act of 1865 and was modified and extended by the Act of 1866; the larger part of its functions ceased in 1869. General O. O. Howard conducted this bureau and "scarcely any subject that has been legislated upon in civil society failed at one time or an-

other to demand the action of this singular bureau." The Bureau had in its period of greatest activity 900 officials scattered from Washington to Texas. Their work included (1) the relief of physical suffering caused by the war; (2) the overseeing of the beginnings of free labor; (3) the buying and selling of land for the freedmen; (4) the establishment of schools; (5) the payment of bounty money to negro soldiers; (6) the administration of justice between white and black in the Bureau courts.

The Bureau distributed 21,000,000 free rations in fifty months, treated 500,000 patients in 60 hospitals and asylums, transported 30,000 fugitives back to the plantations, and made many thousands of contracts for the new free laborer. Little was done in the matter of furnishing the freedmen with land as the confiscated plantations were restored under the amnesty measures; but aided by the "carpet-bag" governments and the missionary societies a system of common schools and higher institutions was founded and nearly six millions spent on it. The Bureau courts were not successful and the general attitude of the whites was bitterly hostile to the institution. Such was the work of the Freedmen's Bureau. To sum it up in brief, we may say: it set going a system of free labor; it established the black peasant proprietor, it secured the recognition of black freemen before courts of law; it helped to found the free public school in the South. On the other hand, it failed to establish good will between ex-masters and freedmen; to guard its work wholly from paternalistic methods that discouraged self-reliance; to make negroes landholders in any considerable numbers. Its successes were the result of hard work, supplemented by the aid of philanthropists and the eager striving of black men. Its failures were the result of bad local agents, inherent difficulties of the work, and national neglect. The Freedmen's Bureau expired by limitation in 1869, save its educational and bounty departments. The educational work came to an end in 1872, and General Howard's connection with the Bureau ceased at that time. The work of paying bounties was transferred to the adjutant-general's office, where it was continued three or four years longer.

The Freedmen's Bureau really ended in the 14th and 15th amendments to the Constitution (1868 and 1870) giving negroes the right of suffrage. The last efforts of Charles Sumner were given to the Civil Rights Act of 1875, which forbade the exclusion of negroes from public conveniences and places of entertainment on account of color. This was afterward declared an interference with the rights of the States by the Supreme Court, and therefore unconstitutional. The matter of civil rights of negroes is therefore to-day left to the States and has resulted in widespread discrimination in the former slave States. Whites and negroes are separated in schools, railway trains, hospitals, jails, and graveyards by law, and by custom in hotels, theatres, lectures, libraries and churches, and often in street cars and elevators. Beside this there is a tendency to limit all economic and social intercourse to the barest amount necessary among neighbors. Intermarriage is forbidden and the concubinage of black women though decreasing is still considerable; and while it is very difficult to secure the punishment of a white man who violates a black woman, the black man who is even accused of rape against a white woman is usually lynched before he has had a legal trial. These separating laws and centrifugal tendencies have gone beyond reason, and the better thought of the South realizes it. In the future it is probable that lynching will cease, and kindlier intercourse be cultivated.

Political Rights.— Free negroes voted in many of the colonies in early times when otherwise qualified, but later the privilege was taken away as in Virginia in 1723. In the free States they continued to vote, but later were restricted sometimes by special qualifications, as in New York in 1821, or by limiting of the suffrage to whites, as in Pennsylvania in 1838. The 14th amendment to the United States Constitution sought to penalize States which reduced the electorate, and the 15th amendment made discrimination on account of race and color in the qualification of voters illegal. These enactments were made necessary by the opposition of the South to the Freedmen's Bureau and the evident determination of the southern legislatures to re-enslave the freedmen to all intents and purposes by civil restrictions, vagrancy laws, and special legislation. The result of the amendments was to throw the government of the southern States largely in the hands of the freedmen during the years 1866–76. So sudden increase of the electorate in any community would mean a period of disturbance and difficulty, but with honest leadership the outcome might have been different. As it was, dishonest and self-seeking politicians from both North and South sought to use the ignorant negro voters for their own ends, and much extravagance and some misgovernment ensued. Nevertheless it has been truly said of these negro governments:

> They obeyed the Constitution of the United States, and annulled the bonds of States, counties, and cities, which had been issued to carry on the war of rebellion and maintain armies in the field against the Union. They instituted a public school system in a realm where public schools had been unknown. They opened the ballot box and jury box to thousands of white men who had been debarred from them by a lack of earthly possessions. They introduced home rule into the South. They abolished the whipping post, the branding iron, the stocks and other barbarous forms of punishment which had up to that time prevailed. They reduced capital felonies from about twenty to two or three. In an age of extravagance they were extravagant in the sums appropriated for public works. In all of that time no man's rights of person were invaded under the forms of law. Every Democrat's life, home, fireside and business were safe. No man obstructed any white man's way to the ballot box, interfered with his freedom of speech or boycotted him on account of his political faith.

And a negro legislator of that period in South Carolina said in defense of his race that the men who criticised the extravagance of the period between 1869 and 1873 failed to mention

> Those imperishable gifts bestowed upon South Carolina between 1873 and 1876 by negro legislators — the laws relative to finance, the building of penal and charitable institutions, and, greatest of all, the establishment of the public school system. Starting as infants in legislation in 1869, many wise measures were not thought of, many injudicious acts were passed. But in the administration of affairs for the next four years, having learned by experience the result of bad acts, we immediately passed reformatory laws touching every department of state, county, municipal and town governments. These enactments are today upon the statute books of South Carolina. They stand as living witnesses of the negro's fitness to vote and legislate upon the rights of mankind.

Nevertheless, by force and fraud the negro governments were overthrown about 1876, and from that time until the present the negro has been disfranchised either by physical compulsion or cheating at the polls or ingenious legislation. The effects of these methods were so unfortunate that there arose in the South about 1890 a movement to deprive the negro of his vote by legal enactment. This has been practically accomplished now in Mississippi, Louisiana, South Carolina, North Carolina, Alabama, and Virginia, and movements in that direction have been started in other States. The avowed objects of these constitutional amendments have been (*a*) To disfranchise no white voter; (*b*) To disfranchise as many negroes as possible. This has been accomplished by the following measures:

1. *Illiteracy.*— The voter must be able to read and write. (This discriminates against negroes because the negro public school system in the South is much poorer than that of the whites.)
2. *Property.*— The voter must own not less than $300 worth of taxable property and pay taxes on it. (This of course discriminates against a poverty-stricken race of freedmen who could not legally hold property prior to 1863, and who to-day suffer in economic competition by reason of their color and training.)
3. *Poll Tax.*— A voter must have paid his poll tax. (This is a source of discrimination only when it extends back for several years as in Virginia.)
4. *Occupation.*— A voter must have a regular occupation. (This is designed to shut out negro laborers, and is a source of discrimination because of the difficulty of proving its truth.)
5. *Army Service.*— Soldiers or their descendants may vote. (Thoroughly vicious like the preceding.)
6. *Character.*—Persons of "good character" who "understand the duties of citizenship may vote." (This is a source of much discrimination and puts too much power in the hands of registrars.)
7. *"Grandfather" Clause.*— Persons who could vote 1 Jan. 1867 or their descendants may vote if registered within a limited time. (This is a thoroughly vicious attempt to admit ignorant white voters when the same class of blacks are barred.)
8. *"Understanding" Clause.*— Persons may vote who "understand" a clause of the Constitution and can explain it when read to them. (Another indefensible provision designed to shut out blacks arbitrarily by placing large powers of discretion in the hands of local registrars.)

Thus far States have adopted the above qualifications as follows:

Mississippi.— The literacy (1) qualification *or* the "understanding" clause (8) together with the poll tax (3) provision.

Alabama.— The army service (5) and character (6) clauses for persons registering prior to 1903; thereafter the literacy clause (1) and occupation clause (4), *or* the property qualification (2).

South Carolina.— For those registering before 1898, the literacy clause (1) except that writing is not required, *or* the understanding clause (8); after 1898 the literacy (1) *or* property (2) qualifications.

Louisiana.— Literacy (1) *or* property (2) clauses, in addition to the "grandfather" clause (7) which originated here.

North Carolina.— Literacy (1) *and* Poll tax (3) provisions, and "grandfather" clause.

Virginia.— For those registering before 1904, army service (5) *or* Property clauses (2); or literacy (1) *and* understanding clauses (8). After 1904, poll tax clause (3) providing the tax has been paid for three years, and literacy clause (1). Army service (5) excuses from the poll tax (3).

Other Southern States will probably adopt some of these expedients. Just what the ultimate results of these enactments will be is questionable. Probably the more flagrant provisions are unconstitutional and will be declared so eventually. If the negroes progress in the future as hitherto they cannot permanently be deprived of the suffrage.

Economic Status.— The occupations of negroes according to the census of 1890 were as follows:

Per cent of total negroes in gainful occupations 41.1 per cent.

	Total per cent	Male per cent	Female per cent
Professions	1.1	0.2	0.9
Agriculture	57.2	63.4	44.0
Trade and transportation	4.7	6.8	0.2
Manufacture	5.6	7.0	2.8
Domestic and personal service.	31.4	21.6	52.1

This shows that most of the freedmen's sons are farmers and servants as one would expect. Of 1,410,769 negro heads of families in 1890 264,288, or 18.89 per cent of all, owned the homes or farms they lived in; the corresponding figures for the American whites are 51.48 per cent; for Russian- and Polish-Americans 31.38 per cent; for Italians in America 14.51 per cent. In the larger cities (50,000 or more) 9.14 per cent of the negroes owned their homes. In 1900 the per cent of negro owners had risen to 21.8 per cent of all negro families, or 372,414. If we consider particularly negro farmers we find that in the country districts of the South emancipation has been but partial, and that the negro serf is still bound to the soil by peonage, plantation stores and a system of crop mortgages. Nevertheless negro farmers starting with almost nothing a generation ago own to-day 25.2 per cent of all the farms they cultivate, or 188,072 farms out of 746,717 farms, with a total acreage of over 12,000,000, and farm property worth nearly $250,000,000. The total value of the farm property owned and leased by negroes was in 1900, $499,943,734, of which $324,244,397 was represented by the land, $71,903,315 by the buildings, $18,859,757 by the farming tools, and $84,936,265 by the live stock. The average negro farm is worth $669 and contains 51.2 acres. Seventy per cent of the negro farms report cotton as the chief crop; these farms raise 4 million bales of cotton, 24 million pounds of rice, 9 million bushels of sweet potatoes, 88 million pounds of tobacco and 100 million bushels of corn.

Beside these independent farmers there are a vast number of negro laborers, who raise the crops on the farms of the white farmers. There were the following negroes in the designated trades in 1890:

Carpenters	22,318
Barbers	17,480
Saw-mill operatives	17,230
Miners	15,809
Tobacco factory employees	15,004
Blacksmiths	10,762
Brick-makers	10,521
Masons	9,647
Engineers and firemen	7,662
Dressmakers	7,479
Iron and steel workers	5,790
Shoemakers	5,065
Mill and factory operatives	5,050
Painters	4,396
Plasterers	4,006
Quarrymen	3,198
Coopers	2,648
Butchers	2,510
Wood-workers	1,375
Tailors	1,280
Stone cutters	1,279
Leather-curriers	1,099

There were in the United States in 1890 about 175,000 negro skilled artisans in the main classes enumerated above.

In trade negroes are but making a beginning and have about ten millions of dollars invested in small grocery stores, drug-stores, undertaking establishments, newspapers, restaurants, etc. The negroes in professions included in 1890 12,000 clergymen, 400 lawyers, 1,000 government officials, 800 physicians, and 25,000 teachers. The number of those in the civil service and the number of physicians has greatly increased in late years.

Social Condition.— The illiteracy of the negro population 10 years of age and over has decreased as follows:

	Per cent
1870	80
1880	70
1890	57.1
1900	44.5

Of the negro population of voting age (males 21 years and over) 47.4 per cent are illiterate.

Negroes have graduated from college courses as follows:

Number of negro graduates from:

	Negro Colleges	White Colleges
Before '76	137	75
'75–80	143	22
'80–85	250	31
'85–90	413	43
'90–95	465	66
'95–99	475	88
Class unknown	58	64
Total	1,941	390

In the parts of the United States where deaths are regularly registered the death-rate of negroes was 32.4 per 1,000 in 1890, and 30.2 in 1900. The corresponding figures in cities are 33.7 and 31.1. In neither case do these figures apply to those rural districts where the negro population is massed. The record for the dis-

STATISTICS OF NEGRO CHURCHES IN 1890.

Denominations	Organizations	Church edifices	Approximate seating capacity	Halls, etc.	Seating capacity	Value of church property	Communicants or members
Total	23,462	23,770	6,800,035	1,358	114,644	$26,626,448	2,673,977

Reformed Episcopal	37	36	5,975	1	100	18,401	1,723

eases most fatal to negroes is as follows per 100,000 living:

	1890	1900
Consumption	546.11	490.6
Pneumonia	278.97	349.0
Diarrheal diseases	253.84	205.8
Heart disease and dropsy	203.99	216.6
Diseases of nervous system	332.9	294.6

Negroes have a smaller death-rate than the whites in scarlet fever, diphtheria and croup, cancer and tumor and diseases of the liver; about the same death-rate in measles and influenza, and considerably higher in malaria and typhoid fevers, diarrheal diseases, consumption, heart disease, pneumonia and diseases of the nervous system.

There were in the prisons of the nation in 1870, 1,642 negroes for every million of the negro population; in 1880, 2,480, and in 1890, 3,508. The increase of crime among whites in this period was large, but not so large as that among negroes. This negro crime is due to the economic stress following emancipation, to discrimination in the courts in the South, and to the fact that through the convict lease systems of the South crime is a source of profit to the State and consequently little is done to curtail it effectively. There is beginning now a movement toward reformatories for the young in the South. The home life of negroes has greatly improved since emancipation. In the country districts about half the population still live in the one-room cabin which used to be almost universal, one third live in two-room homes, and the rest in homes of three or more rooms. The food has an excess of fats, but is improving. The chastity of the women which was made a by-word under the slave regime has taken great strides, so that even in the back country districts not above 9 per cent of the population may be classed as distinctly lewd; and in the cities and the better rural districts the better class of negro women bear comparison with the white women of any section. There still remains, however, a great work of uplift among the masses. The habitat of the negro population shows many changes in the last generation: First, it is segregating itself in a black belt extending from Carolina to Texas, and centring in the Mississippi bottoms; secondly, it is seeking northern cities; thirdly, it is beginning to move to the cities and towns of the South; 4.2 per cent of the negroes were in cities of 8,000 or more in 1860; 12 per cent in 1890.

Religion.— The statistics of negro churches in 1890 are given in tables on preceding page.

Amalgamation of Blood.— The negroes of America are not of pure negro blood. There has gone on in the country first an intermingling of the various African tribes transported and secondly a large infusion of white blood. The census reports of this latter intermingling are admittedly far below the truth:

1850—	405,751	mulattoes	or	11.2%	of all negroes.
1860—	588,352	"	"	13.2%	" "
1870—	585,601	"	"	12. %	" "
1890—1,132,060		"	"	15.2%	" "

As a matter of fact, probably a third of the negroes of the United States, or 3 millions, have traces of white blood.

Literature and Art.— The distinctive writings which reflect the life and feeling of American negroes can be found in their works as follows:

1773—Phillis Wheatley: Poems. London.
1793—Richard Allen: Life. Philadelphia, 8vo, 69 pp.
1808—African Society: Essay on Freedom. Boston, 22 pp.
1810—Act of Incorporation, Causes and Motives of the African Episcopal Church. Philadelphia.
1812—Paul Cuffe: Brief Account . . . of Sierra Leone. N. Y., 12 pp.
1829—David Walker: An Appeal, etc. Boston.
1838—Appeal of 40,000 Colored Citizens. Philadelphia.
1852—M. R. Delaney: Condition . . . of the Colored People. Philadelphia. W. C. Nell: Services of Colored Americans in the Wars of 1776, 1812. Boston.
1854—F. E. W. Harper: Miscellaneous Poems. Boston.
1855—Frederick Douglass: My Bondage and Freedom. New York, 464 pp.
1862—William Douglass: Annals of St. Thomas. Philadelphia.
1863—W. W. Brown: The Black Man. New York, 310 pp.
1867—B. T. Tanner: Apology for African Methodism. Philadelphia, 468 pp.
1875—Sojourner Truth: Narrative. Boston, 320 pp.
1878—J. M. Trotter: Music and Some Highly Musical People. Boston, 505 pp.
1881—W. S. Scarborough: First Greek Lessons. New York, 150 pp.
1882—G. W. Williams: History of the Negro Race in America. New York, 1882.
1883—J. M. Langston: Freedom and Citizenship. Washington, 286 pp.
1883—W. Still: Underground Railroad. Philadelphia, 780 pp.
1884—T. T. Fortune: White and Black. New York, 310 pp.
1885—D. A. Payne: Domestic Education. Cincinnati, 184 pp.
1887—W. J. Simmons: Men of Mark.
1890—1900—A. J. Cooper: Voice From the South. Xenia, O., 304 pp. W. H. Crogman: Talks for the Times. Atlanta, 330 pp. A. Grimke: Charles Sumner. New York, 515 pp. P. L. Dunbar: Lyrics of Lowly Life. B. T. Washington: Up from Slavery. C. W. Chesnutt: The Marrow of Tradition. DuBois: Souls of Black Folk.

The one contribution of negroes to art is their plaintive and beautiful folk-songs, many collections of which have been made by Fisk University and Hampton Institute.

Notable Men.— The negro race in America has given birth to many men of more than average ability. Frederick Douglass was an orator who greatly helped the abolition cause; Phillis Wheatley wrote better than most writers of her day; Benjamin Banneker did some work in astronomy and helped lay out the city of Washington; Ira Aldridge gained a European reputation as an actor; George W. Williams wrote the best extant history of the negro in America; Lemuel Haynes, Alexander Crummell and Daniel Payne were clergymen of unimpeachable character and wide influence for good. Blanche K. Bruce was United States senator and register of the treasury.

References.— The history of the negro prior to emancipation will be found in the abundant literature of slavery. Official sources of information are the United States census reports, especially 1850–1900, and the bulletin of the United States Bureau of Labor. Next to these may be placed the serial publications of the American Negro Academy, of the trustees of the Slater Fund and of Atlanta University, and the studies of Johns Hopkins University. The more important single works are Williams' 'History,' Washington's 'Up from Slavery,' Payne's 'A. M. E. Church,' the essays by Cable on the negro question, Chesnutt's 'Marrow of Tradition,' Dunbar's poems, and various articles by Kelly Miller. Much of the more important work is in the periodicals, and may be traced through Poole's 'Index.'

W. E. B. Du Bois,
Atlanta University.

Negro Melodies. In slavery days the Southern Negroes were noted for their field and cabin songs and dances. Many of their original plantation songs had been handed down from their African ancestors. The tunes while melodious had a range of a few notes, the major key predominating. Following the ancestral melodies came the tunes adapted from Baptist and Methodist hymns. After the war the Negro songs began to disappear and nondescript Afric-European melodies, which eventually developed into ragtime (q.v.) became popular in both the North and South. This change was due to two causes; the desire of the freed slaves to throw aside all remembrances of slavery days, and to the widespread development of modern Negro minstrelsy.

Negro Minstrels, a species of musical entertainment of a quaint and simple kind, which originated among the Negroes of the southern United States, and was first made popular at public entertainments by E. P. Christy, the originator of the troupes of imitation Negro musicians. The words of the songs are generally in broken English, and the harmonies almost entirely limited to the chords of the tonic and dominant. The bones and banjo and tambourine are the chief accompanying instruments, but minstrel troupes are usually accompanied by orchestras. Their entertainments are not now exclusively musical, but may include amusing interludes, dramatic sketches, acrobatic, and similar performances. Among modern Negro minstrels in the United States the names of Haverly, Backus, Kersands, Emerson, Henry, Carncross, and West are familiar to the amusement loving public.

Negro Monkey, the name of several monkeys noted for the blackness of their coats; especially a large long-tailed East Indian and Malayan langur (*Semnopithecus maurus*), which is reddish when young.

Negro Plot, in American history, the name given to a local rebellion in New York city in 1741. On 18 March of that year a fire occurred in the chapel and barracks at Fort George at the Battery. It was generally believed to be accidental, but charges were set afloat that it arose from a plot by the negroes to burn the city. Eight other fires of a mysterious nature within a month strengthened this belief, and later one Mary Burton, a servant, furnished testimony implicating a number of sailors and Negroes. Twenty whites and over 160 Negro slaves were seized and imprisoned. Finally Mary Burton's accusations inculpated persons of such character that danger from that direction checked the investigation. It was charged that the Spanish were inciting plots among the Negroes through Roman Catholic priests. Four whites were hanged, 18 negroes hanged, and 13 burned at the stake.

Negro Population in the United States. The census reports show that in 1790 there were 757,000 colored people in the United States; in 1800 there were 1,002,000; in 1810, 1,378,000; in 1820, 1,772,000; in 1830, 2,329,000; in 1840, 2,874,000; in 1850, 3,639,000; in 1860, 4,442,000; in 1870, 4,880,000; in 1880, 6,581,000; in 1890, 7,470,000; in 1900, 8,840,789. In 1900, in the 11 Southern States which were banded together in the old Secession Confederacy, there were 7,132,617 negroes and 11,776,291 whites. Following are the statistics by States:

	Whites	Negroes
Alabama	1,001,152	827,307
Arkansas	944,580	366,856
Florida	247,333	230,730
Georgia	1,181,294	1,034,813
Louisiana	729,612	650,804
Mississippi	641,200	907,630
North Carolina	1,263,603	624,469
South Carolina	557,807	728,321
Tennessee	1,540,186	480,243
Texas	2,426,669	620,722
Virginia	1,192,855	660,722

Negro (nā'grō) **Rio.** See RIO NEGRO.

Negro Troops, the negro has proved a valiant soldier in the various American wars. A very few of them were employed in the Revolutionary War. Though a few generals made use of them in the first two years of the Civil War, and Congress authorized their employment at the Sea Islands, the first general provision for their enlistment was made in July 1863. After that they were employed in considerable numbers, and at times with great success. Soon after the Rebellion a Negro regiment, the Ninth Infantry, was organized as a part of the regular army corps and performed valuable service in the West in various engagements with the Indians. The Ninth also was conspicuous for bravery in the Spanish-American War, in the Cuban campaign, and later in the Philippines.

Negropont, nē'grō-pŏnt. See EUBŒA.

Negros, nā'grōs, Philippines, an island lying southeast of Panay, west of Cebu, and northwest of Mindanao, bounded on the north by the Visayan Sea, and on the south by the Sulu Sea; length, 134 miles; greatest width, 33 miles; area, 4,839 square miles, with dependent islands 4,854 square miles. It is the fourth island in size of the archipelago.

Topography.— A central mountain range, which divides the island into two almost equal divisions, extends from the extreme northern point to Caladias, only 14 miles from the southern coast; the spurs from this range extending east and west form large valleys. Near the northern end of the range is the Canlaón volcano, also known as Malaspina, 8,192 feet in height; and in the southern summits of the Sierra Dumaguete are two mountain lakes, the larger five miles long, the smaller two miles. A few miles southeast of the larger lake are the hot springs of Mainit, and near the coast near Dáuèn are several sulphur and thermal springs. There are no large rivers, but numerous small streams flowing through the valleys.

Industrial Resources.— The soil is fertile and the vegetable products abundant; they include chocolate of excellent quality, sugar, coffee, rice, tobacco, wheat, cotton, hemp, bago, etc. There are also valuable forests in the interior. Important deposits of coal are found in both eastern and western Negros, and indications of iron in the western part. The most important industry of the island is agriculture; the natives understand methods of irrigation, and use the numerous streams for this purpose; next in importance are the fisheries; turtle shells, sea cucumbers, and sea shells are also gathered. Sugar and sugar sacks are manufactured, hydraulic

machinery being used in the production of the former; in the eastern part of the island cotton pillows are manufactured, which are used on steamers. A wagon road or trail follows the coast, but there are few roads extending far into the interior; there are only two defiles through the mountain range. All the important towns are on the seacoast, and most of the local trade is carried on by water.

People and Government.— The people of the coast are Visayans, and those of the mountains Panayanos; the chief language is Visayan. The island was occupied by United States troops in 1900, and operations were carried on against bands of outlaws and robbers. In 1899 a native constitutional convention was held at Bacólod, and a constitution framed and submitted to the United States authorities, this being the first attempt to institute civil government in the Philippines. A temporary government was proclaimed in July 1899, and in 1901 the Philippine Commission divided the island into two provinces, Negros Occidental (western), and Negros Oriental (eastern), and established civil government similar to that in other provinces. Pop. 372,010; Occidental, 231,512; Oriental, 140,498.

Negruzzi, nā-groot'sē, **Jacob,** Rumanian author, son of Konstantin Negruzzi (q.v.): b. Jassy 11 Jan. 1843. He published his father's complete works; was professor of commercial law at Jassy and after 1885 at Bucharest; founded in 1867 the periodical called 'Convorbiri literare' for which he wrote verse, fiction, and prose idylls; and translated Schiller into Rumanian.

Negruzzi, Konstantin, Rumanian poet and author: b. Jassy 1809; d. there 1866. He studied in Jassy and Bessarabia, edited 'Dacia Literaria' (1840) with Cogalniceanu and Alecsandri, was a leader in the Liberal party and a minister of Count Cusa, and wrote versions of Pushkin, Kantemir, and Hugo; 'The Sins of Youth,' a volume in prose and verse; and the epics 'Aprodul Parice' and 'Lapusneanu.'

Negun'do, a genus of trees represented by the box-elder (q.v.). It was regarded by Gray as a genus of the soapberry family (*Sapindaceæ*), but more recently botanists have classed it with the maples (*Aceraceæ*).

Ne'gus, a beverage made of wine, water, sugar, nutmeg, and lemon-juice; so called from Col. Francis Negus, the inventor, who lived in the time of Queen Anne. Negus is also the native title bestowed upon the sovereign of Abyssinia.

Nehalle'nia, in Scandinavian mythology, a deity who presides over commerce and navigation.

Nehemiah, nē-hē-mī'a, **Book of,** a part of the canonical scriptures which is thus called from the name of the chief personage mentioned in it. The Book of Ezra (q.v.) is so named from the same reason. Certain parts of the Book of Nehemiah we may suppose to have been written by him, as they are in the first person. This and the Book of Ezra originally formed one work as they still do in the Hebrew canon, though separated in modern Hebrew bibles. They are connected as historical narratives, Nehemiah forming the sequel to Ezra. Ezra arrived in Jerusalem in the 7th year of Artaxerxes, king of Persia, and we hear nothing of his doings, subsequent to the events attending his arrival, until 13 years later Nehemiah appears upon the scene and relates what is written in the present book. He was cupbearer to the king of Persia, and Artaxerxes noticed his sadness, for he was grieving over the condition of his countrymen in Judah. The king therefore gave him leave to return to Jerusalem as governor of the city; he was also furnished with certain materials for re-fortifying it. Then the Samaritans were filled with envy at the favor shown the Jews and the dignity conferred upon Nehemiah. Meanwhile the latter was earnestly pressing on the work of rebuilding the wall, and as the Ammonites and Arabians threatened to interrupt the operations, he armed the builders and in 52 days the walls and towers were completed. The machinations of his enemies kept him constantly on the alert, but safety was at length secured by putting trustworthy men in command of the walls and gates. About a week after the restoration of the fortifications in Jerusalem Ezra is introduced into the narrative as a scribe learned in the law. A great gathering of the tribes is held at which he recites the Law. Priests and Levites assist him by explaining what he reads and such interest is created that the assembly continues its session from morning till noon. The Feast of Tabernacles is afterward celebrated, and the Jews, "the seed of Israel," dedicate themselves once more to a state of separateness from the heathen and to an observance of the ordinances of the Law. Then the walls were solemnly dedicated, and Nehemiah returned to Persia in the 32d year of Artaxerxes. When he subsequently returned to Jerusalem he found that the high priest had polluted the temple by assigning to the associate of the Samaritan governor a room within its precincts. Nehemiah cleared out and purified the chamber and the book closes in the midst of his zealous labors for the protection of pure temple worship. The Book of Nehemiah is a page from the post-exilic history of the Jews, as animated by a revivid interest in and care for the Scriptures and a renewed national life under the ordinances of the Law. Consult Sayce, 'Introduction to Ezra, Nehemiah, and Esther' (1889); Reuss, 'Geschichte der heiligen Schriften des Alten Testaments' (1890).

Neher, nā'hĕr, **Bernhard von,** German painter: b. Biberach, Würtemberg, 16 Jan. 1806; d. Stuttgart 17 Jan. 1886. He received his first instruction in art from Dannecker and Hetsch in Stuttgart, but was more especially indebted to Cornelius, under whose eye he painted in Munich. His student life was completed by a four years' residence in Rome, where he painted 'The Raising of the Widow's Son at Nain,' now in the Public Gallery at Stuttgart. In 1832 he returned to Munich and applied himself to fresco painting and in 1836 was commissioned to decorate two rooms in the castle of the grand duke at Weimar with scenes from the poems of Schiller and Goethe. He became director of the Leipsic Academy of Painting in 1841; professor in the art school at Stuttgart in 1846; and di-

rector of the same in 1854. During his residence in the latter city he executed the large oil painting 'The Taking Down from the Cross,' now in the Stuttgart gallery; 'The Crucifixion' for the church at Ravensburg; and the small painting, 'Spring,' now in the royal palace; 'The Sacrifice of Abraham'; 'Christ Blessing the Little Children'; 'Abraham Receiving the Angels'; and several portraits. He also drew ten large cartoons for reproduction in glass, six in the cathedral, three in the chapel of the ducal palace, and one in Saint Leonard's Chapel in the king's palace at Stuttgart.

Neher, Michael, German painter: b. Munich 31 March 1798; d. there 4 Dec. 1876. For three years he attended the Art Academy of his native place and subsequently worked as an assistant to the court-painter Klotz and the decorator Angelo Quaglio. In 1819 he visited Italy, where he applied himself to architectural landscape. He returned to Munich in 1825 and made a reputation by his paintings of different costumes, his landscapes, views of city squares, and architectural pictures. He also made copies of paintings by Rubens and Schwind for the castle of Hohenschwangau.

Nehlig, nā-lēg, **Victor,** French painter: b. Paris 1830. He came to the United States in 1856, after learning his art under Cogniet and Abel de Pujol, and opened a studio in New York, where he was made a member of the National Academy (1870). Since 1872 he has resided in Paris. He is a very successful painter of history and genre, and among his best known pictures are 'The Bravo' (1870); 'Armorer of the Old Time'; 'Gertrude of Wyoming'; 'The Artist's Dream'; 'The Cavalry Charge of Lieutenant Hidden' (New York Historical Society); 'Battle of Antietam' (William Astor collection); etc.

Neide, nī'dė, **Emil,** German painter: b. Königsberg, East Prussia, 28 Dec. 1843. He was educated at the local art school, but studied also at Düsseldorf and Munich, where he became especially an imitator and follower of Diez. His student travels took him through Belgium, Holland, and northern Italy. He subsequently settled at Königsberg. He had executed before making his tour a fresco in the hall of the local University, 'Ptolemy Observing the Course of the Stars.' On his return to Königsberg he followed this up by a series of mythological paintings, among which the most remarkable were 'Psyche Ferried over the Styx by Charon' (1873, in the Museum at Königsberg); 'Orpheus and Eurydice' (1876, in the Halsey collection, New York); and scenes from the Odyssey, for the Gymnasium at Insterburg. In 1886 he produced two genre pictures which showed a complete change in style, coloring, and handling as well as choice of subject, from what had characterized his work hitherto. These are 'The Scene of the Deed' (the discovery of the corpse of a murdered man); and 'Life-Weariness,' works which have greatly extended the popularity of their author, and have been excelled by none of his subsequent productions. He is professor in the art academy at Königsberg.

Neidhart von Reuenthal, nīt'härt fŏn roi'-ĕn-täl, German poet of the 13th century. A Bavarian and a poor noble by birth he is famous for his peasant lyrics, satiric and unflattering in tone, which created a new style of "court-poetry." Neidhart was a favorite of Frederick the Quarrelsome (after breaking with Leopold VII. of Austria), with whom he went on the Egyptian crusade of 1218–9. He died between 1240 and 1245, heartily hated by the peasants he portrayed, who styled him Neidhart Fuchs. His poems were edited by Haupt (1858).

Neighbor Jackwood, an anti-slavery novel, by J. T. Trowbridge (q.v.), published in 1857. It was written just after the author had seen the fugitive slave, Anthony Burns, returned by the Commonwealth of Massachusetts to his Virginia bondage. Like his juvenile stories, this novel for grown folks is crowded with incident and dialogue,— homely and true to life in part, and in part melodramatic. The story was dramatized and played in Northern theatres with considerable success.

Neilgherry (nēl-gĕr'ē) **Hills.** See NILGIRI HILLS.

Neill, nēl, **Edward Duffield,** American historian and educator: b. Philadelphia 9 Aug. 1823; d. 26 Sept. 1893. He was graduated from Amherst in 1842, and later studied at the Andover Theological Seminary. In 1848, having entered the Presbyterian ministry, he was settled as pastor of the first Protestant church established at Saint Paul, Minn. He served (1851–3) as superintendent of public instruction for that Territory, and as chancellor of the State University, 1858–61. As army and hospital chaplain he served in the Civil War from 1861 to 1864, then till 1869 was an assistant private secretary, first to President Lincoln, and afterward to President Johnson. In 1869 he was for a short time consul at Dublin. He was president of Manchester College, Saint Paul, 1873–84, and professor of history and literature there from the latter year until his death. His books on historical subjects deal chiefly with colonial and pioneer times, and include the 'History of Minnesota' (1858); 'Terra Mariæ,' a history of early Maryland (1867); 'History of the Virginia Company of London' (1869); 'English Colonization of America During the Seventeenth Century' (1871); 'Minnesota Explorers and Pioneers' (1881); 'Virginia Vetusta' (1885); and 'Virginia Carolorum' (1886).

Neillsville, nēlz'vīl, Wis., city, county-seat of Clark County; at the junction of the Black and the O'Neil rivers, and on the Chicago, St. P., M. & O. railroad; about 125 miles northwest of Madison. The surrounding country is largely agricultural, but considerable attention is given to stock-raising. The chief manufactures are flour, lumber, and lumber products. There is considerable trade in lumber, flour, farm products, and live-stock. It has a library of about 3,000 volumes. Pop. (1890) 1,936; (1900) 2,104.

Neilson, nēl'sŏn, **James Beaumont,** Scottish inventor of the hot blast in manufacturing iron: b. Shettleston, near Glasgow, 22 June 1792; d. Queenshill, Kircudbrightshire, 18 Jan. 1865. His father was a millwright, too poor to give his son much education. The latter worked at engines as a boy, acquired a little money by marriage, and in Glasgow at 25 became foreman of the new gas-works, in connection with which he opened a library, reading-room, and lecture

hall for the employees. His experiments with the hot blast date from about 1825; they were contrary to the theory of the ironmasters of the time who saw that the iron was more easily worked and better in winter and so attempted artificial refrigeration. The result, of course, was that no one would let Neilson use his blast furnace for a decisive test for a time. The method introduced (1828) by Neilson is thrice as cheap as the cold blast; hence the patent was constantly infringed and for 15 years he was involved in exhausting law-suits, which, with the exception of the great case against the Bairds of Gartsherrie, who refused to pay license for the hot blast, were mostly unsuccessful.

Neilson, Lilian Adelaide, English actress, whose real name was Elizabeth Ann Brown: b. Leeds 3 March 1848; d. Paris 15 Aug. 1880. She worked in a mill at Guiseley and then as a nurse maid, and, upon learning the story of her birth, ran away from her mother, an actress, and went to London. There she was a bar-maid; gave dramatic recitations from Shakespeare; and made her début in 1865 as Juliet, possibly her best role. She played for several years in London with great success due to her beauty, her girlish grace, splendid voice, and dramatic power; and appeared in New York in 1872, '74 '76, '79, and '80. Joseph Knight says of her: "As a tragedian she had no English rival during the last half of this century." Her roles included Isabella, Julia, Rosalind, Beatrice, Lady Teazle, Amy Robsart in Andrew Halliday's 'Kenilworth,' and Rebecca in Halliday's 'Ivanhoe.'

Neilson, Samuel, Irish politician, leader of the United Irishmen: b. Ballyroney September 1761; d. Poughkeepsie, N. Y., 29 Aug. 1803. After marrying the daughter of a rich merchant he went into the woolen business in Belfast. His part in politics became increasingly engrossing and in 1791 he suggested the organization of the United Irish Society, which was very successful, thanks to Wolf Tone. To assist this enterprise Neilson became editor of the 'Northern Star,' of which he was sole proprietor in 1794, and which was suppressed in 1797 after his arrest for treason. He was released in February 1798, rearrested almost immediately, and was again released in 1802. During these years it is impossible to decide whether he was faithful to his parole to the government or to his oath to his fellow conspirators; but it seems likely he was false to both parties. He came to America in December 1802 and died in the next year. Consult: Madden, 'United Irishmen' (1842–6), and the 'Life' by Dornin (1804).

Neisse, nīs'sė, Germany, a town in the Prussian province of Silesia and the government of Oppeln, on a river of same name, 47 miles by rail southeast of Breslau. It is a place of considerable strength, surrounded by detached forts and other works; has some notable edifices, military and other important schools, and manufactures furniture, blankets, wire-netting, etc. Neisse was anciently the chief town of a principality, and residence of a prince-bishop. It came into the possession of Prussia in 1741, when, after a valiant defense, it was taken by Frederick II. Pop. (1900) 24,271.

Neith, nē'ĭth, or **Neitha,** in Egyptian mythology, a goddess who was worshipped especially as a local divinity in Lower Egypt. By the Greeks she was identified with Athene. She often appears as the companion of Phtha, who, as local divinity of the old capital of Memphis, stood at the head of the pantheon of Lower Egypt; and on that account she is not unfrequently styled the great Mother of the Gods. Like all the great Egyptian goddesses, she was identified with Isis.

Nejd, or Nejed. See NEDJED.

Nek'en, in Scandinavian mythology, the evil spirit of the North, said to have had his home in the Arctic seas.

Nekrassoff, nĕk-rä'sŏf, **Nikolai Alexeievitch,** Russian poet: b. Podolia 4 Dec. 1821; d. St. Petersburg 8 Jan. 1888. He was educated in St. Petersburg, where he left the army for the University against his father's wishes and was disowned by his family. By teaching and writing he made a bare livelihood. In 1847 he succeeded Bielinsky as editor of the 'Contemporary,' which post he kept until 1866; and in 1868 became editor of the 'Annals of the Fatherland,' in which most of his poetry appeared. He bitterly attacked administrative abuse, notably in his long poem, 'Who Lives in Russia Happily?' showing the discontent and the suffering in all classes. His satiric attacks on the bureaucracy should be mentioned and the pathetic and powerful 'Last Songs' (1877).

Nélaton, nā-lā-tôn, **Auguste,** French physician and surgeon: b. 17 June 1807; d. Paris 21 Sept. 1873. He studied medicine at Paris under Dupuytren, and was graduated 1836. Soon after he was appointed hospital surgeon and private lecturer in the faculty of medicine in the University of Paris. In 1851 he was appointed professor of clinical surgery, an office which he held till 1867, when he retired. In 1868 he was raised to the dignity of senator. Nélaton was equally distinguished as a professor and as an operator, and invented "Nélaton's probe," used in military surgery in locating bullets. His chief publication is his 'Eléments de Pathologie chirurgicale' (1844–60; 2d ed. 1868–85), a work of great value, in which several of his pupils took part.

Neleus, nē'lūs, in ancient Greek mythology, a son of Poseidon and twin brother of Pelias. He was exposed, but reared by a shepherd. He refused to purify Hercules after the murder of Iphitus, and Hercules in vengeance killed all his sons but Nestor. It is said that he revived the Olympian games.

Neligh, nē'lĭg, Neb., city, county-seat of Antelope County; on the Elkhorn River, and on the Fremont, E. & M. V. railroad; about 120 miles in direct line northwest of Lincoln, and 130 miles in direct line northwest of Omaha. It is in a fertile agricultural section in which corn and wheat are the chief farm products. Considerable attention is given to raising cattle and hogs. It is the seat of Gates Academy, under the auspices of the Congregational Church. Pop. (1890) 1,209; (1900) 1,135.

Nell Gwynn. See GWYNN, ELEANOR.

Nellore, nĕ-lōr', or **Nellur,** nĕ-loor', India, a town, the capital of a district of Madras, on

the Pennair River, eight miles from its mouth in the Bay of Bengal, and 109 miles by rail northwest of Madras city. Pop. (1901) 32,040. The district of Nellore, area 8,765 square miles, is famous for its breed of cattle. Pop. (1901) 1,497,796.

Nel'son, Aven, American botanist: b. Lee County, Iowa, 24 March 1859. He was graduated from the State Normal School at Kirksville, Mo., in 1883, and since 1887 has been professor of botany in the University of Wyoming. He has published 'The Trees of Wyoming and How to Know Them' (1899); 'Key to the Rocky Mountain Flora' (1902); etc.

Nelson, Cleland Kinloch, American Protestant Episcopal bishop: b. near Cobham, Va., 23 May 1852. He was graduated from St. John's College, Annapolis, Md., in 1872, studied theology at Berkeley Divinity School, Middletown, Conn., and was ordained to the priesthood in 1876. He was rector of the church of St. John the Baptist at Germantown, Philadelphia, 1876–82, and of the Church of the Nativity, South Bethlehem, Pa., 1882–92. In the year last named he was consecrated bishop of Georgia.

Nelson, Edward William, American naturalist: b. Manchester, N. H., 8 May 1855. He was graduated from the Cook County Normal School, Chicago, in 1875. He was engaged in scientific research in Alaska in 1877–81 and was a member of the Arctic expedition on the United States steamer Corwin in her search for the Jeannette in 1881. He accompanied the Death Valley expedition in 1890 and has spent much time in scientific explorations in Mexico. He has published: 'Birds of the Behring Sea and the Arctic Ocean' (1883); 'Squirrels of Mexico and South America' (1899); etc.

Nelson, Henry Loomis, American journalist: b. New York 5 Jan. 1846. After a course at Williams College, he studied law, was admitted to the bar in 1869, was Washington correspondent of the Boston *Post* in 1875–85, and editor of that journal in 1885–6. In 1894–8 he was editor-in-chief of 'Harper's Weekly,' and in 1902 became professor of political science in Williams College. He published: 'Our Unjust Tariff Law' (1884); 'John Rantoul' (1884); 'The Money We Need' (1896).

Nelson, Horatio, 1ST VISCOUNT, English naval officer: b. Burnham-Thorpe, Norfolk, England, 29 Sept. 1758; d. on board the Victory at Trafalgar, 21 Oct. 1805. He entered the English navy at 12 (1770). Three years after he went on an Arctic expedition under Commodore Phipps and on his return (1777) was made a lieutenant. Two years later he was promoted to the rank of post-captain. He was then sent to Nicaragua in command of a man-of-war, and took Fort San Carlos, in the San Juan River. In 1781–2 he made another expedition into the North Sea, but returned to the West Indies in 1782 and, placed in command of the Boreas; he was kept on this duty for five years, accomplishing much good from his vigorous attempts to prevent smuggling between the United States and the British colonies. Nelson's indomitable spirit in insisting upon enforcing the Navigation Acts against all foreign nations brought him into conflict with his commander, Sir Richard Hughes, and made him unpopular in commercial circles; for a long time he was harassed with vexatious law-suits. He was, however, upheld by the British government. It was while on this station that Nelson met and married the widow of Dr. Josiah Nesbit (11 March 1787). Six months after his marriage he returned with his wife to England and was placed upon the retired list. It has been hinted that through jealousy undue influence was brought to bear upon the Admiralty to keep him from active service. At any rate he remained in obscurity until all officers were recalled into active service on the outbreak of the war with the French Republic in 1792.

The year 1793 saw the real beginning of Nelson's career. He had attracted Lord Hood's attention, and at his solicitation was placed in command of the ship Agamemnon, 64 guns, and sent to join Lord Hood in the Mediterranean, where he rendered him valuable assistance at the siege of Bastia (May 1794). He participated in the siege of Calvi and there had the misfortune to lose one of his eyes. While on this station he also served under Hotham and Sir John Jervis. While on a diplomatic mission to Naples in September 1793 he met Lady Emma Hamilton, who was destined to be so closely identified with an important part of his life. In 1796 he was promoted to be commodore and was given a new command. On 25 Sept. 1796 orders came ordering the abandonment of Corsica and the Mediterranean, and Nelson sorrowfully left the field. He was, however, shortly sent back to secure supplies which had been left on the island of Elba, and on returning passed through the whole Spanish fleet which had then joined the common cause of France. On the following day occurred the famous battle of Cape St. Vincent (q.v.), 14 Feb. 1797. For his gallantry and skill in maneuvering his vessel he was made rear-admiral of the blue and appointed to the command of the inner squadron at the blockade of Cadiz. His next service was an attack on the town of Santa Cruz, in the Island of Teneriffe, in which he suffered the loss of his right arm. The wound refused to heal and he was obliged to return to England. He was decorated with the Order of the Bath by George III. and at the same time awarded a pension of $5,000. On the 29th of March 1798 he again set sail and joined the Earl of Saint Vincent (Admiral Jervis) off Cadiz 30 April. The admiral sent him to watch the progress of the armament at Toulon. Notwithstanding his vigilance, the French fleet which conveyed Bonaparte to Egypt escaped. Thither Nelson followed, and discovered the enemy's fleet moored in the Bay of Aboukir, where he obtained a complete victory, all the French ships but two being taken or destroyed (1 Aug. 1798). This achievement was rewarded with the title of Baron Nelson of the Nile and an additional pension of $10,000. Nelson set sail from Alexandria 19 August and arrived at Naples 22 September. Here began the pitiable period of his career, which left an indelible blot upon his otherwise unblemished name. He came under the influence of Lady Hamilton, wife of the English ambassador. His criminal relations with that lady, with whom he lived openly after the death of her husband, led to his ultimate separation from his devoted wife. Her influence can be recognized in many of his pub-

lic acts during the two years he spent under her spell in Naples. During this time he seemed to fall into a lethargy which for the time being made him forget his duty to Great Britain, and at one time he practically acted in the capacity of admiral of the Neapolitan navy. He did, however, really get the Neapolitans to take up arms against the French, but their army was soon subdued and the Parthenopean Republic was established by Napoleon.

Finally Nelson seemed to awake to a new sense of duty, being goaded by the appointment of a junior officer, Sir Sidney Smith, to an important command in the Levant, and also aroused by the exciting news that Admiral Bruix had escaped with the French fleet from Brest and was about to enter the Mediterranean. The imminent danger of the French regaining the naval supremacy of the Mediterranean set Nelson to work with all his old time vigor. In the meantime Jervis had resigned his command and was succeeded by Keith, with whom he was at variance from the very start. He determined to take Naples before the possible arrival of the French, and forthwith appeared before that city 24 June 1799. Here he found Commodore Caraccioli in command of a Neapolitan squadron which was in league with the Republicans who were in complete control. The forts of the city surrendered on 26 June and then followed Nelson's worst mistake. The Neapolitan admiral was not captured till 29 June, but Nelson immediately ordered a court-martial and condemned him to death, thus violating the capitulation concluded 23 June. Caraccioli was cruelly hanged. The whole miserable affair has been attributed to the influence of Lady Hamilton, who was also the favorite of the queen of Naples. It was little honor to Nelson that the despicable king of Naples, Ferdinand IV., soon after this created him Duke of Bronte.

Nelson's flagrant disobedience of orders shortly after this is also ascribed to feminine influence. He obstinately remained at Naples when ordered to join Lord Keith, who expected to meet the French fleet. This meeting, as a matter of fact, never took place, but a great victory might have been won had Nelson's fleet put in an appearance in time. This affair had a great deal to do with his quarrels with Keith and also his subsequent orders recalling him to England. He arrived home 6 Nov. 1800, having traveled overland with the Hamiltons; soon after this the scandal of his life culminated in the final breach with his wife.

Nelson's promotion to the rank of vice-admiral was dated 1 Jan. 1801 and he was at once employed on an expedition to aid Sir Hyde Parker against the league of the Northern Confederation. This league by its policy of armed neutrality was really aiding the French Republic, and Nelson wished to strike first at Russia, but this policy was overridden, and Nelson contented himself with making a bold attack on the Danish fleet at Copenhagen. He completely annihilated the fleet and silenced the shore batteries 2 April. During the battle his attention was called to the fact that his ship had been signaled to cease firing. Placing a telescope to his blind eye he remarked: "I really cannot see the signal." This remark added to his popularity at home. For his success and gallantry upon this occasion he was created a viscount, and his honors were made hereditary in his family, even in the female line. He then took command of the squadron for defense against the contemplated French invasion of England and attacked the French flotilla off Boulogne 15 August. He then went back to Lady Hamilton in Merton, Surrey, and remained there during the Peace of Amiens. When hostilities recommenced after the Peace of Amiens, Lord Nelson was appointed to command the fleet in the Mediterranean, and for nearly two years was engaged in the blockade of Toulon. But in spite of his vigilance the French fleet got out of port (30 March 1805), and being joined by a Spanish squadron from Cadiz, sailed to the West Indies. The British admiral hastened to give chase and pursued them all the way to the West Indies and back again to Europe, one of the most exciting chases that ever took place in naval history. Villeneuve finally took refuge at Cadiz, but Nelson's object had been accomplished, for without his naval forces Napoleon could not carry out his plan of invasion and was now obliged to turn his attention to Austria, which had in the meantime declared war. Nelson now had Villeneuve in a trap, but hardly expected him to leave the harbor. The French admiral, however, learned that Napoleon was contemplating relieving him of his command because he would not fight. In despair, Villeneuve decided on desperate measures and the French and Spanish fleets sailed forth to meet the dreaded enemy, leaving the harbor 19 October, the French commanded by Villeneuve, the Spaniards by Gravina. On 21 October they came up with the British squadron off Cape Trafalgar. Then occurred the famous battle of Trafalgar, as desperate an engagement as ever took place upon the high seas. The engagement ended in a glorious victory for the British, but it cost them the greatest naval hero England ever produced. Nelson was mortally wounded early in the day and died during the afternoon. His remains were carried to England and he was buried with much pomp in St. Paul's Cathedral 8 Jan. 1806.

Consult: Southey, 'Life of Nelson' (1828); E. de Forgues, 'Histoire de Nelson' (1860); J. C. Jeaffreson, 'Lady Hamilton and Lord Nelson' (1888), 'The Queen of Naples and Lord Nelson' (1889); Laughton, 'Nelson' (1895); Mahan, 'Life of Nelson' (1899); Russell, 'Horatio Nelson' (1899).

Nelson, Samuel, American jurist: b. Hebron, N. Y., 10 Nov. 1792; d. Cooperstown, N. Y., 13 Dec. 1873. He was graduated from Middlebury College, Vt., in 1813, and in 1817 was admitted to the bar. He soon established a reputation which gained for him a large practice and in 1823–31 he was circuit judge. In 1831 he became associate justice of the supreme court of New York and in 1837–45 he was chief justice. He was appointed associate justice of the Supreme Court of the United States by President Tyler in 1845 and in the famous Dred Scott case he sustained Chief Justice Taney in his decision that if Congress had authority to destroy slavery it had also power to establish it. He disapproved the intrusion of military power in what he considered civil affairs, but maintained an unquestioned loyalty during the Civil War. He was appointed by President Grant a member of the Alabama Arbitration Committee in 1871, and in 1872 he resigned from the bench.

Nelson, Thomas, American patriot: b. Yorktown, Va., 26 Dec. 1738; d. in Hanover County, Va., 4 Jan. 1789. He was the son of William Nelson, governor of Virginia 1770–1, and was educated at Eton and Trinity College, Cambridge, England. Returning to Yorktown in 1761, he was elected to the House of Burgesses, in which he served for several terms; and he also sat in the Provincial Conventions, 1774–5–6, in the last of which he introduced the resolution instructing the Virginia delegates in the Continental Congress to move for a declaration of independence. Later (1775–7) he was himself a delegate to the Continental Congress, and was a signer of the Declaration. He resigned on account of impaired health, but was soon (August 1777) in command of the Virginia State forces, at whose head he remained until near the close of 1782. At the siege of Yorktown he ordered American gunners to fire upon his own mansion, in which Cornwallis was believed to have his headquarters. In 1779 he was again a member of Congress, and again resigned by reason of ill health. During the next year on his own security he raised public moneys for Virginia and paid certain military arrearages out of his private funds. In 1781 he became governor of the State, succeeding Thomas Jefferson, but in a few months resigned. His patriotic generosity had impoverished him, and he saw his property sold for payment of public debts contracted on the security he had given, while his own days ended in circumstances of privation.

Nelson, William, American sailor and soldier: b. Maysville, Ky., 1825; d. Louisville, Ky., 29 Sept. 1862. Entering the United States Navy in 1840 he became lieutenant in 1855 and at the opening of the Civil War was put in command of the gunboats on the Ohio, with rank of lieutenant-commander. On leaving the navy, soon after he entered the army, became a brigadier-general of volunteers and commanded the 2d division under Buell and the Battle of Shiloh. In a quarrel with the Federal general, Jefferson C. Davis, he was fatally shot at the Galt House in Louisville.

Nelson, Wolfred, Canadian physician: b. Montreal, Canada, 10 July 1792; d. there 17 June 1863. He was a surgeon in the British army in the War of 1812, but in 1837 he headed the rebellion decided upon in the meeting of the "Four Countries." He was captured and sentenced to imprisonment for life in the Bermudas, but the sentence was declared illegal and he was liberated. He lived in the United States in 1838–42, when he returned to Montreal and was twice chosen mayor of that city. He also served as president of the medical board and College of Surgeons of Lower Canada.

Nelson, Canada, town, in the southeastern part of British Columbia; on the Kootenay River; about 18 miles west of Kootenay Lake and 250 miles west of Vancouver. It is in the midst of the noted Kootenay silver-mining region. Its chief industrial establishment is a large smelter. It has a foundry, lumber mill, machine shops, and other manufacturing plants. Pop. (1901) 5,273.

Nelson, England, a town of Lancashire, about 3 miles northeast of Burnley, and 30 miles north of Manchester. Among its chief municipal features are a free library, technical school, large recreation ground, and market hall; it owns also its water, gas, and electric lighting plants. It is a thriving cotton manufacturing centre. Pop. (1901) 32,816.

Nelson, a river in Canada, the largest in the Territory of Keewatin. It is an outlet of Lake Winnipeg; leaving the lake at the north end, it first flows north through several lakes to Split Lake, then northeast to Hudson Bay, which it enters through Port Nelson. The volume of water it discharges is very large; it is a deep, swift-flowing stream, with many rapids and cascades along its course of about 425 miles. It is navigable for boats to about 130 miles from its mouth, and for about 100 miles from Lake Winnipeg.

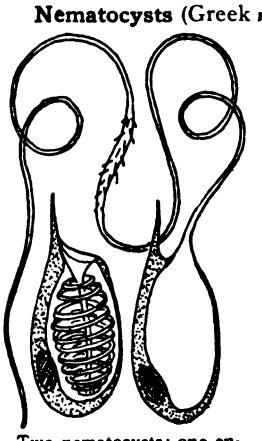
Nelson Fort, a former Revolutionary fort at Norfolk, Va., now the site of the United States Marine Hospital.

Nel'sonville, Ohio, city, in Athens County, on the Hocking River and on the Hocking Valley railroad; about 60 miles southeast of Columbus. It is in the vicinity of bituminous coal fields, and has a large trade in coal. Its chief manufacturing establishments are car wheel works, mining implement shops, foundry, and repair shops. The city owns and operates the waterworks. Pop. (1890) 4,558; (1900) 5,421.

Nelum'bium, a genus of aquatic plants of the family *Nymphaceæ,* containing the East Indian lotus (*N. speciosum*) and the Egyptian lotus (*N. cærulea*). The former serves many useful purposes in the East. The filaments are there deemed astringent and cooling, and are prescribed in burns, piles, and menorrhagia; the seeds are given to prevent vomiting, and to children as diuretics and refrigerants. The large leaves are made into bed sheets for fever patients; a sherbet made from the plant is given as a refrigerant in smallpox, etc. The rhizome, stalks, and seeds are eaten by the Hindus, and furnish a preparation known in commerce as "Chinese arrowroot." A fibre derived from the stalk is used as a wick for lamps in Hindu temples, the plant being considered sacred. See LOTUS.

Nem"athelmin'thes, a phylum of worms. See table of classification under ANATOMY, COMPARATIVE; EEL-WORMS; ROUNDWORMS; THREAD-WORMS; etc.

Nematocysts (Greek νημα, thread, κύστις, bag, cell), peculiar cells occurring in the *Cœlenterata* (q.v.) and in a few members of other groups of animals (*Protozoa Turbellaria, Mollusca*) which serve as weapons of offense and defense. In structure a nematocyst is a cell one end of which is drawn out into a long tube, the thread, which is inverted into the body of the cell as the finger of a glove may be turned into the palm. Connected with the cell



Two nematocysts: one entire, the other exploded.

is a hair-like structure, the cnidocil, and when this is touched the nematocyst "explodes." The thread is forced out, carrying with it the fluid contents of the cell, which in its physiological action is much like formic acid. This is sufficient to kill small animals, to paralyze those of larger size. Some Cœlenterates, like the Portuguese man-of-war, have nematocysts which can produce very disagreeable effects on man. Once exploded, a nematocyst cannot be used again. From their structure and action nematocysts are also known as thread cells, nettle cells, lasso cells, and cnidæ.

Nemato'da, a class of worms in the phylum *Nemathelminthes,* the thread-worms, having a very elongated cylindrical body pointed at both ends, clothed in a tough cuticle, and containing in the body-cavity a clear fluid. The enteric canal is straight, and consists of pharynx (a stomodæum), intestine and rectum; the mouth is anterior and terminal, the arms ventral and near the posterior end. Excretory canals running in the lateral lines are usually present. "The nervous system," says Parker, "consists of a pharyngeal ring containing nerve-cells and giving off nerves forward and backward; of the latter a single ventral nerve-cord, or two cords, respectively dorsal and ventral, are of considerable size and extend to the posterior end of the body." The nematodes are in nearly all cases diœcious, immense numbers of eggs being produced, and impregnated within the body of the female. The class is divided into two orders: (1) *Nematoidea,* the free-living nematodes and most parasitic forms in which the cœlom is not lined by epithelium, but is bounded directly by body-muscles; (2) *Gordioidea,* a small number of great elongated worms (see EEL-WORMS) which are parasitic in the asexual, free-living in the sexual stage. See THREADWORMS.

Nematog'nathi, a group of fishes, the catfish (q.v.).

Nematoph'yton, a genus of fossil algæ, preserved in the Devonian rocks of the eastern United States and Canada, the stems of which were often several inches in diameter. The best known species is *N. logani.*

Nemcová, nyĕm'tsō-vä, **Bozena** ("BARBARA PANKL"), Czech poet: b. Vienna 4 Feb. 1820; d. Prague 21 Jan. 1862. Her reputation was made largely by the collections, 'National Tales and Legends' (1845–6), and 'Slovak Tales and Legends' (1858). Her 'Sebrané Spisy' ('Collected Works') appeared at Prague (with a biographical sketch by Podlipská).. One of the best of her original stories from common life was published in a German version as 'Die Grossmutter' in Reclam's 'Universalbibliothek'.

Nemea, nē'mę-a, Greece, a classic valley of Argolis, the site now marked by the village of Nemea, due north of Argos, on the railroad to the Gulf of Corinth. The valley from north to south is from two to three miles long, and more than half a mile broad. It possessed a sacred grove, with a magnificent temple to Zeus, and here biennially were held the celebrated Nemean Games, one of the four great national athletic and musical festivals of the Greeks.

Nemean (nē'mę-an or nę-mē'an) **Games,** in ancient Greece, public games or festivals were celebrated at Nemea, probably triennially. The Argives were the judges at these games, which comprised boxing and athletic contests, as well as chariot-races. The conquerors were crowned with olive.

Nemertin'ea, a class of *Platyhelminthes* (q.v.) of which a few are terrestrial and a few occur in fresh water, but the great majority are marine. As a rule they have a flattened body without any processes and covered on the outside with cilia. The mouth is on the ventral surface at the anterior end and the vent at the opposite end of the body. The alimentary canal is straight; in some with enlargements on either side at regular intervals. Above the alimentary canal is a peculiar proboscis which can be everted through an opening above the mouth, by means of which the animal captures its prey, which consists of other animals, largely of worms. There is no body-cavity, the body being solid from the intestine to the outer wall, except for the small tubes of the blood vessels and excretory organs. The sense-organs are the usually present eyes, and also, in many, grooves upon the sides of the head which are usually regarded as organs of smell. The nervous system consists of a "brain" around the anterior part of the alimentary canal, from which three nerve cords (two lateral and one between the digestive tract and the proboscis sheath) run backward through the body. Some nemertines develop directly while others go through a complicated metamorphosis, in which part of the body is cast off. Most nemertines are small, but some reach respectable dimensions. One species on the New England coast can stretch itself to a length of 15 feet or retract itself to two. The largest species (*Lineus longissimus*) may extend to 90 feet.

Nemesianus, nē-mē-sī-ā'nŭs, **Marcus Aurelius Olympius,** Latin poet of the close of the 3d century B.C., probably a Carthaginian. He won much fame by his verse at the court of Numerianus, who alone surpassed him in composition; wrote on fishing ('Halieutica'), sailing ('Nautica'), and hunting ('Cynegetica'), only a part of the last poem being extant; and is supposed to be the author of four pastoral poems found in MSS. together with Calpurnius' eclogues, and hence formerly attributed to Calpurnius. The peculiar movement of these pastorals has suggested the theory that the 'Pervigilium Veneris' is by Nemesianus. All his extant works are edited by Bährens (1879); the 'Eclogæ' by Schenkl (1885); an English version of the latter by Scott appeared in 1891.

Nem'esis, in Greek mythology, the daughter of Erebus and Night. Other accounts make her the daughter of Zeus and Necessity, or of Ocean and Night. She is goddess of retribution, the tamer of the passions, the avenger, the enemy of pride and haughtiness; and she watches over the observance of the honors due to the dead, on which account a yearly festival in memory of the departed was called by the Greek Nemesia. Nemesis is represented under the figure of a majestic female clothed in a tunic. With the right hand she grasps a part of her garments over her breast; in her left hand

she holds a cup. On coins she appears drawn in a car by dragons, sometimes wearing a mural crown, and rarely winged. The great number of coins and gems on which she is found proves her worship to have been extensive and popular.

Nemesius, nẹ-mē'sĭ-ŭs, Greek philosopher: b. in the first half of the 4th century A.D. He became bishop of Emesa in Syria, and has been remembered chiefly through his treatise on 'The Nature of Man,' which declares the freedom of the will, the supremacy of the spiritual powers, the indestructibility of matter. The book is thought to show some anticipations of the theory of the circulation of the blood. It has been translated into various modern languages.

Nemi, nā'mē, Italy, a classic lake about 18 miles south of Rome, filling the crater of an extinct volcano, the sides of which are formed partly of basalt and partly of consolidated scoriæ. The lake is 1,022 feet above the level of the sea, and has a circuit of five miles. Owing to its beauty, it is accounted the gem of the Alban Mountains, and was celebrated by the Latin poets under the name of Lacus Nemorensis or Speculum Dianæ — Diana's Mirror. On the northeast shore near the village of Nemi, a famous temple of Diana was situated, of which modern excavations have yielded interesting remains; remnants of rafts used in the festival services of Diana, and dating from the reign of Caligula, were also recovered from the bed of the lake in 1895.

Nemours, nė-moor, **Duc de** (Gaston de Foix). See Foix, Gaston de.

Nemours, Louis Charles Philippe Raphael d'Orleans, Duke of, French soldier, second son of King Louis Philippe: b. Paris 25 Oct. 1814; d. Versailles 26 June 1896. He entered the army in 1826; gained little by the Revolution of 1830, since he had been a favorite with Charles X., who intended to marry him to the daughter of the Duc de Berry; refused the crown of Belgium in 1831; served in the Belgian campaigns and in Algiers, where his bravery won him the grade of lieutenant-general in 1837; became heir apparent by the death of his brother, the Duke of Orleans, in 1842; but was so unpopular that he found it wise not to press his claims in 1848, but to remove to England. He returned to France in 1870, re-entered the army, from whose lists his name was struck by the anti-royalist measures of 1886, and spent his last years in retirement.

Nemours, France, a town in the department of Seine-et-Marne, 10 miles south of Fontainebleau. The old castle of Nemours, built in the 12th century, is memorable on account of the edict revoking the privileges of the Huguenots, signed here by Henry III., 7 July 1585. Pop. (1901) 4,861.

Nemours, with the surrounding territory, was erected into a duchy in favor of the Count of Evreux in 1404. In 1507 Louis XII. bestowed the duchy upon his nephew Gaston de Foix, who was killed at the battle of Ravenna in 1512. From 1528 to 1689 the duchy was possessed by the house of Savoy. In 1689 it was purchased by Louis XIV., who bestowed it upon the Orleans family. King Louis Philippe gave his second son the title of Duke of Nemours, and the titular dignity is still borne by a branch of the Orleans family.

Nena (nā'nä) **Sahib.** See Nana Sahib.

Nennius, nĕn'ĭ-ŭs, British historian: b. in the latter part of the 8th century. He is said to have lived in Wales and to have been the author of the chronicle, 'Historia Britonum,' or 'Eulogium Britanniæ,' reaching down to the 8th century. The manuscript, written in Latin, is in the British Museum, and the work has been republished several times. The best editions are those of J. Stevenson (1838), and Mommsen, in 'Monumenta Germaniæ Historica,' etc. (1898). An English translation by W. Gunn was published in 1819. Ellis speaks of the work as that of "a credulous compiler, though, from the antiquity of his materials, valuable to an inquisitive historian." His work gives the mythical account of the origin of the Britons, the Roman occupation, the settlement of the Saxons, and closes with the 12 victorious battles of King Arthur. The writer has preserved valuable fragments of earlier treatises which have been lost. The historical value of his work is not great, but in mythical and legendary matters it has a recognized importance. Consult Zimmer, 'Nennius Vindicatus' (1893).

Ne"o-Dar'winism. See Weismannism.

Neo-Hegelianism, the doctrine of a modern school of philosophy, which has representatives among English, Scottish and American thinkers. They profess their belief in an eternal consciousness, of which the universe is the object; basing their conviction on the theory that in the world of thought consciousness and object are correlatives, and mutually implicated; and that the existence of the physical universe was prior to that of finite consciousness, and this latter is in some way correlated with physiological organisms. The most prominent Neo-Hegelian in England was Green (see Green, Thomas Hill), who may be said to be the founder of English Neo-Hegelianism.

Neo-Kantianism, the teaching of those who accept Kant's theory of knowledge, but refuse to acknowledge the doctrine of practical reason as the best guide in working out a metaphysic. Among this school may be mentioned F. A. Lange and H. Cohen. See Kant, Immanuel.

Ne"o-Lamarck'ism, the doctrine held by a school of modern naturalists, mainly American, that the results of organic evolution are due mainly to the principles and factors formulated by Lamarck (q.v.) and expounded in the article Lamarckism (q.v.), and not mainly to natural selection as asserted by the Darwinians. The modification and expansion of Lamarck's theories, due to enlarged knowledge, constitutes Neo-Lamarckism,— a term first applied by Prof. A. S. Packard, who with E. D. Cope and Alpheus Hyatt, was among its foremost exponents.

Neo-Pla'tonism, the revival and mystical transformation of the Platonic philosophy, mainly through the speculations of non-Hellenic thinkers. The word has, however, two meanings. In the first and historic sense it denotes

the metaphysical theories which prevailed during the whole of the third and last period of Greek philosophy; and these theories and their several schools are usually spoken of as three in number: (1) The Jewish-Greek philosophy; (2) Neo-Pythagoreanism (q.v.), and (3) Neo-Platonism proper. In its general sense, Neo-Platonism was a syncretism of Orientalism, Judaism, and Hellenism. The favorite subjects of discussion among Neo-Platonists were what they styled the dualistic opposition of the divine and the earthly; God as an abstract conception; contempt of the world of the senses; various theories of intermediate beings, half human, half divine; asceticism and the nature of enthusiasm as expounded by Hermes Trismegistus (q.v.) and the Christian Gnostics (q.v.). Near the Neo-Platonists stand Philo (q.v.), Aristobulus, the Essenes and Therapeutæ (q.v.).

Neo-Platonism in a narrower sense is the philosophy which originated with Plotinus and his school, and not with Ammonius Saccas, as an ancient tradition relates. Neo-Platonism was a last attempt made by Alexandrian thinkers to explain the dualism of appearance and reality. This attempt was made by a despairing leap beyond nature and reason; a solution was sought outside rationality, by a sort of intellectual suicide, and the attempts ended in the dreams of passive mysticism. It was taught that if we lose self-conscious thinking, the distinction between subject and object disappears, and if we reach *ecstacy*, we attain "union with God" and in that union all antinomies vanish. If by philosophy we understand rational thinking, Neo-Platonism must be considered a philosophical failure, and as the Neo-Platonist movement was not continued in new developments, it may well be said to represent the exhaustion and dissolution of ancient philosophy.

Its historical movement has three stages. In its first stage Neo-Platonism was essentially a "scientific" theory. Its main characteristic was the emphasis laid upon knowledge, the object of knowledge being God, and the aim of philosophy to conceive the divine essence immediately and with the innermost activity of the soul. In the second stage of Neo-Platonistic development appeared Iamblichus' (q.v.) systematic theology of polytheism, which distinguished what is usually called the Syrian phase of Neo-Platonism. This theology stood in strong opposition to Christianity. In its third stage Neo-Platonism lost its identity and under this name we are presented with a mere scholastic recapitulation, in a dialectic way, of the whole of classical philosophy. This scholastic and historic Neo-Platonism is represented by Proclus (q.v.) who reigned philosophically supreme at Athens until his school was closed by that edict of Emperor Justinian (q.v.) in 529 which was "the official certification of the death of ancient philosophy." In almost all its stages Neo-Platonism was characterized by theurgy, magic and sorcery of all kinds, and Neo-Platonist teachers did not hesitate to call themselves hierophants and to make money by divination. In attempting to repair the ravages wrought in the Greek mind by a despairing Skepticism (q.v.) Plotinus propounded the theory that knowledge transcended reason; that the absolutely true could be comprehended immediately, and intuitionally, namely, by ecstacy. Such inner knowing was the beholding of "the One" in itself; and a resolving of self into the absolute. The subject could not, it was taught, master the absolute by objective knowledge or through the medium of dialectic.

The Godhead, "the First," "the One," "the Good," is the original Being, incapable of definite characterization, wholly unspeakable and superior to all comparisons; it is "that which stands above being," and is neither thinking, willing, nor desiring. The world emanates from out the Godhead by an eternal, timeless, and necessary process, without division of itself or loss of essence. The world, being an effluence or overflowing of the divine, is more or less perfect according to the degree of nearness to or remoteness from its source. Each degree of emanation, however, has for its principle the totality of being. Next to the original "One," reason is the most perfect. It contains in itself the Ideal World and the whole of true and changeless being. Christian Neo-Platonists often identified the reason (*Nous*) of Plotinus with Logos, the second person of the Christian Trinity. That was a mistake. Logos with Plotinus is scarcely more than "law" regarded as "vital force" and in operation resembling instinct. The Johannean Logos is both immanent and transcendant. From reason emanates the World-soul, though reason incurs no change thereby. The World-soul actualizes reason in the outer world; it gives external qualities to sensible matter, which is the last and lowest of the emanations. Matter is itself undetermined, has no quality nor being. The visible universe is only a transcript of the World-soul. Plotinus does not concern himself much about the fact of the imperfections of individual things and the sin which exists in the world. As the World-soul links reason and matter, so do individual souls partake both of reason and sense. Mankind has a supersensible soul, which has pre-existed, and a lower soul which builds up the body. Souls came down from the rational or light-world, which is their real home and retain a recollection of it, hence their longings are always for a return. From these longings come our redemption and our prospective union with Divinity, and the degree of seriousness with which we realize them determines our worth as individuals. Pure sense-perceptions do not help the soul in its soaring which is rather promoted by thought and reflection. The strongest incentive and most potent force in the elevation of human nature is love of the beautiful, the Platonic ἔρως Neo-Platonism, together with Neo-Pythagoreanism, which had preceded it, represents an effort of paganism toward reform and reconstruction in order to meet the supernaturalism, monotheism, and universalism of the victorious Christianity which was everywhere pushing hard upon pagan thought and religion. In Iamblichus ("the divine" or "the famous hero" as Emperor Julian (q.v.) called him) Neo-Platonism finds expressed its religion, and expressed not so much according to Plato as according to Pythagoras (q.v.). Iamblichus created a fantastic pantheon in order to bring the entire world of gods into a system, in which he co-ordinated all cults, excluding Christianity, which was feared as a rival; but this erudite religion failed to meet "the desire of the nations" or

"the spirit of the times." "Any old woman of the Christians," said Augustine, sarcastically, "is wiser than these philosophers."

Neo-Platonism, as represented by Proclus, made a last supreme effort to retain an authoritative position in the world of thought. Proclus attempted to systematize the entire historical content of Greek philosophical thought, and place it upon a coherent and logical basis, but the effort was fruitless. A few feeble echoes of this teaching are perceptible in the writings of some of the Church Fathers, as for instance, Clement and Origen. Subsequent phases of philosophic speculation bear sometimes the imprint of Neo-Platonism. Attempts were made by Ficinus (1433–99), a celebrated Italian scholar, by Pico della Mirandula and other Florentines for its restoration. The English "Cambridge Platonists" in the 17th century also tried to revive it. Thomas Taylor (q.v.) (1758–1835) may be called the last European Neo-Platonist.

Consult: Whittaker, 'The Neo-Platonists'; Bigg, 'Neo-Platonism'; Richter, 'Neu-Platonische Studien'; Kirchner, 'Philosophie des Plotin'; the larger Handbooks of Philosophy, such as those of Ueberweg, Windelband, and Zeller.

C. H. A. Bjerregaard,
Librarian, New York Public Library.

Neo-Pythagoreanism, a revived form of Pythagoreanism held in the 1st century B.C. at Alexandria. The author of this revival was Nigidius Figulus, a Roman magistrate; but Apollonius of Tyana (q.v.) was its most brilliant expounder. The latter was an opponent of Neo-Platonism (q.v.) and mixed the philosophy of numbers with certain modified forms of Oriental theosophy, and ascetic ideas. Consult: Zeller, 'Die Philosophie der Griechen' (1880–1); Vacherot, 'Histoire Critique de l'Ecole d'Alexandrie' (1846–51).

Ne'ocene, in geology, a term used by the U. S. Geological Survey to include what Lyell called the Miocene and Pliocene periods. The word means "new (or late) recent," and is contrasted with Eocene, "dawn (or early) recent." See Tertiary.

Neoco'mian (Lat. *Neocomum*, Neuchâtel), in geology, a term applied to the lowest marine stages of the Cretaceous system, because of its typical occurrence at Neuchâtel in Switzerland. There and in southern France this formation, consisting of limestones and marls, is as much as 1,600 feet thick. The term corresponds to the English Wealden and lower greensand, and to the German Hils; is little used in America; and in France is used broadly and strictly, Neocomian in the wider sense including the stricter Neocomian (made up of Hauterivian and Valanginian), as well as Barremian and Aptian. Consult Pavlow, 'Quarterly Journal London Geological Society,' Vol. LIII., 1896.

Neody'mium, in chemistry, a substance, provisionally considered to be an element, whose existence as a constituent of didymium (q.v.) was recognized by Auer von Welsbach. It has the chemical symbol Nd and an atomic weight of about 140.8, and is distinguished from other constituents of didymium by yielding rose-colored salts. Its oxid has the formula Nd_2O_3. Further research is necessary before the elementary character of neodymium can be regarded as positively established.

Ne'ogene (Greek, "late-born," "late"), in geology, a term used by Continental geologists to include the Lyellian Pliocene and Miocene, that is, corresponding with Neocene (q.v.), as used by the U. S. Geological Survey.

Neolith'ic, in archæology, the more recent of the two periods into which the Stone Age has been subdivided. The Neolithic stone implements are finely shaped and polished, and are found in connection with the remains of extinct animals.

Ne'on (Greek, "new"), a gaseous element constituting from the fifty-thousandth to the hundred-thousandth part of the bulk of the earth's atmosphere, which was discovered by Ramsay and Travers, in 1898, in liquid argon. Neon closely resembles helium and argon (qq.v.) in its general properties, but its properties are less perfectly known. The density of neon appears to be about 9.96 times as great as that of hydrogen under the same conditions of temperature and pressure; and although no compounds of neon with other elements have yet been prepared, this density, taken in connection with the fact that the ratio of the specific heats of the gas appears to be 1.66 (see Argon, and Gases, Kinetic Theory of), indicates that the atomic weight of neon is about 19.92.

Ne'ophyte (Greek, "newly planted or grafted on"), originally applied to those newly initiated into the Eleusinian or other ancient Greek mysteries, of whom Plato says, "there are many wand bearers (the wand being the badge of the initiated) but few mystics." The catechumens who had been just baptized were so styled in the early Church. These newly made Christians were considered less likely to stand firm against paganism than their older and more experienced brethren. Hence the term was slightly tinged with disparagement. St. Paul forbade the ordination of the neophyte or novice (1 Tim. iii. 6), and the 3d Council of Arles (524) decreed that a year's probation was necessary for candidates for holy orders among the newly baptized. Yet Ambrose was elected bishop of Milan (374) when he was but a catechumen and was consecrated soon after his baptism. Newly converted pagans or disbelievers are still styled neophytes by Roman Catholic missionaries and Gregory XIII. established a college at Rome (1622), the Propaganda, in which they might be educated and trained to preach to and convert the people of their own land.

Ne'oplasms. See Tumors.

Neoptolemus, nē-ŏp'tŏl'ē-mŭs (also called Pyrrhus), in Greek legend, the son of Achilles and Deidamia. Taken to Troy by Odysseus, he was one of the band who captured the city by means of the wooden horse. He slew Priam and took to himself Andromache, the wife of Hector. He afterward went to Epirus, where he married Hermione, in consequence of which Orestes, her former lover, killed him.

Neornithes, nē-ôr'nĭ-thēz, or **Euornithes,** a sub-class of the class *Aves* (birds) embracing all known birds, fossil or recent, since the Jurassic Period, as distinguished from another sub-class, *Archæornithes,* which, contains, so far as yet known, only the archæopteryx (q.v.). The sub-class *Neornithes* may be divided into

three sub-divisions, namely (1) *Ratitæ;* (2) *Odontolcæ;* (3) *Carinatæ.*

Neosho, Mo., city, county-seat of Newton County; on the Kansas City, P. & G. and the St. Louis & S. F. R.R's; about 170 miles southwest of Jefferson City and 140 miles south by east of Kansas City. It was settled in 1839; in 1868 was incorporated as a town, and received its city charter in 1878. It is near the lead and zinc mining region of Missouri. The chief manufacturing establishments are machine-shops, flour mills, foundry, agricultural implement works, repair shops, and furniture factory. There is located here a government fish hatchery which occupies 13 ponds. It is the seat of the Scarritt Collegiate Institute (M. E. South) and has a high school, elementary schools, and a public school library. Pop. (1890) 2,198; (1900) 2,725.

Neosho, nē-ō'shō, a river which has its rise in Morris County, Kan., in the central part of the State. Some of the small streams which form the head-waters have their sources near short streams that flow north into the Kansas River. The Neosho flows south by east and enters the Indian Territory at the northeast corner. It continues an irregular course, mainly southeast, for a distance of about 40 miles, then turns southwest, which course is continued to its junction with the Arkansas River at Fort Gibson. Its whole length is about 355 miles. Some of the cities on its banks are Council Grove, Emporia, Burlington, Iola, Humboldt, Erie, and Oswego, all in Kansas.

Neot'eny, a term formerly applied to a phase of Parthenogenesis (q.v.). The larva of Amblystoma, or the Siredon, has been known not infrequently to lay eggs which have hatched young. This appears due to the premature development or acceleration of the reproductive organs and is comparable to the phenomenon of production of larvæ by the maggot of a fly (Miastor) to which the name of pædogenesis has been given. See under PARTHENOGENESIS.

Neotrop'ical Region, or **Neogæa,** one of the primary faunistic divisions in the zoogeographical scheme of Wallace and Sclater, embracing South America, Central America, as far north as the highlands of northern Mexico and the West India islands. It is perhaps the most sharply defined and separable of all the "regions," but shows some extraordinary affinities with eastern South Africa (Madagascar) and Australasia; hence some students of the distribution of animals have united it with those parts of the world in a still more comprehensive "province," called the Antarctic or Neogæan, in contrast with the Northern hemisphere as the Holarctic or Arctogæan Province. See ZOOGEOGRAPHY.

Neozo'ic (Greek, "late life"), in geology, a term introduced by Edward Forbes, but never in common usage, to include the Mesozoic and Cenozoic, between which he argued there was no such distinction as between them on the one hand and the Palæzoic on the other. The word is sometimes used as an equivalent of Tertiary and sometimes as synonymous with Cenozoic.

Nepal, nē-pâl', **Nipal,** nē-pâl', or **Nepaul,** Asia, an independent kingdom, on the southwest slope of the highest part of the Himalaya range, north of India, bounded on the north by Tibet, on the east by Sikhim, and on the south and west by Bengal, and the United Provinces of Agra and Oudh, British India. It lies between lat. 26° 25′ and 30° 17′ N., and lon. 80° 6′ and 88° 14′ E.; is 500 miles long with a maximum breadth of 150 miles, and has an estimated area of 54,000 square miles. The main portion of the country is a table-land from 3,000 to 6,000 feet above sea-level. Within its boundaries are the highest mountains in the world, Everest, Dhawalagiri, and on its eastern border, Kanchinjinga. From the mountains, the land gradually descends southward, forming four distinct terraces, differing in climate and vegetation. The Terai or southern lowland, well wooded and extensively cultivated, is traversed by numerous small streams. The most important rivers are the Karnali, the Gandak, and the Kusi, all of which rise in Tibet, and force their way through the Himalayas, by deep and precipitous gorges to join the Ganges. The climate is on the whole, temperate, except in the most elevated northern districts, where it is very cold. Magnificent forests of sal, sisoo, and toon trees stretch along the declivities of the lower hills into the adjacent plains. The forests higher up exhibit a greater variety, gradually assuming more and more of an Alpine character. The principal products are rice, wheat, barley, pulse, sugarcane, buck-wheat, hemp, cotton, tobacco, and madder. In the mountainous parts a valuable article of cultivation is a large species of cardamom, and in other places ginger is grown to a considerable extent. Pasturage is on the whole scarce and indifferent. The sheep and goats, however, have fine wool. Horses are imported from Tibet. The wild animals are elephants, black bears of great size, hogs, hog-deer, foxes, jackals, and a few tigers. Fish abound in the streams of the Terai. The manufactures of Nepal are confined chiefly to two kinds of coarse cotton cloth, called khadi and changa, of which the dress of the middle and lower classes of the people is made. Articles in copper, brass, and iron are also manufactured in various places; likewise bells of a kind of bell-metal called phul, but considered inferior to those of Tibet; and also a very strong paper, remarkably well fitted for packages. The trade of Nepal is chiefly carried on with British India and Tibet. From the former it imports Bengal cottons and muslins, silks and raw silk, carpets, English cutlery, etc.; and from the latter Chinese silk stuffs, paper, drugs, gold and silver, sheep, musk, skins of the musk-deer, etc. Its chief exports are the natural products of the country.

The government of the country is a military oligarchy with a maharaja as the nominal head, but a prime minister as its real ruler. The ruler acknowledges a certain amount of dependence on the Chinese government, but is in more real dependence on British authority. A British Resident and a small body of British troops are stationed at the capital, Khatmandu, and British influence is gradually increasing. The population of the country is estimated at over 2,000,000. The inhabitants are chiefly Newars, a race probably of Mongolian and Chinese origin; the dominating race is the Ghurkas (q.v.). In the east there is a considerable mixture of Hindus. The pre-

vailing religion is Brahmanism, but there are also some Buddhists. Most of the domestic servants are slaves. The ordinary language of Nepal is the Prabratiya or mountain Hindu dialect, but the Newars have a language peculiar to themselves. The country was formerly possessed by numerous independent rajahs, and extended west to the Sutlej; but about the middle of the 18th century the rajah of Ghurka began to extend his dominions by conquest, in which he and his successors were so successful that in less than 50 years they had conquered the whole of Nepal, and made themselves kings of that territory. Subsequently (1816) a large portion of the kingdom was cut off by the British, who reduced its western limit to the river Kali instead of the Sutlej. By the Kot massacre in 1845 Jung Bahadur made himself master of the country, and proved a firm but beneficent ruler; at his death in 1877 he was succeeded by his brother who reigned until his assassination in 1885, when he was succeeded by the present maharaja Dhiraj Pirthvi Bir Bikram, born 1875.

Nepenthe, nẹ-pĕn'thē (Greek, *nē*, a negative prefix, and *penthos,* sorrow), a magic potion or drug which was fabled by the poets to banish the remembrance of grief and to cheer the soul. The invention was attributed to the Egyptians.

Nepen'thes, a genus of pitcher-plants (q.v.).

Neph'elite, or **Nephelin,** a native silicate of aluminum, potassium and sodium, crystallizing in the hexagonal system, and also occurring in massive forms. It exhibits various colors, and has a vitreous lustre, a hardness of from 5.5 to 6, and a specific gravity of about 2.6. It occurs in recent eruptive rocks, notably at Mount Somma, Vesuvius.

Nephe'lium, a genus of fruit-trees. See LITCHI.

Nephi, nē'fī, Utah, city, county-seat of Juab County; on the Sanpete V. and the Oregon S. L. R.R.'s; about 80 miles south of Salt Lake City. It is in a high valley in which there are a number of good farms. The chief products of the surrounding country, all of which contribute to the prosperity of Nephi, are farm products, salt, gypsum, lumber, and live stock. Pop. (1890) 2,034; (1900) 2,208.

Neph'oscope, an instrument for determining the apparent velocity and motion of clouds. It is in the form of a horizontal mirror, with compass-points or degrees drawn on the mirror, or on the surrounding frame; with an adjustable sighting piece placed above the mirror. The sighting-piece serves as a fixed point for viewing the cloud shadow as it moves away from the centre of the mirror.

Nephrectomy, the excision or removal of a kidney. In cases of calculi, multiple abscesses, pyonephrosis, hydronephrosis, sarcoma, wounds, tears and ruptures of the ureters, and movable kidneys this operation may be called for. The removal of a single or horseshoe kidney is considered a fatal operation. Before removing a kidney it is necessary to ascertain whether the remaining organ is capable of excreting its due amount of urine. Abdominal nephrectomy (anterior nephrectomy) is the excision of a kidney through an incision in the abdominal wall; lumbar nephrectomy (posterior nephrectomy), an excision, through an incision in the loin.

Nephrorrhaphy, nephropexia, or nephropexy is the fixation of a movable kidney by sutures.

Neph'rite. See JADE.

Nephri'tis. See BRIGHT'S DISEASE; CIRRHOSIS, KIDNEYS.

Nephrotomy, incision of a kidney, an operation deemed necessary by the surgeon when it has been ascertained by exploration with the aspirator-needle or otherwise that the kidney is the seat of any condition or disease which endangers the life of the patient. It is resorted to for the removal of calculi (nephrolithotomy), of tumors, and for relieving congestion.

Nephthys, nĕf'thĭs, in Egyptian mythology, a deity, sister of Osiris and Isis, wife of Typhon, and mother of Anubis by Osiris. Some consider her as the symbol of the Egyptian coast on the Mediterranean; others as the personification of the five intercalary days of the Egyptian year, in which point of view they are called her children by Mercury, the Sun, and Saturn.

Nep'idæ. See FRESH-WATER INSECTS.

Nep'igon, or **Nip'igon,** a lake in Canada, in the northwestern part of the province of Ontario; about 33 miles north of Lake Superior. It is over 800 feet above Superior; about 65 miles long and 40 miles wide; its outlet is Nepigon River which flows south and enters Lake Superior through Nepigon Bay. The coast line is remarkably rocky and irregular, in some places lofty headlands; the total length of coast line is nearly 600 miles. It has a number of small wooded islands. Several streams enter the lake, and in the vicinity are a large number of small lakes, all of which, together with Nepigon, once formed a very large lake. The lake is a favorite place for sportsmen as it is well stocked with fish.

Nepomuk, Johann, yō'hän nā'pō-mook, patron saint of Bohemia: b. Pomuk between 1330 and 1340; d. Prague 20[?] March 1393. He rose to be a high ecclesiastical dignitary, and was put to death at the order of King Wenzel IV. of Bohemia by being thrown into the Moldau River. Differences as to Church policy and other reasons, often conflicting, are assigned for this procedure. But the most authentic account, compiled (1670) originally by Bohuslav Balbinus, a Jesuit, narrates the story as follows: According to Balbinus, Nepomuk obtained the degree of magister at Prague, eventually became almoner to King Wenzel and confessor to Queen Johanna and, after imprisonment and torture, was put to death for refusal to divulge certain matter of the confessional. Balbinus dates the martyrdom in 1383, but the best sources make the time as above given, 10 years later. Hajek of Labocan conjectured (1541) that there were two Johns and this idea was assumed by Balbinus; but Dabrovski established (1787) the fact that there was but one. Abel ('Die Legende vom heiligen Nepomuk' 1855) presented the curious theory that John of Nepomuk was really the development of the Protestant hero, John Huss, into a Catholic saint. But this is altogether without foundation. Previous to his canonization by Pope Benedict XIII. in 1729,

Nepomuk had already been venerated as protector against slander and danger by water. His day, 16 May, is still observed in Bohemia as a time of high festival. Consult: Frind, 'Der geschichtliche Johannes von Nepomuk' (2d ed. 1871).

Nepos, nē'pŏs, **Cornelius,** Roman historian: b. Upper Italy about 100 B.C.; d. about 24 B.C. His earliest writings consisted of verses and three books of 'Chronica.' With the exception of a geographical treatise, his remaining works were directed toward the study of manners, customs, and character. Such are the five books of 'Exempla,' supposed to have been an account of the men who stood as types of the virtues of earlier Rome. Such, too, were the elaborate biographies of Cicero and Cato the Elder. But the most comprehensive of his publications was the 'De Viris Illustribus' ('Of Illustrious Men') in probably 16 books, in which the lives of foreigners and of Romans were juxtaposed in a parallel arrangement. Of this there are extant the portion 'De Excellentibus Ducibus Exterarum Gentium' ('Of Prominent Foreign Generals') and the biographies of Cato and Atticus. The lives of Atticus and Cato have been uncontestably assigned to Nepos, but until the edition of Dionysius Lambinus (1569) the 'De Excellentibus Ducibus' was supposed to be the work of a certain Æmilius Probus. Lambinus' verdict, based on both historical and stylistic grounds, has been almost universally accepted. The style of Nepos is too colloquial; his matter is often lamentably inaccurate; but the essays are in general well arranged and fair in their judgments. There are several good editions by Nipperdey (rev. by Lupus 1879) and others.

Nep'otism, a system or custom practised by several of the earlier popes of granting high honors, dignities, offices, pensions, and the like to their family relations, generally their nephews; hence family favoritism of any sort.

Neptune, (1) in astronomy, the most distant of the known planets, its mean distance from the sun being 2,745,998,000 miles, and its least distance from the earth 2,629,000,000 miles. The eccentricity of its orbit is .00872; its inclination to the plane of the ecliptic is 1° 47′. The apparent diameter is about 2′ 7″. The real diameter is estimated at 36,000 miles, and it seems to have very little polar compression. Its mass is about 16¾ times that of the earth. The largest telescopes give us little information as to whether or not it has belts. A satellite of Neptune was discovered by Lassell of Liverpool in 1846. It is peculiar in revolving from east to west. Neptune revolves round the sun in 164.6 years. (2) In Roman mythology the god of the sea; son of Saturn and Rhea, and brother of Jupiter and Pluto. He is variously represented; sometimes with a trident in his right hand, a dolphin in his left, and with one of his feet resting on part of a ship; at others in a chariot drawn by sea-horses, with a triton on each side. See POSEIDON.

Neptune, Temple of, the name of two ancient structures, one at Paestum in Lucania, and the other on the Campus Martius in Rome. The latter was erected by Agrippa 26 B.C. It was destroyed by fire 80 A.D., but was restored by Hadrian.

Neptu'nian Theory (Lat. *Neptunus,* god of sea), in geology the view advanced by Werner that geological change is due entirely to the influence of water, the earth in the beginning having been covered with water, which hold rock-material in solution. This hypothesis, also styled Diluvian Theory, was opposed by the Vulcanians, who held the igneous theory. See GEOLOGY.

Nérac, nā-räk', France, a town, capital of an arrondissement in the department of Lot-et-Garonne, 16 miles southwest of Agen, on the precipitous banks of the Baise. In its old castle, now a mere ruin, Henry IV., of whom there is a bronze statue in the town, spent part of his youth, and at an earlier period Calvin and other reformers found an asylum with Margaret of Valois, queen of Navarre. The town has manufactures of coarse woolens, shipbiscuit, corks, etc. Pop. (1901) 6,435.

Nerbudda, nėr-bŭd'da, or **Narbada,** nŭr-bä'dä, India, a river which rises in the Maikal range, 3,493 feet above sea-level, in the north of the Central Provinces, flows first west and northwest across the Amarkantak plateau, then west, inclining gently to the south, and after forming part of the boundary between the Central Provinces and Indore, falls into the Gulf of Cambay, after a course of about 800 miles. In the wet season it rises in some places 25 feet, and in others 70 feet above its lowest level. Though much obstructed by shelves and cataracts, it is navigated by boats to the falls of Daree, about 250 miles from its mouth. To the Hindus the river is a sacred stream, almost equal to the Ganges in sanctity. It is regarded as a meritorious act to walk from the sea to its source and back again along the banks of the river. There are valuable coal and iron beds in the valley near Hoshangabad, and a railroad skirts the river from Barhanpur to Sihora.

Nereids, nē'rē-ĭdz, in Greek mythology, were sea nymphs, daughters of Nereus and Doris. They were 50 in number, and they had, like their father, the gift of prophecy and the power of assuming different shapes. They were specially the nymphs of the Mediterranean, and were distinguished on the one hand from the Naiads or the nymphs of fresh water, and on the other hand from the Oceanides or nymphs of the ocean.

Ne'reis, a marine annelid, one of many species, scattered throughout the world, of polychæt worms (see POLYCHÆTA), of the family *Nereidæ,* which contains the most highly organized of this group of animals — "the highest type of *Annulata*" according to Packard. Their bodies are visibly annulated, flat and scaly. A distinct head is present, provided with a retractile proboscis, which is usually armed with teeth or jaws. Eyes and tentacles are borne on the head. The locomotive appendages are very fully developed, and the respiratory or breathing organs, in the form of tuft-like branchiæ or gills of rudimentary nature, are borne on the dorsal aspect of the body-segments. The sexes are separate, the eggs are probably laid in masses between tide-marks, and the young at first appear as surface-swimming ciliated bodies, but the stages of development have not been traced. A typical and numerous species on the Eastern American coast is *Nereis virens,* which lives

between tide-marks in holes in the mud. It secretes a viscid fluid lining its hole, up which it moves, pushing itself along by its bristles and ligulæ. At night, probably, during the breeding season, they leave their holes and swim at the surface of the water. Some of these nereids are what Van Beneden calls "free messmates." *N. bilineata* and *N. succinea* inhabit the tubes of a species of Teredo, and *N. costæ* is found in the cavities of sponges. Consult: Packard, 'Zoology' (1897); Arnold, 'Sea Beach at Ebb Tide' (1901).

Nereus, nē'rūs, in Greek mythology, a divinity of the sea, the progenitor of the Nereids (q.v.). He is represented as an old man, with a wreath of sedge, sitting on the waves with a sceptre in his hand.

Neri, Filippo de', fē-lēp'pō dā nā'rē (known in English as Saint Philip Neri) founder of the order of Oratorians (q.v.): b. Florence 22 July 1515; d. Rome 26 May 1595. He was of noble family with rich connections, but his only aim in early life seemed to be that of self discipline and the pursuit of learning. He deliberately sacrificed the favor of a rich uncle, who wished to make his nephew heir to his fortune, by secretly leaving him (1533) and taking up his residence at Rome as private tutor in a gentleman's family. He sold his books in 1538 and gave the price to the poor, and ever afterward devoted himself to the sick and to pilgrims. In 1548 he established the Fraternity of the Holy Trinity for the succoring of the sick and pilgrims, founding the hospice which later became one of the finest at Rome. He did not enter the priesthood until 1551 and in 1574, with Cæsar Baronius and other priests, he founded the Oratorians of which he was styled "Father" up to 1592. His congregation received the approval of Gregory XIII. in 1575. He was the most popular saint in Europe since the days of Francis d'Assisi and of unprecedented independence and originality in his life and utterances. Goethe has styled him "a saint with a sense of humor." His motto was "Spernere mundum, spernere se ipsum, spernere se sperni." (Despise the world, despise self, think it a light thing to be despised of all.) He was canonized in 1622, and in 1726 the day selected for his festival was the anniversary of his death. His letters (1751), poems (Rime Oneste, Vol. 8), have been published. Consult: Gallonio, 'San Filippo dei Neri'; Reiching, 'Leben des heiligen Philippo de' Neri' (1859).

Neri'ne, a genus of plants of the order *Amaryllidaceæ* (q.v.). The 10 species, which are all South African, are bulbous-rooted, have narrow leaves which die down during the spring months, and leafless scapes which appear in late summer surmounted by umbels of strikingly beautiful six-parted flowers varying from scarlet through all tints to white, and seemingly covered with hoar frost. In popular usage the name *Nerine japonica* is used, but this name is properly applied to a distinct plant, which, however, has similar habits and may be managed in the same way. It has black seeds; true nerines have green seeds. The most commonly grown species is *N. sarniensis,* the Guernsey lily. The bulbs should be planted in autumn in the greenhouse and given plenty of water and plant food until the leaves turn yellow when both may be gradually withheld, the pots laid on their sides and the bulbs allowed to mature. In late summer, when the plants show signs of life, water may be given.

Nernst, nĕrnst, **Walther,** German physicist: b. Briesen, West Prussia, 25 June 1864. He was educated in the leading universities of Germany and in 1889 became lecturer in chemistry at Leipsic. In 1891 he was called to the chair of chemistry at Göttingen where in 1895 he established an institute for physical chemistry. His invention of the Nernst incandescent electric lamp has made him a prominent figure in the electrical world. He has written: 'Theoretische Chemie' (1898); 'Ueber die Bedeutung elektrischer Methoden u. Theorien für die Chemie' (1901); etc.

Nernst Lamp. See ELECTRIC LIGHTING.

Ne'ro, Lucius Domitius Ahenobarbus (after his adoption by the Emperor Claudius called Claudius Cæsar Drusus Germanicus), 6th Roman emperor: b. Antium (Latium) 37 A.D.; d. 68 A.D. He was the son of Gneius Domitius Ahenobarbus and Agrippina, the daughter of Germanicus. His adoption was due to the marriage of his mother with the emperor. Soon after, when only 16 he married Octavia, daughter of Claudius and Messalina 53 A.D. Agrippina wished to secure the succession to her own son to the prejudice of Britannicus, the son of Claudius. In this she succeeded, and Nero became emperor on the death of Claudius in the year following 54 A.D. His tutors were able men, Burrus, the prefect of the prætorian guards, and the philosopher Seneca (q.v.). For a short time he gave a promise of reigning well, and allowed himself to be guided by his instructors, but it was not long before he gave himself to the greatest excesses and cruelty. His first crime was the poisoning of Britannicus, 55 A.D., whom Agrippina, having quarreled with her son, threatened to raise to the throne in place of Nero. He next caused Agrippina herself to be put to death, 59 A.D. The most distinguished victims of his cruelty, beside Britannicus and Agrippina, were his instructor Seneca, the poet Lucan, and his wives Octavia and Poppæa Sabina. "My predecessors," said he, "did not know the rights of monarchy. People may hate me, if they only fear me." During his reign, in 64 A.D., a great conflagration took place at Rome, which lasted for six days and seven nights, and when thought to have been extinguished, broke out and burned two days more. During this fire most beautiful monuments of art and of history were burned to the ground. Nero was commonly suspected of being the originator of the fire, with the view of having a real representation of the burning of Troy; and although this suspicion was admitted by Tacitus to be without evidence and is regarded by modern scholars as almost incredible, it was so generally entertained at the time that Nero did his utmost to transfer the guilt of this action to the Christians, whom he caused to be cruelly persecuted for it throughout the empire. He caused the burned part of the city to be rebuilt in a manner more splendid and magnificent than before. The most remarkable of his buildings was the palace which he erected for himself in Rome, known as the Golden House. Several conspiracies, formed against

him in Rome, ended in the destruction of the conspirators themselves. At last the revolt of Galba, his governor in Spain, succeeded. The Prætorian guards declared for Galba, and the Senate pronounced against Nero sentence of death. The tyrant anticipated the punishment which awaited him through requesting death by the sword of an attendant. Consult: Baring-Gould, 'The Tragedy of the Cæsars,' Vol. II. (1892).

Nero, Golden House of. See GOLDEN HOUSE OF NERO.

Ne'roli, a perfume, extracted from the flowers of a small Italian orange tree. It is an essential oil, obtained by distillation from the orange blossoms.

Nertchinsk, nĕr-chĭnsk', Siberia, a town in the Transbaikalia Territory, on the Nercha, near its mouth in the Shilka, 570 miles east of Irkutsk. Although comparatively small it is an important trading centre for Russians, Mongols, Turcomans, and Tunguses, and has a considerable export trade in the gold, silver, lead, tin, and zinc of the surrounding mining region. Pop. (1897) 6,713.

Nerthus, nĕr'thŭs, in German mythology, a goddess, regarded as representing the earth.

Ner'va, 13th Roman emperor: b. Narnia, Umbria, 32 A.D.; d. 98 A.D. He occupied posts of trust in the reigns of Vespasian and Titus. He became emperor at an advanced age, after the assassination of Domitian, 96 A.D. through the aid of Parthenius, chamberlain of the imperial palace, and Petronius Secundus, commander of the Prætorians. Nerva was a man of cultivated mind, with some poetical talent. His reign was beneficent. He recalled exiles, allowed no senator to be put to death, abolished several oppressive taxes, observed a strict economy for the relief of the poor, and tolerated Christianity. But he was unable to put down the violence and insubordination of the Prætorian soldiers. Seeing, perhaps, that an element of greater energy was needful, he adopted as successor Marcus Ulpius Trajanus (see TRAJAN), then commanding an army in Germany, whom he made co-sovereign. Consult: Merivale, 'History of the Romans under the Empire' (1865).

Nerval, Gerard de, zhā-rār dė nār-văl (properly GERARD LABRUNIE), French author: b. Paris 21 May 1808; d. 26 Jan. 1855. He was educated at the Lycée Charlemagne, and made one of the first renderings (1828) of Goethe's 'Faust.' In his 'Poésies Allemandes' (1830) are to be found translations from other German authors, such as Schiller, Uhland, and Heine. He was a collaborator on various literary periodicals; wrote verse, including 'Elégies Nationales et Satires Politiques' (1827); a few dramas, among them 'L'Alchimiste' with Dumas; and several volumes of prose, such as 'Scènes de la Vie Orientale' (1848–50), and 'La Bohème Galante' (1855).

Nervii, nėr'vĭ-ī, an ancient people of Gaul, famous for the stand they made against Cæsar's advance in 57 and 54 B.C. They submitted to the Romans in 53 B.C.

Nervous Diseases, disorders arising either from actual changes in the structure of nerve-fibres or nerve-centres, or from some irregularity of nerve-function without actual structural change. Thus nervous diseases may be due to inflammation or degeneration of nerve-substance; to the pressure on some part of the nervous system by tumors, effused blood, or other fluid; to the death of some part by the cutting off of its blood-supply, etc.; to accident or injury due to internal or external poisons, or to violence; or they may be the result of lowered nervous action as a part of general bad health. It is customary to speak of organic and functional diseases of the nervous system, meaning diseases in which structural changes are demonstrable, and those in which no such alterations can be seen by appropriate instruments of precision. While such a difference is perfectly valid from the practical point of view, from the more scientific standpoint no such distinctions can be maintained save on the most general grounds.

Nervous diseases are further subdivided into affections of the motor and sensory functions of the body (neuroses), and those of the mental or thought processes (psychoses). Most disorders occupy both fields within certain limits, the distinctions being purely formal and academic. Nervous diseases are extremely widespread in the community. It has been estimated that one in every 300 of the population is afflicted with some one of the insanities; one in every 500 has epilepsy, and it is common belief that neurasthenia is on the increase. Diseases of the nervous system are naturally increasing with the increasing population. Whether this is a relative increase or not is not definitely proven. So far as the insanities are concerned, there seems to be little doubt that they are not only relatively but absolutely increasing. With respect to this latter belief, however, it should be remembered that the increase in the material comforts afforded patients suffering from insanity is tending to encourage the community to send their semi-dependent members to institutions and thus escape the individual cost of their care. This makes an apparent increase in the proportion of insanity, for many cases in this manner enter into statistics which would not otherwise be counted. The complex conditions of modern civilization are causative in bringing about a certain amount of breakdown of the nervous system, and the keen competition for subsistence and for luxuries also tends to increase these evils.

Nervous diseases present a greater diversity of symptoms than disease of any other organ-system of the body. Over 200 divisions have been made, and this number is subject to constant revision. The nervous system is the most highly developed and most intricate part of the body; hence nervous diseases present a greater complexity than any others. At the same time, so far as the neuroses are concerned, their accurate determinatio is a matter of very precise anatomical knowledge. This gives to the study of them a peculiar fascination. Nervous diseases are further characterized by their extreme severity. Other organs of the body, when diseased, recover their functions in a comparatively short time. Nerve-function, when disturbed, recovers very slowly. Chemically, nervous tissue is extremely complex and much time is necessary to reconstruct it after injury. This is particularly true for mental diseases. Years and months are

necessary for recovery, when weeks and days are occupied in the restoratior of non-nervous structures. Economically, nervous diseases are of serious effect, frequently depriving the community of wage-earners without eliminating them, so that they become burdens; and they contribute to swell their own ranks by the added stress they cause to the community which must support them. The great majority of chronic invalids are those suffering from nervous ailments. Idiots, imbeciles, the insane, epileptic, paralytic, and criminal make up a large class of parasites. The study of economic conditions due to disorders of nervous structures is of wide and practical import. It is the largest and most important chapter in social economics.

One of the most important agents in reducing the amount of nervous disease is hygienic living, and a greatly increased amount of general information bearing on the part played by alcohol and other poisons in the development of nervous affections. All things considered, it seems highly probable that there is a relative decrease in nervous diseases in the community. It is highly desirable that in the primary schools, high schools, and colleges, more attention should be paid to the education that fits people better for the conditions with which they are to struggle in after years. Physical exercise, gymnastics, open-air play, nature-study, general rules of hygienic eating, of hygienic clothing, and the general principles of preventive medicine should enter into the curriculum of every school for both sexes. All this is being provided for wisely in most of the communities of the United States, and there is every reason to suppose that coming generations will be much better fitted physically to stand nervous stress than their predecessors.

Text-books on nervous disorders are numerous. A few of the more important recent works are here mentioned. Reference works: 'Jahresbericht über die Fortschritte in der Neurologie und Psychiatrie,' the most important bibliographic work published. Nothnagel's 'Specielle Pathologie und Therapie' contains the most recent series of monographs bearing on nervous disorders. Brourdel's 'Traité de Médécin' is one of the best recent French collections. Albutt's 'System of Medicine' is the best of the recent English systems. Valuable individual works on diseases of the nervous system are those of Starr, Dana, Church and Peterson, Gowers, Dejerine, and Oppenheim. On mental disorders Ballét's 'Traité de Pathologie Mentale' (1904) is one of the most comprehensive as well as most recent. Kraepelin, Weygandt, and Ziehen are German authors in favor; Berkeley, Defendort, Peterson, and Haines are well-known American authorities; Maudsley, Mercier, Clouston, and Bevan Lewis are among the foremost English writers of a generation past; Bianchi, in Italy, and Muratow, in Russia, are other well-known authors on nervous diseases. See BRAIN; INSANITY; NERVOUSNESS; NERVOUS SYSTEM, EVOLUTION OF THE; NEUROSIS; NERVOUS SYSTEM, TRAUMATIC AFFECTIONS OF THE; PSYCHIATRY; PSYCHOSIS.

Nervous System, Evolution of the. The nervous system is that part of the body which has developed most particularly the function of adapting the different organs of the body to their environment. It is the great regulator of all the physiological processes. It may be said to consist of two parts, that portion which has to do with the reception of impulses from without, in general spoken of as the sensory nervous system, and that portion which, in response to the incoming impulses, causes some form of adaptation in answer. Such adaptations are often of a muscular character, and the motor-nervous structures are concerned in bringing about such relationship. The human nervous system is fundamentally arranged on this plan, but while theoretically so simple in organization, practically and anatomically it is an extremely complex and complicated series of structures. This complexity is the result of untold ages of development; but a study of the nervous system in a number of the lower forms of life, as well as the study of the various nerve-structures of man himself in their development from the fœtal stage, has enabled the student of the human nervous system to trace the gradual steps of its evolution.

Plants are considered not to possess any nervous structures, yet the protoplasm responds to many forms of stimuli in much the same manner as the protoplasm of more highly developed living things. In a few plants, Venus' fly-trap, the sensitive plant, etc., there are found certain cells in the midribs of the leaf and in the stem, in which the protoplasm differs from that of other plants. They do not possess special nervous structures, but they are cells in which the protoplasm seems to possess special nervous conductive properties. In many of the lowest animals no known nervous structures have been found, but even in the very simplest animals the prototypes or forerunners of human nerve-structures are known to occur. In these animals the simple nerve-unit or neuron is found. In its simplest form this neuron consists of a strand of nervous tisue, a nerve-fibre, in some portion of which an enlargement or nerve-cell (so called) occurs. From the nerve-cell (or station, as it were) the fibre usually passes out in two directions, becoming attenuated in its passage and, branching or not, finally terminates in extremely fine processes (dendrites), which in different animals widely vary. One branch of this neuron is usually found in the periphery of the animal body, and may be spoken of as the incoming or sensory part of the structure; the other is frequently distributed to the muscles of the body. As the animals rise in the scale of complexity, this most primitive condition becomes modified, and a neuron of distinctly sensitive nature develops, which is brought in contact by the end-filaments of the neuron-branches with a similar motor neuron.

Such simple arrangements are found in animals of the very lowest organization, polyps, sponges, etc. In higher animals collections of these neurons form ganglia. These ganglia, at first isolated, become co-ordinated and grouped until as in the insects, for instance, a double chain of ganglia is found from in front of the mouth to the anus, arranged along the abdomen. These ganglia are connected by cables of nerve-fibres, and to and from each ganglion sensory and motor fibres pass, and thus the entire nervous system is brought into co-ordination. In thought it is but a step from the ventral double chain of ganglia in the insects to the solid spinal cord of the mammals with its ganglionic enlargements, constituting the medulla and brain

(see BRAIN), but it has taken many ages to bring about this integration. Theoretically, the nervous structure of the lowest mammals, *Amphioxus* and *Petromyzon,* are of the simplest type, a trifle more advanced than the insect double chain; but in the study of the nerve-structures of these lowest forms glimmerings of the complex nervous system of man are to be found. The homologues of the much diversified and complex spinal cord and brain in man are present in the primitive conditions in these animals.

While the developmental stages of the growth of the nervous system to its present complexity may be thus summarized, the details of the different forms are intricate, and only on philosophical grounds can they be thus described. In the lowest *Infusoria* structures that are definitely nervous in their function, and resembling nervous tissue in their forms, are first met with. These are located almost exclusively on the periphery of the body. In the bell-animalcules (*Vorticella, Stentor,* etc.) a mixed form of neuromuscular cells is found. These possess the combined functions of these two types of tissue. In the sea-anemones and polyps similar nervous structures are found and small ganglionic masses are present. Starfish possess a comparatively complex nervous system. Each arm of the starfish has a small ganglion near the mouth, and a nervous cord passing down the arm. The ganglia are farther connected by special nerve-fibres, bringing about an integration of nervous impulses. In the mollusks (snails, oysters, clams, etc.) the nervous system consists of a ring of ganglia surrounding the œsophagus; one above is larger and by some is spoken of as a brain, but it is not homologous with the brain of mammals in any sense. Communicating fibres pass to the foot, and to the breathing apparatus. In the worms the nervous system is still more complex. An enlarged double bilateral ganglionic mass at the head of the animal constitutes the brain; special offshoots pass to nervous structures in the eyes on each side; double cords pass backward, connecting the brain with paired ganglia, which may be fused into one mass or may be separated and connected by commissural fibres. From the ganglionic enlargements fibres pass out to the periphery of the body. This form of nervous system represents in skeleton what the more complicated mammalian system is to become. It is bilateral and is segmented, or metameric. The bilateral character of the mammalian nervous system remains throughout, with but slight fusion; the metameric character, however, undergoes many changes by the fusing together of ganglionic masses and their later distortion. The separate ganglionic mass in the worms entails greater individual independence. Thus if the head of a centipede be cut off, the legs will still cause the animal to run. Ants, flies, and butterflies will move about aimlessly for some time after the head is cut off. The head-ganglion in the ant is much more complex than in many other insects, showing in some measure by its structure the more highly developed character of this animal's "brain-ganglion."

The transition from lower to higher types of nervous system is found in one of the lowest of the vertebrates, the *Amphioxus.* In the lower forms the ganglionic masses and their connecting cords are located for the most part in the lower or ventral portion of the body, and the ganglia and fibres are distinct. In the vertebrate type the nervous system becomes dorsal, and the ganglia and fibres become fused into a long cord, or cerebro-spinal axis, which lies protected in the bony cavities of the skull and spinal cord. Certain accumulations of ganglionic centres occur and give a varying form in the different animals, and throughout the entire cerebro-spinal axis there runs a small cavity. In the head, or cephalic end, the brain is located, the ganglion-cells, or gray matter, being usually situated on the outside of the mass, the connecting and collecting fibres, white matter, on the inside. In the lower or cord portion, the gray masses come to lie on the inside of the structure and are partly surrounded by the fibres (see SPINAL CORD.) The ganglionic masses in the cord remain isolated, but much shifted in their position, coming to assume in the highest types the character of rods or pyramids of gray matter embedded in the cord. From the entire nerve-axis fibres pass out and are regularly paired, bringing all parts of the body into close nervous contact by intercommunicating nerve-fibres. In *Amphioxus* only the foreshadowings of the arrangements in higher vertebrates may be seen, but the work of Edinger, Kupfer, His, Retzius, and others has shown that most of the structures of the higher animals are found in this low animal in their simplest forms. In the fishes the brain-hemispheres begin to show more advanced stages. The olfactory nerves and bulbs are very prominent. The optic lobes are small, and the presence of a cerebellum is only indicated. In the amphibians, frogs, toads, salamanders, and the reptilians, snakes, etc., the hemispheres are prominent, and a certain degree of complexity of their minute anatomy is evident. The olfactory lobes are still very large, the cerebellum is very poorly developed, and the spinal cord is extremely simple in structure. The pyramidal tracts are not yet characteristic, but fibre-systems are present, passing from the brain to the cord. The spinal cord remains, however, a somewhat independent organ. In the fishes a sensory spinal fibre-system is probably found. With the birds the more characteristic higher-type brain begins to show itself. Its hemispheres have convolutions resembling somewhat in type those of higher forms. The cerebellum is well developed, and shows the characteristic histological structure of more highly evoluted animals. The spinal cord has well-marked pyramidal motor tracts and a differentiated sensory tract. Finally in the mammals practically all of the structures of the human brain are present, although great variations in the size and complexity of the different parts are to be noted. The brain of man differs from that of the lower animals not so much in the matter of size or weight, although it is relatively large and heavy, as by reason of the almost infinite number of connecting or association fibres. These bring all parts of the nervous system into relation, and permit of the endless variety of thought-constructions that go to make up man in his social conditions. In man, moreover, the hemispheres become relatively much larger than the other parts of the brain, and by reason of their many fissures and convolutions make very wide areas in which countless nerve-

cells develop. These hemispheres lie over the other parts of the brain. Throughout the entire animal series a certain evolution in localization takes place. Functions which in lower forms are generalized, and can be assumed by any part of the nervous system, in higher animals become specialized, and are relegated to certain particular organs. Thus it is found that in animals in which the sense of smell is extremely important large olfactory lobes are present; and conversely, animals so situated as not to possess certain organs do not develop certain nervous structures. The eyeless animals of caves have usually small optic lobes; the footless dolphins show small pyramidal (motor) tracts in their spinal cords, etc.

In the nervous system are illustrated very thoroughly the general principles of evolution as seen in its broadest aspects, and the development of the richly convoluted and highly complex brain is the index of the superior mental power of the human race. Consult: Beaunis, 'L'Evolution du Systeme Nerveux' (1890), which gives a simple account of the general structural changes in the nervous system throughout animals; Edinger, 'Bau der Nervösen Centralorgane' (6th ed. 1903); Cajal, 'Les Nouvelles Idées sur la Structure du Systeme nerveux' (1895); Koelliker, 'Handbuch der Gewebelehre des Menschen' (1896), for minute anatomy. For the most comprehensive works on the human nervous system, Dejerine, 'Anatomie du Systeme Nerveux' (1900), and Van Gehuchten, 'Anatomie du Systeme Nerveux' (3d ed. 1903). See ANATOMY; BRAIN.

SMITH ELY JELLIFFE, M.D.,
Editor 'Journal of Nervous and Mental Disease.'

Nervous System, Traumatic Affections of the. Accident and injury play a large role in the development of affections of the nervous system. These forms of disease, or disorder, may be grouped under two general heads, organic affections and functional affections, the dividing line between some forms of each being very obscure. Affections of the peripheral nerves are among the commonest of the organic accidental injuries. Thus, pressure of a crutch under the arm, the use of the crutch being necessitated by a broken leg, often produces a paralysis of the muscles of the arm. Other forms of peripheral palsies result from wounds of the arm and forearm whereby a nerve is cut, either by an instrument that penetrates the skin or by a splinter of bone from a fractured limb. Paralysis of one half of the body (hemiplegia) sometimes follows severe injury to the head. Such injuries frequently result from football accidents, from falls during drunkenness, from collisions, being thrown from a horse or vehicle, etc. Fractures of the spinal column often result in death, due to injury of the spinal cord; and if death does not result immediately, paralysis of the entire body below the site of the fracture (paraplegia) results. Lesions of the nervous system resulting from gunshot injuries are very common in times of war and constitute a very important chapter in military surgery. Such injuries usually cause either paralysis of different parts of the body, resulting from division of the nerve-fibres, or severe neuralgic pain due to irritation of the sensory nerves. Occasionally epilepsy is caused by accidental injury to the head, especially injury to the child's head during birth. One of the most interesting chapters in the history of traumatic affections of the nervous system is that of "traumatic neurasthenia," or "traumatic neuroses." These have been frequently classified under the head of "spinal concussion," "railway spine," "Erichsen's disease," etc. The most characteristic features of this affection were pointed out by Charcot, who allied it with neurasthenia and hysteria; and at the present time it is usual to speak of three classes of these conditions: (1) affections of a purely surgical nature; (2) traumatic hysteria; (3) traumatic neurasthenia. In a severe railway accident, for instance, any one of these forms may be present, and combinations of two or three are not unusual. The neurasthenia which may arise from such accidents is of a nature precisely similar to neurasthenia due to other causes. It is characteristic, however, that many of these neurasthenics recover when damages are collected from the railroad; some, however, persist and there is no doubt that the affection is a real one in many instances, and not simulated. At the same time, it should not be forgotten that many people grossly exaggerate their symptoms; moreover, there are certain parasites in the community who make it a business to sue railway and other corporations on the basis of alleged traumatic disease. Hysteria resulting from traumatism is of the same nature as ordinary hysteria, and is governed by the same general laws of this disease when due to other causes. It is important to emphasize the fact, not only to the layman, but to the professional man, that traumatic neurasthenia and traumatic hysteria are real diseases, and that their consequences may be serious and disabling. Each case needs special treatment, and in all cases in which litigation occurs there should be thorough investigation by competent medical experts, as well as trial by jury to determine the degree of disability on its merits. Consult: Peterson and Haines, 'Text-book of Legal Medicine' (1904); Bailey, 'Accident and Injury.'

Nervousness. If one were to ask half a dozen persons calling themselves nervous to define what they mean by their nervousness, he would find it hard to get thereby a general and comprehensive definition, for each would fall to describing his particular variety of nervousness. The nervous business man feels in a perpetual hurry. He is impatient and restless while waiting for his car or for his luncheon. He eats quickly, talks rapidly, and when he has a chance to rest he fidgets. At night he tosses and thinks for an hour or two before sleeping; but, instead of thinking consecutively his ideas flash around in a distracting circle that leads to no conclusion. The nervous woman of leisure starts at the slightest noise; she feels bright and like herself during any exciting pleasure, but has the blues and is morbidly depressed when life is dull. She has headaches, and moods in which she wants to scream. The overworked nervous student broods over his studies, cannot fasten his attention on his work, and what he has once known well he fears he has forgotten, and he expects to fail in his examinations. The young girl who is nervous about playing or reciting before an audience finds that her heart beats furiously; her hands are icy and stiff, and when she sits down at the piano the notes dance wildly before her

eyes. The nervous mother or housekeeper is troubled by her irritability. She is distracted, forgets where she puts things and cannot remember what she started to do. At night she excuses her "good cry" as a relief to her nerves.

All such people agree that nerves are the bane of modern civilization, and it seems to be taken for granted that nerves are a new development of the human anatomy. When national comparisons are made, Americans will generally admit, in fact claim, that they are the most nervous of nations. To be nervous seems to imply the possession of a finer sensibility, a greater responsibility in affairs, and a more strenuous and enviable mode of living. Hence the afflicted dwell with relish upon their symptoms, with a lurking contempt for such as do not manifest the like.

To have nerve, however, is quite a different thing from having "nerves." Nerve implies the ability to bring all one's powers under control of the will, to keep steady in trial and danger, calm when others are in panic, and buoyant through any crisis. This modern use of the word nerve and the common supposition that the nerves which play such pranks with man's mind and temper and disposition are all in some way under control of the will illustrates the vagueness of general knowledge concerning the nervous system and its relation to nervousness.

The absolute control of man's nerves is no more a thing of his will than is the act of sneezing. The power that he calls his will is but the steadily directed training of portions of his nervous system to act in a desired way according to certain decisions. The most pitiful sight in life is a man who "has no will," who has noble impulses and high desires with no disciplined nervous machinery to carry them out. The men and women who are known to have that will power which carries them through ordeals, and who are productive in their activities, are those who have been accustomed to "do noble things, not dream them all day long." As all success in life, as well as every pleasure of mind or body, depends on a well-conditioned nervous system, it is a matter of highest moment to know how to preserve, train, and care for one's "nerves."

Not every man is born equal in his nervous equipment. Some inherit an excellent nervous system, which they may dissipate with unwise living, or may husband and improve. Others have very little vigor of the nervous system, but by careful training and right living they spend only what nervous force they can spare. With a poor heritage, in the strenuousness of city life, and sharing the prevalent ignorance concerning the nervous forces, a man may feel that by excessive work he is making a brave and noble struggle to succeed, when in reality he is spending his nervous capital, and at 40 will be a wreck. The nervous capital is the quality of nervous energy with which one was born, plus the quality he has gained by training. The question of quantity concerns only the average amount of nerve-work one is able to do in a day without fatigue too great for recuperation.

Every spoken or written word, every plan, every carefully executed order that takes thought, every act of attention, and every bit of creative work means expenditure of nervous energy. Rest, sleep, recreation, and fresh air enable the nervous system to renew in a few hours all that it has lost, with ability gained to do the same kind of work the next day with less of voluntary effort, and consequently less fatigue.

The slowly accumulating nervous power that shows itself in increased accuracy and judgment makes men successful and prevents nervousness. Too many girls and boys, in their student days, in their social or university careers, in their early business ambitions, are so anxious to succeed quickly, that they spend more of their nervous capital than can come back to them in the time allowed for sleep and recreation, until finally they find themselves nervous bankrupts. "Time is money" may well be paraphrased, "Nerves are money," and they are also power and success.

In no part of the body are the effects of heredity so marked as in the nervous system, but most conclusions regarding this are based on *post-hoc* reasoning. It can never be shown that, because two highly nervous, excitable, or hysterical persons marry, their children must have the same strain; for a healthful environment and good physical and mental training can overcome the tendency to lack of nervous control. Neither can it be assumed that the children of two calm, well-balanced persons, of good nervous force, will grow up to be like their parents; for disease, overwork, and dissipation may ruin the best nervous organization. The chances are, however, that the same environment and training which have helped to exaggerate the nervousness of parents will also surround and affect their children, as it is equally probable that the wise and healthful training which has developed good nervous stock in parents will be passed on to their offspring.

Neurologists term this inborn tendency in the nervous system to give way under stress, the neuropathic tendency, or nervousness. They mean that, while no actual nervous disease is inherited, yet under the stress of habits and environment the nervous system fails to meet the demands made upon it. A man with this neuropathic tendency who drinks even moderately usually becomes nervous and less capable, where another might suffer almost no ill effects. Two students may smoke cigarettes incessantly, and one develop shaky muscles, an irritable heart, dyspepsia, and nervous breakdown; the other feeling no ill effects. A certain percentage of telegraphers, typewriters, writers with the pen, pianists, tailors, ballet-dancers, etc., develop occupation-neuroses (see OCCUPATION, HYGIENE OF), with muscular cramps and consequent disability, by reason of the extra burden put upon a deficient nervous inheritance.

The inheritance of a sound nervous organization means that a child is born with sufficient nervous energy to control its body and not so much as to stimulate it to excess. Perfect health in a mother during pregnancy means a valuable asset for her child's nervous system. Shock, fatigue, infectious disease in the mother may even stop the child's nervous development, and cause the babe to be born an imbecile. A normal infant at birth has the mechanism of its nervous system definitely laid out though wholly undeveloped. All growth comes through repeated experiences, which begin with the first day of life, and on that day the training of the nervous sys-

tem should begin. Clock-like regularity in the hours of eating and sleeping is the first step in the healthful training of an infant's nervous system. By control of the involuntary start on hearing loud sounds, a child may be so trained as to be spared much nervousness when he grows up. Parents, by word and example, should teach their children to work with concentrated attention in spite of distracting sounds. It is the total lack of training that makes it impossible for so many nervous people to inhibit their reflex actions. They tremble, shudder, start, exclaim, are disturbed in their work, wakeful at night, simply because they have always allowed their nerves to respond to trifling stimuli, instead of inhibiting the responses. All mechanical actions, all brain actions tend by repetition to become automatic. The muscle-worker rarely suffers from nervousness. But in the brain-worker the establishment of new connections brings great nervetire. So the expenditure of nervous energy in forming new nerve-connections, receiving new impressions, etc., tends to make the most agreeable occupations exhausting. Let it be remembered by the older generations, and taught to the younger, that the training and economizing of nerve-force are vitally important to health and efficiency, and that the great workers achieve their ends by that very quality of nervous energy which, if dissipated, degenerates into nervousness.

SMITH ELY JELLIFFE, M.D.,
Editor 'Journal of Nervous and Mental Disease.'

Nesbit, nĕz'bĭt, **E.** See BLAND, EDITH NESBIT.

Nesbit Moor, in British history, a battle fought 7 May 1402, between the Scotch, under Sir P. Hepburn, and the English, under the Earls of Percy and March. The Scots were defeated, their leaders killed, the most of them taken prisoners.

Nesr, in Arabian mythology, an idol in the form of a vulture, worshipped by the tribe of Hemyer.

Ness, Loch, lŏH nĕs, Scotland, a lake of Inverness-shire, on the line of the Caledonian Canal. It is long and narrow, stretching southwest and northeast about 22 miles, with a fairly uniform breadth of about a mile, and a maximum depth of 780 feet. Its northeastern extremity is about six miles from Inverness. Fort Augustus is situated at its southwest end. It occupies the centre of the valley of Glenmore, and is enclosed by steep and often finely wooded hills, about 1,000 feet high. The outlet is by the Ness into the Moray Firth.

Nesselrode, nĕs'sĕl-rō-dė, **Karl Robert,** COUNT, Russian statesman: b. Lisbon 14 Dec. 1780; d. Saint Petersburg 23 March 1862. His father was Russian ambassador to Portugal, and the son also, at an early period, entered the diplomatic service, and in 1807 was made councillor of the Russian embassy at Paris. He succeeded in detaching Russia from the Austrian alliance, and was present at the important conferences between Napoleon, Alexander I., and the German princes, at Erfurt in 1808. He gained immense influence over Alexander's mind; was made chancellor of the empire, and dictated its foreign policy; followed the emperor to France in 1814, and signed the Quadruple Alliance; and took part in the Congress of Vienna. He was one of the chief formers of the Holy Alliance, which made Russia virtually supreme in Europe. He became minister of foreign affairs in 1816, and took part at the congresses of Aix-la-Chapelle, Troppau, Laibach, and Verona. Nesselrode's influence was considerably limited under Nicholas I., and he strove in vain to avert the war which broke out in 1853. After the accession of Alexander II., and the signing of the Treaty of Paris in 1856, Nesselrode retired from the foreign office, but continued in the chancellorship, and also held a seat in the Ministerial Council. His autobiography appeared in 1866.

Nessus, nĕs'ŭs, in Greek mythology, a centaur whom Hercules ordered to carry his wife Deïanira across a river. The centaur illtreated the woman, and Hercules shot him with a poisoned arrow. Nessus, in revenge, gave Deïanira his tunic, saying whomsoever she gave it to would love her exclusively. Deïanira gave it to her husband, who was poisoned and after enduring agony, threw himself on a funeral pile and was consumed.

Nestle, Christof Eberhard, German scholar: b. Stuttgart 1 May 1851. He was educated at Tübingen and Leipsic and was tutor at the former university 1877–80, and professor at Ulm 1880–90, and again, 1893–8. Since 1878 he has been professor at Maulbronn, Würtemberg. He has published 'Die israelitischen Eigennamen' (1876); 'Psalterium Tetraglottum' (1879); 'Syriac Grammar' (Lat. 1891, Ger. 1888, Eng. 1889); 'Septuagintastudien' (1886–99); 'Marginalien und Materialien' (1893); etc.

Nes'tor, Russian monk and author, of the 11th century. He was of the Cave Monastery at Kiev, and wrote an account of the martyrs Boris and Gleb, and a 'Life' of Theodosius, a former abbot of his monastery. For a long time he was regarded as at least the original author of the so-called 'Chronicle of Nestor,' the most important of the early authorities for Russian history, but later investigations have proved the supposition erroneous. The 'Chronicle,' perhaps the work of Abbot Silvester, gives an account of Slavonic history in the form of annals for the period 850–1110 A.D., the last 40 years being from a contemporary viewpoint. For the preceding time, use is made of the Byzantine historians, the Bible, the Apocrypha, traditions, biographies and legends of saints and the records of monasteries, etc. There are various translations into German by Schlözer (as far as 980 only); in his 'Russische Annalen' (1802–9); into French by Léger (1884).

Nestor, in Greek legend, one of the heroes at Troy distinguished for his great age, experience, and wisdom, as well as for his mild and persuasive eloquence. These are the qualities Homer has attributed to him in the Iliad. He was the son of Neleus, king of Pylos, and was born at Gerenia, in Messenia. He succeeded his father as king of Pylos. In his youth and manhood he distinguished himself by many bold exploits, and early acquired the reputation of a prudent counsellor and persuasive orator. Though he had lived through two generations when the expedition to Troy was undertaken he nevertheless took part in it, and conducted the forces under his command in 20 vessels to

Troy. On account of his extreme age he did not take a personal action in the encounters before the city. The part which is attributed to him in the Iliad is that of an experienced counsellor. He had several sons and daughters, but they are not distinguished in history. After Nestor had outlived three generations he died quietly at Pylos, where, in the time of Pausanias, the inhabitants pretended to distinguish his dwelling and his grave.

Nesto'rianism, the theory of the Incarnation of Jesus Christ taught by the Nestorians or followers of Nestorius. Nestorius was a presbyter of Antioch who in 428 was made patriarch of Constantinople and was charged with teaching that there were two persons in Jesus Christ, of which one is the word of God, and the other the man Jesus, and that Mary his mother ought not to be styled mother of God (Theotokos) but mother of Christ (Christotokos). Cyril, patriarch of Alexandria, accordingly accused him of teaching the dual personality of Christ, a view which was formally condemned and anathematized by the Third Council of Ephesus, 431. He was deposed, driven from one place to another and met with a miserable death in 440. The controversy lasted for two centuries. In 435 the Nestorians who had organized themselves into a church in Syria took refuge from the persecutions of the Orthodox church in Persia, Mesopotamia and Arabia, assuming the title of Chaldæan Christians. At the Council of Seleucia (498) the Persian church clearly formulated this dogma in opposition to the teaching of the Catholic Church. These views flourished in Antioch, Edessa and Nisibis, and their adherents were the fosterers of learning in history, philosophy and medicine, and under the Arabian domination were often raised to high posts in the government. Tamerlane afterward desolated the Nestorian Church throughout almost all Asia, so that only a remnant escaped to the mountains of Kurdistan. Under Popes Alexander III., Innocent IV., and Nicholas IV., some attempt was made in the 16th century to effect a union with the Roman Church, in consequence of which the United Nestorians separated from the main body of the Chaldæan Christians. These separatists are numbered at some 20,000. They acknowledge the primacy of Rome, but use a Greek liturgy. Their patriarch has his see at Diarbekir, Asiatic Turkey. The Non-United Nestorians in Mesopotamia, Persia and Syria celebrate the sacraments of baptism and the Lord's Supper but do not teach Transubstantiation; they do not impose celibacy on their clergy; they number some 150,000 souls. The Nestorians of India are called Christians of Saint Thomas; in 1599 they acknowledged the primacy of the Roman see. Consult: Badger, 'The Nestorians and their Rituals' (1852); Rae, 'The Syrian Church in India' (1892).

Nesto'rius. See NESTORIANISM.

Nests of Birds, the receptacles prepared by birds for the holding and security of their eggs and young. The offspring of birds, as of all the animals lower in rank than they, begin life in the very immature state we call eggs. Those of lower animals are, however, protected from harm, when protected at all, by being buried under water or in the ground, or otherwise concealed and shielded. (See EGG; NIDIFICATION.) The eggs of birds, however, are few in number, larger in proportion, and more advanced in development than those of fishes, amphibians or reptiles, and are encased in very fragile shells, the rupture of which would be fatal to the enclosed embryo; they are never (with a single exception) buried out of harm's way; and they require a comparatively high degree of warmth, continuously applied, in order to mature successfully into living and energetic young. (See EGG.) To meet these complicated conditions of success great care is necessary on the part of the parent-birds; and the necessity for this care increases in proportion to the superiority of organization and development of the bird,— a matter of wide range in the class. The young of the higher forms, as hawks and thrushes, would inevitably perish under the limited care that suffices for such lower forms as the seafowl. In this view birds are divisible into two classes: first, those whose young are developed within the egg, that is before hatching, to such a point that they are able as soon as freed from the shell to run about, pick up their food and to a great degree take care of themselves; second, those hatched before they have reached this state of advancement, and which hence must be fed, protected and guarded by their parents until they have completed their development to the point of self-care. Parental preparations for the former need have regard only to the proper incubation of the eggs; for the latter it must be extended to the safety and comfort of the young for a period after they have hatched greater or less according to their helplessness, which varies with the degree of organization. It is among birds of the highest organization, therefore, that complete and elaborate nests are alone to be found, because there only are they required as cradles and homes for the young. The lowest seafowl, such as penguins and auks, make no nest whatever, depositing only a single egg on some cliff-ledge or sea-islet, almost inaccessible to enemies, and covering it with their warm bodies until the young one hatches, when it is immediately ready to go into the water and fish for itself. The great company of shore-breeding birds, gulls, sandpipers, etc., need do nothing more than scrape a smooth hollow among the pebbles or sea-wrack where their eggs may lie close together and not roll or be blown away. The waterfowl — rails, ducks, pelicans and others,— seeking the greater seclusion of marshes and swamps, must do a little better, making a firm raised bed of earth with a rim around it, or else a platform of reeds, etc., to keep their eggs out of the mud or water. Some of these, as the herons, cormorants and the like, have learned to make their homes in bushes and trees, and these are likely to be rather more substantial than those on the ground, to prevent their falling to pieces in the swaying of the branches, or dropping the eggs over the side or through the bottom. Similarly the great tribe of ratite, limicoline and game-birds, which breed inland on the ground, do not make nests in such sense as are those of the song-birds, but mere beds for the eggs, since these are all *Precoces,* or *Nidifugæ,* that is, of those whose chicks run about as soon as they hatch.

The higher families of birds, however, called

Altrices or *Nidicolæ*, must safeguard and nourish their young for a period after birth from the egg, and these must make a home for them which shall be durable and of such a form and finish as shall protect the helpless young from bad weather, observation and attack, and prevent their falling out. These objects are attained with a varying degree of success, but in many cases seem to be almost perfectly accomplished, and the nests resulting have added to them the finish of great beauty. Some birds' nests are marvels of skill, ingenuity and adornment; while others, perhaps made by nearly related species, are rude or slovenly.

Classifying Nests.— Several of the earlier writers on ornithology have attempted to classify birds according to their modes of nest-building. Such attempts are not without value, but they are purely artificial and of no use to the systematic ornithologist. The classification of nests may take account of their situation, means of support, shape, materials, or other characters, or of two or more of these. Taking the first-mentioned consideration as a basis we may group birds into miners, such as the kingfisher and the sand-martin; mound-builders, like the brush-turkey and scrub-pheasant of Australia; masons, which use a sort of mortar of earth or clay, including several swallows and allied birds, etc. One of the most distinctive categories is that of the borers, such as the woodpeckers and their relatives, which carve out tunnels and chambers in the trunks of trees as breeding-places. Many of the terms employed in nest classification are useful for descriptive purposes. Such are platform-nests, basket-nests, pensile nests, etc., or, as names of birds, weavers, tailors, felt-makers, etc. As a general rule birds of the same family or lesser group will agree pretty well in their style of nidification; but there are many exceptions, as for example, the North American tyrant-flycatchers.

Methods of Construction.— Birds choose for their nests the material of that kind to which they are habituated which lies nearest; and if it cannot be found will seek a good substitute, so that the nests of birds whose specific range covers a wide region will be found varied greatly and often much improved in some localities. Similarly the builders are likely to change the site when necessary, breeding in trees in wooded regions and on the ground or rocks where trees are absent. In this way certain birds have greatly modified their nesting-habits since the civilization of their habitats — notably the swallows and swifts which all over the world abandon, as a rule, their natural breeding places in hollow trees, or about rocky cliffs, and make their nests under the roofs of farm outbuildings or in bird-boxes. This adaptability extends to each species, where the nests of closely related birds vary considerably. In many families, as, notably, in the *Fringillidæ*, some species nest on the ground, others in bushes or trees: and it is hard to say which is to be considered the normal method.

Birds' nests are usually in the form of bowls, and may be formed of sticks, or weed-stems, or coarse grass, and form an immense mass, as is the case with the birds of prey, crows, or herons, one of which, the umbrette of Central Africa, makes a home large enough to fill a dumping-cart. Such great structures are likely to be used many years in succession; but few small nests outlast the winter. The hollow bed in the centre is formed by a lining of lesser and smoother substances. Small birds naturally use finer materials, and the character of the structures varies with the characteristics and habits of the birds. Some are made almost wholly of twigs, others of grass blades, others of flexible ribbons of such bark as that of the grape-vine, others of shreds of hempen fibre torn from the milk-weed and similar plants, others of a matted felt formed of the down of cat-tail flags or of ferns. Some are made in whole or in part of mud, and plastered upon rocks, either supported upon a ledge or projecting glued to the face of a cliff like a hollow bracket. Of this shape are the nests of many swifts, some of which are composed almost wholly of glutinous saliva, as is the case with that of the edible swift mentioned below. Some of the rudest nests externally are beautifully soft and smooth within; while others are exquisitely finished and adorned outside as well as in; or are intricately woven, as are the pensile hammocks of the vireos, the pouches of the Baltimore orioles, European titmouses and others, and the leaf-sewn nests of the tailor-birds and many humming-birds. In most cases the female is the architect, while the male is permitted to do little but bring materials which are often rejected by the fastidious builder. While most, especially of the smaller kinds of birds, separate into pairs and seek secluded places for their homes, others breed gregariously, as is the custom of many seafowl and most herons, pelicans, etc. Some of the land-birds, as the swallows, betray a tendency toward this; but the most remarkable case is that of the African social weaver-birds (q.v.), which actually build a roof in common, beneath which each pair of the flock establishes its individual dwelling. This strictly community life does not occur elsewhere among birds, although cases of commensalism are occasional.

Edible Nests.— Few birds' nests serve any human utility, though many are utilized by other members of the animal kingdom. One, however, is valuable as food. This is the nest of the salangane (*Collocalia fuciphaga*) and other species of swifts or swiftlets, found in the Malay Archipelago, used as an article of luxury among the Chinese. It has the shape of a common swallow's nest, is about the size of a half teacup, is found in caves, particularly in sea-cliffs, and has the appearance of fibrous gelatine or isinglass. It is composed of a mucilaginous substance secreted by special glands, and is not as was formerly thought made from a glutinous seaweed. The caves in which these swifts dwell in crowds are particularly abundant in Sumatra and Borneo, especially near the north end of the island, and are in most cases the property of wealthy owners, who get a large annual income from the hazardous occupation of securing the nests, which can be done only by climbing about the interior of the great sea-caves, holding torches and raking off the nests into little bags hung upon the end of the pike-poles. The best, which are whitish in color, and almost free from any mixture with the pure glutine from the glands in the mouth of the bird, are worth $10 to $15 a pound.

Among works dealing with the subject of birds' nests we may mention Rennie, 'Architec-

ture of Birds' (1831); Wood, 'Homes without Hands' (1865); Dixon, 'Nests and Eggs of British Birds' (1893); Newton, 'Dictionary of Birds' (1893–6) and Wallace, 'Darwinism' (1889).

ERNEST INGERSOLL.

Net, an open fabric made of hemp, jute, flax, and sometimes of cotton and other fibres. The open spaces are called meshes, and in order that these may retain their shape and size the fibres of which the net is made have to be knotted at the intersections. Nets were formerly made only by hand, but an ingenious kind of loom has for many years been in use by which the operation of netting can be performed mechanically. Nets are used for a great variety of purposes, but chiefly for fishing. The three chief kinds of nets used in fishing are the seine, the drift-net, and the trawl. The first two are very long in proportion to their breadth, and differ from one another only in the manner in which they are employed. The seine has a line of corks along one of its long borders, and a line of leaden weights along the other; so that when the net is thrown into the water it assumes a perpendicular position. The drift-net is not loaded with lead, but floats in the water. The trawl, again, is dragged along the bottom by the motion of the boat. Nets are also used to catch birds and animals, to protect crops from birds, the blossoms of trees from frost, etc. Wire nets or netting is also used for domestic purposes.

Netherlands, Kingdom of the, frequently called **Holland,** a northwestern European country with a north and western coastline of 470 miles on the North Sea, its eastern frontier bounded by Germany, and its southern by Belgium. It comprises the northern and smaller half of the numerous provinces formerly combined under the name NETHERLANDS or LOW COUNTRIES, part of which is now included in Belgium. It received its general English name of HOLLAND from its coastal provinces North and South Holland. From north to south the country has an extent of 150 miles, with a breadth from west to east of 120 miles throughout and a total land area of 12,648 square miles.

Political Divisions.—The Netherlands at the present day has nearly the original limits of the Seven United Provinces in the 16th century. The modern provinces are given in the accompanying table:

PROVINCES	Area in sq. miles	Population 1901
North Brabant	1,980	566,551
Gelderland	1,965	580,691
South Holland	1,166	1,194,463
North Holland	1,070	1,001,799
Zeeland	690	219,832
Utrecht	534	259,834
Friesland	1,282	345,004
Overyssel	1,291	343,924
Groningen	790	305,781
Drenthe	1,030	153,281
Limburg	850	292,072
	12,648	5,263,232

The Duchy of Luxemburg (q.v.) was under the sovereignty of the king of Holland, until the death of William III. in 1890 dissolved this union. The most densely peopled province is South Holland (981 per sq. m.), and the least densely peopled is Drenthe (144).

Topography and Physical Features.—The Netherlands forms the most characteristic portion of the great plain of northern and western Europe. From the middle of Belgium, a few miles northeast of Brussels, the country becomes a dead level, extending in monotonous sandy flats, through Hanover, Jutland, Holstein, and, with little interruption, through Prussia into Russia. The lowest part of this immense level, and that which has most recently emerged from the sea, is the country lying between the mouths of the Schelde and Ems. Within this distance the Rhine, joined by the Maas, Yssel, and other rivers, enters the sea through a number of arms, and sluggish, winding channels. This delta in early ages was evidently liable to perpetual change of form, as new mud-banks were deposited, old channels being blocked up, and new ones formed. In addition to this the river floods, in forming a domain of alluvial deposits, had to contend with the sea, which washed away the accumulations of mud, or covered them with sand, according to the vicissitudes of weather and season. The soil of the Netherlands shows everywhere the proofs of this struggle between the ocean and the river, in the alternation of salt and fresh water deposits. It therefore became a problem of existence with the early inhabitants to secure the natural permanence of their territorial possessions, by embankments high and strong enough to protect them under ordinary circumstances from the waves; by windmills on the embankments — a characteristic feature of Dutch landscapes — they worked the pumps which drained the enclosed lands. In consequence, the Netherlands has the appearance of an artificially constructed country, some portions of which are 16 feet below the surface of the sea, and nearly all too low for natural drainage. The whole country is divided by dikes, some of them 60 feet high, which protect portions of land from the sea, lakes, or rivers. These enclosed lands are called *polders.* On the chief dikes are roads and canals also joining the rivers, the canals generally large enough to be navigable. There are no mountains nor rocks in the Netherlands, which is popularly described as a country without mountains, wild trees, or natural springs. The only heights are the sand-hills, about 100 to 180 feet high along the coast of Holland; and a chain of low hills, of similar origin perhaps, which extend from the middle of the province of Utrecht into Gelderland.

The principal coast features are the wide estuaries of the Schelde, and of the Maas, the latter receiving the waters of the Rhine; north of the Maas the Zuider Zee, which was formed by an irruption of the sea in the beginning of the 13th century, and now covers an area of 1,200 square miles. Between the mouths of the Maas and the entrance of the Zuider Zee, a distance of 75 miles, the coast is chiefly formed of sand-hills or dunes, frequently 180 feet high, dreary and sterile to the last degree; and separating, with their broad band of irreclaimable desert, the low fertile meadows on the one side from the waves of the ocean on the other. In a line with these dunes, stretching beyond the mouth of the Zuider Zee, runs a chain of

islands, namely, Texel, Vlieland, Terschelling, Ameland, etc., which seem to indicate the original line of the coast before the ocean broke in upon the low lands. The coast of Friesland, opposite to these islands, depends for its security altogether on artificial embankments. The Lauwers Zee, a deep bay on the confines of Friesland and Groningen, also owes its origin to an irruption of the ocean; and again the Dollart, a gulf at the mouth of the Ems, between Holland and Germany, was formed about half a century later than the Zuider Zee, and by a similar convulsion, which is said to have swept away 70 villages and 100,000 people. From the left bank of the Ems extends the Bourtang morass, a vast and irreclaimable peat marsh, partly in Germany, partly in Holland; the Peel, a marsh of like nature but less extent, lies near the left bank of the Maas, on the east side of North Brabant. The work of reclaiming the waste is constantly going forward; in the provinces of North and South Holland alone about ninety lakes have been drained. The principal of these was the Lake of Haarlem, the drainage of which, begun in 1839, was completed in 1852. The draining of large portions of the Zuider Zee has been begun.

Hydrography.—The chief rivers of the Netherlands are the Rhine, Maas, Schelde, Yssel, Vecht, and Hunse. The Rhine is above half a mile wide where it enters the Netherlands; it soon divides, the south and principal arm taking the name of Waal, and uniting with the Maas, while the north arm, communicating with the Yssel, takes the name of Leck; a branch from it named the Kromme (crooked) Rhein, winds by Utrecht to the Zuider Zee, while another very diminished stream called the Old Rhine flows from Utrecht by Leyden, to the sea at Katwijk. The Maas, entering the Netherlands from Belgium, receives the Roer; of the Schelde only the mouths, the east and the west, or Old Schelde, lie within the Dutch boundary. The Yssel and Vecht, flowing from Germany, both enter the Zuider Zee by mouths at no great distance asunder. The Hunse, rising in the Bourtang Marsh, flows through Groningen to the Lauwers Zee. The canals of the Netherlands are collectively more important than the rivers. The chief is the great ship canal, 26 feet deep and 197 wide, from Wijk, on the North Sea, to Amsterdam, and connected by locks with the Zuider Zee, opened in November 1877. This great canal shortens the distance between Amsterdam and the sea to about 15 miles. The North Holland Canal allows large ships to pass between Amsterdam and the Helder, a distance of 40 miles, so as to avoid the intricate navigation of the Zuider Zee; the Winschoten Canal, also for ships, 18 miles long, connects the Dollart with Groningen; the Damster-Diep, of equal magnitude, runs from Groningen to the sea at Delfzijl; another canal connects Harlingen, on the Zuider Zee, with Groningen; the Nieuwer Sluis unites Utrecht with Amsterdam, while the latter city also communicates with Rotterdam. The Dutch canals are much used by passengers, and the slowness of the trekschuyts or boats is compensated in some measure by their punctuality. In winter their frozen surface offers convenient roads to skaters, and they are then traveled over with greater speed.

Climate.—The climate is extremely humid, changeable, and disagreeable; violent winds, with varying temperature, frequently blow from southwest or northwest, and heavy sea-fogs are driven in, which injure vegetation. The mean average annual temperature is 50° F.; 35° in January, and 65° in July; the average annual rainfall is 26 inches. The winter is severe, and the sky is almost always overcast and troubled. The bright days hardly exceed forty in the year. Low fevers visit the marshy districts in autumn, but the dry cold of winter restores the peasant's health. Although the climate is to strangers cheerless and depressing, its prejudicial effects on health are counterbalanced by good food and clothing, and habitual cleanliness; the Dutch give particular attention to these domestic safeguards, and, notwithstanding the ungenial climate in which they live, longevity is not rarer among them than elsewhere.

Agriculture, etc.—Horticulture and agriculture have been developed to a high degree of perfection, although the latter holds a subordinate place in rural industry. The soil consists chiefly of alluvial deposits. Wheat, of excellent quality, is grown only in favored portions of the south provinces. Rye, oats, and buckwheat, with horse-beans, beet, madder, and chicory, are more common crops; and tobacco is cultivated in the provinces of Gelderland, South Holland, and Utrecht; flax in Zeeland and the environs of Dortrecht, and hemp, oil-seeds, and hops in various parts of the kingdom. Culinary vegetables are cultivated on a much larger scale for home use, and also for the exportation of the seeds, which form an important article of Dutch commerce. Dutch agriculture atones in thoroughness for what it lacks in extent. The farmers are highly skilled, and to them many of the chief improvements in modern agriculture are due. The culture of flowers, and especially of flowering bulbs, has long been one of the most important industries of the country, and is of ever-increasing importance. The chief centre of this industry is Haarlem, and every year large quantities of bulbs of all kinds are exported to foreign countries. It is in stock, and dairy produce in particular, that the rural industry of the Netherlands shows its greatest strength. Their horses are remarkable for size and strength, and much sought after; and in the number and excellence of their horned cattle the Dutch stand equally high. The poultry-yard is also to the Dutch farmer a source of wealth. Beeculture is likewise actively carried on, especially in Gelderland and Drenthe. The quantity of cheese and butter brought to market is enormous. About 2,100,000 acres are under culture, nearly 3,000,000 are pasture land, over 150,000 are devoted to gardens and orchards, some 620,000 are forest, about 1,500,000 are uncultivated heath, fully 300,000 are water and morass, and about 125,000 acres are occupied by dikes and roads.

Manufactures and Commerce.—Manufactures have never held a very important place, though the linen of the Dutch Netherlands has long held the first rank. The manufacture of woolen cloth centres in Leyden, Utrecht, and Tilburg. The distilleries of Schiedam are well known; Gouda supplies tobacco-pipes, the best

of their kind; and the same praise may be bestowed on the leather, the refined sugar of the Dutch, the pottery, bricks, tiles, glassware, and many other articles intended for continental use. Ship-building and the manufactures subsidiary to that industry are largely carried on in many places. Coal is mined in the province of Limburg, the mines chiefly belonging to the state; 312,717 tons were extracted in 1901, valued at $725,924. The commerce with the Dutch possessions in the East Indies, particularly Java, is of great and continually increasing importance. The total exports of home produce, and imports for home consumption, inclusive of bullion and specie, in 1901 were, imports $818,800,000; exports $697,200,000. The trade is chiefly with Great Britain and Germany.

Shipping, Navigation, and Fisheries.—The mercantile navy of the Netherlands on 1 Jan. 1901, numbered 638 vessels of 40 tons and upwards; 213 steamers of 268,159 tons, and 425 sailing vessels of 78,413; making a total tonnage of 346,572. The vessels entered in 1900 were 12,307 of 9,448,225 tons; cleared, 12,367 of 9,423,156 tons. The herring, oyster, and other fisheries of the North Sea employed 5,851 vessels of all kinds, manned by over 20,000 seamen. The oyster fishery yielded over 1,994 tons of oysters in 1901, while the value of the herring fishery was estimated at $2,956,138.

Railways, the Post-office, Telegraphs, etc.—The total length of railways in the Netherlands is over 1,700 miles, of which 900 miles belong to the state, and the remainder to private companies. The state railways yield an annual revenue of between $1,500,000 and $2,000,000. The post-office is well organized, and also yields a revenue in excess of the expenditure. The length of state telegraph lines in operation is about 3,800 miles. The canals have a length of over 1,900 miles (see paragraph on *Hydrography*).

Money, Weights, and Measures.—The guilder or florin, value 40 cents, is the chief denomination of money. Ten-guilder gold pieces are coined, but silver is chiefly in circulation. The French metric system of weights and measures has been adopted, the principal names being—the kilogram or *pond,* metre or *el,* kilometre or *mijl,* are or *vierkante roede,* hektare or *bunder,* stere or *wisse,* litre or *kan,* and hektolitre or *vat.*

Government, Finances, etc.—The kingdom of the Netherlands, as now constituted, is a constitutional monarchy. The executive power lies wholly with the sovereign, who shares also the work of legislation with the States-General. These consist of two chambers—the upper with 50 and the lower with 100 members—who assemble for deliberation and despatch of business at the Hague ('Sgravenhage). The members of the upper chamber are elected by the provincial states from among the most highly assessed inhabitants of the various counties; the others are elected by ballot, at the rate of one deputy to every 45,000 souls. The government is strong, and the administration in every department is simple and economical. The revenue of the Netherlands during the last few years has averaged about $56,000,000 per annum, and the expenditure about $58,000,000. The debt of the state amounts to about $485,000,000, the interest on which forms the largest branch of the expenditure. The chief items of revenue are yielded by the excise and direct and indirect taxation. The army comprises some 68,000 men (excluding officers) on a war footing, but only about 30,000 altogether in peace. It is formed partly by conscription and partly by enlistment. Substitution was abolished in 1898. The army of the East Indies is about 42,000 strong. The navy comprises 6 first-class iron-clads, 22 second-class iron-clads and cruisers, besides a number of gun-boats, torpedo-boats, training-ships, etc.

Colonies.—In addition to her European territories the Netherlands possesses a wide extent of colonies and dependencies in Asia and America, with which she carries on an extensive commerce, and which contribute materially to her greatness. Her chief Asiatic colonies are the Dutch East Indies (q.v.) comprising Java, Sumatra, part of Borneo, Celebes, and part of New Guinea, with Banca, Bali, Lombok, Sumbawa, Flores, and other islands in the Malay Archipelago; while in America she possesses Surinam or Dutch Guiana, and the West Indian islands of Curaçao, Saba, St. Eustatius, etc. Estimated area 782,863 square miles; pop. about 34,000,000.

Ethnology.—The stock to which the people belong is the Teutonic, the great majority of the inhabitants being descendants of the old Batavians. They comprise over 70 per cent of the population, and are chiefly settled in the provinces of North and South Holland, Zeeland, Utrecht, and Gelderland. The Flemings of North Brabant and Limburg, and the Frisians, inhabiting Friesland, Groningen, Drenthe, and Overyssel, form the other groups.

Population.—As given in the paragraph *Political Division* the total population in 1901 was 5,263,232, of whom 2,603,486 were males and 2,659,746 females. In 1899 there were 52,625 resident foreigners, of whom 31,865 were Germans, 14,903 Belgians, 1,307 English, and 4,550 from other countries. The emigration in 1901 was 1,874, to North America exclusively.

Education.—In respect of education the Netherlands occupy a high place among the nations of Europe. In 1857 a non-denominational primary instruction law was passed, and in 1878 this law was supplemented by another containing more stringent regulations with the view of making primary education more general. In 1900 instruction was made obligatory. An act passed in 1889 diminished public instruction and encouraged private instruction, which is now supported by the state. The cost of public primary education is borne jointly by the state and the communes, the former contributing to teachers' salaries and being responsible for one quarter of the cost of founding or purchasing schools. Above the primary schools are the middle class, secondary, and classical schools, a Polytechnic Institution at Delft, special colleges for agriculture, horticulture, etc. There are four public universities, namely, at Leyden, Utrecht, Groningen, and Amsterdam, and also a private university.

Religion.—A majority of the inhabitants belong to the Reformed Church, and Roman Catholics also are numerous. The members of all religious denominations possess, by the constitution, perfect liberty of conscience and social equality. The census returns of 1899 give the

number of Protestants as 3,067,971; of Roman Catholics, 1,798,915; Jews, 103,988; other religions, 17,926; persons not belonging to any religious body, 115,179. The Reformed Church is Presbyterian in government, while the Roman Catholics are ruled by an archbishop and four bishops.

History.—The south portion of the Low Countries belonged at the beginning of the Christian era to Belgic Gaul (see GAUL). The north portion, inhabited by the Batavians and Frisians (see those articles), formed part of Germany. The south portion as far as the Rhine was held by Rome up to 400 A.D., after which it came under the rule of the Franks, as did also subsequently the rest of the country. In the 11th century the territory comprised in the present kingdoms of Belgium and the Netherlands formed a number of counties, marquisates, and duchies corresponding more or less with the modern provinces. By the latter part of the 15th century all these had been acquired by the Duke of Burgundy, and passed to the house of Hapsburg on the marriage of the daughter of Charles the Bold of Burgundy to the son of the Emperor Frederick III. On the abdication of Charles V. in 1556 they passed to his son Philip II. of Spain (q.v.). In consequence of religious persecution in 1576 Holland and Zeeland openly rebelled, and in 1579 the five north provinces — Holland, Zeeland, Utrecht, Guelders, and Friesland — concluded the celebrated Union of Utrecht, by which they declared themselves independent of Spain. They were joined in 1580 by Overyssel, and in 1594 by Groningen. After the assassination of William of Orange, 10 July 1584, Maurice became stadtholder (governor). His victories at Nieuport and in Brabant, the bold and victorious exploits of the Dutch admirals against the navy of Philip II., the wars of France and England against Spain, and the apathy of Philip II., caused in 1609 the peace of Antwerp. But Holland had yet to go through the Thirty Years' war before its independence, now recognized by all the powers except Spain, was fully secured by the peace of Westphalia. In the middle of the 17th century the United Netherlands was the first commercial state and the first maritime power in the world, and for a long time maintained the dominion of the sea. The south provinces alternated between the rule of Spain and Austria till 1797, when they came under the power of the French republic. In 1806 Louis Napoleon became king of Holland, but in 1810 it was incorporated with the French empire. In 1814 all the provinces both of Holland and Belgium were united by the treaty of Paris to form the kingdom of the Netherlands. This arrangement lasted till 1830, when the south provinces broke away and formed the kingdom of Belgium. King Willem I. attempted to reduce the revolted provinces by force; but the great powers intervened, and finally matters were adjusted between the two countries in 1839. The king abdicated in 1840, and was succeeded by his son Willem II. (1840–1849), he being again succeeded by his son Willem III., whose reign on the whole was uneventful. Slavery was abolished in the Dutch West Indian possessions in 1863, slave-owners receiving compensation. In 1873 the Dutch began a war with the Acheenese of Sumatra, and hostilities have lingered on ever since. In 1887 the Heemskerk Liberal ministry passed a bill amending the constitution.

On 23 Nov. 1890, the king died, and was succeeded by his young daughter, Wilhelmina Helena Pauline Maria, under the regency of her mother, the Queen-dowager Emma. The year 1892 was marked by serious disturbances among the unemployed, and in 1893 the Socialists carried on a vigorous propaganda. In 1896 the franchise was extended by a new bill, which received the regent's assent. Besides the unsuccessful war against the people of Acheen, in Sumatra, the Dutch in 1894 had to face also a revolt in the island of Lombok. A Dutch force met with a serious disaster here, but soon afterward General Vetter re-established the authority of the Netherlands. In 1898 Queen Wilhelmina attained her legal majority, and formally took up the reins of government. The most notable event of 1899 was the meeting of the great Peace Conference at The Hague. (See HAGUE CONFERENCE.) In 1900 primary education was made compulsory by law. In Feb. 1901, the queen married Prince Henry of Mecklenburg-Schwerin. Consult: Amicis, 'Holland' (1893); Bernard, 'La Hollande Geographique, Ethnologique, etc.' (1900); Havard, 'In the Heart of Holland' (1880); Meldrum, 'Holland and the Hollanders' (1880); Motley, 'The Rise of the Dutch Republic' (1858), and 'History of the United Netherlands' (1869); Wood, 'Through Holland' (1877).

Netherlands, Language, Literature and Science of the. The literary language of the kingdom of the Netherlands is in English called Dutch, but by the people themselves is called Hollandsch or Nederduitsch, that is, Low Dutch. This name it receives in opposition to the Hochdeutsch or High Dutch, the literary language of modern Germany. Closely allied to the Dutch, so closely indeed as to be distinguished from it only by some orthographic and other minor differences, is the Flemish (Vlaemisch) language, spoken partly in the kingdom of Holland, but mainly in the Belgian provinces of East and West Flanders, Limburg, Antwerp and South Brabant. (See FLEMISH LANGUAGE AND LITERATURE.) Both languages belong to the Low German group of the Teutonic or Germanic branch of the Indo-European family of languages. The two languages, or rather dialects, are in fact in their early history identical and the term Flemish is applied, on the one hand, to the original form of both dialects and to the literature produced in it before it separated into these dialects; and on the other hand to that one of the two dialects which is still spoken in the parts above mentioned, and to the literature produced in it. It is only in this latter application of the term that the Flemish language and literature can be noticed separately. The non-literary Low-German dialects spoken in the Netherlands may be divided into the Frisian, an idiom which is gradually disappearing (it has a small literature — see FRISIANS); the Guelders dialect, or the so-called Lower Rhenish; the Groningen dialect, to which also belongs the Over-Yssel dialect, bearing a considerable resemblance to the German.

The common parent of the modern Dutch and Flemish was at one time supposed to be a development of the Old Frisian, but the general

view at the present day appears to be that the characteristic forms of the language of the Netherlands are at least as old as those of the Old Frisian, and that both languages are separate developments of a still older original. The Dutch language resembles the German in its vocabulary and syntax, but is considerably simpler in its accidence. Its vowel sounds are broader than those of the Germans, and its gutturals harsher. It possesses the same power of forming compound words from native materials as the German, and even to a greater extent, for while the German frequently borrows adjectives (for example) from foreign sources to correspond to nouns of native formation, the Dutch has for the most part such adjectives paronymous with the nouns. Thus the Germans may use the word Wissenschaftslehre for philosophy, but are obliged to adopt philosophisch for philosophical; while the Dutch have Wijsbegeerte and wijsgeerig, both of native origin.

The oldest literary monument of the language of the Netherlands is, as far as can be ascertained, an ordinance of the town of Brussels dated 1229, although it is possible that a few of the poems which have come down to us, particularly 'Reinaert de Vos' (Renard the Fox) may belong to the second half of the 12th century. In the latter part of the 13th century the language was brought to a pretty high point of literary cultivation by Jacob van Maerlant (born 1235), author of the 'Spiegel Historiæ,' but not long after his date the language began to decay, owing to the introduction of French forms, words, and idioms through the Burgundian domination (1363–1477). A few literary societies called Rederijkerskamern, appear to have striven against this result, but their efforts were not rewarded with any success until the struggle witn Spain at the close of the 16th century produced a reaction among the population of the Netherlands in favor of their native language, a reaction which, however, proved permanent only in the northern Protestant provinces, which eventually succeeded in throwing off the Spanish yoke, and which now form the kingdom of the Netherlands. The chief specimens of the language belonging to the period intervening between Maerlant and the reaction at the close of the 16th century are the civic laws of Antwerp (1300), a few chronicles such as that of J. Van Clere, and a translation of Boethius by Jacob Velt of Bruges (15th century).

The leaders in the restoration of the language of the Netherlands, or as we may now call it Dutch, to the dignity of a literary medium were Dirk Volkertszoon Coornhert and Filips van Marnix, both distinguished also as statesmen who took a leading part in all the political and theological conflicts of the day. Coornhert (1522–90) was a poet and dramatist as well as a prose-writer; but while in his poems and dramas he rises little above the Rederijker of his time — of a society of whom at Amsterdam he was a member — his numerous prose works are still looked upon as works of merit. Marnix (1538–98), although inferior to the former in purity of language, obtained even greater renown by his 'Bijenkorf der heil Roomsche Kerche' (1569, often since reprinted and translated into foreign languages). One of these two (it is uncertain which) is also the author of the national song 'Wilhelmus van Nassauwen.' The efforts of these men were entirely successful so that before the final conclusion of peace (1648) the golden age of the Dutch national literature, which fills up the greater part of the 17th century, had begun. Energy, independence, vivacity, and elevation of sentiment characterize the more important writers at the beginning of this period, among whom Hooft and Vondel hold the first place. Pieter Corneliszoon Hooft (1581-1647) brought the prose style to a high degree of excellence, and Joost van den Vondel (1587–1679), the greatest of Dutch dramatists, performed the same service for the language of poetry, and made it peculiarly fit for the expression of the sublime. Jacob Cats, familiarly known in Holland as 'Father Cats' (1577–1660), on the other hand, confined himself to the sphere of every-day life. His verses are marked by a careless ease, sometimes even slovenliness; but his language is pure, a circumstance of some importance, since after the termination of the war, when the mind of the people had become toned down from the high pitch to which it had been raised by their struggle for freedom and independence, he became the special favorite of his countrymen, and had thus a large share of influence in determining the character of the national language. Among the other leading names in pure literature belonging to this period are those of Constantyn Huygens (1596–1686), father of the celebrated mathematician, a satirist, epigrammatist, and didactic poet; Jacob van Westerbaan (died 1670) and Jan Van Hemskerk (died 1656), both erotic poets, the latter author of 'Minnedichten,' in imitation of Ovid, and also of a poetic romance entitled 'Bataavsche Arcadia'; Dirk Kamphuisen (died 1626), a celebrated hymn-writer. No department of literature received more attention than the drama during this period, and several authors who afterward distinguished themselves in other fields began their literary career as dramatists. Among these were Brandt (died 1685), who was also an historian and epigrammatist; Ondaan (died 1692), a political writer and lyrist; and Antonides van der Goes (died 1684) celebrated as a lyrist chiefly on account of his poem 'De Ijstroom' in which he sings the praises of Amsterdam. The principal writer of comedies was Bredero (1585–1618), whose language is that of the lowest of the people.

With the sinking of the national spirit which followed the conclusion of peace the national literature also began to decline, and its decline was hastened by its falling under French influence, to a great extent in consequence of the large influx of French Huguenots after the revocation of the Edict of Nantes (1685). In the crowd of feeble imitators of French originals which the 18th century produced in Holland, there are but few that can be singled out either as having kept themselves more or less free from that baneful influence, or as having shown unusual ability in what they performed under it. Among the former are the nature-poet Hubert Corneliszoon Poot (died 1733), the lyrist Jan van Broekhuisen (died 1707), and Pieter Langendijk (died 1756), a writer of comedies; among the latter Lucas Rotgans (died 1710), author of a number of dramas and a tedious epic entitled 'Willem III.,' Arnold Hoogvliet, Sijbrand Feitama, Nicolas Simon-

szoon van Winter (died 1795), and the brothers Van Haren.

During all this period, however, the language had maintained its purity almost uncorrupted, and again swept itself quite free from foreign taint when the literature took a more healthful development in the last quarter of the 18th century. The immediate cause of this change was the occupation of the Dutch with German literature, at that time energetically rising into prominence; and the change was assisted subsequently by their becoming acquainted with English literature, and by the internal commotions and the dangers from without, which quickened the national spirit. The change was first discernible in the lyric poetry. Jacob Bellamy (1757–86) and Rijnvis Feith (1753–1824) show most plainly in this branch of poetry the influence of the Germans, while Pieter Nieuwland (1764–94) formed himself more after the ancients. Willem Bilderijk (1756–1831), admirably gifted by nature, acquired by study and practice a wide knowledge of literature and a rare command of language, and shone in all departments of poetry, but was unable to breathe into his works any originality, owing to his rigorous adherence to the pedantic rules of Boileau, which prevented his rightly appreciating English and German literature. J. F. Helmers (1767–1813), a poet of more warmth than Bilderdijk, won great applause by the descriptive poem 'De Hollandsche Natie,' in which he glorifies his native country. The pleasing Hendrik Tollens (1780–1856) was as a lyrist the avowed favorite of his country, and his 'Overwintering der Hollanders op Nova-Zembla' is regarded as the best descriptive poem in the Dutch language. Among the others whose productions have met with more or less acceptance are Cornelis Loots, Adriaan Loosjes, Ad. Simons, the original and humorous A. C. W. Staring van den Wildenborch, Bilderdijk's disciple and eulogist Isaak Dacosta, by birth a Portuguese Jew, and J. J. L. ten Cate, an able translator of foreign poetry. An important service was rendered to the literature of his country by Jacob van Lennep (1802–68), who, incited by the example of Scott and Byron, introduced romanticism, and successfully repressed French classicism, by his masterly treatment of native tales and historical subjects in narrative poems. His chief followers are A. Bogaers, H. A. Meyer, B. ter Haar, and N. Beets. The dramatic productions of this period are comparatively insignificant. Prose, which since Brandt had sunk very low in Holland, was first raised again by Justus van Effen in his 'Hollandschen Spectator' (1731–5), an interesting periodical in imitation of the English 'Spectator.' About the beginning of the 19th century Van der Palm, De Borch, Siegenbeek, and others, acquired more or less distinction as historians; but the prose of Holland continued to be characterized by a somewhat strained rhetorical style till it was freed from its fetters by Geel and Van Lennep, the latter of whom wrote novels in language at once refined and popular. The novelists who rank next to Van Lennep are Oltmans (pseudonym Van den Hage), Mrs. Bosboom-Toussaint, Mulder, Hofdyk, Adele Opzoomer (pseudonym A. S. C. Wallis), Dekker, Daum (pseudonym Maurits), Van Rees, etc. Maarten Maartens writes his novels both in English and Dutch. Besides these novelists by profession the dramatist Schimmel has done good work in the department of the historical novel, and the poet N. Beets has published, under the title of 'Camera Obscura,' a series of sketches and tales illustrative of Dutch life overflowing with wit and humor. The list of recent Dutch prose writers also includes Weitzel, Lange, J. ten Brink, Gorter, Huet, Fruin (the Dutch Motley), Vosmaer, Vissering, Pierson, Keller, the youthful poet Perk (1860–81), Emants, Kloos, Netoscher, Verwey, Pol de Mont, Couperus, Schaepmann, Borel, Van Hulzen, Van Eeden, Helene Swarth-Lapidoth, Van Deyssel, De Koo, and Steijn Streuvels.

Dutch Science and Scholarship.— The Dutch on the whole can point to higher names in the various branches of scholarship and science than in that of pure literature, a circumstance which is no doubt partly due to the greater ease with which the results of such labors can become known and appreciated in translations than those of pure literature. Gansfort and Agricola in Groningen were among the first who distinguished themselves as divines and scholars. Erasmus of Rotterdam made far greater progress. A still greater genius, Hugo Grotius, in the beginning of the 17th century devoted himself simultaneously to philology and antiquities, poetry, history, philosophy, theology, and jurisprudence in all its branches. The northern provinces were long destitute of a university; that of Louvain, in Brabant, served for all the Low Countries. But the University of Leyden, founded in 1575 by Prince William I., soon exerted a beneficial influence over the whole united Netherlands. Men like Scaliger, Lipsius, Daniel and Nicolas Heinsius, Gronovius, Spanheim, Arminius, Drusius, Coccejus, and others, made this university famous over all Europe. Universities were also founded at Franeker in 1585, at Groningen in 1614, Utrecht in 1636, and Harderwijk in 1647, and their competition with the University of Leyden was very advantageous to science. Toward the end of the 17th century Huygens, Leeuwenhoek, Zwammerdam, and Hartsoeker distinguished themselves, in natural history and astronomy; Alb. Schultens, Tiberius Hemsterhuis, Lambert ten Kate, and Hermann Boerhaave in medicine; and a series of distinguished men flourished, particularly at Leyden. Utrecht had its Wesseling, Duker, Drakenborch, and Saxe. Among the jurisconsults Mathaeus, Huber, Noot, and Voet are distinguished. The cultivation of the Dutch language was especially promoted by Lambert ten Kate, Sewels, Zeydelaar, Kramer, and Van Moerbeek. In philology, history, geography, mathematics, natural philosophy, and medicine, the Dutch distinguished themselves in the highest degree, and their contributions to civil and public law are very valuable. They have always had men of the first distinction in ancient classical literature. From these notes it will appear that efforts have been made to adopt the language to elevated purposes, and that they have been crowned with success. The prose of the Dutch has little euphony and elegance, but it is well adapted to express practical truths in a simple and popular manner. It would undoubtedly have acquired greater perfection if their philosophical and other writers had not often made use of a foreign language. Erasmus, Lipsius,

Grotius, Wyttenbach, and others, wrote in Latin, and Francis Hemsterhuys in French. As with philosophy, so also with history. The sciences have flourished in the northern provinces, and kept pace with the progress of the times; but this is not the case in the southern provinces. The study of the law and of general jurisprudence is in a flourishing condition, and medicine has its notable exponents. The Dutch excel in mechanics and hydraulics. The orthography of the Dutch language was at one time very unsettled; but a uniform system has been adopted in the schools since 1804, though opposed vigorously by Bilderdijk and others. Consult: Schneider, 'Geschichte der Niederländischen Litteratur' (1887); and Ten Brink, 'Geschiedenis der Nederlandsche Letterkunde' (1896).

CHARLES LEONARD-STUART, B.A.,
Editorial Staff, 'Encyclopedia Americana.'

Netherlands Schools of Painting, The, are comprised in the Dutch and the Flemish schools.

The Flemish school was founded by the brothers Hubert and Jan van Eyck, who established themselves at Bruges, and attracted scholars from far and near. They are believed to have flourished between 1370 and 1445. The Flemish school is distinguished by brilliant coloring; magical effect of the chiaroscuro; carefully labored, though often tasteless drawing; a strong yet natural expression, and boldness in composition. Among the scholars of the Van Eycks is Hans Memling, an artist whose works are among the best of the early Flemish school. Among later masters of the same school are Quintin Matsys or Messys of Antwerp (died 1529), Luke of Leyden (died 1533), and wholly in the 16th century Francis Floris (born 1520; died 1570), called, on account of the great influence he exercised on contemporary painting, the Flemish Raphael. Among his scholars were the two Francks, the two Pourbuses, and Mart. de Vos (born 1520). Other painters rather later in time are Spranger (born 1546); Henry Steenwyk, the painter of perspective (born 1550); Denis Calvert; the brothers Paul and Matthew Bril; Van Ort (born 1557); and the two Pieter Breughels, father and son; Roland Savery of Courtray (born in 1576). After all these came Peter Paul Rubens (1577–1646), the boldest painter of modern times; a man of inexhaustible industry, of gigantic imagination and power of representation, to whom about 4,000 paintings are ascribed. With him the Flemish school reached its acme. Several distinguished painters follow: Frans Snyders (born 1579), whose hunting and animal pieces excel all others in boldness and truth; Josse de Momper (born 1580), a landscape-painter esteemed for his valleys and the distant views which they present; Pieter Neefs, the famous church painter; David Teniers, father and son, noted for their representations of peasants, guard-rooms, tap-houses, and all kinds of low life; Gaspar de Crayer (born 1582), who approaches in the expression and coloring of his historical paintings to Rubens; Gerard Seghers, distinguished as a historical painter; his brother Daniel, famous for flower and insect pieces. Jakob Jordaens (born 1594), however, excelled all those who make Rubens their model. Abraham Janssen and his pupil Theodoor Rombouts equal Rubens in coloring, but not in conception. The industrious Luke van Uden executed the landscapes for Rubens' paintings, and his views of the sky at dawn are worthy the study of every artist. Anthony Vandyck (born 1599) obtained the name of the "king of portrait painters." He excelled Rubens in correctness and beauty of forms. Cornelius Schut, for whom Jan Wildens often painted the landscapes, distinguished himself as a historical painter; Adriaan Brouwer acquired fame by his excellent representations of scenes from common life; Jan van der Meer by his pastoral pieces; Anton Francis van der Meulen by his battle pieces; Frans and Jan Milet, father and son, by their landscapes. Besides these there are the names of Jan Bol, Wenceslaus Koeberger, Hendrik Goltzius, Hendrik van Balen, Frans Hals, Willem van den Nieuwelandt, Abraham Diepenbeck, Theod. van Thulden, Gerard Lairesse, Jan Frans van Bloemann, Jan van Cleef, Pieter Eykens, Robert van Oudenarde, Jan Anton van der Leepe, Jan van Breda, etc.

The Dutch school is distinguished for a faithful copying of nature, great finish, good chiaroscuro, skilful disposition of colors, and delicate penciling; but it is reproached with choosing often ignoble subjects and with incorrectness of drawing. Its founder is Luke of Leyden (born 1494). Its most prominent artists are Otho van Veen, of Leyden (born 1586; died 1634), who deserves mention also as the teacher of Rubens. Abraham Bloemart of Gorkum (died 1647) painted historical subjects, landscapes, and animals in good taste. Cornelis Poellenburg of Utrecht (born 1586; died 1663) was peculiarly happy in painting small landscapes with figures. Worthy pupils of his are Daniel Vertange and Jan van Haensberge. Johan Wynants of Haarlem (born 1600) is distinguished as a landscape-painter; and Jan Daniel de Heem, of Utrecht (born 1604; died 1674) for his faithful imitation of flowers, fruits, carpets, vases, etc. The highest place belongs to Rembrandt (1606–69), whose masterly coloring atones for all his defects. In the delineation of common life the following are distinguished: Gerard Terburg of Zwoll (born 1608; died 1681); Pieter van Laar (1613–73), the two Ostades, and Jan Steen (1636–89); in landscapes, Jan Both of Utrecht (born 1610; died 1650); Hermann Swaneveld of Woerden (born 1620; died 1690). Asselyn (born 1610; died 1680) painted battles, landscapes, and pastoral pieces with a brilliant coloring and a delicate pencil. Scarcely any painter drew more correctly, colored more beautifully, and distributed light more truly than Gerhard Dow or Douw (born 1613; died 1680). John Fyt (born at Antwerp, 1625) was a good painter of beasts, birds, and fruits; Gabriel Metzu, who worked in the style of Terburg, excelled him in softness of penciling. The landscapes of Benenberg of Utrecht are full of life and freshness. Philip Wouvermans (born 1620; died 1668), the most famous painter of horses, produced battle and hunting pieces, horse-markets, travelers, and robbers; and his paintings of all kinds are highly esteemed. The landscapes of Anton Waterloo, for which Weenix executed the figures, are sometimes cold, but please on account of the accuracy with which he represents light playing through foli-

age and the reflection of objects in water. Berghem acquired the name of the Theocritus of painters; and perhaps Paul Potter is the only one who can dispute the superiority in representing cattle with him. While Ludolf Backhuysen painted storms at sea with an effect as true as it is terrible, Frans Mieris distinguished himself by fine and accurate representations of many domestic subjects, and Jan Pieter Slingeland was hardly less accurate. Godfrey Schalken of Dort excelled in the illumination of night scenes. Excellent market scenes, animals, and landscapes were painted by Karel du Jardin. Albert Cuyp and Adriaan van de Velde painted landscapes and animals with almost unequaled perfection. Hobbema is another excellent landscape-painter. For the representations of the beautiful solitudes of nature Jakob Ruysdael is celebrated, and for quiet lovely moonlight scenes Van der Neer. No painter has painted more delicately and with more finish, even in insignificant trifles, than Adriaan van der Werf. The flower-painters, Pieter van Hulst of Dort, and Jakob van Huysum, are almost unrivaled in this department. Other names are Cornelis Ketel, Bartholomew van der Helst, Albert van Everdingen, Gerbrandt van den Hendrik Verschuuring, Maria van Oosterwyk, Willem Kalf, Melchior Hondekoeter, Cornelis de Bruyn, the two Houbraken, Rachel Ruisch, Cornelis du Sart, Jan de Witt, Cornelis Troost, Van Os, Van Spaendonck, Scheffer, Ommeganck, etc. About the beginning of the 19th century the classicism of France had a great influence on the Dutch historical school, as seen in the works of Kruseman, Pieneman, Navez, and Van Bree. In genre painting the old models were still followed, and good work was done by Jan Kobell and Eugene Verboeckhoven; Scheefhout and Schotel deserve mention as landscape and marine painters. A more natural and correct style followed the fall of the school of David in France, and Louis Gallait, Edouard de Biefve, Gustaf Wappers, Nicaise de Keyzer, and Hendrik Leys distinguished themselves as historical painters. Florent Willems and Alfred Stevens were genre painters. A. de Kuyff and Xavier de Cock painted excellent landscapes. Among Dutch painters of the present day we should specially mention Alma Tadema and Josef Israels. The former long resident in England, a baronet and member of the Royal Academy, is remarkable for the skill with which he treats subjects selected from states of civilization that have passed away, as from ancient Egypt, Rome, or the Franklin monarchy. The genre pictures of Israels and of Bisschop are also well known. The artists of the Netherlands are still distinguished by the peculiarities of the two schools, the Dutch and the Flemish. The reproach of an almost exclusive adherence to common reality has been often made to the whole school of the Netherlands, but is confined by some to the Dutch; while the Flemish school, they say, in its more elevated productions has striven to represent a nobler nature. The chief question in painting, however, is not what the artist attempts, but what he accomplishes; and if critics are right in saying that in the works of the Flemish painters we generally miss the spirit of the poet in the beauty of the manual execution, then the Dutch school would deserve the preference, because, though it takes most of its subjects from common reality, it often represents them with a poetic conception of their character. It would be better, however, to describe them both as deficient in ideal beauty, but as distinguished in the highest degree for faithful imitation of nature.

CHARLES LEONARD-STUART, B.A.,
Editorial Staff, 'Encyclopedia Americana.'

Nethersole, nĕth'ẽr-sōl, **Olga,** Anglo-American actress: b. Kensington, England, 18 Jan. 1870. She made her début in 'Harvest' at the Theatre Royal, Brighton, in 1887 and the year following was engaged at the Royal Adelphi theatre in London. She was later engaged at the Garrick in London and then made a tour of Australia. Her next appearance in London was at the head of her own company playing 'The Transgressor.' She has made several trips to the United States where she has been well received. Her leading roles are: Camille; Juliet; Carmen; etc. See Strang, 'Famous Actresses of the Day in America' (1899).

Neth'inim, in Biblical history, the lowest order of ministers of the temple at Jerusalem. They were hereditary attendants on the Levites in the services of the Temple and were to do the more menial part of the work. It is supposed that the Gibeonites originally held a similar office (Josh. ix. 21–27.) At the return from Babylon, 392 of these ministers accompanied Zerubbabel (Ezra ii. 58, Neh. vii. 60), and 220 came with Ezra (Ezra viii. 17, 20); 612 of them in all.

Néthou, nā-too', **Pic de,** Spain, the highest point (11,169 feet) of the Pyrenees (q.v.).

Net'ley, Abbey, and **Netley Hospital,** England. See SOUTHAMPTON.

Netscher, nĕts'hĕr, **Caspar,** Dutch painter: b. Heidelberg 1639; d. The Hague 15 Jan. 1684. He was taken to Holland in early childhood and as the adopted son of a physician early began the study of medicine, but eventually learned painting from Koster, a still-life painter of Utrecht, and from Terborch (q.v.) at Deventer; he also spent a short time during his student years at Bordeaux, France, but eventually settled permanently at The Hague. He was a genre painter who imitated the manner of Terborch, and chose his subjects from aristocratic life. He sometimes, however, painted kitchen interiors, and sheep, also portraits. His weakest work consists of small, delicately handled and enamel-like pictures of historical and mythological subjects, which are blemished by mannerisms. Almost every public gallery in Europe contains examples of his numerous works, but the Dresden gallery is particularly rich in his cabinet pieces, such as, his 'Lady at the Harpsichord'; 'The Doctor's Visit'; 'The Harp Player.'

Nettement, nĕt-mäṅ, **Alfred François,** French journalist: b. Paris, France, 22 July 1805; d. there 15 Nov. 1869. He was educated at the Collège Rollin in Paris and entered journalism. He founded 'L'Opinion Publique' and for his staunch support of the grandson of Charles X. he was imprisoned by Louis Philippe after his accession. He wrote: 'History of the Revolution of July, 1830' (1833); 'History of French Literature under the Reign of

Louis Philippe' (1854); 'Histoire de la Restauration' (8 vols. 1860-72); etc.

Net'ter, Thomas, also called **Waldensis,** English Roman Catholic clergyman: b. Saffron Walden, England, about 1377; d. Rouen, France, 2 Nov. 1430. He entered the Carmelite order and graduated from Oxford, receiving ordination in 1394. He became provincial prior of the Carmelites in 1414 and strongly opposed the Lollard reform movement. He was confessor to Henry V. and Henry VI. and died while on a mission to Poland for the latter. He wrote: 'Doctrinale Fidei Ecclesiæ Catholicæ contra Wiclevistas et Hussitas' and the 'Fasciculi Zizanorium Magistri Johannis Wyclif.'

Nettle, a plant of the natural order *Urticaceæ,* having unisexual flowers, the male and female on the same or separate plants: the male flowers with a 4-parted perianth and four stamens; the female flowers with a 2-parted perianth and a tufted stigma, fertilized by the wind; the fruit an achenium. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. These hairs are stiff and terminate in a silicious point which penetrates an animal's skin, breaks off and sets free a poison, the nature of which is not understood. When a nettle is grasped in such a way as to press the hairs to the stem no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *Urtica crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about 24 hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima,* the devil's leaf of Timor. The two most familiar species throughout America and Europe in waste places are the small virulent *U. urens,* and the least venomous is the most common and only perennial species, the great nettle (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woolen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* have been much used in some parts of Scotland and other countries as greens, and their peculiar flavor is much relished by some, although, in general, the use of them is confined to the poor. They are valuable as antiscorbutics, but are gritty to the taste from the quantity of crystals (cystolithes) contained. Whatever it is that gives nettles their stinging power is dissipated by boiling and drying. The high value of nettles as food for swine is well known to the peasantry of many countries; the great nettle is cultivated in Sweden for fodder of domestic animals; and nettles are also highly esteemed as food for turkeys. The seeds are extremely nutritious to poultry, and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves are employed in some parts of England for the manufacture of a light kind of beer, called nettle beer. The bast-fibre of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *U. dioica* was used by the ancient Egyptians, and is still used in various countries. When wanted for fibre the plant is cut in the middle of summer, and treated like hemp. Nettle-cloth, or grass-cloth, is a beautiful fabric made from rhea fibre. The fibre of *U. cannabina,* a native of the south of Siberia, Central Asia, is much used; and from that of *U. whitlavi* both fine lace and strong ropes can be manufactured. The fibre of *U. japonica* is much used in Japan, that of *U. argentea* in the South Sea Islands; that of *U. canadensis* in Canada; and that of *U. heterophylla,* a widely-diffused Indian species, is of very glossy silky appearance, and is manufactured into cloth in Assam. (See FIBRE.) The seeds and herbage of *U. membranacea* are used in Egypt as emmenagogue and aphrodisiac; and somewhat similar properties are ascribed to *U. dioica. U. tuberosa* produces tubers, which are nutritious, and are eaten in India raw, boiled, or roasted. Australia produces a magnificent tree-nettle, *U. gigas,* abundant in some parts of New South Wales, ordinarily from 25 to 50 feet high, but sometimes 120 or 140 feet, with trunk of great thickness, and very large green leaves, which when young sting violently.

Many plants are so-called, as the "dead nettles," labiates of the genus *Lamium;* the "horse nettle" (*Solanum carolinense*); and others.

Nettle-butterfly, a European butterfly (*Vanessa urticæ*), which feeds and lays its eggs on nettles; other butterflies, including American species, have the same habit.

Nettle Rash. See URTICARIA.

Nettle-tree, a tree of the genus *Celtis,* especially in the United States the hackberry (q.v.); and in Europe *C. australis,* commonly planted as a shade-tree in France and Italy.

Nettleship, net'l-shĭp, **John Trivett,** English painter and writer: b. Kettering, England, 11 Feb. 1841; d. London 31 Aug. 1902. He studied art under Poynter in the Slade School, London, and made a specialty of wild animals. His many striking and imaginative canvases include: 'Puma Devouring a Peacock'; 'A Death Grip'; 'A Mighty Hunter'; 'A Big Drink'; 'The Blood Trail.' Among his writings are: 'Essays and Thoughts,' a contribution to Browning Literature (1890), and 'George Moreland' (1898).

Nettleton, nĕt'l-tŏn, **Alvred Bayard,** American soldier and journalist: b. Berlin, Ohio, 14 Nov. 1838. He was educated at Oberlin College and entered the Union Army at the outbreak of the Civil War, rising from the ranks to be brevet brigadier-general. He studied law after the war and engaged in a journalistic career, and in 1890–3 he was assistant United States treasurer. He wrote: 'Trusts or Competition' (1900).

Neu Brandenburg, noi-brän'dĕn-boorg, Germany, a town of the grand-duchy of Mecklenburg-Strelitz, 20 miles northeast of Neu Strelitz near Lake Tollense. It was founded in 1248, and retains its picturesque mediæval ramparts and gateways. Its chief edifices are the Belvedere palace, and a 13th century Gothic church. It has manufactures of pianos, machines, paper, etc. Pop. (1900) 10,560.

Neu-Lauenburg, noi low'ĕn-boorg, formerly DUKE OF YORK ISLAND, an island of the Bismarck Archipelago (q.v.) off the west coast of New Mecklenburg.

Neu Pommern, noi pŏm'ĕrn. See NEW POMERANIA.

Neuchâtel, nė-shä-tĕl, or **Neufchâtel,** Switzerland, the name of a canton, town, and lake. (1) The canton in the west of the country, bounded by the cantons of Bern and Vaud, the lake of Neuchâtel, and France, has an area of 312 square miles. It lies in the midst of the Jura Mountains, four chains of which, running from northeast to southwest, traverse the canton, and are separated by elevated, longitudinal valleys. The greater number of the numerous streams which water the canton flow into the Rhine; several are feeders of the Lake of Neuchâtel mentioned below. Chief of the minerals is the asphalte of Val de Travers. Grazing is extensively attended to; wine, absinthe, fruits, hemp, and flax are produced. The manufactures are important; the principal are lace, cotton, clocks, and watches; a considerable industry is also carried on in cutlery, mathematical and philosophical instruments, chintz, and other cotton stuffs. The famous Neuchâtel cream-cheeses, however, are made, not in this canton as popularly supposed, but in France, at Neuchâtel-en-Bray, a small Norman town, 25 miles southeast of Dieppe by rail. Neuchâtel was an independent principality as early as 1034. After various changes of masters it came into the hands of the old French family of Longueville (1504), which became extinct in 1707. The king of Prussia, as heir of the house of Orange, was then called to the sovereignty by the states of Neuchâtel, and his title was confirmed by the Treaty of Utrecht. In 1806 Prussia ceded it to France, and the emperor conferred it on Marshal Berthier, afterward Prince of Neuchâtel-Wagram. By the Peace of Paris it was restored, with additions, to Prussia. In 1814 the principality was received into the Swiss Confederacy, and it was the only canton with a monarchical government, which it preserved till 1848. The religion is Protestant (Reformed). The language is French; but German is also spoken. Neuchâtel furnishes 960 men to the army of the Swiss Confederacy. Pop. (1900) 126,279.

(2) The capital, Neuchâtel, is 24 miles west of Bern, on a steep slope above the northwest shore of Lake Neuchâtel. It has an old Gothic church of the 12th century; many charitable institutions; a gymnasium or college, containing a valuable natural history collection founded by Professor Agassiz, a native of the town, etc. It has various manufactures and an extensive trade. Pop. (1901) 20,843.

(3) The Lake of Neuchâtel (Neuenburgersee), 1,420 feet above sea-level, is 25 miles long, from three to six miles wide, with a maximum depth of 472 feet. The Thiele serves as its outlet, and carries its waters into the neighboring Lake of Bienne, and thence into the River Aar which communicates with the Rhine. The lake is plentifully supplied with fish; steamers ply on its waters between Neuchâtel, Morat, Yverdun, Estavayer, etc.

Neuendorff, noi'ĕn-dŏrf, **Adolph Heinrich Anton Magnus,** American musician: b. Hamburg, Germany, 13 June 1843; d. New York 4 Dec. 1897. He came to the United States when 12, was educated in the public schools and pursued a course in music. At 15 he made his début as a pianist, and the next year he led a chorus and played in an orchestra. In 1864 he was musical director of the German Theatre, Milwaukee, Wis., and in 1865 he conducted the German grand opera in New York. He founded the Germania Theatre in 1872 and managed it for 11 years; he assumed the leadership of the Philharmonic Society of New York in 1878, and later became director of the Metropolitan Orchestra. Among his compositions are: 'The Rat Charmer of Hamelin' (1880); 'Don Quixote' (1882); 'Prince Waldmeister' (1888), etc.

Neufeld, noi'fĕlt, **Charles,** Anglo-German contractor: b. Dannerau, East Prussia, 1856. He was educated at the universities of Königsberg and Leipsic, was a trader in Upper Egypt and then entered the English army of occupation at Alexandria as interpreter; later becoming constructor to the Royal Engineer department. He served in the Nile campaign 1884–5, and while fortifying Assouan in 1887 was captured by the Dervishes, taken to Khartum and sentenced to death, but was saved from this fate by Kitchener's capture of Khartum. He has published 'A Prisoner of the Khaleefa' (1899); 'Under the Rebel's Reign' (1900).

Neuhof, noi'hŏf, **Theodor von,** BARON, German adventurer, King Theodore I. of Corsica: b. Metz 1686; d. London 11 Dec. 1756. His father was a Westphalian noble in the French service; the son became page to the Duchess of Orleans; fought in the French and in the Swedish armies; was employed by Count Goertz and then by Alberoni on diplomatic errands; married Lady Sarsfield, whom he deserted, having stolen her diamonds; lost all his property in Law's schemes; went to Florence in 1732; and there intrigued with some Corsican revolutionists, at whose invitation he landed in Corsica in 1736, with arms and equipment furnished by the Bey of Tunis, and was proclaimed king. He was at first successful against the Genoese, who, however, were reinforced by the French during Neuhof's absence in Holland; and he was defeated upon his return in 1738. After the withdrawal of the French in 1741, he made several attempts in 1743 to recover his kingdom and in 1749 retired to England, where he was jailed for debt, and was released in 1756, thanks to a subscription raised by Horace Walpole. His son, Colonel Frederick Neuhof, an English officer, wrote 'Mémoires pour Servir à l'Histoire de Corse' (1768). Consult Fitzgerald, 'King Theodore of Corsica' (1890).

Neuilly, nė-yē, or **Neuilly-sur-Seine,** sür sān, France, a town in the department of Seine, suburban to Paris, immediately north of the Bois de Boulogne. The fine 18th century level bridge by Perronet, across the river here, is an attractive feature, and the town is noted for

its benevolent institutions, parks, and a handsome residential section built chiefly on the site of the historic royal castle and park of Neuilly, destroyed during the revolution of 1848. Neuilly also has factories of several Paris establishments for the production of domestic commodities. Pop. (1901) 36,437.

Neumann, noi'män, **Franz Ernst,** German physicist and mineralogist: b. Joachimsthal 11 Sept. 1798; d. Königsberg 23 May 1895. He studied at Berlin, and became professor at Königsberg in 1828. His work in physics was of the greatest importance and he is reckoned the father of mathematical physics in Germany, and the founder of the modern theory of mineralogy by reason of his studies of the optical relations of crystals. He published a law of electrodynamics different from that of Ampère and from Grassmann's; determined the diffusivity of soils and of metals; and studied reflection and refraction of light, induction currents, specific heat, etc. He contributed to various scientific journals. Many of his lecture courses were edited and published by his pupils; among these are 'The Theory of Magnetism' (1881), 'Introduction to Theoretical Physics' (1883), 'Theoretical Optics' (1885), 'Theory of the Potential' (1887), and 'Capillary Attraction' (1894). Consult the biography by Volkmann (1896).

Neumann, John Nepomucene, Roman Catholic bishop of Philadelphia: b. Prachatitz, Bohemia, 28 March 1811; d. Philadelphia 5 June 1860. He was educated at Budweis and Prague; took orders; came to America as a missionary in 1836; engaged in work near Niagara for four years; in 1840 entered the Redemptorist Order; and became assistant pastor of St. James' Church, Baltimore, in 1842. He was again busied in mission work in Pennsylvania, Maryland and Virginia; was appointed superior of the Redemptorist Convent in Pittsburg, where he built the church of St. Philomena; returned to Baltimore in 1847 as provincial of the Redemptorists in America; established the Sisters of Notre Dame in this country; and in 1851 became bishop of Philadelphia. He went to Rome in 1854 and assisted in the definition of the dogma of the Immaculate Conception. Bishop Neumann was a man of culture and of administrative ability. Consult the 'Life' by Berger (translated into English by Grimm, 1884).

Neumann, Karl Friedrich, German Orientalist: b. Reichmansdorf, Bavaria, 22 Dec. 1798; d. Berlin 17 March 1870. He was educated at Heidelburg, Munich, and Göttingen, and after travels in India and China (1829–30) from which he returned with a great number of Hindu and Chinese books, was professor of Oriental languages at Munich 1831–52. He was a Liberal in politics, a circumstance which finally cost him the loss of his professorship. Among his many works are 'Mémoires sur la Vie et les Ouvrages de David Philosophe Arménien' (1829); 'Asiatische Studien' (1837); 'Geschichte der Vereinigten Staaten von Nordamerika' (1863-6); 'Hoen Schein, or the Discovery of America by Buddist Monks' (1874).

Neumann, Karl Gottfried, German mathematician, son of F. E. Neumann (q.v.): b. Königsberg 7 May 1832; he studied at Königsberg, became instructor of mathematics at Halle in 1858, was made professor at Basel in 1863 and at Tübingen in 1865, and since 1868 has been professor at Leipsic. His publications and special studies have been in the field of mathematical physics (following his father) and in higher analysis. Among his books mention should be made of 'The Mechanical Theory of Heat' (1875), 'Hydrodynamic Studies' (1881), 'Some Points in Mathematical Physics' (1893), 'Newton's Law of Attraction' (1896).

Neumayer, noi'mī-ėr, **Georg,** German meteorologist and hydrographer: b. Kirchheimbolanden, Bavaria, 21 June 1826. He was educated at the University of Munich and went to Australia under the auspices of Maximilian II. and there founded the Flagstaff Observatory at Melbourne, where he made valuable magnetic observations. He returned to Germany in 1864 and promoted the German-African Company and organized several expeditions to the North and South Polar regions. He was long connected with the hydrographic bureau at Berlin and in 1876 became director of the Marine Observatory at Hamburg. He wrote: 'Die Beobachtungsergebnisse der deutschen Stationen im Systeme der internationalen Polarforschung' (with Börgen, 1886); 'Atlas des Erdmagnetismus' (1891); 'Anemometer-Studien' (1897); and 'Auf zum Südpol!' (1901).

Neumayr, noi'mīr, **Melchior,** Austrian geologist: b. Munich 24 Oct. 1845; d. Vienna 29 Jan. 1890. He was educated in his native city and at Heidelberg, becoming docent at the latter university in 1872 and full professor of geology there in 1880. He traveled extensively in the Carpathian Mountains, the Alps, Italy, Dalmatia and elsewhere in southern Europe, studying the Jurassic formations. He published 'Die Stämme des Tierreichs: Wirbellose Tiere' (1890); 'Erdgeschichte' (1885–7); etc.

Neumes, nūmz, in music, (1) signs or characters in early music indicating tones or phrases. A large number of these characters were used, being more or less complicated in form and meaning. This was the first step toward a graphic musical notation. (2) Melodic phrases sung to a single syllable, more particularly at the end of a sentence or clause. (3) Modulation of the voice in singing. See MUSIC; MUSICAL NOTATION.

Neumünster, noi'mün-stĕr, Germany, a town in the Prussian province of Schleswig-Holstein, on the Schwale, 17 miles by rail southwest of Kiel. It is a well-built, busy manufacturing centre, producing principally woolens, and also leather, paper, ironware, soap, etc. Pop. (1900) 27,335.

Neuquen, nā-oo-kān', Argentina, a territory in the western part of the republic, bounded on the west by Chile. Its area is 42,345 square miles. The main range of the Andes Mountains crosses the western part from north to south, and numerous short ranges extend throughout the territory. The Rio Negro and its largest tributaries have their rise in Neuquen, and the Rio Colorado is on its northern boundary. The principal occupations are mining silver and cattle-raising. The population is mostly Indians, but since 1884 a number of Chileans have settled in the territory. The

capital is Chosnalal in the northern part. Pop. (1895) 14,517; (1900) 16,095.

Neural'gia (Greek *νεῦρον*, nerve + *ἄλγος*, pain), severe paroxysmal pain, either along the course of one or more sensory nerves, or at the place of their distribution. In neuralgia proper no definite lesions are discoverable. Sometimes there is reason to believe that inflammation of the sheath of the nerve is the starting-point. Not infrequently there are well-defined points of tenderness (ascertained by palpation) over the affected nerve, especially where it emerges upon the skin from a bony groove or opening. Sometimes with the pain there is a twitching of adjacent muscles. Radiation of pain, neuralgic in character, to nerve-branches other than those affected is quite common. Dental caries, for example, may produce supra-orbital neuralgia, and uterine disease, occipital neuralgia. Neuralgic pains are described by the sufferers as cutting, burning, boring, lightning-like, crushing, etc. After a neuralgic attack the part affected has a feeling of discomfort and bruising. There is frequently also a sense of exhaustion, with a desire to sleep. If there are repeated attacks of neuralgia, pallor of the skin, followed by intense redness, by hyperæsthesia, or by loss of tactile sensibility in the part affected, horripilation and other evidences of vasomotor disturbances are not uncommon. The disease may attack any part of the body, but is most common in the face. When involving the facial branches of the fifth pair of nerves (the trifacial nerves) it is popularly called tic-douloureux. There are severe flashes of pain over the eyebrows, in the eyes, nose, lips, chin, teeth, etc.

Neuralgias affecting various parts of the body are named in accordance with the part affected. Sciatica, for example, is neuralgia of the sciatic nerve, the pain extending down the back portion of the thigh and into the calf of the leg. Enteralgia is neuralgia of the bowels; gastralgia, of the stomach, angina pectoris, of the heart; intercostal neuralgia, of the intercostal muscles; and myalgia of the muscles in general. The presence of neuralgia, especially with repeated attacks, usually indicates a weak state of the general system, which may follow long-continued fevers. The disease may occur during the progress of various acute affections. The causes of neuralgia are various: poor blood and malnutrition, pressure of a tumor upon a sensory nerve, irritation of the nerve from the swelling of an adjacent part, exposure to cold and wet, fatigue, mental emotion, the abuse of tea, coffee, and alcohol, etc. The treatment varies with the nature of the different cases. Hot applications and anodyne liniments are often of value. As the pain is severe, persons affected are too often tempted to resort to narcotics for relief. Such drugs should not be used without the advice of a physician.

Neurastheni'a (from Greek *νεῦρον*, nerve + *ἀσθένεια*, weakness), a condition of nervous debility or exhaustion; popularly called nervous weakness, nervous prostration, etc. The term is now generally applied to a disordered condition of the nervous system manifested by various symptoms. It was originally used in 1879 by Dr. George M. Beard. Nervousness, so called, is manifested chiefly by undue sensitiveness to external impressions. It frequently precedes or progresses into nervous prostration. The distinction between hysteria (q.v.) and neurasthenia is not always plain, for the two affections frequently merge into one another. Neurasthenia is not a disease; it is a neurosis, a functional derangement, usually lasting a considerable time, but generally recovered from under proper hygienic and medicinal treatment. No morbid anatomical changes are at present known. The disorder is caused sometimes by various functional and organic affections of the body, but in these instances there is probably a pre-existing basis of functional perverted action of the nervous system. Neurasthenia so produced is known as symptomatic. When certain symptoms predominate, distinctive terms are sometimes used; for example, in acoustic neurasthenia, symptoms of deafness; in gastric neurasthenia, weak digestive action, gastric pain (nervous dyspepsia); in cardiac neurasthenia, palpitations, irregular action of the heart, præcordial pain, etc., symptoms simulating heart-disease; and in cerebral neurasthenia, despondency, irritability, moodiness, sleeplessness, restlessness, and confusion of mind, especially in relation to figures.

Neurasthenia is about as common among men as among women, and occurs usually between the ages of 20 and 50, when worry and work are maximal. Signs of a neurasthenic tendency are sometimes seen in young people (of a neuropathic or neurotic diathesis); namely, oversensitiveness, precocity, insomnia, chorea, somnambulism, and night-terrors. In girls especially there are also headache, backache, anæmia, and lassitude. Sometimes neurasthenia marks the beginning of mental disease, such as melancholia. The causes of neurasthenia may be classified as predisposing (such as heredity and a neurasthenic tendency), and exciting or acquired. Mental irritability and the loss of self-control in parents are causes. So also gout, syphilis, rheumatism, and chronic alcoholism are conditions that transmit neurasthenic tendencies. Improper mental and physical training of children, and too much coddling are often responsible for the affection. Among the exciting causes are: injuries; severe mental and physical work for a length of time beyond the individual's power of endurance; worry, especially if associated with lack of rest, of pure air and of suitable food; and the excessive concentration of the thoughts upon one's self. So common has neurasthenia become in the strenuous, competitive life of America, especially in cities, that it is sometimes spoken of as "the American disease." Most individuals naturally have more nervous force and energy than is required for the ordinary necessities of life; while neurasthenia appears most frequently among those not in robust health and who are particularly susceptible to nervous impressions, quick, versatile, sensitive, and perhaps talented persons. Still persons of strong physical and mental powers, by reason of dissipation, overexercise, overeating and drinking, late hours, etc., may unduly tax their reserve supply of nervous energy, and sooner or later exhaust the nervous system and bring on mental and physical bankruptcy. The habit of high-pitched and rapid conversation and the use of exaggerated language, the ready willingness to call oneself

"nervous," the very common and unjustifiable use of the terms nervousness and nervous prostration, all tend indirectly to debilitate the nervous system and pervert its action. The use of the term "nervous" as an excuse for failure to do one's duty is too common. So used, it means weak-mindedness, the loss of self-control. "Nerveless" is a better term which has been suggested for such cases.

The symptoms of neurasthenia are many and various. The individual may appear to be in perfect health, but frequently has a worried look. There may be irritability of temper, fatigue without adequate reason, poor sleep, with exhaustion on waking, headache, with sense of weight or constriction, impaired memory, want of appetite, constipation, various forms of muscular weakness, muscular tremors and contractions, an uncertain gait, a feeling of weariness, giddiness, pain along the spine (spinal irritation) and in the joints, hyperæsthesia, or paræsthesia (numbness and tickling), sexual emissions, and defects of sight and hearing. There is no capacity for sustained work. The recognition of mental and physical weakness causes the individual affected to become self-conscious, to distrust others, to have a feeling of isolation, to prefer solitude, to exaggerate trifling impressions, to dread the dark, and to suspect contamination from food, touch, etc.

Treatment of this obscure nervous disorder requires considerable time and the care of a kind but firm physician and nurse, who have the confidence of the patient. The co-operation of the patient should be elicited in the plans for recovery. If possible, the change from familiar scenes and surroundings, from the tumult and cares of city life to the country, to life in the open, in the woods, by the seashore or in the mountains, should be effected. Complete rest (see REST CURE), physical and mental, is the leading factor in the treatment. Travel, massage, electricity, induced sleep, carefully selected food, the removal of exciting causes, such as gout, lithæmia, and uterine disease, are all remedial and curative measures of importance in this affection.

Neureuther, Eugen Napoleon, German artist: b. Munich 13 Jan. 1806; d. there 23 March 1882. He began his studies at the Munich Academy, continued them at Paris (1830) and going subsequently to Rome (1838) fell under the influence of Cornelius (q.v.). In 1848 he was put at the head of the design department in the Royal Porcelain Manufactory at Nymphenburg, a position which he held until the sale of that establishment in 1856. He was engaged from 1868–77 as professor of design in the Royal Institution of Industrial Art. His brilliant versatility is shown in his skill as a house decorator, etcher, painter and industrial designer. He designed the border illustrations for Goethe's 'Ballads and Romances' (1829–40); he published 'Souvenir du 27, 28, 29 July 1830–1831); and 'Bavarian Shepherd's Song with Illustrations' (1834). In 1835 he painted scenes from Wieland's 'Oberon' for the royal palace at Munich. For the *édition de luxe* of Herder's 'Cid' he produced 70 illustrations. His etchings after Mottmann's frescoes are admirable, and among his oil paintings are to be found in the Schack Gallery at Munich: 'Portia's Dream'; 'The Dying Nun'; 'The Villa Mills'; 'The Villa Malta'; and a scene from 'Hermann und Dorothea.' He also furnished designs for the School of Industrial Art, and decorated the ceiling of the staircase and the cupola of the Polytechnique at Munich with graffito painting.

Neu'ridine, a ptomaine having the chemical formula $C_5H_{14}N_2$, which is formed during the putrefactive decomposition of flesh, appearing usually on the second day, and disappearing again on the fourth day. It also occurs in the fresh human brain, whence the name (Greek, "nerve"). Neuridine is a non-crystalline substance with an offensive odor, readily soluble in water, but insoluble in alcohol and in ether. According to some authorities it is intensely poisonous, while according to others it is not at all poisonous when pure.

Neu'rine, Choline, or **Sincaline,** a basic chemical substance having the empirical formula $C_5H_{15}NO_2$, or the constitutional formula $(CH_3)_3.C_2H_4.OH.NOH$. It occurs in putrefying flesh, in the fly agaric, in ergot, in beet-root juice, and in the actively-growing parts of numerous plants. It may be prepared by boiling pigs' bile or ox-brain with baryta. Neurine is a syrupy body with markedly basic properties and a strongly alkaline reaction. It is not poisonous, but is converted by oxidation into muscarine (q.v.), to which substance the poisonous qualities of the fly agaric are commonly ascribed.

Neuri'tis (N. Lat. from Greek *νεῦρον*, nerve + *itis*, a suffix denoting inflammation), inflammation of a nerve. Multiple neuritis is the inflammation of serveral nerves together. Varying with the cause, neuritis is traumatic, gouty, leprous, endemic, alcoholic, etc. The disease may be acute or chronic, primary or secondary. It results from an inflammation, swelling, and thickening of the nerve-sheath and its prolongations. They may be associated with inflammatory and degenerative changes of the substance of the nerve. The principal symptoms of the disease are persistent burning pain, more or less severe, and a tenderness in the course of the nerve and at the points of its distribution. These are followed by or associated with muscular weakness or paralysis, numbness — loss of sensibility or hyperæsthesia — and atrophy of muscles. The causes of the disease are various; for example, injury to a nerve, as in dislocations and fractures; extension of inflammation from a neighboring part; poisoning by lead, arsenic, mercury or alcohol (see POISONS); gout, syphilis, cancer, diphtheria, and infection. The simpler forms of the disease are usually recovered from, under treatment, in a few weeks, although recovery may be imperfect. In severe forms death may occur in from a week to ten days, from paralysis of the inspiratory muscles, or after several weeks from exhaustion due to continuous pain and bed-sores.

Neuroglia, the connective tissue found in many parts of the nervous system, differing very materially in its general structure from that found in other organs, wherefore it has received its special name. It is also sometimes designated as spider-cells, because of the many-branched processes which the cells possess.

Neurology, that branch of science which treats of the structure and functions of the nervous system. It deals with that system under

all its aspects of form and condition, both in health and in disease, but especially with its pathological states, its hygiene, and its medical treatment. See NERVOUS DISEASES; NERVOUS SYSTEM, EVOLUTION OF THE; NERVOUSNESS.

Neuron. See NERVOUS SYSTEM, EVOLUTION OF THE.

Neurop'tera, the order of "nerve-winged" insects, so-called by Linnæus from the abundant supporting rods or "nerves" which ramify in a network throughout the wings. Since its establishment the original largely artificial group has been much restricted by the separation from it of large divisions. Typical *Neuroptera* have two pairs of large, equal, richly netted-veined, membranous wings, strong biting jaws, conspicuous, many-jointed antennæ, a free prothorax and a complete metamorphosis. This order is of relatively slight economic importance, but the eight or ten families include many common and interesting American insects. See ANT-LION; CORYDALIS; DOBSON; LACEWING; etc.

Neuro'sis (Greek *νεῦρον*, nerve), an affection of the nervous system indicated by disordered sensation, volition, or mental expression, without any recognized lesion of parts, and sometimes without a discoverable adequate cause. Many abnormal conditions are now considered as neuroses; some of them result from nervous dyspepsia, shown by belching and eructation, by spasm and atony of the stomach, due to increased or decreased peristalsis, etc. Cardialgia and cardiospasm (functional disturbances of the heart) may produce such conditions. They are variously described, and include accident-neurosis, a neurosis following a severe injury; traumatic neurosis, following a severe wound; cyclist's neurosis, following excessive bicycle-riding; alcoholic neurosis, due to overuse of alcoholics; occupation-neurosis (see OCCUPATION, HYGIENE OF), indicated by spasmodic manifestations when attempting to perform movements peculiar to the employment of the individual, as the cramps of writers, milkers, etc.; and angioneurosis, a neurosis of the blood-vessels of a part. Herpes zoster is spoken of as a vasomotor neurosis, an exanthematous angioneurosis.

Neurot'ic. As an adjective, this term signifies having relation to the nerves. Physicians speak of neurotic individuals or subjects, neurotic ulceration, neurotic poisons, etc. As a noun the term was formerly chiefly applied in medicine to any substance — drug or poison — which acts especially on the nervous system, neurotics being classified as cerebral (morphine, etc.), cerebro-spinal (as aconite), and spinal (as strychnine). This use of the word neurotics has become obsolescent, and the term is now mainly reserved for sufferers from nervous disease or excessive nervous activity.

Neusatz, noi'zäts, or **Ujvidek,** ooy'vē-dāk, Hungary, a town in the district of Bács, on the Danube, opposite Peterwardein. During the civil war in 1849 it was stormed and taken by the imperial troops under Jellachich, and almost destroyed by the fire of the insurgents from the castle of Peterwardein. It was rebuilt and is now a thriving trading and educational centre. Pop. (1900) 29,296.

Neuse, nūs, a river of North Carolina, which has its rise in the north central part of the State and flows southeast into the Atlantic through Pamlico Sound. Its mouth is an estuary about 30 miles long, and is 10 miles wide at its mouth. It is about 310 miles long and navigable for about 100 miles. A number of streams flow into the Neuse but it has no large tributary.

Neusiedler See, noi'zēd-lĕr-zā, Hungary, a lake in the northwest, between the counties of Ödenburg and Wieselburg, 30 miles southeast of Vienna. Its greatest length, north to south, is 23 miles, average breadth five miles, circuit about 60 miles. It is saline and shallow, its greatest depth seldom exceeding 15 feet; on the east side it is lost in the great morass of Hanság. Large quantities of salt crystallize on its shores in summer, consisting of a mixture of common and of Glauber salt. It contains abundance of fish, such as carp and pike, some of the latter being 70 or 80 pounds weight. Its frequent inundations occasioned great damage, till a canal was cut in 1800, to carry off its superfluous waters and discharge them into the Little Raab. The water several times has disappeared almost entirely. The last occasion was between 1865 and 1870, when crops were grown on its bed.

Neuss, nois, Germany, a town of the Prussian Rhenish province, on the Erft, near its junction with the Rhine, 21 miles northwest of Cologne. It has several fine churches, that of Saint Quirinus founded in 1209 being a notable transitional specimen from the Round to the Pointed style. The numerous industrial establishments include flour and oil mills, iron foundries, machine works, woolen and cotton factories, paper mills, etc. Pop. (1900) 28,484.

Neustadt, noi'stät, or **Wiener-Neustadt,** vē'nĕr-noi'stät, Austria, a town near the Hungarian frontier, on the Kerbach, 13 miles by rail, and by canal, south of Vienna. It retains its mediæval walls, and is dominated by the 13th century Babenburg ducal castle, now a military academy, and noted for its richly decorated Gothic chapel (1460), the burial place of Maximilian I. Locomotives and machinery, sugar, woolens, cottons, ribbons, starch, leather, pottery, wire, etc., are among the manufactures. The city was founded in 1192, and was rebuilt after the great fire of 1834. Pop. (1900) 28,700.

Neustria, nūs'trī-a, or **West France,** the name given in the times of the Merovingians and Carlovingians, to the western portion of the Frankish Empire, in contradistinction to Austrasia (q.v.), the eastern portion, the term being derived from *ne* (not) and Austria. The division took place at the death of Clovis in 511. Neustria lay between the Meuse, the Loire, and the Atlantic Ocean; after the cession of the northwestern portion to the Normans in 912, the name was applied to Normandy but soon fell into disuse. See FRANCE.

Neuter, a term formerly applied in zoology to those animals — represented chiefly among the *Hymenoptera* — in which the characteristics of sex are either present in a rudimentary condition or may not be developed at all. They are infertile females. Their status is given in the accounts, in this work of ants, bees, wasps and termites.

Neutral Nation, an American Indian tribe of the Iroquois family, formerly residing on the

north shore of Lake Erie. The French called them the Neutral Nation because they took no part in the long war between the Hurons and the Iroquois. The Hurons afterward made war on the Neutrals and utterly destroyed them.

Neutral Salts. See SALTS; NEUTRALIZATION.

Neutral Tint, in art, a pigment used in water-colors, of a dull-grayish hue partaking of the character of none of the bright colors. It is prepared by mixing together blue, red, and yellow in various proportions.

Neutrality, in international law, a term applied to the status of a state which maintains an attitude of non-interference in respect to an existing war between other states, rendering neither aid nor service to either belligerent in his military operations. The doctrine of neutrality constitutes a large and increasing part of the existing body of international law, but in ancient and mediæval times it occupied almost no place. Grotius, in the first important treatise on international law ever written, gave but an insignificant place to the subject, whereas in any modern treatise it occupies a place hardly second to any. Among the states of the ancient world the status of neutrality hardly ever existed. War rather than peace was the normal state of mankind and when it existed practically all nations participated either as principals or allies. If one nation undertook to pursue a neutral policy it had few rights as such which any of the belligerents felt bound to respect and consequently it was more often to its advantage to choose an able ally as a means of self-protection rather than to remain neutral.

It was among the flourishing maritime states of the Mediterranean region, during the later Middle Ages, that the modern doctrine of neutrality had its origin, and the first recognition of neutral rights was embodied in a famous maritime code, the "Consolato del Mare," which declared that the goods of a neutral were exempt from capture although found on an enemy's vessel. This wise and liberal rule in time came to be adopted by all the European powers and continued as a generally accepted principle of maritime warfare until superseded by the more liberal rule embodied in the Declaration of Paris of 1856. By the latter declaration, which was acceded to by all the nations of Europe and America except Spain, the United States and Mexico, the principle that free ships make free goods was adopted, that is, the goods of an enemy (contraband of war excepted) under a neutral flag, and neutral goods (contraband excepted) under an enemy's flag, are free from capture. The United States refused to give its adhesion to the declaration for the reason that it was disinclined to surrender the right of privateering, the abolition of which was also one of the provisions of the declaration. The United States assumed this position chiefly because of the smallness of its navy and the consequent disadvantage it would suffer in a war with the larger powers were it prohibited from increasing its naval strength by accepting the service of privateers. The government, however, proposed to become a party to the declaration provided a clause were added exempting private property from capture at sea the same as on land but it was never done and the United States has never formally given its adhesion. But as a matter of practice it has observed the rules of the declaration quite as scrupulously as if it had been one of the signatory powers.

Several forms and gradations of neutrality are or were formerly recognized. It may be *qualified,* as where the neutral state is bound by an anterior agreement to furnish one of the belligerents a contingent of troops or a sum of money; or *absolute,* as where the state abstains wholly from interference on the side of either belligerent; or *perpetual,* as in the case of Belgium and Switzerland, whose neutrality and inviolability have been guaranteed by the powers upon considerations which have to do with the preservation of the balance of power among European states; or *armed* as where several neutrals unite for the purpose of enforcing by armed intervention their views of neutral rights as against the aggressions of belligerent powers. The most notable examples of such alliances were the armed neutralities of the Baltic powers in 1780 and 1800 for the purpose of enforcing against England the neutral doctrine that "free ships make free goods." It should be said that international law no longer recognizes the right of a state to maintain a qualified neutrality. If it is under prior treaty obligation to furnish one of the belligerents with men, money or ammunition, however trifling the quantity, it becomes an ally as soon as it undertakes to carry out the treaty stipulations and is no longer entitled to be treated as a neutral.

The obligations and rights of neutrals are determined by the usages of international law, not by those of municipal law. In this connection it should be observed that in judging of the violation of neutral duties a distinction is made between the acts of a state and those which are individual in character. The act of an individual therefore in supplying a belligerent with arms or ammunition would not be considered as a violation by the state of its neutral duties, although it might be a violation of municipal law. It is not sufficient that the neutral treat each belligerent with impartiality; he must abstain from giving aid to either except where the ordinary dictates of humanity require. He must not lend either belligerent money, furnish him with troops or ships of war or any article susceptible of warlike use, or allow his territory to be made the basis of hostile operations or for the organization and equipment of hostile expeditions, or as a recruiting ground for the enlistment of troops, or allow prizes to be brought into his ports and there adjudicated, or allow his subjects to aid in the preparation or organization of a hostile expedition against a friendly power. In the three rules adopted by the Geneva Arbitration Tribunal in the case of the Alabama Claims (q.v.) it was declared to be the duty of neutral governments to use due diligence to prevent the fitting out and departure of such expeditions from their territory, to prevent their ports from being made use of by either belligerent for hostile purposes; and to exercise the same diligence in respect to all persons within their jurisdiction in order to prevent any violations of the foregoing duties. On the other hand, it is not a violation of neutral duty to discharge the duties of humanity to either belligerent as by

allowing a belligerent vessel in distress to seek shelter in the neutral's port for the purpose of obtaining supplies or undergoing repairs or by furnishing asylum to a defeated and fugitive belligerent force. Nor is it at international law a violation of neutral duty when the subject of a neutral government in the ordinary course of trade sells to a belligerent firearms or other supplies which the latter may wish to buy. Likewise he may transport by ship to belligerents whatever they may want, subject, of course, to the right of the other belligerent to capture and confiscate such articles as may be deemed contraband of war. These are legitimate acts of trade unaffected by war, and neutral governments are not expected to interfere with them or assume responsibility therefor. Finally it is not a violation of neutral duty for one state to recognize the belligerency of another state at war or of a part of a state in rebellion against the established government. Nor is it a violation of neutral duty to recognize the independence of a revolted people when the revolt has reached such a stage as to give reason to believe that the revolutionists will establish their independence as a fact and maintain it.

The above enumeration of the duties of neutrals indicates in a rough way the *rights* which belligerents are bound to respect in the conduct of their warlike operations. They may be comprehended under the general head of complete immunity from the acts of either belligerent within their jurisdiction. No act of hostility may be committed by either belligerent within neutral territory nor within its territorial waters. Fugitive troops fleeing from an enemy may not be pursued in neutral territory nor may an armed vessel pursue and capture an enemy's vessel in neutral waters. As a means of enforcing its neutral obligations it is customary for states to enact *neutrality laws,* so called, making it criminal for their citizens or subjects to do certain specified acts which are considered to be violations of neutral duties, but such laws neither increase nor diminish the responsibility of the state enacting them. Consequently the state cannot plead the insufficiency of such laws or inability to execute efficient laws, in extenuation of its offense if it fails to enforce its neutral obligations. The foundation of the neutrality policy of the United States was laid during Washington's administration when upon the outbreak of war between England and France, Washington after a thorough consideration of our obligations to France, under the treaty of 1778, issued a public proclamation announcing that the United States would remain neutral and warned all citizens of the United States to abstain from giving aid to either belligerent. In the year following, Congress passed a neutrality act which as modified in 1818, and again in 1828, constitutes in all essential particulars the neutrality law now in force. It makes it a misdemeanor for any citizen of the United States to accept or exercise a commission to serve a foreign power in a war against a state at peace with the United States; or to enlist or to induce another person to enlist or to go beyond the jurisdiction of the United Sates to enlist in such foreign service; or to fit out, arm or augment the force of any armed vessel to be employed in such service; or to provide the means for setting on foot any military expedition against a friendly state. No belligerent vessel is allowed to provide itself with military supplies in the territory of the United States, and the President is authorized to use force to send out of our territorial waters any vessel not entitled to remain therein. The neutrality laws of Great Britain are embodied in the Foreign Enlistment Act of 1870 and besides provisions similar to those contained in the laws of the United States they contain detailed and stringent regulations designed to prevent the building or equipping in British jurisdiction of ships intended to be used in war against a friendly power.

JAMES WILFORD GARNER,
Instructor in Political Science, University of Pennsylvania.

Neu"traliza'tion, in chemistry, the process by which a solution, originally acid or alkaline, is rendered neutral, or brought into a state in which it is neither acid nor alkaline. If the solution is originally alkaline, it is made neutral by the addition of an acid substance; and if it is originally acid, it is neutralized by the addition of an alkali. A solution of caustic potash, for example, is strongly alkaline, and turns red litmus paper blue almost instantly; but if hydrochloric acid is gradually added to it, the alkalinity becomes reduced in proportion to the quantity of acid added, until a state is finally attained in which the solution does not manifest either acid or alkaline properties, and does not affect the color either of red or of blue litmus paper. It is then said to be "neutralized," the neutralization being due to the fact that the potash has entered into combination with the acid to form a salt (potassium chloride) which is neither acid nor alkaline. If more acid is added than is required to effect precise neutralization, the excess renders the solution acid, and in order to make it neutral again, caustic potash or some other alkali must be added. It is often highly important, in chemistry, to effect the precise neutralization of a solution, and a method of quantitative chemical analysis, known as "volumetric analysis," is based upon the determination of the quantities of certain standard acid and alkaline solutions which must be added to the given solution, in order to precisely neutralize it. See CHEMICAL ANALYSIS.

Neuville, Alphonse Marie de, äl-fôńs mărē dė nė-vēl, French painter: b. St. Omer 31 May 1836; d. Paris 20 May 1885. While he was for a short time the pupil of Picot, he must be considered largely a self-taught artist developing his talent under the direction of Delacroix. He made his first appearance as a battle painter with his 'Episode in the Crimean War' (1859), followed by 'The Trench of the Mamelon'; 'Zouave Guard' (Museum of St. Omer); 'The Battle of San Lorenzo in Mexico.' Meanwhile he was producing numerous illustrations for periodicals and for Guizot's 'Histoire de France.' He served as an engineer in the Franco-Prussian war and the second period of his artistic activity began. He tickled the vanity and boastfulness of his countrymen by depicting in his glowing and energetic canvases the French as chivalrous heroes, the Germans

as brutal barbarians, and became the most popular war painter of 'Young France' and the artistic representative of Chauvinism. Among his works with this tendency are: 'Bivouac before the Village of Le Bourget' (1872, Museum of Dijon); 'The Last Cartridge at Balan' (1873, familiar through its many reproductions), and numerous others often photographed or engraved and thus widely distributed. He left many aquarelles and drawings which were eagerly bought up.

Neuville, Jean Guillaume, zhŏn gē-yōm, BARON HYDE DE, French statesman: b. near Charité-sur-Loire, France, 24 Jan. 1776; d. Paris, France, 28 May 1857. He was educated at the Collège Cardinal Lemoine, Paris, and early became an active agent of the exiled Bourbon princes. In 1799 he interviewed Napoleon with the purpose to restore the throne to Louis XVIII., and later his estates were confiscated; but in 1806 upon his agreeing to exile himself to the United States, Napoleon refunded them. With the accession of Louis XVIII. in 1814 he returned to France and in 1815 was elected to the Chamber of Deputies. He was sent to the United States as minister and consul-general in 1816–21 and was then made ambassador to Portugal. In 1830 he became secretary of the navy. He wrote: 'An Historical Eulogy of General Moreau'; etc.

Neva, nē'vä (Russian, nyĕ-vä'), Russia, a river which flows from Lake Ladoga, and after a westerly winding course of 40 miles, has its outlet in the Bay of Cronstadt, an inlet of the Gulf of Finland. It is best known as the river on the delta of which Saint Petersburg (q.v.) is built. The river carries to the sea an enormous volume of water from lakes Ladoga, Onega, Ilmen, and others; in places it is over 4,000 feet wide, elsewhere narrows to 180 feet, and at one or two points navigation is obstructed by reefs and rapids; it is frozen over during five months of the year. The Neva connects with the Volga by the Ladoga Canal, and thus joins the Baltic with the Caspian Sea.

Nevada, nę-vä'dä, **Emma,** stage name of EMMA WIXON, American opera singer: b. Austin, Nev., 1862. She studied in Paris with Marchesi and made her first appearance in opera in London in 1880, as Amina in 'La Sonnambula.' She sang with success in Paris, Italy, and in the United States, where she toured in 1885. In 1885 she was married to Dr. Raymond Palmer.

Nevada, popularly known as "the sage-hen State" and "the sage-brush State," the name being derived from the Spanish, Nevada signifying "snow-covered"; one of the Pacific slope States of the Union and one of the most important from the standpoint of mineral wealth. Nevada is bounded on the west by California; on the south by California and Arizona; on the east by Utah and Arizona, and on the north by Oregon and Idaho. It has an area of 112,090 square miles; extreme length north to south, 484 miles, and width, east to west, 321 miles. Nevada ranks fourth in size among the States of the Union. The capital is Carson City.

Topography.—The northern portion of the State lies in the Great American Basin, included between the Sierra Nevada on the west and the Wahsatch Mountains on the east. This basin forms a plateau 4,000 feet above the sea. There are numerous parallel ranges from 20 to 50 miles apart, running north and south through the State, broken by passes and valleys. In the southwestern portion a few mountains are scattered over an alkali plain. Some of these ranges rise above 9,000 feet. The highest point in the State is Wheeler Peak, near the centre of the eastern boundary, with an altitude of 13,058 feet. Other lofty mountains are White Pine, Piñon, Trinity, Humboldt, Santa Rosa, Lookout, Antelope, Diamond, Granite, Shell Creek, Goshoot, Desert, Opal, and Quartz. The mountains of Nevada show formations of nearly every epoch, from the Azoic to the late Jurassic.

Rivers and Lakes.—The southwestern part of the State has no waterways. The principal river, the Humboldt, rises in the northeast and flows across the State to Humboldt Lake. Several rivers rise in the Sierra Nevada and flow into lakes in the west-central part of the State. These include Walker River, Carson River, and the Truckee River. Pyramid Lake is the largest lake in the State and measures 35 miles in length by 10 miles in width. Lake Tahoe lies on the western boundary at an altitude of over 6,000 feet. It is 21 miles long. There is also Mud Lake, Carson Lake, Walker Lake, and others. In the north is the Owyhee River, a tributary of the Columbia.

Geology and Mining.—The mountains and surface rocks are composed of limestone, calcareous spar, granite, syenite, porphyry, and slate. Volcanic rocks occur in various places, and in the northwestern part of the State there are extensive lava beds. The minerals include silver, gold, antimony, lead, copper, mercury, coal, and nickel, and also sulphur, gypsum, and deposits of salt and borax. The extensive deposits of gold and silver created the State and made it famous through the Comstock Lode (q.v.), which produced as much as $39,000,000 in bullion in a single year. (See GOLD; SILVER.) In 1900 the gold production was 107,364 fine ounces, valued at $2,219,000; silver, 843,400 fine ounces, valued at $1,090,457; copper, 556,775 pounds, and lead, 3,388 short tons. The building stones include limestone, granite, slate, sandstone, agate, and marble. Amethysts, carnelians, and tourmalines are also found.

Banking and Finance.—In the State in 1902, there was but one National bank in operation, having $82,000 in capital, $14,692 in outstanding circulation, and $33,500 in United States bonds. There were also three State banks, with $400,000 in capital, and $110,199 surplus; and one private bank with $25,000 capital and $74,529 in resources. On 1 Jan. 1901 the total bonded debt of the State was $276,600; floating debt, $17,852; and cash in treasury, $260,258. The total assessed valuation in 1900 was $23,692,709, divided as follows: real estate, $15,862,249; personal property, $7,704,209; and net proceeds of mines, $126,251. The State tax rate for 1901 was $8.00 per $1,000.

Irrigation.—Nevada has been the scene of the first work performed under the Irrigation Law passed by Congress in 1902. Work has been begun on what is called the Truckee dam, and the first contract calls for an expenditure of $900,000. The problem of irrigation has become the most prominent local question in Nevada, and the statement is frequently made

that, with a greater supply and distribution of water, Nevada would eventually become one of the foremost agricultural States on the Pacific slope. Chief Hydrographer Newell of the Geological Survey predicts that Nevada will have a population of 500,000 people within 50 years. See IRRIGATION.

Agriculture.— It is the scanty rainfall rather than the poverty of the soil that has given the impression that Nevada is a desert. In 1901, nearly 90 per cent of the improved area was under irrigation, with astonishing results. In the cultivated valleys the crops include spring wheat, barley, oats, potatoes, and vegetables. The State is well suited for stock-raising, which is carried on to a large extent. The white sage brush affords the best of winter pasturage, and much hay is cut along the river bottoms and in the valleys. The breeding of Cashmere and Angora goats is carried on to a limited extent. In 1900 the State had 13,606 dairy cattle, 370,000 meat cattle, 80,000 horses, 3,000 mules, 568,000 sheep, and 16,000 hogs. The forest trees are chiefly pines, firs, and spruces of great size. The foothills are covered with mountain mahogany, dwarf cedar, willow, beech, cottonwood, and wild cherry. Apple, peach, pear, and plum trees flourish and bear excellent fruit.

Commerce and Industries.— Upward of $1,600,000 is invested in the various industries of the State, although there are no manufactures of any particular prominence, the industries being small and varied. This is due largely to a lack of railroad facilities, Nevada having a smaller mileage than any other State in the Union, which is only about 1,000 miles. The Southern Pacific, running east to west through the State, is the principal line with a few smaller or branch roads. In 1900 there were reported by the United States census 261 manufacturing establishments, employing $1,531,789 capital and 617 persons; paying $426,692 in wages, and $832,058 for raw materials; and having an annual output valued at $1,673,880. The principal articles of manufacture include railroad cars, dairy products, flour and grist, printed material, saddlery and harness, clothing, chemicals, boots and shoes, brick and tile, wagons and carriages, confectionery, liquors, lumber and timber products, and salt.

Government.—The State is governed by the original constitution of 1864. Suffrage is restricted to male citizens 21 years of age, who have resided in the State six months and the district or county 30 days. The number of members of both branches of the legislature cannot exceed 75. Assemblymen serve two years and senators four years. Both are elected on the Tuesday after the first Monday in November of even years. A governor, lieutenant-governor, secretary, treasurer, controller, surveyor-general, and attorney-general are elected at the same time and serve for four years. There is a supreme court, district courts, and justices of the peace. A system of county and township government is established by the legislature. The State maintains an orphans' home, at Carson; a hospital for mental diseases, at Reno; and a State penitentiary at Carson.

Education.— In 1902 the children of school age in the State numbered about 8,000; average daily attendance 4,860. The public schools are maintained by State and local taxes and are in charge of a State Board of Education and three superintendents. Education is compulsory. There are 400 pupils in the high schools and over 300 in the Nevada State University (q.v.), a coeducational institution located at Reno, in connection with which the United States government has established an agricultural experiment station. The government also maintains a school for Indian children. The public school property is valued at $284,563. The receipts for the year amounted to $225,926, and the expenditures, $225,622. For higher education there are public high schools at Austin, Carson City, Elko, Eureka, Gold Hill, Reno, and Virginia City.

Churches.— The strongest denominations in the State are the Roman Catholic, Protestant Episcopal, Mormon, Methodist Episcopal, and Presbyterian. In 1901 there were 59 Evangelical Sunday-schools, with 868 officers and teachers, and 3,342 scholars.

Political.— Nevada, more than any other State in the Union, is largely controlled politically by local interests. It was counted as Republican up to 1892, when it cast its vote for the candidates of the People's Party. In 1896 it voted for free silver, and again in 1900 cast its vote for William J. Bryan for President. The first and only Territorial governor was James W. Nye (1861–4). In the State elections Nevada has elected five Republican governors, two Democratic governors, two Silver Party governors, and one Silver-Democratic governor. In 1901 there were 188 post-offices of all grades; and 30 periodicals, of which 7 were daily, 2 semi-weekly, 20 weekly, and 1 semi-monthly. The principal newspapers are the Virginia *Chronicle,* the Carson *Appeal,* and the Reno *Cazette.*

History.— Nevada was originally a part of California, known as "the Washoe Country," until it was organized as a Territory in 1861. It was first visited by the white man in 1775, when Francisco Garcés, a Franciscan friar, stopped here on his way to California. In 1825 Peter Ogden, of the Hudson Bay Company, visited the Humboldt River, which for a time was called the Ogden. In 1826 Jedediah S. Smith crossed the State from west to east. Frémont passed through the State in 1843–4–5, and occasional immigrants to Oregon or California settled here. In 1849 the Mormons founded a trading post on the Carson River, near Genoa. A part of the State was included in Utah Territory, when it was organized in 1850, but in 1853 the settlers in the Carson Valley petitioned to be annexed to California, claiming that Utah did not protect them. A petition for Territorial government was sent to Congress in 1857, and in 1858 a provisional government was formed at Carson City with Isaac Roop as governor. In 1860 another petition was sent to Congress and the Territorial delegate applied for admission. The Comstock Lode was discovered in 1859, and miners flocked into the district from the east and north and from California. At the outbreak of the Civil War the scanty population sent loyal troops to the front and Nevada citizens donated $50,000 in silver bricks to the Sanitary Commission. In September 1863 an election was held for delegates to form a State constitution, but the proposition was defeated in January 1864. The political situation made two additional Republican votes in the United States

Senate exceedingly desirable, and Congress, in March 1864, again passed an enabling act, in July the constitution was accepted, and the State was admitted 31 Oct. 1864. The great Sutro Tunnel (q.v.) designed to drainage and access to the mines of the Comstock Lode, was constructed in 1879. The silver product of the State from 1859 to 1869 amounted to $137,382,000, and this had much to do with gaining Nevada a place in the Union.

Population.— In 1883 Nevada at its zenith had a population of 66,265, including 3,152 Chinese and 4,000 Indians. In 1903 the population was about 40,000. The census for 1890 reported a population of 45,761, and in 1900 of 42,335. The decline of the mining industry of the State, and failure to develop in other directions, has caused the diminution of population. It now has the fewest inhabitants of any State. The capital city is Carson, pop. (1891) 3,950; (1901) 2,100. The largest city is Virginia City, pop. (1891) 8,571; (1901) 2,695. Reno is next in size, pop. (1891) 3,563; (1901) 4,300.

Bibliography.—Angell, 'History of Nevada' (1881); Bancroft, 'Nevada' (1890); 'Nevada and Her Resources' (1894).

Nevada, Iowa, city, county-seat of Story County; on a branch of the Chicago & Northwestern railroad; about 30 miles north by east of Des Moines. It is in an agricultural region in which stock-raising is a prominent industry. Its chief manufactures are flour, brick, tile, lumber and dairy products. It has a large cold-storage plant, and considerable trade in dairy products, poultry, eggs, grain, flour, and live-stock. The public library contains about 5,500 volumes. Pop. (1890) 1,662; (1900) 2,472.

Nevada, Mo., city, county-seat of Vernon County; on the Missouri, K. & T., and the Missouri P. R.R.'s; about 130 miles southwest of Jefferson City and 100 miles south of Kansas City. It was settled about 1830 by a colony from the eastern part of the State, incorporated in 1865 or 1866, and chartered as a city in 1883. It is in an agricultural and stock-raising region, and in the vicinity of the zinc mines. Its manufactures are chiefly local. The number of men employed in railroad shops and manufacturing establishments is about 1,000. The city has considerable trade in agricultural products and live-stock, and it is a distributing centre for a large part of Vernon County. Its educational institutions are public schools, Cottey College for Young Women, opened in 1884 under the auspices of the Methodist Episcopal (South) Church, and Saint Francis Academy (R. C.). It has an orphan asylum, the State Lunatic Asylum, and Artesian Lake Park. The three banks have a combined capital of $250,000. The government is vested in a mayor and a council of 10 members, who hold office two years; five councilmen are elected each year. Pop. (1890) 7,262; (1900) 7,461.

Nevada State University, first founded at Elko in 1873, then removed to Reno and opened in 1886. It is a part of the public educational system of Nevada and the only school of collegiate grade in the State. Besides the regular collegiate courses in the classics, literature and general science, there are courses in agriculture, civil, mechanical, and mining engineering, and domestic science; also a business course; a normal and a preparatory department. In the agricultural department short winter courses are offered in agriculture, dairying and domestic science. In 1901 a branch school of mines was established at Virginia City under the head of university extension. The State Experiment Station is also connected with the university. The degrees conferred are A.B. and B.S., with the corresponding masters' degrees for graduate work. Women are admitted and constitute fully half the number of students; military drill for the men is a part of the curriculum. As the agricultural department is connected with the university, it receives the income from the Federal land grants for agricultural colleges; the total income in 1903 amounted to $60,000. The students numbered 392, and the faculty 24.

Névé, nā-vā. See GLACIER.

Nevers, nē-vār, France, the capital of the former province of Nivernais, now of the department of Nièvre, picturesquely built on the slope of a hill 600 feet above sea-level, at the influx of the Nièvre to the Loire, 159 miles southeast of Paris. It was the Roman Noviodunum, and has been an episcopal see since 506; its 13th century cathedral has been restored since 1879; the 11th century Romanesque church of St. Etienne is interesting. The stately court-house, dating from 1475, was formerly the castle of the Dukes of Nevers. The city contains a fine public garden, a bridge of 14 arches over the Loire, a mediæval gateway, housing a museum of Gallo-Roman antiquities, and a triumphal arch (1746) commemorating Fontenoy. The industries comprise the manufacture of cannon, iron cables and chains, porcelain (introduced by Italians about 1565), etc. Pop. (1900) 27,673.

Nev'ersink Highlands. See NAVESINK HIGHLANDS.

Neville, nĕv'ĭl, **Henry,** English actor: b. Manchester 20 June 1837. He achieved great success on the London stage, where he first appeared in 1860, and later took the chief role in 'The Ticket of Leave Man.' He was lessee of the Olympic in 1873–9, and established a dramatic school in 1884. Besides plays, such as 'The Duke's Device' and 'The Violin-Maker,' he wrote 'The Stage: Its Past and Present'; 'Gesture' (in Campbell's 'Voice, Speech, and Gesture,' 1895).

Neville, Richard, earl of Warwick. See WARWICK, RICHARD NEVILLE, EARL OF.

Neville's Cross, Battle of. See BRUCE, DAVID.

Nev'in, Ethelbert Woodbridge, American composer: b. Edgeworth, Pa., 25 Nov. 1862; d. New Haven, Conn., 17 Feb. 1901. He obtained his musical education in Pittsburg and in Berlin and after three years spent in the latter city returned to the United States and opened a studio in Boston. He appeared in public occasionally but his reputation rests chiefly upon his compositions which date from his 12th year. 'Narcissus,' which has a world-wide popularity, was written when he was 13, and 'O, that we Two were Maying' a year later. Other compositions are: 'A Day in Venice'; 'Cradle Song'; 'Milkmaid's Song'; etc.

Nevin, John Williamson, American Reformed (German) clergyman: b. Shippensburg,

Pa., 20 Feb. 1803; d. Lancaster, Pa., 7 June 1886. He was graduated from Union College, Schenectady, N. Y., in 1821 and from Princeton Theological Seminary in 1826, where he remained for a few years as tutor. He was professor of Hebrew at the Presbyterian Theological Seminary at Allegheny City 1829–39, became president of the Mercersburg Theological Seminary in 1840 and was president of Marshall College 1841–53. His translation of Schaff's 'The Principle of Protestantism' created the once famous controversy over 'Mercersburg Theology' (q.v.), of which he was for the rest of his life the principal advocate. He edited the Mercersburg 'Review' 1849–53, resigned from the presidency of the Seminary in 1851 and from Marshall College in 1853. In the last named year the college was removed to Lancaster, Pa., and merged with Franklin College, Dr. Nevin serving as president of Franklin and Marshall College (q.v.) 1866–76. He published 'The Mystical Presence' (1846); 'The History and Genius of the Heidelberg Catechism' (1847); 'Antichrist or the Spirit of Sect and Schism' (1848).

Nevin, Robert Jenkins, American Episcopal clergyman: b. Allegheny, Pa., 24 Nov. 1839. He was a son of John Williamson Nevin and was graduated from Franklin and Marshall College, Lancaster, Pa., in 1859; he served through the Civil War in the Union army, attaining the rank of brevet-major. He was ordained in 1867 and since 1869 he has been rector of St. Paul's American Church in Rome which he built in 1870–6. He has written: 'St. Paul's within the Walls' (1878); 'Reunion Conference at Bonn' (1875); etc.

Nev'ins, Winfield Scott, American journalist: b. Brunswick, Maine, 6 Dec. 1850. He has been connected with the Boston *Herald* for 30 years and was president for four years of the school board of Salem, Mass. He has published 'Old Naumkeag' (with Webber) (1878); 'Guide to North Shore of Massachusetts' (annually, 1880–96); 'The Intervale, New Hampshire' (1887); 'Witchcraft in Salem Village' (1892).

Nev'inson, Henry W., English journalist. He was a war correspondent of the London *Daily Chronicle* during the Græco-Turkish war of 1897, and also from the Transvaal and Natal during the Boer war in 1899. He has published 'Life of Schiller' (1889); 'Neighbors of Ours' (1895); 'In the Valley of Tophet' (1890); 'The Thirty Days' War' (1898); 'Ladysmith' (1900); 'The Plea of Pan' (1901).

Nev'is, West Indies, one of the Leeward Islands, belonging to Great Britain, two miles southeast of Saint Christopher, with which, since 1882, it is administratively connected. It is circular in form, rises in the centre to a wooded ancient crater (3,200 feet), and has an area of 50 square miles. The lower slopes are cultivated, the sugarcane being the principal crop; limes and oranges are grown to a small extent. The capital is the port of Charlestown. Nevis was discovered by Columbus in 1498 and colonized by England in 1628. In the 18th century it was twice taken and restored by the French. Pop. (1900) 15,305.

New, Clarence Herbert, American author: b. New York 1862. He was educated at the Polytechnic Institute of Brooklyn, and engaged in travels which took him all over the world. In 1886–92 he was a constructing engineer and became lieutenant of naval volunteers in 1891–3. Since 1898 he has been a publisher. He has written: 'Franc Elliot' (1894); 'Chronicles of Murphy's Gulch' (1898); etc.

New, John Chalfant, American financier: b. Vernon, Ind., 6 July 1831. He was graduated from Bethany College, Va., in 1851 and studied law, becoming clerk of Marion County in 1856. In the Civil War he served as quartermaster of Indiana until his election to the State senate in 1862. He was cashier of the First National bank of Indianapolis in 1865 and later became its president. He was United States treasurer in 1875–6 and served as assistant treasurer in 1882–4. He was appointed consul-general at London in 1889 by President Harrison and is at present proprietor of the Indianapolis *Journal.*

New Al'bany, Ind., city, county-seat of Floyd County; on the Ohio River, and on the Baltimore O. & S., the Pittsburg, C. C. & St. L., the Louisville, E. & St. L., and the Louisville, N. A. & C. R.R.'s; nearly opposite Louisville, Ky., and about 110 miles south of Indianapolis. It was laid out for a city in 1813, and in 1839 was incorporated. It is two miles below the falls in the Ohio River (See LOUISVILLE) and has extensive water-power. Its chief manufacturing establishments are large glass works, pork-packing establishments, tanneries, engine and boiler works, furniture factories, flour mills, rolling mills, lumber and planing mills, and foundries. It has a large trade in its manufactures, the farm products of Floyd County, and in building material. Some of its prominent buildings are the government building, the city-hall, court-house, fair-ground buildings, the churches, and the schools. It is the seat of De Pauw College for women, Saint Mary's Academy (R.C.), Holy Trinity Academy (R.C.); it has public and parish schools and a free public library. Outside the city limits is a National cemetery in which are 2,908 graves, 676 of unknown dead. The government is administered under the charter of 1839 and provides for a mayor, who holds office four years, and a council. Some of the administrative officials are appointed by the mayor and the others are elected by the council. Pop. (1890) 21,059; (1900) 20,628.

New Al'bion, the name given by Sir Francis Drake, in 1579, to the coast of North America. Humboldt and later writers restricted the name to the region between San Francisco and what is now the northern boundary of the State of Oregon.

New Atlan'tis. See ATLANTIS.

New Bed'ford, Mass., city, port of entry, one of the county-seats of Bristol County; on the Acushnet River and New Bedford Harbor, an arm of Buzzard's Bay; and on the New York, New Haven & Hartford railroad. It is connected with Fall River, Brockton, Onset, and Dartmouth by electric lines, and by steamers with New York, Martha's Vineyard, and other places, and is 56 miles south of Boston. It was settled in 1652 by John Cook and others from Plymouth, and was a part of Dartmouth until

it was incorporated in 1787; chartered as a city in 1847. It was once noted for the number of its inhabitants engaged in the whale fisheries, but since 1860 its whaling interests have decreased and its manufacturing industries increased. The town occupied a prominent place in the Revolution, especially in sending out privateers which harassed the enemy and captured many of the British vessels. On 5 Sept. 1778 the town was attacked by a British fleet, captured and almost destroyed. The harbor is protected by Fort Rodman, on Clark Point. A large lighthouse is on Palmer Island at the entrance of the harbor. The area of New Bedford is nearly 20 square miles. It is well laid out, the streets are clean and nearly all paved. Fine roads along the shore, good views of the sea, opportunities to go out into the country on electric cars, all add to the attractiveness of the city which is now a most important manufacturing centre. The chief manufacturing establishments are 41 cotton mills (1904), representing a capital of $24,000,000, and having 1,603,080 spindles and 16,000 employees; the Twist Drill Company, 500 employees; cordage works, 400; one of the large shoe factories has 500 employees; woolen mill, 200; glass works, 300; paint works, 500; and 50 other industries, all giving employment to thousands of people. In 1902 New Bedford received 215,000 bales of cotton, new cotton mills were erected, and the old mills enlarged. New Bedford ranks first of the cities of the United States in the manufacture of fine cotton goods and fine cotton yarns, and second in the number of spindles. The total number of building-permits granted during 1902 was 470, at an estimated cost of $2,000,000. The city has an extensive trade; its manufactured articles are exported to nearly all parts of the world. The coal received at its docks (1904) amounts to over 600,000 tons annually, and it is a distributing centre for large quantities of food products which are brought from other parts of the United States and from other countries. Among the prominent buildings are the government building, the city-hall, county court-house, the Merchants' National Bank, Masonic and Odd Fellows' buildings, Saint Luke's Hospital, Saint Mary's Home for Aged and Orphans, and a State Armory. The public parks have a combined area of about 260 acres. The bridge which spans the harbor and connects Fairhaven and the east side with the city cost $1,500,000. The educational institutions are 30 public schools, five parish schools (R.C.), the Swain Free School, a State Textile School, a kindergarten (R.C.) and a public library which contains about 74,000 volumes. This library was founded in the early part of the 19th century, but did not become a municipal institution until 1856. There are 50 churches several of which are fine buildings. The national and trust company banks have a combined capital of $2,800,000; the savings banks have deposits (1903) amounting to $22,161,694.

The government is administered under the revised charter of 1896 which provides for a mayor, elected annually, a board of aldermen and a council. There are 6 aldermen and 24 members of the council, 4 from each ward. The mayor appoints, subject to approval of the board of aldermen, the license and the park commissions and the board of health. The council elects the officers of the fire department, the overseers of the poor, and the water board. There are two sources of supply of water, one opened in 1869, the other in 1899. The whole cost the city about $3,150,000. The water of the first plant is now held in reserve for emergencies, and great precautions are taken to have an uninterrupted flow of water in case of fire. There are now about 110 miles of water mains. The annual municipal expenditures for maintenance and operation are about $1,010,000. The chief items of expense are, for schools, $236,000; for police department, $114,000; streets, $71,000; fire department, $81,000; charitable institutions, $75,000; lighting, $50,000; interest on debt, about $150,000. There is a large foreign element, chiefly French Canadian, in the city, but all who have made permanent homes here are becoming American. The nationalities represented (1 Jan. 1904), are about as follows: French Canadian, 15,000; Portuguese, 12,000; English, 10,000; German, 2,000. The total population (1890) 40,733; (1900) 62,442; (1 Jan. 1904) about 78,000.

Consult: Rickeston, 'History of New Bedford'; 'Centennial in New Bedford.'

G. A. HOUGH,
Editor, 'Evening Standard.'

New Braunfels, brown'fĕlz, Texas, city, county-seat of Comal County; on the Guadaloupe River, at the mouth of the Comal, and on the Missouri, K. & T., and the International & G. N. R.R.'s; about 50 miles southwest of Austin, the capital, and 30 miles northeast of San Antonio. The short stream called Comal River has its source in artesian springs, and furnishes the city industries with an extensive volume of water. It is in a productive agricultural region in which stock-raising is given considerable attention. The chief manufacturing establishments are large flour mills, tannery, brick works, wagon factory, and cottonseed-oil mills. The trade is chiefly in wheat, flour, cotton, and live-stock. The inhabitants are nearly all Germans or of German descent. Pop. (1890) 1,608; (1900). 2,097.

New Brighton, brī'tŏn, Pa., borough, in Beaver County; on the east bank of Beaver River; two miles from its junction with the Ohio, and on branches of the Pennsylvania and the Pittsburg & L. E. R.R.'s; 28 miles northwest of Pittsburg. It was settled in 1799 by the laborers employed to build Wolf's mill,—a flouring mill; laid out in 1818, and incorporated as a borough in 1838. Coal-fields and fire-clay beds are in the vicinity. It is in a section of the State in which manufacturing and industries connected with coal are prominent. The good water power furnished by Beaver River is utilized in a number of manufactories, chief of which are potteries, coffee mills, flour mills, wire, rivet, and nail factories, brick and sewer pipe works, twine factory, iron enameled bath tub works, fire-engine, keg, and brass casting works. There are about 1,000 employees in the manufacturing establishments. There are 10 churches, 12 public schools, and one parish school. It has the Beaver Valley General Hospital, a public art gallery and library, and a park. The three banks have a combined capital of $1,150,000. The government is vested in a burgess and a council of 12 members. About three fourths of

the population are native born Americans. Pop. (1890) 5,616; (1900) 6,820.

New Brighton. See RICHMOND, BOROUGH OF.

New Britain, brĭt'n, Conn., city, in Hartford County; on the New York, N. H. & H. railroad; about 11 miles southwest of Hartford. It was settled in 1687 and remained a part of Berlin until 1850 when it was incorporated as a town. In 1871 it was granted a city charter. It is in an agricultural region, but is noted for its extensive manufacturing interests. The chief manufactures are: stamped ware, hardware, foundry and machine-shop products, knit goods, hosiery, and cutlery. The trade is chiefly in the manufactured goods, but it is a distributing centre for quite a number of the nearby villages. It has a park, area, about 80 acres, well-kept streets, and a large number of fine church buildings. It is the seat of a State Normal School and the New Britain Institute; it has good public and parish schools.

The revised city charter of 1896 provides for a mayor, who holds office two years, and a council. Some of the administrative officials are appointed or elected by the mayor and council. The sheriff, city clerk and assistant, collector, treasurer, and auditor are elected by popular vote. The town elects the school board. The city owns and operates the waterworks. Elihu Burritt (q.v.) was born in New Britain and lived here nearly all his life. Pop. (1890) 16,519; (1900) 25,998.

New Britain. See NEW POMERANIA.

New Brunswick, Canada, a maritime province on the east coast, bounded northwest and north by the province of Quebec and Chaleur Bay, east by the Gulf of Saint Lawrence and Northumberland Strait, the latter separating it from Prince Edward's Island; south by Nova Scotia and the Bay of Fundy, and west by Maine, United States; area, 28,200 square miles, of which 100 square miles are water.

Topography.—The general surface of the country presents a series of bold undulations, sometimes rising into mountains or continuous ridges of high land. The latter are seldom of any considerable height, but their precipitous acclivities, sharp outline and deep ravines give them a picturesque character that finely and strikingly contrasts with the rich valleys and sheltered plains which alternate with the more rugged scenery. The shores of the Gulf of Saint Lawrence and Northumberland Strait, however, present different and less pleasing features. There the land for about twelve miles inland is low and sandy, covered with trees of a stunted growth, and skirted with extensive marshes, and long sand-beaches, on the southern portion of the east coast there are numerous small harbors. The whole coast line about 540 miles in length, is interrupted only at the point of junction with Nova Scotia, where an isthmus of not more than 14 miles in breadth connects the two territories and separates the waters of Northumberland Strait from those of the Bay of Fundy. Across this isthmus the Chignecto ship-railway has been constructed. The most extensive indentations and harbors are Chaleur and Nepisiquit bays on the north coast, Miramichi Bay, on the east coast; the Bay of Fundy, Chignecto Bay, Passamaquoddy Bay, and Saint John Harbor on the south coast.

Hydrography.—The principal rivers are the Saint John, 450 miles long, navigable for vessels of 100 tons to Fredericton, 90 miles from its entrance into the Bay of Fundy, and forming the boundary with the United States for a considerable distance; the Miramichi, 225 miles long, which falls into the bay of the same name, and is navigable for large vesels 25 miles from the gulf; the Restigouche, 200 miles long, and three miles wide at its entrance in Chaleur Bay. The largest lakes, which are in the south of the province, are Grand Lake, 25 miles long by about 5 miles broad; and Washedemoak Lake, about 20 miles long by 2 miles broad, both lying between Saint John and Fredericton.

Geology and Mineral Resources.—Along the shores of Chaleur Bay and the Gulf of Saint Lawrence gray sandstone and gray clay-slate predominate, with detached rocks of granite, quartz, and iron-stone; on the south coast, limestone, clay-slate, with sandstone, interrupted occasionally by gneiss, trap, and granite. Specimens of amethyst, carnelian, jasper, etc., have been found in various places. Coal is plentiful, and iron-ore abundant; the former is said to extend over 10,000 square miles, or above one third part of the whole area, and is worked. Copper and manganese also abound. Gypsum, limestone, and freestone abound. Salt springs, strongly saturated, are numerous; and some sulphurous springs have also been discovered.

Climate.—The climate, like that of other portions of the North American continent, is subject to extremes of heat and cold. The severest cold of the winter usually continues from 21 December to 21 March. The prevailing summer winds are from the southwest and south; when from the southwest dense fogs are often produced on the shores of the Bay of Fundy, and stretch 15 miles to 20 miles inland. In the interior the climate is said to have been greatly ameliorated in consequence of the clearing away of the forests, by which the sun's rays are permitted to reach the surface of the earth, where the heat thus absorbed is again diffused by radiation. It is stated, as a result of this process, that the winters are reduced to nearly half their former duration. The climate is, on the whole, healthful, and the autumn, as in other parts of the North American continent, is a season of exceeding beauty, the air being dry and clear, and the woods glowing with innumerable tints of the richest and most brilliant hues.

Vegetation, etc.— New Brunswick is one of the most densely wooded regions of the world, the usual variety of North American trees being found; the forests supply three fourths of the total exports, pine constituting the principal lumber. A large portion of the soil is adapted for agriculture, but only a small part is developed. Indian-corn is grown in the south part of the province; flax, wheat and other cereals, turnips and good potatoes are raised. The wheat of New Brunswick is of the best quality and is said to be much heavier than that of the United States. In 1901 26,010 acres, yielding 478,886 bushels, were devoted to wheat culture; 184,114 acres, yielding 4,944,992 bushels, were devoted to the production of oats. Great attention is given to the improvement of live stock, sheep and cattle predominating.

Fisheries.—The rivers and lakes, and the great extent of the coast with its numerous deep bays, coves, and inlets afford great scope for the pursuit of the fishing industry, which, however, has not received the development its importance merits. Still New Brunswick ranks third among Canadian provinces in its fish products, the value of its catches in 1900 being $3,769,742.

Commerce and Manufactures.— Owing to its cheap coal, lumber, etc., and its proximity to the markets of the world, New Brunswick is expected to develop as a manufacturing state, especially since the railway system has been completed connecting with the rest of Canada and with the United States. Shipbuilding, formerly more important, is still carried on at Saint John. The manufacture of timber in various forms, such as deals, battens, planks, boards, shingles, staves, and as wood-pulp, is the chief industry; with fish it constitutes the principal article of export. The imports include beef, pork, beer, ale, books, brass and copper manufactures, bread, biscuit, cider, coffee, copper, cordage, corn, grain, wheat-flour, Indian and other meal, cotton, linen, silk, and other manufactures, earthenware, fishing-tackle, glassware, gunpowder, haberdashery, hardware, hemp, hides, iron, leather, medicines, oakum, linseed, painters' colors, rice, soap, rum, spirits, sugar, tallow, tea, snuff. tobacco, wines, etc. The value of the imports from beyond the Dominion considerably exceeds a million sterling; more than half is from the United States, and more than one third from Great Britain. The exports are about equal to the imports. The province owns a relatively large amount of shipping, the greater part of it still consisting of wooden vessels.

Government.—The province is divided into 15 counties, and is administered by a lieutenant-governor, an executive council consisting of nine members, and a Legislative Assembly (1901) of 45 representatives. The upper house or legislative council was abolished in 1892. The province sends ten members to the senate, and fourteen to the house of commons of the Dominion parliament. The judicial department comprises a supreme court, with a chief and four puisne judges; a court of chancery, one of marriage and divorce, and one for the trial of offenses committed at sea; over these three courts the lieutenant-governor presides.

Population.—The population in 1901 amounted to 331,120. The majority of the inhabitants are British settlers and their descendants. There are a few inhabitants of French stock, who are principally settled on the Chaleur Bay; and there is a small number of Micmacs, Melicetes, and other Indians in the north part of the province. The capital is Fredericton. Saint John is the chief port and largest town.

Education and Religion.—Education is abundantly provided for, both high and elementary, and is under the supervision of a superintendent of education and an educational council. In 1901 there were 1,756 schools, with 1,886 teachers, attended by 61,565 pupils, and the amount expended for education was $600,340. In religion, Roman Catholics predominate, numbering in 1901, 125,698, while Baptists come next with 80,946, Anglicans numbering 41,767, Presbyterians 39,424, and Methodists 35,973. Each sect maintains its own university and seminaries.

History.—New Brunswick was first settled by the French in 1639, and it continued, along with Nova Scotia, to form part of Acadia or New France, till it fell into the hands of the British after the conquest of Quebec. The first British settlers in New Brunswick emigrated from Scotland to Miramichi in 1764. After the United States Revolutionary War it received a notable addition, in 1783, of 5,000 United Empire loyalists, and in 1784 was separated from Nova Scotia, and formed into a distinct province. In 1826 the standing timber in the district around Miramichi Bay took fire, and enveloped an area of 6,000 square miles in flames, consuming four thriving towns, many large vessels lying in Miramichi River, and destroying 500 human beings. In 1867 New Brunswick became a province of the Dominion of Canada.

Consult: Cooney, 'History of New Brunswick'; Gesner, 'New Brunswick'; Hannay, 'History of Acadia'; Bailey and Jack, 'Woods and Minerals of New Brunswick'; Perley, 'Early History of New Brunswick' (1891).

New Brunswick, brŭnz'wĭk, N. J., city, county-seat of Middlesex County; on the Raritan River, the Delaware and Raritan Canal; and on the Raritan R., and the Pennsylvania R.R.'s; about 25 miles north by east of Trenton, 30 miles west by south of New York, and 15 miles from the mouth of the river. It was settled in 1681, and until 1697 it was called "Prigmore's Swamp." The name was changed to "Inion's Ferry," and in 1714 it was again changed and called New Brunswick after the House of Brunswick. In 1730 it was granted a royal charter; in 1736 it was incorporated as a town, and in 1784 was chartered as a city. It was the scene of much of the trouble during the Revolutionary War; it was occupied by the British the winter of 1776–7.

It is a manufacturing city, and has considerable trade, as it has good shipping facilities by land and water. The chief manufacturing establishments are cigar factories which have about 1,400 employees; rubber works, 1,000 employees; wall-paper factory, 500 employees; and a large number of smaller works, all of which are prospering. It is the seat of Rutgers College (q.v.), the State Agricultural and Mechanical College (q.v.), and Saint Agnes' Academy. The Theological Seminary of the Dutch Reformed Church is connected with Rutgers. It has seven public schools, three parish schools, the Gardner A. Sage library which contains about 45,000 volumes, and the public library with about 18,000 volumes. The Saint Mary's Orphan Asylum and Home for the Aged is in charge of Sisters of Saint Francis.

The government is administered under the charter of 1863 and is vested in a mayor, who holds office two years, and a council of 13 members. The mayor appoints the board of health and the library trustees; the council elects the water commissioners; the board of education is elected by the people. The city owns and operates the waterworks. Pop. (1890) 18,603; (1900) 20,006.

New Caanan, kā'nan, Conn., town in Fairfield County; on the New York, New Haven & Hartford railroad; eight miles northeast of Stamford and six miles northwest of Norwalk. It is a beautiful residential town and a favorite summer resort for New York business men.

The surface is hilly, the altitude about 400 feet, and the climate cool in summer and temperate in winter. The hard well-kept roads extend into the country and to the beaches on the Sound. It has some manufacturing establishments, chief of which are clothing, boot and shoe factories, and cigar factories. It has a public library and reading room. Pop. (1890) 2,701; (1900) 2,968.

New Caledo'nia, or **Nouvelle Calédonie,** noo-vĕl kā-lā-dō-nē, an island and penal colony belonging to France, in the Pacific Ocean, lying between the parallel of 20° S. and the Tropic of Capricorn, about 700 miles east of Australia. Its length northwest to southeast is 250 miles, the breadth being about 35 miles. The area is 8,100 square miles. It is surrounded by coral reefs, at a distance of from five to 18 miles. It was discovered by Cook in his second voyage (1774). Two parallel ranges of mountains extend through the island, attaining in the north a height of 5,570 feet. The soil is fertile, and the island produces the bread-fruit tree, banana, sugarcane, arum, cocoa, and excellent timber. The climate is healthful. Iron, copper, cobalt, nickel, silver, mercury, antimony, and gold have been discovered in recent years, and the nickel mines are now an important source of this metal. Coal is also found in abundance. The animals are very few, mammals and reptiles being specially deficient. The Melanesian natives, known as Kanakas, were formerly given to cannibalism. They are mainly Papuan in character, and are grouped in tribes, each with its own chief. In the irrigation and tillage of the soil they show no small skill. The Catholic mission, which has numerous stations, has made many converts. The aborigines sometimes engage as laborers under the Europeans, and natives of the neighboring islands are also introduced for the sake of their labor. The chief crops of the island are maize and taro; and among the other objects of cultivation are rice, wheat, sugarcane, coffee, cotton, cocoanuts, etc. The imports, largely for the convict stations, are wines and spirits, flour, vegetables, etc.; and the exports include nickel, preserved meat, chrome and other ores, etc. New Caledonia was taken possession of by the French on 24 Sept. 1853, and a small colony was formed there. During the time of the Second Empire it was employed as a place of banishment for criminals, a purpose which it still serves. The dependencies of the island are the Isle of Pines, the Loyalty Islands, the Huon Islands, the Chesterfield Islands, and the Wallis Archipelago. The whole of this territory is under a governor, advised by a council-general, and is divided into five arrondissements, of which four are ruled by administrators, whilst the fifth, Nouméa, is directly under the governor. The government of the island is essentially military, and the frequent escape of convicts (sometimes unwelcome visitors to Australia) has rendered the authorities very strict. The convicts are grouped in five classes, of which two have contributed much to the improvement of the colony by the construction of roads, etc., whilst a third is virtually free. A railway now connects Nouméa with Kanala. The capital, and only important town, is Nouméa, formerly called Port-de-France, with a pop. (1901) 6,968. It lies in a small mountainous peninsula on an excellent bay of the same name. In 1901 the total population was 51,415, of whom 12,253 were European civilians, 10,056 undergoing punishment, and 29,106 natives. Consult Griffith, 'In an Unknown Prison Land' (1901).

New Caledonia, North America, a former name for a region west of the Rocky Mountains, 500 miles long from north to south, and 400 from east to west, now included in British Columbia.

New Castile, kăs-tēl', Spain, an ancient province, corresponding to the old kingdom of Toledo, and now forming the provinces of Madrid, Ciudad-Real, Cuenca, Guadalajara, and Toledo, occupying nearly the centre of the peninsula; it had an area of 28,010 square miles, and the population of the region in 1897 was 1,853,314. With the province of Old Castile which bounded it on the north, and is now divided into the provinces Avila, Burgos, Logrono, Palencia, Santander, Segovia, Soria, and Valladolid, area, 25,490 square miles, pop. (1897) 1,764,440. New Castile formed the kingdom of Castile which was instrumental in expelling the Moors from Spain (q.v.).

New Church. See SWEDENBORGIANS.

New-chwang, nū-chwāng'. See NIU-CHUANG.

New Col'lege, Oxford, England, was founded in 1379 by William of Wykeham, bishop of Winchester and lord-chancellor of England, as the College of Saint Mary of Winchester, the scholars to be recruited from the most promising pupils of the great public school of Winchester (q.v.). Its original establishment comprised a warden, 70 fellows and scholars, 10 chaplains, three clerks, and 16 choristers; its modern establishment comprises a warden, 22 fellows, three chaplains, 40 scholars, a choir, and an average of nearly 300 graduates. Forty church presentations are within its gifts. The college buildings are among the finest in Oxford, and originated the style of English college architecture; the chief features are the hall, the chapel, and the gardens. Among celebrities associated with the college are Vitelli, Grocyn, Archbishop Chichele, Bishops Waynflete, Lowth, Ken, and Sydney Smith.

New Comerstown, kŭm'ĕrz-town, Ohio, city, in Tuscarawas County; on the Tuscarawas River, and on the Pennsylvania and the Pittsburg, C., C. & St. L. R.R.'s; about 80 miles east by north of Columbus. It is in a fertile agricultural region, near bituminous and clay deposits. The chief manufactures are lumber and planing mill products, cigars, brick, and dairy products. Pop. (1890) 1,251; (1900) 2,659.

New Connection of General Baptists, an orthodox body protesting against the growing Arianism and Socinianism of the English Baptist Church dating from 1770 and led by Dan Taylor (1738–1816), a Cornish miner.

New Connection Methodists, the first secession from the English Wesleyans, dating from 1797. The New Connection comprised the followers of Alexander Kilham (hence sometimes called KILHAMITES), who in 1795 published 'The Progress of Liberty,' a criticism of the lax church discipline of the day, for which he was expelled from the Conference a year later. In 1797 three other ministers joined him.

The church government of the New Connection gives laymen equal authority with the clergy in Conference. With but a few congregations in Ireland and in Canada the body is not growing and in 1890 numbered about 35,000 members.

New Creek (Keyser), **Engagements at.** While Gen. J. E. Johnston was at Winchester, Va., 14 June 1861, he heard that Col. Lew Wallace, with the 11th Indiana regiment, had marched from Cumberland, Md., and driven a Confederate force from Romney. Believing it to be the advance of McClellan's column from West Virginia, Johnston ordered Col. A. P. Hill, with three regiments, to march on Romney, 45 miles west, drive out Wallace, and destroy the bridges on the Baltimore & Ohio Railroad west of Cumberland. Hill reached Romney, but Wallace had fallen back to Cumberland. At night of the 18th Hill sent Col. Vaughn, with four companies of infantry, to destroy the bridge of the Baltimore & Ohio Railroad over New Creek, guarded by about 200 local militia and two guns. Vaughn crossed the north branch of the Potomac, beyond which the Union troops had taken position, and put them to flight, captured the two guns and a set of colors, burned the bridge over the mouth of New Creek, and then pushed on to Piedmont, five miles westward, destroyed parts of the railroad and cut the telegraph wires, and then returned to Winchester. Later the position at New Creek was fortified and garrisoned to protect the railroad bridge. On 4 Aug. 1864 it was held by Col. Robert Stevenson of the 154th regiment Ohio National Guard with his regiment, small detachments of three other regiments, and eight guns, in all about 1,500 men. During the day Stevenson was attacked by Gen. John McCausland, who returning from his raid on Chambersburg, had approached by way of Romney. After a severe fight of several hours McCausland withdrew toward Moorefield, leaving several dead and severely wounded on the field. The Union loss was 8 killed, 29 wounded and missing. On 27 Nov. 1864 New Creek was held by Col. Latham, 5th West Virginia cavalry, with about 700 dismounted cavalry, four heavy guns, and three field pieces. On the morning of the 27th Gen. Rosser with two brigades of cavalry, his own and Payne's, crossed Great North Mountain into Hardy County, surprised and captured Latham's pickets, charged over his works, and captured his artillery and most of his command with but slight resistance. The prisoners taken numbered about 500, and with them their arms and some colors. Four of the seven guns, being heavy pieces, were spiked and left, the carriages being burned. All the government buildings, containing a large amount of ordnance, quartermaster and commissary stores, and 200 wagons, were burned, and Rosser marched away with his prisoners, three guns, about 250 horses, also several hundred head of cattle and a large number of sheep collected from the farms of Hardy and Hampshire counties.

E. A. CARMAN.

New Cum'berland, W. Va., town, county-seat of Hancock County; on the Ohio River, and the Pittsburg, C., C. & St. L. railroad; about 35 miles north of Wheeling. In the vicinity are coal mines and valuable clay beds. The chief manufactures are sewer pipe, tile, a semi-porcelain pottery, fire and paving brick, foundry products, and machinery. It has large mills where the fire clay, for use in the iron works, is pulverized. It has an extensive trade in coal and clay products. Pop. (1890) 2,305; (1900) 2,198.

New Decatur, dē-kā'tėr, Ala., city, in Morgan County; near the Tennessee River, and on the Memphis & C., and the Louisville & N. R.R.'s; about two miles south of Decatur and 85 miles north by west of Birmingham. The first settlement was made in 1887, and in 1889 it was incorporated. It is in an agricultural, lumbering, and manufacturing section of the State. Its industrial interests are connected with the manufacturing and shipping of iron products, lumbering and farm products. It has a good trade in wool. Pop. (1890) 3,565; (1900) 4,457.

New Eng'land, a collective term applied to the northeastern portion of the United States, comprising the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. It extends from lat. 41° to 48° N., and from lon. 67° to 74° W., with an aggregate area of 65,000 square miles. It has a coast line of about 700 miles, without allowing for the smaller inlets, and constitutes a large part of the great peninsula which, including Nova Scotia, New Brunswick, and parts of Lower Canada, is formed by the Atlantic Ocean, the St. Lawrence, and the connected waters of Lakes Champlain and George and the river Hudson. It was originally granted for colonization by James I. in 1606 to the Plymouth company under the name of North Virginia, and received its present name from Capt. John Smith, who in 1614 explored and made a map of the coast. For the details of the geography and history of New England, see the States respectively of which it is composed. Consult Palfrey, 'History of New England.'

New Eng'land, A Compendious History of, by John Gorham Palfrey (q.v.). It covers the time from the first discovery of New England by Europeans down to the first general Congress of the Anglo-American colonies in 1765, with a supplementary chapter giving a summary of the events of the last ten years of colonial dependence, and was published 1865–73.

New England Emigrant Company, The, in American history, a corporation organized at Boston in 1855 to control emigration to the Territory of Kansas in the interest of the anti-slavery party. The Emigrant Company aided largely in making Kansas a free State.

New England Historic and Genealogical Society, The, an association organized in Boston, Mass., in 1845 for historical research and the preserving of early New England records. A quarterly magazine, 'The New England Historical and Genealogical Register,' was begun in 1847 and the society also publishes the 'Bibliopolist' for circulation among its members. The library of the society contained in 1903 over 32,000 volumes.

New England Order of Protection, an American fraternal and beneficial Society organized in 1887. In 1903 it had 6 grand lodges, 335 sub lodges and 31,854 members. In 1902 it disbursed $485,000 in benefits, and over $3,000,000 since its organization.

New England Primer, a famous educational work, compiled by one Benjamin Harris, an English versifier and printer, who established a nondescript shop in Boston during the reign of James II. He first published 'The Protestant Tutor,' and before 1690 the 'New England Primer' as an abridgment of the earlier work. It is thought that in the 18th century about 2,000,000 copies were sold, yet of these less than 50 are known to be extant. These surviving copies represent about 40 editions. Only a small portion of the supposed 1st edition is in existence, this so-called 'Bradford Fragment' having been discovered as waste in the binding of a later work. The contents of the 'Primer' was variously altered in accommodation to religious and political changes. The alphabet rimes, with wood-cuts crude as themselves, are probably the best-known feature. One of the most curious of these illustrations shows Job liberally covered with spots. The shorter Westminster catechism is also included. P. L. Ford (q.v.) did much to clear up the subject of the 'Primer' by his historical and bibliographical study, 'The New England Primer: A History of its Origin and Development, with a Reprint of the Unique Copy of the Earliest Known Edition' (1897).

New England Shilling, the name given to the first American colonial coins issued in 1652. They were of the value of "12d, 6d and 3d peeces," stamped N E on the face and XII, VI or III on the reverse to denote the value. See NUMISMATICS.

New England Theology, a Calvinistic school of theology, originated in New England by Jonathan Edwards (see EDWARDS, JONATHAN). This school was controversially opposed to Arminianism (q.v.). A new element was introduced into the theological atmosphere of New England by the preaching of Universalism (q.v.) by John Murray 1770. The controversies of the early 19th century resulted in the crystallization of New England Theology into a complete system, comprising the tenets, that sin is voluntary; that depravity is inherited from Adam; that repentance or turning to God can only result from preventing grace; that man has complete freedom of will; that holiness consists in unselfish love; that certain persons are predestined to receive the grace of God which leads to repentance. Modern philosophy and criticism have dissolved the dogmatism of this theology which is no longer taught in an unmodified form in Congregational seminaries. Consult: Walker, 'History of the Congregational Churches in the United States' (1894); Boardman, 'New England Theology' (1899).

New Essays: Observations, Divine and Moral, collected out of the Holy Scriptures, Ancient and Modern Writers, both Divine and Human; as also out of the Great Volume of Men's Manners; tending to the furtherance of Knowledge and Virtue. By John Robinson (q.v.) (1624). A volume of 62 essays, on the plan of Bacon's, but at greater length, and in ethical, religious, and human interest more like Emerson's 'Essays' in our own time: the work of an English clergyman and scholar, in exile at Leyden in Holland, under whose ministry and through whose counsel the Pilgrim Fathers developed religious liberalism and executed the earliest planting of New England.

New Forest, England, a public pleasure ground in the southwest of Hampshire, bordering on the Solent and English Channel, and bounded northeast by Southampton Water, and west by the river Avon. It measures 14 by 16 miles, is about 60 miles in circuit, and has an extreme area of 144 square miles. Its name dates from 1079 when William the Conqueror made a "mickle deer-frith," in so doing destroying several hamlets. This afforestation, enforced by the savage "Forest Laws" was regarded as an act of the greatest cruelty, and the violent deaths in the forest of his sons Richard and William Rufus, were looked upon as special judgments. Oak and beech are the principal trees; the deer were removed in 1851. The forest is under the supervision of the Court of Verderers since 1877; it gives its name to a county parliamentary division. There are several villages within its limits, Lyndhurst being the forest capital.

New France, or **La Nouvelle France,** lä noo-vĕl fräṅs, the original name given to Canada (q.v.) by the earliest settlers, who were Frenchmen.

New Glasgow, glăs'gō or -kō, Canada, town in Pictou County in Nova Scotia; on the East River, and on the Nova Scotia railroad and a branch line, eight miles long, which connects it with Pictou Landing on Northumberland Strait. In the vicinity are coal fields and large deposits of iron ore. The chief industries which contribute to the prosperity of the town are iron and coal mining, manufacturing implements for mining and manufacturing glass and leather. It has large ship-building yards and considerable trade in coal, iron ore, and manufactured articles. Pop. (1891) 3,776; (1901) 4,447.

New Granada, grạ-nä'dạ, the name by which the republic now called Colombia (q.v.), was known for many years after its settlement by people from Granada, Spain.

New Guinea, gĭn'ĭ, or **Papua,** păp'oo-ä or pä'poo-ä, Australasia, a large island of the Melanesian region, the western and larger portion of which belongs to the Netherlands, while the eastern portion is divided into northern and southern sections, belonging respectively to Germany and Great Britain. The island, which after Australia and Greenland ranks third among the largest islands of the world, lies on the southwestern side of the Pacific Ocean, between lat. 0° 19′ and 10° 42′ S., and lon. 130° 57′ and 150° 52′ E. Its length is about 1,490 miles; maximum breadth, 410 miles; estimated area, over 312,000 square miles. It is separated from Australia (Queensland) on the south by Torres Strait, from the northern territory of South Australia by the Arafura Sea, and from the Moluccas on the west by Gilolo Passage. The island has a somewhat irregular form, but it may be described as consisting of a broad central portion from which proceed two narrower peninsulas, one in the northwest and the other in the southeast. The coasts are mostly lofty, but in the neighborhood of Torres Strait and to the west the shore presents the appearance of a marshy flat, covered with dense forests. The outline is broken by many indentations,

among the chief being the Gulf of Papua and M'Cluer Inlet on the southern side, and Great Geelvink Bay, Astrolabe Bay, and Huon Gulf on the northern side. Many islands, large and small, lie off the coast, chief of which are those of the Bismarck Archipelago (q.v.) belonging to Germany off Kaiser Wilhelm Land, the northeastern section of New Guinea.

In the southeast of the island the mountain ranges rise in Owen Stanley to a height of 13,205 feet; farther west and near the north coast Mount Schopenhauer reaches 20,000 feet; in the eastern continuation of the Charles Louis Range in Dutch New Guinea, as yet unexplored, there are still loftier mountains, covered with perpetual snow, and volcanoes. The chief rivers are the Fly, in British territory, with its tributary the Strickland; the Kaiserin Augusta, in German territory; and the Amberno, in Dutch territory, with a large delta. New Guinea has few indigenous mammals, and all these, with the exception of a species of pig and some mice, are marsupials and monotremes. It abounds in birds, among which are immense flocks of parrots, pigeons, and kingfishers, and the celebrated birds of paradise. There are also several remarkable species of bower-birds, belonging to the genus *Amblyornis*. The forests abound in enormous trees, including the camphor-tree; and bananas, cocoanuts, sago, sugarcanes, rice, maize, and yams, are cultivated by the natives. On the west coast there are numerous Malay settlements, but the bulk of the inhabitants is composed of Papuans, a race resembling the negroes of Guinea. They are divided into numerous tribes chiefly in a neolithic stage of civilization, some of whom are of a friendly disposition, while others are fierce and untractable, but gradually improving under Europeanizing and missionary influence.

The discovery of New Guinea is said to have been made by Abreu in 1511, but the first navigator who is known to have visited the island was another Portuguese, Jorge de Meneses, who touched on it in 1526. The present name was given to the island by the Spaniard Ynigo Ortiz de Retes, who sailed along its north coast in 1546. From the beginning of the 17th century much exploring work was done by the Dutch, especially along the west and south coasts of what is now Dutch New Guinea. Dampier in 1700 added to our knowledge of the south coast, and discovered Dampier Strait. In 1827 the Dutch formed a settlement at Triton Bay, but they soon abandoned it. The southeast coast was surveyed between 1845 and 1850 by Captain Owen Stanley, and 1873 Captain Moresby ascertained the exact form of the southeastern extremity. The naturalists were the first to make incursions into its interior, and among these Dr. A. R. Wallace, who visited it in 1858, was the pioneer. The missionaries came next, and mission stations formed by Germans are maintained on the northeast coast, and by the London Missionary Society at various points on the southeast coast. Germany, and the Australian colonies also, began to take an interest in New Guinea, and the latter urged the British Government to annex the east part of the island, the west portion having long been recognized as Dutch. The delimitation and division of the island between Great Britain, Germany and Holland was settled in 1885. That part of the island lying west of the 141st meridian was assigned to Holland, and comprises 151,789 square miles; the north part of the rest of the island is assigned to Germany, and the south to Great Britain. The Germany territory, called Kaiser Wilhelm's Land, contains about 70,000 square miles; the English territory, 90,540 square miles.

The government of the British portion is in the hands of an administrator appointed by the crown, assisted by an executive and a legislative council. New South Wales, Victoria, and Queensland each contribute to the expense of the government. Land cannot be purchased except from the administrator. The deportation of the natives is forbidden, as is also the sale to them of firearms, intoxicating spirits, or opium. The official centre is Port Moresby. The islands of Torres Strait, which are the seat of a valuable pearl-shell and trepang fishery, and which practically command the strait, have all been annexed to Queensland. A German chartered company whose object is to develop the resources of the country has stations in German New Guinea, where also the sale of firearms, gunpowder, and spirits is forbidden. The Dutch have done little or nothing for their portion of the island. The population of the Dutch portion is estimated at 200,000; of the German, 110,000; of the British, 350,000; total, 560,000. Consult: Chalmers, 'Pioneer Life and Work in New Guinea' (1895); Cooke, 'Australian Defences and New Guinea' (1887); Haddon, 'Decorative Art of British New Guinea' (1894); MacGregor, 'British New Guinea' (1897); Romilly, 'The Western Pacific and New Guinea' (1887); Webster, 'Through New Guinea' (1889).

New Hampshire, hămp'shĭr, one of the New England States, is named from Hampshire in England, the title being first applied in 1629. It is also locally and popularly known as the «Granite State.»

Physical Conditions.— The most northerly of the 13 original colonies, New Hampshire lies 70° 37′ and 72° 37′ longitude west from Greenwich, and between 42° 40′ and 45° 18′ 23″ north latitude. In general outline its outline is that of a scalene, almost a right-angled triangle, with a north and south perpendicular of 180 miles. The extreme width near the southern boundary is 100 miles. The State is bounded on the north by the Province of Quebec, on the east by the State of Maine, on the southeast by the Atlantic Ocean and Essex County, Mass., on the south by the State of Massachusetts, on the west and northwest chiefly by the State of Vermont and partly by the Province of Quebec. Within these bounds is included an area of 9,336 square miles of greatly diversified country, comprising sea coast, lakes, rivers, mountain ranges, forests and tillable land. The surface contour is in general rugged and picturesque. By reason of latitude, ocean proximity, high mountains and narrow valleys the climate conditions present great variety. The mean average temperature of the northern portion for the year is 41; for the winter 17; for the summer 65; of the southern part the mean average for the year is 45; for the winter 23; for the summer 66.5. The average precipitation is nearly 40 inches per year, quite evenly distributed both as to area and period. There are five distinct water-shed areas, drained by the Connecticut, Merrimac, Androscoggin,

Saco and Piscataqua rivers and their numerous tributaries. These streams contribute materially to the economic resources of the State through their abundant water power, and to the fertility of their valleys. The mountain district comprises 1,270 square miles, the culminating point of which is Mount Washington, 6,270 feet high. This area is divided into two nearly equal divisions by the deep and continuous valleys of the Saco and the Ammonoosuc, and these in turn are subdivided into several smaller groups. Winnepesaukee, situated in Belknap and Carroll counties, is the largest lake, having an area of 70 square miles, exclusive of islands, of which it contains 264. Other important lakes in order of their size are Umbagog, 18 square miles; Squam, 15.6, and Sunapee, 11.2.

Settlement.— The first description of any of the region now included within the State of New Hampshire was given by Captain John Smith, who skirted the New England coast in 1614, from Penobscot Bay to Cape Cod, and discovered the Piscataqua River and the adjacent harbor, although the coast is said to have been visited in 1603 by Martin Pring. In 1623 the first settlement on the mainland was effected. That of Thomson at Odiorne's Point and that of the Hiltons at Dover Point have occasioned some controversy among the local historians on questions of priority. Several other settlements followed in the succeeding 20 years. A movement up the Merrimac Valley began and was continued in the later colonial period in accordance with the jurisdictional claims of Massachusetts, which at times were asserted, theoretically, to an east and west boundary three miles north of a point now and since 1652 marked by Endicott Rock in Lake Winnepesaukee at the Weirs. The Connecticut Valley was an attractive region and settlers worked their way northward in the face of the torch and tomahawk, from Fort Dummer to "No. 4," in the intervals between the Indian wars. A much later influx of settlers from southern New Hampshire, Massachusetts, Rhode Island and Connecticut should also be noted. Practically the whole of the northwestern portion of the State had remained ungranted and unsettled until the English conquest of Canada in 1760. But as soon as peace assured tranquillity to settlers, a tide of immigration at once set in along the course of the Connecticut and its tributaries, and in the years from 1749 to 1764 Gov. Wentworth granted no less than 129 townships and six individual grants west of the Connecticut and 50 or more on the east side. About the same time still another, but less important movement, was going on in the valley of the Saco.

Political Divisions.— For purposes of administration the State is divided into 10 counties, with county-seats and population as follows:

Counties	Pop. 1900	County-seat	Pop. 1900
Belknap	19,526	Laconia	8,042
Carroll	16,895	Ossipee	1,479
Cheshire	31,321	Keene	9,165
Coös	29,468	Colebrook	1,876
		Lancaster	3,190
Grafton	40,844	Haverhill	3,414
		Plymouth	1,972
		Lebanon	4,965
Hillsborough	112,640	Manchester	56,987
		Nashua	23,898
Merrimack	52,430	Concord	19,632
Rockingham	51,118	Exeter	4,922
		Portsmouth	10,637
Strafford	39,337	Dover	13,207
Sullivan	18,009	Newport	3,126

The United States Courts.— The Federal circuit and districts courts are held at Portsmouth, Concord and Littleton (population 4,066). The district judge resides at Littleton and the residence and office of the clerk of these courts is at Concord.

Population.— In 1900 New Hampshire stood 36th in respect to population, having a total of 411,588. Of these 323,481 were native born, and 88,107 foreign born. There were 12,924 aliens. The density is 45.7 to the square mile. There are 11 cities with population as follows: Berlin 8,886, Concord 19,632, Dover 13,209, Franklin 5,846, Keene 9,165, Laconia 8,042, Manchester 56,987, Nashua 23,898, Portsmouth 10,637, Rochester 8,466, Somersworth 7,023.

The suffrage is accorded to males 21 years of age, except paupers, persons voluntarily excused from taxation, and unnaturalized aliens. An educational test was imposed by the last amendment of the constitution. Women may vote in school meetings. The State election is biennial, on the even year, and occurs in November. The governor, council of five members, and the legislature, which consists of 24 senators and (1903) 393 representatives, assume office on the first Wednesday in January of the odd years. The number of senators is fixed at 24, while the membership of the house depends upon population. Concord became the seat of government in 1808, and the state house was erected there in 1819. The ancient New England town system still prevails except in the cities, and is regarded as preferable to the city form of government in municipalities even of very large population.

The Judiciary.— The courts of the State are a supreme court, consisting of a chief justice and four associates, having jurisdiction over issues of law; a superior court, consisting of a chief justice and four associates, having jurisdiction for the trial of issues of fact, the judges of this court attending the trial terms in a circuit of the shire towns which includes the entire State; the 10 courts of probate organized with a judge and register for each county; the municipal courts (one in each of the 11 cities and 33 towns), having limited and preliminary criminal jurisdiction and jurisdiction of civil causes in which not more than $100.00 is claimed and the title of real estate is not in issue; justices of the peace, having preliminary and limited criminal jurisdiction in towns and places where no municipal court is established and jurisdiction in civil causes to the amount of $13.33, provided the title to real estate is not involved. The board of railroad commissioners, the board of license commissioners and the board of equalization of taxes also have judicial functions. Admission to the bar requires three years of actual and certified study, followed by examination, both oral and written, before a standing board of examiners appointed by the court. Certificates of graduation from law schools are not accepted in lieu of actual qualification, ascertained in the manner above stated.

County Government.— A board of three commissioners elected by popular vote are the executive officers of each county. These officials also have certain judicial functions relative to the laying of highways, the settlement of paupers and issues of fact referred to them for trial by the superior court. The members of the legis-

lature for each county, assembled in convention, are a legislative body for the county. They vote taxes for county purposes and direct as to their expenditure.

Agriculture.— About 62.6 per cent. of the land area of New Hampshire, or 5,640 square miles, is devoted to agriculture. In the early life of the State this industry, as is usual in most new communities, largely predominated over all others, and although it now occupies a second place, it is still of great importance. The soil along the sea-coast and in the river valleys is fertile, while the upland farms require careful treatment to render them fairly productive. The number of farms has fluctuated only slightly from decade to decade since 1860, and is now 29,324, only 95 more than at the former date. These farms contain 3,609,864 acres, of which 1,076,879 are improved, and 2,532,985 are unimproved. The percentage of improved land has decreased from 64.4 in 1850 to 29.8 in 1900. This significant fact denotes a readjustment of methods to meet the competition of the West. Cereals and crops requiring large areas have given place to the more intensive forms, such as dairying, fruit growing, market gardening, poultry raising, etc. Since 1850 the value of farm property has increased $19,410,073, being now estimated at $85,842,096. A board of agriculture, established in 1820, a board of cattle commissioners, established in 1891, and an extensive and an influential State section of the Patrons of Husbandry, introduced in 1873, are directing, co-operating and stimulating forces in the field of agriculture. The recently organized Board of Commissioners for the examination of veterinary surgeons, as well as efficient laws governing the inspection of cattle, of milk and other food products, and the prevention of the adulteration and the commercial imposition of fraudulent and deleterious food stuffs, are in the domain of official activity endorsed or sustained by the State in the interest both of improved agriculture and the conservation of the public health. These agencies are partly under the direction of the Board of Agriculture, partly subordinate to the State Board of Health, and partly in the exercise of functions under organizations distinct from either of those boards.

Manufactures.— The excellent water-power privileges upon the numerous streams of the State early become a controlling factor in the permanent location and development of manufacturing industries. Since 1850 the progress has been striking, especially compared with the slow growth of population, and during that period manufacturing has supplanted agriculture as the leading industry of the State. While the increase of population since 1850 has been but 29.4 per cent, that of the average number of wage earners has been 159.9 per cent. In 1850 the latter constituted only 8.5 per cent of the population, while in 1900 they had increased to 21.1 per cent. The manufacture of boots and shoes has assumed strikingly large proportions, and now, with a total output of $23,405,558, occupies the first place, which for a long time was held by the manufacture of cotton goods. Although the latter industry has now taken second place, its growth has been steady. The Amoskeag corporation continues to hold its rank as the largest single establishment for the manufacture of cotton goods in the world. In 1900 the total production was $22,998,249. The woolen industry ranks third, its history extending over a period from 1801 when James Sanderson built, at Ipswich, the first carding mill in the State. The total output of this industry was valued at $10,381,056 in 1900. Lumber and timber products, the fourth in rank, date their history from the erection by Mason's colonists of the first saw-mill in New England near Portsmouth in 1635. The lumber mills in Berlin and Lincoln have been developed and improved in recent years until they are among the most extensive and best equipped in the United States. The total production in 1900 was $9,218,310. Among other important industries are the manufacture of wood-pulp, hosiery and knit goods, and foundry and machine-shop products. In 1900 there were 5,267 manufacturing establishments with a total capital of $101,370,866, and a production of $188,985,902. They were paying $27,654,404 to 70,786 wage earners. Important brewing and distilling establishments are located at Portsmouth and Manchester.

Finance.— The report of the treasurer for the fiscal year ending 31 May 1903 showed a total of receipts of $876,333.53; disbursements of $766,712.13; a balance of $109,621.40; and an indebtedness of $646,810.96. The assessed valuation of taxable property was $216,837,497.00, and the rate $1.98 per $100.00.

Banks.— In 1792 the first bank was established at Portsmouth. On 30 June 1903 there were 56 national banks, 53 savings banks, 8 banking and trust companies, two State banks, and 16 building and loan associations. The savings banks and savings departments of the trust and banking companies that were in active operation showed that their aggregate resources on 30 June 1903 were $69,102,213.21. Due depositors, $63,919,183.10. Guaranty fund and interest, $5,300,036.47. The average rate of interest was about 3¼ per cent. The number of depositors was 155,309, an increase during the year of 7,381. The supervision of State banks is committed to a board of three commissioners. This office was established in 1837.

Insurance.— A total of 108 fire insurance companies were doing business in the State 1 April 1903. Of these 30 were mutual; 78 were stock companies of which 30 were domestic, and 48 foreign. There were also 26 life insurance companies, 7 fidelity and surety companies, 18 casualty companies, 6 assessment casualty companies and 29 fraternal associations. The total of premiums received by all companies was $3,965,925.53, and the total of losses paid was $2,126,498.93. It was in New Hampshire that the valued policy law first became established after a notable contest with the insurance companies in 1885. A single State commissioner supervises all branches of insurance. The office was created in 1851.

Railroads.— The first railroad was chartered in 1835, since which time the mileage has increased to 1,189.34. The railroads of the State are now consolidated under the systems of the Boston & Maine, which operates 1,037.15 miles; the Maine Central, 100.13; the Grand Trunk, 52.06. There has been but one accident in New Hampshire since 1883 in which a passenger has been seriously injured, while being transported upon a steam passenger train. In 1900 there were 10 street railways, with a mileage of 138, which had issued stock to the amount of $1,478,000.00; and bonds to the amount of $1,486,744.76. A

railroad commission of three members has been appointive since 1883, but the office as first established in 1844 was elective and continued to be for 40 years. Under later laws the functions of the commission have become greatly extended.

Accommodation for Tourists.— The State is becoming the home and a place of sojourn of thousands of those who are seeking recreation and location in a region of the most healthful climate and the most attractive ocean and mountain scenery on the western side of the national domain. Recent statistics of this business exhibit an investment of $10,442,352 in the State. The help employed in 1899 was 12,354, with wages of $539,901; 204 towns were entertaining summer tourists; more than 20,000 of these people occupied cottages in 1899. They were also patronizing several hundred hotels, and 1,624 farm houses. The volume of this business estimated by its cash receipts in 1899 was nearly $7,000,000.

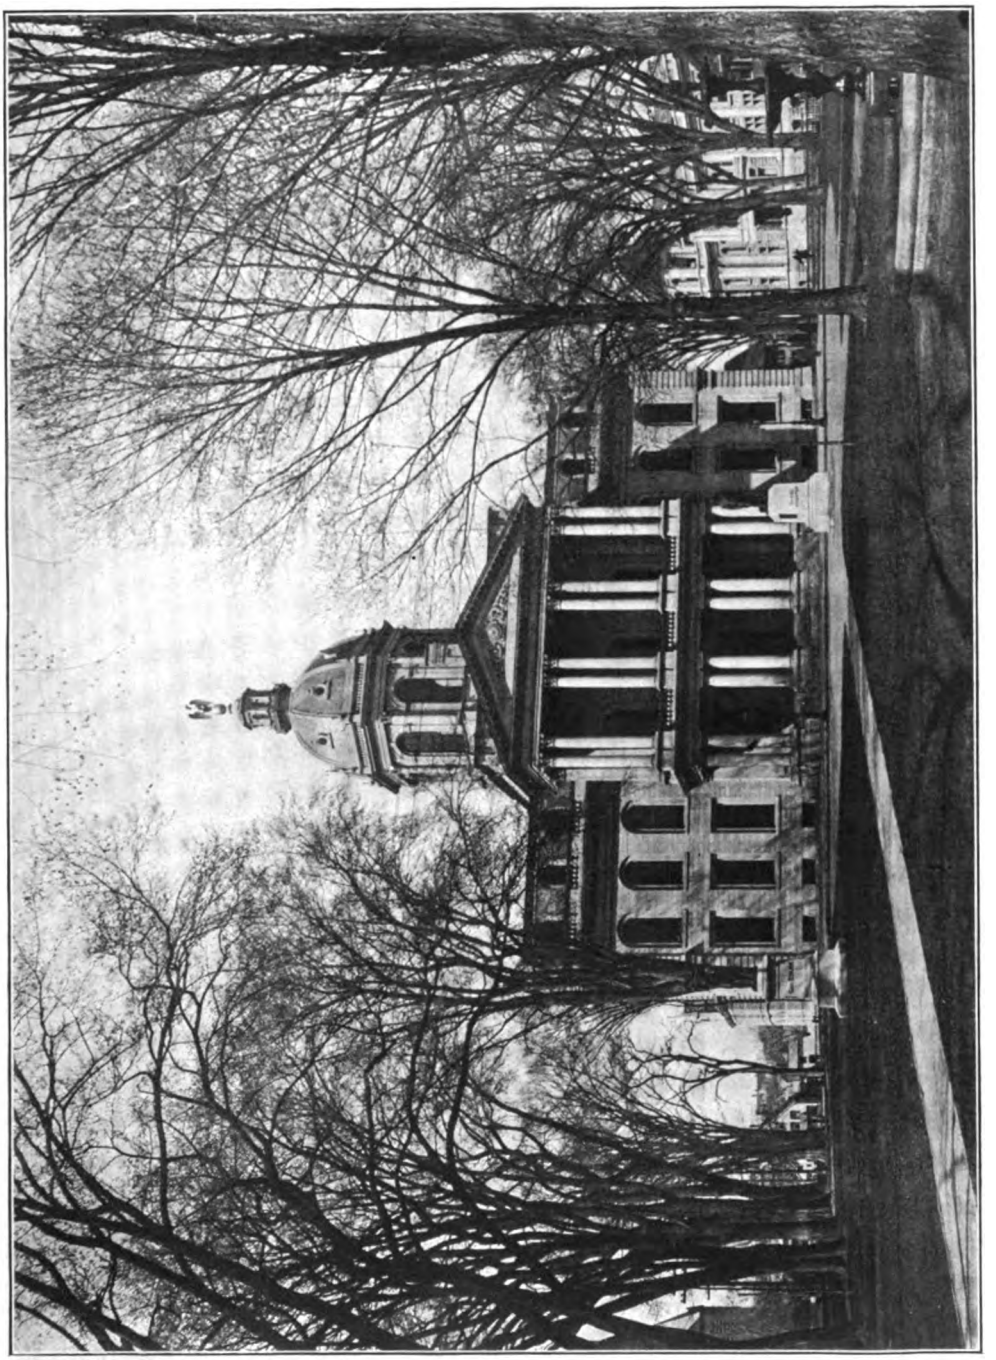
State Institutions.— The New Hampshire Asylum for the Insane, founded at Concord in 1838, is supported by occasional State aid, the income of invested funds, and sums paid by individuals for care of patients. Each county has also its own insane asylum and almshouse. The State board of health is also a commission of lunacy. The New Hampshire Orphans' Home was established at Franklin in 1871. It is undenominational, and is supported by voluntary contributions. The State prison at Concord was established in 1812. There is also an industrial school at Manchester, and a School for the Feeble Minded at Laconia. The New Hampshire Conference of Charities and Correction is a semi-official organization, wholly educational in its purposes. A considerable number of well ordered and beneficent institutions devoted to hospital purposes, the care and education of orphans and other worthy objects of religious charity have been established at populous points and are maintained by the authorities of the Roman Catholic Church. Many local hospitals are established under secular control, by municipal support or through private benefactions. Eighteen of these institutions are located as follows: Berlin, Claremont, Manchester (3); Plymouth, Exeter, Dover, Nashua (2); Laconia, Hanover, Concord (2), Portsmouth, Woodstock and Whitefield. Homes for orphans and retreats for the aged are established at Manchester and Concord, one by the Masonic fraternity and the other by the order of Odd Fellows.

Public Health.— This function of the State government has been developed to a very efficient status since its inception in 1881. The science of preventative medicine is applied with intelligent efficiency and upon the most approved modern methods. Registration of vital statistics, bacteriological analysis and other subjects related to State medicine are under the direction or supervision of the State board of health. Independent of the Board of Health, both in action and organization, and yet properly regarded as agencies of the State's paternalism in respect to the public health, are the department of examination and registration of practitioners of medicine, auxiliary to which are the several boards of examiners designated by the state associations of doctors of medicine representing the several schools of practice, the similar board appointed by the state association of dentists, and the commissioners of pharmacy and practical chemistry. The New Hampshire Medical College, established at Hanover in 1798, is a high class institution and practically a department of Dartmouth College.

Public Libraries.— New Hampshire has been a pioneer in and sturdy supporter of the library movement. Perhaps the earliest mention we have of it is in connection with a lottery in Portsmouth in the year 1750 in aid of an association library. From 1792 to 1883, 220 libraries received special charters from the legislature. These were mostly private library corporations which have now given place to, or become merged in the public library. The first free public library in the United States was established in Peterborough in 1833. The State was in 1849 the first to pass a law authorizing towns to aid in establishing and maintaining public libraries. This was followed logically by the second and third steps in the progress, namely, by the law of 1891 granting State aid to town libraries, and by the compulsory law of 1895, requiring every town to appropriate a certain proportion of its taxes for the support of a public library. The first legislative incorporation of a State library association was by New Hampshire in 1889. In May 1903, 296 public libraries were reported. The number of books contained in them and accessible to the public, exclusive of reports and pamphlets, was 801,463. The State Library now occupies a separate establishment and has a collection of nearly 100,000 volumes.

Education.— Since 1885 the common schools of the State have been organized on the town district system. Attendance from 8 to 14 is compulsory. In the school year of 1899–1900 the total enrolment of pupils was 35,688, or 73.97 per cent of the entire school population. The average number of days for the year was 147.65, and the number of teachers 2,740. The total value of school property was estimated at $4,052,202. The State Normal School was established in 1870, and is located at Plymouth. Its attendance in 1901 was 122. There are 30 academies and seminaries, and 3 colleges: Dartmouth, founded at Hanover, 1769; New Hampshire College of Agriculture and Mechanic Arts, at Durham; and Saint Anselm's College, at Manchester. Among the secondary schools of national reputation are Saint Paul's at Concord and Phillips Exeter. The cities and larger towns all have high schools supported by the public taxes and revenue. Seventy-one seminaries, academies and high schools are registered by the State Superintendent of Instruction as equipped to provide college preparatory courses. Tuition, text-books and all school supplies are free to the pupils to the completion of the high school course. Parochial schools are in successful operation in many places under the control and patronage of the Roman Catholic Church.

Military Affairs.—Between 1675 and 1762 the people of New Hampshire participated in six wars against the French and Indians, aggregating a period of 38 years. The frontier position of the State made it peculiarly exposed to attack by the Indians, from whose ravages it suffered severely. The State contributed 500 men toward the siege of Louisburg, and the same number for the operations at Crown Point in 1755, and at other times in this war 2,600 more soldiers. In 1775 the population of the colony



CAPITOL BUILDING AT CONCORD.

was only 82,200. In the province militia establishment there were 13 regiments of foot and 1 of cavalry, besides special organizations of cadets and of artillery. The capture of Fort William and Mary in Portsmouth Harbor, under the leadership of John Langdon and John Sullivan, occurred 13 Dec. 1774, over four months before the battle of Lexington. The powder which was taken on this occasion later supplied the patriot army assembled about Boston, and was returned to the British in a different form at the battle of Bunker Hill, so-called, where New Hampshire men constituted over one half the Americans actually engaged. The passing of royal authority in the province was attended with very little commotion, and comparatively no manifestation of violence. The convention of 21 April 1775 caused a reorganization of the militia in August of that year, and in 1777 the number of regiments had been increased to 17. The number of men enrolled in 1775 was 16,710, and this comprised practically all residents of military age in the State. In that year three regiments were raised for service in the continental field. One regiment was in Canada; 33 companies under Colonel Wingate were guarding the sea-coast; 2 companies of men from this State were detached from Washington's army and accompanied Arnold in his famous march through Maine to Quebec, Coos and the Connecticut Valley were guarded, while 31 companies were raised to replace the Connecticut men who declined to remain longer at the siege of Boston. Undoubtedly more than 5,000 of the men of this State were in the field in 1775. In 1776 the three New Hampshire regiments of the Continental line were continued and strengthened, distinguishing themselves in the Canadian service, at Trenton and Princeton. Sullivan for superior conduct in bringing the unsuccessful American forces out of Canada in 1776, in the face of formidable difficulties, was made a continental major-general. Bedel led a new regiment into Canada, while one regiment was transferred from the coast to the aid of Ticonderoga, and four more regiments reinforced the patriot army at different points that year. New Hampshire's contributions reached high water mark in 1777. In May large bodies of organized militia marched to the relief of Ticonderoga. The regiments in the continental line remained in service and distinguished themselves at Stillwater, Saratoga, and other critical points. Stark's brigade at Bennington struck the blow which decided the fate of Burgoyne's invasion. When Stark's men returned to their farms and harvests, Whipple's brigade was forwarded with promptitude and energy to reinforce the northern army under Gates. Meanwhile Stark assembled another force of New Hampshire volunteers and with them was in season in this, his second campaign of the year, to complete the investment of Burgoyne along the Fort Edward fords. A number of New Hampshire companies also served against Burgoyne in Vermont organizations. In addition a regiment was sent to the aid of Rhode Island. The winter of 1778 found the New Hampshire men of the continental line at Valley Forge, and in the summer Whipple's brigade took part in the Rhode Island campaign under General Sullivan. In the remaining years of the war New Hampshire contingents served where the exigency of the contest led them, from the northern frontier to Virginia, bearing themselves with valor and effectiveness at Monmouth, against the Six Nations, and acting an important part in the campaign which culminated in the surrender of Cornwallis at Yorktown. One New Hampshire regiment, at least, and possibly two, and John Stark, who had been made a continental brigadier-general after Bennington, continued in the regular or permanent continental service under Washington or in other important commands until the end. Among the New Hampshire statesmen whose names must always stand high on the records of revolutionary service and achievement are Weare, Langdon, Livermore, Bartlett, Dudley and Gilman, and conspicuous also in military fame are Sullivan, Stark, Poor, Scammell, Whipple, Cilley and Dearborn. It is not improbable that of approximately 17,000 men in New Hampshire then capable of bearing arms, about 20 per cent of the total population, nearly every man was in active service, and, many of them, through repeated terms of enlistment; and in that seven years of struggle, no armed enemies in visible organization crossed the boundaries of the Granite State.

War of 1812.—Early in the War of 1812 Portsmouth was fortified and garrisoned, and the northern frontier guarded by a company at Stewartstown. Many New Hampshire men distinguished themselves in this war, among whom was Major-General Henry Dearborn, the Revolutionary war veteran, and Major-General Eleazar Wheelock Ripley, later a member of Congress for Louisiana.

Mexican War, 1846-8.—Upon the outbreak of the Mexican War the State responded with spirit to the calls of the President, and promptly forwarded its quota. Franklin Pierce was a brigadier-general, and participated in Scott's campaign. Several New Hampshire men who later became prominent in the war for the Union began their military career at this time.

War of 1861-5.—In the war for the Union, 17 full regiments of infantry were sent into the service from New Hampshire. The State also contributed a battalion of cavalry, afterward enlarged to a regiment, a part of a separate (17th) regiment, united with the second, three companies of sharpshooters, a battery of light artillery, and a regiment of heavy artillery. Besides these it furnished a liberal number of men for the navy. The total number in the service was 32,750, or 10 per cent of the whole population. Their record was long and brilliant. The first Kearsarge was a New Hampshire ship. A good number of marines and sailors and a long array of worthy naval officers represented the State in that branch of the public service.

There were no military leaders in this war, residents or natives, of New Hampshire, who would be assigned to the class in which Grant, Thomas, Sherman and Sheridan stood. On the civil side, however, both in the war period and in the reconstruction years, natives and residents of this State were conspicuous at the very fountain heads of power and influence. In the Senate Wilson, a native of Farmington, was chairman of the committee on military affairs, Hale, naval affairs, Fessenden, native of Boscawen, finance and appropriations, Grimes, native of Deering, District of Columbia, Z. Chandler, native of Bedford, commerce, and Clark, claims and president *pro tempore*. In the cabinet suc-

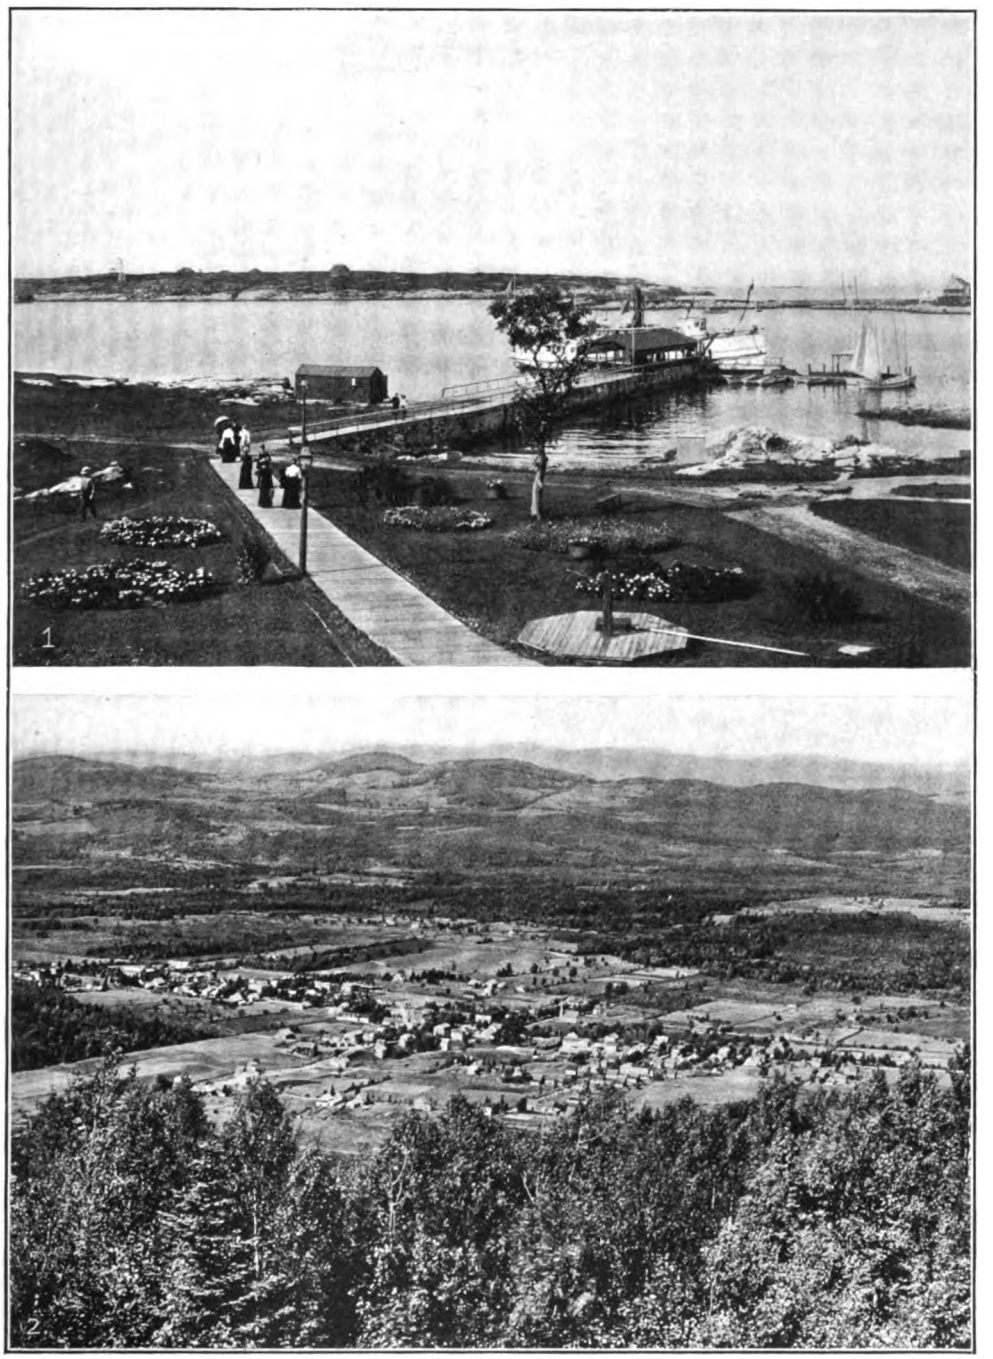
cessively holding the treasury portfolio were Dix (Boscawen), Chase (Cornish) and Fessenden. Greeley, native of Amherst, was the greatest intellectual force in the journalism of that day. Dana was assistant secretary of war. Dix, Butler, native of Deerfield, John G. Foster, native of Whitefield, and Fitz John Porter, native of Portsmouth, were major-generals. Walter Kittridge, author of 'Tenting on the Old Camp Ground,' and Charles Carleton Coffin, who was the historian of the war for the youth of the land, were of the Granite State. In the naval service were John G. Walker, Belknap, Parrott, Pearson, Storer, Wyman, Pickering, Prentiss, Browne, Long, Miller, William S. Walker, Perkins, Spence, Thornton, Park, and Craven. In the years immediately following the War, Zachariah Chandler, W. E. Chandler, Marshall Jewell and Amos T. Akerman of the New Hampshire stock were called to the cabinet, Horace Greeley and Benj. F. Butler were named for the presidency, and Salmon P. Chase ended a notable career as chief justice of the Supreme Court of the United States.

Spanish-American War, 1898.— In the war with Spain New Hampshire's quota, a full three battalion regiment of infantry, though filled with promptitude, was not called upon to go farther than the concentration camp at Chickamauga. This regiment was commanded by Robert H. Rolfe. General Leonard Wood was a native of New Hampshire, as were Admiral Asa Walker and other distinguished naval officers.

National Guard.— This organization has a brigade formation. There are now two regiments of infantry, each of 12 companies, in battalion arrangement; a four gun light battery; a troop of cavalry; signal corps; hospital corps; and two regimental bands — 109 officers, 48 musicians, 1,175 enlisted men — total 1,332.

History.— Three of the four original towns, Portsmouth, Dover, Exeter and Hampton, occupied the interesting position of independent democracies between 1622, the year when Thomson's indenture was drawn and the first settlement definitely planned, and 1643, when they had all become, by their own choice or the necessities of their situation, constituent parts of the Massachusetts Bay Colony. This was the first union with Massachusetts Bay, and was conditional on certain important privileges and guarantees accorded to the towns by the Massachusetts General Court. The history of the period of this union is in a large measure identical with that of Massachusetts Bay. In 1679 the Masonian heirs succeeded in procuring in the home government orders for the establishment of a separate province for these four frontier towns. John Cutt, a merchant of Portsmouth, was the first President, as the chief magistrate was then styled. The four towns were made a part of the Dominion of New England in 1686. This government under Dudley and Andros survived only three years. From the spring of 1689 to the latter part of the winter of 1689–90 the New Hampshire towns governed themselves in the independent democratic fashion of the first period of their history. A second union with Massachusetts Bay was then effected and continued for two years. In 1692 the province government by royal commission was re-established and subsequently administered by appointees of the crown until 1775. With the governor was associated a lieutenant governor, and a council appointed by the king. The legislative function was vested in a general assembly constituted of the governor, the council, and the deputies, elected by freeholders. The right of veto was committed to the governor and the right of confirmation and disallowance of laws remained with the crown. From 1699, when the Earl of Bellomont assumed office, to the termination of Belcher's administration 1741, this province and Massachusetts had the same governor. The provincial assembly was continued until the departure of Governor John Wentworth in 1775. A succession of conventions beginning with that of 21 July 1774, finally resulted in the formal organization of a legislative body on a full representation of the people in view of the apparent necessity of establishing a new state government. The people of New Hampshire entered upon the active stages of a national movement for independence with deliberation and unanimity. Perhaps no one of the colonies was so free from the so-called loyalist element as was this. The «Association Test» put every man on record, either for or against the common cause. The original files are preserved, and the names of those who dissented or refused to take an unequivocal position constitute a surprisingly meagre list.

The civil government of New Hampshire from the time of the departure of Gov. Wentworth to the organization of a new form of government in June 1784, under the constitution of 1783, was purely legislative. The constitution of 1776, probably the first adopted by either of the thirteen States, by its own independent action, was a brief instrument and evidently intended to be temporary, or, as it was officially stated at the time, "to continue during the present, unhappy and unnatural contest with Great Britain." It was adopted and promulgated by the fifth convention, chosen in the latter part of 1775, and it was never submitted for acceptance or rejection to (or formally ratified by) the people. During the period of the Revolution the administrators of the New Hampshire government were embarrassed by a serious defection in the western part of the State, and particularly in Grafton County. Many of the leading men of the Connecticut River towns were from Connecticut, and their ideas of government were naturally in accordance with their education and experience in the commonwealth from which they had emigrated. The form of government temporarily adopted by the Fifth Provincial Congress was not acceptable to the majority of these people. The group of towns which included Gunthwait on the north and Lebanon on the south in Grafton County organized themselves into associations for purposes of civil and military government, and formally declined to recognize the new state government of New Hampshire. The contention of the «New Connecticut» party, so called, was, that upon the dissolution of political relations between the colonies and the mother country, and more especially in respect to the territory in controversy between New York and New Hampshire, the towns, being the political units, and the original source of political authority, were invested with the right to determine for themselves the question whether to accord



1. Star Island, Isles of Shoals.

2. Bethlehem, White Mountains.

allegiance to one or the other of the disputing States, or whether to erect themselves into an independent State. They urged that inasmuch as the constitution of 1776 had never been submitted to the people, or to the towns for ratification, and had been accepted by a part of the towns only, it was operative only upon such as had elected to ratify its provisions. Their argument was presented with great skill and effectiveness, and although the movement ultimately failed to accomplish its purpose, its sponsors succeeded in making themselves felt as a political force to be reckoned with by three established States, and the Continental Congress, as well as the prospective commonwealth of Vermont. In 1783 a new State constitution, modeled closely upon the Massachusetts constitution of 1780, was adopted, which, except as modified by the amendments emanating from the subsequent conventions of 1791–2, 1850, 1876, 1889, and 1902, still remains in force. In 1787 a Federal convention formulated a constitution for the United States of America. At this critical time the Constitution became the organic law of the new nation on its ratification by New Hampshire, the ninth State, in June 1788. John Langdon of New Hampshire was chosen president, *pro tempore,* of the first session of the United States Senate under the new Constitution, and to him fell the honor of informing Washington of his election to the presidency. In the years immediately ensuing the Federalist party was evolved and was in political control at an early date in this State, but gave place to the Anti-Federalists, then known as Republicans — the Jefferson party of that day — from 1805 to 1812 (both of these years inclusive,) except 1809, when Jeremiah Smith, Federalist, broke in upon the succession as Governor. In 1813, 1814, and 1815 the Federalists were again in control of the State. In 1816 they met with irretrievable defeat, and thereafter the Jeffersonian Republicans remained in power, excepting in the brief period of a temporary reverse in 1846, until permanently overthrown in 1855 by the American party, more commonly called the "Know-nothings." The earlier part of this period was one of ecclesiastical agitation. The people of New Hampshire had become in the later colonial period almost entirely Congregationalists, and that denomination had maintained its ascendency as practically a state church during a long period, the town ministers being called by the church, approved in town meeting and supported by public taxation. Universalists, Baptists, Methodists, and Free Thinkers had now become potent enough to assert themselves effectively in politics, and the contest reached its culmination in the so-called toleration act of 1819. Hosea Ballou, a New Hampshire minister, was the founder of Universalism in its modern form, and Benj. Randall, another minister of this State, was the founder of the Free Baptist denomination. The latest New Hampshire contribution to religious denominationalism is Christian Science, the founder and chief exponent of which is a resident and native of this State. In this year, 1819, also, was decided the historic Dartmouth College case, which Senator Lodge described as one "in its effects more far-reaching and of more general interest than perhaps any other ever made in this country." Through this futile attempt by the State to amend the charter of Dartmouth College for the purpose of reorganizing the government of the institution, inviolability of charters never before enjoyed was secured. Incidentally the case served to make prominent and to bring into the view of the whole country the fact that in Daniel Webster, Jeremiah Mason, Jeremiah Smith, Ichabod Bartlett, and their compeers, there was at the bar of New Hampshire, and on the bench of her highest court, a group of jurists whose law learning and forensic ability could not be surpassed at that day in the entire length of the Union.

In 1826 occurred the anti-Masonic uprising, which drifted into politics, and for a time commanded serious attention. The second quarter of the 19th century was remarkable for the number of men of New Hampshire birth and residence who held commanding positions in shaping the destiny of the republic. The names of Webster, Cass, Woodbury, Pierce, Kendall, Chase, Hale, Atherton, Clifford, Tuck, and Greeley constitute a conspicuous part of a long list that might be enumerated.

The years following 1846 were marked by the development of a strong reform sentiment especially in the cause of temperance and on the slavery question. In case of the former, the movement resulted in the prohibitory law 1855, which became the accepted principle of liquor legislation until at length a reactionary sentiment expressed itself in the license act of 1903. The slavery movement found many earnest and devoted adherents, intense and uncompromising in their propaganda. The Free-soil vote had already appeared in 1841, and continued to be of more or less importance until 1856. Until 1896, with the exception of a significant, and with many of its participants, permanent revolt from the Republican party in 1872, political alignments had been strictly maintained, and political contests had usually had more or less of the hazard of uncertainty. The Free-silver agitation of 1896 found New Hampshire voters strongly in favor of the gold standard, and led to many transfers of party allegiance. Since 1856, the Republican party has had control of every department of the State government and carried every State election except in the years 1871 and 1874.

In the constituents of population, the descendants of the original New England stock still predominate. From an early date, however, there have been at intervals important additions of Irish Presbyterians and Irish Catholics. The representatives of this race from both its sectarian branches, have been speedily assimilated and are adepts at leadership in business, the professions and public affairs. The German immigrants manifest the same assimilative tendencies. The Canadian French are becoming also an important part of the population. They adapt themselves with facility to trade, agriculture, mechanics, and as operatives in manufacturing establishments. They are represented in all the learned professions, but more numerously in the priesthood and medicine. The activities and resources of the State, religious, benevolent, commercial, industrial, educational, and productive, as manifested in visible results, were never in more satisfactory adjustment having reference to a fair and reasonable dis-

tribution of burdens and benefits than to-day; and the State government in all its branches is administered in conformity with such principles as to command the respect and approval of the governed.

A. S. BATCHELLOR,
Editor of State Papers, Littleton, N. H.

New Hampshire College of Agriculture and Mechanic Arts, opened in 1867, at Durham, N. H. The courses offered include the regular four years' courses in agriculture, mechanical and electrical engineering, technical chemistry, and general science, for completion of which the degree of B.S. is conferred; a two years' course in agriculture; and ten weeks' winter courses in agriculture and dairying. There is also a preparatory department; and the State experiment station is connected with the college. Women are admitted to all courses, but form a small proportion of the student body. The income of the college is derived from the Federal land grant of 1862 and from Federal and State appropriations; in 1902 the total amounted to $63,830; the students numbered 126 (13 women), and the faculty 27.

New Han'over, an island of the Bismarck Archipelago (q.v.), about 40 miles long and 20 miles broad, northwest of New Ireland, or New Mecklenburg (q.v.), from which it is separated by Byron Strait.

New Har'mony, Ind., town, in Posey County; on the Wabash River, and on the Illinois Central railroad; about 25 miles in direct line northwest of Evansville. The first settlement was made by a German community called Harmonists (q.v.), in 1815. In 1824 Robert Owen purchased the village and domain and the Harmonists returned to Pennsylvania. The next year Owen established a "Preliminary Society" and issued a general invitation to all "the industrious and well disposed of all nations" to join the new community which was to be governed and conducted on new plans. All goods were to be held in common, but their use was regulated by age; "moral lectures" were to replace religious worship; the young were to be educated by trained teachers, and this education was to begin when the children were two years of age. The whole experiment proved a failure; those who accepted the invitation were not all "well disposed" and many were far from "industrious." In 1826 Owen assumed control of the community and established order; but in a few months dissensions arose, three communities were formed of the original one, and soon after the "community idea" was abandoned. One of the leaders, William Maclure, purchased part of the land and established an industrial school which also was a failure. The free library of the Workingmen's Institute, established in 1838, is in a most flourishing condition and contains about 16,000 volumes. The town has some manufacturing establishments, chief of which are flour and lumber mills and brick works. Pop. (1890) 1,197; (1900) 1,341.

New Haven, Conn., city and county-seat of New Haven County, and the largest city in the State. It is popularly called "the City of Elms" from the magnificent elm trees planted there over 100 years ago. New Haven lies at the head of New Haven Bay, four miles distant from Long Island Sound. It is on the New York, New Haven & Hartford railroad, 36 miles from Hartford and 74 miles from New York city.

Topography.—The city lies on a level sandy, plain, bordered on the east and west by the West and Quinnipiak rivers. It has an area of 23 square miles. "The Old Green" is a public square in the centre of the city, about which the original settlers lived, and used at night as a corral for their cattle. It also for years was the public burial ground. The bones of thousands lie there to-day. Near the city limits rise East Rock and West Rock, 360 and 400 feet in height respectively, from the summits of which a fine view of the city and surroundings may be obtained. East Rock, which has been made into a park, is crowned at its summit by a monument dedicated to the Connecticut soldiers and sailors who fell in the Civil War. The entire park system in New Haven embraces nearly 1,200 acres. The sewer system is most complete, including 95 miles of sewer.

Streets and Avenues.—Chapel street, the business promenade, extends in a northwesterly direction throughout the length of the city. The homes and dwelling houses are generally surrounded by gardens, and many of them are almost hidden from view among trees. The number of magnificent elms with which the principal avenues are planted were mostly set out about the close of the 18th century by James Hillhouse, or through his influence and example. Early residents laid out the city with six streets running nearly north and south and six streets running east and west, but this plan was rejected owing to the position of the harbor, and roadways were built at various angles, with "The Old Green" as a common centre. In 1903 there were 225 miles of streets and avenues, of which 90 miles were paved.

Prominent Buildings.— Here is the seat of Yale University (q.v.), with its numerous halls, dormitories, schools and special buildings which are celebrated in educational and historical annals. The Yale Campus, which lies two blocks west of "The Old Green," is a rectangle containing two city blocks. A series of college buildings form an enclosed court about the campus. Two of these buildings, Vanderbilt and Osborn Halls, are among the chief architectural attractions of the city, though Woolsey Hall is the most beautiful of all the university buildings. The Sheffield Scientific School and the departments of law and medicine, are a little removed from the campus. The Hopkins Grammar School, founded in 1660, is also located here. Other buildings and institutions are the State Normal School; the Boardman Manual Training School; the Hillhouse High School; New Haven Hospital; Grace Hospital; Saint Francis Roman Catholic Orphan Asylum; the Public Library, containing 60,000 volumes; New Haven Orphan Asylum and the Young Men's Institute. Here are also the archives and libraries of the New Haven Colony Historical Society and the American Oriental Society.

Churches and Schools.— New Haven has 70 churches, some of which were built as early as 1800. In the old burying ground in Grove street are the graves of Noah Webster, Theodore Winthrop, Eli Whitney, F. B. Morse and other celebrities. The churches are divided among the following denominations: Congregational, 17;

Methodist Episcopal, 14; Protestant Episcopal, 12; Roman Catholic, 9; Baptist, 7; Lutheran, 4; Jewish, 4; and Universalist, Unitarian, and others. There are 40 public school buildings in the city, with a daily attendance of 20,000. The school system is maintained at a cost of $380,000 annually.

Trade and Commerce.— New Haven up to the middle of the 19th century was an important ship-building centre, but this industry has gradually diminished. Ship-building interests were seriously crippled by the Embargo (q.v.) and the War of 1812. There is an excellent natural harbor here which has been improved and enlarged at State and Federal expense. New Haven has two lines of steamships to New York and is the commercial and distributing centre for a large section of the State. In manufacturing New Haven ranks first among Connecticut cities, and has many and varied industries, including clocks, watches, hardware, firearms, ammunition, wagons, carriages, engines and boilers, automobiles, rubber goods, wearing apparel, iron foundries, machine shops, canneries and packing houses. The headquarters and repair shops of the New York, New Haven & Hartford railroad are also located here. According to the last census, New Haven industries represent a capital of $30,464,000, with an annual production valued at $40,762,000. Over 20,000 persons are employed in the 1,300 factories of the city and over $12,000,000 are annually paid in wages. The city has a dozen national banks, and numerous trust companies, state banks, savings banks and buildings and loan companies.

Government.—The city maintains a consolidated town and municipal government under a special charter of 1897; the name New Haven being applied to three distinct corporations, the city, the town and the school district of New Haven. The corporate limits of the town and the municipality are the same. A mayor, elected every two years, is the city's chief executive, and he has the power to appoint a majority of the municipal administrative officers. The city affairs are administered by a board of aldermen of 21 members, which appoints the assistant city clerk. The sheriff, city treasurer, collector of taxes, city clerk and comptroller are elected every two years by popular vote. In the town government the administration is in the hands of a board of selectmen of seven members, elected by the people at regular town meetings. The administration of the school district is in the hands of a Board of Education of nine members, appointed by the mayor. The fire and police departments of the municipality are managed by Boards of Commissioners, the latter bi-partisan. The central clearing house is the Board of Finance, which fixes the rate of taxation and makes the appropriations.

Municipal Finances.—The assessed valuation of real and personal property is more than $120,000,000, including exemptions. The provided debt of the city amounts to $3,500,000. The city expends each year for maintenance and general expenses $1,415,000; of which the largest item is $380,000 for schools; police department, $190,000; fire department, $150,000; interest on provided debt, $140,000; street cleaning, $90,000; lighting, $80,000; charity, $75,000.

History.—New Haven was settled in 1638 by a company of Puritans chiefly from London under Theophilus Eaton, their first governor, and the Rev. John Davenport. It was a distinct colony until 1660, when after a protracted struggle it was united with Connecticut under the charter of 1662. It was incorporated as a city in 1784. In its earliest days New Haven was called Quinnipiak by the Indians. It was also called Roodenberg by some of the early colonists. The Indian chief Momanguin sold a large tract of land here to the London company, receiving in return an assortment of coats, hatchets, spoons and knives. Treaties were signed by both parties, the Indians agreeing not to "terrify, disturb or injure" the settlers, who in turn promised to protect the Indians, and allow them to hunt in portions of the ceded territory. Another tract 10 miles wide by 12 miles long was purchased six months later, and in June 1639 a fundamental and written constitution was adopted by the settlers. The privilege of voting and holding office was strictly limited to church members. In both civil and church affairs the Bible was the only recognized law.

Theophilus Eaton, the first governor of the New Haven Colony, was re-elected and retained the office until his death in 1658. The city of New Haven was incorporated in 1784 and Roger Sherman was its first mayor. He was mayor and United States Senator when he died. The settlement took its name from Newhaven, England, and under its first charter of 1662 embraced the towns of Milford, Stamford, Guilford and Branford, and this confederation known as the "New Haven Colony" entered the New England Union. In 1701, New Haven was made a joint capital with Hartford, and remained as such until 1873. Yale College was removed from Saybrook to its present site in 1717. The town was captured 5 July 1779 by a British force under Gens. Tryon and Garth after a sharp skirmish. In this engagement the Americans lost 29 killed and 17 wounded, while the British loss was 70 killed and 40 wounded. After its incorporation as a city New Haven began to make rapid strides. Steamboat communication was opened with New York in 1815, and the first railroad entered the town in 1848.

Population.—In 1800 New Haven had a population of 4,049; (1850) 20,345; (1870) 50,840; (1880) 62,882; (1890) 81,298; (1900) 108,027, including 30,000 of foreign birth and 2,800 of negro descent. The estimated population in 1903 was 112,500, plus.

New Hebrides, hĕb'rĭ-dēz, a group of islands in the South Pacific, east of Australia, extending from lat. 13° to 20° S., and from lon. 165° to 170° E.; area, about 4,900 square miles. The largest ones are Mallicollo, and Espiritu Santo (q.v.). Tanna has an active volcano; and in consequence probably of vol-

canic action, Aurora, one of the most fertile, sank out of sight in 1871. Some of the group are of coral formation. They are all wooded and hilly; ebony and sandalwood being obtained; their chief products are yams, bananas, cocoanuts, and sweet potatoes. The chief animal is a small pig, not larger when full-grown than a rabbit. The native inhabitants, belonging to the Papuan race, are in general degraded and very ferocious, except on Aneityum, where there are Christian missions, and where the majority of the inhabitants can read and write. These islands, according to the Anglo-French convention of 1887, are under the control of a mixed commission of French and British naval officers. The population is decreasing; in 1901 it was about 50,000.

New Iberia, ī-bē'rĭ-ạ, La., town, parish-seat of Iberia Parish, on the Bayou Teche, and on the Southern Pacific railroad; about 100 miles in direct line west of New Orleans. A short railroad extends to Avery Island, where there is a valuable salt-mine. It is in a fertile agricultural section, in which the chief products are the pepper, from which tabasco sauce is made, cotton, sugarcane, corn, rice, vegetables, and berries. It has considerable manufacturing; some of the industrial establishments are machine-shops, a knitting-mill, ship-yards, foundries, wagons, brick works, soap factories, cottonseed-oil mills, factories for different lumber products, and tabasco sauce factory. The town is in a section of the State mentioned by Longfellow in 'Evangeline.' It has a government building, a city-hall, and a large public market. Its educational institutions are the public and parish schools for white and colored children, a high school, and a public high school library. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 3,447; (1900) 6,815.

New Ireland. See NEW MECKLENBURG.

New Jersey, the "Garden State," and one of the original 13, adopted the Federal Constitution, by unanimous vote, in convention 18 Dec. 1787. The State is bounded on the north and east by New York and the Atlantic Ocean, on the south and west by Delaware and Pennsylvania. Of the 487 miles of total frontier, only 48 miles are defined by natural boundaries. Capital, Trenton. Area, 8,224 square miles, of which 710 square miles is water surface. The extreme length of the State is 166 miles, the narrowest portion being 33½ miles. Pop. (1900) State census, 1,883,669.

Topography and Geology.— The topographic features and geological structure of the State are intimately related and are explanatory of the surface conditions. New Jersey is characterized as being on the Atlantic slope of the continent and is divided into four topographic zones: (1) Appalachian, including the Kittatinny Mountain and Valley. (2) Highlands. (3) Red sandstone or Triassic area. (4) Coastal plain.

The Appalachian zone includes the Kittatinny or Blue Mountain and the Kittatinny Valley, occupying the northwestern portion of the State. This range is level-topped, narrow, rough, rocky and heavily wooded. It extends across New Jersey from the New York State line, where it is known as the Shawangunk Mountain, to the Delaware River at the Delaware Water Gap. At High Point, near the northernmost point of the State, it is 1,804 feet high, which is the greatest elevation of the State. The Kittatinny Valley, 10 to 13 miles wide, is shut in by the Kittatinny Mountain on the northwest and by the Highlands on the southeast. It is characterized by high, rolling hills and minor valleys, pleasing landscapes, and beautiful farming country. This valley is continuous, on the northeast, with the valley of Orange County in New York, and to the southwest stretches away into the great Cumberland Valley of the Atlantic slope of the continent.

The Highlands cross New Jersey in a general north-northeast and south-southwest direction. The surface of this zone is hilly-mountainous, and is made up of several parallel ridges, separated by deep and generally narrow valleys. The latter are like the Kittatinny Valley — smooth — and are largely cleared and in farms. The mountain ranges are remarkably uniform in height. This division may be considered as a seaward-sloping table-land, whose northwest side has an elevation of 1,000 to 1,500 feet above the ocean and its southeastern side 600 to 900 feet above the sea. In the northern part there are several lakes elevated amid the mountains — Hopatcong, Greenwood, Macopin, Splitrock, Green, Wawayanda, and Budd's being the more important of these natural upland sheets of water.

The Red Sandstone Plain or Triassic Area, also called the Piedmont plain, is bounded on its northern border by the Highlands. On the southeast, this third great topographic zone merges into the clays and marls of the coastal plain. It is 67 miles long and 30 miles wide at the Delaware River. The trap-rock ridges, known as Palisades, Watchung, Sourland, Cushetunk and other mountain ranges, rise abruptly above the general level of the sandstone plain. They are generally forested, whereas the sandstone country is nearly cleared and in farms. These mountains rise 400 to 900 feet above sea-level. The drainage is largely by the Hackensack, Passaic, and Raritan rivers and their tributaries.

The fourth zone, known as the coastal plain, includes all the country southeast of the Triassic sandstone area and borders the ocean. This zone is about 100 miles long from Sandy Hook to Salem City, and is 10 to 20 miles wide. The surface is hilly in part, but with gentle slopes, except where some of the streams have cut their way through its earthy beds and formed steep-sided stream valleys. The Navesink Highlands and the Mount Pleasant Hills are the highest lands in this zone. The drainage is by many tributaries westward into the Delaware, and by the Atlantic coast streams into the Atlantic Ocean. In the northwestern part of this zone there are clay beds and greensand marls, which make the outcrop on the surface in places; on the southeast there are sands, clays, and gravels, and fringing the sea a narrow range of sand hills or coastal dunes. Within the coastal plain lie the "Pines," a wooded area of so great an extent as to contribute largely to the forest acreage of New Jersey. In lots of 10 acres and over, there are 2,070,000 acres of woodland, with only 2,000,000 acres of im-

proved land in farms. The famous sea-side resorts of the State fringe the coastal plain.

As set forth by Professor John C. Smack, the geologic structure of New Jersey is so related to the topography that observations concerning the physical features give a satisfactory clue to such structure. All of the larger geological formations of the United States, except coal, occur in parallel zones, as has been indicated. These formations extend from northeast to southwest, and a section line across the State from Port Jervis southeast to the ocean crosses them nearly at right angles to their trend. The oldest geological formations in the State are the crystalline rocks of the Highlands. Granite, gneisses, and other crystalline schistose rocks and beds of magnetic iron ore make up the mass of these mountain ranges. These rocks are generally much tilted in position, almost on edge, and are also much faulted. They strike northeast and southwest and dip to the southeast or northwest. The iron ores and zinc ores which are mined in the State are found in these formations. The granite, gneiss, and crystalline limestone or marble, used in building, are also from these Highland formations.

The Palæozoic rocks are found in the valleys included in the Highlands, in the Kittatinny Valley and Kittatinny Mountain, and in the Green Pond and Copperas Mountains. Cambrian, Silurian, and Devonian are represented, and the rocks are limestones, slates, sandstones, and silicious conglomerates. The magnesian limestones and the slates constitute wide belts in the Kittatinny Valley, the Musconetcong, Pohatcong, Pequest, and other valleys. The Kittatinny Mountain mass consists of sandstones and conglomerates of the Oneida and the Medina epochs of the Silurian age. In the valley of the Upper Delaware, west of this mountain, there are narrow belts of waterlime, Lower Helderberg, and Upper Helderberg, fossiliferous limestones, with Marcellus shale as the highest member of the Devonian within the State. The Green Pond Mountain rocks also have been referred to the Oneida horizon. The limestones and slates are the formations on which the rich wheat lands of Warren County and the dairy farms of Sussex are situated. Stone for building, slate for roofing and flagging stone, and limestone for lime and cement, are quarried in the Palæozoic areas. Copper, lead, and zinc ores, and barite, limonite, or brown hematite, and glass sand have been worked in many localities.

The red shales and sandstones and the included trap-rocks of the northern-central part of the State are referred to the Jura-trias of Mesozoic time. The sandstone beds dip in general toward the northwest, at a low angle of inclination in the sandstone. The erupted trap-rocks form long ranges of steep-sloping hills or mountains, often crescentic in form. A great deal of excellent sandstone for building and stone for road-making is quarried in this formation. Copper ores occur in the sandstone near the trap-rock or at their junction. Barite also has been mined in the sandstone at one locality.

The cretaceous rocks of the State include the clay district of Middlesex County and the greensand marl developed in Monmouth County, and thence southwest to Salem County. A large amount of clay is dug in the Raritan clay district. The greensand marl, dug in shallow pits generally, and in numberless localities, has had a wide use locally as a fertilizer.

The formations of the coastal plain zone, later than the cretaceous beds, are greensand marls of the Eocene, clays and sands of the Miocene, and the clays, sands, and gravels of the post-Tertiary. They are recognized in a fourfold division, and are known as Beacon Hill, Bridgeton, Pensauken, and Cape May formations. Clays and sands for brick, terra-cotta, and pottery, marls for fertilizer, glass sands, and gravel for road-building are dug in these formations.

In the northern part of the State there are surface formations of glacial epochs, and the terminal moraine of the last glacial ice is traced from Perth Amboy by Morristown and Hackettstown to Belvidere on the Delaware.

Alluvial deposits of recent time are recognized in the river valleys and in the tidal marshes and in some of the fresh-water swamps.

Economic Geology.— To the early settlers the mineral wealth of the State was well known. Before the Revolution, copper, "bog" iron, brick clay, and glass sand were exploited. At the present time, the copper ores are not worked, owing to their low grade. Copper is distributed throughout the red sandstone zone. Of the iron-mining industry, the magnetic iron ores form the basis. Of about 17 active iron mines, in 1900, the output amounted to about 342,000 gross tons, while the mines of limonite, or brown hematite, and of red hematite, are not worked.

The output of zinc, in 1900, amounted to 195,000 tons, the ores being red oxide, silicate, and franklinite. The zinc deposits of Ogdensburg and Franklin Furnace in Sussex County are the most famous, although other localities where zinc blende occurs have been exploited, but have not been developed into mines. Lead in the form of galena has been mined in Sussex County. Arsenical and nickeliferous pyrites also occur. Graphite is disseminated widely in the crystalline schistose rocks of the Highlands. Molybdenum occurs in form of molybdic sulphide at the Ogden mines and at the Hude mine, Sussex County, but is not worked. Barite has been found in quantity for mining near Newton, Sussex County, and at Hopewell, Mercer County.

Clays are found throughout New Jersey. There are numerous beds of fire-clay, stoneware or potter's clay, and clay used in the manufacture of paper, terra-cotta, pipes, and bricks. The district at the mouth of the Raritan River produces, for its own establishments and more distant points, a vast tonnage of fire and ware clay. The large openings are near Woodbridge, Perth Amboy, Sand Hills, South Amboy, Sayreville, and Cheesequake. Clays for ware and for terra-cotta are obtained at various points, notably near Trenton and at Palmyra. Fire-clays are found along the line of the New Jersey Southern Railroad, large works being located at Winslow.

Brick-earth, or brick-clay, is found in thick beds along the Raritan River and Raritan Bay, along the Delaware, on the Hackensack, and there are very large brickyards on these navigable tidal waters, which make a large part of the brick used in structural work in New York

and Philadelphia. Fire-sand, kaolin, and feldspar, as well as fire-clay, are also dug extensively in the Raritan clay district and put into fire-brick. The supply of glass sand in the coastal plain is practically inexhaustible.

Of building stone, granite has been quarried at Charlottenburg in Morris County, and Pochuck Mountain, in Sussex County. Gneisses, for heavy bridge work, are quarried at Dover. Sandstone quarries at Avondale, Newark, Paterson, Little Falls, Haledon, Stockton, and Greensburg, or Wilburtha, produce brownstone for cut work, while trap-rock, widely distributed and accessible to railroads and canals, has been most successfully used on State roads.

The marbles of the State are not at present worked, while slate for roofing has been quarried at the Delaware Water Gap, and at Newton and Lafayette in Sussex County. Flagging-stone quarries are opened near Deckertown in Sussex County; at Milford, on the Delaware, and at Woodsville in Mercer County. The Green Pond Mountain range also affords a flagstone. Limestone, suitable for the manufacture of Portland cement, is quarried extensively near Phillipsburg in Warren County.

Agricultural Interests.— The staple crops produced in New Jersey are corn, wheat, rye, oats, buckwheat, hay, white and sweet potatoes. The value of these products may be thus estimated: corn, $4,000,000; wheat, $2,000,000; rye, oats, and buckwheat, $1,600,000; hay, $8,000,000; white potatoes, $2,000,000; sweet potatoes, $1,250,000, or a total of $18,850,000. Of animals there are horses, mules, milch cows, other cattle and sheep. Horses are estimated to be valued at $7,600,000, mules $750,000, milch cows $9,000,000, other cattle $1,275,000, sheep $200,000, or a total of $18,825,000 for staple crops and stock, adding the product of milch cattle, about 360,000,000 quarts of milk, valued at $10,000,000, the total is nearly $50,000,000.

Possessing a great diversity of soils, and a somewhat notable variation in temperature, New Jersey has ever occupied a distinctive position as an agricultural community. The average yearly temperature ranges from 49.6° in the Highlands to 53.0° on the sea coast. The average annual precipitation, including melted snow, is 47.18 inches in the Highlands, and 45.92 inches on the sea coast. Aside from the staple crops, above mentioned, the fruits of the State have a large sale in the nearby markets of Philadelphia and New York. Peaches and apples are extensively grown in the northern and northwestern portions of the State, while pears are cultivated in the midland counties. These fruits are common, however, in all sections. The southern counties produce large acreages of strawberries, raspberries and blackberries, while cranberries are a staple product of boggy areas in Burlington and Ocean counties. Grapes are grown extensively in the southern section of New Jersey, while plums, cherries, and currants are common in all sections. Huckleberries are of spontaneous growth and are gathered in large quantities. In truck farming, watermelons and cantaloupes, the Hackensack variety of the latter competing with the Colorado product, are grown on the large plantations and small farms near Philadelphia and New York. Market gardening, owing to the reasonable price of land, and extensive stone-road system, and quick, cheap, and safe transportation by rail and boat, is a profitable industry in New Jersey, more particularly in the vicinity of New York. Commercial floriculture gives to the State a preeminence. Dairying is largely confined to the northern, central, and southwestern portions of the State. The poultry farms of New Jersey are near the markets of Philadelphia and New York. The forest lands, including stump and brush lands to merchantable timber, of the State occupy about 2,000,000 acres; the cleared farm land about the same acreage; 1,200,000 acres of forest land is coniferous, pitch pine on the uplands and white cedar in the swamps. This is the region known as the "Pines" extending from Lakewood on the north to Cape May County on the south, and embracing a number of health resorts. The northeastern Highlands, with 210,000 acres, the Kittatinny Mountain with 58,000 acres, the Palisade Mountain with 11,000, are the remaining large forest areas. The forest products are worth about $4,000,000 annually. Owing to a lack of interest and knowledge, an inherited desire to denude the surface of the earth and almost constant fires during dry seasons, the forests of New Jersey have been neglected and rendered unproductive to the last degree. During the colonial period, forest lands were not only of a relative but actually of a greater value than they are at present. The State renders directly and indirectly great assistance to agricultural interests by the media of an agricultural college located in New Brunswick, experiment stations, a board of agriculture, grange and horticultural society. Reports, institutes, and lectures are the means of disseminating information.

Manufactures.— The great manufacturing districts of New Jersey are located in the immediate vicinity of New York and Philadelphia. Within the limits of the city of Newark alone it is claimed there are made a wider variety of articles than in any other city in the United States. Newark is famous for leather, jewelry, hats, and celluloid, Paterson for silks and locomotives, Passaic for woolen and worsted goods, Jersey City for tobacco products and soap, Trenton for pottery of all grades, structural steel and iron and rubber goods, Camden for shipbuilding and chemicals, Elizabeth for sewing machines and shipbuilding, New Brunswick for hosiery, Perth Amboy and its vicinity for bricks and terra-cotta, Bridgeton, Millville, Vineland and smaller towns for glass. There are approximately 200,000 wage-earners in New Jersey, and the annual product of their labor is

	No. of establishments	Persons employed	Capital invested
Bricks and terra-cotta	66	6,600	$ 7,000,000
Window and bottle glass	23	6,300	4,000,000
Men's felt and wool hats	51	5,500	2,000,000
Jewelry	65	2,700	3,000,000
Pottery	30	3,700	5,500,000
Leather	55	3,900	6,300,000
Shoes	48	4,900	2,300,000
Woolen and worsted goods	38	7,600	8,000,000
Chemical products	42	3,400	13,800,000
Refined oils and by-products	14	2,800	17,300,000
Silk	152	27,700	22,500,000

about $400,000,000. From reports obtained for 1900, the data as shown in the foregoing table is presented in round figures as to the 11 great industries of New Jersey.

Of the other industries, outside those of an agricultural and manufacturing character, the oyster and fish industry is most conspicuous. From the mouth of the Raritan River to Sandy Hook, from Barnegat Bay to Cape May and thence in Delaware Bay to Salem, are about 15,000 acres of productive oyster beds. From the famous Maurice River oyster beds alone $2,275,000 worth of these bivalves were shipped, exceeding in value the wheat crop of the State. From the Atlantic Ocean and Delaware Bay, vast quantities of clams, and fish of many kinds are sent to nearby markets. Shad and sturgeon, the latter furnishing caviare, are caught in Delaware Bay and river.

Transportation.— There are in New Jersey about 2,300 miles of railroad, with about 35,000 employees, whose duties are performed within the limits of the State. The railroad companies having trackage in the State are the Pennsylvania and the West Jersey and Sea Shore, representing about one third of the total miles of track. The remaining roads are the Central of New Jersey, Philadelphia and Reading, Erie, Delaware, Lackawanna and Western, New York, Susquehanna and Western, the Lehigh Valley and about 30 unclassified companies. Within the State are the two gateways, Jersey City and adjacent cities leading to greater New York and Camden to Philadelphia. All of the above companies have terminal facilities in Jersey City, Weehawken and Hoboken. Every railroad entering New York city from the west and south, except the New York Central, now lands its passengers in New Jersey. There are nearly 1,000 miles of cable, electric and horse railroad in the State, a large percentage of the trackage being under the control of the Public Service Corporation. A practically continuous trolley service has been established between Jersey City and Camden, uniting Philadelphia and Greater New York. These roads have cost nearly $150,000,000. In conjunction with the counties, townships, and cities and assessments upon abutting property owners, New Jersey has aided in the construction of 1,000 miles of good roads, penetrating every section of the State and usable at all seasons of the year. The canal systems of the State embrace the Delaware and Raritan, extending from Bordentown to New Brunswick, and the Morris, extending from Jersey City to Phillipsburg and uniting with the canal system of the commonwealth of Pennsylvania. The total mileage is 173.34.

State Institutions.— New Jersey has lately largely increased her activities in the matter of support of State institutions. That of a penal character is the State Prison located at Trenton. Those of a correctional character are the Reformatory for men and boys located near Rahway, the State Home for Girls near Trenton, and the State Home for Boys near Jamesburg. Those for dependents, defectives and delinquents are the State Hospitals for the Insane near Trenton and near Morristown, the Home for Feeble-minded Women and the Home for Feeble-minded Children (separate institutions) each located at Vineland, the State Village for Epileptics near Skillman and the School for the Deaf at Trenton, the latter being under the control of the State Board of Education. These institutions are under the administration of separate boards appointed by the governor of the State. New Jersey has not yet adopted the plan of a general board of supervision or control. In matters of education, the State sustains a Normal and Model School at Trenton, the Farnum Preparatory School at Beverly, Manual Training and Industrial School for Colored Youth at Bordentown, agricultural college and experiment station, and teachers' institutes and libraries. Other functions assumed by the State are the preservation of fish, game and oysters, the care of the lives of employees in factories and workshops, an extensive geological survey, the preservation of historic sites, of the Palisades of the Hudson River and of public documents, the removal of children from such improper influences as poor-houses, the prospective care of tuberculosis patients. For her soldiers and sailors and their wives New Jersey has established homes at Kearney and Vineland.

Seaside Resorts.— The diversified scenery and climate of the State has led to the establishment of many resorts in all parts of New Jersey. Along the sea coast, Cape May has been noted as such for about a century, to be soon followed by Long Branch. Atlantic City has had in 1904 an organized existence of 50 years and represents, in growth and attractiveness, the most conspicuous example of municipal sea-shore development to be found in the world. Asbury Park and Ocean Grove were established about 1870. Within the last quarter of a century, practically every foot of beach front from Sandy Hook to Cape May has been subjected to a greater or less degree of development. Of the mountain resorts, one hotel property at Schoaley's Mountain has entertained visitors for a century. Such lakes as Budd's, Hopatcong, and Greenwood are noted, while many hotels are to be found in the hilly country within easy access of New York. There are in the hills and mountains of the State, however, no communities devoted exclusively to furnishing amusement and health to visitors. In the "Pines" are a number of small resorts, all being overshadowed by Lakewood, the nearest point in the Pines accessible to Greater New York.

Education.— As early as 1662 a schoolmaster was settled among the Dutch land owners in what is now Jersey City; about 10 years later schools were erected in Newark, Woodbridge, Amboy, Elizabethtown, Freehold and Piscataway, while in 1683 the Society of Friends at Burlington set aside rents from an island in the Delaware, for the purposes of public education. In 1817, after nearly 20 years' agitation, the legislature created the first school fund. The management of the schools of the State is vested in a State Board of Education appointed by the governor. This board appoints superintendents for each of the 21 counties of the State. Although the Constitution requires that the State shall provide free instruction for all children between the ages of 5 and 18, the State has extended the age from 4 to 20. Courses in kindergarten and manual training have been extensively adopted, particularly in the large industrial centres.

The number of school-houses in the State is about 1,900, providing accommodations for

300,000 pupils. The value of the school property is $15,000,000.

There are enrolled in the public schools about 950 male teachers, at an average annual salary of $866, and 6,200 female teachers, at an average annual salary of $500.

There are enrolled in the public schools about 325,000, and in private schools about 50,000, making the total number of children in school about 81 per cent of the children in the State. Of the private schools in the State among the most conspicuous are Lawrenceville School (John C. Green Foundation), one of the most famous in the country, Princeton Preparatory School, Peddie Institute at Hightstown, Pennington Seminary, all in the county of Mercer. Other schools are St. Mary's Hall in Burlington, the West Jersey Academy and South Jersey Institute at Bridgeton, Newark Academy, Hasbrouck Institute at Jersey, Bordentown Military Academy, Blair Presbyterial Academy at Blairstown, Centenary Collegiate Institute at Hackettstown. There are theological institutions of the Reformed Church in America at New Brunswick, of the Presbyterian Church at Princeton, of the Methodist Episcopal Church (Drew Seminary) at Madison, the German Theological School at Newark and Seton Hall of the Roman Catholic Church. The three conspicuous colleges in the State are Princeton University, Rutgers College at New Brunswick and Stevens Institute of Technology at Hoboken.

Churches.— Throughout the colonial period of New Jersey three lines of religious activity were noticeable. In the eastern portion, the various phases of Calvinism were transplanted over-sea by the settlers. The Hollanders, the Scotch and many of the English emigrants, and the French Huguenots found a common bond of association in Calvinism. Ultimately Presbyterianism, outside of the sphere of Dutch influence, became dominant. In the western portion of the colony the Society of Friends held sway, with strength in Monmouth County, a part of the eastern portion. The Church of England never obtained a strong hold in the colony, its main congregations being at Burlington, Trenton, Perth Amboy, Elizabeth and Newark. During the middle part of the 18th century, Whitefield and Tennant, as Calvinists, and John Woolman, the apostle of the abolition movement in America, paved the way for future changes. Following the Revolution, the Methodist Episcopal Church, with its democratic teachings, recruited largely from the Society or Friends and from many of the Presbyterian congregations. With the coming of the Irish and German emigrants into New Jersey, in the period of extension of transportation systems (1830–60), the Roman Catholic Church made great advance.

Banks and Banking.— The State Legislature granted charters to two banks, one in Newark and one in Trenton in 1804. In 1812 a general banking law was passed for the protection of depositors, the law remaining in force until 1850, when other laws were passed. There were eight banks of issue in 1860. In 1868 there were 55 national banks in the State, 115 in 1900, and 124 in 1901. In the last named year there were 18 State banks. The Legislature established a department of banks and insurance in 1891, and the banking law was again revised in 1899. Since 1880 New Jersey has been a favorite State for trust companies and for the organization of large corporations. Savings banks were first established in 1828. In 1876 a law was passed regulating these institutions. In 1902 the condition of the New Jersey banks was thus summarized:

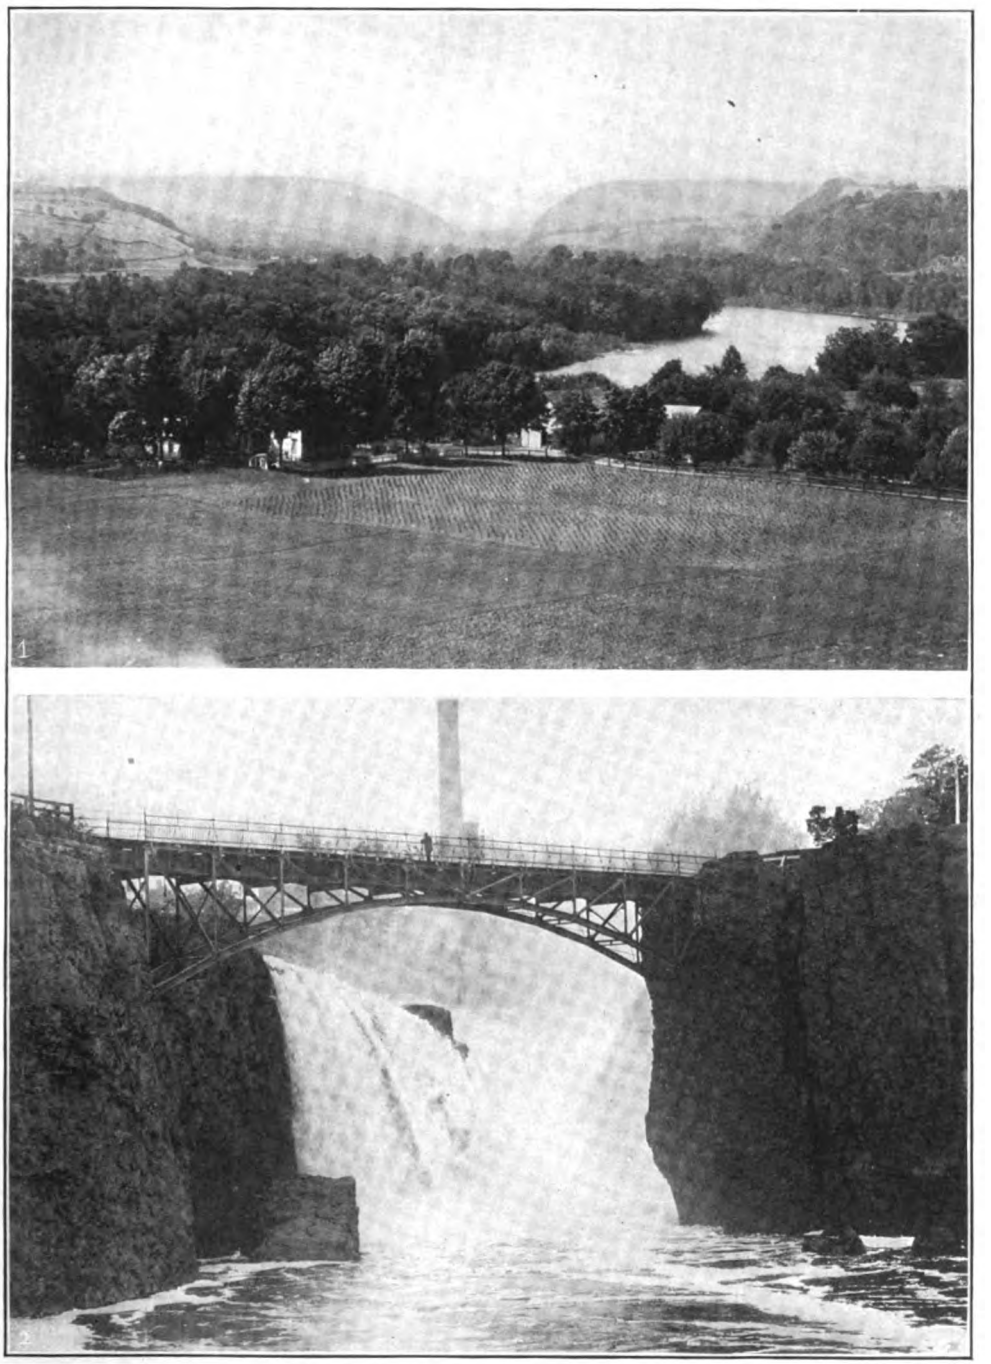
	No.	Capital	Surplus
National banks	124	$17,164,000	$11,375,000
State banks	18	1,503,000	979,000
Savings banks	28	.....	6,060,000
Trust companies	47	9,321,000	6,890,000

Finances.— The finances of the State are in most excellent condition, there being no bond issues for which interest and a sinking fund must be provided, nor is there a State tax levied. The total receipts of the State at the close of the fiscal year ending 31 Oct. 1903 amounted to $4,692,845.07. Of such total receipts $3,088,034.80 was derived from the tax on railroad and miscellaneous corporations, being about three fourths of the total revenue. Other important sources of revenue are State fees from the offices of the clerks in chancery and supreme courts, the collateral inheritance tax, from the office of commissioner of banking and insurance, from the office of Secretary of State (fees for filing certificates of incorporation), from the State Prison and State Reformatory and from the oyster commission. During the fiscal year of 1903 the disbursements of the State amounted to $4,485,926.16, leaving a balance of $206,918.91. The school fund represents an annual amount of nearly $2,500,000, the elements of receipts being a State school tax, interest on stocks and bonds, rents from riparian leases and real estate, licenses.

Population.— New Jersey began to obtain rapid growth in population about the year 1840; the absolute increase being the greatest in the decade from 1890 to 1900, due largely to the immigration of foreigners and the suburban New York population. The growth of population is given by the government census as follows: (1790) 184,139; (1820); 277,426; (1850) 489,555; (1860) 672,035; (1870) 906,096; (1880) 1,131,116; (1890) 1,444,933; (1900) 1,883,669. In 1900 there were 431,884 residents of foreign birth, one half of which number were German and Irish. There were in the same year 69,844 negroes in the State. There are 250 people to the square mile, and 67 per cent of the total population reside in 49 cities of over 4,000 population each.

The largest cities in the State with their population for 1900 and 1890 are as follows:

	1900	1890
Newark	246,070	181,830
Jersey City	206,433	163,003
Paterson	105,171	78,347
Camden	75,935	58,313
Trenton	73,307	57,458
Hoboken	59,364	43,648
Elizabeth	52,130	37,764
Bayonne	32,722	19,033
Atlantic City	27,838	13,055
Passaic	27,727	13,028
Orange	24,141	18,844
New Brunswick	20,006	18,603



1. Looking toward the Delaware Water Gap from Manunka Chunk.
2. Falls of the Passaic, Paterson.

Following is a list of the counties in New Jersey with their population for 1900 and 1890:

County	Square Miles	1900	1890
Atlantic	567	46,402	28,836
Bergen	236	78,441	47,226
Burlington	869	58,241	58,528
Camden	222	107,643	87,687
Cape May	256	13,201	11,268
Cumberland	511	51,193	45,438
Essex	127	359,053	256,098
Gloucester	326	31,905	28,649
Hudson	43	386,048	275,126
Hunterdon	437	34,507	35,355
Mercer	226	95,365	79,978
Middlesex	312	79,762	61,754
Monmouth	479	82,057	69,128
Morris	475	65,156	54,101
Ocean	583	19,747	15,974
Passaic	198	155,202	105,046
Salem	359	25,530	25,151
Somerset	305	32,948	28,311
Sussex	529	24,134	22,259
Union	103	99,353	72,467
Warren	362	37,781	36,553
Total	7,525	1,883,669	1,444,933

Government.— The general government of the State is administered under a Constitution adopted by the people in 1844, and in 1875 amended by a special election. Amendments to become a law, or a part of the Constitution, must receive the approval of the majority of the members of two consecutively chosen legislatures of the State, and must then be submitted to the people. A majority vote of the electors of the State is necessary for adoption. Five years is the time that must elapse between the submission of amendments to the people. Duly qualified voters are male citizens who have resided in the State one year, and in the county five months. The law requires the registration of voters. State elections are held annually on the Tuesday after the first Monday in November. The State has 10 representatives in the Lower House of Congress.

Legislature.— There are 21 State senators composing the Upper House of the Legislature, one from each county, and the term of office is three years. There are 60 members of the House of Representatives, elected from the counties on the basis of population. The term of office of a member of the Lower House is one year. Revenue bills originate in the Lower House.

Executive.— The governor is chosen by popular vote and for a term of three years. He cannot be re-elected without an intervening three years. He has power to call extra sessions of the Legislature, or of the Senate without the Representatives. He has the usual veto power which may be overruled by a majority vote of all the members of the Legislature. He grants pardons and reprieves in conjunction with the chancellor and six judges of errors and appeals. The state treasurer and comptroller are appointed for three years at a joint session of the Legislature. The governor, subject to the approval of the Senate, appoints for terms of five years the secretary of state, attorney-general, clerk of supreme court, clerk of the court of chancery, and keeper of the State prison.

Judiciary.—New Jersey has courts of law and courts of equity. The chancellor of the State and the judges of the supreme court are appointed by the governor, subject to approval by the Senate, for terms of seven years. The courts are supreme court, county courts, orphans' court, and court of general quarter sessions of peace. The chancellor, the justices of the supreme court, and six judges specially appointed, constitute the court of errors and appeals. The Senate tries cases of impeachment.

Local Government.—The counties and towns are governed under general laws, and special laws cannot be passed unless by amendment of the Constitution. The justices of the peace are elected for five years by vote of the electors of the townships. The counties elect surrogates and clerks for terms of five years. The counties elect, also, sheriffs and coroners for three years, but such officers cannot be re-elected without an intervening three years. The cities and townships are required to have local boards of health.

History.— Based upon the conclusions reached by a group of scientists of international reputation, it may be stated that Man, known as "Glacial," "Argellite," and "Palæolithic," resided within the limits of New Jersey, at the close of the Age of Ice. The proofs offered are the presence of non-intrusive stone implements, remains of extinct quadrupeds, used by primitive man as food, and human skulls and bones, all of which have been found in and near the city of Trenton. At this point, a large deposit of river wash, particularly sand and gravel, indicates that at one time the mouth of the Delaware River was directly south of Trenton. In the river wash the above mentioned evidences of human occupancy have been found. The culture point attained by these earliest inhabitants was probably that reached by Man in the Stone Age in Europe.

The Indians whom the Dutch and Swedes found in New Jersey were known as the Lenni-Lenapé, members of the great Algonquin family. They were comparatively few in number, scattered in shifting communities along the river valleys and the sea coast. Less warlike than the Indians of New England or of Virginia, the Lenni-Lenapé, later known as the Delawares, made some progress in agriculture and in the elementary arts. With the Dutch and Swedes, the Indians maintained comparatively peaceful relations, although a traders and settlers' war in the Raritan Valley, before the coming of the English, is a matter of record. After the English conquest of 1664, the Indian, although kindly treated by the Society of Friends in West Jersey, and tolerated by the Calvinists in East Jersey, could not withstand the effects of European civilization. Consumption, smallpox, venereal diseases, and alcoholism drove him down to the depths. Distrustful of the efforts made by the missionaries, his personal liberty restrained by legislation and social custom, the Indian was enslaved, and by intermarriage with the negro, lost his identity. In 1758, most of the New Jersey Indians were removed to the first reservation ever established within the limits of the present United States — that located at Edgepelick, Brotherton, or Indian Mills in the "Pines" of Burlington County. At the opening of the 19th century the Indians were removed to New York, and thence after various wanderings to Indian Territory. Lenni-Lenapé of the full blood are now extinct in New Jersey.

Holland, politically and religiously free, and

struggling with Sweden for supremacy as a world power, located upon Manhattan Island, her principal fort and trading post in the New World. Her navigators explored the coasts of New Jersey, and to one of the great rivers, the North, was given the name of Hudson. Cornelius Jacobsen Mĕy sailed up the Delaware, then known as the South River, and commemorated himself by the name Cape May. By discovery and occupancy Holland laid claim to the soil of New Jersey. From New Amsterdam, farmers and traders established themselves in what is now Hudson and Bergen counties. By 1650 colonists had penetrated the river valleys emptying into all the waters of the Greater New York Harbor. Settlements were attempted on the Delaware. The efforts of the Dutch, in the colonization of New Jersey, were only successful in the northeastern portion of the State, where the church, speech, and lines of political thought of the fatherland firmly impressed themselves upon the community until recent years.

Gustavus Adolphus, in his scheme of Swedish colonization for North America, utterly disregarded the presence of the Dutch in New Jersey. For about 15 years after 1640, several groups of Swedish settlers occupied the valley of the Delaware, locating principally in the vicinity of Philadelphia. The communities of Swedes in New Jersey, isolated, and neglected by the home government and harassed by the Dutch, finally submitted, with their associates in Pennsylvania and Delaware, to the domination of Holland. From 1655 to 1664, New Jersey remained under the absolute control of Holland.

Recognizing the fact that Dutch control of the valleys of the Hudson and the Delaware separated New England from the southern colonies, Charles II., king of England, granted to his brother, James, Duke of York, a vast domain in North America, including much of what is now New England, New York, and New Jersey. An English naval expedition, in the summer of 1664, sent to New Amsterdam, secured the capitulation of the Dutch. To John, Lord Berkeley and Sir George Carteret, two faithful adherents of the House of Stuart during the Protectorate, the Duke of York made a transfer of what is practically the territory of New Jersey.

In recognition of Carteret's defense of the island of Jersey, against the Cromwellian forces, the Berkeley-Carteret grant was called *New* Jersey. The policy of the proprietors was to attract settlement, which was accomplished by exploiting the natural advantages of the colony, granting a liberal frame of government and providing for allotments of free or low-priced land. There was a very pronounced New England movement into the valleys of the Passaic and smaller streams, and by the introduction of social, political and religious views of the Congregationalists, the eastern portion of the colony became a partial reproduction of New England itself. Within a few years Berkeley disposed of his interests to a company largely composed of members of the Society of Friends. A partition being desirable, a line was run from Little Egg Harbor to a point near the Delaware Water Gap. Henceforth, after 1676, begins the political history of East and West Jersey. To Carteret fell East Jersey; while West Jersey became the property of the members of the Society of Friends. After 1676, the western portion of the State was open to English settlement, the dominant spirit being William Penn. The communities established in the Delaware river valley were isolated, and a plantation life, not unlike that of Virginia and Maryland, lacking certain religious characteristics, was developed. The county in West Jersey became the political unit, as the town became the political unit in East Jersey. Both the Jerseys passed later under the domination of Boards of Proprietors, who exercised broad governmental powers, and, until the present, held title to unoccupied lands. From 1664 to 1702, when both boards relinquished governmental rights to the Crown, there was a constant spirit of popular unrest, and one complete and one attempted change in government. In 1673 New Jersey was recaptured and occupied for a few months by the Dutch. When James, Duke of York, became King James II., he endeavored, by means of Sir Edmund Andros, to upset the proprietary governments, the matter not being finally settled, favorably to the proprietors, until 1681. In the meantime, internal disturbances growing out of quit-rent agitations, affected the peace of the two proprietaries. The period from 1702 to the outbreak of the American Revolution was undisturbed by any dramatic incidents. The growth of Philadelphia and New York, as commercial centres, tended to develop the agricultural interests of New Jersey. As early as 1710 the tendency to draw the active forces of the colony into the two cities was apparent, leading to Benjamin Franklin's famous aphorism, uttered soon thereafter, that New Jersey was like a cider barrel, tapped at both ends. The usual colonial quarrels between the Crown officers and the popular branch of the legislature were reflected in New Jersey, as elsewhere. Landed interests dominated the governor's council, small property owners were disfranchised, business enterprises were restricted, if not prohibited, by legislation in Parliament, and by taxation, commerce on the high seas was suppressed by the Navigation acts, metallic currency was withdrawn from the colony,—a score of causes, mainly economic, operated to produce the resort to arms.

While loyal to the Crown, there were, nevertheless, mutterings of discontent, of ill-concealed defiance of law officers and a spirit of restlessness, restrained by the wave of patriotism evoked by the French and Indian war, but which swept on with increasing force after the opening of the year 1770. The most notable events of this period, from 1702 to 1775, were the suppression of piracy in the vicinity of New York and Cape May; the establishment of a continuous land and water route from Philadelphia and New York; the erection of ferries and post roads; the appearance, in the northern, central and western parts of the colony, of Huguenot, Scotch-Irish and Palatinate emigrants; the chartering of Princeton University and Rutgers College; the establishment of the first Indian reservation in the United States in Burlington County, the religious revival of George Whitefield, and the promulgation of John Woolman's abolition doctrine; the massacres by the Indians in Sussex County, and the erection of a series of barracks, owing to their need in the French and Indian war, in various parts of the State. The open-

ing of the American Revolution found New Jersey divided in sentiment. The Calvinistic element, represented so largely in East Jersey, took the initiative. The spirit of war, as in New England, appeared in the town meeting. The professional classes, the members of the Society of Friends, and the large merchants were either opposed to war or were non-combatants. A minority awaited the results of agitation. The strength of the element loyal to the home government may be shown from the fact that upon 2 July 1776, when New Jersey asserted her statehood, the Constitution contained a proviso that the document should not be operative in case of a reconciliation between England and New Jersey. William Franklin, the last colonial governor of New Jersey, remained loyal to the Crown, and, banished from New Jersey, sought refuge among Tory sympathizers in New York city, becoming the adviser of those planning movements of Tory invaders in the State. Largely conducted in the northern central portion of New Jersey, under the control of Crown sympathizers, these raiders gained the name of «Pine Robbers.» During the Revolution, nearly 100 battles and skirmishes were fought upon the soil of the State. Most conspicuous were the battles of Trenton (26 Dec. 1776), Princeton (3 Jan. 1777), Red Bank (22 Oct. 1777), Monmouth (28 June 1778), and Paulus Hook (19 Aug. 1779). Among minor engagements of importance were the fights at Bound Brook (13 April 1777), Egg Harbor (15 Oct. 1778), Hancock's Bridge (21 March 1778), Tom's River (24 March 1782), the burning of Bordentown (8 May 1778), and no less than a score of engagements in and around Elizabeth and Newark and nearby territory. During the war occurred the «retreat across the Jerseys» and Washington's two winter occupations of Morristown. At the close of the war, New Jersey was sadly impoverished. Her spirit was distinctively Federal. She participated in the Annapolis Convention, her representatives advocated the «New Jersey plan» at Philadelphia, in the framing of the Federal Constitution, which she adopted without a dissenting voice. With the opening of the 19th century, New Jersey became a political storm-centre. As a Federalist leader, Alexander Hamilton had wielded a powerful influence in the State. He had been active in the establishment of the Society for the Improvement of Useful Manufactures, out of which grew the city of Paterson, and had urged the development of Paulus Hook (the site of Jersey City). He was closely allied with the Federal elements until then in control of New Jersey politics. Arrayed against him was Aaron Burr, son of the Rev. Aaron Burr, sometime President of the College of New Jersey, now Princeton University. The end of the antagonism between Burr and Hamilton came in a duel fought in 1804, at Weehawken, New Jersey. The activities in politics were reflected in industrial life. Before the second war with England, a chain of State banks was established, bridges crossed the rivers between Philadelphia and New York, steamboats were to be found upon the Delaware and Hudson rivers, highways were extended to every accessible part of the State, and the development of water-power led to the establishment of many small factories. The second war with England blighted the prospects of growth. Although no engagements occurred upon her soil, New Jersey, as much for the protection of Philadelphia and New York, as for her own interest, furnished militia to garrison forts on the Delaware and at Sandy Hook. The position of the State led to overland transportation of military supplies between the North and South, for the reason that the Atlantic seaboard was blockaded by British fleets. From this condition and owing to the demand for good roads, the first railroad charter ever granted in the United States passed the Legislature in the year 1815. This, in connection with the revival of agitation concerning internal waterways, led to the constructing of the Camden and Amboy railroad and the Delaware and Raritan canal, now a part of the standard lines of the Pennsylvania Railroad system across the State of New Jersey.

The development of the industrial era, following the close of the War of 1812, broken by the panics of 1817, 1837, and 1857, marked the growth of Newark, Jersey City, Paterson, Elizabeth, New Brunswick, Trenton, and Camden. The period of social unrest characteristic of Jacksonian dominancy in politics led to the adoption of a new State constitution in 1844, pronounced reforms of a penalogical and charitable character, the extension of the public school system and the growth of railroads. The Civil War found New Jersey ready to respond to the call for troops. To the cause of the Union she furnished 88,305 men, or within 10,501 of her entire militia, and for the organization, subsisting, supplying, supporting and transporting her troops she paid nearly $3,000,000. Following the war came a period of prosperity. The agricultural advantages of the southern portion of the State, first practically promoted at Vineland and latterly fully disclosed by the success of the Jewish settlement at Woodbine, revolutionized a large area south of Camden. The overplus of population of Philadelphia and New York sought permanent and temporary homes in New Jersey, while the industrial centres of the northern and eastern portions of the State grew with unprecedented rapidity. The present prosperity of the State is largely due to the changes which have occurred in the last three decades.

Editor-in-Chief of 'New Jersey as a Colony and as a State.'

New Jersey, College of. See PRINCETON UNIVERSITY.

New Jersey Foreigners, in American humor, an allusion to New Jersey as a foreign country, and to New Jerseymen as foreigners; a saying handed down from the time when Joseph Bonaparte, ex-king of Spain and Naples, after the downfall of Napoleon, sought an asylum in the United States. As an alien he was obliged to obtain a special act of Legislature to enable him to hold real estate. Pennsylvania refused, but New Jersey consented, and he established himself in princely magnificence at Bordentown. Hence men of other States used to declare that the Jerseymen, with their foreign prince, were foreigners.

New Jersey Plan, in American history, a plan for a Federal Constitution proposed at the Convention of 1787 by William Paterson, of New Jersey. The resolution provided for the enlargement and correction of the Articles of Confederation; that Congress should remain a single body, and should regulate taxation and commerce, and should choose the executive; that requisitions from States should be continued; that a judiciary should be established; that naturalization should be uniform; that the executive should coerce refractory States or individuals, and other provisions of less importance. This plan was unfavorably reported from the committee to whom it was referred.

New Jersey Tea. See CEANOTHUS.

New Jerusalem, je-roo'sa-lĕm, the name given by the Apostle John in the Book of Revelation to heaven.

New Jerusalem, Church of the. See CHURCH OF THE NEW JERUSALEM.

New Ken'sington, Pa., borough, in Westmoreland County; on the Allegheny River, and on a division of the Pennsylvania railroad; about 15 miles northeast of Pittsburg. It is in a region noted for the manufacture of iron and steel. Its chief manufactures are steel and iron products, flour, lumber, brick, beer, and furniture. The glass and white lead works in the vicinity contribute to the industrial prosperity of the borough. Pop. (1900) 4,665.

New Leb'anon, N. Y., town, in Columbia County; on the Chatham & Lebanon Valley railroad. The town includes several villages; Mount Lebanon, a Shaker village (see SHAKERS); Lebanon Springs, a noted summer resort. The town is in an agricultural section, but has some manufacturing interests. The chief manufactures are glass, brooms, baskets, flour, lumber, patent medicines, barometers, and thermometers. Pop. (1890) 1,765; (1900) 1,556.

New Leinster, lēn'stėr or līn'stėr. See STEWART ISLAND.

New Lexington, lĕk'sĭng-tŏn, Ohio, village, county-seat of Perry County; on the Cincinnati & M. V., and the Toledo & O. C. R.R.'s; about 50 miles east by south of Columbus. It is in an agricultural section, and in the vicinity are coal fields and deposits of fire clay. The manufactures are chiefly brick and other clay products. There is considerable trade in farm products, brick, clay, and coal. It is the seat of Saint Aloysius Academy. Pop. (1890) 1,470; (1900) 1,701.

New Light, a fish. See CRAPPIE.

New Lon'don, Conn., city, port of entry, one of the county-seats of New London County; on the Thames River, and on the Central V., and the New York, N. H. & H. R.R.'s; about three miles from Long Island Sound and 50 miles in direct line southeast of Hartford. It has regular steamer connection with New York and all the Sound ports. Its fine harbor is protected by Forts Griswold and Trumbull.

In 1646 John Winthrop, the younger, founded Naumeag, and in 1658 the name was changed to New London. Prior to the Revolution it was of considerable commercial importance and had established trade with the coast towns of the nearby colonies and with the West Indies. During the war it suffered from attacks by the British. On 6 Sept. 1781 a British force under command of Benedict Arnold attacked the town, destroyed the wharves and many of the buildings, and killed a number of the people. In memory of this attack, a shaft 127 feet high has been erected at the place (see GROTON) where the massacre occurred. The town was incorporated in 1784. The first session of the Catholic Summer School of America (q.v.) was held in New London.

New London has a number of large manufacturing establishments, chief of which are machine shops, foundries, printing-press works, silk-mills, cotton-gin factory, woolen mills, bed-quilt factory, furniture factory, and ship-yards. Sealing and whaling continue to be of importance, and a considerable amount of farm products are exported. It is a distributing centre for a large amount of the imports used in the southeastern part of the State. Some of the historic places of interest are the Old Town Mill, built in 1646, the school house where Nathan Hale was once a teacher, and the Hempstead House. A government naval station is on the river outside the city limits. The Thames River is a favorite stream for college boat races. A railroad drawbridge, opened in 1890, spans the river at New Haven. The parks, Williams, Memorial, and Boulder, are most attractive, and White Beach is a favorite bathing place. The prominent edifices are the city buildings, the churches, schools, and libraries. It has public and parish schools, the New London County Historical Society and Library, and a public library. The government is administered under a charter of 1894 which provides for a mayor, who holds office three years, and a council. The school board is chosen by popular vote. Pop. (1890) 13,757; (1900) 17,548. Consult: 'Historic New London,' in 'New England Magazine,' Vol. V.; Caulkins, 'History of New London'; Starr, 'Centennial Sketch of New London.'

New Mad'rid, Mo., city, county-seat of New Madrid County; on the Mississippi River, and on the Saint Louis Southwestern railroad; about 130 miles in direct line south by east of Saint Louis and about 50 miles below Cairo, Ill. It has regular steamboat connection with all the river ports. It was settled by Americans in 1788, when the Spanish owned east of the Mississippi. During the Civil War it was used as a Confederate station until 14 March 1862, when it was abandoned and became a Federal possession. It is situated in a productive agricultural region in which the principal crops are cotton, grain, and fruit. It has extensive lum-

ber interests. The trade is chiefly in lumber, grain, fruit, live-stock, and cotton. Pop. (1890) 1,193; (1900) 1,489.

New Market, Battle of. In co-operation with Gen. Grant's Wilderness campaign and the movements of Gen. Crook, who was marching from West Virginia on Staunton, Va., Gen. Sigel, commanding the Union forces in the Shenandoah Valley, on 9 May 1864, marched from Martinsburg up the Valley pike with Gen. Sullivan's division of infantry, Gen. Stahel's division of cavalry, and five batteries of artillery, in all about 6,500 men and 28 guns. He arrived at Woodstock on the 11th, his cavalry pushing on to Mount Jackson, where, on the 14th, it encountered some of Imboden's cavalry, forced it across the Shenandoah, and followed as far as New Market. Col. Moor with parts of Sullivan's division and cavalry, joined the advanced cavalry at New Market late in the evening, and a skirmish ensued, in which artillery was used. Twice during the night strong demonstrations were made on Moor, which he repulsed. Gen. Breckinridge, commanding the Confederate troops in the valley, hearing of Sigel's advance, had collected at Staunton a force of 5,000 men, including the cadets of the Virginia Military Institute, with eight guns, and at daylight of the 15th drew up two miles south of New Market to give battle. Moor had, beside 300 cavalry and two guns, two regiments of his own brigade and two of Col. Thoburn's. Stahel came up in the morning and took command, and as it neared noon Sigel arrived with the rest of his army, and made disposition for battle. Moor was left in his advanced position, with his own two regiments and a small body of cavalry to hold Breckinridge in check, until Sigel could complete his dispositions, which were well made. Thoburn's brigade constituted the main line, along which were the batteries. The cavalry was behind the centre and on the left flank. The line extended across the pike on rising ground, another slope in front being held by Moor, Breckinridge formed line with Echols' brigade on the right and Wharton's on the left, the Institute Cadets and the 62d Virginia between the two. Imboden's cavalry and a six-gun battery were on the extreme right. McLaughlin's artillery occupied a sharp ridge left of and parallel to the pike and opened furiously upon Sigel's guns, which as furiously responded. Breckinridge advanced, and Moor, being overlapped on both flanks, fell back in some disorder, and Breckinridge, without pausing, pressed on and attacked Thoburn, who, charging from his right, checked him, Sigel's guns using shell and canister with great effect. Meanwhile Imboden crossed Smith's Creek and, moving down its east bank, gained the top of a small hill opposite Sigel's left, placed his guns on it, and at short range opened a rapid fire upon Sigel's massed cavalry, which immediately fell back, and Sigel ordered his entire line to fall back half a mile. Imboden's guns were now turned on the flank of the infantry, Breckinridge pressed on in front, and the contest was desperate and at close quarters, Von Kleiser's battery being particularly destructive to the centre of Breckinridge's line held by the Cadets. An order to charge the battery was given, the Cadets and the 62d Virginia went forward in fine style, and with great loss captured the battery; the rest of the line advanced, and Sigel retreated, followed a short distance by Breckinridge. At Rude's Hill, nearly three miles from the field, Sigel halted and formed line; Breckinridge soon came up; there was an exchange of artillery firing; and at 7 P.M. Sigel abandoned Rude's Hill, crossed the Shenandoah, burned the bridge, and continued his retreat down the valley to Cedar Creek, which was reached early in the morning of the 17th. The Union loss was 93 killed, 552 wounded, and 186 missing. The Confederate loss was 42 killed, 522 wounded, and 13 missing. Consult: 'Official Records,' Vol. XXXVII.; Pond, 'The Shenandoah Valley in 1864'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.; Wise, 'The Battle of New Market.'

E. A. CARMAN.

New Mecklenburg, měk'lĕn-bĕrg, formerly NEW IRELAND, the second largest island of the Bismarck Archipelago (q.v.) to the northeast of New Pomerania, from which it is separated by Saint George Channel. It has an estimated area of nearly 5,000 square miles; with the exception of a small European trading station on the north coast it is inhabited by wild Papuan tribes.

New Mexico, a territory of the United States (Western or Pacific group), between lat. 31° 20′ and 37° N., and lon. 103° and 109° 2′ W.; bounded on the north by Colorado, on the east by Oklahoma and Texas, on the south by Texas and Mexico, and on the west by Arizona. Area, 122,460 square miles (78,374,400 acres), of which two thirds are public lands. Organized 25 Nov. 1850, under act of 9 Sept. 1850. Pop. (1890) 153,593; (1900) 195,310, or about 1.6 to the square mile. Capital, Santa Fé.

Topography.— New Mexico occupies a lofty plateau which reaches its greatest elevation in the north and west and slopes to the south and to the southeast, where lies the western part of the Llano Estacado, or staked plain, no part of the plateau being less than 3,000 feet above sea-level. The altitude of Santa Fé, in the north, is 6,998 feet, that of Albuquerque on the Rio Grande, near the middle of the Territory, 5,008 feet, while Carlsbad (formerly Eddy), on the Rio Pecos, is 3,122 feet. From the vast table-land, both east and west of the Rio Grande, rise numerous sierras and more or less isolated peaks belonging to the Rocky Mountain system. The Sangre de Cristo range of Colorado extends southward into New Mexico to lat. 35° 30′, the various component ridges being the Culebra, Cimarron, Taos, Santa Fé, Mora, Las Vegas, Raton, etc. The principal peaks are Cerro Blanco (14,269), Truchas (13,150), Taos (13,145), Costilla (12,634), Baldy (12,623), Lake (12,380), and Mora (12,020). Southward from these and extending eastward are numerous isolated sierras — the Sandia, Manzano, Gallinas, Jicarilla, Caballo, Oscuro, San Andres, Organ, Blanca, Capitan, Sacramento, Hueco, Guadalupe, and many lesser mountains. West of the Rio Grande and within its immediate drainage is another broken sierra, extending southward from the Colorado line, its principal component groups being the Petaca, Valles, Gallinas, Nacimiento, Jemez, San Mateo, Magdalena, Socorro, Black, Mimbres, Florida, and Potrillo mountains. In the northwest the Carrizo, Tunicha, and Choiska mountains, forming

part of the continental divide, extend into the Territory from Arizona, as do the San Francisco and Peloncillo ranges in the southwest; while lying between the western boundary and the mountains of the Rio Grande area are the Zuñi, Datil, Little Diablo, Black, Tularosa, Mogollon, Pinos, Burro, Pyramid, Big Hatchet, Hacheta, and Animas ranges, with many others of lesser note.

Rivers.—The streams of northeastern, eastern, and central New Mexico flow into the Mississippi and the Gulf of Mexico, while those of the western portion empty into the Gulf of California. The largest river is the Rio Grande, which flows generally southwesterly from the Colorado boundary to lat. 33°, then southeasterly across the Mexican line. This river has several unimportant tributaries within the Territory — the Chama, Jemez, and Rio Puerco from the west and several of even less significance from the east. The Pecos has its source in the Las Vegas Mountains, flows southeasterly, then generally southward, almost paralleling the western escarpment of the staked plain, and southeasterly across the Texas border, finally joining the Rio Grande. The Canadian, with its several headstreams, drains northeastern New Mexico and passes out of the Territory in lat. 35° 25', forming a branch of the Arkansas. The western part is drained entirely by headwaters of the Colorado — the San Juan, the Zuñi, and the Gila. The Rio Mimbres, which heads in the Florida Mountains, is, like all except the largest streams, non-perennial, and indeed even the channel of the lower Rio Grande is frequently dry.

Forests.— Several of the mountain ranges, particularly those of the north and in Lincoln and western Socorro, Grant, and McKinley counties, are covered with timber, the most valuable being pine, although oak, juniper, cedar, birch, maple, and other trees are common. The Pecos River, Lincoln, and Gila River forest areas have been reserved by the United States, but grazing of cattle is allowed under certain conditions. Piñon and cedar are abundant in the foot-hills throughout the Territory; mesquite is found in the southeastern part, east of the Pecos, while the saguaro or giant cactus forms a feature of the landscape in the southern and southwestern parts, where there are also groves of oak and walnut. Along all the watercourses cottonwoods are abundant, and occasionally willows and sycamores are found. Yucca, the roots of which are used as a substitute for soap, is everywhere abundant.

Agriculture.— In many of the valleys and mountain ranges (where the latter are not of exposed basalt) are nutritious grasses — at least 14 varieties, mostly gramma, being found — affording fairly abundant food for the large flocks and herds. Bear, deer, mountain lions, wildcats, and antelope elk are found in the mountains, and rabbits, hares, coyotes, and prairie-dogs are common in the plains. The valley lands are fertile, but as the Territory lies within the arid region, agriculture is conducted largely through irrigation, the irrigated farms forming 74.1 per cent. Much of the water diverted from the streams is wasted by crude methods, and as yet no reservoirs for the conservation of storm water have been constructed. It is estimated that the drainage area of the Pecos River within the Territory alone is susceptible of irrigating 13,000,000 acres of excellent land, or 250 per cent more than the aggregate of farm lands now in the entire Territory. By reason of recent congressional action in providing, by means of reservoirs, for the reclamation of the public lands of the arid region, however, agriculture in New Mexico will doubtless be greatly increased in the next few years. While possessing important mineral resources, New Mexico is pre-eminently an agricultural country, 41 per cent of the 66,396 persons pursuing gainful occupations being engaged in farming and stock-raising. The following table shows the acreage, yield, and value of crops in 1889 and 1899:

	1899	1889
Number of farms	12,311	4,458
Farms irrigated	9,128	.....
Farms not irrigated	3,183	.....
Acreage, irrigated farms	2,892,855	787,882
Acreage, non-irrigated farms	2,238,023	
Acres under culture	203,893	91,745
Value of irrigated farm lands	$13,551,592	8,140,800
Value of non-irrig. farm lands	$ 3,772,117	
Value of farm buildings	$ 3,565,105	.....
Value of live stock	$21,727,400	$25,111,201

In 1903 there were in the Territory 1,123,000 cattle, 5,674,000 sheep, 113,000 goats, and 97,500 horses. The wool clip amounted to 22,000 lbs.; 184,602 cattle were shipped, also 5,526 horses, 17,275 hides, and 422,252 sheep. Irrigated farms number 74.1 per cent of the total, and in acreage 56.4 per cent; in value of land and improvements, exclusive of buildings, 78.2 per cent; in buildings, 77.8 per cent; in implements and machinery, 75.9 per cent; in live stock, 49.7 per cent; in total farm wealth, 64.5 per cent. Average size of all farms (exclusive of those of Indians), 464 acres; of irrigated farms, 360 acres; average value per acre for irrigated land, $29.26; for best irrigated alfalfa land, $50 to $100; for irrigated fruit land, up to $400 and sometimes $500 per acre.

The principal crops in 1899, with their acreage, yield, and value, were:

Crops	Acreage	Yield	Value
Corn	41,345	677,305 bu.	$519,936
Wheat	37,907	603,303 bu.	390,616
Oats	15,848	342,777 bu.	154,347
Barley	1,110	24,107 bu.	12,475
Potatoes	1,169	72,613 bu.	54,140
Forage	87,358	177,390 tons	1,427,317
Beans	3,349	36,022 bu.	73,001
Pease	2,220	28,071 bu.	.....
Onions	160	25,014 bu.	.....
Orchard fruits	7,219	267,835 bu.	197,331

Mineral Resources.—The mining industry is important. From 1860 to 1890 $17,600,000 in gold was produced; in 1903 the value of the yield was: gold, $384,685; silver, $148,659; copper, $860,737; lead, $94,936. Coal mining is extensively carried on, although only the fields adjacent to the railroads have been worked. The output of coal in 1900–03 (mostly bituminous) was 3,710,004 tons, valued at $5,011,281. During the same period 94,097 tons of coke were produced, valued at $252,642. Twenty-eight coal mines were in operation in 1903, with 2,341 operatives and a production of 1,359,530 tons. The coal area lies chiefly in McKinley, San Juan, Colfax,

and Rio Arriba counties, in the northern and western parts of the Territory. The coal-bearing formations aggregate 1,850,000 acres, of which about 40 per cent is probably productive. Iron, salt, gypsum, clay, soda, ochre, potash, mica, marble, molybdenum, tungsten, and vanadium are also found, as are turquoise, garnets, opals, and chalcedony. Mineral springs are abundant.

Political Divisions.— The following table gives the counties, with their area, property assessment, population, and county-seats:

County	Area (sq. m.)	Property assessment	Population (1900)	County-seat	Population (1900)
Bernalillo	1,567	$3,103,120	15,465	Albuquerque	6,238

* Population is that of Guadalupe County, out of which Leonard Wood County was principally formed.

Climate.— The climate is very dry and healthful, and has made the Territory justly celebrated as a resort for those afflicted with pulmonary troubles. The annual mean temperature ranges from 42.4° at Winsors, San Miguel County (8,000 feet), to 65° at Carlsbad, Eddy County (3,122 feet). The highest temperature recorded in 1902 was 112° at Carlsbad (25 June), and the lowest —12° at Bluewater, Valencia County (2 Feb.). The total precipitation for 1902 ranged from 22.42 inches at Carlsbad, to 4.66 inches at Deming, Luna County. Nearly half the precipitation (10.5 inches) at Carlsbad occurred in July. The greatest rainfall occurs between May and August, the least between February and April. The number of rainy days in 1902 ranged from 78 at Santa Fé to 18 at Albuquerque; average, about 40 days. The prevailing winds are southwest, west, southeast, and east. Although the summer temperature is sometimes high, especially in the southern part, owing to the dryness of the atmosphere the heat is never oppressive and the nights are always cool.

Population.—(1870) 91,874; (1880) 119,565; (1890) 153,593; (1900) 195,310 (native, 181,685; foreign, 13,625; males, 104,228; females, 91,082; white, 180,207; colored, 15,103—of whom 13,144 are Indians). Illiterates form 33.2 per cent of the total population, a reduction from 44.5 per cent in 1890.

Finances.—The Territorial net assessment for taxation in 1903 was $39,596,951, and the exemption $2,235,615. In 1893 the total assessment was $41,602,198. In the former year the indebtedness was $1,098,300, and the indebtedness sinking fund $134,590. Revenue from taxation aggregated $419,622; from other sources, $156,788. Territorial tax rate in 1902, 13.99 mills. United States internal revenue collected in 1903, $33,918. There are 19 national and 11 State banks, with resources of $10,696,449; capital stock, $1,439,200; deposits, $7,440,409 (National, $5,675,594; State $1,764,815); loans and discounts, $5,803,697. The value of Territorial buildings and grounds is about $2,000,000.

Education.—The number of public schools in the Territory in 1903 was 655, with 757 teachers. The school population (5–21 years) was estimated at 68,152, the enrolment 37,646, and the average attendance 24,856. The expenditure for public schools was $287,545, and the value of school property $690,697, exclusive of land grants. The Territory maintains the University of New Mexico at Albuquerque, the College of Agriculture and Mechanic Arts at Las Cruces; a Normal University at Las Vegas, a Normal School at Silver City, a School of Mines at Socorro, and a Military Institute at Roswell. The government supports Indian training schools at Santa Fé and Albuquerque, with 300 pupils each, also two boarding schools with 174 pupils, and 19 day schools with about 600 pupils. The educational facilities of the Territory have greatly increased in the last 10 years. In 1901 there were 11 public, society, and school libraries having 1,000 volumes or more, aggregating 27,732 volumes, or 14 books per 100 population.

Religion.—The population consists largely of Roman Catholics, who have an archbishop, a bishop, a vicar-general, 16 regular priests, 43 secular priests, 42 churches, 325 mission churches, 6 academies for young women, a college, 8 parochial schools, 2 Indian boarding schools with 300 pupils, 2 day schools for Indians with 200 pupils, and 2 academies for boys. The Baptists have 36 churches, a college, and several mission schools; the Methodists 17 English-speaking and a number of Spanish-speaking congregations, together with a number of mission schools; the Presbyterians 45 congregations, 30 preaching stations, 25 mission schools with 45 teachers and 1,562 pupils; the Mormons 2 churches with 277 members. Other Protestant denominations have

about 20 congregations, and the Hebrews 5 organizations and 2 synagogues.

Charitable, Penal, etc.—The Territory supports an asylum for the insane at Las Vegas, an asylum for the deaf and dumb at Santa Fé, an institute for the blind at Alamogordo, a miners' hospital at Raton, a reform school at El Rito, and an orphanage at Belen. The Territorial Penitentiary is situated at Santa Fé. A hospital and orphanage at Santa Fé and a sanatorium at Albuquerque are supported by the Roman Catholic Sisters of Charity; there are also two hospitals at Silver City, one at Deming, and one at Carlsbad, all of which are supported in part by the Territory. Government sanatoria are in successful operation at Fort Bayard and Fort Stanton, where several hundred soldiers and sailors from all parts of the country have been cured of pulmonary tuberculosis. There are also several private sanatoria in the Territory.

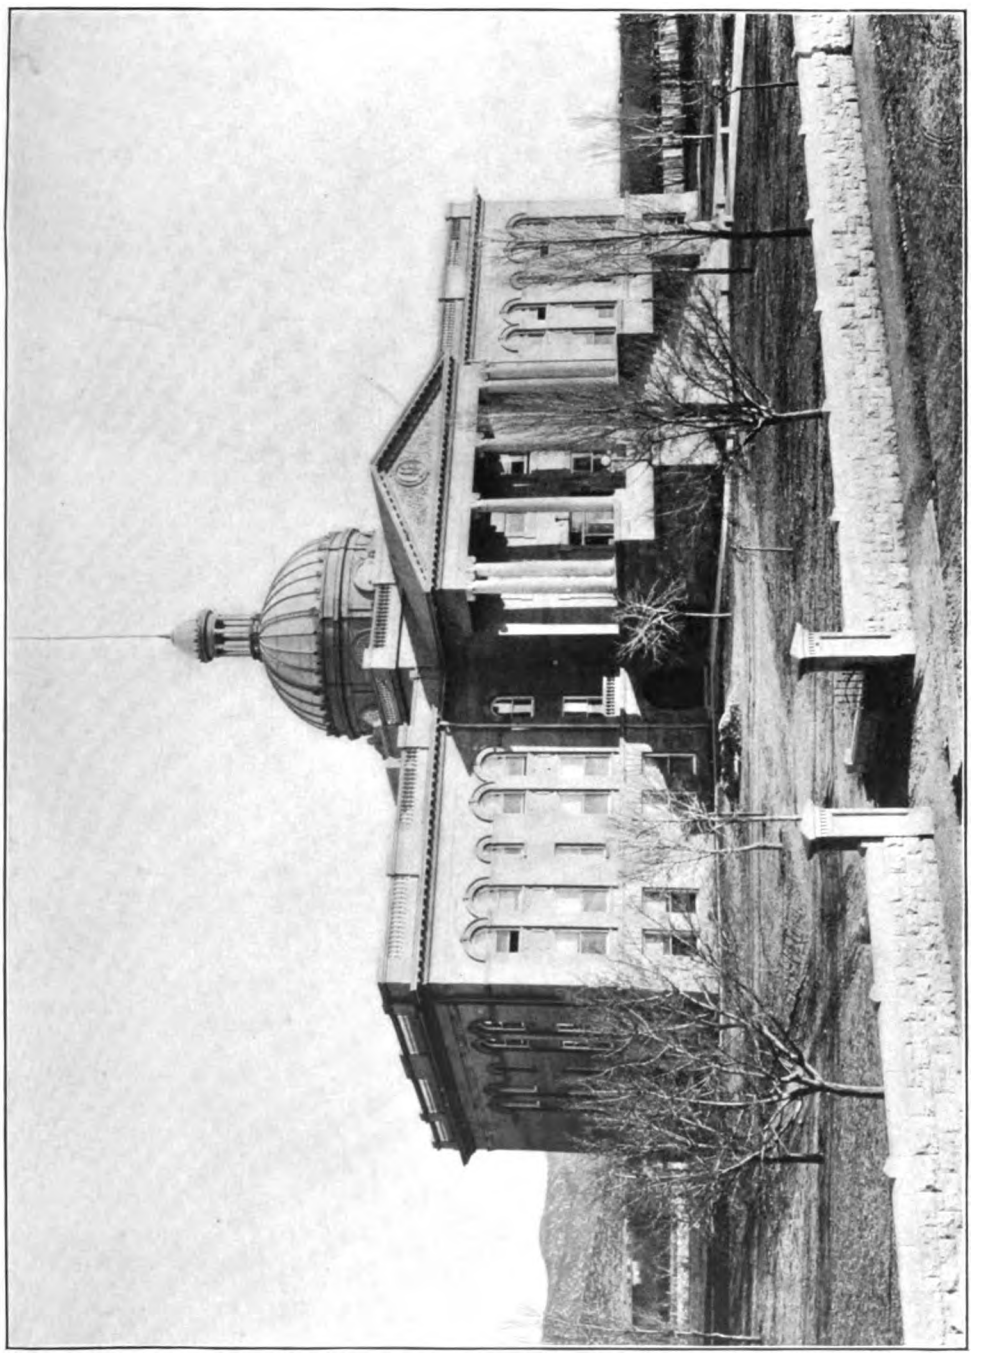
Transportation.—The total railroad mileage of New Mexico in 1903 was 2,520, an increase of 841 miles in three years.

There were 393 post-offices and 70 periodicals (5 daily, 60 weekly, 5 monthly).

History.—For untold generations before the discovery of America, New Mexico was the home of sedentary tribes of Indians — the ancestors of the present Pueblos — as well as of nomadic predatory tribes. The former constructed villages, principally of stone, on the mesas, in the shelves of rocky cliffs (see CLIFF-DWELLERS), and in the valleys. Their numbers considerably exceeded that of their descendants of to-day, but there is no reasonable ground for the generally popular belief that New Mexico ever contained a teeming sedentary aboriginal population, notwithstanding the hundreds of ruins scattered throughout its area, particularly west of the Rio Grande. There is definite historical as well as traditionary evidence that many of the pueblos occupied at the time of the discovery of the Southwest were later abandoned on account of Apache and Navaho raids, or by reason of epidemics, the failure of water supply, through superstition, or the efforts of early Spanish missionaries to concentrate the natives. Many ruined pueblos in the Territory may thus be accounted for; for although Coronado in 1540–2 recorded 64 inhabited villages, some of them extensive, only two (Acoma and Isleta) of the 17 which remain still occupy their 16th century sites. The recorded history of New Mexico dates from 1539, in which year Marcos de Niza, a Franciscan friar, accompanied by a Barbary negro named Estevan, or Estevanico, traversed the country from Mexico to the Zuñi Indian villages, then known as the "Seven Cities of Cibola," in the western part of the Territory. Estevan, preceding Fray Marcos during the latter days of the journey, was killed by the natives at their village of Hawikuh, one of the seven towns; Niza followed, viewed the pueblo from an adjacent height, and fled back to Mexico. In February of the following year Francisco Vasquez Coronado, guided by Niza and accompanied by a large force, marched from Compostela, Mexico, to Cibola, storming and capturing Hawikuh (which he named Granada), in July. Expeditions sent out from here by Coronado resulted in the discovery of the Hopi or Moqui villages (called Tusayan) in northeastern Arizona, and the Grand Cañon of the Colorado. In the autumn the army moved to the province of Tiguex, in the vicinity of the present Bernalillo, on the Rio Grande, where winter quarters were established and whence parties were sent to visit the neighboring pueblos.

In the spring of 1541 Coronado crossed the Pecos River into the present Texas and northward through the buffalo plains to the Wichita settlements of Kansas — the "Province of Quivira" — where several months were spent in exploration; but gold, which formed the object of the dreary march, was not found. The expedition returned to the Rio Grande, and thence to Mexico in the spring of 1542, having spent nearly two years in the country. Two friars remained in New Mexico and one in Kansas, but these were killed by the Indians. New Mexico was visited in 1581 by Francisco Sanchez Chamuscado, with a small escort and three Franciscans, the latter being left among the Rio Grande Pueblos. These were killed after Chamuscado's departure. Late in 1582 Antonio de Espejo, with a bodyguard, was authorized to explore the new province and to learn the fate of the missionaries. Following the route of Chamuscado up the Rio Grande, he reached Puala, or Puaray, near the present Bernalillo (the principal town of Coronado's Province of Tiguex), where the friars had been slain, the Indians fleeing on his approach. From this point Espejo extended his travels to the pueblos of Sia, Jemez, Acoma, and Zuñi, and to the Hopi towns of Arizona, thence eastward to the Rio Pecos and back to Mexico. The next important event was the colonization of New Mexico by Juan de Oñate, the first governor of the province, who reached the new country via the Rio Grande in 1598 with about 400 colonists, and established the town of San Francisco de los Españoles, later known as San Gabriel, where Chamita, at the mouth of the Rio Chama, now stands. All the sedentary tribes were visited and their vows of obedience and vassalage taken, and the country from eastern Kansas to the head of the Gulf of California explored between 1598 and 1605. In the latter year San Gabriel was abandoned and the seat of government moved to Santa Fé, which dates from this time. During the following few years the new colony barely existed; in 1617 it had only 48 soldiers and colonists, although the missionaries had been so zealous that 11 churches had been built and 14,000 natives baptized. In 1680 the Pueblos rebelled against Spanish authority, killed many missionaries and colonists, and laid siege to Santa Fé, where the panic-stricken survivors had taken refuge in the adobe Palace, which still stands. Governor Otermin finally succeeded in driving the Indians off with considerable loss, and in retreating down the Rio Grande to El Paso, Texas, with a thousand followers, leaving the natives in almost uninterrupted possession of New Mexico until 1692. In that year Diego de Vargas reconquered the province, with great loss to the Indians, enabling its resettlement toward the close of the year by 800 colonists. In 1696 the Indians again revolted, killing five friars and 21 other Spaniards, and it was not until the close of the century that the Pueblos were entirely overcome.

Henceforward New Mexico grew in im-



CAPITOL AT SANTA FE.

portance; new towns were established in the Rio Grande Valley, which slowly increased in population despite the constant depredations of the Apaches and Navahos. Early in the 19th century a considerable trade sprang up between the province and the settlements along the American frontier, notably Kaskaskia in Illinois, and later Franklin and Independence in Missouri, which increased from $22,000 in 1822 to $750,000 in 1844. This was the beginning of the overland commerce via the famous Santa Fé trail, which came to a close when the Atchison, T. & S. F. Railroad entered the Territorial capital in 1880. Mexico having thrown off the yoke of Spain in 1821, New Mexico became a Mexican province; in 1824 it was made a territory, and in 1836 a department, remaining such until 1846, when it was taken possession of by General Stephen W. Kearny in the name of the United States. In 1848, by the Treaty of Guadalupe Hidalgo (q.v.), New Mexico, the boundaries of which were very indefinite, but which comprised Arizona north of the Gila (see GADSDEN PURCHASE), and a part of Colorado, was ceded to the United States, and on 25 Nov. 1850 the Territory was organized through the agreement by Texas to the New Mexico boundary, under the Act of Congress approved 9 September. In 1863 western New Mexico became the Territory of Arizona, and in 1865 a northern strip was annexed to Colorado.

New Mexico was the scene of several conflicts during the Civil War, notably the defeat of the Federals under Canby, by the Texans under Sibley at Valverde in February 1862. Santa Fé was occupied by the Union forces in March; Sibley took possession of it a week later, but was forced to evacuate in the following month, after the defeat of the Confederates in a two-days' engagement in Apache Cañon. Efforts for the admission of New Mexico as a State have been made for many years, but thus far without success.

F. W. HODGE,
Smithsonian Institution, Washington, D. C.

New Mexico College of Agriculture and Mechanic Arts, opened in 1891, at Mesilla Park. It does not share in the United States land grant of 1862, but receives the annual appropriation from the Federal government provided for in the law of 1890, and also receives annually an appropriation from the Territory; the total income in 1902 amounted to $48,000. The regular four years' courses are general scientific, agriculture, and mechanical engineering, on completion of which the degree of B. S. is conferred. There are in addition two years' courses in agriculture and practical mechanics, a 12 weeks' course in agriculture and horticulture, a one year course in stenography and typewriting, graduate courses, and a preparatory department (five years' course). The college is coeducational, women forming about one half the number of students; there are also women on the faculty. The library in 1902 contained about 10,000 volumes; the students in all departments numbered 307, of whom 144 were in the preparatory department.

New Mexico, University of, situated at Albuquerque, incorporated in 1889 by the legislature of the Territory, and intended for the State University when New Mexico is admitted to the Union. It was first opened in 1892, and new departments subsequently added till the organization now includes the collegiate department (classical and scientific courses), the departments of music and art, a business school, and normal and preparatory departments. The degrees of bachelor of arts and bachelor of pedagogy are given; also master of arts and doctor of philosophy. Women are admitted on equal terms, and a cottage for their use has been built on the campus. Connected with the university is the Hadley Climatological Laboratory devoted particularly to the investigation of the effect of the dry and plateau regions of the United States upon health and disease. The income, which is derived largely from State appropriations, was $14,000 in 1903; the students in that year numbered 100, and the faculty 12.

New Mil'ford, Conn., town, county-seat of Litchfield County; on the Housatonic River, and on the Berkshire division of the New York, N. H. & H. railroad. It was settled in 1707 by John Noble from Westfield, Mass., and later a colony from (Old) Milford, Conn., located at New Milford. It is situated in a hilly country which has considerable good farm land; tobacco is the great specialty. The extensive water-power of the Housatonic is being utilized by means of a canal two miles long, which extends from Bulls Bridge to New Milford. The New Milford Power Company, who own the plant, will furnish electricity to towns at a considerable distance. The tobacco warehouses have over 500 employees; the wood finishing factory, 90; the hat factory, 285; upholstery works, 40; lime works, about 60. There are several other smaller manufacturing establishments. A library and Memorial Hall for the free use of the Grand Army veterans, the town hall, the churches, and schools are all fine buildings. The educational institutions are good public schools, Ingleside School for young women, and Weantinong School for boys. There are three banks, with a combined capital of about $400,000. The government is administered by three selectmen chosen annually by the people. Pop. (1890) 3,917; (1900) 4,804.

J. A. BOLLES,
Editor 'New Milford Gazette.'

New Netherlands, neth'ĕr-landz, the name given by the Dutch to the colony they established in America in 1626. A British fleet, under command of Richard Nicolls, captured the place in 1664; and by order of Nicolls, the Duke of York was made ruler and the name changed to New York. See NEW YORK.

New Or'ange, a name applied to New York in 1673, when the colony of New Netherlands was retaken from England by the States-General of Holland. The name was used in honor of the Prince of Orange.

New Orleans, La., the twelfth city of the United States in population, and the largest south of the Potomac and Ohio rivers, is situated on the Mississippi River, 107 miles from its mouth. Built in a bend, it was originally crescent-shaped, whence its title of "the Crescent City." It has spread out in all directions, and has even taken in the suburbs on the west bank of the river, so that the resemblance to a crescent has completely disappeared.

Area and Drainage.—The corporate limits cover 189 square miles, including a large area of uninhabited swamp. The improved portion is 26,026 acres, or 41 square miles, in extent. The site of the city is several feet below the level of the river at extreme high water. The land is mostly flat, and slopes back from the Mississippi, draining into Lake Pontchartrain. These conditions have made the problem of draining and sewering the city very difficult; and it was finally solved only in 1895, when a threefold system was adopted, the sewage being emptied into the Mississippi on the south, the drainage into Lake Borgne on the east, and the ordinary rainfall into Lake Pontchartrain on the north.

In consequence of these improvements important changes have taken place in the soil and climate, which have been rendered much drier; and whereas because of the saturation of the soil it was formerly thought impossible to erect buildings more than three or four stories high, "sky-scrapers" are now built as in other American cities. As early as 1728 levees or dikes were built in front of the city to protect it against freshets. It is now surrounded by levees, and no portion of it has suffered from flood for over 50 years.

Climate.—The climate is mild and damp. A "freeze" is rare, and the thermometer has been below 17° F. only once. The mean temperature is 69° F. The summers, while long, are not excessively hot, as the nights are cool, and prostrations from sunstroke are much rarer than in other large American cities. Formerly the city suffered severely from malarial fevers, but these have disappeared with sanitary improvements, and in 1902 the death-rate among the whites had fallen to 17.2, a decrease of nearly one half, in 20 years. Among the negroes the mortality is still high.

Population.—In the years 1830-60 New Orleans increased in population from 46,310 to 168,875; the next 30 years brought the number up to 242,039; in 1900 it was 287,104; in 1903, about 325,000. The creoles, of French and Spanish origin, and once the dominant element in politics and business, still constitute one fourth of the white population, and largely determine the social tone of the city, most of the customs and usages being borrowed from them — holidays, public celebrations and balls, the carnival, the cuisine, fashions, etc. The American influence, however, is increasing steadily.

Architectural Features.— A wide central thoroughfare, Canal Street, the shopping centre, divides the old French city, *le Vieux Carré* (the Old Square) from the newer districts. The former is built in the French and Spanish architecture of a century ago. A large part of the old city was destroyed in the fire of 1788, but many buildings still remain which date back from before the fire, and there are hundreds over a century old. The oldest public building is the Archiepiscopal Palace, dating from 1737, originally erected as a convent for the Ursuline Nuns. The Cabildo, now occupied by the State Supreme Court, was erected in 1795, and was formerly the government building. Here the cession of Louisiana from France to the United States took place in 1803. The Civil Court Building, also of Spanish architecture, was erected at the same time. The Saint Louis Cathedral, originally the Parish church of New Orleans, was erected in 1723. It was twice destroyed, once by a hurricane, again by fire, and was rebuilt in 1794. The Church of St. Anthony de Padua (Italian) was formerly the mortuary chapel of the old Saint Louis cemetery. In this quarter the residences are of a characteristic architecture styled "creole," largely modeled on the plantation homes of the West Indies, the dwellings being of wood or of brick and stucco. In the more densely populated section they have large courtyards in the centre; in the suburbs they are surrounded by wide verandas or "galleries," and shaded by an abundance of shrubbery.

Besides those already mentioned, the more important public buildings are the custom-house, of New England granite and solid Egyptian architecture — for many years the largest public building in this country; the Cotton Exchange, of florid Renaissance; the Saint Louis Hotel, at one time the largest in the United States, and used for some years as the Louisiana State-house; the United States Mint, Tulane University, Newcomb College, the Public Library, Howard Memorial Library, Tulane Hall, the Church of the Immaculate Conception (Jesuit), with college attached; Christ Church Cathedral, criminal courts, city-hall, and the French Opera-house, the oldest opera-house in this country.

Parks, etc.— The city is somewhat deficient in parks. The City Park is geographically central, in what was formerly used as a dueling ground. Audubon Park, fronting on the Mississippi, was the de Boré plantation, on which sugar was first produced in Louisiana. Both are well shaded by immense live oaks over a century old. Audubon Park has a handsome horticultural hall, erected in 1884, containing a fine collection of tropical trees and plants, and here is also a model sugar and cotton farm — the Audubon Experiment Station. Jackson Square, formerly the Place d'Armes, on which the Saint Louis Cathedral, Cabildo, and court buildings face, was laid off at the foundation of the city, and was the centre of New Orleans history for a century and a half. It contains an equestrian statue of Gen. Andrew Jackson. Beauregard Square was formerly Congo Square, the gathering place of slaves in the earlier days. Lafayette Square, on which the city-hall faces, contains statues of Henry Clay and John McDonogh, who left his large fortune to educational purposes. Lee Circle contains a tall pillar surmounted by a statue of Gen. Robert E. Lee. Margaret Place contains a statue of Margaret Haughery, "the friend of the orphans." Jackson Barracks, the United States army station, has extensive grounds. On the west side of the river is the United States Naval Reservation, with a large floating dock for the use of men-of-war and a naval station in the course of construction.

Municipal Divisions and Government.—New Orleans is divided into seven municipal districts, corresponding with the towns or "faubourgs" that have at different times been annexed to the original city, and 17 wards. Its assessed valuation is $156,500,000. The government is administered by a mayor and council, but most of the municipal functions are under the control of appointive boards or commissions.

Banking.—New Orleans is the most impor-

tant banking centre of the Southwest. It has eight national, seven state, and five savings banks, with a capital of $15,890,150, deposits of $58,579,600, and resources of $77,356,346.

Commerce.— New Orleans is the second port of the United States, being exceeded in commerce only by New York. Its commerce, foreign and coastwise, amounts to $720,000,000 a year. The Mississippi River, which is the chief channel of trade, is from 1,800 to 3,600 feet wide and from 60 to 240 feet deep. Including the commercial suburbs of Port Chalmette, Gretna, and Westwego, New Orleans has a frontage on the river of 26 miles, lined throughout the greater part with wharves and docks. The present channel through the Eads jetties in South Pass permits vessels drawing 30 feet of water to ascend from the Gulf of Mexico to New Orleans. Work was begun in 1903, to be completed in 1908, on a new outlet through Southwest Pass, which will admit vessels drawing 35 feet of water.

New Orleans is the largest cotton port in America and has the largest export of cotton-seed-oil and by-products. It is first in the importation of tropical fruits, and second in coffee. Its export is also large in hides, wool, lumber, staves, rice, flour, tobacco, and all the products of the South and West.

The railroads centring at New Orleans are the Southern Pacific, Texas & Pacific, Louisville & Nashville, Southern, Illinois Central, Yazoo & Mississippi Valley, New Orleans & Northeastern, St. Louis & San Francisco, Shreveport & Red River Valley with two local lines, the New Orleans & Southern, and the New Orleans, Fort Jackson & Grande Isle, all together operating or controlling 49,363 miles of road.

All the lines have extensive yards and terminal facilities, the most important being those of the Illinois Central at Stuyvesant Docks, with a mile front on the Mississippi, and those of the Southern and the St. Louis & San Francisco at Port Chalmette, with three miles of front on the river and improvements to cost $15,000,000.

The Mississippi River, besides offering wharfage for ocean vessels, is the source of a large steamboat and barge traffic, extending to all parts of the Mississippi Valley. The Carondelet and New canals give access to Lake Pontchartrain and Mississippi Sound, and handle a large trade in coal, iron, lumber, building materials, and naval stores. There are from 5,000 to 6,000 arrivals per year by canal, generally of small vessels.

Manufactures.— The manufacturing interests have greatly developed since 1885. New Orleans has now the largest manufacture of cottonseed-oil and by-products; the largest milling of rice; and is one of the chief centres of sugar-refining, and of the manufacture of lumber, clothing, bags, cigars, and cotton goods. The census of 1900 returned 89 different industries, 1,534 factories with $46,003,604 of capital, and a total output of $63,514,505, which had increased by 1903 to more than $80,000,000.

Educational and Charitable Institutions.—The educational facilities of the city have been greatly improved and extended in recent years. Tulane University has four departments, law, medicine, the arts, and sciences, and Newcomb College for the higher education of women, all well endowed. It has 67 teachers and 1,350 students. The College of the Immaculate Conception has an average annual attendance of 400 students. There are also a college of pharmacy and a college of dentistry, besides numerous minor educational institutions. There are four colleges for negroes: Southern University (supported by the State), New Orleans University (Methodist), Leland University (Baptist), and Straight University (Congregational), with 60 teachers and 3,400 students, mainly in the preparatory grades. The public school system includes three high schools and 69 grammar and preparatory schools, with an average attendance of 32,000 children. The private and parochial (mainly Catholic) schools have an average attendance of 12,000 pupils. The Ursuline Convent, for the higher education of girls, is the oldest school of its kind in the United States, having been in uninterrupted session since 1729. Newcomb College, established in 1887, has done much for the development of education and art among the women of Louisiana. The three libraries — the Fisk and Public Libraries, the Howard Memorial, and the State Library — have a total of 180,000 volumes.

Most important among the charitable institutions is the Charity Hospital, founded in 1782. It is supported by the State, has 850 beds, accommodates an average of 8,500 patients, while 20,000 to 25,000 more are given outside treatment each year. Connected with it is the Richard Milliken Hospital for children. The Eye, Ear, Nose and Throat Hospital is also a charity institution. Other hospitals are the United States Marine Hospital, the Touro Infirmary, Hotel Dieu, New Orleans Sanitarium, and the Louisiana Retreat, the last for the insane. There are 47 asylums with 3,500 inmates, receiving small appropriations from the city, but maintained mainly by charity or endowment funds.

Churches.—There are 294 churches, of which 203 are for whites and 91 for negroes. The Catholics, with 41 churches, are strongest in point of numbers. The Baptists have 66 churches, of which 61 are for negroes; the Methodists 39, of which 21 are for negroes; the Episcopalians 14, Presbyterians and Lutherans 13 each. There are also 6 Jewish synagogues.

Cemeteries.—The cemeteries number 33, some of them being in the central portion of the city. The dead are usually buried above ground in vaults on account of the humidity of the soil. The National Cemetery at Chalmette contains the bodies of many Union soldiers.

History.—The site of New Orleans, on which stood a village of the Houma Indians, was first visited in 1699 by a French expedition under Bienville, who in 1718 obtained the consent of the French government to the establishment of a colony there, and the city was laid out and named in honor of the French regent, the Duc d'Orléans. In 1726 it was made the capital of the French colony of Louisiana, which then included nearly all the Mississippi Valley. The first colonists, either Frenchmen or French Canadians, were reinforced by settlers from the West Indies and Germans sent over by John Law (q.v.). The province having been transferred to Spain in 1763, a Spanish force was sent to take possession of New Orleans, but was driven out by the inhabitants, who established a government of their own, to which the Spaniards put an end in 1769. The population, at that time,

3,190, was greatly increased during the period of Spanish domination by accessions from Spain, the Canary Islands, and Santo Domingo, and of French Acadians from Nova Scotia. The original population was never friendly to Spain. By Spanish governors New Orleans was walled and surrounded with fortifications. At the time of the Louisiana Purchase (q.v.), in 1803, its inhabitants numbered 11,856; its commerce was large, and its society, which included many families of wealth and culture, was noted for fashion and refinement.

New Orleans was incorporated as a city in 1804. When, in 1812, Louisiana (q.v.) was admitted to the Union as a State, the city was its capital, as it had been that of the province, remaining such until 1852. From 1865–80 it was again the State capital.

On 8 Jan. 1815 occurred the battle in which Gen. Andrew Jackson defeated the British army under Gen. Pakenham. It was fought at Chalmette, now a suburb of the city.

The racial jealousies existing between the creoles and the new comers or Americans led to division of New Orleans in 1836 into three municipalities, each with a government of its own. They were consolidated again in 1852, at which time New Orleans was the third city in population in the Union, and was disputing with New York the first place in commerce.

Soon after the secession of Louisiana from the Union and the establishment of the Confederate government, New Orleans was blockaded by the Federal fleet under Farragut. It was captured in April 1862. A succession of misfortunes followed the Civil War — epidemics, political troubles, and the inundation of the surrounding country. The city for a time increased slowly in population and actually declined in commerce and business. Improvement began in 1879, with the Eads jetties, which enabled vessels of larger draft to enter the Mississippi. A more marked gain came in 1896 in the way of improved sewerage and drainage, for which the people voted a special tax of $16,000,000. Better sanitary conditions were secured, and then followed the increase and extension of railroad facilities, the opening up of new territory to trade, and the development of manufacturing industries, all leading to the present rapid growth and sustained prosperity of the city.

NORMAN WALKER,
Associate Editor 'Times-Democrat.'

New Orleans, Battle of, The, in American history, an engagement fought on 8 Jan. 1815, between a force of 12,000 British under Sir Edward Pakenham, and one of 6,000 Americans under Gen. Andrew Jackson. The latter were in a strongly intrenched position and awaited Pakenham's assault on their lines. The battle lasted only 25 minutes, when the British fled, leaving behind them 2,600 killed and wounded. Pakenham was among the slain. The Americans' loss was only 8 killed and 13 wounded. In this battle the weight and precision of the American fire were such that no troops in the world could have stood against it. One British authority says that not even from Saint Sebastian had so severe a fire been poured upon an attacking force. One British regiment, the 93d Highlanders, distinguished for its services in many parts of the world, lost more than half its men, having been brought to a point where it could do no good, but where it could be most effectually operated upon by the Americans. The British troops never behaved better, but they were badly handled.

New Orleans, Capture of, in 1862. The Civil War engagement which resulted (24 April) in the taking of New Orleans, was actually fought 70 miles down the Mississippi. The great bend next below the city was commanded by Fort Jackson on the west (north) bank, and Fort Saint Philip on the east. Supposed to mount 150 guns each, they had in fact 109 together, over half of them only 24's; and the garrison was largely Northerners and foreigners. The river was blocked by a chain buoyed by 11 steamer-hulks, and there were fire-raft and boats above. Farragut's fleet comprised 17 wooden vessels with 154 guns; besides six gunboats with 30 guns and 20 mortar-schooners with one gun each, under command of David D. Porter (q.v.). Bombardment on the forts was opened 18 April; and on the night of the 20th a Union vessel hugging the bank got above the boom, and coming down with a full head and current, snapped the chain and left the channel free. After three days' more bombardment it was determined to pass the forts instead, in the dark, and on the morning of the 24th, about 2:30, the vessels steamed forward in two columns, Farragut leading one in the Hartford, Capt. Theodorus Bailey the other, while the mortar-boats shelled the water-battery commanding the approach to Fort Jackson. All but the last three of Farragut's column succeeded in passing the boats before daylight made it impossible, the vessels' guns in turn driving the fort gunners from their posts. Above, the Confederate flotilla of 17 vessels inflicted great damage, one Union gunboat being sunk, one badly crushed by a ram and the Hartford fired by a fire-boat. Nine Confederate vessels were sunk or captured, however, and the Union fleet proceeded to New Orleans and compelled it to surrender. On the 28th the forts also capitulated. It is due to history to add that of the 17 Confederate vessels, 9 of which were rams and 2 ironclads, only 4 vessels and 12 guns were in such condition as to be capable of making a fight. If the materials of the force of John K. Mitchell, the Confederate commander, had been completed, his little fleet could have made a very creditable defense; but J. R. Soley, of the United States navy, truly says that no commander, taking hold of his vessels in their incomplete condition four days before the fight, could have made much out of them. This victory of Farragut's prevented Louis Napoleon from recognizing the Confederacy and raising the blockade, and hence was one of the most important of the war.

JOSEPH T. DERRY,
Author of 'History of Georgia.'

New Orleans University, in New Orleans, La.; coeducational, founded in 1873 under the auspices of the Methodist Episcopal Church. It has preparatory and collegiate departments, and its courses lead to the degrees of A.B., B.S., and Ph.B. In 1903 there were connected with the school 24 professors and instructors and nearly 600 students. The library contained over 6,000 volumes, the grounds and buildings were

valued at $130,000, the productive fund was about $12,000, and the income about $8,000.

New Philadel'phia, Ohio, city, county-seat of Tuscarawas County; on the Tuscarawas River and the Ohio Canal, and on the Pennsylvania and the Cleveland, L. & W. R.R.'s; about 100 miles northeast of Columbus and 90 miles south of Cleveland. It was settled in 1805 and incorporated in 1808. It is in an agricultural region, but its good water-power and facilities for transportation have contributed toward making it a manufacturing city. Some of the manufactures are pressed, stamped, and enameled goods, steel products, flour, woolen goods, brooms, canned goods, tile, and wagons and carriages. Shorenbraun Springs and Springer's Park are of interest. The mayor is elected biennially, and the council appoint or elect the administrative officials. Pop. (1890) 4,456; (1900) 6,213.

New Philippines, fĭl'ĭp-pĭnz or -pēnz, a name sometimes given to the Caroline Islands (q.v.).

New Pla'tonists. See NEO-PLATONISM.

New Pomera'nia, or **Neu Pommern,** noi pōm'ĕrn, formerly NEW BRITAIN, the largest island of the Bismarck Archipelago (q.v.), 50 miles distant from Kaiser Wilhelm's Land, New Guinea, Rock Island and the Dampier, and the Vitiaz straits, intervening. It is crescent shaped, 300 miles long, with a maximum breadth of 90 miles, and an estimated area of 9,500 square miles. There is a German mission and trading station on the northeast coast. The inhabitants are savage Papuans.

New Prov'idence, one of the Bahama Islands (q.v.), northeast of Andros Islands and about 300 miles east by north of Key West. In 1629 the first English settlement on the Bahamas was made on New Providence. This island has the best harbor of any of the group. Nassau (q.v.), the capital of the islands, is on New Providence. Although this island, as all of the group, belongs to Great Britain, it is a part of Roman Catholic archdiocese of New York.

New Red Sandstone, in geology, a term formerly used, in contra-distinction to Old Red Sandstone (q.v.), of red shale, loam and sandstone lying above the coal measures. The nomenclature is faulty, being based only on a color distinction, and it is now recognized that the rocks formerly grouped under this name are at two very different eras, the Permian and Triassic (qq.v.).

New River. See GREAT KANAWHA.

New Rochelle, rō-shĕl', N. Y., city, in Westchester County; on Long Island Sound, and on the New York, N. H. & H. railroad; 16½ miles from the Grand Central Station in New York city. It has connection by electric railroads and trolleys with New York city and several of the villages and cities in the vicinity. It was settled in 1687 by Huguenots, and was named after La Rochelle, France. It has a beautiful location, and is considered a desirable residential city by a large number of the business men of New York. It has a well-kept park, and Glen Island, Echo and Neptune bays are nearby. The prominent buildings are a number of old colonial edifices, several of the churches, especially Saint Gabriel's (R.C.), with its parish school building, both gifts of Adrian Iselin, the Masonic Temple, a hospital, Knights of Columbus and the city buildings. The water supply is exceptionally pure; and the vital statistics show a low death rate. It is the seat of the Ursuline Seminary of Saint Teresa, founded in 1898, and it has several private schools, good public and parish schools, and a public library which contains about 9,000 volumes. Thomas Paine resided here for some years. At present (1904) it is the home of a number of well known authors and artists. Pop. (1890) 9,057; (1900) 14,720.

New Roof, The, a term used in early American history for the Federal Constitution.

New Sallee, să-lă', Morocco. See RABAT.

New Shet'land. See SOUTH SHETLAND ISLANDS.

New Sibe'ria, or **Liakhof** (lē-ăH'ŏf), **Islands,** a group of islands in the Arctic Ocean, off the north coast of Siberia, between the mouths of the Lena and Indigirka, and administratively attached to the government of Yakutsk. The group comprises Liakhof, Maloi, New Siberia, Thaddeus, Kotelnoi, and Bennett Islands; the area is estimated at 20,480 square miles; they are rocky, treeless, icebound all the year round, and uninhabited. Reindeer, foxes, and white bears are found, and there is immense wealth in fossil ivory, the remains of mammoth, rhinoceros, and buffalo.

New Som'ersetshire, in American history, a name given the territory extended to William Gorges in 1636, and comprising those settlements along the coast of Maine, which had not been included in the Ferdinando Gorges patent of 1631. William Gorges was appointed first deputy-governor of the district.

New South Shetland Islands. See SOUTH SHETLAND ISLANDS.

New South Wales, Australia, the oldest Australasian colony of Great Britain and since 1901 one of the six original and the most populous, though not the largest, state of the commonwealth, in the southeastern portion of the continent. It is separated from Queensland on the north by an irregular line running southwest from Port Danger in lat. 28° 8′ S., till it meets the 29th parallel of latitude which forms the rest of the north boundary; on the east the Pacific Ocean is the boundary; on the south the Murray River, and a line running northwest from Cape Howe, lat. 37° 31′ S., separates it from Victoria; while on the west the 141st meridian forms the boundary between the state and South Australia.

The state has an area of 310,700 square miles divided into 141 counties. It is more than twice the size of the State of California and five times the size of England and Wales.

Topography.—The surface, more especially in the eastern and most populous portion, is much diversified, and presents, in its general features, a succession of hills and valleys, mountains and plains. The great dividing chain forming the great watershed of the state, with many summits

varying in height from 3,000 to 6,000 feet, extends from north to south nearly parallel to the coast, at the distance commonly of from 30 to 50 miles inland or sometimes more, and takes in the north the name of Liverpool Range, in the centre that of the Blue Mountains, and in the south that of the Australian Alps. The highest summit is Mount Kosciusko, in the southeast 7,328 feet. The space between the mountains and the sea is partly broken by spurs and ramifications, but descends from the west with more or less rapidity, and has a generally undulating surface, intersected by water-courses; in some places well wooded, and in others covered with dense brush-wood. The coast line presents in general bold perpendicular cliffs of sandstone, in horizontal strata. Occasionally the cliffs are interrupted by low sandy beaches, some of which stretch to a considerable distance inland, and appear to have been covered by the sea at no very remote period. The indentations of the coast are remarkable for their number, and the excellent harbors which they form. Among them are Port Stephens, Port Hunter, Broken Bay, Port Jackson (on which lies Sydney), Botany Bay, Jervis Bay, Sussex Haven, and Twofold Bay.

Hydrography.—The most important rivers are the Murray, which is navigable as far as Albury (lon. 147° E.); the Murrumbidgee and Lachlan, farther north, which after uniting fall into the Murray; and the Darling, which flows from northeast to southwest through the whole extent of the state, and also falls into the Murray. The Darling, in its upper course known as the Barwon, has among its more considerable affluents the Bogan, the Macquarie, the Castlereagh, the Namoi, the Gwydir, the Macintyre, and the Warrego. The Murrumbidgee is 1,350 miles long, the Darling 1,160, the Macquarie 750, the Lachlan 700. Notwithstanding the existence of those large rivers the western plains are but sparsely watered. The comparatively narrow space between the mountains and the Pacific leaves little room for the development of large rivers. Many of them are for a great part of the year either altogether dry, or form a succession of deep ponds or waterholes instead of continuous streams. The chief are the Hunter, 300 miles, which falls into the fine port of that name at Newcastle, and is navigable for 50 miles above its mouth by small craft of 30 to 40 tons; and the Hawkesbury, 330 miles, which falls into Broken Bay, and is navigable by vessels of 100 tons as far as Windsor, a distance of 140 miles. Others are the Shoalhaven, 260 miles; the Clarence, 240 miles, of which 70 are navigable; the Macleay, 190 miles; and the Richmond, 120. Some of these rivers in the winter season cause disastrous floods.

Geology and Mineral Resources.—In the southeast, east, and middle the prevailing rocks are Palæozoic (Silurian and other), with granite and other igneous rocks forcing their way to the surface, and in this region are chiefly situated the metalliferous deposits in which New South Wales is so rich. In the east Carboniferous and Permo-Carboniferous rocks also occur extensively, and to these belong the large and valuable coal fields of the country. Valuable sandstones also exist here in abundance. Cretaceous rocks extend over a wide area in the north and west, and the plains are mostly of Pleistocene origin. In connection with the granite, limestone, both granular and foliated, occurs in abundance, and besides being often hollowed out into stalactitic caverns, sometimes passes into a beautiful close-grained marble, as white as that of Carrara.

The coal fields extend over an area of 10,000 acres, with more than 91 mines. The state exports considerable quantities of coal to the west coast of North and South America. Copper ore of the richest quality and tin exist in large quantities, and iron is very generally distributed. Gold is found in all parts of the state; the value of the output in 1901 was $4,606,410, showing a considerable diminution; the total value of the output of gold for fifty years since its discovery in 1851, is $248,309,075. Most of the gold is sent to the mint for coinage. The combined value of the silver and lead output in the same year was over $6,500,000. Several varieties of precious stones have been found, notably opals.

Climate.—As the area of the state extends over 110 degrees of latitude and contains a good deal of elevated ground, nearly every variety of climate is to be found. In the north the climate is tropical, while on the table-lands severe frost is not uncommon. The interior plains are very dry, and severe droughts occasionally kill millions of sheep, but the coast districts have abundant rains. Though the hot winds of the warm season are annoying, they are not unhealthful, while storms and electrical disturbances are comparatively rare.

Forestry, etc.— About one fourth of the area of the state consists of forest lands, which in 1887 were taken under the care of the government by the creation of a Forest Conservation Department. For the Flora and the Fauna of the state, see AUSTRALIA.

Agriculture and Stockraising.—The absence of water renders much of the land useless for agricultural purposes, but a large proportion is devoted to pasturage and grazing. In some places artesian wells have been introduced with good results. There is no great breadth of highly fertile land away from the river banks; but the fertility of the land on the margins of rivers is exceptional. Where liable to inundation, however, the year's harvest may be swept away in a few hours. The area under cultivation in 1902 was 2,274,493 acres, and the crops included wheat, maize, barley, oats, rye, millet, potatoes, lucerne and artificial grasses, vines, orange-trees, sugarcane, some tobacco, etc. Dairy husbandry is becoming important, and butter is exported. Native fruits are neither numerous nor valuable, but the best of those of Europe are acclimatized. So well does the peach thrive, for instance, that farmers sometimes feed their pigs with the windfalls of their orchards. Other fruits include oranges, apples, pears, apricots, nectarines, cherries, plums, figs, grapes, melons, mulberries, gooseberries, currants, etc., and in the more northern parts the banana is abundant. The rearing of silkworms on the mulberry, which might be carried to an almost indefinite extent, has attracted attention. The grapevine is successfully cultivated, as well as the sugarcane; considerable quantities of wine, brandy, and sugar being made. The rearing of sheep (of which there are about 50,000,000 in the state) and cattle are the chief employments of the people.

Commerce and Industries.—Wool is the most

important article of export. The annual value of this export is not without fluctuation, but is again increasing. In 1901 the quantity of wool exported was 285,176,505 pounds, valued at $47,336,270. Other important exports comprise coal, silver ore, silver lead, gold, and coin, frozen and preserved meat, butter, tallow, leather, wheat, and flour. The principal imports are wearing apparel, sugar, tea, and hardware. The value of the total exports in 1901 was $136,755,620, of imports $134,641,090; 3,452 vessels of 4,196,408 tons entered, and 3,375 vessels of 4,324,826 tons cleared the ports.

The manufacturing industries are naturally not of much importance as yet, but they are already very varied, and help to supply a considerable share of the home demand. In 1901 there were 2,930 miles of railway open, nearly all constructed by government, which has spent about $195,000,000 upon the railways; 14,272 miles of telegraph line were in operation.

Government.— The constitution of New South Wales vests the legislative power in a parliament of two houses, namely the Legislative Council and the Legislative Assembly. The former consists of 21 members nominated by the crown, originally for the term of five years, but, subject to certain conditions, for life at the expiration of that period; and the latter of 125 members chosen by the same number of constituencies. Members of the Assembly receive £300 per annum, and they are entitled to travel free by rail or tram in the state. As electors require no property qualification there is virtually universal suffrage. The executive consists of a governor nominated by the crown, assisted by a council composed of state secretary, state treasurer, the ministers for lands, public works, mines and agriculture, education, and justice, the postmaster-general, and the attorney-general. The parliaments last for three years. Unless local acts supersede them the imperial laws are enforced. No enactment of the state legislature becomes law till sanctioned by the governor, and in some cases by the sovereign. The state sends 6 representatives to the federal senate, and 26 to the federal house of representatives. The state has taken measures for its own defense, and has a force, partly paid, partly volunteer, numbering more than 6,000, and including infantry, cavalry, artillery, engineers, naval brigade, etc.

Population.—On 30 June 1902 the estimated population was 1,395,600, of whom 731,620 were males and 663,980 females, chiefly British-born subjects. The aborigines numbered 4,287 and the Chinese 10,974. Sydney is the capital, and other urban centres are Broken Hill, Newcastle, Parramatta, Goulburn, Maitland and Bathurst.

Religion and Education.—There is no established religion. Among the religious sects the Church of England, Roman Catholics, Wesleyan and other Methodists, and Presbyterians hold the chief place. Education has been since 1880 controlled by a minister of public instruction. The public schools are classified as public primary schools, superior public schools in the chief centres of population, evening schools, high schools for boys, and high schools for girls. Primary education is compulsory, but not free, unless in cases where parents are unable to pay fees. Among the higher educational institutions are the Sydney Grammar School, and St. Paul's, St. John's and St. Andrew's colleges, and the Women's College, the colleges being all connected with the University of Sydney — an important institution, attended by between 600 and 700 students, and granting degrees in arts, medicine, science, and law. Technical education is administered by a special branch of the department of public instruction.

History.—New South Wales was discovered by Captain Cook in 1770, and founded as a penal settlement (at Botany Bay) in 1788, the convicts being employed in road-making and preparing the soil for agriculture. One of its early governors was the notorious Captain Bligh, who was deposed by the colonists in 1808. The most important events in its history since convict immigration ceased in 1840 are the establishment of representative institutions in 1843; the erection of Victoria into a separate colony in 1850; the discovery in May 1851 of extensive gold tracts; the rush to the diggings, with consequent great increase in population and prosperity; and the incorporation of the colony in the Australian commonwealth in 1901. The first railway, from Sydney to Parramatta, was opened in 1855. Among more recent events are the Sydney Exhibition held in 1879, and the Intercolonial Conference held at Sydney in 1883. The colony celebrated its centenary in January 1888, and a special series of stamps of elaborate design was issued in commemoration of the event. On 1 Jan. 1901 Sydney was the scene of the inauguration of the first governor-general of the new commonwealth, Lord Hopetoun. (See AUSTRALIA; AUSTRALIAN FEDERATION.) CHARLES LEONARD-STUART, B.A.,
Editorial Staff, 'Encyclopedia Americana.'

New Swe'den, or **New Swedeland,** a name given in the 17th century to land lying between the Dutch colony of New Netherlands and the English colony of Virginia. It included territory in what is now Delaware and New Jersey. It was settled in 1638 by a colony from Sweden; and in 1655 it was taken possession of by the Dutch.

New Tes'tament. See BIBLE.

New Testament Chronology, the chronology of the events related in the four Gospels, and the Acts of the Apostles, together with the dates of the Apostolic epistles. It may be outlined as follows:

The Birth of Jesus Christ.— According to the First Gospel Christ was born in the days of Herod the Great, whose death, as shown by concurrent testimony, took place 750 A.U.C. Josephus (Ant. XVII. viii. 1) tells us that this event occurred 37 years after he had been raised to the throne by the Romans 714 A.U.C. This would be 40 years before the Christian era as calculated by Dionysius Exiguus (533), who placed the birth of Christ in the year 754 A.U.C. Herod, therefore, died 750 A.U.C. Josephus says this event took place a little before the Passover, that is, in the spring of 750. The Nativity must be placed before this, and far enough before it to admit of time sufficient being allowed for the presentation in the temple, the visit of the Magi,

and the flight into and sojourn in Egypt, during which last period the death of Herod took place. It cannot then be placed later than the autumn of 749 A.U.C. (5–4 B.C.). The day and the month on which the whole Christian Church celebrates the event was fixed in the time of Chrysostom (about 386 A.D.) and has been retained ever since among both Eastern and Western Christians. There is no historic or scientific basis for the assignment. Some have held that as 25 December follows the winter solstice and is a period of the year at which the sun is rising day by day higher in the heavens with the new promise of spring, it was chosen arbitrarily, but fancifully, as a suitable time for celebrating the dawn of an era which brought fresh life to the human race. Others, with more reason, aver that as the Saturnalia extended in old Roman times from 17 December to 23 December, so the Christian festival was chosen at a date at which it may be thought suggestively to replace a pagan holiday during which slaves were for a few days free, sat at their masters' tables, and were served by them. Perhaps the Latin festival of the Brumalia, the feast "Invicti Solis" (of the "Invincible Sun") was intended to be superseded by the Christian festival of the "Sun of Righteousness." It may be observed in passing that as the supposed day of the Nativity would have occurred during the rainy season in Palestine it is extremely unlikely that shepherds would then have been watching their flocks by night in the open air.

Synchronistic Roman History.— (1) Saint Luke says that the census which took Joseph and Mary to Bethlehem took place while Quirinus (Cyrenius) was legate of Syria (Luke ii. 2). This legate, history tells us, was appointed to carry out the census 10 years later, 6 A.D. This had been made much of by Strauss and others, but Dr. A. W. Zumpt (see ZUMPT, AUGUST W.), the famous German philologist, in his tractate, 'Das Geburtsjahr Christi' (1869), has shown that Quirinus was twice governor of Syria, for the second time 753 A.U.C. (2) Another difficulty has been found in Saint Luke's date of Saint John Baptist's mission, which he says (Luke iii. 1) began in the 15th year of the reign of Tiberius. Tiberius did not become sole emperor until 14 A.D., but he began his reign as associate emperor with Augustus 12 A.D. (765 A.U.C.) which gives 780 A.U.C. or 27 A.D. for the date of the Baptist's ministry, when he would be in his 30th year, as was Jesus Christ (Luke iii. 23) and not 28 as if calculating from the sole reign of Tiberius. (3) The restoration of the temple by Herod the Great began 18 B.C. (John ii. 20). Forty-six years after that would be 27 or 28 A.D., which would be the commencement of our Lord's ministry in Galilee. The completion of the temple to its full magnificence was not accomplished until the day of Herod Agrippa II., 64 A.D. (Compare Josephus, 'Antiquities of the Jews,' XV. xi. 1). (4) The death of Herod I. (Acts xii. 23) occurred 44 A.D. (5) According to Tacitus, 'Annales,' xii. 52, and Suetonius, 'Claudius,' the Jews were expelled from Rome (Acts xviii. 2) by the emperor Claudius 52 A.D. (6) Festus (Porcius Festus), Acts xxv. 1, was appointed procurator of Judæa 60 A.D. (7) The persecution of Nero in which Saint Paul was put to death began 64 A.D. in the 10th year of that emperor's reign, while Gessius Florus was procurator of Judæa.

From the Birth of Christ to the Fall of Jerusalem.— At the time of Christ's birth C. Sentius Saturninus had been succeeded as legate of Syria by P. Quintilius Varus with whom, according to Dr. A. W. Zumpt, P. Sulpicius Quirinus was associated (Luke ii. 2). Judæa was made an imperial province under Augustus himself, who governed it by procurators, or stewards, on the deposition of Archelaus, 6 A.D. Herod Antipas continued to reign as vassal king of Galilee and Peræa, while Cyrenius (Publius Sulpicius Quirinus) carried out the census; enrolment of the population, or "taxing" (Luke ii. 2). Coponius appears to have been the first procurator and was followed, 9 A.D., by Marcus Ambivius. The appointment of Tiberius as colleague to Augustus at Rome in 12 A.D., corroborates the computation of years in Luke iii. 1. Annius Rufus was procurator in 13 A.D. and Valerius Gratus in 14 A.D. Tiberius was made sole emperor in the same year. Caiaphas was made high priest in 25 A.D., and Pontius Pilate appointed by Tiberius his procurator in Judæa 26 A.D. The last Passover of Christ, his Crucifixion, Resurrection and Ascension occurred in the early spring of 30 A.D., and the day of Pentecost on 26 May of the same year. The martyrdom of Stephen and the conversion of Saint Paul happened two or three years later, and Paul's first visit to Jerusalem took place 35 A.D. Caligula was emperor in succession to Tiberius in 37. He in turn was succeeded by Claudius in 41 A.D., the same year that Herod Agrippa was made king of Judæa and Samaria. Saul was introduced to the Christians at Antioch in 43 A.D. and Herod died in 44; in that year Cuspius Fadus was appointed by the emperor Claudius to be his procurator in Judæa. It was 45–46 A.D. that the famine raged at Jerusalem and Paul and Barnabas visited the brethren there with relief. Tiberius Alexander was procurator when the famine reached its height in 46 A.D. In 47 A.D. Paul and Barnabas made their first missionary journey together, and returned in the autumn of 49 to go to Antioch. The Council of Jerusalem took place the same year. In 50 A.D. Paul set out with Silas on his second missionary journey, in which year Claudius uttered his decree of banishment against all the Jews, sorcerers and magicians in Rome. In 51–52 A.D. Saint Paul visited Athens and Corinth, and from the latter city wrote his first and second epistles to the Thessalonians. He left Corinth early in 53 A.D. and arrived at Jerusalem in March, whence he proceeded to Antioch and wrote his epistle to the Galatians. Thence in the same year he started on his third missionary journey which ended at Ephesus, where he spent three years, 53–56 A.D. Nero succeeded to the purple in 54; the first epistle to the Corinthians was despatched 55, and in 56 Saint Paul left Ephesus and visited Macedonia and Corinth. From Macedonia he wrote his second epistle to the Corinthians, 56 A.D., and from Corinth his epistle to the Romans 57 A.D., after which he left Corinth for Jerusalem, where he was arrested in the temple and brought before the procurator Porcius Festus. He was taken to Cæsarea 57–59, appealed to Cæsar, as a Roman citizen, and was sent to Rome, 59 A.D. He was shipwrecked at Malta,

but reached Rome in March 60. While in prison (61–62 A.D.) he wrote his epistles to the Colossians, the Ephesians, the Philippians and Philemon. He was tried and acquitted early in the year 62 A.D., and made a missionary journey in Macedonia, Asia Minor, Crete and most probably Spain (63–66 A.D.). In the meantime he wrote his first epistle to Timothy and his epistle to Titus. He wintered at Nicopolis and in the spring of 66 A.D. was sent to Rome and underwent a second trial 67 A.D., wrote a second epistle to Timothy and was put to death by the sword in the last year of Nero's reign, in the 68th year of his age, and the 35th of his conversion. The first persecution of the Christians took place under Nero, who was succeeded by Galba 68 A.D. Under Vespasian who took the purple 68 A.D., the Romans made war on the Jews under the leadership of Titus, son of and eventually successor to Vespasian, and the destruction of Jerusalem took place 70 A.D. Consult: Lewin, 'Fasti Sacri' (1865); Ramsay, 'Saint Paul the Traveler and Roman Citizen' (1896); Ideler, 'Handbuch der Mathematischen und technischen Chronologie' (1825); Wieseler, 'Chronologische Synopse der vier Evangelien' (1843; English translation, London 1878); 'Chronologie des apostolischen Zeitalters' (1848).

New Testament Theology, that branch of theological science which has for its peculiar task to state, arrange and compare the theological doctrines and conceptions found in the New Testament. While it might be combined with Old Testament theology under the name Biblical theology, yet the differences in dates, language, style and contents between the Old Testament and the New are such that their respective theologies have usually been treated separately, although their methods are necessarily identical. It is also possible to state the doctrinal teachings and theological conceptions of any individual author, and even those found in any single work of any author, and such contributions to Biblical theology have often proved exceedingly valuable; but the historic unity of the New Testament renders it practically important that the teachings and views of the various New Testament authors should be so presented and compared as to give but a single impression of the whole. Such works as have merely placed these several views side by side, give only an incomplete and unsatisfactory treatment of the science.

Character and Relations.— New Testament theology is strictly a historical science, neither attacking nor defending the conceptions which it finds, but merely stating, arranging and comparing them. As a historical science it is connected with Ecclesiastical History, and might be considered the first volume of the History of Christian Doctrine. But it demands such a mastery of the results of the sciences of Isagogics and Exegesis on which it depends, that it is usually associated rather with interpretation, of which it might be reckoned the crown. It also presupposes and builds upon Old Testament history and the history of the world in New Testament times, and in its turn it provides much material for Dogmatics.

History.— The name Biblical Theology, which had earlier been employed to designate such a system of dogmatics as was based upon the Scriptures rather than upon either creeds or reason, was first used in its modern sense by Gabler in 1787, since which time the science in its application both to the Old Testament and the New has gradually developed. The first American work in the sphere of New Testament theology was published in 1870, and the first lectures in any American theological school are said to have been given in 1883. Since then it has received a steadily increasing amount of attention.

Difficulties.— The task of the New Testament theologian presents peculiar difficulties. It is impossible for him to increase the amount of the material with which he deals, however helpful for supplementing or verifying his conclusions such increase might be. All expression of thought is defective, and most of all is this true in theology, where upon words derived from the earthly and the human is laid the burden of declaring the heavenly and the divine. Further, the teachings to be considered come in a form due to ancient ages, tongues and conditions, and accordingly accurately and adequately to restate in modern form thoughts which have thus come down in ancient garb cannot be easy. Then, since with few exceptions the theological thoughts contained in the New Testament found expression solely for ends then immediately practical, it follows that the statements are often partial and incomplete, and the emphasis upon certain aspects of truth is only relative, and these statements must be read with constant reference to the thought of the age and the details of the local situation to which they belong. Hence only with difficulty can the incomplete expressions of practical religious thought be fitted together to reconstitute such systems of doctrine as may be credibly attributed to the various New Testament authors. Yet this task has been so successfully accomplished that the religious thoughts and conceptions of the New Testament authors have been restated with a good degree of trustworthiness.

Grouping of the Books.— There is general agreement as to the grouping of the New Testament books according to the types of thought which they exemplify. The teaching of Jesus demands attention first, if not as a standard for the rest or as of superior authoritativeness, as at any rate prior in time to the other New Testament teachings and as presupposed by them. The records of Christ's teaching are necessarily subdivided into the Synoptic and Johannine reports. The second group of documents represents the type of Christian thought which developed among Christians of Hebrew descent, and consists of the first part of the book of Acts, the letters of James and Jude, the two letters of Peter (which, however, show that there had been a development considerably beyond the primitive conceptions current in the church), and such traces of apostolic or other early doctrine as may be noted in the Gospels. In the Pauline section the Epistles attributed to this Apostle fall naturally into four groups, which differ in theme and matter as well as in date and style. If any of these letters should not be held to be Pauline in origin, they are yet so distinctly in harmony with Paul's views that this would not change their place in the general classification, while the Epistle to the Hebrews is a natural pendant to the writings of Paul. The fourth

group of New Testament writings consists of the books attributed to the Apostle John, consisting of his letters, of so much of the Fourth Gospel as is not the teaching of Christ and of the Revelation.

Kingdom of Heaven.— In the Synoptic reports Jesus begain his teaching by echoing the proclamation of his forerunner, John the Baptist: "The kingdom of heaven is at hand." While from the beginning of this preaching he seems to have recognized that he himself was to be the head of the promised kingdom, yet his own conception of the character and work of the Messiah was so different from the popular conception, so much loftier and purer, that he could not present himself at once and unreservedly as the Coming King, for, had he immediately and unmistakably advanced his claim, political enthusiasm would have forestalled religious faith, and even on the part of true followers earthly ideals, expectations and plans would have obscured and neutralized heavenly, as, indeed, to some extent actually occurred in spite of caution and reserve. The name kingdom of heaven or of God, however, remained prominent throughout the teaching of Jesus, but in the latter part of it with an altered meaning. Convinced that he had nothing to hope from the leaders of the nation or the people whom they controlled for the kingdom of prophecy, which was intended to reach its spiritual ends through a local, national, political organization, Jesus necessarily substituted individual submission to the sovereignty of God, and retaining the name without the form, the kingdom which he strove to establish became in his teaching universal and spiritual.

Repentance and Faith.— While the state of individuals and society which he would establish thus took a new form in consequence of his rejection by his nation, the conditions of entrance, as well as the ultimate ends to be attained, remain unchanged. The first demand upon each and all is for repentance. As a morally transformed and thus fit nation should have met its King come at last, so only a soul turned from evil to good can receive the spiritual blessings which Jesus bestows. More and more clearly as antagonism gave renewed opportunity, Jesus denounced sin and demanded from all without exception penitence and reformation, although in serene consciousness of sinlessness he ever held himself apart from all confession of any evil on his own part.

The Supreme Place of Christ.— With repentance as a reversal of moral tendency must come acceptance of himself as Supreme Master and absolute submission to him. His demand for self-denial is a demand for complete self-abjuration; his invitation, "Come unto Me," is not only an invitation, but no less the presentation of himself to the world as the one fountain of spiritual blessing; to receive him he says is to receive God himself, and personal service to him is regarded as proof of sins forgiven; devotion beyond all other loves is required, and so absolutely supreme is the relation of the soul to him that on confession or denial of him he makes the issues of the future life to hinge. This relation is made still more significant by the few but clear and emphatic teachings as to his death, by virtue of which as a ransom salvation would be rendered possible for men.

God's Love.— The fourth element in the teaching of Jesus which the Synoptists record relates to God. This teaching is almost never metaphysical, only religious and practical. The chief thought in it is God's love. This love, which exceeds that of any earthly father for his child, is shown in the rising of the sun on the evil and the good alike and the coming of the rain on both just and unjust, and in care for sparrows, ravens and lilies, and finds its crown of perfectness in kindness to the unworthy. The climax of this teaching appears in the parables about rescue of the lost, in the third of which, usually called the "Parable of the Prodigal Son," this tender love of God is so winningly presented that it has given a very common name for the love of God, so that all Christ's teaching is said by many to be dominated by the thought of God's "Fatherhood," a view which should be so held as to include the other conceptions of Jesus as to God's special relation of fatherhood to believers, and his unique fatherhood to Christ himself.

Johannine Teaching of Jesus.— In the Gospel of John the teaching of Jesus is presented with a superficial dissimilarity at first sight striking, but in essential consistency with the Synoptic reports. As the place of the ministry reported is largely the city of Jerusalem instead of the open country of Galilee, as we have often hostile Pharisees for interlocutors instead of disciples for reverent auditors, so of the four chief elements of the Synoptic teaching, the Kingdom, Repentance and Faith, his own unique supremacy and the fatherly Love of God, the kingdom is scarcely mentioned, repentance is ignored and faith given a different aspect, and the paternal kindness of God is much less emphasized, while Jesus insists even more upon his own pre-eminence and shows it in new lights.

Deity of Christ.— The two foci of the teaching reported in the Fourth Gospel are, as might be expected from the author's own statement of his purpose as stated at the end of his writing, the deity of Christ and the duty of Faith. All the discourses in the Gospel are selected with a view to showing Christ's self-revelation to the world on the one hand and to his disciples on the other. While his Messiahship is not here emphasized, there is presented instead a conception of a sonship based on a unique unity with God, combined with hints of pre-existence, suggestions and implications of divinity and, finally, a welcome by Jesus to the assertion of his deity.

Faith.— The proper relation on the part of his disciples, and, indeed, of all men, toward this personality who thus presents himself is not mere acceptance of statements about him and of truths relating to him, but further spiritual union with him by entering into relations to him, appropriation, in a word.

Judaic Teaching.— The earliest Apostolic teaching and the type of doctrine which seems long to have prevailed among the churches which were of Judaic origin and cast, was only to a very slight degree dogmatic, and brought no enlarged or corrected doctrines touching the nature of God or the character of men. Indeed, no New Testament authors ever approach these themes as if intending to communicate fresh truth, but rather to confirm and apply truth already commonly apprehended. The chief thought of the primitive church was the place and rank of Jesus, and here even the earliest teaching of the Apostles is developed in many

respects beyond that of Jesus himself, a fact which is not surprising when it is remembered on the one hand that we cannot rightfully suppose that he exhausted the contents of his consciousness in even his frankest disclosures to his disciples, and on the other hand he himself promised that the guidance of the Spirit whom he would send from God would result in larger knowledge than his own instructions had brought. While the name of the kingdom is dropped at once and permanently out of use, at the same time the Messiahship of Jesus is asserted, and it is insisted upon that by his coming forth from the tomb re-embodied, which was the resurrection to which his Apostles testified, his Messiahship and Lordship were fully confirmed. While it was constantly recognized that Jesus was no less man than other men, he was regarded as distinguished from other men, not only by his character of unique holiness, but also by his Messianic rank which gave him universal sovereignty and Lordship, and, further, he was given the title Lord, which had been a familiar substitute for the most sacred of all the divine names. Theological discussions as to the nature, basis and conditions of salvation are not to be expected in such documents as represent Judaic Christianity, but it is plain that it was thought of as release alike from the consequences and the power of sin, provided, especially in the former aspect, by the death of Christ, and to be obtained by repentance.

Pauline Teaching.— The teachings of Paul are much fuller than those of the other Apostles, and in many places, owing to the doctrinal controversies which evoked them, they approach somewhat closely to dogmatic form, while such was the diversity of the occasions out of which the letters arose and of the situations of their first readers, that they cover nearly the whole field of Christian thought. Paul's conceptions of the nature and attributes of God, of his sovereignty and his love, and of the ruined condition of sinful men, while frequently brought out with great distinctness, were in no sense peculiar to himself. His special topics are, besides the rank of Christ, his saving work, the duty of man in relation to it, and the activity of the Holy Spirit in completing it. While Paul implies a general knowledge of the life and teachings of Jesus, he looked to Christ as far transcending in nature and rank what might be inferred from these facts. In Paul's mind the unique fact of the resurrection of Jesus at once certified to his unique nature and relation to God and opened to him the way to supreme exaltation and universal dominion which would become fully his when he should return in glory to earth. He shared the divine essence; in his activities before his birth of a woman he created the universe and continues to uphold it, and to him worship is rightfully paid. The life and especially the death of Jesus were a part of the divine plan for the rescue of men from the state into which their sin had brought them. The death of Christ was clearly set forth by Paul as provided in the love of God as a basis indispensably prerequisite for the favorable treatment which he gives to every penitent: the blood of Christ was to Paul the ransom and propitiation by virtue of which redemption and reconciliation are secured for men. Paul was led by controversy to insist with peculiar urgency that Divine forgiveness and favor are conditioned on faith alone, that is, that salvation does not primarily depend on the behavior of a man, but on his acceptance of God's gracious gift, but while faith alone is the condition of entrance on the Christian's state, yet the Christian life in its ideal involves nothing less than the perfect performance of every duty, and this ideal is practically attained only by the aid and power of the Holy Spirit, whom he regards as possessing personal, divine attributes, who is imparted to every believer and permanently dwells in him.

Teaching of the Epistle to the Hebrews.—The letter to the Hebrews makes no contribution of special novelty to the theology of the New Testament. While somewhat unlike the thought of Paul in that it presents the Mosaic system as helpfully preparatory to Christianity which supersedes it, the views which it presents of the transcendent rank and sacrificial death of Christ are in fullest harmony with Paul's. That Christ is a "high priest," that is, a representative of men before God, and that faith is an unyielding grasp on the invisible, are thoughts which are peculiar to the author of this Epistle.

Johannine Teaching.— The teachings of John relate themselves proportionally more to God himself than those of any other New Testament teacher, but his conceptions of the deity, like theirs, are mainly dynamic and ethical, rather than metaphysical. His thought seems to sum itself up in three words, life, light and love, which suggest that God is the constant source of all power and joy; that he is spotlessly holy and tends unceasingly to manifest himself as such in and to his universe, and that his most central, essential and characteristic attribute is kindness and beneficence, unceasing and all-embracing. In the teaching of John the eternal Logos, or expression of God, became incarnate in Jesus, and thus presents God to men; and in turn by his death he became the "propitiation" in virtue of which forgiveness is promised on condition of penitence and confession. The privilege and duty of Christians is fellowship with God, that is, by refraining from all sin to share his spotless holiness.

Professor of New Testament Interpretation, Hamilton Theological Seminary, Colgate University.

New Theology, or **New Divinity, The.** See EDWARDS, JONATHAN; PRESBYTERIANISM; NEW ENGLAND THEOLOGY.

New-Thought is an idealistic or metaphysical movement in this country. It began about 20 years ago. It is a direct successor of New England transcendentalism, but is much more practical and democratic. The older idealisms were seclusive, but this one is preached and practised on the highroads and carried into the minutiæ of daily life, often assuming the forms of religion and philosophy. It boasts of being the greatest healer the world has yet seen

and scorns the idea of being mere speculation. It is claimed that New-Thought will not create any new religion or creed and that it will not formulate any new system of metaphysics. As regards religions, it is said by the representatives of New-Thought, that they are not desirable, because they are based on will, not on thought, and because they demand obedience. As regards metaphysics, no system is wanted, because life and thought cannot be confined in a system. The world needs illumination and freedom, not limitation.

The first apostles of New-Thought were P. P. Quimby of Portland, Maine, Dr. W. F. Evans, and their immediate disciples. The first preached it orally, the other by the pen. None of these, however, are its parents in any sense, nor are they quoted as authorities by any present-day followers or teachers. New-Thought is the modern expression of an inherent self-affirmation of the soul as old as the soul itself. New-Thought self-affirmation is intensely individualistic and has found its philosophy in Emerson's "Self-reliance." In the Emersonian extreme and in Tennyson's

> Self-reverence, self-knowledge, self-control,
> These three alone lead life to sovereign power,
> — *Œnone.*

may be found its First Principles. New-Thought people, however, identify the self with the "Oversoul" and commonly prefer to quote the Biblical "*I am* (that I am)" as their motto and foundation. The revealed secrets of the "I am" are to be read upon every page of their hundred and one serial publications. These "revelations" resound with mystic refrains of the Oriental *tat twam asi*, "That (namely the 'Universal Self') art Thou!" and they run into the high notes of Promethean self-deification and rebellion. "The Song of the Soul Victorious" is of freedom, of our being centres; of concentration and self-assertion, human divinity, ideal suggestion, the souls' prerogative to rule and of "vibrations" which are the redemptive forces of existence. In strong contrast and as a jarring note in this solemn and highflowing song one reads immediately afterward that the publisher does healing, "absent treatment, a specialty," at so much or so much per contract, if the reader promptly forwards the money.

New-Thought ontology teaches "oneness of life," that "all life is one," but the student searches in vain for any scholastic definition of these axiomatic teachings as also for the theological dogma "God is omniscient, omnipotent and omnipresent." This last, the omnipresence of God, is taught to the exclusion of all other attributes. The bearing of these two doctrines leave, however, no doubt about their being inherently pantheistic in character, and implying a pantheism in the direction of the Hegelian pan-logism. To New-Thought life, God and all other categorical terms are swallowed up by Mind or "the limitless self." New-Thought epistemology is in harmony therewith: "all knowledge is one," it declares with much force, but without argument, the popular understanding being that human knowledge is one with divine knowledge.

New-Thought is often confounded with Christian Science, but their difference can clearly be seen by their cosmology. The latter holds the Oriental doctrine that the world and its things are illusory, products of "the mortal mind," but New-Thought asserts the reality of the world and considers it an expression of God, the two being related as cause and effect. The central doctrines of New-Thought lie in psychology. They consist in asserting the supremacy of mind over all other energies and in identifying it with the perennial stream of energy which permeates existence at large. Our mind is identical with the supreme mind, it makes us what we are and creates our conditions and environment; by inherent love it overcomes all hatred, malice and sickness; by inherent law it establishes itself as the world's law and by inherent order it rules everywhere. It keeps itself alive in love, law, and order by constant affirmation of itself: "I am, that I am!" In ethics, the New-Thought is of a decided optimistic tendency. Its programme is the Emersonian "don't bark against the bad, but chant the beauties of the good." Evil is not real, but only an imperfection which illumination dissolves. New-Thought is not iconoclastic, but fulfils the ends of creation in "peace and good will." If others do not know Reality and only worship "an unknown God," New-Thought people do not think it right to use violence or even persuasion; growth and experience will bring truth.

New-Thought is intensely practical. It professes to heal sickness and to remove the sting of death. Sickness is error and is cured by right and wholesome thinking, and death is but a transition, a "passing out" into another condition. If we always stood fast in right thinking we should never die, but simply transform ourselves.

New-Thought "circles of healing" are very common. They are found in every State in the Union, and in most cities followers of the cult can be found. It is estimated they exist by the million. The cult and its teachings have spread to Canada, England, and many places on the continent, especially France and Germany. The circles are not churches, but "bethels" or "houses of thought" for instruction and meditations. Services on Sunday usually begin with the singing of "Omnipresence, Omnipresence, Omnipresence, manifest Thyself in me!" and are followed by a few minutes of meditation for the concentration of mind, before the discourse is given. Speakers are chosen without regard to creed or race, etc. Their main qualification lies in their experience of oneness with the Great All. At the circles rooms are set apart for daily noon-hour meditation. In the rooms are also private classes for instruction, etc. The circles are maintained by voluntary contributions, but no teachers, excepting private class teachers, are paid.

New-Thought healers are many, but New-Thought teachers are many more. Experience has shown that no man or woman can heal more than a very limited period of their lives. When they can heal no more, they teach others the method. The methods of healing run through the whole scale of impressing the "new" thought by suggestion, hypnotism, faith, or simple rationality. Healing is done also by "absent treatment" or telepathy and is paid for in hard cash. "Healing and doing good" as Jesus did is unknown in New-Thought.

A New-Thought convention was held in Chicago, 17–20 Nov. 1903, attended by many

thousands. The following «progressive» declaration of principles was adopted:

1. The New-Thought is the new interpretation of universal and eternal Truth.

2. God — Universal Spirit, Mind, Principle — is omnipresent, omniscient, and omnipotent.

3. Man is the individual expression of God, possessing inherently and capable of manifesting all the aspects of God.

4. Man unfolds to a continuously expanding consciousness and manifestation of these aspects, through right thinking and right living.

5. The consciousness of harmony is Heaven, here and now; in the realization of which abide peace of mind and health of body.

6. The essentials of the New-Thought are suggested by the words — Unity, Co-operation, Freedom, Brotherhood, and Individuality.

C. H. A. BJERREGAARD.

New Ulm, Minn., city, county-seat of Brown County; on the Minnesota River, and on the Minneapolis & St. L. and the Chicago & N. W. R.R.'s; about 80 miles in direct line west by south of Saint Paul, and 25 miles west by north of Mankato. It was settled in 1857 by a German Land Company, incorporated in 1870, and chartered as a city in 1876. It was the scene of an Indian massacre in 1862. It is in a productive agricultural region in which there is considerable attention given to stock-raising. Its chief industrial establishments are flour mills, breweries, cigar factories, a creamery, a cooperage, machine-shops, a pottery, brick and lumber yards, and grain elevators. The mills have about 175 employees; the cigar factories, about 70; the breweries, 75; and the brick yards, 50. It has an extensive trade in farm products and live-stock. There are five churches, and the educational institutions are public and parish schools, Dr. Martin Luther College, Saint Michael's Academy, a public school library, and the Turnverein Library. The three banks have a combined capital of $170,000, and the annual business is about $15,000,000. The government, under a revised charter of 1891, is vested in a mayor, who holds office two years, and a council. The electric-light plant and the waterworks are owned and operated by the city. The majority of the inhabitants are German or of German descent. Pop. (1890) 3,741; (1900) 5,403.

PHILIP LIESCH,
Editor, 'Journal.'

New West'minster, Canada, a cathedral city, the former capital of British Columbia, on the Fraser River, about 15 miles from its mouth. It is connected with the rest of Canada by the Canadian Pacific Railway, and with the United States railway system by a short branch; an electric railroad 8 miles long connects it with Vancouver. The town has electric lighting, municipal waterworks, and public parks. It is the headquarters of the river traffic of the province. Salmon-fishing and canning are its chief industries; there are also saw-mills and a considerable trade in lumber. Pop. (1901) 6,499.

New World, The, a name applied at a very early period to the Western Hemisphere. Ferdinand inscribed on the tomb of Columbus, «To Castile and to Leon, Columbus gave a new world.»

New Year's. The observance of the first day of the year is of very ancient origin. The Romans on this day were accustomed to exchange greetings and make presents. New Year's under the Cæsars was a great source of profit to the emperor and quite burdensome to his subjects. The church at first prohibited Christians from having anything to do with it, but at last made the day a Christian festival. Before 1752 the year began on 25 March. The change in the calendar was made in that year for Great Britain by an act of parliament. In Persia the year is supposed to begin on 21 March, and the day is one of universal rejoicing. Men who never take a bath or get shaved at any other time do so on that day, and the barbers reap a rich harvest in consequence. Our Teutonic and Saxon ancestors found it impossible to celebrate the day without a wassail bowl. Pledges were drunk from it, and from this came the name, wassail being derived from the Saxon «wasshail»—«to your health.» The bowl was so big that when a man rose to drink from it he had to use both hands to raise it to his lips, and such were the gentle manners of the times that a friend always stood by with drawn sword while he did so to prevent his being stabbed.

New Year's is a great day in the courts of European royalty. All monarchs begin the day by going to church, and much of the time that remains is devoted to the reception of the great dignitaries of church, state, army and diplomatic corps. At Saint Petersburg and Moscow, where New Year's is celebrated according to the rite and calendar of the Greek Church, the favorite form of luxury appears to be bric-a-brac. Under the pretext of sending bonbons, men pack the candies in the most exquisite caskets of Saxe and Sevres porcelain, or else in boxes made of that beautiful enameled silverware for which Russian jewelers are so famous.

In Japan the new year is a season of much festivity and innocent mirth. Every portal is decorated, and each object of which the decoration is composed has a symbolic meaning. The usual form of the decoration is a green arch. On the right is placed a small pine tree with a reddish stem and on the left one with a black stem. Fancy has attributed to the light one a feminine and to the dark one a masculine sex. Also this hardy tree symbolizes a stalwart age that has withstood the storms and struggles of existence. Close to the pines on either side are set graceful stems of bamboo, which, rising erect with succession of rings, form a fit symbol of hale life and fulness of years. The distance between the pines — about six feet — is spanned by a grass rope, sufficiently raised to admit of passage beneath it. This, according to its symbolic purpose, debars all unclean and evil things from crossing the threshold. Among the Chinese the day is the greatest festival of the year, and in France it is observed more than Christmas.

According to an old superstition, ill fortune is sure to attend the family whose first visitor on New Year's day is a female, while a lady's first caller should be a dark man, as a fair one is thought to be a harbinger of evil. A custom similar to that of making New Year's calls is the sending of cards to one's friends on the day. In this way one can keep up acquaintances

that might otherwise die out merely from lack of time for great sociability. After the restoration of the Bourbons it became fashionable in Paris to send bonbons on New Year's day, and in 1822 a thousand tons of them were sold in the two days preceding the festival.

The day was more or less observed among the American Indian tribes. The Moqui celebration, called So-yal-u-na, is largely a presentation of a singular and elaborate mythic drama, divided into two parts, in which offerings are made to effigies of the great plume headed serpent, the enemy of the sun, followed by a sun dance, in which the conflict between the sun and the inferior hostile gods is admirably portrayed by Moqui men personifying the various deities.

In the United States it has always been the custom of the Presidents to receive on New Year's day. In 1790, when New York was the seat of government, Washington held a reception between the hours of 12 and 3 and was visited by all the home and foreign dignitaries. He expressed the hope on that occasion that whatever change might take place in the manners and customs of the city the observance of New Year's day might never be given up. In New York and other cities there are services in many churches and receptions in many clubs and drawing rooms. The formal custom of receiving New Year's calls has nearly become obsolete in our larger cities, it having been superseded by the regular afternoon and informal evening receptions, to which gentlemen take more kindly than to the old-fashioned New Year's party. The good old Knickerbocker custom is still maintained by some families. Some give formal dinners, and in the country, carriage loads not infrequently go round from hosue to house making merry calls, picking up additions to the party and finally ending with supper at some hospitable house and in an evening with games, refreshed by apples, roast chestnuts, plum cake and sweet cider. The day was not observed in Colonial times with the formality which has marked its observation in later years. After the Colonies had adjusted business affairs to the new date, the first of January grew in importance and in course of time became a legal holiday. See CALENDAR.

New York (the "Empire State"), a State in the northeastern part of the United States; lying between lat. 40° 30′ and 45° 1′ N. and lon. 71° 50′ and 79° 46′ W.; bounded on the north by Lake Ontario, Saint Lawrence River, and Canada; on the east by Vermont, Massachusetts, and Connecticut; on the south by the Atlantic Ocean, New Jersey, and Pennsylvania; on the west by Pennsylvania, Lake Erie, and the Niagara River. Lake Ontario is west of the northern part of the State, and New Jersey is west of the southern part of the State. Lake Champlain is on the boundary between New York and Vermont. The extreme length of the State from north to south is 312 miles; and from east to west 326 miles, or 412 miles including Long Island. The area is 49,170 square miles, of which 1,550 square miles are water surface. The State contains 30,476,800 acres of land, of which 22,648,109 are in farms. It ranks in size the 26th among the States of the Union.

Topography.—About one half the boundary of the State, exclusive of Long Island, is water. The chief inlet is New York Bay. Long Island, southeast of the mainland of the State, is separated from Connecticut by Long Island Sound; southeast of the mainland of the State, is separated from New Jersey by Staten Island Sound, Arthur Kill, and Newark Bay. Both these islands have inlets along the coast, some of which are good harbors. Along the shores of Lake Champlain and Lake Ontario there are a number of small inlets. In the Saint Lawrence River, where it leaves Lake Ontario, are numerous islands, many of them well wooded and beautiful. The group is called "The Thousand Islands." These islands are favorite summer resorts. Long Island on the south is a part of the coastal plain; the greater part low; the highest elevation is 382 feet. The eastern part of the State is mountainous, the ranges extending generally northeast and southwest. The central and western parts of the State are rolling or level land. The mountains belong to the Appalachian system. In the northeastern part of the State are the Adirondacks. Mount Marcy, the highest elevation in the State, 5,344 feet, is a peak of the Adirondacks. There are several peaks from 2,000 to 4,000 feet. These mountains are covered with forests, largely pine. The Adirondacks extend along Lake Champlain south to the valley of the Mohawk and west nearly to Lake Ontario. They are noted summer and health resorts; more people visit the Adirondacks annually for health or pleasure than any other outing place in the country. These mountains toward the south become ranges of hills which slope to the Mohawk in the east and to the lake shore plain on the west. South of the Mohawk Valley the land again rises to what is known as Catskill Mountains. Some of the peaks amid the Catskills are fully 3,000 feet high. Slide Mountain, the highest peak, is 4,205 feet above the sea. The Shawangunk Mountains, more a plateau, are south of the Catskills. The highest part of the plateau is in the west back from the Hudson from 1,000 to 2,000 feet. On the southeast and north is a limestone escarpment, Helderberg Mountain, which in some places attains a height of several hundred feet. In the western part of the State and parallel with Lake Ontario are two well defined terraces each about two hundred feet in height. The Lower Terrace, called Lake Ridge, extends from the Genesee River to the Niagara, and is from three to eight miles distant from Lake Ontario. This Lake Ridge marked at one time the southern short of Lake Ontario, when the outlet of the lake was by way of the Mohawk Valley. The Upper Terrace, called Mountain Ridge, is about thirty miles inland, and extends east and west almost parallel with Lake Ridge. The highest part of the plain or plateau portion of the State is in Otsego County, where it attains the altitude of 2,300 feet. "Rock City," Allegany County, upon a summit 1,400 feet above the surrounding valleys, consists of a tract of 40 acres covered with rocks broken into layers forming streets and alleys.

Hydrography.—The waters of all the rivers of the State finally enter the Atlantic Ocean. They reach the ocean by way of the Saint Lawrence, Hudson, Susquehanna, Delaware, and Mississippi rivers. The great valleys of the State are the Hudson and Mohawk valleys,

which divide the State into three sections, one east of the Hudson and south of Lake Champlain, one in the northern part of the State, almost surrounded by water; Lake Champlain and the Hudson on the east, the Mohawk and Oswego rivers on the south and southwest, and Lake Ontario and the Saint Lawrence River on the west and north. The remaining section embraces the central and western parts of the State. The main stream lying wholly within the State is the Hudson River (q.v.), which with its tributaries, the largest being the Mohawk (q.v.), has been a great aid in the development of the commerce of the State. Through the Mohawk Valley the Erie Canal extends, and beyond to the Great Lakes, thus making a continuous waterway from the ocean north to the Mohawk and thence west across the State. The northern part of the State is drained by rivers which flow direct to the Saint Lawrence. The largest are the Black, Oswegatchie, Grasse, Racquette, Saint Regis, and Salmon. The Saranac enters the Saint Lawrence through Lake Champlain, and the Genesee and Oswego through Lake Ontario. The Susquehanna has its head waters in Otsego County, and the source of the Delaware is southeast of Otsego Lake. The Allegheny River, in the western part of the State, enters the Mississippi through the Ohio River. There are a number of falls and picturesque gorges in the Genesee River in the vicinity of the points where the stream breaks through the terraces. In the Adirondack region there are a number of beautiful lakes, the waters of which are remarkably clear. Lake George (q.v.), on the south slope of the mountains, is famous for its scenery and the points of historic interest surrounding it. Lake Champlain (q.v.), on the eastern boundary, together with Lake George, belong to the Saint Lawrence River basin. In the central part of the State are a number of lakes, long and narrow, which are called the Finger Lakes. The largest are Cayuga and Seneca, about 40 miles long, and from two to four miles wide. Oneida (q.v.) Lake is nearly circular in form. Lake Chautauqua, in the western part of the State, 1,212 feet above sea-level, is the highest navigable body of water east of the Rocky Mountains. The waters of this lake enter the Mississippi although it is only nine miles from Lake Erie. The most noted waterfalls and natural curiosities in the State are Niagara Falls, in Niagara River, 2,900 feet wide and 160 feet high; Portage Falls, in Genesee River, consisting of two falls, of 70 feet and 110 feet, and a series of rapids 150 feet; Genesee Falls, in Genesee River, at and below Rochester, consisting of three falls, of 96 feet, 25 feet and 84 feet, within a distance of two and a half miles; Trenton Falls, in West Canada Creek, Herkimer County, consisting of five cascades with a total fall of 200 feet in half a mile; Taughannock Falls, in Tompkins County, 230 feet; Chittenango Falls, in Chittenango Creek, Madison County, 136 feet; Lyons Falls, in Black River, Lewis County, flowing down an inclined plane 63 feet, at an angle of 60°; Kaaterskill Falls, Greene County, consisting of two falls, 175 feet and 85 feet; Baker's Falls, Washington County, consisting of a succession of falls and rapids, having a total descent of 76 feet in 60 rods; Cohoes Falls, in the Mohawk, near its mouth, with a total fall including rapids, of 103 feet; Glens Falls, Warren County, 50 feet; High Falls, in the Hudson, Warren County, 60 feet; High Falls, Ulster County, 50 feet; the Ausable Falls, in Wilmington, Essex County, 100 feet; Enfield Falls, Tompkins County, consisting of a series of cascades with a total fall of 230 feet; Buttermilk Falls, Genesee County, 90 feet; and the falls in Fall Creek, Tompkins County, consisting of five falls with a total descent of over 500 feet in a mile. In East Canada Creek, about two and a half miles from its mouth, is a series of cascades and rapids having a total fall of 75 feet in 80 rods. Upon Stone Bridge Creek, Warren County, is a natural bridge 40 feet high, 80 rods broad, and 247 feet long. Dover Stone Church, Dutchess County, is a ravine 25 feet wide at the bottom, one to three feet wide at the top, about 40 feet long, and 40 to 50 feet high. Near Kyserike, Ulster County, is a cave which has been explored one and one half miles from its entrance. On Black River, at Lyons Falls, are the "Pictured Rocks"; and in Onondaga County are the "Cratean Lakes" and "Green Lakes."

Geology.— Nearly all the geological formations are present in New York. The Archæan is represented in the Adirondacks and the Highlands of the Hudson, by gneisses, granites, ancient crystalline and metamorphic rocks. Potsdam sandstone of a kind which denotes existence in the Cambrian age, is on the northeast and west of the Archæan area of the north. The lower Cambrian rock shows in a narrow strip extending south from the head of Lake Champlain and in the vicinity of Lake George. The palæozoic constitutes four fifths of the State and is represented by schists, slates, metamorphosed rocks in the east and by massive and hard sandstones in the Catskills. The palæozoic is represented by the Cambrian, Silurian, and Devonian periods. The Adirondacks, Highlands and lands west were above sea-level in the Silurian period, but the area of the State west of this uplift remained submerged until the Devonian period. The Triassic and Jurassic are represented by Newark sandstones and shales, in Rockland County; and the Pleistocene, by glacial drift, and lacustrinea and estaurine clays cover a great part of the State. The Pleistocene ice-sheet covered the entire State and accounts for many of the peculiarities of the topography.

Mineralogy.—The Federal census of 1900 gives as the principal mineral productions for the year: salt, 6,791,798 barrels, valued at $2,369,323; gypsum, 58,890 short tons, valued at $929,038; petroleum, 1,320,909 barrels, valued at $1,708,926; fibrous talc, 63,500 short tons, valued at $499,500; metallic paint, 2,500 short tons, valued at $26,900; mortar colors, 2,350 short tons, valued at $25,050; Portland cement, 465,832 barrels, valued at $582,290; rock cement, 3,409,085 barrels, valued at $2,045,451; natural gas, valued at $363,367; limestone, $1,730,161; marble, $332,518; slate, $62,755; sandstone, $1,467,496; granite, $446,171; clay products, $7,660,606; and iron, 441,485 long tons. Coal does not seem to exist in the State although found in large quantities not far south of the boundary. The Catskill and Potsdam sandstone, the Hudson River blue stone, and most of the limestone are valuable for building stone. The greatest deposits of hematite and magnetite are found in the

Adirondack region. Rock salt is found south of Lake Ontario in the vicinity of Warsaw. The mineral springs exceed in value any other State except Wisconsin. The principal mineral and medicinal springs are the salt springs of Onondaga County, from which over 7,000,000 bushels of salt are annually received; Saratoga Springs; New Lebanon and Stockport, Columbia County; Massena, Saint Lawrence County; Richfield, Otsego County; Avon, Livingston County; Clifton, Ontario County; Sharon, Schoharie County; Chittenango, Madison County; and Alabama, Genesee County.

Climate.—The climate of the State, as a whole, is continental; but that of Manhattan Island, Long Island, and Staten Island is modified by the ocean. The average maximum temperature for the State is 100°, and the minimum is a little below zero. The Adirondack region, north of the highest point, or on the northern slope, is the coldest, having the longest and most severe winters. The mean temperature for January is, in the Adirondacks, 15°; on the coast 30°; in the western part 26°. The mean temperature for July, in the Adirondacks, is 64°; on the coast 70°, and in the western part 72°. The rainfall is copious, averaging for the eastern part of the State about 50 inches and for the western part 40 inches. The State is remarkably free from malarial conditions. The Adirondack region is noted for its freedom from conditions inducing tuberculosis.

Flora.— See UNITED STATES.

Fauna.— See UNITED STATES.

Mining and Minerals.— The chief products mined in New York State are salt, iron ore, sandstone, limestone, fire-clay, marble, granite and slate. The salt output of Michigan exceeded that of New York until 1893, since which year New York has ranked first as a salt-producing State. The average annual value from 1898 to 1900 was $2,000,000. The output of iron ore, in 1900, was $1,103,817; for the same year the natural gas brought $363,367; the sandstone $1,467,496; the limestone, $1,730,162; rock cement, $2,045,451; clay products, $8,073,769; the granite averages nearly $400,000, and the marble the same. Gold in small quantities has been found in the Adirondack region, and natural gas near Lake Erie.

Fisheries.— The oyster fisheries are the most productive, representing over half the total value of the fishing industries of the State. Next in value are the menhaden, bluefish, and clams. The most valuable fisheries are on the coast of Long Island; Suffolk County ranks first. The shad and alewives are found in the Hudson; trout in the Adirondack lakes. In 1900 the canned fish amounted to $196,869. The number of persons engaged in the fisheries has diminished from 1880. The State department having charge of the "Forest, Fish, and Game," is pursuing a scientific system, looking to the preservation of the forests, fish, and game of the State.

Agriculture and Stock-raising.— The soil of two thirds of the State is suitable for agriculture, only the rocky mountain area and some sand-belts are considered so unproductive as not to be classed with agricultural lands. All the other conditions for productive farming exist in a favorable degree. Until 1890 New York State ranked first in the value of its agricultural products; in that year some of the Western States reached first place and the farm products of each of three of them were greater that year than those of New York. As the wheat and corn output of the West has increased, the farm products and farm improvements of New York State have decreased. The average of improved land has decreased since 1880, and the nature of the crops raised has varied. The Western wheat and corn in competition has caused the decrease of wheat and corn crops and an increase in the hay acreage. Corn for forage is increasing. The hay forage acreage in 1900 was about half the total crop acreage of the State. The principal farm products of 1900 were: Corn, 17,236,032 bushels, valued at $5,002,048; oats, 44,538,974 bushels, valued at $14,252,472; barley, 3,751,924 bushels, valued at $1,785,932; buckwheat, 3,280,150 bushels, valued at $1,869,690; hay 3,351,991 tons, valued at $47,095,474; potatoes, 27,481,356 bushels, valued at $12,366,610. These figures show that oats is the most important cereal; it is the chief cereal crop of the Saint Lawrence River basin. Next in importance of farm products come potatoes. New York takes first rank in the acreage devoted to potatoes, and in the quality of the crop it is not surpassed. Market gardening is of considerable importance. Nearly all the farm lands of Long Island and in the counties near New York city, on both sides of the Hudson, are devoted to market gardening. In 1850 the average size of farms was 112.1 acres, and in 1900, 99.9. The amount of farm area of the State, in 1900, was 74.3 per cent, of which the amount improved was 68.9 per cent. There were in farms 22,648,109 acres. In 1900 the farms occupied by tenants was 23.9 per cent of the total number. The dairy products of the State are of great importance and great value. The State ranks first in the value of butter and milk, and among the first in the value of cheese. The amount produced is sometimes greater in some of the other States, but the quality in New York is the best and always brings the highest prices. The soil, vegetable, and climatic conditions, and the introduction of scientific methods in dairy farming, have greatly improved the quality of the dairy products. The milk sold in 1900 brought $36,248,833; butter, $9,868,446. The dairy products in 1900 brought 30.5 per cent of the total income from the farms. Along the Hudson, especially in Ulster County, and in the Genesee Valley and west, there are large fruit orchards, apples predominating. In the lake region in the central part of the State grapes flourish. Hops and tobacco are cultivated in the central part, and hops flourish in Franklin County. Floriculture is increasing in counties near the city markets. Fertilizers are used on nearly all farm lands which are productive. The amount used depends upon the nature of the soil and the crop. The farm buildings throughout the State are in a fair condition; the general appearance of the farms indicates thrift and industry.

The table at the top of the succeeding page shows the number and acreage of farms and value of farm property 1 June 1900.

The number of sheep and swine have decreased. Poultry is becoming more prominent, especially where the city and summer resort markets are convenient.

Principal Source of Income	Number of farms	Number of acres in farms			Value of farm property	
		Average	Total	Per cent	Total	Per cent
The State	226,720	99.9	22,648,109	100.0	$1,069,723,895	100.0
Hay and grain	27,095	104.1	2,819,847	12.5	140,739,391	13.2

*Less than one tenth of 1 per cent.

Stock holdings were as follows for the years given:

	1890	1900
Dairy cows	1,440,230	1,501,608
Other cattle	691,162	1,094,781
Horses	664,430	628,438
Mules and asses	4,636	3,651
Sheep	1,528,976	984,516
Swine	843,142	676,639

Forests and Lumbering.—The original forests of the Adirondack region were composed chiefly of white pine, hemlock, and spruce; near the base of the northern slope of these mountains there were large forests of maple, birch, elm, white pine, basswood, hemlock, and spruce. The hard and soft woods were also found in the southern and western parts of the State. At one time New York ranked first among the States in lumbering interests. The only forests still standing in which there is much lumbering are in the northern part of the State. Spruce and hemlock now form the principal output for lumber. The pulp wood mills and paper mills are using (1904) large quantities of timber, mostly spruce. This industry increased about 90 per cent during the years 1890–1900. The State owns 1,163,414 acres of Adirondack lands (State Reservation), and there are about 705,914 acres in private parks, and about 1,356,816 acres owned by individuals and companies for their own purposes. During the last decade efforts have been made to preserve the forests of the State. See Forestry.

Manufactures.—New York ranks first among the States in the value of manufactured products. The Erie Canal was a great aid in developing many of the manufacturing industries of the State. It gave an opportunity to bring the raw material at small cost to places where there was water-power, and then, still at low cost, to send the finished products to the markets. The rivers with their extensive water-power have continued to hold the large share of the manufacturing even during the period when steam was the main power in many places, and now the water-power is of greater importance in the development of electrical power. The enormous power of Niagara Falls is causing a remarkable increase in the output of manufactories, especially the aluminum, carborundum, and machinery made at the city of Niagara Falls. The great electrical plants of the State are increasing the manufacturing power; as at Schenectady, Mechanicville and other places on and near the Hudson River (q.v.); also at Massena (q.v.) near the Saint Lawrence River, and in many other parts of the State. According to the Federal census of 1900 there were 78,658 manufacturing establishments, employing $1,651,210,220 capital and 849,056 persons; paying $408,855,652 for wages and $1,143,791,776 for materials; and yielding products having a combined value of $2,175,726,900. The principal articles according to value of output were men's clothing, in factories, $126,478,057; women's clothing, in factories, $106,892,390; foundry and machine shop products, $96,636,517; and sugar and molasses, $90,680,478. The percentage of the population engaged as laborers in manufacturing establishments was, in 1850, 6.4; in 1900, 11.7. In 1900 the value of the manufactures for New York State was one seventh more than that for Pennsylvania. New York's manufacturing establishments were, in 1900, more than one sixth of the total for the United States. About one fifth of the output belongs to the State outside of New York city; three fifths to New York city. Factory-made clothing for men and women is almost all made in New York city. Other cities have special large industries, as the carpet, cotton, and shoe industries at Utica, knitting industry at Yonkers and Cohoes, men's shirts and neckwear at Troy, optical instruments and kodaks at Rochester.

The following table compiled from the Federal census of 1900 gives a comparative summary of 36 leading industries of the State:

COMPARATIVE SUMMARY OF THIRTY-SIX LEADING INDUSTRIES.

Industries	Year	Number of establishments	Capital	Wage-earners		Miscellaneous expenses	Cost of materials used	Value of products, including custom work and repairing
				Average number	Total wages			
Total for selected industries for state	1900	24,417	$1,156,396,994	502,839	$234,922,692	$152,077,272	$759,215,666	$1,380,975,268
	1890	21,309	760,830,178	445,867	211,497,587	86,352,935	583,692,855	1,082,595,478

Transportation and Commerce.— The principal railroad systems crossing the State are the New York Central & Hudson River, the West Shore (New York, Chicago & Saint Louis), the Erie, the Lehigh Valley, the New York, Ontario & Western, the Delaware, Lackawanna & Western, the Pennsylvania, and the Delaware & Hudson. The great trunk lines of the country make connections with all these roads. In 1900 there were 8,095 miles of railroad in the State. In the year 1899 the railroads of the State had one fourth of all the passenger carrying trade and one fifth of all the freight traffic of the United States. The Mohawk and Hudson was the first railroad in the State; it was completed and ready for operation in 1831, extended from Albany to Schenectady and was 17 miles long. About 11 years afterwards there was a railroad completed from Albany to Buffalo; next came the Erie, and then the road from New York city to Albany. In 1825 the Erie Canal (q.v.) was opened, and it has been in use in the carrying trade since that time. Other canals of the State are the Oswego, the Champlain and several branches. At the general election, in November 1903, the people voted an appropriation of $101,000,000 to enlarge the Erie Canal. The State board of railroad commissioners have general supervision of railroads, especially with reference to public safety and convenience and to any violations of the law governing the railroads of New York. The total construction and equipment of all railroads, steam, surface, and elevated, within the State, is as follows: 1850, $63,255,847.83; 1860, $137,848,323.59;

1870, $308,890,198.76; 1880, $716,101,467.28; 1890, $1,385,560,174.65; 1900, $1,732,960,017.48. New York ranks first in the Union in foreign commerce. At present large numbers of Chinese coming to the country are held at Malone for trial as to their rights to enter. In the year 1900 there passed through the port of New York 35.60 per cent of the exports of the United States, and 64 per cent of the imports. The commerce between the places in New York State and other points in the Union is much greater than the foreign trade of the State.

Banks.— In 1782 the first bank in the State was incorporated as the Capital Bank of North America. The second bank was chartered in 1791, as the Bank of New York. The privilege to establish a bank or the granting of a bank charter became a political favor after 1804, when the law was passed making it necessary to have the sanction of the Legislature to establish a bank or issue currency. In 1812 there were 20 banks in the State, and in 1829, 48 banks. The charters were for a specified term of years, and various means were resorted to to secure renewals. It was deemed necessary to change the laws for the establishment and government of banks, and in 1829–30 a change was effected. The "safety fund" method was established. A board of bank commissioners was created, examinations and annual reports were established. (See BANKS.) The system of clearing houses now deemed essential, began in New York city. In 1854, the first year of trial for the new system, the exchange amounted to $5,500,000,000. The total exchanges in 1900 were over $60,000,000,000. The conditions which govern commerce and finance make the clearing house of New York, practically, the clearing house of the United States.

The following statistics give valuable information regarding the growth of the banking system of the State:

BANKS, BANKING ASSOCIATIONS, AND INDIVIDUAL BANKERS.

	1834	1840	1850	1860	1870	1880	1890	1900

Finance.— The State income is derived mainly from a tax for general expenses and for schools, 29 per cent; corporation tax, 25.5 per cent; excise tax, 17.5; and inheritance tax, 14 per cent. The first arrangement made for an income for State expenditures was the formation of a productive fund from the sale of public land. For a time the income derived from this general fund was sufficient for the support for the State government and the schools. In 1814 it was found necessary to increase the revenue, and this was done by forming another productive fund for school purposes. Later a direct tax was levied, but in 1826 this was discontinued. A system of public improvements was instituted in 1817, and a public debt of $7,000,000 was incurred. The Erie Canal and other public improvements increased the debt. An effort was made to meet the new obligations by a sinking fund and by canal tolls and other means. The plan of loaning State credit to private corporations, principally railroads, was begun in 1827. In 1842 the Erie Railroad failed with a large indebtedness to the State. Other smaller creditors failed also, and this new debt, together with that of the former, amounted to $20,310,000. A tax was imposed sufficient to meet expenses, many public improvements were stopped, and outside debts were funded. The Constitution adopted in 1846 inserted clauses looking to a prevention of such conditions. No debt could be contracted except for war, and then popular sanction by a referendum was necessary. A general sinking fund and a canal sinking fund were created. The Constitution now in force (1904) retains the provision relative to popular sanction by a referendum. In the year 1865 the State debt was the greatest it has ever been, $53,000,000. Of this amount $30,000,000 was war bounty debt. In five years the debt was reduced to $32,400,000; another decade saw it only $8,988,000; and the whole debt was canceled in 1893. In 1900 a new debt was created for improvement of the Erie Canal. On 1 Jan. 1903 the total State debt was $10,000,000. The income at present is derived from taxes on assessable property, fees from foreign corporations, licenses, taxes on certain public franchises, trusts, and banks. For the year 1903 the expenditures were $23,601,955; the balance in the treasury was $6,992,599.

Government.— The government of the State is administered in accordance with the provision of the State Constitution. This Constitution may be amended by a majority vote of the House in two consecutive Legislatures and adopted by popular vote of the people. It may be revised by a Constitutional Convention, and the popular vote of the people. The last revision of the State Constitution was made in 1894, and went into effect 1 Jan. 1895. This Constitution provides for amendments and revisions as stated, and that the question of a Constitutional Convention and of a revision of the Constitution must be submitted to the general vote of the people every 20 years, or more frequently if so ordered by the Legislature. It provides also for a State census every 10 years. All male citizens in New York State can vote, unless debarred by crimes against the law or of unsound mind. To be a citizen of New York State a man must have been a citizen 90 days, one year a resident of the State, four months a resident of the county, and 30 days a resident of the town or precinct. It is also required that voters to be entitled to vote must register, but registration for town and village elections cannot be made obligatory unless by express provision of law. In the cities the holding of party primaries are regulated by law; and the way in which votes shall be cast in all parts of the State is also regulated by law. The officers of the government are the executive, the members of the Legislature, the judiciary, and their subordinates.

Executive.— The governor of New York is elected biennially, by popular vote at a general election held throughout the State the first Tuesday after the first Monday in November. He appoints a superintendent of public works, a superintendent of banking, of insurance, of State prisons, a factory inspector, a commissioner of agriculture, commissioner of labor, statistics, and an excise commissioner. He has a veto right which may be used to prevent appropriations or other legislative measures; but the Legislature may overrule the veto of the governor by a two-thirds vote of the members of the Senate and Assembly. He may pardon or reprieve criminals, and he may commute a sentence. He has power to make appointments other than those mentioned subject to approval by the Senate. The officials elected with the governor and for the same number of years are the lieutenant-governor, secretary of state, comptroller, treasurer, attorney-general, and state engineer and surveyor. The most important State boards or commissions are for health, lunacy, and charities, for forestry, railroads, quarantine, and tax equalization.

Legislature.— The Legislature is composed of a Senate of 50 members, who hold office two years; and an Assembly of 150 members, who hold office one year. The State is divided into senatorial and assembly districts. The senatorial districts, being less in number, have each a much greater population than each of the assembly districts. The lieutenant-governor is president of the Senate. The members of the Assembly elect their own presiding officer, who is called the Speaker. The populous counties are divided into two or more assembly districts. The members of the Legislature receive a salary of $1,500 and mileage for each session. The Legislature holds its sessions in the State Capitol at Albany.

Judiciary.— The court of appeals is the highest court in the State. It consists of the chief justice and six associate justices, each chosen by a popular vote and for a term of 14 years. There are 76 judges belonging to the supreme court, each one of which is chosen by popular vote for 14 years. The State is divided into eight judicial districts. Other courts provided for by law are county courts, city courts, surrogate's courts, justice's courts.

Local Government.— The incorporation of villages, chartering cities, and organization of counties is within the jurisdiction of the Legislature. The Legislature decides the limit of taxation and assessment for incorporated villages and cities, and restricts their power of borrowing money. Any special legislation for a city or the cities of the State shall be submitted to the cities concerned, for their approval or rejection; but the Legislature may later over-

rule the veto of the city. Cities are divided, according to population, into three classes. The first class includes cities having a population of 250,000 or more; the second class includes cities having a population of over 50,000 and less than 250,000; the third class includes all other cities in the State. The cities are classified as follows: First class — New York, Buffalo; second class — Albany, Rochester, Syracuse, Troy; third class — Amsterdam, Auburn, Binghamton, Cohoes, Corning, Cortland, Dunkirk, Elmira, Geneva, Gloversville, Hornellsville, Hudson, Ithaca, Jamestown, Johnstown, Kingston, Little Falls, Lockport, Middletown, Mount Vernon, Newburgh, New Rochelle, Niagara Falls, North Tonawanda, Ogdensburg, Olean, Oneida, Oswego, Poughkeepsie, Plattsburgh, Rensselaer, Rome, Schenectady, Utica, Watertown, Watervliet, Yonkers.

Militia.—The National Guard, a portion of the State militia, is armed, equipped, and ready for service at all times. It numbers 14,410, which includes officers and enlisted men. The Naval militia is also a part of the State militia, and it also is ready for service at any time. It numbers 651 officers and enlisted men. There are four brigades of the National Guard. The headquarters are in Albany.

Political Divisions.—The State is divided into 61 counties. The county officers are judge, surrogate, sheriff, clerk, treasurer, district attorney, superintendent of the poor, and coroners. Each county, except New York, is divided into towns. The officers of the town are supervisor, clerk, commissioner of highways, assessors, constables. There are 42 cities (1904), the largest of which are: New York, pop. (1900) 3,437,202; Buffalo, 352,387; Rochester, 162,608; Syracuse, 108,374; Albany, 94,151; Troy, 60,651; Utica, 56,383. The other cities were, as reported by the Federal census of 1900, less than 50,000. The government of the cities is vested in a mayor, board of aldermen, and the subordinate officials. Some cities are governed under a special charter. The villages are usually smaller than the cities, and the government is administered by a president and a board of village trustees. There are 37 congressional districts; the State sends 37 Representatives to Congress. There is a State Park or Reservation in the Adirondack Mountains, and one at Niagara Falls. There is a State Reservation for Indians on the Saint Lawrence River at the mouths of the Saint Regis and the Racquette rivers.

Religion.— All Christian denominations, and the Jews, have churches and large congregations throughout the State. Among Christian Churches, the Roman Catholic predominates in number of communicants and church attendance, in the cities, and Protestants in the smaller cities and country places. The Protestant denominations, according to number of communicants and attendance, rank as follows: Methodists, Presbyterians, Baptists, Protestant Episcopalians, Lutherans, and Congregationalists.

Education.— The system of education aims to furnish free schools for all the minors of the State, and in late years a system of education for adults has been organized and put into force with success. For many years the Regents of the University (q.v.) had the supervision of the secondary schools, colleges, and universities, aided, supported, or incorporated by the State, and the elementary schools, normal and training schools, teachers' institutes, training classes, and Indian schools were in charge of the State Department of Public Instruction. The Legislature (February 1904) has under consideration a plan to unify the two departments of State school supervision. Children between the ages of 8 and 16 years are compelled to attend school (public or private). The school census of 1901 gave as the number of persons of school age (from 5 to 18 years), 1,620,287. Of this number 1,242,416 were enrolled in the public schools; 200,000 in the parish schools (not private schools), leaving 277,871 not accounted for by the public and parish school records. Of this number not so enrolled, a large per cent were in attendance at private schools, and a number over 16 and under 18 may not have been attending school. In the advanced secondary schools, the colleges, universities and seminaries of the State there is a large attendance of pupils over 18 years of age. The compulsory law is so wisely and rigidly enforced that it is safe to say that all the children of the ages reached by the compulsory law are being educated in some school, unless prevented by mental or physical disorders. The illiterate population of the State (1901), 10 years of age and over, was 5.5 per cent of the whole population. This per cent is about 1.1 for native white, or less. The school revenue for 1901 was from the permanent school fund. $272,477; from State taxes, $3,500,000; from local taxes, $26,451,363; from other sources, $8,245,437, making a total of $38,469,277. The cost per pupil was $41.68. There were, in 1901, 383 public high schools, with an enrolment of 63,549 pupils; and 199 private high schools and academies, with an enrolment of 11,650 pupils.

Training for teachers is given in 11 State normal and training schools, one State normal college, and a large number of training classes located in different villages and cities, according to the needs of the sections asking for the establishment of such schools. Teachers' institutes are provided by the State, and a regular teaching institute staff is maintained. (See SCHOOLS, NORMAL AND TRAINING.) The system of granting certificates or of licensing teachers is by uniform examinations. The Examination Department makes out the questions, assigns the time (for State examinations, the place), examines all the papers of the candidates, and decides who shall or shall not receive certificates. Many of the cities have special rules regarding other examinations, and also the establishment and maintenance of city training schools and classes. The local supervisor in a city is the superintendent of schools, in an assembly district, the school commissioner. The country sections are divided into school districts.

Cornell University (q.v.) is the only institution of collegiate grade in the State which awards scholarships by examinations. Columbia University (q.v.), founded under the auspices of the Protestant Episcopal Church, is the oldest institution of the kind in the State. Other colleges and universities are: New York University, New York city; College of the City of New York; Union College at Schenectady; Hamilton College, Clinton; Hobart College, Geneva; Colgate University, Hamilton; Saint John's, Saint

Francis Xavier, Manhattan, and De la Salle colleges, New York city; colleges and universities in Buffalo, Syracuse, and Rochester. Vassar College (q.v.) is at Poughkeepsie, Barnard is affiliated with Columbia. There are 17 theological seminaries, 12 medical schools, 4 schools of pharmacy, 3 dental schools, 7 law schools. The State requires a certain degree of education before beginning the study of a profession, in a State school, and an examination is given at the end of the course to determine fitness and ability for graduation. The New York State Library (q.v.) claims to be the first public library in the State; it was founded in 1700. (See LIBRARIES; REGENTS, for "Traveling Libraries" and "Home Study Clubs.") The following statistics show the growth of the educational movement in the State:

	Cost of maintenance of schools	Amount expended for teachers' wages	Amount expended for school houses, sites, furniture, and repairs	Amount expended for libraries
1850	$ 1,607,684.85	$ 2,025,367		
1853				
1857			$ 746,092	$ 49,499
1860	3,744,236.95	2,597,964	642,291	34,036
1870	9,905,514.22	6,496,692	1,970,579	30,652
1880	10,296,977.26	7,638,922	1,145,831	30,399
1890	17,392,471.61	10,422,171	4,593,264	49,889
1900	33,421,491.37	19,218,893	8,548,643	142,158

Charitable Institutions.— The governor and the Senate appoint the State boards of charities, corrections, and lunacy. The duties of the Board of Charities are to exercise an advisory supervision over charitable institutions, State and local, and over private institutions to which public charges have been committed. The institutions thus supervised (1902) are about 510, and the number of inmates in these institutions is about 60,000. The office of fiscal supervisor of State charities was created by ch. 252, Laws of 1902. He is appointed by the governor subject to confirmation by the Senate, and has the general supervision over the accounts and expenditures of the charitable and correctional institutions of the State, which include reformatories, industrial schools, institutions for the mentally defective, institutions for soldiers, for the blind, orphans, crippled, deformed, and treatment of tuberculosis. State charity institution buildings are contracted for under the supervision or by the approval of the governor, president of the State Board of Charities and the state comptroller. The present (1904) State institutions are houses of refuge for women at Albion and Hudson, reformatory for women at Bedford, soldiers' and sailors' home at Bath, Craig colony for epileptics at Sonyea, home for feeble-minded women at Newark, home for orphan Indian children at Iroquois, industrial school, Rochester, home for feeble-minded children, Syracuse, home for soldiers' orphans at Oxford, hospital for crippled and deformed children at Tarrytown, school for the blind at Batavia, hospital for cases of incipient pulmonary diseases at Raybrook. There are schools for the deaf and dumb, and several private institutions which receive State aid, but are not wholly supported by the State. There were supported in county almshouses, during the year ending 1 Oct. 1900, 15,780 persons. In city and town almshouses fully 70,000 were supported. During the same time about 210,000 received temporary relief. The State expenditures for the institutions supervised by the Board of Charities for the year ending 30 Sept. 1900 were $16,107,000.

The Board of Lunacy has supervision of the State insane hospitals. They are located at Binghamton, Buffalo, Dannemora, Flatbush, Gowanda, Kings Park, Matteawan, Middletown, Ogdensburg, Poughkeepsie, Rochester, Utica, Wards Island (New York city), Willard, Ovid. There were, in 1900, 23,267 patients in these institutions, and the number is now (1904) considerably increased. There are also 20 private institutions authorized by the State board to receive insane patients. The private institutions, partially under State supervision, had, in 1900, nearly 1,000 inmates. The cost for maintenance and operation of the State insane asylums for the year 1900 was $3,594,873.

Penal Institutions.— The State prisons are located at Ossining (Sing Sing), Auburn, Clinton (Dannemora). The State reformatories are at Elmira and Napanoch; one for women at Bedford. Houses of refuge are at Albion and Hudson. The State penitentiaries (county institutions for short term convicts) are in the counties of Albany, Clinton, Erie, Kings, Monroe, and New York. The counties which do not have penitentiaries arrange with the penitentiary of some other county for care and support of those sentenced to such a place of detention and punishment. The number of persons in prisons and jails of the whole State, in the year 1898, was 149,677; in 1902, 96,932. The abolition of the fee system in many of the counties, the more general application of the law of suspended sentence, the efforts to induce prisoners to reform, all have contributed to the decrease in the number of prison inmates. The system of instruction and training employed at Elmira is resulting in practical reforms. The parole law and the indeterminate sentence are being introduced into many other prisons. Capital punishment is still in force in the State; death by electricity, since 1880, has been substituted for hanging. Murder in the first degree is the only crime for which capital punishment is inflicted.

Population.— Since 1820 the State has held first rank in population. The State receives (and a large number remain) the majority of the emigrants. The number of the foreign born, resident of the State in 1900, was 1,900,425, or nearly double the number in any other State. The population born in the State, but of foreign parents, was 2,415,845. There were the same year, 5,257 Indians, 7,170 Chinese, and 99,232 negroes. The urban population has increased more than the country. In the decade from 1890 to 1900, the rate of increase for the State was 21.2 per cent; the rate for the same year for the whole United States was 20.7 per cent. Pop. (1800) 589,051; (1810) 959,049; (1820) 1,372,111; (1830) 1,918,608; (1840) 2,428,921; (1850) 3,097,394; (1860) 3,880,735; (1870) 4,382,759; (1880) 5,082,871; (1890) 5,997,853; (1900) 7,268,012.

History.— As the credit for the discovery of America belongs to one Italian, Christopher Columbus, the protégé of the far-seeing Queen Isabella of Spain, the credit for the discovery of New York is linked with the name of another

Italian, Giovanni da Verrazano, the Florentine, in the service of Francis I. of France. Verrazano's ship, La Dauphine, which left Dieppe with several others in the autumn of 1523, unquestionably sailed by Sandy Hook in the middle of April 1524; proceeded as far as Raritan Bay, when by stress of weather Verrazano was forced to return to the open sea and continue his journey to the eastward. While Spain's discovery of the Continent antedated the French discovery of New York by forty-two years, the French navigators anticipated the Dutch on the same lines by eighty-five years. The English who were the last to arrive had no part in discovering any of the land which is now known as New York, although eventually they controlled the entire territory from Florida northward.

French enterprise early determined the importance commercially and politically of the New World, although handicapped by the fierce civil wars that raged from 1560 until the accession of Henry IV. in 1594. The year made memorable by the Edict of Nantes, 1598, which secured freedom of worship for the Protestants, the Marquis de la Roche obtained a commission to conquer Canada. His expedition was a lamentable failure. Five years later De Monts, who had been commissioned governor of Acadia, brought a number of colonists to Port Royal, subsequently called Annapolis by the English, but after two years of hardships the settlement was abandoned, the pioneers returning to France. De Monts' commission, which had been revoked, was revived by a company of French merchants who entrusted their fortunes to Samuel de Champlain, a man who by education, ability and perseverance was thoroughly competent to execute the responsible trust committed to him. What William Penn was to the English court, that was Champlain to the French king, Henry of Navarre. He was a soldier and sailor of fortune; a sincere and devoted Christian. To him must be accorded the imperishable honor of being the first man who set his foot in New York, as he was the first to teach religion to the Iroquois. In 1608 he founded the city of Quebec. The twelve years' truce which acknowledged the sovereignty and independence of the Netherlands by Philip II. after their long and sanguinary struggle for liberty marked the beginning of a historic era in the New World. On the evening of 29 July 1609, Champlain at the head of a band of Montagnais Indians encountered a war party of Iroquois on the west bank of Lake Champlain near Ticonderoga in Essex County. The next morning the unfortunate Iroquois were introduced violently to gunpowder and the white man's sway and the white man's way opened in the Western Hemisphere.

One 3 September following, Hendrik Hudson sailed into New York Bay on the eighty ton ship Half Moon, with a crew of eighteen men, half English and half Dutch. Hudson's son accompanied him. Hudson was an Englishman who had twice essayed to reach far Cathay by the Northwest passage. The Dutch East India Company, which was the pioneer company to take advantage of discoveries of new territory and whose powers were elastic for the colonization of new empires and the government thereof, persuaded Hudson by the offer of a seductive pecuniary inducement to lend his ability and fearlessness as an explorer to their enterprise. Accordingly on the fourth day of April 1609, he sailed from Amsterdam to seek for the third time the passage to India by the north. Again he was thwarted by gigantic icebergs and impassable seas of frozen ice which blocked his way. He changed his course to the westward, passed Greenland and Newfoundland, and sailed South until he descried the promontory of Cape Cod. He designated the region beyond it New Netherlands and for a long time the Dutch considered Cape Cod as the northeast boundary line of their territorial possessions. Continuing on his way, Hudson made Chesapeake Bay, but from letters which he had received from John Smith he understood his countrymen were in possession by right of discovery. He put about and headed to the north. He discovered Delaware Bay and river which he christened the Dutch South River. He fixed the southern boundary of New Netherlands from that point. On the second of September the Highlands of Navesink turned up over the horizon to the north. For a week Hudson loitered in the vicinity of Staten Island, which he named — an object of curiosity to the Indians as his ship was of wonder to them. September twelfth Hudson sailed into the Upper Bay and de Groote River, which was called by the natives Shatemuc or Mohicanituck, subsequently the North River, in contradistinction to the South and the East, and eventually the Hudson River in honor of the distinguished explorer who discovered it. Hudson had explored the neighborhood from Sandy Hook to Amboy, indulged in amiable converse with the aborigines, and proceeded on his course in search of the Northwest passage to India by the way of the Hudson River. It was only after eleven days' sail when he reached the end of navigable waters that he was compelled reluctantly to abandon the undertaking. With a deep feeling of disappointment he turned the prow of the Half Moon to the southward. The reports of his success, however, were forwarded to Holland and stimulated further enterprises in the way of exploring and colonization, while Hudson was detained at Dartmouth, England, whither he had put in, owing to the threatened mutiny of his crew.

The following year the fur merchants of Holland despatched another vessel to the River of the Mountains, which for the time was called the Mauritius after Prince Maurice, the stadtholder. In 1611 Hendrik Christiaensen of Cleves sailed for the same destination and returned with two young Indians, the sons of a Manhattan chief. In 1612 three Amsterdam merchants, Hans Hongers, Paulus Pelgrom and Lambert Van Tweenhuysen, sent two ships, the Fortune and the Tiger, to open up trade along the Hudson River. The Tiger was accidentally burned at Manhattan Island and Adriaen Block, its commander, during the winter of 1613–14, built a new vessel, the Onrest, of eighteen tons, the first to be constructed on Manhattan Island.

Two settlements had already been started in what is now the State of New York; one by Christiaensen on Castle or Patroon's Island, on the west bank of the Hudson a mile or two South of the present Albany, called Fort Nassau; the second on Manhattan Island, covering the space midway between the Battery and Rec-

tor Street on the west side of Broadway. Block in the meantime had sailed away to the eastward in the vessel he had built, discovered the island which bears his name, drew a map of all the region, and in consequence secured from the States-General a charter for the "New Netherlands Company" under which he enjoyed the monopoly of trade in that region until 1621, when the charter expired. In the latter year the Dutch West India Company came into existence, with a charter granted by the States-General of Holland. Two years later additions were made and an act of amplification given. Under this charter, which was to endure for 24 years, the company was permitted to trade with the West Indies, Africa, and "other places"; all other inhabitants of the United Netherlands were prohibited from trafficking with those countries. It was permitted to appoint governors and other officers; to determine the forms of administering justice, to make treaties and enact laws. Their first packet, the New Netherland — under the superintendence of Cornelis Jacobsen May — which plied her ocean trade for thirty years, brought in May 1624 over thirty families, eighteen of whom established a settlement at Fort Orange near Albany under Adriaen Joris. Two years later two ships loaded with emigrants, agricultural implements and domestic animals, left Holland for Manhattan Island, where the company had decided to erect a larger colony and their headquarters for New Netherlands. With the later colonists came the director-general, Peter Minuit, who the following year, 1626, purchased the island of Manhattan, containing 22,000 acres, from the Indians, for 60 guilders, or about 24 dollars.

The Colony "boomed" from the beginning and the stock of the West India Company sailed upward. Under "the Freedoms and Exemptions" act, adopted in 1628, the company gave authority to every person who should send over a colony of 50 souls above the age of 15 years, the title of "patroon" and the privilege of selecting tracts of land, except on Manhattan Island, eight miles in length along the river and as far inland as he pleased. It was obligatory for the patroon to be a member of the company. He was looked upon as a feudal prince. His possessions were exempt from taxation for ten years. The colonists were prohibited from manufacturing woolen, linen or cotton cloth. Under authority thus conferred Kiliaen Van Rensselaer, of Amsterdam, a diamond and pearl polisher, obtained, through Sebastian Jansen Krol, who had come out with Jan Huyck two years before as "a consoler of the sick," a tract of land 20 miles in length, from Baeren Island to Smacks Island, and 24 miles on either side of the river "stretching two days' journey into the interior," constituting the greater part of the present counties of Albany, Rensselaer and Columbia. Michael Pauw purchased from the Indians, Staten Island and the land upon which Jersey City and Bayonne are now built. With the development of the land and trade the inevitable occurred. The patroons practically became rivals of the West India Company in the fur trade. As the business of the latter diminished the wealth of the former expanded. Minuit, unable to readjust the differences, was recalled. For two years the office was vacant. It was then filled by Wouter Van Twiller, a name that has been rendered synonymous with farce, burlesque, contempt and arrogance. Van Twiller had married a niece of Van Rensselaer and was an administrator of fair parts. He began the construction of a new fort; he built the first church edifice; a bakery, a brewery; he substituted brick for frame houses and new windmills for old. But his plans failed to mature because of his peculiar disposition. Dominie Bogardus, who had accompanied him to this country in the same ship, stigmatized him as "a child of the devil" and threatened to "shake" him "from the pulpit as would make him shudder." Van Twiller was removed under charges in 1637 and left office, as did many of his successors, with a fortune he had accumulated in service. His successor was William Kieft, a man of slender abilities and an embezzler, whose ten years of service were conspicuous for strife — with the English and with the Indians. Like Van Twiller, Kieft was deficient in the art of conciliation. His position was too big for him to handle. He gives a discouraging report of the condition in which he found the colony; farms were barren of tenants and of cultivation or thrown into common; trading vessels in poor shape; houses out of repair; only one saw-mill out of three was in operation; the fort at New Amsterdam, for whose repair his predecessor had received 4,172 guilders, lay in a state of dilapidation and the magazine was scarcely discoverable.

The first English flag seen in the vicinity of New York floated from the vessel commanded by Captain Samuel Argall, the roving buccaneer, who in 1612 had captured Pocahontas and held her as a hostage for the good behavior of her father. Argall had been despatched in 1614 on an extraordinary expedition by Sir Thomas Dale, governor of Virginia, to dispossess the unfortunate French people who had settled at Acadia. On his return from this successful buccaneering expedition, Argall paid his respects to the Dutch. He proceeded up the Hudson River to Albany, forced a surrender in the name of the English king, and sailed away. New Amsterdam likewise submitted to Argall's demand, but as soon as his vessels disappeared through the Narrows, the Dutch flag replaced the English ensign as had been done at Albany. In 1633, Jacobus Eelkens, the Dutch commissary at Fort Orange, brazenly attempted to establish English trade on the Hudson, but the scheme was crushed at its inception. The New Englanders were not satisfied with their possessions but coveted the more prosperous settlements of the Dutch to the westward. In 1638 Kieft had issued a prohibition against the English trading at Fort Good Hope near the present Hartford, which had been built in 1623. Shortly afterward, owing to the insolence of the English, an order in Council was issued, to strengthen the post, to maintain Dutch supremacy. We first hear of English settlers in New York in 1640 on Long Island. They had crossed the Sound from Connecticut. When the English audaciously confiscated land, near Fort Good Hope, which the Dutch had prepared for planting, and brutally chastised farmers who tried to plant, Kieft threw a detachment across the Sound in retaliation and dispersed an English settlement at Oyster Bay.

But Kieft found more trouble on his hands.

The Indians of New Jersey betrayed signs of restlessness toward the governor of New Netherlands; he was threatened by the Swedes at the south; he realized the unfriendliness with which the cavaliers of Virginia, Maryland and Delaware regarded his colony; he could expect no favors from the Puritans on the east. At this crisis he unwisely provoked a quarrel with the Indians by demanding tribute in maize and fur on the ground that the Dutch had supported them in defense of their enemies. From the day Champlain introduced gunpowder to the savages on Lake Champlain, the red man of the forest had sedulously and successfully cultivated its acquaintance. So that when Kieft imprudently attempted to suppress the sale of guns and their accessories to the Indians, turbulence broke loose along the New York frontier. For three years the bloody strife continued, during which the Dutch in New Amsterdam were driven for protection under the guns of the fort and were reduced to much distress by the aggressive operations of the Manhattans, from the north, the Long Island Indians from the east and Delawares from the south and west. Roger Williams brought about an interview between Kieft and the sachems, but the peace which followed was of brief duration, for hostilities were resumed more savagely than ever before the end of the year. The Indians were bent upon a war of extermination of the whites. They felt their power, the force of their numbers and were thirsting for revenge. "When you first came to our shores you were destitute of food" exclaimed a Sachem before a treaty council. "We gave you our beans and our corn. We fed you with oysters and fish. And now for our recompense, you murder our people."

In 1643 "the first germ" of our Federal Constitution was planted by the formation of a league for self government and common defense by the colonies of Massachusetts, Plymouth, New Haven and Connecticut. For the time it was a powerful organization. To it, Kieft appealed in vain for aid, to carry on his Indian war. The confederacy was organized as much to make aggressions upon the thrifty Dutch as for defense against the Indians. Matters were going badly for Kieft until he solicited the support of Captain John Underhill, a valiant warrior, under whose skill and energy, an able-bodied force was raised, which encountered and defeated the Indians in several pitched battles. Peace was eventually assured in 1645 through the intervention of the Iroquois. Kieft failed to profit by the lesson. The act that led to his recall was the most infamous in Dutch Colonial annals. Without the slightest provocation, he crossed to the west bank of the Hudson, with the soldiers from the fort, a mob from the streets, and privateersmen and sailors from the harbor. Under cover of darkness he fell upon a band of peaceable and unsuspecting Indians at Pavonia and massacred men, women and children indiscriminately. Kieft left for home with a fortune. The ship was wrecked off the coast of Wales and governor and fortune went down together.

We now come to the much misrepresented and misunderstood Petrus Stuyvesant who arrived at New Amsterdam 27 May 1647, two years after his appointment as director-general. Stuyvesant was the son of a Friesland clergyman, had been educated to the army and navy as well, had lost a leg in the attack on the Portuguese island of Saint Martin and wore as a substitute a wooden one, that was girdled with silver bands. He was 45 years of age, overbearing in manner, autocratic in speech, prompt and decisive in action and a devout churchman. He conscientiously attempted to carry out the instructions that directed him to guard against aggressions on the colony's boundaries, to preserve peace with the Indians and to stimulate the growth of villages by the colonists. He found the colony much out of repair and the colonists next to demoralized. The dominating spirit that pervaded the West India Company and all that were connected with it, to the colonists themselves, was personal gain. New Amsterdam and Fort Orange or Aurania as it was sometimes called, were flooded with an aggregation of unscrupulous merchants and traders, who robbed the Indians on one side and their customers on the other. The example was established by succeeding directors-general and the plain people emulated that example. Stuyvesant inherited the turbulence and the dissatisfaction left by his predecessor and struggled with it courageously and with a hand so firm as to incite unpopularity among many whose plans he thwarted. A year before his arrival, Kieft had served notice on New England that the English "without provocation" had invaded New Netherlands, usurped divers places, done injuries and not given satisfaction, and that unless reparation were given "such means as God affords" shall be employed "manfully to redress ourselves." Stuyvesant for five years diligently attempted to establish pacificatory measures with the most powerful rivals of the Dutch, the English, and finally in 1650 by repairing personally to Hartford secured a treaty that fixed Oyster Bay, on Long Island, the western boundary of the New Englanders and Greenwich on the mainland.

In the meantime internecine quarrels aroused all the choler and tyranny in his nature. Without funds, the internal improvements he had in contemplation could not be carried out. He had seen how Kieft had quarreled with his "Eight Men," and as a concession for his taxation scheme he ordered an election, allowing the settlers in Manhattan, Brooklyn which had been established in 1645, Amersfoort and Pavonia, to elect 18 individuals from whom the governor and his council should select nine, who were to confer with the director on all measures tending "to promote the welfare of the commonalty and the country." Between the director and "the Nine," dissensions arose over finances. The latter refused to provide money for the repair of the fort, claiming the Company was responsible for that expense. They objected to Stuyvesant's management; complained of the heavy assessment levied upon trade, and when he peremptorily refused permission for the people to assemble, they made a house to house canvass. The director ordered delegates from the militia and "the Nine" ordered a journal to be kept by one of their number, Adriaen Van der Donck, and forwarded eventually to the home authorities. Stuyvesant blazing with wrath arrested the writer, threw him in prison on the charge of libeling the government and seized the papers. The controversy was carried

with more or less acrimony on both sides to Holland; petitions were despatched across the sea complaining of the unreasonable and arbitrary exercise of power by the director. Stuyvesant in the meantime played into the hands of his enemies by his reduction of the Swedish possessions in Delaware. As the dissatisfaction of the Dutch burghers against him expanded, sympathy for him on the part of English settlers increased. He had established a weekly market in New York; in 1652 the city was incorporated; a year later the palisades were constructed to the north of the present Wall Street from the East to the North River; four years later citizenship was created and the city was surveyed, streets were regulated and named and several of them paved.

Under Stuyvesant's administration religion was encouraged and fostered. As early as 1626, Sebastian Jansen Krol and Jan Huyck who had originally sailed to the country as "consolers of the sick" are found, on the Sabbath, reading texts out of the Scripture and the creeds to persons who would attend. Two years later, in 1628, Michaelius, a minister of the Reformed Church, organized the first Dutch church in the New Netherlands with 50 communicants. In 1633 arrived Everardus Bogardus who sailed to this country on the same vessel with one governor, Van Twiller, to return home on the same vessel with another, Kieft, only to meet his fate at sea. His quarrels with both have become historical. Along in 1640 Dominie Johannes Megapolensis preached in the church which Kieft had built within the fort, before proceeding to his charge at Fort Orange, the present Albany. The Reverend Johannes Backerus, formerly a clergyman at Curaçoa, in 1647, superseded Dominie Bogardus in the pastoral charge of the Dutch church. New York had not escaped the wave of religious intolerance that had rolled over Europe during the preceding half century. An ordinance was adopted by the Dutch in 1640 that prohibited the exercise of all other religions except the "Reformed as it is at present preached and practised by public Authority" in the United Netherlands. The following year, however, this bigoted mandate was temporarily revoked. Father Jogues, the first Catholic missionary to New Netherlands, found that the colony harbored Catholics, English Puritans, Quakers, Lutherans, Anabaptists termed "Mnistes" (the Mennists or Mennonites) and Dutch Reformers. He reported an order was in force denying "public worship" to all but Calvinists. In 1654 the application of the Lutherans to erect a church in New Amsterdam was refused; "no doctrine shall be encouraged in the colony" but "the true reformed," ruled the director-general. The English settlements repudiated the teachings of Megapolensis who in 1649 had succeeded Backerus and who claimed the Classis of Amsterdam in Holland exercised spiritual jurisdiction over the colony. Quakers were arrested, beaten with ropes, were fined and imprisoned for their presumption in preaching their heresies.

The outbreak of war between Holland and England called in play all of Stuyvesant's great ability as an executive officer. The city was put in a state of defense. He had established the city of New Amsterdam and appointed the burgomasters, the schepens and fiscal. He now attempted to adjust affairs with New England but in vain. Indian outbreaks excited the colony for several years. An uprising near New Netherlands was followed by massacres at Pavonia, Hoboken and Staten Island. In three days 100 Dutch colonists were killed, 150 were taken prisoners and a financial loss of 200,000 guilders, $80,000, was sustained. Devastations at Esopus and the destruction of Wiltwyck were not the least disturbing problems he encountered in dealing with the Indians.

In the meantime the villages of Jamaica and New Haerlem had been created; a municipal court was established at Esopus, known as Wiltwyck; Arendt van Curler, long loved and trusted by the Indians as "Corlaer," had purchased the great flats at Schenectady and the colony was spreading forth like a blossoming plant, north, west and southwest of Albany.

The aggressions of the "malignant English" had been a source of annoyance to the Dutch for years. Cromwell at one time threatened to seize New Netherlands. In 1657 the commissioners of the United New England Colonies conceded Oyster Bay and Huntington to the jurisdiction of New Haven and three years later Huntington and Seatauket. In 1662 Connecticut laid claim to Westchester in spite of the provisional treaty. Charles II. had granted to the younger Winthrop, Massachusetts Bay, including Connecticut, and to his brother James, New Netherlands; the fact that a great part of this territory was not his to give, but belonged to the Dutch, was not included in the consideration in the least. About this time John Scott appeared on the scene. He produced orders for the stringent enforcement of the British navigation laws in the colonies, claimed that Long Island belonged to the Duke of York and proceeded to place the English Long Island towns under one organization, of which he was elected "president." When he attempted to seduce the Dutch towns he encountered the strong arm and the stubborn will of the director-general. The contest was acrimoniously conducted, was protracted and only ended by the appearance, 29 Aug. 1664, in the bay, of the English fleet under Colonel Richard Nicolls, who had been ordered by his royal master, the Duke, to take possession of the Dutch province, to reduce the Dutch to entire obedience, "to put them out of capacity of doing such mischief" as they had perpetrated in other quarters. It was repugnant and mortifying to Stuyvesant's courage to surrender his charge without firing a shot and, like a soldier of high spirit, he prepared to make determined resistance, in spite of the appeals of the city authorities and the clergy. "I would much rather be carried out dead," he exclaimed. Stuyvesant appealed in vain for help and for several days cleverly delayed the inevitable. He only yielded when Nicolls entered the harbor with his ships and an overpowering force, and he regretfully signed the articles of capitulation that had been agreed to by the magistrates. On 3 September, New Amsterdam became New York in honor of the Duke, the name of the fort was changed to James, also in honor of the Duke and three weeks later Fort Orange surrendered and was called Albany, in honor of the Duke. One of the inconsistencies conspicuous in the seizure of New Netherlands by the English is that at the time peace prevailed between England and Holland.

The province received the name of New York. Its population was estimated from 6,000 to 10,000 souls. Municipal officers continued in power, but no more elections of magistrates were to be held by the people. Stuyvesant had insisted upon the guaranty of property and civil rights and freedom of worship — the Church of England Service to be held in the Dutch church at New York upon the termination of the service of the Reformed Church. Court proceedings were to follow English models. The province felt the direful effects of the next ten years of European wars. On 30 July 1673 with war under way between Holland on one side and France and England allied, a Dutch fleet under Cornelis Evertsen and Jacob Benckes suddenly appeared off Staten Island. Captain John Manning, in the absence of Governor Francis Lovelace, who had succeeded the Duke of York's personal representative, Colonel Nicolls, was not disposed to offer resistance, for his soldiers refused to fight and his own people spiked his guns. He surrendered, and the name of New York was temporarily changed, and that of the fort to "William Hendrick." Anthony Colve was proclaimed governor of the province. Under the treaty of 1674 New York was restored to the English. Sir Edmund Andros, an intelligent and wise officer, was appointed governor. In 1678 he describes the province as containing 24 towns or villages with 20 churches, specifies its products and exports as provisions, tar, furs and lumber, fixes the value of estates at £150,000, and the number of men capable of bearing arms at 2,000. Under his regime the navigation act was enforced; friendship with the Indians was cultivated to neutralize the influence of the French; a classis of the Reformed Church was established 1679 in New York to ordain ministers, and the governor endeavored to individualize New York as "the most English in sentiment of the American Colonies." Owing to disputes with New Jersey, complaints were filed against Andros with the home authorities. He was recalled, and exonerated; in 1688 he returned under a viceregal government to consolidate the Northern colonies. In the interim the office had been filled by Thomas Dongan, an Irish soldier, a Catholic and a discreet and conservative leader. He brought instructions to issue writs for an Assembly; and the people now saw in reality the culmination of hopes begun during Stuyvesant's time — the possibility of popular franchise. Accordingly 17 Oct. 1683 the representatives of the people of New York met for the first time in Assembly in New York city. The sessions continued until 3 November. It was ordained that Assemblies should convene triennially. In 1685 a charter was granted to New York and in 1686 to Albany. The hopes of the colonists for better things were dashed to the ground; the Assembly promised by the Charter of Liberties and Privileges never convened, for in February 1685, Charles II. died, his brother James the Duke ascended the throne and as James the King repudiated the acts of James the Duke; the charter was vetoed, and the Assembly abolished. Dongan had fallen under the royal displeasure by his failure to push forward the doctrines of the Church of Rome and was recalled.

Governor Andros was in arrest at Boston when the news arrived that James had been dethroned and the lieutenant-governor, Francis Nicholson, lacked energy and decision for the crisis. People moreover distrusted him. Wild and exciting rumors were abroad in the land. Stories were circulated that the Catholics were to join hands with the French and overturn the existing order of things. Jacob Leisler was a prosperous merchant and captain of one of the train bands. He had been born at Frankfort and had seen service in the German army. The people turned to him. But the three councillors remained loyal to Nicholson. Leisler and his friends, fearful of the intrigues of the Catholics, proclaimed William of Orange, king. Ten members of the Assembly were appointed by Leisler as a committee of safety, and Leisler was declared by them to be governor. He carried his authority with a high hand. He usurped the functions of the lieutenant-governor and claimed the title; he opened letters addressed to Nicholson and arrested and imprisoned those who refused to obey him. When French invasion upon the destruction of Schenectady in 1689 was imminent, he displayed great energy, declared himself as the acting governor and forced recognition from Peter Schuyler, mayor of Albany, who had resisted the authority of Jacob Milborne, son-in-law of Leisler, whom he despatched up the Hudson with an armed force to subdue the thriving city. On the strife between Leisler on one side and Captain Richard Ingoldesby and Colonel Henry Sloughter, who had been appointed governor by William and Mary on the other; on Leisler's imprudent actions, it is not necessary to dwell. Eventually he was forced to submit. Pursued by vindictive enemies, he and Milborne died as martyrs. Sloughter, stupefied with rum, signed their death warrants and they were hanged near the site of the present *World* building in New York city 16 May 1691. Leisler was unquestionably a sincere but misguided man. Four years later Parliament reversed the attainder of Leisler and his associates. Lord Bellomont, afterward the enlightened governor of the province, declared that Leisler and his son-in-law were "not only murdered but barbarously murdered."

The history of the province for the following 84 years is conspicuous for brawls between the governor and the Assembly; for efforts to disseminate the doctrines of the Episcopal Church and to weaken the influence of the French and of the Catholic Church; to develop the land and the fur trade; to increase the growth of the towns, to preserve peace with the Indians; to cultivate privateering, and to wink at piracy; to reconcile differences with neighboring colonies. Much depended upon the sincerity, honesty and integrity of the governors. In the whole line of administrators from Nicolls to Tryon, under English rule not more than three governors can be cited in whom those three traits can be found. The governor's power was absolute. He not only made the laws but interpreted and executed them and when necessary unmade them. He usurped the prerogatives of the Assembly and of the courts; his Council were mere automatons who danced when he pulled the string. No act of the Assembly was placed on the statute book without his signature, and no decision of the court was valid until he, as chief justice, passed judgment; and in this respect he exercised powers denied to the king for his

majesty, while permitted to sit on the king's bench, was prohibited from expressing judgment. Time and again the governor was threatened with removal; now and then charges were preferred against him and once the grand jury was urged to indict him for high treason. It is a sad commentary on the record, that every colonial governor who took office poor left office a wealthy man. There were three notable exceptions, the Irish earl, Lord Bellomont; Robert Hunter, the friend of Addison and Swift; and William Burnet, son of the bishop of Salisbury. The province had already become the haven of the persecuted of foreign countries. Between the years 1678 and 1696 the population of New York city had nearly doubled — from 3,400 to 6,000; that of the province had increased to nearly 30,000. The infamous practice of transporting felons to America and the degrading slave trade produced the most pernicious effects upon the cause of labor, stamping it with the stigma of disgrace in the one instance and involving a contraction of wages in the other.

Under General Hunter was tried the experiment of colonizing the Palatines. The scheme originated with English politicians who saw in it vast profit in developing the British commercial resources at the same time menacing French supremacy by strengthing the frontiers. Settlements were established first at Livingston's Manor, and subsequently along the Mohawk and in the Schoharie region. The experiment involved a loss of £100,000 to its projectors.

In 1732 occurred the memorable struggle between Rip Van Dam, the senior councillor, and Governor Cosby. The original cause was puerile and insignificant, and involved only a few pounds, a fraction of the salary Van Dam claimed during the 13 months he acted as governor; it culminated in one of the most glorious episodes in history and established the principles for the freedom of the press in this country for all time, through the courage of John Peter Zenger, editor, and the brilliant scholarship of Andrew Hamilton, his advocate in the famous trial for libel. Nine years later, the province was thrown into paroxysms of alarm over the so-called "Negro Plot." Several mysterious fires occurred in New York about the same time and the impression got abroad that negroes had kindled them with the ultimate determination of burning down the town. The only basis for the suspicion was the unsupported testimony of an ignorant immigrant woman who was bound out to the keeper of a disreputable resort. Every negro became a suspect and large rewards were offered for the conviction of an incendiary. Before the frenzy ended, under the judgment of the court, 13 unfortunates were burned to death, 18 were hanged and 70 transported.

For years, more or less apprehension prevailed over French invasion. The French wielded greater influence over the Indians through religion and princely presents. Settlements had been established at Oswego and at Niagara, and the governors were periodically at their wits' ends to protect them. November 1745, instigated by the French, a band of redskins rushed upon Saratoga — after Fort Hoosick had surrendered — killed the brother of Peter Schuyler and a number of others, spread destruction over the surrounding country and carried off to Canada a number of captives. The Assembly of New York then followed the example set by Massachusetts and offered a bounty for Indian scalps. England had been remiss to a degree in neglecting even ordinary protection for its settlers. The home ministry permitted France to fortify and hold Crown Point, in spite of the protests from the province, whence war parties darted on their incursions of devastation, desolation and death.

Governor Clinton who succeeded Clarke as governor in 1743 was a sailor by profession and carried into the office all the old time martinetism of the quarter deck. He attempted to overcome England's handicap with her redskin neighbors. In August and September 1746 he held a council at Albany with the Iroquois with the intention of establishing an alliance and to counteract the marplotting of the French and the Jesuits. To strengthen the bonds of friendship and as an effective object lesson, Sir William Johnson, the English Indian agent for New York, appeared in the full garb of a savage, paint and all, and walked as an Indian chief at the head of the Mohawks. Owing to the illness of Governor Clinton, Cadwallader Colden explained to them that the French had been defeated at Annapolis; and that troops from Massachusetts, Connecticut and New Hampshire had captured Louisberg. He informed them that the English king had sent troops enough to take Canada from the French and urged them to join the English in the undertaking. Orations were thereupon delivered, belts exchanged and presents divided; the Indians gorged and guzzled, warbled and danced, and agreed to join the English procession, and the northern part of the province was overrun with war parties who scalped and spattered blood, of male and female, young and old, the strong and the helpless, with unbridled ferocity. Governor Clinton accumulated a princely fortune during his ten years' service as governor and could well afford to quarrel with his Assembly, as several of his predecessors had done over the permanent support bill. His successor, Sir Danvers Osborne, hanged himself with his handkerchief 12 Sept. 1753, five days after his arrival in New York.

James DeLancey, lieutenant-governor, one of the best equipped men in the province for the position, succeeded him. He had been born in Albany and was the first governor to the manner born. He presided over the Congress at Albany in 1754 that contemplated union among the colonies, and opposed the plan. The treaty of Aix la Chapelle was a dead letter so far as the colonies were concerned, for French aggressions were more exasperating than ever. With the outbreak of the French and Indian war, Sir William Johnson, who had married the sister of the Indian chief Joseph Brant, and who never had commanded a company of troops on the field, was placed at the head of a force of 3,400, who marched to the northward. At Lake George on 8 Sept. 1755, occurred the battle which brought a baronetcy and a fortune to Johnson, deprived the officers who really won the victory of credit, led to the death of the celebrated Mohawk, Hendrick, and put to rout the French forces under the accomplished French general, Dieskau.

The main incidents in the French and Indian

war were the capture of Fort Oswego by the French general, Montcalm, 14 August 1756; the surrender and massacre at Fort William Henry at Lake George on 9 August 1757 where Montcalm with 8,000 French and 2,000 Indians overcame the garrison of Colonel Monroe of 3,000 men; the surrender of Fort Frontenac to Col. John Bradstreet, and the surrender of Fort Niagara to the English 20 July 1759.

The birth of liberty in the State of New York practically occurred in the Colonial Convention to consider the Stamp Act, 7 Oct. 1765. With the accession of George III., 25 Oct. 1760, a new conflict broke out between the colonists and the authorities. All commissions expired with the sovereign. It was now contemplated to permit the judges to hold office only "during his Majesty's pleasure" instead of "during good behavior." Up to 31 March 1774, when the Boston Port Bill became a law, agitation throughout the provinces had become more and more pronounced and the people more and more unsettled. The battle of Golden Hill in New York city in 1770 had inflamed the public mind to the possibilities, and the representatives of the Crown in their constant collisions with the Sons of Liberty over the destruction of their liberty pole contributed naught in diminishing the drift of popular sentiment. On 23 May 1774, New York published its declaration of rights at Fraunce's Tavern in New York city. Two months later delegates were chosen for the first Continental Congress which convened in Philadelphia 17 Sept. 1774. On 1 May 1775 the committee of 100 was appointed as the successor of the New York Committee of Correspondence and the Committee on Inspection, respectively. The constitutional government had gone out of existence. The sentiment of the English party in New York city was naturally in sympathy with England; the old Dutch settlers, with their bitter remembrance of the 100 years of English rule, were almost unanimously in favor of revolution, but when the second Continental Congress convened in Philadelphia 10 May 1775, and the country had tasted all the horrors of war, there were members, especially from New York, who were still hopeful that the manifold grievances might be redressed. Grave events were happening with great rapidity. Fort Ticonderoga had been surprised and captured by Ethan Allen and Benedict Arnold 10 May; two days later Crown Point surrendered; within a week Arnold had captured St. Johns, Canada, and William Tryon the last English governor, who five years before had succeeded Lord Dunmore, sought refuge on the British gunboat Asia in the harbor of New York. Throughout the war New York was the real battle ground; topographically and strategically its position was recognized as of the utmost value to English and American as well. The English plan of campaign was based upon that of the French of 1689 and of Montcalm in 1757; namely, to break the back of the province by an invasion operating from the north and from the south along the valley of the Hudson. It was this objective that brought Burgoyne to America in the summer of 1777, when the American forces and American people were disheartened by successive defeats that included the battles of Long Island and the evacuation of New York city; the defeat at White Plains and surrender and massacre at Fort Washington. Three of the most important battles of the Revolution were fought on the soil of New York; that of Oriskany, 6 Aug. 1777, which practically shattered the right arm of Burgoyne, and that of Walloomsac, for many years mistakenly called Bennington, which shattered his left arm, both of which contributed immeasurably to the culminating defeat at Saratoga where the first British army in the history of England lay down its arms to an army composed of farmers.

Sir Henry Clinton had started from New York only too late to assist Burgoyne and had captured Forts Clinton and Montgomery in the Highlands of the Hudson 6 October, eleven days before the surrender. On 16 Oct. 1777, the British Colonel, Vaughan, ascended the Hudson to Kingston, which was burned without the slightest provocation, leaving a stigma upon the British name for pure vandalism that has never been effaced.

With Burgoyne's surrender, New York State was relieved of large standing armies, but was called upon to encounter straggling foes that menaced the frontiers and exposed towns to the close of the war. During the campaign of 1776 the safety of the people was indubitably secured by the tireless energy and countless resources of General Schuyler, but with his retirement from the Continental army as commander of the Northern District, the frontiers were left to shift to a large extent for themselves, and the Indians under Brant with the Tories under the bloodthirsty Butler swept over them with torch and scalping knife, meeting with feeble resistance, until Congress and General Washington selected John Sullivan to destroy their crops and burn their villages from the Chemung to Niagara.

In October 1780 the Schoharie and Mohawk valleys were ravaged by a force of 800 Indians and Tories under Sir John Johnson. With the exception of the slight skirmish at Johnson Hall where Col. Marinus Willett put the enemy to rout, New York saw no more active fighting except sporadic brushes here and there between the militia and straggling bands of Indians.

The constitutional history of New York dates from the adoption of the Declaration of Independence. The Provincial Congress which had been elected in April met in the city of New York 14 May 1776. Before the convention adjourned the subject of independence was considered, and it was resolved that it was the sense of the Colony that the people desired to continue dependent upon Great Britain. As soon, however, as it was known that the Continental Congress recommended that each colony should establish its own form of government, a decided change of sentiment occurred in New York. When the newly elected convention assembled at White Plains 9 July 1776, the old regime had ceased to exist, and the New York Congress became "the convention of the representatives of the State of New York," the Declaration of Independence was speedily ratified, and a committee was selected of which John Jay was chairman, to draft a constitution for the State of New York. The enemy seriously interfered with the plans of the Convention. New York had been abandoned. The British men of war patrolled the harbor within seven miles of the place where the constitution framers were

at work. Courts of law had been abolished, but the Convention ordered that all magistrates and civil officers who were affected toward independence should continue to exercise their duties and that processes hereafter must issue in the name of the people of the State of New York.

The draft of the constitution was submitted 12 March 1777. It was adopted 20 April and an election was ordered to be held in June. The sentiment of the constitution was decidedly English and its tone was aristocratic. It discredited the office of governor and it distrusted the people. Its abiding faith in the judiciary stands out in a strong light. It was liberal in its religious sentiments in that it permitted "the free exercise of religious profession and worship without discrimination or preference of all mankind." Slavery was still supported, although Gouverneur Morris and John Jay, who had been most instrumental in drafting the instrument, had attempted to move for its gradual obliteration. Its two weak features were the Council of Appointment, which was supposed to be a check upon the governor, and the Council of Revision, which was supposed to be a check upon the legislature. The Constitutional Convention of 1801 was called to determine the jurisdiction of the governor and the Council of Appointment in the matter of patronage. The decision of the Convention divided the responsibility equally between the four Senators who constituted the Council of Appointment and the governor. The two obnoxious councils, Revision and Appointment, were abolished by the constitution of 1821 which at the same time enlarged the area of the elective franchise by removing the property qualification. The weakness of the articles of confederation that had become apparent within a year of their adoption, threatened to shipwreck the country unless a strong form of government was organized and substituted in its place. General Washington and Alexander Hamilton had been agitating the necessity for a more powerful and cohesive instrument. On 17 Feb. 1787, the Assembly of New York adopted joint resolutions instructing the delegates of the State in Congress to move that a convention be held for the purpose of amending the Articles of Confederation so as "to render them adequate to the preservation and support of the Union."

Messrs. Robert Yates, John Lansing, Jr., and Alexander Hamilton were appointed delegates to the Federal constitutional convention which met in Philadelphia on the second Monday in May 1787, and which concluded its work 17 September. Messrs. Yates and Lansing withdrew and Hamilton was the only delegate from this State who signed the new constitution. The State convention to act upon the new constitution convened at Poughkeepsie 17 June, and adjourned 26 July. Ten of the thirteen States had ratified the Constitution — one more than the number necessary — with New York rebellious. George Clinton, governor of the State from 1777–95, appeared as the most resourceful opponent of the new Constitution and led the anti-federalist forces on the argument that New York was too powerful and wealthy to place herself on a par with States not her equal in income and resources. Alexander Hamilton and Robert R. Livingston were the strongest advocates of the new Constitution. In July notification was officially made that Virginia and New Hampshire had approved the new Constitution, and the Federalists thereupon offered a resolution "that the Constitution be ratified in full confidence that the amendments proposed by this convention will be adopted." The resolution was adopted 30 to 27, eight members, including Governor Clinton, declining to vote. From this time forth two parties existed in the State of New York, the strict and the loose constructionists. The State of New York, owing to the failure of the legislature to agree in the choice of electors, lost its vote for President at the first election under the Federal Constitution.

The first political struggle in the State occurred in 1792 over the election for governor, when Governor Clinton by a fluke defeated John Jay. New York had experienced a number of disputes with her neighbors over boundary jurisdiction, especially with New Jersey, Vermont, New Hampshire and Massachusetts. New York was the first of the States to cede lands belonging to her to the United States for the encouragement and development of immigration. Within a space of seven years, 5,500,000 acres of land within the State had been thrown open to settlers, bringing to the State treasury $1,030,433. Population fairly jumped, and it was necessary to create a number of new counties north and west of Albany. Internal improvements, turnpikes, and the development of waterways were constant subjects of discussion, and these subjects received an extraordinary stimulus in 1807 when Robert Fulton made the first trip with his steamboat on the Hudson River between New York and Albany. Three years later a commission was appointed to survey a route for a canal to Lake Erie. On 16 April 1816, commissioners of construction were appointed, and in 1817 commissioners of the canal fund were organized. As the construction of the canal proceeded a number of counties were opened to the right and left, and when the canal was completed in 1825, the population of the State had increased to 1,500,000.

Up to the outbreak of the second war with Great Britain, political struggles in New York were marked by fierce acrimony. Never was hostility more bitterly displayed and personal vituperation carried to greater excess. Hamilton had fallen in the duel with Burr, and from that hour dueling was banished as a social evil in the State of New York. The Clinton family, the venerable George, who had been a candidate for President against Madison, through the wire pulling of his brilliant nephew DeWitt Clinton, had been elected vice-president, and opposed the Federal administration of President Madison, whose New York representative seems to have been Governor Daniel D. Tompkins, an adroit politician and an able man.

At the opening of the presidential campaign of 1812, DeWitt Clinton aspired, through his Republican affiliations, for the presidential nomination and was nominated by a number of his friends in New York city; but on 18 May, President Madison was unanimously nominated. When Congress declared war in June, the President issued a patriotic proclamation which rallied to his support the entire Republican party and forced Clinton to abandon his own party and consort with the Federalists.

During the second war, Governor Tompkins

stands out as strong a character as George Clinton during the War of the Revolution, and like the first war governor of the State, he was selected, in honor of the distinguished services he had rendered to his party and State to serve as vice-president of the United States with James Monroe from 1817 to 1825, during "the era of good feeling."

Judge Tompkins presided over the Constitutional Convention of 1821. With the adoption of this Constitution, the Federalist party went out of existence for all time. New York State, and the new conservative element under the leadership of Martin Van Buren and DeWitt Clinton took charge of the party machinery.

It was during the term of DeWitt Clinton as governor that the anti-masonic craze swept the State and largely influenced national politics by the disappearance of William Morgan from Canada, 12 Sept. 1826. On 4 July 1827, by legislative enactment, slavery was abolished. Governor DeWitt Clinton died suddenly at Albany on 11 Feb. 1828 and his successor, Martin Van Buren, resigned in order to become secretary of state in the cabinet of President Jackson.

Under the administration of Enos T. Throop, who acted as governor until the regular election in 1830 when he was chosen governor, the manufacture of brick by machinery was begun in New York; the Albany *Evening Journal* was started by Thurlow Weed; the first omnibus was built and used in New York city; the Albany and Schenectady Railway was opened; chloroform was first obtained at Sacket Harbor; the Whig party was formed; the first horse street railway in the world was opened on Fourth Avenue, New York city; and the anti-slavery society of New York was organized. William L. Marcy who succeeded Mr. Throop, resigned his seat as United States Senator upon his election as governor, was a rabid partisan and rigid economist and favored moderate protection to home industry. He advocated internal improvements and after his re-election in 1834 recommended enlargement of the Erie canal and approved the construction of the Black River and Genesee Valley canals. The city of Albany now was recognized next to Washington as the political storm centre of the Union for her reputed "Albany Regency," which for years made and unmade candidates, controlled legislation and ruled the party and the State with arbitrary and at times high-handed methods. Mr. Van Buren was responsible for the breaking up of President Jackson's cabinet by his open recognition of Peggy O'Neil; his rejection by the United States Senate as minister to England by the casting vote of Vice-President Calhoun, would have led to a general dissolution of the Democratic party had it not been for the resolute individuality of President Jackson.

New York suffered with the rest of the country by the panic of 1837, which originally can be traced to the removal of the deposits from the United States Bank in 1833, and by the deluge of "shinplasters," as a consequence of legislative prohibition of bank bills under the denomination of five dollars. The election of President Van Buren was immediately followed by the financial disaster, a calamity which arrayed against the State and national administrations the entire banking and financial institutions of the entire country; that opened the way to the election of William H. Seward, the first Whig governor, in 1838, and two years later of William Henry Harrison on the "Tippecanoe and Tyler too" platform, the first Whig President of the United States. So demoralized were the finances that in 1841 the State was unable to borrow money to pay contractors upon the canals, and in 1842 a law was passed suspending work and providing for the raising of money by taxation. The Erie railway which secured a charter in 1832, which obtained from the legislature in 1836 a loan of $3,000,000 and which by 1840 was completed as far as Goshen, was abandoned, the company made an assignment, and it was not until 1851 that the road was completed. Public works of all character were suspended and discouragement and depression were paramount.

During the next decade through the administrations of Governors Bouck, Silas Wright, Hamilton Fish and Washington Hunt, the anti-rent troubles were a very prominent disturbing factor in the State, and the question of slavery throughout the country began to assume proportions that pointed inevitably to war. The Constitutional Convention of 1846 was held at the height of the demand of popular sentiment for the limitation of the power of the governor and of the legislature and for the extension of the elective franchise. The Convention abolished the court of chancery, limited the power of the legislature over the revenues, stripped the legislature of the power to appoint general administrative officers of the State, and substituted general laws for the organization of business corporations instead of special legislation. In consequence a great impetus was given to the organization of banking, telegraph, insurance and railway companies to conform with the prodigiously expanding institutions of the State.

The split in the Democratic party, owing to the slavery problem, and the rapid growth of the Free Soil movement in New York, decided the election of General Taylor for President in 1848 and the election of Hamilton Fish as governor. The Whig party in turn was torn by dissensions in 1850 when Washington Hunt was elected governor over Horatio Seymour, and two years later when Seymour carried the election, was a natural consequence of the condemnation of the people for the Compromise measures in Congress. The Whig party ceased to exist as a factor after 1852. With the exception of the slight disturbances in the State over temperance legislation, national politics monopolized the attention of politicians until 1857. In the meantime the American party and the Republican party came into existence. The agitations in Kansas and Nebraska, with the reckless threats of the Southern leaders in Congress, opened the eyes of the most sagacious to the possibilities of war between the sections of the country. The panic of 1857 produced a temporary set-back to the rapidly growing prosperity of this State. When Edwin D. Morgan was elected governor in 1858, the most active parties were the Democrats, the Americans, the Abolitionists and the Republicans. Governor Morgan was re-elected in 1860 on the same ticket with Abraham Lincoln, who had defeated New York's favorite Senator, William Henry Seward,

for the nomination for President at the Chicago convention.

On 12 April 1861 Fort Sumter in Charleston Harbor was attacked. On the 15th President Lincoln issued a call for 75,000 volunteers to defend the life of the Union. The Union Defense Committee of New York was organized that evening. Within ten days 7,334 men were on their way to Washington — the first regiment to respond to the call was the 7th New York, Colonel Leffert's. April 16th the legislature created a State board to enlist and equip 30,000 men. Eighty-two companies were accepted in one week. The first volunteer regiment left the State 29 April and the last 12 July. Governor Morgan who had been commissioned major general, was placed in command of a separate military department of the United States constituting the State of New York. During the four years of war, New York furnished 448,850 men, or one sixth of the total. This proportion holds good in the total losses and casualties. For organizing, uniforming, equipping, substituting and transporting troops, the State expended $3,745,554.98; for bounties $50,657,406; for relief $500,773; or in aggregate, all things considered in the way of official outlay on the authority of the State, $57,569,082.56. The sentiment of New York State placed the responsibility for the war upon the Democratic party, although at the outbreak, thousands upon thousands of Democrats who had stood shoulder to shoulder with the political fire-eaters of the South, joined the Republican ranks, a very large proportion obtaining commissions as officers in the army of volunteers which had been hurriedly thrown together. The succession of Union disasters, however, and the declaration of the Emancipation Proclamation by President Lincoln, had created a feeling of distrust, uncertainty and doubt, which led in 1862 to the overthrow of the Republican party and the election of Horatio Seymour as governor over General James S. Wadsworth, an estimable gentleman and valiant soldier. The rebuke administered was not so much in the nature of a protest against the war as it was a protest against the conduct of the war. The success of the Democrats led to a marked decrease in the number of enlistments, which forced the national government to resort to the expedient of drafts. The demagogical utterances of Governor Seymour had led the reckless and lawless throughout the State to believe his hostility to the conduct of the war included protection for them in the commitment of criminal acts. Unprotected by the transfer of its local militia to Pennsylvania after the battle of Gettysburg, New York city was now exposed for several days to mob law in the enforcement of the drafting, unequaled in the history of the country. Governor Seymour directly repaired to the metropolis, began a conciliatory speech by addressing the mob as "my friends," but eventually warned them by proclamation. The insurrection was only subdued by the return of the local military organizations.

Governor Reuben E. Fenton succeeded Governor Seymour in 1864, having been elected on the same ticket which returned Abraham Lincoln to the White House for his second term as President of the Nation. With the return of peace the country was confronted with the difficult problem of assimilating the hundreds of thousands of soldiers who were now seeking employment in civil life and ordinary avocations. One of the first propositions considered by the people during the second term of Governor Fenton, was the agitation for the convention to revise the constitution, which culminated in the Constitutional Convention of 1867 that assembled at Albany on 4 June. The Honorable William A. Wheeler of Malone, afterward vice-president of the United States, was president of the convention which ended its labors on 28 Feb. 1868. The new constitution was adopted in the convention by a strict party vote. It introduced several original propositions. The legislature was reorganized, restrictions were imposed upon the exercise of legislative powers; the veto power of the governor was strengthened; a court of claims was created and the judiciary system was modified. The legislature of 1868 failed to pass an act to submit the proposed constitution to the people; as a result of the general election held in that year, the power of the State was transferred from Republican to Democratic hands. John T. Hoffman of New York was elected governor, largely due, it was claimed at the time, by flagitious debauchery of the ballot boxes in New York city by the Tweed ring which succeeded in carrying the State for the Democratic candidate for President, Horatio Seymour, by 10,000. From this year the vote of the city of New York in State politics was recognized as a powerful factor. Governor Hoffman was called "the veto governor" because of the unprecedented exercise of the veto power. During his four years in office, he vetoed 495 bills, only two of which subsequently became laws. He established the precedent of filing his reason in writing with bills he declined to sign at the end of the legislative session. The Tweed ring during his reign attained the height of its power. For audacity and rapacity the methods of the Tweed ring were unequaled, but it was soon brought to grief through the disclosures of the New York *Times*. In the meantime it had succeeded in re-electing its favorite candidate, John T. Hoffman, who at the close of his office retired to private life. As a consequence of the operations of this ring, two supreme court judges, George G. Barnard and Albert Cardozo and one superior court judge, John H. McCunn, were ordered to be impeached. Barnard was convicted and removed from office; Cardozo resigned and dodged his trial; McCunn was removed and shortly after died of a broken heart. While the exposé of the Tweed ring demoralized the Democrats, the Republicans were more or less torn by the dissensions in their own ranks on national affairs. An agitation for the revision of the constitution had been general throughout the State for several years, had been advocated by Governor Hoffman and was now recommended by Governor Dix, who in his message called attention to the misuse of sinking funds and to the abuse of the appropriations by the legislature for private charities. The State was suffering from the oppressive financial weights that had been imposed by the War of the Rebellion and from the reckless extravagance that had become a part of the body politic. A constitutional commission undertook to curb the expenditures and the squandering of public moneys. Samuel J. Tilden, who defeated General John A. Dix for

governor in 1874, and who had been actively instrumental in prosecuting the Tweed ring, carefully scrutinized the heavy expenditures that had been made on the canals, and advocated rigid retrenchment. The effect of the financial disasters of 1873 had fallen heavily upon the people of the State. In the winter of 1875 canal boatmen, owners and forwarders petitioned the governor for relief, urging a further reduction of tolls. Accordingly on 18 March 1875, the governor sent a special message to the Legislature arraigning the management of the canals. A commission was accordingly appointed to investigate the system. Twelve special reports were made to the governor disclosing a long line of abuses and calling for the prosecution and punishment of recreant public officers.

Lucius Robinson was elected governor in 1876. He followed the patriotic efforts of his predecessor to curb extravagant outlays upon charitable institutions, urged economy in all public expenditures and used the veto power fearlessly. Governor Robinson was defeated in 1879 owing to the defection of Tammany Hall which nominated John Kelly against him. Alonzo B. Cornell, Republican, was the successful candidate. But for several years the Republican party, although successful in the election for President in 1880, was akin to demoralization because of the fierce struggle between the Stalwarts and Half-breeds, consequent upon President Garfield's repudiation of Senators Conkling and Platt in the matter of making Federal appointments in the city and State of New York. The assassination of President Garfield, the accession of Vice-President Arthur, the defeat for governor in 1882 of Charles J. Folger, who had resigned the high office of Chief Justice of the Court of Appeals of the State of New York to become secretary of the treasury under President Arthur, the defeat for nomination to the Presidency of General Arthur, and the election of Grover Cleveland for governor in 1882 and as President in 1884, all resulted from this bitter and unrelenting partisan warfare.

David B. Hill succeeded, as governor, Grover Cleveland who was elected President, and held office from January 1885 to January 1892. During these years the first practical plan for the creation of an Adirondack State Preserve was taken; the Niagara Falls Reservation was created; introduction of electricity in death sentences was established; the State Board of Arbitration was created; the centennial of the inauguration of George Washington was celebrated in New York; the Australian ballot system first introduced by Charles T. Saxton of Wayne County in 1888 was submitted to the governor and vetoed; a big strike of 3,000 train men on the New York Central Railroad occurred.

Governor Hill's successors in the gubernatorial chair were Roswell P. Flower, Levi P. Morton, Frank S. Black, Theodore Roosevelt and Benjamin B. Odell, Jr.

In 1894 very radical modifications were made to the constitution by a convention which assembled in Albany 8 May and adjourned in September. The new constitution was adopted by the people 6 November.

Governor Odell's administration was marked by several radical reforms, especially in the management of the charitable and public institutions of the State; by rigid economy in all public expenditures and by the adoption by the people of a plan in 1903 calling for the expenditure of $101,000,000 for the improvement and enlargement of the Erie Canal.

GOVERNORS OF THE STATE OF NEW YORK.

Name	Party	When elected
George Clinton		1777, 1780, 1783, 1786, 1789, 1792
John Jay		1795, 1798
George Clinton		1801
Morgan Lewis	Dem.-Rep.	1804
Daniel D. Tompkins	"	1807, 1810, 1813, 1816

HUGH HASTINGS,
State Historian.

New York, N. Y., first city in the State and in the United States; situated on the shores of the Hudson and North rivers and of Long Island Sound and the Atlantic. The city originally began at the lower end of Manhattan Island, and has spread mainly north and east, having in 1903 an area of 327 square miles. The borough of Manhattan, the business centre of the city, is laid out above 14th Street in rectangular streets and avenues. The chief retail business streets are Broadway, Sixth Avenue, and the Bowery, running north and northwest,

and 14th, 23d, and 42d streets, running east and west across the island. Each of these thoroughfares is several miles long. Fifth and Madison avenues have been for many years the finest residence streets, but these are now giving way to Riverside and West End avenues, noble thoroughfares overlooking the Hudson and set with large separate mansions. Wall and Broad streets, where centre the financial interests of the city and the nation, are short streets lying east of Broadway and near the southern end of the Island.

Municipal Service and Improvements.— The streets of New York have a total length of 2,534½ miles, of which 1,765 miles are paved; and it costs $5,555,538 to clean and sprinkle them, and $2,730,566 to light them. The total length of the city's sewers is 1,557 miles, and the annual cost of removing the garbage and ashes is $2,511,789. The city supports public free floating baths on the East and North rivers during the summer months. There is also a free interior permanent bath, and five more were in course of erection in 1903. All these things help to keep the city death rate down to 19.06 in 1,000. The city owns its own waterworks, including 1,998 miles of mains, which cost $122,590,000 and have a total capacity of 544,654,000 gallons, one third more than the average daily consumption. The water supply of Manhattan is received from the Croton watershed, 30 miles north of the borough. The police department numbers 7,707 men, with 82 stations, and a harbor patrol steamer; and its annual cost is $11,566,680. The fire department has 2,624 paid and 3,999 volunteer members, and its annual cost is $5,218,300. The street railways of the city, operated mainly by electricity, cover 1,232 miles of line, and represent an outlay for construction and equipment of $250,000,000.

Public Parks and Cemeteries.— The park system of the entire city covers 6,982.4 acres; that of the boroughs of Manhattan, Richmond, and the Bronx 5,406.7 acres. The largest park in Manhattan is Central Park, covering an area of 840 acres, and representing a cost of $15,000,000. It extends from 59th Street to 110th Street. In the southwest corner is the playground and carrousel for children, and beyond the common lawn of 16 acres. The menagerie is in the southeast part. The mall is a broad parade a quarter of a mile long, bordered by double rows of elm trees and famous for its collection of statues. The terrace, a pile of richly carved masonry, and the lake, come next in view, and beyond the lake is the ramble of 36 acres. Farther on is the Belvedere, a tower of stone, and next are the city reservoirs. On the left is the American Museum of Natural History (q.v.). Opposite the Obelisk and near Fifth Avenue and 83d Street is the Metropolitan Museum of Art (q.v.). The largest park in the Bronx is Bronx Park, in the central northern section of the borough. The northwestern section of 250 acres has been assigned to the Botanical Society, whose gardens are free to the public at all times. The southeastern section of the park comprising 261 acres is in charge of the Zoological Society, and its buildings, cages and ranges are free to the public except on Mondays and Thursdays. There are 84 cemeteries in New York and vicinity, the borough of Queens containing more cemeteries than any other section. The number of interments in that borough is 2,500,000, of which 2,000,000 are in the town of Newtown, which has a cemetery area of 1,800 acres. The largest average burial per acre has been reached by Calvary Cemetery — 600,000 in 214 acres, or an average of 2,800 burials to the acre.

Chief Buildings.— First among the buildings of the city devoted to official or public purposes, taking them in the order of their distribution, is the City Aquarium in Battery Park, popularly known as Castle Garden. Originally a fort, this structure later became a public assembly room, and after that for 35 years served as a landing place for immigrants, during which time nearly 10,000,000 immigrants passed through its portals. Since December 1896, it has been used as an aquarium. The new Custom House, now building at the foot of Broadway on the original site of Fort Amsterdam, is to cost $10,000,000. The structure at the corner of Wall and Nassau streets, built by the general government in 1834, was first used as a custom-house, but has been the home since 1863 of the sub-treasury. A handsome building at 65 Liberty Street, the site of which cost $1,000,000, houses the Chamber of Commerce organized 5 May 1768, in Fraunces' Tavern (still standing at Broad and Pearl Streets), and for more than a century the most powerful unit of force in the financial and commercial affairs of the city. A structure of great architectural beauty near the head of Broad Street has been the home since the opening in 1903 of the New York Stock Exchange, which, organized on 17 May 1792, has been for many years the financial centre of the continent. The Post-office building at the lower end of City Hall Park was erected in 1875, and its imposing dimensions bear witness to the wonderful growth of a city whose mail less than 100 years ago was handled by one man. A little to the north of it is the city-hall, completed in 1811, a marble structure of rare beauty and simplicity of design. Cooper Union at the junction of Third and Fourth avenues houses Cooper Institute, founded by Peter Cooper, for "the instruction of the people of the United States in practical science and art." The Institute has an endowment of upward of $2,000,000 and has given instruction to thousands of pupils. Mention must also be made of the Metropolitan Museum of Art in Central Park, which houses the finest art collection in America and has an ample endowment for future purchases; the Metropolitan Opera House, a noble home of the opera with a seating capacity of 3,449; Madison Square Garden (q.v.), one of the most spacious places of public assemblage in the Western World, and finally of the building given in 1900 to New York University for a Hall of Fame of great Americans, a semicircular edifice of granite, which eventually is to contain tablets commemorating all of the Nation's most eminent and honored dead.

Population.— The census of 1900 gave New York a population of 3,437,202, which in 1903 increased to 3,682,159. The area comprised within the present limits of New York city had a population of 49,401 in 1790, which had grown to 696,115 in 1850, an increase of 1,309 per cent. The population of the present city had grown to 2,507,414 in 1890, an increase since 1850 of 260 per cent. Between 1890 and 1900 there was an increase of 929,788, or 37.1 per cent. The

present population is the most remarkable collection of people in the world, the most various in race and religion ever gathered together in such numbers in the history of mankind. In 1900 only 21.5 per cent of the population were native whites of native parentage, and on Manhattan Island only 16.9 per cent or about one sixth. Since the census was taken even these small percentages have diminished, for immigration has been in unprecedentedly great volume, and the birth rate is highest in the districts of the city where the population of alien birth is largest. Even of the native population of native parentage, 737,477 in number, nearly one fifth were born outside of the State of New York. The great feature of the city's population, however, is its immediate foreign derivation. Almost every race on the globe is represented in its population of alien birth, as is shown by the following figures: Germany, 786,435; Ireland, 725,511; Russia, 245,525; Italy, 218,918; England, 155,180; Austria, 113,237; Poland, 53,469; Hungary, 52,430; Scotland, 48,929; Sweden, 44,798; Bohemia, 28,849; Canada (English), 30,550; Canada (French), 5,305; Norway, 18,087; Switzerland, 15,474; Denmark, 9,369; Wales, 4,370; other countries, 58,080 — a total of 2,643,957. The Jewish and Italian populations have increased very largely since the above enumeration was made.

Government.— The charter of New York, as revised by the Legislature of 1901, follows, in the main, the lines of the charter of the old city, with important provisions adopted from the charter of the former city of Brooklyn, and from those of other American and European cities. The greater part of it is the law as it has existed for half a century, and the chief changes have to do with the adoption of the borough system and the system of giving control to localities over their own affairs. The executive power is vested in the mayor, the presidents of the boroughs and the heads of the departments. The mayor, who holds office for two years and is eligible for re-election, appoints the heads of departments and commissioners, except those over which the presidents of the boroughs have jurisdiction, and except also the comptroller or head of the department of finance who is elected by the people. He can, with few exceptions, remove any official appointed by him, and can himself be removed by the governor, after a hearing upon charges. The mayor has the power of veto over all ordinances and resolutions of the Board of Aldermen, but an ordinance or resolution can be passed over his veto by a vote of two thirds of the members of that body, except that when it involves the expenditure of money, the creation of a debt or the laying of an assessment, a three fourths vote is required. The president of each borough holds office for two years. He presides over each local board in his borough, with the right to vote on and of veto over its actions, and is an ex-officio member of the board of estimate and apportionment. He is also a member of the Board of Aldermen and has the same right to vote as any member elected to that body. The borough president appoints and may at pleasure remove a commissioner of public works for his borough with control of all matters relating to the improvement and repair of streets and sewers. He also has control of the public buildings in his borough except schools, hospitals, penitentiaries and fire and police stations, and exercises the supervision vested in the city over the construction of buildings in his borough, except such powers as are directly vested in the Tenement House Commission.

Newspapers.— In 1903 there were published in New York 579 regular periodicals: 37 dailies, 222 weeklies; 9 fortnightly, 17 semi-monthly, 272 monthly and 22 quarterly. One third of the books annually published in the United States also bear a New York imprint.

Libraries.— The chief library of the city is the New York Public Library — Astor, Lenox and Tilden Foundations, established in 1895 by consolidation of the Astor and Lenox libraries and the Tilden Trust. The Astor was founded in 1849 by John Jacob Astor, and the Lenox in 1870 by James Lenox. The Tilden Trust was created in 1884 by the will of Samuel J. Tilden, and at the end, by compromise, of a legal contest, became possessed of $1,000,000. The consolidated library has an invested endowment of $4,500,000. It contains 756,000 bound volumes and 220,000 pamphlets, and is eventually to be housed in a building in Bryant Park which will cost $2,800,000. The Carnegie endowment, announced in 1901, provides for 50 branch library buildings which will cost over $3,000,000. Besides the Public Library, there are many institutional, private and special libraries, the chief being that of Columbia University, with 330,000 volumes; others are the library of the New York Historical Society of 100,000 volumes; the Society Library of 100,000 volumes, and the Mercantile Library of 233,000 volumes.

Education and Intellectual Associations.— The city in 1903 had 500 schools, free and wholly supported by taxation at a yearly cost of $23,000,000 — the largest sum spent for public education by any community in the world. This is wholly additional to the amount expended for the sites and the construction of new school houses, the cost of which is met by the issue of city bonds. Five eighths of the annual outlay of $23,000,000 represents the salaries of 13,000 teachers, who give instruction to 535,000 pupils. Evening schools cost $700,000 a year, and vacation schools and play grounds $300,000. First among the city's higher institutions of learning are Columbia University, founded in 1754, with 380 instructors and 4,700 students; the College of the City of New York, established in 1848, with 92 instructors and 2,300 pupils; the New York University, with 212 instructors and 1,900 students; the College of Physicians and Surgeons; the College of St. Francis Xavier, and St. John's College, conducted by the Jesuits; the General Theological Seminary of the Protestant Episcopal Church; Manhattan College; the Conservatory of Music; the New York Law School, the Normal College, and the Union Theological Seminary. A majority of the hospitals have training schools for nurses. There are many art and literary associations, chief among them the New York Historical Society and the National Academy of Design; and, exclusive of Brooklyn, 94 dramatic and musical clubs, 163 social clubs, and 53 music halls and theatres.

Charities.— First among the charitable institutions of the city is the Charity Organization Society, which is supported by voluntary contributions and legacies and serves as a centre of inter-communication between various churches

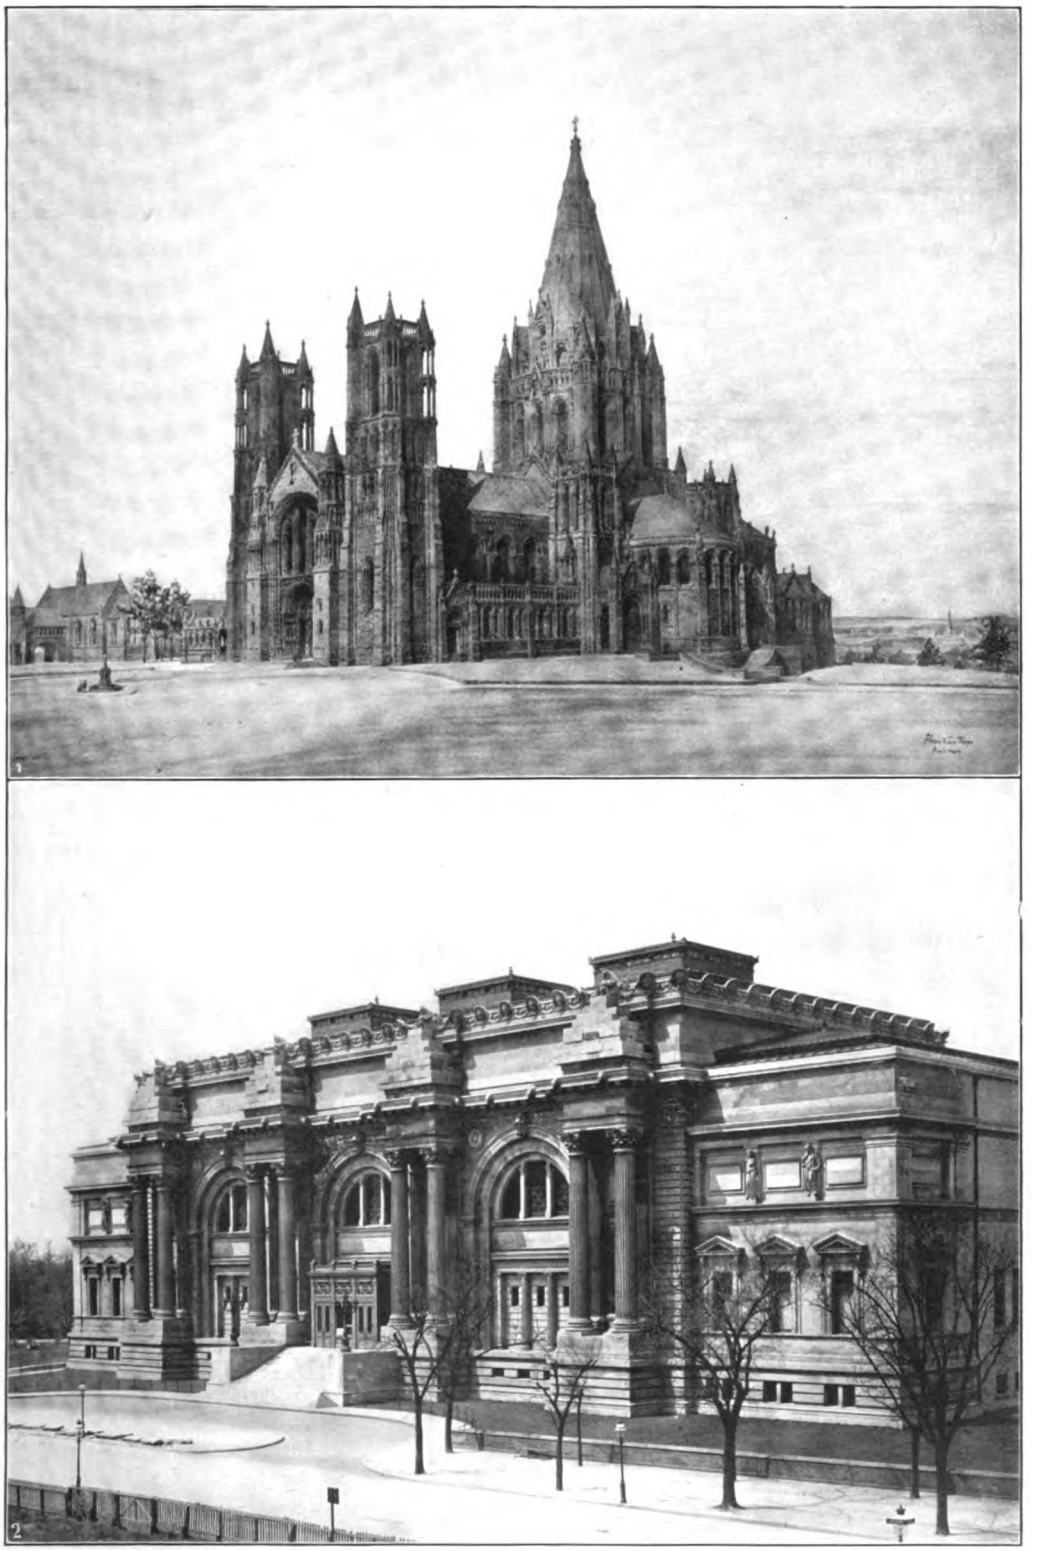

Photo. by Chas. Ballard.

1. Cathedral of St. John the Divine. 2. The Metropolitan Museum of Art.

and charitable agencies. There are 28 hospitals, refuges and asylums which receive government or official aid, and 98 hospitals and dispensaries supported by voluntary contributions and private endowment. Twenty-nine institutions and associations are conducted for the relief of the aged, and 122 for the relief of children. In the latter class mention should be made of the Children's Aid Society, organized in 1853, which has provided 75,000 boys and girls with homes and places of employment, and in its industrial schools given aid and instruction to over 115,000 children; the New York Foundling Hospital, which is controlled by the Sisters of Charity and contains 4,300 inmates, and the Society for the Prevention of Cruelty to Children, by which an average of 9,000 complaints are yearly received and investigated. There are 26 organized agencies for the reformation of children, fallen women and intemperate men: these include the Catholic Protectory, where 4,500 children are taught trades and industrial employments, and the House of Refuge, where 1,300 boys and girls, received upon commitment of the city courts, are given a common school education and industrial instruction. Noteworthy among agencies for rendering special or temporary relief to the poor are the Grace Institute, endowed by William R. Grace in 1897 to furnish women and girls instruction in trades and occupations and which now has 900 pupils; the Legal Aid Society, which gives free legal aid and assistance to those unable to procure the same; the Prison Association of New York, which aids reformed convicts after discharge; the Provident Loan Society, which loans on pledges of personal property at one per cent a month; the Baron de Hirsch Fund for the benefit of Hebrew immigrants; 15 Church and College Settlement Houses; and the Sailors' Snug Harbor on Staten Island, where a home is provided for 900 aged and decrepit sailors. Mention must also be made of the Society for the Prevention of Cruelty to Animals, founded in 1864 by Henry Bergh, and the parent of similar organizations in many other States and cities.

Churches.—New York is the seat of a Roman Catholic and of an Episcopal archbishop. There are in the city, exclusive of Brooklyn, 151 Roman Catholic, 138 Protestant Episcopal, 86 Presbyterian, 103 Methodist Episcopal, 69 Baptist, 52 Reformed, 68 Lutheran, 18 Congregational, 7 Christian Science, 4 Disciples of Christ, 2 Friends, 7 Moravian, 4 Unitarian, 3 Universalist, 2 Evangelical, and 43 miscellaneous churches and chapels, and 119 Jewish synagogues. The value of church property in the city, exclusive of Brooklyn, is $95,076,000. The finest church building is the Roman Catholic cathedral in Fifth Avenue. Of the others the most notable is Trinity Church in Broadway at the head of Wall Street, which has the longest continuous history of any parish in the city. It was in 1697 that William and Mary granted a parcel of land "in or near to a street without the north gate of the city, commonly called Broadway," for use "as the parish church and church-yard of the parish of Trinity Church within our said city of New York." The church built on this grant was occupied in 1698, and in 200 years has had only nine rectors, each holding the office, on an average, for more than twenty years. Destroyed in the fire of 1776, the church was rebuilt two years later on the original site; but the second building was found to be unsafe in 1839, and in 1846 was replaced by the present structure. In 1705 Queen Anne granted to Trinity the tract of land then known as the Queen's Farm, and lying between the present Fulton and Charlton streets and Broadway and the North River; and this grant, with the growth of the city, had made it the wealthiest parish in America, enabling it to become the generous mother of many children. Saint Paul's in Broadway, built in 1764, and seven other churches and chapels, are all included in Trinity parish and wholly maintained by it. Besides these churches, the parish contributes to the support of many others, and to various missions and hospitals. The income received from what remains to it of the land included in Queen Anne's grant exceeds $500,000 a year, and this splendid revenue is administered in no niggardly spirit. A large part of it is expended on the estate, and upward of a tenth is given to poor churches outside the parish.

Finances and Banking.— The assessed valuation of property within the city for the year 1902 was $3,857,047,718, five sixths of it being real estate. The net bonded debt of the city is $437,796,661. The city expenses are $97,119,031 a year, the tax rate 2.273 per cent, and the city owns property valued at $354,000,000. There are 422 banks of discount (53 national), 49 savings banks, 49 trust companies and 133 building and loan associations. The total stock of the 37 national and 17 state banks which are members of the Clearing House Association is $109,822,700, and their undivided profits $129,257,100 — a total of $239,079,800 actual capital invested in these 46 institutions. The trust companies of New York at the opening of 1903 owned $193,044,837 of stocks and bonds; the state banks, on 23 May 1903 owned $9,720,400, and the national banks (exclusive of bonds held to secure circulation and United States deposits) owned on 9 June 1903, $106,412,100 — a total of more than $300,000,000 in securities owned by the banks and trust companies of the city. Two notable developments in the New York banking world in recent years have been a great increase in bank capitalization leading to the creation of $25,000,000 and $10,000,000 banks, and the establishment of powerful chains of banks and trust companies — that is to say, the close affiliation by ties of common ownership, of a number of large credit institutions, so that it may be said that six or seven such chains now constitute the money power of New York. The largest of the city's savings banks is the Bowery Savings Bank, which at the opening of 1903 had upward of 135,000 accounts open with a total amount deposited of $75,696,854. There are 36 fire and marine, and 5 life insurance companies in the city. The best known of the city's financial institutions is the Stock Exchange, an association for the exchange of securities for currency or its representatives. The securities bought and sold at the New York Stock Exchange are certificates of stock, and bonds issued under national, state, or municipal authority, or by corporations doing business as common carriers, or in banking, mining, manufacturing, or other industrial pursuits. The cash value of the annual transactions in this national monetary institution defies ordinary comprehension. The chief business of its members is buying and selling these stocks and bonds for outside clients,

and so great is the demand for their services that an average of $200,000 a day or $70,000,000 a year is distributed among them in commissions — the charge being one eighth of one per cent on the par value of every transaction. The Stock Exchange is limited to a membership of 1,200, and all new members are now admitted through transfer, "seats" being worth from $65,000 to $75,000. All told, the securities listed on the floor of the Exchange aggregate in round numbers as follows: Railroad stocks, $4,500,000,000; miscellaneous stocks, $3,500,000,000; railroad bonds, $5,000,000,000; miscellaneous bonds, $500,000,000, or a total of $13,500,000,000.

Trade and Commerce.— Nature and man have made New York the main portal of the foreign commerce of the United States. Manhattan Island has over nine miles of docks, but this is not the limit of the city's capacity. Miles of the Hudson River front on the New Jersey side are owned by the great railroad corporations, whose terminals afford docks for the reception of freight and passengers. Across the East River are the docks of sugar refineries, factories, warehouses, government storage houses, and great basins for canal boats, while of late years the shores of Staten Island have been hidden by the growth of docks. The total tonnage of the over-sea vessels entering and leaving the port of New York in 1902 was 17,398,058, only 166,050 tons less than that of London, and if the figures of its coastal are included with those of its deep-sea trade, New York is to-day the leading seaport of the world. Its total import trade is now over $600,000,000 a year, or 55 per cent of the imports of the whole country, and its total export trade $560,000,000, or three fifths of the exports from all the ports of the United States. There are owned in New York 4,000 vessels of all classes, with a total tonnage of 1,247,828. No less than 157 steamship and steamboat lines run from New York to points on the coast, sound, and river, and to ports in Central and South America, Europe, Africa, Asia, and Australia. As to the railroads, it is the terminal of the main line of the Central Railroad of New Jersey, the Pennsylvania, the New York Central, the Erie, the New York, New Haven & Hartford, the West Shore, the Delaware, Lackawanna & Western, the New York, Lake Erie & Western, the Long Island, and the New York, Ontario & Western. The number of passenger trains arriving and leaving the city every week day exceeds 1,000. The New York Central in 1903 projected terminal improvements which will cost $25,000,000, while of even greater importance is the Pennsylvania project of tunneling under the Hudson and East rivers and the boroughs of Manhattan and Queens, giving a continuous track connection between the Pennsylvania and Long Island railroads, with a central station in the borough of Manhattan, and a terminal emergence of the tunnel system at a point near Thompson Avenue, Long Island City. The plans for this improvement, devised by Charles M. Jacobs, call for at least five tubes, each of which will be 18 feet 6 inches inside diameter. Three of these tubes will be 100 feet below high tide under the Hudson River, and two under the East River, each tube holding a single track. The tunnel system will converge at a central station located in a space between Seventh and Tenth avenues, Manhattan. The station structure, designed after the Quai d'Orsay in Paris, but twice as large, will be 1,500 feet in length by 500 feet in width, and will enclose 25 tracks at tunnel level, which will be approached by gradual carriage drive and walk ways. The tunnel tubes will be laid below 31st Street in Manhattan, and underneath Long Island City in Queens. A second central station is contemplated for Brooklyn in East New York. The entire length of the tunnel system will be 15 miles, its cost $50,000,000, and it will be completed before December 1905.

Manufactures.— New York is a great manufacturing as well as trading city. There are at the present time about 440,000 people employed in manufacturing industries in the city, in 39,000 establishments. These establishments represent an invested capital of $840,000,000, and each year pay upward of $210,000,000 in wages. The annual cost of the materials used by them is $570,000,000, and the value of their finished product $1,100,000,000. The principal industries, aside from food, tinsmithing, and mason, carpenter and structural iron work, are the manufacture of sugar, tobacco, and clothing; of brass and copper, chemicals, patent medicines and compounds, clocks, watches, and musical instruments; of rope and cordage, products of iron and steel, boats and sails, glass and glassware, arms and ammunition, india rubber and leather products; of instruments for scientific purposes, gold and silver ware, malt liquors and distilled spirits, paper, oils, paints, pigments and colors, products of cotton, wool, and wood, and of soap, starch, and matches. Mention must also be made of fine printing, lithographing, engraving and map making in which New York holds first place in America. All told the industries conducted in the city number more than 1,000.

History.— The first white men known to have visited Manhattan Island, the future site of New York city, were Giovanni da Verrazano, an Italian sailing in the French service, and Diego Gomez, a Portuguese sailing in the Spanish service, both of whom, while seeking a westerly way to the Indies in 1524, entered what is now the harbor of New York. Nothing, however, in the way of colonization came of their voyage. Eighty-five years later in April 1609 Henry Hudson, an English adventurer in the service of the Dutch East India Company, sailed from Amsterdam as captain of the ship Half Moon, with a charge from his employers to seek a water route to the Indies by the north side of Nova Zembla. Ice early blocked his advance into the Arctic, and so, heading westward, a month's cruise brought him, in July, to the coast of Newfoundland. Thence he sailed southward to the James River, Virginia, and, again altering his course, still in pursuit of a new channel to India, came on 11 Sept. 1609 upon the river which bears his name. He anchored for a time at its mouth and then sailed up the stream until warned by shoaling water that he was at the head of navigation, near the present site of Albany; whereupon he turned his vessel southward, and early in October set out on his homeward voyage. Hudson's account of the stores of fine peltries he had seen in the possession of the Indians moved his employers to prompt action, and in 1609 the former mate of the Half Moon was sent across to trade with the savages and report further upon the country. Handsome profits attended this venture, and in

Mail

1613 the Fortune and the Tiger, commanded respectively by Hendrick Christaensen and Adrian Block, sailed for the Hudson River, being followed within a year by three other vessels from Amsterdam and Hoven. These carried back to Holland such generous cargoes of furs that their owners hastened to open regular communication with the Hudson River country and to establish posts at its head and at its mouth for the purchase and collection of skins while the vessels were on their voyages to and from Holland. The main post, called Fort Nassau, was located just below the site of Albany; but a smaller fort was built on Manhattan Island, its site being just south of the present Bowling Green. Captain Christaensen was appointed head man over both posts, and he and his half dozen comrades were, therefore, the first white settlers on Manhattan Island. Though Christaensen soon lost his life in a quarrel with the Indians, the trade he had helped to found grew and prospered, and soon the merchants who had first engaged in it joined with others in the formation of the United New Netherlands Company, to which, so far as the power lay with the States-General of Holland, was granted for three years from 1615 the monopoly of the fur trade with the newly opened country. This monopoly was renewed for a year at a time until 1621, when the Dutch West India Company came into existence with chartered rights to the exclusive trade of all the coasts of both Americas. The new corporation was, speaking in a broad way, a commercial federation, with branches established in the several cities of Holland. Each branch, though subject to the collective authority of its fellows, was clothed with distinct rights and privileges of its own, and was assigned a specific territory, over which it exercised the right of government and of trade. Thus, the post on Manhattan Island, with its dependent territory, was assigned to the Amsterdam branch, which at once addressed itself to the development of what had now come to be known as the Province of New Netherlands. Accordingly in 1623 thirty families of settlers were sent out from Amsterdam, and a part of them put ashore on Manhattan Island. More colonists arrived in 1625, men who had come as homemakers, and not as transient traders; and to confirm this promise of permanency Peter Minuit was appointed director-general of the colony, with power to organize a provisional government. He arrived at his post in May 1626, at the head of another band of colonists, and having bought Manhattan Island from its Indian owners for a consideration of $24 he proceeded to christen the infant town New Amsterdam. Recalled from his directorship in 1632, Minuit was succeeded in turn by Wouter van Twiller, William Kieft and Peter Stuyvesant. A savage Indian war in Kieft's time well nigh extinguished the colony, but it made rapid recovery under Stuyvesant, who directed its affairs from 1647 to 1664, and by the year last named the hamlet on Manhattan Island has become a town of 1,000 souls, under the government, organized in 1652, of a schout, two burgomasters and five schepens, while thriving settlements had sprung up on both sides of the Hudson and on the lands about the Bay.

The Dutch, however, did not long retain possession of New Netherlands. The English claimed the entire continent as having been discovered by Cabot, and whenever the English and the Dutch were at war New Amsterdam had always to fear the threatened attack of some English squadron. The dreaded blow finally fell in 1664, when Charles II. resolved to seize New Netherlands by surprise. In pursuit of this purpose the king made to his brother James, Duke of York and Albany, a grant which included the whole of the Dutch possessions in America, and late in August 1664 a British squadron appeared before New Amsterdam and demanded its surrender. The coming of the English found the town ill-prepared for a siege, and though Stuyvesant wished to fight, even against heavy odds, he was not allowed to have his way. Articles of capitulation were quickly agreed upon, and on 8 September the flag of the West India Company fell from Fort Amsterdam to be replaced by that of England, and Colonel Richard Nicolls took possession of the town and province in the name of the English king and for the use of the Duke of York.

New Amsterdam was speedily renamed New York, and in June 1665 the city government was reorganized, in accordance with English customs, by replacing the schout, burgomasters, and schepens with a sheriff, aldermen, and mayor. Once again, from 30 July 1673 until 10 Nov. 1674, the Dutch were in possession of the town and province; but the treaty of Westminster finally transferred them from the States-General to England; and the permanent change of ownership was attended by a change of policy which made for the more rapid upbuilding of the town. One important act looking to this end bestowed on New York the sole right to bolt and export flour. The Bolting Act remained in force from 1678 until 1694, and during that time it trebled the population of the town, and gave a prosperous permanency to its foreign commerce. According to the provisions of the act no person outside of the city could grind flour for market or pack breadstuffs in any form for sale. The result of this interdict was to throw the considerable and growing export trade in breadstuffs, mainly with the West Indies, wholly in the hands of the millers and merchants of New York, so that during the sixteen years that the act remained operative the city revenues more than doubled and the total number of buildings in the town increased from 384 to 983, two thirds of which depended in one way or another on the trade in flour, while the port's sailing craft grew from 11 to 85 sloops and ships.

It was while the Bolting Act was still in force that, on 22 April 1686, New York received the charter,—known as the Dongan charter, because granted through the governor of that name,—which still forms the basis of its civic rights. The governor, under this instrument, appointed the mayor and sheriff, but the city was allowed a large quantity of real estate, from some of which it draws a revenue to the present day, while the aldermen were elected by the freeholders of the six wards into which the town had been recently divided, and enacted by laws for its government. The Dongan charter, amended by Queen Anne in 1708, was further enlarged by George II., in 1730, into the Montgomery charter, which, confirmed by the assembly of the province in 1732, made New York virtually a free city. The mayor until the Revolution was appointed by the governor

in council, until 1821 by the governor of the State and four members of the council of appointment, and then for thirteen years by the common council of the city. Since 1834 he has been chosen by the people.

The revolution by which, in April 1689, the crown of England passed from James II. to his daughter and her husband, bred a popular uprising in New York, and control of affairs passed for the time being from the crown officers to a Committee of Safety of ten members, chosen by the citizens. This committee appointed Jacob Leisler, a leading merchant, captain of the fort, and invested him with the power of commander-in-chief until orders should arrive from the new sovereigns. This arrangement was opposed by the so-called Aristocratic party, whose leaders had been office-holders under King James, but without effect, and the government of the town and province remained in the hands of Leisler until March 1691, when Colonel Henry Sloughter, who had been appointed governor of the Colony by William and Mary, arrived in New York. Leisler declined to surrender the fort unless assured immunity for his acts as governor. This was refused by Sloughter, who had fallen under the empire of the Aristocratic party, many of Leisler's followers deserted him, and he was thrown into prison. A little later, with his son-in-law Jacob Milborne and other of his adherents, he was brought to trial charged with treason and murder. All were found guilty by a prejudiced and hostile court, and Leisler and Milborne suffered death on the gallows. Their execution was little less than a judicial murder. Leisler's son afterward secured an order for the restoration of his confiscated estate, and, in 1698, an act was passed by the Parliament of England which canceled the judgments of the court in New York and sustained Leisler's course as governor. Three years afterward the bodies of Leisler and Milborne, denied funeral honors at the time of execution, were taken from their temporary resting place, near the present site of the *Sun* building, and, after lying in state in the City Hall, were with impressive ceremony reinterred in a burial-ground which stood in what is now Exchange Place. No man knows their present sepulture.

The political turmoils of the period did not retard the growth of New York, and the opening of the 18th century found the town's population increased to 5,000 souls,—Dutch and English nearly equal in numbers; a few French, Swedes, and Jews, and about 800 negroes, nearly all of whom were slaves. Slave importation into New York began some time prior to 1628, and reached a climax about 1746, when a census of the town showed 2,400 slaves in a total of less than 12,000 population. Thereafter each year marked a lessening demand for slaves, though they continued to be bought and sold during the entire colonial period. One reason for the decline of slave-holding and slave-buying in New York was the dread of a servile insurrection, dread which led uprisings among the blacks to be punished with unsparing hand. When, in 1712, a party of negroes, forming a wild plot to slay all the whites, met at night in an orchard near Maiden Lane, and killed and wounded a dozen men before being put to flight, 21 of those captured were shot, hung or burned at the stake. Reprisals even more sweeping attended the "Great Negro Plot" of 1741, a panic compounded of fear, rage and suspicion, which has been likened to the witchcraft delusion at Salem Village in 1692. This panic had its origin in a series of fires which in March 1741 alarmed the town, and fixed in the minds of many citizens the belief that they were the work of disaffected slaves.

A short time before the indentured servant-girl of a low tavern-keeper on the North River had been arrested, together with her master and mistress and two negroes, for complicity in a robbery. When a proclamation appeared offering a reward with a full pardon to any conspirator who would tell what he knew about a plot for burning the town, she saw in it a chance to regain her freedom, and "confessed" that her master and mistress, along with sundry blacks and semi-criminal whites, had matured such a plot as the first step in a projected uprising. It has ever since been doubted whether this plot was anything more than a figment of the imagination of a depraved and abandoned girl, but at the moment the creature's charges produced a reign of terror, and scores were jailed and put to death on little save her unsupported statements. Fourteen negroes were burned at the stake, 18 were hanged, and 71 transported, while of the 20 whites thrown into prison four were condemned and put to death. Glutted with victims, the panic finally subsided in September 1741, leaving behind it one of the darkest pages in the history of the city. It would be unjust, however, to judge this affair by the standards of a later time. Fear and terror, fed by fraud, appear to have prompted some awful mistakes, but those who committed them lived and acted under the hair-hung sword. The panic of 1741, moreover, was followed by a wholesome revulsion of popular feeling in favor of the negroes. They were admitted to the franchise within 10 years, and in 1758 the abolition of slavery in New York was practically accomplished by an act which declared that from that time forth all children born of slave parents should be free.

During the first part of the 18th century ocean industries were what mainly contributed to New York's growth and wealth. Kalm, the Swedish traveler, records that 211 vessels entered and 222 vessels cleared from this port in 1730, and the town's river, coast and sea trade grew steadily until the opening of the Revolution, when about one tenth of all the foreign commerce of the colonies was centred at New York. But with the arrival of the British army of occupation, 15 Sept. 1776, a seven years' blight settled over the town. During this period it lost more than half of its population and all of its commerce, and was twice visited by destructive fires. These laid a full fourth part of the town in ashes, nor was any attempt made to repair the devastation until after the British evacuation, 25 Nov. 1783. The war ended, however, the men of New York faced the future with stout hearts. "The town is ruined by the war, but its future greatness is unquestioned," wrote one of them; and in this hopeful spirit was begun the work of building anew—a work pushed with such resolute purpose that within eight years from the town's evacuation its population trebled and its commerce regained and passed its former limit. During this period also it was for a year and a half the capital of the Federal government, and in the Federal

Hall in Wall Street, on 30 April 1789, Washington was inaugurated first President of the United States.

New York ceased to be the Federal capital in August 1790, but this did not retard its growth, and in 1807, by which time it had reached a population of 60,000, robust faith in its future prompted the appointment of a commission to plot the city south of 155th Street substantially as it exists to-day. The commissioners, however, had hardly begun their task, duly completed in 1811, when New York was made to suffer from the chain of events which led to and attended the second war with England. The act of embargo passed by Congress, in September 1807, dealt what seemed at the moment a mortal blow to the prosperity of the town; and John Lambert, the English traveler, writes that in April of the following year he found 500 vessels in its harbor lying up useless and rotting for want of employment, while the losses of the next six years bore more heavily upon New York than any other city. But with the conclusion of a treaty of peace in December 1814 the town's commerce revived on the instant, and the annual revenues of the port, which had fallen to but little more than $500,000, shot up in 1815 to $14,000,000.

The end of another two years brought the practical inception of an enterprise to which the modern city is largely indebted for its commercial supremacy,—the cutting of a waterway from the Hudson River to the Great Lakes. The Erie Canal, begun on 4 July 1817, and completed on 26 Oct. 1825, made New York the gateway to the commerce of half a continent; and so profoundly did this union of the inland and the outland seas affect its growth that the year 1835 found it a city of 200,000 souls. A fire in December 1835, which caused a money loss of upward of $20,000,000, and the financial panic of 1837, were temporary checks to this growth, but only temporary ones. Gas was introduced into the city in 1825; the first street railway was set afoot in 1831, and in 1851, with the completion of the first trunk line to the Great Lakes, was inaugurated the railway service which has long made New York the seaboard terminus of all east and west lines. This was the Erie, begun in 1836, and extending from Piermont on the Hudson to Dunkirk on Lake Erie. Two years later the second trunk line connecting New York and the West, the New York Central & Hudson River Railroad, was established by the consolidation of a number of shorter lines. Several railroads had been built meanwhile in New Jersey, connecting New York with Philadelphia and other points. These in the process of time became one corporation, as the United Railroads of New Jersey, only to be in turn absorbed by the Pennsylvania Railroad, which after 1854 connected Philadelphia with Pittsburg, thereby not only perfecting New York's connection with the Middle and Southern States, but also sending from the heart of commerce an artery of traffic into the Middle Western States. The building of these and other lines, called, however, for the investment of large sums of money, from which quick returns were expected, and this bred a spirit of speculation whose blighting influence spared no part of the nation. The banks of New York suspended payment from October until December, trade and industry came to a standstill, and there were 5,000 failures, with liabilities exceeding $300,000,000. But confidence returned with the spring, and with it a resumption of railway construction, which, though temporarily retarded by the Civil War, has ever since tended in growing measure to strengthen New York's hold upon the business of the interior of the country. To-day ten trunk lines terminate in New York, which is also the objective point of a major portion of the traffic of all the railroads running east and west.

New York's devotion to the Union during the Civil War found expression in many ways. A sixth of its able-bodied male citizens were in the field before the close of the first year of the struggle, while from the first the women of the city busied themselves with efforts to care for the soldiers in camp and hospital and for their widows and orphans. They led in the founding of the Sanitary and Christian Commissions, and a single fair held in behalf of the former yielded more than $1,000,000. A kindred organization ministered to the necessities of refugees from the South, and a Soldiers' Rest was established on the site of Madison Square Garden, where soldiers could find a temporary home while on their way to and from the front. But in no form did New York's devotion to the Union find more sufficing expression than in the labors of the Union League Club, which, founded in the closing days of 1862 on the basis of "absolute and unqualified loyalty to the government, and unwavering support of its effort for the suppression of the rebellion," counted among its members every loyal citizen of note in the town; $210,000,000 were subscribed by the bankers and capitalists of Manhattan to the loans made by the government between 1861 and 1865, and the major portion of this sum was furnished or secured by members of the Union League Club. There was but one blot on New York's story of splendid loyalty. Proof of the existence of a turbulent element in the population had been furnished in 1849 when some thousands of rioters, taking into their own hands a quarrel between Edwin Forrest and the English actor William Charles Macready, sought to drive the latter from the stage of the Astor Place Opera House, but were held in check by the police, fired into by the militia, and finally dispersed; and the same lawless spirit found expression in an outbreak yet more ferocious in July 1863. Congress had passed a draft law that unwisely exempted from its operation all who should pay into the Federal treasury the sum of $300, and the discontent thus produced was systematically fomented in New York city by pot-house politicians, who in bar-rooms and on street corners declared the draft unconstitutional, and that it bore with peculiar oppressiveness on the poor man. Many vowed resistance, and, borrowing courage from the fact that the city, to beat back Lee's invasion of Pennsylvania, had been denuded of all but 300 troops, made plans to attack the drafting officers. No trouble occurred on the first day of the draft, 11 July, but on the third, 13 July, an organized mob attacked and wrecked the office of the provost-marshal at the corner of Third Avenue and 46th Street. Then the rioters, inspired by animosity toward the negro race, made a raid on a colored orphan asylum in Fifth Avenue, between 43d and 44th streets; and though a handful of policemen aided the nurses in getting the chil-

dren through a rear door to a place of safety, the building was burned to the ground. After this the mob attacked another enrolling office at 1190 Broadway, near 28th Street, with the resultant firing and pillage of most of the shops in the neighborhood. A cry now went up to kill the police, and soon 5,000 rioters, so rapidly had the mob swelled in numbers, were marching down Broadway, bent upon the destruction of police headquarters in Mulberry Street. Thomas C. Acton, president of the police board, informed of the rioters' purpose, detailed Sergeant Daniel Carpenter with 200 men to lie in wait for them. Carpenter marched his squad into Bleecker Street and so to Broadway, at the same time sending detachments up the nearest parallel streets east and west to strike the flanks of the oncoming mob. "Hit for their heads, men," were his orders. "Hit quick and hard, and take no prisoners." The fight that followed came soon to an end, and Broadway was cleared of rioters, save those that lay on the pavement with broken skulls. Routed at one point, however, the mob soon rallied at another, and a few hours later, under cover of darkness, a desperate attempt was made to sack and burn the office of the *Tribune* in Park Row. Here again the police did heroic service, and a charge led by Inspector George W. Dilks at the head of 110 men drove the rioters from the field with heavy loss in killed and wounded. Riotous feints meantime had been made upon the Seventh Avenue and Center Street arsenals and upon the armory at the corner of Second Avenue and 21st Street; the house of George Opdyke, mayor of the city, invaded and some of his furniture destroyed, and an attack made against that of Henry J. Raymond, editor of the *Times*, which had strongly supported the draft. It was clear at the close of Monday that the police force of the city was too small to cope with the lawless spirit. The mayor accordingly called on the State and Federal authorities for aid, and all of the New York regiments at the front were ordered to repair to the city. While this order was in process of execution the mob continued its work of firing and looting houses, and of maltreating and murdering unoffending negroes; but on the evening of Wednesday the returning regiments began to arrive in the city. With their coming, bayonets and bullets were substituted for policemen's clubs, and the rioters were attacked at every point with a resolute desire to do them harm. This wholesome policy, with a temporary suspension of the draft, quelled the rioting, and on Friday 17 July the mayor was able to announce the complete restoration of order. Two millions dollars' worth of property had been destroyed and over 1,200 rioters slain.

New York during the last 40 years has witnessed the assembling of but one mob which the police could not handle without the assistance of the military. That was in July 1871, when the Orange lodges of the city undertook to parade on the anniversary of the Battle of the Boyne. Announcement of their purpose evoked threats of violence from the Catholic Irish, and, fearing trouble, the governor of the State ordered five regiments of the National Guard to escort and protect the procession. Policemen were also detailed to surround and guard it. The point of departure was the corner of Eighth Avenue and 29th Street, and at the appointed hour in the afternoon of 12 July the paraders began their line of march,—a detail of patrolmen in front, then a regiment and next the Orangemen, with a moving wall around them, and two other regiments bringing up the rear. Before they had moved two blocks a volley of sticks and stones from sidewalks, house-tops and windows rained upon Orangemen, police, and soldiery, many of whom were injured. Angered at this treatment, the members of one of the rear regiments, not waiting for orders, fired, some into the crowd and others at house-tops and windows. There was only one discharge, but 54 persons were slain. After this one deadly volley, police clubs and bayonets held some of the rioters at bay, while the greater number turned and ran as the reserve patrolmen along the line hastened to the scene. The remainder of the march passed without incident.

The political history of New York during the first half of the last century was a varied and turbulent one, but with a steady trend toward making the government democratic in all its branches. Until 1834, the mayor, as has been noted elsewhere, was chosen by the State council of appointment or by the common council of the city, which method of selection brought to the office such men as Edward Livingston, DeWitt Clinton, and Philip Hone. After 1834, however, the mayor was elected by the citizens, to whom in the meantime had been granted an unrestricted suffrage. A dozen years later the judiciary was also made elective, and thenceforth most local officers were chosen in the same manner. During this period the Democratic party was the one most often in power. The Federalists, or their successors, the Whigs and Republicans, now and then gained the upper hand; but in the long run the Democrats, under the leadership of Tammany Hall, a secret organization whose social and benevolent aims had been early put aside for political ones, always recovered their hold on the reins. The first mayor chosen by popular suffrage was a Democrat, and so were most of his successors prior to the Civil War. A Republican in 1862 succeeded to the office, but Tammany Hall soon regained control of the municipal government, and for several years political corruption ran riot in the city. Tammany Hall's master spirit at that period was William M. Tweed (q.v.), an able, but coarse and unscrupulous man, who following 1863 organized the politicians of his own party and a number of the local Republican leaders of the baser sort into a gigantic conspiracy to plunder the city. The Tweed Ring, as it was called, attained its greatest power in 1869, when it was master of every department, not only of the city, but also of the State government. Its greatest scheme of robbery was the building of a new court-house in City Hall Park. Work on this structure was begun under a stipulation that the cost should not exceed $250,000, but before 1871 $8,000,000 were expended on it, more than $1,000,000 of this sum being traced to Tweed's pocket. The end came in 1871, when the *Times* exposed the operations of the ring. Then an aroused public sentiment compassed its defeat at the polls, and this was followed by the prosecution and imprisonment of the chief offenders, Tweed himself dying in a felon's cell.

The material prosperity of the city has in-

creased steadily in the last 40 years. A chief factor in the making of the New York of to-day was the construction of the elevated railway system, completed in 1880 through the efforts of Cyrus W. Field. This brought all parts of the island within easy distance of each other, and the unbroken lines of city blocks which quickly followed in its wake wrought a complete transformation in the region in and about Harlem, formerly an isolated suburb reached only by horse-car or steamboat, but now as near the heart of trade as 14th or 42d street was in earlier years. More recently the cable-car and the electric trolley-car have ministered to the increasing need for rapid transportation, and the present year (1904) marks the completion of an underground railway system. The bridge across the East River, completed in 1883, having been found inadequate to the needs of an ever-growing population, a second has been built and two others are being thrown across that stream, while private enterprise is making ready to bind the Jersey shore to Manhattan by driving a tunnel under the North River.

The territorial expansion of New York has the while more than kept pace with its material development. By an act of the legislature passed in 1873, the corporate limits were carried across the Harlem, and a part of Westchester County, amounting to 13,000 acres, erected into city wards. A dozen years later a movement was set on foot to include in one municipality Manhattan Island, Brooklyn, part of Queens County, Staten Island or Richmond County, and yet another portion of Westchester County; and in 1890 a commission of eleven members, headed by Andrew H. Green, was appointed to inquire into and report upon the expediency of the project. The labors of the commission took shape in a bill passed by the legislature in 1894, which provided for the submission of the question to a vote of the people of the cities, towns and villages included in the proposed consolidation. The people gave their vote in November of the same year, and only the residents of Mount Vernon and the town of Westchester failed to record their approval. Meanwhile, by act of the legislature, West Chester, East Chester, Pelham, and Wakefield (or South Mount Vernon), were in June 1895 annexed to New York city, whereby another 20,000 acres were brought within the corporate limits, and Westchester township's vote against consolidation rendered ineffective. This carried the city line to the limit in Westchester County recommended by Commissioner Green and his associates, and in January 1896 a bill was passed by the legislature which made Kings County, a portion of Queens, and all of Richmond integral parts of Greater New York. The same year a commission of nine members was appointed by the governor to frame a charter for the new municipality and report the same to the legislature; and its labors had issue in a bill which on 5 May 1897 received the signature of the governor. This measure, which took effect 1 Jan. 1898, divides the city into five boroughs — Manhattan, the Bronx, Brooklyn, Queens, and Richmond,— embracing an area of a little less than 327 square miles, and counting a population in 1903 of 3,682,159. Thus, fulfilling its imperial destiny, has the village of 250 years ago become the second city in the world. RUFUS ROCKWELL WILSON,
Author of 'New York Old and New.'

New York, College of the City of. See COLLEGE OF THE CITY OF NEW YORK, THE.

New York Academy of Sciences, The, was originally incorporated in 1818 under the name «The Lyceum of Natural History in the City of New York.» The title was changed in 1876. There are four classes of members in the association: active, fellows, corresponding and honorary. Annals, memoirs and many pamphlets are published under the auspices of the society.

New York Central and Hudson River Railroad Company, the incorporate name of one of the great transportation systems of the United States. Having its beginning in 1826 as the Mohawk and Hudson Railroad with less than 20 miles of track and an equipment of but a single train, this remarkable railroad system, popularly known as "the Four Track Road," has resulted in the consolidation of over 100 small railroads, and in 1903 it operated as owner or lessee over 3,242 miles of track. In 1903 the New York Central carried 42,437,265 passengers, which required an equipment of 2,118 cars and 547 locomotives. In its transportation of freight during the same year the road employed 63,542 cars and 936 locomotives.

The Beginning.— The growth and development of the New York Central extending over the period from 1826 to 1904 is typical of American commercial progress. The genesis of the great corporation was the Mohawk and Hudson Railroad, chartered in 1826 and opened 12 Sept. 1831. It was the first railroad built in the State of New York. The name was changed a few years later to the Albany and Schenectady. Together with nine other small railroads the Mohawk and Hudson was merged into a corporation, organized under a special law, 2 April 1853, called the New York Central Railroad Company.

The Central.— The ten roads comprising the New York Central were: (1) the Albany and Schenectady; (2) the Schenectady and Troy, chartered in 1836, and opened in 1842; (3) the Utica and Schenectady, chartered in 1833, and opened in 1836; (4) the Mohawk Valley, organized in 1851; (5) the Syracuse and Utica, chartered in 1836, and opened in 1839; (6) the Syracuse and Utica Direct, chartered in 1853; (7) the Rochester and Syracuse, a consolidation of the Auburn and Rochester (1836), and the Auburn and Syracuse (1834); (8) the Buffalo and Rochester, a consolidation of the Tonawanda Railroad (1832) and the Attica and Buffalo (1836); (9) the Rochester, Lockport and Niagara Falls Railroad, organized in 1850; (10) the Buffalo and Lockport, chartered in 1852, and opened in 1854. This consolidation gave the New York Central a continuous line of railway from Albany to Buffalo. The following roads were subsequently leased and then merged into the consolidation: Rochester and Lake Ontario (1855); Buffalo and Niagara Falls (1855); the Lewiston (1855), and the Saratoga and Hudson River (1867).

The Hudson River.— The Hudson River Railroad Company was chartered 12 May 1846. It leased the Troy and Greenbush Railroad, which was chartered in 1845, and in October 1851 opened the new Hudson River line through its entire length from New York city to East Albany. At this stage of the development there were the two consolidated systems, the Hudson River (New York to Albany), and the Central (Albany to Buffalo).

The Consolidation.— On 1 Nov. 1869, the New York Central and Hudson River Railroad Company was organized by the consolidation of the New York Central Railroad Company and the Hudson River Railroad Company. This gave a direct line from New York city to Buffalo. The new company added the following extensive roads to its system: (1) the New York and Harlem, chartered in 1831, and extending from 42d street, New York, to Chatham, included a lease of the New York and Mahopac Railroad from Golden's Bridge to Lake Mahopac. (2) The Spuyten Duyvil and Port Morris Railroad, six miles long, chartered in 1867. (3) The Geneva and Lyons Railroad, from Geneva to Lyons, distance 14 miles. (4) The Syracuse Junction Railroad, a local system. (5) The Buffalo Junction Railroad, between East Buffalo and North Buffalo. (6) The Troy Union Railroad, chartered as a terminal line in 1851, and originally owned by the city of Troy. (7) The two Hudson River bridges, owned by the Hudson River Bridge Company, and crossing the Hudson at Albany and East Albany. (8) The Dunkirk, Allegheny Valley and Pittsburg Railroad, leased until 2373. (9) The West Shore Railroad. (10) The New Jersey Junction Railroad. (11) The Beech Creek Railroad. (12) The Rome, Watertown and Ogdensburg. (13) The Mohawk and Malone Railway. (14) The Carthage and Adirondack Railway. (15) The Gouverneur and Oswegatchie Railroad. (16) The New York and Putnam Railroad. (17) The Pine Creek Railway. (18) The Syracuse, Geneva and Corning Railway. (19) The Fall Brook Railway. (20) The Wallkill Valley Railroad. (21) The Boston and Albany Railroad. Many of these consolidated lines were in themselves great railway systems and are worthy of brief historical sketches.

The Boston and Albany.— On 4 Sept. 1867, the Boston and Albany Railroad Company was formed by the consolidation of the Boston and Worcester Railroad Corporation and the Western Railroad Corporation, and later, 1870, the Boston and Albany Railroad Company consolidated with itself the Albany and West Stockbridge Railroad Company and the Hudson and Boston Railroad Company. Other roads going into the Boston and Albany were the Springfield and North Eastern, the North Brookfield, the Pittsfield and North Adams, the Ware River, the Providence, Webster and Springfield, the Chester and Becket. The entire Boston and Albany system was leased to the N. Y. C. & H. R. R.R. on 15 Nov. 1899 for a term of 99 years.

The West Shore.— The West Shore system was composed of the New York, West Shore and Buffalo and the Syracuse, Ontario and New York, under the name of the West Shore Railroad Company, and was leased to the N. Y. C. & H. R. R.R. Co., 5 Dec. 1885, for 475 years. This lease was ratified by the New Jersey State Legislature.

The Beech Creek.— The Beech Creek Railroad Company was organized 29 June 1886, as the successor of the Beech Creek, Clearfield and Southwestern, chartered 1883, and extending from Williamsport, Pa., to the southern line of Clearfield County, a distance of 100 miles. This was leased to the N. Y. C. & H. R. R.R. on 1 Oct. 1890, for a period of 999 years.

Rome, Watertown and Ogdensburg.— In 1860 the Rome, Watertown and Ogdensburg Railroad was organized by the consolidation of the following roads: Watertown and Rome, Potsdam and Watertown, and subsequently added the Lake Ontario, the Syracuse and Northern, Windsor Beach and Ontario, Rochester and Lake Beach, the Norwood and Montreal, Fulton and Oswego, Syracuse, Phœnix and Oswego, Oswego and Rome, the Utica and Black River, the Clayton and Theresa, the Black River and Morristown, the Ogdensburg and Morristown, and the Carthage, Watertown and Sackett's Harbor. This system was leased to the N. Y. C. & H. R. R.R. on 14 March 1891.

The Mohawk and Malone.— This company was organized in 1892, by the consolidation of the Herkimer, Newport and Poland; the Herkimer, Newport and Poland Extension and the Saint Lawrence and Adirondack. This company's property was leased to the N. Y. C. & H. R. R.R.

The New York and Putnam.— Organized in 1892, this company represented a merging and consolidation of the New York and Northern; Yonkers Rapid Transit, New York City and Northern; New York, Westchester and Putnam; the West Side and Yonkers and the New York, Boston and Montreal. The system was leased to the N. Y. C. & H. R. RR. on 30 Jan. 1894.

The Fall Brook.— This system included the Blossburg and Corning, the Wellsboro and Lawrenceville and the Cowanesque Valley, and was leased to the N. Y. C. & H. R. R.R. on 11 April 1899, for 999 years.

The Dunkirk, Allegheny Valley and Pittsburg.— Organized 1 Dec. 1872, this system had been the result of a consolidation of the Dunkirk, Warren and Pittsburg, the Warren and Venango and the Conewango Valley. It was leased to the N. Y. C. & H. R. R.R. in 1872 for a period of 501 years.

The Directors.— The directors of the N. Y. C. & H. R. R.R. at its organization in 1869, were Cornelius Vanderbilt, William H. Vanderbilt, Augustus Schell, Horace F. Clark, Daniel Torrance, Chester W. Chapin, James H. Banker, Samuel Barton, Joseph Harker, George J. Whitney, Samuel F. Barger, Wm. A. Kissam, and H. Henry Baxter. Of this original directorate the only survivor in 1903 was Samuel F. Barger. The directors in 1903 were Wm. K. Vanderbilt, Chauncey M. Depew, Frederick W. Vanderbilt, J. Pierpont Morgan, Charles C. Clarke, Wm. Bliss, H. McK. Twombley, Geo. S. Bowdoin, Samuel F. Barger, Wm. Rockefeller, D. O. Mills, W. H. Newman and E. V. W. Rossiter.

The Presidents.— The presidents of the N. Y. C. & H. R. R.R. Company have been Cornelius Vanderbilt, Wm. H. Vanderbilt, James H. Rut-

THE NEW YORK CUSTOM HOUSE.

WHEN COMPLETED TO BE THE FINEST IN THE WORLD.

ter, C. M. Depew, Samuel R. Callaway and William H. Newman, in the order named.

Characteristics.— The entire system of the N. Y. C. & H. R. R.R. consisted in 1903 of 1 main line, 2 contract lines, 13 branch lines and 59 leased lines and branches of railroad. It had a total mileage of 3,242.49; has 1,374 steel bridges, 136 stone bridges, 89 wooden bridges, 180 trestles, 33 tunnels, 8 grain elevators, a fleet of 205 barges, ferryboats and other vessels, and employed an army of 50,000 men, to whom $33,000,000 are annually paid in wages. The lines of the company extend through the States of New York, Pennsylvania, New Jersey and Massachusetts.

In 1903, the New York Central owned large proprietary interests (through ownership of stock) amounting to $115,267,134, in the Lake Shore and Michigan Southern, the Michigan Central, the Chesapeake and Ohio, the New York, New Haven and Hartford, and sundry other railroads.

New York Custom-House, in New York, perhaps the most imposing custom-house in the world. It occupies an entire block, irregular in shape, bounded by Bowling Green, Whitehall, State, and Bridge streets. The frontage on Bowling Green is 191 feet; on Whitehall Street and State Street about 288 feet; and on Bridge Street about 278 feet. It has seven stories above the sidewalk and two below, the entire cubical contents being about 8,400,000 cubic feet. Its cost was $4,500,000. The exterior of the building is constructed of Maine granite, is monumental in design, and is richly embellished by carving and sculpture, by the most eminent sculptors in America. The architectural style is that of the Renaissance period. A few public rooms are specially decorated and finished in fine marbles, including the offices of the collector, the main halls, and also the central rotunda. The building is the finest custom-house in the world, both as a structure, and as an office for transaction of customs business.

New York Historical Society, The, an association organized 20 Nov. 1804, for the collection and preservation of historical matter relating to the United States in general and the State of New York in particular. The collections of the society are rare and valuable. In the department of antiquities is the Abbott collection of Egyptian antiques, which is considered one of the finest in the world. The art gallery, which contains nearly 1,000 paintings and 200 portraits, includes the Bryan gallery of old masters, the Durr collection, New York gallery of fine arts, and the works of the American art union. The library has a valuable collection of books, maps, manuscripts and engravings. From 1857 to 1903 the collection was housed in the society's building at 170 Second Avenue, New York. In November 1903 a new home for the society at 77th Street and Central Park West was dedicated and plans made for the removal of the historical treasures owned by the society.

New York Public Library, established 23 May 1895 by a consolidation of the Astor, Lenox and Tilden libraries. Legally this was an amalgamation of three corporations known as the Tilden Trust, the trustees of the Astor Library, and the trustees of the Lenox Library. From these institutions 21 trustees were selected to serve as members of the new corporation. The agreement of consolidation provided for the establishment and maintenance of a free public library and reading room in the city of New York, with such branches as might be deemed advisable for the continued promotion of the objects and purposes of these several corporations. The Astor Library (267,000 volumes) was founded in 1849, by John Jacob Astor, and his endowment was increased, and land and buildings added, by the beneficence of various members of the Astor family. The Lenox Library (86,000 volumes) was founded by James Lenox, who gave land on Fifth Avenue, between 70th and 71st Streets, large funds and valuable collections of Bibles, manuscripts, and Americana. It received subsequently large endowments from his sister, Miss Henrietta Lenox, from Mrs. R. L. Stuart, and others. The Tilden Trust (20,000 volumes), incorporated in 1887, was created by the will of Samuel J. Tilden, made in 1884, which gave his entire residuary estate to trustees to establish and maintain a free library and reading room. A long contest in the courts resulted, before the termination of the suit, in an agreement of compromise by which the Tilden Trust became possessed of over $2,000,000.

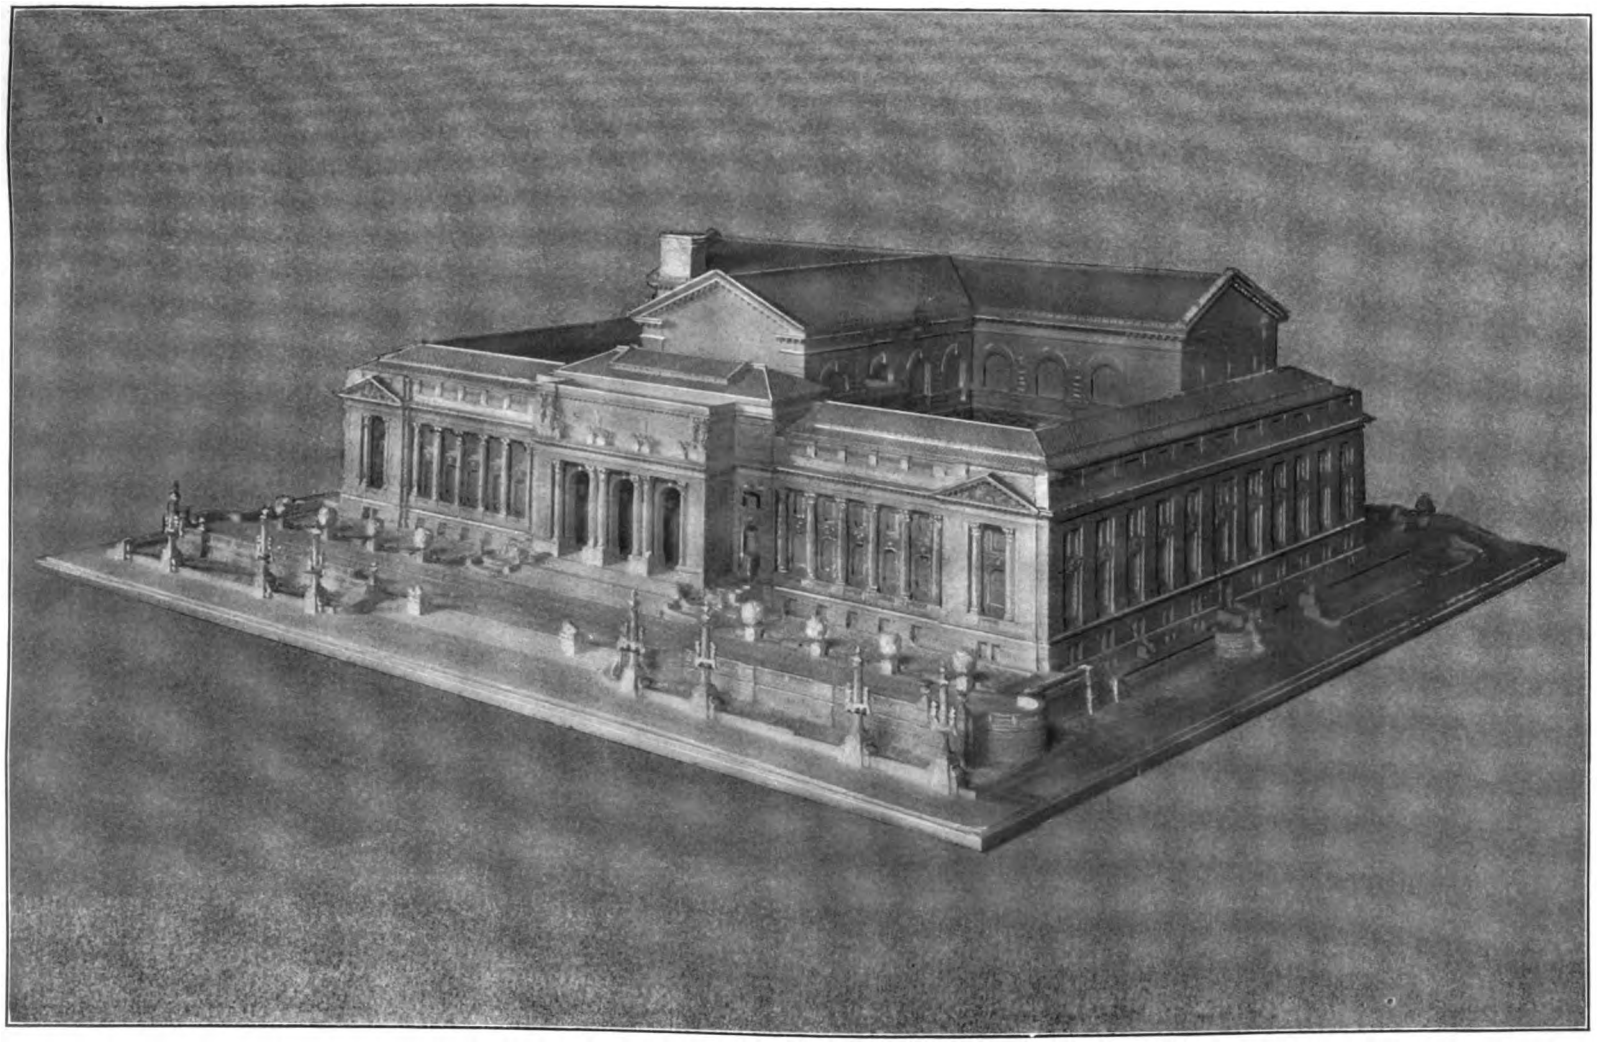
The trustees of the New York Public Library soon after the consolidation in 1885 determined to pursue a liberal policy and to create a great library system not only for the use of scholars, but for the people. The best permanent site for the future great library was considered to be in Bryant Park, on Fifth Avenue, between 40th and 42d Streets, on the site of the city reservoir, which had become obsolete and was practically unused. On 25 March 1896 the trustees made a formal address to the mayor asking aid from the city in securing the site of the reservoir, and in May 1896 the legislature passed a law authorizing the removal of the reservoir and the lease of the land to the library. On 19 May 1897, another act was passed providing for the construction by the city of a library building on the reservoir site, and for its lease to the library, which act was amended in 1900, removing the limit of cost. On 10 November the architects were selected for the new building, and on 1 December the plans were approved by the city. The style of architecture will be Renaissance and the material used will be white marble. The building will front on Fifth Avenue, looking east. The greatest projection of the main façade of the building is 75 feet back of the Fifth Avenue building line. It is intended to make a terrace out of this 75 feet of foreground, serving as a grand approach to the main entrance. The terrace will be 455 feet long. There will be a hallway in the centre of the building 80 feet long and 40 feet wide. The staircases which lead to the second and third floors will be of stone, 12 feet wide. The arches forming the vestibule will be 35 feet high and 15 feet wide. The entrance to the stairs and the elevators will be found on the 40th Street side. On the first floor will be the main exhibition room. On the second floor will be the rooms of the director and trustees, lecture room, and reading room. The top floor will contain the Stuart collection. There will be about 140 feet of ground between the west elevation of the building and the present park. The

design of the building will be monumental in character, with classical proportions. After delays, owing to the inability of the city to appropriate funds for the work, the removal of the reservoir was begun on 6 June 1899. The reservoir has since been removed and the foundation for the new building completed and the cornerstone for the building laid. The Park Department, acting on behalf of the city, entered into a contract with contractors to construct the building at a cost of $2,865,706. In June 1900 the Finance Department of the city requested the library to investigate the condition of the free circulating libraries, and on 24 September a report was made, after careful investigation, recommending a definite centralized system of free circulating libraries. On 11 Dec. 1900 the trustees of the New York Free Circulating Library offered to consolidate with the Public Library, and on 23 Feb. 1901, an agreement of consolidation was effected. An act permitting libraries to deed their properties to the Public Library became a law on 6 March 1901, and under it the Saint Agnes Free Library and the Washington Heights Free Library have conveyed all their property to the Public Library. On 14 Nov. 1900 the library received a communication from the New York Board of Education for the boroughs of Manhattan and the Bronx, recommending co-operation with the public schools, and on 12 December an agreement with the Board of Education was made by which books were to be supplied in 1901, for reading rooms in eight public schools. In 1901 Andrew Carnegie gave to the New York Public Library the sum of $5,200,000, for branch libraries, the city agreeing to furnish 65 sites for such branches.

New York State University. The University of the State of New York is a State department and at the same time a federation of more than 1,900 institutions of secondary and higher education. Its object as defined by law is to encourage and promote education in advance of the common elementary branches; and this is accomplished through an organization embracing high schools, academic departments of union free schools, academies, colleges, universities, professional and technical schools, libraries, museums, study clubs, extension courses and similar agencies. Its government is conducted by 19 elective regents and four ex-officio regents, the governor, lieutenant governor, secretary of state and superintendent of public instruction. The officers of the University are a chancellor and a vice chancellor, who are regents, and a secretary, who administers the department, and has charge of the immediate supervisory work. The regents grant, alter, suspend or revoke charters, confer honorary degrees, appoint boards to examine candidates for admission to the professions, and distribute state funds to secondary schools and free public libraries. They exercise supervision over secondary institutions through a system of preliminary and academic examinations, combined with inspection, and over professional education through their power to admit qualified students to professional schools and state examinations, and license candidates who have met the State tests or otherwise proved their fitness to engage in practice. The annual meeting is held the first Thursday in December, and other meetings as business requires. Since 1892 the regents have held 204 committee meetings and 43 full board meetings, the latter attended by an average of 14 members. In 1903 the appropriations for the department and the schools and libraries to which it apportions money were $661,456.31, including the fund of $350,000 for secondary schools. The University consists of six departments, Administrative, College, High School, Home Education, State Library and State Museum.

In 1754 letters patent were granted to a corporation under the name "Governors of the College of the Province of New York in the City of New York in America." Chapter 51 of the laws of 1784 vested all the rights, privileges and immunities of this corporation (then Columbia College) in the regents of the University of the State of New York, who were thereby "erected into a corporation or body corporate and politic, and enabled to hold, possess and enjoy" these rights, privileges and immunities, together with such other powers as were granted by this act. The original charter of the University authorized the regents "to found schools and colleges in any such part of this State as may seem expedient to them . . . every such school or college being at all times to be deemed a part of the University and as such subject to the control and direction of the said regents." At first the existence of the University was closely associated with that of Columbia College, and the idea of a governing board distinct from all teaching institutions but bringing all into vital relations with the State was attained somewhat later. In 1787 the incorporating act received important modifications, and the regents' powers took the shape which they have ever since possessed. The authorship of the University has been the subject of discussion, generally being ascribed to Alexander Hamilton; but the honor must be shared with James Duane and Ezra L'Hommedieu, as well as other men who took part in the establishment of the institution in 1784 or contributed later to its final organic form. The name regents was naturally adopted for the administering body by men who had the English universities in mind while they were laying the foundation of an educational structure; but the scope of the regents' functions was early determined in an original direction by the needs and freer conditions of education in the American commonwealth.

From the beginning the supervision of courses of education in high schools and academies has been, as it is to-day, the chief function of the regents, the heart of their work, the foundation on which the whole system of higher, professional and technical education rests. In 1784 New York had no system of secondary schools. In 1903 such schools reported 95,096 students and a total net property of $33,771,006.27, with expenditures for the year of $7,106,999.90, property and expenditures being thus divided between high schools and academies: high school property $14,400,278.45, high school expenditures $5,007,055.02; academy property $19,370,727.82, academy expenditures $2,099,944.88. The following table shows the relative growth in academies and academic departments of union schools since 1870:



THE NEW YORK PUBLIC LIBRARY.

FROM THE ARCHITECT'S MODEL.

Mau

	1870	1880	1890	1900	1903
Academic departments ..	62	153	231	565	636
Academies	125	86	104	140	144
Totals	187	239	335	705	780

From 1890 to 1900, while the growth in enrolment in the New York common schools was 16 per cent, the number of secondary school students increased more than 100 per cent. In 1903, 418,230 examination papers, sent in from the schools, were marked in the regents' office.

The regents are charged with the duty of administering the statutes which provide for the general education and special training of professional practitioners. In 1903 they licensed as a result of state examinations, 633 physicians, 176 dentists, 17 veterinary surgeons and 11 certified public accountants. Under exemptions in the professional laws they also licensed 69 physicians, 36 dentists, 6 veterinary surgeons and 3 certified public accountants. The improvement of commercial education and of business schools has been stimulated by their influence and standards. In 1784 Columbia was the only college in New York State. Harvard had been founded in 1636, Yale in 1701, but no serious movement was made in New York in this direction till 1746. In 1903 the universities, colleges and professional and technical schools connected with the university system numbered 118 and reported 39,718 students and a total net property of $86,375,792.30 and expenditures for the year of $10,061,269.25.

The State Library and the associated Home Education department combine a number of educational agencies, including the Library School, traveling libraries and pictures, extension classes and literary clubs. The regents received in 1903 reports from 1,160 public libraries, and State aid to the amount of $21,704.17 was granted to free public libraries, a sum equal to the grant in each case being raised from local sources. The State Library contains 504,525 volumes, 310,340 pamphlets and more than 250,000 manuscripts.

The State Museum, which has developed from the natural history survey undertaken by the State in 1836, comprises departments in geology, mineralogy, palæontology, general zoology, entomology, botany and archæology; and is engaged in pure research and practical scientific experiment. Its collections, representing the investigations pursued under its direction, are extensive and valuable.

The University publishes numerous bulletins in education, history and science, which are widely circulated among students of these subjects.

JAMES RUSSELL PARSONS, JR.
Secretary of the University of the State of New York.

New York University, established in 1830 in New York city. The first steps toward the founding of the university were taken in December 1829, when nine prominent citizens of New York met to discuss the project of establishing an institution of higher learning in the city. Through their efforts the co-operation of various literary and scientific institutions was obtained, a standing committee was organized, and $100,000 subscription raised, most of which was contributed in comparatively small sums. In 1830 the University Council was elected by the subscribers and the university incorporated in 1831. In 1832 the collegiate department was opened for instruction. The ideals of the university were from the first most liberal; the address of the standing committee issued in 1830 stated three fundamental principles which have been consistently adhered to: (1) "The object of the University shall be to extend the benefits of education in greater abundance and variety and at a cheaper rate than at present they are enjoyed"; (2) "Persons of every religious denomination shall be eligible to all offices" that the University may never be under sectarian control; (3) Those attending the University shall pursue studies according to their own preference "having an unlimited choice of the branches taught in the institution."

The present organization of the University includes eight schools, besides the Summer School and the Woman's Law Class. These schools are: the University College (founded 1832), including the College Extension department; the School of Applied Science (1862); the Graduate School (1886); the University Law School (1835); the University and Bellevue Hospital Medical College (founded as the University Medical College in 1841); the School of Pedagogy (1890); the New York American Veterinary College (1899); the School of Commerce, Accounts and Finance (1900). The university senate comprises the deans of the Union Theological Seminary, the General Theological Seminary (New York city) and the Drew, New Brunswick, Catholic, and Jewish theological seminaries. The work of the University College, which had always been largely elective, was in 1894 arranged for the group system; since then the arrangement of groups has been altered, but the principle has been most satisfactory; the groups include the classical, the classical scientific, the Semitic language and literature, political science, philosophy, natural science, exact science, and medical preparatory. The work of the School of Applied Science is arranged on the same principle, the courses include civil, mechanical, marine and chemical engineering. The School of Pedagogy was the first university school to put professional instruction in pedagogy on the same plane with the professional university instruction in law and medicine; it was also the first school to establish degrees in pedagogy; but before its first degree was actually conferred the New York State regents gave the honorary degree of doctor of pedagogy. The Medical College in 1898 was consolidated with the Bellevue Hospital Medical College under its present name; in 1896 this college began requiring a four years' course for all students; this action was in advance of State requirements, as the State law making a four years' course obligatory was not passed till the next year. No university in the eastern States has grown relatively so fast as New York University; within 20 years (1902) the number of students has more than trebled and the value of its property more than quadrupled. The period of its greatest growth has been since 1891, when a site for a new campus was purchased on University Heights, containing about 23 acres. The University College and the School of Applied Science were moved there in 1894, the summer school is located there, and the scientific work of the graduate school is also done there; the other departments, with the exception of the medical and veterinary, are at

Washington Square. Since that time the curriculum has been enlarged, two new schools besides the summer school have been organized, and the number of students steadily increased. The university organization has also been completed, and the various schools closely affiliated under the government of the University Senate. This senate consists of the chancellor, the deans of the various schools, one professor from each of the schools, and advisory members.

Among the buildings on University Heights the most notable is the library building. An adjoining colonnade, with museum below, is known as the Hall of Fame (q.v.). The library emphasizes the seminar rooms, of which there are eighteen, each with its stack room adjoining, the greater number of the books are in these seminar stacks; in 1903 there were 67,364 volumes. The total value of the university plant was over $2,750,000, one of the most valuable educational plants in the United States. The students in 1904 numbered 2,177, the professors 93, and lecturers and instructors 95. The chancellor (1904) since 1891 is Dr. H. M. MacCracken (q.v.).

New York Zoological Society, an association having 1,200 members, organized for the establishment of a free zoological park containing collections of North American animals, the study of animal life, and the promotion of zoological science in general.

New Zealand, a colony of Great Britain in the Pacific Ocean, 1,200 miles east of Australia, consisting of two principal islands known as North Island and South or Middle Island, besides Stewart Island south of Middle Island, and several small outlying islands. The group lies between lat. 34° 20′ to 47° 30′ S.; lon. 166° to 178° E. The length of the group, north to south, is about 1,000 miles; the maximum breadth 200 miles; it has a coast line of over 3,000 miles; and an aggregate area of 104,751 square miles. North Island comprises 44,468 square miles, Middle Island 58,525 square miles, Stewart Island 665 square miles, total 103,658 square miles, the rest being divided among Cook and other islands in the Pacific Ocean, since 1901, officially attached to the colony. New Zealand is divided into nine provincial districts, of which four,— Auckland, Taranaki, Wellington and Hawke's Bay, are in North Island, and five — Nelson, Marlborough, Canterbury, Otago, and Westland, in South Island.

Topography.— Cook's Strait, 25 miles wide between its narrowest points, separates North Island from South Island. It is very irregular in shape, and indented by deep bays and projecting headlands. It consists of a main body with projections running east, south, and west, and a long narrow projection 280 miles in length, and tapering from 53 to 8 miles in breadth, which stretches north with a curve in a westerly direction. This remarkable peninsula is nearly cut through by Hauraki Gulf or the Firth of the Thames on the east, and Manukau or Symonds' Harbor on the west; the connecting link being the narrow isthmus on which the town of Auckland is built. Its west coast, with exception of the indentations formed by the harbors of Manukau, Kaipara, and Hokianga, is almost a continuous straight line, whereas the whole of the east coast is a constant succession of bays and promontories, the largest inlets being the Bay of Islands, Wangarei Bay, Wangaruru Harbor, and Doubtless Bay. The main body of the island, as well as its peninsulas, has, for the most part, a rugged and mountainous surface. Besides being traversed from south to north by chains of mountains such as the Te Whaiti, the Kaimanawa, the Ruahine, the Puketoi, and the Tararua range, it presents a number of lofty isolated peaks, among which the most conspicuous are Tongariro and Ruapehu, near the centre of the island, the former 6,500 feet, the latter 9,195 feet high, and Taranaki, near the west coast, 8,280 feet high. Notwithstanding its generally rugged aspect, the mountains of the North Island do not cover more than one tenth of its surface. The streams which descend from the mountains are numerous, but mostly torrents, which bring down immense deposits of shingle. There are, however, two rivers of conspicuous size, the Waikato, with its scenery of great beauty and grandeur. The only other considerable streams are the Manawatu, farther south; the Waiho or Thames, falling into Hauraki Gulf; and the Rangitikei emptying into the Bay of Plenty. Some of the rivers, especially the Wanganui and Manawatu, flow through forest and mountain gorges, amid scenery of great beauty and grandeur. The largest of all the lakes is Taupo, situated near the centre of the island, of an irregular triangular shape, about 25 miles long by 20 miles broad, with an area of about 200 square miles. Northeast from it — in the remarkable region known as the "Hot Lake District," from the numerous hot springs, geysers, and natural warm baths — are Lakes Rotorua, Rotoiti, and Rotomahana. Wairarapa and several other lakes are near the south extremity of the island. In the same locality is one of the most extensive plains of the island, occupying an area of above 600 square miles.

South or *Middle Island* is of a more compact and regular form, and may be considered roughly as a parallelogram, stretching about 500 miles from northeast to southwest, with a medium breadth of about 130 miles. In the north, where it is separated from North Island by Cook's Strait, it is very rugged and broken, and corresponds so closely with the opposite coast, both in its general structure and the direction of its headlands and submerged reefs, as to give good ground for the opinion that the two islands were at one time continuous. In the southwest, too, the high mountainous country is broken into by long winding fiords or sounds; but with these exceptions, and a remarkable spur on the east coast called Banks' Peninsula, the coast-line on the whole is continuous. The chief indentations in the north are Tasman or Blind Bay and Massacre or Golden Bay; on the east are Cloudy Bay and Pegasus Bay; in the south and southwest are Preservation Inlet, Caswell, George, Dusky, and Milford Sounds. The interior is traversed north to south by a lofty mountain chain, which is evidently a continuation of that which terminates on the opposite coast of the northern island. This chain has an average height of about 8,000 feet; but Mount Cook, in lat. 43° 30′ S., has two peaks, the one 12,200 feet and the other 13,200 feet high, in the midst of magnificent alpine and glacier scenery. Here

Mau

this mountain range runs nearer to the west coast; and between it and the east coast lies the great Canterbury Plain, more than 120 miles in length, and rising toward the south into the undulating downs of North Otago. Numerous rivers flow down from the mountains to the sea on both sides, the longest on the east. The largest river is the Clutha, which has a course of 150 miles, and enters the sea near the south-east angle of the island. There are a number of lakes, generally situated among the mountains at a considerable elevation. The largest are Te Anau, area 132 square miles; and Wakatipu, area 114 square miles. The scenery of the lakes and sounds of this island attracts numerous visitors.

Stewart Island, separated from South Island by Foveaux Strait, about 15 miles wide, and is of triangular form. Its shores are wooded to the water's edge, while numerous bays, separated by rocky headlands, indent the coast, which is fringed, more especially toward the south, with numerous islands. The interior is mountainous, but none of the summits exceed 3,200 feet.

Of islands lying round the New Zealand coast the largest are Great Barrier Island, at the outer entrance to the Hauraki Gulf, and D'Urville Island at the corner of Tasman Bay. The following more distant groups also belong to the colony:— Chatham Islands, Auckland Islands, Campbell Islands, Bounty Islands and Antipodes Islands. The British resident in the Harvey, or Cook, group is appointed on the recommendation of the New Zealand government.

Geology and Mineralogy.— To the geologist the two large islands are a continuity, and form the remnant of a continent which once extended eastward and was probably connected with South America. A great leading range of Palæozoic rocks stretches through both islands, branching out in the south to enclose the extensive schistose area of Central Otago. Upper Mesozoic formations have also enormous development; and in the North Island their outcrops are distinguishable through the volcanic deposits which cover a good part of the surface. In this island are also extensive areas of hydrothermal agency, marking the expiring activity of volcanic outbursts. So late as 1886 there was a violent eruption of Mount Tarawera in the Hot Lake District, during which the celebrated Pink and White Terraces of world-wide fame as natural wonders, disappeared; it was previously supposed to be an extinct volcano; Mount Tongariro and Ngaruhoe, in the heart of the island, also are still active. Sedimentary rocks, chiefly of gray sandstone, are often seen, both among the ridges of the interior, and on the coast, where they frequently form precipitous cliffs; but the far greater part of the rocks are crystalline. Among a great variety of fossils the most notable are those of a gigantic bird, the Moa (*Dinornis giganteus*), which survived down to recent times. New Zealand is extremely rich in mineral deposits, and gold-mining forms one of its staple industries. Gold was first discovered in 1853, and the total value of the output to 31 March 1901, was over $289,000,000. The output in 1902 was 508,043 ounces, valued at $9,496,634. The great gold-producing regions are the Thames district of Auckland, the west coast of the South Island, and the interior of Otago. During the last few years the method of raising gold by dredging the beds of rivers has developed to a remarkable extent. In 1900 326,457 ounces of silver were exported. The extensive coal-measures are also a source of wealth. Among many varieties the best is the bituminous coal of the west coast of the South Island, which is equal in quality to that found in any part of the world. The output has been steadily increasing, and for 1900 amounted to 1,093,990 tons. Copper, chrome ore, manganese ore, sulphur, and other minerals have been worked with varying success. Working miners make good wages, and there is a good deal of independent prospecting. Mining schools have been established in different parts of the colony, and the study of mineralogy is pursued with considerable zeal.

Climate.—In a country stretching through 13 degrees of latitude the climate naturally is very varied, but generally is very healthful. In the northern peninsula of North Island the conditions are semi-tropical, while in the high lands of Otago and Southland the frosts in winter are very severe, and the summer bracing and temperate. In Wellington, which may be taken as the centre of the colony, the temperature scarcely ever falls more than one or two degrees below freezing point; while in Auckland, the most northerly of the large cities, the heat is tempered by sea-breezes, and never reaches the intensity which makes life in summer so trying in the great Australian cities. Rapid changes of temperature are caused by sudden shiftings of wind, and are somewhat trying to new arrivals in the country. The greatest rainfall is along the west coast of the South Island, where it sometimes reaches 130 inches a year; whereas a characteristic station on the Canterbury Plains will seldom give more than 25 inches.

Ethnology.— The original natives of New Zealand are called Maoris. Ethnologists differ regarding their origin, but many class them as Caucasians. Their arrival in New Zealand was probably part of a series of Polynesian migrations from west to east, and took place, according to their own tradition, about five hundred years ago. Before the European occupation the life of the Maoris was occupied with incessant tribal warfare, and victory was followed by cannibalism. Both of these have disappeared; but in districts far removed from white settlement they preserve many of their ancient habits. In their own villages they are kindly and hospitable, but dirty. Much is being done through organized efforts for the education and Christianization of the Maoris. They have native schools and one native college, and some of their students have obtained distinction in the New Zealand University. They possess a good deal of land, especially in the North Island, and have their own representatives in both legislative chambers. The census returns for some time showed a steady decline in their numbers, but this has now been checked. Lung diseases, fever, and scrofula are said to be the chief enemies of the race, but much has been done to improve their sanitary conditions and personal habits.

Flora, Fauna, etc.— Among vegetable productions the most characteristic are the ferns (130

different species), which form almost the only vegetation over immense districts. Some of them are more than 30 feet high, and remarkable for the elegance of their forms. The flax plant furnishes an article of export. A number of the forest trees furnish valuable timber, among them the rare kauri or damar pine. Flowering plants are remarkably scarce, and there are no indigenous fruits.

In animals New Zealand is singularly deficient, only a sort of fox-dog, now extinct like the moa, a rat, and two species of bats, being indigenous. Rabbits have been introduced and have multiplied so as to become a perfect pest; pigs now run wild, as well as cats. Pheasants, partridges, quails, and red and fallow deer have also been successfully introduced. All the common European quadrupeds appear to be easily acclimated. Pigeons and parrots are the most common native birds. Among others are the apteryx (a wingless bird), the huia or parson-bird, and the owl-parrot. The chief reptiles are a few lizards. The coast waters teem with fish, and seals are still numerous in some parts.

Land Tenure, etc.— Since 1840 the crown has been gradually acquiring by purchase the land of the natives in the North Island, and in 1899 it was estimated that 13,500,000 acres had become crown estate. Most of the crown lands are now disposed of for terms of 999 years at a 4 per cent rental on the capital value. Other modes of tenure are: cash purchase, one fourth of the purchase money being paid down at once, the remainder within 30 days; lease for 25 years, with a purchasing clause at a 5 per cent rental on the values. The amount of land that can be acquired by any individual is limited to 640 acres of first-class, and 2,000 acres of second-class, land. Provision is also made for "small-farm associations," under which any twelve persons may, with the approval of the minister of lands, select a block of not more than 11,000 acres. A scheme for "village settlements" in 1885 has had considerable success.

Agriculture.— The soil and climate of New Zealand produce in perfection every European grain, grass, fruit, and vegetable, and many besides. Wheat, oats, barley, potatoes, onions, apples, plums, peaches, and their congeners, are excellent in quality, and the peach bears profusely as a standard. In the gardens of the warmer valleys fruits of a semi-tropical character — the pomegranate, citron, orange, and olive — might be raised. The vine thrives well under glass. Maize, the taro, a native of the Sandwich Islands, and the kumera, a sweet-potato, are partially cultivated by the natives in sheltered sunny spots of the North Island; but under common field cultivation maize will not ripen. Geraniums and myrtles, attaining a shrub size, and various plants which require the greenhouse in England, flourish through the winter in the open air. New Zealand is primarily a pastoral, and secondarily an agricultural, country. Of the 12,500,000 acres of land under cultivation about 87 per cent is under sown grasses, 6½ per cent under root and green crops, the remainder being occupied by garden and orchard cultivation. The fluctuations in the price of produce cause considerable variation in the extent of land laid under crop from year to year; but new land is broken in every year. The number of sheep in the colony was, in 1861, 2,761,383, in 1891, 18,227,186, and in 1902, 20,233,099. The increase in horses, horned cattle and swine is in about the same proportion.

Industries and Commerce.— Agriculture and stock-raising are the most important resources, and mining is also an important occupation, as already pointed out in the paragraphs on agriculture, geology and mineral resources. In connection with these industries there were in 1900, 3,163 supplemental establishments for meat freezing, preserving, and boiling down, tanning, wool-scouring, the production of clothing and boots, saw mills, grain mills, butter and cheese factories, iron and brass works, employing 41,726 work people, with an invested capital of about $40,000,000, and an annual estimated produce of about $85,000,000. By far the most important export is wool, about $20,000,000 annually; frozen meat and grain are also largely exported. Gold is the next valuable export; others are tallow, timber, and kauri gum. In 1901 the exports amounted to $63,452,300, the imports to $59,089,575.

Railways, etc.—In 1901, there were 2,300 miles of railway in New Zealand open for traffic. Almost the whole of this has been constructed by government, which up to the period mentioned had expended $86,000,000 on the construction of railways. Several hundred additional miles are in course of construction or projected, chiefly in South Island. There is a system of telegraphs belonging to the government with 7,249 miles of line in 1901. Roads are being opened up in all directions, either under the central department or the local bodies, and the administrative ownership of all public utilities such as railways, telegraphs, telephones, street car lines, water, gas, and electric plants, is a socialistic feature in the political economy of New Zealand, that is attracting considerable attention from older communities. The principal ports of New Zealand are: In North Island, Auckland, Napier, New Plymouth, and Wellington; in South Island, Port Chalmers, the port of Dunedin, Nelson, Lyttleton, the port of Christchurch, and Invercargill. The principal towns are Auckland, Christchurch, Dunedin, and Wellington, the last being the seat of government.

Government.— By the constitution the king appoints the governor; but the legislative power is vested in the General Assembly, or Parliament of two houses — a Legislative Council consisting of 48 members nominated by the crown for life; and a House of Representatives, which is made up of 74 members, including 4 Maoris, elected by the people for three years. The governor is aided and advised by a ministry comprising the chief officers of state, who are members of the General Assembly. By the act passed by the assembly in 1875, which abolished the provincial system, the powers previously exercised by superintendents and provincial officers were delegated to 83 county councils, or vested in the governor.

Woman suffrage; administrative ownership of public utilities; old-age pensions; appointments for life in the civil service, with provision for support in old age; post-office savings banks; the loaning of money by the state on mortgages; a government life insurance company; a public trust office for administering and settling estates; taxation on a progressive scale, by which

Mqu

nearly the entire burden falls upon the rich; the compulsory division of large estates into small holdings; compulsory arbitration in the case of labor disputes, with power to fix the minimum wage, form a partial list of the innovations now sanctioned by law in New Zealand. The civil and criminal laws are the same as those of England. For colonial defense a number of volunteers have been enrolled (about 8,500); the chief ports are also being put in a state of defense.

Religion and Education.—There is no state-aided Church, but most Christian sects are well provided for. The Church of England is most numerously represented. Elementary education is free, secular, and compulsory. Secondary education is provided for in numerous high schools, grammar schools, colleges, etc. At the head of the higher education is the University of New Zealand, an examining body empowered to grant honors, degrees, and scholarships. Affiliated with it are several colleges throughout the colony. There is also a separate university at Dunedin. There are training colleges for teachers, theological colleges, etc.

Population.— In 1901 the population of North Island was 390,751; of Middle Island, 381,661; of Stewart Island, 272; of Chatham Islands, 207, and of Kermadec Islands, 8; total, 815,862, including 43,143 Maoris, and 2,857 Chinese, the bulk, 98.50 per cent, being British subjects, born in New Zealand, or immigrants from the United Kingdom.

History.— New Zealand was discovered by Tasman, the Dutch navigator, in 1642, but information concerning the country commences with the visits of Captain Cook, made in 1769, 1773, 1774, and 1777. Missionaries and whalers were the chief visitors until 1823, when a British resident was appointed to the settlement of Kororareka, now Russell, in the Bay of Islands. In 1840, by the Treaty of Waitangi, the native chiefs, to the number of five or six hundred, ceded sovereign rights to the queen, while retaining territorial rights for themselves and their tribes. Casual differences culminated at last in a war which lasted from 1860 to 1866, caused widespread distress, and retarded progress and settlement for ten years. The war was confined to the North Island, and to the districts of Auckland, Taranaki, and Hawke's Bay. Many of the tribes remained friendly, and used their influence to protect the settlers; and on the whole the Maoris showed themselves brave and high-minded foes. The new settlement recovered slowly from the devastating effects of the war, and since then there has been no serious interruption, beyond ordinary economic fluctuations, of the expansion of the country in trade and agriculture. Successive administrations have employed their energies in promoting land settlement and in legislating for the social and commercial needs of a growing people. The history of the country was entirely internal until the war between England and the South African Republics, 1899–1900, when a force of about 1,700 mounted men was despatched to the aid of the mother country. New Zealand has, up to the present (1904), declined to join the Federation of the Australian Colonies.

Editorial Staff, 'Encyclopedia Americana.'

New Zealand Flax. See FIBRE.

New Zealand Sub-region, a faunistic division by some naturalists included as a subregion under the Australian region, and by others regarded as so distinct as to be entitled to a place of the first rank. It includes besides New Zealand neighboring islands southward and eastward. See ZOOGEOGRAPHY.

Newark, nū'ark, Del., town, in Newcastle County; on the Philadelphia, B. & W., and the Baltimore & O. R.R.'s; about 11 miles south of Wilmington. It is in a section of the State noted for its productiveness. The chief manufactures are paper, machinery, fibre, and canned goods. There is considerable trade in the manufactured articles, fruit, and vegetables. It is the seat of the State College, opened in 1833. The town owns and operates the electric-light plant and the waterworks. Pop. (1890) 1,191; (1900) 1,213.

Newark, N. J., city, county-seat of Essex County, and the metropolis of New Jersey, is situated in latitude 40° 45′ N., longitude 74° 10′ W. It is one of several cities in New Jersey within the direct zone of influence of Greater New York.

History.— Immediately following the English conquest of the New Netherlands in 1664, a part of the Dutch possessions in North America, being practically what is now the State of New Jersey, was granted to Lord John Berkeley and Sir George Carteret. The settlement of northeastern New Jersey was immediately begun under a liberal form of government; a site near the mouth of the Passaic River proving attractive to certain Congregationalists, then settled in the Colony of Connecticut. In May 1666, the New Englanders removed "their families, their beloved pastor, their church records, and communion service, their deacons, and their household goods" to the site of the future city of Newark. By 1685, Newark, in which the Congregationalists had settled, was a compact town of 500 inhabitants. The system of local government was like that of many early New England villages, being the limitation of political and religious activity, through the agency of the town meeting, to those who professed Congregationalism.

The strong element of conservatism, characteristic of the settlement of Newark, remained unchanged until long after the opening of the 19th century. Religion and education were warmly supported, and for several years the College of New Jersey, now Princeton University, was located at Newark. The tidal waters of the Passaic River gave easy access to New York, the country-side supplying provisions and wood to the inhabitants of Manhattan island. Newark was also engaged in a coastwise trade. To a degree the young community was somewhat isolated owing to the difficulty of road-building over the marshes and the ridge of rocks separating Newark from Paulus Hook, now Jersey City.

In the Revolutionary struggle, Newark took an active part. As early as June 1774, her in-

habitants protested against the Port Bill, and offered to become parties to a plan of union to redress grievances. In November of the same year, inhabitants of Newark, as members of the Essex County grand jury, patriotically answered the charge of the loyalist chief justice, while in January 1775, the royal newspapers were boycotted by many of the inhabitants of the town. In the spring of that year some of the inhabitants declared that they were willing to risk their lives and fortunes for American liberty. The "gentlemen Traders of this Town" were recommended not to supply provisions to Canada and other loyal portions of North America. In March 1776 the Newark committee regulated the price of West India products, and traders were notified that defiance of regulation would cause the storekeeper to be declared an enemy to his country.

During the Revolutionary War, Newark and the fertile farms surrounding the town were subject to predatory raids, conducted by the Anglo-Hessian troops stationed in New York city and on Staten Island. The most important of a long series of minor engagements, directly affecting Newark, was that of 25 Jan. 1778. The exposed situation of that portion of New Jersey made Newark an object of attack, particularly as there were in the town a number of influential Royalists, whose property was largely confiscated during the later years of the Revolutionary War.

Newark was early identified with the efforts made to secure internal improvements, even before the second war with England. Turnpikes were extended in every direction, bringing the town in close communication with the northwestern portion of the State, from which section Newark has largely drawn men who have become locally prominent. During the early years of the 19th century, the first bank organized in New Jersey (1804) was established in Newark, while one of the chain of State banks (1812) was erected in that city. In 1824 the city was declared by legislative enactment to be the terminal of the Morris and Essex canal, which was soon constructed, and united the waters of New York Bay with those of the upper Delaware. During the early 30's the New Jersey railroad was built between Jersey City and New Brunswick, which with Camden and Amboy connections placed Newark on the direct route between New York and Philadelphia. Following the construction of these lines, now a part of the Pennsylvania railroad system, came railroads now forming parts of the Lackawanna and the Central Railroad of New Jersey systems.

Statistics of Growth.— In 1836 Newark received a municipal charter from the legislature of New Jersey, the township ceasing to exist. Although seriously affected by the panic of 1837, Newark recovered rapidly. By 1840, in the jewelry, leather, brewers and carriage making business there was invested a capital of $1,500,000. From 1820 to 1860 the growth of the city was from 6,500 to 72,000, the accessions being largely foreign-born. From 1840 to 1850 the increase was 125 per cent, while at the present time the population of Newark may be estimated at 275,000. In 1853, the Roman Catholic diocese of New Jersey was set off, with Newark as the episcopal see. Newark had three of the thirty-three Roman Catholic churches then in New Jersey.

Municipal Improvements.— Newark has a total area of about 22 square miles, of which 14 square miles are built up. In that region are 225 miles of improved streets, and 190 miles of sewers. The water supply of the city is furnished through 225 miles of mains, the source for such supply being in water-sheds, lakes and reservoirs in the hills of northern New Jersey. The water plant of the city is valued at $15,000,000. The city is well lighted, and possesses an extensive transportation service by means of steam and electric cars. The total park area of Newark and Essex County embraces about 4,000 acres. Of the 30,000 buildings in the city there are about 170 churches, 20 banks, including the National, State and savings and the trust companies, six department stores, seven theatres, one normal school, two academies (R. C.), one high school 21 grammar schools, 53 primary schools, one school for colored pupils, 13 summer schools and structures for the use of well equipped fire and police departments. There are nine public and private hospitals and about 30 charitable institutions of various kinds. The public library, the collections of the New Jersey Historical Society, the Prudential Insurance Company's Law Library, and the library of the Lawyers' Club are the prominent institutions of their class in the city.

Industries.— As an insurance centre, Newark is exceeded only by New York and Hartford. There are about 3,500 manufacturing plants in Newark, having over $100,000,000 of capital invested and giving employment to 50,000 persons. The annual wages paid these employees amount to about $24,000,000. Of the 225 separate industries in the city, fine jewelry, patent enameled leather, celluloid, campaign buttons and novelties, hats, shoes, harnesses, wagons, cut and stained glass windows, cutlery, clothing, malt liquors, inks, and printing supplies are conspicuous.

Finance.— The total value of the real and personal property is from $275,000,000 to $300,000,000. The city debt is about $13,500,000. The city in 1901 received from all sources about $5,000,000 and disbursed about $4,325,000. Extensive improvements, which will take until 1910 to complete, include public buildings, increased water supply, and school facilities.

Suburbs.— In the hilly country, near Newark, are located the "Oranges" and other suburban communities. Although possessing independent local government, these cities and towns are in such constant business and social relation with Newark as to be practically a part of the city. In the growth of Newark, these communities will become absorbed, under conditions similar to those which existed in Boston and Philadelphia, when annexation of adjacent municipalities occurred. This would add about 100,000 people to the population of a Greater Newark. Pop. (1890) 181,830; (1900) 246,070.

FRANCIS B. LEE,
Editor-in-chief of 'New Jersey as a Colony and a State.'

Newark, N. Y., village, in Wayne County; on the Erie Canal, and on the West S., the

Northern C., and the New York C. & H. R. R.R.'s; about 176 miles west by north of Albany, and 30 miles east by south of Rochester. It was settled in 1820 by people from Rensselaer County in the eastern part of the State. It was incorporated as a village in 1825. It is in a fertile agricultural region, but the village has considerable manufacturing interests. In the tinware works there are 150 employees; in the paper box factories, 150; the glass factory, 50; the canning and preserving factory, 200; and in other establishments fully 200 more employees. Newark has a large trade in farm and dairy products, fruit, and its manufactured articles. Its educational institutions are the Union Free School and Academy, the public elementary schools, and the free public library. There are 10 churches, and a number of church and literary charitable and educational societies. The State Custodial Asylum for Feeble-Minded Women is located here. The three banks have a combined capital of $175,000. The government, according to the "Village Law of the State," is vested in a president and trustees,— eight trustees — two of whom are elected each year. The population consists of nearly all native born Americans, over one half of whom are of Dutch, German, and Irish descent. Pop. (1890) 3,698; (1900) 4,578.

Newark, Ohio, city, county-seat of Licking County; at the junction of three branches of the Licking River and on the Ohio Canal, and the Baltimore & O., and the Pennsylvania R.R.'s; about 30 miles east by north of Columbus, and within 14 miles of the centre of the State. It was settled in 1802 by a colony from the eastern part of the United States. Nearby are two large mounds which belong to the works of the "Mound Builders." It is in an agricultural region, and in the vicinity are valuable deposits of sandstone, extensive coal-fields, and natural gas. The chief manufactures are glassware, chemical instruments, carriages, hardwood, bottles, electric cars, locomotives, machine-shop products, rope, foundry products, flour and lumber products. There are (1903) 21 manufacturing establishments in which there are 7,460 employees. The streets are well paved and well kept. The State Encampment Ground, and the Auditorium, a fine theatre erected as a memorial to dead soldiers of the Civil War, are of much interest. There are 15 churches, a high school, public and parish elementary schools, and a public library, established in 1877. The six banks have a combined capital of $690,000; and the annual amount of business transacted is $3,000,000. The government is administered under the charters in accordance with the Ohio State Municipal Code. The inhabitants are nearly all American born. Pop. (1890) 14,270; (1900) 18,157.

Newark-upon-Trent, England, a town of Nottinghamshire, on the Trent, 17 miles northeast of Nottingham. It has an important trade in malt and flour, large breweries and malting works, iron and brass foundries, agricultural implement, and boiler works. Newark is of great antiquity. On the northwest of the town are extensive remains of the 12th century castle, "the Key of the North," a royalist stronghold three times besieged during the civil war. The adjoining grounds have been converted into a public park. Pop. (1901) 14,985.

Newark Series, in geology, a term applied to that part of the Triassic system (q.v.) in eastern North America. Its limits are Nova Scotia on the north and South Carolina at the south. The typical deposits are near Newark, N. Y., whence the name is taken. The deposits in the series are conglomerates; breccias; thick red sandstones, which must have originated in crystalline waste, as is evident from the comparatively large amount of mica and the feldspaths; and basalt, which accompanies the sedimentary rocks and occurs in dikes and sheets, such that the violent volcanic character of their derivation is made certain. Some few fossils occur in the series, scarcely any of marine types, plants and foot-prints preponderating. The commercial value of the deposits of the Newark series is in the brown sandstone building stone of New Jersey and Connecticut, and the coal veins of North Carolina and Virginia.

Newaygo, nē'wā'gō, Mich., village, county-seat of Newaygo County; on the Muskegon River, and on the Pere Marquette Railroad; about 85 miles in direct line northwest of Lansing, the capital of the State. It is in a lumbering region, and is also well known as a hunting and fishing section. The manufactures are flour, lumber products, furniture, cement, and cigars. Pop. (1890) 1,330; (1900) 1,172.

Newbern, nū'bėrn (formerly NEW BERNE), N. C., city, county-seat of Craven County, port of entry of the Pamlico district; at the confluence of the Neuse and Trent rivers, and on the Atlantic C. L., the Atlantic & N. C., and the Pamlico, O. & W. R.R.'s; about 100 miles in direct line southeast of Raleigh. It has regular steamer connection with New York and other Atlantic ports. It was settled in 1710 by a company of Swiss and Germans under Baron De Graffenreid. The place was named "New Berne" after Berne in Switzerland. It was incorporated as a city in 1723. It soon became an important southern seaport, on account of its harbor. It was the capital of the Province of North Carolina for several years. It was one of the strongly fortified ports of the Confederacy. (See NEWBERN, OPERATIONS AT, IN THE CIVIL WAR.) The chief industrial establishments are lumber and planing mills, grist mills, shingle factories, fertilizing works, ice factory, knitting mill, pickle works, turpentine distillery, ship-yard, carriage factory, lime kiln, canning factory, and the Atlantic & North Carolina railroad-shops, in all having 2,500 employees. There is an extensive trade in lumber, cotton, turpentine, vegetables, and fish. The prominent buildings are, a government building (court-house, custom-house, and post-office), the county court-house, jail, County Home, and the opera house. The educational institutions are the public schools, separate for white and colored. There are 10 church edifices and others in contemplation. The three banks have a combined capital of $152,000. The government is vested in a mayor, board of aldermen, and a council of 12 members. The electric-light plant and the waterworks are owned and operated by the city. About 95 per cent of the inhabitants are native born Americans. Pop. (1890) 7,843; (1900) 9,090.

C. L. STEVENS,
Editor 'New Berne Journal.'

Newbern, Operations at, in the Civil War. Roanoke Island (q.v.), N. C., was captured by Gen. Burnside 8 Feb. 1862, and on 6 March he embarked his troops for an expedition against Newbern, a point of much military importance, at the confluence of the Neuse and Trent rivers, near the head of an extensive and navigable arm of the sea, and connected by railroad with Beaufort Harbor at Moorehead City. By night of the 11th the entire naval and land command was off the mouth of Slocum's Creek, south of the Neuse, and about 15 miles below Newbern. The approaches to the city had been obstructed by sunken vessels and a double row of piles in the river. Four miles below the city, on the southern side of the river, and opposite the obstruction in the stream, was Fort Thompson, mounting 13 heavy guns. From the fort inland was a line of rifle-pits and redoubts extending about two miles to and beyond the Atlantic and North Carolina Railroad, and terminating on almost impassable ground. In the fort and on this line were 41 heavy guns and 19 field-pieces. The position was held by seven North Carolina regiments, a battalion of militia, and three batteries of artillery, numbering in all some 5,000 men, under command of Gen. L. O'B. Branch. Burnside's troops, 13 regiments of infantry, about 9,000 men, and 8 guns, were landed by noon of the 13th, and after a hard march in rain and deep mud bivouacked near the Confederate position, the naval vessels, under Commodore Rowan, moving up the river abreast of the infantry, and shelling the road and woods in advance. On the morning of the 14th the attack was made. Gen. J. G. Foster, with the 10th Connecticut and the 23d, 24th, and 28th Massachusetts, moved up a country road on the right; Gen. J. L. Reno on the left, with the 21st Massachusetts, 9th New Jersey, 51st New York, and 51st Pennsylvania, moved along the line of the railroad; while Gen. J. G. Parke, with the 4th and 5th Rhode Island and 11th Connecticut, moved in the centre, on a country road, as a reserve. Foster began the battle about 8 A.M. by an attack on Fort Thompson and the line near it, maintained the brunt of the contest for some time, and was reinforced by Parke. Meanwhile Reno had gained ground on the left, the entire division now became engaged, and the Confederates, after a resistance of four hours, broke and retreated to Newbern, burning behind them the railroad and turnpike bridges over Trent River. Burnside followed, crossed the Trent in boats, Branch retreating, and in the afternoon the Union troops occupied the city, capturing many heavy guns and other material. The Union loss was 90 killed, and 380 wounded. The Confederate loss was 64 killed, 101 wounded, and 413 captured or missing.

Confederate Efforts to Recapture Newbern. —The fall of Newbern was a serious blow to the Confederates, but the necessities of the army in Virginia forbade attempt to regain it until after the close of the campaigns of 1862, when troops were sent to North Carolina, and 13 March 1863, Gen. D. H. Hill, who had been assigned to the command in the State, organized an expedition for its recapture. Gen. Daniel's brigade moved from Kinston toward Newbern by the lower Trent road; Gen. Robertson's cavalry brigade was sent by the upper Trent road; and Gen. Pettigrew, with five North Carolina regiments and 15 guns, was ordered to approach the city near Barrington's Ferry, north of the Neuse, to attack two small gunboats in the river, and capture Fort Anderson, an earthwork on the river, opposite the city, garrisoned by 300 men of the 92d New York. At Deep Gully, a few miles out of Newbern, Daniel attacked five companies of the 25th Massachusetts, supported by two guns, and drove them in, but advanced no farther, as Pettigrew had failed. That officer, at daylight of the 14th, appeared in front of Fort Anderson and demanded its surrender, which was refused, and Pettigrew opened fire from all his guns, and engaged the gunboats Hetzel and Hunchback, which had been towed into position. The fire of the gunboats, with that of five guns of a battery of rifled guns from the other side of the Neuse, caused Pettigrew to withdraw and cover the movement of the 85th New York to reinforce the 92d. The casualties on either side were insignificant.

On 20 January 1864, Gen. Lee ordered Gen. Pickett, then at Petersburg, Va., to capture Newbern if upon examination he found it practicable, and authorized him to use four brigades of his command for the purpose, in addition to which he promised to assist him with Hoke's brigade of the Army of Northern Virginia. He gave detailed instructions for the movement, and all the Confederate forces in eastern North Carolina were to co-operate and retake Newbern, Plymouth, Washington, and other coast towns. On the morning of 30 January the movement began from Kinston in three columns; Gen. Barton, with his own brigade, Kemper's, part of Ransom's, 14 guns, and 600 cavalry, was directed to cross the Trent, take the works in front of Newbern in reverse, and cut off communication with the place. Col. Dearing was sent north of the Neuse with a cavalry force, two infantry regiments, and three guns, to attack Fort Anderson. Col. J. T. Wood, with picked crews in boats, was to descend the Neuse, seize the Union gunboats, and co-operate with Dearing in the attack on Fort Anderson. Gen. Pickett, with Hoke's brigade, three regiments of Corse's, two of Clingman's, and 10 guns, was to advance by the Dover road. Newbern had been strongly fortified, and was held by 2,000 men, under Gen. I. N. Palmer, and three gunboats were stationed in the Neuse and Trent rivers. An outpost of 300 men of the 132d New York was at Bachelor's Creek, eight miles above Newbern. Gen. Hoke, advancing by the Dover road, on 1 February, at Bachelor's Creek encountered the Union outpost, which was driven in after a severe Federal loss, and Pickett with his column crossed the creek and advanced toward Newbern. The batteries opened upon him; he made no attack, but awaited the result of the co-operating movements. Col. Wood, with 10 rowboats, carrying picked crews of 15 men each, armed with rifles and cutlasses, left Kinston at noon of 31 January, dropped down the river, and at 4 A.M. of 1 February arrived near the town; but, owing to a fog, he could not locate the position of the gunboats. He finally located the Underwriter, moored close in shore, near the wharf, and not more than 100 yards from three

batteries; and at night he boarded her, killing her commander and some of the crew, and capturing a third of the remainder in a hand-to-hand conflict. The fires under the boilers of the vessel were very low, and in attempting to tow her out Wood was subjected to fire of artillery and infantry from the forts on shore, and therefore he set her on fire. Pickett waited for Barton's movement, which failed, and after a feeble demonstration he gave up the enterprise and withdrew to Kinston, after a loss of 45 killed and wounded. The Union loss was 326 killed, wounded, and missing.

The third attempt on Newbern was made by Gen. Hoke, who, after his capture of Plymouth, N. C. (q.v.), 20 April 1864, moved against the place and demanded its surrender, and on being refused began a siege. Hoke was recalled to Kinston, 5 May, and ordered to Petersburg, Va. Consult: 'Official Records,' Vol. IX., XVIII., XXXIII., XXXVI., and The Century Company's 'Battles and Leaders of the Civil War,' Vol. I. E. A. CARMAN.

Newberry, nū'bĕr-ĭ, **John Strong,** American geologist: b. Windsor, Conn., 22 Dec. 1822; d. New Haven 7 Dec. 1892. His early life was passed chiefly in the Western Reserve, Ohio, and he was graduated at the Western Reserve College in 1846 and at the Cleveland Medical School in 1848. From 1851 to 1855 he practised medicine in Cleveland. He was assistant surgeon and geologist to the government expedition that explored the country between San Francisco and the Columbia River; also accompanied Lieut. Ives in his exploration of the Colorado River, and the expedition under Captain Macomb in its exploration from the Santa Fé to the junction of the Grand and Green rivers. His reports upon the scientific results of these expeditions brought him great credit in the scientific world. At the beginning of the Civil War he became attached to the Sanitary Commission, and later secretary of its Western department. He was afterward connected with the Smithsonian Institution, and with the Columbian University, Washington, and in 1866 was appointed professor of geology and palæontology at the Columbia College School of Mines, which post he retained till his death. Besides many special reports and parts of general reports, his writings include: 'The Rock Oils of Ohio' (1859); 'Catalogue of the Plants of Ohio' (1860); 'Iron Resources of the United States' (1874); 'The Structure and Relations of Dinichthys' (1875); 'Palæozoic Fishes of North America' (1889); 'Later Extinct Floras' (1898); etc. He was especially conversant with the palæontology of the Carboniferous Era in America, and particularly with extinct fishes; and as a teacher he had great popularity and influence. He was among the early members of the National Academy of Sciences.

Newberry, S. C., town, county-seat of Newberry County; on the Atlantic Coast Line and the Southern R.R.'s; about 40 miles northwest of Columbia. It is in a region in which the cultivation of cotton is one of the chief industries. It has manufacturing establishments for cottonseed-oil, cotton goods, preparing cotton for shipment, coffins, fertilizers, and lumber products. It has considerable trade, chiefly in cotton products, fruit, and vegetables. It has a fine court-house and city-hall, and is the seat of Newberry College, a coeducational institution founded in 1858 under the auspices of the Lutheran Church. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 3,020; (1900) 4,607.

Newbery, nū'bĕr-ĭ, **John,** English publisher and bookseller: b. Waltham Saint Lawrence, Berkshire, 1713; d. London 22 Dec. 1767. Going to London he began, in 1745, in Saint Paul's Churchyard, the publishing and selling of books. He also published 'The Universal Chronicle and Weekly Gazette,' in which Johnson's 'Idlers' appeared, and 'The Public Ledger,' in which Goldsmith's 'Citizen of the World' was printed. Newbery made a specialty of books for children, and published the 'Juvenile Library,' a choice collection of volumes, among which were 'Goody Two Shoes,' 'Tommy Trip and His Dog Growler,' and other surviving favorites. His intimate association with famous authors, the merits of his own work, and the reputation which he left for a spirit and life of benevolence combine to perpetuate an interest in Newbery's memory.

New'bolt, Henry John, English author: b. Bilston, Staffordshire, 6 June 1862. He was educated at Clifton and Oxford and was called to the bar of Lincoln's Inn in 1887. After practising his profession till 1899 he established the next year the London 'Monthly Review,' which he has since edited. He has published 'Taken from the Enemy,' a novel (1892); 'Mordred,' a tragedy (1895); 'Admirals All' (1897), verse; 'The Island Race' (1897); 'Stories from Froissart' (1899); 'Froissart in Britain' (1900); 'The Sailing of the Long-Ships' (1902).

Newbolt, William Charles Edmund, English Anglican clergyman and author: b. Somerton, Somerset, 14 Aug. 1844. He was educated at Oxford, was vicar of Dymock 1870–7, and of Malvern Link 1877–88. He was principal of the Theological School, Ely, 1887–90 and is a canon and chancellor of St. Paul's Cathedral. Among his published works are 'Counsels of Faith and Practice' (1883); 'The Prayer Book: its Voice and Teaching' (1889); 'The Dial of Prayer' (1901); 'Apostles of the Lord' (1901).

Newborn, a sect of Antinomians, which arose in the United States in the early part of the 18th century. Its founder was a German immigrant, named Mathias Bawmann (who died 1727). They held the doctrine of the deification of humanity by regeneration. They denied that the Bible was necessary for the illumination of Christians, and scoffed at the sacraments. They claimed that their regeneration or newbirth was brought about by dreams, apparitions and supernatural inspiration, and was like the new name written on the white stone and known only to him that receiveth it (Rev. ii. 17).

Newburgh, nū'bĕrg, N. Y., city in Orange County; on the west bank of the Hudson River, and on the Erie and the West Shore R. R.'s; 58 miles north of New York. The first settlement was made by emigrants from the Rhenish Palatinate, in the winter of 1798–9. They called the place, "Palatine Parish by Quassaic." The Germans were soon followed by emigrants from Great Britain, and in 1750 the English and Scotch were there in numbers sufficient to change the name to "Parish of Newburgh" in
